is weakly contractible. Unwinding the definitions, we can identify $\mathbf{\Delta}_{/[m]} \times_{\mathbf{\Delta}} \mathbf{\Delta}_{/[n]}$ with the category of simplices $\mathbf{\Delta}_S$ of Construction 1.1.3.9, where S is the product $\Delta^m \times \Delta^n$. Note that S can be identified with the nerve of a partially ordered set, and is therefore a braced simplicial set (Exercise 3.3.1.2). Let $\mathbf{\Delta}_S^{\mathrm{nd}}$ denote the full subcategory of $\mathbf{\Delta}_S$ spanned by the nondegenerate simplices of S (Notation 3.3.3.11), so that the inclusion $\mathbf{\Delta}_S^{\mathrm{nd}} \hookrightarrow \mathbf{\Delta}_S$ admits a left adjoint (Exercise 3.3.3.15). It follows that the inclusion map $\mathrm{N}_\bullet(\mathbf{\Delta}_S^{\mathrm{nd}}) \hookrightarrow \mathrm{N}_\bullet(\mathbf{\Delta}_S)$ is a homotopy equivalence of simplicial sets (Proposition 3.1.6.9). It will therefore suffice to show that the nerve $\mathrm{N}_\bullet(\mathbf{\Delta}_S^{\mathrm{nd}})$ is weakly contractible. Using Proposition 3.3.3.16, we can identify $\mathrm{N}_\bullet(\mathbf{\Delta}_S^{\mathrm{nd}})$ with the subdivision $\mathrm{Sd}(S)$, so that Construction 3.3.4.3 supplies a weak homotopy equivalence $\lambda_S : \mathrm{N}_\bullet(\mathbf{\Delta}_S^{\mathrm{nd}}) \to S$. We conclude by observing that the simplicial set $S = \Delta^m \times \Delta^n$ is weakly contractible (in fact, it is contractible, since it is the nerve of a partially ordered set having a smallest element). □

02QQ **Exercise 7.2.8.11.** Let $\mathbf{\Delta}_{\leq 1}$ denote the full subcategory of $\mathbf{\Delta}$ spanned by the objects $[0]$ and $[1]$, which we depict informally as a diagram

$$\begin{tikzcd} {[0]} \arrow[r, shift left=2] \arrow[r, shift right=2] & {[1]}. \arrow[l] \end{tikzcd}$$

Show that:

- The opposite category $\mathbf{\Delta}^{\mathrm{op}}_{\leq 1}$ satisfies condition $(*)$ of Warning 7.2.8.2 (that is, it is a sifted category in the sense of [1]).
- The simplicial set $\mathrm{N}_{\bullet}(\mathbf{\Delta}^{\mathrm{op}}_{\leq 1})$ is not sifted.

7.3 Kan Extensions

02Y1 Let $F : \mathcal{C} \to \mathcal{D}$ be a functor between categories. In practice, it is often possible to reconstruct the functor F (at least up to isomorphism) from its restriction to a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. To make this more precise, it will be convenient to introduce some terminology.

02Y2 **Definition 7.3.0.1.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor between categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. We say that F is *left Kan extended from* $\mathcal{C}^0$ if, for every object $C \in \mathcal{C}$, the collection of morphisms $\{F(u) : F(C_0) \to F(C)\}_{u: C_0 \to C}$ exhibits $F(C)$ as a colimit of the diagram

$$(\mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C}) \to \mathcal{C}^0 \hookrightarrow \mathcal{C} \xrightarrow{F} \mathcal{D}\,.$$

The central features of Definition 7.3.0.1 can be summarized as follows:

02Y3 **Exercise 7.3.0.2** (Uniqueness of Kan Extensions)**.** Let $F, G : \mathcal{C} \to \mathcal{D}$ be functors between categories, and suppose that F is left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Show that the restriction map

$$\begin{tikzcd} \{\text{Natural transformations from } F \text{ to } G\} \arrow[d] \\ \{\text{Natural transformations from } F|_{\mathcal{C}^0} \text{ to } G|_{\mathcal{C}^0}\} \end{tikzcd}$$

is a bijection. In particular, the functor F can be recovered (up to canonical isomorphism) from the restriction $F|_{\mathcal{C}^0}$.

02Y4 **Exercise 7.3.0.3** (Existence of Kan Extensions)**.** Let $\mathcal{C}$ be a category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and let $F_0 : \mathcal{C}^0 \to \mathcal{D}$ be a functor between categories. Show that the following conditions are equivalent;

(1) There exists a functor $F : \mathcal{C} \to \mathcal{D}$ which is left Kan extended from $\mathcal{C}^0$ and satisfies $F|_{\mathcal{C}^0} = F_0$.

(2) For every object $C \in \mathcal{C}$, the diagram

$$(\mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C}) \to \mathcal{C}^0 \xrightarrow{F_0} \mathcal{D} \tag{7.13}$$ 02Y5

has a colimit in $\mathcal{D}$.

Stated more informally, if the diagram (7.13) has a colimit in $\mathcal{D}$, then that colimit depends functorially on the object $C \in \mathcal{C}$.

In this section, we adapt the theory of Kan extensions to the ∞-categorical setting. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. We will say that F is *left Kan extended from* $\mathcal{C}^0$ if it satisfies an ∞-categorical analogue of the condition appearing in Definition 7.3.0.1, which we formulate in §7.3.2 (see Definition 7.3.2.1). Our main results are ∞-categorical counterparts of Exercises 7.3.0.2 and 7.3.0.3, which we prove in §7.3.6 and §7.3.5, respectively (see Corollary 7.3.6.9 and Corollary 7.3.5.8).

For many applications, it will be useful to consider a different generalization of Definition 7.3.0.1, where we replace the inclusion map $\mathcal{C}^0 \hookrightarrow \mathcal{C}$ by an arbitrary functor $\delta : \mathcal{K} \to \mathcal{C}$. Suppose we are given functors $F : \mathcal{C} \to \mathcal{D}$, $\delta : \mathcal{K} \to \mathcal{C}$, and $F_0 : \mathcal{K} \to \mathcal{D}$, together with a natural transformation $\beta : F_0 \to F \circ \delta$, as indicated in the diagram

$$\begin{tikzcd}
 & \mathcal{C} \arrow[dr, "F"] & \\
\mathcal{K} \arrow[ur, "\delta"] \arrow[rr, "F_0"'] & {} \arrow[u, Rightarrow, "\beta"'] & \mathcal{D}.
\end{tikzcd}$$

We will say that β *exhibits* F *as a left Kan extension of* F_0 *along* δ if, for every object $C \in \mathcal{C}$, the collection of morphisms $\{(F(u) \circ \beta_X) : F_0(X) \to F(C)\}_{u : \delta(X) \to C}$ exhibits $F(C)$ as a colimit of the diagram $\mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C} \to \mathcal{K} \xrightarrow{F_0} \mathcal{D}$. This notion also has an ∞-categorical generalization which we introduce in §7.3.1 (Variant 7.3.1.5), for which we have counterparts of Exercises 7.3.0.2 and 7.3.0.3 (see Propositions 7.3.6.1 and 7.3.5.1). In the special case where $\mathcal{K} = \mathcal{C}^0$ is a full subcategory of $\mathcal{C}$ and δ is the inclusion map, the Kan extension condition guarantees that β is an isomorphism, and therefore essentially reduces to the notion of Kan extension introduced in Definition 7.3.0.1 (see Corollary 7.3.2.7 for a precise statement). In §7.3.4 we study a different extreme, where the functor δ is assumed to be a cocartesian fibration: in this case, the left Kan extension F of a functor $F_0 : \mathcal{K} \to \mathcal{D}$ along δ is given concretely by the formula

$$F(C) = \varinjlim_{\delta(X) = C} (F_0(X))$$

where the colimit is taken over the *fiber* $\mathcal{K}_C = \mathcal{K} \times_{\mathcal{C}} \{C\}$ (see Proposition 7.3.4.1 and Corollary 7.3.4.2).

In §7.3.3 we consider another variant of Definition 7.3.0.1, where we replace colimits in $\mathcal{D}$ by the more general notion of U-colimit for an auxiliary functor $U : \mathcal{D} \to \mathcal{E}$ (see §7.1.5). The extra generality afforded by the relative setting is quite convenient in practice: for example, in §7.3.6 we show that relative Kan extensions satisfy a universal property (Proposition 7.3.6.7, analogous to Exercise 7.3.0.2) which can be formally deduced from an existence criterion (Proposition 7.3.5.5, analogous to Exercise 7.3.0.3).

In §7.3.8, we study the transitivity properties of Kan extensions. Let $\overline{F} : \overline{\mathcal{C}} \to \mathcal{D}$ be a functor of ∞-categories, and suppose we are given full subcategories $\mathcal{C}^0 \subseteq \mathcal{C} \subseteq \overline{\mathcal{C}}$ such that $F = \overline{F}|_{\mathcal{C}}$ is left Kan extended from $\mathcal{C}_0$. We will show that $\overline{F}$ is left Kan extended from $\mathcal{C}$ if and only if it is left Kan extended from $\mathcal{C}^0$ (Corollary 7.3.8.8). Moreover, we prove analogous statements for relative left Kan extensions (Proposition 7.3.8.6) and for Kan extensions along more general functors (Proposition 7.3.8.18). In §7.3.9, we apply these ideas to give a characterization of U-colimit diagrams in the special case where $U : \mathcal{D} \to \mathcal{E}$ is a cocartesian fibration of ∞-categories.

02Y6 **Remark 7.3.0.4.** In the summary above, we considered only the notion of *left* Kan extensions. There is also a dual theory of *right* Kan extensions, which can be obtained from the theory of left Kan extensions by passing to opposite categories.

7.3.1 Kan Extensions along General Functors

02Y7 We begin by introducing some notation.

02Y8 **Notation 7.3.1.1.** Let $\mathcal{C}$ be an ∞-category and let $\delta : K \to \mathcal{C}$ be a diagram. For each object $C \in \mathcal{C}$, we let $K_{/C}$ denote the fiber product $K \times_{\mathcal{C}} \mathcal{C}_{/C}$. Note that the slice diagonal of Construction 4.6.4.13 determines a map $K_{/C} \to K \tilde{\times}_{\mathcal{C}} \{C\}$, which we can identify with a natural transformation of diagrams $\gamma : \delta|_{K_{/C}} \to \underline{C}$; here $\delta|_{K_{/C}}$ denotes the composition $K_{/C} \to K \xrightarrow{\delta} \mathcal{C}$, while $\underline{C}$ denotes the constant diagram $K_{/C} \to \mathcal{C}$ taking the value C. Similarly, we let $K_{C/}$ denote the fiber product $\mathcal{C}_{C/} \times_{\mathcal{C}} K$, so that the coslice diagonal of Construction 4.6.4.13 determines a natural transformation $\gamma' : \underline{C} \to \delta|_{K_{C/}}$.

02Y9 **Definition 7.3.1.2** (Right Kan Extensions)**.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. Suppose we are given a simplicial set K together with diagrams $\delta : K \to \mathcal{C}$ and $F_0 : K \to \mathcal{D}$

and a natural transformation $\alpha : F \circ \delta \to F_0$, as indicated in the diagram

$$\begin{tikzcd}
& \mathcal{C} \arrow[dr, "F"] \arrow[d, phantom, "\Downarrow \alpha"] & \\
K \arrow[ur, "\delta"] \arrow[rr, "F_0"'] & & \mathcal{D}.
\end{tikzcd}$$

We will say that α *exhibits* F *as a right Kan extension of* F_0 *along* δ if, for every object $C \in \mathcal{C}$, the following condition is satisfied:

$(*_C)$ Let α_C denote a composition of the natural transformations

$$\underline{F(C)} \xrightarrow{F(\gamma')} (F \circ \delta)|_{K_{C/}} \xrightarrow{\alpha} F_0|_{K_{C/}}$$

(formed in the ∞-category $\mathrm{Fun}(K_{C/}, \mathcal{D})$), where $\gamma' : \underline{C} \to \delta|_{K_{C/}}$ is defined in Notation 7.3.1.1. Then α_C exhibits $F(C)$ as a limit of the diagram

$$K_{C/} = \mathcal{C}_{C/} \times_{\mathcal{C}} K \to K \xrightarrow{F_0} \mathcal{D},$$

in the sense of Definition 7.1.1.1.

Remark 7.3.1.3. Stated more informally, a diagram 02YA

$$\begin{tikzcd}
& \mathcal{C} \arrow[dr, "F"] \arrow[d, phantom, "\Downarrow \alpha"] & \\
K \arrow[ur, "\delta"] \arrow[rr, "F_0"'] & & \mathcal{D}.
\end{tikzcd}$$

exhibits F as a right Kan extension of F_0 along δ if, for every object $C \in \mathcal{C}$, we can calculate the value $F(C) \in \mathcal{D}$ as a limit of the diagram

$$K_{C/} = \mathcal{C}_{C/} \times_{\mathcal{C}} K \to K \xrightarrow{F_0} \mathcal{D}.$$

Note that this requirement characterizes the object $F(C) \in \mathcal{D}$ up to isomorphism (see Proposition 7.1.1.12). We will later prove a stronger assertion: if the diagrams $\delta : K \to \mathcal{C}$ and $F_0 : K \to \mathcal{D}$ are fixed, then a right Kan extension of F_0 along δ is uniquely determined (up to isomorphism) as an object of the ∞-category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$ (Remark 7.3.6.6).

Warning 7.3.1.4. In the situation of Definition 7.3.1.2, the natural transformation α_C appearing in condition $(*_C)$ is defined as a composition of morphisms in the ∞-category $\mathrm{Fun}(K_{/C}, \mathcal{D})$, which is only well-defined up to homotopy. However, the condition that α_C exhibits $F(C)$ as a colimit of the diagram $F_0|_{K_{/C}}$ depends only on the homotopy class $[\beta_C]$ (Remark 7.1.1.7). 02YB

02YC **Variant 7.3.1.5** (Left Kan Extensions)**.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. Suppose we are given a simplicial set K together with diagrams $\delta : K \to \mathcal{C}$ and $F_0 : K \to \mathcal{D}$ and a natural transformation $\beta : F_0 \to F \circ \delta$, as indicated in the diagram

$$\begin{tikzcd} & \mathcal{C} \arrow[dr, "F"] & \\ K \arrow[ur, "\delta"] \arrow[rr, "F_0"'] & \Uparrow \beta & \mathcal{D}. \end{tikzcd}$$

We will say that β *exhibits* F *as a left Kan extension of* F_0 *along* δ if, for every object $C \in \mathcal{C}$, the following condition is satisfied:

$(*_C)$ Let β_C denote a composition of the natural transformations

$$F_0|_{K_{/C}} \xrightarrow{\beta} (F \circ \delta)|_{K_{/C}} \xrightarrow{F(\gamma)} \underline{F(C)}$$

(formed in the ∞-category $\mathrm{Fun}(K_{/C}, \mathcal{D})$), where $\gamma : \delta|_{K_{/C}} \to \underline{C}$ is defined in Notation 7.3.1.1. Then β_C exhibits $F(C)$ as a colimit of the diagram

$$K_{/C} = K \times_{\mathcal{C}} \mathcal{C}_{/C} \to K \xrightarrow{F_0} \mathcal{D},$$

in the sense of Definition 7.1.1.1.

02YD **Remark 7.3.1.6.** In the situation of Variant 7.3.1.5, the natural transformation $\beta : F_0 \to F \circ \delta$ exhibits F as a left Kan extension of F_0 along δ if and only if it exhibits F^{op} as a right Kan extension of F_0^{op} along δ^{op}, when regarded as a morphism in the ∞-category $\mathrm{Fun}(K^{\mathrm{op}}, \mathcal{D}^{\mathrm{op}}) \simeq \mathrm{Fun}(K, \mathcal{D})^{\mathrm{op}}$.

02YE **Example 7.3.1.7.** Let $\mathcal{D}$ be an ∞-category, let $F_0 : K \to \mathcal{D}$ be a diagram. Let $\delta : K \to \Delta^0$ be the projection map and let $F : \Delta^0 \to \mathcal{D}$ be the functor corresponding to an object $Y \in \mathcal{D}$. Then:

- A natural transformation $\alpha : \underline{Y} = (F \circ \delta) \to F_0$ exhibits Y as a limit of F_0 (in the sense of Definition 7.1.1.1) if and only if it exhibits F as a right Kan extension of F_0 along δ (in the sense of Definition 7.3.1.2).
- A natural transformation $\beta : F_0 \to (F \circ \delta) = \underline{Y}$ exhibits Y as a colimit of F_0 (in the sense of Definition 7.1.1.1) if and only if it exhibits F as a left Kan extension of F_0 along δ (in the sense of Variant 7.3.1.5).

02YF **Example 7.3.1.8.** Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories, and let $\alpha : F \to G$ be a morphism in the ∞-category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$. The following conditions are equivalent:

(1) The natural transformation α is an isomorphism in the ∞-category $\operatorname{Fun}(\mathcal{C}, \mathcal{D})$.

(2) The natural transformation α exhibits F as a right Kan extension of G along the identity functor $\mathrm{id}_{\mathcal{C}} : \mathcal{C} \to \mathcal{C}$.

(3) The natural transformation α exhibits G as a left Kan extension of F along the identity functor $\mathrm{id}_{\mathcal{C}} : \mathcal{C} \to \mathcal{C}$.

To prove the equivalence of (1) and (2), fix an object $C \in \mathcal{C}$. Since the identity morphism id_C is an initial object of the ∞-category $\mathcal{C}_{C/}$ (Proposition 4.6.7.22), the natural transformation α satisfies condition $(*_C)$ of Definition 7.3.1.2 if and only if the induced map $\alpha_C : F(C) \to G(C)$ is an isomorphism in $\mathcal{D}$ (Corollary 7.2.2.6). The equivalence (1) $\Leftrightarrow$ (2) now follows from the criterion of Theorem 4.4.4.4. The equivalence (1) $\Leftrightarrow$ (3) follows by a similar argument.

Remark 7.3.1.9. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories and let $\delta : K \to \mathcal{C}$ and $F_0 : K \to \mathcal{D}$ be diagrams. Then: `02YG`

- The condition that a natural transformation $\alpha : F \circ \delta \to F_0$ exhibits F as a right Kan extension of F_0 along δ depends only on the homotopy class $[\alpha]$ (as a morphism in the ∞-category $\operatorname{Fun}(K, \mathcal{D})$).
- The condition that a natural transformation $\beta : F_0 \to F \circ \delta$ exhibits F as a left Kan extension of F_0 along δ depends only on the homotopy class $[\beta]$ (as a morphism in the ∞-category $\operatorname{Fun}(K, \mathcal{D})$).

See Remark 7.1.1.7.

Remark 7.3.1.10. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, let $\delta : K \to \mathcal{C}$ be a diagram, and let $\rho : F_0 \to F_0'$ be an isomorphism in the ∞-category $\operatorname{Fun}(K, \mathcal{D})$. Then: `02YH`

- A natural transformation $\alpha : F \circ \delta \to F_0$ exhibits F as a right Kan extension of F_0 along δ if and only if the composite natural transformation

  $$F \circ \delta \xrightarrow{\alpha} F_0 \xrightarrow{\rho} F_0'$$

  exhibits F as a right Kan extension of F_0' along δ (note that this condition is independent of the composition chosen, by virtue of Remark 7.3.1.9).

- A natural transformation $\beta : F_0' \to F \circ \delta$ exhibits F as a left Kan extension of F_0' along δ if and only if the composite natural transformation

  $$F_0 \xrightarrow{\rho} F_0' \xrightarrow{\beta} F \circ \delta$$

  exhibits F as a left Kan extension of F_0 along δ.

See Remark 7.1.1.8.

03J9 **Remark 7.3.1.11.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, let $F_0 : K \to \mathcal{D}$ be a diagram, and let $\rho : \delta' \to \delta$ be an isomorphism in the ∞-category $\mathrm{Fun}(K, \mathcal{C})$. Then:

- A natural transformation $\alpha : F \circ \delta \to F_0$ exhibits F as a right Kan extension of F_0 along δ if and only if the composite natural transformation

  $$F \circ \delta' \xrightarrow{\rho} F \circ \delta \xrightarrow{\alpha} F_0$$

  exhibits F as a right Kan extension of F_0 along δ' (note that this condition is independent of the composition chosen, by virtue of Remark 7.3.1.9).

- A natural transformation $\beta : F_0 \to F \circ \delta'$ exhibits F as a left Kan extension of F_0 along δ' if and only if the composite natural transformation

  $$F_0 \xrightarrow{\beta} F \circ \delta' \xrightarrow{\rho} F \circ \delta$$

  exhibits F as a left Kan extension of F_0 along δ.

See Remark 7.1.1.8.

02YJ **Remark 7.3.1.12.** Suppose we are given a diagram

$$\begin{tikzcd}
& \mathcal{C} \arrow[dr, "F"] \arrow[d, phantom, "\Downarrow \alpha"] & \\
K \arrow[ur, "\delta"] \arrow[rr, "F_0"'] & {} & \mathcal{D}
\end{tikzcd}$$

as in Definition 7.3.1.2. Let $\rho : F' \to F$ be a morphism in the ∞-category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$. Then any two of the following conditions imply the third:

- The natural transformation α exhibits F as a right Kan extension of F_0 along δ.

- The composite natural transformation

  $$\delta \circ F' \xrightarrow{\rho} \delta \circ F \xrightarrow{\alpha} F_0$$

  exhibits F' as a right Kan extension of F_0 along δ (note that this condition does not depend on the composition chosen, by virtue of Remark 7.3.1.9).

- The morphism ρ is an isomorphism in the ∞-category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$.

This follows by combining Remark 7.1.1.9 with Theorem 4.4.4.4.

Remark 7.3.1.13 (Change of Target)**.** Suppose we are given a diagram 02YK

$$\begin{tikzcd} & \mathcal{C} \arrow[dr, "F"] \arrow[d, phantom, "\Downarrow \alpha"] & \\ K \arrow[ur, "\delta"] \arrow[rr, "F_0"'] & {} & \mathcal{D} \end{tikzcd}$$

as in Definition 7.3.1.2, and let $G : \mathcal{D} \to \mathcal{E}$ be a functor of ∞-categories. Then:

- If G is fully faithful and $G(\alpha) : (G \circ F) \circ \delta \to G \circ F_0$ exhibits $G \circ F$ as a right Kan extension of $G \circ F_0$ along δ, then α exhibits F as a right Kan extension of F_0 along δ.

- If G is an equivalence of ∞-categories and α exhibits F as a right Kan extension of F_0 along δ, then $G(\alpha)$ exhibits $G \circ F$ as a right Kan extension of $G \circ F_0$ along δ.

See Remark 7.1.1.10.

Proposition 7.3.1.14 (Change of Diagram)**.** *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, let $\delta : K \to \mathcal{C}$ and $F_0 : K \to \mathcal{D}$ be diagrams, and let $\epsilon : K' \to K$ be a categorical equivalence of simplicial sets. Then:* 02YL

(1) *A natural transformation $\alpha : F \circ \delta \to F_0$ exhibits F as a right Kan extension of F_0 along δ if and only if the induced transformation $\alpha' : F \circ (\delta \circ \epsilon) \to F_0 \circ \epsilon$ exhibits F as a right Kan extension of $F_0 \circ \epsilon$ along $\delta \circ \epsilon$.*

(2) *A natural transformation $\beta : F_0 \to F \circ \delta$ exhibits F as a left Kan extension of F_0 along δ if and only if the induced transformation $\beta' : F_0 \circ \epsilon \to F \circ (\delta \circ \epsilon)$ exhibits F as a left Kan extension of $F_0 \circ \epsilon$ along $\delta \circ \epsilon$.*

Proof. We will prove (1); the proof of (2) is similar. Fix an object $C \in \mathcal{C}$. Since ϵ is a categorical equivalence and the projection map $\mathcal{C}_{C/} \to \mathcal{C}$ is a left fibration (Proposition 4.3.6.1), it follows that the induced map $\epsilon_{C/} : K' \times_{\mathcal{C}} \mathcal{C}_{C/} \to K \times_{\mathcal{C}} \mathcal{C}_{C/}$ is also a categorical equivalence of simplicial sets (Corollary 5.6.7.6). In particular, $\epsilon_{C/}$ is left cofinal (Corollary 7.2.1.13). Applying Corollary 7.2.2.3, we see that the natural transformation α satisfies condition $(*_C)$ of Definition 7.3.1.2 if and only if α' satisfies condition $(*_C)$. The desired result now follows by allowing the object $C \in \mathcal{C}$ to vary. □

02YM **Proposition 7.3.1.15.** *Suppose we are given a diagram*

$$\begin{tikzcd} & \mathcal{C} \arrow[dr, "F"] \arrow[d, phantom, "\Downarrow \alpha"] & \\ K \arrow[ur, "\delta"] \arrow[rr, "F_0"'] & & \mathcal{D} \end{tikzcd}$$

as in Definition 7.3.1.2, where δ factors as a composition

$$K \xrightarrow{\delta^0} \mathcal{C}^0 \xrightarrow{G} \mathcal{C}$$

for some ∞-category $\mathcal{C}^0$. Then:

(1) *If G is fully faithful and α exhibits F as a right Kan extension of F_0 along δ, then it also exhibits $F \circ G$ as a right Kan extension of F_0 along δ^0.*

(2) *If G is an equivalence of ∞-categories and α exhibits $F \circ G$ as a right Kan extension of F_0 along δ^0, then it exhibits F as a right Kan extension of F_0 along δ.*

Proof. Assume that G is fully faithful. Then, for every pair of objects $X, Y \in \mathcal{C}^0$, the induced map of left-pinched morphism spaces

$$\mathcal{C}^0_{X/} \times_{\mathcal{C}} \{Y\} = \operatorname{Hom}^{\mathrm{L}}_{\mathcal{C}^0}(X,Y) \to \operatorname{Hom}^{\mathrm{L}}_{\mathcal{C}}(G(X), G(Y)) = \mathcal{C}_{G(X)/} \times_{\mathcal{C}} \{G(Y)\}$$

is a homotopy equivalence. Allowing Y to vary and applying Corollary 5.1.7.16, we see that the natural map $\mathcal{C}^0_{X/} \to \mathcal{C}_{G(X)/} \times_{\mathcal{C}} \mathcal{C}^0$ is an equivalence of left fibrations over $\mathcal{C}^0$. It follows that the induced map

$$\mathcal{C}^0_{X/} \times_{\mathcal{C}^0} K \to \mathcal{C}_{G(X)/} \times_{\mathcal{C}} K$$

is an equivalence of left fibrations over K. In particular it is a categorical equivalence of simplicial sets (Proposition 5.1.7.5) and therefore left cofinal (Corollary 7.2.1.13). Applying Corollary 7.2.2.3, we see that the natural transformation α satisfies condition $(*_X)$ of Definition 7.3.1.2 if and only if it satisfies condition $(*_{G(X)})$. Assertion (1) now follows by allowing the object $X \in \mathcal{C}^0$ to vary.

We now prove (2). Assume that G is an equivalence of ∞-categories and that α exhibits $F \circ G$ as a right Kan extension of F_0 along δ^0; we wish to show that α exhibits F as a right Kan extension of F_0 along δ. Let $H : \mathcal{C} \to \mathcal{C}^0$ be a homotopy inverse of G. Then H is left adjoint to G, so we can choose natural transformations

$$\eta : \mathrm{id}_{\mathcal{C}} \to G \circ H \qquad \epsilon : H \circ G \to \mathrm{id}_{\mathcal{C}^0}$$

which are compatible up to homotopy in the sense of Definition 6.2.1.1. Note that η and ϵ are isomorphisms (Proposition 6.1.4.1). Let α' denote a composition of the natural transformations

$$F \circ G \circ H \circ G \circ \delta^0 \xrightarrow{\epsilon} F \circ G \circ \delta^0 \xrightarrow{\alpha} F_0.$$

Using Remark 7.3.1.11, we see that α' exhibits $F \circ G$ as a right Kan extension of F_0 along $H \circ G \circ \delta^0 = H \circ \delta$. Applying assertion (1) to the fully faithful functor $H : \mathcal{C} \to \mathcal{C}^0$, we deduce that α' also exhibits δ as a right Kan extension of F_0 along $F \circ G \circ H$. The compatibility of η and ϵ guarantees that α is a composition of the natural transformations

$$F \circ \delta \xrightarrow{\eta} F \circ G \circ H \circ \delta \xrightarrow{\alpha'} F_0.$$

Applying Remark 7.3.1.12, we conclude that α exhibits F as a right Kan extension of F_0 along δ, as desired. □

Corollary 7.3.1.16. *Let $G : \mathcal{C}^0 \to \mathcal{C}$, $F_0 : \mathcal{C}^0 \to \mathcal{D}$, and $F : \mathcal{C} \to \mathcal{D}$ be functors of ∞-categories, where G is fully faithful. Then:* 02YN

- *If $\alpha : F \circ G \to F_0$ is a natural transformation which exhibits F as a right Kan extension of F_0 along G, then α is an isomorphism in the ∞-category $\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})$.*
- *If $\beta : F_0 \to F \circ G$ is a natural transformation which exhibits F as a left Kan extension of F_0 along G, then β is an isomorphism in the ∞-category $\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})$.*

Proof. Let $\alpha : F \circ G \to F_0$ be a natural transformation which exhibits F as a right Kan extension of F_0 along G. Applying Proposition (in the special case where $K = \mathcal{C}^0$), we deduce that α also exhibits $F \circ G$ as a right Kan extension of F_0 along the identity functor $\mathrm{id}_{\mathcal{C}^0} : \mathcal{C}^0 \to \mathcal{C}^0$. Invoking Example 7.3.1.8, we see that α is an isomorphism. This proves the first assertion; the second follows by a similar argument. □

Proposition 7.3.1.17. *Suppose we are given a diagram* 039N

$$\begin{tikzcd}
 & \mathcal{C} \arrow[dr, "F"] \arrow[d, Rightarrow, "\alpha"] & \\
K \arrow[ur, "\delta"] \arrow[rr, "F_0"'] & {} & \mathcal{D}
\end{tikzcd}$$

as in Definition 7.3.1.2. Assume that δ exhibits $\mathcal{C}$ as a localization of K (with respect to some collection of edges of K) and that α is an isomorphism in the ∞-category $\mathrm{Fun}(K, \mathcal{D})$. Then α exhibits F as a right Kan extension of F_0 along δ.

Proof. Fix an object $C \in \mathcal{C}$. Since α is an isomorphism, it will suffice to show that the tautological map $\underline{F(C)} \to (F \circ \delta)|_{K_{C/}}$ exhibits $F(C)$ as a limit of the diagram $(F \circ \delta)|_{K_{C/}}$. Since the projection map $\mathcal{C}_{C/} \to \mathcal{C}$ is a left fibration (Proposition 4.3.6.1), the map $\delta_{C/} : K_{C/} \to \mathcal{C}_{C/}$ exhibits the ∞-category $\mathcal{C}_{C/}$ as a localization of the simplicial set $K_{C/}$ (Corollary 6.3.5.5). In particular, $\delta_{C/}$ is left cofinal (Proposition 7.2.1.10). We can therefore replace K by $\mathcal{C}$ (Corollary 7.2.2.7), in which case the desired result follows from the criterion of Corollary 7.2.2.6. □

7.3.2 Kan Extensions along Inclusions

`02YP` Let $\mathcal{C}$ be an ∞-category and let $\delta : K \to \mathcal{C}$ be a diagram. In §7.3.1, we introduced the notion of a functor $F : \mathcal{C} \to \mathcal{D}$ being a left Kan extension of another diagram $F_0 : K \to \mathcal{D}$ along δ (Variant 7.3.1.5). Beware that this terminology is potentially misleading: if F is a left Kan extension of F_0 along δ, then the composition $F \circ \delta$ need not be equal to F_0. Instead, it is equipped with a natural transformation $\beta : F_0 \to F \circ \delta$ satisfying a certain universal property. In this section, we specialize to the case where $K = \mathcal{C}^0$ is a full subcategory of $\mathcal{C}$ and $\delta : \mathcal{C}^0 \hookrightarrow \mathcal{C}$ is the inclusion map. In this case, the natural transformation β is necessarily an isomorphism (Corollary 7.3.1.16). Consequently, the Kan extension condition can be substantially simplified: it can be regarded as a *property* of the functor F, which can be formulated without reference to the diagram F_0 or the natural transformation β.

`02YQ` **Definition 7.3.2.1.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Fix an object $C \in \mathcal{C}$. We will say that F *is left Kan extended from* $\mathcal{C}^0$ *at* C if the composite map

$$(\mathcal{C}^0_{/C})^{\triangleright} \hookrightarrow (\mathcal{C}_{/C})^{\triangleright} \xrightarrow{c} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a colimit diagram in the ∞-category $\mathcal{D}$. Here $\mathcal{C}^0_{/C}$ denotes the fiber product $\mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C}$ (Notation 7.3.1.1), and c is the slice contraction morphism of Construction 4.3.5.12. Similarly, we say that F *is right Kan extended from* $\mathcal{C}^0$ *at* C if the composite map

$$(\mathcal{C}^0_{C/})^{\triangleleft} \hookrightarrow (\mathcal{C}_{C/})^{\triangleleft} \xrightarrow{c'} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a limit diagram in $\mathcal{D}$. We say that F *is left Kan extended from* $\mathcal{C}^0$ if it is left Kan extended from $\mathcal{C}^0$ at every object $C \in \mathcal{C}$. We say that F *is right Kan extended from* $\mathcal{C}^0$ if it is right Kan extended from $\mathcal{C}^0$ at every object $C \in \mathcal{C}$.

`02YR` **Remark 7.3.2.2.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Then F is right Kan extended from $\mathcal{C}^0$ if and only if the opposite functor $F^{\mathrm{op}} : \mathcal{C}^{\mathrm{op}} \to \mathcal{D}^{\mathrm{op}}$ is left Kan extended from $\mathcal{C}^0$.

`02YS` **Exercise 7.3.2.3.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Show that, for every object $C \in \mathcal{C}^0$, the functor F is both left and right Kan extended from $\mathcal{C}^0$ at C. For a more general statement, see Proposition 7.3.3.7.

Remark 7.3.2.4. Let $F : \mathcal{B} \star \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories and set $G = F|_{\mathcal{B}}$, so that F can be identified with a functor $f : \mathcal{C} \to \mathcal{D}_{G/}$. If $\mathcal{C}^0$ is a full subcategory of $\mathcal{C}$, then f is left Kan extended from $\mathcal{C}^0$ at an object $C \in \mathcal{C}$ if and only if F is left Kan extended from $\mathcal{B} \star \mathcal{C}^0$ at C (see Remark 7.1.2.11). Combining this observation with Exercise 7.3.2.3, we see that f is left Kan extended from $\mathcal{C}^0$ if and only if F is left Kan extended from $\mathcal{B} \star \mathcal{C}^0$. 04K2

Example 7.3.2.5. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ordinary categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Then F is left Kan extended from $\mathcal{C}^0$ (in the sense of Definition 7.3.0.1) if and only if the induced functor of ∞-categories $\mathrm{N}_\bullet(F) : \mathrm{N}_\bullet(\mathcal{C}) \to \mathrm{N}_\bullet(\mathcal{D})$ is left Kan extended from $\mathrm{N}_\bullet(\mathcal{C}^0)$ (in the sense of Definition 7.3.2.1). 02YT

We now show that Definition 7.3.2.1 can be regarded as a special case of the notions introduced in §7.3.1:

Proposition 7.3.2.6. *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, let F_0 denote the restriction of F to a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$, and let $\iota : \mathcal{C}^0 \hookrightarrow \mathcal{C}$ denote the inclusion functor. Then:* 02YU

- *The functor F is left Kan extended from $\mathcal{C}^0$ (in the sense of Definition 7.3.2.1) if and only if the identity transformation $\mathrm{id} : F_0 \to F \circ \iota$ exhibits F as a left Kan extension of F_0 along ι (in the sense of Variant 7.3.1.5).*
- *The functor F is right Kan extended from $\mathcal{C}^0$ (in the sense of Definition 7.3.2.1) if and only if the identity transformation $\mathrm{id}_{F_0} : F \circ \iota \to F_0$ exhibits F as a right Kan extension of F_0 along ι (in the sense of Definition 7.3.1.2).*

Proof. Fix an object $C \in \mathcal{C}$. It follows from Remark 7.1.2.6 that the composition

$$(\mathcal{C}^0_{/C})^{\triangleright} \hookrightarrow (\mathcal{C}_{/C})^{\triangleright} \to \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a colimit diagram in $\mathcal{D}$ if and only if the natural transformation id_{F_0} satisfies condition $(*_C)$ of Variant 7.3.1.5. The first assertion follows by allowing the object C to vary, and the second follows by a similar argument. □

Corollary 7.3.2.7. *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and let $\beta : F_0 \to F|_{\mathcal{C}^0}$ be a natural transformation of functors from $\mathcal{C}^0$ to $\mathcal{D}$. Then β exhibits F as a left Kan extension of F_0 along the inclusion map $\iota : \mathcal{C}^0 \hookrightarrow \mathcal{C}$ (in the sense of Variant 7.3.1.5) if and only if the following pair of conditions is satisfied:* 02YV

(1) *The functor F is left Kan extended from $\mathcal{C}^0$ (in the sense of Definition 7.3.2.1).*

(2) *The natural transformation β is an isomorphism in the ∞-category $\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})$.*

Proof. By virtue of Corollary 7.3.1.16, we may assume that condition (2) is satisfied. Using Remark 7.3.1.10, we can reduce further to the special case where $F_0 = F|_{\mathcal{C}^0}$ and β is the identity transformation, in which case the desired result is a restatement of Proposition 7.3.2.6. □

02YW **Corollary 7.3.2.8.** *Let $\mathcal{C}$ be an ∞-category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and let $F_0 : \mathcal{C}^0 \to \mathcal{D}$ be a functor of ∞-categories. The following conditions are equivalent:*

(1) *There exists a functor $F : \mathcal{C} \to \mathcal{D}$ and a natural transformation $\beta : F_0 \to F|_{\mathcal{C}^0}$ which exhibits F as a left Kan extension of F_0 along the inclusion functor $\mathcal{C}^0 \hookrightarrow \mathcal{C}$.*

(2) *There exists a functor $F : \mathcal{C} \to \mathcal{D}$ which is left Kan extended from $\mathcal{C}^0$ and satisfies $F_0 = F|_{\mathcal{C}^0}$.*

Proof. We will show that (1) implies (2); the converse is an immediate consequence of Proposition 7.3.2.6. Let $\beta : F_0 \to F'|_{\mathcal{C}^0}$ exhibit F' as a left Kan extension of F_0 along the inclusion functor $\mathcal{C}^0 \hookrightarrow \mathcal{C}$. Then β is an isomorphism in the ∞-category $\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})$ (Corollary 7.3.1.16). Using Corollary 4.4.5.9, we can lift β to an isomorphism $\widetilde{\beta} : F \to F'$ in the ∞-category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$, where F satisfies $F|_{\mathcal{C}^0} = F_0$. Applying Remark 7.3.1.12, we deduce that the identity transformation id_{F_0} exhibits F as a left Kan extension of F_0 along the inclusion map $\mathcal{C}^0 \hookrightarrow \mathcal{C}$. Invoking Proposition 7.3.2.6, we conclude that F is left Kan extended from $\mathcal{C}^0$. □

02YX **Definition 7.3.2.9.** Let $\mathcal{C}$ be an ∞-category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and suppose we are given functors $F : \mathcal{C} \to \mathcal{D}$ and $F_0 : \mathcal{C}^0 \to \mathcal{D}$. We will say that F *is a left Kan extension of* F_0 if F is left Kan extended from $\mathcal{C}^0$ and satisfies $F|_{\mathcal{C}^0} = F_0$. We will say that F *is a right Kan extension of* F_0 if F is right Kan extended from $\mathcal{C}^0$ and satisfies $F|_{\mathcal{C}^0} = F_0$.

02YY **Warning 7.3.2.10.** Let $\mathcal{C}$ be an ∞-category, let $\iota : \mathcal{C}^0 \hookrightarrow \mathcal{C}$ be the inclusion of a full subcategory, and let $F_0 : \mathcal{C}^0 \to \mathcal{D}$. be a functor. We have given two definitions for the notion of Kan extension:

(a) A functor $F : \mathcal{C} \to \mathcal{D}$ is a left Kan extension of F_0 if it is left Kan extended from $\mathcal{C}^0$ and satisfies $F|_{\mathcal{C}^0} = F_0$ (Definition 7.3.2.9).

(b) A functor $F : \mathcal{C} \to \mathcal{D}$ is a left Kan extension of F_0 along ι if there exists a natural transformation $\beta : F_0 \to F|_{\mathcal{C}^0}$ which exhibits F as a left Kan extension of F_0 along ι, in the sense of Variant 7.3.1.5.

These definitions are not quite equivalent. By virtue of Proposition 7.3.2.6, a functor $F : \mathcal{C} \to \mathcal{D}$ satisfies condition (a) if and only if it satisfies a stronger version of condition (b), where β is required to be an identity natural transformation. In particular, condition (a)

implies condition (b). However, the converse is false: if F is a left Kan extension of F_0 along ι, then the restriction $F|_{\mathcal{C}^0}$ need not be *equal* to F_0. However, it is necessarily isomorphic to F_0, by virtue of Corollary 7.3.2.7.

Let $\delta : \mathcal{K} \to \mathcal{C}$ be a functor of ∞-categories. The preceding results show that, if δ is an isomorphism from $\mathcal{K}$ to a full subcategory of $\mathcal{C}$, then the theory of Kan extensions along δ (in the sense of §7.3.1) can be reformulated in terms of Definition 7.3.2.1. We now extend this observation to the case of a general functor, by identifying $\mathcal{K}$ with a full subcategory of the relative join $\mathcal{K} \star_{\mathcal{C}} \mathcal{C}$ of Construction 5.2.3.1.

Proposition 7.3.2.11. *Let $\delta : \mathcal{K} \to \mathcal{C}$ be a functor of ∞-categories, let $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{D}$ be another functor having restrictions $F_0 = F|_{\mathcal{K}}$ and $F_1 = F|_{\mathcal{C}}$, so that the composition* 02YZ

$$\Delta^1 \times \mathcal{K} \simeq \mathcal{K} \star_{\mathcal{K}} \mathcal{K} \to \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

determines a natural transformation $\beta : F_0 \to F_1 \circ \delta$. The following conditions are equivalent:

(1) *The functor F is left Kan extended from the full subcategory $\mathcal{K} \subseteq \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$ (in the sense of Definition 7.3.2.1).*

(2) *The natural transformation β exhibits F_1 as a left Kan extension of F_0 along δ (in the sense of Variant 7.3.1.5).*

Proof. By virtue of Exercise 7.3.2.3, it will suffice to show that for every object $C \in \mathcal{C}$, the following conditions are equivalent:

(1_C) The functor F is left Kan extended from $\mathcal{K}$ at C (in the sense of Definition 7.3.2.1).

(2_C) The natural transformation β satisfies condition $(*_C)$ of Variant 7.3.1.5.

For the remainder of the proof, let us regard the object $C \in \mathcal{C}$ as fixed, and set $\mathcal{K}_{/C} = \mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C}$. Let $\pi : \Delta^2 \times \mathcal{K}_{/C} \to (\Delta^1 \times \mathcal{K}_{/C})^{\triangleright}$ be the functor which is the identity on $\Delta^1 \times \mathcal{K}_{/C}$ and carries $\{2\} \times \mathcal{K}_{/C}$ to the cone point of $(\Delta^1 \times \mathcal{K}_{/C})^{\triangleright}$. Let σ denote the composite map

$$\begin{aligned} \Delta^2 \times \mathcal{K}_{/C} & \xrightarrow{\pi} (\Delta^1 \times \mathcal{K}_{/C})^{\triangleright} \\ & \simeq ((\mathcal{K} \times \Delta^1) \times_{\mathcal{K} \star_{\mathcal{C}} \mathcal{C}} (\mathcal{K} \star_{\mathcal{C}} \mathcal{C})_{/C})^{\triangleright} \\ & \to \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \\ & \xrightarrow{F} \mathcal{D}. \end{aligned}$$

We will regard σ as a 2-simplex in the ∞-category $\operatorname{Fun}(\mathcal{K}_{/C}, \mathcal{D})$, which we display as a

diagram

$$\begin{tikzcd}
& (F_1 \circ \delta)|_{\mathcal{K}_{/C}} \arrow[dr] & \\
F_0|_{\mathcal{K}_{/C}} \arrow[ur] \arrow[rr] & & \underline{F_1(C)}
\end{tikzcd}$$

which witnesses the bottom horizontal map as the natural transformation β_C appearing in condition $(*_C)$. By construction, this natural transformation β_C is given by the composite map

$$\mathrm{N}_{\bullet}(\{0 < 2\}) \times \mathcal{K}_{/C} \to (\mathcal{K}_{/C})^{\triangleright} \to \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \xrightarrow{F} \mathcal{D},$$

so the equivalence $(1_C) \Leftrightarrow (2_C)$ is a special case of Remark 7.1.2.6. □

02Z0 **Warning 7.3.2.12.** For a general diagram

$$\begin{tikzcd}
& \mathcal{C} \arrow[dr, "F_1"] \arrow[d, phantom, "\Uparrow \beta"] & \\
\mathcal{K} \arrow[ur, "\delta"] \arrow[rr, "F_0"'] & {} & \mathcal{D},
\end{tikzcd}$$

we cannot always arrange that there exists a functor $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{D}$ satisfying the requirements of Proposition 7.3.2.11. However, we can always find a functor $F' : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{D}$ which satisfies $F'|_{\mathcal{K}} = F_0$, $F'|_{\mathcal{C}} = F_1$, and the map

$$\Delta^1 \times \mathcal{K} \simeq \mathcal{K} \star_{\mathcal{K}} \mathcal{K} \to \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \xrightarrow{F'} \mathcal{D}$$

determines a natural transformation $\beta' : F_0 \to F_1 \circ \delta$ which is homotopic to β. To see this, set $M = (\Delta^1 \times \mathcal{K}) \coprod_{(\{1\} \times \mathcal{K})} \mathcal{C}$, so that the pair (β, F_1) determines a morphism of simplicial sets $f : M \to \mathcal{D}$. Proposition 5.2.4.5 supplies a categorical equivalence of simplicial sets $\theta : M \to \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$, so the induced map

$$\mathrm{Fun}_{\mathcal{K} \coprod \mathcal{C}/}(\mathcal{K} \star_{\mathcal{C}} \mathcal{C}, \mathcal{D}) \xrightarrow{\circ \theta} \mathrm{Fun}_{\mathcal{K} \coprod \mathcal{C}/}(M, \mathcal{D})$$

is an equivalence of ∞-categories (Corollary 4.5.4.5). It follows that there exists a functor $F' : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{D}$ such that $F'|_{\mathcal{K}} = F_0$, $F'|_{\mathcal{C}} = F_1$, and $F' \circ \theta$ is isomorphic to f as an object of the ∞-category $\mathrm{Fun}_{\mathcal{K} \coprod \mathcal{C}/}(M, \mathcal{D})$. The last requirement is a reformulation of the condition that $\beta' = F'|_{\Delta^1 \times \mathcal{K}}$ is homotopic to β.

02Z1 **Corollary 7.3.2.13.** *Let $\delta : \mathcal{K} \to \mathcal{C}$, $F_0 : \mathcal{K} \to \mathcal{D}$, and $F_1 : \mathcal{C} \to \mathcal{D}$ be functors of ∞-categories. The following conditions are equivalent:*

(1) *There exists a functor* $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{D}$ *which is left Kan extended from* $\mathcal{K}$ *which satisfies* $F_0 = F|_{\mathcal{K}}$ *and* $F_1 = F|_{\mathcal{C}}$.

(2) *There exists a natural transformation* $\beta : F_0 \to F_1 \circ \delta$ *which exhibits* F_1 *as a left Kan extension of* F_0 *along* δ.

Proof. The implication (1) $\Leftrightarrow$ (2) follows immediately from Proposition 7.3.2.11. Conversely, suppose that there exists a natural transformation $\beta : F_0 \to F_1 \circ \delta$ which exhibits F_1 as a left Kan extension of F_0 along δ. By virtue of Remark 7.3.1.9, we can modify β by a homotopy and thereby arrange that there exists a functor $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{D}$ satisfying $F|_{\mathcal{K}} = F_0$, $F|_{\mathcal{K}} = F_1$ and for which the induced map

$$\Delta^1 \times \mathcal{K} \simeq \mathcal{K} \star_{\mathcal{K}} \mathcal{K} \to \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

coincides with β (Warning 7.3.2.12). Applying Proposition 7.3.2.11, we see that F is left Kan extended from $\mathcal{K}$. □

For later use, we record a slightly more general version of Proposition 7.3.2.11.

Corollary 7.3.2.14. *Let* $F : \mathcal{C} \to \mathcal{D}$ *be a functor of* ∞*-categories, and let* $U : \mathcal{C} \to \Delta^1$ *be a cocartesian fibration having fibers* $\mathcal{C}_0 = \{0\} \times_{\Delta^1} \mathcal{C}$ *and* $\mathcal{C}_1 = \{1\} \times_{\Delta^1} \mathcal{C}$. *Choose a functor* $G : \mathcal{C}_0 \to \mathcal{C}_1$ *and a natural transformation* $\beta : \mathrm{id}_{\mathcal{C}_0} \to G$ *which exhibits* G *as given by covariant transport along the nondegenerate edge of* Δ^1 *(see Definition 5.2.2.4). The following conditions are equivalent:* 03U3

(1) *The functor* F *is left Kan extended from* $\mathcal{C}_0$.

(2) *The natural transformation* $F(\beta) : F|_{\mathcal{C}_0} \to F|_{\mathcal{C}_1} \circ G$ *exhibits* $F|_{\mathcal{C}_1}$ *as a left Kan extension of* $F|_{\mathcal{C}_0}$ *along* G.

Proof. Let us regard the functor G as fixed. Let $M = (\Delta^1 \times \mathcal{C}_0) \coprod_{(\{1\} \times \mathcal{C}_0)} \mathcal{C}_1$ be the mapping cylinder of G, and let us abuse notation by identifying $\mathcal{C}_0 \simeq \{0\} \times \mathcal{C}_0$ and $\mathcal{C}_1$ with (disjoint) simplicial subsets of M. We can then identify α with a morphism of simplicial sets $\mu : M \to \mathcal{C}$ which is the identity when restricted to $\mathcal{C}_0$ and $\mathcal{C}_1$.

Note that the tautological map

$$\Delta^1 \times \mathcal{C}_0 \simeq \mathcal{C}_0 \star_{\mathcal{C}_0} \mathcal{C}_0 \to \mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1$$

extends to a morphism of simplicial sets $\lambda : M \to \mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1$ which is the identity on $\mathcal{C}_1$; moreover, λ is a categorical equivalence (Proposition 5.2.4.5). It follows that precomposition with λ induces an equivalence of ∞-categories

$$\mathrm{Fun}_{\mathcal{C}_0 \coprod \mathcal{C}_1 /}(\mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1, \mathcal{C}) \to \mathrm{Fun}_{\mathcal{C}_0 \coprod \mathcal{C}_1 /}(M, \mathcal{C}).$$

We can therefore choose a functor $G : \mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1 \to \mathcal{C}$ satisfying $G|_{\mathcal{C}_0} = \mathrm{id}_{\mathcal{C}_0}$ and $G|_{\mathcal{C}_1} = \mathrm{id}_{\mathcal{C}_1}$, where $G \circ \lambda$ is isomorphic to μ as an object of the ∞-category $\mathrm{Fun}_{\mathcal{C}_0 \coprod \mathcal{C}_1 /}(M, \mathcal{C})$ Since condition (2) depends only on the homotopy class of the natural transformation β (Remark 7.3.1.9), we are free to modify β and may therefore assume that $G \circ \lambda = \mu$. In this case, Proposition 7.3.2.11 allows us to reformulate condition (2) as follows:

($2'$) The functor $(F \circ G) : \mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1 \to \mathcal{D}$ is left Kan extended from $\mathcal{C}_0$.

Since λ and μ are categorical equivalences of simplicial sets (Proposition 5.2.4.5), the functor G is an equivalence of ∞-categories (Remark 4.5.3.5). The equivalence of (1) and ($2'$) is now a special case of Proposition 7.3.3.18. □

7.3.3 Relative Kan Extensions

02Z2 For many applications, it will be convenient to work with a generalization of Definition 7.3.2.1. In what follows, we assume that the reader is familiar with the theory of relative (co)limit diagrams introduced in §7.1.5.

02Z3 **Definition 7.3.3.1** (Relative Kan Extensions)**.** Let $F : \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. For each object $C \in \mathcal{C}$, we will say that F *is U-left Kan extended from $\mathcal{C}^0$ at C* if the composite map

$$(\mathcal{C}^0_{/C})^{\triangleright} \hookrightarrow (\mathcal{C}_{/C})^{\triangleright} \xrightarrow{c} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a U-colimit diagram in the ∞-category $\mathcal{D}$. We say that F *is U-right Kan extended from $\mathcal{C}^0$ at C* if the composite map

$$(\mathcal{C}^0_{C/})^{\triangleleft} \hookrightarrow (\mathcal{C}_{C/})^{\triangleleft} \xrightarrow{c'} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a U-limit diagram in $\mathcal{D}$. Here c and c' denote the slice and coslice contraction morphisms of Construction 4.3.5.12. We say that F *is U-left Kan extended from $\mathcal{C}^0$* if it is U-left Kan extended from $\mathcal{C}^0$ at every object $C \in \mathcal{C}$. We say that F *is U-right Kan extended from $\mathcal{C}^0$* if it is U-right Kan extended from $\mathcal{C}^0$ at every object $C \in \mathcal{C}$.

02Z4 **Remark 7.3.3.2.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Then F is left Kan extended from $\mathcal{C}^0$ (in the sense of Definition 7.3.2.1) if and only if it is U-left Kan extended from $\mathcal{C}^0$ (in the sense of Definition 7.3.3.1), where $U : \mathcal{D} \to \Delta^0$ is the projection map. Similarly, F is right Kan extended from $\mathcal{C}^0$ if and only if it is U-right Kan extended from $\mathcal{C}^0$. See Example 7.1.5.3.

03Y2 **Remark 7.3.3.3.** Let $\mathcal{C}$ be an ∞-category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and let $U : \mathcal{D} \to \mathcal{E}$ be a functor of ∞-categories. Consider the evaluation functor

$$\mathrm{ev} : \mathcal{C} \times \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \to \mathcal{D} \qquad (C, F) \mapsto F(C).$$

For every object $C \in \mathcal{C}$ and every functor $F : \mathcal{C} \to \mathcal{D}$, the following conditions are equivalent:

(a) The functor F is U-left Kan extended from $\mathcal{C}^0$ at C.

(b) The evaluation functor ev is U-left Kan extended from $\mathcal{C}^0 \times \operatorname{Fun}(\mathcal{C}, \mathcal{D})$ at (C, F).

To prove this, it will suffice to show that the inclusion map

$$\mathcal{C}^0_{/C} \times \{\mathrm{id}_F\} \hookrightarrow \mathcal{C}^0_{/C} \times \operatorname{Fun}(\mathcal{C}, \mathcal{D})_{/F}$$

is right cofinal (Corollary 7.2.2.2). This follows from Corollary 7.2.1.19, since the inclusion map $\{\mathrm{id}_F\} \hookrightarrow \operatorname{Fun}(\mathcal{C}, \mathcal{D})_{/F}$ is right cofinal (the identity morphism id_F is an isomorphism in $\operatorname{Fun}(\mathcal{C}, \mathcal{D})$, and therefore final when regarded as an object of the ∞-category $\operatorname{Fun}(\mathcal{C}, \mathcal{D})_{/F}$ by virtue of Proposition 4.6.7.22).

Remark 7.3.3.4. In the situation of Definition 7.3.3.1, the morphism $F : \mathcal{C} \to \mathcal{D}$ is U-right Kan extended from $\mathcal{C}^0$ if and only if the opposite functor $F^{\mathrm{op}} : \mathcal{C}^{\mathrm{op}} \to \mathcal{D}^{\mathrm{op}}$ is U^{op}-left Kan extended from $(\mathcal{C}^0)^{\mathrm{op}}$. `02Z5`

Example 7.3.3.5. Let $F : \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories. If U is fully faithful, then F is U-left Kan extended and U-right Kan extended from any full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$ (see Example 7.1.5.4). `02Z7`

Example 7.3.3.6. Let $U : \mathcal{D} \to \mathcal{E}$ be a functor of ∞-categories. Then a functor $F : \mathcal{C} \to \mathcal{D}$ is U-left Kan extended from the empty subcategory $\emptyset \subseteq \mathcal{C}$ if and only if it carries each object of $\mathcal{C}$ to a U-initial object of $\mathcal{D}$. Similarly, F is U-right Kan extended from the empty subcategory if and only if it carries each object of $\mathcal{C}$ to a U-final object of $\mathcal{D}$. `043F`

To verify the Kan extension conditions of Definition 7.3.3.1, it suffices to consider objects C which do *not* belong to the full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$.

Proposition 7.3.3.7. *Let $F : \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories. Let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory and let $C \in \mathcal{C}$ be an object which is isomorphic to an object of $\mathcal{C}^0$. Then F is both U-left Kan extended from $\mathcal{C}^0$ and U-right Kan extended from $\mathcal{C}^0$ at C.* `02Z8`

Proof. We will show that F is U-left Kan extended from $\mathcal{C}^0$ at C; the analogous statement for the right Kan extension condition follows by a similar argument. Let $c : (\mathcal{C}^0_{/C})^{\triangleright} \to \mathcal{C}$ be the slice contraction morphism; we wish to show that the composition $(F \circ c) : (\mathcal{C}^0_{/C})^{\triangleright} \to \mathcal{D}$ is a U-colimit diagram. Choose an object $C' \in \mathcal{C}^0$ and an isomorphism $u : C' \to C$ in the ∞-category $\mathcal{C}$. Our assumption that u is an isomorphism guarantees that it is final when viewed as an object of the slice ∞-category $\mathcal{C}_{/C}$ (Proposition 4.6.7.22), and therefore also when viewed as an object of the ∞-category $\mathcal{C}^0_{/C}$. The desired result now follows from Corollary 7.2.3.6, since $F(u)$ is an isomorphism in the ∞-category $\mathcal{D}$. □

Example 7.3.3.8. Let $F : \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories. Then F is U-left Kan extended and U-right Kan extended from the full subcategory $\mathcal{C} \subseteq \mathcal{C}$. `03U4`

02Z9 **Example 7.3.3.9.** Let $\overline{F} : \mathcal{C}^{\triangleright} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories, and set $F = \overline{F}|_{\mathcal{C}}$. Then F is U-left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$ if and only if $\overline{F}$ is U-left Kan extended from the cone $(\mathcal{C}^0)^{\triangleright} \subseteq \mathcal{C}^{\triangleright}$. To prove this, it suffices (by virtue of Proposition 7.3.3.7) to show that F is U-left Kan extended from $\mathcal{C}^0$ at an object $C \in \mathcal{C}$ if and only if $\overline{F}$ is U-left Kan extended from $(\mathcal{C}^0)^{\triangleright}$ at C, which follows immediately from the definition.

02ZA **Example 7.3.3.10.** Let $\mathcal{C}$ be an ∞-category and let $U : \mathcal{D} \to \mathcal{E}$ be a functor of ∞-categories. It follows from Proposition 7.3.3.7 that a functor $\overline{F} : \mathcal{C}^{\triangleright} \to \mathcal{D}$ is a U-colimit diagram (in the sense of Definition 7.1.5.1) if and only if it is U-left Kan extended from $\mathcal{C}$.

039R **Proposition 7.3.3.11.** *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, let $U : \mathcal{D} \to \mathcal{E}$ be an inner fibration of ∞-categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a coreflective subcategory of $\mathcal{C}$. The following conditions are equivalent:*

(1) *The functor F is U-left Kan extended from $\mathcal{C}^0$.*

(2) *Let $e : X \to Y$ be a morphism in $\mathcal{C}$ which exhibits X as a $\mathcal{C}^0$-coreflection of Y (Definition 6.2.2.1). Then $F(e)$ is a U-cocartesian morphism of $\mathcal{D}$.*

(3) *Let $T : \mathcal{C} \to \mathcal{C}_0$ be a right adjoint to the inclusion. If e is a morphism in $\mathcal{C}$ and $T(e)$ is an isomorphism in $\mathcal{C}_0$, then $F(e)$ is a U-cocartesian morphism of $\mathcal{D}$.*

Proof. Let Y be an object of $\mathcal{C}$. By assumption, there exists an object $X \in \mathcal{C}^0$ and a morphism $e : X \to Y$ which exhibits X as a $\mathcal{C}^0$-coreflection of Y. Then e is final when viewed as an object of the ∞-category $\mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/Y}$. It follows that F is U-left Kan extended from $\mathcal{C}^0$ at Y if and only if $F(e)$ is U-cocartesian morphism of $\mathcal{D}$; in particular, this condition is independent of the choice of e. Allowing the object Y to vary, we deduce the equivalence (1) $\Leftrightarrow$ (2).

Using Lemma 6.2.2.14, we can choose a functor $T : \mathcal{C} \to \mathcal{C}^0$ and a natural transformation $\epsilon : T \to \mathrm{id}_{\mathcal{C}}$ which exhibits T as a $\mathcal{C}^0$-coreflection functor, so that T is right adjoint to the inclusion of $\mathcal{C}^0$ into $\mathcal{C}$ (Proposition 6.2.2.15). Let $e : X \to Y$ be a morphism in $\mathcal{C}$. If e exhibits X as a $\mathcal{C}^0$-coreflection of Y, then $T(e)$ is an isomorphism in $\mathcal{C}^0$, which shows immediately that (3) implies (2). Conversely, suppose that (2) is satisfied and that $T(e)$ is an isomorphism in $\mathcal{C}^0$. We then have a commutative diagram

$$\begin{tikzcd}
(F \circ T)(X) \arrow[r, "(F\circ T)(e)"] \arrow[d, "F(\epsilon_X)"] & (F \circ T)(Y) \arrow[d, "F(\epsilon_Y)"] \\
F(X) \arrow[r, "F(e)"] & F(Y)
\end{tikzcd}$$

in the ∞-category $\mathcal{D}$, where the upper horizontal map is an isomorphism and the vertical maps are U-cocartesian. Using Corollary 5.1.2.4, we see that $F(e)$ is also U-cocartesian. □

Corollary 7.3.3.12. *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a coreflective subcategory. The following conditions are equivalent:* 039S

(1) *The functor F is left Kan extended from $\mathcal{C}^0$.*

(2) *Let $e : X \to Y$ be a morphism in $\mathcal{C}$ which exhibits X as a $\mathcal{C}^0$-coreflection of Y (Definition 6.2.2.1). Then $F(e)$ is an isomorphism in $\mathcal{D}$.*

(3) *Let $T : \mathcal{C} \to \mathcal{C}_0$ be a right adjoint to the inclusion. If e is a morphism in $\mathcal{C}$ and $T(e)$ is an isomorphism in $\mathcal{C}_0$, then $F(e)$ is an isomorphism in $\mathcal{D}$.*

Proof. Combine Proposition 7.3.3.11 with Example 5.1.1.4 (for a closely related statement, see Proposition 7.3.1.17). □

Corollary 7.3.3.13. *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, let $U : \mathcal{D} \to \mathcal{E}$ be an inner fibration of ∞-categories, and suppose that $\mathcal{C}$ contains an initial object. The following conditions are equivalent:* 043G

(1) *The functor F is U-left Kan extended from the full subcategory $\mathcal{C}^{\mathrm{init}} \subseteq \mathcal{C}$ spanned by the initial objects.*

(2) *The functor F carries every morphism of $\mathcal{C}$ to a U-cocartesian morphism of $\mathcal{D}$.*

Proof. Combine Proposition 7.3.3.11 with Example 6.2.2.5. □

Corollary 7.3.3.14 (Constant Diagrams)**.** *Let $\mathcal{C}$ be an ∞-category which contains an initial object, and let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. The following conditions are equivalent:* 05E0

(1) *The functor F is left Kan extended from the full subcategory $\mathcal{C}^{\mathrm{init}} \subseteq \mathcal{C}$ spanned by the initial objects.*

(2) *The functor F carries each morphism in $\mathcal{C}$ to an isomorphism in the ∞-category $\mathcal{D}$.*

(3) *The functor F is isomorphic to a constant functor.*

Proof. The equivalence (1) ⇔ (2) follows from Corollary 7.3.3.13 by taking $\mathcal{E} = \Delta^0$, and the implication (3) ⇒ (2) is immediate. To prove the converse, we observe that condition (2) guarantees that F can be regarded as a morphism from $\mathcal{C}$ to the Kan complex $\mathcal{D}^{\simeq}$. Since $\mathcal{C}$ has an initial object, it is weakly contractible (Corollary 4.6.7.25), so this morphism is automatically nullhomotopic (Remark 3.2.4.18). □

We now record some basic stability properties enjoyed by the class of relative Kan extensions, which follow easily from the analogous stability properties of relative (co)limit diagrams.

02ZB **Remark 7.3.3.15.** Suppose we are given a commutative diagram of ∞-categories

$$\begin{tikzcd}
\mathcal{D} \arrow[r, "G"] \arrow[d, "U"] & \mathcal{D}' \arrow[d, "U'"] \\
\mathcal{E} \arrow[r] & \mathcal{E}',
\end{tikzcd}$$

where the horizontal functors are equivalence of ∞-categories. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Then F is U-left Kan extended from $\mathcal{C}^0$ if and only if $G \circ F$ is U'-left Kan extended from $\mathcal{C}^0$ (see Remark 7.1.5.6). Similarly, F is U-right Kan extended from $\mathcal{C}^0$ if and only if $G \circ F$ is U'-right Kan extended from $\mathcal{C}^0$.

02ZC **Remark 7.3.3.16.** Let $F : \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Let $V : \mathcal{D} \to \mathcal{E}$ be a functor which is isomorphic to U (as an object of the ∞-category $\operatorname{Fun}(\mathcal{D}, \mathcal{E})$). Then F is U-left Kan extended from $\mathcal{C}^0$ if and only if it is V-left Kan extended from $\mathcal{C}^0$ (see Remark 7.1.5.7). Similarly, F is U-right Kan extended from $\mathcal{C}^0$ if and only if it is V-right Kan extended from $\mathcal{C}^0$.

02ZD **Remark 7.3.3.17.** Let $F : \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories, let $G : \mathcal{C} \to \mathcal{D}$ be a functor which is isomorphic to F (as an object of the ∞-category $\operatorname{Fun}(\mathcal{C}, \mathcal{D})$), and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Then F is U-left Kan extended from $\mathcal{C}^0$ if and only if G is U-left Kan extended from $\mathcal{C}^0$ (see Proposition 7.1.5.13). Similarly, F is U-right Kan extended from $\mathcal{C}^0$ if and only if G is U-right Kan extended from $\mathcal{C}^0$.

03U5 **Proposition 7.3.3.18** (Change of Source). *Let $F : \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a replete full subcategory. Let $G : \mathcal{B} \to \mathcal{C}$ be an equivalence of ∞-categories, and set $\mathcal{B}^0 = \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{B}$. Then F is U-left Kan extended from $\mathcal{C}^0$ if and only if $F \circ G$ is U-left Kan extended from $\mathcal{B}^0$.*

Proof. Assume first that F is U-left Kan extended from $\mathcal{C}^0$; we will show that $F \circ G$ is U-left Kan extended from $\mathcal{B}^0$. Fix an object $B \in \mathcal{B}$ and set $\mathcal{B}^0_{/B} = \mathcal{B}^0 \times_{\mathcal{B}} \mathcal{B}_{/B}$; we wish to show that the composite map

$$\theta : (\mathcal{B}^0_{/B})^{\triangleright} \hookrightarrow \mathcal{B}^{\triangleright}_{/B} \to \mathcal{B} \xrightarrow{F \circ G} \mathcal{D}$$

is a U-colimit diagram. Set $C = G(B)$ and $\mathcal{C}^0_{/C} = \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}^0$. Since G is an equivalence of ∞-categories, the induced map $G_{/B} : \mathcal{B}_{/B} \to \mathcal{C}_{/C}$ is also an equivalence of ∞-categories

(Corollary 4.6.4.19). Our assumption that $\mathcal{C}^0$ is a replete subcategory of $\mathcal{C}$ guarantees that $\mathcal{C}^0_{/C}$ is a replete subcategory of $\mathcal{C}_{/C}$. In particular, the inclusion map $\mathcal{C}^0_{/C} \hookrightarrow \mathcal{C}_{/C}$ is an isofibration, so that $G_{/B}$ restricts to an equivalence of ∞-categories $G^0_{/B} : \mathcal{B}^0_{/B} \to \mathcal{C}^0_{/C}$. By construction, the morphism θ is the composition of $(G^0_{/B})^{\triangleright}$ with the map

$$\theta' : (\mathcal{C}^0_{/C})^{\triangleright} \hookrightarrow \mathcal{C}^{\triangleright}_{/C} \to \mathcal{C} \xrightarrow{F} \mathcal{D},$$

which is a U-colimit diagram by virtue of our assumption that F is U-left Kan extended from $\mathcal{C}^0$. Applying Corollary 7.2.2.2, we deduce that θ is also a U-colimit diagram.

We now prove the converse. Assume that $F \circ G$ is U-left Kan extended from $\mathcal{B}^0$; we wish to show that F is U-left Kan extended from $\mathcal{C}^0$. Let $H : \mathcal{C} \to \mathcal{B}$ be a homotopy inverse to G, so that $(G \circ H) : \mathcal{C} \to \mathcal{C}$ is isomorphic to the identity functor $\mathrm{id}_{\mathcal{C}}$. Since $\mathcal{C}^0 \subseteq \mathcal{C}$ is replete, it coincides with the inverse image $(G \circ H)^{-1}\,\mathcal{C}^0 = H^{-1}\,\mathcal{B}^0$. Applying the first part of the proof, we deduce that the functor $(F \circ G \circ H) : \mathcal{C} \to \mathcal{D}$ is U-left Kan extended from $\mathcal{C}^0$. The functor F is isomorphic to $F \circ G \circ H$, and is therefore also U-left Kan extended from $\mathcal{C}^0$ (Remark 7.3.3.17). □

Remark 7.3.3.19 (Transitivity)**.** Let $F : \mathcal{C} \to \mathcal{D}$, $U : \mathcal{D} \to \mathcal{E}$, and $V : \mathcal{E} \to \mathcal{E}'$ be functors of ∞-categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose that $U \circ F$ is V-left Kan extended from $\mathcal{C}^0$. Then F is U-left Kan extended from $\mathcal{C}^0$ if and only if it is $(V \circ U)$-left Kan extended from $\mathcal{C}^0$ (see Proposition 7.1.5.14). Similarly, if $U \circ F$ is V-right Kan extended from $\mathcal{C}^0$, then F is U-right Kan extended from $\mathcal{C}^0$ if and only if it is $(V \circ U)$-right Kan extended from $\mathcal{C}^0$. 02ZE

Remark 7.3.3.20. Let $F : \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose that $U \circ F$ is left Kan extended from $\mathcal{C}^0$. Then F is left Kan extended from $\mathcal{C}^0$ if and only if it is U-left Kan extended from $\mathcal{C}^0$; this follows by applying Remark 7.3.3.19 in the special case $\mathcal{E}' = \Delta^0$. Similarly, if $U \circ F$ is right Kan extended from $\mathcal{C}^0$, then F is right Kan extended from $\mathcal{C}^0$ if and only if it is U-right Kan extended from $\mathcal{C}^0$. 02ZF

Proposition 7.3.3.21 (Base Change)**.** *Suppose we are given a commutative diagram of* 02ZG

∞-categories

02ZH
$$\begin{tikzcd}
\mathcal{D}' \arrow[rr, "H'"] \arrow[dr] \arrow[dd, "G"] & & \mathcal{E}' \arrow[dl] \arrow[dd] \\
& \mathcal{B}' \arrow[dd] & \\

Corollary 7.3.3.23. *Let $U : \mathcal{D} \to \mathcal{E}$ be an inner fibration of ∞-categories, let $\mathcal{D}_E = \{E\} \times_{\mathcal{E}} \mathcal{D}$ be the fiber of U over an object $E \in \mathcal{E}$, let $F : \mathcal{C} \to \mathcal{D}_E$ be a functor of ∞-categories, and $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. If F is U-left Kan extended from $\mathcal{C}^0$ (when regarded as a functor from $\mathcal{C}$ to $\mathcal{D}$), then it is left Kan extended from $\mathcal{C}^0$ (when regarded as a functor from $\mathcal{C}$ to $\mathcal{D}_E$). The converse holds if U is a cartesian fibration.* 02ZK

Proof. Apply Corollary 7.3.3.22 in the special case $\mathcal{E}' = \{E\}$. □

Remark 7.3.3.24. In the situation of Corollary 7.3.3.23, the functor F is U-left Kan extended from $\mathcal{C}^0$ if and only if, for every morphism $f : E \to E'$ in the ∞-category $\mathcal{E}$, the composite map 05J9

$$\mathcal{C} \xrightarrow{F} \{E\} \times_{\mathcal{E}} \mathcal{D} \hookrightarrow \Delta^1 \times_{\mathcal{E}} \mathcal{D}$$

is left Kan extended from the full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. See Remark 7.1.5.23.

7.3.4 Kan Extensions along Fibrations

In this section, we study the formation of left Kan extension along cocartesian fibrations. We can state a preliminary version of our main result as follows: 02ZL

Proposition 7.3.4.1. *Let $\delta : \mathcal{K} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories. Suppose we are given functors of ∞-categories $F_0 : \mathcal{K} \to \mathcal{D}$ and $F : \mathcal{C} \to \mathcal{D}$ and a natural transformation $\beta : F_0 \to F \circ \delta$. The following conditions are equivalent:* 02ZM

(1) *The natural transformation β exhibits F as a left Kan extension of F_0 along δ.*

(2) *For each object $C \in \mathcal{C}$, the restriction of β to the fiber $\mathcal{K}_C = \{C\} \times_{\mathcal{C}} \mathcal{K}$ determines a natural transformation $F_0|_{\mathcal{K}_C} \to \underline{F(C)}$ which exhibits $F(C)$ as a colimit of the diagram $F_0|_{\mathcal{K}_C}$ in the ∞-category $\mathcal{D}$.*

Proof. By virtue of Corollary 7.2.2.7, it will suffice to show that for each object $C \in \mathcal{C}$, the tautological map

$$\mathcal{K}_C = \mathcal{K} \times_{\mathcal{C}} \{C\} \hookrightarrow \mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C}$$

is right cofinal. Since δ is a cocartesian fibration, it will suffice to show that the inclusion map $\{\mathrm{id}_C\} \hookrightarrow \mathcal{C}_{/C}$ is right cofinal (Proposition 7.2.3.12). This follows from Corollary 4.6.7.24, since id_C is a final object of the ∞-category $\mathcal{C}_{/C}$ (Proposition 4.6.7.22). □

Corollary 7.3.4.2. *Let $\delta : \mathcal{K} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories and let $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. The following conditions are equivalent:* 02ZN

(1) *The functor F is left Kan extended from $\mathcal{K}$.*

(2) *For every object $C \in \mathcal{C}$, the functor*

$$F_C : \mathcal{K}_C^{\triangleright} \simeq \mathcal{K}_C \star_{\{C\}} \{C\} \hookrightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a colimit diagram.

Proof. Combine Propositions 7.3.4.1 and 7.3.2.11. □

Corollary 7.3.4.2 generalizes to the setting of relative Kan extensions:

`02ZP` **Proposition 7.3.4.3.** *Let $\delta : \mathcal{K} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories and let $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors. The following conditions are equivalent:*

(1) *The functor F is U-left Kan extended from $\mathcal{K}$.*

(2) *For every object $C \in \mathcal{C}$, the functor*

$$F_C : \mathcal{K}_C^{\triangleright} \simeq \mathcal{K}_C \star_{\{C\}} \{C\} \hookrightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a U-colimit diagram.

Proof. By virtue of Proposition 7.3.3.7, it will suffice to show that for each object $C \in \mathcal{C}$, the following conditions are equivalent:

(1_C) The functor F is U-left Kan extended from $\mathcal{K}$ at C.

(2_C) The functor F_C is a U-colimit diagram.

This follows from Corollary 7.2.2.3, since the tautological map

$$\mathcal{K}_C \simeq \{\mathrm{id}_C\} \times_{\mathcal{C}_{/C}} \mathcal{K}_{/C} \hookrightarrow \mathcal{K}_{/C}$$

is right cofinal (as noted in the proof of Proposition 7.3.4.1). □

Our next goal is establish a companion to Proposition 7.3.4.1, which provides necessary and sufficient conditions for the *existence* of a left Kan extension.

`02ZQ` **Proposition 7.3.4.4.** *Let $\delta : \mathcal{K} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories and let $F_0 : \mathcal{K} \to \mathcal{D}$ be a functor of ∞-categories. The following conditions are equivalent:*

(1) *The functor F_0 admits a left Kan extension along δ.*

(2) *For every object $C \in \mathcal{C}$, the induced diagram*

$$\mathcal{K}_C = \{C\} \times_{\mathcal{C}} \mathcal{K} \hookrightarrow \mathcal{K} \xrightarrow{F_0} \mathcal{D}$$

has a colimit in the ∞-category $\mathcal{D}$.

Note that the implication (1) ⇒ (2) of Proposition 7.3.4.4 follows immediately from Proposition 7.3.4.1. To prove the converse, it will be convenient to again translate to a question about the inclusion map $\mathcal{K} \hookrightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$, which we will address in a more general form. First, we need a variant of Corollary 7.1.6.6.

Lemma 7.3.4.5. *Let $\delta : \mathcal{K} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets, let $U : \mathcal{D} \to \mathcal{E}$ be an isofibration of ∞-categories, let $\mathcal{C}_0 \subseteq \mathcal{C}$ be a simplicial subset which contains every vertex of $\mathcal{C}$, and set $\mathcal{K}_0 = \mathcal{C}_0 \times_{\mathcal{C}} \mathcal{K}$. Suppose we are given a lifting problem* `02ZR`

$$\begin{tikzcd}
\mathcal{K} \coprod_{\mathcal{K}_0} (\mathcal{K}_0 \star_{\mathcal{C}_0} \mathcal{C}_0) \arrow[r, "F_0"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
\mathcal{K} \star_{\mathcal{C}} \mathcal{C} \arrow[r] \arrow[ur, dashed] & \mathcal{E}
\end{tikzcd} \tag{7.15}$$

`02ZS`

which satisfies the following condition:

- $(*)$ *Let $\sigma : \Delta^n \to \mathcal{C}$ be an n-simplex which is not contained in $\mathcal{C}_0$ and set $C = \sigma(0)$. Then the composite map*
$$\mathcal{K}_C^{\triangleright} \simeq \mathcal{K}_C \star_{\{C\}} \{C\} \hookrightarrow \mathcal{K}_0 \star_{\mathcal{C}_0} \mathcal{C}_0 \xrightarrow{F_0} \mathcal{D}$$
is a U-colimit diagram in the ∞-category $\mathcal{D}$.

Then the lifting problem (7.15) admits a solution.

Proof. Without loss of generality, we may assume that $\mathcal{C}$ is an ∞-category (working one simplex at a time, we could even assume that $\mathcal{C} = \Delta^m$ is a standard simplex and that $\mathcal{C}_0 = \partial \Delta^m$ is its boundary). Set $\overline{\mathcal{K}} = \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$, so that δ extends to a map

$$\overline{\delta} : \overline{\mathcal{K}} = \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{C} \star_{\mathcal{C}} \mathcal{C} \simeq \Delta^1 \times \mathcal{C} \to \mathcal{C}.$$

Since δ is a cocartesian fibration, Lemma 5.2.3.17 guarantees that $\overline{\delta}$ is also a cocartesian fibration. Applying Corollary 5.3.6.8, we obtain a commutative diagram of ∞-categories

$$\begin{tikzcd}
\mathrm{Fun}(\overline{\mathcal{K}} / \mathcal{C}, \mathcal{D}) \arrow[rr] \arrow[dd, "U\circ"] \arrow[dr, "T"] & & \mathrm{Fun}(\mathcal{K} / \mathcal{C}, \mathcal{D}) \arrow[dd, "U\circ"] \arrow[dl] \\
& \mathcal{C} & \\
\mathrm{Fun}(\overline{\mathcal{K}} / \mathcal{C}, \mathcal{E}) \arrow[rr] \arrow[ur] & & \mathrm{Fun}(\mathcal{K} / \mathcal{C}, \mathcal{E}), \arrow[ul]
\end{tikzcd} \tag{7.16}$$

`02ZT`

where the diagonal arrows are cartesian fibrations and the morphisms on the outside of the diagram preserve cartesian morphisms. Applying Proposition 5.1.4.20, we see that the induced map

$$T' : \mathrm{Fun}(\mathcal{K} \,/\, \mathcal{C}, \mathcal{D})) \times_{\mathrm{Fun}(\mathcal{K} \,/\, \mathcal{C}, \mathcal{E})} \mathrm{Fun}(\overline{\mathcal{K}}/\, \mathcal{C}, \mathcal{E}) \to \mathcal{C}$$

is also a cartesian fibration, and that the outer square of the diagram (7.16) determines a functor

$$V : \mathrm{Fun}(\overline{\mathcal{K}}/\, \mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{K} \,/\, \mathcal{C}, \mathcal{D})) \times_{\mathrm{Fun}(\mathcal{K} \,/\, \mathcal{C}, \mathcal{E})} \mathrm{Fun}(\overline{\mathcal{K}}/\, \mathcal{C}, \mathcal{E}) \to \mathcal{C}$$

which carries T-cartesian morphisms to T'-cartesian morphisms.

We next claim that V is an isofibration. Fix a monomorphism of simplicial sets $i : A \hookrightarrow B$ which is also a categorical equivalence; we wish to show that every diagram

$$\begin{tikzcd}
A \arrow[r] \arrow[d] & \mathrm{Fun}(\overline{\mathcal{K}}/\, \mathcal{C}, \mathcal{D}) \arrow[d, "V"] \\
B \arrow[r] \arrow[ur, dashed] & \mathrm{Fun}(\mathcal{K} \,/\, \mathcal{C}, \mathcal{D})) \times_{\mathrm{Fun}(\mathcal{K} \,/\, \mathcal{C}, \mathcal{E})} \mathrm{Fun}(\overline{\mathcal{K}}/\, \mathcal{C}, \mathcal{E})
\end{tikzcd}$$

admits a solution. Note that this lifting problem determines a morphism of simplicial sets $B \to \mathcal{C}$. Invoking the universal property of Proposition 4.5.9.5, we can rewrite this as a lifting problem

$$\begin{tikzcd}
(A \times_{\mathcal{C}} \overline{\mathcal{K}}) \coprod_{(A \times_{\mathcal{C}} \mathcal{K})} (B \times_{\mathcal{C}} \mathcal{K}) \arrow[r] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
B \times_{\mathcal{C}} \overline{\mathcal{K}} \arrow[r] \arrow[ur, dashed] & \mathcal{E} .
\end{tikzcd}$$

Since U is an isofibration, it will suffice to show that the left vertical map is a categorical equivalence of simplicial sets, or equivalently that the diagram

$$\begin{tikzcd}
A \times_{\mathcal{C}} \mathcal{K} \arrow[r] \arrow[d] & B \times_{\mathcal{C}} \mathcal{K} \arrow[d] \\
A \times_{\mathcal{C}} \overline{\mathcal{K}} \arrow[r] & B \times_{\mathcal{C}} \overline{\mathcal{K}}
\end{tikzcd}$$

is a categorical pushout square (Proposition 4.5.4.11). This follows from Proposition 4.5.4.10, since the horizontal maps are categorical equivalences (Corollary 5.6.7.6).

Unwinding the definitions, we can rewrite (7.15) as a lifting problem

$$\begin{tikzcd}
\mathcal{C}_0 \arrow[r, "G_0"] \arrow[d] & \mathrm{Fun}(\overline{\mathcal{K}}/\,\mathcal{C}, \mathcal{D}) \arrow[d, "V"] \\
\mathcal{C} \arrow[r] \arrow[ur, dashed] & \mathrm{Fun}(\mathcal{K}\,/\,\mathcal{C}, \mathcal{D})) \times_{\mathrm{Fun}(\mathcal{K}\,/\,\mathcal{C}, \mathcal{E})} \mathrm{Fun}(\overline{\mathcal{K}}/\,\mathcal{C}, \mathcal{E}).
\end{tikzcd}$$

By virtue of Corollary 7.1.6.6, to show that this lifting problem admits a solution, it will suffice to verify the following:

$(*')$ Let $\sigma : \Delta^n \to \mathcal{C}$ be an n-simplex which is not contained in $\mathcal{C}_0$ and set $C = \sigma(0)$. Then $G_0(C)$ is a V-initial object of the ∞-category $\mathrm{Fun}(\overline{\mathcal{K}}/\,\mathcal{C}, \mathcal{D})$.

Unwinding the definitions, we see that the functor $T^{-1}\{C\} \to T'^{-1}\{C\}$ induced by V can be identified with the restriction map

$$V_C : \mathrm{Fun}(\mathcal{K}_C^{\triangleright}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{K}_C, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{K}_C, \mathcal{E})} \mathrm{Fun}(\mathcal{K}_C^{\triangleright}, \mathcal{E}).$$

Combining assumption $(*)$ with Proposition 7.1.6.3, we see that $G_0(C)$ is a V_C-initial object of the ∞-category $\mathrm{Fun}(K_C^{\triangleright}, \mathcal{D})$. Proposition 7.1.4.19 then guarantees that $G_0(C)$ is also V-initial when regarded as an object of the ∞-category $\mathrm{Fun}(\overline{\mathcal{K}}/\,\mathcal{C}, \mathcal{D})$. □

Lemma 7.3.4.6. *Let $\delta : \mathcal{K} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets, let $U : \mathcal{D} \to \mathcal{E}$ be an isofibration of ∞-categories, and suppose we are given a lifting problem* `02ZU`

`02ZV`

$$\begin{tikzcd}
\mathcal{K} \arrow[r, "F_0"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
\mathcal{K} \star_{\mathcal{C}} \mathcal{C} \arrow[r, "G"] \arrow[ur, dashed, "F"] & \mathcal{E}
\end{tikzcd} \qquad (7.17)$$

with the following property:

$(*)$ *For each vertex $C \in \mathcal{C}$, the induced lifting problem*

$$\begin{tikzcd}
\mathcal{K}_C \arrow[r] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
\mathcal{K}_C \star_{\{C\}} \{C\} \arrow[r] \arrow[ur, dashed, "F_C"] & \mathcal{E}
\end{tikzcd}$$

admits a solution $F_C : \mathcal{K}_C^{\triangleright} \to \mathcal{D}$ which is a U-colimit diagram.

Then (7.17) admits a solution $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{D}$ satisfying $F|_{\mathcal{K}_C^{\triangleright}} = F_C$ for each vertex $C \in \mathcal{C}$.

Proof. Let $\mathcal{C}_0 = \mathrm{sk}_0(\mathcal{C})$ be the 0-skeleton of $\mathcal{C}$ and set $\mathcal{K}_0 = \mathcal{C}_0 \times_{\mathcal{C}} \mathcal{K} = \coprod_{C \in \mathcal{C}} \mathcal{K}_C$, so that we can amalgamate F_0 with the morphisms $\{F_C\}_{C \in \mathcal{C}}$ to obtain a map $F_1 : \mathcal{K} \coprod_{\mathcal{K}_0} (\mathcal{K}_0 \star_{\mathcal{C}_0} \mathcal{C}_0) \to \mathcal{D}$. To prove Lemma 7.3.4.6, we must show that the lifting problem

$$\begin{tikzcd}
\mathcal{K} \coprod_{\mathcal{K}_0} (\mathcal{K}_0 \star_{\mathcal{C}_0} \mathcal{C}_0) \arrow[r, "F_1"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
\mathcal{C} \star_{\mathcal{C}} \mathcal{C} \arrow[r, "G"] \arrow[ur, dashed] & \mathcal{E}
\end{tikzcd}$$

has a solution, which is a special case of Lemma 7.3.4.5. □

02ZW **Proposition 7.3.4.7.** *Let $\delta : \mathcal{K} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories, let $U : \mathcal{D} \to \mathcal{E}$ be an isofibration of ∞-categories, and suppose we are given a lifting problem*

02ZX
$$\begin{tikzcd}
\mathcal{K} \arrow[r, "F_0"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
\mathcal{K} \star_{\mathcal{C}} \mathcal{C} \arrow[r] \arrow[ur, dashed, "F"] & \mathcal{E} .
\end{tikzcd} \tag{7.18}$$

The following conditions are equivalent:

(1) *The lifting problem (7.18) has a solution $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{D}$ which is U-left Kan extended from $\mathcal{K}$.*

(2) *For every object $C \in \mathcal{C}$, the associated lifting problem*

$$\begin{tikzcd}
\mathcal{K}_C \arrow[r] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
\mathcal{K}_C^{\triangleright} \arrow[r] \arrow[ur, dashed] & \mathcal{E}
\end{tikzcd}$$

has a solution $\mathcal{K}_C^{\triangleright} \to \mathcal{D}$ which is a U-colimit diagram.

Proof. Combine Lemma 7.3.4.6 with Proposition 7.3.4.3. □

02ZY **Corollary 7.3.4.8.** *Let $\delta : \mathcal{K} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories and let $F_0 : \mathcal{K} \to \mathcal{D}$ be a functor of ∞-categories. The following conditions are equivalent:*

(1) *There exists a functor* $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{D}$ *which is left Kan extended from* $\mathcal{K}$ *and satisfies* $F|_{\mathcal{K}} = F_0$.

(2) *For every object* $C \in \mathcal{C}$, *the diagram*

$$\mathcal{K}_C = \{C\} \times_{\mathcal{C}} \mathcal{K} \hookrightarrow \mathcal{K} \xrightarrow{F_0} \mathcal{D}$$

admits a colimit in the ∞*-category* $\mathcal{D}$.

Proof of Proposition 7.3.4.4. Let $\delta : \mathcal{K} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories and let $F_0 : \mathcal{K} \to \mathcal{D}$ be a functor of ∞-categories. Suppose that, for every object $C \in \mathcal{C}$, the diagram

$$\mathcal{K}_C = \{C\} \times_{\mathcal{C}} \mathcal{K} \hookrightarrow \mathcal{K} \xrightarrow{F_0} \mathcal{D}$$

has a colimit in the ∞-category $\mathcal{D}$. Applying Corollary 7.3.4.8, we deduce that there exists a functor $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{D}$ which is left Kan extended from $\mathcal{K}$ and satisfies $F|_{\mathcal{K}} = F_0$. Applying Proposition 7.3.1.15, we see that the restriction $F|_{\mathcal{C}}$ is a left Kan extension of F_0 along δ. □

7.3.5 Existence of Kan Extensions

Our goal in this section is to establish the following existence criterion for Kan extensions: 02ZZ

Proposition 7.3.5.1. *Let* $\mathcal{C}$ *and* $\mathcal{D}$ *be* ∞*-categories, and suppose we are given diagrams* $\delta : K \to \mathcal{C}$ *and* $F_0 : K \to \mathcal{D}$. *Then:* 0300

- *The diagram* F_0 *admits a left Kan extension along* δ *if and only if, for every object* $C \in \mathcal{C}$, *the diagram*
$$K_{/C} = K \times_{\mathcal{C}} \mathcal{C}_{/C} \to K \xrightarrow{F_0} \mathcal{D}$$
has a colimit in the ∞*-category* $\mathcal{D}$.

- *The diagram* F_0 *admits a right Kan extension along* δ *if and only if, for every object* $C \in \mathcal{C}$, *the diagram*
$$K_{C/} = K \times_{\mathcal{C}} \mathcal{C}_{C/} \to K \xrightarrow{F_0} \mathcal{D}$$
has a limit in the ∞*-category* $\mathcal{D}$.

Corollary 7.3.5.2. *Let* $\mathcal{C}$ *and* $\mathcal{D}$ *be* ∞*-categories and let* $\delta : K \to \mathcal{C}$ *be a diagram. Assume that, for every object* $C \in \mathcal{C}$, *the* ∞*-category* $\mathcal{D}$ *admits* $K_{/C}$*-indexed colimits. Then every diagram* $F_0 : K \to \mathcal{D}$ *admits a left Kan extension along* δ. 0301

Corollary 7.3.5.3. *Let* $\mathcal{C}$ *be a category, let* $\mathscr{G} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ *be a diagram of simplicial sets, let* $\mathcal{D}$ *be an* ∞*-category, and let* $F_0 : \underrightarrow{\mathrm{holim}}(\mathscr{G}) \to \mathcal{D}$ *be a diagram. The following conditions are equivalent:* 039T

(1) *The diagram F_0 admits a left Kan extension along the projection map $U : \underrightarrow{\mathrm{holim}}(\mathscr{G}) \to \mathrm{N}_\bullet(\mathcal{C})$.*

(2) *For every object $C \in \mathcal{C}$, the diagram*

$$\mathscr{G}(C) \simeq \{C\} \times_{\mathrm{N}_\bullet(\mathcal{C})} \underrightarrow{\mathrm{holim}}(\mathscr{G}) \hookrightarrow \underrightarrow{\mathrm{holim}}(\mathscr{G}) \xrightarrow{F_0} \mathcal{D}$$

admits a colimit in the ∞-category $\mathcal{D}$.

Proof. For each object $C \in \mathcal{C}$, the inclusion map

$$\mathscr{G}(C) \hookrightarrow \mathrm{N}_\bullet(\mathcal{C}_{/C}) \times_{\mathrm{N}_\bullet(\mathcal{C})} \underrightarrow{\mathrm{holim}}(\mathscr{G}) \simeq \underrightarrow{\mathrm{holim}}(\mathscr{G}|_{\mathcal{C}_{/C}})$$

is right anodyne (Example 7.2.3.11), and therefore right cofinal. The desired result now follows by combining Proposition 7.3.5.1 with Corollary 7.2.2.10. □

039U **Remark 7.3.5.4.** In the situation of Corollary 7.3.5.3, suppose we are given a functor $F : \mathrm{N}_\bullet(\mathcal{C}) \to \mathcal{D}$ and a natural trnasformation $\beta : F_0 \to F \circ U$. Then β exhibits F as a left Kan extension of F along U if and only if, for every object $C \in \mathcal{C}$, the induced natural transformation $\beta_C : F_0|_{\mathscr{G}(C)} \to \underline{F(C)}$ exhibits $F(C)$ as a colimit of the diagram $F_0|_{\mathscr{G}(C)}$

In the special case where δ is a cocartesian fibration, Proposition 7.3.5.1 is essentially a reformulation of Proposition 7.3.4.4. We will proceed in general by reducing to this special case (see [52] for a similar approach). With an eye toward future applications, we first consider a variant of Proposition 7.3.5.1 in the setting of *relative* Kan extensions.

0302 **Proposition 7.3.5.5.** *Let $\mathcal{C}$ be an ∞-category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, let $U : \mathcal{D} \to \mathcal{E}$ be an isofibration of ∞-categories, and suppose we are given a lifting problem*

0303

$$\begin{tikzcd} \mathcal{C}^0 \arrow[r, "F_0"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\ \mathcal{C} \arrow[r, "G"] \arrow[ur, dashed, "F"] & \mathcal{E} \end{tikzcd} \tag{7.19}$$

Then (7.19) admits a solution $F : \mathcal{C} \to \mathcal{D}$ which is U-left Kan extended from $\mathcal{C}^0$ if and only if, for every object $C \in \mathcal{C}$, the following condition is satisfied:

($*_C$) *The induced lifting problem*

0304

$$\begin{tikzcd} \mathcal{C}^0_{/C} \arrow[rr] \arrow[d] & & \mathcal{D} \arrow[d, "U"] \\ (\mathcal{C}^0_{/C})^{\triangleright} \arrow[r] \arrow[urr, dashed, "F_C"] & \mathcal{C} \arrow[r, "G"] & \mathcal{E} \end{tikzcd} \tag{7.20}$$

admits a solution $F_C : (\mathcal{C}^0_{/C})^{\triangleright} \to \mathcal{D}$ *which is a* U*-colimit diagram.*

Proof. Assume that condition $(*_C)$ is satisfied for every object $C \in \mathcal{C}$; we will show that the lifting problem (7.19) admits a solution $F : \mathcal{C} \to \mathcal{D}$ which is U-left Kan extended from $\mathcal{C}^0$ (the converse follows immediately from the definitions). Let $\mathcal{K}$ denote the oriented fiber product $\mathcal{C}^0 \tilde{\times}_{\mathcal{C}} \mathcal{C}$: that is, the full subcategory of $\mathrm{Fun}(\Delta^1, \mathcal{C})$ spanned by those morphisms $e : X \to Y$ of $\mathcal{C}$ such that X belongs to the subcategory $\mathcal{C}^0$. Let $\pi : \mathcal{K} \to \mathcal{C}^0$ and $\pi' : \mathcal{K} \to \mathcal{C}$ be the evaluation maps, given on objects by $\pi(e) = X$ and $\pi'(e) = Y$, respectively. We then have a natural transformation $\alpha : \pi \to \pi'$ (which carries each morphism $e : X \to Y$ to itself). Regarding $\mathcal{K}$ as an object of $(\mathrm{Set}_{\Delta})_{/\mathcal{C}}$ via the functor π', let $\mathcal{K} \star_{\mathcal{C}} \mathcal{C}$ denote the relative join of Construction 5.2.3.1. We will write $\iota_{\mathcal{K}} : \mathcal{K} \hookrightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$ and $\iota_{\mathcal{C}} : \mathcal{C} \hookrightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$ for the inclusion maps, and $\iota_{\mathcal{C}^0}$ for the restriction of $\iota_{\mathcal{C}}$ to the full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. The natural transformation α then determines a functor $S : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{C}$ satisfying $S \circ \iota_{\mathcal{K}} = \pi$ and $S \circ \iota_{\mathcal{C}} = \mathrm{id}_{\mathcal{C}}$. Consider the lifting problem

0305

$$\begin{tikzcd}
\mathcal{K} \arrow[rr, "F_0 \circ \pi"] \arrow[d] & & \mathcal{D} \arrow[d, "U"] \\
\mathcal{K} \star_{\mathcal{C}} \mathcal{C} \arrow[r, "S"] \arrow[urr, "\overline{F}"] & \mathcal{C} \arrow[r, "G"] & \mathcal{E} .
\end{tikzcd} \tag{7.21}$$

For each object $C \in \mathcal{C}$, write $\mathcal{K}_C$ for the fiber $\pi'^{-1}\{C\}$, so that (7.21) restricts to a lifting problem

0306

$$\begin{tikzcd}
\mathcal{K}_C \arrow[r] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
\mathcal{K}_C \star_{\{C\}} \{C\} \arrow[r] \arrow[ur, dashed, "\overline{F}_C"] & \mathcal{E} .
\end{tikzcd} \tag{7.22}$$

Note that $\mathcal{K}_C$ can be identified with the oriented fiber product $\mathcal{C}^0 \tilde{\times}_{\mathcal{C}} \{C\}$. Moreover, after precomposing with the slice diagonal equivalence $\mathcal{C}^0_{/C} \to \mathcal{C}^0 \tilde{\times}_{\mathcal{C}} \{C\}$ of Theorem 4.6.4.17, (7.22) recovers the lifting problem (7.20). Combining assumption $(*_C)$ with Proposition 7.2.2.9, we deduce that the lifting problem (7.22) admits a solution $\overline{F}_C : \mathcal{K}_C^{\triangleright} \to \mathcal{D}$ which is a U-colimit diagram. Since $\pi' : \mathcal{K} \to \mathcal{C}$ is a cocartesian fibration (Corollary 5.3.7.3), Proposition 7.3.4.7 guarantees that the lifting problem (7.21) admits a solution $\overline{F} : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{D}$ which is U-left Kan extended from $\mathcal{K}$.

Note that the diagonal inclusion $\mathcal{C} \hookrightarrow \mathrm{Fun}(\Delta^1, \mathcal{C})$ restricts to a map $\delta : \mathcal{C}^0 \hookrightarrow \mathcal{K}$. Let β denote the composite map

$$\Delta^1 \times \mathcal{C}^0 \simeq \mathcal{C}^0 \star_{\mathcal{C}^0} \mathcal{C}^0 \xrightarrow{\delta \star \mathrm{id}} \mathcal{K} \star_{\mathcal{C}} \mathcal{C},$$

which we regard as a natural transformation from $\iota_{\mathcal{K}} \circ \delta$ to $\iota_{\mathcal{C}^0}$. This natural transformation carries each object $X \in \mathcal{C}^0$ to a morphism $\beta_X : \iota_{\mathcal{K}}(\mathrm{id}_X) \to \iota_{\mathcal{C}}(X)$ in the ∞-category $\mathcal{K} \star_{\mathcal{C}} \mathcal{C}$. Since id_X is a final object of the ∞-category $\mathcal{K}_X \simeq \mathcal{C}^0 \tilde{\times}_{\mathcal{C}^0} \{X\}$ (Proposition 4.6.7.22) and $\overline{F}|_{\mathcal{K}_X^{\triangleright}}$ is a U-colimit diagram (Proposition 7.3.4.3), the image $\overline{F}(\beta_X)$ is a U-cocartesian morphism of $\mathcal{D}$ (Corollary 7.2.2.5). Since $U(\overline{F}(\beta_X)) = \mathrm{id}_{G(X)}$ is an isomorphism in $\mathcal{E}$, we conclude that $\overline{F}(\beta_X)$ is an isomorphism in $\mathcal{D}$. Applying Corollary 4.4.5.9, we deduce that $\overline{F}(\beta)$ can be lifted to an isomorphism $F \to \overline{F} \circ \iota_{\mathcal{C}}$ in the ∞-category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$, where $F : \mathcal{C} \to \mathcal{D}$ is a solution to the lifting problem (7.19). We will show $\overline{F} \circ \iota_{\mathcal{C}}$ is U-left Kan extended from $\mathcal{C}^0$, so that F is also U-left Kan extended from $\mathcal{C}^0$ (Remark 7.3.3.17).

Fix an object $C \in \mathcal{C}$, let $c : (\mathcal{C}^0_{/C})^{\triangleright} \to \mathcal{C}$ be the slice contraction map and set $T^+ = \iota_{\mathcal{C}} \circ c$; we wish to show that $T^+ : (\mathcal{C}^0_{/C})^{\triangleright} \to \mathcal{D}$ is a U-colimit diagram. Let $\psi : \mathcal{C}_{/C} \hookrightarrow \mathcal{C} \tilde{\times}_{\mathcal{C}} \{C\}$ be the slice diagonal of Construction 4.6.4.13. Note that ψ is an equivalence of right fibrations over $\mathcal{C}$ (Theorem 4.6.4.17 and Proposition 5.1.7.5), and therefore restricts to an equivalence of full subcategories $\psi_0 : \mathcal{C}^0_{/C} \to \mathcal{C}^0 \tilde{\times}_{\mathcal{C}} \{C\} = \mathcal{K}_C$. Let T^- denote the composite functor

$$(\mathcal{C}^0_{/C})^{\triangleright} \xrightarrow{\psi_0^{\triangleright}} \mathcal{K}_C^{\triangleright} = \mathcal{K}_C \star_{\{C\}} \{C\} \hookrightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C}.$$

Because $\overline{F}$ is U-left Kan extended from $\mathcal{K}$, the $\overline{F}|_{\mathcal{K}_C^{\triangleright}}$ is a U-colimit diagram in $\mathcal{D}$ (Proposition 7.3.4.3). Since the functor ψ_0 is right cofinal (Corollary 7.2.1.13), the functor $\overline{F} \circ T^-$ is also a U-colimit diagram (Corollary 7.2.2.2). Beware that the functors $T^-, T^+ : (\mathcal{C}^0_{/C})^{\triangleright} \to \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$ are not isomorphic: if $\widetilde{X}$ is an object of the ∞-category $\mathcal{C}_{/C}$ given by a morphism $e : X \to C$ in $\mathcal{C}$, then we have $T^+(\widetilde{X}) = \iota_{\mathcal{C}}(X)$ and $T^-(\widetilde{X}) = \iota_{\mathcal{K}}(e)$. However, we will show that the functors $\overline{F} \circ T^-$ and $\overline{F} \circ T^+$ are isomorphic when regarded as objects of the ∞-category $\mathrm{Fun}((\mathcal{C}^0_{/C})^{\triangleright}, \mathcal{D})$, so that $\overline{F} \circ G^+$ a U-colimit diagram by virtue of Proposition 7.1.5.13.

Let $b : (\mathcal{C}^0_{/C})^{\triangleright} \to \Delta^1$ be the map carrying $\mathcal{C}^0_{/C}$ to the vertex $0 \in \Delta^1$ and the cone point of $(\mathcal{C}^0_{/C})^{\triangleright}$ to the vertex $1 \in \Delta^1$. Note that the map $(b, c) : (\mathcal{C}^0_{/C})^{\triangleright} \to \Delta^1 \times \mathcal{C}$ factors through the full subcategory

$$\mathcal{C}^0 \star_{\mathcal{C}} \mathcal{C} \subseteq \mathcal{C} \star_{\mathcal{C}} \mathcal{C} \subseteq \Delta^1 \times \mathcal{C}.$$

We let $T : (\mathcal{C}^0_{/C})^{\triangleright} \to \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$ denote the composite functor

$$(\mathcal{C}^0_{/C})^{\triangleright} \xrightarrow{(b,c)} \mathcal{C}^0 \star_{\mathcal{C}} \mathcal{C} \xrightarrow{\delta \star \mathrm{id}} \mathcal{K} \star_{\mathcal{C}} \mathcal{C}.$$

Concretely, the functor T carries the cone point of $(\mathcal{C}^0_{/C})^{\triangleright}$ to the object $\iota_{\mathcal{C}}(C) \in \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$, and carries an object $(e : X \to C)$ of $\mathcal{C}^0_{/C}$ to the object $\iota_{\mathcal{K}}(\mathrm{id}_X) \in \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$. We will complete the proof by verifying the following:

(a) There exists a natural transformation of functors $\gamma^+ : T \to T^+$, which carries the cone point of $(\mathcal{C}^0_{/C})^{\triangleright}$ to the identity morphism $\iota_{\mathcal{C}}(\mathrm{id}_C)$, and carries each object $(e : X \to C) \in \mathcal{C}^0_{/C}$ to the morphism β_X.

(b) There exists a natural transformation of functors $\gamma^{-} : T \to T^{-}$, which carries the cone point of $(\mathcal{C}^0_{/C})^{\triangleright}$ to the identity morphism $\iota_{\mathcal{C}}(\mathrm{id}_C)$ and carries each object $(e : X \to C)$ to the morphism of $\mathcal{K} \subseteq \mathrm{Fun}(\Delta^1, \mathcal{C})$ given by a commutative diagram

$$\begin{tikzcd}
X \arrow[r, "\mathrm{id}_X"] \arrow[d, "\mathrm{id}_X"] & X \arrow[d, "e"] \\
X \arrow[r, "e"] & C
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$.

Assuming this has been done, we observe that the natural transformations $\overline{F}(\gamma^{-})$ and $\overline{F}(\gamma^{+})$ carry each object of $(\mathcal{C}^0_{/C})^{\triangleright}$ to an isomorphism in the ∞-category $\mathcal{D}$ and therefore supply isomorphisms $\overline{F} \circ T^{-} \xleftarrow{\sim} \overline{F} \circ T \xrightarrow{|sim} \overline{F} \circ T^{+}$ in the ∞-category $\mathrm{Fun}((\mathcal{C}^0_{/C})^{\triangleright}, \mathcal{D})$.

We begin by constructing the natural transformation γ^{+}. Let $b' : (\mathcal{C}^0_{/C})^{\triangleright} \to \Delta^1$ be the constant map taking the value 1, so that there is a unique natural transformation $\xi : b \to b'$. Note that ξ induces a natural transformation from (b, c) to (b', c) in the ∞-category $\mathrm{Fun}((\mathcal{C}^0_{/C})^{\triangleright}, \mathcal{C}^0 \star_{\mathcal{C}} \mathcal{C})$. Composing with the map $(\delta \star \mathrm{id}) : \mathcal{C}^0 \star_{\mathcal{C}} \mathcal{C} \to \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$, we obtain a natural transformation $\gamma^{+} : T \to T^{+}$ satisfying the requirements of (a).

We now construct the natural transformation γ^{-}. Note that T and T_{-} both carry $\mathcal{C}^0_{/C}$ into $\mathcal{K}$ and the cone point of $(\mathcal{C}^0_{/C})^{\triangleright}$ to the object $\iota_{\mathcal{C}}(C)$ and can therefore be identified with functors $T_0, T_0^{-} : \mathcal{C}^0_{/C} \to \mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C}$. Let σ be an n-simplex of the product $\Delta^1 \times \mathcal{C}^0_{/C}$, which we identify with a pair (ϵ, τ) where $\epsilon : [n] \to [1]$ is a nondecreasing function and $\tau : \Delta^{n+1} \to \mathcal{C}$ has the property that $\tau|_{\Delta^n}$ factors through $\mathcal{C}^0$ and $\tau(n+1) = C$. Let $\rho : \Delta^1 \times \Delta^n \to \Delta^{n+1}$ and $\rho' : \Delta^{n+1} \to \Delta^{n+1}$ denote the maps given on vertices by the formulae

$$\rho(i,j) = \begin{cases} n+1 & \text{if } i = 1 = \epsilon(j) \\ j & \text{otherwise} \end{cases} \qquad \rho'(j) = \begin{cases} j & \text{if } j \leq n \text{ and } \epsilon(j) = 0 \\ n+1 & \text{otherwise.} \end{cases}$$

Then $(\rho \circ \tau) : \Delta^1 \times \Delta^n \to \mathcal{C}$ can be identified with an n-simplex of the simplicial set $\mathcal{K} \subseteq \mathrm{Fun}(\Delta^1, \mathcal{C})$, so that $(\rho \circ \tau, \rho' \circ \tau)$ is an n-simplex of $\mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C}$. The construction $\sigma \mapsto (\rho \circ \tau, \rho' \circ \tau)$ depends functorially on $[n]$, and therefore determines a morphism of simplicial sets

$$\Delta^1 \times \mathcal{C}^0_{/C} \to \mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C}$$

We can identify this map with a natural transformation $\gamma_0^{-} : T_0 \to T_0^{-}$, which then determines a natural transformation $\gamma^{-} : T \to T^{-}$ satisfying the requirements of (b). $\square$

Example 7.3.5.6. Let $U : \mathcal{D} \to \mathcal{E}$ be an isofibration of ∞-categories and let $G : \mathcal{C} \to \mathcal{E}$ be 043H
a functor. Suppose that, for every object $C \in \mathcal{C}$, the image $G(C) \in \mathcal{E}$ can be lifted to a

U-initial object of $\mathcal{D}$. Applying Proposition 7.3.5.5 (in the special case $\mathcal{C}^0 = \emptyset$), we deduce that G can be lifted to a functor $F : \mathcal{C} \to \mathcal{D}$ which carries each object of $\mathcal{C}$ to a U-initial object of $\mathcal{D}$ (see Example 7.3.3.6).

043J **Corollary 7.3.5.7.** *Let $U : \mathcal{D} \to \mathcal{C}$ be a cartesian fibration of ∞-categories. Suppose that, for every object $C \in \mathcal{C}$, the fiber $\mathcal{D}_C = \{C\} \times_{\mathcal{C}} \mathcal{D}$ has an initial object. Then the ∞-category* $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ *has an initial object. Moreover, an object $F \in \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{D})$ is initial if and only if it satisfies the following condition:*

$(*)$ For each object $C \in \mathcal{C}$, the image $F(C)$ is an initial object of $\mathcal{D}_C$.

Proof. Since U is a cartesian fibration, an object $D \in \mathcal{D}$ is U-initial if and only if it is initial when viewed as an object of the ∞-category $\mathcal{D}_C$ for $C = U(D)$ (Corollary 7.1.4.21). It follows from Example 7.3.5.6 that there exists a functor $F \in \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{D})$ which satisfies condition $(*)$. Proposition 7.1.6.9 then guarantees that F is an initial object of $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{D})$. Any other initial object of $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{D})$ is isomorphic to F, and therefore also satisfies condition $(*)$. □

0307 **Corollary 7.3.5.8.** *Let $\mathcal{C}$ be an ∞-category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, let $F_0 : \mathcal{C}^0 \to \mathcal{D}$ be a functor of ∞-categories. Then:*

- *The functor F_0 admits a left Kan extension $F : \mathcal{C} \to \mathcal{D}$ if and only if, for every object $C \in \mathcal{C}$, the diagram*
$$\mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C} \to \mathcal{C}^0 \xrightarrow{F_0} \mathcal{D}$$
has a colimit in the ∞-category $\mathcal{D}$.

- *The functor F_0 admits a right Kan extension $F : \mathcal{C} \to \mathcal{D}$ if and only if, for every object $C \in \mathcal{C}$, the diagram*
$$\mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{C/} \to \mathcal{C}^0 \xrightarrow{F_0} \mathcal{D}$$
has a limit in the ∞-category $\mathcal{D}$.

Proof. The first assertion follows by applying the criterion of Proposition 7.3.5.5 in the special case $\mathcal{E} = \Delta^0$, and the second assertion follows by a similar argument. □

047U **Corollary 7.3.5.9.** *Let $\mathcal{C}$ be an ∞-category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a coreflective full subcategory and let $U : \mathcal{D} \to \mathcal{E}$ be an isofibration of ∞-categories. Suppose we are given a lifting problem*

039W
$$\begin{tikzcd}
\mathcal{C}^0 \arrow[r, "F_0"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
\mathcal{C} \arrow[r, "G"] \arrow[ur, dashed, "F"] & \mathcal{E} .
\end{tikzcd} \qquad (7.23)$$

The following conditions are equivalent:

(1) *The lifting problem (7.23) admits a solution F which is U-left Kan extended from $\mathcal{C}^0$.*

(2) *For every morphism $u : C' \to C$ of $\mathcal{C}$ which exhibits C' as a $\mathcal{C}^0$-coreflection of $\mathcal{C}$, the image $G(u)$ can be lifted to a U-cocartesian morphism $F_0(C') \to D$ of $\mathcal{D}$.*

Proof. Fix an object $C \in \mathcal{C}$, and choose a morphism $u : C' \to C$ which exhibits C' as a $\mathcal{C}^0$-coreflection of $\mathcal{C}$. By virtue of Proposition 7.3.5.5, it will suffice to show that the lifting problem

$$\begin{tikzcd}
\mathcal{C}^0_{/C} \arrow[rr] \arrow[d] & & \mathcal{D} \arrow[d, "U"] \\
(\mathcal{C}^0_{/C})^{\triangleright} \arrow[r] \arrow[urr, dashed, "F_C"] & \mathcal{C} \arrow[r, "G"] & \mathcal{E}
\end{tikzcd}$$

admits a solution which is a U-colimit diagram if and only if $G(u)$ can be lifted to a U-cocartesian morphism $F_0(C') \to D$. This follows from Corollary 7.2.2.14, since u is final when viewed as an object of the ∞-category $\mathcal{C}^0_{/C}$. □

Corollary 7.3.5.10. *Let $\mathcal{C}$ be an ∞-category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a coreflective full subcategory, and let $U : \mathcal{D} \to \mathcal{E}$ be a cocartesian fibration of ∞-categories. Then every lifting problem* 039V

$$\begin{tikzcd}
\mathcal{C}^0 \arrow[r, "F_0"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
\mathcal{C} \arrow[r, "G"] \arrow[ur, dashed, "F"] & \mathcal{E}
\end{tikzcd}$$

admits a solution $F : \mathcal{C} \to \mathcal{D}$ which is U-left Kan extended from $\mathcal{C}^0$.

Corollary 7.3.5.11. *Let $\mathcal{C}$ be an ∞-category which has an initial object and let $U : \mathcal{D} \to \mathcal{E}$ be a cocartesian fibration of ∞-categories. Then every lifting problem* 043K

$$\begin{tikzcd}
\mathcal{C}^{\mathrm{init}} \arrow[r, "F_0"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
\mathcal{C} \arrow[r, "G"] \arrow[ur, dashed, "F"] & \mathcal{E}
\end{tikzcd}$$

admits a solution $F : \mathcal{C} \to \mathcal{D}$ which is U-left Kan extended from the full subcategory $\mathcal{C}^{\mathrm{init}} \subseteq \mathcal{C}$ spanned by the initial objects.

Proof. Combine Corollary 7.3.5.10 with Example 6.2.2.5. □

Proof of Proposition 7.3.5.1. Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories, and suppose we are given diagrams $\delta : K \to \mathcal{C}$ and $F_0 : K \to \mathcal{D}$ with the property that, for every object $C \in \mathcal{C}$, the composite map

$$K_{/C} = K \times_{\mathcal{C}} \mathcal{C}_{/C} \to K \xrightarrow{F_0} \mathcal{D}$$

has a colimit in the ∞-category $\mathcal{D}$. We wish to show that F_0 has a left Kan extension along δ (the converse assertion is immediate from the definitions, and the analogous assertion for right Kan extensions will follow by a similar argument). Using Corollary 4.1.3.3, we can choose an inner anodyne morphism $\iota : K \hookrightarrow \mathcal{K}$, where $\mathcal{K}$ is an ∞-category. Since $\mathcal{C}$ and $\mathcal{D}$ are ∞-categories, we can extend δ and F_0 to functors $\overline{\delta} : \mathcal{K} \to \mathcal{C}$ and $\overline{F}_0 : \mathcal{K} \to \mathcal{D}$, respectively (Proposition 4.1.3.1). For every object $C \in \mathcal{C}$, the induced map $K \times_{\mathcal{C}} \mathcal{C}_{/C} \hookrightarrow \mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C}$ is a categorical equivalence (Corollary 5.6.7.6), and therefore right cofinal (Corollary 7.2.1.13). Applying Proposition 7.2.2.9, we deduce that the composite map

$$\mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C} \to \mathcal{K} \xrightarrow{\overline{F}_0} \mathcal{D}$$

has a colimit in $\mathcal{D}$. Corollary 7.3.5.8 now guarantees that the functor $\overline{F}_0$ admits a left Kan extension $\overline{F} : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{D}$. Set $F = \overline{F}|_{\mathcal{C}}$. Applying Proposition 7.3.2.11, we obtain a natural transformation $\overline{\beta} : \overline{F}_0 \to F \circ \overline{\delta}$ which exhibits F as a left Kan extension of $\overline{F}_0$ along $\overline{\delta}$. Since ι is a categorical equivalence, it follows that $\overline{\beta}$ restricts to a natural transformation $F_0 \to F \circ \delta$ which exhibits F as a left Kan extension of F_0 along δ (Proposition 7.3.1.14). □

7.3.6 The Universal Property of Kan Extensions

0308 The goal of this section is to show that Kan extensions (when they exist) can be characterized by a universal mapping property.

0309 **Proposition 7.3.6.1.** *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, let $\delta : K \to \mathcal{C}$ and $F_0 : K \to \mathcal{D}$ be diagrams, and let $\beta : F_0 \to F \circ \delta$ be a natural transformation which exhibits F as a left Kan extension of F_0 along δ. Then, for every functor $G : \mathcal{C} \to \mathcal{D}$, the composite map*

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{D})}(F, G) \to \mathrm{Hom}_{\mathrm{Fun}(K,\mathcal{D})}(F \circ \delta, G \circ \delta) \xrightarrow{\circ[\beta]} \mathrm{Hom}_{\mathrm{Fun}(K,\mathcal{D})}(F_0, G \circ \delta)$$

is a homotopy equivalence of Kan complexes.

We will give the proof of Proposition 7.3.6.1 at the end of this section.

030A **Warning 7.3.6.2.** In classical category theory, some authors take the universal property of Proposition 7.3.6.1 as the definition of a Kan extension. Beware that this is a slightly different notion in general: it is possible for a natural transformation $\beta : F_0 \to F \circ \delta$ to satisfy the universal property of Proposition 7.3.6.1 without exhibiting F as a left Kan extension of F_0 along δ (in which case F_0 cannot admit any other left Kan extension along δ; see Corollary 7.3.6.5).

Corollary 7.3.6.3. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories, and let $\delta : K \to \mathcal{C}$ be a diagram. Suppose that every diagram $F_0 : K \to \mathcal{D}$ has a left Kan extension along δ. Then the restriction functor* 030B

$$\mathrm{Fun}(\mathcal{C}, \mathcal{D}) \xrightarrow{\circ\delta} \mathrm{Fun}(K, \mathcal{D})$$

has a left adjoint, which carries each diagram $F_0 : K \to \mathcal{D}$ to a left Kan extension of F_0 along δ.

Proof. Combine Propositions 7.3.6.1 and 6.2.4.1. □

Corollary 7.3.6.4. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories and let $\delta : K \to \mathcal{C}$ be a diagram. Suppose that, for every object $C \in \mathcal{C}$, the ∞-category $\mathcal{D}$ admits colimits indexed by the simplicial set $K_{/C} = K \times_{\mathcal{C}} \mathcal{C}_{/C}$. Then the restriction functor* 030C

$$\mathrm{Fun}(\mathcal{C}, \mathcal{D}) \xrightarrow{\circ\delta} \mathrm{Fun}(K, \mathcal{D})$$

has a left adjoint, which carries each diagram $F_0 : K \to \mathcal{D}$ to a left Kan extension of F_0 along δ.

Proof. Combine Corollaries 7.3.6.3 and 7.3.5.2. □

Corollary 7.3.6.5. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories equipped with diagrams $\delta : K \to \mathcal{C}$ and $F_0 : K \to \mathcal{D}$, and suppose that F_0 admits a left Kan extension along δ. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor and let $\beta : F_0 \to F \circ \delta$ be a natural transformation. The following conditions are equivalent:* 030D

(1) *The natural transformation β exhibits F as a left Kan extension of F_0 along δ.*

(2) *For every functor $G : \mathcal{C} \to \mathcal{D}$, the composite map*

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{D})}(F, G) \to \mathrm{Hom}_{\mathrm{Fun}(K,\mathcal{D})}(F \circ \delta, G \circ \delta) \xrightarrow{\circ[\beta]} \mathrm{Hom}_{\mathrm{Fun}(K,\mathcal{D})}(F_0, G \circ \delta)$$

is a homotopy equivalence of Kan complexes.

(3) *For every functor $G : \mathcal{C} \to \mathcal{D}$, the composite map*

$$\mathrm{Hom}_{\mathrm{hFun}(\mathcal{C},\mathcal{D})}(F, G) \to \mathrm{Hom}_{\mathrm{hFun}(K,\mathcal{D})}(F \circ \delta, G \circ \delta)) \xrightarrow{\circ[\beta]} \mathrm{Hom}_{\mathrm{hFun}(K,\mathcal{D})}(F_0, G \circ \delta)$$

is a bijection of sets.

Proof. The implication (1) $\Rightarrow$ (2) follows from Proposition 7.3.6.1 and the implication (2) $\Rightarrow$ (3) is immediate. We will complete the proof by showing that (3) $\Rightarrow$ (1). By assumption, there exists a functor $F' : \mathcal{C} \to \mathcal{D}$ and a natural transformation $\beta' : F_0 \to F' \circ \delta$ which exhibits F' as a left Kan extension of F along δ. Applying Proposition 7.3.6.1, we deduce that there exists a natural transformation $\gamma : F' \to F$ for which β is a composition of β' with the induced transformation $\gamma|_K : (F' \circ \delta) \to (F \circ \delta)$. For each object $G \in \mathrm{Fun}(\mathcal{C}, \mathcal{D})$, we have a commutative diagram

$$\begin{tikzcd}
\mathrm{Hom}_{\mathrm{hFun}(\mathcal{C},\mathcal{D})}(F, G) \arrow[rr, "\circ[\gamma]"] \arrow[dr] & & \mathrm{Hom}_{\mathrm{hFun}(\mathcal{C},\mathcal{D})}(F', G) \arrow[dl] \\
& \mathrm{Hom}_{\mathrm{hFun}(K,\mathcal{D})}(F_0, G \circ \delta), &
\end{tikzcd}$$

where the right vertical map is bijective. If condition (3) is satisfied, then the left vertical map is also bijective. Allowing the functor G to vary, it follows that the homotopy class $[\gamma]$ is an isomorphism in the homotopy category $\mathrm{hFun}(\mathcal{C}, \mathcal{D})$, so that γ is an isomorphism in $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$. Invoking Remark 7.3.1.12, we conclude that β exhibits F as a left Kan extension of F_0 along δ. □

030E **Remark 7.3.6.6.** Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories equipped with diagrams $\delta : K \to \mathcal{C}$ and $F_0 : K \to \mathcal{D}$. It follows from Corollary 7.3.6.5 that if F_0 admits a left Kan extension $F : \mathcal{C} \to \mathcal{D}$ along δ, then the isomorphism class of the functor F is uniquely determined: it is characterized by the requirement that it corepresents the functor

$$\mathrm{hFun}(\mathcal{C}, \mathcal{D}) \to \mathrm{Set} \qquad G \mapsto \mathrm{Hom}_{\mathrm{hFun}(K,\mathcal{D})}(F_0, G \circ \delta).$$

We will deduce Proposition 7.3.6.1 from a more general statement about *relative* Kan extensions.

030F **Proposition 7.3.6.7.** *Let $\mathcal{C}$ be an ∞-category, let $U : \mathcal{D} \to \mathcal{E}$ be a functor of ∞-categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Let $F, G : \mathcal{C} \to \mathcal{D}$ be functors having restrictions $F_0 = F|_{\mathcal{C}^0}$ and $G_0 = G|_{\mathcal{C}^0}$, so that we have a commutative diagram of Kan complexes*

030G
$$\begin{tikzcd}
\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{D})}(F, G) \arrow[r] \arrow[d] & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0,\mathcal{D})}(F_0, G_0) \arrow[d] \\
\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{E})}(U \circ F, U \circ G) \arrow[r] & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0,\mathcal{E})}(U \circ F_0, U \circ G_0).
\end{tikzcd} \tag{7.24}$$

If F is U-left Kan extended from $\mathcal{C}^0$ or G is U-right Kan extended from $\mathcal{C}^0$, then (7.24) is a homotopy pullback square.

Remark 7.3.6.8. In the situation of Proposition 7.3.6.7, the horizontal maps in the diagram (7.24) are Kan fibrations (Corollary 4.1.4.2 and Proposition 4.6.1.21). Consequently, the diagram (7.24) is a homotopy pullback square if and only if the induced map 030H

$$\begin{tikzcd}
\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{D})}(F, G) \arrow[d, "\theta"] \\
\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0,\mathcal{D})}(F_0, G_0) \times_{\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0,\mathcal{E})}(UF_0, UG_0)} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{E})}(UF, UG)
\end{tikzcd}$$

is a homotopy equivalence (Example 3.4.1.3). Writing $\mathcal{M}$ for the fiber product

$$\mathrm{Fun}(\mathcal{C}^0, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}^0,\mathcal{E})} \mathrm{Fun}(\mathcal{C}, \mathcal{E})$$

and $V : \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \to \mathcal{M}$ for the functor given by $V(H) = (H|_{\mathcal{C}^0}, U \circ H)$, we can identify θ with the map $\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{D})}(F, G) \to \mathrm{Hom}_{\mathcal{M}}(V(F), V(G))$ determined by V. We can therefore restate Proposition 7.3.6.7 as follows:

- If the functor $F : \mathcal{C} \to \mathcal{D}$ is U-left Kan extended from $\mathcal{C}^0 \subseteq \mathcal{C}$, then it is V-initial when viewed as an object of the ∞-category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$.
- If the functor $G : \mathcal{C} \to \mathcal{D}$ is U-right Kan extended from $\mathcal{C}^0 \subseteq \mathcal{C}$, then it is V-final when viewed as an object of the ∞-category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$.

Proof of Proposition 7.3.6.7. We will assume that the functor F is U-left Kan extended from $\mathcal{C}^0$ (the proof in the case where G is U-right Kan extended from $\mathcal{C}^0$ is similar). Using Corollary 4.5.2.23, we can factor the functor U as a composition $\mathcal{D} \xrightarrow{T} \mathcal{D}' \xrightarrow{U'} \mathcal{E}$, where U' is an isofibration and T is an equivalence of ∞-categories. Note that the functor $T \circ F$ is U'-left Kan extended from $\mathcal{C}^0$ (Remark 7.3.3.15), and that the natural maps

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{D})}(F, G) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{D}')}(T \circ F, T \circ G)$$

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0,\mathcal{D})}(F_0, G_0) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0,\mathcal{D}')}(T \circ F_0, T \circ G_0)$$

are homotopy equivalences. Consequently, we can replace $\mathcal{D}$ by $\mathcal{D}'$ and thereby reduce to proving Proposition 7.3.6.7 in the special case where the functor $U : \mathcal{D} \to \mathcal{E}$ is an isofibration of ∞-categories.

Let $V : \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}^0, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}^0,\mathcal{E})} \mathrm{Fun}(\mathcal{C}, \mathcal{E})$ be as in Remark 7.3.6.8; we wish to show that F is a V-initial object of the ∞-category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$. Note that V is also an isofibration (Proposition 4.4.5.1). By virtue of Corollary 7.1.4.17, it will suffice to show that every lifting problem

030J
$$\begin{tikzcd}
\partial\Delta^n \arrow[r, "\sigma_0"] \arrow[d] & \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \arrow[d, "V"] \\
\Delta^n \arrow[r] \arrow[ur, dashed] & \mathrm{Fun}(\mathcal{C}^0, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{E})} \mathrm{Fun}(\mathcal{C}, \mathcal{E})
\end{tikzcd} \tag{7.25}$$

has a solution, provided that $n \geq 0$ and $\sigma_0(0) = F$. Unwinding the definitions, we can rewrite (7.25) as a lifting problem

030K
$$\begin{tikzcd}
\mathcal{C}^0 \arrow[r, "G_0"] \arrow[d] & \mathrm{Fun}(\Delta^n, \mathcal{D}) \arrow[d, "V'"] \\
\mathcal{C} \arrow[r] \arrow[ur, dashed, "G"] & \mathrm{Fun}(\partial\Delta^n, \mathcal{D}) \times_{\mathrm{Fun}(\partial\Delta^n, \mathcal{E})} \mathrm{Fun}(\Delta^n, \mathcal{E})
\end{tikzcd} \tag{7.26}$$

Note that V' is also an isofibration of ∞-categories (Proposition 4.4.5.1).

We will complete the proof by showing that the lifting problem (7.26) admits a solution $G : \mathcal{C} \to \mathrm{Fun}(\Delta^n, \mathcal{D})$ which is V'-left Kan extended from $\mathcal{C}^0$. By virtue of Proposition 7.3.5.5, it will suffice to show that for each object $C \in \mathcal{C}$, the induced lifting problem

030L
$$\begin{tikzcd}
\mathcal{C}^0_{/C} \arrow[r] \arrow[d] & \mathrm{Fun}(\Delta^n, \mathcal{D}) \arrow[d, "V'"] \\
(\mathcal{C}^0_{/C})^{\triangleright} \arrow[r] \arrow[ur, dashed, "Q"] & \mathrm{Fun}(\partial\Delta^n, \mathcal{D}) \times_{\mathrm{Fun}(\partial\Delta^n, \mathcal{E})} \mathrm{Fun}(\Delta^n, \mathcal{E})
\end{tikzcd} \tag{7.27}$$

admits a solution $Q : (\mathcal{C}^0_{/C})^{\triangleright} \to \mathrm{Fun}(\Delta^n, \mathcal{D})$ which is a V'-colimit diagram. Our assumption that $\sigma_0(0) = F$ is U-left Kan extended from $\mathcal{C}^0$ guarantees that the composite map

$$(\mathcal{C}^0_{/C})^{\triangleright} \to \mathrm{Fun}(\partial\Delta^n, \mathcal{D}) \to \mathrm{Fun}(\{0\}, \mathcal{D}) = \mathcal{D}$$

is a U-colimit diagram. Applying Corollary 7.1.6.6, we conclude that the lifting problem (7.27) admits a solution Q, and Proposition 7.1.6.9 guarantees that Q is automatically a V'-colimit diagram. □

Corollary 7.3.6.9. *Let $F, G : \mathcal{C} \to \mathcal{D}$ be functors of ∞-categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. If F is left Kan extended from $\mathcal{C}^0$ or G is right Kan extended from $\mathcal{C}^0$, then the restriction map* 030M

$$\theta : \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C},\mathcal{D})}(F, G) \to \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}^0,\mathcal{D})}(F|_{\mathcal{C}^0}, G|_{\mathcal{C}^0})$$

is a trivial Kan fibration.

Proof. Let $F, G : \mathcal{C} \to \mathcal{D}$ be functors of ∞-categories and let $\mathcal{C}^0$ be a full subcategory of $\mathcal{C}$. Assume either that F is left Kan extended from $\mathcal{C}^0$ or that G is right Kan extended from $\mathcal{C}^0$. Applying Proposition 7.3.6.7 in the special case $\mathcal{E} = \Delta^0$, we deduce that the restriction map

$$\theta : \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C},\mathcal{D})}(F, G) \to \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}^0,\mathcal{D})}(F|_{\mathcal{C}^0}, G|_{\mathcal{C}^0})$$

is a homotopy equivalence of Kan complexes. Since the restriction map $\operatorname{Fun}(\mathcal{C}, \mathcal{D}) \to \operatorname{Fun}(\mathcal{C}^0, \mathcal{D})$ is an inner fibration of ∞-categories (Corollary 4.1.4.2), the map θ is also a Kan fibration (Proposition 4.6.1.21), and therefore a trivial Kan fibration (Proposition 3.3.7.6). □

Corollary 7.3.6.10. *Let $\mathcal{C}$ be an ∞-category containing an initial object C, let $U : \mathcal{D} \to \mathcal{E}$ be a cocartesian fibration of ∞-categories, and let $F, G : \mathcal{C} \to \mathcal{D}$ be a pair of functors satisfying $U \circ F = U \circ G$. Suppose that F carries each morphism of $\mathcal{C}$ to a U-cocartesian morphism of $\mathcal{D}$. Then evaluation at C induces a homotopy equivalence* 043M

$$\theta : \operatorname{Hom}_{\operatorname{Fun}_{/\mathcal{E}}(\mathcal{C},\mathcal{D})}(F, G) \to \operatorname{Hom}_{\operatorname{Fun}_{/\mathcal{E}}(\{C\},\mathcal{D})}(F(C), G(C)).$$

Proof. Let $\mathcal{C}^{\text{init}}$ denote the full subcategory of $\mathcal{C}$ spanned by its initial objects. The morphism θ then factors as a composition

$$\begin{aligned} \operatorname{Hom}_{\operatorname{Fun}_{/\mathcal{E}}(\mathcal{C},\mathcal{D})}(F, G) &\xrightarrow{\theta'} \operatorname{Hom}_{\operatorname{Fun}_{/\mathcal{E}}(\mathcal{C}^{\text{init}},\mathcal{D})}(F|_{\mathcal{C}^{\text{init}}}, G|_{\mathcal{C}^{\text{init}}}) \\ &\xrightarrow{\theta''} \operatorname{Hom}_{\operatorname{Fun}_{/\mathcal{E}}(\{C\},\mathcal{D})}(F(C), G(C)). \end{aligned}$$

Our assumption guarantees that F is U-left Kan extended from $\mathcal{C}^{\text{init}}$ (Corollary 7.3.3.13), so that the morphism θ' is a homotopy equivalence (Proposition 7.3.6.7). Since $\mathcal{C}^{\text{init}}$ is a contractible Kan complex (Corollary 4.6.7.14), the inclusion map $\{C\} \hookrightarrow \mathcal{C}^{\text{init}}$ is a categorical equivalence of simplicial sets, which implies that θ'' is also a homotopy equivalence. □

Corollary 7.3.6.11. *Let $\overline{F} : \mathcal{C} \to \mathcal{E}$ be a functor of ∞-categories and let $U : \mathcal{D} \to \mathcal{E}$ be a cocartesian fibration. Suppose that $\mathcal{C}$ contains an initial object C having image $E = \overline{F}(C)$ and that the ∞-category $\mathcal{D}_E = \{E\} \times_{\mathcal{E}} \mathcal{D}$ has an initial object. Then the ∞-category $\operatorname{Fun}_{/\mathcal{E}}(\mathcal{C}, \mathcal{D})$ has an initial object. Moreover, an object $F \in \operatorname{Fun}_{/\mathcal{E}}(\mathcal{C}, \mathcal{D})$ is initial if and only if it satisfies the following conditions:* 043N

(1) *The image $F(C)$ is an initial object of the ∞-category $\mathcal{D}_E$.*

(2) *The functor F carries each morphism of $\mathcal{C}$ to a U-cocartesian morphism of $\mathcal{D}$.*

Proof. It follows from Corollary 7.3.6.10 that any object of $\operatorname{Fun}_{/\mathcal{E}}(\mathcal{C}, \mathcal{D})$ which satisfies conditions (1) and (2) is initial. It will therefore suffice to show that there exists an object $F \in \operatorname{Fun}_{/\mathcal{E}}(\mathcal{C}, \mathcal{D})$ satisfying (1) and (2) (any other initial object of $\operatorname{Fun}_{/\mathcal{E}}(\mathcal{C}, \mathcal{D})$ will be isomorphic to F, and will therefore also satisfy (1) and (2)).

Let $\mathcal{C}^{\mathrm{init}}$ denote the full subcategory of $\mathcal{C}$ spanned by its initial objects, and let D be an initial object of the ∞-category $\mathcal{D}_E$. Since $\mathcal{C}^{\mathrm{init}}$ is a contractible Kan complex, we can lift $\overline{F}|_{\mathcal{C}^{\mathrm{init}}}$ to a functor $F_0 : \mathcal{C}^{\mathrm{init}} \to \mathcal{D}$ satisfying $F_0(C) = D$. Corollary 7.3.5.11 then guarantees that F_0 admits a U-left Kan extension $F \in \operatorname{Fun}_{/\mathcal{E}}(\mathcal{C}, \mathcal{D})$, which satisfies condition (2) by virtue of Corollary 7.3.3.13. ☐

Note that relative Kan extensions are characterized by the mapping property described in Proposition 7.3.6.7:

030N **Corollary 7.3.6.12.** *Suppose we are given a commutative diagram of ∞-categories*

030P
$$\begin{tikzcd}
\mathcal{C}^0 \arrow[r, "F_0"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
\mathcal{C} \arrow[r, "\overline{F}"] \arrow[ur, dashed] & \mathcal{E}
\end{tikzcd} \tag{7.28}$$

where $\mathcal{C}^0$ is a full subcategory of $\mathcal{C}$. Assume that the lifting problem (7.28) admits a solution given by a functor $\mathcal{C} \to \mathcal{D}$ which is U-left Kan extended from $\mathcal{C}^0$. Let $F : \mathcal{C} \to \mathcal{D}$ be an arbitrary solution to the lifting problem (7.28). Then the following conditions are equivalent:

(1) *The functor F is U-left Kan extended from $\mathcal{C}^0$.*

(2) *For every functor $G : \mathcal{C} \to \mathcal{D}$, the diagram of Kan complexes*

$$\begin{tikzcd}
\operatorname{Hom}_{\operatorname{Fun}(\mathcal{C},\mathcal{D})}(F, G) \arrow[r] \arrow[d] & \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}^0,\mathcal{D})}(F|_{\mathcal{C}^0}, G|_{\mathcal{C}^0}) \arrow[d] \\
\operatorname{Hom}_{\operatorname{Fun}(\mathcal{C},\mathcal{E})}(U \circ F, U \circ G) \arrow[r] & \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}^0,\mathcal{E})}(U \circ F|_{\mathcal{C}^0}, U \circ G|_{\mathcal{C}^0}).
\end{tikzcd}$$

is a homotopy pullback square.

Proof. The implication (1) ⇒ (2) follows from Proposition 7.3.6.7. To prove the converse, let $F' : \mathcal{C} \to \mathcal{D}$ be a solution to the lifting problem (7.28) which is U-left Kan extended from $\mathcal{C}^0$, and let $V : \operatorname{Fun}(\mathcal{C}, \mathcal{D}) \to \operatorname{Fun}(\mathcal{C}^0, \mathcal{D}) \times_{\operatorname{Fun}(\mathcal{C}^0, \mathcal{E})} \operatorname{Fun}(\mathcal{C}, \mathcal{E})$ be as in Remark 7.3.6.8. If condition (2) is satisfied, then F and F' are both V-initial objects of $\operatorname{Fun}(\mathcal{C}, \mathcal{D})$ satisfying $V(F) = V(F')$. Applying Corollary 7.1.4.12, we see that F and F' are isomorphic as objects of the ∞-category $\operatorname{Fun}(\mathcal{C}, \mathcal{D})$, so that F is also U-left Kan extended from $\mathcal{C}^0$ (Remark 7.3.3.17). □

Corollary 7.3.6.13. *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, and let $F_0 = F|_{\mathcal{C}^0}$ be the restriction of F to a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Suppose that the functor F_0 admits a left Kan extension to $\mathcal{C}$. The following conditions are equivalent:* 030Q

(1) *The functor F is left Kan extended from $\mathcal{C}^0$.*

(2) *For every functor $G : \mathcal{C} \to \mathcal{D}$, the restriction map*

$$\theta : \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}, \mathcal{D})}(F, G) \to \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}^0, \mathcal{D})}(F|_{\mathcal{C}^0}, G|_{\mathcal{C}^0})$$

is a homotopy equivalence of Kan complexes.

(3) *For every functor $G : \mathcal{C} \to \mathcal{D}$, the restriction map*

$$\theta : \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}, \mathcal{D})}(F, G) \to \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}^0, \mathcal{D})}(F|_{\mathcal{C}^0}, G|_{\mathcal{C}^0})$$

is a trivial Kan fibration of simplicial sets.

Proof. The equivalence (1) ⇔ (2) follows by applying Corollary 7.3.6.12 in the special case $\mathcal{E} = \Delta^0$. The equivalence (2) ⇔ (3) is a special case of Proposition 3.3.7.6, since the morphism θ is automatically a Kan fibration (see Corollary 4.1.4.2 and Proposition 4.6.1.21). □

Combining Proposition 7.3.6.7 with the existence criterion of Proposition 7.3.5.5, we obtain the following:

Theorem 7.3.6.14. *Let $\mathcal{C}$ be an ∞-category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and let $U : \mathcal{D} \to \mathcal{E}$ be an isofibration of ∞-categories. Let $\operatorname{Fun}'(\mathcal{C}, \mathcal{D})$ denote the full subcategory of $\operatorname{Fun}(\mathcal{C}, \mathcal{D})$ spanned by those functors which are U-left Kan extended from $\mathcal{C}^0$, and let $\mathcal{B}$ denote the full subcategory of $\operatorname{Fun}(\mathcal{C}^0, \mathcal{D}) \times_{\operatorname{Fun}(\mathcal{C}^0, \mathcal{E})} \operatorname{Fun}(\mathcal{C}, \mathcal{E})$ whose objects correspond to lifting problems* 030R

$$\begin{tikzcd}
\mathcal{C}^0 \arrow[r] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
\mathcal{C} \arrow[r] \arrow[ur, dashed] & \mathcal{E}
\end{tikzcd}$$

with the following property:

$(*)$ *For every object $C \in \mathcal{C}$, the induced lifting problem*

$$\begin{tikzcd}
\mathcal{C}^0_{/C} \arrow[r] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
(\mathcal{C}^0_{/C})^{\triangleright} \arrow[r] \arrow[ur, dashed] & \mathcal{E}
\end{tikzcd}$$

admits a solution which is a U-colimit diagram $(\mathcal{C}^0_{/C})^{\triangleright} \to \mathcal{D}$.

Then the restriction map

$$V : \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}^0, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{E})} \mathrm{Fun}(\mathcal{C}, \mathcal{E})$$

restricts to a trivial Kan fibration $\mathrm{Fun}'(\mathcal{C}, \mathcal{D}) \to \mathcal{B}$.

Stated more informally, Theorem 7.3.6.14 asserts that if we are given a lifting problem

$$\begin{tikzcd}
\mathcal{C}^0 \arrow[r] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
\mathcal{C} \arrow[r] \arrow[ur, dashed, "F"] & \mathcal{E}
\end{tikzcd}$$

which has a *possibility* to be solved by a functor $F : \mathcal{C} \to \mathcal{D}$ which is U-left Kan extended from $\mathcal{C}^0$, then the functor F exists and is unique up to a contractible space of choices.

Proof of Theorem 7.3.6.14. Note that the functor V is an isofibration of ∞-categories (Proposition 4.4.5.1). It follows from Proposition 7.3.5.5 that $\mathcal{B}$ is the essential image of the functor $V|_{\mathrm{Fun}'(\mathcal{C}, \mathcal{D})}$, and from Proposition 7.3.6.7 (together with Remark 7.3.6.8) that every object of $\mathrm{Fun}'(\mathcal{C}, \mathcal{D})$ is V-initial when regarded as an object of $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$. Applying Corollary 7.1.4.18, we see that the functor $V|_{\mathrm{Fun}(\mathcal{C}, \mathcal{D})} : \mathrm{Fun}'(\mathcal{C}, \mathcal{D}) \to \mathcal{B}$ is a trivial Kan fibration. □

030S **Corollary 7.3.6.15.** *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Let* $\mathrm{Fun}'(\mathcal{C}, \mathcal{D})$ *denote the full subcategory of* $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$ *spanned by those functors which are left Kan extended from $\mathcal{C}^0$, and let* $\mathrm{Fun}'(\mathcal{C}^0, \mathcal{D})$ *denote the full subcategory of* $\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})$ *spanned by those functors F_0 which satisfy the following condition:*

$(*)$ *For every object $C \in \mathcal{C}$, the diagram*

$$\mathcal{C}^0_{/C} = \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C} \to \mathcal{C}^0 \xrightarrow{F_0} \mathcal{D}$$

has a colimit in the ∞-category $\mathcal{D}$.

Then the restriction map $\mathrm{Fun}'(\mathcal{C},\mathcal{D}) \to \mathrm{Fun}'(\mathcal{C}^0,\mathcal{D})$ *is a trivial Kan fibration of simplicial sets.*

Proof. Apply Theorem 7.3.6.14 in the special case $\mathcal{E} = \Delta^0$. □

We now return to the proof of Proposition 7.3.6.1.

Proof of Proposition 7.3.6.1. Let $F, G : \mathcal{C} \to \mathcal{D}$ be functors of ∞-categories. Suppose we are given a simplicial set K equipped with diagrams $\delta : K \to \mathcal{C}$ and $F_0 : K \to \mathcal{D}$, together with a natural transformation $\beta : F_0 \to F \circ \delta$ which exhibits F as a left Kan extension of F_0 along δ. Let θ denote the composite map

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{D})}(F,G) \to \mathrm{Hom}_{\mathrm{Fun}(K,\mathcal{D})}(F\circ\delta, G\circ\delta) \xrightarrow{\circ[\beta]} \mathrm{Hom}_{\mathrm{Fun}(K,\mathcal{D})}(F_0, G\circ\delta).$$

We wish to show that θ is a homotopy equivalence.

It follows from Corollary 4.1.3.3 that there exists an inner anodyne morphism $K \hookrightarrow \mathcal{K}$, where $\mathcal{K}$ is an ∞-category. Since $\mathcal{C}$ and $\mathcal{D}$ are ∞-categories, we can extend δ and F_0 to functors $\delta' : \mathcal{K} \to \mathcal{C}$ and $F_0' : \mathcal{K} \to \mathcal{D}$, respectively (Proposition 1.5.6.7). Moreover, the restriction functor $\mathrm{Fun}(\mathcal{K},\mathcal{D}) \to \mathrm{Fun}(K,\mathcal{D})$ is a trivial Kan fibration (Proposition 1.5.7.6). We can therefore extend β to a natural transformation $\beta' : F_0' \to F \circ \delta'$, which induces a map of Kan complexes $\theta' : \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{D})}(F,G) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K},\mathcal{D})}(F_0', G\circ\delta')$. By construction, the map θ is obtained (up to homotopy) by composing θ' with the restriction map $\mathrm{Hom}_{\mathrm{Fun}(\mathcal{K},\mathcal{D})}(F_0', G\circ\delta') \to \mathrm{Hom}_{\mathrm{Fun}(K,\mathcal{D})}(F_0, G\circ\delta)$, which is a trivial Kan fibration. Consequently, to show that θ is a homotopy equivalence, it will suffice to show that θ' is a homotopy equivalence. We may therefore replace K by $\mathcal{K}$ and thereby reduce to proving Proposition 7.3.6.1 in the special case where $K = \mathcal{K}$ is an ∞-category.

Let $\overline{\mathcal{C}}$ denote the relative join $\mathcal{K} \star_{\mathcal{C}} \mathcal{C}$. Note that the definition of θ (as a morphism in the homotopy category hKan) depends only on the homotopy class of β. We may therefore assume without loss of generality that there exists a functor $\overline{F} : \overline{\mathcal{C}} \to \mathcal{D}$ for which $\overline{F}|_{\mathcal{K}} = F_0$, $\overline{F}|_{\mathcal{C}} = F$, and the natural transformation β is given by the composition

$$\Delta^1 \times \mathcal{K} \simeq \mathcal{K} \star_{\mathcal{K}} \mathcal{K} \to \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \xrightarrow{\overline{F}} \mathcal{D}.$$

Let $\overline{G} : \overline{\mathcal{C}} \to \mathcal{D}$ denote the functor given by the composition

$$\mathcal{K} \star_{\mathcal{C}} \mathcal{C} \to \mathcal{C} \star_{\mathcal{C}} \mathcal{C} \simeq \Delta^1 \times \mathcal{C} \to \mathcal{C} \xrightarrow{G} \mathcal{D}.$$

Our assumption on β guarantees that $\overline{F}$ is left Kan extended from the full subcategory $\mathcal{K} \subseteq \overline{\mathcal{C}}$ (Proposition 7.3.2.11). Applying Corollary 7.3.6.9, we deduce that precomposition with the inclusion $\mathcal{K} \hookrightarrow \overline{\mathcal{C}}$ determines a trivial Kan fibration

$$\varphi_{-} : \mathrm{Hom}_{\mathrm{Fun}(\overline{\mathcal{C}},\mathcal{D})}(\overline{F}, \overline{G}) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K},\mathcal{D})}(F_0, G\circ\delta).$$

We claim that $\overline{G}$ is right Kan extended from the full subcategory $\mathcal{C} \subseteq \overline{\mathcal{C}}$. To prove this, it will suffice to show that for every object $X \in \mathcal{K}$, the functor $\overline{G}$ is right Kan extended from $\mathcal{C}$ at X (see Proposition 7.3.3.7). Let $e_X : X \to \delta(X)$ denote the morphism in $\overline{\mathcal{C}}$ given by the edge

$$\Delta^1 \simeq \{X\} \star_{\{\delta(X)\}} \{\delta(X)\} \hookrightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C} = \overline{\mathcal{C}}.$$

Note that e_X is cocartesian with respect to the projection map $\overline{\mathcal{C}} \to \Delta^1$ (Proposition 5.2.3.15), and therefore exhibits $\delta(X)$ as a $\mathcal{C}$-reflection of X in the ∞-category $\overline{\mathcal{C}}$ (Lemma 6.2.3.1). It will therefore suffice to show that $\overline{G}$ carries e_X to an isomorphism in the ∞-category $\mathcal{D}$, which is clear (by construction, $\overline{G}(e_X)$ is the identity morphism id_D for $D = G(\delta(X))$). Applying Corollary 7.3.6.9 again, we deduce that precomposition with the inclusion map $\mathcal{C} \hookrightarrow \overline{\mathcal{C}}$ determines a trivial Kan fibration

$$\varphi_+ : \mathrm{Hom}_{\mathrm{Fun}(\overline{\mathcal{C}},\mathcal{D})}(\overline{F}, \overline{G}) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{D})}(F, G).$$

Let $\varphi_\pm : \mathrm{Hom}_{\mathrm{Fun}(\overline{\mathcal{C}},\mathcal{D})}(\overline{F}, \overline{G}) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K},\mathcal{D})}(F \circ \delta, G \circ \delta)$ be given by precomposition with the functor $\mathcal{K} \xrightarrow{\delta} \mathcal{C} \hookrightarrow \overline{\mathcal{C}}$. Consider the diagram of Kan complexes

030T
$$\begin{tikzcd}
 & \mathrm{Hom}_{\mathrm{Fun}(\overline{\mathcal{C}},\mathcal{D})}(\overline{F}, \overline{G}) \arrow[dl, "\varphi_+"'] \arrow[d, "\varphi_\pm"] \arrow[dr, "\varphi_-"] & \\
\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{D})}(F, G) \arrow[r] & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K},\mathcal{C})}(F \circ \delta, G \circ \delta) \arrow[r, "\circ[\beta]"] & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K},\mathcal{D})}(F_0, G \circ \delta).
\end{tikzcd} \tag{7.29}$$

Note that the diagonal maps are homotopy equivalences, and the triangle on the left is commutative. Consequently, to show that θ is a homotopy equivalence, it will suffice to show that the triangle on the right commutes up to homotopy.

Let $\mathrm{Hom}_{\mathrm{Fun}(\mathcal{K},\mathcal{D})}(F_0, F \circ \delta, G \circ \delta)$ be the Kan complex introduced in Notation 4.6.9.1. To verify the homotopy commutativity of the right triangle in the diagram (7.29), it will suffice to show that there is exists map of Kan complexes $\rho : \mathrm{Hom}_{\mathrm{Fun}(\overline{\mathcal{C}},\mathcal{D})}(\overline{F}, \overline{G}) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K},\mathcal{D})}(F_0, F \circ \delta, G \circ \delta)$ satisfying the following conditions:

- The composition

  $$\mathrm{Hom}_{\mathrm{Fun}(\overline{\mathcal{C}},\mathcal{D})}(\overline{F}, \overline{G}) \xrightarrow{\rho} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K},\mathcal{D})}(F_0, F \circ \delta, G \circ \delta) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K},\mathcal{D})}(F_0, F \circ \delta)$$

  is the constant map taking the value β.

- The composition

  $$\mathrm{Hom}_{\mathrm{Fun}(\overline{\mathcal{C}},\mathcal{D})}(\overline{F}, \overline{G}) \xrightarrow{\rho} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K},\mathcal{D})}(F_0, F \circ \delta, G \circ \delta) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K},\mathcal{D})}(F_0, G \circ \delta)$$

  is equal to φ_-.

- The composition

  $$\mathrm{Hom}_{\mathrm{Fun}(\overline{\mathcal{C}},\mathcal{D})}(\overline{F},\overline{G}) \xrightarrow{\rho} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K},\mathcal{D})}(F_0, F\circ\delta, G\circ\delta) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K},\mathcal{D})}(F\circ\delta, G\circ\delta)$$

  is equal to $\varphi_{\pm}$.

Let σ denote the 2-simplex of $\Delta^1 \times \Delta^1$ given on vertices by the formulae

$$\sigma(0) = (0,0) \qquad \sigma(1) = (0,1) \qquad \sigma(2) = (1,1),$$

and let $T : \Delta^2 \times \mathcal{K} \to \Delta^1 \times \overline{\mathcal{C}}$ be the functor given by the composition

$$\begin{aligned} \Delta^2 \times \mathcal{K} &\xrightarrow{\sigma\times\mathrm{id}_{\mathcal{K}}} \Delta^1 \times \Delta^1 \times \mathcal{K} \\ &\simeq \Delta^1 \times (\mathcal{K} \star_{\mathcal{K}} \mathcal{K}) \\ &\to \Delta^1 \times (\mathcal{K} \star_{\mathcal{C}} \mathcal{C}) \\ &= \Delta^1 \times \overline{\mathcal{C}}. \end{aligned}$$

More concretely, the functor T is given on objects by the formulae

$$T(0,X) = (0,X) \qquad T(1,X) = (0,\delta(X)) \qquad T(2,X) = (1,\delta(X)).$$

We conclude by observing that precomposition with T induces a map of Kan complexes

$$\rho : \mathrm{Hom}_{\mathrm{Fun}(\overline{\mathcal{C}},\mathcal{D})}(\overline{F},\overline{G}) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K},\mathcal{D})}(F_0, F\circ\delta, G\circ\delta)$$

having the desired properties. □

7.3.7 Kan Extensions in Functor ∞-Categories

Let $U : \mathcal{C} \to \mathcal{B}$ be an exponentiable inner fibration of ∞-categories (Definition 4.5.9.10). For every ∞-category $\mathcal{D}$, Corollary 4.5.9.19 guarantees that the simplicial set $\mathrm{Fun}(\mathcal{C}\,/\,\mathcal{B},\mathcal{D})$ is an ∞-category (see Construction 4.5.9.1). The goal of this section is to describe (relative) Kan extensions of functors which take values in the ∞-category $\mathrm{Fun}(\mathcal{C}\,/\,\mathcal{B},\mathcal{D})$. We can state our main result as follows: 047V

Theorem 7.3.7.1. *Let $U : \mathcal{C} \to \mathcal{B}$ be an exponentiable inner fibration of ∞-categories, let $V : \mathcal{D} \to \mathcal{E}$ be a functor of ∞-categories, and let $V' : \mathrm{Fun}(\mathcal{C}\,/\,\mathcal{B},\mathcal{D}) \to \mathrm{Fun}(\mathcal{C}\,/\,\mathcal{B},\mathcal{E})$ denote the functor given by postcomposition with V. Let $f : \mathcal{A} \to \mathrm{Fun}(\mathcal{C}\,/\,\mathcal{B},\mathcal{D})$ be a functor of ∞-categories, corresponding to a morphism $\mathcal{A} \to \mathcal{B}$ and a functor $F : \mathcal{A} \times_{\mathcal{B}} \mathcal{C} \to \mathcal{D}$. Let $\mathcal{A}^0 \subseteq \mathcal{A}$ be a full subcategory. If F is V-left Kan extended from $\mathcal{A}^0 \times_{\mathcal{B}} \mathcal{C}$, then f is V'-left Kan extended from $\mathcal{A}^0$.* 047W

We will give the proof of Theorem 7.3.7.1 at the end of this section.

047X **Remark 7.3.7.2.** In the situation of Theorem 7.3.7.1, suppose that the functor $F^0 = F|_{\mathcal{A}^0 \times_{\mathcal{B}} \mathcal{C}}$ admits a V-left Kan extension $F' : \mathcal{A} \times_{\mathcal{B}} \mathcal{C}$ satisfying $V \circ F' = V \circ F$. Then the converse of Theorem 7.3.7.1 is also true: if f is V'-left Kan extended from $\mathcal{A}^0$, then F is V-left Kan extended from $\mathcal{A}^0 \times_{\mathcal{B}} \mathcal{C}$. To prove this, it will suffice to show that the functors F and F' are isomorphic (Remark 7.3.3.17). This is clear: we can identify F' with a functor $f' : \mathcal{A} \to \operatorname{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$ satisfying $V' \circ f' = V' \circ f$, and Theorem 7.3.7.1 guarantees that f' is V'-left Kan extended from $\mathcal{A}^0$. Since the functors f and f' coincide on $\mathcal{A}^0$, they are isomorphic by virtue of Theorem 7.3.6.14.

047Y **Corollary 7.3.7.3.** *Let $U : \mathcal{C} \to \mathcal{B}$ be an exponentiable inner fibration of ∞-categories, let $\mathcal{D}$ be an ∞-category, and let $\pi : \operatorname{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}) \to \mathcal{B}$ be the projection map. Let $f : \mathcal{A} \to \operatorname{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$ be a functor of ∞-categories and let $\mathcal{A}^0 \subseteq \mathcal{A}$ be a full subcategory. If the induced map $\mathcal{A} \times_{\mathcal{B}} \mathcal{C} \to \mathcal{D}$ is left Kan extended from $\mathcal{A}^0 \times_{\mathcal{B}} \mathcal{C}$, then f is π-left Kan extended from $\mathcal{A}^0$.*

Proof. Apply Theorem 7.3.7.1 in the special case $\mathcal{E} = \Delta^0$. □

047Z **Corollary 7.3.7.4.** *Let $\mathcal{C}$ be an ∞-category, let $V : \mathcal{D} \to \mathcal{E}$ be a functor of ∞-categories, and let $V' : \operatorname{Fun}(\mathcal{C}, \mathcal{D}) \to \operatorname{Fun}(\mathcal{C}, \mathcal{E})$ be the functor given by postcomposition with V'. Suppose we are given another functor $f : \mathcal{A} \to \operatorname{Fun}(\mathcal{C}, \mathcal{D})$ and a full subcategory $\mathcal{A}^0 \subseteq \mathcal{A}$. If the induced map $\mathcal{A} \times \mathcal{C} \to \mathcal{D}$ is V-left Kan extended from $\mathcal{A}^0 \times \mathcal{C}$, then f is V'-left Kan extended from $\mathcal{A}^0$.*

Proof. Apply Theorem 7.3.7.1 in the special case $\mathcal{B} = \Delta^0$. □

0480 **Corollary 7.3.7.5.** *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories and let $f : \mathcal{A} \to \operatorname{Fun}(\mathcal{C}, \mathcal{D})$ be a functor of ∞-categories, corresponding to a functor $F : \mathcal{A} \times \mathcal{C} \to \mathcal{D}$. Let $\mathcal{A}^0 \subseteq \mathcal{A}$ be a full subcategory. If F is left Kan extended from $\mathcal{A}^0 \times \mathcal{C}$, then f is left Kan extended from $\mathcal{A}^0$.*

Proof. Apply Corollary 7.3.7.4 in the special case $\mathcal{E} = \Delta^0$. □

0481 **Corollary 7.3.7.6.** *Let $U : \mathcal{C} \to \mathcal{B}$ be an exponentiable inner fibration of ∞-categories, let $V : \mathcal{D} \to \mathcal{E}$ be an isofibration of ∞-categories, and let $V' : \operatorname{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}) \to \operatorname{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})$ be the isofibration given by postcomposition with V (see Proposition 4.5.9.18). Let e be a morphism of the ∞-category $\operatorname{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$, corresponding to a pair $(\overline{e}, f)$ where $\overline{e}$ is a morphism of $\mathcal{B}$ and $f : \Delta^1 \times_{\mathcal{B}} \mathcal{C} \to \mathcal{D}$ is a functor of ∞-categories. If f is V-left Kan extended from $\{0\} \times_{\mathcal{B}} \mathcal{C}$, then the morphism e is V'-cocartesian.*

Proof. Apply Theorem 7.3.7.1 in the special case $\mathcal{A} = \Delta^1$ and $\mathcal{A}^0 = \{0\}$ (see Example 7.1.5.9). □

Example 7.3.7.7. In the situation of Corollary 7.3.7.6, suppose that $\mathcal{B} = \Delta^0$. Corollary 7.3.7.6 then asserts that a morphism $e : X \to Y$ in the functor ∞-category $\operatorname{Fun}(\mathcal{C}, \mathcal{D})$ is V'-cocartesian if, for every object $C \in \mathcal{C}$, the induced map $e_C : X(C) \to Y(C)$ is a V-cocartesian morphism of $\mathcal{D}$. This is a special case of Lemma 5.2.1.5. 0482

Example 7.3.7.8. In the situation of Corollary 7.3.7.6, suppose that U is a cartesian fibration. Let $U_{\overline{e}} : \Delta^1 \times_{\mathcal{B}} \mathcal{C} \to \Delta^1$ denote the cartesian fibration given by projection onto the first factor. By virtue of Proposition 7.3.3.11, the functor f is V-left Kan extended from $\{0\} \times_{\mathcal{B}} \mathcal{C}$ if and only if it carries $U_{\overline{e}}$-cartesian morphisms of $\Delta^1 \times_{\mathcal{B}} \mathcal{C}$ to V-cocartesian morphisms of $\mathcal{D}$. In this case, Corollary 7.3.7.6 is a special case of (the dual of) Lemma 5.3.6.11. 0483

Corollary 7.3.7.9. *Let $U : \mathcal{C} \to \mathcal{B}$ be an exponentiable inner fibration of ∞-categories, let $\mathcal{D}$ be an ∞-category, and let $\pi : \operatorname{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}) \to \mathcal{B}$ be the projection map. Let e be a morphism of the ∞-category $\operatorname{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$, corresponding to a pair $(\overline{e}, f)$ where $\overline{e}$ is a morphism of $\mathcal{B}$ and $f : \Delta^1 \times_{\mathcal{B}} \mathcal{C} \to \mathcal{D}$ is a functor of ∞-categories. If f is left Kan extended from $\{0\} \times_{\mathcal{B}} \mathcal{C}$, then the morphism e is π-cocartesian.* 0484

Proof. Apply Corollary 7.3.7.6 in the special case $\mathcal{E} = \Delta^0$. □

The proof of Theorem 7.3.7.1 will require some preliminaries.

Lemma 7.3.7.10. *Let $V : \mathcal{D} \to \mathcal{E}$ be an isofibration of ∞-categories, let K be a simplicial set equipped with a diagram $\overline{f} : K^{\triangleright} \to \mathcal{E}$, and let $\operatorname{Fun}'_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D}) \subseteq \operatorname{Fun}_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D})$ be a full subcategory. Let $\operatorname{Fun}'_{/\mathcal{E}}(K, \mathcal{D})$ denote the essential image of $\operatorname{Fun}'_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D})$ under the restriction map $\operatorname{Fun}_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D}) \to \operatorname{Fun}_{/\mathcal{E}}(K, \mathcal{D})$. Suppose that every simplicial set A satisfies the following condition:* 0485

($*_A$) *For every extension of $\overline{f}$ to a morphism $K^{\triangleright} \star A \to \mathcal{E}$, the restriction functor*

$$\begin{tikzcd}
\operatorname{Fun}'_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D}) \times_{\operatorname{Fun}_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D})} \operatorname{Fun}_{/\mathcal{E}}(K^{\triangleright} \star A, \mathcal{D}) \arrow[d, "\theta_A"] \\
\operatorname{Fun}'_{/\mathcal{E}}(K, \mathcal{D}) \times_{\operatorname{Fun}_{/\mathcal{E}}(K, \mathcal{D})} \operatorname{Fun}_{/\mathcal{E}}(K \star A, \mathcal{D})
\end{tikzcd}$$

is an equivalence of ∞-categories.

Then every object of $\operatorname{Fun}'_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D})$ is a V-colimit diagram in the ∞-category $\mathcal{D}$.

Proof. Without loss of generality, we may assume that the full subcategory $\operatorname{Fun}'_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D})$ is replete. For every extension of $\overline{f}$ to a morphism $K^{\triangleright} \star A \to \mathcal{E}$, let $\operatorname{Fun}'_{/\mathcal{E}}(K^{\triangleright} \star A, \mathcal{D}) \subseteq \operatorname{Fun}_{/\mathcal{E}}(K^{\triangleright} \star A, \mathcal{D})$ and $\operatorname{Fun}'_{/\mathcal{E}}(K \star A, \mathcal{D}) \subseteq \operatorname{Fun}_{/\mathcal{E}}(K \star A, \mathcal{D})$ denote the inverse images of $\operatorname{Fun}'_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D})$ and $\operatorname{Fun}'_{/\mathcal{E}}(K, \mathcal{D})$, respectively. For every monomorphism of simplicial sets $A \hookrightarrow B$, Proposition 4.4.5.1 guarantees that the restriction map $\mathrm{Fun}_{/\mathcal{E}}(K \star B, \mathcal{D}) \to \mathrm{Fun}_{/\mathcal{E}}(K \star A, \mathcal{D})$ is an isofibration, and therefore induces an isofibration $\mathrm{Fun}'_{/\mathcal{E}}(K \star B, \mathcal{D}) \to \mathrm{Fun}'_{/\mathcal{E}}(K \star A, \mathcal{D})$ Combining Corollary 4.5.2.30 with assumptions $(*_A)$ and $(*_B)$, we conclude that the restriction map

$$\theta_{A,B} : \mathrm{Fun}'_{/\mathcal{E}}(K^{\triangleright} \star B, \mathcal{D}) \to \mathrm{Fun}'_{/\mathcal{E}}(K^{\triangleright} \star A, \mathcal{D}) \times_{\mathrm{Fun}'_{/\mathcal{E}}(K \star A, \mathcal{D})} \mathrm{Fun}'_{/\mathcal{E}}(K \star B, \mathcal{D})$$

is an equivalence of ∞-categories. Proposition 4.4.5.1 implies that $\theta_{A,B}$ is also an isofibration, and is therefore a trivial Kan fibration (Proposition 4.5.5.20). In particular, $\theta_{A,B}$ is surjective on vertices. Unwinding the definitions, we conclude that every lifting problem

$$\begin{tikzcd}
(K^{\triangleright} \star A)\coprod_{(K \star A)}(K \star B) \arrow[r, "g"] \arrow[d] & \mathcal{D} \arrow[d, "V"] \\
K^{\triangleright} \star B \arrow[r] \arrow[ur, dashed] & \mathcal{E}
\end{tikzcd}$$

admits a solution, provided that the restriction $g|_{K^{\triangleright}}$ belongs to $\mathrm{Fun}'_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D})$. The desired result now follows by invoking the criterion of Remark 7.1.5.11. □

0486 **Exercise 7.3.7.11.** Prove the converse of Lemma 7.3.7.10.

0487 **Remark 7.3.7.12.** In the situation of Lemma 7.3.7.10, suppose we are given an inner anodyne morphism of simplicial sets $A \hookrightarrow B$. Then every diagram $K^{\triangleright} \star A \to \mathcal{E}$ can be extended to a morphism $K^{\triangleright} \star B \to \mathcal{E}$, so that condition $(*_A)$ is satisfied if and only if condition $(*_B)$ is satisfied. Consequently, to show that every object of $\mathrm{Fun}'_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D})$ is a V-colimit diagram, it suffices to verify condition $(*_A)$ in the special case where A is an ∞-category (see Corollary 4.1.3.3).

We will deduce Theorem 7.3.7.1 from the following special case:

0488 **Proposition 7.3.7.13.** *Let $U : \mathcal{C} \to \mathcal{B}$ be an exponentiable inner fibration of ∞-categories, let $V : \mathcal{D} \to \mathcal{E}$ be a functor of ∞-categories, and let $V' : \mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})$ denote the functor given by postcomposition with V. Let $\mathcal{K}$ be an ∞-category and let $f : \mathcal{K}^{\triangleright} \to \mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$ be a functor, corresponding to a morphism $\mathcal{K}^{\triangleright} \to \mathcal{B}$ and a functor $F : \mathcal{K}^{\triangleleft} \times_{\mathcal{B}} \mathcal{C} \to \mathcal{D}$. If F is V-left Kan extended from $\mathcal{K} \times_{\mathcal{B}} \mathcal{C}$, then f is a V'-colimit diagram.*

Proof. Without loss of generality, we may assume that V is an isofibration, so that V' is also an isofibration (Proposition 4.5.9.18). Fix a morphism $\overline{f} : \mathcal{K}^{\triangleright} \to \mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})$, and let

$$\mathrm{Fun}'_{/\mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})}(\mathcal{K}^{\triangleright}, \mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})) \subseteq \mathrm{Fun}_{/\mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})}(\mathcal{K}^{\triangleright}, \mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}))$$

denote the full subcategory spanned by those morphisms $\mathcal{K}^{\triangleright} \to \operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{D})$ which correspond to functors $\mathcal{K}^{\triangleleft} \times_{\mathcal{B}} \mathcal{C} \to \mathcal{D}$ which are V-left Kan extended from $\mathcal{K}$, and let $\operatorname{Fun}'_{/\operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{E})}(\mathcal{K}, \operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{D}))$ denote its essential image under the restriction map

$$\operatorname{Fun}_{/\operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{E})}(\mathcal{K}^{\triangleright}, \operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{D})) \to \operatorname{Fun}_{/\operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{E})}(\mathcal{K}, \operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{D})).$$

We will complete the proof by showing that every object of $\operatorname{Fun}'_{/\operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{E})}(\mathcal{K}^{\triangleright}, \operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{D}))$ is a V'-colimit diagram in the ∞-category $\operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{D})$. By virtue of Remark 7.3.7.12, it will suffice to verify condition $(*_{\mathcal{A}})$ of Lemma 7.3.7.10 for every ∞-category $\mathcal{A}$.

Fix a morphism $\mathcal{K}^{\triangleright} \star \mathcal{A} \to \operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{E})$ extending $\overline{f}$, which we identify with a diagram $\mathcal{K}^{\triangleright} \star \mathcal{A} \to \mathcal{B}$ and a functor

$$\overline{G} : (\mathcal{K}^{\triangleright} \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C} \to \mathcal{E}\,.$$

Let $\operatorname{Fun}'_{/\mathcal{E}}((\mathcal{K}^{\triangleright} \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D})$ denote denote the full subcategory of $\operatorname{Fun}_{/\mathcal{E}}((\mathcal{K}^{\triangleright} \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D})$ given by the inverse image of $\operatorname{Fun}'_{/\operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{E})}(\mathcal{K}^{\triangleright}, \operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{D}))$, and define $\operatorname{Fun}'_{/\mathcal{E}}((\mathcal{K} \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D})$ similarly. We wish to show that the restriction map

$$\theta : \operatorname{Fun}'_{/\mathcal{E}}((\mathcal{K}^{\triangleright} \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D}) \to \operatorname{Fun}'_{/\mathcal{E}}((\mathcal{K} \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D})$$

is an equivalence of ∞-categories. Unwinding the definitions (and using the existence criterion of Proposition 7.3.5.5), we see that a functor $G \in \operatorname{Fun}_{/\mathcal{E}}((\mathcal{K}^{\triangleright} \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D})$ belongs to the subcategory $\operatorname{Fun}'_{/\mathcal{E}}((\mathcal{K}^{\triangleright} \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D})$ if and only if it is V-left Kan extended from $(\mathcal{K} \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}$, and that a functor $G_0 \in \operatorname{Fun}_{/\mathcal{E}}((\mathcal{K}^{\triangleright} \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D})$ belongs to $\operatorname{Fun}'_{/\operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{E})}(\mathcal{K}^{\triangleright}, \operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{D}))$ if and only if admits a left Kan extension $G : (\mathcal{K}^{\triangleright} \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C} \to \mathcal{D}$ satisfying $V \circ G = \overline{G}$. Applying Theorem 7.3.6.14, we conclude that θ is a trivial Kan fibration. □

Example 7.3.7.14. In the situation of Proposition 7.3.7.13, suppose that $\mathcal{B} = \Delta^0$, so that we can identify F with a functor from $\mathcal{K}^{\triangleleft} \times \mathcal{C}$ to $\mathcal{D}$. Let X denote the cone point of $\mathcal{K}^{\triangleright}$. For each object $C \in \mathcal{C}$, the inclusion map $\mathcal{K} \times \{\mathrm{id}_C\} \hookrightarrow \mathcal{K} \times \mathcal{C}_{/C}$ is right cofinal (see Corollary 7.2.1.19). Applying Corollary 7.2.2.2, we deduce that F is V-left Kan extended from $\mathcal{K} \times \mathcal{C}$ if and only if the induced map 0489

$$\mathcal{K}^{\triangleleft} \simeq \mathcal{K}^{\triangleleft} \times \{C\} \hookrightarrow \mathcal{K}^{\triangleleft} \times \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a V-colimit diagram for each $C \in \mathcal{C}$. Proposition 7.3.7.13 asserts that, if this condition is satisfied, then F determines a V'-colimit diagram $\mathcal{K}^{\triangleleft} \to \operatorname{Fun}(\mathcal{C}, \mathcal{D})$; this is a special case of Corollary 7.1.6.11.

Proof of Theorem 7.3.7.1. Let $U : \mathcal{C} \to \mathcal{B}$ be an inner fibration of ∞-categories, let $V : \mathcal{D} \to \mathcal{E}$ be a functor of ∞-categories, and let $V' : \operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{D}) \to \operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{E})$ be the functor given by postcomposition with V'. Suppose we are given a functor $f : \mathcal{A} \to \operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{D})$

and a full subcategory $\mathcal{A}^0 \subseteq \mathcal{A}$. Assume that the induced map $F : \mathcal{A} \times_{\mathcal{B}} \mathcal{C} \to \mathcal{D}$ is V-left Kan extended from $\mathcal{A}^0 \times_{\mathcal{B}} \mathcal{C}$; we ish show that f is V'-left Kan extended from $\mathcal{A}^0$. Fix an object $A \in \mathcal{A}$ and set $\mathcal{A}^0_{/A} = \mathcal{A}^0 \times_{\mathcal{A}} \mathcal{A}_{/A}$; we wish to show that the composite map

$$(\mathcal{A}^0_{/A})^{\triangleright} \hookrightarrow (\mathcal{A}_{/A})^{\triangleright} \to \mathcal{A} \xrightarrow{f} \operatorname{Fun}(\mathcal{C} \,/\, \mathcal{B}, \mathcal{D})$$

is a V-colimit diagram. Let F_A denote the composition

$$(\mathcal{A}^0_{/A})^{\triangleright} \times_{\mathcal{B}} \mathcal{C} \to \mathcal{A} \times_{\mathcal{B}} \mathcal{C} \xrightarrow{F} \mathcal{D}.$$

By virtue of Proposition 7.3.7.13, it will suffice to show that F_A is V-left Kan extended from $\mathcal{A}^0_{/A} \times_{\mathcal{B}} \mathcal{C}$. Let X denote the cone point of $(\mathcal{A}^0_{/A})^{\triangleright}$, let B denote its image in $\mathcal{B}$, and let $C \in \mathcal{C}$ be an object satisfying $U(C) = B$. Unwinding the definitions, we see that F_A is V-left Kan extended from $\mathcal{A}^0_{/A} \times_{\mathcal{B}} \mathcal{C}$ at the object (X, C) if and only if the diagram

$$(\mathcal{A}^0_{/A} \times_{\mathcal{B}_{/B}} \mathcal{C}_{/C})^{\triangleright} \to (\mathcal{A}^0_{/A})^{\triangleright} \times_{(\mathcal{B}_{/B})^{\triangleright}} (\mathcal{C}_{/C})^{\triangleright} \to \mathcal{A} \times_{\mathcal{B}} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a V-colimit diagram. This follows from our assumption that F is V-left Kan extended from the full subcategory $\mathcal{A}^0 \times_{\mathcal{B}} \mathcal{C}$ at the object (A, C). □

7.3.8 Transitivity of Kan Extensions

030U Let $\overline{\mathcal{C}}$ be an ∞-category equipped with full subcategories $\mathcal{C}^0 \subseteq \mathcal{C} \subseteq \overline{\mathcal{C}}$. Our goal in this section is to show that a functor of ∞-categories $\overline{F} : \overline{\mathcal{C}} \to \mathcal{D}$ is left Kan extended from $\mathcal{C}^0$ if and only if it is left Kan extended from $\mathcal{C}$ and $\overline{F}_{\mathcal{C}}$ is left Kan extended from $\mathcal{C}^0$ (Corollary 7.3.8.8). We begin by analyzing the case special case where the ∞-category $\overline{\mathcal{C}}$ has the form $\mathcal{C}^{\triangleright}$.

030V **Proposition 7.3.8.1.** *Let $\mathcal{C}$ be an ∞-category, let $\overline{F} : \mathcal{C}^{\triangleright} \to \mathcal{D}$ be a functor of ∞-categories, and let $U : \mathcal{D} \to \mathcal{E}$ be another functor of ∞-categories. Assume that $F = \overline{F}|_{\mathcal{C}}$ is U-left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Then $\overline{F}$ is a U-colimit diagram if and only if the composite map*

$$(\mathcal{C}^0)^{\triangleright} \hookrightarrow \mathcal{C}^{\triangleright} \xrightarrow{\overline{F}} \mathcal{D}$$

is a U-colimit diagram.

Proof. For each object $D \in \mathcal{D}$, let $\underline{D} \in \operatorname{Fun}(\mathcal{C}^{\triangleright}, \mathcal{D})$ denote the constant functor taking the value D. By virtue of Proposition 7.1.5.12, the functor $\overline{F}$ is a U-colimit diagram if and only if, for each $D \in \mathcal{D}$, the upper half of the diagram

`030W`

$$\begin{tikzcd}
\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\triangleright},\mathcal{D})}(\overline{F}, \underline{D}) \arrow[r] \arrow[d] & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\triangleright},\mathcal{E})}(U \circ \overline{F}, U \circ \underline{D}) \arrow[d] \\
\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{D})}(F, \underline{D}|_{\mathcal{C}}) \arrow[r] \arrow[d] & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{E})}(U \circ F, U \circ \underline{D}|_{\mathcal{C}}) \arrow[d] \\
\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0,\mathcal{D})}(F|_{\mathcal{C}^0}, \underline{D}|_{\mathcal{C}^0}) \arrow[r] & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0,\mathcal{E})}(U \circ F|_{\mathcal{C}^0}, U \circ \underline{D}|_{\mathcal{C}^0})
\end{tikzcd} \tag{7.30}$$

is a homotopy pullback square. Since F is U-left Kan extended from $\mathcal{C}^0$, Proposition 7.3.6.7 shows that the right half of the diagram is a homotopy pullback square. It follows that $\overline{F}$ is a U-colimit diagram if and only if the outer rectangle of (7.30) is a homotopy pullback square for each $D \in \mathcal{D}$ (Proposition 3.4.1.11).

Let v denote the cone point of $\mathcal{C}^{\triangleright}$. Let $\mathcal{C}^1$ denote the cone $(\mathcal{C}^0)^{\triangleright}$, which we regard as a full subcategory of $\mathcal{C}^{\triangleright}$. Note that the functors $\underline{D}$, $\underline{D}|_{\mathcal{C}^1}$, $U \circ \underline{D}$ and $U \circ \underline{D}|_{\mathcal{C}^1}$ are right Kan extended from the cone point, so Corollary 7.3.6.9 implies that the restriction maps

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\triangleright},\mathcal{D})}(\overline{F}, \underline{D}) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^1,\mathcal{D})}(\overline{F}|_{\mathcal{C}^1}, \underline{D}|_{\mathcal{C}^1}) \to \mathrm{Hom}_{\mathcal{D}}(\overline{F}(v), D)$$

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\triangleright},\mathcal{E})}(U \circ \overline{F}, U \circ \underline{D}) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^1,\mathcal{E})}(U \circ \overline{F}|_{\mathcal{C}^1}, U \circ \underline{D}|_{\mathcal{C}^1}) \to \mathrm{Hom}_{\mathcal{E}}((U \circ \overline{F}(v))), U(D))$$

are homotopy equivalences. It follows that the restriction map from the outer rectangle of (7.30) to the diagram

`030X`

$$\begin{tikzcd}
\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^1,\mathcal{D})}(\overline{F}|_{\mathcal{C}^1}, \underline{D}|_{\mathcal{C}^1}) \arrow[r] \arrow[d] & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0,\mathcal{D})}(F|_{\mathcal{C}^0}, \underline{D}|_{\mathcal{C}^0}) \arrow[d] \\
\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^1,\mathcal{E})}(U \circ \overline{F}|_{\mathcal{C}^1}, U \circ \underline{D}|_{\mathcal{C}^1}) \arrow[r] & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0,\mathcal{E})}(U \circ F, U \circ \underline{D}|_{\mathcal{C}^0})
\end{tikzcd} \tag{7.31}$$

is a levelwise homotopy equivalence. In particular, the outer rectangle of (7.30) is a homotopy pullback square if and only if (7.31) is a homotopy pullback square (Corollary 3.4.1.12). By virtue of Proposition 7.1.5.12, this is satisfied for every object $D \in \mathcal{D}$ if and only if F^1 is a U-colimit diagram. □

030Y **Corollary 7.3.8.2.** *Let $\mathcal{C}$ be an ∞-category and let $\overline{F} : \mathcal{C}^{\triangleright} \to \mathcal{D}$ be a functor of ∞-categories. Suppose that $F = \overline{F}|_{\mathcal{C}}$ is left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Then $\overline{F}$ is a colimit diagram if and only if the composite map*

$$(\mathcal{C}^0)^{\triangleright} \hookrightarrow \mathcal{C}^{\triangleright} \xrightarrow{\overline{F}} \mathcal{D}$$

is a colimit diagram.

Proof. Apply Proposition 7.3.8.1 in the special case $\mathcal{E} = \Delta^0$. □

030Z **Proposition 7.3.8.3.** *Let $F : \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose we are given a right fibration of ∞-categories $V : \mathcal{B} \to \mathcal{C}$ and set $\mathcal{B}^0 = \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{B}$. Then, for every object $B \in \mathcal{B}$, the functor $F \circ V$ is U-left Kan extended from $\mathcal{B}^0$ at B if and only if F is U-left Kan extended from $\mathcal{C}^0$ at $V(B)$.*

Proof. Set $C = V(B)$, and let F_C denote the composite map

$$(\mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C})^{\triangleright} \to (\mathcal{C}_{/C})^{\triangleright} \to \mathcal{C} \xrightarrow{F} \mathcal{D}.$$

We wish to show that F_C is a U-colimit diagram if the composite map

$$(\mathcal{B}^0 \times_{\mathcal{B}} \mathcal{B}_{/B})^{\triangleright} \to (\mathcal{B}_{/B})^{\triangleright} \to \mathcal{B} \xrightarrow{V} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a U-colimit diagram. By virtue of Corollary 7.2.2.2, it will suffice to show that the natural map

$$\theta : \mathcal{B}^0 \times_{\mathcal{B}} \mathcal{B}_{/B} \to \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C}$$

is right cofinal. By construction, θ is a pullback of the map $V_{/B} : \mathcal{B}_{/B} \to \mathcal{C}_{/V(B)}$. Our assumption that V is a right fibration guarantees that $V_{/B}$ is a trivial Kan fibration (Corollary 4.3.7.13). It follows that θ is also a trivial Kan fibration, and therefore right cofinal by virtue of Corollary 7.2.1.13. □

0310 **Corollary 7.3.8.4.** *Let $F : \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose we are given a right fibration of ∞-categories $V : \mathcal{B} \to \mathcal{C}$ and set $\mathcal{B}^0 = \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{B}$. If F is U-left Kan extended from $\mathcal{C}^0$, then $F \circ V$ is U-left Kan extended from $\mathcal{B}^0$. The converse holds if every fiber of V is nonempty.*

0311 **Corollary 7.3.8.5.** *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose we are given a right fibration of ∞-categories $V : \mathcal{B} \to \mathcal{C}$ and set $\mathcal{B}^0 = \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{B}$. If F is left Kan extended from $\mathcal{C}^0$, then $F \circ V$ is left Kan extended from $\mathcal{B}^0$. The converse holds if every fiber of V is nonempty.*

Proof. Apply Corollary 7.3.8.4 in the special case $\mathcal{E} = \Delta^0$. □

Proposition 7.3.8.6 (Transitivity for Kan Extensions)**.** *Let $\overline{F} : \overline{\mathcal{C}} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories. Let $\mathcal{C}^0 \subseteq \mathcal{C} \subseteq \overline{\mathcal{C}}$ be full subcategories. Then $\overline{F}$ is U-left Kan extended from $\mathcal{C}^0$ if and only if it satisfies the following pair of conditions:* 0312

(1) *The functor $\overline{F}$ is U-left Kan extended from $\mathcal{C}$.*

(2) *The restriction $\overline{F}|_{\mathcal{C}}$ is U-left Kan extended from $\mathcal{C}^0$.*

Remark 7.3.8.7. In the special case $\overline{\mathcal{C}} = \mathcal{C}^{\triangleright}$, Proposition 7.3.8.6 is essentially a restatement of Proposition 7.3.8.1 (see Example 7.3.3.10). 0313

Proof of Proposition 7.3.8.6. It follows immediately from the definitions that if $\overline{F}$ is U-left Kan extended from $\mathcal{C}^0$, then the functor $F = \overline{F}|_{\mathcal{C}}$ has the same property. We may therefore assume that condition (2) is satisfied. Fix an object $X \in \overline{\mathcal{C}}$. We will complete the proof by showing that $\overline{F}$ is U-left Kan extended from $\mathcal{C}^0$ at X if and only if it is U-left Kan extended from $\mathcal{C}$ at X. Let $\overline{F}_X$ denote the composite map

$$(\mathcal{C} \times_{\overline{\mathcal{C}}} \overline{\mathcal{C}}_{/X})^{\triangleright} (\overline{\mathcal{C}}_{/X})^{\triangleright} \to \overline{\mathcal{C}} \xrightarrow{\overline{F}} \mathcal{D}.$$

We wish to show that $\overline{F}_X$ is a U-colimit diagram if and only if its restriction to $(\mathcal{C}^0 \times_{\overline{\mathcal{C}}} \overline{\mathcal{C}}_{/X})^{\triangleright}$ is a U-colimit diagram. Let F_X denote the restriction of $\overline{F}_X$ to $\mathcal{C} \times_{\overline{\mathcal{C}}} \overline{\mathcal{C}}_{/X}$. By virtue of Proposition 7.3.8.1, it will suffice to show that F_X is U-left Kan extended from $\mathcal{C}^0 \times_{\overline{\mathcal{C}}} \overline{\mathcal{C}}_{/X}$. This follows by applying Corollary 7.3.8.4 to the right fibration $\mathcal{C} \times_{\overline{\mathcal{C}}} \overline{\mathcal{C}}_{/X} \to \mathcal{C}$. □

Corollary 7.3.8.8. *Let $\overline{F} : \overline{\mathcal{C}} \to \mathcal{D}$ be a functor of ∞-categories, and let $\mathcal{C}^0 \subseteq \mathcal{C} \subseteq \overline{\mathcal{C}}$ be full subcategories. Then $\overline{F}$ is left Kan extended from $\mathcal{C}^0$ if and only if it satisfies the following pair of conditions:* 0314

(1) *The functor $\overline{F}$ is left Kan extended from $\mathcal{C}$.*

(2) *The restriction $\overline{F}|_{\mathcal{C}}$ is left Kan extended from $\mathcal{C}^0$.*

Proof. Apply Proposition 7.3.8.6 in the special case $\mathcal{E} = \Delta^0$. □

Corollary 7.3.8.9. *Let $F : \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and let $C, C' \in \mathcal{C}$ be objects which are isomorphic. If F is U-left Kan extended from $\mathcal{C}^0$ at C, then it is U-left Kan extended from $\mathcal{C}^0$ at C'.* 0315

Proof. Let $\mathcal{C}^1 \subseteq \mathcal{C}$ be the full subcategory spanned by the objects of $\mathcal{C}^0$ together with the object C, and let $\mathcal{C}^2 \subseteq \mathcal{C}$ be the full subcategory spanned by the objects of $\mathcal{C}$ together with the objects C and C'. If F is U-left Kan extended from $\mathcal{C}^0$ at C, then the functor $F|_{\mathcal{C}^1}$ is U-left Kan extended from $\mathcal{C}^0$. Since every object of $\mathcal{C}^2$ is isomorphic to an object of $\mathcal{C}^1$. the functor $F|_{\mathcal{C}^2}$ is automatically U-left Kan extended from $\mathcal{C}^1$ (Proposition 7.3.3.7). Applying Proposition 7.3.8.6, we see that $F|_{\mathcal{C}^2}$ is also U-left Kan extended from $\mathcal{C}^0$. In particular, F is U-left Kan extended from $\mathcal{C}^0$ at the object $C' \in \mathcal{C}^2$. □

We now prove a variant of Proposition 7.3.8.6, which gives a criterion for the *existence* of relative Kan extensions.

0316 **Proposition 7.3.8.10.** *Let $F : \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories, and suppose that F is U-left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Set $F_0 = F|_{\mathcal{C}^0}$. Then the restriction map*

$$\theta : \mathcal{D}_{F/} \to \mathcal{D}_{F_0/} \times_{\mathcal{E}_{(U \circ F_0)/}} \mathcal{E}_{(U \circ F)/}$$

is an equivalence of ∞-categories.

Proof. Note that the restriction maps

$$\mathcal{D}_{F/} \to \mathcal{D}_{F_0/} \qquad \mathcal{D}_{F_0/} \to \mathcal{D} \qquad \mathcal{E}_{(U \circ F)/} \to \mathcal{E}_{(U \circ F_0)/}$$

are left fibrations of simplicial sets (Corollary 4.3.6.11). It follows that we can regard θ as a functor of ∞-categories which are left-fibered over $\mathcal{D}$. Consequently, to show that θ is an equivalence of ∞-categories, it will suffice to show that for every object $D \in \mathcal{D}$, the commutative diagram

0317
$$\begin{tikzcd}
\mathcal{D}_{F/} \times_{\mathcal{D}} \{D\} \arrow[r] \arrow[d] & \mathcal{D}_{F_0/} \times_{\mathcal{D}} \{D\} \arrow[d] \\
\mathcal{E}_{(U \circ F)/} \times_{\mathcal{E}} \{U(D)\} \arrow[r] & \{U(D)\} \times_{\mathcal{E}_{(U \circ F_0)/}} \times_{\mathcal{E}} \{U(D)\}
\end{tikzcd} \tag{7.32}$$

induces a homotopy equivalence of Kan complexes

$$\mathcal{D}_{F/} \times_{\mathcal{D}} \{D\} \to (\mathcal{D}_{F_0/} \times_{\mathcal{E}_{(U \circ F_0)/}} \mathcal{E}_{(U \circ F)/}) \times_{\mathcal{D}} \{D\}.$$

Note that the horizontal maps in the diagram (7.32) are left fibrations between Kan complexes (Corollary 4.3.6.11), and therefore Kan fibrations (Corollary 4.4.3.8). We are therefore reduced to showing that the diagram (7.32) is a homotopy pullback square (Example 3.4.1.3).

Let $\underline{D} \in \operatorname{Fun}(\mathcal{C}, \mathcal{D})$ denote the constant functor taking the value D. Using Theorem 4.6.4.17, we obtain a (termwise) homotopy equivalence from (7.32) to the diagram of morphism spaces

0318
$$\begin{tikzcd}
\operatorname{Hom}_{\operatorname{Fun}(\mathcal{C},\mathcal{D})}(F, \underline{D}) \arrow[r] \arrow[d] & \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}^0,\mathcal{E})}(F_0, \underline{D}|_{\mathcal{C}^0}) \arrow[d] \\
\operatorname{Hom}_{\operatorname{Fun}(\mathcal{C},\mathcal{E})}(U \circ F, U \circ \underline{D}) \arrow[r] & \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}^0,\mathcal{E})}(U \circ F_0, U \circ \underline{D}|_{\mathcal{C}^0}).
\end{tikzcd} \tag{7.33}$$

Using Corollary 3.4.1.12, we are reduced to showing that the diagram (7.33) is a homotopy pullback square, which is a special case of Proposition 7.3.6.7. □

Corollary 7.3.8.11. *Let $F : \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories, where U is an inner fibration and F is U-left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Set $F_0 = F|_{\mathcal{C}^0}$. Then the restriction map* 0319

$$\theta : \mathcal{D}_{F/} \to \mathcal{D}_{F_0/} \times_{\mathcal{E}_{(U \circ F_0)/}} \mathcal{E}_{(U \circ F)/}$$

is a trivial Kan fibration.

Proof. It follows from Proposition 4.3.6.8 that θ is a left fibration, and therefore an isofibration (Example 4.4.1.11). By virtue of Proposition 4.5.5.20, it will suffice to show that θ is an equivalence of ∞-categories, which follows from Proposition 7.3.8.10. □

Corollary 7.3.8.12. *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which is Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$, and set $F_0 = F|_{\mathcal{C}^0}$. Then the restriction functor $\theta : \mathcal{C}_{F/} \to \mathcal{C}_{F_0/}$ is a trivial Kan fibration.* 031A

Proof. Apply Corollary 7.3.8.11 in the special case $\mathcal{E} = \Delta^0$. □

Corollary 7.3.8.13. *Let $\mathcal{C}$ be an ∞-category, let $U : \mathcal{D} \to \mathcal{E}$ be an inner fibration of ∞-categories, and suppose we are given a lifting problem* 031B

031C

$$\begin{tikzcd} \mathcal{C} \arrow[r, "F"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\ \mathcal{C}^{\triangleright} \arrow[r] \arrow[ur, dashed, "\overline{F}"] & \mathcal{E}. \end{tikzcd} \qquad (7.34)$$

Assume that F is U-left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. The following conditions are equivalent:

(1) *The lifting problem (7.34) admits a solution $\overline{F} : \mathcal{C}^{\triangleright} \to \mathcal{D}$ which is a U-colimit diagram.*

(2) *The induced lifting problem*

031D

$$\begin{tikzcd} \mathcal{C}^0 \arrow[r, "F|_{\mathcal{C}^0}"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\ (\mathcal{C}^0)^{\triangleright} \arrow[r] \arrow[ur, dashed, "\overline{F}_0"] & \mathcal{E}. \end{tikzcd} \qquad (7.35)$$

admits a solution $\overline{F}_0 : (\mathcal{C}^0)^{\triangleright} \to \mathcal{D}$ which is a U-colimit diagram.

Proof. The implication (1) ⇒ (2) follows immediately from Proposition 7.3.8.1. For the converse, suppose that $\overline{F}_0 : (\mathcal{C}^0)^{\triangleright} \to \mathcal{D}$ is a U-colimit diagram which solves the lifting problem (7.35). Applying Corollary 7.3.8.11, we see that $\overline{F}_0$ can be extended to a functor $\overline{F} : \mathcal{C}^{\triangleright} \to \mathcal{D}$ which solves the lifting problem (7.34). It then follows from Proposition 7.3.8.1 that $\overline{F}$ is a U-colimit diagram. □

031E **Corollary 7.3.8.14.** *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which is left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Then F has a colimit in $\mathcal{D}$ if and only if the restriction $F|_{\mathcal{C}^0}$ has a colimit in $\mathcal{D}$.*

Proof. Apply Corollary 7.3.8.13 in the special case $\mathcal{E} = \Delta^0$. □

03E5 **Remark 7.3.8.15.** In the situation of Corollary 7.3.8.14, an object of $\mathcal{D}$ is a colimit of the diagram F if and only if it is a colimit of the diagram $F|_{\mathcal{C}^0}$. This follows by combining Corollaries 7.3.8.14 and 7.3.8.2.

031F **Proposition 7.3.8.16.** *Let $\overline{\mathcal{C}}$ be an ∞-category, let $\mathcal{C} \subseteq \overline{\mathcal{C}}$ be a full subcategory, and let $U : \mathcal{D} \to \mathcal{E}$ be an isofibration of ∞-categories. Suppose we are given a lifting problem*

031G
$$\begin{tikzcd}
\mathcal{C} \arrow[r, "F"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
\overline{\mathcal{C}} \arrow[r] \arrow[ur, dashed, "\overline{F}"] & \mathcal{E},
\end{tikzcd} \tag{7.36}$$

where F is U-left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. The following conditions are equivalent:

(1) *The lifting problem (7.36) admits a solution $\overline{F} : \overline{\mathcal{C}} \to \mathcal{D}$ which is U-left Kan extended from $\mathcal{C}$.*

(2) *The induced lifting problem*

031H
$$\begin{tikzcd}
\mathcal{C}^0 \arrow[r, "F|_{\mathcal{C}^0}"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
\overline{\mathcal{C}} \arrow[r] \arrow[ur, dashed, "\overline{F}"] & \mathcal{E},
\end{tikzcd} \tag{7.37}$$

admits a solution $\overline{F} : \overline{\mathcal{C}} \to \mathcal{D}$ which is U-left Kan extended from $\mathcal{C}^0$.

Proof. The implication (1) ⇒ (2) follows immediately from Proposition 7.3.8.6. For the converse, assume that (2) is satisfied. To prove (1), it will suffice to show that for each object $C \in \overline{\mathcal{C}}$, the induced lifting problem

031J
$$\begin{tikzcd}
\mathcal{C}_{/C} \arrow[r, "F_C"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
(\mathcal{C}_{/C})^{\triangleright} \arrow[r] \arrow[ur, dashed, "\overline{F}_C"] & \mathcal{E}
\end{tikzcd} \tag{7.38}$$

admits a solution $\overline{F}_C : (\mathcal{C}_{/C})^{\triangleright} \to \mathcal{D}$ which is a U-colimit diagram (Proposition 7.3.5.5). Arguing as in the proof of Proposition 7.3.8.6, we see that F_C is U-left Kan extended from the full subcategory $\mathcal{C}^0_{/C} \subseteq \mathcal{C}_{/C}$. Let F^0_C denote the restriction of F_C to the subcategory $\mathcal{C}^0_{/C} \subseteq \mathcal{C}_{/C}$. By virtue of Corollary 7.3.8.13, it will suffice to show that the induced lifting problem

031K
$$\begin{tikzcd}
\mathcal{C}^0_{/C} \arrow[r, "F^0_C"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\
(\mathcal{C}^0_{/C})^{\triangleright} \arrow[r] \arrow[ur, dashed, "\overline{F}^0_C"] & \mathcal{E}
\end{tikzcd} \tag{7.39}$$

has a solution $\overline{F}^0_C : (\mathcal{C}^0_{/C})^{\triangleright} \to \mathcal{D}$ which is a U-colimit diagram, which follows immediately from assumption (2). □

Corollary 7.3.8.17. *Let $\overline{\mathcal{C}}$ be an ∞-category, let $\mathcal{C} \subseteq \overline{\mathcal{C}}$ be a full subcategory, and let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which is left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Then F admits a left Kan extension $\overline{\mathcal{C}} \to \mathcal{D}$ if and only if the restriction $F|_{\mathcal{C}^0}$ admits a left Kan extension $\overline{\mathcal{C}} \to \mathcal{D}$.* 031L

Proof. Apply Proposition 7.3.8.16 in the special case $\mathcal{E} = \Delta^0$. □

We close this section by establishing counterparts of Corollaries 7.3.8.8 and 7.3.8.14 for Kan extensions along more general functors.

Proposition 7.3.8.18. *Let $\mathcal{C}_0$, $\mathcal{C}_1$, $\mathcal{C}_2$, and $\mathcal{D}$ be ∞-categories. Suppose we are given functors $F_i : \mathcal{C}_i \to \mathcal{D}$ for $0 \leq i \leq 2$, functors $G : \mathcal{C}_0 \to \mathcal{C}_1$ and $H : \mathcal{C}_1 \to \mathcal{C}_2$, and natural transformations* 031M

$$\alpha : F_0 \to F_1 \circ G \qquad \beta : F_1 \to F_2 \circ H,$$

where α exhibits F_1 as a left Kan extension of F_0 along G. The following conditions are equivalent:

(1) *The natural transformation β exhibits F_2 as a left Kan extension of F_1 along H.*

(2) *Let $\gamma : F_0 \to F_2 \circ H \circ G$ be a composition of α with $\beta|_{\mathcal{C}^0}$ (formed in the ∞-category $\mathrm{Fun}(\mathcal{C}_0, \mathcal{D})$). Then γ exhibits F_2 as a left Kan extension of F_0 along $H \circ G$.*

Proof. Let $\mathcal{C}$ denote the iterated relative join $(\mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1) \star_{\mathcal{C}_2} \mathcal{C}_2$, so that we have a cocartesian fibration of ∞-categories $\pi : \mathcal{C} \to \Delta^2$ having fibers $\pi^{-1}\{i\} = \mathcal{C}_i$ for $0 \leq i \leq 2$ (see Lemma 5.2.3.17). For $0 \leq i < j \leq 2$, let $\mathcal{C}_{ij}$ denote the fiber product $\mathrm{N}_{\bullet}(\{i < j\}) \times_{\Delta^2} \mathcal{C}$, which we will identify with $\mathcal{C}_i \star_{\mathcal{C}_j} \mathcal{C}_j$. By virtue of Remark 7.3.1.9, we are free to replace α and β by homotopic natural transformations. We can therefore assume that there exist functors

$$F_{01} : \mathcal{C}_{01} \to \mathcal{D} \qquad F_{12} : \mathcal{C}_{12} \to \mathcal{D}$$

satisfying $F_{01}|_{\mathcal{C}_0} = F_0$, $F_{01}|_{\mathcal{C}_1} = F_1 = F_{12}|_{\mathcal{C}_1}$, and $F_{12}|_{\mathcal{C}_2} = F_2$, where α and β are given by the composite maps

$$\Delta^1 \times \mathcal{C}_0 \simeq \mathcal{C}_0 \star_{\mathcal{C}_0} \mathcal{C}_0 \to \mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1 \xrightarrow{F_{01}} \mathcal{D}$$

$$\Delta^1 \times \mathcal{C}_1 \simeq \mathcal{C}_1 \star_{\mathcal{C}_1} \mathcal{C}_1 \to \mathcal{C}_1 \star_{\mathcal{C}_2} \mathcal{C}_2 \xrightarrow{F_{12}} \mathcal{D}$$

(see Warning 7.3.2.12). Note that F_{01} and F_{12} can be amalgamated to a morphism of simplicial sets $F' : \Lambda^2_1 \times_{\Delta^1} \mathcal{C} \to \mathcal{D}$. Since π is a cocartesian fibration, the inclusion map $\Lambda^2_1 \times_{\Delta^1} \mathcal{C} \hookrightarrow \mathcal{C}$ is a categorical equivalence (Proposition 5.3.6.1). Applying Lemma 4.5.5.2, we can extend F' to a functor $F : \mathcal{C} \to \mathcal{D}$.

Let F_{02} denote the restriction of F to $\mathcal{C}_{02}$, and let $\gamma : F_0 \to F_2 \circ H \circ G$ denote the natural transformation given by the composite map

$$\Delta^1 \times \mathcal{C}_0 \simeq \mathcal{C}_0 \star_{\mathcal{C}_0} \mathcal{C}_0 \to \mathcal{C}_0 \star_{\mathcal{C}_2} \mathcal{C}_2 \xrightarrow{F_{02}} \mathcal{D}.$$

Note that the composite map

$$\Delta^2 \times \mathcal{C}_0 \simeq (\mathcal{C}_0 \star_{\mathcal{C}_0} \mathcal{C}_0) \star_{\mathcal{C}_0} \mathcal{C}_0 \to (\mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1) \star_{\mathcal{C}_2} \mathcal{C}_2 \xrightarrow{F} \mathcal{D}$$

can be regarded as a 2-simplex of the ∞-category $\mathrm{Fun}(\mathcal{C}_0, \mathcal{D})$, which witnesses γ as a composition of α with $\beta|_{\mathcal{C}_0}$. Applying Proposition 7.3.2.11, we see that (1) and (2) can be reformulated as follows:

($1'$) The functor $F_{12} : \mathcal{C}_{12} \to \mathcal{D}$ is left Kan extended from $\mathcal{C}_1$.

($2'$) The functor $F_{02} : \mathcal{C}_{02} \to \mathcal{D}$ is left Kan extended from $\mathcal{C}_0$.

By assumption, the natural transformation α exhibits F_1 as a left Kan extension of F_0 along G. Applying Proposition 7.3.2.11, we see that the functor F_{01} is left Kan extended from $\mathcal{C}_0$. In particular, F is left Kan extended from $\mathcal{C}^0$ at every object of the full subcategory $\mathcal{C}_1 \subseteq \mathcal{C}$. It follows that ($2'$) is equivalent to the following:

$(2'')$ The functor $F : \mathcal{C} \to \mathcal{D}$ is left Kan extended from $\mathcal{C}_0$.

Using Corollary 7.3.8.8, we see that $(2'')$ is equivalent to the following:

$(1'')$ The functor $F : \mathcal{C} \to \mathcal{D}$ is left Kan extended from $\mathcal{C}_{01}$.

To complete the proof, it will suffice to show that conditions $(1')$ and $(1'')$ are equivalent. We will prove something slightly more precise: for every object $X \in \mathcal{C}_2$, the conditions are equivalent:

$(1'_X)$ The functor $F_{12} : \mathcal{C}_{12} \to \mathcal{D}$ is left Kan extended from $\mathcal{C}_1$ at X.

$(1''_X)$ The functor $F : \mathcal{C} \to \mathcal{D}$ is left Kan extended from $\mathcal{C}_{01}$ at X.

Let us regard the object X as fixed, and let F_X denote the composite map

$$(\mathcal{C}_{01} \times_{\mathcal{C}} \mathcal{C}_{/X})^{\triangleright} \hookrightarrow (\mathcal{C}_{/X})^{\triangleright} \to \mathcal{C} \xrightarrow{F} \mathcal{D}.$$

We wish to show that F_X is a colimit diagram in $\mathcal{D}$ if and only if its restriction to $(\mathcal{C}_1 \times_{\mathcal{C}} \mathcal{C}_{/X})^{\triangleright}$ is a colimit diagram in $\mathcal{D}$. By virtue of Corollary 7.2.2.3, it will suffice to show that the inclusion map $\mathcal{C}_1 \times_{\mathcal{C}} \mathcal{C}_{/X} \hookrightarrow \mathcal{C}_{01} \times_{\mathcal{C}} \mathcal{C}_{/X}$ is right cofinal. This follows by applying Proposition 7.2.3.12 to the upper square of the pullback diagram

$$\begin{tikzcd}
\mathcal{C}_1 \times_{\mathcal{C}} \mathcal{C}_{/X} \arrow[r] \arrow[d] & \{1\} \arrow[d] \\
\mathcal{C}_{01} \times_{\mathcal{C}} \mathcal{C}_{/X} \arrow[r] \arrow[d] & \Delta^1 \arrow[d] \\
\mathcal{C}_{/X} \arrow[r, "\pi'"] & \Delta^2,
\end{tikzcd}$$

where π' denotes the composite map $\mathcal{C}_{/X} \to \mathcal{C} \to \Delta^2$ (which is a cocartesian fibration by virtue of Proposition 5.1.4.19). □

Proposition 7.3.8.19. *Let $\mathcal{C}_0$, $\mathcal{C}_1$, $\mathcal{C}_2$, and $\mathcal{D}$ be ∞-categories. Suppose we are given functors $F_0 : \mathcal{C}_0 \to \mathcal{D}$, $F_1 : \mathcal{C}_1 \to \mathcal{D}$, $G : \mathcal{C}_0 \to \mathcal{C}_1$, and $H : \mathcal{C}_1 \to \mathcal{C}_2$, where F_1 is a left Kan extension of F_0 along G. The following conditions are equivalent:* 031N

(1) *The functor F_1 admits a left Kan extension along H.*

(2) *The functor F_0 admits a left Kan extension along $H \circ G$.*

Proof. The implication (1) ⇒ (2) is immediate from Proposition 7.3.8.18. To prove the converse, assume that (2) is satisfied. Define $\mathcal{C}$ as in the proof of Proposition 7.3.8.18. Using the criterion of Corollary 7.3.5.8, we see that F_0 admits a left Kan extension $F : \mathcal{C} \to \mathcal{D}$. It follows from Proposition 7.3.2.11 that $F|_{\mathcal{C}_1}$ is a left Kan extension of F_0 along G, and is therefore isomorphic to F_1 (Remark 7.3.6.6). We may therefore assume without loss of generality that $F_1 = F|_{\mathcal{C}_1}$ (Remark 7.3.1.10). We will complete the proof by showing that $F_{12} = F|_{\mathcal{C}_{12}}$ is left Kan extended from $\mathcal{C}_1$, and therefore exhibits $F|_{\mathcal{C}_2}$ as a left Kan extension of F_1 along H (Proposition 7.3.2.11).

Fix an object $X \in \mathcal{C}_2$, and let F_X denote the composite map

$$(\mathcal{C}_{01} \times_{\mathcal{C}} \mathcal{C}_{/X})^{\triangleright} \hookrightarrow (\mathcal{C}_{/X})^{\triangleright} \to \mathcal{C} \xrightarrow{F} \mathcal{D}.$$

We wish to show that the composite map

$$(\mathcal{C}_1 \times_{\mathcal{C}} \mathcal{C}_{/X})^{\triangleright} \hookrightarrow (\mathcal{C}_{01} \times_{\mathcal{C}} \mathcal{C}_{/X})^{\triangleright} \xrightarrow{F_X} \mathcal{D}$$

is a colimit diagram in $\mathcal{D}$. As in the proof of Proposition 7.3.8.18, the inclusion map $\mathcal{C}_1 \times_{\mathcal{C}} \mathcal{C}_{/X} \hookrightarrow \mathcal{C}_{01} \times_{\mathcal{C}} \mathcal{C}_{/X}$ is right cofinal. It will therefore suffice to show that F_X is a colimit diagram in $\mathcal{D}$ (Corollary 7.2.2.3). This is clear: by construction, the functor F is left Kan extended from the full subcategory $\mathcal{C}_0 \subseteq \mathcal{C}$, and is therefore also left Kan extended from the larger subcategory $\mathcal{C}_{01} \subseteq \mathcal{C}$ (Proposition 7.3.8.6). □

039X **Corollary 7.3.8.20.** *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, let $\delta : K \to \mathcal{C}$ and $F_0 : K \to \mathcal{D}$ be diagrams, and let $\alpha : F_0 \to F \circ \delta$ be a natural transformation which exhibits F as a left Kan extension of F_0 along δ (see Variant 7.3.1.5). Then:*

(1) *The diagram F admits a colimit in $\mathcal{D}$ if and only if F_0 admits a colimit in $\mathcal{D}$.*

(2) *Let X be an object of $\mathcal{D}$, let $\underline{X} : \mathcal{C} \to \mathcal{D}$ denote the constant functor taking the value X. Then a natural transformation $\beta : F \to \underline{X}$ exhibits X as a colimit of the diagram F if and only if the composite natural transformation*

$$F_0 \xrightarrow{\alpha} F \circ \delta \xrightarrow{\beta|_K} \underline{X}|_K$$

exhibits X as a colimit of the diagram F_0.

Proof. Using Corollary 4.1.3.3, we can choose an inner anodyne morphism $i : K \hookrightarrow \mathcal{K}$, where $\mathcal{K}$ is an ∞-category. Since $\mathcal{C}$ is an ∞-category, we extend δ and F_0 to functors $\overline{\delta} : \mathcal{K} \to \mathcal{C}$ and $\overline{F}_0 : \mathcal{K} \to \mathcal{D}$, respectively. Similarly, we can extend α to a natural transformation $\overline{\alpha} : \overline{F}_0 \to F \circ \overline{\delta}$. It follows from Proposition 7.3.1.14 that we $\overline{\alpha}$ exhibits F as a left Kan extension of $\overline{F}_0$ along $\overline{\delta}$. We may therefore replace K by $\mathcal{K}$ and thereby reduce to proving Corollary 7.3.8.20 in the special case where K is an ∞-category. In this case, assertion (1) is a special case of Proposition 7.3.8.19, and assertion (2) is a special case of Proposition 7.3.8.18 (see Example 7.3.1.7). □

Exercise 7.3.8.21. Show that the conclusions of Propositions 7.3.8.18 and 7.3.8.19 hold if we drop the assumption that the simplicial set $\mathcal{C}_0$ is an ∞-category. 031P

7.3.9 Relative Colimits for Cocartesian Fibrations

031Q Let $U : \mathcal{C} \to \mathcal{D}$ be an inner fibration of ∞-categories, let $D \in \mathcal{D}$ be an object, and suppose we are given a morphism

$$f : K^{\triangleright} \to \mathcal{C}_D = \{D\} \times_{\mathcal{D}} \mathcal{C} \subseteq \mathcal{C}.$$

If f is a U-colimit diagram in the ∞-category $\mathcal{C}$, then it is a colimit diagram in the ∞-category $\mathcal{C}_D$. The converse holds if U is a cartesian fibration (Corollary 7.1.5.20), but not in general. In this section, we study the dual situation where U is a cocartesian fibrations. Our main result asserts that f is a U-colimit diagram in $\mathcal{C}$ if and only if it is a *transport-stable* colimit diagram in the ∞-category $\mathcal{C}_D$: that is, for every morphism $e : D \to D'$ in $\mathcal{D}$, the covariant transport functor $e_! : \mathcal{C}_D \to \mathcal{C}_{D'}$ carries f to a colimit diagram in the ∞-category $\mathcal{C}_{D'}$ (Proposition 7.3.9.2). We begin by showing that the collection of U-colimit diagrams is stable under covariant transport.

Proposition 7.3.9.1. *Let $U : \mathcal{C} \to \mathcal{D}$ be an inner fibration of ∞-categories, let K be a simplicial set, and let $\alpha : F_0 \to F_1$ be a natural transformation between diagrams $F_0, F_1 : K^{\triangleright} \to \mathcal{C}$. Suppose that, for every vertex $x \in K^{\triangleright}$, the morphism $\alpha_x : F_0(x) \to F_1(x)$ is U-cocartesian. Then:* 031R

(1) *If F_0 is a U-colimit diagram, then F_1 is also a U-colimit diagram.*

(2) *If F_1 is a U-colimit diagram and the natural transformation α carries the cone point $v \in K^{\triangleright}$ to an isomorphism $\alpha_v : F_0(v) \to F_1(v)$, then F_0 is a U-colimit diagram.*

Proof. Using Corollary 4.1.3.3, we can choose an inner anodyne morphism $i : K \hookrightarrow \mathcal{K}$, where $\mathcal{K}$ is an ∞-category. It follows that the induced map $i^{\triangleright} : K^{\triangleright} \hookrightarrow \mathcal{K}^{\triangleright}$ is also inner anodyne (Example 4.3.6.7), so that the restriction map $\operatorname{Fun}(\mathcal{K}^{\triangleright}, \mathcal{C}) \to \operatorname{Fun}(K^{\triangleright}, \mathcal{D})$ is a trivial Kan fibration of simplicial sets (Proposition 1.5.7.6). We can therefore lift α to a natural transformation $\overline{\alpha} : \overline{F}_0 \to \overline{F}_1$ between natural transformations $\overline{F}_0, \overline{F}_1 : \mathcal{K}^{\triangleright} \to \mathcal{C}$. Since $i^{\triangleright}$ is bijective on vertices, the natural transformation $\overline{\alpha}$ carries each object of $\mathcal{K}^{\triangleright}$ to a U-cocartesian morphism of $\mathcal{C}$. The morphism $i^{\triangleright}$ is right cofinal (Corollary 7.2.1.13), so Corollary 7.2.2.2 guarantees that F_0 is a U-colimit diagram if and only if $\overline{F}_0$ is a U-colimit diagram. Similarly, F_1 is a U-colimit diagram if and only if $\overline{F}_1$ is a U-colimit diagram. We may therefore replace α by $\overline{\alpha}$ in the statement of Proposition 7.3.9.1, and thereby reduce to the case where $K = \mathcal{K}$ is an ∞-category.

Let us identify α with a functor of ∞-categories $F : \Delta^1 \times \mathcal{K}^{\triangleright} \to \mathcal{C}$. For each object $x \in \mathcal{K}^{\triangleright}$, we can regard $\Delta^1 \times \{x\}$ with a morphism $e_x : (0, x) \to (1, x)$ in the ∞-category

$\Delta^1 \times \mathcal{K}^{\triangleright}$. By construction, the functor F carries each e_x to the U-cocartesian morphism α_x of $\mathcal{C}$. By virtue of Proposition 4.6.7.22, e_x is final when viewed as an object of the ∞-category

$$(\{0\} \times \mathcal{K}^{\triangleright}) \times_{(\Delta^1 \times \mathcal{K}^{\triangleright})} (\Delta^1 \times \mathcal{K}^{\triangleright})_{/(1,x)} \simeq (\mathcal{K}^{\triangleright})_{/x},$$

so that F is U-left Kan extended from $\{0\} \times \mathcal{K}^{\triangleright}$ at $(1,x)$ (Corollary 7.2.2.5). Allowing the object x to vary, we see that the functor F is U-left Kan extended from $\{0\} \times \mathcal{K}^{\triangleright}$.

We now prove (1). Suppose that F_0 is a U-colimit diagram. Then F_0 is U-left Kan extended from $\mathcal{K}$ (Example 7.3.3.9). Applying Proposition 7.3.8.6, we see that the functor F is U-left Kan extended from $\{0\} \times \mathcal{K}$, and therefore from the larger subcategory $\Delta^1 \times \mathcal{K} \subseteq \Delta^1 \times \mathcal{K}^{\triangleright}$. It follows that the composite map

$$(\Delta^1 \times \mathcal{K}) \star \{(1,v)\} \hookrightarrow \Delta^1 \times (\mathcal{K} \star \{v\}) \xrightarrow{F} \mathcal{C}$$

is a U-colimit diagram. Since the inclusion map $\{1\} \times \mathcal{K} \hookrightarrow \Delta^1 \times \mathcal{K}$ is right cofinal (Proposition 7.2.1.3), Corollary 7.2.2.2 guarantees that $F_1 = F|_{\{1\} \times \mathcal{K}^{\triangleright}}$ is also a U-colimit diagram.

We now prove (2). Let $\pi : \mathcal{K}^{\triangleright} \to \Delta^1$ be the functor carrying $\mathcal{K}$ to the vertex $0 \in \Delta^1$ and the cone point $v \in \mathcal{K}^{\triangleright}$ to the vertex $1 \in \Delta^1$, and let $G : \mathcal{K}^{\triangleright} \to \mathcal{C}$ be the functor given by the composition

$$\mathcal{K}^{\triangleright} \xrightarrow{(\pi, \mathrm{id})} \Delta^1 \times \mathcal{K}^{\triangleright} \xrightarrow{F} \mathcal{C}.$$

Note that there is a natural transformation $\beta : F_0 \to G$ which is the identity when restricted to $\mathcal{K}$ and which carries the cone point v to the morphism $\alpha_v : F_0(v) \to F_1(v) = G(v)$. If α_v is an isomorphism, then the natural transformation β is also an isomorphism (Theorem 4.4.4.4). Consequently, to show that F_0 is a U-colimit diagram, it will suffice to show that G is a U-colimit diagram (Proposition 7.1.5.13). Arguing as above, we see that the functor $F|_{\Delta^1 \times \mathcal{K}}$ is U-left Kan extended from the full subcategory $\{0\} \times \mathcal{K} \subseteq \Delta^1 \times \mathcal{K}$. Applying Proposition 7.3.8.1, we see that G is a U-colimit diagram if and only if the composite map

$$(\Delta^1 \times \mathcal{K}) \star \{(1,v)\} \hookrightarrow \Delta^1 \times (\mathcal{K} \star \{v\}) \xrightarrow{F} \mathcal{C}$$

is a U-colimit diagram. By virtue of Corollary 7.2.2.2, this is equivalent to the requirement that F_1 is a U-colimit diagram. □

031S **Proposition 7.3.9.2.** *Let $U : \mathcal{C} \to \mathcal{D}$ be a locally cocartesian fibration of ∞-categories, let $D \in \mathcal{D}$ be an object, and let $f : K^{\triangleright} \to \mathcal{C}_D = \{D\} \times_{\mathcal{D}} \mathcal{C}$ be a diagram. Then f is a U-colimit diagram in the ∞-category $\mathcal{C}$ if and only if it satisfies the following condition:*

(∗) *Let $e : D \to D'$ be a morphism in the ∞-category $\mathcal{D}$ and let $e_! : \mathcal{C}_D \to \mathcal{C}_{D'}$ be the covariant transport functor of Notation 5.2.2.9. Then $(e_! \circ f) : K^{\triangleright} \to \mathcal{C}_{D'}$ is a colimit diagram in the ∞-category*

Example 7.3.9.3. In the situation of Proposition 7.3.9.2, suppose that that U is also a cartesian fibration. Then, for every morphism $e : D \to D'$ of $\mathcal{D}$, the covariant transport functor $e_!$ has a right adjoint e^*, given by contravariant transport along e (Proposition 6.2.3.4). In particular, the functor $e_!$ automatically preserves K-indexed colimits (Corollary 7.1.3.21). We therefore recover the criterion of Corollary 7.1.5.20: the morphism f is a U-colimit diagram in $\mathcal{C}$ if and only if it is a colimit diagram in the ∞-category $\mathcal{C}_D$. 031T

Proof of Proposition 7.3.9.2. For every morphism $e : D \to D'$ in $\mathcal{D}$, we can choose a natural transformation $\alpha : f \to e_! \circ f$ carrying each vertex of $K^{\triangleright}$ to a U-cocartesian morphism of $\mathcal{C}$. It follows from Proposition 7.3.9.1 that if f is a U-colimit diagram, then $e_! \circ f$ is also a U-colimit diagram, and therefore a colimit diagram in the ∞-category $\mathcal{C}_{D'}$ (Corollary 7.1.5.20). This proves the necessity of condition $(*)$. For the converse, suppose that f satisfies condition $(*)$; we wish to show that f is a U-colimit diagram. By virtue of Proposition 7.1.5.12, this is equivalent to the assertion that for every object $C \in \mathcal{C}$, the diagram of Kan complexes

031U
$$\begin{tikzcd}
\operatorname{Hom}_{\operatorname{Fun}(K^{\triangleright},\mathcal{C})}(f,\underline{C}) \arrow[r] \arrow[d] & \operatorname{Hom}_{\operatorname{Fun}(K,\mathcal{C})}(f|_K,\underline{C}|_K) \arrow[d] \\
\operatorname{Hom}_{\operatorname{Fun}(K^{\triangleright},\mathcal{D})}(U\circ f,U\circ\underline{C}) \arrow[r] & \operatorname{Hom}_{\operatorname{Fun}(K,\mathcal{D})}(U\circ f|_K,U\circ\underline{C}|_K)
\end{tikzcd} \tag{7.40}$$

is a homotopy pullback square, where $\underline{C} \in \operatorname{Fun}(K^{\triangleright},\mathcal{C})$ is the constant diagram taking the value C. Since U is an inner fibration, the vertical maps in this diagram are Kan fibrations (Proposition 4.6.1.21 and Corollary 4.1.4.3). Using the criterion of Example 3.4.1.4, it will suffice to show that for every vertex $u \in \operatorname{Hom}_{\operatorname{Fun}(K^{\triangleright},\mathcal{D})}(U\circ f, U\circ\underline{C})$, the induced map

$$\begin{tikzcd}
\{u\} \times_{\operatorname{Hom}_{\operatorname{Fun}(K^{\triangleright},\mathcal{D})}(U\circ f,U\circ\underline{C})} \operatorname{Hom}_{\operatorname{Fun}(K^{\triangleright},\mathcal{C})}(f,\underline{C}) \arrow[d, "\theta_u"] \\
\{u\} \times_{\operatorname{Hom}_{\operatorname{Fun}(K,\mathcal{D})}(U\circ f|_K,U\circ\underline{C}|_K)} \operatorname{Hom}_{\operatorname{Fun}(K,\mathcal{C})}(f|_K,\underline{C}|_K)
\end{tikzcd}$$

is a homotopy equivalence of Kan complexes. Set $D' = U(C)$, so that u can be identified with a morphism of simplicial sets $K^{\triangleright} \to \operatorname{Hom}_{\mathcal{D}}(D,D')$, and the condition that θ_u is a homotopy equivalence depends only on the homotopy class of u. Since the simplicial set $K^{\triangleright}$ is weakly contractible (Example 4.3.7.11), we may assume without loss of generality that $u : K^{\triangleright} \to \operatorname{Hom}_{\mathcal{D}}(D,D')$ is the constant map taking the value e, for some morphism

$e : D \to D'$ in $\mathcal{D}$. In this case, we can use Proposition 5.1.3.11 to replace θ_u by the restriction map

$$\mathrm{Hom}_{\mathrm{Fun}(K^{\triangleright}, \mathcal{C}_{D'})}(e_! \circ f, \underline{D}) \to \mathrm{Hom}_{\mathrm{Fun}(K, \mathcal{C}_{D'})}(e_! \circ f|_K, \underline{D}|_K),$$

which is a homotopy equivalence by virtue of assumption $(*)$ (see Proposition 7.1.5.12). □

Using Proposition 7.3.9.2, we obtain a relative version of Corollary 7.2.3.5:

`031V` **Corollary 7.3.9.4.** *Let $U : \mathcal{C} \to \mathcal{D}$ be a cocartesian fibration of ∞-categories, let K be a weakly contractible simplicial set, and let $\overline{f} : K^{\triangleright} \to \mathcal{C}$ be a diagram. The following conditions are equivalent:*

(1) *The diagram $\overline{f}$ carries each edge of $K^{\triangleright}$ to a U-cocartesian morphism of $\mathcal{C}$.*

(2) *The restriction $f = \overline{f}|_K$ carries each edge of K to a U-cocartesian morphism of $\mathcal{C}$, and $\overline{f}$ is a U-colimit diagram.*

Proof. Without loss of generality, we may assume that f carries each edge of K to a U-cocartesian morphism of $\mathcal{C}$. Let $\pi : \Delta^1 \times K^{\triangleright} \to K^{\triangleright}$ be the morphism which is the identity on $\{0\} \times K^{\triangleright}$ and which carries $\{1\} \times K^{\triangleright}$ to the cone point $v \in K^{\triangleright}$. Set $C = f(v) \in \mathcal{C}$ and $D = U(C) \in \mathcal{D}$. Proposition 5.2.1.3 guarantees that the lifting problem

$$\begin{tikzcd}
\{0\} \times K^{\triangleright} \arrow[r, "\overline{f}"] \arrow[d] & \mathcal{C} \arrow[d, "U"] \\
\Delta^1 \times K^{\triangleright} \arrow[r, "U \circ \overline{f} \circ \pi"] \arrow[ur, dashed, "\alpha"] & \mathcal{D}
\end{tikzcd}$$

admits a solution $\alpha : \Delta^1 \times K^{\triangleright} \to \mathcal{C}$ which carries $\Delta^1 \times \{x\}$ to a U-cocartesian morphism of $\mathcal{C}$, for each vertex $x \in K^{\triangleright}$. Set $\overline{g} = \alpha|_{\{1\} \times K^{\triangleright}}$, which we regard as a morphism from $K^{\triangleright}$ to the ∞-category $\mathcal{C}_D$, and let us identify α with a natural transformation from $\overline{f}$ to $\overline{g}$. Note that $\alpha_v : \overline{f}(v) \to \overline{g}(v)$ is a U-cocartesian morphism of $\mathcal{C}$ satisfying $U(\alpha_v) = \mathrm{id}_D$, and is therefore an isomorphism (Proposition 5.1.1.8). Applying Proposition 7.3.9.1, we can reformulate (2) as follows:

(2′) The morphism $\overline{g} : K^{\triangleright} \to \mathcal{C}_D$ is a U-colimit diagram in $\mathcal{C}$.

Set $g = \overline{g}|_K$. For every edge $u : x \to y$ of K, we have a commutative diagram

$$\begin{tikzcd}
f(x) \arrow[r, "f(u)"] \arrow[d, "\alpha_x"] & f(y) \arrow[d, "\alpha_y"] \\
g(x) \arrow[r, "g(u)"] & g(y)
\end{tikzcd}$$

where $f(u)$, α_x, and α_y are U-cocartesian. Applying Corollary 5.1.2.4, we deduce that $g(u)$ is U-cocartesian when viewed as a morphism of $\mathcal{C}$, and is therefore an isomorphism in the ∞-category $\mathcal{C}_D$ (Proposition 5.1.1.8). Similarly, for every vertex $x \in K$, the unique edge $c_x : x \to v$ of $K^{\triangleright}$ determines a commutative diagram

$$\begin{tikzcd}
f(x) \arrow[r, "\overline{f}(c_x)"] \arrow[d, "\alpha_x"] & \overline{f}(v) \arrow[d, "\alpha_v"] \\
g(x) \arrow[r, "\overline{g}(c_x)"] & \overline{g}(v),
\end{tikzcd}$$

where α_x is U-cocartesian and α_v is an isomorphism. Combining Corollary 5.1.2.4, Corollary 5.1.2.5, and Proposition 5.1.1.8, we see that $\overline{f}(c_x)$ is U-cocartesian if and only if $\overline{g}(c_x)$ is an isomorphism in the ∞-category $\mathcal{C}_D$. We can therefore reformulate condition (1) as follows:

($1'$) The diagram $\overline{g}$ carries each edge of $K^{\triangleright}$ to an isomorphism in the ∞-category $\mathcal{C}_D$.

By virtue of Corollary 7.2.3.5, ($1'$) is equivalent to the requirement that $\overline{g}$ is a colimit diagram in the ∞-category $\mathcal{C}_D$. In particular, the implication ($2'$) $\Rightarrow$ ($1'$) follows from Corollary 7.1.5.20. To prove the converse, it will suffice to show that condition ($1'$) is satisfied, then for every morphism $e : D \to D'$ in $\mathcal{D}$, the covariant transport functor $e_! : \mathcal{C}_D \to \mathcal{C}_{D'}$ carries $\overline{g}$ to a colimit diagram in the ∞-category $\mathcal{C}_{D'}$ (Proposition 7.3.9.2). This follows immediately from Corollary 7.2.3.5 (applied to the composite diagram $K^{\triangleleft} \xrightarrow{\overline{g}} \mathcal{C}_D \xrightarrow{e_!} \mathcal{C}_{D'}$). $\square$

The criterion of Proposition 7.3.9.2 has a counterpart for the *existence* of U-colimit diagrams.

Proposition 7.3.9.5. *Let $U : \mathcal{C} \to \mathcal{D}$ be a cocartesian fibration of ∞-categories, and suppose we are given a lifting problem* 031W

031X

$$\begin{tikzcd}
K \arrow[r, "f_0"] \arrow[d] & \mathcal{C} \arrow[d, "U"] \\
K^{\triangleright} \arrow[r, "g"] \arrow[ur, dashed, "\overline{f}_0"] & \mathcal{D}
\end{tikzcd} \tag{7.41}$$

Let $v \in K^{\triangleright}$ be the cone point and set $D = g(v)$. Then there exists a diagram $f_1 : K \to \mathcal{C}_D \subseteq \mathcal{C}$ and a natural transformation $\alpha : f_0 \to f_1$ which carries each vertex $x \in K$ to a U-cocartesian morphism $\alpha_x : f_0(x) \to f_1(x)$ of $\mathcal{C}$, where$U \circ \alpha$ is given by the composition $\Delta^1 \times K \xrightarrow{c} K^{\triangleright} \xrightarrow{g} \mathcal{D}$. Moreover, the lifting problem (7.41) admits a solution $\overline{f}_0 : K^{\triangleright} \to \mathcal{C}$ which is a U-colimit diagram if and only if the following pair of conditions is satisfied:

(1) *The diagram f_1 admits a colimit $\overline{f}_1 : K^{\triangleright} \to \mathcal{C}_D$ in the ∞-category $\mathcal{C}_D$.*

(2) *Let $e : D \to D'$ be a morphism in the ∞-category $\mathcal{D}$ and let $e_! : \mathcal{C}_D \to \mathcal{C}_{D'}$ be the covariant transport functor of Notation 5.2.2.9. Then $(e_! \circ \overline{f}_1) : K^{\triangleright} \to \mathcal{C}_{D'}$ is a colimit diagram in the ∞-category $\mathcal{C}_{D'}$.*

Proof. The existence (and essential uniqueness) of the diagram f_1 and the natural transformation $\alpha : f_0 \to f_1$ follow from Proposition 5.2.1.3. Let us first show that conditions (1) and (2) are necessary. Suppose that the lifting problem (7.41) admits a solution $\overline{f}_0 : K^{\triangleright} \to \mathcal{C}$ which is a U-colimit diagram. Using Proposition 5.2.1.3, we can extend f_1 to a diagram $\overline{f}_1 : K^{\triangleright} \to \mathcal{C}_D$ and α to a natural transformation $\overline{\alpha} : \overline{f}_0 \to \overline{f}_1$ which carries each vertex $x \in K^{\triangleright}$ to a U-cocartesian morphism $\overline{\alpha}_x : \overline{f}_0(x) \to \overline{f}_1(x)$. Proposition 7.3.9.1 guarantees that $\overline{f}_1$ is a U-colimit diagram in the ∞-category $\mathcal{C}$, and therefore satisfies conditions (1) and (2) by virtue of Proposition 7.3.9.2.

Now suppose that conditions (1) and (2) are satisfied. Let $\overline{f}_1 : K^{\triangleright} \to \mathcal{C}_D$ be a colimit diagram extending f_1. It follows from (2) that $\overline{f}_1$ is a U-colimit diagram in the ∞-category $\mathcal{C}$. Let $\pi : (\Delta^1 \times K)^{\triangleright} \to K^{\triangleright}$ denote the morphism which is the identity when restricted to $\{0\} \times K$, and which carries $(\{1\} \times K)^{\triangleright}$ to the cone point of $K^{\triangleright}$. Since the inclusion map $\{1\} \times K \hookrightarrow \Delta^1 \times K$ is right cofinal (Proposition 7.2.1.3), Proposition 7.2.2.9 guarantees that the lifting problem

$$\begin{tikzcd}
\Delta^1 \times K \arrow[r, "\alpha"] \arrow[d] & \mathcal{C} \arrow[d, "U"] \\
(\Delta^1 \times K)^{\triangleright} \arrow[r, "g\circ\pi"] \arrow[ur, dashed, "\overline{\alpha}"] & \mathcal{D}
\end{tikzcd}$$

admits a solution $\overline{\alpha} : (\Delta^1 \times K)^{\triangleright} \to \mathcal{C}$ which is a U-colimit diagram. Note that in this case $\overline{f}'_1 = \overline{\alpha}|_{(\{1\}\times K)^{\triangleright}}$ is also a U-colimit diagram (Corollary 7.2.2.2). Setting $\overline{f}_0 = \overline{\alpha}|_{(\{0\}\times K)^{\triangleright}}$, we note that $\overline{\alpha}$ determines a natural transformation of functors $\overline{f}_0 \to \overline{f}'_1$ which carries each vertex of x to a U-cocartesian morphism of $\mathcal{C}$ and carries the cone point to an identity morphism of $\mathcal{C}$. Applying the criterion of Proposition 7.3.9.1, we conclude that $\overline{f}_0$ is a U-colimit diagram which solves the lifting problem (7.41). □

031Y **Corollary 7.3.9.6.** *Let $U : \mathcal{C} \to \mathcal{D}$ be a cocartesian fibration of ∞-categories and let K be a simplicial set. The following conditions are equivalent:*

(1) *For every object $D \in \mathcal{D}$, the ∞-category $\mathcal{C}_D = \{D\} \times_{\mathcal{D}} \mathcal{C}$ admits K-indexed colimits. Moreover, for every morphism $e : D \to D'$ in $\mathcal{D}$, the covariant transport functor $e_! : \mathcal{C}_D \to \mathcal{C}_{D'}$ preserves K-indexed colimits.*

(2) *Every lifting problem*

031Z
$$\begin{tikzcd} K \arrow[r, "f"] \arrow[d] & \mathcal{C} \arrow[d, "U"] \\ K^{\triangleright} \arrow[r] \arrow[ur, dashed, "\overline{f}"] & \mathcal{D} \end{tikzcd} \tag{7.42}$$

admits a solution $\overline{f} : K^{\triangleright} \to \mathcal{C}$ *which is a* U*-colimit diagram.*

Proof. The implication (1) ⇒ (2) follows immediately from Proposition 7.3.9.5. Conversely, suppose that (2) is satisfied. For each object $D \in \mathcal{D}$, condition (2) guarantees that every diagram $f : K \to \mathcal{C}_D$ admits an extension $\overline{f} : K^{\triangleright} \to \mathcal{C}_D$ which is a U-colimit diagram in $\mathcal{C}$. In particular, $\overline{f}$ is a colimit diagram in $\mathcal{C}_D$ (Corollary 7.1.5.20) having the property that for every morphism $e : D \to D'$ in $\mathcal{D}$, the composition $e_! \circ \overline{f}$ is a colimit diagram in $\mathcal{C}_{D'}$ (Proposition 7.3.9.2). To complete the proof, we observe that if $\overline{f}' : K^{\triangleright} \to \mathcal{C}_D$ is any other colimit diagram satisfying $\overline{f}'|_K = f$, then $\overline{f}'$ is isomorphic to $\overline{f}$ as an object of the ∞-category $\operatorname{Fun}(K^{\triangleright}, \mathcal{C}_D)$, so that $e_! \circ \overline{f}'$ is also a colimit diagram in $\mathcal{C}_{D'}$ (Corollary 7.1.2.14). □

Corollary 7.3.9.7. *Let* $U : \mathcal{D} \to \mathcal{E}$ *be a cocartesian fibration of* ∞*-categories, let* $\mathcal{C}$ *be an* ∞*-category, and let* $\mathcal{C}^0 \subseteq \mathcal{C}$ *be a full subcategory. Suppose that the following conditions are satisfied:* 0320

- *For every object* $C \in \mathcal{C}$ *and every object* $E \in \mathcal{E}$*, the* ∞*-category* $\mathcal{D}_E = \{E\} \times_{\mathcal{E}} \mathcal{D}$ *admits* $\mathcal{C}^0_{/C}$*-indexed colimits.*
- *For every object* $C \in \mathcal{C}$ *and every morphism* $e : E \to E'$ *in* $\mathcal{E}$*, the covariant transport functor* $e_! : \mathcal{D}_E \to \mathcal{D}_{E'}$ *preserves* $\mathcal{C}^0_{/C}$*-indexed colimits.*

Then every lifting problem

$$\begin{tikzcd} \mathcal{C}^0 \arrow[r, "F"] \arrow[d] & \mathcal{D} \arrow[d, "U"] \\ \mathcal{C} \arrow[r] \arrow[ur, dashed, "\overline{F}"] & \mathcal{E} \end{tikzcd}$$

admits a solution $\overline{F} : \mathcal{C} \to \mathcal{D}$ *which is* U*-left Kan extended from* $\mathcal{C}^0$*.*

Proof. Combine Proposition 7.3.5.5 with Corollary 7.3.9.6. □

7.4 Limits and Colimits of ∞-Categories

02SX Recall that the collection of (small) ∞-categories can be organized into a (large) ∞-category $\mathcal{QC}$ (see Construction 5.5.4.1). Our goal in this section is to study limits and colimits in the ∞-category $\mathcal{QC}$. Fix a small ∞-category $\mathcal{C}$, and suppose we are given a diagram $\mathscr{F} : \mathcal{C} \to \mathcal{QC}$. We will show that the diagram $\mathscr{F}$ admits both a limit $\varprojlim(\mathscr{F})$ and a colimit $\varinjlim(\mathscr{F})$, which can be described explicitly in terms of the ∞-category of elements $\int_{\mathcal{C}} \mathscr{F}$ introduced in Definition 5.6.2.1:

(1) Let $U : \int_{\mathcal{C}} \mathscr{F} \to \mathcal{C}$ be the forgetful functor, and let $\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \int_{\mathcal{C}} \mathscr{F})$ denote the full subcategory of $\operatorname{Fun}_{/\mathcal{C}}(\mathcal{C}, \int_{\mathcal{C}} \mathscr{F})$ spanned by those functors $F : \mathcal{C} \to \int_{\mathcal{C}} \mathscr{F}$ which satisfy $U \circ F = \mathrm{id}_{\mathcal{C}}$ and which carry each morphism of $\mathcal{C}$ to a U-cocartesian morphism of $\int_{\mathcal{C}} \mathscr{F}$. In §7.4.1, we show that the ∞-category $\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \int_{\mathcal{C}} \mathscr{F})$ is a limit of the diagram $\mathscr{F}$ (Corollary 7.4.1.10).

(2) Let W be the collection of all U-cocartesian morphisms of $\int_{\mathcal{C}} \mathscr{F}$, and let $(\int_{\mathcal{C}} \mathscr{F})[W^{-1}]$ denote a localization of $\int_{\mathcal{C}} \mathscr{F}$ with respect to W (Definition 6.3.1.9). In §7.4.3, we show that $(\int_{\mathcal{C}} \mathscr{F})[W^{-1}]$ is a colimit of the diagram $\mathscr{F}$ (Corollary 7.4.3.12).

For many applications, it is not enough to describe the limit $\varprojlim(\mathscr{F})$ and colimit $\varinjlim(\mathscr{F})$ as *abstract* ∞-categories: we also need to understand their relationship to the diagram $\mathscr{F} : \mathcal{C} \to \mathcal{QC}$. In other words, we would like to have criteria which can be used to detect when an extension $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathcal{QC}$ is a limit diagram, and when an extension $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathcal{QC}$ is a colimit diagram. To formulate these criteria, it will be convenient to slightly shift our perspective. Fix a cocartesian fibration $U : \mathcal{E} \to \mathcal{C}$ having covariant transport representation $\mathscr{F}$ (that is, a cocartesian fibration which is equivalent to the forgetful functor $\int_{\mathcal{C}} \mathscr{F} \to \mathcal{C}$).

- Suppose U is obtained as the pullback of a cocartesian fibration $\overline{U} : \overline{\mathcal{E}} \to \mathcal{C}^{\triangleleft}$, and let $\overline{\mathcal{E}}_{\mathbf{0}}$ denote the fiber of $\overline{U}$ over the cone point $\mathbf{0} \in \mathcal{C}^{\triangleleft}$. In §7.4.1, we introduce a map

  $$\mathrm{Df} : \overline{\mathcal{E}}_{\mathbf{0}} \to \operatorname{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}),$$

  which we will refer to as the *covariant diffraction functor* (Construction 7.4.1.3). Roughly speaking, it is characterized by the requirement that for every object $X \in \overline{\mathcal{E}}_{\mathbf{0}}$ and every object $C \in \mathcal{C}$, there is a $\overline{U}$-cocartesian morphism $X \to \mathrm{Df}(X)(C)$ (depending functorially on X and C).

- Suppose U is obtained as the pullback of a cocartesian fibration $\overline{U} : \overline{\mathcal{E}} \to \mathcal{C}^{\triangleright}$, and let $\overline{\mathcal{E}}_{\mathbf{1}}$ denote the fiber of $\overline{U}$ over the cone point $\mathbf{1} \in \mathcal{C}^{\triangleright}$. In §7.4.3, we introduce a map

  $$\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}},$$

which we will refer to as the *covariant refraction functor* (Definition 7.4.3.1). Roughly speaking, it is characterized by the requirement that for every object $X \in \mathcal{E}$, there is a $\overline{U}$-cocartesian morphism $X \to \mathrm{Rf}(X)$ (depending functorially on X).

We will deduce (1) and (2) from the following more precise assertions:

Diffraction Criterion: Suppose we are given a pullback diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleleft},
\end{tikzcd}$$

where U and $\overline{U}$ are cocartesian fibrations. Then the covariant transport representation $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{E}^{\triangleleft}} : \mathcal{C}^{\triangleleft} \to \mathcal{QC}$ is a limit diagram (in the ∞-category $\mathcal{QC}$) if and only if the covariant diffraction functor $\mathrm{Df} : \overline{\mathcal{E}}_{\mathbf{0}} \to \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is a fully faithful embedding, whose essential image is the the ∞-category $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ of cocartesian sections of U (see Theorem 7.4.1.1 and Remark 7.4.1.5).

Refraction Criterion: Suppose we are given a pullback diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleright},
\end{tikzcd}$$

where U and $\overline{U}$ are cocartesian fibrations. Then the covariant transport representation $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{E}^{\triangleright}} : \mathcal{C}^{\triangleright} \to \mathcal{QC}$ is a colimit diagram (in the ∞-category $\mathcal{QC}$) if and only if the covariant refraction functor $\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}}$ exhibits $\overline{\mathcal{E}}_{\mathbf{1}}$ as a localization of $\mathcal{E}$ with respect to the collection of U-cocartesian morphisms (Theorem 7.4.3.6).

We will establish the diffraction and refraction criteria in §7.4.2 and §7.4.3, respectively. In §7.4.5, we restrict our attention to the special case where $U : \mathcal{E} \to \mathcal{C}$ is a left fibration, and apply the results described above to describe limits and colimits in the ∞-category $\mathcal{S}$ of spaces.

Remark 7.4.0.1. In the outline above, we have implicitly suggested that $\mathcal{C}$ is an ∞-category. This is not important: all of the results of this section can be applied to diagrams $\mathscr{F} : \mathcal{C} \to \mathcal{QC}$ indexed by an arbitrary (small) simplicial set $\mathcal{C}$. 02SY

02SZ **Remark 7.4.0.2.** For any cocartesian fibration $\overline{U} : \overline{\mathcal{E}} \to \mathcal{C}^{\triangleleft}$, the associated covariant diffraction functor $\mathrm{Df} : \overline{\mathcal{E}}_{\mathbf{0}} \to \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ automatically factors through the full subcategory $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ (see Construction 7.4.1.3). Similarly, for any cocartesian fibration $\overline{U} : \overline{\mathcal{E}} \to \mathcal{C}^{\triangleright}$, the covariant refraction functor $\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}}$ automatically carries U-cocartesian edges of $\mathcal{E}$ to isomorphisms in the ∞-category $\overline{\mathcal{E}}_{\mathbf{1}}$ (Remark 7.4.3.5).

7.4.1 Limits of ∞-Categories

02T0 Let $\mathcal{QC}$ denote the ∞-category of (small) ∞-categories (Construction 5.5.4.1). Our goal in this section (and §7.4.2) is to show that the ∞-category $\mathcal{QC}$ admits small limits (Corollary 7.4.1.11). In fact, we will prove something more precise: if $\mathcal{C}$ is a small ∞-category, then the limit of any diagram $\mathscr{F} : \mathcal{C} \to \mathcal{QC}$ can be realized as explicitly as a full subcategory of the ∞-category of sections of the cocartesian fibration $U : \int_{\mathcal{C}} \mathscr{F} \to \mathcal{C}$ of Proposition 5.6.2.2 (Corollary 7.4.1.10).

Recall that, if $U : \mathcal{E} \to \mathcal{C}$ and $U' : \mathcal{E}' \to \mathcal{C}$ are cocartesian fibrations of simplicial sets, then $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}')$ denotes the full subcategory of $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}')$ spanned by those functors $F : \mathcal{E} \to \mathcal{E}'$ which carry U-cocartesian edges of $\mathcal{E}$ to U'-cocartesian edges of $\mathcal{E}'$ (Notation 5.3.1.10). Our main result can be stated as follows:

02T8 **Theorem 7.4.1.1** (Diffraction Criterion)**.** *Suppose we are given a pullback diagram of small simplicial sets*

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleleft},
\end{tikzcd}$$

where U and $\overline{U}$ are cocartesian fibrations. The following conditions are equivalent:

(1) *The restriction map*

$$\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}}) \to \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$$

is an equivalence of ∞-categories.

(2) *The covariant transport representation*

$$\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleleft}} : \mathcal{C}^{\triangleleft} \to \mathcal{QC}$$

of Notation 5.6.5.14 is a limit diagram in the ∞-category $\mathcal{QC}$.

02T9 **Remark 7.4.1.2.** In the situation of Theorem 7.4.1.1, the restriction map $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}}) \to \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is automatically an isofibration of ∞-categories (Remark 5.3.1.18). Using Proposition 4.5.5.20, we see that condition (1) of Theorem 7.4.1.1 is equivalent to the following *a priori* stronger condition:

$(1')$ The restriction map

$$\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}}) \to \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$$

is a trivial Kan fibration of simplicial sets.

Construction 7.4.1.3 (Covariant Diffraction)**.** Suppose we are given a pullback diagram of simplicial sets 02TD

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleleft},
\end{tikzcd}$$

where U and $\overline{U}$ are cocartesian fibrations. Let $\overline{\mathcal{E}}_{\mathbf{0}}$ denote the fiber of $\overline{U}$ over the cone point $\mathbf{0} \in \mathcal{C}^{\triangleleft}$. We then have restriction maps

$$\overline{\mathcal{E}}_{\mathbf{0}} \xleftarrow{\mathrm{ev}} \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}}) \xrightarrow{\theta} \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}),$$

where ev is a trivial Kan fibration (Corollary 5.3.1.23). Composing θ with a section of ev, we obtain a functor of ∞-categories $\mathrm{Df} : \overline{\mathcal{E}}_{\mathbf{0}} \to \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ which is well-defined up to isomorphism. We will refer to Df as the *covariant diffraction functor* associated to the cocartesian fibration $\overline{U}$.

Remark 7.4.1.4. In the situation of Construction 7.4.1.3, let $C \in \mathcal{C}$ be a vertex and let $\mathrm{ev}_C : \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \to \mathcal{E}_C$ be the evaluation functor, given on objects by $\mathrm{ev}_C(F) = F(C)$. Then the composition 02TE

$$\overline{\mathcal{E}}_{\mathbf{0}} \xrightarrow{\mathrm{Df}} \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \xrightarrow{\mathrm{ev}_C} \mathcal{E}_C$$

is given by covariant transport along the unique edge $\mathbf{0} \to C$ of $\mathcal{C}^{\triangleleft}$.

Remark 7.4.1.5. Suppose we are given a pullback diagram of small simplicial sets 02TF

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleleft}.
\end{tikzcd}$$

Then the covariant diffraction functor $\mathrm{Df} : \overline{\mathcal{E}}_{\mathbf{0}} \to \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ of Construction 7.4.1.3 is an equivalence of ∞-categories if and only if the covariant transport representation $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleleft}} : \mathcal{C}^{\triangleleft} \to \mathcal{QC}$ is a limit diagram in the ∞-category $\mathcal{QC}$ (this is a restatement of Theorem 7.4.1.1).

We now show that there exists a good supply of cocartesian fibrations which satisfy the hypotheses of Theorem 7.4.1.1.

02TG **Proposition 7.4.1.6.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then there exists a pullback diagram*

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleleft},
\end{tikzcd}$$

where $\overline{U}$ is a cocartesian fibration and the restriction map

$$\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}}) \to \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$$

is an equivalence of ∞-categories.

Proof. Let $\mathrm{ev} : \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C} \to \mathcal{E}$ denote the evaluation morphism (given on vertices by the formula $\mathrm{ev}(F, C) = F(C)$), and let

$$\mathcal{E}' = (\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}) \star_{\mathcal{E}} \mathcal{E}$$

denote the relative join of Construction 5.2.3.1. Note that we have a canonical map

$$U' : \mathcal{E}' = (\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}) \star_{\mathcal{E}} \mathcal{E} \to \mathcal{C} \star_{\mathcal{C}} \mathcal{C} \simeq \Delta^1 \times \mathcal{C}\,.$$

Let $\pi : \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C} \to \mathcal{C}$ be given by projection onto the second factor. Note that π is a cocartesian fibration, and that an edge of the product $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}$ is π-cocartesian if and only if its image in $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is an isomorphism. It follows that the ev carries π-cocartesian edges of $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}$ to U-cocartesian edges of $\mathcal{E}$. Applying Lemma 5.2.3.17, we deduce that U' is a cocartesian fibration. By construction, we can identify $\mathcal{E}$ with the inverse image of $\{1\} \times \mathcal{C}$ under U'.

Let $\mathcal{E}''$ denote the pushout

$$(\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}^{\triangleleft}) \coprod_{(\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}^{\triangleleft})} \mathcal{E}'\,.$$

Amalgamating U' with the projection map $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}^{\triangleleft} \to \mathcal{C}^{\triangleleft}$, we obtain a morphism of simplicial sets $U'' : \mathcal{E}'' \to K$, where K denotes the pushout $(\{0\} \times \mathcal{C})^{\triangleleft} \coprod_{(\{0\} \times \mathcal{C})} (\Delta^1 \times \mathcal{C})$. It follows from Proposition 5.1.4.7 that U'' is also a cocartesian fibration.

Let us abuse notation by identifying K with its image in the simplicial set $(\Delta^1 \times \mathcal{C})^{\triangleleft}$. Since the inclusion map $\{0\} \times \mathcal{C} \hookrightarrow \Delta^1 \times \mathcal{C}$ is left anodyne (Proposition 4.2.5.3), the inclusion

$K \hookrightarrow (\Delta^1 \times \mathcal{C})^{\triangleleft}$ is inner anodyne (Example 4.3.6.5). Applying Proposition 5.6.7.2, we can write U'' as the pullback of a cocartesian fibration $U''' : \mathcal{E}''' \to (\Delta^1 \times \mathcal{C})^{\triangleleft}$. We then have a commutative diagram of simplicial sets

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \mathcal{E}' \arrow[r] \arrow[d, "U'"] & \mathcal{E}'' \arrow[r] \arrow[d, "U''"] & \mathcal{E}''' \arrow[d, "U'''"] \\
\{1\} \times \mathcal{C} \arrow[r] & \Delta^1 \times \mathcal{C} \arrow[r] & K \arrow[r] & (\Delta^1 \times \mathcal{C})^{\triangleleft},
\end{tikzcd}$$

where each square is a pullback and each vertical map is a cocartesian fibration. Let $\overline{\mathcal{E}}$ denote the pullback $(\{1\} \times \mathcal{C})^{\triangleleft} \times_{(\Delta^1 \times \mathcal{C})^{\triangleleft}} \mathcal{E}'''$, so that U''' restricts to a cocartesian fibration $\overline{U} : \overline{\mathcal{E}} \to (\{1\} \times \mathcal{C})^{\triangleleft}$. We will complete the proof by showing that the commutative diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\{1\} \times \mathcal{C} \arrow[r] & (\{1\} \times \mathcal{C})^{\triangleleft}
\end{tikzcd}$$

satisfies the requirements of Proposition 7.4.1.6.

For every simplicial subset $A \subseteq (\Delta^1 \times \mathcal{C})^{\triangleleft}$, let $\mathcal{D}(A)$ denote the ∞-category

$$\mathrm{Fun}^{\mathrm{CCart}}_{/A}(A, A \times_{(\Delta^1 \times \mathcal{C})^{\triangleleft}} \mathcal{E}''').$$

Let $\mathbf{0}$ denote the cone point of $(\Delta^1 \times \mathcal{C})^{\triangleleft}$. Note that we have a commutative diagram of restriction functors

$$\begin{tikzcd}
\mathcal{D}((\Delta^1 \times \mathcal{C})^{\triangleleft}) \arrow[r, "\alpha'"] \arrow[d, "\beta"] & \mathcal{D}((\{1\} \times \mathcal{C})^{\triangleleft}) \arrow[d, "\alpha"] \\
\mathcal{D}(K) \arrow[r, "\beta'"] \arrow[d, "\gamma"] & \mathcal{D}(\{1\} \times \mathcal{C}) \\
\mathcal{D}(\{\mathbf{0}\}). &
\end{tikzcd}$$

We wish to show that α is an equivalence of ∞-categories. Since the inclusion $K \hookrightarrow (\Delta^1 \times \mathcal{C})^{\triangleleft}$ is inner anodyne (as noted above) and the inclusion $(\{1\} \times \mathcal{C})^{\triangleleft} \hookrightarrow (\Delta^1 \times \mathcal{C})^{\triangleleft}$ is left anodyne

(Lemma 4.3.7.8), the morphisms α' and β are trivial Kan fibrations (Proposition 5.3.1.21). It will therefore suffice to show that β' is an equivalence of ∞-categories.

Amalgamating the map

$$\begin{aligned}
\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C},\mathcal{E}) \times \Delta^1 \times \mathcal{C} &\simeq (\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C},\mathcal{E}) \times \mathcal{C}) \star_{(\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C},\mathcal{E})\times\mathcal{C})} (\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C},\mathcal{E}) \times \mathcal{C}) \\
&\to (\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C},\mathcal{E}) \times \mathcal{C}) \star_{\mathcal{E}} \mathcal{E} \\
&= \mathcal{E}'
\end{aligned}$$

with the identity on $\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C},\mathcal{E}) \times \mathcal{C}^{\triangleleft}$, we obtain a morphism of simplicial sets $F : \operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C},\mathcal{E}) \times K \to \mathcal{E}''$. If e is an edge of the product $\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C},\mathcal{E}) \times K$ whose image in $\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C},\mathcal{E})$ is an isomorphism, then $F(e)$ is a U''-cocartesian edge of $\mathcal{E}''$. We can therefore identify F with a morphism of simplicial sets $f : \operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C},\mathcal{E}) \to \mathcal{D}(K)$. Unwinding the definitions, we see that $\beta' \circ f$ is an isomorphism of simplicial sets. Consequently, to show that β' is an equivalence of ∞-categories, it will suffice to show that f is an equivalence of ∞-categories. Similarly, the composite map $\gamma \circ f$ is an isomorphism, so we are reduced to proving that γ is an equivalence of ∞-categories. Since β is a trivial Kan fibration, this is equivalent to the assertion that $\gamma \circ \beta$ is an equivalence of ∞-categories, which is a special case of Corollary 5.3.1.23. □

02TH **Remark 7.4.1.7.** If $U : \mathcal{E} \to \mathcal{C}$ is a cocartesian fibration of small simplicial sets, then the simplicial set $\overline{\mathcal{E}}$ constructed in the proof of Proposition 7.4.1.6 will also be small.

03E6 **Remark 7.4.1.8.** In the situation of Proposition 7.4.1.6, suppose that $U : \mathcal{E} \to \mathcal{C}$ is a left fibration. Then the extension $\overline{U} : \overline{\mathcal{E}} \to \mathcal{C}^{\triangleleft}$ is also a left fibration. To prove this, it will suffice to show that the fiber $\overline{\mathcal{E}}_{\mathbf{0}}$ is a Kan complex (Proposition 5.1.4.14). This follows from the fact that the covariant diffraction functor

$$\operatorname{Df} : \overline{\mathcal{E}}_{\mathbf{0}} \to \operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C},\mathcal{E}) = \operatorname{Fun}_{/\mathcal{C}}(\mathcal{C},\mathcal{E})$$

is an equivalence of ∞-categories, since the simplicial set $\operatorname{Fun}_{/\mathcal{C}}(\mathcal{C},\mathcal{E})$ is a Kan complex by (Corollary 4.4.2.5).

02TJ **Corollary 7.4.1.9.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of small simplicial sets and let $\operatorname{Tr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \to \mathcal{QC}$ be a covariant transport representation for U. Then the diagram $\operatorname{Tr}_{\mathcal{E}/\mathcal{C}}$ has a limit in the ∞-category $\mathcal{QC}$, given by the ∞-category $\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C},\mathcal{E})$ of cocartesian sections of U.*

Proof. Using Proposition 7.4.1.6 (and Remark 7.4.1.7), we see that there exists a pullback diagram of small simplicial sets

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleleft},
\end{tikzcd}$$

where $\overline{U}$ is a cocartesian fibration and the restriction map $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}}) \to \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is a trivial Kan fibration. Using Corollary 5.6.5.11, we can extend $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ to a diagram $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleleft}} : \mathcal{C}^{\triangleleft} \to \mathcal{QC}$ which is a covariant transport representation for $\overline{U}$. Let $\mathbf{0}$ denote the cone point of $\mathcal{C}^{\triangleleft}$. It follows from Theorem 7.4.1.1 that $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleleft}}$ is a limit diagram in the ∞-category $\mathcal{QC}$, and therefore exhibits the ∞-category $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleleft}}(\mathbf{0}) \simeq \overline{\mathcal{E}}_{\mathbf{0}}$ as a limit of the diagram $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$. Using Remark 7.4.1.5, we see that covariant diffraction supplies an equivalence of ∞-categories $\overline{\mathcal{E}}_{\mathbf{0}} \to \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$, so that $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is also a limit of the diagram $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ (Proposition 7.1.1.12). □

Corollary 7.4.1.10. *Let $\mathcal{C}$ be a small simplicial set and let $\mathscr{F} : \mathcal{C} \to \mathcal{QC}$ be a diagram in the ∞-category $\mathcal{QC}$. Then the ∞-category of cocartesian sections $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \int_{\mathcal{C}} \mathscr{F})$ is a limit of the diagram $\mathscr{F}$.* 02TK

Proof. Apply Corollary 7.4.1.9 to the cocartesian fibration $U : \int_{\mathcal{C}} \mathscr{F} \to \mathcal{C}$. □

Corollary 7.4.1.11. *The ∞-category $\mathcal{QC}$ is complete: that is, it admits small limits.* 02TL

By inspecting the proof of Corollary 7.4.1.11, we can obtain more precise information.

Corollary 7.4.1.12. *Let n be an integer, let $\mathcal{C}$ be a simplicial set and let $\mathscr{F} : \mathcal{C} \to \mathcal{QC}$ be a diagram. Suppose that, for every vertex $C \in \mathcal{C}$, the ∞-category $\mathscr{F}(C)$ is locally n-truncated. Then the limit $\varprojlim(\mathscr{F})$ is a locally n-truncated ∞-category.* 05E1

Proof. Without loss of generality, we may assume that $\mathcal{C}$ is an ∞-category and that $n \geq -2$. Let $\mathcal{E} = \int_{\mathcal{C}} \mathscr{F}$ denote the ∞-category of elements of $\mathscr{F}$. It follows from Variant 5.1.5.17 that the projection map $U : \mathcal{E} \to \mathcal{C}$ is an essentially $(n+1)$-categorical cocartesian fibration. Applying Corollary 4.8.6.22, we see that the ∞-category of sections $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is locally n-truncated. Since $\varprojlim(\mathscr{F})$ can be identified with a full subcategory of $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ (Corollary 7.4.1.10), it is also locally n-truncated (Remark 4.8.2.3). □

Corollary 7.4.1.13. *Let λ be an uncountable cardinal and let $\kappa = \mathrm{ecf}(\lambda)$ be the exponential cofinality of λ. Suppose we are given a diagram $\mathscr{F} : \mathcal{C} \to \mathcal{QC}$, where $\mathcal{C}$ is a κ-small simplicial set. If the ∞-category $\mathscr{F}(C)$ is essentially λ-small for each $C \in \mathcal{C}$, then the limit $\varprojlim(\mathscr{F})$ is also essentially λ-small.* 03U6

Proof. Using Proposition 4.7.5.5, we can choose a categorical equivalence $G : \mathcal{C} \to \mathcal{D}$, where $\mathcal{D}$ is a λ-small ∞-category (if κ is uncountable, we can even arrange that $\mathcal{D}$ is κ-small). Without loss of generality, we may assume that $\mathscr{F}$ is obtained as the restriction of the covariant transport representation of some cocartesian fibration $U : \mathcal{E} \to \mathcal{D}$. Using Corollary 7.4.1.9, we can identify $\varprojlim(\mathscr{F})$ with a full subcategory of the ∞-category $\mathrm{Fun}_{/\mathcal{D}}(\mathcal{C}, \mathcal{E})$. It will therefore suffice to show that the ∞-category $\mathrm{Fun}_{/\mathcal{D}}(\mathcal{C}, \mathcal{E})$ is essentially λ-small (Corollary 4.7.5.13). By construction, we have a pullback diagram of simplicial sets

03U7
$$\begin{tikzcd}
\mathrm{Fun}_{/\mathcal{D}}(\mathcal{C}, \mathcal{E}) \arrow[r] \arrow[d] & \mathrm{Fun}(\mathcal{C}, \mathcal{E}) \arrow[d, "U\circ"] \\
\{G\} \arrow[r] & \mathrm{Fun}(\mathcal{C}, \mathcal{D})
\end{tikzcd} \tag{7.43}$$

where the vertical maps are cocartesian fibrations (Theorem 5.2.1.1), and therefore isofibrations (Proposition 5.1.4.8). It follows that (7.43) is also a categorical pullback square (Corollary 4.5.2.27). Using Corollary 4.7.5.16, we are reduced to proving that the ∞-categories $\mathrm{Fun}(\mathcal{C}, \mathcal{E})$ and $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$ are essentially λ-small, which follows from Remark 4.7.5.10. □

7.4.2 Proof of the Diffraction Criterion

02UG The goal of this section is to prove Theorem 7.4.1.1. We begin by treating a special case (which is already sufficient for most applications).

02UM **Proposition 7.4.2.1.** *Suppose we are given a pullback diagram of small ∞-categories*

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleleft},
\end{tikzcd}$$

where U and $\overline{U}$ are cocartesian fibrations and the restriction map $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}}) \to \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is an equivalence of ∞-categories. Then the covariant transport representation

$$\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleleft}} : \mathcal{C}^{\triangleleft} \to \mathcal{QC}$$

is a limit diagram in the ∞-category $\mathcal{QC}$.

Proof. Suppose we are given an integer $n \geq 1$ and a diagram $\mathscr{F}_0 : \partial\Delta^n \star \mathcal{C} \to \mathcal{QC}$ with the property that $\mathscr{F}_0|_{\{n\}\star\mathcal{C}} : \{n\} \star \mathcal{C} \to \mathcal{QC}$ is a covariant transport representation for the cocartesian fibration $\overline{U}$; here we abuse notation by identifying $\{n\} \star \mathcal{C}$ with the cone $\mathcal{C}^{\triangleleft}$. We wish to show that $\mathscr{F}_0$ can be extended to a diagram $\mathscr{F} : \Delta^n \star \mathcal{C} \to \mathcal{QC}$. Using Lemma 5.6.7.1, we can choose a pullback diagram

$$\begin{tikzcd}
\overline{\mathcal{E}} \arrow[r] \arrow[d, "\overline{U}"] & \overline{\mathcal{E}}^{+} \arrow[d, "\overline{U}^{+}"] \\
\{n\} \star \mathcal{C} \arrow[r] & \partial\Delta^n \star \mathcal{C},
\end{tikzcd}$$

where $\overline{U}^{+}$ is a cocartesian fibration having covariant transport representation $\mathscr{F}_0$. Fix an auxiliary symbol c, so that the projection map $\mathcal{C} \to \{c\}$ induces a cartesian fibration of ∞-categories $T : \Delta^n \star \mathcal{C} \to \Delta^n \star \{c\}$ (this follows by repeated application of Lemma 5.2.3.17). Note that T restricts to a to a morphism of simplicial sets $T_0 : \partial\Delta^n \star \mathcal{C} \to \partial\Delta^n \star \{c\}$ which is a pullback of T, and is therefore also a cartesian fibration. Let $\mathcal{D}$ be the cocartesian direct image $\operatorname{Res}^{\mathrm{CCart}}_{\partial\Delta^n \star \mathcal{C} \,/\, \partial\Delta^n \star \{c\}}(\overline{\mathcal{E}}^{+})$ introduced in Notation 5.3.7.7, so that the projection map $\pi : \mathcal{D} \to \partial\Delta^n \star \{c\}$ is a cocartesian fibration of simplicial sets (Proposition 5.3.7.9).

Applying Corollary 5.6.5.12, we can choose a covariant transport representation $\mathscr{G}_0 : \partial\Delta^n \star \{c\} \to \mathcal{QC}$ for the cocartesian fibration π. Note that the value of $\mathscr{G}_0$ on the edge $e = \{n\} \star \{c\} \subseteq \partial\Delta^n \star \{c\}$ can be identified with the composition

$$\begin{aligned}
\mathscr{G}_0(\{n\}) &\simeq \pi^{-1}\{n\} \\
&\xrightarrow{s} \operatorname{Fun}^{\mathrm{CCart}}_{/e}(e, e \times_{\partial\Delta^n \star \{c\}} \mathcal{D}) \\
&\xrightarrow{u} \pi^{-1}\{c\},
\end{aligned}$$

where u is given by evaluation on the final vertex $\{c\} \subseteq e$, and s is a section of the trivial Kan fibration $\operatorname{Fun}^{\mathrm{CCart}}_{/e}(e, e \times_{\partial\Delta^n \star \{c\}}, \mathcal{D}) \to \pi^{-1}\{n\}$ given by evaluation at the initial vertex $\{n\} \subseteq e$. Using Proposition 5.3.7.10, we can identify u with the restriction map $\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \mathcal{E}) \to \operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$, which is an equivalence of ∞-categories (by assumption). It follows that the diagram $\mathscr{G}_0$ carries the edge e to an isomorphism in the ∞-category $\mathcal{QC}$. Identifying $\partial\Delta^n \star \{c\}$ with the outer horn Λ^{n+1}_{n+1} and applying Theorem 4.4.2.6, we deduce that $\mathscr{G}_0$ can be extended to a diagram $\mathscr{G} : \Delta^n \star \{c\} \to \mathcal{QC}$.

Note that we have a commutative diagram of simplicial sets

$$\begin{tikzcd}
(\partial\Delta^n \star \mathcal{C}) \times_{(\partial\Delta^n \star \{c\})} \mathcal{D} \arrow[rr, "\mathrm{ev}"] \arrow[dr, "\pi'"'] & & \overline{\mathcal{E}}^{+} \arrow[dl, "\overline{U}^{+}"] \\
& \partial\Delta^n \star \mathcal{C}, &
\end{tikzcd}$$

where π' is given given by projection onto the first factor and ev is the restriction of the evaluation map described in Construction 4.5.9.1. Note that ev carries π'-cocartesian edges of $(\partial\Delta^n \star \mathcal{C}) \times_{(\partial\Delta^n \star \{c\})} \mathcal{D}$ to $\overline{U}^{+}$-cocartesian edges of $\overline{\mathcal{E}}^{+}$. Let $\overline{\mathcal{E}}^{++}$ denote the relative join

$$(\partial\Delta^n \star \mathcal{C}) \times_{(\partial\Delta^n \star \{c\})} \mathcal{D}) \star_{\overline{\mathcal{E}}^{+}} \overline{\mathcal{E}}^{+}$$

of Construction 5.2.3.1. Applying Lemma 5.2.3.17, we see that π' and $\overline{U}^{+}$ induce a cocartesian fibration

$$\overline{U}^{++} : \overline{\mathcal{E}}^{++} \to (\partial\Delta^n \star \mathcal{C}) \star_{(\partial\Delta^n \star \mathcal{C})} (\partial\Delta^n \star \mathcal{C}) \simeq \Delta^1 \times (\partial\Delta^n \star \mathcal{C}).$$

Applying Corollary 5.6.5.11, we deduce that $\overline{U}^{++}$ admits a covariant transport representation $\mathscr{H}_0 : \Delta^1 \times (\partial\Delta^n \star \mathcal{C}) \to \mathcal{QC}$ having the property that $\mathscr{H}_0|_{\{0\}\times(\partial\Delta^n \star \mathcal{C})} = \mathscr{G}_0 \circ T_0$ and $\mathscr{H}_0|_{\{1\}\times(\partial\Delta^n \star \mathcal{C})} = \mathscr{F}_0$. Note that, for $0 \leq i \leq n$, the evaluation map ev restricts to an isomorphism of ∞-categories $\{i\} \times_{(\partial\Delta^n \star \{c\})} \mathcal{D} \to \{i\} \times_{(\partial\Delta^n \star \mathcal{C})} \overline{\mathcal{E}}^{+}$, so that the diagram $\mathscr{H}_0$ carries the edge ge $\Delta^1 \times \{i\}$ to an isomorphism in the ∞-category $\mathcal{QC}$. Moreover, if $\sigma : \Delta^m \to \Delta^n \star \mathcal{C}$ is any simplex which does not factor through $\partial\Delta^n \star \mathcal{C}$, then the vertex $\sigma(0)$ must belong to $\partial\Delta^n$. Applying Proposition 4.4.5.8, we can extend $\mathscr{H}_0$ to a diagram $\mathscr{H} : \Delta^1 \times (\Delta^n \star \mathcal{C}) \to \mathcal{QC}$ satisfying $\mathscr{H}|_{\{0\}\times(\Delta^n \star \mathcal{C})} = \mathscr{G} \circ T$. We complete the proof by observing that the restriction $\mathscr{F} = \mathscr{H}|_{\{1\}\times(\Delta^n \star \mathcal{C})}$ provides the desired extension of the diagram $\mathscr{F}_0$. □

Proof of Theorem 7.4.1.1. Suppose we are given a pullback diagram of small simplicial sets

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleleft},
\end{tikzcd}$$

where U and $\overline{U}$ are cocartesian fibrations. Assume first that the restriction map

$$\theta : \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}}) \to \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$$

is an equivalence of ∞-categories; we wish to show that the covariant transport representation $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleleft}} : \mathcal{C}^{\triangleleft} \to \mathcal{QC}$ is a limit diagram in the ∞-category $\mathcal{QC}$.

Using Corollary 4.1.3.3, we can choose an inner anodyne morphism $\mathcal{C} \hookrightarrow \mathcal{C}'$, where $\mathcal{C}'$ is an ∞-category. Note that the induced map $\mathcal{C}^{\triangleleft} \hookrightarrow \mathcal{C}'^{\triangleleft}$ is also inner anodyne (Proposition 4.3.6.4). Applying Corollary 5.6.7.3, we can realize $\overline{U}$ as the pullback of a cocartesian fibration of ∞-categories $\overline{U}' : \overline{\mathcal{E}}' \to \mathcal{C}'^{\triangleleft}$. Set $\mathcal{E}' = \mathcal{C}' \times_{\mathcal{C}'^{\triangleleft}} \overline{\mathcal{E}}'$, so that we have a commutative diagram of restriction functors

$$\begin{tikzcd}
\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}'^{\triangleleft}}(\mathcal{C}'^{\triangleleft}, \overline{\mathcal{E}}') \arrow[r, "\theta'"] \arrow[d] & \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}'}(\mathcal{C}', \mathcal{E}') \arrow[d] \\
\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}}) \arrow[r, "\theta"] & \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}),
\end{tikzcd}$$

where the vertical maps are trivial Kan fibrations (Proposition 5.3.1.21). It follows that θ' is also an equivalence of ∞-categories.

Using Corollary 5.6.5.11, we can extend $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleleft}}$ to a functor

$$\mathrm{Tr}_{\overline{\mathcal{E}}'/\mathcal{C}'^{\triangleleft}} : \mathcal{C}'^{\triangleleft} \to \mathcal{QC}$$

which is a covariant transport representation for the cocartesian fibration $\overline{U}'$. Since $\mathcal{C}'$ is an ∞-category, Proposition 7.4.2.1 guarantees that $\mathrm{Tr}_{\overline{\mathcal{E}}'/\mathcal{C}'^{\triangleleft}}$ is a limit diagram in the ∞-category $\mathcal{QC}$. Since the inclusion map $\mathcal{C} \hookrightarrow \mathcal{C}'$ is left cofinal (Proposition 7.2.1.3), it follows that $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleleft}}$ is also a limit diagram in $\mathcal{QC}$.

We now prove the converse. Assume that the covariant transport representation $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleleft}}$ is a limit diagram in the ∞-category $\mathcal{QC}$; we wish to show that θ is an equivalence of ∞-categories. Using Proposition 7.4.1.6, we can choose another pullback diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \mathcal{E}^{+} \arrow[d, "U^{+}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleleft},
\end{tikzcd}$$

where U^{+} is a cocartesian fibration for which the restriction map $\theta^{+} : \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \mathcal{E}^{+}) \to \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}^{+})$ is an equivalence of ∞-categories. Applying Corollary 5.6.5.11, we see that U^{+} admits a covariant transport representation $\mathrm{Tr}_{\mathcal{E}^{+}/\mathcal{C}^{\triangleleft}} : \mathcal{C}^{\triangleleft} \to \mathcal{QC}$ satisfying $(\mathrm{Tr}_{\mathcal{E}^{+}/\mathcal{C}^{\triangleleft}})|_{\mathcal{C}} = (\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleleft}})|_{\mathcal{C}}$. The first part of the proof shows that $\mathrm{Tr}_{\mathcal{E}^{+}/\mathcal{C}^{\triangleleft}}$ is also a limit diagram in the ∞-category $\mathcal{QC}$, and is therefore isomorphic to $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleleft}}$ as an object of the ∞-category

$\operatorname{Fun}(\mathcal{C}^{\triangleleft}, \mathcal{QC})$. Applying Theorem 5.6.0.2, we deduce that there exists a morphism $F : \overline{\mathcal{E}} \to \overline{\mathcal{E}}^{+}$ which is an equivalence of cocartesian fibrations over $\mathcal{C}^{\triangleleft}$. We have a commutative diagram of ∞-categories

$$\begin{tikzcd}
\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \mathcal{E}^{+}) \arrow[r, "\theta^{+}"] \arrow[d] & \operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}') \arrow[d] \\
\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}}) \arrow[r, "\theta"] & \operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}),
\end{tikzcd}$$

where the vertical maps are given by precomposition with F and are therefore equivalences of ∞-categories. Since θ^{+} is an equivalence of ∞-categories, it follows that θ is also an equivalence of ∞-categories. □

7.4.3 Colimits of ∞-Categories

02UN Let $\mathcal{QC}$ denote the ∞-category of (small) ∞-categories (Construction 5.5.4.1). Our goal in this section is to show that the ∞-category $\mathcal{QC}$ admits small colimits (Corollary 7.4.3.13). In fact, we will prove something more precise: if $\mathcal{C}$ is a small ∞-category, then the colimit of any diagram $\mathscr{F} : \mathcal{C} \to \mathcal{QC}$ can be described explicitly as the localization $(\int_{\mathcal{C}} \mathscr{F})[W^{-1}]$, where $\int_{\mathcal{C}} \mathscr{F}$ denotes the ∞-category of elements of $\mathscr{F}$ (Definition 5.6.2.4) and W is the collection of all morphisms of $\int_{\mathcal{C}} \mathscr{F}$ which are cocartesian with respect to the forgetful functor $U : \int_{\mathcal{C}} \mathscr{F} \to \mathcal{C}$ (Corollary 7.4.3.12).

We begin with some general remarks. Let $\mathcal{C}^{\triangleright}$ denote the right cone on on a simplicial set $\mathcal{C}$ (Construction 4.3.3.26), and let $\mathbf{1} \in \mathcal{C}^{\triangleright}$ denote the cone point. For every vertex $C \in \mathcal{C}$, there is a unique edge $e_C : C \to \mathbf{1}$ in $\mathcal{C}^{\triangleright}$. If $\overline{U} : \overline{\mathcal{E}} \to \mathcal{C}^{\triangleright}$ is a cocartesian fibration of simplicial sets, then covariant transport along e_C determines a functor

$$e_{C!} : \overline{\mathcal{E}}_C = \{C\} \times_{\mathcal{C}^{\triangleright}} \overline{\mathcal{E}} \to \{\mathbf{1}\} \times_{\mathcal{C}^{\triangleright}} \overline{\mathcal{E}} = \overline{\mathcal{E}}_{\mathbf{1}}.$$

In what follows, it will be convenient to amalgamate the functors $\{e_{C!}\}_{C \in \mathcal{C}}$ into a single morphism $\mathrm{Rf} : \mathcal{C} \times_{\mathcal{C}^{\triangleright}} \overline{\mathcal{E}} \to \overline{\mathcal{E}}_{\mathbf{1}}$, which we will refer to as the *covariant refraction diagram.*

02UP **Definition 7.4.3.1.** Let $\mathcal{C}$ be a simplicial set, and let $\mathbf{1}$ denote the cone point of the simplicial set $\mathcal{C}^{\triangleright} \simeq \mathcal{C} \star \{\mathbf{1}\}$. Suppose that we are given a cocartesian fibration $\overline{U} : \overline{\mathcal{E}} \to \mathcal{C}^{\triangleright}$, and set

$$\mathcal{E} = \mathcal{C} \times_{\mathcal{C}^{\triangleright}} \overline{\mathcal{E}} \qquad \overline{\mathcal{E}}_{\mathbf{1}} = \{\mathbf{1}\} \times_{\mathcal{C}^{\triangleright}} \overline{\mathcal{E}}.$$

We will say that a morphism $\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}}$ is a *covariant refraction diagram* if there exists a morphism of simplicial sets $H : \Delta^1 \times \mathcal{E} \to \overline{\mathcal{E}}$ satisfying the following conditions:

- The restriction $H|_{\{0\} \times \mathcal{E}}$ is the identity morphism from $\mathcal{E}$ to itself.

- The restriction $H|_{\{1\}\times\mathcal{E}}$ is equal to Rf.
- For every vertex $X \in \mathcal{E}$, the restriction $H|_{\Delta^1\times\{X\}}$ is a $\overline{U}$-cocartesian edge of $\overline{\mathcal{E}}$.

Remark 7.4.3.2. In the situation of Definition 7.4.3.1, suppose that $\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}}$ is a covariant refraction diagram. Then, for every vertex $C \in \mathcal{C}$, the restriction $\mathrm{Rf}|_{\mathcal{E}_C} : \mathcal{E}_C \to \overline{\mathcal{E}}_{\mathbf{1}}$ is given by covariant transport along the unique edge $e_C : C \to \mathbf{1}$ of $\mathcal{C}^{\triangleright}$, in the sense of Definition 5.2.2.4. 02UQ

Proposition 7.4.3.3. *Let $\overline{U} : \overline{\mathcal{E}} \to \mathcal{C}^{\triangleright}$ be a cocartesian fibration of simplicial sets, set $\mathcal{E} = \mathcal{C} \times_{\mathcal{C}^{\triangleright}} \overline{\mathcal{E}}$, and let $\mathbf{1}$ denote the cone point of $\mathcal{C}^{\triangleright}$. Then:* 02UR

(1) *There exists a covariant refraction diagram* $\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}}$ *(Definition 7.4.3.1).*

(2) *Let $F : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}}$ be any morphism of simplicial sets. Then F is a covariant refraction diagram if and only if it is isomorphic to* Rf *as an object of the ∞-category* $\mathrm{Fun}(\mathcal{E}, \overline{\mathcal{E}}_{\mathbf{1}})$.

Proof. This is a special case of Lemma 5.2.2.13. □

Example 7.4.3.4. Let $\mathcal{C}$ be an ∞-category and let $\mathbf{1}$ denote the cone point of $\mathcal{C}^{\triangleright}$. Using Example 5.2.3.18, we see that the tautological map $V : \mathcal{C}^{\triangleright} \to (\Delta^0)^{\triangleright} \simeq \Delta^1$ is a cocartesian fibration. If $\overline{U} : \overline{\mathcal{E}} \to \mathcal{C}^{\triangleright}$ is another cocartesian fibration, then the ∞-categories $\mathcal{E} = \mathcal{C} \times_{\mathcal{C}^{\triangleright}} \overline{\mathcal{E}}$ and $\overline{\mathcal{E}}_{\mathbf{1}} = \{\mathbf{1}\} \times_{\mathcal{C}^{\triangleright}} \overline{\mathcal{E}}$ can be identified with the fibers of the composite map 02US

$$(V \circ \overline{U}) : \overline{\mathcal{E}} \to \Delta^1,$$

which is also a cocartesian fibration (Proposition 5.1.4.13). In this case, the covariant refraction diagram $\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}}$ of Proposition 7.4.3.3 is given by covariant transport for the cocartesian fibration $V \circ \overline{U}$ (along the nondegenerate edge of Δ^1).

Remark 7.4.3.5. Suppose we are given a pullback diagram of simplicial sets 02UT

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleright},
\end{tikzcd}$$

where U and $\overline{U}$ are cocartesian fibrations. Let $\mathbf{1}$ denote the cone point of $\mathcal{C}^{\triangleright}$ and let $\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}}$ be a covariant refraction diagram. For every U-cocartesian edge $e : X \to Y$ of

$\mathcal{E}$, the image $\mathrm{Rf}(e)$ is an isomorphism in the ∞-category $\overline{\mathcal{E}}_{\mathbf{1}}$. To prove this, we observe that there is a morphism $\Delta^1 \times \Delta^1 \rightarrow \overline{\mathcal{E}}$ as indicated in the diagram

$$\begin{tikzcd}
X \arrow[r] \arrow[d, "e"] & \mathrm{Rf}(X) \arrow[d, "\mathrm{Rf}(e)"] \\
Y \arrow[r] & \mathrm{Rf}(Y),
\end{tikzcd}$$

where the horizontal maps are $\overline{U}$-cocartesian. Applying Proposition 5.1.4.12, we deduce that $\mathrm{Rf}(e)$ is an $\overline{U}$-cocartesian edge of $\overline{\mathcal{E}}$, and therefore an isomorphism in the ∞-category $\overline{\mathcal{E}}_{\mathbf{1}}$ (Proposition 5.1.4.11).

Our study of colimits in the ∞-category $\mathcal{QC}$ will make use of the following recognition principle for colimits in the ∞-category $\mathcal{QC}$:

02UU **Theorem 7.4.3.6** (Refraction Criterion)**.** *Suppose we are given a pullback diagram of small simplicial sets*

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleright},
\end{tikzcd}$$

where U and $\overline{U}$ are cocartesian fibrations. Let $\mathbf{1}$ denote the cone point of $\mathcal{C}^{\triangleright}$ and let W be the collection of all U-cocartesian edges of $\mathcal{E}$. The following conditions are equivalent:

(1) *The covariant refraction diagram* $\mathrm{Rf} : \mathcal{E} \rightarrow \overline{\mathcal{E}}_{\mathbf{1}}$ *of Proposition 7.4.3.3 exhibits $\overline{\mathcal{E}}_{\mathbf{1}}$ as a localization of $\mathcal{E}$ with respect W.*

(2) *The covariant transport representation* $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleright}} : \mathcal{C}^{\triangleright} \rightarrow \mathcal{QC}$ *of Notation 5.6.5.14 is a colimit diagram in the ∞-category $\mathcal{QC}$.*

02UV **Remark 7.4.3.7.** In the statement of Theorem 7.4.3.6, the covariant refraction diagram $F : \mathcal{E} \rightarrow \overline{\mathcal{E}}_{\mathbf{1}}$ and the covariant transport representation $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleright}} : \mathcal{C}^{\triangleright} \rightarrow \mathcal{QC}$ are only well-defined up to isomorphism (as objects of the ∞-categories $\mathrm{Fun}(\mathcal{E}, \overline{\mathcal{E}}_{\mathbf{1}})$ and $\mathrm{Fun}(\mathcal{C}^{\triangleright}, \mathcal{QC})$, respectively). However, conditions (1) and (2) depend only on their isomorphism classes (see Exercise 6.3.1.11 and Corollary 7.1.2.14).

02UW **Exercise 7.4.3.8.** Let $\overline{U} : \overline{\mathcal{E}} \rightarrow \mathcal{C}^{\triangleright}$ and $\overline{U}' : \overline{\mathcal{E}}' \rightarrow \mathcal{C}^{\triangleright}$ be cocartesian fibrations of simplicial sets which are equivalent as inner fibrations over $\mathcal{C}^{\triangleright}$ (in the sense of Definition 5.1.7.1). Show that $\overline{U}$ satisfies condition (1) of Theorem 7.4.3.6 if and only if $\overline{U}'$ satisfies condition (1) of Theorem 7.4.3.6.

We will prove Theorem 7.4.3.6 in §7.4.4. The remainder of this section is devoted to explaining some of its consequences. We begin by showing that there is a good supply of cocartesian fibrations which satisfy the assumptions of Theorem 7.4.3.6.

Proposition 7.4.3.9. *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets and let $\mathbf{1}$ denote the cone point of $\mathcal{C}^{\triangleright}$. Then there exists a pullback diagram* 02UX

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleright},
\end{tikzcd}$$

where $\overline{U}$ is a cocartesian fibration and a covariant refraction diagram $\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}}$ which exhibits $\overline{\mathcal{E}}_{\mathbf{1}}$ as a localization of $\mathcal{E}$ with respect to the collection of all U-cocartesian edges of $\mathcal{E}$.

Proof. Let W be the collection of all U-cocartesian edges of $\mathcal{E}$. Applying Proposition 6.3.2.1, we deduce that there exists an ∞-category $\mathcal{E}[W^{-1}]$ and a diagram $\mathrm{Rf} : \mathcal{E} \to \mathcal{E}[W^{-1}]$ which exhibits $\mathcal{E}[W^{-1}]$ as a localization of $\mathcal{E}$ with respect to W. In particular, the diagram Rf carries each U-cocartesian edge of $\mathcal{E}$ to an isomorphism in $\mathcal{E}[W^{-1}]$. Let $\overline{\mathcal{E}}$ denote the relative join $\mathcal{E} \star_{\mathcal{E}[W^{-1}]} \mathcal{E}[W^{-1}]$ (Construction 5.2.3.1). Applying Lemma 5.2.3.17 to the commutative diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[r, "\mathrm{Rf}"] \arrow[d, "U"] & \mathcal{E}[W^{-1}] \arrow[d] \\
\mathcal{C} \arrow[r] & \Delta^0,
\end{tikzcd}$$

we deduce that vertical maps induce a cocartesian fibration

$$\overline{U} : \overline{\mathcal{E}} = \mathcal{E} \star_{\mathcal{E}[W^{-1}]} \mathcal{E}[W^{-1}] \to \mathcal{C} \star_{\Delta^0} \Delta^0 \simeq \mathcal{C}^{\triangleright}.$$

By construction, we have a pullback diagram of simplicial sets

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleright},
\end{tikzcd}$$

and the fiber of $\overline{U}$ over the cone point $\mathbf{1} \in \mathcal{C}^{\triangleright}$ can be identified with the ∞-category $\mathcal{E}[W^{-1}]$. Moreover, Rf induces a morphism of simplicial sets

$$H : \Delta^1 \times \mathcal{E} \simeq \mathcal{E} \star_{\mathcal{E}} \mathcal{E} \to \mathcal{E} \star_{\mathcal{E}[W^{-1}]} \mathcal{E}[W^{-1}] = \overline{\mathcal{E}}$$

for which $H|_{\{0\} \times \mathcal{E}}$ is the inclusion map $\mathcal{E} \hookrightarrow \overline{\mathcal{E}}$, and $H|_{\{1\} \times \mathcal{E}}$ is the diagram $\mathrm{Rf} : \mathcal{E} \to \mathcal{E}[W^{-1}]$. For every vertex $X \in \mathcal{E}$, the criterion of Lemma 5.2.3.17 guarantees that $H|_{\Delta^1 \times \{X\}}$ is a $\overline{U}$-cocartesian edge of $\overline{\mathcal{E}}$, so that H exhibits $\mathrm{Rf} : \mathcal{E} \to \mathcal{E}[W^{-1}]$ as a covariant refraction diagram. □

02UY **Remark 7.4.3.10.** In the situation of Proposition 7.4.3.9, suppose that the simplicial sets $\mathcal{E}$ and $\mathcal{C}$ are small. Then the localization $\mathcal{E}[W^{-1}]$ supplied by Proposition 6.3.2.1 can also be chosen to be small. It follows that the simplicial set $\overline{\mathcal{E}}$ constructed in the proof is also small.

02UZ **Corollary 7.4.3.11.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration between small simplicial sets, and let $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \to \mathcal{QC}$ be a covariant transport representation of U. Then the diagram $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ admits a colimit in $\mathcal{QC}$. Moreover, an object $\mathcal{D} \in \mathcal{QC}$ is a colimit of the diagram $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ if and only if it is equivalent to the localization $\mathcal{E}[W^{-1}]$, where W is the collection of all U-cocartesian morphisms of $\mathcal{E}$.*

Proof. Let $\mathbf{1}$ denote the cone point of $\mathcal{C}^{\triangleright}$. By virtue of Proposition 7.4.3.9 (and Remark 7.4.3.10), there exists a pullback diagram of small simplicial sets

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleright}
\end{tikzcd}$$

where $\overline{U}$ is a cocartesian fibration, and a covariant refraction diagram $\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}}$ which exhibits $\overline{\mathcal{E}}_{\mathbf{1}}$ as a localization of $\mathcal{E}$ with respect to W. Applying Corollary 5.6.5.11, we see that $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ extends to a covariant transport representation $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleright}} : \mathcal{C}^{\triangleright} \to \mathcal{QC}$. By virtue of Theorem 7.4.3.6, this extension is a colimit diagram carrying $\mathbf{0}$ to the ∞-category $\overline{\mathcal{E}}_{\mathbf{1}} \simeq \mathcal{E}[W^{-1}]$. □

02V0 **Corollary 7.4.3.12.** *Let $\mathcal{C}$ be a small simplicial set, let $\mathscr{F} : \mathcal{C} \to \mathcal{QC}$ be a diagram, let $U : \int_{\mathcal{C}} \mathscr{F} \to \mathcal{C}$ denote the projection map, and let W be the collection of all U-cocartesian morphisms of $\int_{\mathcal{C}} \mathscr{F}$. Then the localization $(\int_{\mathcal{C}} \mathscr{F})[W^{-1}]$ is a colimit of the diagram $\mathscr{F}$ in the ∞-category $\mathcal{QC}$.*

Proof. Apply Corollary 7.4.3.11 to the cocartesian fibration $\int_{\mathcal{C}} \mathscr{F} \to \mathcal{C}$. □

Corollary 7.4.3.13. *The ∞-category $\mathcal{QC}$ is cocomplete: that is, it admits small colimits.* `02V1`

By examining the proof of Corollary 7.4.3.13, we can obtain more precise information.

Corollary 7.4.3.14. *Let κ be an uncountable regular cardinal, let $\mathcal{C}$ be a simplicial set which is essentially κ-small, and suppose we are given a diagram $\mathscr{F} : \mathcal{C} \to \mathcal{QC}$ with the property that, for each vertex $C \in \mathcal{C}$, the ∞-category $\mathscr{F}(C)$ is essentially κ-small. Then the colimit $\varinjlim(\mathscr{F})$ (formed in the ∞-category $\mathcal{QC}$) is essentially κ-small.* `03U8`

Proof. Without loss of generality, we may assume that $\mathscr{F}$ is a covariant transport representation for a cocartesian fibration $U : \mathcal{E} \to \mathcal{C}$, so that the colimit $\varinjlim(\mathscr{F})$ can be identified with the localization $\mathcal{E}[W^{-1}]$, where W is the collection of U-cocartesian morphisms of $\mathcal{E}$ (Corollary 7.4.3.11). By virtue of Variant 6.3.2.6, it will suffice to show that the simplicial set $\mathcal{E}$ is essentially κ-small, which follows from Corollary 5.6.7.7. □

Corollary 7.4.3.15. *Let λ be an uncountable cardinal and let $\kappa = \mathrm{cf}(\lambda)$ be the cofinality of λ. Let $\mathcal{C}$ be a κ-small simplicial set and let $\mathscr{F} : \mathcal{C} \to \mathcal{QC}$ be a diagram. Suppose that, for each object $C \in \mathcal{C}$, the ∞-category $\mathscr{F}(C)$ is essentially λ-small. Then the colimit $\varinjlim(\mathscr{F})$ is essentially λ-small.* `03U9`

Proof. For each vertex $C \in \mathcal{C}$, the ∞-category $\mathscr{F}(C)$ is essentially λ-small, and is therefore essentially τ_C^+-small for some infinite cardinal $\tau_C < \lambda$ (Corollary 4.7.6.17). Since λ has cofinality κ, the supremum $\tau = \sup\{\tau_C\}_{C \in \mathcal{C}}$ satisfies $\tau < \lambda$. Replacing λ by the cardinal $\sup\{\tau^+, \kappa\}$, we are reduced to proving Corollary 7.4.3.15 in the special case where λ is regular. In this case, the desired result follows from Variant 7.4.3.14. □

For strictly commutative diagrams, we can use the results of §5.3 to give an alternative description of the colimit.

Corollary 7.4.3.16. *Let $\mathcal{C}$ be a small category and let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be a (strictly commutative) diagram of ∞-categories indexed by $\mathcal{C}$. Let $U : \mathrm{N}_\bullet^{\mathscr{F}}(\mathcal{C}) \to \mathrm{N}_\bullet(\mathcal{C})$ be the cocartesian fibration of Definition 5.3.3.1, and let W be the collection of U-cocartesian morphisms of $\mathrm{N}_\bullet^{\mathscr{F}}(\mathcal{C})$. Then the localization $\mathrm{N}_\bullet^{\mathscr{F}}(\mathcal{C})[W^{-1}]$ is a colimit of the diagram $\mathrm{N}_\bullet^{\mathrm{hc}}(\mathscr{F}) : \mathrm{N}_\bullet(\mathcal{C}) \to \mathcal{QC}$.* `039J`

Proof. Combine Corollary 7.4.3.16 with Example 5.6.5.6. □

Corollary 7.4.3.17. *Let $\mathcal{C}$ be an ∞-category, let $\overline{U} : \overline{\mathcal{E}} \to \mathcal{C}^{\triangleright}$ be a cocartesian fibration, and set $\mathcal{E} = \mathcal{C} \times_{\mathcal{C}^{\triangleright}} \overline{\mathcal{E}}$. Let $F : \overline{\mathcal{E}} \to \mathcal{D}$ be a functor of ∞-categories which carries $\overline{U}$-cocartesian morphisms of $\overline{\mathcal{E}}$ to isomorphisms in $\mathcal{D}$. If the covariant transport representation $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleright}} : \mathcal{C}^{\triangleright} \to \mathcal{QC}$ is a colimit diagram, then F is left Kan extended from $\mathcal{E}$.* `039P`

Proof. Let $\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}}$ be a covariant refraction diagram, so that there exists a natural transformation $h : \mathrm{id}_{\mathcal{E}} \to \mathrm{Rf}$ (in the ∞-category $\mathrm{Fun}(\mathcal{E}, \overline{\mathcal{E}})$) which carries each object $X \in \mathcal{E}$ to an $\overline{U}$-cocartesian morphism $h_X : X \to \mathrm{Rf}(X)$. Our assumption that $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleright}}$ is a colimit diagram guarantees that the functor Rf exhibits $\overline{\mathcal{E}}_{\mathbf{1}}$ as a localization of $\mathcal{E}$ (Corollary 7.4.3.9). Moreover, for each object $X \in \mathcal{C}$, the functor F carries h_X to an isomorphism in the ∞-category $\mathcal{D}$. Set $F_0 = F|_{\mathcal{E}}$ and $F_1 = F|_{\overline{\mathcal{E}}_{\mathbf{1}}}$. Applying Proposition 7.3.1.17, we deduce that the natural transformation $F(h) : F_0 \to F_1 \circ \mathrm{Rf}$ exhibits the functor F_1 as a left Kan extension of F_0 along Rf. By virtue of Example 7.4.3.4, the natural transformation h exhibits Rf as a covariant transport functor for the cocartesian fibration

$$\overline{\mathcal{E}} \xrightarrow{\overline{U}} \mathcal{C}^{\triangleright} \to (\Delta^0)^{\triangleright} \simeq \Delta^1.$$

Applying Corollary 7.3.2.14, we conclude that the functor F is left Kan extended from $\mathcal{E}$. □

7.4.4 Proof of the Refraction Criterion

02V2 Our goal in this section is to prove Theorem 7.4.3.6. Our starting point is the following extension property for outer horns of the ∞-category $\mathcal{QC}$:

02V3 **Lemma 7.4.4.1.** *Let $n \geq 2$, let $X : \Lambda^n_0 \to \mathcal{QC}$ be a diagram, and let W be a collection of morphisms of the ∞-category $X(0)$ which satisfies the following pair of conditions:*

(1) *Let $1 \leq i \leq n$, and let $X(0 < i) : X(0) \to X(i)$ be the functor obtained by evaluating X on the edge $\mathrm{N}_{\bullet}(\{0 < i\}) \subseteq \Lambda^n_0$. Then $X(0 < i)$ carries each element of W to an isomorphism in the ∞-category $X(i)$.*

(2) *The functor $X(0 < 1) : X(0) \to X(1)$ exhibits $X(1)$ as a localization of $X(0)$ with respect to W.*

Then X can be extended to an n-simplex $\Delta^n \to \mathcal{QC}$.

Proof. Set $\mathcal{C} = X(0)$, $\mathcal{D} = X(1)$, and let $F : \mathcal{C} \to \mathcal{D}$ be the functor $X(0 < 1)$. Using the isomorphism $\Lambda^n_0 \simeq (\partial \Delta^{n-1})^{\triangleleft}$, we can identify X with a diagram $\sigma_0 : \partial \Delta^{n-1} \to \mathcal{QC}_{\mathcal{C}/}$. To complete the proof, it will suffice to show that σ_0 can be extended to an $(n-1)$-simplex of $\mathcal{QC}_{\mathcal{C}/}$. Let us identify the objects of the ∞-category $\mathcal{QC}_{\mathcal{C}/}$ with pairs $(\mathcal{E}, G)$, where $\mathcal{E}$ is a small ∞-category and $G : \mathcal{C} \to \mathcal{E}$ is a functor. Let $\mathcal{QC}^W_{\mathcal{C}/}$ denote the full subcategory of $\mathcal{QC}_{\mathcal{C}/}$ spanned by those pairs $(\mathcal{E}, G)$, where the functor G carries each element of W to an isomorphism in $\mathcal{E}$. It follows from assumption (1) that the diagram σ_0 factors through the subcategory $\mathcal{QC}^W_{\mathcal{C}/} \subseteq \mathcal{QC}_{\mathcal{C}/}$. To prove the existence of σ, it will suffice (by virtue of Corollary 4.6.7.13) to show that $\sigma_0(0) = (\mathcal{D}, F)$ is an initial object of the ∞-category $\mathcal{QC}^W_{\mathcal{C}/}$. Fix another object $(\mathcal{E}, G) \in \mathcal{QC}^W_{\mathcal{C}/}$; we wish to show that the morphism space $\mathrm{Hom}_{\mathcal{QC}^W_{\mathcal{C}/}}((\mathcal{D}, F), (\mathcal{E}, G)) = \mathrm{Hom}_{\mathcal{QC}_{\mathcal{C}/}}((\mathcal{D}, F), (\mathcal{E}, G))$ is a contractible Kan complex. Using

Corollary 4.6.9.18 and Remark 5.5.4.6, we can identify $\mathrm{Hom}_{\mathcal{QC}_{\mathcal{C}/}}((\mathcal{D}, F), (\mathcal{E}, G))$ with the homotopy fiber of the map of Kan complexes

$$\mathrm{Fun}(\mathcal{D}, \mathcal{E})^{\simeq} \xrightarrow{\circ F} \mathrm{Fun}(\mathcal{C}, \mathcal{E})^{\simeq}$$

over the vertex $G \in \mathrm{Fun}(\mathcal{C}, \mathcal{E})^{\simeq}$. Assumption (2) guarantees that this map is a homotopy equivalence onto the summand of $\mathrm{Fun}(\mathcal{C}, \mathcal{E})^{\simeq}$ spanned by those functors $\mathcal{C} \to \mathcal{E}$ which carry each element of W to an isomorphism in $\mathcal{E}$. It will therefore suffice to show that this summand contains the functor G, which follows from the definition of $\mathcal{QC}^{W}_{\mathcal{C}/}$. □

We now prove a weak form of Theorem 7.4.3.6 (which is already sufficient for most of our applications):

Proposition 7.4.4.2. *Suppose we are given a pullback diagram of small ∞-categories* 02V4

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleright},
\end{tikzcd}$$

where U and $\overline{U}$ are cocartesian fibrations. Let W be the collection of all U-cocartesian morphism of $\mathcal{E}$, let 0 denote the cone point of $\mathcal{C}^{\triangleright} \simeq \mathcal{C} \star \{0\}$, and assume that the covariant refraction diagram $\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_0$ of Proposition 7.4.3.3 exhibits $\overline{\mathcal{E}}_0$ as a localization of $\mathcal{E}$ with respect to W. Then the covariant transport representation $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleright}} : \mathcal{C}^{\triangleright} \to \mathcal{QC}$ is a colimit diagram in the ∞-category $\mathcal{QC}$.

Proof. Fix an integer $n > 0$, and suppose we are given a diagram $\mathscr{F}_0 : \mathcal{C} \star \partial \Delta^n \to \mathcal{QC}$ for which the restriction $\mathscr{F}_0|_{\mathcal{C} \star \{0\}}$ coincides with $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleright}}$. We wish to show that $\mathscr{F}_0$ can be extended to a functor $\mathscr{F} : \mathcal{C} \star \Delta^n \to \mathcal{QC}$. Applying Lemma 5.6.7.1, we can choose a pullback diagram

$$\begin{tikzcd}
\overline{\mathcal{E}} \arrow[r] \arrow[d, "\overline{U}"] & \overline{\mathcal{E}}^{-} \arrow[d, "\overline{U}^{-}"] \\
\mathcal{C} \star \{0\} \arrow[r] & \mathcal{C} \star \partial \Delta^n,
\end{tikzcd}$$

where $\overline{U}^{-}$ is a cocartesian fibration having covariant transport representation $\mathscr{F}_0$. For $0 \leq i \leq n$, let us write $\overline{\mathcal{E}}^{-}_{i}$ for the ∞-category given by the fiber of $\overline{U}^{-}$ on the vertex $i \in \partial \Delta^n$.

Fix an auxiliary symbol c, so that the projection map $\mathcal{C} \to \{c\}$ induces a cocartesian fibration of ∞-categories $V^{+} : \mathcal{C} \star \Delta^{n} \to \{c\} \star \Delta^{n}$ (this follows by repeated application of Lemma 5.2.3.17). Note that V^{+} restricts to a morphism of simplicial sets $V^{-} : \mathcal{C} \star \partial\Delta^{n} \to \{c\} \star \partial\Delta^{n}$ which is a pullback of V^{+}, and therefore also a cocartesian fibration (Remark 5.1.4.6). Applying Proposition 5.1.4.13, we deduce that the composite map $(V^{-} \circ \overline{U}^{-}) : \overline{\mathcal{E}}^{-} \to \{c\} \star \partial\Delta^{n} \simeq \Lambda^{n+1}_{0}$ is also a cocartesian fibration.

Let $\mathscr{G}_0 : \{c\} \star \partial\Delta^{n} \to \mathcal{QC}$ be a covariant transport representation for the cocartesian fibration $V^{-} \circ \overline{U}^{-}$. Let us identify $\mathscr{G}_0(c)$ with the ∞-category $\mathcal{E}$. For $0 \leq i \leq n$, we can identify $\mathscr{G}_0(i)$ with the ∞-category $\overline{\mathcal{E}}^{-}_{i}$ for $0 \leq i \leq n$, and the restriction of $\mathscr{G}_0$ to the edge $\{c\} \star \{i\}$ with a functor $G_i : \mathcal{E} \to \overline{\mathcal{E}}^{-}_{i}$. Applying Example 7.4.3.4 (and Remark 5.6.5.8), we see that G_i is a covariant refraction diagram for the cocartesian fibration

$$(\mathcal{C} \star \{i\}) \times_{\mathcal{C} \star \partial\Delta^{n}} \overline{\mathcal{E}}^{-} \to \mathcal{C} \star \{i\}.$$

In particular, each of the functors G_i carries elements of W to isomorphisms in the ∞-category $\overline{\mathcal{E}}^{-}_{i}$ (Remark 7.4.3.5). Moreover, the functor G_0 is isomorphic to Rf (Proposition 7.4.3.3), and therefore exhibits $\overline{\mathcal{E}}^{-}_{0} = \overline{\mathcal{E}}_{0}$ as a localization of $\mathcal{E}$ with respect to W (Exercise 6.3.1.11). Applying Lemma 7.4.4.1, we can extend $\mathscr{G}_0$ to a diagram $\mathscr{G} : \{c\} \star \Delta^{n} \to \mathcal{QC}$. Using Lemma 5.6.7.1, we can choose a pullback diagram

$$\begin{tikzcd}
\overline{\mathcal{E}}^{-} \arrow[r] \arrow[d, "V^{-} \circ \overline{U}^{-}"] & \overline{\mathcal{E}}^{+} \arrow[d, "T"] \\
\mathcal{C} \star \partial\Delta^{n} \arrow[r] & \mathcal{C} \star \Delta^{n},
\end{tikzcd}$$

where T is a cocartesian fibration having covariant transport representation $\mathscr{G}$. Note that we can write T uniquely as a composition

$$\overline{\mathcal{E}}^{+} \xrightarrow{\overline{U}^{+}} \mathcal{C} \star \Delta^{n} \xrightarrow{V^{+}} \{c\} \star \Delta^{n},$$

where $\overline{U}^{+}$ is a morphism of simplicial sets which fits into a pullback diagram

$$\begin{tikzcd}
\overline{\mathcal{E}}^{-} \arrow[r] \arrow[d, "\overline{U}^{-}"] & \overline{\mathcal{E}}^{+} \arrow[d, "\overline{U}^{+}"] \\
\mathcal{C} \star \partial\Delta^{n} \arrow[r] & \mathcal{C} \star \Delta^{n}.
\end{tikzcd}$$

We will show that the morphism $\overline{U}^{+}$ is a cocartesian fibration. Assuming this, we can complete the proof by applying Corollary 5.6.5.11 to extend $\mathscr{F}_0$ to a diagram $\mathscr{F} : \mathcal{C} \star \Delta^{n} \to \mathcal{QC}$ (which is a covariant transport representation for the cocartesian fibration $\overline{U}^{+}$).

We first prove that $\overline{U}^{+}$ is an inner fibration of simplicial sets. Suppose we are given integers $0 < i < m$; we wish to show that every lifting problem

02V5

$$\begin{tikzcd}
\Lambda^m_i \arrow[r, "\sigma_0"] \arrow[d] & \overline{\mathcal{E}}^{+} \arrow[d, "\overline{U}^{+}"] \\
\Delta^m \arrow[r, "\overline{\sigma}"] \arrow[ur, dashed, "\sigma"] & \mathcal{C} \star \Delta^n
\end{tikzcd} \tag{7.44}$$

admits a solution. If $\overline{\sigma}$ factors through $\mathcal{C}$, then a solution exists by virtue of the fact that U is an inner fibration. Let us therefore assume that $\overline{\sigma}$ does not factor through $\mathcal{C}$. Since T is an inner fibration, we can extend σ_0 to an n-simplex σ of $\overline{\mathcal{E}}^{+}$ satisfying $T \circ \sigma = V^{+} \circ \overline{\sigma}$. We claim that the n-simplex σ solves the lifting problem (7.44). Set $\overline{\sigma}' = \overline{U}^{+} \circ \sigma$; we wish to show that $\overline{\sigma}'$ coincides with $\overline{\sigma}$ (as m-simplices of the simplicial set $\mathcal{C} \star \Delta^n$). Note that we have $V^{+} \circ \overline{\sigma} = V^{+} \circ \overline{\sigma}'$. It follows that $\overline{\sigma}$ and $\overline{\sigma}'$ both carry the final vertex $m \in \Delta^m$ to the same vertex of $\Delta^n \subseteq \mathcal{C} \star \Delta^n$. Consequently, it will suffice to show that $\overline{\sigma}$ and $\overline{\sigma}'$ agree when restricted to the face $\Delta^{m-1} \subseteq \Delta^m$. This follows from the commutativity of the diagram (7.44), since Δ^{m-1} is contained in the horn $\Lambda^m_i \subseteq \Delta^m$.

Fix an object X of the ∞-category $\overline{\mathcal{E}}^{+}$ having image $\overline{X} = \overline{U}^{+}(X)$ and a morphism $\overline{e} : \overline{X} \to \overline{Y}$ in the ∞-category $\mathcal{C} \star \Delta^m$. We will complete the proof by showing that $\overline{e}$ can be lifted to an $\overline{U}^{+}$-cocartesian morphism $e : X \to Y$ of $\mathcal{E}$. If $\overline{X}$ and $\overline{Y}$ belong to $\mathcal{C}$, then we take $e : X \to Y$ to be a U-cocartesian morphism of $\mathcal{E}$ satisfying $U(e) = \overline{e}$ (which exists by virtue of our assumption that U is a cocartesian fibration). Otherwise, we take $e : X \to Y$ to be a T-cocartesian morphism of $\overline{\mathcal{E}}^{+}$ satisfying $T(e) = V^{+}(\overline{e})$ (which exists by virtue of the fact that T is a cocartesian fibration). In either case, we will prove that the morphism e is $\overline{U}^{+}$-cocartesian by verifying the criterion of Proposition 5.1.2.1. Choose another object $Z \in \overline{\mathcal{E}}^{+}$ having image $\overline{Z} = \overline{U}^{+}(Z)$; we wish to show that the diagram of Kan complexes

02V6

$$\begin{tikzcd}
\{c\} \times_{\operatorname{Hom}_{\overline{\mathcal{E}}^{+}}(X,Y)} \operatorname{Hom}_{\overline{\mathcal{E}}^{+}}(X,Y,Z) \arrow[r] \arrow[d] & \operatorname{Hom}_{\overline{\mathcal{E}}^{+}}(X,Z) \arrow[d] \\
\{\overline{e}\} \times_{\operatorname{Hom}_{\mathcal{C} \star \Delta^n}(\overline{X},\overline{Y})} \operatorname{Hom}_{\mathcal{C} \star \Delta^n}(\overline{X},\overline{Y},\overline{Z}) \arrow[r] & \operatorname{Hom}_{\mathcal{C} \star \Delta^n}(\overline{X},\overline{Z})
\end{tikzcd} \tag{7.45}$$

is a homotopy pullback square. We consider several cases:

- Suppose first that the object $\overline{Z}$ belongs to $\mathcal{C}$. If $\overline{X}$ and $\overline{Y}$ belong to $\mathcal{C}$, then we deduce that (7.45) is a homotopy pullback square by applying Proposition 5.1.2.1 to the cocartesian fibration $U : \mathcal{E} \to \mathcal{C}$ (since, by construction, the morphism e is

U-cocartesian). Otherwise, each of the Kan complexes appearing in the diagram (7.45) is empty, so there is nothing to prove.

- Suppose that the objects $\overline{Y}$ and $\overline{Z}$ belong to Δ^n. In this case, we deduce that (7.45) is a homotopy pullback square by applying Proposition 5.1.2.1 to the cocartesian fibration $T : \overline{\mathcal{E}}^+ \to \{c\} \star \Delta^n$ (since, by construction, the morphism e is T-cocartesian).

- Suppose that the objects $\overline{X}$ and $\overline{Y}$ belong to $\mathcal{C}$, but the object $\overline{Z}$ belongs to Δ^n. In this case, the Kan complexes on the bottom row of (7.45) are contractible (see Example 4.6.1.6; in fact, they are both isomorphic to Δ^0). In particular, the bottom horizontal map is a homotopy equivalence. To show that (7.45) is a homotopy pullback square, we must show that the upper horizontal map is also a homotopy equivalence (Corollary 3.4.1.5). In other words, we must show that composition with the homotopy class $[e]$ induces an isomorphism $\theta : \mathrm{Hom}_{\overline{\mathcal{E}}^+}(Y, Z) \to \mathrm{Hom}_{\overline{\mathcal{E}}^+}(X, Z)$ in the homotopy category hKan (see Notation 4.6.9.15). Let

$$G : \mathcal{E} = \{c\} \times_{\{c\}\star\Delta^n} \overline{\mathcal{E}}^+ \to \{\overline{Z}\} \times_{\{c\}\star\Delta^n} \overline{\mathcal{E}}^+ = \overline{\mathcal{E}}^+_{\overline{Z}}$$

  be given by covariant transport for the cocartesian fibration T. Using Corollary 5.1.2.3, we can identify θ with the morphism $\mathrm{Hom}_{\overline{\mathcal{E}}^+_{\overline{Z}}}(G(Y), Z) \to \mathrm{Hom}_{\overline{\mathcal{E}}^+_{\overline{Z}}}(G(X), Z)$ given by precomposition with the morphism $G(e) : G(X) \to G(Y)$. Since the morphism e is U-cocartesian, its image $G(e)$ is an isomorphism in the ∞-category $\overline{\mathcal{E}}^+_{\overline{Z}}$, so that θ is a homotopy equivalence as desired.

□

To extend Proposition 7.4.4.2 to the case where $\mathcal{C}$ is not assumed to be an ∞-category, we will need the following variant of Corollary 5.6.7.6:

02V7 **Lemma 7.4.4.3.** *Suppose we are given a pullback diagram of simplicial sets*

$$\begin{tikzcd}
\mathcal{E}_0 \arrow[r, "\widetilde{F}"] \arrow[d, "U_0"] & \mathcal{E} \arrow[d, "U"] \\
\mathcal{C}_0 \arrow[r, "F"] & \mathcal{C},
\end{tikzcd}$$

where U_0 and U are cocartesian fibrations. Let W_0 denote the collection of all U-cocartesian edges of $\mathcal{E}_0$, and let W denote the collection of all U-cocartesian morphisms of $\mathcal{E}$. If F is inner anodyne, then $\widetilde{F}$ induces an equivalence of ∞-categories $\mathcal{E}_0[W_0^{-1}] \to \mathcal{E}[W^{-1}]$.

Remark 7.4.4.4. Using Theorem 7.4.3.6, one can show that conclusion of Lemma 7.4.4.3 holds more generally under the assumption that $F : \mathcal{C}_0 \to \mathcal{C}$ is a left cofinal morphism of simplicial sets. For simplicity, let us assume that each of the simplicial sets appearing in the statement of Lemma 7.4.4.3 is small. Using Proposition 7.4.3.9, we can assume that U is the pullback of a cocartesian fibration $\overline{U} : \overline{\mathcal{E}} \to \mathcal{C}^{\triangleright}$ for which the covariant refraction diagram $\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}}$ exhibits the ∞-category $\overline{\mathcal{E}}_{\mathbf{1}}$ as a localization of $\mathcal{E}$ with respect to W. Using Theorem 7.4.3.6, we deduce that the covariant transport representation $\mathrm{Tr} = \mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleright}} : \mathcal{C}^{\triangleright} \to \mathcal{QC}$ is a colimit diagram. Since F is right cofinal, it follows that the restriction $\mathrm{Tr}|_{\mathcal{C}_0^{\triangleright}}$ is also a colimit diagram (Corollary 7.2.2.3). Applying Theorem 7.4.3.6 again, we conclude that $\mathrm{Rf}|_{\mathcal{E}_0}$ exhibits $\overline{\mathcal{E}}_{\mathbf{1}}$ as a localization of $\mathcal{E}_0$ with respect to W_0, so that $\widetilde{F}$ induces an equivalence $\mathcal{E}_0[W_0^{-1}] \xrightarrow{\sim} \mathcal{E}[W^{-1}]$. 02V8

Proof of Lemma 7.4.4.3. Fix an ∞-category $\mathcal{D}$; we wish to show that precomposition with $\widetilde{F}$ induces an equivalence of ∞-categories $\mathrm{Fun}(\mathcal{E}[W^{-1}], \mathcal{D}) \to \mathrm{Fun}(\mathcal{E}_0[W_0^{-1}], \mathcal{D})$ (see Notation 6.3.1.1). Corollary 5.6.7.6 guarantees that $\widetilde{F}$ is a categorical equivalence of simplicial sets, so that precomposition with $\widetilde{F}$ induces an equivalence of ∞-categories $\mathrm{Fun}(\mathcal{E}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{E}_0, \mathcal{D})$. It will therefore suffice to prove the following:

$(*)$ Let $G : \mathcal{E} \to \mathcal{D}$ be a morphism of simplicial sets with the property that $G \circ \widetilde{F}$ carries every U_0-cocartesian edge of $\mathcal{E}_0$ to an isomorphism in $\mathcal{D}$. Then G carries each U-cocartesian edge of $\mathcal{E}$ to an isomorphism in $\mathcal{D}$.

Let us henceforth regard the ∞-category $\mathcal{D}$ and the functor $G : \mathcal{E} \to \mathcal{D}$ as fixed. For every morphism of simplicial sets $K \to \mathcal{C}$, let $\mathcal{E}_K$ denote the fiber product $K \times_{\mathcal{C}} \mathcal{E}$, let $U_K : \mathcal{E}_K \to K$ be the projection map, and let G_K denote the restriction of G to $\mathcal{E}_K$. Let us say that a monomorphism of simplicial sets $K' \hookrightarrow K$ is *good* if, for every morphism $K \to \mathcal{C}$ with the property that $G_{K'}$ carries $U_{K'}$-cocartesian morphisms of $\mathcal{E}_{K'}$ to isomorphisms in $\mathcal{D}$, the morphism G_K carries U_K-cocartesian morphisms of $\mathcal{E}_K$ to isomorphisms in $\mathcal{D}$. To prove $(*)$, it will suffice to show that $F : \mathcal{C}_0 \to \mathcal{C}$ is weakly saturated. It is not difficult to see that the collection of good morphisms is weakly saturated, in the sense of Definition 1.5.4.12. It will therefore suffice to show that the horn inclusion $\Lambda^n_i \hookrightarrow \Delta^n$ is good for $0 < i < n$. In other words, it will suffice to prove $(*)$ in the special case where $\mathcal{C} = \Delta^n$ is a standard simplex and $F : \Lambda^n_i \hookrightarrow \Delta^n$ is the inclusion of an inner horn.

If $n \geq 3$, then every edge of $\mathcal{C} = \Delta^n$ is contained in the horn Λ^n_i; it follows that the morphism $\widetilde{F} : \mathcal{E}_0 \to \mathcal{E}$ induces a bijection $W_0 \xrightarrow{\sim} W$, so there is nothing to prove. We may therefore assume without loss of generality that $n = 2$. Let $w : X \to Z$ be a U-cocartesian of $\mathcal{E}$ which does not belong to the simplicial subset $\mathcal{E}_0 = \Lambda^2_1 \times_{\Delta^2} \mathcal{E}$, so that $U(X) = 0$ and $U(Z) = 2$. Since U is a cocartesian fibration, we can choose a U-cocartesian morphism $u : X \to Y$ with $U(Y) = 1$. Our assumption that u is U-cocartesian guarantees that there exists a 2-simplex of $\mathcal{E}'$ whose boundary is indicated in the diagram

$$\begin{tikzcd} & Y \arrow[dr, "v"] & \\ X \arrow[ur, "u"] \arrow[rr, "w"] & & Z. \end{tikzcd}$$

Invoking Corollary 5.1.2.4, we see that v is also U-cocartesian, so that u and v can be regarded as elements of W_0. It now suffices to observe that if $G : \mathcal{E} \to \mathcal{D}$ is any functor which carries both u and v to isomorphisms in $\mathcal{D}$, then G also carries w to an isomorphism in $\mathcal{D}$.

□

Proof of Theorem 7.4.3.6. Suppose we are given a pullback diagram of small simplicial sets

$$\begin{tikzcd} \mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\ \mathcal{C} \arrow[r] & \mathcal{C}^{\triangleright}, \end{tikzcd}$$

where U and $\overline{U}$ are cocartesian fibrations. Let W denote the collection of all U-cocartesian edges of $\mathcal{E}$, let $\mathbf{1}$ denote the cone point of $\mathcal{C}^{\triangleright}$, let $\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}}$ be a covariant refraction diagram (Definition 7.4.3.1). Assume first that Rf exhibits the ∞-category $\overline{\mathcal{E}}_{\mathbf{1}}$ as a localization of $\mathcal{E}$ with respect to W. We wish to show that the covariant transport representation $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleright}} : \mathcal{C}^{\triangleright} \to \mathcal{QC}$ is a colimit diagram in the ∞-category $\mathcal{QC}$.

Using Corollary 4.1.3.3, we can choose an inner anodyne morphism $\mathcal{C} \hookrightarrow \mathcal{C}'$, where $\mathcal{C}'$ is an ∞-category. Note that the induced map $\mathcal{C}^{\triangleright} \hookrightarrow \mathcal{C}'^{\triangleright}$ is also inner anodyne (Proposition 4.3.6.4). Applying Corollary 5.6.7.3, we can realize $\overline{U}$ as the pullback of a cocartesian fibration of ∞-categories $\overline{U}' : \overline{\mathcal{E}}' \to \mathcal{C}'^{\triangleright}$. Form a pullback diagram

02V9
$$\begin{tikzcd} \mathcal{E}' \arrow[r] \arrow[d, "U'"] & \overline{\mathcal{E}}' \arrow[d, "\overline{U}'"] \\ \mathcal{C}' \arrow[r] & \mathcal{C}'^{\triangleright}, \end{tikzcd} \tag{7.46}$$

and let W' denote the collection of all U'-cocartesian morphisms of $\mathcal{E}'$. Using Proposition 7.4.3.3, we can choose a covariant refraction diagram $\mathrm{Rf}' : \mathcal{E}' \to \overline{\mathcal{E}}'_{\mathbf{1}} = \overline{\mathcal{E}}_{\mathbf{1}}$ for the cocartesian fibration $\overline{U}'$. Note that the restriction $\mathrm{Rf}|_{\mathcal{E}}$ is a covariant refraction collapse diagram for the cocartesian fibration $\overline{U}$, and is therefore isomorphic to Rf as an object of the ∞-category $\mathrm{Fun}(\mathcal{E}, \overline{\mathcal{E}}_{\mathbf{1}}$. It follows that $\mathrm{Rf}'|_{\mathcal{E}}$ also exhibits the ∞-category $\overline{\mathcal{E}}_{\mathbf{1}}$ as a localization of $\mathcal{E}$ with respect to W (Exercise 6.3.1.11). Applying Lemma 7.4.4.3, we see that Rf exhibits $\overline{\mathcal{E}}_{\mathbf{1}}$ as a localization of $\mathcal{E}'$ with respect to W.

Using Corollary 5.6.5.11, we can extend $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleright}}$ to a functor

$$\mathrm{Tr}_{\overline{\mathcal{E}}'/\mathcal{C}'^{\triangleright}} : \mathcal{C}'^{\triangleright} \to \mathcal{QC}$$

which is a covariant transport representation for $\overline{U}'$. Applying Proposition 7.4.4.2 to the diagram of ∞-categories (7.46), we deduce that $\mathrm{Tr}_{\overline{\mathcal{E}}'/\mathcal{C}'^{\triangleright}}$ is a colimit diagram in the ∞-category $\mathcal{QC}$. Since the inclusion map $\mathcal{C} \hookrightarrow \mathcal{C}'$ is right cofinal (Proposition 7.2.1.3), it follows that $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleright}}$ is also a colimit diagram in $\mathcal{QC}$, as desired.

We now prove the converse. Assume that the covariant transport representation $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleright}}$ is a colimit diagram in the ∞-category $\mathcal{QC}$; we wish to show that the covariant refraction diagram Rf exhibits $\overline{\mathcal{E}}_{\mathbf{1}}$ as a localization of $\mathcal{E}$ with respect to W. By virtue of Proposition 7.4.3.9 (and Remark 7.4.3.10), we can choose another pullback diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \mathcal{E}^{+} \arrow[d, "U^{+}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleright},
\end{tikzcd}$$

where U^{+} is a cocartesian fibration for which the covariant refraction diagram $\mathrm{Rf}^{+} : \mathcal{E} \to \mathcal{E}^{+}_{\mathbf{1}}$ exhibits $\mathcal{E}^{+}_{\mathbf{1}}$ as a localization of $\mathcal{E}$ with respect to W. Applying Corollary 5.6.5.11, we see that U^{+} admits a covariant transport representation $\mathrm{Tr}_{\mathcal{E}^{+}/\mathcal{C}^{\triangleright}} : \mathcal{C}^{\triangleright} \to \mathcal{QC}$ satisfying $(\mathrm{Tr}_{\mathcal{E}^{+}/\mathcal{C}^{\triangleright}})|_{\mathcal{C}} = (\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleright}})|_{\mathcal{C}}$. The first part of the proof shows that $\mathrm{Tr}_{\mathcal{E}^{+}/\mathcal{C}^{\triangleright}}$ is also a colimit diagram in the ∞-category $\mathcal{QC}$, and is therefore isomorphic to $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleright}}$ as an object of the ∞-category $\mathrm{Fun}(\mathcal{C}^{\triangleright}, \mathcal{QC})$. Applying Theorem 5.6.0.2, we see $\overline{U} : \overline{\mathcal{E}} \to \mathcal{C}^{\triangleright}$ and $U^{+} : \mathcal{E}^{+} \to \mathcal{C}^{\triangleright}$ are equivalent as cocartesian fibrations over $\mathcal{C}^{\triangleright}$. Applying Exercise 7.4.3.8, we conclude that Rf also exhibits $\overline{\mathcal{E}}_{\mathbf{1}}$ as a localization of $\mathcal{E}$ with respect to W, as desired. □

7.4.5 Limits and Colimits of Spaces

Let $\mathcal{S}$ denote the ∞-category of spaces (Construction 5.5.1.1), which we regard as a full subcategory of the ∞-category $\mathcal{QC}$ (Remark 5.5.4.8). Our goal in this section is to describe limits and colimits in the ∞-category $\mathcal{S}$. Given the results of §7.4.1 and §7.4.3, this is a relatively formal exercise. We begin with an elementary observation: 02VA

`02VB` **Proposition 7.4.5.1.** *Let $f : K \to \mathcal{S}$ be a diagram. Then:*

- *An extension $\overline{f} : K^{\triangleleft} \to \mathcal{S}$ is a limit diagram if and only if it is a limit diagram in the ∞-category $\mathcal{QC}$.*
- *An extension $\overline{f} : K^{\triangleright} \to \mathcal{S}$ is a colimit diagram if and only if it is a colimit diagram in the ∞-category $\mathcal{QC}$.*

Proof. It follows immediately from the definitions that a diagram in $\mathcal{S}$ which is a limit (or colimit) diagram in the larger ∞-category $\mathcal{QC}$, then it is already a limit (or colimit) diagram in $\mathcal{S}$ (see Variant 7.1.3.10). To prove the converse implications, we must show that the inclusion functor $\iota : \mathcal{S} \to \mathcal{QC}$ preserves all limits and colimits. This follows from Corollary 7.1.3.21, since the functor ι admits both left and right adjoints (Example 6.2.2.16). □

`02VC` **Corollary 7.4.5.2.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a left fibration between small simplicial sets and let $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \to \mathcal{S}$ be a covariant transport representation for U. Then the simplicial set $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ of sections of U is a Kan complex, which is a limit of the diagram $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ in the ∞-category $\mathcal{S}$.*

Proof. Since U is a left fibration, Corollary 4.4.2.4 guarantees that the simplicial set $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is a Kan complex. Note that every edge of $\mathcal{E}$ is U-cocartesian (Example 5.1.1.3), so that $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ coincides with the ∞-category $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ of cocartesian sections of U. Applying Corollary 7.4.1.9, we see that the Kan complex $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is a limit of the diagram $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ in the ∞-category $\mathcal{QC}$, and therefore also in the full subcategory $\mathcal{S} \subseteq \mathcal{QC}$ (Proposition 7.4.5.1). □

`02VD` **Corollary 7.4.5.3.** *Let $\mathcal{C}$ be a small simplicial set. Then any diagram $\mathscr{F} : \mathcal{C} \to \mathcal{S}$ admits a limit in the ∞-category $\mathcal{S}$, given by the ∞-category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \int_{\mathcal{C}} \mathscr{F})$.*

Proof. Apply Corollary 7.4.5.2 to the left fibration $U : \int_{\mathcal{C}} \mathscr{F} \to \mathcal{C}$ of Example 5.6.2.9. □

`02VE` **Corollary 7.4.5.4.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a left fibration between small simplicial sets and let $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \to \mathcal{S}$ be a covariant transport representation for U. Then the diagram $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ admits a colimit in the ∞-category $\mathcal{S}$. Moreover, a Kan complex X is a colimit of $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ if and only if there exists a weak homotopy equivalence $\mathcal{E} \to X$.*

Proof. Since U is a left fibration, every edge of $\mathcal{E}$ is U-cocartesian (Example 5.1.1.3). Let W be the collection of all U-cocartesian edges of $\mathcal{E}$. By virtue of Corollary 7.4.3.11, an ∞-category X is a colimit of $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ in the ∞-category $\mathcal{QC}$ if and only if there exists a functor $f : \mathcal{E} \to X$ which exhibits X as a localization of $\mathcal{E}$ with respect to W. By virtue of Proposition 6.3.1.20, this is equivalent to the requirement that X is a Kan complex and that f is a weak homotopy equivalence. In this case, X is also a colimit of the diagram $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ in the full subcategory $\mathcal{S} \subseteq \mathcal{QC}$ (Proposition 7.4.5.1). □

Corollary 7.4.5.5. *Let $\mathcal{C}$ be a small simplicial set. Then any diagram $\mathscr{F} : \mathcal{C} \to \mathcal{S}$ admits a colimit in the ∞-category $\mathcal{S}$. Moreover, a Kan complex X is a colimit of the diagram $\mathscr{F}$ if and only if there exists a weak homotopy equivalence $\int_{\mathcal{C}} \mathscr{F} \to X$.* 02VF

Proof. Apply Corollary 7.4.5.4 to the left fibration $U : \int_{\mathcal{C}} \mathscr{F} \to \mathcal{C}$ of Example 5.6.2.9. □

Corollary 7.4.5.6. *The ∞-category $\mathcal{S}$ is complete and cocomplete.* 02VG

Proof. Combine Corollaries 7.4.5.5 and 7.4.5.3 □

Remark 7.4.5.7 (Size Estimates for Colimits)**.** Let λ be an uncountable cardinal and let $\kappa = \mathrm{cf}(\lambda)$ be its cofinality. Suppose we are given a diagram $\mathscr{F} : \mathcal{C} \to \mathcal{S}$, where $\mathcal{C}$ is a κ-small simplicial set, and that the Kan complex $\mathscr{F}(C)$ is essentially λ-small for each $C \in \mathcal{C}$. Then the colimit $\varinjlim(\mathscr{F})$ is also essentially λ-small. This follows from Corollary 7.4.3.15 and Proposition 7.4.5.1. 03UA

Variant 7.4.5.8 (Size Estimates for Limits)**.** Let λ be an uncountable cardinal and let $\kappa = \mathrm{ecf}(\lambda)$ be its exponential cofinality. Suppose we are given a diagram $\mathscr{F} : \mathcal{C} \to \mathcal{S}$, where $\mathcal{C}$ is a κ-small simplicial set, and that the Kan complex $\mathscr{F}(C)$ is essentially λ-small for each $C \in \mathcal{C}$. Then the limit $\varprojlim(\mathscr{F})$ is also essentially λ-small. This follows from Corollary 7.4.1.13 and Proposition 7.4.5.1. 03UB

Remark 7.4.5.9 (Limits of Truncated Spaces)**.** Let n be an integer. Suppose we are given a diagram $\mathscr{F} : \mathcal{C} \to \mathcal{S}$ such that, for every vertex $C \in \mathcal{C}$, the Kan complex $\mathscr{F}(C)$ is n-truncated. Then the limit $\varprojlim(\mathscr{F})$ is n-truncated. For $n \geq -1$, this follows by combining Corollary 7.4.1.12 with Example 4.8.2.4. For $n \leq -2$, our assumption ensures that each of the Kan complexes $\mathscr{F}(C)$ is contractible, and we wish to show that the Kan complex $\varprojlim(\mathscr{F})$ is also contractible. This follows from the description given in Corollary 7.4.5.3, since the projection map $U : \int_{\mathcal{C}} \mathscr{F} \to \mathcal{C}$ is a trivial Kan fibration (see Proposition 4.4.2.14). 05E2

Corollary 7.4.5.10. *Let n be an integer, let $\mathcal{C}$ be a simplicial set and let $\mathscr{F} : \mathcal{C} \to \mathcal{S}$ be a diagram. Suppose that, for every vertex $C \in \mathcal{C}$, the Kan complex $\mathscr{F}(C)$ is n-truncated. Then the limit $\varprojlim(\mathscr{F})$ is an n-truncated Kan complex.∞-category.* 05E3

Proposition 7.4.5.11. *Let $\mathcal{C}$ be an ∞-category and let $f : K \to \mathcal{C}$ be a morphism of simplicial sets. The following conditions are equivalent:* 04K3

(1) *The morphism f is right cofinal (Definition 7.2.1.1).*

(2) *For every corepresentable functor $h : \mathcal{C} \to \mathcal{S}$, the composite map $K \xrightarrow{f} \mathcal{C} \xrightarrow{h} \mathcal{S}$ has a contractible colimit.*

Proof. Fix an object $X \in \mathcal{C}$, and let $h^X : \mathcal{C} \to \mathcal{S}^{<\kappa}$ be a functor corepresented by X (Theorem 5.6.6.13). Using Proposition 5.6.6.21, we see that $f \circ h^X$ is a covariant transport representation for the left fibration $K \times_{\mathcal{C}} \mathcal{C}_{X/} \to K$. Using Corollary 7.4.5.4, we can reformulate condition (2) as follows:

$(2')$ For each object $X \in \mathcal{C}$, the simplicial set $K \times_{\mathcal{C}} \mathcal{C}_{X/}$ is weakly contractible.

The equivalence $(1) \Leftrightarrow (2')$ follows from Theorem 7.2.3.1. □

For strictly commutative diagrams, we can use the results of §5.3 to give an alternative construction.

039K **Corollary 7.4.5.12.** *Let $\mathcal{C}$ be a small category and let $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$ be a (strictly commutative) diagram of Kan complexes indexed by $\mathcal{C}$. Then a Kan complex X is a colimit of the functor $\mathrm{N}_\bullet^{\mathrm{hc}}(\mathscr{F}) : \mathrm{N}_\bullet(\mathcal{C}) \to \mathcal{S}$ if and only if it is weakly homotopy equivalent to the weighted nerve $\mathrm{N}_\bullet^{\mathscr{F}}(\mathcal{C})$ of Definition 5.3.3.1.*

Proof. Combine Corollary 7.4.5.4 with Example 5.6.5.6. □

For many applications, it will be useful to have more precise versions of the preceding results, which characterize limit and colimit *diagrams* in the ∞-category $\mathcal{S}$.

02VH **Corollary 7.4.5.13.** *Suppose we are given a pullback diagram of small simplicial sets*

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleleft},
\end{tikzcd}$$

where U and $\overline{U}$ are left fibrations. The following conditions are equivalent:

(1) *The restriction map*

$$\mathrm{Fun}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}}) \to \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$$

is a homotopy equivalence of Kan complexes.

(2) *The covariant transport representation $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleleft}} : \mathcal{C}^{\triangleleft} \to \mathcal{S}$ is a limit diagram in the ∞-category $\mathcal{S}$.*

Proof. Since $\overline{U}$ is a left fibration, every edge of $\overline{\mathcal{E}}$ is $\overline{U}$-cocartesian (Example 5.1.1.3). We can therefore identify $\mathrm{Fun}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}})$ and $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ with the ∞-categories $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}})$ and $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$, respectively. The desired result now follows by combining Theorem 7.4.1.1 with Proposition 7.4.5.1. □

As an application, we prove a converse of Corollary 7.2.2.3:

Corollary 7.4.5.14. *Let $e : \mathcal{C}' \to \mathcal{C}$ be a morphism of simplicial sets. Then e is left cofinal if and only if it satisfies the following condition:* 03E7

$(*)$ *For every limit diagram $\overline{F} : \mathcal{C}^{\triangleleft} \to \mathcal{S}$, the composition $(\overline{F} \circ e^{\triangleleft}) : \mathcal{C}'^{\triangleleft} \to \mathcal{S}$ is also a limit diagram.*

Proof. Assume that condition $(*)$ is satisfied; we will show that e is left cofinal (the reverse implication is a special case of Corollary 7.2.2.3). Fix a left fibration $U : \mathcal{E} \to \mathcal{C}$; we wish to show that the restriction map

$$e^* : \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \to \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}', \mathcal{E})$$

is a homotopy equivalence of Kan complexes. Using Proposition 7.4.1.6 (together with Remark 7.4.1.8), we can extend U to a left fibration $\overline{U} : \overline{\mathcal{E}} \to \mathcal{C}^{\triangleleft}$ for which the restriction map

$$T : \mathrm{Fun}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}}) \to \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$$

is a homotopy equivalence.

Form a pullback diagram of simplicial sets

$$\begin{tikzcd}
\overline{\mathcal{E}}' \arrow[r] \arrow[d, "\overline{U}'"] & \overline{\mathcal{E}} \arrow[d, "U"] \\
\mathcal{C}'^{\triangleleft} \arrow[r, "e"] & \mathcal{C}^{\triangleleft}.
\end{tikzcd}$$

Let $\overline{F} : \mathcal{C}^{\triangleleft} \to \mathcal{S}$ be a covariant transport representation for the left fibration $\overline{U}$, so that $\overline{F} \circ e^{\triangleleft}$ is a covariant transport representation for the left fibration $\overline{U}'$. It follows from the criterion of Corollary 7.4.5.13 that $\overline{F}$ is a limit diagram in the ∞-category $\mathcal{S}$. Applying assumption $(*)$, we see that $\overline{F} \circ e^{\triangleleft}$ is also a limit diagram in the ∞-category $\mathcal{S}$. We therefore have a commutative diagram of restriction maps

$$\begin{tikzcd}
\mathrm{Fun}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}'^{\triangleleft}, \overline{\mathcal{E}}) \arrow[r, "T'"] \arrow[d, "(e^{\triangleleft})^*"] & \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}', \mathcal{E}) \arrow[d, "e^*"] \\
\mathrm{Fun}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}}) \arrow[r, "T"] & \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}),
\end{tikzcd}$$

where the horizontal maps are homotopy equivalences (Corollary 7.4.5.13). Consequently, to show that e^* is a homotopy equivalence, it will suffice to show that $(e^{\triangleleft})^*$ is a homotopy equivalence. We now observe that $(e^{\triangleleft})^*$ fits into a commutative diagram

$$\begin{tikzcd}
\mathrm{Fun}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}'^{\triangleleft}, \overline{\mathcal{E}}) \arrow[dd, "(e^{\triangleleft})^*"] \arrow[dr] & \\
& \{\mathbf{0}\} \times_{\mathcal{C}^{\triangleleft}} \overline{\mathcal{E}} \\
\mathrm{Fun}_{/\mathcal{C}^{\triangleleft}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}}), \arrow[ur] &
\end{tikzcd}$$

where the horizontal maps are given by evaluation at the cone points of the simplicial sets $\mathcal{C}^{\triangleleft}$ and $\mathcal{C}'^{\triangleleft}$ are are therefore trivial Kan fibrations (Corollary 5.3.1.23). $\square$

`02VJ` **Corollary 7.4.5.15.** *Suppose we are given a pullback diagram of small simplicial sets*

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \overline{\mathcal{E}} \arrow[d, "\overline{U}"] \\
\mathcal{C} \arrow[r] & \mathcal{C}^{\triangleright},
\end{tikzcd}$$

where U and $\overline{U}$ are left fibrations. The following conditions are equivalent:

(1) *The inclusion map $\mathcal{E} \hookrightarrow \overline{\mathcal{E}}$ is a weak homotopy equivalence of simplicial sets.*

(2) *The inclusion map $\mathcal{E} \hookrightarrow \overline{\mathcal{E}}$ is left cofinal.*

(3) *The covariant transport representation $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleright}} : \mathcal{C}^{\triangleright} \to \mathcal{S}$ is a colimit diagram in the ∞-category $\mathcal{S}$.*

Proof. Let $\mathbf{1}$ denote the cone point of $\mathcal{C}^{\triangleright}$, and let $\overline{\mathcal{E}}_{\mathbf{1}} = \{\mathbf{1}\} \times_{\mathcal{C}^{\triangleright}} \overline{\mathcal{E}}$ denote the corresponding fiber of $\overline{\mathcal{E}}$. Since the inclusion map $\{\mathbf{1}\} \hookrightarrow \mathcal{C}^{\triangleright}$ is right anodyne (Example 4.3.7.11), the inclusion $\iota : \overline{\mathcal{E}}_{\mathbf{1}} \hookrightarrow \overline{\mathcal{E}}$ is also right anodyne (Corollary 7.2.3.13). In particular, ι is a weak homotopy equivalence of simplicial sets. Let $\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}}$ be a covariant refraction diagram (Proposition 7.4.3.3), so that the inclusion map $\mathcal{E} \hookrightarrow \overline{\mathcal{E}}$ is homotopic to the composition $\iota \circ \mathrm{Rf}$. It follows that condition (1) can be reformulated as follows:

$(1')$ The covariant refraction diagram $\mathrm{Rf} : \mathcal{E} \to \overline{\mathcal{E}}_{\mathbf{1}}$ is a weak homotopy equivalence.

The equivalence $(1') \Leftrightarrow (3)$ follows by combining Proposition 7.4.5.1, Theorem 7.4.3.6, and Proposition 6.3.1.20.

The implication $(2) \Rightarrow (1)$ follows from Proposition 7.2.1.5. We will complete the proof by showing that $(1')$ implies (2). Choose an inner anodyne monomorphism $\mathcal{C} \hookrightarrow \mathcal{C}'$, where K' is an ∞-category. Then the induced map $\mathcal{C}^{\triangleright} \to \mathcal{C}'^{\triangleright}$ is also inner anodyne (Corollary 4.3.6.6); in particular, it is a categorical equivalence. Using Proposition 5.6.7.2 (and Remark 5.6.7.4), we can assume that $\overline{U}$ is the pullback of a left fibration $\overline{U}' : \overline{\mathcal{E}}' \to \mathcal{C}'^{\triangleright}$. Setting $\mathcal{E}' = \mathcal{C}' \times_{\mathcal{C}'^{\triangleright}} \overline{\mathcal{E}}'$, we have a commutative diagram of inclusion maps

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d] & \overline{\mathcal{E}} \arrow[d] \\
\mathcal{E}' \arrow[r] & \overline{\mathcal{E}}',
\end{tikzcd}$$

where the vertical maps are categorical equivalences (Corollary 5.6.7.6). Consequently, to prove that the inclusion map $\mathcal{E} \hookrightarrow \overline{\mathcal{E}}$ is left cofinal, it will suffice to show that the inclusion $\mathcal{E}' \hookrightarrow \overline{\mathcal{E}}'$ is left cofinal (Corollary 7.2.1.22). We may therefore replace $\overline{U}$ by the left fibration $\overline{U}' : \overline{\mathcal{E}}' \to \mathcal{C}'^{\triangleright}$, and thereby reduce to proving the implication $(1') \Rightarrow (2)$ under the assumption that $\mathcal{C}$ is an ∞-category.

Let $\mathcal{E} \tilde{\times}_{\overline{\mathcal{E}}} \overline{\mathcal{E}}_{\mathbf{1}}$ denote the oriented fiber product of Definition 4.6.4.1, and consider the projection maps

$$\mathcal{E} \xleftarrow{\pi} \mathcal{E} \tilde{\times}_{\overline{\mathcal{E}}} \overline{\mathcal{E}}_{\mathbf{1}} \xrightarrow{\pi'} \overline{\mathcal{E}}_{\mathbf{1}}.$$

The functor π is a trivial Kan fibration, and the refraction functor Rf is obtained by composing π' with a choice of section of π. Consequently, assumption $(1')$ guarantees that π' is a weak homotopy equivalence of simplicial sets. For each vertex $X \in \overline{\mathcal{E}}_{\mathbf{1}}$, we have a pullback diagram of simplicial sets

048A

$$\begin{tikzcd}
\mathcal{E} \tilde{\times}_{\overline{\mathcal{E}}} \{X\} \arrow[r] \arrow[d] & \{X\} \arrow[d] \\
\mathcal{E} \tilde{\times}_{\overline{\mathcal{E}}} \overline{\mathcal{E}}_{\mathbf{1}} \arrow[r, "\pi"] & \overline{\mathcal{E}}_{\mathbf{1}}.
\end{tikzcd} \tag{7.47}$$

Since π' is an isofibration of ∞-categories (Corollary 5.3.7.3), the diagram(7.47) is a categorical pullback square (Corollary 4.5.2.27). Because $\overline{\mathcal{E}}_{\mathbf{1}}$ is a Kan complex, the diagram (7.47) is also a homotopy pullback square (Variant 4.5.2.11). Our assumption that π' is a weak homotopy equivalence guarantees that the upper horizontal map is also a weak homotopy equivalence: that is, the simplicial set $\mathcal{E} \tilde{\times}_{\overline{\mathcal{E}}} \{X\}$ is weakly contractible (Corollary 3.4.1.5). Condition (2) now follows by allowing the object X to vary and applying the criterion of of Theorem 7.2.3.1 (together with Remark 7.2.3.2). □

05JA **Corollary 7.4.5.16.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a left fibration of ∞-categories, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and set $\mathcal{E}^0 = \mathcal{E} \times_{\mathcal{C}} \mathcal{C}^0$. The following conditions are equivalent:*

(1) *The covariant transport representation $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \to \mathcal{S}$ is left Kan extended from $\mathcal{C}^0$.*

(2) *The inclusion functor $\mathcal{E}^0 \hookrightarrow \mathcal{E}$ is left cofinal.*

Proof. Fix an object $C \in \mathcal{C}$ and set $\mathcal{C}^0_{/C} = \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C}$. Note that the inclusion map $\mathcal{C}^0_{/C} \to \mathcal{C}_{/C}$ factors as a composition

$$\mathcal{C}^0_{/C} \hookrightarrow (\mathcal{C}^0_{/C})^{\triangleright} \xrightarrow{\lambda} \mathcal{C}_{/C},$$

where λ carries the cone point $(\mathcal{C}^0_{/C})^{\triangleright}$ to the final object $\mathrm{id}_C \in \mathcal{C}_{/C}$. In particular, λ is right cofinal (Corollary 7.2.1.9). It follows that the induced map $\lambda_{\mathcal{E}} : \mathcal{E} \times_{\mathcal{C}} (\mathcal{C}^0_{/C})^{\triangleright} \to \mathcal{E} \times_{\mathcal{C}} \mathcal{C}_{/C}$ is also right cofinal (Proposition 7.2.3.12); in particular, $\lambda_{\mathcal{E}}$ is a weak homotopy equivalence (Proposition 7.2.1.5). Combining this observation with Corollary 7.4.5.15, we see that the following conditions are equivalent:

(1_C) The covariant transport representation $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ is left Kan extended from $\mathcal{C}^0$ at the object $C \in \mathcal{C}$.

($1'_C$) The inclusion map $\iota_C : \mathcal{E} \times_{\mathcal{C}} \mathcal{C}^0_{/C} \hookrightarrow \mathcal{E} \times_{\mathcal{C}} \mathcal{C}_{/C}$ is a weak homotopy equivalence.

Choose an object $X \in \mathcal{E}$ satisfying $U(X) = C$ and set $\mathcal{E}^0_{/X} = \mathcal{E}^0 \times_{\mathcal{E}} \mathcal{E}_{/X}$, so that we have a pullback diagram of simplicial sets

05JB
$$\begin{tikzcd}
\mathcal{E}^0_{/X} \arrow[r] \arrow[d] & \mathcal{E}_{/X} \arrow[d] \\
\mathcal{E} \times_{\mathcal{C}} \mathcal{C}^0_{/C} \arrow[r, "\iota_C"] & \mathcal{E} \times_{\mathcal{C}} \mathcal{C}_{/C} .
\end{tikzcd} \tag{7.48}$$

Since U is a left fibration, the vertical maps in this diagram are Kan fibrations; it follows that (7.48) is also a homotopy pullback square (Example 3.4.1.3). In particular, if condition ($1'_C$) is satisfied, then the inclusion map $\mathcal{E}^0_{/X} \hookrightarrow \mathcal{E}_{/X}$ is a weak homotopy equivalence (Corollary 3.4.1.5), so that the ∞-category $\mathcal{E}^0_{/X}$ is weakly contractible. Conversely, if $\mathcal{E}^0_{/X}$ is weakly contractible for *every* object $X \in \mathcal{C}$ satisfying $U(X) = C$, then ι_C is a weak homotopy equivalence: this follows from the observation that every connected component of $\mathcal{E} \times_{\mathcal{C}} \mathcal{C}_{/C}$ has nonempty intersection with the fiber $\mathcal{E}_C = \mathcal{E} \times_{\mathcal{C}} \{C\}$. It follows that ($1'_C$) can be reformulated as follows:

(2_C) For every object $X \in \mathcal{E}$ satisfying $U(X) = C$, the ∞-category $\mathcal{E}^0_{/X}$ is weakly contractible.

The equivalence of (1) and (2) now follows from the equivalence $(1_C) \Leftrightarrow (2_C)$ by allowing the object $C \in \mathcal{C}$ to vary (and applying Theorem 7.2.3.1). □

We conclude this section with an application of Corollary 7.4.5.13.

Proposition 7.4.5.17. *Let $\mathcal{C}$ be a locally small ∞-category and let K be a small simplicial set. Then a morphism $F : K^{\triangleleft} \to \mathcal{C}$ is a limit diagram if and only if, for every object $X \in \mathcal{C}$, the composition* 039L

$$K^{\triangleleft} \xrightarrow{F} \mathcal{C} \xrightarrow{h^X} \mathcal{S}$$

is a limit diagram in the ∞-category of spaces; here h^X denotes the functor corepresented by X (Notation 5.6.6.14).

Proof. Applying Proposition 7.1.5.12, we see that F is a limit diagram if and only if, for every object $X \in \mathcal{C}$, the restriction map

$$\theta_X : \mathrm{Hom}_{\mathrm{Fun}(K^{\triangleleft},\mathcal{C})}(\underline{X}, F) \to \mathrm{Hom}_{\mathrm{Fun}(K,\mathcal{C})}(\underline{X}|_K, F|_K)$$

is a homotopy equivalence of Kan complexes. Let $\mathcal{E}$ denote the oriented fiber product $\{X\} \tilde{\times}_{\mathcal{C}} \mathcal{C}$ and let $U : \mathcal{E} \to \mathcal{C}$ be given by projection onto the second factor. Note that U is a left fibration (Proposition 4.6.4.11) and that θ_X can be identified with the restriction map

$$\mathrm{Fun}_{/\mathcal{C}}(K^{\triangleleft}, \mathcal{E}) \to \mathrm{Fun}_{/\mathcal{C}}(K, \mathcal{E}).$$

The identity morphism id_X can be viewed as an initial object of $\mathcal{E}$ satisfying $U(\mathrm{id}_X) = X$ (Proposition 4.6.7.22), so the corepresentable functor $h^X : \mathcal{C} \to \mathcal{S}$ is a covariant transport representation for U (Proposition 5.6.6.21). Applying Corollary 7.4.5.13, we see that θ_X is a homotopy equivalence if and only if $h^X \circ F$ is a limit diagram in the ∞-category $\mathcal{S}$. □

Corollary 7.4.5.18. *Let $\mathcal{C}$ be a locally small ∞-category. For every object $X \in \mathcal{C}$, the functors* 039M

$$h^X : \mathcal{C} \to \mathcal{S} \qquad h_X : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}$$

preserve K-indexed limits, for every small simplicial set K.

Remark 7.4.5.19. Let λ be an uncountable cardinal and let $\mathcal{C}$ be an ∞-category which is locally λ-small. Let $\kappa = \mathrm{ecf}(\lambda)$ be the exponential cofinality of λ and let K be a κ-small simplicial set. Then, in the statements of Proposition 7.4.5.17 and Corollary 7.4.5.18, we can replace $\mathcal{S}$ by the ∞-category $\mathcal{S}^{<\lambda}$ of λ-small spaces (see Variant 7.4.5.8). 03V0

7.5 Homotopy Limits and Colimits

039Y Let $\mathcal{C}$ be a small category, and let $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$ be a diagram of Kan complexes indexed by $\mathcal{C}$. Recall that the diagram $\mathscr{F}$ has a limit $\varprojlim(\mathscr{F})$ in the category of simplicial sets, given concretely by the formula

$$\varprojlim(\mathscr{F})(C)_n = \varprojlim_{C \in \mathcal{C}} \mathscr{F}(C)_n$$

(Remark 1.1.0.8). However, from the perspective of homotopy theory, the construction $\mathscr{F} \mapsto \varprojlim(\mathscr{F})$ is poorly behaved:

- Although each of the simplicial sets $\{\mathscr{F}(C)\}_{C \in \mathcal{C}}$ is assumed to be a Kan complex, the inverse limit $\varprojlim(\mathscr{F})$ need not be a Kan complex.

- If $\alpha : \mathscr{F} \to \mathscr{G}$ is a natural transformation between diagrams $\mathscr{F}, \mathscr{G} : \mathcal{C} \to \mathrm{Kan}$ which is a levelwise homotopy equivalence (Remark 4.5.6.2), then the induced map $\varprojlim(\mathscr{F}) \to \varprojlim(\mathscr{G})$ need not be a (weak) homotopy equivalence (see Warning 3.4.0.1).

These deficiencies can be remedied by working in the framework of ∞-categories. By passing to the homotopy coherent nerve, every functor of ordinary categories $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$ determines a functor of ∞-categories $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathscr{F}) : \mathrm{N}_{\bullet}(\mathcal{C}) \to \mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathrm{Kan}) = \mathcal{S}$. By virtue of Corollary 7.4.5.6, the ∞-category of spaces $\mathcal{S}$ admits all (small) limits and colimits. In particular, there exists a Kan complex X which is a limit of the diagram $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathscr{F})$. This construction has the advantage of being homotopy invariant: if $\alpha : \mathscr{F} \to \mathscr{G}$ is a levelwise homotopy equivalence, then X is also a limit of the diagram $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathscr{G})$ (see Remark 7.1.1.8). However, it has the disadvantage of being somewhat inexplicit: the Kan complex X is *a priori* well-defined only up to homotopy equivalence, rather than up to isomorphism.

By combining the results of §7.4 and §5.3, we can obtain a more direct description of the Kan complex X. Let $\mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C})$ denote the $\mathscr{F}$-weighted nerve of $\mathcal{C}$ (Definition 5.3.3.1). It follows from Example 5.6.5.6 that $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathscr{F})$ is a covariant transport representation for the left fibration $U : \mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C}) \to \mathrm{N}_{\bullet}(\mathcal{C})$. By virtue of Corollary 7.4.5.2, the Kan complex $\mathrm{Fun}_{/\mathrm{N}_{\bullet}(\mathcal{C})}(\mathrm{N}_{\bullet}(\mathcal{C}), \mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C}))$ is a limit of the diagram $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathscr{F})$. We will denote this Kan complex by $\mathrm{ho}\varprojlim(\mathscr{F})$ and refer to it as the *homotopy limit* of the diagram $\mathscr{F}$ (Construction 7.5.1.1). In §7.5.1, we give review some elementary properties of this construction (which goes back to the work of Bousfield and Kan; see [6]).

In §7.5.2, we extend the definition of the homotopy limit $\mathrm{ho}\varprojlim(\mathscr{F})$ to the case where $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ is a diagram of ∞-categories (rather than a diagram of Kan complexes). In this case, the projection map $U : \mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C}) \to \mathrm{N}_{\bullet}(\mathcal{C})$ is a cocartesian fibration (rather than a left fibration), and we define $\mathrm{ho}\varprojlim(\mathscr{F})$ to be the ∞-category of *cocartesian* sections of U (that is, sections which carry each morphism of $\mathcal{C}$ to a U-cocartesian morphism of $\mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C})$:

see Construction 7.5.2.1). It follows from the results of §7.4 that $\mathrm{ho}\varprojlim(\mathscr{F})$ is a limit of the diagram of ∞-categories $\mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathscr{F}) : \mathrm{N}_{\bullet}(\mathcal{C}) \to \mathcal{QC}$ (Proposition 7.5.2.6).

In §7.5.3, we consider another perspective on the homotopy limit construction $\mathscr{F} \mapsto \mathrm{ho}\varprojlim(\mathscr{F})$: it can be viewed as a *right derived functor* of the usual inverse limit $\mathscr{F} \mapsto \varprojlim(\mathscr{F})$. More precisely, for every diagram of ∞-categories $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$, there is a canonical isomorphism $\mathrm{ho}\varprojlim(\mathscr{F}) \simeq \varprojlim(\mathscr{F}^{+})$, where $\mathscr{F}^{+} : \mathcal{C} \to \mathrm{QCat}$ is an *isofibrant replacement* for the diagram $\mathscr{F}$ (see Construction 7.5.3.3 and Proposition 7.5.3.7). In particular, there is a tautological map $\varprojlim(\mathscr{F}) \hookrightarrow \mathrm{ho}\varprojlim(\mathscr{F})$ (see Remark 7.5.2.12), which is an equivalence of ∞-categories when the diagram $\mathscr{F}$ is already isofibrant (Proposition 7.5.3.12). This condition is satisfied, for example, when the diagram $\mathscr{F}$ corresponds to a tower of ∞-categories

$$\cdots \to \mathcal{E}(3) \to \mathcal{E}(2) \to \mathcal{E}(1) \to \mathcal{E}(0)$$

in which the transition functors are isofibrations (see Example 7.5.3.13).

Let $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$ be a diagram of Kan complexes and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ be an extension of $\mathscr{F}$, carrying the initial object of $\mathcal{C}^{\triangleleft}$ to a Kan complex X. We say that $\overline{\mathscr{F}}$ is a *homotopy limit diagram* if the composite map

$$X \to \varprojlim(\mathscr{F}) \hookrightarrow \mathrm{ho}\varprojlim(\mathscr{F})$$

is a homotopy equivalence (Definition 7.5.4.1). In §7.5.4, we show that this condition is equivalent to the requirement that $\mathrm{N}_{\bullet}^{\mathrm{hc}}(\overline{\mathscr{F}})$ is a limit diagram in the ∞-category $\mathcal{S}$ (Proposition 7.5.4.5). Moreover, we extend the definition of homotopy limit diagram to the case where $\overline{\mathscr{F}}$ is an arbitrary diagram of simplicial sets (Definition 7.5.4.8), and show that it generalizes the notion of homotopy pullback diagram introduced in §3.4.1 (Proposition 7.5.4.13). In §7.5.5, we introduce the parallel (and closely related) notion of *categorical limit diagram* (Definition 7.5.5.11), and show that it generalizes the notion of categorical pullback square introduced in §4.5.2 (Corollary 7.5.5.10).

There is a close relationship between the homotopy limit construction $\mathscr{F} \mapsto \mathrm{ho}\varprojlim(\mathscr{F})$ of this section and the homotopy colimit construction $\mathscr{F} \mapsto \mathrm{ho}\varinjlim(\mathscr{F})$ introduced in §5.3.2. If $\mathscr{F} : \mathcal{C}^{\mathrm{op}} \to \mathrm{Set}_{\Delta}$ is a diagram of simplicial sets and X is a Kan complex, then there is a canonical isomorphism of simplicial sets

$$\mathrm{ho}\varprojlim(X^{\mathscr{F}})^{\mathrm{op}} \simeq \mathrm{Fun}(\mathrm{ho}\varinjlim(\mathscr{F}^{\mathrm{op}}), X^{\mathrm{op}}),$$

where $X^{\mathscr{F}} : \mathcal{C} \to \mathrm{Kan}$ denotes the functor given by $C \mapsto \mathrm{Fun}(\mathscr{F}(C), X)$ (Example 7.5.1.7; see Example 7.5.2.11 for a generalization to the case where X is an ∞-category). Just as the homotopy limit construction can be viewed as a *right* derived functor of the limit functor $\varprojlim : \mathrm{Fun}(\mathcal{C}, \mathrm{Set}_{\Delta}) \to \mathrm{Set}_{\Delta}$, the homotopy colimit construction can be viewed as a *left* derived functor of the colimit functor $\varinjlim : \mathrm{Fun}(\mathcal{C}, \mathrm{Set}_{\Delta}) \to \mathrm{Set}_{\Delta}$. More precisely, we show in §7.5.6 that the homotopy colimit of a diagram $\mathscr{F}$ is isomorphic to the colimit $\varinjlim(\mathscr{G})$, where $\mathscr{G}$ is a projectively cofibrant diagram of simplicial sets equipped with a levelwise weak homotopy equivalence $\alpha : \mathscr{G} \to \mathscr{F}$ (Construction 7.5.6.8).

In §7.5.7, we show that the homotopy colimit construction has a close relationship with the formation of colimits in the ∞-category $\mathcal{S}$. If $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$ is a diagram of Kan complexes, then a Kan complex is a colimit of the diagram $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathscr{F})$ if and only if it is weakly homotopy equivalent to $\mathrm{ho}\varinjlim(\mathscr{F})$ (Proposition 7.5.7.1). In fact, we can be more precise: if $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Kan}$ is a diagram extending $\mathscr{F}$ which carries the final object of $\mathcal{C}^{\triangleright}$ to a Kan complex X, then $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathscr{F})$ is a colimit diagram if and only if the composite map $\mathrm{ho}\varinjlim(\mathscr{F}) \twoheadrightarrow \varinjlim(\mathscr{F}) \to X$ is a weak homotopy equivalence (Corollary 7.5.7.7). If this condition is satisfied, we will say that $\overline{\mathscr{F}}$ is a *homotopy colimit diagram* (Definition 7.5.7.3). In §7.5.8, we introduce the parallel notion of *categorical colimit diagram* (Definition 7.5.8.2), which has a similar relationship with colimits in the ∞-category $\mathcal{QC}$ (Corollary 7.5.8.9).

7.5.1 Homotopy Limits of Kan Complexes

039Z In this section, we introduce the *homotopy limit* of a diagram of Kan complexes, following Bousfield and Kan (see [6]).

03A0 **Construction 7.5.1.1** (Homotopy Limits of Kan Complexes). Let $\mathcal{C}$ be a category, let $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$ be a diagram of Kan complexes indexed by $\mathcal{C}$, and $\mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C})$ denote the weighted nerve of $\mathscr{F}$ (Definition 5.3.3.1). We define

$$\mathrm{ho}\varprojlim(\mathscr{F}) = \mathrm{Fun}_{/\,\mathrm{N}_{\bullet}(\mathcal{C})}(\mathrm{N}_{\bullet}(\mathcal{C}), \mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C}))$$

to be the simplicial set which parametrizes sections of the projection map $\mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C}) \to \mathrm{N}_{\bullet}(\mathcal{C})$. We will refer to $\mathrm{ho}\varprojlim(\mathscr{F})$ as the *homotopy limit* of the diagram $\mathscr{F}$.

03A1 **Proposition 7.5.1.2.** *Let $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$ be a diagram of Kan complexes. Then the homotopy limit $\mathrm{ho}\varprojlim(\mathscr{F})$ is a Kan complex.*

Proof. This is a special case of Corollary 4.4.2.5, since the projection map $U : \mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C}) \to \mathrm{N}_{\bullet}(\mathcal{C})$ is a left fibration (Corollary 5.3.3.19). □

03A2 **Remark 7.5.1.3** (Homotopy Invariance). Let $\mathcal{C}$ be a category and let $\alpha : \mathscr{F} \to \mathscr{G}$ be a natural transformation between functors $\mathscr{F}, \mathscr{G} : \mathcal{C} \to \mathrm{Kan}$. Then α induces a morphism of weighted nerves $T : \mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C}) \to \mathrm{N}^{\mathscr{G}}_{\bullet}(\mathcal{C})$, and therefore a morphism of Kan complexes $\mathrm{ho}\varprojlim(\alpha) : \mathrm{ho}\varprojlim(\mathscr{F}) \to \mathrm{ho}\varprojlim(\mathscr{G})$. If α is a levelwise homotopy equivalence, then T is an equivalence of left fibrations over $\mathrm{N}_{\bullet}(\mathcal{C})$ (Corollary 5.3.3.20), so $\mathrm{ho}\varprojlim(\alpha)$ is a homotopy equivalence.

Warning 7.5.1.4. In [6], Bousfield and Kan define the homotopy limit of an arbitrary diagram $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ to be the simplicial set $\mathrm{Fun}_{/\mathrm{N}_{\bullet}(\mathcal{C})}(\mathrm{N}_{\bullet}(\mathcal{C}), \mathrm{N}_{\bullet}^{\mathscr{F}}(\mathcal{C}))$ appearing in Construction 7.5.1.1. We will avoid this convention for two reasons: 03A3

- Many important features of the Bousfield-Kan construction (such as the homotopy invariance property of Remark 7.5.1.3) are true for diagrams of Kan complexes, but not for general diagrams of simplicial sets.
- In the case where $\mathscr{F}$ is a diagram of ∞-categories, it will be convenient to adopt a slightly different definition of homotopy limit (Construction 7.5.2.1), which generally does not agree with the Bousfield-Kan construction.

Note that every (strictly commutative) diagram of Kan complexes $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$ determines a diagram

$$\mathrm{N}_{\bullet}^{\mathrm{hc}} : \mathrm{N}_{\bullet}(\mathcal{C}) \to \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathrm{Kan}) = \mathcal{S}$$

in the ∞-category of spaces $\mathcal{S}$.

Proposition 7.5.1.5. *Let $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$ be a diagram of Kan complexes. Then the Kan complex $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ is a limit of the diagram* 03A4

$$\mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathscr{F}) : \mathrm{N}_{\bullet}(\mathcal{C}) \to \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathrm{Kan}) = \mathcal{S}$$

in the ∞-category $\mathcal{S}$.

Proof. This is a special case of Corollary 7.4.5.2, since the functor $\mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathscr{F})$ is a covariant transport representation for the projection map $U : \mathrm{N}_{\bullet}^{\mathscr{F}}(\mathcal{C}) \to \mathrm{N}_{\bullet}(\mathcal{C})$ (Example 5.6.5.6). □

We now give a more concrete description of the homotopy limit.

Remark 7.5.1.6. Let $\mathcal{C}$ be a category. For each object $C \in \mathcal{C}$, let $\mathscr{E}(C)$ denote the simplicial set $\mathrm{N}_{\bullet}(\mathcal{C}_{/C})$. The construction $C \mapsto \mathscr{E}(C)$ determines a functor $\mathscr{E} : \mathcal{C} \to \mathrm{Set}_{\Delta}$, which we view as an object of the functor category $\mathrm{Fun}(\mathcal{C}, \mathrm{Set}_{\Delta})$. For every diagram of Kan complexes $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$, Proposition 5.3.3.24 supplies a canonical isomorphism 03A5

$$\underleftarrow{\mathrm{holim}}(\mathscr{F}) = \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathrm{Set}_{\Delta})}(\mathscr{E}, \mathscr{F})_{\bullet},$$

where the right hand side is defined using the simplicial enrichment of $\mathrm{Fun}(\mathcal{C}, \mathrm{Set}_{\Delta})$ described in Example 2.4.2.2.

Stated more concretely, we can identify $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ with a simplicial subset of the product $\prod_{C \in \mathcal{C}} \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathcal{C}_{/C}), \mathscr{F}(C))$, whose n-simplices are collections of maps $\{\sigma_C : \Delta^n \times \mathrm{N}_{\bullet}(\mathcal{C}_{/C}) \to \mathscr{F}(C)\}$ which satisfy the following condition:

$(*)$ For every morphism $f : C \to D$ in the category $\mathcal{C}$, the diagram of simplicial sets

$$\begin{tikzcd}
\Delta^n \times \mathrm{N}_\bullet(\mathcal{C}_{/C}) \arrow[r, "\circ f"] \arrow[d, "\sigma_C"] & \Delta^n \times \mathrm{N}_\bullet(\mathcal{C}_{/D}) \arrow[d, "\sigma_D"] \\
\mathscr{F}(C) \arrow[r, "\mathscr{F}(f)"] & \mathscr{F}(D)
\end{tikzcd}$$

is commutative.

In particular, we have an equalizer diagram of simplicial sets

$$\underleftarrow{\mathrm{holim}}(\mathscr{F}) \to \prod_C \mathrm{Fun}(\mathrm{N}_\bullet(\mathcal{C}_{/C}), \mathscr{F}(C)) \rightrightarrows \prod_{f:C\to D} \mathrm{Fun}(\mathrm{N}_\bullet(\mathcal{C}_{/C}), \mathscr{F}(D)).$$

03A6 **Example 7.5.1.7** (Duality with Homotopy Colimits)**.** Let $\mathscr{F} : \mathcal{C}^{\mathrm{op}} \to \mathrm{Set}_\Delta$ be a diagram of simplicial sets, let X be a Kan complex, and let $X^{\mathscr{F}} : \mathcal{C} \to \mathrm{Kan}$ be the diagram of Kan complexes given by the formula $X^{\mathscr{F}}(C) = \mathrm{Fun}(\mathscr{F}(C), X)$. Let us write $\mathscr{F}^{\mathrm{op}} : \mathcal{C}^{\mathrm{op}} \to \mathrm{Set}_\Delta$ for the functor given by the formula $\mathscr{F}^{\mathrm{op}}(C) = \mathscr{F}(C)^{\mathrm{op}}$, and let $\mathscr{E} : \mathcal{C} \to \mathrm{Set}_\Delta$ denote the functor given by $\mathscr{E}(C) = \mathrm{N}_\bullet(\mathcal{C}_{/C})$. Combining Remark 7.5.1.6 with Proposition 5.3.2.21, we obtain canonical isomorphisms

$$\begin{aligned}
\underleftarrow{\mathrm{holim}}(X^{\mathscr{F}})^{\mathrm{op}} &\simeq \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathrm{Set}_\Delta)}(\mathscr{E}, X^{\mathscr{F}})_\bullet^{\mathrm{op}} \\
&\simeq \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}},\mathrm{Set}_\Delta)}(\mathscr{F}, X^{\mathscr{E}})_\bullet^{\mathrm{op}} \\
&\simeq \mathrm{Fun}(\underrightarrow{\mathrm{holim}}(\mathscr{F}^{\mathrm{op}}), X^{\mathrm{op}}).
\end{aligned}$$

7.5.2 Homotopy Limits of ∞-Categories

03A7 We now extend the definition of homotopy limit to diagrams taking values in the category QCat.

03A8 **Construction 7.5.2.1** (Homotopy Limits of ∞-Categories)**.** Let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be a (strictly commutative) diagram of ∞-categories, let $\mathrm{N}_\bullet^{\mathscr{F}}(\mathcal{C})$ denote the weighted nerve of $\mathscr{F}$ (Definition 5.3.3.1), and let $U : \mathrm{N}_\bullet^{\mathscr{F}}(\mathcal{C}) \to \mathrm{N}_\bullet(\mathcal{C})$ the cocartesian fibration of Corollary 5.3.3.16. We let $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ denote the full subcategory

$$\mathrm{Fun}^{\mathrm{CCart}}_{/\,\mathrm{N}_\bullet(\mathcal{C})}(\mathrm{N}_\bullet(\mathcal{C}), \mathrm{N}_\bullet^{\mathscr{F}}(\mathcal{C})) \subseteq \mathrm{Fun}_{/\,\mathrm{N}_\bullet(\mathcal{C})}(\mathrm{N}_\bullet(\mathcal{C}), \mathrm{N}_\bullet^{\mathscr{F}}(\mathcal{C}))$$

whose objects are functors $G : \mathrm{N}_\bullet(\mathcal{C}) \to \mathrm{N}_\bullet^{\mathscr{F}}(\mathcal{C})$ which satisfy $U \circ G = \mathrm{id}_{\mathrm{N}_\bullet(\mathcal{C})}$ and which carry each morphism of $\mathcal{C}$ to a U-cocartesian morphism of $\mathrm{N}_\bullet^{\mathscr{F}}(\mathcal{C})$ (see Notation 5.3.1.10). We will refer to $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ as the *homotopy limit* of the diagram $\mathscr{F}$.

Example 7.5.2.2 (Homotopy Limits of Kan Complexes)**.** Let $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$ be a (strictly commutative) diagram of Kan complexes. Then the projection map $U : \mathrm{N}_{\bullet}^{\mathscr{F}}(\mathcal{C}) \to \mathrm{N}_{\bullet}(\mathcal{C})$ is a left fibration of simplicial sets (Corollary 5.3.3.19). It follows that every morphism of the ∞-category $\mathrm{N}_{\bullet}^{\mathscr{F}}(\mathcal{C})$ is U-cocartesian, so the homotopy limit $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ of Construction 7.5.2.1 coincides with the homotopy limit $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ of Construction 7.5.1.1. 03A9

Remark 7.5.2.3. Let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be a (strictly commutative) diagram of ∞-categories, let K be a simplicial set, and let $\mathscr{F}^K : \mathcal{C} \to \mathrm{QCat}$ denote the functor given on objects by the formula $\mathscr{F}^K(C) = \mathrm{Fun}(K, \mathscr{F}(C))$. Then there is a canonical isomorphism of simplicial sets $\underleftarrow{\mathrm{holim}}(\mathscr{F}^K) \simeq \mathrm{Fun}(K, \underleftarrow{\mathrm{holim}}(\mathscr{F}))$ (see Remarks 5.3.3.5 and 5.3.1.19). 03AA

Variant 7.5.2.4 (Homotopy Limits of Ordinary Categories)**.** Let Cat denote the (ordinary) category of categories, let $\mathscr{F} : \mathcal{C} \to \mathrm{Cat}$ be a functor, and let $\int_{\mathcal{C}} \mathscr{F}$ denote the category of elements of $\mathscr{F}$. We let $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ denote the category $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \int_{\mathcal{C}} \mathscr{F})$ whose objects are sections of the projection functor $U : \int_{\mathcal{C}} \mathscr{F} \to \mathcal{C}$ which carry each morphism of $\mathcal{C}$ to a U-cocartesian morphism of $\int_{\mathcal{C}} \mathscr{F}$. Let $\mathrm{N}_{\bullet}(\mathscr{F})$ denote the QCat-valued functor given by $C \mapsto \mathrm{N}_{\bullet}(\mathscr{F}(C))$. Combining Proposition 1.5.3.3 with Example 5.6.1.8, we obtain a canonical isomorphism of simplicial sets 03Y3

$$\underleftarrow{\mathrm{holim}}(\mathrm{N}_{\bullet}(\mathscr{F})) \simeq \mathrm{N}_{\bullet}(\underleftarrow{\mathrm{holim}}(\mathscr{F})).$$

In particular, the formation of homotopy limits preserves the full subcategory of QCat spanned by the (nerves of) ordinary categories.

Remark 7.5.2.5. Let $\mathscr{F} : \mathcal{C} \to \mathrm{Cat}$ be a functor of ordinary categories. Then the category $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ can be described more concretely as follows: 03Y4

(1) An $M \in \underleftarrow{\mathrm{holim}}(\mathscr{F})$ is a rule which assigns to each object $C \in \mathcal{C}$ an object $M(C) \in \mathscr{F})$, and to each morphism $u : C \to D$ in $\mathcal{C}$ an isomorphism $M(u) : \mathscr{F}(u)(M(C)) \xrightarrow{\sim} M(D)$, subject to the following constraints:

  - For each object $C \in \mathcal{C}$, $M(\mathrm{id}_C)$ is the identity morphism from $M(C)$ to itself.
  - For every pair of composable morphisms $u : C \to D$ and $v : D \to E$ of $\mathcal{C}$, we have $M(v \circ u) = M(v) \circ \mathscr{F}(v)(M(u))$.

(2) If M and N are objects of $\underleftarrow{\mathrm{holim}}(\mathscr{F})$, then a morphism $\alpha : M \to N$ in $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ is a rule which assigns to each object $C \in \mathcal{C}$ a morphism $\alpha_C : M(C) \to N(C)$ in the category $\mathscr{F}(C)$, subject to the following constraint:

- For every morphism $u : C \to D$ of $\mathcal{C}$, the diagram

$$\begin{tikzcd}
\mathscr{F}(u)(M(C)) \arrow[r, "M(u)", "\sim"'] \arrow[d, "\mathscr{F}(u)(\alpha_C)"] & M(D) \arrow[d, "\alpha_D"] \\
\mathscr{F}(u)(N(C)) \arrow[r, "N(u)", "\sim"'] & N(D)
\end{tikzcd}$$

commutes (in the category $\mathscr{F}(D)$).

03AB **Proposition 7.5.2.6.** *Let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be a (strictly commutative) diagram of ∞-categories. Then the homotopy limit $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ is an ∞-category. Moreover, $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ can be identified with a limit of the diagram*

$$\mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathscr{F}) : \mathrm{N}_{\bullet}(\mathcal{C}) \to \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathrm{QCat}) = \mathcal{QC}$$

in the ∞-category $\mathcal{QC}$.

Proof. By virtue of Example 5.6.5.6, the functor $\mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathscr{F})$ is a covariant transport representation for the cocartesian fibration $U : \mathrm{N}_{\bullet}^{\mathscr{F}}(\mathcal{C}) \to \mathrm{N}_{\bullet}(\mathcal{C})$. Proposition 7.5.2.6 is therefore a special case of Corollary 7.4.1.9. □

03AC **Remark 7.5.2.7** (Homotopy Invariance)**.** Let $\mathcal{C}$ be a category and let $\alpha : \mathscr{F} \to \mathscr{G}$ be a natural transformation between functors $\mathscr{F}, \mathscr{G} : \mathcal{C} \to \mathrm{QCat}$. Then α determines a commutative diagram of ∞-categories

$$\begin{tikzcd}
\mathrm{N}_{\bullet}^{\mathscr{F}}(\mathcal{C}) \arrow[rr, "T"] \arrow[dr, "U"'] & & \mathrm{N}_{\bullet}^{\mathscr{G}}(\mathcal{C}) \arrow[dl, "V"] \\
& \mathrm{N}_{\bullet}(\mathcal{C}). &
\end{tikzcd}$$

The functor T carries U-cocartesian morphisms of $\mathrm{N}_{\bullet}^{\mathscr{F}}(\mathcal{C})$ to V-cocartesian morphisms of $\mathrm{N}_{\bullet}^{\mathscr{G}}(\mathcal{C})$ (see Corollary 5.3.3.16), and therefore induces a functor of ∞-categories $\underleftarrow{\mathrm{holim}}(\alpha) : \underleftarrow{\mathrm{holim}}(\mathscr{F}) \to \underleftarrow{\mathrm{holim}}(\mathscr{G})$. If α is a levelwise categorical equivalence, then T is an equivalence of cocartesian fibrations over $\mathrm{N}_{\bullet}(\mathcal{C})$ (Corollary 5.3.3.20), so $\underleftarrow{\mathrm{holim}}(\alpha)$ is an equivalence of ∞-categories.

03AD **Example 7.5.2.8** (Homotopy Limits of Cores)**.** Let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be a diagram of ∞-categories, and let $\mathscr{F}^{\simeq} : \mathcal{C} \to \mathrm{Kan}$ be the functor given on objects by the formula

$\mathscr{F}^{\simeq}(C) = \mathscr{F}(C)^{\simeq}$. Then the inclusion map $\mathscr{F}^{\simeq} \hookrightarrow \mathscr{F}$ induces a monomorphism of simplicial sets $\underleftarrow{\mathrm{holim}}(\mathscr{F}^{\simeq}) \to \underleftarrow{\mathrm{holim}}(\mathscr{F})$, whose image is the core of the ∞-category $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ (see Example 5.3.3.21 and Remark 5.3.1.20). In other words, there is a canonical isomorphism of Kan complexes $\underleftarrow{\mathrm{holim}}(\mathscr{F}^{\simeq}) \simeq \underleftarrow{\mathrm{holim}}(\mathscr{F})^{\simeq}$.

Remark 7.5.2.9. Let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be a diagram of ∞-categories and let $\mathscr{F}_0 = \mathscr{F}|_{\mathcal{C}_0}$ be the restriction of $\mathscr{F}$ to a subcategory $\mathcal{C}_0 \subseteq \mathcal{C}$. Suppose that the inclusion $\mathrm{N}_{\bullet}(\mathcal{C}_0) \hookrightarrow \mathrm{N}_{\bullet}(\mathcal{C})$ is left anodyne (this condition is satisfied, for example, if the inclusion map $\mathcal{C}_0 \hookrightarrow \mathcal{C}$ has a right adjoint: see Corollary 7.2.3.7). Then the restriction map $\underleftarrow{\mathrm{holim}}(\mathscr{F}) \to \underleftarrow{\mathrm{holim}}(\mathscr{F}_0)$ is a trivial Kan fibration of ∞-categories (see Proposition 5.3.1.21). `03AE`

Remark 7.5.2.10. Let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be a diagram of ∞-categories. Arguing as in Remark 7.5.1.6, we can identify the homotopy limit $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ with a simplicial subset of the product $\prod_{C \in \mathcal{C}} \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathcal{C}_{/C}), \mathscr{F}(C))$, whose n-simplices are collections of maps $\{\sigma_C : \Delta^n \times \mathrm{N}_{\bullet}(\mathcal{C}_{/C}) \to \mathscr{F}(C)\}$ which satisfy the following pair of conditions: `03AF`

$(*)$ For every morphism $f : C \to D$ in the category $\mathcal{C}$, the diagram of simplicial sets

$$\begin{tikzcd}
\Delta^n \times \mathrm{N}_{\bullet}(\mathcal{C}_{/C}) \arrow[r, "\circ f"] \arrow[d, "\sigma_C"] & \Delta^n \times \mathrm{N}_{\bullet}(\mathcal{C}_{/D}) \arrow[d, "\sigma_D"] \\
\mathscr{F}(C) \arrow[r, "\mathscr{F}(f)"] & \mathscr{F}(D)
\end{tikzcd}$$

is commutative.

$(*')$ For every object $C \in \mathcal{C}$ and every integer $0 \leq i \leq n$, the composite map

$$\{i\} \times \mathrm{N}_{\bullet}(\mathcal{C}_{/C}) \hookrightarrow \Delta^n \times \mathrm{N}_{\bullet}(\mathcal{C}_{/C}) \xrightarrow{\sigma_C} \mathscr{F}(C)$$

carries every morphism in the category $\mathcal{C}_{/C}$ to an isomorphism in the ∞-category $\mathscr{F}(C)$.

Example 7.5.2.11 (Duality with Homotopy Colimits)**.** Let $\mathcal{C}$ be a category, let $\mathscr{F} : \mathcal{C}^{\mathrm{op}} \to \mathrm{Set}_{\Delta}$ be a diagram of simplicial sets, and let W denote the collection of horizontal edges of the homotopy colimit $\underrightarrow{\mathrm{holim}}(\mathscr{F}^{\mathrm{op}})$ (see Definition 5.3.4.1). Let $\mathcal{D}$ be an ∞-category and let $\mathcal{D}^{\mathscr{F}} : \mathcal{C} \to \mathrm{QCat}$ denote the functor given by the formula $\mathcal{D}^{\mathscr{F}}(C) = \mathrm{Fun}(\mathscr{F}(C), \mathcal{D})$. Arguing as in Example 7.5.1.7, we obtain a canonical isomorphism `03AG`

$$\theta : \mathrm{Fun}_{/\,\mathrm{N}_{\bullet}(\mathcal{C})}(\mathrm{N}_{\bullet}(\mathcal{C}), \mathrm{N}_{\bullet}^{\mathcal{D}^{\mathscr{F}}}(\mathcal{C}))^{\mathrm{op}} \simeq \mathrm{Fun}(\underrightarrow{\mathrm{holim}}(\mathscr{F}^{\mathrm{op}}), \mathcal{D}^{\mathrm{op}}).$$

Unwinding the definitions, we see that θ restricts to an isomorphism of ∞-categories $\underleftarrow{\mathrm{holim}}(\mathcal{D}^{\mathscr{F}})^{\mathrm{op}} \simeq \mathrm{Fun}(\underrightarrow{\mathrm{holim}}(\mathscr{F}^{\mathrm{op}})[W^{-1}], \mathcal{D}^{\mathrm{op}})$.

03AH **Remark 7.5.2.12** (Comparison with the Limit)**.** Let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be a diagram of ∞-categories and let $X = \varprojlim(\mathscr{F})$ denote the limit of $\mathscr{F}$, formed in the category of simplicial sets. Let $\underline{X} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ denote the constant functor taking the value X. We then have a tautological map $\underline{X} \to \mathscr{F}$. The induced morphism of simplicial sets

$$X \times \mathrm{N}_{\bullet}(\mathcal{C}) \simeq \mathrm{N}_{\bullet}^{\underline{X}}(\mathcal{C}) \to \mathrm{N}_{\bullet}^{\mathscr{F}}(\mathcal{C})$$

determines a comparison map $\iota : X = \varprojlim(\mathscr{F}) \to \mathrm{ho}\varprojlim(\mathscr{F})$. Note that ι is a monomorphism of simplicial sets (since each of the projection maps $X = \varprojlim(\mathscr{F}) \to \mathscr{F}(C)$ factor through ι).

03AJ **Proposition 7.5.2.13.** *Let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be a diagram of ∞-categories, and suppose that the category $\mathcal{C}$ has an initial object. Then the comparison map $\iota : \varprojlim(\mathscr{F}) \hookrightarrow \mathrm{ho}\varprojlim(\mathscr{F})$ of Remark 7.5.2.12 is an equivalence of ∞-categories.*

Proof. Let $C \in \mathcal{C}$ be an initial object, so that the inclusion map $\{C\} \to \mathrm{N}_{\bullet}(\mathcal{C})$ is left anodyne (Corollary 4.6.7.24). Applying Remark 7.5.2.9, we see that evaluation at C induces an equivalence of ∞-categories $\mathrm{ev}_C : \mathrm{ho}\varprojlim(\mathscr{F}) \to \mathscr{F}(C)$. Our assumption that C is initial also guarantees that the composition $(\mathrm{ev}_C \circ \iota) : \varprojlim(\mathscr{F}) \to \mathscr{F}(C)$ is an isomorphism of simplicial sets, so that $\varprojlim(\mathscr{F})$ is an ∞-category and ι is an equivalence of ∞-categories. $\square$

03AK **Example 7.5.2.14.** Let I be a set, which we regard as a category having only identity morphisms. Let $\mathscr{F} : I \to \mathrm{QCat}$ be a diagram, which we view as a collection of ∞-categories $\{\mathcal{C}_i\}_{i \in I}$ indexed by I. Then the comparison morphism

$$\textstyle\prod_{i \in I} \mathcal{C}_i = \varprojlim(\mathscr{F}) \to \mathrm{ho}\varprojlim(\mathscr{F})$$

of Remark 7.5.2.12 is an isomorphism.

03AL **Exercise 7.5.2.15** (Homotopy Limits of Sets)**.** Let $\mathcal{C}$ be a category and let $\mathscr{F} : \mathcal{C} \to \mathrm{Set}$ be a diagram in the category of sets. Let us abuse notation by identifying Set with the full subcategory of Kan spanned by the constant simplicial sets. Show that the comparison map $\varprojlim(\mathscr{F}) \hookrightarrow \mathrm{ho}\varprojlim(\mathscr{F})$ of Remark 7.5.2.12 is an isomorphism.

Beware that the comparison morphism of Remark 7.5.2.12 is not an isomorphism in general.

03AM **Example 7.5.2.16.** Let $[1]$ denote the linearly ordered set $\{0 < 1\}$ and let $\mathscr{F} : [1] \to \mathrm{QCat}$ be a diagram, which we identify with a functor of ∞-categories $T : \mathcal{C} \to \mathcal{D}$. Then the homotopy limit $\mathrm{ho}\varprojlim(\mathscr{F})$ of Construction 7.5.1.1 can be identified with the homotopy fiber product

$$\mathcal{C} \times^{\mathrm{h}}_{\mathcal{D}} \mathcal{D} = \mathcal{C} \times_{\mathrm{Fun}(\{0\}, \mathcal{D})} \mathrm{Isom}(\mathcal{D})$$

of Construction 4.5.2.1. Under this identification, the comparison morphism $\varprojlim(\mathscr{F}) \to \operatorname{ho}\varprojlim(\mathscr{F})$ of Remark 7.5.2.12 corresponds to the monomorphism

$$\mathcal{C} \simeq \mathcal{C} \times_{\mathcal{D}} \mathcal{D} \hookrightarrow \mathcal{C} \times^{\mathrm{h}}_{\mathcal{D}} \mathcal{D}$$

of Proposition 3.4.0.7. This morphism is usually not an isomorphism of simplicial sets, though it is always an equivalence of ∞-categories (Proposition 7.5.2.13).

Example 7.5.2.17. Let $\mathcal{K}$ be the partially ordered set depicted in the diagram 03AN

$$\bullet \to \bullet \leftarrow \bullet$$

and suppose we are given a functor $\mathscr{F} : \mathcal{K} \to \mathrm{QCat}$, which we depict as a diagram of ∞-categories

$$\mathcal{C}_0 \xrightarrow{T_0} \mathcal{C} \xleftarrow{T_1} \mathcal{C}_1 .$$

Then the homotopy limit $\operatorname{ho}\varprojlim(\mathscr{F})$ can be identified with the iterated homotopy pullback $\mathcal{C}_0 \times^{\mathrm{h}}_{\mathcal{C}} (\mathcal{C}_1 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C})$. Applying Corollary 4.5.2.20, we see that the equivalence $\mathcal{C}_1 \hookrightarrow \mathcal{C}_1 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}$ of Example 7.5.2.16 induces an equivalence of ∞-categories

$$\mathcal{C}_0 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}_1 \hookrightarrow \mathcal{C}_0 \times^{\mathrm{h}}_{\mathcal{C}} (\mathcal{C}_1 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}) \simeq \operatorname{ho}\varprojlim(\mathscr{F}).$$

In particular, the comparison map $\varprojlim(\mathscr{F}) \to \operatorname{ho}\varprojlim(\mathscr{F})$ is a categorical equivalence of simplicial sets if and only if the inclusion $\mathcal{C}_0 \times_{\mathcal{C}} \mathcal{C}_1 \hookrightarrow \mathcal{C}_0 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}_1$ is a categorical equivalence of simplicial sets. This condition is satisfied if either T_0 or T_1 is a isofibration of ∞-categories (Corollary 4.5.2.28), but not in general.

7.5.3 The Homotopy Limit as a Derived Functor

Let $\mathcal{C}$ be a small category. In general, the inverse limit functor $\varprojlim : \mathrm{Fun}(\mathcal{C}, \mathrm{QCat}) \to \mathrm{Set}_{\Delta}$ 03AP does not respect categorical equivalence: that is, if $\alpha : \mathscr{F} \to \mathscr{G}$ is a levelwise categorical equivalence of diagrams $\mathscr{F}, \mathscr{G} : \mathcal{C} \to \mathrm{QCat}$, then the induced map $\varprojlim(\alpha) : \varprojlim(\mathscr{F}) \to \varprojlim(\mathscr{G})$ need not be a categorical equivalence of simplicial sets. In §7.5.2 and §4.5.6, we discussed two different ways of addressing this point:

- We can replace the limit $\varprojlim(\mathscr{F})$ by the homotopy limit $\operatorname{ho}\varprojlim(\mathscr{F})$ of Construction 7.5.2.1. If $\alpha : \mathscr{F} \to \mathscr{G}$ is a levelwise categorical equivalence of diagrams $\mathscr{F}, \mathscr{G}$, then Remark 7.5.2.7 guarantees that the induced map $\operatorname{ho}\varprojlim(\alpha) : \operatorname{ho}\varprojlim(\mathscr{F}) \to \operatorname{ho}\varprojlim(\mathscr{G})$ is an equivalence of ∞-categories.

- We can restrict our attention to *isofibrant* diagrams of ∞-categories (Definition 4.5.6.3). If $\alpha : \mathscr{F} \to \mathscr{G}$ is a levelwise categorical equivalence between isofibrant diagrams, then Corollary 4.5.6.16 guarantees that the induced map $\varprojlim(\alpha) : \varprojlim(\mathscr{F}) \to \varprojlim(\mathscr{G})$ is an equivalence of ∞-categories.

In this section, we will show that these perspectives are closely related: if $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ is a diagram of ∞-categories, then the homotopy limit $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ can be identified with the limit of an *isofibrant replacement* for $\mathscr{F}$. More precisely, we show that there exists a canonical isomorphism $\underleftarrow{\mathrm{holim}}(\mathscr{F}) \simeq \varprojlim(\mathscr{F}^+)$, where $\mathscr{F}^+ : \mathcal{C} \to \mathrm{QCat}$ is an isofibrant diagram of simplicial sets equipped with a levelwise categorical equivalence $\alpha : \mathscr{F} \hookrightarrow \mathscr{F}^+$ (Construction 7.5.3.3 and Proposition 7.5.3.7). Moreover, we show that for *any* isofibrant diagram $\mathscr{G} : \mathcal{C} \to \mathrm{QCat}$, the inclusion map $\varprojlim(\mathscr{G}) \hookrightarrow \underleftarrow{\mathrm{holim}}(\mathscr{G})$ is an equivalence of ∞-categories (Proposition 7.5.3.12). Consequently, if $\beta : \mathscr{F} \to \mathscr{G}$ is any levelwise categorical equivalence from $\mathscr{F}$ to an isofibrant diagram $\mathscr{G}$, then the maps

$$\underleftarrow{\mathrm{holim}}(\mathscr{F}) \xrightarrow{\underleftarrow{\mathrm{holim}}(\beta)} \underleftarrow{\mathrm{holim}}(\mathscr{G}) \leftarrow \varprojlim(\mathscr{G})$$

are equivalences of ∞-categories; in particular, the ∞-categories $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ and $\varprojlim(\mathscr{G})$ are equivalent (see Remark 7.5.3.15).

We begin with some elementary observations.

03AQ **Proposition 7.5.3.1.** *Let $\mathcal{C}$ be a small category and let $U : \mathcal{E} \to \mathrm{N}_\bullet(\mathcal{C})$ be an isofibration of ∞-categories. Then the weak transport representation*

$$\mathrm{wTr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \to \mathrm{Set}_\Delta \qquad C \mapsto \mathrm{Fun}_{/\mathrm{N}_\bullet(\mathcal{C})}(\mathrm{N}_\bullet(\mathcal{C}_{C/}), \mathcal{E})$$

of Construction 5.3.1.1 is an isofibrant diagram of simplicial sets.

Proof. Let $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_\Delta$ be a functor and let $\mathscr{F}_0 \subseteq \mathscr{F}$ be a subfunctor for which the inclusion $\mathscr{F}_0 \hookrightarrow \mathscr{F}$ is a levelwise categorical equivalence. We wish to show that every natural transformation $\alpha_0 : \mathscr{F}_0 \to \mathrm{wTr}_{\mathcal{E}/\mathcal{C}}$ admits an extension $\alpha : \mathscr{F} \to \mathrm{wTr}_{\mathcal{E}/\mathcal{C}}$. Using Corollary 5.3.2.23, we can reformulate this as a lifting problem

$$\begin{tikzcd}
\underrightarrow{\mathrm{holim}}(\mathscr{F}_0) \arrow[r] \arrow[d] & \mathcal{E} \arrow[d, "U"] \\
\underrightarrow{\mathrm{holim}}(\mathscr{F}) \arrow[r] \arrow[ur, dashed] & \mathrm{N}_\bullet(\mathcal{C})
\end{tikzcd}$$

in the category of simplicial sets. Since U is an isofibration, we are reduced to showing that the inclusion map $\underrightarrow{\mathrm{holim}}(\mathscr{F}_0) \hookrightarrow \underrightarrow{\mathrm{holim}}(\mathscr{F})$ is a categorical equivalence (Proposition 4.5.5.1), which is a special case of Variant 5.3.2.19. □

03AR **Corollary 7.5.3.2.** *Let $\mathcal{C}$ be a small category and let $U : \mathcal{E} \to \mathrm{N}_\bullet(\mathcal{C})$ be a cocartesian fibration of ∞-categories. Then the strict transport representation*

$$\mathrm{sTr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \to \mathrm{Set}_\Delta \qquad C \mapsto \mathrm{Fun}^{\mathrm{CCart}}_{/\mathrm{N}_\bullet(\mathcal{C})}(\mathrm{N}_\bullet(\mathcal{C}_{C/}), \mathcal{E})$$

of Construction 5.3.1.5 is an isofibrant diagram of simplicial sets.

Proof. Let $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ be a functor and let $\mathscr{F}_0 \subseteq \mathscr{F}$ be a subfunctor for which the inclusion $\mathscr{F}_0 \hookrightarrow \mathscr{F}$ is a levelwise categorical equivalence. Suppose we are given a natural transformation $\alpha_0 : \mathscr{F}_0 \to \mathrm{sTr}_{\mathcal{E}/\mathcal{C}}$. It follows from Proposition 7.5.3.1 that α_0 can be extended to a natural transformation $\alpha : \mathscr{F} \to \mathrm{wTr}_{\mathcal{E}/\mathcal{C}}$. To complete the proof, it will suffice to show that α factors through the subfunctor $\mathrm{sTr}_{\mathcal{E}/\mathcal{C}}$. Equivalently, we must show that for each object $C \in \mathcal{C}$, the lifting problem

$$\begin{tikzcd}
\mathscr{F}_0(C) \arrow[r] \arrow[d] & \mathrm{sTr}_{\mathcal{E}/\mathcal{C}}(C) \arrow[d] \\
\mathscr{F}(C) \arrow[r] \arrow[ur, dashed] & \mathrm{wTr}_{\mathcal{E}/\mathcal{C}}(C)
\end{tikzcd}$$

admits a (unique) solution. This is clear, since the left vertical map is a categorical equivalence and $\mathrm{sTr}_{\mathcal{E}/\mathcal{C}}(C)$ is a replete subcategory of $\mathrm{wTr}_{\mathcal{E}/\mathcal{C}}(C)$ (see Remark 5.3.1.15). □

Construction 7.5.3.3 (Explicit Isofibrant Replacement)**.** Let $\mathcal{C}$ be a small category and let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be a (strictly commutative) diagram of ∞-categories. Let $\mathrm{N}_{\bullet}^{\mathscr{F}}(\mathcal{C})$ denote the $\mathscr{F}$-weighted nerve of $\mathcal{C}$ (Definition 5.3.3.1), and let $\mathscr{F}^{+} = \mathrm{sTr}_{\mathrm{N}_{\bullet}^{\mathscr{F}}(\mathcal{C})/\mathcal{C}}$ denote the strict transport representation of the projection map $\mathrm{N}_{\bullet}^{\mathscr{F}}(\mathcal{C}) \to \mathrm{N}_{\bullet}(\mathcal{C})$. It follows from Remark 5.3.4.10 that there is a unique natural transformation $\alpha : \mathscr{F} \to \mathscr{F}^{+}$ for which the diagram of simplicial sets `03AS`

$$\begin{tikzcd}
 & \underrightarrow{\mathrm{holim}}(\mathscr{F}^{+}) \arrow[dr, "\lambda_u"] & \\
\underrightarrow{\mathrm{holim}}(\mathscr{F}) \arrow[ur, "\underrightarrow{\mathrm{holim}}(\alpha)"] \arrow[rr, "\lambda_t"] & & \mathrm{N}_{\bullet}^{\mathscr{F}}(\mathcal{C}),
\end{tikzcd}$$

is commutative, where λ_u denotes the universal scaffold of Construction 5.3.4.7 and λ_t denotes the taut scaffold of Construction 5.3.4.11. We will refer to $\mathscr{F}^{+}$ as the *isofibrant replacement* of $\mathscr{F}$.

Proposition 7.5.3.4. *Let $\mathcal{C}$ be a small category, let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be a diagram of ∞-categories, and let $\alpha : \mathscr{F} \to \mathscr{F}^{+}$ be the natural transformation of Construction 7.5.3.3. Then $\mathscr{F}^{+} : \mathcal{C} \to \mathrm{QCat}$ is an isofibrant diagram, and α is a levelwise categorical equivalence. Moreover, α is also a monomorphism.* `03AT`

Proof. It follows from Corollary 7.5.3.2 that the diagram $\mathscr{F}^+$ is isofibrant. To see that α is a monomorphism, we observe that for each object $C \in \mathcal{C}$, the functor

$$\alpha_C : \mathscr{F}(C) \to \mathscr{F}^+(C) = \operatorname{Fun}^{\mathrm{CCart}}_{/\mathrm{N}_\bullet(\mathcal{C})}(\mathrm{N}_\bullet(\mathcal{C}_{C/}), \mathrm{N}^{\mathscr{F}}_\bullet(\mathcal{C}))$$

has a left inverse, given by the evaluation map

$$\mathrm{ev}_C : \operatorname{Fun}^{\mathrm{CCart}}_{/\mathrm{N}_\bullet(\mathcal{C})}(\mathrm{N}_\bullet(\mathcal{C}_{C/}), \mathrm{N}^{\mathscr{F}}_\bullet(\mathcal{C})) \to \{C\} \times_{\mathrm{N}_\bullet(\mathcal{C})} \mathrm{N}^{\mathscr{F}}_\bullet(\mathcal{C}) \simeq \mathscr{F}(C).$$

Since ev_C is a trivial Kan fibration (Proposition 5.3.1.7), it follows that α_C is an equivalence of ∞-categories. ☐

03AU **Corollary 7.5.3.5** (Existence of Isofibrant Replacements)**.** *Let $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_\Delta$ be a diagram of simplicial sets. Then there exists a monomorphism of diagrams $\alpha : \mathscr{F} \hookrightarrow \mathscr{G}$, where α is a levelwise categorical equivalence and $\mathscr{G} : \mathcal{C} \to \mathrm{QCat}$ is an isofibrant diagram of ∞-categories.*

Proof. Using Proposition 4.1.3.2, we can reduce to the case where $\mathscr{F}$ is a diagram of ∞-categories. In this case, we can take α to be the natural transformation $\mathscr{F} \hookrightarrow \mathscr{F}^+$ of Construction 7.5.3.3 (Proposition 7.5.3.4). ☐

03AV **Variant 7.5.3.6.** Let $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_\Delta$ be a diagram of simplicial sets. Then there exists a monomorphism of diagrams $\alpha : \mathscr{F} \hookrightarrow \mathscr{G}$, where α is a levelwise weak homotopy equivalence and $\mathscr{G} : \mathcal{C} \to \mathrm{Kan}$ is an isofibrant diagram of Kan complexes.

Proof. Using Proposition 3.1.7.1, we can reduce to the case where $\mathscr{F}$ is a diagram of Kan complexes. In this case, we can again take α to be the natural transformation $\mathscr{F} \hookrightarrow \mathscr{F}^+$ of Construction 7.5.3.3 (since α is a levelwise categorical equivalence, it follows that $\mathscr{F}^+$ is also a diagram of Kan complexes: see Remark 4.5.1.21). ☐

03AW **Proposition 7.5.3.7.** *Let $\mathcal{C}$ be a small category, let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be a diagram, and let $\mathscr{F}^+ : \mathcal{C} \to \mathrm{QCat}$ be the isofibrant replacement of Construction 7.5.3.3. Then there is a canonical isomorphism of simplicial sets $\theta : \underleftarrow{\mathrm{holim}}(\mathscr{F}) \xrightarrow{\sim} \underleftarrow{\lim}(\mathscr{F}^+)$, which is characterized by the following requirement: for each object $C \in \mathcal{C}$, the composition*

$$\begin{aligned} \operatorname{Fun}^{\mathrm{CCart}}_{/\mathrm{N}_\bullet(\mathcal{C})}(\mathrm{N}_\bullet(\mathcal{C}), \mathrm{N}^{\mathscr{F}}_\bullet(\mathcal{C})) &= \underleftarrow{\mathrm{holim}}(\mathscr{F}) \\ &\xrightarrow{\theta} \underleftarrow{\lim}(\mathscr{F}^+) \\ &\to \mathscr{F}^+(C) \\ &= \operatorname{Fun}^{\mathrm{CCart}}_{/\mathrm{N}_\bullet(\mathcal{C})}(\mathrm{N}_\bullet(\mathcal{C}_{C/}), \mathrm{N}^{\mathscr{F}}_\bullet(\mathcal{C})) \end{aligned}$$

is given by precomposition with the projection map $\mathcal{C}_{C/} \to \mathcal{C}$.

Proposition 7.5.3.7 is a consequence of the following concrete assertion:

Lemma 7.5.3.8. *Let $\mathcal{C}$ be a category. Then the collection of projection maps $\{\mathrm{N}_\bullet(\mathcal{C}_{C/}) \to \mathrm{N}_\bullet(\mathcal{C})\}_{C \in \mathcal{C}}$ exhibit $\mathrm{N}_\bullet(\mathcal{C})$ as the colimit of the diagram* `03AX`

$$\mathcal{C}^{\mathrm{op}} \to \mathrm{Set}_\Delta \qquad C \mapsto \mathrm{N}_\bullet(\mathcal{C}_{C/}).$$

Proof. Fix an integer $n \geq 0$; we wish to show that the canonical map

$$\rho : \varinjlim_{C \in \mathcal{C}^{\mathrm{op}}} \mathrm{N}_n(\mathcal{C}_{C/}) \to \mathrm{N}_n(\mathcal{C})$$

is an isomorphism in the category of sets. Let σ be an n-simplex of $\mathrm{N}_n(\mathcal{C})$, given by a diagram

$$X_0 \to X_1 \to \cdots \to X_n$$

in the category $\mathcal{C}$. Then the fiber $\rho^{-1}\{\sigma\}$ can be identified with the colimit

$$\varinjlim_{C \in \mathcal{C}^{\mathrm{op}}} \mathrm{Hom}_{\mathcal{C}}(C, X_0),$$

formed in the category of sets. This colimit consists of a single element, represented by the identity morphism $\mathrm{id}_{X_0} \in \mathrm{Hom}_{\mathcal{C}}(X_0, X_0)$. □

Remark 7.5.3.9. Let $\mathcal{C}$ be a category, let $U : \mathcal{E} \to \mathrm{N}_\bullet(\mathcal{C})$ is a morphism of simplicial sets, and let $\mathrm{wTr}_{\mathcal{E}\,/\,\mathcal{C}} : \mathcal{C} \to \mathrm{Set}_\Delta$ denote the weak transport representation of Construction 5.3.1.1, given on objects by the formula $\mathrm{wTr}_{\mathcal{E}\,/\,\mathcal{C}}(C) = \mathrm{Fun}_{/\,\mathrm{N}_\bullet(\mathcal{C})}(\mathrm{N}_\bullet(\mathcal{C}_{C/}), \mathcal{E})$. Then Lemma 7.5.3.8 supplies a canonical isomorphism of simplicial sets `03AY`

$$\mathrm{Fun}_{/\,\mathrm{N}_\bullet(\mathcal{C})}(\mathrm{N}_\bullet(\mathcal{C}), \mathcal{E}) \xrightarrow{\sim} \varprojlim(\mathrm{wTr}_{\mathcal{E}\,/\,\mathcal{C}}).$$

Variant 7.5.3.10. Let $\mathcal{C}$ be a category, let $U : \mathcal{E} \to \mathrm{N}_\bullet(\mathcal{C})$ be a cocartesian fibration of ∞-categories, and let $\mathrm{sTr}_{\mathcal{E}\,/\,\mathcal{C}} : \mathcal{C} \to \mathrm{Set}_\Delta$ denote the strict transport representation of Construction 5.3.1.5, given on objects by the formula $\mathrm{sTr}_{\mathcal{E}\,/\,\mathcal{C}}(C) = \mathrm{Fun}^{\mathrm{CCart}}_{/\,\mathrm{N}_\bullet(\mathcal{C})}(\mathrm{N}_\bullet(\mathcal{C}_{C/}), \mathcal{E})$. Then the isomorphism of Remark 7.5.3.9 restricts to an isomorphism of simplicial sets `03AZ`

$$\mathrm{Fun}^{\mathrm{CCart}}_{/\,\mathrm{N}_\bullet(\mathcal{C})}(\mathrm{N}_\bullet(\mathcal{C}), \mathcal{E}) \xrightarrow{\sim} \varprojlim(\mathrm{sTr}_{\mathcal{E}\,/\,\mathcal{C}}).$$

Proof of Proposition 7.5.3.7. Apply Variant 7.5.3.10 in the special case where $\mathcal{E} = \mathrm{N}^{\mathscr{F}}_\bullet(\mathcal{C})$ is the $\mathscr{F}$-weighted nerve of the category $\mathcal{C}$. □

Remark 7.5.3.11. In the situation of Proposition 7.5.3.7, the isomorphism $\theta : \operatorname{ho}\varprojlim(\mathscr{F}) \xrightarrow{\sim} \varprojlim(\mathscr{F}^+)$ fits into a commutative diagram `03B0`

$$\begin{tikzcd}
 & \operatorname{ho}\varprojlim(\mathscr{F}) \arrow[dr, "\theta", "\sim"'] & \\
\varprojlim(\mathscr{F}) \arrow[ur, "\iota"] \arrow[rr, "\varprojlim(\alpha)"] & & \varprojlim(\mathscr{F}^+),
\end{tikzcd}$$

where ι is the comparison map of Remark 7.5.2.12 and $\alpha : \mathscr{F} \hookrightarrow \mathscr{F}^{+}$ is the natural transformation appearing in Construction 7.5.3.3.

03B1 **Proposition 7.5.3.12.** *Let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be an isofibrant diagram of ∞-categories. Then the inclusion map $\iota : \varprojlim(\mathscr{F}) \hookrightarrow \operatorname{ho}\varprojlim(\mathscr{F})$ is an equivalence of ∞-categories.*

Proof. Let $\alpha : \mathscr{F} \hookrightarrow \mathscr{F}^{+}$ be the isofibrant replacement of Construction 7.5.3.3. By virtue of Proposition 7.5.3.7 (and Remark 7.5.3.11), it will suffice to show that the limit $\varprojlim(\alpha) : \varprojlim(\mathscr{F}) \hookrightarrow \varprojlim(\mathscr{F}^{+})$ is an equivalence of ∞-categories. This is a special case of Corollary 4.5.6.17, since α is a levelwise categorical equivalence between isofibrant diagrams (Proposition 7.5.3.4). □

03B2 **Example 7.5.3.13** (Towers of Isofibrations)**.** Suppose we are given a tower of ∞-categories

$$\cdots \to \mathcal{C}(3) \to \mathcal{C}(2) \to \mathcal{C}(1) \to \mathcal{C}(0),$$

which we identify with a functor $\mathscr{F} : \mathbf{Z}_{\geq 0}^{\mathrm{op}} \to \mathrm{QCat}$. If each of the transition functors $\mathcal{C}(n{+}1) \to \mathcal{C}(n)$ is an isofibration, then the comparison map $\varprojlim_{n} \mathcal{C}(n) = \varprojlim(\mathscr{F}) \hookrightarrow \operatorname{ho}\varprojlim(\mathscr{F})$ is an equivalence of ∞-categories. This follows by combining Example 4.5.6.8 with Proposition 7.5.3.12.

03B3 **Warning 7.5.3.14.** Let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be a strictly commutative diagram of ∞-categories and let $\alpha : \mathscr{F} \hookrightarrow \mathscr{F}^{+}$ denote the isofibrant replacement of Construction 7.5.3.3, and let $\theta : \operatorname{ho}\varprojlim(\mathscr{F}) \xrightarrow{\sim} \varprojlim(\mathscr{F}^{+})$ be the isomorphism of Proposition 7.5.3.7. We then have a diagram of simplicial sets

$$\begin{tikzcd}
\varprojlim(\mathscr{F}) \arrow[r, "\varprojlim(\alpha)"] \arrow[d] & \varprojlim(\mathscr{F}^{+}) \arrow[d] \\
\operatorname{ho}\varprojlim(\mathscr{F}) \arrow[r, "\operatorname{ho}\varprojlim(\alpha)"'] \arrow[ur, "\theta", "\sim"'] & \operatorname{ho}\varprojlim(\mathscr{F}^{+}),
\end{tikzcd}$$

where the outer square and the upper left triangle are commutative (Remark 7.5.3.11). Beware that the lower right triangle is usually *not* commutative. That is, $\operatorname{ho}\varprojlim(\mathscr{F})$ and $\varprojlim(\mathscr{F}^{+})$ are isomorphic when viewed as *abstract* simplicial sets, but do not coincide when identified with simplicial subsets of $\operatorname{ho}\varprojlim(\mathscr{F}^{+})$.

03B4 **Remark 7.5.3.15** (The Homotopy Limit as a Right Derived Functor)**.** The results of this section can be interpreted in the language of model categories. For every small category $\mathcal{C}$, the category $\mathrm{Fun}(\mathcal{C}, \mathrm{Set}_{\Delta})$ can be equipped with a model structure in which the cofibrations are monomorphisms and the weak equivalences are levelwise categorical equivalences (see Example [?]). The inverse limit functor

$$\varprojlim : \mathrm{Fun}(\mathcal{C}, \mathrm{Set}_{\Delta}) \to \mathrm{Set}_{\Delta}$$

then admit a *right derived functor* $\mathrm{R}\varprojlim : \mathrm{Fun}(\mathcal{C}, \mathrm{Set}_{\Delta}) \to \mathrm{Set}_{\Delta}$, which carries a diagram $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ to the limit of a fibrant replacement of $\mathscr{F}$. It follows from Propositions 7.5.3.4 and 7.5.3.7 that, when restricted to the subcategory $\mathrm{Fun}(\mathcal{C}, \mathrm{QCat}) \subset \mathrm{Fun}(\mathcal{C}, \mathrm{Set}_{\Delta})$, the functor $\mathrm{R}\varprojlim$ is (categorically) equivalent to the homotopy limit functor $\mathrm{ho}\varprojlim : \mathrm{Fun}(\mathcal{C}, \mathrm{QCat}) \to \mathrm{QCat}$ of Construction 7.5.2.1. We will return to this point in §[?].

7.5.4 Homotopy Limit Diagrams

Let $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$ be a diagram in the category of Kan complexes, and let 03B5

$$\mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathscr{F}) : \mathrm{N}_{\bullet}(\mathcal{C}) \to \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathrm{Kan}) = \mathcal{S}$$

be the induced functor of ∞-categories. Then the homotopy limit $\varprojlim(\mathscr{F})$ is a Kan complex, which can be regarded as a limit of the diagram $\mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathscr{F})$ in the ∞-category of spaces $\mathcal{S}$ (Proposition 7.5.1.5). For many applications, this assertion is insufficiently precise: we would like to have not only a Kan complex X which is known *abstractly* to be a limit of the diagram $\mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathscr{F})$, but also a diagram $\mathrm{N}_{\bullet}(\mathcal{C}^{\triangleleft}) \to \mathcal{S}$ which *exhibits* X as a limit of $\mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathscr{F})$.

Definition 7.5.4.1. Let $\mathcal{C}$ be a category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ be a functor having restriction $\mathscr{F} = \overline{\mathscr{F}}|_{\mathcal{C}}$. We will say that $\overline{\mathscr{F}}$ is a *homotopy limit diagram* if the composite map 03B6

$$\overline{\mathscr{F}}(\mathbf{0}) \to \varprojlim(\mathscr{F}) \hookrightarrow \mathrm{ho}\varprojlim(\mathscr{F})$$

is a homotopy equivalence of Kan complexes; here $\mathbf{0}$ denotes the initial object of the cone $\mathcal{C}^{\triangleleft} \simeq \{\mathbf{0}\} \star \mathcal{C}$, and the morphism on the right is the comparison map of Remark 7.5.2.12).

Example 7.5.4.2 (Limits of Isofibrant Diagrams)**.** Let $\mathcal{C}$ be a small category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{Set}_{\Delta}$ be a limit diagram in the category of simplicial sets. Suppose that the diagram $\mathscr{F} = \overline{\mathscr{F}}|_{\mathcal{C}}$ is isofibrant (Definition 4.5.6.3) and that, for each object $C \in \mathcal{C}$, the simplicial set $\mathscr{F}(C)$ is a Kan complex. Then $\overline{\mathscr{F}}$ is a homotopy limit diagram of Kan complexes: this follows by combining Corollary 4.5.6.20 with Proposition 7.5.3.12. 03B7

Warning 7.5.4.3. For every diagram of Kan complexes $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$, the homotopy limit $\mathrm{ho}\varprojlim(\mathscr{F})$ of Construction 7.5.1.1 is well-defined. However, one cannot always extend $\mathscr{F}$ to a homotopy limit *diagram* $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ (see Warning 3.4.1.8). This is possible only if the tautological map $\varprojlim(\mathscr{F}) \hookrightarrow \mathrm{ho}\varprojlim(\mathscr{F})$ has a left homotopy inverse. However, we can always choose a levelwise homotopy equivalence $\alpha : \mathscr{F} \hookrightarrow \mathscr{G}$, where $\mathscr{G}$ is an isofibrant diagram of 03B8

Kan complexes (Variant 7.5.3.6). We can then extend $\mathscr{G}$ can be extended to a limit diagram $\overline{\mathscr{G}} : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$, which is also a homotopy limit diagram (Example 7.5.4.2). Moreover, if take $\mathscr{G} = \mathscr{F}^{+}$ to be the isofibrant replacement of Construction 7.5.3.3, then $\overline{\mathscr{G}}$ carries the initial object of $\mathcal{C}^{\triangleleft}$ to the homotopy limit $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ (Proposition 7.5.3.7).

03B9 **Proposition 7.5.4.4** (Homotopy Invariance)**.** *Let $\mathcal{C}$ be a category and let $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{G}}$ be a natural transformation between diagrams $\overline{\mathscr{F}}, \overline{\mathscr{G}} : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$. Assume that, for every object $C \in \mathcal{C}$, the induced map $\alpha_C : \overline{\mathscr{F}}(C) \to \overline{\mathscr{G}}(C)$ is a homotopy equivalence of Kan complexes. Then any two of the following conditions imply the third:*

(1) *The functor $\overline{\mathscr{F}}$ is a homotopy limit diagram.*

(2) *The functor $\overline{\mathscr{G}}$ is a homotopy limit diagram.*

(3) *The natural transformation α induces a homotopy equivalence $\overline{\mathscr{F}}(\mathbf{0}) \to \overline{\mathscr{G}}(\mathbf{0})$, where $\mathbf{0}$ denotes the cone point of $\mathcal{C}^{\triangleleft}$.*

Proof. Setting $\mathscr{F} = \overline{\mathscr{F}}|_{\mathcal{C}}$ and $\mathscr{G} = \overline{\mathscr{G}}|_{\mathcal{C}}$, we observe that α determines a commutative diagram of Kan complexes

$$\begin{tikzcd}
\overline{\mathscr{F}}(\mathbf{0}) \arrow[r] \arrow[d] & \overline{\mathscr{G}}(\mathbf{0}) \arrow[d] \\
\underleftarrow{\mathrm{holim}}(\mathscr{F}) \arrow[r] & \underleftarrow{\mathrm{holim}}(\mathscr{G}),
\end{tikzcd}$$

where the bottom horizontal map is a homotopy equivalence (Remark 7.5.1.3). The desired result now follows from the two-out-of-three property (Remark 3.1.6.7). □

03BA **Proposition 7.5.4.5.** *Let $\mathcal{C}$ be a small category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ be a diagram of Kan complexes. Then $\overline{\mathscr{F}}$ is a homotopy limit diagram (in the sense of Definition 7.5.4.1) if and only if the induced functor of ∞-categories*

$$\mathrm{N}_{\bullet}^{\mathrm{hc}}(\overline{\mathscr{F}}) : \mathrm{N}_{\bullet}(\mathcal{C}^{\triangleleft}) \to \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathrm{Kan}) = \mathcal{S}$$

is a limit diagram (in the sense of Definition 7.1.2.4).

Proof. Let $\mathrm{N}_{\bullet}^{\overline{\mathscr{F}}}(\mathcal{C}^{\triangleleft})$ be the weighted nerve of the functor $\overline{\mathscr{F}}$ (Definition 5.3.3.1) and let $U : \mathrm{N}_{\bullet}^{\overline{\mathscr{F}}}(\mathcal{C}^{\triangleleft}) \to \mathrm{N}_{\bullet}(\mathcal{C}^{\triangleleft})$ be the projection map. Then U is a left fibration, and $\mathrm{N}_{\bullet}^{\mathrm{hc}}(\overline{\mathscr{F}})$ is a covariant transport representation for U (Example 5.6.5.6). Set $\mathscr{F} = \overline{\mathscr{F}}|_{\mathcal{C}}$. Applying Corollary 7.4.5.13, we deduce that $\mathrm{N}_{\bullet}^{\mathrm{hc}}(\overline{\mathscr{F}})$ is a limit diagram in the ∞-category $\mathcal{S}$ if and only if the restriction map

$$\rho : \mathrm{Fun}_{/\,\mathrm{N}_{\bullet}(\mathcal{C}^{\triangleleft})}(\mathrm{N}_{\bullet}(\mathcal{C}^{\triangleleft}), \mathrm{N}_{\bullet}^{\overline{\mathscr{F}}}(\mathcal{C}^{\triangleleft})) \xrightarrow{\simeq} \mathrm{Fun}_{/\,\mathrm{N}_{\bullet}(\mathcal{C})}(\mathrm{N}_{\bullet}(\mathcal{C}), \mathrm{N}_{\bullet}^{\mathscr{F}}(\mathcal{C}))$$

is a homotopy equivalence of Kan complexes. We then have a commutative diagram ρ fits into a commutative diagram

$$\begin{tikzcd}
\varprojlim(\overline{\mathscr{F}}) \arrow[r, "\rho'"] \arrow[d, "\overline{\iota}"] & \varprojlim(\mathscr{F}) \arrow[d, "\iota"] \\
\operatorname{holim}_{\longleftarrow}(\overline{\mathscr{F}}) \arrow[r, "\rho"] & \operatorname{holim}_{\longleftarrow}(\mathscr{F}),
\end{tikzcd}$$

where ι and $\overline{\iota}$ are the comparison maps of Remark 7.5.2.12. Since the category $\mathcal{C}^{\triangleleft}$ has an initial object, the morphism $\overline{\iota}$ is a homotopy equivalence (Proposition 7.5.2.13). It follows that ρ is a homotopy equivalence if and only if the composition $\rho \circ \overline{\iota} = \iota \circ \rho'$ is a homotopy equivalence. We conclude by observing that the composition $\iota \circ \rho'$ can be identified with the map $\overline{\mathscr{F}}(\mathbf{0}) \to \operatorname{holim}_{\longleftarrow}(\mathscr{F})$ appearing in Definition 7.5.4.1. □

Corollary 7.5.4.6. *Let $\mathcal{C}$ be a small category, let $\mathcal{D}$ be a locally Kan simplicial category, and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathcal{D}$ be a functor. The following conditions are equivalent:* `03BB`

(1) *The functor*

$$\mathrm{N}_{\bullet}^{\mathrm{hc}}(\overline{\mathscr{F}}) : \mathrm{N}_{\bullet}(\mathcal{C})^{\triangleleft} \simeq \mathrm{N}_{\bullet}(\mathcal{C}^{\triangleleft}) \to \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathcal{D})$$

is a limit diagram in the ∞-category $\mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathcal{D})$.

(2) *For every object $D \in \mathcal{D}$, the functor*

$$\mathcal{C}^{\triangleleft} \to \mathrm{Kan} \qquad C \mapsto \mathrm{Hom}_{\mathcal{D}}(D, \mathscr{F}(C))_{\bullet}$$

is a homotopy limit diagram of Kan complexes.

Proof. By virtue of Proposition 7.4.5.17, condition (1) is satisfied if and only if, for every object $D \in \mathcal{D}$, the composition $(h^D \circ \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathscr{F})) : \mathrm{N}_{\bullet}(\mathcal{C})^{\triangleleft} \to \mathcal{S}$ is a limit diagram in the ∞-category $\mathcal{S}$, where $h^D : \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathcal{D}) \to \mathcal{S}$ denotes a functor corepresented by D. Using Proposition 5.6.6.17, we can take h^D to be the homotopy coherent nerve of the simplicial functor $\mathrm{Hom}_{\mathcal{D}}(D, \bullet) : \mathcal{D} \to \mathrm{Kan}$. In this case, $h^D \circ \mathrm{N}_{\bullet}^{\mathrm{hc}}(X)$ is the homotopy coherent nerve of the functor $C \mapsto \mathrm{Hom}_{\mathcal{D}}(D, \mathscr{F}(C))_{\bullet}$. The equivalence (1) $\Leftrightarrow$ (2) now follows from the criterion of Proposition 7.5.4.5. □

Corollary 7.5.4.7. *Let $\mathcal{C}$ be a small category and let $\mathscr{F} : \mathcal{C} \to$* Kan *be an isofibrant diagram of Kan complexes. Then $\mathscr{F}$ has a limit in the category* Kan*, which is preserved by the inclusion functor* $\mathrm{N}_{\bullet}(\mathrm{Kan}) \hookrightarrow \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathrm{Kan}) = \mathcal{S}$. `03BC`

Proof. Combine Example 7.5.4.2 with Proposition 7.5.4.5. □

For some applications, it is useful to extend Definition 7.5.4.1 to diagrams of simplicial sets which do not take values in the full subcategory $\mathrm{Kan} \subset \mathrm{Set}_{\Delta}$ of Kan complexes.

03BD **Definition 7.5.4.8** (Homotopy Limit Diagrams of Simplicial Sets)**.** Let $\mathcal{C}$ be a small category. We say that a functor $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{Set}_{\Delta}$ is a *homotopy limit diagram* if there exists a levelwise weak homotopy equivalence $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{G}}$, where $\overline{\mathscr{G}} : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ is a homotopy limit diagram of Kan complexes (in the sense of Definition 7.5.4.1).

03BE **Remark 7.5.4.9.** Let $\mathcal{C}$ be a small category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ be a functor. The following conditions are equivalent:

(1) The functor $\overline{\mathscr{F}}$ is a homotopy limit diagram in the sense of Definition 7.5.4.1 (that is, it induces a homotopy equivalence $\overline{\mathscr{F}}(\mathbf{0}) \to \underleftarrow{\mathrm{holim}}(\overline{\mathscr{F}}|_{\mathcal{C}})$, where $\mathbf{0}$ denotes the cone point of $\mathcal{C}^{\triangleleft}$).

(2) The functor $\overline{\mathscr{F}}$ is a homotopy limit diagram in the sense of Definition 7.5.4.8: that is, there exists a homotopy limit diagram of Kan complexes $\overline{\mathscr{G}} : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ and a levelwise weak homotopy equivalence $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{G}}$.

The implication (1) ⇒ (2) is immediate, and the reverse implication follows from Proposition 7.5.4.4.

03BF **Proposition 7.5.4.10.** *Let $\mathcal{C}$ be a small category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{Set}_{\Delta}$ be a functor. The following conditions are equivalent:*

(1) *The functor $\overline{\mathscr{F}}$ is a homotopy limit diagram. That is, there exists a homotopy limit diagram $\overline{\mathscr{F}}' : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ and a levelwise weak homotopy equivalence $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{F}}'$.*

(2) *Let $\overline{\mathscr{F}}' : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ be any functor. If there exists a levelwise weak homotopy equivalence $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{F}}'$, then $\overline{\mathscr{F}}'$ is a homotopy limit diagram.*

Proof. Using Proposition 3.1.7.1, we can choose a functor $\overline{\mathscr{G}} : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ and a natural transformation $\beta : \overline{\mathscr{F}} \to \overline{\mathscr{G}}$ which carries each object $C \in \mathcal{C}^{\triangleleft}$ to an anodyne morphism of simplicial sets $\beta_C : \overline{\mathscr{F}}(C) \to \overline{\mathscr{G}}(C)$. We will show that (1) and (2) are equivalent to the following:

(3) The functor $\overline{\mathscr{G}}$ is a homotopy limit diagram.

The implications (2) ⇒ (3) ⇒ (1) are immediate. To prove the reverse implications, suppose we are given another functor $\overline{\mathscr{F}}' : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ and a levelwise weak homotopy equivalence $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{F}}'$. We will show that $\overline{\mathscr{F}}'$ is a homotopy limit diagram if and only if $\overline{\mathscr{G}}$ is a homotopy limit diagram.

Applying Proposition 3.1.7.1 again, we can choose a functor $\overline{\mathscr{G}}' : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ and a commutative diagram

$$\begin{tikzcd}
\overline{\mathscr{F}} \arrow[r, "\alpha"] \arrow[d, "\beta"] & \overline{\mathscr{F}}' \arrow[d, "\beta'"] \\
\overline{\mathscr{G}} \arrow[r, "\alpha'"] & \overline{\mathscr{G}}'
\end{tikzcd}$$

with the property that, for every object $C \in \mathcal{C}^{\triangleleft}$, the induced map

$$\overline{\mathscr{F}}'(C) \coprod_{\overline{\mathscr{F}}(C)} \overline{\mathscr{G}}(C) \to \overline{\mathscr{G}}'(C)$$

is anodyne (and, in particular, a weak homotopy equivalence). Applying Proposition 3.4.2.11, we see that the diagram of simplicial sets

$$\begin{tikzcd}
\overline{\mathscr{F}}(C) \arrow[r, "\alpha_C"] \arrow[d, "\beta_C"] & \overline{\mathscr{F}}'(C) \arrow[d, "\beta'_C"] \\
\overline{\mathscr{G}}(C) \arrow[r, "\alpha'_C"] & \overline{\mathscr{G}}'(C)
\end{tikzcd}$$

is a homotopy pushout square. Since α_C and β_C are weak homotopy equivalences, it follows that α'_C and β'_C are also weak homotopy equivalences (Proposition 3.4.2.10). Applying Proposition 7.5.4.4, we see that $\overline{\mathscr{F}}'$ and $\overline{\mathscr{G}}$ are homotopy limit diagrams if and only if $\overline{\mathscr{G}}'$ is a homotopy limit diagram. □

Corollary 7.5.4.11 (Homotopy Invariance)**.** *Let $\mathcal{C}$ be a category, let $\overline{\mathscr{F}}, \overline{\mathscr{G}} : \mathcal{C}^{\triangleleft} \to \mathrm{Set}_{\Delta}$ be functors, and let $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{G}}$ be a natural transformation. Suppose that, for every object $C \in \mathcal{C}$, the induced map $\alpha_C : \overline{\mathscr{F}}(C) \to \overline{\mathscr{G}}(C)$ is a weak homotopy equivalence. Then any two of the following conditions imply the third:* `03BG`

(1) *The functor $\overline{\mathscr{F}}$ is a homotopy limit diagram.*

(2) *The functor $\overline{\mathscr{G}}$ is a homotopy limit diagram.*

(3) *The natural transformation α induces a weak homotopy equivalence $\overline{\mathscr{F}}(\mathbf{0}) \to \overline{\mathscr{G}}(\mathbf{0})$, where $\mathbf{0}$ denotes the cone point of $\mathcal{C}^{\triangleleft}$.*

Proof. Using Proposition 3.1.7.1, we can choose functors $\overline{\mathscr{F}}', \overline{\mathscr{G}}' : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ and a commutative diagram

$$\begin{tikzcd}
\overline{\mathscr{F}} \arrow[r, "\alpha"] \arrow[d] & \overline{\mathscr{G}} \arrow[d] \\
\overline{\mathscr{F}}' \arrow[r, "\alpha'"] & \overline{\mathscr{G}}',
\end{tikzcd}$$

where the vertical maps are levelwise weak homotopy equivalences. Using Proposition 7.5.4.10, we can replace α by the natural transformation $\alpha' : \overline{\mathscr{F}}' \to \overline{\mathscr{G}}'$, in which case the desired result follows from Proposition 7.5.4.4. □

03BH **Corollary 7.5.4.12.** *Let $\mathcal{C}$ be a category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{Set}_{\Delta}$ be a functor. Let $\overline{\mathscr{F}}^{\mathrm{op}} : \mathcal{C}^{\triangleleft} \to \mathrm{Set}_{\Delta}$ be the functor given on objects by $\overline{\mathscr{F}}^{\mathrm{op}}(C) = \overline{\mathscr{F}}(C)^{\mathrm{op}}$. Then $\overline{\mathscr{F}}$ is a homotopy limit diagram if and only if $\overline{\mathscr{F}}^{\mathrm{op}}$ is a homotopy limit diagram.*

Proof. For each object $C \in \mathcal{C}^{\triangleleft}$, let $|\overline{\mathscr{F}}(C)|$ denote the geometric realization of the simplicial set $\overline{\mathscr{F}}(C)$ (Definition 1.2.3.1). Then the construction $C \mapsto \mathrm{Sing}_{\bullet}(|\overline{\mathscr{F}}(C)|)$ determines a functor $\overline{\mathscr{G}} : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$, and the unit maps $\overline{\mathscr{F}}(C) \to \mathrm{Sing}_{\bullet}(|\overline{\mathscr{F}}(C)|)$ determine a levelwise weak homotopy equivalence $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{G}}$ (Theorem 3.6.4.1). By virtue of Corollary 7.5.4.11, it will suffice to show that the functor $\overline{\mathscr{G}}$ is a homotopy limit diagram if and only if $\overline{\mathscr{G}}^{\mathrm{op}}$ is a homotopy limit diagram. This is clear, since the functors $\overline{\mathscr{G}}$ and $\overline{\mathscr{G}}^{\mathrm{op}}$ are isomorphic (see Example 1.4.2.5). □

The notion of homotopy pullback square (see §3.4.1) can be regarded as a special case of the notion of homotopy limit diagram:

03BJ **Proposition 7.5.4.13.** *Suppose we are given a commutative diagram of simplicial sets*

03BK
$$\begin{tikzcd}
X_{01} \arrow[r] \arrow[d] & X_0 \arrow[d] \\
X_1 \arrow[r] & X,
\end{tikzcd} \tag{7.49}$$

which we identify with a functor $\mathscr{F} : [1] \times [1] \to \mathrm{Set}_{\Delta}$. Then (7.49) is a homotopy pullback square (in the sense of Definition 3.4.1.1) if and only if $\mathscr{F}$ is a homotopy limit diagram (in the sense of Definition 7.5.4.8).

Proof. Using Proposition 3.1.7.1, we can choose a levelwise weak homotopy equivalence $\alpha : \mathscr{F} \to \mathscr{F}'$, where $\mathscr{F}'$ is a diagram of Kan complexes. Using Corollaries 3.4.1.12 and

7.5.4.11, we can replace $\mathscr{F}$ by $\mathscr{F}'$ and thereby reduce to the case where (7.49) is a diagram of Kan complexes. By virtue of Corollary 3.4.1.6, the diagram (7.49) is a homotopy pullback square if and only if it induces a homotopy equivalence $f : X_{01} \to X_0 \times^{\mathrm{h}}_X X_1$, where $X_0 \times^{\mathrm{h}}_X X_1$ is the homotopy fiber product of Construction 3.4.0.3. On the other hand, $\mathscr{F}$ is a homotopy limit diagram if and only if the composition $\iota \circ f$ is a homotopy equivalence, where

$$\iota : X_0 \times^{\mathrm{h}}_X X_1 \hookrightarrow X_0 \times^{\mathrm{h}}_X (X_1 \times^{\mathrm{h}}_X X) \simeq \underleftarrow{\mathrm{holim}}(F)$$

is the comparison map described in Example 7.5.2.17. The desired result now follows from the observation that ι is a homotopy equivalence (see Example 7.5.2.17). □

7.5.5 Categorical Limit Diagrams

The theory of homotopy limit diagrams introduced in §7.5.4 should be regarded as belonging to the "classical" homotopy theory of simplicial sets: for example, it is invariant under weak homotopy equivalence (Corollary 7.5.4.11). When using simplicial sets to model higher category theory (rather than homotopy theory), it is useful to work with slightly different class of diagrams. 03BL

Definition 7.5.5.1 (Categorical Limit Diagrams of ∞-Categories)**.** Let $\mathcal{C}$ be a small category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$ be a functor having restriction $\mathscr{F} = \overline{\mathscr{F}}|_{\mathcal{C}}$. We will say that $\overline{\mathscr{F}}$ is a *categorical limit diagram* if the composite map 03BM

$$\overline{\mathscr{F}}(\mathbf{0}) \to \underleftarrow{\lim}(\mathscr{F}) \hookrightarrow \underleftarrow{\mathrm{holim}}(\mathscr{F})$$

is an equivalence of ∞-categories; here $\mathbf{0}$ denotes the initial object of the cone $\mathcal{C}^{\triangleleft} \simeq \{\mathbf{0}\} \star \mathcal{C}$, and the morphism on the right is the comparison map of Remark 7.5.2.12.

Example 7.5.5.2. Let $\mathcal{C}$ be a category. A diagram of Kan complexes $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ is a categorical limit diagram (in the sense of Definition 7.5.5.1) if and only if it is a homotopy limit diagram (in the sense of Definition 7.5.4.1). 03BN

Example 7.5.5.3 (Limits of Isofibrant Diagrams)**.** Let $\mathcal{C}$ be a small category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{Set}_{\Delta}$ be a limit diagram in the category of simplicial sets. Suppose that the diagram $\mathscr{F} = \overline{\mathscr{F}}|_{\mathcal{C}}$ is isofibrant (Definition 4.5.6.3). Then $\overline{\mathscr{F}}$ is a categorical limit diagram of ∞-categories: this follows by combining Corollary 4.5.6.13 with Proposition 7.5.3.12. 03BP

Warning 7.5.5.4. Let $\mathcal{C}$ be a category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$ be a diagram of ∞-categories. In general, the condition that $\overline{\mathscr{F}}$ is a categorical limit diagram (in the sense of Definition 7.5.5.1) is independent of the condition that it is a homotopy limit diagram (in the sense of Definition 7.5.4.8): see Exercises 4.5.2.12 and 4.5.2.13. 03BQ

03BR **Remark 7.5.5.5.** Let $\mathcal{C}$ be a category, let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$ be a categorical limit diagram of ∞-categories, and define $\overline{\mathscr{F}}^{\simeq} : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ by the formula $\overline{\mathscr{F}}^{\simeq}(C) = \overline{\mathscr{F}}(C)^{\simeq}$. Then $\overline{\mathscr{F}}^{\simeq}$ is a homotopy limit diagram. This follows by combining Example 7.5.2.8 with Remark 4.5.1.20.

03BS **Remark 7.5.5.6** (Homotopy Invariance)**.** Let $\mathcal{C}$ be a small category and let $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{G}}$ be a natural transformation between diagrams $\overline{\mathscr{F}}, \overline{\mathscr{G}} : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$. Assume that, for every object $C \in \mathcal{C}$, the induced map $\alpha_C : \overline{\mathscr{F}}(C) \to \overline{\mathscr{G}}(C)$ is an equivalence of ∞-categories. Then α determines a commutative diagram of ∞-categories

$$\begin{tikzcd}
\overline{\mathscr{F}}(\mathbf{0}) \arrow[r] \arrow[d] & \underleftarrow{\mathrm{holim}}(\overline{\mathscr{F}}|_{\mathcal{C}}) \arrow[d] \\
\overline{\mathscr{G}}(\mathbf{0}) \arrow[r] & \underleftarrow{\mathrm{holim}}(\overline{\mathscr{G}}|_{\mathcal{C}}),
\end{tikzcd}$$

where the right vertical map is an equivalence (Remark 7.5.2.7). It follows that any two of the following conditions imply the third:

(1) The functor $\overline{\mathscr{F}}$ is a categorical limit diagram.

(2) The functor $\overline{\mathscr{G}}$ is a categorical limit diagram.

(3) The natural transformation α induces an equivalence of ∞-categories $\overline{\mathscr{F}}(\mathbf{0}) \to \overline{\mathscr{G}}(\mathbf{0})$, where $\mathbf{0}$ denotes the cone point of $\mathcal{C}^{\triangleleft}$.

03BT **Proposition 7.5.5.7.** *Let $\mathcal{C}$ be a category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$ be a functor. The following conditions are equivalent:*

(1) *The functor $\overline{\mathscr{F}}$ is a categorical limit diagram, in the sense of Definition 7.5.5.1.*

(2) *For every simplicial set K, the functor*

$$\overline{\mathscr{F}}^{K} : \mathcal{C}^{\triangleleft} \to \mathrm{QCat} \qquad C \mapsto \mathrm{Fun}(K, \overline{\mathscr{F}}(C))$$

is a categorical limit diagram.

(3) *For every simplicial set K, the functor*

$$(\overline{\mathscr{F}}^{K})^{\simeq} : \mathcal{C}^{\triangleleft} \to \mathrm{Kan} \qquad C \mapsto \mathrm{Fun}(K, \overline{\mathscr{F}}(C))^{\simeq}$$

is a homotopy limit diagram.

(4) *The functor $(\overline{\mathscr{F}}^{\Delta^1})^{\simeq} : \mathcal{C}^{\triangleleft} \to \mathrm{Kan}$ is a homotopy limit diagram.*

Proof. The implication (1) ⇒ (2) follows from Remarks 7.5.2.3 and 4.5.1.16, the implication (2) ⇒ (3) from Remark 7.5.5.5, and the implication (3) ⇒ (4) is immediate. Set $\mathscr{F} = \overline{\mathscr{F}}|_{\mathcal{C}}$, and let $\mathbf{0}$ denote the initial object of $\mathcal{C}^{\triangleleft}$. Using Remark 7.5.2.3 and Example 7.5.2.8, we see that condition (4) is equivalent to the requirement that the map $\overline{\mathscr{F}}(\mathbf{0}) \to \underset{\longleftarrow}{\mathrm{holim}}(\mathscr{F})$ induces a homotopy equivalence of Kan complexes

$$\mathrm{Fun}(\Delta^1, \overline{\mathscr{F}}(\mathbf{0}))^{\simeq} \to \mathrm{Fun}(\Delta^1, \underset{\longleftarrow}{\mathrm{holim}}(\mathscr{F}))^{\simeq} \simeq \underset{\longleftarrow}{\mathrm{holim}}((\overline{\mathscr{F}}^{\Delta^1})^{\simeq}).$$

The implication (4) ⇒ (1) now follows from Theorem 4.5.7.1. □

Corollary 7.5.5.8. *Let $\mathcal{C}$ be a category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$ be a functor. Then $\overline{\mathscr{F}}$ is a categorical limit diagram if and only if the induced functor of ∞-categories* 03BU

$$\mathrm{N}^{\mathrm{hc}}_{\bullet}(\overline{\mathscr{F}}) : \mathrm{N}_{\bullet}(\mathcal{C}^{\triangleleft}) \to \mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathrm{QCat}) = \mathcal{QC}$$

is a limit diagram in the ∞-category $\mathcal{QC}$ (in the sense of Definition 7.1.2.4).

Proof. By virtue of Corollary 7.5.4.6, the diagram $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\overline{\mathscr{F}})$ is a limit diagram in the ∞-category $\mathcal{QC}$ if and only if, for every ∞-category $\mathcal{E}$, the diagram of Kan complexes

$$\mathcal{C}^{\triangleleft} \to \mathrm{Kan} \qquad C \mapsto \mathrm{Hom}_{\mathrm{QCat}}(\mathcal{E}, \overline{\mathscr{F}}(C))_{\bullet} = \mathrm{Fun}(\mathcal{E}, \overline{\mathscr{F}}(C))^{\simeq}$$

is a homotopy limit diagram. Using Proposition 7.5.5.7, we see that this is equivalent to the requirement that $\overline{\mathscr{F}}$ is a categorical limit diagram. □

Corollary 7.5.5.9. *Let $\mathcal{C}$ be a small category and let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be an isofibrant diagram of ∞-categories Then $\mathscr{F}$ has a limit in the category* QCat*, which is preserved by the inclusion functor* $\mathrm{N}_{\bullet}(\mathrm{QCat}) \hookrightarrow \mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathrm{QCat}) = \mathcal{QC}$. 03BV

Proof. Combine Example 7.5.5.3 with Corollary 7.5.5.8. □

Corollary 7.5.5.10. *Suppose we are given a commutative diagram of ∞-categories* 03BW

03BX

$$\begin{tikzcd}
\mathcal{C}_{01} \arrow[r] \arrow[d] & \mathcal{C}_0 \arrow[d] \\
\mathcal{C}_1 \arrow[r] & \mathcal{C},
\end{tikzcd} \tag{7.50}$$

which we identify with a functor $\overline{\mathscr{F}} : [1] \times [1] \to \mathcal{QC}$. The following conditions are equivalent:

(1) *The diagram (7.50) is a categorical pullback square, in the sense of Definition 4.5.2.8.*

(2) *The functor $\overline{\mathscr{F}}$ is a categorical limit diagram, in the sense of Definition 7.5.5.1.*

Proof. Using Proposition 4.5.2.14, we can restate (2) as follows:

(2′) For every simplicial set K, the diagram of Kan complexes

$$\begin{tikzcd}
\mathrm{Fun}(K, \mathcal{C}_{01})^{\simeq} \arrow[r] \arrow[d] & \mathrm{Fun}(K, \mathcal{C}_0)^{\simeq} \arrow[d] \\
\mathrm{Fun}(K, \mathcal{C}_1)^{\simeq} \arrow[r] & \mathrm{Fun}(K, \mathcal{C})^{\simeq}
\end{tikzcd}$$

is a homotopy pullback square.

The equivalence (1) ⇔ (2′) follows by combining Propositions 7.5.4.13, and 7.5.5.7. □

We now extend the scope of Definition 7.5.5.1 to arbitrary diagrams of simplicial sets.

03BY **Definition 7.5.5.11** (Categorical Limit Diagrams of Simplicial Sets)**.** Let $\mathcal{C}$ be a category. We say that a functor $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{Set}_{\Delta}$ is a *categorical limit diagram* if there exists a levelwise categorical equivalence $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{G}}$, where $\overline{\mathscr{G}} : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$ is a categorical limit diagram (in the sense of Definition 7.5.5.1).

03BZ **Remark 7.5.5.12.** Let $\mathcal{C}$ be a category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$ be a functor. The following conditions are equivalent:

(1) The functor $\overline{\mathscr{F}}$ is a categorical limit diagram in the sense of Definition 7.5.5.1: that is, it induces an equivalence of ∞-categories $\overline{\mathscr{F}}(\mathbf{0}) \to \underleftarrow{\mathrm{holim}}(\overline{\mathscr{F}}|_{\mathcal{C}})$.

(2) The functor $\overline{\mathscr{F}}$ is a categorical limit diagram in the sense of Definition 7.5.5.11: that is, there exists a levelwise categorical equivalence $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{G}}$, where $\overline{\mathscr{G}} : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$ induces an equivalence of ∞-categories $\overline{\mathscr{G}}(\mathbf{0}) \to \underleftarrow{\mathrm{holim}}(\overline{\mathscr{G}}|_{\mathcal{C}})$.

The implication (1) ⇒ (2) is immediate, and the reverse implication follows from Remark 7.5.5.6.

03C0 **Proposition 7.5.5.13.** *Let $\mathcal{C}$ be a category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{Set}_{\Delta}$ be a functor. The following conditions are equivalent:*

(1) *The functor $\overline{\mathscr{F}}$ is a categorical limit diagram. That is, there exists a categorical limit diagram $\overline{\mathscr{F}}' : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$ and a levelwise categorical equivalence $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{F}}'$.*

(2) *Let $\overline{\mathscr{F}}' : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$ be any functor. If there exists a levelwise categorical equivalence $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{F}}'$, then $\overline{\mathscr{F}}'$ is a categorical limit diagram.*

Proof. We proceed as in the proof of Proposition 7.5.4.10. Using Proposition 4.1.3.2, we can choose a functor $\overline{\mathscr{G}} : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$ and a natural transformation $\beta : \overline{\mathscr{F}} \to \overline{\mathscr{G}}$ for which the morphism of simplicial sets $\beta_C : \overline{\mathscr{F}}(C) \to \overline{\mathscr{G}}(C)$ is inner anodyne for each object $C \in \mathcal{C}^{\triangleleft}$. We will show that (1) and (2) are equivalent to the following:

(3) The functor $\overline{\mathscr{G}}$ is a categorical limit diagram.

The implications (2) ⇒ (3) ⇒ (1) are immediate. To prove the reverse implications, suppose we are given another functor $\overline{\mathscr{F}}' : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$ and a levelwise categorical equivalence $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{F}}'$. We will show that $\overline{\mathscr{F}}'$ is a categorical limit diagram if and only if $\overline{\mathscr{G}}$ is a categorical limit diagram.

Applying Proposition 4.1.3.2 again, we can choose a functor $\overline{\mathscr{G}}' : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$ and a commutative diagram

$$\begin{tikzcd}
\overline{\mathscr{F}} \arrow[r, "\alpha"] \arrow[d, "\beta"] & \overline{\mathscr{F}}' \arrow[d, "\beta'"] \\
\overline{\mathscr{G}} \arrow[r, "\alpha'"] & \overline{\mathscr{G}}'
\end{tikzcd}$$

with the property that, for every object $C \in \mathcal{C}^{\triangleleft}$, the induced morphism of simplicial sets $\overline{\mathscr{F}}'(C) \coprod_{\overline{\mathscr{F}}(C)} \overline{\mathscr{G}}(C) \to \overline{\mathscr{G}}'(C)$ is inner anodyne (and, in particular, a categorical equivalence). Applying Proposition 4.5.4.11, we see that the diagram of simplicial sets

$$\begin{tikzcd}
\overline{\mathscr{F}}(C) \arrow[r, "\alpha_C"] \arrow[d, "\beta_C"] & \overline{\mathscr{F}}'(C) \arrow[d, "\beta'_C"] \\
\overline{\mathscr{G}}(C) \arrow[r, "\alpha'_C"] & \overline{\mathscr{G}}'(C)
\end{tikzcd}$$

is a categorical pushout square. Since α_C and β_C are categorical equivalences, it follows that α'_C and β'_C are also categorical equivalences (Proposition 4.5.4.10). Applying Remark 7.5.5.6, we see that $\overline{\mathscr{F}}'$ and $\overline{\mathscr{G}}$ are categorical limit diagrams if and only if $\overline{\mathscr{G}}'$ is a categorical limit diagram. □

Corollary 7.5.5.14. *Let $\mathcal{C}$ be a category, let $\overline{\mathscr{F}}, \overline{\mathscr{F}}' : \mathcal{C}^{\triangleleft} \to \mathrm{Set}_{\Delta}$ be functors, and let $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{F}}'$ be a natural transformation. Suppose that, for every object $C \in \mathcal{C}$, the induced map $\alpha_C : \overline{\mathscr{F}}(C) \to \overline{\mathscr{F}}'(C)$ is a categorical equivalence of simplicial sets. Then any two of the following conditions imply the third:* 03C1

(1) *The functor $\overline{\mathscr{F}}$ is a categorical limit diagram.*

(2) *The functor* $\overline{\mathscr{F}}'$ *is a categorical limit diagram.*

(3) *The natural transformation* α *induces a categorical equivalence of simplicial sets* $\overline{\mathscr{F}}(\mathbf{0}) \to \overline{\mathscr{F}}'(\mathbf{0})$*, where* $\mathbf{0}$ *denotes the initial object of* $\mathcal{C}^{\triangleleft}$*.*

Proof. Using Proposition 4.1.3.2, we can choose functors $\overline{\mathscr{G}}, \overline{\mathscr{G}}' : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$ and a commutative diagram

$$\begin{tikzcd}
\overline{\mathscr{F}} \arrow[r, "\alpha"] \arrow[d] & \overline{\mathscr{F}}' \arrow[d] \\
\overline{\mathscr{G}} \arrow[r, "\beta"] & \overline{\mathscr{G}}',
\end{tikzcd}$$

where the vertical maps are levelwise categorical equivalences. By virtue of Proposition 7.5.5.13, we can replace α by the natural transformation $\beta : \overline{\mathscr{G}} \to \overline{\mathscr{G}}'$. In this case, the desired result follows from Remark 7.5.5.6. □

03C2 **Corollary 7.5.5.15.** *Let* $\mathcal{C}$ *be a small category and let* $\overline{\mathscr{F}} : \mathcal{C}^{\triangleleft} \to \mathrm{Set}_{\Delta}$ *be a functor. Let* $\overline{\mathscr{F}}^{\mathrm{op}} : \mathcal{C}^{\triangleleft} \to \mathrm{Set}_{\Delta}$ *be the functor given on objects by* $\overline{\mathscr{F}}^{\mathrm{op}}(C) = \overline{\mathscr{F}}(C)^{\mathrm{op}}$*. Then* $\overline{\mathscr{F}}$ *is a categorical limit diagram if and only if* $\overline{\mathscr{F}}^{\mathrm{op}}$ *is a categorical limit diagram.*

Proof. Using Proposition 4.1.3.2, we can choose a functor $\overline{\mathscr{G}} : \mathcal{C}^{\triangleleft} \to \mathrm{QCat}$ and a levelwise categorical equivalence $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{G}}$. By virtue of Corollary 7.5.5.14, it will suffice to show that $\overline{\mathscr{G}}$ is a categorical limit diagram if and only if $\overline{\mathscr{G}}^{\mathrm{op}}$ is a categorical limit diagram. This follows by combining Proposition 7.5.5.7 with Corollary 7.5.4.12. □

7.5.6 The Homotopy Colimit as a Derived Functor

03C3 Let $\mathcal{C}$ be a small category and let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be a diagram of ∞-categories. In §7.5.3, we showed that the homotopy limit $\underleftarrow{\mathrm{holim}}(\mathscr{F})$ can be identified with the limit of an *isofibrant replacement* for $\mathscr{F}$: that is, there exists an isomorphism $\underleftarrow{\mathrm{holim}}(\mathscr{F}) \simeq \underleftarrow{\lim}(\mathscr{F}^{+})$, where $\mathscr{F}^{+} : \mathcal{C} \to \mathrm{QCat}$ is an isofibrant diagram equipped with a levelwise categorical equivalence $\mathscr{F} \hookrightarrow \mathscr{F}^{+}$ (Construction 7.5.3.3 and Proposition 7.5.3.7). Our goal in this section is to present a parallel treatment of the homotopy colimit functor of Construction 5.3.2.1. More precisely, we show that the homotopy colimit of a diagram $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ can be identified with the colimit of an auxiliary diagram $\mathscr{F}_{+} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ which is equipped with a levelwise weak homotopy equivalence $\mathscr{F}_{+} \twoheadrightarrow \mathscr{F}$ (Proposition 7.5.6.12).

We begin by introducing some terminology. Recall that a natural transformation $\beta : \widetilde{\mathscr{G}} \to \mathscr{G}$ is a *levelwise trivial Kan fibration* if, for each object $C \in \mathcal{C}$, the morphism $\beta_C : \widetilde{\mathscr{G}}(C) \to \mathscr{G}(C)$ is a trivial Kan fibration of simplicial sets.

Definition 7.5.6.1. Let $\mathcal{C}$ be a small category. We say that a diagram of simplicial sets $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ is *projectively cofibrant* if, for every levelwise trivial Kan fibration $\beta : \mathscr{G}' \to \mathscr{G}$, the induced map 03C4

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathrm{Set}_{\Delta})}(\mathscr{F}, \mathscr{G}') \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathrm{Set}_{\Delta})}(\mathscr{F}, \mathscr{G})$$

is surjective. That is, every natural transformation $\alpha : \mathscr{F} \to \mathscr{G}$ factors through β.

Example 7.5.6.2. Let $\mathcal{C}$ be a category and let $U : \mathcal{E} \to \mathrm{N}_{\bullet}(\mathcal{C})$ be a morphism of simplicial sets. Then the diagram 03C5

$$\mathscr{F}_{\mathcal{E}} : \mathcal{C} \to \mathrm{Set}_{\Delta} \qquad \mathscr{F}_{\mathcal{E}}(C) = \mathrm{N}_{\bullet}(\mathcal{C}_{/C}) \times_{\mathrm{N}_{\bullet}(\mathcal{C})} \mathcal{E}$$

is projectively cofibrant, in the sense of Definition 7.5.6.1. To prove this, we must show that for every levelwise trivial Kan fibration $\mathscr{G}' \to \mathscr{G}$ between functors $\mathscr{G}', \mathscr{G} : \mathcal{C} \to \mathrm{Set}_{\Delta}$, the induced map

$$\theta : \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{S})}(\mathscr{F}_{\mathcal{E}}, \mathscr{G}') \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{S})}(\mathscr{G}_{\mathcal{E}}, \mathscr{G})$$

is surjective. Using Proposition 5.3.3.24, we can identify θ with a pullback of the map $\mathrm{Hom}_{\mathrm{Set}_{\Delta}}(\mathcal{E}, \mathrm{N}^{\mathscr{G}'}_{\bullet}(\mathcal{C})) \to \mathrm{Hom}_{\mathrm{Set}_{\Delta}}(\mathcal{E}, \mathrm{N}^{\mathscr{G}}_{\bullet}(\mathcal{C}))$, which is surjective by virtue of Exercise 5.3.3.11.

Exercise 7.5.6.3 (Well-Founded Diagrams)**.** Let $(Q, \leq)$ be a well-founded partially ordered set. Show that a diagram of simplicial sets $\mathscr{F} : Q \to \mathrm{Set}_{\Delta}$ is projectively cofibrant if and only if, for each element $q \in Q$, the associated map $\varinjlim_{p<q} \mathscr{F}(p) \to \mathscr{F}(q)$ is a monomorphism of simplicial sets (compare with Proposition 4.5.6.6). 03C6

Example 7.5.6.4 (Projectively Cofibrant Sequences)**.** A sequential diagram of simplicial sets 03C7

$$X(0) \to X(1) \to X(2) \to X(3) \to \cdots$$

is projectively cofibrant (when regarded as a functor $\mathbf{Z}_{\geq 0} \to \mathrm{Set}_{\Delta}$) if and only if each of the transition maps $X(n) \to X(n+1)$ is a monomorphism.

Example 7.5.6.5 (Projectively Cofibrant Squares)**.** A commutative diagram of simplicial sets 03C8

03C9
$$\begin{tikzcd} A \arrow[r, "f_0"] \arrow[d, "f_1"] & A_0 \arrow[d, "f_1"] \\ A_1 \arrow[r, "f_0"] & A_{01} \end{tikzcd} \qquad (7.51)$$

is projectively cofibrant (when regarded as a functor $[1] \times [1] \to \mathrm{Set}_{\Delta}$) if and only if the morphisms

$$f_0 : A \to A_0 \qquad f_1 : A \to A_1 \qquad (f_1', f_0') : A_0 \coprod_A A_1 \to A_{01}$$

are monomorphisms of simplicial sets. Equivalently, (7.51) is projectively cofibrant if it is a pullback square consisting of monomorphisms.

03CA **Remark 7.5.6.6** (Relationship to Isofibrant Diagrams)**.** Let $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ be a diagram of simplicial sets, let $\mathcal{D}$ be an ∞-category, and let $\mathcal{D}^{\mathscr{F}} : \mathcal{C}^{\mathrm{op}} \to \mathrm{Set}_{\Delta}$ denote the functor given by the construction $C \mapsto \mathrm{Fun}(\mathscr{F}(C), \mathcal{D})$. If $\mathscr{F}$ is projectively cofibrant (in the sense of Definition 7.5.6.1), then $\mathcal{D}^{\mathscr{F}}$ is isofibrant (in the sense of Definition 4.5.6.3). That is, if $\mathscr{E} : \mathcal{C}^{\mathrm{op}} \to \mathrm{Set}_{\Delta}$ is a diagram of simplicial sets and $\mathscr{E}_0 \subseteq \mathscr{E}$ is a subfunctor for which the equivalence $\mathscr{E}_0 \hookrightarrow \mathscr{E}$ is a levelwise categorical equivalence, then the restriction map

$$\theta : \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathrm{Set}_{\Delta})}(\mathscr{E}, \mathcal{D}^{\mathscr{F}}) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathrm{Set}_{\Delta})}(\mathscr{E}_0, \mathcal{D}^{\mathscr{F}})$$

is surjective. This follows from the observation that θ can be identified with the map

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathrm{Set}_{\Delta})}(\mathscr{F}, \mathcal{D}^{\mathscr{E}}) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathrm{Set}_{\Delta})}(\mathscr{F}, \mathcal{D}^{\mathscr{E}_0})$$

given by composition with the restriction map $\mathcal{D}^{\mathscr{E}} \to \mathcal{D}^{\mathscr{E}_0}$, which is a levelwise trivial Kan fibration by virtue of Corollary 4.5.5.19.

03CB **Proposition 7.5.6.7.** *Let $\mathcal{C}$ be a small category and let $\alpha : \mathscr{F} \to \mathscr{G}$ be a natural transformation between projectively cofibrant diagrams $\mathscr{F}, \mathscr{G} : \mathcal{C} \to \mathrm{Set}_{\Delta}$. If α is a levelwise categorical equivalence, then the induced map $\varinjlim(\alpha) : \varinjlim(\mathscr{F}) \to \varinjlim(\mathscr{G})$ is a categorical equivalence of simplicial sets. If α is a levelwise weak homotopy equivalence, then $\varinjlim(\alpha)$ is a weak homotopy equivalence.*

Proof. We will prove the first assertion; the second follows by a similar argument. Assume that α is levelwise categorical equivalence and let $\mathcal{D}$ be an ∞-category; we wish to show that precomposition with $\varprojlim(\alpha)$ induces an equivalence of ∞-categories $\alpha^* : \mathrm{Fun}(\varinjlim(\mathscr{G}), \mathcal{D}) \to \mathrm{Fun}(\varinjlim(\mathscr{F}), \mathcal{D})$. α is a levelwise categorical equivalence, precomposition with α induces a levelwise categorical equivalence $\beta : \mathcal{D}^{\mathscr{G}} \to \mathcal{D}^{\mathscr{F}}$ in the category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathrm{Set}_{\Delta})$. Unwinding the definitions, we see that α^* can be identified with the limit $\varprojlim(\beta)$. Since $\mathcal{D}^{\mathscr{F}}$ and $\mathcal{D}^{\mathscr{G}}$ are isofibrant diagrams (Remark 7.5.6.6), the functor $\varprojlim(\beta)$ is an equivalence of ∞-categories (Corollary 4.5.6.17). □

We now show that every diagram of simplicial sets $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ admits a weak homotopy equivalence from a projectively cofibrant diagram (for a stronger statement, see Proposition 7.5.9.7).

03CC **Construction 7.5.6.8** (Explicit Cofibrant Replacement)**.** Let $\mathcal{C}$ be a small category, let $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ be a diagram of simplicial sets, and let $\mathrm{ho}\varinjlim(\mathscr{F})$ denote the homotopy colimit of $\mathscr{F}$ (Construction 5.3.2.1). For each object $C \in \mathcal{C}$, we let $\mathscr{F}_+(C)$ denote the simplicial set given by the fiber product

$$\mathrm{N}_{\bullet}(\mathcal{C}_{/C}) \times_{\mathrm{N}_{\bullet}(\mathcal{C})} \mathrm{ho}\varinjlim(\mathscr{F}) = \mathrm{ho}\varinjlim(\mathscr{F}|_{\mathcal{C}_{/C}}).$$

The construction $C \mapsto \mathscr{F}_{+}(C)$ determines a diagram of simplicial sets $\mathscr{F}_{+} : \mathcal{C} \to \mathrm{Set}_{\Delta}$. This diagram is equipped with a natural transformation $\alpha : \mathscr{F}_{+} \twoheadrightarrow \mathscr{F}$, which carries each object $C \in \mathcal{C}$ to the comparison map

$$\mathscr{F}_{+}(C) = \underrightarrow{\mathrm{holim}}(\mathscr{F}|_{\mathcal{C}_{/C}}) \twoheadrightarrow \underrightarrow{\lim}(\mathscr{F}|_{\mathcal{C}_{/C}}) \simeq \mathscr{F}(C)$$

of Remark 5.3.2.9.

Proposition 7.5.6.9. *Let $\mathcal{C}$ be a small category and let $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ be a diagram of simplicial sets. Then the diagram $\mathscr{F}_{+} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ of Construction 7.5.6.8 is projectively cofibrant, and the natural transformation $\alpha : \mathscr{F}_{+} \to \mathscr{F}$ is a levelwise weak homotopy equivalence. Moreover, α is also an epimorphism.* 03CD

Proof. Example 7.5.6.2 shows that the diagram $\mathscr{F}_{+}$ is projectively cofibrant and Remark 5.3.2.9 shows that α is an epimorphism. To complete the proof, it will suffice to show that for each object $C \in \mathcal{C}$, the map $\alpha_C : \mathscr{F}_{+}(C) \to \mathscr{F}(C)$ is a weak homotopy equivalence of simplicial sets. Replacing $\mathcal{C}$ by the slice category $\mathcal{C}_{/C}$, we can reduce to the case where C is a final object of $\mathcal{C}$; in this case, we wish to prove that the comparison map

$$\underrightarrow{\mathrm{holim}}(\mathscr{F}) \to \underrightarrow{\lim}(\mathscr{F}) \simeq \mathscr{F}(C)$$

is a weak homotopy equivalence. Note that this map admits a section, given by the inclusion map

$$\iota : \mathscr{F}(C) \simeq \{C\} \times_{\mathrm{N}_{\bullet}(\mathcal{C})} \underrightarrow{\mathrm{holim}}(\mathscr{F}) \to \underrightarrow{\mathrm{holim}}(\mathscr{F}).$$

We complete the proof by that our assumption that $C \in \mathcal{C}$ is a final object guarantees that ι is right anodyne (Example 7.2.3.11). □

Warning 7.5.6.10. In the situation of Proposition 7.5.6.9, the natural transformation $\alpha : \mathscr{F}_{+} \twoheadrightarrow \mathscr{F}$ is usually not a levelwise categorical equivalence. For example, if $\mathscr{F}$ is the constant functor taking the value Δ^0, then $\mathscr{F}_{+}$ is given by the construction $C \mapsto \mathrm{N}_{\bullet}(\mathcal{C}_{/C})$. 03CE

Remark 7.5.6.11. Constructions 7.5.6.8 and 7.5.3.3 are closely related. Let $\mathcal{C}$ be a small category, let $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ be a diagram of simplicial sets, and let $\mathscr{G} : \mathcal{C} \to \mathrm{Kan}$ be a diagram of Kan complexes. Combining Corollary 5.3.2.24 with Proposition 5.3.3.24, we obtain canonical isomorphisms of Kan complexes 03CF

$$\begin{aligned} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathrm{Set}_{\Delta})}(\mathscr{F}, \mathscr{G}^{+})_{\bullet} &= \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathrm{Set}_{\Delta})}(\mathscr{F}, \mathrm{sTr}_{\mathrm{N}^{\mathscr{G}}_{\bullet}(\mathcal{C})/\mathcal{C}}) \\ &\simeq \mathrm{Fun}_{/\mathrm{N}_{\bullet}(\mathcal{C})}(\underrightarrow{\mathrm{holim}}(\mathscr{F}), \mathrm{N}^{\mathscr{G}}_{\bullet}(\mathcal{C})) \\ &\simeq \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathrm{Set}_{\Delta})}(\mathscr{F}_{+}, \mathscr{G})_{\bullet}. \end{aligned}$$

More generally, if $\mathscr{G}$ is a diagram of ∞-categories, we can identify $\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathrm{Set}_{\Delta})}(\mathscr{F},\mathscr{G}^{+})_{\bullet}$ with the full subcategory of $\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathrm{Set}_{\Delta})}(\mathscr{F}_{+},\mathscr{G})_{\bullet}$ spanned by those natural transformations $\alpha : \mathscr{F}_{+} \rightarrow \mathscr{G}$ having the property that, for each object $C \in \mathcal{C}$, the diagram

$$\alpha_C : \mathscr{F}_{+}(C) = \underrightarrow{\mathrm{holim}}(\mathscr{F}|_{\mathcal{C}_{/C}}) \rightarrow \mathscr{G}(C)$$

carries horizontal edges of $\underrightarrow{\mathrm{holim}}(\mathscr{F}|_{\mathcal{C}_{/C}})$ to isomorphisms in the ∞-category $\mathscr{G}(C)$.

`03CG` **Proposition 7.5.6.12.** *Let $\mathcal{C}$ be a small category, let $\mathscr{F} : \mathcal{C} \rightarrow \mathrm{Set}_{\Delta}$ be a diagram of simplicial sets, and let $\mathscr{F}_{+} : \mathcal{C} \rightarrow \mathrm{Set}_{\Delta}$ be the diagram of Construction 7.5.6.8. Then there is a canonical isomorphism of simplicial sets $\lambda : \varinjlim(\mathscr{F}_{+}) \rightarrow \underrightarrow{\mathrm{holim}}(\mathscr{F})$ which is characterized by the following requirement: for each object $C \in \mathcal{C}$, the composition*

$$\begin{aligned} \mathrm{N}_{\bullet}(\mathcal{C}_{/C}) \times_{\mathrm{N}_{\bullet}(\mathcal{C})} \underrightarrow{\mathrm{holim}}(\mathscr{F}) &= \mathscr{F}_{+}(C) \\ &\rightarrow \varinjlim(\mathscr{F}_{+}) \\ &\xrightarrow{\lambda} \underrightarrow{\mathrm{holim}}(\mathscr{F}) \end{aligned}$$

is given by projection onto the second factor.

Proof. It follows from the definition of the colimit that there is a unique morphism of simplicial sets $\lambda : \varinjlim(\mathscr{F}_{+}) \rightarrow \underrightarrow{\mathrm{holim}}(\mathscr{F})$ having the desired property. Using the dual of Lemma 7.5.3.8, we deduce that λ is an isomorphism. □

`03CH` **Remark 7.5.6.13.** Let $\mathscr{F} : \mathcal{C} \rightarrow \mathrm{Set}_{\Delta}$ be a diagram of simplicial sets, let $\theta : \underrightarrow{\mathrm{holim}}(\mathscr{F}) \twoheadrightarrow \varinjlim(\mathscr{F})$ be the comparison map of Remark 5.3.2.9, and let $\lambda : \varinjlim(\mathscr{F}_{+}) \xrightarrow{\sim} \underrightarrow{\mathrm{holim}}(\mathscr{F})$ be the isomorphism of Proposition 7.5.6.12. Then the composition $(\theta \circ \lambda) : \varinjlim(\mathscr{F}_{+}) \rightarrow \varinjlim(\mathscr{F})$ is induced by the natural transformation $\alpha : \mathscr{F}_{+} \twoheadrightarrow \mathscr{F}$ appearing in Construction 7.5.6.8.

`03CJ` **Corollary 7.5.6.14.** *Let $\mathcal{C}$ be a small category and let $\mathscr{F} : \mathcal{C} \rightarrow \mathrm{Set}_{\Delta}$ be a projectively cofibrant diagram of simplicial sets. Then the comparison map $\underrightarrow{\mathrm{holim}}(\mathscr{F}) \twoheadrightarrow \varinjlim(\mathscr{F})$ of Remark 5.3.2.9 is a weak homotopy equivalence.*

Proof. By virtue of Remark 7.5.6.13, it will suffice to show that the natural transformation $\alpha : \mathscr{F}_{+} \twoheadrightarrow \mathscr{F}$ of Construction 7.5.6.8 induces a weak homotopy equivalence $\varinjlim(\alpha) : \varinjlim(\mathscr{F}_{+}) \rightarrow \varinjlim(\mathscr{F})$. This is a special case of Proposition 7.5.6.7, since α is a levelwise weak homotopy equivalence between projectively cofibrant diagrams (Proposition 7.5.6.9). □

`03CK` **Warning 7.5.6.15.** Let $\mathscr{F} : \mathcal{C} \rightarrow \mathrm{QCat}$ be a diagram of simplicial sets, let $\alpha : \mathscr{F}_{+} \twoheadrightarrow \mathscr{F}$ be the natural transformation of Construction 7.5.6.8, and let $\lambda : \varinjlim(\mathscr{F}_{+}) \xrightarrow{\sim} \underrightarrow{\mathrm{holim}}(\mathscr{F})$ be the isomorphism of Proposition 7.5.6.12. Then we have a diagram of simplicial sets

$$\begin{tikzcd}
\underrightarrow{\mathrm{holim}}(\mathscr{F}_+) \arrow[r, "\underrightarrow{\mathrm{holim}}(\alpha)"] \arrow[d] & \underrightarrow{\mathrm{holim}}(\mathscr{F}) \arrow[d] \\
\underrightarrow{\lim}(\mathscr{F}_+) \arrow[r, "\underrightarrow{\lim}(\alpha)"'] \arrow[ur, "\lambda", "\sim"'] & \underrightarrow{\lim}(\mathscr{F}),
\end{tikzcd}$$

where the outer square and the lower right triangle are commutative (Remark 7.5.6.13). Beware that the upper left triangle is usually *not* commutative. That is, $\underrightarrow{\mathrm{holim}}(\mathscr{F})$ and $\underrightarrow{\lim}(\mathscr{F}_+)$ are isomorphic when viewed as abstract simplicial sets, but not when viewed as quotients of the simplicial set $\underrightarrow{\mathrm{holim}}(\mathscr{F}_+)$ (compare with Warning 7.5.3.14).

Remark 7.5.6.16 (The Homotopy Colimit as a Left Derived Functor)**.** The preceding results can be interpreted in the language of model categories. For every small category $\mathcal{C}$, the category $\mathrm{Fun}(\mathcal{C}, \mathrm{Set}_\Delta)$ can be equipped with a model structure in which the fibrations are levelwise Kan fibrations and weak equivalences are levelwise weak homotopy equivalences (see Example [?]). Combining Propositions 7.5.6.9 and 7.5.6.12, we deduce that the homotopy colimit functor $\underrightarrow{\mathrm{holim}} : \mathrm{Fun}(\mathcal{C}, \mathrm{Set}_\Delta) \to \mathrm{Set}_\Delta$ can be viewed as a *left derived* functor of the usual colimit $\underrightarrow{\lim} : \mathrm{Fun}(\mathcal{C}, \mathrm{Set}_\Delta) \to \mathrm{Set}_\Delta$ (see Definition [?]). `03CL`

7.5.7 Homotopy Colimit Diagrams

Let $\mathcal{C}$ be a (small) category and let $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$ be a (strictly commutative) diagram of Kan complexes indexed by $\mathcal{C}$. Passing to the homotopy coherent nerve, we obtain a functor of ∞-categories `03CM`

$$\mathrm{N}^{\mathrm{hc}}_\bullet(\mathscr{F}) : \mathrm{N}_\bullet(\mathcal{C}) \to \mathrm{N}^{\mathrm{hc}}_\bullet(\mathrm{Kan}) = \mathcal{S}.$$

By virtue of Corollary 7.4.5.6, this functor admits a colimit in the ∞-category $\mathcal{S}$. This colimit admits a classical description, using the *homotopy colimit* of Construction 5.3.2.1.

Proposition 7.5.7.1. *Let $\mathcal{C}$ be a small category and let $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$ be a (strictly commutative) diagram of ∞-categories indexed by $\mathcal{C}$. Then a Kan complex X is a colimit of the functor $\mathrm{N}^{\mathrm{hc}}_\bullet(\mathscr{F})$ if and only if it is weakly homotopy equivalent to the homotopy colimit $\underrightarrow{\mathrm{holim}}(\mathscr{F})$.* `03CN`

Proof. Let $\lambda_t : \underrightarrow{\mathrm{holim}}(\mathscr{F}) \to \mathrm{N}^{\mathscr{F}}_\bullet(\mathcal{C})$ be the taut scaffold of Construction 5.3.4.11. Then λ_t is a categorical equivalence of simplicial sets (Corollary 5.3.5.9), and therefore a weak homotopy equivalence (Remark 4.5.3.4). The desired result now follows from Corollary 7.4.5.12. □

03CP **Example 7.5.7.2.** Let $\mathcal{C}$ be a groupoid and let $\mathscr{F} : \mathcal{C} \to \mathrm{Kan}$ be a diagram of Kan complexes indexed by $\mathcal{C}$. Then the homotopy colimit $\underrightarrow{\mathrm{holim}}(\mathscr{F})$ is a Kan complex (Corollary 5.3.4.23). In this case, Proposition 7.5.7.1 guarantees that $\underrightarrow{\mathrm{holim}}(\mathscr{F})$ is a colimit of the diagram $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathscr{F})$ in the ∞-category $\mathcal{S}$. For example, if X is a Kan complex equipped with an action of a group G, then the homotopy quotient $X_{\mathrm{h}G}$ is a colimit of the associated diagram $B_{\bullet}G \to \mathcal{S}$ (Example 5.3.4.24).

Our goal in this section is to formulate a companion to Proposition 7.5.7.1, which provides concrete models for colimit *diagrams* in the ∞-category $\mathcal{S}$ (rather than colimits in the abstract).

03CQ **Definition 7.5.7.3.** Let $\mathcal{C}$ be a category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$ be a diagram of simplicial sets restriction $\mathscr{F} = \overline{\mathscr{F}}|_{\mathcal{C}}$. We will say that $\overline{\mathscr{F}}$ is a *homotopy colimit diagram* if the composite map

$$\underrightarrow{\mathrm{holim}}(\mathscr{F}) \twoheadrightarrow \underrightarrow{\lim}(\mathscr{F}) \to \overline{\mathscr{F}}(\mathbf{1})$$

is a weak homotopy equivalence of simplicial sets. Here $\mathbf{1}$ denotes the final object of the cone $\mathcal{C}^{\triangleright} \simeq \mathcal{C} \star \{\mathbf{1}\}$, and the morphism on the left is the comparison map of Remark 5.3.2.9.

03CR **Example 7.5.7.4.** Let $\mathcal{C}$ be a small category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$ be a colimit diagram in the category of simplicial sets. If the diagram $\mathscr{F} = \overline{\mathscr{F}}|_{\mathcal{C}}$ is projectively cofibrant, then $\overline{\mathscr{F}}$ is a homotopy colimit diagram: this is a reformulation of Corollary 7.5.6.14 (for a stronger statement, see Corollary 7.5.8.7).

03CS **Proposition 7.5.7.5** (Homotopy Invariance)**.** *Let $\mathcal{C}$ be a category and let $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{G}}$ be a natural transformation between diagrams $\overline{\mathscr{F}}, \overline{\mathscr{G}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$. Assume that, for every object $C \in \mathcal{C}$, the induced map $\alpha_C : \overline{\mathscr{F}}(C) \to \overline{\mathscr{G}}(C)$ is a weak homotopy equivalence of simplicial sets. Then any two of the following conditions imply the third:*

(1) *The functor $\overline{\mathscr{F}}$ is a homotopy colimit diagram.*

(2) *The functor $\overline{\mathscr{G}}$ is a homotopy colimit diagram.*

(3) *The natural transformation α induces a weak homotopy equivalence $\overline{\mathscr{F}}(\mathbf{1}) \to \overline{\mathscr{G}}(\mathbf{1})$, where $\mathbf{1}$ denotes the cone point of $\mathcal{C}^{\triangleright}$.*

Proof. Setting $\mathscr{F} = \overline{\mathscr{F}}|_{\mathcal{C}}$ and $\mathscr{G} = \overline{\mathscr{G}}|_{\mathcal{C}}$, we observe that α determines a commutative diagram of simplicial sets

$$\begin{tikzcd}
\underrightarrow{\mathrm{holim}}(\mathscr{F}) \arrow[r] \arrow[d] & \underrightarrow{\mathrm{holim}}(\mathscr{G}) \arrow[d] \\
\overline{\mathscr{F}}(\mathbf{1}) \arrow[r] & \overline{\mathscr{G}}(\mathbf{1})
\end{tikzcd}$$

where the upper horizontal map is a weak homotopy equivalence (Proposition 5.3.2.18). The desired result now follows from the two-out-of-three property (Remark 3.1.6.16). □

There is a close relationship between homotopy colimit diagrams (in the sense of Definition 7.5.7.3) and homotopy limit diagrams (in the sense of Definition 7.5.4.1).

Proposition 7.5.7.6. *Let $\mathcal{C}$ be a category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$ be a diagram of simplicial sets. Then $\overline{\mathscr{F}}$ is a homotopy colimit diagram if and only if, for every Kan complex X, the functor* 03CT

$$X^{\overline{\mathscr{F}}} : (\mathcal{C}^{\triangleright})^{\mathrm{op}} \to \mathrm{Kan} \qquad C \mapsto \mathrm{Fun}(\overline{\mathscr{F}}(C), X)$$

is a homotopy limit diagram.

Proof. Set $\mathscr{F} = \overline{\mathscr{F}}|_{\mathcal{C}}$, let $\mathbf{1}$ denote the final object of $\mathcal{C}^{\triangleright}$, and let $\theta : \underrightarrow{\mathrm{holim}}(\mathscr{F}) \to \overline{\mathscr{F}}(\mathbf{1})$ be the map appearing in Definition 7.5.7.3. Then $\overline{\mathscr{F}}$ is a homotopy colimit diagram if and only if, for every Kan complex X, precomposition with θ induces a homotopy equivalence of Kan complexes

$$\theta^{*} : \mathrm{Fun}(\overline{\mathscr{F}}(\mathbf{1}), X) \to \mathrm{Fun}(\underrightarrow{\mathrm{holim}}(\mathscr{F}), X).$$

Setting $\mathscr{G} = \mathscr{F}^{\mathrm{op}}$, $\overline{\mathscr{G}} = \overline{\mathscr{F}}^{\mathrm{op}}$, and $Y = X^{\mathrm{op}}$, Example 7.5.1.7 identifies θ^{*} with the opposite of the restriction map $Y^{\overline{\mathscr{G}}}(\mathbf{1}) \to \underleftarrow{\mathrm{holim}}(Y^{\mathscr{G}})$ appearing in Definition 7.5.4.1. In particular, θ^{*} is a homotopy equivalence if and only if $Y^{\overline{\mathscr{G}}}$ is a homotopy limit diagram of Kan complexes. By virtue of Corollary 7.5.4.12, this is equivalent to the requirement that $X^{\overline{\mathscr{F}}}$ is a homotopy limit diagram. □

Corollary 7.5.7.7. *Let $\mathcal{C}$ be a small category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Kan}$ be a diagram of Kan complexes. Then $\overline{\mathscr{F}}$ is a homotopy colimit diagram (in the sense of Definition 7.5.7.3) if and only if the induced functor of ∞-categories* 03CU

$$\mathrm{N}^{\mathrm{hc}}_{\bullet}(\overline{\mathscr{F}}) : \mathrm{N}_{\bullet}(\mathcal{C}^{\triangleright}) \to \mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathrm{Kan}) = \mathcal{S}$$

is a colimit diagram (in the sense of Variant 7.1.2.5).

Proof. Combine Proposition 7.5.7.6 with Corollary 7.5.4.6 (applied to the simplicial category $\mathrm{Kan}^{\mathrm{op}}$). □

Corollary 7.5.7.8. *Let $\mathcal{C}$ be a category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$ be a functor. Let $\overline{\mathscr{F}}^{\mathrm{op}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$ be the functor given on objects by $\overline{\mathscr{F}}^{\mathrm{op}}(C) = \overline{\mathscr{F}}(C)^{\mathrm{op}}$. Then $\overline{\mathscr{F}}$ is a homotopy colimit diagram if and only if $\overline{\mathscr{F}}^{\mathrm{op}}$ is a homotopy colimit diagram.* 03CV

Proof. Combine Proposition 7.5.7.6 with Corollary 7.5.7.8. □

03CW **Corollary 7.5.7.9.** *Suppose we are given a commutative diagram of simplicial sets*

03CX
$$\begin{tikzcd} A \arrow[r] \arrow[d] & A_0 \arrow[d] \\ A_1 \arrow[r] & A_{01}, \end{tikzcd} \tag{7.52}$$

which we identify with a functor $\mathscr{F} : [1] \times [1] \to \mathrm{Set}_{\Delta}$. *Then (7.52) is a homotopy pushout square (in the sense of Definition 3.4.2.1) if and only if* $\mathscr{F}$ *is a homotopy colimit diagram (in the sense of Definition 7.5.7.3).*

Proof. Combine Propositions 7.5.7.6 and 7.5.4.13. □

7.5.8 Categorical Colimit Diagrams

03CY In §7.5.7, we introduced the notion of a *homotopy colimit diagram* (Definition 7.5.7.3), and showed that one can use homotopy colimit diagrams to compute colimits in the ∞-category $\mathcal{S}$ of spaces (Corollary 7.5.7.7). In this section, we introduce the closely related notion of *categorical colimit diagram*, which can be used to compute colimits in the larger ∞-category $\mathcal{QC} \supset \mathcal{S}$.

03CZ **Proposition 7.5.8.1.** *Let* $\mathcal{C}$ *be a small category and let* $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ *be a (strictly commutative) diagram of* ∞*-categories indexed by* $\mathcal{C}$*, and let* W *denote the collection of horizontal edges of the homotopy colimit* $\underrightarrow{\mathrm{holim}}(\mathscr{F})$ *(Definition 5.3.4.1). Then an* ∞*-category* $\mathcal{D}$ *is a colimit of the diagram*

$$\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathscr{F}) : \mathrm{N}_{\bullet}(\mathcal{C}) \to \mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathrm{QCat}) = \mathcal{QC}$$

if and only if it is a localization of $\underrightarrow{\mathrm{holim}}(\mathscr{F})$ *with respect to* W*, in the sense of Remark 6.3.2.2.*

Proof. Let $U : \mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C}) \to \mathrm{N}_{\bullet}(\mathcal{C})$ be the projection map of Definition 5.3.3.1 and let W' denote the collection of all U-cocartesian morphisms of $\mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C})$. Choose a functor of ∞-categories $T : \mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C}) \to \mathcal{D}$ which exhibits $\mathcal{D}$ as a localization of $\mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C})$ with respect to W'. Let $\lambda_t : \underrightarrow{\mathrm{holim}}(\mathscr{F}) \to \mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C})$ denote the taut scaffold of Construction 5.3.4.11. Then λ_t is a categorical equivalence of simplicial sets (Corollary 5.3.5.9). Moreover, a morphism of $\mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C})$ belongs to W' if and only if it is isomorphic (as an object of the ∞-category $\mathrm{Fun}(\Delta^1, \mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C}))$ to an element of $\lambda_t(W)$ (see Corollary 5.3.3.16). It follows that the composite map $\underrightarrow{\mathrm{holim}}(\mathscr{F}) \xrightarrow{\lambda_t} \mathrm{N}^{\mathscr{F}}_{\bullet}(\mathcal{C}) \xrightarrow{T} \mathcal{D}$ exhibits $\mathcal{D}$ as a localization of $\underrightarrow{\mathrm{holim}}(\mathscr{F})$ with respect to W. We conclude by observing that $\mathcal{D}$ is a colimit of the diagram $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathscr{F})$ (Corollary 7.4.3.16). □

Motivated by Proposition 7.5.8.1, we introduce the following variant of Definition 7.5.7.3:

Definition 7.5.8.2. Let $\mathcal{C}$ be a category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$ be a diagram of simplicial sets. Set $\mathscr{F} = \overline{\mathscr{F}}|_{\mathcal{C}}$, and let W denote the collection of horizontal edges of $\underrightarrow{\mathrm{holim}}(\mathscr{F})$ (Definition 5.3.4.1). We will say that $\overline{\mathscr{F}}$ is a *categorical colimit diagram* if the composite map 03D0

$$\underrightarrow{\mathrm{holim}}(\mathscr{F}) \twoheadrightarrow \underrightarrow{\lim}(\mathscr{F}) \to \overline{\mathscr{F}}(\mathbf{1})$$

exhibits $\overline{\mathscr{F}}(\mathbf{1})$ as a localization of $\underrightarrow{\mathrm{holim}}(\mathscr{F})$ with respect to W. (see Definition 6.3.1.9). Here $\mathbf{1}$ denotes the final object of the cone $\mathcal{C}^{\triangleright} \simeq \mathcal{C} \star \{\mathbf{1}\}$, and the morphism on the left is the comparison map of Remark 5.3.2.9.

Remark 7.5.8.3. Let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$ be a categorical colimit diagram of simplicial sets. Then $\overline{\mathscr{F}}$ is also a homotopy colimit diagram of simplicial sets, in the sense of Definition 7.5.7.3. This follows from the observation that every localization of simplicial sets is a weak homotopy equivalence (Remark 6.3.1.16). 03D1

Proposition 7.5.8.4. *Let $\mathcal{C}$ be a category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$ be a diagram of simplicial sets. The following conditions are equivalent:* 03D2

(1) *The diagram $\overline{\mathscr{F}}$ is a categorical colimit diagram.*

(2) *For every ∞-category $\mathcal{D}$, the diagram of ∞-categories*

$$(\mathcal{C}^{\triangleright})^{\mathrm{op}} \to \mathrm{QCat} \qquad C \mapsto \mathrm{Fun}(\overline{\mathscr{F}}(C), \mathcal{D})$$

is a categorical limit diagram (Definition 7.5.5.1).

(3) *For every ∞-category $\mathcal{D}$, the diagram of Kan complexes*

$$(\mathcal{C}^{\triangleright})^{\mathrm{op}} \to \mathrm{Kan} \qquad C \mapsto \mathrm{Fun}(\overline{\mathscr{F}}(C), \mathcal{D})^{\simeq}$$

is a homotopy limit diagram (Definition 7.5.4.1).

Proof. The equivalence of (1) and (2) follows by combining Example 7.5.2.11 with Corollary 7.5.5.15. The equivalence with (3) follows by combining the same results with Proposition 6.3.1.13 and Example 7.5.2.8. □

Corollary 7.5.8.5. *Suppose we are given a commutative diagram of simplicial sets* 03D3

03D4

$$\begin{tikzcd}
A \arrow[r] \arrow[d] & A_0 \arrow[d] \\
A_1 \arrow[r] & A_{01},
\end{tikzcd} \tag{7.53}$$

which we identify with a functor $\mathscr{F} : [1] \times [1] \to \mathrm{Set}_{\Delta}$*. Then (7.53) is a categorical pushout square (in the sense of Definition 4.5.4.1) if and only if* $\mathscr{F}$ *is a categorical colimit diagram (in the sense of Definition 7.5.8.2).*

03D5 **Corollary 7.5.8.6** (Homotopy Invariance)**.** *Let* $\mathcal{C}$ *be a category and let* $\alpha : \overline{\mathscr{F}} \to \overline{\mathscr{G}}$ *be a natural transformation between diagrams* $\overline{\mathscr{F}}, \overline{\mathscr{G}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$*. Assume that, for every object* $C \in \mathcal{C}$*, the induced map* $\alpha_C : \overline{\mathscr{F}}(C) \to \overline{\mathscr{G}}(C)$ *is a categorical equivalence of simplicial sets. Then any two of the following conditions imply the third:*

(1) *The functor* $\overline{\mathscr{F}}$ *is a categorical colimit diagram.*

(2) *The functor* $\overline{\mathscr{G}}$ *is a categorical colimit diagram.*

(3) *The natural transformation* α *induces a categorical equivalence* $\overline{\mathscr{F}}(\mathbf{1}) \to \overline{\mathscr{G}}(\mathbf{1})$*, where* $\mathbf{1}$ *denotes the cone point of* $\mathcal{C}^{\triangleright}$*.*

Proof. By virtue of Proposition 7.5.8.4 (and Proposition 4.5.3.8), it will suffice to show that for every ∞-category $\mathcal{D}$, any two of the following conditions imply the third:

($1_{\mathcal{D}}$) The functor

$$(\mathcal{C}^{\triangleright})^{\mathrm{op}} \to \mathrm{QCat} \qquad C \mapsto \mathrm{Fun}(\overline{\mathscr{F}}(C), \mathcal{D})$$

is a categorical limit diagram.

($2_{\mathcal{D}}$) The functor

$$(\mathcal{C}^{\triangleright})^{\mathrm{op}} \to \mathrm{QCat} \qquad C \mapsto \mathrm{Fun}(\overline{\mathscr{G}}(C), \mathcal{D})$$

is a categorical limit diagram.

($3_{\mathcal{D}}$) The natural transformation α induces an equivalence of ∞-categories $\mathrm{Fun}(\overline{\mathscr{G}}(\mathbf{1}), \mathcal{D}) \to \mathrm{Fun}(\overline{\mathscr{F}}(\mathbf{1}), \mathcal{D})$.

This follows from Remark 7.5.5.6. □

03D6 **Corollary 7.5.8.7.** *Let* $\mathcal{C}$ *be a small category and let* $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$ *be a colimit diagram in the category of simplicial sets. If the diagram* $\mathscr{F} = \overline{\mathscr{F}}|_{\mathcal{C}}$ *is projectively cofibrant, then* $\overline{\mathscr{F}}$ *is a categorical colimit diagram.*

Proof. Let $\mathcal{D}$ be an ∞-category and define $\overline{\mathscr{G}} : (\mathcal{C}^{\triangleright})^{\mathrm{op}} \to \mathrm{QCat}$ by the formula $\overline{\mathscr{G}}(C) = \mathrm{Fun}(\overline{\mathscr{F}}(C), \mathcal{D})$. By virtue of Proposition 7.5.8.4, it will suffice to show that the diagram of Kan complexes $\overline{\mathscr{G}}^{\simeq}$ is a homotopy limit diagram. Setting $\mathscr{G} = \overline{\mathscr{G}}|_{\mathcal{C}^{\mathrm{op}}}$, our assumption that $\mathscr{F}$ is projectively cofibrant guarantees that the diagram $\mathscr{G}$ is isofibrant (Remark 7.5.6.6). It follows that the diagram of Kan complexes $\mathscr{G}^{\simeq}$ is also isofibrant, and that $\overline{\mathscr{G}}^{\simeq}$ is a limit diagram (Corollary 4.5.6.21). The desired result now follows from Example 7.5.4.2. □

Corollary 7.5.8.8. *Let $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ be a diagram of simplicial sets, let $\theta : \underrightarrow{\mathrm{holim}}(\mathscr{F}) \to \underrightarrow{\lim}(\mathscr{F})$ be the comparison map of Remark 5.3.2.9, and let W denote the collection of all horizontal edges of the homotopy colimit $\underrightarrow{\mathrm{holim}}(\mathscr{F})$ (Definition 5.3.4.1). If $\mathscr{F}$ is projectively cofibrant (Definition 7.5.6.1), then θ exhibits $\underrightarrow{\lim}(\mathscr{F})$ as a localization of $\underrightarrow{\mathrm{holim}}(\mathscr{F})$ with respect to W.* 03D7

Proof. This is a restatement of Corollary 7.5.8.7. □

Corollary 7.5.8.9. *Let $\mathcal{C}$ be a small category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{QCat}$ be a diagram of ∞-categories. Then $\overline{\mathscr{F}}$ is a categorical colimit diagram (in the sense of Definition 7.5.7.3) if and only if the induced functor of ∞-categories* 03D8

$$\mathrm{N}_{\bullet}^{\mathrm{hc}}(\overline{\mathscr{F}}) : \mathrm{N}_{\bullet}(\mathcal{C}^{\triangleright}) \to \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathrm{QCat}) = \mathcal{QC}$$

is a colimit diagram (in the sense of Variant 7.1.2.5).

Proof. Combine Proposition 7.5.8.4 with Corollary 7.5.4.6 (applied to the simplicial category $\mathrm{QCat}^{\mathrm{op}}$). □

Corollary 7.5.8.10. *Let $\mathcal{C}$ be a small category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Kan}$ be a diagram of Kan complexes. Then $\overline{\mathscr{F}}$ is a categorical colimit diagram if and only if it is a homotopy colimit diagram.* 03D9

Proof. Combine Corollary 7.5.8.9, Corollary 7.5.7.7, and Proposition 7.4.5.1. □

Corollary 7.5.8.11. *Let $\mathcal{C}$ be a category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$ be a functor. Let $\overline{\mathscr{F}}^{\mathrm{op}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$ be the functor given on objects by $\overline{\mathscr{F}}^{\mathrm{op}}(C) = \overline{\mathscr{F}}(C)^{\mathrm{op}}$. Then $\overline{\mathscr{F}}$ is a categorical colimit diagram if and only if $\overline{\mathscr{F}}^{\mathrm{op}}$ is a categorical colimit diagram.* 03DA

Proof. Combine Proposition 7.5.8.4 with Corollary 7.5.5.15. □

We close this section with an application of the formalism of categorical colimit diagrams.

Proposition 7.5.8.12 (Rewriting Colimits)**.** *Let $\mathcal{C}$ be a small category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$ be a categorical colimit diagram which carries the final object of $\mathcal{C}^{\triangleright}$ to a simplicial set K. Let $\mathcal{D}$ be an ∞-category equipped with a diagram $q : K \to \mathcal{D}$ satisfying the following condition:* 03DB

(∗) *For each object $C \in \mathcal{C}$, the composite map*

$$q_C : \overline{\mathscr{F}}(C) \to K \xrightarrow{q} \mathcal{D}$$

admits a colimit in the ∞-category $\mathcal{D}$.

Then there exists a functor $Q : \mathrm{N}_{\bullet}(\mathcal{C}) \to \mathcal{D}$ *with the following properties:*

(1) *For each object* $C \in \mathcal{C}$*, the object* $Q(C) \in \mathcal{D}$ *is a colimit of the diagram* q_C*.*

(2) *An object* $X \in \mathcal{D}$ *is a colimit of the diagram* q *if and only if it is a colimit of* Q*. In particular, the diagram* q *has a colimit in* $\mathcal{D}$ *if and only if the diagram* Q *has a colimit in* $\mathcal{D}$*.*

(3) *Let* $G : \mathcal{D} \to \mathcal{E}$ *be a functor of* ∞*-categories which preserves the colimit of each of the diagrams* q_C*, and suppose that the diagrams* q *and* Q *admit colimits in* $\mathcal{D}$*. Then* G *preserves the colimit of* q *if and only if it preserves the colimit of* Q*.*

Proof. Set $\mathscr{F} = \overline{\mathscr{F}}|_{\mathcal{C}}$, let $U : \underrightarrow{\mathrm{holim}}(\mathscr{F}) \to \mathrm{N}_{\bullet}(\mathcal{C})$ be the projection map, and let W be the collection of all horizontal edges of $\underrightarrow{\mathrm{holim}}(\mathscr{F})$. The diagram $\overline{\mathscr{F}}$ then determines a morphism of simplicial sets $T : \underrightarrow{\mathrm{holim}}(\mathscr{F}) \to K$ which exhibits K as a localization of $\underrightarrow{\mathrm{holim}}(\mathscr{F})$ with respect to W. It follows from assumption $(*)$ that for each object $C \in \mathcal{C}$, the composite map

$$\mathscr{F}(C) \simeq \{C\} \times_{\mathrm{N}_{\bullet}(\mathcal{C})} \underrightarrow{\mathrm{holim}}(\mathscr{F}) \hookrightarrow \underrightarrow{\mathrm{holim}}(\mathscr{F}) \xrightarrow{T} K \xrightarrow{q} \mathcal{D}$$

admits a colimit in $\mathcal{D}$. Applying Corollary 7.3.5.3, we conclude that there is a functor $Q : \mathrm{N}_{\bullet}(\mathcal{C}) \to \mathcal{D}$ and a natural transformation $\beta : T \circ q \to Q \circ U$ which exhibits Q as a left Kan extension of $T \circ q$ along U. We will complete the proof by showing that Q satisfies conditions (1), (2), and (3) of Proposition 7.5.8.12. Condition (1) follows immediately from Remark 7.3.5.4.

We now prove (2). Assume first that $X \in \mathcal{D}$ is a colimit of the diagram Q. For every simplicial set S, we let $\underline{X}_S$ denote the image of X in the ∞-category $\mathrm{Fun}(S, \mathcal{D})$. Choose a natural transformation $\alpha : Q \to \underline{X}_{\mathrm{N}_{\bullet}(\mathcal{C})}$ which exhibits $X \in \mathcal{D}$ as a colimit of the diagram Q, let $\widetilde{\alpha} : Q \circ U \to \underline{X}_{\underrightarrow{\mathrm{holim}}(\mathscr{F})}$ denote the image of α in $\mathrm{Fun}(\underrightarrow{\mathrm{holim}}(\mathscr{F}), \mathcal{D})$, and let $\widetilde{\gamma} : q \circ T \to \underline{X}_{\underrightarrow{\mathrm{holim}}(\mathscr{F})} = \underline{X}_K \circ T$ be a composition of β with $\widetilde{\alpha}$ in $\mathrm{Fun}(\underrightarrow{\mathrm{holim}}(\mathscr{F}), \mathcal{D})$. Since precomposition with T induces a fully faithful functor $\mathrm{Fun}(K, \mathcal{D}) \to \mathrm{Fun}(\underrightarrow{\mathrm{holim}}(\mathscr{F}), \mathcal{D})$, we may assume without loss of generality that $\widetilde{\gamma}$ is the image of a natural transformation $\gamma : q \to \underline{X}_K$. Note that $\widetilde{\gamma}$ exhibits X as a colimit of the diagram $q \circ T$ (Corollary 7.3.8.20). Since T is right cofinal (Proposition 7.2.1.10), it follows that γ exhibits X as a colimit of the diagram q (Corollary 7.2.2.7).

To prove the reverse implication, it will suffice to show that if the diagram $q : K \to \mathcal{D}$ admits a colimit, then Q also admits a colimit. Since T is right cofinal, the diagram $q \circ T$ also admits a colimit in $\mathcal{D}$ (Corollary 7.2.2.11), so the desired result is immediate from Corollary 7.3.8.20.

We now prove (3). Let $G : \mathcal{D} \to \mathcal{E}$ be a functor of ∞-categories which preserves the colimit of the diagram q_C, for each object $C \in \mathcal{C}$. Let $\alpha : Q \to \underline{X}_{\mathrm{N}_{\bullet}(\mathcal{C})}$ and $\gamma : q \to \overline{X}_K$ be defined as above; we wish to show that $G(\alpha)$ exhibits $G(X)$ as a colimit of the diagram $G \circ Q$ if and only if $G(\gamma)$ exhibits $G(X)$ as a colimit of the diagram $G \circ q$. Using Corollary 7.2.2.7, we see that latter condition is equivalent to the requirement that $G(\widetilde{\gamma})$ exhibits $G(X)$ as a colimit of the diagram $G \circ q \circ T$. By virtue of Corollary 7.3.8.20, we are reduced to showing that the natural transformation $G(\beta)$ exhibits $G \circ Q$ as a left Kan extension of $G \circ q \circ T$ along U. This follows from the criterion of Remark 7.3.5.4. □

Corollary 7.5.8.13. *Let $\mathcal{C}$ be a small category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$ be a categorical colimit diagram carrying the final object of $\mathcal{C}^{\triangleright}$ to a simplicial set K. Let $\mathcal{D}$ be an ∞-category which admits $\mathrm{N}_{\bullet}(\mathcal{C})$-indexed colimits and $\overline{\mathscr{F}}(C)$-indexed colimits, for each object $C \in \mathcal{C}$. Then $\mathcal{D}$ also admits K-indexed colimits. Moreover, if $G : \mathcal{D} \to \mathcal{E}$ is a functor of ∞-categories which preserves $\mathrm{N}_{\bullet}(\mathcal{C})$-indexed colimits and $\overline{\mathscr{F}}(C)$-indexed colimits for each $C \in \mathcal{C}$, then G also preserves K-indexed colimits.* 03DC

7.5.9 Application: Filtered Colimits of ∞-Categories

Let $\mathcal{C}$ be a small filtered category, let $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ be a diagram, and let $\mathcal{E} = \varinjlim(\mathscr{F})$ denote the colimit of $\mathscr{F}$ in the category of simplicial sets. If each of the simplicial sets $\mathscr{F}(C)$ is an ∞-category, then the simplicial set $\mathcal{E}$ is also an ∞-category (Remark 1.4.0.9). Our goal in this section is to show that, in this case, we can also regard $\mathcal{E}$ as a colimit of the diagram $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathscr{F}) : \mathrm{N}_{\bullet}(\mathcal{C}) \to \mathcal{QC}$. This is a consequence of the following more general result: 03DD

Proposition 7.5.9.1. *Let $\mathcal{C}$ be a small filtered category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_{\Delta}$ be a colimit diagram in the category of simplicial sets. Then $\overline{\mathscr{F}}$ is a categorical colimit diagram.* 03DE

Remark 7.5.9.2. Let $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ be a diagram of simplicial sets and let W denote the collection of horizontal edges of the homotopy colimit $\underrightarrow{\mathrm{holim}}(\mathscr{F})$. Proposition 7.5.9.1 asserts that, if the category $\mathcal{C}$ is filtered, then the comparison map $\theta : \underrightarrow{\mathrm{holim}}(\mathscr{F}) \twoheadrightarrow \varinjlim(\mathscr{F})$ exhibits $\varinjlim(\mathscr{F})$ as a localization of $\underrightarrow{\mathrm{holim}}(\mathscr{F})$ with respect to W. In particular, θ is a weak homotopy equivalence. 03DF

Before giving the proof of Proposition 7.5.9.1, let us record some of its consequences.

Corollary 7.5.9.3. *Let $\mathcal{C}$ be a small filtered category. Then the inclusion map* 03DG

$$\mathrm{N}_{\bullet}(\mathrm{QCat}) \hookrightarrow \mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathrm{QCat}) = \mathcal{QC}$$

preserves $\mathrm{N}_{\bullet}(\mathcal{C})$-indexed colimits.

Proof. We first observe that the full subcategory $\mathrm{QCat} \subseteq \mathrm{Set}_{\Delta}$ is closed under filtered colimits (Remark 1.4.0.9), so the category QCat admits $\mathcal{C}$-indexed colimits. Fix a colimit diagram $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{QCat}$ in the ordinary category QCat. We wish to show that the induced map $\mathrm{N}_\bullet^{\mathrm{hc}}(\overline{\mathscr{F}}) : \mathrm{N}_\bullet(\mathcal{C}) \to \mathcal{QC}$ is a colimit diagram in the ∞-category $\mathcal{QC}$. By virtue of Corollary 7.5.8.9, this is equivalent to the requirement that $\overline{\mathscr{F}}$ is a categorical colimit diagram, which follows from Proposition 7.5.9.1. □

03DH **Variant 7.5.9.4.** Let $\mathcal{C}$ be a small filtered category. Then the inclusion map

$$\mathrm{N}_\bullet(\mathrm{Kan}) \hookrightarrow \mathrm{N}_\bullet^{\mathrm{hc}}(\mathrm{Kan}) = \mathcal{S}$$

preserves $\mathrm{N}_\bullet(\mathcal{C})$-indexed colimits.

03DJ **Corollary 7.5.9.5.** *Let $\mathcal{C}$ be a small filtered category and let $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_\Delta$ be a diagram of simplicial sets having colimit $K = \varinjlim(\mathscr{F})$. Let $\mathcal{D}$ be an ∞-category which admits $\mathrm{N}_\bullet(\mathcal{C})$-indexed colimits and which admits $\mathscr{F}(C)$-indexed colimits, for each $C \in \mathcal{C}$. Then $\mathcal{D}$ also admits K-indexed colimits. Moreover, if $G : \mathcal{D} \to \mathcal{E}$ is a functor which preserves both $\mathrm{N}_\bullet(\mathcal{C})$-indexed colimits and $\mathscr{F}(C)$-indexed colimits for each $C \in \mathcal{C}$, then G also preserves K-indexed colimits.*

Proof. Combine Proposition 7.5.9.1 with Corollary 7.5.8.13. □

03DK **Corollary 7.5.9.6.** *Let $\mathcal{D}$ be an ∞-category which admits finite colimits and small filtered colimits. Then $\mathcal{D}$ admits all small colimits. Moreover, if $G : \mathcal{D} \to \mathcal{E}$ is a functor of ∞-categories which preserves finite colimits and small filtered colimits, then G preserves all small colimits.*

Proof. This is a special case of Corollary 7.5.9.5, since every small simplicial set K can be realized as a (small) filtered colimit of finite simplicial sets. For example, we can write K as the union of all finite simplicial subsets of itself. □

Our proof of Proposition 7.5.9.1 will require a brief digression. Let $\mathcal{C}$ be a small category and let $\mathscr{G} : \mathcal{C} \to \mathrm{Set}_\Delta$ be a diagram of simplicial sets. In §7.5.6, we showed that there exists a projectively cofibrant diagram $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_\Delta$ equipped with a levelwise weak homotopy equivalence $\alpha : \mathscr{F} \to \mathscr{G}$ (Proposition 7.5.6.9). Using a somewhat less explicit construction, we can obtain a better approximation to $\mathscr{G}$:

03DL **Proposition 7.5.9.7.** *Let $\mathcal{C}$ be a small category and let $\mathscr{G} : \mathcal{C} \to \mathrm{Set}_\Delta$ be a diagram of simplicial sets. Then there exists a projectively cofibrant diagram $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_\Delta$ and a levelwise trivial Kan fibration $\alpha : \mathscr{F} \to \mathscr{G}$.*

Proof of Proposition 7.5.9.1 from Proposition 7.5.9.7. Let $\mathcal{C}$ be a small filtered category and let $\overline{\mathscr{F}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_\Delta$ be a colimit diagram in the category of simplicial sets; we wish to show that $\overline{\mathscr{F}}$ is a categorical colimit diagram. Set $\mathscr{F} = \overline{\mathscr{F}}|_{\mathcal{C}}$. Using Proposition 7.5.9.7, we can choose a levelwise categorical equivalence $\alpha : \mathscr{E} \to \mathscr{F}$, where $\mathscr{E} : \mathcal{C} \to \mathrm{Set}_\Delta$ is projectively cofibrant. Let $\overline{\mathscr{E}} : \mathcal{C}^{\triangleright} \to \mathrm{Set}_\Delta$ be a colimit diagram extending $\mathscr{E}$, so that α extends uniquely to a natural transformation $\overline{\alpha} : \overline{\mathscr{E}} \to \overline{\mathscr{F}}$. Applying Corollary 4.5.7.2, we deduce that $\overline{\alpha}$ is also a levelwise categorical equivalence. Consequently, to show that $\overline{\mathscr{F}}$ is a categorical colimit diagram, it will suffice to show that $\overline{\mathscr{E}}$ is a categorical colimit diagram (Corollary 7.5.8.6). This follows from Corollary 7.5.8.7, since $\mathscr{E}$ is projectively cofibrant. □

It will be useful to formulate a slightly stronger version of Proposition 7.5.9.7. First, we need some terminology.

Definition 7.5.9.8. Let $\mathcal{C}$ be a small category and let $\alpha : \mathscr{F}' \to \mathscr{F}$ be a natural transformation between diagrams $\mathscr{F}, \mathscr{F}' : \mathcal{C} \to \mathrm{Set}_{\Delta}$. We say that α is a *projective cofibration* if it is left semiorthgonal to all levelwise trivial Kan fibrations (see Remark 4.5.6.2). That is, α is a projective cofibration if every lifting problem 03DM

$$\begin{tikzcd}
\mathscr{F}' \arrow[r] \arrow[d, "\alpha"] & \mathscr{G}' \arrow[d, "\beta"] \\
\mathscr{F} \arrow[r] \arrow[ur, dashed] & \mathscr{G}
\end{tikzcd}$$

admits a solution, under the assumption that β is a levelwise trivial Kan fibration between diagrams $\mathscr{G}, \mathscr{G}' : \mathcal{C} \to \mathrm{Set}_{\Delta}$.

Example 7.5.9.9. Let $\mathcal{C}$ be a small category. Then a diagram of simplicial sets $\mathscr{F} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ is projectively cofibrant (in the sense of Definition 7.5.6.1) if and only if the unique natural transformation $\underline{\emptyset} \to \mathscr{F}$ is a projective cofibration (in the sense of Definition 7.5.9.8). Here $\underline{\emptyset} : \mathcal{C} \to \mathrm{Set}_{\Delta}$ denotes the initial object of the category $\mathrm{Fun}(\mathcal{C}, \mathrm{Set}_{\Delta})$, which carries every object of $\mathcal{C}$ to the empty simplicial set. 03DN

Example 7.5.9.10. Let $\mathcal{C}$ be a small category. For each object $C \in \mathcal{C}$, let $h^C : \mathcal{C} \to \mathrm{Set}$ denote the functor corepresented by C (given on objects by the formula $h^C(D) = \mathrm{Hom}_{\mathcal{C}}(C, D)$). If $A \hookrightarrow B$ is a monomorphism of simplicial sets, then the natural transformation $\underline{A} \times h^C \hookrightarrow \underline{B} \times h^C$ is a projective cofibration in $\mathrm{Fun}(\mathcal{C}, \mathrm{Set}_{\Delta})$; here $\underline{A}$ and $\underline{B}$ denote the constant simplicial sets taking the values A and B, respectively. 03DP

Remark 7.5.9.11. Let $\mathcal{C}$ be a small category. Then the collection of projective cofibrations in $\mathrm{Fun}(\mathcal{C}, \mathrm{Set}_{\Delta})$ is weakly saturated, in the sense of Definition 1.5.4.12. That is, it is closed under retracts, pushouts, and transfinite composition. See Proposition 1.5.4.13. 03DQ

Proposition 7.5.9.12. *Let $\mathcal{C}$ be a small category and let $\alpha_0 : \mathscr{F}_0 \to \mathscr{G}$ be a natural transformation between diagrams $\mathscr{F}_0, \mathscr{G} : \mathcal{C} \to \mathrm{Set}_{\Delta}$. Then α_0 factors as a composition* 03DR

$$\mathscr{F}_0 \xrightarrow{\beta} \mathscr{F} \xrightarrow{\alpha} \mathscr{G},$$

where β is a projective cofibration and α is a levelwise trivial Kan fibration.

Proof. We will construct $\mathscr{F}$ as the colimit of a diagram of projective cofibrations

$$\mathscr{F}_0 \to \mathscr{F}_1 \to \mathscr{F}_2 \to \mathscr{F}_3 \to \cdots$$

in the category $\operatorname{Fun}(\mathcal{C}, \operatorname{Set}_{\Delta})_{/\mathscr{G}}$. Fix $n \geq 0$, and suppose that we have constructed an object $\mathscr{F}_n \in \operatorname{Fun}(\mathcal{C}, \operatorname{Set}_{\Delta})_{/\mathscr{G}}$, which we identify with a natural transformation $\alpha_n : \mathscr{F}_n \to \mathscr{G}$. For each object $C \in \mathcal{C}$, Exercise 3.1.7.11 guarantees that $\alpha_{n,C}$ factors as a composition

$$\mathscr{F}_n(C) \xrightarrow{\alpha'_{n,C}} \mathscr{F}'_n(C) \xrightarrow{\alpha''_{n,C}} \mathscr{G}(C),$$

where $\alpha'_{n,C}$ is a monomorphism and $\alpha''_{n,C}$ is a trivial Kan fibration (beware that $\mathscr{F}'_n(C)$ does not depend functorially on C). Form a pushout diagram

$$\begin{tikzcd}
\coprod_{C \in \mathcal{C}} \underline{\mathscr{F}_n(C)} \times h^C \arrow[r] \arrow[d] & \coprod_{C \in \mathcal{C}} \underline{\mathscr{F}'_n(C)} \times h^C \arrow[d] \\
\mathscr{F}_n \arrow[r] & \mathscr{F}_{n+1}
\end{tikzcd}$$

in the category $\operatorname{Fun}(\mathcal{C}, \operatorname{Set}_{\Delta})_{/\mathscr{G}}$, where the upper horizontal map is the coproduct of the projective cofibrations described in Example 7.5.9.10. Using Remark 7.5.9.11, we see that each of the maps

$$\mathscr{F}_0 \to \mathscr{F}_1 \to \mathscr{F}_2 \to \mathscr{F}_3 \to \cdots$$

is a projective cofibration. Setting $\mathscr{F} = \varinjlim_n \mathscr{F}_n$, we obtain a factorization of α_0 as a composition $\mathscr{F}_0 \xrightarrow{\beta} \mathscr{F} \xrightarrow{\alpha} \mathscr{G}$, where β is a projective cofibration. We complete the proof by observing that for each object $C \in \mathcal{C}$, the morphism $\alpha_C : \mathscr{F}(C) \to \mathscr{G}(C)$ is a trivial Kan fibration, since it can be written as a filtered colimit (in the arrow category $\operatorname{Fun}([1], \operatorname{Set}_{\Delta})$) of the trivial cofibrations $\alpha''_{n,C} : \mathscr{F}'_n(C) \to \mathscr{G}(C)$ (see Remark 1.5.5.3). □

Proof of Proposition 7.5.9.7. Apply Proposition 7.5.9.12 in the special case $\mathscr{F}_0 = \underline{\emptyset}$ (see Example 7.5.9.9). □

03DS **Corollary 7.5.9.13.** *Let $\mathcal{C}$ be a small category, and let S be the collection of all projective cofibrations in the category $\operatorname{Fun}(\mathcal{C}, \operatorname{Set}_{\Delta})$. Then S is the smallest weakly saturated collection of morphisms which contains each of the inclusion maps $\iota_{n,C} : \underline{\partial \Delta^n} \times h^C \hookrightarrow \underline{\Delta^n} \times h^C$, for each $n \geq 0$ and each object $C \in \mathcal{C}$.*

Proof. It follows from Remark 7.5.9.11 that S is weakly saturated. Let S' be the smallest weakly saturated collection of morphisms of $\operatorname{Fun}(\mathcal{C}, \operatorname{Set}_{\Delta})$ which contains each $\iota_{n,C}$. Using Example 7.5.9.10, we see that S' is contained in S. For every monomorphism of simplicial sets $A \hookrightarrow B$ and every object $C \in \mathcal{C}$, Proposition 1.5.5.14 guarantees that the projective cofibration $\underline{A} \times h^C \hookrightarrow \underline{B} \times h^C$ is contained in S'. It follows from the proof of Proposition 7.5.9.12 that every morphism $\alpha_0 : \mathscr{F}_0 \to \mathscr{G}$ in $\operatorname{Fun}(\mathcal{C}, \mathrm{Set}_\Delta)$ factors as a composition $\mathscr{F}_0 \xrightarrow{\beta} \mathscr{F} \xrightarrow{\alpha} \mathscr{G}$, where β belongs to S' and α is a trivial Kan fibration. If α_0 is projective cofibration, then the lifting problem

$$\begin{tikzcd}
\mathscr{F}_0 \arrow[r, "\beta"] \arrow[d, "\alpha_0"] & \mathscr{F} \arrow[d, "\alpha"] \\
\mathscr{G} \arrow[r, equal] \arrow[ur, dashed] & \mathscr{G}
\end{tikzcd}$$

admits a solution. It follows that α_0 is a retract of the morphism β, and therefore belongs to S'. □

7.6 Examples of Limits and Colimits

Let $\mathcal{C}$ be an ∞-category. In §7.1, we introduced the notion of limit and colimit for an arbitrary morphism of simplicial sets $\sigma : K \to \mathcal{C}$. Our goal in this section is to make the general theory more explicit for some special classes of diagrams which arise frequently in practice. 03E8

We begin in §7.6.1 by considering the case where K is a *discrete* simplicial set. In this case, specifying a functor $\sigma : K \to \mathcal{C}$ is equivalent to specifying a collection of objects $\{Y_k \in \mathcal{C}\}_{k \in K}$, indexed by the collection of vertices of K. We say that an object of $\mathcal{C}$ is a *product* of the collection $\{Y_k\}_{k \in K}$ if it is a limit of the diagram σ, and a *coproduct* of the collection $\{Y_k\}_{k \in K}$ if it is a colimit of the diagram σ. These conditions can be formulated purely in terms of the homotopy category $\mathrm{h}\mathcal{C}$, provided that we regard $\mathrm{h}\mathcal{C}$ as enriched over the homotopy category of Kan complexes hKan (see Remark 7.6.1.5). In particular, the forgetful functor from $\mathcal{C}$ to (the nerve of) its homotopy category $\mathrm{h}\mathcal{C}$ preserves products and coproducts (Warning 7.6.1.2).

In §7.6.2, we allow K to be an arbitrary simplicial set, but require $\sigma : K \to \mathcal{C}$ to be a constant diagram taking some value $Y \in \mathcal{C}$. In this case, we will denote a limit of σ (if it exists) by Y^K and a colimit of σ (if it exists) by $K \otimes Y$ (Notation 7.6.2.5). We refer to Y^K as a *power of Y by K*, and $K \otimes Y$ as a *tensor product of Y by K*. These notions can again be formulated purely at the level of the homotopy category $\mathrm{h}\mathcal{C}$, regarded as an hKan-enriched category (Definition 7.6.2.1 and Remark 7.6.2.6).

In §7.6.3, we study limit and colimit diagrams indexed by the simplicial set $K = \Delta^1 \times \Delta^1$.

Let $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$ be a functor of ∞-categories, which we depict as a diagram

$$\begin{tikzcd}
X_{01} \arrow[r] \arrow[d] & X_0 \arrow[d, "f_0"] \\
X_1 \arrow[r, "f_1"] & X.
\end{tikzcd}$$

We say that σ is a *pullback square* if it is a limit diagram, and a *pushout square* if it is a colimit diagram (Definition 7.6.3.1). Beware that these conditions cannot be formulated at the level of the homotopy category $\mathrm{h}\mathcal{C}$, even if its hKan-enrichment is accounted for: see Warning 7.6.3.3 Example 7.6.3.4.

It follows from Proposition 7.5.4.13 that a (strictly commutative) diagram of Kan complexes

$$\begin{tikzcd}
X_{01} \arrow[r] \arrow[d] & X_0 \arrow[d] \\
X_1 \arrow[r] & X
\end{tikzcd}$$

determines a pullback square in the ∞-category $\mathcal{S}$ if and only if it is a homotopy pullback square. However, not every pullback square in the ∞-category $\mathcal{S}$ arises in this way. In §7.6.4, we give a detailed classification of *all* pullback squares in the ∞-category $\mathcal{S}$ (Corollary 7.6.4.10). In particular, for every pair of morphisms of Kan complexes $f_0 : X_0 \to X$ and $f_1 : X_1 \to X$, we construct a pullback diagram

$$\begin{tikzcd}
X_0 \times^{\mathrm{h}}_{X} X_1 \arrow[r] \arrow[d] & X_0 \arrow[d, "f_0"] \\
X_1 \arrow[r, "f_1"] & X
\end{tikzcd}$$

in the ∞-category $\mathcal{S}$ (Example 7.6.4.12); beware that this diagram usually does not commute in the ordinary category of simplicial sets. Our analysis can be applied more generally to any ∞-category which arises as the homotopy coherent nerve of a locally Kan simplicial category (Corollary 7.6.4.14); in particular, it can be applied to the ∞-category $\mathcal{C} = \mathcal{QC}$ of small ∞-categories (see Proposition 7.6.4.8 and Corollary 7.6.4.9).

Let $(\bullet \rightrightarrows \bullet)$ denote the simplicial set given by the coproduct $\Delta^1 \coprod_{\partial \Delta^1} \Delta^1$ (Notation 7.6.5.1). In §7.6.5, we study limits and colimits of diagrams indexed by $(\bullet \rightrightarrows \bullet)$. For any ∞-category $\mathcal{C}$, functors $\sigma : (\bullet \rightrightarrows \bullet) \to \mathcal{C}$ can be identified with pairs $f_0, f_1 : Y \to X$ of morphisms in $\mathcal{C}$ having the same source and target. In this case, we denote a limit of σ (if it exists) by $\mathrm{Eq}(f_0, f_1)$, and a colimit of σ (if it exists) by $\mathrm{Coeq}(f_0, f_1)$ (Notation 7.6.5.5). We refer to $\mathrm{Eq}(f_0, f_1)$ as an *equalizer* of the pair (f_0, f_1), and to $\mathrm{Coeq}(f_0, f_1)$ as a *coequalizer* of (f_0, f_1) (Definition 7.6.5.4). Beware that, as with pullbacks and pushouts, the notions of equalizer and coequalizer cannot be formulated purely in terms of the homotopy category $\mathrm{h}\mathcal{C}$; in particular, the forgetful functor from $\mathcal{C}$ to (the nerve of) its homotopy category need not preserve equalizers and coequalizers.

Let $\mathbf{Z}_{\geq 0}$ denote the set of nonnegative integers, endowed with its usual linear ordering. In §7.6.6, we study colimits of diagram $X : \mathrm{N}_{\bullet}(\mathbf{Z}_{\geq 0}) \to \mathcal{C}$, which we represent informally as

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \xrightarrow{f_3} X(4) \to \cdots$$

In the special case where $\mathcal{C} = \mathcal{S}$ is the ∞-category of spaces, we show that the colimit $\varinjlim X(n)$ (formed in the ordinary category of simplicial sets, using the transition morphisms f_i) is also a colimit in the ∞-category $\mathcal{S}$ (Variant 7.6.6.9). Similarly, if $Y : \mathrm{N}_{\bullet}(\mathbf{Z}_{\geq 0}^{\mathrm{op}}) \to \mathcal{S}$ is a diagram which we depict informally as

$$\cdots \to Y(4) \xrightarrow{g_3} Y(3) \xrightarrow{g_2} Y(2) \xrightarrow{g_1} Y(1) \xrightarrow{g_0} Y(0),$$

then the usual inverse limit $\varprojlim Y(n)$ (formed in the category of simplicial sets, using the transition morphisms g_n) is also a limit in the ∞-category $\mathcal{S}$, provided that each of the maps g_n is a Kan fibration (Variant 7.6.6.11). These assertions have counterparts for sequential limits and colimits in the ∞-category $\mathcal{QC}$: see Examples 7.6.6.8 and 7.6.6.10.

Though the classes of diagrams we study in this section are of a very restricted type, they are nonetheless useful for analyzing limits and colimits in general. If K is a complicated simplicial set which can be decomposed into simpler constituents, then we can often use Proposition 7.5.8.12 to reduce questions about K-indexed (co)limits to questions about (co)limits indexed by those constituents. We will consider several variants on this theme:

- If a simplicial set K decomposes as a disjoint union $\coprod_{j \in J} K_j$, then we can often rewrite K-indexed limits as products; see Proposition 7.6.1.18.
- If a simplicial set K fits into a categorical pushout diagram

$$\begin{tikzcd} K_{01} \arrow[r] \arrow[d] & K_0 \arrow[d] \\ K_1 \arrow[r] & K, \end{tikzcd}$$

  then we can often rewrite K-indexed limits as pullbacks; see Proposition 7.6.3.26.

- If $\mathcal{C}$ is an ∞-category which admits finite products, then an equalizer of a pair of morphisms $f_0, f_1 : Y \to X$ (if it exists) is characterized by the existence of a pullback diagram

  $$\begin{tikzcd}
  \mathrm{Eq}(f_0, f_1) \arrow[r] \arrow[d] & Y \arrow[d, "{(f_0,f_1)}"] \\
  X \arrow[r, "\delta_X"] & X \times X;
  \end{tikzcd}$$

  see Proposition 7.6.5.22.

- If $\mathcal{C}$ is an ∞-category which admits finite products, then a pullback of a diagram $X_0 \xrightarrow{f_0} X \xleftarrow{f_1} X_1$ can be rewritten as the equalizer of a diagram $X_0 \times X_1 \rightrightarrows X$ (Proposition 7.6.5.23).

- If $\mathcal{C}$ is an ∞-category which admits countable products, then the limit of a tower

  $$\cdots \to X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0)$$

  can be rewritten as an equalizer $\mathrm{Eq}(f, \mathrm{id}_X)$, where X is the product $\prod_{n \geq 0} X(n)$ and $f : X \to X$ is the endomorphism of X determined by the sequence $\{f_n\}_{n \geq 0}$; see Proposition 7.6.6.16.

- If K is a simplicial set which can be written as the colimit of a sequence

  $$K(0) \to K(1) \to K(2) \to K(3) \to \cdots,$$

  then we can often rewrite K-indexed limits as sequential limits (Corollary 7.6.6.14).

By applying these observations iteratively, one can build arbitrarily complicated limits (and colimits) out of the constructions studied in this section. For example, we show that an ∞-category $\mathcal{C}$ admits finite limits if and only if it admits pullbacks and has a final object (Corollary 7.6.3.27).

7.6.1 Products and Coproducts

03E9 We now study limits and colimits of diagrams which are indexed by *discrete* simplicial sets. In this case, the definitions of limit and colimit can be formulated entirely at the level of the (enriched) homotopy category.

03EA **Definition 7.6.1.1.** Let hKan denote the homotopy category of Kan complexes and let $\mathcal{C}$ be an hKan-enriched category. We say that a collection of morphisms $\{q_i : Y \to Y_i\}_{i \in I}$ of $\mathcal{C}$

exhibits Y as an hKan-*enriched product of the collection* $\{Y_i\}_{i \in I}$ if, for every object $X \in \mathcal{C}$, the collection of maps $\underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y) \xrightarrow{q_i \circ} \underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y_i)$ induces an isomorphism

$$\underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y) \to \prod_{i \in I} \underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y_i)$$

in the homotopy category hKan.

We say that a collection of morphisms $\{e_i : Y_i \to Y\}_{i \in I}$ *exhibits Y as an* hKan-*enriched coproduct of the collection* $\{Y_i\}_{i \in I}$ if, for every object $Z \in \mathcal{C}$, the collection of maps $\underline{\mathrm{Hom}}_{\mathcal{C}}(Y, Z) \xrightarrow{\circ e_i} \underline{\mathrm{Hom}}_{\mathcal{C}}(Y_i, Z)$ induces an isomorphism

$$\underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y) \to \prod_{i \in I} \underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y_i)$$

Warning 7.6.1.2. Let $\mathcal{C}$ be an hKan-enriched category, and let $\{q_i : Y \to Y_i\}_{i \in I}$ be a collection of morphisms in $\mathcal{C}$. If $\{q_i\}_{i \in I}$ exhibits Y as an hKan-enriched product of $\{Y_i\}_{i \in I}$, then it also exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ in the underlying category $\mathcal{C}$ (where we neglect its hKan-enrichment). Beware that the converse is false in general (see Warning 7.6.1.11). 03EB

Definition 7.6.1.3. Let $\mathcal{C}$ be an ∞-category. We say that a collection of morphisms $\{q_i : Y \to Y_i\}_{i \in I}$ in $\mathcal{C}$ *exhibits Y as a product of the collection* $\{Y_i\}_{i \in I}$ if the collection of homotopy classes $\{[q_i] : Y \to Y_i\}_{i \in I}$ exhibits Y as an hKan-enriched product $\{Y_i\}_{i \in I}$ in the homotopy category $\mathrm{h}\mathcal{C}$ (equipped with the hKan-enrichment described in Construction 4.6.9.13). In other words, the collection of morphisms $\{q_i\}_{i \in I}$ exhibits Y as a product of the collection of objects $\{Y_i\}_{i \in I}$ if, for every object $X \in \mathcal{C}$, the induced map 03EC

$$\mathrm{Hom}_{\mathcal{C}}(X, Y) \to \prod_{i \in I} \mathrm{Hom}_{\mathcal{C}}(X, Y_i)$$

is a homotopy equivalence of Kan complexes. Similarly, we say that a collection of morphisms $\{e_i : Y_i \to Y\}_{i \in I}$ of $\mathcal{C}$ *exhibits Y as a coproduct of the collection* $\{Y_i\}_{i \in I}$ if, for every object $Z \in \mathcal{C}$, the induced map

$$\mathrm{Hom}_{\mathcal{C}}(Y, Z) \to \prod_{i \in I} \mathrm{Hom}_{\mathcal{C}}(Y_i, Z)$$

is a homotopy equivalence of Kan complexes.

Remark 7.6.1.4. Let $\{f_i : Y \to Y_i\}_{i \in I}$ be a collection of morphisms in an ∞-category $\mathcal{C}$. Then the collection $\{q_i\}_{i \in I}$ exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ in the category $\mathcal{C}$ if and only if it exhibits Y as a coproduct of the collection $\{Y_i\}_{i \in I}$ in the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$. 03ED

Remark 7.6.1.5. Let $\mathcal{C}$ be an ∞-category and let $\{Y_i\}_{i \in I}$ be a collection of objects of $\mathcal{C}$, which we will identify with a diagram 03EE

$$F : I \to \mathcal{C} \qquad F(i) = Y_i$$

indexed by the constant simplicial set associated to I (Remark 1.1.5.3). Suppose we are given another object $Y \in \mathcal{C}$ together with a collection of morphisms $\{q_i : Y \to Y_i\}_{i \in I}$. The following conditions are equivalent:

(1) The collection of morphisms $\{q_i\}_{i \in I}$ exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$, in the sense of Definition 7.6.1.3.

(2) Let $\underline{Y} : I \to \mathcal{C}$ denote the constant diagram taking the value Y, so that the collection $\{q_i\}_{i \in I}$ can be identified with a natural transformation $q : \underline{Y} \to F$. Then q exhibits Y as a limit of the diagram F, in the sense of Definition 7.1.1.1.

(3) Let $\overline{F} : I^{\triangleleft} \to \mathcal{C}$ be the diagram carrying each edge $\{i\}^{\triangleleft} \subseteq I^{\triangleleft}$ to the morphism q_i. Then $\overline{F}$ is a limit diagram in $\mathcal{C}$, in the sense of Definition 7.1.2.4.

The equivalence (1) ⇔ (2) is immediate from the definitions (see Remark 4.6.1.9) and the equivalence (2) ⇔ (3) follows from Remark 7.1.2.6.

`03EF` **Remark 7.6.1.6.** Let $\mathcal{C}$ be an ordinary category, and let $\{q_i : Y \to Y_i\}_{i \in I}$ be a collection of morphisms in $\mathcal{C}$. Then $\{q_i\}_{i \in I}$ exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ in the category $\mathcal{C}$ (in the sense of classical category theory) if and only if it exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ∞-category $\mathrm{N}_{\bullet}(\mathcal{C})$ (in the sense of Definition 7.6.1.3).

`03EG` **Notation 7.6.1.7.** Let $\mathcal{C}$ be an ∞-category and let $\{Y_i\}_{i \in I}$ be a collection of objects of $\mathcal{C}$. We will say that an object $Y \in \mathcal{C}$ is a *product* of the collection $\{Y_i\}_{i \in I}$ if there exists a collection of morphisms $\{q_i : Y \to Y_i\}$ which exhibits Y as a product of $\{Y_i\}_{i \in I}$. If this condition is satisfied, then the object Y is uniquely determined up to isomorphism (see Proposition 7.1.1.12). To emphasize this uniqueness, we will sometimes denote the object Y by $\prod_{i \in I} Y_i$, and refer to it as *the* product of the collection $\{Y_i\}_{i \in I}$. Similarly, we say that Y is a *coproduct* of the collection $\{Y_i\}_{i \in I}$ if there exists a collection of morphisms $\{e_i : Y_i \to Y\}_{\in I}$ which exhibits Y as a coproduct of $\{Y_i\}_{i \in I}$. In this case, we sometimes denote the object Y by $\coprod_{i \in I} Y_i$ and refer to it as *the* coproduct of the collection $\{Y_i\}_{i \in I}$.

`03EH` **Example 7.6.1.8** (Initial and Final Objects)**.** Let $\mathcal{C}$ be an ∞-category. An object $Y \in \mathcal{C}$ is initial (in the sense of Definition 4.6.7.1) if and only if it is the coproduct of the empty collection of objects of $\mathcal{C}$ (see Example 7.1.1.6). Similarly, Y is final if and only if it is a product of the empty collection of objects.

`03EJ` **Example 7.6.1.9** (Isomorphisms)**.** Let $f : X \to Y$ be a morphism in an ∞-category $\mathcal{C}$. The following conditions are equivalent:

(1) The morphism f is an isomorphism.

(2) The morphism f exhibits X as a product of the one-element collection of objects $\{Y\}$.

(3) The morphism f exhibits Y as a coproduct of the one-element collection of objects $\{X\}$.

Notation 7.6.1.10. In practice, we will use Definition 7.6.1.3 most often in the case where the set I has exactly two elements, so that the collection $\{Y_i\}_{i \in I}$ can be identified with an ordered pair (Y_0, Y_1) of objects of $\mathcal{C}$. In this case, we say that morphisms $q_0 : Y \to Y_0$ and $q_1 : Y \to Y_1$ *exhibit* Y *as a product of* Y_0 *with* Y_1 if they satisfy the requirement of Definition 7.6.1.3: that is, for every object $X \in \mathcal{C}$, the induced map `03EK`

$$\mathrm{Hom}_{\mathcal{C}}(X, Y) \to \mathrm{Hom}_{\mathcal{C}}(X, Y_0) \times \mathrm{Hom}_{\mathcal{C}}(X, Y_1)$$

is a homotopy equivalence. If this condition is satisfied, then we will often denote the object Y by $Y_0 \times Y_1$ and refer to it as *the* product of Y_0 with Y_1. Similarly, we say that a pair of morphisms $e_0 : Y_0 \to Y$ and $e_1 : Y_1 \to Y$ *exhibit* Y *as a coproduct of* Y_0 *with* Y_1 if, for every object $Z \in \mathcal{C}$, the induced map

$$\mathrm{Hom}_{\mathcal{C}}(Y, Z) \to \mathrm{Hom}_{\mathcal{C}}(Y_0, Z) \times \mathrm{Hom}_{\mathcal{C}}(Y_1, Z)$$

is a homotopy equivalence; in this case, we denote Y by $Y_0 \coprod Y_1$ and refer to it as *the* coproduct of Y_0 with Y_1.

Warning 7.6.1.11. Let $\mathcal{C}$ be an ∞-category. if $\{q_i : Y \to Y_i\}_{i \in I}$ is a collection of morphisms of $\mathcal{C}$ which exhibits Y as a product of the collection of objects $\{Y_i\}_{i \in I}$ in the ∞-category $\mathcal{C}$, then the collection of homotopy classes $\{[q_i] : Y \to Y_i\}_{i \in I}$ exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ordinary category $\mathrm{h}\mathcal{C}$. The converse holds if the collection $\{Y_i\}_{i \in I}$ admits a products in the ∞-category $\mathcal{C}$. However, the converse need not hold in general, even in the special case where the set I is empty: see Warning 4.6.7.18. `03EL`

Proposition 7.6.1.12. *Let $\mathcal{C}$ be an ∞-category containing an object X. The following conditions are equivalent:* `04Q7`

(1) *For every object $Y \in \mathcal{C}$, there exists a product of $X \times Y$ in the ∞-category $\mathcal{C}$.*

(2) *The forgetful functor $U : \mathcal{C}_{/Y} \to \mathcal{C}$ admits a right adjoint.*

If these conditions are satisfied, then the right adjoint of U is given on objects by the construction $Y \mapsto X \times Y$.

Proof. If Y is an object of $\mathcal{C}$, then a product $X \times Y$ (if it exists) can be identified with a final object of the ∞-category $\mathcal{C}_{/X} \times_{\mathcal{C}} \mathcal{C}_{/Y}$. The equivalence of (1) and (2) is therefore a special case of the criterion of Corollary 6.2.4.2. □

Example 7.6.1.13 (Homotopy Products). Let $\mathcal{C}$ be a locally Kan simplicial category, and let $\{q_i : Y \to Y_i\}_{i \in I}$ be a collection of morphisms in $\mathcal{C}$. By virtue of Theorem 4.6.8.5 (and Proposition 4.6.9.19), the following conditions are equivalent: `03EM`

(1) The morphisms q_i exhibit Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ∞-category $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathcal{C})$.

(2) For every object $X \in \mathcal{C}$, composition with the morphisms q_i determines a homotopy equivalence of Kan complexes

$$\mathrm{Hom}_{\mathcal{C}}(X, Y)_{\bullet} \to \prod_{i \in I} \mathrm{Hom}_{\mathcal{C}}(X, Y_i)_{\bullet}.$$

03EN **Example 7.6.1.14** (Products in $\mathcal{S}$)**.** Let $\{Y_i\}_{i \in I}$ be a collection of Kan complexes and let $Y = \prod_{i \in I} Y_i$ denote their product, formed in the ordinary category of simplicial sets. For each $i \in I$, let $q_i : Y \to Y_i$ denote the projection map. Applying Example 7.6.1.13 to the simplicial category category Kan, we deduce that the morphisms q_i also exhibit Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ∞-category of spaces $\mathcal{S} = \mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathrm{Kan})$. Similarly, if $Y' = \coprod_{i \in I} Y_i$ is the coproduct of the collection $\{Y_i\}_{i \in I}$ in the ordinary category of simplicial sets, then the inclusion maps $Y_i \hookrightarrow Y'$ exhibit Y' as a coproduct of $\{Y_i\}_{i \in I}$ in the ∞-category $\mathcal{S}$.

03EP **Example 7.6.1.15** (Products in $\mathcal{QC}$)**.** Let $\{\mathcal{C}_i\}_{i \in I}$ be a collection of ∞-categories and let $\mathcal{C} = \prod_{i \in I} \mathcal{C}_i$ denote their product, formed in the ordinary category of simplicial sets. For each $i \in I$, let $q_i : \mathcal{C} \to \mathcal{C}_i$ denote the projection map. Applying Example 7.6.1.13 to the simplicial category QCat (see Construction 5.5.4.1), we deduce that the morphisms q_i also exhibit $\mathcal{C}$ as a product of the collection $\{\mathcal{C}_i\}_{i \in I}$ in the ∞-category $\mathcal{QC} = \mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathrm{QCat})$ (this is a special case of the diffraction criterion of Theorem 7.4.1.1). Similarly, if $\mathcal{C}' = \coprod_{i \in I} \mathcal{C}_i$ is the coproduct of the collection $\{\mathcal{C}_i\}_{i \in I}$ in the ordinary category of simplicial sets, then the inclusion maps $\mathcal{C}_i \hookrightarrow \mathcal{C}'$ exhibit $\mathcal{C}'$ as a coproduct of $\{\mathcal{C}_i\}_{i \in I}$ in the ∞-category QCat (this is a special case of the refraction criterion of Theorem 7.4.3.6).

03EQ **Example 7.6.1.16** (Products in a Duskin Nerve)**.** Let $\mathcal{C}$ be a $(2,1)$-category and let $\{q_i : Y \to Y_i\}$ be a collection of 1-morphisms in $\mathcal{C}$. Then the following conditions are equivalent:

(1) The morphisms q_i exhibit Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ∞-category $\mathrm{N}^{\mathrm{D}}_{\bullet}(\mathcal{C})$.

(2) For every object $X \in \mathcal{C}$, horizontal composition with the 1-morphisms q_i induces an equivalence of categories

$$\underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y) \to \prod_{i \in I} \underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y_i).$$

This follows from the explicit description of pinched morphism spaces in $\mathrm{N}^{\mathrm{D}}_{\bullet}(\mathcal{C})$ supplied by Example 4.6.5.13.

Example 7.6.1.17 (Products in a Differential Graded Nerve)**.** Let $\mathcal{C}$ be a differential graded category and let $\{q_i : Y \to Y_i\}$ be a collection of morphisms in the underlying category of $\mathcal{C}$ (that is, each q_i is a 0-cycle of the chain complex $\mathrm{Hom}_{\mathcal{C}}(Y, Y_i)_*$). Using Example 4.6.5.15 (together with Exercise 3.2.2.22), we see that the following conditions are equivalent: 03ER

(1) The morphisms q_i exhibit Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ∞-category $\mathrm{N}^{\mathrm{dg}}_{\bullet}(\mathcal{C})$.

(2) For every object $X \in \mathcal{C}$, the map of chain complexes

$$\mathrm{Hom}_{\mathcal{C}}(X, Y)_* \to \prod_{i \in I} \mathrm{Hom}_{\mathcal{C}}(X, Y_i)_*$$

induces an isomorphism on homology in degrees ≥ 0.

Proposition 7.6.1.18 (Rewriting Limits as Products)**.** *Let $\mathcal{C}$ be an ∞-category, and let $\{f_i : K_i \to \mathcal{C}\}_{i \in I}$ be a collection of diagrams, each of which admits a limit $X_i = \varprojlim(f_i)$. Set $K = \coprod_{i \in I} K_i$, so that the collection $\{f_i\}_{i \in I}$ determines a diagram $f : K \to \mathcal{C}$. Then an object of $\mathcal{C}$ is a limit of the diagram f if it is a product of the collection of objects $\{X_i\}_{i \in I}$.* 03ES

Proof. This is a special case of (the dual of) Proposition 7.5.8.12. □

Remark 7.6.1.19. In the situation of Proposition 7.6.1.18, let $F : \mathcal{C} \to \mathcal{D}$ be a functor which preserves the limits of each of the diagrams f_i. Suppose that the collection $\{X_i\}_{i \in I}$ admits a product in $\mathcal{C}$. Then the product of $\{X_i\}_{i \in I}$ is preserved by the functor F if and only if the limit of f is preserved by the functor F. 03ET

Corollary 7.6.1.20. *Let $\{K_i\}_{i \in I}$ be a collection of simplicial sets having coproduct $K = \coprod_{i \in I} K_i$, and let $\mathcal{C}$ be an ∞-category. Suppose that $\mathcal{C}$ admits I-indexed products and K_i-indexed limits for each $i \in I$. Then $\mathcal{C}$ admits K-indexed limits. Moreover, if $F : \mathcal{C} \to \mathcal{D}$ is a functor which preserves I-indexed products and K_i-indexed colimits for each $i \in I$, then F also preserves K-indexed limits.* 03EU

Corollary 7.6.1.21. *Let $\mathcal{C}$ be an ∞-category. Then $\mathcal{C}$ admits finite products if and only if it satisfies the following pair of conditions:* 03EV

(1) *The ∞-category $\mathcal{C}$ has a final object* $\mathbf{1}$.

(2) *The ∞-category $\mathcal{C}$ admits pairwise products. That is, every pair of objects $X, Y \in \mathcal{C}$ have a product $X \times Y$ in $\mathcal{C}$.*

Proof. The necessity of conditions (1) and (2) is clear (see Example 7.6.1.8). Conversely, suppose that (1) and (2) are satisfied, and let I be a finite set. We wish to show that $\mathcal{C}$ admits I-indexed limits. We proceed by induction on the cardinality of I. If I is empty, then the desired result follows from assumption (1). If I is a singleton, then the desired result is obvious (see Example 7.6.1.9). Otherwise, we can write I as a disjoint union of proper subsets $I_-, I_+ \subset I$. Our inductive hypothesis then guarantees that $\mathcal{C}$ admits I_--indexed limits and I_+-indexed limits. Combining assumption (2) with Corollary 7.6.1.20, we deduce that $\mathcal{C}$ admits limits indexed by $I = I_- \coprod I_+$. $\square$

03EW **Remark 7.6.1.22.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, where $\mathcal{C}$ admits finite products. Then F preserves finite products if and only if it preserves final objects and pairwise products.

7.6.2 Powers and Tensors

03EX We now study limits and colimits which are indexed by *constant* diagrams of simplicial sets. Like products and coproducts, these can be characterized by universal properties in the (enriched) homotopy category.

03EY **Definition 7.6.2.1.** Let $\mathcal{C}$ be an ∞-category containing a pair of objects X and Y, and let $e : K \to \mathrm{Hom}_{\mathcal{C}}(X, Y)$ be a morphism of simplicial sets. We will say that *e exhibits X as a power of Y by K* if, for every object $W \in \mathcal{C}$, the composition law $\circ : \mathrm{Hom}_{\mathcal{C}}(X, Y) \times \mathrm{Hom}_{\mathcal{C}}(W, X) \to \mathrm{Hom}_{\mathcal{C}}(W, Y)$ of Construction 4.6.9.9 induces a homotopy equivalence of Kan complexes $\mathrm{Hom}_{\mathcal{C}}(W, X) \to \mathrm{Fun}(K, \mathrm{Hom}_{\mathcal{C}}(W, Y))$.

We will say that *e exhibits Y as a tensor product of X by K* if, for every object $Z \in \mathcal{C}$, the composition law $\circ : \mathrm{Hom}_{\mathcal{C}}(Y, Z) \times \mathrm{Hom}_{\mathcal{C}}(X, Y) \to \mathrm{Hom}_{\mathcal{C}}(X, Z)$ induces a homotopy equivalence of Kan complexes $\mathrm{Hom}_{\mathcal{C}}(Y, Z) \to \mathrm{Fun}(K, \mathrm{Hom}_{\mathcal{C}}(X, Z))$.

03EZ **Warning 7.6.2.2.** In the situation of Definition 7.6.2.1, the composition law

$$\circ : \mathrm{Hom}_{\mathcal{C}}(Y, Z) \times \mathrm{Hom}_{\mathcal{C}}(X, Y) \to \mathrm{Hom}_{\mathcal{C}}(X, Z)$$

is only well-defined up to homotopy. However, the requirement that it induces a homotopy equivalence $\mathrm{Hom}_{\mathcal{C}}(Y, Z) \to \mathrm{Fun}(K, \mathrm{Hom}_{\mathcal{C}}(X, Z))$ depends only on its homotopy class.

03F0 **Remark 7.6.2.3.** In the situation of Definition 7.6.2.1, the condition that $e : K \to \mathrm{Hom}_{\mathcal{C}}(X, Y)$ exhibits X as a power of Y by K (or Y as a tensor product of X by K) depends only on the homotopy class $[e] \in \pi_0(\mathrm{Fun}(K, \underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y)))$.

03F1 **Remark 7.6.2.4** (Duality)**.** In the situation of Definition 7.6.2.1, the morphism $e : K \to \mathrm{Hom}_{\mathcal{C}}(X, Y)$ exhibits X as a power of Y by K in the ∞-category $\mathcal{C}$ if and only if the morphism

$$e^{\mathrm{op}} : K^{\mathrm{op}} \to \mathrm{Hom}_{\mathcal{C}}(X, Y)^{\mathrm{op}} \simeq \mathrm{Hom}_{\mathcal{C}^{\mathrm{op}}}(Y, X)$$

exhibits X as a tensor product of Y by K^{op} in the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$.

Notation 7.6.2.5. Let $\mathcal{C}$ be an ∞-category, let Y be an object of $\mathcal{C}$, and let K be a simplicial set. Suppose that there exists an object $X \in \mathcal{C}$ and a morphism $e : K \to \operatorname{Hom}_{\mathcal{C}}(X, Y)$ which exhibits X as a power of Y by K. In this case, the object X is uniquely determined up to isomorphism. To emphasize this uniqueness, we will sometimes denote the object X by Y^K. 03F2

Similarly, if there exists an object $Z \in \mathcal{C}$ and a morphism $e : K \to \underline{\operatorname{Hom}}_{\mathcal{C}}(Y, Z)$ which exhibits Z as a tensor product of Y by K, then Z is uniquely determined up to isomorphism. We will sometimes emphasize this dependence by denoting the object Z by $K \otimes Y$.

Remark 7.6.2.6 (Powers as Limits)**.** Let $\mathcal{C}$ be an ∞-category containing objects X and Y. Then a morphism of simplicial sets $e : K \to \operatorname{Hom}_{\mathcal{C}}(X, Y)$ can be identified with a natural transformation $\alpha : \underline{X} \to \underline{Y}$, where $\underline{X}, \underline{Y} : K \to \mathcal{C}$ denote the constant diagrams taking the values X and Y, respectively. In this case: 03F3

- The natural transformation α exhibits the object X as a limit of the diagram $\underline{Y}$ (in the sense of Definition 7.1.1.1) if and only if e exhibits X as a power of Y by K (in the sense of Definition 7.6.2.1).
- The natural transformation α exhibits the object Y as a colimit of the diagram $\underline{X}$ (in the sense of Definition 7.1.1.1) if and only if e exhibits Y as a tensor product of X by K (in the sense of Definition 7.6.2.1).

Example 7.6.2.7. Let $\mathcal{C}$ be an ∞-category containing objects X and Y, and suppose we are given a collection of morphisms $\{f_j : X \to Y\}_{j \in J}$ indexed by a set J. If we abuse notation by identifying J with the corresponding discrete simplicial set, then the collection $\{f_j\}_{j \in J}$ can be identified with a map $e : J \to \operatorname{Hom}_{\mathcal{C}}(X, Y)$. In this case: 03F4

- The morphism e exhibits X as a power of Y by J (in the sense of Definition 7.6.2.1) if and only if the collection $\{f_j\}_{j \in J}$ exhibits X as a product of the collection $\{Y\}_{j \in J}$ (in the sense of Definition 7.6.1.3). Stated more informally, we have a canonical isomorphism $Y^J \simeq \prod_{j \in J} Y$ (provided that either side is defined).
- The morphism e exhibits Y as a tensor product of X by J (in the sense of Definition 7.6.2.1) if and only if the collection $\{f_j\}_{j \in J}$ exhibits Y as a coproduct of the collection $\{X\}_{j \in J}$ (in the sense of Definition 7.6.1.3). Stated more informally, we have a canonical isomorphism $J \otimes X \simeq \coprod_{j \in J} X$ (provided that either side is defined).

Example 7.6.2.8. Let $\mathcal{C}$ be an ∞-category containing objects X and Y. Then the unique morphism $e : \emptyset \to \operatorname{Hom}_{\mathcal{C}}(X, Y)$ exhibits X as a power of Y by the empty simplicial set if and only if X is a final object of $\mathcal{C}$. Similarly, e exhibits Y as a tensor product of X by the empty simplicial set if and only if Y is an initial object of $\mathcal{C}$. 03F5

Notation 7.6.2.9 (Diagonal Morphisms)**.** Let $\mathcal{C}$ be an ∞-category containing a pair of objects X and Y, and let $e : K \to \operatorname{Hom}_{\mathcal{C}}(X, Y)$ be a morphism of simplicial sets which 04K4 exhibits X as a power of Y by K. Then there exists a morphism $\delta : Y \to X$ which is characterized (up to homotopy) by the requirement that the diagram of simplicial sets

$$\begin{tikzcd}
K \arrow[r, "e"] \arrow[d] & \mathrm{Hom}_{\mathcal{C}}(X,Y) \arrow[d, "\circ[\delta]"] \\
\{\mathrm{id}_Y\} \arrow[r] & \mathrm{Hom}_{\mathcal{C}}(Y,Y)
\end{tikzcd}$$

commutes up to homotopy. We will refer to δ as the *diagonal morphism.*

We will be particularly interested in the special case where $K = \partial\Delta^1$, so that X can be identified with the product $Y \times Y$ (Example 7.6.2.7). In this case, we will often denote δ by $\delta_Y : Y \to Y \times Y$ and refer to it as the *diagonal of* Y.

03F6 **Proposition 7.6.2.10.** *Let $\mathcal{C}$ be a locally Kan simplicial category, let X and Y be objects of $\mathcal{C}$, and let $e : K \to \mathrm{Hom}_{\mathcal{C}}(X,Y)_\bullet$ be a morphism of simplicial sets. Let $\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})$ denote the homotopy coherent nerve of $\mathcal{C}$, and let $\theta_{X,Y} : \mathrm{Hom}_{\mathcal{C}}(X,Y)_\bullet \to \mathrm{Hom}_{\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})}(X,Y)$ denote the comparison map of Remark 4.6.8.6. Then:*

(1) *The morphism $\theta_{X,Y} \circ e$ exhibits X as a power of Y by K in the ∞-category $\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})$ if and only if, for every object $W \in \mathcal{C}$, composition with e induces a homotopy equivalence of Kan complexes*

$$c_W : \mathrm{Hom}_{\mathcal{C}}(W,X)_\bullet \to \mathrm{Fun}(K, \mathrm{Hom}_{\mathcal{C}}(W,Y)_\bullet).$$

(2) *The morphism $\theta_{X,Y} \circ e$ exhibits Y as a tensor product of X by K in the ∞-category $\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})$ if and only if, for every object $Z \in \mathcal{C}$, precomposition with e induces a homotopy equivalence of Kan complexes*

$$\mathrm{Hom}_{\mathcal{C}}(Y,Z)_\bullet \to \mathrm{Fun}(K, \mathrm{Hom}_{\mathcal{C}}(X,Z)_\bullet).$$

Proof. We will prove (1); the proof of (2) is similar. Fix an object $W \in \mathcal{C}$, so that the composition law

$$\circ : \mathrm{Hom}_{\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})}(X,Y) \times \mathrm{Hom}_{\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})}(W,X) \to \mathrm{Hom}_{\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})}(W,Y)$$

of Construction 4.6.9.9 determines a morphism of Kan complexes $c'_W : \mathrm{Hom}_{\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})}(W,X) \to \mathrm{Fun}(K, \mathrm{Hom}_{\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})}(W,Y)_\bullet)$ (which is well-defined up to homotopy). To prove Proposition 7.6.2.10, it will suffice to show that c'_W is a homotopy equivalence if and only if c_W is a homotopy equivalence. Proposition 4.6.9.19 guarantees that the diagram

$$\begin{tikzcd}
\mathrm{Hom}_{\mathcal{C}}(W,X)_\bullet \arrow[r, "c_W"] \arrow[d, "\theta_{W,X}"] & \mathrm{Fun}(K, \mathrm{Hom}_{\mathcal{C}}(W,Y)_\bullet) \arrow[d, "\theta_{W,Y}\circ"] \\
\mathrm{Hom}_{\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})}(W,X) \arrow[r, "c'_W"] & \mathrm{Fun}(K, \mathrm{Hom}_{\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})}(W,Y)_\bullet
\end{tikzcd}$$

commutes up to homotopy. We conclude by observing that the horizontal maps are homotopy equivalences, by virtue of Theorem 4.6.8.5 (and Remark 4.6.8.6). □

Example 7.6.2.11. Let X and Y be essentially small Kan complexes, let $e_0 : K \to \operatorname{Fun}(X, Y)$ be a morphism of simplicial sets, and let $e : K \to \operatorname{Hom}_{\mathcal{S}}(X, Y)$ denote the composition of e_0 with the homotopy equivalence $\operatorname{Fun}(X, Y) \to \operatorname{Hom}_{\mathcal{S}}(X, Y)$ of Remark 5.5.1.5. Then: 03F7

- The morphism e exhibits X as a power of Y by K in the ∞-category $\mathcal{S}$ and only the induced map $X \to \operatorname{Fun}(K, Y)$ is a homotopy equivalence of Kan complexes.
- The morphism e exhibits Y as a tensor product of X by K in the ∞-category $\mathcal{S}$ if and only if the induced map $K \times X \to Y$ is a weak homotopy equivalence of simplicial sets.

Example 7.6.2.12. Let Y be an essentially small Kan complex. Suppose we are given a morphism of simplicial sets $f : K \to \operatorname{Hom}_{\mathcal{S}}(\Delta^0, Y)$, which we identify with a morphism $\widetilde{f} : \underline{\Delta^0}_K \to \underline{Y}_K$ in the ∞-category $\operatorname{Fun}(K, \mathcal{S})$. Then f is a weak homotopy equivalence if and only if $\widetilde{f}$ exhibits Y as a tensor product of Δ^0 by K (in the ∞-category $\mathcal{S}$). To prove this, we are free to modify the morphism f by a homotopy (see Remark 7.6.2.3). We may therefore assume without loss of generality that f factors through the homotopy equivalence $e : \operatorname{Fun}(\Delta^0, Y) \to \operatorname{Hom}_{\mathcal{S}}(\Delta^0, Y)$ of Remark 5.5.1.5, in which case the desired result follows from the criterion of Example 7.6.2.11 (applied in the case $X = \Delta^0$). Taking $K = Y$ and $f = e$, we see that every Kan complex Y can be viewed as a colimit of the constant diagram $Y \to \{\Delta^0\} \hookrightarrow \mathcal{S}$ (see Remark 7.6.2.6). 03F8

Remark 7.6.2.13 (Cofinality and Kan Extensions)**.** Let $\mathcal{C}$ be an ∞-category and let $\delta : K \to \mathcal{C}$ be a morphism of simplicial sets. The following conditions are equivalent: 03LS

(1) The morphism δ is left cofinal.

(2) The identity transformation $\mathrm{id} : \underline{\Delta^0}_K \to \underline{\Delta^0}_{\mathcal{C}} \circ \delta$ exhibits the constant functor $\underline{\Delta^0}_{\mathcal{C}} : \mathcal{C} \to \mathcal{S}$ as a left Kan extension of the constant diagram $\underline{\Delta^0}_K : K \to \mathcal{S}$ along δ.

By virtue of Theorem 7.2.3.1 and Example 7.6.2.12, both conditions are equivalent to the requirement that, for every object $C \in \mathcal{C}$, the simplicial set $K_{/C} = K \times_{\mathcal{C}} \mathcal{C}_{/C}$ is weakly contractible.

Example 7.6.2.14. Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories, let $e_0 : K \to \operatorname{Fun}(\mathcal{C}, \mathcal{D})^{\simeq}$ be a morphism of Kan complexes, and let e denote the composition of e_0 with the homotopy equivalence $\operatorname{Fun}(\mathcal{C}, \mathcal{D})^{\simeq} \to \operatorname{Hom}_{\mathcal{QC}}(\mathcal{C}, \mathcal{D})$ of Remark 5.5.4.5. Combining Propositions 7.6.2.10 and 4.4.3.22, we obtain the following: 03F9

- The morphism e exhibits $\mathcal{C}$ as a power of $\mathcal{D}$ by K in the ∞-category $\mathcal{QC}$ if and only if the induced map $\mathcal{C} \to \operatorname{Fun}(K, \mathcal{D})$ is an equivalence of ∞-categories.

- The morphism e exhibits $\mathcal{C}$ as a tensor product of $\mathcal{D}$ by K in the ∞-category $\mathcal{QC}$ if and only if the induced map $K \times \mathcal{C} \to \mathcal{D}$ is an equivalence of ∞-categories.

03FA **Warning 7.6.2.15.** In the statement of Example 7.6.2.14, the assumption that K is a Kan complex cannot be omitted.

Examples 7.6.2.11 and 7.6.2.14 show that the ∞-categories $\mathcal{S}$ and $\mathcal{QC}$ admit powers and tensor products by any small simplicial set K. Beware that it is very rare for a *small* ∞-category to have the same property:

048B **Proposition 7.6.2.16.** *Let S be an infinite set of cardinality κ and let $\mathcal{C}$ be an ∞-category which is locally κ^+-small. The following conditions are equivalent:*

(1) *The ∞-category $\mathcal{C}$ is equivalent to the nerve of a partially ordered set.*

(2) *For every nonempty simplicial set K and every object $X \in \mathcal{C}$, the constant map*

$$K \to \{\mathrm{id}_X\} \hookrightarrow \mathrm{Hom}_{\mathcal{C}}(X, X)$$

exhibits X as a power of itself by K.

(3) *Every object $X \in \mathcal{C}$ admits a power by S.*

Proof. The implications (1) ⇒ (2) ⇒ (3) are immediate from the definitions. We will show that (3) implies (1). Assume that condition (3) is satisfied and fix a pair of objects $X, Y \in \mathcal{C}$; we wish to show that the morphism space $M = \mathrm{Hom}_{\mathcal{C}}(Y, X)$ is either empty or contractible. Assume otherwise: then there exists a morphism $f : Y \to X$ in $\mathcal{C}$ and an integer $n \geq 0$ such that the homotopy set $\pi_n(M, f)$ has at least two elements. Using assumption (3), we can choose an object $X' \in \mathcal{C}$ and a collection of morphisms $\{g_s : X' \to X\}$ which exhibit X' as a power of X by S. Choose a morphism $f' : Y \to X$ such that $g_s \circ f'$ is homotopic to f for each $s \in S$. Then $\pi_n(M', f')$ can be identified with the product $\prod_{s \in S} \pi_n(M, f)$. This set has cardinality larger than κ (Proposition 4.7.2.8), contradicting our assumption that $\mathcal{C}$ is locally κ^+-small. □

We can use Example 7.6.2.11 to give an alternative proof of the univerality of the left fibration $\mathcal{S}_* \to \mathcal{S}$ (see Corollary 5.6.0.6).

03LT **Proposition 7.6.2.17** (Covariant Transport as a Kan Extension)**.** *Let $U : \mathcal{E} \to \mathcal{C}$ be an essentially small left fibration of ∞-categories, let $\underline{\Delta^0}_{\mathcal{E}}$ denote the constant functor $\mathcal{E} \to \mathcal{S}$ taking the value Δ^0, and let $\mathscr{F} : \mathcal{C} \to \mathcal{S}$ be any functor. Suppose we are given a natural transformation $\beta : \underline{\Delta^0}_{\mathcal{E}} \to \mathscr{F} \circ U$. The following conditions are equivalent:*

(1) *The natural transformation β exhibits $\mathscr{F}$ as a left Kan extension of $\underline{\Delta^0}_{\mathcal{E}}$ along U (in the sense of Variant 7.3.1.5).*

(2) *The commutative diagram*

03LU

$$\begin{tikzcd}
\mathcal{E} \arrow[r, "\beta"] \arrow[d, "U"] & \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{S} \arrow[d] \\
\mathcal{C} \arrow[r, "\mathscr{F}"] & \mathcal{S}
\end{tikzcd} \tag{7.54}$$

is a categorical pullback square.

Proof. Fix an object $C \in \mathcal{C}$ and let $\mathcal{E}_C$ denote the fiber $\{C\} \times_{\mathcal{C}} \mathcal{E}$, so that the restriction of β to $\mathcal{E}_C$ can be identified with a morphism of Kan complexes $e_C : \mathcal{E}_C \to \mathrm{Hom}_{\mathcal{S}}(\Delta^0, \mathscr{F}(C))$. By virtue of Proposition 7.3.4.1 and Corollary 5.1.7.16, it will suffice to show that the following conditions are equivalent:

(1_C) The morphism e_C exhibits $\mathscr{F}(C)$ as a tensor product of Δ^0 by $\mathscr{E}_C$ (as an object of the ∞-category $\mathcal{S}$).

(2_C) The morphism e_C is a homotopy equivalence.

This is a special case of Example 7.6.2.12. □

Corollary 7.6.2.18. *Let $U : \mathcal{E} \to \mathcal{C}$ be an essentially small left fibration of ∞-categories. Then a functor $\mathscr{F} : \mathcal{C} \to \mathcal{S}$ is a covariant transport representation for U (in the sense of Definition 5.6.5.1) if and only if it is a left Kan extension of the constant functor $\underline{\Delta^0}_{\mathcal{E}}$ along U.* 03LV

Proof. Combine Proposition 7.6.2.17 with the equivalence $\mathcal{S}_* \hookrightarrow \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{S}$ of Theorem 4.6.4.17. □

Variant 7.6.2.19. Let $U : \mathcal{E} \to \mathcal{C}$ be a left fibration of ∞-categories, and suppose that the fibers of U are essentially κ-small for some uncountable cardinal κ. Then, in the statements of Proposition 7.6.2.17 and Corollary 7.6.2.18, we can replace $\mathcal{S}$ by the ∞-category $\mathcal{S}^{<\kappa}$ of κ-small spaces (see Variant 5.5.4.12). 03V1

We now consider a variant of Proposition 7.6.2.10. Suppose we are given a differential graded category $\mathcal{C}$ containing objects X and Y. Let

$$\rho_{X,Y} : \mathrm{K}(\mathrm{Hom}_{\mathcal{C}}(X,Y)_*) \hookrightarrow \mathrm{Hom}_{\mathrm{N}_\bullet^{\mathrm{dg}}(\mathcal{C})}(X,Y)$$

denote the composition of the isomorphism $\mathrm{K}(\mathrm{Hom}_{\mathcal{C}}(X,Y)_*) \simeq \mathrm{Hom}^{\mathrm{L}}_{\mathrm{N}_\bullet^{\mathrm{dg}}(\mathcal{C})}(X,Y)$ of Example 4.6.5.15 with the pinch inclusion morphism $\mathrm{Hom}^{\mathrm{L}}_{\mathrm{N}_\bullet^{\mathrm{dg}}(\mathcal{C})}(X,Y) \hookrightarrow \mathrm{Hom}^{\mathrm{L}}_{\mathrm{N}_\bullet^{\mathrm{dg}}(\mathcal{C})}(X,Y)$ of Construction 4.6.5.7.

03FB **Proposition 7.6.2.20.** *Let $\mathcal{C}$ be a differential graded category, let X and Y be objects of $\mathcal{C}$, and suppose we are given a morphism of simplicial sets $e_0 : S \to \mathrm{K}(\mathrm{Hom}_{\mathcal{C}}(X,Y)_*)$, which we identify with a morphism of chain complexes $f : \mathrm{N}_*(S;\mathbf{Z}) \to \mathrm{Hom}_{\mathcal{C}}(X,Y)_*$. Let $e : S \to \mathrm{Hom}_{\mathrm{N}_\bullet^{\mathrm{dg}}(\mathcal{C})}(X,Y)$ denote the composition of e_0 with the morphism $\rho_{X,Y}$. The following conditions are equivalent:*

(1) *The morphism e exhibits Y as a tensor product of X by S in the ∞-category $\mathrm{N}_\bullet^{\mathrm{dg}}(\mathcal{C})$.*

(2) *Let Z be an object of $\mathcal{C}$, so that f induces a morphism of chain complexes*

$$\theta : \mathrm{Hom}_{\mathcal{C}}(Y,Z)_* \to \mathrm{Hom}_{\mathrm{Ch}(\mathbf{Z})}(\mathrm{N}_*(S;\mathbf{Z}), \mathrm{Hom}_{\mathcal{C}}(X,Z)_*)_*.$$

Then θ is an isomorphism on homology in degrees ≥ 0.

Proof of Proposition 7.6.2.20. Fix an object $Z \in \mathcal{C}$. Using Proposition 4.6.9.21, we see that the diagram of Kan complexes

$$\begin{tikzcd}
\mathrm{K}(\mathrm{Hom}_{\mathcal{C}}(Y,Z)_*) \arrow[r, "\mathrm{K}(\theta)"] \arrow[dd, "\rho_{Y,Z}"] & \mathrm{K}(\mathrm{Hom}_{\mathrm{Ch}(\mathbf{Z})}(\mathrm{N}_*(S;\mathbf{Z}), \mathrm{Hom}_{\mathcal{C}}(X,Z)_*)_*) \arrow[d, "\psi"] \\
 & \mathrm{Fun}(S, \mathrm{K}(\mathrm{Hom}_{\mathcal{C}}(X,Z)_*)) \arrow[d, "\rho_{X,Z}\circ"] \\
\mathrm{Hom}_{\mathrm{N}_\bullet^{\mathrm{dg}}(\mathcal{C})}(Y,Z) \arrow[r] & \mathrm{Fun}(S, \mathrm{Hom}_{\mathrm{N}_\bullet^{\mathrm{dg}}(\mathcal{C})}(X,Z))
\end{tikzcd}$$

commutes up to homotopy, where ψ is the homotopy equivalence of Example 3.1.6.11 and the bottom horizontal map is given by combining e with the composition law on the ∞-category $\mathrm{N}_\bullet^{\mathrm{dg}}(\mathcal{C})$. Note that condition (1) is equivalent to the requirement that the bottom horizontal map is a homotopy equivalence (for each object $Z \in \mathcal{C}$). Since the map $\rho_{Y,Z}$ and $\rho_{X,Z}$ are also homotopy equivalences (Proposition 4.6.5.10), this is equivalent to the requirement that $\mathrm{K}(\theta)$ is a homotopy equivalence (for each object $Z \in \mathcal{C}$). The equivalence of (1) and (2) now follows from the criterion of Corollary 3.2.7.4. □

03FC **Example 7.6.2.21** (Homology as a Colimit)**.** Let $\mathcal{C} = \mathrm{Ch}(\mathbf{Z})$ denote the category of chain complexes of abelian groups, which we regard as a differential graded category (see Example 2.5.2.5). Let A be an abelian group, and let us abuse notation by identifying A with its image in $\mathcal{C}$ (by regarding it as a chain complex concentrated in degree zero). For every simplicial set S, let $\mathrm{N}_*(S;A)$ denote the normalized chain complex of S with coefficients in A, given by the tensor product $\mathrm{N}_*(S;\mathbf{Z}) \boxtimes A$. Then the tautological map

$$f : \mathrm{N}_*(S;\mathbf{Z}) \to \mathrm{Hom}_{\mathrm{Ch}(\mathbf{Z})}(A, \mathrm{N}_*(S;A))_*$$

satisfies condition (2) of Proposition 7.6.2.20: in fact, for every object $M_* \in \mathcal{C}$, precomposition with f induces an *isomorphism* of chain complexes

$$\mathrm{Hom}_{\mathcal{C}}(\mathrm{N}_*(S;A), M_*)_* \to \mathrm{Hom}_{\mathcal{C}}(\mathrm{N}_*(S;\mathbf{Z}), \mathrm{Hom}_{\mathcal{C}}(A, M_*)_*)_*.$$

It follows that the induced map $S \to \mathrm{Hom}_{\mathrm{N}_\bullet^{\mathrm{dg}}(\mathcal{C})}(A, \mathrm{N}_*(S;A))$ exhibits $\mathrm{N}_*(S;A)$ as a tensor product of A by S in the ∞-category $\mathrm{N}_\bullet^{\mathrm{dg}}(\mathcal{C})$. In particular, the chain complex $\mathrm{N}_*(S;A)$ can be viewed as a colimit of the constant diagram $S \to \{A\} \hookrightarrow \mathrm{N}_\bullet^{\mathrm{dg}}(\mathrm{Ch}(\mathbf{Z}))$.

Variant 7.6.2.22 (Cohomology as a Limit)**.** Let A be an abelian group, let S be a simplicial set, and let 03FD

$$\mathrm{N}^*(S;A) = \mathrm{Hom}_{\mathrm{Ch}(\mathbf{Z})}(\mathrm{N}_*(S;\mathbf{Z}), A)$$

denote the normalized *cochain* complex of S with coefficients in A. Applying Proposition 7.6.2.20 to the differential graded category $\mathrm{Ch}(\mathbf{Z})^{\mathrm{op}}$ (and using Remark 7.6.2.4), we see that the tautological chain map $\mathrm{N}_*(S;\mathbf{Z}) \to \mathrm{Hom}_{\mathrm{Ch}(\mathbf{Z})}(\mathrm{N}^*(S;A), A)_*$ induces a morphism of simplicial sets

$$e : S \to \mathrm{Hom}_{\mathrm{N}_\bullet^{\mathrm{dg}}(\mathrm{Ch}(\mathbf{Z}))}(\mathrm{N}^*(S;A), A)$$

which exhibits $\mathrm{N}^*(S;A)$ as a power of A by S in the ∞-category $\mathrm{N}_\bullet^{\mathrm{dg}}(\mathrm{Ch}(\mathbf{Z}))$. In particular, $\mathrm{N}^*(S;A)$ can be viewed as a limit of the constant diagram $S \to \{A\} \hookrightarrow \mathrm{N}_\bullet^{\mathrm{dg}}(\mathrm{Ch}(\mathbf{Z}))$.

7.6.3 Pullbacks and Pushouts

Let $\mathcal{C}$ be an ∞-category. Recall that a *commutative square* in $\mathcal{C}$ is a morphism of simplicial sets $\Delta^1 \times \Delta^1 \to \mathcal{C}$ which we represent informally by a diagram 03FE

$$\begin{tikzcd}
X' \arrow[r] \arrow[d] & Y' \arrow[d] \\
X \arrow[r] & Y
\end{tikzcd}$$

(see Example 1.5.2.15). Note that the simplicial set $\Delta^1 \times \Delta^1 \simeq \mathrm{N}_\bullet([1] \times [1])$ can be regarded both as a left cone (on the nerve of the partially ordered set $[1] \times [1] \setminus \{(0,0)\}$) and as a right cone (on the nerve of the partially ordered set $[1] \times [1] \setminus \{(1,1)\}$).

03FF **Definition 7.6.3.1.** Let $\mathcal{C}$ be an ∞-category and let $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$ be a commutative square. We say that σ is a *pullback square* if it is a limit diagram in $\mathcal{C}$ (see Definition 7.1.2.4), and that σ is a *pushout square* if it is a colimit diagram in $\mathcal{C}$.

03FG **Example 7.6.3.2.** Let $\mathcal{C}$ be an ordinary category. Then diagram $\sigma : [1] \times [1] \to \mathcal{C}$ is a pullback square in $\mathcal{C}$ (in the sense of classical category theory) if and only if the induced map

$$\mathrm{N}_\bullet(\sigma) : \Delta^1 \times \Delta^1 \to \mathrm{N}_\bullet(\mathcal{C})$$

is a pullback square in the ∞-category $\mathrm{N}_\bullet(\mathcal{C})$ (in the sense of Definition 7.6.3.1); this follows from Example 7.1.1.4 and Remark 7.1.2.6. Similarly, σ is a pushout square in $\mathcal{C}$ if and only if $\mathrm{N}_\bullet(\sigma)$ is a pushout square in the ∞-category $\mathrm{N}_\bullet(\mathcal{C})$.

03FH **Warning 7.6.3.3.** Let $\mathcal{C}$ be an ∞-category and let $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$ be a morphism, which we depict as a diagram

$$\begin{tikzcd}
X_{01} \arrow[r, "g_0"] \arrow[d, "g_1"] & X_0 \arrow[d, "f_0"] \\
X_1 \arrow[r, "f_1"] & X.
\end{tikzcd}$$

Beware that, if σ is a pullback square in the ∞-category $\mathcal{C}$, then the associated diagram

$$\begin{tikzcd}
X_{01} \arrow[r, "{[g_0]}"] \arrow[d, "{[g_1]}"] & X_0 \arrow[d, "{[f_0]}"] \\
X_1 \arrow[r, "{[f_1]}"] & X
\end{tikzcd}$$

need not be a pullback square in the homotopy category $\mathrm{h}\mathcal{C}$ (see Example 7.6.3.4 and Exercise 7.6.3.5). If Y is an object of $\mathcal{C}$, then the map of sets

$$\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(Y, X_{01}) \xrightarrow{([g_0],[g_1])\circ} \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(Y, X_0) \times_{\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(Y,X)} \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(Y, X_1)$$

is surjective, but need not be injective. Given a commutative diagram

03FJ
$$\begin{tikzcd}
Y \arrow[r, "{[g_0]}"] \arrow[d, "{[g_1]}"] & X_0 \arrow[d, "{[f_0]}"] \\
X_1 \arrow[r, "{[f_1]}"] & X
\end{tikzcd} \qquad (7.55)$$

in the homotopy category $\mathrm{h}\mathcal{C}$, we can always find a morphism $g_{01} : Y \to X_{01}$ satisfying $g_{01} : Y \to X_{01}$ satisfying $[g_0] = [f_0'] \circ [g_{01}]$ and $[g_1] = [f_1'] \circ [g_{01}]$. However, the homotopy class $[g_{01}]$ is not uniquely determined: roughly speaking, to construct g_{01}, we need to lift (7.55) to a commutative diagram in the ∞-category $\mathcal{C}$. Such a lift always exists (Exercise 1.5.2.10), but is not unique (even up to homotopy).

Example 7.6.3.4. Let $q : X \to S$ be a Kan fibration between Kan complexes, let $s \in S$ be a vertex, and let X_s denote the fiber $\{s\} \times_S X$. Then the commutative diagram of simplicial sets 03FK

03FL
$$\begin{tikzcd} X_s \arrow[r] \arrow[d] & X \arrow[d, "q"] \\ \{s\} \arrow[r] & S \end{tikzcd} \qquad (7.56)$$

is a homotopy pullback square (Example 3.4.1.3), and therefore induces a pullback square in the ∞-category $\mathcal{S} = \mathrm{N}_\bullet^{\mathrm{hc}}(\mathrm{Kan})$ (see Example 7.6.4.2). However, if X is contractible and X_s is not, then (7.56) is not a pullback square in the homotopy category hKan.

Exercise 7.6.3.5. Let G be a group and let $H \subseteq G$ be a commutative normal subgroup, so that we have a commutative diagram of Kan complexes 03FM

03FN
$$\begin{tikzcd} B_\bullet H \arrow[r] \arrow[d] & B_\bullet G \arrow[d] \\ \Delta^0 \arrow[r] & B_\bullet(G/H) \end{tikzcd} \qquad (7.57)$$

- Show that (7.57) is a pullback diagram in the ordinary category of Kan complexes, and that it determines a pullback diagram in the ∞-category $\mathcal{S} = \mathrm{N}_\bullet^{\mathrm{hc}}(\mathrm{Kan})$ (see Example 7.6.4.2).
- Show that, if H is contained in the center of G, then the diagram (7.57) is also pullback square in the homotopy category hKan.
- Show that, if H is not contained in the center of G, then the diagram $B_\bullet G \to B_\bullet(G/H) \leftarrow \Delta^0$ does not have a limit in the homotopy category hKan. In particular, the diagram (7.57) is not a pullback square in hKan.

Variant 7.6.3.6. Let $U : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. We say that a diagram $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$ is a *U-pullback square* if it is a U-limit diagram in $\mathcal{C}$ (Definition 7.1.5.1). We say that σ is a *U-pushout square* if it is a U-colimit diagram in the ∞-category $\mathcal{C}$. 048C

048D **Remark 7.6.3.7.** Let $\mathcal{C}$ be an ∞-category and let $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$ be a commutative square in $\mathcal{C}$. Then σ is a pullback square if and only if it is U-pullback square, where $U : \mathcal{C} \to \Delta^0$ is the projection map (see Example 7.1.5.3).

03FP **Remark 7.6.3.8** (Symmetry)**.** Let $\mathcal{C}$ be an ∞-category, let $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$ be a commutative square in $\mathcal{C}$, and let $\sigma' : \Delta^1 \times \Delta^1 \to \mathcal{C}$ denote the commutative square which is obtained from σ by precomposing with the automorphism of $\Delta^1 \times \Delta^1$ given by permuting the factors. Then σ is a pullback square if and only if σ' is a pullback square, and σ is a pushout square if and only if σ' is a pushout square.

More generally, if $U : \mathcal{C} \to \mathcal{D}$ is a functor of ∞-categories, then σ is a U-pullback square if and only if σ' is a U-pullback square, and σ is a U-pushout square if and only if σ' is a U-pushout square.

03FQ **Remark 7.6.3.9.** Let $\mathcal{C}$ be an ∞-category and let $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$ be a commutative diagram in $\mathcal{C}$. Then σ is a pushout diagram in $\mathcal{C}$ if and only if the opposite diagram $\sigma^{\mathrm{op}} : \Delta^1 \times \Delta^1 \to \mathcal{C}^{\mathrm{op}}$ is a pullback diagram in the ∞-category $\mathcal{C}^{\mathrm{op}}$; here we implicitly identify the simplicial set $\Delta^1 \times \Delta^1$ with its opposite (beware that there are two possible identifications we could choose, but the choice does not matter by virtue of Remark 7.6.3.8).

More generally, if $U : \mathcal{C} \to \mathcal{D}$ is a functor of ∞-categories, then σ is a U-pushout diagram if and only if σ^{op} is a U^{op}-pullback diagram.

03FR **Remark 7.6.3.10.** Let $\mathcal{C}$ be an ∞-category and let $\sigma, \sigma' : \Delta^1 \times \Delta^1 \to \mathcal{C}$ be square diagrams which are isomorphic (when viewed as objects of the ∞-category $\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})$). Then σ is a pullback square if and only if σ' is a pullback square, and a pushout square if and only if σ' is a pushout square.

More generally, if $U : \mathcal{C} \to \mathcal{D}$ is a functor of ∞-categories, then then σ is a U-pullback square if and only if σ' is a U-pullback square, and σ is a U-pushout square if and only if σ' is a U-pushout square (see Proposition 7.1.5.13).

03FS **Notation 7.6.3.11** (Fiber Products)**.** Let $\mathcal{C}$ be an ∞-category, and suppose we are given a pair of morphisms $f_0 : X_0 \to X$ and $f_1 : X_1 \to X$ of $\mathcal{C}$ having the same target. It follows from Proposition 7.1.1.12 that if there exists a pullback diagram

$$\begin{tikzcd}
X_{01} \arrow[r] \arrow[d] & X_0 \arrow[d, "f_0"] \\
X_1 \arrow[r, "f_1"] & X
\end{tikzcd}$$

in $\mathcal{C}$, then the object X_{01} is determined up to isomorphism by f_0 and f_1. To emphasize this, we will often denote the object X_{01} by $X_0 \times_X X_1$ and refer to it as the *fiber product of* X_0

with X_1 *over* X. Similarly, if there exists a pushout diagram

$$\begin{tikzcd}
Y \arrow[r, "g_0"] \arrow[d, "g_1"] & Y_0 \arrow[d] \\
Y_1 \arrow[r] & Y_{01}
\end{tikzcd}$$

in $\mathcal{C}$, then the object Y_{01} is determined up to isomorphism by g_0 and g_1. To emphasize this, we often denote the object Y_{01} by $Y_0 \coprod_Y Y_1$ and refer to it as the *pushout of* Y_0 *with* Y_1 *along* Y.

Definition 7.6.3.12. Let $\mathcal{C}$ be an ∞-category. We will say that $\mathcal{C}$ *admits pullbacks* if, for every pair of morphisms $f_0 : X_0 \to X$ and $f_1 : X_1 \to X$ having the same target, there exists a pullback diagram 03FT

$$\begin{tikzcd}
X_{01} \arrow[r] \arrow[d] & X_0 \arrow[d, "f_0"] \\
X_1 \arrow[r, "f_1"] & X.
\end{tikzcd}$$

We say that a functor $F : \mathcal{C} \to \mathcal{D}$ *preserves pullbacks* if, for every pullback square $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$ in the ∞-category $\mathcal{C}$, the composition $(F \circ \sigma) : \Delta^1 \times \Delta^1 \to \mathcal{D}$ is a pullback square in the ∞-category $\mathcal{D}$.

We say that $\mathcal{C}$ *admits pushouts* if, for every pair of morphisms $g_0 : Y \to Y_0$ and $g_1 : Y \to Y_1$ having the same source, there exists a pushout diagram

$$\begin{tikzcd}
Y \arrow[r, "g_0"] \arrow[d, "g_1"] & Y_0 \arrow[d] \\
Y_1 \arrow[r] & Y_{01}.
\end{tikzcd}$$

We say that a functor $F : \mathcal{C} \to \mathcal{D}$ *preserves pushouts* if, for every pushout square $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$ in the ∞-category $\mathcal{C}$, the composition $(F \circ \sigma) : \Delta^1 \times \Delta^1 \to \mathcal{D}$ is a pushout square in the ∞-category $\mathcal{D}$.

Remark 7.6.3.13. Let $U : \mathcal{C} \to \mathcal{D}$ be a right fibration of ∞-categories, and suppose that $\mathcal{D}$ admits pullbacks. Then $\mathcal{C}$ also admits pullbacks, and the functor U preserves pullbacks. See Corollary 7.1.5.18. 04Q8

03FU **Proposition 7.6.3.14.** *Let $\mathcal{C}$ be an ∞-category and let $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$ be a commutative square, which we represent by a diagram*

$$\begin{tikzcd}
X_{01} \arrow[r] \arrow[d] & X_0 \arrow[d] \\
X_1 \arrow[r] & X.
\end{tikzcd}$$

Then σ is a pullback diagram in $\mathcal{C}$ if and only if it exhibits X_{01} as a product of X_0 with X_1 in the slice ∞-category $\mathcal{C}_{/X}$.

Proof. This is a special case of Remark 7.1.2.11. □

We now give an alternative characterization of the fiber product construction.

04Q9 **Definition 7.6.3.15.** Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$. We will say that a functor $f^* : \mathcal{C}_{/Y} \to \mathcal{C}_{/X}$ is *given by pullback along f* if it is a right adjoint to the functor $\mathcal{C}_{/X} \to \mathcal{C}_{/Y}$ given by postcomposition with f (see Example 4.3.6.14). Note that this condition characterizes the functor f^* up to isomorphism (see Remark 6.2.1.19).

04QA **Proposition 7.6.3.16.** *Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$. The following conditions are equivalent:*

(1) *There exists a functor $f^* : \mathcal{C}_{/Y} \to \mathcal{C}_{/X}$ given by pullback along f (in the sense of Definition 7.6.3.15).*

(2) *For every morphism $u : Y' \to Y$, there exists a pullback diagram*

$$\begin{tikzcd}
X' \arrow[r] \arrow[d] & Y' \arrow[d, "u"] \\
X \arrow[r, "f"] & Y
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$.

Moreover, if these conditions are satisfied, then the pullback functor f^* carries each object $Y' \in \mathcal{C}_{/Y}$ to the fiber product $X \times_Y Y'$.

Proof. Let $e_0 : \mathcal{C}_{/f} \to \mathcal{C}_{/X}$ and $e_1 : \mathcal{C}_{/f} \to \mathcal{C}_{/Y}$ denote the restriction map. Then e_0 is a trivial Kan fibration (Corollary 4.3.6.13), and postcomposition with f is defined as the composition of e_1 with a section of e_0 (Example 4.3.6.14). We can therefore reformulate (1) as follows:

(1′) The restriction functor $e_1 : \mathcal{C}_{/f} \to \mathcal{C}_{/Y}$ admits a right adjoint.

Let us identify the morphism f with an object $\widetilde{X} \in \mathcal{C}_{/Y}$. Using Proposition 7.6.3.14, we can reformulate condition (2) as follows:

$(2')$ For every object $\widetilde{Y}' \in \mathcal{C}_{/Y}$, there exists a product of $\widetilde{X}$ with $\widetilde{Y}'$ in $\mathcal{C}_{/Y}$.

The equivalence of $(1')$ and $(2')$ now follows from Proposition 7.6.1.12, applied to the slice ∞-category $\mathcal{C}_{/Y}$. □

Corollary 7.6.3.17. *Let $\mathcal{C}$ be an ∞-category. Then $\mathcal{C}$ admits fiber products if and only if, for every morphism $f : X \to Y$ in $\mathcal{C}$, the postcomposition functor* 04QB

$$\mathcal{C}_{/X} \to \mathcal{C}_{/Y} \qquad e \mapsto (f \circ e)$$

of Example 4.3.6.14 admits a right adjoint.

Notation 7.6.3.18 (Relative Diagonals)**.** Let $\mathcal{C}$ be an ∞-category and let $f : Y \to X$ be a morphism in $\mathcal{C}$. Suppose that there exists a pullback square 04K5

04K6
$$\begin{tikzcd} Y \times_X Y \arrow[r, "\pi"] \arrow[d, "\pi'"] & Y \arrow[d, "f"] \\ Y \arrow[r, "f"] & X \end{tikzcd} \tag{7.58}$$

in the ∞-category $\mathcal{C}$. Let us abuse notation by identifying Y with an object of the slice ∞-category $\mathcal{C}_{/X}$, so that $Y \times_X Y$ can be viewed as a product of Y with itself in $\mathcal{C}_{/X}$ (Proposition 7.6.3.14). Applying the construction of Notation 7.6.2.9, we obtain a morphism $\delta_{Y/X} : Y \to Y \times_X Y$, which we will refer to as the *relative diagonal of f*. It is characterized (up to homotopy) by the requirement that (7.58) can be extended to a commutative diagram

$$\begin{tikzcd} Y \arrow[dr, "\delta_{Y/X}"] \arrow[drr, "\mathrm{id}_Y"] \arrow[ddr, "\mathrm{id}_Y"'] & & \\ & Y \times_X Y \arrow[r, "\pi"] \arrow[d, "\pi'"] & Y \arrow[d, "f"] \\ & Y \arrow[r, "f"] & X, \end{tikzcd}$$

where the outer square is the commutative diagram given by the composition

$$\Delta^1 \times \Delta^1 \xrightarrow{(i,j) \mapsto ij} \Delta^1 \xrightarrow{f} \mathcal{C}.$$

Variant 7.6.3.19 (Relative Codiagonals)**.** Let $\mathcal{C}$ be an ∞-category, let $f : Y \to X$ be a morphism of $\mathcal{C}$, and suppose that there exists a pushout square 04K7

$$\begin{tikzcd} Y \arrow[r, "f"] \arrow[d, "f"] & X \arrow[d] \\ X \arrow[r] & X \coprod_Y X. \end{tikzcd}$$

Applying the construction of Notation 7.6.3.18 in the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$, we obtain a morphism $\gamma_{Y/X} : X \coprod_Y X \to X$ which we will refer to as the *relative codiagonal* of the morphism f.

Stated more informally, a fiber product $X_0 \times_X X_1$ (formed in an ∞-category $\mathcal{C}$) is a product of X_0 with X_1 in the ∞-category $\mathcal{C}_{/X}$.

03FV **Corollary 7.6.3.20.** *Let $\mathcal{C}$ be an ∞-category. Then $\mathcal{C}$ admits pullbacks if and only if, for each object $X \in \mathcal{C}$, the slice ∞-category $\mathcal{C}_{/X}$ admits finite products.*

Proof. By virtue of Proposition 7.6.3.14, the ∞-category $\mathcal{C}$ admits pullbacks if and only if, for every object $X \in \mathcal{C}$, the ∞-category $\mathcal{C}_{/X}$ admits pairwise products. Since $\mathcal{C}_{/X}$ has an initial object (given by the identity morphism $\mathrm{id}_X : X \to X$; see Proposition 4.6.7.22), this is equivalent to the requirement that $\mathcal{C}_{/X}$ admits finite products (Corollary 7.6.1.21). □

03FW **Remark 7.6.3.21.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor between ∞-categories, where $\mathcal{C}$ admits pullbacks. Then F preserves pullbacks if and only if, for each object $X \in \mathcal{C}$, the induced functor $\mathcal{C}_{/X} \to \mathcal{D}_{/F(X)}$ preserves finite products.

03FX **Corollary 7.6.3.22.** *Let $\mathcal{C}$ be an ∞-category and let $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$ be a commutative square, which we represent by a diagram*

$$\begin{tikzcd}
X \arrow[r, "f_0"] \arrow[d, "f_1"] & X_0 \arrow[d] \\
X_1 \arrow[r] & \mathbf{1}.
\end{tikzcd}$$

Suppose that $\mathbf{1}$ is a final object of $\mathcal{C}$. Then σ is a pullback square if and only if the morphisms f_0 and f_1 exhibit X as a coproduct of X_0 with X_1 in the ∞-category $\mathcal{C}$.

Proof. The assumption that $\mathbf{1}$ is final guarantees that the projection map $\mathcal{C}_{/\mathbf{1}} \to \mathcal{C}$ is a trivial Kan fibration (Proposition 4.6.7.10), so that the desired result follows from the criterion of Proposition 7.6.3.14. □

048E **Proposition 7.6.3.23.** *Let $U : \mathcal{C} \to \mathcal{D}$ be an inner fibration of ∞-categories and let $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$ be a commutative square, represented informally by the diagram*

$$\begin{tikzcd}
X' \arrow[r, "f'"] \arrow[d] & Y' \arrow[d] \\
X \arrow[r, "f"] & Y.
\end{tikzcd}$$

Then:

(1) *If f is U-cartesian, then σ is a U-pullback square if and only if f' is also U-cartesian.*

(2) *If f' is U-cocartesian, then σ is a U-pushout square if and only if f is also U-cocartesian.*

Proof. We will prove (1); the proof of (2) is similar. Note that σ restricts to a diagram

$$\sigma_0 : \mathrm{N}_\bullet(\{(0,1) < (1,1) > (1,0)\}) \to \mathcal{C}$$

satisfying $\sigma_0(0,1) = X$, $\sigma_0(1,1) = Y$, and $\sigma_0(1,0) = Y'$. The assumption that f is U-cartesian guarantees that σ_0 is U-right Kan extended from the full subcategory

$$\{1\} \times \Delta^1 \subseteq \mathrm{N}_\bullet(\{(0,1) < (1,1) > (1,0)\}).$$

It follows that σ is a U-pullback diagram if and only if the restriction $\sigma|_{\mathrm{N}_\bullet(\{(0,0)<(1,0)<(1,1)\})}$ is a U-limit diagram (Proposition 7.3.8.1) By virtue of Corollary 7.2.2.5, this is equivalent to the requirement that f' is U-cartesian. □

Corollary 7.6.3.24. *Let $\mathcal{C}$ be an ∞-category and let $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$ be a commutative square, represented informally by the diagram* 048F

$$\begin{tikzcd}
X' \arrow[r, "f'"] \arrow[d] & Y' \arrow[d] \\
X \arrow[r, "f"] & Y.
\end{tikzcd}$$

Then:

(1) *If f is an isomorphism, then σ is a pullback square if and only if f' is also an isomorphism.*

(2) *If f' is an isomorphism, then σ is a pushout square if and only if f is also an isomorphism.*

Proof. Combine Proposition 7.6.3.23 with Remark 7.6.3.7 (and Example 5.1.1.4). □

Proposition 7.6.3.25 (Transitivity). *Let $U : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories and let $\sigma : \Delta^2 \times \Delta^1 \to \mathcal{C}$ be diagram, which we depict informally as* 03FZ

03G0

$$\begin{tikzcd}
X' \arrow[r] \arrow[d] & Y' \arrow[r] \arrow[d] & Z' \arrow[d] \\
X \arrow[r] & Y \arrow[r] & Z.
\end{tikzcd} \tag{7.59}$$

Then:

(1) *Assume that the right square of (7.59) is a U-pullback. Then the left square is a U-pullback if and only if the outer rectangle is a U-pullback.*

(2) *Assume that the left square of (7.59) is a U-pushout. Then the left square is a U-pushout if and only if the outer rectangle is a U-pushout.*

Proof. We will prove (1); the proof of (2) is similar. Let A denote the partially ordered set $([2] \times [1]) \setminus \{(0,0)\}$. Note that the inclusion maps

$$A \setminus \{(2,0),(2,1)\} \hookrightarrow A \qquad A \setminus \{(1,0),(1,1)\} \hookrightarrow A \setminus \{(1,0)\}$$

admit right adjoints, and therefore induce left cofinal morphisms

$$\mathrm{N}_\bullet(A \setminus \{(2,0),(2,1)\}) \hookrightarrow \mathrm{N}_\bullet(A) \qquad \mathrm{N}_\bullet(A \setminus \{(1,0),(1,1)\}) \hookrightarrow \mathrm{N}_\bullet(A \setminus \{(1,0)\})$$

(Corollary 7.2.3.7). Applying Corollary 7.2.2.2, we obtain the following:

- The left square of (7.59) is a U-pullback diagram if and only if σ is a U-limit diagram.
- The outer rectangle of (7.59) is a U-pullback diagram if and only if the restriction $\sigma|_{\mathrm{N}_\bullet(([2]\times[1])\setminus\{(1,0)\})}$ is a U-limit diagram.

If the right square of (7.59) is a U-pullback diagram, then $\sigma|_{\mathrm{N}_\bullet(A)}$ is U-right Kan extended from $\sigma|_{\mathrm{N}_\bullet(A\setminus\{(1,0)\})}$, so the desired equivalence follows from Proposition 7.3.8.1. □

03G1 **Proposition 7.6.3.26** (Rewriting Limits as Pullbacks). *Suppose we are given a categorical pushout square of simplicial sets*

$$\begin{tikzcd}
K \arrow[r] \arrow[d] & K_0 \arrow[d] \\
K_1 \arrow[r] & K_{01}.
\end{tikzcd}$$

Let $\mathcal{C}$ be an ∞-category which admits pullbacks. If $\mathcal{C}$ admits K-indexed limits, K_0-indexed limits, and K_1-indexed limits, then it also admits K_{01}-indexed limits. Moreover, if $F : \mathcal{C} \to \mathcal{D}$ is a functor of ∞-categories which preserves pullback squares, K-indexed limits, K_0-indexed limits, and K_1-indexed limits, then F also preserves K-indexed limits.

Proof. Combine Corollary 7.5.8.5 with (the dual of) Corollary 7.5.8.13. □

03G2 **Corollary 7.6.3.27.** *Let $\mathcal{C}$ be an ∞-category. Then $\mathcal{C}$ admits finite limits if and only if it admits pullbacks and has a final object. If these conditions are satisfied, then a functor $F : \mathcal{C} \to \mathcal{D}$ preserves finite limits if and only if it preserves pullbacks and final objects.*

Proof. We will prove the first assertion; the second follows by a similar argument. Assume that the ∞-category $\mathcal{C}$ admits pullbacks and has a final object; we wish to show that $\mathcal{C}$ admits K-indexed limits for every finite simplicial set K (the converse is immediate from the definitions). We proceed by induction on the dimension of K. If K is empty, then the desired result follows from our assumption that $\mathcal{C}$ has a final object. Let us therefore assume that K has dimension $n \geq 0$, and proceed also by induction on the number of nondegenerate n-simplices of K. It follows from Proposition 1.1.4.12 that there exists a pushout square of simplicial sets

$$\begin{tikzcd}
\partial\Delta^n \arrow[r] \arrow[d] & \Delta^n \arrow[d] \\
K' \arrow[r] & K,
\end{tikzcd}$$

where K' is a simplicial subset of K. Since the horizontal maps are monomorphisms, this pushout square is also a categorical pushout square (Example 4.5.4.12). By virtue of Proposition 7.6.3.26, it will suffice to show that the ∞-category $\mathcal{C}$ admits K'-indexed limits, $\partial\Delta^n$-indexed limits, and Δ^n-indexed limits. In the first two cases, this follows from our inductive hypothesis. To handle the third case, we observe that the inclusion $\{0\} \hookrightarrow \Delta^n$ is left cofinal (Example 4.3.7.11). Using Corollary 7.2.2.12, we are reduced to proving that $\mathcal{C}$ admits Δ^0-indexed limits, which is immediate (see Example 7.1.1.5). □

Example 7.6.3.28. Let $\mathcal{C}$ be an ∞-category which admits pullbacks. Then, for every object $X \in \mathcal{C}$, the slice ∞-category $\mathcal{C}_{/X}$ admits finite limits. This follows from Corollary 7.6.3.27, since $\mathcal{C}_{/X}$ also admits finite pullbacks (Remark 7.6.3.13), and has a final object given by the identity morphism $\mathrm{id}_X : X \to X$ (Proposition 4.6.7.22). Similarly, if $F : \mathcal{C} \to \mathcal{D}$ is a functor which preserves pullbacks, then the induced functor $F_{/X} : \mathcal{C}_{/X} \to \mathcal{D}_{/F(X)}$ preserves finite limits. 05E4

7.6.4 Examples of Pullback and Pushout Squares

We now give some examples of ∞-categorical pullback diagrams. 03G3

Proposition 7.6.4.1. *Let $\mathcal{C}$ be a locally Kan simplicial category and let σ :* 03G4

$$\begin{tikzcd}
X_{01} \arrow[r] \arrow[d] & X_0 \arrow[d] \\
X_1 \arrow[r] & X
\end{tikzcd}$$

be a commutative diagram in $\mathcal{C}$. The following conditions are equivalent:

(1) *The composite map*

$$\Delta^1 \times \Delta^1 \xrightarrow{\mathrm{N}_\bullet(\sigma)} \mathrm{N}_\bullet(\mathcal{C}) \hookrightarrow \mathrm{N}_\bullet^{\mathrm{hc}}(\mathcal{C})$$

is a pullback square in the ∞-category $\mathrm{N}_\bullet^{\mathrm{hc}}(\mathcal{C})$ (in the sense of Definition 7.6.3.1).

(2) *For every object $Y \in \mathcal{C}$, the diagram of Kan complexes*

$$\begin{tikzcd}
\mathrm{Hom}_{\mathcal{C}}(Y, X_{01})_\bullet \arrow[r] \arrow[d] & \mathrm{Hom}_{\mathcal{C}}(Y, X_0)_\bullet \arrow[d] \\
\mathrm{Hom}_{\mathcal{C}}(Y, X_1)_\bullet \arrow[r] & \mathrm{Hom}_{\mathcal{C}}(Y, X)_\bullet
\end{tikzcd}$$

is a homotopy pullback square (in the sense of Definition 3.4.1.1).

Proof. Combine Corollary 7.5.4.6 with Proposition 7.5.4.13. □

03G5 **Example 7.6.4.2.** A (strictly) commutative diagram of Kan complexes

$$\begin{tikzcd}
X_{01} \arrow[r] \arrow[d] & X_0 \arrow[d] \\
X_1 \arrow[r] & X
\end{tikzcd}$$

is a homotopy pullback square (in the sense of Definition 3.4.1.1) if and only if the induced diagram $\Delta^1 \times \Delta^1 \to \mathrm{N}_\bullet^{\mathrm{hc}}(\mathrm{Kan}) = \mathcal{S}$ is a pullback square in the ∞-category of spaces $\mathcal{S}$. This follows by combining Propositions 7.5.4.13 and 7.5.4.5.

03G6 **Example 7.6.4.3.** A (strictly) commutative diagram of Kan complexes

$$\begin{tikzcd}
A \arrow[r] \arrow[d] & A_0 \arrow[d] \\
A_1 \arrow[r] & A_{01}
\end{tikzcd}$$

is a homotopy pushout square (in the sense of Definition 3.4.2.1) if and only if the induced diagram $\Delta^1 \times \Delta^1 \to \mathrm{N}_\bullet^{\mathrm{hc}}(\mathrm{Kan}) = \mathcal{S}$ is a pushout square in the ∞-category of spaces $\mathcal{S}$. This follows by combining Corollaries 7.5.7.7 and 7.5.7.9.

Example 7.6.4.4. A (strictly) commutative diagram of ∞-categories 03G7

$$\begin{tikzcd}
\mathcal{C}_{01} \arrow[r] \arrow[d] & \mathcal{C}_0 \arrow[d] \\
\mathcal{C}_1 \arrow[r] & \mathcal{C}
\end{tikzcd}$$

is a categorical pullback square (in the sense of Definition 4.5.2.8) if and only if the induced diagram $\Delta^1 \times \Delta^1 \to \mathrm{N}_\bullet^{\mathrm{hc}}(\mathrm{QCat}) = \mathcal{QC}$ is a pullback square in the ∞-category $\mathcal{QC}$. This follows by combining Corollaries 7.5.5.8 and 7.5.5.10.

Example 7.6.4.5. A (strictly) commutative diagram of ∞-categories 03G8

$$\begin{tikzcd}
\mathcal{C} \arrow[r] \arrow[d] & \mathcal{C}_0 \arrow[d] \\
\mathcal{C}_1 \arrow[r] & \mathcal{C}_{01}
\end{tikzcd}$$

is a categorical pushout square (in the sense of Definition 4.5.4) if and only if the induced diagram $\Delta^1 \times \Delta^1 \to \mathrm{N}_\bullet^{\mathrm{hc}}(\mathrm{QCat}) = \mathcal{QC}$ is a pushout square in the ∞-category $\mathcal{QC}$. This follows by combining Corollaries 7.5.8.5 and 7.5.8.9.

Recall that the ∞-category of spaces $\mathcal{S}$ admits small limits and colimits (Corollary 7.4.5.6). In particular, if $f_0 : X_0 \to X$ and $f_1 : X_1 \to X$ are morphisms of Kan complexes, then there exists a pullback diagram σ :

$$\begin{tikzcd}
X_{01} \arrow[r] \arrow[d] & X_0 \arrow[d, "f_0"] \\
X_1 \arrow[r, "f_1"] & X
\end{tikzcd}$$

in the ∞-category $\mathcal{S}$. However, it is not always possible to obtain σ from a commutative diagram in the ordinary category Kan. It will therefore be useful to have a generalization of Proposition 7.6.4.1, which applies to *homotopy coherent* squares.

Remark 7.6.4.6 (Homotopy Coherent Squares)**.** Let $\mathcal{C}$ be a simplicial category and let $\mathrm{N}_\bullet^{\mathrm{hc}}(\mathcal{C})$ denote the homotopy coherent nerve of $\mathcal{C}$. Combining Examples 1.5.2.9, 2.4.3.9, and 2.4.3.10, we see that morphisms from $\Delta^1 \times \Delta^1$ to $\mathrm{N}_\bullet^{\mathrm{hc}}(\mathcal{C})$ can be identified with the following data: 03G9

(a) A collection of objects X_{01}, X_0, X_1, and X of the category $\mathcal{C}$.

(b) A collection of morphisms $f_0 : X_0 \to X$, $f_1 : X_1 \to X$, $g_0 : X_{01} \to X_0$, $g_1 : X_{01} \to X_1$.

(c) A morphism $h : X_{01} \to X$ in $\mathcal{C}$ together with a pair of edges $\alpha_0 : f_0 \circ g_0 \to h$ and $\alpha_1 : f_1 \circ g_1 \to h$ in the simplicial set $\operatorname{Hom}_{\mathcal{C}}(X_{01}, X)_\bullet$.

We can summarize this data in a diagram

$$\begin{tikzcd}
X_{01} \arrow[r, "g_0"] \arrow[d, "g_1"'] \arrow[dr, "h" description] & X_0 \arrow[d, "f_0"] \arrow[dl, phantom, "\overset{\alpha_0}{\Swarrow}"] \\
X_1 \arrow[r, "f_1"'] \arrow[ur, phantom, "\overset{\alpha_1}{\Nearrow}"] & X.
\end{tikzcd}$$

Here we can regard (a) and (b) as supplying a (potentially) non-commutative square diagram in the category $\mathcal{C}$, and (c) as supplying a witness to the fact that it commutes up to homotopy.

03GA **Example 7.6.4.7** (Square Diagrams in $\mathcal{QC}$)**.** Let $F_0 : \mathcal{C}_0 \to \mathcal{C}$ and $F_1 : \mathcal{C}_1 \to \mathcal{C}$ be functors of ∞-categories. Using Remark 7.6.4.6, we see that the data of a commutative diagram

$$\begin{tikzcd}
\mathcal{C}_{01} \arrow[r] \arrow[d] & \mathcal{C}_0 \arrow[d, "F_0"] \\
\mathcal{C}_1 \arrow[r, "F_1"] & \mathcal{C}
\end{tikzcd}$$

in the ∞-category $\mathcal{QC}$ is equivalent to the data of an ∞-category $\mathcal{C}_{01}$ equipped with functors

$$G_0 : \mathcal{C}_{01} \to \mathcal{C}_0 \qquad G_1 : \mathcal{C}_{01} \to \mathcal{C}_1 \qquad H : \mathcal{C}_{01} \to \mathcal{C}$$

together with natural isomorphisms $\alpha_0 : (F_0 \circ G_0) \xrightarrow{\sim} H$ and $\alpha_1 : (F_1 \circ G_1) \xrightarrow{\sim} H$. In this case, we can identify the data of the tuple $(G_0, \alpha_0, G_1, \alpha_1, H)$ with a single functor of ∞-categories

$$G : \mathcal{C}_{01} \to \mathcal{C}_0 \times^{\mathrm{h}}_{\mathcal{C}} (\mathcal{C}_1 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}).$$

Proposition 7.6.4.8. *Suppose we are given a commutative diagram* 03GB

03GC
$$\begin{tikzcd}
\mathcal{C}_{01} \arrow[r] \arrow[d] & \mathcal{C}_0 \arrow[d, "F_0"] \\
\mathcal{C}_1 \arrow[r, "F_1"] & \mathcal{C}
\end{tikzcd} \tag{7.60}$$

in the ∞-category $\mathcal{QC}$, corresponding to a functor

$$G : \mathcal{C}_{01} \to \mathcal{C}_0 \times^{\mathrm{h}}_{\mathcal{C}} (\mathcal{C}_1 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}).$$

Then (7.60) is a pullback square in $\mathcal{QC}$ if and only if the functor G is an equivalence of ∞-categories.

Proof. Let us identify the diagram (7.60) with a functor of simplicial categories $\mathscr{F} : \mathrm{Path}[[1] \times [1]]_{\bullet} \to \mathrm{QCat}$. Using Corollary 4.5.2.23, we can factor the functor F_0 as a composition $\mathcal{C}_0 \xrightarrow{T} \mathcal{C}'_0 \xrightarrow{F'_0} \mathcal{C}$, where T is an equivalence of ∞-categories and F'_0 is an isofibration. Let $\mathcal{C}'_{01}$ denote the iterated homotopy fiber product $\mathcal{C}'_0 \times^{\mathrm{h}}_{\mathcal{C}} (\mathcal{C}_1 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C})$. Then Example 7.6.4.7 supplies a commutative diagram

03GD
$$\begin{tikzcd}
\mathcal{C}'_{01} \arrow[r] \arrow[d] & \mathcal{C}'_0 \arrow[d, "F'_0"] \\
\mathcal{C}_1 \arrow[r, "F_1"] & \mathcal{C}
\end{tikzcd} \tag{7.61}$$

in the ∞-category $\mathcal{QC}$, which we view as a functor of simplicial categories $\mathscr{F}' : \mathrm{Path}[[1] \times [1]]_{\bullet} \to \mathrm{QCat}$. The morphisms G and T determine a natural transformation of simplicial functors $\mathscr{F} \to \mathscr{F}'$, which induces a natural transformation from the diagram (7.60) to the diagram (7.61) in the ∞-category $\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{QC})$. By virtue of Corollary 4.5.2.20, this natural transformation is an isomorphism of diagrams if and only if the functor G is an equivalence of ∞-categories. Consequently, Proposition 7.6.4.8 is equivalent to the assertion that (7.61) is a pullback square in the ∞-category $\mathcal{QC}$ (see Proposition 7.1.2.13).

Note that we have a (strictly) commutative diagram of simplicial sets

03GE
$$\begin{tikzcd}
\mathcal{C}'_0 \times_{\mathcal{C}} \mathcal{C}_1 \arrow[r] \arrow[d] & \mathcal{C}'_0 \arrow[d, "F'_0"] \\
\mathcal{C}_1 \arrow[r, "F'_1"] & \mathcal{C},
\end{tikzcd} \tag{7.62}$$

which determines a subfunctor $\mathscr{F}'' \subseteq \mathscr{F}'$. Since F_0' is an isofibration, it follows from Corollaries 4.5.2.28, 4.5.2.22, and 4.5.2.29 that the inclusion maps

$$\begin{aligned} \mathcal{C}_0' \times_{\mathcal{C}} \mathcal{C}_1 &\hookrightarrow \mathcal{C}_0' \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}_1 \\ &\hookrightarrow \mathcal{C}_0' \times^{\mathrm{h}}_{\mathcal{C}} (\mathcal{C}_1 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}) \end{aligned}$$

are equivalences of ∞-categories. Consequently, the inclusion $\mathscr{F}'' \hookrightarrow \mathscr{F}'$ is a levelwise categorical equivalence of simplicial functors and therefore induces an isomorphism from the diagram (7.62) to the diagram (7.61) in the ∞-category $\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})$. By virtue of Proposition 7.1.2.13, it will suffice to show that the diagram (7.62) is a pullback square in the ∞-category $\mathcal{QC}$. This is a special case of Example 7.6.4.4, since (7.62) is a categorical pullback square (see Corollary 4.5.2.27). □

`03GF` **Corollary 7.6.4.9.** *Let $F_0 : \mathcal{C}_0 \to \mathcal{C}$ and $F_1 : \mathcal{C}_1 \to \mathcal{C}$ be functors of ∞-categories, let let $\mathcal{C}_0 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}_1$ denote the homotopy fiber product of Construction 4.5.2.1, and let*

$$G_0 : \mathcal{C}_0 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}_1 \to \mathcal{C}_0 \qquad G_1 : \mathcal{C}_0 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}_1 \to \mathcal{C}_1$$

denote the projection maps, so that we have a canonical isomorphism $\alpha : F_0 \circ G_0 \to F_1 \circ G_1$ in the ∞-category $\mathrm{Fun}(\mathcal{C}_0 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}_1, \mathcal{C})$. Then the diagram

$$\begin{tikzcd}
\mathcal{C}_0 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}_1 \arrow[r, "G_0"] \arrow[d, "G_1"'] \arrow[dr, "F_1 \circ G_1", ""{name=D}] & \mathcal{C}_0 \arrow[d, "F_0"] \\
\mathcal{C}_1 \arrow[r, "F_1"'] & \mathcal{C}
\arrow[from=1-2, to=D, Rightarrow, "\alpha"', shorten=8mm]
\arrow[from=2-1, to=D, Rightarrow, "\mathrm{id}", shorten=8mm]
\end{tikzcd}$$

corresponds to a pullback square in the ∞-category $\mathcal{QC}$. In particular, $\mathcal{C}_0 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}_1$ is a fiber product of $\mathcal{C}_0$ with $\mathcal{C}_1$ over $\mathcal{C}$ in the ∞-category $\mathcal{QC}$.

Proof. By virtue of Proposition 7.6.4.8, it will suffice to show that the inclusion

$$\delta : \mathcal{C}_1 \simeq \mathcal{C}_1 \times_{\mathcal{C}} \mathcal{C} \hookrightarrow \mathcal{C}_1 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}$$

induces an equivalence of homotopy fiber products

$$\mathcal{C}_0 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}_1 \hookrightarrow \mathcal{C}_0 \times^{\mathrm{h}}_{\mathcal{C}} (\mathcal{C}_1 \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C}).$$

This is a special case of Corollary 4.5.2.20, since δ is an equivalence of ∞-categories (Corollary 4.5.2.22). □

Corollary 7.6.4.10. *Suppose we are given a commutative diagram* 03GG

03GH
$$\begin{tikzcd}
X_{01} \arrow[r] \arrow[d] & X_0 \arrow[d] \\
X_1 \arrow[r] & X
\end{tikzcd} \tag{7.63}$$

in the ∞-category $\mathcal{S}$, classified by a map of Kan complexes

$$g : X_{01} \to X_0 \times^{\mathrm{h}}_{X} (X_1 \times^{\mathrm{h}}_{X} X).$$

Then (7.63) is a pullback square in $\mathcal{S}$ if and only if g is a homotopy equivalence.

Proof. Combine Propositions 7.6.4.8 and 7.4.5.1. □

Corollary 7.6.4.11. *Let n be an integer and suppose we are given a pullback diagram* 05E5

$$\begin{tikzcd}
X' \arrow[r] \arrow[d, "f'"] & X \arrow[d, "f"] \\
Y' \arrow[r] & Y
\end{tikzcd}$$

in the ∞-category $\mathcal{S}$. If f is n-truncated, then f' is n-truncated. If f is n-connective, then f' is n-connective.

Proof. Combine Corollaries 7.6.4.10, 3.5.9.12, and 3.5.1.25. □

Example 7.6.4.12. Let $f_0 : X_0 \to X$ and $f_1 : X_1 \to X$ be morphisms of Kan complexes. 03GJ Applying the construction of Corollary 7.6.4.9, we obtain a pullback square

$$\begin{tikzcd}
X_0 \times^{\mathrm{h}}_{X} X_1 \arrow[r] \arrow[d] & X_0 \arrow[d, "f_0"] \\
X_1 \arrow[r, "f_1"] & X
\end{tikzcd}$$

in the ∞-category $\mathcal{S}$.

Exercise 7.6.4.13. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, so that Corollary 7.6.4.9 04K8 supplied an identification of $\mathcal{C} \times^{\mathrm{h}}_{\mathcal{D}} \mathcal{C}$ with the fiber product of $\mathcal{C}$ with itself over $\mathcal{D}$ in the

∞-category $\mathcal{QC}$. Show that, under this identification, the relative diagonal of F (in the sense of Notation 7.6.3.18) is represented by the inclusion map $\mathcal{C} \hookrightarrow \mathcal{C} \times^{\mathrm{h}}_{\mathcal{D}} \mathcal{C}$. Moreover, if F is an isofibration, then we can replace the homotopy fiber product $\mathcal{C} \times^{\mathrm{h}}_{\mathcal{D}} \mathcal{C}$ with the fiber product $\mathcal{C} \times_{\mathcal{D}} \mathcal{C}$ (formed in the ordinary category of simplicial sets); see Corollary 4.5.2.27.

03GK **Corollary 7.6.4.14.** *Let $\mathcal{C}$ be a locally Kan simplicial category, and suppose we are given a commutative diagram $\sigma : \Delta^1 \times \Delta^1 \to \mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathcal{C})$, corresponding to a diagram*

$$\begin{tikzcd}
X_{01} \arrow[r, "g_0"] \arrow[d, "g_1"'] \arrow[dr, "h" description] & X_0 \arrow[d, "f_0"] \\
X_1 \arrow[r, "f_1"'] & X
\arrow[from=1-2, to=2-1, Rightarrow, shorten <=12mm, shorten >=28mm, "\alpha_0"']
\arrow[from=2-1, to=1-2, Rightarrow, shorten <=12mm, shorten >=28mm, "\alpha_1"]
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$ (see Remark 7.6.4.6). Then σ is a pullback square in the ∞-category $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathcal{C})$ if and only if, for every object $Y \in \mathcal{C}$, the induced map

$$\mathrm{Hom}_{\mathcal{C}}(Y, X_{01})_{\bullet} \to \mathrm{Hom}_{\mathcal{C}}(Y, X_0)_{\bullet} \times^{\mathrm{h}}_{\mathrm{Hom}_{\mathcal{C}}(Y,X)_{\bullet}} (\mathrm{Hom}_{\mathcal{C}}(Y, X_1)_{\bullet} \times^{\mathrm{h}}_{\mathrm{Hom}_{\mathcal{C}}(Y,X)_{\bullet}} \mathrm{Hom}_{\mathcal{C}}(Y, X)_{\bullet})$$

is a homotopy equivalence of Kan complexes.

Proof. Combine Corollary 7.6.4.10 with Proposition 7.4.5.17. □

7.6.5 Equalizers and Coequalizers

03GL We now study (co)limits of a particularly simple shape.

03GM **Notation 7.6.5.1.** Let $(\bullet \rightrightarrows \bullet)$ denote the simplicial set given by the pushout $\Delta^1 \coprod_{\partial \Delta^1} \Delta^1$. For any ∞-category $\mathcal{C}$, we will identify morphisms from $(\bullet \rightrightarrows \bullet)$ to $\mathcal{C}$ with pairs (f_0, f_1), where $f_0 : Y \to X$ and $f_1 : Y \to X$ are morphisms of $\mathcal{C}$ having the same source and target.

03GN **Remark 7.6.5.2.** The simplicial set $(\bullet \rightrightarrows \bullet)$ of Notation 7.6.5.1 is isomorphic to the nerve of its homotopy category $\mathcal{J}$, which can be described concretely as follows:

- The category $\mathcal{J}$ has exactly two objects Y and X.
- There are exactly two non-identity morphisms in $\mathcal{J}$, both of which have source Y and target X.

Remark 7.6.5.3. There is a tautological epimorphism of simplicial sets 03GP

$$\begin{aligned} (\bullet \rightrightarrows \bullet) &= \Delta^1 \coprod_{\partial \Delta^1} \Delta^1 \\ &\twoheadrightarrow \Delta^1 \coprod_{\partial \Delta^1} \Delta^0 \\ &= \Delta^1 / \partial \Delta^1 . \end{aligned}$$

It follows from Example 6.3.4.4 that this epimorphism exhibits $\Delta^1 / \partial \Delta^1$ as a localization of $(\bullet \rightrightarrows \bullet)$. In particular, it is both left and right cofinal (Proposition 7.2.1.10).

Definition 7.6.5.4 (Equalizers and Coequalizers)**.** Let $\mathcal{C}$ be an ∞-category and let $f_0, f_1 : Y \to X$ be morphisms of $\mathcal{C}$ having the same source and target, which we identify with functor $\sigma : (\bullet \rightrightarrows \bullet) \to \mathcal{C}$. An *equalizer of* f_0 *and* f_1 is a limit of the diagram σ. A *coequalizer of* f_0 *and* f_1 is a colimit of the diagram σ. We say that the ∞-category $\mathcal{C}$ *admits equalizers* if every pair of morphisms $f_0, f_1 : Y \to X$ have an equalizer in $\mathcal{C}$, and that $\mathcal{C}$ *admits coequalizers* if every pair of morphisms $f_0, f_1 : Y \to X$ have a coequalizer in $\mathcal{C}$. 03GQ

Notation 7.6.5.5. Let $\mathcal{C}$ be an ∞-category and let $f_0, f_1 : Y \to X$ be morphisms of $\mathcal{C}$ having the same source and target. If there exists an object $Z \in \mathcal{C}$ which is an equalizer of f_0 and f_1, then Z is uniquely determined up to isomorphism (Proposition 7.1.1.12). To emphasize this uniqueness, we denote the object Z (if it exists) by $\mathrm{Eq}(f_0, f_1)$. Similarly, if there exists an object $W \in \mathcal{C}$ which is a coequalizer of f_0 and f_1, then W is uniquely determined up to isomorphism; to emphasize this, we denote W by $\mathrm{Coeq}(f_0, f_1)$. 03GR

Remark 7.6.5.6 (Duality)**.** The simplicial set $(\bullet \rightrightarrows \bullet)$ is canonically isomorphic to its opposite $(\bullet \rightrightarrows \bullet)^{\mathrm{op}}$. Consequently, if $f_0, f_1 : Y \to X$ are morphisms in an ∞-category $\mathcal{C}$ which admit an equalizer $Z = \mathrm{Eq}(f_0, f_1)$, then Z can be regarded as a coequalizer of f_0 and f_1 in the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$. 03GS

Remark 7.6.5.7 (Symmetry)**.** The simplicial set $(\bullet \rightrightarrows \bullet)$ has a unique nontrivial automorphism, which exchanges its nondegenerate edges. It follows that, if $f_0, f_1 : Y \to X$ are a pair of morphisms in an ∞-category $\mathcal{C}$, then we can identify (co)equalizers of the pair (f_0, f_1) with (co)equalizers of the pair (f_1, f_0). 03GT

Example 7.6.5.8 (Fixed Points of Endomorphisms)**.** Let $\mathcal{C}$ be an ∞-category and let X be an object of $\mathcal{C}$. An *endomorphism of* X is a morphism $f : X \to X$ from the object X to itself. Note that the pair (X, f) can be identified with a morphism of simplicial sets $\sigma : (\Delta^1 / \partial \Delta^1) \to \mathcal{C}$. It follows from Remark 7.6.5.3 (together with Corollary 7.2.2.11) that an object of $\mathcal{C}$ is a limit of the diagram σ if and only if it is an equalizer of the pair of morphisms $f, \mathrm{id}_X : X \to X$. Similarly, an object of $\mathcal{C}$ is a colimit of σ if and only if it is a coequalizer of the pair (f, id_X). 03GU

03GV **Variant 7.6.5.9.** Let $\mathbf{Z}_{\geq 0}$ denote the collection of nonnegative integers, which we regard as a commutative monoid under addition, and let $B_\bullet \mathbf{Z}_{\geq 0}$ denote the classifying simplicial set of Construction 1.3.2.5. The simplicial set $B_\bullet \mathbf{Z}_{\geq 0}$ is an ∞-category which contains a (unique) object X, and the generator $1 \in \mathbf{Z}_{\geq 0}$ determines an endomorphism $e : X \to X$. We can regard $B_\bullet \mathbf{Z}_{\geq 0}$ as *freely generated* by the endomorphism e: more precisely, the pair (X, e) determines a morphism of simplicial sets $\sigma : \Delta^1 / \partial \Delta^1 \hookrightarrow B_\bullet \mathbf{Z}_{\geq 0}$ which is inner anodyne (see Example 1.5.7.11), and therefore induces a trivial Kan fibration $\mathrm{Fun}(B_\bullet \mathbf{Z}_{\geq 0}, \mathcal{C}) \to \mathrm{Fun}(\Delta^1 / \partial \Delta^1, \mathcal{C})$ for every ∞-category $\mathcal{C}$. In particular, the morphism σ is both left and right cofinal (Proposition 7.2.1.3).

If $F : B_\bullet \mathbf{Z}_{\geq 0} \to \mathcal{C}$ is a functor of ∞-categories, then Corollary 7.2.2.11 guarantees that an object of $\mathcal{C}$ is a limit of the functor F if and only if it is a limit of the diagram $F \circ \sigma$: that is, if and only if it is an equalizer of the pair of morphisms $F(e), \mathrm{id}_{F(X)} : F(X) \to F(X)$ (see Example 7.6.5.8). Similarly, an object of $\mathcal{C}$ is a colimit of the functor F if and only if it is a coequalizer of the pair $(F(e), \mathrm{id}_{F(X)})$.

03GW **Definition 7.6.5.10** (Equalizer and Coequalizer Diagrams)**.** Let $\mathcal{C}$ be an ∞-category. An *equalizer diagram in* $\mathcal{C}$ is a limit diagram $(\bullet \rightrightarrows \bullet)^{\triangleleft} \to \mathcal{C}$. A *coequalizer diagram* is a colimit diagram $(\bullet \rightrightarrows \bullet)^{\triangleright} \to \mathcal{C}$.

03GX **Warning 7.6.5.11.** Let $\mathcal{C}$ be an ∞-category and suppose we are given an equalizer diagram

03GY
$$\begin{tikzcd} Z \arrow[r, "g"] & Y \arrow[r, shift left, "f_0"] \arrow[r, shift right, "f_1"'] & X \end{tikzcd} \tag{7.64}$$

in $\mathcal{C}$. Then the image of (7.64) in the homotopy category $\mathrm{h}\mathcal{C}$ need not be an equalizer diagram. In other words, the forgetful functor $\mathcal{C} \to \mathrm{N}_\bullet(\mathrm{h}\mathcal{C})$ does not preserve equalizer diagrams in general.

03GZ **Example 7.6.5.12.** Let X be a Kan complex containing vertices x and y. Then there exists an equalizer diagram

03H0
$$\begin{tikzcd} \{x\} \times^{\mathrm{h}}_X \{y\} \arrow[r, "f"] & \Delta^0 \arrow[r, shift left, "x"] \arrow[r, shift right, "y"'] & X \end{tikzcd} \tag{7.65}$$

in the ∞-category $\mathcal{S}$ (for a more general statement, see Corollary 7.6.5.21). However, unless the homotopy fiber product $\{x\} \times^{\mathrm{h}}_X \{y\}$ is either empty or contractible, the image of (7.65) in the homotopy category hKan is not an equalizer diagram (since the homotopy class $[f]$ is a monomorphism in hKan).

03H1 **Exercise 7.6.5.13.** Let $\mathcal{C}$ be an ∞-category and suppose we are given an equalizer diagram

03H2
$$\begin{tikzcd} Z \arrow[r, "g"] & Y \arrow[r, shift left, "f_0"] \arrow[r, shift right, "f_1"'] & X \end{tikzcd} \tag{7.66}$$

in $\mathcal{C}$. Show that, for every object $C \in \mathcal{C}$, the map of sets

$$\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(C, Z) \xrightarrow{[g]\circ} \mathrm{Eq}(\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(C, Y) \rightrightarrows \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(C, X))$$

is surjective (though it is generally not injective).

We now give some examples of (co)equalizer diagrams.

Proposition 7.6.5.14. *Let $F_0, F_1 : \mathcal{D} \to \mathcal{C}$ be functors of ∞-categories, and let $G : \mathcal{E} \to \mathcal{D}$ be a functor of ∞-categories satisfying $F_0 \circ G = F_1 \circ G$. The following conditions are equivalent:* 03H3

(1) *The resulting diagram of ∞-categories $(\bullet \rightrightarrows \bullet)^{\triangleleft} \to \mathcal{QC}$ is an equalizer diagram.*

(2) *The commutative diagram*

03H4

$$\begin{tikzcd}
\mathcal{E} \arrow[r, "G"] \arrow[d] & \mathcal{D} \arrow[d, "(F_0, F_1)"] \\
\mathcal{C} \arrow[r, "(\mathrm{id}, \mathrm{id})"] & \mathcal{C} \times \mathcal{C}
\end{tikzcd} \qquad (7.67)$$

is a categorical pullback square (Definition 4.5.2.8).

Proof. Let us identify the pair (F_0, F_1) with a functor of ordinary categories $\mathscr{F} : \mathcal{J} \to \mathrm{QCat}$, where $\mathcal{J}$ is the category described in Remark 7.6.5.2. The functor G then induces a map $\mathcal{E} \to \underleftarrow{\mathrm{holim}}(\mathscr{F})$, which can be identified with the map

$$\mathcal{E} \to \mathcal{C} \times^{\mathrm{h}}_{(\mathcal{C} \times \mathcal{C})} \mathcal{D}$$

determined by the diagram (7.67). Proposition 7.6.5.14 now follows from the criterion of Corollary 7.5.5.8. □

Corollary 7.6.5.15. *Let $f_0, f_1 : Y \to X$ be morphisms of Kan complexes and let $g : Z \to Y$ be a morphism of Kan complexes satisfying $f_0 \circ g = f_1 \circ g$. The following conditions are equivalent:* 03H5

(1) *The resulting diagram of ∞-categories $(\bullet \rightrightarrows \bullet)^{\triangleleft} \to \mathcal{S}$ is an equalizer diagram.*

(2) *The commutative diagram of Kan complexes*

$$\begin{tikzcd}
Z \arrow[r, "g"] \arrow[d] & Y \arrow[d, "(f_0, f_1)"] \\
X \arrow[r, "(\mathrm{id}, \mathrm{id})"] & X \times X
\end{tikzcd}$$

is a homotopy pullback square.

Proof. Combine Propositions 7.6.5.14 and 7.4.5.1. □

03H6 **Corollary 7.6.5.16.** *Let $\mathcal{C}$ be a locally Kan simplicial category and suppose we are given morphisms*

$$\begin{tikzcd} Z \arrow[r, "g"] & Y \arrow[r, shift left, "f_0"] \arrow[r, shift right, "f_1"'] & X \end{tikzcd}$$

in $\mathcal{C}$ satisfying $f_0 \circ g = f_1 \circ g$. The following conditions are equivalent:

(1) *The induced diagram $(\bullet \rightrightarrows \bullet)^{\triangleleft} \to \mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathcal{C})$ is an equalizer diagram in the ∞-category $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathcal{C})$, in the sense of Definition 7.6.5.10.*

(2) *For every object $C \in \mathcal{C}$, the diagram of Kan complexes*

$$\begin{tikzcd} \mathrm{Hom}_{\mathcal{C}}(C, Z)_{\bullet} \arrow[r] \arrow[d, "g"] & \mathrm{Hom}_{\mathcal{C}}(C, Y)_{\bullet} \arrow[d] \\ \mathrm{Hom}_{\mathcal{C}}(C, X)_{\bullet} \arrow[r, "(f_0, f_1)"] & \mathrm{Hom}_{\mathcal{C}}(C, X)_{\bullet} \times \mathrm{Hom}_{\mathcal{C}}(C, X)_{\bullet} \end{tikzcd}$$

is a homotopy pullback square.

Proof. Combine Corollary 7.6.5.15 with Proposition 7.4.5.17. □

Let $f_0, f_1 : Y \to X$ be morphisms of Kan complexes. By virtue of Corollary 7.4.5.6, the morphisms f_0 and f_1 have an equalizer in the ∞-category $\mathcal{S}$. Beware that this equalizer generally cannot be obtained from Corollary 7.6.5.15. For example, if f_0 and f_1 have disjoint images, then the existence of a morphism $g : Z \to Y$ satisfying $f_0 \circ g = f_1 \circ g$ guarantees that the simplicial set Z is empty. In such cases, to extend the pair (f_0, f_1) to an equalizer diagram in $\mathcal{S}$, we are forced to consider homotopy coherent diagrams which do not strictly commute.

03H7 **Remark 7.6.5.17.** Let $F_0, F_1 : \mathcal{D} \to \mathcal{C}$ be functors of ∞-categories, which we identify with a diagram $\sigma : (\bullet \rightrightarrows \bullet) \to \mathcal{QC}$. Unwinding the definitions, we see that extensions of σ to a diagram $\overline{\sigma} : (\bullet \rightrightarrows \bullet)^{\triangleleft} \to \mathcal{QC}$ can be identified with the following data:

- An ∞-category $\mathcal{E}$ equipped with functors $G : \mathcal{E} \to \mathcal{D}$ and $H : \mathcal{E} \to \mathcal{C}$.
- Isomorphisms $\alpha_0 : F_0 \circ G \xrightarrow{\sim} H$ and $\alpha_1 : F_1 \circ G \xrightarrow{\sim} H$ in the ∞-category $\mathrm{Fun}(\mathcal{E}, \mathcal{C})$.

In this case, we can identify the quadruple $(G, H, \alpha_0, \alpha_1)$ with a single functor of ∞-categories

$$U : \mathcal{E} \to \mathcal{D} \times^{\mathrm{h}}_{(\mathcal{C} \times \mathcal{C})} \mathcal{C}.$$

Proposition 7.6.5.18. *Let $F_0, F_1 : \mathcal{D} \to \mathcal{C}$ be functors of ∞-categories, which we identify with a diagram $\sigma : (\bullet \rightrightarrows \bullet) \to \mathcal{QC}$. Suppose we are given an extension $\overline{\sigma} : (\bullet \rightrightarrows \bullet)^{\triangleleft} \to \mathcal{QC}$ of σ, corresponding to a functor of ∞-categories* 03H8

$$T : \mathcal{E} \to \mathcal{D} \times^{\mathrm{h}}_{(\mathcal{C} \times \mathcal{C})} \mathcal{C}.$$

Then $\overline{\sigma}$ is an equalizer diagram in the ∞-category $\mathcal{QC}$ if and only if T is an equivalence of ∞-categories.

Proof. We proceed as in the proof of Proposition 7.6.4.8, with minor modifications. Let $\mathcal{A}$ denote the simplicial path category of $(\bullet \rightrightarrows \bullet)^{\triangleleft}$, so that we can identify $\overline{\sigma}$ with a simplicial functor $\mathscr{F} : \mathcal{A} \to \mathrm{QCat}$. Using Corollary 4.5.2.23, we can factor the functor $(F_0, F_1) : \mathcal{D} \to \mathcal{C} \times \mathcal{C}$ as a composition

$$\mathcal{D} \xrightarrow{U} \mathcal{D}' \xrightarrow{(F_0', F_1')} \mathcal{C} \times \mathcal{C},$$

where U is an equivalence of ∞-categories and (F_0', F_1') is an isofibration. The pair (F_0', F_1') can be identified with a morphism of simplicial sets $\sigma' : (\bullet \rightrightarrows \bullet) \to \mathcal{QC}$. Applying Remark 7.6.5.17, we can extend σ' to a diagram $\overline{\sigma}' : (\bullet \rightrightarrows \bullet)^{\triangleleft} \to \mathcal{QC}$, carrying the cone point to the ∞-category $\mathcal{E}' = \mathcal{D}' \times^{\mathrm{h}}_{(\mathcal{C} \times \mathcal{C})} \mathcal{C}$. The diagram $\overline{\sigma}'$ corresponds to a simplicial functor $\mathscr{F}' : \mathcal{A} \to \mathrm{QCat}$. The morphisms T and U determine a natural transformation of simplicial functors $\mathscr{F} \to \mathscr{F}'$, hence also a morphism $\overline{\sigma} \to \overline{\sigma}'$ in the ∞-category $\mathrm{Fun}((\bullet \rightrightarrows \bullet)^{\triangleleft}, \mathcal{QC})$. By virtue of Corollary 4.5.2.20, this natural transformation is an isomorphism of diagrams if and only if the functor T is an equivalence of ∞-categories. Consequently, Proposition 7.6.5.18 is equivalent to the assertion that $\overline{\sigma}'$ is an equalizer diagram in $\mathcal{QC}$ (Proposition 7.1.2.13).

Invoking Remark 7.6.5.17 again, we obtain another diagram $\overline{\sigma}''$ extending σ', which carries the cone point of $(\bullet \rightrightarrows \bullet)^{\triangleleft}$ to the equalizer $\mathrm{Eq}(F_0', F_1') = \mathcal{D}' \times_{(\mathcal{C} \times \mathcal{C})} \mathcal{C}$ (formed in the category of simplicial sets). The diagram $\overline{\sigma}''$ corresponds to another simplicial functor $\mathscr{F}'' : \mathcal{A} \to \mathrm{QCat}$. Note that there is a natural inclusion map $\mathscr{F}'' \hookrightarrow \mathscr{F}'$, which carries the cone point to the inclusion

$$\iota : \mathcal{D}' \times_{(\mathcal{C} \times \mathcal{C})} \mathcal{C} \subseteq \mathcal{D}' \times^{\mathrm{h}}_{(\mathcal{C} \times \mathcal{C})} \mathcal{C}.$$

Since (F_0', F_1') is an isofibration, the functor ι is an equivalence of ∞-categories (Corollary 4.5.2.28). It follows that the inclusion $\mathscr{F}'' \hookrightarrow \mathscr{F}'$ induces an isomorphism $\overline{\sigma}'' \to \overline{\sigma}'$ in the ∞-category $\mathrm{Fun}((\bullet \rightrightarrows \bullet)^{\triangleleft}, \mathcal{QC})$. By virtue of Proposition 7.1.2.13, we are reduced to showing that $\overline{\sigma}''$ is an equalizer diagram in $\mathcal{QC}$. This follows from the criterion of Proposition 7.6.5.14 (since ι is an equivalence of ∞-categories). □

It follows from Proposition 7.6.5.18 that, if $F_0, F_1 : \mathcal{D} \to \mathcal{C}$ are functors of ∞-categories, then the homotopy fiber product $\mathcal{D} \times^{\mathrm{h}}_{(\mathcal{C} \times \mathcal{C})} \mathcal{C}$ is an equalizer of F_0 and F_1 in the ∞-category

$\mathcal{QC}$ (this can also be viewed as a special case of Proposition 7.5.2.6). However, it is possible to be more efficient.

03H9 **Construction 7.6.5.19** (The Homotopy Equalizer)**.** Let $F_0, F_1 : \mathcal{D} \to \mathcal{C}$ be functors of ∞-categories, and form a pullback diagram of simplicial sets

$$\begin{tikzcd}
\mathrm{hEq}(F_0, F_1) \arrow[r] \arrow[d, "G"] & \mathrm{Isom}(\mathcal{C}) \arrow[d] \\
\mathcal{D} \arrow[r, "(F_0, F_1)"] & \mathcal{C} \times \mathcal{C} .
\end{tikzcd}$$

Note that the right vertical map is an isofibration (Corollary 4.4.5.5), so the left vertical map is also an isofibration; in particular, $\mathrm{hEq}(F_0, F_1)$ is an ∞-category. We will refer to $\mathrm{hEq}(F_0, F_1)$ as the *homotopy equalizer* of the functors F_0 and F_1. By construction, objects of $\mathrm{hEq}(F_0, F_1)$ can be identified with pairs (X, u), where X is an object of $\mathcal{D}$ and $u : F_0(X) \to F_1(X)$ is an isomorphism in the ∞-category $\mathcal{C}$.

Set $H = G \circ F_1$, so that the construction $(X, u) \mapsto u$ determines an isomorphism $\alpha_0 : G \circ F_0 \xrightarrow{\sim} H$ in the ∞-category $\mathrm{Fun}(\mathrm{Eq}(F_0, F_1), \mathcal{C})$. Taking α_1 to be the identity morphism $\mathrm{id} : G \circ F_1 \xrightarrow{\sim} H$, we see that the quadruple $(G, H, \alpha_0, \alpha_1)$ determines a diagram $\overline{\sigma} : (\bullet \rightrightarrows \bullet)^{\triangleleft} \to \mathcal{QC}$, carrying the cone point to the homotopy equalizer $\mathrm{hEq}(F_0, F_1)$ (see Remark 7.6.5.17).

03HA **Corollary 7.6.5.20.** *Let $F_0, F_1 : \mathcal{D} \to \mathcal{C}$ and $F_1 : \mathcal{D} \to \mathcal{C}$ be functors of ∞-categories. Then the morphism $\overline{\sigma} : (\bullet \rightrightarrows \bullet)^{\triangleleft} \to \mathcal{QC}$ of Construction 7.6.5.19 is an equalizer diagram. In particular, the homotopy equalizer* $\mathrm{hEq}(F_0, F_1)$ *is an equalizer of F_0 and F_1 in the ∞-category $\mathcal{QC}$.*

Proof. The diagram $\overline{\sigma}$ can be identified with a functor $U : \mathrm{hEq}(F_0, F_1) \to \mathcal{D} \times^{\mathrm{h}}_{(\mathcal{C} \times \mathcal{C})} \mathcal{C}$. By virtue of Proposition 7.6.5.18, it will suffice to show that U is an equivalence of ∞-categories. Unwinding the definitions, we see that U fits into a commutative diagram

$$\begin{tikzcd}
\mathrm{hEq}(F_0, F_1) \arrow[r, "U"] \arrow[d] & \mathcal{D} \times^{\mathrm{h}}_{(\mathcal{C} \times \mathcal{C})} \mathcal{C} \arrow[r] \arrow[d] & \mathcal{D} \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C} \arrow[d] \\
\mathcal{D} \arrow[r] & \mathcal{D} \times^{\mathrm{h}}_{\mathcal{C}} \mathcal{C} \arrow[r] & \mathcal{D} \times \mathcal{C},
\end{tikzcd}$$

where the homotopy fiber product on the upper right is formed using the functor F_0, and the homotopy fiber product on the lower middle is formed using the functor F_1. Each of the squares in this diagram is a pullback, and the right vertical map is an isofibration (Remark 4.5.2.2). It follows that the left side of the diagram is a categorical pullback square (Corollary 4.5.2.27). Since the functor on the lower left is an equivalence of ∞-categories (Corollary 4.5.2.22), it follows that U is an equivalence of ∞-categories. □

Corollary 7.6.5.21. *Let $f_0, f_1 : Y \to X$ be morphisms of Kan complexes. Then the homotopy equalizer* $\mathrm{hEq}(f_0, f_1)$ *is a Kan complex, which is an equalizer of f_0 and f_1 in the ∞-category $\mathcal{S}$.* 03HB

Proof. Combine Corollary 7.6.5.20 with Proposition 7.4.5.1. □

Corollaries 7.6.5.20 and 7.6.5.21 illustrate a general phenomenon: if $\mathcal{C}$ is an ∞-category which admits pairwise products, then equalizers in $\mathcal{C}$ can be viewed as a special kind of fiber product.

Proposition 7.6.5.22 (Rewriting Equalizers as Pullbacks)**.** *Let $\mathcal{C}$ be an ∞-category, let $f_0, f_1 : Y \to X$ be morphisms of $\mathcal{C}$. Let $X \times X$ be a product of X with itself in the ∞-category $\mathcal{C}$, so that f_0 and f_1 determine a morphism $(f_0, f_1) : Y \to X \times X$, and let $\delta_X : X \to X \times X$ be the diagonal map (Notation 7.6.2.9). Then an object of $\mathcal{C}$ is an equalizer of f_0 and f_1 if and only if it is a fiber product of Y with X over $X \times X$.* 03HC

Proof. Let $\mathcal{K}$ denote the simplicial set given by the product $(\bullet \rightrightarrows \bullet)^{\triangleleft} \times \Delta^1$. Then $\mathcal{K}$ is an ∞-category, which we depict informally by the diagram

$$\begin{tikzcd}
z \arrow[r] \arrow[d] & y \arrow[r, shift left] \arrow[r, shift right] \arrow[d] & x \arrow[d] \\
z' \arrow[r] & y' \arrow[r, shift left] \arrow[r, shift right] & x'.
\end{tikzcd}$$

We now proceed in several steps.

- Let $\mathcal{K}_0$ denote the full subcategory of $\mathcal{K}$ spanned by the objects x and y. Then $\mathcal{K}_0$ is isomorphic to the simplicial set $(\bullet \rightrightarrows \bullet)$. In particular, the pair of morphisms $f_0, f_1 : Y \to X$ can be identified with a functor $\sigma_0 : \mathcal{K}_0 \to \mathcal{C}$, satisfying $\sigma_0(x) = X$ and $\sigma_0(y) = Y$. By definition, an object of $\mathcal{C}$ is an equalizer of the pair (f_0, f_1) if and only if it is a limit of the diagram σ_0.

- Let $\mathcal{K}_1$ denote the full subcategory of $\mathcal{K}$ spanned by the objects x, x', and y. Note that the identity map $\mathrm{id}_{\mathcal{K}_0}$ extends uniquely to a retraction $r : \mathcal{K}_1 \to \mathcal{K}_0$, carrying the object $x' \in \mathcal{K}_1$ to $x \in \mathcal{K}_0$. Let $\sigma_1 : \mathcal{K}_1 \to \mathcal{C}$ be the composition $\sigma_0 \circ r$. Note that that the inclusion map $\mathcal{K}_0 \hookrightarrow \mathcal{K}_1$ admits a right adjoint (given by the retraction r), and is therefore left cofinal (Corollary 7.2.3.7). It follows that an object of $\mathcal{C}$ is a limit of the diagram σ_0 if and only if it is a limit of the diagram σ_1 (Corollary 7.2.2.11).

- Choose a pair of morphisms $\pi_0, \pi_1 : X \times X \to X$ in the ∞-category $\mathcal{C}$ which exhibit $X \times X$ as a product of X with itself. The morphism $(f_0, f_1) : Y \to X$ is characterized (up to homotopy) by the requirement that there exist 2-simplices σ_0 and σ_1 of $\mathcal{C}$, where σ_i exhibits f_i as a composition of π_i with (f_0, f_1). Let $\mathcal{K}_2$ denote the full subcategory of $\mathcal{K}$ spanned by the objects x, x', y, and y'. Then the pair (σ_0, σ_1) determines an extension of σ_1 to a functor $\sigma_2 : \mathcal{K}_2 \to \mathcal{C}$ satisfying $\sigma_2(y') = X \times X$.

- The diagonal morphism $\delta_X : X \to X \times X$ is characterized (up to homotopy) by the requirement that there exist 2-simplices τ_0 and τ_i of $\mathcal{C}$, where τ_i exhibits id_X as a composition of π_i with δ_X. Let $\mathcal{K}_3$ denote the full subcategory of $\mathcal{K}$ spanned by the objects x, x', y, and y', and z'. Then the pair (τ_0, τ_1) determines an extension of σ_2 to a functor $\sigma_3 : \mathcal{K}_3 \to \mathcal{C}$ satisfying $\sigma_3(z') = X$. The diagram σ_3 can be represented informally by the diagram

$$\begin{tikzcd}
\bullet \arrow[r, dashed] \arrow[d, dashed] & Y \arrow[r, shift left, "f_0"] \arrow[r, shift right, "f_1"'] \arrow[d, "{(f_0,f_1)}"] & X \arrow[d, "\mathrm{id}_X"] \\
X \arrow[r, "\delta_X"] & X \times X \arrow[r, shift left, "\pi_0"] \arrow[r, shift right, "\pi_1"'] & X.
\end{tikzcd}$$

Note that σ_3 is right Kan extended from the full subcategory $\mathcal{K}_1 \subseteq \mathcal{K}_3$. Consequently, an object of $\mathcal{C}$ is a limit of the diagram σ_1 if and only if it is a limit of the diagram σ_3 (Remark 7.3.8.15).

- Let $\mathcal{K}_4$ denote the full subcategory of $\mathcal{K}$ spanned by the objects x', y, y', and z'. Note that the functor σ_3 is right Kan extended from $\mathcal{K}_4$. It follows that an object of $\mathcal{C}$ is a limit of the functor σ_3 if and only if it is a limit of the functor $\sigma_4 = \sigma_3|_{\mathcal{K}_4}$.

- Let $\mathcal{K}_5$ denote the full subcategory of $\mathcal{K}$ spanned by the objects y, y', and z'. Using the criterion of Theorem 7.2.3.1, we see that the inclusion $\mathcal{K}_5 \hookrightarrow \mathcal{K}_4$ is left cofinal. It follows that an object of $\mathcal{C}$ is a limit of the diagram σ_4 if and only if it is a limit of the diagram $\sigma_5 = \sigma_4|_{\mathcal{K}_5}$ (Corollary 7.2.2.11).

Combining these steps, we deduce that an object of $\mathcal{C}$ is an equalizer of f_0 and f_1 if and only if it is a limit of the diagram σ_5: that is, if and only if it is a fiber product of Y with X over $X \times X$ (along the morphisms (f_0, f_1) and δ_X). $\square$

In an ∞-category which admits finite products, we can use a similar argument to describe pullbacks in terms of equalizers.

Proposition 7.6.5.23 (Rewriting Pullbacks as Equalizers)**.** *Let $\mathcal{C}$ be an ∞-category and let $f_0 : X_0 \to X$ and $f_1 : X_1 \to X$ be morphisms of $\mathcal{C}$. Suppose that X_0 and X_1 admit a product $X_0 \times X_1$, and let $\pi_0 : X_0 \times X_1 \to X_0$ and $\pi_1 : X_0 \times X_1 \to X_1$ denote the projection maps. For $i \in \{0, 1\}$, let $g_i : X_0 \times X_1 \to X$ denote a composition of π_i with f_i in the ∞-category $\mathcal{C}$. Then an object of $\mathcal{C}$ is a pullback of X_0 with X_1 over X if and only if it is an equalizer of the pair of morphisms (g_0, g_1).* `03HD`

Proof. Let $\mathcal{K}$ denote the category which is freely generated by a non-commutative square, as indicated in the diagram

$$\begin{tikzcd}
Y_{01} \arrow[r] \arrow[d] \arrow[dr, shift left] \arrow[dr, shift right] & Y_0 \arrow[d] \\
Y_1 \arrow[r] & Y.
\end{tikzcd}$$

Note that the upper right and lower left regions of this diagram determine monomorphisms $\tau_0, \tau_1 : \Delta^2 \hookrightarrow \mathrm{N}_\bullet(\mathcal{K})$. The images of τ_0 and τ_1 are simplicial subsets of $\mathrm{N}_\bullet(\mathcal{K})$, whose union is $\mathrm{N}_\bullet(\mathcal{K})$ and whose intersection is the discrete simplicial set $\{Y_{01}, Y\}$. It follows that τ_0 and τ_1 induce an isomorphism of simplicial sets $(\tau_0, \tau_1) : \Delta^2 \coprod_{\{0,2\}} \Delta^2 \simeq \mathrm{N}_\bullet(\mathcal{K})$.

For $i \in \{0, 1\}$, let σ_i be a 2-simplex of $\mathcal{C}$ which witnesses g_i as a composition of π_i with f_i (in the sense of Definition 1.4.4.1). Then there is a unique morphism of simplicial sets $q : \mathrm{N}_\bullet(\mathcal{K}) \to \mathcal{C}$ satisfying $q \circ \tau_i = \sigma_i$, which we indicate as a diagram

$$\begin{tikzcd}
X_0 \times X_1 \arrow[r, "\pi_0"] \arrow[d, "\pi_1"'] \arrow[dr, shift left, "g_0"] \arrow[dr, shift right, "g_1"'] & X_0 \arrow[d, "f_0"] \\
X_1 \arrow[r, "f_1"] & X.
\end{tikzcd}$$

Let $\mathcal{K}_+ \subseteq \mathcal{K}$ denote the full subcategory spanned by the objects Y_{01} and Y. Then the nerve $\mathrm{N}_\bullet(\mathcal{K}_+)$ can be identified with the simplicial set $(\bullet \rightrightarrows \bullet)$ of Notation 7.6.5.1, and the restriction $q_+ = q|_{\mathrm{N}_\bullet(\mathcal{K}_+)}$ corresponds to the pair of morphisms $g_0, g_1 : X_0 \times X_1 \to X$. Note that the full subcategory $\mathrm{N}_\bullet(\mathcal{K}_+) \subset \mathrm{N}_\bullet(\mathcal{K})$ is coreflective, so the inclusion map $\mathrm{N}_\bullet(\mathcal{K}_+) \hookrightarrow \mathrm{N}_\bullet(\mathcal{K})$ is left cofinal (Corollary 7.2.3.7). It follows that an object of $\mathcal{C}$ is an equalizer of g_0 and g_1 if and only if it is a limit of the diagram q (Corollary 7.2.2.11).

To complete the proof, it will suffice to show that an object of $\mathcal{C}$ is a limit of q if and only if it is a fiber product of X_0 with X_1 over X. Let $\mathcal{K}_- \subseteq \mathcal{K}$ denote the full subcategory spanned by the objects Y_0, Y_1, and Y. By virtue of Corollaries 7.3.8.2 and 7.3.8.14, it will suffice to show that the functor q is right Kan extended from $\mathrm{N}_\bullet(\mathcal{K}_-)$. E quivalently, we wish to show that the natural map

$$\mathrm{N}_\bullet(\mathcal{K}_- \times_{\mathcal{K}} \mathcal{K}_{Y_{01}/})^{\triangleleft} \to \mathrm{N}_\bullet(\mathcal{K}) \xrightarrow{q} \mathcal{C}$$

is a limit diagram in $\mathcal{C}$. Unwinding the definitions, we see that $\mathcal{K}_- \times_{\mathcal{K}} \mathcal{K}_{Y_{01}/}$ can be written as a disjoint union of subcategories having initial objects Y_0 and Y_1, respectively. In particular, the inclusion map

$$\{Y_0, Y_1\} \hookrightarrow \mathrm{N}_\bullet(\mathcal{K}_- \times_{\mathcal{K}} \mathcal{K}_{Y_{01}/})$$

is left cofinal. The desired result now follows from Corollary 7.2.2.3, together with our assumption that the maps π_0 and π_1 exhibit $X_0 \times X_1$ as a product of X_0 with X_1. □

03HE **Exercise 7.6.5.24.** In the situation of Proposition 7.6.5.23, suppose that X_0 and X_1 admit a fiber product over X. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which preserves the product of X_0 and X_1 (that is, $F(\pi_0)$ and $F(\pi_1)$ exhibit $F(X_0 \times X_1)$ as a product of $F(X_0)$ with $F(X_1)$ in the ∞-category $\mathcal{D}$). Show that F preserves the fiber product of X_0 with X_1 over X if and only if it preserves the equalizer of the morphisms g_0 and g_1.

03HF **Corollary 7.6.5.25.** *Let $\mathcal{C}$ be an ∞-category. Then $\mathcal{C}$ admits finite limits if and only if it admits finite products and equalizers. If these conditions are satisfied, then a functor $F : \mathcal{C} \to \mathcal{D}$ preserves finite limits if and only if it preseves finite products and equalizers.*

Proof. Combine Corollary 7.6.3.27 with Proposition 7.6.5.23 (and Exercise 7.6.5.24). □

7.6.6 Sequential Limits and Colimits

03HG Throughout this section, we let $\mathbf{Z}_{\geq 0}$ denote the set of nonnegative integers, endowed with its usual ordering.

03HH **Definition 7.6.6.1** (Towers)**.** Let $\mathcal{C}$ be an ∞-category. A *tower* in $\mathcal{C}$ is a functor $\mathrm{N}_\bullet(\mathbf{Z}_{\geq 0}^{\mathrm{op}}) \to \mathcal{C}$. We say that $\mathcal{C}$ *admits sequential limits* if every tower in $\mathcal{C}$ has a limit, and that $\mathcal{C}$ *admits sequential colimits* if every diagram $\mathrm{N}_\bullet(\mathbf{Z}_{\geq 0}) \to \mathcal{C}$ has a colimit. We say that a functor of ∞-categories $F : \mathcal{C} \to \mathcal{D}$ *preserves sequential limits* if it preserves limits indexed by the simplicial set $\mathrm{N}_\bullet(\mathbf{Z}_{\geq 0}^{\mathrm{op}})$, and that it *preserves sequential colimits* if it preserves colimits indexed by the simplicial set $\mathrm{N}_\bullet(\mathbf{Z}_{\geq 0})$.

03HJ **Notation 7.6.6.2.** Let $\mathcal{C}$ be an ∞-category. We will generally abuse notation by identifying a functor $X : \mathrm{N}_\bullet(\mathbf{Z}_{\geq 0}) \to \mathcal{C}$ with the collection of objects $\{X(n)\}_{n \geq 0}$ and morphisms $f_n : X(n+1) \to X(n)$ obtained by the evaluating X on the edges of $\mathrm{N}_\bullet(\mathbf{Z}_{\geq 0})$ corresponding to ordered pairs of the form $(n, n+1)$; we will depict the pair $(\{X(n)\}_{n \geq 0}, \{f_n\}_{n \geq 0})$ as a diagram

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \xrightarrow{f_3} X(4) \rightarrow \cdots$$

Similarly, we abuse notation by identifying towers $X : \mathrm{N}_\bullet(\mathbf{Z}_{\geq 0}^{\mathrm{op}}) \rightarrow \mathcal{C}$ with diagrams

$$\cdots \rightarrow X(4) \xrightarrow{f_3} X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0).$$

Beware that the convention of Notation 7.6.6.2 is slightly abusive: the simplicial set $\mathrm{N}_\bullet(\mathbf{Z}_{\geq 0})$ has nondegenerate simplices in every dimension, so a functor $X : \mathrm{N}_\bullet(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{C}$ is not literally determined by its underlying diagram

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \xrightarrow{f_3} X(4) \rightarrow \cdots$$

However, the abuse is essentially harmless:

Remark 7.6.6.3. Let $\mathrm{Spine}[\mathbf{Z}_{\geq 0}]$ denote the simplicial subset of $\mathrm{N}_\bullet(\mathbf{Z}_{\geq 0})$ whose k-simplices are sequences of nonnegative integers $(n_0, n_1, \cdots, n_k)$ satisfying $n_0 \leq n_1 \leq \cdots \leq n_k \leq n_0 + 1$. Then $\mathrm{Spine}[\mathbf{Z}_{\geq 0}]$ is a 1-dimensional simplicial set, which corresponds (under the equivalence of Proposition 1.1.6.9) to the directed graph G indicated in the diagram 03HK

$$0 \rightarrow 1 \rightarrow 2 \rightarrow 3 \rightarrow \cdots .$$

Moreover, the linearly ordered set $(\mathbf{Z}_{\geq 0}, \leq)$ can be identified with the path category $\mathrm{Path}[G]$ of Construction 1.3.7.1. It follows that the inclusion map $\mathrm{Spine}[\mathbf{Z}_{\geq 0}] \hookrightarrow \mathrm{N}_\bullet(\mathbf{Z}_{\geq 0})$ is inner anodyne (Proposition 1.5.7.3).

In particular, for any ∞-category $\mathcal{C}$, the restriction map

$$\mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{Z}_{\geq 0}), \mathcal{C}) \rightarrow \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}_{\geq 0}], \mathcal{C})$$

is a trivial Kan fibration (Theorem 1.5.7.1). Stated more informally, every sequence of composable morphisms

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \xrightarrow{f_3} X(4) \rightarrow \cdots$$

admits an *essentially unique* extension to a functor $\mathrm{N}_\bullet(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{C}$.

Example 7.6.6.4. Let $\mathcal{C}$ be a locally Kan simplicial category, and suppose we are given a collection of objects $\{X(n)\}_{n \geq 0}$ and morphisms $f_n : X(n) \rightarrow X(n+1)$ in $\mathcal{C}$. It follows from Remark 7.6.6.3 that the diagram 03HL

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \xrightarrow{f_3} X(4) \rightarrow \cdots$$

can be extended to a functor $\mathrm{N}_\bullet(\mathbf{Z}_{\geq 0}) \rightarrow \mathrm{N}_\bullet^{\mathrm{hc}}(\mathcal{C})$. In fact, there is a preferred choice of such an extension, which is uniquely determined by the requirement that it factors through the inclusion map $\mathrm{N}_\bullet(\mathcal{C}) \hookrightarrow \mathrm{N}_\bullet^{\mathrm{hc}}(\mathcal{C})$.

03HM **Remark 7.6.6.5.** Let $\mathcal{C}$ be an ∞-category, and suppose we are given a tower $X : \mathrm{N}_\bullet(\mathbf{Z}_{\geq 0}^{\mathrm{op}}) \to \mathcal{C}$, which we depict as a diagram

$$\cdots \to X(4) \xrightarrow{f_3} X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0),$$

having a limit $\varprojlim(X)$. Then, for every object $Y \in \mathcal{C}$, the map of sets

$$\theta : \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(Y, \varprojlim(X)) \to \varprojlim(\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(Y, X(n)))$$

is surjective. To prove this, suppose we are given a collection of morphisms $g_n : Y \to X(n)$ satisfying $[f_n] \circ [g_{n+1}] = [g_n]$ in the homotopy category $\mathrm{h}\mathcal{C}$. Then, for each $n \geq 0$, we can choose a 2-simplex σ_n in $\mathcal{C}$ as indicated in the diagram

$$\begin{tikzcd} & X(n+1) \arrow[dr, "f_n"] & \\ Y \arrow[ur, "g_{n+1}"] \arrow[rr, "g_n"] & & X(n). \end{tikzcd}$$

Let X_0 denote the restriction of X to the spine $\mathrm{Spine}[\mathbf{Z}_{\geq 0}^{\mathrm{op}}] \subset \mathrm{N}_\bullet(\mathbf{Z}_{\geq 0}^{\mathrm{op}})$. Then the collection of 2-simplices $\{\sigma_n\}_{n \geq 0}$ determines an extension of X_0 to a diagram $\overline{X}_0 : \mathrm{Spine}[\mathbf{Z}_{\geq 0}^{\mathrm{op}}]^{\triangleleft} \to \mathcal{C}$ carrying the cone point to the object Y. The isomorphism class of this extension can be identified with a morphism $[g] : Y \to \varprojlim(X_0) \simeq \varprojlim(X)$ in the homotopy category $\mathrm{h}\mathcal{C}$, which is a preimage of the sequence $\{[g_n]\}_{n \geq 0}$ under the function θ.

03HN **Warning 7.6.6.6.** In the situation of Remark 7.6.6.5, the map

$$\theta : \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(Y, \varprojlim(X)) \to \varprojlim(\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(Y, X(n)))$$

need not be injective. That is, the forgetful functor $\mathcal{C} \to \mathrm{N}_\bullet(\mathrm{h}\mathcal{C})$ generally does not preserve sequential limits (or colimits).

03HP **Example 7.6.6.7.** Fix a prime number p. For every integer $n \geq 0$, let $p^n\,\mathbf{Z}$ denote the cyclic subgroup of $\mathbf{Z}$ generated by p^n, so that we have a tower of classifying simplicial sets

03HQ
$$\begin{tikzcd} \cdots \arrow[r] & B_\bullet(p^3\,\mathbf{Z}) \arrow[r] & B_\bullet(p^2\,\mathbf{Z}) \arrow[r] & B_\bullet(p\,\mathbf{Z}) \arrow[r] & B_\bullet(\mathbf{Z}). \end{tikzcd} \quad (7.68)$$

Then:

- The tower (7.68) has a limit in the ordinary category of simplicial sets, given by the simplicial set Δ^0 (which we can identify with the classifying simplicial set for the trivial group $(0) = \bigcap_{n \geq 0} p^n\,\mathbf{Z}$).

- The simplicial set Δ^0 is also a limit of the tower (7.68) in the homotopy category hKan.
- In the ∞-category $\mathcal{S}$, the tower (7.68) has a different limit, which has uncountably many connected components (see Remark [?]).

We now give some easy examples of sequential limits and colimits.

Example 7.6.6.8 (Sequential Colimits in $\mathcal{QC}$)**.** Suppose we are given a collection of ∞-categories $\{\mathcal{C}(n)\}_{n \geq 0}$ and functors $F_n : \mathcal{C}(n) \to \mathcal{C}(n+1)$, which we view as a diagram 03HR

$$\mathcal{C}(0) \xrightarrow{F_0} \mathcal{C}(1) \xrightarrow{F_1} \mathcal{C}(2) \xrightarrow{F_2} \mathcal{C}(3) \to \cdots$$

Let $\varinjlim_n \mathcal{C}(n)$ denote the colimit of this diagram (formed in the ordinary category of simplicial sets). Then $\varinjlim_n \mathcal{C}(n)$ is also an ∞-category, which is also a colimit of the associated diagram $\mathrm{N}_\bullet(\mathbf{Z}_{\geq 0}) \to \mathcal{QC}$. This is a special case of Corollary 7.5.9.3.

Variant 7.6.6.9 (Sequential Colimits in $\mathcal{S}$)**.** Suppose we are given a collection of Kan complexes $\{X(n)\}_{n \geq 0}$ and morphisms $f_n : X(n) \to X(n+1)$, which we view as a diagram 03HS

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \to \cdots$$

Let $\varinjlim_n X(n)$ denote the colimit of this diagram (formed in the ordinary category of simplicial sets). Then $\varinjlim_n X(n)$ is also a Kan complex, which is also a colimit of the associated diagram $\mathrm{N}_\bullet(\mathbf{Z}_{\geq 0}) \to \mathcal{S}$. See Variant 7.5.9.4.

Example 7.6.6.10 (Towers of Isofibrations)**.** Suppose we are given a collection of ∞-categories $\{\mathcal{C}(n)\}_{n \geq 0}$ and functors $F_n : \mathcal{C}(n+1) \to \mathcal{C}(n)$, which we view as a tower 03HT

$$\cdots \to \mathcal{C}(4) \xrightarrow{F_3} \mathcal{C}(3) \xrightarrow{F_2} \mathcal{C}(2) \xrightarrow{F_1} \mathcal{C}(1) \xrightarrow{F_0} \mathcal{C}(0)$$

If each of the functors F_n is an isofibration, then the limit $\varprojlim_n \mathcal{C}(n)$ (formed in the ordinary category of simplicial sets) is also an ∞-category, which can be also be viewed as a limit of the associated tower $\mathrm{N}_\bullet(\mathbf{Z}^{\mathrm{op}}_{\geq 0}) \to \mathcal{QC}$. This follows by combining Example 4.5.6.8, Example 7.5.5.3, and Proposition 7.5.5.7.

Variant 7.6.6.11 (Towers of Kan Fibrations)**.** Suppose we are given a collection of Kan complexes $\{X(n)\}_{n \geq 0}$ and morphisms $f_n : X(n+1) \to X(n)$, which we view as a tower 03HU

$$\cdots \to X(4) \xrightarrow{f_3} X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0).$$

If each of the morphisms f_n is a Kan fibration, then the limit $\varprojlim_n X(n)$ (formed in the ordinary category of simplicial sets) is also a Kan complex, which can be also be viewed as a limit of the associated tower $\mathrm{N}_\bullet(\mathbf{Z}^{\mathrm{op}}_{\geq 0}) \to \mathcal{S}$ (combine Example 7.6.6.10 with Proposition 7.4.5.1).

03HV **Variant 7.6.6.12** (Limits of General Towers)**.** Suppose we are given a sequence of ∞-categories $\{\mathcal{C}(n)\}_{n \geq 0}$ and functors $F_n : \mathcal{C}(n+1) \to \mathcal{C}(n)$, which we view as a tower

03HW
$$\cdots \to \mathcal{C}(4) \xrightarrow{F_3} \mathcal{C}(3) \xrightarrow{F_2} \mathcal{C}(2) \xrightarrow{F_1} \mathcal{C}(1) \xrightarrow{F_0} \mathcal{C}(0) \tag{7.69}$$

If the functors F_n are not assumed to be isofibrations, then the limit $\varprojlim_n \mathcal{C}(n)$ (formed in the ordinary category of simplicial sets) might not be a limit of the associated tower in $\mathcal{QC}$ (for example, $\varprojlim_n \mathcal{C}(n)$ might fail to be an ∞-category). Nevertheless, we can always compute the relevant limit in $\mathcal{QC}$ by replacing (7.69) by a levelwise equivalent diagram of ∞-categories in which the transition functors are isofibrations. For example, we can replace (7.69) by the isofibrant tower of iterated homotopy fiber products

$$\cdots \to \mathcal{C}(2) \times^{\mathrm{h}}_{\mathcal{C}(1)} (\mathcal{C}(1) \times^{\mathrm{h}}_{\mathcal{C}(0)} \mathcal{C}(0)) \to \mathcal{C}(1) \times^{\mathrm{h}}_{\mathcal{C}(0)} \mathcal{C}(0) \to \mathcal{C}(0).$$

Let us denote the limit of this tower (in the category of simplicial sets) by

$$\cdots \times^{\mathrm{h}}_{\mathcal{C}(3)} \mathcal{C}(3) \times^{\mathrm{h}}_{\mathcal{C}(2)} \mathcal{C}(2) \times^{\mathrm{h}}_{\mathcal{C}(1)} \mathcal{C}(1) \times^{\mathrm{h}}_{\mathcal{C}(0)} \mathcal{C}(0).$$

It is an ∞-category whose objects can be identified with sequences of pairs $\{(C_n, \alpha_n)\}_{n \geq 0}$, where each C_n is an object of the ∞-category $\mathcal{C}(n)$ and each $\alpha_n : F_n(C_{n+1}) \xrightarrow{\sim} C_n$ is an isomorphism in the ∞-category $\mathcal{C}(n)$. Combining Example 7.6.6.10 with Remark 7.1.1.8, we see that it can be identified with a limit of the diagram (7.69) in the ∞-category $\mathcal{QC}$.

Sequential limits are useful for building more complicated types of limits.

03HX **Proposition 7.6.6.13.** *Suppose we are given a diagram of simplicial sets*

$$K(0) \to K(1) \to K(2) \to K(3) \to \cdots$$

having colimit K. Let $\mathcal{C}$ be an ∞-category and let $f : K \to \mathcal{C}$ be a diagram, corresponding to a compatible sequence of diagrams $f_n : K(n) \to \mathcal{C}$. Suppose that each of the diagrams f_n admits a limit in $\mathcal{C}$. Then there exists a tower $X : \mathrm{N}_\bullet(\mathbf{Z}^{\mathrm{op}}_{\geq 0}) \to \mathcal{C}$ with the following properties:

(1) *For each $n \geq 0$, the object $X(n) \in \mathcal{C}$ is a limit of the diagram f_n.*

(2) *An object of $\mathcal{C}$ is a limit of the diagram f if and only if it is a limit of the tower X. In particular, the diagram f has a limit if and only if the tower X has a limit.*

(3) *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which preserves the limits of each of the diagrams f_n. Then F preserves limits of the diagram f if and only if it preserves limits of the tower X.*

Proof. Combine Propositions 7.5.8.12 and 7.5.9.1. □

Corollary 7.6.6.14. *Suppose we are given a diagram of simplicial sets* 03HY

$$K(0) \to K(1) \to K(2) \to K(3) \to \cdots$$

having colimit K, and let $\mathcal{C}$ be an ∞-category which admits sequential limits and $K(n)$-indexed limits, for each $n \geq 0$. Then $\mathcal{C}$ admits K-indexed colimits. If $F : \mathcal{C} \to \mathcal{D}$ is a functor of ∞-categories which preserves sequential limits and $K(n)$-indexed limits for each $n \geq 0$, then it also preserves K-indexed limits.

Example 7.6.6.15. Let $\mathcal{C}$ be an ∞-category which admits finite products. If $\mathcal{C}$ admits sequential limits, then it also admits countable products. More precisely, for any countable collection of objects $\{X_n\}_{n \geq 0}$ of $\mathcal{C}$, the product $\prod_{n \geq 0} X_n$ can be computed as the limit of a tower 03HZ

$$\cdots \to X_2 \times X_1 \times X_0 \to X_1 \times X_0 \to X_0.$$

We now establish a partial converse to Example 7.6.6.15. Let $\mathcal{C}$ be an ∞-category which admits countable products, and suppose that we are given a tower

$$\cdots \to X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0)$$

in $\mathcal{C}$. Then the collection of morphisms $\{f_n\}_{n \geq 0}$ determine an endomorphism f of the product $P = \prod_{n \geq 0} X(n)$, given informally by the composition

$$\begin{array}{ccc} P & = & \prod_{n \geq 0} X(n) \\ & \to & \prod_{n > 0} X(n) \\ & = & \prod_{m \geq 0} X(m+1) \\ & \xrightarrow{\prod_{m \geq 0} f_m} & \prod_{m \geq 0} X(m) \\ & = & P. \end{array}$$

In this case, we can identify limits of the tower X with equalizers of the pair of morphisms $f, \mathrm{id}_P : P \to P$. We can formulate this assertion more precisely as follows:

Proposition 7.6.6.16 (Sequential Limits as Equalizers)**.** *Let $\mathcal{C}$ be an ∞-category and let $X : \mathrm{N}_{\bullet}(\mathbf{Z}^{\mathrm{op}}_{\geq 0}) \to \mathcal{C}$ be a tower, which we identify with the diagram* 03J0

$$\cdots \to X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0).$$

Suppose that there exists an object $P \in \mathcal{C}$ equipped with morphisms $\{q_n : P \to X(n)\}_{n \geq 0}$ which exhibits P as a product of the collection $\{X(n)\}_{n \geq 0}$. Then:

(1) *There exists a morphism $f : P \to P$ with the property that, for each $n \geq 0$, the diagram*

03J1
$$\begin{tikzcd}
P \arrow[r, "{[f]}"] \arrow[d, "{[q_{n+1}]}"] & P \arrow[d, "{[q_n]}"] \\
X(n+1) \arrow[r, "{[f_n]}"] & X(n)
\end{tikzcd} \tag{7.70}$$

commutes in the homotopy category $\mathrm{h}\mathcal{C}$. *Moreover, the morphism f is uniquely determined up to homotopy.*

(2) *An object of $\mathcal{C}$ is a limit of the tower X if and only if it is an equalizer of the pair of morphisms $f, \mathrm{id}_P : P \to P$.*

Proof. Assertion (1) follows immediately from the definitions (see Warning 7.6.1.11). To prove (2), let $M = \mathbf{Z}_{\geq 0}$ denote the set of nonnegative integers, which we regard as a commutative monoid with respect to addition. Let BM denote the associated category (consisting of a single object E having endomorphism monoid $\mathrm{Hom}_{BM}(E, E) = M$) and let $B_\bullet M$ denote the nerve of BM (Construction 1.3.2.5). There is a functor of ordinary categories $(\mathbf{Z}_{\geq 0}, \leq)^{\mathrm{op}} \to BM$ which is characterized by the requirement that, for every pair of nonnegative integers $m \leq n$, the induced map

$$\mathrm{Hom}_{\mathbf{Z}_{\geq 0}}(m, n) \to \mathrm{Hom}_{BM}(E, E) = M$$

carries the unique element of $\mathrm{Hom}_{\mathbf{Z}_{\geq 0}}(m, n)$ to the difference $n - m \in M$. Passing to nerves, we obtain a functor of ∞-categories $U : \mathrm{N}_\bullet(\mathbf{Z}_{\geq 0}^{\mathrm{op}}) \to B_\bullet M$. The functor U is a cartesian fibration, whose fiber over the vertex $E \in B_\bullet M$ can be identified with the discrete simplicial set $\{0, 1, 2, \cdots\}$. Applying Corollary 7.3.4.8, we deduce that there exists a functor $Y : B_\bullet M \to \mathcal{C}$ and a natural transformation $\alpha : Y \circ U \to X$ which exhibits Y as a right Kan extension of X along U.

For every nonnegative integer n, α induces a morphism $\alpha_n : Y(E) \to X(n)$ in the ∞-category $\mathcal{C}$. Using the criterion of Proposition 7.3.4.1, we see that the collection of morphisms $\{\alpha_n\}_{n \geq 0}$ exhibit $Y(E)$ as a product of the collection of objects $\{X(n)\}_{n \geq 0}$. We may therefore assume without loss of generality that $P = Y(E)$ and $q_n = \alpha_n$, for each $n \geq 0$. Let $f : P \to P$ be the morphism obtained by evaluating the functor Y on the generator $1 \in M$. For each $n \geq 0$, the natural transformation α carries the edge $n + 1 \to n$ of $\mathrm{N}_\bullet(\mathbf{Z}_{\geq 0})$

to a commutative diagram

$$\begin{tikzcd}
P \arrow[r, "f"] \arrow[d, "q_{n+1}"] & P \arrow[d, "q_n"] \\
X(n+1) \arrow[r, "f_n"] & X(n)
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$, which witnesses the commutativity of the diagram (7.70) in the homotopy category $\mathrm{h}\mathcal{C}$. Moreover, an object $C \in \mathcal{C}$ is an equalizer of the pair of morphisms $f, \mathrm{id}_P : P \to P$ if and only if it is a limit of the diagram Y (Variant 7.6.5.9). To prove (2), it suffices to observe that this is equivalent to the requirement that C is a limit of the tower X, which follows from Corollary 7.3.8.20. □

Remark 7.6.6.17. In the situation of Proposition 7.6.6.16, suppose that $F : \mathcal{C} \to \mathcal{D}$ is a functor of ∞-categories which preserves the product of the collection $\{X(n)\}_{n \geq 0}$. Then F preserves limits of the tower X if and only if it preserves equalizers of the pair of morphisms $f, \mathrm{id}_P : P \to P$. 03J2

7.6.7 Small Limits

We now study limits and colimits indexed by diagrams of bounded size. 03UC

Definition 7.6.7.1. Let κ be an infinite cardinal and let $\mathcal{C}$ be an ∞-category. We say that $\mathcal{C}$ is *κ-complete* if admits K-indexed limits, for every κ-small simplicial set K. 03UD

We say that a functor of ∞-categories $F : \mathcal{C} \to \mathcal{D}$ *preserves κ-small limits* if it preserves K-indexed limits, for every κ-small simplicial set K (Definition 7.1.3.4).

Remark 7.6.7.2. Let $\mathcal{C}$ be an ∞-category and let λ be an infinite cardinal. If $\mathcal{C}$ is λ-complete, then it is also κ-complete for each infinite cardinal $\kappa < \lambda$. Similarly, if a functor $F : \mathcal{C} \to \mathcal{D}$ preserves λ-small limits, then it also preserves κ-small limits for each $\kappa < \lambda$. In both cases, the converse holds if λ is an uncountable limit cardinal (since, in that case, every λ-small simplicial set K is κ-small for some $\kappa < \lambda$). 03UE

Example 7.6.7.3. An ∞-category $\mathcal{C}$ is $\aleph_0$-complete if and only if it admits finite limits. Similarly, a functor $F : \mathcal{C} \to \mathcal{D}$ preserves $\aleph_0$-small limits if and only if it preserves finite limits. 03UF

Example 7.6.7.4. Let λ be an uncountable regular cardinal and let $\kappa = \mathrm{ecf}(\lambda)$ be its exponential cofinality (Definition 4.7.3.16). Let $\mathcal{S}^{<\lambda}$ denote the ∞-category of λ-small spaces (Variant 5.5.4.12) and let $\mathcal{QC}^{<\lambda}$ denote the ∞-category of λ-small ∞-categories (Variant 03UG

5.5.4.10). Then the ∞-categories $\mathcal{S}^{<\lambda}$ and $\mathcal{QC}^{<\lambda}$ are κ-complete. Moreover, the inclusion maps

$$\mathcal{S}^{<\lambda} \hookrightarrow \mathcal{S} \qquad \mathcal{QC}^{<\lambda} \hookrightarrow \mathcal{QC}$$

preserve κ-small limits. See Corollary 7.4.1.13 and Variant 7.4.5.8. In particular, if $\kappa = \lambda$ is a strongly inaccessible cardinal, then the ∞-categories $\mathcal{S}^{<\kappa}$ and $\mathcal{QC}^{<\kappa}$ are κ-complete.

048G **Remark 7.6.7.5.** Let $\mathcal{C}$ be an ∞-category which is κ-complete for some infinite cardinal κ. Then, for every simplicial set K, the ∞-category $\mathrm{Fun}(K, \mathcal{C})$ is also κ-complete. See Corollary 7.1.6.2.

03UH **Remark 7.6.7.6.** Let κ be an uncountable cardinal and let $\mathcal{C}$ be an ∞-category. The following conditions are equivalent:

- The ∞-category $\mathcal{C}$ is κ-complete: that is, it admits K-indexed limits for every κ-small simplicial set K.
- The ∞-category $\mathcal{C}$ admits K-indexed limits, for every simplicial set K which is essentially κ-small.

Moreover, in either case, it suffices to consider the case where K is an ∞-category. See Remark 7.1.1.15 and Proposition 4.7.5.5. Similarly, a functor $F : \mathcal{C} \to \mathcal{D}$ preserves κ-small limits if and only if it preserves K-indexed limits, for every simplicial set K which is essentially κ-small (and it again suffices to consider the case where K is an ∞-category).

03UJ **Variant 7.6.7.7.** Let κ be an infinite cardinal. We say that an ∞-category $\mathcal{C}$ is *κ-cocomplete* if it admits K-indexed colimits, for every κ-small simplicial set K. Equivalently, the ∞-category $\mathcal{C}$ is κ-cocomplete if the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$ is κ-complete.

We say that a functor of ∞-categories $F : \mathcal{C} \to \mathcal{D}$ *preserves κ-small colimits* if it preserves K-indexed colimits, for every κ-small simplicial set K. Equivalently, F preserves κ-small colimits if the opposite functor $F^{\mathrm{op}} : \mathcal{C}^{\mathrm{op}} \to \mathcal{D}^{\mathrm{op}}$ preserves κ-small limits.

03UK **Example 7.6.7.8.** Let λ be an uncountable regular cardinal and let $\kappa = \mathrm{cf}(\lambda)$ denote its cofinality. Then the ∞-categories $\mathcal{S}^{<\lambda}$ and $\mathcal{QC}^{<\lambda}$ are κ-cocomplete. Moreover, the inclusion maps

$$\mathcal{S}^{<\lambda} \hookrightarrow \mathcal{S} \qquad \mathcal{QC}^{<\lambda} \hookrightarrow \mathcal{QC}$$

preserve κ-small colimits. See Corollary 7.4.3.15 and Remark 7.4.5.7. In particular, if $\kappa = \lambda$ is an uncountable regular cardinal, then the ∞-categories $\mathcal{S}^{<\kappa}$ and $\mathcal{QC}^{<\kappa}$ are κ-cocomplete.

03UL **Proposition 7.6.7.9.** *Let $\mathcal{C}$ be an ∞-category and let κ be an infinite cardinal. Then $\mathcal{C}$ is κ-complete if and only if it satisfies the following conditions:*

(1) *The ∞-category $\mathcal{C}$ admits κ-small products. That is, every collection of objects $\{X_j\}_{j \in J}$ indexed by a κ-small set J admits a product in $\mathcal{C}$.*

(2) *The ∞-category $\mathcal{C}$ admits finite limits.*

Proof. Assume that $\mathcal{C}$ satisfies conditions (1) and (2); we wish to show that $\mathcal{C}$ is κ-complete (the converse is immediate from the definitions). Let S be a κ-small simplicial set; we wish to show that $\mathcal{C}$ admits S-indexed limits. If $\kappa = \aleph_0$, this follows immediately from assumption (2) (Example 7.6.7.3). We may therefore assume that κ is uncountable, so that $\mathcal{C}$ admits countable products.

For each $n \geq 0$, let $\mathrm{sk}_n(S)$ denote the n-skeleton of S (Construction 1.1.4.1), so that $S = \bigcup_n \mathrm{sk}_n(S)$. It follows from Proposition 7.6.6.16 that $\mathcal{C}$ admits sequential limits. Consequently, to show that $\mathcal{C}$ admits S-indexed limits, it will suffice to show that it admits $\mathrm{sk}_n(S)$-indexed limits, for each $n \geq 0$ (Corollary 7.6.6.14). We may therefore assume without loss of generality that the simplicial set S has finite dimension. We proceed by induction on the dimension n of S. If $n = -1$, then S is empty and the desired result is immediate. Assume that $n \geq 0$ and let $\{\sigma_j\}_{j \in J}$ denote the collection of nondegenerate n-simplices of S, so that Proposition 1.1.4.12 supplies a pushout diagram of simplicial sets

$$\begin{tikzcd}
\coprod_{j \in J} \partial \Delta^n \arrow[r] \arrow[d] & \coprod_{j \in J} \Delta^n \arrow[d] \\
\mathrm{sk}_{n-1}(S) \arrow[r] & \mathrm{sk}_n(S).
\end{tikzcd}$$

Since the horizontal maps in this diagram are monomorphisms, it is also a categorical pushout square (Example 4.5.4.12). By virtue of Proposition 7.6.3.26, it will suffice to show that $\mathcal{C}$ admits limits indexed by the simplicial sets $\mathrm{sk}_{n-1}(S)$, $J \times \partial \Delta^n$, and $J \times \Delta^n$. In the first two cases, this follows from our inductive hypothesis. To handle the third case, we can use assumption (1) and Corollary 7.6.1.20 to reduce to showing that the ∞-category $\mathcal{C}$ admits Δ^n-indexed limits. This is clear, since the simplicial set Δ^n is an ∞-category containing an initial object (see Corollary 7.2.2.12). □

Remark 7.6.7.10. In the situation of Proposition 7.6.7.9, we can replace (2) by either of the following *a priori* weaker conditions: 03UM

(2′) The ∞-category $\mathcal{C}$ admits pullbacks.

(2″) The ∞-category $\mathcal{C}$ admits equalizers.

See Corollary 7.6.3.27 and 7.6.5.25.

03J4 **Exercise 7.6.7.11.** Let κ be an infinite cardinal, let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, and suppose that $\mathcal{C}$ is κ-complete. Show that F preserves κ-small limits if and only if it preserves finite limits and κ-small products.

03UN **Corollary 7.6.7.12.** *Let $\mathcal{C}$ be an ∞-category and let λ be an infinite cardinal which is not regular. The following conditions are equivalent:*

(1) *The ∞-category $\mathcal{C}$ is λ-complete.*

(2) *For every infinite cardinal $\kappa < \lambda$, the ∞-category $\mathcal{C}$ is κ-complete.*

(3) *The ∞-category $\mathcal{C}$ is λ^+-complete, where λ^+ denotes the successor cardinal of λ.*

By virtue of Corollary 7.6.7.12, little information is lost by restricting the use of Definition 7.6.7.1 to the case where κ is a regular cardinal.

Proof of Corollary 7.6.7.12. The equivalence (1) $\Leftrightarrow$ (2) and the implication (3) $\Rightarrow$ (1) follow from Remark 7.6.7.2. We will complete the proof by showing that (1) implies (3). Assume that $\mathcal{C}$ is λ-complete; we wish to show that it is λ^+-complete. By virtue of Proposition 7.6.7.9, it will suffice to show that every collection of objects $\{X_i\}_{i \in I}$ admits a product in $\mathcal{C}$, provided that the index set I has cardinality $\leq \lambda$. Our assumption that λ is not regular guarantees that we can decompose I as a disjoint union of λ-small subsets $\{I_j \subseteq I\}_{j \in J}$, where the index set J is λ-small. It follows from (1) that $\mathcal{C}$ admits J-indexed products and also that it admits I_j-indexed products for each $j \in J$, and therefore admits I-indexed products by virtue of Corollary 7.6.1.20. $\square$

The existence of κ-small limits can be used to prove the existence of a large class of Kan extensions.

03UP **Proposition 7.6.7.13.** *Let κ be an uncountable regular cardinal and let K be a simplicial set which is essentially κ-small. Suppose we are given a pair of ∞-categories $\mathcal{C}$ and $\mathcal{D}$, together with diagrams $\delta : K \to \mathcal{C}$ and $F_0 : K \to \mathcal{D}$. Suppose that $\mathcal{C}$ is locally κ-small and that $\mathcal{D}$ is κ-complete. Then F_0 admits a right Kan extension along δ.*

Proof. By virtue of Proposition 7.3.5.1, it will suffice to show that for every object $C \in \mathcal{C}$, the composite map

$$K \times_{\mathcal{C}} \mathcal{C}_{C/} \to K \xrightarrow{F_0} \mathcal{D}$$

admits a limit in the ∞-category $\mathcal{D}$. Note that the projection map $K \times_{\mathcal{C}} \mathcal{C}_{C/}$ is a left fibration of simplicial sets (Proposition 4.3.6.1), whose fiber over each vertex $x \in K$ can be identified with the Kan complex $\mathrm{Hom}^{\mathrm{L}}_{\mathcal{C}}(C, \delta(x))$. Invoking Proposition 4.6.5.10, we see that $\mathrm{Hom}^{\mathrm{L}}_{\mathcal{C}}(C, \delta(x)$ is homotopy equivalent to the morphism space $\mathrm{Hom}_{\mathcal{C}}(C, \delta(x))$, and is therefore essentially κ-small (by virtue of our assumption that $\mathcal{C}$ is locally κ-small). Since K

is essentially κ-small, Corollary 5.6.7.7 implies that the simplicial set $K \times_{\mathcal{C}} \mathcal{C}_{C/}$ is essentially κ-small. The desired result now follows from our assumption that $\mathcal{D}$ is κ-complete (Remark 7.6.7.6). □

Chapter 8

The Yoneda Embedding

03JA 8.1 Twisted Arrows and Cospans

03JB Let $\mathcal{C}$ be an ∞-category. In §4.6.1, we associated to every pair of objects $X, Y \in \mathcal{C}$ a Kan complex $\operatorname{Hom}_{\mathcal{C}}(X, Y)$, whose vertices are morphisms from X to Y. In §8.3.3, we will see that the construction $(X, Y) \mapsto \operatorname{Hom}_{\mathcal{C}}(X, Y)$ can be refined to a functor of ∞-categories

$$\operatorname{Hom}_{\mathcal{C}}(\bullet, \bullet) : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}\mathrm{et} = \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathrm{Kan}).$$

It is somewhat cumbersome to give an explicit description of this functor. It will therefore be more convenient to specify it *implicitly* by realizing it as the covariant transport representation of a left fibration over $\mathcal{C}^{\mathrm{op}} \times \mathcal{C}$. We begin by discussing the counterpart of this fibration in the setting of classical category theory.

00AZ **Construction 8.1.0.1** (The Twisted Arrow Category)**.** Let $\mathcal{C}$ be a category. We define a new category $\operatorname{Tw}(\mathcal{C})$ as follows:

- An object of $\operatorname{Tw}(\mathcal{C})$ is a morphism $f : X \to Y$ in $\mathcal{C}$.
- Let $f : X \to Y$ and $f' : X' \to Y'$ be objects of $\operatorname{Tw}(\mathcal{C})$. A morphism from f to f' in $\operatorname{Tw}(\mathcal{C})$ is a pair of morphisms $u : X' \to X$, $v : Y \to Y'$ in $\mathcal{C}$ satisfying $f' = v \circ f \circ u$, so that we have a commutative diagram

$$\begin{tikzcd}
X \arrow[d, "f"] & X' \arrow[l, "u"'] \arrow[d, "f'"] \\
Y \arrow[r, "v"] & Y'.
\end{tikzcd}$$

- Let $f : X \to Y$, $f' : X' \to Y'$, and $f'' : X'' \to Y''$ be objects of $\mathrm{Tw}(\mathcal{C})$. If (u, v) is a morphism from f to f' in $\mathrm{Tw}(\mathcal{C})$ and (u', v') is a morphism from f' to f'' in $\mathcal{C}$, then the composition $(u', v') \circ (u, v)$ in $\mathrm{Tw}(\mathcal{C})$ is the pair $(u \circ u', v' \circ v)$.

We will refer to $\mathrm{Tw}(\mathcal{C})$ as the *twisted arrow category* of $\mathcal{C}$.

Remark 8.1.0.2. Let $\mathcal{C}$ be a category. Then the construction $(f : X \to Y) \mapsto (X, Y)$ determines a forgetful functor $\lambda : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$. Moreover, λ is a left covering functor, in the sense of Definition 4.2.3.1. `00B1`

Remark 8.1.0.3 ($\mathrm{Tw}(\mathcal{C})$ as a Category of Elements)**.** Let $\mathcal{C}$ be a category. Then the construction $(X, Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X, Y)$ determines a functor $\mathrm{Hom}_{\mathcal{C}}(\bullet, \bullet) : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathrm{Set}$. The twisted arrow category $\mathrm{Tw}(\mathcal{C})$ of Construction 8.1.0.1 can be identified with the category of elements $\int_{\mathcal{C}^{\mathrm{op}} \times \mathcal{C}} \mathrm{Hom}_{\mathcal{C}}(\bullet, \bullet)$ (see Construction 5.2.6.1). `03JC`

It follows that the functor $\mathrm{Hom}_{\mathcal{C}}(\bullet, \bullet)$ is determined (up to canonical isomorphism) by the datum of the twisted arrow category $\mathrm{Tw}(\mathcal{C})$ together with the forgetful functor $\lambda : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ of Remark 8.1.0.2 (see Corollary 5.2.7.5).

Warning 8.1.0.4 (Untwisted Arrow Categories)**.** Let $[1] = \{0 < 1\}$ denote a linearly ordered set with two elements. For any category $\mathcal{C}$, we can identify morphisms of $\mathcal{C}$ with functors $F : [1] \to \mathcal{C}$. The collection of such functors can be organized into a category $\mathrm{Fun}([1], \mathcal{C})$, which we refer to as the *arrow category* of $\mathcal{C}$. The arrow category $\mathrm{Fun}([1], \mathcal{C})$ has the same objects as the twisted arrow category $\mathrm{Tw}(\mathcal{C})$. However, the morphisms are different: if $f : X \to Y$ and $f' : X' \to Y'$ are morphisms of $\mathcal{C}$, then morphisms from f to f' in $\mathrm{Fun}([1], \mathcal{C})$ can be identified with commutative diagrams `03JD`

$$\begin{tikzcd}
X \arrow[r] \arrow[d, "f"] & X' \arrow[d, "f'"] \\
Y \arrow[r] & Y',
\end{tikzcd}$$

where the horizontal maps are oriented in the same direction.

Example 8.1.0.5. Let Q be a partially ordered set, which we regard as a category. Then the twisted arrow category $\mathrm{Tw}(Q)$ can be identified (via the forgetful functor of Remark 8.1.0.2) with the partially ordered set `00B2`

$$\{(p, q) \in Q^{\mathrm{op}} \times Q : p \leq q\} \subseteq Q^{\mathrm{op}} \times Q.$$

Remark 8.1.0.6. Let $\mathcal{C}$ be a category. For every object $X \in \mathcal{C}$, the fiber $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ can be identified with the coslice category $\mathcal{C}_{X/}$ of Variant 4.3.1.4. Similarly, the fiber $\mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{X\}$ can be identified with the *opposite* of the slice category $\mathcal{C}_{/X}$ of Construction 4.3.1.1. `03JE`

In §8.1.1, we generalize Construction 8.1.0.1 to the setting of ∞-categories. To every simplicial set $\mathcal{C}$, we associate another simplicial set $\mathrm{Tw}(\mathcal{C})$, whose n-simplices can be identified with $(2n+1)$-simplices of $\mathcal{C}$ (Construction 8.1.1.1). This construction has the following features:

- If $\mathcal{C} = \mathrm{N}_{\bullet}(\mathcal{C}_0)$ is (the nerve of) an ordinary category $\mathcal{C}_0$, then $\mathrm{Tw}(\mathcal{C})$ can be identified with the nerve of the twisted arrow category $\mathrm{Tw}(\mathcal{C}_0)$ (Proposition 8.1.1.10). Consequently, the twisted arrow construction of §8.1.1 can be regarded as a generalization of Construction 8.1.0.1.

- The simplicial set $\mathrm{Tw}(\mathcal{C})$ is equipped with a projection map $\lambda : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$. If $\mathcal{C}$ is an ∞-category, then λ is a left fibration (Proposition 8.1.1.11); in particular, $\mathrm{Tw}(\mathcal{C})$ is also an ∞-category (Corollary 8.1.1.12).

Let $\mathcal{C}$ be an ∞-category. In §8.1.2, we study the fibers of the left fibration $\lambda : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$. Our main result asserts that if $f : X \to Y$ is an isomorphism in the ∞-category $\mathcal{C}$, then f is initial when viewed as an object of the ∞-category $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ (see Proposition 8.1.2.1, and Corollary 8.1.2.21 for the converse). From this, we deduce an analogue of Remark 8.1.0.6: there is a canonical equivalence of ∞-categories $\mathcal{C}_{X/} \hookrightarrow \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ (Proposition 8.1.2.9), which induces a homotopy equivalence of Kan complexes

$$\mathrm{Hom}_{\mathcal{C}}(X, Y) \simeq \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$$

for each object $Y \in \mathcal{C}$ (Notation 8.1.2.14). Moreover, we show that these homotopy equivalences are compatible with covariant transport for the left fibration λ (Corollary 8.1.2.18).

The twisted arrow construction $S \mapsto \mathrm{Tw}(S)$ determines a functor from the category of simplicial sets to itself. In particular, to every simplicial set T we can associate a new simplicial set $\mathrm{Cospan}(T)$, whose n-simplices are given by maps $\mathrm{Tw}(\Delta^n) \to T$. We will refer to $\mathrm{Cospan}(T)$ as the *simplicial set of cospans in* T (Construction 8.1.3.1). This construction has the following features:

- The construction $T \mapsto \mathrm{Cospan}(T)$ determines a functor from the category of simplicial sets to itself, which is right adjoint to the twisted arrow functor $S \mapsto \mathrm{Tw}(S)$ (Corollary 8.1.3.8).

- Let $\mathcal{C}$ be an ordinary category which admits pushouts, and let $\mathrm{Cospan}(\mathcal{C})$ denote the 2-category of cospans in $\mathcal{C}$ (Example 2.2.2.1). Then there is a canonical isomorphism of simplicial sets
$$\mathrm{Cospan}(\mathrm{N}_{\bullet}(\mathcal{C})) \xrightarrow{\sim} \mathrm{N}^{\mathrm{D}}_{\bullet}(\mathrm{Cospan}(\mathcal{C})),$$
which we construct in §8.1.3 (see Corollary 8.1.3.15).

- Let $\mathcal{C}$ be a 2-category containing a pair of objects X and Y, and let $\underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y)$ denote the category of 1-morphisms from X to Y. Then there is a canonical isomorphism of simplicial sets
$$\mathrm{Cospan}(\mathrm{N}_{\bullet}\, \underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y)) \xrightarrow{\sim} \mathrm{Hom}_{\mathrm{N}^{\mathrm{D}}_{\bullet}(\mathcal{C})}(X, Y),$$
which we construct in §8.1.8 (see Corollary 8.1.8.6).

- If $\mathcal{C}$ is an ∞-category which admits pushouts, then the simplicial set $\mathrm{Cospan}(\mathcal{C})$ is an $(\infty, 2)$-category (Proposition 8.1.4.1). We prove this in §8.1.4 using an explicit characterization of the collection of thin 2-simplices of $\mathrm{Cospan}(\mathcal{C})$ (Proposition 8.1.4.2), which we prove in §8.1.5.

8.1.1 The Twisted Arrow Construction

We now describe an ∞-categorical generalization of Construction 8.1.0.1. 03JF

Construction 8.1.1.1 (Twisted Arrows in Simplicial Sets)**.** Let $\boldsymbol{\Delta}$ denote the simplex category (Definition 1.1.0.2) and let $\mathcal{C}$ be a simplicial set. We let $\mathrm{Tw}(\mathcal{C}) : \boldsymbol{\Delta}^{\mathrm{op}} \to \mathrm{Set}$ denote the functor given by the construction 03JG

$$(J \in \boldsymbol{\Delta}^{\mathrm{op}}) \mapsto \mathrm{Hom}_{\mathrm{Set}_{\Delta}}(\mathrm{N}_{\bullet}(J^{\mathrm{op}} \star J), \mathcal{C}).$$

We will refer to $\mathrm{Tw}(\mathcal{C})$ as the *simplicial set of twisted arrows of* $\mathcal{C}$.

Remark 8.1.1.2. For every integer $n \geq 0$, there is a unique isomorphism of simplicial sets $\mathrm{N}_{\bullet}([n]^{\mathrm{op}} \star [n]) \simeq \Delta^{2n+1}$. It follows that, for every simplicial set $\mathcal{C}$, we can identify n-simplices σ of $\mathrm{Tw}(\mathcal{C})$ with $(2n+1)$-simplices $\overline{\sigma}$ of $\mathcal{C}$. In terms of these identifications, the face and degeneracy operators of $\mathrm{Tw}(\mathcal{C})$ are given explicitly by the formulae 03JH

$$\overline{d^n_i \sigma} = d^{2n}_{n-i} d^{2n+1}_{n+1+i} \overline{\sigma} \qquad \overline{s^n_i \sigma} = s^{2n+2}_{n-i} s^{2n+1}_{n+1+i} \overline{\sigma}.$$

Remark 8.1.1.3. Let $\mathcal{C}$ be a simplicial set. We will generally use Remark 8.1.1.2 to identify vertices of the simplicial set $\mathrm{Tw}(\mathcal{C})$ with edges $f : X \to Y$ of $\mathcal{C}$. More generally, it will be useful to think of n-simplices of $\mathrm{Tw}(\mathcal{C})$ as encoding diagrams 03JJ

$$\begin{tikzcd}
X_0 \arrow[d, "f_0"] & X_1 \arrow[l] \arrow[d, "f_1"] & X_2 \arrow[l] \arrow[d, "f_2"] & \cdots \arrow[l] \arrow[d] & X_n \arrow[l] \arrow[d, "f_n"] \\
Y_0 \arrow[r] & Y_1 \arrow[r] & Y_2 \arrow[r] & \cdots \arrow[r] & Y_n.
\end{tikzcd}$$

Remark 8.1.1.4. The construction $\mathcal{C} \mapsto \mathrm{Tw}(\mathcal{C})$ determines a functor from the category of simplicial sets to itself, which preserves all limits and colimits (this follows from Remark 8.1.1.2, since limits and colimits in the category Set_{Δ} are computed levelwise). 00B3

03Y5 **Remark 8.1.1.5.** Let κ be an uncountable cardinal. If $\mathcal{C}$ is a κ-small simplicial set, then $\mathrm{Tw}(\mathcal{C})$ is also κ-small. To prove this, we may assume without loss of generality that κ is the smallest uncountable cardinal for which $\mathcal{C}$ is κ-small. In particular, κ is regular. It will therefore suffice to show that, for every integer n, the set of n-simplices of $\mathrm{Tw}(\mathcal{C})$ is κ-small (Proposition 4.7.4.9). This follows from the κ-smallness of the set of $(2n+1)$-simplices of $\mathcal{C}$ (Remark 8.1.1.2).

03JK **Notation 8.1.1.6** (Projection Maps)**.** Let $\mathcal{C}$ be a simplicial set. Then the simplicial set $\mathrm{Tw}(\mathcal{C})$ is equipped with projection maps

$$\lambda_- : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \qquad \lambda_+ : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}.$$

Here λ_+ carries an n-simplex σ of $\mathrm{Tw}(\mathcal{C})$ to the n-simplex of $\mathcal{C}$ given by the composition

$$\Delta^n = \mathrm{N}_\bullet([n]) \hookrightarrow \mathrm{N}_\bullet([n]^{\mathrm{op}} \star [n]) \xrightarrow{\sigma} \mathcal{C},$$

while λ_- carries σ to the n-simplex of $\mathcal{C}^{\mathrm{op}}$ given by the composite map

$$(\Delta^n)^{\mathrm{op}} = \mathrm{N}_\bullet([n]^{\mathrm{op}}) \hookrightarrow \mathrm{N}_\bullet([n]^{\mathrm{op}} \star [n]) \xrightarrow{\sigma} \mathcal{C}.$$

Concretely, λ_- and λ_+ are given on vertices by the formulae $\lambda_-(f : X \to Y) = X$ and $\lambda_+(f : X \to Y) = Y$.

03JL **Remark 8.1.1.7** (Duality)**.** Let $\mathcal{C}$ be a simplicial set. Then there is a canonical isomorphism of simplicial sets $\iota : \mathrm{Tw}(\mathcal{C}) \simeq \mathrm{Tw}(\mathcal{C}^{\mathrm{op}})$, given on n-simplices by precomposition with the unique isomorphism

$$\mathrm{N}_\bullet([n]^{\mathrm{op}} \star [n])^{\mathrm{op}} \simeq \mathrm{N}_\bullet([n]^{\mathrm{op}} \star [n]).$$

The isomorphism ι interchanges the projection maps λ_- and λ_+ of Notation 8.1.1.6.

03JM **Exercise 8.1.1.8** (Slices of Twisted Arrows)**.** Let $\mathcal{C}$ be a simplicial set and let $f : X \to Y$ be an edge of $\mathcal{C}$, which we regard as a vertex of the simplicial set $\mathrm{Tw}(\mathcal{C})$. Show that there is a canonical isomorphism of simplicial sets

$$\mathrm{Tw}(\mathcal{C})_{/f} \simeq \mathrm{Tw}(\mathcal{C}_{X/\,/Y}).$$

Here $\mathcal{C}_{X/\,/Y}$ denotes the simplicial set $(\mathcal{C}_{X/})_{/Y} \simeq (\mathcal{C}_{/Y})_{X/}$, obtained either by promoting Y to a vertex of $\mathcal{C}_{X/}$ or X to a vertex of $\mathcal{C}_{/Y}$ by means of the edge f (see Remark 4.6.6.2).

03LW **Warning 8.1.1.9.** Let $\mathcal{C}$ be a simplicial set. Then there is a tautological map $T : \mathcal{C} \to \mathrm{Tw}(\mathcal{C}^{\mathrm{op}} \star \mathcal{C})$, which carries an n-simplex $\sigma : \Delta^n \to \mathcal{C}$ to the n-simplex $T(\sigma)$ of $\mathrm{Tw}(\mathcal{C}^{\mathrm{op}} \star \mathcal{C})$ given by the composition

$$\mathrm{N}_\bullet([n]^{\mathrm{op}} \star [n]) \xrightarrow{\sigma^{\mathrm{op}} \star \sigma} \mathcal{C}^{\mathrm{op}} \star \mathcal{C}.$$

If $\mathcal{D}$ is another simplicial set, then precomposition with T induces a comparison map

$$\mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathcal{C}^{\mathrm{op}} \star \mathcal{C}, \mathcal{D}) \to \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathrm{Tw}(\mathcal{C}^{\mathrm{op}} \star \mathcal{C}), \mathrm{Tw}(\mathcal{D})) \xrightarrow{\circ T} \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathcal{C}, \mathrm{Tw}(\mathcal{D})).$$

Beware that, in general, this map is not a bijection. However, it is a bijection whenever $\mathcal{C}$ is isomorphic to the nerve of a linearly ordered set Q. To prove this, we can write Q as a filtered colimit of its finite subsets and thereby reduce to the case where Q is finite. In this case, the linearly ordered set Q is either empty (in which case the desired result is obvious) or isomorphic to $[n]$ for some integer $n \geq 0$ (in which case the desired result follows from the definition of the $\mathrm{Tw}(\mathcal{D})$).

We now show that Construction 8.1.1.1 can be regarded as a generalization of Construction 8.1.0.1.

Proposition 8.1.1.10. *Let $\mathcal{C}$ be a category. Then there is a canonical isomorphism of simplicial sets $T : \mathrm{N}_\bullet(\mathrm{Tw}(\mathcal{C})) \xrightarrow{\sim} \mathrm{Tw}(\mathrm{N}_\bullet(\mathcal{C}))$, which is uniquely determined by the following requirements:* 03JN

(1) *For every morphism $f : C \to D$ in the category $\mathcal{C}$, the map T carries f (regarded as an object of $\mathrm{Tw}(\mathcal{C})$) to itself (regarded as a vertex of $\mathrm{Tw}(\mathrm{N}_\bullet(\mathcal{C}))$).*

(2) *The diagram*

$$\begin{tikzcd}
\mathrm{N}_\bullet(\mathrm{Tw}(\mathcal{C})) \arrow[r, "T"] \arrow[d] & \mathrm{Tw}(\mathrm{N}_\bullet(\mathcal{C})) \arrow[d, "(\lambda_-, \lambda_+)"] \\
\mathrm{N}_\bullet(\mathcal{C}^{\mathrm{op}} \times \mathcal{C}) \arrow[r, "\sim"] & \mathrm{N}_\bullet(\mathcal{C})^{\mathrm{op}} \times \mathrm{N}_\bullet(\mathcal{C})
\end{tikzcd}$$

commutes, where the right vertical map is given by Notation 8.1.1.6 and the left vertical map is the nerve of the forgetful functor

$$\mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \qquad (f : X \to Y) \mapsto (X, Y).$$

Proof. Let σ be an n-simplex of the simplicial set $\mathrm{N}_\bullet(\mathrm{Tw}(\mathcal{C}))$, which we identify with a diagram

$$(f_0 : X_0 \to Y_0) \xrightarrow{(u_1, v_1)} (f_1 : X_1 \to Y_1) \xrightarrow{(u_2, v_2)} \cdots \xrightarrow{(u_n, v_n)} (f_n : X_n \to Y_n)$$

in the category $\mathrm{Tw}(\mathcal{C})$. Here each $f_i : X_i \to Y_i$ denotes a morphism in $\mathcal{C}$, and each (u_i, v_i) is a pair of morphisms in $\mathcal{C}$ which determine a commutative diagram

$$\begin{tikzcd}
X_{i-1} \arrow[d, "f_{i-1}"] & X_i \arrow[l, "u_i"'] \arrow[d, "f_i"] \\
Y_{i-1} \arrow[r, "v_i"] & Y_i.
\end{tikzcd}$$

In this case, we can regard the chain of morphisms

03JP
$$\begin{tikzcd}
X_0 \arrow[d, "f_0"] & X_1 \arrow[l, "u_1"'] & X_2 \arrow[l, "u_2"'] & \cdots \arrow[l] & X_n \arrow[l, "u_n"'] \\
Y_0 \arrow[r, "v_1"] & Y_1 \arrow[r, "v_2"] & Y_2 \arrow[r] & \cdots \arrow[r, "v_n"] & Y_n
\end{tikzcd} \tag{8.1}$$

as a $(2n+1)$-simplex of $\mathrm{N}_\bullet(\mathcal{C})$, which we identify with an n-simplex $T(\sigma)$ of $\mathrm{Tw}(\mathrm{N}_\bullet(\mathcal{C}))$. The construction $\sigma \mapsto T(\sigma)$ then determines a morphism of simplicial sets $T : \mathrm{N}_\bullet(\mathrm{Tw}(\mathcal{C})) \to \mathrm{Tw}(\mathrm{N}_\bullet(\mathcal{C}))$, which satisfies conditions (1) and (2) by construction.

We now claim that T is an isomorphism of simplicial sets. Let τ be an n-simplex of $\mathrm{Tw}(\mathrm{N}_\bullet(\mathcal{C}))$; we wish to show that there is a unique n-simplex σ of $\mathrm{N}_\bullet(\mathrm{Tw}(\mathcal{C}))$ satisfying $T(\sigma) = \tau$. Let us identify τ with a diagram of the form (8.1) in the category $\mathcal{C}$. We wish to show that there is a unique collection of morphisms $\{f_i : X_i \to Y_i\}_{1 \leq i \leq n}$ satisfying the identities $f_i = v_i \circ f_{i-1} \circ u_i$, which follows immediately by induction on i.

We now complete the proof by establishing the uniqueness of T. Suppose that $T' : \mathrm{N}_\bullet(\mathrm{Tw}(\mathcal{C})) \xrightarrow{\sim} \mathrm{Tw}(\mathrm{N}_\bullet(\mathcal{C}))$ is another morphism of simplicial sets satisfying conditions (1) and (2). Then $T^{-1} \circ T'$ determines a functor F from the twisted arrow category $\mathrm{Tw}(\mathcal{C})$ to itself. Because T and T' both satisfy condition (1), the functor F carries each object of $\mathrm{Tw}(\mathcal{C})$ to itself. Since the forgetful functor $\mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ is faithful, condition (2) guarantees that F also carries each morphism of $\mathrm{Tw}(\mathcal{C})$ to itself. It follows that F is the identity functor, so that $T' = T$. □

Let $\mathcal{C}$ be a simplicial set. It follows from Proposition 8.1.1.10 that if $\mathcal{C}$ is isomorphic to the nerve of a category, then the simplicial set $\mathrm{Tw}(\mathcal{C})$ is also isomorphic to the nerve of a category. Moreover, the projection maps of Notation 8.1.1.6 determine a left covering map $\mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ (see Remark 8.1.0.2). This observation has an ∞-categorical counterpart:

03JQ **Proposition 8.1.1.11.** *Let $\mathcal{C}$ be an ∞-category. Then the projection maps of Notation 8.1.1.6 determine a left fibration of simplicial sets*

$$(\lambda_-, \lambda_+) : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}\,.$$

Corollary 8.1.1.12. *Let $\mathcal{C}$ be an ∞-category. Then the simplicial set* $\mathrm{Tw}(\mathcal{C})$ *is also an ∞-category.* 03JR

Proof. Combine Proposition 8.1.1.11 with Remark 4.1.1.9. □

Corollary 8.1.1.13. *Let $\mathcal{C}$ be a Kan complex. Then the projection map* $(\lambda_-, \lambda_+) : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ *is a Kan fibration. In particular,* $\mathrm{Tw}(\mathcal{C})$ *is a Kan complex.* 048H

Proof. Combine Proposition 8.1.1.11 with Corollary 4.4.3.8. □

In the situation of Corollary 8.1.1.12, we will refer to $\mathrm{Tw}(\mathcal{C})$ as the *twisted arrow ∞-category of $\mathcal{C}$.*

Corollary 8.1.1.14. *Let $\mathcal{C}$ be an ∞-category. Then the projection maps* $\lambda_- : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}}$ *and* $\lambda_+ : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}$ *are cocartesian fibrations of ∞-categories. Moreover, a morphism f of* $\mathrm{Tw}(\mathcal{C})$ *is λ_--cocartesian if and only if $\lambda_+(f)$ is an isomorphism, and λ_+-cocartesian if and only if $\lambda_-(f)$ is an isomorphism.* 03JS

Proof. Let $\pi_- : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{C}^{\mathrm{op}}$ and $\pi_+ : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{C}$ denote the projection maps. Then π_- and π_+ are cocartesian fibrations of simplicial sets. Moreover, a morphism (e_-, e_+) of $\mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ is π_--cocartesian if and only if e_+ is an isomorphism in $\mathcal{C}$, and π_+-cocartesian if and only if e_- is an isomorphism in $\mathcal{C}^{\mathrm{op}}$ (this follows immediately from Remark 5.1.4.6 and Example 5.1.1.4). Corollary 8.1.1.14 now follows by applying Proposition 8.1.1.11 to left and right sides of the diagram

$$\begin{tikzcd}
 & \mathrm{Tw}(\mathcal{C}) \arrow[dl, "\lambda_-"'] \arrow[d, "(\lambda_-, \lambda_+)"] \arrow[dr, "\lambda_+"] & \\
\mathcal{C}^{\mathrm{op}} & \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \arrow[l, "\pi_-"'] \arrow[r, "\pi_+"] & \mathcal{C},
\end{tikzcd}$$

since the vertical map in the center is a left fibration (Proposition 8.1.1.11). □

Proposition 8.1.1.11 is a special case of the following more general assertion:

Proposition 8.1.1.15. *Let $U : \mathcal{C} \to \mathcal{D}$ be an inner fibration of simplicial sets. Then the projection maps of Notation 8.1.1.6 determine a left fibration of simplicial sets* 03JT

$$\mathrm{Tw}(\mathcal{C}) \to (\mathcal{C}^{\mathrm{op}} \times \mathcal{C}) \times_{(\mathcal{D}^{\mathrm{op}} \times \mathcal{D})} \mathrm{Tw}(\mathcal{D}).$$

Proof. Fix a pair of integers $0 < i \leq n$; we wish to show that every lifting problem

03JU
$$\begin{tikzcd}
\Lambda^n_{n-i} \arrow[r] \arrow[d] & \mathrm{Tw}(\mathcal{C}) \arrow[d] \\
\Delta^n \arrow[r] \arrow[ur, dashed] & (\mathcal{C}^{\mathrm{op}} \times \mathcal{C}) \times_{(\mathcal{D}^{\mathrm{op}} \times \mathcal{D})} \mathrm{Tw}(\mathcal{D})
\end{tikzcd} \tag{8.2}$$

admits a solution.

For each nonempty subset $S \subseteq [2n+1] = \{0 < 1 < \cdots < 2n+1\}$, let σ_S denote the corresponding nondegenerate simplex of Δ^{2n+1}. Let us say that S is *basic* if it satisfies one of the following conditions:

(a) The set S is contained in $\{0 < 1 < \cdots < n\}$.

(b) The set S is contained in $\{n+1 < n+2 < \cdots < 2n+1\}$.

(c) There exists an integer $j \neq i$ such that $0 \leq j \leq n$ and $S \cap \{j, 2n+1-j\} = \emptyset$.

Let $K_0 \subseteq \Delta^{2n+1}$ be the simplicial subset whose nondegenerate simplices have the form σ_S, where S is basic. Unwinding the definitions, we can rewrite (8.2) as a lifting problem

$$\begin{tikzcd}
K_0 \arrow[r] \arrow[d] & \mathcal{C} \arrow[d, "U"] \\
\Delta^{2n+1} \arrow[r] \arrow[ur, dashed] & \mathcal{D}.
\end{tikzcd}$$

Since U is an inner fibration, it will suffice to show that the inclusion $K_0 \hookrightarrow \Delta^{2n+1}$ is an inner anodyne map of simplicial sets.

We now introduce two more collections of subsets of $[2n+1]$.

- We say that a subset $S \subseteq [2n+1]$ is *primary* if it is not basic, the intersection $S \cap \{0, 1, \cdots, i-1\}$ is empty, and $2n+1-i \in S$.
- We say that a subset $S \subseteq [2n+1]$ is *secondary* if it is not basic, the intersection $S \cap \{0, 1, \cdots, i-1\}$ is nonempty, and $i \in S$.

Let $\{S_1, S_2, \cdots, S_m\}$ be an ordering of the collection of all subsets of $[2n+1]$ which are either primary or secondary, satisfying the following conditions:

- The sequence of cardinalities $|S_1|, |S_2|, \cdots, |S_m|$ is nondecreasing. That is, for $1 \leq p \leq q \leq m$, we have $|S_p| \leq |S_q|$.

- If $|S_p| = |S_q|$ for $p \leq q$ and S_q is primary, then S_p is also primary.

For $1 \leq q \leq m$, let $\sigma_q \subseteq \Delta^{2n+1}$ denote the simplex spanned by the vertices of S_q, and let K_q denote the union of K_0 with the simplices $\{\sigma_1, \sigma_2, \cdots, \sigma_q\}$. We have inclusion maps

$$K_0 \hookrightarrow K_1 \hookrightarrow K_2 \hookrightarrow \cdots \hookrightarrow K_m.$$

Note that we have $\sigma_m = K_m = \Delta^{2n+1}$ (since the set $[2n+1]$ is secondary). It will therefore suffice to show that for $1 \leq q \leq m$, the inclusion map $K_{q-1} \hookrightarrow K_q$ is inner anodyne.

In what follows, we regard q as fixed. Let d be the dimension of the simplex σ_q. Let us abuse notation by identifying σ_q with a morphism of simplicial sets $\Delta^d \to K_q \subseteq \Delta^{2n+1}$, and set $L = \sigma_q^{-1} K_{q-1} \subseteq \Delta^d$. To complete the proof, it will suffice to show that L is an inner horn of Δ^d, so that the diagram of simplicial sets

$$\begin{tikzcd}
L \arrow[r] \arrow[d] & K_{q-1} \arrow[d] \\
\Delta^d \arrow[r, "\sigma_q"] & K_q.
\end{tikzcd}$$

is a pushout square by virtue of Lemma 3.1.2.11.

We first consider the case where the set $S_q = \{j_0 < j_1 < \cdots < j_d\}$ is primary, so that we have $j_0 \geq i$ and $j_k = 2n+1-i$ for some $0 \leq k \leq d$. Note that we must have $k > 0$ (otherwise S_q satisfies condition (b)) and $k < d$ (otherwise, S_q satisfies condition (c), since it is disjoint from $\{0, 2n+1\}$). In this case, we will show that L coincides with the inner horn $\Lambda^d_k \subset \Delta^d$. This can be restated as follows:

$(*)$ Let j be an element of S_q, and set $S' = S_q \setminus \{j\}$. Then $\sigma_{S'}$ is contained in K_{q-1} if and only if $j \neq 2n+1-i$.

Assume first that $j \neq 2n+1-i$. Then the set S' contains $2n+1-i$ and satisfies $S' \cap \{0, 1, \cdots, i-1\} = \emptyset$. Consequently, the set S' is either primary (and therefore coincides with $S_{q'}$ for some $q' < q$) or basic. In either case, the simplex $\sigma_{S'}$ belongs to the simplicial subset $K_{q-1} \subseteq \Delta^{2n+1}$.

We now prove $(*)$ in the case $j = 2n+1-i$. Since S_q does not satisfy conditions (b) or (c), the set S' also does not satisfy conditions (b) or (c). It also cannot satisfy condition (a): if S' were contained in the set $\{0, 1, \cdots, n\}$, then S_q would be contained in the set $\{i, i+1, \cdots, n, 2n+1-i\}$, and would therefore satisfy condition (c). It follows that S' is not basic. Assume, for a contradiction, that $\sigma_{S'}$ is contained in K_{q-1}. We then have $\sigma_{S'} \subseteq \sigma_{q'}$ for some $q' < q$. Since S' is neither primary nor secondary, this must be a proper inclusion: that is, we must have

$$\dim(\sigma_q) - 1 = \dim(\sigma_{S'}) < \dim(\sigma_{q'}) \leq \dim(\sigma_q).$$

It follows that the second inequality must be an equality: that is, we have $|S_{q'}| = |S_q|$ and therefore $S_{q'}$ is also primary. In particular, the set $S_{q'}$ contains $2n+1-i$, and therefore contains the union $S' \cup \{2n+1-i\} = S_q$. Since S_q and $S_{q'}$ have the same cardinality, it follows that $S_q = S_{q'}$ and therefore $q = q'$, contradicting our assumption that $q' < q$.

We now consider the case where $S_q = \{j_0 < j_1 < \cdots < j_d\}$ is secondary, so that we have $j_0 < i$ and $j_k = i$ for some $0 < k \leq d$. Note that we must have $k < d$ (otherwise, S_q satisfies condition (a)). In this case, we will show that L coincides with the inner horn $\Lambda^d_k \subset \Delta^d$. This can be restated as follows:

$(*')$ Let $j \in S_q$ and set $S' = S_q \setminus \{j\}$. Then the simplex $\sigma_{S'}$ is contained in K_{q-1} if and only if $j = i$.

We first treat the case where $j \neq i$, so that $i \in S'$. If S' is basic, then $\sigma_{S'} \subseteq K \subseteq K_{q-1}$. We may therefore assume that S' is not basic. If the intersection $S' \cap \{0, 1, \cdots, i-1\}$ is nonempty, then S' is secondary and has smaller cardinality than S_q. It follows that $S' = S_{q'}$ for some $q' < q$, so that $\sigma_{S'} \subseteq K_{q'} \subseteq K_{q-1}$. We may therefore assume that the intersection $S' \cap \{0, 1, \cdots, i-1\}$ is empty. In this case, the union $S' \cup \{2n+1-i\}$ is a primary set of cardinality $\leq |S_q|$, and therefore has the form $S_{q'}$ for some $q' < q$. From this, we again conclude that $\sigma_{S'} \subseteq K_{q'} \subseteq K_{q-1}$.

We now prove $(*')$ in the case $j = i$. Since S_q does not satisfy conditions (a) or (c), it follows that S' also does not satisfy conditions (a) or (c). The set S' also does not satisfy condition (b), since the intersection $S' \cap \{0, \cdots, i-1\}$ is nonempty. It follows that S' is not basic. Assume, for a contradiction, that $\sigma_{S'}$ is contained in K_{q-1}. We then have $\sigma_{S'} \subseteq \sigma_{q'}$ for some $q' < q$. Since the intersection $S_{q'} \cap \{1, \cdots, i-1\}$ is nonempty, the set $S_{q'}$ cannot be primary and is therefore secondary. In particular, the set $S_{q'}$ contains the element i and therefore contains the union $S' \cup \{i\} = S_q$. Combining this observation with the inequality $|S_{q'}| \leq |S_q|$, we deduce that $S_{q'} = S_q$ and therefore $q' = q$, contradicting our assumption that $q' < q$. □

8.1.2 Homotopy Transport for Twisted Arrows

03JV Let $\mathcal{C}$ be an ∞-category and let $\mathrm{Tw}(\mathcal{C})$ denote its twisted arrow ∞-ategory. For every pair of objects $X, Y \in \mathcal{C}$, Proposition 8.1.1.11 guarantees that the fiber product

$$\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$$

is a Kan complex, whose vertices can be identified with morphisms $f : X \to Y$. Our goal in this section is to show that this identification can be promoted to a homotopy equivalence of Kan complexes

$$\mathrm{Hom}^{\mathrm{L}}_{\mathcal{C}}(X, Y) \hookrightarrow \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\},$$

where $\mathrm{Hom}^{\mathrm{L}}_{\mathcal{C}}(X,Y) = \mathcal{C}_{X/} \times_{\mathcal{C}} \{Y\}$ denotes the left-pinched morphism space of Construction 4.6.5.1 (see Corollary 8.1.2.10). Our starting point is the following result:

Proposition 8.1.2.1. *Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be an isomorphism in $\mathcal{C}$. Then f is initial when viewed as an object of the ∞-category $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$.* 03JW

Remark 8.1.2.2. The converse of Proposition 8.1.2.1 is also true: see Corollary 8.1.2.21. 03JX

We will prove Proposition 8.1.2.1 at the end of this section. First, let us record some consequences.

Corollary 8.1.2.3. *Let $\mathcal{C}$ be a Kan complex. Then the projection maps* 048J

$$\mathcal{C}^{\mathrm{op}} \xleftarrow{\lambda_-} \mathrm{Tw}(\mathcal{C}) \xrightarrow{\lambda_+} \mathcal{C}$$

are trivial Kan fibrations of simplicial sets.

Proof. It follows from Corollary 8.1.1.13 that λ_- and λ_+ are Kan fibrations. By virtue of Proposition 3.3.7.6, it will suffice to show that the fibers of λ_- and λ_+ are contractible Kan complexes, which is an immediate consequence of Proposition 8.1.2.1 (see Corollary 4.6.7.11). □

Corollary 8.1.2.4. *Let $\mathcal{C}$ be a simplicial set. Then the projection map $\lambda_+ : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}$ is universally localizing (see Definition 6.3.6.1).* 048K

Proof. Writing $\mathcal{C}$ as the filtered colimit of its skeleta $\mathrm{sk}_n(\mathcal{C})$ and using Proposition 6.3.6.12, we can reduce to the case where $\mathcal{C}$ has dimension $\leq n$ for some integer $n \geq 0$. We proceed by induction on n. If $n = 0$, the morphism λ_+ is an isomorphism. Let us therefore assume that n is positive. Let S denote the collection of nondegenerate n-simplices of $\mathcal{C}$, so that Proposition 1.1.4.12 supplies a pushout square

$$\begin{tikzcd}
S \times \partial \Delta^n \arrow[r] \arrow[d] & S \times \Delta^n \arrow[d] \\
\mathrm{sk}_{n-1}(\mathcal{C}) \arrow[r] & \mathcal{C},
\end{tikzcd}$$

where the horizontal maps are monomorphisms. Combining our inductive hypothesis with Proposition 6.3.6.13, we can replace $\mathcal{C}$ by $S \times \Delta^n$ and thereby reduce to the case where $\mathcal{C}$ is an ∞-category. In this case, λ_+ is a cocartesian fibration (Corollary 8.1.1.14) having weakly contractible fibers (Proposition 8.1.2.1 and Corollary 4.6.7.25), and is therefore universally localizing by virtue of Example 6.3.6.2. □

048L **Corollary 8.1.2.5.** *Let $\mathcal{C}$ be a simplicial set. Then the projection map $\lambda_+ : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}$ is a weak homotopy equivalence.*

Proof. Combine Corollary 8.1.2.4 with Remark 6.3.6.5. □

048M **Corollary 8.1.2.6.** *Let $F : \mathcal{C} \to \mathcal{D}$ be a morphism of simplicial sets. Then F is a weak homotopy equivalence if and only if the induced map $\mathrm{Tw}(F) : \mathrm{Tw}(\mathcal{C}) \to \mathrm{Tw}(\mathcal{D})$ is a weak homotopy equivalence.*

Proof. We have a commutative diagram of simplicial sets

$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{C}) \arrow[r, "\mathrm{Tw}(F)"] \arrow[d] & \mathrm{Tw}(\mathcal{D}) \arrow[d] \\
\mathcal{C} \arrow[r] & \mathcal{D},
\end{tikzcd}$$

where the vertical maps are weak homotopy equivalences by virtue of Corollary 8.1.2.4. □

03JY **Construction 8.1.2.7.** Let $\mathcal{C}$ be a simplicial set and let X be a vertex of $\mathcal{C}$. Let σ be an n-simplex of the coslice simplicial set $\mathcal{C}_{X/}$, which we identify with a morphism of simplicial sets $\{x\} \star \Delta^n \to \mathcal{C}$ satisfying $\sigma(x) = X$. Then the composite map

$$(\Delta^n)^{\mathrm{op}} \star \Delta^n \twoheadrightarrow \{x\} \star \Delta^n \xrightarrow{\sigma} \mathcal{C}$$

can be identified with an n-simplex of the twisted arrow simplicial set $\mathrm{Tw}(\mathcal{C})$, which we will denote by $\iota_X(\sigma)$. The construction $\sigma \mapsto \iota_X(\sigma)$ is compatible with the formation of face and degeneracy operators, and therefore determines a morphism of simplicial sets $\iota_X : \mathcal{C}_{X/} \to \mathrm{Tw}(\mathcal{C})$. Moreover, the diagram

$$\begin{tikzcd}
\mathcal{C}_{X/} \arrow[r, "\iota_X"] \arrow[d] & \mathrm{Tw}(\mathcal{C}) \arrow[d, "\lambda_-"] \\
\{X\} \arrow[r] & \mathcal{C}^{\mathrm{op}}
\end{tikzcd}$$

commutes, where λ_- is the projection map of Notation 8.1.1.6. It follows that ι_X can be regarded as a morphism of simplicial sets from $\mathcal{C}_{X/}$ to the fiber $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. We will refer to this morphism as the *coslice inclusion*.

Remark 8.1.2.8. Let $\mathcal{C}$ be a simplicial set and let $X \in \mathcal{C}$ be a vertex. Then an n-simplex σ of $\mathcal{C}_{X/}$ can be identified with an $(n+1)$-simplex of $\mathcal{C}$, which we represent informally as a diagram 03JZ

$$X \xrightarrow{f} Y_0 \xrightarrow{v_1} Y_1 \xrightarrow{v_2} Y_2 \rightarrow \cdots \xrightarrow{v_n} Y_n.$$

The morphism ι_X of Construction 8.1.2.7 carries σ to a $(2n+1)$-simplex τ of $\mathcal{C}$, which can be represented informally by the diagram

$$\begin{tikzcd}
X \arrow[d, "f"] & X \arrow[l, "\mathrm{id}"'] & X \arrow[l, "\mathrm{id}"'] & \cdots \arrow[l, "\mathrm{id}"'] & X \arrow[l, "\mathrm{id}"'] \\
Y_0 \arrow[r, "v_1"] & Y_1 \arrow[r, "v_2"] & Y_2 \arrow[r] & \cdots \arrow[r, "v_n"] & Y_n.
\end{tikzcd}$$

Note that σ can be recover from τ (by composing with the inclusion map $\Delta^{n+1} \hookrightarrow \Delta^{2n+1}$, given on vertices by $i \mapsto i+n$). It follows that ι_X is a monomorphism of simplicial sets $\mathcal{C}_{X/} \hookrightarrow \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ (as suggested by our terminology).

Proposition 8.1.2.9. *Let $\mathcal{C}$ be an ∞-category. For every object $X \in \mathcal{C}$, the coslice inclusion* 03K0

$$\iota_X : \mathcal{C}_{X/} \hookrightarrow \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$$

is an equivalence of ∞-categories.

Proof. By construction, we have a commutative diagram

$$\begin{tikzcd}
\mathcal{C}_{X/} \arrow[rr, "\iota_X"] \arrow[dr] & & \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[dl, "\lambda_+"] \\
& \mathcal{C}, &
\end{tikzcd}$$

where the vertical maps are left fibrations of ∞-categories (Propositions 4.3.6.1 and 8.1.1.11). Moreover, the ∞-category $\mathcal{C}_{X/}$ has an initial object $\widetilde{X}$, given by the identity morphism $\mathrm{id}_X : X \to X$ (Proposition 4.6.7.22). Proposition 8.1.2.1 guarantees that $\iota_X(\widetilde{X})$ is an initial object of the ∞-category $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$, so that ι_X is an equivalence of ∞-categories by virtue of Corollary 5.6.6.20. □

Corollary 8.1.2.10. *Let $\mathcal{C}$ be an ∞-category. For every pair of objects $X, Y \in \mathcal{C}$, the coslice inclusion ι_X restricts to a homotopy equivalence of Kan complexes* 03K1

$$\mathrm{Hom}^{\mathrm{L}}_{\mathcal{C}}(X,Y) \hookrightarrow \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}.$$

Proof. Combine Proposition 8.1.2.9 with Corollary 5.1.6.4. □

03K2 **Corollary 8.1.2.11.** *Let $\mathcal{C}$ be an ∞-category and let $f, f' : X \to Y$ be morphisms of $\mathcal{C}$. Then f and f' are homotopic (in the sense of Definition 1.4.3.1) if and only they belong to the same connected component of the Kan complex $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$. Consequently, we have a canonical isomorphism of sets*

$$\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(X, Y) \simeq \pi_0(\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}).$$

03K3 **Exercise 8.1.2.12.** Prove Corollary 8.1.2.11 directly from the definitions.

03K4 **Exercise 8.1.2.13.** Let $\mathcal{C}$ be an ∞-category containing morphisms $u : X' \to X$ and $v : Y \to Y'$, so that covariant transport for the left fibration $\mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ determines a morphism of Kan complexes

$$T : \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \to \{X'\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y'\}.$$

Show that, under the identifications supplied by Corollary 8.1.2.11, the induced map of connected components $\pi_0(T) : \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(X, Y) \to \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(X', Y')$ is given by the construction $[f] \mapsto [v] \circ [f] \circ [u]$.

We now apply Proposition 8.1.2.9 to describe the left fibration $(\lambda_-, \lambda_+) : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ of Proposition 8.1.1.15.

03K5 **Notation 8.1.2.14.** Let $\mathcal{C}$ be an ∞-category. For every pair of objects $X, Y \in \mathcal{C}$, Proposition 4.6.5.10 and Corollary 8.1.2.10 supply homotopy equivalences of Kan complexes

$$\mathrm{Hom}_{\mathcal{C}}(X, Y) \hookleftarrow \mathrm{Hom}^{\mathrm{L}}_{\mathcal{C}}(X, Y) \hookrightarrow \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}.$$

Passing to homotopy, we obtain an isomorphism

$$\alpha_{X,Y} : \mathrm{Hom}_{\mathcal{C}}(X, Y) \xrightarrow{\sim} \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$$

in the homotopy category hKan.

03LX **Corollary 8.1.2.15.** *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. Then F is fully faithful if and only if the diagram*

03LY
$$\begin{tikzcd} \mathrm{Tw}(\mathcal{C}) \arrow[r, "\mathrm{Tw}(F)"] \arrow[d] & \mathrm{Tw}(\mathcal{D}) \arrow[d] \\ \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \arrow[r, "F^{\mathrm{op}} \times F"] & \mathcal{D}^{\mathrm{op}} \times \mathcal{D} \end{tikzcd} \qquad (8.3)$$

is a categorical pullback square.

Proof. Since the vertical maps in the diagram (8.3) are left fibrations (Proposition 8.1.1.11), it is a categorical pullback square if and only if, for every pair of objects $X, Y \in \mathcal{C}$, the induced map

$$\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \to \{F(X)\} \times_{\mathcal{D}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{D}) \times_{\mathcal{D}} \{F(Y)\}$$

is a homotopy equivalence of Kan complexes (Corollary 5.1.7.16). Using Notation 8.1.2.14, we see that this is equivalent to the requirement that F induces a homotopy equivalence $\mathrm{Hom}_{\mathcal{C}}(X, Y) \to \mathrm{Hom}_{\mathcal{D}}(F(X), F(Y))$. □

Corollary 8.1.2.16. *Let $F : \mathcal{C} \to \mathcal{D}$ be an equivalence of ∞-categories. Then the induced map $\mathrm{Tw}(F) : \mathrm{Tw}(\mathcal{C}) \to \mathrm{Tw}(\mathcal{D})$ is also an equivalence of ∞-categories.* 03K9

Proof. Combine Corollary 8.1.2.15 with Proposition 4.5.2.21. □

Corollary 8.1.2.17. *Let $\mathcal{C}$ be an uncountable cardinal and let $\mathcal{C}$ be an ∞-category. If $\mathcal{C}$ is essentially κ-small, then $\mathrm{Tw}(\mathcal{C})$ is essentially κ-small.* 03Y6

Proof. Choose an equivalence of ∞-categories $\mathcal{C}' \to \mathcal{C}$, where $\mathcal{C}'$ is a κ-small simplicial set. It follows from Corollary 8.1.2.16 that the induced map $\mathrm{Tw}(\mathcal{C}') \to \mathrm{Tw}(\mathcal{C})$ is also an equivalence of ∞-categories. We conclude by observing that $\mathrm{Tw}(\mathcal{C}')$ is also a κ-small simplicial set (Remark 8.1.1.5). □

Corollary 8.1.2.18. *Let $\mathcal{C}$ be an ∞-category, let $\mathrm{h}\mathcal{C}$ be its homotopy category, and let* 03K6

$$\underline{\mathrm{Hom}}_{\mathrm{h}\mathcal{C}} : \mathrm{h}\mathcal{C}^{\mathrm{op}} \times \mathrm{h}\mathcal{C} \to \mathrm{hKan} \qquad (X, Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X, Y)$$

denote the functor determined by the hKan*-enrichment of Construction 4.6.9.13. Then the assignment $(X, Y) \mapsto \alpha_{X,Y}$ of Notation 8.1.2.14 determines an isomorphism from $\underline{\mathrm{Hom}}_{\mathrm{h}\mathcal{C}}$ to the homotopy transport representation of the left fibration $(\lambda_{-}, \lambda_{+}) : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$.*

Proof. Let $H : \mathrm{h}(\mathcal{C}^{\mathrm{op}}) \times \mathrm{h}\mathcal{C} \to \mathrm{hKan}$ denote the homotopy transport representation for the left fibration $(\lambda_{-}, \lambda_{+})$, given on objects by the formula $H(X, Y) = \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$. For every pair of objects $X, Y \in \mathcal{C}$, Notation 8.1.2.14 determines an isomorphism

$$\alpha_{X,Y} : \underline{\mathrm{Hom}}_{\mathrm{h}\mathcal{C}}(X, Y) \xrightarrow{\sim} H(X, Y)$$

in the homotopy category hKan. We wish to show that $\alpha_{X,Y}$ depends functorially on X and Y.

We first establish a strong form of functoriality in Y. Fix an object $X \in \mathcal{C}$, and let $h^X : \mathrm{h}\mathcal{C} \to \mathrm{hKan}$ denote the hKan-enriched functor corepresented by X, given concretely by the formula $h^X(Y) = \underline{\mathrm{Hom}}_{\mathrm{h}\mathcal{C}}(X, Y) = \mathrm{Hom}_{\mathcal{C}}(X, Y)$. Let $H^X : \mathrm{h}\mathcal{C} \to \mathrm{hKan}$ denote the restriction $H|_{\{X\} \times \mathrm{h}\mathcal{C}}$, which we also regard as an hKan-enriched functor (using Variant 5.2.8.11). Note that h^X can be identified with the (enriched) homotopy transport representation of the left fibration $\{X\} \tilde{\times}_{\mathcal{C}} \mathcal{C} \to \mathcal{C}$ (see Example 5.2.8.13). Corollary 4.6.4.18 and Proposition 8.1.2.9 supply equivalences

$$\{X\} \tilde{\times}_{\mathcal{C}} \mathcal{C} \hookleftarrow \mathcal{C}_{X/} \hookrightarrow \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$$

of left fibrations over $\mathcal{C}$, which induce an isomorphism of hKan-enriched functors $\alpha_{X,-} : h^X \xrightarrow{\sim} H^X$. By construction, this isomorphism carries each object $Y \in \mathrm{h}\mathcal{C}$ to the isomorphism $\alpha_{X,Y} : \underline{\mathrm{Hom}}(X,Y) \xrightarrow{\sim} H(X,Y)$ of Notation 8.1.2.14, which proves that $\alpha_{X,Y}$ depends functorially on Y.

We now show that $\alpha_{X,Y}$ depends functorially on X. Fix a morphism $f : W \to X$ in the ∞-category $\mathcal{C}$. We then have a diagram of hKan-enriched functors

03K7
$$\begin{tikzcd}
h^X \arrow[r, "\alpha_{X,-}"] \arrow[d] & H^X \arrow[d] \\
h^W \arrow[r, "\alpha_{X,-}"] & H^W,
\end{tikzcd} \tag{8.4}$$

where the vertical maps are induced by the homotopy class $[f] \in \mathrm{Hom}_{\mathrm{h}\mathcal{C}^{\mathrm{op}}}(X,W)$. To complete the proof, it will suffice to show that this diagram commutes. Using the corepresentability of the hKan-enriched functor h^X, we are reduced to showing that clockwise and counterclockwise composition around the diagram (8.4) carry $[\mathrm{id}_X] \in \pi_0(h^X(X)) = \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(X,X)$ to the same element of $\pi_0(H^W(X))$. We conclude by observing that under the identification $\pi_0(H^W(X)) \simeq \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(W,X)$ supplied by Corollary 8.1.2.11, both constructions carry $[\mathrm{id}_X]$ to $[f]$ (Exercise 8.1.2.13). □

03K8 **Warning 8.1.2.19.** Let $\mathcal{C}$ be an ∞-category. Our proof of Corollary 8.1.2.18 shows that the isomorphism $\alpha_{X,Y} : \underline{\mathrm{Hom}}_{\mathrm{h}\mathcal{C}}(X,Y) \to H(X,Y)$ is compatible with the hKan-enrichment in the second variable. Beware that things are a bit more subtle if we wish to view $\underline{\mathrm{Hom}}_{\mathrm{h}\mathcal{C}}(X,Y)$ and $H(X,Y)$ as hKan-enriched functors of the *first* variable. The functor $\underline{\mathrm{Hom}}_{\mathrm{h}\mathcal{C}}$ is defined using the enrichment of the category $\mathrm{h}\mathcal{C}$, and can therefore be viewed an hKan-enriched functor

$$(\mathrm{h}\mathcal{C})^{\mathrm{op}} \times \mathrm{h}\mathcal{C} \to \mathrm{hKan}.$$

On the other hand, the functor H is defined as the enriched homotopy transport representation of the left fibration $(\lambda_-, \lambda_+) : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$, which is an hKan-enriched functor

$$\mathrm{h}(\mathcal{C}^{\mathrm{op}}) \times \mathrm{h}\mathcal{C} \to \mathrm{hKan}.$$

The hKan-enriched categories $(\mathrm{h}\mathcal{C})^{\mathrm{op}}$ and $\mathrm{h}(\mathcal{C}^{\mathrm{op}})$ are *a priori* different objects: to a pair of objects $X, Y \in \mathcal{C}$, they assign morphism spaces $\mathrm{Hom}_{\mathcal{C}}(X,Y)$ and $\mathrm{Hom}_{\mathcal{C}}(X,Y)^{\mathrm{op}}$, respectively.

It is possible to address this point (since $\mathrm{Hom}_{\mathcal{C}}(X,Y)$ and $\mathrm{Hom}_{\mathcal{C}}(X,Y)^{\mathrm{op}}$ are canonically isomorphic as objects of the homotopy category hKan), but we will not pursue the matter here.

We can use Proposition 8.1.2.9 to deduce a stronger form of Proposition 8.1.2.1.

Corollary 8.1.2.20. *Let $U : \mathcal{C} \to \mathcal{D}$ be an inner fibration of ∞-categories and let $f : X \to Y$ be a morphism of $\mathcal{C}$, which we regard as an object of the twisted arrow ∞-category* $\mathrm{Tw}(\mathcal{C})$. *Then:* 03KA

- *The morphism f is U-cocartesian if and only if it is V-initial, where V denotes the induced map*
$$\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \{U(X)\} \times_{\mathcal{D}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{D}).$$
- *The morphism f is U-cartesian if and only if it is V'-initial, where V' denotes the induced map*
$$\mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \to \mathrm{Tw}(\mathcal{D}) \times_{\mathcal{D}} \{U(Y)\}.$$

Proof. We will prove the first assertion; the proof of the second is similar. Construction 8.1.2.7 supplies a commutative diagram of ∞-categories

$$\begin{tikzcd}
\mathcal{C}_{X/} \arrow[r, "\iota_X"] \arrow[d, "U_{X/}"] & \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[d, "V"] \\
\mathcal{D}_{U(X)/} \arrow[r, "\iota_{U(X)}"] & \{U(X)\} \times_{\mathcal{D}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{D}),
\end{tikzcd}$$

where the horizontal maps are equivalences of ∞-categories (Proposition 8.1.2.9). By virtue of Remark 7.1.4.9, it will suffice to show that f is U-cocartesian if and only if it is a $U_{X/}$-initial object of the ∞-category $\mathcal{C}_{X/}$, which is a special case of Example 7.1.5.9. □

Corollary 8.1.2.21. *Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$. The following conditions are equivalent:* 03KB

(1) *The morphism f is an isomorphism in the ∞-category $\mathcal{C}$.*

(2) *The morphism f is initial when regarded as an object of the ∞-category* $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$.

(3) *The morphism f is initial when regarded as an object of the ∞-category* $\mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$.

Proof. Apply Corollary 8.1.2.20 in the special case $\mathcal{D} = \Delta^0$ (together with Examples 7.1.4.2 and 5.1.1.4). □

Proof of Proposition 8.1.2.1. Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be an isomorphism in $\mathcal{C}$; we wish to show that f is initial when viewed as an object of the ∞-category $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. Fix an integer $n > 0$ and a morphism $\rho_0 : \partial \Delta^n \to \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ satisfying $\rho_0(0) = f$; we wish to show that ρ_0 can be extended to an n-simplex of $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$.

We now use a variation on the proof of Proposition 8.1.1.15. For every nonempty subset $S \subseteq [2n+1]$, let σ_S denote the corresponding nondegenerate simplex of Δ^{2n+1}. Let us say that S is *basic* if it satisfies one of the following conditions:

(a) The set S is contained in $\{0 < 1 < \cdots < n\}$.

(b) There exists an integer $0 \leq i \leq n$ such that $S \cap \{i, 2n+1-i\} = \emptyset$.

Let $K_0 \subseteq \Delta^{2n+1}$ be the simplicial subset whose nondegenerate simplices have the form σ_S, where S is basic. Unwinding the definitions, we can identify ρ_0 with a morphism of simplicial sets $\theta_0 : K \to \mathcal{C}$, where the composition $\Delta^n \hookrightarrow K \xrightarrow{\theta_0} \mathcal{C}$ is the constant map taking the value X and the composition

$$\Delta^1 \simeq \mathrm{N}_\bullet(\{n < n+1\}) \hookrightarrow K \xrightarrow{\theta_0} \mathcal{C}$$

is the morphism f. To complete the proof, we must show that θ_0 admits an extension $\theta : \Delta^{2n+1} \to \mathcal{C}$.

Let S be a nonempty subset of $[2n+1]$ which is not basic. Then there exists an integer $0 \leq i \leq n$ such that $2n+1-i$ belongs to S. We denote the largest such integer by $\mathrm{pr}(S)$ and refer to it as the *priority* of S. We say that S is *prioritized* if it also contained the integer $\mathrm{pr}(S)$. Let $\{S_1, S_2, \cdots, S_m\}$ be an ordering of the collection of all prioritized (non-basic) subsets of $[2n+1]$ which satisfies the following conditions:

- The sequence of priorities $\mathrm{pr}(S_1), \mathrm{pr}(S_2), \cdots, \mathrm{pr}(S_m)$ is nondecreasing. That is, if $1 \leq p \leq q \leq m$, then we have $\mathrm{pr}(S_p) \leq \mathrm{pr}(S_q)$.
- If $\mathrm{pr}(S_p) = \mathrm{pr}(S_q)$ for $p \leq q$, then $|S_p| \leq |S_q|$.

For $1 \leq q \leq m$, let $\sigma_q \subseteq \Delta^{2n+1}$ denote the simplex spanned by the vertices of S_q, and let $K_q \subseteq \Delta^{2n+1}$ denote the union of K_0 with the simplices $\{\sigma_1, \sigma_2, \cdots, \sigma_q\}$, so that we have inclusion maps

$$K_0 \hookrightarrow K_1 \hookrightarrow K_2 \hookrightarrow \cdots \hookrightarrow K_m.$$

Note that the set $S = [2n+1]$ is prioritized (with priority n), and is therefore equal to S_m. It follows that $K_m = \Delta^{2n+1}$. We will complete the proof by showing that θ_0 admits a compatible sequence of extensions $\{\theta_q : K_q \to \mathcal{C}\}_{0 \leq q \leq m}$, so that $\theta = \theta_m$ is an extension of θ_0 to Δ^{2n+1}.

For the remainder of the proof, we fix an integer $1 \leq q \leq m$, and suppose that the morphism $\theta_{q-1} : K_{q-1} \to \mathcal{C}$ has already been constructed. Let d denote the dimension of the simplex σ_q, let us abuse notation by identifying σ_q with a morphism of simplicial sets $\Delta^d \to K_q \subseteq \Delta^{2n+1}$, and set $L = \sigma_q^{-1} K_{q-1} \subseteq \Delta^d$. Let $i = \mathrm{pr}(S_q)$ denote the priority of S_q, so that S_q contains both i and $2n+1-i$. Write $S_q = \{j_0 < j_1 < \cdots < j_d\}$, so that $i = j_k$ for some integer $0 \leq k \leq d$. We will prove below that L is equal to the horn $\Lambda^d_k \subseteq \Delta^d$, so that the diagram of simplicial sets

$$\begin{tikzcd}
L \arrow[r] \arrow[d] & K_{q-1} \arrow[d] \\
\Delta^d \arrow[r, "\sigma_q"] & K_q
\end{tikzcd}$$

is a pushout square (Lemma 3.1.2.11). Let τ_0 denote the composite map $L \xrightarrow{\sigma_q} K_{q-1} \xrightarrow{\theta_{q-1}} \mathcal{C}$. We will complete the proof by showing that τ_0 admits an extension $\tau : \Delta^d \to \mathcal{C}$ (which then determines a morphism $\theta_q : K_q \to \mathcal{C}$ extending θ_{q-1}). The proof splits into four cases:

- Suppose that $0 < k < d$. Then $\Lambda^d_k \subseteq \Delta^d$ is an inner horn, so that τ_0 admits an extension $\tau : \Delta^d \to \mathcal{C}$ by virtue of our assumption that $\mathcal{C}$ is an ∞-category.

- Suppose that $k = d$. Then S_q is contained in $\{0, 1, \cdots, n\}$, contradicting our assumption that S_q is not basic.

- Suppose $k = 0$ and $i < n$, so that i is the least element of S_q. Our assumption $\mathrm{pr}(S_q) = i$ guarantees that $2n - i \notin S$. Since S_q does not satisfy (b), we must also have $i + 1 \in S_q$. It follows that $d \geq 2$ (otherwise, S_q would satisfy (a)), and that $\tau_0 : \Lambda^d_0 \to \mathcal{C}$ carries the initial edge $\mathrm{N}_\bullet(\{0 < 1\})$ to the identity morphism id_X. In this case, the existence of the extension τ follows from Theorem 4.4.2.6.

- Suppose $k = 0$ and $i = n$, so that $i = n$ is the least element of S_q. Since S_q has priority n, the element $n + 1$ also belongs to S_q. We must then have $d \geq 2$ (otherwise, S_q would satisfy condition (b)). It follows that $\tau_0 : \Lambda^d_0 \to \mathcal{C}$ carries the initial edge $\mathrm{N}_\bullet(\{0 < 1\})$ to the morphism f, which is an isomorphism in $\mathcal{C}$. In this case, the existence of the extension τ again follows from Theorem 4.4.2.6.

It remains to prove that $L = \Lambda^d_k$, which we can formulate more concretely as follows:

$(*)$ Let j be an element of S_q, and set $S' = S_q \setminus \{j\}$. Then $\sigma_{S'}$ is contained in K_{q-1} if and only if $j \neq i$.

We first treat the case $j = i$; in this case, we wish to show that $\sigma_{S'}$ is not contained in K_{q-1}. Note that S' cannot be basic: it cannot be contained in $\{0, 1, \cdots, n\}$ (otherwise

$S_q = S' \cup \{i\}$ would have the same property) and cannot have empty intersection with a set of the form $\{i', 2n+1-i'\}$ (otherwise S_q would have the same property; here we use the fact that $2n+1-i$ is contained in S_q). Moreover, we have $\mathrm{pr}(S') = i \notin S'$, so that S' is not prioritized. Assume, for a contradiction, that $\sigma_{S'}$ is contained in K_{q-1}. Then we must have $S' \subseteq S_{q'}$, for some $1 \leq q' < q$. Note that $2n+1-i \in S' \subseteq S_{q'}$, so that $S_{q'}$ has priority $\geq i$. Since $q' < q$, it follows that $S_{q'}$ has priority i and that $|S_{q'}| \leq |S_q|$. Since $S_{q'}$ is prioritized, it contains the element i, and therefore contains $S_q = S' \cup \{i\}$. It follows that $S_{q'} = S_q$, contradicting our assumption that $q' < q$.

We now treat the case $j \neq i$; in this case, we wish to show that $\sigma_{S'}$ is contained in K_{q-1}. We may assume without loss of generality that S' is not basic (otherwise, the simplex $\sigma_{S'}$ is already contained in K_0). Let $i' = \mathrm{pr}(S')$ denote the priority of S'; note that the inclusion $S' \subseteq S_q$ guarantees that $i' \leq i$. If $i' < i$, then $S' \cup \{i'\}$ is a prioritized set of priority $< i$, and therefore of the form $S_{q'}$ for some $q' < q$. If $i' = i$, then S' is a prioritized set of priority i and cardinality $|S_q| - 1$, and therefore of the form $S_{q'}$ for some $q' < q$. In either case, we obtain $\sigma_{S'} \subseteq \sigma_{q'} \subseteq K_{q-1}$. □

8.1.3 The Cospan Construction

00AY Let $\mathcal{C}_0$ be a category which admits pushouts. In §2.2.1, we introduced a 2-category $\mathrm{Cospan}(\mathcal{C}_0)$ having the same objects, where 1-morphisms from X to Y in $\mathrm{Cospan}(\mathcal{C}_0)$ are *cospans* from X to Y: that is, diagrams $X \xrightarrow{f} B \xleftarrow{g} Y$ in the category $\mathcal{C}_0$ (see Example 2.2.2.1). In this section, we introduce a generalization of this construction, which will allow us to replace the ordinary category $\mathcal{C}_0$ by an ∞-category. More precisely, we will associate to every simplicial set $\mathcal{C}$ a simplicial set $\mathrm{Cospan}(\mathcal{C})$ of *cospans in* $\mathcal{C}$ (Construction 8.1.3.1). In the special case where $\mathcal{C} = \mathrm{N}_{\bullet}(\mathcal{C}_0)$ is the nerve of a category $\mathcal{C}_0$ which admits pushouts, we show that $\mathrm{Cospan}(\mathcal{C})$ can be identified with the Duskin nerve of the 2-category $\mathrm{Cospan}(\mathcal{C}_0)$ (Corollary 8.1.3.15).

03KN **Construction 8.1.3.1.** Let $\mathcal{C}$ be a simplicial set. For every integer $n \geq 0$, we let $\mathrm{Cospan}_n(\mathcal{C})$ denote the collection of morphisms $\mathrm{Tw}(\Delta^n) \to \mathcal{C}$ in the category of simplicial sets. The construction $[n] \mapsto \mathrm{Cospan}_n(\mathcal{C})$ depends functorially on the set $[n] = \{0 < 1 < \cdots < n\}$ as an object of the category $\mathbf{\Delta}^{\mathrm{op}}$, and can therefore be viewed as a simplicial set. We will denote this simplicial set by $\mathrm{Cospan}(\mathcal{C})$ and refer to it as the *simplicial set of cospans in* $\mathcal{C}$.

03KP **Remark 8.1.3.2.** Let $n \geq 0$ be an integer. Then the simplicial set $\mathrm{Tw}(\Delta^n)$ can be identified with the nerve of the partially ordered set $Q = \{(i,j) \in [n]^{\mathrm{op}} \times [n] : i \leq j\}$ (see Example 8.1.0.5). Consequently, if $\mathcal{C}$ is an arbitrary simplicial set, then n-simplices of $\mathrm{Cospan}(\mathcal{C})$ can be identified with morphisms $\mathrm{N}_\bullet(Q) \to \mathcal{C}$, which we depict informally as diagrams

$$\begin{tikzcd}
X_{0,0} \arrow[dr] & & X_{1,1} \arrow[dl] \arrow[dr] & \cdots & X_{n-1,n-1} \arrow[dl] \arrow[dr] & & X_{n,n} \arrow[dl] \\
& \cdots \arrow[dr] & & \cdots \arrow[dl] \arrow[dr] & & \cdots \arrow[dl] & \\
& & X_{0,n-1} \arrow[dr] & & X_{1,n} \arrow[dl] & & \\
& & & X_{0,n}. & & &
\end{tikzcd}$$

Example 8.1.3.3. Let $\mathcal{C}$ be a simplicial set. Then: 03KQ

- Vertices of the simplicial set $\mathrm{Cospan}(\mathcal{C})$ can be identified with vertices of $\mathcal{C}$.
- Let X and Y be vertices of $\mathcal{C}$. Then edges of $\mathrm{Cospan}(\mathcal{C})$ joining X to Y can be identified with pairs (f, g), where $f : X \to B$ and $g : Y \to B$ are edges of $\mathcal{C}$ having the same target.

Remark 8.1.3.4 (Symmetry)**.** Let $\mathcal{C}$ be a simplicial set and let σ be an n-simplex of $\mathrm{Cospan}(\mathcal{C})$, which we identify with a morphism of simplicial sets $\mathrm{Tw}(\Delta^n) \to \mathcal{C}$. Composing with the automorphism 03KR

$$\mathrm{Tw}(\Delta^n) \xrightarrow{\sim} \mathrm{Tw}(\Delta^n) \qquad (i, j) \mapsto (n - j, n - i),$$

we obtain a new n-simplex $\overline{\sigma}$ of $\mathrm{Cospan}(\mathcal{C})$. The construction $\sigma \mapsto \overline{\sigma}$ determines an isomorphism of simplicial sets $\tau : \mathrm{Cospan}(\mathcal{C}) \simeq \mathrm{Cospan}(\mathcal{C})^{\mathrm{op}}$, which can be described concretely as follows:

- For every vertex $X \in \mathcal{C}$, the morphism τ carries X (regarded as a vertex of $\mathrm{Cospan}(\mathcal{C})$) to itself.
- Let X and Y be vertices of $\mathcal{C}$, and let $e : X \to Y$ be an edge of $\mathrm{Cospan}(\mathcal{C})$, given by a pair of edges $(f : X \to B, g : Y \to B)$ of $\mathcal{C}$. Then $\tau(e) : Y \to X$ is the edge of $\mathrm{Cospan}(\mathcal{C})$ given by the pair (g, f).

Note that τ is involutive: that is, the composition

$$\mathrm{Cospan}(\mathcal{C}) \xrightarrow{\tau} \mathrm{Cospan}(\mathcal{C})^{\mathrm{op}} \xrightarrow{\tau^{\mathrm{op}}} \mathrm{Cospan}(\mathcal{C})$$

is the identity automorphism of $\mathrm{Cospan}(\mathcal{C})$.

03KT **Construction 8.1.3.5.** Let $\mathcal{D}$ be a simplicial set and let $\sigma : \Delta^n \to \mathcal{D}$ be an n-simplex of $\mathcal{D}$. Invoking the functoriality of the twisted arrow construction, we obtain a map $\mathrm{Tw}(\Delta^n) \xrightarrow{\mathrm{Tw}(\sigma)} \mathrm{Tw}(\mathcal{D})$, which we can identify with an n-simplex $u(\sigma)$ of the simplicial set $\mathrm{Cospan}(\mathrm{Tw}(\mathcal{D}))$. The construction $\sigma \mapsto u(\sigma)$ is compatible with face and degeneracy operators, and therefore determines a morphism of simplicial sets $u : \mathcal{D} \to \mathrm{Cospan}(\mathrm{Tw}(\mathcal{D}))$ which we will refer to as the *unit map.*

048N **Example 8.1.3.6** (Tautological Cospans)**.** Let $\mathcal{D}$ be a simplicial set and let $e : X \to Y$ be an edge of $\mathcal{D}$, which we also view as a vertex of the simplicial set $\mathrm{Tw}(\mathcal{D})$. Then the morphism $\mathcal{D} \to \mathrm{Cospan}(\mathrm{Tw}(\mathcal{D}))$ carries e to an edge of the simplicial set $\mathrm{Cospan}(\mathrm{Tw}(\mathcal{D}))$, which we can identify with a pair of edges

$$\mathrm{id}_X \xrightarrow{e_L} e \xleftarrow{e_R} \mathrm{id}_Y$$

in the simplicial set $\mathrm{Tw}(\mathcal{D})$. Here e_L and e_R can be identified with degenerate 3-simplices of $\mathcal{D}$, which we depict informally in the diagrams

$$\begin{tikzcd} X \arrow[d, "\mathrm{id}_X"] & X \arrow[l, "\mathrm{id}_X"] & & Y \arrow[d, "\mathrm{id}_Y"] & X \arrow[l, "f"] \\ X \arrow[r, "f"] & Y & & Y \arrow[r, "\mathrm{id}_Y"] & Y. \end{tikzcd}$$

03KU **Proposition 8.1.3.7.** *Let $\mathcal{D}$ be a simplicial set and let $u : \mathcal{D} \to \mathrm{Cospan}(\mathrm{Tw}(\mathcal{D}))$ be the unit map of Construction 8.1.3.5. For every simplicial set $\mathcal{C}$, the composite map*

$$\begin{aligned} \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathrm{Tw}(\mathcal{D}), \mathcal{C}) &\to \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathrm{Cospan}(\mathrm{Tw}(\mathcal{D})), \mathrm{Cospan}(\mathcal{C})) \\ &\xrightarrow{\circ u} \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathcal{D}, \mathrm{Cospan}(\mathcal{C})) \end{aligned}$$

is a bijection.

Proof. Let us regard the simplicial set $\mathcal{C}$ as fixed. For every simplicial set $\mathcal{D}$, the unit map u of Construction 8.1.3.5 determines a function

$$\theta_{\mathcal{D}} : \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathrm{Tw}(\mathcal{D}), \mathcal{C}) \to \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathcal{D}, \mathrm{Cospan}(\mathcal{C})).$$

Using Remark 8.1.1.4, we see that the construction $\mathcal{D} \mapsto \theta_{\mathcal{D}}$ carries colimits (in the category of simplicial sets) to limits (in the arrow category $\mathrm{Fun}([1], \mathrm{Set})$). Consequently, to show that $\theta_{\mathcal{D}}$ is a bijection, we may assume without loss of generality that $\mathcal{D} = \Delta^n$ is a standard simplex (see Remark 1.1.3.13). In this case, the desired result follows immediately from the definition of the simplicial set $\mathrm{Cospan}(\mathcal{C})$. □

Corollary 8.1.3.8. *The twisted arrow functor* 03KV

$$\mathrm{Tw} : \mathrm{Set}_{\Delta} \to \mathrm{Set}_{\Delta} \qquad \mathcal{D} \mapsto \mathrm{Tw}(\mathcal{D})$$

has a right adjoint, given on objects by the construction $\mathcal{C} \mapsto \mathrm{Cospan}(\mathcal{C})$.

Remark 8.1.3.9. Let $\mathcal{C}$ and $\mathcal{D}$ be simplicial sets. Using Proposition 8.1.3.7, we obtain bijections 048P

$$\begin{aligned}
\mathrm{Hom}_{\mathrm{Set}_{\Delta}}(\Delta^n, \mathrm{Fun}(\mathcal{C}, \mathrm{Cospan}(\mathcal{D}))) &\simeq \mathrm{Hom}_{\mathrm{Set}_{\Delta}}(\Delta^n \times \mathcal{C}, \mathrm{Cospan}(\mathcal{D})) \\
&\simeq \mathrm{Hom}_{\mathrm{Set}_{\Delta}}(\mathrm{Tw}(\Delta^n \times \mathcal{C}), \mathcal{D}) \\
&\simeq \mathrm{Hom}_{\mathrm{Set}_{\Delta}}(\mathrm{Tw}(\Delta^n) \times \mathrm{Tw}(\mathcal{C}), \mathcal{D}) \\
&\simeq \mathrm{Hom}_{\mathrm{Set}_{\Delta}}(\mathrm{Tw}(\Delta^n), \mathrm{Fun}(\mathrm{Tw}(\mathcal{C}), \mathcal{D})) \\
&\simeq \mathrm{Hom}_{\mathrm{Set}_{\Delta}}(\Delta^n, \mathrm{Cospan}(\mathrm{Fun}(\mathrm{Tw}(\mathcal{C}), \mathcal{D}))).
\end{aligned}$$

These bijections depend functorially on $[n] \in \mathbf{\Delta}$, and therefore determine an isomorphism of simplicial sets $\mathrm{Fun}(\mathcal{C}, \mathrm{Cospan}(\mathcal{D})) \simeq \mathrm{Cospan}(\mathrm{Fun}(\mathrm{Tw}(\mathcal{C}), \mathcal{D}))$.

Corollary 8.1.3.10. *Let* $U : \mathcal{C} \to \mathcal{D}$ *be a Kan fibration of simplicial sets. Then the induced map* $\mathrm{Cospan}(U) : \mathrm{Cospan}(\mathcal{C}) \to \mathrm{Cospan}(\mathcal{D})$ *is also a Kan fibration.* 048Q

Proof. Let $i : A \hookrightarrow B$ be a monomorphism of simplicial sets which is a weak homotopy equivalence. We wish to show that every lifting problem

048R

$$\begin{tikzcd}
A \arrow[r] \arrow[d, "i"] & \mathrm{Cospan}(\mathcal{C}) \arrow[d, "\mathrm{Cospan}(U)"] \\
B \arrow[r] \arrow[ur, dashed] & \mathrm{Cospan}(\mathcal{D})
\end{tikzcd} \tag{8.5}$$

admits a solution. Using Proposition 8.1.3.7, we can rewrite (8.5) as a lifting problem of the form

$$\begin{tikzcd}
\mathrm{Tw}(A) \arrow[r] \arrow[d, "\mathrm{Tw}(i)"] & \mathcal{C} \arrow[d, "U"] \\
\mathrm{Tw}(B) \arrow[r] \arrow[ur, dashed] & \mathcal{D}.
\end{tikzcd}$$

Our assumption that U is a Kan fibration guarantees that this lifting problem has a solution, since the monomorphism $\mathrm{Tw}(i) : \mathrm{Tw}(A) \hookrightarrow \mathrm{Tw}(B)$ is also a weak homotopy equivalence (Corollary 8.1.2.6). □

048S **Corollary 8.1.3.11.** *Let $\mathcal{C}$ be a Kan complex. Then the simplicial set* $\mathrm{Cospan}(\mathcal{C})$ *is also a Kan complex.*

Proof. Apply Corollary 8.1.3.10 in the special case $\mathcal{D} = \Delta^0$. □

We now study the relationship between Construction 8.1.3.1 with the classical cospan construction (Example 2.2.2.1).

00B4 **Construction 8.1.3.12.** Let $\mathcal{C}$ be a category which admits pushouts, and let $\mathrm{Cospan}(\mathcal{C})$ denote the 2-category of Example 2.2.2.1. Suppose we are given another category $\mathcal{D}$ and a functor $F : \mathrm{Tw}(\mathcal{D}) \to \mathcal{C}$. We define a strictly unitary lax functor $F^+ : \mathcal{D} \to \mathrm{Cospan}(\mathcal{C})$ as follows:

- For each $X \in \mathcal{D}$, we define $F^+(X) = F(\mathrm{id}_X)$; here we regard the identity morphism $\mathrm{id}_X : X \to X$ as an object of the twisted arrow category $\mathrm{Tw}(\mathcal{C})$.
- For each morphism $f : X \to Y$ in $\mathcal{D}$, we define $F^+(f)$ to be the 1-morphism of $\mathrm{Cospan}(\mathcal{C})$ given by the cospan

$$F(\mathrm{id}_X) \xrightarrow{F(\mathrm{id}_X, f)} F(f) \xleftarrow{F(f, \mathrm{id}_Y)} F(\mathrm{id}_Y).$$

  Note that this determines the values of F^+ on 2-morphisms, since every 2-morphism in $\mathcal{D}$ is an identity 2-morphism.

- For every pair of composable morphisms $X \xrightarrow{f} Y \xrightarrow{g} Z$ in $\mathcal{D}$, the composition constraint $\mu_{g,f} : F^+(g) \circ F^+(f) \Rightarrow F^+(g \circ f)$ is the 2-morphism of $\mathrm{Cospan}(\mathcal{C})$ corresponding to the map $F(f) \amalg_{F(\mathrm{id}_Y)} F(g) \to F(g \circ f)$ classifying the commutative diagram

$$\begin{tikzcd}
F(\mathrm{id}_Y) \arrow[r, "F(f, \mathrm{id}_Y)"] \arrow[d, "F(\mathrm{id}_Y, g)"] & F(f) \arrow[d, "F(\mathrm{id}_X, g)"] \\
F(g) \arrow[r, "F(f, \mathrm{id}_Z)"] & F(g \circ f)
\end{tikzcd}$$

  in the category $\mathcal{C}$.

03KW **Example 8.1.3.13.** Let $\mathcal{C}$ be a category which admits pushouts and let n be a nonnegative integer. Applying Construction 8.1.3.12 in the special case where $\mathcal{D} = [n]$, we obtain a function

$$\{\text{Functors } \mathrm{Tw}([n]) \to \mathcal{C}\} \xrightarrow{\sim} \{\text{Strictly unitary lax functors } [n] \to \mathrm{Cospan}(\mathcal{C})\}.$$

Using Propositions 1.3.3.1 and 8.1.1.10, we can identify the left hand side with the collection of n-simplices of the simplicial set $\mathrm{Cospan}(\mathrm{N}_\bullet(\mathcal{C}))$. This construction depends functorially on n, and therefore determines a morphism of simplicial sets from $\mathrm{Cospan}(\mathrm{N}_\bullet(\mathcal{C}))$ to the Duskin nerve $\mathrm{N}^{\mathrm{D}}_\bullet(\mathrm{Cospan}(\mathcal{C}))$.

We can now formulate our main result.

Theorem 8.1.3.14. *Let $\mathcal{C}$ and $\mathcal{D}$ be categories, where $\mathcal{C}$ admits pushouts. Then Construction 8.1.3.12 induces a bijection of sets* 00B5

$$\{\text{Functors } F : \mathrm{Tw}(\mathcal{D}) \to \mathcal{C}\} \xrightarrow{\sim} \{\text{Strictly unitary lax functors } F^{+} : \mathcal{D} \to \mathrm{Cospan}(\mathcal{C})\}.$$

Corollary 8.1.3.15. *Let $\mathcal{C}$ be a category which admits pushouts. Then the comparison map of Example 8.1.3.13 determines an isomorphism of simplicial sets* 00B6

$$\mathrm{Cospan}(\mathrm{N}_\bullet(\mathcal{C})) \to \mathrm{N}^{\mathrm{D}}_\bullet(\mathrm{Cospan}(\mathcal{C})).$$

Exercise 8.1.3.16. Show that Corollary 8.1.3.15 implies Theorem 8.1.3.14. That is, to prove Theorem 8.1.3.14 in general, it suffices to treat the special case where $\mathcal{D}$ is a category of the form $[n] = \{0 < 1 < \cdots < n\}$ for $n \geq 0$. 03KX

Remark 8.1.3.17. Let $\mathcal{C}$ be a category which admits pushouts. The construction of the 2-category $\mathrm{Cospan}(\mathcal{C})$ of Example 2.2.2.1 involves some auxiliary choices: if $X \to B \leftarrow Y$ and $Y \to C \leftarrow Z$ are cospans in $\mathcal{C}$, then their composition (as 1-morphisms of $\mathrm{Cospan}(\mathcal{C})$) is given by $X \to (B \amalg_Y C) \leftarrow Z$, where the pushout $B \amalg_Y C$ is only well-defined up to (canonical) isomorphism. Corollary 8.1.3.15 supplies a description of the Duskin nerve $\mathrm{N}^{\mathrm{D}}_\bullet(\mathrm{Cospan}(\mathcal{C}))$ which does not depend on these choices. This shows, in particular, that the 2-category $\mathrm{Cospan}(\mathcal{C})$ is well-defined up to (non-strict) isomorphism; see Example 2.2.6.13. 03KY

Example 8.1.3.18. Let $\mathcal{C}$ be a category which admits pushouts. Then 2-simplices σ of the Duskin nerve $\mathrm{N}^{\mathrm{D}}_\bullet(\mathrm{Cospan}(\mathcal{C}))$ can be identified with commutative diagrams 00B8

$$\begin{tikzcd}
X_{0,0} \arrow[dr] & & X_{1,1} \arrow[dl] \arrow[dr] & & X_{2,2} \arrow[dl] \\
& X_{0,1} \arrow[dr] & & X_{1,2} \arrow[dl] & \\
& & X_{0,2} & &
\end{tikzcd}$$

in the category $\mathcal{C}$. It follows from Theorem 2.3.2.5 that the 2-simplex σ is thin (in the sense of Definition 2.3.2.3) if and only if the square appearing in the diagram is a pushout: that is, it induces an isomorphism $X_{0,1} \amalg_{X_{1,1}} X_{1,2} \to X_{0,2}$ in the category $\mathcal{C}$.

Proof of Theorem 8.1.3.14. Let $\mathcal{C}$ and $\mathcal{D}$ be categories, where $\mathcal{C}$ admits pushouts, and let $G : \mathcal{D} \to \operatorname{Cospan}(\mathcal{C})$ be a strictly unitary lax functor of 2-categories. For every morphism $f : X \to Y$ in the category $\mathcal{D}$, we can identify $G(f)$ with a cospan from $G(X)$ to $G(Y)$ in the category $\mathcal{C}$, given by a diagram we will denote by $G(X) \xrightarrow{b_-(f)} B(f) \leftarrow b_+(f) G(Y)$. Our assumption that G is strictly unitary guarantees the following:

($*$) For each object $X \in \mathcal{D}$, the object $B(\mathrm{id}_X)$ is equal to $G(X)$, and the maps $b_-(\mathrm{id}_X) : G(X) \to B(\mathrm{id}_X)$ and $b_+(\mathrm{id}_X) : G(X) \to B(\mathrm{id}_X)$ are the identity morphisms from $G(X)$ to itself in the category $\mathcal{C}$.

For every pair of composable 1-morphisms $X \xrightarrow{f} Y \xrightarrow{g} Z$, the composition constraint $\mu_{g,f}$ for the lax functor G can be identified with a morphism from the pushout $B(f) \amalg_{G(Y)} B(g)$ to $B(g \circ f)$, or equivalently with a pair of morphisms

$$p(g,f) : B(f) \to B(g \circ f) \qquad q(g,f) : B(g) \to B(g \circ f)$$

satisfying $p(g,f) \circ b_+(f) = q(g,f) \circ b_-(g)$. The axioms for a lax functor (Definition 2.2.4.5) then translate to the following additional conditions:

(a) For every morphism $f : X \to Y$ in the category $\mathcal{D}$, $p(\mathrm{id}_Y, f)$ is the identity morphism from $B(f)$ to itself.

(b) For every morphism $f : X \to Y$ in the category $\mathcal{D}$, $q(f, \mathrm{id}_X)$ is the identity morphism from $B(f)$ to itself.

(c) For every composable triple of 1-morphisms $W \xrightarrow{f} X \xrightarrow{g} Y \xrightarrow{h} Z$ in the category $\mathcal{D}$, we have

$$p(h \circ g, f) = p(h, g \circ f) \circ p(g,f) \qquad q(h, g \circ f) = q(h \circ g, f) \circ q(h,g)$$

$$p(h, g \circ f) \circ q(g,f) = q(h \circ g, f) \circ p(h,g).$$

We wish to show that there exists a unique functor of ordinary categories $F : \operatorname{Tw}(\mathcal{D}) \to \mathcal{C}$ such that $G = F^+$, where F^+ is the lax functor associated to F by Construction 8.1.3.12. For this condition to be satisfied, the functor F must satisfy the following conditions:

(0) For each object $X \in \mathcal{D}$, we have $F(\mathrm{id}_X) = G(X)$ (this guarantees that G and F^+ coincide on objects).

(1) For each morphism $f : X \to Y$ in $\mathcal{D}$ (regarded as an object of $\mathrm{Tw}(\mathcal{D})$), we have $F(f) = B(f)$, and the morphisms $b_-(f)$ and $b_+(f)$ are given by $F(\mathrm{id}_X, f)$ and $F(f, \mathrm{id}_Y)$, respectively (this guarantees that G and F^+ coincide on 1-morphisms, and therefore also on 2-morphisms).

(2) For every pair of composable 1-morphisms $X \xrightarrow{f} Y \xrightarrow{g} Z$, the morphisms $p(g, f) : B(f) \to B(g \circ f)$ and $q(g, f) : B(g) \to B(g \circ f)$ are given by $F(\mathrm{id}_X, g) : F(f) \to F(g \circ f)$ and $F(f, \mathrm{id}_Z) : F(g) \to F(g \circ f)$, respectively (this guarantees that the composition constraints on G and F^+ coincide).

Note that the value of F on each object of $\mathrm{Tw}(\mathcal{D})$ is determined by condition (1). Moreover, if (u, v) is a morphism from $f : X \to Y$ to $f' : X' \to Y'$ in the category $\mathrm{Tw}(\mathcal{D})$, then condition (2) guarantees that $F(u, v)$ must be equal to the composition

$$F(f) = B(f) \xrightarrow{q(f,u)} B(f \circ u) \xrightarrow{p(v, f \circ u)} B(v \circ f \circ u) = B(f') = F(f').$$

This proves the uniqueness of the functor F.

To prove existence, we define F on objects f of $\mathrm{Tw}(\mathcal{D})^{\mathrm{op}}$ by the formula $F(f) = B(f)$, and on morphisms $(u, v) : f \to f'$ by the formula $F(u, v) = p(v, f \circ u) \circ q(f, u)$. For any morphism $f : X \to Y$ in $\mathcal{C}$, we can use (a) and (b) to compute

$$F(\mathrm{id}_X, \mathrm{id}_Y) = p(\mathrm{id}_X, f) \circ q(f, \mathrm{id}_Y) = \mathrm{id}_{B(f)} \circ \mathrm{id}_{B(f)} = \mathrm{id}_{B(f)},$$

so that F carries identity morphisms in $\mathrm{Tw}(\mathcal{D})$ to identity morphisms in $\mathcal{C}$. To complete the proof that F is a functor, we note that for every pair of composable morphisms

$$(f : X \to Y) \xrightarrow{(u,v)} (f' : X' \to Y') \xrightarrow{(u',v')} (f'' : X'' \to Y'')$$

in the twisted arrow category $\mathrm{Tw}(\mathcal{D})$, the identities given in (c) allow us to compute

$$\begin{aligned}
F(u', v') \circ F(u, v) &= p(v', f' \circ u') \circ q(f', u') \circ p(v, f \circ u) \circ q(f, u) \\
&= p(v', v \circ f \circ u \circ u') \circ q(v \circ f \circ u, u') \circ p(v, f \circ u) \circ q(f, u) \\
&= p(v', v \circ f \circ u \circ u') \circ p(v, f \circ u \circ u') \circ q(f \circ u, u') \circ q(f, u) \\
&= p(v' \circ v, f \circ u \circ u') \circ q(f, u \circ u') \\
&= F(u \circ u', v' \circ v).
\end{aligned}$$

We now complete the proof by showing that the functor F satisfies conditions (0), (1), and (2). Condition (0) is an immediate consequence of $(*)$. To prove (2), we note that for any pair of composable morphisms $X \xrightarrow{f} Y \xrightarrow{g} Z$ in $\mathcal{D}$, identities (a) and (b) yield equalities

$$F(\mathrm{id}_X, g) = p(g, f) \circ q(f, \mathrm{id}_X) = p(g, f) \qquad F(f, \mathrm{id}_Z) = p(\mathrm{id}_Z, g \circ f) \circ q(g, f) = q(g, f).$$

To prove (1), we note that if $f : X \to Y$ is a morphism in $\mathcal{D}$, then we have

$$\begin{aligned} F(\mathrm{id}_X, f) &= p(f, \mathrm{id}_X \circ \mathrm{id}_X) \circ q(\mathrm{id}_X, \mathrm{id}_X) \\ &= p(f, \mathrm{id}_X) \circ \mathrm{id}_{G(X)} \\ &= p(f, \mathrm{id}_X) \circ b_+(\mathrm{id}_X) \\ &= q(f, \mathrm{id}_X) \circ b_-(f) \\ &= \mathrm{id}_{B(f)} \circ b_-(f) \\ &= b_-(f), \end{aligned}$$

and a similar calculation yields $F(f, \mathrm{id}_Y) = b_+(f)$. □

8.1.4 Cospans in ∞-Categories

03L4 Let $\mathcal{C}$ be an ∞-category, and let $\mathrm{Cospan}(\mathcal{C})$ denote the simplicial set of cospans in $\mathcal{C}$ (Construction 8.1.3.1). In the special case where $\mathcal{C} = \mathrm{N}_\bullet(\mathcal{C}_0)$ is the nerve of an ordinary category $\mathcal{C}_0$ which admits pushouts, Corollary 8.1.3.15 supplies an isomorphism of $\mathrm{Cospan}(\mathcal{C})$ with the Duskin nerve of the 2-category $\mathrm{Cospan}(\mathcal{C}_0)$ of Example 2.2.2.1. In particular, $\mathrm{Cospan}(\mathcal{C})$ is an $(\infty, 2)$-category (see Proposition 5.4.1.5). Our goal in this section is to prove an ∞-categorical generalization of this result.

03L5 **Proposition 8.1.4.1.** *Let $\mathcal{C}$ be an ∞-category. Then the simplicial set* $\mathrm{Cospan}(\mathcal{C})$ *is an $(\infty, 2)$-category if and only if $\mathcal{C}$ admits pushouts.*

Our proof of Proposition 8.1.4.1 will require several steps. The main ingredient is the following characterization of thin 2-simplices of $\mathrm{Cospan}(\mathcal{C})$, which we will establish in §8.1.5:

03L6 **Proposition 8.1.4.2.** *Let $\mathcal{C}$ be an ∞-category and let σ be a 2-simplex of* $\mathrm{Cospan}(\mathcal{C})$*, which we identify with a diagram*

03L7

$$\begin{tikzcd} X_{0,0} \arrow[dr] & & X_{1,1} \arrow[dl] \arrow[dr] & & X_{2,2} \arrow[dl] \\ & X_{0,1} \arrow[dr] & & X_{1,2} \arrow[dl] & \\ & & X_{0,2} & & \end{tikzcd} \tag{8.6}$$

in the ∞-category $\mathcal{C}$. Then σ is thin (in the sense of Definition 2.3.2.3) if and only if the inner region is a pushout square in the ∞-category $\mathcal{C}$.

Corollary 8.1.4.3. *Let $\mathcal{C}$ be an ∞-category. Then every degenerate 2-simplex of* $\operatorname{Cospan}(\mathcal{C})$ *is thin.* 03L8

Proof. Let σ be a 1-simplex of $\operatorname{Cospan}^{L,R}(\mathcal{C})$, corresponding to a diagram $X \xrightarrow{f} B \xleftarrow{g} Y$ in the ∞-category $\mathcal{C}$ where f belongs to L and g belongs to R. We will show that the left-degenerate 2-simplex $s^1_0(\sigma)$ is thin; a similar argument will show that the right-degenerate 2-simplex $s^1_1(\sigma)$ is thin (see Remark 8.1.3.4). Unwinding the definitions, we see that $s^1_0(\sigma)$ corresponds to a diagram in $\mathcal{C}$ of the form

$$\begin{tikzcd}
X \arrow[dr, "\mathrm{id}_X"'] & & X \arrow[dl, "\mathrm{id}_X"] \arrow[dr, "f"'] & & Y \arrow[dl, "g"] \\
& X \arrow[dr, "f"'] & & B \arrow[dl, "\mathrm{id}_B"] & \\
& & B. & &
\end{tikzcd}$$

By virtue of Proposition 8.1.4.2, it will suffice to show that the inner region of the diagram is a pushout square in $\mathcal{C}$. This follows from Corollary 7.6.3.24, since id_B and id_X are isomorphisms in $\mathcal{C}$. □

Lemma 8.1.4.4. *Let $\mathcal{C}$ be an ∞-category and let $\sigma_0 : \Lambda^2_1 \to \operatorname{Cospan}(\mathcal{C})$ be a morphism of simplicial sets, corresponding to a diagram* 048T

03LA

$$\begin{tikzcd}
X_{0,0} \arrow[dr] & & X_{1,1} \arrow[dl, "u"] \arrow[dr, "v"'] & & X_{2,2} \arrow[dl] \\
& X_{0,1} & & X_{1,2} &
\end{tikzcd} \tag{8.7}$$

in the ∞-category $\mathcal{C}$. Then any commutative diagram

048U

$$\begin{tikzcd}
X_{1,1} \arrow[r, "u"] \arrow[d, "v"] & X_{1,2} \arrow[d] \\
X_{0,1} \arrow[r] & X_{0,2}
\end{tikzcd} \tag{8.8}$$

can be obtained from an extension of σ_0 to a 2-simplex of $\operatorname{Cospan}(\mathcal{C})$*. In particular, if $X_{1,2}$ and $X_{0,1}$ admit a pushout along $X_{1,1}$, then σ_0 can be extended to a thin 2-simplex of $\mathcal{C}$.*

Proof. Let us identify $\mathrm{Tw}(\Delta^2)$ with the simplicial set $\mathrm{N}_\bullet(\overline{Q})$, where $\overline{Q}$ denotes the partially ordered set $\{(i,j) \in [2]^{\mathrm{op}} \times [2] : i \leq j\}$. Under this identification, $\mathrm{Tw}(\Lambda^2_1)$ corresponds to the simplicial subset $\mathrm{N}_\bullet(Q) \subseteq \mathrm{N}_\bullet(\overline{Q})$, where $Q = \overline{Q} \setminus \{(0,2)\}$, so σ_0 determines a diagram $\tau : \mathrm{N}_\bullet(Q) \to \mathcal{C}$.

Set $Q_0 = Q \setminus \{(0,0),(2,2)\}$ and $\tau_0 = \tau|_{\mathrm{N}_\bullet(Q_0)}$. Lemma 8.1.4.4 is equivalent to the assertion that the restriction map $\mathcal{C}_{\tau/} \to \mathcal{C}_{\tau_0/}$ is surjective on vertices. To prove this, it will suffice to show that the inclusion map $\mathrm{N}_\bullet(Q_0) \hookrightarrow \mathrm{N}_\bullet(Q)$ is right anodyne (Corollary 4.3.6.13), or equivalently that it is right cofinal (Proposition 7.2.1.3). This is a special case of Corollary 7.2.3.7, since the inclusion map $Q_0 \hookrightarrow Q$ has a left adjoint (given by $(0,0) \mapsto (0,1)$ and $(2,2) \mapsto (1,2)$). □

03LB **Remark 8.1.4.5.** Let $\mathcal{C}$ be an ∞-category and suppose we are given a morphism of simplicial sets $\varphi : \mathrm{Tw}(\Delta^2) \to \mathcal{C}$, which we display as a diagram

$$\begin{tikzcd}
X_{0,0} \arrow[dr] & & X_{1,1} \arrow[dl] \arrow[dr] & & X_{2,2} \arrow[dl] \\
& X_{0,1} \arrow[dr] & & X_{1,2} \arrow[dl] & \\
& & X_{0,2}. & &
\end{tikzcd}$$

The proof of Lemma 8.1.4.4 shows that φ is a colimit diagram if and only if the inner region is a pushout square.

We now study the problem of filling outer horns in simplicial sets of the form $\mathrm{Cospan}(\mathcal{C})$.

048V **Lemma 8.1.4.6.** *Let $U : \mathcal{C} \to \mathcal{D}$ be an inner fibration of simplicial sets. Suppose we are given an integer $n \geq 3$ and a lifting problem*

048W
$$\begin{tikzcd}
\Lambda^n_0 \arrow[r, "\sigma_0"] \arrow[d] & \mathrm{Cospan}(\mathcal{C}) \arrow[d, "\mathrm{Cospan}(U)"] \\
\Delta^n \arrow[r, "\overline{\sigma}"] \arrow[ur, dashed] & \mathrm{Cospan}(\mathcal{D}),
\end{tikzcd} \tag{8.9}$$

where σ_0 corresponds to a morphism of simplicial sets $F_0 : \mathrm{Tw}(\Lambda^n_0) \to \mathcal{C}$ with the following properties:

(a) The morphism F_0 carries the edge $(0,0) \to (0,1)$ of $\mathrm{Tw}(\Lambda^n_0)$ to a U-cocartesian edge of $\mathcal{C}$.

(b) The morphism F_0 carries the edge $(1,n) \to (0,n)$ to a U-cartesian edge of $\mathcal{C}$.

Then the lifting problem (8.9) admits a solution.

Proof. Using Proposition 8.1.3.7, we can rewrite (8.9) as a lifting problem

048X

$$\begin{tikzcd}
\mathrm{Tw}(\Lambda^n_0) \arrow[r, "F_0"] \arrow[d] & \mathcal{C} \arrow[d, "U"] \\
\mathrm{Tw}(\Delta^n) \arrow[r, "\overline{F}"] \arrow[ur, dashed] & \mathcal{D}.
\end{tikzcd} \tag{8.10}$$

Let P denote the set of all ordered pairs (i,j), where i and j are integers satisfying $0 \leq i \leq j \leq n$. We regard P as a partially ordered set by identifying it with its image in the product $[n]^{\mathrm{op}} \times [n]$ (so that $(i,j) \leq (i',j')$ if and only if $i' \leq i$ and $j \leq j'$). In what follows, we will identify $\mathrm{Tw}(\Delta^n)$ with the nerve $\mathrm{N}_\bullet(P)$; under this identification, $\mathrm{Tw}(\Lambda^n_0)$ corresponds to a simplicial subset $K_0 \subseteq \mathrm{N}_\bullet(P)$.

Let $S = \{(i_0,j_0) < (i_1,j_1) < \cdots < (i_d,j_d)\}$ be a nonempty linearly ordered subset of P, so that we have inequalities $0 \leq i_d \leq i_{d-1} \leq \cdots \leq i_0 \leq j_0 \leq j_1 \leq \cdots \leq j_d \leq n$. In this case, we write τ_S for the corresponding nondegenerate d-simplex of $\mathrm{N}_\bullet(P)$. We will say that S is *basic* if τ_S is contained in K_0. Equivalently, S is basic if the set $\{i_0, i_1, \cdots, i_d, j_0, j_1, \cdots, j_d\}$ does not contain $\{1 < 2 < \cdots < n\}$. If S is not basic, we let $\mathrm{pr}(S)$ denote the largest integer j such that S contains the pair (i,j) for some $i \neq 0$. If no such integer exists, we define $\mathrm{pr}(S) = 0$. We will refer to $\mathrm{pr}(S)$ as the *priority* of S. We say that S is *prioritized* if it is not basic and contains the pair $(0, \mathrm{pr}(S))$.

Let $\{S_1, S_2, \cdots, S_m\}$ be an enumeration of the collection of all prioritized linearly ordered subsets of P which satisfies the following conditions:

- The sequence of priorities $\mathrm{pr}(S_1), \mathrm{pr}(S_2), \cdots, \mathrm{pr}(S_m)$ is nondecreasing. That is, if $1 \leq k \leq \ell \leq m$, then we have $\mathrm{pr}(S_k) \leq \mathrm{pr}(S_\ell)$.
- If $\mathrm{pr}(S_k) = \mathrm{pr}(S_\ell)$ for $k \leq \ell$, then $|S_k| \leq |S_\ell|$.

For $1 \leq \ell \leq m$, let $\tau_\ell \subseteq \mathrm{N}_\bullet(P)$ denote the simplex τ_{S_ℓ} and let $K_\ell \subseteq \mathrm{N}_\bullet(P)$ denote the union of K_0 with the simplices $\{\tau_1, \tau_2, \cdots, \tau_\ell\}$, so that we have inclusion maps

$$K_0 \hookrightarrow K_1 \hookrightarrow K_2 \hookrightarrow \cdots \hookrightarrow K_m.$$

We claim that $K_m = \mathrm{N}_\bullet(P)$: that is, K_m contains τ_S for every nonempty linearly ordered subset $S \subseteq P$. If S is basic, there is nothing to prove. We may therefore assume that S

has priority p for some integer $p \geq 0$. The union $S \cup \{(0,p)\}$ is then a prioritized linearly ordered subset of P, and therefore coincides with S_ℓ for some $1 \leq \ell \leq m$. In this case, we have $\tau_S \subseteq \tau_\ell \subseteq K_\ell \subseteq K_m$.

We will complete the proof by constructing a compatible sequence of maps $F_\ell : K_\ell \to \mathcal{C}$ extending F_0 and satisfying $U \circ F_\ell = \overline{F}|_{K_\ell}$. Fix an integer $1 \leq \ell \leq m$, and suppose that $F_{\ell-1}$ has already been constructed. Write $S_\ell = \{(i_0, j_0) < (i_1, j_1) < \cdots < (i_d, j_d)\}$, so that the simplex τ_ℓ has dimension d. Let p be the priority of S_ℓ. Since S_ℓ is prioritized, it contains $(0,p)$; we can therefore write $(0,p) = (i_{d'}, j_{d'})$ for some integer $0 \leq d' \leq d$. Let $L \subseteq \Delta^d$ denote the inverse image of $K_{\ell-1}$ under the map $\tau_\ell : \Delta^d \to \mathrm{N}_\bullet(P)$. We will show that L coincides with the horn $\Lambda^d_{d'}$, so that the pullback diagram of simplicial sets

$$\begin{tikzcd}
L \arrow[r] \arrow[d] & K_{\ell-1} \arrow[d] \\
\Delta^d \arrow[r, "\tau_\ell"] & K_\ell.
\end{tikzcd}$$

is also a pushout square (Lemma 3.1.2.11). This can be stated more concretely as follows:

$(*)$ Let (i,j) be an element of S_ℓ, and set $S' = S_\ell \setminus \{(i,j)\}$. Then the simplex $\tau_{S'}$ is contained in $K_{\ell-1}$ if and only if $(i,j) \neq (0,p)$.

We first prove $(*)$ in the case where $(i,j) \neq (0,p)$; in this case, we wish to show that $\tau_{S'}$ is contained in $K_{\ell-1}$. If S' is basic, then $\tau_{S'}$ is contained in K_0 and there is nothing to prove. Let us therefore assume that S' is not basic. Let $p' = \mathrm{pr}(S')$ denote the priority of S'. Then the union $S' \cup \{(0,p')\}$ is a prioritized subset of P, and therefore has the form S_k for some $1 \leq k \leq m$. By construction, we have $\mathrm{pr}(S_k) = p' \leq p = \mathrm{pr}(S_\ell)$. Moreover, if $p' = p$, then our assumption $(i,j) \neq (0,p)$ guarantees that $S_k = S'$, so that $|S_k| < |S_\ell|$. It follows that $k < \ell$, so that we have $\tau_{S'} \subseteq \tau_k \subseteq K_k \subseteq K_{\ell-1}$.

We now prove $(*)$ in the case $(i,j) = (0,p)$; in this case, we wish to show that $\tau_{S'}$ is not contained in $K_{\ell-1}$. Assume otherwise. Then, since S' is not basic, it is contained in S_k for some $k < \ell$. The inequalities

$$p = \mathrm{pr}(S') \leq \mathrm{pr}(S_k) \leq \mathrm{pr}(S_\ell) = p.$$

ensure that S_k has priority p. Since S_k is prioritized, it contains $(0,p)$, and therefore contains the union $S_\ell = S' \cup \{(0,p)\}$. The inequality $|S_k| \leq |S_\ell|$ then forces $k = \ell$, contradicting our assumption that $k < \ell$. This completes the proof of $(*)$.

Let ρ_0 denote the composite map $\Lambda^d_{d'} = L \xrightarrow{\tau_\ell} K_{\ell-1} \xrightarrow{F_{\ell-1}} \mathcal{C}$. To complete the proof, it will suffice to show that the lifting problem

048Y

$$\begin{tikzcd}
\Lambda^d_{d'} \arrow[r, "\rho_0"] \arrow[d] & \mathcal{C} \arrow[d, "U"] \\
\Delta^d \arrow[r, "\overline{F} \circ \tau_\ell"] \arrow[ur, dashed] & \mathcal{D}
\end{tikzcd} \tag{8.11}$$

admits a solution. We consider three cases:

- If $0 < d' < d$, then the lifting problem (8.11) admits a solution by virtue of our assumption that U is an inner fibration of simplicial sets.
- Suppose that $d' = 0$: that is, the pair $(0, p)$ is the smallest element of S_ℓ. Then S_ℓ does not contain any pairs (i, j) with $i \neq 0$, so we have $p = 0$. Since the set S_ℓ is not basic, we must have $S_\ell = \{(0,0) < (0,1) < \cdots < (0, n-1) < (0, n)\}$. In this case, the lifting problem (8.11) admits a solution by virtue of assumption (a).
- Suppose that $d' = d$: that is, the pair $(0, p)$ is the largest element of S_ℓ. Our assumption that S_ℓ is not basic then guarantees that $p = n$ and $(1, n) \in S_\ell$: that is, we have $S_\ell = \{(i_0, j_0) < (i_1, j_1) < \cdots < (1, n) < (0, n)\}$. In this case, the lifting problem (8.11) admits a solution by virtue of assumption (b).

□

Specializing Lemma 8.1.4.6 to the case $\mathcal{D} = \Delta^0$, we obtain the following:

Lemma 8.1.4.7. *Let $\mathcal{C}$ be an ∞-category and let $\sigma_0 : \Lambda^n_0 \to \mathrm{Cospan}(\mathcal{C})$ be a morphism of simplicial sets, which we identify with a diagram $X : \mathrm{Tw}(\Lambda^n_0) \to \mathrm{Cospan}(\mathcal{C})$. Assume that $n \geq 3$ and that the morphisms $X(0,0) \to X(0,1)$ and $X(1,n) \to X(0,n)$ are isomorphisms in $\mathcal{C}$. Then σ_0 can be extended to an n-simplex of* Cospan($\mathcal{C}$). 03LC

Proof of Proposition 8.1.4.1. Let $\mathcal{C}$ be an ∞-category. By virtue of Lemma 8.1.4.7 and Corollary 8.1.4.3, the simplicial set Cospan($\mathcal{C}$) satisfies conditions (2) and (3) of Definition 5.4.1.1. Since Cospan($\mathcal{C}$) is isomorphic to $\mathrm{Cospan}(\mathcal{C})^{\mathrm{op}}$ (Remark 8.1.3.4), it also satisfies condition (4) of Definition 5.4.1.1. It follows that Cospan($\mathcal{C}$) is an $(\infty, 2)$-category if and only if it satisfies the following condition:

$(*)$ Every morphism of simplicial sets $\Lambda^2_1 \to \mathrm{Cospan}(\mathcal{C})$ can be extended to a thin 2-simplex of Cospan($\mathcal{C}$).

Using Lemma 8.1.4.4, we can rewrite condition $(*)$ as follows:

$(*')$ For every diagram

$$\begin{tikzcd}
X \arrow[dr] & & Y \arrow[dl] \arrow[dr] & & Z \arrow[dl] \\
& B & & C &
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$, there exists a pushout of B and C along Y.

It is clear that if the ∞-category $\mathcal{C}$ admits pushouts, then it satisfies condition $(*')$. The converse follows by applying condition $(*')$ to diagrams of the form

$$\begin{tikzcd}
X \arrow[dr, "\mathrm{id}_X"] & & Y \arrow[dl] \arrow[dr] & & Z \arrow[dl, "\mathrm{id}_Z"'] \\
& X & & Z. &
\end{tikzcd}$$

□

03LD **Corollary 8.1.4.8.** *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, where $\mathcal{C}$ and $\mathcal{D}$ admit pushouts. The following conditions are equivalent:*

(1) *The functor F carries pushout squares in $\mathcal{C}$ to pushout squares in $\mathcal{D}$.*

(2) *The induced map $\mathrm{Cospan}(F) : \mathrm{Cospan}(\mathcal{C}) \to \mathrm{Cospan}(\mathcal{D})$ is a functor of $(\infty, 2)$-categories, in the sense of Definition 5.4.7.1.*

Proof. The implication (1) ⇒ (2) follows immediately from the criterion of Proposition 8.1.4.2. For the converse implication, suppose that $\mathrm{Cospan}(F) : \mathrm{Cospan}(\mathcal{C}) \to \mathrm{Cospan}(\mathcal{D})$ is a functor of 2-categories, and let $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$ be a pushout square, which we display as a diagram

$$\begin{tikzcd}
X \arrow[r] \arrow[d] & X_0 \arrow[d] \\
X_1 \arrow[r] & X_{01}.
\end{tikzcd}$$

Let $\rho : \mathrm{Tw}(\Delta^2) \to \Delta^1 \times \Delta^1$ denote the morphism of simplicial sets given on vertices by the formula $\rho(i,j) = (\max(0, 1-i), \max(0, j-1))$. Then $\sigma \circ \rho$ can be identified with a 2-simplex

τ of $\operatorname{Cospan}(\mathcal{C})$, corresponding to a diagram

$$\begin{tikzcd}
X_0 \arrow[dr, "\mathrm{id}"'] & & X \arrow[dl] \arrow[dr] & & X_1 \arrow[dl, "\mathrm{id}"] \\
& X_0 \arrow[dr] & & X_1 \arrow[dl] & \\
& & X_{01} & &
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$. It follows from the criterion of Proposition 8.1.4.2 that τ is a thin 2-simplex of $\operatorname{Cospan}(\mathcal{C})$. If $\operatorname{Cospan}(F)$ is a functor of $(\infty, 2)$-categories, then it carries τ to a thin 2-simplex of $\operatorname{Cospan}(\mathcal{D})$. Applying the criterion of Proposition 8.1.4.2 again, we conclude that $F(\sigma)$ is a pushout square in $\mathcal{D}$. □

8.1.5 Thin 2-Simplices of $\operatorname{Cospan}(\mathcal{C})$

Let $\mathcal{C}$ be an ∞-category. Our goal in this section is to prove Proposition 8.1.4.2, which provides necessary and sufficient conditions for a 2-simplex of the simplicial set $\operatorname{Cospan}(\mathcal{C})$ to be thin. By virtue of Remark 8.1.4.5, it will suffice to prove the following pair of assertions: `03LE`

Lemma 8.1.5.1. *Let $\mathcal{C}$ be an ∞-category and let σ be a 2-simplex of $\operatorname{Cospan}(\mathcal{C})$, which we identify with a diagram $\varphi : \operatorname{Tw}(\Delta^2) \to \mathcal{C}$. If σ is thin, then φ is a colimit diagram.* `03LF`

Lemma 8.1.5.2. *Let $\mathcal{C}$ be an ∞-category and let σ be a 2-simplex of $\operatorname{Cospan}(\mathcal{C})$, which we identify with a diagram $\varphi : \operatorname{Tw}(\Delta^2) \to \mathcal{C}$. If φ is a colimit diagram, then σ is thin.* `03LG`

Proof of Lemma 8.1.5.1. Let Q denote the partially ordered set appearing in the proof of Lemma 8.1.4.4, so that we can identify $\operatorname{Tw}(\Lambda^2_1)$ with the nerve of Q. Set $\varphi_0 = \varphi|_{\operatorname{N}_\bullet(Q)}$. Assume that σ is thin. We wish to show that the restriction map $\mathcal{C}_{\varphi/} \to \mathcal{C}_{\varphi_0/}$ is a trivial Kan fibration: that is, every lifting problem

`03LH`

$$\begin{tikzcd}
\partial \Delta^n \arrow[r] \arrow[d] & \mathcal{C}_{\varphi/} \arrow[d] \\
\Delta^n \arrow[r] \arrow[ur, dashed] & \mathcal{C}_{\varphi_0/}
\end{tikzcd} \tag{8.12}$$

admits a solution.

Let K denote the coproduct $(\mathrm{Tw}(\Delta^2) \star \partial \Delta^n) \coprod_{(\mathrm{N}_\bullet(Q) \star \partial \Delta^n)} (\mathrm{N}_\bullet(Q) \star \Delta^n)$, which we regard as a simplicial subset of $\mathrm{Tw}(\Delta^2) \star \Delta^n$. Unwinding the definitions, we can identify the lifting problem (8.12) with a morphism of simplicial sets $\tau_0 : K \to \mathcal{C}$ satisfying $\tau_0|_{\mathrm{Tw}(\Delta^2)} = \varphi$. We wish to show that τ_0 can be extended to a morphism $\tau : \mathrm{Tw}(\Delta^2) \star \Delta^n \to \mathcal{C}$.

Let $\iota : \mathrm{Tw}(\Delta^2) \star \Delta^n \to \mathrm{Tw}(\Delta^{n+3})$ be the morphism of simplicial sets given on vertices by the formula

$$\iota(x) = \begin{cases} (i,j) & \text{if } x = (i,j) \in \mathrm{Tw}(\Delta^2) \\ (0, x+3) & \text{if } x \in \Delta^n. \end{cases}$$

The morphism ι has a left inverse $\rho : \mathrm{Tw}(\Delta^{n+3}) \to \mathrm{Tw}(\Delta^2) \star \Delta^n$, given on vertices by the formula

$$\rho(i,j) = \begin{cases} (i,j) \in \mathrm{Tw}(\Delta^2) & \text{if } j \leq 2 \\ j - 3 \in \Delta^n & \text{otherwise.} \end{cases}$$

We observe that ι and ρ restrict to morphisms of simplicial subsets

$$\iota_0 : K \to \mathrm{Tw}(\Lambda^{n+3}_1) \qquad \rho_0 : \mathrm{Tw}(\Lambda^{n+3}_1) \to K,$$

so that we have a commutative diagram of simplicial sets

$$\begin{tikzcd}
K \arrow[r, "\iota_0"] \arrow[d] & \mathrm{Tw}(\Lambda^{n+3}_1) \arrow[r, "\rho_0"] \arrow[d] & K \arrow[d] \\
\mathrm{Tw}(\Delta^2) \star \Delta^n \arrow[r, "\iota"] & \mathrm{Tw}(\Delta^{n+3}) \arrow[r, "\rho"] & \mathrm{Tw}(\Delta^2) \star \Delta^n
\end{tikzcd}$$

where the horizontal compositions are equal to the identity.

The composition $\tau_0 \circ \rho_0$ can be identified with a morphism of simplicial sets $\psi_0 : \Lambda^{m+3}_1 \to \mathrm{Cospan}(\mathcal{C})$ having the property that the composition

$$\Delta^2 \simeq \mathrm{N}_\bullet(\{0 < 1 < 2\}) \xrightarrow{\psi_0} \mathrm{Cospan}(\mathcal{C})$$

coincides with σ. Since σ is thin, we can extend ψ_0 to an $(n+3)$-simplex ψ of $\mathrm{Cospan}(\mathcal{C})$, which we identify with a map $\tau' : \mathrm{Tw}(\Delta^{n+3}) \to \mathcal{C}$. It follows that the composition $\tau = \tau' \circ \iota$ is a morphism $\mathrm{Tw}(\Delta^2) \star \Delta^n \to \mathcal{C}$ satisfying $\tau|_K = \tau_0$. □

Proof of Lemma 8.1.5.2. Let $\mathcal{C}$ be an ∞-category and let σ be a 2-simplex of $\mathrm{Cospan}(\mathcal{C})$, which we identify with a diagram $\varphi : \mathrm{Tw}(\Delta^2) \to \mathcal{C}$. Assume that φ is a colimit diagram. We wish to show that σ is thin. We proceed by a (somewhat more complicated) variation on the proof of Lemma 8.1.4.7.

Fix integers $0 < q < n$ with $n \geq 3$, and suppose that we are given a morphism $f_0 : \Lambda^n_q \to \mathrm{Cospan}(\mathcal{C})$ for which the composition

$$\Delta^2 \simeq \mathrm{N}_\bullet(\{q-1 < q < q+1\}) \hookrightarrow \Lambda^n_q \xrightarrow{f_0} \mathrm{Cospan}(\mathcal{C})$$

is equal to σ; we wish to show that f_0 can be extended to an n-simplex of $\mathrm{Cospan}(\mathcal{C})$. Using Proposition 8.1.3.7, we can identify f_0 with a morphism of simplicial sets $F_0 : \mathrm{Tw}(\Lambda^n_q) \to \mathcal{C}$; we wish to show that F_0 admits an extension $\mathrm{Tw}(\Delta^n) \to \mathcal{C}$.

Let P denote the set of all ordered pairs (i, j), where i and j are integers satisfying $0 \leq i \leq j \leq n$. We regard P as a partially ordered set by identifying it with its image in the product $[n]^{\mathrm{op}} \times [n]$ (so that $(i, j) \leq (i', j')$ if and only if $i' \leq i$ and $j \leq j'$). In what follows, we will identify $\mathrm{Tw}(\Delta^n)$ with the nerve $\mathrm{N}_\bullet(P)$; under this identification, $\mathrm{Tw}(\Lambda^n_q)$ corresponds to a simplicial subset $K_0 \subseteq \mathrm{N}_\bullet(P)$.

Let $S = \{(i_0, j_0) < (i_1, j_1) < \cdots < (i_d, j_d)\}$ be a nonempty linearly ordered subset of P, so that we have inequalities $0 \leq i_d \leq i_{d-1} \leq \cdots \leq i_0 \leq j_0 \leq j_1 \leq \cdots \leq j_d \leq n$. In this case, we write τ_S for the corresponding nondegenerate d-simplex of $\mathrm{N}_\bullet(P)$. Let $C(S)$ denote the set of integers $\{i_0, i_1, \cdots, i_d, j_0, j_1, \cdots, j_d\}$, which we regard as a subset of $[n] = \{0 < 1 < \cdots < n\}$; we will refer to $C(S)$ as the *content* of S.

- We will say that S is *basic* if $C(S) \cup \{q\} \neq [n]$. Equivalently, S is basic if the simplex τ_S is contained in K_0.

- Suppose that S is not basic and that it contains an ordered pair of the form $(p, q+1)$. We will say that S is *low* if the largest such integer p satisfies $p \leq q-2$. In this case, we will denote p by $\mathrm{pr}(S)$ and refer to it as the *priority* of S.

- Suppose that S is not basic and that it contains an ordered pair of the form $(q-1, r)$. We will say that S is *high* if the smallest such integer r satisfies $r \geq q+2$.

Note that the set S cannot be both low and high, since the elements $(p, q+1)$ and $(q-1, r)$ are incomparable in P when $p < q < r$. Moreover, if S is low, then any nonempty subset $S' \subseteq S$ is either low (and satisfies $\mathrm{pr}(S') \leq \mathrm{pr}(S)$) or satisfies $q+1 \notin C(S')$, so that S' is basic (the set S' cannot contain any elements of the form $(q+1, r)$, since these are incomparable with $(p, q+1)$). Consequently, the collection of simplices of the form τ_S where S is either basic or low determine a simplicial subset $K_{\mathrm{low}} \subseteq \mathrm{N}_\bullet(P)$. Similarly, the collection of simplices of the form τ_S where S is either basic or high determine a simplicial subset $K_{\mathrm{high}} \subseteq \mathrm{N}_\bullet(P)$, and the intersection $K_{\mathrm{low}} \cap K_{\mathrm{high}}$ is equal to K_0.

We will prove the following:

$(*)$ The inclusion maps $K_0 \hookrightarrow K_{\mathrm{low}}$ and $K_0 \hookrightarrow K_{\mathrm{high}}$ are inner anodyne.

We will prove that the inclusion map $K_0 \hookrightarrow K_{\text{low}}$ is inner anodyne; the analogous assertion for the inclusion $K_0 \hookrightarrow K_{\text{high}}$ follows by a similar argument. Let us say that a linearly ordered subset $S \subseteq P$ is *prioritized* if it low and contains the ordered pair (p, q), where $p = \mathrm{pr}(S)$ denotes the priority of S.

Let $\{S_1, S_2, \cdots, S_m\}$ be an enumeration of the collection of all prioritized low subsets of P which satisfies the following conditions:

- The sequence of priorities $\mathrm{pr}(S_1), \mathrm{pr}(S_2), \cdots, \mathrm{pr}(S_m)$ is nondecreasing. That is, if $1 \leq k \leq \ell \leq m$, then we have $\mathrm{pr}(S_k) \leq \mathrm{pr}(S_\ell)$.
- If $\mathrm{pr}(S_k) = \mathrm{pr}(S_\ell)$ for $k \leq \ell$, then $|S_k| \leq |S_\ell|$.

For $1 \leq \ell \leq m$, let $\tau_\ell \subseteq \mathrm{N}_\bullet(P)$ denote the simplex τ_{S_ℓ} and let K_ℓ denote the union of K_0 with the simplices $\{\tau_1, \tau_2, \cdots, \tau_\ell\}$, so that we have inclusion maps

$$K_0 \hookrightarrow K_1 \hookrightarrow K_2 \hookrightarrow \cdots \hookrightarrow K_m.$$

We claim that $K_m = K_{\text{low}}$: that is, every low subset $S \subseteq P$ is contained in S_ℓ for some $1 \leq \ell \leq m$. This is clear: if $p = \mathrm{pr}(S)$ is the priority of S, then the union $S \cup \{(p, q)\}$ is a prioritized low subset of P (having the same priority p).

We will prove $(*)$ by showing that, for $1 \leq \ell \leq m$, the inclusion map $K_{\ell-1} \hookrightarrow K_\ell$ is inner anodyne. Set $S_q = \{(i_0, j_0) < (i_1, j_1) < \cdots < (i_d, j_d)\}$. Let p denote the priority of S_ℓ. Since S_ℓ is prioritized, it contains the ordered pair (p, q). We therefore have $(p, q) = (i_c, j_c)$ for some $0 \leq c \leq d$. Note that since $p \leq q - 2$, we must have $c > 0$: otherwise, we have $q - 1 \notin C(S_\ell)$, contradicting our assumption that S_ℓ is not basic. Since S_ℓ also contains $(p, q+1)$, we must also have $c < d$. Let $L \subseteq \Delta^d$ denote the inverse image of $K_{\ell-1}$ under the map $\tau_\ell : \Delta^d \to \mathrm{N}_\bullet(P)$. We will complete the proof of $(*)$ by showing that L coincides with the inner horn Λ^d_c, so that the pullback diagram of simplicial sets

$$\begin{tikzcd}
L \arrow[r] \arrow[d] & K_{\ell-1} \arrow[d] \\
\Delta^d \arrow[r, "\tau_\ell"] & K_\ell
\end{tikzcd}$$

is also a pushout square (Lemma 3.1.2.11). This can be stated more concretely as follows:

$(*')$ Let (i, j) be an element of S_ℓ, and set $S' = S_\ell \setminus \{(i, j)\}$. Then the simplex $\tau_{S'}$ is contained in $K_{\ell-1}$ if and only if $(i, j) \neq (p, q)$.

We first prove $(*')$ in the case where $(i, j) \neq (p, q)$; in this case, we wish to show that $\tau_{S'}$ is contained in $K_{\ell-1}$. If S' is basic, then $\tau_{S'}$ is contained in K_0 and there is nothing to prove.

We may therefore assume that S' is not basic, and is therefore low. If $(i,j) \neq (p,q+1)$, then S' is a prioritized low subset of P satisfying $\mathrm{pr}(S') = p = \mathrm{pr}(S_\ell)$ and $|S'| < |S_\ell|$. It follows that $S' = S_k$ for some $k < \ell$, so that $\tau_{S'}$ is contained in $K_k \subseteq K_{\ell-1}$. In the case $(i,j) = (p,q+1)$, the set S' has priority $p' = \mathrm{pr}(S') < p$. It follows that $S' \cup \{(p',q)\}$ is a prioritized low subset of P having priority $p' < \mathrm{pr}(S_q)$, and is therefore of the form S_k for some $k < \ell$. In this case, we again conclude that $\tau_{S'}$ is contained in $K_k \subseteq K_{\ell-1}$.

We now prove $(*')$ in the case where $(i,j) = (p,q)$; in this case, we wish to show that $\tau_{S'}$ is not contained in $K_{\ell-1}$. Note that, since S' contains $(p,q+1)$, we have $C(S') \cup \{q\} = C(S_\ell) \cup \{q\}$. Since S_ℓ is not basic, it follows that S' is not basic. Assume, for a contradiction, that $\tau_{S'}$ is contained in $K_{\ell-1}$; it follows that we have $S' \subseteq S_k$ for some $1 \leq k \leq< \ell$. We then have $\mathrm{pr}(S_k) \leq \mathrm{pr}(S_\ell) = p$. Since S_k contains $(p,q+1)$, we must have $\mathrm{pr}(S_k) = p$. Since S_k is prioritized, it contains (p,q), and therefore contains $S' \cup \{(p,q)\} = S_\ell$. The inequality $k < \ell$ guarantees that $|S_k| \leq |S_\ell|$. It follows that $S_k = S_\ell$, contradicting our assumption that $k < \ell$. This completes the proof of $(*)$.

Since $\mathcal{C}$ is an ∞-category, assertion $(*)$ guarantees that the morphism $F_0 : K_0 \to \mathcal{C}$ admits an extension $F_{\mathrm{low}} : K_{\mathrm{low}} \to \mathcal{C}$ (Proposition 1.5.6.7). Similarly, the morphism F_0 admits an extension $F_{\mathrm{high}} : K_{\mathrm{high}} \to \mathcal{C}$. Let K denote the union of K_{low} with K_{high} (as simplicial subsets of $\mathrm{N}_\bullet(P)$). Since the intersection $K_{\mathrm{low}} \cap K_{\mathrm{high}}$ coincides with K_0, we can amalgamate F_{low} with F_{high} to obtain a morphism of simplicial sets $F : K \to \mathcal{C}$. We will complete the proof of Proposition 8.1.4.2 by showing that F can be extended to a morphism $\mathrm{N}_\bullet(P) \to \mathcal{C}$.

Set $P_- = \{(i,j) \in P : (i,j) < (q-1,q+1)\}$ and $P_+ = \{(i,j) \in P : (i,j) > (q-1,q+1)\}$. Let us say that a nonempty linearly ordered subset $S \subseteq P$ is *decomposable* if the union $S \cup \{(q-1,q+1)\}$ is also linearly ordered. In this case, we can write S (uniquely) as a union $S_- \cup S_0 \cup S_+$, where $S_- \subseteq P_-$, $S_0 \subseteq \{(q-1,q+1)\}$, and $S_+ \subseteq P_+$. The collection of simplices τ_S, where S is decomposable, span a simplicial subset of $\mathrm{N}_\bullet(P)$ which will identify with the join $\mathrm{N}_\bullet(P_-) \star \{(q-1,q+1)\} \star \mathrm{N}_\bullet(P_+)$.

We next claim that $\mathrm{N}_\bullet(P)$ is the union of K with the join $\mathrm{N}_\bullet(P_-) \star \{(q-1,q+1)\} \star \mathrm{N}_\bullet(P_+)$. In other words, if a nonempty linearly ordered subset $S \subseteq P$ is not decomposable, then τ_S is contained in K. Choose an element $(i,j) \in S$ which is incomparable with $(q-1,q+1)$ in the partially ordered set P. Without loss of generality, we may assume that $i < q-1$ and $j < q+1$. If S is basic, there is nothing to prove. We may therefore assume that $q+1$ belongs to the content $C(S)$. Note that ordered pairs of the form $(q+1,r)$ are incomparable with (i,j), and therefore cannot be contained in S. It follows that S contains an element of the form $(p,q+1)$. Since $(p,q+1)$ is comparable with (i,j) in P, we must have $p \leq i \leq q-2$. It follows that S is low, so that τ_S is contained in $K_{\mathrm{low}} \subseteq K$.

Let $K' \subseteq K$ denote the intersection of K with the join $\mathrm{N}_\bullet(P_-) \star \{(q-1,q+1)\} \star \mathrm{N}_\bullet(P_+)$, so that we have a pushout diagram of simplicial sets

$$\begin{tikzcd}
K' \arrow[r] \arrow[d] & K \arrow[d] \\
\mathrm{N}_\bullet(P_-) \star \{(q-1,q+1)\} \star \mathrm{N}_\bullet(P_+) \arrow[r] & \mathrm{N}_\bullet(P).
\end{tikzcd}$$

Set $F' = F|_{K'}$. To complete the proof, it will suffice to show that F' can be extended to a morphism of simplicial sets $\mathrm{N}_\bullet(P_-) \star \{(q-1,q+1)\} \star \mathrm{N}_\bullet(P_+) \to \mathcal{C}$.

We now give a more explicit description of K'. Let us say that a linearly ordered subset $S_+ \subseteq P_+$ is *old* if the simplex $\tau_{S_+ \cup \{(q-1,q+1)\}}$ is contained in K. Let $S \subseteq P$ be an arbitrary decomposable subset, and write $S = S_- \cup S_0 \cup S_+$ as above. We then make the following observations:

(*a*) Suppose that $S_0 = \{(q-1,q+1)\}$. Then replacing S by the subset $S_0 \cup S_+$ does not change the set $C(S) \cup \{q\}$. In particular, S is basic if and only if $S_0 \cup S_+$ is basic. Moreover, since S_- does not contain any pairs of the form $(p, q+1)$ for $p \leq q-1$, it follows that S is low if and only if $S_0 \cup S_+$ is low. Similarly, S is high if and only if $S_0 \cup S_+$ is high. It follows that τ_S is contained in K if and only if $\tau_{S_0 \cup S_+}$ is contained in K: that is, if and only if S_+ is old.

(*b*) Suppose that $S_0 = \emptyset$. In this case, we claim that τ_S is automatically contained in K. Assume otherwise. Then S is not basic, so the set $C(S)$ contains the element $q+1$. Since ordered pairs of the form $(q+1, q')$ are incomparable with $(q-1, q+1)$ for $q' > q+1$, it follows that S contains an ordered pair of the form $(p, q+1)$ for some $p \leq q+1$. Since S is not low, we must have $p \geq q-1$. By assumption, S does not contain $(q-1, q+1)$, so we must have $p \in \{q, q+1\}$. By the same reasoning (using the fact that $C(S)$ contains $q-1$ and S is not high), we conclude that S contains an element of the form $(q-1, r)$ for $r \in \{q-1, q\}$. This is a contradiction, since S is linearly ordered and the ordered pairs $(p, q+1)$ and $(q-1, r)$ are incomparable in P.

Let $A \subseteq \mathrm{N}_\bullet(P_+)$ denote the simplicial subset spanned by the simplices τ_{S_+}, where S_+ is old. Combining (*a*) and (*b*), we deduce that K' can be identified with the pushout

$$(\mathrm{N}_\bullet(P_-) \star \{(q-1,q+1)\} \star A) \coprod_{\mathrm{N}_\bullet(P_-) \star A} (\mathrm{N}_\bullet(P_-) \star \mathrm{N}_\bullet(P_+)).$$

Note that, since the restriction of f_0 to the simplex $\mathrm{N}_\bullet(\{q-1 < q < q+1\})$ coincides with σ, the restriction of F' to the simplicial subset $\mathrm{N}_\bullet(P_-) \star \{(q-1,q+1)\} \subseteq K$ can be identified with the diagram $\varphi : \mathrm{Tw}(\Delta^2) \to \mathcal{C}$. Let φ_0 denote the restriction of φ to

$\mathrm{N}_\bullet(P_-)$. Unwinding the definitions, we see that the problem of extension of F' to a morphism $\mathrm{N}_\bullet(P_-) \star \{(q-1, q+1)\} \star \mathrm{N}_\bullet(P_+) \rightarrow \mathcal{C}$ can be rewritten as a lifting problem

$$\begin{tikzcd}
A \arrow[r] \arrow[d] & \mathcal{C}_{\varphi/} \arrow[d] \\
\mathrm{N}_\bullet(P_+) \arrow[r] \arrow[ur, dashed] & \mathcal{C}_{\varphi_0/} .
\end{tikzcd}$$

This lifting problem admits a solution by virtue of our assumption that φ is a colimit diagram in $\mathcal{C}$. □

8.1.6 Restricted Cospans

Let $\mathcal{C}$ be an ∞-category, and let $\mathrm{Cospan}(\mathcal{C})$ be the simplicial set introduced in Construction 8.1.3.1. By definition, the edges of $\mathrm{Cospan}(\mathcal{C})$ correspond to cospans in the ∞-category $\mathcal{C}$: that is, pairs of morphisms $X \xrightarrow{f} B \xleftarrow{g} Y$ having a common target. In practice, it will sometimes be useful to consider a variant of this construction, where we place additional restrictions on the morphisms f and g. 048Z

Definition 8.1.6.1 (Restricted Cospans)**.** Let $\mathcal{C}$ be a simplicial set and let L and R be collections of edges of $\mathcal{C}$. We let $\mathrm{Cospan}^{L,R}(\mathcal{C})$ denote the simplicial subset of $\mathrm{Cospan}(\mathcal{C})$ whose n-simplices are given by diagrams $X : \mathrm{Tw}(\Delta^n) \rightarrow \mathcal{C}$ which satisfy the following condition: 0490

- For every pair of integers $0 \leq i \leq j \leq n$, the edge $X_{i,i} \rightarrow X_{i,j}$ belongs to L and the edge $X_{j,j} \rightarrow X_{i,j}$ belongs to R.

Remark 8.1.6.2 (Symmetry)**.** Let $\mathcal{C}$ be a simplicial set and let L and R be collections of edges of $\mathcal{C}$. Then the isomorphism $\mathrm{Cospan}(\mathcal{C}) \xrightarrow{\sim} \mathrm{Cospan}(\mathcal{C})^{\mathrm{op}}$ of Remark 8.1.3.4 restricts to an isomorphism of simplicial subsets $\mathrm{Cospan}^{L,R}(\mathcal{C}) \xrightarrow{\sim} \mathrm{Cospan}^{R,L}(\mathcal{C})^{\mathrm{op}}$. 0491

Remark 8.1.6.3. Let $\mathcal{C}$ be a simplicial set and let L and R be collections of edges of $\mathcal{C}$. Suppose we are given a morphism of simplicial sets $f : \mathcal{D} \rightarrow \mathrm{Cospan}(\mathcal{C})$, corresponding to a morphism $F : \mathrm{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$ (see Proposition 8.1.3.7). For every edge $e : X \rightarrow Y$ of $\mathcal{D}$, let $e_L : \mathrm{id}_X \rightarrow e$ and $e_R : \mathrm{id}_Y \rightarrow e$ be the edges of $\mathrm{Tw}(\mathcal{D})$ described in Example 8.1.3.6. Then f factors through the simplicial subset $\mathrm{Cospan}^{L,R}(\mathcal{C})$ if and only if the edge $F(e_L)$ belongs to L and the edge $F(e_R)$ belongs to R, for every edge e of $\mathcal{D}$. 0492

Remark 8.1.6.4. Let $\mathcal{C}$ be a simplicial set, let L and R be collections of edges of $\mathcal{C}$, and let $\mathrm{Cospan}^{L,R}(\mathcal{C})$ denote the restricted cospan construction of Definition 8.1.6.1. Note that a 0493 morphism of simplicial sets $K \to \mathrm{Cospan}(\mathcal{C})$ factors through $\mathrm{Cospan}^{L,R}(\mathcal{C})$ if and only if its restriction to the 1-skeleton $\mathrm{sk}_1(K)$ factors through $\mathrm{Cospan}^{L,R}(\mathcal{C})$. In particular, if σ is a 2-simplex of $\mathrm{Cospan}^{L,R}(\mathcal{C})$ which is thin when viewed as a 2-simplex of $\mathrm{Cospan}(\mathcal{C})$, then it is also thin when viewed as a 2-simplex of $\mathrm{Cospan}^{L,R}(\mathcal{C})$. For a partial converse, see Corollary 8.1.6.8.

We now formulate a criterion which guarantees that the simplicial set $\mathrm{Cospan}^{L,R}(\mathcal{C})$ is an $(\infty, 2)$-category.

0494 **Definition 8.1.6.5.** Let $\mathcal{C}$ be an ∞-category and let L and R be collections of morphisms of $\mathcal{C}$. We will say that L and R are *pushout-compatible* if, for every morphism $f_0 : X \to X_0$ of $\mathcal{C}$ which belongs to L and every morphism $f_1 : X \to X_1$ of $\mathcal{C}$ which belongs to R, there exists a pushout diagram

$$\begin{tikzcd}
X \arrow[r, "f_0"] \arrow[d, "f_1"] & X_0 \arrow[d, "f_1'"] \\
X_1 \arrow[r, "f_0'"] & X_{01}
\end{tikzcd}$$

where f_0' belongs to L and f_1' belongs to R.

0495 **Example 8.1.6.6.** Let $\mathcal{C}$ be an ∞-category, let L be a collection of morphisms of $\mathcal{C}$, and let R be the collection of all isomorphisms in $\mathcal{C}$. Assume that L is stable under isomorphism (that is, if f if a morphism of $\mathcal{C}$ which is isomorphic to an element of L in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$, then f also belongs to L). Then L and R are pushout-compatible.

0496 **Proposition 8.1.6.7.** *Let $\mathcal{C}$ be an ∞-category and let L and R denote collections of morphisms of $\mathcal{C}$ which are closed under composition. If L and R are pushout-compatible (in the sense of Definition 8.1.6.5), then the simplicial set* $\mathrm{Cospan}^{L,R}(\mathcal{C})$ *is an* $(\infty, 2)$*-category.*

Proof. We will show that $\mathrm{Cospan}^{L,R}(\mathcal{C})$ satisfies each condition of Definition 5.4.1.1:

(1) Let $\sigma_0 : \Lambda^2_1 \to \mathrm{Cospan}^{L,R}(\mathcal{C})$ be a morphism of simplicial sets; we wish to show that σ_0 can be extended to a thin 2-simplex of $\mathrm{Cospan}^{L,R}(\mathcal{C})$. Let us identify σ_0 with a diagram

0497
$$\begin{tikzcd}
X_{0,0} \arrow[dr, "u"] & & X_{1,1} \arrow[dl, "u'"'] \arrow[dr, "v"] & & X_{2,2} \arrow[dl, "v'"'] \\
& X_{0,1} & & X_{1,2} &
\end{tikzcd} \tag{8.13}$$

in the ∞-category $\mathcal{C}$, where the morphisms u and v belong to L and the morphisms u' and v' belong to R. Combining our assumption that L and R are pushout-compatible with Lemma 8.1.4.4, we can enlarge (8.13) to a commutative diagram

$$\begin{tikzcd}
X_{0,0} \arrow[dr, "u"] & & X_{1,1} \arrow[dl, "u'"'] \arrow[dr, "v"] & & X_{2,2} \arrow[dl, "v'"'] \\
& X_{0,1} \arrow[dr, "w"] & & X_{1,2} \arrow[dl, "w'"'] & \\
& & X_{0,2}, & &
\end{tikzcd}$$

where w belongs to L, w' belongs to R, and the lower square is a pushout. By virtue of Proposition 8.1.4.2, this extension can be viewed as a thin 2-simplex of the simplicial set $\operatorname{Cospan}(\mathcal{C})$. Using our assumption that L and R are closed under composition, we see that σ belongs to the simplicial subset $\operatorname{Cospan}^{L,R}(\mathcal{C})$, and is therefore also thin when regarded as a 2-simplex of $\operatorname{Cospan}^{L,R}(\mathcal{C})$ (Remark 8.1.6.4).

(2) Every degenerate 2-simplex of $\operatorname{Cospan}^{L,R}(\mathcal{C})$ is thin; this follows from Corollary 8.1.4.3 and Remark 8.1.6.4.

(3) Let $n \geq 3$ and let $\sigma_0 : \Lambda^n_0 \to \operatorname{Cospan}^{L,R}(\mathcal{C})$ be a morphism of simplicial sets with the property that the 2-simplex $\sigma_0|_{\mathrm{N}_\bullet(\{0<1<n\})}$ is left-degenerate. Using Lemma 8.1.4.7, we can extend σ_0 to an n-simplex σ of $\operatorname{Cospan}(\mathcal{C})$. Since every edge of Δ^n is contained in Λ^n_0, the extension σ is automatically contained in $\operatorname{Cospan}^{L,R}(\mathcal{C})$ (Remark 8.1.6.4).

(4) Let $n \geq 3$ and let $\sigma_0 : \Lambda^n_n \to \operatorname{Cospan}^{L,R}(\mathcal{C})$ be a morphism of simplicial sets with the property that the 2-simplex $\sigma_0|_{\mathrm{N}_\bullet(\{0<n-1<n\})}$ is right-degenerate. Then σ_0 can be extended to an n-simplex of $\operatorname{Cospan}^{L,R}(\mathcal{C})$; this follows by applying (3) to the opposite simplicial set $\operatorname{Cospan}^{L,R}(\mathcal{C})^{\mathrm{op}} \simeq \operatorname{Cospan}^{R,L}(\mathcal{C})$ (see Remark 8.1.6.2).

□

Corollary 8.1.6.8. *Let $\mathcal{C}$ be an ∞-category and let L and R denote collections of morphisms of $\mathcal{C}$ which are closed under composition. If L and R are pushout-compatible, then a 2-simplex of $\operatorname{Cospan}^{L,R}(\mathcal{C})$ is thin if and only if it is thin when viewed as a 2-simplex of the simplicial set $\operatorname{Cospan}(\mathcal{C})$.* 0498

Proof. Let σ be a thin 2-simplex of $\mathrm{Cospan}^{L,R}(\mathcal{C})$; we will show that σ is also thin when viewed as a 2-simplex of $\mathrm{Cospan}(\mathcal{C})$ (the reverse implication follows from Remark 8.1.6.4). Choose a fully faithful functor $f : \mathcal{C} \to \mathcal{D}$, where $\mathcal{D}$ is an ∞-category which admits pushouts and the functor f preserves all pushout squares which exist in $\mathcal{C}$ (see Corollary 8.3.3.17). Then f induces a morphism of simplicial sets $F : \mathrm{Cospan}^{L,R}(\mathcal{C}) \to \mathrm{Cospan}(\mathcal{D})$. The proof of Proposition 8.1.6.7 shows that every morphism $\tau_0 : \Lambda^2_1 \to \mathrm{Cospan}^{L,R}(\mathcal{C})$ can be extended to a 2-simplex τ of $\mathrm{Cospan}^{L,R}(\mathcal{C})$ which is thin when viewed as a 2-simplex of $\mathrm{Cospan}(\mathcal{C})$. Since f preserves pushout squares, the criterion of Proposition 8.1.4.2 guarantees that $F(\tau)$ is a thin 2-simplex of $\mathrm{Cospan}(\mathcal{D})$. Allowing τ_0 to vary and invoking Proposition 5.4.7.9, we deduce that F is a functor of $(\infty, 2)$-categories. In particular, $F(\sigma)$ is a thin 2-simplex of $\mathrm{Cospan}(\mathcal{D})$. Using the criterion of Proposition 8.1.4.2 and the assumption that f is fully faithful, we deduce that σ is also thin when viewed as a 2-simplex of $\mathrm{Cospan}(\mathcal{C})$.

□

0499 **Remark 8.1.6.9.** In the situation of Proposition 8.1.6.7, let σ be an n-simplex of the $(\infty, 2)$-category $\mathrm{Cospan}^{L,R}(\mathcal{C})$, corresponding to a diagram

049A

$$\begin{tikzcd}
X_{0,0} \arrow[dr] & & X_{1,1} \arrow[dl] \arrow[dr] & \cdots & X_{n-1,n-1} \arrow[dl] \arrow[dr] & & X_{n,n} \arrow[dl] \\
& \cdots \arrow[dr] & & \cdots \arrow[dl] \arrow[dr] & & \cdots \arrow[dl] & \\
& & X_{0,n-1} \arrow[dr] & & X_{1,n} \arrow[dl] & & \\
& & & X_{0,n} & & &
\end{tikzcd} \tag{8.14}$$

in the ∞-category $\mathcal{C}$. Then σ is contained in the pith $\mathrm{Pith}(\mathrm{Cospan}^{L,R}(\mathcal{C}))$ if and only if each of the rectangular regions in the diagram (8.14) is a pushout square in the ∞-category $\mathcal{C}$. This follows from the thinness criterion of Corollary 8.1.6.8 (together with Proposition 7.6.3.25).

049B **Corollary 8.1.6.10** (Invertible Cospans)**.** *Let $\mathcal{C}$ be an ∞-category. Let L and R be collections of morphisms of $\mathcal{C}$ which contain all isomorphisms and are closed under composition. Assume that L and R are pushout-compatible and let $e : X \to Y$ be a morphism in the $(\infty, 2)$-category $\mathrm{Cospan}^{L,R}(\mathcal{C})$, which we identify with a diagram $X \xrightarrow{f} B \xleftarrow{g} Y$ in the ∞-category $\mathcal{C}$. Then e is an isomorphism in $\mathrm{Cospan}^{L,R}(\mathcal{C})$ if and only if f and g are isomorphisms in $\mathcal{C}$.*

Proof. Let $\mathcal{C}^{\simeq}$ denote the core of $\mathcal{C}$ (Construction 1.3.5.4). If f and g are isomorphisms, then e can be regarded as an edge of the simplicial set $\mathrm{Cospan}(\mathcal{C}^{\simeq})$. Since $\mathcal{C}^{\simeq}$ is a Kan complex (Corollary 4.4.3.11), the simplicial set $\mathrm{Cospan}(\mathcal{C}^{\simeq})$ is also a Kan complex (Corollary 8.1.3.11), so e is automatically an isomorphism when viewed as a morphism of $\mathrm{Cospan}(\mathcal{C}^{\simeq})$ (Proposition 1.4.6.10). Since the inclusion map $\mathrm{Cospan}(\mathcal{C}^{\simeq}) \hookrightarrow \mathrm{Cospan}^{L,R}(\mathcal{C})$ is a functor of $(\infty, 2)$-categories (Corollary 8.1.6.8), it follows that e is also an isomorphism when regarded as a morphism of $\mathrm{Cospan}^{L,R}(\mathcal{C})$ (Remark 5.4.7.5).

Now suppose that e is an isomorphism in the $(\infty, 2)$-category $\mathrm{Cospan}^{L,R}(\mathcal{C})$. Arguing as in the proof of Proposition 5.4.6.6, we can produce a 3-simplex $\sigma : \Delta^3 \to \mathrm{Pith}(\mathrm{Cospan}^{L,R}(\mathcal{C}))$, where $\sigma|_{\mathrm{N}_{\bullet}(\{0<1\})}$ is the morphism e, $\sigma|_{\mathrm{N}_{\bullet}(\{0<2\})}$ is the identity morphism id_X, and $\sigma|_{\mathrm{N}_{\bullet}(\{1<3\})}$ is the identity morphism id_Y. Let us identify σ with a diagram

$$\begin{tikzcd}
X \arrow[dr, "f"] & & Y \arrow[dl, "g"', "\sim"] \arrow[dr] & & X \arrow[dl] \arrow[dr] & & Y \arrow[dl] \\
& B \arrow[dr, "u"] & & C \arrow[dl] \arrow[dr] & & D \arrow[dl] & \\
& & X \arrow[dr, "v"] & & Y \arrow[dl] & & \\
& & & Z & & &
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$. This diagram exhibits the identity morphism id_X as a composition of u with f. Since $\sigma|_{\mathrm{N}_{\bullet}(\{0<1<3\})}$ is a thin 2-simplex of $\mathrm{Cospan}^{L,R}(\mathcal{C})$, the outer rectangular region on the left is a pushout square in $\mathcal{C}$ (Corollary 8.1.6.8). It follows that the composition of v with u is an isomorphism in $\mathcal{C}$ (since it is a pushout of the identity morphism id_Y; see Corollary 7.6.3.24). Applying the two-out-of-six property to the 3-simplex of $\mathcal{C}$ given by the left edge of the diagram, we conclude that f is an isomorphism in $\mathcal{C}$ (see Proposition 5.4.6.5). A similar argument shows that g is an isomorphism in $\mathcal{C}$. □

Exercise 8.1.6.11. Show that, if the conditions of Corollary 8.1.6.10 are satisfied, then the diagram $Y \xrightarrow{g} B \xleftarrow{f} X$ is a homotopy inverse of e, when regarded as a morphism from Y to X in the $(\infty, 2)$-category $\mathrm{Cospan}^{L,R}(\mathcal{C})$. 049C

Corollary 8.1.6.12. *Let $\mathcal{C}$ be an ∞-category containing objects X and Y. Let L and R be collections of morphisms of $\mathcal{C}$ which are pushout-compatible, contain all isomorphisms of $\mathcal{C}$,* 049D *and are closed under composition. Then X and Y are isomorphic as objects of the ∞-category $\mathcal{C}$ if and only if they are isomorphic as objects of the $(\infty, 2)$-category* $\mathrm{Cospan}^{L,R}(\mathcal{C})$.

8.1.7 Comparing $\mathcal{C}$ with $\mathrm{Cospan}(\mathcal{C})$

`049E` Let $\mathcal{C}$ be a category which admits pushouts. Then there is a functor from $\mathcal{C}$ to the 2-category $\mathrm{Cospan}(\mathcal{C})$ of Example 2.2.2.1, which carries each object of $\mathcal{C}$ to itself and each morphism $f : X \to Y$ to the cospan $X \xrightarrow{f} Y \xleftarrow{\mathrm{id}_Y} Y$. This observation has an ∞-categorical counterpart:

`049F` **Construction 8.1.7.1.** Let $\mathcal{C}$ be a simplicial set and let $\lambda_+ : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}$ be the projection map of Notation 8.1.1.6, carrying each vertex $(f : X \to Y)$ of $\mathrm{Tw}(\mathcal{C})$ to the vertex $Y \in \mathcal{C}$. Under the bijection supplied by Proposition 8.1.3.7, we can identify λ_+ with a morphism of simplicial sets $\rho_+ : \mathcal{C} \to \mathrm{Cospan}(\mathcal{C})$. If σ is an n-simplex of $\mathcal{C}$, which we display informally as a diagram

$$X_0 \xrightarrow{f_1} X_1 \xrightarrow{f_2} X_2 \to \cdots \xrightarrow{f_n} X_n,$$

then $\rho_+(\sigma)$ is an n-simplex of $\mathrm{Cospan}(\mathcal{C})$ which can be depicted informally as a diagram

$$\begin{tikzcd}
X_0 \arrow[dr, "f_1"] & & X_1 \arrow[dl, "\mathrm{id}"] \arrow[dr, "f_2"] & & \cdots \arrow[dl] \arrow[dr] & & X_{n-1} \arrow[dl, "\mathrm{id}"] \arrow[dr, "f_n"] & & X_n \arrow[dl, "\mathrm{id}"] \\
& X_1 \arrow[dr, "f_2"] & & X_2 \arrow[dl, "\mathrm{id}"] \arrow[dr, "f_3"] & \cdots & X_{n-1} \arrow[dl, "\mathrm{id}"] \arrow[dr, "f_n"] & & X_n \arrow[dl, "\mathrm{id}"] & \\
& & \cdots \arrow[dr, "f_{n-1}"] & & \cdots \arrow[dl, "\mathrm{id}"] \arrow[dr, "f_n"] & & \cdots \arrow[dl, "\mathrm{id}"] & & \\
& & & X_{n-1} \arrow[dr, "f_n"] & & X_n \arrow[dl, "\mathrm{id}"] & & & \\
& & & & X_n. & & & &
\end{tikzcd}$$

Note that ρ_+ is a monomorphism of simplicial sets.

Our goal in this section is to study the behavior of Construction 8.1.7.1 in the case where the simplicial set $\mathcal{C}$ is an ∞-category. In this case, we will show that ρ_+ induces an equivalence of $\mathcal{C}$ with a certain restricted cospan construction (Proposition 8.1.7.6).

`049G` **Construction 8.1.7.2.** Let $\mathcal{C}$ be an ∞-category. We let $\mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C})$ denote the simplicial subset of $\operatorname{Cospan}(\mathcal{C})$ whose n-simplices are diagrams

$$\begin{tikzcd}
X_{0,0} \arrow[dr] & & X_{1,1} \arrow[dl, "\sim"'] \arrow[dr] & \cdots & X_{n-1,n-1} \arrow[dl, "\sim"'] \arrow[dr] & & X_{n,n} \arrow[dl, "\sim"'] \\
& \cdots \arrow[dr] & & \cdots \arrow[dl, "\sim"'] \arrow[dr] & & \cdots \arrow[dl, "\sim"'] & \\
& & X_{0,n-1} \arrow[dr] & & X_{1,n} \arrow[dl, "\sim"'] & & \\
& & & X_{0,n}, & & &
\end{tikzcd}$$

where each of the leftward-directed arrows is an isomorphism in $\mathcal{C}$.

Remark 8.1.7.3. Let $\mathcal{C}$ be an ∞-category. Then the simplicial set $\operatorname{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C})$ of Construction 8.1.7.2 coincides with the restricted cospan construction $\operatorname{Cospan}^{L,R}(\mathcal{C})$ of Definition 8.1.6.1, where we take L to be the collection of all morphisms of $\mathcal{C}$ and R to be the collection of all isomorphisms in $\mathcal{C}$ (see Example 8.1.7.10 for a more general statement). `049H`

Variant 8.1.7.4. Let $\mathcal{C}$ be a simplicial set and let R be a collection of edges of $\mathcal{C}$. We let $\operatorname{Cospan}^{\mathrm{all},R}(\mathcal{C})$ denote the simplicial subset $\operatorname{Cospan}^{A,R}(\mathcal{C}) \subseteq \operatorname{Cospan}(\mathcal{C})$, where A is the collection of all edges of $\mathcal{C}$. Similarly, if L is a collection of edges of $\mathcal{C}$, we let $\operatorname{Cospan}^{L,\mathrm{all}}(\mathcal{C})$ denote the simplicial subset $\operatorname{Cospan}^{L,A}(\mathcal{C}) \subseteq \operatorname{Cospan}(\mathcal{C})$. Note that the simplicial set $\operatorname{Cospan}^{L,R}(\mathcal{C})$ of Definition 8.1.6.1 can be recovered as the intersection $\operatorname{Cospan}^{L,\mathrm{all}}(\mathcal{C}) \cap \operatorname{Cospan}^{\mathrm{all},R}(\mathcal{C})$. `049J`

Proposition 8.1.7.5. *Let $\mathcal{C}$ be an ∞-category. Then the simplicial set $\operatorname{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C})$ is an ∞-category.* `049K`

Proof. Let σ be a 2-simplex of $\mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C})$, which we identify with a diagram

$$\begin{tikzcd}
X_{0,0} \arrow[dr] & & X_{1,1} \arrow[dl, "\sim"'] \arrow[dr] & & X_{2,2} \arrow[dl, "\sim"'] \\
& X_{0,1} \arrow[dr] & & X_{1,2} \arrow[dl, "\sim"'] & \\
& & X_{0,2} & &
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$ where the leftward-directed morphisms are isomorphisms. Using Corollary 7.6.3.24, we deduce that the inner region is a pushout square in $\mathcal{C}$. It follows that σ is automatically thin when regarded as a 2-simplex of $\mathrm{Cospan}(\mathcal{C})$ (Proposition 8.1.4.2), and therefore also when regarded as a 2-simplex of $\mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C})$ (Remark 8.1.6.4). To complete the proof, it will suffice to show that every diagram $\Lambda^2_1 \to \mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C})$ can be extended to a 2-simplex of $\mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C})$ (see Example 2.3.2.4). Using Lemma 8.1.4.4, we can restate this as follows: for every pair of morphisms $f : X_{1,1} \to X_{1,2}$ and $u : X_{1,1} \to X_{0,1}$ of $\mathcal{C}$ where u is an isomorphism, there exists a commutative diagram

$$\begin{tikzcd}
& X_{1,1} \arrow[dl, "u"'] \arrow[dr, "f"] & \\
X_{0,1} \arrow[dr] & & X_{1,2} \arrow[dl, "v"'] \\
& X_{0,2} &
\end{tikzcd}$$

where v is also an isomorphism. This follows immediately from the definitions (or from Corollary 4.4.5.9). □

Let $\mathcal{C}$ be an ∞-category and let $\rho_+ : \mathcal{C} \hookrightarrow \mathrm{Cospan}(\mathcal{C})$ the morphism described in Construction 8.1.7.1. Note that ρ_+ carries each object of $\mathcal{C}$ to itself, and each morphism $f : X \to Y$ of $\mathcal{C}$ to the edge of $\mathrm{Cospan}(\mathcal{C})$ given by the diagram $X \xrightarrow{f} Y \xleftarrow{\mathrm{id}_Y}$. Since every identity morphism in $\mathcal{C}$ is an isomorphism, ρ_+ factors through the ∞-category $\mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C})$. The remainder of this section is devoted to the proof of the following:

Proposition 8.1.7.6. *Let $\mathcal{C}$ be an ∞-category. Then the functor $\rho_+ : \mathcal{C} \hookrightarrow \mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C})$ is an equivalence of ∞-categories.* 049L

Example 8.1.7.7. Let X be a Kan complex. Applying Proposition 8.1.7.6 (and noting that every edge of X is an isomorphism), we see that $\rho_+ : X \to \mathrm{Cospan}(X)$ is a homotopy equivalence of Kan complexes (see Corollary 8.1.3.11). 049M

Our proof of Proposition 8.1.7.6 will require some preliminaries.

Definition 8.1.7.8. Let $\mathcal{C}$ be a simplicial set and let W be a collection of morphisms of $\mathcal{C}$. We say that W *has the left two-out-of-three property* if, for every 2-simplex of $\mathcal{C}$ with boundary indicated in by the diagram 049N

$$\begin{tikzcd}
X \arrow[rr, "h"] \arrow[dr, "f"'] & & Z \\
& Y, \arrow[ur, "g"'] &
\end{tikzcd}$$

where f belongs to W, g belongs to W if and only if h belongs to W.

Lemma 8.1.7.9. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories and let $F : \mathrm{Tw}(\mathcal{D}) \to \mathcal{C}$ be a functor, corresponding to a morphism of simplicial sets $f : \mathcal{D} \to \mathrm{Cospan}(\mathcal{C})$. Let L and R be collections of morphisms of $\mathcal{C}$ which satisfy the left two-out-of-three property. Then f factors through $\mathrm{Cospan}^{L,R}(\mathcal{C})$ if and only if F satisfies the following pair of conditions:* 049P

(1) *For each object X in $\mathcal{D}$, the morphism F carries every morphism of $\{X\} \times_{\mathcal{D}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{D})$ to a morphism of $\mathcal{C}$ which belongs to L.*

(2) *For each vertex Y in $\mathcal{D}$, the morphism F carries every morphism of $\mathrm{Tw}(\mathcal{D}) \times_{\mathcal{D}} \{Y\}$ to a morphism of $\mathcal{C}$ which belongs to R.*

Proof. For every morphism $e : X \to Y$ of $\mathcal{D}$, let $\mathrm{id}_X \xrightarrow{e_L} e \xleftarrow{e_R} \mathrm{id}_Y$ be the tautological cospan in $\mathrm{Tw}(\mathcal{D})$ described in Example 8.1.3.6. By virtue of Remark 8.1.6.3, the morphism f factors through $\mathrm{Cospan}^{L,R}(\mathcal{C})$ if and only if it satisfies the following pair of conditions:

(1′) For every morphism $e : X \to Y$ of $\mathcal{D}$, the functor F carries e_L to a morphism of $\mathcal{C}$ which belongs to L.

(2′) For every morphism $e : X \to Y$ of $\mathcal{D}$, the functor F carries e_R to a morphism of $\mathcal{C}$ which belongs to R.

The implications (1) ⇒ (1′) and (2) ⇒ (2′) are immediate (if $e : X \to Y$ is any morphism of $\mathcal{D}$, then e_L is contained to the fiber $\{X\} \times_{\mathcal{D}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{D})$, and e_R is contained in $\mathrm{Tw}(\mathcal{D}) \times_{\mathcal{D}} \{Y\}$). We will complete the proof by showing that (1′) implies (1); a similar argument shows that (2′) implies (2).

Assume that condition (1′) is satisfied, let X be an object of $\mathcal{D}$, and let $u : X \to Y$ and $v : X \to Z$ be morphisms of $\mathcal{D}$. Suppose we are given a morphism $g : u \to v$ in the ∞-category $\mathcal{E} = \{X\} \times_{\mathcal{D}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{D})$; we wish to show that $F(g)$ belongs to L. Since id_X is initial when viewed as an object of $\mathcal{E}$ (Proposition 8.1.2.1), there is a 2-simplex of $\mathcal{E}$ whose boundary is indicated in the diagram

$$\begin{tikzcd}
& \mathrm{id}_X \arrow[dl, "u_L"'] \arrow[dr, "v_L"] & \\
u \arrow[rr, "g"] & & v.
\end{tikzcd}$$

Assumption (1′) guarantees that $F(u_L)$ and $F(v_L)$ belong to L. Since L satisfies the left two-out-of-three property, it follows that $F(g)$ also belongs to L. □

049Q **Example 8.1.7.10.** Let $\mathcal{C}$ be an ∞-category and let σ be an n-simplex of the simplicial set $\mathrm{Cospan}(\mathcal{C})$, corresponding to a diagram

049R

$$\begin{tikzcd}
X_{0,0} \arrow[dr] & & X_{1,1} \arrow[dl] \arrow[dr] & \cdots & X_{n-1,n-1} \arrow[dl] \arrow[dr] & & X_{n,n} \arrow[dl] \\
& \cdots \arrow[dr] & & \cdots \arrow[dl] \arrow[dr] & & \cdots \arrow[dl] & \\
& & X_{0,n-1} \arrow[dr] & & X_{1,n} \arrow[dl] & & \\
& & & X_{0,n}. & & &
\end{tikzcd} \qquad (8.15)$$

Let L and R be collections of morphisms of $\mathcal{C}$ which contain all identity morphisms and have the left two-out-of-three property. Then σ belongs to $\mathrm{Cospan}^{L,R}(\mathcal{C})$ if and only if each of the rightward-pointing morphisms displayed in (8.15) belong to L, and each of the leftward-pointing morphisms displayed in (8.15) belong to R.

049S **Remark 8.1.7.11.** Let $\mathcal{C}$ be an ∞-category, let R be a collection of morphisms of $\mathcal{C}$ which has the left two-out-of-three property, and let $\mathcal{D}$ be a simplicial set. Suppose we are given a pair of morphisms $f, g : \mathcal{D} \to \mathrm{Fun}^{\mathrm{all},R}(\mathcal{C})$, corresponding to diagrams $F, G : \mathrm{Tw}(\mathcal{D}) \to \mathcal{C}$. If $\alpha : F \to G$ is a natural transformation of diagrams, then the following conditions are equivalent:

(a) For every edge $u : D' \to D$ of $\mathcal{D}$, the morphism $\alpha_u : F(u) \to G(u)$ belongs to R.

(b) For every degenerate edge $u : D \to D$ of $\mathcal{D}$, the morphism $\alpha_u : F(u) \to G(u)$ belongs to R.

The implication (a) ⇒ (b) is immediate. To prove the reverse implication, let $u : D' \to D$ be an edge of $\mathcal{D}$ and let $u_R : \mathrm{id}_D \to u$ be the edge of $\mathrm{Tw}(\mathcal{D})$ described in Example 8.1.3.6. Evaluating α on the morphism u_R, we obtain a commutative diagram

$$\begin{tikzcd}
F(\mathrm{id}_D) \arrow[r, "\alpha_{\mathrm{id}_D}"] \arrow[d] & G(\mathrm{id}_D) \arrow[d] \\
F(u) \arrow[r, "\alpha_u"] & G(u)
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$, where the vertical maps belong to R by virtue of our assumption that f and g factor through $\mathrm{Cospan}^{\mathrm{all},R}(\mathcal{C})$. Applying the left two-out-of-three property, we conclude that if the upper horizontal map belongs to R, then the lower horizontal map also belongs to R.

Lemma 8.1.7.12. *Let $\mathcal{C}$ be an ∞-category, let L and R be collections of morphisms of $\mathcal{C}$ which have the left two-out-of-three property, and let $\mathrm{Fun}'(\mathrm{Tw}(\mathcal{D}), \mathcal{C})$ denote the full subcategory of $\mathrm{Fun}(\mathrm{Tw}(\mathcal{D}), \mathcal{C})$ spanned by those objects which correspond to diagrams $\mathcal{D} \to \mathrm{Cospan}^{L,R}(\mathcal{C}) \subseteq \mathrm{Cospan}(\mathcal{C})$. Let R' be the collection of morphisms in $\mathrm{Fun}'(\mathrm{Tw}(\mathcal{D}), \mathcal{C})$ which satisfy the equivalent conditions of Remark 8.1.7.11, and define L' similarly. Then the isomorphism $\mathrm{Fun}(\mathcal{D}, \mathrm{Cospan}(\mathcal{C})) \simeq \mathrm{Cospan}(\mathrm{Fun}(\mathrm{Tw}(\mathcal{D}), \mathcal{C}))$ of Remark 8.1.3.9 restricts to an isomorphism of simplicial subsets $\mathrm{Fun}(\mathcal{D}, \mathrm{Cospan}^{L,R}(\mathcal{C})) \simeq \mathrm{Cospan}^{L',R'}(\mathrm{Fun}'(\mathrm{Tw}(\mathcal{D}), \mathcal{C}))$.* 049T

Proof. Writing $\mathrm{Cospan}^{L,R}(\mathcal{C})$ as the intersection $\mathrm{Cospan}^{L,\mathrm{all}}(\mathcal{C}) \cap \mathrm{Cospan}^{\mathrm{all},R}(\mathcal{C})$ (see Variant 8.1.7.4), we can reduce to the case where either L or R is the collection of all morphisms of $\mathcal{C}$. Let us assume that L is the collection of all morphisms of $\mathcal{C}$, so that L' is the collection of all morphisms of $\mathrm{Fun}'(\mathrm{Tw}(\mathcal{D}), \mathcal{C})$. Suppose we are given another simplicial set $\mathcal{E}$ and a diagram $F : \mathrm{Tw}(\mathcal{D}) \times \mathrm{Tw}(\mathcal{E}) \to \mathcal{C}$. We can identify F with a morphism of simplicial sets $\mathcal{E} \to \mathrm{Fun}(\mathcal{D}, \mathrm{Cospan}(\mathcal{C}))$. By virtue of Remark 8.1.6.3, this morphism factors through the simplicial subset $\mathrm{Fun}(\mathcal{D}, \mathrm{Cospan}^{L,R}(\mathcal{C}))$ if and only if, for every edge $u : D' \to D$ of $\mathcal{D}$ and every edge $v : E' \to E$ of $\mathcal{E}$, the morphism F satisfies the following condition:

($1_{u,v}$) Let $u_R : \mathrm{id}_D \to u$ and $v_R : \mathrm{id}_E \to v$ be the edges of $\mathrm{Tw}(\mathcal{D})$ and $\mathrm{Tw}(\mathcal{E})$ described in Example 8.1.3.6. Then the morphism $F(u_R, v_R)$ belongs to R.

Identifying F with a morphism $f : \mathcal{E} \to \mathrm{Cospan}(\mathrm{Fun}(\mathrm{Tw}(\mathcal{D}), \mathcal{C}))$, we see that f factors through $\mathrm{Cospan}(\mathrm{Fun}'(\mathrm{Tw}(\mathcal{D}), \mathcal{C}))$ if and only if it satisfies condition ($1_{u,v}$) whenever v is a degenerate edge of $\mathcal{E}$. Under this assumption, f factors through $\mathrm{Cospan}^{L',R'}(\mathrm{Fun}'(\mathrm{Tw}(\mathcal{D}), \mathcal{C}))$ if and only if, for every edge $u : D' \to D$ of $\mathcal{D}$ and every edge $v : E' \to E$ of $\mathcal{E}$, the diagram F satisfies the following condition:

($2_{u,v}$) The morphism $F(\mathrm{id}_u, v)$ belongs to R.

To complete the proof, it suffices to observe that if condition ($1_{u,\mathrm{id}_E}$) is satisfied, then condition ($1_{u,v}$) is equivalent to condition ($2_{u,v}$). This follows by applying the left two-out-of-three property to the upper triangle appearing in the diagram

$$\begin{tikzcd}
F(\mathrm{id}_D, \mathrm{id}_E) \arrow[r, "F(u_R,\mathrm{id})"] \arrow[d, "F(\mathrm{id},v_R)"] \arrow[dr, "F(u_R,v_R)"] & F(u, \mathrm{id}_E) \arrow[d, "F(\mathrm{id}_u,v_R)"] \\
F(\mathrm{id}_D, v) \arrow[r, "F(u_R,\mathrm{id}_v)"] & F(u, v).
\end{tikzcd}$$

□

049U **Lemma 8.1.7.13.** *Let $\mathcal{C}$ be an ∞-category, let $\mathcal{D}$ be a simplicial set, and suppose we are given a pair of diagrams $f, g : \mathcal{D} \to \mathrm{Cospan}^{\mathrm{all,iso}}(\mathcal{C})$, corresponding to diagrams $F, G : \mathrm{Tw}(\mathcal{D}) \to \mathcal{C}$. The following conditions are equivalent:*

(1) *The diagrams f and g are isomorphic when viewed as objects of the ∞-category $\mathrm{Fun}(\mathcal{D}, \mathrm{Cospan}^{\mathrm{all,iso}}(\mathcal{C}))$.*

(2) *The diagrams F and G are isomorphic when viewed as objects of the ∞-category $\mathrm{Fun}(\mathrm{Tw}(\mathcal{D}), \mathcal{C})$.*

Proof. Let $\mathrm{Fun}'(\mathrm{Tw}(\mathcal{D}), \mathcal{C})$ denote the full subcategory of $\mathrm{Fun}(\mathrm{Tw}(\mathcal{D}), \mathcal{C})$ spanned by those functors $\mathrm{Tw}(\mathcal{D}) \to \mathcal{C}$ which correspond to diagrams $\mathcal{D} \to \mathrm{Cospan}^{\mathrm{all,iso}}(\mathcal{C})$. Lemma 8.1.7.12, identifies $\mathrm{Fun}(\mathcal{D}, \mathrm{Cospan}^{\mathrm{all,iso}}(\mathcal{C}))$ with the ∞-category $\mathrm{Cospan}^{\mathrm{all,iso}}(\mathrm{Fun}'(\mathrm{Tw}(\mathcal{D}), \mathcal{C}))$. We are therefore reduced to proving that F and G are isomorphic when viewed as objects of the ∞-category $\mathrm{Fun}'(\mathrm{Tw}(\mathcal{D}), \mathcal{C})$ if and only if they are isomorphic when viewed as objects of the ∞-category $\mathrm{Cospan}^{\mathrm{all,iso}}(\mathrm{Fun}'(\mathrm{Tw}(\mathcal{D}), \mathcal{C}))$. This is a special case of Corollary 8.1.6.12. □

Proof of Proposition 8.1.7.6. Let $\mathcal{C}$ be an ∞-category. We wish to show that the comparison map $\rho_+ : \mathcal{C} \hookrightarrow \mathrm{Cospan}^{\mathrm{all,iso}}(\mathcal{C})$ of Construction 8.1.7.1. Let $\mathcal{D}$ be a simplicial set; we will show that composition with ρ_+ induces a bijection $\theta : \pi_0(\mathrm{Fun}(\mathcal{D},\mathcal{C})^{\simeq}) \to \pi_0(\mathrm{Fun}(\mathcal{D}, \mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C}))^{\simeq})$.

Let $\lambda_+ : \mathrm{Tw}(\mathcal{D}) \to \mathcal{D}$ denote the projection map, and let W be the collection of all edges e of $\mathrm{Tw}(\mathcal{D})$ such that $\lambda_+(e)$ is a degenerate edge of $\mathcal{D}$. Let $\mathrm{Fun}(\mathrm{Tw}(\mathcal{D})[W^{-1}], \mathcal{C})$ denote the full subcategory of $\mathrm{Fun}(\mathrm{Tw}(\mathcal{D}), \mathcal{C})$ spanned by those diagrams $F : \mathrm{Tw}(\mathcal{D}) \to \mathcal{C}$ which carry each edge of W to an isomorphism in $\mathcal{C}$ (Notation 6.3.1.1). Using Lemmas 8.1.7.9 and 8.1.7.13, we can identify θ with the map $\pi_0(\mathrm{Fun}(\mathcal{D},\mathcal{C})^{\simeq}) \to \pi_0(\mathrm{Fun}(\mathrm{Tw}(\mathcal{D})[W^{-1}],\mathcal{C})^{\simeq})$ given by composition λ_+. To complete the proof, it will suffice to show that λ_+ exhibits $\mathcal{D}$ as a localization of $\mathrm{Tw}(\mathcal{D})$ with respect to W, in the sense of Definition 6.3.1.9. This follows from Corollary 6.3.6.4, since the morphism λ_+ is universally localizing (Corollary 8.1.2.4). □

Variant 8.1.7.14. Let $\mathcal{C}$ be a simplicial set. Then the projection map $\lambda_- : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}}$ determines a morphism of simplicial sets $\rho_- : \mathcal{C}^{\mathrm{op}} \to \mathrm{Cospan}(\mathcal{C})$. If σ is an n-simplex of $\mathcal{C}^{\mathrm{op}}$, which we display informally as a diagram 049V

$$X_0 \xleftarrow{f_1} X_1 \xleftarrow{f_2} X_2 \leftarrow \cdots \xleftarrow{f_n} X_n,$$

then $\rho_-(\sigma)$ is an n-simplex of $\mathrm{Cospan}(\mathcal{C})$ which is depicted informally by the diagram

$$\begin{tikzcd}
X_0 \arrow[dr, "\mathrm{id}"] & & X_1 \arrow[dl, "f_1"] \arrow[dr, "\mathrm{id}"] & & \cdots \arrow[dl] \arrow[dr] & & X_{n-1} \arrow[dl, "f_{n-1}"] \arrow[dr, "\mathrm{id}"] & & X_n \arrow[dl, "f_n"] \\
& X_0 \arrow[dr, "\mathrm{id}"] & & X_1 \arrow[dl, "f_1"] \arrow[dr, "\mathrm{id}"] & \cdots & X_{n-2} \arrow[dl, "f_{n-2}"] \arrow[dr, "\mathrm{id}"] & & X_{n-1} \arrow[dl, "f_{n-1}"] & \\
& & \cdots \arrow[dr, "\mathrm{id}"] & & \cdots \arrow[dl, "f_1"] \arrow[dr, "\mathrm{id}"] & & \cdots \arrow[dl, "f_2"] & & \\
& & & X_0 \arrow[dr, "\mathrm{id}"] & & X_1 \arrow[dl, "f_1"] & & & \\
& & & & X_0. & & & &
\end{tikzcd}$$

If $\mathcal{C}$ is an ∞-category, then ρ_- restricts an equivalence $\mathcal{C}^{\mathrm{op}} \hookrightarrow \mathrm{Cospan}^{\mathrm{iso},\mathrm{all}}(\mathcal{C})$, where $\mathrm{Cospan}^{\mathrm{iso},\mathrm{all}}(\mathcal{C})$ is the simplicial subset $\mathrm{Cospan}^{L,R}(\mathcal{C}) \subseteq \mathrm{Cospan}(\mathcal{C})$ where L is the collection of isomorphisms in $\mathcal{C}$, and R is the collection of all morphisms of $\mathcal{C}$.

8.1.8 Morphisms in the Duskin Nerve

Let S be a simplicial set. Recall that, for every pair of vertices $X, Y \in S$, the morphism space $\mathrm{Hom}_S(X,Y)$ is defined by the formula 03KZ

$$\mathrm{Hom}_S(X,Y) = \{X\} \tilde{\times}_S \{Y\} = \{X\} \times_{\mathrm{Fun}(\{0\},S)} \mathrm{Fun}(\Delta^1, S) \times_{\mathrm{Fun}(\{1\},S)} \{Y\}.$$

In this section, we specialize to the case where $S = \mathrm{N}^{\mathrm{D}}_{\bullet}(\mathcal{C})$ is the Duskin nerve of a 2-category $\mathcal{C}$. In this case, we will see that there is close relationship between the simplicial set $\mathrm{Hom}_S(X, Y)$ and the category $\underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y)$ of 1-morphisms from X to Y. More precisely, we will construct a comparison map

$$\mathrm{Cospan}(\mathrm{N}_{\bullet}\, \underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y)) \to \mathrm{Hom}_{\mathrm{N}^{\mathrm{D}}_{\bullet}(\mathcal{C})}(X, Y),$$

and show that it is an isomorphism of simplicial sets (Corollary 8.1.8.6).

03L0 **Warning 8.1.8.1.** Let $\mathcal{C}$ be a 2-category. If every 2-morphism in $\mathcal{C}$ is invertible, then the Duskin nerve $\mathrm{N}^{\mathrm{D}}_{\bullet}(\mathcal{C})$ is an ∞-category (Theorem 2.3.2.1). It follows that, for every pair of objects $X, Y \in \mathcal{C}$, the simplicial set $\mathrm{Hom}_{\mathrm{N}^{\mathrm{D}}_{\bullet}(\mathcal{C})}(X, Y)$ is a Kan complex. Beware that, in the case where $\mathcal{C}$ contains non-invertible 2-morphisms, the simplicial set $\mathrm{Hom}_{\mathrm{N}^{\mathrm{D}}_{\bullet}(\mathcal{C})}(X, Y)$ is generally not an ∞-category (in fact, it is not even an $(\infty, 2)$-category unless the category $\mathrm{Hom}_{\mathcal{C}}(X, Y)$ admits pushouts: see Proposition 8.1.4.1). In such cases, it may be more useful to consider the *pinched* morphism spaces of $\mathrm{N}^{\mathrm{D}}_{\bullet}(\mathcal{C})$: see Example 4.6.5.13 and Remark 8.1.8.8.

01G9 **Construction 8.1.8.2.** Let $\mathcal{A}$ be a category, let $\mathcal{C}$ be a 2-category containing objects X and Y, and let $F : \mathrm{Tw}(\mathcal{A}) \to \underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y)$ be a functor. We define a strictly unitary lax functor $U_F : [1] \times \mathcal{A} \to \mathcal{C}$ as follows:

(1) The lax functor U_F is given on objects by $U_F(0, A) = X$ and $U_F(1, A) = Y$ for each object $A \in \mathcal{A}$.

(2) Let $f : A \to B$ be a morphism in the category $\mathcal{A}$, which we also regard as an object of the twisted arrow category $\mathrm{Tw}(\mathcal{A})$. For $0 \leq i \leq j \leq 1$, we let f_{ji} denote the corresponding morphism from (i, A) to (j, B) in the product category $[1] \times \mathcal{A}$. Then the lax functor U_F is given on 1-morphisms by the formula

$$U_F(f_{ji}) = \begin{cases} \mathrm{id}_X & \text{if } i = j = 0 \\ \mathrm{id}_Y & \text{if } i = j = 1 \\ F(f) & \text{if } 0 = i < j = 1. \end{cases}$$

(3) Let $f : A \to B$ and $v : B \to C$ be composable morphisms in the category $\mathcal{A}$, and let $0 \leq i \leq j \leq k \leq 1$. Then the composition constraint $\mu_{g_{kj}, f_{ji}}$ for the lax functor U_F is given as follows:

- If $i = j = k = 0$, then $\mu_{g_{kj}, f_{ji}}$ is the unit constraint $\upsilon_X : \mathrm{id}_X \circ \mathrm{id}_X \xRightarrow{\sim} \mathrm{id}_X$ of the 2-category $\mathcal{C}$.
- If $i = 0$ and $j = k = 1$, then $\mu_{g_{kj}, f_{ji}}$ is given by the composition

$$\mathrm{id}_Y \circ F(f) \xRightarrow{\lambda_{F(f)}} F(f) \xRightarrow{F(\mathrm{id}_A, g)} F(g \circ f),$$

where $\lambda_{F(f)}$ is the left unit constraint of Construction 2.2.1.11 and we regard the pair (id_A, g) as an element of $\mathrm{Hom}_{\mathrm{Tw}(\mathcal{A})}(f, g \circ f)$.

- If $i = j = 0$ and $k = 1$, then $\mu_{g_{kj}, f_{ji}}$ is given by the composition

$$F(g) \circ \mathrm{id}_X \xRightarrow{\rho_{F(g)}} F(g) \xRightarrow{F(f, \mathrm{id}_C)} F(g \circ f),$$

where $\rho_{F(g)}$ is the right unit constraint of Construction 2.2.1.11 and we regard the pair (f, id_C) as an element of $\mathrm{Hom}_{\mathrm{Tw}(\mathcal{A})}(g, g \circ f)$.

- If $i = j = k = 1$, then $\mu_{g_{kj}, f_{ji}}$ is equal to the unit constraint $\upsilon_Y : \mathrm{id}_Y \circ \mathrm{id}_Y \overset{\sim}{\Longrightarrow} \mathrm{id}_Y$ of the 2-category $\mathcal{C}$.

Exercise 8.1.8.3. Show that Construction 8.1.8.2 is well-defined. That is, given a functor $F : \mathrm{Tw}(\mathcal{A}) \to \underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y)$ as in Construction 8.1.8.2, show that there is a unique strictly unitary lax functor U_F satisfying properties (1), (2), and (3) of Construction 8.1.8.2. `01GA`

We can now formulate the main result of this section.

Theorem 8.1.8.4. *Let $\mathcal{A}$ be a category and let $\mathcal{C}$ be a 2-category containing objects X and Y. Then the assignment $F \mapsto U_F$ of Construction 8.1.8.2 induces a monomorphism of sets* `01GB`

$$\begin{tikzcd}
\{\text{Functors } F : \mathrm{Tw}(\mathcal{A}) \to \underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y)\} \arrow[d] \\
\{\text{Strictly unitary lax functors } U : [1] \times \mathcal{A} \to \mathcal{C}\}.
\end{tikzcd}$$

The image of this monomorphism consists of those strictly unitary lax functors $U : [1] \times \mathcal{C} \to \mathcal{D}$ having the property that $U|_{\{0\} \times \mathcal{A}}$ and $U|_{\{1\} \times \mathcal{A}}$ are the constant functors taking the values X and Y, respectively.

Remark 8.1.8.5. Let $\mathcal{C}$ be a 2-category containing objects X and Y. For every category $\mathcal{A}$, we can use Theorem 2.3.4.1 to identify strictly unitary lax functors $U : [1] \times \mathcal{A} \to \mathcal{C}$ with morphisms of simplicial sets $G : \Delta^1 \times \mathrm{N}_\bullet(\mathcal{A}) \to \mathrm{N}^{\mathrm{D}}_\bullet(\mathcal{C})$. Consequently, Theorem 8.1.8.4 supplies a bijection `03L1`

$$\begin{tikzcd}
\{\text{Functors } F : \mathrm{Tw}(\mathcal{A}) \to \underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y)\} \arrow[d, "\sim"] \\
\{\text{Morphisms of simplicial sets } \mathrm{N}_\bullet(\mathcal{A}) \to \mathrm{Hom}_{\mathrm{N}^{\mathrm{D}}_\bullet(\mathcal{C})}(X, Y)\}.
\end{tikzcd}$$

Note that the bijection of Remark 8.1.8.5 depends functorially on the simplicial set $\mathcal{A}$. Specializing to categories of the form $\mathcal{A} = [n]$, we obtain the following:

01GC **Corollary 8.1.8.6.** *Let $\mathcal{C}$ be a 2-category containing objects X and Y. Then Construction 8.1.8.2 induces an isomorphism of simplicial sets*

$$\mathrm{Cospan}(\mathrm{N}_\bullet \underline{\mathrm{Hom}}_{\mathcal{C}}(X,Y)) \xrightarrow{\sim} \mathrm{Hom}_{\mathrm{N}^{\mathrm{D}}_\bullet(\mathcal{C})}(X,Y).$$

03L2 **Exercise 8.1.8.7.** Show that Theorem 8.1.8.4 follows from Corollary 8.1.8.6. In other words, to prove Theorem 8.1.8.4, there is no loss of generality in assuming that $\mathcal{A}$ has the form $\{0 < 1 < \cdots < n\}$ for some integer $n \geq 0$.

03L3 **Remark 8.1.8.8.** Let $\mathcal{C}$ be a 2-category containing a pair of objects X and Y. Then we have a commutative diagram of simplicial sets

$$\begin{tikzcd}
\mathrm{N}_\bullet \underline{\mathrm{Hom}}_{\mathcal{C}}(X,Y) \arrow[r, "\rho_+"] \arrow[d, "\sim"] & \mathrm{Cospan}(\mathrm{N}_\bullet \underline{\mathrm{Hom}}_{\mathcal{C}}(X,Y)) \arrow[d, "\sim"] & \mathrm{N}_\bullet \underline{\mathrm{Hom}}_{\mathcal{C}}(X,Y)^{\mathrm{op}} \arrow[l, "\rho_-"'] \arrow[d, "\sim"] \\
\mathrm{Hom}^{\mathrm{L}}_{\mathrm{N}^{\mathrm{D}}_\bullet(\mathcal{C})}(X,Y) \arrow[r, "\iota^{\mathrm{L}}"] & \mathrm{Hom}_{\mathrm{N}^{\mathrm{D}}_\bullet(\mathcal{C})}(X,Y) & \mathrm{Hom}^{\mathrm{R}}_{\mathrm{N}^{\mathrm{D}}_\bullet(\mathcal{C})}(X,Y) \arrow[l, "\iota^{\mathrm{R}}"']
\end{tikzcd}$$

where the upper horizontal maps are the inclusions of Construction 8.1.7.1 and Variant 8.1.7.14, the lower horizontal maps are the pinch inclusion maps of Construction 4.6.5.7, the outer vertical maps are the isomorphisms of Example 4.6.5.13, and the inner vertical map is the isomorphism of Corollary 8.1.8.6.

Stated more concretely, Corollary 8.1.8.6 asserts that we can identify n-simplices of the simplicial set $\mathrm{Hom}_{\mathrm{N}^{\mathrm{D}}_\bullet(\mathcal{C})}(X,Y)$ with commutative diagrams

$$\begin{tikzcd}[column sep=small]
f_{0,0} \arrow[dr, Rightarrow] & & f_{1,1} \arrow[dl, Rightarrow] \arrow[dr, Rightarrow] & & \cdots \arrow[dl, Rightarrow] \arrow[dr, Rightarrow] & & f_{n-1,n-1} \arrow[dl, Rightarrow] \arrow[dr, Rightarrow] & & f_{n,n} \arrow[dl, Rightarrow] \\
& \cdots \arrow[dr, Rightarrow] & & \cdots \arrow[dl, Rightarrow] \arrow[dr, Rightarrow] & & \cdots \arrow[dl, Rightarrow] \arrow[dr, Rightarrow] & & \cdots \arrow[dl, Rightarrow] & \\
& & f_{0,n-2} \arrow[dr, Rightarrow] & & f_{1,n-1} \arrow[dl, Rightarrow] \arrow[dr, Rightarrow] & & f_{2,n} \arrow[dl, Rightarrow] & & \\
& & & f_{0,n-1} \arrow[dr, Rightarrow] & & f_{1,n} \arrow[dl, Rightarrow] & & & \\
& & & & f_{0,n} & & & &
\end{tikzcd}$$

in the category of 1-morphisms $\underline{\mathrm{Hom}}_{\mathcal{C}}(X,Y)$. The image of the left-pinch inclusion morphism

$$\iota^{\mathrm{L}} : \mathrm{Hom}^{\mathrm{L}}_{\mathrm{N}^{\mathrm{D}}_\bullet(\mathcal{C})}(X,Y) \hookrightarrow \mathrm{Hom}_{\mathrm{N}^{\mathrm{D}}_\bullet(\mathcal{C})}(X,Y)$$

consists of those simplices which correspond (under this identification) to commutative diagrams in which each of the leftward pointing 2-morphisms $f_{i,j} \Rightarrow f_{i-1,j}$ is an identity map. In this case, the entire diagram is determined by the sequence of composable morphisms $f_{0,0} \Rightarrow f_{0,1} \Rightarrow f_{0,2} \Rightarrow \cdots \Rightarrow f_{0,n}$ in the category $\underline{\mathrm{Hom}}_{\mathcal{C}}(X,Y)$. Similarly, the image of the right-pinch inclusion morphism

$$\iota^{\mathrm{R}} : \mathrm{Hom}^{\mathrm{R}}_{\mathrm{N}^{\mathrm{D}}_{\bullet}(\mathcal{C})}(X,Y) \hookrightarrow \mathrm{Hom}_{\mathrm{N}^{\mathrm{D}}_{\bullet}(\mathcal{C})}(X,Y)$$

consists of those simplices which correspond to commutative diagrams in which the rightward pointing 2-morphisms $f_{i,j} \Rightarrow f_{i,j+1}$ are identity maps, which ensures that the entire diagram is determined by the sequence of composable morphisms $f_{n,n} \Rightarrow f_{n-1,n} \Rightarrow f_{n-2,n} \Rightarrow \cdots \Rightarrow f_{0,n}$ in $\underline{\mathrm{Hom}}_{\mathcal{C}}(X,Y)$.

Proof of Theorem 8.1.8.4. Let $\mathcal{A}$ be an ordinary category, let $\mathcal{C}$ be a 2-category containing objects X and Y, and let $U : [1] \times \mathcal{A} \to \mathcal{C}$ be a strictly unitary lax functor having the property that $U|_{\{0\}\times\mathcal{A}}$ and $U|_{\{1\}\times\mathcal{A}}$ are the constant functors taking the values X and Y, respectively. We wish to show that there exists a unique functor of ordinary categories $F : \mathrm{Tw}(\mathcal{A}) \to \underline{\mathrm{Hom}}_{\mathcal{C}}(X,Y)$ such that U is equal to the strictly unitary lax functor U_F given by Construction 8.1.8.2. To prove this, we may assume without loss of generality that the 2-category $\mathcal{C}$ is strictly unitary (Proposition 2.2.7.7). Given a morphism $f : A \to B$ in the category $\mathcal{A}$ and a pair of integers $0 \leq i \leq j \leq 1$, we write $f_{ji} : (i,A) \to (j,B)$ for the corresponding morphism in the product category $[1] \times \mathcal{A}$. Unwinding the definitions, we see that the identity $U = U_F$ imposes the following requirements on the functor F:

(1) Let $f : A \to B$ be a morphism in the category $\mathcal{C}$, which we identify with an object of the twisted arrow category $\mathrm{Tw}(\mathcal{A})$. Then $F(f)$ is equal to $U(f_{10}) \in \underline{\mathrm{Hom}}_{\mathcal{C}}(X,Y)$.

(2) Let $f : A \to B$ and $g : B \to C$ be composable morphisms in the category $\mathcal{A}$, and regard the pairs (id_A, g) and (f, id_C) as elements of $\mathrm{Hom}_{\mathrm{Tw}(\mathcal{A})}(f, g\circ f)$ and $\mathrm{Hom}_{\mathrm{Tw}(\mathcal{A})}(g, g\circ f)$, respectively. Then $F(\mathrm{id}_A, g)$ and $F(f, \mathrm{id}_C)$ are equal to the composition constraints $\mu_{g_{11}, f_{10}}$ and $\mu_{g_{10}, f_{00}}$ for the lax functor U, respectively.

We now establish the uniqueness of the functor F. The value of F on objects is determined by condition (1). If $f : A \to B$ and $f' : A' \to B'$ are objects of the twisted arrow category $\mathrm{Tw}(\mathcal{A})$, then an element of $\mathrm{Hom}_{\mathrm{Tw}(\mathcal{A})}(f, f')$ can be identified with a pair (u, v) where $u \in \mathrm{Hom}_{\mathcal{A}}(A', A)$ and $v \in \mathrm{Hom}_{\mathcal{A}}(B, B')$ satisfy $f' = v \circ f \circ u$. In this case, the morphism (u, v) factors as a composition $(u, \mathrm{id}_{B'}) \circ (\mathrm{id}_A, v)$, so condition (2) guarantees the identity

$$F(u,v) = F(u, \mathrm{id}_{B'}) \circ F(\mathrm{id}_A, v) = \mu_{(vf)_{10}, u_{00}} \circ \mu_{v_{11}, f_{10}}.$$

This proves the uniqueness of F on morphisms.

To prove existence, we define the functor F on objects $f \in \mathrm{Tw}(\mathcal{A})$ by setting $F(f) = U(f_{10})$, and on morphisms $(u, v) \in \mathrm{Hom}_{\mathrm{Tw}(\mathcal{A})}(f, f')$ by the formula

$$F(u, v) = \mu_{(vf)_{10}, u_{00}} \circ \mu_{v_{11}, f_{10}}.$$

Note that this prescription automatically satisfies condition (1). Since U is a strictly unitary functor between strictly unitary 2-categories, its composition constraints $\mu_{g,h}$ are the identity whenever either g or h is an identity morphism (Remark 2.2.7.5), which shows that F satisfies condition (2) and that it carries identity morphisms to identity morphisms. We will complete the proof by showing that F is compatible with composition. Let $f : A \to B$, $f' : A' \to B'$, and $f'' : A'' \to B''$ be objects of the twisted arrow category $\mathrm{Tw}(\mathcal{A})$, and suppose we are given morphisms $(u, v) \in \mathrm{Hom}_{\mathrm{Tw}(\mathcal{A})}(f, f')$ and $(u', v') \in \mathrm{Hom}_{\mathrm{Tw}(\mathcal{A})}(f', f'')$. We wish to prove an equality $F(u \circ u', v' \circ v) = F(u', v') \circ F(u, v)$ of morphisms from $F(f)$ to $F(f'')$ in the category $\underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y)$. Unwinding the definitions, this is equivalent to the commutativity of the outer cycle of the diagram

$$\begin{tikzcd}
& & F(vfu) \arrow[dr, Rightarrow, "\mu_{v'_{11},(vfu)_{10}}"] & & \\
& F(vf) \arrow[ur, Rightarrow, "\mu_{(vf)_{10},u_{00}}"] \arrow[dr, Rightarrow, "\mu_{v'_{11},(vf)_{10}}"] & & F(v'vfu) \arrow[dr, Rightarrow, "\mu_{(v'vfu)_{10},u'_{00}}"] & \\
F(f) \arrow[ur, Rightarrow, "\mu_{v_{11},f_{10}}"] \arrow[rr, Rightarrow, "\mu_{(v'v)_{11},f_{10}}"] & & F(v'vf) \arrow[ur, Rightarrow, "\mu_{(v'vf)_{10},u_{00}}"] \arrow[rr, Rightarrow, "\mu_{(v'vf)_{10},(uu')_{00}}"] & & F(v'vfuu')
\end{tikzcd}$$

in the category $\underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y)$. In fact, the entire diagram commutes. The commutativity of the upper square follows by applying property (c) of Definition 2.2.4.5 to the composable triple of morphisms

$$(0, A') \xrightarrow{u_{00}} (0, A) \xrightarrow{(vf)_{10}} (1, B') \xrightarrow{v'_{11}} (1, B'')$$

in the product category $[1] \times \mathcal{A}$. The commutativity of the lower left triangle follows by applying property (c) to the composable triple of morphisms

$$(0, A) \xrightarrow{f_{10}} (1, B) \xrightarrow{v_{11}} (1, B') \xrightarrow{v'_{11}} (1, B'')$$

and noting that the composition constraint $\mu_{v'_{11}, v_{11}}$ is equal to the identity (by virtue of our assumption that the lax functor $U|_{\{1\} \times \mathcal{A}}$ is constant). Similarly, the commutativity of the lower right triangle follows by applying (c) to the compostable triple of morphisms

$$(0, A'') \xrightarrow{u'_{00}} (0, A') \xrightarrow{u_{00}} (0, A) \xrightarrow{(v'vf)_{10}} (1, B'')$$

and noting that the composition constraint $\mu_{u_{00},u'_{00}}$ is equal to the identity (by virtue of our assumption that the lax functor $U|_{\{0\}\times\mathcal{A}}$ is constant). □

8.1.9 Cospan Fibrations

Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets. Beware that the induced map $\mathrm{Cospan}(U) : \mathrm{Cospan}(\mathcal{E}) \to \mathrm{Cospan}(\mathcal{C})$ is usually not an inner fibration. For example, in the special case $\mathcal{C} = \Delta^0$, the morphism U is an inner fibration if and only if $\mathcal{E}$ is an ∞-category. In this case, the simplicial set $\mathrm{Cospan}(\mathcal{E})$ is usually not an ∞-category (unless $\mathcal{E}$ is a Kan complex). However, it contains an ∞-category $\mathrm{Cospan}^{\mathrm{all,iso}}(\mathcal{E}) \subseteq \mathrm{Cospan}(\mathcal{E})$ (Construction 8.1.7.2), which is canonically equivalent to the ∞-category $\mathcal{E}$ (Proposition 8.1.7.6). In this section, we describe a generalization which applies to any simplicial set $\mathcal{C}$. Our main result can be stated as follows: `049W`

Proposition 8.1.9.1. *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets and let W denote the collection of all U-cocartesian edges of $\mathcal{E}$. Then the induced map* $\mathrm{Cospan}^{\mathrm{all},W}(\mathcal{E}) \to \mathrm{Cospan}(\mathcal{C})$ *is an inner fibration of simplicial sets.* `049X`

We will give the proof of Proposition 8.1.9.1 at the end of this section.

Remark 8.1.9.2. In the situation of Proposition 8.1.9.1, let C be a vertex of $\mathcal{C}$ and let $\mathcal{E}_C$ denote the fiber $\{C\} \times_{\mathcal{C}} \mathcal{E}$. Note that a morphism u in the ∞-category $\mathcal{E}_C$ is an isomorphism if and only if it is U-cocartesian when viewed as a morphism in $\mathcal{E}$ (Proposition 5.1.4.11). It follows that the fiber $\{C\} \times_{\mathrm{Cospan}(\mathcal{C})} \mathrm{Cospan}^{\mathrm{all},W}(\mathcal{E})$ can be identified with the ∞-category $\mathrm{Cospan}^{\mathrm{all,iso}}(\mathcal{E}_C)$. In particular, Proposition 8.1.7.6 supplies an equivalence of ∞-categories `049Y`

$$\rho_+ : \{C\} \times_{\mathcal{C}} \mathcal{E} \hookrightarrow \{C\} \times_{\mathrm{Cospan}(\mathcal{C})} \mathrm{Cospan}^{\mathrm{all},W}(\mathcal{E}).$$

Remark 8.1.9.3. Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories and let W be the collection of all U-cocartesian morphisms of $\mathcal{E}$. Then we have a commutative diagram `049Z`

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \mathrm{Cospan}^{\mathrm{all,iso}}(\mathcal{E}) \arrow[r] \arrow[d] & \mathrm{Cospan}^{\mathrm{all},W}(\mathcal{E}) \arrow[d] \\
\mathcal{C} \arrow[r] & \mathrm{Cospan}^{\mathrm{all,iso}}(\mathcal{C}) \arrow[r] & \mathrm{Cospan}(\mathcal{C}),
\end{tikzcd}$$

where the horizontal maps on the left are equivalences of ∞-categories (Proposition 8.1.7.6), and the right half of the diagram is a pullback square (Proposition 5.1.1.8). It follows that from Proposition 8.1.9.1 that map $\mathrm{Cospan}^{\mathrm{all,iso}}(\mathcal{E}) \to \mathrm{Cospan}^{\mathrm{all,iso}}(\mathcal{C})$ is an inner fibration of ∞-categories. In fact, it is even an isofibration: this follows easily from the description of isomorphisms in the ∞-categories $\mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C})$ and $\mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{E})$ supplied by Corollary 8.1.6.10 (together with the fact that U is an isofibration; see Proposition 5.1.4.8). Applying Theorem 5.1.6.1 to the right side of the diagram, we conclude that the map $\mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{E}) \to \mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C})$ is also a cocartesian fibration of simplicial sets. Moreover, Corollary 4.5.2.29 guarantees that the induced map

$$\mathcal{E} \hookrightarrow \mathcal{C} \times_{\mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C})} \mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{E}) \simeq \mathcal{C} \times_{\mathrm{Cospan}(\mathcal{C})} \mathrm{Cospan}^{\mathrm{all},W}(\mathcal{E})$$

is an equivalence of ∞-categories.

04FN **Remark 8.1.9.4.** Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories and let W be the collection of all U-cocartesian morphisms of $\mathcal{E}$. It follows from Proposition 8.1.9.1 that U also induces an inner fibration $\mathrm{Cospan}^{W,\mathrm{all}}(\mathcal{E}) \to \mathrm{Cospan}(\mathcal{C})$, whose fiber over an object $C \in \mathcal{C}$ is equivalent to the *opposite* of the ∞-category $\mathcal{E}_C$ (see Variant 8.1.7.14). This construction will play an important role in §8.6.

For later use, it will be convenient to have a generalization of Proposition 8.1.9.1, where we impose some additional constraints on the cospans that we consider.

04A0 **Definition 8.1.9.5.** Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets and let $\overline{f} : \overline{X} \to \overline{Y}$ be an edge of $\mathcal{C}$. We say that $\overline{f}$ *admits U-cartesian lifts* if, for every vertex $Y \in \mathcal{E}$ satisfying $U(Y) = \overline{Y}$, there is a U-cartesian edge $f : X \to Y$ of $\mathcal{E}$ satisfying $U(f) = \overline{f}$. We say that $\overline{f}$ *admits U-cocartesian lifts* if, for every vertex $X \in \mathcal{E}$ satisfying $U(X) = \overline{X}$, there is a U-cocartesian edge $f : X \to Y$ of $\mathcal{E}$ satisfying $U(f) = \overline{f}$.

04A1 **Remark 8.1.9.6.** In the situation of Definition 8.1.9.5, the edge $\overline{f}$ admits U-cocartesian lifts if and only if it it admits U^{op}-cartesian lifts, when regarded as an edge of the opposite simplicial set $\mathcal{E}^{\mathrm{op}}$.

04A2 **Example 8.1.9.7.** Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets. Then U is a cocartesian fibration if and only if every edge of $\mathcal{C}$ admits U-cocartesian lifts. Similarly, U is a cartesian fibration if and only if every edge of $\mathcal{C}$ admits U-cartesian lifts.

04A3 **Example 8.1.9.8.** Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of ∞-categories. The following conditions are equivalent:

- The morphism U is an isofibration of ∞-categories.
- Every isomorphism of $\mathcal{C}$ admits U-cocartesian lifts.
- Every isomorphism of $\mathcal{C}$ admits U-cartesian lifts.

04A4 **Proposition 8.1.9.9.** *Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets, let R be a collection of edges of $\mathcal{C}$ which admits U-cocartesian lifts, and let $\widetilde{R}$ denote the collection of all U-cocartesian edges f of $\mathcal{E}$ such that $U(f)$ belongs to $\overline{R}$. Then the induced map $\mathrm{Cospan}^{\mathrm{all},\widetilde{R}}(\mathcal{E}) \to \mathrm{Cospan}^{\mathrm{all},R}(\mathcal{C})$ is an inner fibration of simplicial sets.*

Proof. Replacing $\mathcal{C}$ by a full simplicial subset if necessary, we may assume that R contains every degenerate edge of $\mathcal{C}$. Choose integers $0 < i < n$; we wish to show that every lifting problem

04A5

$$\begin{tikzcd}
\Lambda^n_i \arrow[r, "f_0"] \arrow[d] & \mathrm{Cospan}^{\mathrm{all},\widetilde{R}}(\mathcal{E}) \arrow[d] \\
\Delta^n \arrow[r, "\overline{f}"] \arrow[ur, dashed] & \mathrm{Cospan}^{\mathrm{all},R}(\mathcal{C})
\end{tikzcd} \tag{8.16}$$

admits a solution. Using Proposition 8.1.3.7, we can rewrite (8.16) as a lifting problem

$$\begin{tikzcd}
\mathrm{Tw}(\Lambda^n_i) \arrow[r, "F_0"] \arrow[d] & \mathcal{E} \arrow[d, "U"] \\
\mathrm{Tw}(\Delta^n) \arrow[r, "\overline{F}"] \arrow[ur, dashed, "F"] & \mathcal{C},
\end{tikzcd}$$

where the morphism F is required to satisfy the following additional condition:

$(*)$ For every pair of integers $0 \leq i \leq j \leq n$, the morphism F carries $(j, j) \to (i, j)$ to a U-cocartesian edge of $\mathcal{E}$.

Replacing $\mathcal{E}$ by the fiber product $\mathrm{Tw}(\Delta^n) \times_{\mathcal{C}} \mathcal{E}$, we can reduce to the case where $\mathcal{C} = \mathrm{Tw}(\Delta^n)$, and $\overline{F}$ is the identity morphism. Since U is an inner fibration, it follows that $\mathcal{E}$ is an ∞-category.

Suppose first that $n \geq 3$. In this case, F_0 determines a commutative diagram

04A6

$$\begin{tikzcd}
F_0(i,i) \arrow[r] \arrow[d] & F_0(i-1,i) \arrow[d] \\
F_0(i,i+1) \arrow[r] & F_0(i-1,i+1)
\end{tikzcd} \tag{8.17}$$

in the ∞-category $\mathcal{E}$. Using our assumption that f_0 factors through $\mathrm{Cospan}^{\mathrm{all},\widetilde{R}}(\mathcal{E}) \subseteq \mathrm{Cospan}(\mathcal{E})$ (together with Corollary 5.1.2.4), we deduce that the horizontal maps the diagram (8.17) are U-cocartesian. In particular, (8.17) is a U-colimit diagram (Proposition 7.6.3.23). Since the image of (8.17) in $\mathrm{Tw}(\Delta^n)$ is a pushout square, it is a pushout diagram in $\mathcal{E}$ (Corollary 7.1.5.15). Applying Proposition 8.1.4.2, we deduce that $f_0|_{\mathrm{N}_{\bullet}(\{i-1<i<i+1\})}$ is a thin 2-simplex of $\mathrm{Cospan}(\mathcal{E})$, and therefore also of $\mathrm{Cospan}^{\mathrm{all},\widetilde{R}}(\mathcal{E})$ (Remark 8.1.6.4). It

follows that f_0 can be extended to an n-simplex σ of $\mathrm{Cospan}^{\mathrm{all},\widetilde{R}}(\mathcal{E})$, which we can identify with a functor $F : \mathrm{Tw}(\Delta^n) \to \mathcal{E}$ satisfying condition $(*)$ and the identity $F|_{\mathrm{Tw}(\Lambda^n_i)} = F_0$. The equality $U \circ F = \overline{F}$ is automatic, since $\mathrm{Tw}(\Delta^n)$ is the nerve of a partially ordered set and $\mathrm{Tw}(\Lambda^n_i)$ contains every vertex of $\mathrm{Tw}(\Delta^n)$.

We now treat the case $n = 2$ (so that $i = 1$). In this case, we can identify F_0 with a diagram

$$X_{0,0} \xrightarrow{r} X_{0,1} \xleftarrow{u} X_{1,1} \xrightarrow{s} X_{1,2} \leftarrow v X_{2,2}$$

in the ∞-category $\mathcal{E}$, where the morphisms u and v are U-cocartesian. Our assumption that $\overline{f}$ factors through $\mathrm{Cospan}^{\mathrm{all},R}(\mathcal{C})$ guarantees that the morphism $(2,2) \to (0,2)$ belongs to R. Since morphisms of R admit U-cocartesian lifts, we can choose a U-cocartesian morphism $w' : X_{2,2} \to X_{0,2}$ in $\mathcal{E}$, where $X_{0,2}$ belongs to the fiber over the object $(0,2) \in \mathcal{C}$. Since v is also U-cocartesian, we can choose a 2-simplex σ_0 of $\mathcal{E}$ with boundary indicated in the diagram

$$\begin{tikzcd}
X_{2,2} \arrow[rr, "w'"] \arrow[dr, "v"'] & & X_{0,2} \\
& X_{1,2}. \arrow[ur, "w"'] &
\end{tikzcd}$$

Since $\mathcal{E}$ is an ∞-category, we can choose another 2-simplex σ_1 of $\mathcal{E}$ with boundary indicated in the diagram

$$\begin{tikzcd}
X_{1,1} \arrow[rr, "q"] \arrow[dr, "s"'] & & X_{0,2} \\
& X_{1,2}. \arrow[ur, "w'"'] &
\end{tikzcd}$$

Invoking our assumption that u is U-cocartesian, we can choose another 2-simplex σ_2 of $\mathcal{E}$ with boundary indicated in the diagram

$$\begin{tikzcd}
X_{1,1} \arrow[rr, "q"] \arrow[dr, "u"'] & & X_{0,2} \\
& X_{0,1}. \arrow[ur, "t"'] &
\end{tikzcd}$$

Using the fact that $\mathcal{E}$ is an ∞-category, we obtain another 2-simplex σ_3 of $\mathcal{E}$ with boundary indicated in the diagram

$$\begin{tikzcd}
X_{0,0} \arrow[rr] \arrow[dr, "r"] & & X_{0,2} \\
& X_{0,1}. \arrow[ur, "t"] &
\end{tikzcd}$$

The 2-simplices σ_0, σ_1, σ_2, and σ_3 determine a functor $F : \mathrm{Tw}(\Delta^2) \to \mathcal{C}$ extending F_0, which we display informally as a diagram

$$\begin{tikzcd}
X_{0,0} \arrow[dr, "r"] & & X_{1,1} \arrow[dl, "u"'] \arrow[dr, "s"] & & X_{2,2} \arrow[dl, "v"'] \\
& X_{0,1} \arrow[dr, "t"] & & X_{1,2} \arrow[dl, "w"'] & \\
& & X_{0,2}. & &
\end{tikzcd}$$

Since the morphism w' is U-cocartesian, the functor F satisfies condition $(*)$ and can therefore be viewed as a solution to the lifting problem (8.16). □

Proof of Proposition 8.1.9.1. Combine Proposition 8.1.9.9 with Example 8.1.9.7. □

Proposition 8.1.9.10. *Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of ∞-categories, let L and R be collections of morphisms of $\mathcal{C}$ which are pushout-compatible, and assume that morphisms of R admit U-cocartesian lifts. Let $\widetilde{L}$ denote the collection of all morphisms f of $\mathcal{E}$ such that $U(f) \in L$, and let $\widetilde{R}$ denote the collection of all U-cocartesian morphisms f of $\mathcal{E}$ such that $U(f) \in R$. Then the collections $\widetilde{L}$ and $\widetilde{R}$ are also pushout-compatible.* 04A7

Proof. Let $f : X \to X_1$ be a morphism of $\mathcal{E}$ which belongs to $\widetilde{L}$, and let $g' : X \to X_0$ be a morphism of $\mathcal{E}$ which belongs to $\widetilde{R}$. We wish to show that there exists a pushout diagram

04A8

$$\begin{tikzcd}
X \arrow[r, "g'"] \arrow[d, "f"] & X_0 \arrow[d, "f'"] \\
X_1 \arrow[r, "g"] & X_{01}
\end{tikzcd} \qquad (8.18)$$

in the ∞-category $\mathcal{E}$, where f' belongs to $\widetilde{L}$ and g belongs to $\widetilde{R}$. Since L and R are pushout compatible, there exists a pushout diagram

04A9
$$\begin{tikzcd}
U(X) \arrow[r, "U(g')"] \arrow[d, "U(f)"] & U(X_0) \arrow[d, "\overline{f}'"] \\
U(X_1) \arrow[r, "\overline{g}"] & \overline{X}_{01}
\end{tikzcd} \tag{8.19}$$

in the ∞-category $\mathcal{C}$, where $\overline{f}'$ belongs to L and $\overline{g}$ belongs to R. Our assumption on U guarantees that $\overline{g}$ can be lifted to a U-cocartesian morphism $g : X_0 \to X_{01}$ of $\mathcal{E}$. Since U is an inner fibration, the lower left half of (8.19) can be lifted to a 2-simplex σ of $\mathcal{E}$ which we display as a diagram

$$\begin{tikzcd}
X \arrow[d, "f"] \arrow[dr, "h"] & \\
X_1 \arrow[r, "g"] & X_{01}.
\end{tikzcd}$$

Since g' is U-cocartesian, we can then lift the upper right half of (8.19) to a 2-simplex τ of $\mathcal{E}$ which we display as a diagram

$$\begin{tikzcd}
X \arrow[r, "g'"] \arrow[dr, "h"] & X_0 \arrow[d, "f'"] \\
& X_{01}.
\end{tikzcd}$$

Amalgamating σ and τ, we obtain a diagram of the form (8.18), where $f' \in \widetilde{L}$ and $g \in \widetilde{R}$. We will complete the proof by showing that this diagram is a pushout square in the ∞-category $\mathcal{E}$. Since (8.19) is a pushout square in $\mathcal{C}$, it will suffice to show that 8.18 is a U-pushout square (Corollary 7.1.5.16). This is a special case of Proposition 7.6.3.23, since the horizontal morphisms appearing in the diagram are U-cocartesian. □

04AA **Remark 8.1.9.11.** In the situation of Proposition 8.1.9.10, suppose that the collections L and R are closed under composition. Then $\widetilde{L}$ and $\widetilde{R}$ are also closed under composition (see Corollary 5.1.2.4). Applying Proposition 8.1.6.7, we deduce that the simplicial sets $\mathrm{Cospan}^{L,R}(\mathcal{C})$ and $\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})$ are $(\infty,2)$-categories. Moreover, it follows from the proof of Proposition 8.1.9.10 that for every pushout diagram σ :

$$\begin{tikzcd}
X \arrow[r, "g'"] \arrow[d, "f"] & X_0 \arrow[d, "f'"] \\
X_1 \arrow[r, "g"] & X_{01}
\end{tikzcd}$$

in $\mathcal{E}$ where f belongs to $\widetilde{L}$ and g belongs to $\widetilde{R}$, the image $U(\sigma)$ is a pushout diagram in $\mathcal{C}$. Combining this observation with Corollary 8.1.6.8 and Proposition 8.1.4.2, we see that a 2-simplex of $\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})$ is thin if and only if its image in $\mathrm{Cospan}^{L,R}(\mathcal{C})$ is thin. In particular:

- The induced map $\overline{V} : \mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E}) \to \mathrm{Cospan}^{L,R}(\mathcal{C})$ is a functor of $(\infty, 2)$-categories.
- The functor $\overline{V}$ is an inner fibration (since it is a pullback of the inner fibration $\mathrm{Cospan}^{\mathrm{all},\widetilde{R}}(\mathcal{E}) \to \mathrm{Cospan}^{\mathrm{all},R}(\mathcal{C})$ of Proposition 8.1.9.9).
- The underlying functor $V : \mathrm{Pith}(\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})) \to \mathrm{Pith}(\mathrm{Cospan}^{L,R}(\mathcal{C}))$ is also an inner fibration (since it is a pullback of $\overline{V}$).

8.1.10 Beck-Chevalley Fibrations

Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of ∞-categories. For each object $C \in \mathcal{C}$, we let $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ denote the corresponding fiber of U. If U is a cartesian fibration, then every morphism $f : C \to B$ in $\mathcal{C}$ determines a functor $f^* : \mathcal{E}_B \to \mathcal{E}_C$, given by contravariant transport along f (Definition 5.2.2.15). If U is a cocartesian fibration, then every morphism morphism $f' : C' \to B$ determines a functor $f'_! : \mathcal{E}_{C'} \to \mathcal{E}_B$, given by covariant transport along f' (Definition 5.2.2.4). If both of these conditions are satisfied, then every cospan $C \xrightarrow{f} B \xleftarrow{f'} C'$ in $\mathcal{C}$ determines a functor from $\mathcal{E}_{C'}$ to $\mathcal{E}_C$, given by the composition $f^* \circ f'_!$. Our goal in this section is to show that, under some mild assumptions, the construction $(f, f') \mapsto f^* \circ f'_!$ is compatible with the composition law on cospans, up to coherent homotopy. More precisely, we will show that this construction is given by contravariant transport for a certain cartesian fibration between cospan constructions (Theorem 8.1.10.3 and Remark 8.1.10.4). First, we need some terminology. 04AB

Definition 8.1.10.1. Let $\mathcal{C}$ be an ∞-category which admits pushouts. We will say that an inner fibration $U : \mathcal{E} \to \mathcal{C}$ is a *dual Beck-Chevalley fibration* if the following conditions are satisfied: 04AC

(1) The morphism U is a cartesian fibration.

(2) The morphism U is a cocartesian fibration.

(3) Suppose we are given a morphism $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{E}$, which we display informally as a diagram

$$\begin{tikzcd}
X \arrow[r, "f"] \arrow[d, "g"] & X_0 \arrow[d, "g'"] \\
X_1 \arrow[r, "f'"] & X_{01}.
\end{tikzcd}$$

Assume that f is U-cartesian, that g' is U-cocartesian, and that $U(\sigma)$ is a pushout square in $\mathcal{C}$. Then f' is U-cartesian if and only if g is U-cocartesian.

04AD **Example 8.1.10.2.** Let $\mathcal{E} = \mathrm{Mod(Ab)}$ denote the category of pairs (A, M), where A is a commutative ring and M is an A-module (see Example 5.0.0.2). Let $\mathcal{C}$ denote the category of commutative rings and let $U : \mathcal{E} \to \mathcal{C}$ be the forgetful functor $(A, M) \mapsto A$. Then (the nerve of) U is a dual Beck-Chevalley fibration, in the sense of Definition 8.1.10.1. To see this, suppose we are given a commutative diagram σ :

$$\begin{tikzcd}
(A, M) \arrow[r, "f"] \arrow[d, "g"] & (A_0, M_0) \arrow[d, "g'"] \\
(A_1, M_1) \arrow[r, "f'"] & (A_{01}, M_{01})
\end{tikzcd}$$

in the category $\mathcal{E}$. Then:

- The morphism f is U-cartesian if and only if the underlying map $M \to M_1$ is an isomorphism of A-modules.
- The morphism g' is U-cocartesian if and only if it exhibits M_{01} as obtained from M_1 by extending scalars along the ring homomorphism $A_1 \to A_{01}$: that is, if and only if it induces an isomorphism $A_{01} \otimes_{A_1} M_1 \to M_{01}$.
- The image of σ is a pushout diagram in $\mathcal{C}$ if and only if the induced map $A_0 \otimes_A A_1 \to A_{01}$ is an isomorphism.

If all three of these conditions are satisfied, then the composite map $A_0 \otimes_A M \to M_0 \to M_{01}$ is an isomorphism. Using the two-out-of-three property, we conclude that f' is U-cartesian if and only if g is U-cocartesian.

We can now formulate our main result, which we prove at the end of this section.

Theorem 8.1.10.3. *Let $\mathcal{C}$ be an ∞-category which admits pushouts, let $U : \mathcal{E} \to \mathcal{C}$ be a dual Beck-Chevalley fibration and let R denote the collection of all U-cocartesian morphisms of $\mathcal{E}$. Then the map* $\mathrm{Cospan}(U) : \mathrm{Cospan}(\mathcal{E}) \to \mathrm{Cospan}(\mathcal{C})$ *restricts to a cartesian fibration of ∞-categories* 04AE

$$V : \mathrm{Pith}(\mathrm{Cospan}^{\mathrm{all},R}(\mathcal{E})) \to \mathrm{Pith}(\mathrm{Cospan}(\mathcal{C})).$$

Moreover, a morphism of $\mathrm{Pith}(\mathrm{Cospan}^{\mathrm{all},R}(\mathcal{E}))$ *is V-cartesian if and only if it corresponds to a cospan $X \xrightarrow{f} B \xleftarrow{g} Y$ in the ∞-category $\mathcal{E}$, where f is U-cartesian and g is U-cocartesian.*

Remark 8.1.10.4 (Contravariant Transport for Cospan Fibrations)**.** In the situation of Theorem 8.1.10.3, let C and C' be objects of $\mathcal{C}$, so that Proposition 8.1.7.6 supplies equivalences of ∞-categories 04AF

$$\rho_{+}^{C} : \mathcal{E}_{C} \hookrightarrow \mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{E}_{C}) = V^{-1}\{C\} \qquad \rho_{+}^{C'} : \mathcal{E}_{C'} \hookrightarrow \mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{E}_{C'}) = V^{-1}\{C'\}.$$

Let e be a morphism from C to C' in the $(\infty,2)$-category $\mathrm{Cospan}(\mathcal{C})$, which we identify with a pair of morphisms $C \xrightarrow{f} B \xleftarrow{f'} C'$ in the ∞-category $\mathcal{C}$. Choose functors $f^{*} : \mathcal{E}_{B} \to \mathcal{E}_{C}$, $f'_{!} : \mathcal{E}_{C'} \to \mathcal{E}_{B}$ and diagrams

$$\begin{tikzcd}
\Delta^1 \times \mathcal{E}_B \arrow[r, "H"] \arrow[d] & \mathcal{E} \arrow[d, "U"] & \Delta^1 \times \mathcal{E}_{C'} \arrow[l, "H'"'] \arrow[d] \\
\Delta^1 \arrow[r, "f"] & \mathcal{C} & \Delta^1 \arrow[l, "f'"']
\end{tikzcd}$$

which exhibit f^{*} and $f'_{!}$ as given by contravariant and covariant transport along f and f', respectively (see Definitions 5.2.2.4 and 5.2.2.15). Then the composition

$$\begin{array}{lll}
\mathrm{Tw}(\Delta^1 \times \mathcal{E}_{C'}) & \simeq & \mathrm{Tw}(\Delta^1) \times \mathrm{Tw}(\mathcal{E}_{C'}) \\
 & \to & \mathrm{Tw}(\Delta^1) \times \mathcal{E}_{C'} \\
 & \simeq & (\mathrm{N}_{\bullet}(\{(0,0) < (0,1)\}) \amalg_{\mathrm{N}_{\bullet}(\{(0,1)\})} \mathrm{N}_{\bullet}(\{(1,1) < (0,1)\})) \times \mathcal{E}_{C'} \\
 & \xrightarrow{(H \circ (\mathrm{id} \times f'_{!}), H')} & \mathcal{E}
\end{array}$$

can be identified with a functor $T : \Delta^1 \times \mathcal{E}_{C'} \to \mathrm{Cospan}(\mathcal{E})$ which fits into a commutative diagram

$$\begin{tikzcd}
\Delta^1 \times \mathcal{E}_{C'} \arrow[r, "T"] \arrow[d] & \mathrm{Pith}(\mathrm{Cospan}^{\mathrm{all},W}(\mathcal{E})) \arrow[d, "V"] \\
\Delta^1 \arrow[r, "e"] & \mathrm{Pith}(\mathrm{Cospan}(\mathcal{C})).
\end{tikzcd}$$

For each object $X \in \mathcal{E}_{C'}$, the characterization of V-cartesian morphisms given in Theorem 8.1.10.3 shows that $T|_{\Delta^1 \times \{X\}}$ is a V-cartesian morphism of $\mathrm{Pith}(\mathrm{Cospan}^{\mathrm{all},R}(\mathcal{E}))$. It follows that the diagram

$$\begin{tikzcd}
\mathcal{E}_{C'} \arrow[r, "f'_!"] \arrow[d, "\rho_+^{C'}"] & \mathcal{E}_B \arrow[r, "f^*"] & \mathcal{E}_C \arrow[d, "\rho_+^{C}"] \\
V^{-1}\{C'\} \arrow[rr, "e^*"] & & V^{-1}\{C\}
\end{tikzcd}$$

commutes up to homotopy, where the functor e^* is given by contravariant transport along e (for the cartesian fibration V).

04AG **Corollary 8.1.10.5.** *Let $\mathcal{C}$ be an ∞-category which admits pushouts, let $U : \mathcal{E} \to \mathcal{C}$ be a dual Beck-Chevalley fibration, let L be the collection of all U-cartesian morphisms of $\mathcal{C}$, and let R be the collection of all U-cocartesian morphisms of $\mathcal{C}$. Then* $\mathrm{Cospan}^{L,R}(\mathcal{E})$ *is an* $(\infty, 2)$*-category, and U induces a right fibration of ∞-categories* $\mathrm{Pith}(\mathrm{Cospan}^{L,R}(\mathcal{E})) \to \mathrm{Pith}(\mathrm{Cospan}(\mathcal{C}))$.

Proof. The collections L and R are closed under composition (Corollary 5.1.2.4) and pushout-compatible by virtue of our assumption that U is a Beck-Chevalley fibration. Using Proposition 8.1.6.7, we see that $\mathrm{Cospan}^{L,R}(\mathcal{E})$ is an $(\infty, 2)$-category. Moreover, the pith of $\mathrm{Cospan}^{L,R}(\mathcal{E})$ can be identified with the subcategory of $\mathrm{Pith}(\mathrm{Cospan}^{\mathrm{all},R}(\mathcal{E}))$ spanned by those morphisms which are cartesian with respect to the fibration $V : \mathrm{Pith}(\mathrm{Cospan}^{\mathrm{all},R}(\mathcal{E})) \to \mathrm{Pith}(\mathrm{Cospan}(\mathcal{C}))$ of Theorem 8.1.10.3. The desired result now follows from Corollary 5.1.4.15. □

For later use, we will prove a more general form of Theorem 8.1.10.3, where we place some restrictions on the cospans under consideration. This will allow us to loosen the requirements of Definition 8.1.10.1.

04AH **Definition 8.1.10.6.** Let $\mathcal{C}$ be an ∞-category and let L and R be collections of morphisms of $\mathcal{C}$ which are pushout-compatible (Definition 8.1.6.5). We will say that an inner fibration $U : \mathcal{E} \to \mathcal{C}$ is a *dual Beck-Chevalley fibration relative to* (L, R) if the following conditions are satisfied:

(1) Every morphism of $\mathcal{C}$ which belongs to L admits U-cartesian lifts (Definition 8.1.9.5).

(2) Every morphism of $\mathcal{C}$ which belongs to R admits U-cocartesian lifts.

(3) Suppose we are given a morphism $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{E}$, which we display informally as a

diagram

$$\begin{tikzcd}
X \arrow[r, "f"] \arrow[d, "g"] & X_0 \arrow[d, "g'"] \\
X_1 \arrow[r, "f'"] & X_{01}.
\end{tikzcd}$$

Assume that f is U-cartesian, that g is U-cocartesian, that $U(f)$ belongs to L, that $U(g)$ belongs to R, and that $U(\sigma)$ is a pushout square in $\mathcal{C}$. Then f' is U-cartesian if and only if g is U-cocartesian.

Example 8.1.10.7. Let $\mathcal{C}$ be an ∞-category which admits pushouts and let A denote the collection of all morphisms of $\mathcal{C}$. Then an inner fibration $U : \mathcal{E} \to \mathcal{C}$ is a dual Beck-Chevalley fibration (in the sense of Definition 8.1.10.6) if and only if if it is a dual Beck-Chevalley fibration relative to (A, A) (in the sense of Definition 8.1.10.6). 04AJ

Example 8.1.10.8. In the situation of Definition 8.1.10.6, suppose that L is the collection of all isomorphisms in $\mathcal{C}$. Then condition (1) is equivalent to the requirement that U is an isofibration (Example 8.1.9.8), and condition (3) is automatic. Similarly, if R is the collection of all isomorphisms in $\mathcal{C}$, then condition (2) is the requirement that U is an isofibration, and condition (3) is automatic. 04AK

Theorem 8.1.10.9. *Let $\mathcal{C}$ be an ∞-category, let L and R be collections of morphisms of $\mathcal{C}$ which are closed under composition and pushout-compatible. Let $U : \mathcal{E} \to \mathcal{C}$ be a dual Beck-Chevalley fibration with respect to (L, R) and define $\widetilde{L}$ and $\widetilde{R}$ as in Proposition 8.1.9.10. Then the functor $V : \mathrm{Pith}(\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})) \to \mathrm{Pith}(\mathrm{Cospan}^{L,R}(\mathcal{E}))$ of Remark 8.1.9.11 is a cartesian fibration of ∞-categories. Moreover, a morphism e of $\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})$ is V-cartesian if and only if it satisfies the following condition:* 04AL

$(*)$ *The morphism e corresponds to a cospan $X \xrightarrow{f} B \xleftarrow{g} Y$ in the ∞-category $\mathcal{E}$, where f is U-cartesian and g is U-cocartesian.*

Proof. Let us say that a morphism e of $\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})$ is *special* if it satisfies condition $(*)$. We first show that every special morphism e of $\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})$ is V-cartesian. Suppose we are given an integer $n \geq 2$ and a lifting problem

04AM

$$\begin{tikzcd}
\Lambda^n_n \arrow[r, "h_0"] \arrow[d] & \mathrm{Pith}(\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})) \arrow[d, "U'"] \\
\Delta^n \arrow[r, "\overline{h}"] \arrow[ur, dashed, "h"] & \mathrm{Pith}(\mathrm{Cospan}^{L,R}(\mathcal{C}),
\end{tikzcd} \qquad (8.20)$$

where the composition

$$\Delta^1 \simeq \mathrm{N}_\bullet(\{n-1 < n\}) \subseteq \Lambda^n_n \xrightarrow{h_0} \mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})$$

coincides with the edge e; we wish to show that (8.20) admits a solution. Let us identify $\overline{h}$ with a diagram $\overline{F} : \mathrm{Tw}(\Delta^n) \to \mathcal{E}$ and h_0 with a diagram $H_0 : \mathrm{Tw}(\Lambda^n_n) \to \mathcal{C}$ satisfying $U \circ H_0 = \overline{H}|_{\mathrm{Tw}(\Lambda^n_n)}$. We first treat the case $n = 2$. In this case, we can identify F_0 with a pair of cospans

$$X_{0,0} \xrightarrow{f'} X_{0,2} \xleftarrow{g'} X_{2,2} \qquad X_{1,1} \xrightarrow{f} X_{1,2} \xleftarrow{g} X_{2,2}$$

in the ∞-category $\mathcal{E}$, where $f, f' \in \widetilde{L}$ and $g, g' \in \widetilde{R}$. Since g is U-cocartesian, we can lift $\overline{H}((2,2) \to (1,2) \to (0,2))$ to a 2-simplex σ_0 of $\mathcal{E}$ whose boundary we display in the diagram

$$\begin{tikzcd}
X_{2,2} \arrow[rr, "g'"] \arrow[dr, "g"'] & & X_{0,2} \\
& X_{1,2}. \arrow[ur, "g''"'] &
\end{tikzcd}$$

Since g and g' are U-cocartesian by assumption, Corollary 5.1.2.4 guarantees that g'' is also U-cocartesian. Since U is an inner fibration, we can lift $\overline{H}((1,1) \to (1,2) \to (0,2))$ to a 2-simplex σ_1 of $\mathcal{E}$, whose boundary we display in the diagram

$$\begin{tikzcd}
X_{1,1} \arrow[rr, "s"] \arrow[dr, "f"'] & & X_{0,2} \\
& X_{1,2}. \arrow[ur, "g''"'] &
\end{tikzcd}$$

Since morphisms of R admit U-cocartesian lifts, we can lift $\overline{H}((1,1) \to (0,1) \to (0,2))$ to a 2-simplex σ_2 of $\mathcal{E}$ displayed in the diagram

$$\begin{tikzcd}
X_{1,1} \arrow[rr, "s"] \arrow[dr, "g'''"'] & & X_{0,2} \\
& X_{0,1}, \arrow[ur, "f''"'] &
\end{tikzcd}$$

where g''' is U-cocartesian. Applying condition (3) of Definition 8.1.10.6 to the diagram

$$\begin{tikzcd}
X_{1,1} \arrow[r, "f"] \arrow[d, "g'''"] & X_{1,2} \arrow[d, "g''"] \\
X_{0,1} \arrow[r, "f''"] & X_{0,2},
\end{tikzcd}$$

we deduce that the morphism f'' is U-cartesian. We can therefore lift $\overline{H}((0,0) \rightarrow (0,1) \rightarrow (0,2))$ to a 2-simplex σ_3 of $\mathcal{E}$ which we display as a diagram

$$\begin{tikzcd}
X_{0,0} \arrow[rr, "f'"] \arrow[dr, "f'''"'] & & X_{0,2} \\
& X_{0,1}, \arrow[ur, "f''"'] &
\end{tikzcd}$$

The 2-simplices σ_0, σ_1, σ_2, and σ_3 can then be amalgamed into a functor $H : \mathrm{Tw}(\Delta^2) \rightarrow \mathcal{E}$ which we display informally as a diagram

$$\begin{tikzcd}
X_{0,0} \arrow[dr, "f'''"] & & X_{1,1} \arrow[dl, "g'''"'] \arrow[dr, "f"] & & X_{2,2} \arrow[dl, "g"'] \\
& X_{0,1} \arrow[dr, "f''"] & & X_{1,2} \arrow[dl, "g''"] & \\
& & X_{0,2}, & &
\end{tikzcd}$$

which is a solution to the lifting problem (8.20).

We now treat the case $n \geq 3$. By virtue of Lemma 8.1.4.6, it will suffice to show that the following conditions are satisfied:

(a) The functor F_0 carries the edge $(n,n) \rightarrow (n-1,n)$ of $\mathrm{Tw}(\Lambda^n_n)$ to a U-cocartesian edge of $\mathcal{E}$.

(b) The functor F_0 carries the edge $(0,n-1) \rightarrow (0,n)$ of $\mathrm{Tw}(\Lambda^n_n)$ to a U-cartesian edge of $\mathcal{E}$.

Assertion (a) follows immediately from our requirement that f_0 factors through $\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})$. To prove (b), we observe that F_0 determines a commutative diagram τ :

$$\begin{tikzcd}
F_0(n-1,n-1) \arrow[r, "f"] \arrow[d, "g"] & F_0(n-1,n) \arrow[d, "g'"] \\
F_0(0,n-1) \arrow[r, "f'"] & F_0(0,n)
\end{tikzcd}$$

in the ∞-category $\mathcal{E}$, where $f \in \widetilde{L}$ and $g \in \widetilde{R}$. Our assumption that e is special guarantees that f is U-cartesian, and our assumption that $\overline{h}$ factors through the pith of $\mathrm{Cospan}^{L,R}(\mathcal{C})$ guarantees that $U(\tau)$ is a pushout diagram in $\mathcal{C}$. Applying Corollary 5.1.2.4 to the diagram

$$\begin{tikzcd}
F_0(n,n) \arrow[rr] \arrow[dr] & & F_0(0,n) \\
& F_0(n-1,n), \arrow[ur, "g'"] &
\end{tikzcd}$$

we see that g' is U-cocartesian. Condition (3) of Definition 8.1.10.6 then guarantees that f' is U-cartesian, as desired. This completes the proof that every special morphism of $\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})$ is V-cartesian.

It follows from Remark 8.1.9.11 that V is an inner fibration of ∞-categories. To show that V is a cartesian fibration, it will suffice to show that for every object $Y \in \mathcal{E}$ and every morphism $\overline{e} : \overline{X} \to U(Y)$ in the ∞-category $\mathrm{Pith}(\mathrm{Cospan}^{L,R}(\mathcal{C}))$, there exists a special morphism $e : X \to Y$ in $\mathrm{Pith}(\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E}))$ satisfying $V(e) = \overline{e}$. Let us identify $\overline{e}$ with a cospan $\overline{X} \xrightarrow{\overline{f}} \overline{B} \xleftarrow{\overline{g}} U(Y)$ in the ∞-category $\mathcal{C}$. Then $\overline{g}$ belongs to R, and can therefore be lifted to a U-cocartesian morphism $g : Y \to B$ in the ∞-category $\mathcal{E}$. Since $\overline{f}$ belongs to L, it can be lifted to a U-cartesian morphism $f : X \to B$ in the ∞-category $\mathcal{E}$. The cospan $X \xrightarrow{f} B \xleftarrow{g} Y$ then determines a special morphism $e : X \to Y$ of $\mathrm{Pith}(\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E}))$ satisfying $V(e) = \overline{e}$.

We now complete the proof of Theorem 8.1.10.3 by showing that every V-cartesian morphism $e : X \to Y$ of $\mathrm{Pith}(\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E}))$ is special. Let $\overline{e}$ denote the image of e in $\mathrm{Pith}(\mathrm{Cospan}^{L,R}(\mathcal{C}))$. Arguing as above, we can lift $\overline{e}$ to a special morphism $e' : X' \to Y$ of $\mathrm{Pith}(\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E}))$. Then e' is also V-cartesian. Applying Remark 5.1.3.8, we can choose a 2-simplex σ of $\mathrm{Pith}(\mathrm{Cospan}^{L,R}(\mathcal{C})$ which exhibits e as the composition of e' with an isomorphism in the ∞-category $\mathrm{Pith}(\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E}))$. Let us identify σ with a diagram

$$\begin{tikzcd}
X \arrow[dr, "u"] & & X' \arrow[dl, "v"'] \arrow[dr, "f"] & & Y \arrow[dl] \\
& X'' \arrow[dr, "f'"] & & B' \arrow[dl, "w"] & \\
& & B & &
\end{tikzcd}$$

in the ∞-category $\mathcal{E}$. Corollary 8.1.6.10 implies that u and v are isomorphisms in $\mathcal{E}$. Since the inner region is a pushout diagram in $\mathcal{E}$, it follows that w is also an isomorphism (Corollary 7.6.3.24). Our assumption that e' is special guarantees that f is U-cartesian. Applying Corollary 5.1.2.5, we deduce that f' is U-cartesian. It follows that any composition of f' with u is U-cartesian (Corollary 5.1.2.4), so that the morphism e is also special. □

Proof of Theorem 8.1.10.3. Apply Theorem 8.1.10.9 in the special case $L = A = R$, where A is the collection of all morphisms in the ∞-category $\mathcal{C}$ (Example 8.1.10.7). □

Remark 8.1.10.10. In the situation of Theorem 8.1.10.9, the morphism 04AN

$$\overline{V} : \mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E}) \to \mathrm{Cospan}^{L,R}(\mathcal{C})$$

is a locally cartesian fibration. To prove this, we observe that Remark 8.1.9.11 guarantees that $\overline{V}$ is an inner fibration of $(\infty, 2)$-categories and that the diagram

$$\begin{tikzcd}
\mathrm{Pith}(\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})) \arrow[r] \arrow[d, "V"] & \mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E}) \arrow[d, "\overline{V}"] \\
\mathrm{Pith}(\mathrm{Cospan}^{L,R}(\mathcal{C})) \arrow[r] & \mathrm{Cospan}^{L,R}(\mathcal{C})
\end{tikzcd}$$

is a pullback square. Since every morphism of $\mathrm{Cospan}^{L,R}(\mathcal{C})$ is contained in the pith $\mathrm{Pith}(\mathrm{Cospan}^{L,R}(\mathcal{C}))$, the desired result follows from Theorem 8.1.10.9 (see Remark 5.1.5.6).

Remark 8.1.10.11. In the situation of Theorem 8.1.10.9, suppose that $\mathrm{Cospan}^{L,R}(\mathcal{C})$ is an 04AP ∞-category (this condition is satisfied, for example, if either L or R consists of isomorphisms; see Proposition 8.1.7.5). Then every 2-simplex of $\mathrm{Cospan}^{L,R}(\mathcal{C})$ is thin. Applying Remark

8.1.9.11, we deduce that every 2-simplex of $\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})$ is thin, so that $\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})$ is also an ∞-category (Example 2.3.2.4). In this case, Theorem 8.1.10.9 asserts that the projection map $V : \mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E}) \to \mathrm{Cospan}^{L,R}(\mathcal{E})$ is a cartesian fibration.

We also have the following variant of Corollary 8.1.10.5:

`04AQ` **Corollary 8.1.10.12.** *Let $\mathcal{C}$ be an ∞-category, let L and R be collections of morphisms of $\mathcal{C}$ which are closed under composition and pushout-compatible. Let $U : \mathcal{E} \to \mathcal{C}$ be a dual Beck-Chevalley fibration with respect to (L, R), let $\widetilde{L}$ denote the collection of all U-cartesian morphisms f of $\mathcal{E}$ such that $U(f) \in L$, and let $\widetilde{R}$ denote the collection of all U-cocartesian morphisms f of $\mathcal{E}$ such that $U(f) \in R$. Then:*

(1) *The simplicial set* $\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})$ *is an* $(\infty, 2)$*-category.*

(2) *The morphism U induces a right fibration* $\mathrm{Pith}(\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})) \to \mathrm{Pith}(\mathrm{Cospan}^{L,R}(\mathcal{C}))$.

(3) *If* $\mathrm{Cospan}^{L,R}(\mathcal{C})$ *is an ∞-category, then* $\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E})$ *is an ∞-category, and U induces a right fibration* $\mathrm{Cospan}^{\widetilde{L},\widetilde{R}}(\mathcal{E}) \to \mathrm{Cospan}^{L,R}(\mathcal{C})$.

`04AR` **Example 8.1.10.13.** Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of ∞-categories and let L and R be collections of morphisms of $\mathcal{C}$ which are closed under composition and pushout-compatible. Assume that the following conditions are satisfied:

(0) Let $f : X \to Y$ be a morphism of $\mathcal{E}$. If $U(f)$ belongs to L, then f is U-cartesian. If $U(f)$ belongs to R, then f is U-cocartesian.

(1) For every object $Y \in \mathcal{E}$ and every morphism $\overline{f} : \overline{X} \to U(Y)$ of $\mathcal{C}$ which belongs to L, there exists a morphism $f : X \to Y$ of $\mathcal{E}$ satisfying $U(f) = \overline{f}$.

(2) For every object $X \in \mathcal{E}$ and every morphism $\overline{f} : U(X) \to \overline{Y}$ of $\mathcal{C}$ which belongs to R, there exists a morphism $f : X \to Y$ of $\mathcal{E}$ satisfying $U(f) = \overline{f}$.

Then U is a dual Beck-Chevalley fibration relative to (L, R). Applying Remark 8.1.10.10, we deduce that the projection map

$$V : \mathrm{Cospan}(\mathcal{E}) \times_{\mathrm{Cospan}(\mathcal{C})} \mathrm{Cospan}^{L,R}(\mathcal{C}) \to \mathrm{Cospan}^{L,R}(\mathcal{C})$$

is a locally cartesian fibration. Corollary 8.1.10.12 guarantees that each fiber of V is a Kan complex, so that V is a right fibration (Corollary 5.1.5.12).

8.2 Couplings of ∞-Categories

We now axiomatize an essential feature of the twisted arrow construction introduced in §8.1. 043P

Definition 8.2.0.1. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories. A *coupling of* $\mathcal{C}_+$ *with* $\mathcal{C}_-$ is an ∞-category $\mathcal{C}$ equipped with a left fibration $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$. 043Q

In the situation of Definition 8.2.0.1, we will often refer to the functor $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ as a *coupling of* ∞*-categories*. This terminology signifies both that λ is a left fibration and that its target is equipped with a *specified* factorization as a product of ∞-categories $\mathcal{C}_-^{\mathrm{op}}$ and $\mathcal{C}_+$.

Example 8.2.0.2 (The Twisted Arrow Coupling)**.** Let $\mathcal{C}$ be an ∞-category. Then the map $\lambda : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ of Notation 8.1.1.6 is a coupling of $\mathcal{C}$ with itself (Proposition 8.1.1.11). We will refer to λ as the *twisted arrow coupling* of the ∞-category $\mathcal{C}$. 043R

Construction 8.2.0.3. Let $G : \mathcal{C}_+ \to \mathcal{C}_-$ be a functor of ∞-categories. Pulling back the left fibration $\mathrm{Tw}(\mathcal{C}_-) \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_-$ of Proposition 8.1.1.11, we obtain a left fibration of ∞-categories 043S

$$\lambda_G : \mathrm{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \mathcal{C}_+ \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+,$$

which we regard as a coupling of $\mathcal{C}_+$ with $\mathcal{C}_-$. We will refer to λ_G as the *coupling associated to the functor* G.

We say that a coupling $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ is *representable* if, for every object $C_+ \in \mathcal{C}_+$, the ∞-category $\mathcal{C} \times_{\mathcal{C}_+} \{C_+\}$ has an initial object (Definition 8.2.1.3). It is not difficult to show that, for every functor $G : \mathcal{C}_+ \to \mathcal{C}_-$, the coupling λ_G of Construction 8.2.0.3 is representable (Variant 8.2.1.6). Our primary goal in this section is to prove the converse:

Theorem 8.2.0.4. *Let* $\mathcal{C}_-$ *and* $\mathcal{C}_+$ *be* ∞*-categories. Then the assignment* $G \mapsto \lambda_G$ *of Construction 8.2.0.3 induces a bijection* 043T

$$\begin{tikzcd}
\{\text{Functors } G : \mathcal{C}_+ \to \mathcal{C}_-\}/\text{Isomorphism} \arrow[d] \\
\{\text{Representable couplings } \lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+\}/\text{Equivalence.}
\end{tikzcd}$$

Remark 8.2.0.5. Let $\mathcal{C}_-$ be a (locally small) ∞-category. For every ∞-category $\mathcal{C}_+$, Corollary 5.6.0.6 supplies an identification of equivalence classes of couplings $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ (having essentially small fibers) with isomorphism classes of functors $T : \mathcal{C}_+ \to$ 043U

$\mathrm{Fun}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{S})$. Moreover, λ is representable if and only if T factors through the full subcategory $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{S}) \subseteq \mathrm{Fun}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{S})$ spanned by the representable functors (see Proposition 5.6.6.21). Consequently, Theorem 8.2.0.4 supplies a bijection

$$\mathrm{Hom}_{\mathrm{hQCat}}(\mathcal{C}_+, \mathcal{C}_-) \xrightarrow{\sim} \mathrm{Hom}_{\mathrm{hQCat}}(\mathcal{C}_+, \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{S})).$$

It is not hard to see that this bijection depends functorially on $\mathcal{C}_+$, and is therefore induced by an isomorphism $\mathcal{C}_- \simeq \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{S})$ in the homotopy category hQCat. We can therefore regard Theorem 8.2.0.4 as an “implicit” version of Yoneda’s lemma. We will give a more precise formulation in §8.3 (see Theorem 8.3.3.13).

Let us outline our approach to Theorem 8.2.0.4. Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories. For a functor $G : \mathcal{C}_+ \to \mathcal{C}_-$, we say that λ is *representable by G* if it is equivalent to the coupling λ_G of Construction 8.2.0.3 (Definition 8.2.3.1). Theorem 8.2.0.4 asserts that every representable coupling is representable by some functor $G : \mathcal{C}_+ \to \mathcal{C}_-$, which is uniquely determined up to isomorphism. To prove this, we need to construct a commutative diagram

043V

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "\widetilde{G}"] \arrow[d, "\lambda"] & \mathrm{Tw}(\mathcal{C}_-) \arrow[d] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "\mathrm{id} \times G"] & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_-
\end{tikzcd} \tag{8.21}$$

which is a categorical pullback square; in this case, we say that (8.21) *exhibits λ as represented by G* (Definition 8.2.3.5).

It will be useful to place this problem in a somewhat larger context. Suppose that $\mu : \mathcal{D} \to \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ is another coupling of ∞-categories. We will refer to a commutative diagram

043W

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "F"] \arrow[d, "\lambda"] & \mathcal{D} \arrow[d, "\mu"] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "F_-^{\mathrm{op}} \times F_+"] & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+
\end{tikzcd} \tag{8.22}$$

as a *morphism of couplings* from λ to μ (Definition 8.2.2.1). The collection of such diagrams can be organized into an ∞-category $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$, which is equipped with a forgetful functor

$$\Phi : \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+).$$

It is not difficult to see that Φ is also a left fibration: that is, it can be regarded as a coupling of the ∞-category $\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)$ with the ∞-category $\mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)$ (Proposition

8.2.2.2). Suppose now that the coupling λ is representable, and that the coupling μ is corepresentable (that is, for every object $D_- \in \mathcal{D}_-$, the ∞-category $\{D_-\} \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$ has an initial object). In §8.2.2, we show these these assumptions imply that the coupling Φ is also corepresentable (Theorem 8.2.2.11). In particular, every functor $F_- : \mathcal{C}_- \to \mathcal{D}_-$ has a canonical promotion to a commutative diagram of the form (8.22), which is characterized (up to isomorphism) by the requirement that it represents an initial object of the ∞-category $\{F_-\} \times_{\mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$. In §8.2.3, we specialize this assertion to the situation where μ is the twisted arrow coupling $\mathrm{Tw}(\mathcal{C}_-) \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and F_- is the identity functor from $\mathcal{C}_-$ to itself. In this case, we obtain a diagram of the form (8.21) and use it to deduce Theorem 8.2.0.4.

Every assertion in the preceding discussion has a dual counterpart, where the assumption of representability is replaced by corepresentability (and vice versa). If $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ is a corepresentable coupling of ∞-categories, then Theorem 8.2.0.4 guarantees the existence of a categorical pullback square

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "\widetilde{F}"] \arrow[d, "\lambda"] & \mathrm{Tw}(\mathcal{C}_+) \arrow[d] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "F^{\mathrm{op}} \times \mathrm{id}"] & \mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ .
\end{tikzcd}$$

for some functor $F : \mathcal{C}_- \to \mathcal{C}_+$, which is uniquely determined up to isomorphism; in this case, we say that the coupling λ is *corepresentable by* F (Variant 8.2.3.8). In §8.2.5, we study couplings which are simultaneously representable and corepresentable. Our main result asserts that if a coupling $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ is representable by a functor $G : \mathcal{C}_+ \to \mathcal{C}_-$, then it is corepresentable by a functor $F : \mathcal{C}_- \to \mathcal{C}_+$ if and only if F is left adjoint to G (Theorem 8.2.5.1). Our proof is based on an alternative characterization of the corepresenting functor F, which we explain in §8.2.4.

Let $\mathcal{C}$ be an ∞-category. Then the twisted arrow coupling $\lambda : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ has the following features:

(*a*) The coupling λ is corepresentable. That is, for every object $X \in \mathcal{C}$, the ∞-category $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ has an initial object.

(*b*) The coupling λ is representable. That is, for every object $Y \in \mathcal{C}$, the ∞-category $\mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$ has an initial object.

(*c*) Let f be an object of the ∞-category $\mathrm{Tw}(\mathcal{C})$, which we regard as a morphism $X \to Y$ in the ∞-category $\mathcal{C}$. Then f is initial when viewed as an object of the ∞-category $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ if and only if it is initial when viewed as an object of the ∞-category

$\mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$ (by virtue of Corollary 8.1.2.21, both conditions are equivalent to the requirement that f corresponds to an isomorphism in the ∞-category $\mathcal{C}$).

In §8.2.6, we show that twisted arrow couplings are characterized (up to equivalence) by these properties. More precisely, we show that a coupling $\mu : \mathcal{D} \to \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ satisfies conditions (a), (b) and (c) if and only if it is representable (or corepresentable) by an equivalence of ∞-categories (Theorem 8.2.6.5), and therefore equivalent to the twisted arrow ∞-category associated to the ∞-category $\mathcal{D}_-$ (or $\mathcal{D}_+$). In this case, we say that the coupling λ is *balanced* (Definition 8.2.6.1).

8.2.1 Representable Couplings

043X We now axiomatize an essential feature of the couplings that can be obtained from Construction 8.2.0.3.

043Y **Definition 8.2.1.1.** Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories and let C be an object of $\mathcal{C}$, having image $\lambda(C) = (C_-, C_+) \in \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$. We say that X is *universal* if it is an initial object of the ∞-category $\mathcal{C} \times_{\mathcal{C}_+} \{C_+\}$, and *couniversal* if it is an initial object of the ∞-category $\{C_-\} \times_{\mathcal{C}_-^{\mathrm{op}}} \mathcal{C}$.

043Z **Remark 8.2.1.2** (Uniqueness)**.** Let $\lambda = (\lambda_+, \lambda_-) : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories, let C be a universal object of $\mathcal{C}$, and let D be another object of $\mathcal{C}$. The following conditions are equivalent:

- The object C is isomorphic to D (as an object of the ∞-category $\mathcal{C}$).
- The object D is universal, and $\lambda_+(D)$ is isomorphic to $\lambda_+(C)$ (as an object of the ∞-category $\mathcal{C}_+$).

0440 **Definition 8.2.1.3.** Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories.

- We say that λ is *representable* if, for every object $C_+ \in \mathcal{C}_+$, there exists a universal object $C \in \mathcal{C}$ satisfying $\lambda_+(C) = C_+$.
- We say that λ is *corepresentable* if, for every object $C_- \in \mathcal{C}_-$, there exists a couniversal object $C \in \mathcal{C}$ satisfying $\lambda_-(C) = C_-$.

0441 **Remark 8.2.1.4** (Symmetry)**.** Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories, and let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of $\mathcal{C}_+$ with $\mathcal{C}_-$. Then the transposition $\lambda' = (\lambda_+, \lambda_-)$ can be regarded as a coupling of $\mathcal{C}_-^{\mathrm{op}}$ with $\mathcal{C}_+^{\mathrm{op}}$. In this situation:

- An object $C \in \mathcal{C}$ is universal for the coupling λ if and only if it is couniversal for the coupling λ'.

- The coupling λ is representable if and only if the coupling λ' is corepresentable.

Example 8.2.1.5. Let $\mathcal{C}$ be an ∞-category and let $\lambda : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ be the twisted arrow coupling of Example 8.2.0.2. For every morphism $f : X \to Y$ in the ∞-category $\mathcal{C}$, Corollary 8.1.2.21 asserts that the following conditions are equivalent: `0442`

(1) The morphism f is an isomorphism in $\mathcal{C}$.

(2) As an object of $\mathrm{Tw}(\mathcal{C})$, f is couniversal with respect to the coupling λ.

(3) As an object of $\mathrm{Tw}(\mathcal{C})$, f is universal with respect to the coupling λ.

In particular, the coupling λ is both representable and corepresentable.

Variant 8.2.1.6. Let $G : \mathcal{C}_+ \to \mathcal{C}_-$ be a functor of ∞-categories, set $\mathcal{C} = \mathrm{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \mathcal{C}_+$, and let $\lambda_G : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ denote the coupling of Construction 8.2.0.3. Unwinding the definitions, we see that objects of $\mathcal{C}$ can be identified with pairs (e, C_+), where C_+ is an object of the ∞-category $\mathcal{C}_+$ and $e : C_- \to G(C_+)$ is a morphism in the ∞-category $\mathcal{C}_-$. It follows from Example 8.2.1.5 that an object $(e, C_+) \in \mathcal{C}$ is universal if and only if e is an isomorphism in the ∞-category $\mathcal{C}_-$. Note that every object $C_+ \in \mathcal{C}_+$ can be lifted to a universal object of $\mathcal{C}$ (for example, we can choose e to be the identity morphism from $G(C_+)$ to itself), so that the coupling λ_G is representable. In §8.2.3, we will prove the converse: every representable coupling of ∞-categories can be obtained (up to equivalence) from Construction 8.2.0.3(Theorem 8.2.0.4). `0443`

Our goal in this section is to establish a universal mapping property of (co)representable couplings (Proposition 8.2.1.8). First, we give a reformulation of Definition 8.2.0.1 (compare with Corollary 8.1.1.14).

Proposition 8.2.1.7. *Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories. Then a morphism of simplicial sets $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ is a left fibration if and only if it satisfies the following conditions:* `0444`

(1) *The morphism λ is an isofibration; in particular, $\mathcal{C}$ is an ∞-category.*

(2) *The functor $\lambda_- : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}}$ is a cocartesian fibration. Moreover, a morphism u of $\mathcal{C}$ is λ_--cocartesian if and only if $\lambda_+(u)$ is an isomorphism in $\mathcal{C}_+$.*

(3) *The functor $\lambda_+ : \mathcal{C} \to \mathcal{C}_+$ is a cocartesian fibration. Moreover, a morphism u of $\mathcal{C}$ is λ_+-cocartesian if and only if $\lambda_-(u)$ is an isomorphism in $\mathcal{C}_-^{\mathrm{op}}$.*

Proof. Suppose first that λ is a left fibration. Then λ is a cocartesian fibration, and every morphism of $\mathcal{C}$ is λ-cocartesian (Proposition 5.1.4.14). In particular, λ is an isofibration. Let $\pi_- : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{C}_-^{\mathrm{op}}$ and $\pi_+ : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{C}_+$ denote the projection maps. Note that

π_- is a cocartesian fibration, and that a morphism (u_-, u_+) of $\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ is π_--cocartesian if and only if $u_+ = \pi_+(u_-, u_+)$ is an isomorphism in the ∞-category $\mathcal{C}_+$ (see Remark 5.1.4.6). Applying Proposition 5.1.4.13, we see that $\lambda_- = \pi_- \circ \lambda$ is also a cocartesian fibration, and that a morphism u of $\mathcal{C}$ is λ_--cocartesian if and only if $\pi_+(\lambda(u)) = \lambda_+(u)$ is an isomorphism in $\mathcal{C}_+$. This proves assertion (2), and assertion (3) follows by a similar argument.

We now prove the converse. Suppose that λ satisfies conditions (1), (2), and (3); we wish to show that λ is a left fibration. We first show that λ is a cocartesian fibration. Fix an object $X \in \mathcal{C}$ having image $\overline{X} = \lambda(X)$, together with a morphism $\overline{w} : \overline{X} \to \overline{Z}$ in the product $\mathcal{C}_- \times \mathcal{C}_+$. We wish to show that we can write $\overline{u} = \lambda(w)$ for some λ-cocartesian morphism $w : X \to Z$ in $\mathcal{C}$. Invoking assumption (2), we can choose a λ_--cocartesian morphism $u : X \to Y$ of $\mathcal{C}$ satisfying $\lambda_-(u) = \pi_-(\overline{w})$. Set $\overline{Y} = \lambda(Y)$ and $\overline{u} = \lambda(u)$. Note that the morphism $\lambda_+(u) = \pi_+(\overline{u})$ is an isomorphism in the ∞-category $\mathcal{C}_+$. We can therefore choose a 2-simplex $\overline{\sigma}$ of $\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ as indicated in the diagram

$$\begin{tikzcd}
& \overline{Y} \arrow[dr, "\overline{v}"] & \\
\overline{X} \arrow[ur, "\overline{u}"] \arrow[rr, "\overline{w}"] & & \overline{Z},
\end{tikzcd}$$

for which the image $\pi_-(\overline{\sigma})$ is a right-degenerate 2-simplex of $\mathcal{C}_-^{\mathrm{op}}$. Note that, if v can be lifted to a λ-cocartesian morphism $v : Y \to Z$ of $\mathcal{C}$, then assumption (1) guarantees that we can lift $\overline{\sigma}$ to a diagram

$$\begin{tikzcd}
& Y \arrow[dr, "v"] & \\
X \arrow[ur, "u"] \arrow[rr, "w"] & & Z
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$, where w is λ-cocartesian by virtue of Proposition 5.1.4.12. Consequently, to prove the existence of w, we can replace $\overline{w}$ by $\overline{v}$ and thereby reduce to the case where $\lambda_-(\overline{w})$ is an isomorphism in the ∞-category $\mathcal{C}_-^{\mathrm{op}}$. Repeating this argument with the roles of $\mathcal{C}_-^{\mathrm{op}}$ and $\mathcal{C}_+$ interchanged, we may also assume that $\lambda_+(\overline{w})$ is an isomorphism in the ∞-category $\mathcal{C}_+$. In this case, assumption (1) guarantees that we can lift $\overline{w}$ to an isomorphism $w : X \to Z$ in the ∞-category $\mathcal{C}$, which is λ-cocartesian by virtue of Proposition 5.1.1.8. This completes the proof that λ is a cocartesian fibration.

To complete the proof that λ is a left fibration, it will suffice to show that every morphism $w : X \to Z$ in $\mathcal{C}$ is λ-cocartesian (see Proposition 5.1.4.14). Arguing as in Remark 5.1.3.8, we can choose a diagram

$$\begin{tikzcd}
 & Y \arrow[dr, "v"] & \\
X \arrow[ur, "u"] \arrow[rr, "w"] & & Z
\end{tikzcd}$$

in $\mathcal{C}$, where u is λ-cocartesian and $\lambda(v)$ is an isomorphism in $\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$. It follows from (2) that v is λ_--cocartesian. Since $\lambda_-(v)$ is an isomorphism in $\mathcal{C}_-^{\mathrm{op}}$, it follows that v is an isomorphism in $\mathcal{C}$ (Proposition 5.1.1.8). In particular, v is λ-cocartesian (Proposition 5.1.1.8), so that $w = v \circ u$ is also λ-cocartesian (Proposition 5.1.4.12). □

Proposition 8.2.1.8. *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a corepresentable coupling and let $U : \mathcal{E} \to \mathcal{C}_+$ be a cocartesian fibration of ∞-categories. Suppose that, for every object $Y \in \mathcal{C}_+$, the fiber $\{Y\} \times_{\mathcal{C}_+} \mathcal{E}$ has an initial object. Then the ∞-category $\mathrm{Fun}_{/\mathcal{C}_+}(\mathcal{C}, \mathcal{E})$ has an initial object. Moreover, an object $F \in \mathrm{Fun}_{/\mathcal{C}_+}(\mathcal{C}, \mathcal{E})$ is initial if and only if it satisfies the following pair of conditions:* 0445

(1) *For every couniversal object $C \in \mathcal{C}$, the image $F(C)$ is initial when viewed as an object of the ∞-category $\{\lambda_+(C)\} \times_{\mathcal{C}_+} \mathcal{E}$.*

(2) *The functor F carries λ_+-cocartesian morphisms of $\mathcal{C}$ to U-cocartesian morphisms of $\mathcal{E}$.*

Remark 8.2.1.9. By virtue of Proposition 8.2.1.7, we can restate condition (2) of Proposition 8.2.1.8 as follows: 0446

(2′) Let e be a morphism of $\mathcal{C}$ having the property that $\lambda_-(e)$ is an isomorphism in the ∞-category $\mathcal{C}_-^{\mathrm{op}}$. Then $F(e)$ is a U-cocartesian morphism of $\mathcal{E}$.

Proof of Proposition 8.2.1.8. The functor $\lambda_- : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}}$ is a cocartesian fibration (Proposition 8.2.1.7) and is therefore exponentiable (Proposition 5.3.6.1). Let $\mathrm{Fun}(\mathcal{C} / \mathcal{C}_-^{\mathrm{op}}, \mathcal{E})$ and $\mathrm{Fun}(\mathcal{C} / \mathcal{C}_-^{\mathrm{op}}, \mathcal{C}_+)$ be the relative exponentials introduced in Construction 4.5.9.1. Composition with U induces a functor $V : \mathrm{Fun}(\mathcal{C} / \mathcal{C}_-^{\mathrm{op}}, \mathcal{E}) \to \mathrm{Fun}(\mathcal{C} / \mathcal{C}_-^{\mathrm{op}}, \mathcal{C}_+)$, which is an isofibration by virtue of Proposition 4.5.9.18. Let us identify the functor $\lambda_+ : \mathcal{C} \to \mathcal{C}_+$ with a section s of the projection map $\mathrm{Fun}(\mathcal{C} / \mathcal{C}_-^{\mathrm{op}}, \mathcal{C}_+) \to \mathcal{C}_-^{\mathrm{op}}$, and form a pullback diagram

$$\begin{tikzcd}
\mathcal{D} \arrow[r] \arrow[d, "V'"] & \mathrm{Fun}(\mathcal{C} / \mathcal{C}_-^{\mathrm{op}}, \mathcal{E}) \arrow[d, "V"] \\
\mathcal{C}_-^{\mathrm{op}} \arrow[r, "s"] & \mathrm{Fun}(\mathcal{C} / \mathcal{C}_-^{\mathrm{op}}, \mathcal{C}_+).
\end{tikzcd}$$

Since V' is a pullback of V, it is also an isofibration (Remark 4.5.5.11). Moreover, the ∞-category $\operatorname{Fun}_{/\mathcal{C}_+}(\mathcal{C}, \mathcal{E})$ can be identified with the ∞-category $\operatorname{Fun}_{/\mathcal{C}_-^{\mathrm{op}}}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{D})$ of sections of V'.

For each object $X \in \mathcal{C}_-$, let $\mathcal{C}_X$ denote the fiber $\{X\} \times_{\mathcal{C}_-^{\mathrm{op}}} \mathcal{C}$. Unwinding the definitions, we can identify objects of $\mathcal{D}$ with pairs (X, F_X), where X is an object of $\mathcal{C}_-$ and $F_X : \mathcal{C}_X \to \mathcal{E}$ is a functor satisfying $U \circ f = \lambda_+|_{\mathcal{C}_X}$. For fixed $X \in \mathcal{C}_-$, our assumption that λ is corepresentable guarantees that the ∞-category $\mathcal{C}_X$ has an initial object C. Set $Y = \lambda_+(C)$. By assumption, the ∞-category $\{Y\} \times_{\mathcal{C}_+} \mathcal{E}$ also has an initial object. Invoking the criterion of Corollary 7.3.6.11, we see that the ∞-category $\{X\} \times_{\mathcal{C}_-^{\mathrm{op}}} \mathcal{D} \simeq \operatorname{Fun}_{/\mathcal{C}_+}(\mathcal{C}_X, \mathcal{E})$ also has an initial object. Moreover, an object $F_X \in \operatorname{Fun}_{/\mathcal{C}_+}(\mathcal{C}_X, \mathcal{E})$ is initial if and only if it satisfies the following pair of conditions:

(1_X) For every initial object $C \in \mathcal{C}_X$, the image $F_X(C)$ is an initial object of the ∞-category $\{Y\} \times_{\mathcal{C}_+} \mathcal{E}$.

(2_X) The functor F_X carries each morphism in $\mathcal{C}_X$ to a U-cocartesian morphism of $\mathcal{E}$.

We will prove below that the functor V' is a cartesian fibration. Assuming this Corollary 7.3.5.7, we guarantees that the ∞-category

$$\operatorname{Fun}_{/\mathcal{C}_+}(\mathcal{C}, \mathcal{E}) \simeq \operatorname{Fun}_{/\mathcal{C}_-^{\mathrm{op}}}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{D})$$

has an initial object. Moreover, an object $F \in \operatorname{Fun}_{/\mathcal{C}_+}(\mathcal{C}, \mathcal{E})$ is initial if and only if, for every object $X \in \mathcal{C}_-$, the restriction $F_X = F|_{\mathcal{C}_X}$ satisfies conditions (1_X) and (2_X) above. Unwinding the definitions, this is equivalent to the requirement that F satisfies condition (1) and the following variant of condition $(2')$ of Remark 8.2.1.9:

$(2'')$ If e is a morphism of $\mathcal{C}$ such that $\lambda_-(e)$ is an identity morphism of $\mathcal{C}_-^{\mathrm{op}}$, then $F(e)$ is a U-cocartesian morphism of $\mathcal{E}$.

The implication $(2') \Rightarrow (2'')$ is immediate. The reverse implication follows from the observation that if $\lambda_-(e)$ is an isomorphism in $\mathcal{C}_-^{\mathrm{op}}$, then e is isomorphic (as an object of $\operatorname{Fun}(\Delta^1, \mathcal{C})$) to a morphism e' such that $\lambda_-(e')$ is an identity morphism of $\mathcal{C}_-^{\mathrm{op}}$.

We now complete the proof by showing that V' is a cartesian fibration. Fix an object $(X, F_X) \in \mathcal{D}$, and a morphism $u : X' \to X$ in the ∞-category $\mathcal{C}_-^{\mathrm{op}}$. We wish to show that u can be lifted to a V'-cartesian morphism $\widetilde{u} : (X', F_{X'}) \to (X, F_X)$ in the ∞-category $\mathcal{D}$. We will prove a slightly stronger assertion: we can arrange that the image of $\widetilde{u}$ in the ∞-category $\operatorname{Fun}(\mathcal{C} \,/\, \mathcal{C}_-^{\mathrm{op}}, \mathcal{E})$ is V-cartesian. Let us identify u with a morphism $\Delta^1 \to \mathcal{C}_-^{\mathrm{op}}$ and set $\mathcal{C}_u = \Delta^1 \times_{\mathcal{C}_-^{\mathrm{op}}} \mathcal{C}$, so that $\mathcal{C}_X$ can be identified with the fiber $\{1\} \times_{\Delta^1} \mathcal{C}_u$. By virtue of Corollary 7.3.7.6, it will suffice to show that the lifting problem

$$\begin{tikzcd}
\mathcal{C}_X \arrow[r, "F_X"] & \mathcal{E} \arrow[d, "U"] \\
\mathcal{C}_u \arrow[r] \arrow[ur, dashed, "F_u"] & \mathcal{C}_+
\end{tikzcd}$$

admits a solution having the property that F_u is U-right Kan extended from $\mathcal{C}_X$.

Let $\pi : \mathcal{C}_u \to \Delta^1$ denote the projection map. Since π is a pullback of λ_-, it is a cocartesian fibration of ∞-categories (Proposition 8.2.1.7). In particular, $\mathcal{C}_X$ is a reflective subcategory of $\mathcal{C}_u$. Moreover, if C is an object of $\mathcal{C}_X$, then a morphism $v : C' \to C$ in $\mathcal{C}_u$ is π-cocartesian if and only if it exhibits C as a $\mathcal{C}_X$-reflection of C' (see Proposition 6.2.2.22). By virtue of Corollary 7.3.5.9, it will suffice to show that if this condition is satisfied, then $\lambda_+(v)$ can be lifted to a U-cartesian morphism $E \to F_X(C)$ in $\mathcal{E}$. This is clear: our assumption that v is π-cocartesian guarantees that $\lambda_+(v)$ is an isomorphism in the ∞-category $\mathcal{C}_+$ (Proposition 8.2.1.7), and can therefore be lifted to an isomorphism in $\mathcal{E}$ by virtue of the fact that U is an isofibration (Proposition 5.1.4.8). □

Corollary 8.2.1.10. *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories. Suppose that, for every object $C \in \mathcal{C}$, the ∞-category $\mathcal{E}_C = \mathcal{E} \times_{\mathcal{C}} \{C\}$ has an initial object. Then the ∞-category $\mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}), \mathcal{E})$ has an initial object. Moreover, an object $F \in \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}), \mathcal{E})$ is initial if and only if it satisfies the following pair of conditions:* 0447

(1) *For every object $C \in \mathcal{C}$, the image $F(\mathrm{id}_C)$ is an initial object of the ∞-category $\mathcal{E}_C$.*

(2) *Let e be a morphism of $\mathrm{Tw}(\mathcal{C})$ whose image in $\mathcal{C}^{\mathrm{op}}$ is an isomorphism. Then $F(e)$ is a U-cocartesian morphism of $\mathcal{E}$.*

Stated more informally, Corollary 8.2.1.10 asserts that the twisted arrow ∞-category $\mathrm{Tw}(\mathcal{C})$ is *universal* among ∞-categories $\mathcal{E}$ equipped with a cocartesian fibration $U : \mathcal{E} \to \mathcal{C}$ having the property that each fiber of U has an initial object.

8.2.2 Morphisms of Couplings

We begin by introducing a companion of Definition 8.2.0.1. 0448

Definition 8.2.2.1. Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \to \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be couplings of ∞-categories. A *morphism of couplings* from λ to μ is a triple of functors 0449

$$F_- : \mathcal{C}_- \to \mathcal{D}_- \qquad F : \mathcal{C} \to \mathcal{D} \qquad F_+ : \mathcal{C}_+ \to \mathcal{D}_+$$

for which the diagram

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "F"] \arrow[d, "\lambda"] & \mathcal{D} \arrow[d, "\mu"] \\
\mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{+} \arrow[r, "F_{-}^{\mathrm{op}} \times F_{+}"] & \mathcal{D}_{-}^{\mathrm{op}} \times \mathcal{D}_{+}
\end{tikzcd}$$

is commutative. Note that such diagrams can be identified with the vertices of a simplicial set $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$, defined by the formula

$$\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) = \mathrm{Fun}(\mathcal{C}_{-}, \mathcal{D}_{-})^{\mathrm{op}} \times_{\mathrm{Fun}(\mathcal{C}, \mathcal{D}_{-}^{\mathrm{op}})} \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}, \mathcal{D}_{+})} \mathrm{Fun}(\mathcal{C}_{+}, \mathcal{D}_{+}).$$

044A **Proposition 8.2.2.2.** *Let $\lambda : \mathcal{C} \to \mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{+}$ and $\mu : \mathcal{D} \to \mathcal{D}_{-}^{\mathrm{op}} \times \mathcal{D}_{+}$ be couplings of ∞-categories. Then the projection maps*

$$\Phi_{-} : \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}_{-}, \mathcal{D}_{-})^{\mathrm{op}} \qquad \Phi_{+} : \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}_{+}, \mathcal{D}_{+})$$

induce a left fibration

$$(\Phi_{-}, \Phi_{+}) : \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}_{-}, \mathcal{D}_{-})^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}_{+}, \mathcal{D}_{+}).$$

Proof. By construction, there is a pullback diagram of simplicial sets

$$\begin{tikzcd}
\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \arrow[r] \arrow[d, "(\Phi_{-}, \Phi_{+})"] & \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \arrow[d, "\mu\circ"] \\
\mathrm{Fun}(\mathcal{C}_{-}, \mathcal{D}_{-})^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}_{+}, \mathcal{D}_{+}) \arrow[r, "\circ\lambda"] & \mathrm{Fun}(\mathcal{C}, \mathcal{D}_{-}^{\mathrm{op}} \times \mathcal{D}_{+}).
\end{tikzcd}$$

It will therefore suffice to show that the right vertical map is a left fibration (Remark 4.2.1.8), which follows from our assumption that μ is a left fibration (Corollary 4.2.5.2). ☐

044B **Remark 8.2.2.3** (Functor Couplings)**.** Let $\lambda : \mathcal{C} \to \mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{+}$ and $\mu : \mathcal{D} \to \mathcal{D}_{-}^{\mathrm{op}} \times \mathcal{D}_{+}$ be couplings of ∞-categories. Proposition 8.2.2.2 asserts that the induced map

$$\Phi = (\Phi_{-}, \Phi_{+}) : \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}_{-}, \mathcal{D}_{-})^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}_{+}, \mathcal{D}_{+})$$

is also a coupling of ∞-categories. Moreover, it is characterized by a universal property: for every coupling of ∞-categories $\kappa : \mathcal{B} \to \mathcal{B}_{-}^{\mathrm{op}} \times \mathcal{B}_{+}$, there is a canonical isomorphism of simplicial sets

$$\mathrm{Fun}_{\pm}(\mathcal{B}, \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})) \simeq \mathrm{Fun}_{\pm}(\mathcal{B} \times \mathcal{C}, \mathcal{D}),$$

where the right hand side is defined using the product coupling

$$\mathcal{B} \times \mathcal{C} \xrightarrow{\kappa \times \lambda} (\mathcal{B}_{-} \times \mathcal{C}_{-})^{\mathrm{op}} \times (\mathcal{B}_{+} \times \mathcal{C}_{+}).$$

Remark 8.2.2.4. Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and $\mu = (\mu_-, \mu_+) : \mathcal{D} \to \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be couplings of ∞-categories, and suppose we are given a morphism of couplings 044C

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "F"] \arrow[d, "\lambda"] & \mathcal{D} \arrow[d, "\mu"] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "F_-^{\mathrm{op}} \times F_+"] & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+ .
\end{tikzcd}$$

It follows from Proposition 8.2.1.7 that the functor F carries λ_--cocartesian morphisms of $\mathcal{C}$ to μ_--cocartesian morphisms of $\mathcal{D}$, and λ_+-cocartesian morphisms of $\mathcal{C}$ to μ_+-cocartesian morphisms of $\mathcal{D}$.

Corollary 8.2.2.5. *Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \to \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be couplings of ∞-categories. Then the simplicial set $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$ is an ∞-category.* 044D

Proof. Combine Proposition 8.2.2.2 with Remark 4.2.1.4. □

Example 8.2.2.6. The canonical isomorphism $\lambda : \Delta^0 \xrightarrow{\sim} (\Delta^0)^{\mathrm{op}} \times \Delta^0$ can be regarded as a coupling of the 0-simplex Δ^0 with itself. For every coupling of ∞-categories $\mu : \mathcal{D} \to \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$, the ∞-category $\mathrm{Fun}_{\pm}(\Delta^0, \mathcal{D})$ can be identified with the ∞-category $\mathcal{D}$. 044E

Exercise 8.2.2.7. Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \to \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be couplings of ∞-categories, and suppose we are given a morphism of couplings 04AS

04AT

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "F"] \arrow[d, "\lambda"] & \mathcal{D} \arrow[d, "\mu"] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "F_-^{\mathrm{op}} \times F_+"] & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+
\end{tikzcd} \qquad (8.23)$$

Show that the following conditions are equivalent:

- The functors F_-, F, and F_+ are equivalences of ∞-categories.
- There exists a morphism of couplings $(G_-, G, G_+) \in \mathrm{Fun}_{\pm}(\mathcal{D}, \mathcal{C})$ which is a homotopy inverse to (F_-, F, F_+), in the sense that the compositions $(G_- \circ F_-, G \circ F, G_+ \circ F_+)$ and $(F_- \circ G_-, F \circ G, F_+ \circ G_+)$ are isomorphic to $(\mathrm{id}_{\mathcal{C}_-}, \mathrm{id}_{\mathcal{C}}, \mathrm{id}_{\mathcal{C}_+})$ and $(\mathrm{id}_{\mathcal{D}_-}, \mathrm{id}_{\mathcal{D}}, \mathrm{id}_{\mathcal{D}_+})$ as objects of the ∞-categories $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{C})$ and $\mathrm{Fun}_{\pm}(\mathcal{D}, \mathcal{D})$, respectively.

If these conditions are satisfied, we will say that the diagram (8.23) is an *equivalence of couplings.*

04AU **Remark 8.2.2.8.** Suppose we are given a morphism of couplings

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "F"] \arrow[d, "\lambda"] & \mathcal{D} \arrow[d, "\mu"] \\
\mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{+} \arrow[r, "F_{-}^{\mathrm{op}} \times F_{+}"] & \mathcal{D}_{-}^{\mathrm{op}} \times \mathcal{D}_{+}
\end{tikzcd}$$

which is an equivalence (in the sense of Exercise 8.2.2.7). Then:

- The coupling λ is representable if and only if the coupling μ is representable.
- The coupling λ is corepresentable if and only if the coupling μ is corepresentable.
- An object $C \in \mathcal{C}$ is universal (with respect to the coupling λ) if and only if $F(C)$ is universal $\mathcal{D}$ (with respect to the coupling μ).
- An object $C \in \mathcal{C}$ is universal (with respect to the coupling λ) if and only if $F(C)$ is universal $\mathcal{D}$ (with respect to the coupling μ).

See Corollaries 4.6.7.21 and 4.6.7.20.

Beware that, in the situation of Definition 8.2.2.1, the ∞-category $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$ depends not only on $\mathcal{C}$ and $\mathcal{D}$, but also on the left fibrations $\lambda : \mathcal{C} \to \mathcal{C}_{-} \times \mathcal{C}_{+}$ and $\mu : \mathcal{D} \to \mathcal{D}_{-} \times \mathcal{D}_{+}$. Our goal in this section is to show that, nevertheless, it can often be identified with a full subcategory of $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$ (Proposition 8.2.2.9).

044F **Proposition 8.2.2.9.** *Let $\lambda = (\lambda_{-}, \lambda_{+}) : \mathcal{C} \to \mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{+}$ and $\mu = (\mu_{-}, \mu_{+}) : \mathcal{D} \to \mathcal{D}_{-}^{\mathrm{op}} \times \mathcal{D}_{+}$ be couplings of ∞-categories. Let $\mathcal{E}_{-} \subseteq \mathrm{Fun}(\mathcal{C}, \mathcal{D})$ be the full subcategory spanned by those functors $F : \mathcal{C} \to \mathcal{D}$ which carry λ_{+}-cocartesian morphisms of $\mathcal{C}$ to μ_{+}-cocartesian morphisms of $\mathcal{D}$, define $\mathcal{E}_{+} \subseteq \mathrm{Fun}(\mathcal{C}, \mathcal{D})$ similarly, and set $\mathcal{E}_{\pm} = \mathcal{E}_{-} \cap \mathcal{E}_{+}$. Then:*

(1) *Suppose that, for every object $C_{-} \in \mathcal{C}_{-}$, the ∞-category $\{C_{-}\} \times_{\mathcal{C}_{-}^{\mathrm{op}}} \mathcal{C}$ is weakly contractible. Then the forgetful functor*

$$\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \to \mathcal{E}_{-} \times_{\mathrm{Fun}(\mathcal{C}, \mathcal{D}_{+})} \mathrm{Fun}(\mathcal{C}_{+}, \mathcal{D}_{+})$$

is an equivalence of ∞-categories.

(2) *Suppose that, for every object $C_{+} \in \mathcal{C}_{+}$, the ∞-category $\mathcal{C} \times_{\mathcal{C}_{+}} \{C_{+}\}$ is weakly contractible. Then the forgetful functor*

$$\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}_{-}, \mathcal{D}_{-})^{\mathrm{op}} \times_{\mathrm{Fun}(\mathcal{C}, \mathcal{D}_{-}^{\mathrm{op}})} \mathcal{E}_{+}$$

is an equivalence of ∞-categories.

(3) *If the hypotheses of both* (1) *and* (2) *are satisfied, then the forgetful functor* $\mathrm{Fun}_{\pm}(\mathcal{C},\mathcal{D}) \to \mathcal{E}_{\pm}$ *is an equivalence of* ∞*-categories.*

Proof. We first prove (1). Let W be the collection of all λ_+-cocartesian morphisms of $\mathcal{C}$. Note that a morphism u of $\mathcal{C}$ belongs to W if and only if $\lambda_-(u)$ is an isomorphism in the ∞-category $\mathcal{C}_-^{\mathrm{op}}$ (Proposition 8.2.1.7). Suppose that, for every object $C_- \in \mathcal{C}_-$, the ∞-category $\{C_-\} \times_{\mathcal{C}_-} \mathcal{C}$ is weakly contractible. Applying Corollary 6.3.5.3, we deduce that the functor λ_- exhibits $\mathcal{C}_-^{\mathrm{op}}$ as a localization of $\mathcal{C}$ with respect to W. It follows that precomposition with λ_- induces an equivalence of ∞-categories $\mathrm{Fun}(\mathcal{C}_-,\mathcal{D}_-)^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{C}[W^{-1}],\mathcal{D}_-^{\mathrm{op}})$, where $\mathrm{Fun}(\mathcal{C}[W^{-1}],\mathcal{D}_-^{\mathrm{op}})$ denotes the full subcategory of $\mathrm{Fun}(\mathcal{C},\mathcal{D}_-^{\mathrm{op}})$ spanned by those functors which carry each element of W to an isomorphism in $\mathcal{D}_-^{\mathrm{op}}$ (Notation 6.3.1.1). We have a commutative diagram of ∞-categories

044G

$$\begin{tikzcd}
\mathrm{Fun}_{\pm}(\mathcal{C},\mathcal{D}) \arrow[r] \arrow[d] & \mathrm{Fun}(\mathcal{C}_-,\mathcal{D}_-)^{\mathrm{op}} \arrow[d, "\circ\lambda_-"] \\
\mathcal{E}_- \times_{\mathrm{Fun}(\mathcal{C},\mathcal{D}_+)} \mathrm{Fun}(\mathcal{C}_+,\mathcal{D}_+) \arrow[r] \arrow[d] & \mathrm{Fun}(\mathcal{C}[W^{-1}],\mathcal{D}_-^{\mathrm{op}}) \arrow[d] \\
\mathrm{Fun}(\mathcal{C},\mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C},\mathcal{D}_+)} \mathrm{Fun}(\mathcal{C}_+,\mathcal{D}_+) \arrow[r, "\theta"] & \mathrm{Fun}(\mathcal{C},\mathcal{D}_-^{\mathrm{op}})
\end{tikzcd} \quad (8.24)$$

in which both squares are pullbacks. To prove (1), it will suffice to show that the upper square is a categorical pullback diagram (Proposition 4.5.2.21). In fact, we will show that θ is an isofibration, so that both squares are categorical pullback diagrams (Corollary 4.5.2.27). This follows by observing that θ factors as a composition

$$\mathrm{Fun}(\mathcal{C},\mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C},\mathcal{D}_+)} \mathrm{Fun}(\mathcal{C}_+,\mathcal{D}_+) \xrightarrow{\theta'} \mathrm{Fun}(\mathcal{C},\mathcal{D}_-^{\mathrm{op}}) \times \mathrm{Fun}(\mathcal{C}_+,\mathcal{D}_+) \xrightarrow{\theta''} \mathrm{Fun}(\mathcal{C},\mathcal{D}_-^{\mathrm{op}}),$$

where θ' is a pullback of the composition map $\mathrm{Fun}(\mathcal{C},\mathcal{D}) \xrightarrow{\mu\circ} \mathrm{Fun}(\mathcal{C},\mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+)$ (hence a left fibration by virtue of Corollary 4.2.5.2) and θ'' is a pullback of the projection map $\mathrm{Fun}(\mathcal{C}_+,\mathcal{D}_+) \to \Delta^0$. This completes the proof of assertion (1).

Assertion (2) follows by a similar argument. We now prove (3). Suppose that λ satisfies the hypotheses of both (1) and (2); we wish to prove that the forgetful functor $T : \mathrm{Fun}_{\pm}(\mathcal{C},\mathcal{D}) \to \mathcal{E}_{\pm}$ is an equivalence of ∞-categories. Note that T factors as a composition

$$\mathrm{Fun}_{\pm}(\mathcal{C},\mathcal{D}) \xrightarrow{T'} \mathrm{Fun}(\mathcal{C}_-,\mathcal{D}_-)^{\mathrm{op}} \times_{\mathrm{Fun}(\mathcal{C},\mathcal{D}_-^{\mathrm{op}})} \mathcal{E}_+ \xrightarrow{T''} \mathcal{E}_{\pm},$$

where T' is an equivalence of ∞-categories by virtue of (2). It will therefore suffice to show that T'' is an equivalence of ∞-categories. We have a commutative diagram

$$\begin{tikzcd}
\mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}} \times_{\mathrm{Fun}(\mathcal{C}, \mathcal{D}_-^{\mathrm{op}})} \mathcal{E}_+ \arrow[r] \arrow[d, "T''"] & \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}} \arrow[d, "\circ \lambda_-"] \\
\mathcal{E}_\pm \arrow[r, "\mu_- \circ"] \arrow[d] & \mathrm{Fun}(\mathcal{C}[W^{-1}], \mathcal{D}_-^{\mathrm{op}}) \arrow[d] \\
\mathcal{E}_+ \arrow[r, "\rho"] & \mathrm{Fun}(\mathcal{C}, \mathcal{D}_-^{\mathrm{op}}),
\end{tikzcd}$$

where both squares are pullbacks and the upper right vertical map is an equivalence of ∞-categories. It will therefore suffice to show that the upper square is a categorical pullback diagram (Proposition 4.5.2.21). In fact, we claim that ρ is an isofibration, so that both squares are categorical pullback diagrams (Corollary 4.5.2.27). This follows by observing that ρ is the restriction of the map $\mathrm{Fun}(\mathcal{C}, \mathcal{D}) \xrightarrow{\mu_- \circ} \mathrm{Fun}(\mathcal{C}, \mathcal{D}_-^{\mathrm{op}})$ (which is a cocartesian fibration by virtue of Proposition 8.2.1.7 and Theorem 5.2.1.1) to a replete subcategory $\mathcal{E}_+ \subseteq \mathrm{Fun}(\mathcal{C}, \mathcal{D})$. □

044H **Corollary 8.2.2.10.** *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and $\mu = (\mu_-, \mu_+) : \mathcal{D} \to \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be couplings of ∞-categories. Fix a functor $F_+ : \mathcal{C}_+ \to \mathcal{D}_+$. If λ is corepresentable, then the forgetful functor*

$$\mathrm{Fun}_\pm(\mathcal{C}, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} \to \mathrm{Fun}_{/\mathcal{D}_+}(\mathcal{C}, \mathcal{D})$$

is fully faithful, and its essential image is the full subcategory $\mathrm{Fun}^0_{/\mathcal{D}_+}(\mathcal{C}, \mathcal{D}) \subseteq \mathrm{Fun}_{/\mathcal{D}_+}(\mathcal{C}, \mathcal{D})$ spanned by those functors which carry λ_+-cocartesian morphisms of $\mathcal{C}$ to μ_+-cocartesian morphisms of $\mathcal{D}$.

Proof. Let $\mathcal{E}_- \subseteq \mathrm{Fun}(\mathcal{C}, \mathcal{D})$ be the full subcategory defined in Proposition 8.2.2.9. We then have a commutative diagram of ∞-categories

044J

$$\begin{tikzcd}
\mathrm{Fun}_{\pm}(\mathcal{C},\mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}_+,\mathcal{D}_+)} \{F_+\} \arrow[r] \arrow[d] & \mathrm{Fun}_{\pm}(\mathcal{C},\mathcal{D}) \arrow[d] \\
\mathrm{Fun}^0_{/\mathcal{D}_+}(\mathcal{C},\mathcal{D}) \arrow[r] \arrow[d] & \mathcal{E}_- \times_{\mathrm{Fun}(\mathcal{C},\mathcal{D}_+)} \mathrm{Fun}(\mathcal{C}_+,\mathcal{D}_+) \arrow[d] \\
\{F_+\} \arrow[r] & \mathrm{Fun}(\mathcal{C}_+,\mathcal{D}_+),
\end{tikzcd} \tag{8.25}$$

where both squares are pullback diagrams. Note that the vertical map on the lower right is a pullback of the functor $\mathcal{E}_- \to \mathrm{Fun}(\mathcal{C},\mathcal{D}_+)$ obtained by restricting the cocartesian fibration $\mathrm{Fun}(\mathcal{C},\mathcal{D}) \xrightarrow{\mu_+\circ} \mathrm{Fun}(\mathcal{C},\mathcal{D}_+)$ (see Proposition 8.2.1.7 and Theorem 5.2.1.1) to the replete subcategory $\mathcal{E}_- \subseteq \mathrm{Fun}(\mathcal{C},\mathcal{D})$, and is therefore an isofibration. Moreover, the right vertical composition $\mathrm{Fun}_{\pm}(\mathcal{C},\mathcal{D}) \to \mathrm{Fun}(\mathcal{C}_+,\mathcal{D}_+)$ is a cocartesian fibration (see Proposition 8.2.1.7 and Remark 8.2.2.3), and therefore an isofibration. It follows that the bottom square and outer rectangle of (8.25) are categorical pullback diagrams (Corollary 4.5.2.27), so that the upper square is also a categorical pullback diagram (Proposition 4.5.2.18). Our assumption that λ is corepresentable guarantees that for each object $X_- \in \mathcal{C}_-$, the fiber $\{X_-\} \times_{\mathcal{C}_-^{\mathrm{op}}} \mathcal{C}$ has an initial object, and is therefore weakly contractible. Applying Proposition 8.2.2.9, we deduce that the vertical map on the upper right is an equivalence of ∞-categories. Invoking Proposition 4.5.2.21, we conclude that the forgetful functor $\mathrm{Fun}_{\pm}(\mathcal{C},\mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}_+,\mathcal{D}_+)} \{F_+\} \to \mathrm{Fun}^0_{/\mathcal{D}_+}(\mathcal{C},\mathcal{D})$ is also an equivalence of ∞-categories. □

We can now formulate the main result of this section.

Theorem 8.2.2.11. *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a representable coupling of ∞-categories and let $\mu : \mathcal{D} \to \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be a corepresentable coupling of ∞-categories. Then the functor coupling* 044K

$$\Phi = (\Phi_-, \Phi_+) : \mathrm{Fun}_{\pm}(\mathcal{C},\mathcal{D}) \to \mathrm{Fun}(\mathcal{C}_-,\mathcal{D}_-)^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}_+,\mathcal{D}_+)$$

is corepresentable. Moreover, an object $(F_-, F, F_+) \in \mathrm{Fun}_{\pm}(\mathcal{C},\mathcal{D})$ is couniversal if and only if the functor $F : \mathcal{C} \to \mathcal{D}$ carries universal objects of $\mathcal{C}$ to couniversal objects of $\mathcal{D}$.

Proof. Fix a functor $F_- : \mathcal{C}_- \to \mathcal{D}_-$; we wish to show that it can be extended to a couniversal object $(F_-, F, F_+) \in \mathrm{Fun})_{\pm}(\mathcal{C},\mathcal{D})$. Set $\mathcal{E} = \mathcal{C}_-^{\mathrm{op}} \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$. Then projection onto the first factor determines a cocartesian fibration $U : \mathcal{E} \to \mathcal{C}_-^{\mathrm{op}}$ (Proposition 8.2.1.7). Let $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}_-^{\mathrm{op}}}(\mathcal{C},\mathcal{E})$

denote the full subcategory of $\operatorname{Fun}_{/\mathcal{C}_-^{\mathrm{op}}}(\mathcal{C},\mathcal{E})$ spanned by those functors which carry λ_--cocartesian morphisms of $\mathcal{C}$ to U-cocartesian of $\mathcal{E}$ (Notation 5.3.1.10). Corollary 8.2.2.10 guarantees that the forgetful functor

$$\{F_-\} \times_{\operatorname{Fun}(\mathcal{C}_-,\mathcal{D}_-)^{\mathrm{op}}} \operatorname{Fun}_{\pm}(\mathcal{C},\mathcal{D}) \to \operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}_-^{\mathrm{op}}}(\mathcal{C},\mathcal{E})$$

is an equivalence of ∞-categories. Theorem 8.2.2.11 can therefore be restated as follows:

(1) The ∞-category $\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}_-^{\mathrm{op}}}(\mathcal{C},\mathcal{E})$ has an initial object.

(2) An object $F \in \operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}_-^{\mathrm{op}}}(\mathcal{C},\mathcal{E})$ is initial if and only if, for universal object $C \in \mathcal{C}$, the image $F(C)$ is an initial object of the ∞-category

$$\mathcal{E}_{\lambda_-(C)} \simeq \{F_-(\lambda_-(C))\} \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}.$$

Our assumption that μ is corepresentable guarantees that, for each object $C \in \mathcal{C}$, the ∞-category $\mathcal{E}_{\lambda_-(C)}$ has an initial object. Consequently, assertions (1) and (2) follow from (the dual of) Proposition 8.2.1.8. □

044L **Example 8.2.2.12.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. Then the commutative diagram

044M
$$\begin{tikzcd}
\operatorname{Tw}(\mathcal{C}) \arrow[r, "\operatorname{Tw}(F)"] \arrow[d] & \operatorname{Tw}(\mathcal{D}) \arrow[d] \\
\mathcal{C}^{\mathrm{op}} \times \mathcal{C} \arrow[r, "F^{\mathrm{op}} \times F"] & \mathcal{D}^{\mathrm{op}} \times \mathcal{D}
\end{tikzcd} \tag{8.26}$$

is a morphism of couplings. It follows from Theorem 8.2.2.11 that this morphism is initial when viewed as an object of the ∞-category $\{F\} \times_{\operatorname{Fun}(\mathcal{C},\mathcal{D})^{\mathrm{op}}} \operatorname{Fun}_{\pm}(\operatorname{Tw}(\mathcal{C}), \operatorname{Tw}(\mathcal{D}))$.

044N **Corollary 8.2.2.13.** *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories, and suppose we are given a pair of functors $F_-, F_+ : \mathcal{C} \to \mathcal{D}$. Then F_- and F_+ are isomorphic (as objects of the ∞-category* $\operatorname{Fun}(\mathcal{C},\mathcal{D})$*) if and only if there exists a morphism of couplings*

044P
$$\begin{tikzcd}
\operatorname{Tw}(\mathcal{C}) \arrow[r, "\widetilde{F}"] \arrow[d] & \operatorname{Tw}(\mathcal{D}) \arrow[d] \\
\mathcal{C}^{\mathrm{op}} \times \mathcal{C} \arrow[r, "F_-^{\mathrm{op}} \times F_+"] & \mathcal{D}^{\mathrm{op}} \times \mathcal{D}
\end{tikzcd} \tag{8.27}$$

having the property that the functor $\widetilde{F}$ carries isomorphisms of $\mathcal{C}$ (regarded as objects of $\operatorname{Tw}(\mathcal{C})$*) to isomorphisms of $\mathcal{D}$ (regarded as objects of* $\operatorname{Tw}(\mathcal{D})$*).*

Proof. Suppose first that there exists an isomorphism of functors $\alpha : F_- \to F_+$. Since the projection map $\mathrm{Tw}(\mathcal{D}) \to \mathcal{D}^{\mathrm{op}} \times \mathcal{D}$ is an isofibration, we can use Corollary 4.4.5.6 to lift the natural transformation

$$(\mathrm{id} \times \alpha) : F_-^{\mathrm{op}} \times F_+ \to F_-^{\mathrm{op}} \times F_-$$

to an isomorphism $\widetilde{F} \to \mathrm{Tw}(F_-)$ in the ∞-category $\mathrm{Fun}(\mathrm{Tw}(\mathcal{C}), \mathrm{Tw}(\mathcal{D}))$, so that we have a commutative diagram

$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{C}) \arrow[r, "\widetilde{F}"] \arrow[d] & \mathrm{Tw}(\mathcal{D}) \arrow[d] \\
\mathcal{C}^{\mathrm{op}} \times \mathcal{C} \arrow[r, "F_-^{\mathrm{op}} \times F_+"] & \mathcal{D}^{\mathrm{op}} \times \mathcal{D}
\end{tikzcd}$$

where $\widetilde{F}$ carries isomorphisms of $\mathcal{C}$ to isomorphisms of $\mathcal{D}$.

We now prove the converse. Suppose we are given a commutative diagram (8.27), where $\widetilde{F}$ carries isomorphisms of $\mathcal{C}$ to isomorphisms of $\mathcal{D}$. Applying Theorem 8.2.2.11, we deduce that the triple $(F_-, \widetilde{F}, F_+)$ is initial when viewed as an object of the ∞-category $\{F_-\} \times_{\mathrm{Fun}(\mathcal{C},\mathcal{D})^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}), \mathrm{Tw}(\mathcal{D}))$. Applying Example 8.2.2.12 (and Corollary 4.6.7.15), we deduce that $(F_-, \widetilde{F}, F_+)$ is isomorphic to $(F_-, \mathrm{Tw}(F_-), F_-)$ as an object of the ∞-category $\{F_-\} \times_{\mathrm{Fun}(\mathcal{C},\mathcal{D})^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}), \mathrm{Tw}(\mathcal{D}))$. In particular, F_+ is isomorphic to F_- as an object of $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$. □

8.2.3 Representations of Couplings

We now apply Theorem 8.2.2.11 to give a classification of representable couplings. 044Q

Definition 8.2.3.1. Let $G : \mathcal{C}_+ \to \mathcal{C}_-$ be a functor of ∞-categories. We will say that a coupling $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ is *representable by G* if it is equivalent (as a left fibration over $\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$) to the coupling λ_G of Construction 8.2.0.3. 044R

Remark 8.2.3.2. Let $G, G' : \mathcal{C}_+ \to \mathcal{C}_-$ be functors which are isomorphic (as objects of the ∞-category $\mathrm{Fun}(\mathcal{C}_+, \mathcal{C}_-)$). Then a coupling $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ is representable by G if and only if it is representable by G'. See Proposition 5.1.7.5. 044S

Example 8.2.3.3. Let $\mathcal{C}$ be an ∞-category. Then the twisted arrow coupling $\lambda : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ of of Example 8.2.0.2 is representable by the identity functor $\mathrm{id} : \mathcal{C} \to \mathcal{C}$. 044T

Our goal is to prove the following restatement of Theorem 8.2.0.4:

Theorem 8.2.3.4. *Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories. Then λ is representable (in the sense of Definition 8.2.1.3) if and only there exists a functor $G : \mathcal{C}_+ \to \mathcal{C}_-$ such that λ is representable by G (in the sense of Definition 8.2.3.1). If this condition is satisfied, then the functor G is uniquely determined up to isomorphism.* 044U

Before giving the proof of Theorem 8.2.3.4, it will be useful to formulate a more precise version of Definition 8.2.3.1.

044V **Definition 8.2.3.5.** Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories and let $G : \mathcal{C}_+ \to \mathcal{C}_-$ be a functor. We say that a morphism of couplings

044W
$$\begin{tikzcd}
\mathcal{C} \arrow[r, "\widetilde{G}"] \arrow[d, "\lambda"] & \mathrm{Tw}(\mathcal{C}_-) \arrow[d] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "\mathrm{id} \times G"] & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_-,
\end{tikzcd} \tag{8.28}$$

exhibits the coupling λ as represented by G if it is a categorical pullback square. Note that λ is representable by G if and only if there exists a morphism of couplings which exhibits λ as represented by G.

We now describe an alternative formulation of Definition 8.2.3.5.

044X **Lemma 8.2.3.6.** *Suppose we are given a morphism of couplings*

044Y
$$\begin{tikzcd}
\mathcal{C} \arrow[r, "F"] \arrow[d, "\lambda"] & \mathcal{D} \arrow[d, "\mu"] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "F_-^{\mathrm{op}} \times F_+"] & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+,
\end{tikzcd} \tag{8.29}$$

where λ is representable and F_- is an equivalence of ∞-categories. The following conditions are equivalent:

(1) *The diagram (8.29) is a categorical pullback square.*

(2) *For every object $Y \in \mathcal{C}_+$, the functor F induces an equivalence of ∞-categories*

$$F_Y : \mathcal{C} \times_{\mathcal{C}_+} \{Y\} \to \mathcal{D} \times_{\mathcal{D}_+} \{F_+(Y)\}.$$

(3) *For every universal object $C \in \mathcal{C}$, the image $F(C) \in \mathcal{D}$ is universal.*

Proof. The equivalence (1) ⇔ (2) follows from Theorem 5.1.6.1 and Remark 8.2.2.4. To complete the proof, it will suffice to show that for each object $Y \in \mathcal{C}_+$, the following conditions are equivalent:

(2_Y) The functor F_Y is an equivalence of ∞-categories.

(3_Y) The functor F_Y carries initial objects of $\mathcal{C} \times_{\mathcal{C}_+} \{Y\}$ to initial objects of $\mathcal{D} \times_{\mathcal{D}_+} \{F_+(Y)\}$.

Replacing $\mathcal{D}$ by the ∞-category $\mathcal{C}_-^{\mathrm{op}} \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$, we can assume that F_- is an isomorphism. In this case, the equivalence of (2_Y) and (3_Y) is a special case of Corollary 4.6.7.21. □

Proposition 8.2.3.7. *Suppose we are given a morphism of couplings* 044Z

0450
$$\begin{tikzcd}
\mathcal{C} \arrow[r, "\widetilde{G}"] \arrow[d, "\lambda"] & \mathrm{Tw}(\mathcal{C}_-) \arrow[d, "\mu"] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "\mathrm{id} \times G"] & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_-,
\end{tikzcd} \tag{8.30}$$

The following conditions are equivalent:

(1) *The diagram (8.30) exhibits the coupling λ as represented by the functor G (in the sense of Definition 8.2.3.1).*

(2) *For every object $C \in \mathcal{C}_+$, the functor $\widetilde{G}$ induces an equivalence of ∞-categories*

$$\widetilde{G}_C : \mathcal{C} \times_{\mathcal{C}_+} \{C\} \to \mathrm{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \{G(C)\}.$$

(3) *The coupling λ is representable and, for every universal object $C \in \mathcal{C}$, the image $\widetilde{G}(C) \in \mathrm{Tw}(\mathcal{C}_-)$ is an isomorphism (when viewed as a morphism of the ∞-category $\mathcal{C}_-$).*

(4) *The coupling λ is representable and the triple $(\mathrm{id}, \widetilde{G}, G)$ is initial when viewed as an object of the ∞-category $\{\mathrm{id}\} \times_{\mathrm{Fun}(\mathcal{C}_-,\mathcal{C}_-)^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathcal{C}, \mathrm{Tw}(\mathcal{C}_-))$.*

Proof. The implication (1) ⇒ (2) is immediate. Note that, if condition (2) is satisfied, then the coupling λ is representable; the implications (2) ⇒ (3) ⇒ (1) then follow from Lemma 8.2.3.6 (using the characterization of universal objects of $\mathrm{Tw}(\mathcal{C}_-)$ given by Example 8.2.1.5). The equivalence (3) ⇔ (4) follows from Theorem 8.2.2.11. □

Proof of Theorem 8.2.3.4. Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories. It follows from Proposition 8.2.3.7 that λ is representable by a functor $G : \mathcal{C}_+ \to \mathcal{C}_-$ if and only if it is representable and G can be lifted to an initial object of the ∞-category $\mathcal{E} = \{\mathrm{id}\} \times_{\mathrm{Fun}(\mathcal{C}_-,\mathcal{C}_-)^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathcal{C}, \mathrm{Tw}(\mathcal{C}_-))$. This immediately shows that G is uniquely determined up to isomorphism. To prove existence, it suffices to show that if λ is representable then $\mathcal{E}$ has an initial object. This follows from Theorem 8.2.2.11. □

0451 **Variant 8.2.3.8.** Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories and let $F : \mathcal{C}_- \to \mathcal{C}_+$ be a functor. We say that λ is *corepresentable by F* if there exists a categorical pullback square

0452
$$\begin{tikzcd}
\mathcal{C} \arrow[r, "\widetilde{F}"] \arrow[d, "\lambda"] & \mathrm{Tw}(\mathcal{C}_+) \arrow[d] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "F^{\mathrm{op}} \times \mathrm{id}"] & \mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ .
\end{tikzcd} \tag{8.31}$$

In this case, we will say that the diagram (8.31) *exhibits the coupling λ as corepresented by F*. It follows from Theorem 8.2.3.4 that λ is corepresentable (in the sense of Definition 8.2.1.3) if and only if it is corepresentable by F, for some functor $F : \mathcal{C}_- \to \mathcal{C}_+$. Moreover, if this condition is satisfied, then the functor F is uniquely determined up to isomorphism.

Couplings representable by a functor $G : \mathcal{C}_+ \to \mathcal{C}_-$ can be characterized by a universal mapping property.

0453 **Proposition 8.2.3.9.** *Let $\mu = (\mu_-, \mu_+) : \mathcal{D} \to \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be a coupling of ∞-categories, let $G : \mathcal{D}_+ \to \mathcal{D}_-$ be a functor, and suppose we are given a morphism of couplings*

0454
$$\begin{tikzcd}
\mathcal{D} \arrow[r, "\widetilde{G}"] \arrow[d] & \mathrm{Tw}(\mathcal{D}_-) \arrow[d] \\
\mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+ \arrow[r, "\mathrm{id} \times G"] & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_- .
\end{tikzcd} \tag{8.32}$$

The following conditions are equivalent:

(1) *The diagram (8.32) exhibits μ as represented by G (in the sense of Definition 8.2.3.5).*

(2) *For every coupling of ∞-categories $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and every pair of functors $F_- : \mathcal{C}_- \to \mathcal{D}_-$ and $F_+ : \mathcal{C}_+ \to \mathcal{D}_+$, composition with $\widetilde{G}$ induces a homotopy equivalence of Kan complexes*

$$\begin{tikzcd}
\{F_-\} \times_{\mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} \arrow[d] \\
\{F_-\} \times_{\mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathcal{C}, \mathrm{Tw}(\mathcal{D}_-)) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_-)} \{G \circ F_+\}
\end{tikzcd}$$

(3) *For every coupling of ∞-categories $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and every functor $F_+ : \mathcal{C}_+ \to \mathcal{D}_+$, composition $\widetilde{G}$ induces an equivalence of ∞-categories*

$$\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} \to \mathrm{Fun}_{\pm}(\mathcal{C}, \mathrm{Tw}(\mathcal{D}_-)) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_-)} \{G \circ F_+\}.$$

Proof. We first show that (1) ⇒ (2). Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories and let $F_- : \mathcal{C}_- \to \mathcal{D}_-$ and $F_+ : \mathcal{C}_+ \to \mathcal{D}_+$ be functors. If condition (1) is satisfied, then Remark 4.5.2.9 guarantees that the diagram

$$\begin{tikzcd}
\mathrm{Fun}(\mathcal{C}, \mathcal{D}) \arrow[r, "\widetilde{G}\circ"] \arrow[d, "\mu\circ"] & \mathrm{Fun}(\mathcal{C}, \mathrm{Tw}(\mathcal{D}_-)) \arrow[d] \\
\mathrm{Fun}(\mathcal{C}, \mathcal{D}_-^{\mathrm{op}}) \times \mathrm{Fun}(\mathcal{C}, \mathcal{D}_+) \arrow[r] & \mathrm{Fun}(\mathcal{C}, \mathcal{D}_-^{\mathrm{op}}) \times \mathrm{Fun}(\mathcal{C}, \mathcal{D}_-)
\end{tikzcd}$$

is a categorical pullback square, where the vertical maps are left fibrations (Corollary 4.2.5.2). Assertion (2) now follows by applying Corollary 4.5.2.31 to the object $(F_-^{\mathrm{op}} \circ \lambda_-, F_+ \circ \lambda_+) \in \mathrm{Fun}(\mathcal{C}, \mathcal{D}_-^{\mathrm{op}}) \times \mathrm{Fun}(\mathcal{C}, \mathcal{D}_+)$. The implication (2) ⇒ (3) follows by applying Corollary 5.1.6.4 to the commutative diagram of ∞-categories

$$\begin{tikzcd}
\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} \arrow[rr] \arrow[dr] & & \mathrm{Fun}_{\pm}(\mathcal{C}, \mathrm{Tw}(\mathcal{D}_-)) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_-)} \{G \circ F_+\} \arrow[dl] \\
& \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}}, &
\end{tikzcd}$$

since the vertical maps are left fibrations (Proposition 8.2.2.2). We complete the proof by showing that (3) implies (1). Specializing assertion (3) to the coupling $\lambda : \Delta^0 \xrightarrow{\sim} (\Delta^0)^{\mathrm{op}} \times \Delta^0$, we deduce that $\widetilde{G}$ induces an equivalence of ∞-categories $\mathcal{D} \times_{\mathcal{D}_+} \{D\} \to \mathrm{Tw}(\mathcal{D}_-) \times_{\mathcal{D}_-} \{G(D)\}$ for each object $D \in \mathcal{D}_+$, so that (8.32) is a categorical pullback square by virtue of Proposition 8.2.3.7. □

8.2.4 Presentations of Representable Couplings

For some applications, it is convenient to work with a variant of Definition 8.2.3.5. 0455

0456 **Definition 8.2.4.1.** Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories and let $G : \mathcal{C}_+ \to \mathcal{C}_-$ be a functor. We will say that a morphism of couplings

0457
$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{C}_+) \arrow[r, "\widetilde{G}"] \arrow[d] & \mathcal{C} \arrow[d, "\lambda"] \\
\mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "G^{\mathrm{op}} \times \mathrm{id}"] & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+
\end{tikzcd} \tag{8.33}$$

exhibits λ *as represented by* G if, for every object $C \in \mathcal{C}_+$, the image $\widetilde{G}(\mathrm{id}_C)$ is a universal object of $\mathcal{C}$.

0458 **Remark 8.2.4.2.** In the situation of Definition 8.2.4.1, if the diagram (8.33) exhibits λ as represented by G if and only if the functor $\widetilde{G}$ carries each isomorphism in $\mathcal{C}_+$ (regarded as an object of the ∞-category $\mathrm{Tw}(\mathcal{C}_+)$) to a universal object of $\mathcal{C}$. This follows from Remark 8.2.1.2, since every isomorphism in $\mathcal{C}_+$ is isomorphic to an identity morphism (when viewed as an object of $\mathrm{Tw}(\mathcal{C}_+)$).

0459 **Proposition 8.2.4.3.** *Let* $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ *be a coupling of* ∞*-categories and let* $G : \mathcal{C}_+ \to \mathcal{C}_-$ *be a functor. The following conditions are equivalent:*

(1) *The coupling* λ *is representable by* G *(in the sense of Definition 8.2.3.1).*

(2) *There exists a morphism of couplings*

$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{C}_+) \arrow[r, "\widetilde{G}"] \arrow[d] & \mathcal{C} \arrow[d, "\lambda"] \\
\mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "G^{\mathrm{op}} \times \mathrm{id}"] & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+
\end{tikzcd}$$

which exhibits λ *as represented by* G *(in the sense of Definition 8.2.4.1).*

Proof. We first show that (2) implies (1). Suppose that there exists a morphism of couplings

045A
$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{C}_+) \arrow[r, "\widetilde{G}"] \arrow[d] & \mathcal{C} \arrow[d, "\lambda"] \\
\mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "G^{\mathrm{op}} \times \mathrm{id}"] & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+
\end{tikzcd} \tag{8.34}$$

which exhibits λ as represented by G (in the sense of Definition 8.2.4.1). For each object $C_+ \in \mathcal{C}_+$, the functor $\widetilde{G}$ carries id_C to a universal object of $C \in \mathcal{C}$ satisfying $\lambda_+(C) = C_+$. It follows that the coupling λ is representable. Theorem 8.2.3.4, guarantees that there exists a functor $G' : \mathcal{C}_+ \to \mathcal{C}_-$ such that λ is representable by G'. Choose morphism of couplings

045B

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "\widetilde{G'}"] \arrow[d, "\lambda"] & \mathrm{Tw}(\mathcal{C}_-) \arrow[d] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "\mathrm{id} \times G'"] & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_-,
\end{tikzcd} \tag{8.35}$$

which exhibits λ as represented by G' (in the sense of Definition 8.2.3.5). Composing (8.35) with (8.34), we obtain a morphism of twisted arrow couplings

$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{C}_+) \arrow[r, "\widetilde{G'} \circ \widetilde{G}"] \arrow[d] & \mathrm{Tw}(\mathcal{C}_-) \arrow[d] \\
\mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "G^{\mathrm{op}} \times G'"] & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+
\end{tikzcd}$$

where the functor $\widetilde{G'} \circ \widetilde{G}$ carries isomorphisms of $\mathcal{C}_+$ to isomorphisms of $\mathcal{C}_-$. Invoking Corollary 8.2.2.13, we deduce that the functors G and G' are isomorphic, so that λ is also representable by G (Remark 8.2.3.2).

We now show that (1) implies (2). Assume that λ is representable by G. Setting $G' = G$, we can choose a diagram (8.35) which exhibits λ as represented by G. Applying Proposition 8.2.3.9, we deduce that composition with $\widetilde{G'}$ induces a homotopy equivalence of Kan complexes

$$\begin{tikzcd}
\{G\} \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{C}_-)^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_+), \mathcal{C}) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{C}_+)} \{\mathrm{id}\} \arrow[d, "\theta"] \\
\{G\} \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{C}_-)^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_+), \mathrm{Tw}(\mathcal{C}_-)) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{C}_-)} \{G\}.
\end{tikzcd}$$

In particular, there exists an object $(G, \widetilde{G}, \mathrm{id}) \in \mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_+), \mathcal{C})$ such that $(\mathrm{id}, \widetilde{G'}, G) \circ (G, \widetilde{G}, \mathrm{id})$ is isomorphic to $(G, \mathrm{Tw}(G), G)$ in the ∞-category $\mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_+), \mathrm{Tw}(\mathcal{C}_-))$. In particular, the functor $\widetilde{G'} \circ \widetilde{G} : \mathrm{Tw}(\mathcal{C}_+) \to \mathrm{Tw}(\mathcal{C}_-)$ is isomorphic to the functor $\mathrm{Tw}(G)$, and therefore carries isomorphisms of $\mathcal{C}_+$ to isomorphisms of $\mathcal{C}_-$. It follows that the functor

$\widetilde{G} : \mathrm{Tw}(\mathcal{C}_+) \to \mathcal{C}$ carries isomorphisms in $\mathcal{C}_+$ to universal objects of $\mathcal{C}$, so that the diagram (8.34) exhibits λ as represented by G. □

045C **Corollary 8.2.4.4.** *Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \to \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be couplings of ∞-categories which are representable by functors $G : \mathcal{C}_+ \to \mathcal{C}_-$ and $H : \mathcal{D}_+ \to \mathcal{D}_-$, respectively. Let $F_- : \mathcal{C}_- \to \mathcal{D}_-$ and $F_+ : \mathcal{C}_+ \to \mathcal{D}_+$ be functors. The following conditions are equivalent:*

(1) *The functors $H \circ F_+$ and $F_- \circ G$ are isomorphic (as objects of the ∞-category* $\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_-)$*). That is, the diagram of ∞-categories*

$$\begin{tikzcd} \mathcal{C}_+ \arrow[r, "F_+"] \arrow[d, "G"] & \mathcal{D}_+ \arrow[d, "H"] \\ \mathcal{C}_- \arrow[r, "F_-"] & \mathcal{D}_- \end{tikzcd}$$

commutes up to isomorphism.

(2) *There is a morphism of couplings*

045D
$$\begin{tikzcd} \mathcal{C} \arrow[r, "\widetilde{F}"] \arrow[d, "\lambda"] & \mathcal{D} \arrow[d, "\mu"] \\ \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}^+ \arrow[r, "F_-^{\mathrm{op}} \times F_+"] & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+, \end{tikzcd} \tag{8.36}$$

where the functor $\widetilde{F}$ carries universal objects of $\mathcal{C}$ to universal objects of $\mathcal{D}$.

Proof. Choose morphisms of couplings

045E
$$\begin{tikzcd} \mathrm{Tw}(\mathcal{C}_+) \arrow[r, "\widetilde{G}"] \arrow[d] & \mathcal{C} \arrow[d, "\lambda"] & \mathcal{D} \arrow[r, "\widetilde{H}"] \arrow[d, "\mu"] & \mathrm{Tw}(\mathcal{D}_-) \arrow[d] \\ \mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "G^{\mathrm{op}} \times \mathrm{id}"] & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+ \arrow[r, "\mathrm{id} \times H"] & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_-, \end{tikzcd} \tag{8.37}$$

which exhibit λ and μ as represented by G and H, respectively. We first prove that (2) implies (1). Suppose there exists a diagram (8.36), where $\widetilde{F}$ carries universal objects of $\mathcal{C}$ to universal objects of $\mathcal{D}$. Composing with the morphisms (8.37), we obtain a morphism of twisted arrow couplings

$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{C}_+) \arrow[r, "\widetilde{H}\circ\widetilde{F}\circ\widetilde{G}"] \arrow[d] & \mathrm{Tw}(\mathcal{D}_-) \arrow[d] \\
\mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "(F_-\circ G)^{\mathrm{op}}\times(H\circ F_+)"] & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_-,
\end{tikzcd}$$

where the functor $\widetilde{H} \circ \widetilde{F} \circ \widetilde{G}$ carries isomorphisms in $\mathcal{C}_+$ to isomorphisms in $\mathcal{D}_-$. Applying Corollary 8.2.2.13, we deduce that the functors $F_- \circ G$ and $H \circ F_+$ are isomorphic.

We now show that (1) implies (2). Since λ is representable and the twisted arrow pairing $\mathrm{Tw}(\mathcal{D}_-) \to \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_-$ is corepresentable, Theorem 8.2.2.11 guarantees that there exists a morphism of pairings

045F

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "\widetilde{T}"] \arrow[d, "\lambda"] & \mathrm{Tw}(\mathcal{D}_-) \arrow[d] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "F_-^{\mathrm{op}}\times T_+"] & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_-,
\end{tikzcd} \tag{8.38}$$

where $\widetilde{T}$ carries universal objects of $\mathcal{C}$ to isomorphisms in the ∞-category $\mathcal{D}_-$. Composing with the pairing on the left half of (8.37), we obtain a morphism of twisted arrow pairings

$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{C}_+) \arrow[r, "\widetilde{T}\circ\widetilde{G}"] \arrow[d] & \mathrm{Tw}(\mathcal{D}_-) \arrow[d] \\
\mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "(F_-\circ G)^{\mathrm{op}}\times T_+"] & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_- .
\end{tikzcd}$$

Applying Corollary 8.2.2.13, we conclude that T_+ is isomorphic to the functor $F_- \circ G$. If condition (1) is satisfied, then T_+ is also isomorphic to the functor $H \circ F_+$. Replacing (8.38) by an isomorphic objects of ∞-category $\{F_-\} \times_{\mathrm{Fun}(\mathcal{C}_-,\mathcal{D}_-)^{\mathrm{op}}} \times \mathrm{Fun}_{\pm}(\mathcal{C}, \mathrm{Tw}(\mathcal{D}_-))$, we may assume without loss of generality that T_+ is equal to $H \circ F_+$. Invoking the universal property of Proposition 8.2.3.9, we can further assume that (8.38) factors as a composition

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "\widetilde{F}"] \arrow[d, "\lambda"] & \mathcal{D} \arrow[r, "\widetilde{H}"] \arrow[d, "\mu"] & \mathrm{Tw}(\mathcal{D}_-) \arrow[d] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "F_-^{\mathrm{op}} \times F_+"] & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+ \arrow[r, "\mathrm{id} \times H"] & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_- .
\end{tikzcd}$$

Since $\widetilde{T} = \widetilde{H} \circ \widetilde{F}$ carries universal objects of $\mathcal{D}$ to isomorphisms in $\mathcal{D}_-$, the functor $\widetilde{F}$ carries universal objects of $\mathcal{C}$ to universal objects of $\mathcal{D}$. □

045G **Variant 8.2.4.5.** Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories and let $F : \mathcal{C}_- \to \mathcal{C}_+$ be a functor. We will say that a morphism of couplings

045H
$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{C}_-) \arrow[r, "\widetilde{F}"] \arrow[d] & \mathcal{C} \arrow[d, "\lambda"] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_- \arrow[r, "\mathrm{id} \times F"] & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+
\end{tikzcd} \qquad (8.39)$$

exhibits λ as corepresented by F if, for every object $X_- \in \mathcal{C}_-$, the image $\widetilde{F}(\mathrm{id}_{X_-})$ is a couniversal object of $\mathcal{C}$. Equivalently, the diagram (8.39) exhibits λ as corepresented by F if exhibits the coupling $\lambda' : \mathcal{C} \to \mathcal{C}_+ \times \mathcal{C}_-^{\mathrm{op}}$ of Remark 8.2.1.4 as represented by the functor $F^{\mathrm{op}} : \mathcal{C}_-^{\mathrm{op}} \to \mathcal{C}_+^{\mathrm{op}}$.

We now apply these ideas to prove a more precise version of Theorem 8.2.2.11. To (slightly) simplify the notation, we state the result in a dual form.

045J **Theorem 8.2.4.6.** *Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \to \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be couplings of ∞-categories. Assume that λ is corepresentable by a functor $F : \mathcal{C}_- \to \mathcal{C}_+$ and that μ is representable by a functor $G : \mathcal{D}_+ \to \mathcal{D}_-$. Then:*

(1) *The coupling*

$$\Phi : \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)$$

of Remark 8.2.2.3 is representable by the functor

$$\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+) \to \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-) \qquad T_+ \mapsto G \circ T_+ \circ F.$$

(2) *An object $(T_-, T, T_+) \in \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$ is universal if and only if the functor T carries couniversal objects of $\mathcal{C}$ to universal objects of $\mathcal{D}$.*

Remark 8.2.4.7. Stated more informally, Theorem 8.2.4.6 states that if a coupling $\lambda : \mathcal{C} \to \mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{+}$ is corepresented by a functor $F : \mathcal{C}_{-} \to \mathcal{C}_{+}$ and a coupling $\mu : \mathcal{D} \to \mathcal{D}_{-}^{\mathrm{op}} \times \mathcal{D}_{+}$ is represented by a functor $G : \mathcal{D}_{+} \to \mathcal{D}_{-}$, then the objects of $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$ can be identified with triples (T_{-}, T_{+}, α) where T_{+} is a functor from $\mathcal{C}_{+}$ to $\mathcal{D}_{+}$, and $\alpha : T_{-} \to G \circ T_{+} \circ F$ is a natural transformation of functors from $\mathcal{C}_{-}$ to $\mathcal{D}_{-}$. Moreover, the natural transformation α is an isomorphism if and only if the corresponding functor $\mathcal{C} \to \mathcal{D}$ carries couniversal objects to universal objects. 045K

Example 8.2.4.8. Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories, let $(\lambda_{-}, \lambda_{+}) : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ and $(\mu_{-}, \mu_{+}) : \mathrm{Tw}(\mathcal{D}) \to \mathcal{D}^{\mathrm{op}} \times \mathcal{D}$ be the twisted arrow couplings of Example 8.2.0.2, and let 045L

$$\mathrm{ev} : \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \times \mathcal{C} \to \mathcal{D} \qquad (F, C) \mapsto F(C)$$

be the evaluation functor. Passing to twisted arrow ∞-categories, we obtain a map

$$\mathrm{Tw}(\mathrm{ev}) : \mathrm{Tw}(\mathrm{Fun}(\mathcal{C}, \mathcal{D})) \times \mathrm{Tw}(\mathcal{C}) \to \mathrm{Tw}(\mathcal{D}),$$

which we can identify with a functor $\widetilde{E} : \mathrm{Tw}(\mathrm{Fun}(\mathcal{C}, \mathcal{D})) \to \mathrm{Fun}(\mathrm{Tw}(\mathcal{C}), \mathrm{Tw}(\mathcal{D}))$. By construction, the functor $\widetilde{E}$ fits into a commutative diagram

$$\begin{tikzcd}
\mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\mathrm{op}} \arrow[d, "\circ\lambda_{-}"] & \mathrm{Tw}(\mathrm{Fun}(\mathcal{C}, \mathcal{D})) \arrow[l] \arrow[r] \arrow[d, "\widetilde{T}"] & \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \arrow[d, "\circ\lambda_{+}"] \\
\mathrm{Fun}(\mathrm{Tw}(\mathcal{C}), \mathcal{D}^{\mathrm{op}}) & \mathrm{Fun}(\mathrm{Tw}(\mathcal{C}), \mathrm{Tw}(\mathcal{D})) \arrow[l, "\mu_{-}\circ"'] \arrow[r, "\mu_{+}\circ"] & \mathrm{Fun}(\mathrm{Tw}(\mathcal{C}), \mathcal{D}),
\end{tikzcd}$$

and therefore determines a functor $E : \mathrm{Tw}(\mathrm{Fun}(\mathcal{C}, \mathcal{D})) \to \mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}), \mathrm{Tw}(\mathcal{D}))$. The commutative diagram

$$\begin{tikzcd}
\mathrm{Tw}(\mathrm{Fun}(\mathcal{C}, \mathcal{D})) \arrow[r, "E"] \arrow[d] & \mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}), \mathrm{Tw}(\mathcal{D})) \arrow[d, "\Phi"] \\
\mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \arrow[r, "\mathrm{id} \times \mathrm{id}"] & \mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}, \mathcal{D})
\end{tikzcd}$$

exhibits the coupling Φ as represented by the identity functor $\mathrm{Fun}(\mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}, \mathcal{D})$.

Proof of Theorem 8.2.4.6. Let $\lambda : \mathcal{C} \to \mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{+}$ be a coupling which is corepresented by a functor $F : \mathcal{C}_{-} \to \mathcal{C}_{+}$, and let $\mu : \mathcal{D} \to \mathcal{D}_{-}^{\mathrm{op}} \times \mathcal{D}_{+}$ be a coupling which is represented by a functor $G : \mathcal{D}_{+} \to \mathcal{D}_{-}$. It follows from Theorem 8.2.2.11 that the coupling

$$\Phi : \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}_{-}, \mathcal{D}_{-})^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}_{+}, \mathcal{D}_{+})$$

of Remark 8.2.2.3 is representable, and that an object $(T_-, T, T_+) \in \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$ is universal if and only if the functor T carries couniversal objects of $\mathcal{C}$ to universal objects of $\mathcal{D}$. We will complete the proof by showing that the coupling Φ is representable by the functor

$$H : \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+) \to \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-) \qquad T_+ \mapsto G \circ T_+ \circ F.$$

Choose a morphism of couplings

045M

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "\widetilde{F}"] \arrow[d, "\lambda"] & \mathrm{Tw}(\mathcal{C}_+) \arrow[d] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "F^{\mathrm{op}} \times \mathrm{id}"] & \mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+
\end{tikzcd} \tag{8.40}$$

which exhibits λ as corepresented by F, and a morphism of couplings

045N

$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{D}_+) \arrow[r, "\widetilde{G}"] \arrow[d] & \mathcal{D} \arrow[d, "\mu"] \\
\mathcal{D}_+^{\mathrm{op}} \times \mathcal{D}_+ \arrow[r, "G^{\mathrm{op}} \times \mathrm{id}"] & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+
\end{tikzcd} \tag{8.41}$$

which exhibits μ as represented by G.

Let $E : \mathrm{Tw}(\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)) \to \mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_+), \mathrm{Tw}(\mathcal{D}_+))$ be the comparison map of Example 8.2.4.8. Precomposition with (8.40) and postcomposition with (8.41) determines a functor $E' : \mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_+), \mathrm{Tw}(\mathcal{D}_+)) \to \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$ for which the diagram

$$\begin{tikzcd}
\mathrm{Tw}(\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)) \arrow[r, "E' \circ E"] \arrow[d] & \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \arrow[d] \\
\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+) \arrow[r, "H^{\mathrm{op}} \times \mathrm{id}"] & \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)
\end{tikzcd}$$

is commutative. We will complete the proof by showing that this diagram exhibits the coupling Φ as represented by H.

Fix a functor $T_+ : \mathcal{C}_+ \to \mathcal{D}_+$; we wish to show that the composite functor

$$\mathrm{Tw}(\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)) \xrightarrow{E} \mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_+), \mathrm{Tw}(\mathcal{D}_+)) \xrightarrow{E'} \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$$

carries id_{T_+} to a universal object of $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$. Unwinding the definitions, we see that the image of id_{T_+} is given by the triple $(G \circ T_+ \circ F, \widetilde{G} \circ \mathrm{Tw}(T_+) \circ \widetilde{F}, T_+) \in \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$. Using the criterion of Theorem 8.2.2.11, we are reduced to showing that the composite functor

$$\mathcal{C} \xrightarrow{\widetilde{F}} \mathrm{Tw}(\mathcal{C}_+) \xrightarrow{\mathrm{Tw}(T_+)} \mathrm{Tw}(\mathcal{D}_+) \xrightarrow{\widetilde{G}} \mathcal{D}$$

carries every couniversal object $X \in \mathcal{C}$ to a universal object of $\mathcal{D}$. Proposition 8.2.3.7 guarantees that $\widetilde{F}(X) \in \mathrm{Tw}(\mathcal{C}_+)$ corresponds to an isomorphism in $\mathcal{C}_+$, so its image under $\mathrm{Tw}(T_+)$ corresponds to an isomorphism in $\mathcal{D}_+$; the desired result now follows from our hypothesis that the functor $\widetilde{G}$ carries isomorphisms in $\mathcal{D}_+$ to universal objects of $\mathcal{D}$. □

We close this section by recording an alternative formulation of Definition 8.2.4.1:

Proposition 8.2.4.9. *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories, let $G : \mathcal{C}_+ \to \mathcal{C}_-$ be a functor, and suppose we are given a morphism of couplings* 045P

045Q

$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{C}_+) \arrow[r, "\widetilde{G}"] \arrow[d, "\mu"] & \mathcal{C} \arrow[d, "\lambda"] \\
\mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "G^{\mathrm{op}} \times \mathrm{id}"] & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+
\end{tikzcd} \qquad (8.42)$$

where $\mu = (\mu_-, \mu_+)$ is the twisted arrow coupling of Example 8.2.0.2. The following conditions are equivalent:

(1) *The diagram (8.42) exhibits λ as represented by G, in the sense of Definition 8.2.4.1. That is, the functor $\widetilde{G}$ carries isomorphisms of $\mathcal{C}_+$ to universal objects of $\mathcal{C}$.*

(2) *The functor $\widetilde{G}$ is left cofinal.*

Proof. By virtue of Proposition 8.2.1.7, the functors λ_+ and μ_+ are cocartesian fibrations, and the functor $\widetilde{G}$ carries μ_+-cocartesian morphisms of $\mathrm{Tw}(\mathcal{C}_+)$ to λ_+-cocartesian morphisms of $\mathcal{C}$. By virtue of Corollary 7.2.3.15, the functor $\widetilde{G}$ is left cofinal if and only if, for every object $C \in \mathcal{C}_+$, the induced map $\widetilde{G}_C : \mathrm{Tw}(\mathcal{C}_+) \times_{\mathcal{C}_+} \{C\} \to \mathcal{C} \times_{\mathcal{C}_+} \{C\}$ is left cofinal. It will therefore suffice to show that the following conditions are equivalent, for each object $C \in \mathcal{C}_+$.

(1_C) The image $\widetilde{G}(\mathrm{id}_C)$ is a universal object of $\mathcal{C}$: that is, it is initial when viewed as an object of the ∞-category $\mathcal{C} \times_{\mathcal{C}_+} \{C\}$.

(2_C) The functor $\widetilde{G}_C$ is left cofinal.

The equivalence $(1_C) \Leftrightarrow (2_C)$ is a special case of Corollary 7.2.1.9, since id_C is initial when viewed as an object of the ∞-category $\mathrm{Tw}(\mathcal{C}_+) \times_{\mathcal{C}_+} \{C\}$ (see Proposition 8.1.2.1). □

8.2.5 Adjunctions as Couplings

045R Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories which is both representable and corepresentable. Using Theorem 8.2.3.4 (and its dual), we can choose a functor $G : \mathcal{C}_+ \to \mathcal{C}_-$ which represents λ and a functor $F : \mathcal{C}_- \to \mathcal{C}_+$ which corepresents λ. Either of these functors determines the pairing λ up to equivalence, and therefore determines the other up to isomorphism. Our goal in this section is to establish the following more precise result:

045S **Theorem 8.2.5.1.** *Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories which is representable by a functor $G : \mathcal{C}_+ \to \mathcal{C}_-$. Then a functor $F : \mathcal{C}_- \to \mathcal{C}_+$ corepresents the coupling λ if and only if it is left adjoint to G.*

We first establish a weaker version of Theorem 8.2.5.1.

045T **Proposition 8.2.5.2.** *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be coupling of ∞-categories which is representable by a functor $G : \mathcal{C}_+ \to \mathcal{C}_-$. The following conditions are equivalent:*

(1) *The coupling λ is corepresentable.*

(2) *The functor G admits a left adjoint.*

Proof. By virtue of the criterion of Corollary 6.2.4.2, it will suffice to show that for each object $X \in \mathcal{C}_-$, the following conditions are equivalent:

(1_X) There exists a couniversal object $\widetilde{X} \in \mathcal{C}$ satisfying $\lambda_-(\widetilde{X}) = X$.

(2_X) The ∞-category $(\mathcal{C}_-)_{X/} \times_{\mathcal{C}_-} \mathcal{C}_+$ has an initial object.

Note that Proposition 8.1.2.9 supplies an equivalence $(\mathcal{C}_-)_{X/} \hookrightarrow \{X\} \times_{\mathcal{C}_-^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}_-)$ of ∞-categories which are left-fibered over $\mathcal{C}_-$. Restricting along the functor G, we obtain an equivalence of ∞-categories

$$(\mathcal{C}_-)_{X/} \times_{\mathcal{C}_-} \mathcal{C}_+ \hookrightarrow \{X\} \times_{\mathcal{C}_-}^{\mathrm{op}} \mathrm{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \mathcal{C}_+ .$$

Since λ is representable by G, there exists a categorical pullback square

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "\widetilde{G}"] \arrow[d, "\lambda"] & \mathrm{Tw}(\mathcal{C}_-) \arrow[d] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "\mathrm{id} \times G"] & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_-
\end{tikzcd}$$

which induces an equivalence of ∞-categories

$$\{X\} \times_{\mathcal{C}_-^{\mathrm{op}}} \mathcal{C} \to \{X\} \times_{\mathcal{C}_-}^{\mathrm{op}} \mathrm{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \mathcal{C}_+ .$$

The equivalence of (1_X) and (2_X) now follows from Corollary 4.6.7.21. $\square$

Proof of Theorem 8.2.5.1. Let $\lambda : \mathcal{C} \to \mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{+}$ be a coupling of ∞-categories which is representable by a functor $G : \mathcal{C}_{-}^{\mathrm{op}} \to \mathcal{C}_{+}$. By virtue of Proposition 8.2.5.2, the functor G admits a left adjoint if and only if the coupling λ is corepresentable. If this condition is satisfied, then there exists a functor $F : \mathcal{C}_{-} \to \mathcal{C}_{+}$ which corepresents the coupling λ; moreover, F is uniquely determined up to isomorphism (Theorem 8.2.0.4). We will complete the proof by showing that F is a left adjoint of G.

Choose a diagram

045U

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "\widetilde{G}"] \arrow[d, "\lambda"] & \mathrm{Tw}(\mathcal{C}_{-}) \arrow[d] \\
\mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{+} \arrow[r, "\mathrm{id} \times G"] & \mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{-},
\end{tikzcd} \tag{8.43}$$

which exhibits λ as represented by G (see Definition 8.2.3.5). Then, for each universal object $C \in \mathcal{C}$, the image $\widetilde{G}(C) \in \mathrm{Tw}(\mathcal{C}_{-})$ corresponds to an isomorphism in the ∞-category $\mathcal{C}_{-}$ (Proposition 8.2.3.7). Using Proposition 8.2.4.3, we can choose a commutative diagram

045V

$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{C}_{-}) \arrow[r, "\widetilde{F}"] \arrow[d] & \mathcal{C} \arrow[d, "\lambda"] \\
\mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{-} \arrow[r, "\mathrm{id} \times F"] & \mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{+}
\end{tikzcd} \tag{8.44}$$

which exhibits λ as corepresented by F (see Variant 8.2.4.5). It follows that the composite functor $\widetilde{F} \circ \widetilde{G} : \mathcal{C} \to \mathcal{C}$ carries universal objects of $\mathcal{C}$ to couniversal objects of $\mathcal{C}$. Applying Theorem 8.2.4.6, we deduce that the diagram

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "\widetilde{F} \circ \widetilde{G}"] \arrow[d, "\lambda"] & \mathcal{C} \arrow[d, "\lambda"] \\
\mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{+} \arrow[r, "\mathrm{id} \times (F \circ G)"] & \mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{+}
\end{tikzcd}$$

is couniversal when viewed as an object of the ∞-category $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{C})$.

In particular, there exists an (essentially unique) morphism

$$\widetilde{\epsilon} : (\mathrm{id}_{\mathcal{C}_{-}}, \widetilde{F} \circ \widetilde{G}, F \circ G) \to (\mathrm{id}_{\mathcal{C}_{-}}, \mathrm{id}_{\mathcal{C}}, \mathrm{id}_{\mathcal{C}_{+}})$$

in the ∞-category $\{\mathrm{id}_{\mathcal{C}_-}\} \times_{\mathrm{Fun}(\mathcal{C}_-,\mathcal{C}_-)^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathcal{C},\mathcal{C})$. Let $\epsilon : F \circ G \to \mathrm{id}_{\mathcal{C}_+}$ denote the image of $\widetilde{\epsilon}$ under the forgetful functor $\mathrm{Fun}_{\pm}(\mathcal{C},\mathcal{C}) \to \mathrm{Fun}(\mathcal{C}_+,\mathcal{C}_+)$. We will show that ϵ is the counit of an adjunction between F and G.

Using Example 8.2.2.12, we see that the diagram

$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{C}_-) \arrow[r, "\mathrm{id}"] \arrow[d] & \mathrm{Tw}(\mathcal{C}_-) \arrow[d] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_- \arrow[r, "\mathrm{id} \times \mathrm{id}"] & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_-
\end{tikzcd}$$

is couniversal when viewed as an object of the ∞-category $\mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_-),\mathrm{Tw}(\mathcal{C}_-))$. In particular, there exists an (essentially unique) morphism

$$\widetilde{\eta} : (\mathrm{id}_{\mathcal{C}_-^{\mathrm{op}}}, \mathrm{id}_{\mathrm{Tw}(\mathcal{C}_-)}, \mathrm{id}_{\mathcal{C}_-}) \to (\mathrm{id}_{\mathcal{C}_-^{\mathrm{op}}}, \widetilde{G} \circ \widetilde{F}, G \circ F)$$

in the ∞-category $\{\mathrm{id}_{\mathcal{C}_-}\} \times_{\mathrm{Fun}(\mathcal{C}_-,\mathcal{C}_-)^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_-),\mathrm{Tw}(\mathcal{C}_-))$. Let $\eta : \mathrm{id}_{\mathcal{C}_+} \to G \circ F$ denote the image of $\widetilde{\eta}$ under the forgetful functor $\mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_-),\mathrm{Tw}(\mathcal{C}_-)) \to \mathrm{Fun}(\mathcal{C}_-,\mathcal{C}_-)$. We will complete the proof by showing that η is compatible with ϵ up to homotopy, in the sense of Definition 6.2.1.1. For this, we must verify the following:

($Z1$) The identity isomorphism id_F is a composition of the natural transformations

$$F = F \circ \mathrm{id}_{\mathcal{C}_-} \xrightarrow{\mathrm{id} \circ \eta} F \circ G \circ F \xrightarrow{\epsilon \circ \mathrm{id}} \mathrm{id}_{\mathcal{C}_+} \times F = F$$

in the ∞-category $\mathrm{Fun}(\mathcal{C}_-,\mathcal{C}_+)$.

($Z2$) The identity isomorphism id_G is a composition of the natural transformations

$$G = \mathrm{id}_{\mathcal{C}_-} \circ G \xrightarrow{\eta \circ \mathrm{id}} G \circ F \circ G \xrightarrow{\mathrm{id} \circ \epsilon} G \times \mathrm{id}_{\mathcal{C}_+} = G$$

in the ∞-category $\mathrm{Fun}(\mathcal{C}_+,\mathcal{C}_-)$.

Using Theorem 8.2.4.6, we deduce that the diagram (8.43) is a couniversal object of $\mathrm{Fun}_{\pm}(\mathcal{C},\mathrm{Tw}(\mathcal{C}_-)$: that is, it is initial when viewed as an object of the ∞-category $\mathcal{E} = \{\mathrm{id}_{\mathcal{C}_-}\} \times_{\mathrm{Fun}(\mathcal{C}_-,\mathcal{C}_-)^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathcal{C},\mathrm{Tw}(\mathcal{C}_-))$. It follows that the diagram

$$\begin{tikzcd}
 & (\mathrm{id}_{\mathcal{C}_-}, \widetilde{G} \circ \widetilde{F} \circ \widetilde{G}, G \circ F \circ G) \arrow[dr, "\mathrm{id} \circ \widetilde{\epsilon}"] & \\
(\mathrm{id}_{\mathcal{C}_-}, \widetilde{G}, G) \arrow[ur, "\widetilde{\eta} \circ \mathrm{id}"] \arrow[rr, "\mathrm{id}"] & & (\mathrm{id}_{\mathcal{C}_-}, \widetilde{G}, G)
\end{tikzcd}$$

commutes up to homotopy in $\mathcal{E}$. Assertion $(Z2)$ follows by applying the forgetful functor $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathrm{Tw}(\mathcal{C}_-)) \to \mathrm{Fun}(\mathcal{C}_+, \mathcal{C}_-)$. Assertion $(Z1)$ follows by a similar argument, using the observation that the diagram (8.44) is a couniversal object of $\mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_-), \mathcal{C})$ (Theorem 8.2.2.11). □

8.2.6 Balanced Couplings

Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories. In this section, we formulate a concrete criterion to determine if λ is representable (or corepresentable) by an equivalence of ∞-categories. 045W

Definition 8.2.6.1. Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \to \mathcal{C}_+$ be a coupling of ∞-categories. We say that λ is *balanced* if it satisfies the following conditions: 045X

(1) The coupling λ is representable. That is, for each object $C_+ \in \mathcal{C}_+$, there exists a universal object $C \in \mathcal{C}$ satisfying $\lambda_+(C) = C_+$.

(2) The coupling λ is corepresentable. That is, for each object $C_- \in \mathcal{C}_-$, there exists a couniversal object $C \in \mathcal{C}$ satisfying $\lambda_-(C) = C_-$.

(3) An object $C \in \mathcal{C}$ is universal if and only if it is couniversal.

Example 8.2.6.2. For every ∞-category $\mathcal{C}$, the twisted arrow coupling $\mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \to \mathcal{C}$ of Example 8.2.0.2 is balanced. See Example 8.2.1.5. 045Y

Example 8.2.6.3. Let X be a Kan complex, let $\lambda_- : \mathrm{Fun}(\Delta^1, X) \to X$ be the morphism given by evaluation at the vertex $0 \in \Delta^1$, and let $\lambda_+ : \mathrm{Fun}(\Delta^1, X) \to X$ be the morphism given by evaluation at the vertex $1 \in \Delta^1$. It follows from Corollary 3.1.3.3 that the map 04AV

$$\lambda = (\lambda_-, \lambda_+) : \mathrm{Fun}(\Delta^1, X) \to X \times X$$

is a Kan fibration; in particular, we can view it as a coupling of X with itself. For each vertex $x \in X$, the path spaces $\lambda_-^{-1}\{x\} = \{x\} \tilde{\times}_X X$ and $\lambda_+^{-1}\{x\} = X \tilde{\times}_X \{x\}$ are contractible Kan complexes (Example 3.4.1.13), so that every object of $\mathrm{Fun}(\Delta^1, X)$ is both universal and couniversal for the coupling λ. In particular, λ is a balanced coupling.

Remark 8.2.6.4. Suppose we are given a morphism of couplings 04AW

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "F"] \arrow[d, "\lambda"] & \mathcal{D} \arrow[d, "\mu"] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "F_-^{\mathrm{op}} \times F_+"] & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+
\end{tikzcd}$$

which is an equivalence (in the sense of Exercise 8.2.2.7). Then λ is balanced if and only if μ is balanced. See Remark 8.2.2.8.

We can now formulate the main result of this section.

045Z **Theorem 8.2.6.5.** *Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories. The following conditions are equivalent:*

(1) *The coupling λ is balanced.*

(2) *The coupling λ is representable by an equivalence of ∞-categories $G : \mathcal{C}_+ \to \mathcal{C}_-$.*

(3) *The coupling λ is corepresentable by an equivalence of ∞-categories $F : \mathcal{C}_- \to \mathcal{C}_+$.*

04AX **Corollary 8.2.6.6.** *Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories. Then $\mathcal{C}_-$ and $\mathcal{C}_+$ are equivalent if and only if there exists a balanced coupling $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$.*

0460 **Corollary 8.2.6.7.** *Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories. Then λ is balanced if and only if there exists an equivalence of couplings*

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "F"] \arrow[d, "\lambda"] & \mathrm{Tw}(\mathcal{D}) \arrow[d] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "F_-^{\mathrm{op}} \times F_+"] & \mathcal{D}^{\mathrm{op}} \times \mathcal{D}.
\end{tikzcd}$$

Proof. Suppose that λ is balanced. By virtue of Theorem 8.2.6.5, the coupling λ is corepresentable by a functor $F_- : \mathcal{C}_- \to \mathcal{C}_+$ which is an equivalence of ∞-categories. We can therefore choose a categorical pullback square

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "F"] \arrow[d, "\lambda"] & \mathrm{Tw}(\mathcal{C}_+) \arrow[d] \\
\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "F_-^{\mathrm{op}} \times \mathrm{id}"] & \mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+
\end{tikzcd}$$

which exhibits λ as corepresented by F_-. Since F_- is an equivalence of ∞-categories, it follows that F is also an equivalence of ∞-categories (Proposition 4.5.2.21). The reverse implication is an immediate consequence of Example 8.2.6.2 (and Remark 8.2.6.4). $\square$

We will deduce Theorem 8.2.6.5 from the following more general result.

Proposition 8.2.6.8. *Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories which is representable by a functor $G : \mathcal{C}_+ \to \mathcal{C}_-$. The following conditions are equivalent:* 0461

(1) *Every universal object of $\mathcal{C}$ is couniversal.*

(2) *The functor G is fully faithful.*

Proof. Using Proposition 8.2.4.3, we can choose a commutative diagram

0462
$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{C}_+) \arrow[r, "\widetilde{G}'"] \arrow[d] & \mathcal{C} \arrow[r, "\widetilde{G}"] \arrow[d, "\lambda"] & \mathrm{Tw}(\mathcal{C}_-) \arrow[d] \\
\mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "G^{\mathrm{op}} \times \mathrm{id}"] & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \arrow[r, "\mathrm{id} \times G"] & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_-,
\end{tikzcd} \tag{8.45}$$

where the left square exhibits λ as represented by G in the sense of Definition 8.2.4.1, and the right square exhibits λ as represented by G in the sense of Definition 8.2.3.5. Invoking (the dual of) Lemma 8.2.3.6, we see that (1) is equivalent to the following:

($1'$) The left square of (8.45) is a categorical pullback diagram.

For each object $C \in \mathcal{C}_+$, Proposition 8.2.3.7 guarantees that the composite functor $\widetilde{G} \circ \widetilde{G}'$ carries id_C to an isomorphism of $\mathcal{C}_-$ (regarded as an object of $\mathrm{Tw}(\mathcal{C}_-)$). It follows from Theorem 8.2.2.11 that $(G, \widetilde{G}' \circ \widetilde{G}, G)$ and $(G, \mathrm{Tw}(G), G)$ are isomorphic when viewed as objects of $\mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_+), \mathrm{Tw}(\mathcal{C}_-))$ (since both are initial objects of the ∞-category $\mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_+), \mathrm{Tw}(\mathcal{C}_-)) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{C}_-)} \{G\}$). In particular, for every pair of objects $X, Y \in \mathcal{C}_+$, the diagram of Kan complexes

$$\begin{tikzcd}
\mathrm{Hom}_{\mathcal{C}_+}(X, Y) \arrow[r] \arrow[d, "G"] & \{X\} \times_{\mathcal{C}_+^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}_+) \times_{\mathcal{C}_+} \{Y\} \arrow[d, "\widetilde{G}' \circ \widetilde{G}"] \\
\mathrm{Hom}_{\mathcal{C}_-}(G(X), G(Y)) \arrow[r] & \{G(X)\} \times_{\mathcal{C}_-^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \{G(Y)\}
\end{tikzcd}$$

commutes up to homotopy, where the horizontal maps are the homotopy equivalences of Notation 8.1.2.14. Using Corollary 5.1.7.16, we see that (2) is equivalent to the following:

($2'$) The outer rectangle of (8.45) is a categorical pullback diagram.

The equivalence of ($1'$) and ($2'$) is a special case of Proposition 4.5.2.18, since the right square of (8.45) is a categorical pullback square by assumption. □

Proof of Theorem 8.2.6.5. We will prove the equivalence (1) ⇔ (2); the equivalence (1) ⇔ (3) follows by a similar argument. Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ is a coupling of ∞-categories which is representable by a functor $G : \mathcal{C}_+ \to \mathcal{C}_-$. Combining Theorem 8.2.5.1 with Proposition 8.2.6.8, we see that λ is balanced if and only if the following conditions are satisfied:

- The functor G is fully faithful.
- The functor G admits a left adjoint $F : \mathcal{C}_- \to \mathcal{C}_+$.
- The functor F is fully faithful.

It follows from Corollary 6.2.2.19 that these conditions are satisfied if and only if G is an equivalence of ∞-categories. □

8.3 The Yoneda Embedding

03LZ Let $\mathcal{C}$ be a category. For every object $X \in \mathcal{C}$, we let $h^X : \mathcal{C} \to \mathrm{Set}$ denote the functor corepresented by X, given on objects by the formula $h^X(Y) = \mathrm{Hom}_{\mathcal{C}}(X, Y)$. The construction $X \mapsto h^X$ determines a functor from $\mathcal{C}^{\mathrm{op}}$ to the functor category $\mathrm{Fun}(\mathcal{C}, \mathrm{Set})$, which we refer to as the *(contravariant) Yoneda embedding.* This terminology is justified by the following:

03M0 **Proposition 8.3.0.1** (Yoneda's Lemma, Weak Form)**.** *For any (locally small) category $\mathcal{C}$, the Yoneda embedding*

$$\mathcal{C}^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{C}, \mathrm{Set}) \qquad X \mapsto h^X$$

is fully faithful.

The goal of this section is to extend Proposition 8.3.0.1 to the setting of ∞-categories. Our first step is to construct an analogue of the functor $X \mapsto h^X$. For every pair of objects $X, Y \in \mathcal{C}$, the morphism space $\mathrm{Hom}_{\mathcal{C}}(X, Y)$ is a Kan complex (Proposition 4.6.1.10), which we can regard as an object of the ∞-category $\mathcal{S}$. In §8.3.3, we show that the construction $(X, Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X, Y)$ can be upgraded to a functor from the product $\mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ to the ∞-category $\mathcal{S}$. More precisely, every locally small ∞-category $\mathcal{C}$ admits a Hom-*functor* $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$, which is characterized (up to isomorphism) by the requirement that it is a covariant transport representation for the twisted arrow fibration $\mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ of Proposition 8.3.3.2. This condition guarantees that for every object $X \in \mathcal{C}$, the functor $\mathscr{H}(X, -) : \mathcal{C} \to \mathcal{S}$ is corepresentable by X. We can therefore identify $\mathscr{H}$ with a functor

$$h^{\bullet} : \mathcal{C}^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{C}, \mathcal{S}) \qquad X \mapsto \mathscr{H}(X, -)$$

carrying each object of $\mathcal{C}$ to a functor that it corepresents; we will refer to $h^{\bullet}$ as a *contravariant Yoneda embedding* for $\mathcal{C}$ (Definition 8.3.3.9).

To show that the Yoneda embedding is fully faithful, we will need an additional ingredient. Let us return to the situation where $\mathcal{C}$ is an ordinary category. Proposition 8.3.0.1 asserts that for every pair of objects $X, Y \in \mathcal{C}$, the natural map $\mathrm{Hom}_{\mathcal{C}}(Y, X) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathrm{Set})}(h^X, h^Y)$ is a bijection. It is easy to see that this map is injective: in fact, it has a left inverse $T : \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathrm{Set})}(h^X, h^Y) \to \mathrm{Hom}_{\mathcal{C}}(Y, X)$, which carries a natural transformation $\alpha : h^X \to h^Y$ to the element $\alpha_X(\mathrm{id}_X) \in h^Y(X) = \mathrm{Hom}_{\mathcal{C}}(Y, X)$. It will therefore suffice to show that T is bijective. This is a consequence of the following *strong* version of Yoneda's lemma: for every functor $\mathscr{F} : \mathcal{C} \to \mathrm{Set}$, the evaluation map

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathrm{Set})}(h^X, \mathscr{F}) \to \mathscr{F}(X) \qquad \alpha \mapsto \alpha_X(\mathrm{id}_X)$$

is a bijection (Proposition 8.3.1.1). This assertion also has a counterpart in the setting of ∞-categories (Proposition 8.3.1.3), which we formulate and prove in §8.3.1.

To exploit the universal mapping property of (co)representable functors, it will be convenient to introduce some terminology. Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories. We define a *profunctor from $\mathcal{D}$ to $\mathcal{C}$* to be a functor $\mathscr{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \to \mathcal{S}$ (Definition 8.3.2.1). We say that a profunctor $\mathscr{K}$ is *corepresentable* if, for every object $X \in \mathcal{C}$, the functor $\mathscr{K}(X, -) : \mathcal{D} \to \mathcal{S}$ is corepresentable. In this case, the construction $X \mapsto \mathscr{K}(X, -)$ determines a functor from $\mathcal{C}^{\mathrm{op}}$ to the full subcategory $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{D}, \mathcal{S}) \subseteq \mathrm{Fun}(\mathcal{D}, \mathcal{S})$ spanned by the corepresentable functors. In §8.3.2, we establish a criterion for this functor to be an equivalence of ∞-categories (Corollary 8.3.2.20). Our ∞-categorical version of Yoneda's lemma then follows by specializing this criterion to the situation where $\mathcal{C} = \mathcal{D}$ and $\mathscr{K}$ is a Hom-functor (Theorem 8.3.3.13).

Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories. Assume that $\mathcal{C}$ is locally small, so that it admits a Hom-functor $\mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$. For every functor $G : \mathcal{D} \to \mathcal{C}$, the composition

$$\mathcal{C}^{\mathrm{op}} \times \mathcal{D} \xrightarrow{\mathrm{id} \times G} \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \xrightarrow{\mathscr{H}} \mathcal{S},$$

can be regarded as a profunctor $\mathscr{K}_G$ from $\mathcal{D}$ to $\mathcal{C}$, given informally by the construction $(X, Y) \mapsto \mathrm{Hom}_{\mathcal{D}}(X, G(Y))$. In §8.3.4, we show that this construction determines a fully faithful functor $\mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}, \mathcal{S})$, whose essential image is spanned by the *representable* profunctors (Proposition 8.3.4.1). Using the results of §8.2, we give an alternative characterization of representable profunctors (Proposition 8.3.4.15) and show that they satisfy a universal mapping property (Corollary 8.3.4.21). As an application, we show that morphism spaces in the ∞-category $\mathrm{Fun}(\mathcal{D}, \mathcal{C})$ can be computed as limits indexed by the twisted arrow ∞-category $\mathrm{Tw}(\mathcal{D})$ (Example 8.3.4.22).

Warning 8.3.0.2. If $\mathcal{C}$ is an ordinary category, the Yoneda embedding 03M1

$$h^{\bullet} : \mathcal{C}^{\mathrm{op}} \hookrightarrow \mathrm{Fun}(\mathcal{C}, \mathrm{Set}) \qquad X \mapsto h^X$$

is given by a completely explicit construction. Beware that in the ∞-categorical setting, the Yoneda embedding depends on a choice of covariant transport representation for the twisted arrow fibration $\mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$, which is well-defined only up to isomorphism. However, it is sometimes possible to eliminate this ambiguity. Suppose that $\mathcal{C} = \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathcal{C}_0)$ is the homotopy coherent nerve of a locally Kan simplicial category $\mathcal{C}_0$. In this case, the simplicial enrichment of $\mathcal{C}_0$ determines a functor of simplicial categories

$$\mathcal{C}_0^{\mathrm{op}} \times \mathcal{C}_0 \to \mathrm{Kan} \qquad (X,Y) \mapsto \mathrm{Hom}_{\mathcal{C}_0}(X,Y)_{\bullet}.$$

Passing to the homotopy coherent nerve, we obtain a functor of ∞-categories $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$ (Construction 8.3.6.1). In §8.3.6, we show that $\mathscr{H}$ is a Hom-functor for the ∞-category $\mathcal{C}$ (Proposition 8.3.6.2). Our proof uses a recognition principle for Hom-functors, which we formulate and prove in §8.3.5.

8.3.1 Yoneda's Lemma

03M2 Let $\mathcal{C}$ be a category. Every object $X \in \mathcal{C}$ determines a corepresentable functor $h^X : \mathcal{C} \to \mathrm{Set}$, given on objects by the formula $h^X(Y) = \mathrm{Hom}_{\mathcal{C}}(X,Y)$. This functor can be characterized by a universal mapping property:

03M3 **Proposition 8.3.1.1** (Yoneda's Lemma, Strong Form)**.** *Let $\mathcal{C}$ be a category containing an object X. For every functor $\mathscr{F} : \mathcal{C} \to \mathrm{Set}$, evaluation on the identity morphism $\mathrm{id}_X \in h^X(X)$ induces a bijection*

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathrm{Set})}(h^X, \mathscr{F}) \to \mathscr{F}(X).$$

Proof. Fix an element $x \in \mathscr{F}(X)$. We wish to show that there is a unique natural transformation $\alpha : h^X \to \mathscr{F}$ which carries $\mathrm{id}_X \in h^X(X)$ to the element $x \in \mathscr{F}(X)$.

For any object $Y \in \mathcal{C}$, every element $f \in h^X(Y) \in \mathrm{Hom}_{\mathcal{C}}(X,Y)$ can be obtained by evaluating the function $h^X(f) : h^X(X) \to h^X(Y)$ on the object id_X. It follows that, if $\alpha : h^X \to \mathscr{F}$ is a natural transformation satisfying $\alpha_X(\mathrm{id}_X) = x$, then it must satisfy the identity

$$\alpha_Y(f) = \alpha_Y(h^X(f)(\mathrm{id}_X)) = \mathscr{F}(f)(h_X(\mathrm{id}_X)) = \mathscr{F}(f)(x).$$

This proves uniqueness. To establish existence, it will suffice to show that the collection of functions

$$\alpha_Y : \mathrm{Hom}_{\mathcal{C}}(X,Y) \to \mathscr{F}(Y) \qquad f \mapsto \mathscr{F}(f)(x)$$

determine a natural transformation from h^X to $\mathscr{F}$. In other words, we must show that for each morphism $g : Y \to Z$ in $\mathcal{C}$, the diagram of sets

$$\begin{tikzcd}
\mathrm{Hom}_{\mathcal{C}}(X,Y) \arrow[r, "g\circ"] \arrow[d, "\alpha_Y"] & \mathrm{Hom}_{\mathcal{C}}(X,Z) \arrow[d, "\alpha_Z"] \\
\mathscr{F}(Y) \arrow[r, "\mathscr{F}(g)"] & \mathscr{F}(Z)
\end{tikzcd}$$

is commutative. This follows from the observation that, for every morphism $f : X \to Y$ of $\mathcal{C}$, we have an equality $\mathscr{F}(g \circ f)(x) = (\mathscr{F}(g) \circ \mathscr{F}(f))(x)$ in the set $\mathscr{F}(Z)$. □

Our goal in this section is prove a generalization of Yoneda's lemma, where we replace $\mathcal{C}$ by an ∞-category and Set by the ∞-category $\mathcal{S}$ of spaces (Proposition 8.3.1.3). In the ∞-categorical setting, the proof is more subtle: to construct a natural transformation α between functors $\mathscr{F}, \mathscr{G} : \mathcal{C} \to \mathcal{S}$, it is not enough to specify a collection of morphisms $\{\alpha_Y : \mathscr{G}(Y) \to \mathscr{F}(Y)\}_{Y \in \mathcal{C}}$ and to verify a compatibility condition. To address this difficulty, we will use the formalism of Kan extensions developed in §7.3 (see Lemma 8.3.1.7).

Notation 8.3.1.2. Let $\mathcal{S}$ denote the ∞-category of spaces (Construction 5.5.1.1). Let $\mathcal{C}$ be an ∞-category and suppose we are given a pair of functors $\mathscr{F}, \mathscr{G} : \mathcal{C} \to \mathcal{S}$. Fix an object $X \in \mathcal{C}$ and a vertex $\eta \in \mathscr{F}(X)$. We then obtain a comparison morphism 03M4

$$\begin{aligned}
\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{S})}(\mathscr{F},\mathscr{G}) &\xrightarrow{\mathrm{ev}_X} \mathrm{Hom}_{\mathcal{S}}(\mathscr{F}(X),\mathscr{G}(X)) \\
&\xrightarrow{\circ[\eta]} \mathrm{Hom}_{\mathcal{S}}(\Delta^0,\mathscr{G}(X)) \\
&\simeq \mathscr{G}(X)
\end{aligned}$$

in the homotopy category hKan, where the first map is given by evaluation on the object X, the second by the composition law of Notation 4.6.9.15, and the third is (the inverse of) the homotopy equivalence of Remark 5.5.1.5.

Proposition 8.3.1.3 (∞-Categorical Yoneda Lemma)**.** *Let $\mathcal{C}$ be an ∞-category containing an object X, let $\mathscr{F} : \mathcal{C} \to \mathcal{S}$ be a functor, and let $\eta \in \mathscr{F}(X)$ be a vertex which exhibits the functor $\mathscr{F}$ as corepresented by X (see Definition 5.6.6.1). Then, for every functor $\mathscr{G} : \mathcal{C} \to \mathcal{S}$, the comparison map* 03M5

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{S})}(\mathscr{F},\mathscr{G}) \to \mathscr{G}(X)$$

of Notation 8.3.1.2 is an isomorphism in the homotopy category hKan*.*

Remark 8.3.1.4. In the special case where $\mathcal{C}$ is (the nerve of) an ordinary category and $\mathscr{G}$ is a set-valued functor, Proposition 8.3.1.3 reduces to Proposition 8.3.1.1. 03M6

03M7 **Remark 8.3.1.5.** Let $\mathcal{C}$ be a locally small ∞-category and let X be an object of $\mathcal{C}$. In §5.6.6, we proved that there exists a functor $\mathscr{F} : \mathcal{C} \to \mathcal{S}$ which is corepresented by X, and that $\mathscr{F}$ is uniquely determined up to isomorphism (Theorem 5.6.6.13). Proposition 8.3.1.3 can be regarded as a more refined version of this uniqueness assertion: the functor $\mathscr{F}$ is characterized, up to isomorphism, by the requirement that it corepresents the evaluation functor

$$\mathrm{ev}_X : \mathrm{Fun}(\mathcal{C}, \mathcal{S}) \to \mathcal{S} \qquad \mathscr{G} \mapsto \mathscr{G}(X).$$

03M8 **Corollary 8.3.1.6.** *Let $\mathcal{C}$ be an ∞-category containing an object X. Suppose that, for every object $Y \in \mathcal{C}$, the Kan complex $\mathrm{Hom}_{\mathcal{C}}(X, Y)$ is essentially small (this condition is satisfied, for example, if $\mathcal{C}$ is small). Let $\mathscr{F} : \mathcal{C} \to \mathcal{S}$ be a functor, and let η be a vertex of the Kan complex $\mathscr{F}(X)$. The following conditions are equivalent:*

(1) *The vertex η exhibits the functor $\mathscr{F}$ as corepresented by X, in the sense of Definition 5.6.6.1.*

(2) *For every functor $\mathscr{G} : \mathcal{C} \to \mathcal{S}$, the comparison map of Notation 8.3.1.2 is a homotopy equivalence $\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{S})}(\mathscr{F}, \mathscr{G}) \to \mathscr{G}(X)$.*

(3) *For every functor $\mathscr{F} : \mathcal{C} \to \mathcal{S}$, the comparison map of Notation 8.3.1.2 induces a bijection $\pi_0(\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{S})}(\mathscr{F}, \mathscr{G})) \to \pi_0(\mathscr{G}(X))$.*

Proof. The implication (1) $\Rightarrow$ (2) follows from Proposition 8.3.1.3, and the implication (2) $\Rightarrow$ (3) is immediate. We will complete the proof by showing that (3) implies (1). Our assumption that the morphism space $\mathrm{Hom}_{\mathcal{C}}(X, Y)$ is essentially small for each $Y \in \mathcal{C}$ guarantees that there exists a functor $\mathscr{F} : \mathcal{C} \to \mathcal{S}$ and a vertex $\eta' \in \mathscr{F}'(X)$ which exhibits $\mathscr{F}'$ as corepresented by X (see Theorem 5.6.6.13). Applying assumption (3), we deduce that there exists a natural transformation $\alpha : \mathscr{F}' \to \mathscr{F}$ such that $\alpha_X(\eta')$ and η lie in the same connected component of $\mathscr{F}'$. Since the pair $(\mathscr{F}', \eta')$ also satisfies condition (3), composition with α induces a bijection $\pi_0(\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{S})}(\mathscr{F}, \mathscr{G})) \to \pi_0(\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{S})}(\mathscr{F}', \mathscr{G}))$ for each object $\mathscr{G} \in \mathrm{Fun}(\mathcal{C}, \mathcal{S})$. It follows that α is an isomorphism. Applying Remark 5.6.6.4, we deduce that $\alpha_X(\eta') \in \mathscr{F}(X)$ exhibits the functor $\mathscr{F}$ as corepresented by X. Since η and $\alpha_X(\eta)$ belong to the same connected component of $\mathscr{F}(X)$, it follows that η has the same property (Remark 5.6.6.3). $\square$

Proposition 8.3.1.3 is an easy consequence of the following:

03M9 **Lemma 8.3.1.7.** *Let $\mathcal{C}$ be an ∞-category containing an object X, let κ be an uncountable cardinal, let $\mathscr{F} : \mathcal{C} \to \mathcal{S}^{<\kappa}$ be a functor, and let $\eta \in \mathscr{F}(X)$ be a vertex. The following conditions are equivalent:*

(1) *The vertex η exhibits $\mathscr{F}$ as corepresented by the object X, in the sense of Definition 5.6.6.1.*

(2) *Let $\iota : \{X\} \hookrightarrow \mathcal{C}$ denote the inclusion map and let $\mathscr{F}_0 : \{X\} \to \mathcal{S}$ denote the constant functor taking the value Δ^0, so that η can be regarded as a natural transformation from $\mathscr{F}_0$ to the composite functor $\mathscr{F} \circ \iota$. Then η exhibits $\mathscr{F}$ as a left Kan extension of $\mathscr{F}_0$ along ι, in the sense of Variant 7.3.1.5. Moreover, for each object $Y \in \mathcal{C}$, the mapping space* $\mathrm{Hom}_{\mathcal{C}}(X, Y)$ *is essentially κ-small.*

Proof. Fix an object $Y \in \mathcal{C}$ and set $M = \mathrm{Hom}_{\mathcal{C}}(X, Y)$. We may assume without loss of generality that M is essentially κ-small (this follows immediately from condition (2), and also follows from (1) since the Kan complex $\mathscr{F}(Y)$ is essentially small). For every Kan complex K, let $\underline{K}_M$ denote the constant functor $M \to \mathcal{S}$ taking the value K, so that the functor $\mathscr{F}$ determines a natural transformation $\gamma : \underline{\mathscr{F}(X)}_M \to \underline{\mathscr{F}(Y)}_M$. We will show that the following pair of conditions is equivalent:

(1_Y) The composite map

$$\mathrm{Hom}_{\mathcal{C}}(X, Y) \to \mathrm{Hom}_{\mathcal{S}}(\mathscr{F}(X), \mathscr{F}(Y)) \xrightarrow{\circ[\eta]} \mathrm{Hom}_{\mathcal{S}}(\Delta^0, \mathscr{F}(Y))$$

is a homotopy equivalence of Kan complexes.

(2_Y) The composite natural transformation

$$\underline{\Delta^0}_M \xrightarrow{\eta} \underline{\mathscr{F}(X)}_M \xrightarrow{\gamma} \underline{\mathscr{F}(Y)}_M$$

exhibits $\mathscr{F}(Y)$ as a colimit of the constant diagram $\underline{\Delta^0}|_M$ in the ∞-category $\mathcal{S}$.

The equivalence of (1_Y) and (2_Y) is a special case of Proposition 7.6.2.10 (see Example 7.6.2.12). Lemma 8.3.1.7 follows by allowing the object $Y \in \mathcal{C}$ to vary. □

Proof of Proposition 8.3.1.3. Combine Lemma 8.3.1.7 and 7.3.6.1. □

For later use, let us record another consequence of Lemma 8.3.1.7.

Corollary 8.3.1.8. *Let κ be an uncountable cardinal, let $T : \mathcal{C} \to \mathcal{D}$ be a functor between locally κ-small ∞-categories, let $\mathscr{F} : \mathcal{C} \to \mathcal{S}^{<\kappa}$ and $\mathscr{G} : \mathcal{D} \to \mathcal{S}^{<\kappa}$ be functors, and let $\beta : \mathscr{F} \to \mathscr{G} \circ T$ be a natural transformation of functors from $\mathcal{C}$ to $\mathcal{S}$. Fix an object $C \in \mathcal{C}$ and a vertex $\eta \in \mathscr{F}(C)$ which exhibits the functor $\mathscr{F}$ as corepresented by $\mathcal{C}$. The following conditions are equivalent:* 04B5

(1) *The natural transformation β carries η to a vertex of $\mathscr{G}(T(C))$ which exhibits the functor $\mathscr{G}$ as corepresented by the object $T(C) \in \mathcal{D}$.*

(2) *The natural transformation β exhibits $\mathscr{G}$ as a left Kan extension of $\mathscr{F}$ along the functor T (see Variant 7.3.1.5).*

Proof. Combine Lemma 8.3.1.7 with Proposition 7.3.8.18. □

04B6 **Corollary 8.3.1.9.** *Let κ be an uncountable cardinal, let $T : \mathcal{C} \to \mathcal{D}$ be a functor between locally κ-small ∞-categories and let $\mathscr{F} : \mathcal{C} \to \mathcal{S}$ be a functor which is corepresented by an object $C \in \mathcal{C}$. Then a functor $\mathscr{G} : \mathcal{D} \to \mathcal{S}$ is a left Kan extension of $\mathscr{F}$ along T if and only if it is corepresentable by the object $T(C) \in \mathcal{D}$.*

Proof. Assume that $\mathscr{G}$ is corepresentable by $T(C)$; we will show that it is a left Kan extension of $\mathscr{F}$ along T (the reverse implication follows immediately from Corollary 8.3.1.8). Fix a vertex $\eta \in \mathscr{F}(C)$ which exhibits $\mathscr{F}$ as corepresented by C. It follows from Proposition 8.3.1.3 that evaluation at η induces a homotopy equivalence of Kan complexes

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C},\mathcal{S})}(\mathscr{F}, \mathscr{G} \circ T) \to \mathscr{G}(T(C)).$$

We can therefore choose a natural transformation $\beta : \mathscr{F} \to \mathscr{G} \circ T$ which carries η to a vertex which exhibits $\mathscr{G}$ as corepresented by $T(C)$. Applying Corollary 8.3.1.8, we see that β exhibits $\mathscr{G}$ as a left Kan extension of $\mathscr{F}$ along T. □

8.3.2 Profunctors of ∞-Categories

03MA Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be categories. A *profunctor* from $\mathcal{C}_+$ to $\mathcal{C}_-$ is a Set-valued functor on the product category $\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$. This notion has an evident ∞-categorical analogue, where we replace the ordinary category of sets by the ∞-category $\mathcal{S}$ of spaces (see Construction 5.5.1.1).

03MB **Definition 8.3.2.1.** Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories. A *profunctor from $\mathcal{C}_+$ to $\mathcal{C}_-$* is a functor $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$.

03MC **Example 8.3.2.2.** Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ordinary categories. Then every functor $K : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathrm{Set}$ determines a morphism of simplicial sets

$$\mathrm{N}_\bullet(K) : \mathrm{N}_\bullet(\mathcal{C}_-)^{\mathrm{op}} \times \mathrm{N}_\bullet(\mathcal{C}_+) \to \mathrm{N}_\bullet(\mathrm{Set}) \subset \mathcal{S}\,.$$

This construction determines a monomorphism from the collection of profunctors from $\mathcal{C}_+$ to $\mathcal{C}_-$ (in the sense of classical category theory) to the collection of profunctors from $\mathrm{N}_\bullet(\mathcal{C}_+)$ to $\mathrm{N}_\bullet(\mathcal{C}_-)$ (in the sense of Definition 8.3.2.1). Beware that this map is (usually) not bijective: its image consists of those profunctors

$$\mathscr{K} : \mathrm{N}_\bullet(\mathcal{C}_-)^{\mathrm{op}} \times \mathrm{N}_\bullet(\mathcal{C}_+) \to \mathcal{S}$$

having the property that for every pair of objects $X \in \mathcal{C}_-$ and $Y \in \mathcal{C}_+$, the Kan complex $\mathscr{K}(X, Y)$ is a constant simplicial set (see Proposition 1.3.3.1 and Remark 5.5.1.7).

Remark 8.3.2.3 (Symmetry)**.** Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories and let $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ be a profunctor from $\mathcal{C}_+$ to $\mathcal{C}_-$. Then, by transposing its arguments, we can also regard $\mathscr{K}$ as a profunctor from $\mathcal{C}_-^{\mathrm{op}}$ to $\mathcal{C}_+^{\mathrm{op}}$. 03MD

Example 8.3.2.4 (From Profunctors to Couplings)**.** Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories, let $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ be a profunctor from $\mathcal{C}_+$ to $\mathcal{C}_-$ (Definition 8.3.2.1). Applying the construction of Definition 5.6.2.1, we obtain an ∞-category $\int_{\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+} \mathscr{K}$ whose objects are triples (X, Y, η) where X is an object of $\mathcal{C}_-$, Y is an object of $\mathcal{C}_+$, and η is a vertex of the Kan complex $\mathscr{K}(X, Y)$. This ∞-category is equipped with a left fibration 0463

$$\lambda : \int_{\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+} \mathscr{K} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+,$$

given on objects by the construction $\lambda(X, Y, \eta) = (X, Y)$ (see Example 5.6.2.9). The left fibration λ is a coupling of $\mathcal{C}_+$ with $\mathcal{C}_-$, in the sense of Definition 8.2.0.1; we will refer to it as the *coupling associated to the profunctor* $\mathscr{K}$.

Modulo set-theoretic issues, every coupling can be obtained from the construction of Example 8.3.2.4:

Remark 8.3.2.5 (From Couplings to Profunctors)**.** Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories. By virtue of Corollary 5.6.0.6, the construction of Example 8.3.2.4 induces a monomorphism 0464

$$\begin{tikzcd}
\{\text{Profunctors } \mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}\}/\text{Isomorphism} \arrow[d] \\
\{\text{Couplings } \lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+\}/\text{Equivalence,}
\end{tikzcd}$$

whose image consists of equivalence classes of couplings $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ having essentially small fibers.

In particular, to every coupling $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ with essentially small fibers, we can associate a profunctor $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$, which is characterized (up to isomorphism) by the requirement that it is a covariant transport representation for λ (see Definition 5.6.5.1).

Variant 8.3.2.6. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories, and let κ be an uncountable cardinal. Then the construction of Example 8.3.2.4 induces a monomorphism 0465

$$\begin{tikzcd}
\{\text{Profunctors } \mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}^{<\kappa}\}/\text{Isomorphism} \arrow[d] \\
\{\text{Couplings } \lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+\}/\text{Equivalence,}
\end{tikzcd}$$

whose image consists of equivalence classes of couplings $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ whose fibers are essentially κ-small.

Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories. A profunctor $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ can be identified with a functor from $\mathcal{C}_-^{\mathrm{op}}$ to the ∞-category $\mathrm{Fun}(\mathcal{C}_+, \mathcal{S})$. Our primary goal in this section is to formulate a condition which guarantees that this functor is fully faithful. First, it will be convenient to introduce some terminology.

0466 **Definition 8.3.2.7.** Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories and let $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ be a profunctor. Let X be an object of $\mathcal{C}_-$, let Y be an object of $\mathcal{C}_+$, and let η be a vertex of the Kan complex $\mathscr{K}(X, Y)$. We will say that η is *universal* if it exhibits the functor $\mathscr{K}(-, Y) : \mathcal{C}_-^{\mathrm{op}} \to \mathcal{S}$ as represented by the object $X \in \mathcal{C}_-$. We say that η is *couniversal* if it exhibits the functor $\mathscr{K}(X, -) : \mathcal{C}_+ \to \mathcal{S}$ as corepresented by the object $Y \in \mathcal{C}_+$.

0467 **Remark 8.3.2.8.** Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories and let $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ be a covariant transport representation for λ. Let C be an object of $\mathcal{C}$ and set $\lambda(C) = (X, Y)$. Then the isomorphism class of C (as an object of the fiber $\lambda^{-1}\{(X, Y)\}$) can be identified with a connected component $[\eta]$ of the Kan complex $\mathscr{K}(X, Y)$. Invoking Proposition 5.6.6.21, we deduce the following:

- The object $C \in \mathcal{C}$ is universal (in the sense of Definition 8.2.1.1) if and only if the vertex $\eta \in \mathscr{K}(X, Y)$ is universal (in the sense of Definition 8.3.2.7).
- The object $C \in \mathcal{C}$ is couniversal (in the sense of Definition 8.2.1.1) if and only if the vertex $\eta \in \mathscr{K}(X, Y)$ is couniversal (in the sense of Definition 8.3.2.7).

03ME **Definition 8.3.2.9.** Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories, and let $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ be a profunctor from $\mathcal{C}_+$ to $\mathcal{C}_-$. We say that $\mathscr{K}$ is *representable* if, for each object $Y \in \mathcal{C}_+$, the functor $\mathscr{K}(-, Y) : \mathcal{C}_-^{\mathrm{op}} \to \mathcal{S}$ is representable (in the sense of Variant 5.6.6.2). We will say that $\mathscr{K}$ is *corepresentable* if, for each object $X \in \mathcal{C}_-$, the functor $\mathscr{K}(X, -) : \mathcal{C}_+ \to \mathcal{S}$ is corepresentable (in the sense of Definition 5.6.6.1).

03MF **Warning 8.3.2.10.** The terminology of Definition 8.3.2.9 is potentially confusing. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories, let $\mathcal{C}$ denote the product $\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$, and let $\mathscr{K} : \mathcal{C} \to \mathcal{S}$ be a morphism of simplicial sets. In general, there is no relationship between the corepresentability of $\mathscr{K}$ as a $\mathcal{S}$-valued functor on $\mathcal{C}$ (in the sense of Definition 5.6.6.1) and the corepresentability of $\mathscr{K}$ as a *profunctor* from $\mathcal{C}_+$ to $\mathcal{C}_-$ (in the sense of Definition 8.3.2.9). However, these notions of corepresentability coincide when $\mathcal{C}_-$ is a contractible Kan complex (see Example 8.3.2.13).

03MG **Remark 8.3.2.11** (Symmetry)**.** Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories and let $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ be a profunctor from $\mathcal{C}_+$ to $\mathcal{C}_-$. Then $\mathscr{K}$ is representable if and only if it is corepresentable when regarded as a profunctor from $\mathcal{C}_-^{\mathrm{op}}$ to $\mathcal{C}_+^{\mathrm{op}}$ (see Remark 8.3.2.3).

Remark 8.3.2.12. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories and let $\mathscr{K}$ and $\mathscr{K}'$ be profunctors from $\mathcal{C}_+$ to $\mathcal{C}_-$ which are isomorphic (as objects of the ∞-category $\mathrm{Fun}(\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+, \mathcal{S})$). Then $\mathscr{K}$ is representable if and only if $\mathscr{K}'$ is representable. Similarly, $\mathscr{K}$ is corepresentable if and only if $\mathscr{K}'$ is corepresentable. See Remark 5.6.6.4. 03MH

Example 8.3.2.13. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories and let $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ be a profunctor. If $\mathcal{C}_- = \Delta^0$, then the profunctor $\mathscr{K}$ is corepresentable (in the sense of Definition 8.3.2.9) if and only if it is corepresentable when regarded as a functor $\mathcal{C}_+ \to \mathcal{S}$ (in the sense of Definition 5.6.6.1). Similarly, if $\mathcal{C}_+ = \Delta^0$, then the profunctor $\mathscr{K}$ is representable (in the sense of Definition 8.3.2.9) if and only if it is representable when viewed as a functor $\mathcal{C}_-^{\mathrm{op}} \to \mathcal{S}$ (in the sense of Variant 5.6.6.2). 03MJ

Exercise 8.3.2.14. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ordinary categories. Show that a profunctor 03MK

$$\mathscr{K} : \mathrm{N}_\bullet(\mathcal{C}_-)^{\mathrm{op}} \times \mathrm{N}_\bullet(\mathcal{C}_+) \to \mathcal{S}$$

is representable (in the sense of Definition 8.3.2.9) if and only if it it is isomorphic to the profunctor $(X, Y) \mapsto \mathrm{Hom}_{\mathcal{C}_-}(X, G(Y))$, for some functor $G : \mathcal{C}_+ \to \mathcal{C}_-$. See Proposition 8.3.4.1 for a more general result.

Remark 8.3.2.15. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories and let $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ be a profunctor. Then $\mathscr{K}$ is representable if and only if, for every object $Y \in \mathcal{C}_+$, there exists an object $X \in \mathcal{C}_-$ and a universal vertex $\eta \in \mathscr{K}(X, Y)$. Similarly, $\mathscr{K}$ is corepresentable if and only if, for every object $X \in \mathcal{C}_-$, there exists an object $Y \in \mathcal{C}_+$ and a couniversal vertex $\eta \in \mathscr{K}(X, Y)$. 0468

Remark 8.3.2.16. Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories and let $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ be a covariant transport representation for λ. Using Remark 8.3.2.8, we deduce the following: 0469

- The coupling λ is representable (in the sense of Definition 8.2.1.3) if and only if the profunctor $\mathscr{K}$ is representable (in the sense of Definition 8.3.2.9).
- The coupling λ is corepresentable (in the sense of Definition 8.2.1.3) if and only if the profunctor $\mathscr{K}$ is corepresentable (in the sense of Definition 8.3.2.9).

The main result of this section is the following variant of Proposition 8.2.6.8:

Proposition 8.3.2.17. *Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories, and let $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ be a corepresentable profunctor from $\mathcal{C}_+$ to $\mathcal{C}_-$. The following conditions are equivalent:* 03ML

(1) *The profunctor $\mathscr{K}$ determines a fully faithful functor*

$$\mathcal{C}_-^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{C}_+, \mathcal{S}) \qquad X \mapsto \mathscr{K}(X, -).$$

(2) *Let X be an object of $\mathcal{C}_-$ and let Y be an object of $\mathcal{C}_+$. Then every couniversal vertex $\eta \in \mathscr{K}(X,Y)$ is also universal.*

Proof. Choose an object $X \in \mathcal{C}_-$. Since the functor $\mathscr{K}(X,-) : \mathcal{C}_+ \to \mathcal{S}$ is corepresentable, we can choose an object $Y \in \mathcal{C}_+$ and a couniversal vertex $\eta \in \mathscr{K}(X,Y)$. We will show that the following conditions are equivalent:

(1_X) For every object $X' \in \mathcal{C}_-$, the profunctor $\mathscr{K}$ induces a homotopy equivalence

$$\mathrm{Hom}_{\mathcal{C}_-^{\mathrm{op}}}(X,X') \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}_+,\mathcal{S})}(\mathscr{K}(X,-),\mathscr{K}(X',-)).$$

(2_X) The vertex η is universal.

Proposition 8.3.2.17 will then follow by allowing the triple (X,Y,η) to vary.

Condition (2_X) is the assertion that, for each object $X' \in \mathcal{C}_-$, the composite map

$$\begin{aligned}\mathrm{Hom}_{\mathcal{C}_-^{\mathrm{op}}}(X,X') &\to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}_+,\mathcal{S})}(\mathscr{K}(X,-),\mathscr{K}(X',-))\\ &\to \mathrm{Hom}_{\mathcal{S}}(\mathscr{K}(X,Y),\mathscr{K}(X',Y))\\ &\xrightarrow{\circ[\eta]} \mathrm{Hom}_{\mathcal{S}}(\Delta^0,\mathscr{K}(X',Y))\\ &\simeq \mathscr{K}(X',Y)\end{aligned}$$

is an isomorphism in the homotopy category hKan. The equivalence of this assertion with (1_X) follows immediately from Proposition 8.3.1.3. □

03MM **Definition 8.3.2.18** (Balanced Profunctors)**.** Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories. We say that a profunctor $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ is *balanced* if it satisfies the following conditions:

- The profunctor $\mathscr{K}$ is representable and corepresentable (Definition 8.3.2.9).
- Let X be an object of $\mathcal{C}_-$, let Y be an object of $\mathcal{C}_+$, and let η be a vertex of the Kan complex $\mathscr{K}(X,Y)$. Then η is universal if and only if it is couniversal.

In other words, $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ is balanced if it satisfies the hypotheses of Proposition 8.3.2.17 both when regarded as a profunctor from $\mathcal{C}_+$ to $\mathcal{C}_-$ and when regarded as a profunctor from $\mathcal{C}_-^{\mathrm{op}}$ to $\mathcal{C}_+^{\mathrm{op}}$.

046A **Remark 8.3.2.19.** Let $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞-categories and let $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ be a covariant transport representation for λ. Then the coupling λ is balanced (in the sense of Definition 8.2.6.1) if and only if the profunctor $\mathscr{K}$ is balanced (in the sense of Definition 8.3.2.18). See Remark 8.3.2.8.

03MN **Corollary 8.3.2.20.** *Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories and let $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ be a profunctor from $\mathcal{C}_-$ to $\mathcal{C}_+$. The following conditions are equivalent:*

(1) *The profunctor $\mathscr{K}$ is balanced (in the sense of Definition 8.3.2.18).*

(2) *The ∞-category $\mathcal{C}_+$ is locally small and $\mathscr{K}$ induces a fully faithful functor*

$$\mathcal{C}_-^{\mathrm{op}} \to \operatorname{Fun}(\mathcal{C}_+, \mathcal{S}) \qquad X \mapsto \mathscr{K}(X, -),$$

whose essential image is spanned by the corepresentable functors $\mathcal{C}_+ \to \mathcal{S}$.

(3) *The ∞-category $\mathcal{C}_-$ is locally small and $\mathscr{K}$ induces a fully faithful functor*

$$\mathcal{C}_+ \to \operatorname{Fun}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{S}) \qquad Y \mapsto \mathscr{K}(-, Y),$$

whose essential image is spanned by the representable functors $\mathcal{C}_-^{\mathrm{op}} \to \mathcal{S}$.

Proof. We will prove the equivalence of (1) and (2); the equivalence of (1) and (3) follows by a similar argument. Assume first that $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ is a balanced profunctor. Invoking Proposition 8.3.2.17, we see that the functor

$$\Phi : \mathcal{C}_-^{\mathrm{op}} \to \operatorname{Fun}(\mathcal{C}_+, \mathcal{S}) \qquad X \mapsto \mathscr{K}(X, -)$$

is fully faithful, and that the essential image of Φ consists of corepresentable functors from $\mathcal{C}_+$ to $\mathcal{S}$. Fix an object $Y \in \mathcal{C}_+$. Since $\mathscr{K}$ is representable, there exists an object $X \in \mathcal{C}_-$ and a universal vertex $\eta \in \mathscr{K}(X, Y)$. Our assumption that $\mathscr{K}$ is balanced guarantees that η is also couniversal. In particular, for every object $Y' \in \mathcal{C}_+$, η induces a homotopy equivalence $\operatorname{Hom}_{\mathcal{C}_+}(Y, Y') \xrightarrow{\sim} \mathscr{K}(X, Y')$, so that the Kan complex $\operatorname{Hom}_{\mathcal{C}_+}(X, Y')$ is essentially small. If $F : \mathcal{C}_+ \to \mathcal{S}$ is any functor corepresented by Y, then Theorem 5.6.6.13 guarantees that F is isomorphic to $\mathscr{K}(X, -)$ (as an object of the ∞-category $\operatorname{Fun}(\mathcal{C}_+, \mathcal{S})$), and therefore belongs to the essential image of Φ. Allowing the object Y to vary, we deduce that the profunctor $\mathscr{K}$ satisfies condition (2).

We now prove the converse. Assume that the functor Φ is fully faithful and that the essential image of Φ is spanned by the corepresentable functors $\mathcal{C}_+ \to \mathcal{S}$. We wish to show that the profunctor $\mathscr{K}$ is balanced. Since Φ takes values in the full subcategory of $\operatorname{Fun}(\mathcal{C}_+, \mathcal{S})$ spanned by the corepresentable functors, the profunctor $\mathscr{K}$ is corepresentable. We next show that $\mathscr{K}$ is representable. Fix an object $Y \in \mathcal{C}_+$; we wish to show that the functor $\mathscr{K}(-, Y) : \mathcal{C}_-^{\mathrm{op}} \to \mathcal{S}$ is representable. Since $\mathcal{C}_-$ is locally small, there exists a functor $F : \mathcal{C}_- \to \mathcal{S}$ which is corepresentable by Y (Theorem 5.6.6.13). Then F belongs to the essential image of Φ. We may therefore assume without loss of generality that $F = \mathscr{K}(X_0, -)$ for some object $X_0 \in \mathcal{C}_-$. Choose a couniversal vertex $\eta_0 \in \mathscr{K}(X_0, Y) = F(Y)$. Since Φ is fully faithful, Proposition 8.3.2.17 implies that η_0 is also universal, so that $\mathscr{K}(-, Y)$ is representable by X_0.

To complete the proof, we must show that the pairing $\mathscr{K}$ satisfies the second condition of Definition 8.3.2.18. Let $Y \in \mathcal{C}_+$ be as above, let X be any object of $\mathcal{C}_-$, and let η be a vertex of the Kan complex $\mathscr{K}(X,Y)$. Assume that η is universal; we wish to show that it is also couniversal (the reverse implication follows from Proposition 8.3.2.17). Choose $\eta_0 \in \mathscr{K}(X_0,Y)$ as above. Since η_0 is universal, there exists an isomorphism $u : X \to X_0$ in the ∞-category $\mathcal{C}_-$ such that $\mathscr{K}(u, \mathrm{id}_Y)(\eta_0)$ and η belong to the same connected component of the Kan complex $\mathscr{K}(X,Y)$ (Remark 5.6.6.6). We may therefore assume without loss of generality that $\eta = \mathscr{K}(u, \mathrm{id}_Y)(\eta_0)$ (Remark 5.6.6.3). The desired result now follows by applying Remark 5.6.6.4 to the isomorphism of functors $\mathscr{K}(u,-) : \mathscr{K}(X_0,-) \to \mathscr{K}(X,-)$. □

03MP **Corollary 8.3.2.21.** *Let $\mathcal{C}$ be a locally small ∞-category, and let $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{C},\mathcal{S})$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C},\mathcal{S})$ spanned by the corepresentable functors. Then the evaluation map*

$$\mathrm{ev} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{C},\mathcal{S}) \times \mathcal{C} \to \mathcal{S} \qquad (F,C) \mapsto F(C)$$

is a balanced profunctor.

03MQ **Remark 8.3.2.22.** Up to equivalence, every balanced profunctor $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}$ can be obtained from the construction of Corollary 8.3.2.21. More precisely, let $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{C}_+,\mathcal{S})$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C}_+,\mathcal{S})$ spanned by the corepresentable functors. If $\mathscr{K}$ is balanced, then it factors as a composition

$$\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \xrightarrow{\Phi\times\mathrm{id}} \mathrm{Fun}^{\mathrm{corep}}(\mathcal{C}_+,\mathcal{S}) \times \mathcal{C}_+ \xrightarrow{\mathrm{ev}} \mathcal{S},$$

where Φ is an equivalence of ∞-categories by virtue of Corollary 8.3.2.20.

8.3.3 Hom-Functors for ∞-Categories

03MR Let $\mathcal{C}$ be an ∞-category. In §4.6.1, we associated to every pair of objects $X, Y \in \mathcal{C}$ a Kan complex $\mathrm{Hom}_{\mathcal{C}}(X,Y)$ parametrizing morphisms from X to Y. In this section, we will promote the construction $(X,Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X,Y)$ to a functor of ∞-categories.

046B **Definition 8.3.3.1.** Let $\mathcal{C}$ be an ∞-category. We say that a profunctor

$$\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$$

is a Hom-*functor for* $\mathcal{C}$ if it is a covariant transport representation for the twisted arrow coupling $\lambda : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$.

03N2 **Proposition 8.3.3.2** (Existence and Uniqueness)**.** *Let $\mathcal{C}$ be an ∞-category. Then $\mathcal{C}$ admits a* Hom*-functor $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$ if and only if it is locally small. If this condition is satisfied, then $\mathscr{H}$ is uniquely determined up to isomorphism.*

Proof. Combine Remark 8.3.5.3 with Corollary 5.6.0.6 (applied to the left fibration $\lambda : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$). □

Remark 8.3.3.3. Let $\mathcal{C}$ be an ∞-category and let let $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$ be a Hom-functor for $\mathcal{C}$. Passing to homotopy categories, we obtain a functor $H : \mathrm{h}\mathcal{C}^{\mathrm{op}} \times \mathrm{h}\mathcal{C} \to \mathrm{hKan}$. It follows from Corollary 8.1.2.18 (and Remark 5.6.5.8) that H is isomorphic to the functor $(X, Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X, Y)$ determined by the hKan enrichment of the homotopy category $\mathrm{h}\mathcal{C}$ (see Construction 4.6.9.13). See Remark 8.3.5.4 for a more precise statement. 03MX

Example 8.3.3.4. Let $\mathcal{C}$ be a category. The construction $(X, Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X, Y)$ determines a functor 03MW

$$\mathscr{H} : \mathrm{N}_{\bullet}(\mathcal{C})^{\mathrm{op}} \times \mathrm{N}_{\bullet}(\mathcal{C}) \to \mathrm{N}_{\bullet}(\mathrm{Set}) \subset \mathcal{S} \qquad (X, Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X, Y),$$

which is a Hom-functor for the ∞-category $\mathrm{N}_{\bullet}(\mathcal{C})$. For a more general statement, see Proposition 8.3.6.2.

Variant 8.3.3.5. Let κ be an uncountable cardinal and let $\mathcal{S}^{<\kappa}$ denote the ∞-category of κ-small spaces (Variant 5.5.4.12). Then an ∞-category $\mathcal{C}$ admits a Hom-functor 03V2

$$\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}^{<\kappa}$$

if and only if it is locally κ-small. If this condition is satisfied, then $\mathscr{H}$ is uniquely determined up to isomorphism.

Remark 8.3.3.6 (Duality)**.** Let $\mathcal{C}$ be an ∞-category, let $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$ be a functor, and let $\mathscr{H}' : \mathcal{C} \times \mathcal{C}^{\mathrm{op}} \to \mathcal{S}$ be the functor obtained from $\mathscr{H}$ by transposing its arguments. If $\mathscr{H}$ is a Hom-functor for $\mathcal{C}$, then $\mathscr{H}'$ is a Hom-functor for the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$. 03MY

Notation 8.3.3.7. Let $\mathcal{C}$ be a locally small ∞-category. We will often use the notation $\mathrm{Hom}_{\mathcal{C}}(-,-)$ to denote a Hom-functor $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$. Beware that this convention introduces a slight potential for confusion. Given a pair of objects $X, Y \in \mathcal{C}$, we have two potentially different definitions of $\mathrm{Hom}_{\mathcal{C}}(X, Y)$: 03N4

(a) The Kan complex $\{X\} \tilde{\times}_{\mathcal{C}} \{Y\}$ of Construction 4.6.1.1, which is well-defined up to canonical isomorphism.

(b) The Kan complex $\mathscr{H}(X, Y)$, which is only well-defined up to homotopy equivalence (since it depends on a choice of Hom-functor $\mathscr{H}$).

However, the danger is slight: Remark 8.3.3.3 guarantees the existence of homotopy equivalences $\{X\} \tilde{\times}_{\mathcal{C}} \{Y\} \simeq \mathscr{H}(X, Y)$, which can be chosen to depend functorially on X and Y (as morphisms in the homotopy category hKan). Consequently, we can always modify the choice of Hom-functor $\mathscr{H}$ to arrange that definitions (a) and (b) coincide (see Corollary 4.4.5.3).

046C **Proposition 8.3.3.8.** *Let $\mathcal{C}$ be an ∞-category and let $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$ be a* Hom-*functor for $\mathcal{C}$. Then $\mathscr{H}$ is a balanced profunctor (see Definition 8.3.2.18).*

Proof. By virtue of Remark 8.3.2.19, it suffices to observe that the twisted arrow coupling $\mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ is balanced; see Example 8.2.6.2. □

03NF **Definition 8.3.3.9.** Let $\mathcal{C}$ be an ∞-category and let

$$h_{\bullet} : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \qquad Y \mapsto h_Y$$

be a functor. We say that $h_{\bullet}$ is a *covariant Yoneda embedding for $\mathcal{C}$* if the construction $(X, Y) \mapsto h_Y(X)$ is a Hom-functor for $\mathcal{C}$, in the sense of Definition 8.3.3.1. Similarly, we say that a functor

$$h^{\bullet} : \mathcal{C}^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{C}, \mathcal{S}) \qquad X \mapsto h^X$$

is a *contravariant Yoneda embedding for $\mathcal{C}$* if the construction $(X, Y) \mapsto h^X(Y)$ is a Hom-functor for $\mathcal{C}$.

03NG **Remark 8.3.3.10** (Duality)**.** A functor $h^{\bullet} : \mathcal{C}^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{C}, \mathcal{S})$ is a contravariant Yoneda embedding for $\mathcal{C}$ if and only if it is a covariant Yoneda embedding for the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$; see Remark 8.3.3.6.

03NH **Remark 8.3.3.11.** Let $\mathcal{C}$ be an ∞-category. By virtue of Proposition 8.3.3.2, the following conditions are equivalent:

- The ∞-category $\mathcal{C}$ is locally small.
- The ∞-category $\mathcal{C}$ admits a covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$.
- The ∞-category $\mathcal{C}$ admits a contravariant Yoneda embedding $h^{\bullet} : \mathcal{C}^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{C}, \mathcal{S})$.

If these conditions are satisfied, then the functors $h_{\bullet}$ and $h^{\bullet}$ are uniquely determined up to isomorphism. Moreover, for every object $X \in \mathcal{C}$, the functor $h_X : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}$ is representable by X, and the functor $h^X : \mathcal{C} \to \mathcal{S}$ is corepresentable by X (Proposition 8.3.5.5).

03V4 **Variant 8.3.3.12.** Let κ be an uncountable cardinal and let $\mathcal{S}^{<\kappa}$ denote the ∞-category of κ-small spaces (see Variant 5.5.4.12). For every ∞-category $\mathcal{C}$, the following conditions are equivalent:

- The ∞-category $\mathcal{C}$ is locally κ-small.
- The ∞-category $\mathcal{C}$ admits a covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$.
- The ∞-category $\mathcal{C}$ admits a contravariant Yoneda embedding $h^{\bullet} : \mathcal{C}^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{C}, \mathcal{S}^{<\kappa})$.

See Variant 8.3.5.7.

Theorem 8.3.3.13 (Yoneda's Lemma for ∞-Categories)**.** *Let $\mathcal{C}$ be a locally small ∞-category. Then the covariant and contravariant Yoneda embeddings* 03NJ

$$h_{\bullet} : \mathcal{C} \to \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \qquad h^{\bullet} : \mathcal{C}^{\mathrm{op}} \to \operatorname{Fun}(\mathcal{C}, \mathcal{S})$$

are fully faithful functors, whose essential images are the full subcategories

$$\operatorname{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \subseteq \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \qquad \operatorname{Fun}^{\mathrm{corep}}(\mathcal{C}, \mathcal{S}) \subseteq \operatorname{Fun}(\mathcal{C}, \mathcal{S})$$

spanned by the representable and corepresentable functors, respectively.

Proof. By virtue of Corollary 8.3.2.20, this is a reformulation of Proposition 8.3.3.8. □

We close this section by recording a simple observation about the Yoneda embedding.

Proposition 8.3.3.14. *Let $\mathcal{C}$ be a locally small ∞-category and let $h_{\bullet} : \mathcal{C} \to \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ be a covariant Yoneda embedding for $\mathcal{C}$. Suppose we are given a diagram $\overline{f} : K^{\triangleleft} \to \mathcal{C}$, where K is a small simplicial set. The following conditions are equivalent:* 03NP

(1) *The morphism $\overline{f}$ is a limit diagram in $\mathcal{C}$.*

(2) *The composition $h_{\bullet} \circ \overline{f}$ is a limit diagram in the ∞-category $\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$.*

Following the convention of Remark 4.7.0.5, we can regard Proposition 8.3.3.14 as a special case of the following more precise assertion (applied in the special case where $\kappa = \lambda$ is a strongly inaccessible cardinal):

Variant 8.3.3.15. Let λ be an uncountable cardinal, let $\mathcal{C}$ be a locally λ-small ∞-category, and let $h_{\bullet} : \mathcal{C} \to \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda})$ be a covariant Yoneda embedding for $\mathcal{C}$. Let $\kappa = \operatorname{ecf}(\lambda)$ be the exponential cofinality of λ, let K be a κ-small simplicial set, and let $\overline{f} : K^{\triangleleft} \to \mathcal{C}$ be a diagram. Then the following conditions are equivalent: 03V5

(1) The morphism $\overline{f}$ is a limit diagram in $\mathcal{C}$.

(2) The composition $h_{\bullet} \circ \overline{f}$ is a limit diagram in the ∞-category $\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda})$.

Proof. Since K is κ-small, the ∞-category $\mathcal{S}^{<\lambda}$ admits K-indexed limits (Example 7.6.7.4). For each object $X \in \mathcal{C}$, let $\operatorname{ev}_X : \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda}) \to \mathcal{S}^{<\lambda}$ denote the functor given by evaluation at X. By virtue of Proposition 7.1.6.1, condition (2) is equivalent to the requirement that for each object $X \in \mathcal{C}$, the composition

$$K^{\triangleleft} \xrightarrow{\overline{f}} \mathcal{C} \xrightarrow{h_{\bullet}} \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda}) \xrightarrow{\operatorname{ev}_X} \mathcal{S}^{<\lambda}$$

is a limit diagram in the ∞-category $\mathcal{S}^{<\lambda}$. Since the composite functor $(\operatorname{ev}_X \circ h_{\bullet}) : \mathcal{C} \to \mathcal{S}^{<\lambda}$ is corepresentable by X, the equivalence (1) $\Leftrightarrow$ (2) follows from Proposition 7.4.5.17 (and Remark 7.4.5.19). □

03V6 **Remark 8.3.3.16.** In the situation of Variant 8.3.3.15, suppose that the ∞-category $\mathcal{C}$ admits K-indexed limits. Then the ∞-category of representable functors $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda})$ also admits K-indexed limits, which are preserved by the inclusion functor $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda}) \hookrightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda})$.

03Y7 **Corollary 8.3.3.17.** *Let $\mathcal{C}$ be an ∞-category and let κ be an infinite cardinal. Then there exists a fully faithful functor $F : \mathcal{C} \to \widehat{\mathcal{C}}$, where $\widehat{\mathcal{C}}$ is κ-complete and κ-cocomplete. Moreover, we can arrange that F preserves the limits of all κ-small diagrams which exist in $\mathcal{C}$.*

Proof. Using Remark 4.7.3.19, we can choose an uncountable cardinal λ of exponential cofinality $\geq \kappa$. Enlarging λ if necessary, we may assume that $\mathcal{C}$ is locally λ-small. Let $\widehat{\mathcal{C}}$ denote the ∞-category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda})$ and let $F = h_{\bullet}$ be a covariant Yoneda embedding for $\mathcal{C}$. Since $\mathcal{S}^{<\lambda}$ is κ-complete and κ-cocomplete (Remark 7.4.5.7 and Variant 7.4.5.8), the ∞-category $\widehat{\mathcal{C}}$ has the same property (Remark 7.6.7.5). Moreover, the functor F is fully faithful (Theorem 8.3.3.13) and preserves limits of κ-small diagrams (Remark 8.3.3.16). $\square$

8.3.4 Representable Profunctors

03NQ Let $\mathcal{C}$ and $\mathcal{D}$ be categories. There is a fully faithful embedding from the category of functors $\mathrm{Fun}(\mathcal{D}, \mathcal{C})$ to the category of profunctors $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}, \mathrm{Set})$, which assigns to each functor $G : \mathcal{D} \to \mathcal{C}$ the representable profunctor

$$\mathcal{C}^{\mathrm{op}} \times \mathcal{D} \to \mathrm{Set} \qquad (X, Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X, G(Y)).$$

This construction has an ∞-categorical counterpart:

03NR **Proposition 8.3.4.1** (Classification of Representable Profunctors)**.** *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories. Let κ be an uncountable cardinal for which $\mathcal{C}$ is locally κ-small, and let*

$$\mathrm{Hom}_{\mathcal{C}}(-,-) : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}^{<\kappa}$$

be a Hom*-functor for $\mathcal{C}$ (see Notation 8.3.3.7). Then the construction $G \mapsto \mathrm{Hom}_{\mathcal{C}}(-, G(-))$ determines a fully faithful functor*

$$\mathrm{Fun}(\mathcal{D}, \mathcal{C}) \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}, \mathcal{S}^{<\kappa}),$$

whose essential image is spanned by the representable profunctors from $\mathcal{D}$ to $\mathcal{C}$.

Proof. Let $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ spanned by the representable functors. By virtue of Theorem 8.3.3.13, the construction $Y \mapsto \mathrm{Hom}_{\mathcal{C}}(-, Y)$ determines an equivalence of ∞-categories $h^{\bullet} : \mathcal{C} \to \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$. It follows that postcomposition with $h^{\bullet}$ induces an equivalence of ∞-categories

$$\mathrm{Fun}(\mathcal{D}, \mathcal{C}) \to \mathrm{Fun}(\mathcal{D}, \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})),$$

which is a restatement of Proposition 8.3.4.1. $\square$

Definition 8.3.4.2. Let $G : \mathcal{D} \to \mathcal{C}$ be a functor of ∞-categories. Assume that $\mathcal{C}$ is locally κ-small and let $\mathrm{Hom}_{\mathcal{C}}(-,-) : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}^{<\kappa}$ be a Hom-functor for $\mathcal{C}$. We say that a profunctor $\mathscr{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \to \mathcal{S}$ is *representable by* G if it isomorphic to the composition 03NS

$$\mathcal{C}^{\mathrm{op}} \times \mathcal{D} \xrightarrow{\mathrm{id} \times G} \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \xrightarrow{\mathrm{Hom}_{\mathcal{C}}(-,-)} \mathcal{S} \qquad (X,Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X, G(Y))$$

as an object of the ∞-category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}, \mathcal{S}^{<\kappa})$. By virtue of Proposition 8.3.3.2, this condition does not depend on the choice of Hom-functor $\mathrm{Hom}_{\mathcal{C}}(-,-)$.

Example 8.3.4.3. Let $\mathcal{C}$ be a locally κ-small ∞-category, and let $\mathscr{F} : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}^{<\kappa}$ be a functor. Then $\mathscr{F}$ is representable by an object $X \in \mathcal{C}$ (in the sense of Variant 5.6.6.2) if and only if, when regarded as a profunctor from Δ^0 to $\mathcal{C}$, it is representable by the functor $\Delta^0 \to \{X\} \hookrightarrow \mathcal{C}$ (in the sense of Definition 8.3.4.2). 03NT

Interchanging the roles of $\mathcal{C}$ and $\mathcal{D}$, we obtain the following dual notion:

Variant 8.3.4.4. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. Assume that $\mathcal{D}$ is locally κ-small and let $\mathrm{Hom}_{\mathcal{D}}(-,-) : \mathcal{D}^{\mathrm{op}} \times \mathcal{D} \to \mathcal{S}^{<\kappa}$ be a Hom-functor for $\mathcal{D}$. We say that a profunctor $\mathscr{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \to \mathcal{S}$ is *corepresentable by* F if it isomorphic to the composition 03NU

$$\mathcal{C}^{\mathrm{op}} \times \mathcal{D} \xrightarrow{F^{\mathrm{op}} \times \mathrm{id}} \mathcal{D}^{\mathrm{op}} \times \mathcal{D} \xrightarrow{\mathrm{Hom}_{\mathcal{D}}(-,-)} \mathcal{S} \qquad (X,Y) \mapsto \mathrm{Hom}_{\mathcal{D}}(F(X), Y)$$

as an object of the ∞-category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}, \mathcal{S}^{<\kappa})$. By virtue of Proposition 8.3.3.2, this condition does not depend on the choice of Hom-functor $\mathrm{Hom}_{\mathcal{C}}(-,-)$.

Example 8.3.4.5. Let $\mathcal{C}$ be a locally κ-small ∞-category and let $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}^{<\kappa}$ be a profunctor from $\mathcal{C}$ to itself. The following conditions are equivalent: 03NV

- The profunctor $\mathscr{H}$ is a Hom-functor for $\mathcal{C}$.
- The profunctor $\mathscr{H}$ is representable by the identity functor $\mathrm{id}_{\mathcal{C}} : \mathcal{C} \to \mathcal{C}$ (Definition 8.3.4.2).
- The profunctor $\mathscr{H}$ is corepresentable by the identity functor $\mathrm{id}_{\mathcal{C}} : \mathcal{C} \to \mathcal{C}$ (Variant 8.3.4.4).

Remark 8.3.4.6. Let $\lambda : \mathcal{C} \to \mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{+}$ be a coupling of ∞-categories which is essentially κ-small for some uncountable cardinal κ and let $\mathscr{K} : \mathcal{C}_{-}^{\mathrm{op}} \times \mathcal{C}_{+} \to \mathcal{S}^{<\kappa}$ be a covariant transport representation for λ. Then the profunctor $\mathscr{K}$ is representable by a functor $G : \mathcal{C}_{+} \to \mathcal{C}_{-}$ (in the sense of Definition 8.3.4.2) if and only if the coupling λ is representable by G (in the sense of Definition 8.2.3.1). Similarly, $\mathscr{K}$ is corepresentable by a functor $F : \mathcal{C}_{-} \to \mathcal{C}_{+}$ if and only if λ is corepresentable by F. 046D

03NW **Remark 8.3.4.7** (Uniqueness)**.** Let κ be an uncountable cardinal and let $\mathscr{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \to \mathcal{S}^{<\kappa}$ be a profunctor of ∞-categories. If $\mathcal{C}$ is locally κ-small small, then Proposition 8.3.4.1 guarantees that $\mathscr{K}$ is representable (in the sense of Definition 8.3.2.9 if and only if it is representable by G, for some functor $G : \mathcal{D} \to \mathcal{C}$. Moreover, if this condition is satisfied, then the functor G is determined uniquely to up isomorphism. Similarly, if $\mathcal{D}$ is locally κ-small small, then $\mathscr{K}$ is corepresentable if and only if it is corepresentable by some functor $F : \mathcal{C} \to \mathcal{D}$. In this case, the functor F is also uniquely determined up to isomorphism.

046E **Example 8.3.4.8.** Let κ be an uncountable cardinal, let $\mathcal{C}_-$ and $\mathcal{C}_+$ be locally κ-small ∞-categories, and let $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}^{<\kappa}$ be a profunctor from $\mathcal{C}_+$ to $\mathcal{C}_-$. The following conditions are equivalent:

- The profunctor $\mathscr{K}$ is balanced (Definition 8.3.2.18).
- The profunctor $\mathscr{K}$ is representable by a functor $G : \mathcal{C}_+ \to \mathcal{C}_-$ which is an equivalence of ∞-categories.
- The profunctor $\mathscr{K}$ is corepresentable by a functor $F : \mathcal{C}_- \to \mathcal{C}_+$ which is an equivalence of ∞-categories.

By virtue of Theorem 8.3.3.13, this is a reformulation of Corollary 8.3.2.20.

03PA **Proposition 8.3.4.9** (Adjunctions as Profunctors)**.** *Let $G : \mathcal{C}_+ \to \mathcal{C}_-$ be a functor of ∞-categories which represents a profunctor $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}^{<\kappa}$. Then a functor $F : \mathcal{C}_- \to \mathcal{C}_+$ is left adjoint to G if and only if it corepresents the profunctor $\mathscr{K}$. In particular, $\mathscr{K}$ is corepresentable if and only if the functor G admits a left adjoint.*

Proof. Choose a realization of $\mathscr{K}$ as the covariant transport representation of a coupling of ∞-categories $\lambda : \mathcal{C} \to \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ (see Remark 8.3.2.5). By virtue of Remark 8.3.4.6, the coupling λ is representable by the functor G. By virtue of Theorem 8.2.5.1, a functor $F : \mathcal{C}_- \to \mathcal{C}_+$ is left adjoint to G if and only if it corepresents the coupling λ. Invoking Remark 8.3.4.6 again, we see that this is equivalent to the requirement that F corepresents the profunctor $\mathscr{K}$. □

Recall that, if $\mathcal{C}_-$ and $\mathcal{C}_+$ are ∞-categories, then we write $\mathrm{LFun}(\mathcal{C}_-, \mathcal{C}_+)$ for the full subcategory of $\mathrm{Fun}(\mathcal{C}_-, \mathcal{C}_+)$ spanned by those functors $F : \mathcal{C}_- \to \mathcal{C}_+$ which are left adjoints (Notation 6.2.1.3). Similarly, we write $\mathrm{RFun}(\mathcal{C}_+, \mathcal{C}_-)$ for the full subcategory of $\mathrm{Fun}(\mathcal{C}_+, \mathcal{C}_-)$ spanned by those functors $G : \mathcal{C}_+ \to \mathcal{C}_-$ which are right adjoints.

04B7 **Corollary 8.3.4.10.** *Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞-categories. Let κ be an uncountable cardinal for which $\mathcal{C}_-$ and $\mathcal{C}_+$ are locally κ-small, and let $\mathcal{E} \subseteq \mathrm{Fun}(\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+, \mathcal{S}^{<\kappa})$ denote the full subcategory spanned by those profunctors $\mathscr{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \to \mathcal{S}^{<\kappa}$ which are both representable and corepresentable. Then:*

(1) *Composition with the covariant Yoneda embedding* $\mathcal{C}_- \to \mathrm{Fun}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ *induces an equivalence of* ∞*-categories* $\rho : \mathrm{RFun}(\mathcal{C}_+, \mathcal{C}_-) \to \mathcal{E}$.

(2) *Composition with the contravariant Yoneda embedding* $\mathcal{C}_+^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{C}_+, \mathcal{S}^{<\kappa})$ *induces an equivalence of* ∞*-categories* $\lambda : \mathrm{LFun}(\mathcal{C}_-, \mathcal{C}_+) \to \mathcal{E}^{\mathrm{op}}$.

(3) *The composition* $[\rho]^{-1} \circ [\lambda^{\mathrm{op}}]$ *determines a canonical isomorphism* $\mathrm{LFun}(\mathcal{C}_-, \mathcal{C}_+)^{\mathrm{op}} \simeq \mathrm{RFun}(\mathcal{C}_+, \mathcal{C}_-)$ *in the homotopy category* hQCat*, which carries each functor* $F \in \mathrm{LFun}(\mathcal{C}_-, \mathcal{C}_+)$ *to a functor* $G \in \mathrm{RFun}(\mathcal{C}_+, \mathcal{C}_-)$ *which is right adjoint to* F.

Proof. Assertion (1) follows by combining Propositions 8.3.4.1 and 8.3.4.9, and assertion (2) follows by a similar argument. Assertion (3) follows by combining (1) and (2) with Proposition 8.3.4.9. □

For many applications, Definition 8.3.4.2 is insufficiently precise. Given a functor of ∞-categories $G : \mathcal{D} \to \mathcal{C}$, we would like to be able to consider not only profunctors which are *representable* by G (meaning that they are *abstractly* isomorphic to the profunctor $(X, Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X, G(Y))$) but profunctors which are *represented* by G (meaning that we have *chosen* an isomorphism with the profunctor $(X, Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X, G(Y))$, or some essentially equivalent datum). Here it is inconvenient that the functor $\mathrm{Hom}_{\mathcal{C}}(-, -)$ is well-defined only up to isomorphism. To address this point, it is convenient to encode representability in a different way.

Notation 8.3.4.11. Let $\mathcal{S}$ denote the ∞-category of spaces (Construction 5.5.1.1). We will regard the contractible Kan complex Δ^0 as an object of $\mathcal{S}$. For every ∞-category $\mathcal{E}$, we let $\underline{\Delta^0}_{\mathcal{E}}$ denote the constant functor $\mathcal{E} \to \mathcal{S}$ taking the value Δ^0. 03MS

Definition 8.3.4.12. Let $G : \mathcal{D} \to \mathcal{C}$ be a functor of ∞-categories, let $\mathscr{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \to \mathcal{S}$ be a profunctor from $\mathcal{D}$ to $\mathcal{C}$, and let $\mathscr{K}|_{\mathrm{Tw}(\mathcal{D})}$ denote the composite functor 03NX

$$\mathrm{Tw}(\mathcal{D}) \to \mathcal{D}^{\mathrm{op}} \times \mathcal{D} \xrightarrow{G^{\mathrm{op}} \times \mathrm{id}} \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \xrightarrow{\mathscr{K}} \mathcal{S}.$$

Suppose we are given a natural transformation $\beta : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{D})} \to \mathscr{K}|_{\mathrm{Tw}(\mathcal{D})}$, where $\underline{\Delta^0}_{\mathrm{Tw}(\mathcal{D})}$ denotes the constant functor $\mathrm{Tw}(\mathcal{D}) \to \mathcal{S}$ taking the value Δ^0. We say that β *exhibits the profunctor* $\mathscr{K}$ *as represented by* G if, for every object $D \in \mathcal{D}$, the evaluation of β at the object $\mathrm{id}_D \in \mathrm{Tw}(\mathcal{D})$ determines a vertex $\beta(\mathrm{id}_D) \in \mathscr{K}(G(D), D)$ which exhibits the functor $\mathscr{K}(-, D)$ as represented by the object $G(D) \in \mathcal{C}$ (see Variant 5.6.6.2).

Remark 8.3.4.13. In the situation of Definition 8.3.4.12, the natural transformation β can 046F be identified with a functor $\widetilde{G}$ which fits into a commutative diagram

$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{D}) \arrow[r, "\widetilde{G}"] \arrow[d] & \{\Delta^0\} \tilde{\times}_{\mathcal{S}} (\mathcal{C}^{\mathrm{op}} \times \mathcal{D}) \arrow[d, "\lambda"] \\
\mathcal{D}^{\mathrm{op}} \times \mathcal{D} \arrow[r, "G^{\mathrm{op}} \times \mathrm{id}"] & \mathcal{C}^{\mathrm{op}} \times \mathcal{D}.
\end{tikzcd}$$

Moreover, the natural transformation β exhibits $\mathscr{K}$ as represented by G (in the sense of Definition 8.3.4.12) if and only if $\widetilde{G}$ exhibits the coupling λ as represented by G (in the sense of Definition 8.2.4.1).

03NY **Example 8.3.4.14.** In the situation of Definition 8.3.4.12, suppose that $\mathcal{D} = \Delta^0$. In this case, we can identify the profunctor $\mathscr{K}$ with a functor $K : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}$, we can identify the functor G with an object $X \in \mathcal{C}$, and we can identify β with a vertex of the Kan complex $K(X)$. Then β exhibits the profunctor $\mathscr{K}$ as represented by the functor G (in the sense of Definition 8.3.4.12) if and only if it exhibits the functor K as represented by the object X (in the sense of Variant 5.6.6.2.

03P5 **Proposition 8.3.4.15.** *Let $G : \mathcal{D} \to \mathcal{C}$ be a functor of ∞-categories, where $\mathcal{C}$ is locally small, and let $\mathscr{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \to \mathcal{S}$ be a profunctor. The following conditions are equivalent:*

(1) *The profunctor $\mathscr{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \to \mathcal{S}$ is representable by G, in the sense of Definition 8.3.4.2.*

(2) *There exists a natural transformation $\beta : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{D})} \to \mathscr{K}|_{\mathrm{Tw}(\mathcal{D})}$ which exhibits $\mathscr{K}$ as represented by G, in the sense of Definition 8.3.4.12.*

Proof. By virtue of Remarks 8.3.4.6 and 8.3.4.13, this follows by applying Proposition 8.2.4.3 to the coupling

$$\{\Delta^0\} \tilde{\times}_{\mathcal{S}} (\mathcal{C}^{\mathrm{op}} \times \mathcal{D}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{D}.$$

□

03P8 **Variant 8.3.4.16** (Corepresentable Profunctors)**.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories and let $\mathscr{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \to \mathcal{S}$ be a profunctor. We say that a natural transformation $\beta : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{C})} \to \mathscr{K}|_{\mathrm{Tw}(\mathcal{C})}$ *exhibits $\mathscr{K}$ as corepresented by F* if, for every object $X \in \mathcal{C}$, the image $\beta(\mathrm{id}_X) \in \mathscr{K}(X, F(X))$ exhibits the functor $\mathscr{K}(X, -) : \mathcal{D} \to \mathcal{S}$ as corepresented by the object $F(X) \in \mathcal{D}$, in the sense of Definition 5.6.6.1. Equivalently, β exhibits $\mathscr{K}$ as corepresented by F if it exhibits $\mathscr{K}$ as represented by the opposite functor F^{op}, when regarded as a profunctor from $\mathcal{C}^{\mathrm{op}}$ to $\mathcal{D}^{\mathrm{op}}$ (see Remark 8.3.2.3).

Remark 8.3.4.17 (Homotopy Invariance)**.** In the situation of Definition 8.3.4.12, the condition that β exhibits $\mathscr{K}$ as corepresented by G depends only on the homotopy class $[\beta]$ (as a morphism in the homotopy category $\mathrm{hFun}(\mathrm{Tw}(\mathcal{D}), \mathcal{S})$) (see Remark 5.6.6.3). `03P0`

Remark 8.3.4.18 (Change of $\mathscr{K}$)**.** Let $G : \mathcal{D} \to \mathcal{C}$ be a functor of ∞-categories. Suppose we are given a pair of profunctors $\mathscr{K}, \mathscr{K}' : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \to \mathcal{S}$, a natural transformation $\alpha : \mathscr{K} \to \mathscr{K}'$, and a commutative diagram `03P1`

$$\begin{tikzcd}
 & \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{D})} \arrow[dl, "\beta"'] \arrow[dr, "\beta'"] & \\
\mathscr{K}|_{\mathrm{Tw}(\mathcal{D})} \arrow[rr, "\alpha|_{\mathrm{Tw}(\mathcal{D})}"] & & \mathscr{K}'|_{\mathrm{Tw}(\mathcal{D})}
\end{tikzcd}$$

in the ∞-category $\mathrm{Fun}(\mathrm{Tw}(\mathcal{D}), \mathcal{S})$. Then any two of the following conditions imply the third:

- The natural transformation β exhibits the profunctor $\mathscr{K}$ as represented by G.
- The natural transformation β' exhibits the profunctor $\mathscr{K}'$ as represented by G.
- The natural transformation α is an isomorphism.

See Remark 5.6.6.4.

Proposition 8.3.4.19. *Suppose we are given a functor of ∞-categories $G : \mathcal{D} \to \mathcal{C}$, a profunctor $\mathscr{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \to \mathcal{S}$, and a natural transformation $\beta : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{D})} \to \mathscr{K}|_{\mathrm{Tw}(\mathcal{D})}$. Then β exhibits $\mathscr{K}$ as represented by G (in the sense of Definition 8.3.4.12) if and only if the induced map $\mathrm{Tw}(\mathcal{D}) \to \{\Delta^0\} \tilde{\times}_{\mathcal{S}} (\mathcal{C}^{\mathrm{op}} \times \mathcal{D})$ is left cofinal.* `03P2`

Proof. By virtue of Remark 8.3.4.13, this is a special case of Proposition 8.2.4.9. □

Proposition 8.3.4.20 (Representable Profunctors as Kan Extensions)**.** *Let $G : \mathcal{D} \to \mathcal{C}$ be a functor of ∞-categories, let $\mathscr{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \to \mathcal{S}$ be a profunctor, and let $\beta : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{D})} \to \mathscr{K}|_{\mathrm{Tw}(\mathcal{D})}$ be a natural transformation which exhibits $\mathscr{K}$ as represented by G. Then β exhibits $\mathscr{K}$ as a left Kan extension of the constant diagram $\underline{\Delta^0}_{\mathrm{Tw}(\mathcal{D})}$ along the composite map* `03P3`

$$\mathrm{Tw}(\mathcal{D}) \to \mathcal{D}^{\mathrm{op}} \times \mathcal{D} \xrightarrow{G^{\mathrm{op}} \times \mathrm{id}} \mathcal{C}^{\mathrm{op}} \times \mathcal{D}.$$

Proof. Let $\mathcal{E}$ denote the oriented fiber product $\{\Delta^0\} \tilde{\times}_{\mathcal{S}} (\mathcal{C}^{\mathrm{op}} \times \mathcal{D})$ and let $\mu : \mathcal{E} \to \mathcal{C}^{\mathrm{op}} \times \mathcal{D}$ be the projection onto the second factor, so that we have a tautological natural transformation $\widetilde{\beta} : \underline{\Delta^0}_{\mathcal{E}} \to \mathscr{K} \circ \mu$. It follows from Proposition 7.6.2.17 that $\widetilde{\beta}$ exhibits $\mathscr{K}$ as a left Kan extension of $\underline{\Delta^0}_{\mathcal{E}}$ along μ. The natural transformation β then determines a functor

$T : \mathrm{Tw}(\mathcal{D}) \to \mathcal{E}$ such that precomposition with T carries $\widetilde{\beta}$ to β. By the transitivity of the formation of of Kan extensions (Proposition 7.3.8.18), we are reduced to showing that the identity transformation $\mathrm{id} : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{D})} \to \underline{\Delta^0}_{\mathcal{E}} \circ T$ exhibits $\underline{\Delta^0}_{\mathcal{E}}$ as a left Kan extension of $\underline{\mathrm{Tw}(\mathcal{D})}$ along T. This is a special case of Remark 7.6.2.13, since the functor T is left cofinal (Proposition 8.3.4.19). □

046K **Corollary 8.3.4.21** (The Universal Mapping Property of Representable Profunctors)**.** *Let $G : \mathcal{D} \to \mathcal{C}$ be a functor of ∞-categories. Suppose we are given a pair of profunctors $\mathscr{K}, \mathscr{K}' : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \to \mathcal{S}$, and let $\beta : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{D})} \to \mathscr{K}|_{\mathrm{Tw}(\mathcal{D})}$ be a natural transformation which exhibits $\mathscr{K}$ as represented by G. Then precomposition with β induces a homotopy equivalence of Kan complexes*

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}, \mathcal{S})}(\mathscr{K}, \mathscr{K}') \to \mathrm{Hom}_{\mathrm{Fun}(\mathrm{Tw}(\mathcal{D}), \mathcal{S})}(\underline{\Delta^0}_{\mathrm{Tw}(\mathcal{D})}, \mathscr{K}'|_{\mathrm{Tw}(\mathcal{D})}).$$

Proof. Combine Propositions 8.3.4.20 and 7.3.6.1. □

03P7 **Example 8.3.4.22** (Spaces of Natural Transformation)**.** Let $G, G' : \mathcal{D} \to \mathcal{C}$ be functors of ∞-categories and let $\mathscr{H}$ be a Hom-functor for $\mathcal{C}$. Combining Corollary 8.3.4.21 with Proposition 8.3.4.1, we obtain homotopy equivalences of Kan complexes

$$\begin{aligned} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{D}, \mathcal{C})}(G, G') &\simeq \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}, \mathcal{S})}(\mathscr{H} \circ (\mathrm{id} \times G), \mathscr{H} \circ (\mathrm{id} \times G')) \\ &\simeq \mathrm{Hom}_{\mathrm{Fun}(\mathrm{Tw}(\mathcal{D}), \mathcal{S})}(\underline{\Delta^0}_{\mathrm{Tw}(\mathcal{D})}, \mathscr{H}|_{\mathrm{Tw}(\mathcal{D})}) \\ &\simeq \varprojlim(\mathscr{H}|_{\mathrm{Tw}(\mathcal{D})}). \end{aligned}$$

Stated more informally, the space of natural transformations from G to G' can be viewed as a limit of the diagram

$$\mathrm{Tw}(\mathcal{D}) \to \mathcal{S} \qquad (f : X \to Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(G(X), G'(Y)).$$

8.3.5 Recognition of Hom-Functors

046H Let $\mathcal{C}$ be an ∞-category. If $\mathcal{C}$ is locally small, then Proposition 8.3.3.2 guarantees that it admits a Hom-functor $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$, which is uniquely determined up to isomorphism. Our goal in this section is to formulate a more precise statement, which characterizes the functor $\mathscr{H}$ up to *canonical* isomorphism (see Proposition 8.3.5.6).

03MT **Definition 8.3.5.1.** Let $\mathcal{C}$ be an ∞-category, let $\lambda : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ denote the left fibration of Proposition 8.1.1.11, and let $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$ be a profunctor. We say that a natural transformation $\alpha : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{C})} \to \mathscr{H}|_{\mathrm{Tw}(\mathcal{C})}$ *exhibits $\mathscr{H}$ as a* Hom-*functor for $\mathcal{C}$* if it satisfies the following condition:

$(*)$ For every pair of objects $X, Y \in \mathcal{C}$, the natural transformation α induces a homotopy equivalence of Kan complexes

$$\alpha_{X,Y} : \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \to \mathrm{Hom}_{\mathcal{S}}(\Delta^0, \mathscr{H}(X,Y)).$$

Remark 8.3.5.2. Let $\mathcal{C}$ be an ∞-category and let $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$ be a profunctor. 03MZ The datum of a natural transformation $\alpha : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{C})} \to \mathscr{H}|_{\mathrm{Tw}(\mathcal{C})}$ can be identified with a commutative diagram of ∞-categories

03N0

$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{C}) \arrow[r] \arrow[d] & \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{S} \arrow[d] \\
\mathcal{C}^{\mathrm{op}} \times \mathcal{C} \arrow[r, "\mathscr{H}"] & \mathcal{S}.
\end{tikzcd} \tag{8.46}$$

In this case, the natural transformation α exhibits $\mathscr{H}$ as a Hom-functor for $\mathcal{C}$ if and only if the diagram (8.46) is a categorical pullback square (see Corollary 5.1.7.16).

Remark 8.3.5.3. Let $\mathcal{C}$ be an ∞-category. A profunctor $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$ is a Hom-functor 03N1 for $\mathcal{C}$ (in the sense of Definition 8.3.3.1) if and only if there exists a natural transformation $\alpha : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{C})} \to \mathscr{H}|_{\mathrm{Tw}(\mathcal{C})}$ which exhibits $\mathscr{H}$ as a Hom-functor for $\mathcal{C}$ (in the sense of Definition 8.3.5.1).

Remark 8.3.5.4. Let $\mathcal{C}$ be an ∞-category, let $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$ be a profunctor, and let 03MV $\alpha : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{C})} \to \mathscr{H}|_{\mathrm{Tw}(\mathcal{C})}$ be a natural transformation. For every pair of objects $X, Y \in \mathcal{C}$, Notation 8.1.2.14 and Remark 5.5.1.5 supply canonical isomorphisms

$$\mathrm{Hom}_{\mathcal{C}}(X,Y) \simeq \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \qquad \mathscr{H}(X,Y) \simeq \mathrm{Hom}_{\mathcal{S}}(\Delta^0, \mathscr{H}(X,Y))$$

in the homotopy category hKan. Consequently, the homotopy class of the morphism $\alpha_{X,Y}$ appearing in Definition 8.3.5.1 can be identified with a map $[\alpha_{X,Y}] : \mathrm{Hom}_{\mathcal{C}}(X,Y) \to \mathscr{H}(X,Y)$ in hKan, which depends functorially on X and Y (see Corollary 8.1.2.18). The natural transformation α exhibits $\mathscr{H}$ as a Hom-functor for $\mathcal{C}$ (in the sense of Definition 8.3.5.1) if and only if each $[\alpha_{X,Y}]$ is an isomorphism in the category hKan.

Proposition 8.3.5.5. *Let $\mathcal{C}$ be an ∞-category, let $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$ be a profunctor, and let* 03NK *$\alpha : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{C})} \to \mathscr{H}|_{\mathrm{Tw}(\mathcal{C})}$ be a natural transformation. The following conditions are equivalent:*

(1) *The natural transformation α exhibits $\mathscr{H}$ as a* Hom*-functor for $\mathcal{C}$ (in the sense of Definition 8.3.5.1).*

(2) *The natural transformation α exhibits the profunctor $\mathscr{H}$ as represented by the identity functor* $\mathrm{id} : \mathcal{C} \to \mathcal{C}$ *(in the sense of Definition 8.3.4.12). That is, for every object $X \in \mathcal{C}$, the vertex $\alpha(\mathrm{id}_X) \in \mathscr{H}(X, X)$ exhibits the functor $\mathscr{H}(-, X) : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}$ as represented by the object X.*

(3) *The natural transformation α exhibits the profunctor $\mathscr{H}$ as corepresented by the identity functor* $\mathrm{id} : \mathcal{C} \to \mathcal{C}$ *(in the sense of Variant 8.3.4.16). That is, for every object $X \in \mathcal{C}$, the vertex $\alpha(\mathrm{id}_X) \in \mathscr{H}(X, X)$ exhibits the functor $\mathscr{H}(X, -) : \mathcal{C} \to \mathcal{S}$ as corepresented by the object X.*

Proof. We will show that (1) $\Leftrightarrow$ (3); the proof of the equivalence (1) $\Leftrightarrow$ (2) is similar. The natural transformation α can be identified with a functor $T : \mathrm{Tw}(\mathcal{C}) \to \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{S}$. For each object $X \in \mathcal{C}$, let T_X denote the restriction of B to the simplicial subset $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \subseteq \mathrm{Tw}(\mathcal{C})$, and consider the following condition:

(1_X) The diagram of ∞-categories

03NL
$$\begin{tikzcd}
\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r, "T_X"] \arrow[d] & \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{S} \arrow[d] \\
\mathcal{C} \arrow[r, "\mathscr{H}(X,-)"] & \mathcal{S}
\end{tikzcd} \tag{8.47}$$

is a categorical pullback square.

By virtue of Corollary 5.1.7.16, the natural transformation α exhibits $\mathscr{H}$ as a Hom-functor for $\mathcal{C}$ if and only if it satisfies condition (1_X) for every object $X \in \mathcal{C}$. To complete the proof, it will suffice to show that (1_X) is satisfied if and only if $\alpha(\mathrm{id}_X) \in \mathscr{H}(X, X)$ exhibits the functor $\mathscr{H}(X, -)$ as corepresented by X. This is a special case of Proposition 5.6.6.21, since the id_X is an initial object of the ∞-category $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ (Proposition 8.1.2.1). □

03N3 **Proposition 8.3.5.6.** *Let $\mathcal{C}$ be a locally small ∞-category, let $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}$ be a functor, and let $\alpha : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{C})} \to \mathscr{H}|_{\mathrm{Tw}(\mathcal{C})}$ be a natural transformation. The following conditions are equivalent:*

(1) *The natural transformation α exhibits $\mathscr{H}$ as a* Hom-*functor for $\mathcal{C}$: that is, it satisfies condition $(*)$ of Definition 8.3.5.1.*

(2) *The diagram*

$$\begin{tikzcd}
 & \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \arrow[dr, "\mathscr{H}"] & \\
 \operatorname{Tw}(\mathcal{C}) \arrow[ur, "\lambda"] \arrow[rr, "\underline{\Delta^0}_{\operatorname{Tw}(\mathcal{C})}"'] & {} \arrow[u, Rightarrow, "\alpha"'] & \mathcal{S}.
\end{tikzcd}$$

exhibits $\mathscr{H}$ *as a left Kan extension of the constant functor* $\underline{\Delta^0}_{\operatorname{Tw}(\mathcal{C})}$ *along the left fibration* $\operatorname{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$.

(3) *The pair* $(\mathscr{H}, \alpha)$ *is initial when viewed as an object of the oriented fiber product* $\{\underline{\Delta^0}_{\operatorname{Tw}(\mathcal{C})}\} \tilde{\times}_{\operatorname{Fun}(\operatorname{Tw}(\mathcal{C}),\mathcal{S})} \operatorname{Fun}(\mathcal{C}^{\mathrm{op}} \times \mathcal{C}, \mathcal{S})$

Proof. The equivalence (1) ⇔ (2) follows from Proposition 7.6.2.17 and Remark 8.3.5.2. Since $\mathcal{C}$ is locally small, Proposition 8.3.3.2 guarantees that the functor $\underline{\Delta^0}_{\operatorname{Tw}(\mathcal{C})}$ admits a left Kan extension along λ, so the equivalence (2) ⇔ (3) follows from Corollary 7.3.6.5. □

Variant 8.3.5.7. Let κ be an uncountable cardinal and let $\mathcal{C}$ be an ∞-category which is locally κ-small. Then, in the statement of Proposition 8.3.5.6, we can replace $\mathcal{S}$ with the ∞-category $\mathcal{S}^{<\kappa}$ of κ-small spaces (Variant 5.5.4.12). 03V3

Corollary 8.3.5.8 (Functoriality of Hom-Functors)**.** *Let* $F : \mathcal{C} \to \mathcal{D}$ *be a functor between ∞-categories. Choose natural transformations* 046J

$$\alpha : \underline{\Delta^0}_{\operatorname{Tw}(\mathcal{C})} \to \mathscr{H}_{\mathcal{C}}|_{\operatorname{Tw}(\mathcal{C})} \qquad \beta : \underline{\Delta^0}_{\operatorname{Tw}(\mathcal{D})} \to \mathscr{H}_{\mathcal{D}}|_{\operatorname{Tw}(\mathcal{D})}$$

which exhibit $\mathscr{H}_{\mathcal{C}}$ *and* $\mathscr{H}_{\mathcal{D}}$ *as* Hom-*functors for* $\mathcal{C}$ *and* $\mathcal{D}$, *respectively. Then there exists a natural transformation* $\gamma : \mathscr{H}_{\mathcal{C}}(-,-) \to \mathscr{H}_{\mathcal{D}}(F(-), F(-))$ *for which the diagram*

03PC

$$\begin{tikzcd}
 & \underline{\Delta^0}_{\operatorname{Tw}(\mathcal{C})} \arrow[dl, "{[\alpha]}"'] \arrow[dr, "{[\beta]}"] & \\
 \mathscr{H}_{\mathcal{C}}|_{\operatorname{Tw}(\mathcal{C})} \arrow[rr, "{[\gamma]}"] & & \mathscr{H}_{\mathcal{D}}|_{\operatorname{Tw}(\mathcal{C})}
\end{tikzcd} \tag{8.48}$$

commutes (in the homotopy category $\operatorname{hFun}(\operatorname{Tw}(\mathcal{C}), \mathcal{S})$*). Moreover, the natural transformation* γ *is uniquely determined up to homotopy.*

Proof. This is a special case of Proposition 7.3.6.1, since α exhibits $\mathscr{H}_{\mathcal{C}}$ as a left Kan extension of $\underline{\Delta^0}_{\operatorname{Tw}(\mathcal{C})}$ along the left fibration $\operatorname{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ (Proposition 8.3.5.6). □

03PD **Remark 8.3.5.9.** In the situation of Corollary 8.3.5.8, suppose that we are given a pair of objects $X, Y \in \mathcal{C}$. The commutativity of (8.48) guarantees that the diagram

$$\begin{tikzcd}
\mathrm{Hom}_{\mathcal{C}}(X,Y) \arrow[r, "F"] \arrow[d, "\sim"] & \mathrm{Hom}_{\mathcal{D}}(F(X),F(Y)) \arrow[d, "\sim"] \\
\mathscr{H}_{\mathcal{C}}(X,Y) \arrow[r, "\gamma"] & \mathscr{H}_{\mathcal{D}}(F(X),F(Y))
\end{tikzcd}$$

commutes in the homotopy category hKan, where the vertical maps are the isomorphisms of Remark 8.3.5.4. We can summarize the situation more informally as follows: if $F : \mathcal{C} \to \mathcal{D}$ is a functor between (locally small) ∞-categories, then the induced map of Kan complexes $\mathrm{Hom}_{\mathcal{C}}(X,Y) \to \mathrm{Hom}_{\mathcal{D}}(F(X),F(Y))$ depends functorially on the pair (X,Y) (as an object of the ∞-category $\mathcal{C}^{\mathrm{op}} \times \mathcal{C}$).

8.3.6 Strict Models for Hom-Functors

03N5 Let $\mathcal{E}$ be a (locally small) ∞-category. Proposition 8.3.3.2 guarantees the existence of a Hom-functor $\mathscr{H} : \mathcal{E}^{\mathrm{op}} \times \mathcal{E} \to \mathcal{S}$, which is well-defined up to isomorphism. Our goal in this section is to give an explicit construction of a Hom-functor in the special case where $\mathcal{E} = \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathcal{C})$ arises as the homotopy coherent nerve of a (locally Kan) simplicial category $\mathcal{C}$.

03N6 **Construction 8.3.6.1.** Let $\mathcal{C}$ be a locally Kan simplicial category. Then the construction $(X,Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X,Y)_{\bullet}$ determines a simplicial functor $\mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathrm{Kan}$. Passing to homotopy coherent nerves, we obtain a functor of ∞-categories

$$\mathscr{H}_{\mathcal{C}} : \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathcal{C})^{\mathrm{op}} \times \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathcal{C}) \to \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathrm{Kan}) = \mathcal{S}.$$

03N7 **Proposition 8.3.6.2.** *Let $\mathcal{C}$ be a locally Kan simplicial category. Then the functor $\mathscr{H}_{\mathcal{C}}$ of Construction 8.3.6.1 is a* Hom*-functor for the ∞-category $\mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathcal{C})$.*

03N8 **Remark 8.3.6.3.** Let $\mathcal{C}$ be an ordinary category, which we identify with the corresponding constant simplicial category (see Example 2.4.2.4). In this case, Proposition 8.3.6.2 reduces to Example 8.3.3.4.

03N9 **Remark 8.3.6.4.** By combining Proposition 8.3.6.2 with the rectification results of §[?], we can give an explicit construction of a Hom-functor for an arbitrary (small) ∞-category $\mathcal{E}$. Let $\mathrm{Path}[\mathcal{E}]_{\bullet}$ denote the simplicial path category of $\mathcal{E}$ (Definition 2.4.4.1) and let $\mathcal{C}$ be the locally Kan simplicial having the same objects, with morphism spaces given by $\mathrm{Hom}_{\mathcal{C}}(X,Y)_{\bullet} = \mathrm{Ex}^{\infty}(\mathrm{Hom}_{\mathrm{Path}[\mathcal{E}]}(X,Y)_{\bullet})$ (see Example [?]). It follows from Proposition 3.3.6.7 that the tautological map $\mathrm{Path}[\mathcal{E}]_{\bullet} \to \mathcal{C}$ is a weak equivalence of simplicial categories (in the sense of Definition 4.6.8.7), and therefore corresponds to an equivalence of ∞-categories $F : \mathcal{E} \to \mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})$ (Theorem [?]). Using Proposition 8.3.6.2, we deduce that the composition

$$\mathcal{E}^{\mathrm{op}} \times \mathcal{E} \xrightarrow{F^{\mathrm{op}} \times F} \mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})^{\mathrm{op}} \times \mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C}) \xrightarrow{\mathscr{H}_{\mathcal{C}}} \mathcal{S}$$

is a Hom-functor for $\mathcal{E}$, given on objects by $(X, Y) \mapsto \mathrm{Ex}^\infty(\mathrm{Hom}_{\mathrm{Path}[\mathcal{E}]}(X, Y))$.

Beware that, although this construction is completely explicit in principle, it is hard to use in practice (since the operations $\mathcal{E} \mapsto \mathrm{Path}[\mathcal{E}]_\bullet$ and $S \mapsto \mathrm{Ex}^\infty(S)$ are both difficult to control).

Proposition 8.3.6.2 asserts that the functor $\mathscr{H}_{\mathcal{C}}$ is a covariant transport representation for the left fibration $\mathrm{Tw}(\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})) \to \mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})^{\mathrm{op}} \times \mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})$ (Remark 8.3.5.3). We will prove this by constructing a categorical pullback square of ∞-categories

$$\begin{tikzcd}
\mathrm{Tw}(\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})) \arrow[r, "\widetilde{\mathscr{H}_{\mathcal{C}}}"] \arrow[d] & \mathcal{S}_* \arrow[d, "U"] \\
\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})^{\mathrm{op}} \times \mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C}) \arrow[r, "\mathscr{H}_{\mathcal{C}}"] & \mathcal{S}.
\end{tikzcd}$$

To define the upper horizontal map, we will use a variant of Construction 8.3.6.1.

Construction 8.3.6.5. Let $\mathcal{C}$ be a locally Kan simplicial category, let $\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})$ denote its homotopy coherent nerve. Let J be a linearly ordered set and let $\overline{J}$ denote its opposite; for each element $j \in J$, we write $\overline{j}$ for the corresponding element of $\overline{J}$. Suppose we are given a morphism of simplicial sets $\sigma : \mathrm{N}_\bullet(J) \to \mathrm{Tw}(\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C}))$, which we identify with a simplicial functor $f : \mathrm{Path}[\overline{J} \star J]_\bullet \to \mathcal{C}$ (see Warning 8.1.1.9 and Proposition 2.4.4.15). Note that the composition `03NA`

$$\mathrm{N}_\bullet(J) \xrightarrow{\sigma} \mathrm{Tw}(\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})) \to \mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})^{\mathrm{op}} \times \mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C}) \xrightarrow{\mathscr{H}_{\mathcal{C}}} \mathcal{S}$$

can be identified with a simplicial functor $F_\sigma : \mathrm{Path}[J]_\bullet \to \mathrm{Kan}$, given on objects by the formula $F_\sigma(j) = \mathrm{Hom}_{\mathcal{C}}(f(\overline{j}), f(j))_\bullet$ (see Proposition 2.4.4.15). Let $J^{\triangleleft} = \{x\} \star J$ denote the linearly ordered set obtained from J by adding a new smallest element x. We extend F_σ to a simplicial functor $\widetilde{F}_\sigma : \mathrm{Path}[J^{\triangleleft}]_\bullet \to \mathrm{Kan}$ as follows:

(a) The functor $\widetilde{F}_\sigma$ carries the element $x \in J^{\triangleleft}$ to the Kan complex Δ^0.

(b) Let j be an element of J. Let us identify $\mathrm{Hom}_{\mathrm{Path}[J^{\triangleleft}]}(x, j)_\bullet$ with the nerve $\mathrm{N}_\bullet(Q)$, where Q is the collection of finite subsets $I \subseteq J$ satisfying $\max(I) = j$ (partially ordered by reverse inclusion). Similarly, we identify $\mathrm{Hom}_{\mathrm{Path}[\overline{J} \star J]}(\overline{j}, j)_\bullet$ with the nerve $\mathrm{N}_\bullet(Q')$, where Q' is the collection of finite subsets $I' \subseteq \overline{J} \star J$ satisfying $\max(I') = j$

and $\min(I') = \overline{j}$ (partially ordered by reverse inclusion). Then $\widetilde{F}_\sigma$ is defined on the morphism space $\mathrm{Hom}_{\mathrm{Path}[J^{\triangleleft}]}(x, j)_\bullet$ by the composition

$$\begin{aligned}
\mathrm{Hom}_{\mathrm{Path}[J^{\triangleleft}]}(x, j)_\bullet &\simeq \mathrm{N}_\bullet(Q) \\
&\xrightarrow{I \mapsto \overline{I} \cup I} \mathrm{N}_\bullet(Q') \\
&\simeq \mathrm{Hom}_{\mathrm{Path}[\overline{J} \star J]}(\overline{j}, j)_\bullet \\
&\xrightarrow{f} \mathrm{Hom}_{\mathcal{C}}(f(\overline{j}), f(j))_\bullet \\
&\simeq \mathrm{Fun}(\widetilde{F}_\sigma(x), \widetilde{F}_\sigma(j)).
\end{aligned}$$

In the special case where J is the linearly ordered set $[n] = \{0 < 1 < \cdots < n\}$, we can identify $\widetilde{F}_\sigma$ with an n-simplex of the ∞-category of pointed spaces $\mathcal{S}_* = \mathrm{N}^{\mathrm{hc}}_\bullet(\mathrm{Kan})_{\Delta^0/}$. The assignment $\sigma \mapsto \widetilde{F}_\sigma$ depends functorially on $[n]$, and therefore determines a functor $\widetilde{\mathscr{H}}_{\mathcal{C}} : \mathrm{Tw}(\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})) \to \mathcal{S}_*$. By construction, this functor fits into a commutative diagram

03NB
$$\begin{tikzcd}
\mathrm{Tw}(\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})) \arrow[r, "\widetilde{\mathscr{H}}_{\mathcal{C}}"] \arrow[d] & \mathcal{S}_* \arrow[d, "U"] \\
\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C})^{\mathrm{op}} \times \mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C}) \arrow[r, "\mathscr{H}_{\mathcal{C}}"] & \mathcal{S},
\end{tikzcd} \tag{8.49}$$

where the left vertical map is the twisted arrow fibration of Proposition 8.1.1.11 and the right vertical map is the forgetful functor.

03NC **Exercise 8.3.6.6.** Verify that Construction 8.3.6.5 is well-defined. That is, for every linearly ordered set J and every morphism $\sigma : \mathrm{N}_\bullet(J) \to \mathrm{Tw}(\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{C}))$, show that the simplicial functor F_σ admits a unique extension $\widetilde{F}_\sigma : \mathrm{Path}[J^{\triangleleft}]_\bullet \to \mathrm{Kan}$ which satisfies conditions (a) and (b).

Proposition 8.3.6.2 is an immediate consequence of the following more precise result:

03ND **Proposition 8.3.6.7.** *Let $\mathcal{C}$ be a locally Kan simplicial category. Then the diagram (8.49) is a categorical pullback square.*

Proof. Note that the vertical maps in the diagram (8.49) are left fibrations (Propositions 8.1.1.11 and 5.5.3.2). It will therefore suffice to show that, for every pair of objects $X, Y \in \mathcal{C}$, the induced map of fibers

$$\begin{aligned}
\widetilde{\mathscr{H}}_{X,Y} : \{X\} \times_{\mathcal{E}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{E}) \times_{\mathcal{E}} \{Y\} &\to \{\mathscr{H}_{\mathcal{C}}(X, Y)\} \times_{\mathcal{S}} \mathcal{S}_* \\
&= \mathrm{Hom}^{\mathrm{L}}_{\mathcal{S}}(\Delta^0, \mathrm{Hom}_{\mathcal{C}}(X, Y)_\bullet)
\end{aligned}$$

is a homotopy equivalence of Kan complexes (see Corollary 5.1.7.16). Note that the coslice inclusion of Construction 8.1.2.7 induces a monomorphism of simplicial sets $\iota : \operatorname{Hom}^{\mathrm{L}}_{\mathcal{E}}(X,Y) \hookrightarrow \{X\} \times_{\mathcal{E}^{\mathrm{op}}} \operatorname{Tw}(\mathcal{E}) \times_{\mathcal{E}} \{Y\}$. Unwinding the definitions, we see that the composite map

$$(\widetilde{\mathscr{H}}_{X,Y} \circ \iota) : \operatorname{Hom}^{\mathrm{L}}_{\mathcal{E}}(X,Y) \to \operatorname{Hom}^{\mathrm{L}}_{\mathcal{S}}(\Delta^0, \operatorname{Hom}_{\mathcal{C}}(X,Y)_{\bullet})$$

coincides with isomorphism described in Remark 4.6.8.18. It will therefore suffice to show that ι is a homotopy equivalence, which is a special case of Corollary 8.1.2.10. □

8.4 Cocompletion

Let $\mathcal{C}$ be a small ∞-category. It is very rare for $\mathcal{C}$ to admit small colimits: this is possible only if $\mathcal{C}$ is (equivalent to the nerve of) a partially ordered set (Proposition 7.6.2.16). However, it is always possible to *embed* $\mathcal{C}$ into a larger ∞-category which admits small colimits. Our goal in this section is to study the universal example of such an enlargement. 03V7

Definition 8.4.0.1. Let $h : \mathcal{C} \to \widehat{\mathcal{C}}$ be a functor of ∞-categories. We will say that h *exhibits $\widehat{\mathcal{C}}$ as a cocompletion of $\mathcal{C}$* if the following conditions are satisfied: 04B8

(1) The ∞-category $\widehat{\mathcal{C}}$ admits small colimits.

(2) Let $\mathcal{D}$ be an ∞-category which admits small colimits and let $\operatorname{Fun}'(\widehat{\mathcal{C}}, \mathcal{D})$ denote the full subcategory of $\operatorname{Fun}(\widehat{\mathcal{C}}, \mathcal{D})$ spanned by those functors which preserve small colimits. Then precomposition with h induces an equivalence of ∞-categories $\operatorname{Fun}'(\widehat{\mathcal{C}}, \mathcal{D}) \to \operatorname{Fun}(\mathcal{C}, \mathcal{D})$.

Remark 8.4.0.2. Stated more informally, condition (2) of Definition 8.4.0.1 asserts that if $f : \mathcal{C} \to \mathcal{D}$ is a functor of ∞-categories where $\mathcal{D}$ admits small colimits, then f factors (up to isomorphism) as a composition $\mathcal{C} \xrightarrow{h} \widehat{\mathcal{C}} \xrightarrow{F} \mathcal{D}$, where the functor F preserves small colimits; moreover, this factorization is required to be essentially unique. In other words, the ∞-category $\widehat{\mathcal{C}}$ should be "freely generated" by $\mathcal{C}$ under small colimits. 04B9

It follows immediately from the definition that if an ∞-category $\mathcal{C}$ admits a cocompletion $\widehat{\mathcal{C}}$, then $\widehat{\mathcal{C}}$ is determined uniquely up to equivalence. Our primary goal in this section is to prove the following existence result:

Theorem 8.4.0.3. *Let $\mathcal{C}$ be an essentially small ∞-category and let $h_{\bullet} : \mathcal{C} \to \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ be a covariant Yoneda embedding for $\mathcal{C}$ (Definition 8.3.3.9). Then $h_{\bullet}$ exhibit $\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ as a cocompletion of $\mathcal{C}$ (in the sense of Definition 8.4.0.1).* 03W9

Example 8.4.0.4. Let X be a contractible Kan complex, which we identify with a vertex x of the simplicial set $\mathcal{S}$. Applying Theorem 8.4.0.3 in the special case where $\mathcal{C} = \Delta^0$, we 03WC deduce that the map $x : \Delta^0 \to \mathcal{S}$ exhibits $\mathcal{S}$ as a cocompletion of the 0-simplex Δ^0. That is, for every ∞-category $\mathcal{D}$ which admits small colimits, the evaluation map

$$\operatorname{Fun}'(\mathcal{S}, \mathcal{D}) \to \mathcal{D} \qquad F \mapsto F(X)$$

is an equivalence of ∞-categories, where $\operatorname{Fun}'(\mathcal{S}, \mathcal{D})$ denotes the full subcategory of $\operatorname{Fun}(\mathcal{S}, \mathcal{D})$ spanned by the colimit-preserving functors. Note that this property characterizes the ∞-category $\mathcal{S}$ up to equivalence: it is "freely generated" under small colimits by the object Δ^0.

04BA **Warning 8.4.0.5.** In §8.4.5, we will show that *every* ∞-category $\mathcal{C}$ admits a cocompletion $\widehat{\mathcal{C}}$ (Proposition 8.4.5.3). Beware that, if $\mathcal{C}$ is not essentially small, then $\widehat{\mathcal{C}}$ cannot necessarily be identified with the ∞-category $\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ (Warning 8.4.3.4). However, if $\mathcal{C}$ is *locally* small, then it can be identified with a full subcategory of $\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ (see Construction 8.4.5.5).

Let $f : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, where $\mathcal{C}$ is essentially small and $\mathcal{D}$ admits small colimits. Using the ∞-categorical version of Yoneda's lemma (Theorem 8.3.3.13), we see that f factors (up to isomorphism) as a composition

$$\mathcal{C} \xrightarrow{h_\bullet} \operatorname{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \xrightarrow{F_0} \mathcal{D},$$

where $\operatorname{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ denotes the full subcategory of $\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ spanned by the representable functors. Theorem 8.4.0.3 asserts that F_0 admits an essentially unique extension to a functor $\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \to \mathcal{D}$ which preserves small colimits. To prove this, it will be useful to characterize this extension in a different way. For any functor $F : \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \to \mathcal{D}$, we will show that the following conditions are equivalent:

(a) The functor F preserves small colimits.

(b) The functor F is left Kan extended from the subcategory $\operatorname{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \subseteq \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$.

Granting this equivalence, the proof of Theorem 8.4.0.3 is reduced to showing that every functor $F_0 : \operatorname{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \to \mathcal{D}$ admits an essentially unique left Kan extension $F : \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \to \mathcal{D}$, which follows from the general results of §7.3.

To establish the equivalence of (a) and (b), we will proceed by reduction to an important special case. Suppose that $\mathcal{D} = \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ and that $F : \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \to \mathcal{D}$ is the identity functor. In this case, condition (a) is automatically satisfied. Condition (b) then asserts that the full subcategory $\operatorname{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \subseteq \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is *dense*: that is, every object $\mathscr{G} \in \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ can be recovered as the colimit of the diagram

$$\operatorname{Fun}^{\mathrm{rep}}(\mathcal{C}\,\mathrm{op}, \mathcal{S}) \times_{\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})} \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathscr{F}} \to \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$$

of representable functors over $\mathscr{G}$ (see Definition 8.4.1.5). In §8.4.1, we discuss dense subcategories in general and provide a concrete criterion can be used to show that a subcategory is dense (Proposition 8.4.1.8). In §8.4.2, we apply this criterion to establish the density of the full subcategory $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \subseteq \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ (Corollary 8.4.2.2). In §8.4.3, we use this result to establish the equivalence of (a) and (b) in general (Theorem 8.4.3.6), and deduce Theorem 8.4.0.3 as an easy consequence.

Let us now specialize the preceding discussion to the situation where the ∞-category $\mathcal{D}$ is locally small. In this case, we will show that conditions (a) and (b) above are equivalent to the following:

(c) The functor $F : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \to \mathcal{D}$ admits a right adjoint $G : \mathcal{D} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$.

The implication $(c) \Rightarrow (a)$ is formal (by virtue of Corollary 7.1.3.21, every left adjoint preserves colimits). In §8.4.4, we prove the reverse implication by giving an explicit construction of the right adjoint G: it carries each object $D \in \mathcal{D}$ to the functor

$$\mathscr{F} : \mathcal{C}^{\mathrm{op}} \to \mathcal{S} \qquad C \mapsto \mathrm{Hom}_{\mathcal{D}}(f(C), D)$$

where $\mathrm{Hom}_{\mathcal{D}}(\bullet, \bullet)$ is a Hom-functor for the ∞-category $\mathcal{D}$ (see Proposition 8.4.4.1). The equivalence of (a) and (c) is a special case of the ∞-categorical adjoint functor theorem (Theorem [?]), which we discuss in §[?] .

If $\mathcal{C}$ is an essentially small ∞-category, then its cocompletion $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is a drastic enlargement of $\mathcal{C}$, obtained by (freely) adjoining a colimit for *every* small diagram. In practice, it will be useful to consider a variant of Definition 8.4.0.1, where we restrict our attention to diagrams indexed by some collection of simplicial sets $\mathbb{K}$. We say that a functor of ∞-categories $h : \mathcal{C} \to \widehat{\mathcal{C}}$ *exhibits* $\widehat{\mathcal{C}}$ *as a* $\mathbb{K}$*-cocompletion of* $\mathcal{C}$ if $\widehat{\mathcal{C}}$ admits K-indexed colimits for each $K \in \mathbb{K}$, and is universal with respect to this property (see Definition 8.4.5.1). In §8.4.5, we show that every ∞-category $\mathcal{C}$ admits a $\mathbb{K}$-cocompletion $\widehat{\mathcal{C}}$ (Proposition 8.4.5.3). Our proof proceeds by explicit construction. Assume for simplicity that the ∞-category $\mathcal{C}$ and each of the simplicial sets $K \in \mathbb{K}$ is essentially small; in this case, we show that we can take $\widehat{\mathcal{C}}$ to be the smallest full subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ which contains all representable functors and is closed under K-indexed colimits, for each $K \in \mathbb{K}$ (Construction 8.4.5.5 and Proposition 8.4.5.7).

Let us isolate another important feature of the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ associated to an essentially small ∞-category $\mathcal{C}$. For every pair of objects $X \in \mathcal{C}$ and $\mathscr{F} \in \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$, the ∞-categorical analogue of Yoneda's lemma supplies a homotopy equivalence

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})}(h_X, \mathscr{F}) \xrightarrow{\sim} \mathscr{F}(X)$$

(Proposition 8.3.1.3). It follows that h_X is an *atomic* object of the ∞-category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$: that is, it corepresents a functor which preserves small colimits (Definition 8.4.6.1). The Yoneda embedding is essentially characterized by this property, together with the fact that it is dense and fully faithful. More precisely, suppose that we are given a functor of

∞-categories $h : \mathcal{C} \to \widehat{\mathcal{C}}$, where $\mathcal{C}$ is small and $\widehat{\mathcal{C}}$ admits small colimits. In §8.4.6, we show that h exhibits $\widehat{\mathcal{C}}$ as a cocompletion of $\mathcal{C}$ if and only if it is dense, fully faithful, and carries each object of $\mathcal{C}$ to an atomic object of $\widehat{\mathcal{C}}$ (Proposition 8.4.6.6). In §8.4.7, we apply this characterization to show that the formation of cocompletions is compatible with the formation of slice ∞-categories (Proposition 8.4.7.1). In particular, if $U : \widetilde{\mathcal{C}} \to \mathcal{C}$ is a right fibration between essentially small ∞-categories, we show that there is an equivalence of ∞-categories $\mathrm{Fun}(\widetilde{\mathcal{C}}^{\mathrm{op}}, \mathcal{S}) \simeq \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathscr{F}}$, where $\mathscr{F}$ denotes a covariant transport representation for the left fibration U^{op} (Corollary 8.4.7.2).

8.4.1 Dense Functors

03V8 To study the behavior of a (large) category $\mathcal{D}$, it is often useful to approximate $\mathcal{D}$ by well-chosen (small) subcategory $\mathcal{C} \subseteq \mathcal{D}$. The following condition guarantees that, for some purposes, passage from $\mathcal{D}$ to $\mathcal{C}$ does not lose too much information:

03V9 **Definition 8.4.1.1.** Let $\mathcal{D}$ be a (locally small) category. We say that a full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is *dense* if the functor

$$\mathcal{D} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathrm{Set}) \qquad Y \mapsto \mathrm{Hom}_{\mathcal{D}}(\bullet, Y)$$

is fully faithful.

03VA **Remark 8.4.1.2.** Definition 8.4.1.1 was introduced by Isbell in [29]. Beware that Isbell uses the term *left adequate* subcategory for what we refer to as a *dense* subcategory.

03VB **Example 8.4.1.3.** Let Cat denote the ordinary category whose objects are small categories and whose morphisms are functors, and let $\mathbf{\Delta} \subset \mathrm{Cat}$ be the simplex category. Proposition 1.3.3.1 asserts that the restricted Yoneda embedding

$$\mathrm{Cat} \to \mathrm{Fun}(\mathbf{\Delta}^{\mathrm{op}}, \mathrm{Set}) = \mathrm{Set}_{\Delta} \qquad \mathcal{C} \mapsto \mathrm{N}_{\bullet}(\mathcal{C})$$

is fully faithful, so that $\mathbf{\Delta}$ is a dense subcategory of Cat.

03VC **Exercise 8.4.1.4.** Let $\mathcal{C}$ denote the category of partially ordered sets, and let $\mathbf{\Delta}_{\leq 1}$ denote the full subcategory of $\mathcal{C}$ spanned by the objects $[0]$ and $[1]$. Show that $\mathbf{\Delta}_{\leq 1}$ is a dense subcategory of $\mathcal{C}$.

We now introduce an ∞-categorical counterpart of Definition 8.4.1.1.

03VD **Definition 8.4.1.5.** Let $\mathcal{D}$ be an ∞-category. We will say that a full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is *dense* if, for every object $X \in \mathcal{D}$, the composition

$$(\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/X})^{\triangleright} \hookrightarrow \mathcal{D}_{/X}^{\triangleright} \to \mathcal{D}$$

is a colimit diagram.

Remark 8.4.1.6. Let $\mathcal{D}$ be an ∞-category. Then a full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is dense if and only if the identity functor $\mathrm{id}_{\mathcal{D}}$ is left Kan extended from $\mathcal{C}$. 03VE

Example 8.4.1.7. Let $\mathcal{C}$ be an ∞-category. Then $\mathcal{C}$ is a dense full subcategory of itself (see Example 7.3.3.8). 03VF

In the situation of Definition 8.4.1.5, suppose that the ∞-category $\mathcal{D}$ is locally small, and let $h_{\bullet} : \mathcal{D} \to \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S})$ be a covariant Yoneda embedding for $\mathcal{D}$ (see Definition 8.3.3.9). Composing with the restriction functor $\mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}) \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$, we obtain a functor

$$\mathcal{D} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \qquad Y \mapsto h_Y^{\circ}$$

which we will refer to as the *restricted Yoneda embedding.*

Proposition 8.4.1.8. *Let $\mathcal{D}$ be a locally small ∞-category. A full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is dense if and only if the restricted Yoneda embedding $\mathcal{D} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is fully faithful.* 03VG

We will deduce Proposition 8.4.1.8 from a more general result (Proposition 8.4.1.22), which we prove at the end of this section.

Corollary 8.4.1.9. *Let $\mathcal{D}$ be a locally small category. Then a full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is dense (in the sense of Definition 8.4.1.1) if and only if $\mathrm{N}_{\bullet}(\mathcal{C})$ is a dense subcategory of the ∞-category $\mathrm{N}_{\bullet}(\mathcal{D})$ (in the sense of Definition 8.4.1.5).* 03VH

Warning 8.4.1.10. Let $\mathcal{D}$ be an ∞-category. Consider the following conditions on a full subcategory $\mathcal{C} \subseteq \mathcal{D}$: 03VJ

(1) The ∞-category $\mathcal{C} \subseteq \mathcal{D}$ is dense, in the sense of Definition 8.4.1.5.

(2) Every object $X \in \mathcal{D}$ can be realized as the colimit of a diagram taking values in the full subcategory $\mathcal{C} \subseteq \mathcal{D}$.

(3) The ∞-category $\mathcal{D}$ is generated by $\mathcal{C}$ under colimits. That is, if $\mathcal{D}_0 \subseteq \mathcal{D}$ is a full subcategory which contains $\mathcal{C}$ and is closed under the formation of colimits in $\mathcal{D}$, then $\mathcal{D}_0 = \mathcal{D}$.

It follows immediately from the definitions that (1) $\Rightarrow$ (2) $\Rightarrow$ (3). Beware that neither of this implications is reversible. See Exercises 8.4.1.11 and 8.4.1.12.

Exercise 8.4.1.11. Let $\mathcal{D}$ denote the category of free abelian groups, and let $\mathcal{C} \subseteq \mathcal{D}$ denote the full subcategory spanned by object $\mathbf{Z}$. Show that $\mathcal{C}$ is not a dense subcategory of $\mathcal{D}$. Consequently, the inclusion map $\mathrm{N}_{\bullet}(\mathcal{C}) \subset \mathrm{N}_{\bullet}(\mathcal{D})$ satisfies condition (2) of Warning 8.4.1.10, but does not satisfy condition (1). 03VK

03VL **Exercise 8.4.1.12.** Let Cat denote the (ordinary) category of small categories, and let $\mathbf{\Delta}_{\leq 1} \subset \mathrm{Cat}$ denote the full subcategory spanned by the objects $[0]$ and $[1]$. Show that:

- The full subcategory $\mathbf{\Delta}_{\leq 1}$ generates Cat under colimits.
- A small category $\mathcal{C}$ can be realized as the colimit (in Cat) of a diagram $\mathcal{K} \to \mathbf{\Delta}_{\leq 1}$ if and only if the category $\mathcal{C}$ is free, in the sense of Definition 1.3.7.7.

In particular, the inclusion $\mathrm{N}_{\bullet}(\mathbf{\Delta}_{\leq 1}) \subset \mathrm{N}_{\bullet}(\mathrm{Cat})$ satisfies condition (3) of Warning 8.4.1.10, but does not satisfy condition (2).

03VM **Warning 8.4.1.13** (Failure of Transitivity)**.** Let $\mathcal{E}$ be an ∞-category and let $\mathcal{C} \subseteq \mathcal{D} \subseteq \mathcal{E}$ be full subcategories. Suppose that $\mathcal{C}$ is a dense subcategory of $\mathcal{E}$. Then $\mathcal{C}$ is also a dense subcategory of $\mathcal{D}$, and $\mathcal{D}$ is a dense subcategory of $\mathcal{E}$ (see Corollary 7.3.8.8). Beware that the converse is false (Example 8.4.1.14).

03VN **Example 8.4.1.14.** Let Cat denote the (ordinary) category of small categories. Then the simplex category $\mathbf{\Delta}$ is a dense full subcategory of Cat (Example 8.4.1.3), and $\mathbf{\Delta}_{\leq 1}$ is a dense full subcategory of $\mathbf{\Delta}$ (Exercise 8.4.1.4). However, $\mathbf{\Delta}_{\leq 1}$ is not a dense full subcategory of Cat (Exercise 8.4.1.12).

For some applications, it will be useful to consider the following generalization of Definition 8.4.1.5.

03VP **Definition 8.4.1.15.** Let $\mathcal{D}$ be an ∞-category and let $F : \mathcal{C} \to \mathcal{D}$ be a morphism of simplicial sets. We say that F is *dense* if the identity transformation $\mathrm{id}_F : F \to \mathrm{id}_{\mathcal{D}} \circ F$ exhibits the identity functor $\mathrm{id}_{\mathcal{D}}$ as a left Kan extension of F along F (see Variant 7.3.1.5).

03VQ **Example 8.4.1.16.** Let $\mathcal{D}$ be an ∞-category. Then a full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is dense (in the sense of Definition 8.4.1.5) if and only if the inclusion functor $\mathcal{C} \hookrightarrow \mathcal{D}$ is dense (in the sense of Definition 8.4.1.15). See Proposition 7.3.2.6.

03VS **Remark 8.4.1.17** (Homotopy Invariance)**.** Let $\mathcal{D}$ be an ∞-category, let C be a simplicial set, and let $F, F' : \mathcal{C} \to \mathcal{D}$ be diagrams which are isomorphic (when viewed as objects of the ∞-category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$). Then F is dense if and only if F' is dense. This follows by combining Remarks 7.3.1.10 and 7.3.1.11.

03VT **Remark 8.4.1.18** (Change of Source)**.** Let $\mathcal{D}$ be an ∞-category, let $F : \mathcal{C} \to \mathcal{D}$ be a morphism of simplicial sets, and let $G : \mathcal{B} \to \mathcal{C}$ be a categorical equivalence of simplicial sets. Then F is dense if and only if $F \circ G$ is dense. See Proposition 7.3.1.14.

03VU **Remark 8.4.1.19** (Change of Target)**.** Let $G : \mathcal{D} \to \mathcal{E}$ be a functor of ∞-categories and let $F : \mathcal{C} \to \mathcal{D}$ be a morphism of simplicial sets. Then:

- If G is fully faithful and $G \circ F$ is dense, then F is dense.
- If G is an equivalence of ∞-categories and F is dense, then $G \circ F$ is dense.

See Remark 7.3.1.13.

Remark 8.4.1.20. Let $\mathcal{D}$ be an ∞-category and let $F : \mathcal{C} \to \mathcal{D}$ be a morphism of simplicial sets. Then f is dense if and only if, for every object $Y \in \mathcal{D}$, the composite map 03VV

$$(\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/Y})^{\triangleright} \to \mathcal{D}_{/Y}^{\triangleright} \to \mathcal{D}$$

is a colimit diagram in $\mathcal{D}$.

Remark 8.4.1.21. Let κ be an uncountable regular cardinal and let $F : \mathcal{C} \to \mathcal{D}$ be a morphism of simplicial sets. Assume that $\mathcal{C}$ is essentially κ-small and that $\mathcal{D}$ is a locally κ-small ∞-category. Then, for each object $X \in \mathcal{D}$, the fiber product $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/X}$ is also essentially κ-small (Corollary 5.6.7.7). Let λ be an infinite cardinal satisfying $\mathrm{ecf}(\lambda) \geq \kappa$ (see Definition 4.7.3.16). Then F is dense if and only if, for every representable functor $h_Y : \mathcal{D}^{\mathrm{op}} \to \mathcal{S}^{<\lambda}$, the identity transformation $\mathrm{id} : h_Y \circ F^{\mathrm{op}} \to h_Y \circ F^{\mathrm{op}}$ exhibits the functor h_Y as a right Kan extension of $h_Y \circ F^{\mathrm{op}}$ along F^{op}. This follows by combining Remark 8.4.1.20 with Proposition 7.4.5.17 (together with Remark 7.4.5.19). 03VW

Proposition 8.4.1.22. *Let λ be an uncountable cardinal, let $\mathcal{D}$ be an ∞-category which is locally λ-small, and let* 03VX

$$h_{\bullet} : \mathcal{D} \to \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\lambda}) \qquad Y \mapsto h_Y$$

be a covariant Yoneda embedding for $\mathcal{D}$ (Definition 8.3.3.9). If $\mathcal{C}$ is a simplicial set, then a diagram $F : \mathcal{C} \to \mathcal{D}$ is dense if and only if the composite functor

$$\mathcal{D} \xrightarrow{h_{\bullet}} \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\lambda}) \xrightarrow{\circ F^{\mathrm{op}}} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda})$$

is fully faithful.

Proof. Choose an uncountable cardinal κ such that $\mathcal{C}$ is essentially κ-small and $\mathcal{D}$ is locally κ-small. Enlarging λ if necessary, we may assume that the exponential cofinality of λ is $\geq \kappa$ (see Remark 4.7.3.19). For each object $Y \in \mathcal{D}$, let $h_Y^{\circ} : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}^{<\lambda}$ denote the composite functor $h_Y \circ F^{\mathrm{op}}$, given on objects by the construction $C \mapsto \mathrm{Hom}_{\mathcal{D}}(F(C), Y)$. By virtue of Remark 8.4.1.21, it will suffice to show that the following conditions are equivalent:

(1_Y) The identity transformation $\mathrm{id} : h_Y \circ F^{\mathrm{op}} \to h_Y$ exhibits h_Y as a right Kan extension of h_Y° along the functor F^{op}.

(2_Y) For each object $X \in \mathcal{C}$, the composite map

$$\mathrm{Hom}_{\mathcal{D}}(X, Y) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S})}(h_X, h_Y) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})}(h^{\circ}_X, h^{\circ}_Y)$$

is a homotopy equivalence of Kan complexes.

Since the covariant Yoneda embedding $X \mapsto h_X$ is fully faithful (Theorem 8.3.3.13), we can reformulate (2_Y) as follows:

$(2'_Y)$ The restriction map

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\lambda})}(h_X, h_Y) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda})}(h^{\circ}_X, h^{\circ}_Y)$$

is a homotopy equivalence of Kan complexes.

The inequality $\kappa \leq \mathrm{ecf}(\lambda)$ guarantees that the ∞-category $\mathcal{S}^{<\lambda}$ admits κ-small limits (Corollary 7.4.1.13). Using Proposition 7.6.7.13, we can choose a functor $\mathscr{G} : \mathcal{D}^{\mathrm{op}} \to \mathcal{S}^{<\lambda}$ and a natural transformation $\alpha : \mathscr{G} \circ F^{\mathrm{op}} \to h^{\circ}_Y$ which exhibits $\mathscr{G}$ as a right Kan extension of h°_Y along the functor F^{op}. Invoking the universal mapping property of $\mathscr{G}$ (Proposition 7.3.6.1), we see that there exists a natural transformation $\beta : h_Y \to \mathscr{G}$ and a commutative diagram

03VY

$$\begin{tikzcd} & \mathscr{G} \circ F^{\mathrm{op}} \arrow[dr, "\alpha"] & \\ h_Y \circ F^{\mathrm{op}} \arrow[ur, "\beta"] \arrow[rr, "\mathrm{id}"] & & h^{\circ}_Y \end{tikzcd} \tag{8.50}$$

in the ∞-category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda})$. Using Remark 7.3.1.12, we see that condition (1_Y) is satisfied if and only if the natural transformation β is an isomorphism: that is, it induces a homotopy equivalence of Kan complexes $\beta_X : h_Y(X) \to \mathscr{G}(X)$ for each object $X \in \mathcal{D}$ (Theorem 4.4.4.4). Combining this observation with Proposition 8.3.1.3, we can reformulate (1_Y) as follows:

$(1'_Y)$ For each object $X \in \mathcal{C}$, precomposition with β induces a homotopy equivalence

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\lambda})}(h_X, h_Y) \xrightarrow{\circ[\beta]} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\lambda})}(h_X, \mathscr{G}).$$

Using the commutativity of (8.50), we see that the diagram of Kan complexes

$$\begin{tikzcd} & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\lambda})}(h_X, \mathscr{G}) \arrow[dr] & \\ \mathrm{Hom}_{\mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\lambda})}(h_X, h_Y) \arrow[ur, "\circ[\beta]"] \arrow[rr] & & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda})}(h^{\circ}_X, h^{\circ}_Y) \end{tikzcd}$$

commutes up to homotopy, where the diagonal map on the right is the homotopy equivalence of Proposition 7.3.6.1. It follows that conditions $(1'_Y)$ and $(2'_Y)$ are equivalent. □

Proof of Proposition 8.4.1.8. Let $\mathcal{D}$ be a locally small ∞-category and let $\mathcal{C} \subseteq \mathcal{D}$ be a full subcategory. By virtue of Example 8.4.1.16, it will suffice to show that the inclusion functor $\mathcal{C} \hookrightarrow \mathcal{D}$ is dense if and only if the restricted Yoneda embedding $\mathcal{D} \to \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is fully faithful. Following the convention of Remark 4.7.0.5, this is a special case of Proposition 8.4.1.22. □

Proposition 8.4.1.23. *Let $\mathcal{D}$ be an ∞-category, let $F : \mathcal{C} \to \mathcal{D}$ be a morphism of simplicial sets, and let $\mathcal{D}_0 \subseteq \mathcal{D}$ be a full subcategory which contains the image of F. If F is dense, then the subcategory $\mathcal{D}_0$ is dense.* `03VZ`

Proof. Using Proposition 4.1.3.2, we can factor F as a composition $\mathcal{C} \xrightarrow{F'} \mathcal{C}' \xrightarrow{F''} \mathcal{D}$, where F' is inner anodyne and F'' is an inner fibration. Using Remark 8.4.1.18, we see that the functor F' is dense. Replacing F by F'', we can reduce to proving Proposition 8.4.1.23 in the special case where $\mathcal{C}$ is an ∞-category.

Let γ denote the identity map id_F, which we regard as a natural transformation from F to $\mathrm{id}_{\mathcal{D}} \circ F$. Our assumption that F is dense guarantees that γ exhibits $\mathrm{id}_{\mathcal{D}}$ as a left Kan extension of F along F. To avoid confusion, let us write F_0 to denote the functor F, regarded as a functor from $\mathcal{C}$ to $\mathcal{D}_0$. Let $\iota : \mathcal{D}_0 \hookrightarrow \mathcal{D}$ denote the inclusion map, so that $F = \iota \circ F_0$. We can therefore also regard the identity map id_F as a natural transformation $\alpha : F \to \iota \circ F_0$. Our assumption that F is dense also guarantees that α exhibits ι as a left Kan extension of F along F_0. Note that $\gamma = \mathrm{id}_F$ is a composition of $\alpha = \mathrm{id}_F$ with $\beta|_{\mathcal{C}}$, where $\beta = \mathrm{id}_{\iota}$ is the identity transformation from ι to itself. Invoking the transitivity of Kan extensions (Proposition 7.3.8.18), we deduce that β exhibits the identity functor $\mathrm{id}_{\mathcal{D}}$ as a left Kan extension of ι along itself: that is, the functor ι is dense. Applying Example 8.4.1.16, we conclude that $\mathcal{D}_0$ is a dense subcategory of $\mathcal{D}$. □

Remark 8.4.1.24. Let $\mathcal{D}$ be an ∞-category and let $F : \mathcal{C} \to \mathcal{D}$ be a dense diagram. Choose another diagram $q : K \to \mathcal{D}$ and set $\widetilde{\mathcal{D}} = \mathcal{D}_{/q}$, so that the projection map $\pi : \widetilde{\mathcal{D}} \to \mathcal{D}$ is a right fibration. Then the projection map $\mathcal{C} \times_{\mathcal{D}} \widetilde{\mathcal{D}} \to \widetilde{\mathcal{D}}$ is dense. To prove this, it will suffice to show that for every object $Y \in \widetilde{\mathcal{D}}$, the induced map `03W0`

$$\theta : (\mathcal{C} \times_{\mathcal{D}} \widetilde{\mathcal{D}}_{/Y})^{\triangleright} \to \widetilde{\mathcal{D}}^{\triangleright}_{/Y} \to \widetilde{\mathcal{D}}$$

is a colimit diagram in $\widetilde{\mathcal{D}}$ (Remark 8.4.1.20). By virtue of Proposition 7.1.3.19, this is equivalent to the requirement that $\pi \circ \theta$ is a colimit diagram in $\mathcal{D}$. Unwinding the definitions, we see that $\pi \circ \theta$ is given by the composition

$$(\mathcal{C} \times_{\mathcal{D}} \widetilde{\mathcal{D}}_{/Y})^{\triangleright} \to (\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/\pi(Y)})^{\triangleright} \to \mathcal{D}^{\triangleright}_{/\pi(Y)} \to \mathcal{D}.$$

Since π is a right fibration, the map $\widetilde{\mathcal{D}}_{/Y} \to \mathcal{D}_{/\pi(Y)}$ is a trivial Kan fibration (Proposition 4.3.7.12). Using Corollary 7.2.2.2, we are reduced to showing that the map $(\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/\pi(Y)})^{\triangleright} \to \mathcal{D}^{\triangleright}_{/\pi(Y)} \to \mathcal{D}$ is a colimit diagram, which follows from our assumption that F is dense (Remark 8.4.1.20).

8.4.2 Density of Yoneda Embeddings

03W1 Our goal in this section is to prove the following result, which supplies an important source of examples of dense functors:

03W2 **Theorem 8.4.2.1.** *Let $\mathcal{C}$ be a locally small ∞-category, and let $h_{\bullet} : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ be a covariant Yoneda embedding (Definition 8.3.3.9). Then $h_{\bullet}$ is a dense functor.*

Since the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is fully faithful, Theorem 8.4.2.1 can be reformulated as follows:

03W3 **Corollary 8.4.2.2.** *Let $\mathcal{C}$ be a locally small ∞-category and let $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \subseteq \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ denote the full subcategory spanned by the representable functors. Then $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is a dense subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$.*

Proof. By virtue of Example 8.4.1.16, it will suffice to show that the inclusion map $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \hookrightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is a dense functor. Since the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \to \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is an equivalence of ∞-categories (Theorem 8.3.3.13), this is equivalent to the assertion that $h_{\bullet}$ is a dense functor from $\mathcal{C}$ to $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ (Remark 8.4.1.18), which follows from Theorem 8.4.2.1. □

03W4 **Example 8.4.2.3.** Let $\mathcal{S}_{\mathrm{cont}}$ denote the full subcategory of $\mathcal{S}$ spanned by the contractible Kan complexes. Then $\mathcal{S}_{\mathrm{cont}}$ is a dense subcategory of $\mathcal{S}$. This follows by applying Corollary 8.4.2.2 in the special case $\mathcal{C} = \Delta^0$. Moreover, the same assertion holds if we replace $\mathcal{S}_{\mathrm{cont}}$ by any nonempty subcategory of itself; for example, the full subcategory of $\mathcal{S}$ spanned by the standard 0-simplex Δ^0.

By virtue of the convention of Remark 4.7.0.5, Theorem 8.4.2.1 can be regarded as a special case of the following:

03W5 **Variant 8.4.2.4.** Let κ be an uncountable cardinal and let $\mathcal{C}$ be an ∞-category which is locally κ-small. Then the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ is a dense functor.

We will deduce Variant 8.4.2.4 from a more precise result. Recall that, if X is an object of a (locally small) ∞-category $\mathcal{C}$, then the representable functor $h_X \in \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ corepresents the evaluation functor $\mathrm{ev}_X : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \to \mathcal{S}$ (Remark 8.3.1.5). That is, for every functor $\mathscr{F} : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}$, there is a canonical homotopy equivalence

$$\mathscr{F}(X) \xrightarrow{\sim} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})}(h_X, \mathscr{F}),$$

which depends functorially on $\mathscr{F}$. The following result guarantees that this homotopy equivalence can also be chosen to depend functorially on X:

Proposition 8.4.2.5. *Let κ be an uncountable cardinal and let $\mathcal{C}$ be an ∞-category which is locally κ-small. Then the profunctor* 03W6

$$\mathrm{ev} : \mathcal{C}^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \to \mathcal{S}^{<\kappa} \qquad (X, \mathscr{F}) \mapsto \mathscr{F}(X)$$

is corepresentable by the covariant Yoneda embedding $h_\bullet : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$.

Proof. Let $\mathrm{Tw}(\mathcal{C})$ denote the twisted arrow ∞-category of $\mathcal{C}$, let $\lambda : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ be the left fibration of Proposition 8.1.1.11, and let $\underline{\Delta^0}_{\mathrm{Tw}(\mathcal{C})}$ denote the constant functor $\mathrm{Tw}(\mathcal{C}) \to \mathcal{S}^{<\kappa}$. Let $\mathscr{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \to \mathcal{S}^{<\kappa}$ denote the composition $\mathrm{ev} \circ (\mathrm{id} \times h_\bullet)$, so that $\mathscr{H}$ is a Hom-functor for $\mathcal{C}$. We can therefore choose a natural transformation

$$\alpha : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{C})} \to \mathscr{H} \circ \lambda = \mathrm{ev} \circ (\mathrm{id} \times h_\bullet) \circ \lambda$$

which exhibits $\mathscr{H}$ as a Hom-functor for $\mathcal{C}$, in the sense of Definition 8.3.5.1. By virtue of Proposition 8.3.4.15, it will suffice to show that the natural transformation α also exhibits the profunctor ev as corepresented by the functor $h_\bullet$, in the sense of Variant 8.3.4.16. Fix an object $X \in \mathcal{C}$, so that α carries the object $\mathrm{id}_X \in \mathrm{Tw}(\mathcal{C})$ to a vertex $\eta \in \mathscr{H}(X, X) = \mathrm{ev}(X, h_X)$. We wish to show that η exhibits evaluation functor $\mathrm{ev}_X : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \to \mathcal{S}^{<\kappa}$ as corepresented by h_X. This follows from Proposition 8.3.1.3, since η exhibits the functor h_X as represented by X. □

Example 8.4.2.6. Let $\mathcal{C}$ be a locally small category. Then the evaluation profunctor 03W7

$$\mathrm{ev} : \mathcal{C}^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \to \mathcal{S} \qquad (X, \mathscr{F}) \mapsto \mathscr{F}(X)$$

is corepresentable by the covariant Yoneda embedding $h_\bullet : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$.

Proof of Variant 8.4.2.4. Let κ be an uncountable cardinal and let $\mathcal{C}$ be an ∞-category which is locally κ-small. We wish to show that the covariant Yoneda embedding $h^{\mathcal{C}}_\bullet : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ is dense. Choose a cardinal $\lambda \geq \kappa$ for which the ∞-category $\mathcal{D} = \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ is locally λ-small, and let $h^{\mathcal{D}}_\bullet : \mathcal{D} \to \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\lambda})$ be a covariant Yoneda embedding for $\mathcal{D}$. By virtue of Proposition 8.4.1.22, it will suffice to show that the composite functor

$$\mathcal{D} \xrightarrow{h^{\mathcal{D}}_\bullet} \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\lambda}) \xrightarrow{\circ h^{\mathcal{C}}_\bullet} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda})$$

is fully faithful. Applying Proposition 8.4.2.5, we see that this functor is isomorphic to the inclusion of $\mathcal{D} = \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ as a full subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda})$. □

Using Proposition 8.4.2.5, we can also give an alternative characterization of the covariant transport representation associated to a left fibration of ∞-categories.

04BB **Corollary 8.4.2.7.** *Let $\mathcal{C}$ be a locally κ-small ∞-category, let $U : \widetilde{\mathcal{C}} \to \mathcal{C}$ be a right fibration, and let $\mathscr{F} : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}^{<\kappa}$ be a functor. The following conditions are equivalent:*

(1) *The functor $\mathscr{F}$ is a covariant transport representation for the left fibration $U^{\mathrm{op}} : \widetilde{\mathcal{C}}^{\mathrm{op}} \to \mathcal{C}^{\mathrm{op}}$.*

(2) *There exists a categorical pullback square*

$$\begin{tikzcd}
\widetilde{\mathcal{C}} \arrow[r] \arrow[d, "U"] & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})_{/\mathscr{F}} \arrow[d] \\
\mathcal{C} \arrow[r, "h_\bullet"] & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}),
\end{tikzcd}$$

where $h_\bullet$ is a covariant Yoneda embedding for $\mathcal{C}$.

Proof. Choose a cardinal $\lambda \geq \kappa$ such that $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ is locally λ-small, and let $H : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})^{\mathrm{op}} \to \mathcal{S}^{<\lambda}$ be a functor represented by $\mathscr{F} \in \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$. It follows from Proposition 5.6.6.21 that H is a covariant transport representation for the left fibration $(\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})_{/\mathscr{F}})^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})^{\mathrm{op}}$. Consequently, if condition (2) is satisfied, then $H \circ h_\bullet^{\mathrm{op}}$ is a covariant transport representation for the left fibration U^{op}. Proposition 8.4.2.5 implies that $H \circ h_\bullet^{\mathrm{op}}$ is isomorphic to $\mathscr{F}$. This proves the implication (2) $\Rightarrow$ (1), and the reverse implication follows from the fact that the equivalence class of a left fibration is determined by its covariant transport representation (Corollary 5.6.0.6). $\square$

8.4.3 Cocompletion via the Yoneda Embedding

03W8 Let $\mathcal{C}$ be an essentially small ∞-category. Our goal in this section is to prove Theorem 8.4.0.3, which asserts that the covariant Yoneda embedding $h_\bullet : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ exhibits $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ as a cocompletion of $\mathcal{C}$. We begin by formulating a slightly more general assertion.

04BC **Notation 8.4.3.1.** Let κ be an uncountable regular cardinal. If $\mathcal{C}$ and $\mathcal{D}$ are κ-cocomplete ∞-categories, we let $\mathrm{Fun}^{\kappa}(\mathcal{C}, \mathcal{D})$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$ spanned by those functors $F : \mathcal{C} \to \mathcal{D}$ which preserve κ-small colimits.

04BD **Definition 8.4.3.2.** Let κ be an uncountable regular cardinal. We say that a functor of ∞-categories $h : \mathcal{C} \to \widehat{\mathcal{C}}$ *exhibits $\widehat{\mathcal{C}}$ as a κ-cocompletion of* $\mathcal{C}$ if the following conditions are satisfied:

(1) The ∞-category $\widehat{\mathcal{C}}$ is κ-cocomplete.

(2) For every κ-cocomplete ∞-category $\mathcal{D}$, precomposition with h induces an equivalence of ∞-categories $\mathrm{Fun}^{\kappa}(\widehat{\mathcal{C}}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}, \mathcal{D})$.

Following the convention of Remark 4.7.0.5, we can regard Theorem 8.4.0.3 as a special case of the following more general assertion:

Theorem 8.4.3.3. *Let κ be an uncountable regular cardinal, let $\mathcal{C}$ be an ∞-category which is essentially κ-small, and let $h_{\bullet} : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ be a covariant Yoneda embedding for $\mathcal{C}$. Then $h_{\bullet}$ exhibits* $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ *as a κ-cocompletion of $\mathcal{C}$.* `04BE`

Warning 8.4.3.4. The conclusion of Theorem 8.4.3.3 is not necessarily satisfied if we assume only that $\mathcal{C}$ is locally κ-small. For example, suppose that $\mathcal{C} = S$ is a set of cardinality κ (regarded as a discrete simplicial set), and let $\mathcal{D}$ be (the nerve of) the partially ordered set $\{0 < 1\}$. Then we can identify objects of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ with collections of κ-small Kan complexes $\{X_s\}_{s \in S}$. Define a functor $\lambda : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \to \mathcal{D}$ by the formula `03WF`

$$\lambda(\{X_s\}_{s \in S}) = \begin{cases} 0 & \text{if } |\{s \in S : X_s \neq \emptyset\}| < \kappa \\ 1 & \text{otherwise,} \end{cases}$$

and let $\lambda_0 : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \to \mathcal{D}$ be the constant functor taking the value 0. The functors λ and λ_0 both preserve κ-small colimits and coincide on the image of the Yoneda embedding $h_{\bullet}$, but do not coincide in general.

The proof of Theorem 8.4.3.3 will require some preliminaries. Let κ be an uncountable cardinal, and let $\mathcal{C}$ be an ∞-category which is locally κ-small. In what follows, we let $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ spanned by the representable functors $\mathscr{F} : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}^{<\kappa}$. We will need the following elementary observation:

Lemma 8.4.3.5. *Let κ be an uncountable regular cardinal, let $\mathcal{C}$ be an ∞-category which is essentially κ-small, and let $\mathscr{F} : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}^{<\kappa}$ be a functor. Then the ∞-category* `03WG`

$$\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})_{/\mathscr{F}} = \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \times_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})_{/\mathscr{F}}$$

is essentially κ-small.

Proof. The ∞-category $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ is equivalent to $\mathcal{C}$ (Theorem 8.3.3.13), and is therefore essentially κ-small. Since κ is regular, it will suffice to show that each fiber of the right fibration $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})_{/\mathscr{F}} \to \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ is an essentially κ-small Kan complex (Corollary 5.6.7.7). Equivalently, we must show that for each object $\mathscr{G} \in \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$, the mapping space $X = \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})}(\mathscr{G}, \mathscr{F})$ is essentially κ-small. This follows from Proposition 8.3.1.3: if $\mathscr{G}$ is representable by the object $C \in \mathcal{C}$, then X is homotopy equivalent to the κ-small Kan complex $\mathscr{F}(C)$. □

We will deduce Theorem 8.4.3.3 from the following more precise assertion:

03WH **Theorem 8.4.3.6.** *Let κ be an uncountable regular cardinal, let $\mathcal{C}$ be an ∞-category which is essentially κ-small, and let $T : \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \to \mathcal{D}$ be a functor of ∞-categories. The following conditions are equivalent:*

(1) *The functor T preserves κ-small colimits.*

(2) *The functor T is left Kan extended from the full subcategory $\operatorname{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \subseteq \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$.*

Proof. We first show that (1) implies (2). Assume that the functor T preserves κ-small colimits and let $\mathscr{F} : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}^{<\kappa}$ be a functor; we wish to show that the composite functor

$$\operatorname{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})^{\triangleright}_{/\mathscr{F}} \to \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \xrightarrow{T} \mathcal{D}$$

is a colimit diagram in the ∞-category $\mathcal{D}$. Lemma 8.4.3.5 guarantees that the ∞-category $\operatorname{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})_{/\mathscr{F}}$ is essentially κ-small. Since T preserves κ-small colimits, it will suffice to show that the map $\operatorname{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})^{\triangleright}_{/\mathscr{F}} \to \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ is a colimit diagram (Remark 7.6.7.6), which follows from Corollary 8.4.2.2.

We now show that (2) implies (1). Assume that T is left Kan extended from the ∞-category $\operatorname{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$; we wish to show that it preserves κ-small colimits. Choose a cardinal λ such that $\mathcal{D}$ is locally λ-small. Enlarging λ if necessary, we may assume that it has exponential cofinality $\geq \kappa$ (Remark 4.7.3.19). By virtue of Proposition 7.4.5.17 (and Remark 7.4.5.19), it will suffice to show that for every representable functor $H : \mathcal{D}^{\mathrm{op}} \to \mathcal{S}^{<\lambda}$, the composition $H^{\mathrm{op}} \circ T$ preserves κ-small colimits. Since H^{op} preserves κ-small colimits (Proposition 7.4.5.17 and Remark 7.4.5.19), the functor $H^{\mathrm{op}} \circ T$ is left Kan extended from $\operatorname{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$. Consequently, to show that (2) implies (1), we may replace T by $H^{\mathrm{op}} \circ T$ and thereby reduce to the case where $\mathcal{D} = (\mathcal{S}^{<\lambda})^{\mathrm{op}}$, for some cardinal λ of exponential cofinality $\geq \kappa$.

Let $h_{\bullet} : \mathcal{C} \to \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ be a covariant Yoneda embedding for $\mathcal{C}$, and let $\mathscr{F}$ denote the composite functor

$$\mathcal{C}^{\mathrm{op}} \xrightarrow{h_{\bullet}^{\mathrm{op}}} \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})^{\mathrm{op}} \xrightarrow{T^{\mathrm{op}}} \mathcal{S}^{<\lambda}.$$

Using Remark 4.7.3.19 again, we can choose a cardinal $\lambda' \geq \lambda$ of exponential cofinality $\geq \kappa$ such that $\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda})$ is locally λ'-small. In what follows, we abuse notation by identifying T with the composite functor $\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \xrightarrow{T} (\mathcal{S}^{<\lambda})^{\mathrm{op}} \hookrightarrow (\mathcal{S}^{<\lambda'})^{\mathrm{op}}$. Note that, since the inclusion $\mathcal{S}^{<\lambda} \hookrightarrow \mathcal{S}^{<\lambda'}$ preserves κ-small limits (see Variant 7.4.5.8), this composite functor is also left Kan extended from $\operatorname{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$.

Let $H' : \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda})^{\mathrm{op}} \to \mathcal{S}^{<\lambda'}$ be a functor represented by $\mathscr{F} \in \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda})$, and let U denote the composite functor

$$\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \subseteq \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\lambda}) \xrightarrow{H'^{\mathrm{op}}} (\mathcal{S}^{<\lambda'})^{\mathrm{op}}.$$

Applying Proposition 8.4.2.5, we see that the composition $U \circ h_\bullet$ is isomorphic to the functor $\mathscr{F} = T \circ h_\bullet$. Since the covariant Yoneda embedding $h_\bullet : \mathcal{C} \to \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ is an equivalence of ∞-categories (Theorem 8.3.3.13), it follows that the functors U and T are isomorphic when restricted to $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$. Proposition 7.4.5.17 and Remark 7.4.5.19 guarantee that the functor U preserves κ-small colimits. Invoking the implication (1) ⇒ (2), we see that U is left Kan extended from $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$. Applying the universal property of Kan extensions (Corollary 7.3.6.13), we deduce that the functor T is isomorphic to U, and therefore also preserves κ-small colimits. □

Remark 8.4.3.7. In the statement of Theorem 8.4.3.6, it is not necessary to assume that the ∞-category $\mathcal{D}$ admits κ-small colimits (though we will primarily be interested in cases where this condition is satisfied). 03WJ

Example 8.4.3.8. Let $\mathcal{C}$ be a small ∞-category and let $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ spanned by the representable functors. Then a functor of ∞-categories $F : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \to \mathcal{D}$ preserves small colimits if and only if it is left Kan extended from $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$. 03WK

Proof of Theorem 8.4.3.3. Let κ be an uncountable regular cardinal and let $\mathcal{C}$ be an ∞-category which is essentially κ-small. It follows from Example 7.6.7.8 that the ∞-category $\mathcal{S}^{<\kappa}$ is κ-cocomplete, so that the functor ∞-category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ is also κ-cocomplete (Remark 7.6.7.5). Let $\mathcal{D}$ be an ∞-category which admits κ-small colimits. We wish to show that that the composite functor

$$\mathrm{Fun}^{\kappa}(\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}), \mathcal{D}) \to \mathrm{Fun}(\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}), \mathcal{D}) \xrightarrow{\circ h_\bullet} \mathrm{Fun}(\mathcal{C}, \mathcal{D})$$

is an equivalence of ∞-categories. Theorem 8.3.3.13 guarantees that the covariant Yoneda embedding $\mathcal{C} \to \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ is an equivalence of ∞-categories. We are therefore reduced to showing that the restriction functor

$$U : \mathrm{Fun}^{\kappa}(\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}), \mathcal{D}) \to \mathrm{Fun}(\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}), \mathcal{D}) \qquad F \mapsto F|_{\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})}$$

is an equivalence of ∞-categories. By virtue of Theorem 8.4.3.6, $\mathrm{Fun}^{\kappa}(\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}), \mathcal{D})$ is the full subcategory of $\mathrm{Fun}(\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}), \mathcal{D})$ spanned by those functors which are left Kan extended from $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$. Applying Corollary 7.3.6.15, we see that U restricts to a trivial Kan fibration

$$\mathrm{Fun}^{\kappa}(\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}), \mathcal{D}) \to \mathrm{Fun}'(\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}), \mathcal{D}),$$

where $\mathrm{Fun}'(\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}), \mathcal{D})$ denotes the full subcategory of $\mathrm{Fun}(\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}), \mathcal{D})$ spanned by those functors which admit a left Kan extension to $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$.

We will complete the proof by showing that every functor $f : \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \to \mathcal{D}$ admits a left Kan extension to $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$. Fix an object $\mathscr{F} \in \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ and let $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})_{/\mathscr{F}}$ be as in the statement of Lemma 8.4.3.5. By virtue of Corollary 7.3.5.8, it will suffice to show the diagram

$$\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})_{/\mathscr{F}} \to \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \xrightarrow{f} \mathcal{D}$$

admits a colimit in the ∞-category $\mathcal{D}$. Since $\mathcal{D}$ admits κ-small colimits, we are reduced to showing that the ∞-category $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})_{/\mathscr{F}}$ is essentially κ-small (see Remark 7.6.7.6), which follows from Lemma 8.4.3.5. □

03WL **Corollary 8.4.3.9.** *Let κ be an uncountable regular cardinal, let $\mathcal{C}$ be an ∞-category which is essentially κ-small, and let $h_{\bullet} : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ be a covariant Yoneda embedding for $\mathcal{C}$. Then every object $\mathscr{F} \in \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ can be realized as the colimit of a diagram*

$$\mathcal{K} \to \mathcal{C} \xrightarrow{h_{\bullet}} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}),$$

where $\mathcal{K}$ is a κ-small ∞-category.

Proof. Let $\mathcal{K}'$ denote the fiber product $\mathcal{C} \times_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathscr{F}}$. Combining Lemma 8.4.3.5 with Theorem 8.3.3.13, we deduce that $\mathcal{K}'$ is essentially κ-small. We can therefore choose an equivalence of ∞-categories $e : \mathcal{K} \to \mathcal{K}'$, where $\mathcal{K}$ is κ-small. Applying Theorem 8.4.3.3, we deduce that $\mathscr{F}$ is a colimit of the composite functor

$$\mathcal{K} \xrightarrow{e} \mathcal{K}' = \mathcal{C} \times_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathscr{F}} \to \mathcal{C} \xrightarrow{h_{\bullet}} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}).$$

□

05JC **Corollary 8.4.3.10.** *Let κ be an uncountable regular cardinal and let $\mathcal{C}$ be an ∞-category which is essentially κ-small, and let $h^{\mathcal{C}}_{\bullet} : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ be a covariant Yoneda embedding. Suppose we are given a functor*

$$T : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})^{\mathrm{op}} \to \mathcal{S}^{<\lambda},$$

where λ is a cardinal of exponential cofinality $< \kappa$. The following conditions are equivalent:

(1) *For each object $C \in \mathcal{C}$, the Kan complex $T(h^{\mathcal{C}}_{C})$ is essentially κ-small.*

(2) *The functor T preserves κ-small limits.*

Moreover, if these conditions are satisfied, then the functor T is representable by the object $\mathscr{F} = T \circ (h^{\mathcal{C}}_{\bullet})^{\mathrm{op}}$.

Proof. Assume first that T is representable by an object $\mathscr{G} \in \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$. In this case, Corollary 7.4.5.18 guarantees that T satisfies condition (2). To verify (1), we note that for each object $C \in \mathcal{C}$, Proposition 8.3.1.3 supplies a homotopy equivalence

$$T(h^{\mathcal{C}}_{C}) \simeq \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})}(h^{\mathcal{C}}_{C}, \mathscr{G}) \xrightarrow{\sim} \mathscr{G}(C);$$

the desired result now follows from the observation that $\mathscr{G}(C)$ is essentially κ-small.

We now prove the converse. Assume that T satisfies conditions (1) and (2) and set $\mathscr{F} = T \circ (h^{\mathcal{C}}_{\bullet})^{\mathrm{op}}$. Condition (1) guarantees that we can view $\mathscr{F}$ as an object of the ∞-category $\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$. Since λ has exponential cofinality $\geq \kappa$, the ∞-category $\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ is locally λ-small (Corollary 4.7.8.8). We can therefore choose a functor $T' : \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})^{\mathrm{op}} \to \mathcal{S}^{<\lambda}$ which is representable by $\mathscr{F}$ (Theorem 5.6.6.13). It follows from Proposition 8.4.2.5 that the composition $T' \circ (h^{\mathcal{C}}_{\bullet})^{\mathrm{op}}$ is isomorphic to the functor $\mathscr{F} = T \circ (h^{\mathcal{C}}_{\bullet})^{\mathrm{op}}$. Using condition (2) (and Corollary 7.4.5.18), we see that the functors T and T' both preserve κ-small limits. Applying Theorem 8.4.3.3, we conclude that T' is isomorphic to T, so that the functor T is also representable by the object $\mathscr{F}$. □

8.4.4 Example: Extensions as Adjoints

Let $f : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, where $\mathcal{C}$ is small and $\mathcal{D}$ admits small colimits. It follows from Theorem 8.4.0.3 that, up to isomorphism, the functor f factors as a composition 03WM

$$\mathcal{C} \xrightarrow{h_{\bullet}} \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \xrightarrow{F} \mathcal{D},$$

where $h_{\bullet}$ denotes a covariant Yoneda embedding for $\mathcal{C}$ and F is a functor which preserves small colimits. The functor F is uniquely determined up to isomorphism: by virtue of Theorem 8.4.3.6, it can be characterized as a left Kan extension of f along $h_{\bullet}$. Our goal in this section is to show that, if the ∞-category $\mathcal{D}$ is locally small, then we can give another characterization of the functor F: it is left adjoint to the functor

$$\mathcal{D} \to \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \qquad D \mapsto \operatorname{Hom}_{\mathcal{D}}(f(\bullet), D).$$

Proposition 8.4.4.1. *Let $f : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. Assume that $\mathcal{C}$ is essentially small, that $\mathcal{D}$ is cocomplete and locally small, and let* 03WN

$$h^{\mathcal{C}}_{\bullet} : \mathcal{C} \to \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \qquad h^{\mathcal{D}}_{\bullet} : \mathcal{D} \to \operatorname{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S})$$

be covariant Yoneda embeddings for $\mathcal{C}$ and $\mathcal{D}$, respectively. Let G denote the composite functor

$$\mathcal{D} \xrightarrow{h^{\mathcal{D}}_{\bullet}} \operatorname{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}) \xrightarrow{\circ f^{\mathrm{op}}} \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}).$$

Then the functor G admits a left adjoint $F : \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \to \mathcal{D}$. Moreover, the composition $F \circ h^{\mathcal{C}}_{\bullet}$ is isomorphic to f.

04BF **Corollary 8.4.4.2.** *Let κ be a regular cardinal, let $\mathcal{C}$ be an essentially κ-small ∞-category, let $\mathcal{D}$ be an ∞-category which is cocomplete and locally small, and let $F : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \to \mathcal{D}$ be a functor. The following conditions are equivalent:*

(1) *The functor F preserves small colimits.*

(2) *The functor F admits a right adjoint $G : \mathcal{D} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$.*

Proof. Assume that F preserves small colimits; we will show that it admits a right adjoint (the reverse implication follows from Corollary 7.1.3.21). Choose covariant Yoneda embeddings

$$h^{\mathcal{C}}_{\bullet} : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \qquad h^{\mathcal{D}}_{\bullet} : \mathcal{D} \to \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}),$$

set $f = F \circ h^{\mathcal{C}}_{\bullet}$, and let G denote the composite functor

$$\mathcal{D} \xrightarrow{h^{\mathcal{D}}_{\bullet}} \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}) \xrightarrow{\circ f^{\mathrm{op}}} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}).$$

It follows from Proposition 8.4.4.1 that G admits a left adjoint $F' : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \to \mathcal{D}$ such that $F' \circ h^{\mathcal{C}}_{\bullet}$ is isomorphic to $f = F \circ h^{\mathcal{C}}_{\bullet}$. Since the functor F' also preserves small colimits (Corollary 7.1.3.21), Theorem 8.4.0.3 implies that it is isomorphic to F. It follows that G is also a right adjoint of F. □

04BG **Corollary 8.4.4.3.** *Let $\mathcal{C}$ be an essentially small ∞-category and let $\mathscr{F} : \mathrm{Fun}(\mathcal{C}, \mathcal{S})^{\mathrm{op}} \to \mathcal{S}$ be a functor. The following conditions are equivalent:*

(1) *The functor $\mathscr{F}$ admits a left adjoint.*

(2) *The functor $\mathscr{F}$ is representable by an object of* $\mathrm{Fun}(\mathcal{C}, \mathcal{S})$.

(3) *The functor $\mathscr{F}$ preserves small limits.*

Proof. Since the identity functor $\mathrm{id} : \mathcal{S} \to \mathcal{S}$ is corepresentable (by the object $\Delta^0 \in \mathcal{S}$), the implication (1) ⇒ (2) follows from Corollary 6.2.4.2. The equivalence (2) ⇔ (3) is a special case of Corollary 8.4.3.10. The implication (3) ⇒ (1) follows by applying Corollary 8.4.4.2 to to the opposite functor $\mathscr{F}^{\mathrm{op}} : \mathrm{Fun}(\mathcal{C}, \mathcal{S}) \to \mathcal{S}^{\mathrm{op}}$. □

Following the convention of Remark 4.7.0.5, we will deduce Proposition 8.4.4.1 from the following more general assertion:

03WP **Variant 8.4.4.4.** Let κ be an uncountable regular cardinal and let $f : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. Assume that $\mathcal{C}$ is essentially κ-small, that $\mathcal{D}$ admits κ-small colimits, and that the morphism space $\mathrm{Hom}_{\mathcal{D}}(f(C), D)$ is essentially κ-small for every pair of objects $C \in \mathcal{C}$, $D \in \mathcal{D}$. Then the functor

$$G : \mathcal{D} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \qquad D \mapsto \mathrm{Hom}_{\mathcal{D}}(f(\bullet), D)$$

admits a left adjoint $F : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \to \mathcal{D}$ which preserves κ-small colimits. Moreover, the composite functor $\mathcal{C} \xrightarrow{h^{\mathcal{C}}_{\bullet}} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \xrightarrow{F} \mathcal{D}$ is isomorphic to f.

Proof. We first prove the existence of the functor F. Fix a cardinal λ of exponential cofinality $\geq \kappa$, so that the ∞-category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ is locally λ-small (see Corollary 4.7.8.8). By virtue of Proposition 6.2.4.1, it will suffice to show that for every functor $\mathscr{F} : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}^{<\kappa}$, the composite functor

$$\mathcal{D} \xrightarrow{G} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \xrightarrow{\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})}(\mathscr{F}, \bullet)} \mathcal{S}^{<\lambda}$$

is corepresentable by an object of $\mathcal{D}$. Since $\mathcal{D}$ admits κ-small colimits, the collection of functors $\mathscr{F}$ which satisfy this condition is closed under κ-small colimits (Remark 8.3.3.16). Using Corollary 8.4.3.9, we can reduce to the case where the functor $\mathscr{F}$ is representable by an object $C \in \mathcal{C}$. In this case, the object $\mathscr{F} \in \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ corepresents the evaluation functor $\mathrm{ev}_C : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ (Remark 8.3.1.5). It now follows from the definition of the functor G that the composition $\mathrm{ev}_C \circ G$ is corepresentable by the object $f(C) \in \mathcal{D}$.

Choose functor $F : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \to \mathcal{D}$ and a natural transformation $\epsilon : (F \circ G) \to \mathrm{id}_{\mathcal{D}}$ which exhibits F as a left adjoint to the functor G. It follows from Corollary 7.1.3.21 that the functor F preserves all colimits which exist in $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$; in particular, it preserves κ-small colimits. We will complete the proof by showing that $F \circ h^{\mathcal{C}}_{\bullet}$ is isomorphic to f.

For every pair of objects $X, Y \in \mathcal{C}$, let $\alpha_{X,Y}$ denote the morphism of Kan complexes

$$h^{\mathcal{C}}_{Y}(X) = \mathrm{Hom}_{\mathcal{C}}(X, Y) \to \mathrm{Hom}_{\mathcal{D}}(f(X), f(Y)) = G(f(Y))(X).$$

By virtue of Corollary 8.3.5.8, we can promote the construction $(X, Y) \mapsto \alpha_{X,Y}$ to a natural transformation of functors $\alpha : h^{\mathcal{C}}_{\bullet} \to G \circ f$. Let β denote a composition of the natural transformations

$$F \circ h^{\mathcal{C}}_{\bullet} \xrightarrow{F(\alpha)} F \circ G \circ f \xrightarrow{\epsilon} \mathrm{id}_{\mathcal{D}} \circ f = f.$$

We claim that β is an isomorphism in the ∞-category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$. By virtue of Theorem 4.4.4.4, it will suffice to show that β induces an isomorphism $\beta_X : F(h^{\mathcal{C}}_X) \to f(X)$ for each object $X \in \mathcal{C}$. Fix an object $D \in \mathcal{D}$; we wish to show that precomposition with β_X induces a homotopy equivalence of Kan complexes

$$\beta_{X,D} : \mathrm{Hom}_{\mathcal{D}}(f(X), D) \to \mathrm{Hom}_{\mathcal{D}}(F(h^{\mathcal{C}}_X), D) \simeq \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})}(h^{\mathcal{C}}_X, G(D))$$

We conclude by observing that $\beta_{X,D}$ is left homotopy inverse to the morphism

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})}(h^{\mathcal{C}}_X, G(D)) \to G(D)(X) \simeq \mathrm{Hom}_{\mathcal{D}}(f(X), D)$$

given by evaluation at $\mathrm{id}_X \in h^{\mathcal{C}}_X(X)$, which is a homotopy equivalence by virtue of Proposition 8.3.1.3 □

03WQ **Example 8.4.4.5** (Functoriality of the Presheaf Construction)**.** Let κ be an uncountable regular cardinal, let $f : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. Assume that $\mathcal{C}$ is essentially κ-small and that $\mathcal{D}$ is locally κ-small, and fix covariant Yoneda embeddings

$$h_{\bullet}^{\mathcal{C}} : \mathcal{C} \to \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \qquad h_{\bullet}^{\mathcal{D}} : \mathcal{D} \to \operatorname{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\kappa}).$$

Let $G : \operatorname{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \to \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ be given by precomposition with f. Then the functor G admits a left adjoint $F : \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \to \operatorname{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$. Moreover, the diagram of ∞-categories

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "h_{\bullet}^{\mathcal{C}}"] \arrow[d, "f"] & \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \arrow[d, "F"] \\
\mathcal{D} \arrow[r, "h_{\bullet}^{\mathcal{D}}"] & \operatorname{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\kappa}).
\end{tikzcd}$$

commutes up to isomorphism. This follows by applying Variant 8.4.4.4 to the composite functor $(h_{\bullet}^{\mathcal{D}} \circ f) : \mathcal{C} \to \operatorname{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$.

8.4.5 Adjoining Colimits to ∞-Categories

04BH Let $\mathcal{C}$ be an essentially small ∞-category and set $\widehat{\mathcal{C}} = \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$. Theorem 8.4.0.3 asserts that the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \to \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a cocompletion of $\mathcal{C}$: that is, it is freely generated from $\mathcal{C}$ by adjoining colimits of small diagrams. In this section, we consider a variant of this construction, where we adjoint colimits of an arbitrary collection of diagrams (and we drop the assumption that $\mathcal{C}$ is essentially small).

04BJ **Definition 8.4.5.1.** Let $\mathbb{K}$ be a collection of simplicial sets. We say that an ∞-category $\mathcal{C}$ is $\mathbb{K}$-*cocomplete* if it admits K-indexed colimits, for each $K \in \mathbb{K}$. If $\mathcal{C}$ and $\mathcal{D}$ are $\mathbb{K}$-cocomplete ∞-categories, we let $\operatorname{Fun}^{\mathbb{K}}(\mathcal{C}, \mathcal{D})$ denote the full subcategory of $\operatorname{Fun}(\mathcal{C}, \mathcal{D})$ spanned by those functors which preserve K-indexed colimits, for each $K \in \mathbb{K}$. We say that a functor of ∞-categories $h : \mathcal{C} \to \widehat{\mathcal{C}}$ *exhibits* $\widehat{\mathcal{C}}$ *as a* $\mathbb{K}$-*cocompletion of* $\mathcal{C}$ if the following conditions are satisfied:

- The ∞-category $\widehat{\mathcal{C}}$ is $\mathbb{K}$-cocomplete.
- For every $\mathbb{K}$-cocomplete ∞-category $\mathcal{D}$, precomposition with h induces an equivalence of ∞-categories $\operatorname{Fun}^{\mathbb{K}}(\widehat{\mathcal{C}}, \mathcal{D}) \to \operatorname{Fun}(\mathcal{C}, \mathcal{D})$.

04BK **Example 8.4.5.2.** Let κ be an uncountable regular cardinal, and let $\mathbb{K}$ denote the collection of all κ-small simplicial sets. Then an ∞-category $\mathcal{C}$ is $\mathbb{K}$-cocomplete if and only if it is κ-cocomplete, in the sense of Variant 7.6.7.7. A functor of ∞-categories $h : \mathcal{C} \to \widehat{\mathcal{C}}$ exhibits

$\widehat{\mathcal{C}}$ as a $\mathbb{K}$-cocompletion of $\mathcal{C}$ if and only if it exhibits $\widehat{\mathcal{C}}$ as a κ-cocompletion of $\mathcal{C}$, in the sense of Definition 8.4.3.2.

In particular, if $\mathbb{K}$ is the collection of all small simplicial sets, then an ∞-category $\mathcal{C}$ is a $\mathbb{K}$-cocomplete if and only if it is cocomplete, and a functor $h : \mathcal{C} \to \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$-cocompletion of $\mathcal{C}$ if and only if it exhibits $\widehat{\mathcal{C}}$ as a cocompletion of $\mathcal{C}$.

Our goal in this section is to prove the following existence result:

Proposition 8.4.5.3. *Let $\mathbb{K}$ be a collection of simplicial sets and let $\mathcal{C}$ be an ∞-category. Then there exists an ∞-category $\widehat{\mathcal{C}}$ and a functor $h : \mathcal{C} \to \widehat{\mathcal{C}}$ which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$-cocompletion of $\mathcal{C}$. Moreover, the functor h is dense and fully faithful.* 04BL

Warning 8.4.5.4. Let $\mathbb{K}$ be a collection of simplicial sets and let $h : \mathcal{C} \to \widehat{\mathcal{C}}$ be a functor of ∞-categories which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$-cocompletion of $\mathcal{C}$. In general, it is not true that every object of $\widehat{\mathcal{C}}$ can be recovered as the colimit of a diagram 04BM

$$K \to \mathcal{C} \xrightarrow{h} \widehat{\mathcal{C}}$$

for some $K \in \mathbb{K}$.

Let κ be an uncountable regular cardinal. If $\mathbb{K}$ is the collection of all κ-small simplicial sets and the ∞-category $\mathcal{C}$ is essentially κ-small, then Proposition 8.4.5.3 follows from Theorem 8.4.3.3; in this case, we can take $\widehat{\mathcal{C}}$ to be the ∞-category of functors $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$. To prove Proposition 8.4.5.3 in general, we will build on this special case.

Construction 8.4.5.5. Let $\mathbb{K}$ be a collection of simplicial sets and let $\mathcal{C}$ be an ∞-category. Choose an uncountable regular cardinal κ such that $\mathcal{C}$ is locally κ-small and every simplicial set $K \in \mathbb{K}$ is essentially κ-small. We let $\widehat{\mathcal{C}}$ denote the smallest full subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ which contains all representable functors and is closed under the formation of K-indexed colimits, for each $K \in \mathbb{K}$. Note that covariant Yoneda embedding for $\mathcal{C}$ determines a functor $h_{\bullet} : \mathcal{C} \to \widehat{\mathcal{C}}$, which is dense (by virtue of Variant 8.4.2.4 and Remark 8.4.1.19) and fully faithful (by virtue of Theorem 8.3.3.13). 04BN

Remark 8.4.5.6. In the situation of Construction 8.4.5.5, the ∞-category $\widehat{\mathcal{C}}$ is independent of the choice of κ (provided that κ is chosen large enough that $\mathcal{C}$ is locally κ-small and each $K \in \mathbb{K}$ is essentially κ-small). 04BP

Proposition 8.4.5.3 is an immediate consequence of the following more precise result:

Proposition 8.4.5.7. *Let $\mathbb{K}$ be a collection of simplicial sets, let $\mathcal{C}$ be an ∞-category, and define $\widehat{\mathcal{C}}$ as in Construction 8.4.5.5. Then the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \to \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$-cocompletion of $\mathcal{C}$.* 04BQ

The proof of Proposition 8.4.5.7 will require some preliminaries.

04BR **Lemma 8.4.5.8.** *Let $\mathbb{K}$ be a collection of simplicial sets, let $\mathcal{C}$ be an ∞-category, and define $\widehat{\mathcal{C}}$ as in Construction 8.4.5.5. Let $f : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, where $\mathcal{D}$ is $\mathbb{K}$-cocomplete. Then there exists a functor $F : \widehat{\mathcal{C}} \to \mathcal{D}$ and an isomorphism $f \to F|_{\mathcal{C}}$, where the functor F is left Kan extended from the essential image of the Yoneda embedding $h_{\bullet} : \mathcal{C} \to \widehat{\mathcal{C}}$. Moreover, the functor F preserves K-indexed colimits, for each $K \in \mathbb{K}$.*

Proof. Fix an uncountable regular cardinal κ such that $\mathcal{C}$ is essentially κ-small and each $K \in \mathbb{K}$ is essentially κ-small. By virtue of Corollary 8.3.3.17, we may assume without loss of generality that $\mathcal{D}$ is a replete full subcategory of a κ-cocomplete ∞-category $\mathcal{D}'$, and that the inclusion map $\mathcal{D} \hookrightarrow \mathcal{D}'$ preserves all κ-small colimits which exist in $\mathcal{D}$. By virtue of Theorem 8.4.3.3, we can also assume that f factors as a composition

$$\mathcal{C} \xrightarrow{h_{\bullet}} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \xrightarrow{F'} \mathcal{D}',$$

where F' preserves κ-small colimits. The full subcategory $F'^{-1}(\mathcal{D}) \subseteq \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ contains all representable functors and is closed under K-indexed colimits for each $K \in \mathbb{K}$, and therefore contains $\widehat{\mathcal{C}}$. It follows that F' restricts to a functor $F : \widehat{\mathcal{C}} \to \mathcal{D}$ which preserves K-indexed colimits for each $K \in \mathbb{K}$. Theorem 8.4.3.6 implies that F' is left Kan extended from the full subcategory $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$, so the functor $F = F'|_{\widehat{\mathcal{C}}}$ has the same property. □

04BS **Lemma 8.4.5.9.** *Let $\mathbb{K}$ be a collection of simplicial sets, let $\mathcal{C}$ be an ∞-category, and define $\widehat{\mathcal{C}}$ as in Construction 8.4.5.5. Let $\mathcal{D}$ be a $\mathbb{K}$-cocomplete ∞-category and let $F : \widehat{\mathcal{C}} \to \mathcal{D}$ be a functor. The following conditions are equivalent:*

(1) *The functor F is left Kan extended from the essential image of the Yoneda embedding $h_{\bullet} : \mathcal{C} \to \widehat{\mathcal{C}}$.*

(2) *The functor F preserves K-indexed colimits, for each $K \in \mathbb{K}$.*

Proof. Let F_0 denote the restriction of F to the essential image of $h_{\bullet}$. Applying Lemma 8.4.5.8, we deduce that F_0 admits a left Kan extension $F' : \widehat{\mathcal{C}} \to \mathcal{D}$ which preserves K-indexed colimits for each $K \in \mathbb{K}$. Invoking the universal property of Kan extensions (Corollary 7.3.6.9), we see that there is an essentially unique natural transformation $\alpha : F' \to F$ which restricts to the identity transformation from F_0 to itself. We can then reformulate condition (1) as follows:

(1′) The natural transformation α is an isomorphism. That is, for each object $X \in \widehat{\mathcal{C}}$, the induced map $\alpha_X : F'(X) \to F(X)$ is an isomorphism in the ∞-category $\mathcal{D}$.

The implication (1′) ⇒ (2) follows from the fact that F' preserves K-indexed colimits for each $K \in \mathbb{K}$. To prove the converse, let $\widehat{\mathcal{C}}' \subseteq \widehat{\mathcal{C}}$ denote the full subcategory spanned by those objects X for which α_X is an isomorphism in the ∞-category $\mathcal{D}$. By construction, $\widehat{\mathcal{C}}'$ contains all representable functors $\mathcal{C}^{\mathrm{op}} \to \mathcal{S}^{<\kappa}$. If condition (2) is satisfied, then $\widehat{\mathcal{C}}'$ is closed under the formation of K-indexed colimits for each $K \in \mathbb{K}$, and therefore coincides with $\widehat{\mathcal{C}}$. □

Proof of Proposition 8.4.5.7. Let $\mathbb{K}$ be a collection of simplicial sets, let $\mathcal{C}$ be an ∞-category, and let $\widehat{\mathcal{C}}$ be as in Construction 8.4.5.5. By construction, the ∞-category $\widehat{\mathcal{C}}$ is $\mathbb{K}$-cocomplete. To complete the proof, we must show that if $\mathcal{D}$ is any $\mathbb{K}$-cocomplete ∞-category, then composition with the covariant Yoneda embedding $h_\bullet : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ induces an equivalence of ∞-categories $\theta : \mathrm{Fun}^{\mathbb{K}}(\widehat{\mathcal{C}}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}, \mathcal{D})$.

Let $\mathcal{C}' \subseteq \widehat{\mathcal{C}}$ be the essential image of $h_\bullet$, so that θ factors as a composition

$$\mathrm{Fun}^{\mathbb{K}}(\widehat{\mathcal{C}}, \mathcal{D}) \xrightarrow{\theta'} \mathrm{Fun}(\mathcal{C}', \mathcal{D}) \xrightarrow{\theta''} \mathrm{Fun}(\mathcal{C}, \mathcal{D})$$

where θ'' is an equivalence of ∞-categories (Theorem 8.3.3.13). Using Lemma 8.4.5.9, we see that $\mathrm{Fun}^{\mathbb{K}}(\widehat{\mathcal{C}}, \mathcal{D})$ is the full subcategory of $\mathrm{Fun}(\widehat{\mathcal{C}}, \mathcal{D})$ spanned by those functors which are left Kan extended from $\mathcal{C}'$. It follows from Corollary 7.3.6.15 that θ' is a trivial Kan fibration onto a full subcategory of $\mathrm{Fun}(\mathcal{C}', \mathcal{D})$; in particular, it is fully faithful, so that θ is fully faithful. Lemma 8.4.5.8 implies that θ is essentially surjective, and therefore an equivalence of ∞-categories (Theorem 4.6.2.20). □

Corollary 8.4.5.10. *Let $\mathbb{K}$ be a collection of simplicial sets and let $h : \mathcal{C} \to \widehat{\mathcal{C}}$ be a functor of ∞-categories which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$-cocompletion of $\mathcal{C}$. Let $U : \mathcal{E} \to \widehat{\mathcal{C}}$ be a left fibration of ∞-categories. The following conditions are equivalent:* `05JD`

(1) *The covariant transport representation $\mathrm{Tr}_{\mathcal{E}/\widehat{\mathcal{C}}} : \widehat{\mathcal{C}} \to \mathcal{S}$ preserves K-indexed colimits, for each $K \in \mathbb{K}$.*

(2) *The projection map $\mathcal{E} \times_{\widehat{\mathcal{C}}} \mathcal{C} \to \mathcal{C}$ is left cofinal.*

Proof. It follows from Proposition 8.4.5.3 that the functor h is fully faithful. We can therefore replace $\mathcal{C}$ by its essential image and thereby reduce to the case where $\mathcal{C}$ is a replete full subcategory of $\widehat{\mathcal{C}}$ (and h is the inclusion functor). In this case, condition (1) is equivalent to the requirement that the functor $\mathrm{Tr}_{\mathcal{E}/\widehat{\mathcal{C}}}$ is left Kan extended from $\mathcal{C}$ (Lemma 8.4.5.9). The equivalence (1) ⇔ (2) is now a special case of Corollary 7.4.5.16. □

Remark 8.4.5.11. The $\mathcal{K}$-cocompletion construction of this section has been studied in more detail by Rezk; we refer the reader to [47] for more details. `04BT`

8.4.6 Recognition of Cocompletions

03WR Let $\mathcal{C}$ be an essentially small ∞-category, let $\widehat{\mathcal{C}}$ denote the ∞-category $\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$, and let $h : \mathcal{C} \to \widehat{\mathcal{C}}$ be a covariant Yoneda embedding for $\mathcal{C}$. Then:

(1) The functor h is fully faithful (Theorem 8.3.3.13).

(2) For each object $X \in \mathcal{C}$, the functor

$$\operatorname{Hom}_{\widehat{\mathcal{C}}}(h(X), \bullet) : \widehat{\mathcal{C}} \to \mathcal{S}$$

preserves small colimits (see Example 8.4.6.2 below).

(3) The ∞-category $\widehat{\mathcal{C}}$ is generated (under small colimits) by the essential image of h (in fact, the functor h is dense: see Theorem 8.4.2.1).

Our goal in this section is to prove the converse: if $h : \mathcal{C} \to \widehat{\mathcal{C}}$ is *any* functor which satisfies conditions (1) through (3), then h exhibits $\widehat{\mathcal{C}}$ as a cocompletion of $\mathcal{C}$ (Proposition 8.4.6.6) and is therefore equivalent to the covariant Yoneda embedding of $\mathcal{C}$. First, let us introduce a bit of terminology.

03WS **Definition 8.4.6.1.** Let $\mathcal{D}$ be a locally small ∞-category which admits small colimits. We say that an object $X \in \mathcal{D}$ is *atomic* if the corepresentable functor

$$h^X : \mathcal{D} \to \mathcal{S} \qquad Y \mapsto \operatorname{Hom}_{\mathcal{D}}(X, Y)$$

preserves small colimits.

03WT **Example 8.4.6.2** (Representable Functors are Atomic)**.** Let $\mathcal{C}$ be an essentially small ∞-category. Then every representable functor $\mathscr{F} : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}$ is atomic when regarded as an object of the ∞-category $\widehat{\mathcal{C}} = \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$. To see this, suppose that $\mathscr{F}$ is representable by an object $C \in \mathcal{C}$. Using Remark 8.3.1.5, we see that $\mathscr{F}$ corepresents the evaluation functor

$$\operatorname{ev}_C : \widehat{\mathcal{C}} = \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \to \mathcal{S} \qquad \mathscr{G} \mapsto \mathscr{G}(C),$$

and therefore preserves small colimits by virtue of Proposition 7.1.6.1.

03WU **Definition 8.4.6.3.** Let $\widehat{\mathcal{C}}$ be an ∞-category. We say that a full subcategory $\mathcal{C} \subseteq \widehat{\mathcal{C}}$ is *weakly dense* if the following condition is satisfied:

- Let $f : Y \to Z$ be a morphism of $\widehat{\mathcal{C}}$ such that, for every object $X \in \mathcal{C}$, the induced map

  $$\operatorname{Hom}_{\widehat{\mathcal{C}}}(X, Y) \xrightarrow{[f]\circ} \operatorname{Hom}_{\widehat{\mathcal{C}}}(X, Z)$$

  is a homotopy equivalence of Kan complexes. Then f is an isomorphism.

We say that a collection of objects $\{X_i\}_{i \in I}$ of $\widehat{\mathcal{C}}$ is *weakly dense* if it spans a weakly dense full subcategory of $\widehat{\mathcal{C}}$.

Remark 8.4.6.4. Let $\widehat{\mathcal{C}}$ be a locally small ∞-category. A full subcategory $\mathcal{C} \subseteq \widehat{\mathcal{C}}$ is weakly dense if and only if the restricted Yoneda embedding $\widehat{\mathcal{C}} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is conservative. 03WV

Example 8.4.6.5. Let $\widehat{\mathcal{C}}$ be an ∞-category and let $\mathcal{C} \subseteq \widehat{\mathcal{C}}$ be a full subcategory which generates $\widehat{\mathcal{C}}$ under colimits (see Warning 8.4.1.10). Then the full subcategory $\mathcal{C}$ is weakly dense. In particular, every dense subcategory of $\widehat{\mathcal{C}}$ is weakly dense. 03WW

Proposition 8.4.6.6. *Let $f : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, where $\mathcal{C}$ is essentially small. Then f exhibits $\mathcal{D}$ as a cocompletion of $\mathcal{C}$ (in the sense of Definition 8.4.0.1) if and only if the following conditions are satisfied:* 03WX

(0) *The ∞-category $\mathcal{D}$ is locally small and cocomplete.*

(1) *The functor f is fully faithful.*

(2) *For each object $C \in \mathcal{C}$, the image $f(C) \in \mathcal{D}$ is atomic.*

(3) *The collection of objects $\{f(C)\}_{C \in \mathcal{C}}$ is weakly dense in $\mathcal{D}$.*

Corollary 8.4.6.7. *Let $\mathcal{D}$ be an ∞-category. The following conditions are equivalent:* 03WY

(a) *There exists an essentially small ∞-category $\mathcal{C}$ and a functor $h : \mathcal{C} \to \mathcal{D}$ which exhibits $\mathcal{D}$ as a cocompletion of $\mathcal{C}$.*

(b) *The ∞-category $\mathcal{D}$ is locally small and cocomplete. Moreover, it contains a small collection of atomic objects $\{X_i\}_{i \in I}$ which is weakly dense.*

Proof. We first show that (a) implies (b). Without loss of generality, we may assume that $\mathcal{D} = \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$, where $\mathcal{C}$ is a small ∞-category. Since the ∞-category $\mathcal{S}$ is cocomplete (Corollary 7.4.5.6), the ∞-category $\mathcal{D}$ is also cocomplete (Remark 7.6.7.5). Corollary 4.7.8.9 guarantees that $\mathcal{D}$ is locally small. For each object $X \in \mathcal{C}$, let $h_X \in \mathcal{D}$ be a functor represented by X. The collection of objects $\{h_X\}_{X \in \mathcal{C}}$ span a full subcategory of $\mathcal{D}$ which is dense (Corollary 8.4.2.2), and therefore weakly dense (Example 8.4.6.5). We conclude by observing that each of the representable functors h_X is a atomic object of $\mathcal{D}$ (Example 8.4.6.2).

We now show that (b) implies (a). Assume that $\mathcal{D}$ is locally small and cocomplete. Let $\{X_i\}_{i \in I}$ be a small collection of atomic objects of $\mathcal{D}$, and let $\mathcal{D}_0 \subseteq \mathcal{D}$ be the full subcategory that they span. It follows from Proposition 4.7.8.7 that the ∞-category $\mathcal{D}_0$ is essentially small. If $\mathcal{D}_0$ is weakly dense in $\mathcal{D}$, then the inclusion map $\mathcal{D}_0 \hookrightarrow \mathcal{D}$ satisfies the hypotheses of Proposition 8.4.6.6, and therefore exhibits $\mathcal{D}$ as a cocompletion of $\mathcal{D}_0$. □

Let $f : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, where $\mathcal{C}$ is essentially small and $\mathcal{D}$ is cocomplete. Using Theorem 8.4.0.3, we see that f admits an essentially unique factorization as a composition

$$\mathcal{C} \xrightarrow{h_{\bullet}} \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \xrightarrow{F} \mathcal{D},$$

where the functor F preserves small colimits. As a first step towards the proof of Proposition 8.4.6.6, we study conditions which guarantee that F is fully faithful. With an eye towards future applications, we consider a slightly more general situation.

03X1 **Lemma 8.4.6.8.** *Let $\mathbb{K}$ be a collection of simplicial sets, let $h : \mathcal{C} \to \widehat{\mathcal{C}}$ be a functor of ∞-categories which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$-cocompletion of $\mathcal{C}$, and let $F : \widehat{\mathcal{C}} \to \mathcal{D}$ a functor which satisfies the following conditions:*

(0) *The ∞-category $\mathcal{D}$ is $\mathbb{K}$-cocomplete and the functor F preserves K-indexed colimits, for each $K \in \mathbb{K}$.*

(1) *The functor $f = F \circ h$ is fully faithful.*

(2) *Let κ be an uncountable regular cardinal such that $\mathcal{D}$ is locally κ-small and each $K \in \mathbf{K}$ is essentially κ-small. Then, for each $C \in \mathcal{C}$, the corepresentable functor*

$$\mathcal{D} \to \mathcal{S}^{<\kappa} \qquad D \mapsto \operatorname{Hom}_{\mathcal{D}}(f(C), D)$$

preserves K-indexed colimits, for each $K \in \mathbb{K}$.

Then F is fully faithful.

Proof. By virtue of Proposition 8.4.5.7, we may assume without loss of generality that $\widehat{\mathcal{C}}$ is the smallest replete full subcategory of $\operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ which contains all representable functors and is closed under the formation of K-indexed colimits for $K \in \mathbb{K}$ (see Construction 8.4.5.5). For every pair of objects $\mathscr{G}, \mathscr{G}' \in \widehat{\mathcal{C}}$, the functor F induces a morphism of Kan complexes

$$\theta_{\mathscr{G},\mathscr{G}'} : \operatorname{Hom}_{\widehat{\mathcal{C}}}(\mathscr{G}, \mathscr{G}') \to \operatorname{Hom}_{\mathcal{D}}(F(\mathscr{G}), F(\mathscr{G}')).$$

By virtue of Corollary 8.3.5.8 (and Remark 8.3.5.9), we can promote the construction $(\mathscr{G}, \mathscr{G}') \mapsto \theta_{\mathscr{G},\mathscr{G}'}$ to a functor of ∞-categories

$$\theta : \widehat{\mathcal{C}}^{\mathrm{op}} \times \widehat{\mathcal{C}} \to \operatorname{Fun}(\Delta^1, \mathcal{S}^{<\kappa}).$$

We wish to show that, for every pair of objects $\mathscr{G}, \mathscr{G}' \in \widehat{\mathcal{C}}$, the morphism $\theta_{\mathscr{G},\mathscr{G}'}$ is a homotopy equivalence. Let us first regard the functor $\mathscr{G}'$ as fixed. Let $\widehat{\mathcal{C}}'$ denote the full subcategory of $\widehat{\mathcal{C}}$ spanned by those objects $\mathscr{G}$ for which $\theta_{\mathscr{G},\mathscr{G}'}$ is a homotopy equivalence. For each $K \in \mathbb{K}$, our assumption that F preserves K-indexed colimits guarantees that the functor $\mathscr{G} \mapsto \theta_{\mathscr{G},\mathscr{G}'}$ preserves K^{op}-indexed limits (Proposition 7.4.5.17). Consequently, the full subcategory $\widehat{\mathcal{C}}' \subseteq \widehat{\mathcal{C}}$ is closed under the formation of K-indexed colimits. It will therefore suffice to show that $\theta_{\mathscr{G},\mathscr{G}'}$ is a homotopy equivalence in the special case where $\mathscr{G} = h_C$ is the functor represented by some object $C \in \mathcal{C}$.

Let us now regard $\mathscr{G} = h_C$ as fixed. Combining Example 8.4.6.2 with assumption (2), we deduce that the functor

$$\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \to \mathrm{Fun}(\Delta^1, \mathcal{S}^{<\lambda}) \qquad \mathscr{G}' \mapsto \theta_{\mathscr{G},\mathscr{G}'}$$

preserves K-indexed colimits, for each $K \in \mathbb{K}$. Invoking Corollary 8.4.3.9 again, we are reduced to proving that $\theta_{\mathscr{G},\mathscr{G}'}$ is a homotopy equivalence in the special case where $\mathscr{G}' = h_{C'}$ for some object $C' \in \mathcal{C}$. In this case, we have a commutative diagram of Kan complexes

$$\begin{tikzcd}
 & \mathrm{Hom}_{\mathcal{C}}(C, C') \arrow[dl] \arrow[dr] & \\
\mathrm{Hom}_{\widehat{\mathcal{C}}}(\mathscr{G}, \mathscr{G}') \arrow[rr, "\theta_{\mathscr{G},\mathscr{G}'}"] & & \mathrm{Hom}_{\mathcal{D}}(F(\mathscr{G}), F(\mathscr{G}')),
\end{tikzcd}$$

where the left vertical map is a homotopy equivalence by virtue of Yoneda's lemma (Theorem 8.3.3.13) and the right vertical map is a homotopy equivalence by virtue of assumption (1). It follows that lower horizontal map is also a homotopy equivalence. □

Proof of Proposition 8.4.6.6. Let $\mathcal{C}$ be an essentially small ∞-category, let $\mathcal{D}$ be a cocomplete ∞-category, and let $f : \mathcal{C} \to \mathcal{D}$ be a functor. By virtue of Theorem 8.4.0.3, the functor f admits an essentially unique factorization as a composition

$$\mathcal{C} \xrightarrow{h_\bullet} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \xrightarrow{F} \mathcal{D},$$

where $h_\bullet$ is the covariant Yoneda embedding for $\mathcal{C}$ and the functor F preserves small colimits. Moreover, f exhibits $\mathcal{D}$ as a cocompletion of $\mathcal{C}$ if and only if the functor F is an equivalence of ∞-categories. If this condition is satisfied, then $\mathcal{D}$ is locally small (Corollary 4.7.8.9), the functor f is fully faithful (Theorem 8.3.3.13), the essential image of f consists of atomic objects of $\mathcal{D}$ (Example 8.4.6.2). We may therefore assume without loss of generality that f satisfies conditions (0), (1), and (2) of Proposition 8.4.6.6, so that F is fully faithful (Lemma 8.4.6.8). Using Proposition 8.4.4.1, we see that the functor F admits a right adjoint $G : \mathcal{D} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$, given on objects by the formula $G(D)(C) = \mathrm{Hom}_{\mathcal{D}}(f(C), D)$. By virtue of Corollary 6.2.2.19, the functor F is an equivalence if and only if the functor G is conservative: that is, if and only if the collection of objects $\{f(C)\}_{C \in \mathcal{C}}$ is weakly dense. □

Proposition 8.4.6.6 has a counterpart for more general cocompletions:

03WZ **Variant 8.4.6.9.** Let $\mathbb{K}$ be a collection of simplicial sets and let $f : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. Then f exhibits $\mathcal{D}$ as a $\mathbb{K}$-cocompletion of $\mathcal{C}$ (in the sense of Definition 8.4.5.1) if and only if the following conditions are satisfied:

(0) The ∞-category $\mathcal{D}$ is $\mathbb{K}$-cocomplete.

(1) The functor f is fully faithful.

(2) Let κ be an uncountable regular cardinal such that $\mathcal{D}$ is locally κ-small and each $K \in \mathbf{K}$ is essentially κ-small. Then, for each $C \in \mathcal{C}$, the corepresentable functor

$$\mathcal{D} \to \mathcal{S}^{<\kappa} \qquad D \mapsto \mathrm{Hom}_{\mathcal{D}}(f(C), D)$$

preserves K-indexed colimits, for each $K \in \mathbb{K}$.

(3) The ∞-category $\mathcal{D}$ is generated by the objects $\{f(C)\}_{C \in \mathcal{C}}$ under the formation of K-indexed colimits for $K \in \mathbb{K}$.

Proof. Let κ be as in (2), and let $\widehat{\mathcal{C}} \subseteq \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ denote the smallest replete full subcategory which contains all representable functors and is closed under the formation of K-indexed colimits, for each $K \in \mathbb{K}$ (see Construction 8.4.5.5). By virtue of Proposition 8.4.5.7, the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \to \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$-cocompletion of $\mathcal{C}$. Assume that $\mathcal{D}$ is $\mathbb{K}$-complete, so that f factors (up to isomorphism) as a composition $\mathcal{C} \xrightarrow{h_{\bullet}} \widehat{\mathcal{C}} \xrightarrow{F} \mathcal{D}$, where the functor F preserves K-indexed colimits for each $K \in \mathbb{K}$. To complete the proof, it will suffice to show that if f satisfies conditions (1), (2), and (3), then the functor F is an equivalence of ∞-categories (the reverse implication follows from Theorem 8.3.3.13 and Example 8.4.6.2). Applying Lemma 8.4.6.8, we see that the functor F is fully faithful and therefore restricts to an equivalence of $\widehat{\mathcal{C}}$ with a replete full subcategory $\mathcal{D}_0 \subseteq \mathcal{D}$. For each $K \in \mathbb{K}$, our assumption that F preserves K-indexed colimits guarantees that the subcategory $\mathcal{D}_0 \subseteq \mathcal{D}$ is closed under the formation of K-indexed colimits. Since $\mathcal{D}_0$ contains the essential image of the functor f, the equality $\mathcal{D}_0 = \mathcal{D}$ follows from assumption (3). □

05JE **Corollary 8.4.6.10.** *Let $\mathbb{K}$ be a collection of simplicial sets and let $f : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which exhibits $\mathcal{D}$ as a $\mathbb{K}$-cocompletion of $\mathcal{C}$. Let $\mathcal{C}_0 \subseteq \mathcal{C}$ be a full subcategory, and let $\mathcal{D}_0 \subseteq \mathcal{D}$ be the smallest full subcategory which contains the essential image of $f_0 : f|_{\mathcal{C}_0}$ and is closed under the formation of K-indexed colimits, for each $K \in \mathbb{K}$. Then the functor $f_0 : \mathcal{C}_0 \to \mathcal{D}_0$ exhibits $\mathcal{D}_0$ as a $\mathbb{K}$-cocompletion of $\mathcal{C}_0$.*

8.4.7 Slices of Cocompletions

04BU

Let $U : \widetilde{\mathcal{C}} \to \mathcal{C}$ be a functor between essentially small ∞-categories. Using Example 8.4.4.5, we see that U admits an essentially unique extension $\operatorname{Fun}(\widetilde{\mathcal{C}}^{\mathrm{op}}, \mathcal{S}) \to \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ which preserves small colimits. Our goal in this section is to show that, up to equivalence, this construction carries right fibrations to right fibrations. More precisely, if U is a right fibration, we show that $\operatorname{Fun}(\widetilde{\mathcal{C}}^{\mathrm{op}}, \mathcal{S})$ is equivalent to the slice ∞-category $\operatorname{Fun}(\widetilde{\mathcal{C}}^{\mathrm{op}}, \mathcal{S})_{/\mathscr{F}}$, where $\mathscr{F} : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}$ is a covariant transport representation for the left fibration U^{op} (Corollary 8.4.7.2). This is a consequence of the following:

Proposition 8.4.7.1. *Let $h : \mathcal{C} \to \widehat{\mathcal{C}}$ be a functor of ∞-categories which exhibits $\widehat{\mathcal{C}}$ as a cocompletion of $\mathcal{C}$, let $\mathscr{F} \in \widehat{\mathcal{C}}$ be an object, and let* 04BV

$$\begin{tikzcd}
\widetilde{\mathcal{C}} \arrow[r, "\widetilde{h}"] \arrow[d] & \widehat{\mathcal{C}}_{/\mathscr{F}} \arrow[d] \\
\mathcal{C} \arrow[r, "h"] & \widehat{\mathcal{C}}
\end{tikzcd}$$

be a categorical pullback square of ∞-categories. Then $\widetilde{h}$ exhibits $\widehat{\mathcal{C}}_{/\mathscr{F}}$ as a cocompletion of $\widetilde{\mathcal{C}}$.

Corollary 8.4.7.2. *Let $U : \widetilde{\mathcal{C}} \to \mathcal{C}$ be a right fibration between essentially small ∞-categories and let $\mathscr{F} : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}$ be a covariant transport representation for the left fibration U^{op}. Then there exists an equivalence of ∞-categories $T : \operatorname{Fun}(\widetilde{\mathcal{C}}^{\mathrm{op}}, \mathcal{S}) \to \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathscr{F}}$ for which the diagram of ∞-categories* 04BW

$$\begin{tikzcd}
\widetilde{\mathcal{C}} \arrow[r, "h^{\widetilde{\mathcal{C}}}_{\bullet}"] \arrow[dd, "U"] & \operatorname{Fun}(\widetilde{\mathcal{C}}^{\mathrm{op}}, \mathcal{S}) \arrow[d, "T"] \\
 & \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathscr{F}} \arrow[d] \\
\mathcal{C} \arrow[r, "h^{\mathcal{C}}_{\bullet}"] & \operatorname{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})
\end{tikzcd}$$

commutes up to isomorphism. Here $h^{\mathcal{C}}_{\bullet}$ and $h^{\widetilde{\mathcal{C}}}_{\bullet}$ denote covariant Yoneda embeddings for $\mathcal{C}$ and $\widetilde{\mathcal{C}}$, respectively.

Proof. Using Corollary 8.4.2.7, we can choose categorical pullback square

$$\begin{tikzcd} \widetilde{\mathcal{C}} \arrow[r, "\widetilde{h}"] \arrow[d, "U"] & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathscr{F}} \arrow[d] \\ \mathcal{C} \arrow[r, "h^{\mathcal{C}}_{\bullet}"] & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}). \end{tikzcd}$$

It follows from Theorem 8.4.0.3 that the functor $\widetilde{h}$ factors (up to isomorphism) as a composition

$$\widetilde{\mathcal{C}} \xrightarrow{h^{\widetilde{\mathcal{C}}}_{\bullet}} \mathrm{Fun}(\widetilde{\mathcal{C}}^{\mathrm{op}}, \mathcal{S}) \xrightarrow{T} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathscr{F}},$$

where the functor T preserves small colimits. To complete the proof, it will suffice to show that T is an equivalence of ∞-categories. This is equivalent to the assertion that $\widetilde{h}$ exhibits $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathscr{F}}$ as a cocompletion of $\widetilde{\mathcal{C}}$, which is a special case of Proposition 8.4.7.1. □

Proposition 8.4.7.1 is a special case of the following more general assertion:

04BX **Proposition 8.4.7.3.** *Let $\mathbb{K}$ be a collection of simplicial sets, let $h : \mathcal{C} \to \widehat{\mathcal{C}}$ be a functor which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$-cocompletion of $\mathcal{C}$, let $f : L \to \widehat{\mathcal{C}}$ be any morphism of simplicial sets, and let*

04BY
$$\begin{tikzcd} \widetilde{\mathcal{C}} \arrow[r, "\widetilde{h}"] \arrow[d] & \widehat{\mathcal{C}}_{/f} \arrow[d] \\ \mathcal{C} \arrow[r, "h"] & \widehat{\mathcal{C}} \end{tikzcd} \tag{8.51}$$

be a categorical pullback square of ∞-categories. Then $\widetilde{h}$ exhibits $\widehat{\mathcal{C}}_{/f}$ as a $\mathbb{K}$-cocompletion of $\widetilde{\mathcal{C}}$.

Proof. We will show that $\widetilde{h}$ satisfies the hypotheses of Variant 8.4.6.9:

(0) The ∞-category $\widehat{\mathcal{C}}_{/f}$ is $\mathbb{K}$-cocomplete: that is, it admits K-indexed colimits, for each $K \in \mathbb{K}$. This follows from Corollary 7.1.3.20, since the ∞-category $\widehat{\mathcal{C}}$ is $\mathbb{K}$-cocomplete.

(1) The functor $\widetilde{h}$ is fully faithful. This is a special case of Remark 4.6.2.7, since the diagram (8.51) is a categorical pullback square and the functor h is fully faithful.

(2) Choose an uncountable regular cardinal κ such that $\widehat{\mathcal{C}}$ and $\widehat{\mathcal{C}}_{/f}$ are locally κ-small, and each simplicial set $K \in \mathbb{K}$ is essentially κ-small. Choose an object $\widetilde{C} \in \widetilde{\mathcal{C}}$ having image $C \in \mathcal{C}$, and let

$$\mathscr{F} : \widehat{\mathcal{C}} \to \mathcal{S}^{<\kappa} \qquad \widetilde{\mathscr{F}} : \widehat{\mathcal{C}}_{/f} \to \mathcal{S}^{<\kappa}$$

be functors corepresented by the objects $X = h(C)$ and $\widetilde{X} = \widetilde{h}(\widetilde{C})$, respectively. For every simplicial set $K \in \mathbb{K}$, the functor $\mathscr{F}$ preserves K-indexed colimits, and we must show$\widetilde{\mathscr{F}}$ has the same property. Choose a colimit diagram $\widetilde{g} : K^{\triangleright} \to \widehat{\mathcal{C}}_{/f}$; we wish to show that $\widetilde{\mathscr{F}} \circ \widetilde{g}$ is a colimit diagram in the ∞-category $\mathcal{S}^{<\kappa}$. Let $g : K^{\triangleright} \to \widehat{\mathcal{C}}$ denote the composition of $\widetilde{g}$ with the projection map. Then g is a colimit diagram in $\widehat{\mathcal{C}}$ (Corollary 7.1.3.20), so $\mathscr{F} \circ g$ is a colimit diagram in the ∞-category $\mathcal{S}^{<\kappa}$. Define

$$\mathcal{E} = K^{\triangleright} \times_{\widehat{\mathcal{C}}} \widehat{\mathcal{C}}_{X/} \qquad \widetilde{\mathcal{E}} = K^{\triangleright} \times_{\widehat{\mathcal{C}}} \widehat{\mathcal{C}}_{X/}.$$

Using Proposition 5.6.6.21, we see that $\mathscr{F} \circ g$ and $\widetilde{\mathscr{F}} \circ \widetilde{g}$ are covariant transport representations for the left fibrations $\mathcal{E} \to K^{\triangleleft}$ and $\overline{\mathcal{E}} \to K^{\triangleleft}$, respectively. Our assumption that $\mathscr{F} \circ g$ is a colimit diagram guarantees that the inclusion map $K \times_{K^{\triangleleft}} \mathcal{E} \hookrightarrow \mathcal{E}$ is left cofinal, and we wish to show that the inclusion map $K \times_{K^{\triangleleft}} \widetilde{\mathcal{E}} \hookrightarrow \widetilde{\mathcal{E}}$ is also left cofinal (Corollary 7.4.5.15). This follows from Proposition 7.2.3.12, since the tautological map $\widetilde{\mathcal{E}} \to \mathcal{E}$ is a pullback of the projection map $(\widehat{\mathcal{C}}_{X/})_{/f} \to \widehat{\mathcal{C}}_{X/}$, and therefore a right fibration (Proposition 4.3.6.1).

(3) Let $\widehat{\mathcal{C}}'_{/f}$ denote the smallest replete full subcategory of $\widehat{\mathcal{C}}_{/f}$ which contains the essential image of $\widetilde{h}$ and is closed under the formation of K-indexed colimits for $K \in \mathbb{K}$. We wish to show that $\widehat{\mathcal{C}}'_{/f} = \widehat{\mathcal{C}}_{/f}$. Let $\widehat{\mathcal{C}}' \subseteq \widehat{\mathcal{C}}$ denote the full subcategory spanned by those objects $X \in \widehat{\mathcal{C}}$ having the property that every object $\widetilde{X} \in \widehat{\mathcal{C}}_{/f}$ lying over X belongs to $\widehat{\mathcal{C}}^{0}_{/f}$. We will complete the proof by showing that $\widehat{\mathcal{C}}' = \widehat{\mathcal{C}}$. Since the diagram (8.51) is a categorical pullback square, $\widehat{\mathcal{C}}'$ contains the essential image of the functor h. It will therefore suffice to show that $\widehat{\mathcal{C}}'$ is closed under the formation of K-indexed colimits, for each $K \in \mathbb{K}$. Fix a colimit diagram $g : K^{\triangleright} \to \widehat{\mathcal{C}}$ carrying the cone point of $K^{\triangleright}$ to an object $X \in \widehat{\mathcal{C}}$. Assume that $g|_K$ factors through $\widehat{\mathcal{C}}'$; we wish to show that X also belongs to $\widehat{\mathcal{C}}'$. Let $\widetilde{X}$ be an object of $\widehat{\mathcal{C}}_{/f}$ lying over X. Since the inclusion of the cone point into $K^{\triangleright}$ is right anodyne (Example 4.3.7.11), we can lift g to a diagram $\widetilde{g} : K^{\triangleright} \to \widehat{\mathcal{C}}_{/f}$ carrying the cone point to $\widetilde{X}$ (Proposition 4.2.4.5). The assumption that $g|_K$ factors through $\widehat{\mathcal{C}}'$ guarantees that $\widetilde{g}|_K$ factors through $\widehat{\mathcal{C}}^{0}_{/f}$. Since g is a colimit diagram, $\widetilde{g}$ is also a colimit diagram (Corollary 7.1.3.20). It follows that $\widetilde{X}$ belongs to $\widehat{\mathcal{C}}'_{/f}$. Allowing the object $\widetilde{X}$ to vary, we conclude that X belongs to $\widehat{\mathcal{C}}'$, as desired.

□

8.5 Retracts and Idempotents

Let $\mathcal{C}$ be a category containing an object X. Recall that an object $Y \in \mathcal{C}$ is a *retract of* 03Y9
X if there exist morphisms $i : Y \to X$ and $r : X \to Y$ satisfying $\mathrm{id}_Y = r \circ i$, so that we have

a commutative diagram

03YA
$$\begin{tikzcd}
& X \arrow[dr, "r"] & \\
Y \arrow[ur, "i"] \arrow[rr, "\mathrm{id}_Y"] & & Y.
\end{tikzcd} \tag{8.52}$$

In this case, we will refer to (8.52) as a *retraction diagram in $\mathcal{C}$*.

04BZ **Remark 8.5.0.1.** Let X and Y be objects of a category $\mathcal{C}$. Then a retraction diagram (8.52) can be viewed as a morphism from id_X to id_Y in the twisted arrow category $\mathrm{Tw}(\mathcal{C})$ of Construction 8.1.0.1. In particular, Y is a retract of X if and only if there exists a morphism $\mathrm{id}_X \to \mathrm{id}_Y$ in $\mathrm{Tw}(\mathcal{C})$.

There is a universal example of a retraction diagram:

03YB **Construction 8.5.0.2.** We define a category Ret as follows:

- The category Ret has exactly two objects, which we denote by $\widetilde{X}$ and $\widetilde{Y}$.
- The morphisms sets in Ret are given by

$$\mathrm{Hom}_{\mathrm{Ret}}(\widetilde{X}, \widetilde{X}) = \{\mathrm{id}_{\widetilde{X}}, \widetilde{e}\} \qquad \mathrm{Hom}_{\mathrm{Ret}}(\widetilde{X}, \widetilde{Y}) = \{\widetilde{r}\}$$
$$\mathrm{Hom}_{\mathrm{Ret}}(\widetilde{Y}, \widetilde{X}) = \{\widetilde{i}\} \qquad \mathrm{Hom}_{\mathrm{Ret}}(\widetilde{Y}, \widetilde{Y}) = \{\mathrm{id}_{\widetilde{Y}}\}.$$

- The composition law in Ret is given (on non-identity morphisms) by the formulae

$$\widetilde{r} \circ \widetilde{i} = \mathrm{id}_{\widetilde{Y}} \qquad \widetilde{i} \circ \widetilde{r} = \widetilde{e}$$
$$\widetilde{e} \circ \widetilde{i} = \widetilde{i} \qquad \widetilde{e} \circ \widetilde{e} = \widetilde{e} \qquad \widetilde{r} \circ \widetilde{e} = \widetilde{r}.$$

03YC **Exercise 8.5.0.3.** Let $\mathcal{C}$ be a category containing a retraction diagram

$$\begin{tikzcd}
& X \arrow[dr, "r"] & \\
Y \arrow[ur, "i"] \arrow[rr, "\mathrm{id}_Y"] & & Y.
\end{tikzcd}$$

Show that there is a unique functor $F : \mathrm{Ret} \to \mathcal{C}$ which is given on objects by $F(\widetilde{X}) = X$ and $F(\widetilde{Y}) = Y$, and also satisfies $F(\widetilde{i}) = i$ and $F(\widetilde{r}) = r$. We therefore obtain a bijection

$$\{\text{Functors } \mathrm{Ret} \to \mathcal{C}\} \xrightarrow{\sim} \{\text{Retraction diagrams in } \mathcal{C}\}.$$

In particular, an object $Y \in \mathcal{C}$ is a retract of another object $X \in \mathcal{C}$ if and only if there exists a functor $F : \mathrm{Ret} \to \mathcal{C}$ satisfying $F(\widetilde{X}) = X$ and $F(\widetilde{Y}) = Y$.

Our first goal in this section is to extend the theory of retracts to the setting of higher category theory. Here there are (at least) two ways that we might choose to proceed:

(a) Let $\mathcal{C}$ be an ∞-category containing an object X. We could define an object $Y \in \mathcal{C}$ to be a retract of X if there exist morphisms $i : Y \to X$ and $r : X \to Y$ such that the identity morphism id_Y is a composition of r with i, in the sense of Definition 1.4.4.1.

(b) Let $\mathcal{C}$ be an ∞-category containing an object X. We could define an object $Y \in \mathcal{C}$ to be a retract of X if there exists a functor of ∞-categories $F : \mathrm{N}_\bullet(\mathrm{Ret}) \to \mathcal{C}$ satisfying $F(\widetilde{X}) = X$ and $F(\widetilde{Y}) = Y$.

In §8.5.1, we show that these definitions are equivalent. Note that objects $X, Y \in \mathcal{C}$ satisfy condition (a) if and only if there exists a 2-simplex σ of $\mathcal{C}$ whose boundary is indicated in the diagram

$$\begin{tikzcd}
& X \arrow[dr, "r"] & \\
Y \arrow[ur, "i"] \arrow[rr, "\mathrm{id}_Y"] & & Y;
\end{tikzcd}$$

in this case, we will say that σ is a *retraction diagram in* $\mathcal{C}$ (Definition 8.5.1.19). We will establish the equivalence of (a) and (b) by showing that every retraction diagram in $\mathcal{C}$ can be extended to a functor $F : \mathrm{N}_\bullet(\mathrm{Ret}) \to \mathcal{C}$ (Corollary 8.5.1.28). In contrast with Exercise 8.5.0.3, the functor F is not necessarily unique; however, it is uniquely determined up to isomorphism (in fact, up to a contractible space of choices).

Our second goal in this section is to address the following:

Question 8.5.0.4. Given an ∞-category $\mathcal{C}$ and an object $X \in \mathcal{C}$, how can one classify the retracts of X? 03YD

In §8.5.2, we recall the answer to Question 8.5.0.4 in the situation where $\mathcal{C}$ is an ordinary category. We say that an endomorphism $e : X \to X$ is *idempotent* if it satisfies the identity $e \circ e = e$ (Definition 8.5.2.1). Every retraction diagram

03YE

$$\begin{tikzcd}
& X \arrow[dr, "r"] & \\
Y \arrow[ur, "i"] \arrow[rr, "\mathrm{id}_Y"] & & Y.
\end{tikzcd} \tag{8.53}$$

determines an idempotent endomorphism of X, given by the composition $e = i \circ r$ (Example 8.5.2.3). We say that an idempotent endomorphism is *split* if it can be obtained in this way

(Example 8.5.2.3). In this case, we can recover the retraction diagram (8.53) up to (unique) isomorphism from e; for example the object Y can be recovered as the equalizer of the pair of morphisms $(e, \mathrm{id}_X) : X \rightrightarrows X$ (see Corollary 8.5.2.5 and its proof). We therefore obtain a bijection

$$\{\text{Split idempotent endomorphisms of } X\} \simeq \{\text{Retraction Diagrams}\}/\text{Isomorphism}.$$

We can therefore reformulate Question 8.5.0.4 as follows:

03YF **Question 8.5.0.5.** What is the correct ∞-categorical counterpart of the notion of an idempotent endomorphism?

In §8.5.3, we propose an answer to Question 8.5.0.5. Let Idem denote the full subcategory of Ret spanned by the object $\widetilde{X}$ (Construction 8.5.2.7). We define an *idempotent in* $\mathcal{C}$ to be a functor of ∞-categories $F : \mathrm{N}_\bullet(\mathrm{Idem}) \to \mathcal{C}$ (Definition 8.5.3.1). Every retraction diagram in $\mathcal{C}$ can be extended to a functor $\overline{F} : \mathrm{N}_\bullet(\mathrm{Ret}) \to \mathcal{C}$, which we can restrict to obtain an idempotent $F : \mathrm{N}_\bullet(\mathrm{Idem}) \to \mathcal{C}$. We will say that an idempotent in $\mathcal{C}$ is *split* if it can be obtained in this way. In this case, we will show that $\overline{F}$ can be recovered from the idempotent F up to isomorphism (Corollary 8.5.3.10). Consequently, we obtain a bijection

$$\{\text{Split idempotents in } \mathcal{C}\}/\text{Isomorphism} \simeq \{\text{Retraction diagrams in } \mathcal{C}\}/\text{Isomorphism}.$$

To fully address Question 8.5.0.4, we also need to provide a criterion to determine when an idempotent splits. Here we have several closely related results:

- If $\mathcal{C}$ is (the nerve of) an ordinary category, then an idempotent endomorphism $e : X \to X$ is split if and only if the pair of morphisms $(e, \mathrm{id}_X) : X \rightrightarrows X$ admits an equalizer (or a coequalizer); see Corollary 8.5.2.5. If this condition is satisfied, then the (co)equalizer is the associated retract of X.
- If $\mathcal{C}$ is an ∞-category, then an idempotent $F : \mathrm{N}_\bullet(\mathrm{Idem}) \to \mathcal{C}$ is split if and only if it admits a limit (or a colimit); see Corollary 8.5.3.11. If this condition is satisfied, then the (co)limit is the associated retract of $X = F(\widetilde{X})$.
- Let $\mathcal{C}$ be an ∞-category and let $F : \mathrm{N}_\bullet(\mathrm{Idem}) \to \mathcal{C}$ be an idempotent, carrying the morphism $\widetilde{e} : \widetilde{X} \to \widetilde{X}$ of Idem to a morphism $e : X \to X$ of $\mathcal{C}$. Then F is split if and only if the sequential diagram

  $$\cdots \to X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \to \cdots$$

  admits a limit (or a colimit); see Proposition 8.5.4.16. If this condition is satisfied, then the (co)limit is the associated retract of X.

In §8.5.4, we study ∞-categories $\mathcal{C}$ in which every idempotent is split; if this condition is satisfied, we say that $\mathcal{C}$ is *idempotent complete* (Definition 8.5.4.1). Many ∞-categories which arise in practice are idempotent complete. For example, an ∞-category which admits sequential limits or colimits is automatically idempotent complete (Corollary 8.5.4.17). In §8.5.5, we show that every ∞-category $\mathcal{C}$ admits an *idempotent completion* $\widehat{\mathcal{C}}$ which is characterized (up to equivalence) by the existence of a functor $H : \mathcal{C} \to \widehat{\mathcal{C}}$ having the following properties:

- The ∞-category $\widehat{\mathcal{C}}$ is idempotent complete.
- The functor H is fully faithful.
- Every object of $\widehat{\mathcal{C}}$ is a retract of $H(X)$, for some object $X \in \mathcal{C}$.

Moreover, the idempotent completion $\widehat{\mathcal{C}}$ can be characterized by a universal mapping property: for every idempotent complete ∞-category $\mathcal{D}$, composition with H induces an equivalence of ∞-categories $\operatorname{Fun}(\widehat{\mathcal{C}}, \mathcal{D}) \to \operatorname{Fun}(\mathcal{C}, \mathcal{D})$ (see Proposition 8.5.5.2).

Let $\mathcal{C}$ be an ∞-category, let X be an object of $\mathcal{C}$, and let $e : X \to X$ be an endomorphism of X. We will say that e is *idempotent* if there exists a functor $F : \mathrm{N}_{\bullet}(\mathrm{Idem}) \to \mathcal{C}$ satisfying $F(\widetilde{X}) = X$ and $F(\widetilde{e}) = e$. If $\mathcal{C}$ is (the nerve of) an ordinary category, then the functor F is completely determined by the pair (X, e). In general, this need not be true: the simplicial set $\mathrm{N}_{\bullet}(\mathrm{Idem})$ contains a nondegenerate simplex of every dimension (Remark 8.5.3.3), so the specification of F requires an infinite quantity of data. Nevertheless, we prove in §8.5.6 that F is determined by the pair (X, e) up to (canonical) isomorphism (Corollary 8.5.6.5). This motivates the following:

Question 8.5.0.6. Let $\mathcal{C}$ be an ∞-category and let $e : X \to X$ be an endomorphism in $\mathcal{C}$. How can one determine if e is idempotent? 03YG

Let us first record a necessary condition. We say that an endomorphism $e : X \to X$ is *homotopy idempotent* if the homotopy class $[e]$ is an idempotent endomorphism in the homotopy category $\mathrm{h}\mathcal{C}$ (Definition 8.5.7.1). It follows immediately from the definitions that every idempotent endomorphism in $\mathcal{C}$ is homotopy idempotent. In §8.5.7, we show that the converse is false in general (Proposition 8.5.7.15), though it is true in some important special cases (see Corollary 8.5.7.6 and Exercise 8.5.7.8).

For every integer $n \geq 0$, let $\mathrm{N}_{\leq n}(\mathrm{Idem})$ denote the n-skeleton of the simplicial set $\mathrm{N}_{\bullet}(\mathrm{Idem})$ (Variant 1.3.1.6). Note that an endomorphism $e : X \to X$ in $\mathcal{C}$ can be identified with a diagram $F : \mathrm{N}_{\leq 1}(\mathrm{Idem}) \to \mathcal{C}$ (Example 8.5.8.2), and that e is homotopy idempotent if and only if F admits an extension to $\mathrm{N}_{\leq 2}(\mathrm{Idem})$ (Example 8.5.8.3). In §8.5.8, we address Question 8.5.0.6 by showing that e is idempotent if and only if F admits an extension to $\mathrm{N}_{\leq 3}(\mathrm{Idem})$ (Corollary 8.5.8.8). As an application, we show that the construction $\mathcal{C} \mapsto \operatorname{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C})$ commutes with filtered colimits, up to equivalence (Corollary 8.5.8.9).

8.5.1 Retracts in ∞-Categories

03YH The notion of retract has an obvious counterpart in the setting of ∞-categories.

03YJ **Definition 8.5.1.1.** Let $\mathcal{C}$ be an ∞-category containing an object X. We say that an object $Y \in \mathcal{C}$ is a *retract of* X if there exist morphisms $i : Y \to X$ and $r : X \to Y$ for which the identity morphism id_Y is a composition of i and r, in the sense of Definition 1.4.4.1.

03YK **Remark 8.5.1.2.** Let $\mathcal{C}$ be an ∞-category containing an object X. Then an object $Y \in \mathcal{C}$ is a retract of X (in the sense of Definition 8.5.1.1) if and only if it is a retract of X when viewed as an object of the homotopy category $\mathrm{h}\mathcal{C}$.

04K9 **Variant 8.5.1.3.** Let $\mathcal{C}$ be an ∞-category containing morphisms $f : X \to X'$ and $g : Y \to Y'$. The following conditions are equivalent:

(1) The morphism g is a retract of f in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$.

(2) The homotopy class $[g]$ is a retract of $[f]$ in the ordinary category $\mathrm{Fun}([1], \mathrm{h}\mathcal{C})$.

The implication (1) $\Rightarrow$ (2) is immediate. Conversely, suppose that (2) is satisfied. Then we can choose a commutative diagram

$$\begin{tikzcd}
Y \arrow[r, "{[i]}"] \arrow[d, "{[g]}"] & X \arrow[r, "{[r]}"] \arrow[d, "{[f]}"] & Y \arrow[d, "{[g]}"] \\
Y' \arrow[r, "{[i']}"] & X' \arrow[r, "{[r']}"] & Y'
\end{tikzcd}$$

in the homotopy category $\mathrm{h}\mathcal{C}$, where the horizontal compositions are the identity morphisms $[\mathrm{id}_Y]$ and $[\mathrm{id}_{Y'}]$, respectively. By virtue of Exercise 1.5.2.10, the squares on the left and right of this diagram can be lifted to commutative diagrams in the ∞-category $\mathcal{C}$, which we can identify with morphisms $\alpha : g \to f$ and $\beta : f \to g$ in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$. Beware that the composition $(\beta \circ \alpha) : g \to g$ need not be homotopic to the identity morphism id_g. However, the criterion of Theorem 4.4.4.4 guarantees that $\beta \circ \alpha$ is an isomorphism in $\mathrm{Fun}(\Delta^1, \mathcal{C})$. In particular, α admits a left homotopy inverse, and therefore exhibits g as a retract of f.

03YL **Remark 8.5.1.4.** Let $\mathcal{C}$ be a category containing an object X. Then an object $Y \in \mathcal{C}$ is retract of X if and only if it is a retract of X when viewed as an object of the ∞-category $\mathrm{N}_\bullet(\mathcal{C})$ (in the sense of Definition 8.5.1.1). Consequently, Definition 8.5.1.1 can be viewed as a generalization of the classical notion of retract.

03YM **Example 8.5.1.5.** Let $\mathcal{C}$ be an ∞-category containing an object X. If an object $Y \in \mathcal{C}$ is isomorphic to X, then Y is a retract of X. In particular, the object X is a retract of itself.

Remark 8.5.1.6 (Transitivity)**.** Let $\mathcal{C}$ be an ∞-category containing objects X, Y, and Z. If Y is a retract of X and Z is a retract of Y, then Z is a retract of X. To prove this, it suffices to establish the analogous result for the homotopy category $\mathrm{h}\mathcal{C}$ (Remark 8.5.1.2), which follows immediately from Remark 8.5.0.1. `03YN`

In practice, many important properties of an object X of an ∞-category $\mathcal{C}$ are inherited by any retract of X. We record a few examples of this phenomenon which will be useful later.

Proposition 8.5.1.7 (Retracts of Isomorphisms)**.** *Let $\mathcal{C}$ be an ∞-category containing morphisms $f : X \to X'$ and $g : Y \to Y'$. Suppose that g is a retract of f (when regarded as objects of the arrow ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$). If f is an isomorphism, then g is also an isomorphism.* `03YP`

Proof. By virtue of Variant 8.5.1.3, we may assume that $\mathcal{C}$ is (the nerve of) an ordinary category. Choose a commutative diagram

$$\begin{tikzcd}
Y \arrow[r, "i"] \arrow[d, "g"] & X \arrow[r, "r"] \arrow[d, "f"] & Y \arrow[d, "g"] \\
Y' \arrow[r, "i'"] & X' \arrow[r, "r'"] & Y',
\end{tikzcd}$$

where the horizontal compositions are the identity morphisms id_Y and $\mathrm{id}_{Y'}$, respectively. If f is an isomorphism, then g is also an isomorphism, with inverse given by the composition $Y' \xrightarrow{i'} X' \xrightarrow{f^{-1}} X \xrightarrow{r} Y$. This follows from the calculations

$$g \circ r \circ f^{-1} \circ i' = r' \circ f \circ f^{-1} \circ i' = r' \circ \mathrm{id}_{X'} \circ i' = r' \circ i' = \mathrm{id}_{Y'}$$

$$r \circ f^{-1} \circ i' \circ g = r \circ f^{-1} \circ f \circ i = r \circ \mathrm{id}_X \circ i = r \circ i = \mathrm{id}_Y .$$

□

Proposition 8.5.1.8. *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose that every object $Y \in \mathcal{C}$ is a retract of some object $X \in \mathcal{C}^0$. Then F is left and right Kan extended from $\mathcal{C}^0$.* `03YQ`

Proof. We will show that F is left Kan extended from $\mathcal{C}^0$; the assertion that F is right Kan extended from $\mathcal{C}^0$ follows by a similar argument. Choose a regular cardinal κ for which $\mathcal{C}$ is essentially κ-small. Using Corollary 8.3.3.17, we can choose a fully faithful functor $\mathcal{D} \to \widehat{\mathcal{D}}$, where $\widehat{\mathcal{D}}$ admits κ-small colimits. By virtue of Remark 7.3.1.13, we can replace $\mathcal{D}$ by $\widehat{\mathcal{D}}$ and thereby reduce to proving Proposition 8.5.1.8 in the special case where $\mathcal{D}$ admits κ-small colimits.

Set $F^0 = F|_{\mathcal{C}^0}$. Using Proposition 7.6.7.13, we can extend F^0 to a functor $F' : \mathcal{C} \to \mathcal{D}$ which is left Kan extended from $\mathcal{C}^0$. Invoking the universal mapping property of Corollary 7.3.6.9, we deduce that there is a natural transformation $\alpha : F' \to F$ which restricts to the identity transformation from F^0 to itself. The natural transformation α carries each object $Y \in \mathcal{C}$ to a morphism $\alpha_Y : F'(Y) \to F(Y)$ in the ∞-category $\mathcal{D}$. By assumption, the object Y is a retract of some object $X \in \mathcal{C}^0$. It follows that α_Y is a retract of the morphism $\alpha_X = \mathrm{id}_{F(X)}$, and is therefore an isomorphism (Proposition 8.5.1.7). Invoking Theorem 4.4.4.4, we deduce that the natural transformation α is an isomorphism, so that F is left Kan extended from $\mathcal{C}^0$ by virtue of Remark 7.3.3.17. □

Proposition 8.5.1.8 immediately implies the following stronger version of Proposition 7.3.3.7:

03YR **Corollary 8.5.1.9.** *Let $F : \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose that F is U-left Kan extended from $\mathcal{C}^0$ at an object $X \in \mathcal{C}$. If $Y \in \mathcal{C}$ is a retract of X, then F is also U-left Kan extended from $\mathcal{C}^0$ at Y.*

Proof. Without loss of generality, we may assume that $\mathcal{C}$ is spanned by $\mathcal{C}^0$ together with the objects X and Y. By virtue of Proposition 7.3.8.6, we can further assume that $\mathcal{C}^0$ contains the object X. In this case, Proposition 8.5.1.8 implies that the functors F and $U \circ F$ are left Kan extended from $\mathcal{C}^0$, so that F is U-left Kan extended from $\mathcal{C}^0$ by virtue of Remark 7.3.3.20. □

03YS **Corollary 8.5.1.10.** *Let $F : \mathcal{C} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{E}$ be functors of ∞-categories. Suppose that F is U-left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Then any functor $G : \mathcal{C} \to \mathcal{D}$ which is a retract of F (in the ∞-category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$) is also U-left Kan extended from $\mathcal{C}^0$.*

Proof. Let $\mathrm{ev} : \mathcal{C} \times \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \to \mathcal{D}$ denote the evaluation functor. By virtue of Remark 7.3.3.3, the functor F is U-left Kan extended from $\mathcal{C}^0$ at an object $C \in \mathcal{C}$ if and only if the functor ev is U-left Kan extended from $\mathcal{C}^0 \times \mathrm{Fun}(\mathcal{C}, \mathcal{D})$ at the object (C, F). If this condition is satisfied, then Corollary 8.5.1.9 guarantees that ev is also U-left Kan extended from $\mathcal{C}^0 \times \mathrm{Fun}(\mathcal{C}, \mathcal{D})$ at the object (C, G), so that G is U-left Kan extended from $\mathcal{C}^0$ at C. The desired result now follows by allowing the object $C \in \mathcal{C}$ to vary. □

03YT **Corollary 8.5.1.11.** *Let $U : \mathcal{D} \to \mathcal{E}$ be a functor of ∞-categories, let K be a simplicial set, and suppose we are given a pair of diagrams $f, g : K^{\triangleright} \to \mathcal{D}$. If f is a U-colimit diagram and g is a retract of f (in the ∞-category $\mathrm{Fun}(K^{\triangleright}, \mathcal{D})$), then g is also a U-colimit diagram.*

Proof. Using Corollary 4.1.3.3, we can choose an inner anodyne morphism $K \hookrightarrow \mathcal{K}$, where $\mathcal{K}$ is an ∞-category. Using Remark 4.3.6.7, we see that the induced map $K^{\triangleright} \hookrightarrow \mathcal{K}^{\triangleright}$ is also inner anodyne. We may therefore extend f and g to functors $F, G : \mathcal{K}^{\triangleright} \to \mathcal{D}$. Since the restriction functor $\mathrm{Fun}(\mathcal{K}^{\triangleright}, \mathcal{D}) \to \mathrm{Fun}(K^{\triangleright}, \mathcal{D})$ is a trivial Kan fibration (Proposition 1.5.7.6), it follows that G is a retract of F. By virtue of Corollary 7.2.2.2, we can replace K by $\mathcal{K}$ and thereby reduce to proving Corollary 8.5.1.11 in the special case where K is an ∞-category. In this case, the desired result is a special case of Corollary 8.5.1.10 (see Example 7.3.3.9). □

Corollary 8.5.1.12. *Let $\mathcal{D}$ be an ∞-category and let $f, g : K^{\triangleright} \to \mathcal{D}$ be diagrams. If f is a colimit diagram and g is a retract of f, then g is also a colimit diagram.* 05E6

Proof. Apply Corollary 8.5.1.11 in the special case $\mathcal{E} = \Delta^0$. □

Corollary 8.5.1.13. *Let $U : \mathcal{D} \to \mathcal{E}$ be an inner fibration of ∞-categories and let f be a U-cocartesian morphism in $\mathcal{D}$. Then any retract of f (in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$) is also U-cocartesian.* 04KA

Proof. Apply Corollary 8.5.1.11 in the special case $K = \Delta^0$ (see Example 7.1.5.9). □

Corollary 8.5.1.14. *Let K be a simplicial set and let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which preserves K-indexed colimits. If $G : \mathcal{C} \to \mathcal{D}$ is a retract of F (in the ∞-category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$), then G also preserves K-indexed colimits.* 03YU

Proposition 8.5.1.15. *Let $\mathcal{X}$ and $\mathcal{Y}$ be ∞-categories and let κ be an uncountable cardinal. Suppose that $\mathcal{Y}$ is a retract of $\mathcal{X}$ in the ∞-category $\mathcal{QC}$. If $\mathcal{X}$ is essentially κ-small, then $\mathcal{Y}$ is also essentially κ-small.* 03YV

Proof. By virtue of Proposition 4.7.6.15, we may assume that the ∞-categories $\mathcal{X}$ and $\mathcal{Y}$ are minimal, so that $\mathcal{X}$ is a κ-small simplicial set (Corollary 4.7.6.12). Choose functors $i : \mathcal{Y} \to \mathcal{X}$ and $r : \mathcal{X} \to \mathcal{Y}$ such that the composition $(r \circ i) : \mathcal{Y} \to \mathcal{Y}$ is isomorphic to the identity functor. Then $r \circ i$ is an equivalence of ∞-categories. Since $\mathcal{Y}$ is minimal, it follows that $r \circ i$ is an isomorphism of simplicial sets (Proposition 4.7.6.13). In particular, the functor $i : \mathcal{Y} \to \mathcal{X}$ is a monomorphism of simplicial sets. It follows that $\mathcal{Y}$ is κ-small (Remark 4.7.4.8), and therefore essentially κ-small. □

Remark 8.5.1.16. In the situation of Proposition 8.5.1.15, suppose that the ∞-category $\mathcal{X}$ is a Kan complex. Then $\mathcal{Y}$ is also a Kan complex, and is therefore a retract of X in the homotopy category hKan. To prove this, it will suffice to show that every morphism $f : Y \to Y'$ in the ∞-category $\mathcal{Y}$ is an isomorphism (Proposition 4.4.2.1). Since $\mathcal{X}$ is a Kan complex, the morphism $i(f) : i(Y) \to i(Y')$ is an isomorphism in $\mathcal{X}$ (Proposition 1.4.6.10). It follows that $(r \circ i)(f)$ is an isomorphism in $\mathcal{Y}$ (Remark 1.5.1.6). Since f is isomorphic to $(r \circ i)(f)$ (as an object of the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{Y})$), it is also an isomorphism (Example 4.4.1.14). 03YW

Corollary 8.5.1.17. *Let X and Y be Kan complexes and let κ be an uncountable cardinal. Suppose that Y is a retract of X in the ∞-category $\mathcal{S}$. If X is essentially κ-small, then Y is essentially κ-small.* 03YX

03YY **Warning 8.5.1.18.** In the statement of Corollary 8.5.1.17, the uncountability assumption on κ cannot be omitted. That is, if X is a Kan complex for which there exists a weak homotopy equivalence $K \to X$ for a *finite* simplicial set K, then a retract of X need not inherit the same property. See §[?].

We now make Definition 8.5.1.1 slightly more explicit.

03YZ **Definition 8.5.1.19.** Let $\mathcal{C}$ be an ∞-category. A *retraction diagram in* $\mathcal{C}$ is a 2-simplex $\sigma : \Delta^2 \to \mathcal{C}$ for which the "long" face $d_1^2(\sigma)$ is an identity morphism of $\mathcal{C}$. In this case, we indicate σ by a diagram

$$\begin{tikzcd}
 & X \arrow[dr, "r"] & \\
Y \arrow[ur, "i"] \arrow[rr, "\mathrm{id}_Y"] & & Y,
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$, and we say that σ *exhibits* Y *as a retract of* X.

03Z0 **Remark 8.5.1.20.** Let $\mathcal{C}$ be an ∞-category containing an object X. Then an object $Y \in \mathcal{C}$ is a retract of X (in the sense of Definition 8.5.1.1) if and only if there exists a retraction diagram which exhibits Y as a retract of X (in the sense of Definition 8.5.1.19).

03Z1 **Warning 8.5.1.21.** If $\mathcal{C}$ is (the nerve of) an ordinary category, then a retraction diagram in $\mathcal{C}$ can be identified with a pair of morphisms $i : Y \to X$ and $r : X \to Y$ satisfying the condition $r \circ i = \mathrm{id}_Y$. Beware that, if $\mathcal{C}$ is a general ∞-category, then a retraction diagram

$$\begin{tikzcd}
 & X \arrow[dr, "r"] & \\
Y \arrow[ur, "i"] \arrow[rr, "\mathrm{id}_Y"] & & Y
\end{tikzcd}$$

generally cannot be recovered (even up to isomorphism) from the morphisms i and r alone: one also needs a homotopy which witnesses the identity $[r] \circ [i] = [\mathrm{id}_Y]$ in the homotopy category $\mathrm{h}\mathcal{C}$.

03Z2 **Remark 8.5.1.22.** Let $\mathcal{C}$ be an ∞-category. A 2-simplex σ of $\mathcal{C}$ is a retraction diagram if and only if it is a retraction diagram when viewed as an object of the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$. Consequently, if X and Y are objects of $\mathcal{C}$, then Y is a retract of X in $\mathcal{C}$ if and only if it is a retract of X in the ∞-category $\mathcal{C}^{\mathrm{op}}$.

Remark 8.5.1.23 (Lifting Retraction Diagrams)**.** Let $U : \mathcal{E} \to \mathcal{C}$ be a cartesian fibration of ∞-categories. Suppose we are given a retraction diagram 04KB

04KC

$$\begin{tikzcd} & X \arrow[dr, "r"] & \\ Y \arrow[ur, "i"] \arrow[rr, "\mathrm{id}_Y"] & & Y \end{tikzcd} \tag{8.54}$$

in $\mathcal{C}$ and an object $\widetilde{Y} \in \mathcal{E}$ satisfying $U(\widetilde{Y}) = Y$. Our assumption that U is a cartesian fibration guarantees the existence of a U-cartesian morphism $\widetilde{r} : \widetilde{X} \to \widetilde{Y}$ in $\mathcal{E}$ satisfying $U(\widetilde{r}) = r$. Since $\widetilde{r}$ is U-cartesian, we can lift (8.54) to a retraction diagram

$$\begin{tikzcd} & \widetilde{X} \arrow[dr, "\widetilde{r}"] & \\ \widetilde{Y} \arrow[ur, "\widetilde{i}"] \arrow[rr, "\mathrm{id}_{\widetilde{Y}}"] & & \widetilde{Y} \end{tikzcd}$$

In particular, the object $\widetilde{Y}$ can be realized as a retract of an object $\widetilde{X}$ satisfying $U(\widetilde{X}) = X$.

Our goal in this section is carry out an ∞-categorical analogue of Exercise 8.5.0.3.

Notation 8.5.1.24. Let Ret denote the category introduced in Construction 8.5.0.2. By construction, the ∞-category $\mathrm{N}_\bullet(\mathrm{Ret})$ contains a retraction diagram $\sigma : \Delta^2 \to \mathrm{N}_\bullet(\mathrm{Ret})$, which we depict as 03Z3

$$\begin{tikzcd} & \widetilde{X} \arrow[dr, "\widetilde{r}"] & \\ \widetilde{Y} \arrow[ur, "\widetilde{i}"] \arrow[rr, "\mathrm{id}"] & & \widetilde{Y}. \end{tikzcd}$$

We let $\mathcal{R}$ denote the image of σ, which we regard as a simplicial subset of $\mathrm{N}_\bullet(\mathrm{Ret})$.

Remark 8.5.1.25. In the situation of Notation 8.5.1.24, the map $\sigma : \Delta^2 \twoheadrightarrow \mathcal{R}$ is an epimorphism of simplicial sets, which fits into a pushout square 03Z4

$$\begin{tikzcd} \mathrm{N}_\bullet(\{0 < 2\}) \arrow[r] \arrow[d] & \Delta^0 \arrow[d] \\ \Delta^2 \arrow[r, "\sigma"] & \mathcal{R}. \end{tikzcd}$$

It follows that, for every ∞-category $\mathcal{C}$, composition with σ induces a bijection from $\operatorname{Hom}_{\mathrm{Set}_\Delta}(\mathcal{R}, \mathcal{C})$ to the set of retraction diagrams in $\mathcal{C}$ (in the sense of Definition 8.5.1.19).

03Z5 **Remark 8.5.1.26.** Let $\sigma : \Delta^2 \twoheadrightarrow \mathcal{R}$ be the epimorphism of Notation 8.5.1.24. For every ∞-category $\mathcal{C}$, precomposition with σ induces a fully faithful functor $\operatorname{Fun}(\mathcal{R}, \mathcal{C}) \hookrightarrow \operatorname{Fun}(\Delta^2, \mathcal{C})$, whose essential image is the full subcategory $\operatorname{Fun}'(\Delta^2, \mathcal{C}) \subseteq \operatorname{Fun}(\Delta^2, \mathcal{C})$ spanned by those diagrams

$$\begin{tikzcd}
 & X \arrow[dr, "r"] & \\
Y \arrow[ur, "i"] \arrow[rr, "u"] & & Y'
\end{tikzcd}$$

where u is an isomorphism. This follows by applying Corollary 4.5.2.29 to the pullback square

$$\begin{tikzcd}
\operatorname{Fun}(\mathcal{R}, \mathcal{C}) \arrow[r] \arrow[d] & \operatorname{Fun}'(\Delta^2, \mathcal{C}) \arrow[d] \\
\mathcal{C} \arrow[r] & \operatorname{Isom}(\mathcal{C}),
\end{tikzcd}$$

since the vertical maps are isofibrations (Corollary 4.4.5.3) and the lower horizontal map is an equivalence of ∞-categories by virtue of Corollary 4.5.3.13.

Our main result can now be stated as follows:

03Z6 **Proposition 8.5.1.27.** *The inclusion map* $\mathcal{R} \hookrightarrow \mathrm{N}_\bullet(\mathrm{Ret})$ *is an inner anodyne morphism of simplicial sets.*

03Z7 **Corollary 8.5.1.28.** *Let* $\mathcal{C}$ *be an* ∞*-category. Then composition with the inclusion map* $\mathcal{R} \hookrightarrow \mathrm{N}_\bullet(\mathrm{Ret})$ *induces a trivial Kan fibration*

$$\operatorname{Fun}(\mathrm{N}_\bullet(\mathrm{Ret}), \mathcal{C}) \to \operatorname{Fun}(\mathcal{R}, \mathcal{C}) \simeq \operatorname{Fun}(\Delta^2, \mathcal{C}) \times_{\operatorname{Fun}(\mathrm{N}_\bullet(\{0<2\}), \mathcal{C})} \mathcal{C}.$$

In particular, every retraction diagram in $\mathcal{C}$ *can be extended to a functor* $\mathrm{N}_\bullet(\mathrm{Ret}) \to \mathcal{C}$, *which is uniquely determined up to isomorphism.*

Proof. Combine Propositions 8.5.1.27 and 1.5.7.6. □

03Z8 **Remark 8.5.1.29.** Exercise 8.5.0.3 is an immediate consequence of Proposition 8.5.1.27 (see Variant 1.5.6.8).

Corollary 8.5.1.30. *Let $\mathcal{C}$ be an ∞-category. Then composition with the retraction diagram of Notation 8.5.1.24 induces a fully faithful functor* $\mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Ret}), \mathcal{C}) \to \mathrm{Fun}(\Delta^2, \mathcal{C})$*, whose essential image is spanned by those diagrams* 03Z9

$$\begin{tikzcd}
 & X \arrow[dr, "r"] & \\
Y \arrow[ur, "i"] \arrow[rr, "u"] & & Y'
\end{tikzcd}$$

where u is an isomorphism.

Proof. Combine Corollary 8.5.1.28 with Remark 8.5.1.26. □

Remark 8.5.1.31. Corollary 8.5.1.30 asserts that the map $\sigma : \Delta^2 \to \mathrm{N}_{\bullet}(\mathrm{Ret})$ exhibits $\mathrm{N}_{\bullet}(\mathrm{Ret})$ as a localization of the standard 2-simplex Δ^2 with respect to the "long edge" $0 \to 2$ (see Definition 6.3.1.9). 04KD

Corollary 8.5.1.32. *Let $\{\mathcal{C}_i\}_{i \in \mathcal{I}}$ be a diagram of simplicial sets indexed by a filtered category $\mathcal{I}$. Suppose that each $\mathcal{C}_i$ is an ∞-category. Then the tautological map* 03ZA

$$\theta : \varinjlim_{i \in \mathcal{I}} \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Ret}), \mathcal{C}_i) \to \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Ret}), \varinjlim_{i \in \mathcal{I}} \mathcal{C}_i)$$

is an equivalence of ∞-categories.

Proof. The morphism θ fits into a commutative diagram

$$\begin{tikzcd}
\varinjlim_{i \in \mathcal{I}} \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Ret}), \mathcal{C}_i) \arrow[r, "\theta"] \arrow[d] & \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Ret}), \varinjlim_{i \in \mathcal{I}} \mathcal{C}_i) \arrow[d] \\
\varinjlim_{i \in \mathcal{I}} \mathrm{Fun}(\mathcal{R}, \mathcal{C}_i) \arrow[r, "\theta'"] & \mathrm{Fun}(\mathcal{R}, \varinjlim_{i \in \mathcal{I}} \mathcal{C}_i),
\end{tikzcd}$$

where the vertical maps are trivial Kan fibrations (Corollary 8.5.1.30). It will therefore suffice to show that θ' is an equivalence of ∞-categories. In fact, θ' is an isomorphism of simplicial sets, since the simplicial set $\mathcal{R}$ is finite (Corollary 3.6.1.10). □

The proof of Proposition 8.5.1.27 will require the following:

Lemma 8.5.1.33 (Sparse Horns). *Let $n \geq 0$ be an integer and let S be a subset of $[n] = \{0 < 1 < \cdots < n\}$. Let $K \subseteq \Delta^n$ be the simplicial subset spanned by those nondegenerate simplices which do not contain every element of S. Suppose that there exist $0 \leq i < j < k \leq n$ such that $i, k \in S$, $j \notin S$. Then the inclusion $K \hookrightarrow \Delta^n$ is inner anodyne.* 03ZB

03ZC **Example 8.5.1.34.** In the situation of Lemma 8.5.1.33, suppose that $S = [n] \setminus \{j\}$ for some $0 \leq j \leq n$. Then K is the horn $\Lambda^n_j \subseteq \Delta^n$. The hypothesis of Lemma 8.5.1.33 guarantees that K is an inner horn, so that the inclusion map $K \hookrightarrow \Delta^n$ is inner anodyne by definition.

Proof of Lemma 8.5.1.33. Let P denote the collection of all subsets $S' \subseteq [n]$ which contain $S \cup \{j\}$. Choose a linear ordering

$$\{S(1) \leq \cdots \leq S(c)\}$$

of P with the property that if $S(a) \subseteq S(b)$, then $a \leq b$. Let For $0 \leq b \leq c$, let $K(b) \subseteq \Delta^n$ denote the union of K with the faces $\{\mathrm{N}_\bullet(S(a)) \subseteq \Delta^n\}_{1 \leq a \leq b}$. We then have inclusion maps

$$K = K(0) \subseteq K(1) \subseteq K(2) \subseteq \cdots \subseteq K(c-1) \subseteq K(c) = \Delta^n.$$

It will therefore suffice to show that, for every positive integer $b \leq c$, the inclusion map $K(b-1) \hookrightarrow K(b)$ is inner anodyne.

Let us identify $\mathrm{N}_\bullet(S(b))$ with the image of a nondegenerate simplex $\sigma : \Delta^m \hookrightarrow \Delta^n$. Let $L \subseteq \Delta^m$ be the inverse image $\sigma^{-1}(S(b-1))$, so that we have a pushout diagram of simplicial sets

$$\begin{tikzcd}
L \arrow[r] \arrow[d] & \Delta^m \arrow[d, "\sigma"] \\
S(b-1) \arrow[r] & S(b).
\end{tikzcd}$$

It will therefore suffice to show that the inclusion map $L \subseteq \Delta^m$ is inner anodyne. Because $S(b)$ contains the integers $i < j < k$, we can write $j = \sigma(\overline{j})$ for some $0 < \overline{j} < n$. We conclude by observing that L can be identified with the inner horn $\Lambda^m_{\overline{j}} \subseteq \Delta^m$. □

Proof of Proposition 8.5.1.27. Let τ be a nondegenerate m-simplex of the simplicial set $\mathrm{N}_\bullet(\mathrm{Ret})$. We define the *weight* $w(\tau)$. to be the cardinality of the set $\{i \in [m] : \tau(i) = \widetilde{X}\}$. Note that, if τ' is any nondegenerate facet of τ, then $w(\tau') \leq w(\tau)$. For $n \geq 1$, the collection of nondegenerate simplices of weight $\leq n$ span a simplicial subset $\mathcal{R}(n) \subseteq \mathrm{N}_\bullet(\mathrm{Ret})$. It follows that we can write $\mathrm{N}_\bullet(\mathrm{Ret})$ as the union of an increasing sequence

$$\mathcal{R}(1) \hookrightarrow \mathcal{R}(2) \hookrightarrow \mathcal{R}(3) \hookrightarrow \cdots,$$

where $\mathcal{R}(1)$ coincides with the simplicial set $\mathcal{R}$ introduced in Notation 8.5.1.24. We will complete the proof by showing that, for each $n \geq 2$, the inclusion map $\mathcal{R}(n-1) \hookrightarrow \mathcal{R}(n)$ is inner anodyne.

Let $\sigma_n : \Delta^{2n} \to \mathrm{N}_\bullet(\mathrm{Ret})$ denote the simplex corresponding to the diagram

$$\widetilde{Y} \xrightarrow{\widetilde{i}} \widetilde{X} \xrightarrow{\widetilde{r}} \widetilde{Y} \xrightarrow{\widetilde{i}} \widetilde{X} \to \cdots \to \widetilde{X} \xrightarrow{\widetilde{r}} \widetilde{Y} \xrightarrow{\widetilde{i}} \widetilde{X} \xrightarrow{\widetilde{r}} \widetilde{Y}.$$

Note that σ_n is a nondegenerate simplex of weight n, and therefore factors through $\mathcal{R}(n)$. Let $K \subseteq \Delta^{2n}$ denote the inverse image $\sigma_n^{-1}\mathcal{R}(n-1)$, so that we have a commutative diagram of simplicial sets

03ZD

$$\begin{tikzcd}
K \arrow[r] \arrow[d] & \Delta^{2n} \arrow[d, "\sigma_n"] \\
\mathcal{R}(n-1) \arrow[r] & \mathcal{R}(n).
\end{tikzcd} \tag{8.55}$$

Note that a nondegenerate simplex of Δ^{2n} belongs to K if and only if it does not contain $\mathrm{N}_\bullet(\{1 < 3 < \cdots < 2n-1\}) \subseteq \Delta^{2n}$. Applying Lemma 8.5.1.33, we deduce that the inclusion map $K \hookrightarrow \Delta^{2n}$ is inner anodyne. It will therefore suffice to show that the diagram (8.55) is a pushout square.

Let τ be an m-simplex of $\mathrm{N}_\bullet(\mathrm{Ret})$ which belongs to $\mathcal{R}(n)$, but does not belong to $\mathcal{R}(n-1)$. We wish to show that τ factors uniquely through σ_n. We first prove the existence of the desired factorization. For this, we may assume without loss of generality that τ is nondegenerate. Then τ has weight n, so we can write

$$\{i \in [m] : \tau(i) = X\} = \{d_1 < d_2 < \cdots < d_n\}.$$

Let $\alpha : \Delta^m \to \Delta^{2n}$ be the unique morphism of simplices which is given on vertices by the formula $\alpha(d_i) = 2i-1$ for $1 \leq i \leq n$. We claim that $\tau = \sigma_n \circ \alpha$. Note that τ and $\sigma_n \circ \alpha$ can both be regarded as functors from the linearly ordered set $[m]$ to the category Ret. By construction, these functors coincide on objects. It will therefore suffice to show that, for $0 \leq j < j' < m$, the functors τ and $\sigma_n \circ \alpha$ determine the same element of $\mathrm{Hom}_{\mathrm{Ret}}(\tau(j), \tau(j'))$. If $\tau(j) = \widetilde{Y}$ or $\tau(j') = \widetilde{Y}$, this condition is automatic (since the set $\mathrm{Hom}_{\mathrm{Ret}}(\tau(j), \tau(j'))$ has only one element). We may therefore assume without loss of generality that $\tau(j) = \widetilde{X} = \tau(j')$: that is, we have $j = d_i$ and $j' = d_{i'}$ for some $i < i'$. In this case, the functors τ and $\sigma_n \circ \alpha$ both carry the pair $(j < j')$ to the element $e \in \mathrm{Hom}_{\mathrm{Ret}}(X, X)$.

We now prove uniqueness. Suppose we are given a pair of maps $\alpha, \beta : \Delta^m \to \Delta^{2n}$ satisfying $\sigma_n \circ \alpha = \tau = \sigma_n \circ \beta$; we wish to show that $\alpha = \beta$. Suppose otherwise. Then there is some smallest integer $j \in [m]$ such that $\alpha(j) \neq \beta(j)$. Without loss of generality, we may assume that $\alpha(j) < \beta(j)$. Assume first that $\alpha(j)$ is odd. Since τ does not belong to K, $\alpha(j)$ is contained in the image of β; that is, we can write $\alpha(j) = \beta(i)$ for some $i < j$. Then minimality of j then guarantees that $\alpha(i) = \alpha(j)$, so that $\sigma_n \circ \alpha$ carries the pair $(i < j)$ to the identity morphism $\mathrm{id}_{\widetilde{X}}$ in the category Ret. Since $\sigma_n \circ \beta = \tau = \sigma_n \circ \alpha$, the morphism $\sigma_n \circ \beta$ also carries $(i < j)$ to the identity morphism $\mathrm{id}_{\widetilde{X}}$. It follows that $\beta(i) = \beta(j)$, contradicting our assumption that $\beta(i) = \alpha(j) < \beta(j)$.

We now treat the case where $\alpha(j)$ is even, so that $\tau(j) = (\sigma_n \circ \alpha)(j) = Y$. Using the equality $\sigma_n \circ \beta = \tau$, we deduce that $\beta(j)$ is also even. Since τ does not belong to K, the odd number $\beta(j) - 1$ belongs to the image of β. We therefore have $\beta(j) - 1 = \beta(i)$ for some integer $i < j$. We then have

$$\alpha(i) \leq \alpha(j) < \alpha(j) + 1 \leq \beta(j) - 1 = \beta(i),$$

contradicting the minimality of j. □

8.5.2 Idempotents in Ordinary Categories

03ZE Let M be a monoid. Recall that an element $e \in M$ is *idempotent* if it satisfies the equation $e^2 = e$. We now consider the special case where $M = \mathrm{End}_{\mathcal{C}}(X) = \mathrm{Hom}_{\mathcal{C}}(X, X)$ is the set of endomorphisms of an object X of some category $\mathcal{C}$.

03ZF **Definition 8.5.2.1.** Let $\mathcal{C}$ be a category. An *idempotent endomorphism in* $\mathcal{C}$ is a pair (X, e), where X is an object of $\mathcal{C}$ and $e : X \to X$ is an endomorphism of X which satisfies the identity $e = e \circ e$, so that we have a commutative diagram

$$\begin{tikzcd} & X \arrow[dr, "e"] & \\ X \arrow[ur, "e"] \arrow[rr, "e"] & & X. \end{tikzcd}$$

In this situation, we will also say that e is an *idempotent endomorphism of* X.

03ZG **Example 8.5.2.2** (Identity Morphisms)**.** Let $\mathcal{C}$ be a category. For every object $X \in \mathcal{C}$, the identity morphism $\mathrm{id}_X : X \to X$ is an idempotent endomorphism in $\mathcal{C}$. Conversely, if $e : X \to X$ is an idempotent endomorphism in $\mathcal{C}$ which is also an isomorphism, then $e = \mathrm{id}_X$.

03ZH **Example 8.5.2.3** (Split Idempotents)**.** Let $\mathcal{C}$ be a category containing a retraction diagram

03ZJ

$$\begin{tikzcd} & X \arrow[dr, "r"] & \\ Y \arrow[ur, "i"] \arrow[rr, "\mathrm{id}_Y"] & & Y \end{tikzcd} \tag{8.56}$$

(see Definition 8.5.1.19). Then $e = i \circ r$ is an idempotent endomorphism of X. This follows from the calculation

$$e \circ e = (i \circ r) \circ (i \circ r) = i \circ \mathrm{id}_Y \circ r = i \circ r = e.$$

We will say that an idempotent endomorphism $e : X \to X$ is *split* if it can be obtained in this way (that is, if $e = i \circ r$, for some pair of morphisms $i : Y \to X$ an $r : X \to Y$ satisfying $r \circ i = \mathrm{id}_Y$.

In the situation of Example 8.5.2.3, the diagram (8.56) can be recovered (up to isomorphism) from the idempotent endomorphism $e : X \to X$, by virtue of the following:

Proposition 8.5.2.4. *Let $\mathcal{C}$ be a category containing a retraction diagram* 03ZK

$$\begin{tikzcd} & X \arrow[dr, "r"] & \\ Y \arrow[ur, "i"] \arrow[rr, "\mathrm{id}_Y"] & & Y, \end{tikzcd}$$

and let $e = i \circ r$ be the idempotent endomorphism Example 8.5.2.3. Then:

(1) *The morphism i exhibits Y as an equalizer of the pair of morphisms $(e, \mathrm{id}_X) : X \rightrightarrows X$.*

(2) *The morphism r exhibits Y as a coequalizer of the pair of morphisms $(e, \mathrm{id}_X) : X \rightrightarrows X$.*

Proof. We will prove (1); the proof of (2) is similar. Fix an object $Z \in \mathcal{C}$ and a morphism $f : Z \to X$ satisfying $e \circ f = \mathrm{id}_X \circ f$; we wish to show that there is a unique morphism $g : Z \to Y$ satisfying $i \circ g = f$. To prove uniqueness, we note that g is determined by the identity

$$g = \mathrm{id}_Y \circ g = (r \circ i) \circ g = r \circ (i \circ g) = r \circ f.$$

To establish existence, we observe that the composition $g = r \circ f$ satisfies the identity

$$i \circ g = i \circ (r \circ f) = (i \circ r) \circ f = e \circ f = \mathrm{id}_X \circ f = f.$$

□

Corollary 8.5.2.5. *Let $\mathcal{C}$ be a category and let $e : X \to X$ be an idempotent endomorphism in $\mathcal{C}$. The following conditions are equivalent:* 03ZL

(1) *The idempotent endomorphism e splits. That is, e admits a factorization $X \xrightarrow{r} Y \xrightarrow{i} X$, where $r \circ i = \mathrm{id}_Y$.*

(2) *The pair of morphisms $(e, \mathrm{id}_X) : X \rightrightarrows X$ admits an equalizer in $\mathcal{C}$.*

(3) *The pair of morphisms $(e, \mathrm{id}_X) : X \rightrightarrows X$ admits a coequalizer in $\mathcal{C}$.*

Proof. The implications (1) ⇒ (2) and (1) ⇒ (3) follow from Proposition 8.5.2.4. We will show that (2) implies (1); the proof of the implication (3) ⇒ (1) is similar. Suppose that there exists a morphism $i : Y \to X$ which exhibits Y as an equalizer of the pair of morphisms $(e, \mathrm{id}_X) : X \rightrightarrows X$. Since e is idempotent, we have $e \circ e = e = \mathrm{id}_X \circ e$. Invoking the universal property of Y, we deduce that there is a unique morphism $r : X \to Y$ satisfying $e = i \circ r$.

To complete the proof, it will suffice to show that $r \circ i$ is the identity morphism from Y to itself. Since i is a monomorphism, this follows from the calculation

$$i \circ (r \circ i) = (i \circ r) \circ i = e \circ i = \mathrm{id}_X \circ i = i = i \circ \mathrm{id}_Y .$$

□

03ZM **Corollary 8.5.2.6.** *Let $\mathcal{C}$ be a category which admits equalizers (or coequalizers). Then every idempotent endomorphism in $\mathcal{C}$ is split.*

03ZN **Construction 8.5.2.7** (The Universal Idempotent)**.** We define a category Idem as follows:

- The category Idem has single object $\widetilde{X}$.
- Morphisms in Idem are given by $\mathrm{Hom}_{\mathrm{Idem}}(\widetilde{X}, \widetilde{X}) = \{\mathrm{id}_{\widetilde{X}}, \widetilde{e}\}$.
- The composition law on Idem is given (on non-identity morphisms) by $\widetilde{e} \circ \widetilde{e} = \widetilde{e}$.

03ZP **Remark 8.5.2.8.** Let $\mathcal{C}$ be a category and let $e : X \to X$. be an idempotent endomorphism in $\mathcal{C}$. Then there is a unique functor $F : \mathrm{Idem} \to \mathcal{C}$ satisfying $F(\widetilde{X}) = X$ and $F(\widetilde{e}) = e$.

03ZQ **Exercise 8.5.2.9.** Show that the category Idem is filtered (see Definition 7.2.4.1).

03ZR **Remark 8.5.2.10.** Let Ret denote the category introduced in Construction 8.5.0.2. Then Idem can be identified with the full subcategory of Ret spanned by the object $\widetilde{X}$. Let $\mathcal{C}$ be a category and let $\overline{F} : \mathrm{Ret} \to \mathcal{C}$ be the functor determined by a retraction diagram in $\mathcal{C}$ (see Exercise 8.5.0.3). Then the restriction $F = \overline{F}|_{\mathrm{Idem}}$ corresponds (under the identification of Remark 8.5.2.8) to the idempotent endomorphism of Example 8.5.2.3.

8.5.3 Idempotents in ∞-Categories

03ZS We now consider an ∞-categorical counterpart of Definition 8.5.2.1.

03ZT **Definition 8.5.3.1.** Let $\mathcal{C}$ be an ∞-category. An *idempotent in* $\mathcal{C}$ is a functor of ∞-categories $\mathrm{N}_{\bullet}(\mathrm{Idem}) \to \mathcal{C}$. Here Idem denotes the category introduced in Construction 8.5.2.7.

03ZU **Remark 8.5.3.2.** Let $\mathcal{C}$ be a category. It follows from Remark 8.5.2.8 (and Proposition 1.3.3.1) that evaluation on the morphism $\widetilde{e} \in \mathrm{Hom}_{\mathrm{Idem}}(\widetilde{X}, \widetilde{X})$ supplies a bijection from the set of idempotents in the ∞-category $\mathrm{N}_{\bullet}(\mathcal{C})$ (in the sense of Definition 8.5.3.1) to the set of idempotent endomorphisms (X, e) in the category $\mathcal{C}$ (in the sense of Definition 8.5.2.1). We can therefore view Definition 8.5.3.1 as a generalization of Definition 8.5.2.1.

Remark 8.5.3.3 (The Structure of $\mathrm{N}_\bullet(\mathrm{Idem})$)**.** For every integer $n \geq 0$, the simplicial set $\mathrm{N}_\bullet(\mathrm{Idem})$ contains a unique nondegenerate n-simplex σ_n, given by the diagram 03ZV

$$\widetilde{X} \xrightarrow{\widetilde{e}} \widetilde{X} \xrightarrow{\widetilde{e}} \widetilde{X} \xrightarrow{\widetilde{e}} \cdots \rightarrow \widetilde{X} \xrightarrow{\widetilde{e}} \widetilde{X}.$$

Moreover, the face morphisms of $\mathrm{N}_\bullet(\mathrm{Idem})$ satisfy $d_i^n(\sigma_n) = \sigma_{n-1}$ for $0 \leq i \leq n$. Applying Corollary 3.3.1.8, we obtain an isomorphism of $\mathrm{N}_\bullet(\mathrm{Idem})$ with the simplicial set $(\Delta^0)^+$ introduced in Construction 3.3.1.6. Here we abuse notation by identifying Δ^0 with its underlying semisimplicial set.

Remark 8.5.3.4. The simplicial set $\mathrm{N}_\bullet(\mathrm{Idem})$ is weakly contractible. This is a special case of Lemma 3.4.5.9, applied to the (discrete) category $[0]$. 03ZW

Definition 8.5.3.5 (Split Idempotents)**.** Let $\mathcal{C}$ be an ∞-category and let $F : \mathrm{N}_\bullet(\mathrm{Idem}) \to \mathcal{C}$ be an idempotent in the ∞-category $\mathcal{C}$. A *splitting of* F is a functor $\overline{F} : \mathrm{N}_\bullet(\mathrm{Ret}) \to \mathcal{C}$ satisfying $\overline{F}|_{\mathrm{N}_\bullet(\mathrm{Idem})} = F$. We say that F is *split* if there exists a splitting of F. 03ZX

Example 8.5.3.6. Let $\mathcal{C}$ be a category and let $e : X \to X$ be an idempotent endomorphism in $\mathcal{C}$. Then e is split (in the sense of Example 8.5.2.3) if and only if the induced map $\mathrm{N}_\bullet(\mathrm{Idem}) \to \mathrm{N}_\bullet(\mathcal{C})$ is a split idempotent in the ∞-category $\mathrm{N}_\bullet(\mathcal{C})$ (in the sense of Definition 8.5.3.5). 03ZY

Remark 8.5.3.7. Let $\mathcal{C}$ be an ∞-category and let $F, F' : \mathrm{N}_\bullet(\mathrm{Idem}) \to \mathcal{C}$ be idempotents which are isomorphic (when regarded as objects of the ∞-category $\mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Idem}), \mathcal{C})$). Then F is split if and only if F' is split. See Corollary 4.4.5.3. 03ZZ

Let $\mathcal{C}$ be an ∞-category and let $F : \mathrm{N}_\bullet(\mathrm{Idem}) \to \mathcal{C}$ be an idempotent in $\mathcal{C}$. If F is split, then the splitting is essentially unique.

Proposition 8.5.3.8. *Let $\mathcal{C}$ be an ∞-category and let $\overline{F} : \mathrm{N}_\bullet(\mathrm{Ret}) \to \mathcal{C}$ be a functor. Then $\overline{F}$ is both left and right Kan extended from the full subcategory* $\mathrm{N}_\bullet(\mathrm{Idem}) \subset \mathrm{N}_\bullet(\mathrm{Ret})$. 0400

Proof. This is a special case of Proposition 8.5.1.8. □

Remark 8.5.3.9. The category Ret of Construction 8.5.0.2 contains an initial object $\widetilde{Y}$. It follows that the inclusion map $\mathrm{Idem} \hookrightarrow \mathrm{Ret}$ has a unique extension $T : \mathrm{Idem}^{\triangleleft} \to \mathrm{Ret}$ carrying the cone point of $\mathrm{Idem}^{\triangleleft}$ to the object $\widetilde{Y}$. Unwinding the definitions, we see that a functor of ∞-categories $\overline{F} : \mathrm{N}_\bullet(\mathrm{Ret}) \to \mathcal{C}$ is right Kan extended from $\mathrm{N}_\bullet(\mathrm{Idem})$ if and only if the composition 0401

$$\mathrm{N}_\bullet(\mathrm{Idem})^{\triangleleft} \xrightarrow{\mathrm{N}_\bullet(T)} \mathrm{N}_\bullet(\mathrm{Ret}) \xrightarrow{\overline{F}} \mathcal{C}$$

is a limit diagram. Proposition 8.5.3.8 asserts that this condition is automatically satisfied. In particular, the object $\overline{F}(\widetilde{Y})$ is a limit of the underlying diagram $F = \overline{F}|_{\mathrm{N}_\bullet(\mathrm{Idem})}$. Similarly, $\overline{F}(\widetilde{Y})$ is a colimit of the diagram F.

0402 **Corollary 8.5.3.10** (Uniqueness of Splittings)**.** *Let $\mathcal{C}$ be an ∞-category. Then the restriction functor*

$$\mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Ret}), \mathcal{C}) \to \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C})$$

is fully faithful, and its essential image is the full subcategory consists of the split idempotents in $\mathcal{C}$.

Proof. Combine Proposition 8.5.3.8 with Corollary 7.3.6.15. □

0403 **Corollary 8.5.3.11.** *Let $\mathcal{C}$ be an ∞-category and let $F : \mathrm{N}_{\bullet}(\mathrm{Idem}) \to \mathcal{C}$ be an idempotent in $\mathcal{C}$. The following conditions are equivalent:*

(1) *The idempotent F is split: that is, it can be extended to a functor $\mathrm{N}_{\bullet}(\mathrm{Ret}) \to \mathcal{C}$.*

(2) *The diagram F admits a limit in $\mathcal{C}$.*

(3) *The diagram F admits a colimit in $\mathcal{C}$.*

Proof. The implications (1) ⇒ (2) and (1) ⇒ (3) follow from Remark 8.5.3.9, and the reverse implications follow from Corollary 7.3.5.8. □

0404 **Corollary 8.5.3.12.** *Let $\mathcal{C}$ be an ∞-category and let $F : \mathrm{N}_{\bullet}(\mathrm{Idem}) \to \mathcal{C}$ be an idempotent in $\mathcal{C}$. If F admits a limit (or colimit) in $\mathcal{C}$, then it is preserved by any functor of ∞-categories $G : \mathcal{C} \to \mathcal{D}$.*

Proof. Suppose that F admits a limit in $\mathcal{C}$. Then F splits (Corollary 8.5.3.11): that is, it extends to a diagram $\overline{F} : \mathrm{N}_{\bullet}(\mathrm{Ret}) \to \mathcal{C}$. Let $T : \mathrm{Idem}^{\triangleleft} \to \mathrm{Ret}$ be as in Remark 8.5.3.9, so that $(\overline{F} \circ \mathrm{N}_{\bullet}(T)) : \mathrm{N}_{\bullet}(\mathrm{Idem})^{\triangleleft} \to \mathcal{C}$ is a limit diagram in the ∞-category $\mathcal{C}$. We wish to show that the functor $(G \circ \overline{F} \circ \mathrm{N}_{\bullet}(T)) : \mathrm{N}_{\bullet}(\mathrm{Idem})^{\triangleleft} \to \mathcal{D}$ is a limit diagram in the ∞-category $\mathcal{D}$. By virtue of Proposition 8.5.3.8, this is automatic (Remark 8.5.3.9). □

8.5.4 Idempotent Completeness

0405 We now study ∞-categories in which every idempotent splits.

0406 **Definition 8.5.4.1.** Let $\mathcal{C}$ be an ∞-category. We say that $\mathcal{C}$ is *idempotent complete* if every idempotent $\mathrm{N}_{\bullet}(\mathrm{Idem}) \to \mathcal{C}$ splits (see Definition 8.5.3.5).

0407 **Example 8.5.4.2.** Let $\mathcal{C}$ be a category. If $\mathcal{C}$ admits equalizers (or coequalizers), then the ∞-category $\mathrm{N}_{\bullet}(\mathcal{C})$ is idempotent complete (this is a restatement of Corollary 8.5.2.6). In particular, if $\mathcal{C}$ admits finite limits or finite colimits, then $\mathrm{N}_{\bullet}(\mathcal{C})$ is idempotent complete.

0408 **Warning 8.5.4.3.** An ∞-category which admits finite limits (or colimits) need not be idempotent complete. See Example [?].

Example 8.5.4.4. Let X be a Kan complex. Since the simplicial set $\mathrm{N}_{\bullet}(\mathrm{Idem})$ is weakly contractible (Remark 8.5.3.4), every morphism of simplicial sets $\mathrm{N}_{\bullet}(\mathrm{Idem}) \to X$ is homotopic to a constant map. It follows that X is idempotent complete when viewed as an ∞-category. `0409`

Remark 8.5.4.5. Let $\mathcal{C}$ be an ∞-category. Then $\mathcal{C}$ is idempotent complete if and only if the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$ is idempotent complete. `040A`

Proposition 8.5.4.6. *Let $\mathcal{C}$ be an idempotent complete ∞-category and let $\mathcal{C}_0 \subseteq \mathcal{C}$ be a full subcategory. Suppose that, for every object $X \in \mathcal{C}_0$ and every object $Y \in \mathcal{C}$ which is a retract of X, there exists an object $Y' \in \mathcal{C}_0$ which is isomorphic to Y. Then $\mathcal{C}_0$ is idempotent complete.* `040B`

Proof. Let Ret denote the category of Construction 8.5.0.2. Suppose we are given an idempotent $F : \mathrm{N}_{\bullet}(\mathrm{Idem}) \to \mathcal{C}_0$, carrying the object $\widetilde{X} \in \mathrm{Idem}$ to an object $X = F(\widetilde{X}) \in \mathcal{C}_0$. We wish to show that F is a split idempotent in $\mathcal{C}_0$. Since $\mathcal{C}$ is idempotent complete, we can extend F to a functor $\overline{F} : \mathrm{N}_{\bullet}(\mathrm{Ret}) \to \mathcal{C}$, carrying the object $\widetilde{Y} \in \mathrm{Ret}$ to an object $Y = \overline{F}(\widetilde{Y})$ which is a retract of X. By assumption, we can choose an isomorphism $\alpha_0 : Y \to Y'$, where Y' belongs to $\mathcal{C}_0$. Using Corollary 4.4.5.3, we can lift α_0 to an isomorphism of functors $\alpha : \overline{F} \to \overline{F}'$ in $\mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Ret}), \mathcal{C})$, whose image in $\mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C})$ is the identity transformation from F to itself. Then $\overline{F}' : \mathrm{N}_{\bullet}(\mathrm{Ret}) \to \mathcal{C}_0$ is a splitting of the idempotent F. □

Proposition 8.5.4.7. *Let $\mathcal{C}$ be an ∞-category. The following conditions are equivalent:* `040C`

(1) *The ∞-category $\mathcal{C}$ is idempotent complete.*

(2) *The ∞-category $\mathcal{C}$ admits limits indexed by* $\mathrm{N}_{\bullet}(\mathrm{Idem})$.

(3) *The ∞-category $\mathcal{C}$ admits colimits indexed by* $\mathrm{N}_{\bullet}(\mathrm{Idem})$.

Proof. This is an immediate consequence of Corollary 8.5.3.11. □

Remark 8.5.4.8. Let $\mathcal{C}$ be an ∞-category. Then $\mathcal{C}$ is idempotent complete if and only if the restriction functor `040D`

$$\mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Ret}), \mathcal{C}) \to \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C})$$

is an equivalence of ∞-categories. This is an immediate consequence of Corollary 8.5.3.10.

Corollary 8.5.4.9. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories which are equivalent. Then $\mathcal{C}$ is idempotent complete if and only if $\mathcal{D}$ is idempotent complete.* `040E`

Corollary 8.5.4.10. *Let $\mathcal{C}$ be an ∞-category and let K be a simplicial set. If $\mathcal{C}$ is idempotent complete, then* $\mathrm{Fun}(K, \mathcal{C})$ *is idempotent complete.* `040F`

Proof. Combine Propositions 8.5.4.7 and 7.1.6.1. □

040G **Corollary 8.5.4.11.** *Let $\mathcal{C}$ be an ∞-category and let $f : K \to \mathcal{C}$ be a morphism of simplicial sets. If $\mathcal{C}$ is idempotent complete, then the slice and coslice ∞-categories $\mathcal{C}_{/f}$ and $\mathcal{C}_{f/}$ are idempotent complete.*

Proof. Combine Proposition 8.5.4.7 with Corollary 7.1.3.20. □

To apply the criterion of Proposition 8.5.4.7, it is often useful to replace $\mathrm{N}_\bullet(\mathrm{Idem})$ by a simpler simplicial set.

040H **Notation 8.5.4.12.** Let $\mathrm{Spine}[\mathbf{Z}]$ denote the 1-dimensional simplicial set associated to the directed graph

$$\cdots \to -2 \to -1 \to 0 \to 1 \to 2 \to \cdots$$

We let $Q : \mathrm{Spine}[\mathbf{Z}] \to \mathrm{N}_\bullet(\mathrm{Idem})$ be the morphism of simplicial sets corresponding to the diagram

$$\cdots \to X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \to \cdots$$

in the category Idem.

040J **Remark 8.5.4.13.** Since the simplicial set $\mathrm{Spine}[\mathbf{Z}]$ is 1-dimensional, the morphism Q of Notation 8.5.4.12 factors (uniquely) through the 1-skeleton of $\mathrm{N}_\bullet(\mathrm{Idem})$, which we can identify with the simplicial circle $\Delta^1 / \partial\Delta^1$. Under this identification, Q corresponds to a morphism of simplicial sets $q : \mathrm{Spine}[\mathbf{Z}] \to \Delta^1 / \partial\Delta^1$. This is a covering map (see Definition 3.1.4.1), which exhibits the simplicial circle $\Delta^1 / \partial\Delta^1$ as the quotient of $\mathrm{Spine}[\mathbf{Z}]$ by a free action of the group $(\mathbf{Z}, +)$ by translations. The induced map of geometric realizations $|\mathrm{Spine}[\mathbf{Z}]| \to |\Delta^1 / \partial\Delta^1|$ can be identified with the standard covering map $\mathbf{R} \to S^1$ in the category of topological spaces.

040K **Remark 8.5.4.14.** In the situation of Notation 8.5.4.12, we can regard $\mathrm{Spine}[\mathbf{Z}]$ as a simplicial subset of the nerve $\mathrm{N}_\bullet(\mathbf{Z})$, where we regard the set of integers $\mathbf{Z} = \{\cdots < -2 < -1 < 0 < 1 < 2 < \cdots\}$ as equipped with its usual linear ordering. Moreover, the inclusion $\mathrm{Spine}[\mathbf{Z}] \hookrightarrow \mathrm{N}_\bullet(\mathbf{Z})$ is inner anodyne (this is a special case of Proposition 1.5.7.3).

040L **Remark 8.5.4.15.** The simplicial set $\mathrm{Spine}[\mathbf{Z}]$ is weakly contractible. This follows from Remark 8.5.4.14, since the ∞-category $\mathrm{N}_\bullet(\mathbf{Z})$ is filtered and therefore weakly contractible (Proposition 7.2.4.9). Alternatively, it can be deduced from Example 3.6.4.4, since the geometric realization $|\mathrm{Spine}[\mathbf{Z}]|$ is homeomorphic to the set of real numbers $\mathbf{R}$ (endowed with its usual topology).

040M **Proposition 8.5.4.16.** *The morphism $Q : \mathrm{Spine}[\mathbf{Z}] \to \mathrm{N}_\bullet(\mathrm{Idem})$ of Notation 8.5.4.12 is both left and right cofinal.*

Proof. We will show that Q is left cofinal; a similar argument will show that it is right cofinal. By virtue of Theorem 7.2.3.1, it will suffice to show that the simplicial set $K = \mathrm{Spine}[\mathbf{Z}] \times_{\mathrm{N}_\bullet(\mathrm{Idem})} \mathrm{N}_\bullet(\mathrm{Idem})_{/\widetilde{X}}$ is weakly contractible. Let us identify the vertices of K with pairs (n, f), where n is an integer and $f : \widetilde{X} \to \widetilde{X}$ is a morphism in the category Idem. Unwinding the definitions, we see that K is the 1-dimensional simplicial set associated to the direct graph given in the diagram

$$\begin{tikzcd}
\cdots \arrow[r] \arrow[dr] & (-1, \widetilde{e}) \arrow[r] \arrow[dr] & (0, \widetilde{e}) \arrow[r] \arrow[dr] & (1, \widetilde{e}) \arrow[r] \arrow[dr] & \cdots \\
\cdots & (-1, \mathrm{id}_{\widetilde{X}}) & (0, \mathrm{id}_{\widetilde{X}}) & (1, \mathrm{id}_{\widetilde{X}}) & \cdots .
\end{tikzcd}$$

The inclusion of the upper part of the diagram determines a monomorphism of simplicial sets $\mathrm{Spine}[\mathbf{Z}] \hookrightarrow K$ which is left anodyne (since it is a pushout of a coproduct of countably many copies of the inclusion map $\{0\} \hookrightarrow \Delta^1$), and therefore a weak homotopy equivalence (Proposition 3.1.6.14). The desired result now follows from the weak contractibility of the simplicial set $\mathrm{Spine}[\mathbf{Z}]$ (Remark 8.5.4.15). □

Corollary 8.5.4.17. *Let $\mathcal{C}$ be an ∞-category which admits sequential limits (or colimits). Then $\mathcal{C}$ is idempotent complete.* 040N

Proof. It follows from Proposition 8.5.4.16 (and Corollary 7.2.2.12) that the ∞-category $\mathcal{C}$ admits limits (or colimits) indexed by the ∞-category $\mathrm{N}_\bullet(\mathrm{Idem})$, and is therefore idempotent complete by virtue of Proposition 8.5.4.7. □

Remark 8.5.4.18. Broadly speaking, Proposition 8.5.4.16 will be useful to us because it shows that the ∞-category $\mathrm{N}_\bullet(\mathrm{Idem})$ admits a (left and right) cofinal diagram $Q : K \to \mathrm{N}_\bullet(\mathrm{Idem})$, where the simplicial set K is finite-dimensional. Beware that it is not possible to arrange that the simplicial set K is *finite*, since an ∞-category which admits finite colimits need not be idempotent complete (Warning 8.5.4.3). In particular, there does not exist a categorical equivalence $K \to \mathrm{N}_\bullet(\mathrm{Idem})$, where K is a finite simplicial set. 040P

Example 8.5.4.19. Let $\mathcal{QC}$ denote the ∞-category of (small) ∞-categories. Then $\mathcal{QC}$ is idempotent complete. More generally, for every uncountable cardinal κ, the ∞-category $\mathcal{QC}^{<\kappa}$ of κ-small ∞-categories is idempotent complete. To prove this, we can use Propositions 8.5.4.6 and 8.5.1.15 to reduce to the case where κ has uncountable cofinality. In this case, the ∞-category $\mathcal{QC}^{<\kappa}$ admits sequential colimits (Example 7.6.7.8), so the desired result follows from Corollary 8.5.4.17. 040Q

040R **Example 8.5.4.20.** Let $\mathcal{S}$ denote the ∞-category of spaces. Then $\mathcal{S}$ is idempotent complete. More generally, for every uncountable cardinal κ, the ∞-category $\mathcal{S}^{<\kappa}$ of κ-small spaces is idempotent complete. This follows from Example 8.5.4.19 and Proposition 8.5.4.6, since the full subcategory $\mathcal{S}^{<\kappa} \subseteq \mathcal{QC}^{<\kappa}$ is closed under the formation of retracts (Remark 8.5.1.16).

040S **Warning 8.5.4.21.** Let $\mathcal{C}$ be an ∞-category. If $\mathcal{C}$ is idempotent complete, then its homotopy category $\mathrm{h}\mathcal{C}$ need not be idempotent complete. For example, the ∞-category of spaces $\mathcal{S}$ is idempotent complete (Example 8.5.4.20), but its homotopy category $\mathrm{h}\mathcal{S} = \mathrm{hKan}$ is not (see Proposition 8.5.7.15).

8.5.5 Idempotent Completion

040T Let $\mathcal{C}$ be an ∞-category. It follows from Corollary 8.3.3.17 (together with the criterion of Proposition 8.5.4.7) that we can choose a fully faithful functor $H : \mathcal{C} \to \widehat{\mathcal{C}}$, where $\widehat{\mathcal{C}}$ is idempotent complete. Our goal in this section is to show that there is a canonical choice for the ∞-category $\widehat{\mathcal{C}}$, which is characterized (up to equivalence) by the requirement that it is as small as possible.

040U **Definition 8.5.5.1.** Let $\mathcal{C}$ be an ∞-category. We say that a functor of ∞-categories $H : \mathcal{C} \to \widehat{\mathcal{C}}$ *exhibits $\widehat{\mathcal{C}}$ as an idempotent completion of $\mathcal{C}$* if it satisfies the following conditions:

(1) The functor H is fully faithful.

(2) The ∞-category $\widehat{\mathcal{C}}$ is idempotent complete.

(3) For every object $Y \in \widehat{\mathcal{C}}$, there exists an object $X \in \mathcal{C}$ such that Y is a retract of $H(X)$.

We will say that an ∞-category $\widehat{\mathcal{C}}$ *is an idempotent completion of $\mathcal{C}$* if there exists a functor $H : \mathcal{C} \to \widehat{\mathcal{C}}$ which exhibits $\widehat{\mathcal{C}}$ as an idempotent completion of $\mathcal{C}$.

Our first goal is to show that the idempotent completion of an ∞-category $\mathcal{C}$ is uniquely determined up to equivalence. To prove this, we reformulate Definition 8.5.5.1 as a universal mapping property:

0411 **Proposition 8.5.5.2.** *Let $H : \mathcal{C} \to \widehat{\mathcal{C}}$ be a functor of ∞-categories, where $\widehat{\mathcal{C}}$ is idempotent complete. The following conditions are equivalent:*

(a) The functor H exhibits $\widehat{\mathcal{C}}$ as an idempotent completion of $\mathcal{C}$, in the sense of Definition 8.5.5.1.

(b) For every idempotent complete ∞-category $\mathcal{D}$, precomposition with H induces an equivalence of ∞-categories $\mathrm{Fun}(\widehat{\mathcal{C}}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}, \mathcal{D})$.

Proof. By virtue of Proposition 8.5.4.7, an ∞-category $\mathcal{D}$ is idempotent complete if and only if it admits $\mathrm{N}_\bullet(\mathrm{Idem})$-indexed colimits: that is, if and only if it is $\mathbb{K}$-cocomplete, where $\mathbb{K} = \{\mathrm{N}_\bullet(\mathrm{Idem})\}$ (see Definition 8.4.5.1). Moreover, every functor of ∞-categories $F : \widehat{\mathcal{C}} \to \mathcal{D}$ automatically preserves $\mathrm{N}_\bullet(\mathrm{Idem})$-indexed colimits (Corollary 8.5.3.12). We can therefore restate (b) as follows:

(b') The functor H exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$-cocompletion of $\mathcal{C}$, in the sense of Definition 8.4.5.1.

Using Variant 8.4.6.9, we see that this condition is satisfied if and only if H satisfies conditions (1) and (2) of Definition 8.5.5.1, together with the following variant of (3):

$(3')$ The ∞-category $\widehat{\mathcal{C}}$ is generated by the essential image of H under the formation of $\mathrm{N}_\bullet(\mathrm{Idem})$-indexed colimits. That is, if $\widehat{\mathcal{C}}' \subseteq \widehat{\mathcal{C}}$ is a replete full subcategory which contains the essential image of H and is closed under retracts, then $\widehat{\mathcal{C}}' = \widehat{\mathcal{C}}$.

The implication $(3) \Rightarrow (3')$ is immediate. To prove the converse, let $\widehat{\mathcal{C}}' \subseteq \widehat{\mathcal{C}}$ be the full subcategory spanned by those objects Y which are retracts of $H(X)$, for some $X \in \mathcal{C}$. Condition (3) of Definition 8.5.5.1 asserts that $\widehat{\mathcal{C}}' = \widehat{\mathcal{C}}$. This is a special case of $(3')$, since $\widehat{\mathcal{C}}'$ is closed under the formation of retracts (Remark 8.5.1.6). □

Corollary 8.5.5.3 (Existence)**.** *Let $\mathcal{C}$ be an ∞-category. Then there exists a functor $H : \mathcal{C} \to \widehat{\mathcal{C}}$ which exhibits $\widehat{\mathcal{C}}$ as an idempotent completion of $\mathcal{C}$.* 040Z

Proof. By virtue of Proposition 8.5.5.2 (and its proof), this is a special case of Proposition 8.4.5.3 □

Using the Yoneda embedding of §8.3, we can give an explicit construction of idempotent completions. For simplicity, let us assume first that $\mathcal{C}$ is an essentially small ∞-category. We let $\mathrm{Fun}^{\mathrm{atm}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ spanned by those functors $\mathscr{F} : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}$ which are *atomic*, in the sense of Definition 8.4.6.1.

Proposition 8.5.5.4. *Let $\mathcal{C}$ be an essentially small ∞-category and let $h_\bullet : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ be a covariant Yoneda embedding for $\mathcal{C}$ (Definition 8.3.3.9). Then the functor $h_\bullet$ exhibits $\mathrm{Fun}^{\mathrm{atm}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ as an idempotent completion of $\mathcal{C}$.* 040X

Following the convention of Remark 4.7.0.5, we can regard Proposition 8.3.3.14 as a special case of the following more general assertion (which is essentially a special case of Proposition 8.4.5.7):

Proposition 8.5.5.5. *Let κ be an uncountable regular cardinal, let $\mathcal{C}$ be an ∞-category which is essentially κ-small, and let $\widehat{\mathcal{C}} \subseteq \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ be the full subcategory spanned by those functors $\mathscr{F}$ for which the corepresentable functor $\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})}(\mathscr{F}, \bullet)$ commutes with κ-small colimits. Then the covariant Yoneda embedding $h_\bullet : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ exhibits $\widehat{\mathcal{C}}$ as an idempotent completion of $\mathcal{C}$.* 040Y

Proof. To simplify the notation, set $\mathcal{D} = \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$. For each object $C \in \mathcal{C}$, the representable functor $h_C \in \mathcal{D}$ corepresents the functor

$$\mathcal{D} \to \mathcal{S}^{<\kappa} \qquad \mathscr{F} \mapsto \mathscr{F}(C)$$

given by evaluation at C, which preserves κ-small colimits by virtue of Proposition 7.1.6.1. It follows that the covariant Yoneda embedding $h_{\bullet}$ factors through the subcategory $\widehat{\mathcal{C}} \subseteq \mathcal{D}$. Moreover, the functor $h_{\bullet}$ is fully faithful (Theorem 8.3.3.13).

The ∞-category $\mathcal{D}$ admits κ-small colimits, and is therefore idempotent complete by virtue of Proposition 8.5.4.7. It follows from Corollary 8.5.1.14 that the full category $\widehat{\mathcal{C}} \subseteq \mathcal{D}$ is closed under the formation of retracts, and is therefore also idempotent complete (Proposition 8.5.4.6).

To complete the proof, it will suffice to show that every object $\mathscr{F} \in \widehat{\mathcal{C}}$ is a retract of h_C for some object $C \in \mathcal{C}$. Applying Corollary 8.4.3.9, we deduce that $\mathscr{F}$ can be realized as the colimit of a diagram

$$\mathcal{K} \xrightarrow{T} \mathcal{C} \xrightarrow{h_{\bullet}} \mathcal{D},$$

where $\mathcal{K}$ is an essentially κ-small ∞-category. Since the functor $\mathrm{Hom}_{\mathcal{D}}(\mathscr{F}, \bullet)$ preserves κ-small colimits, it follows that the identity map $\mathrm{id}_{\mathscr{F}} \in \mathrm{Hom}_{\mathcal{D}}(\mathscr{F}, \mathscr{F})$ factors (up to homotopy) through $h_{T(B)}$ for some B. In particular, $\mathscr{F}$ is a retract of the representable functor $h_{T(B)}$. □

Let $\mathcal{C}$ be an ∞-category. Proposition 8.5.5.5 supplies an explicit description of its idempotent completion $\widehat{\mathcal{C}}$ which is somewhat transcendental in nature: it locates $\widehat{\mathcal{C}}$ as a full subcategory of an ∞-category which is much larger than $\mathcal{C}$. Let us remark that this is not necessary: the ∞-category $\widehat{\mathcal{C}}$ is essentially of the same size as $\mathcal{C}$ itself.

0410 **Proposition 8.5.5.6.** *Let $\mathcal{C}$ be an ∞-category, let $\widehat{\mathcal{C}}$ be an idempotent completion of $\mathcal{C}$, and let κ be an uncountable cardinal. Then:*

(1) *The ∞-category $\mathcal{C}$ is locally κ-small if and only if $\widehat{\mathcal{C}}$ is locally κ-small.*

(2) *The ∞-category $\mathcal{C}$ is essentially κ-small if and only if $\widehat{\mathcal{C}}$ is essentially κ-small.*

Proof. Choose a functor $H : \mathcal{C} \to \widehat{\mathcal{C}}$ which exhibits $\widehat{\mathcal{C}}$ as an idempotent completion of $\mathcal{C}$. We first prove (1). Assume that $\mathcal{C}$ is locally κ-small; we wish to show that $\widehat{\mathcal{C}}$ is locally κ-small (the reverse implication follows immediately from the definition). Fix a pair of objects $Y, Y' \in \widehat{\mathcal{C}}$; we wish to show that the morphism space $\mathrm{Hom}_{\widehat{\mathcal{C}}}(Y, Y')$ is essentially κ-small. By assumption, the object $Y \in \widehat{\mathcal{C}}$ is a retract of $H(X)$ for some object $X \in \mathcal{C}$. It follows that $\mathrm{Hom}_{\widehat{\mathcal{C}}}(Y, Y')$ is a retract of $\mathrm{Hom}_{\widehat{\mathcal{C}}}(H(X), Y')$ in the homotopy category hKan. By virtue of Corollary 8.5.1.17, it will suffice to show that the Kan complex $\mathrm{Hom}_{\widehat{\mathcal{C}}}(H(X), Y')$ is essentially κ-small. Applying the same argument to Y', we are reduced to showing that the mapping space $\mathrm{Hom}_{\widehat{\mathcal{C}}}(H(X), H(X'))$ is essentially κ-small for every pair of objects $X, X' \in \mathcal{C}$. Since the functor F is fully faithful, the canonical map $\mathrm{Hom}_{\mathcal{C}}(X, X') \to \mathrm{Hom}_{\widehat{\mathcal{C}}}(H(X), H(X'))$ is a homotopy equivalence. The desired result now follows from our assumption that the ∞-category $\mathcal{C}$ is essentially κ-small.

We now prove (2). Assume that $\mathcal{C}$ is essentially κ-small; we wish to show that $\widehat{\mathcal{C}}$ is also essentially κ-small (again, the reverse implication follows immediately from the definitions). Without loss of generality, we may assume that κ is the smallest cardinal for which $\mathcal{C}$ is essentially κ-small, and is therefore regular (Corollary 4.7.6.17). By virtue of the criterion of Proposition 4.7.8.7, it will suffice to show that the set of isomorphism classes $S = \pi_0(\widehat{\mathcal{C}}^{\simeq})$ is κ-small. For each object $X \in \mathcal{C}$, let $S_X \subseteq S$ be the collection of isomorphism classes of objects $Y \in \widehat{\mathcal{C}}$ which can be realized as a retract of $H(X)$. Note that we can write S as a union of the subsets S_X, where the X ranges over a set of representatives for the isomorphism classes in $\mathcal{C}$. Since κ is regular, and the set $\pi_0(\mathcal{C}^{\simeq})$ is κ-small, it will suffice to show that each of the sets S_X is κ-small. Let us henceforth regard the object $X \in \mathcal{C}$ as fixed, and let Y be any retract of $H(X)$ in the ∞-category $\widehat{\mathcal{C}}$. It follows from Proposition 8.5.2.4 that, as an object of the homotopy category $\mathrm{h}\mathcal{C}$, Y can be identified with the equalizer of a pair of morphisms $(\mathrm{id}, e) : H(X) \to H(X)$. It follows that the cardinality of the set of isomorphism classes S_X is bounded above by the cardinality of the set $\mathrm{Hom}_{\mathrm{h}\widehat{\mathcal{C}}}(H(X), H(X))$ of morphisms $e : H(X) \to H(X)$ in $\mathrm{h}\mathcal{C}$, which we can identify with the κ-small set $\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(X, X)$. □

Let $\mathcal{QC}$ denote the ∞-category of (small) ∞-categories (Construction 5.5.4.1), and let $\mathcal{QC}^{\mathrm{ic}}$ denote the full subcategory of $\mathcal{QC}$ spanned by the idempotent complete ∞-categories. Proposition 8.5.5.2 asserts that a functor $F : \mathcal{C} \to \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as an idempotent completion of $\mathcal{C}$ if and only if exhibits $\widehat{\mathcal{C}}$ as a $\mathcal{QC}^{\mathrm{ic}}$-reflection of $\mathcal{C}$, in the sense of Definition 6.2.2.1. Consequently, Proposition 8.5.5.6 is equivalent to the assertion that $\mathcal{QC}^{\mathrm{ic}} \subseteq \mathcal{QC}$ is reflective. Combining this observation with Proposition 6.2.2.11, we obtain the following:

Corollary 8.5.5.7. *Then the inclusion functor $\mathcal{QC}^{\mathrm{ic}} \hookrightarrow \mathcal{QC}$ admits a left adjoint, which carries each ∞-category $\mathcal{C}$ to an idempotent completion $\widehat{\mathcal{C}}$.* 0414

Corollary 8.5.5.8. *Let $\mathcal{C}$ be an ∞-category which can be realized as the limit of a small diagram $\mathscr{F} : \mathcal{D} \to \mathcal{QC}$. Suppose that, for each vertex $D \in \mathcal{D}$, the ∞-category $\mathscr{F}(D)$ is idempotent complete. Then $\mathcal{C}$ is idempotent complete.* 0415

Proof. Combine Corollary 8.5.5.7 with Variant 7.1.3.24. □

Corollary 8.5.5.9. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories. Suppose that $\mathcal{D}$ is a retract of $\mathcal{C}$ in the homotopy category* hQCat. *If $\mathcal{C}$ is idempotent complete, then $\mathcal{D}$ is also idempotent complete.* 0416

Proof. By virtue of Remark 8.5.3.9, we can identify $\mathcal{D}$ with the limit of a diagram $\mathrm{N}_\bullet(\mathrm{Idem}) \to \mathcal{QC}$ carrying the unique object of Idem to the idempotent complete ∞-category $\mathcal{C}$. The desired result is now a special case of Corollary 8.5.5.8. □

0417 **Exercise 8.5.5.10.** Give a direct proof of Corollary 8.5.5.9.

8.5.6 Idempotent Endomorphisms

0418 Let $\mathcal{C}$ be an ∞-category and let $F : \mathrm{N}_\bullet(\mathrm{Idem}) \to \mathcal{C}$ be an idempotent in $\mathcal{C}$. Then F carries the unique object of Idem to an object $X \in \mathcal{C}$, and the unique non-identity morphism of Idem to an endomorphism $e : X \to X$ in $\mathcal{C}$. If $\mathcal{C}$ is (the nerve of) an ordinary category, then the functor F is uniquely determined by the pair (X, e) (Remark 8.5.2.8). In more general situations, this is false: the simplicial set $\mathrm{N}_\bullet(\mathrm{Idem})$ contains a nondegenerate simplex of each dimension (Remark 8.5.3.3), so the specification of the functor F requires an infinite amount of data. Our goal in this section is to show that, nevertheless, the idempotent $F : \mathrm{N}_\bullet(\mathrm{Idem}) \to \mathcal{C}$ can be recovered *up to isomorphism* from the underlying endomorphism (X, e). We begin by introducing some terminology.

0419 **Notation 8.5.6.1.** Let $\Delta^1 / \partial \Delta^1$ denote the simplicial circle (Example 1.5.7.11). For every ∞-category $\mathcal{C}$, we let $\mathrm{End}_{\mathcal{C}}$ denote the ∞-category of diagrams $\mathrm{Fun}(\Delta^1 / \partial \Delta^1, \mathcal{C})$. Note that objects of $\mathrm{End}_{\mathcal{C}}$ can be identified with pairs (X, e), where X is an object of $\mathcal{C}$ and $e : X \to X$ is an endomorphism of X. We will refer to $\mathrm{End}_{\mathcal{C}}$ as the *∞-category of endomorphisms in $\mathcal{C}$*.

041A **Remark 8.5.6.2.** Let $\mathcal{C}$ be an ∞-category. Evaluation on the unique vertex of $\Delta^1 / \partial \Delta^1$ induces an isofibration of ∞-categories $\mathrm{End}_{\mathcal{C}} \to \mathcal{C}$. Moreover, for each object $X \in \mathcal{C}$, the fiber $\{X\} \times_{\mathcal{C}} \mathrm{End}_{\mathcal{C}}$ can be identified with the endomorphism space $\mathrm{End}_{\mathcal{C}}(X) = \mathrm{Hom}_{\mathcal{C}}(X, X)$ of Variant 4.6.1.3.

041B **Definition 8.5.6.3** (Idempotent Endomorphisms)**.** Let $\mathcal{C}$ be an ∞-category and let $e : X \to X$ be an endomorphism in $\mathcal{C}$. We will say that e is *idempotent* if there exists a functor $F : \mathrm{N}_\bullet(\mathrm{Idem}) \to \mathcal{C}$ satisfying $F(\widetilde{e}) = e$; here $\widetilde{e}$ denotes the (unique) non-identity morphism in the category Idem. We let $\mathrm{End}^{\mathrm{idm}}_{\mathcal{C}}$ denote the full subcategory of $\mathrm{End}_{\mathcal{C}}$ spanned by the idempotent endomorphisms.

We can now formulate our main result.

041C **Proposition 8.5.6.4.** *Let $\mathcal{C}$ be an ∞-category. Then the restriction functor*

$$\mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Idem}), \mathcal{C}) \to \mathrm{End}^{\mathrm{idm}}_{\mathcal{C}}$$

has a left homotopy inverse.

Stated more informally, Proposition 8.5.6.4 asserts that if $e : X \to X$ is an endomorphism in the ∞-category $\mathcal{C}$ which can be extended to an idempotent $F : \mathrm{N}_\bullet(\mathrm{Idem}) \to \mathcal{C}$, then F is uniquely determined up to isomorphism and can be chosen to depend functorially on the pair (X, e).

Corollary 8.5.6.5. *For every ∞-category $\mathcal{C}$, evaluation on the non-identity morphism of* Idem *induces a bijection* 041D

$$\theta : \pi_0(\mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C})^{\simeq}) \to \pi_0((\mathrm{End}_{\mathcal{C}}^{\mathrm{idm}})^{\simeq}).$$

Proof. The surjectivity of θ follows from the definition of an idempotent endomorphism, and the injectivity from Proposition 8.5.6.4. □

Warning 8.5.6.6. Let $\mathcal{C}$ be an ∞-category and let $R : \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C}) \to \mathrm{End}_{\mathcal{C}}^{\mathrm{idm}}$ be the restriction functor. Proposition 8.5.6.4 asserts that there exists a functor $S : \mathrm{End}_{\mathcal{C}}^{\mathrm{idm}} \to \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C})$ for which the composition 041E

$$\mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C}) \xrightarrow{R} \mathrm{End}_{\mathcal{C}}^{\mathrm{idm}} \xrightarrow{S} \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C}).$$

is isomorphic to the identity functor. Let $e : X \to X$ be an idempotent endomorphism in $\mathcal{C}$, so that e can be extended to a morphism $F : \mathrm{N}_{\bullet}(\mathrm{Idem}) \to \mathcal{C}$. Then $S(e) = (S \circ R)(F)$ is isomorphic to F, so there is an isomorphism of $(R \circ S)(e)$ with e in the category $\mathrm{End}_{\mathcal{C}}^{\mathrm{idm}}$. Beware that this isomorphism usually *cannot* be chosen to depend functorially on e. In general, the functor R is not an equivalence of ∞-categories, so the composition

$$\mathrm{End}_{\mathcal{C}}^{\mathrm{idm}} \xrightarrow{S} \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C}) \xrightarrow{R} \mathrm{End}_{\mathcal{C}}^{\mathrm{idm}}$$

is not isomorphic to the identity functor on $\mathrm{End}_{\mathcal{C}}^{\mathrm{idm}}$.

Example 8.5.6.7. For any ∞-category $\mathcal{C}$, we have a commutative diagram 041F

$$\begin{tikzcd}
 & \mathcal{C} \arrow[dl] \arrow[dr, "\delta"] & \\
\mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C}) \arrow[rr] & & \mathrm{End}_{\mathcal{C}}^{\mathrm{idm}},
\end{tikzcd}$$

where the vertical maps are the diagonal embeddings. If $\mathcal{C}$ is a Kan complex, then the left vertical map is a homotopy equivalence of Kan complexes (since the simplicial set $\mathrm{N}_{\bullet}(\mathrm{Idem})$ is weakly contractible; see Remark 8.5.3.4). In this case, Proposition 8.5.6.4 reduces to the assertion that the diagonal map

$$\delta : \mathcal{C} \to \mathrm{End}_{\mathcal{C}}^{\mathrm{idm}} \subseteq \mathrm{Fun}(\Delta^1 / \partial \Delta^1, \mathcal{C}) \qquad X \mapsto (X, \mathrm{id}_X)$$

has a left homotopy inverse. This is clear: the map δ has a left inverse in the category of simplicial sets, given by evaluation at the vertex of $\Delta^1 / \partial \Delta^1$. Beware that δ is usually not a homotopy equivalence, since the simplicial set $\Delta^1 / \partial \Delta^1$ is not contractible.

We will give the proof of Proposition 8.5.6.4 at the end of this section. First, let us introduce an important class of idempotent endomorphisms.

`041G` **Definition 8.5.6.8.** Let $\mathcal{C}$ be an ∞-category. We say that an endomorphism $e : X \to X$ in $\mathcal{C}$ is *split idempotent* if the homotopy class $[e]$ is a split idempotent in the homotopy category $\mathrm{h}\mathcal{C}$ (see Example 8.5.2.3).

`041H` **Remark 8.5.6.9.** Let $\mathcal{C}$ be an ∞-category. Then an endomorphism $e : X \to X$ is split idempotent if and only there exists a retraction diagram

$$\begin{tikzcd} & X \arrow[dr, "r"] & \\ Y \arrow[ur, "i"] \arrow[rr, "\mathrm{id}_Y"] & & Y. \end{tikzcd}$$

in the ∞-category $\mathcal{C}$, where e factors as a composition $X \xrightarrow{r} Y \xrightarrow{i} X$.

`041J` **Proposition 8.5.6.10** (Lifting Split Idempotents)**.** *Let $\mathcal{C}$ be an ∞-category and let $e : X \to X$ be an endomorphism in $\mathcal{C}$. Then e is split idempotent endomorphism if and only if it extends to a split idempotent $\mathrm{N}_\bullet(\mathrm{Idem}) \to \mathcal{C}$, in the sense of Definition 8.5.3.5. In particular, every split idempotent endomorphism is an idempotent endomorphism.*

Proof. Assume that the endomorphism e is split idempotent; we will show that e can be extended to a split idempotent $F : \mathrm{N}_\bullet(\mathrm{Idem}) \to \mathcal{C}$ (the reverse implication follows immediately from the definitions). Choose a retraction diagram

`041K`

$$\begin{tikzcd} & X \arrow[dr, "r"] & \\ Y \arrow[ur, "i"] \arrow[rr, "\mathrm{id}_Y"] & & Y \end{tikzcd} \tag{8.57}$$

in the ∞-category $\mathcal{C}$, where $[e] = [i] \circ [r]$ in the homotopy category $\mathrm{h}\mathcal{C}$. Using Corollary 8.5.1.28, we can extend the diagram (8.57) to a functor $\overline{F} : \mathrm{N}_\bullet(\mathrm{Ret}) \to \mathcal{C}$. By construction, $\overline{F}$ carries the unique non-identity morphism of Idem to a morphism $e' : X \to X$ of $\mathcal{C}$ which is homotopic to e. Replacing $\overline{F}$ by an isomorphic functor if necessary, we may assume that $e' = e$ (see Corollary 4.4.5.3). Then $F = \overline{F}|_{\mathrm{N}_\bullet(\mathrm{Idem})}$ is a split idempotent in $\mathcal{C}$ extending e. □

Let $\mathcal{C}$ be an ∞-category. When restricted to *split* idempotents, Proposition 8.5.6.4 asserts every retraction diagram

$$\begin{tikzcd} & X \arrow[dr, "r"] & \\ Y \arrow[ur, "i"] \arrow[rr, "\mathrm{id}_Y"] & & Y \end{tikzcd}$$

can be recovered (up to canonical isomorphism) from a choice of composition $e = (i \circ r)$ in the ∞-category $\mathcal{C}$. To prove this, we will exploit the observation that Y can be realized as the limit (and colimit) of the diagram

$$\cdots \rightarrow X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \rightarrow \cdots ,$$

indexed by the 1-dimensional simplicial set $\mathrm{Spine}[\mathbf{Z}]$ of Notation 8.5.4.12.

Notation 8.5.6.11. Let $q : \mathrm{Spine}[\mathbf{Z}] \rightarrow \Delta^1 / \partial \Delta^1$ be the covering map of Remark 8.5.4.13. For every ∞-category $\mathcal{C}$, precomposition with q induces a functor `041L`

$$T : \mathrm{End}_{\mathcal{C}} = \mathrm{Fun}(\Delta^1 / \partial \Delta^1, \mathcal{C}) \hookrightarrow \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{C}) \qquad (X, e) \mapsto T_e.$$

More informally, the functor T carries each endomorphism $e : X \rightarrow X$ in the ∞-category $\mathcal{C}$ to the associated sequential diagram

$$\cdots \rightarrow X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \rightarrow \cdots$$

Proposition 8.5.6.12. *Let $\mathcal{C}$ be an ∞-category and let $e : X \rightarrow X$ be an idempotent endomorphism in $\mathcal{C}$. Then e splits if and only if the diagram $T_e : \mathrm{Spine}[\mathbf{Z}] \rightarrow \mathcal{C}$ admits a limit.* `041M`

Proof. Since e is idempotent, it can be extended to a functor $F : \mathrm{N}_{\bullet}(\mathrm{Idem}) \rightarrow \mathcal{C}$. Then $T_e = F \circ Q$, where $Q : \mathrm{Spine}[\mathbf{Z}] \rightarrow \mathrm{N}_{\bullet}(\mathrm{Idem})$ is the left cofinal morphism of Proposition 8.5.4.16. Using Corollary 7.2.2.10, we see that T_e has a limit in $\mathcal{C}$ if and only if F has a limit in $\mathcal{C}$. The desired result now follows from the criterion of Corollary 8.5.3.11 □

Remark 8.5.6.13. Let $\mathcal{C}$ be an ∞-category and let $e : X \rightarrow X$ be an split idempotent endomorphism in $\mathcal{C}$, so that the diagram `041N`

$$\cdots \rightarrow X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \rightarrow \cdots$$

admits both a limit and colimit in $\mathcal{C}$. The limit and colimit of this diagram are automatically preserved by any functor of ∞-categories $\mathcal{C} \rightarrow \mathcal{D}$. This follows by combining Corollary 8.5.3.12 with Proposition 8.5.4.16.

Motivated by Proposition 8.5.6.12, we introduce a variant of Definition 8.5.6.8.

041P **Definition 8.5.6.14.** Let $\mathcal{C}$ be an ∞-category and let $e : X \to X$ be an endomorphism in $\mathcal{C}$. We will say that e is *weakly split* if it satisfies the following conditions:

(1) The diagram T_e of Notation 8.5.6.11 can be extended to a limit diagram in $\mathcal{C}$, which we depict as

$$\begin{tikzcd}
 & & & Y \arrow[dll] \arrow[dl] \arrow[d, "i"] \arrow[dr] \arrow[drr] & & & \\
\cdots \arrow[r] & X \arrow[r, "e"] & X \arrow[r, "e"] & X \arrow[r, "e"] & X \arrow[r, "e"] & X \arrow[r, "e"] & \cdots
\end{tikzcd}$$

(2) The diagram T_e of Notation 8.5.6.11 can be extended to a colimit diagram in $\mathcal{C}$, which we depict as

$$\begin{tikzcd}
\cdots \arrow[r] & X \arrow[r, "e"] \arrow[drr] & X \arrow[r, "e"] \arrow[dr] & X \arrow[r, "e"] \arrow[d, "r"] & X \arrow[r, "e"] \arrow[dl] & X \arrow[r, "e"] \arrow[dll] & \cdots \\
 & & & Z. & & &
\end{tikzcd}$$

(3) The composition $Y \xrightarrow{i} X \xrightarrow{r} Z$ is an isomorphism in $\mathcal{C}$.

Our next goal is to show that every split idempotent endomorphism is weakly split.

041Q **Notation 8.5.6.15.** Let Ret denote the category of Construction 8.5.0.2. Then the object $\widetilde{Y} \in \mathrm{Ret}$ is both initial and final. It follows that the diagram $Q : \mathrm{Spine}[\mathbf{Z}] \to \mathrm{N}_\bullet(\mathrm{Idem})$ of Proposition 8.5.4.16 admits unique extensions

$$Q^- : \mathrm{Spine}[\mathbf{Z}]^{\triangleleft} \to \mathrm{N}_\bullet(\mathrm{Ret}) \qquad Q^+ : \mathrm{Spine}[\mathbf{Z}]^{\triangleright} \to \mathrm{N}_\bullet(\mathrm{Ret})$$

which carry the cone points to the object $\widetilde{Y}$.

041R **Lemma 8.5.6.16.** *Let $\mathcal{C}$ be an ∞-category and let $F : \mathrm{N}_\bullet(\mathrm{Ret}) \to \mathcal{C}$ be a functor. Then the composition $\mathrm{Spine}[\mathbf{Z}]^{\triangleleft} \xrightarrow{Q^-} \mathrm{N}_\bullet(\mathrm{Ret}) \xrightarrow{F} \mathcal{C}$ is a limit diagram in $\mathcal{C}$, and the composition $\mathrm{Spine}[\mathbf{Z}]^{\triangleright} \xrightarrow{Q^+} \mathrm{N}_\bullet(\mathrm{Ret}) \xrightarrow{F} \mathcal{C}$ is a colimit diagram in $\mathcal{C}$.*

Proof. Combine Remark 8.5.3.9, Corollary 7.2.2.3, and Proposition 8.5.4.16. □

041S **Proposition 8.5.6.17.** *Let $\mathcal{C}$ be an ∞-category and let $e : X \to X$ be a split idempotent endomorphism in $\mathcal{C}$. Then e is weakly split.*

Proof. Let Ret denote the category introduced in Construction 8.5.0.2. Using Proposition 8.5.6.10, we can choose a functor $F : \mathrm{N}_\bullet(\mathrm{Ret}) \to \mathcal{C}$ satisfying $F(\widetilde{X}) = X$ and $F(\widetilde{e}) = e$.

Let $Q : \mathrm{Spine}[\mathbf{Z}] \to \mathrm{N}_\bullet(\mathrm{Idem})$ denote the (left and right) cofinal morphism of Proposition 8.5.4.16, and let $Q^- : \mathrm{Spine}[\mathbf{Z}]^{\triangleleft} \to \mathrm{N}_\bullet(\mathrm{Ret})$ and $Q^+ : \mathrm{Spine}[\mathbf{Z}]^{\triangleright} \to \mathrm{N}_\bullet(\mathrm{Ret})$ be the extensions of Notation 8.5.6.15. Lemma 8.5.6.16 guarantees that $F \circ Q^-$ is a limit diagram in $\mathcal{C}$ extending $F \circ Q = T_e$, so that e satisfies condition (1) of Definition 8.5.6.14. Similarly, $F \circ Q^+$ is a colimit diagram extending T_e, so that e satisfies condition (2) of Definition 8.5.6.14. Condition (3) follows from the observation that any composition of $F(\widetilde{i})$ with $F(\widetilde{r})$ is homotopic to the morphism $F(\widetilde{r} \circ \widetilde{i}) = F(\mathrm{id}_{\widetilde{Y}}) = \mathrm{id}_{F(\widetilde{Y})}$, and is therefore an isomorphism. □

Warning 8.5.6.18. The converse of Proposition 8.5.6.17 is false. For example, every isomorphism $e : X \to X$ is weakly split, but is split idempotent only if e is homotopic to the identity morphism id_X (see Example 8.5.2.2). 041T

Let $\mathcal{C}$ be an ∞-category, and let $\mathrm{End}^w_{\mathcal{C}}$ denote the full subcategory of $\mathrm{End}_{\mathcal{C}}$ spanned by the weakly split endomorphisms in $\mathcal{C}$. It follows from Proposition 8.5.6.17 that the restriction functor

$$\mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Ret}), \mathcal{C}) \to \mathrm{End}_{\mathcal{C}} \qquad F \mapsto F(e)$$

factors through $\mathrm{End}^w_{\mathcal{C}}$. We will deduce Proposition 8.5.6.4 from the following:

Proposition 8.5.6.19. *Let $\mathcal{C}$ be an ∞-category. Then the restriction functor* 041U

$$\mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Ret}), \mathcal{C}) \to \mathrm{End}^w_{\mathcal{C}}$$

admits a left homotopy inverse.

Proof. Let $\mathcal{D} \subseteq \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{C})$ denote the full subcategory spanned by those diagrams $S : \mathrm{Spine}[\mathbf{Z}] \to \mathcal{C}$ which admit both a limit and a colimit. Let u and v be auxiliary symbols, and let $\widetilde{\mathcal{D}}$ denote the full subcategory of $\mathrm{Fun}(\{u\} \star \mathrm{Spine}[\mathbf{Z}] \star \{v\}, \mathcal{C})$ spanned by those diagrams $S^{\pm} : \{u\} \star \mathrm{Spine}[\mathbf{Z}] \star \{v\} \to \mathcal{C}$ which satisfy the following conditions:

(1) The restriction $S^- = S^{\pm}|_{\{u\} \star \mathrm{Spine}[\mathbf{Z}]}$ is a limit diagram in $\mathcal{C}$.

(2) The restriction $S^+ = S^{\pm}|_{\mathrm{Spine}[\mathbf{Z}] \star \{v\}}$ is a colimit diagram in $\mathcal{C}$.

Note that the simplicial set $\mathrm{Spine}[\mathbf{Z}]$ is weakly contractible (Remark 8.5.4.15), so that the inclusion map $\mathrm{Spine}[\mathbf{Z}] \hookrightarrow \{u\} \star \mathrm{Spine}[\mathbf{Z}]$ is right anodyne (Proposition 4.3.7.9). Applying Corollary 7.2.2.3, we can replace (2) by the condition that $S^{\pm}$ is a colimit diagram in $\mathcal{C}$. Moreover, the functor S^- admits a colimit if and only if $S = S^{\pm}|_{\mathrm{Spine}[\mathbf{Z}]}$ admits a colimit (Corollary 7.2.2.10). Invoking Corollary 7.3.6.15 twice, we deduce that the restriction functor

$$R : \widetilde{\mathcal{D}} \to \mathcal{D} \qquad S^{\pm} \mapsto S^{\pm}|_{\mathrm{Spine}[\mathbf{Z}]}$$

is a trivial Kan fibration of ∞-categories.

Let $\widetilde{\mathcal{D}}^{w}$ denote the replete full subcategory of $\widetilde{\mathcal{D}}$ spanned by those functors $S^{\pm}$ for which the composition

$$\Delta^1 \simeq \{u\} \star \{v\} \hookrightarrow \{u\} \star \operatorname{Spine}[\mathbf{Z}] \star \{v\} \xrightarrow{S^{\pm}} \mathcal{C}$$

is an isomorphism in $\mathcal{C}$. Let $\mathcal{D}^w \subseteq \mathcal{D}$ be the essential image of $\widetilde{\mathcal{D}}^{w}$ under R, so that R restricts to a trivial Kan fibration $R^w : \widetilde{\mathcal{D}}^{w} \to \mathcal{D}^w$.

Let $T : \operatorname{End}_{\mathcal{C}} \to \operatorname{Fun}(\operatorname{Spine}[\mathbf{Z}], \mathcal{C})$ be the functor given by precomposition with the covering map $\operatorname{Spine}[\mathbf{Z}] \to \Delta^1 / \partial \Delta^1$ (see Notation 8.5.4.12). By definition, and endomorphism e of $\mathcal{C}$ is weakly split if and only if the associated diagram $T_e : \operatorname{Spine}[\mathbf{Z}] \to \mathcal{C}$ is an object of $\mathcal{D}^w$. Consequently, the functor T restricts to a functor $T^w : \operatorname{End}_{\mathcal{C}} \to \mathcal{D}_w$.

Since the object $\widetilde{Y} \in \operatorname{Ret}$ is both initial and final, the diagram $Q : \operatorname{Spine}[\mathbf{Z}] \to \operatorname{N}_{\bullet}(\operatorname{Idem})$ admits an unique extension $Q^{\pm} : \{u\} \star \operatorname{Spine}[\mathbf{Z}] \star \{v\} \to \operatorname{N}_{\bullet}(\operatorname{Ret})$ carrying both u and v to the object $\widetilde{Y}$. It follows from Lemma 8.5.6.16 that precomposition with $Q^{\pm}$ induces a functor

$$\widetilde{T} : \operatorname{Fun}(\operatorname{N}_{\bullet}(\operatorname{Ret}), \mathcal{C}) \to \widetilde{\mathcal{D}}^{w} \subseteq \operatorname{Fun}(\{u\} \star \operatorname{Spine}[\mathbf{Z}] \star \{v\}, \mathcal{C}).$$

By construction, we have a commutative diagram of ∞-categories

$$\begin{tikzcd}
\operatorname{Fun}(\operatorname{N}_{\bullet}(\operatorname{Ret}), \mathcal{C}) \arrow[r, "\widetilde{T}"] \arrow[d] & \widetilde{\mathcal{D}}^{w} \arrow[d, "\sim"', "R^w"] \\
\operatorname{End}_{\mathcal{C}}^{w} \arrow[r, "T^w"] & \mathcal{D}^w,
\end{tikzcd}$$

where the right vertical map is a trivial Kan fibration. Consequently, to show that the left vertical map has a left homotopy inverse, it will suffice to show that the functor $\widetilde{T}$ has a left homotopy inverse.

Note that precomposition with the map

$$\Delta^2 \simeq \{u\} \star \{0\} \star \{v\} \hookrightarrow \{u\} \star \operatorname{Spine}[\mathbf{Z}] \star \{v\}$$

determines an evaluation functor $\operatorname{ev} : \widetilde{\mathcal{D}} \to \operatorname{Fun}(\Delta^2, \mathcal{C})$. Let $\operatorname{Fun}^w(\Delta^2, \mathcal{C})$ denote the full subcategory of $\operatorname{Fun}(\Delta^2, \mathcal{C})$ spanned by those diagrams

$$\begin{tikzcd}
& X \arrow[dr, "r"] & \\
Y \arrow[ur, "i"] \arrow[rr, "u"] & & Y'
\end{tikzcd}$$

where u is an isomorphism, so that ev restricts to a functor $\mathrm{ev}^w : \widetilde{\mathcal{D}}^w \to \mathrm{Fun}^w(\Delta^2, \mathcal{C})$. It will therefore suffice to show that the composite functor

$$\mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Ret}), \mathcal{C}) \xrightarrow{\widetilde{T}} \widetilde{\mathcal{D}}^w \xrightarrow{\mathrm{ev}^w} \mathrm{Fun}^w(\Delta^2, \mathcal{C})$$

has a left homotopy inverse. We conclude by observing that this composite functor is an equivalence of ∞-categories, by virtue of Corollary 8.5.1.30. □

Proof of Proposition 8.5.6.4. Let $\mathcal{C}$ be an ∞-category. We wish to show that the restriction functor

$$R : \mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Idem}), \mathcal{C}) \to \mathrm{End}^{\mathrm{idm}}_{\mathcal{C}}$$

has a left homotopy inverse. Using Corollary 8.5.5.3, we can choose a fully faithful functor $H : \mathcal{C} \to \mathcal{C}'$, where $\mathcal{C}'$ is idempotent complete. Replacing $\mathcal{C}$ by the essential image of H, we may assume without loss of generality that $\mathcal{C}$ is a full subcategory of $\mathcal{C}'$ (and H is the inclusion functor). Then R is the restriction of a functor $R' : \mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Idem}), \mathcal{C}') \to \mathrm{End}^{\mathrm{idm}}_{\mathcal{C}'}$. Since $\mathcal{C}'$ is idempotent complete, every idempotent endomorphism in $\mathcal{C}'$ is split, and therefore weakly split. Applying Proposition 8.5.6.19, we deduce that the composition

$$\mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Ret}), \mathcal{C}') \to \mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Idem}), \mathcal{C}') \xrightarrow{R'} \mathrm{End}^{\mathrm{idm}}_{\mathcal{C}'} \subseteq \mathrm{End}^{w}_{\mathcal{C}}$$

admits a left homotopy inverse. The restriction map $\mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Ret}), \mathcal{C}') \to \mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Idem}), \mathcal{C}')$ is an equivalence of ∞-categories (Remark 8.5.4.8), so R' admits a left homotopy inverse $S' : \mathrm{End}^{\mathrm{idm}}_{\mathcal{C}'} \to \mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Idem}), \mathcal{C}')$. Restricting to the full subcategory $\mathrm{End}^{\mathrm{idm}}_{\mathcal{C}} \subseteq \mathrm{End}^{\mathrm{idm}}_{\mathcal{C}'}$, we obtain a functor $S : \mathrm{End}^{\mathrm{idm}}_{\mathcal{C}} \to \mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Idem}), \mathcal{C})$ which is left homotopy inverse to R. □

8.5.7 Homotopy Idempotent Endomorphisms

Let $\mathcal{C}$ be an ∞-category and let $e : X \to X$ be an endomorphism in $\mathcal{C}$. If e is idempotent (in the sense of Definition 8.5.6.3), then the homotopy class $[e]$ is an idempotent endomorphism in the homotopy category $\mathrm{h}\mathcal{C}$. One can ask if the converse is true: if the homotopy class $[e]$ is an idempotent endomorphism in $\mathrm{h}\mathcal{C}$, does it follow that e is an idempotent endomorphism of $\mathcal{C}$? In this section, we will show that this question has a negative answer in general (Proposition 8.5.7.15), but a positive answer under some additional assumptions (Corollary 8.5.7.5). Let us begin by introducing some terminology. 041V

Definition 8.5.7.1. Let $\mathcal{C}$ be an ∞-category and let $e : X \to X$ be an endomorphism in $\mathcal{C}$. We say that e is *homotopy idempotent* if the homotopy class $[e]$ is an idempotent in the homotopy category $\mathrm{h}\mathcal{C}$, in the sense of Definition 8.5.2.1. 041W

041X **Remark 8.5.7.2.** Let $\mathcal{C}$ be an ∞-category and let $e : X \to X$ be an endomorphism in $\mathcal{C}$. Then e is homotopy idempotent if and only if there exists a 2-simplex σ of $\mathcal{C}$ whose boundary is indicated in the diagram

$$\begin{tikzcd}
& X \arrow[dr, "e"] & \\
X \arrow[ur, "e"] \arrow[rr, "e"] & & X.
\end{tikzcd}$$

041Y **Example 8.5.7.3.** Let $\mathcal{C}$ be an ∞-category and let $e : X \to X$ be an endomorphism in $\mathcal{C}$. If e is idempotent (that is, if it extends to a functor $\mathrm{N}_{\bullet}(\mathrm{Idem}) \to \mathcal{C}$), then it is homotopy idempotent.

We now provide a partial converse to Example 8.5.7.3.

041Z **Proposition 8.5.7.4.** *Let $\mathcal{C}$ be an ∞-category and let $e : X \to X$ be an endomorphism in $\mathcal{C}$. The following conditions are equivalent:*

(1) *The homotopy class $[e]$ is a split idempotent in the homotopy category $\mathrm{h}\mathcal{C}$.*

(2) *The endomorphism e is a split idempotent in $\mathcal{C}$.*

(3) *The endomorphism e is homotopy idempotent and weakly split (Definition 8.5.6.14).*

(4) *The endomorphism e is homotopy idempotent and there exists a limit diagram*

$$\begin{tikzcd}
& & & Y \arrow[dlll] \arrow[dl, "i(-1)"'] \arrow[d, "i(0)"] \arrow[dr, "i(1)"] \arrow[drrr] & & & \\
\cdots \arrow[rr] & & X \arrow[r, "e"] & X \arrow[r, "e"] & X \arrow[rr, "e"] & & \cdots
\end{tikzcd}$$

in $\mathcal{C}$, where the morphism $i(0)$ has a left homotopy inverse.

Proof. The equivalence (1) $\Leftrightarrow$ (2) is tautology, the implication (2) $\Rightarrow$ (3) follows from Proposition 8.5.6.17 (and Example 8.5.7.3), and the implication (3) $\Rightarrow$ (4) is immediate. We will complete the proof by showing that (4) implies (1). Assume that e is homotopy idempotent, so that there exists a 2-simplex σ of $\mathcal{C}$ whose boundary is indicated in the diagram

$$\begin{tikzcd}
 & X \arrow[dr, "e"] & \\
X \arrow[ur, "e"] \arrow[rr, "e"] & & X.
\end{tikzcd}$$

Let $\mathrm{Spine}[\mathbf{Z}]$ denote the 1-dimensional simplicial set of Notation 8.5.4.12, and let $T_{\sigma} : \mathrm{Spine}[\mathbf{Z}] \to \mathcal{C}_{X/}$ be the morphism of simplicial sets which carries each vertex of $\mathrm{Spine}[\mathbf{Z}]$ to e (regarded as an object of the coslice ∞-category $\mathcal{C}_{X/}$) and each nondegenerate edge of $\mathrm{Spine}[\mathbf{Z}]$ to σ (regarded as a morphism of the coslice ∞-category $\mathcal{C}_{X/}$). We will identify T_{σ} with a diagram $\overline{T}_e : \mathrm{Spine}[\mathbf{Z}]^{\triangleleft} \to \mathcal{C}$, where the restriction $\overline{T}_e|_{\mathrm{Spine}[\mathbf{Z}]}$ is the diagram $T_e : \mathrm{Spine}[\mathbf{Z}] \to \mathcal{C}$ of Notation 8.5.6.11. Let us further identify $\overline{T}_e$ with an object $\overline{X}$ of the slice ∞-category $\mathcal{C}_{/T_e}$, lying over the object $X \in \mathcal{C}$. By virtue of assumption (4), the ∞-category $\mathcal{C}_{/T_e}$ has a final object $\overline{Y}$, lying over a some object $Y \in \mathcal{C}$. We can therefore choose a morphism $\overline{r} : \overline{X} \to \overline{Y}$ in the ∞-category $\mathcal{C}_{/T_e}$, having some image $r : X \to Y$ in $\mathcal{C}$. The morphism $\overline{r}$ can be identified with a diagram $\Delta^1 \star \mathrm{Spine}[\mathbf{Z}] \to \mathcal{C}$, which we display informally as

$$\begin{tikzcd}
 & & X \arrow[d, "r"] & & \\
 & & Y \arrow[dl, "i(-1)"'] \arrow[d, "i(0)"] \arrow[dr, "i(1)"] & & \\
\cdots \arrow[r] & X \arrow[r, "e"] & X \arrow[r, "e"] & X \arrow[r, "e"] & \cdots
\end{tikzcd}$$

By construction, the restriction of this diagram to the middle column witnesses the equality $[i(0)] \circ [r] = [e]$ in the homotopy category $\mathrm{h}\mathcal{C}$. To show that the homotopy class $[e]$ is a split idempotent, it will suffice to show that $[r] \circ [i(0)]$ is the identity morphism $[\mathrm{id}_Y]$ in the homotopy category $\mathrm{h}\mathcal{C}$. Since the morphism $[i(0)]$ admits a left inverse, it will suffice to show that equality holds after postcomposition with $[i(0)]$. This follows from the calculation

$$\begin{aligned}
[i(0)] \circ ([r] \circ [i(0)]) &= ([i(0)] \circ [r]) \circ [i(0)] \\
&= [e] \circ [i(0)] \\
&= [e] \circ ([e] \circ [i(-1)]) \\
&= ([e] \circ [e]) \circ [i(-1)] \\
&= [e] \circ [i(-1)] \\
&= [i(0)].
\end{aligned}$$

□

0420 **Corollary 8.5.7.5.** *Let $\mathcal{C}$ be an ∞-category which admits sequential limits and colimits, and let $e : X \to X$ be an endomorphism in $\mathcal{C}$. Then e is idempotent if and only if it is homotopy idempotent and the composite map*

$$\varprojlim(\cdots \to X \xrightarrow{e} X \to \cdots) \to X \to \varinjlim(\cdots \to X \xrightarrow{e} X \to \cdots)$$

is an isomorphism (see Definition 8.5.6.14).

Proof. This is a special case of Proposition 8.5.7.4, together with the observation that every idempotent in $\mathcal{C}$ is split (Proposition 8.5.6.12). □

Let us now present a sample application of Proposition 8.5.7.4.

0421 **Corollary 8.5.7.6.** *Let X be a connected Kan complex and let $x \in X$ be a vertex. Then every homotopy idempotent endomorphism $e : (X, x) \to (X, x)$ in the ∞-category $\mathcal{S}_*$ is (split) idempotent.*

Proof. Without loss of generality, we may assume that the morphism e is obtained from a morphism $(X, x) \to (X, x)$ in the ordinary category of pointed Kan complexes (see Proposition 5.5.3.8). Then the diagram $T_e : \mathrm{Spine}[\mathbf{Z}] \to \mathcal{S}_*$ of Notation 8.5.6.11 lifts to a functor of ordinary categories $\mathscr{F} : (\mathbf{Z}, \leq) \to \mathrm{Kan}_*$, which we display as

$$\cdots \to (X, x) \xrightarrow{e} (X, x) \xrightarrow{e} (X, x) \xrightarrow{e} (X, x) \xrightarrow{e} (X, x) \to \cdots$$

Let us abuse notation by identifying $\mathscr{F}$ with its image in the category of Kan complexes Kan. Applying Variant 7.5.3.6, we can choose a levelwise homotopy equivalence $\alpha : \mathscr{F} \to \mathscr{G}$, where $\mathscr{G} : (\mathbf{Z}, \leq) \to \mathrm{Kan}$ is an isofibrant diagram of Kan complexes. Note that we can also regard $\mathscr{G}$ as a diagram of pointed Kan complexes, by equipping each $\mathscr{G}(n)$ with the base point $y_n = \alpha(n)(x)$. Let us extend $\mathscr{G}$ to a functor $\mathscr{G}^{\pm} : (\mathbf{Z} \cup \{-\infty, \infty\}, \leq) \to \mathrm{Kan}_*$ by setting $\mathscr{G}^{\pm}(-\infty) = \varprojlim(\mathscr{G})$ and $\mathscr{G}^{\pm}(\infty) = \varinjlim(\mathscr{G})$, where the limit and colimit are formed in the category of (pointed) simplicial sets; we denote the base points of $\mathscr{G}^{\pm}(-\infty)$ and $\mathscr{G}^{\pm}(\infty)$

by $y_{-\infty}$ and y_{∞}, respectively. Passing to nerves, the functor $\mathscr{G}^{\pm}$ determines a diagram $S : \{-\infty\} \star \operatorname{Spine}[\mathbf{Z}] \star \{\infty\} \to \mathcal{S}_{*}$.

Let $U : \mathcal{S}_{*} \to \mathcal{S}$ be the forgetful functor (given on objects by $U(X, x) = X$). Since the diagram $\mathscr{G}$ is isofibrant and the inclusion $\operatorname{Spine}[\mathbf{Z}] \hookrightarrow \operatorname{N}_{\bullet}(\mathbf{Z})$ is left cofinal (Remark 8.5.4.14), the restriction $(U \circ S)|_{\{-\infty\} \star \operatorname{Spine}[\mathbf{Z}]}$ is a limit diagram in the ∞-category $\mathcal{S}$ (Corollary 7.5.4.7). Applying Corollary 7.1.3.20, we see that $S|_{\{-\infty\} \star \operatorname{Spine}[\mathbf{Z}]}$ is a limit diagram in the ∞-category $\mathcal{S}_{*}$. Since the ∞-category $\operatorname{N}_{\bullet}(\mathbf{Z})$ is filtered and the inclusion $\operatorname{Spine}[\mathbf{Z}] \hookrightarrow \operatorname{N}_{\bullet}(\mathbf{Z})$ is right cofinal, the restriction $(U \circ S)|_{\operatorname{Spine}[\mathbf{Z}] \star \{\infty\}}$ is a colimit diagram in the ∞-category $\mathcal{S}$ (Corollary 7.5.9.3). Since the spine $\operatorname{Spine}[\mathbf{Z}]$ is weakly contractible (Remark 8.5.4.15), it follows that $S|_{\operatorname{Spine}[\mathbf{Z}] \star \{\infty\}}$ is a colimit diagram in the ∞-category $\mathcal{S}_{*}$. Moreover, the natural transformation α induces an isomorphism $T_e \to S|_{\operatorname{Spine}[\mathbf{Z}]}$ in the ∞-category $\operatorname{Fun}(\operatorname{Spine}[\mathbf{Z}], \mathcal{S}_{*})$. It follows that the morphism e is idempotent if and only if the composition

$$\Delta^1 \simeq \{-\infty\} \star \{\infty\} \hookrightarrow \{-\infty\} \star \operatorname{Spine}[\mathbf{Z}] \star \{\infty\} \xrightarrow{S} \mathcal{S}_{*}$$

is an isomorphism in $\mathcal{S}_{*}$: that is, if and only if the map of Kan complexes

$$\theta : \mathscr{G}^{\pm}(-\infty) = \varprojlim(\mathscr{G}) \to \varinjlim(\mathscr{G}) = \mathscr{G}^{\pm}(\infty)$$

is a homotopy equivalence of (pointed) Kan complexes (Corollary 8.5.7.6).

Since each $\mathscr{G}(n)$ is a connected Kan complex, it follows that the colimit $\varinjlim(\mathscr{G})$ is also connected. By virtue of Theorem 3.2.7.1, it will suffice to show that, for every integer $d \geq 0$, θ induces a bijection $\pi_d(\varprojlim(\mathscr{G}), y_{-\infty}) \to \pi_d(\varinjlim(\mathscr{G}), y_{\infty})$ (note that, in the case $d = 0$, this guarantees that the Kan complex $\varprojlim(\mathscr{G})$ is also connected, so that a similar conclusion holds for any choice of base point). Let $\overleftarrow{G}$ denote the diagram of sets

$$\cdots \to \pi_d(\mathscr{G}(-1), y_{-1}) \to \pi_d(\mathscr{G}(0), y_0) \to \pi_d(\mathscr{G}(1), y_1) \to \cdots$$

Note that α determines an isomorphism of $\overleftarrow{G}$ with the diagram

$$\cdots \to \pi_d(X, x) \xrightarrow{f_d} \pi_d(X, x) \xrightarrow{f_d} \pi_d(X, x) \to \cdots$$

where each of the transition maps is induced by e. Since e is homotopic to $e \circ e$ (in the homotopy category of pointed Kan complexes), it follows that $f_d = f_d \circ f_d$, so that the tautological map $v : \varprojlim(\overleftarrow{G}) \to \varinjlim(\overleftarrow{G})$ is a bijection. Unwinding the definition, we see that $\pi_d(\theta)$ factors as a composition

$$\pi_d(\varprojlim_n \mathscr{G}(n), y_{\infty}) \xrightarrow{u} \varprojlim_n \pi_d(\mathscr{G}(n), y_n)) \xrightarrow{v} \varinjlim_n \pi_d(\mathscr{G}(n), y_n) \xrightarrow{w} \pi_d(\mathscr{G}(\infty), y_{\infty}),$$

where the map w is also bijective (Remark 3.2.2.16). It will therefore suffice to show that the map u is bijective. By virtue of the Milnor exact sequence (Proposition [?]), this is equivalent to the assertion that the set

$$\varprojlim^1(\cdots \to \pi_{d+1}(\mathscr{G}(-2), y_{-2}) \to \pi_{d+1}(\mathscr{G}(-1), y_{-1}) \to \pi_{d+1}(\mathscr{G}(0), y_0))$$

has a single element. This is a special case of Proposition [?], since the inverse system of groups

$$\cdots \to \pi_{d+1}(X, x) \xrightarrow{f_{d+1}} \pi_{d+1}(X, x) \xrightarrow{f_{d+1}} \pi_{d+1}(X, x)$$

is Mittag-Leffler (since f_{d+1} is idempotent, its image coincides with the image of f_{d+1}^n for every integer $n > 0$). □

0422 **Corollary 8.5.7.7.** *Let X be a connected Kan complex and let $e : X \to X$ be a homotopy idempotent endomorphism in the ∞-category $\mathcal{S}$. Then e is idempotent if and only if it can be lifted to a homotopy endomorphism endomorphism $\widetilde{e} : (X, x) \to (X, x)$ in the ∞-category $\mathcal{S}_*$.*

Proof. Let $\widetilde{e} : (X, x) \to (X, x)$ be a lift of e to a morphism in the ∞-category $\mathcal{S}_*$. If $\widetilde{e}$ is homotopy idempotent, then it is idempotent (Corollary 8.5.7.6), so that e is also idempotent. For the converse, suppose that e is idempotent: that is, it can be extended to a functor $F : \mathrm{N}_\bullet(\mathrm{Idem}) \to \mathcal{C}$. Since the ∞-category $\mathcal{S}$ admits small colimits (Corollary 7.4.5.6), the idempotent F splits. Consequently, there is a retraction diagram

0423
$$\begin{tikzcd} & X \arrow[dr, "r"] & \\ Y \arrow[ur, "i"] \arrow[rr, "\mathrm{id}_Y"] & & Y \end{tikzcd} \tag{8.58}$$

in the ∞-category of spaces $\mathcal{S}$, where e is homotopic to the composition $(i \circ r) : X \to X$. Fix vertices $x \in X$ and $y \in Y$. Since X is connected, we can lift i to a morphism $\widetilde{i} : (Y, y) \to (X, x)$ in the ∞-category $\mathcal{S}_*$ (see Example 5.5.3.4). Since the forgetful functor $\mathcal{S}_* \to \mathcal{S}$ is a left fibration, we can lift (8.58) to a retraction diagram

$$\begin{tikzcd} & (X, x) \arrow[dr, "\widetilde{r}"] & \\ (Y, y) \arrow[ur, "\widetilde{i}"] \arrow[rr, "\mathrm{id}"] & & (Y, y) \end{tikzcd}$$

in the ∞-category $\mathcal{S}_*$. It follows that e can be lifted to a (split) homotopy idempotent in $\mathcal{S}_*$, given by any composition of $\widetilde{r}$ with $\widetilde{i}$. □

Exercise 8.5.7.8. Let (X, x) be a pointed Kan complex and let $e : X \to X$ be a morphism from X to itself. Show that: 0424

- If X is connected, then e can be lifted to a morphism $\widetilde{e} : (X, x) \to (X, x)$ in the ∞-category $\mathcal{S}_*$.
- If X is simply connected, then e is homotopy idempotent (in the ∞-category $\mathcal{S}$) if and only if $\widetilde{e}$ is homotopy idempotent (in the ∞-category $\mathcal{S}_*$).

In particular, if X is simply connected, then every homotopy idempotent $e : X \to X$ is (split) idempotent (Corollary 8.5.7.7).

In the situation of Exercise 8.5.7.8, the simple connectivity assumption on X cannot be omitted. That is, not every homotopy idempotent in the ∞-category $\mathcal{S}$ is split. We present a counterexample, due originally to Freyd and Heller (see [21]).

Definition 8.5.7.9 (Dyadic Homeomorphisms)**.** Recall that a *dyadic rational number* is a real number of the form $\frac{a}{2^n}$, where a and n are integers. Let $s, t \geq 0$ be dyadic rational numbers. We say that a homeomorphism $f : [0, s] \xrightarrow{\sim} [0, t]$ is *dyadic* if it satisfies the following conditions: 0425

- The function f is piecewise linear; in particular, it is differentiable away from finitely many points of the closed interval $[0, s]$.
- If $x \in [0, s]$ is a point where f is not differentiable, then x is a dyadic rational number.
- For every point $x \in [0, s]$ where f is differentiable, the derivative $f'(x)$ is equal to 2^n for some integer n.

Note that the third condition implies that the homeomorphism f is strictly increasing, so that $f(0) = 0$ and $f(s) = t$.

Exercise 8.5.7.10 (Inverses of Dyadic Homeomorphisms)**.** Let $s, t \geq 0$ be dyadic rational numbers and let $f : [0, s] \xrightarrow{\sim} [0, t]$ be a dyadic homeomorphism. Show that the inverse homeomorphism $f^{-1} : [0, t] \xrightarrow{\sim} [0, s]$ is also dyadic. 0426

Exercise 8.5.7.11 (Composition of Dyadic Homeomorphisms)**.** Let $s, t, u \geq 0$ be dyadic rational numbers and let $f : [0, s] \xrightarrow{\sim} [0, t]$ and $g : [0, t] \xrightarrow{\sim} [0, u]$ be dyadic homeomorphisms. Show that the composition $(g \circ f) : [0, s] \xrightarrow{\sim} [0, u]$ is also a dyadic homeomorphism. 0427

Definition 8.5.7.12 (The Thompson Group)**.** Let $\mathrm{Aut}_{\mathrm{Dy}}([0, 1])$ denote the collection of all dyadic homeomorphisms from the unit interval $[0, 1]$ to itself. It follows from Exercises 8.5.7.10 and 8.5.7.11 that $\mathrm{Aut}_{\mathrm{Dy}}([0, 1])$ has the structure of a group (where the group law is given by composition of homeomorphisms). We will refer to $\mathrm{Aut}_{\mathrm{Dy}}([0, 1])$ as the *Thompson group*. 0428

0429 **Construction 8.5.7.13** (Speeding Up)**.** Let $f : [0,1] \to [0,1]$ be an orientation-preserving homeomorphism. We define $\alpha(f) : [0,1] \to [0,1]$ by the formula

$$\alpha(f)(x) = \begin{cases} f(2x)/2 & \text{if } 0 \leq x \leq 1/2 \\ x & \text{if } 1/2 \leq x \leq 1. \end{cases}$$

Then $\alpha(f)$ is also an orientation-preserving homeomorphism of $[0,1]$ with itself. Moreover, if f is dyadic, then $\alpha(f)$ is also dyadic. It follows that the construction $f \mapsto \alpha(f)$ determines a group homomorphism α from the Thompson group $\mathrm{Aut}_{\mathrm{Dy}}([0,1])$ to itself.

042A **Proposition 8.5.7.14.** *Let* $\mathrm{Aut}_{\mathrm{Dy}}([0,1])$ *be the Thompson group of Definition 8.5.7.12 and let* $X = B_{\bullet} \mathrm{Aut}_{\mathrm{Dy}}([0,1])$ *denote its classifying simplicial set (Construction 1.3.2.5). Then the homomorphism* α *of Construction 8.5.7.13 induces a homotopy idempotent endomorphism* $e : X \to X$ *in the* ∞*-category* $\mathcal{S}$*.*

Proof. We wish to show that the diagram of Kan complexes

$$\begin{tikzcd}
& X \arrow[dr, "e"] & \\
X \arrow[ur, "e"] \arrow[rr, "e"] & & X
\end{tikzcd}$$

commutes up to homotopy. By virtue of Proposition 1.5.3.3, this is equivalent to the assertion that the homomorphisms $\alpha, \alpha^2 : \mathrm{Aut}_{\mathrm{Dy}}([0,1]) \to \mathrm{Aut}_{\mathrm{Dy}}([0,1])$ are conjugate: that is, there exists an element $g \in \mathrm{Aut}_{\mathrm{Dy}}([0,1])$ satisfying the identity $\alpha(f) \circ g = g \circ \alpha^2(f)$ for every element $f \in \mathrm{Aut}_{\mathrm{Dy}}([0,1])$. Concretely, we can take g to be any dyadic homeomorphism satisfying the identity $g(x) = 2x$ for $0 \leq x \leq 1/4$. □

We now show that the homotopy idempotent of Proposition 8.5.7.14 cannot be refined to an idempotent in the ∞-category $\mathcal{S}$.

042B **Proposition 8.5.7.15.** *Let* $X = B_{\bullet} \mathrm{Aut}_{\mathrm{Dy}}([0,1])$*. Then homotopy idempotent endomorphism* $e : X \to X$ *of Proposition 8.5.7.14 is not idempotent.*

Proof. Let x denote the unique vertex of X. Suppose, for a contradiction, that e is idempotent. Then we can lift e to a homotopy idempotent morphism $\widetilde{e} : (X,x) \to (X,x)$ in the ∞-category $\mathcal{S}_*$ (Corollary 8.5.7.7). Passing to fundamental groups, we obtain an idempotent homomorphism β from the Thompson group $\mathrm{Aut}(_{\mathrm{Dy}}([0,1]) = \pi_1(X,x)$ to itself. Since the forgetful functor $\mathcal{S}_* \to \mathcal{S}$ carries $\widetilde{e}$ to e, β is conjugate to the homomorphism α of Construction 8.5.7.13. Since α is a monomorphism, it follows that β is also a monomorphism. The equation $\beta^2 = \beta$ then implies that β is the identity map. This is a contradiction, since β is conjugate to the homomorphism α (which is not the identity morphism). □

8.5.8 Partial Idempotents

Let Idem denote the category introduced in Construction 8.5.2.7. For each integer $n \geq 0$, we let $\mathrm{N}_{\leq n}(\mathrm{Idem})$ denote the n-skeleton of the simplicial set $\mathrm{N}_{\bullet}(\mathrm{Idem})$ (see Variant 1.3.1.6). If $\mathcal{C}$ is an ∞-category, we will refer to a morphism $\mathrm{N}_{\leq n}(\mathrm{Idem}) \to \mathcal{C}$ as a *partial idempotent* in $\mathcal{C}$. 042C

Example 8.5.8.1. The simplicial set $\mathrm{N}_{\leq 0}(\mathrm{Idem})$ is isomorphic to the standard simplex Δ^0. Consequently, if $\mathcal{C}$ is an ∞-category, then a morphism $\mathrm{N}_{\leq 0}(\mathrm{Idem}) \to \mathcal{C}$ can be identified with an object $X \in \mathcal{C}$. 042D

Example 8.5.8.2. The simplicial set $\mathrm{N}_{\leq 1}(\mathrm{Idem})$ can be identified with the simplicial circle $\Delta^1 / \partial \Delta^1$, obtained from the standard simplex Δ^1 by identifying its endpoints. Consequently, if $\mathcal{C}$ is an ∞-category, then a morphism $\mathrm{N}_{\leq 1}(\mathrm{Idem}) \to \mathcal{C}$ can be identified with a pair (X, e), where X is an object of $\mathcal{C}$ and e is an endomorphism of X. 042E

Example 8.5.8.3. Let $\mathcal{C}$ be an ∞-category. Then a morphism $\mathrm{N}_{\leq 2}(\mathrm{Idem}) \to \mathcal{C}$ can be identified with a triple (X, e, σ), where X is an object of $\mathcal{C}$, $e : X \to X$ is an endomorphism of X, and σ is a 2-simplex of $\mathcal{C}$ with boundary indicated in the diagram 042F

$$\begin{tikzcd}
 & X \arrow[dr, "e"] & \\
X \arrow[ur, "e"] \arrow[rr, "e"] & & X,
\end{tikzcd}$$

so that σ witnesses the identity $[e] = [e] \circ [e]$ in the homotopy category $\mathrm{h}\mathcal{C}$.

Let $\mathcal{C}$ be an ∞-category and let $e : X \to X$ be an endomorphism in $\mathcal{C}$, which we identify with a morphism $F_{\leq 1} : \mathrm{N}_{\leq 1}(\mathrm{Idem}) \to \mathcal{C}$. The endomorphism e is homotopy idempotent (in the sense of Definition 8.5.7.1) if and only if $F_{\leq 1}$ admits an extension $F_{\leq 2} : \mathrm{N}_{\leq 2}(\mathrm{Idem}) \to \mathcal{C}$. Proposition 8.5.7.15 shows that this condition does not guarantee the existence of an idempotent $F : \mathrm{N}_{\bullet}(\mathrm{Idem}) \to \mathcal{C}$ extending $F_{\leq 1}$. Our goal in this section is to show that a slightly stronger condition does suffice: namely, it is enough to assume that $F_{\leq 1}$ can be extended to a diagram $F_{\leq 3} : \mathrm{N}_{\leq 3}(\mathrm{Idem}) \to \mathcal{C}$. This is a consequence of the following:

Theorem 8.5.8.4. *Let $n \geq 3$ be an integer. The inclusion map $\mathrm{N}_{\leq n}(\mathrm{Idem}) \hookrightarrow \mathrm{N}_{\bullet}(\mathrm{Idem})$ admits a factorization* 042G

$$\mathrm{N}_{\leq n}(\mathrm{Idem}) \xrightarrow{\iota} \mathcal{E} \xrightarrow{U} \mathrm{N}_{\bullet}(\mathrm{Idem}),$$

where $\mathcal{E}$ is an ∞-category, ι is an inner anodyne morphism which is bijective on simplices of dimension $< n$, and the functor U admits a right inverse $V : \mathrm{N}_{\bullet}(\mathrm{Idem}) \to \mathcal{E}$.

042H **Remark 8.5.8.5.** In the situation of Theorem 8.5.8.5, we can regard ι and $V|_{\mathrm{N}_{\leq n}(\mathrm{Idem})}$ as morphisms from $\mathrm{N}_{\leq n}(\mathrm{Idem})$ to $\mathcal{E}$. By construction, these morphisms coincide after composing with the functor $U : \mathcal{E} \to \mathrm{N}_{\bullet}(\mathrm{Idem})$. Since U is bijective on simplices of dimensions $< n$, it follows that ι and $V|_{\mathrm{N}_{\leq n}(\mathrm{Idem})}$ coincide when on the $(n-1)$-skeleton of $\mathrm{N}_{\bullet}(\mathrm{Idem})$. Beware that ι and V do *not* coincide on the nondegenerate n-simplex of $\mathrm{N}_{\bullet}(\mathrm{Idem})$. In fact, we claim that ι and $V|_{\mathrm{N}_{\leq n}(\mathrm{Idem})}$ are not even isomorphic when viewed as an object of the ∞-category $\mathrm{Fun}(\mathrm{N}_{\leq n}(\mathrm{Idem}), \mathcal{E})$. Assume, for a contradiction, that there exists an isomorphism α of $\iota = \mathrm{id}_{\mathcal{E}} \circ \iota$ with $V|_{\mathrm{N}_{\leq n}(\mathrm{Idem})} = (V \circ U) \circ \iota$. Since ι is inner anodyne, we could then lift α to an isomorphism $\widetilde{\alpha} : \mathrm{id}_{\mathcal{E}} \to V \circ U$ in the ∞-category $\mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C})$. It would follow that U is an equivalence of ∞-categories (with homotopy inverse given by V). Then $(U \circ \iota) : \mathrm{N}_{\leq n}(\mathrm{Idem}) \to \mathrm{N}_{\bullet}(\mathrm{Idem})$ would be a categorical equivalence of simplicial sets, which contradicts Remark 8.5.4.18.

We will give the proof of Theorem 8.5.8.4 at the end of this section. First, let us record some consequences.

042J **Corollary 8.5.8.6.** *Let $n \geq 3$ be an integer, and let $\mathcal{C}$ be an ∞-category equipped with a partial idempotent $F_{<n} : \mathrm{N}_{\leq n-1}(\mathrm{Idem}) \to \mathcal{C}$. The following conditions are equivalent:*

(1) *The morphism $F_{<n}$ extends to an idempotent $F : \mathrm{N}_{\bullet}(\mathrm{Idem}) \to \mathcal{C}$.*

(2) *The morphism $F_{<n}$ extends to a partial idempotent $F_{\leq n} : \mathrm{N}_{\leq n}(\mathrm{Idem}) \to \mathcal{C}$.*

Proof. The implication (1) ⇒ (2) is immediate. To prove the converse, suppose that $F_{\leq n} : \mathrm{N}_{\leq n}(\mathrm{Idem}) \to \mathcal{C}$ is an extension of $F_{<n}$. Let $\iota : \mathrm{N}_{\leq n}(\mathrm{Idem}) \hookrightarrow \mathcal{E}$, $U : \mathcal{E} \to \mathrm{N}_{\bullet}(\mathrm{Idem})$, and $V : \mathrm{N}_{\bullet}(\mathrm{Idem}) \to \mathcal{E}$ be as in Theorem 8.5.8.4. Since ι is inner anodyne, we can choose a functor $\overline{F} : \mathcal{E} \to \mathcal{C}$ satisfying $\overline{F} \circ \iota = F_{\leq n}$. Then $F = \overline{F} \circ V$ is a functor from $\mathrm{N}_{\bullet}(\mathrm{Idem})$ to $\mathcal{C}$, and Remark 8.5.8.5 shows that F coincides with $F_{<n}$ on the $(n-1)$-skeleton of $\mathrm{N}_{\bullet}(\mathrm{Idem})$. □

042K **Warning 8.5.8.7.** Let $\mathcal{C}$ be an ∞-category and let $F_{\leq n} : \mathrm{N}_{\leq n}(\mathrm{Idem}) \to \mathcal{C}$ be a partial idempotent in $\mathcal{C}$. Corollary 8.5.8.6 asserts that, if $n \geq 3$, then we can choose an idempotent $F : \mathrm{N}_{\bullet}(\mathrm{Idem}) \to \mathcal{C}$ such that F and $F_{\leq n}$ coincide on the $(n-1)$-skeleton $\mathrm{N}_{\bullet}(\mathrm{Idem})$. Beware that we generally cannot arrange that $F|_{\mathrm{N}_{\leq n}(\mathrm{Idem})}$ coincides with $F_{\leq n}$. For example, this always fails in the (universal) case $F_{\leq n}$ is the inner anodyne morphism $\iota : \mathrm{N}_{\leq n}(\mathrm{Idem}) \hookrightarrow \mathcal{E}$ of Theorem 8.5.8.4 (see Remark 8.5.8.5).

042L **Corollary 8.5.8.8.** *Let $\mathcal{C}$ be an ∞-category and let $e : X \to X$ be an endomorphism in $\mathcal{C}$. Then e is idempotent if and only if it can be extended to a diagram $\mathrm{N}_{\leq 3}(\mathrm{Idem}) \to \mathcal{C}$.*

042M **Corollary 8.5.8.9.** *Let $\{\mathcal{C}_i\}_{i \in \mathcal{I}}$ be a diagram of simplicial sets indexed by a filtered category $\mathcal{I}$. Suppose that each $\mathcal{C}_i$ is an ∞-category. Then the tautological map*

$$\theta : \varinjlim_{i \in \mathcal{I}} \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C}_i) \to \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \varinjlim_{i \in \mathcal{I}} \mathcal{C}_i)$$

is an equivalence of ∞-categories.

Proof. Choose any integer $n \geq 3$, and let $\iota : \mathrm{N}_{\leq n}(\mathrm{Idem}) \hookrightarrow \mathcal{E}$, $U : \mathcal{E} \to \mathrm{N}_{\bullet}(\mathrm{Idem})$, and $V : \mathrm{N}_{\bullet}(\mathrm{Idem}) \to \mathcal{E}$ be as in Theorem 8.5.8.4. We then have a commutative diagram of ∞-categories

$$\begin{tikzcd}
\varinjlim \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C}_i) \arrow[r, "\circ V"] \arrow[d, "\theta"] & \varinjlim \mathrm{Fun}(\mathcal{E}, \mathcal{C}_i) \arrow[r, "\circ U"] \arrow[d, "\theta'"] & \varinjlim \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C}_i) \arrow[d, "\theta"] \\
\mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \varinjlim \mathcal{C}_i) \arrow[r, "\circ V"] & \mathrm{Fun}(\mathcal{E}, \varinjlim \mathcal{C}_i) \arrow[r, "\circ U"] & \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \varinjlim \mathcal{C}_i),
\end{tikzcd}$$

where the horizontal compositions are identity morphisms. Consequently, to show that θ is an equivalence of ∞-categories, it will suffice to show that θ' is an equivalence of ∞-categories (Proposition 8.5.1.7). The functor θ' fits into a commutative diagram

$$\begin{tikzcd}
\varinjlim \mathrm{Fun}(\mathcal{E}, \mathcal{C}_i) \arrow[r, "\circ \iota"] \arrow[d, "\theta'"] & \varinjlim \mathrm{Fun}(\mathrm{N}_{\leq n}(\mathrm{Idem}), \mathcal{C}_i) \arrow[d, "\theta''"] \\
\mathrm{Fun}(\mathcal{E}, \varinjlim \mathcal{C}_i) \arrow[r, "\circ \iota"] & \mathrm{Fun}(\mathrm{N}_{\leq n}(\mathrm{Idem}), \varinjlim(\mathcal{C}_i)).
\end{tikzcd}$$

Since ι is inner anodyne, the horizontal maps are trivial Kan fibrations (Proposition 1.5.7.6). We conclude by observing that θ'' is an isomorphism of simplicial sets, since the simplicial set $\mathrm{N}_{\leq n}(\mathrm{Idem})$ is finite (Corollary 3.6.1.10). □

Corollary 8.5.8.10. *Let $\{\mathcal{C}_i\}_{i \in \mathcal{I}}$ be a diagram of simplicial sets indexed by a filtered category $\mathcal{I}$. Suppose that each $\mathcal{C}_i$ is an idempotent complete ∞-category. Then the colimit $\mathcal{C} = \varinjlim_i \mathcal{C}_i$ is idempotent complete.* 042N

Proof. For each object $i \in \mathcal{I}$, our assumption that $\mathcal{C}_i$ is idempotent complete guarantees that the restriction functor $R_i : \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Ret}), \mathcal{C}_i) \to \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C}_i)$ is an equivalence of ∞-categories (Remark 8.5.4.8). Passing to filtered colimits, we deduce that the induced map $\varinjlim \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Ret}), \mathcal{C}_i) \to \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C}_i)$ is also an equivalence of ∞-categories (Corollary 4.5.7.2). This map fits into a commutative diagram

$$\begin{tikzcd}
\varinjlim \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Ret}), \mathcal{C}_i) \arrow[r] \arrow[d] & \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Ret}), \mathcal{C}) \arrow[d, "R"] \\
\varinjlim \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C}_i) \arrow[r] & \mathrm{Fun}(\mathrm{N}_{\bullet}(\mathrm{Idem}), \mathcal{C}),
\end{tikzcd}$$

where the horizontal maps are equivalences of ∞-categories (Corollaries 8.5.8.9 and 8.5.1.32). It follows that the restriction functor $R : \mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Ret}), \mathcal{C}) \to \mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Idem}), \mathcal{C})$ is also an equivalence of ∞-categories, so that $\mathcal{C}$ is idempotent complete (Remark 8.5.4.8). □

042P **Corollary 8.5.8.11.** *Let $\mathcal{C}$ be a small filtered ∞-category and let $\mathscr{F} : \mathcal{C} \to \mathcal{QC}$ be a functor. Suppose that, for every object $C \in \mathcal{C}$, the ∞-category $\mathscr{F}(C)$ is idempotent complete. Then the colimit $\varinjlim(\mathscr{F})$ (formed in the ∞-category $\mathcal{QC}$) is also idempotent complete.*

Proof. Using Theorem 7.2.7.2, we can choose a directed partially ordered set $(A, \leq)$ and a right cofinal functor $\mathrm{N}_\bullet(A) \to \mathcal{C}$. Using Corollary 7.2.2.3 we can replace $\mathcal{C}$ by $\mathrm{N}_\bullet(A)$ and thereby reduce to the case where $\mathcal{C}$ is (the nerve of) a directed partially ordered set. Replacing $\mathscr{F}$ by an isomorphic functor if necessary, we can assume that it obtained from an A-indexed diagram in the ordinary category QCat (Corollary 5.6.5.16). In this case, the colimit $\varinjlim(\mathscr{F})$ in the ∞-category $\mathcal{QC}$ can be identified with its colimit in the ordinary category $\mathrm{QCat} \subset \mathrm{Set}_\Delta$ (Corollary 7.5.9.3), so the desired result follows from Corollary 8.5.8.10. □

We now turn to the proof of Theorem 8.5.8.4. The existence of an inner anodyne morphism $\iota : \mathrm{N}_{\leq n}(\mathrm{Idem}) \to \mathcal{E}$ which is bijective on simplices of dimension $< n$ is essentially formal, by virtue of the following variant of Corollary 4.1.3.3:

042Q **Lemma 8.5.8.12.** *Let $n \geq 0$ be an integer and let K be a simplicial set which satisfies the following condition for $0 \leq m \leq n$:*

$(*_m)$ *For every integer $0 < i < m$, every morphism of simplicial sets $\sigma : \Lambda^m_i \to K$ can be extended to an m-simplex of K.*

Then there exists an inner anodyne morphism $\iota : K \hookrightarrow \mathcal{E}$, where $\mathcal{E}$ is an ∞-category and ι is bijective on simplices of dimension $< n$.

Proof. We construct $\mathcal{E}$ as the colimit of a sequence of inner anodyne maps

$$K = K(0) \hookrightarrow K(1) \hookrightarrow K(2) \hookrightarrow K(3) \hookrightarrow \cdots$$

Assume that $K(t)$ has been constructed for some $t \geq 0$, and let S be the collection of all maps $\sigma : \Lambda^m_i \to K(t)$ where $0 < i < m$ and $m > n$. For every $\sigma \in S$, let us write C_σ for the simplicial set Λ^m_i which is the source of σ, and D_σ for the simplex Δ^m. We then construct a pushout diagram of simplicial sets

$$\begin{tikzcd}
\coprod_{\sigma \in S} C_\sigma \arrow[r] \arrow[d] & K(t) \arrow[d] \\
\coprod_{\sigma \in S} D_\sigma \arrow[r] & K(t+1).
\end{tikzcd}$$

By construction, the morphism $K(t) \to K(t+1)$ is inner anodyne and bijective on simplices of dimension $< n$. To complete the proof, it will suffice to show that the colimit $\mathcal{E} = \varinjlim_t K(t)$ is an ∞-category. Fix a pair of integers $0 < i < m$ and a morphism $\sigma : \Lambda^m_i \to \mathcal{E}$; we wish to show that σ can be extended to an m-simplex of $\mathcal{E}$. Since Λ^m_i is a finite simplicial set, σ factors (uniquely) through $K(t)$ for some integer $t \gg 0$. By construction, if $m > n$ then σ can be extended to an m-simplex of $K(t+1)$. We may therefore assume that $m \leq n$. In this case, we can take $k = 0$, in which case the existence of the desired extension follows from assumption $(*_m)$. □

Example 8.5.8.13. Let $\mathcal{C}$ be an ∞-category. For every integer $n \geq 0$, the skeleton $\mathrm{sk}_n(\mathcal{C})$ satisfies condition $(*_m)$ of Lemma 8.5.8.12 for $0 \leq m \leq n$. We can therefore choose an inner anodyne morphism $\iota : \mathrm{sk}_n(\mathcal{C}) \hookrightarrow \mathcal{E}$, where $\mathcal{E}$ is an ∞-category and f is bijective on simplices of dimension $< n$. 042R

In what follows, we will write X for the unique object of the category Idem, and $e : X \to X$ for the unique non-identity morphism. The main content of Theorem 8.5.8.4 is contained in the following result:

Proposition 8.5.8.14. *Let $\mathcal{E}$ be an ∞-category and let $\iota : \mathrm{N}_{\leq 3}(\mathrm{Idem}) \to \mathcal{E}$ be a morphism of simplicial sets which is bijective on simplices of dimension ≤ 2. Then $\iota(\widetilde{e})$ is an idempotent morphism of $\mathcal{E}$.* 042S

Proof. Let us regard the linearly ordered set $\mathbf{Z} = \{\cdots < -2 < -1 < 0 < 1 < 2 < \cdots\}$ as a category. Let $X \in \mathrm{Fun}(\mathbf{Z}, \mathrm{Idem})$ denote the constant functor taking the value X, and let $Y \in \mathrm{Fun}(\mathbf{Z}, \mathrm{Idem})$ denote the functor which carries each non-identity morphism of $\mathbf{Z}$ to the morphism $\widetilde{e}$ of Idem. We then have natural transformations

$$e_X : X \to X \qquad i : Y \to X \qquad r : X \to Y \qquad e_Y : Y \to Y$$

which carry each element of $\mathbf{Z}$ to the morphism $\widetilde{e}$. Note that the linearly ordered set $(\mathbf{Z}, \leq)$ can be identified with the homotopy category of the simplicial set $\mathrm{Spine}[\mathbf{Z}]$ of Notation 8.5.4.12. Let $G : \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathrm{N}_{\leq 3}(\mathrm{Idem})) \to \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{E})$ be the morphism of simplicial sets given by composition with ι. Since the simplicial set $\mathrm{Spine}[\mathbf{Z}]$ is 1-dimensional, the inclusion map

$$\mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathrm{N}_{\leq 3}(\mathrm{Idem})) \hookrightarrow \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathrm{N}_{\bullet}(\mathrm{Idem})) \simeq \mathrm{N}_{\bullet}(\mathrm{Fun}(\mathbf{Z}, \mathrm{Idem}))$$

is bijective on simplices of dimension ≤ 2, and therefore induces an equivalence of homotopy categories. It follows that G induces a functor of homotopy categories $\mathrm{h}G : \mathrm{Fun}(\mathbf{Z}, \mathrm{Idem}) \to \mathrm{hFun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{E})$.

In what follows, we will identify the morphisms X and Y with vertices of the simplicial set $\mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathrm{N}_{\leq 3}(\mathrm{Idem}))$, and the morphisms i, r, e_X, and e_Y with edges of the simplicial set $\operatorname{Fun}(\operatorname{Spine}[\mathbf{Z}], \mathrm{N}_{\leq 3}(\mathrm{Idem}))$. Let $\delta_{\mathcal{E}} : \mathcal{E} \to \operatorname{Fun}(\operatorname{Spine}[\mathbf{Z}], \mathcal{E})$ be the diagonal map, so that we have $G(X) = \delta_{\mathcal{C}}(\iota(\widetilde{X}))$ and $G(e_X) = \delta_{\mathcal{C}}(\iota(\widetilde{e}))$. We will deduce Proposition 8.5.8.14 from the following:

$(*)$ There exists an ∞-category $\mathcal{C}$ and a functor $T : \operatorname{Fun}(\operatorname{Spine}[\mathbf{Z}], \mathcal{E}) \to \mathcal{C}$ such that $(T \circ \delta_{\mathcal{E}}) : \mathcal{E} \to \mathcal{C}$ is fully faithful and $(T \circ G)(e_Y)$ is an isomorphism in $\mathcal{C}$.

Let us first assume $(*)$, and show that it implies Proposition 8.5.8.14. We wish to show that $\iota(\widetilde{e})$ is an idempotent endomorphism in the ∞-category $\mathcal{E}$. Since $T \circ \delta_{\mathcal{E}}$ is fully faithful, this is equivalent to the statement that $(T \circ \delta_C)(\iota(\widetilde{e})) = (T \circ G)(e_X))$ is an idempotent endomorphism in the ∞-category $\mathcal{C}$. By virtue of Proposition 8.5.6.10, it will suffice to show that the homotopy class $[T(G(e_X))] = (\mathrm{h}T \circ \mathrm{h}G)(e_X)$ is a split idempotent in the homotopy category $\mathrm{h}\mathcal{C}$. By construction, the morphism e_X factors as a composition $i \circ r$ in the category $\operatorname{Fun}(\mathbf{Z}, \mathrm{Idem})$. It will therefore suffice to show that the functor $\mathrm{h}T \circ \mathrm{h}G$ carries the commutative diagram

$$\begin{tikzcd}
 & X \arrow[dr, "r"] & \\
Y \arrow[ur, "i"] \arrow[rr, "e_Y"] & & Y
\end{tikzcd}$$

to a retraction diagram in $\mathrm{h}\mathcal{C}$: that is, that $(\mathrm{h}T \circ \mathrm{h}G)(e_Y)$ is an identity morphism. This follows from Remark 8.5.2.2, since the morphism $(\mathrm{h}T \circ \mathrm{h}G)(e_Y)$ is both idempotent (since e_Y is an idempotent in the category $\operatorname{Fun}(\mathbf{Z}, \mathrm{Idem})$) and an isomorphism (by virtue of assumption $(*)$).

We now prove $(*)$. Using Corollary 8.3.3.17, we can choose a fully faithful functor of ∞-categories $H : \mathcal{E} \to \mathcal{C}$, where the ∞-category $\mathcal{C}$ admits sequential colimits. Let $\mathcal{D}$ denote the full subcategory of $\operatorname{Fun}(\operatorname{Spine}[\mathbf{Z}]^{\triangleright}, \mathcal{C})$ spanned by the colimit diagrams. Our assumption that $\mathcal{C}$ admits sequential colimits guarantees that the restriction functor

$$\mathcal{D} \to \operatorname{Fun}(\operatorname{Spine}[\mathbf{Z}], \mathcal{C}) \qquad U \mapsto U|_{\operatorname{Spine}[\mathbf{Z}]}$$

is a trivial Kan fibration of ∞-categories (Corollary 7.3.6.15). Let $\delta_{\mathcal{C}} : \mathcal{C} \hookrightarrow \operatorname{Fun}(\operatorname{Spine}[\mathbf{Z}], \mathcal{C})$ and $\widetilde{\delta}_{\mathcal{C}} : \mathcal{C} \hookrightarrow \operatorname{Fun}(\operatorname{Spine}[\mathbf{Z}]^{\triangleright}, \mathcal{C})$ be the diagonal embeddings. Since the simplicial set $\operatorname{Spine}[\mathbf{Z}]$ is weakly contractible, the morphism $\widetilde{\delta}_{\mathcal{C}}$ factors through $\mathcal{D}$ (Corollary 7.2.3.5). Let

$s : \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{C}) \to \mathcal{D}$ be a solution to the lifting problem

$$\begin{tikzcd}
\mathcal{C} \arrow[rr, "\widetilde{\delta}_{\mathcal{C}}"] \arrow[d, "\delta_{\mathcal{C}}"] & & \mathcal{D} \arrow[d, "U \mapsto U|_{\mathrm{Spine}[\mathbf{Z}]}"] \\
\mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{C}) \arrow[rr, "\mathrm{id}"] \arrow[urr, dashed, "s"] & & \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{C}).
\end{tikzcd}$$

Let $\mathrm{ev} : \mathcal{D} \to \mathcal{C}$ be the functor given by evaluation at the cone point of $\mathrm{Spine}[\mathbf{Z}]^{\triangleright}$. We let $T : \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{E}) \to \mathcal{C}$ denote the functor given by the composition

$$\mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{E}) \xrightarrow{H\circ} \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{C}) \xrightarrow{s} \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}]^{\triangleright}, \mathcal{C}) \xrightarrow{\mathrm{ev}} \mathcal{C}.$$

Stated more informally, the functor T carries a diagram

$$\cdots \to C_{-2} \to C_{-1} \to C_0 \to C_1 \to C_2 \to \cdots$$

in the ∞-category $\mathcal{E}$ to a colimit of the diagram

$$\cdots \to H(C_{-2}) \to H(C_{-1}) \to H(C_0) \to H(C_1) \to H(C_2) \to \cdots$$

in the ∞-category $\mathcal{C}$. By construction, $T \circ \delta_{\mathcal{E}}$ coincides with the fully faithful functor H.

We now complete the proof by showing that the functor T carries $G(e_Y)$ to an isomorphism in $\mathcal{C}$. Let us regard $G(\widetilde{Y})$ as a diagram $\mathrm{Spine}[\mathbf{Z}] \to \mathcal{E}$. Since the inclusion $\mathrm{Spine}[\mathbf{Z}] \hookrightarrow \mathrm{N}_{\bullet}(\mathbf{Z})$ is inner anodyne (Remark 8.5.4.14), we can extend $G(Y)$ to a functor $C : \mathrm{N}_{\bullet}(\mathbf{Z}) \to \mathcal{E}$. Let $a : \{0 < 1\} \times \mathbf{Z} \to \mathbf{Z}$ be the morphism of partially ordered sets given by $a(i, n) = i + n$. Passing to nerves, we obtain a morphism of simplicial sets $A : \Delta^1 \times \mathrm{N}_{\bullet}(\mathbf{Z}) \to \mathrm{N}_{\bullet}(\mathbf{Z})$. The composition $M = C \circ A$ then corresponds to a diagram in $\mathcal{E}$ which we display informally as

$$\begin{tikzcd}
\cdots \arrow[r] & \iota(\widetilde{X}) \arrow[r, "\iota(\widetilde{e})"] \arrow[d, "\iota(\widetilde{e})"] & \iota(\widetilde{X}) \arrow[r, "\iota(\widetilde{e})"] \arrow[d, "\iota(\widetilde{e})"] & \iota(\widetilde{X}) \arrow[r, "\iota(\widetilde{e})"] \arrow[d, "\iota(\widetilde{e})"] & \cdots \\
\cdots \arrow[r] & \iota(\widetilde{X}) \arrow[r, "\iota(\widetilde{e})"] & \iota(\widetilde{X}) \arrow[r, "\iota(\widetilde{e})"] & \iota(\widetilde{X}) \arrow[r, "\iota(\widetilde{e})"] & \cdots
\end{tikzcd}$$

Let f denote the restriction $M|_{\Delta^1 \times \mathrm{Spine}[\mathbf{Z}]}$, which we regard as a morphism in the ∞-category $\mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{E})$. Since ι is bijective on simplices of dimension ≤ 2 and the simplicial set $\mathrm{Spine}[\mathbf{Z}]$ has dimension ≤ 1, the morphism G is bijective on simplices of dimension ≤ 1. We can therefore write $f = G(f_0)$ for a unique edge f_0 of $\mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathrm{N}_{\leq 3}(\mathrm{Idem}))$. It follows by inspection that f_0 must coincide with $e_{\widetilde{Y}}$. We are therefore reduced to showing that $T(f)$ is an isomorphism in the ∞-category $\mathcal{C}$.

Since the ∞-category $\mathcal{C}$ admits sequential colimits, we can extend $(H \circ C) : \mathrm{N}_{\bullet}(\mathbf{Z}) \to \mathcal{C}$ to a colimit diagram $\overline{C} : \mathrm{N}_{\bullet}(\mathbf{Z})^{\triangleright} \to \mathcal{C}$. Note that A extends uniquely to a morphism of simplicial sets $\overline{A} : \Delta^1 \times \mathrm{N}_{\bullet}(\mathbf{Z})^{\triangleright} \to \mathrm{N}_{\bullet}(\mathbf{Z})^{\triangleright}$ (given on vertices by $\overline{A}(i,v) = v$, where v is the cone point of $\mathrm{N}_{\bullet}(\mathbf{Z})^{\triangleright}$). Let us identify the restriction $(\overline{C} \circ \overline{A})|_{\Delta^1 \times \mathrm{Spine}[\mathbf{Z}]^{\triangleright}}$ with a morphism $\overline{f} : D \to D'$ in the ∞-category $\mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}]^{\triangleright}, \mathcal{C})$. Since the inclusion $\mathrm{Spine}[\mathbf{Z}] \hookrightarrow \mathrm{N}_{\bullet}(\mathbf{Z})$ is right cofinal (Proposition 7.2.1.3), both D and D' are colimit diagrams in $\mathcal{D}$ (Corollary 7.2.2.3). Consequently, we can view $\overline{f}$ as a morphism in the ∞-category $\mathcal{D}$. By construction, the restriction functor $\mathcal{D} \to \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{C})$ carries $\overline{f}$ to $H(f)$. It follows that $T(f) = (\mathrm{ev} \circ s \circ H)(f)$ is isomorphic to $\mathrm{ev}(\overline{f})$ as an object of the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$. We are therefore reduced to showing that $\mathrm{ev}(\overline{f})$ is an isomorphism in $\mathcal{C}$. This is clear: the morphism $\mathrm{ev}(\overline{f})$ is an identity morphism in $\mathcal{C}$, since the functor $\overline{A}$ carries $\Delta^1 \times \{v\}$ to a degenerate edge of $\mathrm{N}_{\bullet}(\mathbf{Z})^{\triangleright}$. □

Proof of Theorem 8.5.8.4. Fix an integer $n \geq 0$. Using Example 8.5.8.13, we can choose an ∞-category $\mathcal{E}$ and an inner anodyne morphism $\iota : \mathrm{N}_{\leq n}(\mathrm{Idem}) \hookrightarrow \mathcal{E}$ which is bijective on simplices of dimension $< n$. Since ι is inner anodyne, there is a unique functor $U : \mathcal{E} \to \mathrm{N}_{\bullet}(\mathrm{Idem})$ for which $U \circ \iota$ is coincides with the inclusion map $\mathrm{N}_{\leq n}(\mathrm{Idem}) \hookrightarrow \mathrm{N}_{\bullet}(\mathrm{Idem})$. If $n \geq 3$, then Proposition 8.5.8.14 guarantees that $\iota(\widetilde{e})$ is an idempotent endomorphism in $\mathcal{E}$: that is, there exists a functor $V : \mathrm{N}_{\bullet}(\mathrm{Idem}) \to \mathcal{E}$ satisfying $V(\widetilde{e}) = \iota(\widetilde{e})$. To complete the proof, it will suffice to show that the composition $\mathrm{N}_{\bullet}(\mathrm{Idem}) \xrightarrow{V} \mathcal{E} \xrightarrow{U} \mathrm{N}_{\bullet}(\mathrm{Idem})$ is the identity functor. This follows from the universal property of Remark 8.5.2.8 (together with Proposition 1.3.3.1), it since the functor $U \circ V$ carries the morphism e to itself. □

8.5.9 The Thompson Groupoid

042T In §8.5.7, we constructed an example of a homotopy idempotent endomorphism $e : X \to X$ which is not idempotent. Our construction (following Heller and Freyd) involved the Thompson group $\mathrm{Aut}_{\mathrm{Dy}}([0,1])$. Our goal in this section is to show that this is no coincidence: there is a universal example of an ∞-category $\mathcal{C}$ containing a homotopy idempotent endomorphism, whose structure can be described explicitly in terms of $\mathrm{Aut}_{\mathrm{Dy}}([0,1])$. We begin with a variant of Definition 8.5.7.12.

042U **Definition 8.5.9.1** (The Thompson Groupoid)**.** We define a category Dy as follows:

- The objects of Dy are closed intervals of the form $[0,s]$, where $s \geq 0$ is a dyadic rational number.
- If $s,t \geq 0$ are dyadic rational numbers, then a morphism from $[0,s]$ to $[0,t]$ in the category Dy is a dyadic homeomorphism $[0,s] \xrightarrow{\sim} [0,t]$ (see Definition 8.5.7.9).

- The composition law on Dy is given by composition of dyadic homeomorphisms (which is well-defined by virtue of Exercise 8.5.7.11).

It follows from Exercise 8.5.7.10 that the category Dy is a groupoid. We will refer to Dy as the *Thompson groupoid*.

Remark 8.5.9.2. The Thompson groupoid Dy contains exactly two isomorphism classes: `042V`

- The isomorphism class of the degenerate interval $[0,0] = \{0\}$, whose automorphism group is the trivial group.
- The isomorphism class of the unit interval $[0,1]$, whose automorphism group is the Thompson group $\mathrm{Aut}_{\mathrm{Dy}}([0,1])$ of Definition 8.5.7.12.

By virtue of Remark 8.5.9.2, the Thompson groupoid Dy is equivalent to the full subcategory spanned by the objects $\{0\}$ and $[0,1]$, which can be described explicitly in terms of the Thompson group $\mathrm{Aut}_{\mathrm{Dy}}([0,1])$. However, allowing a larger class of intervals in the definition reveals some additional structure.

Construction 8.5.9.3 (Concatenation)**.** Let Dy denote the Thompson groupoid. We define a functor $\circledast : \mathrm{Dy} \times \mathrm{Dy} \to \mathrm{Dy}$ as follows: `042W`

- On objects, the functor $\circledast$ is given by the formula

$$[0,s] \circledast [0,t] = [0,s+t].$$

- On morphisms, the functor $\circledast$ is given by the formula

$$(f \circledast g)(x) = \begin{cases} g(x) & \text{if } 0 \leq x \leq t \\ f(x-t)+s & \text{if } t \leq x \leq s+t. \end{cases}$$

We will refer to $\circledast : \mathrm{Dy} \times \mathrm{Dy} \to \mathrm{Dy}$ as the *concatenation functor* on the Thompson groupoid Dy. Note that the operation $\circledast$ is strictly associative, and admits a (strict) unit given by the degenerate interval $\{0\} = [0,0]$. Consequently, $\circledast$ determines a strict monoidal structure on the category Dy (in the sense of Definition 2.1.2.1).

Notation 8.5.9.4. Let $B\mathrm{Dy}$ denote the (strict) 2-category obtained by delooping Dy (see Example 2.2.0.8). Since Dy is a groupoid, $B\mathrm{Dy}$ is a $(2,1)$-category. It follows that the Duskin nerve $\mathrm{N}^{\mathrm{D}}_{\bullet}(B\mathrm{Dy})$ is an ∞-category (Theorem 2.3.2.1). We can describe the low-dimensional simplices of $\mathrm{N}^{\mathrm{D}}_{\bullet}(B\mathrm{Dy})$ explicitly as follows: `042X`

- The ∞-category $\mathrm{N}^{\mathrm{D}}_{\bullet}(B\mathrm{Dy})$ has a unique object, which we will denote by $\overline{X}$.

- Morphisms from $\overline{X}$ to itself in the ∞-category $\mathrm{N}_{\bullet}^{\mathrm{D}}(B\mathrm{Dy})$ can be identified with nonnegative dyadic rational numbers s (corresponding to the closed interval $[0, s]$, regarded as an object of the Thompson groupoid Dy).
- Suppose we are given dyadic rational numbers $s, t, u \geq 0$. Then 2-simplices of $\mathrm{N}_{\bullet}^{\mathrm{D}}(B\mathrm{Dy})$ with boundary indicated in the diagram

$$\begin{tikzcd} & \overline{X} \arrow[dr, "s"] & \\ \overline{X} \arrow[ur, "t"] \arrow[rr, "u"] & & \overline{X} \end{tikzcd}$$

  can be identified with dyadic homeomorphisms $[0, s+t] \xrightarrow{\sim} [0, u]$.

Let $\overline{e} : \overline{X} \to \overline{X}$ denote the morphism in $\mathrm{N}_{\bullet}^{\mathrm{D}}(B\mathrm{Dy})$ corresponding to the object $[0,1] \in \mathrm{Dy}$, and let $\overline{\sigma}$ be the 2-simplex of $\mathrm{N}_{\bullet}^{\mathrm{D}}(B\mathrm{Dy})$ corresponding to the dyadic homeomorphism

$$[0,1] \circledast [0,1] = [0,2] \xrightarrow{\sim} [0,1] \qquad x \mapsto x/2.$$

Then the triple $(\overline{X}, \overline{e}, \overline{\sigma})$ can then be viewed as a partial idempotent $\iota : \mathrm{N}_{\leq 2}(\mathrm{Idem}) \to \mathrm{N}_{\bullet}^{\mathrm{D}}(B\mathrm{Dy})$ (see Example 8.5.8.3).

We can now formulate our main result:

042Y **Theorem 8.5.9.5.** *The partial idempotent $\iota : \mathrm{N}_{\leq 2}(\mathrm{Idem}) \to \mathrm{N}_{\bullet}^{\mathrm{D}}(B\mathrm{Dy})$ of Notation 8.5.9.4 is a categorical equivalence of simplicial sets.*

042Z **Corollary 8.5.9.6.** *Let $\mathcal{C}$ be an ∞-category. Then composition with the partial idempotent ι of Notation 8.5.9.4 induces a trivial Kan fibration of ∞-categories*

$$\mathrm{Fun}(\mathrm{N}_{\bullet}^{\mathrm{D}}(B\mathrm{Dy}), \mathcal{C}) \to \mathrm{Fun}(\mathrm{N}_{\leq 2}(\mathrm{Idem}), \mathcal{C}).$$

Proof. Combine Theorem 8.5.9.5 with Corollary 4.5.5.19 (noting that ι is a monomorphism of simplicial sets). □

0430 **Corollary 8.5.9.7.** *Let $\mathcal{C}$ be an ∞-category containing an endomorphism $e : X \to X$. Then e is homotopy idempotent if and only if there is a functor of ∞-categories $F : \mathrm{N}_{\bullet}^{\mathrm{D}}(B\mathrm{Dy}) \to \mathcal{C}$ satisfying $F(\overline{e}) = e$.*

0431 **Example 8.5.9.8.** Let $\mathrm{Dy}_{>0}$ denote the full subcategory of the Thompson groupoid Dy spanned by the intervals $[0, s]$ where $s > 0$. Note that the action of Dy on itself (via concatenation) restricts to an action of Dy on the groupoid $\mathrm{Dy}_{>0}$, and therefore determines a (strict) functor of 2-categories

$$B\mathrm{Dy} \to \{\text{Groupoids}\} \qquad X \mapsto \mathrm{Dy}_{>0}.$$

Passing to nerves, we obtain a functor of ∞-categories

$$\mathrm{N}_\bullet^{\mathrm{D}}(B\mathrm{Dy}) \to \mathcal{S} \qquad X \mapsto \mathrm{N}_\bullet(\mathrm{Dy}_{>0}),$$

which carries the 1-morphism $\overline{e}$ of $B\mathrm{Dy}$ to the homotopy idempotent endomorphism

$$\mathrm{N}_\bullet(\mathrm{Dy}_{>0}) \to \mathrm{N}_\bullet(\mathrm{Dy}_{>0}) \qquad [0,s] \mapsto [0,1] \circledast [0,s] = [0,1+s].$$

Note that, up to isomorphism, this coincides with the homotopy idempotent endomorphism constructed in Proposition 8.5.7.14; this follows from the observation that the diagram of categories

$$\begin{tikzcd}
B\,\mathrm{Aut}_{\mathrm{Dy}}([0,1]) \arrow[r, "\alpha"] \arrow[d, "\sim"] & B\,\mathrm{Aut}_{\mathrm{Dy}}([0,1]) \arrow[d, "\sim"] \\
\mathrm{Dy}_{>0} \arrow[r, "{[0,1]\circledast}"] & \mathrm{Dy}_{>0}
\end{tikzcd}$$

commutes up to isomorphism (where the vertical maps are the inclusion functors and α is the homomorphism of Construction 8.5.7.13).

Our first goal is to reduce Theorem 8.5.9.5 to a more concrete statement about simplicial monoids.

Notation 8.5.9.9. Let $\mathrm{N}_{\leq 2}(\mathrm{Idem})$ denote the simplicial set described in Example 8.5.8.3. 0432 By virtue of Proposition 2.4.4.3, we can choose a simplicial category $\mathcal{C}$ and a morphism of simplicial sets $u : \mathrm{N}_{\leq 2}(\mathrm{Idem}) \to \mathrm{N}_\bullet^{\mathrm{hc}}(\mathcal{C})$ which exhibits $\mathcal{C}$ as a simplicial path category for $\mathrm{N}_{\leq 2}(\mathrm{Idem})$. The morphism u carries the unique vertex $\widetilde{X}$ of $\mathrm{N}_{\leq 2}(\mathrm{Idem})$ to an object $X \in \mathcal{C}$. Set $E_\bullet = \mathrm{Hom}_{\mathcal{C}}(X,X)_\bullet$, which we regard as a simplicial monoid. Evaluating the morphism u on the nondegenerate edge $\widetilde{e}$ of $\mathrm{N}_{\leq 2}(\mathrm{Idem})$, we obtain a morphism $e : X \to X$ in the category $\mathcal{C}$, which we can view as a vertex of the simplicial set $E_\bullet$. Evaluating the morphism u on the nondegenerate 2-simplex of $\mathrm{N}_{\leq 2}(\mathrm{Idem})$, we obtain an edge $h : e^2 \to e$ in the simplicial monoid $E_\bullet$.

Let $\mathrm{N}_\bullet(\mathrm{Dy})$ denote the nerve of the Thompson groupoid. The concatenation functor of Notation 8.5.9.4 endows $\mathrm{N}_\bullet(\mathrm{Dy})$ with the structure of a simplicial monoid. We let $B\,\mathrm{N}_\bullet(\mathrm{Dy})$ denote the simplicial category given by delooping $\mathrm{N}_\bullet(\mathrm{Dy})$ (Example 2.4.2.3), so that the homotopy coherent nerve of $B\,\mathrm{N}_\bullet(\mathrm{Dy})$ can be identified with the Duskin nerve of the strict

2-category $B\mathrm{Dy}$ (see Example 2.4.3.11). It follows that the partial idempotent ι of Notation 8.5.9.4 can be identified with a morphism from $\mathrm{N}_{\leq 2}(\mathrm{Idem})$ to $\mathrm{N}_{\bullet}^{\mathrm{hc}}(B\,\mathrm{N}_{\bullet}(\mathrm{Dy}))$, which factors unique as a composition

$$\mathrm{N}_{\leq 2}(\mathrm{Idem}) \xrightarrow{u} \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathcal{C}) \xrightarrow{\mathrm{N}_{\bullet}^{\mathrm{hc}}(F)} \mathrm{N}_{\bullet}^{\mathrm{hc}}(B\,\mathrm{N}_{\bullet}(\mathrm{Dy}))$$

for some simplicial functor $F : \mathcal{C} \to B\,\mathrm{N}_{\bullet}(\mathrm{Dy})$, which we can identify with a homomorphism of simplicial monoids

$$\varphi : E_{\bullet} = \mathrm{Hom}_{\mathcal{C}}(X, X)_{\bullet} \xrightarrow{F} \mathrm{Hom}_{B\,\mathrm{N}_{\bullet}(\mathrm{Dy})}(F(X), F(X))_{\bullet} = \mathrm{N}_{\bullet}(\mathrm{Dy}).$$

By construction, the homomorphism φ carries the vertex e to the object $[0,1] \in \mathrm{Dy}$, and the edge $h : e^2 \to e$ to the dyadic homeomorphism

$$[0,1] \circledast [0,1] = [0,2] \xrightarrow{\sim} [0,1] \qquad x \mapsto x/2.$$

0433 **Remark 8.5.9.10.** Using the universal property of the path category $\mathcal{C} = \mathrm{Path}[\mathrm{N}_{\leq 2}(\mathrm{Idem})]_{\bullet}$, it is not difficult to see that $E_{\bullet}$ is freely generated (as a simplicial monoid) by the vertex e and the edge $h : e^2 \to e$. In particular, the homomorphism of simplicial monoids $\varphi : E_{\bullet} \to \mathrm{N}_{\bullet}(\mathrm{Dy})$ is uniquely determined by the requirement that it carries e to the unit interval $[0,1] \in \mathrm{Dy}$ and h to the dyadic homeomorphism $x \mapsto x/2$.

We will deduce Theorem 8.5.9.5 from the following:

0434 **Proposition 8.5.9.11.** *The homomorphism $\varphi : E_{\bullet} \to \mathrm{N}_{\bullet}(\mathrm{Dy})$ is a weak homotopy equivalence of simplicial sets.*

Proof of Theorem 8.5.9.5 from Proposition 8.5.9.11. We wish to show that the partial idempotent

$$\iota : \mathrm{N}_{\leq 2}(\mathrm{Idem}) \to \mathrm{N}_{\bullet}^{\mathrm{D}}(B\mathrm{Dy}) \simeq \mathrm{N}_{\bullet}^{\mathrm{hc}}(B\,\mathrm{N}_{\bullet}(\mathrm{Dy}))$$

is a categorical equivalence of simplicial sets. Since the category Dy is a groupoid, the simplicial monoid $\mathrm{N}_{\bullet}(\mathrm{Dy})$ is a Kan complex (Proposition 1.3.5.2). It follows that the simplicial category $B\,\mathrm{N}_{\bullet}(\mathrm{Dy})$ is locally Kan. Invoking Theorem [?], we are reduced to showing that ι induces a weak equivalence of simplicial categories $F : \mathrm{Path}[\mathrm{N}_{\leq 2}(\mathrm{Idem})]_{\bullet} \to B\,\mathrm{N}_{\bullet}(\mathrm{Dy})$, in the sense of Definition 4.6.8.7. Write X for the unique object of the path category $\mathrm{Path}[\mathrm{N}_{\leq 2}(\mathrm{Idem})]_{\bullet}$, so that $F(X)$ is the unique object of $B\,\mathrm{N}_{\bullet}(\mathrm{Dy})$. We are then reduced to showing that F induces a weak homotopy equivalence of simplicial monoids

$$\varphi : E_{\bullet} = \mathrm{Hom}_{\mathrm{Path}[\mathrm{N}_{\leq 2}(\mathrm{Idem})]}(X, X)_{\bullet} \to \mathrm{Hom}_{B\,\mathrm{N}_{\bullet}(\mathrm{Dy})}(F(X), F(X)) = \mathrm{N}_{\bullet}(\mathrm{Dy}),$$

which follows from Proposition 8.5.9.11. □

We will deduce Proposition 8.5.9.11 from a more refined result, which characterizes the simplicial monoid $E_\bullet$ up to categorical equivalence (rather than merely up to weak homotopy equivalence).

Notation 8.5.9.12. Let m and n be nonnegative integers. We will say that a homeomorphism $f : [0, m] \xrightarrow{\sim} [0, n]$ is a *dyadic contraction* if, for every integer $0 \leq k < m$, the restriction of f to the closed interval $[k, k+1]$ is given by the formula $f(x) = (x + a)/2^b$ for some integers a and b with $b \geq 0$. 0435

We let Dy_+ denote the subcategory of the Thompson groupoid Dy whose objects are intervals of the form $[0, m]$, where m is a nonnegative integer, and whose morphisms are dyadic contractions.

Exercise 8.5.9.13. Show that the subcategory $\mathrm{Dy}_+ \subset \mathrm{Dy}$ is well-defined: that is, the collection of dyadic contractions is closed under composition. 0436

Warning 8.5.9.14. The category Dy_+ of Notation 8.5.9.12 is not a groupoid. In fact, every isomorphism in the category Dy_+ is an identity morphism. 0437

Proposition 8.5.9.15. *The homomorphism $\varphi : E_\bullet \to \mathrm{N}_\bullet(\mathrm{Dy})$ factors as a composition* 0438

$$E_\bullet \xrightarrow{\varphi_+} \mathrm{N}_\bullet(\mathrm{Dy}_+) \subset \mathrm{N}_\bullet(\mathrm{Dy}),$$

where φ_+ is inner anodyne.

Proof of Proposition 8.5.9.11 from Proposition 8.5.9.15. By virtue of Proposition 8.5.9.15, it will suffice to show that the inclusion of categories $\mathrm{Dy}_+ \hookrightarrow \mathrm{Dy}$ induces a weak homotopy equivalence of simplicial sets $U : \mathrm{N}_\bullet(\mathrm{Dy}_+) \hookrightarrow \mathrm{N}_\bullet(\mathrm{Dy})$. Using Quillen's Theorem A (Example 7.2.3.3), we are reduced to proving the following: for every object $[0, s] \in \mathrm{Dy}$, the category $\mathcal{A} = \mathrm{Dy}_+ \times_{\mathrm{Dy}} \mathrm{Dy}_{[0,s]/}$ has weakly contractible nerve. We can describe the category $\mathcal{A}$ more concretely as follows:

- The objects of $\mathcal{A}$ are dyadic homeomorphisms $f : [0, s] \xrightarrow{\sim} [0, m]$, where m is an integer.
- Let $f : [0, s] \xrightarrow{\sim} [0, m]$ and $g : [0, s] \xrightarrow{\sim} [0, n]$ be dyadic homeomorphisms. Then there is a morphism from f to g (in the category $\mathcal{A}$) if and only if the homeomorphism $(g \circ f^{-1}) : [0, m] \to [0, n]$ is a dyadic contraction. If this condition is satisfied, then the morphism is unique.

It follows that the category $\mathcal{A}$ can be viewed as a partially ordered set. Moreover, every finite subset of $\mathcal{A}$ has a lower bound, given by the dyadic homeomorphism

$$[0, s] \xrightarrow{\sim} [0, 2^k s] \qquad x \mapsto 2^k x$$

for some integer $k \gg 0$. It follows that the category $\mathcal{A}^{\mathrm{op}}$ is filtered (Exercise 7.2.4.2), so that $\mathrm{N}_\bullet(\mathcal{A})$ is weakly contractible by virtue of Proposition 7.2.4.9. □

The proof of Proposition 8.5.9.15 will require some preliminaries.

0439 **Notation 8.5.9.16.** Let $n \geq 0$ be an integer and let J be a subset of $\{1, 2, \cdots, n\}$. We let $b_J : [0, n] \xrightarrow{\sim} [0, n + |J|]$ be the dyadic homeomorphism which is characterized by the following requirement: for every integer $1 \leq j \leq n$, the function b_I is differentiable at every point $x \in (j - 1, j)$, with derivative given by the formula

$$b'_J(x) = \begin{cases} 1 & \text{if } j \notin J \\ 2 & \text{if } j \in J. \end{cases}$$

Note that, if this condition is satisfied, then the inverse homeomorphism $b_J^{-1} : [0, n + |J|] \xrightarrow{\sim} [0, n]$ is a dyadic contraction. We say that a dyadic contraction is *elementary* if it has the form b_J^{-1}, for some integer $n \geq 0$ and some subset $J \subseteq \{1, 2, \cdots, n\}$.

043A **Remark 8.5.9.17.** Let $f : [0, m] \xrightarrow{\sim} [0, n]$ be a dyadic contraction. The following conditions are equivalent:

- The dyadic contraction f is elementary, in the sense of Notation 8.5.9.16.
- For every point $x \in [0, m]$ where f is differentiable, the derivative $f'(x)$ is either 1 or 1/2.
- The dyadic contraction f can be written as a concatenation $f_1 \circledast f_2 \circledast \cdots \circledast f_n$, where each f_i is either the identity function $\mathrm{id} : [0, 1] \xrightarrow{\sim} [0, 1]$ or the homeomorphism

$$H : [0, 2] \xrightarrow{\sim} [0, 1] \qquad x \mapsto x/2.$$

043B **Lemma 8.5.9.18.** *The collection of elementary dyadic contractions is a class of short morphisms for the ∞-category $\mathrm{N}_\bullet(\mathrm{Dy}_+)$, in the sense of Definition 6.2.5.4.*

Proof. Let S denote the collection of all elementary dyadic contractions. We verify that S satisfies conditions (1) through (4) of Definition 6.2.5.4:

(1) For every integer $n \geq 0$, the identity morphism $\mathrm{id} : [0, n] \xrightarrow{\sim} [0, n]$ is an elementary dyadic contraction. This is immediately from the definitions.

(2) Suppose we are given a commutative diagram of dyadic contractions

$$\begin{tikzcd} & {[0, m]} \arrow[dr, "g"] & \\ {[0, k]} \arrow[ur, "f"] \arrow[rr, "h"] & & {[0, n].} \end{tikzcd}$$

Assume that g and h are elementary; we wish to show that f is also elementary (in fact, the assumption that g is elementary will not be needed). Choose a point $x \in [0, k]$ at which f is differentiable; we wish to show that $f'(x) \geq 1/2$ (see Remark 8.5.9.17). Replacing x by a nearby point if necessary, we may assume that g is differentiable at the point $y = f(x)$. Since g is a dyadic contraction and h is an elementary dyadic contraction, we have $g'(y) \leq 1$ and $h'(x) \geq 1/2$. Applying the chain rule, we obtain inequalities $f'(x) \geq f'(x) \cdot g'(y) = h'(x) \geq 1/2$.

(3) Let $f : [0, m] \xrightarrow{\sim} [0, n]$ be a dyadic contraction. We wish to show that f admits an S-optimal factorization (in the sense of Definition 6.2.5.1). Let P denote the collection of all subsets $\{1, 2, \cdots, n\}$ having the property that the composition $(b_J \circ f) : [0, m] \to [0, n+|J|]$ is a dyadic contraction; here b_J denotes the dyadic homeomorphism introduced in Notation 8.5.9.16. Unwinding the definitions, we can identify P with the set of factorizations $f = s \circ g$, where g is a dyadic contraction and s is an elementary dyadic contraction (the identification carries a set $J \in P$ to the pair $(s, g) = (b_J^{-1}, b_J \circ f)$). Under this identification, a factorization $f = s \circ g$ is S-optimal if and only if J is a largest element of P. We conclude by observing that P has a largest element $J_{\max}$, given by the collection of those integers $j \in \{1, 2, \cdots, n\}$ having the property that the inverse homeomorphism f^{-1} has derivative ≥ 2 at every point $x \in [j-1, j]$ where f^{-1} is differentiable (alternatively, $J_{\max}$ can be described as the set of integers $1 \leq j \leq n$ which satisfy $f^{-1}(j) > f^{-1}(j-1) + 1$).

(4) Let $f : [0, m] \to \sim [0, n]$ be a dyadic contraction. Let us define the *length of* f to be the smallest nonnegative integer k such that $f'(x) \geq 1/2^k$ for every point $x \in [0, m]$ where f is differentiable. We claim that, if this condition is satisfied, then f can be written as a composition $s_1 \circ s_2 \circ \cdots \circ s_k$, where each s_i is an elementary dyadic contraction. Our proof proceeds by induction on k. If $k = 0$, then f is an identity morphism and there is nothing to prove. Let us therefore assume that $k > 0$, and let $f = s_1 \circ g$ be an S-optimal factorization of f. We claim that g can be written as a composition of elementary contractions $s_2 \circ \cdots \circ s_k$. By virtue of our inductive hypothesis, it will suffice to show that g has length $k - 1$, which follows from the proof of (3).

□

Proof of Proposition 8.5.9.15. Let $\mathrm{N}_\bullet(\mathrm{Dy}_+)^{\mathrm{short}}$ denote the simplicial subset of $\mathrm{N}_\bullet(\mathrm{Dy}_+)$ whose m-simplices are diagrams of dyadic contractions σ :

$$[0, n_0] \xrightarrow{\sim} [0, n_1] \xrightarrow{\sim} \cdots \xrightarrow{\sim} [0, n_m]$$

for which the composite map $[0, n_0] \xrightarrow{\sim} [0, n_m]$ is an elementary dyadic contraction (note that this guarantees that each intermediate composition $[0, n_i] \xrightarrow{\sim} [0, n_j]$ is also elementary). It follows from Lemma 8.5.9.18 and Theorem 6.2.5.10 that the inclusion map $\mathrm{N}_\bullet(\mathrm{Dy}_+)^{\mathrm{short}} \hookrightarrow \mathrm{N}_\bullet(\mathrm{Dy}_+)$ is inner anodyne. We will complete the proof by showing that the morphism $\varphi : E_\bullet \to \mathrm{N}_\bullet(\mathrm{Dy})$ induces of Notation 8.5.9.9 induces an isomorphism of $E_\bullet$ with the simplicial subset $\mathrm{N}_\bullet(\mathrm{Dy}_+)^{\mathrm{short}} \subseteq \mathrm{N}_\bullet(\mathrm{Dy})$.

Fix an integer $m \geq 0$, so that φ induces a monoid homomorphism $\varphi_m : E_m \to \mathrm{N}_m(\mathrm{Dy})$. We wish to show that φ_m is a monomorphism, whose image is the subset $\mathrm{N}_m(\mathrm{Dy}_+)^{\mathrm{short}} \subseteq \mathrm{N}_m(\mathrm{Dy})$. Note that $\mathrm{N}_m(\mathrm{Dy}_+)^{\mathrm{short}}$ is closed under concatenation, and therefore inherits the structure of a monoid. Let us say that an m-simplex σ of $\mathrm{N}_\bullet(\mathrm{Dy}_+)^{\mathrm{short}}$ is *indecomposable* if it corresponds to a diagram of dyadic contractions

$$[0, n_0] \xrightarrow{\sim} [0, n_1] \xrightarrow{\sim} \cdots \xrightarrow{\sim} [0, n_m]$$

with $n_m = 1$. In this case, we define the *index of* σ to be the smallest integer k such that $n_k = 1$. For every integer $0 \leq k \leq m$, the simplicial set $\mathrm{N}_\bullet(\mathrm{Dy}_+)^{\mathrm{short}}$ has a unique indecomposable m-simplex σ_k of index k, which can be described explicitly as follows:

- If $k = 0$, then σ_k is the diagram of identity morphisms
$$[0,1] \xrightarrow{\mathrm{id}} [0,1] \xrightarrow{\mathrm{id}} [0,1] \xrightarrow{\mathrm{id}} \cdots \xrightarrow{\mathrm{id}} [0,1].$$
- If $k > 0$, then the diagram σ_k has the form
$$[0,2] \xrightarrow{\mathrm{id}} \cdots \xrightarrow{\mathrm{id}} [0,2] \xrightarrow{x \mapsto x/2} [0,1] \xrightarrow{\mathrm{id}} \cdots \xrightarrow{\mathrm{id}} [0,1].$$

Moreover, every m-simplex of $\mathrm{N}_\bullet(\mathrm{Dy}_+)^{\mathrm{short}}$ can be written uniquely as a concatenation of indecomposable m-simplices of $\mathrm{N}_\bullet(\mathrm{Dy}_+)^{\mathrm{short}}$: that is, $\mathrm{N}_m(\mathrm{Dy}_+)^{\mathrm{short}}$ can be identified with the free monoid generated by the set $\{\sigma_0, \sigma_1, \cdots, \sigma_m\}$.

Let $\mathcal{C}_\bullet = \mathrm{Path}[\mathrm{N}_{\leq 2}(\mathrm{Idem})]_\bullet$ denote the simplicial path category of $\mathrm{N}_{\leq 2}(\mathrm{Idem})$. Theorem 2.4.4.10 supplies an identification of $\mathcal{C}_m$ with the path category $\mathrm{Path}[G]$, where G is a directed graph having a single vertex X (corresponding to the unique vertex of the simplicial set $\mathrm{N}_{\leq 2}(\mathrm{Idem})$. It follows that $E_m = \mathrm{Hom}_{\mathcal{C}_m}(X, X)$ can be identified with the free monoid generated by the set of edges $\mathrm{Edge}(G)$ (Example 1.3.7.3). It will therefore suffice to prove the following:

$(*_m)$ The monoid homomorphism φ_m induces a bijection from the set $\mathrm{Edge}(G)$ to the collection $\{\sigma_0, \sigma_1, \cdots, \sigma_m\}$ of indecomposable m-simplices of $\mathrm{N}_\bullet(\mathrm{Dy}_+)^{\mathrm{short}}$.

To prove $(*_m)$, we recall that $\mathrm{Edge}(G)$ can be identified with the set of pairs $(\tau, \overrightarrow{I})$, where τ is a nondegenerate simplex of $\mathrm{N}_{\leq 2}(\mathrm{Idem})$ of dimension $n > 0$ and $\overrightarrow{I} = (I_0 \supseteq I_1 \supseteq \cdots \supseteq I_{m-1} \supseteq I_m)$ is a chain of subsets of $[n] = \{0 < 1 < \cdots < n\}$ satisfying $I_0 = [n]$ and $I_m = \{0, n\}$. We consider two possibilities:

- The simplex τ has dimension $n = 1$. In this case, both τ and $\overrightarrow{I}$ are uniquely determined. We claim that the homomorphism φ_m carries $(\tau, \overrightarrow{I})$ to the indecomposable m-simplex σ_0. To prove this, we can invoke our assumption that φ is a morphism of simplicial monoids to reduce to the case $m = 0$, in which case it reduces to the identity $\varphi(e) = [0,1]$ of Remark 8.5.9.10.

- The simplex τ has dimension $n = 2$. In this case, τ is again uniquely determined, and the chain $\overrightarrow{I}$ is determined by a single integer $1 \leq k \leq m$, given by the formula $k = \min\{j : I_j = \{0,2\}\}$. We claim that the homomorphism φ_m carries $(\tau, \overrightarrow{I})$ to the indecomposable m-simplex σ_k. To prove this, we can again invoke our assumption that φ is a morphism of simplicial monoids to reduce to the case $m = 1$, in which case it reduces to the assertion that φ carries the edge $h : e^2 \to e$ of $E_\bullet$ to the dyadic contraction
$$[0,2] \xrightarrow{\sim} [0,1] \qquad x \mapsto x/2;$$
see Remark 8.5.9.10.

□

8.6 Conjugate and Dual Fibrations

Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories. For each object $C \in \mathcal{C}$, we let $\mathcal{E}_C$ denote the the fiber $U^{-1}\{C\} = \{C\} \times_{\mathcal{C}} \mathcal{E}$. In §5.2.5, we showed that this construction determines a functor 04C0

$$\mathrm{hTr}_{\mathcal{E}/\mathcal{C}} : \mathrm{h}\mathcal{C} \to \mathrm{hQCat} \qquad C \mapsto \mathcal{E}_C,$$

which we refer to as the *(covariant) homotopy transport representation* of the cocartesian fibration U (Construction 5.2.5.2). Similarly, if $U' : \mathcal{E}' \to \mathcal{C}'$ is a cartesian fibration of ∞-categories, then the assignment $C \mapsto \mathcal{E}'_C$ determines a functor

$$\mathrm{hTr}_{\mathcal{E}'/\mathcal{C}'} : \mathrm{h}\mathcal{C}'^{\mathrm{op}} \to \mathrm{hQCat} \qquad C \mapsto \mathcal{E}'_C$$

which we refer to as the *(contravariant) homotopy transport representaiton* of the cartesian fibration U (Construction 5.2.5.7). There is an obvious relationship between these constructions. If $U : \mathcal{E} \to \mathcal{C}$ is a cocartesian fibration, then the opposite map $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \to \mathcal{C}^{\mathrm{op}}$ is a cartesian fibration, and the homotopy transport representations $\mathrm{hTr}_{\mathcal{E}/\mathcal{C}}$ and $\mathrm{hTr}_{\mathcal{E}^{\mathrm{op}}/\mathcal{C}^{\mathrm{op}}}$ are interchanged by composing with the automorphism

$$\sigma : \mathrm{hQCat} \to \mathrm{hQCat} \qquad \mathcal{A} \mapsto \mathcal{A}^{\mathrm{op}}.$$

In this section, we show that the passage from a cocartesian fibration $U : \mathcal{E} \to \mathcal{C}$ to the opposite cartesian fibration $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \to \mathcal{C}^{\mathrm{op}}$ can be broken into two steps:

- To every cocartesian fibration $U : \mathcal{E} \to \mathcal{C}$, we will associate another cocartesian fibration $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ which we refer to as the *cocartesian dual of* U, whose (covariant) homotopy transport representation is given (up to isomorphism) by the construction
$$\mathrm{hTr}_{\mathcal{E}^{\vee}/\mathcal{C}} : \mathrm{h}\mathcal{C} \to \mathrm{hQCat} \qquad C \mapsto \mathcal{E}_C^{\mathrm{op}} .$$
In particular, each fiber of $U^{\vee}$ is equivalent to the *opposite* of the corresponding fiber of U.

- To every cocartesian fibration $U : \mathcal{E} \to \mathcal{C}$, we will associate a cartesian fibration $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ which we refer to as the *cartesian conjugate* of U, whose (contravariant) homotopy transport representation is given (up to isomorphism) by the construction
$$\mathrm{hTr}_{\mathcal{E}^{\dagger}/\mathcal{C}^{\mathrm{op}}} : \mathrm{h}\mathcal{C} \to \mathrm{hQCat} \qquad C \mapsto \mathcal{E}_C .$$
In particular, each fiber of $U^{\dagger}$ is equivalent to the corresponding fiber of U.

For a fixed ∞-category (or simplicial set) $\mathcal{C}$, the relationships between these constructions is summarized by the following diagram:

04C1

$$\begin{tikzcd}
\{\text{Cocartesian fibrations } U : \mathcal{E} \to \mathcal{C}\} \arrow[r, Leftrightarrow, "U \longleftrightarrow U^{\mathrm{op}}"] \arrow[d, Leftrightarrow, "U \longleftrightarrow U^{\dagger}"] \arrow[dr, Leftrightarrow, "U \longleftrightarrow U^{\vee}"] & \{\text{Cartesian fibrations } U' : \mathcal{E} \to \mathcal{C}^{\mathrm{op}}\} \arrow[d, Leftrightarrow, "V^{\dagger} \longleftrightarrow V"] \\
\{\text{Cartesian fibrations } V' : \mathcal{E} \to \mathcal{C}^{\mathrm{op}}\} \arrow[r, Leftrightarrow, "V^{\mathrm{op}} \longleftrightarrow V"] & \{\text{Cocartesian fibrations } V : \mathcal{E} \to \mathcal{C}\}
\end{tikzcd}$$

(8.59)

If $U : \mathcal{E} \to \mathcal{C}$ is a cocartesian fibration of ∞-categories, then the opposite fibration $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \to \mathcal{C}^{\mathrm{op}}$ is easy to describe at the level of simplicial sets (see §1.4.2). For the dual and conjugate fibrations $U^{\vee}$ and $U^{\dagger}$, this is somewhat more subtle. For example, the passage from a simplicial set $\mathcal{E}$ to its opposite $\mathcal{E}^{\mathrm{op}}$ is involutive, in the sense that there is a canonical isomorphism $\mathcal{E} \simeq (\mathcal{E}^{\mathrm{op}})^{\mathrm{op}}$ (in fact, if we adhere strictly to the convention of Construction 1.4.2.2, then the simplicial sets $\mathcal{E}$ and $(\mathcal{E}^{\mathrm{op}})^{\mathrm{op}}$ are *identical*). It is therefore natural to hope for the passage from a cocartesian fibration $U : \mathcal{E} \to \mathcal{C}$ to its dual $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ to have a similar property: heuristically, $\mathcal{E}^{\vee}$ is obtained from $\mathcal{E}$ by applying the preceding construction to each fiber of U. Unfortunately, it does not seem possible to give a construction where this property is visible at the level of simplicial sets: the best we can expect is that cocartesian duality is involutive *up to equivalence*, in the sense that the double dual $(U^{\vee})^{\vee} : (\mathcal{E}^{\vee})^{\vee} \to \mathcal{C}$ is equivalent to the original cocartesian fibration $U : \mathcal{E} \to \mathcal{C}$ in some natural way. To address this point, it will be convenient to view duality as a *relationship* which can exist between cocartesian fibrations $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ over the same base, rather than as an *operation* which takes U as input and produces $U^{\vee}$ as an output. Similarly, we will view conjugacy as a relationship which can exist between a cocartesian fibration $U : \mathcal{E} \to \mathcal{C}$ and a cartesian fibration $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ over the opposite base. Our first goal will be to describe these relationships more precisely:

- Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. We will say that a cartesian fibration $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ is a *cartesian conjugate* of U if there exists a commutative diagram

$$\begin{tikzcd}
\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r, "T"] \arrow[d] & \mathcal{E} \arrow[d, "U"] \\
\mathrm{Tw}(\mathcal{C}) \arrow[r] & \mathcal{C}
\end{tikzcd}$$

  satisfying two axioms (Definition 8.6.1.1), one of which requires that T restricts to an equivalence of ∞-categories $T_C : \mathcal{E}^{\dagger}_C \to \mathcal{E}_C$ for each vertex $C \in \mathcal{C}$. In §8.6.1, we develop the properties of this definition and give some examples.

- Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. We say that a cocartesian fibration $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ is a *cocartesian dual* of U if there exists a left fibration of simplicial sets $\lambda : \widetilde{\mathcal{E}} \to \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E}$ satisfying two axioms (Definition 8.6.4.1), one of which requires that for each vertex $C \in \mathcal{C}$, the induced map $\lambda_C : \widetilde{\mathcal{E}}_C \to \mathcal{E}^{\vee}_C \times \mathcal{E}_C$ is a balanced coupling of ∞-categories (Definition 8.2.6.1). This guarantees in particular that $\mathcal{E}^{\vee}_C$ is equivalent to the opposite ∞-category $\mathcal{E}^{\mathrm{op}}_C$ (Corollary 8.2.6.6). In §8.6.4, we develop the properties of this definition and give some examples.

Our next goal is to show that, if $U : \mathcal{E} \to \mathcal{C}$ is a cocartesian fibration of simplicial sets, then it admits a cartesian conjugate $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ and a cocartesian dual $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$, which are uniquely determined up to equivalence. In each case, we will prove existence (and ultimately uniqueness) using explicit constructions at the level of simplicial sets. To fix ideas, let us first assume that $\mathcal{C} = \Delta^0$. In this case, constructing the dual of cocartesian fibration $U : \mathcal{E} \to \mathcal{C}$ is tantamount to constructing an ∞-category $\mathcal{E}^{\vee}$ which is equivalent to the opposite of $\mathcal{E}$. We consider three different solutions to this problem:

(*a*) We can take $\mathcal{E}^{\vee}$ to be the opposite ∞-category $\mathcal{E}^{\mathrm{op}}$ itself, given concretely by Construction 1.4.2.2.

(b) We can take $\mathcal{E}^{\vee}$ to be the ∞-category $\mathrm{Cospan}^{\mathrm{iso},\mathrm{all}}(\mathcal{E})$ of Variant 8.1.7.14, whose morphisms are given by cospans $X \xrightarrow{f} B \xleftarrow{g} Y$ in the ∞-category $\mathcal{E}$ where f is an isomorphism. By virtue of Proposition 8.1.7.6, this is equivalent to the ∞-category $\mathcal{E}^{\mathrm{op}}$.

(c) We can take $\mathcal{E}^{\vee}$ to be the ∞-category of corepresentable functors $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E}, \mathcal{S})$. This is equivalent to $\mathcal{E}^{\mathrm{op}}$ by virtue of the ∞-categorical version of Yoneda's lemma (Theorem 8.3.3.13), at least if $\mathcal{E}$ is locally small.

Each of these approaches can be adapted to more general situations. Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets.

- Assume that $\mathcal{C}$ is an ∞-category. In §8.6.2, we define a fibration

$$\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \mathcal{E}) \to \mathcal{C}^{\mathrm{op}}$$

  and show that it is a cartesian conjugate of U (Proposition 8.6.2.3). In the special case $\mathcal{C} = \Delta^0$, this definition reproduces the original ∞-category $\mathcal{E}$; consequently, after passing to opposite fibrations, it can be viewed as a relative version of construction (a).

- Let $\mathrm{Cospan}^{\dagger}(\mathcal{E} / \mathcal{C})$ denote the fiber product $\mathrm{Cospan}^{\mathrm{all},R}(\mathcal{E}) \times_{\mathrm{Cospan}(\mathcal{C})} \mathcal{C}^{\mathrm{op}}$, where R denotes the collection of all U-cocartesian edges of $\mathcal{E}$. In §8.6.3, we show that projection onto the second factor determines a cartesian fibration $\mathrm{Cospan}^{\dagger}(\mathcal{E} / \mathcal{C}) \to \mathcal{C}^{\mathrm{op}}$ which is conjugate to U (Proposition 8.6.3.5). In the special case $\mathcal{C} = \Delta^0$, this definition reproduces the ∞-category $\mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C})$. Consequently, after passing to opposite fibrations, it can be viewed as a relative version of construction (b).

- Assume that, for each vertex $C \in \mathcal{C}$, the ∞-category $\mathcal{E}_C$ is locally small. In §8.6.5, we define a fibration $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}) \to \mathcal{C}$ and show that it is a cocartesian dual of U (Proposition 8.6.5.8). In the special case $\mathcal{C} = \Delta^0$, this definition reproduces the ∞-category of corepresentable functors $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E}, \mathcal{S})$; consequently, it can be viewed as a relative version of construction (c).

04C2 **Remark 8.6.0.1.** Ultimately, each of the constructions described above gives rise to essentially the same object. However, it will be useful to consider all three, since each reveals different facets of the overall picture. Fix a cocartesian fibration of simplicial sets $U : \mathcal{E} \to \mathcal{C}$.

- The construction of §8.6.2 can be used to show that U admits a cartesian conjugate $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ (Corollary 8.6.2.4). However, from this point of view, it is not obvious that the cartesian fibration $U^{\dagger}$ is unique (unless $\mathcal{C}$ is assumed to be an ∞-category), or that every cartesian fibration can be obtained in this way.

- The construction of §8.6.3 produces a cartesian fibration $V : \mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C}) \to \mathcal{C}^{\mathrm{op}}$ having the property that *every* cartesian conjugate of U is equivalent to V (Proposition 8.6.3.11). This guarantees that the cartesian conjugate of U is unique up to equivalence. However, it does not by itself prove existence (see Warning 8.6.3.13).
- The construction of §8.6.5 can be used to show that U admits a cocartesian dual $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$, which is uniquely determined up to equivalence (Theorem 8.6.5.1). In §8.6.6, we show that the opposite fibration $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \to \mathcal{C}^{\mathrm{op}}$ can be realized as a cartesian conjugate of $U^{\vee}$ (Proposition 8.6.6.1). It follows that every cartesian fibration can be realized as the conjugate of a cocartesian fibration. However, from this point of view, it is not obvious that this realization is unique.

Remark 8.6.0.2 (Duality via Transport Representations)**.** Let $\mathcal{QC}$ denote the ∞-category of small ∞-categories (Construction 5.5.4.1). Then $\mathcal{QC}$ admits an autoequivalence $\sigma : \mathcal{QC} \to \mathcal{QC}$, given on objects by the formula $\sigma(\mathcal{A}) = \mathcal{A}^{\mathrm{op}}$ (see Construction 8.6.7.6). Recall that an (essentially small) cocartesian fibrations $U : \mathcal{E} \to \mathcal{C}$ is determined, up to equivalence, by a functor $\mathrm{Tr}_{\mathcal{E}\,/\,\mathcal{C}} : \mathcal{C} \to \mathcal{QC}$, which we refer to as the *covariant transport representation* of U (Definition 5.6.5.1). In §8.6.7, we show that a cocartesian fibration $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ is a cocartesian dual of U if and only if its covariant transport representation is isomorphic to the composition $\mathcal{C} \xrightarrow{\mathrm{Tr}_{\mathcal{E}\,/\,\mathcal{C}}} \mathcal{QC} \xrightarrow{\sigma} \mathcal{QC}$ (Proposition 8.6.7.12). This gives another construction of the cocartesian dual of U (albeit one which is cumbersome to work with). 04C3

Remark 8.6.0.3. The commutativity of the diagram (8.59) is not immediately obvious: the notions of cartesian conjugacy and cocartesian duality have separate definitions that are *a priori* unrelated to one another. We will maintain this separation in our exposition: the portions of this section which discuss conjugate fibrations (§8.6.1, §8.6.2, and §8.6.3) can be read independently of those which discuss dual fibrations (§8.6.4, §8.6.5, and §8.6.7). Only in §8.6.6 will we consider both notions simultaneously. 04C4

Remark 8.6.0.4. Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. The construction of the conjugate fibration $\mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C}) \to \mathcal{C}^{\mathrm{op}}$ studied in §8.6.3 appears in work of Barwick-Glasman-Nardin; see [3]. 04C5

8.6.1 Conjugate Fibrations

Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration, and let $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration. Our goal in this section is to formalize the requirement that U and $U^{\dagger}$ have "the same fibers": that is, that there exists a family of equivalences $\{T_C : \mathcal{E}^{\dagger}_C \to \mathcal{E}_C\}_{C \in \mathcal{C}}$ which in some sense depend functorially on the vertex $C \in \mathcal{C}$. 04C6

Definition 8.6.1.1 (Conjugate Fibrations)**.** Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration, and let $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration. Let $\lambda_{-} : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}}$ 04C7 and $\lambda_+ : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}$ be the projection maps of Notation 8.1.1.6. We say that a morphism of simplicial sets $T : \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$ *exhibits* $U^{\dagger}$ *as a cartesian conjugate of* U if the following conditions are satisfied:

(0) The diagram

$$\begin{tikzcd}
\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r, "T"] \arrow[d] & \mathcal{E} \arrow[d, "U"] \\
\mathrm{Tw}(\mathcal{C}) \arrow[r, "\lambda_+"] & \mathcal{C}
\end{tikzcd}$$

is commutative.

(1) For every vertex $C \in \mathcal{C}$, restricting T to the inverse image of the vertex $\mathrm{id}_C \in \mathrm{Tw}(\mathcal{C})$ determines an equivalence of ∞-categories $T_C : \mathcal{E}^{\dagger}_C \to \mathcal{E}_C$.

(2) Let e be an edge of the simplicial set $\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. If the image of e in $\mathcal{E}^{\dagger}$ is $U^{\dagger}$-cartesian, then $T(e)$ is a U-cocartesian edge of $\mathcal{E}$.

We say that $U^{\dagger}$ *is a cartesian conjugate of* U if there exists a morphism $T : \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$ which exhibits $U^{\dagger}$ as a cartesian conjugate of U.

04C8 **Warning 8.6.1.2** (Symmetry). Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration, and let $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration. In §8.6.6, we will show that $U^{\dagger}$ is a cartesian conjugate of U if and only if U^{op} is a cocartesian conjugate of $U^{\dagger,\mathrm{op}}$ (Corollary 8.6.6.2). Beware that this is not obvious from Definition 8.6.1.1.

04C9 **Example 8.6.1.3.** Let $\mathcal{E}$ and $\mathcal{E}^{\dagger}$ be ∞-categories. Set $\mathcal{C} = \Delta^0$ and let $U : \mathcal{E} \to \mathcal{C}^{\mathrm{op}}$ and $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}$ denote the projection maps. Then a functor

$$T : \mathcal{E}^{\dagger} \simeq \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$$

exhibits $U^{\dagger}$ are a cartesian conjugate of U if and only if it an equivalence of ∞-categories. In particular, $U^{\dagger}$ is a cartesian conjugate of U if and only if the ∞-category $\mathcal{E}^{\dagger}$ is equivalent to $\mathcal{E}$.

04CA **Remark 8.6.1.4** (Base Change). Let $F : \mathcal{C}' \to \mathcal{C}$ be a morphism of simplicial sets. Suppose we are given pullback squares

$$\begin{tikzcd}
\mathcal{E}'^{\dagger} \arrow[r, "U'^{\dagger}"] \arrow[d] & \mathcal{C}'^{\mathrm{op}} \arrow[d, "F^{\mathrm{op}}"] & & \mathcal{E}' \arrow[r, "U'"] \arrow[d] & \mathcal{C}' \arrow[d, "F"] \\
\mathcal{E}^{\dagger} \arrow[r, "U^{\dagger}"] & \mathcal{C}^{\mathrm{op}} & & \mathcal{E} \arrow[r, "U"] & \mathcal{C},
\end{tikzcd}$$

where $U^{\dagger}$ is a cartesian fibration and U is a cocartesian fibration. If $T : \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$ is a morphism which exhibits $U^{\dagger}$ as a cartesian conjugate of U, then the induced map $T' : \mathcal{E}'^{\dagger} \times_{\mathcal{C}'^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}') \to \mathcal{E}'$ exhibits $U'^{\dagger}$ as a cartesian conjugate of U'.

In the situation of Definition 8.6.1.1, we can regard condition (2) as a formulation of the requirement that the functor $T_C : \mathcal{E}^{\dagger}_C \to \mathcal{E}_C$ depends functorially on the vertex $C \in \mathcal{C}$. This heuristic can be articulated more precisely as follows:

Proposition 8.6.1.5. *Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration, and let $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration. Let $e : C \to C'$ be an edge of $\mathcal{C}$, and let* 04CB

$$e^* : \mathcal{E}^{\dagger}_C \to \mathcal{E}^{\dagger}_{C'} \qquad e_! : \mathcal{E}_C \to \mathcal{E}_{C'}$$

be functors given by contravariant and covariant transport along e for the fibrations $U^{\dagger}$ and U, respectively. If $T : \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$ is a morphism which satisfies conditions (0) and (2) of Definition 8.6.1.1, then the diagram of ∞-categories

$$\begin{tikzcd}
\mathcal{E}^{\dagger}_C \arrow[r, "e^*"] \arrow[d, "T_C"] & \mathcal{E}^{\dagger}_{C'} \arrow[d, "T_{C'}"] \\
\mathcal{E}_C \arrow[r, "e_!"] & \mathcal{E}_{C'}
\end{tikzcd}$$

commutes up to isomorphism.

Proof. The restriction of T to the inverse image of the vertex $\{e\} \subseteq \mathrm{Tw}(\mathcal{C})$ determines a functor of ∞-categories $T_e : \mathcal{E}^{\dagger}_C \to \mathcal{E}_{C'}$. To complete the proof, it will suffice to verify the following pair of assertions:

(a) The functor T_e is isomorphic to the composition $T_{C'} \circ e^*$.

(b) The functor T_e is isomorphic to the composition $e_! \circ T_C$.

We begin by proving (a). Choose a diagram

$$\begin{tikzcd}
\mathcal{E}^{\dagger}_C \times \Delta^1 \arrow[r, "H"] \arrow[d] & \mathcal{E}^{\dagger} \arrow[d, "U^{\dagger}"] \\
\Delta^1 \arrow[r, "e"] & \mathcal{C}^{\mathrm{op}}
\end{tikzcd}$$

which witnesses $e^* = H_{\mathcal{E}^{\dagger}_{C} \times \{0\}}$ as given by contravariant transport along e (see Definition 5.2.2.15). Let $e_L : \mathrm{id}_C \to e$ and $e_R : \mathrm{id}_{C'} \to e$ denote the edges of $\mathrm{Tw}(\mathcal{C})$ described in Example 8.1.3.6, and let $\widetilde{H}$ denote the product morphism

$$\mathcal{E}^{\dagger}_{C} \times \Delta^1 \xrightarrow{H \times e_R} \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}).$$

Then the composition $T \circ \widetilde{H}$ can be regarded as a natural transformation from the functor $T_{C'} \circ e^*$ to T_e. For each object X of the ∞-category $\mathcal{E}^{\dagger}_{C}$, the restriction $H|_{\{X\} \times \Delta^1}$ is a $U^{\dagger}$-cartesian edge of $\mathcal{E}^{\dagger}$. Using condition (2) of Definition 8.6.1.1, we conclude that $(T \circ \widetilde{H})|_{\{X\} \times \Delta^1}$ is a U-cocartesian edge of $\mathcal{E}$ lying over the degenerate edge $\mathrm{id}_{C'}$ of $\mathcal{C}$, and is therefore an isomorphism in the ∞-category $\mathcal{E}_{C'}$ (Proposition 5.1.4.11). Applying Theorem 4.4.4.4, we conclude that $T \circ \widetilde{H}$ is an isomorphism of functors from $T_{C'} \circ e^*$ to T_e.

We now prove (b). Let H' denote the composite map

$$\mathcal{E}^{\dagger}_{C} \times \Delta^1 \xrightarrow{\mathrm{id} \times e_L} \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \xrightarrow{T} \mathcal{E},$$

We then have a commutative diagram

$$\begin{tikzcd}
\mathcal{E}^{\dagger}_{C} \times \Delta^1 \arrow[r, "H'"] \arrow[d] & \mathcal{E} \arrow[d, "U"] \\
\Delta^1 \arrow[r, "e"] & \mathcal{C}.
\end{tikzcd}$$

Condition (2) of Definition 8.6.1.1 guarantees that, for each object $X \in \mathcal{E}^{\dagger}_{C}$, the restriction $H'|_{\{X\} \times \Delta^1}$ is a U-cocartesian edge of $\mathcal{E}$. It follows that H' determines an isomorphism of $T_e = H'|_{\mathcal{E}^{\dagger}_{C} \times \{1\}}$ with the composition $e_! \circ (H'|_{\mathcal{E}^{\dagger}_{C} \times \{0\}}) = e_! \circ T_C$. □

04CC **Corollary 8.6.1.6.** *Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration having homotopy transport representation $\mathrm{hTr}_{\mathcal{E}/\mathcal{C}} : \mathrm{h}\mathcal{C} \to \mathrm{hQCat}$ (Construction 5.2.5.2), and let $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration having homotopy transport representation $\mathrm{hTr}_{\mathcal{E}^{\dagger}/\mathcal{C}^{\mathrm{op}}} : \mathrm{h}\mathcal{C} \to \mathrm{hQCat}$ (Construction 5.2.5.7). If $T : \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$ exhibits $U^{\dagger}$ as a cartesian conjugate of U, then T induces an isomorphism of functors $\mathrm{hTr}_{\mathcal{E}^{\dagger}/\mathcal{C}^{\mathrm{op}}} \xrightarrow{\sim} \mathrm{hTr}_{\mathcal{E}/\mathcal{C}}$, carrying each vertex $C \in \mathcal{C}$ to (the isomorphism class of) the equivalence $T_C : \mathcal{E}^{\dagger}_{C} \to \mathcal{E}_C$.*

04CD **Corollary 8.6.1.7.** *Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration, and let $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration. If $U^{\dagger}$ is a cartesian conjugate of U, then the homotopy transport representations*

$$\mathrm{hTr}_{\mathcal{E}^{\dagger}/\mathcal{C}^{\mathrm{op}}}, \mathrm{hTr}_{\mathcal{E}/\mathcal{C}} : \mathrm{h}\mathcal{C} \to \mathrm{hQCat}$$

are isomorphic.

We now give some concrete examples of conjugate fibrations.

Proposition 8.6.1.8 (Conjugates of Left Fibrations)**.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a left fibration of simplicial sets. Then:* 04CE

- (a) *The map $H : \mathrm{Tw}(\mathcal{E}) \to \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ is a trivial Kan fibration of simplicial sets.*
- (b) *Let T_0 be a section of H, and let $T : \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$ be the composition of T_0 with the projection map $\mathrm{Tw}(\mathcal{E}) \to \mathcal{E}$. Then T exhibits the opposite fibration $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \to \mathcal{C}^{\mathrm{op}}$ as a cartesian conjugate of U.*

Proof. Note that the morphism H factors as a composition

$$\mathrm{Tw}(\mathcal{E}) \to \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \to \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}),$$

where the map on the left is a left fibration by virtue of Proposition 8.1.1.15, and the map on the right is pullback of U (and is therefore also a left fibration). It follows that H is a left fibration (Remark 4.2.1.11). To prove (a), it will suffice to show that every fiber of H is a contractible Kan complex (Proposition 4.4.2.14). For this, we may assume without loss of generality that $\mathcal{C} = \Delta^0$. In this case, $\mathcal{E}$ is a Kan complex (Proposition 4.4.2.1) and we can identify H with the projection map $\mathrm{Tw}(\mathcal{E}) \to \mathcal{E}^{\mathrm{op}}$, which is a trivial Kan fibration by virtue of Corollary 8.1.2.3.

Let $T : \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$ be as in (b); we wish to show that T satisfies conditions (0), (1), and (2) of Definition 8.6.1.1. Condition (0) follows from the commutativity of the diagram

$$\begin{tikzcd}
\mathrm{Tw}(\mathcal{E}) \arrow[rr] \arrow[d, "H"] & & \mathcal{E} \arrow[d, "U"] \\
\mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r] & \mathrm{Tw}(\mathcal{C}) \arrow[r] & \mathcal{C},
\end{tikzcd}$$

and condition (2) is vacuous (our assumption that U is a left fibration guarantees that every edge of $\mathcal{E}$ is U-cocartesian; see Example 5.1.1.3). To verify condition (1), we may again assume that $\mathcal{C} = \Delta^0$, in which case the desired result follows from the observation that the projection maps $\mathcal{E}^{\mathrm{op}} \leftarrow \mathrm{Tw}(\mathcal{E}) \to \mathcal{E}$ are homotopy equivalences of Kan complexes (see Corollary 8.1.2.3). □

Construction 8.6.1.9 (Conjugacy for Categories of Elements)**.** Let $\mathcal{C}$ be a category, let **Cat** denote the 2-category of (small) categories, and let $\mathscr{F} : \mathcal{C} \to \mathbf{Cat}$ be a functor of 2-categories. Let 04CF

$$\int^{\mathcal{C}^{\mathrm{op}}} \mathscr{F} \qquad \int_{\mathcal{C}} \mathscr{F}$$

denote the contravariant and covariant categories of elements of $\mathscr{F}$, respectively (see Definitions 5.6.1.4 and 5.6.1.1). Recall that objects of either category can be identified with pairs (C, X), where C is an object of $\mathcal{C}$ and X is an object of the category $\mathscr{F}(C)$. However, morphisms are defined differently:

- A morphism from (C, X) to (D, Y) in the category $\int_{\mathcal{C}} \mathscr{F}$ is a pair (f, u) where $f : C \to D$ is a morphism in the category $\mathcal{C}$ and $u : \mathscr{F}(f)(X) \to Y$ is a morphism in the category $\mathscr{F}(D)$.
- A morphism from (C, X) to (D, Y) in the category $\int^{\mathcal{C}^{\mathrm{op}}} \mathscr{F}$ is a pair (g, v), where $g : D \to C$ is a morphism in the category $\mathcal{C}$, and $v : X \to \mathscr{F}(g)(Y)$ is a morphism in the category $\mathscr{F}(C)$.

Let us identify the objects of the fiber product $(\int^{\mathcal{C}^{\mathrm{op}}} \mathscr{F}) \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ with pairs $(s : C' \to C, X)$, where $s : C' \to C$ is a morphism in $\mathcal{C}$ and X is an object of the category $\mathscr{F}(C')$. We define a functor We define a functor

$$T : (\int^{\mathcal{C}^{\mathrm{op}}} \mathscr{F}) \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \int_{\mathcal{C}} \mathscr{F}$$

as follows:

- On objects, T is given by the formula $T(s : C' \to C, X) = (C, \mathscr{F}(s)(X))$.
- Let $(s : C' \to C, X)$ and $(t : D' \to D, Y)$ be objects of the category $(\int^{\mathcal{C}^{\mathrm{op}}} \mathscr{F}) \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. Unwinding the definitions, we see that a morphism from $(s : C' \to C, X)$ to $(t : D' \to D, Y)$ can be identified with triples (f, f', u), where $f : C \to D$ and $f' : D' \to C'$ are morphisms in $\mathcal{C}$ satisfying $t = f \circ s \circ f'$, and $u : X \to \mathscr{F}(f')(Y)$ is a morphism in the category $\mathscr{F}(C')$. In this case, we define $T(f, f', u)$ to be the morphism $(f, v) : (C, \mathscr{F}(s)(X)) \to (D, \mathscr{F}(t)(Y))$, where v is the morphism in $\mathscr{F}(D)$ given by the composition

$$\begin{array}{ccc} (\mathscr{F}(f) \circ \mathscr{F}(s))(X) & \xrightarrow{(\mathscr{F}(f) \circ \mathscr{F}(s))(u)} & (\mathscr{F}(f) \circ \mathscr{F}(s) \circ \mathscr{F}(f'))(Y) \\ & \simeq & \mathscr{F}(f \circ s \circ f')(Y) \\ & = & \mathscr{F}(t)(Y), \end{array}$$

  where the unlabeled isomorphism is supplied by the composition constraints for the functor $\mathscr{F}$.

04CG **Proposition 8.6.1.10.** *Let $\mathcal{C}$ be a category and let $\mathscr{F} : \mathcal{C} \to$ **Cat** be a functor. Then, after passing to nerves, the functor*

$$T : (\int^{\mathcal{C}^{\mathrm{op}}} \mathscr{F}) \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \int_{\mathcal{C}} \mathscr{F}$$

of Construction 8.6.1.9 exhibits the forgetful functor $U^{\dagger} : \int^{\mathcal{C}^{\mathrm{op}}} \mathscr{F} \to \mathcal{C}^{\mathrm{op}}$ as a cartesian conjugate of the forgetful functor $U : \int_{\mathcal{C}} \mathscr{F} \to \mathcal{C}$.

Proof. Condition (0) of Definition 8.6.1.1 follows immediately from the construction. To verify condition (1), we observe that for each object $C \in \mathcal{C}$, the functor

$$T_C : (\int^{\mathcal{C}^{\mathrm{op}}} \mathscr{F}) \times_{\mathcal{C}^{\mathrm{op}}} \{C\} \to \{C\} \times_{\mathcal{C}} (\int_{\mathcal{C}} \mathscr{F})$$

can be identified with the functor $\mathscr{F}(\mathrm{id}_C) : \mathscr{F}(C) \to \mathscr{F}(C)$. The identity constraint of $\mathscr{F}$ supplies an isomorphism of functors $\mathrm{id}_{\mathscr{F}(C)} \xrightarrow{\sim} T_C$, so that T_C is an equivalence of categories. To verify condition (2), suppose we are given a morphism e in the category $(\int^{\mathcal{C}^{\mathrm{op}}} \mathscr{F}) \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. We wish to show that, if the image of e in the category $\int^{\mathcal{C}^{\mathrm{op}}} \mathscr{F}$ is $U^{\dagger}$-cartesian, then $T(e)$ is a U-cocartesian morphism in the category $\int_{\mathcal{C}} \mathscr{F}$. Writing $e = (f, f', u)$ and $T(e) = (f, v)$ as in Construction 8.6.1.9, we are reduced to showing that if u is an isomorphism, then v is also an isomorphism (Proposition 5.6.1.15), which is immediate from the construction. □

Construction 8.6.1.11 (Conjugacy for Weighted Nerves)**.** Let QCat denote the category of ∞-categories (which we regard as a full subcategory of the category of simplicial sets). Let $\mathcal{C}$ be a category equipped with a functor $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$, and let $\mathcal{E} = \mathrm{N}_{\bullet}^{\mathscr{F}}(\mathcal{C})$ denote the weighted nerve of Definition 5.3.3.1. We will identify n-simplices of $\mathcal{E}$ with pairs (σ_+, τ_+), where $\sigma_+ = (C_0 \to C_1 \to \cdots \to C_n)$ is an n-simplex of the simplicial set $\mathrm{N}_{\bullet}(\mathcal{C})$ and $\tau_+ = (\tau_0, \tau_1, \cdots, \tau_n)$ is the datum of a commutative diagram 04CH

$$\begin{tikzcd}
\Delta^0 \arrow[r, hook] \arrow[d, "\tau_0"'] & \Delta^1 \arrow[r, hook] \arrow[d, "\tau_1"] & \Delta^2 \arrow[r, hook] \arrow[d, "\tau_2"'] & \cdots \arrow[r, hook] \arrow[d] & \Delta^n \arrow[d, "\tau_n"'] \\
\mathscr{F}(C_0) \arrow[r] & \mathscr{F}(C_1) \arrow[r] & \mathscr{F}(C_2) \arrow[r] & \cdots \arrow[r] & \mathscr{F}(C_n).
\end{tikzcd}$$

Let $U : \mathcal{E} \to \mathrm{N}_{\bullet}(\mathcal{C})$ be the cocartesian fibration of Corollary 5.3.3.16, given on n-simplices by the formula $U(\sigma_+, \tau_+) = \sigma_+$.

Let $\mathscr{F}^{\mathrm{op}} : \mathcal{C} \to \mathrm{QCat}$ denote the functor given by the formula $\mathscr{F}^{\mathrm{op}}(C) = \mathscr{F}(C)^{\mathrm{op}}$, and let $\mathcal{E}^{\dagger}$ denote the ∞-category $\mathrm{N}_{\bullet}^{\mathscr{F}^{\mathrm{op}}}(\mathcal{C})^{\mathrm{op}}$. Unwinding the definitions, we see that n-simplices of $\mathcal{E}^{\dagger}$ can be identified with pairs (σ_-, τ_-), where $\sigma_- = (C'_n \to C'_{n-1} \to \cdots \to C'_0)$ is an n-simplex of the simplicial set $\mathrm{N}_{\bullet}(\mathcal{C})^{\mathrm{op}}$ and $\tau_- = (\tau'_n, \tau'_{n-1}, \cdots, \tau'_0)$ is the datum of a

commutative diagram

$$\begin{tikzcd}
\{n\} \arrow[r, hook] \arrow[d, "\tau'_n"'] & \mathrm{N}_\bullet(\{n-1<n\}) \arrow[r, hook] \arrow[d, "\tau'_{n-1}"] & \cdots \arrow[r, hook] & \Delta^n \arrow[d, "\tau'_0"] \\
\mathscr{F}(C'_n) \arrow[r] & \mathscr{F}(C'_{n-1}) \arrow[r] & \cdots \arrow[r] & \mathscr{F}(C'_0).
\end{tikzcd}$$

Corollary 5.3.3.16 supplies a cartesian fibration $U^\dagger : \mathcal{E}^\dagger \to \mathrm{N}_\bullet(\mathcal{C})^{\mathrm{op}}$, given on n-simplices by the formula $U^\dagger(\sigma_-, \tau_-) = \sigma_-$.

Let us identify n-simplices of the fiber product $\mathcal{E}^\dagger \times_{\mathrm{N}_\bullet(\mathcal{C})^{\mathrm{op}}} \mathrm{Tw}(\mathrm{N}_\bullet(\mathcal{C}))$ with quadruples $(\sigma_-, \tau_-, \sigma_+, e)$, where $\sigma_- = (C'_n \to \cdots \to C'_0)$ is an n-simplex of $\mathrm{N}_\bullet(\mathcal{C})^{\mathrm{op}}$, $\tau_- = (\tau'_n, \cdots, \tau'_0)$ is as above, $\sigma_+ = (C_0 \to \cdots \to C_n)$ is an n-simplex of $\mathrm{N}_\bullet(\mathcal{C})$, and $e : C'_0 \to C_0$ is a morphism in the category $\mathcal{C}$. For $0 \leq i \leq n$, we let τ_i denote the i-simplex of $\mathscr{F}(C_i)$ given by the composition

$$\Delta^i \hookrightarrow \Delta^n \xrightarrow{\tau'_0} \mathscr{F}(C'_0) \xrightarrow{\mathscr{F}(e)} \mathscr{F}(C_0) \to \mathscr{F}(C_i).$$

Set $\tau_+ = (\tau_0, \cdots, \tau_n)$, so that the pair (σ_+, τ_+) determines an n-simplex of the simplicial set $\mathcal{E}$. The construction $(\sigma_-, \tau_-, \sigma_+, e) \mapsto (\sigma_+, \tau_+)$ is compatible with face and degeneracy operators, and therefore determines a functor of ∞-categories

$$T : \mathcal{E}^\dagger \times_{\mathrm{N}_\bullet(\mathcal{C})^{\mathrm{op}}} \mathrm{Tw}(\mathrm{N}_\bullet(\mathcal{C})) \to \mathcal{E}\,.$$

04CJ **Proposition 8.6.1.12.** *Let $\mathcal{C}$ be a category equipped with a functor $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$, let $U : \mathrm{N}^{\mathscr{F}}_\bullet(\mathcal{C}) \to \mathrm{N}_\bullet(\mathcal{C})$ denote the cocartesian fibration of Corollary 5.3.3.16, and define $U^\dagger : \mathrm{N}^{\mathscr{F}^{\mathrm{op}}}_\bullet(\mathcal{C})^{\mathrm{op}} \to \mathrm{N}_\bullet(\mathcal{C})^{\mathrm{op}}$ similarly. Then the functor*

$$T : \mathrm{N}^{\mathscr{F}^{\mathrm{op}}}_\bullet(\mathcal{C})^{\mathrm{op}} \times_{\mathrm{N}_\bullet(\mathcal{C})^{\mathrm{op}}} \mathrm{Tw}(\mathrm{N}_\bullet(\mathcal{C})) \to \mathrm{N}^{\mathscr{F}}_\bullet(\mathcal{C})$$

of Construction 8.6.1.11 exhibits $U^\dagger$ as a cartesian conjugate of U.

Proof. Condition (0) of Definition 8.6.1.1 follows immediately from the construction. Condition (1) follows from the observation that, for each object $C \in \mathcal{C}$, the induced map

$$T_C : \mathrm{N}^{\mathscr{F}^{\mathrm{op}}}_\bullet(\mathcal{C})^{\mathrm{op}} \times_{\mathrm{N}_\bullet(\mathcal{C})^{\mathrm{op}}} \{C\} \to \{C\} \times_{\mathrm{N}_\bullet(\mathcal{C})} \mathrm{N}^{\mathscr{F}}_\bullet(\mathcal{C})$$

is an isomorphism of simplicial sets (under the identifications supplied by Example 5.3.3.8, it corresponds to the identity functor from the ∞-category $\mathscr{F}(C)$ to itself). Condition (2) follows from the characterization of U-cocartesian and $U^{\dagger,\mathrm{op}}$-cocartesian morphisms given in Corollary 5.3.3.16. □

We close this section with a technical result, which will be convenient for verifying hypothesis (2) of Definition 8.6.1.1. If $\mathcal{C}$ is a simplicial set and $e : C \to D$ is an edge of $\mathcal{C}$, we write $e_L : \mathrm{id}_C \to e$ and $e_R : \mathrm{id}_D \to e$ for the edges of $\mathrm{Tw}(\mathcal{C})$ described in Example 8.1.3.6.

Proposition 8.6.1.13. *Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration, and let $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration, and suppose we are given a commutative diagram* 04CK

$$\begin{tikzcd}
\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r, "T"] \arrow[d] & \mathcal{E} \arrow[d, "U"] \\
\mathrm{Tw}(\mathcal{C}) \arrow[r, "\lambda_+"] & \mathcal{C} .
\end{tikzcd}$$

Then T satisfies condition (2) of Definition 8.6.1.1 if and only if it satisfies both of the following conditions:

(2′) *For every object $Y \in \mathcal{E}^{\dagger}$ having image $\overline{Y} = U^{\dagger}(Y)$ and every edge $e : \overline{Y} \to \overline{X}$ of $\mathcal{C}$, the morphism T carries $(\mathrm{id}_Y, e_L) : (Y, \mathrm{id}_{\overline{Y}}) \to (Y, e)$ to a U-cocartesian edge of $\mathcal{E}$.*

(2″) *Let $f : X \to Y$ be a $U^{\dagger}$-cartesian edge of $\mathcal{E}^{\dagger}$. Set $\overline{X} = U^{\dagger}(X)$ and $\overline{Y} = U^{\dagger}(Y)$, so that $U^{\dagger}(f)$ can be identified with an edge $e : \overline{Y} \to \overline{X}$ of the simplicial set $\mathcal{C}$. Then T carries $(f, e_R) : (X, \mathrm{id}_{\overline{X}}) \to (Y, e)$ to an isomorphism in the ∞-category $\mathcal{E}_{\overline{Y}}$.*

Proof. The implication (2) ⇒ (2′) is immediate from the definitions, and the implication (2) ⇒ (2″) follows from Proposition 5.1.4.11. For the converse, suppose that conditions (2′) and (2″) are satisfied. Let $f : X \to Y$ be a $U^{\dagger}$-cartesian edge of $\mathcal{E}^{\dagger}$, and let us identify $U^{\dagger}(f)$ with an edge $e : \overline{Y} \to \overline{X}$ of the simplicial set $\mathcal{C}$. Suppose we are given a lift of e to an edge $\widetilde{e} : u \to v$ of $\mathrm{Tw}(\mathcal{C})$, which we identify with a 3-simplex $\sigma : \Delta^3 \to \mathcal{C}$ depicted in the diagram

$$\begin{tikzcd}
\overline{X} \arrow[d, "u"] & \overline{Y} \arrow[l, "e"'] \arrow[d, "v"] \\
\overline{X}' \arrow[r] & \overline{Y}'.
\end{tikzcd}$$

We wish to show that $T(f, \widetilde{e})$ is a U-cocartesian edge of $\mathcal{E}$.

Let σ' denote the degenerate 5-simplex of $\mathcal{C}$ given by $\gamma^*(\sigma)$, where $\gamma : [5] \to [3]$ is given by $\gamma(0) = 0$, $\gamma(1) = \gamma(2) = \gamma(3) = 1$, $\gamma(4) = 2$, and $\gamma(5) = 3$. Let us abuse notation by identifying σ' with the 2-simplex of $\operatorname{Tw}(\mathcal{C})$ depicted in the diagram

04CL
$$\begin{tikzcd}
\overline{X} & \overline{X} \arrow[l, "\mathrm{id}"'] \arrow[d, "u"] & \overline{Y} \arrow[l, "e"'] \arrow[d, "v"] \\
\overline{X} \arrow[u, phantom] \arrow[r, "u"] & \overline{X}' \arrow[r] & \overline{Y}'.
\arrow[from=1-1, to=2-1, "\mathrm{id}"]
\end{tikzcd} \tag{8.60}$$

Evaluating T on the pair $(s_0^1(f), \sigma')$, we obtain a 2-simplex of $\mathcal{E}$ depicted in the diagram

$$\begin{tikzcd}
& T(X,u) \arrow[dr, "T(f{,}\widetilde{e})"] & \\
T(X, \mathrm{id}_X) \arrow[ur, "T(\mathrm{id}_X{,}u_L)"] \arrow[rr] & & T(Y,v),
\end{tikzcd}$$

where the left diagonal map is U-cocartesian by virtue of assumption $(2')$. Consequently, to show that the $T(f, \widetilde{e})$ is U-cocartesian, it will suffice to show that the horizontal edge is U-cocartesian (Proposition 5.1.4.12). Note that, in the special case where $\sigma = s_0^2(\sigma_0)$ for some 2-simplex σ_0 of $\mathcal{C}$, the horizontal edge coincides with $T(\mathrm{id}_X, v_L)$, which is also U-cocartesian by virtue of $(2')$.

To handle the general case, we can replace σ by the 3-simplex of $\mathcal{C}$ given by the outer rectangle of the diagram (8.60) (that is, by the 3-simplex $\sigma'|_{\mathrm{N}_\bullet(\{0<2<3<5\})}$, and thereby reduce to the special case where $\sigma = s_1^2(\sigma_1)$, for some 2-simplex σ_1 of $\mathcal{C}$ (so that $\overline{X} = \overline{X}'$ and u is a degenerate edge of $\mathcal{C}$). In this case, we let σ'' denote the 5-simplex of $\mathcal{C}$ given by $\beta^*(\sigma_1)$, where $\beta : [5] \to [2]$ is given by $\beta(0) = \beta(1) = 0$, $\beta(2) = \beta(3) = \beta(4) = 1$, and $\beta(5) = 2$. Let us view σ'' as a 2-simplex of $\operatorname{Tw}(\mathcal{C})$ depicted in the diagram

$$\begin{tikzcd}
\overline{X} \arrow[d, "u"] & \overline{Y} \arrow[l, "e"'] & \overline{Y} \arrow[l, "\mathrm{id}"'] \\
\overline{X}' \arrow[r, "\mathrm{id}"] & \overline{X}' \arrow[r] & \overline{Y}'.
\end{tikzcd}$$

Evaluating T on the pair $(s_1^1(f), \sigma'')$, we obtain a 2-simplex of $\mathcal{E}$ depicted in the diagram

$$\begin{tikzcd}
& T(Y,e) \arrow[dr] & \\
T(X,u) \arrow[ur, "T(f{,}e_R)"] \arrow[rr, "T(f{,}\widetilde{e})"] & & T(Y,v).
\end{tikzcd}$$

Here the left diagonal edge is U-cocartesian by virtue of assumption $(2'')$ and the right diagonal edge is U-cocartesian by virtue of the special case treated above. Applying Proposition 5.1.4.12, we conclude that $T(f, \widetilde{e})$ is also U-cocartesian. $\square$

Remark 8.6.1.14. In the situation of Proposition 8.6.1.13, suppose that T exhibits $U^{\dagger}$ as a cartesian conjugate of U. Then we have the following stronger version condition of $(2'')$: 05JF

$(*)$ Let $f : X \to Y$ be an edge of $\mathcal{E}^{\dagger}$. Set $\overline{X} = U^{\dagger}(X)$ and $\overline{Y} = U^{\dagger}(Y)$, so that $U^{\dagger}(f)$ can be identified with an edge $e : \overline{Y} \to \overline{X}$ of the simplicial set $\mathcal{C}$. Then f is $U^{\dagger}$-cartesian if and only if $T(f, e_R)$ is an isomorphism in the ∞-category $\mathcal{E}_{\overline{Y}}$.

The "only if" direction follows from Proposition 8.6.1.13. To prove the converse, choose a 2-simplex σ of $\mathcal{E}^{\dagger}$ corresponding to a diagram

$$\begin{tikzcd}
 & X' \arrow[dr, "f'"] & \\
X \arrow[ur, "u"] \arrow[rr, "f"] & & Y
\end{tikzcd}$$

of the simplicial set $\mathcal{E}^{\dagger}$, where $U^{\dagger}(\sigma)$ is a left-degenerate 2-simplex of $\mathcal{C}^{\mathrm{op}}$ and f' is $U^{\dagger}$-cartesian. We then obtain a 2-simplex

$$\begin{tikzcd}
 & T(X', f) \arrow[dr, "{T(f', e_R)}"] & \\
T(X, f) \arrow[ur, "T_{\overline{Y}}(u)"] \arrow[rr, "{T(f, e_R)}"] & & T(Y, \mathrm{id}_Y)
\end{tikzcd}$$

in the ∞-category $\mathcal{E}_{\overline{Y}}$. If both $T(f, e_R)$ and $T(f', e_R)$ are isomorphisms, then $T_{\overline{Y}}(u)$ is an isomorphism as well. Since the functor $T_{\overline{Y}} : \mathcal{E}^{\dagger}_{\overline{Y}} \to \mathcal{E}_{\overline{Y}}$ is an equivalence of ∞-categories, we conclude that u is an isomorphism in the ∞-category$\mathcal{E}^{\dagger}_{\overline{Y}}$, so that f is also $U^{\dagger}$-cartesian (see Remark 5.1.3.8).

8.6.2 Existence of Conjugate Fibrations

Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories. Our goal in this section is to show that U admits a cartesian conjugate $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ (Corollary 8.6.2.4). For this 04CM purpose, we will need to construct a commutative diagram

$$\begin{tikzcd}
\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r] \arrow[d] & \mathcal{E} \arrow[d, "U"] \\
\mathrm{Tw}(\mathcal{C}) \arrow[r] & \mathcal{C}.
\end{tikzcd}$$

We begin by considering the universal example of such a diagram.

04CN **Notation 8.6.2.1.** Let $\mathcal{D}$ be a simplicial set equipped with a morphism $\lambda = (\lambda_-, \lambda_+) : \mathcal{D} \to \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$. For every simplicial set $\mathcal{E}$, we let $\mathrm{Fun}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$ denote the relative exponential of Construction 4.5.9.1. For $n \geq 0$, we will identify n-simplices of $\mathrm{Fun}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$ with pairs (σ, f), where σ is an n-simplex of $\mathcal{D}_-^{\mathrm{op}}$ and $f : \Delta^n \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D} \to \mathcal{E}$ is a morphism of simplicial sets. Suppose that we are also given a morphism of simplicial sets $U : \mathcal{E} \to \mathcal{D}_+$. In this case, we let $\mathrm{Fun}_{/\mathcal{D}_+}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$ denote the simplicial subset of $\mathrm{Fun}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$ whose n-simplices are pairs (σ, f) which satisfy the additional condition that the diagram

$$\begin{tikzcd}
\Delta^n \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D} \arrow[r, "f"] \arrow[d] & \mathcal{E} \arrow[d, "U"] \\
\mathcal{D} \arrow[r, "\lambda_+"] & \mathcal{D}_+
\end{tikzcd}$$

is commutative.

04CP **Construction 8.6.2.2.** Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets, and let $\mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})$ be the simplicial set given in Notation 8.6.2.1. Unwinding the definitions, we see that vertices of $\mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})$ can be identified with pairs (C, f_C), where C is an object of $\mathcal{C}$ and f_C is a morphism which fits into a commutative diagram

$$\begin{tikzcd}
\{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[rr, "f_C"] \arrow[dr] & & \mathcal{E} \arrow[dl, "U"] \\
& \mathcal{C}. &
\end{tikzcd}$$

We let $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})$ denote the full simplicial subset of $\mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})$, spanned by those pairs (C, f_C) where the morphism f_C carries each edge of $\{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ to a U-cocartesian edge of $\mathcal{E}$. By construction, the simplicial set $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})$

is equipped with a projection map $V : \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \mathcal{E}) \to \mathcal{C}^{\mathrm{op}}$ and an evaluation map $\mathrm{ev} : \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \mathcal{E}) \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$, given on vertices by the construction $(C, f_C, u : C \to C') \mapsto f_C(u)$.

We can now formulate the main result of this section:

Proposition 8.6.2.3. *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories. Then the projection map $V : \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \mathcal{E}) \to \mathcal{C}^{\mathrm{op}}$ of Construction 8.6.2.2 is a cartesian fibration of ∞-categories, and the evaluation functor* 04CQ

$$\mathrm{ev} : \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \mathcal{E}) \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E} \qquad (C, f_C, u : C \to C') \mapsto f_C(u)$$

exhibits V as a cartesian conjugate of U.

Corollary 8.6.2.4. *Every cocartesian fibration of simplicial sets $U : \mathcal{E} \to \mathcal{C}$ admits a cartesian conjugate.* 04CR

Proof. Using Corollary 5.6.7.3, we can choose a pullback diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[r] \arrow[d, "U"] & \mathcal{E}' \arrow[d, "U'"] \\
\mathcal{C} \arrow[r] & \mathcal{C}',
\end{tikzcd}$$

where U' is a cocartesian fibration of ∞-categories. By virtue of Remark 8.6.1.4, it will suffice to show that U' admits a cartesian conjugate, which follows from Proposition 8.6.2.3. □

Warning 8.6.2.5. Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. If $\mathcal{C}$ is not an ∞-category, then the morphism $V : \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \mathcal{E}) \to \mathcal{C}^{\mathrm{op}}$ given by Construction 8.6.2.2 need not be a cartesian conjugate of U. In §8.6.3, we will give an alternative construction of a cartesian conjugate which works in complete generality (Proposition 8.6.3.5). 04CS

The proof of Proposition 8.6.2.3 will require some preliminaries.

Lemma 8.6.2.6. *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{D} \to \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be a coupling of ∞-categories and let $U : \mathcal{E} \to \mathcal{D}_+$ be an isofibration. Then:* 04CT

(1) *The projection map $\overline{V} : \mathrm{Fun}_{/\mathcal{D}^+}(\mathcal{D} / \mathcal{D}_-^{\mathrm{op}}, \mathcal{E}) \to \mathcal{D}_-^{\mathrm{op}}$ is a cartesian fibration of ∞-categories.*

(2) *Let $\widetilde{e}$ be a morphism in the ∞-category $\mathrm{Fun}_{/\mathcal{D}^+}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$, corresponding to a morphism e of $\mathcal{D}_-^{\mathrm{op}}$ and a functor $f_e : \Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D} \to \mathcal{E}$. Then $\widetilde{e}$ is $\overline{V}$-cartesian if and only if, for every morphism u of $\Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$ whose image in $\mathcal{D}_+$ is an isomorphism, the image $f_e(u)$ is an isomorphism in $\mathcal{E}$.*

Proof. Unwinding the definitions, we have a pullback diagram of simplicial sets

$$\begin{tikzcd}
\mathrm{Fun}_{/\mathcal{D}_+}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{E}) \arrow[r] \arrow[d, "\overline{V}"] & \mathrm{Fun}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{E}) \arrow[d, "\overline{V}'"] \\
\mathcal{D}_-^{\mathrm{op}} \arrow[r] & \mathrm{Fun}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{D}_+),
\end{tikzcd}$$

where the lower horizontal map classifies the morphism $\lambda_+ : \mathcal{D} \to \mathcal{D}_+$ and $\overline{V}'$ is given by composition with U. The functor $\lambda_- : \mathcal{D} \to \mathcal{D}_-^{\mathrm{op}}$ is a cocartesian fibration (Proposition 8.2.1.7) and therefore exponentiable (Proposition 5.3.6.1). It follows from Proposition 4.5.9.18 guarantees that $\overline{V}'$ is an isofibration, so that $\overline{V}$ is also an isofibration.

Let us say that a morphism $\widetilde{e}$ in the ∞-category $\mathrm{Fun}_{/\mathcal{D}^+}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$ is *special* if it satisfies the condition described in (2). Let us identify $\widetilde{e}$ with a pair (e, f_e), where $e : D' \to D$ is a morphism in the ∞-category $\mathcal{D}_-^{\mathrm{op}}$ and $f_e : \Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D} \to \mathcal{E}$ is a functor of ∞-categories. Let $\pi : \Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D} \to \Delta^1$ be given by the projection map onto the first factor. Then π is a cocartesian fibration, and a morphism u of $\Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$ is π-cocartesian if and only if its image in $\mathcal{D}_+$ is an isomorphism (see Proposition 8.2.1.7). If this condition is satisfied, the assumption that $\widetilde{e}$ is special guarantees that $f_e(u)$ is an isomorphism in the ∞-category $\mathcal{E}$, and is therefore U-cartesian (Proposition 5.1.1.8). Applying Lemma 5.3.6.11, we deduce that $\widetilde{e}$ is $\overline{V}'$-cartesian when regarded as a morphism of $\mathrm{Fun}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$, and therefore also $\overline{V}$-cartesian when regarded as a morphism of $\mathrm{Fun}_{/\mathcal{D}_+}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$.

To show that $\overline{V}$ is a cartesian fibration, it will suffice to show that if (D, f_D) is an object of $\mathrm{Fun}_{/\mathcal{D}^+}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$, then every morphism $e : C \to D$ in the ∞-category $\mathcal{D}_-^{\mathrm{op}}$ can be lifted to a special morphism $\widetilde{e} : (C, f_C) \to (D, f_D)$ in $\mathrm{Fun}_{/\mathcal{D}^+}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$. We first claim that the lifting problem

$$\begin{tikzcd}
\{D\} \times_{\mathcal{C}_-^{\mathrm{op}}} \mathcal{C} \arrow[r, "f_D"] \arrow[d] & \mathcal{E} \arrow[d, "U"] \\
\Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D} \arrow[r] \arrow[ur, dashed, "f_e"] & \mathcal{D}_+
\end{tikzcd}$$

admits a solution f_e which is U-right Kan extended from $\{D\} \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$. Using the criterion of Corollary 7.3.5.9, we are reduced to showing that if $u : X' \to X$ is a π-cocartesian morphism of $\Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$ lying over the nondegenerate edge of Δ^1, then its image in $\mathcal{D}_+$ can be lifted to a U-cartesian morphism $E \to f_D(X)$ in $\mathcal{E}$. Since the image of u in $\mathcal{D}_+$ is an isomorphism (Proposition 8.2.1.7), this follows from our assumption that U is an isofibration. Note that the functor f_e carries *every* π-cocartesian morphism u of $\Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$ to an isomorphism in $\mathcal{D}$ (if the image of u in Δ^1 is degenerate, then u is an isomorphism and this condition is automatically satisfied), so that $\widetilde{e} = (e, f_e)$ is a special morphism of $\mathrm{Fun}_{/\mathcal{D}^+}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$ having target (D, f_D). This completes the proof of (1).

To complete the proof of (2), it will suffice to show that every $\overline{V}$-cartesian morphism $\widetilde{e} = (C, f_C) \to (D, f_D)$ of $\mathrm{Fun}_{/\mathcal{D}^+}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$ is special. Let $e : C \to D$ denote the image of $\widetilde{e}$ in the ∞-category $\mathcal{D}_-^{\mathrm{op}}$. Using the preceding argument, we can lift e to a special morphism $\widetilde{e}' : (C, f'_C) \to (D, f_D)$ of $\mathrm{Fun}_{/\mathcal{D}^+}(\mathcal{D} \,/\, \mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$ Write $\widetilde{e} = (e, f_e)$ and $\widetilde{e}' = (e, f'_e)$. Since $\widetilde{e}'$ is also $\overline{V}$-cartesian, Remark 5.1.3.8 guarantees that the functors f_e and f'_e are isomorphic. In particular, if u is a morphism of $\Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$ such that $f'_e(u)$ is an isomorphism in $\mathcal{E}$, then $f_e(u)$ is also an isomorphism in $\mathcal{E}$. It follows that the morphism $\widetilde{e}$ is also special, as desired. □

Lemma 8.6.2.7. *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories and let $\overline{V} : \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \mathcal{E}) \to \mathcal{C}^{\mathrm{op}}$ be the cartesian fibration of Lemma 8.6.2.6. Then:* 04CU

(1) *Let $\widetilde{e} : (C, f_C) \to (D, f_D)$ be a $\overline{V}$-cartesian morphism of $\mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \mathcal{E})$. If (D, f_D) belongs to the simplicial subset $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \mathcal{E})$ of Construction 8.6.2.2, then (C, f_C) also belongs to $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \mathcal{E})$.*

(2) *The morphism $\overline{V}$ restricts to a cartesian fibration of ∞-categories*

$$V : \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \mathcal{E}) \to \mathcal{C}^{\mathrm{op}}.$$

(3) *A morphism in the ∞-category $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \mathcal{E})$ is V-cartesian if and only if it is $\overline{V}$-cartesian when regarded as a morphism of $\mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \mathcal{E})$.*

Proof. We will prove assertion (1); assertions (2) and (3) then follow as formal consequences (see Proposition 5.1.4.16). Let us identify $\widetilde{e}$ with a pair (e, f_e), where $e : C \to D$ is a morphism in the ∞-category $\mathcal{C}^{\mathrm{op}}$ and $f_e : \Delta^1 \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$ is a functor. Let $u : \widetilde{C} \to \widetilde{C}'$ be a morphism in the fiber $\{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$; we wish to show that $f_C(u)$ is a U-cocartesian morphism of $\mathcal{E}$. Since the projection map $\Delta^1 \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \Delta^1$ is a cocartesian fibration, we can choose a diagram

$$\begin{tikzcd}
\widetilde{C} \arrow[r] \arrow[d, "u"] & \widetilde{D} \arrow[d, "v"] \\
\widetilde{C}' \arrow[r] & \widetilde{D}'
\end{tikzcd}$$

in the ∞-category $\Delta^1 \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$, where v is a morphism of $\{D\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ and the horizontal maps are π-cocartesian. Applying the functor f_e, we obtain a diagram

$$\begin{tikzcd}
f_C(\widetilde{C}) \arrow[r] \arrow[d, "f_C(u)"] & f_D(\widetilde{D}) \arrow[d, "f_D(v)"] \\
f_C(\widetilde{C}') \arrow[r] & f_D(\widetilde{D}')
\end{tikzcd}$$

in the ∞-category $\mathcal{E}$, where the horizontal maps are isomorphisms (by virtue of our assumption that $\widetilde{e}$ is $\overline{V}$-cartesian; see Lemma 8.6.2.6). It will therefore suffice to show that $f_D(v)$ is U-cocartesian (Corollary 5.1.2.5), which follows from our assumption that (D, f_D) is an object of $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})$. □

We will deduce Proposition 8.6.2.3 from the following more precise result:

04CV **Proposition 8.6.2.8.** *Let $\mathcal{C}$ be an ∞-category, let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \to \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration. Suppose we are given a commutative diagram*

$$\begin{tikzcd}
\mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[rr, "T"] \arrow[dr] & & \mathcal{E} \arrow[dl, "U"] \\
& \mathcal{C}, &
\end{tikzcd}$$

which we identify with a functor $F : \mathcal{E}^\dagger \to \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})$. The following conditions are equivalent:

(a) The functor T exhibits $U^\dagger$ as a cartesian conjugate of U (in the sense of Definition 8.6.1.1).

(b) The functor F restricts to an equivalence of $\mathcal{E}^\dagger$ with the full subcategory

$$\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \subseteq \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})$$

introduced in Construction 8.6.2.2.

Proof. Let $\lambda = (\lambda_-, \lambda_+) : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ denote the twisted arrow fibration of Example 8.2.0.2. Recall that (a) is equivalent to the following pair of conditions:

(a_1) For every object $C \in \mathcal{C}$, the restriction of T to the fiber over the vertex $\{\mathrm{id}_C\} \subseteq \mathrm{Tw}(\mathcal{C})$ determines an equivalence of ∞-categories $T_C : \mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \{C\} \to \{C\} \times_{\mathcal{C}} \mathcal{E}$.

(a_2) Let (e', e) be an edge of the fiber product $\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. If e' is a $U^{\dagger}$-cartesian morphism of $\mathcal{E}^{\dagger}$, then $T(e', e)$ is a U-cocartesian morphism of $\mathcal{E}$.

Unwinding the definitions, we see that F factors through $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})$ if and only if T satisfies the following weaker version of (a_2):

(b_0) Let (e', e) be an edge of the fiber product $\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. If e' is a degenerate edge of $\mathcal{E}^{\dagger}$, then $T(e', e)$ is a U-cocartesian morphism of $\mathcal{E}$.

If this condition is satisfied, then we have a commutative diagram

$$\begin{tikzcd}
\mathcal{E}^{\dagger} \arrow[rr, "F"] \arrow[dr, "U^{\dagger}"'] & & \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \arrow[dl, "V"] \\
& \mathcal{C}^{\mathrm{op}}, &
\end{tikzcd}$$

where the vertical maps are cartesian fibrations (Lemma 8.6.2.7). Using Theorem 5.1.6.1, we see that F is an equivalence if and only if it satisfies the following further conditions:

(b_1) For each object $C \in \mathcal{C}$, the functor F restricts to an equivalence of ∞-categories

$$F_C : \mathcal{E}^{\dagger}_C = \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \{C\} \to \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \times_{\mathcal{C}^{\mathrm{op}}} \{C\}.$$

(b_2) The functor F carries $U^{\dagger}$-cartesian morphisms of $\mathcal{E}^{\dagger}$ to V-cartesian morphisms of $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})$.

Let C be an object of $\mathcal{C}$. Unwinding the definitions, we can identify the fiber

$$\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \times_{\mathcal{C}^{\mathrm{op}}} \{C\}$$

with the ∞-category $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}), \mathcal{E})$. Since id_C is initial when viewed as an object of the ∞-category $\{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ (Proposition 8.1.2.1), Proposition 5.3.1.21 guarantees that the evaluation map

$$\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}), \mathcal{E}) \to \{C\} \times_{\mathcal{C}} \mathcal{E}$$

is a trivial Kan fibration. Moreover, the composition of this evaluation map with the functor F_C coincides with the functor T_C appearing in condition (a_1). It follows that conditions (a_1) and (b_1) are equivalent.

Using the characterization of V-cartesian morphisms supplied by Lemmas 8.6.2.6 and 8.6.2.7, we can reformulate (b_2) more concretely as follows:

(b_2') Let (e', e) be an edge of the fiber product $\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. If e' is a $U^{\dagger}$-cartesian morphism of $\mathcal{E}^{\dagger}$ and $\lambda_{+}(e)$ is an isomorphism in $\mathcal{C}$, then $T(e', e)$ is an isomorphism in the ∞-category $\mathcal{E}$.

To complete the proof, it will suffice to show that the functor T satisfies (a_2) if and only if it satisfies both (b_0) and (b_2'). The implication $(a_2) \Rightarrow (b_0)$ is immediate, and the implication $(a_2) \Rightarrow (b_2')$ follows from Corollary 5.1.1.8. The reverse implication follows from Proposition 8.6.1.13. □

Proof of Proposition 8.6.2.3. Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories. It follows from Lemma 8.6.2.7 that the projection map $V : \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \to \mathcal{C}^{\mathrm{op}}$ is a cartesian fibration. We wish to show that the evaluation map

$$\mathrm{ev} : \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$$

exhibits V as a cartesian conjugate of U. This follows from Proposition 8.6.2.8, since the identity automorphism of $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})$ is an equivalence of ∞-categories. □

It follows from Proposition 8.6.2.8 that conjugate fibrations can be characterized by a universal mapping property:

05JG **Corollary 8.6.2.9.** *Let $\mathcal{C}$ be an ∞-category, let $V : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration, and let $V^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration. Suppose we are given a commutative diagram*

$$\begin{tikzcd}
\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[rr, "T"] \arrow[dr] & & \mathcal{E} \arrow[dl, "V"] \\
& \mathcal{C} &
\end{tikzcd}$$

which exhibits $V^{\dagger}$ as a cartesian conjugate of V. Then, for every morphism of simplicial sets $U^{\dagger} : \mathcal{D}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$, composition with T induces a fully faithful functor

$$\mathrm{Fun}_{/\mathcal{C}^{\mathrm{op}}}(\mathcal{D}^{\dagger}, \mathcal{E}^{\dagger}) \to \mathrm{Fun}_{/\mathcal{C}}(\mathcal{D}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}), \mathcal{E}).$$

The essential image is spanned by those diagrams $Q : \mathcal{D}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$ having the property that, for every vertex $D \in \mathcal{D}^{\dagger}$, Q carries every edge of $\{D\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ to a V-cocartesian edge of $\mathcal{E}$.

Example 8.6.2.10 (Functoriality)**.** Suppose we are given a commutative diagram of ∞-categories 05JH

$$\begin{tikzcd}
\mathcal{D} \arrow[rr, "F"] \arrow[dr, "U"'] & & \mathcal{E} \arrow[dl, "V"] \\
& \mathcal{C} &
\end{tikzcd}$$

where U and V are cocartesian fibrations, and the functor F carries U-cocartesian morphisms of $\mathcal{D}$ to V-cocartesian morphisms of $\mathcal{E}$. Let $U^{\dagger} : \mathcal{D}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ and $V^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be cartesian fibrations, and suppose we are given functors

$$T_0 : \mathcal{D}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{D} \qquad T : \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$$

which exhibit $U^{\dagger}$ and $V^{\dagger}$ as cartesian conjugates of U and V, respectively. Then there is a functor $F^{\dagger} : \mathcal{D}^{\dagger} \to \mathcal{E}^{\dagger}$ satisfying $V^{\dagger} \circ F^{\dagger} = U^{\dagger}$ for which the diagram

$$\begin{tikzcd}
\mathcal{D}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r, "T_0"] \arrow[d, "F^{\dagger} \times \mathrm{id}"] & \mathcal{D} \arrow[d, "F"] \\
\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r, "T"] & \mathcal{E}
\end{tikzcd}$$

commutes up to isomorphism (in the ∞-category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{D}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}), \mathcal{E})$). Moreover, the functor $F^{\dagger}$ is uniquely determined up to isomorphism (as an object of the ∞-category $\mathrm{Fun}_{/\mathcal{C}^{\mathrm{op}}}(\mathcal{D}^{\dagger}, \mathcal{E}^{\dagger})$).

Remark 8.6.2.11. In the situation of Example 8.6.2.10, the functor $F^{\dagger}$ automatically carries $U^{\dagger}$-cartesian morphisms of $\mathcal{D}^{\dagger}$ to $V^{\dagger}$-cartesian morphisms of $\mathcal{E}^{\dagger}$. See Remark 8.6.1.14. 05JJ

Let $\mathcal{C}$ be an ∞-category, let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration, and let $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration. It follows from Proposition 8.6.2.8 that if there exists a functor

$$T : \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$$

which exhibits $U^{\dagger}$ as a cartesian conjugate of U, then $U^{\dagger}$ can be recovered from U up to equivalence. We close this section by showing that, in the same situation, we can also recover U from the cartesian fibration $U^{\dagger}$.

Proposition 8.6.2.12. *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories, let $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration of ∞-categories, and suppose we are given a commutative* 04CY *diagram*

$$\begin{tikzcd}
\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r, "T"] \arrow[d] & \mathcal{E} \arrow[d, "U"] \\
\mathrm{Tw}(\mathcal{C}) \arrow[r] & \mathcal{C}
\end{tikzcd}$$

which exhibits $U^{\dagger}$ *as a cartesian conjugate of* U*. Then* T *also exhibits* $\mathcal{E}$ *as a localization of* $\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ *with respect to* W*, where* W *is the collection of all morphisms* $w = (w', w'')$ *where* w' *is a* U'*-cartesian morphism of* $\mathcal{E}^{\dagger}$ *and* w'' *is a morphism of* $\mathrm{Tw}(\mathcal{C})$ *whose image in* $\mathcal{C}$ *is degenerate.*

04CZ **Remark 8.6.2.13.** The converse of Proposition 8.6.2.12 is also true; see Corollary 8.6.6.7.

Proof of Proposition 8.6.2.12. Let $\lambda = (\lambda_{-}, \lambda_{+}) : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ denote the twisted arrow coupling of Example 8.2.0.2, and let $V : \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}$ denote the composition of λ_{+} with projection onto the second factor. Note that V factors as a composition

$$\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \xrightarrow{\mathrm{id} \times \lambda} \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} (\mathcal{C}^{\mathrm{op}} \times \mathcal{C}) \simeq \mathcal{E}^{\dagger} \times \mathcal{C} \to \mathcal{C},$$

where the first map is a left fibration (since it is a pullback of λ, which is a left fibration by virtue of Proposition 8.1.1.15), and the last map is a cocartesian fibration (since it is a pullback of the projection map $\mathcal{E}^{\dagger} \to \Delta^{0}$). It follows that V is a cocartesian fibration, and that a morphism of $\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ is V-cocartesian if and only if its image in $\mathcal{E}^{\dagger}$ is an isomorphism. In particular, our hypotheses on T guarantees that it carries V-cocartesian morphisms of $\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ to U-cocartesian morphisms of $\mathcal{E}$.

Fix an object $C \in \mathcal{C}$. Let $\mathcal{E}^{\dagger}(C)$ denote the fiber $V^{-1}\{C\} = \mathcal{E}' \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{C\}$, so that projection onto the middle factor gives a map $U^{\dagger}_{C} : \mathcal{E}^{\dagger}(C) \to \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{C\}$. Note that $U^{\dagger}_{C}$ is a pullback of $U^{\dagger}$. It follows that $U^{\dagger}_{C}$ is a cartesian fibration, and that a morphism of $\mathcal{E}^{\dagger}(C)$ is $U^{\dagger}_{C}$-cartesian if and only if its image in $\mathcal{E}^{\dagger}$ is $U^{\dagger}$-cartesian (Remark 5.1.4.6). Let W_C denote the collection of morphisms of $\mathcal{E}^{\dagger}(C)$ which satisfy this condition, so that $W = \bigcup_{C \in \mathcal{C}} W_C$. Note that T restricts to a functor $T^{C} : \mathcal{E}^{\dagger}(C) \to \mathcal{E}_{C}$. By virtue of Proposition 6.3.5.2, it will suffice to verify the following (for each object $C \in \mathcal{C}$):

$(*_C)$ The functor T^{C} exhibits the ∞-category $\mathcal{E}_{C}$ as a localization of $\mathcal{E}^{\dagger}(C)$ with respect to W_C.

Let $\mathcal{K}$ denote the full subcategory of $\mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}^{\mathrm{op}}} \{C\}$ whose objects are isomorphisms $D \to C$. By virtue of Proposition 8.1.2.1, $\mathcal{K}$ can also be described as the full subcategory of $\mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}^{\mathrm{op}}} \{C\}$ spanned by its initial objects. It follows that $\mathcal{K}$ is a coreflective subcategory of $\mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}^{\mathrm{op}}} \{C\}$ (Example 6.2.2.5). Let $\mathcal{E}^{\dagger}_{0}(C) \subseteq \mathcal{E}^{\dagger}(C)$ denote the inverse image of $\mathcal{K}$

under $U^{\dagger}_{C}$, so that $\mathcal{E}^{\dagger}_{0}(C)$ is a coreflective subcategory of $\mathcal{E}^{\dagger}(C)$ (Proposition 6.2.2.22). Using Lemma 6.2.2.14, we can choose a functor $L : \mathcal{E}^{\dagger}(C) \to \mathcal{E}^{\dagger}_{0}(C)$ and a natural transformation $\epsilon : L \to \mathrm{id}_{\mathcal{E}^{\dagger}(C)}$ which exhibits L as a $\mathcal{E}^{\dagger}_{0}(C)$-coreflection functor. Our assumption on T guarantees that the functor T^{C} carries each element of W_{C} to an isomorphism in $\mathcal{E}^{\dagger}_{0}(C)$, so that ϵ induces an isomorphism of functors $(T^{C}|_{\mathcal{E}^{\dagger}_{0}(C)} \circ L) \to T^{C}$. Since the Kan complex $\mathcal{K}$ is contractible (Corollary 4.6.7.14), the inclusion map $\{\mathrm{id}_{C}\} \hookrightarrow \mathcal{K}$ is a homotopy equivalence of Kan complexes, and therefore induces an equivalence of ∞-categories $\mathcal{E}^{\dagger}(C) \times_{\mathcal{C}^{\mathrm{op}}} \{C\} \simeq \mathcal{E}^{\dagger}_{0}(C)$ (Corollary 4.5.2.29). Since the composition

$$\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \{C\} \hookrightarrow \mathcal{E}^{\dagger}_{0}(C) \xrightarrow{T^{C}} \mathcal{E}_{C}$$

is an equivalence of ∞-categories, we conclude that the functor $T^{C}|_{\mathcal{E}^{\dagger}_{0}(C)}$ is also an equivalence of ∞-categories. To complete the proof of (2_{C}), it will suffice to show that the functor L exhibits $\mathcal{E}^{\dagger}_{0}(C)$ as a localization of $\mathcal{E}^{\dagger}(C)$ with respect to W_{C} (see Remark 6.3.1.19). Let W^{+}_{C} denote the collection of morphisms v of $\mathcal{E}^{\dagger}(C)$ such that $L(v)$ is an isomorphism in $\mathcal{E}^{\dagger}_{0}(C)$. By virtue of the preceding arguments, this is equivalent to the requirement that $T(v)$ is an isomorphism in the ∞-category $\mathcal{E}_{C}$; in particular, assumption (1) guarantees that W_{C} is contained in W^{+}_{C}. Conversely, if $u : Y \to Z$ is a morphism of $\mathcal{E}^{\dagger}(C)$ which belongs to W^{+}_{C}, then we can choose a commutative diagram

$$\begin{tikzcd}
 & Y \arrow[dr, "v"] & \\
X \arrow[ur, "u"] \arrow[rr, "w"] & & Z
\end{tikzcd}$$

where u and w exhibit X as $\mathcal{E}^{\dagger}_{0}(C)$-coreflections of the objects Y and Z, respectively, and therefore belong to W_{C}. We are therefore reduced to showing that the functor L exhibits $\mathcal{E}^{\dagger}_{0}(C)$ as a localization of $\mathcal{E}^{\dagger}(C)$ with respect to W^{+}_{C}, which is a special case of Example 6.3.3.7. □

8.6.3 Uniqueness of Conjugate Fibrations

Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. It follows from Corollary 8.6.2.4 that U admits a cartesian conjugate $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$. When $\mathcal{C}$ is an ∞-category, Proposition 8.6.2.8 guarantees that $U^{\dagger}$ is unique up to equivalence: any cartesian conjugate of U is equivalent to the cartesian fibration 04EC

$$V : \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \mathcal{E}) \to \mathcal{C}^{\mathrm{op}}$$

of Construction 8.6.2.2. In this section, we will establish a more general uniqueness result, which applies even when $\mathcal{C}$ is not an ∞-category. Our proof will use an alternative construction of the conjugate fibration due to Barwick-Glasman-Nardin ([3]), which involves the restricted cospan construction of §8.1.6.

`04ED` **Notation 8.6.3.1.** Let $\mathcal{C}$ be a simplicial set and let $\rho_{-} : \mathcal{C}^{\mathrm{op}} \to \mathrm{Cospan}(\mathcal{C})$ be the comparison map of Variant 8.1.7.14. For every cocartesian fibration $U : \mathcal{E} \to \mathcal{C}$, we let $\mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C})$ denote the fiber product $\mathrm{Cospan}(\mathcal{E})^{\mathrm{all},R}(\mathcal{E}) \times_{\mathrm{Cospan}(\mathcal{C})} \mathcal{C}^{\mathrm{op}}$, where R is the collection of all U-cocartesian edges of $\mathcal{E}$ (see Definition 8.1.6.1).

`04EE` **Remark 8.6.3.2.** Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. Low-dimensional simplices of the simplicial set $\mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C})$ can be described as follows:

- Vertices of the simplicial set $\mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C})$ can be identified with vertices of the simplicial set $\mathcal{E}$.
- Let X and Y be vertices of $\mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C})$. Then edges $e : X \to Y$ of $\mathrm{Cospan}(\mathcal{E} \,/\, \mathcal{C})$ can be identified with pairs of edges $X \xrightarrow{f} B \xleftarrow{g} Y$ in the simplicial set $\mathcal{E}$ having the property that g is U-cocartesian and $U(f)$ is a degenerate edge of $\mathcal{C}$.

`04EF` **Example 8.6.3.3.** Let $\mathcal{E}$ be an ∞-category, so the projection map $\mathcal{E} \to \Delta^0$ is a cocartesian fibration of simplicial sets. Then the simplicial set $\mathrm{Cospan}^{\dagger}(\mathcal{E} \,/ \Delta^0)$ of Notation 8.6.3.1 can be identified with the simplicial set $\mathrm{Cospan}^{\mathrm{all,iso}}(\mathcal{E})$ of Construction 8.1.7.2. In particular, $\mathrm{Cospan}^{\dagger}(\mathcal{E} \,/ \Delta^0)$ is an ∞-category (Proposition 8.1.7.5), and Proposition 8.1.7.6 supplies an equivalence of ∞-categories $\rho_{+} : \mathcal{E} \to \mathrm{Cospan}^{\dagger}(\mathcal{E} \,/ \Delta^0)$.

`04EG` **Remark 8.6.3.4** (Base Change)**.** Suppose we are given a pullback diagram of simplicial sets

$$\begin{tikzcd}
\mathcal{E}' \arrow[r] \arrow[d, "U'"] & \mathcal{E} \arrow[d, "U"] \\
\mathcal{C}' \arrow[r, "F"] & \mathcal{C},
\end{tikzcd}$$

where U and U' are cocartesian fibrations. Then we have a canonical isomorphism of simplicial sets

$$\mathrm{Cospan}^{\dagger}(\mathcal{E}' \,/\, \mathcal{C}') \simeq \mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C}) \times_{\mathcal{C}^{\mathrm{op}}} \mathcal{C}'^{\,\mathrm{op}}.$$

In particular, for each vertex $C \in \mathcal{C}$, the fiber $\mathrm{Cospan}_{\dagger}(\mathcal{E} \,/\, \mathcal{C}) \times_{\mathcal{C}^{\mathrm{op}}} \{C\}$ is isomorphic to the ∞-category $\mathrm{Cospan}^{\mathrm{all,iso}}(\mathcal{E}_C)$, which is equivalent to the ∞-category $\mathcal{E}_C$.

We can now state a preliminary version of our main result:

Proposition 8.6.3.5. *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then the projection map $V : \mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C}) \to \mathcal{C}^{\mathrm{op}}$ is a cartesian fibration, which is a cartesian conjugate of U.* 05JK

The proof of Proposition 8.6.3.5 will require some preliminaries. Our first step is to show that the projection map V is a cartesian fibration.

Lemma 8.6.3.6. *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories, let R denote the collection of all U-cocartesian morphisms of $\mathcal{E}$, and let L denote the collection of all morphisms $e : X \to Y$ of $\mathcal{E}$ such that $U(e)$ is an isomorphism in $\mathcal{C}$. Then $\mathrm{Cospan}(U) : \mathrm{Cospan}(\mathcal{E}) \to \mathrm{Cospan}(\mathcal{C})$ restricts to a cartesian fibration of ∞-categories $V : \mathrm{Cospan}^{L,R}(\mathcal{E}) \to \mathrm{Cospan}^{\mathrm{iso},\mathrm{all}}(\mathcal{C})$. Moreover, an edge $e : X \to Y$ of $\mathrm{Cospan}^{L,R}(\mathcal{E})$ is V-ccartesian if and only if it satisfies the following condition:* 04EL

$(*)$ The edge e corresponds to a cospan $X \xrightarrow{\ell} B \xleftarrow{r} Y$ in $\mathcal{E}$, where ℓ is an isomorphism and r is U-cocartesian.

Proof. Let L_0 be the collection of all isomorphisms in $\mathcal{C}$, and let R_0 be the collection of all morphisms of $\mathcal{C}$. Then L_0 and R_0 are pushout-compatible, in the sense of Definition 8.1.6.5 (Example 8.1.6.6). Moreover, U is a Beck-Chevalley fibration relative to (R_0, L_0) (Example 8.1.10.8). Since $\mathrm{Cospan}^{L_0,R_0}(\mathcal{C}) = \mathrm{Cospan}^{\mathrm{iso},\mathrm{all}}(\mathcal{C})$ is an ∞-category, the desired result follows from Theorem 8.1.10.9 and Remark 8.1.10.11. □

Remark 8.6.3.7. Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories, let R denote the collection of all U-cocartesian morphisms of $\mathcal{E}$, and let L denote the collection of all morphisms g of $\mathcal{E}$ such that $U(g)$ is an isomorphism in $\mathcal{C}$. We then have a commutative diagram of pullback squares 04EM

$$\begin{tikzcd}
\mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C}) \arrow[r] \arrow[d] & \mathrm{Cospan}^{L,R}(\mathcal{E}) \arrow[r] \arrow[d] & \mathrm{Cospan}^{\mathrm{all},R}(\mathcal{E}) \arrow[d] \\
\mathcal{C}^{\mathrm{op}} \arrow[r, "\rho_{-}"] & \mathrm{Cospan}^{\mathrm{iso},\mathrm{all}}(\mathcal{C}) \arrow[r] & \mathrm{Cospan}(\mathcal{C}),
\end{tikzcd}$$

where the vertical map in the middle is a cartesian fibration (Lemma 8.6.3.6), and the horizontal map on the lower left is an equivalence of ∞-categories (Proposition 8.1.7.6). It follows that the projection map $\mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C}) \to \mathcal{C}^{\mathrm{op}}$ is a cartesian fibration of ∞-categories. Moreover, Corollary 4.5.2.29 implies that the inclusion $\mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C}) \hookrightarrow \mathrm{Cospan}^{L,R}(\mathcal{E})$ is an equivalence of ∞-categories.

Lemma 8.6.3.8. *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then the projection map $V : \mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C}) \to \mathcal{C}^{\mathrm{op}}$ is also a cartesian fibration. Moreover, an* 04EN *edge* $X \to Y$ *of* $\operatorname{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C})$ *is* V*-cartesian if and only if it corresponds to a cospan* $X \xrightarrow{\ell} B \xleftarrow{r} Y$ *in* $\mathcal{E}$*, where* r *is* U*-cocartesian and* ℓ *is an isomorphism in the* ∞*-category* $\{U(X)\} \times_{\mathcal{C}} \mathcal{E}$*.*

Proof. Using Proposition 5.1.4.7 and Remark 8.6.3.4, we can reduce to the case where $\mathcal{C} = \Delta^n$ is a standard simplex. In particular, $\mathcal{C}$ is an ∞-category. In this case, the desired result follows by combining Remark 8.6.3.7 with Lemma 8.6.3.6. □

04EX **Construction 8.6.3.9.** Let $\mathcal{C}$ be a simplicial set, and suppose we are given a pair of morphisms $U : \mathcal{E} \to \mathcal{C}$ and $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$. Let $T : \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \operatorname{Tw}(\mathcal{C}) \to \mathcal{E}$ be a morphism of simplicial sets for which the diagram

04EY
$$\begin{tikzcd}
\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \operatorname{Tw}(\mathcal{C}) \arrow[r, "T"] \arrow[d] & \mathcal{E} \arrow[d, "U"] \\
\operatorname{Tw}(\mathcal{C}) \arrow[r] & \mathcal{C}
\end{tikzcd} \tag{8.61}$$

is commutative. Let $\lambda_{+} : \operatorname{Tw}(\mathcal{E}^{\dagger}) \to \mathcal{E}^{\dagger}$ be the projection map of Notation 8.1.1.6 and let $\iota : \operatorname{Tw}(\mathcal{C}^{\mathrm{op}}) \xrightarrow{\sim} \operatorname{Tw}(\mathcal{C})$ be the isomorphism described in Remark 8.1.1.7. Then we can extend (8.61) to a commutative diagram

04EZ
$$\begin{tikzcd}
\operatorname{Tw}(\mathcal{E}^{\dagger}) \arrow[r, "(\lambda_{+}, \iota \circ \operatorname{Tw}(U^{\dagger}))"] \arrow[d, "\operatorname{Tw}(U^{\dagger})"] & \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \operatorname{Tw}(\mathcal{C}) \arrow[r, "T"] \arrow[d] & \mathcal{E} \arrow[d, "U"] \\
\operatorname{Tw}(\mathcal{C}^{\mathrm{op}}) \arrow[r, "\iota"] & \operatorname{Tw}(\mathcal{C}) \arrow[r] & \mathcal{C} .
\end{tikzcd} \tag{8.62}$$

Using Proposition 8.1.3.7, we can identify the outer rectangle with a diagram

04F0
$$\begin{tikzcd}
\mathcal{E}^{\dagger} \arrow[r] \arrow[d, "U^{\dagger}"] & \operatorname{Cospan}(\mathcal{E}) \arrow[d, "\operatorname{Cospan}(U)"] \\
\mathcal{C}^{\mathrm{op}} \arrow[r, "\rho_{-}"] & \operatorname{Cospan}(\mathcal{C}),
\end{tikzcd} \tag{8.63}$$

which we can identify with a comparison map $\Psi : \mathcal{E}^{\dagger} \to \operatorname{Cospan}(\mathcal{E}) \times_{\operatorname{Cospan}(\mathcal{C})} \mathcal{C}^{\mathrm{op}}$.

04F1 **Remark 8.6.3.10.** In the situation of Construction 8.6.3.9, the morphism Ψ can be described explicitly on low-dimensional simplices as follows:

- If X is a vertex of $\mathcal{E}^{\dagger}$ having image $C = U^{\dagger}(X)$, then $\Psi(X)$ is the vertex of $\mathrm{Cospan}(\mathcal{E})$ corresponding to the vertex $T(X, \mathrm{id}_C) \in \mathcal{E}$.

- Let X and Y be vertices of $\mathcal{E}^{\dagger}$, having images $C = U^{\dagger}(X)$ and $D = U^{\dagger}(Y)$. Let $f : X \to Y$ be an edge of $\mathcal{E}^{\dagger}$, and let us identify $U^{\dagger}(f)$ with an edge $e : D \to C$ in the simplicial set $\mathcal{C}$. Then $\Psi(f) : \Psi(X) \to \Psi(Y)$ is the edge of $\mathrm{Cospan}(\mathcal{E})$ corresponding to the pair of edges $T(X, \mathrm{id}_C) \xrightarrow{T(f, e_R)} T(Y, e) \xleftarrow{T(\mathrm{id}_Y, e_L)} T(Y, \mathrm{id}_D)$ in $\mathcal{E}$; here $e_L : \mathrm{id}_D \to e$ and $e_R : \mathrm{id}_C \to e$ denote the edges of $\mathrm{Tw}(\mathcal{C})$ described in Example 8.1.3.6.

We will deduce Proposition 8.6.3.5 from the following more precise result:

Proposition 8.6.3.11. *Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration, and let $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration. Suppose we are given a morphism $T : \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$ for which the diagram* 04F2

$$\begin{tikzcd}
\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r, "T"] \arrow[d] & \mathcal{E} \arrow[d, "U"] \\
\mathrm{Tw}(\mathcal{C}) \arrow[r] & \mathcal{C}
\end{tikzcd}$$

is commutative. The following conditions are equivalent:

(a) The morphism T exhibits $U^{\dagger}$ as a cartesian conjugate of U, in the sense of Definition 8.6.1.1.

(b) The comparison map Ψ of Construction 8.6.3.9 factors through the simplicial set $\mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C})$ of Notation 8.6.3.1, and the map $\mathcal{E}^{\dagger} \to \mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C})$ is an equivalence of cartesian fibrations over $\mathcal{C}$.

Proof. Using Proposition 5.1.7.15, we see that (b) is equivalent to the following three conditions:

(b_0) The map Ψ factors through the simplicial subset $\mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C}) \subseteq \mathrm{Cospan}(\mathcal{E}) \times_{\mathrm{Cospan}(\mathcal{C})} \mathcal{C}^{\mathrm{op}}$.

(b_1) Let $V : \mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C}) \to \mathcal{C}^{\mathrm{op}}$ be the cartesian fibration of Lemma 8.6.3.8. Then Ψ carries $U^{\dagger}$-cartesian edges of $\mathcal{E}^{\dagger}$ to V-cartesian edges of $\mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C})$.

(b_2) For each vertex $C \in \mathcal{C}$, the morphism Ψ restricts to an equivalence of ∞-categories

$$\Psi_C : \mathcal{E}^{\dagger}_C \to \mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C}) \times_{\mathcal{C}^{\mathrm{op}}} \{C\} = \mathrm{Cospan}^{\mathrm{all,iso}}(\mathcal{E}_C).$$

For every edge $e : D \to C$ of $\mathcal{C}$, let $e_L : \mathrm{id}_D \to e$ and $e_R : \mathrm{id}_C \to e$ denote the edges of $\mathrm{Tw}(\mathcal{C})$ described in Example 8.1.3.6. Using Remark 8.6.3.10, we can rewrite condition (b_0) as follows:

(b_0') Let Y be a vertex of $\mathcal{E}^{\dagger}$ having image $D = U^{\dagger}(Y)$ in $\mathcal{C}$, and let $e : C \to D$ be an edge of $\mathcal{C}$. Then $T(\mathrm{id}_Y, e_L) : T(Y, \mathrm{id}_D) \to T(Y, e)$ is a U-cocartesian edge of $\mathcal{E}$.

Similarly, by combining Remark 8.6.3.10 with the characterization of V-cartesian edges supplied by Lemma 8.6.3.8, we can rewrite condition (b_1) as follows:

(b_1') Let $f : X \to Y$ be a $U^{\dagger}$-cartesian edge of $\mathcal{E}^{\dagger}$, and let us identify $U^{\dagger}(f)$ with an edge $e : D \to C$ of $\mathcal{C}$. Then $T(f, e_R) : T(X, \mathrm{id}_C) \to T(Y, e)$ is an isomorphism in the ∞-category $\mathcal{E}_C$.

Unwinding the definitions, we observe that for each vertex $C \in \mathcal{C}$, the functor Ψ_C factors as a composition

$$\mathcal{E}^{\dagger}_C \xrightarrow{T_C} \mathcal{E}_C \hookrightarrow \mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{E}_C) \simeq \mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C}) \times_{\mathcal{C}^{\mathrm{op}}} \{C\},$$

where the second map is the equivalence of Proposition 8.1.7.6. We can therefore rewrite (b_2) as follows:

(b_2') For each vertex $C \in \mathcal{C}$, the morphism T restricts to an equivalence of ∞-categories $T_C : \mathcal{E}^{\dagger}_C \to \mathcal{E}_C$.

The equivalence of (a) and (b) now follows from Proposition 8.6.1.13. □

04F5 **Example 8.6.3.12.** Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories. Applying Construction 8.6.3.9 to the evaluation functor

$$\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E} \qquad (C, f_C, u : C \to C') \mapsto f_C(u),$$

we we obtain a comparison functor

$$\Psi : \mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \to \mathrm{Cospan}^{\dagger}(\mathcal{E} \,/\, \mathcal{C}).$$

It follows from Propositions 8.6.3.11 and 8.6.2.3 that this functor is an equivalence of ∞-categories.

Proof of Proposition 8.6.3.5. Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. Using Corollary 8.6.2.4, we can choose a cartesian fibration $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ and a morphism

$T : \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$ which exhibits $U^{\dagger}$ as a cartesian conjugate of U. Applying Proposition 8.6.3.11, we see that Construction 8.6.3.9 supplies a commutative diagram

$$\begin{tikzcd}
\mathcal{E}^{\dagger} \arrow[rr, "\Psi"] \arrow[dr, "U^{\dagger}"'] & & \mathrm{Cospan}^{\dagger}(\mathcal{E} / \mathcal{C}) \arrow[dl, "V"] \\
& \mathcal{C}^{\mathrm{op}}, &
\end{tikzcd}$$

where the horizontal map is an equivalence of cartesian fibrations over $\mathcal{C}^{\mathrm{op}}$. It follows that V is also a cartesian conjugate of U. □

Warning 8.6.3.13. Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. Proposition 8.6.3.5 guarantees the existence of a morphism 04F6

$$T : \mathrm{Cospan}^{\dagger}(\mathcal{E} / \mathcal{C}) \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$$

which exhibits the projection map $\mathrm{Cospan}^{\dagger}(\mathcal{E} / \mathcal{C}) \to \mathcal{C}^{\mathrm{op}}$ as a cartesian conjugate of U. Beware that the construction of T requires making some auxiliary choices. For example, if $\mathcal{C}$ is an ∞-category, then we can construct the datum T by choosing a homotopy inverse to the equivalence $\mathrm{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \mathcal{E}) \to \mathrm{Cospan}^{\dagger}(\mathcal{E} / \mathcal{C})$ of Example 8.6.3.12.

Corollary 8.6.3.14 (Uniqueness)**.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then U admits a cartesian conjugate, which is uniquely determined up equivalence.* 04F4

Proof. Combining Propositions 8.6.3.11 and 8.6.3.5, we see that a cartesian fibration $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ is conjugate to U if and only if it is equivalent to the projection map $\mathrm{Cospan}^{\dagger}(\mathcal{E} / \mathcal{C}) \to \mathcal{C}^{\mathrm{op}}$. □

We close this section with a simple application of Proposition 8.6.3.5.

Construction 8.6.3.15. Let e denote the nondegenerate edge of Δ^1, viewed as an object of the ∞-category $\mathrm{Tw}(\Delta^1)$. For every simplicial set $\mathcal{C}$, we let 05JL

$$\Xi : \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Cospan}(\mathrm{Tw}(\mathcal{C}))$$

denote the morphism of simplicial sets which corresponds, under the bijection of Proposition 8.1.3.7, to the composite map

$$\begin{aligned}
\mathrm{Tw}(\mathrm{Fun}(\Delta^1, \mathcal{C})) \quad & \simeq \quad \{e\} \times \mathrm{Tw}(\mathrm{Fun}(\Delta^1, \mathcal{C})) \\
& \hookrightarrow \quad \mathrm{Tw}(\Delta^1) \times \mathrm{Tw}(\mathrm{Fun}(\Delta^1, \mathcal{C})) \\
& \simeq \quad \mathrm{Tw}(\Delta^1 \times \mathrm{Fun}(\Delta^1, \mathcal{C})) \\
& \xrightarrow{\mathrm{Tw}(\mathrm{ev})} \quad \mathrm{Tw}(\mathcal{C}).
\end{aligned}$$

05JM **Remark 8.6.3.16.** Let $\mathcal{C}$ be a simplicial set and let

$$\lambda_- : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}} \qquad \lambda_+ : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}$$

be the projection maps of Notation 8.1.1.6. Then the morphism Ξ of Construction 8.6.3.15 fits into a commutative diagram

05JN
$$\begin{tikzcd}
\mathcal{C} \arrow[d, "\rho_-"] & \mathrm{Fun}(\Delta^1, \mathcal{C}) \arrow[l, "\mathrm{ev}_0"'] \arrow[r, "\mathrm{ev}_1"] \arrow[d, "\Xi"] & \mathcal{C} \arrow[d, "\rho_+"] \\
\mathrm{Cospan}(\mathcal{C}^{\mathrm{op}}) & \mathrm{Cospan}(\mathrm{Tw}(\mathcal{C})) \arrow[l, "\mathrm{Cospan}(\lambda_-)"'] \arrow[r, "\mathrm{Cospan}(\lambda_+)"] & \mathrm{Cospan}(\mathcal{C}),
\end{tikzcd} \tag{8.64}$$

where ρ_+ and ρ_- are the embeddings of Construction 8.1.7.1 and Variant 8.1.7.14. Moreover, the composition of Ξ with the diagonal map $\mathcal{C} \hookrightarrow \mathrm{Fun}(\Delta^1, \mathcal{C})$ is the unit map $\mathcal{C} \to \mathrm{Cospan}(\mathrm{Tw}(\mathcal{C}))$ of Construction 8.1.3.5.

In the situation of Remark 8.6.3.16, suppose that the simplicial set $\mathcal{C}$ is an ∞-category. Then the projection map $\lambda_- : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}}$ is a cocartesian fibration of ∞-categories, and a morphism u of $\mathrm{Tw}(\mathcal{C})$ is λ_--cocartesian if and only if $\lambda_+(u)$ is an isomorphism in $\mathcal{C}$ (Corollary 8.1.1.14). Using the commutativity of the diagram (8.64), we see that the morphism Ξ factors through the simplicial subset $\mathrm{Cospan}^{\dagger}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}) \subseteq \mathrm{Cospan}(\mathrm{Tw}(\mathcal{C}))$ of Notation 8.6.3.1. In this case, we have the following:

05JP **Proposition 8.6.3.17.** *Let $\mathcal{C}$ be an ∞-category. Then the morphism $\Xi : \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Cospan}^{\dagger}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}})$ is an equivalence of ∞-categories.*

Proof. Let $V : \mathrm{Cospan}^{\dagger}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}) \to \mathcal{C}$ be the projection map. It follows from Lemma 8.6.3.8 (and Corollary 8.1.1.14) that V is a cartesian fibration, and that a morphism in $\mathrm{Cospan}^{\dagger}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}})$ is V-cartesian if and only if its image under the composite map

$$\mathrm{Cospan}^{\dagger}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}) \hookrightarrow \mathrm{Cospan}(\mathrm{Tw}(\mathcal{C})) \xrightarrow{\mathrm{Cospan}(\lambda_+)} \mathrm{Cospan}(\mathcal{C})$$

is contained in $\mathrm{Cospan}^{\mathrm{iso,all}}(\mathcal{C})$. Recall that the evaluation functor $\mathrm{ev}_0 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathcal{C}$ is also a cartesian fibration, and that a morphism f of $\mathrm{Fun}(\Delta^1, \mathcal{C})$ is ev_0-cartesian if and only if $\mathrm{ev}_1(f)$ is an isomorphism in $\mathcal{C}$ (Corollary 5.3.7.3). Invoking Remark 8.6.3.16, we obtain a commutative diagram

$$\begin{tikzcd}
\mathrm{Fun}(\Delta^1, \mathcal{C}) \arrow[rr, "\Xi"] \arrow[dr, "\mathrm{ev}_0"'] & & \mathrm{Cospan}^{\dagger}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}) \arrow[dl, "V"] \\
& \mathcal{C}, &
\end{tikzcd}$$

where Ξ carries ev_0-cartesian morphisms of the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$ to V-cartesian morphisms of the ∞-category $\mathrm{Cospan}^{\dagger}(\mathrm{Tw}(\mathcal{C}), \mathcal{C}^{\mathrm{op}})$. By virtue of Proposition 5.1.7.15, it will suffice to show that for each object $X \in \mathcal{C}$, the functor Ξ restricts to an equivalence of fibers

$$\Xi_X : \{X\} \tilde{\times}_{\mathcal{C}} \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \{X\} \times_{\mathcal{C}} \mathrm{Cospan}^{\dagger}(\mathrm{Tw}(\mathcal{C})/\,\mathcal{C}^{\mathrm{op}}) \simeq \mathrm{Cospan}^{\mathrm{all,iso}}(\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})).$$

We conclude by observing that Ξ_X fits into a commutative diagram

$$\begin{tikzcd}
\mathcal{C}_{X/} \arrow[rr] \arrow[d] & & \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[d, "\rho_+"] \\
\{X\} \otimes_{\mathcal{C}} \mathrm{Fun}(\Delta^1, \mathcal{C}) \arrow[r, "\Xi_X"] & \mathrm{Cospan}^{\mathrm{all,iso}}(\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})) &
\end{tikzcd}$$

where the left vertical map is the equivalence of Corollary 4.6.4.18, the right vertical map is the equivalence of Proposition 8.1.7.6, and the upper horizontal map is the equivalence of Proposition 8.1.2.9. □

Corollary 8.6.3.18. *Let $\mathcal{C}$ be an ∞-category. Then the evaluation map* $\mathrm{ev}_0 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathcal{C}$ *is a cartesian conjugate of the cocartesian fibration $\lambda_- : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}^{\mathrm{op}}$.* 05JQ

Proof. Combine Propositions 8.6.3.17 and 8.6.3.5. □

8.6.4 Dual Fibrations

Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. Corollary 8.6.3.14 asserts that U admits a cartesian conjugate $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$, which is uniquely determined up to equivalence. Setting $\mathcal{E}^{\vee} = \mathcal{E}^{\dagger,\mathrm{op}}$ and $U^{\vee} = U^{\dagger,\mathrm{op}}$, we obtain another cocartesian fibration $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$. Our goal in this section is to give a direct characterization of the relationship between U and $U^{\vee}$, which does not rely on the theory of conjugate fibrations developed in §8.6.1 and §8.6.2. To fix ideas, let us begin by considering the case $\mathcal{C} = \Delta^0$. In this case, the conjugate fibration $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ is characterized by the requirement that the ∞-category $\mathcal{E}^{\dagger}$ is equivalent to $\mathcal{E}$. Consequently, the cocartesian fibration $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ is characterized by the requirement that $\mathcal{E}^{\vee}$ is equivalent to the opposite ∞-category $\mathcal{E}^{\mathrm{op}}$. By virtue of Corollary 8.2.6.6, this is equivalent to the existence of a *balanced coupling* $\lambda : \widetilde{\mathcal{E}} \to \mathcal{E}^{\vee} \times \mathcal{E}$: that is, a left fibration which satisfies the following addition conditions: 04D0

- For every object $X \in \mathcal{E}$, there exists an object $\widetilde{X} \in \widetilde{\mathcal{E}}$ satisfying $\lambda_+(\widetilde{X}) = X$ which is *universal*: that is, it is an initial object of the ∞-category $\widetilde{\mathcal{E}} \times_{\mathcal{E}} \{X\}$.
- For every object $X^{\vee} \in \mathcal{E}^{\vee}$, there exists an object $\widetilde{X} \in \widetilde{\mathcal{E}}$ satisfying $\lambda_-(\widetilde{X}) = X^{\vee}$ which is *couniversal*: that is, it is an initial object of the ∞-category $\{X^{\vee}\} \times_{\mathcal{E}^{\vee}} \widetilde{\mathcal{E}}$.

- An object of $\widetilde{\mathcal{E}}$ is universal if and only if it is couniversal.

We now extend the notion of balanced coupling to the relative setting.

04D1 **Definition 8.6.4.1.** Let $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ be cocartesian fibrations of simplicial sets, and let $\lambda = (\lambda_{-}, \lambda_{+}) : \widetilde{\mathcal{E}} \to \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E}$ be a left fibration of simplicial sets. We will say that λ *exhibits* $U^{\vee}$ *as a cocartesian dual of* U if the following conditions are satisfied:

(a) For every vertex $C \in \mathcal{C}$, the left fibration

$$\lambda_C : \widetilde{\mathcal{E}}_C \to \mathcal{E}^{\vee}_C \times \mathcal{E}_C$$

is a balanced coupling of ∞-categories.

(b) Let $\widetilde{U} : \widetilde{\mathcal{E}} \to \mathcal{C}$ denote the projection map $U^{\vee} \circ \lambda_{-} = U \circ \lambda_{+}$, $f : \widetilde{X} \to \widetilde{X}'$ be a $\widetilde{U}$-cocartesian edge of $\widetilde{\mathcal{E}}$, and let $e : C \to C'$ be its image $\widetilde{U}(f)$ in the simplicial set $\mathcal{C}$. If the object $\widetilde{X} \in \widetilde{\mathcal{E}}_C$ is universal for the coupling λ_C, then the object $\widetilde{X}' \in \widetilde{\mathcal{E}}_{C'}$ is universal for the coupling $\lambda_{C'}$.

We say that $U^{\vee}$ *is a cocartesian dual of* U if there exists a left fibration $\lambda : \widetilde{\mathcal{E}} \to \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E}$ which exhibits $U^{\vee}$ as a cocartesian dual of U.

04D2 **Example 8.6.4.2.** Let $\mathcal{E}$ and $\mathcal{E}^{\vee}$ be ∞-categories, and let $U : \mathcal{E} \to \Delta^0$ and $U^{\vee} : \mathcal{E}^{\vee} \to \Delta^0$ denote the projection maps. Then a left fibration $\widetilde{\mathcal{E}} \to \mathcal{E}^{\vee} \times_{\Delta^0} \mathcal{E} = \mathcal{E}^{\vee} \times \mathcal{E}$ exhibits $U^{\vee}$ as a cocartesian dual of U if and only if it is a balanced coupling. In particular, $U^{\vee}$ is a cocartesian dual of U if and only if $\mathcal{E}^{\vee}$ is equivalent to the opposite ∞-category $\mathcal{E}^{\mathrm{op}}$ (Corollary 8.2.6.6).

04D3 **Remark 8.6.4.3** (Symmetry)**.** Let $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ be cocartesian fibrations of simplicial sets. Then a left fibration $\lambda = \widetilde{\mathcal{E}} \to \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E}$ exhibits $U^{\vee}$ as a cocartesian dual of U if and only if it exhibits U as a cocartesian dual of $U^{\vee}$, after identifying $\mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E}$ with $\mathcal{E} \times_{\mathcal{C}} \mathcal{E}^{\vee}$. In particular, $U^{\vee}$ is a cocartesian dual of U if and only if U is a cocartesian dual of $U^{\vee}$.

04D4 **Remark 8.6.4.4** (Base Change)**.** Let $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ be cocartesian fibrations of simplicial sets and $\lambda : \widetilde{\mathcal{E}} \to \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E}$ be a left fibration. The following conditions are equivalent:

(a) The left fibration λ exhibits $U^{\vee}$ as a cocartesian dual of U (in the sense of Definition 8.6.4.1).

(*b*) For every morphism of simplicial sets $\mathcal{C}_0 \to \mathcal{C}$, form a diagram of pullback squares

$$\begin{tikzcd}
\mathcal{E}_0^{\vee} \arrow[r, "U_0^{\vee}"] \arrow[d] & \mathcal{C}' \arrow[d] & \mathcal{E}_0 \arrow[l, "U_0"'] \arrow[d] \\
\mathcal{E} \arrow[r, "U^{\vee}"] & \mathcal{C} & \mathcal{E} . \arrow[l, "U"']
\end{tikzcd}$$

Then the induced map

$$\lambda_0 : (\mathcal{C}_0 \times_{\mathcal{C}} \widetilde{\mathcal{E}}) \to \mathcal{E}_0^{\vee} \times_{\mathcal{C}_0} \mathcal{E}_0$$

exhibits $U_0^{\vee}$ as a cocartesian dual of U_0.

Moreover, it suffices to verify condition (*b*) in the special case where $\mathcal{C}_0 = \Delta^1$ is the standard 1-simplex.

Remark 8.6.4.5. Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets, and let $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ be a cocartesian dual of U. Then, for every morphism of simplicial sets $\mathcal{C}_0 \to \mathcal{C}$, the projection map $U_0^{\vee} : \mathcal{C}_0 \times_{\mathcal{C}} \mathcal{E}^{\vee} \to \mathcal{C}_0$ is a cocartesian dual of the projection map $U_0 : \mathcal{C}_0 \times_{\mathcal{C}} \mathcal{E} \to \mathcal{C}_0$. In particular, for every object $C \in \mathcal{C}$, the ∞-category $\mathcal{E}_C^{\vee} = \{C\} \times_{\mathcal{C}} \mathcal{E}^{\vee}$ is equivalent to the opposite of the ∞-category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ (Example 8.6.4.2). 04D5

Remark 8.6.4.6. Let $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$. In §8.6.6, we will show that $U^{\vee}$ is a cocartesian dual of U (in the sense of Definition 8.6.4.1) if and only if the opposite fibration $U^{\vee,\mathrm{op}} : \mathcal{E}^{\vee,\mathrm{op}} \to \mathcal{C}^{\mathrm{op}}$ is a cartesian conjugate of U (in the sense of Definition 8.6.1.1). See Proposition 8.6.6.1. 04D6

Let $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ be cocartesian fibrations of simplicial sets, and let $\lambda : \widetilde{\mathcal{E}} \to \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E}$ be a left fibration. Condition (*a*) of Definition 8.6.4.1 guarantees that, for each vertex $C \in \mathcal{C}$, the coupling $\lambda_C : \widetilde{\mathcal{E}}_C \to \mathcal{E}_C^{\vee} \times_{\mathcal{C}} \mathcal{E}_C$ is representable by an equivalence of ∞-categories $G_C : \mathcal{E}_C \to (\mathcal{E}_C^{\vee})^{\mathrm{op}}$ (Theorem 8.2.6.5). Heuristically, one can think of condition (*b*) as requiring that the equivalence G_C depends functorially on C. We can articulate this heuristic more precisely as follows:

Proposition 8.6.4.7. *Let $U : \mathcal{E} \to \Delta^1$ and $U^{\vee} : \mathcal{E}^{\vee} \to \Delta^1$ be cocartesian fibrations of ∞-categories, and let $F : \mathcal{E}_0 \to \mathcal{E}_1$ and $F^{\vee} : \mathcal{E}_0^{\vee} \to \mathcal{E}_1^{\vee}$ be functors given by covariant transport along the nondegenerate edge of Δ^1. Let $\lambda = (\lambda_-, \lambda_+) : \widetilde{\mathcal{E}} \to \mathcal{E}^{\vee} \times_{\Delta^1} \mathcal{E}$ be a left fibration, and suppose that the associated couplings* 04D7

$$\lambda_0 : \widetilde{\mathcal{E}}_0 \to \mathcal{E}_0^{\vee} \times \mathcal{E}_0 \qquad \lambda_1 : \widetilde{\mathcal{E}}_1 \to \mathcal{E}_1^{\vee} \times \mathcal{E}_1$$

are representable by functors $G_0 : \mathcal{E}_0 \to (\mathcal{E}_0^\vee)^{\mathrm{op}}$ *and* $G_1 : \mathcal{E}_1 \to (\mathcal{E}_1^\vee)^{\mathrm{op}}$*, respectively. If* λ *satisfies condition* (b) *of Definition 8.6.4.1, then the diagram of* ∞*-categories*

04D8
$$\begin{tikzcd} \mathcal{E}_0 \arrow[r, "F"] \arrow[d, "G_0"] & \mathcal{E}_1 \arrow[d, "G_1"] \\ (\mathcal{E}_0^\vee)^{\mathrm{op}} \arrow[r, "(F^\vee)^{\mathrm{op}}"] & (\mathcal{E}_1^\vee)^{\mathrm{op}} \end{tikzcd} \tag{8.65}$$

commutes up to isomorphism.

Proof. Let $\widetilde{U}$ denote the composite map

$$\widetilde{\mathcal{E}} \xrightarrow{\lambda} \mathcal{E}^\vee \times_{\Delta^1} \mathcal{E} \to \Delta^1.$$

Using Proposition 5.1.4.13, we see that λ is a cocartesian fibration, and that an edge e of $\widetilde{\mathcal{E}}$ is $\widetilde{U}$-cocartesian if and only if $\lambda_+(e)$ is a U-cocartesian edge of $\mathcal{E}$ and $\lambda_-(e)$ is a $U^\vee$-cocartesian edge of $\mathcal{E}^\vee$. Let $\widetilde{F} : \widetilde{\mathcal{E}}_0 \to \widetilde{\mathcal{E}}_1$ be given by covariant transport along the nondegenerate edge of Δ^1. Using Remark 5.2.8.5, we see that the diagram of ∞-categories

04D9
$$\begin{tikzcd} \widetilde{\mathcal{E}}_0 \arrow[r, "\widetilde{F}"] \arrow[d, "\lambda_0"] & \widetilde{\mathcal{E}}_1 \arrow[d, "\lambda_1"] \\ \mathcal{E}_0^\vee \times \mathcal{E}_0 \arrow[r, "F^\vee \times F"] & \mathcal{E}_1^\vee \times \mathcal{E}_1 \end{tikzcd} \tag{8.66}$$

commutes up to isomorphism. Since λ_1 is an isofibration, we can replace $\widetilde{F}$ by an isomorphic functor to arrange that the diagram (8.66) is strictly commutative (see Corollary 4.4.5.6). Condition (b) of Definition 8.6.4.1 guarantees that the functor $\widetilde{F}$ carries universal objects of $\widetilde{\mathcal{E}}_0$ (for the coupling λ_0) to universal objects of $\widetilde{\mathcal{E}}_1$ (for the coupling λ_1). The commutativity of the diagram (8.65) now follows from Corollary 8.2.4.4. □

04DA **Corollary 8.6.4.8.** *Let* $U : \mathcal{E} \to \mathcal{C}$ *and* $U^\vee : \mathcal{E}^\vee \to \mathcal{C}$ *be cocartesian fibrations of simplicial sets having homotopy transport representations*

$$\mathrm{hTr}_{\mathcal{E}/\mathcal{C}}, \mathrm{hTr}_{\mathcal{E}^\vee/\mathcal{C}} : \mathrm{h}\mathcal{C} \to \mathrm{hQCat},$$

and let $\mathrm{hTr}^{\mathrm{op}}_{\mathcal{E}^\vee/\mathcal{C}}$ *denote the functor* $C \mapsto \mathrm{hTr}_{\mathcal{E}^\vee/\mathcal{C}}(C)^{\mathrm{op}} = (\mathcal{E}^\vee_C)^{\mathrm{op}}$*. Let* $\lambda : \widetilde{\mathcal{E}} \to \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ *be a left fibration such that, for each vertex* $C \in \mathcal{C}$*, the coupling* $\lambda_C : \widetilde{\mathcal{E}}_C \to \mathcal{E}^\vee_C \times \mathcal{E}_C$ *is representable by a functor* $G_C : \mathcal{E}_C \to (\mathcal{E}^\vee_C)^{\mathrm{op}}$*. if* λ *satisfies condition* (b) *of Definition 8.6.4.1, then the construction* $C \mapsto [G_C]$ *determines a natural transformation of functors* $\mathrm{hTr}_{\mathcal{E}/\mathcal{C}} \to \mathrm{hTr}^{\mathrm{op}}_{\mathcal{E}^\vee/\mathcal{C}}$.

Corollary 8.6.4.9. *Let $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ be cocartesian fibrations of simplicial sets having homotopy transport representations* 04DB

$$\mathrm{hTr}_{\mathcal{E}/\mathcal{C}}, \mathrm{hTr}_{\mathcal{E}^{\vee}/\mathcal{C}} : \mathrm{h}\mathcal{C} \to \mathrm{hQCat}.$$

Let $\lambda : \widetilde{\mathcal{E}} \to \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E}$ be a left fibration which exhibits $U^{\vee}$ as a cocartesian dual of U. Then λ induces an isomorphism of functors $\mathrm{hTr}_{\mathcal{E}/\mathcal{C}} \xrightarrow{\sim} \mathrm{hTr}^{\mathrm{op}}_{\mathcal{E}^{\vee}/\mathcal{C}}$, which carries each vertex $C \in \mathcal{C}$ to (the isomorphism class of) a functor which represents the balanced coupling $\lambda_C : \widetilde{\mathcal{E}}_C \to \mathcal{E}^{\vee}_C \times \mathcal{E}_C$.

Proof. Combine Corollary 8.6.4.8 with Theorem 8.2.6.5. □

Corollary 8.6.4.10. *Let $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ be cocartesian fibrations of simplicial sets having homotopy transport representations* 04DC

$$\mathrm{hTr}_{\mathcal{E}/\mathcal{C}}, \mathrm{hTr}_{\mathcal{E}^{\vee}/\mathcal{C}} : \mathrm{h}\mathcal{C} \to \mathrm{hQCat}.$$

If $U^{\vee}$ is a cocartesian dual of U, then $\mathrm{hTr}_{\mathcal{E}^{\vee}/\mathcal{C}}$ is isomorphic to the functor

$$\mathrm{hTr}^{\mathrm{op}}_{\mathcal{E}/\mathcal{C}} : \mathrm{h}\mathcal{C} \to \mathrm{hQCat} \qquad C \mapsto \mathcal{E}^{\mathrm{op}}_C .$$

Remark 8.6.4.11. In §8.6.7, we will prove a stronger version of Corollary 8.6.4.10, which gives a reformulation of cocartesian duality in the language of transport representations (see Proposition 8.6.7.12). 04DD

For some applications, it will be convenient to work with a reformulation of Definition 8.6.4.1.

Definition 8.6.4.12. Let $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ be cocartesian fibrations of simplicial sets. We say that a morphism of simplicial sets $\mathscr{K} : \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}$ *exhibits $U^{\vee}$ as a cocartesian dual of U* if the following conditions are satisfied: 04DE

(a) For each vertex $C \in \mathcal{C}$, the induced map $\mathscr{K}_C : \mathcal{E}^{\vee}_C \times \mathcal{E}_C \to \mathcal{S}$ is a balanced profunctor (see Definition 8.3.2.18).

(b) Let $f : X \to Y$ be a U-cocartesian edge of $\mathcal{E}$ and let $f^{\vee} : X^{\vee} \to Y^{\vee}$ be a $U^{\vee}$-cocartesian edge of $\mathcal{E}^{\vee}$ having the same image $e : C \to D$ in $\mathcal{C}$. Then the map of Kan complexes

$$\mathscr{K}(f^{\vee}, f) : \mathscr{K}_C(X^{\vee}, X) \to \mathscr{K}_D(Y^{\vee}, Y)$$

carries universal vertices of $\mathscr{K}_C(X^{\vee}, X))$ to universal vertices of $\mathscr{K}_D(Y^{\vee}, Y)$ (see Definition 8.3.2.7).

04DF **Variant 8.6.4.13.** Let $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ be cocartesian fibrations of simplicial sets. In the formulation of Definition 8.6.4.12, we have implicitly assumed that for each vertex $C \in \mathcal{C}$, the ∞-categories $\mathcal{E}_C$ and $\mathcal{C}^{\vee}_C$ are locally small (if this condition is not satisfied, then a balanced profunctor $\mathscr{K}_C : \mathcal{E}^{\vee}_C \times \mathcal{E}_C \to \mathcal{S}$ cannot exist). However, we will sometimes apply the theory of cocartesian duality in situations where this condition is not satisfied. If κ is an uncountable cardinal (not necessarily small), we will say that a morphism $\mathscr{K} : \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$ *exhibits* $U^{\vee}$ *as a cocartesian dual of* U if it satisfies conditions (a) and (b) of Definition 8.6.4.12. In this case, we can take κ to be any uncountable cardinal having the property that, for each vertex $C \in \mathcal{C}$, the ∞-categories $\mathcal{E}_C$ and $\mathcal{E}^{\vee}_C$ are locally κ-small.

04DG **Remark 8.6.4.14.** Let $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ be cocartesian fibrations of simplicial sets, let $\lambda : \widetilde{\mathcal{E}} \to \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E}$ be a left fibration, and let $\mathscr{K} : \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$ be a covariant transport representation for λ. Then λ exhibits $U^{\vee}$ as a cocartesian dual of U (in the sense of Definition 8.6.4.1) if and only if $\mathscr{K}$ exhibits $U^{\vee}$ as a cocartesian dual of U (in the sense of Variant 8.6.4.13). See Remarks 8.3.2.19 and 8.3.2.8.

Combining Remark 8.6.4.14 with the classification of left fibrations (Corollary 5.6.0.6), we obtain the following:

04DH **Proposition 8.6.4.15.** *Let $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ be cocartesian fibrations of ∞-categories. Let κ be an uncountable cardinal with the property that, for each vertex $C \in \mathcal{C}$, the ∞-categories $\mathcal{E}_C$ and $\mathcal{E}^{\vee}_C$ are locally κ-small. Then $U^{\vee}$ is a cocartesian dual of U if and only if there exists a morphism $\mathscr{K} : \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$ which exhibits $U^{\vee}$ as a cocartesian dual of U, in the sense of Definition 8.6.4.12.*

We now give some examples of cocartesian duality.

04DJ **Proposition 8.6.4.16.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a left fibration of simplicial sets, and set $\widetilde{\mathcal{E}} = \mathcal{C} \times_{\operatorname{Fun}(\Delta^1, \mathcal{E})} \operatorname{Fun}(\Delta^1, \mathcal{E})$. Then the evaluation maps $\mathrm{ev}_0, \mathrm{ev}_1 : \widetilde{\mathcal{E}} \to \mathcal{E}$ determine a left fibration $\lambda : \widetilde{\mathcal{E}} \to \mathcal{E} \times_{\mathcal{C}} \mathcal{E}$ which exhibits U as a cocartesian dual of itself.*

Proof. The morphism λ is a pullback of the restriction map

$$\operatorname{Fun}(\Delta^1, \mathcal{E}) \to \operatorname{Fun}(\partial \Delta^1, \mathcal{E}) \times_{\operatorname{Fun}(\partial \Delta^1, \mathcal{C})} \operatorname{Fun}(\Delta^1, \mathcal{C}),$$

and is therefore a left fibration by virtue of Proposition 4.2.5.1. For every vertex $C \in \mathcal{C}$, we can identify λ_C with the coupling

$$\operatorname{Fun}(\Delta^1, \mathcal{E}_C) \to \operatorname{Fun}(\{0\}, \mathcal{E}_C) \times \operatorname{Fun}(\{1\}, \mathcal{E}_C).$$

It follows from Example 8.2.6.3 that each λ_C is a balanced coupling, so that λ satisfies condition (a) of Definition 8.6.4.1. Moreover, every object of $\operatorname{Fun}(\Delta^1, \mathcal{E}_C)$ is universal for the coupling λ_C, so that condition (b) of Definition 8.6.4.1 is vacuous. □

Corollary 8.6.4.17. *Let $U : \mathcal{E} \to \mathcal{C}$ be a left fibration of simplicial sets. Then U is a cocartesian dual of itself.* 04DK

Example 8.6.4.18. In the special case $\mathcal{C} = \Delta^0$, Corollary 8.6.4.17 asserts that every Kan complex $X = \mathcal{E}$ is homotopy equivalent to the opposite Kan complex X^{op}. This can also be deduced from Theorem 3.6.0.1, since the geometric realizations $|X|$ and $|X^{\mathrm{op}}|$ are homeomorphic. 04DL

Proposition 8.6.4.19. *Let $\mathcal{C}$ be a category, let $\mathscr{F} : \mathcal{C} \to \mathbf{Cat}$ be a functor of 2-categories, and let $\mathscr{F}' : \mathcal{C} \to \mathbf{Cat}$ be the functor given on objects by $C \mapsto \mathscr{F}(C)^{\mathrm{op}}$. Then (the nerves of) the fibrations* 04DM

$$\int_{\mathcal{C}} \mathscr{F} \to \mathcal{C} \qquad \int_{\mathcal{C}} \mathscr{F}' \to \mathcal{C}$$

are cocartesian dual to one another.

We will deduce Proposition 8.6.4.19 from a more precise result. To formulate it, we need to introduce a bit of notation.

Construction 8.6.4.20. Let $\mathcal{C}$ be a category, let $\mathscr{F} : \mathcal{C} \to \mathbf{Cat}$ be a functor of 2-categories, and let $\int_{\mathcal{C}} \mathscr{F}$ denote the category of elements of $\mathscr{F}$ (Definition 5.6.1.1); we identify objects of $\int_{\mathcal{C}} \mathscr{F}$ with pairs (C, X), where C is an object of $\mathcal{B}$ and X is an object of the category $\mathscr{F}(C)$. Let $\mathscr{F}' : \mathcal{C} \to \mathbf{Cat}$ denote the functor given on objects by $\mathscr{F}'(C) = \mathscr{F}(C)^{\mathrm{op}}$. We define a functor 04DN

$$\mathscr{K} : \int_{\mathcal{C}} \mathscr{F}' \times_{\mathcal{C}} \int_{\mathcal{C}} \mathscr{F} \to \mathrm{Set}$$

as follows:

- On objects, $\mathscr{K}$ is given by the formula $\mathscr{K}((C, X'), (C, X)) = \mathrm{Hom}_{\mathscr{F}(C)}(X', X)$.
- Let $f : (C, X) \to (D, Y)$ be a morphism in the category $\int_{\mathcal{C}} \mathscr{F}$ and let $f' : (C, X') \to (D, Y')$ be a morphism in the category $\int_{\mathcal{C}} \mathscr{F}'$ having the same image $u : C \to D$ in $\mathcal{B}$. Let us identify f and f' with morphisms $g : \mathscr{F}(u)(X) \to Y$ and $g' : Y' \to \mathscr{F}(u)(Y)$ in the category $\mathscr{F}(D)$. Then the function $\mathscr{K}(f', f) : \mathscr{K}((C, X'), (C, X)) \to \mathscr{K}((D, Y'), (D, Y))$ is given by the composition

$$\mathrm{Hom}_{\mathscr{F}(C)}(X', X) \xrightarrow{\mathscr{F}(u)} \mathrm{Hom}_{\mathscr{F}(D)}(\mathscr{F}(u)(X'), \mathscr{F}(u)(X)) \xrightarrow{g \circ \bullet \circ g'} \mathrm{Hom}_{\mathscr{F}(D)}(Y', Y).$$

Proposition 8.6.4.21. *Let $\mathcal{C}$ be a category and let $\mathscr{F} : \mathcal{C} \to \mathbf{Cat}$ be a functor of 2-categories. Then the functor* 04DP

$$\mathrm{N}_{\bullet}(\mathscr{K}) : \mathrm{N}_{\bullet}(\int_{\mathcal{C}} \mathscr{F}') \times_{\mathrm{N}_{\bullet}(\mathcal{C})} \mathrm{N}_{\bullet}(\int_{\mathcal{C}} \mathscr{F}) \to \mathrm{N}_{\bullet}(\mathrm{Set}) \subset \mathcal{S}$$

of Construction 8.6.4.20 exhibits the projection map $U' : \mathrm{N}_{\bullet}(\int_{\mathcal{C}} \mathscr{F}') \to \mathrm{N}_{\bullet}(\mathcal{C})$ as a cocartesian dual of the projection map $U : \mathrm{N}_{\bullet}(\int_{\mathcal{C}} \mathscr{F}) \to \mathrm{N}_{\bullet}(\mathcal{C})$.

Proof. For each object $C \in \mathcal{C}$, the restriction of $\mathscr{K}$ to the fiber over C is given concretely by the functor

$$\mathscr{K}_C : \mathscr{F}(C)^{\mathrm{op}} \times \mathscr{F}(C) \to \mathrm{Set} \qquad (X', X) \mapsto \mathrm{Hom}_{\mathscr{F}(C)}(X', X).$$

Example 8.3.3.4 implies that $\mathrm{N}_\bullet(\mathscr{K}_C)$ is a Hom-functor for the ∞-category $\mathrm{N}_\bullet(\mathscr{F}(C))$ and is therefore a balanced profunctor (Proposition 8.3.3.8). Let $u : C \to D$ be a morphism in the category $\mathcal{C}$, and let $f : (C, X) \to (D, Y)$ and $f' : (C, X') \to (D, Y')$ be lifts of u to the categories $\int_{\mathcal{C}} \mathscr{F}$ and $\int_{\mathcal{C}} \mathscr{F}'$, respectively. We wish to show that, if f is U-cocartesian and f' is U'-cocartesian, then the induced map

$$\mathscr{K}(f, f') : \mathscr{K}_C(X', X) \to \mathscr{K}_D(Y', Y)$$

carries universal elements of $\mathscr{K}_C(X', X)$ to universal elements of $\mathscr{K}_D(Y', Y)$. Let us identify f and f' with morphisms $g : \mathscr{F}(u)(X) \to Y$ and $g' : Y' \to \mathscr{F}(u)(Y)$ in the category $\mathscr{F}(D)$, so that $\mathscr{K}(f', f)$ is given by the composition

$$\mathrm{Hom}_{\mathscr{F}(C)}(X', X) \xrightarrow{\mathscr{F}(u)} \mathrm{Hom}_{\mathscr{F}(D)}(\mathscr{F}(u)(X'), \mathscr{F}(u)(X)) \xrightarrow{g \circ - \circ g'} \mathrm{Hom}_{\mathscr{F}(D)}(Y', Y).$$

Our assumption that f is U-cocartesian guarantees that g is an isomorphism in the category $\mathscr{F}(D)$, and our assumption that f' is a U'-cocartesian guarantees that g' is an isomorphism in the category $\mathscr{F}(D)$. The desired result now follows from the observation that if $e : X' \to X$ is an isomorphism in the category $\mathscr{F}(C)$, then the composition $g \circ \mathscr{F}(u)(e) \circ g'$ is an isomorphism in the category $\mathscr{F}(D)$. □

Proof of Proposition 8.6.4.19. Combine Propositions 8.6.4.15 and 8.6.4.21. □

Let QCat be the (ordinary) category of ∞-categories, which we regard as a full subcategory of Set_Δ. If $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ is a functor of ordinary categories, we let $\mathrm{N}_\bullet^{\mathscr{F}}(\mathcal{C})$ denote the weighted nerve of Definition 5.3.3.1. According to Corollary 5.3.3.16, the projection map $U : \mathrm{N}_\bullet^{\mathscr{F}}(\mathcal{C}) \to \mathrm{N}_\bullet(\mathcal{C})$ is a cocartesian fibration, whose fiber over an object $C \in \mathcal{C}$ can be identified with the ∞-category $\mathscr{F}(C)$. In this situation, it is easy to construct a cocartesian dual of U:

04DQ **Proposition 8.6.4.22.** *Let $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ be a functor of ordinary categories, and let $\mathscr{F}' : \mathcal{C} \to \mathrm{QCat}$ denote the functor given on objects by $C \mapsto \mathscr{F}(C)^{\mathrm{op}}$. Then the fibrations*

$$\mathrm{N}_\bullet^{\mathscr{F}}(\mathcal{C}) \to \mathrm{N}_\bullet(\mathcal{C}) \leftarrow \mathrm{N}_\bullet^{\mathscr{F}'}(\mathcal{C})$$

are cocartesian dual to one another.

Proposition 8.6.4.22 is an immediate consequence of the following more precise result:

Proposition 8.6.4.23. *Let* $\mathscr{F} : \mathcal{C} \to \mathrm{QCat}$ *be a functor of ordinary categories and let* $\mathscr{F}', \mathrm{Tw}(\mathscr{F}) : \mathcal{C} \to \mathrm{QCat}$ *be the functors given on objects by the formulae* $\mathscr{F}'(C) = \mathscr{F}(C)^{\mathrm{op}}$ *and* $\mathrm{Tw}(\mathscr{F})(C) = \mathrm{Tw}(\mathscr{F}(C))$*. Then the tautological map* 04DR

$$\lambda = (\lambda_-, \lambda_+) : \mathrm{N}_\bullet^{\mathrm{Tw}(\mathscr{F})}(\mathcal{C}) \to \mathrm{N}_\bullet^{\mathscr{F}^{\mathrm{op}}}(\mathcal{C}) \times_{\mathrm{N}_\bullet(\mathcal{C})} \mathrm{N}_\bullet^{\mathscr{F}}(\mathcal{C})$$

exhibits the fibration $U^\vee : \mathrm{N}_\bullet^{\mathscr{F}'}(\mathcal{C}) \to \mathrm{N}_\bullet(\mathcal{C})$ *as a cocartesian dual of the fibration* $U : \mathrm{N}_\bullet^{\mathscr{F}}(\mathcal{C}) \to \mathrm{N}_\bullet(\mathcal{C})$*.*

Proof. For each object $C \in \mathcal{C}$, Proposition 8.1.1.11 guarantees that the morphism

$$\lambda_C : \mathrm{Tw}(\mathscr{F}(C)) \to \mathscr{F}(C)^{\mathrm{op}} \times \mathscr{F}(C)$$

is a left fibration of ∞-categories, which is a balanced coupling by virtue of Example 8.2.6.2. Applying Corollary 5.3.3.18, we deduce that λ is a left fibration of ∞-categories. Let $U : \mathrm{N}_\bullet^{\mathrm{Tw}(\mathscr{F})}(\mathcal{C}) \to \mathrm{N}_\bullet(\mathcal{C})$ denote the projection map, and let $f : X \to Y$ be a morphism in the ∞-category $\mathrm{N}_\bullet^{\mathrm{Tw}(\mathscr{F})}(\mathcal{C})$ having image $u : C \to D$ in $\mathcal{C}$. To complete the proof, it will suffice to show that if X is universal for the coupling λ_C and f is U-cocartesian, then Y is universal for the coupling λ_D. Our assumption that f is U-cocartesian guarantees that Y is isomorphic to the image of X under the functor $\mathrm{Tw}(\mathscr{F}(u)) : \mathrm{Tw}(\mathscr{F}(C)) \to \mathrm{Tw}(\mathscr{F}(D))$. The desired result now follows from Example 8.2.1.5, since the functor $\mathscr{F}(u)$ carries isomorphisms in the ∞-category $\mathscr{F}(C)$ to isomorphisms in the ∞-category $\mathscr{F}(D)$. □

8.6.5 Existence of Dual Fibrations

The goal of this section is to prove the following: 04DS

Theorem 8.6.5.1. *Let* $U : \mathcal{E} \to \mathcal{C}$ *be a cocartesian fibration of simplicial sets. Then* U *admits a cocartesian dual* $U^\vee : \mathcal{E}^\vee \to \mathcal{C}$*, which is uniquely determined up to equivalence.* 04DT

We will give the proof of Theorem 8.6.5.1 at the end of this section.

Corollary 8.6.5.2. *For every simplicial set* $\mathcal{C}$*, the formation of cocartesian duals induces a bijection* 04DU

$$\begin{tikzcd}
\{\text{Cocartesian fibrations } U : \mathcal{E} \to \mathcal{C}\}/\text{Equivalence} \arrow[d, "\theta"] \\
\{\text{Cocartesian fibrations } U^\vee : \mathcal{E}^\vee \to \mathcal{C}\}/\text{Equivalence.}
\end{tikzcd}$$

Proof. Theorem 8.6.5.1 implies that θ is well-defined, and Remark 8.6.4.3 implies that $\theta \circ \theta$ is the identity; in particular, θ is a bijection. □

04DV **Variant 8.6.5.3** (Cartesian Duality)**.** Let $U : \mathcal{E} \to \mathcal{C}$ and $U' : \mathcal{E}' \to \mathcal{C}$ be cartesian fibrations of simplicial sets. We say that U' *is a cartesian dual of* U if the cocartesian fibration $U'^{\mathrm{op}} : \mathcal{E}'^{\mathrm{op}} \to \mathcal{C}^{\mathrm{op}}$ is a cocartesian dual of $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \to \mathcal{C}^{\mathrm{op}}$. It follows from Theorem 8.6.5.1 that every cartesian fibration $U : \mathcal{E} \to \mathcal{C}$ admits a cartesian dual $U' : \mathcal{E} \to \mathcal{C}$ which is uniquely determined up to equivalence. Moreover, Corollary 8.6.4.10 implies that the (contravariant) homotopy transport representation of U' is given by the composition

$$\mathrm{h}\mathcal{C}^{\mathrm{op}} \xrightarrow{\mathrm{hTr}_{\mathcal{E}\,/\,\mathcal{C}}} \mathrm{hQCat} \xrightarrow{\mathcal{A} \mapsto \mathcal{A}^{\mathrm{op}}} \mathrm{hQCat}.$$

In particular, for every vertex $C \in \mathcal{C}$, the fiber $\mathcal{E}'_C\{C\} \times_{\mathcal{C}} \mathcal{E}'$ is equivalent to the opposite of the ∞-category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$.

04DW **Warning 8.6.5.4.** Let $U : \mathcal{E} \to \mathcal{C}$ be a morphism of simplicial sets which is both a cartesian fibration and a cocartesian fibration. Then U admits a both a cocartesian dual $U' : \mathcal{E}' \to \mathcal{C}$ and a cartesian dual $U'' : \mathcal{E}'' \to \mathcal{C}$. For every vertex $C \in \mathcal{C}$, there are equivalences of ∞-categories $\mathcal{E}'_C \simeq \mathcal{E}_C^{\mathrm{op}} \simeq \mathcal{E}''_C$. Beware that the fibrations U' and U'' are generally not equivalent to one another (see Example 8.6.5.5).

04DX **Example 8.6.5.5.** Let $U : \mathcal{E} \to \Delta^1$ be a cocartesian fibration of ∞-categories. By virtue of Remark 5.2.4.3, the cocartesian fibration U can be recovered (up to equivalence) from its homotopy transport representation, which we can identify with the functor $F : \mathcal{E}_0 \to \mathcal{E}_1$ given by covariant transport along the nondegenerate edge of Δ^1. The fibration U then a cocartesian dual $U' : \mathcal{E}' \to \Delta^1$, whose covariant transport functor can be identified with the composition

$$\mathcal{E}'_0 \simeq \mathcal{E}_0^{\mathrm{op}} \xrightarrow{F^{\mathrm{op}}} \mathcal{E}_1^{\mathrm{op}} \simeq \mathcal{E}'_1$$

(Corollary 8.6.4.10). Applying Proposition 6.2.3.5, we deduce the following:

(a) The cocartesian fibration U is a cartesian fibration if and only if the functor $F : \mathcal{E}_0 \to \mathcal{E}_1$ admits a right adjoint.

(b) The cocartesian fibration U' is a cartesian fibration if and only if the functor $F^{\mathrm{op}} : \mathcal{E}_0^{\mathrm{op}} \to \mathcal{E}_1^{\mathrm{op}}$ admits a right adjoint: that is, if and only if the functor F admits a left adjoint.

Note that conditions (a) and (b) are not equivalent. If (a) is satisfied and (b) is not, then U admits a cartesian dual $U'' : \mathcal{E}'' \to \Delta^1$ which cannot be equivalent to U' (since U'' is a cartesian fibration and U' is not).

Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. Theorem 8.6.5.1 implies that U admits a cocartesian dual $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$. To prove this, it will be convenient to use the formulation of cocartesian duality supplied by Definition 8.6.4.12. In the special case where $\mathcal{C} = \Delta^0$ and $\mathcal{E}$ is locally small, we wish to show that there exists an ∞-category $\mathcal{E}^{\vee}$ and a balanced profunctor $\mathscr{K} : \mathcal{E}^{\vee} \times \mathcal{E} \to \mathcal{S}$. This is a special case of Corollary 8.3.2.21: in fact, we can take $\mathcal{E}^{\vee}$ to be the ∞-category $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E}, \mathcal{S})$ of corepresentable functors from $\mathcal{E}$ to $\mathcal{S}$, and $\mathscr{K}$ to be the evaluation functor

$$\mathrm{ev} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E}, \mathcal{S}) \times \mathcal{E} \to \mathcal{S} \qquad (\mathscr{F}, X) \mapsto \mathscr{F}(X).$$

To handle the general case we will use a variant of this construction, defined using the relative exponential introduced in §4.5.9.

Construction 8.6.5.6. Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets, let κ be an uncountable cardinal, and let let $\mathcal{S}^{<\kappa}$ denote the ∞-category of essentially κ-small spaces. We let $\mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ denote the relative exponential of Construction 4.5.9.1. By construction, we can identify vertices of $\mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ with pairs $(C, \mathscr{F}_C)$, where C is a vertex of $\mathcal{C}$ and $\mathscr{F}_C : \mathcal{E}_C \to \mathcal{S}^{<\kappa}$ is a functor of ∞-categories. We let $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ denote the full simplicial subset of $\mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ spanned by those vertices $(C, \mathscr{F}_C)$ where the functor $\mathscr{F}_C$ is corepresentable by an object of the ∞-category $\mathcal{E}_C$. In what follows, we will generally write $\pi : \mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$ for the projection map, and $\pi^{\mathrm{corep}} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$ for the restriction of π to the simplicial subset $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \subseteq \mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$. 04DY

Remark 8.6.5.7. Construction 8.6.5.6 is independent of the choice of the cardinal κ, provided that each of the ∞-categories $\mathcal{E}_C$ is locally κ-small. If this condition is satisfied and $\lambda \geq \kappa$, then every corepresentable functor $\mathscr{F} : \mathcal{E}_C \to \mathcal{S}^{<\lambda}$ factors through $\mathcal{S}^{<\kappa}$. It follows that $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) = \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\lambda})$. 04DZ

The existence assertion of Theorem 8.6.5.1 is a consequence of the following more precise result:

Proposition 8.6.5.8. *Let κ be an uncountable cardinal and let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets which is locally κ-small (Variant 4.7.9.2). Then the evaluation map* 04E0

$$\mathrm{ev} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa} \qquad ((C, \mathscr{F}_C), X) \mapsto \mathscr{F}_C(X)$$

exhibits the projection map $\pi^{\mathrm{corep}} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$ as a cocartesian dual of U (in the sense of Variant 8.6.4.13).

Our first goal is to show that, in the situation of Proposition 8.6.5.8, the projection map π^{corep} is a cocartesian fibration of simplicial sets. We begin with some more general remarks.

Proposition 8.6.5.9. *Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets which is essentially κ-small, and let $\mathcal{D}$ be an ∞-category which is κ-cocomplete. Then the projection map $\pi : \mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D}) \to \mathcal{C}$ is a cocartesian fibration of simplicial sets.* 04E1

Proof. It follows from Corollary 5.3.6.8 that π is a cartesian fibration of simplicial sets. Let $e : C \to C'$ be an edge of the simplicial set $\mathcal{C}$, and let $e_! : \mathcal{E}_C \to \mathcal{E}_{C'}$ be the functor given by covariant transport along e (for the cocartesian fibration U). Then precomposition with $e_!$ determines a functor

$$e^* : \{C'\} \times_{\mathcal{C}} \operatorname{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{D}) = \operatorname{Fun}(\mathcal{E}_{C'}, \mathcal{D}) \xrightarrow{\circ e_!} \operatorname{Fun}(\mathcal{E}_C, \mathcal{D}) = \{C\} \times_{\mathcal{C}} \operatorname{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{D}).$$

Proposition 5.3.6.9 guarantees that the functor e^* is given by contravariant transport along e (for the cartesian fibration π). Using Proposition 6.2.3.5, we see that π is a cocartesian fibration if and only if the functor e^* has a left adjoint (for every edge e of $\mathcal{C}$). By virtue of Corollary 7.3.6.3, it will suffice to show that every functor $F : \mathcal{E}_C \to \mathcal{D}$ admits a left Kan extension along the functor $e_! : \mathcal{E}_C \to \mathcal{E}_{C'}$. This is a special case of Proposition 7.6.7.13, by virtue of our assumptions on the cardinal κ. □

04E2 **Remark 8.6.5.10.** In the situation of Proposition 8.6.5.9, let $e : C \to C'$ be an edge of $\mathcal{C}$ and let

$$e_! : \mathcal{E}_C \to \mathcal{E}_{C'} \qquad e'_! : \operatorname{Fun}(\mathcal{E}_C, \mathcal{D}) \to \operatorname{Fun}(\mathcal{E}_{C'}, \mathcal{D})$$

be functors given by covariant transport along e (for the cocartesian fibrations U and π, respectively). Then the functor $e'_!$ is given by left Kan extension along $e_!$.

04E3 **Variant 8.6.5.11.** Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \to \mathcal{C}$ be an exponentiable inner fibration which is essentially κ-small, and let $\mathcal{D}$ be an ∞-category which is κ-cocomplete. Then the projection map $\pi : \operatorname{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{D}) \to \mathcal{C}$ is a cocartesian fibration. Moreover, an edge $\widetilde{e}$ of $\operatorname{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{D})$ is π-cocartesian if and only if satisfies the following condition:

$(*)$ Write $\widetilde{e} = (e, F_e)$, where e is an edge of $\mathcal{C}$ and $F_e : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \to \mathcal{D}$ is a functor of ∞-categories. Then F_e is left Kan extended from the full subcategory $\{0\} \times_{\mathcal{C}} \mathcal{E}$.

Proof. Corollary 4.5.9.19 guarantees that π is an isofibration, and Corollary 7.3.7.9 guarantees that every edge of $\operatorname{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{D})$ which satisfies condition $(*)$ is π-cocartesian. Suppose we are given a vertex $\widetilde{C} = (C, F_C)$ of $\operatorname{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{D})$, where C is a vertex of $\mathcal{C}$ and $F_C : \mathcal{E}_C \to \mathcal{D}$ is a functor of ∞-categories. If $e : C \to C'$ is an edge of $\mathcal{C}$, then Proposition 7.6.7.13 guarantees that F_C admits a left Kan extension $F_e : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \to \mathcal{D}$, which we can identify with an edge $\widetilde{e}$ of $\operatorname{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{D})$ satisfying $\pi(\widetilde{e}) = e$. By construction, the morphism $\widetilde{e}$ satisfies condition $(*)$, and is therefore π-cocartesian by virtue of Corollary 7.3.7.9. Allowing $\widetilde{C}$ and e to vary, we conclude that π is a cocartesian fibration. To complete the proof, it will suffice to show that every π-cocartesian edge $\widetilde{e}'$ of $\operatorname{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{D})$ satisfies condition $(*)$. Let us identify $\widetilde{e}'$ with a pair (e, F'_e), where e is an edge of $\mathcal{B}$ and $F'_e : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \to \mathcal{D}$ is a functor. Using the preceding argument, we see that the restriction $F'_e|_{\{0\} \times_{\mathcal{C}} \mathcal{E}}$ admits a left Kan extension $F_e : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \to \mathcal{D}$, corresponding to another edge $\widetilde{e}$ of $\operatorname{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{D})$. By construction, $\widetilde{e}$

satisfies condition $(*)$ and is therefore π-cocartesian. Invoking the uniqueness of cocartesian lifts (Remark 5.1.3.8), we deduce that the functors F_e and F'_e are isomorphic. It follows that F'_e is also left Kan extended from $\{0\} \times_{\mathcal{C}} \mathcal{E}$ (Remark 7.3.3.17), so that $\widetilde{e}'$ satisfies condition $(*)$ as desired. □

Proposition 8.6.5.12. *Let κ be an uncountable regular cardinal and let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets which is essentially κ-small. Then:* 04E4

(1) *The projection map $\pi : \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$ is both a cartesian fibration and a cocartesian fibration.*

(2) *Let $\widetilde{e}$ be a π-cocartesian edge of the simplicial set $\mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$. If the source of $\widetilde{e}$ belongs to the simplicial subset $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$, then the target of $\widetilde{e}$ also belongs to the simplicial subset $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$.*

(3) *The morphism π restricts to a cocartesian fibration $\pi^{\mathrm{corep}} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$. Moreover, an edge of $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$ is π^{corep}-cocartesian if and only if it is π-cocartesian.*

Proof. Assertion (1) follows from Corollary 5.3.6.8 and Proposition 8.6.5.9 (since the ∞-category $\mathcal{S}^{<\kappa}$ admits κ-small colimits; see Remark 7.4.5.7). We will prove (2). Let $\widetilde{e} : (C, \mathscr{F}_C) \to (C', \mathscr{F}_{C'})$ be an edge of the simplicial set $\mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$ having image $e : C \to C'$ in $\mathcal{C}$. Let $e_! : \mathcal{E}_C \to \mathcal{E}_{C'}$ be given by covariant transport along e for the cocartesian fibration U. If $\widetilde{e}$ is π-cocartesian, then we can identify $\mathscr{F}_{C'}$ with a left Kan extension of $\mathscr{F}_C$ along the functor $e_!$ (Remark 8.6.5.10). In particular, if the functor $\mathscr{F}_C : \mathcal{E}_C \to \mathcal{S}$ is corepresentable by an object $X \in \mathcal{E}_C$, then $\mathscr{F}_{C'}$ is corepresentable by the image $e_!(X) \in \mathcal{C}_{C'}$ (Corollary 8.3.1.9). This proves assertion (2), and assertion (3) is a formal consequence (see Proposition 5.1.4.16). □

Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. To show that the projection map $\pi^{\mathrm{corep}} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$ is a cocartesian fibration (at least for $\kappa \gg 0$), we used the fact that the collection of corepresentable functors is closed under the formation of left Kan extensions. To prove Proposition 8.6.5.8, we will need to characterize the collection of π^{corep}-cocartesian edges of the simplicial set $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$ more explicitly.

Lemma 8.6.5.13. *Let κ be an uncountable cardinal, let $\mathcal{E}$ be an ∞-category which is locally κ-small, and let $\mathscr{F} : \mathcal{E} \to \mathcal{S}^{<\kappa}$ be a functor. Suppose we are given a full subcategory $\mathcal{E}_0 \subseteq \mathcal{E}$, an object $X \in \mathcal{E}_0$, and a vertex $\eta \in \mathscr{F}(X)$. Then η exhibits the $\mathscr{F}$ as corepresented by the object X if and only if the following conditions are satisfied:* 04E5

(a) *The vertex η exhibits $\mathscr{F}_0 = \mathscr{F}|_{\mathcal{E}_0}$ as corepresented by the object X.*

(b) *The functor $\mathscr{F}$ is left Kan extended from $\mathcal{E}_0$.*

Proof. It follows immediately from the definition that if η exhibits $\mathscr{F}$ as corepresented by X, then it also exhibits $\mathscr{F}_0$ as corepresented by X. We may therefore assume without loss of generality that condition (a) is satisfied. In this case, the desired equivalence follows immediately by combining the criterion of Lemma 8.3.1.7 with the transitivity property of Kan extensions (Proposition 7.3.8.18). □

04E6 **Lemma 8.6.5.14.** *Let κ be an uncountable cardinal, let $\mathcal{E}$ be an ∞-category which is locally κ-small, and let $\mathscr{F} : \mathcal{E} \to \mathcal{S}^{<\kappa}$ be a functor. Suppose we are given a functor $U : \mathcal{E} \to \Delta^1$ and a U-cocartesian morphism $e : X \to Y$ of $\mathcal{E}$ satisfying $U(X) = 0$ and $U(Y) = 1$. Write $\mathcal{E}_0 = \{0\} \times_{\Delta^1} \mathcal{E}$ and $\mathcal{E}_1 = \{1\} \times_{\Delta^1} \mathcal{E}$, and let $\eta \in \mathscr{F}(X)$ be a vertex which exhibits the functor $\mathscr{F}_0 = \mathscr{F}|_{\mathcal{E}_0}$ as corepresented by the object X. The following conditions are equivalent:*

(1) *The functor $\mathscr{F}$ is left Kan extended from $\mathcal{E}_0$.*

(2) *The vertex η exhibits the functor $\mathscr{F}$ as corepresented by X.*

(3) *The vertex $\mathscr{F}(e)(\eta) \in \mathscr{F}(Y)$ exhibits the functor $\mathscr{F}_1 = \mathscr{F}|_{\mathcal{E}_1}$ as corepresented by the object $Y \in \mathcal{E}_1$.*

Proof. The equivalence of (1) and (2) follows from Lemma 8.6.5.13. We will show that (2) and (3) are equivalent. Fix an object $Z \in \mathcal{E}_1$. Then the diagram of Kan complexes

$$\begin{tikzcd}
\mathrm{Hom}_{\mathcal{E}_1}(Y, Z) \arrow[rr, "\circ[e]"] \arrow[dr] & & \mathrm{Hom}_{\mathcal{E}}(X, Z) \arrow[dl] \\
& \mathscr{F}(Z) &
\end{tikzcd}$$

commutes up to homotopy, where the right vertical map is determined by $\eta\mathscr{F}(X)$ and the left vertical map is determined by $\mathscr{F}(e)(\eta) \in \mathscr{F}(Y)$. Our assumption that e is U-cocartesian guarantees that the horizontal map is a homotopy equivalence (Corollary 5.1.2.3). It follows that the left vertical map is a homotopy equivalence if and only if the right vertical map is a homotopy equivalence. The desired result now follows by allowing the object Z to vary. □

04E7 **Lemma 8.6.5.15.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories, let κ be an uncountable cardinal such that each fiber of U is locally κ-small. Let $\widetilde{e}$ be an edge of the simplicial set $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ corresponding to a pair $(e, \mathscr{F})$, where $e : C \to D$ is an edge of $\mathcal{C}$ and $\mathscr{F} : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$ is a functor. The following conditions are equivalent:*

(1) *The edge $\widetilde{e}$ is π^{corep}-cocartesian (where $\pi^{\mathrm{corep}} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$ denotes the projection map).*

(2) *There exists an object $X \in \mathcal{E}_C$, a vertex $\eta \in \mathscr{F}(X)$ which exhibits $\mathscr{F}|_{\mathcal{E}_C}$ as corepresented by the object X, and a U-cocartesian morphism $\overline{e} : X \to Y$ such that $U(\overline{e}) = e$ and the vertex $\mathscr{F}(\overline{e})(\eta) \in \mathscr{F}(Y)$ exhibits $\mathscr{F}|_{\mathcal{E}_D}$ as corepresented by the object Y.*

(3) *For every object $X \in \mathcal{E}_C$, every vertex $\eta \in \mathscr{F}(X)$ which exhibits $\mathscr{F}|_{\mathcal{E}_C}$ as corepresented by the object X, and every U-cocartesian morphism $\overline{e} : X \to Y$ satisfying $U(\overline{e}) = e$, the vertex $\mathscr{F}(\overline{e})(\eta) \in \mathscr{F}(Y)$ exhibits $\mathscr{F}|_{\mathcal{E}_D}$ as corepresented by the object Y.*

Proof. By virtue of Remark 8.6.5.7, we are free to enlarge the cardinal κ; we may therefore assume without loss of generality that κ is regular and that the ∞-category $\Delta^1 \times_{\mathcal{C}} \mathcal{E}$ is essentially κ-small. In this case, Variant 8.6.5.11 shows that (1) is equivalent to the following:

(1′) The functor $\mathscr{F}$ is left Kan extended from the full subcategory $\mathcal{E}_C \subseteq \Delta^1 \times_{\mathcal{C}} \mathcal{E}$.

The equivalences (1′) ⇔ (2) ⇔ (3) now follow from Lemma 8.6.5.14. □

Proof of Proposition 8.6.5.8. Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets, and let κ be an uncountable cardinal such that each fiber of U is locally κ-small. It follows from Proposition 8.6.5.12 that the projection map $\pi^{\mathrm{corep}} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$ is a cocartesian fibration of simplicial sets. We wish to show that the evaluation map

$$\mathrm{ev} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa} \qquad ((C, \mathscr{F}_C), X) \mapsto \mathscr{F}_C(X)$$

satisfies conditions (a) and (b) of Definition 8.6.4.12. Condition (a) asserts that, for each vertex $C \in \mathcal{C}$, the evaluation map

$$\mathrm{ev}_C : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E}_C, \mathcal{S}^{<\kappa}) \times \mathcal{E}_C \to \mathcal{S}^{<\kappa} \qquad (\mathscr{F}, X) \mapsto \mathscr{F}(X)$$

is a balanced profunctor; this follows from Corollary 8.3.2.21. Assertion (b) is a restatement of the implication (1) ⇒ (3) of Lemma 8.6.5.15. □

Proposition 8.6.5.8 immediately implies the existence assertion of Theorem 8.6.5.1. To establish uniqueness, it will be convenient to introduce some terminology.

Definition 8.6.5.16. Let $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ be cocartesian fibrations of simplicial sets and let κ be an uncountable cardinal. We will say that a morphism $\mathscr{K} : \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$ is a *weak $\mathcal{C}$-family of corepresentable profunctors* if, for every vertex $C \in \mathcal{C}$, the induced map 04E8

$$\mathscr{K}_C : \mathcal{E}^{\vee}_C \times \mathcal{E}_C \to \mathcal{S}^{<\kappa}$$

is a corepresentable profunctor (Definition 8.3.2.9). We say that $\mathscr{K}$ is a *$\mathcal{C}$-family of corepresentable profunctors* if it is a weak $\mathcal{C}$-family of corepresentable profunctors and satisfies the following additional condition:

$(*)$ Let $f : X \to Y$ be a U-cocartesian edge of $\mathcal{E}$ and let $f^\vee : X^\vee \to Y^\vee$ be a $U^\vee$-cocartesian edge of $\mathcal{E}^\vee$ having the same image $u : C \to D$ in $\mathcal{C}$. Then the map of Kan complexes

$$\mathscr{K}(f^\vee, f) : \mathscr{K}_C(X^\vee, X) \to \mathscr{K}_D(Y^\vee, Y)$$

carries couniversal vertices of $\mathscr{K}_C(X^\vee, X)$ to couniversal vertices of $\mathscr{K}_D(Y^\vee, Y)$.

04E9 **Example 8.6.5.17.** In the situation of Definition 8.6.5.16, the morphism $\mathscr{K}$ exhibits $U^\vee$ as a cocartesian dual of U (in the sense of Variant 8.6.4.13) if and only if it is a $\mathcal{C}$-family of corepresentable profunctors having the further property that each of the profunctors $\mathscr{K}_C$ is *balanced*: that is, it is corepresentable by an equivalence of ∞-categories $(\mathcal{E}_C^\vee)^{\mathrm{op}} \to \mathcal{E}_C$ (see Corollary 8.3.2.20).

Let $U : \mathcal{E} \to \mathcal{C}$ be a morphism of simplicial sets, let κ be an uncountable cardinal, and let $\pi : \mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$ denote the projection map. For any morphism of simplicial sets $U^\vee : \mathcal{E}^\vee \to \mathcal{C}$, we can identify morphisms $\mathscr{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$ with morphisms $F : \mathcal{E}^\vee \to \mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ satisfying $\pi \circ F = U$.

04EA **Proposition 8.6.5.18.** *Let $U : \mathcal{E} \to \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \to \mathcal{C}$ be cocartesian fibrations of simplicial sets. Let κ be an uncountable cardinal such that U is locally κ-small. Fix a morphism $\mathscr{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$, which we identify with a morphism $F : \mathcal{E}^\vee \to \mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$. Then:*

(1) *The morphism $\mathscr{K}$ is a weak $\mathcal{C}$-family of corepresentable profunctors if and only if F factors through the simplicial subset $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \subseteq \mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$.*

(2) *The morphism $\mathscr{K}$ is a $\mathcal{C}$-family of corepresentable profunctors if and only if F factors through $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ and carries $U^\vee$-cocartesian edges of $\mathcal{E}^\vee$ to π^{corep}-cocartesian edges of $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$. Here $\pi^{\mathrm{corep}} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$ denotes the cocartesian fibration of Proposition 8.6.5.12.*

(3) *The morphism $\mathscr{K}$ exhibits $U^\vee$ as a cocartesian dual of U if and only if $F : \mathcal{E}^\vee \to \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ is an equivalence of cocartesian fibrations over $\mathcal{C}$.*

Proof. Assertion (1) is immediate from the definitions and assertion (2) follows from Lemma 8.6.5.15. Assertion (3) follows by combining (2) with Example 8.6.5.17 (see Proposition 5.1.7.15). □

Proof of Theorem 8.6.5.1. Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. Fix an uncountable cardinal κ such that U is locally κ-small. Proposition 8.6.5.8 implies that the projection map $\pi^{\mathrm{corep}} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$ is a cocartesian dual of U, and Proposition 8.6.5.18 implies that any other cocartesian dual $U^\vee : \mathcal{E}^\vee \to \mathcal{C}$ is equivalent to π^{corep}. □

Using Proposition 8.6.5.18, we can characterize the dual of a fibration by a universal mapping property.

Corollary 8.6.5.19. *Let $U : \mathcal{E} \to \mathcal{C}$, $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$, and $V : \mathcal{D} \to \mathcal{C}$ be cocartesian fibrations of simplicial sets, let κ be an uncountable cardinal, and let $\mathscr{K} : \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$ exhibit $U^{\vee}$ as a cocartesian dual of U. Then:* 04EB

(1) *Composition with $\mathscr{K}$ induces a fully faithful functor*

$$\mathrm{Fun}_{/\mathcal{C}}(\mathcal{D}, \mathcal{E}^{\vee}) \to \mathrm{Fun}(\mathcal{D} \times_{\mathcal{C}} \mathcal{E}^{\vee}, \mathcal{S}^{<\kappa}).$$

The essential image is spanned by the weak $\mathcal{C}$-families of corepresentable profunctors.

(2) *A morphism $F \in \mathrm{Fun}_{/\mathcal{C}}(\mathcal{D}, \mathcal{E}^{\vee})$ carries V-cocartesian edges of $\mathcal{D}$ to $U^{\vee}$-cocartesian edges of $\mathcal{E}^{\vee}$ if and only if the composite map*

$$\mathcal{D} \times_{\mathcal{C}} \mathcal{E} \xrightarrow{F \times \mathrm{id}} \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E} \xrightarrow{\mathscr{K}} \mathcal{S}^{<\kappa}$$

is a $\mathcal{C}$-family of corepresentable profunctors.

(3) *A morphism $F \in \mathrm{Fun}_{/\mathcal{C}}(\mathcal{D}, \mathcal{E}^{\vee})$ is an equivalence of cocartesian fibrations over $\mathcal{C}$ if and only if the composite map*

$$\mathcal{D} \times_{\mathcal{C}} \mathcal{E} \xrightarrow{F \times \mathrm{id}} \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E} \xrightarrow{\mathscr{K}} \mathcal{S}^{<\kappa}$$

exhibits V as a cocartesian dual of U

Proof. We can identify $\mathscr{K}$ with a morphism $G \in \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}^{\vee}, \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}))$. It follows from Proposition 8.6.5.18 that G is an equivalence of cocartesian fibrations over $\mathcal{C}$. We can therefore replace $\mathcal{E}^{\vee}$ by $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ and $\mathscr{K}$ by the evaluation map $\mathrm{ev} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$. In this case, assertions (1), (2), and (3) follow immediately from the corresponding assertions of Proposition 8.6.5.18. □

8.6.6 Comparison of Dual and Conjugate Fibrations

In this section, we show that the theory of conjugate fibrations (introduced in §8.6.1) can be regarded as a reformulation of cocartesian duality (introduced in §8.6.4). Our main result can be stated as follows: 04ET

Proposition 8.6.6.1. *Let $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ be cocartesian fibrations of simplicial sets. Then U is a cocartesian dual of $U^{\vee}$ if and only if the opposite fibration $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \to \mathcal{C}^{\mathrm{op}}$ is a cartesian conjugate of $U^{\vee}$.* 04EU

Before giving the proof of Proposition 8.6.6.1, let us collect some consequences.

Corollary 8.6.6.2 (Symmetry)**.** *Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration, and let $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration. Then $U^{\dagger}$ is a cartesian conjugate of U if and only if U^{op} is a cartesian conjugate of $U^{\dagger,\mathrm{op}}$.* 04EV

Proof. Combine Proposition 8.6.6.1 with Remark 8.6.4.3. □

05JR **Corollary 8.6.6.3.** *For every simplicial set $\mathcal{C}$, the formation of cartesian conjugates induces a bijection*

$$\begin{tikzcd} \{\text{Cocartesian fibrations } U : \mathcal{E} \to \mathcal{C}\}/\text{Equivalence} \arrow[d] \\ \{\text{Cartesian fibrations } U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}\}/\text{Equivalence}. \end{tikzcd}$$

Proof. Combine Proposition 8.6.6.1 with Corollary 8.6.5.2. □

05JS **Example 8.6.6.4.** Let $\mathcal{C}$ be an ∞-category. Then the evaluation functor $\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathcal{C}$ is a cocartesian fibration, which is cocartesian dual to the projection map $\lambda_+ : \mathrm{Tw}(\mathcal{C}) \to \mathcal{C}$ of Notation 8.1.1.6. This follows by combining Proposition 8.6.6.1 with Corollary 8.6.3.18 (applied to the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$).

05JT **Corollary 8.6.6.5.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets, let L be the collection of U-cocartesian edges of $\mathcal{E}$, and let $\mathcal{E}^{\vee}$ be the fiber product $\mathcal{C} \times_{\mathrm{Cospan}(\mathcal{C})} \mathrm{Cospan}^{L,\mathrm{all}}(\mathcal{E})$. Then the projection map $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ is a cocartesian fibration, which is a cocartesian dual of U.*

Proof. Combine Propositions 8.6.6.1 and 8.6.3.5. □

04F7 **Remark 8.6.6.6.** Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets, and let $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \to \mathcal{C}^{\mathrm{op}}$ be the opposite fibration. By virtue of Theorem 8.6.5.1 and Corollary 8.6.3.14, U admits a cocartesian dual $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ and a cartesian conjugate $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$, which are uniquely determined up to equivalence and opposite to one another (Proposition 8.6.6.1). When $\mathcal{C}$ is an ∞-category, all four of these fibrations can be realized as a suitable restriction of the projection map $\mathrm{Cospan}(U) : \mathrm{Cospan}(\mathcal{E}) \to \mathrm{Cospan}(\mathcal{C})$. Let L denote the collection of all U-cocartesian morphisms of $\mathcal{E}$, and let R denote the collection of all morphisms f of $\mathcal{E}$ such that $U(f)$ is an isomorphism in $\mathcal{C}$. Then:

- Using Proposition 8.1.7.6, we can identify U with the map
$$\mathrm{Cospan}^{\mathrm{all}, L \cap R}(\mathcal{E}) = \mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{E}) \to \mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C}).$$
- Using Variant 8.1.7.14, we can identify U^{op} with the map
$$\mathrm{Cospan}^{L \cap R, \mathrm{all}}(\mathcal{E}) = \mathrm{Cospan}^{\mathrm{iso},\mathrm{all}}(\mathcal{E}) \to \mathrm{Cospan}^{\mathrm{iso},\mathrm{all}}(\mathcal{C}).$$
- Using Proposition 8.6.3.5 (and Remark 8.6.3.7), we can identify $U^{\dagger}$ with the projection map $\mathrm{Cospan}^{R,L}(\mathcal{E}) \to \mathrm{Cospan}^{\mathrm{iso},\mathrm{all}}(\mathcal{C})$.

- Using Corollary 8.6.6.5 (and Remark 8.6.3.7), we can identify $U^{\vee}$ with the map $\mathrm{Cospan}^{L,R}(\mathcal{E}) \to \mathrm{Cospan}^{\mathrm{all},\mathrm{iso}}(\mathcal{C})$.

Corollary 8.6.6.7. *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories, let $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration of ∞-categories, and suppose we are given a commutative diagram* 04EW

$$\begin{tikzcd}
\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r, "T"] \arrow[d] & \mathcal{E} \arrow[d, "U"] \\
\mathrm{Tw}(\mathcal{C}) \arrow[r] & \mathcal{C} .
\end{tikzcd}$$

The following conditions are equivalent:

(1) *The functor T exhibits $U^{\dagger}$ as a cartesian conjugate of U (in the sense of Definition 8.6.1.1).*

(2) *The functor T exhibits $\mathcal{E}$ as a localization of $\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ with respect to W, where W is the collection of all morphisms $w = (w', w'')$ where w' is a U'-cartesian morphism of $\mathcal{E}^{\dagger}$ and w'' is a morphism of $\mathrm{Tw}(\mathcal{C})$ whose image in $\mathcal{C}$ is degenerate.*

Proof. We will show that (2) implies (1); the reverse implication follows from Proposition 8.6.2.12. Using Corollary 8.6.6.3, we can choose a cocartesian fibration $U' : \mathcal{E}' \to \mathcal{C}$ and a commutative diagram

$$\begin{tikzcd}
\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r, "T'"] \arrow[d] & \mathcal{E}' \arrow[d, "U'"] \\
\mathrm{Tw}(\mathcal{C}) \arrow[r] & \mathcal{C}
\end{tikzcd}$$

which exhibits $U^{\dagger}$ as a cartesian conjugate of U'. Assume that condition (2) is satisfied, so that we have a commutative diagram

$$\begin{tikzcd}
\mathrm{Fun}(\mathcal{E}, \mathcal{E}') \arrow[r, "T\circ"] \arrow[d, "U\circ"] & \mathrm{Fun}((\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}))[W^{-1}], \mathcal{E}') \arrow[d, "U'\circ"] \\
\mathrm{Fun}(\mathcal{E}, \mathcal{C}) \arrow[r, "T\circ"] & \mathrm{Fun}((\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}))[W^{-1}], \mathcal{C}),
\end{tikzcd}$$

where the horizontal maps are equivalences of ∞-categories and the vertical maps are isofibrations (Corollary 4.4.5.6). Applying Corollary 4.5.2.32, we deduce that the map

$$(\circ T) : \operatorname{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}') \to \operatorname{Fun}_{/\mathcal{C}}(\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \operatorname{Tw}(\mathcal{C}), \mathcal{E}')$$

is fully faithful, and that its essential image consists of those functors $\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \operatorname{Tw}(\mathcal{C}) \to \mathcal{E}'$ which carry each morphism of W to an isomorphism in $\mathcal{E}'$. We may therefore assume without loss of generality that $T' = F \circ T$ for some functor $F \in \operatorname{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}')$. Proposition 8.6.2.12 implies that T' exhibits $\mathcal{E}'$ as a localization of $\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \operatorname{Tw}(\mathcal{C})$ with respect to W. It follows that F is an equivalence of ∞-categories (Remark 6.3.1.19), so that T also exhibits $U^{\dagger}$ as a cartesian conjugate of U. □

We now turn to the proof of Proposition 8.6.6.1. Consider first the special case where $\mathcal{C} = \Delta^0$. For any ∞-category $\mathcal{E}$, the projection map $U : \mathcal{E} \to \Delta^0$ can be regarded as a cartesian conjugate of itself (Example 8.6.1.3). Consequently, Proposition 8.6.6.1 reduces to the assertion that U is dual to the opposite fibration $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \to \Delta^0$: that is, that there exists a balanced profunctor $\mathscr{H} : \mathcal{E}^{\mathrm{op}} \times \mathcal{E} \to \mathcal{S}$. This is proved by taking $\mathscr{H}$ to be a Hom-functor for $\mathcal{E}$, in the sense of Definition 8.3.3.1. To prove Proposition 8.6.6.1, we will need a relative variant of this construction.

05JU **Definition 8.6.6.8.** Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets, so that the induced map

$$\lambda : \operatorname{Tw}(\mathcal{E}) \to \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \operatorname{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E}$$

is a left fibration (Proposition 8.1.1.15). Let κ be an uncountable cardinal. We say that a diagram

$$\mathscr{H} : \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \operatorname{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$$

is a *relative* Hom-*functor for U* if it is a covariant transport representation for the left fibration λ (Definition 5.6.5.1).

05JV **Remark 8.6.6.9.** Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets and let

$$\lambda : \operatorname{Tw}(\mathcal{E}) \to \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \operatorname{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E}$$

be the left fibration of Proposition 8.1.1.15. If X and Y are vertices of $\mathcal{E}$ and $f : U(X) \to U(Y)$ is an edge of $\mathcal{C}$, then the fiber $\lambda^{-1}\{(X, f, Y)\}$ is a Kan complex, which is homotopy equivalent to the morphism space $\operatorname{Hom}_{\mathcal{E}_f}(X, Y)$, where we abuse notation by identifying X and Y with their preimages in the ∞-category $\mathcal{E}_f = \Delta^1 \times_{\mathcal{C}} \mathcal{E}$. Consequently, if $\mathscr{H}$ is a relative Hom-functor for U, then we have homotopy equivalences $\mathscr{H}(X, f, Y) \simeq \operatorname{Hom}_{\mathcal{E}_f}(X, Y)$.

Remark 8.6.6.10 (Existence and Uniqueness)**.** Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets and let κ be an uncountable cardinal. Then U admits a relative Hom-functor 05JW

$$\mathscr{H} : \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$$

if and only if the inner fibration U is locally κ-small (see Proposition 4.7.9.5). Moreover, if this condition is satisfied, then $\mathscr{H}$ is unique up to isomorphism (Corollary 5.6.0.6).

Example 8.6.6.11. Let $\mathcal{E}$ be a locally κ-small ∞-category and let $\mathscr{H} : \mathcal{E}^{\mathrm{op}} \times \mathcal{E} \to \mathcal{S}^{<\kappa}$ be a Hom-functor for $\mathcal{E}$. Suppose we are given a functor $U : \mathcal{E} \to \mathcal{C}$, where $\mathcal{C} = \mathrm{N}_{\bullet}(J)$ is the nerve of a partially ordered set J. Then U is automatically an inner fibration (Proposition 4.1.1.10). Moreover, the iterated fiber product $\mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E}$ can be identified with the full subcategory of $\mathcal{E}^{\mathrm{op}} \times \mathcal{E}$ spanned by those objects (X, Y) satisfying $U(X) \leq U(Y)$ (see Example 8.1.0.5). In this case, the restriction of $\mathscr{H}$ to this full subcategory is a relative Hom-functor for the inner fibration U, in the sense of Definition 8.6.6.8. 05JX

Remark 8.6.6.12. Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of ∞-categories and let 05JY

$$\mathscr{H} : \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$$

be a relative Hom-functor for U. Then, for every vertex $C \in \mathcal{C}$, the restriction of $\mathscr{H}$ to

$$\mathcal{E}_C^{\mathrm{op}} \times \mathcal{E}_C \simeq \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \{\mathrm{id}_C\} \times_{\mathcal{C}} \mathcal{E}$$

is Hom-functor for the ∞-category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$, in the sense of Definition 8.3.3.1.

Notation 8.6.6.13 (Relative Yoneda Embeddings)**.** Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets, let κ be an uncountable cardinal, and let 05JZ

$$\mathscr{H} : \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$$

be a relative Hom-functor for U. Then $\mathscr{H}$ can be identified with a morphism

$$T : \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa}),$$

where $\mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$ denotes the relative exponential of Construction 4.5.9.1. In this case, we will refer to T as the *relative Yoneda embedding* of the inner fibration U.

Remark 8.6.6.14. Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets. Then the relative Yoneda embedding T of Notation 8.6.6.13 fits into a commutative diagram 05K0

$$\begin{tikzcd}
\mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r, "T"] & \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa}) \arrow[d] \\
\mathrm{Tw}(\mathcal{C}) \arrow[r] & \mathcal{C} .
\end{tikzcd}$$

Consequently, for each vertex $C \in \mathcal{C}$, the restriction of T to $\mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \{\mathrm{id}_C\}$ can be regarded as a functor

$$T_C : \mathcal{E}_C^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{E}_C, \mathcal{S}^{<\kappa}),$$

which is a contravariant Yoneda embedding for the ∞-category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$, in the sense of Definition 8.3.3.9. See Remark 8.6.6.12.

We now formulate a more precise version of Proposition 8.6.6.1.

05K1 **Theorem 8.6.6.15.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets, let κ be an uncountable cardinal for which U is locally κ-small, and let*

$$T : \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$$

be a relative Yoneda embedding for U (see Notation 8.6.6.13). Then:

(a) The morphism T factors through the simplicial subset $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$ of Construction 8.6.5.6.

(b) The morphism T exhibits $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \to \mathcal{C}^{\mathrm{op}}$ as a cartesian conjugate of the cocartesian fibration $\pi^{\mathrm{corep}} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$.

Proof. We first prove (a). Fix an edge $e : C_0 \to C_1$ of $\mathcal{C}$, let $\mathcal{E}_0$ denote the fiber $\{C_0\} \times_{\mathcal{C}} \mathcal{E}$, and define $\mathcal{E}_1$ similarly. Fix an object $Y \in \mathcal{E}_0$, so that we can identify the pair (Y, e) with a vertex of the fiber product $\mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. Then $T(Y, e)$ can be regarded as a functor $F : \mathcal{E}_1 \to \mathcal{S}^{<\kappa}$, and we wish to show that F is corepresentable. Replacing U by the projection map $\Delta^1 \times_{\mathcal{C}} \mathcal{E} \to \Delta^1$, we can reduce to the special case where $\mathcal{C} = \Delta^1$ is the standard 1-simplex (with $C_0 = 0$ and $C_1 = 1$). Our assumption that U is a cocartesian fibration guarantees that there exists a U-cocartesian morphism $f : Y \to X$ with $X \in \mathcal{E}_1$. Let $\mathscr{H} : \mathcal{E}^{\mathrm{op}} \times \mathcal{E} \to \mathcal{S}^{<\kappa}$ be a Hom-functor for $\mathcal{E}$. Using Example 8.6.6.11, we can identify F with the functor

$$\mathcal{E}_1 \hookrightarrow \mathcal{E} \xrightarrow{\mathscr{H}(Y,-)} \mathcal{S}^{<\kappa},$$

so that f can be identified with a vertex of $\eta \in F(X)$. Since f is U-cocartesian, the vertex η exhibits F as corepresented by the object X (see Lemma 8.6.5.14).

We now prove (b). For each vertex $C \in \mathcal{C}$, the restriction of T to the fiber $\mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \{\mathrm{id}_C\}$ determines a functor $T_C : \mathcal{E}_C^{\mathrm{op}} \to \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E}_C, \mathcal{S}^{<\kappa})$ which is a contravariant Yoneda embedding for the ∞-category $\mathcal{E}_C$ (Remark 8.6.6.14), and is therefore an equivalence of ∞-categories (Theorem 8.3.3.13). We will complete the proof by showing that T satisfies conditions $(2')$ and $(2'')$ of Proposition 8.6.1.13. Both of these conditions make an assertion about an arbitrary edge $e : C_0 \to C_1$ of the simplicial set $\mathcal{C}$; let us denote these assertions by $(2'_e)$ and $(2''_e)$, respectively. To verify them, we can replace U by the projection map $\Delta^1 \times_{\mathcal{C}} \mathcal{E} \to \Delta^1$ as above, and thereby reduce to the special case where $\mathcal{C} = \Delta^1$ is the standard 1-simplex and e is the nondegenerate edge of $\mathcal{C}$. Let $\mathscr{H} : \mathcal{E}^{\mathrm{op}} \times \mathcal{E} \to \mathcal{S}^{<\kappa}$ be a Hom-functor for $\mathcal{E}$. Using Example 8.6.6.11 again and Variant 8.6.5.11, we can formulate the hypotheses of Proposition 8.6.1.13 more concretely as follows:

($2'_e$) For every object $Y \in \mathcal{E}_0$, the functor $\mathscr{H}(Y, -) : \mathcal{E} \to \mathcal{S}^{<\kappa}$ is left Kan extended from $\mathcal{E}_0$.

($2''_e$) For every object $Y \in \mathcal{E}_0$ and every U-cocartesian morphism $f : Y \to X$ with $X \in \mathcal{E}_1$, the induced natural transformation $\mathscr{H}(X, -) \to \mathscr{H}(Y, -)$ is an isomorphism when restricted to the subcategory $\mathcal{E}_1$. In other words, for every object $W \in \mathcal{E}_1$, precomposition with f induces a homotopy equivalence $\mathscr{H}(X, W) \to \mathscr{H}(Y, W)$.

Assertion ($2'_e$) now follows from Lemma 8.6.5.13, and assertion ($2''_e$) from Corollary 5.1.2.3. □

Proof of Proposition 8.6.6.1. Let $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ be cocartesian fibrations of simplicial sets. Fix an uncountable cardinal κ such that U and $U^{\vee}$ are locally κ-small. If U is a cocartesian dual of $U^{\vee}$, then Proposition 8.6.5.18 guarantees that $U^{\vee}$ is equivalent to the cocartesian fibration $\pi^{\mathrm{corep}} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$. Combining this observation with Theorem 8.6.6.15, we conclude that U^{op} is a cartesian conjugate of $U^{\vee}$.

We now prove the converse. Assume that U^{op} is a cartesian conjugate of $U^{\vee}$; we wish to show that U is a cartesian dual of $U^{\vee}$. Applying Theorem 8.6.5.1, we see that $U^{\vee}$ admits a cocartesian dual $U' : \mathcal{E}' \to \mathcal{C}$. The first part of the proof shows that the opposite fibration $U'^{\mathrm{op}} : \mathcal{E}'^{\mathrm{op}} \to \mathcal{C}^{\mathrm{op}}$ is a cartesian conjugate of $U^{\vee}$, and is therefore equivalent to the cartesian fibration U^{op} (Corollary 8.6.3.14). It follows that the cocartesian fibrations U and U' are also equivalent, so that U is also a cocartesian dual of $U^{\vee}$. □

8.6.7 The Opposition Functor

Recall that, for every ∞-category $\mathcal{C}$, the opposite simplicial set $\mathcal{C}^{\mathrm{op}}$ is also an ∞-category 04F8 (Proposition 1.4.2.6). Our goal in this section is to show that the construction $\mathcal{C} \mapsto \mathcal{C}^{\mathrm{op}}$ can be promoted to a functor of ∞-categories $\sigma : \mathcal{QC} \to \mathcal{QC}$, where $\mathcal{QC}$ denotes the ∞-category of (small) ∞-categories (Construction 5.5.4.1). Beware that this is not completely obvious from the definition. The ∞-category $\mathcal{QC}$ was obtained as the homotopy coherent nerve $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathrm{QCat})$, where QCat denotes the simplicial category whose objects are ∞-categories and whose morphism spaces are given by the formula $\mathrm{Hom}_{\mathrm{QCat}}(\mathcal{C}, \mathcal{D})_{\bullet} = \mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\simeq}$. The construction $\mathcal{C} \mapsto \mathcal{C}^{\mathrm{op}}$ determines an automorphism of QCat as an ordinary category. However, this automorphism is *not* compatible with the simplicial enrichment of QCat: for ∞-categories $\mathcal{C}$ and $\mathcal{D}$, the Kan complex $\mathrm{Hom}_{\mathrm{QCat}}(\mathcal{C}^{\mathrm{op}}, \mathcal{D}^{\mathrm{op}})_{\bullet} = \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{D}^{\mathrm{op}})^{\simeq}$ identifies with the *opposite* of the Kan complex $\mathrm{Hom}_{\mathrm{QCat}}(\mathcal{C}, \mathcal{D})_{\bullet} = \mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\simeq}$. To address this point, it is convenient to work with a slight variant of Construction 5.5.4.1.

04F9 **Notation 8.6.7.1.** Let $\mathcal{E}$ be a simplicial category. We define a new simplicial category $\mathcal{E}^{\asymp}$ as follows:

- The objects of $\mathcal{E}^{\asymp}$ are the objects of $\mathcal{E}$.
- For every pair of objects $X, Y \in \mathcal{E}$, the simplicial set $\operatorname{Hom}_{\mathcal{E}^{\asymp}}(X,Y)_\bullet$ is the twisted arrow construction $\operatorname{Tw}(\operatorname{Hom}_{\mathcal{E}}(X,Y)_\bullet)$.
- For every triple of objects $X, Y, Z \in \mathcal{E}$, the composition law
$$\circ : \operatorname{Hom}_{\mathcal{E}^{\asymp}}(Y,Z)_\bullet \times \operatorname{Hom}_{\mathcal{E}^{\asymp}}(X,Y)_\bullet \to \operatorname{Hom}_{\mathcal{E}^{\asymp}}(X,Z)_\bullet$$
is obtained by applying the twisted arrow functor Tw to the composition law for the simplicial category $\mathcal{E}$.

The simplicial category $\mathcal{E}^{\asymp}$ is equipped with a simplicial functor $\pi : \mathcal{E}^{\asymp} \to \mathcal{E}$, which carries each object to itself and is given on morphism spaces by the projection map

$$\operatorname{Hom}_{\mathcal{E}^{\asymp}}(X,Y)_\bullet = \operatorname{Tw}(\operatorname{Hom}_{\mathcal{E}}(X,Y)_\bullet) \to \operatorname{Hom}_{\mathcal{E}}(X,Y)_\bullet$$

described in Notation 8.1.1.6.

04FA **Proposition 8.6.7.2.** *Let $\mathcal{E}$ be a locally Kan simplicial category. Then:*

(1) *The simplicial category $\mathcal{E}^{\asymp}$ of Notation 8.6.7.1 is locally Kan.*

(2) *The forgetful functor $\pi : \mathcal{E}^{\asymp} \to \mathcal{E}$ is a weak equivalence of simplicial categories (see Definition 4.6.8.7).*

(3) *The functor π induces an equivalence of ∞-categories $\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{E}^{\asymp}) \to \mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{E})$.*

Proof. Assertions (1) and (2) follow immediately from Corollary 8.1.2.3; assertion (3) then follows from Corollary 4.6.8.8. □

04FB **Remark 8.6.7.3** (Comparison with the Conjugate)**.** Let $\mathcal{E}$ be a simplicial category. Recall that the *conjugate* $\mathcal{E}^{\mathrm{c}}$ is a simplicial category having the same objects, with morphism spaces given by $\operatorname{Hom}_{\mathcal{E}^{\mathrm{c}}}(X,Y)_\bullet = \operatorname{Hom}_{\mathcal{E}}(X,Y)^{\mathrm{op}}_\bullet$ (see Example 2.4.2.12). Then there is a canonical isomorphism of simplicial categories $\mathcal{E}^{\asymp} \xrightarrow{\sim} (\mathcal{E}^{\mathrm{c}})^{\asymp}$, which is the identity on objects and given on morphism spaces by the isomorphisms

$$\operatorname{Hom}_{\mathcal{E}^{\asymp}}(X,Y)_\bullet = \operatorname{Tw}(\operatorname{Hom}_{\mathcal{E}}(X,Y)_\bullet) \simeq \operatorname{Tw}(\operatorname{Hom}_{\mathcal{E}}(X,Y)^{\mathrm{op}}_\bullet) = \operatorname{Hom}_{(\mathcal{E}^{\mathrm{c}})^{\asymp}}(X,Y)_\bullet$$

described in Remark 8.1.1.7. Composing this isomorphism with the forgetful functor $(\mathcal{E}^{\mathrm{c}})^{\asymp} \to \mathcal{E}^{\mathrm{c}}$, we obtain a forgetful functor $\pi^{\mathrm{c}} : \mathcal{E}^{\asymp} \to \mathcal{E}^{\mathrm{c}}$. If $\mathcal{E}$ is locally Kan, then Proposition 8.6.7.2 guarantees that π^{c} is a weak equivalence of simplicial categories. We therefore obtain equivalences of ∞-categories

$$\mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{E}) \xleftarrow{\sim} \mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{E}^{\asymp}) \xrightarrow{\sim} \mathrm{N}^{\mathrm{hc}}_\bullet(\mathcal{E}^{c}).$$

We now specialize to the case of interest to us.

Construction 8.6.7.4. Let QCat denote the simplicial category whose objects are (small) ∞-categories, with morphisms spaces given by $\mathrm{Hom}_{\mathrm{QCat}}(\mathcal{C}, \mathcal{D})_{\bullet} = \mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\simeq}$ (see Construction 5.5.4.1). We let $\mathrm{QCat}^{\asymp}$ denote the simplicial category described in Notation 8.6.7.1, and we let $\mathcal{QC}^{\asymp}$ denote the homotopy coherent nerve $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\mathrm{QCat}^{\asymp})$. 04FC

Proposition 8.6.7.5. *The simplicial set $\mathcal{QC}^{\asymp}$ is an ∞-category. Moreover, the forgetful functor $\mathrm{QCat}^{\asymp} \to \mathrm{QCat}$ of Notation 8.6.7.1 induces an equivalence of ∞-categories $\pi : \mathcal{QC}^{\asymp} \to \mathcal{QC}$.* 04FD

Proof. Apply Proposition 8.6.7.2 to the locally Kan simplicial category $\mathcal{E} = \mathrm{QCat}$. □

Construction 8.6.7.6 (The Opposite Functor)**.** The simplicial category $\mathrm{QCat}^{\asymp}$ is equipped with an automorphism $\widetilde{\sigma}$, given on objects by the construction $\mathcal{C} \mapsto \mathcal{C}^{\mathrm{op}}$ and on morphism spaces by the composition 04FE

$$\begin{aligned}
\mathrm{Hom}_{\mathrm{QCat}^{\asymp}}(\mathcal{C}, \mathcal{D})_{\bullet} &= \mathrm{Tw}(\mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\simeq}) \\
&\simeq \mathrm{Tw}((\mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\simeq})^{\mathrm{op}}) \\
&\simeq \mathrm{Tw}(\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{D}^{\mathrm{op}})^{\simeq}) \\
&= \mathrm{Hom}_{\mathrm{QCat}^{\asymp}}(\mathcal{C}^{\mathrm{op}}, \mathcal{D}^{\mathrm{op}}),
\end{aligned}$$

where the isomorphism on the second line is supplied by Remark 8.1.1.7. It follows from Proposition 8.6.7.5 that there exists a functor of ∞-categories $\sigma : \mathcal{QC} \to \mathcal{QC}$ for which the diagram

$$\begin{tikzcd}
\mathcal{QC}^{\asymp} \arrow[r, "\mathrm{N}^{\mathrm{hc}}_{\bullet}(\widetilde{\sigma})", "\sim"'] \arrow[d, "\pi"] & \mathcal{QC}^{\asymp} \arrow[d, "\pi"] \\
\mathcal{QC} \arrow[r, "\sigma"] & \mathcal{QC}
\end{tikzcd}$$

commutes up to isomorphism. Moreover, the functor σ is uniquely deterrmined up to isomorphism. We will refer to σ as the *opposition functor* for the ∞-category $\mathcal{QC}$.

The terminology of Construction 8.6.7.6 is justified by the following observation:

Proposition 8.6.7.7. *Let $\sigma : \mathcal{QC} \to \mathcal{QC}$ be the opposition functor of Construction 8.6.7.6. Then the diagram of ∞-categories* 04FF

$$\begin{tikzcd}
\mathrm{N}_{\bullet}(\mathrm{QCat}) \arrow[r, "\sigma_0"] \arrow[d] & \mathrm{N}_{\bullet}(\mathrm{QCat}) \arrow[d] \\
\mathcal{QC} \arrow[r, "\sigma"] & \mathcal{QC}
\end{tikzcd}$$

commutes up to isomorphism, where the functor σ_0 is given by the construction $\mathcal{C} \mapsto \mathcal{C}^{\mathrm{op}}$.

Proof. Let QCat° denote the underlying category of the simplicial category QCat, and let us abuse notation by viewing QCat° as a *constant* simplicial category. We can then identify QCat° with a simplicial subcategory of QCat having the same objects, with morphism spaces given by

$$\mathrm{Hom}_{\mathrm{QCat}^{\circ}}(\mathcal{C}, \mathcal{D})_{\bullet} = \mathrm{sk}_0(\mathrm{Hom}_{\mathrm{QCat}}(\mathcal{C}, \mathcal{D})_{\bullet}).$$

Note that the inclusion map $\mathrm{QCat}^{\circ} \hookrightarrow \mathrm{QCat}$ factors as a composition

$$\mathrm{QCat}^{\circ} \xrightarrow{\iota} \mathrm{QCat}^{\asymp} \xrightarrow{\pi} \mathrm{QCat},$$

where the functor $\iota : \mathrm{QCat}^{\circ} \to \mathrm{QCat}^{\asymp}$ carries each ∞-category $\mathcal{C}$ to itself and each functor of ∞-categories $F : \mathcal{C} \to \mathcal{D}$ to the vertex

$$\mathrm{id}_F \in \mathrm{Tw}(\mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\simeq}) = \mathrm{Hom}_{\mathrm{QCat}^{\asymp}}(\mathcal{C}, \mathcal{D})_{\bullet}.$$

We then have a diagram of ∞-categories

$$\begin{tikzcd}
\mathrm{N}_{\bullet}(\mathrm{QCat}) \arrow[r, "\sigma_0"] \arrow[d, "\mathrm{N}^{\mathrm{hc}}_{\bullet}(\iota)"] & \mathrm{N}_{\bullet}(\mathrm{QCat}) \arrow[d, "\mathrm{N}^{\mathrm{hc}}_{\bullet}(\iota)"] \\
\mathcal{QC}^{\asymp} \arrow[r, "\mathrm{N}^{\mathrm{hc}}_{\bullet}(\widetilde{\sigma})"] \arrow[d] & \mathcal{QC}^{\asymp} \arrow[d] \\
\mathcal{QC} \arrow[r, "\sigma"] & \mathcal{QC},
\end{tikzcd}$$

where the upper square is strictly commutative and the lower square commutes up to isomorphism. It follows that the outer rectangle also commutes up to isomorphism. □

04FG **Remark 8.6.7.8.** Let $\sigma : \mathcal{QC} \to \mathcal{QC}$ be the opposition functor of Construction 8.6.7.6. Passing to homotopy categories, we obtain a functor $\overline{\sigma} : \mathrm{hQCat} \to \mathrm{hQCat}$. It follows from Proposition 8.6.7.7 that, up to isomorphism, $\overline{\sigma}$ agrees with the automorphism of hQCat which is given on objects by the construction $\mathcal{C} \mapsto \mathcal{C}^{\mathrm{op}}$, and on morphisms by the construction $[F] \mapsto [F^{\mathrm{op}}]$; here $[F]$ denotes the isomorphism class of a functor $F : \mathcal{C} \to \mathcal{D}$ and $[F^{\mathrm{op}}]$ the isomorphism class of the opposition functor $F^{\mathrm{op}} : \mathcal{C}^{\mathrm{op}} \to \mathcal{D}^{\mathrm{op}}$.

04FH **Proposition 8.6.7.9** (Involutivity)**.** *Let $\sigma : \mathcal{QC} \to \mathcal{QC}$ be the opposition functor. Then the composition $\sigma \circ \sigma$ is isomorphic to the identity functor $\mathrm{id}_{\mathcal{QC}}$. In particular, σ is an equivalence of ∞-categories.*

Proof. This follows from Proposition 8.6.7.5, since the composition $\widetilde{\sigma} \circ \widetilde{\sigma}$ is *equal* to the identity functor of the ∞-category $\mathcal{QC}^{\asymp}$. □

Remark 8.6.7.10 (Uniqueness)**.** Let $\operatorname{Aut}(\mathcal{QC})$ denote the full subcategory of $\operatorname{Fun}(\mathcal{QC}, \mathcal{QC})$ spanned by those functors $\mathcal{QC} \to \mathcal{QC}$ which are equivalences of ∞-categories. A theorem of Toën ([55]) guarantees that $\operatorname{Aut}(\mathcal{QC})$ is a Kan complex having exactly two connected components, each of which is contractible (see Corollary [?]). Consequently, the opposition functor $\sigma : \mathcal{QC} \to \mathcal{QC}$ of Construction 8.6.7.4 is characterized (up to a contractible space of choices) by the fact that it is an equivalence of ∞-categories which is not isomorphic to the identity functor $\mathrm{id}_{\mathcal{QC}}$. 04FJ

Recall that every Kan complex X is homotopy equivalent to its opposite X^{op} (Example 8.6.4.18). The following is a more precise statement:

Proposition 8.6.7.11. *Let $\sigma : \mathcal{QC} \to \mathcal{QC}$ be the opposition functor of Construction 8.6.7.6. Then the restriction $\sigma|_{\mathcal{S}}$ is isomorphic to the identity functor from $\mathcal{S} \subset \mathcal{QC}$ to itself.* 04FK

Proof. For every ∞-category $\mathcal{C}$, the image $\sigma(\mathcal{C}) \in \mathcal{QC}$ is equivalent to the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$ (Remark 8.6.7.8); in particular, $\mathcal{C}$ is a Kan complex if and only if $\sigma(\mathcal{C})$ is a Kan complex. It follows that σ restrict a functor $\sigma_0 : \mathcal{S} \to \mathcal{S}$, which is also an equivalence of ∞-categories. We wish to show that σ_0 is isomorphic to the identity functor $\mathrm{id}_{\mathcal{S}}$. This follows from Example 8.4.0.4, since $\sigma_0(\Delta^0)$ is homotopy equivalent to the Kan complex $(\Delta^0)^{\mathrm{op}} \simeq \Delta^0$. □

Using the classification of cocartesian fibrations given in §5.6, we can use the opposition functor $\sigma : \mathcal{QC} \to \mathcal{QC}$ to give a reformulation of cocartesian duality.

Proposition 8.6.7.12. *Let $U : \mathcal{E} \to \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ be cocartesian fibrations of simplicial sets having transport representations $\operatorname{Tr}_{\mathcal{E}/\mathcal{C}}, \operatorname{Tr}_{\mathcal{E}^{\vee}/\mathcal{C}} : \mathcal{C} \to \mathcal{QC}$. Then $U^{\vee}$ is a cocartesian dual of U if and only if $\operatorname{Tr}_{\mathcal{E}^{\vee}/\mathcal{C}}$ is isomorphic to $\sigma \circ \operatorname{Tr}_{\mathcal{E}/\mathcal{C}}$, where $\sigma : \mathcal{QC} \to \mathcal{QC}$ denotes the opposition functor of Construction 8.6.7.6.* 04FL

Proof. Assume that $\operatorname{Tr}_{\mathcal{E}^{\vee}/\mathcal{C}}$ is isomorphic to $\sigma \circ \operatorname{Tr}_{\mathcal{E}/\mathcal{C}}$; we will show that $U^{\vee}$ is cocartesian dual to U (the reverse implication then follows formally from the fact that cocartesian duals are unique up to equivalence; see Theorem 8.6.5.1). Let $\pi : \mathrm{QCat}^{\asymp} \to \mathrm{QCat}$ denote the forgetful functor, and let $\pi' : \mathrm{QCat}^{\asymp} \to \mathrm{QCat}$ be the composition of π with the automorphism $\widetilde{\sigma} : \mathrm{QCat}^{\asymp} \simeq \mathrm{QCat}^{\asymp}$ described in Construction 8.6.7.6. By virtue of Proposition 8.6.7.5, we may assume without loss of generality that the covariant transport representation $\mathscr{F}_{+} = \operatorname{Tr}_{\mathcal{E}/\mathcal{C}}$ factors as a composition $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\pi) \circ \mathscr{F}$ for some diagram $\mathscr{F} : \mathcal{C} \to \mathcal{QC}^{\asymp}$. Set $\mathscr{F}_{-} = \mathrm{N}^{\mathrm{hc}}_{\bullet}(\pi') \circ \mathscr{F}$. Our assumption then guarantees that $\mathscr{F}_{-}$ is a covariant transport representation for $U^{\vee}$. We may therefore assume without loss of generality that U and $U^{\vee}$ coincide with the projection maps $\int_{\mathcal{C}} \mathscr{F}_{+} \to \mathcal{C}$ and $\int_{\mathcal{C}} \mathscr{F}_{-} \to \mathcal{C}$, respectively.

We now proceed as in the proof of Proposition 8.6.4.23. Define a simplicial functor $\tau : \mathrm{QCat}^{\simeq} \to \mathrm{QCat}$ as follows:

- On objects, τ is given by the construction $\mathcal{D} \mapsto \mathrm{Tw}(\mathcal{D})$.
- On morphism spaces, τ is given by the morphism of simplicial sets

$$\begin{aligned} \mathrm{Hom}_{\mathrm{QCat}^{\simeq}}(\mathcal{D}, \mathcal{D}')_{\bullet} &= \mathrm{Tw}(\mathrm{Fun}(\mathcal{D}, \mathcal{D}')^{\simeq}) \\ &\to \mathrm{Fun}(\mathrm{Tw}(\mathcal{D}), \mathrm{Tw}(\mathcal{D}'))^{\simeq} \\ &= \mathrm{Hom}_{\mathrm{QCat}}(\mathrm{Tw}(\mathcal{D}), \mathrm{Tw}(\mathcal{D}'))_{\bullet}. \end{aligned}$$

which classifies the composition

$$\mathrm{Tw}(\mathcal{D}) \times \mathrm{Tw}(\mathrm{Fun}(\mathcal{D}, \mathcal{D}')^{\simeq}) \hookrightarrow \mathrm{Tw}(\mathcal{D} \times \mathrm{Fun}(\mathcal{D}, \mathcal{D}')) \xrightarrow{\mathrm{Tw(ev)}} \mathrm{Tw}(\mathcal{D}'),$$

where $\mathrm{ev} : \mathcal{D} \times \mathrm{Fun}(\mathcal{D}, \mathcal{D}') \to \mathcal{D}'$ is the evaluation map.

Let $\widetilde{\mathscr{F}} : \mathcal{C} \to \mathcal{QC}$ denote the diagram given by the composition $\mathrm{N}^{\mathrm{hc}}_{\bullet}(\tau) \circ \mathscr{F}$, and set $\widetilde{\mathcal{E}} = \int_{\mathcal{C}} \widetilde{\mathscr{F}}$. There is a natural transformation of simplicial functors $\tau \to \pi' \times \pi$, which carries each ∞-category $\mathcal{D}$ to the left fibration $\mathrm{Tw}(\mathcal{D}) \to \mathcal{D}^{\mathrm{op}} \times \mathcal{D}$ of Proposition 8.1.1.11. Applying Corollary [?], see that this natural transformation induces a left fibration

$$\widetilde{\mathcal{E}} = \int_{\mathcal{C}} \widetilde{\mathscr{F}} \xrightarrow{\lambda} \int_{\mathcal{C}} (\mathscr{F}_{-} \times \mathscr{F}_{+}) \simeq \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E}\,.$$

We will complete the proof by showing that λ exhibits $U^{\vee}$ as a cocartesian dual of U: that is, it satisfies conditions (a) and (b) of Definition 8.6.4.1.

(a) Fix a vertex $C \in \mathcal{C}$; we wish to show that the left fibration

$$\lambda_C : \{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \widetilde{\mathscr{F}} \to (\{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \mathscr{F}_{-}) \times (\{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \mathscr{F}_{+})$$

is a balanced coupling. Set $\mathcal{D} = \widetilde{\mathscr{F}}(C)$. Using Example 5.6.2.18, we obtain a commutative diagram

$$\begin{tikzcd} \mathrm{Tw}(\mathcal{D}) \arrow[r] \arrow[d] & \{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \mathscr{F} \arrow[d, "\lambda_C"] \\ \mathcal{D}^{\mathrm{op}} \times \mathcal{D} \arrow[r] & (\{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \mathscr{F}_{-}) \times (\{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \mathscr{F}_{+}), \end{tikzcd}$$

where the horizontal maps are equivalences of ∞-categories. The desired result now follows from the observation that the twisted arrow coupling $\mathrm{Tw}(\mathcal{D}) \to \mathcal{D}^{\mathrm{op}} \times \mathcal{D}$ is balanced (Example 8.2.6.2).

(b) Let $U : \widetilde{\mathcal{E}} \to \mathcal{C}$ denote the projection map, let $f : X \to X'$ be a U-cocartesian edge of $\widetilde{\mathcal{E}}$, and let $\overline{f} : C \to C'$ denote the image of f in the simplicial set $\mathcal{C}$. The functor $\mathscr{F}$ carries the vertex C to an ∞-category $\mathcal{D}$, C' to an ∞-category $\mathcal{D}'$, and $\overline{f}$ to a vertex of the Kan complex $\mathrm{Tw}(\mathrm{Fun}(\mathcal{D}, \mathcal{D}')^{\simeq})$, which we can identify with an isomorphism $u : F_{-} \to F_{+}$ between functors $F_{-}, F_{+} : \mathcal{D} \to \mathcal{D}'$. We can then identify X with a morphism $e : D_{-} \to D_{+}$ in the ∞-category $\mathcal{D}$ and X' with a morphism $e' : D'_{-} \to D'_{+}$ in the ∞-category $\mathcal{D}'$, so that f determines a morphism in the ∞-category $\mathrm{Tw}(\mathcal{D}')$ which we depict informally in the diagram $\mathcal{D}'$ which we depict informally in the diagram

$$\begin{tikzcd}
F_{-}(D_{-}) \arrow[d, "u(e)"] & D'_{-} \arrow[l] \arrow[d, "e'"] \\
F_{+}(D_{+}) \arrow[r] & D'_{+}.
\end{tikzcd}$$

Our assumption that X is universal for the coupling λ_C guarantees that e is an isomorphism in the ∞-category $\mathcal{D}$ (Example 8.2.1.5), so that the left vertical map is an isomorphism in the ∞-category $\mathcal{D}'$. Our assumption that f is U-cocartesian guarantees that the horizontal maps in the diagram are also isomorphisms (Remark 5.6.2.14). It follows that e' is also an isomorphism in $\mathcal{D}$, so that X' is universal for the coupling $\lambda_{C'}$ as desired.

□

Remark 8.6.7.13. Let $\mathcal{QC}_{\mathrm{Obj}}$ denote the ∞-category of pairs $(\mathcal{C}, X)$, where $\mathcal{C}$ is a small 04FM ∞-category and X is an object of $\mathcal{C}$ (see Definition 5.5.6.10). Then the identity functor $\mathrm{id} : \mathcal{QC} \to \mathcal{QC}$ is a covariant transport representation for the universal cocartesian fibration

$$U : \mathcal{QC}_{\mathrm{Obj}} \to \mathcal{QC} \qquad (\mathcal{C}, X) \mapsto \mathcal{C}\,.$$

Applying Proposition 8.6.7.12, we deduce that the opposition functor $\sigma : \mathcal{QC} \to \mathcal{QC}$ is a covariant transport representation for a cocartesian dual of the fibration U. By virtue of Corollary 5.6.5.13, this property characterizes the functor σ up to isomorphism.

Chapter 9

Large ∞-Categories

04KE 9.1 Local Objects and Factorization Systems

04KF 9.1.1 Local Objects

04KG Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which exhibits $\mathcal{D}$ as a localization of $\mathcal{C}$ with respect to some collection of morphisms W. Recall that F is a *reflective localization* if it admits a right adjoint $G : \mathcal{D} \to \mathcal{C}$. In this case, the functor G is automatically fully faithful (Proposition 6.3.3.6), and its essential image is a reflective subcategory $\mathcal{C}' \subseteq \mathcal{C}$ (Corollary 6.2.2.17). In this situation, we can extract the subcategory $\mathcal{C}'$ directly from W.

02FZ **Definition 9.1.1.1.** Let $\mathcal{C}$ be an ∞-category and let $w : X \to Y$ be a morphism of $\mathcal{C}$. We say that an object $C \in \mathcal{C}$ is *w-local* if precomposition with the homotopy class $[w]$ induces a homotopy equivalence of mapping spaces $\mathrm{Hom}_{\mathcal{C}}(Y, C) \xrightarrow{\circ [w]} \mathrm{Hom}_{\mathcal{C}}(X, C)$. We say that C is *w-colocal* if postcomposition with $[w]$ induces a homotopy equivalence $\mathrm{Hom}_{\mathcal{C}}(C, X) \xrightarrow{[w] \circ} \mathrm{Hom}_{\mathcal{C}}(C, Y)$.

If W is a collection of morphisms of $\mathcal{C}$, we say that an object $C \in \mathcal{C}$ is *W-local* if it is w-local for each $w \in W$. Similarly, we say that C is *W-colocal* if it is w-colocal for each $w \in W$.

04KH **Example 9.1.1.2.** Let $\mathcal{C}$ be an ∞-category and let $w : X \to Y$ be an isomorphism in $\mathcal{C}$. Then every object of $\mathcal{C}$ is w-local.

02G1 **Remark 9.1.1.3.** Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$, which we also view as a collection of morphisms in the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$. Then an object $Z \in \mathcal{C}$ is W-local (in the sense of Definition 9.1.1.1) if and only if it is W-colocal when viewed as an object of $\mathcal{C}^{\mathrm{op}}$.

04KJ **Remark 9.1.1.4.** Let $\mathcal{C}$ be an ∞-category containing a morphism $w : X \to Y$. Let $\pi : \mathcal{C}_{X/} \to \mathcal{C}$ denote the projection map, so that w can be identified with an object $\widetilde{Y} \in \mathcal{C}_{X/}$

satisfying $\pi(\widetilde{Y}) = Y$. Then an object $C \in \mathcal{C}$ is w-local if and only if, for every object $\widetilde{C} \in \mathcal{C}_{X/}$ satisfying $\pi(\widetilde{C}) = C$, the morphism space $\mathrm{Hom}_{\mathcal{C}_{X/}}(\widetilde{Y}, \widetilde{C})$ is contractible. This follows from the criterion of Remark 3.4.0.6, since $\mathrm{Hom}_{\mathcal{C}_{X/}}(\widetilde{Y}, \widetilde{C})$ can be identified with the homotopy fiber of the composition map $\mathrm{Hom}_{\mathcal{C}}(Y, C) \to \mathrm{Hom}_{\mathcal{C}}(X, C)$ over the vertex corresponding to $\widetilde{C}$ (see Corollary 4.6.9.18).

Remark 9.1.1.5. Let $\mathcal{C}$ be an ∞-category, let W be a collection of morphisms of $\mathcal{C}$, and let $w : X \to Y$ be a morphism which belongs to W. Then, for every W-local object C of $\mathcal{C}$, precomposition with the homotopy class $[w]$ induces a bijection $\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(Y, C) \xrightarrow{\circ[w]} \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(X, C)$. In particular, if the objects X and Y are W-local, then w is an isomorphism. 02G2

Remark 9.1.1.6. Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$. If C is a W-local object of $\mathcal{C}$, then any retract of C is also W-local. In particular, the condition that C is W-local depends only on the isomorphism class of C. 04KK

Variant 9.1.1.7. Let $\mathcal{C}$ be an ∞-category, let $w : X \to Y$ be a morphism in $\mathcal{C}$, and let $C \in \mathcal{C}$ be an object which is w-local. Then C is w'-local, for any morphism $w' : X' \to Y'$ which is a retract of w (in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$). 04KL

Remark 9.1.1.8. Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$. Then the collection of W-local objects is closed under the formation of all limits which exist in $\mathcal{C}$ (see Corollary 7.4.5.18). Similarly, the collection of W-colocal objects is closed under the formation of all colimits which exist in $\mathcal{C}$. 04KM

Remark 9.1.1.9. Let $\mathcal{C}$ be an ∞-category, and let f be a morphism of $\mathcal{C}$ which is the colimit of a diagram 04KN

$$K \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \qquad v \mapsto f_v$$

which is preserved by the evaluation functors $\mathrm{ev}_0, \mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathcal{C}$. If an object $C \in \mathcal{C}$ is f_v-local for each vertex $v \in K$, then it is also f-local. This follows from Propositions 7.4.5.17 and 7.1.2.13.

Remark 9.1.1.10. Let $\mathcal{C}$ be an ∞-category containing a pushout diagram 04KP

04KQ

$$\begin{tikzcd} X \arrow[r] \arrow[d, "w"] & X' \arrow[d, "w'"] \\ Y \arrow[r] & Y'. \end{tikzcd} \tag{9.1}$$

If an object $C \in \mathcal{C}$ is w-local, then it is also w'-local. This follows immediately from the observation that the representable functor $h_C : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}$ carries pushout diagrams in $\mathcal{C}$ to pullback diagrams in $\mathcal{S}$ (Corollary 7.4.5.18).

04KR **Remark 9.1.1.11.** Let $\mathcal{C}$ be an ∞-category, let $C \in \mathcal{C}$ be an object, and let W be the collection of all morphisms w in $\mathcal{C}$ such that C is w-local. Then W contains all isomorphisms and has the two-out-of-three property. Moreover, it is also closed under retracts (in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$).

04KS **Remark 9.1.1.12.** Let $\mathcal{C}$ be an ∞-category which admits pushouts, let $w : X \to Y$ be a morphism of $\mathcal{C}$, and let $\gamma_{X/Y} : Y \coprod_X Y \to Y$ be the relative codiagonal of w (see Variant 7.6.3.19). If an object $C \in \mathcal{C}$ is w-local, then it is also $\gamma_{X/Y}$-local. This follows by applying Remark 9.1.1.11 to the diagram

$$\begin{tikzcd}
 & Y \coprod_X Y \arrow[dr, "\gamma_{X/Y}"] & \\
Y \arrow[ur, "w'"] \arrow[rr, "\mathrm{id}"] & & Y;
\end{tikzcd}$$

here w' is a pushout of w (so that C is w'-local by virtue of Remark 9.1.1.10). For a partial converse, see Exercise 9.1.3.16.

04KT **Proposition 9.1.1.13.** *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which exhibits $\mathcal{D}$ as a localization of $\mathcal{C}$ with respect to some collections of morphisms W, and let C be an object of $\mathcal{C}$. The following conditions are equivalent:*

(1) *The object C is W-local, in the sense of Definition 9.1.1.1.*

(2) *For every object $C' \in \mathcal{C}$, the functor F induces a homotopy equivalence of mapping spaces $\theta_{C',C} : \mathrm{Hom}_{\mathcal{C}}(C', C) \to \mathrm{Hom}_{\mathcal{D}}(F(C'), F(C))$.*

Proof. Fix an uncountable regular cardinal κ for which both $\mathcal{C}$ and $\mathcal{D}$ are essentially κ-small. Precomposition with F determines a functor $F^* : \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$. It follows from Proposition 7.6.7.13 that the functor F^* admits a left adjoint $F_!$ (given by left Kan extension along F^{op}). Let $h^{\mathcal{C}}_{\bullet} : \mathcal{C} \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ and $h^{\mathcal{D}}_{\bullet} : \mathcal{D} \to \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ be covariant Yoneda embeddings for $\mathcal{C}$ and $\mathcal{D}$, respectively, so that the diagram of ∞-categories

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "h^{\mathcal{C}}_{\bullet}"] \arrow[d, "F"] & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \arrow[d, "F_!"] \\
\mathcal{D} \arrow[r, "h^{\mathcal{D}}_{\bullet}"] & \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\kappa})
\end{tikzcd}$$

commutes up to isomorphism (Example 8.4.4.5), where the horizontal maps are fully faithful (Theorem 8.3.3.13). It follows that, for every pair of objects $C', C \in \mathcal{C}$, we can identify $\theta_{C',C}$ with the comparison map

$$\begin{aligned}\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}},\mathcal{S}^{<\kappa})}(h^{\mathcal{C}}_{C'}, h^{\mathcal{C}}_{C}) &\rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{D}^{\mathrm{op}},\mathcal{S}^{<\kappa})}(F_! h^{\mathcal{C}}_{C'}, F_! h^{\mathcal{C}}_{C}) \\ &\simeq \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}},\mathcal{S}^{<\kappa})}(h^{\mathcal{C}}_{C'}, F^* F_! h^{\mathcal{C}}_{C})\end{aligned}$$

given by precomposition with the unit $u : h^{\mathcal{C}}_{C} \to F^* F_! h^{\mathcal{C}}_{C}$. Combining this observation with Proposition 8.3.1.1, we see that condition (2) can be restated as follows:

(2′) The unit map $u : h^{\mathcal{C}}_{C} \to F^* F_! h^{\mathcal{C}}_{C}$ is an isomorphism in the ∞-category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$.

Our assumption that F exhibits $\mathcal{D}$ as a localization of $\mathcal{C}$ guarantees that the pullback functor F^* is fully faithful. Using Remark 6.2.2.18, we see that u is an isomorphism if and only the representable functor $h^{\mathcal{C}}_{C}$ belongs to the essential image of F^*: that is, the collection of functors $\mathcal{C}^{\mathrm{op}} \to \mathcal{S}^{<\kappa}$ which carry every morphism of W to an isomorphism in $\mathcal{S}^{<\kappa}$. This is a reformulation of (1). □

Corollary 9.1.1.14. *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which exhibits $\mathcal{D}$ as a localization of $\mathcal{C}$ with respect to some collection of morphisms W. Suppose that F admits a right adjoint $G : \mathcal{D} \to \mathcal{C}$. Then G is fully faithful, and the essential image of G is spanned by the collection of W-local objects of $\mathcal{C}$.* 04KU

Proof. The assertion that G is fully faithful follows from Proposition 6.3.3.6. Let $\eta : \mathrm{id}_{\mathcal{C}} \to G \circ F$ be the unit of an adjunction between F and G. Then an object $C \in \mathcal{C}$ belongs to the essential image of G if and only if the morphism $\eta_C : C \to (G \circ F)(C)$ is an isomorphism. This is equivalent to the requirement that, for every object $B \in \mathcal{C}$, composition with η_C induces a homotopy equivalence of mapping spaces $\theta : \mathrm{Hom}_{\mathcal{C}}(B, C) \to \mathrm{Hom}_{\mathcal{C}}(B, (G \circ F)(C))$. We conclude by observing that θ factors as a composition

$$\mathrm{Hom}_{\mathcal{C}}(B, C) \xrightarrow{F} \mathrm{Hom}_{\mathcal{D}}(F(B), F(C)) \xrightarrow{\sim} \mathrm{Hom}_{\mathcal{C}}(B, (G \circ F)(C))$$

where the second map is the homotopy equivalence of Proposition 6.2.1.17. □

Let $\mathcal{C}$ be an ∞-category, let W be a collection of morphisms of $\mathcal{C}$, and let $\mathcal{C}' \subseteq \mathcal{C}$ be the full subcategory spanned by the W-local objects. Beware that, in general, $\mathcal{C}'$ is not a reflective subcategory of $\mathcal{C}$. To ensure this, we need some additional assumptions on W.

Definition 9.1.1.15. Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$. We say that W is *localizing* if the following conditions are satisfied: 02G0

(1) Every isomorphism of $\mathcal{C}$ is contained in W.

(2) The collection of morphisms W satisfies the two-out-of-three property. That is, for every 2-simplex

$$\begin{tikzcd}
 & Y \arrow[dr, "v"] & \\
X \arrow[ur, "u"] \arrow[rr, "w"] & & Z
\end{tikzcd}$$

in $\mathcal{C}$, if any two of the morphisms u, v, and w belongs to W, then so does the third.

(3) For every object $X \in \mathcal{C}$, there exists a morphism $w : X \to Y$ which belongs to W, where the object Y is W-local.

We will say that W is *colocalizing* if it satisfies conditions (1) and (2), together with the following dual version of (3):

(3′) For every object $X \in \mathcal{C}$, there exists a morphism $w : Y \to X$ which belongs to W, where the object Y is W-colocal.

04KV **Proposition 9.1.1.16.** *Let $F : \mathcal{C} \to \mathcal{D}$ be a reflective localization functor, and let W be the collection of all morphisms w of $\mathcal{C}$ such that $F(w)$ is an isomorphism in $\mathcal{D}$. Then W is localizing.*

Proof. Conditions (1) and (2) of Definition 9.1.1.15 follow immediately from the definitions (and do not require any assumptions on F). We will verify condition (3). Since F is a reflective localization functor, it admits a fully faithful right adjoint $G : \mathcal{D} \to \mathcal{C}$. For every object $Y \in \mathcal{D}$, the image $G(Y) \in \mathcal{C}$ is W-local (Corollary 9.1.1.14). In particular, if X is an object of $\mathcal{C}$, then $(G \circ F)(X)$ is a W-local object of $\mathcal{C}$. Let $\eta : \mathrm{id}_{\mathcal{C}} \to G \circ F$ be the unit of an adjunction between F and G. To complete the proof, it will suffice to show that the unit map $\eta_X : X \to (G \circ F)(X)$ belongs to W: that is, that $F(\eta_X)$ is an isomorphism in $\mathcal{D}$. Since the functor G is fully faithful, this follows from Remark 6.3.3.5. □

04KW **Corollary 9.1.1.17.** *Let $\mathcal{C}$ be an ∞-category, let $\mathcal{C}' \subseteq \mathcal{C}$ be a reflective subcategory, and let $L : \mathcal{C} \to \mathcal{C}'$ be a left adjoint to the inclusion functor $\iota : \mathcal{C}' \hookrightarrow \mathcal{C}$. Let W be the collection of all morphisms $w : X \to Y$ of $\mathcal{C}$ for which $L(w)$ is an isomorphism in $\mathcal{C}'$. Then:*

(1) *The collection W is localizing (Definition 9.1.1.15).*

(2) *Every object of $\mathcal{C}'$ is W-local (Definition 9.1.1.1).*

(3) *If $\mathcal{C}'$ is replete, then every W-local object of $\mathcal{C}$ belongs to $\mathcal{C}'$.*

Proof. Combine Proposition 9.1.1.16 with Corollary 9.1.1.14. □

We now prove the converse of Corollary 9.1.1.17: every localizing collection of morphisms of an ∞-category $\mathcal{C}$ can be obtained from a reflective localization of $\mathcal{C}$.

Proposition 9.1.1.18. *Let $\mathcal{C}$ be an ∞-category, let W be a localizing collection of morphisms of $\mathcal{C}$, and let $\mathcal{C}'$ denote the full subcategory of $\mathcal{C}$ spanned by the W-local objects. Then:* 02G3

(1) *The full subcategory $\mathcal{C}' \subseteq \mathcal{C}$ is reflective (Definition 6.2.2.1).*

(2) *The inclusion functor $\mathcal{C}' \hookrightarrow \mathcal{C}$ admits a left adjoint $L : \mathcal{C} \to \mathcal{C}'$.*

(3) *A morphism w of $\mathcal{C}$ is contained in W if and only if $L(w)$ is an isomorphism in $\mathcal{C}'$.*

(4) *The functor L exhibits $\mathcal{C}'$ as a localization of $\mathcal{C}$ with respect to W.*

Proof. Let X be an object of $\mathcal{C}$. Our assumption that W is localizing guarantees that there exists a morphism $w_X : X \to X'$ which belongs to W, where $X' \in \mathcal{C}'$. By definition, every object $C \in \mathcal{C}'$ is W-local, so composition with w_X induces a homotopy equivalence $\mathrm{Hom}_{\mathcal{C}}(X', C) \to \mathrm{Hom}_{\mathcal{C}}(X, C)$. It follows that w_X exhibits X' as a $\mathcal{C}'$-reflection of X, in the sense of Definition 6.2.2.1. Assertion (1) follows by allowing the object X to vary. The implication (1) $\Rightarrow$ (2) follows from Proposition 6.2.2.15, and the implication (3) $\Rightarrow$ (4) from Example 6.3.3.7.

It remains to prove (3). Choose a natural transformation $\eta : \mathrm{id}_{\mathcal{C}} \to L$ which exhibits L as a $\mathcal{C}'$-reflection functor (see Definition 6.2.2.12). For each object $X \in \mathcal{C}$, the morphism $\eta_X : X \to L(X)$ exhibits $L(X)$ as a $\mathcal{C}'$-reflection of X, and can therefore be obtained by composing w_X with an isomorphism $X' \xrightarrow{\sim} L(X)$. Since W contains all isomorphisms and is closed under composition, it follows that η_X belongs to W.

For every morphism $w : X \to Y$ in $\mathcal{C}$, the natural transformation η determines a commutative diagram

$$\begin{tikzcd}
X \arrow[r, "w"] \arrow[d, "\eta_X"] & Y \arrow[d, "\eta_Y"] \\
L(X) \arrow[r, "L(w)"] & L(Y)
\end{tikzcd}$$

where η_X and η_Y belong to W. Using the two-out-of-three property, we see that w is contained in W if and only if $L(w)$ is contained in W. Since $L(X)$ and $L(Y)$ are W-local, this is equivalent to the requirement that $L(w)$ is an isomorphism (Remark 9.1.1.5). $\square$

04KX **Corollary 9.1.1.19.** *Let $\mathcal{C}$ be an ∞-category and suppose we are given a pushout diagram*

04KY
$$\begin{tikzcd} X \arrow[r, "w"] \arrow[d] & Y \arrow[d] \\ X' \arrow[r, "w'"] & Y' \end{tikzcd} \tag{9.2}$$

in $\mathcal{C}$. If W is a localizing collection of morphisms of $\mathcal{C}$ which contains w, then it also contains w'.

Proof. Let $\mathcal{C}' \subseteq \mathcal{C}$ be the full subcategory of W-local objects and let $L : \mathcal{C} \to \mathcal{C}'$ be a left adjoint to the inclusion. The assumption $w \in W$ guarantees that $L(w)$ is an isomorphism in $\mathcal{C}'$ (Proposition 9.1.1.18). Since L carries the (9.2) to a pushout diagram in the ∞-category $\mathcal{C}'$ (Corollary 7.1.3.21), it follows that $L(w')$ is also an isomorphism (Corollary 7.6.3.24). Applying Proposition 9.1.1.18 again, we conclude that w' belongs to W. □

02G4 **Notation 9.1.1.20.** Let $\mathcal{C}$ be an ∞-category and let W be a localizing collection of morphisms of $\mathcal{C}$. We will often write $\mathcal{C}[W^{-1}]$ for the full subcategory of $\mathcal{C}$ spanned by the W-local objects. By virtue of Proposition 9.1.1.18, this is consistent with Remark 6.3.2.2: that is, we can regard $\mathcal{C}[W^{-1}]$ as a localization of $\mathcal{C}$ with respect to W. This convention is very convenient, since the full subcategory of W-local objects is uniquely determined by $\mathcal{C}$ and W. However, it has the potential to create confusion in some situations: see Warning 9.1.1.23 below.

02G8 **Corollary 9.1.1.21.** *Let $\mathcal{C}$ be an ∞-category. Then the construction $W \mapsto \mathcal{C}[W^{-1}]$ determines a bijection*

$$\begin{tikzcd} \{\text{Localizing collections of morphisms of } \mathcal{C}\} \arrow[d, "\sim"] \\ \{\text{Reflective replete subcategories of } \mathcal{C}\}. \end{tikzcd}$$

Proof. Combine Proposition 9.1.1.18 with Corollary 9.1.1.17. □

Proposition 9.1.1.18 has a counterpart for colocalizing collections of morphisms:

02G5 **Variant 9.1.1.22.** Let $\mathcal{C}$ be an ∞-category, let W be a collection of morphisms of $\mathcal{C}$ which is colocalizing, and let $\mathcal{C}'$ denote the full subcategory of $\mathcal{C}$ spanned by the W-colocal objects. Then:

(1) The full subcategory $\mathcal{C}' \subseteq \mathcal{C}$ is coreflective.

(2) The inclusion functor $\mathcal{C}' \hookrightarrow \mathcal{C}$ admits a right adjoint $L : \mathcal{C} \to \mathcal{C}'$.

(3) A morphism w of $\mathcal{C}$ is contained in W if and only if $L(w)$ is an isomorphism in $\mathcal{C}'$.

(4) The functor L exhibits $\mathcal{C}'$ as a localization of $\mathcal{C}$ with respect to W.

Warning 9.1.1.23. Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$ which is both localizing and colocalizing. In this case, Proposition 9.1.1.18 and Variant 9.1.1.22 provide two *different* concrete realizations of the localization $\mathcal{C}[W^{-1}]$, given by the full subcategories $\mathcal{C}' \subseteq \mathcal{C} \supseteq \mathcal{C}''$ spanned by the W-local and W-colocal objects of $\mathcal{C}$, respectively. Note that $\mathcal{C}'$ and $\mathcal{C}''$ are necessarily equivalent as abstract ∞-categories. More precisely, if $F : \mathcal{C} \to \mathcal{C}[W^{-1}]$ is a functor which exhibits $\mathcal{C}[W^{-1}]$ as the localization of $\mathcal{C}$ with respect to W, then the restrictions 02G6

$$\mathcal{C}' \xrightarrow{F|_{\mathcal{C}'}} \mathcal{C}[W^{-1}] \xleftarrow{F|_{\mathcal{C}''}} \mathcal{C}''$$

are equivalences of ∞-categories. Beware that $\mathcal{C}'$ and $\mathcal{C}''$ usually do not coincide when regarded *as subcategories of* $\mathcal{C}$. See Warning 6.3.3.12.

9.1.2 Digression: Transfinite Composition

Let $\mathcal{C}$ be an ∞-category and let $X : \mathrm{N}_{\bullet}(\mathbf{Z}_{\geq 0}) \to \mathcal{C}$ be a functor, which we display as a diagram 04KZ

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \to \cdots$$

Suppose that X can be extended to a colimit diagram $\overline{X} : \mathrm{N}_{\bullet}(\mathbf{Z}_{\geq 0})^{\triangleright} \to \mathcal{C}$, carrying the cone point to an object $Y = \varinjlim(X)$. In this case, we can evaluate $\overline{X}$ on the edge $\{0\}^{\triangleright} \subseteq \mathrm{N}_{\bullet}(\mathbf{Z}_{\geq 0})^{\triangleright}$ to obtain a morphism $g : X(0) \to Y$. Heuristically, we can think of the morphism g as an "infinite composition" $\cdots f_4 \circ f_3 \circ f_2 \circ f_1 \circ f_0$. Our goal in this section is to extend this heuristic to more general well-ordered diagrams.

In what follows, we assume that the reader is familiar with the theory of ordinals (see §4.7.1 for a review). For every ordinal α, let $\mathrm{Ord}_{\leq \alpha}$ denote the linearly ordered set of ordinals which are less than or equal to α, and let $\mathrm{Ord}_{< \alpha}$ denote the subset consisting of ordinals which are strictly smaller than α.

Definition 9.1.2.1. Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$. 04L0 We will say that a morphism f of $\mathcal{C}$ is a *transfinite composition of morphisms of* W if there exists an ordinal α and a functor $F : \mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq \alpha}) \to \mathcal{C}$ with the following properties:

(a) For every nonzero limit ordinal $\lambda \leq \alpha$, the restriction $F|_{\mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq \lambda})}$ is a colimit diagram: that is, it exhibits $F(\lambda)$ as a colimit of the restriction $F|_{\mathrm{N}_{\bullet}(\mathrm{Ord}_{< \lambda})}$.

(b) For every ordinal $\beta < \alpha$, the morphism $F(\beta) \to F(\beta + 1)$ belongs to W.

(c) The morphism $F(0) \to F(\alpha)$ coincides with f.

In this case, we will say that F *exhibits* f *as a transfinite composition of morphisms of* W.

We say that W is *closed under transfinite composition* if it contains every morphism which is a transfinite composition of morphisms of W.

04L1 **Remark 9.1.2.2.** Let $\mathcal{C}$ be an ordinary category and let W be a collection of morphisms of $\mathcal{C}$. Then a morphism f of $\mathcal{C}$ is a transfinite composition of morphisms belonging to W (in the sense of Definition 1.5.4.10) if and only if the corresponding morphism of the ∞-category $\mathrm{N}_\bullet(\mathcal{C})$ is a transfinite composition of morphisms belonging to W (in the sense of Definition 9.1.2.1).

04L2 **Variant 9.1.2.3.** Let A be a well-ordered set and let α denote its order type. Then there is a unique order-preserving bijection $\mathrm{Ord}_{<\alpha} \simeq A$, which determines an isomorphism of simplicial sets $u : \mathrm{N}_\bullet(\mathrm{Ord}_{\leq \alpha}) \simeq \mathrm{N}_\bullet(A)^{\triangleright}$. If $\mathcal{C}$ is an ∞-category containing a morphism f and a collection of morphisms W, we will say that a diagram $F : \mathrm{N}_\bullet(A)^{\triangleright} \to \mathcal{C}$ *exhibits* f *as a transfinite composition of morphisms of* W if the composition $\mathrm{N}_\bullet(\mathrm{Ord}_{\leq \alpha}) \simeq \mathrm{N}_\bullet(A)^{\triangleright} \xrightarrow{F} \mathcal{C}$ exhibits f as a transfinite composition of morphisms of W, in the sense of Definition 9.1.2.1.

006N **Example 9.1.2.4.** Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$. Then every identity morphism of $\mathcal{C}$ is a transfinite composition of morphisms of W (take $\alpha = 0$ in Definition 9.1.2.1). In particular, if W is closed under transfinite composition, then it contains every identity morphism of $\mathcal{C}$.

006P **Example 9.1.2.5.** Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$. Then every morphism of W is a transfinite composition of morphisms of W (take $\alpha = 1$ in Definition 9.1.2.1).

006Q **Example 9.1.2.6.** Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$ which contains a pair of composable morphisms $f : X \to Y$ and $g : Y \to Z$. Then any composition of f with g is a transfinite composition of morphisms of W (take $\alpha = 2$ in Definition 1.5.4.10). In particular, if W is closed under transfinite composition, then it is closed under composition.

04L3 **Example 9.1.2.7.** Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be an isomorphism in $\mathcal{C}$. Let F denote the composite map $\mathrm{N}_\bullet(\mathbf{Z}_{\geq 0})^{\triangleright} \twoheadrightarrow (\Delta^0)^{\triangleright} \simeq \Delta^1 \xrightarrow{f} \mathcal{C}$, which we display informally as a diagram

$$\begin{tikzcd}
X \arrow[r, "\mathrm{id}"] \arrow[drr, "f"'] & X \arrow[r, "\mathrm{id}"] \arrow[dr, "f"] & X \arrow[r, "\mathrm{id}"] \arrow[d, "f"] & X \arrow[r, "\mathrm{id}"] \arrow[dl, "f"] & \cdots \\
 & & Y. & &
\end{tikzcd}$$

Since the simplicial set $N_\bullet(\mathbf{Z}_{\geq 0})$ is contractible (Example 3.2.4.2), the functor F is a colimit diagram (Corollary 7.2.3.5), and therefore exhibits f as a transfinite composition of morphisms belonging to the singleton $\{\mathrm{id}_X\}$.

Remark 9.1.2.8. Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$ which is closed under transfinite composition. Combining Examples 9.1.2.4 and 9.1.2.7, we deduce that W contains every isomorphism of $\mathcal{C}$. `04L4`

Remark 9.1.2.9. Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$ which is closed under transfinite composition. Then W is closed under isomorphism: that is, if f and g are morphisms of $\mathcal{C}$ which are isomorphic (as objects of the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$), then f belongs to W if and only if g belongs to W. This follows by combining Example 9.1.2.6 with Remark 9.1.2.8. In particular, the condition that a morphism f of $\mathcal{C}$ belongs to W depends only on the homotopy class $[f]$. `04L5`

Example 9.1.2.6 admits a partial converse:

Proposition 9.1.2.10. *Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$. Assume that:* `04L6`

(1) *Every identity morphism of $\mathcal{C}$ belongs to W.*

(2) *The collection W is closed under composition.*

(3) *The collection W is closed under the formation of colimits in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$.*

Then W is closed under transfinite composition.

Proof. Let $f : X \to Y$ be a morphism of $\mathcal{C}$ which is a transfinite composition of morphisms of W; we wish to show that $f \in W$. Choose an ordinal α and a functor $F : N_\bullet(\mathrm{Ord}_{\leq \alpha}) \to \mathcal{C}$ which exhibits f as a transfinite composition of morphisms of W. For each $\beta \leq \alpha$, the functor F carries the ordered pair $(0 \leq \beta)$ to a morphism $f_\beta : F(0) \to F(\beta)$. We will complete the proof by showing that each the morphisms f_β belongs to W. The proof proceeds by transfinite induction on β. If $\beta = 0$, then $f_\beta = \mathrm{id}_X$ and the desired result follows from assumption (1). If β is a nonzero limit ordinal, then the desired result follows from assumption (3). Remark 9.1.1.9. It will therefore suffice to treat the case where $\beta = \gamma + 1$ is a successor ordinal. In this case, the desired result follows by applying assumption (2) to the diagram

$$\begin{tikzcd}
& F(\gamma) \arrow[dr] & \\
X \arrow[ur, "f_\gamma"] \arrow[rr, "f_\beta"] & & F(\beta),
\end{tikzcd}$$

since f_γ belongs to W by virtue of our inductive hypothesis. □

04L7 **Remark 9.1.2.11.** In the statement of Proposition 9.1.2.10, it is not necessary to assume that W is closed under the formation of *all* colimits in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$. It suffices to consider colimits of diagrams indexed by $\mathrm{N}_\bullet(\mathrm{Ord}_{<\beta})$ where β is a limit ordinal; moreover, we can further restrict our attention to colimits which are preserved by the evaluation functors $\mathrm{ev}_0, \mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathcal{C}$.

04L8 **Corollary 9.1.2.12.** *Let $\mathcal{C}$ be an ∞-category and let W be the collection of all isomorphisms in $\mathcal{C}$. Then W is closed under transfinite composition.*

04L9 **Definition 9.1.2.13.** Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$. The *transfinite closure of* W is the smallest collection of morphisms of $\mathcal{C}$ which contains W and is closed under transfinite composition.

04LA **Example 9.1.2.14.** Let $\mathcal{C}$ be an ∞-category and let W be the collection of all isomorphisms in $\mathcal{C}$. It follows from Corollary 9.1.2.12 and Example 9.1.2.7 that W is the smallest collection of morphisms of $\mathcal{C}$ which is closed under transfinite composition: that is, it is the transfinite closure of the empty set.

04LB **Warning 9.1.2.15.** Let $\mathcal{C}$ be an ∞-category, let W be a collection of morphisms of $\mathcal{C}$, and let f be a morphism of $\mathcal{C}$. If f is a transfinite composition of morphisms in W, then it belongs to the transfinite closure of W. Beware that, if we strictly adhere to the terminology of Definition 9.1.2.1, then the converse need not be true. For example, if $W = \emptyset$ and f is an isomorphism, then f belongs to the transfinite closure of W (Example 9.1.2.14). However, f is a transfinite composition of morphisms in W if and only if it is an identity morphism (Example 9.1.2.4).

We can rule out the pathological behavior described in Warning 9.1.2.15 adding a mild additional assumption.

04LC **Proposition 9.1.2.16.** *Let $\mathcal{C}$ be an ∞-category, let W be a collection of morphisms of $\mathcal{C}$, and let $\overline{W}$ be the collection of all morphisms of $\mathcal{C}$ which are transfinite compositions of morphisms belonging to W. If W contains all identity morphisms, then $\overline{W}$ is closed under transfinite composition (and is therefore the transfinite closure of W).*

Our proof of Proposition 9.1.2.16 will make use of the following:

04LD **Lemma 9.1.2.17.** *Let B be a linearly ordered set and let $A \subseteq B$ be a subset which satisfies the following condition:*

$(*)$ *For every element $b \in B$, the set $\{a \in A : a \leq b\}$ has a largest element b_-, and the set $\{a \in A : b \leq a\}$ has a smallest element b_+.*

Let $K(A,B) \subseteq \mathrm{N}_\bullet(B)$ be the simplicial subset whose n-simplices are given by tuples $(b_0 \leq b_1 \leq b_2 \leq \cdots \leq b_n)$ which satisfy one of the following conditions:

(1) *Each of the elements b_i belongs to A.*

(2) *For every element $a \in A$, either $a \leq b_0$ or $a \geq b_n$.*

Then the inclusion map $\iota : K(A,B) \hookrightarrow \mathrm{N}_\bullet(B)$ is a categorical equivalence of simplicial sets.

Proof. Note that we can identify $K(A,B)$ with the (filtered) colimit of the simplicial subsets $K(A,B')$, where B' ranges over the collection of all subsets of B which are obtained from A by adjoining finitely many elements. Since the collection of categorical equivalences is stable under the formation of filtered colimits (Corollary 4.5.7.2), it will suffice to prove Lemma 9.1.2.17 in the special case where $B \setminus A$ is finite.

Let $A_0 \subseteq A$ be the collection of elements which have the form b_- or b_+, where b is an element of $B \setminus A$. Note that, if $A' \subseteq A$ is a subset which contains A_0 and we set $B' = A' \cup (B \setminus A)$, then the pair (A', B') also satisfies condition $(*)$. Moreover, we have $K(A',B') = K(A,B) \cap \mathrm{N}_\bullet(B')$. It follows that $K(A,B)$ can be written as a filtered colimit of simplicial subsets $K(A',B')$, where A' ranges over finite subsets of A which contain A_0. Applying Corollary 4.5.7.2 again, we are reduced to proving Lemma 9.1.2.17 under the additional assumption that A is finite. We will also assume that A is nonempty (otherwise, B is empty and therefore is nothing to prove).

If $B = \emptyset$, there is nothing to prove. We may therefore assume without loss of generality that $B = [n] = \{0 < 1 < \cdots n\}$ for some nonnegative integer n, so that $\mathrm{N}_\bullet(B)$ can be identified with the standard n-simplex Δ^n. Note that the simplicial subset $K(A,B) \subseteq \Delta^n$ contains the spine $\mathrm{Spine}[n]$ of Example 1.5.7.7. The inclusion $\mathrm{Spine}[n] \hookrightarrow \Delta^n$ is inner anodyne (Example 1.5.7.7), and therefore a categorical equivalence. It will therefore suffice to show that the inclusion map $\mathrm{Spine}[n] \hookrightarrow K(A,B)$ is also a categorical equivalence. In fact, we will show that it is inner anodyne.

Write $A = \{a_0 < a_1 < \cdots < a_m\}$, where $a_0 = 0$ and $a_m = n$. Then $\mathrm{N}_\bullet(A)$ is the image of a nondegenerate m-simplex $\sigma : \Delta^m \to \Delta^n$, given by $\sigma(i) = a_i$. Let $K' \subseteq \Delta^n$ denote the simplicial subset consisting of simplices which satisfy condition (1): more concretely, K' is the union of the images of nondegenerate simplices

$$\tau_i : \Delta^{a_i - a_{i-1}} \to \Delta^n \qquad k \mapsto k + a_{i-1}.$$

Note that the inverse image $\sigma^{-1}(K')$ identifies with the spine $\mathrm{Spine}[m]$, so that we have a pushout diagram

$$\begin{tikzcd}
\mathrm{Spine}[m] \arrow[r] \arrow[d] & \Delta^m \arrow[d, "\sigma"] \\
K' \arrow[r] & K(A,B).
\end{tikzcd}$$

Since the inclusion map $\mathrm{Spine}[m] \hookrightarrow \Delta^m$ is inner anodyne (Example 1.5.7.7), it follows that the inclusion $K' \hookrightarrow K(A,B)$ is also inner anodyne. We are therefore reduced to showing that the inclusion map $\mathrm{Spine}[n] \hookrightarrow K'$ is inner anodyne. This follows from the observation that we also have a pushout diagram

$$\begin{tikzcd}
\coprod_{1 \leq i \leq m} \mathrm{Spine}[a_i - a_{i-1}] \arrow[r] \arrow[d] & \mathrm{Spine}[n] \arrow[d] \\
\coprod_{1 \leq i \leq m} \Delta^{a_i - a_{i-1}} \arrow[r, "\{\tau_i\}"] & K',
\end{tikzcd}$$

where the left vertical map is inner anodyne by virtue of Example 1.5.7.7. □

Proof of Proposition 9.1.2.16. Let $\mathcal{C}$ be an ∞-category, let W be a collection of morphisms of $\mathcal{C}$, and let $\overline{W}$ be the collection of morphisms which can be written as transfinite compositions of morphisms belonging to W. Suppose we are given a diagram $F : \mathrm{N}_\bullet(\mathrm{Ord}_{\leq \alpha}) \to \mathcal{C}$ which exhibits the underlying map $f : F(0) \to F(\alpha)$ as a transfinite composition of morphisms of $\overline{W}$. We wish to show that f also belongs to $\overline{W}$.

For each ordinal $\beta < \alpha$, let $u_\beta : F(\beta) \to F(\beta + 1)$ denote the morphism of $\mathcal{C}$ obtained by evaluating F on the pair $(\beta, \beta+1)$. By assumption, u_β belongs to $\overline{W}$. We can therefore choose a well-ordered set $(B(\beta), \leq_\beta)$ and a diagram $G_\beta : \mathrm{N}_\bullet(B(\beta))^{\triangleright} \to \mathcal{C}$ which exhibits u_β as a transfinite composition of morphisms of W, in the sense of Variant 9.1.2.3. Since W contains all isomorphisms in $\mathcal{C}$, we can assume without loss of generality that each $B(\beta)$ is nonempty (see Examples 9.1.2.4 and 9.1.2.5), and therefore contains a smallest element a_β. Let a_α be an auxiliary symbol, set $B(\alpha) = \{a_\alpha\}$, and let B denote the disjoint union $\coprod_{\beta \leq \alpha} B(\beta)$. Given elements $b \in B(\beta)$ and $b' \in B(\beta')$, we write $b \leq b'$ if either $\beta < \beta'$, or $\beta = \beta'$ and $b \leq_\beta b'$. Set $A = \{a_\beta\}_{\beta \leq \alpha} \subseteq B$. The construction $\beta \mapsto a_\beta$ determines an order-preserving bijection $\mathrm{Ord}_{\leq \alpha} \xrightarrow{\sim} A$, so that the diagram F can be identified with a functor from $\mathrm{N}_\bullet(A)$ to $\mathcal{C}$. For each $\beta < \alpha$, let us identify G_β with a functor from $\mathrm{N}_\bullet(B(\beta) \cup \{a_{\beta+1}\})$ to $\mathcal{C}$. Then the functors F and $\{G_\beta\}_{\beta < \alpha}$ determine a morphism of simplicial sets $H_0 : K(A,B) \to \mathcal{C}$, where $K(A,B) \subseteq \mathrm{N}_\bullet(B)$ is the simplicial subset appearing in the statement of Lemma 9.1.2.17. Since the inclusion map $K(A,B) \hookrightarrow \mathrm{N}_\bullet(B)$ is a categorical equivalence of simplicial sets, we can extend H_0 to a diagram $H : \mathrm{N}_\bullet(B) \to \mathcal{C}$.

Note that the linear ordering on B is a well-ordering, with largest element a_{α}. We claim that H exhibits f as a transfinite composition of morphisms of W, in the sense of Variant 9.1.2.3. It follows immediately from the construction that H carries the pair $(a_0 \leq a_{\alpha})$ to the morphism f. Moreover, if an element $b \in B$ has an immediate predecessor $b' \in B$, then there is a (unique) ordinal $\beta < \alpha$ such that both b and b' belong to $B(\beta) \cup \{a_{\beta+1}\}$; our assumption on G_{β} then guarantees that the morphism $H(b') \to H(b)$ belongs to W. To complete the proof, it will suffice to show that if $b \neq a_0$ is an element of B which does *not* have an immediate predecessor, then the restriction $H|_{\mathrm{N}_{\bullet}(B_{\leq b})}$ is a colimit diagram in the ∞-category $\mathcal{C}$. Note that b belongs to $B(\beta)$ for some unique ordinal $0 \leq \beta \leq \alpha$. We consider three cases:

- Suppose that b is not equal to a_{β}. In this case, the inclusion map $B(\beta)_{<b} \hookrightarrow B_{<b}$ is cofinal (in the sense of Definition 4.7.1.26), and therefore induces a right cofinal morphism of simplicial sets $\mathrm{N}_{\bullet}(B(\beta)_{<b}) \hookrightarrow \mathrm{N}_{\bullet}(B_{<b})$ (Corollary 7.2.3.4). Using Corollary 7.2.2.2, we are reduced to showing that the diagram $H|_{\mathrm{N}_{\bullet}(B(\beta)_{\leq b})}$ is a colimit diagram in $\mathcal{C}$, which follows from our assumption on G_{β}.

- Suppose that $b = a_{\beta}$ and that $\beta = \gamma + 1$ is a successor ordinal. In this case, the inclusion map $B_{\gamma} \hookrightarrow B_{<b}$ is cofinal, and therefore induces a right cofinal morphism of simplicial sets $\mathrm{N}_{\bullet}(B_{\beta}) \hookrightarrow \mathrm{N}_{\bullet}(B_{<b})$. The desired result now follows again Corollary 7.2.2.2, since the restriction $H|_{\mathrm{N}_{\bullet}(B_{\gamma} \cup \{b\})}$ can be identified with G_{γ} and is therefore a colimit diagram in the ∞-category $\mathcal{C}$.

- Suppose that $b = a_{\beta}$, where β is a nonzero limit ordinal. In this case, the inclusion map $A_{<b} \hookrightarrow B_{<b}$ is cofinal and therefore induces a right cofinal morphism of simplicial sets $\mathrm{N}_{\bullet}(A_{<b}) \hookrightarrow \mathrm{N}_{\bullet}(B_{<b})$. Using Corollary 7.2.2.2, we are reduced to showing that the restriction $H|_{\mathrm{N}_{\bullet}(A_{\leq b})}$ is a colimit diagram in $\mathcal{C}$. We conclude by observing that this restriction identifies with $F|_{\mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq \beta})}$.

□

Proposition 9.1.2.18. *Let $\mathcal{C}$ be an ∞-category, let W be a collection of morphisms of $\mathcal{C}$ which is closed under isomorphism, and let f be a morphism of $\mathcal{C}$ which is a transfinite composition of morphisms of W. If f is not an isomorphism, then it is a transfinite composition of morphisms of W which are not isomorphisms.* 04LE

Proof. Choose a diagram $F : \mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq \alpha}) \to \mathcal{C}$ which exhibits f as a transfinite composition of morphisms of W. For every pair of ordinals $0 \leq \gamma \leq \beta \leq \alpha$, let $u_{\beta,\gamma} : F(\beta) \to F(\gamma)$ denote the morphism of $\mathcal{C}$ obtained by evaluating F on the edge $(\gamma \leq \beta)$ of $\mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq \alpha})$. We write $\beta \sim \gamma$ if, for every ordinal λ satisfying $\gamma \leq \lambda \leq \beta$, the morphisms $u_{\beta,\lambda}$ and $u_{\lambda,\gamma}$ are both isomorphisms. It is not difficult to see that this is an equivalence relation on the set

$\mathrm{Ord}_{\leq \alpha}$. For every ordinal $\beta \leq \alpha$, the equivalence class of β contains a smallest element which we will denote by β_- (since $\mathrm{Ord}_{\leq \alpha}$ is well-ordered), and a largest element which we will denote by β_+ (since the collection of isomorphisms is closed under transfinite composition; see Corollary 9.1.2.12).

Choose a subset $A \subseteq \mathrm{Ord}_{\leq \alpha}$ which contains exactly one representative of each $\sim$-equivalence class. Our assumption that $f = u_{\alpha,0}$ is not an isomorphism guarantees that 0 and α belong to different equivalence classes; we can therefore arrange that both 0 and α are contained in A. We will complete the proof by showing that the diagram $F|_{\mathrm{N}_\bullet(A)}$ exhibits f as a transfinite composition of morphisms of W which are not isomorphisms (in the sense of Variant 9.1.2.3).

For any pair of ordinals $\gamma < \beta$ which belong to A, we have inequalities $\gamma \leq \gamma_+ < \beta_- \leq \beta$. Then $u_{\beta,\gamma}$ factors as a composition

$$F(\gamma) \xrightarrow{u_{\gamma_+,\gamma}} F(\gamma_+) \xrightarrow{u_{\beta_-,\gamma_+}} F(\beta_-) \xrightarrow{u_{\beta,\beta_-}} F(\beta),$$

where the maps on the left and right are isomorphisms. In particular, $u_{\beta,\gamma}$ is isomorphic to u_{β_-,γ_+} as an object of the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$. If β is an immediate successor of γ in A, then β_- is an immediate successor of γ_+ in $\mathrm{Ord}_{\leq\alpha}$. Our assumption on F then guarantees that u_{β_-,γ_+} is contained in W. Since W is closed under isomorphism, it follows that $u_{\beta,\gamma}$ is also contained in W. Moreover, $u_{\beta,\gamma}$ cannot be an isomorphism (otherwise we would have $\beta \sim \gamma$, contradicting our assumption that A contains exactly one representative of each equivalence class).

For each element $\beta \in A$, set $A_{\leq \beta} = \{\gamma \in A : \gamma \leq \beta\}$ and $A_{<\beta} = \{\gamma \in A : \gamma < \beta\}$. To complete the proof, it will suffice to show that if $\beta \neq 0$ is not the immediate successor of another element of A, then the restriction $F|_{\mathrm{N}_\bullet(A_{\leq\beta})}$ is a colimit diagram in the ∞-category $\mathcal{C}$. Since u_{β,β_-} is an isomorphism, it will suffice to show that $G = F|_{\mathrm{N}_\bullet(A_{<\beta} \cup \{\beta_-\})}$ is a colimit diagram (Corollary 7.1.2.14). Our assumption that β has no immediate predecessor in A guarantees that β_- is a limit ordinal and that $A_{<\beta}$ is a cofinal subset of in $\mathrm{Ord}_{<\beta_-}$. It follows that the inclusion map $\mathrm{N}_\bullet(A_{<\beta}) \hookrightarrow \mathrm{N}_\bullet(\mathrm{Ord}_{<\beta})$ is right cofinal (Corollary 7.2.3.4). The desired result now follows from Corollary 7.2.2.2, since the restriction $F|_{\mathrm{N}_\bullet(\mathrm{Ord}_{\leq\beta_-})}$ is a colimit diagram in $\mathcal{C}$. □

04LF **Corollary 9.1.2.19.** *Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$ which is closed under isomorphism. Then a morphism f of $\mathcal{C}$ belongs to the transfinite closure of W if and only if f is either an isomorphism or a transfinite composition of morphisms of W.*

Proof. Assume that f belongs to the transfinite closure of W; we will show that f is either an isomorphism or a transfinite composition of morphisms of W (the converse is clear, since the transfinite closure of W contains all isomorphisms: see Remark 9.1.2.8). Let W^+ be the union of W with the collection of all identity morphisms of $\mathcal{C}$. Applying Proposition 9.1.2.16, we see that f is a transfinite composition of morphisms of W^{+}. If f is not an isomorphism, then Proposition 9.1.2.18 guarantees that f is a transfinite composition of morphisms which belong to W^{+} and are not isomorphism, and therefore belong to W. □

9.1.3 Weakly Local Objects

Let $\mathcal{C}$ be a category and let W be a collection of morphisms of $\mathcal{C}$. By definition, an object $C \in \mathcal{C}$ is W-local (in the sense of Definition 9.1.1.1) if, for every morphism $f : X \to C$ in $\mathcal{C}$ and every morphism $w : X \to Y$ which belongs to W, there is a unique morphism $g : Y \to C$ satisfying $g \circ w = f$, as indicated in the diagram 04LG

$$\begin{tikzcd}
 & Y \arrow[dr, dashed, "g"] & \\
X \arrow[ur, "w"] \arrow[rr, "f"] & & C.
\end{tikzcd}$$

It will sometimes be useful to consider the following weaker condition:

Definition 9.1.3.1. Let $\mathcal{C}$ be a category and let $w : X \to Y$ be a morphism of $\mathcal{C}$. We say that an object $C \in \mathcal{C}$ is *weakly w-local* if, for every morphism $f : X \to C$ of $\mathcal{C}$, there exists a morphism $g : Y \to C$ satisfying $g \circ w = f$. If W is a collection of morphisms of $\mathcal{C}$, we say that C is *weakly W-local* if it is weakly w-local for each $w \in W$. 04LH

Example 9.1.3.2 (Kan Complexes)**.** Let $\mathcal{C} = \mathrm{Set}_{\Delta}$ be the category of simplicial sets and let W be the collection of all horn inclusions $\Lambda^n_i \hookrightarrow \Delta^n$, where $n > 0$ and $0 \leq i \leq n$. Then a simplicial set is weakly W-local if and only if it is a Kan complex. 04LJ

Example 9.1.3.3 (∞-Categories)**.** Let $\mathcal{C} = \mathrm{Set}_{\Delta}$ be the category of simplicial sets and let W be the collection of all inner horn inclusions $\Lambda^n_i \hookrightarrow \Delta^n$, where $0 < i < n$. Then a simplicial set is weakly W-local if and only if it is an ∞-category. 04LK

Example 9.1.3.4 (Contractible Kan Complexes)**.** Let $\mathcal{C} = \mathrm{Set}_{\Delta}$ be the category of simplicial sets and let W be the collection of inclusion maps $\partial \Delta^n \hookrightarrow \Delta^n$. Then a simplicial set is weakly W-local if and only if it is a contractible Kan complex. 04LL

Definition 9.1.3.1 has an obvious counterpart in the setting of ∞-categories:

Definition 9.1.3.5. Let $\mathcal{C}$ be an ∞-category and let $w : X \to Y$ be a morphism of $\mathcal{C}$. We say that an object $C \in \mathcal{C}$ is *weakly w-local* if, for every morphism $f : X \to C$, there exists a 04LM

2-simplex with boundary indicated in the diagram

$$\begin{tikzcd}
 & Y \arrow[dr, dashed] & \\
X \arrow[ur, "w"] \arrow[rr, "f"] & & C.
\end{tikzcd}$$

If W is a collection of morphisms of $\mathcal{C}$, we say that an object $C \in \mathcal{C}$ is *weakly W-local* if it is weakly w-local for each $w \in W$.

04LN **Example 9.1.3.6.** Let $\mathcal{C}$ be a category and let W be a collection of morphisms of $\mathcal{C}$. Then an object $C \in \mathcal{C}$ is weakly W-local (in the sense of Definition 9.1.3.1) if and only if it is weakly W-local when regarded as an object of the ∞-category $\mathrm{N}_\bullet(\mathcal{C})$ (in the sense of Definition 9.1.3.5).

04LP **Remark 9.1.3.7.** Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$. It follows from Proposition 1.4.4.2 that an object $C \in \mathcal{C}$ is weakly W-local if and only if, for every morphism $w : X \to Y$ which belongs to W, composition with the homotopy class $[w]$ induces a surjection $\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(Y, C) \to \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(X, C)$. In other words, the object C is weakly W-local (in the sense of Definition 9.1.3.5) if and only if it is weakly $[W]$-local when regarded as an object of the homotopy category $\mathrm{h}\mathcal{C}$ (in the sense of Definition 9.1.3.1). Here $[W] = \{[w] : w \in W\}$ denotes the collection of all homotopy classes of morphisms which belong to W.

04LQ **Example 9.1.3.8.** Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$. If an object $C \in \mathcal{C}$ is W-local (in the sense of Definition 9.1.1.1), then it is weakly W-local.

04LR **Example 9.1.3.9.** Let $\mathcal{C}$ be an ∞-category and let $w : X \to Y$ a morphism of $\mathcal{C}$ which admits a left homotopy inverse $r : Y \to X$. Then every object $C \in \mathcal{C}$ is weakly w-local. In particular, if w is an isomorphism, then every object of $\mathcal{C}$ is weakly w-local.

04LS **Remark 9.1.3.10.** Let $\mathcal{C}$ be an ∞-category containing a 2-simplex

$$\begin{tikzcd}
 & Y \arrow[dr, "v"] & \\
X \arrow[ur, "u"] \arrow[rr, "w"] & & Z.
\end{tikzcd}$$

If an object $C \in \mathcal{C}$ is weakly u-local and weakly v-local, then it is weakly w-local. Conversely, if C is weakly w-local, then it is weakly u-local.

Remark 9.1.3.11. Let $\mathcal{C}$ be an ∞-category, let W be a collection of morphisms of $\mathcal{C}$, and let $C \in \mathcal{C}$ be an object which factors as a product of some collection of objects $\{C_i\}_{i \in I}$ (see Definition 7.6.1.3). If each C_i is weakly W-local, then C is weakly W-local. In particular, any final object of $\mathcal{C}$ is weakly W-local. 04LT

Remark 9.1.3.12. Let $\mathcal{C}$ be an ∞-category, let W be a collection of morphisms of $\mathcal{C}$, and let $C \in \mathcal{C}$ be an object. If C is weakly W-local, then any retract of C is also weakly W-local. In particular, the condition that C is weakly W-local depends only on the isomorphism class of C. 04LU

Variant 9.1.3.13. Let $\mathcal{C}$ be an ∞-category, let $w : X \to Y$ and $w' : X' \to Y'$ be morphisms of $\mathcal{C}$, and suppose that w' is a retract of w (in the ∞-category $\operatorname{Fun}(\Delta^1, \mathcal{C})$). If an object $C \in \mathcal{C}$ is weakly w-local, then it is also weakly w'-local. In particular, if we regard the object $C \in \mathcal{C}$ is fixed, then the condition that C is w-local depends only on the isomorphism class of w (as an object of $\operatorname{Fun}(\Delta^1, \mathcal{C})$). 04LV

Proposition 9.1.3.14. *Let $\mathcal{C}$ be an ∞-category containing a pushout diagram* 04LW

04LX
$$\begin{tikzcd}
X \arrow[r] \arrow[d, "w"] & X' \arrow[d, "w'"] \\
Y \arrow[r] & Y'.
\end{tikzcd} \tag{9.3}$$

If an object $C \in \mathcal{C}$ is weakly w-local, then it is also weakly w'-local.

Proof. We have a commutative diagram of sets

$$\begin{tikzcd}
\operatorname{Hom}_{h\mathcal{C}}(Y', C) \arrow[r] & \operatorname{Hom}_{h\mathcal{C}}(X', C) \times_{\operatorname{Hom}_{h\mathcal{C}}(X,C)} \operatorname{Hom}_{h\mathcal{C}}(Y, C) \arrow[r] \arrow[d] & \operatorname{Hom}_{h\mathcal{C}}(X', C) \arrow[d] \\
 & \operatorname{Hom}_{h\mathcal{C}}(Y, C) \arrow[r, "\circ[w]"] & \operatorname{Hom}_{h\mathcal{C}}(X, C),
\end{tikzcd}$$

where the square on the right is a pullback. Our assumption that C is weakly w-local guarantees that the bottom horizontal map is surjective, so that the upper horizontal map on the right is also surjective. Since Proposition 9.3 is a pushout square, the horizontal map on the upper left is also surjective (Warning 7.6.3.3). It follows that the composite map $\operatorname{Hom}_{h\mathcal{C}}(Y', C) \xrightarrow{\circ[w']} \operatorname{Hom}_{h\mathcal{C}}(X', C)$ is also surjective. $\square$

Example 9.1.3.8 admits the following partial converse:

04LY **Proposition 9.1.3.15.** *Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$. Suppose that every morphism $w : X \to Y$ of W admits a relative codiagonal $\gamma_{X/Y} : Y \coprod_X Y \to Y$ which also belongs to W (Variant 7.6.3.19). Then an object $C \in \mathcal{C}$ is W-local if and only if it is weakly W-local.*

Proof. Fix an object $C \in \mathcal{C}$, and let $h_C : \mathcal{C}^{\mathrm{op}} \to \mathcal{S}$ denote the functor represented by C. We wish to show that, for every morphism $w : X \to Y$ which belongs to W, the image $h_C(w)$ is a homotopy equivalence of Kan complexes. By virtue of Remark 3.5.1.19, it will suffice to show that $h_C(w)$ is n-connective for every integer $n \geq 0$. The proof proceeds by induction on n. In the case $n = 0$, we wish to show that the composition map $\mathrm{Hom}_{\mathcal{C}}(Y, C) \to \mathrm{Hom}_{\mathcal{C}}(X, C)$ is surjective on connected components, which follows from our assumption that C is weakly W-local. Let us therefore assume that $n > 0$. Using the criterion of Corollary 3.5.1.29 (together with Exercise 7.6.4.13), we are reduced to proving the $(n-1)$-connectivity of the relative diagonal of $h_C(w)$ (formed in the ∞-category $\mathcal{S}$). Since the functor h_C preserves limits (Proposition 7.4.5.17), we can identify the relative diagonal of $h_C(w)$ with $h_C(\gamma_{X/Y})$, where $\gamma_{X/Y} : Y \coprod_X Y \to Y$ denotes a relative codiagonal of w. By assumption, we can arrange that $\gamma_{X/Y}$ is also contained in W, so the desired result follows from our inductive hypothesis. $\square$

04LZ **Exercise 9.1.3.16.** Let $\mathcal{C}$ be an ∞-category and let $w : X \to Y$ be a morphism of $\mathcal{C}$ which admits a relative codiagonal $\gamma_{X/Y} : Y \coprod_X Y \to Y$. Show that an object $C \in \mathcal{C}$ is w-local if and only if it is both $\gamma_{X/Y}$-local and weakly w-local.

We have the following ∞-categorical counterpart of Proposition 1.5.4.11:

04M0 **Proposition 9.1.3.17.** *Let $\mathcal{C}$ be an ∞-category, let $C \in \mathcal{C}$ be an object, and let W be the collection of morphisms $w : X \to Y$ in $\mathcal{C}$ such that C is weakly w-local. Then W is closed under transfinite composition (see Definition 9.1.2.1).*

Proof. Let $U : \mathcal{C}_{/C} \to \mathcal{C}$ be the projection map and let $f : X \to Y$ be a morphism of $\mathcal{C}$ which can be written as a transfinite composition of morphisms of $\mathcal{C}$. Suppose we are given a morphism $X \to C$ in $\mathcal{C}$, which we identify with an object $\widetilde{X} \in \mathcal{C}_{/C}$ satisfying $U(\widetilde{X}) = X$. We wish to show that there is a morphism $\widetilde{f} : \widetilde{X} \to \widetilde{Y}$ of $\mathcal{C}_{/C}$ satisfying $U(\widetilde{f}) = f$.

Choose an ordinal α and a functor $F : \mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq \alpha}) \to \mathcal{C}$ which exhibits f as a transfinite composition of morphisms of W. Let Q be the collection of all ordered pairs $(\beta, \widetilde{F}_{\leq \beta})$, where $\beta \leq \alpha$ is an ordinal and $\widetilde{F}_{\leq \beta} : \mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq \beta}) \to \mathcal{C}_{/C}$ is a functor satisfying $\widetilde{F}_{\leq \beta}(0) = \widetilde{X}$ and $U \circ \widetilde{F}_{\leq \beta} = F|_{\mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq \beta})}$. We regard Q as a partially ordered set, where $(\beta, \widetilde{F}_{\leq \beta}) \leq (\beta', \widetilde{F}'|_{\leq \beta'})$ if $\beta \leq \beta'$ and $\widetilde{F}_{\leq \beta} = \widetilde{F}'_{\leq \beta'}|_{\mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq \beta})}$.

We first claim that Q satisfies the hypotheses of Zorn's lemma. Let $Q_0 \subseteq Q$ be a linearly ordered subset of Q; we wish to show that Q_0 admits an upper bound. If Q_0 is empty, we can take this upper bound be the pair $(0, \widetilde{F}_{\leq 0})$, where $\widetilde{F}_{\leq 0}$ is the constant functor taking the value $\widetilde{X}$. Without loss of generality, we may assume that Q_0 does not contain a maximal element (otherwise, there is nothing to prove). Write $Q_0 = \{(\beta_i, \widetilde{F}_{\leq \beta_i})\}_{i \in I}$ and let $\beta \leq \alpha$ be the supremum of the set $\{\beta_i\}_{i \in I}$. The functors $\widetilde{F}_{\leq \beta_i}$ can then be amalgamated to a single functor $\widetilde{F}_{<\beta} : \mathrm{N}_{\bullet}(\mathrm{Ord}_{<\beta}) \to \mathcal{C}_{/C}$. To find an upper bound for Q_0, it will suffice to show that the lifting problem

$$\begin{tikzcd}
\mathrm{N}_{\bullet}(\mathrm{Ord}_{<\beta}) \arrow[r, "\widetilde{F}_{<\beta}"] \arrow[d] & \mathcal{C}_{/C} \arrow[d, "U"] \\
\mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq\beta}) \arrow[r, "F|_{\mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq\beta})}"] & \mathcal{C}
\end{tikzcd}$$

admits a solution. This follows immediately from our assumption that $F|_{\mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq\beta})}$ is a colimit diagram in $\mathcal{C}$.

Applying Zorn's lemma, we deduce that Q contains a maximal element $(\beta, \widetilde{F}_{\leq\beta})$. To complete the proof, it will suffice to show that $\beta = \alpha$; we can then take $\widetilde{f}$ to be obtained by applying the functor $\widetilde{F}$ to the edge of $\mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq\alpha})$ given by the pair $(0, \alpha)$. Assume otherwise, let $F_{\leq\beta}$ denote the restriction $F|_{\mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq\beta})}$, and let $\mathcal{D}$ denote the coslice ∞-category $\mathcal{C}_{F_{\leq\beta}/}$. Then $F_{\leq\beta+1}$ and $\widetilde{F}_{\leq\beta}$ can be identified with objects $D, D' \in \mathcal{D}$, and the maximality of $(\beta, \widetilde{F}_{\leq\beta})$ guarantees that $\mathrm{Hom}_{\mathcal{D}}(D, D') = \emptyset$. Since the inclusion map $\{\beta\} \hookrightarrow \mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq\beta})$ is right anodyne (Corollary 4.6.7.24), the restriction map $V : \mathcal{D} = \mathcal{C}_{F_{\leq\beta}/} \to \mathcal{C}_{F(\beta)/}$ is a trivial Kan fibration (Corollary 4.3.6.13). It follows that the mapping space $\mathrm{Hom}_{\mathcal{C}_{F(\beta)/}}(V(D), V(D'))$ is also empty: that is, there is no 2-simplex of $\mathcal{C}$ with boundary indicated in the diagram

$$\begin{tikzcd}
 & F(\beta+1) \arrow[dr, dashed] & \\
F(\beta) \arrow[ur] \arrow[rr] & & C.
\end{tikzcd}$$

This contradicts our assumption that the morphism $F(\beta) \to F(\beta+1)$ belongs to W. □

Variant 9.1.3.18. Let $\mathcal{C}$ be an ∞-category, let $C \in \mathcal{C}$ be an object, and let W be the collection of morphisms $w : X \to Y$ in $\mathcal{C}$ such that C is w-local. Then W is closed under transfinite composition. 04M1

Proof. Let $\mathcal{C}$ be an ∞-category, let $C \in \mathcal{C}$ be an object, and let W be the collection of morphisms w of $\mathcal{C}$ such that C is w-local. Then W contains all identity morphisms, is closed under composition (Remark 9.1.1.11), and is closed under the formation of colimits in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$ which are preserved by the evaluation functors $\mathrm{ev}_0, \mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathcal{C}$

(Remark 9.1.1.9). Applying Proposition 9.1.2.10 (and Remark 9.1.2.11), we conclude that W is closed under transfinite composition. □

We now introduce some terminology which is motivated by the preceding discussion.

04M2 **Definition 9.1.3.19.** Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$. We will say that W is *weakly saturated* if it satisfies the following conditions:

(1) The collection W is closed under pushouts: that is, for every pushout diagram

$$\begin{tikzcd}
X \arrow[r] \arrow[d, "w"] & X' \arrow[d, "w'"] \\
Y \arrow[r] & Y'
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$, if w belongs to W, then w' also belongs to W.

(2) The collection W is closed under the formation of retracts (in the ∞-category $\operatorname{Fun}(\Delta^1, \mathcal{C})$).

(3) The collection W is closed under transfinite composition (Definition 9.1.2.1).

04M3 **Remark 9.1.3.20.** Let $\mathcal{C} = \mathrm{N}_{\bullet}(\mathcal{C}_0)$ be the nerve of an ordinary category $\mathcal{C}_0$. Then a collection of morphisms of $\mathcal{C}$ is weakly saturated (in the sense of Definition 9.1.3.19) if and only if is weakly saturated when regarded as a collection of morphisms of $\mathcal{C}_0$ (in the sense of Definition 1.5.4.12).

04M4 **Example 9.1.3.21.** Let $\mathcal{C}$ be an ∞-category, let $C \in \mathcal{C}$ be an object, and let W be the collection of all morphisms $w : X \to Y$ of $\mathcal{C}$ such that C is weakly w-local. Then W is weakly saturated. This follows from Proposition 9.1.3.14, Variant 9.1.3.13, and Proposition 9.1.3.17.

04M5 **Variant 9.1.3.22.** Let $\mathcal{C}$ be an ∞-category, let $C \in \mathcal{C}$ be an object, and let W be the collection of all morphisms $w : X \to Y$ of $\mathcal{C}$ such that C is w-local. Then W is weakly saturated. This follows from Remark 9.1.1.10, Remark 9.1.1.11, and Variant 9.1.3.18.

04M6 **Remark 9.1.3.23.** Let $\mathcal{C}$ be an ∞-category. Any intersection of weakly saturated collections of morphisms of $\mathcal{C}$ is also weakly saturated. In particular, for any collection W of morphisms of $\mathcal{C}$, there is a smallest collection $\overline{W}$ which is weakly saturated and contains W. We will refer to $\overline{W}$ as the *weakly saturated collection generated by* W.

9.1.4 The Small Object Argument

In §3.1.7, we showed that every simplicial set X admits an anodyne morphism $X \hookrightarrow Q$, where Q is a Kan complex (Corollary 3.1.7.2). The proof is easy to describe: if X is not a Kan complex, then there is some horn $\sigma_0 : \Lambda^n_i \to X$ which cannot be extended to an n-simplex of X. This defect can be remedied by replacing X by the pushout $\Delta^n \coprod_{\Lambda^n_i} X$. The desired Kan complex Q is obtained by a (possibly transfinite) iteration of this procedure. A similar strategy can be used to prove many related results (see for example Exercise 3.1.7.11, Proposition 4.1.3.2, and Proposition 4.2.4.7). Following Quillen ([46]), we will refer to this proof strategy as the *small object argument*. Our goal in this section is to formalize a version of this argument in the ∞-categorical setting. First, we need a bit of terminology. 04M7

Definition 9.1.4.1. Let $\mathcal{C}$ be an ∞-category, let W be a collection of morphisms of $\mathcal{C}$, and let W' denote the collection of those morphisms $w' : X' \to Y'$ for which there exists a pushout square 04M8

$$\begin{tikzcd}
X \arrow[r] \arrow[d, "w"] & X' \arrow[d, "w'"] \\
Y \arrow[r] & Y',
\end{tikzcd}$$

where $w \in W$. We say that a morphism f of $\mathcal{C}$ is a *transfinite pushout of morphisms of* W if it is a transfinite composition of morphisms of W', in the sense of Definition 9.1.2.1.

Remark 9.1.4.2. Let $\mathcal{C}$ be an ∞-category, let W be a collection of morphisms of $\mathcal{C}$, and let $f : X \to Y$ be a morphism of $\mathcal{C}$ which is a transfinite pushout of morphisms which belong to W. Then: 04M9

- If an object $C \in \mathcal{C}$ is weakly W-local, then it is weakly f-local.
- If an object $C \in \mathcal{C}$ is W-local, then it is f-local.

The first assertion follows from Propositions 9.1.3.14 and 9.1.3.17; the second follows from Remark 9.1.1.10 and Variant 9.1.3.18.

We can now formulate the main result of this section:

Theorem 9.1.4.3 (The Small Object Argument)**.** *Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$. Assume that:* 04MA

- *The ∞-category $\mathcal{C}$ is locally small and admits small colimits.*
- *The collection W is small.*

- *For each morphism $w : X \to Y$ which belongs to W, the object $X \in \mathcal{C}$ is κ-compact for some small cardinal κ (see Definition [?]).*

For every object $C \in \mathcal{C}$, there exists a morphism $f : C \to C'$ where C' is weakly W-local and f is a transfinite pushout of morphisms of W.

04MB **Warning 9.1.4.4.** If $\mathcal{C}$ is (the nerve of) an ordinary category, then the morphism $f : C \to C'$ of Theorem 9.1.4.3 can be chosen to depend functorially on C. Beware that this is generally not possible if $\mathcal{C}$ is an ∞-category (see Example 9.1.4.5).

04MC **Example 9.1.4.5.** Fix an integer $n \geq 0$. Let $\mathcal{C} = \mathcal{S}$ be the ∞-category of spaces and let W be the collection of morphisms of $\mathcal{C}$ given by the inclusion maps $\{\mathrm{Ex}^{\infty}(\partial \Delta^m) \hookrightarrow \mathrm{Ex}^{\infty}(\Delta^m)\}_{0 \leq m \leq n}$. Then an object $X \in \mathcal{C}$ weakly W-local if and only if it is n-connective (see Definition 3.5.1.1). In this case, Theorem 9.1.4.3 asserts that every Kan complex X admits a morphism $f : X \to Y$, where Y is an n-connective Kan complex which can be obtained from X by attaching cells of dimension $\leq n$. Beware that, if $n > 0$, then Y cannot be chosen to depend functorially on X.

04MD **Corollary 9.1.4.6.** *Let $\mathcal{C}$ be an ∞-category, let W be a collection of morphisms of $\mathcal{C}$, and let $\mathcal{C}' \subseteq \mathcal{C}$ be the full subcategory spanned by the W-local objects. Assume that:*

- *The ∞-category $\mathcal{C}$ is locally small and admits small colimits.*
- *The collection W is small.*
- *For each morphism $w : X \to Y$ which belongs to W, the objects X and Y are κ-compact for some small infinite cardinal κ.*

Then $\mathcal{C}'$ is a reflective localization of $\mathcal{C}$.

Proof. For each morphism $w : X \to Y$ of $\mathcal{C}$, choose a morphism $\delta_w : Y \coprod_X Y \to Y$ which is a relative codiagonal of w (see Variant 7.6.3.19). Note that, if X and Y are κ-compact for some infinite cardinal κ, then the pushout $Y \coprod_X Y$ is also κ-compact (Proposition [?]). Let W' be the smallest collection of morphisms of $\mathcal{C}$ which contains W and is closed under the construction $w \mapsto \gamma_w$. By virtue of Remark 9.1.1.12, an object of $\mathcal{C}$ is W-local if and only if it is W'-local. We may therefore replace W by W' and thereby reduce to proving Corollary 9.1.4.6 in the special case where W is closed under the formation of relative codiagonals.

Fix an object $C \in \mathcal{C}$. Using Theorem 9.1.4.3, we see that there exists a morphism $f : C \to C'$, where C' is weakly W-local and f is a transfinite pushout of morphisms which belong to W. Using Proposition 9.1.3.15, we see that C' belongs to the subcategory $\mathcal{C}' \subseteq \mathcal{C}$. To complete the proof, it will suffice to show that f exhibits C' as a $\mathcal{C}'$-reflection of C: that is, every object of $\mathcal{C}'$ is f-local. This follows from Remark 9.1.4.2. □

Our proof of Theorem 9.1.4.3 will require some preliminaries.

Lemma 9.1.4.7. *Let $\mathcal{C}$ be an ∞-category which admits small colimits, let $\{w_s : X_s \to Y_s\}_{s \in S}$ be a small collection of morphisms of $\mathcal{C}$ indexed by a set S, let $\{e_s : X_s \to C\}_{s \in S}$ be another collection of morphisms of $\mathcal{C}$, and let D be a colimit of the diagram* 04ME

$$(S \times \Delta^1) \coprod_{S \times \{0\}} S^{\triangleright} \xrightarrow{(\{w_s\}, \{e_s\})} \mathcal{C}.$$

Then the tautological map $u : C \to D$ is a transfinite pushout of morphisms belonging to $\{w_s\}_{s \in S}$.

Proof. Using the well-ordering theorem (Theorem 4.7.1.34), we can choose an ordinal α and a bijection $\ell : S \to \mathrm{Ord}_{<\alpha}$. Let Q denote the disjoint union $(S \times [1]) \coprod \mathrm{Ord}_{\leq \alpha}$. For elements $q, q' \in Q$, we write $q \leq q'$ if (exactly) one of the following conditions holds:

- There exist an element $s \in S$ such that $q = (s, i)$ and $q' = (s, i')$, where $i \leq i'$.
- We have $q = \beta$ and $q' = \beta'$ for ordinals $\beta, \beta' \in \mathrm{Ord}_{\leq \alpha}$ satisfying $\beta \leq \beta'$ (for the usual ordering of $\mathrm{Ord}_{\leq \alpha}$).
- We have $q = (s, 0)$ for some $s \in S$ and $q' = \beta$ for some $\beta \in \mathrm{Ord}_{\leq \alpha}$.
- We have $q = (s, 1)$ and $q' = \beta$ for some $\beta \in \mathrm{Ord}_{\leq \alpha}$ satisfying $\ell(s) < \beta$.

Let $Q_0 = (S \times [1]) \coprod \{0\}$, which we regard as a partially ordered subset of Q. By construction, the nerve $N_{\bullet}(Q_0)$ can be identified with the pushout $(S \times \Delta^1) \coprod_{S \times \{0\}} S^{\triangleright}$. Consequently, the collections $\{e_s\}_{s \in S}$ and $\{w_s\}_{s \in S}$ determine a diagram $F_0 : N_{\bullet}(Q_{\leq 0}) \to \mathcal{C}$. Since $\mathcal{C}$ admits small colimits, the diagram F_0 admits a left Kan extension $F : N_{\bullet}(Q) \to \mathcal{C}$ (Proposition 7.6.7.13). Then $D = F(\alpha)$ is a colimit of the diagram F_0, and we can identify u with the morphism obtained by evaluating the functor F on the edge of $N_{\bullet}(Q)$ given by the pair $(0 \leq \alpha)$. We will show that the restriction $F|_{N_{\bullet}(\mathrm{Ord}_{\leq \alpha})}$ exhibits u as a transfinite pushout of morphisms belonging to $\{w_s\}_{s \in S}$.

We first claim that that if $\beta \leq \alpha$ is a nonzero limit ordinal, then the restriction $F|_{N_{\bullet}(\mathrm{Ord}_{\leq \beta})}$ is a colimit diagram in $\mathcal{C}$. Set $Q_{\leq \beta} = \{q \in Q : q \leq \beta\}$ and $Q_{<\beta} = \{q \in Q : q < \beta\}$. Since the functor F is left Kan extended from $N_{\bullet}(Q_0)$, it is also left Kan extended from larger ∞-category $N_{\bullet}((S \times [1]) \coprod \mathrm{Ord}_{<\beta})$ (see Corollary 7.3.8.8). It follows that $F|_{N_{\bullet}(Q_{\leq \beta})}$ is a colimit diagram in $\mathcal{C}$. It will therefore suffice to show that $N_{\bullet}(\iota)$ is right cofinal, where ι denotes the inclusion map $\mathrm{Ord}_{<\beta} \hookrightarrow Q_{<\beta}$ (Corollary 7.2.2.2). This is a special case of Corollary 7.2.3.7, since ι admits a left adjoint (given on $S \times [1]$ by the construction $(s, 0) \mapsto 0$ and $(s, 1) \mapsto \ell(s) + 1$).

Now suppose that $\beta = \gamma + 1$ is a successor ordinal. Let $s \in S$ be the unique element satisfying $\ell(s) = \gamma$. We will complete the proof by showing that the morphism $F(\gamma) \to F(\beta)$

in $\mathcal{C}$ can be realized as a pushout of w_s. More precisely, we will show that the functor F carries the diagram

$$\begin{tikzcd}
(s,0) \arrow[r] \arrow[d] & (s,1) \arrow[d] \\
\gamma \arrow[r] & \beta
\end{tikzcd}$$

in $\mathrm{N}_\bullet(Q)$ to a pushout diagram in the ∞-category $\mathcal{C}$. Arguing as above, we see that the restriction $F|_{Q_{\leq \beta}}$ is a colimit diagram. Using Corollary 7.2.2.2 again, we are reduced to showing that $\mathrm{N}_\bullet(\iota)$ is right cofinal, where ι denotes the inclusion of partially ordered sets $\{(s,1) > (s,0) < \beta\} \hookrightarrow Q_{<\beta}$. This again follows from Corollary 7.2.3.7, since ι admits a left adjoint given by the construction

$$(q \in Q_{<\beta}) \mapsto \begin{cases} q & \text{if } q = (s,0) \text{ or } q = (s,1) \\ \beta & \text{otherwise.} \end{cases}$$

□

04MF **Lemma 9.1.4.8.** *Let $\mathcal{C}$ be a locally small ∞-category which admits small colimits, and let W be a small collection of morphisms of $\mathcal{C}$. For every object $C \in \mathcal{C}$, there exists a morphism $u : C \to D$ which is a transfinite pushout of morphisms of W with the following property: for every morphism $w : X \to Y$ which belongs to W and every morphism $e : X \to C$, there exists a commutative diagram*

$$\begin{tikzcd}
X \arrow[r, "w"] \arrow[d, "e"] & Y \arrow[d] \\
C \arrow[r, "u"] & D
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$.

Proof. For each morphism $w : X \to Y$ belonging to W, let $\{f_s : X \to C\}_{s \in S_w}$ be a set of representatives for the homotopy classes of morphisms from X to C. Since $\mathcal{C}$ is locally small, the collection S_w is small. Our assumption that W is small then guarantees that the disjoint union $S = \coprod_{w \in W} S_w$ is small. The desired result now follows by applying Lemma 9.1.4.7 to the collection of morphisms $\{f_s\}_{s \in S}$. □

04MG **Lemma 9.1.4.9.** *Let $\mathcal{C}$ be an ∞-category which admits small filtered colimits. Let U be a collection of morphisms with the following property: for every object $D \in \mathcal{C}$, there exists a morphism $u : D \to E$ which belongs to U. Then, for every object $C \in \mathcal{C}$ and every (small) ordinal α, there exists a diagram $F : \mathrm{N}_\bullet(\mathrm{Ord}_{\leq \alpha}) \to \mathcal{C}$ satisfying the following conditions:*

(*a*) *For every nonzero limit ordinal* $\lambda \leq \alpha$*, the restriction* $F|_{\mathrm{N}_\bullet(\mathrm{Ord}_{\leq \lambda})}$ *is a colimit diagram.*

(*b*) *For every ordinal* $\gamma < \alpha$*, the morphism* $F(\gamma) \to F(\gamma+1)$ *belongs to* U*.*

(*c*) *The object* $F(0)$ *coincides with* C*.*

Proof. Let Q denote the collection of all diagrams $F_\beta : \mathrm{N}_\bullet(\mathrm{Ord}_{\leq \beta}) \to \mathcal{C}$ satisfying conditions (*a*), (*b*), and (*c*), where β is an ordinal $\leq \alpha$. We regard Q as a partially ordered set, where $F_\beta \leq F_{\beta'}$ if $\beta \leq \beta'$ and $F_\beta = F_{\beta'}|_{\mathrm{N}_\bullet(\mathrm{Ord}_{\leq \beta})}$. Note that Q is nonempty: it has a least element given by the diagram $\mathrm{N}_\bullet(\mathrm{Ord}_{\leq 0}) \simeq \{C\} \hookrightarrow \mathcal{C}$ taking the value C. We claim that Q satisfies the hypothesis of Zorn's lemma: that is, every linearly ordered set $Q' \subset Q$ admits an upper bound. Without loss of generality, we may assume that Q' is nonempty and has no largest element. In this case, the elements of Q' can be amalgamated to a diagram $F_{<\lambda} : \mathrm{N}_\bullet(\mathrm{Ord}_{<\lambda}) \to \mathcal{C}$, where $\lambda \leq \alpha$ is a nonzero limit ordinal. Our assumption on $\mathcal{C}$ then guarantees that $F_{<\lambda}$ can be extended to a colimit diagram

$$F_\lambda : \mathrm{N}_\bullet(\mathrm{Ord}_{\leq \lambda}) \simeq \mathrm{N}_\bullet(\mathrm{Ord}_{<\lambda})^{\triangleright} \to \mathcal{C}\,.$$

By construction, this diagram satisfies conditions (*a*), (*b*), and (*c*), and is therefore an upper bound for Q'.

Applying Zorn's lemma, we deduce that Q has a maximal element $F_\beta : \mathrm{N}_\bullet(\mathrm{Ord}_{\leq \beta}) \to \mathcal{C}$. We will complete the proof by showing that $\beta < \alpha$. Assume otherwise, and set $X = F_\beta(\beta)$. By assumption, we can choose a morphism $u : X \to Y$ which belongs to U. Let us identify u with an object $\widetilde{Y}$ of the coslice ∞-category $\mathcal{C}_{X/}$. Since the inclusion map $\{\beta+1\} \hookrightarrow \mathrm{N}_\bullet(\mathrm{Ord}_{\leq \beta+1})$ is right anodyne (Example 4.3.7.11), the restriction map $\mathcal{C}_{F_\beta/} \to \mathcal{C}_{X/}$ is a trivial Kan fibration (Corollary 4.3.6.13). We can therefore lift $\widetilde{Y}$ to an object of the ∞-category $\mathcal{C}_{F_\beta/}$, which we can identify with an extension of F_β to a diagram $F_{\beta+1} : \mathrm{N}_\bullet(\mathrm{Ord}_{\leq \beta+1}) \to \mathcal{C}$. By construction, this diagram carries the pair $(\beta, \beta+1)$ to the morphism u of $\mathcal{C}$. It follows that $F_{\beta+1}$ is also an element of Q, contradicting the maximality of F_β. □

Proof of Theorem 9.1.4.3. Let $\mathcal{C}$ be a locally small ∞-category which admits small colimits, let W be a small collection of morphisms of $\mathcal{C}$, and let κ be a small regular cardinal having the property that for each morphism $w : X \to Y$ which belongs to W, the object X is κ-compact. Fix an object $C \in \mathcal{C}$; we wish to show that there exists a morphism $f : C \to C'$ where C' is weakly W-local and f is a transfinite pushout of morphisms belonging to W. Without loss of generality, we may assume that C itself is not weakly W-local (otherwise, we can take $f = \mathrm{id}_C$).

Let W' be the collection of all morphisms of $\mathcal{C}$ which are pushouts of morphisms of W, and let $\overline{W}$ denote the transfinite closure of W' (Definition 9.1.2.13). Let $U \subseteq \overline{W}$ denote the subcollection consisting of those morphisms u which satisfy the requirement of Lemma 9.1.4.8. Using Lemma 9.1.4.9 we deduce that there exists a diagram $F : \mathrm{N}_\bullet(\mathrm{Ord}_{\leq \kappa}) \to \mathcal{C}$

where $F(0) = C$ and F exhibits the induced map $F(0) \xrightarrow{f} F(\kappa)$ as a transfinite composition of morphisms of U.

We first claim that the object $C' = F(\kappa)$ is weakly W-local. Let $w : X \to Y$ be a morphism which belongs to W. We wish to show that every morphism $[\overline{e}] : X \to F(\kappa)$ in the homotopy category $\mathrm{h}\mathcal{C}$ factors through the homotopy class $[w]$. Since F is a colimit diagram and the object X is κ-compact, the morphism $[\overline{e}]$ factors as a composition $X \xrightarrow{[e]} F(\alpha) \to F(\kappa)$ for some ordinal $\alpha < \kappa$ and some morphism $e : X \to F(\alpha)$ in the ∞-category $\mathcal{C}$. Since the transition map $F(\alpha) \to F(\alpha + 1)$ belongs to U, we can choose a commutative diagram

$$\begin{tikzcd}
X \arrow[r, "w"] \arrow[d, "e"] & Y \arrow[d, "e'"] \\
F(\alpha) \arrow[r] & F(\alpha + 1).
\end{tikzcd}$$

It follows that $[\overline{e}]$ factors as a composition $X \xrightarrow{[w]} Y \xrightarrow{[e']} F(\alpha + 1) \to F(\kappa)$.

To complete the proof, it will suffice to show that f is a transfinite composition of morphisms belonging to W'. By construction, f is a transfinite pushout of morphisms of $U \subseteq \overline{W}$, and therefore belongs to $\overline{W}$. This follows from Corollary 9.1.2.19, since f is not an isomorphism (otherwise, the object C would also be weakly W-local, contrary to our initial assumption). □

9.1.5 Lifting Problems in ∞-Categories

04MH Let $\mathcal{C}$ be a category. Recall that a *lifting problem in $\mathcal{C}$* is a commutative diagram

04MJ
$$\begin{tikzcd}
A \arrow[r, "u_0"] \arrow[d, "f"] & X \arrow[d, "g"] \\
B \arrow[r, "\overline{u}"] & Y
\end{tikzcd} \tag{9.4}$$

In this case, a *solution* to the lifting problem (9.4) is a morphism $u : B \to X$ satisfying $u \circ f = u_0$ and $q \circ u = \overline{u}$ (see Definition 1.5.4.1). This definition has an obvious ∞-categorical counterpart:

04MK **Definition 9.1.5.1** (Lifting Problems in ∞-Categories)**.** Let $\mathcal{C}$ be an ∞-category. A *lifting problem in $\mathcal{C}$* is a diagram $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$. In this case, a *solution* to the lifting problem σ is a 3-simplex $\overline{\sigma} : \Delta^3 \to \mathcal{C}$ for which the composition

$$\Delta^1 \times \Delta^1 \xrightarrow{\alpha} \Delta^3 \xrightarrow{\overline{\sigma}} \mathcal{C}$$

coincides with σ, where α denotes the map of simplicial sets given on vertices by $\alpha(i,j) = 2i + j$.

Remark 9.1.5.2. Let us informally display the standard simplex Δ^3 as a diagram 04ML

04MM
$$\begin{tikzcd}
\bullet \arrow[r] \arrow[d] \arrow[dr] & \bullet \arrow[d] \\
\bullet \arrow[r] \arrow[ur, dashed] & \bullet .
\end{tikzcd} \tag{9.5}$$

The morphism $\alpha : \Delta^1 \times \Delta^1 \to \Delta^3$ appearing in Definition 9.1.5.1 is a monomorphism of simplicial sets, whose image is the simplicial subset $Q \subseteq \Delta^3$ consisting of those simplices which do not contain the "inner" edge $\mathrm{N}_\bullet(\{1 < 2\})$ which is indicated by the dotted arrow in the diagram (9.5). Stated more informally, Q is the subset of Δ^3 which is "visible from the top" in the diagram (9.5); in particular, Q contains the inner faces $\mathrm{N}_\bullet(\{0 < 1 < 3\})$ and $\mathrm{N}_\bullet(\{0 < 2 < 3\})$, but not the outer faces $\mathrm{N}_\bullet(\{0 < 1 < 2\})$ and $\mathrm{N}_\bullet(\{1 < 2 < 3\})$.

Notation 9.1.5.3. Let $\mathcal{C}$ be an ∞-category. We will often denote a lifting problem σ in $\mathcal{C}$ by a diagram 04MN

04MP
$$\begin{tikzcd}
A \arrow[r, "u_0"] \arrow[d, "f"'] & X \arrow[d, "g"] \\
B \arrow[r, "\overline{u}"] \arrow[ur, dashed] & Y .
\end{tikzcd} \tag{9.6}$$

Here the dotted arrow in the diagram does not indicate part of the data supplied by lifting problem σ; instead, it indicates part of the data of a hypothetical solution.

Stated more concretely, the lifting problem σ is given by the following data:

- Four objects of $\mathcal{C}$, which are indicated by A, B, X, and Y in the diagram (9.6).
- Five morphisms of $\mathcal{C}$, which we will denote by $f : A \to B$, $g : X \to Y$, $u_0 : A \to X$, $\overline{u} : B \to Y$, and $\overline{u}_0 : A \to Y$. Here the first four of these morphisms are indicated as outer edges of the diagram (9.6), while the fifth is left implicit.
- A pair of 2-simplices τ_1 and τ_2 of $\mathcal{C}$, whose boundaries are indicated in the diagrams

$$\begin{tikzcd}
A \arrow[r, "u_0"] \arrow[dr, "\overline{u}_0"'] & X \arrow[d, "g"] \\
& Y
\end{tikzcd}
\qquad
\begin{tikzcd}
A \arrow[d, "f"'] \arrow[dr, "\overline{u}_0"] & \\
B \arrow[r, "\overline{u}"] & Y .
\end{tikzcd}$$

In other words, τ_1 and τ_2 exhibit the morphism $\overline{u}_0$ as a composition $\overline{u} \circ f$ and a composition $g \circ u_0$, respectively.

A solution to the lifting problem σ is given by the following additional data:

- A morphism $u : B \to X$ (indicated by the dotted arrow in the diagram (9.6).
- A pair of 2-simplices τ_0 and τ_3 of $\mathcal{C}$, whose boundaries are indicated in the diagrams

$$\begin{tikzcd} & X \arrow[d, "g"] \\ B \arrow[ur, "u"] \arrow[r, "\overline{u}"] & Y \end{tikzcd} \qquad \begin{tikzcd} A \arrow[r, "u_0"] \arrow[d, "f"] & X \\ B. \arrow[ur, "u"'] & \end{tikzcd}$$

In other words, τ_0 exhibits $\overline{u}$ as a composition $g \circ u$, and τ_3 exhibits u_0 as a composition $u \circ f$.

- A 3-simplex of $\mathcal{C}$ having boundary $(\tau_0, \tau_1, \tau_2, \tau_3)$.

04MQ **Example 9.1.5.4.** Let $\mathcal{C}_0$ be a category and let $\mathcal{C} = \mathrm{N}_\bullet(\mathcal{C}_0)$ denote its nerve. Then lifting problems σ in the ∞-category $\mathcal{C}$ (in the sense of Definition 9.1.5.1) can be identified with lifting problems σ_0 in the ordinary category $\mathcal{C}_0$ (in the sense of Definition 1.5.4.1). In this case, we can also identify solutions to σ with solutions to σ_0.

04MR **Warning 9.1.5.5.** Let $\mathcal{C}$ be an ∞-category. Every lifting problem

04MS
$$\begin{tikzcd} A \arrow[r, "u_0"] \arrow[d, "f"] & X \arrow[d, "g"] \\ B \arrow[r, "\overline{u}"] \arrow[ur, dashed] & Y \end{tikzcd} \tag{9.7}$$

in $\mathcal{C}$ determines a lifting problem in the homotopy category $\mathrm{h}\mathcal{C}$, given by the diagram

04MT
$$\begin{tikzcd} A \arrow[r, "{[u_0]}"] \arrow[d, "{[f]}"] & X \arrow[d, "{[g]}"] \\ B \arrow[r, "{[\overline{u}]}"] \arrow[ur, dashed] & Y. \end{tikzcd} \tag{9.8}$$

Moreover, every solution to the lifting problem (9.7) determines a solution to the lifting problem (9.8). Beware that the converse is false: it is possible for the lifting problem (9.8) to admit a solution when the lifting problem (9.7) does not (Exercise 9.1.5.6).

Exercise 9.1.5.6. Let $g : X \to S$ be Kan fibration between Kan complexes, where S is connected and X is contractible. Choose a vertex $s \in S$ and let X_s denote the fiber $\{s\} \times_S X$, so that we have a commutative diagram of Kan complexes 04MU

$$\begin{tikzcd} X_s \arrow[r] \arrow[d] & X \arrow[d, "f"] \\ \{s\} \arrow[r] & S \end{tikzcd} \tag{9.9}$$ 04MV

Show that:

- In the ∞-category of spaces $\mathcal{S}$, the lifting problem determined by (9.9) admits a solution only if S is contractible.
- In the homotopy category $\mathrm{h}\mathcal{S}$, the lifting problem determined by (9.9) always has a solution.

Remark 9.1.5.7. Let $\mathcal{C}$ be an ∞-category. Fix a morphism $\overline{u}_0 : A \to Y$ of $\mathcal{C}$, and let $\mathcal{C}_{A//Y}$ denote the ∞-category of Remark 4.6.6.2. The datum of an extension of $\overline{u}_0$ to a lifting problem σ : 04MW

$$\begin{tikzcd} A \arrow[r] \arrow[d] & X \arrow[d] \\ B \arrow[r] \arrow[ur, dashed] & Y \end{tikzcd} \tag{9.10}$$ 04MX

can be identified with a pair of objects $\widetilde{B}, \widetilde{X} \in \mathcal{C}_{A//Y}$. In this case, a solution to the lifting problem (9.10) is a morphism from $\widetilde{B}$ to $\widetilde{X}$ in the ∞-category $\mathcal{C}_{A//Y}$.

Definition 9.1.5.8. Let $\mathcal{C}$ be an ∞-category, and let $f : A \to B$ and $g : X \to Y$ be morphisms of $\mathcal{C}$. We will say that f *is weakly left orthogonal to* g if every lifting problem 04MY

$$\begin{tikzcd} A \arrow[r] \arrow[d, "f"] & X \arrow[d, "g"] \\ B \arrow[r] \arrow[ur, dashed] & Y \end{tikzcd}$$

in the ∞-category $\mathcal{C}$ admits a solution. In this case, we will also say that g is *weakly right orthogonal* to f.

04MZ **Example 9.1.5.9.** In the situation of Definition 9.1.5.8, suppose that $\mathcal{C}$ is the nerve of a category $\mathcal{C}_0$. Then f is weakly left orthogonal to g (in the sense of Definition 9.1.5.8) if and only if it is weakly left orthogonal to g when regarded as a morphism of the category $\mathcal{C}_0$ (in the sense of Definition 1.5.4.3).

04N0 **Warning 9.1.5.10.** Let $\mathcal{C}$ be an ∞-category containing a pair of morphisms $f : A \to B$ and $g : X \to Y$. If f is weakly left orthogonal to g in the ∞-category $\mathcal{C}$, then the homotopy class $[f]$ is weakly left orthogonal to $[g]$ in the homotopy category $\mathrm{h}\mathcal{C}$ (see Exercise 1.5.2.10). Beware that the converse is false in general (see Warning 9.1.5.5 and Exercise 9.1.5.6).

04N1 **Variant 9.1.5.11.** Let $\mathcal{C}$ be an ∞-category and let S and T be collections of morphisms of $\mathcal{C}$. We say that *S is weakly left orthogonal to T* if every morphism $f \in S$ is weakly left orthogonal to every morphism $g \in T$. In this case, we also say that *T is weakly right orthogonal to S*. In the special case where $S = \{f\}$ is a singleton, we abbreviate this condition by saying that *f is weakly left orthogonal to T*, or *T is weakly right orthogonal to f*. In the special case $T = \{g\}$ is a singleton, we abbreviate this condition by saying that *g is weakly right orthogonal to S*, or *S is weakly left orthogonal to g*.

04N2 **Remark 9.1.5.12.** Let $\mathcal{C}$ be an ∞-category containing a morphism $g : X \to Y$, which we identify with an object $\widetilde{X}$ of the slice ∞-category $\mathcal{C}_{/Y}$. Let S be a collection of morphisms of $\mathcal{C}$, and let $\widetilde{S}$ denote its inverse image in $\mathcal{C}_{/Y}$. The following conditions are equivalent:

- The morphism g is weakly right orthogonal to S (in the sense of Variant 9.1.5.11).
- The object $\widetilde{X}$ is weakly $\widetilde{S}$-local (in the sense of Definition 9.1.3.5).

04N3 **Example 9.1.5.13.** Let $\mathcal{C}$ be an ∞-category containing a morphism $g : X \to Y$. Then every isomorphism f of $\mathcal{C}$ is weakly left orthogonal to g. This follows from the criterion of Remark 9.1.5.12, since every lift of f to the ∞-category $\mathcal{C}_{/Y}$ is also an isomorphism (Proposition 4.4.2.11).

We now record a few consequences of Remark 9.1.5.12.

04N4 **Proposition 9.1.5.14.** *Let $\mathcal{C}$ be an ∞-category and let $g : X \to Y$ be a morphism of $\mathcal{C}$. If another morphism $f : A \to B$ is weakly left orthogonal to g, then any retract of f (in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$) is also weakly left orthogonal to g.*

Proof. Let $f' : A' \to B'$ be a retract of f (in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$); we will show that f' is weakly left orthogonal to g. Let $\pi : \mathcal{C}_{/Y} \to \mathcal{C}$ be the projection map, and let us identify g with an object $\widetilde{X} \in \mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{X}) = X$. By virtue of Remark 9.1.5.12, it will suffice to show that for any morphism $\widetilde{f}'$ of $\mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{f}') = f'$, the object $\widetilde{X}$ is weakly $\widetilde{f}'$-local. It follows from Corollary 4.2.5.2 that π induces a right fibration $\mathrm{Fun}(\Delta^1, \mathcal{C}_{/Y}) \to \mathrm{Fun}(\Delta^1, \mathcal{C})$. Applying Remark 8.5.1.23, we deduce that $\widetilde{f}'$ is a retract of a morphism $\widetilde{f}$ of $\mathcal{C}_{/Y}$ satisfying

$U(\widetilde{f}) = f$. By virtue of Variant 9.1.3.13, it will suffice to show that the object $\widetilde{X}$ is weakly $\widetilde{f}$-local, which follows from our assumption that f is weakly left orthogonal to g (Remark 9.1.5.12). □

Proposition 9.1.5.15. *Let $\mathcal{C}$ be an ∞-category containing a pushout diagram* 04N5

04N6

$$\begin{tikzcd} A \arrow[r] \arrow[d, "f"] & A' \arrow[d, "f'"] \\ B \arrow[r] & B'. \end{tikzcd} \qquad (9.11)$$

If f is weakly left orthogonal to a morphism $g : X \to Y$ of $\mathcal{C}$, then f' is also weakly left orthogonal to g.

Proof. Let $\pi : \mathcal{C}_{/Y} \to \mathcal{C}$ be the projection map, and let us identify g with an object $\widetilde{X} \in \mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{X}) = X$. By virtue of Remark 9.1.5.12, it will suffice to show that for any morphism $\widetilde{f}'$ of $\mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{f}') = f'$, the object $\widetilde{X}$ is weakly $\widetilde{f}'$-local. Since π is a right fibration, we can lift (9.11) to a diagram

$$\begin{tikzcd} \widetilde{A} \arrow[r] \arrow[d, "\widetilde{f}"] & \widetilde{A}' \arrow[d, "\widetilde{f}'"] \\ \widetilde{B} \arrow[r] & \widetilde{B}' \end{tikzcd}$$

in the ∞-category $\mathcal{C}_{/Y}$, which is also a pushout square (Proposition 7.1.3.19). By virtue of Proposition 9.1.3.14, it will suffice to show that $\widetilde{X}$ is weakly $\widetilde{f}$-local, which follows from our assumption that f is weakly left orthogonal to g (Remark 9.1.5.12). □

Proposition 9.1.5.16. *Let $\mathcal{C}$ be an ∞-category containing a morphism $g : X \to Y$, and let S be the collection of all morphisms of $\mathcal{C}$ which are weakly left orthogonal to g. Then S is closed under transfinite composition (see Definition 9.1.2.1).* 04N7

Proof. Let $f : A \to B$ be a transfinite composition of morphisms of S; we wish to show that f is weakly left orthogonal to g. Let $\pi : \mathcal{C}_{/Y} \to \mathcal{C}$ be the projection map, and let us identify g with an object $\widetilde{X} \in \mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{X}) = X$. By virtue of Remark 9.1.5.12, it will suffice to show that for every morphism $\widetilde{f} : \widetilde{A} \to \widetilde{B}$ of $\mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{f}) = f$, the object $\widetilde{X}$ is weakly $\widetilde{f}$-local.

Choose an ordinal α and a diagram $F : \mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq \alpha}) \to \mathcal{C}$ which exhibits f as a transfinite composition of morphisms of S (see Definition 9.1.2.1). We will assume that $\alpha > 0$ (otherwise,

f is an identity morphism and the desired result follows from Example 9.1.5.13). In this case, Lemma 4.3.7.8 guarantees that the inclusion map $\mathrm{N}_{\bullet}(\{0 < \alpha\}) \hookrightarrow \mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq \alpha})$ is right anodyne. Since π is a right fibration (Proposition 4.3.6.1), we can lift F to a diagram $\widetilde{F} : \mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq \alpha}) \to \mathcal{C}$ for which the associated morphism $\widetilde{F}(0) \to \widetilde{F}(\alpha)$ coincides with $\widetilde{f}$. For every nonzero limit ordinal $\lambda \leq \alpha$, Proposition 7.1.3.19 guarantees that the restriction $\widetilde{F}|_{\mathrm{N}_{\bullet}(\mathrm{Ord}_{\leq \lambda})}$ is a colimit diagram in the ∞-category $\mathcal{C}_{/Y}$. Using Remark 9.1.5.12, we see that $\widetilde{F}$ exhibits $\widetilde{f}$ as a transfinite composition of morphisms of $\mathcal{C}_{/Y}$ with respect to which $\widetilde{X}$ is weakly local. Applying Proposition 9.1.3.17, we conclude that $\widetilde{X}$ is weakly $\widetilde{f}$-local, as desired. □

`04N8` **Corollary 9.1.5.17.** *Let $\mathcal{C}$ be an ∞-category, let T be a collection of morphisms of $\mathcal{C}$, and let S be the collection of all morphisms of $\mathcal{C}$ which are weakly left orthogonal to T. Then S is weakly saturated.*

Proof. Combine Propositions 9.1.5.14, 9.1.5.15, and 9.1.5.16 with Remark 9.1.3.23. □

9.1.6 Weak Factorization Systems

`04N9` Throughout this text, we have frequently made use of the fact that every morphism of simplicial sets $h : X \to Z$ admits a factorization $X \xrightarrow{f} Y \xrightarrow{g} Z$, where g is some sort of fibration and the morphism f has innocuous properties. In this section, we develop a general framework for results of this type.

`04NA` **Definition 9.1.6.1.** Let $\mathcal{C}$ be an ∞-category. A *weak factorization system on $\mathcal{C}$* is a pair (S_L, S_R), where S_L and S_R are collections of morphisms of $\mathcal{C}$ which satisfy the following conditions:

(1) For every morphism $h : X \to Z$ of $\mathcal{C}$, there exists a 2-simplex

$$\begin{tikzcd} & Y \arrow[dr, "g"] & \\ X \arrow[ur, "f"] \arrow[rr, "h"] & & Z \end{tikzcd}$$

where f belongs to S_L and g belongs to S_R.

(2) Every lifting problem

$$\begin{tikzcd} A \arrow[r] \arrow[d, "f"] & X \arrow[d, "g"] \\ B \arrow[r] \arrow[ur, dashed] & Y \end{tikzcd}$$

in $\mathcal{C}$ admits a solution, provided that $f \in S_L$ and $g \in S_R$.

(3) The collections S_L and S_R are closed under retracts (in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$).

Example 9.1.6.2. Let $\mathcal{C} = \mathrm{Set}_\Delta$ be the category of simplicial sets. We have already encountered several examples of weak factorization systems (S_L, S_R) on $\mathcal{C}$: `04NB`

- We can take S_R to be the collection of Kan fibrations and S_L the collection of anodyne morphisms (Proposition 3.1.7.1).
- We can take S_R to be the collection of inner anodyne morphisms and S_L the collection of inner fibrations (Proposition 4.1.3.2).
- We can take S_R to be the collection of left fibrations and S_L the collection of left anodyne morphisms (Proposition 4.2.4.7).
- We can take S_R to be the collection of right fibrations and S_L the collection of left anodyne morphisms (Variant 4.2.4.8).
- We can take S_R to be the collection of trivial Kan fibrations and S_L the collection of monomorphisms (Exercise 3.1.7.11).

Remark 9.1.6.3 (Symmetry)**.** Let $\mathcal{C}$ be an ∞-category and let (S_L, S_R) be a weak factorization system on $\mathcal{C}$. Then the pair (S_R, S_L) is a weak factorization system on the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$. `04NC`

Remark 9.1.6.4. Let $\mathcal{C}$ be an ∞-category. For every collection of morphisms S of $\mathcal{C}$, let $[S]$ be the collection of homotopy classes of morphisms which belong to S. If (S_L, S_R) is a weak factorization system on $\mathcal{C}$, then $([S_L], [S_R])$ is a weak factorization system on (the nerve of) the homotopy category $\mathrm{h}\mathcal{C}$. See Warning 9.1.5.5 and Variant 8.5.1.3. `04ND`

In the situation of Definition 9.1.6.1, the collections S_L and S_R are determined by one another.

Proposition 9.1.6.5. *Let $\mathcal{C}$ be an ∞-category, let (S_L, S_R) be a weak factorization system on $\mathcal{C}$, and let $h : X \to Z$ be a morphism of $\mathcal{C}$. Then h belongs to S_L if and only if it is weakly left orthogonal to S_R, and h belongs to S_R if and only if it is weakly right orthogonal to S_L.* `04NE`

Proof. We will prove the first assertion; the second follows by a similar argument. Assume that h is weakly left orthogonal to S_R; we wish to show that h belongs to S_L (the reverse implication is immediate from the definition). By virtue of Remark 9.1.6.4, we may assume that $\mathcal{C}$ is (the nerve of) an ordinary category. The morphism h admits a factorization

$X \xrightarrow{f} Y \xrightarrow{g} Z$, where $f \in S_L$ and $g \in S_R$. Since h is weakly left orthogonal to g, the lifting problem

$$\begin{tikzcd}
X \arrow[r, "f"] \arrow[d, "h"] & Y \arrow[d, "g"] \\
Z \arrow[r, "\mathrm{id}"] \arrow[ur, dashed, "i"] & Z
\end{tikzcd}$$

admits a solution. We then have a commutative diagram

$$\begin{tikzcd}
X \arrow[r, "\mathrm{id}"] \arrow[d, "h"] & X \arrow[r, "\mathrm{id}"] \arrow[d, "f"] & X \arrow[d, "h"] \\
Z \arrow[r, "i"] & Y \arrow[r, "g"] & Z
\end{tikzcd}$$

which exhibits h as a retract of f, so that h also belongs to S_L. □

04NF **Corollary 9.1.6.6.** *Let $\mathcal{C}$ be an ∞-category and let (S_L, S_R) be a weak factorization system on $\mathcal{C}$. Then S_L is a weakly saturated collection of morphisms of $\mathcal{C}$ (see Definition 9.1.3.19).*

Proof. Combine Proposition 9.1.6.5 with Corollary 9.1.5.17. □

Using the small object argument of §9.1.4, we can produce many examples of weak factorization systems.

04NG **Theorem 9.1.6.7** (Existence of Weak Factorization Systems)**.** *Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$. Assume that:*

(1) *The ∞-category $\mathcal{C}$ is locally small and admits small colimits.*

(2) *The collection W is small.*

(3) *For every morphism $w : X \to Y$ in W, the object X is κ-compact for some small cardinal κ.*

Then $\mathcal{C}$ admits a weak factorization system (S_L, S_R), where S_L is the weakly saturated collection of morphisms generated by W (Remark 9.1.3.23) and S_R is the collection of morphisms which are weakly right orthogonal to W.

04NH **Remark 9.1.6.8.** Let $\mathcal{C}$ be an ∞-category, let W be a collection of morphisms of $\mathcal{C}$, let $W_{\perp}$ denote the collection of morphisms of $\mathcal{C}$ which are weakly right orthogonal to every morphism of W, and let $\overline{W}$ denote the collection of all morphisms which are weakly left orthogonal to every morphism of $W_{\perp}$. Then $\overline{W}$ is always a weakly saturated collection of morphisms which contains W (Corollary 9.1.5.17). If the hypotheses of Theorem 9.1.6.7 are satisfied, then $\overline{W}$ is the weakly saturated collection generated by W, in the sense of Remark 9.1.3.23.

Proof of Theorem 9.1.6.7. The collection S_L is closed under retracts by construction, and S_R is closed under retracts by virtue of Proposition 9.1.5.14. Corollary 9.1.5.17 guarantees that S_L is weakly left orthogonal to S_R. It will therefore suffice to show that every morphism $h : X \to Z$ of $\mathcal{C}$ factors as a composition $X \xrightarrow{f} Y \xrightarrow{g} Z$, where f belongs to S_L and g belongs to S_R.

Let $\widetilde{\mathcal{C}}$ denote the slice ∞-category $\mathcal{C}_{/Z}$, and let $\pi : \widetilde{\mathcal{C}} \to \mathcal{C}$ denote the projection map. Our assumption that $\mathcal{C}$ is locally small guarantees that $\widetilde{\mathcal{C}}$ is also locally small (Example 4.7.8.11), and our assumption that $\mathcal{C}$ admits small colimits guarantees that $\widetilde{\mathcal{C}}$ admits small colimits (Corollary 7.1.3.20). Let $\widetilde{W}$ denote a set of representatives for the collection of isomorphism classes of morphisms $\widetilde{w}$ of $\mathcal{C}_{/Z}$ satisfying $\pi(\widetilde{w}) \in W$. Since W is small and $\mathcal{C}$ is locally small, the set $\widetilde{W}$ is also small. For every morphism $\widetilde{w} : \widetilde{A} \to \widetilde{B}$ which belongs to $\widetilde{W}$, the image $A = \pi(\widetilde{A})$ is a κ-compact object of $\widetilde{\mathcal{C}}$ for some small cardinal κ, so that $\widetilde{A}$ is a κ-compact object of $\widetilde{\mathcal{C}}$ (Remark [?]). Let us identify the morphism h with an object $\widetilde{X} \in \widetilde{\mathcal{C}}$ satisfying $\pi(\widetilde{X}) = X$. Applying Theorem 9.1.4.3, we deduce that there is a morphism $\widetilde{f} : \widetilde{X} \to \widetilde{Y}$ in the ∞-category $\widetilde{\mathcal{C}}$ which is a transfinite pushout of morphisms of $\widetilde{W}$, where $\widetilde{Y}$ is $\widetilde{W}$-local. Set $f = \pi(\widetilde{f})$, so that $\widetilde{f}$ can be identified with a diagram

$$\begin{tikzcd}
 & Y \arrow[dr, "g"] & \\
X \arrow[ur, "f"] \arrow[rr, "h"] & & Z
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$. Since the functor π preserves small colimits (Corollary 7.1.3.20), the morphism f is a transfinite pushout of morphisms belonging to W, and therefore belongs to S_L. Our assumption that $\widetilde{Y}$ is $\widetilde{W}$-local guarantees that g belongs to S_R (Remark 9.1.5.12). □

9.1.7 Orthogonality

In the ∞-categorical setting, it will often be useful to view the collection of solutions to a lifting problem as a space, rather than a set. 04NJ

04NK **Construction 9.1.7.1.** Suppose we are given a lifting problem

$$\begin{tikzcd} A \arrow[r] \arrow[d, "f"] & X \arrow[d, "g"] \\ B \arrow[r] \arrow[ur, dashed] & Y. \end{tikzcd}$$

in an ∞-category $\mathcal{C}$, given by a morphism $\sigma : \Delta^1 \times \Delta^1 \to \mathcal{C}$. We let $\mathrm{Sol}(\sigma)$ denote the simplicial set $\{\sigma\} \times_{\mathrm{Fun}(Q,\mathcal{C})} \mathrm{Fun}(\Delta^3, \mathcal{C})$, where $Q \subset \Delta^3$ is the simplicial subset described in Remark 9.1.5.2. We will refer to $\mathrm{Sol}(\sigma)$ as the *space of solutions* to the lifting problem σ.

04NL **Remark 9.1.7.2.** In the situation of Construction 9.1.7.1, vertices of the simplicial set $\mathrm{Sol}(\sigma)$ can be identified with solutions to the lifting problem σ (in the sense of Definition 9.1.5.1). In particular, the lifting problem σ admits a solution if and only if $\mathrm{Sol}(\sigma)$ is nonempty.

04NM **Remark 9.1.7.3.** In the situation of Construction 9.1.7.1, the restriction map $\mathrm{Fun}(\Delta^3, \mathcal{C}) \to \mathrm{Fun}(Q, \mathcal{C})$ is an isofibration of ∞-categories (Corollary 4.4.5.3). Moreover, since Q contains every vertex of Δ^3, it is also conservative (Theorem 4.4.4.4). It follows that the solution space $\mathrm{Sol}(\sigma)$ is a Kan complex (Corollary 4.4.3.21).

04NN **Definition 9.1.7.4.** Let $\mathcal{C}$ be an ∞-category, and let $f : A \to B$ and $g : X \to Y$ be morphisms of $\mathcal{C}$. We will say that f *is left orthogonal to* g if, for every lifting problem σ :

$$\begin{tikzcd} A \arrow[r] \arrow[d, "f"] & X \arrow[d, "g"] \\ B \arrow[r] \arrow[ur, dashed] & Y \end{tikzcd}$$

in the ∞-category $\mathcal{C}$, the solution space $\mathrm{Sol}(\sigma)$ is a contractible Kan complex. In this case, we will also say that g is *right orthogonal to* f.

04NP **Example 9.1.7.5.** Let $\mathcal{C}$ be an ordinary category. Then a morphism $f : A \to B$ is left orthogonal to a morphism $g : X \to Y$ in the ∞-category $\mathrm{N}_\bullet(\mathcal{C})$ if and only if every lifting problem

$$\begin{tikzcd} A \arrow[r, "u_0"] \arrow[d, "f"] & X \arrow[d, "g"] \\ B \arrow[r, "\overline{u}"] \arrow[ur, dashed] & Y \end{tikzcd}$$

admits a *unique* solution: that is, there is a unique morphism $u : B \to X$ satisfying $u \circ f = u_0$ and $g \circ u = \overline{u}$.

Remark 9.1.7.6. Let f and g be morphisms in an ∞-category $\mathcal{C}$. Then f is left orthogonal to g in $\mathcal{C}$ if and only if it is right orthogonal to g when regarded as a morphism of the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$. `04NQ`

Remark 9.1.7.7. Let f and g be morphisms in an ∞-category $\mathcal{C}$. If f is left orthogonal to g (in the sense of Definition 9.1.7.4), then it is weakly left orthogonal to g (in the sense of Definition 9.1.5.8). Beware that the converse is false (Exercise 9.1.7.8). `04NR`

Exercise 9.1.7.8. Let $f : A \twoheadrightarrow B$ be a surjective function between sets, and let $g : X \hookrightarrow Y$ be an injective function between sets. Show that: `04NS`

- The morphism f is left orthogonal to g (in the category of sets).
- The morphism g is weakly left orthogonal to f.
- Unless either f or g is a bijection, the morphism g is not left orthogonal to f.

Variant 9.1.7.9. Let $\mathcal{C}$ be an ∞-category and let S and T be collections of morphisms of $\mathcal{C}$. We say that S *is left orthogonal to* T if every morphism $f \in S$ is weakly left orthogonal to every morphism $g \in T$. In this case, we also say that T *is right orthogonal to* S. In the special case where $S = \{f\}$ is a singleton, we abbreviate this condition by saying that f *is left orthogonal to* T, or T *is right orthogonal to* f. In the special case $T = \{g\}$ is a singleton, we abbreviate this condition by saying that g *is right orthogonal to* S, or S *is left orthogonal to* g. `04NT`

To establish some elementary properties of Definition 9.1.7.4, it will be convenient to give an alternative description of the solution spaces $\mathrm{Sol}(\sigma)$.

Construction 9.1.7.10. Let $\mathcal{C}$ be an ∞-category and let σ : `04NU`

$$\begin{tikzcd} A \arrow[r] \arrow[d, "f"] & X \arrow[d, "g"] \\ B \arrow[r] \arrow[ur, dashed] & Y \end{tikzcd}$$

be a lifting problem in $\mathcal{C}$. Then σ determines a pair of objects $\widetilde{B}$, $\widetilde{X}$ in the ∞-category $\mathcal{C}_{A//Y}$ (see Remark 9.1.5.7). Let K denote the morphism space $\mathrm{Hom}_{\mathcal{C}_{A//Y}}(\widetilde{B}, \widetilde{X})$. We then have a tautological map $K \times \Delta^1 \to \mathcal{C}_{A//Y}$, which we can identify with a diagram $\{A\} \star (K \times \Delta^1) \star \{Y\} \to \mathcal{C}$. Composing with the quotient map

$$K \times \Delta^3 \simeq K \times (\{A\} \star \Delta^1 \star \{Y\}) \twoheadrightarrow \{A\} \star (K \times \Delta^1) \star \{Y\},$$

we obtain a morphism $K \to \mathrm{Fun}(\Delta^3, \mathcal{C})$, which factors through the simplicial subset $\mathrm{Sol}(\sigma) \subseteq \mathrm{Fun}(\Delta^3, \mathcal{C})$ of Construction 9.1.7.1. We therefore obtain a comparison map $\theta : \mathrm{Hom}_{\mathcal{C}_{A//Y}}(\widetilde{B}, \widetilde{X}) \to \mathrm{Sol}(\sigma)$.

04NV **Proposition 9.1.7.11.** *Let $\mathcal{C}$ be an ∞-category and let σ :*

04NW
$$\begin{tikzcd} A \arrow[r] \arrow[d] & X \arrow[d] \\ B \arrow[r] \arrow[ur, dashed] & Y \end{tikzcd} \tag{9.12}$$

be a lifting problem in $\mathcal{C}$. Then the comparison map

$$\theta : \mathrm{Hom}_{\mathcal{C}_{A//Y}}(\widetilde{B}, \widetilde{X}) \to \mathrm{Sol}(\sigma)$$

of Construction 9.1.7.10 is a homotopy equivalence of Kan complexes.

Proof. Corollary 4.6.6.9 supplies a categorical pullback diagram of ∞-categories

$$\begin{tikzcd} \mathrm{Fun}(\Delta^1, \mathcal{C}_{A//Y}) \arrow[r] \arrow[d] & \mathrm{Fun}(\{A\} \star \Delta^1 \star \{Y\}, \mathcal{C}) \arrow[d] \\ \mathrm{Fun}(\partial\Delta^1, \mathcal{C}_{A//Y}) \arrow[r] & \mathrm{Fun}(\{A\} \star \partial\Delta^1 \star \{Y\}, \mathcal{C}), \end{tikzcd}$$

where the vertical maps are isofibrations (Corollary 4.4.5.3). Unwinding the definitions, we see that the comparison map θ is obtained by taking vertical fibers over the vertex corresponding to the pair $(\widetilde{B}, \widetilde{X})$. Corollary 4.5.2.31 guarantees that θ is an equivalence of ∞-categories. Since the source and target of θ are Kan complexes (Remark 9.1.7.3), it is a homotopy equivalence (Example 4.5.1.13). □

04NX **Warning 9.1.7.12.** In the situation of Proposition 9.1.7.11, the comparison map θ need not be an isomorphism of simplicial sets. However, it is always bijective on 0-simplices: vertices of both $\mathrm{Hom}_{\mathcal{C}_{A//Y}}(\widetilde{B}, \widetilde{X})$ and $\mathrm{Sol}(\sigma)$ can be identified with solutions to the lifting problem σ.

04NY **Corollary 9.1.7.13.** *Let $\mathcal{C}$ be an ∞-category containing morphisms $f : A \to B$ and $g : X \to Y$. Let $\pi : \mathcal{C}_{/Y} \to \mathcal{C}$ denote the projection map, so that g can be identified with an object $\widetilde{X} \in \mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{X}) = X$. The following conditions are equivalent:*

(1) *The morphism g is right orthogonal to f (in the sense of Definition 9.1.7.4).*

(2) *For every morphism $\widetilde{f} : \widetilde{A} \to \widetilde{B}$ of $\mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{f}) = f$, the object $\widetilde{X} \in \mathcal{C}_{/Y}$ is $\widetilde{f}$-local (in the sense of Definition 9.1.1.1).*

Proof. Combine Proposition 9.1.7.11 with Remark 9.1.1.4. □

Corollary 9.1.7.14. *Let $\mathcal{C}$ be an ∞-category containing morphisms $f : A \to B$ and $g : X \to Y$. If either f or g is an isomorphism, then f is left orthogonal to g.* 04NZ

Proof. Without loss of generality, we may assume that f is an isomorphism. Let $\pi : \mathcal{C}_{/Y} \to \mathcal{C}$ be the projection map, so that we can identify g with an object $\widetilde{X} \in \mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{X}) = X$. By virtue of Corollary 9.1.7.13, it will suffice to show that $\widetilde{X}$ is $\widetilde{f}$-local for every morphism $\widetilde{f}$ of $\mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{f}) = f$. This is a special case of Example 9.1.1.2, since $\widetilde{f}$ is an isomorphism (Proposition 4.4.2.11). □

Corollary 9.1.7.15. *Let $\mathcal{C}$ be an ∞-category containing a morphism $g : X \to Y$ and a 2-simplex* 04P0

04P1

$$\begin{tikzcd} & B \arrow[dr, "f''"] & \\ A \arrow[ur, "f'"] \arrow[rr, "f"] & & C. \end{tikzcd} \tag{9.13}$$

Assume that f' is left orthogonal to g. Then f is left orthogonal to g if and only if f'' is left orthogonal to g.

Proof. Assume that f'' is left orthogonal to g; we will show that f is left orthogonal to g (the proof of the converse is similar). Let $\pi : \mathcal{C}_{/Y} \to \mathcal{C}$ be the projection map, so that we can identify g with an object $\widetilde{X} \in \mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{X}) = X$. By virtue of Corollary 9.1.7.13, it will suffice to show that the object $\widetilde{X}$ is $\widetilde{f}$-local, for every morphism $\widetilde{f}$ of $\mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{f}) = f$. Since π is a right fibration (Proposition 4.3.6.1), we can lift (9.13) to a diagram

$$\begin{tikzcd} & \widetilde{B} \arrow[dr, "\widetilde{f}''"] & \\ \widetilde{A} \arrow[ur, "\widetilde{f}'"] \arrow[rr, "\widetilde{f}"] & & \widetilde{C} \end{tikzcd}$$

in the ∞-category $\mathcal{C}_{/Y}$. Corollary 9.1.7.13 guarantees that the object $\widetilde{X}$ is both $\widetilde{f}'$-local and $\widetilde{f}''$-local, so the desired result follows from Remark 9.1.1.11. □

Warning 9.1.7.16. In the situation of Corollary 9.1.7.15, if the morphisms f and f'' are left orthogonal to g, then f' need not be left orthogonal to g. 04P2

Corollary 9.1.7.17. *Let $\mathcal{C}$ be an ∞-category and let $g : X \to Y$ be a morphism of $\mathcal{C}$. If another morphism $f : A \to B$ is left orthogonal to g, then any retract of f (in the ∞-category* $\mathrm{Fun}(\Delta^1, \mathcal{C})$*) is also left orthogonal to g.* 04P3

Proof. We proceed as in the proof of Proposition 9.1.5.14. Let $f' : A' \to B'$ be a retract of f (in the ∞-category $\operatorname{Fun}(\Delta^1, \mathcal{C})$); we will show that f' is left orthogonal to g. Let $\pi : \mathcal{C}_{/Y} \to \mathcal{C}$ be the projection map, and let us identify g with an object $\widetilde{X} \in \mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{X}) = X$. By virtue of Corollary 9.1.7.13, it will suffice to show that for any morphism $\widetilde{f}'$ of $\mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{f}') = f'$, the object $\widetilde{X}$ is $\widetilde{f}'$-local. It follows from Corollary 4.2.5.2 that π induces a right fibration $\operatorname{Fun}(\Delta^1, \mathcal{C}_{/Y}) \to \operatorname{Fun}(\Delta^1, \mathcal{C})$. Applying Remark 8.5.1.23, we deduce that $\widetilde{f}'$ is a retract of a morphism $\widetilde{f}$ of $\mathcal{C}_{/Y}$ satisfying $U(\widetilde{f}) = f$. By virtue of Variant 9.1.1.7, it will suffice to show that the object $\widetilde{X}$ is $\widetilde{f}$-local, which follows from our assumption that f is left orthogonal to g (Corollary 9.1.7.13). □

04P4 **Corollary 9.1.7.18.** *Let $\mathcal{C}$ be an ∞-category containing a pushout diagram*

04P5
$$\begin{tikzcd}
A \arrow[r] \arrow[d, "f"] & A' \arrow[d, "f'"] \\
B \arrow[r] & B'.
\end{tikzcd} \tag{9.14}$$

If f is left orthogonal to a morphism $g : X \to Y$ of $\mathcal{C}$, then f' is also left orthogonal to g.

Proof. We proceed as in the proof of Proposition 9.1.5.15. Let $\pi : \mathcal{C}_{/Y} \to \mathcal{C}$ be the projection map, and let us identify g with an object $\widetilde{X} \in \mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{X}) = X$. By virtue of Corollary 9.1.7.13, it will suffice to show that for any morphism $\widetilde{f}'$ of $\mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{f}') = f'$, the object $\widetilde{X}$ is weakly $\widetilde{f}'$-local. Since π is a right fibration, we can lift (9.14) to a diagram

$$\begin{tikzcd}
\widetilde{A} \arrow[r] \arrow[d, "\widetilde{f}"] & \widetilde{A}' \arrow[d, "\widetilde{f}'"] \\
\widetilde{B} \arrow[r] & \widetilde{B}'
\end{tikzcd}$$

in the ∞-category $\mathcal{C}_{/Y}$, which is also a pushout square (Proposition 7.1.3.19). By virtue of Remark 9.1.1.10, it will suffice to show that $\widetilde{X}$ is $\widetilde{f}$-local, which follows from our assumption that f is left orthogonal to g (Corollary 9.1.7.13). □

04P6 **Corollary 9.1.7.19.** *Let $\mathcal{C}$ be an ∞-category, and let f be a morphism of $\mathcal{C}$ which is the colimit of a diagram*

$$Q_0 : K \to \operatorname{Fun}(\Delta^1, \mathcal{C}) \qquad v \mapsto f_v$$

which is preserved by the evaluation functors $\operatorname{ev}_0, \operatorname{ev}_1 : \operatorname{Fun}(\Delta^1, \mathcal{C}) \to \mathcal{C}$. Let $g : X \to Y$ be a morphism which is right orthogonal to each of the morphisms f_v. Then g is right orthogonal to f.

Proof. Let $\pi : \mathcal{C}_{/Y} \to \mathcal{C}$ be the projection map, and let us identify g with an object $\widetilde{X} \in \mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{X}) = X$. By virtue of Corollary 9.1.7.13, it will suffice to show that if $\widetilde{f}$ is a morphism in $\mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{f}) = f$, then $\widetilde{X}$ is $\widetilde{f}$-local. Choose a colimit diagram $Q : K^{\triangleright} \to \mathrm{Fun}(\Delta^1, \mathcal{C})$ which satisfies $Q|_K = Q_0$ and carries the cone point of $K^{\triangleright}$ to f. Since the inclusion of the cone point into $K^{\triangleright}$ is right anodyne (Example 4.3.7.11) and the projection map $\mathrm{Fun}(\Delta^1, \mathcal{C}_{/Y}) \to \mathrm{Fun}(\Delta^1, \mathcal{C})$ is a right fibration (Corollary 4.2.5.2) we can lift Q to a diagram $\widetilde{Q} : K^{\triangleright} \to \mathrm{Fun}(\Delta^1, \mathcal{C})$ carrying the cone point to $\widetilde{f}$. Using Corollary 7.1.3.20 and Proposition 7.1.6.1, we see that $\widetilde{Q}$ is a colimit diagram which is preserved by the evaluation functors $\mathrm{ev}_0, \mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}_{/Y}) \to \mathcal{C}_{/Y}$. For each vertex $v \in K$, let $\widetilde{f}_v = \widetilde{Q}(v)$ is a morphism of $\mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{f}_v) = f_v$. Our assumption that f_v is left orthogonal to g guarantees that $\widetilde{X}$ is a $\widetilde{f}_v$-local object of the ∞-category $\mathcal{C}_{/Y}$ (Corollary 9.1.7.13). Applying Remark 9.1.1.9, we deduce that $\widetilde{X}$ is also $\widetilde{f}$-local. □

Corollary 9.1.7.20. *Let $\mathcal{C}$ be an ∞-category, let $g : X \to Y$ be a morphism of $\mathcal{C}$, and let S be the collection of morphisms of $\mathcal{C}$ which are left orthogonal to g. Then S is weakly saturated.* 04P7

Proof. Combining Corollaries 9.1.7.14, 9.1.7.15, and 9.1.7.19 with Proposition 9.1.2.10 (and Remark 9.1.2.11), we see that S is closed under transfinite composition. Since S is also closed under retracts (Corollary 9.1.7.17) and pushouts (Corollary 9.1.7.18), it is weakly saturated. □

Corollary 9.1.7.21. *Let $\mathcal{C}$ be an ∞-category, let S be a collection of morphisms of $\mathcal{C}$, and let $g : X \to Y$ be a morphism of $\mathcal{C}$ which is weakly right orthogonal to S. Assume that every morphism $f : A \to B$ which belongs to S admits a relative codiagonal $\gamma_{A/B} : B \coprod_A B \to B$ which also belongs to S (see Variant 7.6.3.19). Then g is right orthogonal to S.* 04P8

Proof. Let $\pi : \mathcal{C}_{/Y} \to \mathcal{C}$ be the projection map, and let us identify g with an object $\widetilde{X} \in \mathcal{C}_{/Y}$ satisfying $\pi(\widetilde{X}) = X$. Let $\widetilde{S}$ denote the collection of those morphisms $\widetilde{f}$ in $\mathcal{C}_{/Y}$ which satisfy $\pi(\widetilde{f}) \in S$. Our assumption that g is weakly right orthogonal to S guarantees that $\widetilde{X}$ is weakly $\widetilde{S}$-local (Remark 9.1.5.12). It follows from Proposition 7.1.3.19 that every morphism of $\widetilde{S}$ admits a relative codiagonal which also belongs to $\widetilde{S}$, so that $\widetilde{X}$ is $\widetilde{S}$-local (Proposition 9.1.3.15). Invoking Corollary 9.1.7.13, we conclude that g is right orthogonal to S. □

Proposition 9.1.7.22. *Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of ∞-categories, let σ :* 04P9

04PA

$$\begin{tikzcd} A \arrow[r] \arrow[d, "f"'] & X \arrow[d, "g"] \\ B \arrow[r] \arrow[ur, dashed] & Y \end{tikzcd} \tag{9.15}$$

be a lifting problem in the ∞-category $\mathcal{E}$, and let $\overline{\sigma} = U \circ \sigma$ denote the associated lifting problem in the ∞-category $\mathcal{C}$. If the morphism f is U-cocartesian or the morphism $\widetilde{g}$ is U-cartesian, then U induces a homotopy equivalence of solution spaces $\mathrm{Sol}(\sigma) \to \mathrm{Sol}(\overline{\sigma})$.

Proof. Let us identify the diagram (9.15) with a pair of objects $\widetilde{B}, \widetilde{X} \in \mathcal{E}_{A/\,/Y}$. Note that U induces a functor $\widetilde{U} : \mathcal{E}_{A/\,/Y} \to \mathcal{C}_{U(A)/\,/U(Y)}$, and we have a commutative diagram

$$\begin{tikzcd}
\mathrm{Hom}_{\mathcal{E}_{A/\,/Y}}(\widetilde{B}, \widetilde{X}) \arrow[r] \arrow[d] & \mathrm{Sol}(\sigma) \arrow[d] \\
\mathrm{Hom}_{\mathcal{C}_{U(A)/\,/U(Y)}}(\widetilde{U}(\widetilde{B}), \widetilde{U}(\widetilde{X})) \arrow[r] & \mathrm{Sol}(\overline{\sigma}),
\end{tikzcd}$$

where the horizontal maps are the homotopy equivalences supplied by Proposition 9.1.7.11. It will therefore suffice to show that the left vertical map is a homotopy equivalence. Without loss of generality, we may assume that the morphism f is U-cocartesian. In this case, we will complete the proof by showing that the object $\widetilde{B} \in \mathcal{E}_{A/\,/Y}$ is $\widetilde{U}$-initial. Let $U_{/Y} : \mathcal{E}_{/Y} \to \mathcal{C}_{/U(Y)}$ be the inner fibration induced by U; by virtue of Example 7.1.5.9, it will suffice to show that the lower left of the diagram (9.15) is $U_{/Y}$-cocartesian when viewed as a morphism in $\mathcal{E}_{/Y}$. This follows from our assumption that f is U-cocartesian (Corollary 5.1.1.14). □

04PB **Corollary 9.1.7.23.** *Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of ∞-categories and let f and g be morphisms of $\mathcal{E}$. Assume either that f is U-cocartesian or that g is U-cartesian. Then:*

- *If $U(f)$ is left orthogonal to $U(g)$ in the ∞-category $\mathcal{C}$, then f is left orthogonal to g in the ∞-category $\mathcal{E}$.*
- *If $U(f)$ is weakly left orthogonal to $U(g)$ in the ∞-category $\mathcal{C}$, then f is weakly left orthogonal to g in the ∞-category $\mathcal{E}$.*

9.1.8 Uniqueness of Factorizations

04PQ Let $\mathcal{C}$ be an ∞-category, let S_L and S_R be collections of morphisms of $\mathcal{C}$, and let $f : X \to Z$ be a morphism which factors as a composition

$$X \xrightarrow{f_L} Y \xrightarrow{f_R} Z$$

where f_L belongs to S_L and f_R belongs to S_R. Our goal in this section is to show that, if S_L is left orthogonal to S_R, then this factorization is essentially unique (Theorem 9.1.8.2).

Notation 9.1.8.1. Let $\mathcal{C}$ be an ∞-category and let S_L and S_R be collections of morphisms of $\mathcal{C}$. We let $\mathrm{Fun}_L(\Delta^2, \mathcal{C})$ denote the full subcategory of $\mathrm{Fun}(\Delta^2, \mathcal{C})$ spanned by those diagrams 04PS

$$\begin{tikzcd}
& Y \arrow[dr, "f_R"] & \\
X \arrow[ur, "f_L"] \arrow[rr, "f"] & & Z
\end{tikzcd}$$

where f belongs to S_L, and $\mathrm{Fun}_R(\Delta^2, \mathcal{C})$ the full subcategory of $\mathrm{Fun}(\Delta^2, \mathcal{C})$ spanned by those diagrams where g belongs to S_R. We let $\mathrm{Fun}_{LR}(\Delta^2, \mathcal{C})$ denote the intersection $\mathrm{Fun}_L(\Delta^2, \mathcal{C}) \cap \mathrm{Fun}_R(\Delta^2, \mathcal{C})$.

We can now formulate our main result.

Theorem 9.1.8.2. *Let $\mathcal{C}$ be an ∞-category and let S_L and S_R be collections of morphisms of $\mathcal{C}$. If S_L is left orthogonal to S_R, then the restriction functor* 04QC

$$D : \mathrm{Fun}_{LR}(\Delta^2, \mathcal{C}) \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \qquad \sigma \mapsto d_1^2(\sigma)$$

is fully faithful. The converse holds if S_L and S_R contain all identity morphisms of $\mathcal{C}$.

The proof of Theorem 9.1.8.2 will require some preliminaries. We begin by giving another description of the space of solutions to a lifting problem.

Notation 9.1.8.3. Let $\mathcal{C}$ be an ∞-category containing morphisms $f : A \to B$ and $g : X \to Y$. We let ${}_f \mathrm{Fun}(\Delta^3, \mathcal{C})_g$ denote the the iterated fiber product 04PW

$$\{f\} \times_{\mathrm{Fun}(\mathrm{N}_\bullet(\{0<1\})} \mathrm{Fun}(\Delta^3, \mathcal{C}) \times_{\mathrm{Fun}_{\mathrm{N}_\bullet(\{2<3\})}} \{g\},$$

whose objects can be identified with diagrams

$$\begin{tikzcd}
A \arrow[r] \arrow[d, "f"] & X \arrow[d, "g"] \\
B \arrow[ur] \arrow[r] & Y
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$.

Lemma 9.1.8.4. *Let $\mathcal{C}$ be an ∞-category containing morphisms $f : A \to B$ and $g : X \to Y$. Then precomposition with the inclusion map $\mathrm{N}_\bullet(\{1 < 2\}) \hookrightarrow \Delta^3$ induces a trivial Kan fibration of simplicial sets ${}_f \mathrm{Fun}(\Delta^3, \mathcal{C})_g \to \mathrm{Hom}_{\mathcal{C}}(B, X)$. In particular, the simplicial set ${}_f \mathrm{Fun}(\Delta^3, \mathcal{C})_g$ is a Kan complex.* 04PX

Proof. By construction, we have a pullback diagram of simplicial sets

$$\begin{tikzcd}
{}_f \operatorname{Fun}(\Delta^3, \mathcal{C})_g \arrow[r] \arrow[d] & \operatorname{Fun}(\Delta^3, \mathcal{C}) \arrow[d] \\
\operatorname{Hom}_{\mathcal{C}}(B, X) \arrow[r] & \operatorname{Fun}(\operatorname{Spine}[3], \mathcal{C}),
\end{tikzcd}$$

where the right vertical map is a trivial Kan fibration (see Example 1.5.7.7). □

04PY **Notation 9.1.8.5.** Let $\mathcal{C}$ be an ∞-category containing morphisms $f : A \to B$ and $g : X \to Y$. We let $\widetilde{f} = s_1^1(f)$ and $\widetilde{g} = s_0^1(g)$ denote the degenerate 2-simplices of $\mathcal{C}$ depicted in the diagram

$$A \xrightarrow{f} B \xrightarrow{\mathrm{id}} B \qquad X \xrightarrow{\mathrm{id}} X \xrightarrow{g} Y.$$

Let $\beta : \Delta^2 \times \Delta^1 \to \Delta^3$ denote the morphism of simplicial sets given on vertices by the formulae

$$\beta(0,0) = 0 \qquad \beta(1,0) = 1 = \beta(2,0) \qquad \beta(0,1) = 2 = \beta(1,1) \qquad \beta(2,1) = 3.$$

Then precomposition with β determines a functor $\operatorname{Fun}(\Delta^3, \mathcal{C}) \to \operatorname{Fun}(\Delta^2 \times \Delta^1, \mathcal{C})$, which restricts to a map of Kan complexes $T : {}_f \operatorname{Fun}(\Delta^3, \mathcal{C})_g \to \operatorname{Hom}_{\operatorname{Fun}(\Delta^2, \mathcal{C})}(\widetilde{f}, \widetilde{g})$. Concretely, T carries a 3-simplex

$$\begin{tikzcd}
A \arrow[r, "u"] \arrow[d, "f"] & X \arrow[d, "g"] \\
B \arrow[r, "w"] \arrow[ur, "v"] & Y
\end{tikzcd}$$

to the morphism in $\operatorname{Fun}(\Delta^2, \mathcal{C})$ depicted in the diagram

$$\begin{tikzcd}
A \arrow[r, "f"] \arrow[d, "u"] & B \arrow[r, "\mathrm{id}_B"] \arrow[d, "v"] & B \arrow[d, "w"] \\
X \arrow[r, "\mathrm{id}_X"] & X \arrow[r, "g"] & Y.
\end{tikzcd}$$

04PZ **Lemma 9.1.8.6.** *Let $\mathcal{C}$ be an ∞-category containing morphisms $f : A \to B$ and $g : X \to Y$. Then the comparison map*

$$T : {}_f \operatorname{Fun}(\Delta^3, \mathcal{C})_g \to \operatorname{Hom}_{\operatorname{Fun}(\Delta^2, \mathcal{C})}(\widetilde{f}, \widetilde{g})$$

of Notation 9.1.8.5 is a homotopy equivalence.

Proof. By construction, the diagram $\widetilde{f} : \Delta^2 \to \mathcal{C}$ is left Kan extended from the simplicial subset $\Delta^1 \subset \Delta^2$. Applying Corollary 7.3.6.9, we deduce that the restriction functor $\operatorname{Fun}(\Delta^2, \mathcal{C}) \to \operatorname{Fun}(\Delta^1, \mathcal{C})$ determines a trivial Kan fibration $R : \operatorname{Hom}_{\operatorname{Fun}(\Delta^2,\mathcal{C})}(\widetilde{f}, \widetilde{g}) \to \operatorname{Hom}_{\operatorname{Fun}(\Delta^1,\mathcal{C})}(f, \mathrm{id}_X)$. Similarly, the 1-simplex id_X can be viewed as a diagram $\Delta^1 \to \mathcal{C}$ which is right Kan extended from the vertex $\{1\} \subset \Delta^2$, so the evaluation functor $\mathrm{ev}_1 : \operatorname{Fun}(\Delta^1, \mathcal{C}) \to \mathcal{C}$ induces a trivial Kan fibration $Q : \operatorname{Hom}_{\operatorname{Fun}(\Delta^1,\mathcal{C})}(f, \mathrm{id}_X) \to \operatorname{Hom}_{\mathcal{C}}(B, X)$. We are therefore reduced to showing that the composite map

$$_f\operatorname{Fun}(\Delta^3, \mathcal{C})_g \xrightarrow{T} \operatorname{Hom}_{\operatorname{Fun}(\Delta^2,\mathcal{C})}(\widetilde{f}, \widetilde{g}) \xrightarrow{R} \operatorname{Hom}_{\operatorname{Fun}(\Delta^1,\mathcal{C})}(f, \mathrm{id}_X) \xrightarrow{Q} \operatorname{Hom}_{\mathcal{C}}(B, X)$$

is a homotopy equivalence, which follows from Lemma 9.1.8.4. □

In the situation of Lemma 9.1.8.6, restriction to the "long edge" of Δ^2 determines an inner fibration of ∞-categories $\operatorname{Fun}(\Delta^2, \mathcal{C}) \to \operatorname{Fun}(\Delta^1, \mathcal{C})$ (Corollary 4.1.4.2), and therefore induces a Kan fibration of mapping spaces

$$\operatorname{Hom}_{\operatorname{Fun}(\Delta^2,\mathcal{C})}(\widetilde{f}, \widetilde{g}) \to \operatorname{Hom}_{\operatorname{Fun}(\Delta^1,\mathcal{C})}(f, g).$$

Lemma 9.1.8.7. *Let $\mathcal{C}$ be an ∞-category containing a lifting problem σ :* 04Q0

04Q1

$$\begin{tikzcd} A \arrow[r] \arrow[d, "f"'] & X \arrow[d, "g"] \\ B \arrow[r] \arrow[ur, dashed, "s"] & Y, \end{tikzcd} \qquad (9.16)$$

which we identify with a morphism from f to g in the ∞-category $\operatorname{Fun}(\Delta^1, \mathcal{C})$. *Then the comparison map $T : {}_f\operatorname{Fun}(\Delta^3, \mathcal{C})_g \to \operatorname{Hom}_{\operatorname{Fun}(\Delta^2,\mathcal{C})}(\widetilde{f}, \widetilde{g})$ of Notation 9.1.8.5 restricts to a homotopy equivalence of Kan complexes*

$$T_0 : \operatorname{Sol}(\sigma) \to \operatorname{Hom}_{\operatorname{Fun}(\Delta^2,\mathcal{C})}(\widetilde{f}, \widetilde{g}) \times_{\operatorname{Hom}_{\operatorname{Fun}(\Delta^1,\mathcal{C})}(f,g)} \{\sigma\}.$$

Proof. Let $\alpha : \Delta^1 \times \Delta^1 \hookrightarrow \Delta^3$ be the morphism of simplicial sets given on vertices by the formula $\alpha(i, j) = 2i + j$ (see Definition 9.1.5.1). Then precomposition with α induces an isofibration of ∞-categories $U : \operatorname{Fun}(\Delta^3, \mathcal{C}) \to \operatorname{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})$, which restricts to an isofibration $U_0 : {}_f\operatorname{Fun}(\Delta^3, \mathcal{C})_g \to \operatorname{Hom}_{\operatorname{Fun}(\Delta^1,\mathcal{C})}(f, g)$. Since the source and target of U_0 are Kan complexes, it is a Kan fibration (Corollary 4.4.3.10). The desired result now follows by applying Corollary 3.3.7.5 to the diagram of Kan complexes

$$\begin{tikzcd}
{}_f \operatorname{Fun}(\Delta^3, \mathcal{C})_g \arrow[rr, "T"] \arrow[dr, "U_0"] & & \operatorname{Hom}_{\operatorname{Fun}(\Delta^2,\mathcal{C})}(\widetilde{f}, \widetilde{g}) \arrow[dl] \\
& \operatorname{Hom}_{\operatorname{Fun}(\Delta^1,\mathcal{C})}(f,g), &
\end{tikzcd}$$

since T is a homotopy equivalence (Lemma 9.1.8.6). □

04Q2 **Corollary 9.1.8.8.** *Let $\mathcal{C}$ be an ∞-category containing 2-simplices σ and τ. Suppose that the initial edge $f = d_2^2(\sigma)$ is left orthogonal to the final edge $g = d_0^2(\tau)$. Then the restriction map $\theta : \operatorname{Hom}_{\operatorname{Fun}(\Delta^2,\mathcal{C})}(\sigma, \tau) \to \operatorname{Hom}_{\operatorname{Fun}(\Delta^1,\mathcal{C})}(f,g)$ is a trivial Kan fibration.*

Proof. By virtue of Proposition 3.3.7.6, it will suffice to show that every fiber of θ is a contractible Kan complex. Let $D : \operatorname{Fun}(\Delta^2, \mathcal{C}) \to \operatorname{Fun}(\Delta^1, \mathcal{C})$ denote the functor given by precomposition with the inclusion map $\Delta^1 \simeq \operatorname{N}_\bullet(\{0 < 2\}) \hookrightarrow \Delta^2$, and let $E : \operatorname{Fun}(\Delta^1, \mathcal{C}) \to \mathcal{C}$ be given by evaluation at the final vertex $1 \in \Delta^1$. Let $\gamma : \Delta^2 \times \Delta^1 \to \Delta^2$ be the morphism of simplicial sets given on vertices by the formula $\gamma(i,j) = \begin{cases} 1 & \text{if } (i,j) = (0,2) \\ i & \text{otherwise.} \end{cases}$. Then the composition

$$\Delta^2 \times \Delta^1 \xrightarrow{\gamma} \Delta^2 \xrightarrow{\sigma} \mathcal{C}$$

can be regarded as a morphism $e : \widetilde{f} \to \sigma$ in the ∞-category $\operatorname{Fun}(\Delta^2, \mathcal{C})$. It follows from Corollary 5.3.7.5 that the morphism e is $(E \circ D)$-cocartesian and that $D(e)$ is E-cocartesian. Consequently, the morphism e is D-cocartesian (Corollary 5.1.2.6). Using Proposition 5.1.2.1, we deduce that every fiber of θ is homotopy equivalent to a fiber of the restriction map $\theta' : \operatorname{Hom}_{\operatorname{Fun}(\Delta^2,\mathcal{C})}(\widetilde{f}, \tau) \to \operatorname{Hom}_{\operatorname{Fun}(\Delta^1,\mathcal{C})}(f,g)$. It will therefore suffice to prove Corollary 9.1.8.8 in the special case where $\sigma = \widetilde{f}$. By a similar argument, we may also assume that τ is the degenerate 2-simplex $\widetilde{g} = s_0^1(g)$. In this case, Lemma 9.1.8.7 guarantees that every fiber of θ is homotopy equivalent to the space of solutions to some lifting problem

$$\begin{tikzcd}
A \arrow[r] \arrow[d, "f"'] & X \arrow[d, "g"] \\
B \arrow[r] \arrow[ur, dashed, "s"] & Y,
\end{tikzcd}$$

which is contractible by virtue of our assumption that f is left orthogonal to g. □

Proof of Theorem 9.1.8.2. Let $\mathcal{C}$ be an ∞-category and let S_L and S_R be collections of morphisms of $\mathcal{C}$. Suppose first that S_L is left orthogonal to S_R. In this case Corollary 9.1.8.8 guarantees that the restriction map

$$\theta : \mathrm{Hom}_{\mathrm{Fun}(\Delta^2,\mathcal{C})}(\sigma,\sigma') \to \mathrm{Hom}_{\mathrm{Fun}(\Delta^1,\mathcal{C})}(d_1^2(\sigma), d_1^2(\sigma'))$$

is a homotopy equivalence whenever σ belongs to $\mathrm{Fun}_L(\Delta^2,\mathcal{C})$ and σ' belongs to $\mathrm{Fun}_R(\Delta^2,\mathcal{C})$. It follows that the functor

$$D : \mathrm{Fun}_{LR}(\Delta^2,\mathcal{C}) \to \mathrm{Fun}(\Delta^1,\mathcal{C}) \qquad \sigma \mapsto d_1^2(\sigma)$$

is fully faithful.

We now prove the converse. Assume that D is fully faithful and that S_L and S_R contain all identity morphisms of $\mathcal{C}$; we wish to show that S_L is left orthogonal to S_R. Suppose we are given a lifting problem τ :

$$\begin{tikzcd}
A \arrow[r] \arrow[d, "f"'] & X \arrow[d, "g"] \\
B \arrow[r] \arrow[ur, dashed, "s"] & Y
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$, where f belongs to S_L and g belongs to S_R. We wish to show that the solution space $\mathrm{Sol}(\tau)$ is contractible. Let $\widetilde{f} = s_1^1(f)$ and $\widetilde{g} = s_0^1(g)$ denote the degenerate 2-simplices of $\mathcal{C}$ defined in Notation 9.1.8.3. Since S_L and S_R contain all identity morphisms, we can view $\widetilde{f}$ and $\widetilde{g}$ as objects of the ∞-category $\mathrm{Fun}_{LR}(\Delta^2,\mathcal{C})$. Assumption (1) guarantees that the Kan fibration $\mathrm{Hom}_{\mathrm{Fun}(\Delta^2,\mathcal{C})}(\widetilde{f},\widetilde{g}) \to \mathrm{Hom}_{\mathrm{Fun}(\Delta^1,\mathcal{C})}(f,g)$ is a homotopy equivalence. Lemma 9.1.8.7 supplies a homotopy equivalence of $\mathrm{Sol}(\tau)$ with the fiber $\mathrm{Hom}_{\mathrm{Fun}(\Delta^2,\mathcal{C})}(\widetilde{f},\widetilde{g})_\tau$, which is contractible by virtue of Proposition 3.3.7.6. □

9.1.9 Factorization Systems

Motivated by Theorem 9.1.8.2, we introduce the following variant of Definition 9.1.6.1: 04PC

Definition 9.1.9.1. Let $\mathcal{C}$ be an ∞-category. A *factorization system on* $\mathcal{C}$ is a pair (S_L, S_R), where S_L and S_R are collections of morphisms of $\mathcal{C}$ which satisfy the following conditions: 04PD

(1) For every morphism $f : X \to Z$ of $\mathcal{C}$, there exists a 2-simplex

$$\begin{tikzcd}
& Y \arrow[dr, "f_R"] & \\
X \arrow[ur, "f_L"] \arrow[rr, "f"] & & Z
\end{tikzcd}$$

where f_L belongs to S_L and f_R belongs to S_R.

(2) Every morphism of S_L is left orthogonal to every morphism of S_R (Definition 9.1.7.4).

(3) The collections S_L and S_R are closed under isomorphism (in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$).

04PE **Remark 9.1.9.2** (Symmetry)**.** Let $\mathcal{C}$ be an ∞-category and let (S_L, S_R) be a factorization system on $\mathcal{C}$. Then the pair (S_R, S_L) is a weak factorization system on the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$.

04PF **Example 9.1.9.3** (Trivial Factorization Systems)**.** Let $\mathcal{C}$ be an ∞-category, let W be the collection of all isomorphisms in $\mathcal{C}$, and let A denote the collection of all morphisms in $\mathcal{C}$. Then the pairs (W, A) and (A, W) are factorization systems on $\mathcal{C}$ (see Corollary 9.1.7.14).

We now give some more interesting examples of factorization systems. Recall that a functor of ∞-categories $F : \mathcal{C} \to \mathcal{D}$ is *categorically n-connective* if it is m-full for every nonnegative integer $m \leq n$ (Definition 4.8.7.1), and *essentially $(n-1)$-categorical* if it is m-full for $m > n$ (Definition 4.8.6.1). Let $\mathcal{QC}$ denote the ∞-category of (small) ∞-categories (Construction 5.5.4.1).

05E7 **Proposition 9.1.9.4.** *Let n be an integer, let S_L denote the collection of all categorically n-connective functors, and let S_R denote the collection of all essentially $(n-1)$-categorical functors. Then the pair (S_L, S_R) is a factorization system on the ∞-category $\mathcal{QC}$.*

Proof. We first observe that S_R is closed under the formation of relative diagonals: that is, if a functor $G : \mathcal{C} \to \mathcal{D}$ is essentially $(n-1)$-categorical, then the relative diagonal of G (formed in the ∞-category $\mathcal{QC}$) has the same property. Using Exercise 7.6.4.13, we can identify the relative diagonal of G with the inclusion map $\iota : \mathcal{C} \hookrightarrow \mathcal{C} \times^{\mathrm{h}}_{\mathcal{D}} \mathcal{C}$. For $n \geq 1$, it follows from Variant 4.8.6.15 that ι is essentially $(n-2)$-categorical, and therefore also essentially $(n-1)$-categorical (Remark 4.8.6.6). If $n \leq 0$, then the functor G is fully faithful, so ι is an equivalence of ∞-categories.

It follows from Remarks 4.8.5.16, 4.8.5.17, and 4.8.5.18 that S_L and S_R are invariant under isomorphism. Theorem 4.8.8.3 asserts that every functor $F : \mathcal{C} \to \mathcal{E}$ admits a factorization $\mathcal{C} \xrightarrow{F_L} \mathcal{D} \xrightarrow{F_R} \mathcal{E}$, where F_L belongs to S_L and F_R belongs to S_R. We will complete the proof by showing that S_L is left orthogonal to S_R. By virtue of (the dual of) Corollary 9.1.7.21, it will suffice to show that S_L is weakly left orthogonal to S_R: that is, every lifting problem

05E8
$$\begin{tikzcd}
\mathcal{A} \arrow[r] \arrow[d, "F"] & \mathcal{C} \arrow[d, "G"] \\
\mathcal{B} \arrow[r] \arrow[ur, dashed] & \mathcal{D}
\end{tikzcd} \tag{9.17}$$

in the ∞-category $\mathcal{QC}$ admits a solution, provided that F is categorically n-connective and G is essentially $(n-1)$-categorical. By virtue of Corollary 5.6.5.16, we may assume that (9.17) arises from a commutative diagram in the category of simplicial sets. Using Corollary

4.5.2.23, we can further assume that F is a monomorphism of simplicial sets and that G is an isofibration. In this case, the lifting problem (9.17) already admits a solution in the category of simplicial sets: see Corollary 4.8.7.18 and Remark 4.8.7.19. □

Corollary 9.1.9.5. *Let n be an integer, let S_L denote the collection of all n-connective morphisms between Kan complexes, and let S_R denote the collection of all $(n-1)$-truncated morphisms between Kan complexes. Then the pair (S_L, S_R) determines a factorization system on the ∞-category $\mathcal{S}$.* 05E9

Proof. Recall that a morphism of Kan complexes is n-connective if and only if it is categorically n-connective (Example 4.8.7.3), and $(n-1)$-truncated if and only if it is essentially $(n-1)$-categorical (Example 4.8.6.3). It follows immediately from Proposition 9.1.9.4 that S_L and S_R are closed under isomorphism, and that S_L is left orthogonal to S_R. To complete the proof, it suffices to show that every morphism of Kan complexes $f : X \to Z$ admits a factorization $X \xrightarrow{f_L} Y \xrightarrow{f_R} Z$, where f_L is n-connective and f_R is $(n-1)$-truncated. This is the content of Corollary 4.8.8.9. □

Proposition 9.1.9.6. *Let $\mathcal{C}$ be an ∞-category, let (S_L, S_R) be a factorization system on $\mathcal{C}$, and let $\mathrm{Fun}_{LR}(\Delta^2, \mathcal{C}) \subseteq \mathrm{Fun}(\Delta^2, \mathcal{C})$ be the full subcategory of Notation 9.1.8.1. Then the restriction map* 04QD

$$D : \mathrm{Fun}_{LR}(\Delta^2, \mathcal{C}) \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \qquad \sigma \mapsto d_1^2(\sigma)$$

is a trivial Kan fibration.

Proof. Condition (1) of Definition 9.1.9.1 guarantees that D is surjective on objects, and condition (2) guarantees that D is fully faithful (Theorem 9.1.8.2). Applying the criterion Theorem 4.6.2.20, we deduce that D is an equivalence of ∞-categories. Condition (3) of Definition 9.1.9.1 guarantees that the full subcategory $\mathrm{Fun}_{LR}(\Delta^2, \mathcal{C}) \subseteq \mathrm{Fun}(\Delta^2, \mathcal{C})$ is replete, so that D is an isofibration of ∞-categories (see Corollary 4.4.5.3). Applying Proposition 4.5.5.20, we conclude that D is a trivial Kan fibration. □

Corollary 9.1.9.7. *Let $\mathcal{C}$ be an ∞-category and let (S_L, S_R) be a factorization system on $\mathcal{C}$. Then every isomorphism in $\mathcal{C}$ is contained in both S_L and S_R.* 04QE

Proof. Let W be the collection of all isomorphisms in $\mathcal{C}$, and set $S_L^+ = S_L \cup W$ and $S_R^+ = S_R \cup W$. Using Corollary 9.1.7.14, we deduce that S_L^+ is left orthogonal to S_R^+, so that (S_L^+, S_R^+) is also a factorization system on $\mathcal{C}$. Let $\mathrm{Fun}_{LR}(\Delta^2, \mathcal{C})$ be as in Notation 9.1.8.1 and define $\mathrm{Fun}^{+}_{LR}(\Delta^2, \mathcal{C})$ similarly. We then have a commutative diagram

$$\begin{tikzcd}
\mathrm{Fun}_{LR}(\Delta^2, \mathcal{C}) \arrow[rr] \arrow[dr, "D"'] & & \mathrm{Fun}^{+}_{LR}(\Delta^2, \mathcal{C}) \arrow[dl, "D^{+}"] \\
& \mathrm{Fun}(\Delta^1, \mathcal{C}) &
\end{tikzcd}$$

where both of the vertical maps are trivial Kan fibrations (Proposition 9.1.9.6). It follows that the inclusion map $\mathrm{Fun}_{LR}(\Delta^2, \mathcal{C}) \hookrightarrow \mathrm{Fun}^{+}_{LR}(\Delta^2, \mathcal{C})$ is an equivalence of ∞-categories. Since $\mathrm{Fun}_{LR}(\Delta^2, \mathcal{C})$ is a replete full subcategory of $\mathrm{Fun}^{+}_{LR}(\Delta^2, \mathcal{C})$, we must have $\mathrm{Fun}_{LR}(\Delta^2, \mathcal{C}) = \mathrm{Fun}^{+}_{LR}(\Delta^2, \mathcal{C})$. In particular, if $f : X \to Y$ is an isomorphism in $\mathcal{C}$, then the degenerate 2-simplices $s^1_0(f)$ and $s^1_1(f)$ are both contained in $\mathrm{Fun}_{LR}(\Delta^2, \mathcal{C})$, so that f is contained in both S_L and S_R. □

04QF **Corollary 9.1.9.8.** *Let $\mathcal{C}$ be an ∞-category and let (S_L, S_R) be a factorization system on $\mathcal{C}$. Then S_L and S_R are closed under retracts (in the ∞-category* $\mathrm{Fun}(\Delta^1, \mathcal{C})$*).*

Proof. We will show that S_L is closed under retracts; the analogous statement for S_R follows by a similar argument. By virtue of Proposition 9.1.9.6, the restriction map

$$D : \mathrm{Fun}_{LR}(\Delta^2, \mathcal{C}) \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \qquad \sigma \mapsto d^2_1(\sigma)$$

is a trivial Kan fibration. It therefore admits a section $\mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}_{LR}(\Delta^2, \mathcal{C})$, which carries each morphism $f : X \to Z$ of $\mathcal{C}$ to a 2-simplex σ_f :

$$\begin{tikzcd}
& Y \arrow[dr, "f_R"] & \\
X \arrow[ur, "f_L"] \arrow[rr, "f"] & & Z,
\end{tikzcd}$$

where $f_L \in S_L$ and $f_R \in S_R$. We will complete the proof by showing that f belongs to S_L if and only if f_R is an isomorphism in $\mathcal{C}$. One direction is clear: if f_R is an isomorphism, then f is isomorphic to f_L in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$, and therefore belongs to S_L by virtue of our assumption that S_L is closed under isomorphism. For the converse, assume that f belongs to S_L. Since id_Z belongs to S_R (Corollary 9.1.9.7), the degenerate 2-simplex $\widetilde{f} = s^1_1(f)$ can be regarded as an object of $\mathrm{Fun}_{LR}(\Delta^2, \mathcal{C})$ satisfying $D(\widetilde{f}) = f = D(\sigma_f)$. Since D is an equivalence of ∞-categories, the 2-simplex σ_f is isomorphic to $\widetilde{f}$ as an object of the ∞-category $\mathrm{Fun}_{LR}(\Delta^2, \mathcal{C})$. It follows that $f_R = d^2_0(\sigma_f)$ is isomorphic to $\mathrm{id}_Z = d^2_0(\widetilde{f})$ as an object of the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$, so that f_R is an isomorphism (Example 4.4.1.14). □

Corollary 9.1.9.9. *Let $\mathcal{C}$ be an ∞-category and let (S_L, S_R) be a factorization system on $\mathcal{C}$. Then (S_L, S_R) is a weak factorization system on $\mathcal{C}$.* 04QG

Proof. The only nontrivial point is to verify that S_L and S_R are closed under retracts, which follows from Corollary 9.1.9.8. □

Beware that the converse of Corollary 9.1.9.9 is false in general:

Exercise 9.1.9.10. Let Set denote the category of sets and let $\mathcal{C} = \mathrm{N}_{\bullet}(\mathrm{Set})$ be the associated ∞-category. Let S be the collection of surjective functions, and let I be the collection of injective functions. Show that: 04PH

- The pair (S, I) is a factorization system on $\mathcal{C}$.
- The pair (I, S) is a weak factorization system on $\mathcal{C}$.
- The pair (I, S) is not a factorization system on $\mathcal{C}$.

In the situation of Definition 9.1.9.1, either of the collections S_L and S_R can be recovered from the other.

Proposition 9.1.9.11. *Let $\mathcal{C}$ be an ∞-category, let (S_L, S_R) be a factorization system on $\mathcal{C}$, and let f be a morphism of $\mathcal{C}$. The following conditions are equivalent:* 04PJ

(1) *The morphism f belongs to S_L.*

(2) *The morphism f is left orthogonal to S_R.*

(3) *The morphism f is weakly left orthogonal to S_R.*

Proof. The implication (1) ⇒ (2) is immediate from the definition, the implication (2) ⇒ (3) follows from Remark 9.1.7.7, and the implication (3) ⇒ (1) follows from Proposition 9.1.6.5 (together with Corollary 9.1.9.9). □

Corollary 9.1.9.12. *Let $\mathcal{C}$ be an ∞-category which admits pushouts and let (S_L, S_R) be a weak factorization system on $\mathcal{C}$. The following conditions are equivalent:* 04PK

(1) *The pair (S_L, S_R) is a factorization system on $\mathcal{C}$.*

(2) *For every 2-simplex*

$$\begin{tikzcd}
& Y \arrow[dr, "g"] & \\
X \arrow[ur, "f"] \arrow[rr, "h"] & & Z
\end{tikzcd}$$

of $\mathcal{C}$, if f and h belong to S_L, then g also belongs to S_L.

(3) *For every morphism $f : X \to Y$ which belongs to S_L, the relative codiagonal $\gamma_{X/Y} : Y \coprod_X Y \to Y$ also belongs to S_L.*

Proof. We first show that (1) ⇒ (2). Assume that (S_L, S_R) is a factorization system and consider a 2-simplex

$$\begin{tikzcd} & Y \arrow[dr, "g"] & \\ X \arrow[ur, "f"] \arrow[rr, "h"] & & Z \end{tikzcd}$$

of $\mathcal{C}$. If f and h belong to S_L, then they are left orthogonal to S_R. Applying Corollary 9.1.7.15, we deduce that g is also left orthogonal to S_R, so that $g \in S_L$ by virtue of Proposition 9.1.9.11.

We now show that (2) implies (3). Let $f : X \to Y$ be a morphism which belongs to S_L. Then the relative codiagonal $\gamma_{X/Y}$ fits into a commutative diagram

$$\begin{tikzcd} & Y \coprod_X Y \arrow[dr, "\gamma_{X/Y}"] & \\ Y \arrow[ur, "f'"] \arrow[rr, "\mathrm{id}_Y"] & & Y, \end{tikzcd}$$

where f' is a pushout of f. Since S_L is weakly saturated (Corollary 9.1.6.6), it contains the morphisms f' and id_Y. If condition (2) is satisfied, then $\gamma_{X/Y}$ also contains $\gamma_{X/Y}$.

We now complete the proof by showing that (3) implies (1). Let g be a morphism of $\mathcal{C}$ which belongs to S_R. Then g is weakly right orthogonal to S_L, and we wish to show that g is right orthogonal to S_L. This follows by combining assumption (3) with Corollary 9.1.7.21. □

04PL **Proposition 9.1.9.13** (Lifting Factorization Systems)**.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories and let (S_L, S_R) be a weak factorization system on $\mathcal{C}$. Let $\widetilde{S}_L$ denote the collection of all U-cocartesian morphisms $\widetilde{f}$ in $\mathcal{E}$ satisfying $U(\widetilde{f}) \in S_L$, and let $\widetilde{S}_R$ be the collection of all morphisms $\widetilde{g}$ in $\mathcal{E}$ satisfying $U(\widetilde{g}) \in S_R$. Then the pair $(\widetilde{S}_L, \widetilde{S}_R)$ is a weak factorization system on $\mathcal{E}$. If (S_L, S_R) is a factorization system on $\mathcal{C}$, then $(\widetilde{S}_L, \widetilde{S}_R)$ is a factorization system on $\mathcal{E}$.*

Proof. By assumption, the collection S_L is weakly left orthogonal to S_R. Applying Corollary 9.1.7.23, we see that $\widetilde{S}_L$ is weakly left orthogonal to $\widetilde{S}_R$ (and left orthogonal if the pair (S_L, S_R) is a factorization system on $\mathcal{C}$). Since S_L and S_R are closed under isomorphism, the collections $\widetilde{S}_L$ and $\widetilde{S}_R$ have the same property (see Corollary 8.5.1.13). We will complete the proof by showing that the pair $(\widetilde{S}_L, \widetilde{S}_R)$ satisfies condition (1) of Definition 9.1.6.1. Let $\widetilde{h} : \widetilde{X} \to \widetilde{Z}$ be a morphism in the ∞-category $\mathcal{E}$, and let $h : X \to Z$ denote its image in the ∞-category $\mathcal{C}$. Since (S_L, S_R) is a weak factorization system, we can choose a 2-simplex σ :

$$\begin{tikzcd}
& Y \arrow[dr, "g"] & \\
X \arrow[ur, "f"] \arrow[rr, "h"] & & Z
\end{tikzcd}$$

of $\mathcal{C}$, where f belongs to S_L and g belongs to S_R. Our assumption that U is a cocartesian fibration guarantees that we can lift f to a U-cocartesian morphism $\widetilde{f} : \widetilde{X} \to \widetilde{Y}$ in the ∞-category $\mathcal{E}$. Since $\widetilde{f}$ is U-cocartesian, we can lift σ to a 2-simplex $\widetilde{\sigma}$:

$$\begin{tikzcd}
& \widetilde{Y} \arrow[dr, "\widetilde{g}"] & \\
\widetilde{X} \arrow[ur, "\widetilde{f}"] \arrow[rr, "\widetilde{h}"] & & \widetilde{Z}
\end{tikzcd}$$

in the ∞-category $\mathcal{E}$. By construction, we have $\widetilde{f} \in \widetilde{S}_L$ and $\widetilde{g} \in \widetilde{S}_R$. □

Corollary 9.1.9.14. *Let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of ∞-categories, let S be the collection of all U-cocartesian morphisms of $\mathcal{E}$, and let T be the collection of all morphisms f of $\mathcal{E}$ such that $U(f)$ is an isomorphism in $\mathcal{C}$. Then the pair (S, T) is a factorization system on $\mathcal{E}$.* 04PM

Proof. Combine Proposition 9.1.9.13 with Example 9.1.9.3. □

One can produce many examples of factorization systems using the small object argument of §9.1.4.

Theorem 9.1.9.15 (Existence of Factorization Systems)**.** *Let $\mathcal{C}$ be an ∞-category and let W be a collection of morphisms of $\mathcal{C}$. Assume that:* 04PN

(1) *The ∞-category $\mathcal{C}$ is locally small and admits small colimits.*

(2) *The collection W is small.*

(3) *For every morphism $w : X \to Y$ in W, the objects X and Y are κ-compact for some small cardinal κ.*

Then $\mathcal{C}$ admits a factorization system (S_L, S_R), where S_R is the collection of morphisms of $\mathcal{C}$ which are right orthogonal to W.

Proof. By virtue of Corollary 9.1.7.21 (and Proposition [?]), we can enlarge W to arrange that every morphism $w : A \to B$ which belongs to W admits a relative codiagonal $\gamma_{A/B} : B \coprod_A B \to B$ which also belongs to W. Applying Theorem 9.1.6.7, we conclude that $\mathcal{C}$ admits a weak factorization system (S_L, S_R), where S_L is the weakly saturated class of morphisms generated by W and S_R is the collection of morphisms which are weakly right orthogonal to W. Using Corollary 9.1.7.21, we see that a morphism $g : X \to Y$ of $\mathcal{C}$ belongs to S_R if and only if it is right orthogonal to W. If this condition is satisfied, then Corollary 9.1.7.20 guarantees that g is right orthogonal to W. Allowing g to vary, we conclude that (S_L, S_R) is a factorization system. □

04PP **Remark 9.1.9.16.** In the situation of Theorem 9.1.9.15, the collection S_L is characterized by the fact that it is the smallest weakly saturated collection of morphisms which contains W and also satisfies the equivalent conditions of Corollary 9.1.9.12. Beware that it is generally larger than the weakly saturated collection of morphisms generated by W.

We close this section by recording a converse to Proposition 9.1.9.6:

04PT **Theorem 9.1.9.17.** *Let $\mathcal{C}$ be an ∞-category, let S_L and S_R be collections of morphisms of $\mathcal{C}$, and let $\mathrm{Fun}_{LR}(\Delta^2, \mathcal{C}) \subseteq \mathrm{Fun}(\Delta^2, \mathcal{C})$ be the full subcategory of Notation 9.1.8.1. Then (S_L, S_R) is a factorization system on $\mathcal{C}$ if and only if it satisfies the following conditions:*

(1) *The restriction map*

$$D : \mathrm{Fun}_{LR}(\Delta^2, \mathcal{C}) \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \qquad \sigma \mapsto d_1^2(\sigma)$$

is an equivalence of ∞-categories.

(2) *Every identity morphism of $\mathcal{C}$ is contained in both S_L and S_R.*

(3) *The collections S_L and S_R are closed under isomorphism (in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$).*

Proof. The necessity of (3) is immediate from the definitions, and the necessity of (1) and (2) follow from Proposition 9.1.9.6 and Corollary 9.1.9.7, respectively. For the converse, assume that conditions (1), (2), and (3) are satisfied. Combining (1) and (3) with Theorem 9.1.8.2, we deduce that S_L is left orthogonal to S_R. We are therefore reduced to proving that the functor D is surjective on objects. Assumption (3) guarantees that the full subcategory $\mathrm{Fun}_{LR}(\Delta^2, \mathcal{C}) \subseteq \mathrm{Fun}(\Delta^2, \mathcal{C})$ is replete, so that D is an isofibration (see Corollary 4.4.5.3). It will therefore suffice to show that D is essentially surjective, which follows from assumption (1). □

Corollary 9.1.9.18 (Exponentiation of Factorization Systems)**.** *Let $\mathcal{C}$ be an ∞-category equipped with a factorization system (S_L, S_R) and let K be a simplicial set. Then the ∞-category $\operatorname{Fun}(K, \mathcal{C})$ admits a factorization system (S_L^K, S_R^K), where S_L^K denotes the collection of all morphisms f in $\operatorname{Fun}(K, \mathcal{C})$ such that $f(v) \in S_L$ for each vertex v of K, and S_R^K is defined similarly.* 04PV

Proof. Since S_L and S_R contain identity morphisms and are closed under isomorphism, the collections S_L^K and S_R^K have the same properties. By virtue of Theorem 9.1.9.17, it will suffice to show that the restriction map

$$D_K : \operatorname{Fun}_{LR}(\Delta^2, \operatorname{Fun}(K, \mathcal{C})) \to \operatorname{Fun}(\Delta^1, \operatorname{Fun}(K, \mathcal{C})) \qquad \sigma \mapsto d_1^2(\sigma)$$

is an equivalence of ∞-categories. This follows from Remark 4.5.1.16, since D_K is obtained by applying the functor $\operatorname{Fun}(K, \bullet)$ to the restriction map $D : \operatorname{Fun}_{LR}(\Delta^2, \mathcal{C}) \to \operatorname{Fun}(\Delta^1, \mathcal{C})$. □

9.2 Truncated Objects of ∞-Categories

9.2.1 Truncated Objects 05EA

Let n be an integer. Recall that a Kan complex X is *n-truncated* if, for every integer $m \geq n+2$, every morphism $\partial \Delta^m \to X$ can be extended to an m-simplex of X. We now introduce a counterpart of this condition for objects of an arbitrary ∞-category. 05EB

Definition 9.2.1.1. Let $\mathcal{C}$ be an ∞-category and let n be an integer. We say that an object $X \in \mathcal{C}$ is *n-truncated* if, for every object $Y \in \mathcal{C}$, the morphism space $\operatorname{Hom}_{\mathcal{C}}(Y, X)$ is an n-truncated Kan complex. 05EC

Remark 9.2.1.2. In the formulation of Definition 9.2.1.1, we can replace $M = \operatorname{Hom}_{\mathcal{C}}(Y, X)$ by any Kan complex which is homotopy equivalent M. For example, we can replace M by the pinched morphism spaces $\operatorname{Hom}^{\mathrm{L}}_{\mathcal{C}}(Y, X)$ and $\operatorname{Hom}^{\mathrm{R}}_{\mathcal{C}}(Y, X)$ (see Proposition 4.6.5.10). 05ED

Example 9.2.1.3. Let $\mathcal{C}$ be an ∞-category. For $n \leq -2$, an object $X \in \mathcal{C}$ is n-truncated if and only if it is a final object of $\mathcal{C}$ (Definition 4.6.7.1). In particular, this condition is independent of n, so long as $n \leq -2$. Consequently, in the setting of Definition 9.2.1.1, there is no loss of generality in assuming that $n \geq -2$. 05EE

Example 9.2.1.4. Let X be a Kan complex and let n be an integer. The following conditions are equivalent: 05EF

(1) The Kan complex X is n-truncated, in the sense of Definition 3.5.7.1.

(2) For every Kan complex Y, the Kan complex $\operatorname{Fun}(Y, X)$ is n-truncated.

(3) For every simplicial set Y, the Kan complex $\mathrm{Fun}(Y, X)$ is n-truncated.

(4) The Kan complex X is n-truncated when regarded as an object of the ∞-category $\mathcal{S}$ (in the sense of Definition 9.2.1.1).

The implications (3) $\Rightarrow$ (2) $\Rightarrow$ (1) are immediate, the implication (1) $\Rightarrow$ (3) follows from Corollary 3.5.9.27, and the equivalence (2) $\Leftrightarrow$ (4) follows from the homotopy equivalence $\mathrm{Fun}(Y, X) \to \mathrm{Hom}_{\mathcal{S}}(Y, X)$ of Remark 5.5.1.5.

05EG **Remark 9.2.1.5.** Let $\mathcal{C}$ be an ∞-category, and let X and Y be objects of $\mathcal{C}$. If X is n-truncated and Y is a retract of X, then Y is also n-truncated. In particular, if X and Y are isomorphic, then X is n-truncated if and only if Y is n-truncated.

05EH **Remark 9.2.1.6.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, let n be an integer, and let $X \in \mathcal{C}$ be an object whose image $F(X)$ is an n-truncated object of $\mathcal{D}$. If the functor F is essentially $(n+1)$-categorical (Definition 4.8.6.1), then X is an n-truncated object of $\mathcal{C}$ (see Proposition 3.5.9.13). In particular, if F is fully faithful, then X is an n-truncated object of $\mathcal{C}$.

05EJ **Remark 9.2.1.7.** Let $F : \mathcal{C} \to \mathcal{D}$ be an equivalence of ∞-categories. Then an object $X \in \mathcal{C}$ is n-truncated if and only if the image $Y = F(X)$ is an n-truncated object of $\mathcal{D}$. The "if" direction follows from Remark 9.2.1.6. For the converse, suppose that X is n-truncated and let $G : \mathcal{D} \to \mathcal{C}$ be a homotopy inverse to F. Then $G(Y) \in \mathcal{C}$ is isomorphic to X, and is therefore an n-truncated object of $\mathcal{C}$ (Remark 9.2.1.5). Since G is fully faithful, Remark 9.2.1.6 guarantees that Y is an n-truncated object of $\mathcal{D}$.

05EK **Remark 9.2.1.8.** Let $\mathcal{C}$ be an ∞-category and let n be an integer. Then $\mathcal{C}$ is locally n-truncated (in the sense of Definition 4.8.2.1) if and only if every object $X \in \mathcal{C}$ is n-truncated (in the sense of Definition 9.2.1.1).

05EL **Remark 9.2.1.9** (Monotonicity)**.** Let $\mathcal{C}$ be an ∞-category and let $m \leq n$ be integer. If an object $X \in \mathcal{C}$ is m-truncated, then it is also n-truncated (see Remark 3.5.9.6).

05EM **Remark 9.2.1.10.** Let $\mathcal{C}$ be an ∞-category, let X be an object of $\mathcal{C}$, and let $n \geq -2$ be an integer. The following conditions are equivalent:

(1) The object $X \in \mathcal{C}$ is n-truncated, in the sense of Definition 9.2.1.1.

(2) The constant map $\partial \Delta^{n+2} \to \{\mathrm{id}_X\} \hookrightarrow \mathrm{Hom}_{\mathcal{C}}(X, X)$ exhibits X as a power of itself by $\partial \Delta^{n+2}$, in the sense of Definition 7.6.2.1.

(3) The constant map
$$(\partial \Delta^{n+2})^{\triangleright} \simeq \Lambda^{n+3}_{n+3} \to \{X\} \hookrightarrow \mathcal{C}$$
is a limit diagram in $\mathcal{C}$, in the sense of Definition 7.1.2.4.

The equivalence (1) $\Leftrightarrow$ (2) follows from Corollary 3.5.9.22, and the equivalence (2) $\Leftrightarrow$ (3) from Remark 7.6.2.6.

Remark 9.2.1.11. In the formulation of Remark 9.2.1.10, we can replace $\partial \Delta^{n+2}$ by any simplicial set K of the same weak homotopy type (that is, any simplicial set K for which the geometric realization $|K|$ is homotopy equivalent to a sphere of dimension $n+1$). For example, we can take K to be the subdivision $\mathrm{Sd}(\Delta^{n+1})$ (see Proposition 3.3.4.8). 05EN

Remark 9.2.1.12. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which preserves finite limits. Then, for every n-truncated object $X \in \mathcal{C}$, the image $F(X)$ is an n-truncated object of $\mathcal{D}$. This follows from the criterion of Remark 9.2.1.10. 05EP

Remark 9.2.1.13. Let $\mathcal{C}$ be an ∞-category and let n be an integer. Then an object $X \in \mathcal{C}$ is n-truncated if and only if the right fibration $\mathcal{C}_{/X} \to \mathcal{C}$ is essentially n-categorical. This follows from the criterion of Corollary 5.1.5.18 (together with Remark 9.2.1.2). 05EQ

Proposition 9.2.1.14. *Let $\mathcal{C}$ be an ∞-category and let n be an integer. Let X be an object of $\mathcal{C}$, and let us abuse notation by identifying X with its image in the homotopy n-category $\mathrm{h}_{\leq n}(\mathcal{C})$ (Notation 4.8.4.2). Then X is $(n-1)$-truncated if and only if the diagram of ∞-categories* 05K2

$$\begin{tikzcd}
\mathcal{C}_{/X} \arrow[r] \arrow[d] & \mathrm{h}_{\leq n}(\mathcal{C})_{/X} \arrow[d] \\
\mathcal{C} \arrow[r] & \mathrm{h}_{\leq n}(\mathcal{C})
\end{tikzcd} \tag{9.18}$$
05K3

is a categorical pullback square.

Proof. Since the vertical maps in the diagram (9.18) are right fibrations (Proposition 4.3.6.1), it is a categorical pullback square if and only if, for every object $Y \in \mathcal{C}$, the induced map of right-pinched morphism spaces

$$\theta : \mathrm{Hom}^{\mathrm{R}}_{\mathcal{C}}(Y, X) = \{Y\} \times_{\mathcal{C}} \mathcal{C}_{/Y} \to \{Y\} \times_{\mathrm{h}_{\leq n}(\mathcal{C})} (\mathrm{h}_{\leq n}(\mathcal{C}))_{/X} = \mathrm{Hom}^{\mathrm{R}}_{\mathrm{h}_{\leq n(()\mathcal{C})}}(Y, X)$$

is a homotopy equivalence (Corollary 5.1.6.4). It follows from Corollary 4.8.4.8 that θ exhibits $\mathrm{Hom}^{\mathrm{R}}_{\mathrm{h}_{\leq n(()\mathcal{C})}}(Y, X)$ as an $(n-1)$-truncation of $\mathrm{Hom}^{\mathrm{R}}_{\mathcal{C}}(Y, X)$. In particular, it is a homotopy equivalence if and only if $\mathrm{Hom}^{\mathrm{R}}_{\mathcal{C}}(Y, X)$ is $(n-1)$-truncated. This condition is satisfied for every object $Y \in \mathcal{C}$ if and only if the object X is $(n-1)$-truncated (Remark 9.2.1.2). □

Corollary 9.2.1.15. *Let $\mathcal{C}$ be an ∞-category, let n be an integer, and let X be an $(n-1)$-truncated object of $\mathcal{C}$. Then the canonical map $\mathrm{h}_{\leq n}(\mathcal{C}_{/X}) \to \mathrm{h}_{\leq n}(\mathcal{C})_{/X}$ is an equivalence of ∞-categories.* 05K4

Proof. Combine Propositions 9.2.1.14 and 4.8.4.20. □

05ER **Proposition 9.2.1.16** (Limits of Truncated Objects)**.** *Let $\mathcal{C}$ be an ∞-category and let n be an integer. Then the collection of n-truncated objects of $\mathcal{C}$ is closed under limits. That is, if $F : A^{\triangleleft} \to \mathcal{C}$ is a limit diagram in $\mathcal{C}$ having the property that $F(a)$ is n-truncated for each vertex $a \in A$, then F carries the cone point of $A^{\triangleleft}$ to an n-truncated object of $\mathcal{C}$.*

Proof. Fix an object $C \in \mathcal{C}$ and let $h^C : \mathcal{C} \to \mathcal{S}$ denote the functor corepresented by C. We wish to show that the composition

$$A^{\triangleleft} \xrightarrow{F} \mathcal{C} \xrightarrow{h^C} \mathcal{S}$$

carries the cone point of $A^{\triangleleft}$ to an n-truncated Kan complex. This follows from Remark 7.4.5.9, since $h^C \circ F$ is a limit diagram in the ∞-category $\mathcal{S}$ (Corollary 7.4.5.18). □

05ES **Remark 9.2.1.17.** Let $\mathcal{C}$ be an ∞-category, let X be an object of $\mathcal{C}$, and let $\mathcal{C}' \subseteq \mathcal{C}$ be the full subcategory of $\mathcal{C}$ spanned by those objects $Y \in \mathcal{C}$ for which the morphism space $\mathrm{Hom}_{\mathcal{C}}(Y, X)$ is n-truncated. Since the representable functor

$$h_X : \mathcal{C}^{\mathrm{op}} \to \mathcal{S} \qquad Y \mapsto \mathrm{Hom}_{\mathcal{C}}(Y, X)$$

carries colimits in the ∞-category $\mathcal{C}$ to limits in the ∞-category of spaces $\mathcal{S}$, (Corollary 7.4.5.18), Remark 7.4.5.9 guarantees that the subcategory $\mathcal{C}' \subseteq \mathcal{C}$ is closed under the formation of colimits. Consequently, if $\mathcal{C}$ is generated (under the formation of small colimits) by some full subcategory $\mathcal{C}_0 \subseteq \mathcal{C}$, then the object X is n-truncated if and only if the morphism space $\mathrm{Hom}_{\mathcal{C}}(Y, X)$ is n-truncated for each object $Y \in \mathcal{C}_0$.

Definition 9.2.1.1 can be reformulated as a filling condition:

05ET **Proposition 9.2.1.18.** *Let $\mathcal{C}$ be an ∞-category, let X be an object of $\mathcal{C}$, and let $n \geq -2$ be an integer. Then X is n-truncated if and only if it satisfies the following condition for each $m \geq n + 3$:*

$(*_m)$ *Every morphism $\sigma : \partial \Delta^m \to \mathcal{C}$ satisfying $\sigma(m) = X$ can be extended to an m-simplex of $\mathcal{C}$.*

Proof. This is a special case of Proposition 4.8.6.20, since the object X is n-truncated if and only if the right fibration $\mathcal{C}_{/X} \to \mathcal{C}$ is essentially $(n + 1)$-categorical (Remark 9.2.1.13). □

We close this section by classifying the truncated objects of the ∞-category $\mathcal{QC}$ of (small) ∞-categories (Construction 5.5.4.1).

05EU **Proposition 9.2.1.19.** *Let $\mathcal{C}$ be an ∞-category and let n be an integer. The following conditions are equivalent:*

(1) *The ∞-category $\mathcal{C}$ is n-truncated when viewed as an object of $\mathcal{QC}$, in the sense of Definition 9.2.1.1.*

(2) *The Kan complex $\mathrm{Fun}(\Delta^1, \mathcal{C})^{\simeq}$ is n-truncated.*

(3) *The core $\mathcal{C}^{\simeq}$ is an n-truncated Kan complex. Moreover, for every pair of objects $X, Y \in \mathcal{C}$, the morphism space $\mathrm{Hom}_{\mathcal{C}}(X, Y)$ is also an n-truncated Kan complex.*

Proof. By virtue of Proposition [?], the ∞-category $\mathcal{QC}$ is generated under colimits by the object $\Delta^1 \in \mathcal{QC}$. The equivalence (1) $\Leftrightarrow$ (2) now follows by combining Remarks 9.2.1.17 and 5.5.4.5. We next show that, if condition (2) is satisfied, then the core $\mathcal{C}^{\simeq}$ is an n-truncated Kan complex. Let $\mathrm{Isom}(\mathcal{C})$ denote the full subcategory of $\mathrm{Fun}(\Delta^1, \mathcal{C})$ spanned by the isomorphisms of $\mathcal{C}$. Then the diagonal map

$$\mathcal{C} \hookrightarrow \mathrm{Isom}(\mathcal{C}) \qquad X \mapsto \mathrm{id}_X$$

is an equivalence of ∞-categories (Corollary 4.5.3.13), and therefore restricts to a homotopy equivalence of Kan complexes $\mathcal{C}^{\simeq} \hookrightarrow \mathrm{Isom}(\mathcal{C})^{\simeq}$. We are therefore reduced to showing that the Kan complex $\mathrm{Isom}(\mathcal{C})^{\simeq}$ is n-truncated. Since $\mathrm{Isom}(\mathcal{C})^{\simeq}$ is a summand of the Kan complex $\mathrm{Fun}(\Delta^1, \mathcal{C})^{\simeq}$, this follows immediately from assumption (2) if $n \geq -1$. The case $n \leq -2$ then follows from the additional observation that if $\mathrm{Fun}(\Delta^1, \mathcal{C})^{\simeq}$ is nonempty, then the ∞-category $\mathcal{C}$ is nonempty, so $\mathrm{Isom}(\mathcal{C})^{\simeq}$ is nonempty.

We now complete the proof by showing that (2) and (3) are equivalent. By virtue of the preceding argument, we may assume that the core $\mathcal{C}^{\simeq}$ is n-truncated, so the product $\mathcal{C}^{\simeq} \times \mathcal{C}^{\simeq}$ is n-truncated (Remark 3.5.7.6). Using Proposition 3.5.9.13, we see that condition (2) is satisfied if and only if the map of Kan complexes

$$U : \mathrm{Fun}(\Delta^1, \mathcal{C})^{\simeq} \to \mathcal{C}^{\simeq} \times \mathcal{C}^{\simeq} \qquad (f : X \to Y) \mapsto (X, Y)$$

is n-truncated. Since U is a Kan fibration (Corollary 4.4.5.4), this is equivalent to the requirement that each fiber of U is an n-truncated Kan complex (Proposition 3.5.9.8), which is a restatement of (3). □

Remark 9.2.1.20. If $n \geq -1$, we can reformulate condition (3) of Proposition 9.2.1.19 as follows: 05EV

(3′) For every pair of objects $X, Y \in \mathcal{C}$, the morphism space $\mathrm{Hom}_{\mathcal{C}}(X, Y)$ is n-truncated. Moreover, the summand $\mathrm{Isom}_{\mathcal{C}}(X, Y) \subseteq \mathrm{Hom}_{\mathcal{C}}(X, Y)$ spanned by the isomorphisms from X to Y is $(n-1)$-truncated.

See Example 3.5.9.18.

Corollary 9.2.1.21. *Let $\mathcal{C}$ be an ∞-category and let n be an integer. Then:* 05EW

- *If $\mathcal{C}$ is an n-truncated object of $\mathcal{QC}$ (in the sense of Definition 9.2.1.1), then it is locally n-truncated (in the sense of Definition 4.8.2.1).*

- *If $n \geq -1$ and $\mathcal{C}$ is locally $(n-1)$-truncated, then it is an n-truncated object of $\mathcal{QC}$.*

05EX **Warning 9.2.1.22.** In general, neither implication of Corollary 9.2.1.21 is reversible. See Example 9.2.2.11.

9.2.2 Example: Discrete and Subterminal Objects

04UX We now consider some important special cases of Definition 9.2.1.1.

05EY **Definition 9.2.2.1.** Let $\mathcal{C}$ be an ∞-category. We will say that an object $X \in \mathcal{C}$ is *discrete* if, for every object $C \in \mathcal{C}$, every connected component of the morphism space $\mathrm{Hom}_{\mathcal{C}}(C, X)$ is contractible.

04UY **Definition 9.2.2.2.** Let $\mathcal{C}$ be an ∞-category. We will say that an object $X \in \mathcal{C}$ is *subterminal* if, for every object $C \in \mathcal{C}$, the morphism space $\mathrm{Hom}_{\mathcal{C}}(C, X)$ is either empty or contractible.

05EZ **Remark 9.2.2.3.** Let $\mathcal{C}$ be an ∞-category. Then:

- An object $X \in \mathcal{C}$ is discrete (in the sense of Definition 9.2.2.1) if and only if is 0-truncated (in the sense of Definition 9.2.2.1).

- An object $X \in \mathcal{C}$ is subterminal (in the sense of Definition 9.2.2.2) if and only if it is (-1)-truncated.

See Examples 3.5.7.4 and 3.5.7.5.

04V0 **Example 9.2.2.4.** Let $\mathcal{C}$ be an ∞-category. Then every final object of $\mathcal{C}$ is subterminal, and every subterminal object of $\mathcal{C}$ is discrete.

04V1 **Example 9.2.2.5.** Let X be a Kan complex, which we regard as an object of the ∞-category of spaces $\mathcal{S}$ (Construction 5.5.1.1). Then:

- The Kan complex X is a discrete object of the ∞-category $\mathcal{S}$ (in the sense of Definition 9.2.2.1) if and only if every connected component of X is contractible: that is, the projection map $X \to \pi_0(X)$ is a homotopy equivalence.

- The Kan complex X is a subterminal object of the ∞-category $\mathcal{S}$ (in the sense of Definition 9.2.2.2) if and only if X is either empty or contractible.

See Example 9.2.1.4.

05F0 **Example 9.2.2.6.** Let $\mathcal{C} = \mathrm{N}_{\bullet}(\mathcal{C}_0)$ be the nerve of an ordinary category $\mathcal{C}_0$. Then:

- Every object of $\mathcal{C}$ is discrete.
- An object $X \in \mathcal{C}$ is subterminal (in the sense of Definition 9.2.2.2) if and only if it is subterminal in the sense of classical category theory: that is, for every object $Y \in \mathcal{C}$, there is at most one morphism from Y to X.

Remark 9.2.2.7. Let $\mathcal{C}$ be an ∞-category and let X be an object of $\mathcal{C}$. If X is discrete, then the canonical map $\mathrm{h}(\mathcal{C}_{/X}) \to (\mathrm{h}\mathcal{C})_{/X}$ is an equivalence of categories. This is a special case of Corollary 9.2.1.15. 05K5

Proposition 9.2.2.8. *Let $\mathcal{C}$ be an ∞-category and let* 05K6

$$\begin{tikzcd} X_{01} \arrow[r] \arrow[d] & X_0 \arrow[d] \\ X_1 \arrow[r] & X \end{tikzcd} \qquad (9.19)$$ 05K7

be a pullback diagram in $\mathcal{C}$. If the object X is discrete, then (9.19) determines a pullback diagram in the homotopy category $\mathrm{h}\mathcal{C}$.

Beware that the conclusion of Proposition 9.2.2.8 is generally false if we do not assume that the object X is discrete (see Warning 7.6.3.3).

Proof of Proposition 9.2.2.8. By virtue of Proposition 7.6.3.14, it will suffice to show that the the tautological map $F : \mathcal{C}_{/X} \to \mathrm{N}_{\bullet}(\mathrm{h}\mathcal{C})_{/X}$ preserves products. Since X is discrete, we can use Remark 9.2.2.7 to identify F with the canonical map from $\mathcal{C}_{/X}$ to (the nerve of) its homotopy category, which always preserves products (see Warning 7.6.1.11). □

We now record a partial converse to Example 9.2.2.6.

Definition 9.2.2.9. Let $\mathcal{C}$ be an ∞-category. We say that $\mathcal{C}$ is *locally discrete* if every object $X \in \mathcal{C}$ is discrete. 05F1

Note that an ∞-category $\mathcal{C}$ is locally discrete if and only if it is locally 0-truncated, in the sense of Definition 4.8.2.1. Invoking Corollary 4.8.2.15, we obtain the following:

Remark 9.2.2.10. Let $\mathcal{C}$ be an ∞-category. The following conditions are equivalent: 05F2

- The ∞-category $\mathcal{C}$ is locally discrete.
- The comparison map $\mathcal{C} \to \mathrm{N}_{\bullet}(\mathrm{h}\mathcal{C})$ is a trivial Kan fibration.
- There exists an ordinary category $\mathcal{C}_0$ and an equivalence of ∞-categories $\mathcal{C} \to \mathrm{N}_{\bullet}(\mathcal{C}_0)$.

05F3 **Example 9.2.2.11.** Let $\mathcal{QC}$ be the ∞-category of (small) ∞-categories (Construction 5.5.4.1). Then an object $\mathcal{C} \in \mathcal{QC}$ is discrete (in the sense of Definition 9.2.2.1) if and only if it satisfies the following pair of conditions:

- The ∞-category $\mathcal{C}$ is locally discrete: that is, there exists an equivalence $\mathcal{C} \to \mathrm{N}_{\bullet}(\mathcal{C}_0)$, where $\mathcal{C}_0$ is an ordinary category (Remark 9.2.2.10).
- For every object $X \in \mathcal{C}_0$, the automorphism group $\mathrm{Aut}(X)$ is trivial.

See Proposition 9.2.1.19. Beware that the second condition cannot be omitted.

04V2 **Remark 9.2.2.12.** Let $\mathcal{C}$ be an ∞-category, let $X \in \mathcal{C}$ be an object, and let $Y \in \mathcal{C}$ be a retract of X. If X is discrete, then Y is also discrete. If X is subterminal, then Y is also subterminal. See Remark 9.2.1.5.

04V3 **Remark 9.2.2.13.** Let $F : \mathcal{C} \to \mathcal{D}$ be a fully faithful functor of ∞-categories, and let X be an object of $\mathcal{C}$. Then:

- If $F(X)$ is a discrete object of $\mathcal{D}$, then X is a discrete object of $\mathcal{C}$.
- If $F(X)$ is a subterminal object of $\mathcal{D}$, then X is a subterminal object of $\mathcal{C}$.

In both cases, the converse holds if F is an equivalence of ∞-categories.

04V4 **Remark 9.2.2.14.** Let $\mathcal{C}$ be an ∞-category. Then an object $X \in \mathcal{C}$ is discrete if and only if it satisfies the following condition for every integer $m \geq 3$:

$(*_m)$ Every morphism $\sigma : \partial\Delta^m \to \mathcal{C}$ satisfying $\sigma(m) = X$ can be extended to an m-simplex of $\mathcal{C}$.

In this case, X is subterminal if and only if it also satisfies condition $(*_2)$. See Proposition 9.2.1.18.

05F4 **Remark 9.2.2.15.** Let $\mathcal{C}$ be an ∞-category. An object $X \in \mathcal{C}$ is subterminal if and only if the diagram

$$X \xleftarrow{\mathrm{id}_X} X \xrightarrow{\mathrm{id}_X} X$$

exhibits X as a product of X with itself. See Remark 9.2.1.10.

05F5 **Remark 9.2.2.16.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. Then:

- If F preserves finite limits, then it carries discrete objects of $\mathcal{C}$ to discrete objects of $\mathcal{D}$ (see Remark 9.2.1.12).
- If F preserves pairwise products, then it carries subterminal objects of $\mathcal{C}$ to subterminal objects of $\mathcal{D}$ (see Remark 9.2.2.15).

Notation 9.2.2.17 (The Heart of an ∞-Category)**.** Let $\mathcal{C}$ be an ∞-category. We let $\mathcal{C}^{\heartsuit}$ denote the full subcategory of $\mathcal{C}$ spanned by the discrete objects of $\mathcal{C}$. We will refer to $\mathcal{C}^{\heartsuit}$ as the *heart* of the ∞-category $\mathcal{C}$. 05F6

Let $\mathrm{Disc}(\mathcal{C})$ denote the homotopy category of $\mathcal{C}^{\heartsuit}$. By construction, the ∞-category $\mathcal{C}^{\heartsuit}$ is locally discrete, so Remark 9.2.2.10 guarantees that the comparison map $\mathcal{C} \to \mathrm{N}_{\bullet}(\mathrm{h}\mathcal{C})$ restricts to a trivial Kan fibration

$$\mathcal{C}^{\heartsuit} \to \mathrm{N}_{\bullet}(\mathrm{Disc}(\mathcal{C})).$$

For this reason, we will often abuse terminology by identifying the heart $\mathcal{C}^{\heartsuit}$ with the ordinary category $\mathrm{Disc}(\mathcal{C})$, which we also refer to as the *heart* of $\mathcal{C}$.

Notation 9.2.2.18. Let $\mathcal{C}$ be an ∞-category. We let $\mathrm{Sub}(\mathcal{C})$ denote the collection of isomorphism classes of subterminal objects of $\mathcal{C}$. If X is a subterminal object of $\mathcal{C}$, we let $[X] \in \mathrm{Sub}(\mathcal{C})$ denote its isomorphism class. Given a pair of subterminal objects X and X', we write $[X] \subseteq [X']$ if there exists a morphism $f : X \to X'$ in the ∞-category $\mathcal{C}$. Note that the relation $\subseteq$ is a partial ordering on the set $\mathrm{Sub}(\mathcal{C})$. 04V9

Remark 9.2.2.19. Let $\mathcal{C}$ be an ∞-category and let $\mathcal{C}' \subseteq \mathcal{C}$ be the full subcategory spanned by the subterminal objects of $\mathcal{C}$. Then the construction $X \mapsto [X]$ induces a trivial Kan fibration of ∞-categories $\mathcal{C}' \to \mathrm{N}_{\bullet}(\mathrm{Sub}(\mathcal{C}))$. Stated more informally, the partially ordered set $\mathrm{Sub}(\mathcal{C})$ can be identified with the full subcategory $\mathcal{C}' \subseteq \mathcal{C}$. 05F7

Remark 9.2.2.20. Let $\mathcal{C}$ be an ∞-category. 04VA

- If $\mathcal{C}$ has a final object, then the partially ordered set $\mathrm{Sub}(\mathcal{C})$ has a largest element: namely, the isomorphism class $[X]$, where X is any final object of $\mathcal{C}$.
- If $\mathcal{C}$ admits finite products, then $\mathrm{Sub}(\mathcal{C})$ is a lower semilattice: that is, every finite subset of $\mathrm{Sub}(\mathcal{C})$ has a greatest lower bound. In particular, every pair of elements $[X], [Y] \in \mathrm{Sub}(\mathcal{C})$ have a greatest lower bound which we will denote by $[X] \cap [Y]$, given by the isomorphism class of the product $X \times Y$.

9.2.3 Truncated Morphisms

We now introduce a relative version of Definition 9.2.1.1. 05F8

Definition 9.2.3.1. Let $\mathcal{C}$ be an ∞-category and let n be an integer. We say that a morphism $f : X \to Y$ of $\mathcal{C}$ is *n-truncated* if, for every object $C \in \mathcal{C}$, composition with the homotopy class $[f]$ induces an n-truncated morphism of Kan complexes $\mathrm{Hom}_{\mathcal{C}}(C, X) \xrightarrow{[f]\circ} \mathrm{Hom}_{\mathcal{C}}(C, Y)$. 05F9

05FA **Remark 9.2.3.2.** In the situation of Definition 9.2.3.1, the composition map

$$\theta : \operatorname{Hom}_{\mathcal{C}}(C, X) \xrightarrow{[f]\circ} \operatorname{Hom}_{\mathcal{C}}(C, Y)$$

is only well-defined up to homotopy (see Notation 4.6.9.15). However, the condition that θ is n-truncated depends only on its homotopy class (Remark 3.5.9.5).

05FB **Remark 9.2.3.3.** Let $f : X \to Y$ be a morphism in an ∞-category $\mathcal{C}$. The condition that f is n-truncated depends only on the homotopy class $[f]$, regarded as a morphism in the homotopy category $\mathrm{h}\mathcal{C}$.

05FC **Remark 9.2.3.4** (Monotonicity)**.** Let $\mathcal{C}$ be an ∞-category and let $m \leq n$ be integers. If $f : X \to Y$ is an m-truncated morphism of $\mathcal{C}$, then it is also n-truncated.

05FD **Example 9.2.3.5.** Let $\mathcal{C}$ be an ∞-category. For $n \leq -2$, a morphism $f : X \to Y$ of $\mathcal{C}$ is n-truncated if and only if it is an isomorphism. See Example 3.5.9.2.

05FE **Example 9.2.3.6.** Let $f : X \to Y$ be a morphism of Kan complexes and let n be an integer. The following conditions are equivalent:

(1) The morphism f is n-truncated, in the sense of Definition 3.5.9.1.

(2) For every Kan complex K, composition with f induces an n-truncated morphism $\operatorname{Fun}(K, X) \to \operatorname{Fun}(K, Y)$.

(3) For every simplicial set K, composition with f induces an n-truncated morphism $\operatorname{Fun}(K, X) \to \operatorname{Fun}(K, Y)$.

(4) The morphism f is n-truncated when regarded as a morphism in the ∞-category $\mathcal{S}$ of spaces, in the sense of Definition 9.2.3.1.

The implications (3) ⇒ (2) ⇒ (1) are immediate, the implication (1) ⇒ (3) follows from Corollary 3.5.9.26, and the equivalence (2) ⇔ (4) follows from Remark 5.5.1.5.

05FF **Proposition 9.2.3.7.** *Let $\mathcal{C}$ be an ∞-category, let n be an integer, and let $f : X \to Y$ be a morphism of $\mathcal{C}$. Then the morphism f is n-truncated (in the sense of Definition 9.2.3.1) if and only if it is n-truncated when regarded as an object of the slice ∞-category $\mathcal{C}_{/Y}$ (in the sense of Definition 9.2.1.1).*

Proof. By definition, f is n-truncated as an object of $\mathcal{C}_{/Y}$ if and only if, for every morphism $g : C \to Y$ of $\mathcal{C}$, the morphism space $K = \operatorname{Hom}_{\mathcal{C}_{/Y}}(g, f)$ is n-truncated. Using Corollary 4.6.9.18, we can identify K with the homotopy fiber of the composition map $\operatorname{Hom}_{\mathcal{C}}(C, X) \xrightarrow{[f]\circ} \operatorname{Hom}_{\mathcal{C}}(C, Y)$ over the vertex $g \in \operatorname{Hom}_{\mathcal{C}}(C, Y)$. The desired result now follows from Corollary 3.5.9.12. □

Corollary 9.2.3.8 (Homotopy Invariance)**.** *Let $F : \mathcal{C} \to \mathcal{D}$ be an equivalence of ∞-categories and let $f : X \to Y$ be a morphism of $\mathcal{C}$. Then f is n-truncated if and only if the image $F(f) : F(X) \to F(Y)$ is n-truncated.* 05FG

Proof. Using Corollary 4.6.4.19, we see that F induces an equivalence of ∞-categories $\mathcal{C}_{/Y} \to \mathcal{D}_{/F(Y)}$. The desired result now follows by combining Proposition 9.2.3.7 with Remark 9.2.1.7. □

Corollary 9.2.3.9. *Let $\mathcal{C}$ be an ∞-category, let $n \geq 0$ be an integer, let $\square^{n+1}$ denote the simplicial cube of dimension $n+1$ (Notation 2.4.5.2), and let $y \in \square^{n+1}$ be the final vertex. Let $Q : \square^{n+1} \to \Delta^1$ be the morphism given on vertices by* 05FH

$$Q(v) = \begin{cases} 1 & \text{if } v = y \\ 0 & \text{otherwise.} \end{cases}$$

Then a morphism $f : X \to Y$ of $\mathcal{C}$ is $(n-2)$-truncated if and only if the composite map

$$\square^{n+1} \xrightarrow{Q} \Delta^1 \xrightarrow{f} \mathcal{C}$$

is a limit diagram in $\mathcal{C}$.

Proof. Let us identify $\square^{n+1}$ with the iterated join $\{x\} \star \mathrm{Sd}(\partial\Delta^n) \star \{y\}$, where $\mathrm{Sd}(\partial\Delta^n)$ denotes the subdivision of $\partial\Delta^n$ (see Proposition 3.3.3.16). Using Remark 7.1.2.11, we see that $f \circ Q$ is a limit diagram in $\mathcal{C}$ if and only if the constant map

$$\{x\} \star \mathrm{Sd}(\partial\Delta^n) \to \{f\} \hookrightarrow \mathcal{C}_{/Y}$$

is a limit diagram in the slice ∞-category $\mathcal{C}_{/Y}$. The desired result now follows by combining Proposition 9.2.3.7 with Remark 9.2.1.11. □

Corollary 9.2.3.10. *Let $U : \mathcal{C} \to \mathcal{D}$ be a right fibration of ∞-categories, let n be an integer, and let $f : X \to Y$ be a morphism of $\mathcal{C}$. Then f is n-truncated if and only if $U(f)$ is an n-truncated morphism of $\mathcal{D}$.* 05FJ

Proof. Combine Corollaries 9.2.3.9 and 7.1.5.17. □

Corollary 9.2.3.11. *Let $\mathcal{C}$ be an ∞-category and let n be an integer. Then the collection of n-truncated morphisms of $\mathcal{C}$ is closed under retracts (in the ∞-category $\mathrm{Fun}(\Delta^1, \mathcal{C})$).* 05FK

Proof. Combine Corollaries 9.2.3.9 and 8.5.1.12. □

Corollary 9.2.3.12. *Let $\mathcal{C}$ be an ∞-category, let $f : X \to Y$ be a morphism of $\mathcal{C}$, and let $n \geq -2$ be an integer. Then f is n-truncated if and only if it satisfies the following condition for every positive integer $m \geq n+4$:* 05FL

$(*_m)$ *If $\sigma : \Lambda^m_m \to \mathcal{C}$ is a diagram having the property that the composite map*

$$\Delta^1 \simeq \mathrm{N}_\bullet(\{m-1 < m\}) \hookrightarrow \Lambda^m_m \xrightarrow{\sigma} \mathcal{C}$$

is equal to f, then σ can be extended to an m-simplex of $\mathcal{C}$.

Proof. Combine Propositions 9.2.3.7 and 9.2.1.18. □

05FM **Proposition 9.2.3.13.** *Let $\mathcal{C}$ be an ∞-category, let n be an integer, and let $f : X \to Y$ be a morphism of $\mathcal{C}$. Then:*

(1) *If Y is an n-truncated morphism and f is an n-truncated morphism, then X is an n-truncated object.*

(2) *If X is an n-truncated object and Y is an $(n+1)$-truncated object, then f is an n-truncated morphism.*

Proof. Let $C \in \mathcal{C}$ be an object and let $\theta : \mathrm{Hom}_{\mathcal{C}}(C, X) \to \mathrm{Hom}_{\mathcal{C}}(C, Y)$ be given by composition with the homotopy class $[f]$. Invoking Proposition 3.5.9.13, we obtain:

(1_C) If the morphism space $\mathrm{Hom}_{\mathcal{C}}(C, Y)$ is n-truncated and θ is n-truncated, then the morphism space $\mathrm{Hom}_{\mathcal{C}}(C, X)$ is n-truncated.

(2_C) If the morphism space $\mathrm{Hom}_{\mathcal{C}}(C, X)$ is n-truncated and the morphism space $\mathrm{Hom}_{\mathcal{C}}(C, Y)$ is $(n+1)$-truncated, then θ is n-truncated.

Proposition 9.2.3.13 follows by allowing the object C to vary. □

05FN **Corollary 9.2.3.14.** *Let $\mathcal{C}$ be an ∞-category, let n be an integer, and let Y be an n-truncated object of $\mathcal{C}$. Then a morphism $f : X \to Y$ is n-truncated if and only if the object X is n-truncated.*

Proof. Combine Proposition 9.2.3.13 with Remark 9.2.3.4. □

05FP **Example 9.2.3.15.** Let $\mathcal{C}$ be an ∞-category which contains a final object Y. Then every object $X \in \mathcal{C}$ admits a morphism $f : X \to Y$ which is uniquely determined up to homotopy. In this case, the object X is n-truncated (in the sense of Definition 9.2.1.1) if and only if the morphism f is n-truncated (in the sense of Definition 9.2.3.1).

05FQ **Corollary 9.2.3.16** (Composition)**.** *Let $\mathcal{C}$ be an ∞-category containing a 2-simplex*

$$\begin{tikzcd}
& Y \arrow[dr, "g"] & \\
X \arrow[ur, "f"] \arrow[rr, "h"] & & Z,
\end{tikzcd}$$

and let n be an integer. Then:

(1) *If the morphisms f and g are n-truncated, then the morphism h is n-truncated.*

(2) *If the morphism h is n-truncated and the morphism g is $(n+1)$-truncated, then the morphism f is n-truncated.*

Proof. Apply Proposition 9.2.3.13 to the slice ∞-category $\mathcal{C}_{/Z}$ (see Proposition 9.2.3.7). ☐

Proposition 9.2.3.17 (Pullbacks of Truncated Morphisms)**.** *Let $\mathcal{C}$ be an ∞-category containing a pullback diagram* 05FR

$$\begin{tikzcd}
X' \arrow[r] \arrow[d, "f'"] & X \arrow[d, "f"] \\
Y' \arrow[r] & Y
\end{tikzcd}$$

and let n be an integer. If f is n-truncated, then f' is also n-truncated.

Proof. Let $C \in \mathcal{C}$ be an object. Applying Proposition 7.4.5.17, we obtain a pullback diagram

$$\begin{tikzcd}
\mathrm{Hom}_{\mathcal{C}}(C, X') \arrow[r] \arrow[d, "\theta'"] & \mathrm{Hom}_{\mathcal{C}}(C, X) \arrow[d, "\theta"] \\
\mathrm{Hom}_{\mathcal{C}}(C, Y') \arrow[r] & \mathrm{Hom}_{\mathcal{C}}(C, Y)
\end{tikzcd}$$

in the ∞-category of spaces. Corollary 7.6.4.11 guarantees that if θ is n-truncated, then θ' is also n-truncated. Proposition 9.2.3.17 now follows by allowing the object C to vary. ☐

Proposition 9.2.3.18. *Let $\mathcal{C}$ be an ∞-category, let $n \geq -1$ be an integer, and let X be an object of $\mathcal{C}$ for which there exists a product $X \times X$. Then X is n-truncated if and only if the diagonal map $\delta_X : X \to X \times X$ is $(n-1)$-truncated.* 05FS

Proof. For each object $C \in \mathcal{C}$, Example 3.5.9.18 shows that the mapping space $\mathrm{Hom}_{\mathcal{C}}(C, X)$ is n-truncated if and only if the diagonal map

$$\mathrm{Hom}_{\mathcal{C}}(C, X) \to \mathrm{Hom}_{\mathcal{C}}(C, X) \times \mathrm{Hom}_{\mathcal{C}}(C, X)$$

is $(n-1)$-truncated. The desired result now follows by allowing the object C to vary. ☐

Corollary 9.2.3.19. *Let $\mathcal{C}$ be an ∞-category, let $n \geq -1$ be an integer, and let $f : X \to Y$ be a morphism of $\mathcal{C}$ for which there exists a fiber product $X \times_Y X$. Then f is n-truncated if if and only if the relative diagonal $\delta_{X/Y} : X \to X \times_Y X$ is $(n-1)$-truncated (see Notation 7.6.3.18).* 05FT

Proof. Let us identify the morphism f with an object $\overline{X}$ of the slice ∞-category $\mathcal{C}_{/Y}$. By virtue of Proposition 7.6.3.14, there exists a product $\overline{X} \times \overline{X}$ in the ∞-category $\mathcal{C}_{/Y}$, whose image in $\mathcal{C}$ is the fiber product $X \times_Y X$. Moreover, the relative diagonal $\delta_{X/Y}$ can be identified with the image of the diagonal map $\delta_{\overline{X}} : \overline{X} \to \overline{X} \times \overline{X}$ under the forgetful functor $\mathcal{C}_{/Y} \to \mathcal{C}$. Applying Corollary 9.2.3.10, we see that $\delta_{X/Y}$ is an $(n-1)$-truncated morphism of $\mathcal{C}$ if and only if $\delta_{\overline{X}}$ is an $(n-1)$-truncated morphism of $\mathcal{C}_{/Y}$. By virtue of Proposition 9.2.3.18, this is equivalent to the requirement that $\overline{X}$ is n-truncated as an object of $\mathcal{C}_{/Y}$. The desired result now follows from the criterion of Proposition 9.2.3.7. □

05FU **Corollary 9.2.3.20.** *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. Suppose that $\mathcal{C}$ admits pullbacks and that the functor F preserves pullbacks. Then, for every integer n, the functor F carries n-truncated morphisms of $\mathcal{C}$ to n-truncated morphisms of $\mathcal{D}$.*

Proof. For $n \leq -2$, a morphism is n-truncated if and only if it is an isomorphism (Example 9.2.3.5), so the desired result follows from Remark 1.5.1.6. The general case follows by induction on n, using Corollary 9.2.3.19. □

9.2.4 Monomorphisms

04VD Let $\mathcal{C}$ be a category. Recall that a morphism $f : X_0 \to X$ of $\mathcal{C}$ is a *monomorphism* if, for every object C of $\mathcal{C}$, the composition map

$$\mathrm{Hom}_{\mathcal{C}}(C, X_0) \xrightarrow{f\circ} \mathrm{Hom}_{\mathcal{C}}(C, X)$$

is injective. This notion has an obvious counterpart in the setting of ∞-categories.

04VE **Definition 9.2.4.1.** Let $\mathcal{C}$ be an ∞-category and let $f : X_0 \to X$ be a morphism of $\mathcal{C}$. We say that f is a *monomorphism* if, for every object $C \in \mathcal{C}$, the composition map

$$\mathrm{Hom}_{\mathcal{C}}(C, X_0) \xrightarrow{[f]\circ} \mathrm{Hom}_{\mathcal{C}}(C, X)$$

induces a homotopy equivalence of $\mathrm{Hom}_{\mathcal{C}}(C, X_0)$ with a summand of $\mathrm{Hom}_{\mathcal{C}}(C, X)$.

04VF **Warning 9.2.4.2.** Let $f : X_0 \to X$ be a morphism of Kan complexes. The assertion that f is a monomorphism can be given two different interpretations:

(1) The map f is a monomorphism in the ordinary category of Set_{Δ} of simplicial sets.

(2) The map f is a monomorphism in the ∞-category $\mathcal{S}$ of spaces.

Beware that these conditions are unrelated to one another. Condition (2) is homotopy invariant: it is the requirement that f restricts to a homotopy equivalence of X_0 with a summand of X (Example 9.2.4.10). Condition (1) is very far from being homotopy invariant: we can always arrange that it is satisfied by replacing X by a homotopy equivalent Kan complex (see Exercise 3.1.7.11).

Notation 9.2.4.3. Let $\mathcal{C}$ be an ∞-category and let f be a morphism of $\mathcal{C}$ having source X_0 and target X. If f is a monomorphism, we will sometimes visually emphasize this by denoting f with a hooked arrow (that is, we will write $f : X_0 \hookrightarrow X$ in place of $f : X_0 \to X$). Beware that this convention can be ambiguous in some situations (for example if $\mathcal{C} = \mathcal{S}$ is the ∞-category of spaces; see Warning 9.2.4.2). 04VG

Variant 9.2.4.4. Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$. We will say that f is an *epimorphism* if it is a monomorphism when viewed as a morphism of the ∞-category $\mathcal{C}^{\mathrm{op}}$: that is, if the induced map 04VS

$$\mathrm{Hom}_{\mathcal{C}}(Y, C) \xrightarrow{\circ[f]} \mathrm{Hom}_{\mathcal{C}}(X, C)$$

induces a homotopy equivalence of $\mathrm{Hom}_{\mathcal{C}}(Y, C)$ with a summand of $\mathrm{Hom}_{\mathcal{C}}(X, C)$, for each object $C \in \mathcal{C}$. We will generally avoid this terminology, to avoid confusion with the notion of *quotient morphism* which we introduce in §10.2.2 (see Warning 10.2.2.10).

Remark 9.2.4.5. Let $\mathcal{C}$ be an ∞-category. Then a morphism $f : X_0 \to X$ is a monomorphism (in the sense of Definition 9.2.4.1) if and only if it is (-1)-truncated (in the sense of Definition 9.2.3.1). See Example 3.5.9.3. 05FV

Example 9.2.4.6. Let $\mathcal{C}$ be a category and let $f : X_0 \to X$ be a morphism in $\mathcal{C}$. Then f is a monomorphism in the ∞-category $\mathrm{N}_{\bullet}(\mathcal{C})$ (in the sense of Definition 9.2.4.1) if and only if it is a monomorphism in the usual category-theoretic sense. 04VH

Example 9.2.4.7. Let $\mathcal{C}$ be an ∞-category and let $f : X_0 \to X$ be a morphism of $\mathcal{C}$. Then: 04VJ

- If the object X is subterminal and f is a monomorphism, then the object X_0 is also subterminal.
- If the object X_0 is subterminal and the object X is discrete, then f is a monomorphism.

In particular, if X is subterminal, then f is a monomorphism if and only if X_0 is subterminal. See Proposition 9.2.3.13.

Example 9.2.4.8. Let $\mathcal{C}$ be an ∞-category containing a final object $\mathbf{1}$, and let X be an object of $\mathcal{C}$. Then there is a morphism $f : X \to \mathbf{1}$, which is uniquely determined up to homotopy. It follows from Example 9.2.4.7 that f is a monomorphism if and only if X is subterminal. 04VK

Example 9.2.4.9. Let $\mathcal{C}$ be an ∞-category. Then every isomorphism in $\mathcal{C}$ is a monomorphism. 04VL

Example 9.2.4.10. Let $f : X_0 \to X$ be a map of Kan complexes. Then f is a monomorphism in the ∞-category of spaces $\mathcal{S}$ if and only if it induces a homotopy equivalence of X_0 with a summand of X. See Example 9.2.1.4. 05FW

04VM **Warning 9.2.4.11.** Let $\mathcal{C}$ be an ∞-category and let $i : X_0 \to X$ be a morphism of $\mathcal{C}$ which admits a left homotopy inverse $r : X \to X_0$. If $\mathcal{C}$ is (the nerve of) an ordinary category, then i is automatically a monomorphism. In general, this is not necessarily true. For example, let (X, x) be a pointed Kan complex, and regard the inclusion map $i : \{x\} \to X$ as a morphism in the ∞-category $\mathcal{S}$ of spaces. Then i has a left homotopy inverse (given by the constant map $X \to \{x\}$). However, i is a monomorphism in the ∞-category $\mathcal{S}$ only if x belongs to a contractible connected component of X (Example 9.2.4.10).

04VN **Remark 9.2.4.12.** Let $\mathcal{C}$ be an ∞-category and let $f : X_0 \to X$ be a morphism in $\mathcal{C}$. If f is a monomorphism, then the homotopy class $[f] : X_0 \to X$ is a monomorphism in the ordinary category $\mathrm{h}\mathcal{C}$. Beware that the converse is false in general.

04VQ **Remark 9.2.4.13.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories and let $f : X_0 \to X$ be a morphism of $\mathcal{C}$.

- If F is fully faithful and $F(f)$ is a monomorphism in $\mathcal{D}$, then f is a monomorphism in $\mathcal{C}$.
- If F is an equivalence of ∞-categories, then $F(f)$ is a monomorphism in $\mathcal{D}$ if and only if f is a monomorphism in $\mathcal{C}$.

04VP **Remark 9.2.4.14.** Let $\mathcal{C}$ be an ∞-category and let $f : X_0 \to X$ be a morphism of $\mathcal{C}$. The condition that f is a monomorphism depends only on the homotopy class $[f] \in \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(X_0, X)$.

04VR **Remark 9.2.4.15.** Let $\mathcal{C}$ be an ∞-category, and suppose that we are given a commutative diagram

$$\begin{tikzcd}
 & Y \arrow[dr, "g"] & \\
X \arrow[ur, "f"] \arrow[rr, "h"] & & Z
\end{tikzcd}$$

in $\mathcal{C}$, where g is a monomorphism. Then f is a monomorphism if and only if h is a monomorphism. In particular, the collection of monomorphisms is closed under composition. See Corollary 9.2.3.16.

05FX **Remark 9.2.4.16.** Let $\mathcal{C}$ be an ∞-category and let $f : X_0 \to X$ be a morphism of $\mathcal{C}$. Then f is a monomorphism if and only if it is subterminal when viewed as an object of the ∞-category $\mathcal{C}_{/X}$. See Proposition 9.2.3.7.

05FY **Remark 9.2.4.17.** Let $\mathcal{C}$ be an ∞-category and let $f : X_0 \to X$ be a morphism of $\mathcal{C}$. Then f is a monomorphism if and only if it satisfies the following condition for each $m \geq 3$:

$(*_m)$ Let $\sigma : \Lambda^m_m \to \mathcal{C}$ be a morphism of simplicial sets for which the composition

$$\Delta^1 \simeq \mathrm{N}_\bullet(\{m-1 < m\}) \subset \Lambda^m_m \xrightarrow{\sigma} \mathcal{C}$$

coincides with f. Then σ can be extended to an m-simplex of $\mathcal{C}$.

This follows by combining Remarks 9.2.2.14 and 9.2.4.16.

Remark 9.2.4.18. Let $\mathcal{C}$ be an ∞-category, let $f : X_0 \to X$ be a morphism of $\mathcal{C}$, and let σ denote the composite map 05FZ

$$\Delta^1 \times \Delta^1 \xrightarrow{(i,j)\mapsto ij} \Delta^1 \xrightarrow{u} \mathcal{C},$$

which we depict as a diagram

$$\begin{tikzcd}
X_0 \arrow[r, "\mathrm{id}"] \arrow[d, "\mathrm{id}"] & X_0 \arrow[d, "f"] \\
X_0 \arrow[r, "f"] & X.
\end{tikzcd}$$

Then f is a monomorphism if and only if σ is a pullback square in $\mathcal{C}$. This follows by combining Remarks 9.2.4.16 and 9.2.2.15 (see Proposition 7.6.3.14).

Remark 9.2.4.19. Let $\mathcal{C}$ be an ∞-category which admits pullbacks. Stated more informally, Remark 9.2.4.18 asserts that a morphism $f : X_0 \to X$ of $\mathcal{C}$ is a monomorphism if and only if the relative diagonal $\delta_{X_0/X} : X_0 \to X_0 \times_X X_0$ is an isomorphism. 04VX

From the criterion of Remark 9.2.4.18, we immediately obtain the following:

Proposition 9.2.4.20. *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which preserves pullbacks. Then F carries monomorphisms in $\mathcal{C}$ to monomorphisms in $\mathcal{D}$.* 05G0

Remark 9.2.4.21. In the statement of Proposition 9.2.4.20, it is not necessary to assume that the ∞-categories $\mathcal{C}$ and $\mathcal{D}$ admit pullbacks (we only need to know that F preserves those pullback squares which exist in $\mathcal{C}$). 04W1

Example 9.2.4.22. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which admits a left adjoint. Then F carries subterminal objects of $\mathcal{C}$ to subterminal objects of $\mathcal{D}$, and carries monomorphisms in $\mathcal{C}$ to monomorphisms in $\mathcal{D}$. This follows from Proposition 9.2.4.20 and Remark 9.2.2.16, since F preserves limit diagrams (Corollary 7.1.3.21). 04W2

Remark 9.2.4.23. Let $F : \mathcal{C} \to \mathcal{D}$ be a right fibration of ∞-categories and let f be a morphism in $\mathcal{C}$. Then f is a monomorphism if and only if $F(f)$ is a monomorphism in the ∞-category $\mathcal{D}$. See Corollary 9.2.3.10. 05G1

05G2 **Remark 9.2.4.24.** Let $\mathcal{C}$ be an ∞-category and let $f : X \hookrightarrow Y$ be a monomorphism in $\mathcal{C}$. If $f' : X' \to Y'$ is a retract of f (in the ∞-category $\operatorname{Fun}(\Delta^1, \mathcal{C})$), then f' is also a monomorphism. See Corollary 9.2.3.11.

04W8 **Definition 9.2.4.25.** Let $\mathcal{C}$ be an ∞-category and let X be an object of $\mathcal{C}$. A *subobject of* X is a subterminal object of the slice ∞-category $\mathcal{C}_{/X}$: that is, an object which is given by a monomorphism $f : X_0 \hookrightarrow X$ in the ∞-category $\mathcal{C}$ (see Remark 9.2.4.16). In this situation, we will sometimes abuse terminology by referring to X_0 as a *subobject of* X and writing $X_0 \subseteq X$; in this case, we implicitly assume that a monomorphism $X_0 \hookrightarrow X$ has been specified.

04W9 **Notation 9.2.4.26.** Let $\mathcal{C}$ be an ∞-category and let X be an object of $\mathcal{C}$. We let $\operatorname{Sub}(X)$ denote the set $\operatorname{Sub}(\mathcal{C}_{/X})$ of isomorphism classes of subterminal objects of $\mathcal{C}_{/X}$ (see Notation 9.2.2.18). If $f : X_0 \hookrightarrow X$ is a monomorphism, we write $[X_0] \in \operatorname{Sub}(X)$ for the isomorphism class of f. We will sometimes abuse notation by identifying the isomorphism class $[X_0]$ with the object X_0 itself: by virtue of Remark 9.2.2.19, this identification is essentially harmless provided that X_0 is understood as an object of the slice ∞-category $\mathcal{C}_{/X}$ (that is, provided that we remember the data of the monomorphism f). We will refer to $\operatorname{Sub}(X)$ as the *set of subobjects of* X, and we endow it with the partial ordering described in Notation 9.2.2.18: that is, if $f_0 : X_0 \hookrightarrow X$ and $f_1 : X_1 \hookrightarrow X$ are monomorphisms, we write $[X_0] \subseteq [X_1]$ if there exists a 2-simplex

$$\begin{tikzcd}
X_0 \arrow[rr, "g"] \arrow[dr, "f_0"'] & & X_1 \arrow[dl, "f_1"] \\
& Y &
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$. In this case, g is automatically a monomorphism (see Remark 9.2.4.15).

04WA **Example 9.2.4.27.** Let X be a Kan complex, which we regard as an object of the ∞-category $\mathcal{S}$. Using Example 9.2.4.10, we can identify $\operatorname{Sub}(X)$ with the partially ordered collection of all summands of X. Alternatively, we can identify $\operatorname{Sub}(X)$ with the collection of all subsets of the set $\pi_0(X)$ (see Exercise 1.2.1.16).

04WB **Remark 9.2.4.28.** Let $\mathcal{C}$ be an ∞-category. For every object $X \in \mathcal{C}$, the identity morphism $\operatorname{id}_X : X \to X$ is a monomorphism (Example 9.2.4.9), so we can regard X as a subobject of itself. Moreover, the isomorphism class $[X]$ is a largest element of the partially ordered set $\operatorname{Sub}(X)$ (see Remark 9.2.2.20).

04WC **Remark 9.2.4.29.** Let $\mathcal{C}$ be an ∞-category which admits fiber products. Then, for every object $X \in \mathcal{C}$, the slice ∞-category $\mathcal{C}_{/X}$ admits finite products (Corollary 7.6.3.20). It follows that the partially ordered set $\operatorname{Sub}(X)$ is a lower semilattice (see Remark 9.2.2.20). In particular, every pair of objects $[X_0], [X_1] \in \mathrm{Sub}(X)$ have a greatest lower bound $[X_0] \cap [X_1]$ in $\mathrm{Sub}(X)$, given concretely by the isomorphism class of the fiber product $[X_0 \times_X X_1]$.

Remark 9.2.4.30 (Pullbacks of Monomorphisms)**.** Let $\mathcal{C}$ be an ∞-category containing a commutative diagram 04WD

$$\begin{tikzcd} X_0 \arrow[r] \arrow[d, "i"] & Y_0 \arrow[d, "j"] \\ X \arrow[r, "f"] & Y, \end{tikzcd} \tag{9.20}$$

04WE

where $j : Y_0 \to Y$ is a monomorphism. Then (9.20) is a pullback square if and only if the following conditions are satisfied:

- The morphism $i : X_0 \to X$ is also a monomorphism.
- The diagram (9.20) determines a pullback square in the homotopy category $\mathrm{h}\mathcal{C}$. That is, a morphism $g : C \to X_0$ factors (up to homotopy) through i if and only if the $f \circ g$ factors (up to homotopy) through j.

In particular, the collection of monomorphisms in $\mathcal{C}$ is closed under pullbacks.

Construction 9.2.4.31 (Inverse Images)**.** Let $\mathcal{C}$ be an ∞-category which admits fiber products. Then every morphism $f : X \to Y$ in $\mathcal{C}$ determines a pullback functor 04WF

$$f^* : \mathcal{C}_{/Y} \to \mathcal{C}_{/X} \qquad Y' \mapsto X \times_Y Y'$$

(see Proposition 7.6.3.16). The functor f^* has a left adjoint, and therefore carries subterminal objects of $\mathcal{C}_{/X}$ to subterminal objects of $\mathcal{C}_{/Y}$. Passing to isomorphism classes, we obtain a map of partially ordered sets $f^{-1} : \mathrm{Sub}(Y) \to \mathrm{Sub}(X)$, given concretely by the formula $f^{-1}[Y_0] = [Y_0 \times_Y X]$. Since the functor f^* preserves products, f^{-1} is a homomorphism of lower semilattices: that is, it satisfies the identities

$$f^{-1}([Y_0] \cap [Y_1]) = f^{-1}([Y_0]) \cap f^{-1}([Y_1]) \qquad f^{-1}([Y]) = [X].$$

We close this section with a discussion of monomorphisms in the ∞-category $\mathcal{QC}$ of (small) ∞-categories.

Proposition 9.2.4.32. *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. The following conditions are equivalent:* 04W5

(1) *The functor F is a monomorphism in the ∞-category $\mathcal{QC}$.*

(2) *For every pair of objects $X, Y \in \mathcal{C}$, the functor F induces a homotopy equivalence from* $\mathrm{Hom}_{\mathcal{C}}(X,Y)$ *to a summand of* $\mathrm{Hom}_{\mathcal{D}}(F(X), F(Y))$ *which contains every isomorphism from $F(X)$ to $F(Y)$.*

(3) *The functor F induces an equivalence from $\mathcal{C}$ to a replete subcategory $\mathcal{D}_0 \subseteq \mathcal{D}$.*

Proof. We first show that (1) implies (2). By virtue of Corollary 4.5.2.23, we may assume without loss of generality that F is an isofibration of ∞-categories. In this case, it follows from Exercise 7.6.4.13 that the diagonal inclusion $\delta : \mathcal{C} \hookrightarrow \mathcal{C} \times_{\mathcal{D}} \mathcal{C}$ (formed in the ordinary category of simplicial sets) can be identified with the relative diagonal of F in the ∞-category $\mathcal{QC}$. Combining this observation with Remark 9.2.4.18, we deduce that F is a monomorphism (in the ∞-category $\mathcal{QC}$) if and only if δ is an equivalence of ∞-categories. In particular, if F is a monomorphism, then δ is fully faithful: that is, for every pair of objects $X, Y \in \mathcal{C}$, the induced map

$$\mathrm{Hom}_{\mathcal{C}}(X,Y) \to \mathrm{Hom}_{\mathcal{C} \times_{\mathcal{D}} \mathcal{C}}(\delta(X), \delta(Y)) \simeq \mathrm{Hom}_{\mathcal{C}}(X,Y) \times_{\mathrm{Hom}_{\mathcal{D}}(F(X),F(Y))} \mathrm{Hom}_{\mathcal{C}}(X,Y)$$

is a homotopy equivalence. Our assumption that F is an isofibration guarantees that the map $F_{X,Y} : \mathrm{Hom}_{\mathcal{C}}(X,Y) \to \mathrm{Hom}_{\mathcal{D}}(F(X),F(Y))$ is Kan fibration (Proposition 4.6.1.21). Applying Corollary 3.5.1.31, we deduce that $F_{X,Y}$ restricts to a homotopy equivalence of $\mathrm{Hom}_{\mathcal{C}}(X,Y)$ with a summand of $\mathrm{Hom}_{\mathcal{D}}(F(X),F(Y))$. To complete the proof, it will suffice to show that this summand contains every isomorphism from $F(X)$ to $F(Y)$. In fact, we will prove something more precise: the induced map of cores $F^{\simeq} : \mathcal{C}^{\simeq} \to \mathcal{D}^{\simeq}$ is a trivial Kan fibration from $\mathcal{C}^{\simeq}$ to a summand of $\mathcal{D}^{\simeq}$. This follows again from Corollary 3.5.1.31, since $F^{\simeq}$ is a Kan fibration (Proposition 4.4.3.7).

We now show that (2) implies (3). As above, we may assume that F is an isofibration. Let $\mathrm{h}\mathcal{C}$ and $\mathrm{h}\mathcal{D}$ denote the homotopy categories of $\mathcal{C}$ and $\mathcal{D}$, respectively. We define a subcategory $\mathrm{h}\mathcal{D}_0 \subseteq \mathrm{h}\mathcal{D}$ as follows:

- An object $\overline{X}$ of $\mathrm{h}\mathcal{D}$ belongs to the subcategory $\mathrm{h}\mathcal{D}_0$ if and only if it is the image of an object X of $\mathrm{h}\mathcal{C}$.
- A morphism $\overline{u} : \overline{X} \to \overline{Y}$ of $\mathrm{h}\mathcal{D}$ belongs to the subcategory $\mathrm{h}\mathcal{D}_0$ if and only if it is the image of a morphism u of $\mathrm{h}\mathcal{C}$.

We first claim that the subcategory $\mathrm{h}\mathcal{D}_0$ is well-defined: that is, if $\overline{u} : \overline{X} \to \overline{Y}$ and $\overline{v} : \overline{Y} \to \overline{Z}$ are composable morphisms of $\mathrm{h}\mathcal{D}$ which can be lifted to morphisms $u : X \to Y$ and $v : Y' \to Z$ of $\mathrm{h}\mathcal{C}$, then the composite morphism $\overline{v} \circ \overline{u}$ has the same property. Assumption (2) guarantees that the identity morphism $\mathrm{id}_{\overline{Y}}$ belongs to the image of the map

$$\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(Y, Y') = \pi_0(\mathrm{Hom}_{\mathcal{C}}(Y, Y')) \to \pi_0(\mathrm{Hom}_{\mathcal{D}}(\overline{Y}, \overline{Y})) \simeq \mathrm{Hom}_{\mathrm{h}\mathcal{D}}(\overline{Y}, \overline{Y}).$$

That is, there exists a morphism $e : Y \to Y'$ in $\mathrm{h}\mathcal{C}$ satisfying $F(e) = \mathrm{id}_{\overline{Y}}$. Replacing v by the composition $v \circ e$, we can arrange that $Y = Y'$: that is, that u and v are composable morphisms in the category $\mathrm{h}\mathcal{C}$. It then follows that $\overline{v} \circ \overline{u} = F(v \circ u)$ is also morphism of $\mathrm{h}\mathcal{D}_0$, as desired.

By virtue of Proposition 4.1.2.10, the subcategory $\mathrm{h}\mathcal{D}_0 \subseteq \mathrm{h}\mathcal{D}$ is the homotopy category of a (unique) subcategory $\mathcal{D}_0 \subseteq \mathcal{D}$. Using condition (2), we see that the subcategory $\mathcal{D}_0$ is replete. By construction, the functor F factors as a composition $\mathcal{C} \xrightarrow{F_0} \mathcal{D}_0 \hookrightarrow \mathcal{D}$. For every pair of objects $X, Y \in \mathcal{C}$, we can identify $\mathrm{Hom}_{\mathcal{D}_0}(F(X), F(Y))$ with the summand of $\mathrm{Hom}_{\mathcal{D}}(F(X), F(Y))$ given by the essential image of $F_{X,Y}$. Invoking assumption (2), we see that the functor F_0 is fully faithful. By construction, F_0 is also surjective on objects, and is therefore an equivalence of ∞-categories (Theorem 4.6.2.20). This completes the proof of the implication (2) $\Rightarrow$ (3).

We now show that (3) implies (1). Assume that F induces an equivalence from $\mathcal{C}$ to a replete subcategory $\mathcal{D}_0 \subseteq \mathcal{C}$; we wish to show that F is a monomorphism. By virtue of Remark 9.2.4.15 (and Example 9.2.4.9), it will suffice to show that the inclusion map $\iota : \mathcal{D}_0 \hookrightarrow \mathcal{D}$ is a monomorphism in $\mathcal{QC}$. Fix an ∞-category $\mathcal{B}$, so that composition with the homotopy class $[\iota]$ induces a map of Kan complexes $\theta : \mathrm{Hom}_{\mathcal{QC}}(\mathcal{B}, \mathcal{D}_0) \to \mathrm{Hom}_{\mathcal{QC}}(\mathcal{B}, \mathcal{D})$. We wish to show that θ induces a homotopy equivalence from $\mathrm{Hom}_{\mathcal{QC}}(\mathcal{B}, \mathcal{D}_0)$ to a summand of $\mathrm{Hom}_{\mathcal{QC}}(\mathcal{B}, \mathcal{D})$. By virtue of Remark 5.5.4.5, it will suffice to prove the analogous assertion for the inclusion map $\mathrm{Fun}(\mathcal{B}, \mathcal{D}_0)^{\simeq} \hookrightarrow \mathrm{Fun}(\mathcal{B}, \mathcal{D})^{\simeq}$, which follows immediately from Corollary 4.4.3.13. □

Corollary 9.2.4.33. *Let $F : \mathcal{C} \to \mathcal{D}$ be a fully faithful functor of ∞-categories. Then F is a monomorphism in the ∞-category $\mathcal{QC}$.* 04W6

Proof. Let $\mathcal{D}_0 \subseteq \mathcal{D}$ be the essential image of F. By virtue of Proposition 9.2.4.32, it will suffice to show that F induces an equivalence from $\mathcal{C}$ to $\mathcal{D}_0$, which is a reformulation of the requirement that F is fully faithful (Corollary 4.6.2.22). □

Warning 9.2.4.34. Let $\mathcal{C}$ be an ∞-category and let $\mathcal{C}_0 \subseteq \mathcal{C}$ be a subcategory. Beware that, if we do not assume that $\mathcal{C}_0$ is replete (or full), then the inclusion functor $\mathcal{C}_0 \hookrightarrow \mathcal{C}$ need not be a monomorphism in $\mathcal{QC}$. For example, suppose that $\mathcal{C} = \mathrm{N}_{\bullet}(\mathcal{D})$ is the nerve of a category $\mathcal{D}$. Then the 0-skeleton $\mathcal{C}_0 = \mathrm{sk}_0(\mathcal{C})$ is always subcategory of $\mathcal{C}$ (namely, the subcategory spanned by the identity morphisms of $\mathcal{C}$). However, the inclusion $\mathcal{C}_0 \hookrightarrow \mathcal{C}$ is a monomorphism in $\mathcal{QC}$ if and only if every isomorphism in $\mathcal{D}$ is an identity morphism. 04W7

9.3 Fiberwise Cocompletions

Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of ∞-categories. For each vertex $C \in \mathcal{C}$, the fiber $\mathcal{E}_C$ is an ∞-category. In §8.4, we proved that $\mathcal{E}_C$ admits a *cocompletion*: that is, an ∞-category 05K8

$\widehat{\mathcal{E}}_C$ which is universal among cocomplete ∞-categories with a functor from $\mathcal{E}_C$ (Proposition 8.4.5.3). Our goal in this section is to show that the collection of ∞-categories $\{\widehat{\mathcal{E}}_C\}_{C \in \mathcal{C}}$ can be regarded as the fibers of another inner fibration $\widehat{U} : \widehat{\mathcal{E}} \to \mathcal{C}$, where $\widehat{\mathcal{E}}$ is an ∞-category we refer to as the *fiberwise cocompletion of* $\mathcal{E}$. We begin by articulating the relationship between the fibrations U and $\widehat{U}$. To simplify the discussion, let us assume that the inner fibration U is essentially small (see Definition 9.3.1.12 for a more general discussion).

05K9 **Definition 9.3.0.1.** Let $U : \mathcal{E} \to \mathcal{C}$ be an essentially small inner fibration of ∞-categories. We say that a commutative diagram of ∞-categories

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

exhibits $\widehat{\mathcal{E}}$ *as a fiberwise cocompletion of* $\mathcal{E}$ if the following conditions are satisfied:

(1) For every object $C \in \mathcal{C}$, the map of fibers $H_C : \mathcal{E}_C \to \widehat{\mathcal{E}}_C$ exhibits $\widehat{\mathcal{E}}_C$ as a cocompletion of $\mathcal{E}_C$ (see Definition 8.4.0.1).

(2) The functor H is fully faithful.

(3) The functor $\widehat{U}$ is a locally cartesian fibration.

(4) For every morphism $f : C \to D$ of $\mathcal{C}$, the contravariant transport functor $f^* : \widehat{\mathcal{E}}_D \to \widehat{\mathcal{E}}_C$ preserves small colimits.

One of our principal goals in this section is to prove the following:

05KA **Theorem 9.3.0.2.** *Let* $U : \mathcal{E} \to \mathcal{C}$ *be an essentially small inner fibration of* ∞*-categories. Then there exists a commutative diagram*

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ *as a fiberwise cocompletion of* $\mathcal{E}$*. Moreover, the inner fibration* $\widetilde{U}$ *is unique up to equivalence.*

We begin by establishing the uniqueness assertion of Theorem 9.3.0.2. In the situation of Definition 9.3.0.1, the inner fibration $\widehat{U} : \widehat{\mathcal{E}} \to \mathcal{C}$ satisfies the following condition:

$(*)$ For each object $C \in \mathcal{C}$, the ∞-category $\widehat{\mathcal{E}}_C = \{C\} \times_{\mathcal{C}} \widehat{\mathcal{E}}$ is cocomplete and the inclusion functor $\widehat{\mathcal{E}}_C \hookrightarrow \widehat{\mathcal{E}}$ carries (small) colimit diagrams in $\mathcal{E}_C$ to U-colimit diagrams in $\mathcal{E}$.

More generally, we say that an inner fibration of ∞-categories $U' : \mathcal{E}' \to \mathcal{C}$ is *cocomplete* if it satisfies condition $(*)$ (Definition 9.3.1.1). In §9.3.1, we show that if a commutative diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

exhibits $\widehat{\mathcal{E}}$ as a fiberwise cocompletion of $\mathcal{E}$, then it is universal in the following sense: every functor $F : \mathcal{E} \to \mathcal{E}'$ satisfying $U' \circ F = U$ admits an essentially unique extension $\widehat{F} : \widehat{\mathcal{E}} \to \mathcal{E}'$ having the property that, for each object $C \in \mathcal{C}$, the map of fibers $\widehat{F}_C : \widehat{\mathcal{E}}_C \to \mathcal{E}'_C$ preserves small colimits (Theorem 9.3.1.20). It follows that $\widehat{U} : \widehat{\mathcal{E}} \to \mathcal{C}$ is determined (up to equivalence) by the inner fibration U (Remark 9.3.1.21).

To complete the proof of Theorem 9.3.0.2, we must show that every (essentially small) inner fibration $U : \mathcal{E} \to \mathcal{C}$ admits a fiberwise cocompletion $\widehat{U} : \widehat{\mathcal{E}} \to \mathcal{C}$. We begin by treating some special cases:

- Assume that U is a cocartesian fibration. In §9.3.2 we show that there exists a diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

  which exhibits $\widehat{\mathcal{E}}$ as a fiberwise cocompletion of $\mathcal{E}$. Moreover, $\widehat{U}$ is also a cocartesian fibration and the functor H carries U-cocartesian morphisms of $\mathcal{E}$ to $\widehat{U}$-cocartesian morphisms of $\widehat{\mathcal{E}}$ (Theorem 9.3.2.1). Our proof uses the theory of dual fibrations developed in §8.6. More precisely, we show that we can take $\widehat{\mathcal{E}}$ to be the relative exponential $\operatorname{Fun}(\mathcal{E}^{\vee} / \mathcal{C}, \mathcal{S})$, where $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ is a cocartesian dual of U (Lemma 9.3.2.4).

- Assume that U is a cartesian fibration. In §9.3.3 we show that there exists a diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

  which exhibits $\widehat{\mathcal{E}}$ as a fiberwise cocompletion of $\mathcal{E}$. Moreover, $\widehat{U}$ is also a cartesian fibration and the functor H carries U-cartesian morphisms of $\mathcal{E}$ to $\widehat{U}$-cartesian morphisms of $\widehat{\mathcal{E}}$ (Theorem 9.3.3.1). Our strategy is to reduce to the cocartesian case, using the compatibility of fiberwise cocompletion with the formation of conjugate fibrations (Proposition 9.3.3.3).

In §9.3.4, we complete the proof of Theorem 9.3.0.2 by proving the existence of a fiberwise cocompletion for a general inner fibration $U : \mathcal{E} \to \mathcal{C}$. Our strategy is to embed $\mathcal{E}$ into the oriented fiber product $\mathcal{E} \tilde{\times}_{\mathcal{C}} \mathcal{C}$, and thereby reduce to the case where U is a cocartesian fibration (using the oriented fiber product $\mathcal{C} \tilde{\times}_{\mathcal{C}} \mathcal{E}$, we could instead reduce to the case where U is a cartesian fibration).

Recall that an inner fibration of simplicial sets $U : \mathcal{E} \to \mathcal{C}$ is *exponentiable* if the pullback functor

$$(\mathrm{Set}_{\Delta})_{/\mathcal{C}} \to (\mathrm{Set}_{\Delta})_{/\mathcal{E}} \qquad \mathcal{C}' \mapsto \mathcal{C}' \times_{\mathcal{C}} \mathcal{E}$$

preserves categorical equivalences (Definition 4.5.9.10). In §9.3.6, we introduce a closely related condition which has somewhat better formal properties. We say that an inner fibration $U : \mathcal{E} \to \mathcal{C}$ is *flat* if, for every 2-simplex σ of $\mathcal{C}$, the inclusion map

$$\Lambda^2_1 \times_{\mathcal{C}} \mathcal{E} \hookrightarrow \Delta^2 \times_{\mathcal{C}} \mathcal{E}$$

is a categorical equivalence of simplicial sets (Definition 9.3.6.1). It follows immediately from the definitions that if U is an exponentiable inner fibration, then it is flat. In §9.3.6, we show that the converse holds if U is an isofibration (Corollary 9.3.6.30). The key observation is that that an inner fibration $U : \mathcal{E} \to \mathcal{C}$ is flat if and only if the fiberwise cocompletion $\widehat{U} : \widehat{\mathcal{E}} \to \mathcal{C}$ is a cartesian fibration (Lemma 9.3.6.13). In §9.3.8 we show that, under this assumption, we can give a concrete description of $\widehat{\mathcal{E}}$ in terms of the relative Yoneda embedding of U (Theorem 9.3.8.4).

9.3.1 Uniqueness of Fiberwise Cocompletions

05KB

Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of ∞-categories. Our goal in this section is to show that if there exists a diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[rr] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise cocompletion of $\mathcal{E}$ (in the sense of Definition 9.3.0.1), then the inner fibration $\widetilde{U}$ is uniquely determined up to equivalence. To prove this, we will show that the ∞-category $\widehat{\mathcal{E}}$ can be characterized by a universal mapping property (Theorem 9.3.1.20). To formulate it, we will need some terminology.

Definition 9.3.1.1. Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of ∞-categories and let $\mathbb{K}$ be a collection of simplicial sets. We say that U is $\mathbb{K}$-*cocomplete* if it satisfies the following conditions: 05KC

(1) For every object $C \in \mathcal{C}$, the ∞-category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ is $\mathbb{K}$-cocomplete (Definition 8.4.5.1). That is, it admits K-indexed colimits, for every simplicial set $K \in \mathbb{K}$.

(2) Let C be an object of $\mathcal{C}$ and let $K \in \mathbb{K}$. Then every colimit diagram $K^{\triangleright} \to \mathcal{E}_C$ is a U-colimit diagram in $\mathcal{E}$.

If κ is a regular cardinal, we say that the inner fibration $U : \mathcal{E} \to \mathcal{C}$ is κ-*cocomplete* if it $\mathbb{K}$-cocomplete, where $\mathbb{K}$ denotes the collection of all κ-small simplicial sets.

Example 9.3.1.2. Let $\mathcal{E}$ be an ∞-category and let $\mathbb{K}$ be a collection of simplicial sets. Then $\mathcal{E}$ is $\mathbb{K}$-cocomplete (in the sense of Definition 8.4.5.1) if and only if the inner fibration $\mathcal{E} \to \Delta^0$ is $\mathbb{K}$-cocomplete (in the sense of Definition 9.3.1.1). 05KD

Proposition 9.3.1.3. *Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of ∞-categories and let $\mathbb{K}$ be a collection of simplicial sets. Then U is $\mathbb{K}$-cocomplete if and only if, for every morphism $\Delta^1 \to \mathcal{C}$, the inner fibration $\Delta^1 \times_{\mathcal{C}} \mathcal{E} \to \Delta^1$ is $\mathbb{K}$-cocomplete.* 05KE

Proof. This follows immediately from the characterization of U-colimit diagrams supplied by Proposition 7.1.5.22. □

Using Proposition 9.3.1.3, we can formulate a slightly more general version of Definition 9.3.1.1:

05KF **Variant 9.3.1.4.** Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of ∞-categories and let $\mathbb{K}$ be a collection of simplicial sets. We say that U is $\mathbb{K}$-*cocomplete* if, for every edge $\Delta^1 \to \mathcal{C}$, the projection map $\Delta^1 \times_{\mathcal{C}} \mathcal{E} \to \Delta^1$ is a $\mathbb{K}$-cocomplete inner fibration of ∞-categories, in the sense of Definition 9.3.1.1. By virtue of Proposition 9.3.1.3, this agrees with Definition 9.3.1.1 in the special case where $\mathcal{C}$ is an ∞-category.

05KG **Remark 9.3.1.5.** Let $\mathbb{K}$ be a collection of simplicial sets and suppose we are given a pullback diagram

$$\begin{tikzcd}
\mathcal{E}' \arrow[r] \arrow[d, "U'"] & \mathcal{E} \arrow[d, "U"] \\
\mathcal{C}' \arrow[r] & \mathcal{C},
\end{tikzcd}$$

where U and U' are inner fibrations. If U is $\mathbb{K}$-cocomplete, then U' is also $\mathbb{K}$-cocomplete.

05KH **Example 9.3.1.6.** Let $U : \mathcal{E} \to \mathcal{C}$ be a locally cartesian fibration of simplicial sets, and let $\mathbb{K}$ be a collection of simplicial sets. Then U is $\mathbb{K}$-cocomplete if and only if, for each vertex $C \in \mathcal{C}$, the ∞-category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ is $\mathbb{K}$-cocomplete. To prove this, we can assume without loss of generality that $\mathcal{C} = \Delta^1$, so that U is a cartesian fibration. In this case, the desired result follows from Corollary 7.1.5.20.

05KJ **Example 9.3.1.7.** Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets. We say that U is *idempotent complete* if it satisfies either of the following equivalent conditions:

(a) For each vertex $C \in \mathcal{C}$, the ∞-category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ is idempotent complete.

(b) The inner fibration U is $\{\mathrm{N}_\bullet(\mathrm{Idem})\}$-cocomplete, where Idem is the category introduced in Construction 8.5.2.7.

The implication (b) $\Rightarrow$ (a) is immediate (see the proof of Proposition 8.5.5.2). To prove the converse, we may assume without loss of generality that $\mathcal{C} = \Delta^1$; in this case, the result follows from the observation that the inclusion map $\{0\} \times_{\mathcal{C}} \mathcal{E} \hookrightarrow \mathcal{E}$ preserves $\mathrm{N}_\bullet(\mathrm{Idem})$-indexed colimiits (Corollary 8.5.3.12).

We will soon show that if $U : \mathcal{E} \to \mathcal{C}$ is an arbitrary inner fibration, then there is a universal way to enlarge $\mathcal{E}$ to obtain a $\mathbb{K}$-cocomplete inner fibration $\widetilde{U} : \widetilde{\mathcal{E}} \to \mathcal{C}$. We begin by characterizing this enlargement in the special case $\mathcal{C} = \Delta^1$.

05KK **Definition 9.3.1.8.** Let $\mathbb{K}$ be a collection of simplicial sets and suppose that we are given a commutative diagram of ∞-categories

05KL
$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \Delta^1. &
\end{tikzcd} \tag{9.21}$$

We say that the diagram (9.21) *exhibits* $\widehat{\mathcal{E}}$ *as a fiberwise* $\mathbb{K}$*-cocompletion of* $\mathcal{E}$ if the following conditions are satisfied:

(1) For $i \in \{0,1\}$, the map of fibers $H_i : \mathcal{E}_i \to \widehat{\mathcal{E}}_i$ exhibits $\widehat{\mathcal{E}}_i$ as a $\mathbb{K}$-cocompletion of $\mathcal{E}_i$ (Definition 8.4.5.1).

(2) The functor H is fully faithful.

(3) The inner fibration $\widehat{U}$ is $\mathbb{K}$-cocomplete (Definition 9.3.1.1).

(4) For every object $X \in \mathcal{E}_0$, the functor

$$\widehat{\mathcal{E}}_1 \to \mathcal{S} \qquad Y \mapsto \operatorname{Hom}_{\widehat{\mathcal{E}}}(H(X), Y)$$

preserves $\mathbb{K}$-indexed colimits.

If κ is a regular cardinal, we say that (9.21) *exhibits* $\widehat{\mathcal{E}}$ *as a fiberwise* κ*-cocompletion of* $\mathcal{E}$ if it exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$, where $\mathbb{K}$ is the collection of all κ-small simplicial sets.

Remark 9.3.1.9. In condition (4) of Definition 9.3.1.8, we have implicitly assumed that the ∞-category $\widehat{\mathcal{E}}$ is locally small and that each of the simplicial sets $K \in \mathbb{K}$ is (essentially) small. If these conditions are not satisfied, then we should replace the ∞-category $\mathcal{S}$ by $\mathcal{S}^{<\lambda}$, where λ is some regular cardinal having the property that $\widehat{\mathcal{E}}$ is locally τ-small and each $K \in \mathbb{K}$ is essentially τ-small. 05KM

Remark 9.3.1.10. Let $\mathbb{K}$ be a collection of simplicial sets and let $H : \mathcal{C} \to \widehat{\mathcal{C}}$ be a functor of ∞-categories which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$-cocompletion of $\mathcal{C}$. Then the diagram 05KN

$$\begin{tikzcd}
\mathcal{C} \times \Delta^1 \arrow[rr, "H \times \mathrm{id}"] & & \widehat{\mathcal{C}} \times \Delta^1 \arrow[dl] \\
& \Delta^1 &
\end{tikzcd}$$

exhibits $\widehat{\mathcal{C}} \times \Delta^1$ as a fiberwise cocompletion of $\mathcal{C} \times \Delta^1$. Conditions (1) and (3) of Definition 9.3.1.8 are immediate, and conditions (2) and (4) follow from Variant 8.4.6.9.

05KP **Proposition 9.3.1.11.** *Let κ be an uncountable regular cardinal and suppose we are given a commutative diagram of ∞-categories*

05KQ
$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \Delta^1, &
\end{tikzcd} \tag{9.22}$$

where $\mathcal{E}$ is essentially κ-small. Then (9.22) exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ-cocompletion of $\mathcal{E}$ if and only if it satisfies conditions (1) *and* (2) *of Definition 9.3.1.8, together with the following:*

($3'$) *The functor $\widehat{U}$ is a cartesian fibration.*

($4'$) *The contravariant transport functor $\widehat{\mathcal{E}}_1 \to \widehat{\mathcal{E}}_0$ preserves κ-small colimits.*

Proof. Without loss of genearlity, we may assume that H satisfies conditions (1) and (2) of Definition 9.3.1.8. The implication ($3'$) $\Rightarrow$ (3) is a special case of Example 9.3.1.6. Moreover, if ($3'$) is satisfied, then we can use condition (1) (together with Proposition 8.4.2.5) to identify the contravariant transport functor $\widehat{\mathcal{E}}_1 \to \widehat{\mathcal{E}}_0$ with the functor

$$\widehat{\mathcal{E}}_1 \to \operatorname{Fun}(\mathcal{E}_0^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \qquad \widehat{Y} \mapsto \operatorname{Hom}_{\widehat{\mathcal{E}}}(H(-), \widehat{Y}).$$

In this case, the equivalence (4) $\Leftrightarrow$ ($4'$) follows from the observation that κ-small colimits in the ∞-category $\operatorname{Fun}(\mathcal{E}_0^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ are computed levelwise (Corollary 7.1.6.2).

We will complete the proof by showing that if H satisfies conditions (3) and (4), then U is a cartesian fibration. Fix a regular cardinal λ having exponential cofinality $\geq \kappa$ such that $\widehat{\mathcal{E}}$ is locally λ-small. By virtue of Corollary 6.2.3.2, it will suffice to show that for each object $\widehat{Y} \in \widehat{\mathcal{E}}_1$, the functor

$$\mathscr{F} : \widehat{\mathcal{E}}_0^{\mathrm{op}} \to \mathcal{S}^{<\lambda} \qquad \widehat{X} \mapsto \operatorname{Hom}_{\widehat{\mathcal{E}}}(\widehat{X}, \widehat{Y})$$

is representable by an object of $\widehat{\mathcal{E}}_0$. Condition (3) guarantees that $\mathscr{F}$ preserves κ-small limits. Using condition (1) and Corollary 8.4.3.10, we are reduced to showing that for each object $X \in \mathcal{E}_0$, the Kan complex $\mathscr{F}(H(X)) = \operatorname{Hom}_{\widehat{\mathcal{E}}}(H(X), \widehat{Y})$ is κ-small.

Let now us regard the object X as fixed. Condition (4) guarantees that the functor

$$\widehat{\mathcal{E}}_0 \to \mathcal{S}^{<\lambda} \qquad \widehat{Y} \mapsto \operatorname{Hom}_{\widehat{\mathcal{E}}}(H(X), \widehat{Y})$$

preserves κ-small colimits. In particular, the collection of objects $\widehat{Y}$ for which $\operatorname{Hom}_{\widehat{\mathcal{E}}}(H(X), \widehat{Y})$ is essentially κ-small is closed under κ-small colimits (Example 7.6.7.8). Since $\widehat{\mathcal{E}}_1$ is generated under κ-small colimits by the image of H, we can assume that $\widehat{Y} = H(Y)$ for some object $Y \in \mathcal{E}_1$. In this case, condition (2) supplies a homotopy equivalence

$$\mathrm{Hom}_{\mathcal{E}}(X, Y) \to \mathrm{Hom}_{\widehat{\mathcal{E}}}(H(X), \widehat{Y}),$$

so the desired result follows from our assumption that $\mathcal{E}$ is essentially κ-small. □

We now extend the scope of Definition 9.3.1.8.

Definition 9.3.1.12. Let $\mathbb{K}$ be a collection of simplicial sets and suppose we are given a commutative diagram of simplicial sets 05KR

$$\begin{tikzcd} \mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\ & \mathcal{C}, & \end{tikzcd} \tag{9.23}$$

05KS

where U and $\widehat{U}$ are inner fibrations. We will say that the diagram (9.23) *exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$* if, for every edge $e : \Delta^1 \to \mathcal{C}$, the induced map

$$H_e : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \to \Delta^1 \times_{\mathcal{C}} \widehat{\mathcal{E}}$$

exhibits $\Delta^1 \times_{\mathcal{C}} \widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\Delta^1 \times_{\mathcal{C}} \mathcal{E}$ (in the sense of Definition 9.3.1.8).

If κ is a regular cardinal, we say that the diagram (9.23) *exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ-cocompletion of $\mathcal{E}$* if it exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$, where $\mathbb{K}$ is the collection of all κ-small simplicial sets.

Remark 9.3.1.13. In the special case where $\mathcal{C} = \Delta^1$, Definition 9.3.1.12 reduces to Definition 9.3.1.8: see Remark 9.3.1.10. 05KT

Remark 9.3.1.14. In the situation of Definition 9.3.1.12, suppose that $\mathcal{C}$ is an ∞-category. Then H is fully faithful if and only if, for every morphism $\Delta^1 \to \mathcal{C}$, the induced map 05KU

$$\Delta^1 \times_{\mathcal{C}} \mathcal{E} \to \Delta^1 \times_{\mathcal{C}} \widehat{\mathcal{E}}$$

is fully faithful (see Variant 4.8.6.19). In particular, if H exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$, then H is fully faithful.

Remark 9.3.1.15. Let $\mathbb{K}$ be a collection of simplicial sets and suppose we are given a commutative diagram of simplicial sets 05KV

$$\begin{tikzcd} \mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\ & \mathcal{C} & \end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$. Let $\mathcal{E}' \subseteq \widehat{\mathcal{E}}$ be the full simplicial subset spanned by those vertices which belong to the image of H. It follows from Remark 9.3.1.14 and Proposition 5.1.7.9 that the induced map $\mathcal{E} \to \mathcal{E}'$ is an equivalence of inner fibrations over $\mathcal{C}$, so that the inclusion map $\mathcal{E}' \hookrightarrow \widehat{\mathcal{E}}$ exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}'$.

We now show that, in the special case where $\mathbb{K}$ is the collection of small simplicial sets and U is an essentially small inner fibration of ∞-categories, Definition 9.3.1.12 reduces to Definition 9.3.0.1. Following the convention of Remark 4.7.0.5, this can be regarded as a special case of the following:

05KW **Proposition 9.3.1.16.** *Let κ be an uncountable regular cardinal and suppose we are given a commutative diagram of ∞-categories*

05KX
$$\begin{tikzcd} \mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\ & \mathcal{C}, & \end{tikzcd} \tag{9.24}$$

where U and $\widehat{U}$ are inner fibrations and U is essentially κ-small. Then (9.24) exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ-cocompletion of $\mathcal{E}$ (in the sense of Definition 9.3.1.12) if and only if the following conditions are satisfied:

(1) *For each object $C \in \mathcal{C}$, the induced map of fibers $H_C : \mathcal{E}_C \to \widehat{\mathcal{E}}_C$ exhibits $\widehat{\mathcal{E}}_C$ as a κ-cocompletion of $\mathcal{E}_C$.*

(2) *The functor H is fully faithful.*

(3) *The inner fibration $\widehat{U}$ is locally cartesian.*

(4) *For each morphism $f : C \to C'$ of $\mathcal{C}$, the contravariant transport functor $f^* : \widehat{\mathcal{E}}_{C'} \to \widehat{\mathcal{E}}_C$ preserves κ-small colimits.*

Proof. Using Remark 9.3.1.14, we can reduce to the special case $\mathcal{C} = \Delta^1$, which follows from Proposition 9.3.1.11. □

05KY **Example 9.3.1.17** (Fiberwise Idempotent Completion)**.** Suppose we are given a commutative diagram of simplicial sets

05KZ
$$\begin{tikzcd} \mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\ & \mathcal{C}, & \end{tikzcd} \tag{9.25}$$

where U and $\widehat{U}$ are inner fibrations. We say that (9.25) *exhibits $\widehat{\mathcal{E}}$ as a fiberwise idempotent completion of $\mathcal{E}$* if it exhibits $\widehat{\mathcal{E}}$ as a $\{\mathrm{N}_{\bullet}(\mathrm{Idem})\}$-cocompletion of $\mathcal{E}$, in the sense of Definition 9.3.1.12; here Idem is the category introduced in Construction 8.5.2.7.

Proposition 9.3.1.18. *Suppose we are given a commutative diagram of ∞-categories* 05L0

05L1

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C}, &
\end{tikzcd} \tag{9.26}$$

where U and $\widehat{U}$ are inner fibrations. Then (9.26) exhibits $\widehat{\mathcal{E}}$ as a fiberwise idempotent completion of $\mathcal{E}$ if and only if it satisfies the following pair of conditions:

(1) *For each object $C \in \mathcal{C}$, the ∞-category $\widehat{\mathcal{E}}_C$ is idempotent complete.*

(2) *The functor H is fully faithful.*

Proof. As in Proposition 9.3.1.16, we can use Remark 9.3.1.14 to reduce to the case $\mathcal{C} = \Delta^1$; in this case, the result follows from Example 9.3.1.7. □

We can now formulate our main result.

Notation 9.3.1.19. Let $\mathbb{K}$ be a collection of simplicial sets, and let $U : \mathcal{E} \to \mathcal{C}$ and $U' : \mathcal{E}' \to \mathcal{C}$ be $\mathbb{K}$-cocomplete inner fibrations of simplicial sets. We let $\mathrm{Fun}^{\mathbb{K}}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}')$ denote the full subcategory of $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}')$ spanned by those commutative diagrams 05L2

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "F"] \arrow[dr, "U"'] & & \mathcal{E}' \arrow[dl, "U'"] \\
& \mathcal{C} &
\end{tikzcd}$$

having the property that, for every vertex $C \in \mathcal{C}$, the induced map of fibers $F_C : \mathcal{E}_C \to \mathcal{E}'_C$ preserves K-indexed colimits, for each $K \in \mathbb{K}$.

Theorem 9.3.1.20. *Let $\mathbb{K}$ be a collection of simplicial sets. Suppose we are given a diagram of simplicial sets* 05L3

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C}, &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$. Then, for every $\mathbb{K}$-cocomplete inner fibration $U' : \mathcal{E}' \to \mathcal{C}$, precomposition with H induces an equivalence of ∞-categories

$$\mathrm{Fun}^{\mathbb{K}}_{/\mathcal{C}}(\widehat{\mathcal{E}}, \mathcal{E}') \to \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}').$$

05L4 **Remark 9.3.1.21** (Uniqueness)**.** Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets. It follows from Theorem 9.3.1.20 that if there exists a diagram

$$\begin{tikzcd} \mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\ & \mathcal{C} & \end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$, then the inner fibration $\widehat{U}$ is unique up to equivalence (in the sense of Definition 5.1.7.1). More precisely, suppose we are given another commutative diagram

05L5
$$\begin{tikzcd} \mathcal{E} \arrow[rr, "H'"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}}' \arrow[dl, "\widehat{U}'"] \\ & \mathcal{C} & \end{tikzcd} \qquad (9.27)$$

where $\widehat{U}'$ is a $\mathbb{K}$-cocomplete inner fibration. Theorem 9.3.1.20 then guarantees the existence (and essential uniqueness) of a morphism $F \in \mathrm{Fun}^{\mathbb{K}}_{/\mathcal{C}}(\widehat{\mathcal{E}}, \widehat{\mathcal{E}}')$ such that H' is isomorphic to $F \circ H$ (as an object of $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \widehat{\mathcal{E}}')$). In this case, the diagram (9.27) exhibits $\widehat{\mathcal{E}}'$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$ if and only if F is an equivalence of inner fibrations over $\mathcal{C}$.

05L6 **Example 9.3.1.22.** Suppose we are given a commutative diagram of simplicial sets

$$\begin{tikzcd} \mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\ & \mathcal{C}, & \end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise idempotent completion of $\mathcal{E}$. Then, for any idempotent complete inner fibration $U' : \mathcal{E}' \to \mathcal{C}$, precomposition with H induces an equivalence of ∞-categories

$$\mathrm{Fun}_{/\mathcal{C}}(\widehat{\mathcal{E}}, \mathcal{E}') \to \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}').$$

This follows by combining Theorem 9.3.1.20 with Corollary 8.5.3.12.

Our proof of Theorem 9.3.1.20 will require some preliminaries.

Lemma 9.3.1.23. *Let $\widehat{\mathcal{D}}$ be an ∞-category and let $\mathcal{D} \subseteq \widehat{\mathcal{D}}$ be a full subcategory. Suppose that the inclusion functor $\mathcal{D} \hookrightarrow \widehat{\mathcal{D}}$ exhibits $\widehat{\mathcal{D}}$ as a $\mathbb{K}$-cocompletion of $\mathcal{D}$, for some collection of simplicial sets $\mathbb{K}$. Let $U : \mathcal{E} \to \mathcal{C}$ be a $\mathbb{K}$-cocomplete inner fibration of ∞-categories, let $C \in \mathcal{C}$ be an object, and let $F : \widehat{\mathcal{D}} \to \mathcal{E}_C$ be a functor. The following conditions are equivalent:* 05L7

(1) *The functor F preserves K-indexed colimits, for each $K \in \mathbb{K}$.*

(2) *The functor F is left Kan extended from $\mathcal{D}$.*

(3) *When regarded as a functor from $\widehat{\mathcal{D}}$ to $\mathcal{E}$, the functor F is U-left Kan extended from $\mathcal{D}$.*

Proof. The equivalence (1) $\Leftrightarrow$ (2) follows from Lemma 8.4.5.9, and the implication (3) $\Rightarrow$ (2) is a special case of Corollary 7.3.3.23. We will complete the proof by showing that (1) implies (3). By virtue of Remark 7.3.3.24, we may assume that $\mathcal{C} = \Delta^1$ and that C is the initial vertex; in this case, we wish to show that F is left Kan extended from $\mathcal{D}$ (when regarded as a functor from $\widehat{\mathcal{D}}$ to $\mathcal{E}$). Fix an uncountable regular cardinal κ such that every simplicial set $K \in \mathbb{K}$ is essentially κ-small. Let λ be a cardinal of exponential cofinality $\geq \kappa$ such that $\mathcal{E}$ is locally λ-small. By virtue of Proposition 7.4.5.17, it will suffice to show that for every object $E \in \mathcal{E}$, the functor

$$\mathscr{F} : \widehat{\mathcal{D}} \to (\mathcal{S}^{<\lambda})^{\mathrm{op}} \qquad D \mapsto \mathrm{Hom}_{\mathcal{E}}(F(D), E)$$

is left Kan extended from $\mathcal{D}$. By virtue of Lemma 8.4.5.9, this is equivalent to the requirement that $\mathscr{F}$ preserves K-indexed colimits for each $K \in \mathbb{K}$. This follows from (1) together with our assumption that U is $\mathbb{K}$-cocomplete. □

Lemma 9.3.1.24. *Let $\mathbb{K}$ be a collection of simplicial sets and suppose we are given a commutative diagram of ∞-categories* 05L8

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C}, &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$. Let X be an object of $\widehat{\mathcal{E}}$ having image $C = \widehat{U}(X)$ and set $\mathcal{E}_{/X} = \mathcal{E} \times_{\widehat{\mathcal{E}}} \widehat{\mathcal{E}}_{/X}$. If U is an isofibration, then the inclusion map

$$\{\mathrm{id}_C\} \times_{\mathcal{C}_{/C}} \mathcal{E}_{/X} \hookrightarrow \mathcal{E}_{/X}$$

is right cofinal.

Proof. Fix an object $\widetilde{Y} \in \mathcal{E}_{/X}$, which we identify with a pair (Y, v) where Y is an object of $\mathcal{E}$ and $v : H(Y) \to X$ is a morphism in $\widehat{\mathcal{E}}$. By virtue of Theorem 7.2.3.1, it will suffice to show that the ∞-category $\mathcal{A} = \{\mathrm{id}_C\} \times_{\mathcal{C}_{/C}} (\mathcal{E}_{/C})_{\widetilde{Y}/}$ is weakly contractible. Since $\widehat{U}$ is an inner fibration, the map

$$\mathcal{E}_{/X} = \mathcal{E} \times_{\widehat{\mathcal{E}}} \widehat{\mathcal{E}}_{/X} \to \mathcal{E} \times_{\mathcal{C}} \mathcal{C}_{/C}$$

is a right fibration (Proposition 4.3.6.8). Using our assumption that U is an isofibration, we deduce that the map $\mathcal{E}_{/X} \to \mathcal{C}_{/C}$ is also an isofibration. Let $\widetilde{D}$ denote the image of $\widetilde{Y}$ under this isofibration, which we identify with a morphism $f : D \to C$ in the ∞-category $\mathcal{C}$ (so that $D = U(Y)$ and $f = \widehat{U}(v)$). Set $\mathcal{B} = \{\mathrm{id}_C\} \times_{\mathcal{C}_{/C}} (\mathcal{C}_{/C})_{\widetilde{D}/}$, so that U induces an isofibration

$$\mathcal{A} = \{\mathrm{id}_C\} \times_{\mathcal{C}_{/C}} (\mathcal{E}_{/X})_{\widetilde{Y}/}) \to \{\mathrm{id}_C\} \times_{\mathcal{C}_{/C}} (\mathcal{C}_{/C})_{\widetilde{D}/} = \mathcal{B}.$$

Since id_C is final when viewed as an object of $\mathcal{C}_{/C}$ (Proposition 4.6.7.22), the simplicial set $\mathcal{B}$ is a contractible Kan complex. Let $B \in \mathcal{B}$ be the vertex which corresponds to the degenerate 2-simplex of $\mathcal{C}$ depicted in the diagram

$$\begin{tikzcd}
 & C \arrow[dr, "\mathrm{id}_C"] & \\
D \arrow[ur, "f"] \arrow[rr, "f"] & & C,
\end{tikzcd}$$

so that the inclusion map $\{B\} \hookrightarrow \mathcal{B}$ is an equivalence of ∞-categories. Applying Corollary 4.5.2.30, we deduce that the inclusion map $\{B\} \times_{\mathcal{B}} \mathcal{A} \hookrightarrow \mathcal{A}$ is an equivalence of ∞-categories. In particular, it is a weak homotopy equivalence. Consequently, to show that $\mathcal{A}$ is weakly contractible, it will suffice to show that the fiber $\{B\} \times_{\mathcal{B}} \mathcal{A}$ is weakly contractible. Replacing $\mathcal{E}$ and $\widehat{\mathcal{E}}$ by the fiber products $\Delta^1 \times_{\mathcal{C}} \mathcal{E}$ and $\Delta^1 \times_{\mathcal{C}} \widehat{\mathcal{E}}$, respectively, we are reduced to proving that $\mathcal{A}$ is weakly contractible under the additional assumption that $\mathcal{C} = \Delta^1$, where $U(Y) = 0$ and $\widehat{U}(X) = 1$.

For $i \in \{0, 1\}$, set $\mathcal{E}_i = \{i\} \times_{\mathcal{C}} \mathcal{E}$ and $\widehat{\mathcal{E}}_i = \{i\} \times_{\mathcal{C}} \widehat{\mathcal{E}}$. Fix an uncountable regular cardinal κ such that $\widehat{\mathcal{E}}$ is locally κ-small and every simplicial set $K \in \mathbb{K}$ is essentially κ-small. Then the projection map $\widehat{\mathcal{E}}_{H(Y)/} \to \widehat{\mathcal{E}}$ admits a covariant transport representation $\mathscr{F} : \widehat{\mathcal{E}} \to \mathcal{S}^{<\kappa}$, given informally by the formula $\mathscr{F}(E) = \mathrm{Hom}_{\widehat{\mathcal{E}}}(H(Y), E)$. Our assumption that H exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$ guarantees that the restriction $\mathscr{F}|_{\widehat{\mathcal{E}}_1}$ preserves K-indexed colimits, for each $K \in \mathbb{K}$. Applying Corollary 8.4.5.10 (and our assumption that H is fully faithful), we conclude that H induces a left cofinal functor

$$\mathcal{E}_1 \times_{\mathcal{E}} \mathcal{E}_{Y/} \xrightarrow{\sim} \mathcal{E}_1 \times_{\widehat{\mathcal{E}}} \widehat{\mathcal{E}}_{H(Y)/} \to \widehat{\mathcal{E}}_1 \times_{\widehat{\mathcal{E}}} \widehat{\mathcal{E}}_{H(Y)/}.$$

By virtue of Theorem 7.2.3.1, this is a reformulation of the assertion that the ∞-category $\mathcal{A}$ is weakly contractible (for every choice of object $X \in \widehat{\mathcal{E}}_1$). $\square$

Proposition 9.3.1.25. *Let $\mathbb{K}$ be a collection of simplicial sets. Suppose we are given a commutative diagram of ∞-categories* 05L9

$$\begin{tikzcd}
\widehat{\mathcal{E}} \arrow[rr, "F"] \arrow[dr, "\widehat{U}"'] & & \mathcal{E}' \arrow[dl, "U'"] \\
& \mathcal{C} &
\end{tikzcd}$$

and let $\mathcal{E} \subseteq \widehat{\mathcal{E}}$ be a full subcategory. Assume that $U = \widehat{U}|_{\mathcal{E}}$ is an isofibration, that the inclusion map $\mathcal{E} \hookrightarrow \widehat{\mathcal{E}}$ exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$, and that U' is a $\mathbb{K}$-cocomplete inner fibration. The following conditions are equivalent:

(1) *The functor F is U'-left Kan extended from $\mathcal{E}$.*

(2) *For each object $C \in \mathcal{C}$ and each $K \in \mathbb{K}$, the functor $F_C : \widehat{\mathcal{E}}_C \to \mathcal{E}'_C$ preserves K-indexed colimits.*

Proof. Fix an object $C \in \mathcal{C}$, and let X be an object of $\widehat{\mathcal{E}}$ satisfying $\widehat{U}(X) = C$. Combining Lemma 9.3.1.24 with Corollary 7.2.2.2, we see that the following conditions are equivalent:

(1_X) The functor F is U'-left Kan extended from $\mathcal{E}$ at the object $X \in \widehat{\mathcal{E}}$.

(2_X) The functor F_C is U'-left Kan extended from $\mathcal{E}_C$ at the object $X \in \widehat{\mathcal{E}}_C$.

Allowing the object X to vary (with C fixed) and applying Lemma 9.3.1.23, we see that the following are equivalent:

(1_C) For each object $X \in \widehat{\mathcal{E}}$ satisfying $\widehat{U}(X) = C$, the functor F is U'-left Kan extended from $\mathcal{E}$ at the object X.

(2_C) For each $K \in \mathbb{K}$, the functor F_C preserves K-indexed colimits.

The equivalence (1) $\Leftrightarrow$ (2) now follows by allowing the object $C \in \mathcal{C}$ to vary. □

Variant 9.3.1.26. Let $\mathbb{K}$ be a collection of simplicial sets, let $\widehat{U} : \widehat{\mathcal{E}} \to \mathcal{C}$ be an inner fibration of ∞-categories, and let $\mathcal{E} \subseteq \widehat{\mathcal{E}}$ be a full subcategory. Assume that $U = \widehat{U}|_{\mathcal{E}}$ is an isofibration and that the inclusion functor $\mathcal{E} \hookrightarrow \widehat{\mathcal{E}}$ exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$. Let $U' : \mathcal{E}' \to \mathcal{C}$ be a $\mathbb{K}$-cocomplete isofibration. Then every lifting problem 05LA

$$\begin{tikzcd}
\mathcal{E} \arrow[r, "F^0"] \arrow[d] & \mathcal{E}' \arrow[d, "U'"] \\
\widehat{\mathcal{E}} \arrow[r] \arrow[ur, dashed, "F"] & \mathcal{C}
\end{tikzcd}$$

admits a solution, where the functor F is U'-left Kan extended from $\mathcal{E}$.

Proof. Fix an object $C \in \mathcal{C}$, so that F^0 restricts to a functor $F^0_C : \mathcal{E}_C \to \mathcal{E}'_C$. Since the inclusion functor $\mathcal{E}_C \hookrightarrow \widehat{\mathcal{E}}_C$ exhibits $\widehat{\mathcal{E}}_C$ as a $\mathbb{K}$-cocompletion of $\mathcal{E}_C$, the functor F^0_C admits an (essentially unique) extension $F_C : \widehat{\mathcal{E}}_C \to \mathcal{E}'_C$ which preserves K-indexed colimits for each $K \in \mathbb{K}$. It follows from Lemma 9.3.1.23 that F_C is U'-left Kan extended from $\mathcal{E}_C$. In particular, for each object $X \in \widehat{\mathcal{E}}_C$, the composition

$$(\mathcal{E}_C \times_{\widehat{\mathcal{E}}_C} (\widehat{\mathcal{E}}_C)_{/X})^{\triangleright} \widehat{\mathcal{E}}_C \xrightarrow{F_C} \mathcal{E}'$$

is a U'-colimit diagram. Since the inclusion map

$$\mathcal{E}_C \times_{\widehat{\mathcal{E}}_C} (\widehat{\mathcal{E}}_C)_{/X} \hookrightarrow \mathcal{E} \times_{\widehat{\mathcal{E}}} \widehat{\mathcal{E}}_{/X}$$

is right cofinal (Lemma 9.3.1.24), Proposition 7.2.2.9 guarantees that the lifting problem

$$\begin{tikzcd}
\mathcal{E} \times_{\widehat{\mathcal{E}}} \widehat{\mathcal{E}}_{/X} \arrow[r] \arrow[d] & \mathcal{E} \arrow[r, "F"] & \mathcal{E}' \arrow[d, "U'"] \\
(\mathcal{E} \times_{\widehat{\mathcal{E}}} \widehat{\mathcal{E}}_{/X})^{\triangleright} \arrow[r] \arrow[urr, dashed] & \widehat{\mathcal{E}} \arrow[r, "\widehat{U}"] & \mathcal{C}
\end{tikzcd}$$

admits a solution, where the dotted arrow is a U'-colimit diagram. The desired result now follows by allowing the object X to vary and applying the criterion of Proposition 7.3.5.5. □

We now prove a special case of Theorem 9.3.1.20 (which is sufficient for most applications).

05LB **Lemma 9.3.1.27.** *Let $\mathbb{K}$ be a collection of simplicial sets. Suppose we are given a diagram of ∞-categories*

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C}, &
\end{tikzcd}$$

where U and $\widehat{U}$ are isofibrations and H exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$. Then, for every $\mathbb{K}$-cocomplete isofibration $U' : \mathcal{E}' \to \mathcal{C}$, precomposition with H induces an equivalence of ∞-categories

$$\mathrm{Fun}^{\mathbb{K}}_{/\mathcal{C}}(\widehat{\mathcal{E}}, \mathcal{E}') \to \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}').$$

Proof. Since the functor H is fully faithful (see Variant 4.8.6.19), we can assume without loss of generality that $\mathcal{E}$ is a replete full subcategory of $\widehat{\mathcal{E}}$ (and that H is the inclusion functor). In this case, Proposition 9.3.1.25 identifies $\operatorname{Fun}^{\mathbb{K}}_{/\mathcal{C}}(\widehat{\mathcal{E}}, \mathcal{E}')$ with the full subcategory of $\operatorname{Fun}_{/\mathcal{C}}(\widehat{\mathcal{E}}, \mathcal{E}')$ spanned by those functors $F : \widehat{\mathcal{E}} \to \mathcal{E}'$ which are U'-left Kan extended from $\mathcal{E}$. Combining this observation with Theorem 7.3.6.14 and Variant 9.3.1.26, we see that the restriction functor $\operatorname{Fun}^{\mathbb{K}}_{/\mathcal{C}}(\widehat{\mathcal{E}}, \mathcal{E}') \to \operatorname{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}')$ is a trivial Kan fibration. □

Proof of Theorem 9.3.1.20. For every morphism of simplicial sets $S \to \mathcal{C}$, we let $\operatorname{Fun}^{\mathbb{K}}_{/\mathcal{C}}(S \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}')$ denote the (replete) full subcategory of $\operatorname{Fun}_{/\mathcal{C}}(S \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}')$ spanned by those morphisms $F : S \times_{\mathcal{C}} \widehat{\mathcal{E}} \to \mathcal{E}'$ having the property that, for each vertex $s \in S$, the functor $F_s : \{s\} \times_{\mathcal{C}} \widehat{\mathcal{E}} \to \{s\} \times_{\mathcal{C}} \mathcal{E}'$ preserves K-indexed colimits for each $K \in \mathbb{K}$. We will prove the following:

$(*)$ For every morphism of simplicial sets $S \to \mathcal{C}$, precomposition with H induces an equivalence of ∞-categories

$$\theta_S : \operatorname{Fun}^{\mathbb{K}}_{/\mathcal{C}}(S \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}') \to \operatorname{Fun}_{/\mathcal{C}}(S \times_{\mathcal{C}} \mathcal{E}, \mathcal{E}').$$

Writing S as the union of its skeleta $\operatorname{sk}_n(S)$, we can realize θ_S as the limit of a tower of comparison maps

$$\begin{tikzcd}
\cdots \arrow[r] & \operatorname{Fun}^{\mathbb{K}}_{/\mathcal{C}}(\operatorname{sk}_1(S) \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}') \arrow[r] \arrow[d, "\theta_{\operatorname{sk}_1(S)}"] & \operatorname{Fun}^{\mathbb{K}}_{/\mathcal{C}}(\operatorname{sk}_0(S) \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}') \arrow[d, "\theta_{\operatorname{sk}_0(S)}"] \\
\cdots \arrow[r] & \operatorname{Fun}_{/\mathcal{C}}(\operatorname{sk}_1(S) \times_{\mathcal{C}} \mathcal{E}, \mathcal{E}') \arrow[r] & \operatorname{Fun}_{/\mathcal{C}}(\operatorname{sk}_0(S) \times_{\mathcal{C}} \mathcal{E}, \mathcal{E}'),
\end{tikzcd}$$

where the horizontal maps are isofibrations (Variant 4.4.5.11). Consequently, to show that θ_S is an equivalence of ∞-categories, it will suffice to show that $\theta_{\operatorname{sk}_n(S)}$ is an equivalence of ∞-categories for each $n \geq -1$. We may therefore assume without loss of generality that S has dimension $\leq n$, for some integer $n \geq -1$.

We now proceed by induction on n. Assume that $n \geq 0$ (otherwise, S is empty and there is nothing to prove). Let S' be the $(n-1)$-skeleton of S, so that Proposition 1.1.4.12 supplies a pushout diagram

$$\begin{tikzcd}
T' \arrow[r] \arrow[d] & T \arrow[d] \\
S' \arrow[r] & S
\end{tikzcd}$$

where T is a coproduct of standard n-simplices (indexed by the nondegenerate n-simplices of S) and T' is the coproduct of their boundaries. It follows that θ_S can be realized as the horizontal limit of a diagram of comparison maps

$$\begin{tikzcd}
\mathrm{Fun}^{\mathbb{K}}_{/\mathcal{C}}(S' \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}') \arrow[r] \arrow[d, "\theta_{S'}"] & \mathrm{Fun}^{\mathbb{K}}_{/\mathcal{C}}(T' \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}') \arrow[r] \arrow[d, "\theta_{T'}"] & \mathrm{Fun}^{\mathbb{K}}_{/\mathcal{C}}(T \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}') \arrow[d, "\theta_{T}"] \\
\mathrm{Fun}_{/\mathcal{C}}(S' \times_{\mathcal{C}} \mathcal{E}, \mathcal{E}') \arrow[r] & \mathrm{Fun}_{/\mathcal{C}}(T' \times_{\mathcal{C}} \mathcal{E}, \mathcal{E}') & \mathrm{Fun}_{/\mathcal{C}}(T \times_{\mathcal{C}} \mathcal{E}, \mathcal{E}'), \arrow[l]
\end{tikzcd}$$

where the horizontal maps on the right are isofibrations (Variant 4.4.5.11). Since the simplicial sets S' and T' have dimension $< n$, our inductive hypothesis guarantees that $\theta_{S'}$ and $\theta_{T'}$ are equivalences of ∞-categories. Consequently, to show that θ_S is an equivalence of ∞-categories, it will suffice to show that θ_T is an equivalence of ∞-categories (Corollary 4.5.2.30). Replacing $\mathcal{C}$ by T, we are reduced to proving Theorem 9.3.1.20 in the special case where $\mathcal{C}$ is a coproduct of standard simplices. In this case, $\mathcal{C}$ is an ∞-category and the inner fibrations $U : \mathcal{E} \to \mathcal{C}$, $\widehat{U} : \widehat{\mathcal{E}} \to \mathcal{C}$, and $U' : \mathcal{E}' \to \mathcal{C}$ are automatically isofibrations (Example 4.4.1.6), so the desired result follows from Lemma 9.3.1.27. □

9.3.2 Fiberwise Cocompletions of Cocartesian Fibrations

05LC We now specialize our theory of fiberwise cocompletions to the setting of cocartesian fibrations. In this case, Definition 9.3.1.12 can be reformulated:

05LD **Theorem 9.3.2.1.** *Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then a commutative diagram*

05LE
$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd} \qquad (9.28)$$

exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$ if and only if the following conditions are satisfied:

(a) For each vertex $C \in \mathcal{C}$, the functor $H_C : \mathcal{E}_C \to \widehat{\mathcal{E}}_C$ exhibits the ∞-category $\widehat{\mathcal{E}}_C$ as a $\mathbb{K}$-cocompletion of the ∞-category $\mathcal{E}_C$ (Definition 8.4.5.1).

(b) The morphism $\widehat{U}$ is a cocartesian fibration of simplicial sets.

(c) *For every edge $f : C \to C'$ of $\mathcal{C}$, the covariant transport functor $f_! : \widehat{\mathcal{E}}_C \to \widehat{\mathcal{E}}_{C'}$ preserves K-indexed colimits for each $K \in \mathbb{K}$.*

(d) *The morphism H carries U-cocartesian edges of $\mathcal{E}$ to $\widehat{U}$-cocartesian edges of $\widehat{\mathcal{E}}$.*

Moreover, there exists a diagram (9.28) which satisfies these conditions.

Our proof of Theorem 9.3.2.1 will require some preliminaries.

Lemma 9.3.2.2. *Let $\mathbb{K}$ be a collection of simplicial sets and let $\widehat{U} : \widehat{\mathcal{E}} \to \mathcal{C}$ be a cocartesian fibration. Then $\widehat{U}$ is $\mathbb{K}$-cocomplete (in the sense of Variant 9.3.1.4) if and only if it satisfies the following conditions:* 05LF

- *For each object $C \in \mathcal{C}$, the ∞-category $\widehat{\mathcal{E}}_C = \{C\} \times_{\mathcal{C}} \widehat{\mathcal{E}}$ is $\mathbb{K}$-cocomplete.*
- *For each edge $f : C \to C'$ of $\mathcal{C}$, the covariant transport functor $f_! : \mathcal{E}_C \to \mathcal{E}_{C'}$ preserves K-indexed colimits for each $K \in \mathbb{K}$.*

Proof. Without loss of generality, we may assume that $\mathcal{C}$ is an ∞-category (or even that $\mathcal{C} = \Delta^1$). In this case, the desired result follows from the characterization of $\widehat{U}$-colimit diagrams supplied by Proposition 7.3.9.2. □

Lemma 9.3.2.3. *Let $\mathbb{K}$ be a collection of simplicial sets, let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets, and suppose we are given a commutative diagram* 05LG

05LH
$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd} \qquad (9.29)$$

which satisfies the conditions of Theorem 9.3.2.1. Then H exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$.

Proof. Without loss of generality, we may assume that $\mathcal{C} = \Delta^1$. For $i \in \{0, 1\}$, let $\mathcal{E}_i$ denote the fiber $\{i\} \times_{\Delta^1} \mathcal{E}$ and define $\widehat{\mathcal{E}}_i$ similarly, so that H restricts to a functor $H_i : \mathcal{E}_i \to \widehat{\mathcal{E}}_i$. By assumption, the functor H_i exhibits $\widehat{\mathcal{E}}_i$ as a $\mathbb{K}$-cocompletion of $\mathcal{E}_i$, and is therefore fully faithful (Proposition 8.4.5.3). Since H carries U-cocartesian morphisms of $\mathcal{E}$ to $\widehat{U}$-cocartesian morphisms of $\widehat{\mathcal{E}}$, it follows that H is fully faithful (Proposition 5.1.6.7). It follows from Lemma 9.3.2.2 that the cocartesian fibration $\widehat{U}$ is $\mathbb{K}$-cocomplete.

Fix an uncountable regular cardinal κ such that $\widehat{\mathcal{E}}$ is locally κ-small and every simplicial set $K \in \mathbb{K}$ is essentially κ-small. To complete the proof, it will suffice to show that for every object $X \in \mathcal{E}_0$, the functor

$$\mathscr{F} : \widehat{\mathcal{E}}_1 \to \mathcal{S}^{<\kappa} \qquad Y \mapsto \operatorname{Hom}_{\widehat{\mathcal{E}}}(H(X), Y)$$

commutes with K-indexed colimits, for each $K \in \mathbb{K}$. Since U is a cocartesian fibration, we can choose a U-cocartesian morphism $u : X \to X'$ of $\mathcal{E}$ with $X' \in \mathcal{E}_1$. By assumption, $H(u) : H(X) \to H(X')$ is a $\widehat{U}$-cocartesian morphism in the ∞-category $\widehat{\mathcal{E}}$, so the functor $\mathscr{F}$ is corepresented by the object $H(X')$. The desired result now follows from the characterization of $\mathbb{K}$-cocompletions given in Variant 8.4.6.9. □

Our next goal is to prove the existence assertion of Theorem 9.3.2.1. We begin by treating the case where $\mathbb{K}$ is the collection of κ-small simplicial sets, for some uncountable regular cardinal κ, and the cocartesian fibration $U : \mathcal{E} \to \mathcal{C}$ is essentially κ-small. In the special case $\mathcal{C} = \Delta^0$, Theorem 9.3.2.1 reduces to the assertion that there exists a functor $H : \mathcal{E} \to \widehat{\mathcal{E}}$ which exhibits $\widehat{\mathcal{E}}$ as a cocompletion of $\mathcal{E}$. In §8.4, we proved this using an explicit construction: we can take $\widehat{\mathcal{E}}$ to be the ∞-category $\mathrm{Fun}(\mathcal{E}^{\mathrm{op}}, \mathcal{S})$ and H to be the covariant Yoneda embedding (Theorem 8.4.0.3). We now extend this construction to the relative setting, using the duality theory developed in §8.6.

05LJ **Lemma 9.3.2.4.** *Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \to \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \to \mathcal{C}$ be essentially κ-small cocartesian fibrations of simplicial sets, and let $\mathrm{Fun}(\mathcal{E}^\vee / \mathcal{C}, \mathcal{S}^{<\kappa})$ be the relative exponential of Construction 4.5.9.1. Suppose we are given a morphism*

$$\mathscr{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa},$$

which exhibits $U^\vee$ as a cocartesian dual of U (see Variant 8.6.4.13). Then $\mathscr{K}$ is classified by a commutative diagram with a diagram

05LK
$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \mathrm{Fun}(\mathcal{E}^\vee / \mathcal{C}, \mathcal{S}^{<\kappa}) \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} . &
\end{tikzcd} \tag{9.30}$$

which satisfies the conditions of Theorem 9.3.2.1.

Proof. It follows from Proposition 8.6.5.12 that $\widehat{U}$ is both a cartesian and cocartesian fibration, so that condition (b) of Theorem 9.3.2.1 is satisfied and condition (c) is automatic (Corollary 7.1.3.21). Condition (d) follows from Proposition 8.6.5.18, and condition (a) from Theorem 8.4.3.3. □

05LL **Example 9.3.2.5.** Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets which is essentially κ-small, and let $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ be as in Construction 8.6.5.6. It follows from Proposition 8.6.5.8 that the evaluation functor

$$\mathrm{ev} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa} \qquad ((C, \mathscr{F}_C), X) \mapsto \mathscr{F}_C(X)$$

exhibits U as a cocartesian dual of the projection map $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$. Applying Lemma 9.3.2.4 (with the roles of $\mathcal{E}$ and $\mathcal{E}^{\vee}$ switched) and Lemma 9.3.2.3, we conclude that the diagram

$$\begin{tikzcd}
\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa}) \arrow[rr] \arrow[dr] & & \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa}) \arrow[dl] \\
& \mathcal{C} &
\end{tikzcd}$$

exhibits $\mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$ as a fiberwise κ-cocompletion of $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$.

Lemma 9.3.2.6. *Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then there exists a commutative diagram* 05LM

05LN

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C}. &
\end{tikzcd} \tag{9.31}$$

which satisfies the conditions of Theorem 9.3.2.1.

Proof. Choose an uncountable regular cardinal κ such that U is essentially κ-small and each $K \in \mathbb{K}$ is κ-small. Using Theorem 8.6.5.1 (and Proposition 8.6.4.15), we can choose a cocartesian fibration $U^{\vee} : \mathcal{E}^{\vee} \to \mathcal{C}$ and a diagram $\mathscr{K} : \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$ which exhibits $U^{\vee}$ as a cocartesian dual of U. Let $\mathbb{K}'$ be the collection of all κ-small simplicial sets and set $\widehat{\mathcal{E}}' = \mathrm{Fun}(\mathcal{E}^{\vee} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$, so that Lemma 9.3.2.4 supplies a diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H'"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}}' \arrow[dl, "\widehat{U}'"] \\
& \mathcal{C} &
\end{tikzcd}$$

which satisfies the conditions of Theorem 9.3.2.1 with respect to $\mathbb{K}'$.

For each object $C \in \mathcal{C}$, let $\widehat{\mathcal{E}}_C$ denote smallest full subcategory of $\widehat{\mathcal{E}}$ which contains the essential image of the functor $H'_C : \mathcal{E}_C \to \widehat{\mathcal{E}}'_C$ and is closed under K-indexed colimits for each $K \in \mathbb{K}$. For each edge $f : C \to D$ of the simplicial set $\mathcal{C}$, Remark 5.2.2.14 guarantees that the diagram

$$\begin{tikzcd}
\mathcal{E}_C \arrow[r] \arrow[d, "H'_C"] & \mathcal{E}_D \arrow[d, "H'_D"] \\
\widehat{\mathcal{E}}'_C \arrow[r, "f_!"] & \widehat{\mathcal{E}}'_D
\end{tikzcd}$$

commutes up to isomorphism, where the horizontal maps are given by covariant transport along f. In particular, the covariant transport functor $f_! : \widehat{\mathcal{E}}'_C \to \widehat{\mathcal{E}}'_D$ carries the essential image of H'_C into the essential image of H'_D. Since $f_!$ preserves κ-small colimits, it carries $\widehat{\mathcal{E}}_C$ into $\widehat{\mathcal{E}}_D$.

Let $\widehat{\mathcal{E}}$ denote the full simplicial subset of $\widehat{\mathcal{E}}'$ spanned by those vertices X which belong to $\widehat{\mathcal{E}}_C$, where $C = \widehat{U}'(X)$. Applying Proposition 5.1.4.16, we see that $\widehat{U} = \widehat{U}'|_{\widehat{\mathcal{E}}}$ is a cocartesian fibration from $\widehat{\mathcal{E}}$ to $\mathcal{C}$, and that an edge of $\widehat{\mathcal{E}}$ is $\widehat{U}$-cocartesian if and only if it is $\widehat{U}'$-cocartesian when regarded as an edge of $\widehat{\mathcal{E}}'$. It follows that the commutative diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

automatically satisfies conditions (b) and (d) of Theorem 9.3.2.1. Moreover, for each edge $f : C \to D$ of $\mathcal{C}$, the associated covariant transport functor $\widehat{\mathcal{E}}_C \to \widehat{\mathcal{E}}_D$ is can be identified with the restriction of $f_!$ to $\widehat{\mathcal{E}}_C$, and therefore preserves K-indexed colimits for each $K \in \mathbb{K}$. To complete the proof, it will suffice to show that for every vertex $C \in \mathcal{C}$, the induced map $H_C : \mathcal{E}_C \to \widehat{\mathcal{E}}_C$ exhibits $\widehat{\mathcal{E}}_C$ as a $\mathbb{K}$-cocompletion of $\mathcal{E}_C$. This follows from Proposition 8.4.5.7. □

Proof of Theorem 9.3.2.1. Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \to \mathcal{C}$ be a cocartesian fibration of simplicial sets. Using Lemma 9.3.2.6, we can choose a commutative diagram

05LP

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd} \tag{9.32}$$

which satisfies conditions (a), (b), (c), and (d) of Theorem 9.3.2.1. Lemma 9.3.2.3 guarantees any such diagram (9.32) exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$. Conversely, if we are given another diagram

05LQ

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}}' \arrow[dl, "\widehat{U}'"] \\
& \mathcal{C} &
\end{tikzcd} \tag{9.33}$$

which exhibits $\widehat{\mathcal{E}}'$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$, then Remark 9.3.1.21 guarantees that there is an equivalence $F : \widehat{\mathcal{E}} \to \widehat{\mathcal{E}}'$ of inner fibrations over $\mathcal{C}$ such that H' is isomorphic to $F \circ H$ as an object of $\operatorname{Fun}_{/\mathcal{C}}(\mathcal{E}, \widehat{\mathcal{E}}')$. It then follows that (9.33) also satisfies conditions (a), (b), (c), and (d) of Theorem 9.3.2.1. □

9.3.3 Fiberwise Cocompletion of Cartesian Fibrations

We now study fiberwise cocompletion in the setting of cartesian fibrations. Here the main result is the following: 05LR

Theorem 9.3.3.1. *Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \to \mathcal{C}$ be a cartesian fibration of simplicial sets. Then a commutative diagram* 05LS

05LT

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd} \tag{9.34}$$

exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$ if and only if the following conditions are satisfied:

(a) *For each vertex $C \in \mathcal{C}$, the functor $H_C : \mathcal{E}_C \to \widehat{\mathcal{E}}_C$ exhibits the ∞-category $\widehat{\mathcal{E}}_C$ as a $\mathbb{K}$-cocompletion of the ∞-category $\mathcal{E}_C$ (Definition 8.4.5.1).*

(b) *The morphism $\widehat{U}$ is a cartesian fibration of simplicial sets.*

(c) *For every edge $f : C \to C'$ of $\mathcal{C}$, the contravariant transport functor $f^* : \widehat{\mathcal{E}}_{C'} \to \widehat{\mathcal{E}}_C$ preserves K-indexed colimits for each $K \in \mathbb{K}$.*

(d) *The morphism H carries U-cartesian edges of $\mathcal{E}$ to $\widehat{U}$-cartesian edges of $\widehat{\mathcal{E}}$.*

Moreover, there exists a diagram (9.34) which satisfies these conditions.

Our strategy is to reduce Theorem 9.3.3.1 from its counterpart for cocartesian fibrations (Theorem 9.3.2.1), which was proved in §9.3.2. To carry out the reduction, we show that fiberwise cocompletion is compatible with the formation of conjugate fibrations (Proposition 9.3.3.3). As a first step, we record the easy direction of Theorem 9.3.3.1:

05LU **Lemma 9.3.3.2.** *Let $\mathbb{K}$ be a collection of simplicial sets, let $U : \mathcal{E} \to \mathcal{C}$ be a cartesian fibration of simplicial sets, and suppose we are given a commutative diagram*

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

which satisfies the conditions of Theorem 9.3.3.1. Then H exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$.

Proof. Without loss of generality, we may assume that $\mathcal{C} = \Delta^1$. For $i \in \{0, 1\}$, let $\mathcal{E}_i$ denote the fiber $\{i\} \times_{\Delta^1} \mathcal{E}$ and define $\widehat{\mathcal{E}}_i$ similarly, so that H restricts to a functor $H_i : \mathcal{E}_i \to \widehat{\mathcal{E}}_i$. By assumption, the functor H_i exhibits $\widehat{\mathcal{E}}_i$ as a $\mathbb{K}$-cocompletion of $\mathcal{E}_i$, and is therefore fully faithful (Proposition 8.4.5.3). Since H carries U-cartesian morphisms of $\mathcal{E}$ to $\widehat{U}$-cartesian morphisms of $\widehat{\mathcal{E}}$, it follows that H is fully faithful (Proposition 5.1.6.7). It follows from Example 9.3.1.6 that the fibration $\widehat{U}$ is $\mathbb{K}$-cocomplete.

Fix an uncountable regular cardinal κ such that $\widehat{\mathcal{E}}$ is locally κ-small and every simplicial set $K \in \mathbb{K}$ is essentially κ-small. To complete the proof, it will suffice to show that for every object $X \in \mathcal{E}_0$, the functor

$$\mathscr{F} : \widehat{\mathcal{E}}_1 \to \mathcal{S}^{<\kappa} \qquad Y \mapsto \operatorname{Hom}_{\widehat{\mathcal{E}}}(H(X), Y)$$

commutes with K-indexed colimits, for each $K \in \mathbb{K}$. Since $\widehat{U}$ is a cartesian fibration, this functor factors as a composition $\widehat{\mathcal{E}}_1 \xrightarrow{f^*} \widehat{\mathcal{E}}_0 \xrightarrow{\mathscr{G}} \mathcal{S}^{<\kappa}$, where f^* is given by contravariant transport along the nondegenerate edge of $\mathcal{C}$ and the functor $\mathscr{G}$ is corepresented by $H(X)$. We are therefore reduced to showing that the functor $\mathscr{G}$ preserves K-indexed colimits, which follows from the recognition principle of Variant 8.4.6.9. □

05LV **Proposition 9.3.3.3.** *Let $\mathbb{K}$ be a collection of simplicial sets, let $U : \mathcal{E} \to \mathcal{C}$ and $\widehat{U} : \widehat{\mathcal{E}} \to \mathcal{C}$ be cocartesian fibrations of simplicial sets, and suppose we are given a commutative diagram*

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$. Let $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ and $\widehat{U}^{\dagger} : \widehat{\mathcal{E}}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be cartesian fibrations, and let

$$T : \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E} \qquad \widehat{T} : \widehat{\mathcal{E}}^{\dagger} \times^{\mathrm{op}}_{\mathcal{C}} \mathrm{Tw}(\mathcal{C}) \to \widehat{\mathcal{E}}$$

be morphisms which exhibit $U^{\dagger}$ and $\widehat{U}^{\dagger}$ as cartesian conjugates of U and $\widehat{U}$, respectively. Then there exists a morphism $H^{\dagger} : \mathcal{E}^{\dagger} \to \widehat{\mathcal{E}}^{\dagger}$ satisfying $\widehat{U}^{\dagger} \circ H^{\dagger} = U^{\dagger}$, and for which the diagram

05LW

$$\begin{tikzcd}
\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r, "T"] \arrow[d, "H^{\dagger} \times \mathrm{id}"] & \mathcal{E} \arrow[d, "H"] \\
\widehat{\mathcal{E}}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r, "\widehat{T}"] & \widehat{\mathcal{E}}
\end{tikzcd} \tag{9.35}$$

commutes up to isomorphism (in the ∞-category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}), \widehat{\mathcal{E}})$). In this case, the diagram

05LX

$$\begin{tikzcd}
\mathcal{E}^{\dagger} \arrow[rr, "H^{\dagger}"] \arrow[dr, "U^{\dagger}"'] & & \widehat{\mathcal{E}}^{\dagger} \arrow[dl, "\widehat{U}^{\dagger}"] \\
& \mathcal{C}^{\mathrm{op}} &
\end{tikzcd} \tag{9.36}$$

satisfies the hypotheses of Theorem 9.3.3.1, and therefore exhibits $\widehat{\mathcal{E}}^{\dagger}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}^{\dagger}$.

Proof. By virtue of Corollary 5.6.7.3, we may assume that $\mathcal{C}$ is an ∞-category. It follows from the criterion of Theorem 9.3.2.1 that the functor H carries U-cocartesian morphisms of $\mathcal{E}$ to $\widehat{U}$-cocartesian morphisms of $\widehat{\mathcal{E}}$. Invoking Example 8.6.2.10, we deduce that there is an object $H^{\dagger} \in \mathrm{Fun}_{/\mathcal{C}^{\mathrm{op}}}(\mathcal{E}^{\dagger}, \widehat{\mathcal{E}}^{\dagger})$ for which the diagram (9.35) commutes up to isomorphism (moreover, $H^{\dagger}$ is unique up to isomorphism). We complete the proof by showing that the diagram (9.36) satisfies the conditions of Theorem 9.3.3.1:

(*a*) Fix an object $C \in \mathcal{C}$; we wish to show that the functor $H^{\dagger}_{C}$ exhibits the ∞-category $\widehat{\mathcal{E}}^{\dagger}_{C}$ as a $\mathbb{K}$-cocompletion of the ∞-category $\mathcal{E}^{\dagger}_{C}$. Using (9.35), we obtain a diagram of ∞-categories

$$\begin{tikzcd}
\mathcal{E}^{\dagger}_{C} \arrow[r, "T_C"] \arrow[d, "H^{\dagger}_{C}"] & \mathcal{E}_C \arrow[d, "H_C"] \\
\widehat{\mathcal{E}}^{\dagger}_{C} \arrow[r, "\widehat{T}_C"] & \widehat{\mathcal{E}}_C
\end{tikzcd}$$

which commutes up to isomorphism, where the horizontal maps are equivalences. The desired result now follows from our assumption that H_C exhibits the ∞-category $\widehat{\mathcal{E}}_C$ as a $\mathbb{K}$-cocompletion of $\mathcal{E}_C$.

(*b*) The morphism $\widehat{U}^{\dagger}$ is a cartesian fibration by assumption.

(*c*) Fix a morphism $f : C \to C'$ of $\mathcal{C}$ and a simplicial set $K \in \mathbb{K}$; we wish to show that the contravariant transport functor $f^* : \widehat{\mathcal{E}}^{\dagger}_C \to \widehat{\mathcal{E}}^{\dagger}_{C'}$ preserves K-indexed colimits. Proposition 8.6.1.5 then guarantees that the diagram of ∞-categories

$$\begin{tikzcd}
\widehat{\mathcal{E}}^{\dagger}_C \arrow[r, "f^*"] \arrow[d, "\widehat{T}_C"] & \widehat{\mathcal{E}}^{\dagger}_{C'} \arrow[d, "\widehat{T}_{C'}"] \\
\widehat{\mathcal{E}}_C \arrow[r, "f_!"] & \widehat{\mathcal{E}}_{C'}
\end{tikzcd}$$

commutes up to isomorphism, where $f_!$ is given by covariant transport along f for the cocartesian fibration $\widehat{U}$. Since the vertical maps are equivalences of ∞-categories, we are reduced to proving that the functor $f_!$ preserves K-indexed colimits, which follows from Theorem 9.3.2.1.

(*d*) The morphism $H^{\dagger}$ carries $U^{\dagger}$-cartesian edges of $\mathcal{E}^{\dagger}$ to $\widehat{U}^{\dagger}$-cartesian edges of $\widehat{\mathcal{E}}^{\dagger}$: this follows from Remark 8.6.2.11.

□

05LY **Corollary 9.3.3.4.** *Let $\mathbb{K}$ be a collection of simplicial sets and let $U^{\dagger} : \mathcal{E}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration of simplicial sets. Then there exists a diagram*

05LZ

$$\begin{tikzcd}
\mathcal{E}^{\dagger} \arrow[rr, "H^{\dagger}"] \arrow[dr, "U^{\dagger}"'] & & \widehat{\mathcal{E}}^{\dagger} \arrow[dl, "\widehat{U}^{\dagger}"] \\
& \mathcal{C}^{\mathrm{op}} &
\end{tikzcd} \tag{9.37}$$

which satisfies the conditions of Theorem 9.3.3.1.

Proof. Using Corollary 8.6.6.3, we can choose a cocartesian fibration $U : \mathcal{E} \to \mathcal{C}$ and a morphism $T : \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathcal{E}$ which exhibits $U^{\dagger}$ as a cartesian conjugate of U. Applying

Theorem 9.3.2.1, we can choose a diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$, where $\widehat{U}$ is a cocartesian fibration. Using Proposition 8.6.2.3, we can choose a cartesian fibration $\widehat{U}^{\dagger} : \widehat{\mathcal{E}}^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ and a morphism $\widehat{T} : \widehat{\mathcal{E}}^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \widehat{\mathcal{E}}$ which exhibits $\widehat{U}^{\dagger}$ as a cartesian conjugate of $\widehat{U}$. The desired result now follows from Proposition 9.3.3.3. □

Proof of Theorem 9.3.3.1. Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \to \mathcal{C}$ be a cartesian fibration of simplicial sets. Using Corollary 9.3.3.4, we can choose a commutative diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

which satisfies the conditions of Theorem 9.3.3.1, and therefore exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$ (Lemma 9.3.3.2). Conversely, if we are given another diagram

05M0

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}}' \arrow[dl, "\widehat{U}'"] \\
& \mathcal{C} &
\end{tikzcd} \tag{9.38}$$

which exhibits $\widehat{\mathcal{E}}'$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$, then Remark 9.3.1.21 guarantees that there is an equivalence $F : \widehat{\mathcal{E}} \to \widehat{\mathcal{E}}'$ of inner fibrations over $\mathcal{C}$ such that H' is isomorphic to $F \circ H$ as an object of $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \widehat{\mathcal{E}}')$. It then follows that (9.38) the conditions of Theorem 9.3.2.1. □

9.3.4 Existence of Fiberwise Cocompletions

Our goal in this section is to prove the following existence result for fiberwise cocompletions: 05M1

05M2 **Theorem 9.3.4.1.** *Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets. Then there exists a commutative diagram*

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$ (in the sense of Definition 9.3.1.12).

Our strategy for proving Theorem 9.3.4.1 is to reduce to the special case where U is a cocartesian fibration, which was treated in §9.3.2 (see Theorem 9.3.2.1). To carry out the reduction, we will need the following relative version of Corollary 8.4.6.10:

05M3 **Lemma 9.3.4.2.** *Let $\mathbb{K}$ be a collection of simplicial sets, let $U' : \mathcal{E}' \to \mathcal{C}$ be an inner fibration of simplicial sets, and and suppose we are given a commutative diagram*

05M4
$$\begin{tikzcd}
\mathcal{E}' \arrow[rr, "H'"] \arrow[dr, "U'"'] & & \widehat{\mathcal{E}}' \arrow[dl, "\widehat{U}'"] \\
& \mathcal{C} &
\end{tikzcd} \tag{9.39}$$

which exhibits $\widehat{\mathcal{E}}'$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}'$. Let $\mathcal{E}$ be a full simplicial subset of $\mathcal{E}'$ and let $\widehat{\mathcal{E}} \subseteq \widehat{\mathcal{E}}'$ be the full simplicial subset spanned by those vertices Y with the following property:

- *If $C = \widehat{U}'(Y)$, then Y belongs to the smallest full subcategory of $\widehat{\mathcal{E}}'_C$ which contains the essential image of $H|_{\mathcal{E}_C}$ and is closed under K-indexed colimits, for each $K \in \mathbb{K}$.*

Set $H = H'|_{\mathcal{E}}$, $U = U'|_{\mathcal{E}}$, and $\widehat{U} = \widehat{U}'|_{\widehat{\mathcal{E}}}$. Then the diagram

05M5
$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd} \tag{9.40}$$

exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$.

Proof. Without loss of generality, we may assume that $\mathcal{C} = \Delta^1$; in this case, we must show that the diagram (9.40) satisfies conditions (1) through (4) of Definition 9.3.1.8. Condition (1) follows from Corollary 8.4.6.10, and the remaining conditions follow immediately from the corresponding conditions on the diagram (9.39) $\square$

We now prove a special case of Theorem 9.3.4.1, which is already sufficient for most applications:

Lemma 9.3.4.3. *Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \to \mathcal{C}$ be an isofibration of ∞-categories Then there exists a commutative diagram of ∞-categories* `05M6`

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$ (in the sense of Definition 9.3.1.12). Moreover, $\widehat{U}$ is also an isofibration.

Proof. Choose a factorization of U as a composition $\mathcal{E} \xrightarrow{F} \mathcal{E}' \xrightarrow{U'} \mathcal{C}$, where U' is a cocartesian fibration of ∞-categories and F is fully faithful. For example, we can take $\mathcal{E}'$ to be the oriented fiber product $\mathcal{E} \tilde{\times}_{\mathcal{C}} \mathcal{C}$, $U' : \mathcal{E}' \to \mathcal{C}$ be the projection onto the second factor (which is a cocartesian fibration by virtue of Corollary 5.3.7.3), and F to be the inclusion map

$$\mathcal{E} \simeq \mathcal{E} \times_{\mathcal{C}} \mathcal{C} \hookrightarrow \mathcal{E} \tilde{\times}_{\mathcal{C}} \mathcal{C}$$

(which is fully faithful by virtue of Corollary 4.5.2.22). Let $\mathcal{E}'_0 \subseteq \mathcal{E}'$ be the essential image of F. Since U' is an isofibration (Proposition 5.1.4.8), it restricts to an isofibration $\mathcal{E}'_0 \to \mathcal{C}$. Applying Proposition 5.1.7.5, we see that the functor $F : \mathcal{E} \to \mathcal{E}'_0$ is an equivalence of inner fibrations over $\mathcal{C}$. We may therefore replace $\mathcal{E}$ by $\mathcal{E}'_0$ and thereby reduce to the special case where $\mathcal{E}$ is a replete full subcategory of $\mathcal{E}'$.

Applying Theorem 9.3.2.1, we deduce that there is a commutative diagram

$$\begin{tikzcd}
\mathcal{E}' \arrow[rr, "H'"] \arrow[dr, "U'"'] & & \widehat{\mathcal{E}}' \arrow[dl, "\widehat{U}'"] \\
& \mathcal{C} &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}'$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}'$. Moreover, the morphism $\widehat{U}'$ is a cocartesian fibration (and therefore an isofibration; see Proposition 5.1.4.8). Define $\widehat{\mathcal{E}} \subseteq \widehat{\mathcal{E}}'$

as in the statement of Lemma 9.3.4.2. Then $\widehat{\mathcal{E}}$ is a replete full subcategory of $\widehat{\mathcal{E}}'$, so the restriction map $\widehat{U} = \widehat{U}'|_{\widehat{\mathcal{E}}}$ is an isofibration. Moreover, Lemma 9.3.4.2 guarantees that the diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H'|_{\mathcal{E}}"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$. □

We now prove a relative version of Theorem 9.3.4.1.

`05M7` **Lemma 9.3.4.4.** *Let $\mathbb{K}$ be a collection of simplicial sets, let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets, and let $\mathcal{C}_0 \subseteq \mathcal{C}$ be a simplicial subset. Set $\mathcal{E}_0 = \mathcal{C}_0 \times_{\mathcal{C}} \mathcal{C}$, let $U_0 : \mathcal{E}_0 \to \mathcal{C}_0$ be the projection onto the first factor, and suppose we are given a diagram*

$$\begin{tikzcd}
\mathcal{E}_0 \arrow[rr, "H_0"] \arrow[dr, "U_0"'] & & \widehat{\mathcal{E}}_0 \arrow[dl, "\widehat{U}_0"] \\
& \mathcal{C}_0 &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}_0$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}_0$. Then there exists a diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise cocompletion of $\mathcal{E}$ and an isomorphism $\widehat{\mathcal{E}}_0 \simeq \mathcal{C}_0 \times_{\mathcal{C}} \widehat{\mathcal{E}}$ which carries H_0 to the map $(U_0, H) : \mathcal{E}_0 \to \mathcal{C}_0 \times_{\mathcal{C}} \widehat{\mathcal{E}}$.

Proof. Using Proposition 1.1.4.12, we can reduce to the case where $\mathcal{C} = \Delta^n$ is a standard simplex and $\mathcal{C}_0 = \partial \Delta^n$ is its boundary. In this case, U is an isofibration of ∞-categories

(Example 4.4.1.6). Applying Lemma 9.3.4.3, we deduce that there exists a diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H'"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}}' \arrow[dl, "\widehat{U}'"] \\
& \mathcal{C} &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}'$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$. Set $\widehat{\mathcal{E}}'_0 = \mathcal{C}_0 \times_{\mathcal{C}} \widehat{\mathcal{E}}$, so that $H'_0 = H'|_{\mathcal{E}_0}$ exhibits $\widehat{\mathcal{E}}'_0$ as a fiberwise $\mathbb{K}$-completion of $\mathcal{E}_0$. Applying Remark 9.3.1.21, we deduce that there exists an isomorphism $H'_0 \simeq F_0 \circ H_0$ in the ∞-category $\mathrm{Fun}_{/\mathcal{C}_0}(\mathcal{E}_0, \widehat{\mathcal{E}}'_0)$, where $F_0 : \widehat{\mathcal{E}}_0 \to \widehat{\mathcal{E}}'_0$ is an equivalence of inner fibrations over $\mathcal{C}_0$. Using Lemma 5.6.7.1, we can choose an inner fibration $\widehat{U} : \widehat{\mathcal{E}} \to \mathcal{C}$ and an equivalence $F : \widehat{\mathcal{E}} \to \widehat{\mathcal{E}}'$ satisfying $F_0 = F|_{\widehat{\mathcal{E}}_0}$. Composition with F induces an equivalence of ∞-categories $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \widehat{\mathcal{E}}) \to \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \widehat{\mathcal{E}}')$. We can therefore choose a functor $H : \mathcal{E} \to \widehat{\mathcal{E}}$ such that $F \circ H$ is isomorphic to H' in the ∞-category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \widehat{\mathcal{E}}')$. It follows that $F_0 \circ H|_{\mathcal{E}_0}$ is isomorphic to $F_0 \circ H_0$ as objects of the ∞-category $\mathrm{Fun}_{/\mathcal{C}_0}(\mathcal{E}_0, \widehat{\mathcal{E}}'_0)$. Since F_0 is an equivalence of inner fibrations over $\mathcal{C}_0$, it follows that H_0 and $H|_{\mathcal{E}_0}$ are isomorphic as objects of the ∞-category $\mathrm{Fun}_{/\mathcal{C}_0}(\mathcal{E}_0, \widehat{\mathcal{E}}_0)$. Since the restriction functor $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \widehat{\mathcal{E}}) \to \mathrm{Fun}_{/\mathcal{C}_0}(\mathcal{E}_0, \widehat{\mathcal{E}}_0)$ is an isofibration (Proposition 4.1.4.1), we can arrange (after replacing H by an isomorphic functor if necessary) that $H|_{\mathcal{E}_0} = H_0$. We conclude by observing that the diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$-cocompletion of $\mathcal{E}$. □

Proof of Theorem 9.3.4.1. Apply Lemma 9.3.4.4 in the special case $\mathcal{C}_0 = \emptyset$. □

9.3.5 Digression: Morita Equivalence

Recall that a morphism of simplicial sets $F : \mathcal{C} \to \mathcal{D}$ is a *categorical equivalence* if, for every ∞-category $\mathcal{E}$, precomposition with F induces an equivalence of ∞-categories $\mathrm{Fun}(\mathcal{D}, \mathcal{E}) \to \mathrm{Fun}(\mathcal{C}, \mathcal{E})$ (Definition 4.5.3.1). We now consider a slightly weaker version of this condition. 05M8

05M9 **Definition 9.3.5.1.** Let $F : \mathcal{C} \to \mathcal{D}$ be a morphism of simplicial sets. We say that F is a *Morita equivalence* if, for every idempotent complete ∞-category $\mathcal{E}$, precomposition with F induces an equivalence of ∞-categories $\operatorname{Fun}(\mathcal{D}, \mathcal{E}) \to \operatorname{Fun}(\mathcal{C}, \mathcal{E})$.

05MA **Example 9.3.5.2.** Let $F : \mathcal{C} \to \mathcal{D}$ be a morphism of simplicial sets. If F is a categorical equivalence, then it is a Morita equivalence. Beware that the converse is false in general.

05MB **Example 9.3.5.3.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which exhibits $\mathcal{D}$ as an idempotent completion of $\mathcal{C}$. Then F is a Morita equivalence (Proposition 8.5.5.2).

05MC **Remark 9.3.5.4.** Let $\iota : \mathcal{C}_0 \hookrightarrow \mathcal{C}$ be a monomorphism of simplicial sets and let $\mathcal{E}$ be an idempotent complete ∞-category. If ι is a Morita equivalence, then the functor $\operatorname{Fun}(\mathcal{C}, \mathcal{E}) \xrightarrow{\circ \iota} \operatorname{Fun}(\mathcal{C}_0, \mathcal{E})$ is both an isofibration (Corollary 4.4.5.3) and an equivalence of ∞-categories, and therefore a trivial Kan fibration (Proposition 4.5.5.20). In particular, every diagram $\mathcal{C}_0 \to \mathcal{E}$ can be extended to $\mathcal{C}$.

05MD **Remark 9.3.5.5.** Let $F : \mathcal{C} \to \mathcal{D}$ and $G : \mathcal{D} \to \mathcal{E}$ be morphisms of simplicial sets. If two of the morphisms F, G, and $G \circ F$ are Morita equivalences, then so is the third. In particular, the collection of Morita equivalences is closed under composition.

05ME **Remark 9.3.5.6** (Isomorphism Invariance)**.** Let $\mathcal{C}$ be a simplicial set, let $\mathcal{D}$ be an ∞-category, and suppose we are given a pair of diagrams $F, F' : \mathcal{C} \to \mathcal{D}$ which are isomorphic (as objects of the ∞-category $\operatorname{Fun}(\mathcal{C}, \mathcal{D})$). Then F is a Morita equivalence if and only if F' is a Morita equivalence.

05MF **Remark 9.3.5.7.** Let $F : \mathcal{C} \to \mathcal{D}$ be a morphism of simplicial sets. Then F is a Morita equivalence if and only if it satisfies the following condition:

$(*)$ For every idempotent complete ∞-category $\mathcal{E}$, precomposition with F induces a bijection of sets
$$\pi_0(\operatorname{Fun}(\mathcal{D}, \mathcal{E})^{\simeq}) \to \pi_0(\operatorname{Fun}(\mathcal{C}, \mathcal{E})^{\simeq}).$$

The necessity of condition $(*)$ is immediate. Conversely, suppose that condition $(*)$ is satisfied, and let $\mathcal{E}$ be an idempotent complete ∞-category; we wish to show that the functor $\operatorname{Fun}(\mathcal{D}, \mathcal{E}) \xrightarrow{\circ F} \operatorname{Fun}(\mathcal{C}, \mathcal{E})$ is an equivalence of ∞-categories. By virtue of Proposition 4.5.1.22, it will suffice to show that for every simplicial set K, the induced map
$$\pi_0(\operatorname{Fun}(K, \operatorname{Fun}(\mathcal{D}, \mathcal{E}))^{\simeq}) \to \pi_0(\operatorname{Fun}(K, \operatorname{Fun}(\mathcal{C}, \mathcal{E})^{\simeq})$$
is a bijection. This follows by applying condition $(*)$ to the ∞-category $\operatorname{Fun}(K, \mathcal{E})$ (which is idempotent complete by virtue of Corollary 8.5.4.10).

05MG **Proposition 9.3.5.8.** *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. Then F is a Morita equivalence if and only if it satisfies the following pair of conditions:*

(a) *The functor F is fully faithful.*

(b) *For every object $Y \in \mathcal{D}$, there exists an object $X \in \mathcal{C}$ such that Y is a retract of $F(X)$.*

Proof. Using Corollary 8.5.5.3, we can choose a functor $H : \mathcal{D} \to \widehat{\mathcal{D}}$ which exhibits $\widehat{\mathcal{D}}$ as an idempotent completion of $\mathcal{D}$. Then H is a Morita equivalence (Example 9.3.5.3). By virtue of Remark 9.3.5.5, we can replace F by the composite functor $H \circ F$ and thereby reduce to proving Proposition 9.3.5.8 in the special case where $\mathcal{D}$ is idempotent complete. In this case, the desired result is a reformulation of Proposition 8.5.5.2. $\square$

Corollary 9.3.5.9. *Let $F : \mathcal{C} \to \mathcal{D}$ be a morphism of simplicial sets. Then F is a categorical equivalence if and only if it is a Morita equivalence and the induced map of homotopy categories $\mathrm{h}F : \mathrm{h}\mathcal{C} \to \mathrm{h}\mathcal{D}$ is essentially surjective.* `05MH`

Proof. Using Remark 9.3.5.5 (and Proposition 4.1.3.2), we can reduce to the case where $\mathcal{C}$ and $\mathcal{D}$ are ∞-categories, in which case the desired result follows from the criterion of Proposition 9.3.5.8. $\square$

Proposition 9.3.5.10. *Let $F : \mathcal{C} \to \mathcal{D}$ be a morphism of simplicial sets. The following conditions are equivalent:* `05MJ`

(1) *The morphism F is a Morita equivalence.*

(2) *The morphism F^{op} is a Morita equivalence.*

(3) *For every uncountable cardinal κ, precomposition with F induces an equivalence of ∞-categories $\mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$.*

(4) *There exists an uncountable regular cardinal κ such that $\mathcal{C}$ and $\mathcal{D}$ are essentially κ-small and precomposition with F induces an equivalence of ∞-categories $\mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \to \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$.*

Proof. The implications (1) $\Rightarrow$ (2) $\Rightarrow$ (3) $\Rightarrow$ (4) are immediate. We complete the proof by showing that (4) implies (1). Without loss of generality, we may assume that $\mathcal{C}$ and $\mathcal{D}$ are ∞-categories. Fix a regular cardinal κ such that $\mathcal{C}$ and $\mathcal{D}$ are essentially κ-small and assume that precomposition with F induces an equivalence of ∞-categories

$$G : \mathrm{Fun}(\mathcal{D}, \mathcal{S}^{<\kappa}) \to \mathrm{Fun}(\mathcal{C}, \mathcal{S}^{<\kappa}).$$

Let $\widehat{\mathcal{C}} \subseteq \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ be the full subcategory spanned by the atomic object (see Proposition 8.5.5.5) and define $\widehat{\mathcal{D}} \subseteq \mathrm{Fun}(\mathcal{D}, \mathcal{S}^{<\kappa})$ similarly. Then G induces an equivalence of ∞-categories $\widehat{\mathcal{D}} \to \widehat{\mathcal{C}}$, which admits a homotopy inverse $\widehat{F} : \widehat{\mathcal{C}} \to \widehat{\mathcal{D}}$. It follows from Example

8.4.4.5 that the diagram of ∞-categories

$$\begin{tikzcd}
\mathcal{C} \arrow[r, "F"] \arrow[d, "h^{\bullet}_{\mathcal{C}}"] & \mathcal{D} \arrow[d, "h^{\bullet}_{\mathcal{D}}"] \\
\widehat{\mathcal{C}} \arrow[r, "\widehat{F}", "\sim"'] & \widehat{\mathcal{D}}
\end{tikzcd}$$

commutes up to isomorphism. The vertical maps exhibit $\widehat{\mathcal{C}}$ and $\widehat{\mathcal{D}}$ as idempotent completions of $\mathcal{C}$ and $\mathcal{D}$, respectively (Proposition 8.5.5.5), and are therefore Morita equivalences (Example 9.3.5.3). Combining this observation with Remarks 9.3.5.6 and 9.3.5.5, we conclude that F is a Morita equivalence. □

05MK **Proposition 9.3.5.11.** *Suppose we are given a commutative diagram of simplicial sets*

$$\begin{tikzcd}
\mathcal{E} \arrow[r, "F"] \arrow[d, "U"] & \mathcal{E}' \arrow[d, "U'"] \\
\mathcal{C} \arrow[r, "\overline{F}"] & \mathcal{C}'
\end{tikzcd}$$

with the following properties:

(1) *The morphisms U and U' are cartesian fibrations.*

(2) *The morphism F carries U-cartesian edges of $\mathcal{E}$ to U'-cartesian edges of $\mathcal{E}'$.*

(3) *The morphism $\overline{F}$ is a Morita equivalence of simplicial sets*

(4) *For each vertex $C \in \mathcal{C}$ having image $C' = \overline{F}(C)$, the functor*

$$F_C : \mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E} \to \{C'\} \times_{\mathcal{C}'} \mathcal{E}' = \mathcal{E}'_{C'}$$

is a Morita equivalence of ∞-categories.

Then F is a Morita equivalence of simplicial sets.

Proof. Using Corollary 5.6.7.3, we can choose a pullback diagram

$$\begin{tikzcd}
\mathcal{E}' \arrow[r, "G"] \arrow[d, "U'"] & \mathcal{E}'' \arrow[d, "U''"] \\
\mathcal{C}' \arrow[r, "\overline{G}"] & \mathcal{C}'',
\end{tikzcd}$$

where U'' is a cartesian fibration, $\overline{G}$ is inner anodyne, and $\mathcal{C}''$ is an ∞-category. It follows from Corollary 5.6.7.6 that G is a categorical equivalence of simplicial sets; in particular, it is a Morita equivalence (Example 9.3.5.2). Consequently, to show that F is a Morita equivalence, it will suffice to show that the composite map $G \circ F$ is a Morita equivalence (Remark 9.3.5.5). We may therefore replace U' by U'', and thereby reduce to proving Proposition 9.3.5.11 in the special case where $\mathcal{C}'$ is an ∞-category. Similarly, we may assume that $\mathcal{C}$ is an ∞-category. To complete the proof, it will suffice to show that the functor $F : \mathcal{E} \to \mathcal{E}'$ satisfies the conditions of Proposition 9.3.5.8:

(a) Since $\overline{F}$ is a Morita equivalence of ∞-categories, it is fully faithful. Similarly, for each object $C \in \mathcal{C}$ having image $C' = \overline{F}(C)$, condition (4) guarantees that the functor $F_C : \mathcal{E}_C \to \mathcal{E}'_{C'}$ is fully faithful. Using condition (2) and Proposition 5.1.6.7, we conclude that F is fully faithful.

(b) Let Y be an object of $\mathcal{E}'$; we wish to show that Y is a retract of $F(X)$, for some object $X \in \mathcal{E}$. Set $\overline{Y} = U'(Y)$. Since $\overline{F}$ is a Morita equivalence, $\overline{Y}$ is a retract of $C' = \overline{F}(C)$, for some object $C \in \mathcal{C}$. Choose a retraction diagram $\overline{\sigma}$:

$$\begin{tikzcd}
 & C' \arrow[dr, "\overline{r}"] & \\
\overline{Y} \arrow[ur, "\overline{i}"] \arrow[rr, "\mathrm{id}"] & & \overline{Y}
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$. Our assumption that U' is a cartesian fibration guarantees that we can lift $\overline{\sigma}$ to a retraction diagram

$$\begin{tikzcd}
 & X' \arrow[dr, "r"] & \\
Y \arrow[ur, "i"] \arrow[rr, "\mathrm{id}"] & & Y
\end{tikzcd}$$

in the ∞-category $\mathcal{E}'$. Since the functor F_C is a Morita equivalence, there exists an object $X \in \mathcal{E}_C$ such that X' is a retract of $F(X)$ in the ∞-category $\mathcal{E}'_{C'}$, and therefore also in the ∞-category $\mathcal{E}'$. Applying Remark 8.5.1.6, we conclude that Y is a retract of $F(X)$.

$\square$

9.3.6 Application: Flat Inner Fibrations

05ML Recall that an inner fibration of simplicial sets $U : \mathcal{E} \to \mathcal{C}$ is *exponentiable* if the pullback functor

$$(\mathrm{Set}_{\Delta})_{/\mathcal{C}} \to (\mathrm{Set}_{\Delta})_{/\mathcal{E}} \qquad \mathcal{C}' \mapsto \mathcal{C}' \times_{\mathcal{C}} \mathcal{E}$$

preserves categorical equivalences of simplicial sets (Definition 4.5.9.10). In this section, we study a weaker version of this condition.

05MM **Definition 9.3.6.1.** Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets. We say that U is *flat* if, for every 2-simplex σ of $\mathcal{C}$, the inclusion map

$$\Lambda^2_1 \times_{\mathcal{C}} \mathcal{E} \hookrightarrow \Delta^2 \times_{\mathcal{C}} \mathcal{E}$$

is a categorical equivalence of simplicial sets.

05MN **Example 9.3.6.2.** Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets. If U is exponentiable, then it is flat.

05MP **Remark 9.3.6.3** (Homotopy Invariance)**.** Suppose we are given a commutative diagram of simplicial sets

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "F"] \arrow[dr, "U"'] & & \mathcal{E}' \arrow[dl, "U'"] \\
& \mathcal{C}, &
\end{tikzcd}$$

where the vertical maps are inner fibrations and F is an equivalence of inner fibrations over $\mathcal{C}$ (see Definition 5.1.7.1). Then U is flat if and only if U' is flat.

05MQ **Remark 9.3.6.4.** Suppose we are given a pullback diagram of simplicial sets

$$\begin{tikzcd}
\mathcal{E}' \arrow[r] \arrow[d, "U'"] & \mathcal{E} \arrow[d, "U"] \\
\mathcal{C}' \arrow[r, "F"] & \mathcal{C}.
\end{tikzcd}$$

If U is a flat inner fibration, then U' is a flat inner fibration. The converse holds if F is surjective on 2-simplices.

05MR **Remark 9.3.6.5.** Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibraiton of simplicial sets. Then U is flat if and only if the opposite inner fibration $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \to \mathcal{C}^{\mathrm{op}}$ is flat.

Our first goal in this section is to establish a weak converse to Example 9.3.6.2.

Theorem 9.3.6.6. *Let $U : \mathcal{E} \to \mathcal{C}$ be a flat inner fibration of simplicial sets. Then, for every Morita equivalence of simplicial sets $\mathcal{C}' \to \mathcal{C}$, the projection map $\mathcal{C}' \times_{\mathcal{C}} \mathcal{E} \to \mathcal{E}$ is also a Morita equivalence.* 05MS

Corollary 9.3.6.7. *Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets. The following conditions are equivalent:* 05MT

(1) *The pullback functor*

$$(\mathrm{Set}_{\Delta})_{/\mathcal{C}} \to (\mathrm{Set}_{\Delta})_{/\mathcal{E}} \qquad \mathcal{C}' \mapsto \mathcal{C}' \times_{\mathcal{C}} \mathcal{E}$$

preserves Morita equivalences of simplicial sets. That is, if $F : \mathcal{C}'' \to \mathcal{C}'$ is a Morita equivalence in $(\mathrm{Set}_{\Delta})_{/\mathcal{C}}$, then the induced map $F_{\mathcal{E}} : \mathcal{C}'' \times_{\mathcal{C}} \mathcal{E} \to \mathcal{C}' \times_{\mathcal{C}} \mathcal{E}$ is also a Morita equivalence.

(2) *If $F : \mathcal{C}'' \to \mathcal{C}'$ is a categorical equivalence in $(\mathrm{Set}_{\Delta})_{/\mathcal{C}}$, then $F_{\mathcal{E}}$ is a Morita equivalence.*

(3) *If $F : \mathcal{C}'' \to \mathcal{C}'$ is a categorical equivalence in $(\mathrm{Set}_{\Delta})_{/\mathcal{C}}$ which is surjective on vertices, then $F_{\mathcal{E}}$ is a categorical equivalence.*

(4) *The inner fibration U is flat.*

Proof. The implications (1) ⇒ (2) ⇒ (3) ⇒ (4) are immediate from the definitions (see Corollary 9.3.5.9), and the implication (4) ⇒ (1) is a reformulation of Theorem 9.3.6.6. □

Corollary 9.3.6.8. *Let $V : \mathcal{E} \to \mathcal{D}$ and $U : \mathcal{D} \to \mathcal{C}$ be flat inner fibrations of simplicial sets. Then the composite map $(U \circ V) : \mathcal{E} \to \mathcal{C}$ is also a flat inner fibration.* 05MU

Our proof of Theorem 9.3.6.6 will make use of the following flatness criterion:

Proposition 9.3.6.9. *Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets which is essentially κ-small, and suppose we are given a commutative diagram* 05MV

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ-cocompletion of $\mathcal{E}$. Then U is flat if and only if $\widehat{U}$ is a cartesian fibration.

05MW **Example 9.3.6.10.** Suppose we are given a commutative diagram of ∞-categories

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "F"] \arrow[dr, "U"'] & & \mathcal{E}' \arrow[dl, "U'"] \\
& \mathcal{C}, &
\end{tikzcd}$$

where F is fully faithful and induces a Morita equivalence $F_C : \mathcal{E}_C \to \mathcal{E}'_C$, for each object $C \in \mathcal{C}$. If κ is an uncountable regular cardinal such that U' is essentially κ-small, then any fiberwise κ-cocompletion of $\mathcal{E}'$ can also be regarded as a fiberwise κ-cocompletion of $\mathcal{E}$ (see Proposition 9.3.5.10). Applying the criterion of Proposition 9.3.6.9, we conclude that U is flat if and only if U' is flat. In particular, an inner fibration $U : \mathcal{E} \to \mathcal{C}$ is flat if and only if its fiberwise idempotent completion is flat.

The proof of Proposition 9.3.6.9 will require some preliminaries.

05MX **Lemma 9.3.6.11.** *Let K be a simplicial set and let $\widehat{U} : \widehat{\mathcal{E}} \to \mathcal{C}$ be a cartesian fibration of simplicial sets having the property that, for each vertex $C \in \mathcal{C}$, the ∞-category $\widehat{\mathcal{E}}_C = \{C\} \times_{\mathcal{C}} \widehat{\mathcal{E}}$ admits K-indexed colimits. Let $\mathcal{D}$ be an ∞-category which admits K-indexed colimits, let $F : \mathcal{E} \to \mathcal{D}$ be a diagram, and let S be the collection of vertices $C \in \mathcal{C}$ for which the functor $F_C = F|_{\mathcal{E}_C}$ preserves K-indexed colimits. Then S is closed under retracts in the homotopy category $\mathrm{h}\mathcal{C}$.*

Proof. Using Corollary 5.6.7.3, we can reduce to the case where $\mathcal{C}$ is an ∞-category. Fix objects $C, C' \in \mathcal{C}$ such that C is a retract of C', and assume that $F_{C'}$ preserves K-indexed colimits; we wish to show that F_C also preserves K-indexed colimits. Choose a colimit diagram $\overline{u} : K^{\triangleright} \to \widehat{\mathcal{E}}_C$; we will show that $F_C \circ \overline{u}$ is a colimit diagram in the ∞-category $\mathcal{D}$. Set $u = \overline{u}|_K$. It follows from Theorem 5.2.1.1 that $\widehat{U}$ induces a cartesian fibration $\mathrm{Fun}(K, \widehat{\mathcal{E}}) \to \mathrm{Fun}(K, \mathcal{C})$. Applying Remark 8.5.1.23, we deduce that there is a diagram $u' : K \to \widehat{\mathcal{E}}_{C'}$ having the property that u is a retract of u' in the ∞-category $\mathrm{Fun}(K, \widehat{\mathcal{E}})$. Since $\widehat{\mathcal{E}}_{C'}$ admits K-indexed colimits, we can extend u' to a colimit diagram $\overline{u}' : K^{\triangleright} \to \widehat{\mathcal{E}}_{C'}$. Since $\widehat{U}$ is a cartesian fibration, $\overline{u}$ and $\overline{u}'$ are $\widehat{U}$-colimit diagrams in the ∞-category $\widehat{\mathcal{E}}$ (Corollary 7.3.3.23). Using Theorem 7.3.6.14, we see that any diagram which exhibits u as a retract of u' can be extended to a diagram which exhibits $\overline{u}$ as a retract of $\overline{u}'$. It follows that $F_C \circ \overline{u}$ is a retract of $F_{C'} \circ \overline{u}'$ (in the ∞-category $\mathrm{Fun}(K^{\triangleright}, \mathcal{D})$). Consequently, to show that $F_C \circ \overline{u}$ is a colimit diagram in $\mathcal{D}$, it will suffice to show that $F_{C'} \circ \overline{u}'$ is a colimit diagram in $\mathcal{D}$ (Corollary 8.5.1.12). This follows from our assumption that $F_{C'}$ preserves K-indexed colimits. □

Lemma 9.3.6.12. *Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets which is essentially κ-small, and suppose we are given a commutative diagram* 05MY

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ-cocompletion of $\mathcal{E}$. Let $\overline{F} : \mathcal{C}' \to \mathcal{C}$ be a Morita equivalence of simplicial sets. If $\widehat{U}$ is a cartesian fibration, then the projection map $\mathcal{C}' \times_{\mathcal{C}} \mathcal{E} \to \mathcal{E}$ is also a Morita equivalence of simplicial sets.

Proof. Set $\mathcal{E}' = \mathcal{C}' \times_{\mathcal{C}} \mathcal{E}$ and $\widehat{\mathcal{E}}' = \mathcal{C}' \times_{\mathcal{C}} \widehat{\mathcal{E}}$, so that $\overline{F}$ induces projection maps $F : \mathcal{E}' \to \mathcal{E}$ and $\widehat{F} : \widehat{\mathcal{E}}' \to \widehat{\mathcal{E}}$. We wish to show that, for every idempotent complete ∞-category $\mathcal{D}$, precomposition with F induces an equivalence of ∞-categories $\mathrm{Fun}(\mathcal{E}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{E}', \mathcal{D})$. By virtue of Proposition 9.3.5.10, we may assume without loss of generality that $\mathcal{D}$ is κ-cocomplete (in fact, we can assume that $\mathcal{D} = \mathcal{S}^{<\lambda}$ for some uncountable regular cardinal $\lambda \geq \kappa$). Let $\mathrm{Fun}^{\kappa}(\widehat{\mathcal{E}}, \mathcal{D})$ denote the full subcategory of $\mathrm{Fun}(\widehat{\mathcal{E}}, \mathcal{D})$ spanned by those diagrams $G : \widehat{\mathcal{E}} \to \mathcal{D}$ having the property that, for each vertex $C \in \mathcal{C}$, the functor $G_C = G|_{\widehat{\mathcal{E}}_C}$ preserves κ-small colimits, and define $\mathrm{Fun}^{\kappa}(\widehat{\mathcal{E}}', \mathcal{D}) \subseteq \mathrm{Fun}(\widehat{\mathcal{E}}, \mathcal{D})$ similarly. We then have a commutative diagram of ∞-categories

$$\begin{tikzcd}
\mathrm{Fun}^{\kappa}(\widehat{\mathcal{E}}, \mathcal{D}) \arrow[r, "\circ \widehat{F}"] \arrow[d] & \mathrm{Fun}^{\kappa}(\widehat{\mathcal{E}}', \mathcal{D}) \arrow[d] \\
\mathrm{Fun}(\mathcal{E}, \mathcal{D}) \arrow[r, "\circ F"] & \mathrm{Fun}(\mathcal{E}', \mathcal{D}),
\end{tikzcd}$$

where the vertical maps are equivalences by virtue of the universal property of fiberwise κ-cocompletions (Theorem 9.3.1.20). It will therefore suffice to show that precomposition with $\widehat{F}$ induces an equivalence of ∞-categories $\mathrm{Fun}^{\kappa}(\widehat{\mathcal{E}}, \mathcal{D}) \to \mathrm{Fun}^{\kappa}(\widehat{\mathcal{E}}', \mathcal{D})$. Since $\overline{F}$ is a Morita equivalence and $\widehat{U}$ is a cartesian fibration, the morphism $\widehat{F}$ is also a Morita equivalence (Proposition 9.3.5.11). In particular, precomposition with $\widehat{F}$ induces an equivalence of ∞-categories $\mathrm{Fun}(\widehat{\mathcal{E}}, \mathcal{D}) \to \mathrm{Fun}(\widehat{\mathcal{E}}', \mathcal{D})$. To complete the proof, it will suffice to show that an object $G \in \mathrm{Fun}(\widehat{\mathcal{E}}, \mathcal{D})$ belongs to the subcategory $\mathrm{Fun}^{\kappa}(\widehat{\mathcal{E}}, \mathcal{D})$ if and only if $G \circ \widehat{F}$ belongs to $\mathrm{Fun}^{\kappa}(\widehat{\mathcal{E}}', \mathcal{D})$. This follows from Lemma 9.3.6.11. □

Lemma 9.3.6.13. *Let κ be an uncountable regular cardinal, let $\mathcal{E}$ be an ∞-category which* 05MZ *is essentially κ-small, and suppose we are given a commutative diagram of ∞-categories*

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \Delta^2 &
\end{tikzcd}$$

which exhibits $\widehat{E}$ as a fiberwise κ-cocompletion of $\mathcal{E}$. The following conditions are equivalent:

(1) *The inclusion map $\Lambda^2_1 \times_{\Delta^2} \mathcal{E} \hookrightarrow \mathcal{E}$ is a categorical equivalence of simplicial sets.*

(2) *The functor $\widehat{U}$ is a cartesian fibration.*

Proof. The implication (2) $\Rightarrow$ (1) follows from Lemma 9.3.6.12 and Corollary 9.3.5.9. Conversely, suppose that condition (1) is satisfied. Set $\mathcal{E}_0 = \Lambda^2_1 \times_{\Delta^2} \mathcal{E}$ and $\widehat{\mathcal{E}}_0 = \Lambda^2_1 \times_{\Delta^2} \widehat{\mathcal{E}}$. Using Proposition 5.6.7.2, we can choose a pullback diagram

$$\begin{tikzcd}
\widehat{\mathcal{E}}_0 \arrow[r] \arrow[d, "\widehat{U}_0"] & \widehat{\mathcal{E}}' \arrow[d, "\widehat{U}'"] \\
\Lambda^2_1 \arrow[r] & \Delta^2,
\end{tikzcd}$$

where $\widehat{U}'$ is a cartesian fibration. Let us abuse notation by identifying $\widehat{\mathcal{E}}_0$ with its image in $\widehat{\mathcal{E}}'$. It follows from Proposition 5.3.6.1 that the inclusion map $\widehat{\mathcal{E}}_0 \hookrightarrow \widehat{\mathcal{E}}'$ is a categorical equivalence of simplicial sets, so there exists a functor $F : \widehat{\mathcal{E}}' \to \widehat{\mathcal{E}}$ which is the identity on $\widehat{\mathcal{E}}_0$. We will complete the proof by showing that F is an equivalence of inner fibrations over Δ^2, so that $\widehat{U}$ is also a cartesian fibration (Proposition 5.1.7.14).

Note that the inner $\widehat{U}$ and $\widehat{U}'$ are κ-cocomplete. It will therefore suffice to show that, for every κ-cocomplete inner fibration $V : \mathcal{D} \to \Delta^2$, precomposition with F induces an equivalence of ∞-categories

$$\mathrm{Fun}^{\kappa}_{/\Delta^2}(\widehat{\mathcal{E}}, \mathcal{D}) \to \mathrm{Fun}^{\kappa}_{/\Delta^2}(\widehat{\mathcal{E}}', \mathcal{D}).$$

Since the inclusion $\widehat{\mathcal{E}}_0 \hookrightarrow \widehat{\mathcal{E}}'$ is a categorical equivalence, this is equivalent to the statement that the restriction map

$$\mathrm{Fun}^{\kappa}_{/\Delta^2}(\widehat{\mathcal{E}}, \mathcal{D}) \to \mathrm{Fun}^{\kappa}_{/\Lambda^2_1}(\widehat{\mathcal{E}}_0, \mathcal{D}_0)$$

is an equivalence, where $\mathcal{D}_0 = \Lambda^2_1 \times_{\Delta^2} \mathcal{D}$. Invoking the universal property of fiberwise cocompletion (Theorem 9.3.1.20), we are reduced to showing that the restriction map $\mathrm{Fun}_{/\Delta^2}(\mathcal{E}, \mathcal{D}) \to \mathrm{Fun}_{/\Delta^2}(\Lambda^2_1 \times_{\Delta^2}, \mathcal{E}, \mathcal{D})$ is an equivalence of ∞-categories, which follows immediately from assumption (1). $\square$

Proof of Proposition 9.3.6.9. Let $U : \mathcal{E} \to \mathcal{C}$ be an essentially κ-small inner fibration and let

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

be a diagram which exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ-cocompletion of $\mathcal{E}$. It follows from Corollary 5.1.5.11 that $\widehat{U}$ is a cartesian fibration if and only if, for every 2-simplex σ of $\mathcal{C}$, the projection map $\widehat{U}_{\sigma} : \Delta^2 \times_{\mathcal{C}} \widehat{\mathcal{E}} \to \Delta^2$ is a cartesian fibration. By virtue of Lemma 9.3.6.13, this is equivalent to the requirement that U is flat. □

Proof of Theorem 9.3.6.6. Let $U : \mathcal{E} \to \mathcal{C}$ be a flat inner fibration of simplicial sets and let $\mathcal{C}' \to \mathcal{C}$ be a Morita equivalence; we wish to show that the projection map $\mathcal{C}' \times_{\mathcal{C}} \mathcal{E} \to \mathcal{E}$ is also a Morita equivalence. Choose an uncountable regular cardinal κ such that U is essentially κ-small. Using Theorem 9.3.4.1, we can choose a diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \Delta^1 &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ-cocompletion of $\mathcal{E}$. By virtue of Lemma 9.3.6.12, it will suffice to show that $\widehat{U}$ is a cartesian fibration, which is a reformulation of our assumption that U is flat (Proposition 9.3.6.9). □

We record another consequence of Proposition 9.3.6.9.

Corollary 9.3.6.14. *Every functor of ∞-categories $U : \mathcal{E} \to \Delta^1$ is a flat inner fibration.* 05N0

Proof. Choose an uncountable regular cardinal κ for which $\mathcal{E}$ is essentially κ-small. Using Theorem 9.3.4.1, we can choose a diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \Delta^1 &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ-cocompletion of $\mathcal{E}$. It follows from Proposition 9.3.1.11 that $\widehat{U}$ is a cartesian fibration, so that U is flat by virtue of Proposition 9.3.6.9. □

05N1 **Remark 9.3.6.15.** By definition, an inner fibration of simplicial sets $U : \mathcal{E} \to \mathcal{C}$ is flat if, for every 2-simplex σ of $\mathcal{C}$, the inclusion map

$$\Lambda^2_1 \times_{\mathcal{C}} \mathcal{E} \hookrightarrow \Delta^2 \times_{\mathcal{C}} \mathcal{E}$$

is a categorical equivalence of simplicial sets. It follows from Corollary 9.3.6.14 that it suffices to check this condition in the case where σ is nondegenerate.

05N2 **Corollary 9.3.6.16.** *A functor of ∞-categories $U : \mathcal{E} \to \Delta^2$ is a flat inner fibration if and only if the inclusion map $\Lambda^2_1 \times_{\Delta^2} \mathcal{E} \hookrightarrow \mathcal{E}$ is a categorical equivalence of simplicial sets.*

05N3 **Proposition 9.3.6.17.** *Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of ∞-categories. Then U is exponentiable if and only if it is a flat isofibration.*

Proof. Assume that U is a flat isofibration; we will show that U is exponentiable (the converse follows from Remark 4.5.9.12 and Example 9.3.6.2). Suppose we are given a commutative diagram of simplicial sets

$$\begin{tikzcd}
\mathcal{E}'' \arrow[r, "F"] \arrow[d] & \mathcal{E}_0 \arrow[r, "G"] \arrow[d] & \mathcal{E} \arrow[d, "U"] \\
\mathcal{C}_1 \arrow[r, "\overline{F}"] & \mathcal{C}_0 \arrow[r, "\overline{G}"] & \mathcal{C}
\end{tikzcd}$$

in which both squares are pullbacks, where $\overline{F}$ is a categorical equivalence; we wish to show that F is also a categorical equivalence. Using Proposition 4.1.3.2, we can factor $\overline{G}$ as a composition $\mathcal{C}_0 \xrightarrow{\iota_0} \mathcal{C}_0^+ \xrightarrow{V_0} \mathcal{C}$, where ι_0 is inner anodyne and V_0 is an inner fibration. In particular, $\mathcal{C}_0^+$ is an ∞-category. Replacing $\mathcal{C}$ by $\mathcal{C}_0^+$ (and U by the projection map $\mathcal{C}_0^+ \times_{\mathcal{C}} \mathcal{E} \to \mathcal{C}_0^+$), we can assume that $\overline{G}$ is inner anodyne. In this case, Corollary 9.3.6.7 guarantees that G is a categorical equivalence of simplicial sets. It will therefore suffice to show that the composition $(G \circ F) : \mathcal{E}_1 \to \mathcal{E}$ is a categorical equivalence. Applying Proposition 4.1.3.2 again, we can factor $\overline{G} \circ \overline{F}$ as a composition $\mathcal{C}_1 \xrightarrow{\iota_1} \mathcal{C}_1^+ \xrightarrow{V_1} \mathcal{C}$, where ι_1 is inner anodyne and V_1 is an inner fibration. Applying Corollary 9.3.6.7 again, we conclude that the inclusion map $\mathcal{E}_1 \hookrightarrow \mathcal{C}_1^+ \times_{\mathcal{C}} \mathcal{E}$ is a categorical equivalence of simplicial sets. We are therefore reduced to showing that the projection map $\mathcal{C}_1^+ \times_{\mathcal{C}} \mathcal{E} \to \mathcal{E}$ is an equivalence of ∞-categories. Note that $\overline{F}$, $\overline{G}$, and ι_1 are categorical equivalences of simplicial sets, so the inner fibration V_1 is an equivalence of ∞-categories. The desired result now follows from Corollary 4.5.2.29 (since U is an isofibration). □

05N4 **Warning 9.3.6.18.** In the formulation of Proposition 9.3.6.17, the assumption that U is an isofibration cannot be omitted. For example, let $\mathcal{C}$ be a contractible Kan complex containing two vertices C_0 and C_1, let $\mathcal{D}_1$ be an ∞-category which is the idempotent completion of a full subcategory $\mathcal{D}_0 \subseteq \mathcal{D}_1$, and let $\mathcal{E} \subseteq \mathcal{C} \times \mathcal{D}_1$ be the full subcategory spanned by those objects (C_i, D) where D is contained in $\mathcal{D}_i$. It follows from Example 9.3.6.10 that the projection map $U : \mathcal{E} \to \mathcal{C}$ is a flat inner fibration. However, if $\mathcal{D}_0$ is not idempotent complete, then U is not an isofibration.

Corollary 9.3.6.19. *Let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets. Then U is flat if and only if, for every n-simplex $\sigma : \Delta^n \to \mathcal{C}$, the projection map $\Delta^n \times_{\mathcal{C}} \mathcal{E} \to \Delta^n$ is exponentiable. Moreover, it suffices to verify this condition in the case $n = 2$.* 05N5

Proof. Combine Proposition 9.3.6.17 with Example 4.4.1.6. □

We now show that the counterexample of Warning 9.3.6.18 is essentially the only way that a flat inner fibration can fail to be exponentiable.

Lemma 9.3.6.20. *Suppose we are given a commutative diagram of ∞-categories* 05N6

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "F"] \arrow[dr, "U"'] & & \mathcal{E}' \arrow[dl, "U'"] \\
& \mathcal{C}, &
\end{tikzcd}$$

where U is a flat inner fibration, U' is an inner fibration, and F is an equivalence of ∞-categories. Then:

(1) *For every object $C \in \mathcal{C}$, the induced map of fibers $F_C : \mathcal{E}_C \to \mathcal{E}'_C$ is a Morita equivalence.*

(2) *The inner fibration U' is flat.*

Note that, in the statement of Lemma 9.3.6.20, we do *not* assume that F is an equivalence of inner fibrations over $\mathcal{C}$ (otherwise, there would be nothing to prove).

Proof of Lemma 9.3.6.20. We will prove (1); assertion (2) then follows from Example 9.3.6.10. Using Corollary 4.5.2.23, we can factor the inclusion map $\{C\} \hookrightarrow \mathcal{C}$ as a composition $\{C\} \hookrightarrow \widetilde{\mathcal{C}} \xrightarrow{V} \mathcal{C}$, where V is an isofibration and $\widetilde{\mathcal{C}}$ is a contractible Kan complex. Set $\widetilde{\mathcal{E}} = \widetilde{\mathcal{C}} \times_{\mathcal{C}} \mathcal{E}$ and $\widetilde{\mathcal{E}}' = \widetilde{\mathcal{C}} \times_{\mathcal{C}} \mathcal{E}'$, so that we have a commutative diagram of ∞-categories

$$\begin{tikzcd}
\mathcal{E}_C \arrow[r, "F_C"] \arrow[d] & \mathcal{E}'_C \arrow[d] \\
\widetilde{\mathcal{E}} \arrow[r, "\widetilde{F}"] & \widetilde{\mathcal{E}}'.
\end{tikzcd}$$

It follows from Theorem 9.3.6.6 that the vertical maps are Morita equivalences, and from Corollary 4.5.2.29 that $\widetilde{F}$ is an equivalence of ∞-categories. Applying Remark 9.3.5.5, we conclude that F_C is a Morita equivalence. □

05N7 **Warning 9.3.6.21.** Suppose we are given a commutative diagram of ∞-categories

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "F"] \arrow[dr, "U"'] & & \mathcal{E}' \arrow[dl, "U'"] \\
& \mathcal{C}, &
\end{tikzcd}$$

where U and U' are inner fibrations and F is an equivalence of ∞-categories (but not necessarily an equivalence of inner fibrations over $\mathcal{C}$). Lemma 9.3.6.20 asserts that if U is flat, then U' is also flat. Beware that the converse generally does not hold: if U' is flat, then U need not be flat. For example, suppose that U' is an isomorphism and that $F : \mathcal{E} \hookrightarrow \mathcal{E}'$ is an isomorphism from $\mathcal{E}$ to a full subcategory of $\mathcal{E}'$. If F is essentially surjective, then it is an equivalence of ∞-categories. In this case, the inner fibration $U = U' \circ F$ is flat if and only if F is an isomorphism.

05N8 **Proposition 9.3.6.22.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a flat inner fibration of ∞-categories. Then U factors as a composition $\mathcal{E} \xrightarrow{F} \mathcal{E}' \xrightarrow{U'} \mathcal{C}$, where F is an equivalence of ∞-categories and U' is a flat isofibration. Moreover, for each object $C \in \mathcal{C}$, the induced map $F_C : \mathcal{E}_C \to \mathcal{E}'_C$ is a Morita equivalence.*

Proof. Combine Corollary 4.5.2.23 with Lemma 9.3.6.20. □

05N9 **Corollary 9.3.6.23.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a flat inner fibration of ∞-categories. Assume that, for each vertex $C \in \mathcal{C}$, the ∞-category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ is idempotent complete. Then U is an isofibration. In particular, U is exponentiable.*

Proof. Using Proposition 9.3.6.22, we can factor U as a composition $\mathcal{E} \xrightarrow{F} \mathcal{E}' \xrightarrow{U'} \mathcal{C}$, where F is an equivalence of ∞-categories and U' is an isofibration. For each object $C \in \mathcal{C}$, Lemma 9.3.6.20 guarantees that the induced map $F_C : \mathcal{E}_C \to \mathcal{E}'_C$ is a Morita equivalence; in particular, every object of $\mathcal{E}'_C$ is a retract of $F(X)$, for some object $X \in \mathcal{E}_C$ (see Proposition 9.3.5.8). Since $\mathcal{E}_C$ is idempotent complete, it follows that F_C is an equivalence of ∞-categories. Applying Corollary 5.1.7.10, we conclude that F is an equivalence of inner fibrations over $\mathcal{C}$, so that U is also an isofibration (Proposition 5.1.7.14). □

We now extend some of the preceding results to the case of inner fibrations between simplicial sets.

Proposition 9.3.6.24. *Let $\mathcal{C}$ be a simplicial set, let $\mathcal{C}_0 \subseteq \mathcal{C}$ be a simplicial subset which contains every vertex of $\mathcal{C}$, and let $U_0 : \mathcal{E}_0 \to \mathcal{C}_0$ be a flat inner fibration. If the inclusion map $\mathcal{C}_0 \hookrightarrow \mathcal{C}$ is inner anodyne, then there exists a pullback diagram* 05NA

$$\begin{tikzcd}
\mathcal{E}_0 \arrow[r] \arrow[d, "U_0"] & \mathcal{E} \arrow[d, "U"] \\
\mathcal{C}_0 \arrow[r] & \mathcal{C},
\end{tikzcd}$$

where U is a flat inner fibration.

Proof. Choose an uncountable regular cardinal κ for which the inner fibration U_0 is essentially κ-small. Using Theorem 9.3.4.1, we can choose a commutative diagram

$$\begin{tikzcd}
\mathcal{E}_0 \arrow[rr, "H_0"] \arrow[dr, "U_0"'] & & \widehat{\mathcal{E}}_0 \arrow[dl, "\widehat{U}_0"] \\
& \mathcal{C} &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}_0$ as a fiberwise κ-cocompletion of $\mathcal{E}_0$. Let $\mathcal{E}'_0$ be the full simplicial subset of $\widehat{\mathcal{E}}_0$ spanned by those vertices which belong to the image of H_0. It follows from Remark 9.3.1.15 that H_0 induces an equivalence $\mathcal{E}_0 \to \mathcal{E}'_0$ of inner fibrations over $\mathcal{C}_0$. Using Lemma 5.6.7.1 (and Remark 9.3.6.3), we can replace $\mathcal{E}_0$ by $\mathcal{E}'_0$ and thereby reduce to the case where H_0 is an isomorphism from $\mathcal{E}_0$ onto a full simplicial subset of $\widehat{\mathcal{E}}_0$.

Since U_0 is flat, the morphism $\widehat{U}_0$ is a cartesian fibration (Proposition 9.3.6.9). Using Proposition 5.6.7.2, we can choose a pullback diagram

$$\begin{tikzcd}
\widehat{\mathcal{E}}_0 \arrow[r] \arrow[d, "\widehat{U}_0"] & \widehat{\mathcal{E}} \arrow[d, "\widehat{U}"] \\
\mathcal{C}_0 \arrow[r, "\iota"] & \mathcal{C}
\end{tikzcd}$$

where $\widehat{U}$ is a cartesian fibration. Let $\mathrm{Tr}_{\widehat{\mathcal{E}}/\mathcal{C}} : \mathrm{h}\mathcal{C}^{\mathrm{op}} \to \mathrm{h}\mathcal{QC}$ be the homotopy transport representation of $\widehat{U}$. Since ι induces an isomorphism of homotopy categories $\mathrm{h}\mathcal{C}_0 \xrightarrow{\sim} \mathrm{h}\mathcal{C}$, Proposition 9.3.1.16 guarantees that the functor $\mathrm{Tr}_{\widehat{\mathcal{E}}/\mathcal{C}}$ carries each object of $\mathrm{h}\mathcal{C}$ to a κ-cocomplete ∞-category and each morphism of $\mathrm{h}\mathcal{C}$ to a functor which preserves κ-small colimits.

Let $\mathcal{E} \subseteq \widehat{\mathcal{E}}$ be the full simplicial subset spanned by those vertices which belong to the image of $\mathcal{E}_0$, and set $U = \widehat{U}|_{\mathcal{E}}$. Applying the criterion of Proposition 9.3.1.16, we see that the diagram

$$\begin{tikzcd}
\mathcal{E} \arrow[rr] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ-cocompletion of $\mathcal{E}$. Since $\widehat{U}$ is a cartesian fibration, Proposition 9.3.6.9 guarantees that the inner fibration U is flat. By construction, the isomorphism $\widehat{\mathcal{E}}_0 \xrightarrow{\sim} \mathcal{C}_0 \times_{\mathcal{C}} \widehat{\mathcal{E}}$ restricts to an isomorphism of $\mathcal{E}_0$ with the fiber product $\mathcal{C}_0 \times_{\mathcal{C}} \mathcal{E}$. □

05NB **Exercise 9.3.6.25.** In the special case $\mathcal{C} = \Delta^2$ and $\mathcal{C}_0 = \Lambda^2_1$, Proposition 9.3.6.24 reduces to the assertion that every inner fibration $U_0 : \mathcal{E}_0 \to \Lambda^2_1$ fits into a pullback diagram

$$\begin{tikzcd}
\mathcal{E}_0 \arrow[r, "F"] \arrow[d, "U_0"] & \mathcal{E} \arrow[d, "U"] \\
\Lambda^2_1 \arrow[r] & \Delta^2,
\end{tikzcd}$$

where $\mathcal{E}$ is an ∞-category and F is a categorical equivalence of simplicial sets (see Corollary 9.3.6.16). Use the small object argument to give a more direct proof of this statement.

05NC **Corollary 9.3.6.26.** *Let $U_0 : \mathcal{E}_0 \to \mathcal{C}_0$ be a flat inner fibration of simplicial sets. Then there exists a pullback diagram*

$$\begin{tikzcd}
\mathcal{E}_0 \arrow[r] \arrow[d, "U_0"] & \mathcal{E} \arrow[d, "U"] \\
\mathcal{C}_0 \arrow[r, "\iota"] & \mathcal{C},
\end{tikzcd}$$

where U is a flat inner fibration of ∞-categories. Moreover, we may assume that ι is inner anodyne.

05ND **Corollary 9.3.6.27.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a flat inner fibration of simplicial sets. Assume that, for each vertex $C \in \mathcal{C}$, the ∞-category $\mathcal{E}_C$ is idempotent complete. Then U is an isofibration.*

Proof. Combine Corollaries 9.3.6.26 and 9.3.6.23. □

Corollary 9.3.6.28. *Let $U : \mathcal{E} \to \mathcal{C}$ be a flat inner fibration of simplicial sets and suppose we are given a digram* 05NE

$$\begin{tikzcd}
\mathcal{E} \arrow[rr, "H"] \arrow[dr, "U"'] & & \widehat{\mathcal{E}} \arrow[dl, "\widehat{U}"] \\
& \mathcal{C} &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise idempotent completion of $\mathcal{E}$. Then $\widehat{U}$ is a flat isofibration.

Proof. It follows from Example 9.3.6.10 that $\widehat{U}$ is a flat inner fibration. Since the fibers of $\widehat{U}$ are idempotent complete, it is an isofibration (Corollary 9.3.6.27). □

Proposition 9.3.6.29. *Let $U_0 : \mathcal{E}_0 \to \mathcal{C}_0$ be a flat isofibration of simplicial sets. Then there exists a pullback diagram* 05NF

$$\begin{tikzcd}
\mathcal{E}_0 \arrow[r] \arrow[d, "U_0"] & \mathcal{E} \arrow[d, "U"] \\
\mathcal{C}_0 \arrow[r, "\iota"] & \mathcal{C},
\end{tikzcd}$$

where U is a flat isofibration of ∞-categories. Moreover, we may assume that ι is inner anodyne.

Proof. Using Corollary 9.3.6.26, we can choose an inner anodyne map $\iota : \mathcal{C}_0 \hookrightarrow \mathcal{C}$ and a pullback diagram

$$\begin{tikzcd}
\mathcal{E}_0 \arrow[r] \arrow[d, "U_0"] & \mathcal{E}' \arrow[d, "U'"] \\
\mathcal{C}_0 \arrow[r, "\iota"] & \mathcal{C},
\end{tikzcd}$$

where U' is a flat isofibration. Using Proposition 9.3.6.22, we can factor U' as a composition $\mathcal{E}' \xrightarrow{F} \mathcal{E}'' \xrightarrow{U''} \mathcal{C}$, where F is an equivalence of ∞-categories and U'' is a flat isofibration. Set $\mathcal{E}''_0 = \mathcal{C}_0 \times_{\mathcal{C}} \mathcal{E}''$, so that we have a commutative diagram

$$\begin{tikzcd}
\mathcal{E}_0 \arrow[r] \arrow[d, "F_0"] & \mathcal{E}' \arrow[d, "F"] \\
\mathcal{E}''_0 \arrow[r] & \mathcal{E}''.
\end{tikzcd}$$

Since U' and U'' are flat, Proposition 9.3.6.6 guarantees that the horizontal maps are categorical equivalences. Since F is an equivalence of ∞-categories, it follows that F_0 is a categorical equivalence of simplicial sets (Remark 4.5.3.5), and therefore an equivalence of isofibrations over $\mathcal{C}_0$ (Proposition 5.1.7.5). Applying Lemma 5.6.7.1, we conclude that there exists a commutative diagram

$$\begin{tikzcd}
\mathcal{E}_0 \arrow[r] \arrow[d] & \mathcal{E} \arrow[r, "G"] \arrow[d, "U"] & \mathcal{E}'' \arrow[d, "U''"] \\
\mathcal{C}_0 \arrow[r, "\iota"] & \mathcal{C} \arrow[r, "\mathrm{id}"] & \mathcal{C},
\end{tikzcd}$$

where the left square is a pullback, the upper horizontal composition is F_0, and G is an equivalence of inner fibrations over $\mathcal{C}$. Since U'' is a flat isofibration, it follows that U is also a flat isofibration (Remark 9.3.6.3 and Proposition 5.1.7.14). □

05NG **Corollary 9.3.6.30.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a flat isofibration of simplicial sets. Then U is exponentiable.*

Proof. By virtue of Proposition 9.3.6.29, we may assume that $\mathcal{C}$ is an ∞-category. In this case, the result follows from Proposition 9.3.6.17. □

9.3.7 Flatness and Morphism Spaces

05NH Let $\mathcal{E}$ be an ∞-category. For each morphism $f : X \to Z$ of $\mathcal{E}$, we let $\mathcal{E}_{X/\,/Z}$ denote the ∞-category whose objects are diagrams of the form

$$\begin{tikzcd}
 & Y \arrow[dr] & \\
X \arrow[ur] \arrow[rr, "f"] & & Z
\end{tikzcd}$$

(see Notation 4.6.6.1). Our goal in this section is to prove the following:

05NJ **Theorem 9.3.7.1.** *Let $U : \mathcal{E} \to \Delta^2$ be a functor of ∞-categories. Then U is flat if and only if, for every morphism $f : X \to Z$ in $\mathcal{E}$ satisfying $U(X) = 0$ and $U(Z) = 2$, the ∞-category $\{1\} \times_{\Delta^2} \mathcal{E}_{X/\,/Z}$ is weakly contractible.*

Stated more informally, Theorem 9.3.7.1 asserts that a functor $U : \mathcal{E} \to \Delta^2$ is flat if every morphism from an object $X \in \mathcal{E}_0$ to an object $Z \in \mathcal{E}_2$ admits a factorization through an object $Y \in \mathcal{E}_1$, which is unique up to (weakly) contractible choice. To carry out the proof, it will be useful to work with another formulation of this condition.

Lemma 9.3.7.2. *Let κ be an uncountable regular cardinal, let $\mathcal{E}$ be an ∞-category which is essentially κ-small, let X be an object of $\mathcal{E}$, and let $h_X : \mathcal{E} \to \mathcal{S}^{<\kappa}$ be a functor corepresented by X. Let $U : \mathcal{E} \to \Delta^2$ be an inner fibration of ∞-categories, let $\mathcal{E}_{\geq 1}$ be the full subcategory of $\mathcal{E}$ spanned by those objects E satisfying $U(E) \geq 1$, and let $\mathcal{E}_1$ denote the full subcategory spanned by those objects satisfying $U(E) = 1$. If U is flat, then the functor $h_X|_{\mathcal{E}_{\geq 1}}$ is left Kan extended from $\mathcal{E}_1$.* 05NK

Proof. Choose a functor $\mathscr{F}_{\geq 1} : \mathcal{E}_{\geq 1} \to \mathcal{S}$, and set $\mathscr{F}_1 = \mathscr{F}_{\geq 1}|_{\mathcal{E}_1}$. By virtue of Corollary 7.3.6.13, it will suffice to show that the restriction map

$$\theta : \mathrm{Hom}_{\mathrm{Fun}(\mathcal{E}_{\geq 1}, \mathcal{S}^{<\kappa})}(h_X|_{\mathcal{E}_{\geq 1}}, \mathscr{F}_{\geq 1}) \to \mathrm{Hom}_{\mathrm{Fun}(\mathcal{E}_1, \mathcal{S}^{<\kappa})}(h_X|_{\mathcal{E}_1}, \mathscr{F}_1)$$

is a homotopy equivalence of Kan complexes. Let $\mathcal{E}_{\leq 1}$ be the full subcategory of $\mathcal{E}$ spanned by those objects E satisfying $U(E) \leq 1$, and choose a regular cardinal λ of exponential cofinality $\geq \kappa$. Then the ∞-category $\mathcal{S}^{<\lambda}$ is κ-complete (Example 7.6.7.4). Since $\mathcal{E}_{\leq 1}$ is essentially κ-small, the functor $\mathscr{F}_1$ admits a right Kan extension $\mathscr{F}_{\leq 1} : \mathcal{E}_{\leq 1} \to \mathcal{S}^{<\lambda}$. Our assumption that U is flat guarantees that the restriction functor

$$T : \mathrm{Fun}(\mathcal{E}, \mathcal{S}^{<\lambda}) \to \mathrm{Fun}(\mathcal{E}_{\leq 1}, \mathcal{S}^{<\lambda}) \times_{\mathrm{Fun}(\mathcal{E}_1, \mathcal{S}^{<\lambda})} \mathrm{Fun}(\mathcal{E}_{\geq 1}, \mathcal{S}^{<\lambda})$$

is a trivial Kan fibration, so that we can choose a functor $\mathscr{F} : \mathcal{E} \to \mathcal{S}^{<\lambda}$ satisfying $\mathscr{F}|_{\mathcal{E}_{\leq 1}} = \mathscr{F}_{\leq 1}$ and $\mathscr{F}|_{\mathcal{E}_{\geq 1}} = \mathscr{F}_{\geq 1}$. Since T is a trivial Kan fibration, the diagram of Kan complexes

$$\begin{tikzcd}
\mathrm{Hom}_{\mathrm{Fun}(\mathcal{E}, \mathcal{S}^{<\lambda})}(h_X, \mathscr{F}) \arrow[r, "\theta'"] \arrow[d] & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{E}_{\leq 1}, \mathcal{S}^{<\lambda})}(h_X|_{\mathcal{E}_{\leq 1}}, \mathscr{F}_{\leq 1}) \arrow[d] \\
\mathrm{Hom}_{\mathrm{Fun}(\mathcal{E}_{\geq 1}, \mathcal{S}^{<\lambda})}(h_X|_{\mathcal{E}_{\geq 1}}, \mathscr{F}_{\geq 1}) \arrow[r, "\theta"] & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{E}_1, \mathcal{S}^{<\lambda})}(h_X|_{\mathcal{E}_1}, \mathscr{F}_1).
\end{tikzcd}$$

Our assumption that $\mathscr{F}_{\leq 1}$ is right Kan extended from $\mathscr{F}_1$ guarantees that the right vertical map is a homotopy equivalence (Corollary 7.3.6.13). Consequently, to show that θ is a homotopy equivalence, it will suffice to show that θ' is a homotopy equivalence. This follows from the ∞-categorical version of Yoneda's lemma (Proposition 8.3.1.3): the source and target of θ' can both be identified with the Kan complex $\mathscr{F}(X)$. □

The converse of Lemma 9.3.7.2 is also true:

Lemma 9.3.7.3. *Let $U : \mathcal{E} \to \Delta^2$ and κ be as in Lemma 9.3.7.2. Suppose that, for every object $X \in \mathcal{E}$ satisfying $U(X) = 0$, the functor $h_X|_{\mathcal{E}_{\geq 1}}$ is left Kan extended from $\mathcal{E}_1$. Then U is flat.* 05NL

Proof. Using Proposition 9.3.6.24 (or Exercise 9.3.6.25), we can choose a flat inner fibration $U' : \mathcal{E}' \to \Delta^2$ and an isomorphism $F_0 : \Lambda^2_1 \times_{\Delta^2} \mathcal{E}' \xrightarrow{\sim} \Lambda^2_1 \times_{\Delta^2} \mathcal{E}$ of simplicial sets over Λ^2_1. Since the inclusion map $\Lambda^2_1 \times_{\Delta^2} \mathcal{E}' \hookrightarrow \mathcal{E}'$ is a categorical equivalence of simplicial sets, we can extend F_0 to a functor of ∞-categories $F : \mathcal{E}' \to \mathcal{E}$ (which automatically satisfies $U \circ F = U'$). To prove that U is flat, it will suffice to show that F is an equivalence of inner fibrations over Δ^2 (Remark 9.3.6.3).

By construction, F is bijective on objects. By virtue of Corollary 5.1.7.10, we are reduced to showing that F is fully faithful: that is, for every pair of objects $X', Y' \in \mathcal{E}'$ having images $X = F(X')$ and $Y = F(Y')$, the morphism $\overline{F}$ induces a homotopy equivalence of Kan complexes $\mathrm{Hom}_{\mathcal{E}'}(X', Y') \to \mathrm{Hom}_{\mathcal{E}}(X, Y)$. We may assume that $U(X) = 0$ (otherwise, the result follows immediately from the fact that F is an isomorphism). Choose an uncountable regular cardinal κ such that $\mathcal{E}$ and $\mathcal{E}'$ are essentially κ-small, let $h_X : \mathcal{E} \to \mathcal{S}^{<\kappa}$ be the functor represented by X, and define $h_{X'} : \mathcal{E}' \to \mathcal{S}^{<\kappa}$ similarly. The functor F then induces a natural transformation $\alpha : h_{X'} \to h_X \circ F$, and we wish to show that α is an isomorphism. Let $\mathcal{E}'_{\leq 1}$ denote the full subcategory of $\mathcal{E}'$ spanned by those objects Y satisfying $U(Y) \leq 1$, and define $\mathcal{E}'_1$ and $\mathcal{E}'_{\geq 1}$ similarly. Since F_0 is an isomorphism, the natural transformation α is an isomorphism when restricted to $\mathcal{E}'_{\leq 1}$. It will therefore suffice to show that α is also an isomorphism when restricted $\mathcal{E}'_{\geq 1}$. Our assumption (and the fact that F_0 is an isomorphism) guarantees that $(h_X \circ F)|_{\mathcal{E}'_{\geq 1}}$ is left Kan extended from $\mathcal{E}'_1$. Since U' is flat, Lemma 9.3.7.2 guarantees that the functor $h_{X'}|_{\mathcal{E}'_{\geq 1}}$ is also left Kan extended from $\mathcal{E}'_1$. The desired result now follows from the fact that α is an isomorphism when restricted to $\mathcal{E}'_1$. □

05NM **Proposition 9.3.7.4.** *Let $U : \mathcal{E} \to \Delta^2$ be a functor of ∞-categories. Then U is flat if and only if, for every object $X \in \mathcal{E}$ satisfying $U(X) = 0$, the inclusion functor*

$$\iota_X : \{1\} \times_{\Delta^2} \mathcal{E}_{X/} \hookrightarrow \mathrm{N}_\bullet(\{1 < 2\}) \times_{\Delta^2} \mathcal{E}_{X/}$$

is left cofinal.

Proof. Choose an uncountable regular cardinal κ such that $\mathcal{E}$ is essentially κ-small. Using Lemmas 9.3.7.2 and 9.3.7.3, we see that U is flat if and only if, for every object $X \in \mathcal{E}$ satisfying $U(X) = 0$, the corepresentable functor $h_X : \mathcal{E} \to \mathcal{S}^{<\kappa}$ has the property that $h_X|_{\mathcal{E}_{\geq 1}}$ is left Kan extended from $\mathcal{E}_1$. Since h_X is a covariant transport representation for the left fibration $\mathcal{E}_{X/} \to \mathcal{E}$, this is equivalent to the requirement that ι_X is left cofinal (see Corollary 7.4.5.16). □

Proof of Theorem 9.3.7.1. Let $U : \mathcal{E} \to \Delta^2$ be a functor of ∞-categories and let X be an object of $\mathcal{E}$ satisfying $U(X) = 0$. By virtue of Proposition 9.3.7.4, it will suffice to show that the following conditions are equivalent:

(1) The inclusion functor

$$\iota_X : \{1\} \times_{\Delta^2} \mathcal{E}_{X/} \hookrightarrow \mathrm{N}_\bullet(\{1 < 2\}) \times_{\Delta^2} \mathcal{E}_{X/}$$

is left cofinal.

(2) For every morphism $f : X \to Z$ of $\mathcal{E}$ where $U(Z) = 2$, the ∞-category $\{1\} \times_{\Delta^2} \mathcal{E}_{X//Z}$ is weakly contractible.

This follows from the cofinality criterion of Theorem 7.2.3.1. □

9.3.8 Fiberwise Cocompletion via the Yoneda Embedding

Recall that, if $\mathcal{E}$ is an essentially small ∞-category, then the contravariant Yoneda embedding $h^\bullet : \mathcal{E}^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{E}, \mathcal{S})$ exhibits the ∞-category $\mathrm{Fun}(\mathcal{E}, \mathcal{S})$ as a cocompletion of $\mathcal{E}$ (Theorem 8.4.0.3). Our goal in this section is to prove a relative version of this statement. 05NN

Proposition 9.3.8.1. *Let κ be an uncountable regular cardinal and let $U : \mathcal{E} \to \mathcal{C}$ be a flat inner fibration of simplicial sets which is essentially κ-small. Then:* 05NP

(1) *The projection map $V : \mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$ is a cocartesian fibration of simplicial sets (see Construction 4.5.9.1).*

(2) *Let $V^\dagger : \mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})^\dagger \to \mathcal{C}^{\mathrm{op}}$ be a cartesian conjugate of V (Definition 8.6.1.1). Then $V^\dagger$ is a fiberwise κ-cocompletion of $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \to \mathcal{C}^{\mathrm{op}}$.*

The first assertion of Proposition 9.3.8.1 is a special case of the following:

Lemma 9.3.8.2. *Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \to \mathcal{C}$ be an inner fibration of simplicial sets which is essentially κ-small, and let $\mathcal{D}$ be an ∞-category which is κ-cocomplete. Then the projection map $V : \mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D}) \to \mathcal{C}$ is a cocartesian fibration. Moreover, for every edge $e : C \to C'$ of $\mathcal{C}$, the covariant transport functor* 05NQ

$$\mathrm{Fun}(\mathcal{E}_C, \mathcal{D}) = \{C\} \times_{\mathcal{C}} \mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D}) \to \{C'\} \times_{\mathcal{C}} \mathrm{Fun}(\mathcal{E} / \mathcal{C}) = \mathrm{Fun}(\mathcal{E}_{C'}, \mathcal{D})$$

preserves κ-small colimits.

Proof. To show that V is a cocartesian fibration, we may assume without loss of generality that $\mathcal{C} = \Delta^n$ is a standard simplex (Proposition 5.1.4.7). In this case, U is exponentiable (Corollary 9.3.6.19), so the desired result follows from Variant 8.6.5.11. To prove the second assertion, we may assume that $\mathcal{C} = \Delta^1$ with $C = 0$ and $C' = 1$. In this case, $\mathcal{E}_C$ and $\mathcal{E}_{C'}$ are full subcategories of $\mathcal{E}$, and determine restriction functors $R : \mathrm{Fun}(\mathcal{E}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{E}_C, \mathcal{D})$ and $R' : \mathrm{Fun}(\mathcal{E}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{E}_{C'}, \mathcal{D})$. The covariant transport functor $e_!$ can then be identified with the composition $R' \circ R^L$, where R^L is left adjoint to R (given by left Kan extension along the inclusion $\mathcal{E}_C \hookrightarrow \mathcal{E}$). Since the functor R^L preserves all colimits (Corollary 7.1.3.21), we are reduced to showing that the functor R' preserves κ-small colimits, which follows from the criterion of Proposition 7.1.6.1. □

To prove Proposition 9.3.8.1, we may assume without loss of generality that $U : \mathcal{E} \to \mathcal{C}$ is a flat inner fibration of ∞-categories (Corollary 9.3.6.26). In this case, the results of §8.6.2 provide an explicit example of a cartesian dual of the inner fibration V.

`05NR` **Construction 9.3.8.3.** Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \to \mathcal{C}$ be a flat inner fibration of ∞-categories which is essentially κ-small, and let $V : \operatorname{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$ be the cocartesian fibration of Lemma 9.3.8.2. We let $\operatorname{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger}$ denote the full subcategory

$$\operatorname{Fun}^{\mathrm{CCart}}_{/\mathcal{C}}(\operatorname{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \operatorname{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \subseteq \operatorname{Fun}_{/\mathcal{C}}(\operatorname{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \operatorname{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}))$$

introduced in Construction 8.6.2.2, and let $V^{\dagger} : \operatorname{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ denote the projection map. It follows from Proposition 8.6.2.3 that the evaluation map

$$\mathrm{ev} : \operatorname{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \operatorname{Tw}(\mathcal{C}) \to \operatorname{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$$

exhibits $V^{\dagger}$ as a cartesian conjugate of V.

By virtue of Lemma 9.3.8.2 (and Corollary 9.3.6.26), Proposition 9.3.8.1 is a consequence of the following more precise assertion:

`05NS` **Theorem 9.3.8.4.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a flat inner fibration of ∞-categories, let κ be an uncountable regular cardinal for which U is essentially κ-small, and let*

$$H : \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \operatorname{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$$

be a relative Hom*-functor for U (see Definition 8.6.6.8), so that H is classified by a map*

$$h : \mathcal{E}^{\mathrm{op}} \to \operatorname{Fun}(\operatorname{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} / \mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \simeq \operatorname{Fun}_{/\mathcal{C}}(\operatorname{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \operatorname{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})).$$

Then:

(1) *The functor h factors through the full subcategory*

$$\operatorname{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger} \subseteq \operatorname{Fun}_{/\mathcal{C}}(\operatorname{Tw}(\mathcal{C}) / \mathcal{C}^{\mathrm{op}}, \operatorname{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}))$$

of Construction 9.3.8.3.

(2) *The diagram*

$$\begin{tikzcd}
\mathcal{E}^{\mathrm{op}} \arrow[rr, "h"] \arrow[dr, "U^{\mathrm{op}}"'] & & \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger} \arrow[dl, "V^{\dagger}"] \\
& \mathcal{C}^{\mathrm{op}} &
\end{tikzcd}$$

exhibits $\mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger}$ *as a fiberwise* κ*-cocompletion of* $\mathcal{E}^{\mathrm{op}}$*.*

We will carry out the proof of Theorem 9.3.8.4 in several steps.

Remark 9.3.8.5. Let κ be an uncountable regular cardinal and let $U : \mathcal{E} \to \mathcal{C}$ be a flat inner fibration of ∞-categories which is essentially κ-small. Suppose we are given a commutative diagram of simplicial sets 05NT

$$\begin{tikzcd}
\mathcal{D}^{\mathrm{op}} \arrow[rr, "h"] \arrow[dr] & & \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa}) \arrow[dl] \\
& \mathcal{C}^{\mathrm{op}}, &
\end{tikzcd}$$

which we identify with a morphism $H : \mathcal{D}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$. Using the criterion of Variant 8.6.5.11, we see that h factors through $\mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger}$ if and only if H satisfies the following condition:

($*$) Let X be a vertex of $\mathcal{D}$ having image $C \in \mathcal{C}$, let e be an edge of $\{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$, and let H_e denote the composition

$$\Delta^1 \times_{\mathcal{C}} \mathcal{E} \xrightarrow{e \times \mathrm{id}} \{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \hookrightarrow \mathcal{D}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \xrightarrow{H} \mathcal{S}^{<\kappa}.$$

Then the functor H_e is left Kan extended from $\{0\} \times_{\mathcal{C}} \mathcal{E}$.

Moreover, it suffice to verify condition ($*$) under the additional assumption that e belongs to the image of the equivalence $\mathcal{C}_{C/} \to \{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ (see Proposition 8.1.2.9).

We now prove the first assertion of Theorem 9.3.8.4:

Lemma 9.3.8.6. *Let* $U : \mathcal{E} \to \mathcal{C}$ *be a flat inner fibration of* ∞*-categories, let* κ *be an uncountable regular cardinal for which* U *is essentially* κ*-small, and let* $H : \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$ *be a relative* Hom*-functor for* U*. Then* H *is classified by a functor* $h : \mathcal{E}^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger}$*.* 05NU

Proof. Fix an object $X \in \mathcal{E}$ having image $C = U(X)$ and an edge e of the ∞-category $\mathcal{C}_{C/}$, which we identify with a 2-simplex σ :

$$\begin{tikzcd}
& C' \arrow[dr] & \\
C \arrow[ur] \arrow[rr] & & C''
\end{tikzcd}$$

of $\mathcal{C}$, and let $H_e : \mathrm{N}_\bullet(\{C' < C''\}) \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$ be as in condition $(*)$ of Remark 9.3.8.5; we wish to show that the functor F_e is left Kan extended from the subcategory $\{C'\} \times_{\mathcal{C}} \mathcal{E}$. Without loss of generality, we may assume that $\mathcal{C} = \Delta^2$ and that σ is the identity morphism. In this case, we can identify F_e with the composition

$$\mathrm{N}_\bullet(\{1 < 2\}) \times_{\Delta^2} \mathcal{E} \hookrightarrow \mathcal{E} \xrightarrow{\mathscr{F}} \mathcal{S}^{<\kappa},$$

where $\mathscr{F}$ is corepresented by the object $X \in \mathcal{E}$. Since U is flat, the desired result is a reformulation of Lemma 9.3.7.2. □

We now prove a special case of Theorem 9.3.8.4.

05NV **Lemma 9.3.8.7.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a flat inner fibration of ∞-categories, let κ be an uncountable regular cardinal for which U is essentially κ-small, and let*

$$H : \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \to \mathcal{S}^{<\kappa}$$

be a relative Hom*-functor for U. Then the induced map $h : \mathcal{E}^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger}$ exhibits* $\mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$ *as a fiberwise κ-cocompletion of $\mathcal{E}^{\mathrm{op}}$ (relative to $\mathcal{C}^{\mathrm{op}}$).*

Proof. Let us identify H with a functor $F : \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \to \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$. If X an object of $\mathcal{E}$ having image $C = U(X)$ and $u : C \to D$ is a morphism of $\mathcal{C}$, our assumption that U is a cocartesian fibration guarantees that we can lift u to a U-cocartesian morphism $\widetilde{u} : X \to Y$ of $\mathcal{E}$. In this case, we can identify $F(X, u)$ with a functor $\mathcal{E}_D \to \mathcal{S}^{<\kappa}$ which is corepresented by the object Y. It follows that F factors through the full subcategory $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa}) \subseteq \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$ of Construction 8.6.5.6. Unwinding the definitions, we have a commutative diagram

05NW
$$\begin{tikzcd}
\mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r, "F"] \arrow[d, "h \times \mathrm{id}"] & \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa}) \arrow[d] \\
\mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \arrow[r, "\mathrm{ev}"] & \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa}).
\end{tikzcd} \tag{9.41}$$

Let $V : \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$ and $V^{\dagger} : \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger} \to \mathcal{C}^{\mathrm{op}}$ denote the projection maps, and set $V^{\mathrm{corep}} = V|_{\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})}$. Then the lower horizontal map exhibits $V^{\dagger}$ as a cartesian conjugate of V (Proposition 8.6.2.3), and the upper horizontal map exhibits U^{op} as a cartesian conjugate of V^{corep} (Theorem 8.6.6.15). Moreover, the inclusion map $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa}) \subseteq \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$ exhibits $\mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$ as a fiberwise κ-cocompletion of $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$ (Example 9.3.2.5). Applying Proposition 9.3.3.3, we conclude that h exhibits $\mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger}$ as a fiberwise κ-cocompletion of $\mathcal{E}^{\mathrm{op}}$. □

To prove Theorem 9.3.8.4, we need the following relative version of Yoneda's lemma:

Lemma 9.3.8.8. *Let $U : \mathcal{E} \to \mathcal{C}$ be a flat inner fibration of ∞-categories which is essentially κ-small. Then the functor $h : \mathcal{E}^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger}$ of Lemma 9.3.8.6 is fully faithful.* 05NX

Proof. Using Theorem 9.3.4.1, we can choose a diagram

$$\begin{tikzcd}
\mathcal{E}^{\mathrm{op}} \arrow[rr, "F^{\mathrm{op}}"] \arrow[dr, "U^{\mathrm{op}}"'] & & \widehat{\mathcal{E}}^{\mathrm{op}} \arrow[dl, "\widehat{U}^{\mathrm{op}}"] \\
& \mathcal{C}^{\mathrm{op}} &
\end{tikzcd}$$

which exhibits $\widehat{\mathcal{E}}^{\mathrm{op}}$ as a fiberwise κ-cocompletion of $\mathcal{E}^{\mathrm{op}}$. Since U is flat, the inner fibration U^{op} is also flat (Remark 9.3.6.5). Applying the criterion of Proposition 9.3.6.9, we see that $\widehat{U}^{\mathrm{op}}$ is a cartesian fibration. Let λ be a regular cardinal of exponential cofinality $\geq \kappa$ such that $\widehat{U}$ is essentially λ-small. Let h^{+} denote the composition of h with the inclusion functor

$$\begin{aligned}
\mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger} &\hookrightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\,\mathcal{C}^{\mathrm{op}}, \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})) \\
&\hookrightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\,\mathcal{C}^{\mathrm{op}}, \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\lambda})).
\end{aligned}$$

We will complete the proof by showing that h^{+} is fully faithful.

Since λ has exponential cofinality $\geq \kappa$, the ∞-category $\mathcal{S}^{<\lambda}$ admits κ-small limits (Example 7.6.7.4). Let $\mathrm{Fun}(\widehat{\mathcal{E}}/\,\mathcal{C}, \mathcal{S}^{<\lambda})$ denote the relative exponential of Construction 4.5.9.1. By definition, objects of $\mathrm{Fun}(\widehat{\mathcal{E}}/\,\mathcal{C}, \mathcal{S}^{<\lambda})$ can be identified with pairs $(C, \mathscr{G})$, where C is an object of $\mathcal{C}$ and $\mathscr{G} : \widehat{\mathcal{E}}_{C} \to \mathcal{S}^{<\lambda}$ is a functor. Let $\mathrm{Fun}'(\widehat{\mathcal{E}}/\,\mathcal{C}, \mathcal{S}^{<\lambda})$ be the full subcategory spanned by those pairs $(C, \mathscr{F})$, where the functor $\mathscr{G}$ preserves κ-small limits. Let $\widehat{H} : \widehat{\mathcal{E}}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \widehat{\mathcal{E}} \to \mathcal{S}^{<\lambda}$ be a relative Hom-functor for $\widehat{U}$, which we identify with a map

$$\widehat{h} : \widehat{\mathcal{E}}^{\mathrm{op}} \to \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\,\mathcal{C}^{\mathrm{op}}, \mathrm{Fun}(\widehat{\mathcal{E}}/\,\mathcal{C}, \mathcal{S}^{<\lambda}).$$

Since corepresentable functors preserve limits (Corollary 7.4.5.18), the functor $\widehat{h}$ factors through the full subcategory $\mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\,\mathcal{C}^{\mathrm{op}}, \mathrm{Fun}'(\widehat{\mathcal{E}}/\,\mathcal{C}, \mathcal{S}^{<\lambda}))$. Since F is fully faithful

(Remark 9.3.1.14), the functor h^{+} is isomorphic to the composition

$$\begin{aligned} \mathcal{E}^{\mathrm{op}} & \xrightarrow{F^{\mathrm{op}}} \widehat{\mathcal{E}}^{\mathrm{op}} \\ & \xrightarrow{\widehat{h}} \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathrm{Fun}'(\widehat{\mathcal{E}}/\mathcal{C}, \mathcal{S}^{<\lambda})) \\ & \xrightarrow{T} \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathrm{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\lambda})), \end{aligned}$$

where T is given by precomposition with F. It follows from the universal property of Theorem 9.3.1.20 that precomposition with F induces an equivalence $\mathrm{Fun}'(\widehat{\mathcal{E}}/\mathcal{C}, \mathcal{S}^{<\lambda}) \to \mathrm{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\lambda})$ of inner fibrations over $\mathcal{C}$, so that T is an equivalence of ∞-categories. To complete the proof, it will suffice to show that the functor $\widehat{h}$ is fully faithful. In other words, we can replace U by $\widehat{U}$ (and κ by the cardinal λ) and thereby reduce to proving Lemma 9.3.8.8 under the assumption that U is a cocartesian fibration. In this case, the desired result follows from Lemma 9.3.8.7 (and Remark 9.3.1.14). □

Proof of Theorem 9.3.8.4. Let $U : \mathcal{E} \to \mathcal{C}$ be a flat inner fibration of ∞-categories which is essentially κ-small. It follows from Lemma 9.3.8.8 that a relative Hom-functor for U determines a fully faithful functor $h : \mathcal{E}^{\mathrm{op}} \to \mathrm{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger}$. We wish to show that the diagram

$$\begin{tikzcd} \mathcal{E}^{\mathrm{op}} \arrow[rr, "h"] \arrow[dr, "U^{\mathrm{op}}"'] & & \mathrm{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger} \arrow[dl, "V^{\dagger}"] \\ & \mathcal{C}^{\mathrm{op}} & \end{tikzcd}$$

exhibits $\mathrm{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger}$ as a fiberwise κ-cocompletion of $\mathcal{E}^{\mathrm{op}}$. By construction, $V^{\dagger}$ is a cartesian fibration which is conjugate to $V : \mathrm{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa}) \to \mathcal{C}$. In particular, for every morphism $f : C \to C'$ of $\mathcal{C}$, the contravariant transport functor

$$\{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger} \to \{C'\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger}$$

for the cartesian fibration $V^{\dagger}$ can be identified with the covariant transport functor

$$\{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa}) \to \{C'\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa})$$

for the cocartesian fibration V (see Proposition 8.6.1.5), and therefore preserves κ-small colimits (Lemma 9.3.8.2). By virtue of Proposition 9.3.1.16, it will suffice to show that for each object $C \in \mathcal{C}$, the map of fibers

$$h_C : \mathcal{E}^{\mathrm{op}}_C \to \{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger}$$

exhibits $\{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger}$ as a κ-cocompletion of $\mathcal{E}_C^{\mathrm{op}}$. Unwinding the definitions, we see that the composition of h_C with the equivalence

$$\{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})^{\dagger} \simeq \{C\} \times_{\mathcal{C}} \mathrm{Fun}(\mathcal{E} \,/\, \mathcal{C}, \mathcal{S}^{<\kappa})$$

identifies with the contravariant Yoneda embedding for the ∞-category $\mathcal{E}_C$. The desired result now follows from Theorem 8.4.3.3. $\square$

Chapter 10

Exactness and Animation

04QH 10.1 Simplicial Objects of ∞-Categories

04QJ Let $\mathcal{C}$ be a category. Recall that a simplicial object of $\mathcal{C}$ is a functor $\mathbf{\Delta}^{\mathrm{op}} \to \mathcal{C}$, where $\mathbf{\Delta}$ is the simplex category introduced in Definition 1.1.0.2. This notion has an obvious counterpart in the setting of ∞-categories:

04QK **Definition 10.1.0.1** (Simplicial Objects)**.** Let $\mathcal{C}$ be an ∞-category. A *simplicial object of* $\mathcal{C}$ is a functor from the ∞-category $\mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}})$ to $\mathcal{C}$. A *cosimplicial object of* $\mathcal{C}$ is a functor from $\mathrm{N}_\bullet(\mathbf{\Delta})$ to $\mathcal{C}$.

04QL **Notation 10.1.0.2.** Let $\mathcal{C}$ be an ∞-category. We will often use the notation $X_\bullet$ to indicate a simplicial object of $\mathcal{C}$. In this case, we write X_n for the value of the functor $X_\bullet$ on the object $[n] \in \mathbf{\Delta}^{\mathrm{op}}$. Similarly, we often use an expression like $X^\bullet$ to indicate a cosimplicial object of $\mathcal{C}$, and X^n for its value on the object $[n] \in \mathbf{\Delta}$.

04QM **Example 10.1.0.3.** Let $\mathcal{C}$ be a category. Then (co)simplicial objects of the ∞-category $\mathrm{N}_\bullet(\mathcal{C})$ (in the sense of Definition 10.1.0.1) can be identified with (co)simplicial objects of $\mathcal{C}$ (in the sense of Definition 1.1.0.4).

04QN **Notation 10.1.0.4** (Face and Degeneracy Operators)**.** Let $X_\bullet$ be a simplicial object of an ∞-category $\mathcal{C}$. For every pair of integers $0 \leq i \leq n$, we let $s^n_i : X_n \to X_{n+1}$ denote the morphism induced by the surjection $\sigma^i_n : [n+1] \twoheadrightarrow [n]$ of Construction 1.1.2.1; we will refer to s^n_i as the *ith degeneracy operator* for the simplicial object $X_\bullet$. If $n > 0$, we let $d^n_i : X_n \to X_{n-1}$ denote the morphism induced by the inclusion of linearly ordered sets $\delta^i_n : [n-1] \hookrightarrow [n]$ introduced in Construction 1.1.1.4. We will refer to d^n_i as the *ith face operator* of $X_\bullet$.

04QP **Warning 10.1.0.5.** If $\mathcal{C}$ is an ordinary category, then a simplicial object $X_\bullet$ of $\mathcal{C}$ is completely determined by the collection of objects $\{X_n\}_{n \geq 0}$, together with the face and degeneracy operators

$$d_i^n : X_n \to X_{n-1} \qquad s_i^n : X_n \to X_{n+1}$$

(see Proposition 1.1.2.14). In the setting of ∞-categories, this is no longer true.

10.1.1 Geometric Realization

Let S be a simplicial set. Recall that the *geometric realization* of S is a topological space $|S|$ which corepresents the functor 04QQ

$$(X \in \mathrm{Top}) \mapsto \mathrm{Hom}_{\mathrm{Set}_\Delta}(S, \mathrm{Sing}_\bullet(X));$$

here Top denotes the category whose objects are topological spaces and whose morphisms are continuous functions (Definition 1.2.3.1). This property determines the topological space $|S|$ up to homeomorphism: that is, up to isomorphism in the category Top. We now formulate a homotopy-invariant counterpart of this universal property, which determines the topological space $|S|$ up to homotopy equivalence (rather than homeomorphism). In what follows, we regard Top as a simplicially enriched category (see Example 2.4.1.5), and we let $\mathrm{N}_\bullet^{\mathrm{hc}}(\mathrm{Top})$ denote its homotopy coherent nerve.

Proposition 10.1.1.1. *Let S be a simplicial set. Then the geometric realization $|S|$ is a colimit of the diagram* 04QR

$$\mathrm{N}_\bullet(\boldsymbol{\Delta}^{\mathrm{op}}) \xrightarrow{S} \mathrm{N}_\bullet(\mathrm{Set}) \subset \mathrm{N}_\bullet^{\mathrm{hc}}(\mathrm{Top}).$$

Proposition 10.1.1.1 admits a more combinatorial formulation:

Variant 10.1.1.2. Let $S = S_\bullet$ be a simplicial set. Then the Kan complex $\mathrm{Sing}_\bullet(|S|)$ is a colimit of the diagram 04QS

$$\mathrm{N}_\bullet(\boldsymbol{\Delta}^{\mathrm{op}}) \xrightarrow{S} \mathrm{N}_\bullet(\mathrm{Set}) \subset \mathcal{S}.$$

Proof of Variant 10.1.1.2. Let Kan denote the ordinary category of Kan complexes, and let $\mathscr{F} : \boldsymbol{\Delta}^{\mathrm{op}} \to \mathrm{Kan}$ be the functor which carries each object $[n] \in \boldsymbol{\Delta}^{\mathrm{op}}$ to the set of n-simplices S_n (regarded as a constant simplicial set). Let $\underrightarrow{\mathrm{holim}}(\mathscr{F})$ denote the homotopy colimit of the diagram $\mathscr{F}$ (Construction 5.3.2.1). By virtue of Proposition 7.5.7.1 (and Example 1.4.2.5), it will suffice to show that there is a weak homotopy equivalence of simplicial sets $v : \underrightarrow{\mathrm{holim}}(\mathscr{F})^{\mathrm{op}} \to \mathrm{Sing}_\bullet(|S|)$. Using Example 5.3.2.5 (and Example 5.2.6.4), we can identify $\underrightarrow{\mathrm{holim}}(\mathscr{F})^{\mathrm{op}}$ with the nerve of the category of simplices $\boldsymbol{\Delta}_S$ (see Construction 1.1.3.9). We complete the proof by taking v to be the composition

$$\mathrm{N}_\bullet(\boldsymbol{\Delta}_S) \xrightarrow{\psi} S \xrightarrow{u} \mathrm{Sing}_\bullet(|S|),$$

where u is the weak homotopy equivalence of Theorem 3.6.4.1 and $\psi : \mathrm{N}_\bullet(\boldsymbol{\Delta}_S) \to S$ is the comparison map of Construction 3.3.3.9. By virtue of Variant 6.3.7.4, the morphism

ψ is universally localizing, and is therefore also a weak homotopy equivalence (Remark 6.3.6.5). □

Proof of Proposition 10.1.1.1. Let $\mathcal{T}$ be the ∞-category $\mathrm{N}^{\mathrm{hc}}_\bullet(\mathrm{Top})$, and let $\mathcal{T}_0 \subseteq \mathcal{T}$ be the full subcategory spanned by those topological spaces which have the homotopy type of a CW complex. It follows from Example 6.2.2.7 that $\mathcal{T}_0$ is a coreflective subcategory of $\mathcal{T}$; in particular, the inclusion map $\mathcal{T}_0 \hookrightarrow \mathcal{T}$ preserves colimits (Variant 7.1.3.24). It will therefore suffice to show that for every simplicial set S, the geometric realization $|S|$ is a colimit of the diagram $\mathrm{N}_\bullet(\boldsymbol{\Delta}^{\mathrm{op}}) \xrightarrow{S} \mathrm{N}_\bullet(\mathrm{Set}) \subset \mathcal{T}_0$. This is a reformulation of Variant 10.1.1.2, since the functor $X \mapsto \mathrm{Sing}_\bullet(X)$ determines an equivalence of ∞-categories $\mathcal{T}_0 \to \mathcal{S}$ (Remark 5.5.1.9). □

Motivated by Proposition 10.1.1.1, we introduce the following terminology:

04QT **Definition 10.1.1.3** (Geometric Realization)**.** Let $X_\bullet$ be a simplicial object of an ∞-category $\mathcal{C}$. We will say that an object $X \in \mathcal{C}$ is a *geometric realization of* $X_\bullet$ if it is a colimit of the diagram $X_\bullet : \mathrm{N}_\bullet(\boldsymbol{\Delta}^{\mathrm{op}}) \to \mathcal{C}$.

04QU **Warning 10.1.1.4.** Let $S = S_\bullet$ be a simplicial set. Proposition 10.1.1.1 asserts that the topological space $|S|$ introduced in §1.2.3 is a geometric realization of S (in the sense of Definition 10.1.1.3), provided that we regard S as a simplicial object of the ∞-category $\mathrm{N}^{\mathrm{hc}}_\bullet(\mathrm{Top})$ (by equipping each of the sets S_n with the discrete topology). Beware that $|S_\bullet|$ is usually *not* a geometric realization of S (in the sense of Definition 10.1.1.3) if we regard S as a simplicial object of the ∞-category $\mathrm{N}_\bullet(\mathrm{Set})$. The latter is a colimit of the diagram $\boldsymbol{\Delta}^{\mathrm{op}} \xrightarrow{S} \mathrm{Set}$, which identifies with the set of connected components $\pi_0(S)$ (see Remark 1.2.1.20), or equivalently with the set of path components of the topological space $|S|$ (see Corollary 1.2.3.19).

04QV **Notation 10.1.1.5.** Let $X_\bullet$ be a simplicial object of an ∞-category $\mathcal{C}$. It follows from Proposition 7.1.1.12 that, if $X_\bullet$ admits a geometric realization X, then the isomorphism class of X is uniquely determined. To emphasize this, we will often denote X by $|X_\bullet|$ and refer to it as *the* geometric realization of $X_\bullet$. Beware that, in the case where $\mathcal{C}$ is (the nerve of) the category of sets, this is incompatible with the convention of Notation 1.2.3.3 (see Warning 10.1.1.4).

04QW **Exercise 10.1.1.6.** Let $X_\bullet$ be a simplicial object of an ordinary category $\mathcal{C}$. Show that an object $X \in \mathcal{C}$ is a geometric realization of $X_\bullet$ (in the ∞-category $\mathrm{N}_\bullet(\mathcal{C})$) if and only if it is a coequalizer of the face operators $d^1_0, d^1_1 : X_1 \rightrightarrows X_0$. For a slightly more general statement, see Corollary 10.1.2.12.

04QX **Example 10.1.1.7** (Simplicial Abelian Groups)**.** Let Ab denote the category of abelian groups. By virtue of the Dold-Kan correspondence (Theorem 2.5.6.1), there is an equivalence of categories $\mathrm{Fun}(\mathbf{\Delta}^{\mathrm{op}}, \mathrm{Ab}) \to \mathrm{Ch}(\mathbf{Z})_{\geq 0}$, which carries each simplicial abelian group $A_\bullet$ to its normalized Moore complex

$$\mathrm{N}_*(A) = (\cdots \to \mathrm{N}_2(A) \xrightarrow{\partial} \mathrm{N}_1(A) \xrightarrow{\partial} \mathrm{N}_0(A)).$$

Under this equivalence, the coequalizer of the pair of face operators $d^1_0, d^1_1 : A_1 \rightrightarrows A_0$ can be identified with the 0th homology group $\mathrm{H}_0(\mathrm{N}_*(A)) = \mathrm{coker}(\partial : \mathrm{N}_1(A) \to \mathrm{N}_0(A))$, or alternatively with the homotopy group $\pi_0(A_\bullet)$ (see Exercise 3.2.2.22). Using Exercise 10.1.1.6 we see that the $\pi_0(A)$ can be regarded as a geometric realization of $A_\bullet$ in the category of abelian groups. In particular, the forgetful functor Ab → Set commutes with the formation of geometric realizations (this is a special case of a more general phenomenon, which we will return to in §[?]).

Remark 10.1.1.8. Let $X_\bullet$ be a simplicial object of a category $\mathcal{C}$. It follows from Exercise 10.1.1.6 that a geometric realization of $X_\bullet$ (if it exists) depends only on the pair of face operators $d^1_0, d^1_1 : X_1 \rightrightarrows X_0$. Beware that, in the ∞-categorical setting, this is generally not true: the geometric realization $|X_\bullet|$ is sensitive to information about the *entire* simplicial object $X_\bullet$. `04QY`

Variant 10.1.1.9. Let $X^\bullet$ be a cosimplicial object of an ∞-category $\mathcal{C}$. We will say that an object $X \in \mathcal{C}$ is a *totalization of* $X^\bullet$ if it is a limit of the diagram $X^\bullet : \mathrm{N}_\bullet(\mathbf{\Delta}) \to \mathcal{C}$. If this condition is satisfied, then X is uniquely determined up to isomorphism. To emphasize this, we will often denote X by $\mathrm{Tot}(X^\bullet)$ and refer to it as *the* totalization of $X^\bullet$. `04QZ`

For many applications, the language of Definition 10.1.1.3 is insufficiently precise. Given a simplicial object $X_\bullet$ of an ∞-category $\mathcal{C}$, we would like to view its geometric realization $|X_\bullet|$ not abstractly as an object of $\mathcal{C}$, but as an object of the coslice ∞-category $\mathcal{C}_{X_\bullet/}$. For this purpose, it will be convenient to introduce some additional terminology.

Definition 10.1.1.10 (The Augmented Simplex Category)**.** For each integer $n \geq -1$, let $[n]$ denote the linearly ordered set $\{0 < 1 < \cdots < n\}$, so that $[-1]$ is the empty set. We let $\mathbf{\Delta}_+$ denote the category whose objects are the linearly ordered sets $\{[n]\}_{n \geq -1}$, and whose morphisms are nondecreasing functions. We will refer to $\mathbf{\Delta}_+$ as the *augmented simplex category.* `04R0`

Remark 10.1.1.11. The augmented simplex category $\mathbf{\Delta}_+$ of Definition 10.1.1.10 contains the simplex category $\mathbf{\Delta}$ of Definition 1.1.0.2 as a full subcategory (spanned by the objects $[n]$ for $n \geq 0$). Moreover, $\mathbf{\Delta}_+$ can be obtained from $\mathbf{\Delta}$ by adjoining a single object $[-1]$, which is an initial object satisfying $\mathrm{Hom}_{\mathbf{\Delta}_+}([n], [-1]) = \emptyset$ for $n \geq 0$. In other words, $\mathbf{\Delta}_+$ can be identified with the left cone $\mathbf{\Delta}^{\triangleleft}$ (see Example 4.3.2.5). `04R1`

Definition 10.1.1.12 (Augmented Simplicial Objects)**.** Let $\mathcal{C}$ be an ∞-category. An *augmented simplicial object of* $\mathcal{C}$ is a functor from the ∞-category $\mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}_+)$ to $\mathcal{C}$. An *augmented cosimplicial object* is a functor from the ∞-category $\mathrm{N}_\bullet(\mathbf{\Delta}_+)$ to $\mathcal{C}$. `04R2`

04R3 **Notation 10.1.1.13.** Let $\mathcal{C}$ be an ∞-category. We will often use the notation $X_{\bullet}$ to indicate an augmented simplicial object of $\mathcal{C}$. In this case, we write X_n for the value of the functor $X_{\bullet}$ on the object $[n] \in \mathbf{\Delta}_{+}^{\mathrm{op}}$. Similarly, we often use the expression $X^{\bullet}$ to indicate an augmented cosimplicial object of $\mathcal{C}$, and X^n for its value on the object $[n] \in \mathbf{\Delta}_{+}$.

04R4 **Remark 10.1.1.14.** Let $\mathcal{C}$ be an ∞-category. Every augmented simplicial object of $\mathcal{C}$ determines a simplicial object of $\mathcal{C}$, by restriction along the inclusion of full subcategories $\mathbf{\Delta}^{\mathrm{op}} \hookrightarrow \mathbf{\Delta}_{+}^{\mathrm{op}}$. For this reason, we will sometimes use the notation $\overline{X}_{\bullet}$ to indicate an augmented simplicial object of $\mathcal{C}$, to distinguish it from the underlying simplicial object $X_{\bullet} = \overline{X}_{\bullet}|_{\mathrm{N}_{\bullet}(\mathbf{\Delta}^{\mathrm{op}})}$.

04R5 **Remark 10.1.1.15.** Let $\mathcal{C}$ be an ∞-category containing an object X. By virtue of Remark 10.1.1.11, the following data are equivalent:

- Augmented simplicial objects $\mathrm{N}_{\bullet}(\mathbf{\Delta}_{+}^{\mathrm{op}}) \to \mathcal{C}$ carrying the object $[-1]$ to X.
- Simplicial objects of the slice ∞-category $\mathcal{C}_{/X}$.

We will often invoke this equivalence implicitly, using the notation $X_{\bullet}$ to indicate both an augmented simplicial object of $\mathcal{C}$ (satisfying $X_{-1} = X$) and the associated simplicial object of $\mathcal{C}_{/X}$.

04R6 **Definition 10.1.1.16.** Let $\mathcal{C}$ be an ∞-category containing an object X, let $\overline{X}_{\bullet}$ be an augmented simplicial object of $\mathcal{C}$ satisfying $\overline{X}_{-1} = X$, and let $X_{\bullet} = \underline{X}_{\bullet}|_{\mathrm{N}_{\bullet}(\mathbf{\Delta}^{\mathrm{op}})}$ denote its underlying simplicial object. We will say that $\overline{X}_{\bullet}$ *exhibits X as a geometric realization of* $X_{\bullet}$ if it is a colimit diagram in the ∞-category $\mathcal{C}$, in the sense of Variant 7.1.2.5.

Similarly, if $\overline{X}^{\bullet}$ is an augmented cosimplicial object of $\mathcal{C}$ satisfying $\overline{X}^{-1} = X$ and $X^{\bullet} = \overline{X}^{\bullet}|_{\mathrm{N}_{\bullet}(\mathbf{\Delta})}$ is the underlying cosimplicial object, we say that $\overline{X}^{\bullet}$ *exhibits X as a totalization of* $X^{\bullet}$ if it is a limit diagram in the ∞-category $\mathcal{C}$, in the sense of Definition 7.1.2.4.

04R7 **Remark 10.1.1.17.** Let $\mathcal{C}$ be an ∞-category, let $X_{\bullet}$ be a simplicial object of $\mathcal{C}$, and let X be an object of $\mathcal{C}$. Then X is a geometric realization of $X_{\bullet}$ (in the sense of Definition 10.1.1.3) if and only if there exists an augmented simplicial object $\overline{X}_{\bullet}$ which exhibits X as a geometric realization of $X_{\bullet}$ (in the sense of Definition 10.1.1.16). See Remark 7.1.2.7.

10.1.2 Semisimplicial Objects

04R8 Let $\mathbf{\Delta}$ denote the simplex category (Definition 1.1.0.2), and let $\mathbf{\Delta}_{\mathrm{inj}}$ denote the subcategory of $\mathbf{\Delta}$ whose morphisms are strictly increasing functions $[m] \hookrightarrow [n]$ (Definition 1.1.1.2). It will often be useful to consider the following variant of Definition 10.1.0.1:

Definition 10.1.2.1 (Semisimplicial Objects)**.** Let $\mathcal{C}$ be an ∞-category. A *semisimplicial object of* $\mathcal{C}$ is a functor $\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj}}^{\mathrm{op}}) \to \mathcal{C}$. A *cosemisimplicial object of* $\mathcal{C}$ is a functor $\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj}}) \to \mathcal{C}$. `04R9`

Notation 10.1.2.2. Let $\mathcal{C}$ be an ∞-category. We will often use the notation $X_\bullet$ to indicate a semisimplicial object of $\mathcal{C}$. In this case, we write X_n for the value of the functor $X_\bullet$ on the object $[n] \in \mathbf{\Delta}_{\mathrm{inj}}^{\mathrm{op}}$. Similarly, we often use an expression like $X^\bullet$ to indicate a cosemisimplicial object of $\mathcal{C}$, and X^n for its value on the object $[n] \in \mathbf{\Delta}_{\mathrm{inj}}$. `04RA`

Example 10.1.2.3. Let $\mathcal{C}$ be a category. Then (co)semisimplicial objects of the ∞-category $\mathrm{N}_\bullet(\mathcal{C})$ (in the sense of Definition 10.1.2.1) can be identified with (co)semisimplicial objects of $\mathcal{C}$ (in the sense of Definition 1.1.1.2). `04RB`

Example 10.1.2.4. Let $\mathcal{C}$ be an ∞-category and let $X_\bullet$ be a simplicial object of $\mathcal{C}$. The composite functor `04RC`

$$\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj}}^{\mathrm{op}}) \subset \mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}) \xrightarrow{X_\bullet} \mathcal{C}$$

is a semisimplicial object of $\mathcal{C}$, which we will refer to as the *underlying semisimplicial object of* $X_\bullet$. We will often abuse notation by identifying $X_\bullet$ with its underlying semisimplicial object. Similarly, every cosimplicial object $X^\bullet$ of $\mathcal{C}$ has an underlying cosemisimplicial object, given by the composition

$$\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj}}) \subset \mathrm{N}_\bullet(\mathbf{\Delta}) \xrightarrow{X^\bullet} \mathcal{C}\,.$$

Remark 10.1.2.5 (Face Operators)**.** Let $X_\bullet$ be a semisimplicial object of an ∞-category. For every pair of integers $0 \leq i \leq n$ with $n > 0$, we let $d_i^n : X_n \to X_{n-1}$ denote the morphism induced by the inclusion of linearly ordered sets $\delta_n^i : [n-1] \hookrightarrow [n]$ introduced in Construction 1.1.1.4. We will refer to d_i^n as the *ith face operator* of the semisimplicial object $X_\bullet$. `04RD`

The utility of Definition 10.1.2.1 stems in part from the fact that, for many purposes, passage from simplicial to semisimplicial objects does not lose very much information.

Proposition 10.1.2.6. *The inclusion $\mathbf{\Delta}_{\mathrm{inj}} \subset \mathbf{\Delta}$ determines a left cofinal functor of ∞-categories $\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj}}) \hookrightarrow \mathrm{N}_\bullet(\mathbf{\Delta})$.* `04RE`

Proof. By virtue of Theorem 7.2.3.1, it will suffice to show that for every integer $n \geq 0$, the category $\mathcal{C} = \mathbf{\Delta}_{\mathrm{inj}} \times_{\mathbf{\Delta}} \mathbf{\Delta}_{/[n]}$ has weakly contractible nerve. Let $C_0 \in \mathcal{C}$ denote the object corresponding to the inclusion map $[0] \simeq \{n\} \hookrightarrow [n]$. For every object $C \in \mathcal{C}$, given by a nondecreasing function $\alpha : [m] \to [n]$, we let $F(C) \in \mathcal{C}$ denote the object given by the nondecreasing function $\alpha^+ : [m+1] \to [n]$ given by the formula

$$\alpha^+(i) = \begin{cases} \alpha(i) & \text{if } 0 \leq i \leq m \\ n & \text{if } i = m+1. \end{cases}$$

Note that we have canonical maps $C \xrightarrow{\beta_-} F(C) \xleftarrow{\beta_+} C_0$, given by the inclusions

$$\{0 < 1 < \cdots < m\} \hookrightarrow \{0 < 1 < \cdots < m+1\} \hookleftarrow \{m+1\}.$$

These morphisms depend functorially on C, and therefore furnish natural transformations of functors $\mathrm{id}_{\mathcal{C}} \to F \leftarrow \underline{C_0}$, where $\underline{C_0} : \mathcal{C} \to \mathcal{C}$ denotes the constant functor taking the value C_0. It follows that the identity morphism of the simplicial set $\mathrm{N}_\bullet(\mathcal{C})$ is homotopic to the constant morphism $\mathrm{N}_\bullet(\mathcal{C}) \twoheadrightarrow \{C_0\} \hookrightarrow \mathrm{N}_\bullet(\mathcal{C})$, so that the simplicial set $\mathrm{N}_\bullet(\mathcal{C})$ is contractible (and, in particular, it is weakly contractible). □

04RF **Corollary 10.1.2.7.** *Let $\mathcal{C}$ be an ∞-category and let $X_\bullet$ be a simplicial object of $\mathcal{C}$. Then an object $X \in \mathcal{C}$ is a geometric realization of $X_\bullet$ (in the sense of Definition 10.1.1.3) if and only if it is a colimit of the underlying diagram $\mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}_{\mathrm{inj}}) \subset \mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}) \xrightarrow{X_\bullet} \mathcal{C}$.*

Proof. Combine Proposition 10.1.2.6 with Corollary 7.2.2.11. □

04RG **Example 10.1.2.8.** Let S be a simplicial set and let $|S|$ denote its geometric realization as a topological space (Definition 1.2.3.1). Combining Proposition 10.1.1.1 with Corollary 10.1.2.7, we deduce that the homotopy type of the topological space $|S|$ depends only on the underlying semisimplicial set of S. Compare with Corollary 3.4.5.5.

Motivated by Corollary 10.1.2.7, we introduce the following terminology:

04RH **Definition 10.1.2.9.** Let $\mathcal{C}$ be an ∞-category and let $X_\bullet$ be a semisimplicial object of $\mathcal{C}$. We say that an object $X \in \mathcal{C}$ is a *geometric realization of* $X_\bullet$ if it is a colimit of the diagram $X_\bullet : \mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}_{\mathrm{inj}}) \to \mathcal{C}$. If $X^\bullet$ is a cosemisimplicial object of $\mathcal{C}$, we say that an object $X \in \mathcal{C}$ is a *totalization of* $X^\bullet$ if it is a limit of the diagram $X^\bullet : \mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj}}) \to \mathcal{C}$.

04RJ **Remark 10.1.2.10.** Let $X_\bullet$ be a simplicial object of an ∞-category $\mathcal{C}$. Corollary 10.1.2.7 asserts that an object $X \in \mathcal{C}$ is a geometric realization of $X_\bullet$ (in the sense of Definition 10.1.1.3) if and only if it is a geometric realization of the underlying semisimplicial object of $X_\bullet$ (in the sense of Definition 10.1.2.9). In particular, $X_\bullet$ admits a geometric realization if and only if its underlying semisimplicial object admits a geometric realization.

In the setting of classical category theory, the notion of geometric realization can be made more concrete.

04RK **Proposition 10.1.2.11.** *Let $\mathcal{C}$ be a category, let Y be an object of $\mathcal{C}$, and let $\underline{Y}$ denote the constant semisimplicial object of $\mathcal{C}$ taking the value Y. For every semisimplicial object $X_\bullet$ of $\mathcal{C}$, the evaluation map*

$$\mathrm{Hom}_{\mathrm{Fun}(\mathbf{\Delta}^{\mathrm{op}}_{\mathrm{inj}}, \mathcal{C})}(X_\bullet, \underline{Y}) \to \mathrm{Hom}_{\mathcal{C}}(X_0, Y)$$

is a monomorphism, whose image is the set of morphisms $\epsilon : X_0 \to Y$ which satisfy the following condition:

$(*)$ *The face operators* $d^1_0, d^1_1 : X_1 \to X_0$ *of the simplicial object* $X_\bullet$ *satisfy* $\epsilon \circ d^1_0 = \epsilon \circ d^1_1$.

Proof. For every integer $n \geq 0$, let ι_n denote the inclusion map $[0] = \{0\} \hookrightarrow \{0 < 1 < \cdots < n\} = [n]$ and write $\iota^*_n : X_n \to X_0$ for the associated morphism of $\mathcal{C}$. If $f_\bullet : X_\bullet \to \underline{Y}$ is a morphism of semisimplicial objects, then we must have $f_n = f_0 \circ \iota^*_n$ for each $n \geq 0$; in particular, $f_\bullet$ is uniquely determined by the morphism $\epsilon = f_0$. To complete the proof, it will suffice to show that if a morphism $\epsilon : X_0 \to Y$ satisfies condition $(*)$, then the collection $\{(\epsilon \circ \iota^*_n) : X_n \to Y\}_{n \geq 0}$ determines a morphism of semisimplicial objects from $X_\bullet$ to $\underline{Y}$ (the converse follows immediately from the definitions). Fix a strictly increasing function $\alpha : [m] \hookrightarrow [n]$; we wish to show that the diagram

$$\begin{tikzcd}
X_n \arrow[r, "\iota^*_n"] \arrow[d, "\alpha^*"'] & X_0 \arrow[d, "\epsilon"] \\
X_m \arrow[r, "\epsilon \circ \iota^*_m"] & Y
\end{tikzcd} \tag{10.1}$$ 04RL

commutes. If $\alpha(0) = 0$, then $\iota_n = \alpha \circ \iota_m$. It follows that $\iota^*_n = \iota^*_m \circ \alpha^*$, and the desired result follows by composing with ϵ on both sides. We may therefore assume without loss of generality that $\alpha(0) > 0$. Let $\beta : [1] \hookrightarrow [n]$ be the strictly increasing function given by $\beta(0) = 0$ and $\beta(1) = \alpha(0)$. Then (10.1) can be identified with the outer rectangle of the diagram

$$\begin{tikzcd}
X_n \arrow[r, "\beta^*"] \arrow[d, "\alpha^*"'] & X_1 \arrow[r, "d^1_1"] \arrow[d, "d^1_0"] & X_0 \arrow[d, "\epsilon"] \\
X_m \arrow[r, "\iota^*_m"] & X_0 \arrow[r, "\epsilon"] & Y,
\end{tikzcd}$$

where the left square commutes by the naturality of the construction $[k] \mapsto X_k$, and the right square commutes by virtue of assumption $(*)$. □

Corollary 10.1.2.12. *Let* $X_\bullet$ *be a semisimplicial object of a category* $\mathcal{C}$. *Then an object* $X \in \mathcal{C}$ *is a geometric realization of* $X_\bullet$ *(in the* ∞*-category* $\mathrm{N}_\bullet(\mathcal{C})$*) if and only if it is a coequalizer of the face operators* $d^1_0, d^1_1 : X_1 \rightrightarrows X_0$. 04RM

For some applications, we will need more precise language for discussing geometric realizations of semisimplicial objects.

Notation 10.1.2.13. Let $\mathbf{\Delta}_+$ be the augmented simplex category (Definition 10.1.1.10). We let $\mathbf{\Delta}_{\mathrm{inj},+}$ denote the (non-full) subcategory of $\mathbf{\Delta}_+$ whose morphisms are strictly increasing 04RN functions $[m] \hookrightarrow [n]$. Note that $\mathbf{\Delta}_{\mathrm{inj},+}$ can be obtained from the category $\mathbf{\Delta}_{\mathrm{inj}}$ by adjoining an initial object $[-1]$ satisfying $\mathrm{Hom}_{\mathbf{\Delta}_{+,\mathrm{inj}}}([n],[-1]) = \emptyset$ for $n \geq 0$. Consequently, $\mathbf{\Delta}_{\mathrm{inj},+}$ can be identified with the left cone $\mathbf{\Delta}_{\mathrm{inj}}^{\triangleleft}$ (see Example 4.3.2.5).

04RP **Proposition 10.1.2.14.** *The diagram of ∞-categories*

$$\begin{tikzcd}
\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj}}) \arrow[r] \arrow[d] & \mathrm{N}_\bullet(\mathbf{\Delta}) \arrow[d] \\
\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj},+}) \arrow[r] & \mathrm{N}_\bullet(\mathbf{\Delta}_{+})
\end{tikzcd}$$

is a categorical pushout square.

Proof. By virtue of Proposition 7.2.2.1, this is a reformulation of Proposition 10.1.2.6. □

04RQ **Definition 10.1.2.15** (Augmented Semisimplicial Objects)**.** Let $\mathcal{C}$ be an ∞-category. An *augmented semisimplicial object of* $\mathcal{C}$ is a functor from the ∞-category $\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj},+}^{\mathrm{op}})$ to $\mathcal{C}$. An *augmented cosemisimplicial object* is a functor from the ∞-category $\mathrm{N}_\bullet(\mathbf{\Delta}_{+})$ to $\mathcal{C}$.

04RR **Notation 10.1.2.16.** Let $\mathcal{C}$ be an ∞-category. We will often use the notation $X_\bullet$ to indicate an augmented semisimplicial object of $\mathcal{C}$. In this case, we write X_n for the value of the functor $X_\bullet$ on the object $[n] \in \mathbf{\Delta}_{\mathrm{inj},+}^{\mathrm{op}}$. Similarly, we often use the expression $X^\bullet$ to indicate an augmented cosimplicial object of $\mathcal{C}$, and X^n for its value on the object $[n] \in \mathbf{\Delta}_{\mathrm{inj},+}$.

04RS **Remark 10.1.2.17.** Let $\mathcal{C}$ be an ∞-category. Every augmented semisimplicial object of $\mathcal{C}$ determines a semisimplicial object of $\mathcal{C}$, by restriction along the inclusion of full subcategories $\mathbf{\Delta}_{\mathrm{inj}}^{\mathrm{op}} \hookrightarrow \mathbf{\Delta}_{\mathrm{inj},+}^{\mathrm{op}}$. For this reason, we will sometimes use the notation $\overline{X}_\bullet$ to indicate an augmented semisimplicial object of $\mathcal{C}$, to distinguish it from the underlying simplicial object $X_\bullet = \overline{X}_\bullet|_{\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj}}^{\mathrm{op}})}$.

04RT **Remark 10.1.2.18.** Let $\mathcal{C}$ be an ∞-category. It follows from Proposition 10.1.2.14 that the diagram of ∞-categories

$$\begin{tikzcd}
\mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta}_{+}^{\mathrm{op}}),\mathcal{C}) \arrow[r] \arrow[d] & \mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}),\mathcal{C}) \arrow[d] \\
\mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj},+}^{\mathrm{op}}),\mathcal{C}) \arrow[r] & \mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj}}^{\mathrm{op}}),\mathcal{C})
\end{tikzcd}$$

is a categorical pullback square. In particular, if $X_\bullet$ is a simplicial object of $\mathcal{C}$, then the datum of an augmentation of $X_\bullet$ is equivalent to the datum of an augmentation on the underlying semisimplicial object of $X_\bullet$.

Remark 10.1.2.19 (Face Operators)**.** For every pair of integers $0 \leq i \leq n$, there is a unique increasing function $\delta^i_n : [n-1] \hookrightarrow [n]$ whose image is the set $[n] \setminus \{i\}$, given concretely by the formula 04RU

$$\delta^i_n(j) = \begin{cases} j & \text{if } j < i \\ j+1 & \text{if } j \geq i. \end{cases}$$

If $X_\bullet$ is an augmented semisimplicial object of an ∞-category $\mathcal{C}$, then evaluation on the morphism δ^i_n determines a map $d^n_i : X_n \to X_{n-1}$, which we will refer to as the *ith face operator* for the augmented semisimplicial object $X_\bullet$. If $n > 0$, this recover the face operators for the underlying semisimplicial object of $X_\bullet$ (Remark 10.1.2.5). In the case $n = 0$, we obtain a new operator $d^0_0 : X_0 \to X_{-1}$.

Remark 10.1.2.20. Let $\mathcal{C}$ be an ∞-category containing an object X. By virtue of Remark 10.1.1.11, the following data are equivalent: 04RV

- Augmented semisimplicial objects $\mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}_+) \to \mathcal{C}$ carrying the object $[-1]$ to X.
- Semisimplicial objects of the slice ∞-category $\mathcal{C}_{/X}$.

We will often invoke this equivalence implicitly, using the notation $X_\bullet$ to indicate both an augmented simplicial object of $\mathcal{C}$ (satisfying $X_{-1} = X$) and the associated simplicial object of $\mathcal{C}_{/X}$.

Remark 10.1.2.21 (Augmented Moore Complexes)**.** Let $A_\bullet$ be an augmented semisimplicial object of the category of abelian groups. For each $n \geq 0$, let $\partial : A_n \to A_{n-1}$ denote the group homomorphism given by the alternating sum 04RW

$$\partial(\sigma) = \sum_{i=0}^{n} (-1)^i d^n_i(\sigma).$$

The diagram

$$\cdots \to A_2 \xrightarrow{\partial} A_1 \xrightarrow{\partial} A_0 \xrightarrow{\partial} A_{-1}$$

is a chain complex of abelian groups which we will denote by $\mathrm{C}^{\mathrm{aug}}_*(A)$ and refer to as the *augmented Moore complex of* $A_\bullet$. Note that, when restricted to nonnegative degrees, this recovers the Moore complex of the underlying semisimplicial abelian group (see Construction 2.5.5.1).

Variant 10.1.2.22. Let $A_\bullet$ be an augmented simplicial object of the category of abelian groups. Let us abuse notation by identifying $A_\bullet$ with the underlying simplicial abelian group, and let 04RX

$$\mathrm{D}_*(A) \subseteq \mathrm{C}_*(A) \subseteq \mathrm{C}^{\mathrm{aug}}_*(A)$$

be the subcomplex generated by the images of the degeneracy operators (see Proposition 2.5.5.6). We let $\mathrm{N}^{\mathrm{aug}}_*(A)$ denote the quotient complex $\mathrm{C}^{\mathrm{aug}}_*(A)/\mathrm{D}_*(A)$, which we will refer to as the *normalized augmented Moore complex* of $A_\bullet$. Note that, when restricted to nonnegative degrees, this recovers the normalized Moore complex of the underlying simplicial abelian group (Construction 2.5.5.7).

04RY **Definition 10.1.2.23.** Let $\mathcal{C}$ be an ∞-category containing an object X, let $\overline{X}_\bullet$ be an augmented semisimplicial object of $\mathcal{C}$ satisfying $\overline{X}_{-1} = X$, and let $X_\bullet = \underline{X}_\bullet|_{\mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}_{\mathrm{inj}})}$ denote its underlying semisimplicial object. We will say that $\overline{X}_\bullet$ *exhibits X as a geometric realization of $X_\bullet$* if it is a colimit diagram in the ∞-category $\mathcal{C}$, in the sense of Variant 7.1.2.5.

Similarly, if $\overline{X}^\bullet$ is an augmented cosemisimplicial object of $\mathcal{C}$ satisfying $\overline{X}^{-1} = X$ and $X^\bullet = \overline{X}^\bullet|_{\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj}})}$ is the underlying cosemisimplicial object, we say that $\overline{X}^\bullet$ *exhibits X as a totalization of $X^\bullet$* if it is a limit diagram in the ∞-category $\mathcal{C}$, in the sense of Definition 7.1.2.4.

04RZ **Remark 10.1.2.24.** Let $\mathcal{C}$ be an ∞-category, let $X_\bullet$ be a semisimplicial object of $\mathcal{C}$, and let X be an object of $\mathcal{C}$. Then X is a geometric realization of $X_\bullet$ (in the sense of Definition 10.1.2.9) if and only if there exists an augmented semisimplicial object $\overline{X}_\bullet$ which exhibits X as a geometric realization of $X_\bullet$ (in the sense of Definition 10.1.2.23). See Remark 7.1.2.7.

By virtue of Example 4.3.2.15, we can formulate Proposition 10.1.2.11 as follows:

04S0 **Proposition 10.1.2.25.** *Let $\mathcal{C}$ be a category, let X be an object of $\mathcal{C}$, and let $X_\bullet$ be a semisimplicial object of $\mathcal{C}$. The following data are equivalent:*

- *Extensions of $X_\bullet$ to an augmented semisimplicial object $\overline{X}_\bullet$ satisfying $\overline{X}_{-1} = X$.*
- *Morphisms $\epsilon : X_0 \to X$ satisfying $\epsilon \circ d^1_0 = \epsilon \circ d^1_1$, where $d^1_0, d^1_1 : X_1 \rightrightarrows X_0$ are the face operators of the semisimplicial object $X_\bullet$.*

Here the equivalence is implemented by taking ϵ to be the face operator $d^0_0 : X_0 \to X_{-1}$ of Remark 10.1.2.19.

04S1 **Remark 10.1.2.26.** In the situation of Proposition 10.1.2.25, the augmented semisimplicial object $\overline{X}_\bullet$ exhibits X as a geometric realization of $X_\bullet$ (in the sense of Definition 10.1.1.16) if and only if it the morphism ϵ exhibits X as a coequalizer of the face operators $d^1_0, d^1_1 : X_1 \rightrightarrows X_0$.

Combining Propositions 10.1.2.25 and 1.1.1.9, we obtain an explicit characterization of augmented semisimplicial objects of ordinary categories:

04S2 **Corollary 10.1.2.27.** *Let $\mathcal{C}$ be a category and let $\{X_n\}_{n \geq -1}$ be a sequence of objects of $\mathcal{C}$. Then a system of morphisms $\{d^n_i : X_n \to X_{n-1}\}_{0 \leq i \leq n}$ arise as the face operators of an augmented semisimplicial object $X_\bullet$ of $\mathcal{C}$ if and only if they satisfy the following condition:*

($*$) *For all integers $n > 0$ and $0 \leq i < j \leq n$, we have an equality $d_i^{n-1} \circ d_j^n = d_{j-1}^{n-1} \circ d_i^n$ (as morphisms from X_n to X_{n-2}).*

If this condition is satisfied, then the augmented semisimplicial object $X_\bullet$ is uniquely determined.

Variant 10.1.2.28. Let $\mathcal{C}$ be a category and let $\{X_n\}_{n \geq -1}$ be a sequence of objects of $\mathcal{C}$. Then morphisms 04S3

$$\{d_i^n : X_n \to X_{n-1}\}_{0 \leq i \leq n} \qquad \{s_i^n : X_n \to X_{n+1}\}_{0 \leq i \leq n}$$

are the face and degeneracy operators for an augmented simplicial object $X_\bullet$ of $\mathcal{C}$ if and only if they satisfy the following conditions:

(1) For all integers $n > 0$ and $0 \leq i < j \leq n$, we have an equality $d_i^{n-1} \circ d_j^n = d_{j-1}^{n-1} \circ d_i^n$ (as morphisms from X_n to X_{n-2}).

(2) For all integers $0 \leq i \leq j \leq n$, we have an equality $s_i^{n+1} \circ s_j^n = s_{j+1}^{n+1} \circ s_i^n$ (as morphisms from X_n to X_{n+2}).

(3) For all integers $0 \leq i, j \leq n$, we have an equality

$$d_i^{n+1} \circ s_j^n = \begin{cases} s_{j-1}^{n-1} \circ d_i^n & \text{if } i < j \\ \mathrm{id}_{X_n} & \text{if } i = j \text{ or } i = j+1 \\ s_j^{n-1} \circ d_{i-1}^n & \text{if } i > j+1 \end{cases}$$

(as morphisms from X_n to X_n).

If these conditions are satisfied, then the augmented simplicial object $X_\bullet$ is uniquely determined.

Proof. Combine Proposition 1.1.2.14, Remark 10.1.2.18, and Corollary 10.1.2.27. □

We close this section with a few remarks concerning the relationship between simplicial and semisimplicial objects.

Proposition 10.1.2.29. *Let $\mathcal{C}$ be an ∞-category which admits finite coproducts and let $X_\bullet$ be a semisimplicial object of $\mathcal{C}$. Then there exists a simplicial object $X_\bullet^+$ of $\mathcal{C}$ and a natural transformation of semisimplicial objects $f_\bullet : X_\bullet \to X_\bullet^+$ which exhibits $X_\bullet^+$ as a left Kan extension of $X_\bullet$ along the inclusion map $\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj}}^{\mathrm{op}}) \subseteq \mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}})$.* 04S4

Proof. We will show that $X_\bullet$ satisfies the criterion of Proposition 7.3.5.1. Fix an object $[n] \in \mathbf{\Delta}$, let $\mathcal{E}$ denote the fiber product $\mathbf{\Delta}_{\mathrm{inj}} \times_{\mathbf{\Delta}} \mathbf{\Delta}_{[n]/}$, and let F denote the composite map

$$\mathrm{N}_\bullet(\mathcal{E}^{\mathrm{op}}) \to \mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj}}^{\mathrm{op}}) \xrightarrow{X_\bullet} \mathcal{C}\,.$$

We wish to show that F admits a colimit in $\mathcal{C}$.

By definition, objects of the category $\mathcal{E}$ can be identified with pairs $([m], \alpha)$, where $[m]$ is an object of $\mathbf{\Delta}_{\mathrm{inj}}$ is an integer and $\alpha : [n] \to [m]$ is a nondecreasing function. Let $\mathcal{E}_0 \subseteq \mathcal{E}$ denote the full subcategory spanned by those objects $([m], \alpha)$ where α is a surjection. Note that any morphism $\alpha : [n] \to [m]$ in $\mathbf{\Delta}$ factors uniquely as a composition $[n] \xrightarrow{\alpha'} [m'] \xrightarrow{\beta} [m]$, where α' is a surjection and β is an injection. The pair $([m'], \alpha')$ is then an object of the subcategory $\mathcal{E}_0$, and the morphism $\beta : ([m'], \alpha') \to ([m], \alpha)$ exhibits exhibits $([m'], \alpha')$ as a $\mathcal{E}_0$-coreflection of $([m], \alpha)$ (see Definition 6.2.2.1). It follows that the inclusion map $\mathrm{N}_\bullet(\mathcal{E}_0^{\mathrm{op}}) \hookrightarrow \mathrm{N}_\bullet(\mathcal{E}^{\mathrm{op}})$ is right cofinal (Corollary 7.2.2.7). Consequently, to show that F admits a colimit in $\mathcal{C}$, it will suffice to show that the restriction $F|_{\mathrm{N}_\bullet(\mathcal{E}_0^{\mathrm{op}})}$ admits a colimit in $\mathcal{C}$ (Corollary 7.2.2.10). Since the category $\mathcal{E}_0$ has finitely many objects and only identity morphisms, this follows from our assumption that $\mathcal{C}$ admits finite coproducts. □

04S5 **Remark 10.1.2.30.** Let $\mathcal{C}$ be an ∞-category, let $Y_\bullet$ be a simplicial object of $\mathcal{C}$, and suppose we are given a morphism $f_\bullet : X_\bullet \to Y_\bullet$ of semisimplicial objects of $\mathcal{C}$. It follows from the proof of Proposition 10.1.2.29 that $f_\bullet$ exhibits $Y_\bullet$ as a left Kan extension of $X_\bullet$ along the inclusion map $\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj}}^{\mathrm{op}}) \subseteq \mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}})$ if and only if, for every integer $n \geq 0$, the following condition is satisfied:

$(*_n)$ Let E be the collection of all surjections $\alpha : [n] \twoheadrightarrow [m]$ in the category $\mathbf{\Delta}$. For each $\alpha \in E$, let $g_\alpha : X_m \to Y_n$ be a composition of $f_m : X_m \to Y_m$ with the morphism $\alpha^* : Y_m \to Y_n$. Then the collection $\{g_\alpha\}_{\alpha \in E}$ exhibit Y_n as a coproduct of the collection of objects $\{X_m\}_{(\alpha:[n] \twoheadrightarrow [m]) \in E}$.

Compare with Construction 3.3.1.6.

10.1.3 Skeletal Simplicial Objects

05G3 Recall that every set S can be regarded as a simplicial set, by identifying it with the constant functor

$$\underline{S} : \mathbf{\Delta}^{\mathrm{op}} \to \{S\} \hookrightarrow \mathrm{Set}.$$

This construction has a counterpart in an ∞-category:

05G4 **Definition 10.1.3.1.** Let $\mathcal{C}$ be an ∞-category. For each object $C \in \mathcal{C}$, we let $\underline{C}$ denote the simplicial object of $\mathcal{C}$ given by the constant functor

$$\mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}) \to \{C\} \hookrightarrow \mathcal{C}.$$

We say that a simplicial object $X_\bullet$ of $\mathcal{C}$ is *constant* if it is equal to $\underline{C}$, for some object $C \in \mathcal{C}$ (in this case, we must have $C = X_0$). We say that $X_\bullet$ is *essentially constant* it is isomorphic to a constant simplicial object $\underline{C}$, for some $C \in \mathcal{C}$.

Proposition 10.1.3.2. *Let $\mathcal{C}$ be an ∞-category and let $X_\bullet$ be a simplicial object of $\mathcal{C}$. The following conditions are equivalent:* 05G5

(1) *The simplicial object $X_\bullet$ is essentially constant: that is, there exists an isomorphism of simplicial objects $\alpha : \underline{C} \to X_\bullet$ for some object $C \in \mathcal{C}$.*

(2) *The functor $X_\bullet : \mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}) \to \mathcal{C}$ carries each morphism in the category $\mathbf{\Delta}^{\mathrm{op}}$ to an isomorphism in the ∞-category $\mathcal{C}$.*

(3) *The functor $X_\bullet$ is left Kan extended from the full subcategory $\{[0]\} \subseteq \mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}})$.*

(4) *For every simplicial object $Y_\bullet$ of $\mathcal{C}$, the restriction map*

$$\mathrm{Hom}_{\mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}),\mathcal{C})}(X_\bullet, Y_\bullet) \to \mathrm{Hom}_{\mathcal{C}}(X_0, Y_0)$$

is a homotopy equivalence.

Proof. The equivalences (1) ⇔ (2) ⇔ (3) are special cases of Corollary 7.3.3.14, since $[0]$ is a final object of the category $\mathbf{\Delta}$. The equivalence (3) ⇔ (4) follows from Corollary 7.3.6.13. □

We now introduce a generalization of Definition 10.1.3.1.

Notation 10.1.3.3. Let $\mathbf{\Delta}$ denote the simplex category (Definition 1.1.0.2). For every integer n, we let $\mathbf{\Delta}^{\leq n}$ denote the full subcategory of $\mathbf{\Delta}$ spanned by those objects $[m] = \{0 < 1 < \cdots < m\}$ where $0 \leq m \leq n$ (see Construction 1.1.3.9). 05G6

Definition 10.1.3.4. Let $\mathcal{C}$ be an ∞-category and let n be an integer. We say that a simplicial object $X_\bullet$ of $\mathcal{C}$ is *n-skeletal* if the functor 05G7

$$\mathrm{N}_\bullet(\mathbf{\Delta})^{\mathrm{op}} \xrightarrow{X_\bullet} \mathcal{C}$$

is left Kan extended from the full subcategory $\mathrm{N}_\bullet(\mathbf{\Delta}^{\leq n})^{\mathrm{op}} \subseteq \mathrm{N}_\bullet(\mathbf{\Delta})^{\mathrm{op}}$.

Example 10.1.3.5. Let $\mathcal{C}$ be an ∞-category. A simplicial object $X_\bullet$ of $\mathcal{C}$ is 0-skeletal (in the sense of Definition 10.1.3.4) if and only if it is essentially constant (in the sense of Definition 10.1.3.1). See Proposition 10.1.3.2. 05G8

Example 10.1.3.6. Let $X_\bullet$ be a simplicial set and let n be an integer. Then $X_\bullet$ is n-skeletal (in the sense of Definition 10.1.3.4) if and only if it has dimension $\leq n$ (in the sense of Definition 1.1.3.1) . This is a reformulation of Proposition 1.1.3.11 (see Remark 1.1.3.12). 05G9

Exercise 10.1.3.7. Let n be an integer. Show that a simplicial abelian group $A_\bullet$ is n-skeletal (when regarded as a simplicial object of the ∞-category $\mathrm{N}_\bullet(\mathrm{Ab})$) if and only if the normalized Moore complex 05GA

$$\cdots \to \mathrm{N}_2(A) \xrightarrow{\partial} \mathrm{N}_1(A) \xrightarrow{\partial} \mathrm{N}_0(A)$$

is concentrated in degrees $\leq n$: that is, the abelian group $\mathrm{N}_k(A)$ vanishes for $k > n$. Beware that this condition does not guarantee that $A_\bullet$ is n-skeletal when regarded as a simplicial set.

05GB **Remark 10.1.3.8** (Monotonicity)**.** Let $X_\bullet$ be a simplicial object of an ∞-category $\mathcal{C}$ and let $m \leq n$ be integers. If $X_\bullet$ is m-skeletal, then it is also n-skeletal. See Corollary 7.3.8.8.

05GC **Remark 10.1.3.9.** In the formulation of Definition 10.1.3.4, we allow n to be an arbitrary integer. However, for $n < 0$, the notion becomes degenerate: a simplicial object $X_\bullet$ is n-skeletal if and only if each X_m is an initial object of $\mathcal{C}$. In this case, $X_\bullet$ is an initial object in the ∞-category of simplicial objects $\mathrm{Fun}(\mathrm{N}_\bullet(\boldsymbol{\Delta})^{\mathrm{op}}, \mathcal{C})$.

To make Definition 10.1.3.4 more explicit, it will be convenient to introduce an auxiliary construction.

05GD **Construction 10.1.3.10** (Degeneracy Cubes)**.** Fix an integer $k \geq 0$, set $K = \{1, 2, \cdots, k\}$, and let $\square^k = \square^K$ denote the simplicial cube of dimension k (Notation 2.4.5.2). Recall that $\square^k$ can be identified with the nerve of the set $P(K)$ of subsets of K, partially ordered with respect to inclusion.

For every subset $J \subseteq K$ having cardinality j, let $\alpha_J : [k] \twoheadrightarrow [j]$ denote the nondecreasing function function which carries an element $k' \in [k]$ to the cardinality of the intersection $J \cap \{1, 2, \cdots, k'\}$. The construction $J \mapsto \alpha_J$ then determines a functor from $P(K)^{\mathrm{op}}$ to the coslice category $\boldsymbol{\Delta}_{[k]/}$.

If $\mathcal{C}$ is an ∞-category and $X_\bullet$ is a simplicial object of $\mathcal{C}$, we let $\sigma_k : \square^k \to \mathcal{C}$ denote the map given by the composition

$$\square^k \simeq \mathrm{N}_\bullet(P(K)) \xrightarrow{J \mapsto \alpha_J} \mathrm{N}_\bullet(\boldsymbol{\Delta}_{[k]/})^{\mathrm{op}} \to \mathrm{N}_\bullet(\boldsymbol{\Delta})^{\mathrm{op}} \xrightarrow{X_\bullet} \mathcal{C}\,.$$

We will refer to σ_k as the *kth degeneracy cube* of the simplicial object $X_\bullet$.

05GE **Example 10.1.3.11.** Let $X_\bullet$ be a simplicial object of an ∞-category $\mathcal{C}$. For small values of k, the degeneracy cube $\sigma_k : \square^k \to \mathcal{C}$ of Construction 10.1.3.10 can be described more concretely:

- The degeneracy cube σ_0 can be identified with the object X_0 of $\mathcal{C}$.
- The degeneracy cube σ_1 can be identified with the degeneracy operator $s_0^0 : X_0 \to X_1$ of Notation 10.1.0.4.

- The degeneracy cube σ_2 is a square diagram

$$\begin{tikzcd}
X_0 \arrow[r, "s_0^0"] \arrow[d, "s_0^0"] & X_1 \arrow[d, "s_0^1"] \\
X_1 \arrow[r, "s_1^1"] & X_2
\end{tikzcd}$$

  which witnesses the identity $[s_0^1] \circ [s_0^0] = [s_1^1] \circ [s_0^0]$ in the homotopy category $\mathrm{h}\mathcal{C}$.

Notation 10.1.3.12. Let k be a nonnegative integer. For every integer n, we let $\mathbf{\Delta}_{[k]/}^{\leq n}$ denote the full subcategory of the coslice category $\mathbf{\Delta}_{[k]/}$ spanned by objects which correspond to nondecreasing functions $[k] \to [m]$, where $m \leq n$. `05GF`

Lemma 10.1.3.13. *Let $k \geq 0$ and n be integers, let $K = \{1, \cdots, k\}$, and let $P^{\leq n}(K)$ denote the partially ordered collection of all subsets $J \subseteq K$ which have cardinality $\leq n$. Then the assignment $J \mapsto \alpha_J$ of Construction 10.1.3.10 determines a right cofinal functor of ∞-categories* `05GG`

$$\alpha : \mathrm{N}_\bullet(P^{\leq n}(K)) \to \mathrm{N}_\bullet(\mathbf{\Delta}_{[k]/}^{\leq n})^{\mathrm{op}}.$$

Proof. This is a special case of Corollary 7.2.3.7, since the functor α has a left adjoint (which carries a morphism $f : [k] \to [m]$ to the subset $J = \{j \in K : f(j-1) < f(j)\} \in P_{\leq n}(K)$). □

Proposition 10.1.3.14. *Let $\mathcal{C}$ be an ∞-category, let $X_\bullet$ be a simplicial object of $\mathcal{C}$, and let n be an integer. The following conditions are equivalent:* `05GH`

(1) *The simplicial object $X_\bullet$ is n-skeletal, in the sense of Definition 10.1.3.4.*

(2) *Let $k \geq 0$ be a nonnegative integer and set $K = \{1, 2, \cdots, k\}$. Then the kth degeneracy cube*

$$\sigma_k : \square^k = \mathrm{N}_\bullet(P(K)) \to \mathcal{C}$$

exhibits X_k as a colimit of the diagram $\sigma_k|_{\mathrm{N}_\bullet(P^{\leq n}(K))}$.

(3) *For every nonnegative integer $k > n$, the k-degeneracy cube σ_k is a colimit diagram in $\mathcal{C}$.*

Proof. The equivalence (1) ⇔ (2) follows immediately from Lemma 10.1.3.13 (together with Corollary 7.2.2.3). For each integer $k \geq 0$, set $K = \{1, 2, \cdots, k\}$ and consider the following conditions:

(2_k) The degeneracy cube $\sigma_k : \mathrm{N}_\bullet(P(K)) \to \mathcal{C}$ exhibits X_k as a colimit of the diagram $\sigma_k|_{\mathrm{N}_\bullet(P^{\leq n}(K))}$.

(3_k) The degeneracy cube σ_k is a colimit diagram in $\mathcal{C}$.

Note that condition (2_k) is automatic for $k \leq n$. We will complete the proof by showing that if $k > n$ and condition (2_ℓ) is satisfied for every integer $0 \leq \ell < k$, then conditions (2_k) and (3_k) are equivalent. Our hypothesis that condition (2_ℓ) is satisfied for $\ell < k$ guarantees that the functor $\sigma_k|_{\mathrm{N}_\bullet(P^{\leq k-1}(K))}$ is left Kan extended from the full subcategory $\mathrm{N}_\bullet(P^{\leq n}(K)) \subseteq \mathrm{N}_\bullet(P^{\leq k-1}(K))$. The equivalence of (2_k) and (3_k) is therefore a special case of Corollary 7.3.8.2. □

05GJ **Remark 10.1.3.15.** Let $\mathcal{C}$ be an ∞-category and let n be an integer. Using Proposition 10.1.3.14, we see that the condition that a simplicial object $X_\bullet$ of $\mathcal{C}$ is n-skeletal depends only on the restriction of $X_\bullet$ to the (non-full) subcategory $\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{surj}})^{\mathrm{op}} \subset \mathrm{N}_\bullet(\mathbf{\Delta})^{\mathrm{op}}$ (see Notation 1.1.2.12). Stated more informally (and slightly incorrectly), the condition of n-skeletality depends only on the degeneracy operators of $X_\bullet$, and not on its face operators.

05GK **Corollary 10.1.3.16.** *Let $\mathcal{C}$ be an ∞-category and let $n \geq 0$ be an integer. Then a simplicial object $X_\bullet$ of $\mathcal{C}$ is $(n-1)$-skeletal if and only if it is n-skeletal and the degeneracy cube $\sigma_n : \square^n \to \mathcal{C}$ is a colimit diagram in $\mathcal{C}$.*

05GL **Corollary 10.1.3.17.** *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories and let $n \geq 0$ be an integer. Assume that $\mathcal{C}$ admits pushouts and that F preserves pushouts. If $X_\bullet$ is an n-skeletal simplicial object of $\mathcal{C}$, then $F(X_\bullet)$ is an n-skeletal simplicial object of $\mathcal{D}$.*

Proof. Fix an integer $k > n$, and let $\sigma_k : \square^k \to \mathcal{C}$ be the kth degeneracy cube of the simplicial object $X_\bullet$. Set $K = \{1, 2, \cdots, k\}$, and let $P^{>0}(K)$ denote the collection of all nonempty subsets of K. Then σ_k can be identified with a functor σ_k° from $\mathrm{N}_\bullet(P^{>0}(K))$ to the coslice ∞-category $\mathcal{C}_{X_0/}$. Our assumption that $X_\bullet$ is n-skeletal guarantees that σ_k is a colimit diagram in $\mathcal{C}$ (Proposition 10.1.3.14), or equivalently that σ_k° is a colimit diagram in the ∞-category $\mathcal{C}_{X_0/}$ (Remark 7.1.2.11). Since the functor F preserves pushouts, the induced functor of coslice ∞-categories $F_{X_0/} : \mathcal{C}_{X_0/} \to \mathcal{D}_{F(X_0)/}$ preserves finite colimits (Example 7.6.3.28). In particular, $F_{X_0/} \circ \sigma_k^\circ$ is a colimit diagram in the ∞-category $\mathcal{D}_{F(X_0)/}$, so that $F \circ \sigma_k$ is a colimit diagram in $\mathcal{D}$ (Remark 7.1.2.11). Allowing k to vary, we conclude that $F(X_\bullet)$ is an n-skeletal simplicial object of $\mathcal{D}$ (Proposition 10.1.3.14). □

Let $X = X_\bullet$ be a simplicial set. Recall that the *n-skeleton of X* is the largest simplicial subset $\mathrm{sk}_n(X) \subseteq X$ of dimension $\leq n$ (see Construction 1.1.4.1 and Corollary 1.1.4.7). This construction has a counterpart for more general simplicial objects.

05GM **Definition 10.1.3.18.** Let $\mathcal{C}$ be an ∞-category, let $u : Y_\bullet \to X_\bullet$ be a morphism between simplicial objects of $\mathcal{C}$, and let n be an integer. We will say that u *exhibits $Y_\bullet$ as an n-skeleton of $X_\bullet$* if the following conditions are satisfied:

- The simplicial object $Y_\bullet$ is n-skeletal.

- For $0 \leq m \leq n$, the induced map $Y_m \to X_m$ is an isomorphism in the ∞-category $\mathcal{C}$.

Example 10.1.3.19. Let $X = X_\bullet$ be a simplicial set. For every integer n, the inclusion of simplicial sets $\mathrm{sk}_n(X) \hookrightarrow X$ exhibits $\mathrm{sk}_n(X)$ as an n-skeleton of X, in the sense of Definition 10.1.3.18: see Proposition 1.1.4.6. `05GN`

Remark 10.1.3.20 (Uniqueness)**.** Let $\mathcal{C}$ be an ∞-category, let $X_\bullet$ be a simplicial object of $\mathcal{C}$, and let n be an integer. If there exists a morphism of simplicial objects $u : Y_\bullet \to X_\bullet$ which exhibits $Y_\bullet$ as an n-skeleton of $X_\bullet$, then $Y_\bullet$ is uniquely determined up to isomorphism and depends functorially on $X_\bullet$. To emphasize this dependence, we will denote the object $Y_\bullet$ by $\mathrm{sk}_n(X)$ and refer to to it as the *n-skeleton of $X_\bullet$*. By virtue of Example 10.1.3.19, this reduces to the standard definition in the special case where $\mathcal{C}$ is (the nerve of) the category of sets. `05GP`

Using Corollary 7.3.6.13, we see that the n-skeleton of a simplicial object $X_\bullet$ is characterized by the following universal mapping property:

- If $Z_\bullet$ is any n-skeletal simplicial object of $\mathcal{C}$, then composition with u induces a homotopy equivalence of mapping spaces

$$\mathrm{Hom}_{\mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta})^{\mathrm{op}}, \mathcal{C})}(Z_\bullet, \mathrm{sk}_n(X_\bullet)) \to \mathrm{Hom}_{\mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta})^{\mathrm{op}}, \mathcal{C})}(Z_\bullet, X_\bullet).$$

Example 10.1.3.21. Let $A_\bullet$ be a simplicial abelian group and let $\mathrm{N}_*(A)$ denote the normalized Moore complex of $A_\bullet$ (Construction 2.5.5.7). For every integer $n \geq 0$, let $\mathrm{N}_{\leq n}(A)$ denote the subcomplex of $\mathrm{N}_*(A)$ depicted in the diagram `05GQ`

$$\cdots \to 0 \to \mathrm{N}_n(A) \xrightarrow{\partial} \mathrm{N}_{n-1}(A) \to \cdots \to \mathrm{N}_1(A) \xrightarrow{\partial} \mathrm{N}_0(A) \to 0 \to \cdots$$

Then the inclusion map

$$\mathrm{K}(\mathrm{N}_{\leq n}(A)) \hookrightarrow \mathrm{K}(\mathrm{N}_*(A)) \simeq A_\bullet$$

exhibits the Eilenberg-MacLane space $\mathrm{K}(\mathrm{N}_{\leq n}(A))$ as an n-skeleton of $A_\bullet$ in the category of simplicial abelian groups. Beware that the image of this inclusion is usually larger than the n-skeleton of $A_\bullet$ as a simplicial set (see Exercise 10.1.3.7).

Example 10.1.3.22 (0-Skeleta)**.** Let $\mathcal{C}$ be an ∞-category, let $X_\bullet$ be a simplicial object of $\mathcal{C}$, and set $C = X_0$. Then the constant simplicial object $\underline{C}$ is an n-skeleton of $X_\bullet$. More precisely, the identity morphism $\mathrm{id} : C \xrightarrow{\sim} X_0$ admits an (essentially unique) extension to a morphism of simplicial objects $\underline{C} \to X_\bullet$ which exhibits $\underline{C}$ as a 0-skeleton of $X_\bullet$. `05GR`

Proposition 10.1.3.23 (Existence of Skeleta)**.** *Let $\mathcal{C}$ be an ∞-category and let $n \geq 0$ be an integer. If $\mathcal{C}$ admits pushouts, then every simplicial object $X_\bullet$ of $\mathcal{C}$ admits an n-skeleton.* `05GS`

Proof. We will show that the functor

$$\mathrm{N}_\bullet(\mathbf{\Delta}^{\leq n})^{\mathrm{op}} \hookrightarrow \mathrm{N}_\bullet(\mathbf{\Delta})^{\mathrm{op}} \xrightarrow{X_\bullet} \mathcal{C}$$

admits a left Kan extension $Y_\bullet : \mathrm{N}_\bullet(\mathbf{\Delta})^{\mathrm{op}} \to \mathcal{C}$; Corollary 7.3.6.13 then guarantees that there is an (essentially unique) morphism of simplicial objects $u : Y_\bullet \to X_\bullet$ which is the identity when restricted to $\mathrm{N}_\bullet(\mathbf{\Delta}^{\leq n})^{\mathrm{op}}$. By virtue of Corollary 7.3.5.8, it will suffice to show that for every integer $k > n$, the diagram

$$F : \mathrm{N}_\bullet(\mathbf{\Delta}^{\leq n}_{[k]/})^{\mathrm{op}} \to \mathrm{N}_\bullet(\mathbf{\Delta}^{\leq n})^{\mathrm{op}} \xrightarrow{X_\bullet} \mathcal{C}$$

admits a colimit. Set $K = \{1, 2, \cdots, k\}$, let $P^{\leq n}(K)$ denote the collection of all subsets of K having cardinality $\leq n$, and let F_0 denote the composition of F with the right cofinal functor

$$\mathrm{N}_\bullet(P^{\leq n}(K)) \to \mathrm{N}_\bullet(\mathbf{\Delta}^{\leq n}_{[k]/})^{\mathrm{op}}$$

supplied by Lemma 10.1.3.13. Let $Q \subseteq P^{\leq n}(K)$ denote the collection of nonempty subsets of K of cardinality $\leq n$, so that F_0 can be identified with a functor $G : \mathrm{N}_\bullet(Q) \to \mathcal{C}_{X_0/}$. Since $\mathcal{C}$ admits pushouts, the coslice ∞-category $\mathcal{C}_{X_0/}$ admits finite limits (Example 7.6.3.28). In particular, the functor G admits a colimit in $\mathcal{C}_{X_0/}$, which we can identify with a colimit of F_0 in the ∞-category $\mathcal{C}$ (Remark 7.1.2.11). □

`05GT` **Warning 10.1.3.24.** If $X = X_\bullet$ is a simplicial set, then the comparison map $\mathrm{sk}_n(X) \to X$ is a monomorphism of simplicial sets. Beware that the analogous statement is generally false for simplicial objects of more general ∞-categories.

10.1.4 Coskeletal Simplicial Objects

`05GU` Let S be a set. For each $n \geq 0$, we let $\check{\mathrm{C}}_n(S) = \mathrm{Hom}([n], S)$ denote the collection of functions from the set $[n] = \{0 < 1 < \cdots < n\}$ into S. The construction $[n] \mapsto \check{\mathrm{C}}_n(S)$ determines a simplicial set $\check{\mathrm{C}}_\bullet(S)$, which we will refer to as the *Čech nerve* of S. In this section, we study an ∞-categorical counterpart of this construction.

`04SW` **Definition 10.1.4.1.** Let $\mathcal{C}$ be an ∞-category and let $X_\bullet$ be a simplicial object of $\mathcal{C}$. We will say that $X_\bullet$ is a *Čech nerve* if, for every integer $n \geq 0$, the following condition is satisfied:

$(*_n)$ For $0 \leq i \leq n$, let $\nu_i : X_n \to X_0$ be the morphism of $\mathcal{C}$ induced by the inclusion $[0] \simeq \{i\} \subseteq [n]$. Then the morphisms $\{\nu_i\}_{0 \leq i \leq n}$ exhibit X_n as a product of $(n+1)$-copies of X_0.

`04SX` **Remark 10.1.4.2.** Let $\mathcal{C}$ be an ∞-category and let $C_\bullet : \mathrm{N}_\bullet(\mathbf{\Delta})^{\mathrm{op}} \to \mathcal{C}$ be a simplicial object of $\mathcal{C}$. Then $X_\bullet$ is a Čech nerve if and only if it is right Kan extended from the full subcategory of $\mathrm{N}_\bullet(\mathbf{\Delta})^{\mathrm{op}}$ spanned by the object $[0]$.

Definition 10.1.4.3. Let $\mathcal{C}$ be an ∞-category and let X be an object of $\mathcal{C}$. We will say that a simplicial object $X_\bullet$ of $\mathcal{C}$ is a *Čech nerve of* X if $X_\bullet$ is a Čech nerve (in the sense of Definition 10.1.4.1) and $X_0 = X$. 04SY

Notation 10.1.4.4. Let $\mathcal{C}$ be an ∞-category and let X be an object of $\mathcal{C}$ which admits a Čech nerve $X_\bullet$. It follows from Corollary 7.3.6.13 that, for every simplicial object $Y_\bullet$ of $\mathcal{C}$, the restriction map 04SZ

$$\mathrm{Hom}_{\mathrm{Fun}(\mathbf{\Delta}^{\mathrm{op}},\mathcal{C})}(Y_\bullet, X_\bullet) \to \mathrm{Hom}_{\mathcal{C}}(Y_0, X_0) = \mathrm{Hom}_{\mathcal{C}}(Y_0, X)$$

is a homotopy equivalence. In particular, the simplicial object $X_\bullet$ is unique up to isomorphism and depends functorially on X. To emphasize this dependence, we will denote $X_\bullet$ by $\check{\mathrm{C}}_\bullet(X)$ and refer to it as *the* Čech nerve of the object X.

Proposition 10.1.4.5 (Existence)**.** *Let $\mathcal{C}$ be an ∞-category and let X be an object of $\mathcal{C}$. Then X admits a Čech nerve $\check{\mathrm{C}}_\bullet(X)$ if and only if, for every nonempty finite set J, there exists a product of J copies of X in the ∞-category $\mathcal{C}$.* 04T0

Proof. For every integer $n \geq 0$, the category $\{[0]\} \times_{\mathbf{\Delta}} \mathbf{\Delta}_{/[n]}$ is isomorphic to the finite set $\{0, 1, \cdots, n\}$, regarded as a category having only identity morphisms. By virtue of Remark 10.1.4.2, the desired result is a special case of the existence criterion for Kan extensions (Corollary 7.3.5.8). □

Corollary 10.1.4.6. *Let $\mathcal{C}$ be an ∞-category which admits finite products. Then every object $X \in \mathcal{C}$ admits a Čech nerve $\check{\mathrm{C}}_\bullet(X)$.* 04T1

Remark 10.1.4.7. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which preserves finite products. Then the induced functor $\mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta})^{\mathrm{op}}, \mathcal{C}) \to \mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta})^{\mathrm{op}}, \mathcal{D})$ carries Čech nerves to Čech nerves. In particular, if X is an object of $\mathcal{C}$ which admits a Čech nerve $\check{\mathrm{C}}_\bullet(X)$, then the image $Y = F(X)$ also admits a Čech nerve, given by $\check{\mathrm{C}}_\bullet(Y) = F(\check{\mathrm{C}}_\bullet(X))$. 04T2

Corollary 10.1.4.8. *Let $\mathcal{C}$ be an ∞-category which admits finite products. Then the evaluation functor* 04T3

$$\mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta})^{\mathrm{op}}, \mathcal{C}) \to \mathcal{C} \qquad X_\bullet \mapsto X_0$$

admits a right adjoint, given on objects by the Čech nerve $X \mapsto \check{\mathrm{C}}_\bullet(X)$.

Proof. Combine Corollaries 10.1.4.6 and 7.3.6.4. □

We now introduce a generalization of Definition 10.1.4.1.

Definition 10.1.4.9. Let $\mathcal{C}$ be an ∞-category and let n be an integer. We say that a simplicial object $X_\bullet$ of $\mathcal{C}$ is *n-coskeletal* if the functor 05GV

$$\mathrm{N}_\bullet(\mathbf{\Delta})^{\mathrm{op}} \xrightarrow{X_\bullet} \mathcal{C}$$

is right Kan extended from the full subcategory $\mathrm{N}_\bullet(\mathbf{\Delta}^{\leq n})^{\mathrm{op}} \subseteq \mathrm{N}_\bullet(\mathbf{\Delta})^{\mathrm{op}}$.

05GW **Example 10.1.4.10.** Let $\mathcal{C}$ be an ∞-category. A simplicial object $X_\bullet$ of $\mathcal{C}$ is 0-coskeletal if and only if it is a Čech nerve (Remark 10.1.4.2).

05GX **Example 10.1.4.11.** Let $X_\bullet$ be a simplicial set and let n be an integer. The following conditions are equivalent:

- The simplicial set $X_\bullet$ is n-coskeletal in the sense of Definition 3.5.3.1: that is, the restriction map $\operatorname{Hom}_{\mathrm{Set}_\Delta}(\Delta^m, X) \to \operatorname{Hom}_{\mathrm{Set}_\Delta}(\partial\Delta^m, X)$ is bijective for $m > n$.
- The simplicial set $X_\bullet$ is n-coskeletal in the sense of Definition 10.1.4.9: that is, it is a right Kan extension of its restriction to (the opposite of) the subcategory $\mathbf{\Delta}^{\leq n} \subset \mathbf{\Delta}$.

This is a restatement of Corollary 3.5.3.13 (see Remark 3.5.3.14).

05GY **Remark 10.1.4.12** (Monotonicity)**.** Let $X_\bullet$ be a simplicial object of an ∞-category $\mathcal{C}$ and let $m \leq n$ be integers. If $X_\bullet$ is m-coskeletal, then it is also n-coskeletal. See Corollary 7.3.8.8.

05GZ **Remark 10.1.4.13.** In the formulation of Definition 10.1.4.9, we allow n to be an arbitrary integer. However, for $n < 0$, the notion becomes degenerate: a simplicial object $X_\bullet$ is n-coskeletal if and only if each X_m is a final object of $\mathcal{C}$. In this case, $X_\bullet$ is a final object of the ∞-category of simplicial objects $\operatorname{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta})^{\mathrm{op}}, \mathcal{C})$.

Definition 10.1.4.9 has a counterpart for semisimplicial objects.

05H0 **Variant 10.1.4.14.** For every integer n, we let $\mathbf{\Delta}_{\mathrm{inj}}^{\leq n} = \mathbf{\Delta}_{\mathrm{inj}} \cap \mathbf{\Delta}^{\leq n}$ denote the category whose objects are linearly ordered sets $[m] = \{0 < 1 < \cdots < m\}$ for $0 \leq m \leq n$, and whose morphisms are strictly increasing functions. If $\mathcal{C}$ is an ∞-category, we say that a semisimplicial object $X_\bullet : \mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj}})^{\mathrm{op}} \to \mathcal{C}$ is *n-coskeletal* if it is right Kan extended from the full subcategory $\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{inj}}^{\leq n})^{\mathrm{op}}$.

05H1 **Proposition 10.1.4.15.** *Let $\mathcal{C}$ be an ∞-category, let n be an integer, and let $X_\bullet$ be a simplicial object of $\mathcal{C}$. Then $X_\bullet$ is n-coskeletal (in the sense of Definition 10.1.4.9) if and only if its underlying semisimplicial object is n-coskeletal (in the sense of Variant 10.1.4.14).*

Proof. Fix an integer $k \geq 0$, $\mathbf{\Delta}_{/[k]}^{\leq n}$ denote the full subcategory of $\mathbf{\Delta}_{/[k]}$ spanned by those objects which correspond to nondecreasing functions $\alpha : [m] \to [k]$ where $m \leq n$, and let $\mathcal{J}$ be the full subcategory of $\mathbf{\Delta}_{/[k]}^{\leq n}$ spanned by those objects where α is strictly increasing. Unwinding the definitions, we see that $X_\bullet$ is n-coskeletal if and only if, for every integer $k \geq 0$, the composite functor

$$F : \mathrm{N}_\bullet((\mathbf{\Delta}_{/[k]}^{\leq n}))^{\triangleright} \hookrightarrow \mathrm{N}_\bullet(\mathbf{\Delta}_{/[k]}^{\triangleright}) \to \mathrm{N}_\bullet(\mathbf{\Delta}) \xrightarrow{X_\bullet} \mathcal{C}^{\mathrm{op}}$$

is a colimit diagram in the ∞-category $\mathcal{C}^{\mathrm{op}}$. Similarly, the underlying semisimplicial object of $X_\bullet$ is n-coskeletal if and only if, for every integer $k \geq 0$, the restriction $F|_{\mathrm{N}_\bullet(\mathcal{J})^{\triangleright}}$ is a colimit diagram in $\mathcal{C}^{\mathrm{op}}$. Consequently, to show that these conditions are equivalent, it will suffice to prove that the inclusion functor $\mathrm{N}_\bullet(\mathcal{J}) \hookrightarrow \mathrm{N}_\bullet(\mathbf{\Delta}^{\leq n}_{/[k]})$ is right cofinal (Corollary 7.2.2.3). This is a special case of Corollary 7.2.3.7, since the inclusion functor $\mathcal{J} \hookrightarrow \mathbf{\Delta}^{\leq n}_{/[k]}$ has a left adjoint (which carries a nondecreasing function $\alpha : [m] \to [k]$ to the inclusion map $\mathrm{im}(\alpha) \hookrightarrow [k]$; here we abuse notation by identifying $\mathrm{im}(\alpha)$ with the corresponding object of $\mathbf{\Delta}$). □

Corollary 10.1.4.16. *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which preserves finite limits and let n be an integer. Then:* 05H2

(1) *If $X_\bullet$ is an n-coskeletal simplicial object of $\mathcal{C}$, then $F(X_\bullet)$ is an n-coskeletal simplicial object of $\mathcal{D}$.*

(2) *If $X_\bullet$ is an n-coskeletal semisimplicial object of $\mathcal{C}$, then $F(X_\bullet)$ is an n-coskeletal semisimplicial object of $\mathcal{D}$.*

Proof. Assertion (2) is immediate from the definitions (since the category $\mathcal{J}$ appearing in the proof of Proposition 10.1.4.15 is a finite partially ordered set). Assertion (1) follows by combining (2) with Proposition 10.1.4.15. □

Recall that a morphism of simplicial sets $f : X_\bullet \to Y_\bullet$ exhibits $Y_\bullet$ as an n-coskeleton of $X_\bullet$ if $Y_\bullet$ is n-coskeletal and f is bijective on m-simplices for $m \leq n$. This notion has an obvious counterpart for simplicial objects in general:

Definition 10.1.4.17. Let $\mathcal{C}$ be an ∞-category, let $u : X_\bullet \to Y_\bullet$ be a morphism between simplicial objects of $\mathcal{C}$, and let n be an integer. We will say that u *exhibits $Y_\bullet$ as an n-coskeleton of $X_\bullet$* if the following conditions are satisfied: 05H3

- The simplicial object $Y_\bullet$ is n-coskeletal.
- For $0 \leq m \leq n$, the induced map $X_m \to Y_m$ is an isomorphism in the ∞-category $\mathcal{C}$.

Remark 10.1.4.18. Definition 10.1.4.17 has an obvious counterpart for semisimplicial objects. If $u : X_\bullet \to Y_\bullet$ is a morphism between semisimplicial objects of an ∞-category $\mathcal{C}$, we say that u *exhibits $Y_\bullet$ as an n-coskeleton of $X_\bullet$* if $Y_\bullet$ is n-coskeletal and the morphism u induces an isomorphism $X_m \to Y_m$ for $0 \leq m \leq n$. By virtue of Proposition 10.1.4.15, this recovers Definition 10.1.4.17 in the case where u arises from a morphism between simplicial objects of $\mathcal{C}$. 05H4

05H5 **Remark 10.1.4.19** (Uniqueness). Let $\mathcal{C}$ be an ∞-category, let $X_\bullet$ be a simplicial object of $\mathcal{C}$, and let n be an integer. If there exists a morphism of simplicial objects $u : X_\bullet \to Y_\bullet$ which exhibits $Y_\bullet$ as an n-coskeleton of $X_\bullet$, then $Y_\bullet$ is uniquely determined up to isomorphism and depends functorially on $X_\bullet$. To emphasize this dependence, we will denote the object $Y_\bullet$ by $\mathrm{cosk}_n(X)_\bullet$ and refer to to it as the *n-skeleton of $X_\bullet$*. In the special case where $\mathcal{C}$ is (the nerve of) the category of sets, this recovers the convention of Notation 3.5.3.18.

Using Corollary 7.3.6.13, we see that the n-skeleton of a simplicial object $X_\bullet$ is characterized by the following universal mapping property:

- If $Z_\bullet$ is any n-coskeletal simplicial object of $\mathcal{C}$, then composition with u induces a homotopy equivalence of mapping spaces

$$\mathrm{Hom}_{\mathrm{Fun}(\mathrm{N}_\bullet(\boldsymbol{\Delta})^{\mathrm{op}},\mathcal{C})}(\mathrm{cosk}_n(X)_\bullet, Z_\bullet) \to \mathrm{Hom}_{\mathrm{Fun}(\mathrm{N}_\bullet(\boldsymbol{\Delta})^{\mathrm{op}},\mathcal{C})}(X_\bullet, Z_\bullet).$$

05H6 **Example 10.1.4.20.** Let $\mathcal{C}$ be an ∞-category and let $C_\bullet$ be a simplicial object of $\mathcal{C}$. If the object $X = C_0$ admits a Čech nerve $\check{\mathrm{C}}_\bullet(X)$ (Definition 10.1.4.3), then the identity map $C_0 \to X$ can be promoted to a morphism of simplicial objects $C_\bullet \to \check{\mathrm{C}}_\bullet(X)$ (see Notation 10.1.4.4) which exhibits $\check{\mathrm{C}}_\bullet(X)$ as a 0-coskeleton of $C_\bullet$.

05H7 **Proposition 10.1.4.21** (Existence of Coskeleta). *Let $\mathcal{C}$ be an ∞-category which admits finite limits and let n be an integer. Then every (semi)simplicial object $X_\bullet$ of $\mathcal{C}$ admits an n-coskeleton $\mathrm{cosk}_n(X)_\bullet$.*

Proof. We will prove the assertion for simplicial objects; the analogous statement for semisimplicial objects is similar (but easier). It will suffice to show that the functor

$$\mathrm{N}_\bullet(\boldsymbol{\Delta}^{\leq n})^{\mathrm{op}} \hookrightarrow \mathrm{N}_\bullet(\boldsymbol{\Delta})^{\mathrm{op}} \xrightarrow{X_\bullet} \mathcal{C}$$

admits a right Kan extension $Y_\bullet : \mathrm{N}_\bullet(\boldsymbol{\Delta})^{\mathrm{op}} \to \mathcal{C}$; Corollary 7.3.6.13 then guarantees that there is an (essentially unique) morphism of simplicial objects $u : X_\bullet \to Y_\bullet$ which is the identity when restricted to $\mathrm{N}_\bullet(\boldsymbol{\Delta}^{\leq n})^{\mathrm{op}}$. By virtue of Corollary 7.3.5.8, it will suffice to show that for every integer k, the diagram

$$G : \mathrm{N}_\bullet(\boldsymbol{\Delta}^{\leq n}_{/[k]})^{\mathrm{op}} \to \mathrm{N}_\bullet(\boldsymbol{\Delta})^{\mathrm{op}} \xrightarrow{X_\bullet} \mathcal{C}$$

admits a limit. As in the proof of Proposition 10.1.4.15, we observe that the inclusion map $\mathrm{N}_\bullet(\mathcal{J}) \hookrightarrow \mathrm{N}_\bullet(\boldsymbol{\Delta}^{\leq n}_{/[k]})$ is right cofinal, where $\mathcal{J} \subseteq \boldsymbol{\Delta}^{\leq n}_{/[k]}$ is the full subcategory spanned by the injective maps $[m] \hookrightarrow [k]$. We are therefore reduced to showing that $G|_{\mathrm{N}_\bullet(\mathcal{J})^{\mathrm{op}}}$ has a limit in $\mathcal{C}$ (Corollary 7.2.2.10), which follows from our assumption that $\mathcal{C}$ admits finite limits (since $\mathcal{J}$ is the category associated to a finite partially ordered set). $\square$

10.1.5 The Čech Nerve of a Morphism

We now consider a relative version of Definition 10.1.4.1. 04SV

Definition 10.1.5.1. Let $\mathcal{C}$ be an ∞-category and let $C_\bullet$ be an augmented simplicial object of $\mathcal{C}$, which we identify with a simplicial object $C'_\bullet$ of the ∞-category $\mathcal{C}_{/C_{-1}}$ (see Remark 10.1.1.15). We will say that $C_\bullet$ is a *Čech nerve* if the simplicial object $C'_\bullet$ is a Čech nerve in the ∞-category $\mathcal{C}_{/C_{-1}}$ (see Definition 10.1.4.1). 04T4

Remark 10.1.5.2. Let $\mathcal{C}$ be an ∞-category. Stated more informally, an augmented simplicial object $C_\bullet$ of $\mathcal{C}$ is a Čech nerve if, for every integer $n \geq 0$, it exhibits C_n as an iterated fiber product 04T5

$$C_0 \times_{C_{-1}} C_0 \times_{C_{-1}} \cdots \times_{C_{-1}} C_0$$

(where the factor C_0 appears $n+1$ times).

Remark 10.1.5.3. In the augmented simplex category $\mathbf{\Delta}_+$, there is unique morphism $\delta^0_0 : [-1] \to [0]$. This morphism determines a fully faithful functor $[1] \to \mathbf{\Delta}_+$, whose image is the full subcategory $\mathbf{\Delta}_+^{\leq 0} \subseteq \mathbf{\Delta}_+$ spanned by the objects $[0]$ and $[-1]$. Combining Remarks 10.1.4.2 and 7.3.2.4, we see that an augmented simplicial object $X_\bullet$ of an ∞-category $\mathcal{C}$ is a Čech nerve if and only if it is right Kan extended from the subcategory $\mathrm{N}_\bullet(\mathbf{\Delta}_+^{\leq 0})^{\mathrm{op}} \subset \mathrm{N}_\bullet(\mathbf{\Delta}_+)^{\mathrm{op}}$. 04T6

Definition 10.1.5.4. Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$. We will say that an augmented simplicial object $C_\bullet$ of $\mathcal{C}$ is a *Čech nerve of f* if $C_\bullet$ is a Čech nerve (in the sense of Definition 10.1.5.1) and the face operator $d^0_0 : C_0 \to C_{-1}$ coincides with the morphism f (so that $C_0 = X$ and $C_{-1} = Y$). 04T7

Notation 10.1.5.5. Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$. It follows from Remarks 10.1.5.3 and 7.3.6.6 that if f admits a Čech nerve $C_\bullet$, then the augmented simplicial object $C_\bullet$ is determined up to isomorphism and depends functorially on f. To emphasize this dependence, we will denote $C_\bullet$ by $\check{\mathrm{C}}_\bullet(X/Y)$ and refer to it as *the* Čech nerve of the morphism $f : X \to Y$. Alternatively, we can identify $\check{\mathrm{C}}_\bullet(X/Y)$ with the simplicial object of $\mathcal{C}_{/Y}$ given by the Čech nerve of f (in the sense of Notation 10.1.4.4). 04T8

Proposition 10.1.5.6. *Let $\mathcal{C}$ be an ∞-category which admits pullbacks. Then every morphism $f : X \to Y$ in $\mathcal{C}$ admits a Čech nerve $\check{\mathrm{C}}_\bullet(X/Y)$.* 04T9

Proof. Apply Corollary 10.1.4.6 to the ∞-category $\mathcal{C}_{/Y}$, which admits finite products by virtue of our assumption that $\mathcal{C}$ admits pullbacks (Corollary 7.6.3.20). □

Remark 10.1.5.7. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which preserves fiber products. Then the induced functor of augmented simplicial objects 04TA

$$\mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta}_+^{\mathrm{op}}), \mathcal{C}) \to \mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta}_+^{\mathrm{op}}), \mathcal{D})$$

carries Čech nerves to Čech nerves (see Remark 10.1.4.7). In particular, if $u : X \to Y$ is a morphism of $\mathcal{C}$ which admits a Čech nerve $\check{C}_\bullet(X/Y)$, then the morphism $F(u) : F(X) \to F(Y)$ admits a Čech nerve in the ∞-category $\mathcal{D}$, given by $F(\check{C}_\bullet(X/Y))$.

04TB **Corollary 10.1.5.8.** *Let $\mathcal{C}$ be an ∞-category which admits pullbacks. Then the forgetful functor*

$$\mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta}_+^{\mathrm{op}}), \mathcal{C}) \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \qquad C_\bullet \mapsto (d_0^0 : C_0 \to C_{-1})$$

admits a right adjoint, given on objects by the construction $(f : X \to Y) \mapsto \check{C}_\bullet(X/Y)$.

Proof. Combine Proposition 10.1.5.6 with Corollary 7.3.6.4. □

It will sometimes be useful to consider a generalization of Definition 10.1.5.1.

05H8 **Notation 10.1.5.9.** Let $\mathbf{\Delta}_+$ be the augmented simplex category (Definition 10.1.1.10). For every integer n, we let $\mathbf{\Delta}_+^{\leq n}$ denote the full subcategory of $\mathbf{\Delta}_+$ spanned by the collection of objects $\{[m]\}_{-1 \leq m \leq n}$.

05H9 **Definition 10.1.5.10.** Let $\mathcal{C}$ be an ∞-category and let n be an integer. We say that an augmented simplicial object $C_\bullet$ of $\mathcal{C}$ is *n-coskeletal* if the functor

$$C_\bullet : \mathrm{N}_\bullet(\mathbf{\Delta}_+)^{\mathrm{op}} \to \mathcal{C}$$

is right Kan extended from the full subcategory $\mathrm{N}_\bullet(\mathbf{\Delta}_+^{\leq n})^{\mathrm{op}}$.

05HA **Example 10.1.5.11.** Let $\mathcal{C}$ be an ∞-category and let $C_\bullet$ be an augmented simpicial object of $\mathcal{C}$. Then $C_\bullet$ is 0-coskeletal (in the sense of Definition 10.1.5.10) if and only if it is a Čech nerve (in the sense of Definition 10.1.5.1). See Remark 10.1.5.3.

05HB **Example 10.1.5.12.** Let $\mathcal{C}$ be an ∞-category. For $n \leq -2$, an augmented simplicial object $C_\bullet$ of $\mathcal{C}$ is n-coskeletal if and only if each C_m is a final object of $\mathcal{C}$.

05HC **Example 10.1.5.13.** Let $\mathcal{C}$ be an ∞-category and let $C_\bullet$ be an augmented simplicial object of $\mathcal{C}$. The following conditions are equivalent:

(1) The augmented simplicial object $C_\bullet$ is (-1)-coskeletal, in the sense of Definition 10.1.5.10.

(2) The augmented simplicial object $C_\bullet$ is essentially constant: that is, it is isomorphic to a constant functor from $\mathrm{N}_\bullet(\mathbf{\Delta}_+^{\mathrm{op}})$ to $\mathcal{C}$.

(3) The functor $C_\bullet : \mathrm{N}_\bullet(\mathbf{\Delta}_+^{\mathrm{op}}) \to \mathcal{C}$ carries each morphism in the category $\mathbf{\Delta}_+^{\mathrm{op}}$ to an isomorphism in the ∞-category $\mathcal{C}$.

(4) For every augmented simplicial object $X_\bullet$ of $\mathcal{C}$, the restriction map

$$\mathrm{Hom}_{\mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta}_+^{\mathrm{op}}), \mathcal{C})}(X_\bullet, C_\bullet) \to \mathrm{Hom}_{\mathcal{C}}(X_{-1}, C_{-1})$$

is a homotopy equivalence.

The equivalences (1) ⇔ (2) ⇔ (3) are special cases of Corollary 7.3.3.14, since $[-1]$ is an initial object of the category $\mathbf{\Delta}_{+}$. The equivalence (1) ⇔ (4) follows from Corollary 7.3.6.13.

Variant 10.1.5.14. For every integer n, we let $\mathbf{\Delta}_{+,\mathrm{inj}}^{\leq n}$ denote the category whose objects are linearly ordered sets $[m] = \{0 < 1 < \cdots < n\}$ for $-1 \leq m \leq n$, and whose morphisms are strictly increasing functions. We say that an augmented semisimplicial object $C_\bullet$ of an ∞-category $\mathcal{C}$ is *n-coskeletal* if the functor 05HD

$$C_\bullet : \mathrm{N}_\bullet(\mathbf{\Delta}_{+,\mathrm{inj}})^{\mathrm{op}} \to \mathcal{C}$$

is a right Kan extension of its restriction to $\mathrm{N}_\bullet(\mathbf{\Delta}_{+,\mathrm{inj}}^{\leq n})^{\mathrm{op}}$.

Remark 10.1.5.15. Let $\mathcal{C}$ be an ∞-category and let $C_\bullet$ be an augmented simplicial object of $\mathcal{C}$, which we identify with a (semi)simplicial object $C'_\bullet$ of the slice ∞-category $\mathcal{C}_{/C_{-1}}$ (see Remark 10.1.1.15). Then, for $n \geq -1$, the augmented simplicial object $C_\bullet$ is n-coskeletal (in the sense of Definition 10.1.5.10) if and only if the simplicial object $C'_\bullet$ is n-coskeletal (in the sense of Definition 10.1.4.9). Moreover, the analogous statement holds for semisimplicial objects. See Remark 7.3.2.4. 05HE

Warning 10.1.5.16. Let $\mathcal{C}$ be an ∞-category and let $C_\bullet$ be an augmented simplicial object of $\mathcal{C}$. It follow from Remark 10.1.5.15 that if C_{-1} is a final object of $\mathcal{C}$, then $C_\bullet$ is n-coskeletal if and only if its underlying simplicial object is n-coskeletal. Beware that neither implication holds in general if we do not assume that C_{-1} is final. 05HF

Remark 10.1.5.17. Let $\mathcal{C}$ be an ∞-category and let $C_\bullet$ be an augmented simplicial object of $\mathcal{C}$. For every integer n, the augmented simplicial object $C_\bullet$ is n-coskeletal (in the sense of Definition 10.1.5.10) if and only if its underlying augmented semisimplicial object is n-coskeletal (in the sense of Variant 10.1.5.14). For $n \leq -2$, this is trivial (see Example 10.1.5.12). For $n \geq -1$, it follows by combining Remark 10.1.5.15 with Proposition 10.1.4.15 (applied to the slice ∞-category $\mathcal{C}_{/C_{-1}}$). 05HG

To make Definition 10.1.5.10 more concrete, it will be convenient to introduce a dual version of Construction 10.1.3.10.

Construction 10.1.5.18 (Face Cubes)**.** Fix an integer $k \geq -1$, and let $\square^{k+1}$ be the simplicial cube of dimension $k+1$ (Notation 2.4.5.2). In what follows, we will identify $\square^{k+1}$ with the opposite of the nerve of the partially ordered set $P([k])$ of all subsets of $[k] = \{0 < 1 < \cdots < k\}$. Note that there is an isomorphism of categories $P([k]) \to (\mathbf{\Delta}_{+,\mathrm{inj}})_{/[k]}$, which carries each subset $J \subseteq [k]$ of cardinality $j+1$ to the unique strictly increasing function $[j] \hookrightarrow [k]$ having image J. If $C_\bullet$ is an augmented semisimplicial object of an ∞-category $\mathcal{C}$, we let $\tau_k : \square^{k+1} \to \mathcal{C}$ denote the composite functor 05HH

$$\square^{k+1} \simeq \mathrm{N}_\bullet((\mathbf{\Delta}_{+,\mathrm{inj}})_{/[k]})^{\mathrm{op}} \to \mathrm{N}_\bullet(\mathbf{\Delta}_{+,\mathrm{inj}}^{\mathrm{op}}) \xrightarrow{C_\bullet} \mathcal{C}\,.$$

We will refer to τ_k as the *kth face cube* of the augmented semisimplicial object $C_\bullet$.

05HJ **Example 10.1.5.19.** Let $C_\bullet$ be an augmented semisimplicial object of an ∞-category $\mathcal{C}$. For small values of k, the face cube $\tau_k : \square^{k+1} \to \mathcal{C}$ of Construction 10.1.5.18 can be described more explicitly:

- The face cube τ_{-1} can be identified with the object C_{-1} of $\mathcal{C}$.
- The face cube τ_0 can be identified with the face operator $d^0_0 : C_0 \to C_{-1}$.
- The face cube τ_1 is a square diagram

$$\begin{tikzcd}
C_1 \arrow[r, "d^1_0"] \arrow[d, "d^1_1"] & C_0 \arrow[d, "d^0_0"] \\
C_0 \arrow[r, "d^0_0"] & C_{-1}
\end{tikzcd}$$

which witnesses the identity $[d^0_0] \circ [d^1_0] = [d^0_0] \circ [d^1_1]$ in the homotopy category $\mathrm{h}\mathcal{C}$.

05HK **Proposition 10.1.5.20.** *Let $\mathcal{C}$ be an ∞-category, let $C_\bullet$ be an augmented semisimplicial object of $\mathcal{C}$, and let n be an integer. The following conditions are equivalent:*

(1) *The augmented semisimplicial object $C_\bullet$ is $(n-1)$-coskeletal, in the sense of Variant 10.1.5.14.*

(2) *For each $k \geq n$, the face cube $\tau_k : \square^{k+1} \to \mathcal{C}$ of Construction 10.1.5.18 is a limit diagram in $\mathcal{C}$.*

Proof. We proceed as in the proof of Proposition 10.1.3.14. Let us identify each τ_k with a functor $\mathrm{N}_\bullet(P([k]))^{\mathrm{op}} \to \mathcal{C}$, where $P([k])$ denotes the collection of all subsets of $\{0 < 1 < \cdots < k\}$. Let $P^{\leq n}([k])$ denote the subset of $P([k])$ consisting of subsets of cardinality $\leq n$. Unwinding the definitions, we see that $C_\bullet$ is $(n-1)$-coskeletal if and only if the following condition is satisfied for each $k \geq n$:

(1_k) The functor τ_k exhibits C_k as a limit of its restriction to $\mathrm{N}_\bullet(P^{\leq n}([k]))^{\mathrm{op}}$.

Similarly, (2) asserts that the following condition is satisfied for each $k \geq n$:

(2_k) The face cube $\tau_k : \square^{k+1} \to \mathcal{C}$ of Construction 10.1.5.18 is a limit diagram in $\mathcal{C}$.

To complete the proof, it will suffice to show that if condition (1_ℓ) is satisfied for $n \leq \ell < k$, then conditions (1_k) and (2_k) are equivalent. Our hypothesis that condition (2_ℓ) is satisfied for $\ell < k$ guarantees that the functor $\tau_k|_{\mathrm{N}_\bullet(P^{\leq k}([k]))^{\mathrm{op}}}$ is right Kan extended from the full subcategory $\mathrm{N}_\bullet(P^{\leq n}([k]))^{\mathrm{op}} \subseteq \mathrm{N}_\bullet(P^{\leq k}([k]))^{\mathrm{op}}$. The equivalence of (1_k) and (2_k) is therefore a special case of Corollary 7.3.8.2. □

Corollary 10.1.5.21. *Let $\mathcal{C}$ be an ∞-category and let $n \geq -1$ be an integer. Then an augmented (semi)simplicial object $C_\bullet$ of $\mathcal{C}$ is $(n-1)$-coskeletal if and only if it is n-coskeletal and the face cube $\tau_n : \square^{n+1} \to \mathcal{C}$ is a limit diagram in $\mathcal{C}$.* 05HL

Corollary 10.1.5.22. *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories, let $C_\bullet$ be an augmented (semi)simplicial object of $\mathcal{C}$, and let $n \geq -1$ be an integer. Assume that $\mathcal{C}$ admits pullbacks and that F preserves pullbacks. If $C_\bullet$ is n-coskeletal, then the image $F(C_\bullet)$ is n-coskeletal.* 05HM

10.1.6 Split Simplicial Objects

We now introduce a tool which is often useful for computing geometric realizations of simplicial objects. 04S6

Notation 10.1.6.1. We define a category $\mathbf{\Delta}_{\mathrm{min}}$ as follows: 04S7

- The objects of $\mathbf{\Delta}_{\mathrm{min}}$ are linearly ordered sets $[n] = \{0 < 1 < \cdots < n\}$, where n is a nonnegative integer.
- A morphism from $[m]$ to $[n]$ in the category $\mathbf{\Delta}_{\mathrm{min}}$ is a nondecreasing function $\alpha : [m] \to [n]$ satisfying $\alpha(0) = 0$.

Remark 10.1.6.2. By construction, the category $\mathbf{\Delta}_{\mathrm{min}}$ is a (non-full) subcategory of the simplex category $\mathbf{\Delta}$ of Definition 1.1.0.2. It can therefore also be regarded as a subcategory of the augmented simplex category $\mathbf{\Delta}_{+}$ of Definition 10.1.1.10. The inclusion functor $\mathbf{\Delta}_{\mathrm{min}} \hookrightarrow \mathbf{\Delta}_{+}$ admits a left adjoint $C_{+} : \mathbf{\Delta}_{+} \to \mathbf{\Delta}_{\mathrm{min}}$, given concretely by the construction $C_{+}([n]) = [0] \star [n] \simeq [n+1]$. We will refer to C_{+} as the *concatenation functor*. We let $C : \mathbf{\Delta} \to \mathbf{\Delta}_{\mathrm{min}}$ denote the restriction of C_{+} to the simplex category $\mathbf{\Delta}$, which we will also refer to as the *concatenation functor*. 04S8

Definition 10.1.6.3. Let $\mathcal{C}$ be an ∞-category and let $X_\bullet$ be an augmented simplicial object of $\mathcal{C}$ (Definition 10.1.1.12). A *splitting* of $X_\bullet$ is a functor $\overline{X} : \mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}_{\mathrm{min}}) \to \mathcal{C}$ for which the composition 04S9

$$\mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}_{+}) \xrightarrow{C_{+}^{\mathrm{op}}} \mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}_{\mathrm{min}}) \xrightarrow{\overline{X}} \mathcal{C}$$

is equal to $X_\bullet$; here C_{+} denotes the concatenation functor $[n] \mapsto [n] \star [0]$ of Remark 10.1.6.2. We will say that the augmented simplicial object $X_\bullet$ is *split* if there exists a splitting of $X_\bullet$.

Remark 10.1.6.4 (Extra Degeneracies)**.** Let $\mathcal{C}$ be an ∞-category and let $X_\bullet$ be an augmented simplicial object of $\mathcal{C}$. For every integer $n \geq -1$, the function 04SA

$$\sigma^0_{n+1} : [n+2] \to [n+1] \qquad i \mapsto \begin{cases} 0 & \text{if } i = 0 \\ i-1 & \text{if } i > 0 \end{cases}$$

belongs to the subcategory $\mathbf{\Delta}_{\mathrm{min}} \subseteq \mathbf{\Delta}$. If $\overline{X}$ is a splitting of $X_\bullet$, then evaluation on σ^0_{n+1} determines a morphism

$$h_n : X_n = \overline{X}([n+1]) \to \overline{X}([n+2]) = X_{n+1}.$$

Heuristically, one can think of the morphisms $\{h_n\}_{n \geq -1}$ as "extra" degeneracy operators on the augmented simplicial object $X_\bullet$. In the homotopy category $\mathrm{h}\mathcal{C}$, these operators satisfy the identities

04SB
$$d_i^{n+1} \circ h_n \sim \begin{cases} \mathrm{id}_{X_n} & \text{if } i = 0 \\ h_{n-1} \circ d_{i-1}^n & \text{otherwise} \end{cases} \tag{10.2}$$

04SC
$$s_i^{n+1} \circ h_n \sim \begin{cases} h_{n+1} \circ h_n & \text{if } i = 0 \\ h_{n+1} \circ s_{i-1}^n & \text{otherwise.} \end{cases} \tag{10.3}$$

04SD **Exercise 10.1.6.5.** Let $\mathcal{C}$ be an ordinary category and let $X_\bullet$ be an augmented simplicial object of $\mathcal{C}$. Show that the construction of Remark 10.1.6.4 determines a bijection from the set of splittings of $X_\bullet$ (in the sense of Definition 10.1.6.3) to the collection of systems $\{h_n : X_n \to X_{n+1}\}_{n \geq -1}$ satisfying the identities (10.2) and (10.3).

04SE **Example 10.1.6.6.** Let $A_\bullet$ be an augmented simplicial abelian group, and let

$$\mathrm{C}^{\mathrm{aug}}_*(A) = (\cdots \to A_2 \xrightarrow{\partial} A_1 \xrightarrow{\partial} A_0 \xrightarrow{\partial} A_{-1})$$

denote its augmented Moore complex (Remark 10.1.2.21). Suppose we are given a splitting of $A_\bullet$, and let $\{h_n : A_n \to A_{n+1}\}_{n \geq -1}$ be the extra degeneracy operators described in Remark 10.1.6.4. Then the collection $\{h_n\}$ is a contracting homotopy for $\mathrm{C}^{\mathrm{aug}}_*(A)$, in the sense of Definition 2.5.0.5: that is, the homomorphism

$$(h_{n-1} \circ \partial + \partial \circ h_n) : A_n \to A_n$$

is equal to the identity for each $n \geq -1$ (where we adopt the convention that $h_n \circ \partial = 0$ for $n = -1$). This follows from the calculation

$$\begin{aligned} h_{n-1} \circ \partial + \partial \circ h_n &= (\sum_{i=0}^{n} (-1)^i h_{n-1} \circ d_i^n) + (\sum_{j=0}^{n+1} (-1)^j d_j^{n+1} \circ h_n) \\ &= (\sum_{i=0}^{n} (-1)^i (h_{n-1} \circ d_i^n - d_{i+1}^{n+1} \circ h_n)) + d_0^{n+1} \circ h_n \\ &= \mathrm{id}_{A_n}. \end{aligned}$$

where the final equality follows from the identities (10.2).

Variant 10.1.6.7. In the situation of Example 10.1.6.6, let $\mathrm{N}_*^{\mathrm{aug}}(A)$ denote the augmented normalized Moore complex of $A_\bullet$ (Variant 10.1.2.22). It follows from (10.3) that, for every integer $n \geq 0$, the operator 04SF

$$\mathrm{C}_n^{\mathrm{aug}}(A) = A_n \xrightarrow{h_n} A_{n+1} = \mathrm{C}_{n+1}^{\mathrm{aug}}(A)$$

carries degenerate n-simplices of $A_\bullet$ to degenerate $(n+1)$-simplices of $A_\bullet$, and therefore descends to an operator $\overline{h}_n : \mathrm{N}_n^{\mathrm{aug}}(A) \to \mathrm{N}_{n+1}^{\mathrm{aug}}(A)$. The collection of homomorphisms $\{\overline{h}_n\}$ then determine a contracting homotopy for the chain complex $\mathrm{N}_*^{\mathrm{aug}}(A)$.

Warning 10.1.6.8. Let $A_\bullet$ be an augmented simplicial abelian group. In general, not every contracting homotopy for the chain complex $\mathrm{N}_*^{\mathrm{aug}}(A)$ can be obtained from the construction of Variant 10.1.6.7. A splitting of $A_\bullet$ determines a system of homomorphisms $\{h_n : A_n \to A_{n+1}\}_{n \geq 0}$ which satisfy the identity $h_{n+1} \circ h_n = s_0^{n+1} \circ h_n$ (Remark 10.1.6.4). In particular, the composition $h_{n+1} \circ h_n$ carries every n-simplex of $A_\bullet$ to a degenerate $(n+2)$-simplex of $A_\bullet$. It follows that the composite map 04SG

$$\mathrm{N}_n^{\mathrm{aug}}(A) \xrightarrow{\overline{h}_n} \mathrm{N}_{n+1}^{\mathrm{aug}}(A) \xrightarrow{\overline{h}_{n+1}} \mathrm{N}_{n+2}^{\mathrm{aug}}(A)$$

vanishes; for a general contracting homotopy, the analogous statement need not be true.

The utility of Definition 10.1.6.3 stems from the following:

Proposition 10.1.6.9. *Let $\mathcal{C}$ be an ∞-category and let $X_\bullet$ be an augmented simplicial object of $\mathcal{C}$. If $X_\bullet$ is split, then it is a colimit diagram in $\mathcal{C}$.* 04SH

Proof. Let $\overline{X} : \mathrm{N}_\bullet(\mathbf{\Delta}_{\min}^{\mathrm{op}}) \to \mathcal{C}$ be a splitting of $X_\bullet$, and let $C_+ : \mathbf{\Delta}_+ \to \mathbf{\Delta}_{\min}$ denote the concatenation functor of Remark 10.1.6.2. Let us abuse notation by identifying $\mathrm{N}_\bullet(\mathbf{\Delta}_+^{\mathrm{op}})$ with the cone $\mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}})^{\triangleright}$. We wish to show that the augmented simplicial object

$$(X_\bullet = \overline{X} \circ \mathrm{N}_\bullet(C_+^{\mathrm{op}})) : \mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}})^{\triangleright} \to \mathcal{C}$$

is a colimit diagram in $\mathcal{C}$.

Note that $[0]$ is initial when viewed as an object of the category $\mathbf{\Delta}_{\min}$, and therefore final when viewed as an object of the ∞-category $\mathrm{N}_\bullet(\mathbf{\Delta}_{\min}^{\mathrm{op}})$. Unwinding the definitions, we see that the functor $\mathrm{N}_\bullet(C_+^{\mathrm{op}})$ factors as a composition

$$\mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}})^{\triangleright} \xrightarrow{\mathrm{N}_\bullet(C)^{\triangleright}} \mathrm{N}_\bullet(\mathbf{\Delta}_{\min}^{\mathrm{op}})^{\triangleright} \xrightarrow{R} \mathrm{N}_\bullet(\mathbf{\Delta}_{\min}^{\mathrm{op}}),$$

where R is the identity when restricted to $\mathrm{N}_\bullet(\mathbf{\Delta}_{\min}^{\mathrm{op}})$ and carries the cone point of $\mathrm{N}_\bullet(\mathbf{\Delta}_{\min}^{\mathrm{op}})^{\triangleright}$ to $[0]$. Applying Corollary 7.2.2.6, we deduce that $(\overline{X} \circ R) : \mathrm{N}_\bullet(\mathbf{\Delta}_{\min}^{\mathrm{op}})^{\triangleright} \to \mathcal{C}$ is a colimit diagram. Consequently, to show that $X_\bullet$ is a colimit diagram, it will suffice to show that the functor $\mathrm{N}_\bullet(C^{\mathrm{op}}) : \mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}) \to \mathrm{N}_\bullet(\mathbf{\Delta}_{\min}^{\mathrm{op}})$ is right cofinal (Corollary 7.2.2.3). This is a special case of Corollary 7.2.3.7, since the concatenation functor C is left adjoint to the inclusion $\mathbf{\Delta}_{\min} \hookrightarrow \mathbf{\Delta}$ (Remark 10.1.6.2). □

04SJ **Remark 10.1.6.10.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories and let $X_\bullet$ be an augmented simplicial object of $\mathcal{C}$, so that $F(X_\bullet)$ is an augmented cosimplicial object of $\mathcal{D}$. Composition with the functor F carries splittings of $X_\bullet$ to splittings of $F(X_\bullet)$. Consequently, if $X_\bullet$ is split, then $F(X_\bullet)$ is also split. In particular, if $X_\bullet$ is split, then $F(X_\bullet)$ is a colimit diagram in $\mathcal{D}$ (Proposition 10.1.6.9).

04SK **Variant 10.1.6.11.** Let $\mathcal{C}$ be an ∞-category and let $X_\bullet$ be a simplicial object of $\mathcal{C}$. A *splitting* of $X_\bullet$ is a functor $\overline{X} : \mathrm{N}_\bullet(\boldsymbol{\Delta}^{\mathrm{op}}_{\mathrm{min}}) \to \mathcal{C}$ for which the composition

$$\mathrm{N}_\bullet(\boldsymbol{\Delta}^{\mathrm{op}}_{+}) \xrightarrow{C^{\mathrm{op}}} \mathrm{N}_\bullet(\boldsymbol{\Delta}^{\mathrm{op}}_{\mathrm{min}}) \xrightarrow{\overline{X}} \mathcal{C}$$

is equal to $X_\bullet$; here C denotes the concatenation functor $[n] \mapsto [n] \star [0]$ of Remark 10.1.6.2. We will say that the simplicial object $X_\bullet$ is *split* if there exists a splitting of $X_\bullet$.

04SL **Warning 10.1.6.12.** The terminology of Variant 10.1.6.11 (and Definition 10.1.6.3) is potentially confusing. We will use the term *split simplicial object* to refer to a simplicial object $X_\bullet$ of an ∞-category $\mathcal{C}$ for which there *exists* a splitting $\overline{X} : \mathrm{N}_\bullet(\boldsymbol{\Delta}^{\mathrm{op}}_{\mathrm{min}}) \to \mathcal{C}$. Unless otherwise specified, we do not assume that a particular splitting has been chosen. Beware that $\overline{X}$ is not uniquely determined by $X_\bullet$. However, the underlying augmented simplicial object

$$\mathrm{N}_\bullet(\boldsymbol{\Delta}^{\mathrm{op}}_{+}) \xrightarrow{\mathrm{N}_\bullet(C^{\mathrm{op}}_{+})} \mathrm{N}_\bullet(\boldsymbol{\Delta}_{\mathrm{min}}) \xrightarrow{\overline{X}} \mathcal{C}$$

is determined up to isomorphism by $X_\bullet$: by virtue of Proposition 10.1.6.9, it is an extension of $X_\bullet$ to a colimit diagram in $\mathcal{C}$.

04SM **Corollary 10.1.6.13.** *Let $X_\bullet$ be a split simplicial object of an ∞-category $\mathcal{C}$. Then $X_\bullet$ admits a geometric realization $|X_\bullet|$. Moreover, the geometric realization of $X_\bullet$ is preserved by any functor of ∞-categories $F : \mathcal{C} \to \mathcal{D}$.*

Proof. The first assertion follows from Proposition 10.1.6.9, and the second from Remark 10.1.6.10. □

The Čech nerve construction of §10.1.5 provides an abundant supply of split simplicial objects.

05HN **Proposition 10.1.6.14.** *Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$ which admits a Čech nerve $\check{\mathrm{C}}_\bullet(X/Y)$. Then the augmented simplicial object $\check{\mathrm{C}}_\bullet(X/Y)$ splits if and only if f admits a right homotopy inverse.*

04TL **Corollary 10.1.6.15.** *Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$ which admits a Čech nerve $\check{\mathrm{C}}_\bullet(X/Y)$. If f admits a right homotopy inverse, then $\check{\mathrm{C}}_\bullet(X/Y)$ is a colimit diagram: that is, it exhibits Y as a geometric realization of its underlying simplicial object.*

Proof. Combine Propositions 10.1.6.14 and 10.1.6.9. □

Our proof of Proposition 10.1.6.14 will require some preliminaries.

Notation 10.1.6.16. Let $\mathbf{\Delta}_{\mathrm{min}}$ be the category introduced in Notation 10.1.6.1. For every integer n, we let $\mathbf{\Delta}_{\mathrm{min}}^{\leq n}$ denote the full subcategory of $\mathbf{\Delta}_{\mathrm{min}}$ spanned by the collection of objects $\{[m]\}_{0 \leq m \leq n}$. `05HP`

Example 10.1.6.17. For $n < 0$, the category $\mathbf{\Delta}_{\mathrm{min}}^{\leq n}$ is empty. For $n = 0$, it contains a single object $[0]$, and no morphisms other than the identity morphism. `05HQ`

Example 10.1.6.18. Let Ret be the category introduced in Construction 8.5.0.2: that is, the category which is freely generated by a pair of morphisms $i : Y \to X$ and $r : X \to Y$ satisfying the identity $r \circ i = \mathrm{id}_Y$. By virtue of Exercise 8.5.0.3, there is a unique functor $\mathrm{Ret} \to \mathbf{\Delta}$ which carries i to the inclusion map $[0] \hookrightarrow [1]$ and r to the constant function $[1] \twoheadrightarrow [0]$. This functor induces an isomorphism from Ret onto the subcategory $\mathbf{\Delta}_{\mathrm{min}}^{\leq 1} \subset \mathbf{\Delta}$ of Notation 10.1.6.16. `05HR`

Lemma 10.1.6.19. *Let $\mathcal{C}$ be an ∞-category, let $X_\bullet$ be an augmented simplicial object of $\mathcal{C}$, and let $\overline{X} : \mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{min}}^{\mathrm{op}}) \to \mathcal{C}$ be a splitting of $X_\bullet$ (in the sense of Definition 10.1.6.3). For every integer n, the following conditions are equivalent:* `04TE`

(1) *The functor $\overline{X}$ is right Kan extended from the full subcategory $\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{min}}^{\leq n+1})$ of Notation 10.1.6.16.*

(2) *The augmented simplicial object $X_\bullet$ is n-coskeletal: that is, it is right Kan extended from the subcategory $\mathrm{N}_\bullet(\mathbf{\Delta}_{+}^{\leq n})^{\mathrm{op}}$ (Definition 10.1.5.10).*

Proof. For each integer $k \geq -1$, we will show that the following conditions are equivalent:

(1_k) The functor $\overline{X}$ is right Kan extended from the subcategory $\mathrm{N}_\bullet(\mathbf{\Delta}_{\mathrm{min}}^{\leq n+1})^{\mathrm{op}}$ at the object $[k+1]$.

(2_k) The functor $X_\bullet$ is right Kan extended from the subcategory $\mathrm{N}_\bullet(\mathbf{\Delta}_{+}^{\leq n})^{\mathrm{op}}$ at the object $[k]$.

Let $(\mathbf{\Delta}_{+}^{\leq n})_{/[k]}$ denote the fiber product $(\mathbf{\Delta}_{+})_{/[k]} \times_{\mathbf{\Delta}_{+}} \mathbf{\Delta}_{+}^{\leq n}$, and define $(\mathbf{\Delta}_{\mathrm{min}}^{\leq n+1})_{/[k+1]}$ similarly. By virtue of Corollary 7.2.2.3, it will suffice to show that the concatentation functor C_+ induces a right cofinal functor

$$G : \mathrm{N}_\bullet((\mathbf{\Delta}_{+}^{\leq n})_{/[k]}) \to \mathrm{N}_\bullet((\mathbf{\Delta}_{\mathrm{min}}^{\leq n+1})_{/[k+1]}).$$

This follows from Corollary 7.2.3.7, since the functor G admits a left adjoint F (which carries a morphism $\alpha : [m] \to [k+1]$ of $\mathbf{\Delta}_{\mathrm{min}}$ to the nondecreasing function

$$\{k \in [m] : \alpha(k) > 0\} \xrightarrow{\alpha} \{1 < 2 < \cdots < k\} \simeq [k].$$

□

04TF **Variant 10.1.6.20.** Let n be an integer and let $\mathcal{C}$ be an ∞-category which is equipped with a functor $T : \mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{\mathrm{min}}^{\leq n+1})^{\mathrm{op}} \to \mathcal{C}$. The following conditions are equivalent:

(1) The functor T admits a right Kan extension $\overline{F} : \mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{\mathrm{min}}^{\mathrm{op}}) \to \mathcal{C}$.

(2) The composite functor

$$\mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{+}^{\leq n})^{\mathrm{op}} \xrightarrow{C_{+}} \mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{\mathrm{min}}^{\leq n+1})^{\mathrm{op}} \xrightarrow{T} \mathcal{C}$$

can be extended to an n-coskeletal augmented simplicial object of $\mathcal{C}$.

Proof. We maintain the notations from the proof of Lemma 10.1.6.19. By virtue of Corollary 7.3.5.8, it will suffice to show that for every integer $k \geq -1$, the following conditions are equivalent:

(1_k) The diagram

$$\mathrm{N}_{\bullet}((\boldsymbol{\Delta}_{\mathrm{min}}^{\leq n+1})_{/[k+1]}) \to \mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{\mathrm{min}}^{\leq n+1}) \xrightarrow{T} \mathcal{C}^{\mathrm{op}}$$

admits a colimit in the ∞-category $\mathcal{C}^{\mathrm{op}}$.

(2_k) The diagram

$$\mathrm{N}_{\bullet}((\boldsymbol{\Delta}_{+}^{\leq n})_{/[k]}) \xrightarrow{G} \mathrm{N}_{\bullet}((\boldsymbol{\Delta}_{\mathrm{min}}^{\leq n+1})_{/[k+1]}) \to \mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{\mathrm{min}}^{\leq n+1}) \xrightarrow{T} \mathcal{C}^{\mathrm{op}}$$

admits a colimit in the ∞-category $\mathcal{C}^{\mathrm{op}}$.

As in the proof of Lemma 10.1.6.19, the functor G is right cofinal, so the equivalence of (1_k) and (2_k) is a special case of Corollary 7.2.2.10. □

04TG **Proposition 10.1.6.21.** *Let $\mathcal{C}$ be an ∞-category, let n be an integer, let $\mathrm{Fun}'(\mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{+}^{\mathrm{op}}), \mathcal{C})$ be the full subcategory of $\mathrm{Fun}(\mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{+}^{\mathrm{op}}), \mathcal{C})$ spanned by the n-coskeletal augmented simplicial objects of $\mathcal{C}$, and let $\mathrm{Fun}'(\mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{\mathrm{min}}^{\mathrm{op}}), \mathcal{C}) \subseteq \mathrm{Fun}(\mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{\mathrm{min}}^{\mathrm{op}}), \mathcal{C})$ be its inverse image. Then precomposition with the concatenation functor C_{+} induces a trivial Kan fibration*

$$\theta : \mathrm{Fun}'(\mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{\mathrm{min}}^{\mathrm{op}}), \mathcal{C}) \to \mathrm{Fun}'(\mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{\mathrm{min}}^{\leq n+1})^{\mathrm{op}}, \mathcal{C}) \times_{\mathrm{Fun}(\mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{+}^{\leq n})^{\mathrm{op}}, \mathcal{C})} \mathrm{Fun}'(\mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{+}^{\mathrm{op}}), \mathcal{C}).$$

Proof. Let $\mathrm{Fun}'(\mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{+}^{\leq n})^{\mathrm{op}}, \mathcal{C})$ denote the full subcategory of $\mathrm{Fun}(\mathrm{N}_{\bullet}(\boldsymbol{\Delta}_{+}^{\leq n})^{\mathrm{op}}, \mathcal{C})$ spanned by those functors which can be extended to n-coskeletal augmented simplicial objects of $\mathcal{C}$, and define $\mathrm{Fun}'(\mathrm{N}_\bullet(\mathbf{\Delta}_{\min}^{\leq n+1})^{\mathrm{op}}, \mathcal{C})$ similarly. We then have a commutative diagram

$$\begin{tikzcd}
\mathrm{Fun}'(\mathrm{N}_\bullet(\mathbf{\Delta}_{\min}^{\mathrm{op}}), \mathcal{C}) \arrow[r] \arrow[d] & \mathrm{Fun}'(\mathrm{N}_\bullet(\mathbf{\Delta}_{+}^{\mathrm{op}}), \mathcal{C}) \arrow[d] \\
\mathrm{Fun}'(\mathrm{N}_\bullet(\mathbf{\Delta}_{\min}^{\leq n+1})^{\mathrm{op}}, \mathcal{C}) \arrow[r] \arrow[d] & \mathrm{Fun}'(\mathrm{N}_\bullet(\mathbf{\Delta}_{+}^{\leq n})^{\mathrm{op}}, \mathcal{C}) \arrow[d] \\
\mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta}_{\min}^{\leq n+1})^{\mathrm{op}}, \mathcal{C}) \arrow[r] & \mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta}_{+}^{\leq n})^{\mathrm{op}}, \mathcal{C}).
\end{tikzcd}$$

Combining Lemma 10.1.6.19 with Corollary 7.3.6.15, we deduce that the upper vertical maps are trivial Kan fibrations; in particular, the upper half of the diagram is a categorical pullback square (Proposition 4.5.2.21). Variant 10.1.6.20 guarantees that the lower half of the square is a pullback diagram. Since bottom horizontal map is an isofibration of ∞-categories (Corollary 4.4.5.3), it is a categorical pullback square (Corollary 4.5.2.27). It follows that the outer rectangle is a categorical pullback square (Proposition 4.5.2.18), so that θ is an equivalence of ∞-categories (Proposition 4.5.2.26). Corollary 4.4.5.3 guarantees that θ is also an isofibration, so it is a trivial Kan fibration (Proposition 4.5.5.20). □

Proof of Proposition 10.1.6.14. Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$ which admits a Čech nerve $\check{\mathrm{C}}_\bullet(X/Y)$. Applying Proposition 10.1.6.21 (in the case $n = 0$), we see that precomposition with the inclusion map

$$\mathrm{Ret}^{\mathrm{op}} \simeq \mathrm{Ret} \simeq \mathbf{\Delta}_{\min}^{\leq 1} \hookrightarrow \mathbf{\Delta}_{\min}$$

of Example 10.1.6.18 induces a trivial Kan fibration

$$\{\check{\mathrm{C}}_\bullet(X/Y)\} \times_{\mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta}_{+}^{\mathrm{op}}), \mathcal{C})} \mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta}_{\min}^{\mathrm{op}}), \mathcal{C}) \to \{f\} \times_{\mathrm{Fun}(\Delta^1, \mathcal{C})} \mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Ret}), \mathcal{C}).$$

In particular, the left hand side is nonempty if and only if the right hand side is nonempty: that is, the Čech nerve $\check{\mathrm{C}}_\bullet(X/Y)$ splits if and only if f has a right homotopy inverse. □

We close this section by describing an important special class of split simplicial objects.

Construction 10.1.6.22 (Decalage)**.** Let $\mathcal{C}$ be an ∞-category and let $X_\bullet$ be a simplicial object of $\mathcal{C}$. We let $\mathrm{Dec}_+(X)_\bullet$ denote the augmented simplicial object of $\mathcal{C}$ given by the composition 04SN

$$\mathrm{N}_\bullet(\mathbf{\Delta}_{+}^{\mathrm{op}}) \xrightarrow{\mathrm{N}_\bullet(C_{+}^{\mathrm{op}})} \mathrm{N}_\bullet(\mathbf{\Delta}_{\min}^{\mathrm{op}}) \subset \mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}) \xrightarrow{X_\bullet} \mathcal{C},$$

where C_+ denote the concatenation functor of Remark 10.1.6.2. We will refer to $\mathrm{Dec}_+(X)_\bullet$ as the *augmented decalage* of $X_\bullet$. We let $\mathrm{Dec}(X)_\bullet$ denote the underlying simplicial object of $\mathrm{Dec}_+(X)_\bullet$, given by the composition

$$\mathrm{N}_\bullet(\boldsymbol{\Delta}^{\mathrm{op}}) \xrightarrow{\mathrm{N}_\bullet(C^{\mathrm{op}})} \mathrm{N}_\bullet(\boldsymbol{\Delta}^{\mathrm{op}}_{\mathrm{min}}) \subset \mathrm{N}_\bullet(\boldsymbol{\Delta}^{\mathrm{op}}) \xrightarrow{X_\bullet} \mathcal{C}\,.$$

We will defer to $\mathrm{Dec}(X)_\bullet$ as the *decalage* of $\mathrm{Dec}(X)_\bullet$.

04SP **Remark 10.1.6.23.** More informally, the augmented decalage of a simplicial object $X_\bullet$ is given by the formula $\mathrm{Dec}_+(X)_n = X_{n+1}$. Moreover, for every pair of integers $0 \leq i \leq n$, the face and degeneracy operators

$$d^n_i : \mathrm{Dec}_+(X)_n \to \mathrm{Dec}_+(X)_{n-1} \qquad s^n_i : \mathrm{Dec}_+(X)_n \to \mathrm{Dec}_+(X)_{n+1}$$

coincide with the face and degeneracy operators

$$d^{n+1}_{i+1} : X_{n+1} \to X_n \qquad s^{n+1}_{i+1} : X_{n+1} \to X_{n+2}.$$

04SQ **Example 10.1.6.24.** Let X be a simplicial set. Then the decalage $\mathrm{Dec}(X)_\bullet$ can be identified with the disjoint union of coslice constructions $\coprod_x X_{x/}$, where the coproduct is indexed by the collection of all vertices $x \in X$.

04SR **Remark 10.1.6.25.** Let $X_\bullet$ be a simplicial object of an ∞-category $\mathcal{C}$. Then the augmented simplicial object $\mathrm{Dec}_+(X)_\bullet$ is split: it admits a splitting given by the diagram

$$\mathrm{N}_\bullet(\boldsymbol{\Delta}^{\mathrm{op}}_{\mathrm{min}}) \subset \mathrm{N}_\bullet(\boldsymbol{\Delta}^{\mathrm{op}}) \xrightarrow{X_\bullet} \mathcal{C}\,.$$

In particular, Proposition 10.1.6.9 guarantees that $\mathrm{Dec}_+(X)_\bullet$ is a colimit diagram in $\mathcal{C}$: that is, it exhibits the object $X_0 \in \mathcal{C}$ as a geometric realization of the decalage $\mathrm{Dec}(X)_\bullet$.

04SS **Remark 10.1.6.26.** Let $\iota : \boldsymbol{\Delta}_{\mathrm{min}} \hookrightarrow \boldsymbol{\Delta}$ denote the inclusion functor, and let

$$C : \boldsymbol{\Delta} \to \boldsymbol{\Delta}_{\mathrm{min}} \qquad [n] \mapsto [0] \star [n] = [n+1]$$

denote the concatenation functor of Remark 10.1.6.2. There is a natural transformation $\eta : \mathrm{id}_{\boldsymbol{\Delta}} \to \iota \circ C$, which carries each object $[n] \in \boldsymbol{\Delta}$ to the inclusion map

$$[n] \hookrightarrow [n+1] \qquad i \mapsto i+1.$$

If $X_\bullet$ is a simplicial object of an ∞-category $\mathcal{C}$, then composition with η determines a natural transformation of simplicial objects $T_\bullet : \mathrm{Dec}(X)_\bullet \to X_\bullet$, given termwise by the face operator $\mathrm{Dec}(X)_n = X_{n+1} \xrightarrow{d^{n+1}_0} X_n$.

The natural transformation η is the unit of an adjunction between ι and C; it admits a compatible counit $\epsilon : C \circ \iota \to \mathrm{id}_{\mathbf{\Delta}_{\min}}$, which carries each object $[n]$ to the quotient map

$$[n+1] \twoheadrightarrow [n] \qquad i \mapsto \max(0, i-1).$$

We therefore have a commutative diagram

04ST

$$\begin{tikzcd}
 & C \circ \iota \circ C \arrow[dr, "\mathrm{id}_C \circ \epsilon"] & \\
C \arrow[ur, "\eta \circ \mathrm{id}_C"] \arrow[rr, "\mathrm{id}_C"] & & C
\end{tikzcd} \tag{10.4}$$

in the functor category $\mathrm{Fun}(\mathbf{\Delta}, \mathbf{\Delta}_{\min})$. If $\overline{X}$ is a splitting of the simplicial object $X_\bullet$, then precomposition with (10.4) determines a commutative diagram

$$\begin{tikzcd}
 & \mathrm{Dec}(X)_\bullet \arrow[dr, "T_\bullet"] & \\
X_\bullet \arrow[ur, "h_\bullet"] \arrow[rr, "\mathrm{id}"] & & X_\bullet
\end{tikzcd}$$

in the ∞-category of simplicial objects $\mathrm{Fun}(\mathrm{N}_\bullet(\mathbf{\Delta}^{\mathrm{op}}), \mathcal{C})$. Here $h_\bullet$ is given termwise by the extra degeneracy map $h_n : X_n \to X_{n+1} = \mathrm{Dec}(X)_n$ appearing in Remark 10.1.6.4. In particular, if $X_\bullet$ is a split simplicial object of $\mathcal{C}$, then it is a retract of the decalage $\mathrm{Dec}(X)_\bullet$.

Warning 10.1.6.27. Let $X_\bullet$ be a simplicial object of an ∞-category $\mathcal{C}$. It follows from Remark 10.1.6.26 that every splitting of $X_\bullet$ determines a right homotopy inverse to the comparison map $T_\bullet : \mathrm{Dec}(X)_\bullet \to X_\bullet$. Beware that, in general, not every right homotopy inverse can be obtained in this way. For example, suppose that $\mathcal{C}$ is (the nerve of) an ordinary category. Unwinding the definitions, we see that a morphism of simplicial objects from $X_\bullet$ to $\mathrm{Dec}(X)_\bullet$ is given by a collection of morphisms $h_n : X_n \to \mathrm{Dec}(X)_n = X_{n+1}$ which satisfy the identities 04SU

$$d_i^{n+1} \circ h_n = h_{n-1} \circ d_{i-1}^n \qquad s_i^{n+1} \circ h_n = h_{n+1} \circ s_{i-1}^n$$

for $0 < i \leq n+1$. Moreover, $h_\bullet$ is a right inverse of $T_\bullet$ if and only if it satisfies the further identity $d_0^{n+1} \circ h_n = \mathrm{id}_{X_n}$ for each $n \geq 0$. However, $h_\bullet$ arises from a splitting of the simplicial object $X_\bullet$ only if it also satisfies the identities $s_0^{n+1} \circ h_n = h_{n+1} \circ h_n$; see Exercise 10.1.6.5 (compare with Warning 10.1.6.8).

10.2 Regular ∞-Categories

04TM Let X and Y be sets and let $f : X \to Y$ be a function. Recall that the *image* of f is the subset $\mathrm{im}(f) \subseteq Y$ consisting of those elements $y \in Y$ satisfying $y = f(x)$ for some element $x \in X$. Writing i for the inclusion of $\mathrm{im}(f)$ into Y, the function f then factors as a composition

$$X \overset{f_0}{\twoheadrightarrow} \mathrm{im}(f) \overset{i}{\hookrightarrow} Y.$$

This factorization admits a more abstract characterization: it is determined (up to unique isomorphism) by the requirements that i is injective (that is, it is a monomorphism in the category of sets) and that f_0 is surjective (that is, it is an epimorphism in the category of sets).

The construction $f \mapsto \mathrm{im}(f)$ has counterparts in many other categories. For example, every homomorphism of commutative rings $f : R \to S$ has a tautological factorization

$$R \overset{f_0}{\twoheadrightarrow} \mathrm{im}(f) \overset{i}{\hookrightarrow} S,$$

which is again characterized (up to unique isomorphism) by the requirements that that i is injective and that f_0 is surjective. Here the first demand is equivalent to the condition that i is a monomorphism in the category of commutative rings. However, the second demand is more subtle. Every surjective ring homomorphism is an epimorphism in the category of commutative rings, but the converse is false in general.

04TN **Example 10.2.0.1.** Let $\mathbf{Q}$ denote the field of rational numbers, let $\mathbf{Z} \subseteq \mathbf{Q}$ denote the ring of integers, and let $f : \mathbf{Z} \hookrightarrow \mathbf{Q}$ denote the inclusion map. Then f is both a monomorphism and an epimorphism in the category of commutative rings. Consequently, the ring homomorphism f admits (at least) two factorizations as an epimorphism followed by a monomorphism, given by the diagrams

$$\mathbf{Z} \xrightarrow{\mathrm{id}} \mathbf{Z} \xrightarrow{f} \mathbf{Q} \qquad \mathbf{Z} \xrightarrow{f} \mathbf{Q} \xrightarrow{\mathrm{id}} \mathbf{Q}.$$

To address the phenomenon described in Example 10.2.0.1, it is convenient to modify the definition of epimorphism.

04TP **Definition 10.2.0.2.** Let $\mathcal{C}$ be a category which admits fiber products. We will say that a morphism $f : X \to Y$ of $\mathcal{C}$ is a *regular epimorphism* if it exhibits Y as a coequalizer of the pair of projection maps $\pi_0, \pi_1 : X \times_Y X \to X$.

04TQ **Remark 10.2.0.3.** Let $\mathcal{C}$ be a category which admits fiber products and let $f : X \to Y$ be a morphism in $\mathcal{C}$. Then f is an epimorphism if and only if, for every object $Z \in \mathcal{C}$, the function

$$\theta_Z : \mathrm{Hom}_{\mathcal{C}}(Y, Z) \to \mathrm{Hom}_{\mathcal{C}}(X, Z) \qquad g \mapsto g \circ f$$

is injective. The condition that f is a regular epimorphism is (in general) stronger: it requires also that the image of θ_Z is the collection of morphisms $h : X \to Z$ which satisfy the identity $h \circ \pi_0 = h \circ \pi_1$; here π_0 and π_1 denote the projection maps from $X \times_Y X$ to X.

Example 10.2.0.4. Let $\mathcal{C} = \mathrm{Set}$ be the category of sets and let $f : X \twoheadrightarrow Y$ be an epimorphism in $\mathcal{C}$: that is, a surjective function. Then f is a regular epimorphism: that is, it exhibits Y as a quotient of the equivalence relation $\equiv_f$, defined by the requirement 04TR

$$(x \equiv_f x') \Leftrightarrow (f(x) = f(x')).$$

Exercise 10.2.0.5. Let $f : R \to S$ be a homomorphism of commutative rings. Show that f is a regular epimorphism (in the category of commutative rings) if and only if it is surjective (as a map of sets). In particular, the inclusion map $\mathbf{Z} \hookrightarrow \mathbf{Q}$ of Example 10.2.0.1 is an epimorphism in the category of commutative rings which is not regular. 04TS

Let $\mathcal{C}$ be a category which admits fiber products and let $f : X \to Y$ be a morphism in $\mathcal{C}$. We will say that an object $Y_0 \in \mathcal{C}$ is an *image of f* if the morphism f factors as a composition

$$X \overset{f_0}{\twoheadrightarrow} Y_0 \overset{i}{\hookrightarrow} Y,$$

where i is a monomorphism and f_0 is a regular epimorphism. It is not difficult to show that if such a factorization exists, then it is uniquely determined up to (canonical) isomorphism: for example, the object Y_0 can be recovered as the coequalizer of the pair of projection maps $X \times_Y X \rightrightarrows X$. To emphasize the uniqueness, we will typically denote the object Y_0 by $\mathrm{im}(f)$ and refer to it as *the* image of f. This motivates the following:

Definition 10.2.0.6. Let $\mathcal{C}$ be a category. We say that $\mathcal{C}$ is *regular* if it satisfies the following conditions: 04TT

(1) The category $\mathcal{C}$ admits finite limits (in particular, it admits fiber products).

(2) Every morphism $f : X \to Y$ of $\mathcal{C}$ has an image: that is, we can write f as a composition

$$X \overset{f_0}{\twoheadrightarrow} Y_0 \overset{i}{\hookrightarrow} Y$$

where i is a monomorphism and f_0 is a regular epimorphism.

(3) The collection of regular epimorphisms is stable under the formation of pullbacks. That is, for every pullback diagram

$$\begin{tikzcd}
X' \arrow[r] \arrow[d, "f'"] & X \arrow[d, "f"] \\
Y' \arrow[r] & Y
\end{tikzcd}$$

in the category $\mathcal{C}$, if f is a regular epimorphism, then f' is also a regular epimorphism.

04TU **Example 10.2.0.7.** The axioms of Definition 10.2.0.6 tend to be satisfied by any category $\mathcal{C}$ whose objects can be described as "sets with algebraic structure." For example:

- The category of sets is regular.
- The category of groups is regular.
- The category of abelian groups is regular.
- The category of associative rings is regular.
- The category of commutative rings is regular.

04TV **Example 10.2.0.8.** Let $\mathcal{C}$ be the category of partially ordered sets (with morphisms given by nondecreasing functions). Then $\mathcal{C}$ is not regular: it satisfies conditions (1) and (2) of Definition 10.2.0.6, but does not satisfy condition (3) (see Exercise 10.2.2.16).

Our goal in this section is to extend Definition 10.2.0.6 to the setting of ∞-categories. The first step is to find an appropriate ∞-categorical counterpart for the notion of regular epimorphism. Let $\mathcal{C}$ be an ∞-category which admits fiber products. Then, to every morphism $f : X \to Y$ of $\mathcal{C}$, one can associate a diagram

04TW
$$\begin{tikzcd} X \times_Y X \arrow[r, shift left, "\pi_0"] \arrow[r, shift right, "\pi_1"'] & X \arrow[r, "f"] & Y. \end{tikzcd} \tag{10.5}$$

If $\mathcal{C}$ is (the nerve of) an ordinary category, then f is a regular epimorphism if and only if (10.5) is a coequalizer diagram. In the ∞-categorical setting, this condition is almost never satisfied (even if f is an isomorphism). To guarantee that a morphism $g : X \to Z$ factors (up to homotopy) through f, it is typically not enough to know that $g \circ \pi_0$ is homotopic to $g \circ \pi_1$: one needs a homotopy satisfying further coherence conditions, whose formalization involves iterated fiber products $X \times_Y X \times_Y \cdots \times_Y X$. Recall that the collection of all such fiber products can be organized into an augmented simplicial object $\check{\mathrm{C}}_\bullet(X/Y)$ called the *Čech nerve* of f (Definition 10.1.5.4), which we display informally as

$$\begin{tikzcd} \cdots \arrow[r, shift left=3] \arrow[r, shift left=1] \arrow[r, shift right=1] \arrow[r, shift right=3] & X \times_Y X \times_Y X \arrow[r, shift left=2] \arrow[r] \arrow[r, shift right=2] & X \times_Y X \arrow[r, shift left, "\pi_0"] \arrow[r, shift right, "\pi_1"'] & X \arrow[r] & Y. \end{tikzcd}$$

We will say that f is a *quotient morphism* if $\check{\mathrm{C}}_\bullet(X/Y)$ is a colimit diagram in the ∞-category $\mathcal{C}$.

04TX **Remark 10.2.0.9.** In §10.2.2, we adopt a slightly different definition of quotient morphism (Definition 10.2.2.1), which makes sense in any ∞-category $\mathcal{C}$ (that is, we do not need to assume that $\mathcal{C}$ admits fiber products). Our definition is formulated using the language of *sieves*, which we review in §10.2.1. When $\mathcal{C}$ admits fiber products, the sieve-theoretic definition reduces to the requirement that $\check{\mathrm{C}}_\bullet(X/Y)$ is a colimit diagram (see Proposition 10.2.2.4).

Warning 10.2.0.10. Let $\mathcal{C} = \mathrm{N}_\bullet(\mathcal{C}_0)$ be the nerve of an ordinary category $\mathcal{C}_0$, and let $f : X \to Y$ be a morphism of $\mathcal{C}$. Then f is a quotient morphism if and only if it is a regular epimorphism in $\mathcal{C}_0$, in the sense of Definition 10.2.0.2 (see Corollary 10.2.2.7). In particular, every quotient morphism in $\mathcal{C}$ is an epimorphism. Beware that, if $\mathcal{C}$ is not assumed to be the nerve of an ordinary category, then the analogous statement is false: quotient morphisms in $\mathcal{C}$ are usually not epimorphisms (that is, they are not monomorphisms when viewed as morphisms in the opposite ∞-category $\mathcal{C}^{\mathrm{op}}$). See Warning 10.2.2.10). 04TY

Let $\mathcal{C}$ be an ∞-category containing a morphism $f : X \to Y$. We will say that an object $Y_0 \in \mathcal{C}$ is an *image of f* if there exists a diagram

$$\begin{tikzcd}
& Y_0 \arrow[dr, "i"] & \\
X \arrow[ur, "f_0"] \arrow[rr, "f"] & & Y,
\end{tikzcd}$$

where f_0 is a quotient morphism and i is a monomorphism (Definition 10.2.3.1). In §10.2.3, we will show that if such a diagram exists, then it is unique up to isomorphism (in fact, up to a contractible space of choices: see Proposition 10.2.3.14). Following our discussion of the classical case, we will typically denote the object Y_0 by $\mathrm{im}(f)$ and refer to it as the *image* of the morphism f (Notation 10.2.3.12).

Let $\mathcal{C}$ be an ∞-category which admits fiber products. Beware that, in general, the collection of quotient morphisms in $\mathcal{C}$ is not closed under pullback (see Exercise 10.2.2.16). We say that a morphism $f : X \to Y$ if $\mathcal{C}$ is a *universal quotient morphism* if, for every pullback diagram

$$\begin{tikzcd}
X' \arrow[r] \arrow[d, "f'"] & X \arrow[d, "f"] \\
Y' \arrow[r] & Y,
\end{tikzcd}$$

the morphism f' is a quotient morphism. In §10.2.4, we extend this definition to the setting of an ∞-category $\mathcal{C}$ which does not necessarily admit pullbacks (see Definition 10.2.4.1 and Corollary 10.2.4.7) and study its properties. The notion of universal quotient morphism is in some respects better behaved than the notion of quotient morphism: for example, the collection of universal quotient morphisms is always closed under composition (Proposition 10.2.4.12), while the collection of quotient morphisms need not be (Exercise 10.2.2.15).

Armed with a good theory of quotient morphisms, we can formulate an ∞-categorical analogue of Definition 10.2.0.6. We say that an ∞-category $\mathcal{C}$ is *regular* if it satisfies the following axioms (Definition 10.2.5.1):

(1) The ∞-category $\mathcal{C}$ admits finite limits.

(2) Every morphism $f : X \to Y$ of $\mathcal{C}$ has an image: that is, we can write f as a composition of a quotient morphism $X \twoheadrightarrow Y_0$ with a monomorphism $Y_0 \hookrightarrow Y$.

(3) The collection of quotient morphisms in $\mathcal{C}$ is stable under pullback: that is, every quotient morphism is a universal quotient morphism.

In §10.2.5, we discuss various formulations of this definition and give some examples of regular ∞-categories. In particular, we show that the ∞-category of spaces $\mathcal{S}$ is regular (Corollary 10.2.5.6) and that the collection of regular ∞-categories is closed under the formation of slice constructions (Proposition 10.2.5.9) and left exact localization (Proposition 10.2.5.19).

10.2.1 Sieves

04TZ Let $\mathcal{C}$ be a category. Recall that a *sieve on* $\mathcal{C}$ is a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$ satisfying the following condition:

- If $f : X \to Y$ is a morphism of $\mathcal{C}$ and Y belongs to the subcategory $\mathcal{C}^0$, then X also belongs to the subcategory $\mathcal{C}^0$.

This condition has a counterpart in the setting of ∞-categories.

04U0 **Definition 10.2.1.1.** Let $\mathcal{C}$ be a simplicial set. A *sieve on* $\mathcal{C}$ is a simplicial subset $\mathcal{C}^0 \subseteq \mathcal{C}$ for which the inclusion map $\mathcal{C}^0 \hookrightarrow \mathcal{C}$ is a right fibration.

04U1 **Example 10.2.1.2.** Let $\mathcal{C}$ be a simplicial set. Then the simplicial subsets $\emptyset, \mathcal{C} \subseteq \mathcal{C}$ are sieves on $\mathcal{C}$.

04U2 **Remark 10.2.1.3** (Base Change)**.** Let $F : \mathcal{C} \to \mathcal{D}$ be a morphism of simplicial sets, and let $\mathcal{D}^0 \subseteq \mathcal{D}$ be a sieve on $\mathcal{D}$. Then the inverse image $\mathcal{C}^0 = F^{-1}(\mathcal{D}^0)$ is a sieve on $\mathcal{C}$.

04U3 **Remark 10.2.1.4** (Transitivity)**.** Let $\mathcal{C}$ be a simplicial set containing simplicial subsets $\mathcal{C}^1 \subseteq \mathcal{C}^0 \subseteq \mathcal{C}$, where $\mathcal{C}^0$ is a sieve on $\mathcal{C}$. Then $\mathcal{C}^1$ is a sieve on $\mathcal{C}^0$ if and only if it is a sieve on $\mathcal{C}$.

04U4 **Proposition 10.2.1.5.** *Let $\mathcal{C}$ be a simplicial set. Then a simplicial subset $\mathcal{C}^0 \subseteq \mathcal{C}$ is a sieve if and only if it satisfies the following condition:*

(∗) *Let $\sigma : \Delta^n \to \mathcal{C}$ be an n-simplex of $\mathcal{C}$. If the final vertex $\sigma(n)$ is contained in $\mathcal{C}^0$, then σ is contained in $\mathcal{C}^0$.*

Proof. For every integer $n \geq 0$, the inclusion map $\{n\} \hookrightarrow \Delta^n$ is right anodyne (Example 4.3.7.11). If the inclusion map $\iota : \mathcal{C}^0 \hookrightarrow \mathcal{C}$ is a right fibration, then condition $(\ast)$ is a special case of Proposition 4.2.4.5. Conversely, suppose that condition $(\ast)$ is satisfied, and let $\sigma : \Delta^n \to \mathcal{C}$ be an n-simplex of $\mathcal{C}$. For every integer $0 < i \leq n$, the horn Λ^n_i contains the final vertex $\{n\} \subseteq \Delta^n$. Consequently, if the restriction $\sigma|_{\Lambda^n_i}$ factors (uniquely) through ι, then condition $(\ast)$ guarantees that σ factors (uniquely) through ι. Allowing n and i to vary, we conclude that ι is a right fibration. □

Corollary 10.2.1.6. *Let $\mathcal{C}$ be an ∞-category and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a simplicial subset. Then $\mathcal{C}^0$ is a sieve on $\mathcal{C}$ if and only if it is a full subcategory of $\mathcal{C}$ which satisfies the following condition:* 04U5

(∗) *If $f : X \to Y$ is a morphism of $\mathcal{C}$ and Y belongs to the subcategory $\mathcal{C}^0$, then X also belongs to the subcategory $\mathcal{C}^0$.*

Proof. By definition, $\mathcal{C}^0$ is a sieve on $\mathcal{C}$ if and only if the inclusion map $\iota : \mathcal{C}^0 \hookrightarrow \mathcal{C}$ is a right fibration. In particular, this guarantees that ι is an inner fibration, so that $\mathcal{C}^0$ is a subcategory of $\mathcal{C}$. It also guarantees that a morphism $f : X \to Y$ is contained in $\mathcal{C}^0$ if and only if the object Y is contained in $\mathcal{C}^0$, so that the subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$ is full and satisfies $(\ast)$. Conversely, if $\mathcal{C}^0 \subseteq \mathcal{C}$ is a full subcategory satisfying condition $(\ast)$, then ι satisfies the criterion of Proposition 10.2.1.5 and is therefore a right fibration. □

Example 10.2.1.7. Let $\mathcal{C}$ be a category and let S be a simplicial subset of $\mathrm{N}_\bullet(\mathcal{C})$. Then S is a sieve on $\mathrm{N}_\bullet(\mathcal{C})$ (in the sense of Definition 10.2.1.1) if and only if it has the form $\mathrm{N}_\bullet(\mathcal{C}^0)$, where $\mathcal{C}^0$ is sieve on $\mathcal{C}$ (in the usual category-theoretic sense). 04U6

Corollary 10.2.1.8. *Let $\mathcal{C}$ be an ∞-category and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a sieve. Then $\mathcal{C}^0$ is a replete full subcategory of $\mathcal{C}$. In particular, $\mathcal{C}^0$ is an ∞-category.* 04U7

Remark 10.2.1.9. Let $\mathcal{C}$ be an ∞-category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a sieve, and let $f : K \to \mathcal{C}^0$ be a diagram. If the simplicial set K is nonempty, then the inclusion map $\mathcal{C}^0_{/f} \hookrightarrow \mathcal{C}_{/f}$ is an isomorphism. In particular, an extension $\overline{f} : K^{\triangleleft} \to \mathcal{C}^0$ is a limit diagram in the ∞-category $\mathcal{C}^0$ if and only if it is a limit diagram in $\mathcal{C}$. 04U8

Example 10.2.1.10. Let $\mathcal{C}$ be an ∞-category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a sieve, and let X be an object of $\mathcal{C}^0$. If $C_\bullet$ is any simplicial object of $\mathcal{C}$ satisfying $C_0 = X$, then $C_\bullet$ can also be regarded as a simplicial object of $\mathcal{C}^0$. Applying Remark 10.2.1.9, we deduce that $C_\bullet$ is a Čech nerve of X in the ∞-category $\mathcal{C}^0$ if and only if it is a Čech nerve of X in the ∞-category $\mathcal{C}$ (see Definition 10.1.4.1). 04U9

04UA **Proposition 10.2.1.11.** *Let $U : \mathcal{E} \to \mathcal{C}$ be a morphism of simplicial sets. The following conditions are equivalent:*

(1) *The morphism U restricts to an isomorphism of $\mathcal{E}$ with a sieve $\mathcal{C}^0 \subseteq \mathcal{C}$.*

(2) *The morphism U is a right covering map (Definition 4.2.3.8) and, for every vertex $C \in \mathcal{C}$, the fiber $U^{-1}\{C\}$ has at most one element.*

Proof. The implication (1) ⇒ (2) follows from Example 4.2.3.12. Conversely, suppose that condition (2) is satisfied, and let $\mathrm{h}\mathcal{C}$ denote the homotopy category of $\mathcal{C}$. Our assumption that U is a right covering map guarantees the existence of a pullback square

$$\begin{tikzcd}
\mathcal{E} \arrow[r, "U"] \arrow[d] & \mathrm{N}_\bullet(\int^{\mathrm{h}\mathcal{C}} \mathscr{F}) \arrow[d] \\
\mathcal{C} \arrow[r] & \mathrm{N}_\bullet(\mathrm{h}\mathcal{C})
\end{tikzcd}$$

where $\mathscr{F} : \mathrm{h}\mathcal{C}^{\mathrm{op}} \to \mathrm{Set}$ is the contravariant homotopy transport representation of $\mathcal{C}$, given concretely by the formula $\mathscr{F}(C) = U^{-1}\{C\}$ (see Corollary 5.2.7.4). Our assumption that each of the sets $\mathscr{F}(C)$ has at most one element guarantees that the right vertical map induces an isomorphism from $\int^{\mathrm{h}\mathcal{C}} \mathscr{F}$ to the sieve $\mathcal{D} \subseteq \mathrm{h}\mathcal{C}$ spanned by those objects C for which the fiber $U^{-1}\{C\}$ is nonempty. Condition (1) now follows from Example 10.2.1.7 and Remark 10.2.1.3. □

04UB **Corollary 10.2.1.12.** *Let $\mathcal{C}$ be a simplicial set and let $\mathcal{D} = \mathrm{h}\mathcal{C}$ denote its homotopy category. Then the construction $(\mathcal{D}^0 \subseteq \mathcal{D}) \mapsto \mathrm{N}_\bullet(\mathcal{D}^0) \times_{\mathrm{N}_\bullet(\mathcal{D})} \mathcal{C}$ induces a bijection*

$$\{\text{Sieves } \mathcal{D}^0 \subseteq \mathcal{D}\} \to \{\text{Sieves } \mathcal{C}^0 \subseteq \mathcal{C}\}.$$

04UC **Remark 10.2.1.13.** Let $\mathcal{C}$ be a simplicial set. Then the collection of sieves on $\mathcal{C}$ is closed under the formation of intersections. In particular, for every vertex $X \in \mathcal{C}$, there is a smallest sieve $\mathcal{C}^0 \subseteq \mathcal{C}$ containing X. We will refer to $\mathcal{C}^0$ as the *sieve generated by* X. If $\mathcal{C}$ is an ∞-category, then $\mathcal{C}^0$ admits a more explicit description: it is the full subcategory of $\mathcal{C}$ spanned by those objects C for which there exists a morphism $f : C \to X$.

04UZ **Remark 10.2.1.14.** Let $\mathcal{C}$ be an ∞-category, let X be an object of $\mathcal{C}$, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be the sieve generated by X (Remark 10.2.1.13): that is, the full subcategory of $\mathcal{C}$ spanned by those objects C for which the morphism space $\mathrm{Hom}_{\mathcal{C}}(C, X)$ is nonempty. Then X is a subterminal object of $\mathcal{C}$ (in the sense of Definition 9.2.2.2) if and only if it is a final object of $\mathcal{C}^0$ (in the sense of Definition 4.6.7.1).

Remark 10.2.1.15. Let $\mathcal{C}$ be an ∞-category, let X be an object of $\mathcal{C}$, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be the sieve generated by X (Remark 10.2.1.13). Then $\mathcal{C}^0$ is the essential image of the forgetful functor $U : \mathcal{C}_{/X} \to \mathcal{C}$. In particular, U determines a functor $U^0 : \mathcal{C}_{/X} \to \mathcal{C}^0$. Moreover, the following conditions are equivalent: 04V5

(1) The object $X \in \mathcal{C}$ is subterminal (see Definition 9.2.2.2).

(2) The functor U^0 is a trivial Kan fibration.

(3) The functor U^0 is an equivalence of ∞-categories.

The equivalence (1) $\Leftrightarrow$ (2) is a reformulation of Remark 9.2.2.14. Note that U^0 is a pullback of U, and therefore a right fibration (Proposition 4.3.6.1). In particular, U^0 is an isofibration (Example 4.4.1.11), so the equivalence (2) $\Leftrightarrow$ (3) follows from Proposition 4.5.5.20.

Remark 10.2.1.16. Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$. Suppose that $\mathcal{C}$ admits finite limits, so that f admits a Čech nerve $\check{\mathrm{C}}(X/Y)_\bullet$ (Proposition 10.1.5.6). If Y is a subterminal object of $\mathcal{C}$, then the underlying simplicial object of $\check{\mathrm{C}}(X/Y)_\bullet$ is also a Čech nerve of the object X. This follows by combining Remark 10.2.1.15 with Example 10.2.1.10. 04V6

Remark 10.2.1.17. Let $\mathcal{C}$ be an ∞-category containing a 2-simplex 04W3

04W4

$$\begin{tikzcd} & Y \arrow[dr, "g"] & \\ X \arrow[ur, "f"] \arrow[rr, "h"] & & Z, \end{tikzcd} \tag{10.6}$$

where g is a monomorphism. Suppose that $\mathcal{C}$ admits fiber products, so that the morphisms f and h admit Čech nerves $\check{\mathrm{C}}_\bullet(X/Y)$ and $\check{\mathrm{C}}_\bullet(X/Z)$ (Proposition 10.1.5.6). Then the underlying simplicial objects of $\check{\mathrm{C}}_\bullet(X/Y)$ and $\check{\mathrm{C}}_\bullet(X/Z)$ are canonically isomorphic. To see this, let us regard (10.6) as morphism $\widetilde{f} : \widetilde{X} \to \widetilde{Y}$ in the slice ∞-category $\mathcal{C}_{/Z}$. Since the forgetful functor $\mathcal{C}_{/Z} \to \mathcal{C}$ preserves pullbacks (Corollary 7.1.5.18), we can identify $\check{\mathrm{C}}_\bullet(X/Y)$ with the image of $\check{\mathrm{C}}_\bullet(\widetilde{X}/\widetilde{Y})$. The desired result now follows by applying Example 10.2.1.16 to the object $\widetilde{Y} \in \mathcal{C}_{/Z}$ (which is subterminal by virtue of Remark 9.2.4.16).

It will often be convenient to work with a variant Definition 10.2.1.1.

Definition 10.2.1.18. Let $\mathcal{C}$ be an ∞-category and let Y be an object of $\mathcal{C}$. A *sieve on* Y is a sieve on the slice ∞-category $\mathcal{C}_{/Y}$; that is, a full subcategory $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ satisfying the following condition: 04UD

$(*)$ For every 2-simplex

$$\begin{tikzcd}
X' \arrow[rr] \arrow[dr, "f'"'] & & X \arrow[dl, "f"] \\
& Y &
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$, if f is contained in the subcategory $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$, then f' is also contained in $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$.

`04UE` **Example 10.2.1.19.** Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$. By virtue of Remark 10.2.1.13, there is a smallest sieve $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ on the object Y which contains the morphism f. We will refer to $\mathcal{C}^0_{/Y}$ as the *sieve generated by* f. Concretely, a morphism $e : C \to Y$ belongs to the sieve $\mathcal{C}^0_{/Y}$ if and only if there exists a commutative diagram

$$\begin{tikzcd}
C \arrow[rr] \arrow[dr, "e"'] & & X \arrow[dl, "f"] \\
& Y &
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$. Stated more informally, a morphism e belongs to the sieve $\mathcal{C}^0_{/Y}$ if and only if it factors through f.

`04UF` **Remark 10.2.1.20.** Let $\mathcal{C}$ be an ∞-category and let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ be a sieve on an object Y. Then $\mathcal{C}^0_{/Y}$ coincides with $\mathcal{C}_{/Y}$ if and only if it contains the identity morphism $\mathrm{id}_Y : Y \to Y$. In particular, if $\mathcal{C}^0_{/Y}$ is the sieve generated by a morphism $f : X \to Y$ (Example 10.2.1.19), then $\mathcal{C}^0_{/Y} = \mathcal{C}_{/Y}$ if and only if the morphism f admits a right homotopy inverse $s : Y \to X$.

`04UG` **Remark 10.2.1.21.** Let $\mathcal{C}$ be an ∞-category, let Y be an object of $\mathcal{C}$, and let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ be a sieve on Y. The condition that a morphism $f : X \to Y$ belongs to $\mathcal{C}^0_{/Y}$ depends only on the isomorphism class of f as an object of the ∞-category $\mathcal{C}_{/Y}$. In particular, if X is fixed, then the condition that f belongs to $\mathcal{C}^0_{/Y}$ depends only on the homotopy class $[f] \in \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(X, Y)$.

We have the following variant of Corollary 10.2.1.12:

`04UH` **Proposition 10.2.1.22.** *Let $\mathcal{C}$ be an ∞-category, let $\mathcal{D} = \mathrm{h}\mathcal{C}$ be its homotopy category, and let Y be an object of $\mathcal{C}$ (which we also regard as an object of $\mathcal{D}$). Then the construction $(\mathcal{D}^0_{/Y} \subseteq \mathcal{D}_{/Y}) \mapsto \mathrm{N}_\bullet(\mathcal{D}^0_{/Y}) \times_{\mathrm{N}_\bullet(\mathcal{D}_{/Y})} \mathcal{C}_{/Y}$ induces a bijection*

$$\{\text{Sieves } \mathcal{D}^0_{/Y} \subseteq \mathcal{D}_{/Y}\} \xrightarrow{\sim} \{\text{Sieves } \mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}\}.$$

Warning 10.2.1.23. Proposition 10.2.1.22 is not a special case of Corollary 10.2.1.12, because the slice category $\mathcal{D}_{/Y}$ is usually not equivalent to the homotopy category of $\mathcal{C}_{/Y}$. 04UJ

Proof of Proposition 10.2.1.22. Let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ be a sieve on the ∞-category $\mathcal{C}_{/Y}$. We wish to show that there is a unique sieve $\mathcal{D}^0_{/Y} \subseteq \mathcal{D}_{/Y}$ with the following property: a morphism $f : X \to Y$ belongs to the sieve $\mathcal{C}^0_{/Y}$ if and only if the homotopy class $[f]$ belongs to the sieve $\mathcal{D}^0_{/Y}$. The uniqueness assertion is immediate. To prove existence, we define $\mathcal{D}^0_{/Y}$ to be the full subcategory of $\mathcal{D}_{/Y}$ spanned by those homotopy classes $[f] : X \to Y$ such that f belongs to $\mathcal{C}^0_{/Y}$; by virtue of Remark 10.2.1.21, this condition depends only on the homotopy class $[f]$ and not on the choice of representative f. To complete the proof, it will suffice to show that the subcategory $\mathcal{D}^0_{/Y} \subseteq \mathcal{D}_{/Y}$ is a sieve. Suppose we are given a commutative diagram

04UK

$$\begin{tikzcd}
X' \arrow[rr] \arrow[dr, "{[f']}"'] & & X \arrow[dl, "{[f]}"] \\
& Y &
\end{tikzcd} \tag{10.7}$$

in the homotopy category $\mathcal{D} = \mathrm{h}\mathcal{C}$. We wish to show that if $[f]$ belongs to $\mathcal{D}^0_{/Y}$, then $[f']$ also belongs to $\mathcal{D}^0_{/Y}$. This follows from our assumption that $\mathcal{C}^0_{/Y}$ is a sieve on Y, since (10.7) can be lifted to a 2-simplex in the ∞-category $\mathcal{C}$. □

Notation 10.2.1.24 (Pullback Sieves)**.** Let $\mathcal{C}$ be an ∞-category, let $f : X \to Y$ be a morphism of $\mathcal{C}$, and let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ be a sieve on the object Y. We let $f^*(\mathcal{C}^0_{/Y})$ denote the full subcategory of $\mathcal{C}_{/X}$ spanned by those objects $e : C \to X$ for which the composition $(f \circ e) : C \to Y$ belongs to $\mathcal{C}^0_{/Y}$. By virtue of Remark 10.2.1.21, this condition is independent of the choice of composition $f \circ e$. The subcategory $f^*(\mathcal{C}^0_{/Y})$ is a sieve on the object X, which we will refer to as the *pullback of* $\mathcal{C}^0_{/Y}$ *along the morphism* f. 04UL

Example 10.2.1.25. Let $\mathcal{C}$ be an ∞-category containing a pullback diagram 04UM

$$\begin{tikzcd}
X' \arrow[r] \arrow[d, "f'"] & X \arrow[d, "f"] \\
Y' \arrow[r, "u"] & Y,
\end{tikzcd}$$

and let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ be the sieve on Y generated by the morphism f. Then the pullback $u^*(\mathcal{C}^0_{/Y})$ is the sieve on Y' generated by the morphism f'. In other words, a morphism $[v] : C \to X'$ in the homotopy category $\mathrm{h}\mathcal{C}$ factors through $[f']$ if and only if the composite morphism $[u] \circ [v]$ factors through $[f]$ (see Warning 7.6.3.3).

Let $\mathcal{C}$ be an ∞-category. Recall that a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$ is *dense* if the identity functor $\mathrm{id}_{\mathcal{C}} : \mathcal{C} \to \mathcal{C}$ is left Kan extended from $\mathcal{C}^0$ (Definition 8.4.1.5). We now consider a slight variant of this condition.

04UN **Definition 10.2.1.26.** Let $\mathcal{C}$ be an ∞-category and let X be an object of $\mathcal{C}$. We say that a sieve $\mathcal{C}^0_{/X} \subseteq \mathcal{C}_{/X}$ on X is *dense* if the forgetful functor $\mathcal{C}_{/X} \to \mathcal{C}$ is left Kan extended from $\mathcal{C}^0_{/X}$.

04UP **Warning 10.2.1.27.** The terminology of Definition 10.2.1.26 has the potential to create confusion. Since the forgetful functor $\mathcal{C}_{/X} \to \mathcal{C}$ creates colimits (Proposition 7.1.3.19), a sieve $\mathcal{C}^0_{/X} \subseteq \mathcal{C}_{/X}$ which is dense in the sense of Definition 10.2.1.26 is also dense when regarded as a full subcategory of $\mathcal{C}_{/X}$ (in the sense of Definition 8.4.1.5). Beware that the converse is false in general (Example 10.2.1.28). However, it is true if $\mathcal{C}$ admits finite products (Proposition 10.2.1.29).

04UQ **Example 10.2.1.28.** Let $\mathcal{C}$ be the 1-dimensional simplicial set associated to the directed graph depicted in the diagram

$$\begin{tikzcd}
A \arrow[r] \arrow[d] & X \\
Y & B, \arrow[l] \arrow[u]
\end{tikzcd}$$

and let $\mathcal{C}^0_{/X} \subseteq \mathcal{C}_{/X}$ be the sieve spanned by the objects A and B. Then $\mathcal{C}^0_{/X}$ is dense when regarded as a full category of $\mathcal{C}_{/X}$ (in the sense of Definition 8.4.1.5), but not when regarded as a sieve on X (in the sense of Definition 10.2.1.26).

04UR **Proposition 10.2.1.29.** *Let $\mathcal{C}$ be an ∞-category which admits pairwise products and let $X \in \mathcal{C}$. Then a sieve $\mathcal{C}^0_{/X} \subseteq \mathcal{C}_{/X}$ is dense (in the sense of Definition 10.2.1.26) if and only if it is dense when regarded as a subcategory of $\mathcal{C}_{/X}$ (in the sense of Definition 8.4.1.5).*

Proof. Assume that $\mathcal{C}^0_{/X}$ is a dense subcategory of $\mathcal{C}_{/X}$; we will show that it is dense when regarded as a sieve (for the reverse implication, see Warning 10.2.1.27). By assumption, the identity functor $\mathrm{id} : \mathcal{C}_{/X} \to \mathcal{C}_{/X}$ is left Kan extended from $\mathcal{C}^0_{/X}$. We wish to show that the forgetful functor $U : \mathcal{C}_{/X} \to \mathcal{C}$ is also left Kan extended from $\mathcal{C}^0_{/X}$. To prove this, it suffices to show that the functor U preserves colimits. This is a special case of Corollary 7.1.3.21, since the functor U admits a right adjoint (given on objects by the construction $Y \mapsto X \times Y$; see Proposition 7.6.1.12). $\square$

04US **Example 10.2.1.30.** Let $\mathcal{C}$ be an ∞-category. For every object $X \in \mathcal{C}$, the ∞-category $\mathcal{C}_{/X}$ is a dense sieve on X (see Example 7.3.3.8).

Remark 10.2.1.31. Let $\mathcal{C}$ be an ∞-category and let $\mathcal{C}^0_{/X} \subseteq \mathcal{C}^1_{/X} \subseteq \mathcal{C}_{/X}$ be sieves on an object X. If $\mathcal{C}^0_{/X}$ is dense, then $\mathcal{C}^1_{/X}$ is also dense. See Proposition 7.3.8.6. `04UT`

Remark 10.2.1.32. Let $\mathcal{C}$ be an ∞-category, let Y be an object of $\mathcal{C}$, and let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ be a sieve on X. Let $f : X \to Y$ be a morphism of $\mathcal{C}$, which we regard as an object of $\mathcal{C}_{/Y}$, and let $\mathcal{C}^0_{/X} = f^*(\mathcal{C}^0_{/Y})$ be the pullback sieve (Notation 10.2.1.24). Then the forgetful functor $\mathcal{C}_{/Y} \to \mathcal{C}$ is left Kan extended from $\mathcal{C}^0_{/Y}$ at f if and only if the following condition is satisfied: `04UU`

$(*_f)$ The composite map

$$(\mathcal{C}^0_{/X})^{\triangleright} \hookrightarrow \mathcal{C}^{\triangleright}_{/X} \to \mathcal{C}$$

is a colimit diagram in the ∞-category $\mathcal{C}$.

In particular, the sieve $\mathcal{C}^0_{/Y}$ is dense if and only if it satisfies condition $(*_f)$ for *every* morphism $f : X \to Y$ of $\mathcal{C}$.

Proposition 10.2.1.33. *Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$. For every dense sieve $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$, the pullback sieve $f^* \mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/X}$ is also dense.* `04UV`

Proof. This is an immediate consequence of the criterion of Remark 10.2.1.32. □

Proposition 10.2.1.34 (Transitivity)**.** *Let $\mathcal{C}$ be an ∞-category, let Y be an object of $\mathcal{C}$, and let $\mathcal{C}^0_{/Y}, \mathcal{C}^1_{/Y} \subseteq \mathcal{C}_{/Y}$ be sieves on Y. Assume that:* `04UW`

(1) *The sieve $\mathcal{C}^0_{/Y}$ is dense.*

(2) *For each morphism $f : X \to Y$ which belongs to $\mathcal{C}^0_{/Y}$, the pullback sieve $f^*(\mathcal{C}^1_{/Y}) \subseteq \mathcal{C}_{/X}$ is dense.*

Then $\mathcal{C}^1_{/Y}$ is also a dense sieve.

Proof. Let $U : \mathcal{C}_{/Y} \to \mathcal{C}$ denote the projection map; we wish to show that U is left Kan extended from $\mathcal{C}^1_{/Y}$. Assumption (1) guarantees that U is left Kan extended from $\mathcal{C}^0_{/Y}$. By virtue of Corollary 7.3.8.8, it will suffice to show that $U|_{\mathcal{C}^0_{/Y}}$ is left Kan extended from the intersection $\mathcal{C}^{01}_{/Y} = \mathcal{C}^0_{/Y} \cap \mathcal{C}^1_{/Y}$. Fix a morphism $f : X \to Y$ which belongs to the sieve $\mathcal{C}^0_{/Y}$; we wish to show that U is left Kan extended from $\mathcal{C}^{01}_{/Y}$ at f. This follows from our assumption that $f^* \mathcal{C}^{01}_{/Y} = f^* \mathcal{C}^1_{/Y}$ is a dense sieve on X. □

10.2.2 Quotient Morphisms

Let X and Y be sets, and let $f : X \to Y$ be a function. The function f determines an equivalence relation $\equiv_f$ on X, defined by the requirement `04WG`

$$(x \equiv_f x') \Leftrightarrow (f(x) = f(x')).$$

If f is surjective, then it induces an bijection from $X/\equiv_f$ to Y. Stated in more categorical terms, this means that for every set S, composition with f induces a bijection

$$\begin{tikzcd}
\{\text{Functions } Y \to S\} \arrow[d] \\
\{\text{Functions } g : X \to S \text{ satisfying } g(x) = g(x') \text{ when } f(x) = f(x')\}.
\end{tikzcd}$$

Our goal in this section is to study an ∞-categorical counterpart of this condition.

04WH **Definition 10.2.2.1.** Let $\mathcal{C}$ be an ∞-category, let $f : X \to Y$ be a morphism of $\mathcal{C}$, and let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ be the sieve generated by f (see Example 10.2.1.19). We will say that f is a *quotient morphism* if the composite map

$$(\mathcal{C}^0_{/Y})^{\triangleright} \hookrightarrow (\mathcal{C}_{/Y})^{\triangleright} \to \mathcal{C}$$

is a colimit diagram in the ∞-category $\mathcal{C}$.

04WJ **Notation 10.2.2.2.** Let $\mathcal{C}$ be an ∞-category and let f be a morphism of $\mathcal{C}$ having source X and target Y. If f is a quotient morphism, we will often visually emphasize this by denoting f with a double-headed arrow (that is, we will write $f : X \twoheadrightarrow Y$ in place of $f : X \to Y$). Beware that this notation does *not* indicate that f is an epimorphism (see Warning 10.2.2.10).

04WK **Exercise 10.2.2.3.** Let $\mathcal{C}$ be an ∞-category. Show that every isomorphism in $\mathcal{C}$ is a quotient morphism (see Example 10.2.4.3 for a stronger statement).

Stated more informally, a morphism $f : X \to Y$ is a quotient morphism if the object Y can be recovered as the colimit $\varinjlim_{C \to Y} C$, indexed by the ∞-category of morphisms $g : C \to Y$ which factor through f. If the ∞-category $\mathcal{C}$ admits fiber products, this condition admits a more concrete formulation.

04WL **Proposition 10.2.2.4.** *Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$ which admits a Čech nerve $\check{\mathrm{C}}(X/Y)_{\bullet} : \mathrm{N}_{\bullet}(\mathbf{\Delta}^{\mathrm{op}}_{+}) \to \mathcal{C}$ (see Definition 10.1.5.4). Then f is a quotient morphism if and only if $\check{\mathrm{C}}_{\bullet}(X/Y)$ is a colimit diagram in $\mathcal{C}$.*

Stated more informally, Proposition 10.2.2.4 asserts that $f : X \to Y$ is a quotient morphism if and only if it exhibits Y as a geometric realization of the simplicial object depicted in the diagram

$$\cdots \substack{\longrightarrow\\\longrightarrow\\\longrightarrow\\\longrightarrow} X \times_Y X \times_Y X \substack{\longrightarrow\\\longrightarrow\\\longrightarrow} X \times_Y X \rightrightarrows X.$$

The proof will require some preliminaries.

Lemma 10.2.2.5. *Let $\mathcal{C}$ be an ∞-category and let X be an object of $\mathcal{C}$ which admits a Čech nerve $\check{C}(X)_\bullet : N_\bullet(\mathbf{\Delta}^{\mathrm{op}}) \to \mathcal{C}$ (see Definition 10.1.4.3). Let $\mathcal{C}^0 \subseteq \mathcal{C}$ be the sieve generated by X (Example 10.2.1.19). Then the functor $\check{C}(X)_\bullet : N_\bullet(\mathbf{\Delta}^{\mathrm{op}}) \to \mathcal{C}^0$ is right cofinal.* 04WM

Proof. Let C be an object of $\mathcal{C}$ and let $h^C : \mathcal{C} \to \mathcal{S}$ be a functor corepresented by C. Since h^C preserves finite products (Proposition 7.4.5.17), the composition

$$N_\bullet(\mathbf{\Delta}^{\mathrm{op}}) \xrightarrow{\check{C}(X)_\bullet} \mathcal{C} \xrightarrow{h^C} \mathcal{S}$$

is a simplicial object of $\mathcal{S}$ which can be identified with the Čech nerve of the Kan complex $h^C(\check{C}(X)_0) \simeq \mathrm{Hom}_{\mathcal{C}}(C, X)$ (Remark 10.1.4.7). If C belongs to the sieve $\mathcal{C}^0$, then the morphism space $\mathrm{Hom}_{\mathcal{C}}(C, X)$ is nonempty. Applying Corollary 10.1.6.15, we conclude that the geometric realization $|h^C(\check{C}(X)_\bullet)|$ is contractible. The desired result now follows by allowing the object C to vary and applying the criterion of Proposition 7.4.5.11. □

Variant 10.2.2.6. Let $\mathcal{C}$ be an ∞-category, let $f : X \to Y$ be a morphism of $\mathcal{C}$ which admits a Čech nerve $\check{C}(X/Y)_\bullet : N_\bullet(\mathbf{\Delta}_+^{\mathrm{op}}) \to \mathcal{C}$, and let $\mathcal{C}^0_{/Y}$ denote the sieve generated by f. Then $\check{C}(X/Y)_\bullet$ determines a right cofinal functor $N_\bullet(\mathbf{\Delta}^{\mathrm{op}}) \to \mathcal{C}^0_{/Y}$. 04WN

Proof. Apply Lemma 10.2.2.5 to the slice ∞-category $\mathcal{C}_{/Y}$. □

Proof of Proposition 10.2.2.4. Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$ which admits a Čech nerve $\check{C}(X/Y)_\bullet : N_\bullet(\mathbf{\Delta}_+^{\mathrm{op}}) \to \mathcal{C}$. We wish to show that f is a quotient morphism if and only if $\check{C}(X/Y)_\bullet$ is a colimit diagram in $\mathcal{C}$. Let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ denote the sieve generated by X and let Q denote the composite map

$$(\mathcal{C}^0_{/Y})^{\triangleright} \hookrightarrow (\mathcal{C}_{/Y})^{\triangleright} \to \mathcal{C}.$$

Let us identify $\check{C}(X/Y)_\bullet$ with a functor $F : N_\bullet(\mathbf{\Delta}^{\mathrm{op}}) \to \mathcal{C}^{\mathrm{op}}_{/Y}$. Unwinding the definitions, we wish to show that Q is a colimit diagram if and only if the composite functor

$$N_\bullet(\mathbf{\Delta}^{\mathrm{op}})^{\triangleright} \xrightarrow{F^{\triangleright}} (\mathcal{C}^0_{/Y})^{\triangleright} \xrightarrow{Q} \mathcal{C}$$

is a colimit diagram. This is a special case of Corollary 7.2.2.3, since the functor F is right cofinal (Variant 10.2.2.6). □

Corollary 10.2.2.7. *Let $\mathcal{C}$ be a category which admits fiber products and let $f : X \to Y$ be a morphism in $\mathcal{C}$. The following conditions are equivalent:* 04WP

(1) *The morphism f is a quotient morphism in the ∞-category $N_\bullet(\mathcal{C})$ (in the sense of Definition 10.2.2.1).*

(2) *The morphism f is a regular epimorphism: that is, it exhibits Y as a coequalizer of the projection maps $X \times_Y X \rightrightarrows X$ (Definition 10.2.0.2).*

Proof. Combine Proposition 10.2.2.4 with Corollary 10.1.2.12. □

`04WQ` **Example 10.2.2.8.** Let X and Y be sets. Then a function $f : X \to Y$ is a quotient morphism (in the category of sets) if and only if it is surjective (see Example 10.2.0.4).

`04WR` **Variant 10.2.2.9.** Let $\mathcal{C}$ be a category and let $f : X \to Y$ be a morphism of $\mathcal{C}$. If f is a quotient morphism (in the sense of Definition 10.2.2.1), then it is an epimorphism.

Proof. Suppose that we are given a pair of morphisms $e_0, e_1 : Y \to Z$ in $\mathcal{C}$ satisfying $e_0 \circ f = e_1 \circ f$; we wish to show that $e_0 = e_1$. By virtue of our assumption that f is a quotient morphism, it will suffice to show that $e_0 \circ h = e_1 \circ h$ for every morphism $h : C \to Y$ which belongs to the sieve $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ generated by f. In this case, we can write $h = f \circ g$ for some morphism $g : C \to X$; the desired result then follows from the calculation

$$e_0 \circ h = e_0 \circ (f \circ g) = (e_0 \circ f) \circ g = (e_1 \circ f) \circ g = e_1 \circ (f \circ g) = e_1 \circ h.$$

□

`04WS` **Warning 10.2.2.10.** Let $f : X \to Y$ be a quotient morphism in an ∞-category $\mathcal{C}$. If $\mathcal{C}$ is not (the nerve of) an ordinary category, then f need not be an epimorphism. For example, let (X, x) be a pointed Kan complex, and let $\iota : \{x\} \to X$ denote the inclusion map, which we regard as a morphism in the ∞-category $\mathcal{S}$ of spaces. Then:

- The morphism ι is an epimorphism (in the ∞-category $\mathcal{S}$) if and only if X is contractible. To see this, we observe that the identity map id_X and the constant map $c : X \to \{x\} \xrightarrow{\iota} X$ become homotopic after precomposition with ι; if ι is an epimorphism, it follows that id_X is homotopic to c.

- The morphism ι is a quotient morphism if and only if X is connected (see Proposition 10.2.4.17).

`04WT` **Proposition 10.2.2.11** (Homotopy Invariance)**.** *Let $F : \mathcal{C} \to \mathcal{D}$ be an equivalence of ∞-categories and let $f : X \to Y$ be a morphism in $\mathcal{C}$. Then f is a quotient morphism if and only if $F(f)$ is a quotient morphism in the ∞-category $\mathcal{D}$.*

Proof. Let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ be the sieve generated by f, and let $\mathcal{D}^0_{/F(Y)} \subseteq \mathcal{D}^0_{/F(Y)}$ be the sieve generated by $F(f)$. Since F is fully faithful, $\mathcal{C}^0_{/Y}$ is the inverse image of $\mathcal{D}^0_{/F(Y)}$ under the functor $F_{/Y} : \mathcal{C}_{/Y} \to \mathcal{D}_{/F(Y)}$ induced by F. Corollary 4.6.4.19 guarantees that $F_{/Y}$ is an equivalence of ∞-categories, and therefore induces an equivalence $F^0_{/Y} : \mathcal{C}^0_{/Y} \to \mathcal{D}^0_{/F(Y)}$ (Corollary 4.5.2.29). In particular, $F^0_{/Y}$ is right cofinal (Corollary 7.2.1.13). Applying Corollary 7.2.2.3, we deduce that $F(f)$ is a quotient morphism if and only if the composite functor

$$(\mathcal{C}^0_{/Y})^{\triangleright} \hookrightarrow (\mathcal{C}_{/Y})^{\triangleright} \to \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a colimit diagram in $\mathcal{D}$. By virtue of Proposition 7.1.3.9, this is equivalent to the requirement that f is a quotient morphism in $\mathcal{C}$. □

Corollary 10.2.2.12. *Let $\mathcal{C}$ be an ∞-category and let f_0 and f_1 be morphisms of $\mathcal{C}$ which are isomorphic (when viewed as objects of the ∞-category $\operatorname{Fun}(\Delta^1, \mathcal{C})$). Then f_0 is a quotient morphism if and only if f_1 is a quotient morphism.* `04WU`

Proof. Let $\operatorname{Isom}(\mathcal{C})$ denote the full subcategory of $\operatorname{Fun}(\Delta^1, \mathcal{C})$ spanned by the isomorphisms. By virtue of Corollary 4.4.5.10, the evaluation functors $\mathrm{ev}_0, \mathrm{ev}_1 : \operatorname{Isom}(\mathcal{C}) \to \mathcal{C}$ are equivalences of ∞-categories. Our assumption that f_0 is isomorphic to f_1 guarantees that there exists a morphism $\widetilde{f}$ of $\operatorname{Isom}(\mathcal{C})$ satisfying $\mathrm{ev}_0(\widetilde{f}) = f_0$ and $\mathrm{ev}_1(\widetilde{f}) = f_1$. Using Proposition 10.2.2.11, we see that the condition that f_0 is a quotient morphism in $\mathcal{C}$ is equivalent to the condition that $\widetilde{f}$ is a quotient morphism in $\operatorname{Isom}(\mathcal{C})$, which is also equivalent to the condition that f_1 is a quotient morphism in $\mathcal{C}$. □

Example 10.2.2.13. Let $\mathcal{C}$ be an ∞-category containing a pair of morphisms $f_0, f_1 : X \to Y$ which are homotopic. Then f_0 is a quotient morphism if and only if f_1 is a quotient morphism. This is a special case of Corollary 10.2.2.12, but can also be deduced immediately from the definition (since f_0 and f_1 generate the same sieve on Y). `04WV`

Proposition 10.2.2.14. *Let $\mathcal{C}$ be an ∞-category, let $q : K \to \mathcal{C}$ be a diagram, and let $\widetilde{f} : \widetilde{X} \to \widetilde{Y}$ be a morphism in the ∞-category $\mathcal{C}_{/q}$ having image $f : X \to Y$ in $\mathcal{C}$. If f is a quotient morphism in $\mathcal{C}$, then $\widetilde{f}$ is a quotient morphism in $\mathcal{C}_{/q}$.* `04WW`

Proof. Set $\widetilde{\mathcal{C}} = \mathcal{C}_{/q}$, so that we have a commutative diagram of forgetful functors

$$\begin{tikzcd}
\widetilde{\mathcal{C}}_{/\widetilde{Y}} \arrow[r, "V'"] \arrow[d, "\widetilde{U}"] & \mathcal{C}_{/Y} \arrow[d, "U"] \\
\widetilde{\mathcal{C}} \arrow[r, "V"] & \mathcal{C} .
\end{tikzcd}$$

Let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ denote the sieve generated by f, so that $\widetilde{\mathcal{C}}^0_{/\widetilde{Y}} = V'^{-1} \mathcal{C}^0_{/Y}$ is the sieve generated by $\widetilde{f}$. Note that V is a right fibration (Proposition 4.3.6.1), so that V' is a trivial Kan fibration (Corollary 4.3.7.13). In particular, the induced map $\widetilde{\mathcal{C}}^0_{/\widetilde{Y}} \to \mathcal{C}^0_{/Y}$ is a trivial Kan fibration, and therefore right cofinal (Corollary 7.2.1.13). Combining our assumption that f is a quotient morphism with Corollary 7.2.2.3, we deduce that the composite functor

$$(\widetilde{\mathcal{C}}^0_{/\widetilde{Y}})^{\triangleright} \hookrightarrow (\widetilde{\mathcal{C}}_{/\widetilde{Y}})^{\triangleright} \to \widetilde{\mathcal{C}} \xrightarrow{V} \mathcal{C}$$

is a colimit diagram in the ∞-category $\mathcal{C}$. Since the functor V is conservative and creates colimits (Proposition 7.1.3.19), we conclude that $\widetilde{f}$ is a quotient morphism. □

We close this section by recording two negative results, highlighting that the collection of quotient morphisms in an ∞-category $\mathcal{C}$ has poor closure properties in general:

- The collection of quotient morphisms need not be closed under composition (Exercise 10.2.2.15).
- The collection of quotient morphisms need not be closed under the formation of pullbacks (Exercise 10.2.2.16).

Both of these defects can be remedied by working instead with the class of *universal quotient morphisms*, which we study in §10.2.4 (see Definition 10.2.4.1).

04WX **Exercise 10.2.2.15.** Let $\mathcal{C}$ be the (nerve of the) ordinary category depicted informally by the diagram

$$\begin{tikzcd}
\widetilde{X} \arrow[d, shift right, "e_0"'] \arrow[d, shift left, "e_1"] \arrow[dr] & \widetilde{Y} \arrow[d, shift right, "g_0"'] \arrow[d, shift left, "g_1"] \arrow[dr] & \\
X \arrow[r, "f"] & Y \arrow[r, "h"] & Z,
\end{tikzcd}$$

so that $f \circ e_0 = f \circ e_1$ and $h \circ g_0 = h \circ g_1$. Show that f and h are quotient morphisms in $\mathcal{C}$, but the composition $(h \circ f) : X \to Z$ is not a quotient morphism.

04WY **Exercise 10.2.2.16.** Let $\mathcal{C}$ be the category of partially ordered sets (where morphisms are nondecreasing functions). Let $Q = \{a, b, c, d\}$ be a set with four elements, endowed with the partial ordering indicated in the diagram

$$\begin{tikzcd}
a \arrow[r] & b & c \arrow[l] \arrow[r] & d.
\end{tikzcd}$$

Let $f : Q \to [2] = \{0 < 1 < 2\}$ be the nondecreasing function given by

$$f(a) = 0 \qquad f(b) = 1 = f(c) \qquad f(d) = 2,$$

so that we have a pullback diagram of partially ordered sets

04WZ

$$\begin{tikzcd}
\{a, d\} \arrow[r] \arrow[d, "f_0"] & Q \arrow[d, "f"] \\
\{0 < 2\} \arrow[r] & {[2]}.
\end{tikzcd} \tag{10.8}$$

Show that f is a quotient morphism in (the nerve of) the category $\mathcal{C}$, but that f_0 is not.

Variant 10.2.2.17. In the situation of Exercise 10.2.2.16, we can apply the nerve functor to (10.8) and obtain a commutative diagram of ∞-categories 04X0

$$\begin{tikzcd}
\{a,d\} \arrow[r] \arrow[d, "F_0"] & \mathrm{N}_\bullet(Q) \arrow[d, "F"] \\
\mathrm{N}_\bullet(\{0<2\}) \arrow[r] & \Delta^2,
\end{tikzcd}$$

which we can regard as a pullback square in the ∞-category $\mathcal{QC}$. Show that F is a quotient morphism in $\mathcal{QC}$, but that F_0 is not (beware that this is not a formal consequence of Exercise 10.2.2.16: the construction $P \mapsto \mathrm{N}_\bullet(P)$ does not preserve quotient morphisms in general).

10.2.3 Images

Let X and Y be sets. Recall that the *image* of a function $f : X \to Y$ is defined to be the subset $\mathrm{im}(f) = \{y \in Y : f^{-1}\{y\} \neq \emptyset\}$. More abstractly, the set $\mathrm{im}(f)$ is characterized (up to isomorphism) by the requirement that f factors as a composition 04X1

$$X \overset{q}{\twoheadrightarrow} \mathrm{im}(f) \overset{i}{\hookrightarrow} Y,$$

where q is surjective and i is injective. This motivates the following:

Definition 10.2.3.1. Let $\mathcal{C}$ be an ∞-category, let Y be an object of $\mathcal{C}$, and let $Y_0 \subseteq Y$ be a subobject: that is, an object of $\mathcal{C}$ equipped with a (specified) monomorphism $i : Y_0 \hookrightarrow Y$ (see Definition 9.2.4.25). We will say that Y_0 is an *image* of a morphism $f : X \to Y$ if the homotopy class $[f]$ factors as a composition $[i] \circ [q]$, where $q : X \twoheadrightarrow Y_0$ is a quotient morphism in $\mathcal{C}$. 04X2

Remark 10.2.3.2. In the situation of Definition 10.2.3.1, our assumption that i is a monomorphism guarantees that the composition map $\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(X, Y_0) \xrightarrow{[i]\circ} \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(X, Y)$ is injective. It follows that if there exists a morphism $q : X \to Y_0$ satisfying $[f] = [i] \circ [q]$, then q is uniquely determined up to homotopy. In particular, the condition that q is a quotient morphism is independent of the choice of q (see Example 10.2.2.13). 04X3

Remark 10.2.3.3. In the situation of Definition 10.2.3.1, Y_0 is an image of f if and only if there exists a 2-simplex 04X4

04X5

$$\begin{tikzcd}
& Y_0 \arrow[dr, "i"] & \\
X \arrow[ur, "q"] \arrow[rr, "f"] & & Y
\end{tikzcd} \tag{10.9}$$

in the ∞-category $\mathcal{C}$, where q is a quotient morphism. If this condition is satisfied, we say that the 2-simplex (10.9) *exhibits Y_0 as an image of f.*

04X6 **Example 10.2.3.4** (Images of Sets)**.** Let $f : X \to Y$ be a function between sets, and set $Y_0 = \{y \in Y : f^{-1}\{y\} \neq \emptyset\}$. Then f determines a surjection from X to Y_0, which is a quotient morphism in the category of sets (Example 10.2.2.8). It follows that the commutative diagram

$$\begin{tikzcd}
& Y_0 \arrow[dr, "i"] & \\
X \arrow[ur, "f"] \arrow[rr, "f"] & & Y
\end{tikzcd}$$

exhibits Y_0 as an image of f.

04X7 **Example 10.2.3.5** (Images of Monomorphisms)**.** Let $\mathcal{C}$ be an ∞-category and let $f : X \hookrightarrow Y$ be a monomorphism in $\mathcal{C}$. Since the identity map id_X is a quotient morphism (Exercise 10.2.2.3), the left-degenerate 2-simplex

$$\begin{tikzcd}
& X \arrow[dr, "f"] & \\
X \arrow[ur, "\mathrm{id}_X"] \arrow[rr, "f"] & & Y
\end{tikzcd}$$

exhibits X as an image of f.

04X8 **Proposition 10.2.3.6** (Images of Quotient Morphisms)**.** *Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$. Then f is a quotient morphism if and only if Y is an image of f (when regarded as a subobject of itself).*

Proof. Assume first that f is a quotient morphism. Since the identity map id_Y is a monomorphism (Example 9.2.4.9), the right-degenerate 2-simplex

$$\begin{tikzcd}
& Y \arrow[dr, "\mathrm{id}_Y"] & \\
X \arrow[ur, "f"] \arrow[rr, "f"] & & Y
\end{tikzcd}$$

exhibits Y as an image of f. Conversely, if Y is an image of f, then f factors as the composition of a quotient morphism and an isomorphism, and is therefore a quotient morphism by virtue of Corollary 10.2.2.12. $\square$

Warning 10.2.3.7. The terminology of Definition 10.2.3.1 is not entirely standard. In the setting of additive categories, many authors refer to an object Y as the *image* of a morphism $f : X \to Y$ if it is a kernel of the tautological map $Y \twoheadrightarrow \operatorname{coker}(f)$. This agrees with Definition 10.2.3.1 when $\mathcal{C}$ is an abelian category (Proposition [?]), but not in general. 04X9

Warning 10.2.3.8 (Essential Images)**.** Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories. Recall that the *essential image* of F is the full subcategory $\mathcal{D}_0 \subseteq \mathcal{D}$ spanned by objects $D \in \mathcal{D}$ which are isomorphic to $F(C)$, for some object $C \in \mathcal{C}$ (Definition 4.6.2.11). In this case, the inclusion map $\iota : \mathcal{D}_0 \hookrightarrow \mathcal{D}$ is always a monomorphism in $\mathcal{QC}$ (Corollary 9.2.4.33), and F factors (uniquely) as the composition of ι with a functor $F_0 : \mathcal{C} \to \mathcal{D}_0$. Beware that this factorization generally does *not* exhibit $\mathcal{D}_0$ as an image of F in the ∞-category $\mathcal{QC}$, in the sense of Definition 10.2.3.1: that is, the functor F_0 need not be a quotient morphism in $\mathcal{QC}$. This fails, for example, if F is the inclusion functor $\partial\Delta^1 \hookrightarrow \Delta^1$. 04XA

We now show that if $f : X \to Y$ is a morphism in $\mathcal{C}$ which admits an image Y_0, then the subobject $Y_0 \subseteq Y$ is uniquely determined up to isomorphism.

Lemma 10.2.3.9. *Let $q : X \twoheadrightarrow Y$ be a quotient morphism in an ∞-category $\mathcal{C}$. Then every subterminal object $C \in \mathcal{C}$ is q-local.* 04XB

Proof. We wish to show that the composition map $\operatorname{Hom}_{\mathcal{C}}(Y, C) \xrightarrow{\circ[q]} \operatorname{Hom}_{\mathcal{C}}(X, C)$ is a homotopy equivalence of Kan complexes. Since C is subterminal, both mapping spaces are either empty or contractible. It will therefore suffice to show that if $\operatorname{Hom}_{\mathcal{C}}(X, C)$ is nonempty, then $\operatorname{Hom}_{\mathcal{C}}(Y, C)$ is also nonempty.

Let $\mathcal{C}^0_{/Y}$ be the sieve generated by q. Since q is a quotient morphism, Y is a colimit of the diagram

$$F : \mathcal{C}^0_{/Y} \hookrightarrow \mathcal{C}_{/Y} \to \mathcal{C};$$

that is, it can be lifted to an initial object $\widetilde{Y}$ of the coslice ∞-category $\mathcal{C}_{F/}$. Since $C \in \mathcal{C}$ is subterminal, the projection map $U : \mathcal{C}_{/C} \to \mathcal{C}$ restricts to a trivial Kan fibration from $\mathcal{C}_{/C}$ to a sieve $\mathcal{C}^1 \subseteq \mathcal{C}$. The assumption that $\operatorname{Hom}_{\mathcal{C}}(X, C)$ is nonempty guarantees that F takes values in $\mathcal{C}^1$ and therefore factors through $\mathcal{C}_{/C}$. A choice of factorization determines a lift of C to an object $\widetilde{C} \in \mathcal{C}_{F/}$. Since $\widetilde{Y}$ is an initial object of $\mathcal{C}_{F/}$, we can choose a morphism $\widetilde{u} : \widetilde{Y} \to \widetilde{C}$ in the ∞-category $\mathcal{C}_{F/}$. Applying the forgetful functor $\mathcal{C}_{F/} \to \mathcal{C}$, we obtain a morphism $u : Y \to C$ in $\mathcal{C}$. □

Lemma 10.2.3.10. *Let $\mathcal{C}$ be an ∞-category and let $q : X \twoheadrightarrow Y$ be a quotient morphism in $\mathcal{C}$. Then q is left orthogonal to every monomorphism $i : C \hookrightarrow D$ of $\mathcal{C}$.* 04XC

Proof. Let $U : \mathcal{C}_{/D} \to \mathcal{C}$ denote the projection map, so that the monomorphism i can be identified with a subterminal object $\widetilde{C} \in \mathcal{C}_{/D}$ satisfying $U(\widetilde{C}) = C$ (Remark 9.2.4.16). By virtue of Corollary 9.1.7.13, it will suffice to show that the object $\widetilde{C}$ is $\widetilde{q}$-local for every morphism $\widetilde{q}$ of $\mathcal{C}_{/D}$ satisfying $U(\widetilde{q}) = q$. This follows from Lemma 10.2.3.9, since $\widetilde{q}$ is a quotient morphism in the ∞-category $\mathcal{C}_{/D}$ (Proposition 10.2.2.14). □

`04XD` **Proposition 10.2.3.11.** *Let $\mathcal{C}$ be an ∞-category containing a 2-simplex*

`04XE`

$$\begin{tikzcd} X \arrow[d, "q"] \arrow[dr, "f"] & \\ Y_0 \arrow[r, "i_0"] & Y \end{tikzcd} \tag{10.10}$$

which exhibits Y_0 as an image of f. Then, for any monomorphism $i_1 : Y_1 \hookrightarrow Y$ of $\mathcal{C}$, the following conditions are equivalent:

(1) *The morphism f factors (up to homotopy) through i_1. That is, there exists a 2-simplex*

`04XF`

$$\begin{tikzcd} X \arrow[r, "g"] \arrow[dr, "f"'] & Y_1 \arrow[d, "i_1"] \\ & Y \end{tikzcd} \tag{10.11}$$

in the ∞-category $\mathcal{C}$.

(2) *The containment $[Y_0] \subseteq [Y_1]$ holds (where we regard the isomorphism classes $[Y_0]$ and $[Y_1]$ as elements of the partiallly ordered set $\operatorname{Sub}(Y)$; see Notation 9.2.4.26).*

Proof. The implication (2) ⇒ (1) follows immediately from the definitions. To prove the converse, we note that in the situation of (1), we can amalgamate the diagrams (10.10) and (10.11) to obtain a lifting problem

$$\begin{tikzcd} X \arrow[r, "g"] \arrow[d, "q"] & Y_1 \arrow[d, "i_1"] \\ Y_0 \arrow[r, "i_0"] \arrow[ur, dashed] & Y \end{tikzcd}$$

in the ∞-category $\mathcal{C}$. Since q is a quotient morphism and i_1 is a monomorphism, Lemma 10.2.3.10 guarantees that this lifting problem admits an (essentially unique) solution, which proves (2). □

Notation 10.2.3.12. Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism in $\mathcal{C}$ which admits an image $Y_0 \subseteq Y$. It follows from Proposition 10.2.3.11 that the isomorphism class $[Y_0]$ is uniquely determined by f (as an object of the partially ordered set $\mathrm{Sub}(Y)$; see Notation 9.2.4.26). To emphasize this, we will denote the isomorphism class $[Y_0]$ by $\mathrm{im}(f)$ and refer to it as *the* image of f. We will sometimes abuse notation by identifying $\mathrm{im}(f)$ with the object Y_0, viewed either as an object of the slice ∞-category $\mathcal{C}_{/Y}$ or as an object of the ∞-category $\mathcal{C}$. `04XG`

Corollary 10.2.3.13. *Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$. Then f is an isomorphism if and only if it is both a monomorphism and a quotient morphism.* `05HS`

Proof. Without loss of generality, we may assume that f is a monomorphism. Applying Example 10.2.3.5, we see that the isomorphism class $[X] \in \mathrm{Sub}(Y)$ is an image of f. It follows that f is an isomorphism if and only if $\mathrm{im}(f) = [Y]$. By virtue of Proposition 10.2.3.6, this is equivalent to the requirement that f is a quotient morphism. □

Proposition 10.2.3.14 (Uniqueness of Images). *Let $\mathcal{C}$ be an ∞-category and let $\mathrm{Fun}'(\Delta^2, \mathcal{C})$ denote the full subcategory of $\mathrm{Fun}(\Delta^2, \mathcal{C})$ spanned by those 2-simplices* `04XH`

$$\begin{tikzcd}
 & Y_0 \arrow[dr, "i"] & \\
X \arrow[ur, "q"] \arrow[rr, "f"] & & Y
\end{tikzcd}$$

which exhibit Y_0 as an image of f (see Remark 10.2.3.3). Then the restriction functor

$$D : \mathrm{Fun}'(\Delta^2, \mathcal{C}) \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \qquad \sigma \mapsto d_1^2(\sigma)$$

is a trivial Kan fibration from $\mathrm{Fun}'(\Delta^2, \mathcal{C})$ to the full subcategory $\mathrm{Fun}'(\Delta^1, \mathcal{C}) \subseteq \mathrm{Fun}(\Delta^1, \mathcal{C})$ spanned by those morphisms $f : X \to Y$ which admit an image in $\mathcal{C}$.

Proof. Combining Lemma 10.2.3.10 with Theorem 9.1.8.2, we deduce that the functor D is fully faithful, and therefore induces an equivalence from $\mathrm{Fun}'(\Delta^2, \mathcal{C})$ to the full subcategory $\mathrm{Fun}'(\Delta^1, \mathcal{C}) \subseteq \mathrm{Fun}(\Delta^1, \mathcal{C})$. To complete the proof, it will suffice to show that D is an isofibration (Proposition 4.5.5.20). This follows from Corollary 4.4.5.3, since $\mathrm{Fun}'(\Delta^2, \mathcal{C})$ is a replete subcategory of $\mathrm{Fun}(\Delta^2, \mathcal{C})$ (see Corollary 10.2.2.12 and Remark 9.2.4.24). □

Remark 10.2.3.15. Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$. Suppose that $\mathcal{C}$ admits fiber products, so that f admits a Čech nerve $\check{C}_\bullet(X/Y)$ (Proposition `04XJ`

10.1.5.6). If f has an image, then $\mathrm{im}(f)$ can be identified with the geometric realization of the underlying simplicial object of $\check{\mathrm{C}}_\bullet(X/Y)$. To see this, choose a 2-simplex

$$\begin{tikzcd}
 & Y_0 \arrow[dr, "i"] & \\
X \arrow[ur, "q"] \arrow[rr, "f"] & & Y
\end{tikzcd}$$

which exhibits Y_0 as an image of f. Since i is a monomorphism, Remark 10.2.1.17 supplies an isomorphism between the underlying simplicial objects of $\check{\mathrm{C}}_\bullet(X/Y)$ and $\check{\mathrm{C}}_\bullet(X/Y_0)$. It will therefore suffice to show that $\check{\mathrm{C}}_\bullet(X/Y_0)$ is a colimit diagram in $\mathcal{C}$, which is a reformulation of our assumption that q is a quotient morphism (Proposition 10.2.2.4).

04XK **Warning 10.2.3.16.** Let $\mathcal{C}$ be an ∞-category which admits fiber products, let $f : X \to Y$ be a morphism of $\mathcal{C}$, and let $C_\bullet$ denote the underlying simplicial object of the Čech nerve $\check{\mathrm{C}}_\bullet(X/Y)$. Remark 10.2.3.15 asserts that if f has an image, then that image can be identified with a geometric realization of $C_\bullet$. Beware that the converse is false in general. Suppose that $C_\bullet$ admits a geometric realization $|C_\bullet|$, given by the image on an initial object E of the coslice ∞-category $\mathcal{C}_{C_\bullet/}$. The augmented simplicial object $\check{\mathrm{C}}_\bullet(X/Y)$ determines another object $\widetilde{Y} \in \mathcal{C}_{C_\bullet/}$, so there is an (essentially unique) morphism from E to $\widetilde{Y}$. The forgetful functor $\mathcal{C}_{C_\bullet/} \to \mathcal{C}_{X/}$ carries this morphism to a 2-simplex

04XL
$$\begin{tikzcd}
 & {|C_\bullet|} \arrow[dr, "i"] & \\
X \arrow[ur, "q"] \arrow[rr, "f"] & & Y
\end{tikzcd} \tag{10.12}$$

in the ∞-category $\mathcal{C}$. In this situation, the following conditions are equivalent:

- The morphism i is a monomorphism.
- The diagram (10.12) exhibits $|C_\bullet|$ as an image of f.
- The morphism f has an image in $\mathcal{C}$.

04XM **Definition 10.2.3.17.** Let $\mathcal{C}$ be an ∞-category. We say that $\mathcal{C}$ *has images* if every morphism $f : X \to Y$ of $\mathcal{C}$ has an image $\mathrm{im}(f) \in \mathrm{Sub}(Y)$.

04XN **Remark 10.2.3.18** (Functoriality of Images)**.** Let $\mathcal{C}$ be an ∞-category and let $\mathrm{Fun}'(\Delta^2, \mathcal{C}) \subseteq \mathrm{Fun}(\Delta^2, \mathcal{C})$ be the full subcategory described in Proposition 10.2.3.14. Then $\mathcal{C}$ has images if and only if the restriction functor

$$D : \mathrm{Fun}'(\Delta^2, \mathcal{C}) \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \qquad \sigma \mapsto d^2_1(\sigma)$$

is a trivial Kan fibration. If this condition is satisfied, then D admits a section which carries each morphism $f : X \to Y$ of $\mathcal{C}$ to a 2-simplex

$$\begin{tikzcd}
 & \mathrm{im}(f) \arrow[dr] & \\
X \arrow[ur] \arrow[rr, "f"] & & Y
\end{tikzcd}$$

which exhibits $\mathrm{im}(f)$ as an image of f. In particular, we can promote the construction $f \mapsto \mathrm{im}(f)$ as a functor of ∞-categories $\mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathcal{C}$.

Remark 10.2.3.19. Let $\mathcal{C}$ be an ∞-category, let Q denote the collection of all quotient morphisms in $\mathcal{C}$, and let M denote the collection of all monomorphisms in $\mathcal{C}$. Then Q and M are closed under isomorphism (see Corollary 10.2.2.12 and Remark 9.2.4.24), and Q is left orthogonal to M (Lemma 10.2.3.10). It follows that $\mathcal{C}$ has images if and only if the pair (Q, M) is a factorization system on $\mathcal{C}$ (Definition 9.1.9.1). 04XP

Proposition 10.2.3.20. *Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$. If $\mathcal{C}$ has images, the following conditions are equivalent:* 04XQ

(1) *The morphism f is a quotient morphism.*

(2) *The morphism f is left orthogonal to every monomorphism in $\mathcal{C}$.*

(3) *The morphism f is weakly left orthogonal to every monomorphism in $\mathcal{C}$.*

Proof. Combine Remark 10.2.3.19 with Proposition 9.1.9.11. □

Corollary 10.2.3.21. *Let $\mathcal{C}$ be an ∞-category which has images, and let* 04XR

$$\begin{tikzcd}
 & Y \arrow[dr, "g"] & \\
X \arrow[ur, "f"] \arrow[rr, "h"] & & Z
\end{tikzcd}$$

be a 2-simplex of $\mathcal{C}$, where f is a quotient morphism. Then g is a quotient morphism if and only if h is a quotient morphism. In particular, the collection of quotient morphisms is closed under composition.

Proof. Combine Proposition 10.2.3.20 with Corollary 9.1.7.15. □

04XS **Corollary 10.2.3.22.** *Let $\mathcal{C}$ be an ∞-category containing a pushout diagram*

$$\begin{tikzcd}
X \arrow[r] \arrow[d, "f"] & X' \arrow[d, "f'"] \\
Y \arrow[r] & Y'.
\end{tikzcd}$$

If $\mathcal{C}$ is has images and f is a quotient morphism, then f' is also a quotient morphism.

Proof. Combine Proposition 10.2.3.20 with Corollary 9.1.7.18. □

04XT **Corollary 10.2.3.23.** *Let $\mathcal{C}$ be an ∞-category with images. Then the collection of quotient morphisms in $\mathcal{C}$ is closed under retracts (in the ∞-category* $\mathrm{Fun}(\Delta^1, \mathcal{C})$*).*

Proof. Combine Proposition 10.2.3.20 with Corollary 9.1.7.17. □

04XU **Exercise 10.2.3.24.** Show that the conclusion of Corollary 10.2.3.23 holds for every ∞-category $\mathcal{C}$: that is, it is not necessary to assume that $\mathcal{C}$ has images.

10.2.4 Universal Quotient Morphisms

04XV Let $\mathcal{C}$ be an ∞-category. In §10.2.2, we observed that the collection of quotient morphisms in $\mathcal{C}$ can exhibit some bad behavior: they need not be closed under composition (Exercise 10.2.2.15) or under the formation of pullbacks (Exercise 10.2.2.16). These deficiencies can be remedied by adopting a more restrictive definition.

04XW **Definition 10.2.4.1** (Universal Quotient Morphisms)**.** Let $\mathcal{C}$ be an ∞-category, let $f : X \to Y$ be a morphism of $\mathcal{C}$, and let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ be the sieve generated by f (see Example 10.2.1.19). We say that f is a *universal quotient morphism* if the sieve $\mathcal{C}^0_{/X}$ is dense (in the sense of Definition 10.2.1.26).

04XX **Remark 10.2.4.2.** Let $\mathcal{C}$ be an ∞-category and let $f : X \to Y$ be a morphism of $\mathcal{C}$, and let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ be the sieve generated by f. Then f is a quotient morphism if and only if the forgetful functor $\mathcal{C}_{/Y} \to \mathcal{C}$ is left Kan extended from $\mathcal{C}^0_{/Y}$ at the object $\mathrm{id}_Y : Y \to Y$ (see Remark 10.2.1.32). In particular, if f is a universal quotient morphism, then f is a quotient morphism. Beware that the converse is false in general (see Example 10.2.4.11).

04XY **Example 10.2.4.3.** Let $\mathcal{C}$ be an ∞-category, let $f : X \to Y$ be a morphism of $\mathcal{C}$, and let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ be the sieve generated by f. If f admits a right homotopy inverse $s : Y \to X$, then the sieve $\mathcal{C}^0_{/Y}$ coincides with $\mathcal{C}_{/Y}$, and is therefore dense. It follows that f is a universal quotient morphism. In particular, every isomorphism is a universal quotient morphism.

Remark 10.2.4.4. Let $\mathcal{C}$ be an ∞-category, let Y be an object of $\mathcal{C}$, and let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ be a sieve on Y. If $\mathcal{C}^0_{/Y}$ contains a universal quotient morphism $f : X \twoheadrightarrow Y$, then it is dense. See Remark 10.2.1.31. `04XZ`

Remark 10.2.4.5. Let $\mathcal{C}$ be an ∞-category containing a 2-simplex `04Y0`

$$\begin{tikzcd}
 & Y \arrow[dr, "g"] & \\
X \arrow[ur, "f"] \arrow[rr, "h"] & & Z.
\end{tikzcd}$$

If h is a universal quotient morphism, then g is also a universal quotient morphism. This is a special case of Remark 10.2.4.4.

Proposition 10.2.4.6. *Let $\mathcal{C}$ be an ∞-category containing a pullback diagram* `04Y1`

`04Y2`

$$\begin{tikzcd}
X' \arrow[r] \arrow[d, "f'"] & X \arrow[d, "f"] \\
Y' \arrow[r, "u"] & Y.
\end{tikzcd} \tag{10.13}$$

If f is a universal quotient morphism, then f' is also a universal quotient morphism.

Proof. Let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ be the sieve generated by f. Our assumption that f is a universal quotient morphism guarantees that $\mathcal{C}^0_{/Y}$ is a dense sieve on Y. Applying Proposition 10.2.1.33, we deduce that the pullback $u^* \mathcal{C}^0_{/Y}$ is a dense sieve on Y'. Since (10.13) is a pullback square, the sieve $u^* \mathcal{C}^0_{/Y'}$ is generated by f', so that f' is also a universal quotient morphism. □

The terminology of Definition 10.2.4.1 is motivated by the following result:

Corollary 10.2.4.7. *Let $\mathcal{C}$ be an ∞-category which admits fiber products and let $f : X \to Y$ be a morphism of $\mathcal{C}$. The following conditions are equivalent:* `04Y3`

(1) *The morphism f is a universal quotient morphism.*

(2) *For every pullback diagram*

$$\begin{tikzcd}
X' \arrow[r] \arrow[d, "f'"] & X \arrow[d, "f"] \\
Y' \arrow[r] & Y
\end{tikzcd}$$

of $\mathcal{C}$, the morphism f' is a universal quotient morphism.

(3) *For every pullback diagram*

$$\begin{tikzcd}
X' \arrow[r] \arrow[d, "f'"] & X \arrow[d, "f"] \\
Y' \arrow[r] & Y
\end{tikzcd}$$

of $\mathcal{C}$, the morphism f' is a quotient morphism.

Proof. The implication (1) ⇒ (2) follows from Proposition 10.2.4.6, the implication (2) ⇒ (3) from Remark 10.2.4.2, and the implication (3) ⇒ (1) from the criterion of Remark 10.2.1.32 (together with Example 10.2.1.25). □

04Y4 **Corollary 10.2.4.8.** *Let $\mathcal{C}$ be an ∞-category which admits fiber products. The following conditions are equivalent:*

(1) *Every quotient morphism in $\mathcal{C}$ is a universal quotient morphism.*

(2) *The collection of quotient morphisms in $\mathcal{C}$ is closed under pullbacks. That is, for every pullback diagram*

$$\begin{tikzcd}
X' \arrow[r] \arrow[d, "f'"] & X \arrow[d, "f"] \\
Y' \arrow[r] & Y
\end{tikzcd}$$

where f is a quotient morphism, f' is also a quotient morphism.

04Y5 **Corollary 10.2.4.9.** *Let X and Y be sets, and let $f : X \to Y$ be a function. The following conditions are equivalent:*

(1) *The function f is a universal quotient morphism in the category of sets.*

(2) *The function f is a quotient morphism in the category of sets.*

(3) *The function f is surjective.*

Proof. The implication (1) ⇒ (2) follows from Remark 10.2.4.2 and the equivalence (2) ⇔ (3) follows from Example 10.2.2.8. Since the collection of surjections is closed under pullbacks, Corollary 10.2.4.7 guarantees that (3) ⇒ (1). □

04Y6 **Corollary 10.2.4.10.** *Let $\mathcal{C}$ be an ∞-category which admits pullbacks, and suppose that geometric realizations in $\mathcal{C}$ are universal (see Definition [?]). Then every quotient morphism in $\mathcal{C}$ is a universal quotient morphism.*

Proof. Combine Corollary 10.2.4.7 and Proposition 10.2.2.4 (together with Remark 10.1.5.7). □

Example 10.2.4.11. Let $\mathcal{C}$ be (the nerve of) the category of partially ordered sets. Then Exercise 10.2.2.16 supplies an example of a quotient morphism $f : Q \twoheadrightarrow [2]$ in $\mathcal{C}$ which is not a universal quotient morphism. 04Y7

Proposition 10.2.4.12. *Let $\mathcal{C}$ be an ∞-category containing a 2-simplex* 04Y8

$$\begin{tikzcd}
& Y \arrow[dr, "g"] & \\
X \arrow[ur, "f"] \arrow[rr, "h"] & & Z.
\end{tikzcd}$$

If f and g are universal quotient morphisms, then h is also a universal quotient morphism.

Proof. Let $\mathcal{C}^0_{/Z}$ and $\mathcal{C}^1_{/Z}$ be the sieves generated by g and h, respectively. By assumption, the sieve $\mathcal{C}^0_{/Z}$ is dense, and we wish to show that $\mathcal{C}^1_{/Z}$ is also dense. By virtue of Proposition 10.2.1.34, it will suffice to show that for every morphism $u : Z' \to Z$ which belongs to $\mathcal{C}^0_{/Z}$, the pullback $u^* \mathcal{C}^1_{/Z'}$ is a dense sieve on Z'. Using Proposition 10.2.1.33, we can reduce to the special case where u is the morphism $g : Y \twoheadrightarrow Z$. In this case, the pullback sieve $u^*(\mathcal{C}^1_{/Y}) \subseteq \mathcal{C}_{/Y}$ contains the universal quotient morphism $f : X \twoheadrightarrow Y$, and is therefore dense (Remark 10.2.4.4). □

Variant 10.2.4.13. Let $\mathcal{C}$ be an ∞-category containing a 2-simplex 04Y9

$$\begin{tikzcd}
& Y \arrow[dr, "g"] & \\
X \arrow[ur, "f"] \arrow[rr, "h"] & & Z.
\end{tikzcd}$$

If f is a universal quotient morphism and g is a quotient morphism, then h is a quotient morphism.

Proof. Let $\mathcal{C}^0_{/Z}$ and $\mathcal{C}^1_{/Z}$ be the sieves on X generated by g and h, respectively. Our assumption that g is a quotient morphism guarantees that the functor

$$\overline{Q} : (\mathcal{C}^0_{/Z})^{\triangleright} \to (\mathcal{C}_{/Z})^{\triangleright} \to \mathcal{C}$$

is a colimit diagram in the ∞-category $\mathcal{C}$, and we wish to show that the restriction $\overline{Q}|_{(\mathcal{C}^1_{/Z})^{\triangleright}}$ is also a colimit diagram. By virtue of Corollary 7.3.8.2, it will suffice to show that the restriction $Q = \overline{Q}|_{\mathcal{C}^0_{/Z}}$ is left Kan extended from the full subcategory $\mathcal{C}^1_{/Z}$. Fix a morphism $u : Z' \to Z$ which belongs to the sieve $\mathcal{C}^0_{/Z}$; we wish to show that Q is left Kan extended from $\mathcal{C}^1_{/Z}$ at u. In fact, we will prove a slightly stronger assertion: the pullback $u^*(\mathcal{C}^1_{/Z})$ is a dense sieve on Z'. Using Proposition 10.2.1.33, we are reduced to proving this in the special case where u is the morphism $g : Y \to Z$. In this case, the sieve $u^*(\mathcal{C}^1_{/Z})$ contains the quotient morphism f, and is therefore dense by virtue of Remark 10.2.4.4. □

04YA **Corollary 10.2.4.14.** *Let $\mathcal{C}$ be an ∞-category. Then the collection of universal quotient morphisms of $\mathcal{C}$ is closed under retracts (in the ∞-category $\operatorname{Fun}(\Delta^1, \mathcal{C})$).*

Proof. Let $f : X \twoheadrightarrow Y$ be a universal quotient morphism in $\mathcal{C}$ and let $f' : X' \to Y'$ be a retract of f, so that we have a commutative diagram

$$\begin{tikzcd}
X' \arrow[r] \arrow[d, "f'"] & X \arrow[r, "r_X"] \arrow[d, "f"] & X' \arrow[d, "f'"] \\
Y' \arrow[r] & Y \arrow[r, "r_Y"] & Y'
\end{tikzcd}$$

where the vertical compositions are homotopic to the identity. We wish to show that f' is also a universal quotient morphism. By virtue of Remark 10.2.4.5, it will suffice to show that the composition $(f' \circ r_X) : X \to Y'$ is a universal quotient morphism. Using the commutativity of the diagram, we can write $f' \circ r_X$ as a composition of r_Y with f. Since f is a universal quotient morphism by assumption and r_Y is a universal quotient morphism by virtue of Example 10.2.4.3, the desired result follows from Proposition 10.2.4.12. □

04YB **Proposition 10.2.4.15.** *Let $\mathcal{C}$ be an ∞-category, let $q : K \to \mathcal{C}$ be a diagram, and let $\widetilde{f} : \widetilde{X} \to \widetilde{Y}$ be a morphism in the ∞-category $\mathcal{C}_{/q}$ having image $f : X \to Y$ in $\mathcal{C}$. If f is a universal quotient morphism in $\mathcal{C}$, then $\widetilde{f}$ is a universal quotient morphism in $\mathcal{C}_{/q}$.*

Proof. Set $\widetilde{\mathcal{C}} = \mathcal{C}_{/q}$, so that we have a commutative diagram of forgetful functors

$$\begin{tikzcd}
\widetilde{\mathcal{C}}_{/\widetilde{Y}} \arrow[r, "V'"] \arrow[d, "\widetilde{U}"] & \mathcal{C}_{/Y} \arrow[d, "U"] \\
\widetilde{\mathcal{C}} \arrow[r, "V"] & \mathcal{C} .
\end{tikzcd}$$

Let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ denote the sieve generated by f. Since f is a universal quotient morphism, the functor U is left Kan extended from $\mathcal{C}^0_{/Y}$. Note that V is a right fibration (Proposition

4.3.6.1), so that V' is a trivial Kan fibration (Corollary 4.3.7.13). In particular, V' is a right fibration, so that the functor $U \circ V' = V \circ \widetilde{U}$ is left Kan extended from the subcategory $\widetilde{\mathcal{C}}^0_{/\widetilde{Y}} = V'^{-1}\,\mathcal{C}^0_{/Y}$ (Corollary 7.3.8.5). Since the functor V is conservative and creates colimits (Proposition 7.1.3.19), it follows that $\widetilde{U}$ is also left Kan extended from $\widetilde{\mathcal{C}}^0_{/\widetilde{Y}}$. We conclude by observing that $\widetilde{\mathcal{C}}^0_{/\widetilde{Y}}$ is the sieve generated by $\widetilde{f}$, so that $\widetilde{f}$ is a universal quotient morphism in $\widetilde{\mathcal{C}}$. □

We close this section by characterizing (universal) quotient morphisms in the ∞-category $\mathcal{S}$ of spaces.

Lemma 10.2.4.16. *Let $\mathcal{C}$ be an ∞-category, let $\mathcal{C}' \subseteq \mathcal{C}$ be a dense full subcategory, and let $f : X \to Y$ be a morphism of $\mathcal{C}$. Suppose that, for every object $C \in \mathcal{C}'$, postcomposition with $[f]$ induces a surjection $\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(C, X) \to \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(C, Y)$. Then f is a universal quotient morphism.* `04YC`

Proof. Our assumption that $\mathcal{C}'$ is dense guarantees that the identity functor $\mathcal{C} \to \mathcal{C}$ is left Kan extended from $\mathcal{C}'$. Let $U : \mathcal{C}_{/Y} \to \mathcal{C}$ be the projection map and let $\mathcal{C}'_{/Y} \subseteq \mathcal{C}_{/Y}$ denote the inverse image of $\mathcal{C}'$. Since U is a right fibration (Proposition 4.3.6.1), the functor U is left Kan extended from $\mathcal{C}'_{/Y}$. Let $\mathcal{C}^0_{/Y} \subseteq \mathcal{C}_{/Y}$ denote the sieve generated by f. Our hypothesis guarantees that $\mathcal{C}^0_{/Y}$ contains $\mathcal{C}'_{/Y}$. Applying Corollary 7.3.8.8, we conclude that U is left Kan extended from $\mathcal{C}^0_{/Y}$: that is, f is a universal quotient morphism. □

Proposition 10.2.4.17. *Let $f : X \to Y$ be a map of Kan complexes. The following conditions are equivalent:* `04YD`

(1) *The map f is a universal quotient morphism in the ∞-category $\mathcal{S}$ (Definition 10.2.4.1).*

(2) *The map f is a quotient morphism in the ∞-category $\mathcal{S}$ (Definition 10.2.2.1).*

(3) *The map f is 0-connective: that is, it induces a surjection $\pi_0(f) : \pi_0(X) \to \pi_0(Y)$.*

Proof. The implication (1) ⇒ (2) is a special case of Corollary 10.2.4.10. We next show that (2) implies (3). Assume that f is a quotient morphism, so that Y can be identified with the geometric realization of the Čech nerve $\check{\mathrm{C}}(X/Y)_\bullet$ in the ∞-category $\mathcal{S}$ (Proposition 10.2.2.4). Note that the functor

$$\mathcal{S} \to \mathrm{N}_\bullet(\mathrm{Set}) \qquad S \mapsto \pi_0(S)$$

preserves the formation of geometric realizations (since it is left adjoint to the inclusion functor). It follows that $\pi_0(Y)$ can be identified with the geometric realization of $\pi_0(\check{\mathrm{C}}(X/Y)_\bullet)$ in the category of sets: that is, with the coequalizer of the projection maps $\pi_0(X \times_Y X) \rightrightarrows \pi_0(X)$ (see Corollary 10.1.2.12). In particular, the tautological map $\pi_0(X) \to \pi_0(Y)$ is surjective.

We now show that (3) implies (1). Assume that condition (3) is satisfied. For every contractible Kan complex C, the composition map $\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(C, X) \xrightarrow{[f]\circ} \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(C, Y)$ can be identified with $\pi_0(f)$, and is therefore surjective. Since the contractible Kan complexes span a dense subcategory of $\mathcal{S}$ (Example 8.4.2.3), Lemma 10.2.4.16 implies that f is a universal quotient morphism. □

10.2.5 Regular ∞-Categories

04YE We now formulate an ∞-categorical counterpart of Definition 10.2.0.6.

04YF **Definition 10.2.5.1.** Let $\mathcal{C}$ be an ∞-category. We say that $\mathcal{C}$ is *regular* if it satisfies the following conditions:

(1) The ∞-category $\mathcal{C}$ admits finite limits.

(2) The ∞-category $\mathcal{C}$ has images. That is, every morphism $f : X \to Y$ of $\mathcal{C}$ can be extended to a 2-simplex

$$\begin{tikzcd} & Y_0 \arrow[dr, "i"] & \\ X \arrow[ur, "q"] \arrow[rr, "f"] & & Y, \end{tikzcd}$$

where q is a quotient morphism and i is a monomorphism.

(3) The collection of quotient morphisms in $\mathcal{C}$ is closed under pullback. That is, for every pullback diagram

$$\begin{tikzcd} X' \arrow[r] \arrow[d, "f'"] & X \arrow[d, "f"] \\ Y' \arrow[r] & Y \end{tikzcd}$$

of $\mathcal{C}$, if f is a quotient morphism, then f' is also a quotient morphism.

04YG **Example 10.2.5.2.** Let $\mathcal{C}$ be a category. Then $\mathcal{C}$ is regular (in the sense of Definition 10.2.0.6) if and only if $\mathrm{N}_\bullet(\mathcal{C})$ is a regular ∞-category (in the sense of Definition 10.2.5.1). See Corollary 10.2.2.7.

Definition 10.2.5.1 admits a number of reformulations.

04YH **Proposition 10.2.5.3.** *Let $\mathcal{C}$ be an ∞-category which has images and admits finite limits. The following conditions are equivalent:*

(1) *The ∞-category $\mathcal{C}$ is regular: that is, the collection of quotient morphisms in $\mathcal{C}$ is closed under pullbacks.*

(2) *Every quotient morphism in $\mathcal{C}$ is a universal quotient morphism.*

(3) *Every morphism $f : X \to Y$ of $\mathcal{C}$ can be realized as the composition of a universal quotient morphism $q : X \twoheadrightarrow Y_0$ and a monomorphism $i : Y_0 \hookrightarrow Y$.*

(4) *For every pullback diagram*

$$\begin{tikzcd}
X' \arrow[r, "f'"] \arrow[d] & Y' \arrow[d, "u"] \\
X \arrow[r, "f"] & Y,
\end{tikzcd} \tag{10.14}$$

04YJ

the image $\mathrm{im}(f')$ *coincides with* $u^{-1}(\mathrm{im}(f))$ *(as an element of the set* $\mathrm{Sub}(Y')$*).*

Proof. The equivalence of (1) $\Leftrightarrow$ (2) is a special case of Corollary 10.2.4.8, and the implication (2) $\Rightarrow$ (3) is immediate from the definitions. We next show that (3) implies (4). Fix a diagram of the form (10.14). If condition (3) is satisfied, then we can choose a diagram

$$\begin{tikzcd}
 & & Y' \arrow[d, "u"] \\
X \arrow[r, "q"] & Y_0 \arrow[r, "i"] & Y
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$ where q is a universal quotient morphism, i is a monomorphism, and the lower vertical composition coincides with f. Since $\mathcal{C}$ admits finite limits, this diagram admits a right Kan extension

$$\begin{tikzcd}
Y' \times_Y X \arrow[r, "q'"] \arrow[d] & Y' \times_Y Y_0 \arrow[r, "i'"] \arrow[d] & Y' \arrow[d, "u"] \\
X \arrow[r, "q"] & Y_0 \arrow[r, "i"] & Y,
\end{tikzcd} \tag{10.15}$$

04YK

so that the right square and outer rectangle are pullback diagrams. By construction, the inverse image $u^{-1}(\mathrm{im}(f))$ is the isomorphism class of the fiber product $Y' \times_Y Y_0$ (regarded as an object of the ∞-category $\mathcal{C}_{/Y'}$ via the morphism i'). On the other hand, the uniqueness of limits guarantees that $Y' \times_Y X$ is isomorphic to X' as an object of $\mathcal{C}_{/Y'}$, so the image of f' coincides with the image of the composite morphism $i' \circ q'$. To prove that this image coincides with $[Y' \times_Y Y_0]$, it suffices to show that q' is a quotient morphism in $\mathcal{C}$. This follows from Corollary 10.2.4.7, since the left half of (10.15) is also a pullback square (Proposition 7.6.3.25).

We now complete the proof by showing that (4) implies (1). Suppose we are given a pullback square (10.14), where f is a quotient morphism; we wish to show that f' is also a quotient morphism. By virtue of Proposition 10.2.3.6, the assumption that f is a quotient morphism guarantees that $\mathrm{im}(f) = [Y]$ is the largest element of $\mathrm{Sub}(Y)$, and we wish to show that $\mathrm{im}(f') = [Y']$ is the largest element of $\mathrm{Sub}(Y')$. This follows immediately from (4), since the inverse image construction $u^{-1} : \mathrm{Sub}(Y) \to \mathrm{Sub}(Y')$ preserves largest elements (see Construction 9.2.4.31). □

04YL **Remark 10.2.5.4.** Let $\mathcal{C}$ be an ∞-category which has images and admits finite limits. Then, for every pullback diagram

$$\begin{tikzcd}
X' \arrow[r, "f'"] \arrow[d] & Y' \arrow[d, "u"] \\
X \arrow[r, "f"] & Y,
\end{tikzcd}$$

we always have a containment $\mathrm{im}(f') \subseteq u^{-1}(\mathrm{im}(f))$ in $\mathrm{Sub}(Y')$; this follows from the characterization of $\mathrm{im}(f)$ supplied by Proposition 10.2.3.11.

04YM **Corollary 10.2.5.5.** *Let $\mathcal{C}$ be an ∞-category which admits finite limits. Then $\mathcal{C}$ is regular if and only if every morphism $f : X \to Y$ can be obtained by composing a universal quotient morphism $q : X \twoheadrightarrow Y_0$ with a monomorphism $i : Y_0 \hookrightarrow Y$.*

04YN **Corollary 10.2.5.6.** *Let $\mathcal{S}$ denote the ∞-category of spaces. Then $\mathcal{S}$ is a regular ∞-category.*

Proof. Corollary 7.4.5.6 guarantees that $\mathcal{S}$ admits finite limits. By virtue of Corollary 10.2.5.5, it will suffice to show that every map of Kan complexes $f : X \to Y$ factors as a composition $i \circ q$, where $q : X \twoheadrightarrow Y_0$ is a universal quotient morphism in $\mathcal{S}$ and $i : Y_0 \hookrightarrow Y$ is a monomorphism in $\mathcal{S}$. For this, we can take $i : Y_0 \hookrightarrow Y$ to be the inclusion of the essential image of f (which is a monomorphism by Example 9.2.4.10), and $q : X \to Y_0$ to be the restriction of f (which is a universal quotient morphism by Proposition 10.2.4.17. □

04YP **Remark 10.2.5.7.** Let $f : X \to Y$ be a morphism of Kan complexes and let $Y_0 \subseteq Y$ be its essential image. The proof of Corollary 10.2.5.6 shows that Y_0 is an image of f in the ∞-category $\mathcal{S}$.

Warning 10.2.5.8. Let $\mathcal{QC}$ denote the ∞-category of (small) ∞-categories. Then $\mathcal{QC}$ contains quotient morphisms which are not universal quotient morphisms (see Variant 10.2.2.17). In particular, $\mathcal{QC}$ is not regular. `04YQ`

Proposition 10.2.5.9. *Let $\mathcal{C}$ be a regular ∞-category. Then, for every object $Z \in \mathcal{C}$, the slice ∞-category $\mathcal{C}_{/Z}$ is regular.* `04YR`

Proof. It follows from Remark 7.1.2.11 that the ∞-category $\mathcal{C}_{/Z}$ admits finite limits. By virtue of Corollary 10.2.5.5, it will suffice to show that every morphism $\widetilde{f} : \widetilde{X} \to \widetilde{Y}$ can be realized as the composition of a universal quotient morphism $\widetilde{X} \twoheadrightarrow \widetilde{Y}_0$ with a monomorphism $\widetilde{Y}_0 \hookrightarrow \widetilde{Y}$. Let $f : X \to Y$ denote the image of $\widetilde{f}$ in the ∞-category $\mathcal{C}$. Since $\mathcal{C}$ is regular, we can choose a 2-simplex σ :

$$\begin{tikzcd} & Y_0 \arrow[dr, "i"] & \\ X \arrow[ur, "q"] \arrow[rr, "f"] & & Y \end{tikzcd}$$

of $\mathcal{C}$, where q is a universal quotient morphism and i is a monomorphism. The inclusion map $\mathrm{N}_{\bullet}(\{0 < 2\}) \hookrightarrow \Delta^2$ is right anodyne (Lemma 4.3.7.8), so we can lift σ to a 2-simplex

$$\begin{tikzcd} & \widetilde{Y}_0 \arrow[dr, "\widetilde{i}"] & \\ \widetilde{X} \arrow[ur, "\widetilde{q}"] \arrow[rr, "\widetilde{f}"] & & \widetilde{Y} \end{tikzcd}$$

in the ∞-category $\mathcal{C}_{/Z}$. We conclude by observing that $\widetilde{i}$ is a monomorphism (Remark 9.2.4.23) and $\widetilde{q}$ is a universal quotient morphism (Proposition 10.2.4.15). □

We now study functors between regular ∞-categories.

Definition 10.2.5.10. Let $\mathcal{C}$ and $\mathcal{D}$ be regular ∞-categories. We say that a functor $F : \mathcal{C} \to \mathcal{D}$ is *regular* if it preserves finite limits and carries quotient morphisms of $\mathcal{C}$ to quotient morphisms of $\mathcal{D}$. `04YS`

Remark 10.2.5.11. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which preserves pullbacks. Then F carries monomorphisms in $\mathcal{C}$ to monomorphisms in $\mathcal{D}$ (Proposition 9.2.4.20). In particular, for every object $Y \in \mathcal{C}$, the functor F carries subobjects of Y to subobjects of $F(Y)$, and therefore induces a map of partially ordered sets $\mathrm{Sub}(Y) \to \mathrm{Sub}(F(Y))$. `04YT`

04YU **Proposition 10.2.5.12.** *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories which have images, and let $F : \mathcal{C} \to \mathcal{D}$ be a functor which preserves pullback squares. The following conditions are equivalent:*

(1) *The functor F carries quotient morphisms in $\mathcal{C}$ to quotient morphisms in $\mathcal{D}$.*

(2) *For every 2-simplex σ :*

$$\begin{tikzcd} & Y_0 \arrow[dr, "i"] & \\ X \arrow[ur, "q"] \arrow[rr, "f"] & & Y \end{tikzcd}$$

in the ∞-category $\mathcal{C}$ which exhibit Y_0 as an image of f, the 2-simplex $F(\sigma)$ exhibits $F(Y_0)$ as an image of $F(f)$ in the ∞-category $\mathcal{D}$.

(3) *For every morphism $f : X \to Y$ in $\mathcal{C}$, the map* $\mathrm{Sub}(Y) \to \mathrm{Sub}(F(Y))$ *of Remark 10.2.5.11 carries* $\mathrm{im}(f)$ *to* $\mathrm{im}(F(f))$.

Proof. The implication (1) ⇒ (2) follows from the observation that F preserves monomorphisms (Proposition 9.2.4.20), and the implication (2) ⇒ (3) is immediate from the definitions. We will complete the proof by showing that (3) implies (1). Let $f : X \twoheadrightarrow Y$ be a quotient morphism in $\mathcal{C}$; we wish to show that $F(f)$ is a quotient morphism in $\mathcal{D}$. By virtue of Proposition 10.2.3.6, our hypothesis can be reformulated as an equality $\mathrm{im}(f) = [Y]$ in the partially ordered set $\mathrm{Sub}(Y)$, and we wish to prove an equality $\mathrm{im}(F(f)) = [F(Y)]$ in the partially ordered set $\mathrm{Sub}(F(Y))$. This is clear, since the map $\mathrm{Sub}(Y) \to \mathrm{Sub}(F(Y))$ preserves largest elements (see Remark 10.2.5.11). □

04YV **Remark 10.2.5.13.** Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories with images, and let $F : \mathcal{C} \to \mathcal{D}$ be a functor which preserves pullback diagrams. For any morphism $f : X \to Y$ of $\mathcal{C}$, we always have an inclusion $F(\mathrm{im}(f)) \subseteq \mathrm{im}(F(f))$ in the partially ordered set $\mathrm{Sub}(F(Y))$.

04YW **Corollary 10.2.5.14.** *Let $\mathcal{C}$ and $\mathcal{D}$ be regular ∞-categories, and let $F : \mathcal{C} \to \mathcal{D}$ be a functor which preserves finite limits. Then F is regular if and only if, for every morphism $f : X \to Y$ in the ∞-category $\mathcal{C}$, the map* $\mathrm{Sub}(Y) \to \mathrm{Sub}(F(Y))$ *of Remark 10.2.5.11 carries* $\mathrm{im}(f)$ *to* $\mathrm{im}(F(f))$.

04YX **Example 10.2.5.15.** Let $\mathcal{C}$ be a regular ∞-category. Then, for every object $X \in \mathcal{C}$, the slice ∞-category $\mathcal{C}_{/X}$ is also regular (Proposition 10.2.5.9). Moreover, for every morphism $f : X \to Y$ of $\mathcal{C}$, Proposition 7.6.3.16 guarantees that there exists a functor

$$f^* : \mathcal{C}_{/Y} \to \mathcal{C}_{/X} \qquad Z \mapsto X \times_Y Z$$

given by pullback along f. The functor f^* is regular: it preserves finite limits since it right adjoint to the postcomposition functor $(f \circ \bullet) : \mathcal{C}_{/X} \to \mathcal{C}_{/Y}$, and preserves quotient morphisms by virtue of Proposition 10.2.5.3.

Proposition 10.2.5.16. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories which admit finite limits and let $F : \mathcal{C} \to \mathcal{D}$ be a functor which preserves finite limits and geometric realizations of simplicial objects. Then F carries quotient morphisms of $\mathcal{C}$ to quotient morphisms of $\mathcal{D}$. In particular, if the ∞-categories $\mathcal{C}$ and $\mathcal{D}$ are regular, then the functor F is regular.* `04YY`

Proof. Let $f : X \twoheadrightarrow Y$ be a quotient morphism in $\mathcal{C}$; we wish to that $F(f)$ is quotient morphism in $\mathcal{D}$. Let $\check{\mathrm{C}}_\bullet(X/Y) : \mathrm{N}_\bullet(\mathbf{\Delta}_+^{\mathrm{op}}) \to \mathcal{C}$ be a Čech nerve of f (Notation 10.1.5.5. Since f is a quotient morphism (Remark 10.2.4.2), $\check{\mathrm{C}}_\bullet(X/Y)$ is a colimit diagram in $\mathcal{C}$ (Proposition 10.2.2.4). Our assumption that F preserves geometric realizations guarantees that $F \circ \check{\mathrm{C}}_\bullet(X/Y)$ is a colimit diagram in the ∞-category $\mathcal{D}$. Since F preserves finite limits, $F \circ \check{\mathrm{C}}_\bullet(X/Y)$ is a Čech nerve of the morphism $F(f) : F(X) \to F(Y)$. Applying Proposition 10.2.2.4 again, we deduce that $F(f)$ is a quotient morphism in $\mathcal{D}$. □

We now record some closure properties for the collection of regular ∞-categories.

Proposition 10.2.5.17. *Let $\mathcal{C}$ be an ∞-category which admits pullbacks, let $\mathcal{C}_0 \subseteq \mathcal{C}$ be a full subcategory which is closed under the formation of pullbacks, and let $q : X \to Y$ be a morphism in $\mathcal{C}_0$. If q is a quotient morphism in $\mathcal{C}$, then it is also a quotient morphism in $\mathcal{C}_0$. If q is a universal quotient morphism in $\mathcal{C}$, then it is also a universal quotient morphism in $\mathcal{C}_0$.* `04YZ`

Proof. Assume that q is a quotient morphism in $\mathcal{C}$; we will show that it is also a quotient morphism in $\mathcal{C}_0$ (the analogous assertion for universal quotient morphisms then follows from the criterion of Corollary 10.2.4.7). Since $\mathcal{C}$ admits pullbacks and $\mathcal{C}_0$ is stable under the formation of pullbacks, it follows that $\mathcal{C}_0$ also admits pullbacks. Applying Proposition 10.1.5.6, we deduce that q admits a Čech nerve $\check{\mathrm{C}}_\bullet(X/Y) : \mathrm{N}_\bullet(\mathbf{\Delta}_+^{\mathrm{op}}) \to \mathcal{C}_0$, which is also a Čech nerve of q in the ∞-category $\mathcal{C}$. Since q is a quotient morphism, $\check{\mathrm{C}}_\bullet(Z/Y)$ is a colimit diagram in $\mathcal{C}$ (Proposition 10.2.2.4). It follows that $\check{\mathrm{C}}_\bullet(X/Y)$ is also a colimit diagram in $\mathcal{C}_0$, so that q is a quotient morphism in $\mathcal{C}_0$. □

Corollary 10.2.5.18. *Let $\mathcal{C}$ be a regular ∞-category and let $\mathcal{C}_0 \subseteq \mathcal{C}$ be a full subcategory which is closed under finite limits. Assume that, for every morphism f of $\mathcal{C}_0$, the image $\mathrm{im}(f)$ (formed in the ∞-category $\mathcal{C}$) can be chosen to belong to $\mathcal{C}_0$. Then $\mathcal{C}_0$ is also regular.* `04Z0`

Proof. Let $f : X \to Y$ be a morphism in $\mathcal{C}$. Since $\mathcal{C}$ is regular, f can be factored as the composition of a universal quotient morphism $q : X \twoheadrightarrow Y_0$ with a monomorphism $i : Y_0 \hookrightarrow Y$. If X and Y belong to $\mathcal{C}_0$, then our assumption guarantees that we can arrange that Y_0 is also contained in $\mathcal{C}_0$. In this case, i is also a monomorphism in the ∞-category $\mathcal{C}_0$, and

Proposition 10.2.5.17 guarantees that q is a universal quotient morphism in the subcategory $\mathcal{C}_0$. Allowing f to vary and invoking Corollary 10.2.5.5, we conclude that $\mathcal{C}_0$ is regular. $\square$

04Z1 **Proposition 10.2.5.19.** *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor of ∞-categories which admits a fully faithful right adjoint $G : \mathcal{D} \to \mathcal{C}$. Suppose that the ∞-category $\mathcal{C}$ is regular and that F preserves finite limits. Then the ∞-category $\mathcal{D}$ is also regular, and F is a regular functor.*

Proof. Since the functor F has a right adjoint, it preserves geometric realizations of simplicial objects (Corollary 7.1.3.21). Applying Proposition 10.2.5.16, we deduce that the functor F carries quotient morphisms in $\mathcal{C}$ to quotient morphisms in $\mathcal{D}$. It will therefore suffice to show that $\mathcal{D}$ is regular.

It follows from Corollary 7.1.3.27 (together with Corollary 6.2.2.17) that the ∞-category $\mathcal{D}$ admits finite limits. We next show that every morphism $v : D \to D'$ in $\mathcal{D}$ has an image. Let $\epsilon : (F \circ G) \to \mathrm{id}_{\mathcal{D}}$ be the counit of an adjunction between F and G. Since G is fully faithful, the natural transformation ϵ is an isomorphism. We can therefore replace v by the morphism $(F \circ G)(v)$, and thereby reduce to the case where $v = F(u)$ for some morphism $u : C \to C'$ in $\mathcal{C}$. In this case, our assumption that $\mathcal{C}$ has images guarantees that we can factor u as a composition $C \overset{q}{\twoheadrightarrow} C'_0 \overset{i}{\hookrightarrow} C'$, where q is a quotient morphism and i is a monomorphism (in the ∞-category $\mathcal{C}$). It follows that v can be written as the composition of $F(q)$ (which is a quotient morphism in $\mathcal{D}$, as noted above) with $F(i)$ (which is a monomorphism in $\mathcal{D}$ by virtue of Proposition 9.2.4.20). In particular, the object $F'(C_0)$ is an image of v.

We now complete the proof by showing that if

04Z2
$$\begin{tikzcd}
X' \arrow[r, "f'"] \arrow[d] & Z' \arrow[d, "g"] \\
X \arrow[r, "f"] & Z
\end{tikzcd} \qquad (10.16)$$

is a pullback diagram in $\mathcal{C}$ where f is a quotient morphism, then f' is also a quotient morphism. Since $\mathcal{C}$ is regular, we can choose a 2-simplex

$$\begin{tikzcd}
& Y \arrow[dr] & \\
G(X) \arrow[ur, "q"] \arrow[rr, "G(f)"] & & G(Z),
\end{tikzcd}$$

which exhibits Y as an image of $G(f)$. It follows that $F(\sigma)$ exhibits $F(Y)$ as an image of the morphism $(F \circ G)(f)$ in the ∞-category $\mathcal{D}$. Note that $(F \circ G)(f)$ is isomorphic to f

(as an object of $\mathrm{Fun}(\Delta^1, \mathcal{D})$), and is therefore a quotient morphism (Corollary 10.2.2.12). Applying Proposition 10.2.3.6, we conclude that $F(i)$ is an isomorphism in $\mathcal{D}$.

Amalgamating the 2-simplex σ with $G(g)$, we obtain a diagram

$$\begin{tikzcd}
 & & G(Z') \arrow[d, "G(g)"] \\
G(X) \arrow[r, "q"] & Y \arrow[r, "i"] & G(Z)
\end{tikzcd}$$

in the ∞-category $\mathcal{C}$. Since $\mathcal{C}$ admits finite limits, this diagram admits a right Kan extension

04Z3

$$\begin{tikzcd}
G(X) \times_{G(Z)} G(Z') \arrow[r, "q'"] \arrow[d] & Y \times_{G(Z)} G(Z') \arrow[r, "i'"] \arrow[d] & G(Z') \arrow[d, "g"] \\
G(X) \arrow[r, "q"] & Y \arrow[r, "i"] & G(Z),
\end{tikzcd} \tag{10.17}$$

so that the square on the right and the outer rectangle are pullback squares. Note that, after applying the functor F, the outer rectangle of this diagram is isomorphic to (10.16). We are therefore reduced to showing that the functor F carries the upper horizontal composition in (10.17) to a quotient morphism in $\mathcal{D}$. Since F preserves pullback squares, $F(i')$ is a pullback of $F(i)$ and is therefore an isomorphism (Corollary 7.6.3.24). Using Corollary 10.2.2.12, we are reduced to showing that $F(q')$ is a quotient morphism in $\mathcal{D}$. In fact, we claim that q' is a pullback morphism of $\mathcal{C}$. This follows from our assumption that $\mathcal{C}$ is regular, since q is a quotient morphism by construction and the left half the diagram (10.17) is a pullback square (Proposition 7.6.3.25). □

Corollary 10.2.5.20. *Let $\mathcal{C}$ be a regular ∞-category and let $\mathcal{C}_0 \subseteq \mathcal{C}$ be a reflective subcategory, so that the inclusion functor $\mathcal{C}_0 \hookrightarrow \mathcal{C}$ admits a left adjoint $L : \mathcal{C} \to \mathcal{C}_0$. If the functor L preserves finite limits, then $\mathcal{C}_0$ is a regular ∞-category and L is a regular functor.* 04Z4
