Let Sp denote the category of spectra. Given a spectrum *E*, Bousfield constructed an endofunctor  $L_E : \text{Sp} \rightarrow \text{Sp}$  whose image category  $L_E\text{Sp}$  is stable homotopy as seen through the eyes of *E*-theory.

We are interested in the case E = K(n).  $L_{K(n)}$ Sp is much easier to deal with than Sp itself. For example, we can compute  $\pi_* L_{K(2)} V(1)$ , but we have no hope of computing  $\pi_* V(1)$ .
