of the Hawaiian Department. He was promoted to brigadier general in February 1942 and to major general that May, taking command of the 25th Infantry Division.

The 25th Infantry Division relieved the 1st Marine Division on Guadalcanal in December 1942. Collins earned the nickname “Lightning Joe” for his aggressiveness in this campaign, defeating the Japanese there in February 1943. Then Collins assumed command of VII Corps, the post he held for the remainder of the war. On D-day (June 6, 1944), spearheaded by its 4th Division, VII Corps landed on Utah Beach. It then seized the vital port of Cherbourg (June 27). VII Corps is probably best remembered, however, for Operation COBRA (June 25–31), the breakout from the Normandy beachhead at Saint-Lô (July 25), an operation largely planned by Lieutenant General Omar N. Bradley but executed by Collins. VII Corps then repelled the German counterattack at Mortain (August 7–13), which led to the creation of the Falaise-Argentan Pocket.

U.S. Army lieutenant general Joseph L. Collins. “Lightning Joe” Collins was one of the outstanding corps commanders of World War II. (Corbis)

Collins led VII Corps during the disastrous Battle of Hürtgen Forest (September–December 1944); at the Ardennes Offensive (Battle of the Bulge, December 16, 1944–January 25, 1945), where the corps held the northern shoulder of the bulge; at Köln (Cologne, February 1945); in the reduction of the Ruhr Pocket (March–April); and, as the war ended, in the Harz Mountains. In April 1945, he was promoted to lieutenant general.

Following the war, Collins served as director of information for the War Department (December 1945–September 1947). He then served as vice chief of staff of the army (1947–1949). Promoted to full general (January 1948), he was then chief of staff of the army (August 1949–August 1953). Collins is credited with full racial integration of the army during the Korean War (1950–1953), in accordance with President Harry S. Truman’s 1948 executive order.

Collins then served as U.S. representative to the North Atlantic Treaty Organization (NATO) Military Committee and Standing Group. Following the 1954 Geneva Accords, the Dwight D. Eisenhower administration dispatched Collins to the State of Vietnam (later Republic of Vietnam, South Vietnam), as special envoy with the rank of ambassador (1954–1955). Although Collins did not think that Ngo Dinh Diem was capable of leading South Vietnam, he followed his instructions of supporting the Diem government by helping it establish a military training program and agrarian reforms. Collins retired from the army in March 1956. After serving as vice chairman of the President’s Committee for Hungarian Refugee Relief, he entered private business. Collins died in Washington, D.C., on September 12, 1987.

Collishaw, Raymond (1893–1976)

Canadian fighter pilot and senior Royal Air Force (RAF) air vice marshal. Born on November 22, 1893, in Nanaimo, British Columbia, Raymond Collishaw became a seaman in the Canadian Fisheries Protection Service after leaving school, then joined the Royal Naval Air Service in January 1916. After training, he was assigned to France. Collishaw was credited with downing 59 enemy aircraft by the end of World War I.

Collishaw remained with the new Royal Air Force (RAF) after the war. He saw action in southern Russia in 1919, then served in a variety of home and overseas stations in the years before World War II. In 1940, now as air commodore, he was in command of Number 202 Group, the RAF units in the Western Desert of Egypt, when war with Italy began on June 10. Collishaw's theater commander, Air Chief Marshal Sir Arthur Longmore, ordered him to keep his aggressive tendencies in check, largely because of immediate difficulties of supply. But as reinforcements arrived, Collishaw was able to extend air operations against the Italians.

In December 1940, preparations began for a full-scale land offensive into Libya. Collishaw's air units commenced a wide-ranging offensive to set the stage and provided close support for Lieutenant General Sir Richard O'Connor's spectacularly successful advance and destruction of Italian forces under Marshal Rodolfo Graziani. This success was quickly reversed, as the British sent troops and aircraft to Greece and German forces under Lieutenant General Erwin Rommel commenced operations in Africa. Collishaw's air forces provided support as the British retreated and then again stabilized their situation on the Egyptian border.

Collishaw returned to Britain on the staff of Headquarters, Fighter Command, in August 1941, then took command of Number 14 Group, Fighter Command, on March 21, 1942. He retired as an air vice marshal in 1943 and remained in England until the end of the war, when he returned to

Vancouver. In Canada, he set up several successful mining-exploration operations. Collishaw died in West Vancouver on September 28, 1976.

Colmar Pocket, Battle for the (January 20–February 9, 1945)

The Colmar Pocket was the German bridgehead west of the Rhine River and south of the city of Strasbourg, held by Colonel General Friedrich Wiese's Nineteenth Army of eight divisions (some 50,000 men). On January 7, 1945, the Germans launched a major attack out of the Colmar Pocket, gaining little ground. But the Allies wanted to remove the pocket, and the task was assigned to General Jean de Lattre de Tassigny's French First Army of the Allied 6th Army Group.

Two smiling French soldiers fill the hands of American soldiers with candy, in Rouffach, France, during the Allied operation to close the Colmar Pocket, February 5, 1945. (National Archives)

On January 20, de Lattre's troops attacked the Colmar Pocket. The French I Corps led off by attacking the southern flank. On the night of January 22–23, II Corps assaulted the northern flank. The objective was to envelop the pocket by converging on Neuf-Brisach and the Rhine bridge at Breisach. Deep snow along with German mines, machine guns, tanks, and artillery kept the attacks from gaining much ground.

The U.S. 3rd Infantry Division, which was attached to the French, then crossed the Fecht and Ill Rivers. The Germans counterattacked, but the 3rd Infantry Division held them off and reinforced its bridgehead. Severe shortages of French troops led to the eventual attachment to the operation of Major General Frank Milburn's U.S. XXI Corps, composed of the 3rd, 28th, and 75th Infantry Divisions. XXI Corps took over the right of the French II Corps zone and the main effort to envelop the Colmar Pocket from the north. The II Corps secured its left, clearing that area to the Rhine.

The attack continued. The 28th Infantry Division arrived at Colmar on February 2, and the 75th entered the outskirts of Neuf-Brisach in the rear of the pocket. The U.S. 12th Armored Division was then added to the attack. On February 3 it drove south, passing through the 28th Infantry Division. Pockets of German resistance held up one arm of the attack, but the other,

driving down the main road, captured Rouffach on February 5. Other task forces surrounded the town and met the 4th Moroccan Division from French I Corps. This maneuver split the pocket.

On February 5, leading elements of the U.S. 3rd Infantry Division arrived outside the walled town of Neuf-Brisach. Early the next morning as the Americans prepared to attack the city, they encountered a Frenchman who took them to a 60-foot tunnel that led into the town from the dry moat. An American platoon entered through the tunnel and found only 76 German soldiers, who surrendered without a fight. Before leaving, their officers had told them to fight to the finish.

French forces finished off the pocket on February 9. In the entire operation, the Allies had sustained about 18,000 casualties and the Germans between 22,000 and 36,000. Only the 708th Volksgrenadier Division, which evacuated on February 3, escaped reasonably intact. The German 2nd Mountain Division had 1,000 battle casualties and 4,700 men taken as prisoners. Only 500 members of the German 198th Infantry Division and 400 men of the German 338th Infantry Division managed to escape. The Germans also abandoned 55 armored vehicles and 66 field pieces.

Combat Fatigue

Combat fatigue—also known as battle fatigue, war neurosis, exhaustion, or shell shock—is a variable group of symptoms including excessive fatigue, an exaggerated startle response, tremors, violence, nightmares, delusions, hallucinations, withdrawal, and catatonia. Herodotus described combat-induced mental illness in the Athenian Army during the Battle of Marathon in 490 BCE, but the diagnosis was relatively infrequent prior to the 20th century.

The Russians established the first military psychiatric service during the 1905–1905 Russo-Japanese War. The problem became widespread in World War I, during which it was termed "shell shock" under the mistaken theory that explosive concussions caused small brain hemorrhages leading to cerebral dysfunction. By World War II, it was widely understood that the symptoms were psychiatric in nature, were similar to traumatic neuroses seen in the civilian population, and were not caused by identifiable anatomic brain damage. Today, this general set of conditions falls under the rubric of post-traumatic stress disorder (PTSD).

In spite of an early British emphasis on battlefield psychiatry and an American attempt to exclude men with psychiatric illness from military service, mental illness remained a major cause of combat disability, with about 30 percent of Allied combat zone casualties being psychiatric. Although physicians in World War I had learned that treatment close to the front lines made it possible to return a number of psychiatrically disabled soldiers to combat, the lesson was forgotten. Early in World War II, patients with combat fatigue were routinely evacuated to rehabilitation hospitals, and most were discharged. As manpower became scarce, more of these men were placed in pioneer or labor details in the rear area, but few returned to combat.

Captain Frederick R. Hanson, an American neurologist and neurosurgeon who had joined the Canadian Army early in the war and participated in the landing at Dieppe, transferred to the U.S. Army and developed what became a successful and widely employed treatment for what the British now termed "exhaustion" or "combat fatigue." The essential parts of the regimen included sedation, brief periods of rest, and treatment in a facility close to the front, where the patients and staff continued to wear combat clothing. Hanson realized that treating these patients as if they were mentally ill and physically

separating them from their units made it unlikely they would return to duty. Using his treatment protocols, the British Army and the U.S. Army were able to return 70 to 80 percent of combat fatigue victims to their units, and only 15 to 20 percent of patients requiring evacuation to the zone of the interior were psychiatric.

Shortly after the invasion of Italy, the U.S. Army established the post of division psychiatrist, and Hanson produced a manual for internists so nonpsychiatrists could use his methods. As the war went on, Allied military psychiatrists became convinced that no soldier was immune from combat fatigue. They hypothesized that any man subject to continuous combat for a long enough time would become nonfunctional and estimated that 200 days of constant action was about the maximum a soldier could be expected to tolerate. The British adopted a system of unit rotation to give their men regular periods of rest and were able to stretch the tolerable period to close to 400 days, but the Americans, except in the U.S. Army Air Forces, adopted a more haphazard approach of rotating individuals with the longest periods of service rather than entire units. It was not until later wars that regular unit rotation became standard.

Military physicians, mindful of the heavy clinical and financial burden of long-term psychiatric illness after World War I, correctly warned that the true cost of combat fatigue would not become evident until after the soldiers returned to civilian life.

Combined Bomber Offensive (June 10, 1943–April 1945)

Sustained strategic bombing campaign of Germany conducted by the British Royal Air Force (RAF) and the United States Army Air Forces (USAAF). At the Casablanca Conference in French Morocco, North Africa, during January 14–24, 1943, British prime minister Winston Churchill, U.S. president Franklin D. Roosevelt, and the U.S.-British Combined Chiefs of Staff (CCS) met to decide overall strategy for continuing the war against Nazi Germany. Having decided that an invasion of the European continent through France was not feasible in 1943, they worked to find another means by which to actively engage the Germans. The Allied senior leadership ultimately decided to support U.S. major general Ira C. Eaker's plan to begin a combined bomber offensive against Germany, with the Americans bombing principally during the day and the British bombing at night.

Chief of the RAF Air Staff Marshal Sir Charles Portal was assigned the mission of coordinating the operation. On January 21 the CCS issued the Casablanca Directive, which established the objective of the Combined Bomber Offensive (CBO) as "the progressive destruction and dislocation of the German military, industrial, and economic system, and the undermining of the morale of the German people to a point where their capacity for armed resistance is fatally weakened." A supplemental document called the "Directive for the Bomber Offensive" required the Allies to "take every opportunity to attack Germany by day, to destroy objectives that are unsuitable for night attack, … to impose heavy losses on the German day fighter force, and to contain German fighter strength away from the Russian and Mediterranean theatres of war."

The concept of a combined bomber offensive was actually a compromise between the two opposing doctrines of the RAF and the USAAF. The American commanders believed that their heavily armed and supposedly self-defending long-range Boeing B-17 Flying Fortress and Consolidate B-24 Liberator bombers would be sufficient to reach and attack the designated target without fighter escort while sustaining only minimal losses. Because the American bombers were equipped with the Norden bombsight, strategic precision bombing operations could be conducted from high altitudes, above the ceiling of ground-based antiaircraft artillery. American aircraft would

therefore be able to bomb in daylight with minimal loss and strike specific military and industrial targets with only limited collateral damage.

The RAF, which began the war in 1939 with a similar doctrine, quickly discovered that its lightly armed and armored bombers could not operate during the day without suffering crippling losses. In response, the British switched to nighttime area bombing. Although the CBO joined together the two operational concepts, both sets of doctrine were seriously flawed.

Although planned out in four phases between April 1943 and April 1944, the CBO did not actually begin until the "Pointblank Directive" was adopted by the CCS in June 1943. According to that document, continuous aerial warfare would effectively engage and disperse the German Luftwaffe through a war of attrition, particularly through maintaining regular Allied fighter intrusion by day. Putting further pressure on the German fighter defenses, aircraft factories were designated as a primary bombing target. Both the Casablanca directive and the Pointblank plan were based on the establishment of Allied air supremacy as a condition for the success of the Allied invasion of France. A follow-on Allied conference in August 1943 at Quebec, code-named Quadrant, confirmed the previously established set of priorities but rejected bombing attacks specifically to break German civilian morale as a means to achieve the strategic goal.

The missions resulting from the Pointblank plan included the large-scale attacks against Berlin, Hamburg, the Ruhr industrial area, and the ball-bearing manufacturing plants at Schweinfurt. The August 17, 1943, raid on Schweinfurt in particular was a failure because of the devastatingly high losses of U.S. Eighth Air Force bombers and aircrew. Attacking in two waves of 300 bombers without fighter cover, the U.S. aircraft were subjected to relentless attack by German fighters for some six hours. The USAAF lost 60 bombers shot down and 130 damaged. Every bomber downed also meant the loss of 10 highly trained aircrew members.

The Schweinfurt fiasco produced a crisis of confidence in the effectiveness and sustainability of CBO operations. The Americans suspended raids deep into Germany until the North American P-51 Mustang became operational in significant numbers. The new long-range fighter had the operational radius necessary to escort the bombers all the way to the target and back. Since dense cloud cover severely limited the effectiveness of the Norden bombsight, the Americans also postponed their attacks to wait for

better weather. By February 1944 the Americans were ready to resume bombing operations.

The final decision for Operation OVERLORD (the cross-Channel invasion of France) did much to refocus the conflicting priorities of the early CBO strategy. The Allied air forces were now given specific and limited operational target sets specifically designed to reduce the German ability to reinforce against the Allied invasion force ashore rather than the earlier and more ambiguous military and economic strategic targets.

The shift produced a rapid effect. In February 1944, the first six days of the renewed offensive, designated "Big Week," undercut an already weakened and demoralized Luftwaffe, and deep interdiction missions effectively disrupted German rail communications in Western Europe. By June 1944 and the start of Operation OVERLORD, the Luftwaffe was virtually incapable of mounting any significant attacks against the invasion force.

Despite the Combined Bomber Offensive, the production of German fighters actually increased and continued to increase until September 1944. But while the Germans were not quite running out of fighter aircraft, they were running out of fuel and adequately trained pilots. The resumed bombing raids with complete fighter cover cost the Luftwaffe heavily in both aircraft and pilots, but one trained pilot took far longer to replace than one fighter plane.

On D-day (June 6, 1944), therefore, the Allies were able to commit 12,387 aircraft, including 5,400 fighters. German Luftflotte 3 could send aloft only 329 aircraft in response. The virtual elimination of the Luftwaffe and the establishment of Allied air supremacy was one clear-cut success of the CBO.

At the end of the war the CBO was generally considered to have been an overall but costly success. The U.S. Eighth Air Force alone lost 2,400 bombers, and the RAF Bomber Command lost more than 8,000. The casualty rate for aircrew was significantly higher than for infantrymen. The postwar U.S. Strategic Bombing Survey, however, concluded that the CBO largely failed to achieve its broader objective of inflicting significant damage on German strategic targets. Despite the large-scale destruction inflicted on German cities and the casualties to the civilian population, there was no evidence that the German will to fight had been measurably reduced. High-level precision bombing, especially in and near population centers in close proximity to the industrial and military targets, had killed more than 600,000

civilians. The outcome therefore continues to be questioned by historians on both moral and operational effectiveness grounds.

Combined Chiefs of Staff

Ad hoc organization, composed of the British and American military chiefs of staff, that coordinated combined strategic planning and conduct of World War II. The groundwork for military collaboration developed at least a year and a half before the United States was drawn into the war in December 1941. The U.S. Navy Department established a permanent observer mission in London to discuss naval cooperation and information exchange. U.S. Army observers only went to London on special missions until the War Department set up permanent liaison in the spring of 1941. In early 1941, agreements called for the exchange of military missions, and the British established its Joint Staff Mission, representing the British chiefs.

The Combined Chiefs of Staff (CCS) was formally established by the two powers in January 1942 shortly after the Arcadia Conference made the Anglo-American alliance a fact. The organization was to consist of the British chiefs of staff and their opposite numbers in the United States. Because there were no opposite numbers established in the United States at that point, the U.S. Joint Chiefs of Staff (JCS) was formed, consisting of the

army chief of staff, General George C. Marshall; the deputy army chief of staff for air and commanding general of the U.S. Army Air Forces, Lieutenant General Henry H. Arnold; the chief of naval operations, Admiral Harold R. Stark, and the commander in chief of the U.S. Fleet, Admiral Ernest J. King. In March 1942, Stark's and King's positions were combined under King, and Stark went on to command U.S. Naval Forces in Europe, headquartered in London. In July, President Franklin D. Roosevelt, acting in his capacity as commander in chief of the armed forces, brought out of retirement former chief of naval operations Admiral William D. Leahy and appointed him chief of staff to the president.

The British Chiefs of Staff (BCS) organization included the chief of the Imperial General Staff, General Sir Alan Brooke; the first sea lord, Admiral Sir Dudley Pound; and the chief of the air staff, Air Chief Marshal Sir Charles Portal. These men met with their American counterparts only at infrequent military-political conferences, but in the interim, they were represented at the permanent body in Washington by the Joint Staff Mission. The original members of that mission were Lieutenant General Sir Colville Wemyss, Admiral Sir Charles Little, and Air Marshal Arthur T. Harris. In addition, Field Marshal Sir John Dill sat as a member of the CCS representing Prime Minister Winston L. S. Churchill.

The CCS was to formulate and execute policies and plans related to the strategic conduct of the war, to include war requirements, allocation of munitions, and transportation requirements. Combined planning was done by the staffs of the JCS and BCS; the Joint Planning Staff, patterned after the British design; and the Joint Planners. Actual planning by the respective national staffs would work its way through the JCS or BCS for coordination by the Combined Planners, the CCS planning staff, which was more a coordinating than an originating body. This system worked surprisingly well during the war, as the United States and Britain closely integrated their war efforts.

Commando Order (October 18, 1942)

Order issued by German leader Adolf Hitler to counter British commando raids. On October 18, 1942, Hitler issued order 003833/42g.Kdos.OWK/Wst, known historically as the Commando Order. In addition to this order, a directive from army headquarters (Number 551781/42G.K) stated that only commanders of units involved were to see the Commando Order. The order was issued in 12 copies only, and headquarters required that in no circumstances was it to fall into Allied hands and that both documents were to be destroyed immediately following their reading and comprehension.

Hitler claimed that the Allied commando raids were a violation of the Geneva Convention, and he ordered that “From now on all enemies on so-called commando missions in Europe or Africa challenged by German troops, even if they are in uniform, whether armed or unarmed, in battle or in flight, are to be slaughtered to the last man.” In his supplementary directive, he explained to his commanders the reason for the order. Because of Allied successes, Hitler noted,

> I have been compelled to issue strict orders for the destruction of enemy sabotage troops and to declare non-compliance with these orders severely punishable. … It must be made clear to the enemy that all sabotage troops will be exterminated, without exception, to the last man. … Under no circumstances can [they] expect to be treated according to the rule of the Geneva Convention. … If it should

> become necessary for reasons of interrogation to initially spare one man or two, then they are to be shot immediately after interrogation.

Despite Hitler's order, the Allies continued commando raids until the end of the war.

Commandos/Rangers

Commandos and rangers are specialized, highly skilled, elite troops. Rangers were often the first to fight and generally conducted raids and other specialized tasks, frequently in advance of an amphibious assault. But because of their training, commando troops were often employed in patrolling and sniping after a landing and, on occasion, served as bodyguards for prominent figures. All rangers and commandos were trained in infantry skills as well as close-quarter battle techniques. They were adept with rifles, knives, grenades, and blunt instruments. Their fitness was paramount, and they were conditioned through long training to make their way across many miles of terrain to reach their objectives. They were self-reliant, resourceful, and aggressive.

Britain formed its first commando units in southern England in June 1940, just after the evacuation of the British Expeditionary Force from France. A designated British commando unit was the equivalent of a battalion and consisted of 10 troops of 50 men each. On formation and during their initial training, the first commando troops were given a ration allowance and billeted in local houses, where they were responsible for their own discipline

and were made to rely on their initiative and self-motivation. In October 1940, Number 3 Commando, with a total of 475 officers and men, moved to the Combined Training Centre at Inverary in Scotland. Other commando units were also forming at the time.

The first British commando operation took place in March 1941 against German installations on the Lofoten Islands of Norway. Later, commandos raided South Vaagso, also in Norway; conducted operations against the Channel Islands; were landed by submarine off Sicily before Operation HUSKY (July 9–August 22, 1943); and carried out many other operations against German coastal installations. Commandos were again in the forefront of the landings in France in Normandy in June 1944, and they took on an infantry role as they advanced inland, despite the fact that commando troops were not line infantry but special forces. On June 6, 1944, commandos mounted an attack on the German artillery battery at Merville overlooking the invasion beaches; the battery was destroyed.

When the United States entered World War II, Brigadier General Lucian Truscott, U.S. Army liaison to the British General Staff, convinced army chief of staff General George C. Marshall of the need for an American commando unit. On May 26, 1942, the army authorized formation of the 1st Ranger Battalion, which was activated on June 19. During the war, the United States formed six ranger battalions. The first through fifth served in the North African and European theaters, whereas the sixth served in the Pacific.

For training, the U.S. 1st Ranger Battalion was sent to the British Army Command's Training Centre in Scotland. For several weeks, the American rangers were tested to their limits by the Commando Centre trainers. Eighty-five percent of those who began the course graduated.

On August 19, 1942, 50 American rangers were added to a British and Canadian commando raid on the French port city of Dieppe. Three rangers died and five were captured, but the Americans won high praise for their efforts. Rangers subsequently took part in raids on Norway while attached to British commando units. They also fought in Sicily and participated in the landings in Italy at Salerno (September 9, 1943) and Anzio (January 22, 1944). As raiding forces they were only lightly equipped, but they were subsequently employed as infantry troops nonetheless. The 1st and 3rd Battalions led the attack on Cisterna but were almost wiped out. The

remaining 4th Battalion took heavy casualties while trying to rescue the first two. Of 1,500 men in these three battalions, only 449 remained.

During the Allied invasion of France, three companies of the U.S. 2nd Ranger Battalion landed on the west flank of Omaha Beach and moved up to the village of Vierville-sur-Mer to secure the coastal road to Pointe du Hoc, destroying the German positions and radar station along the way. The other three companies, along with the 5th Ranger Battalion, landed with the 116th Infantry at the extreme end of Omaha Beach. The three companies of the 2nd Ranger Battalion received the important task of disabling a battery of six 155mm German coastal artillery pieces at Pointe du Hoc. These guns would be capable of hitting almost any Allied ship supporting the U.S. landing. The rangers successfully scaled the cliffs but found that the German artillery had already been removed. The rangers then pushed inland and sent out patrols to find them. First Sergeant Leonard Lommel led the patrol that found and destroyed the guns, along with all their stacked ammunition.

British commandos, having landed in Normandy on June 6, 1944, set out to capture a German artillery position. (Keystone/Getty Images)

A joint U.S.-Canadian brigade-sized unit, the 1st Special Service Force, known as “The Devil’s Brigade,” also took part in the Aleutian Islands Campaign (1942–1943), in the fighting in Italy, and in the August 1944 landings in southern France. In subsequent European fighting, rangers continued to lead the way and were some of the first units to counter the German Ardennes Offensive in December 1944. In 1945, ranger units established bridgeheads across the Rhine River into the heart of Germany.

Elite formations also served in the Pacific theater. During the Quebec Conference of August 1943, U.S. president Franklin D. Roosevelt and British prime minister Winston L. S. Churchill agreed to have a U.S. ground unit spearhead the Chinese Army with a long-range penetration mission behind Japanese lines in Burma. Its goal would be to destroy Japanese communications and supply lines and to play havoc with Japanese forces while an attempt was made to reopen the Burma Road.

A presidential call for volunteers for “a dangerous and hazardous mission” elicited some 2,900 volunteers. Officially designated as the 5307th Composite Unit (Provisional)—code-named GALAHAD—the unit later became popularly known as Merrill’s Marauders after its commander, Brigadier

General Frank Merrill. Organized into combat teams, two to each battalion, the Marauder volunteers came from various theaters of operation. Some came from stateside cadres, some came from the jungles of Panama and Trinidad, and the remainder were veterans of campaigns in Guadalcanal, New Georgia, and New Guinea. In India, some Signal Corps and Air Corps personnel were added in addition to pack troops with mules.

Following training, undertaken in great secrecy in the jungles of India, about 600 men were detached as a rear-echelon headquarters to remain in India to handle the soon to be vital airdrop link between the six Marauder combat teams (400 men to a team) and the Air Transport Command. In units designated by color-coded names—Red, White, Blue, Green, Orange, and Khaki—the remaining 2,400 Marauders began their march up the Ledo Road and over the outlying ranges of the Himalaya Mountains into Burma.

The Marauders, with no tanks or heavy artillery support, moved overland some 1,000 miles through extremely dense and almost impenetrable jungles and came out with glory. In 5 major and 30 minor engagements, they defeated units of the veteran Japanese 18th Division, the conquerors of Singapore and Malaya, who vastly outnumbered them. Moving in the rear of the main Japanese forces, they disrupted supply and communication lines and climaxed their operations with the capture of Myitkyina Airfield, the only all-weather airfield in Burma. The unit was consolidated with the 475th Infantry on August 10, 1944.

The 6th Ranger Battalion was activated at Port Moresby, New Guinea, in September 1944. Commanded by Colonel Henry “Hank” Mucci, it was the first American force to return to the Philippines. Its mission was to destroy Japanese coastal defense guns and radio and radar stations on the islands of Dinegat and Suluan off Leyte. Landing three days in advance of the main Sixth Army invasion force on October 17–18, 1944, the 6th Battalion swiftly killed or captured some of the Japanese defenders and destroyed all their communications. The unit took part in the U.S. landings on Luzon, and several behind-the-lines patrols, penetrations, and small unit raids served to prime the rangers for what was to become universally known as one of the most daring raids in U.S. military history.

On January 30, 1945, in the Cabanatuan raid—led in person by Colonel Mucci—C Company, supported by a platoon from F Company, struck 30 miles behind Japanese lines to rescue some 500 emaciated and sickly

prisoners of war, many of them survivors of the infamous Bataan Death March. The rangers, aided by Filipino guerrillas, killed more than 200 members of the Japanese garrison, evaded two Japanese regiments, and reached the safety of American lines the following day. Intelligence reports had indicated that the Japanese were planning to kill the prisoners as they withdrew toward Manila. Effective reconnaissance work by Filipino scouts contributed to the success of the raid.

Later commanded by Colonel Robert Garrett, the 6th Ranger Battalion played an important role in the capture of Manila and Appari. At the end of the war, it was preparing to take part in the invasion of Japan. The unit received the Presidential Unit Citation and the Philippine Presidential Citation. It was deactivated on December 30, 1945, in Kyoto, Japan. U.S. Army Rangers today draw their lineage from the six ranger battalions of World War II and from the 5307th Composite Unit. U.S. Army Special Forces today draw their lineage from the 1st Special Service Force.

Commerce Raiders, Surface, German

Germany entered World War II with a navy ill-equipped for waging war against a major naval power. The head of the German Navy, Grand Admiral Erich Raeder, supported by German leader Adolf Hitler, had planned to build

a powerful surface fleet of capital ships to challenge Britain and the United States for world naval mastery. War came too early for this Z Plan, however.

When the war began in September 1939, Raeder recognized that his navy was inadequate for the task ahead, stating that it "would be able to do little more than show that it could die courageously." Lacking the ability to challenge the British and French in a general engagement, the German Navy fell back on the experience of World War I as Raeder sought to wage a war to destroy British commerce. He recognized that surface raiders patrolling the oceans and sinking ships in an irregular manner could in no way serve as a distant blockade of Great Britain. Instead, he hoped they would force the dispersion of Allied naval forces from more important theaters and wear down a large part of the Allied naval strength through the need to escort convoys and form task groups to hunt down elusive raiders.

Raeder had sent the pocket battleships *Deutschland* and *Admiral Graf Spee* to sea in mid-August 1939. Valuable time was lost, however, as Hitler's reluctance to make the first hostile move against Britain meant that the ships were not authorized to begin operations until September 26. The two German capital ships initially met Raeder's expectations, sinking numerous merchant ships and, by October, forcing the Allies to employ a force of 3 carriers, 3 battleships, and 15 cruisers in task groups to hunt for—or to provide strengthened convoy escorts against—these two German ships. The threat did not last long, however, because Germany's strategic position prior to June 1940 precluded easy transit and resupply of the ships. In November 1939 the *Deutschland* returned to Germany, and the *Admiral Graf Spee* met its demise in the Río de la Plata in South America in December 1939.

In late 1940 and early 1941, the *Admiral Scheer* and *Admiral Hipper* made productive raiding sorties in which they accounted for 144,000 tons of shipping, while the *Scharnhorst* and *Gneisenau* had a highly successful two-month foray into the Atlantic in February and March, sinking 115,000 tons. The destruction of the battleship *Bismarck* in May 1941 near the beginning of another foray, however, led Hitler to restrict the use of his capital ships so that by 1943, they rarely ventured to sea.

Beginning in 1940, the Germans deployed another type of ship for commerce raiding, the armed merchant cruiser (AMC). They eventually fielded nine AMCs, known in German as *Hilfskreuzer* (auxiliary cruisers). Made to look innocuous, the AMCs were capable of rapidly changing their

profile to confuse prey and hunter alike; in essence, they were stealth ships. Freighters best served this purpose, because they possessed the holds needed to store supplies for long cruises and could mount six 150mm guns.

From 1940 through early 1943, the nine armed merchant raiders operated at sea, mainly in distant waters, where many unescorted Allied merchant vessels were still to be found. The German AMCs proved elusive, and by the end of 1940, they had sunk 54 Allied vessels totaling 366,644 tons; they also forced the British to devote a significant portion of their naval assets to the effort to hunt them down. As the war dragged on, though, Allied intercepts of German radio communications led to the sinking of four of the AMCs as well as some of their supply ships. The other five AMCs reached German-controlled ports but could not slip back out through the Allied blockade.

The German AMCs sank 846,321 tons of shipping, a major return for what was, after all, a relatively minor investment. This figure represented about 7.5 percent of the more than 11.3 million tons of shipping sunk by Germany in the war. The impact of the AMCs cannot be quantified by this statistic alone, however. These nine ships also disrupted shipping timetables, forced longer voyages, and delayed the arrival of desperately needed Allied war matériel. The capture of the British cargo ship *Automoden* by the AMC *Atlantis*, for instance, included the seizure of important British government papers and dealt a serious blow to Britain's position in the Far East.

A voyage that might normally have taken only two weeks may have extended into months because of a raider's activities. Beyond that, the secondary and tertiary effects, combined with the efforts to eliminate the AMCs, produced results well out of proportion to the time, money, and manpower that Germany put into the program. As in World War I, however, the German Navy could not take advantage of their impact, and by the spring of 1943, no more AMCs were at sea.

Commissar Order (June 6, 1941)

Order issued to the German Army by Adolf Hitler on June 6, 1941, 16 days before the start of Operation BARBAROSSA, the German invasion of the Soviet Union. In early March 1941, Hitler addressed his generals and informed them of what would later be known as the "Commissar Order" (*Kommissarbefehl*). It called on the German military to execute any captured Soviet commissars, the Communist Party officials assigned to military units. This order contravened all international conventions governing the treatment of prisoners of war. In remarks to his commanders, Hitler justified his order on the grounds that the commissars were "the bearers of ideologies directly opposed to National Socialism." He also said that German soldiers guilty of breaking international law would be "excused." Although some German generals, including Field Marshal Erich von Manstein, refused to obey the order, it was widely carried out.

Committee to Defend America by Aiding the Allies

The most prominent pro-Allied lobbying organization in the United States prior to American intervention in World War II. Established in May 1940 at the prompting of President Franklin D. Roosevelt, the Committee to Defend America by Aiding the Allies (CDAAA) was a private organization dedicated to assisting Britain and France by providing American support, both moral and material. The committee emerged from a 1939 lobbying group that had helped to bring about changes in American neutrality legislation, permitting Allied purchases in the United States. The CDAAA was headed by William Allen White, a prominent Kansas journalist. Its organizing committee included Clark Eichelberger, Frank Boudreau, Thomas W. Lamont, and Frederic R. Coudert. White requested 650 prominent Americans to join and form local committee chapters. Eventually, some 600 such groups existed nationwide, with their estimated membership totaling between 6,000 and 20,000 people.

Some CDAAA members favored outright intervention in the war. Publicly, however, the organization sought only to aid the Allies without going to war. Such a circumspect stance was made particularly politic in the bitterly fought 1940 presidential election, in which foreign affairs and peace were major issues. As interventionists became more prominent within the organization, White resigned in January 1941. In November, Eichelberger succeeded him.

Supposedly one step ahead of the Roosevelt administration, CDAAA leaders worked closely with pro-Allied officials, including Roosevelt, Secretary of War Henry Lewis Stimson, and Secretary of the Navy Frank Knox. Measures that CDAAA representatives proposed to the government—for example, increased American naval protection for convoys bound for Britain, enhanced material aid, and extended wartime protective zones—often actually originated within the administration. These tactics enabled the government to claim that it was responding to popular pressure. CDAAA officials also rallied popular and congressional support for government initiatives, including the 1940 Destroyers-for-Bases Agreement with Britain, the introduction of Selective Service conscription, and 1941’s Lend-Lease legislation. By mid-1941 with the election past, Roosevelt increasingly took

executive action on foreign issues, which decreased the CDAAA's significance.

After the December 7, 1941, Pearl Harbor attack, the CDAAA disbanded. Eichelberger and other CDAAA activists subsequently campaigned prominently for the creation of the United Nations.

COMPASS, Operation (December 7, 1940–February 7, 1941)

British campaign against Italian forces in North Africa. On September 13, 1940, three months after Italy entered World War II, Italian dictator Benito Mussolini ordered commander of Italian forces in Libya Marshal Rodolfo Graziani to invade Egypt with General Mario Berti's Tenth Army. Graziani's nine ill-equipped divisions of 250,000 men vastly outnumbered the 36,000 British, New Zealand, and Indian troops of Lieutenant General Richard O'Connor's Western Desert Force (WDF) in Egypt. But Graziani made no attempt to advance after crossing the Egyptian-Libyan border and instead settled in a chain of fortified camps around Sidi Barrani.

British commander in chief General Archibald Wavell conceived a plan to throw Graziani off balance while he dealt with the Italians in East Africa. Because of a shortage of transport in particular, Wavell envisaged not a sustained offensive but a swift large-scale raid lasting no more than five days.

Operation COMPASS began on December 7 with a two-day, 70-mile march by British forces across the desert. After passing through a gap between the Italian camps, Major General Noel Beresford-Peirse's Indian 4th Division stormed Nibeiwa camp from the rear, spearheaded by 50 Matilda infantry tanks of the 7th Royal Tank Regiment. The British surprised the Italian garrison and took 4,000 prisoners, almost without loss.

British forces also stormed Tummar East and West camps that same day and overran the camps around Sidi Barrani the next day. On the third day, Major General Michael Creagh's 7th Armoured Division—the famous Desert Rats—swept westward to the coast beyond Buq Buq and cut the Italian line of retreat. In three days, the British captured 40,000 Italian troops and 400 guns; the remnants of the Italian army took refuge in Bardia, the first town inside Libya, and were rapidly surrounded.

These astonishing results were unforeseen and caused immense problems. The Indian 4th Division was recalled for dispatch to Sudan, as previously planned, leading to the unusual spectacle of British troops withdrawing eastward just as the Italians fled west. The Australian 6th Division, commanded by Major General Iven Mackay, was transferred from Palestine, but the shortage of trucks and the need to feed and evacuate huge numbers of prisoners led to a three-week delay before the operation could be resumed. The ingenious development of field supply dumps in the desert alleviated the problems of transporting supplies across long distances, but the operation's success was only possible because of the capture of large numbers of Italian trucks.

Army Corps general Annibale "Electric Whiskers" Bergonzoli signaled to Mussolini that "In Bardia we are, and here we stay." The Australian infantry, supported by British battleship gunfire support, began the assault on January 3, 1941. After three days, the Italian garrison of 45,000 men surrendered, along with 462 guns and 129 tanks. The Matilda tanks, which were almost invulnerable to the Italian guns, were again the key to the rapid success, and the Australian commander claimed that each tank was worth an entire infantry battalion.

Even before the fighting concluded, the 7th Armoured Division drove west to encircle and isolate Tobruk, which was attacked on January 21. Although just 16 of the precious Matildas were still running, they once again

made the vital penetration, and the fortress fell the next day, yielding 30,000 Italian prisoners, 236 guns, and 87 tanks.

Tobruk's large port allowed supplies to be delivered by sea direct from Alexandria, and O'Connor intended to allow XIII Corps, as the WDF was known from January 1, 1941, to recuperate. On February 3, however, intelligence revealed that the Italians were preparing to abandon Cyrenaica and withdraw beyond the El Algheila bottleneck. O'Connor immediately planned a daring initiative and sent his depleted tank force from Mechili across almost 100 miles of the roughest country in North Africa in just 33 hours to cut off the fleeing Italians at Beda Fomm late on February 5. In a fitting climax, the minuscule British force of no more than 3,000 men and 39 cruiser tanks held off Italian attempts to break out until the morning of February 7 when, completely demoralized, 20,000 Italians surrendered, with 216 guns and 120 tanks.

In a scant 10 weeks, the Commonwealth force of two divisions advanced more than 700 miles and captured 130,000 Italian prisoners, more than 380 tanks, 845 guns, and well over 3,000 vehicles at the relatively slight cost of 500 killed, 1,373 wounded, and 55 missing. O'Connor's operations had far exceeded all expectations, but he was confident that he could continue his advance to Tripoli and completely clear Africa of all Italian forces. Historians have since argued that a golden opportunity to finish the war in Africa was wasted, but recent research has shown that without an operational port at Benghazi to maintain an advance, supply difficulties would have proven impossible. British prime minister Winston L. S. Churchill in any case already had directed Wavell to halt the advance at Benghazi in favor of the campaign in Greece and leave only a minimum force to hold Cyrenaica against the recently arrived German lieutenant general Erwin Rommel.

Concentration Camps, German (1933–1945)

Concentration camps are most often associated with Nazi Germany, but the modern concentration camp is generally thought to have originated with Spanish general Valeriano Weyler y Nicolau in 1896 during the Cuban insurrection against Spain. Weyler sought to concentrate the civilian population near army installations, isolating the *reconcentrados* from the guerrillas. In Cuba at that time—and also in the Philippines during the 1899–1902 Philippine-American War and in South Africa during the 1899–1902 Boer War—large numbers of civilians died in such camps as a consequence of overcrowding, disease, and inadequate supplies.

During World War II, Germany established a number of different types of concentration camps. They can be grouped as penal, transit, labor, or extermination centers. Most served more than one purpose; that is, they were typically both penal and labor. But all of the camps saw great brutality and loss of life, whether from disease, starvation, torture, exposure to the elements, forced labor, medical experiments, or outright execution. All major camps had subcamps that were sources of slave labor. Collectively, the camps numbered in the thousands.

The Nazis opened their first concentration camp at Dachau, near Munich, in March 1933, only two months after Adolf Hitler came to power. This camp was the model for the many others to follow. It operated continuously until April 1945, when the U.S. Army liberated the inmates. Originally intended for the temporary detention of political prisoners, the camps became permanent institutions manned by the Schutzstaffel (SS) Totenkopfverbände (Death’s Head detachments). In these camps, the more sadistic guards, of whom there was no shortage in the SS, were more or less free to inflict indescribable cruelties on the inmates without fear of disciplinary action. The camp system gradually evolved from penal camps to the infamous death mills of Auschwitz-Birkenau, Belzec, Chelmno, Maidanek, Sobibor, and Treblinka.

At first, the camps housed political enemies. Foremost were communists and social democrats. Jews were targeted insofar as they belonged to these other groups, but they were considered “spoilers of German blood” and eventually became the primary victims. In time, Gypsies, Jehovah’s Witnesses, homosexuals, and the mentally ill all fell prey to the Nazis and their collaborators. By 1939 seven large camps existed, with numerous subcamps. These seven large camps were Dachau, Sachsenhausen, Buchenwald, Neuengamme, Flossenbürg, Mauthausen, and Ravensbrück. As the war spread, forced labor became more and more a part of war production, and prisoner exploitation expanded. In the end, the camps stretched from the Pyrenees to Eastern Europe, and millions of people had perished in them. Some camps, notably Drancy in France and Westerbork in the Netherlands, were primarily transit facilities, where Jews were herded together for onward shipment via railroad to the dreadful death mills. No one will ever know just how much the people in the surrounding communities knew about the internal workings of the camps, but the Nazis had accomplices wherever camps existed.

There were penal, work, or transit camps in all countries occupied by or allied with Germany. In Western and Eastern Europe, including the Baltic states, indigenous troops augmented the SS in the camps. In Southern Europe, local forces operated their own camps or executed their victims rather than ship them to the death mills of Eastern Europe. One glaring case was the Jasenovac camp operated by the Nazi puppet state of Croatia. There, the Croatian fascists, the Ustaše, killed tens of thousands of Serbs, Jews, Gypsies, and political enemies.

All the camps were similar. In them, the guards did everything they could to strip every bit of human dignity from the inmates. Those who could do so were forced to work at hard manual labor up to 12 hours a day. Those who could not were encouraged to die. The sign over the camp gate reading “Arbeit macht Frei” (Work Brings Freedom) meant the work of slave labor and freedom only in the release of death.

On arrival at a concentration camp, men and women were segregated and taken off for “medical inspection.” There, they were forced to strip naked and were deloused. Heads were shorn, the hair retained to use for manufacturing mattresses and upholstering furniture. Following a cursory medical inspection, those pronounced fit to work were given clothes, had numbers

tattooed on their arms, and were assigned to barracks where they would exist until they became too weak to work any longer. Those judged unfit to work were taken off in another direction to be executed.

For those who passed the medical inspection, life in the camp was defined by deliberate degradation, with every effort expended to break them physically, mentally, and morally. Barracks were so overcrowded that there often was not enough room for everyone to lie down at once. Buckets were frequently the only sanitary facilities provided, and there were never enough of these. Barracks were unheated, and in many there was no cover provided, even in winter.

Inmates of the Ampfing concentration camp in Germany following their liberation by the U.S. Army. (Library of Congress)

At dawn each morning, men and women lined up in front of their respective barracks for *Zahlappell* (roll call), standing in their thin rags even

in winter. This dreaded roll call occurred at 3:00 a.m. and was repeated at 5:00 p.m. It lasted for hours each time, until the guards could make an official and complete count. Every form of disease was present in the camps, with little or no medical treatment provided. Nourishment was totally inadequate. Breakfast usually consisted of a cup of ersatz coffee and a small portion of stale or moldy bread. Lunch was typically a cup of poorly fortified soup, and dinner routinely consisted of a small serving of bread, perhaps some potatoes or cabbage, and putrid tea.

Punishment in the camps was frequent and brutal, and it often occurred without justification: it had to be especially horrific if it was to exceed the brutality of daily life in the camps. Regulations in some camps required that beating with an ax handle was to be restricted to 25 blows at a time and that a week had to pass before a second beating could be given, but the guards seem not to have paid much attention to such rules. Often, the inmates were assembled to witness punishments and executions, and prisoners were sometimes placed in solitary confinement in total darkness in cells where they could neither stand nor sit nor lie for days or weeks. At Buchenwald, Belsen, and elsewhere, bizarre medical experiments were carried out on unwilling victims, who, if they survived, were often maimed for life. Such experiments investigated, among other things, the effects of rapid compression and decompression, how much cold and exposure a person could stand before he or she died, and how best to revive a victim of freezing.

A number of German industries—such as I. G. Farben, the giant chemical firm that manufactured the Zyklon B gas employed in the death camps—were attracted to Auschwitz and other camps with the promise of cheap slave labor. At Auschwitz, Farben built an enormous factory to process synthetic oil and rubber in order to take advantage of the slave labor available. This facility was the largest plant in the entire I. G. Farben concern, and it was built largely by slave labor. Work was physically exhausting, and beatings for any breach of the rules were common. I. G. Farben claimed that it provided a “special diet” for its workers, which nonetheless resulted in a weight loss of six to nine pounds a week for the prisoners. Death usually came after three months. As an I. G. Farben physician’s report noted, “The prisoners were condemned to burn up their own body weight while working and, providing no infection occurred, finally died of exhaustion.” Slave labor became a

consumable raw material. At least 25,000 people were worked to death at I. G. Farben Auschwitz.

All inmates had to wear insignia (colored triangles) revealing the reason for their incarceration. There were variations, but typically, Jews wore two superimposed triangles that formed a yellow star. Common criminals wore green. Political prisoners had red. Persons considered asocial (e.g., Gypsies and vagrants) wore black. Homosexuals wore pink, and Jehovah's Witnesses wore purple.

Prisoners had to observe a definite hierarchy of prisoner officials as well as the SS guards. The average prisoner had to answer to fellow prisoners at work or in the barracks. The most despised fellow prisoner was the *Kapo*, typically a heavy-handed supervisor willing to beat prisoners for the slightest infraction. The prisoners' work assignments and records were in the hands of other prisoners known as scribes and elders. These prisoner officials could make an inmate's life miserable—or even end it. Likewise, they could make life somewhat easier, and it often behooved ordinary prisoners to make note of this situation. Prisoner officials received better treatment in exchange for their cooperation. But comforts were rare indeed for the victims of this brutal process. The Nazi concentration camp system took the lives of millions and was the principal instrument of the Holocaust.

Coningham, Sir Arthur “Mary” (1895–1948)

Royal Air Force (RAF) air marshal and pioneer in the use of tactical air support. Born in Brisbane, Australia, on January 19, 1895, Arthur Coningham served in the New Zealand Army in World War I until discharged for health reasons in April 1916. He then joined the British Royal Flying Corps and became a pilot, acquiring the nickname of “Mary,” derived from “Maori.” Following the war, Coningham remained in the newly formed Royal Air Force. He served in both Iraq and Egypt and taught at the RAF college, among other assignments.

At the beginning of World War II, Coningham was promoted to air commodore and given command of Number 4 Group, composed of long-range night-bombers based in Yorkshire. Coningham was convinced of the necessity of close air support, which he was able to demonstrate on his promotion in July 1941 to air vice marshal and assignment to North Africa as commander of the Western Desert Air Force. There he became one of the pioneers of tactical air support, which his units provided for the British Eighth Army on the ground. Coningham improved coordination between air and ground forces, and his aircraft played an important role in the British victory in the Battle of El Alamein (October 23–November 4, 1942). He was knighted in 1942 for his services.

Coningham was in charge of air support in other key Allied operations. He commanded the First Tactical Air Force during the invasion of Sicily (July 9–August 22, 1943) and subsequent action in Italy. Transferred to command of Second Allied Tactical Air Force in January 1944, he worked to plan air support for the Normandy Invasion that commenced on June 6. During the invasion and until the end of the war in Europe, he earned high praise from Allied ground commanders.

At the end of the war, Coningham commanded the RAF Flying Training Centre. Promoted to air marshal in 1946, he nonetheless was forced to retire in August 1947, having had little service with the air staff: he had spent his entire career as an active pilot. Coningham died on January 30, 1948, in a passenger plane crash in the Atlantic Ocean.

Connally, Thomas Terry (1877–1963)

Highly influential Democratic politician and a congressman (1917–1929) and senator (1929–1953) from Texas. Thomas Terry Connally was born in McLellan County, Texas, on August 19, 1877. He graduated from Baylor University in 1896 and earned a law degree at the University of Texas at Austin in 1898. That same year, he passed the bar and began the practice of law, first in Waco and then in Falls County. Connally served as a sergeant major during the Spanish-American War (1898) and as a captain during World War I (1918). He also became involved in local Democratic politics.

In 1916, Connally won a seat in the U.S. House of Representatives. He took office in 1917 and retained the seat until 1929. In Congress he immersed himself in foreign affairs and was a mouthpiece for Democratic foreign policy initiatives during the 1920s.

In 1928, Connally was elected to the U.S. Senate and was seated in 1929. He was an avid supporter of President Franklin Roosevelt’s New Deal, although he refused to support the president’s 1937 court-packing scheme. He reliably supported the Southern Democratic platform, which included opposition to the repeal of the poll tax and the implementation of an antilynching law. Despite his less than progressive stand on some domestic issues, Connally was a committed internationalist, and he was at the forefront of those senators who resisted the neutrality acts of the mid and late 1930s. In 1939, for example, he spearheaded the effort to repeal the arms embargo after

World War II had begun (Cash and Carry Act) and pushed aggressively for the implementation of the Lend-Lease Act in 1941.

In 1941, Connally became chairman of the powerful Committee on Foreign Relations, a post he held during 1941–1947 and again from 1949–1953. Connally firmly backed Roosevelt's foreign and military policies during the war and helped assemble a reliably bipartisan majority of internationalists in Congress. In 1943, he cosponsored legislation that extended the president's authority to seize munitions plants that were the subject of labor strikes. By the mid-1940s, Connally had become perhaps the most important U.S. senator.

In 1945, he was the vice chairman of the U.S. delegation to the United Nations (UN) Conference on International Organization, which drafted the UN Charter and commenced its operations. He also served as U.S. representative to the UN in 1946. Notably, Connally sponsored the so-called Connally Reservation, which slightly amended U.S. ratification of the UN Charter so that the International Court of Justice would have no power over domestic affairs in the United States.

In the late 1940s and early 1950s, Connally and Republican senator Arthur H. Vandenberg crafted a bipartisan approach to the building Cold War, and in 1949 Connally helped shepherd the North Atlantic Treaty Organization (NATO) Charter through the Senate. He supported President Harry S. Truman's decision to send troops to Korea in 1950 and gird the economy for a possibly wider war.

Connally did not run for reelection in 1952 and left the Senate in January 1953. Thereafter he practiced law in Washington, D.C. Connally died there on October 28, 1963.

Conolly, Richard Lansing (1892–1962)

U.S. Navy admiral. Born in Waukegan, Illinois, on April 26, 1892, Richard Lansing Conolly was commissioned in the navy on his graduation from the U.S. Naval Academy at Annapolis in 1914. He served in destroyers in the Atlantic, earning the Navy Cross for his part in rescuing a transport vessel damaged by a German submarine attack during World War I. Between the wars, Conolly earned a master of science degree at Columbia University, served as an instructor at the Naval Academy, and captained several destroyers.

From 1939 to 1942, Conolly served in the Pacific theater, successively commanding the 6th and 7th Destroyer Squadrons and providing the destroyer screen for the April 1942 raid on Tokyo. Promoted to rear admiral in July 1942, he spent several months on the staff of the chief of naval operations and commander in chief of the U.S. Fleet, Admiral Ernest J. King.

From March to October 1943, Conolly served with the Atlantic Fleet Amphibious Force and took part in the invasion of Sicily (July 9–August 22), where he earned the nickname “Close-in Conolly” for the naval fire support his ships provided the ground forces. On September 9, he commanded the amphibious component that landed the British 46th Division at Salerno, Italy. Again, he used his destroyers and cruisers to provide close gunfire support.

Conolly then transferred to the Pacific, employing his amphibious landing expertise in operations at Kwajalein (January 19–February 6, 1944), Wake, and Marcus Islands. In 1944 and 1945, he commanded Group 3 of the Pacific Fleet Amphibious Force, leading the July 21, 1944, landing on Guam and landings in January 1945 in the Lingayen Gulf (Leyte) and on Okinawa (March 1945). He participated in six of the seven largest amphibious operations of World War II, missing only Normandy (June 6, 1944).

Conolly was the U.S. naval representative at the 1946 Paris Peace Conference. Promoted to full admiral, he subsequently commanded the Twelfth Fleet for four months and then U.S. Naval Forces, Eastern Atlantic and Mediterranean Fleet, during 1947–1950. He then spent three years at Newport, Rhode Island, as president of the Naval War College. Conolly retired in November 1953 to become president of Long Island University,

where he remained until he and his wife were killed in a commercial air crash at La Guardia Airport in New York on March 1, 1962.

Conscientious Objectors

Individuals who seek exemption from military service based on matters of conscience; in this regard, conscientious objectors (COs) differ from draft dodgers, who merely seek to avoid military service. The first COs were members of small Protestant religious denominations, notably the Mennonites. Although their members were not forced to bear arms, even by Germany and Russia, such groups were generally taxed or required to perform alternative service. During World War I, a number of the democratic nations made provisions for conscientious objection. In Britain, preference was accorded on religious grounds, but CO status was also extended to those who opposed the war on political and ethical grounds. This generous government view was, however, often tempered by local boards, which chose to interpret the law more narrowly.

Perhaps surprisingly given the rampant pacifism of the 1920s that followed the great bloodletting of World War I, COs were too few in number in World War II to have any impact on the war effort of their respective countries. The Axis states refused to recognize CO status, as did the Soviet

Union and many other warring states. CO status was most honored in North America, Australia, New Zealand, the United Kingdom, the Netherlands, and the Scandinavian states.

In the United Kingdom during World War II, CO status was granted on a fairer basis than it had been in World War I. Unconditional exemptions were granted to 6.1 percent of COs there, and alternate service was allowed in civilian jobs. Fewer than 10 percent of British COs were jailed, compared to 33 percent in World War I. The United Kingdom had 60,000 COs, or 1.2 percent of the number drafted, compared with 0.125 percent in World War I.

The United States also widened its interpretation of CO status in World War II. At the time Congress was about to vote on the Selective Service Act in 1940, there was uncertainty about how the draft would treat men who wanted to be exempted from military service on grounds of conscientious objection. A third of all Americans had indicated in polls that they favored either jailing COs or forcing them to fight in combat units, but Congress instead adopted a plan conceived by religious groups and known as Civilian Public Service (CPS).

The exact details of the CPS program were not worked out until early 1942, but it put COs to work on a variety of domestic tasks. Representatives of the Society of Friends (Quakers), the Brethren, and the Mennonites supervised those in CPS, and the costs of the program were paid by these three church organizations at the rate of $35 per month for each CO. CPS members sometimes received a few dollars a month for expenses from church groups but were otherwise not paid. Those seeking to obtain CO status had to file a special document, Form 47, along with their draft information. Local draft boards could and often did reject these requests, but an appeals procedure existed for such cases.

In all, about 37,000 American men obtained CO status. Most were Quakers, Mennonites, and Brethren. There were also Jehovah’s Witnesses, socialists, communists, and others who professed pacifism. An additional 6,000 men who either did not receive CO status or turned it down were prosecuted for refusing to be inducted into the military and served some time in prison.

In many parts of the country, COs took up tasks that previously were assigned to members of the New Deal’s Civilian Conservation Corps (CCC), such as reforestation, road and park building, and repairing drought damage.

Other COs performed excellent service in mental hospitals. A few volunteered as guinea pigs for medical research, and some valuable advances in battling malaria and other tropical diseases came from these experiments. Although Major General Louis Hershey, head of the Selective Service, testified before Congress that, overall, COs were making valuable contributions in the nation, they generally were not welcome in most localities.

Conscientious objectors at work in Wyeth, Oregon, during World War II. (Bettmann/Corbis)

Some COs did enter the military and served overseas in noncombat roles, including the dangerous job of combat medic. Among them was Desmond Doss, a CO who declined a chance to be in the CPS program and entered the U.S. Army as a medic. Private First Class Doss landed on Okinawa with the 77th Infantry Division. There on May 2, 1945, he pulled as many as 70 wounded soldiers off an escarpment while under heavy fire, for which he was awarded the Medal of Honor.

After the war ended, COs returned to civilian life, and their wartime status was generally forgotten. The CPS program, however, served as the model for subsequent objector programs during the Korean War and the Vietnam War.

Conscript Labor

The practice of forcing captive people to provide labor was widespread during World War II. The Axis powers utilized forced labor on a scale that dwarfed in size and severity that employed by the Allies. German practices and policies are the most extensively documented. Ironically, Germany complained forcefully about Soviet labor practices regarding prisoners of war (POWs).

Among other things, Moscow was accused of not adhering to the 1929 Geneva Convention, an international accord that detailed the requirements for fair and humane treatment of war prisoners. No doubt the Soviets were guilty of brutal and exploitative behavior; however (and with further irony), Soviet armies had been formally ordered to respect the convention, and Stalin's government had, through Sweden's good offices, requested that Germany do the same. Despite their protestations over Soviet policies, moreover, the Germans shot, starved, and worked to death millions of Soviet POWs after June 1941. In May 1944, a German government report indicated that of 5,160,000 POWs from the Soviet Union, only slightly more than 1 million survived. At the time, there were approximately 5 million conscripted foreign workers in Germany.

As war losses and production pressures grew, Germany increasingly turned to forced labor to address these problems. The Nazi occupation regime in Poland under Schutzstaffel (SS) Obergruppenführer Hans Frank provided the model for the rest of the Reich. Frank had virtually absolute powers, although his formal title was head of government and not head of state. Decrees and rules made Jews and all other Poles subject to arbitrary conscription for work.

Such policies were subsequently copied in the Baltic states and occupied Soviet territory. Masses of people were rounded up and sent to Germany as laborers, regardless of age or state of health. The indiscriminate approach quickly created new problems. By 1942, an estimated 100,000 such conscripts had been sent back home because they were too old or sick to be useful as labor. The trains used for this transport, as with the Jews in the Holocaust, diverted scant transportation assets from strictly military use.

The response by the regime in Berlin was to increase the comprehensiveness and severity of the conscription process. By the end of the war, the minimum age for laborers had been reduced to 10 years. As Germany began to suffer military reversals in the Soviet Union, pressures grew for additional manpower for the front, and this soon created direct competition with the military.

In the autumn of 1942, SS chief Heinrich Himmler reached an agreement with Minister of Justice Otto Thierack and Minister of Armaments Albert Speer whereby concentration camp inmates and POWs would be released for factory work in return for allocation of an agreed percentage of their output of weapons to the SS. This agreement provided explicitly that any person identified by the Nazi regime as “asocial” could be worked to death.

In March 1942, stricter and more detailed controls were added to the forced labor program. Fritz Sauckel was appointed plenipotentiary for the deployment of labor, with great power over German and foreign workers. The geographic reach of the program was extended, with forced conscription now used in Western and Southeastern Europe as well as in the east. In the Soviet Union, however, skilled workers tended to withdraw with the Red Army forces rather than wait for the occupiers. In Western Europe, existing factories were already supplying the German war effort.

German policies reflected not the implementation of any detailed plan but the increasing pressures of the war. By May 1943, Sauckel’s sustained and brutal approach had yielded approximately 2 million additional foreign workers, and the total labor force employed in Germany had been increased by just under 2 million, despite growing military manpower pressures at the fighting fronts. Clearly the expansion rate could not be maintained. By that time, Poland effectively had been drained of useful labor. Southeastern Europe had a large population, but a significant percentage of the people

there were needed for existing agricultural industry, which was, in turn, vital to feeding the populations in Germany and the other occupied territories.

Such pressures only mounted over time. By 1943, Soviet military offensives had reduced the number of workers available to the Reich. West European production facilities were becoming even more important as the Allied bombing effort took a toll on German factories. In desperation, German authorities began to bypass local governments and other established authorities in the drive to find laborers for the war production machinery. In a telling example, 1,000 French police in Marseille were forced into transport vans while they were out on a practice exercise.

Yet there was never a truly comprehensive recruitment of available workers, as ideology vetoed some ready and skilled conscription, most notably the Jews. Still, all occupied states were required to send laborers to work in the Reich, often in horrific conditions. France alone sent 2.5 million of its citizens to work in Germany, and 200,000 did not return home after the war.

The Nazis initially failed to make use of one ready labor source—women. Nazi doctrine dictated that a woman's place was in the home, focused on reproduction. In 1942, despite extensive military engagements in the Soviet Union and North Africa, 189,000 fewer women were employed in the German workforce than in 1939. As early as 1942, Speer had recommended that women be recruited for industry, but Adolf Hitler would have none of it. Not until 1943 were women between the ages of 17 and 45 required to register for work. Later, the upper age was raised to 50. By 1944, German women actually outnumbered men in the labor force.

Conscript workers ultimately provided a large component of the overall German workforce during the war. The total by 1944 had reached approximately 7 million people. They accounted for roughly one-fifth of the entire workforce during World War II in Germany.

Meanwhile, in the Pacific theater, Japanese approaches to forced labor approximately reflected the harshness of Germany. The population of Korea, which had been formally under Japanese control since 1907, endured particularly harsh treatment. Koreans were conscripted wholesale, the men for particularly grueling and unpleasant physical labor, the women often forced into prostitution for the Japanese military. In this particular case, Tokyo seems to have made special efforts to employ conscripted labor as a

means to degrade an old national opponent. In China and in Asia generally, Japan carried out brutal labor policies, along with widespread atrocities. Japanese behavior in China and elsewhere generally mirrored Nazi excesses throughout Europe, though unlike the Germans, the Japanese did not have a compulsion to provide detailed documentary records.

The Allies made plans to deal with the problem of refugees, including forced laborers, after the war. In November 1943, representatives of 45 nations, the United States among them, established the United Nations Relief and Rehabilitation Administration (UNRRA) as the official agency to handle the situation. At the time, estimates of the likely number of refugees at the conclusion of the war ranged up to 21 million. After the German surrender in May 1945, a range of structures, including former concentration camps and military barracks, were used for a comprehensive relief effort that continued until 1947. On July 1 of that year, the Provisional Committee of the International Refugee Organization (IRO) took over responsibility from the UNRRA for approximately 700,000 people remaining in its care.

Following the war, the newly formed United Nations gave sustained attention to defining and implementing standards for humane treatment of war prisoners and labor. This directly reflected the horrific legacy of World War II.

Continuation War

See Finnish-Soviet War, Second

Contre-Torpilleurs

French warships, a new superdestroyer type inspired by the large destroyers built toward the end of World War I by the navies of Germany, Italy, and Britain. After the war, the French saw the Italians as their principal naval rival, and to counter the large Italian destroyers, in 1923 the French launched the first of a new class of ships, the six contre-torpilleurs of the Chacal class. These vessels were optimized for high-speed gunnery engagements in the Mediterranean, and French naval planners envisioned them acting as high-capacity scouts that could collect information about an enemy fleet while effectively screening their own battle line. Whereas most World War I destroyers were on the order of 1,000 tons' displacement, the Chacal-class vessels displaced 2,400–2,500 tons normal load and 2,950–3,050 tons deep load. They were 415 feet 11 inches in overall length and 37 feet 2 inches in beam. They had a main armament of five 130mm (5.1-inch) guns and carried six 21.7-inch torpedo tubes. They were capable of 35 knots.

The Chacal-class ships were followed during 1928–1931 by the Guépard, Aigle, and Vauquelin classes. These 6-ship classes displaced some 2,400 tons standard load and 3,200 tons deep load and had a main armament of five 138mm (5.5-inch) guns and six to seven torpedo tubes. They were capable of 36 knots. All 18 had four funnels, a unique feature among post–World War I constructed destroyers.

The six ships of the two-funnel Le Fantasque class of 1933 to 1934 were 2,569 tons standard load displacement and 3,200–3,400 tons full load. They were 434 feet 4 inches in overall length and 40 feet 6 inches in beam. They mounted a main armament of five 5.5-inch guns and carried nine 21.7-inch torpedo tubes. These were followed by the two-ship Mogador class, launched in 1936 and 1937. They were 2,884 tons standard load displacement and 4,018 tons full load. At 45l feet 1 inch in overall length and 41 feet 7 inches in beam, they were capable of 39 knots. They mounted eight 5.5-inch guns in four twin turrets. This last class carried 10 torpedo tubes.

All contre-torpilleurs also mounted antiaircraft guns, the number of which was steadily increased. The contre-torpilleurs were attractive ships, marked by fine lines. They were the largest, fastest, and most heavily armed destroyers in the world prior to World War II.

During the war, the contre-torpilleurs saw more action than any other class of large French warships. They served with the Force de Raid and participated in actions against the Italians before the armistice of June 1940. A squadron successfully fought its way out of Mers-el-Kébir during the British attack there of July 3, 1940, and a division of contre-torpilleurs defeated a British squadron in the Battle of Sidon off the coast of Syria on June 9, 1941. These ships also participated in the Battle of Dakar (September 23–25, 1940) and in the Battle of Casablanca against the U.S. Navy on November 9, 1942.

Four of the Le Fantasque–class ships served with the Allies from 1943 through the end of the war. Their high speed and heavy armament made them very useful especially for intruder missions as on February 29, 1944, when *Le Terrible* and *Le Malin* sailed up the Adriatic Sea and destroyed a German convoy. They continued in service until the mid-1950s. Because of their size and armament, the Allies designated them as light cruisers. Only six of the contre-torpilleurs survived the war.

Convoy HG-76 Battle off Portugal (December 14–23, 1941)

On December 14, 1941, Abwehr agents at Gibraltar reported the departure from there of British convoy HG-76. The Kriegsmarine's B-Dienst (naval code-breaking service) had detected the shipping concentration from intercepted communications and alerted the Naval Operations Center (Seekriegsleitung, SKL). B-Dienst decrypts indicated that the convoy was westbound. U-boat command in Berlin notified the Luftwaffe's Fliegerfuhrer Atlantik (Air Commander, Atlantic) and ordered the assembly of a seven-U-boat wolf pack, designated Seeräuber (Pirate). Kampfgeschwader 40 (Bomber Wing 40) launching reconnaissance flights on December 15. *U-74* was the first to sight HG-76, just before midnight on December 14, but *U-77* was the only U-boat to conduct an attack, sinking a 4,970-ton merchantman.

Convoy HG-76's 32 merchant ships had a powerful escort of 13 warships and Britain's first escort carrier, the *Audacity*. More important, Britain had successfully broken the Kriegsmarine's and Luftwaffe's codes and warned the convoy's escort of German intentions. Convoy HG-76 turned southward toward Morocco before dawn on December 15, avoiding KG-40's reconnaissance flights while the *Audacity*'s aircraft drove the U-boats underwater. B-Dienst intercepted and decrypted the convoy's course change instructions, however, enabling German U-boat commander Rear Admiral Karl Dönitz to reposition his wolf pack and the Luftwaffe to support them. With both countries' code breakers at the height of their game, the resulting seven-day engagement off Portugal became a battle of attrition.

KG-40 located the convoy on December 16, but the *Audacity*'s aircraft drove off three U-boats and forced another, *U-131*, to scuttle. *U-434* was sunk two days later, and KG-40 lost two Fw-200 reconnaissance aircraft to *Audacity*'s fighters. Two more U-boats were sunk during the evening of December 18 after sinking only one merchant ship. With B-Dienst reporting virtually all of the convoy's sailing directions, Dönitz rushed every available U-boat within intercept range toward it. However, the *Audacity*'s aircraft prevented KG-40 from continuously tracking the convoy. They also patrolled ahead of the convoy, attacking and forcing the U-boats to dive, all but preventing them from shadowing the convoy or concentrating against it.

Five more U-boats entered the fray on December 20 and managed to sink another merchantman as well as the *Audacity* by December 22, at the cost of *U-567*. The escort successfully drove off the other U-boats and 2 more that intercepted the convoy on December 23, the last day of the battle. All told,

the Seeräuber wolf pack had committed 12 U-boats, losing 5 and sinking 2 merchant ships, an antisubmarine corvette, and the *Audacity.* The battle was a personal victory for escort commander Captain Frederick Walker, who went on to become the Royal Navy's most successful escort commander.

The Convoy HG-76 battle marked the first time Germany's U-boat losses exceeded the number of merchant ships sunk. Strategically the battle had no impact, but operationally it validated Walker's tactics. Also, Britain's code breakers began to suspect that Germany was reading the Merchant Navy Code and initiated an investigation that led to its replacement in April 1942. The convoy's constant rerouting and escort positioning also made Dönitz suspect correctly that the British were reading his signals, and he ordered his codes and systems changed over the objections of Germany's communications experts. He also ordered the development of radar warning systems to enable his U-boats to dive before Allied aircraft could bomb them. These expedients temporarily blinded British code breakers through most of 1942 and gave the U-boats a reprieve from air attacks, but the Allies made adjustments. The HG-76 battle may not have changed the tide in the Atlantic but did signal its coming.

Convoy PQ 13, Attack on (March 29, 1942)

Allied Convoy PQ 13, consisting of 19 merchantmen bound for Murmansk and sailing from Reykjavik, Iceland, on March 20, 1942. On March 24, a violent gale blew up, and by March 27 when the weather moderated, PQ 13 was completely scattered. The German Naval Group North regarded it as a perfect target for surface units based in northern Norway.

On March 28, the 8th Destroyer Flotilla of *Z26* (commanded by Captain Gottfried Pönitz), *Z24*, and *Z25* left Kirkenes and headed north through calm seas. At 1:43 a.m. on March 29, they sank a straggler, the Soviet freighter *Bateau.* Thereafter the weather deteriorated, with snow showers and wind increasing to 25 knots.

Meanwhile, the escorts had collected eight merchantmen in one group, and a Soviet destroyer flotilla out of Murmansk consisting of the *Sokrushitelni* and the *Gremyashchi* and the British *Oribi* had reinforced the close escort of the destroyer *Eclipse* and the trawler *Paynter.* The light cruiser *Trinidad* sailed three miles off the convoy's starboard bow while the destroyer *Fury* guarded the rear approaches.

At 9:46 a.m., the German flotilla unexpectedly encountered the cruiser *Trinidad* looming out of the snow, the radar of which had provided some forewarning; its initial salvo fell short, but the cruiser's next broadside hit the *Z26*, disabling an engine and two gun mounts and igniting a large fire.

After five salvos, the *Trinidad* turned to the *Z25.* In reply, the German destroyers landed two shells on their adversary, causing light damage, then fired torpedoes and turned north. The *Trinidad* dodged this barrage and circled to pursue. At 9:56 a.m., radar detected the *Z26.* The German flagship had become separated from its flotilla and had no support as the cruiser followed its black smoke. The cruiser closed to point-blank range and inflicted heavy damage on the German ship. At 10:22 a.m., the *Trinidad* launched three torpedoes to finish the job, but two failed to deploy and the third malfunctioned. The intense cold had solidified the weapon's engine oil, and it circled back and exploded against the cruiser, causing serious damage.

The *Z26*, which could still maneuver, used the reprieve to escape, and when a destroyer appeared from the muck, it flashed its call sign, assuming that the newcomer was friendly. However, it was the *Eclipse.* Trailing oil and faced with British radar, the *Z26* was unable to break contact, and the British destroyer registered repeated hits on its crippled adversary. By 11:20 a.m. the *Z26* was dead in the water, and the *Eclipse* closed for the kill.

Then the snow stopped and visibility cleared, revealing the *Z24* and *Z25* steaming to assist. They drove off the *Eclipse*, seriously damaging it. It was too late for the *Z26*, which slowly foundered. The *Z24* and *Z25* returned to Kirkenes, while the *Trinidad* limped into Murmansk. The convoy had

escaped the surface threat, but U-boats and aircraft took a toll. Of the 19 ships that left Reykjavik, 14 arrived at their destination.

Convoy PQ 17 (June 27–July 7, 1942)

Disastrous Allied Arctic convoy to Murmansk in the Soviet Union. From August 1941 through May 1945, the Western Allies had sent some 4 million tons of supplies to the northern Soviet Union via the Arctic. A total of 811 ships in convoy sailed east, of which 58 were sunk.

A large percentage of these losses occurred in one convoy, PQ 17. It sailed from Iceland on June 27, 1942, with 36 merchantmen protected by 4 corvettes, 2 antiaircraft ships, and 4 antisubmarine trawlers. At the same time, eastbound convoy QP 13, made up of 35 merchantmen, sailed from Kola Inlet. British rear admiral Louis Henry Keppel Hamilton commanded a covering force to protect both convoys, consisting of 2 British and 2 U.S. heavy cruisers plus 1 British and 2 U.S. destroyers. En route, British commander Jack Egerton Broome joined them with six destroyers. Distant cover was provided by the Home Fleet under Admiral Sir John Tovey. He commanded a mixed British and U.S. force consisting of 2 battleships, 1 aircraft carrier, 2 cruisers, and 14 destroyers.

Tovey was under strict orders to steer clear of the German airfields in northern Norway, where the Luftwaffe had massed 103 bombers, 42 torpedo bombers, 20 dive-bombers, and 89 reconnaissance aircraft to block any convoy passage. The Germans also had 10 U-boats on station, so their tactical reconnaissance advantage was formidable. The Allies hoped to trump this with strategic intelligence gleaned through Ultra decrypts; however, a change in German Enigma cipher settings on July 3 led to an intelligence

blackout. Political pressure from Washington and Moscow compelled leaders to insist that the convoy proceed nonetheless, and it sailed blindly into a German trap.

British first sea lord and admiral of the fleet Sir Dudley Pound agonized over the choices of action. He could not recall the convoy, and he could not allow the Home Fleet to close with it and risk an overwhelming German air and submarine attack. Allied intelligence assumed that German surface units in Norway would attack as well. These forces consisted of the battleship *Tirpitz*, the pocket battleships *Scheer* and *Lützow*, the heavy cruiser *Hipper*, 10 fleet destroyers, and 2 oceangoing torpedo boats.

Even before PQ 17 sailed, Pound informed Tovey that if he believed that a German surface attack was imminent, he would order the convoy to scatter. Tovey pointed out in no uncertain terms that this was contrary to all recent British experience. In any case, at 9:00 p.m. on July 4, Pound, incorrectly assuming that the Germans' big ships were on their way to intercept the convoy and would reach it early the next day, began sending signals ordering PQ 17 to scatter and for its cruisers and fleet destroyers to withdraw toward the Home Fleet because they were too weak to face the German squadron that he believed to be at sea. Although scattering was the logical precaution when a convoy was under surface attack, it was a suicidal move against aircraft and submarines. When the order to scatter was received, it had covered more than half of its route with the loss of only three ships. Now the ships were widely spread, devoid of mutual protection and escorts.

The Germans took advantage. Of the 34 merchant ships still with the convoy when the order to scatter was given, only 13 reached Murmansk. The Allies had suffered one of their worst maritime defeats of the war; the tragedy was that it need not have happened. Convoys to Murmansk were then suspended for the summer, as perpetual Arctic daylight and German strength made them untenable.

Convoy PQ-18, Battle of (September 12–21, 1942)

In late August 1942, the Kriegsmarine's B-Dienst intelligence service detected a concentration of ships and shipping off northern Scotland. This was Allied Convoy PQ-18, which departed Loch Ewe for Murmansk on September 2, 1942. Reconnaissance flights from Luftflotte 5 commenced monitoring its movements two days later. Departing just weeks after PQ-17 had lost 23 ships, PQ-18 was heavily protected. Its 40 merchant ships had a close escort of 10 destroyers, 2 antiaircraft ships, 4 antisubmarine corvettes, 9 antisubmarine trawlers, and 3 minesweepers. They were supported by another 47 warships, including 2 battleships, the escort carrier *Avenger* with 15 aircraft, 8 cruisers, and 20 destroyers. Air and submarines patrols were positioned off Germany's Norwegian operating bases to warn of warship and U-boat sorties. Three Royal Air Force Coastal Command squadrons were in direct support, giving the convoy a total escort of 76 warships and nearly 52 aircraft, a formidable force that, combined with September's cloudy weather, challenged any response from General Admiral Hermann Boehm, heading Marineoberkommando Norwegen, the Norwegian Navy high command.

Although Boehm had 26 U-boats and 4 major warships at his disposal and enjoyed good relations with Luftflotte 5 commander Colonel General Hans-Jürgen Stumpff, poor weather and the *Avenger*'s air wing interfered with his efforts to track and attack the convoy. The battleship *Tirpitz* was undergoing a machinery overhaul in Trondheim and was unavailable. Boehm therefore moved the pocket battleship *Admiral Scheer*, the heavy cruiser *Admiral Hipper*, the light cruiser *Köln*, and six destroyers to Altenfjord, intending to commit them against PQ-18.

The British submarine *Tigris* attacked Boehm's ships as they transited up the Norwegian coast. Although the German warships suffered no damage, the

British were not alerted to their movement, while Boehm lacked information on the location of the British battleships. The *Tigris*'s attack convinced Boehm not to risk the surface ships, and he kept them out of the ensuing action.

The Germans initiated the battle on September 12 with an air strike as their U-boats moved to intercept. During the next eight days, Luftflotte 5's Kampfgeschwader 26 (Bombardment Wing 26) flew 337 sorties against the convoy, scoring 84 torpedo hits. The fiercest fighting took place on September 13 as the convoy passed between Spitzbergen and Bear Island. U-boat and Luftwaffe attacks claimed 11 ships and 5 aircraft. But events turned against the Germans the following day, when they lost the *U-457*, two seaplanes, and a dozen bombers while sinking only one ship. Clouds, high winds, and fog restricted Luftwaffe operations, and the convoy's powerful escort challenged the U-boats. Boehm's forces sank only one more merchant ship, at the cost of another U-boat lost before the convoy arrived in Archangel on September 21.

PQ-18 marked a turning point in the Russian convoy battles. Tactically, it proved the value of the escort carrier as both an antisubmarine and air defense platform, for which Germany had no effective counter. Operationally, PQ-18 proved that the Royal Navy had learned from the PQ-17 disaster. Convoy losses now continued to drop, and tonnage delivered rose. Strategically, the battle further undermined German chancellor Adolf Hitler's faith in his surface ships and demonstrated the Western Allies' resolve and capability to support their Soviet ally.

Convoy QP 11, Attack on (May 1–2, 1942)

Allied Convoy QP 11, with 13 ships, sailed from Murmansk at the end of April 1942. Two days out of port, the *U-456* ambushed the convoy's largest escort, the *Edinburgh*, destroying that light cruiser's stern abaft Y turret. Within hours, Germany's Naval Group North ordered Destroyer Group Arctic, the *Z7, Z24*, and *Z25* under Captain Alfred Schulze-Hinrichs, to strike QP 11 and then double back to sink the cruiser, which was being towed toward Murmansk.

On May 1, Schulze-Hinrichs found the convoy hugging the pack ice southeast of Bear Island with an escort of four old destroyers, the *Bulldog, Beagle, Amazon*, and *Beverley;* the corvettes *Oxlip, Saxafrage, Campanula*, and *Snowflake;* and the armed trawler *Lord Middleton.* It was cold with intermittent visibility amid snow flurries and showers.

At 2:05 p.m. the *Z7* opened fire, whereupon the *Amazon, Beverley*, and *Beagle* formed up behind the *Bulldog* and came between the German destroyers and their target. In an exchange of gunfire from 10,000 yards, the *Amazon* was hit twice and severely damaged. Fearing torpedoes, the Germans did not press this advantage. At 2:30 p.m., they tried a long-range torpedo attack that sank the Soviet freighter *Tsiolkovski*, while a British torpedo salvo missed. Schulze-Hinrichs probed the escort four more times, hoping to catch it out of position or sneak up behind a snowstorm. Each time the British destroyers, feinting torpedo attacks, skillfully weaving smoke screens, and maintaining an intense counterfire, drove off the larger German warships. Finally, at 5:50 p.m. Schulze-Hinrichs disengaged to go after the British cruiser. The *Amazon* was the only warship significantly damaged during this prolonged engagement.

The *Edinburgh* was 250 miles east, limping toward Murmansk at 2 knots, escorted by the destroyers *Foresight* and *Forester*, the Soviet guard ship *Rubin*, and four British minesweepers, the *Hussar*, *Harrier, Gossamer*, and *Niger.* Rushing toward the distant enemy at 35 knots, Schulze-Hinrichs planned to attack with torpedoes from the north with the advantages of light and wind. With the *Edinburgh* unable to maneuver, this plan seemed to guarantee success.

Weather in the Arctic is unpredictable, however. At 6:17 a.m. on May 2, the *Z7* sighted the *Edinburgh* eight miles distant. As the Germans

approached, the cruiser cast off its towlines and, unable to maneuver, began steaming in a circle at eight knots, its best speed. At 6:34 a.m., Schulze-Hinrichs ordered his ships to turn and fire a concentrated torpedo salvo, but a snow shower descended between the *Z7* and the other destroyers, masking their target and leaving the German flagship to conduct the attack alone.

As crewmen on the *Z7* aimed its tubes, the *Edinburgh* circled. The cruiser had no power to train its turrets, but when the destroyer crossed its line of fire, the B turret opened up. Its second salvo landed two rounds that disabled the *Z7*'s engines. The destroyer dropped smoke floats and drifted to a stop.

The *Foresight* and *Forester* then attacked the *Z7*, inflicting additional serious damage. The *Z7* could only reply with single shots over open sights, and although it launched four torpedoes, all missed.

At 6:45 a.m., the *Z24* and *Z25* found their flagship and counterattacked. The *Z25* disabled the *Forester*, hitting it five times in the space of five minutes and leaving the British ship dead in the water. The *Z25* fired four torpedoes to finish the job as the *Foresight* rushed to the *Forester*'s aid. The *Z25* severely damaged the *Foresight* as well, however, and forced it to fall back on the *Edinburgh.* The *Forester* restored some power and slowly followed, hitting the *Z25* once. Then one of the *Z25*'s torpedoes, which had been fired some minutes before, hit the *Edinburgh*, and the explosion nearly broke the cruiser in two.

The minesweepers had kept their distance during the action, but the flashes from their 4-inch guns gave a false impression of strength, and this caused the two operational German destroyers to disengage. At 8:15 a.m., the *Z24* rescued most of the *Z7*'s men after they scuttled the wreck. The two surviving German warships then returned to Norway. Schulze-Hinrichs had led a successful sortie, credited with sinking a cruiser (the *Edinburgh* was scuttled due to damage) and a merchant ship and inflicting heavy damage on three destroyers at the cost of one of his own.

Convoys, Allied

Convoys are organized groups of merchant vessels escorted by warships to defend against Axis attack. As a result of its experience in the latter stages of World War I, Britain was quick to convoy merchant vessels at the beginning of World War II. There was some initial hesitation because of the feared detrimental effect that convoys could have on the efficient employment of shipping, but that changed after the liner *Athena* was torpedoed and sunk on September 3, 1939, indicating that Germany had commenced an unrestricted campaign of submarine warfare against merchant vessels. The first convoy—eight tankers sailing from Gibraltar to the Persian Gulf via the Cape of Good Hope—actually departed on September 2 with a cruiser escort for fear of a possible Italian entry into the war. Regular east coast convoys between the Firth of Forth and the River Thames began on September 6, as did outbound transatlantic convoys from Liverpool two days later.

Operational convoys were set up to cover the movement of merchant vessels chartered by the government to transport and supply the British Expeditionary Force across the English Channel. Subsequent convoys carried troops to Norway and supported operations in North Africa, the Mediterranean, the Middle East, the Far East, and all the other theaters of operations.

A special category of convoys included the series that carried cargo and war matériel to the Soviet Union and the smaller series that ran to resupply the island of Malta. These operations were unusual in that in addition to the strong naval close escorts that normally covered convoys, they often also featured substantial distant cover by heavy units of the main fleet. Between August 1941 and May 1945, 42 convoys were undertaken to the northern Soviet Union, and there were 36 return convoys. A total of 835 ships sailed outbound, losing 60 of their number; 710 returned, with a loss of 37 ships. The Malta convoys included a series of major fleet operations from both the eastern and western ends of the Mediterranean to assist the passage of supplies for the island. Between November 1940 and August 1942, 82 merchant ships took part in these convoys; of these 29 were sunk, and there were substantial losses among their naval escorts.

An Atlantic convoy reaches safety after having come under German air attack off the British Isles, March 14, 1941. (Planet News Archive/ SSPL/Getty Images)

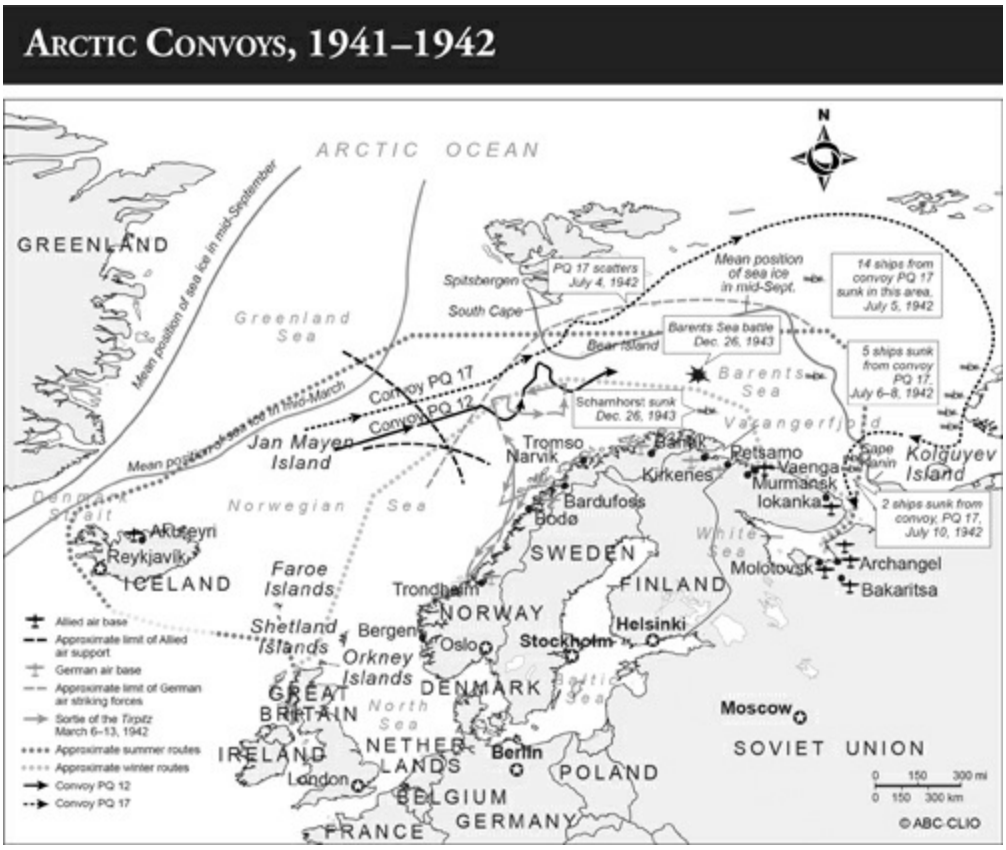
Trade convoys were required for regular commercial traffic on those passages most at risk of air or submarine attack. The initial series operated along the east coast, from London down the English Channel, and outbound from the west coast across the Atlantic and to Gibraltar. The east coast convoys and those to Gibraltar were escorted throughout their passage, whereas escorts accompanied those outbound into the Atlantic only until they were just beyond the expected operating area of German submarines. At that point the convoy dispersed, each ship proceeding individually to its destination. Depending on their destination, some vessels might detach from an outbound convoy prior to its dispersal. Inbound convoys assembled at Halifax, Gibraltar, Freetown, and—for a short period—Kingston, Jamaica. These convoys were escorted by cruiser or armed merchant cruisers until they reached the limit of U-boat operations, where antisubmarine escorts took over. A heavily escorted convoy series also operated between Scotland and Bergen, Norway, commencing in November 1939.

The end of the so-called Phony War in May 1940, with the German invasion of France and the Low Countries, brought major changes to the convoy system. The German attack on Denmark and Norway in April 1940 abruptly ended the Norwegian convoys, and the collapse of France in June brought even more substantial changes. From French bases, German aircraft operated against shipping in the English Channel and far into the Atlantic, and the operational range of the U-boats increased dramatically. Convoys

along the channel accommodated local traffic only, and all oceanic traffic from the east coast now sailed north around Scotland. A series of interlocking convoys provided escort for all coastal shipping.

To accommodate the need for more transatlantic convoys, a second series of slower convoys originating from Sydney, Cape Breton, Nova Scotia, was initiated. The increased threat of attack led to the provision of escort throughout the voyage for all convoys to and from Freetown. Finally, Italy's entry into the war terminated all commercial traffic in the Mediterranean except for heavily escorted operational convoys to carry supplies into Malta and local convoys in the Aegean and along the coastline of the eastern Mediterranean.

The dispersal point for westbound transatlantic convoys and the pickup point for escort groups meeting eastbound shipping gradually moved westward as the range of the escorts was increased. In mid-1941, the United States imposed its neutrality zone on the Western Atlantic and began escorting British convoys in conjunction with Royal Canadian Navy escorts, operating from Argentia in Newfoundland. North Atlantic convoys now were escorted throughout their passage by antisubmarine vessels.



The German declaration of war on the United States on December 10, 1941, brought a major westward expansion of U-boat operations against shipping. A disastrous period followed while the U.S. Navy struggled to secure the escorts and crews required to convoy the enormous volume of merchant traffic along the east coast of the United States; it also struggled with the concept of convoy. Nevertheless, by mid-1942, an elaborate and comprehensive system of interlocking convoy routes and sailings was established for the east coast of North America and in the Caribbean. As commander of German submarines Admiral Karl Dönitz became aware that the convoy system had been extended to a specific area, he shifted U-boat operations to another area where unescorted traffic still operated. Consequently, the U.S. Navy's convoy system gradually expanded to encompass almost all traffic between Rio de Janeiro and Halifax.

Landing operations in North Africa and the Mediterranean brought about some changes. Apart from the significant number of operational troop convoys, the opening of the Mediterranean introduced a series of convoy routes within that sea, and a British shortage of fuel oil also led to a series of

fast tanker convoys between the Caribbean and the United Kingdom. In 1944, Allied military successes in France began to allow a gradual reduction in the scope of convoying. The reduction occurred because U-boats were forced to make more extended passages to their patrol areas as their home ports moved farther from the Atlantic and because German aircraft no longer had quick access to British coastal waters. All these trade convoys sailed at regular intervals, regardless of the number of ships waiting at the departure port. Changes in the interval or convoy cycle could be made but only after careful consideration of the impact on the efficiency of the limited escort force and on trade patterns.

Efficient use of both escorts and shipping required that the employment of convoy be extended or contracted in response to perceived threat levels. Because the U-boats' maximum surface speed was about 16 knots in ideal conditions and much less in the open ocean, ships capable of 15 knots or more sailed independently. Between November 1940 and June 1941, this minimum was lowered arbitrarily to 13 knots, and losses among vessels sailing independently almost tripled; the higher speed minimum was then reinstated. For oceanic convoys, a minimum speed of 7.5 knots soon became the norm, with slower vessels obliged to proceed independently. Ships in coastal convoys, however, could be appreciably slower.

To make the danger zone as a convoy passed a submarine as small as possible, the standard convoy formation, except while transiting cleared channels through minefields, was always a broad front. The most common formation had from 6 to 12 columns in the convoy, each with up to 6 ships. Some of the very large convoys that ran during the spring of 1944, when a shortage of escorts forced planners to consolidate convoys, had as many as 19 columns with 9 or 10 ships each, but this was far in excess of the normal size.

Ships in each column steamed at 400-yard intervals until mid-1943, when the growing number of less experienced captains forced an increase to 600 or even 800 yards. Columns were initially spaced 600 yards apart during daylight and 1,000 yards apart at night, but scientific analysis determined that the wider spacing was preferable from a hit-statistic perspective, and later convoys standardized on the broader spacing. Early in the war, smaller convoys of no more than 35 ships were considered easier to protect, but again, analysis demonstrated that larger convoys made more efficient use of available escorts, so the convoy size increased to 60 ships or more.

Convoys most certainly diminished the efficient use of shipping assets to some extent, and the simultaneous arrival of large numbers of vessels caused significant bottlenecks in the unloading process. Nevertheless, there can be no doubt as to the efficacy of convoys in protecting merchant vessels from attack during World War II, as the dramatic reduction of sinkings after the introduction of convoys on the east coast of the United States demonstrated.

Convoys, Axis

When war began in September 1939, Germany essentially abandoned any attempt to maintain its oceanic trade. Those ships beyond easy reach of the homeland endeavored to reach neutral ports, where they were interned, and closer ships broke for home, with the navy providing cover for those carrying important cargoes.

Norwegian and Swedish ore traffic was the most important sector in Germany's European trade, and securing it became the principal focus of the navy's trade protection efforts throughout the war. After the successful

German invasion of Norway, the navy introduced the convoy of merchant shipping along the Norwegian coast late in 1940. Convoys generally were small—three to six ships—and escorted by a few torpedo boats, trawlers, and light craft. British submarines and aircraft were the principal threats.

As the war progressed and British air attacks became more effective, Germany added defensive coastal antiaircraft batteries and antiaircraft escorts. In addition to ever-increasing strikes by shore-based Royal Air Force Coastal Command aircraft, the Royal Navy mounted periodic carrier strikes against German coastal shipping in 1942 and 1943, culminating over the next two years with more concentrated assaults using escort carriers that came close to paralyzing this traffic.

With the beginning of war with the Soviet Union in June 1941, Soviet Northern Fleet submarines initiated attacks on German shipping around northern Norway and were soon joined by British submarines operating from Kola Bay. Joint operations continued until 1944, when the British crews were sent home and the submarines were turned over to the Soviet Navy. Substantial numbers of Soviet naval aircraft also joined the attack against German convoys from 1943. This assault against the northern Norwegian convoys cost the Germans some 500,000 tons of shipping, a relatively small amount considering that annual traffic was well in excess of 6 million tons.

War with the Soviet Union also brought the threat of attack on Swedish ore traffic, primarily by Soviet submarines at first. The Germans endeavored to keep shipping within Swedish territorial waters as far as possible, escorting vessels for the final leg of their passage behind the protection of defensive minefields and net barriers. During 1942 and 1943, Soviet submarines succeeded in sinking only about 20 ships for a total of some 40,000 tons of shipping out of more than 1,900 vessels in convoy representing well over 5.6 million tons of shipping. During 1944, the Soviet Army’s advances and the defeat of Finland meant that aircraft played a greater role in antishipping operations, but German losses remained relatively light. The collapse of German positions on the Baltic coast early in 1945 required the evacuation by sea of more than 2 million troops and others. Despite some spectacular successes (the sinking of the *Wilhelm Gustloff* and *General Steuben* with 1,200 survivors from the more than 9,000 passengers aboard, for example), Soviet attacks were remarkably ineffective; the Germans lost only about 20 ships with a total of some 100,000 tons of shipping.

The Italian Navy began convoying traffic carrying supplies to its forces in Libya almost as soon as it entered the war in June 1940, for British submarines and aircraft immediately began an interdiction campaign. The navy's responsibilities expanded as Italy undertook campaigns in Yugoslavia and Greece in 1941 and increased still further when Germany took on a larger role in the Balkans and North Africa. During 1941, Italy also began convoying shipping along the Libyan coast.

Italian convoys generally were small—three to six merchant vessels, with two or three escorting destroyers or torpedo boats. As British surface forces operating from Malta began attacking Libya-bound shipping, the Italian Navy had to deploy heavier covering forces, often including cruisers and eventually battleships, to support particularly valuable convoys. In this struggle over shipping, the British possessed two great advantages: radar, which vastly enhanced the night-attack capabilities of its aircraft and surface ships, and signals intelligence, especially Ultra, which consistently gave them advance convoy routing information.

Axis fortunes in this campaign fluctuated greatly. From mid-1941, Axis forces in North Africa required approximately 100,000 tons of supplies each month. But in March 1942, for example, only 47,588 tons got through, whereas in April, 150,389 tons arrived. Overall, the Italian Navy succeeded in bringing about 80 percent of all convoyed shipping to North Africa through to its destination.

Despite its direct experience of successful convoy operations by its destroyers in the Mediterranean during World War I, the Imperial Japanese Navy was slow to introduce convoying of merchant shipping after the Pacific war began. The navy possessed few suitable escort vessels at the outbreak of war, which reflected the overwhelming emphasis it placed on planning for the decisive fleet action that was the centerpiece of its operational strategy. Japan's response to the burgeoning unrestricted submarine campaign conducted by the United States against its shipping was to increase aggressive surface and air patrols; the Japanese Navy continued to eschew defensive convoy of merchant traffic. Not until the later part of 1944, by which date its merchant fleet had been devastated by U.S. submarines, did the navy begin limited convoy, especially of the crucial tankers carrying fuel from the Dutch East Indies, but by then it was too late.

Convoys SC-7 and HX-79, Battles in the North Channel (October 16–20, 1940)

Convoy battle in the North Channel, the strait separating northeastern Ireland from southwestern Scotland. Just before midnight on October 16, 1940, the crew of the *U-48* discovered the 35-ship home-bound Allied Convoy SC-7 northwest of Rockall Bank and attacked, sinking two ships and damaging a third. Losing contact shortly thereafter, the *U-48* reported the convoy's last known position and course a few hours later.

B-Dienst, the German naval code-breaking service, intercepted the convoy escort's report of the action, and commander of German submarines Rear Admiral Karl Dönitz ordered six U-boats—*U-46*, *U-48*, *U-99*, *U-100*, *U-101*, and *U-123*—to establish a patrol line along the convoy's suspected course. Dönitz ordered them to converge on the *U-38*'s sighting report of that morning. The first three boats reached the convoy early that evening. The ensuing battle would leave the U-boats positioned to intercept convoy HX-79 at its conclusion.

SC-7 was poorly protected, having only 1 corvette and 2 sloops for escort. The convoy had already lost 2 stragglers to individual U-boats before its encounter with the *U-48*. Alerted to the coming battle, the Royal Navy's Admiral Martin Dunbar-Nasmith's Combined Operations Headquarters in

Plymouth dispatched another corvette to reinforce the convoy. Unaware that he was facing a wolf pack that included U-boat aces Gunther Prien, Otto Kretschmer, and Joachim Schepke, the convoy commander left one of his corvettes with the damaged merchant ship, negating the impact of the reinforcement, although 2 other corvettes joined the convoy as the battle began. Four of the U-boats initiated their attacks that evening, sinking 17 merchant ships and damaging 2 others before dawn the next morning. The convoy escort exacerbated the situation by staying with damaged and sinking ships, leaving the U-boats free to ravage the remaining merchant ships at will. Three U-boats detached for home that morning because they had expanded all their torpedoes, but 2 other boats attacked on the evening of October 19, sinking 4 more ships. They later broke off contact as the convoy entered the English Channel and gained almost constant air support. The convoy had lost 20 ships, with 7 of them falling to Kretschmer's *U-99.*

Meanwhile, Gunther Prien in *U-47* reported sighting another convoy, the unescorted 49-ship HX-79, on the morning of October 19. Dönitz ordered 4 U-boats (*U-28, U-38, U-48* and *U-100*) to join *U-47*, just as the convoy's 10-ship antisubmarine escort arrived. All but *U-28* reached attack position by that evening. Prien opened the assault, sinking 2 ships. Despite the powerful escort, the U-boats sank 12 ships before daybreak on October 20. The two days of October 19–20 had seen the Germans sink 32 merchant ships and damage 3 others, making this the deadliest two days for Allied merchant shipping of the war.

The shipping losses were a major blow to British morale and caused British naval and political leaders to review the convoy system. This revealed the paucity of escorts, exacerbated by poor tactics and procedures with convoy escorts unprepared for the wolf pack tactics and night surface attacks. British prime minister Winston Churchill now gave the war against German submarines the highest resource and funding priority.

Convoys SC 122 and HX 229, Battle of (March 14–20, 1943)

Largest North Atlantic convoy battle of World War II. March 1943 was the high-water mark of the German U-boat campaign against Allied convoys in the North Atlantic. Between March 10 and 20, Allied signals intelligence suffered a temporary blackout in its operations against the German U-boat cipher Triton. At the same time, the German signals intelligence service was able to decipher the rerouting instructions for two eastbound convoys: SC 122 and HX 229.

The German U-boat command had an unprecedented concentration of submarines in the North Atlantic at that time, and on March 14 it set about forming three large wolf packs from boats that had been operating against convoys SC 121 and HX 228. Groups Raubgraf ("Robber Baron," 8 boats) and Stürmer ("Striker," 18 boats) were to operate against SC 122, and group Dränger ("Pressure," 11 boats) was deployed against HX 229.

On March 16, the first U-boat made contact with HX 229. The convoys were sailing close to each other, and HX 229 was closing on the slower SC 122, which had already passed the Raubgraf patrol line undetected. The Raubgraf boats as well as 11 boats of the Stürmer group were thus deployed against HX 229 in the mistaken belief that it was SC 122. Defended by only 2 destroyers and 2 corvettes, HX 229 suffered heavy damage during the night of March 16–17. The same night, U-boats of the Stürmer group made contact with SC 122. Realizing that the two convoys were about to merge, the German U-boat command committed the remainder of its 40 available U-boats within range to the battle. Throughout March 17, long-range Consolidated B-24 Liberator bombers from Iceland and SC 122 escorts with high-frequency direction-finding (HF/DF) equipment succeeded in fending off the contact-keeping boats. Only 1 U-boat managed to close for an attack, sinking 2 ships out of SC 122 on that day.

On March 18, air cover provided by the Liberators of the Number 120 Squadron again prevented 21 of the 30 U-boats deployed against HX 229 from reaching the scene, and again, only 1 U-boat succeeded in closing for a daylight attack. A reinforcement of the surface escort group prevented serious losses during the night of March 18–19, when the U-boats claimed only 2 further ships before intensified air cover, now flying out of the British Isles, forced them to desist. Two U-boats were damaged and 1 was sunk before Grand Admiral Karl Dönitz called off the operation on March 20.

The tally of 21 Allied ships sunk, totaling 141,000 tons of shipping as well as 1 destroyer lost during this largest convoy battle of the war, was impressive, yet it was also deceptive. It had been achieved primarily because the sheer numbers of U-boats had saturated the convoy defenses. Only 16 of the 40 U-boats deployed against both convoys had actually been able to make contact, and owing to the diligence of the convoys' hard-pressed air and sea escorts, only 9 succeeded in torpedoing ships. Of the 39 U-boats that survived the battle, 16 subsequently required more than 40 days of maintenance due to damage sustained during the battle. Committing virtually all available North Atlantic boats to four convoys—SC 121, SC 122, HX 228, and HX 229—also meant that the other four eastbound North Atlantic convoys in March 1943 made their passage entirely unmolested.

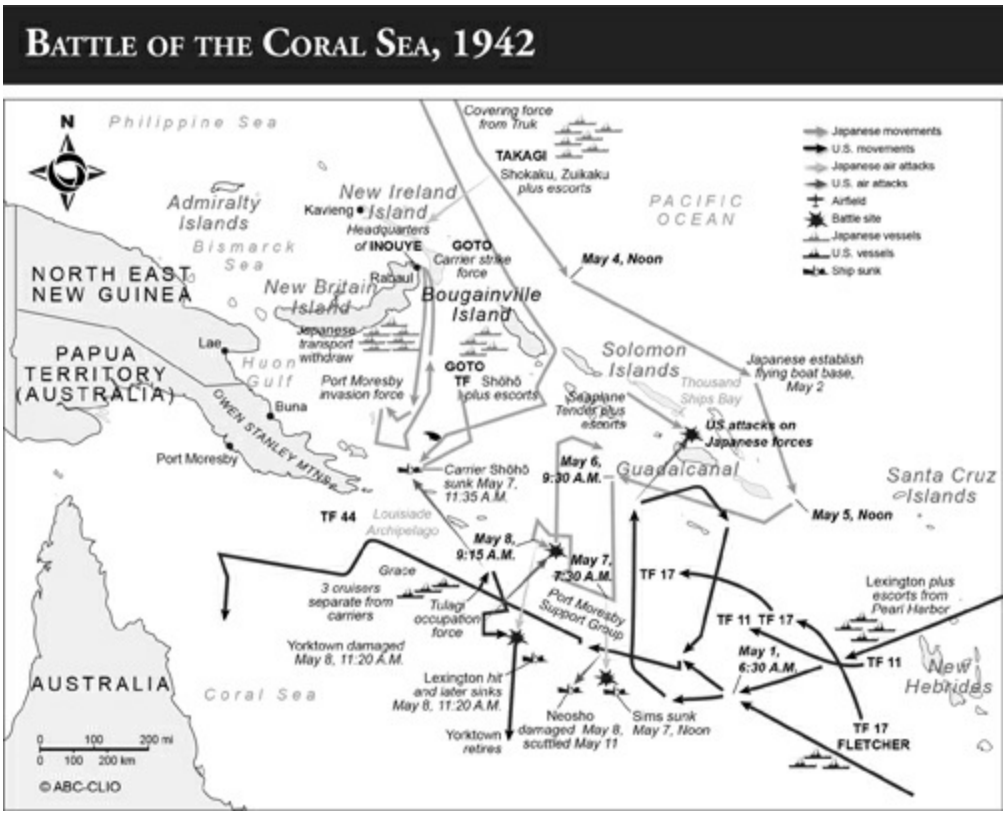
Coral Sea, Battle of the (May 7–8, 1942)

Pacific theater battle fought by units of the U.S. Pacific Fleet and Japanese carrier forces as the United States attempted to prevent a Japanese landing at Port Moresby on New Guinea. The Battle of the Coral Sea was the first naval engagement in history in which two fleets fought without opposing surface ships making visual contact.

Following their successful December 7, 1941, attack on Pearl Harbor and other early military triumphs, Japanese leaders were reluctant to continue with their original strategy of shifting to a defensive posture. They feared the adverse affect that this might have on their forces' fighting spirit and believed that it would allow the Western powers time to regain their strength.

Japanese naval leaders in particular were anxious to occupy the Hawaiian Islands and Australia, the two chief points from which U.S. forces might mount offensive operations. U.S. carriers were operating out of Pearl Harbor, still the headquarters of the U.S. Pacific Fleet. If Japanese forces could take the Hawaiian Islands, it would be virtually impossible for the U.S. Navy to conduct long-range Pacific naval operations. Securing the islands to the north and east of Australia—the Solomons, New Caledonia, and Samoa—would enable the Japanese to establish bases and cut the Allied lifeline from the United States to Australia. Japanese long-range bombers would then be able to strike targets in Australia, preparatory to an invasion of that continent.

The Japanese Army was not enthusiastic about either proposal. Most of its assets were tied down fighting in China and garrisoning Manchuria. Invading Australia and occupying even the populated areas would require significant military resources that the army could not spare. The Army Ministry and General Staff in Tokyo therefore advocated holding the gains already achieved in the southern advance and shifting resources to China. The army formally vetoed the navy plan in early April 1942, but in effect, it was dead by the end of January. Japanese Navy leaders hoped, however, that a success either eastward toward Pearl Harbor or southwest toward Australia might overcome army opposition.

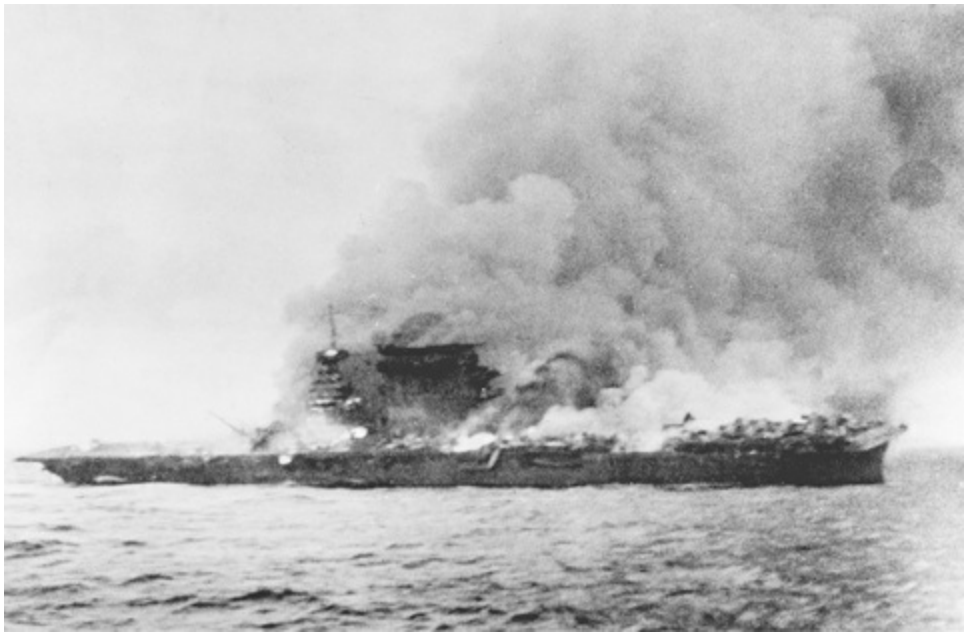


Admiral Yamamoto Isoroku, commander in chief of the Japanese Combined Fleet, and his staff favored taking Midway Island, 1,100 miles west of Pearl Harbor, as a preliminary step before invading Hawaii. Yamamoto expected that this would provoke a strong U.S. naval reaction, enabling him to trap and destroy the U.S. aircraft carriers. The Japanese naval staff, however, preferred the southeasterly drive to isolate Australia. By the end of March, the Japanese had already advanced from Rabaul into the Solomon Islands and along the northern coast of New Guinea.

The Japanese Imperial General Staff then sought a follow-up strategy. Initially, the Naval General Staff favored assaulting Australia, fearing that an Allied buildup there could lead to a counteroffensive against the Japanese defensive perimeter. The army rejected an Australian operation because of long distances, insufficient number of available troops, and inadequate transportation. In January 1942, both agreed on a less demanding joint invasion of Lae and Salamaua in New Guinea, the seizure of Tulagi in the Solomons, and the capture of the Australian base of Port Moresby in Papua New Guinea.

On March 8, 1942, U.S. carriers, sent to beleaguer the Japanese base at Rabaul northeast of New Guinea, interdicted Japanese landing operations at Lae and Salamaua on the Papuan Peninsula of eastern New Guinea. Two carrier task forces, one built around the carrier *Lexington* under Vice Admiral Wilson E. Brown and the other under Rear Admiral Frank Jack Fletcher centered on the carrier *Yorktown*, sailed into the Gulf of Papua on the opposite side of the peninsula. Together, on the morning of March 10 they sent 104 aircraft across the high Owen Stanley Mountains and surprised Japanese ships discharging troops and supplies at both Lae and Salamaua. The attacking U.S. aircraft sank three Japanese ships, including the armed merchant cruiser *Kongo Maru* at a cost of only one plane and one aviator lost.

The action convinced the Japanese operational commander, Vice Admiral Inouye Shigeyoshi, that conquest of New Guinea would have to be postponed until he could secure fleet carriers for protection. That opportunity came only after the return of Japanese carriers from the raids into the Indian Ocean.



Fires rage on the U.S. Navy aircraft carrier *Lexington* during the Battle of the Coral Sea on May 8, 1942. The fires could not be controlled, and the carrier had to be abandoned. It was then scuttled by torpedoes from a destroyer. (Library of Congress)

In early April 1942, the attention of the Imperial Naval General Staff was on southeast operations (seizure of strategic points in New Guinea, New Caledonia, the Fiji Islands, and Samoa) to isolate Australia. The April 1942

Doolittle Raid on Tokyo refocused their attention on the destruction of the U.S. carriers, however, and forced an earlier date for the Tulagi and Port Moresby operations, with the New Caledonia, Fiji, and Samoa operations to follow after Midway.

Admiral Inouye, commanding the Fourth Fleet and Operation mo, as it was designated, broke his forces into five groups: two invasion groups to land army and naval forces at Tulagi and Port Moresby, a support group to establish a seaplane base in the Louisiade Archipelago off New Guinea, a small covering group with the light carrier *Shoho,* and the main striking force of two fleet carriers, the *Shōkaku* and *Zuikaku*, plus escorts. This strike force, commanded by Vice Admiral Takagi Takeo, was to support both landings and to protect the entire force from U.S. carriers.

At Pearl Harbor, Admiral Chester W. Nimitz, commander of the U.S. Pacific Fleet, determined from intercepts that the Japanese would probably attack Port Moresby on May 3. On April 29, he ordered Fletcher and his *Yorktown* group to operate in the vicinity of the Coral Sea beginning on May 1. The *Lexington* group, now under Rear Admiral Aubrey Fitch, and the U.S. Southwest Pacific Command's combined naval force of two Australian cruisers, the U.S. heavy cruiser *Chicago*, and two U.S. destroyers under Rear Admiral John Crace of the Royal Australian Navy were also placed under Fletcher's tactical command. The two carrier groups and Crace's force formed Task Force 17 when they rendezvoused on May 1 some 250 miles off the New Hebrides. While the *Lexington*'s group refueled, Fletcher sailed the *Yorktown*'s group north on May 2 to reconnoiter, having received reports of approaching Japanese naval forces.

On May 3, the Japanese Tulagi invasion group began landing forces without opposition. Learning of this, Fletcher decided to strike Tulagi the next morning without waiting for the *Lexington.* He sent his fleet oiler and its escorts to inform Fitch and Crace of his change of plans and to order them to join him 300 miles south of Guadalcanal on May 5. The *Yorktown* then closed on Tulagi undetected on May 4 and launched three air strikes that met little resistance. Admiral Takagi's carrier striking force had been delayed and was nowhere near Tulagi.

Inexperienced as they were, the U.S. attackers were ineffective, only damaging a destroyer to the point that it had to be beached and sinking three small minesweepers and four landing barges. The planes also shot up some

grounded aircraft. Even this small success was sufficient to send the remainder of the Tulagi invasion force steaming back to Rabaul.

Withdrawing southward, Fletcher rejoined Fitch and Crace as scheduled on May 5. Task Force 17 then moved northwest, expecting to catch Japanese forces as they emerged from the Jomard Passage into the Coral Sea. Although sightings were made by both sides on May 6, ineffective reconnaissance led to little significant action by either.

Before dawn on May 7, the opposing fleet carriers passed within 70 miles of each other. At dawn, both sides sent out search planes over the Coral Sea. Japanese sightings of what they thought were a U.S. carrier and a cruiser led to the sinking of the destroyer *Sims* and fatal damage to the oiler *Neosho.* At about the same time, a U.S. scout aircraft reported two Japanese carriers north of the Louisiades. The action prompted by the U.S. sighting turned out to be a wild goose chase, but the *Lexington* and *Yorktown* pilots stumbled on the light carrier *Shoho* and sank it.

Early the next morning, the two carrier forces found each other. The U.S. planes concentrated their attack on the fleet carrier *Shōkaku* but hit it with just three bombs, causing only modest damage. The fleet carrier *Zuikaku* escaped by hiding in a rainsquall. The *Shōkaku*'s damage was sufficient to prevent launch-and-recovery operations, however; when the Americans withdrew, it turned north toward Japan.

Meanwhile, planes from the *Shōkaku* and *Zuikaku* found the *Lexington* and *Yorktown.* Diving out of the sun, torpedo planes hit the *Lexington* twice on the port side, and dive-bombers scored two minor hits. The *Yorktown* was hit by only one bomb, which did no major damage. Confident they had sunk the *Saratoga*, the *Lexington*'s sister ship, and the *Yorktown*, the Japanese pilots withdrew. Neither ship sank, however, until gasoline vapors aboard the *Lexington* reignited fires that eventually became uncontrollable; as a result it was abandoned, with Fletcher forced to order it scuttled by torpedoes from a nearby destroyer.

Both sides claimed victory. Tactically, the Japanese came out ahead. The United States was hurt most by the loss of the fleet carrier *Lexington*, whereas Japan lost only the light carrier *Shoho* and suffered moderate damage to the large carrier *Shōkaku.* Although Japan scored a tactical victory, the United States had finally blunted a Japanese offensive thrust, preventing the occupation of Port Moresby and thus winning the strategic victory. In

addition, significant losses in aircraft, aircrew, and repairs to the *Shōkaku* prevented both Japanese carriers from taking part in the subsequent Battle of Midway (June 3–6, 1942), undoubtedly impacting that critical battle.

Corap, André Georges (1879–1953)

French Army general. Born at Pont Andemer, Eure Department, France, on June 15, 1879, André Corap entered the French Army in 1898 on graduation from the French Military Academy at Saint-Cyr. He fought in World War I and earned distinction during the 1920–1926 Rif Rebellion in Morocco, where he captured rebel leader Abd-el-Krim in 1926. Ten years later, Corap served as a regimental commander in Morocco.

With the onset of World War II in September 1939 and the mobilization of French forces, Corap was appointed to command the 2nd Military Region of Amiens and the Ninth French Army. His sector of the northeastern part of the front was particularly poorly fortified, and he had far fewer divisions than his counterparts behind the Maginot Line. When German forces invaded on May 10, 1940, in accordance with the prescribed Dyle Plan, Corap

immediately wheeled his troops north to take up positions north of the Meuse River between Namur and Flize, just to the west of Sedan. His forces arrived on May 11–12 to find that two German panzer corps under Generals Hermann Hoth and Georg Hans Reinhardt had anticipated them. Badly mauled by frontal attacks from these troops and under heavy assault, the Ninth Army virtually disintegrated when its right flank came under heavy attack after the collapse of General Charles Huntziger's Second French Army, around Sedan. Only a few units held together and fell back to reserve positions during the night of May 14–15.

General Alphonse Georges, commander in chief of French northeastern forces, held Corap responsible for the German breakthrough, and on May 15, Georges insisted that Corap exchange commands with General Henri Giraud, who headed the Seventh Army. Corap held this post for only four days before Defense Minister Édouard Daladier removed him. On May 21, Prime Minister Paul Reynaud publicly held Corap responsible for the disaster on the Meuse frontier, implying that he might be tried for treason. This seems to have been a desperate search for a scapegoat. Ironically, Huntziger, who certainly bore at least as much blame as Corap, received a promotion and later became minister of war in the Vichy French government.

After the armistice, Corap accompanied the Vichy government to Bordeaux in a vain effort to clear his name. Subsequent revelations at the 1941 Riom trial largely exonerated him, but he held himself aloof from further debate, retiring to his home at Fontainebleau, where he died on August 15, 1953.

CORKSCREW, Operation (June 11, 1943)

Allied operation to secure the small (32-square-mile) Italian island of Pantelleria situated in the Sicily Strait some 60 miles from Sicily and 70 miles from the North African coast. In 1943 the Western Allies considered the capture of Pantelleria vital to the success of Operation HUSKY, the planned invasion of Sicily. Pantelleria lay astride the main invasion route from North Africa to Sicily, but the real prize was a large airfield there, which the Allies wanted to use for fighters supporting the Sicily invasion. Otherwise, these aircraft would have to operate from bases in North Africa.

Operation CORKSCREW commenced in mid-May. In one of the outstanding examples of excessive use of force during the war, the Northwest African Air Force dropped 6,400 tons of bombs on Pantelleria in 4,218 bomber and fighter-bomber sorties. The 12,000-man Brigata Mista Pantelleria on the island was also subjected to naval gunfire. Airpower advocates hoped to demonstrate that bombing alone could force an enemy surrender. The Italian garrison on Pantelleria and nearby Lampedusa Island surrendered immediately on the landing of British troops on June 11. The British took 11,399 prisoners. The sole British casualty was a soldier bitten by a mule.

Cornell, Julien Davies (1910–1994)

Prominent U.S. civil liberties attorney who defended the rights of conscientious objectors during World War II. Born in Brooklyn, New York, on March 17, 1910, Julien Davies Cornell was reared a Quaker. He graduated

from Swarthmore College in 1930, and in 1933 he received his law degree from Yale University and joined his father's Wall Street law firm. He remained there until the start of World War II.

The 1940 Selective Service and Training Act represented an advance for religious conscientious objectors in contrast to the World War I law. But, in the opinion of Cornell, a pacifist, it did not go far enough. Although the 1940 law expanded conscientious objection classification and established the Civilian Public Service (CPS) camps, Cornell argued that the current draft legislation did not come close to resembling the British National Service Act of 1939, which allowed the "absolutist" (pacifist) exemption from any form of state service.

During World War II, Cornell handled hundreds of cases involving conscientious objectors who refused to register for the draft, be inducted, or report to CPS camps for alternative state service. Some of his most important cases were *United States ex rel. Phillips v. Downer, United States v. Julius Eichel, United States v. Clyde W. Summers,* and *United States v. James Louis Girouard.*

Cornell's experiences involving these matters led to the publication of *The Conscientious Objector and the Law* (1943) and *Conscience and the State* (1944). Both works summarized his views that (1) the U.S. government should adopt the British legal model regarding exemption from state service; (2) the conscientious objector should not be made to register or be inducted prior to declaring his objection to war, and that religious training and belief should not be the sole determination for such basis; (3) the CPS camps should not be controlled by the military; and (4) the denial of pay to objectors for camp labor and the government's refusal to provide dependency allotments to families was a gross injustice.

Cornell was best known for his representation in February 1946 of noted expatriate poet Ezra Pound, who was indicted on a charge of treason because of radio speeches he delivered from Rome in 1943. These broadcasts criticized President Franklin Roosevelt and the Allies and smacked of anti-Semitism. When interviewing Pound, Cornell realized that the poet's mental health had seriously deteriorated, probably from being held in solitary confinement in an American military prison in Italy. Cornell produced his own battery of psychiatrists to counter the testimony of the U.S. Army

doctors and prevailed in having Pound placed in a mental hospital, thereby saving him from a possible death sentence.

Shortly after the war, Cornell spent time in Europe working for the American Friends Service Committee. In 1950, he moved to Central Valley, New York, and established a successful legal practice there. Cornell died in Goshen, New York on December 2, 1994.

Cornioley, Cecile Pearl Witherington (1914–2008)

British Special Operations Executive (SOE) operative and French Resistance leader. Born in Paris on June 24, 1914, Cecile Pearl Witherington was one of four daughters of an English businessman who worked for a Swedish firm. Cecile, known as Pearl, had a difficult childhood, for her father's spendthrift habits and heavy drinking split the family. At age 17, she began work as a secretary, earning extra money by teaching English at night. When the Germans invaded France in May 1940, she was employed as a secretary to the British air attaché in Paris. Her family managed to flee France in December 1940 and reach London, where Witherington secured a position with the Air Ministry.

Anxious to do more to assist the Allied war effort against the Germans, in June 1943 Witherington joined the SOE as an agent. During training she was recognized as the best marksman, male or female, in the SOE. Witherington, given the code name Pauline, parachuted into France near Châteauroux on the night of September 22–23, 1943. Soon she joined her French fiancé Henri

Cornioley, who had escaped a German prison and was active in the Resistance. Because of this blend of espionage and romance, some have seen Pearl Cornioley as the inspiration for Sebastian Faulke's popular 1998 novel, *Charlotte Gray*, later made into a film of the same name. She disclaimed this, claiming that she was motivated solely by the desire to defeat the Germans.

Posing as a cosmetics salesperson, Witherington traveled extensively throughout France as a courier. When the head of her network was captured in May 1944, she was forced to change her location and activities. Working in the Department of the Indre, she and Cornioley organized a Resistance group, which they then helped arm. The two were nearly captured on June 11, 1944, shortly after the Allied Normandy Invasion, but by July their Resistance group had grown to some 1,500 people. Witherington was the only SOE operative to head a network, and her Resistance group was credited with having killed as many as 1,000 German soldiers and having captured 18,000. The Germans offered a million-franc reward for her capture.

In September 1944, the couple made it to London, bringing with them—much to the surprise of their superiors—the money from parachute drops that had been unused. The two were married the next month. He became a pharmacist, while she worked as a secretary for the World Bank. In 1995, she published her memoirs, written with Hervé Larroque. Her husband died in 1999. Pearl Cornioley died in the Loire region of France on February 24, 2008.

Corregidor, Battle of (April–May 1942)

Known officially as Fort Mills, Corregidor was the final bastion of U.S. and Filipino forces in the Philippines. At 2.74 square miles, the largest of the islands off the entrance to Manila Bay, Corregidor is shaped like a tadpole. Its chief installations included the post headquarters, a huge barracks, and coastal batteries. Contained within the tail of the island was a vast underground network known as Malinta Tunnel, which measured 1,400 feet in length and 30 feet in width, with 25 400-foot laterals branching from it. The tunnel was the administrative and operational heart of the island fortress. Kindley Airfield was situated on the extremity of the tail, on the second-highest point of the island.

The island also had batteries with an array of 18 12-inch and 10-inch coastal guns and 24 12-inch mortars plus antiaircraft guns and machine-gun positions. Almost all of the armament on the island was obsolete in 1942, but as long as the troops on Corregidor held the island, they could effectively keep the Japanese fleet from using Manila Bay. This was the basic mission of the troops on Corregidor in War Plan Orange.

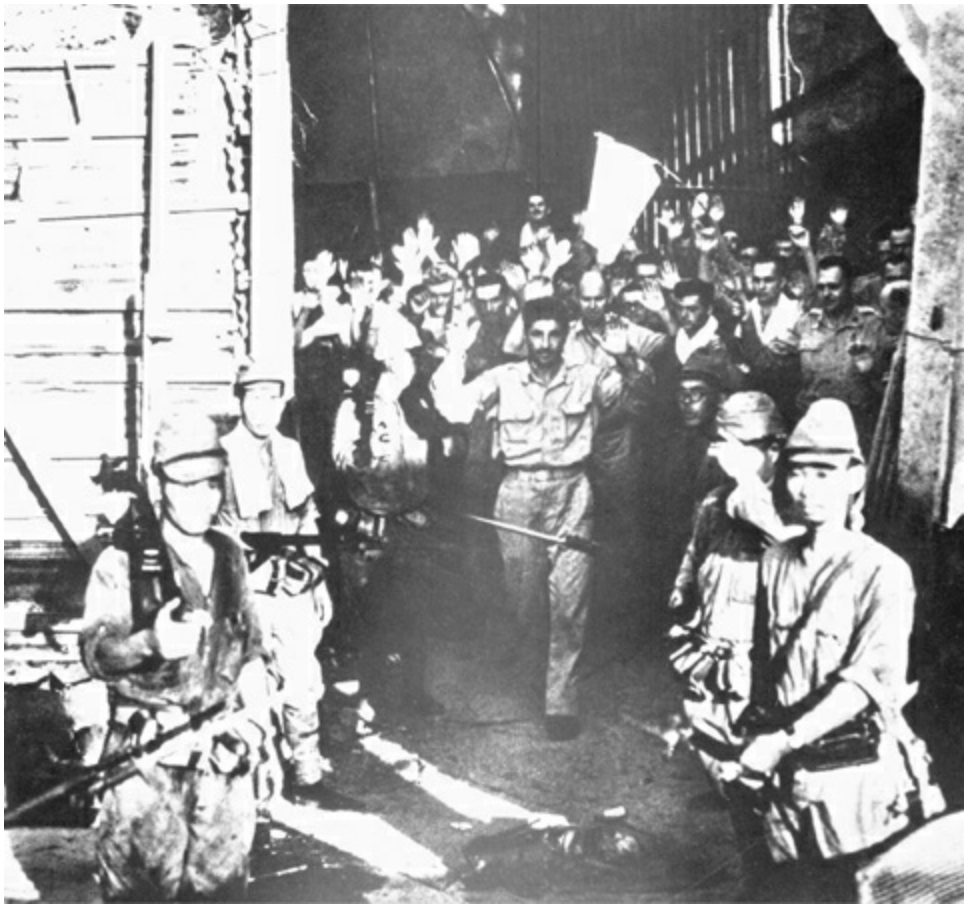
On the departure of General Douglas MacArthur and his staff to Australia, Major General Jonathan M. Wainwright assumed command of the American and Filipino forces on March 12, 1942. The Japanese had bombed and shelled the island constantly since February, but they did so with growing intensity beginning in April. For 27 days, from April 9 to May 6, the Japanese daily increased the shelling. By May 5, the beach defenses had been destroyed, the huge seacoast guns had been silenced, and the antiaircraft batteries had been reduced to scrap. All wire communications had been destroyed, and every attempt to restore them was in vain. Even the geography of Corregidor had changed; the island lay scorched, leafless, pockmarked by bomb craters, and covered in the dust of thousands of explosions.

By the beginning of May, the 9,400 men on Corregidor knew that a Japanese attack was imminent. The island’s defenders had sustained 600 casualties since April 9, and those men who had not been injured were beginning to succumb to malnutrition and malaria. Wainwright wrote on May 4 that there was only enough water to last for four days and that the fortress’s power supply would only hold out for one week at most.

Late in the night of May 5, the long-awaited Japanese attack began, following a particularly intense artillery bombardment directed against the tail end of the island. Shortly before 10:00 p.m. as Japanese landing craft steamed toward the eastern end of the island, an order went out for all able-bodied troops to resist the landing.

The fight for Corregidor lasted only 10 hours. Japanese troops cut across the island, then turned west toward Malinta Tunnel. Most of the fighting during the night and the early morning of May 6 took place at Battery Denver, on a ridge near the east entrance of the tunnel. U.S. troops, including coast artillerymen and a battalion of 500 sailors, fought bravely. At 8:00 a.m., after the Japanese had taken tanks and artillery ashore for a frontal assault, Wainwright committed the last of his reserves. The first sight of armor panicked the defenders, however, and caused some to flee from the lines.

By 10:00 a.m. the situation was critical, with the defenders having no means of stopping the Japanese tanks. Already, 600 to 800 U.S. troops had been killed and another 1,000 wounded. All reserves had been committed, and the Japanese had destroyed all defensive artillery. The Japanese were planning to mount an attack on the other side of the island and would reach Malinta Tunnel, with its 1,000 wounded, in a few hours. Fearing a slaughter, Wainwright decided to surrender. By noon on May 6, all weaponry larger than .45 caliber had been destroyed; all codes, radio equipment, and classified materials had been burned; and the surrender message had been broadcast to the Japanese. The U.S. flag was lowered and burned, and a white flag was hoisted. Wainwright then communicated to President Franklin D. Roosevelt that he had made the decision to surrender. It had taken the Japanese five months to seize the island instead of the two months they had originally estimated.



The surrender of U.S. troops on the island of Corregidor in the Philippine Islands, May 6, 1942. (National Archives)

U.S. forces retook Corregidor in February 1945.

Corsica, Recapture of (September 8–October 4, 1943)

Corsica is a French Mediterranean island that was occupied by Italian forces on November 11, 1942. Free French leader General Charles de Gaulle was determined to retake Corsica, and the Allies soon began sending French and U.S. Office of Strategic Services (OSS) operatives there by submarine. In late August 1943 at de Gaulle's behest, General Alphonse Juin drew up invasion plans. Assuming the Italians would remain neutral, Juin planned a force of two divisions to carry out simultaneous east and west landings to cut the island's two main coastal roads.

On September 8, 1943, the armistice with Italy was announced. By that date, elements of the French troops were ready to deploy, but they lacked the sealift required for the men and their supplies. Nonetheless, de Gaulle was determined to proceed on a reduced scale if need be to liberate Corsica by force of French arms.

Lieutenant General Fridolin von Senger und Etterlin commanded Axis forces on Sardinia and Corsica. On September 11, following the Italian surrender, Adolf Hitler ordered Senger to transfer the 90th Panzer Division from Sardinia to join the Schutzstaffel (SS) brigade already on Corsica. The first French element, a battalion, landed at Ajaccio on September 12. Although Italian major general Giovanni Magli said that his men would fight the French, that did not last long. Soon, much of his VII Corps garrison of four divisions, as well as thousands of local Maquis resistance fighters, were engaging the Germans. Meanwhile, the French steadily built up their resources; two Free French cruisers and two destroyers as well as torpedo boats and submarines participated in the lift there of men and supplies. Commodore W. G. Agnew's British 12 Cruiser Squadron provided cover. Ultimately, the French landed some 6,800 men, 30 tanks, and 20 artillery pieces on the island.

On September 15, Hitler ordered the evacuation of Corsica. This took place through the port of Bastia, which the Germans had taken by force from

its Italian defenders two days earlier. The Germans completed their withdrawal from the island on October 4, wrecking harbor facilities as they departed. Although the Germans were able to remove most of their troops and 3,200 vehicles, the Allies sank 17,000 tons of German shipping; the Germans also had 55 transport aircraft destroyed, most of them on the ground, and they abandoned substantial quantities of equipment.

Military dead in the Allied reoccupation of Corsica totaled about 450 Germans, 637 Italians, 75 French and Moroccans, and 170 Maquisards.

Corvettes and Sloops

Relatively small warships designed primarily for anti-submarine warfare and patrol duties. The Royal Navy in the years prior to World War II and during the war built several classes of both of these types, because their small size allowed for rapid construction not only by large shipyards but, in the case of corvettes, by small privately owned yards.

Britain built a large number of both corvettes and sloops to protect its trade lanes from submarine attack. A good example of the World War II–era sloop is the British Black Swan class constructed during 1939–1940 and a modified version of the same launched throughout the war. A modified Black Swan–class vessel displaced some 1,490 tons, measured 299 feet 6 inches in overall length by 38 feet 6 inches in beam and was capable of 19.75 knots. The unarmored hull mounted six 4-inch guns and carried 110 depth charges

on racks. During the war, upgrades to a few of these ships replaced the racks with hedgehog depth charge launchers. Crew complement was 192 officers and men.

Corvettes are typified by the Castle class, built between 1943 and 1944. Smaller than the sloop, it displaced 1,060 tons, was 252 feet in overall length and 36 feet 8 inches in beam, and was capable of 16.5 knots. Castle-class corvettes were armed with a single 4-inch gun and a Squid depth charge launcher. Crew complement was 120 officers and men.

While both sloops and corvettes participated in the Battle of the Atlantic, neither type proved wholly satisfactory. Corvettes were not ideal for antisubmarine duty because they lacked oceangoing qualities due to their small hulls. Not only were living conditions poor on these ships, but they could not store large amounts of fuel or supplies. Nonetheless, corvettes gradually supplanted sloops because they could be built in greater numbers thanks to their size, which allowed for construction in smaller yards. Larger and more capable frigates supplemented sloops and corvettes during the war.

Aside from the British, the Japanese launched several classes of escorts the size of corvettes and capable of antisubmarine warfare. Other powers such as the United States, France, and Italy also constructed these ships. The United States built one class of corvette as submarine chasers, while other nations that built vessels the size of sloops or corvettes attached duties to them other than antisubmarine warfare. Germany's corvettes were envisioned as fleet escorts, while France employed its corvettes as torpedo boats. Italy constructed 29 units of the Gabbiano class of 660 tons from 1942, and these ships proved capable in the antisubmarine role. Germany took over 4 and completed 10 more after the Italian armistice to equip its Mediterranean antisubmarine flotillas.

Cota, Norman Daniel "Dutch" (1893–1971)

U.S. Army general. Born in Chelsea, Massachusetts, on May 30, 1893, Norman Daniel "Dutch" Cota graduated from the U.S. Military Academy at West Point in 1917 and was commissioned in the infantry with the 22nd Infantry Regiment. He was an instructor at West Point between 1918 and 1920. Cota transferred to the Finance Department in 1920 and was the finance officer of West Point until 1924, when he transferred back to the infantry. Cota graduated from the Infantry School at Fort Benning, Georgia, in 1925 and served in the Hawaiian Department. He graduated from the Command and General Staff School in 1931, was an instructor at the Infantry School in 1932 and 1933, graduated from the Army War College in 1936, and was an instructor at the Command and General Staff School from 1938 to 1940.

Cota was in charge of plans and training for the 1st Infantry Division from March 1941; he was its chief of staff from 1942 to February 1943, taking part in the capture of Oran during Operation TORCH, the invasion of French North Africa (November 8, 1942). Promoted to brigadier general in February 1943, he became U.S. adviser to the Combined Operations Branch of the European theater of operations. Later that year, he was assistant commander of the 29th Infantry Division.

On June 6, 1944, Cota landed with his division on Omaha Beach, Normandy. Several of the men in his landing craft (an LCVP, or landing craft vehicle and personnel) were killed by German fire as soon as the ramp went down. Cota was the only general officer on Omaha Beach that day. With American forces almost pushed back into the sea, he was an inspiring presence. Realizing the men were doomed if they remained on the beach, he exposed himself to German fire as he repeatedly led small parties forward. Many historians credit him with almost single-handedly preventing a disaster that day. Cota later received the Distinguished Service Cross for his actions. Wounded at the Battle of Saint-Lô (July 11–19, 1944) he spent two weeks in the division hospital.

On August 13, 1944, Cota took command of the 28th Infantry Division, which he led through Paris in a liberation parade in August 1944, part of a show of force in support of General Charles de Gaulle to prevent a possible communist takeover. Cota was promoted to major general in September 1944.

On November 2, the 28th Infantry Division began an attack to capture the town of Schmidt during the Hürtgen Forest Campaign (September 12–December 16), which was intended to break the Siegfried Line. The plan of attack was a recipe for disaster, with all three regiments of the division attacking in diverging directions, and had been imposed on the division by staff officers at V Corps. Cota protested his orders to both V Corps commander Major General Leonard Gerow and First Army commander Lieutenant General Courtney Hodges but was ordered to execute the plan. During the next nine days, the 28th Infantry Division suffered more than 6,000 casualties. Near the end of the battle, Cota collapsed under the pressure of what was happening to his division.

If not for his performance on Omaha Beach, Cota almost certainly would have been relieved of his command after this debacle; as it was, the events at Schmidt cast a long shadow over him. The 28th Infantry Division was pulled out of the line and sent south to a quiet sector in Belgium to reconstitute. On December 16, it was manning the sector of the line known as Skyline Drive when the Germans launched the Ardennes Offensive (Battle of the Bulge, December 16, 1944–January 25, 1945). Although the already weak 28th Infantry Division was mauled during the German attack, it did not break. Rather, it conducted a tenacious and effective fighting withdrawal that contributed in no small part to disrupting the German timetable for the offensive. Cota returned to the United States in August 1945 to prepare for the anticipated invasion of Japan.

Cota retired from the army as a major general in 1946. He died in Wichita, Kansas, on October 4, 1971.

See Abadan, Iran, British Attack on

Counterintelligence

Organized activities initiated to counter an opponent's intelligence operations. Counterintelligence operations may include blocking an enemy's sources of information, carrying out deceptions, and working to prevent enemy sabotage and the gathering of intelligence information.

Electronic warfare had matured considerably since the end of World War I. In 1939, unlike in 1914, many nations had functioning cryptological departments, and virtually all nations during the war broke codes of the other side. Circumstances in 1939 varied widely, however. Great Britain, for example, had a solid organization, centered on the Government Code and Cypher School at Bletchley Park.

Communications technology did not solve all counterintelligence issues, as the British discovered soon after the fall of France in June 1940, when refugees began arriving on their shores. Before long, an average of 700 aliens were entering the country per month, and the Travel Section of MI-5 (Security Service) knew that each person needed to be interrogated so that spies could be identified before they could do harm. A pedestrian approach was required. Near the Clapham Junction Railway Station was the empty Royal Victoria Patriotic School (RVPS), built to educate the children of Crimean War veterans. The students of the RVPS and the nearby Emanuel School, an old and excellent London public (private, by American standards)

school, had been evacuated to the country for the duration of the war. The RVPS, later known as the London Reception Center (LRC), became -MI-5's principal interrogation facility. Some 33,000 aliens were inspected at the LRC during the war, and it is believed that only three enemy agents passed through undetected.

The agent at large for the longest period, from November 1940 to April 1941, was Dutch parachutist Englebertus Fukken. He was found dead in a Cambridgeshire air-raid shelter, a suicide. In the early days, a proven German agent might be hanged at the RVPS, next to the faculty common room. Eventually, after July 27, 1940, those aliens held at the LRC were sent to Ham in western London for further interrogation. Under the command of Colonel Robin William George "Tin Eye" Stephens, Camp 020 was the interrogation center of last resort. It should be remembered that Camp 020 functioned in 1940 under fear of the planned German invasion of the British Isles, Operation SEELÖWE (SEA LION).

As the war progressed, more and more German agents arrived, not via the refugee route but by parachute or coastal landing at night from German small craft or even U-boats. On capture—and MI-5 was good at that—these persons could not claim to be refugees. Some did not wait for apprehension but turned themselves in and volunteered to work for the Allies. Under the chairmanship of Sir John Masterman, an Oxford don who had the distinction of spending all of World War I interned in Germany, the XX (Doublecross) Committee was established to develop a deception plan to utilize these double agents.

Composed of representatives of MI-5, MI-6 (the Secret Intelligence Service), the Special Operations Executive (SOE), and other organizations, the committee set up a phony radio situation that fed doctored information mixed with some real facts back to German controllers. The ruse became more successful than most members of the XX Committee ever thought it would or could be.

The Germans were also quite active in counterintelligence operations, one of which worked specifically against the SOE. ENGLANDSPIEL (ENGLAND GAME) was a German operation set up in the Netherlands by Major Herman Giske of the Abwehr and Colonel Josef Schreide of the Reichssicher-heits-hauptamt (RSHA, the Reich Main Security Office) to break up British espionage rings in Holland.

The Abwehr, the military secret service under Admiral Wilhelm Canaris, contained many anti-Nazi elements. The RSHA, which was fervently pro-Nazi, was under Schutzstaffel (SS) chief Heinrich Himmler. The two organizations did not cooperate. ENGLANDSPIEL worked something like the XX Committee in reverse. The Germans "turned" several SOE parachutists, who then asked the SOE to send monetary, material, and human assistance to the espionage rings in Holland. That the British did. ENGLANDSPIEL lasted until two agents escaped from Haaren Prison and made their way to Switzerland, where they exposed the German operation.

The operation had ended by the beginning of April 1944, but it had been quite successful. The British carried out 190 aircraft drops of people and equipment. Of 54 captured agents, 47 were executed. The Germans took 3,000 Sten guns, 5,000 revolvers, 2,000 hand grenades, 500,000 rounds of ammunition, 75 radio transmitters, and 500,000 Dutch guilders. ENGLANDSPIEL was probably the greatest Allied espionage defeat of World War II.

Mention must also be made of the Germans' deception plan for Operation BARBAROSSA, their June 22, 1941, attack on the Soviet Union. For such a momentous military action, there was virtually no attempt at deception. The Abwehr and other organizations merely stated that the transfer of troops from west to east was (1) intended to aid Italy's faltering campaign against the Greeks and (2) a deception for British consumption designed to signal that Operation SEA LION had been abandoned. Soviet leader Joseph Stalin received as many as 100 warnings and ignored all of them, dismissing them as deliberate Allied disinformation.

The Western Allies had a great success in Operation MINCEMEAT, their unique deception campaign preceding the Sicily landings in July 1943. This operation was developed to convince the Germans that the Greek islands and Sardinia were the next Allied targets after North Africa, instead of the more logical Sicily.

Lieutenant Commander Ewen Montagu, who proposed Operation MINCEMEAT. (Bettmann/Corbis)

The most significant Allied deception of the entire war, however, was Operation FORTITUDE, which had two aspects. FORTITUDE north was designed to convince Adolf Hitler that the Allies were planning to invade Norway from Scotland. FORTITUDE SOUTH was designed to convince Hitler that the main Allied invasion of France would come through the Pas de Calais area. The deception plan worked out better than expected. Hitler held German units in place along the Pas de Calais. Indeed, some were still there a month after the Normandy landings.

Crace, Sir John Gregory (1887–1968)

British Royal Navy and Royal Australian Navy (RAN) vice admiral. Born on February 6, 1887, at Gungahleen, New South Wales, Australia, John Gregory Crace joined the Royal Navy in 1902 as a colonial cadet at the midshipman training college at Devon, Britain. In World War I, he saw service at sea as a torpedo lieutenant.

After the war, Crace specialized in torpedoes. Following various assignments that included sea service, he became assistant to the second sea lord in 1937. A rear admiral when World War II began in 1939, Crace was assigned to command the Australian Squadron, in effect becoming the commander of the RAN. The RAN was subordinate to the British Admiralty, and Crace considered asking for another more responsible position in the Royal Navy.

After the United States entered the war in December 1941, the U.S. Navy assumed overall Allied command of the South Pacific, and Crace took command of the mixed U.S.-Australian cruiser Task Force 44. In May 1942, the Allies became aware that the Japanese were preparing to invade Port Moresby, New Guinea. Along with two U.S. carrier task forces, Crace and his squadron set out to intercept the Japanese invasion force, which reconnaissance aircraft had reported as headed for the Jomard Passage. In the

early afternoon of May 7, Japanese medium bombers and torpedo bombers attacked Crace's ships, but skillful maneuvering averted major damage at the hands of the Japanese and also from U.S. Army Air Forces Boeing B-17s, which mistakenly attacked the friendly force.

The presence of Crace's ships and mistaken Japanese impressions about the size of his unit led the invasion force headed for Port Moresby to turn back. Crace's ships played no other role in the May 7–8 Battle of the Coral Sea. They remained in the Jomard Passage for another two days, until being notified of the overall course of the battle, when they returned to Australia.

Crace received high marks from the Americans both as a seaman and as a commander of a joint force. He was placed on the retired list in 1945 but remained in charge of the Chat-ham Dockyard until 1946. Crace died in Liss, Hampshire, England, on May 11, 1968.

Craig, Malin (1875–1945)

U.S. Army general and chief of staff. Born in St. Joseph, Missouri, on August 5, 1875, the son of an army officer, Malin Craig graduated from the U.S. Military Academy at West Point in 1898. Commissioned a second lieutenant of infantry, Craig saw combat during the Spanish-American War that same year with the 6th Cavalry Regiment in Cuba during the Santiago Campaign. Following garrison service in the American West with the 4th Cavalry Regiment, Craig served in the Philippines during the Philippine-American War (1899–1902), and also took part in the international relief expedition to rescue the foreign legations in Beijing (Peking) during the Boxer Rebellion.

Promoted to first lieutenant, he was assigned to the 6th Cavalry Regiment in February 1901.

Craig attended the Infantry and Cavalry School (1903–1904) and the Staff College (1904–1905) at Fort Leavenworth. Promoted to captain in May 1904, he served in the 10th and then the 1st cavalry regiments. He was regimental quartermaster at Fort Clark during 1906–1909.

Craig graduated from the Army War College in 1910. He then held a variety of administrative and troop assignments. Following service with the 1st Cavalry Regiment in the American West during 1912–1916, he was an instructor at Fort Leavenworth in 1916–1917. In 1917 he was detailed to the General Staff Corps.

Following U.S. entry into World War I in April 1917, Craig was promoted to major in May and to lieutenant colonel in August, when he became chief of staff of the 41st ("Sunshine") Division composed of National Guardsmen from the western states commanded by Major General Hunter Liggett; the division went to France as part of the American Expeditionary Forces (AEF). Craig then became chief of staff of I Corps. Craig took part in the Second Battle of the Marne and the Saint-Mihiel and Meuse-Argonne offensives. Promoted to temporary colonel in February 1918 and to temporary brigadier general that June, he was chief of staff of the U.S. Army of Occupation in Germany during 1918–1919.

In August 1919, Craig reverted to his permanent rank of major and returned to the United States as director of the Army War College. Promoted to colonel, he commanded the District of Arizona in 1920–1921. He was once again a brigadier general in April 1921 and was commandant of the Cavalry School during 1921–1923. He commanded the Coast Artillery District of Manila during 1923–1924. Promoted to major general in July 1924, he was chief of cavalry during 1924–1926 and assistant chief of staff for training of the army, 1926–1927, then commanded the Panama Canal Department in 1928–1930 and the IX Corps Area in 1930–1935. He was commandant of the Army War College in 1935.

Promoted to general, Craig succeeded General Douglas MacArthur as chief of staff of the U.S. Army on October 2, 1935, and held that post until his retirement on August 31, 1939. As chief of staff, Craig sought to convince Congress of the army's great weaknesses in manpower and material, and he did what he could, given severe budgetary and other constraints, to reform

the army. His efforts, although largely unheralded at the time, were extremely important in preparing the army for World War II. Craig modernized army equipment, and he introduced realistic training maneuvers that involved large numbers of troops. General George C. Marshall succeeded Craig on his retirement.

Recalled to head the War Department's Personnel Board in September 1941, Craig died in Washington, D.C., on July 25, 1945, following a prolonged illness.

Crerar, Henry Duncan Graham (1888–1965)

Canadian Army general. Born on April 28, 1888, at Hamilton, Ontario, Henry Crerar served with distinction in the artillery during World War I, ending the war as counterbattery staff officer for the Canadian Corps. During the interwar years, he remained in the small Permanent Force (regular army), primarily in staff appointments, and attended both the British Staff College (1923–1924) and the Imperial Defence College (1934–1935).

A brigadier at the onset of World War II, Crerar was promoted to major general in January 1940 and appointed chief of the Canadian General Staff six months later. In that capacity, he played a central role in dispatching two ill-trained Canadian battalions to Hong Kong—and Japanese captivity—in 1941, but he also built up a solid training establishment. Crerar, promoted to lieutenant general in November 1941, was ambitious, ruthless, and jealous of rivals. Posted overseas to command the I Canadian Corps that year, he spent much of his time intriguing against Lieutenant General Andrew McNaughton

and had a major role in planning the disastrous Dieppe Raid (August 19, 1942). Crerar subsequently commanded the I Canadian Corps in Italy from November 1943 until he was recalled to England in March 1944 to lead the Canadian First Army in the Normandy Invasion. With that appointment, Harry Crerar had reached the pinnacle for a Canadian officer. He was promoted to general in November 1944.

Canadian lieutenant general Henry Crerar (right) shown here with British field marshal Bernard Montgomery, in the Netherlands, 1945. (Corel)

Although historians have acknowledged his obvious administrative abilities, the excessively cautious and uninspiring Crerar was, at best, a pedestrian field commander. Field Marshal Bernard Montgomery, under whose command Crerar served in the campaign in Northwestern Europe, had little confidence in him. Crerar's bitter rivalry with the abler Lieutenant General Guy Simonds was unjustified on any military grounds, and there is little doubt, for this and other reasons, that the latter would have replaced him had the war continued much longer. Operation VERITABLE, the assault on the Reichswald region in Germany in February 1945, was an unmitigated disaster. Crerar accumulated vast resources, but his rigid planning forced them into a narrow bottleneck and produced massive casualties.

Crerar nevertheless deserves much credit for effectively representing Canadian interests in Allied councils and for building an overseas

headquarters. He retired from the army in 1946 and died in Ottawa on April 1, 1965.

Crete, Battle of (May 2–June 1, 1941)

Largest German airborne assault of the war. This German victory, however, also marked the end of major German airborne operations. Between April 20 and 26, 1941, British forces evacuated Greece. Crete had become a vital British logistical base, and many of the troops evacuated from Greece landed there.

This alone would have made the island a target for the Germans, but there were other good reasons for a German assault. Located in the eastern Mediterranean, Crete was its fifth-largest island and could be used as an air base for attacking British positions in North Africa and for protecting Axis Mediterranean shipping, especially oil supplies. It might even become a stepping-stone on the route to the Suez Canal. More important, Adolf Hitler saw its capture as necessary to secure his vital southern flank against air attack (especially on the oil fields of Ploieşti) before launching Operation BARBAROSSA, the invasion of the Soviet Union.

British major general Bernard Freyberg commanded the British corps on Crete, centered on the 2nd New Zealand Division. The Allied garrison numbered some 27,550 men and was a mixed group of British, Australian, New Zealander, and Greek forces. Most had only recently arrived, and the

defenders were hardly a cohesive force. Equipment—even basic weaponry—was in short supply. Air support was provided by only a few dozen aircraft. Unlike the Germans, the British did not have air bases within fighter range of the island, which left the Luftwaffe free to operate virtually unopposed, especially since the defenders had few antiaircraft guns.

The German plan for the invasion, code-named Operation MERKUR (MERCURY), centered on parachute drops on the three main airfields of Máleme, H'ráklion, and Rétimo. The Germans planned to hold these and local beaches, especially Souda Bay, until reinforced. Freyberg had been alerted by Ultra intercepts as to the German invasion plans, and he established defensive positions at these obvious targets, but lack of transport meant that his divided forces could not support one another. The Ultra information also worked against the defenders, as Freyberg did not know that the naval assault was small, and he therefore allocated considerable assets to protect against that threat—assets that would have been used to far better purpose to defend the vital airfields.

MERKUR began on May 20, 1941. The operation ultimately involved some 22,000 soldiers—paratroops and mountain forces—and was supported by more than 500 combat aircraft, 700 transport planes, and 80 gliders. The Royal Navy halted the seaborne invasion. Airborne forces at Rétimo were crushed by the few tanks available to the British, and the landings at H'ráklion were also defeated. The key to the battle, however, proved to be at Máleme and nearby Canea and Souda. Luftwaffe bombing at Máleme was particularly effective, and the attackers arrived before the defenders had regained their equilibrium. The British were also surprised by the use of gliders, which landed significant numbers of troops. The fighting was desperate and in some doubt, but the Germans were able to bring in just enough resources to beat back the British counterattacks; the Luftwaffe then ferried in additional supplies to the German troops.

On the night of May 21–22, British warships intercepted an Axis troop convoy consisting of 21 small coastal vessels packed with 2,330 German troops and escorted by a single Italian torpedo boat. In a one-sided engagement, British cruisers and destroyers sank 8 ships in this convoy. At 8:40 a.m. another cruiser force intercepted a second convoy of 30 small steamers and caiques, also escorted by only a single torpedo boat. After a short engagement and with the convoy covered by a smoke screen and

undamaged, the British commander decided to head south because he feared air attacks. The surviving ships of both convoys returned to Greece. Some 400 German soldiers were lost in this effort, and the Germans thereafter relied entirely on air supply and reinforcement in the invasion.

Souda Bay nonetheless became untenable for the British, and the Germans began to land reinforcements. On May 24, Freyberg informed London that German seaborne landings could not be stopped without unacceptable naval losses that would put the entire eastern Mediterranean at risk. Three days later, with the Germans expanding their area of control and Italian troops landing at Sitia on the eastern end of the island, the British ordered an evacuation.

Once again, the Royal Navy rushed to rescue Commonwealth and Allied soldiers (wags said that "BEF" stood for "Back Every Fortnight"). The Royal Navy was able to rescue almost 18,000 men but at considerable cost: three cruisers and six destroyers. The Germans also inflicted damage to the aircraft carrier *Formidable*, the battleships *Barham* and *Warspite*, three cruisers, and numerous other warships. Allied personnel losses in the battle and evacuation were 3,990 dead, 2,750 wounded, and 11,370 captured. The Germans won a victory but lost 220 aircraft and had another 150 damaged. Their casualties totaled 6,698 (3,300 dead), although some British sources reported much higher totals.

The German attack on Crete was audacious and innovative. Hitler, however, refused pleas by Lieutenant General Kurt Student for the airborne forces to next assault Malta; indeed, he removed Student from command of operations on Crete during the battle. In effect, the Battle of Crete was Germany's last real airborne operation of the war, for the German forces that participated were used as elite infantry thereafter. Ironically, the Allies then embraced paratroop operations themselves.

Crimea Campaign (April–May 1944)

Two-month campaign in April and May 1944 that resulted in the Soviet liberation of the Crimean Peninsula, which dominates the northern Black Sea and is connected with Ukraine by the four-mile-wide Perekop Isthmus. As Soviet operations around Kursk drew to an end, Soviet Army generals Fedor I. Tolbukhin and Rodion Malinovsky received instructions to prepare an offensive for mid-August 1943 to clear the Donets Basin region of German troops.

By the winter of 1943, German Army Groups South and A (together numbering 93 divisions) still held a line along the Dnieper River. The German Seventeenth Army held the Crimea but had been isolated from other Wehrmacht units north of it since October. The isolation of the Seventeenth Army was accomplished by Major General Nikolai I. Trufarov's Soviet Fifty-First Army of Tolbukhin's 4th Ukrainian Front, which was at Perekop and along the Sivash, and General Andrei Yeremenko's Independent Coastal Army in Kerch. The plight of German forces in the south was such that Army Groups South and A had to be re-formed. On April 5, 1944, they were redesignated as Army Groups North Ukraine and South Ukraine, respectively.

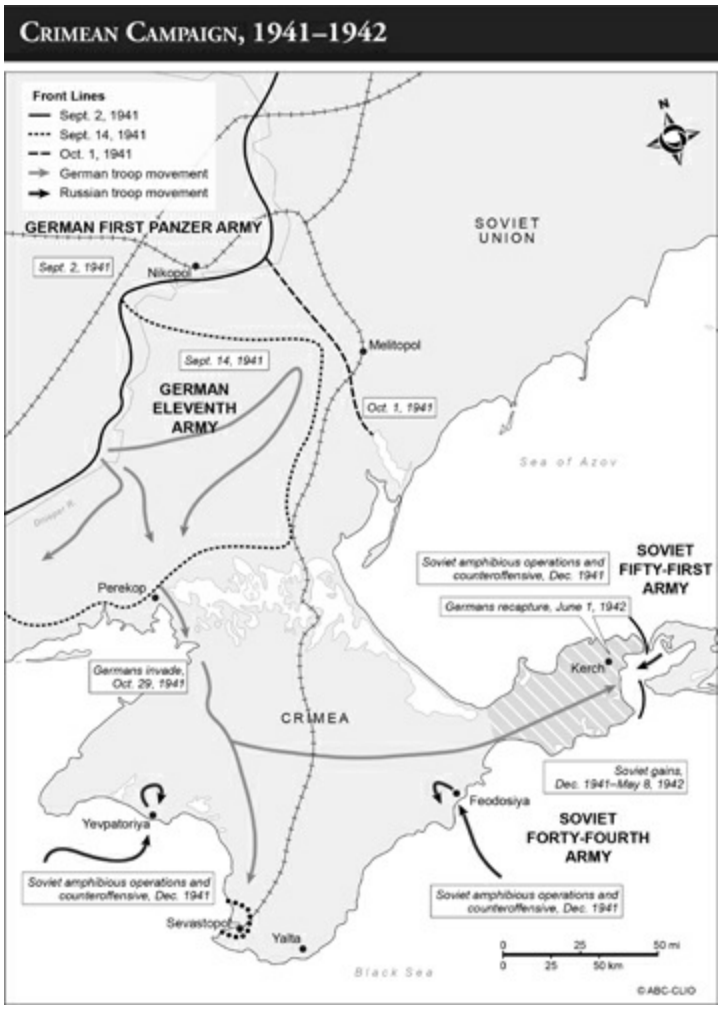
Malinovsky's 3rd Ukrainian Front recaptured Niklolaev on March 28 and then drove toward Odessa, which it retook on April 10. Meanwhile, on March 22, Romanian dictator General Ion Antonescu had flown to Berlin to persuade Adolf Hitler to allow his Romanian forces to withdraw from the Crimea. As might have been expected, the mission was futile. Hitler was determined to hold the Crimea, for in Soviet hands it would serve as a base from which Soviet aircraft could attack the Romanian oil fields at Ploieşti.

Tolbukhin's 4th Ukrainian Front was assigned the task of destroying Colonel General Erwin Jänecke's Seventeenth Army, a mixed force of 11

German and Romanian divisions totaling some 150,000 men. In March, Tolbukhin had been summoned to meet with Soviet dictator Joseph Stalin and the chief of the General Staff, Marshal Aleksandr Vasilevsky, to discuss the plan. The Crimean operation would involve the 4th Ukrainian Front, the Independent Coastal Army, the Azov Flotilla, and the Black Sea Fleet. Tolbukhin would attack across the Perekop Isthmus and through the Sivash lagoon using Lieutenant General Georgii F. Zakharov's Second Guards Army and Lieutenant General Iakov G. Kreizer's Fifty-First Army. Follow-up attacks would target Simferopol and Sevastopol. Simultaneously, Yeremenko would establish a bridgehead on the Kerch Peninsula and block the German escape route as well as German attempts to reinforce against Tolbukhin. Colonel General T. T. Khryukin's Eighth Air Army would support Tolbukhin, and Colonel General Konstantin A. Vershinin's Fourth Air Army would back Yeremenko. The operation involved some 450,000 Soviet personnel.

On April 8, Tolbukhin's artillery opened the attack at Perekop, followed by an artillery barrage at Sivash. Soviet engineers, working waist-deep in icy water, constructed a pontoon bridge. The next day, Yeremenko attacked from Kerch. On April 11, Soviet forces reached the railroad junction at Dzhankoy, behind the Perekop Isthmus.

On April 12, Jänecke ordered his divisions to retreat toward Sevastopol from two prepared lines of defense stretching some 20 miles. This step occurred without Hitler's formal approval. Jänecke's forces reached Sevastopol in surprisingly good order, and he hoped to hold there until his forces could be evacuated by sea. By April 13, Tolbukhin's troops had captured Simferopol, and Yeremenko had secured Feodosiya and Yalta.



Soviet troops in the fight for the city of Sevastopol in the Crimean Peninsula, May 1944. (Yevgeny Khaldei/Corbis)

In the meantime, from April 18, the Soviets built up their forces and artillery in preparation to storm the fortress defenses of Sevastopol, which stretched some 25 miles. These preparations were completed by May 5, the starting date of the final battle to liberate the Crimea. At the end of April, Hitler had decided that Sevastopol had to be held, but its defenses were much weaker than they had been in 1941 when the Germans had attacked there. Also, Jänecke had only five weak divisions and little equipment. Because of Jänecke's repeated requests that his forces be evacuated, Hitler replaced him on May 2 with General of Infantry Karl Allmendinger.

On May 5, the Soviet Second Guards Army attacked from north of Sevastopol via the Belbel Valley. This attack was diversionary, however; the main Soviet attack occurred on May 7, pitting the Fifty-First Army and the Independent Coastal Army against the Sapun Ridge separating Sevastopol from the Inkerman Valley. Soviet forces broke through the German lines, forcing the defenders from the old English cemetery. The Germans then retreated to the Chersonese subpeninsula.

Only on May 9, with both the city and the harbor in Soviet hands, did Hitler authorize an evacuation. The remnants of the German-Romanian force attempted to hold a dock at Kherson. Any German hopes for a final evacuation by sea were dashed by Soviet air and naval operations. Consequently, on May 13, the remaining Axis troops surrendered to the Red Army. Soviet authorities put total German losses in the Crimea Campaign at 50,000 killed (most of them Germans) and 61,000 taken prisoner (30,000 of them at Chersonese). The Germans admitted to having lost 60,000 men; regardless, another German army had been destroyed.

Cripps, Sir Richard Stafford (1889–1952)

British lawyer, politician, ambassador, and cabinet minister. Born in London on April 24, 1889, Richard Stafford Cripps was educated at both Winchester and Oxford University. He studied chemistry and then law, becoming a lawyer in 1913.

Physically unfit for military service, Cripps drove an ambulance in France during World War I. In 1918 he returned to the legal profession, in which he made a fortune. During the Great Depression, he began to shed his Christian Socialist views. He also became involved in Labour Party politics and was elected to Parliament in 1931. Cripps was briefly solicitor general before refusing to serve in the National Government of 1931. Over time, he became more involved in left-wing causes and increasingly opposed to fascism. In 1939, he and Aneurin Bevan were expelled from the Labour Party because their demands for a popular front were regarded as excessively procommunist. Cripps remained in Parliament as an independent through the war.

In 1940, Prime Minister Winston L. S. Churchill sought to encourage Soviet entry in the war. Hoping that Cripps's left-wing reputation would give him some leverage in Moscow, Churchill appointed him ambassador to the Soviet Union. The experiment failed, however, and Cripps was recalled. Churchill then moved to bring him into the government, and in February 1942, Cripps became lord privy seal and leader of the House of Commons. That summer, he was sent to India to offer that country dominion status in hopes of rallying its people against Japan. Divisions in India were too great for this approach to be effective, though, and Cripps returned to London. His dissatisfaction with the British war effort and with Churchill in particular led to his removal from the War Cabinet in October 1942, but the next month he was appointed minister of aircraft production, a post he held for the remainder of the war.

In July 1945, Cripps was readmitted to the Labour Party and was appointed president of the Board of Trade. In 1947, he became chancellor of the exchequer in the new Labour government. Through moral suasion, he mounted an austerity campaign, even convincing unions to accept a voluntary wage freeze. His dominance was challenged in September 1949 when he devalued the pound, and just a year later, exhausted and ill, he resigned. Cripps died in Zurich, Switzerland, on April 21, 1952.

Croatia

In 1939, Croatia was not an independent nation; it was part of the polyglot Yugoslavia and had a population of some 3.8 million. Situated in western Yugoslavia, Croatia covered about 21,000 square miles and had a long border along the Adriatic Sea. The peace treaties ending World War I created the Kingdom of the Serbs, Croats, and Slovenes, soon known as Yugoslavia (South Slavs). However, ethnic and religious diversity in the new country led to instability and strife. Serbia, around which the new nation was formed, had been on the Allied side in the war; Croatia had been part of the old Austro-Hungarian Empire, and Croats had fought for the Central Powers. Although both peoples were Slavs, there were significant differences: Croatians used the Roman alphabet and were Roman Catholic; Serbs utilized the Cyrillic alphabet and were Orthodox Christians.

With some justification, Croats in particular believed they were discriminated against in the new Serb-dominated state, which imposed

political, social, and economic restrictions on Croatia. In response to these policies, Croats formed a separatist right-wing group known as the Ustaše, which was supported by fascist Italy. Many Croats were pro-Italian and pro-German.

Croats generally supported the Yugoslav government's initial March 25, 1941, decision, admittedly taken under heavy German pressure, to join the Axis alliance in World War II. The coup in Belgrade two days later that reversed this course alienated many Croats, and when the German Second Army and the Italian Second Army marched into Slovenia and Croatia on April 6, they received an enthusiastic welcome from many inhabitants. Croat units in the Yugoslav Army mutinied, and on April 10, Ustaše activists proclaimed an independent Croatia and began negotiations with the Germans. Italy and Hungary each annexed parts of Croatia; what remained was combined with Bosnia-Herzegovina to form the Independent State of Croatia, or Nezavisna drava Hrvatska (NDH), with Ante Pavelić as president. Croatia adhered to the Tripartite Pact in June 1941.

The leaders of the NDH supported a policy of ethnic cleansing, and the Ustaše forcibly converted to Roman Catholicism tens of thousands of Orthodox Serbs and Jews. Orthodox Serbs were subject to racial laws. Serbs had to wear blue armbands with the letter P for "Pravoslav" (Orthodox); later they were deported to death camps. The Catholic Church, led by Archbishop Alojzije Stepinac, acquiesced in this and refused to speak out against the murder of Serbs, Jews, and Gypsies (Romas). These groups faced execution at various concentration camps, of which the most infamous was Jasenovac, or they were transported to German death camps such as Auschwitz and Bergen-Belsen. Of an estimated 40,000 Croatian Jews, 32,000 died. Some 26,000 Romanis and between 330,000 and 390,000 Serbs also were executed. There are no reliable estimates as to the number of Muslims killed.

Croat army forces defended the new state's borders and assisted the Germans and Italians in securing the Balkans. Some Croat units were even deployed to defend Nazi-occupied France. Although there were antifascist groups in the Independent State of Croatia, such as the Council for the National Liberation of Croatia (Zemaljsko antifaisti√ko vijeće narodnog oslobođenja Hrvatske), these groups were largely ineffective. Many Croats did join the Partisans, led by Tito (Josip Broz), to fight the Axis occupiers.

At the end of the war as Tito's Partisans pushed north, NDH forces and

Ustaše supporters fled to Austria. What remained of the NDH army surrendered in May 1945, and British military authorities returned many NDH officials and soldiers hiding in Austria to Yugoslavia.

Croatia was then reintegrated into a communist Yugoslavia, and Tito took his vengeance. Within weeks of the war's end, the Partisans executed, without trial, perhaps a quarter million people who had sided with the Germans, most of them Croats.

CROSSBOW, Operation (November 1943–May 1945)

Code name for the Anglo-American air operations against the German long-range weapons program. British intelligence knew about German attempts to create a long-range military rocket within months of the war's beginning. In April 1943, Duncan Sandys, a member of Britain's War Cabinet, conducted a study of German weapons research and declared the rocket program a serious threat. Discovering more about these new "V," or "Vengeance," weapons became a priority. Approximately 40 percent of all Allied reconnaissance flights from Britain between May 1, 1943, and March 31, 1944, sought information concerning Germany's V programs. The Royal Air Force (RAF) then began operations against such targets.

Two main types of V weapons were developed by Germany. First was the V-1, commonly referred to as the buzz bomb, the flying bomb, and the doodlebug. This was an unmanned flying bomb powered by a pulse-jet engine and developed by the German Air Force. Initially, V-1s were to be launched from fixed sites, but as those sites came under Allied attack, the Germans developed simpler prefabricated launch rails that could be set up

faster than the Allies could find and destroy them. The second type was the V-2, a rocket that reached the edge of Earth's atmosphere and flew at supersonic speeds. Developed by the German Army, the V-2 was much more difficult for the Allies to attack because it used a mobile launching platform mounted on a truck.

On the night of August 17–18, 1943, 597 RAF bombers left Britain to strike Peenemünde, the center of German rocket research on the Baltic coast. More than 700 people died in the attack, most of them forced laborers.

In November 1943, the CROSSBOW committee was formally established to coordinate all information concerning Germany's missile program as well as implement appropriate countermeasures. The most important CROSSBOW sites were the launch complexes for V weapons located in northern France. Two kinds of sites were under construction: (1) seven "large sites," massive concrete bunkers for the storage and assembly of V-1s and V-2s, and (2) numerous "ski sites," so-called because of the large curved structures designed to launch V-1s.

American tests indicated that the most effective assaults against these sites were made from minimal altitude using fighter-bombers. British commanders, however, had little faith in the American tests and insisted that heavy bombers should continue against CROSSBOW targets, despite the growing diversion of resources from the combined bomber offensive and preparations for the Allied invasion of France. The dispute was never satisfactorily resolved.

On June 12, 1944, the first V-1s struck Britain. Initially, Allied commanders did not divert resources from OVERLORD, the June 6, 1944, invasion of France, to attack the V-1 launch sites, but within two weeks the number of V-1s reaching Britain forced a response. On average, 97 V-1s struck Britain daily between June 12 and 26, 1944. The largest attack was on the night of June 15–16, when 151 flying bombs reached Britain, of which 73 hit London. By July 15, 2,579 V-1s had struck Britain, 1,280 of which fell within the London area.

As a result, supreme commander of the Allied Expeditionary Force General Dwight Eisenhower gave priority to CROSSBOW sites above all other targets except for "the urgent requirements of the battle." During the next two months, operations against these sites consumed half the energies of Bomber Command, and some 3,000 Allied aircrew were lost in Operation CROSSBOW.

At its peak, the defense of the British Isles against the V-1s included an antiaircraft belt along the coast of 1,000 guns using the new proximity fuze, more than 2,000 barrage balloons, and 21 fighter squadrons.

By September 1944, the Allied advance in France had pushed the Germans beyond the range from which V-1s could reach Britain. But after a brief respite, attacks continued from the Netherlands, either launched in midair by obsolete bombers or from newly constructed launch rails. The last V-1 reached England on March 28, 1945. One day earlier, the last V-2 had struck Britain. Casualties from the V-1s amounted to 6,139 killed and 17,239 seriously wounded; the V-2s accounted for 2,885 deaths and 6,268 seriously wounded.

Cruisers

Class of warships that in the World War II era possessed moderate armor and armament and were capable of high speed. These ships were the successors of the 18th-century frigates in the age of fighting sail. Frigates were primarily employed in reconnaissance duties for the main battle fleet. They also served in commerce protection, commerce raiding, surface combat against enemy vessels of similar strength, and blockades. Technological innovations in the

mid-19th century, such as steam power and iron armor, led to the development of the first modern cruiser, the U.S. Navy's *Wampanoag*, commissioned in 1867.

By World War I, the major naval powers of the world had produced six different types of cruisers charged with the tasks formerly assigned to frigates. They also were given a new task that resulted from technological change—protecting the capital ships of the fleet from torpedo attack. These warships were primarily armored cruisers, protected cruisers, light cruisers, and scout cruisers. Also in production was the battle cruiser—a warship that incorporated battleship armament on a cruiser-sized hull and was capable of high speed. It, however, was viewed largely as a capital ship rather than a cruiser. The final type was the armed merchant cruiser, a civilian-owned merchant ship or passenger liner converted to carry weapons in time of war.

In the years immediately following World War I, most of the armored, protected, and scout cruisers were considered obsolete and scrapped. The major maritime powers, primarily Great Britain, also largely discarded battle cruisers because their light armor did not adequately protect them against heavily armed enemy warships. Britain retained three (the *Hood*, *Renown*, and *Repulse;* the *Tiger* was decommissioned in 1930), whereas Japan had four Kongo-class ships that were modernized and reclassified as battleships.

The interwar years produced many of the cruisers that participated in World War II. Military and diplomatic developments directly affected their design, although technologically they were almost the same as those of World War I. Many naval officials viewed the continued construction of cruisers as a dubious endeavor, partly because of the increasing ability of aircraft to perform reconnaissance, the primary duty of cruisers up to that time. Construction, however, did not diminish, as the major maritime powers still desired a warship that was capable of protecting trade routes and providing support for amphibious operations—a relatively new role that had surfaced in World War I. Cruisers also proliferated as part of a new worldwide naval arms race.

Following World War I, the great powers attempted through international agreements to prevent an arms race in warships, which many politicians believed had been a factor in the tensions that had led to war. The resulting 1922 Washington Naval Conference produced the situation that diplomats had sought to avoid when it placed restrictions on the tonnage of cruisers but

not on the numbers allowed to each naval power. The nations that signed the 1922 agreement tried to correct this problem at the 1930 London Conference, which separated cruisers into two basic types: those mounting 8-inch guns (heavy cruisers) and those with 6-inch or smaller guns (light cruisers). Building ratios between the signatory powers based on total tonnage of cruisers restricted the numbers of each type, and a clause from the Washington Treaty stating that no warship could displace more than 10,000 tons or carry guns larger than 8-inches governed their size. Even so, cruisers continued to be the largest surface warships built, as restrictions on battleship construction that had been set out at the Washington Naval Conference remained in place.

The 8-inch-gunned heavy cruisers were built primarily in the years before the 1930 London Conference, because most of the world's major maritime powers had already built up to the tonnage limit set for these ships by the Washington Agreement. Although the United States and France managed to produce some vessels that were well-balanced designs, the majority were generally unsatisfactory, as armor was sacrificed to meet the 10,000-ton restriction of the Washington Treaty. An example of this imbalance was the U.S. heavy cruiser *Portland.* This ship measured 610 feet long by 66 feet in beam, displaced 10,258 tons, and mounted a primary armament of nine 8-inch guns. It had a maximum speed of 32.5 knots, but its armor protection consisted of a belt only 2.5 inches thick and an armored deck that was 2.5 inches deep. This armor was generally effective only against opposing destroyers armed with 5-inch guns. Larger shells could easily penetrate the protection.

Japan and Italy, each of which had signed one or both of the treaties, built heavy cruisers that solved this problem of protection through subverting the terms of the agreements. Germany, which was restricted by the Treaty of Versailles, nonetheless built heavy cruisers that violated this agreement: the heavy cruisers of the Prinz Eugen class and the more powerful Deutschland class originally classified as a Panzerschiff, or armored ship. The latter class of ships mounted six 11-inch guns and displaced 11,700 tons, in contravention of the 10,000-ton limit set out in the treaty.

The naval powers also produced large numbers of 6-inch-gunned light cruisers, particularly after the 1930 London Conference, as each built up to the construction limit for the type. Many of these vessels also suffered from

inadequate armor protection as a result of the restrictions of the naval treaties. An example was the British light cruiser *Arethusa*, which measured 506 feet by 51 feet and displaced 5,270 tons. It mounted six 6-inch guns and was protected primarily by an armored belt with a maximum thickness of 3 inches that only covered its machinery and ammunition spaces.

These ships were charged with the same duties as the cruisers of the World War I era, with the notable exception of reconnaissance, as airplanes now fulfilled that role. Reconnaissance duty was replaced by a new task resulting from the threat posed by airplanes to surface warships. Most interwar cruisers, particularly light cruisers, were built with large antiaircraft batteries to enable them to help protect battleships and aircraft carriers against enemy aerial attack. Some light cruiser designs were purpose-built for this role. In 1937, Great Britain built the first units of the Dido class, which became known as antiaircraft cruisers. These ships mounted 10 5.25-inch guns in dual-purpose turrets that could either be trained on surface targets or elevated to an extreme angle for use against aircraft.

By the beginning of 1940, four months after the start of World War II, interwar cruiser construction, in combination with some battle cruisers retained from World War I, had created a large world cruiser force. Great Britain maintained 3 battle cruisers, 18 heavy cruisers, and 50 light cruisers; the United States had 18 heavy cruisers and 19 light cruisers; Japan operated 18 heavy cruisers and 19 light cruisers; Italy had 7 heavy cruisers and 14 light cruisers; France maintained 7 heavy cruisers and 12 light cruisers; Germany operated 6 heavy cruisers (3 Deutschland-class Panzerschiffe and 3 Admiral Hipper-class) and 6 light cruisers; and the Soviet Union possessed 5 medium cruisers and 2 old light cruisers. These numbers were augmented by wartime construction.

Cruisers in World War II fulfilled all of the roles that naval officers in the interwar years believed to be important. These ships were particularly valuable on the outbreak of the war in Europe in September 1939. The German Navy, being much smaller than it had been in World War I, was not powerful enough to face the British Royal Navy in open combat. As a result, the German Navy was given the task of waging a commerce war on Great Britain’s overseas trade routes in an effort to deny that country war materials and supplies.

British cruisers were deployed to protect against these raiders. This

situation resulted in the December 13, 1939, Battle of Río de la Plata, the first naval engagement between German and Allied warships in the conflict. The battle pitted the German pocket battleship *Admiral Graf Spee* against one British heavy cruiser and two light cruisers. The German vessel retreated to Montevideo, Uruguay, where its commander scuttled his ship rather than renew battle. British cruisers also served in the 1941 hunt for the German battleship *Bismarck* and the heavy cruiser *Prinz Eugen*, which had been dispatched into the Atlantic to prey on shipping. Although commerce warfare by surface warships declined somewhat after the sinking of the *Bismarck* because of the restrictions Adolf Hitler placed on their use, British cruisers continued to guard merchant convoys in the Atlantic Ocean against the occasional sortie of German warships.

The Royal Navy heavy cruiser *Exeter* took part in the Battle of the River Plate (Rio de la Plata) against the German pocket battleship *Graf Spee* on December 13, 1939, but was sunk in the Second Battle of the Java Sea on March 1, 1942. (Albert Harlingue/Roger Viollet/Getty Images)

In June 1940 with Italy's entry into the war, this duty expanded to the Mediterranean. British cruisers escorted convoys and attacked Axis shipping. Allied cruisers also performed commerce protection duties in the Arctic Ocean following Germany's invasion of the Soviet Union in 1941. Armed merchant cruisers on the Allied side were involved in blockade duty as well from the opening days of the war in the Atlantic. This effort was not very

effective, however, because after occupying Norway and France in 1940, the Germans had access to goods beyond those from the Soviet Union.

Cruisers also provided gunfire support for amphibious invasions not only in the Atlantic, Mediterranean, and Arctic theaters but also in the Pacific, following U.S. entry into the war in December 1941. Germany employed cruisers in the 1940 invasion of Norway, and the Allies utilized them during the 1942 amphibious assault in North Africa and the invasions of Sicily and Italy in 1943. They were also used to bombard and to direct fire during the June 1944 invasion of Normandy, France, Operation OVERLORD. The role of cruisers in supporting amphibious invasions proved particularly important in the Pacific, where mostly U.S. cruisers bombarded Japanese island possessions in preparation for the landing of amphibious forces.

Arguably the greatest use of cruisers in the Pacific theater was in their new role as antiaircraft protection for aircraft carriers. Throughout the conflict, cruisers received upgrades to their antiaircraft weaponry as a response to the extreme threat of air attack. New antiaircraft light cruisers augmented this force. Allied cruisers provided vital cover in operations across the Pacific theater. In the March–June 1945 battle for Okinawa, for instance, cruisers formed part of the defensive screen to prevent Japanese suicide aircraft (kamikazes) from crashing into Allied ships.

The valuable duties performed by cruisers in World War II resulted in a heavy toll of ships sunk. Japan lost 39 light and heavy cruisers. Great Britain had 27 vessels sunk, and Italy and the United States lost 13 and 12, respectively. France lost 10 cruisers, the majority scuttled to prevent their capture by the Germans following the surrender of France in 1940. The Germans lost 7 cruisers, the majority of these sunk early in the war in commerce raiding or during the invasion of Norway.

CRUSADER, Operation (November 18–December 30, 1941)

Successful British North Africa military operation. The failure of Operations BREVITY and BATTLEAXE, the British efforts in Libya during the summer of 1941 to relieve the siege of Tobruk, spurred British prime minister Winston L. S. Churchill's determination to gain a decisive victory over German general Erwin Rommel in North Africa. Disregarding advice to improve the defense of the Far East, particularly the British garrison in Singapore, Churchill rushed reinforcements to Egypt.

By November 1941, Lieutenant General Alan Cunningham's Eighth Army was significantly stronger than Rommel's Panzer Gruppe Afrika in every category. It had more than 700 tanks plus 500 in reserve and in shipment, as compared with Rommel's 174 German and 146 obsolete Italian tanks; it also had almost 700 aircraft, against 120 German and 200 Italian aircraft on Rommel's side. Moreover, Rommel had not received any German reinforcements, and the Italian infantry divisions that had been transferred to Africa lacked transport, which seriously restricted their movement in desert conditions. Rommel had, however, received large numbers of 50mm antitank guns. He had carefully husbanded all his supplies and planned to launch

another offensive to capture Tobruk, but he was preempted by General Claude Auchinleck, Allied commander in chief for the Middle East, who launched Operation CRUSADER on November 18.

Auchinleck planned for Lieutenant General A. R. Godwin-Austin's XIII Corps to pin down the Axis outposts on the Egyptian frontier at Bardia and Sollum, while Lieutenant General Willoughby Norrie's XXX Corps, comprising the mobile armored regiments, would sweep south of these fortified positions through the desert "to seek and destroy" Rommel's armored force. Auchinleck firmly believed that the backbone of Rommel's army had to be destroyed before the Eighth Army linked up with the Tobruk garrison, which would break out from the fortress. Therefore, from the outset the two corps would be operating independently.

A huge storm the night before the attack turned the desert into a quagmire and grounded Luftwaffe reconnaissance flights. The element of surprise was soon wasted, however, as the British attack became disjointed and the armored brigades became involved in piecemeal battles. The majority of the fighting took place around the escarpment of Sidi Rezegh, with the Italian-built road on which Rommel's supplies were transported at the bottom and a German airfield on top. But in a repeat of the summer offensives, the British failed to combine their armor in a concentrated blow.

The first phase of the battle, from November 18 to 23, saw hard confused fighting in which British and German tank formations were habitually intermingled in the highly fluid battle and often found themselves behind what would have been the enemy's lines had they existed. Events culminated on Sunday, November 23, aptly known in the German calendar as Totensonntag, or "Sunday of the Dead," the name by which the Germans remember this battle. Up until that day, Rommel's skillful tactics had decimated the attacking British force, which had just 70 tanks remaining in the end. But in a concentrated attack launched on November 23, Rommel lost 70 of his remaining 160 tanks.

At the end of this phase of the battle, Rommel nevertheless believed that the British armor had been smashed and was spread in disorganized chaos across the desert. Yet he knew that the British were able to sustain greater losses because they had a large reserve. He therefore decided to exploit the British confusion by striking at their vulnerability—their supplies and lines of communication. By launching a lightning thrust to the frontier, he also

planned to strike at the morale and confidence of the British troops and their commanders, as he had successfully done in the past.

Lieutenant General Ludwig Cruewell, commander of Deutsches Afrika Korps, suggested that it would be better to reorganize and salvage the vast stocks of German and British matériel abandoned on the battlefield. But on November 24, ignoring this sound advice, Rommel personally led the deep thrust with the mobile 15th and 21st Panzer Divisions and the Ariete Armored Division to the frontier and into the rear of the Eighth Army; he hoped this would cause panic, result in the capture British supplies, and relieve his garrisons on the border. Rommel's "dash for the wire" nearly succeeded, as he almost overran the two main British supply dumps and created a stampede among the British. Cunningham pessimistically sought permission to withdraw from the battle, but Auchinleck held command with a firm grip and replaced him as commander of the Eighth Army with Major General Neil Ritchie on November 26.

Rommel managed to link up again with his forces surrounding Tobruk, and he inflicted additional heavy losses on XIII Corps, which had advanced in an attempt to relieve Tobruk. But his losses and the strain on his supplies became too great, and on December 7, Rommel began to withdraw. Ultimately, he had to abandon his garrisons in the frontier outposts at Bardia and Sollum, with the loss of 14,000 troops, yet he withdrew with as much skill as he had shown on the battlefield and escaped, with his army still intact, from Cyrenaica back to El Algheila, where he had started nine months earlier.

For the first time in the war, the British had defeated a German army. They achieved much success in the battle, finally raising the siege of Tobruk and inflicting 33,000 casualties at a cost of only 18,000 British and Commonwealth casualties. But most of the Axis losses were Italian troops or German administrative staff who surrendered in mid-January in the border posts, whereas the British casualties were predominantly desert veterans who could not be easily replaced. Moreover, the British had failed in their principal objective of destroying Rommel's armored forces, and he was again recuperating on secure supply lines while the British attempted to prepare for the next offensive over extremely long lines of communication.

The concurrent resurgence of Axis naval power in the central Mediterranean enabled the Italians to send more supplies and reinforcements to Rommel. With additional tanks and fuel, he launched an attack on January

21, 1942, and the next day his force, which now included more Italian divisions, was renamed Panzer Armee Afrika. Rommel's probing raid again precipitated a hasty British withdrawal, and he recaptured Benghazi, but his forces were still too weak to advance beyond the British defensive positions on the Gazala Line, which ran from Gazala (35 miles west of Tobruk) 50 miles south into the desert to Bir Hacheim. There, both sides paused, recuperating and preparing for the next round of the "Benghazi Handicap" in the North African Campaign.

Crutchley, Sir Victor Alexander Charles (1893–1986)

Royal Navy vice admiral. Born on November 2, 1893, in London, Victor Alexander Charles Crutchley served at sea in World War I and won the Victoria Cross for heroism during the action at Ostend, Belgium, in May 1918. He commanded the light cruiser *Diomede* between 1935 and 1936 and was captain of the battleship *Warspite* during 1937–1940, seeing action during the Norwegian Campaign. On April 13, 1940, he led the *Warspite* and

nine destroyers into Narvik Harbor and sank the eight German destroyers trapped there.

Crutchley next commanded the Royal Navy barracks at Devonport before being transferred to the Pacific as a rear admiral in June 1942 to take command of a squadron of Australian and U.S. ships that had recently participated in the May 7–8, 1942, Battle of the Coral Sea. His forces supported the U.S. invasion of Guadalcanal on August 7, 1942. However, Crutchley's dispositions contributed to the subsequent Japanese victory in the August 8–9 Battle of Savo Island, which saw one Australian and three U.S. cruisers sunk with no Japanese losses.

Crutchley avoided official censure for the defeat and went on to participate in further operations in the Pacific, mostly in support of various amphibious landings. Promoted to vice admiral, he assumed command of Gibraltar in 1945 and remained in that post until his retirement two years later. Crutchley died in Nettlecombe, Dorset, England, on January 24, 1986.

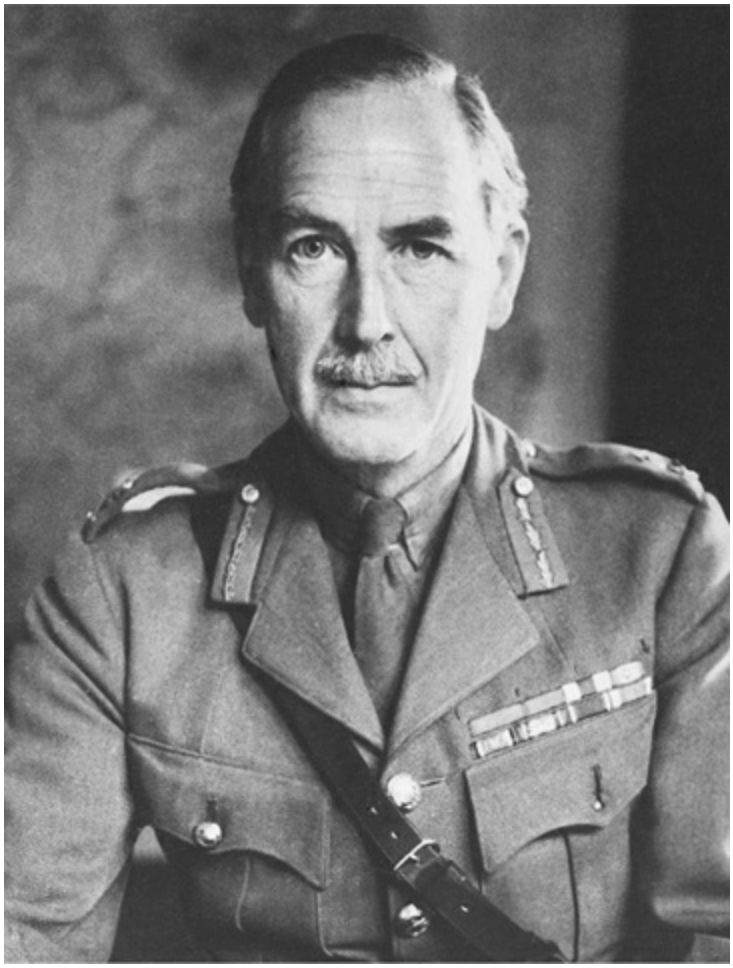
Cunningham, Sir Alan Gordon (1887–1983)

British Army general. Born on May 1, 1887, in Dublin, Ireland, Alan Gordon Cunningham was the younger brother of future admiral Andrew Browne Cunningham. Alan Cunningham was commissioned in the army on graduation from the British Royal Military College, Sandhurst, in 1906. Decorated for his service in World War I as a member of the Royal Horse

Artillery, he was a General Staff officer at the Straits Settlements in Southeast Asia between 1919 and 1921. As a brigadier, he commanded the 1st Division of the Royal Artillery from December 1937 until September 1938, when he took command of the 5th Anti-Aircraft Division.



General Sir Alan Cunningham, British High Commissioner for Palestine, during 1945–1948. (Bettmann/Corbis)

For most of 1940, Cunningham commanded, in succession, the 66th, 9th, and 51st Infantry Divisions in Britain before assuming command of forces in Kenya in October. He was assigned the mission of conquering Italian Somalia from the south with his African 11th and 12th Divisions and the South African 1st Division. Now a major general, Cunningham led his forces in an invasion of Somalia in January, taking Kismayu on February 14 and Mogadishu on February 25, 1941. He then drove northward to Harar and on to the capital of Addis Ababa, which fell on April 6. Coordinating with

General William Platt's forces from the Sudan, Cunningham pinned Italian forces at Amba Alagi and forced their surrender. The campaign was a great success for Cunningham, who was knighted and then transferred to command the British Eighth Army in Egypt on September 10, 1941.

Beginning on November 18, the Eighth Army launched Operation CRUSADER, General Claude Auchinleck's offensive to relieve the siege of Tobruk. With scant time to prepare and as a stranger to armored warfare, Cunningham found himself outmaneuvered by Afrika Korps commander General Erwin Rommel at Sidi Rezegh, 20 miles from Tobruk. In what became known to the Germans as the Battle of Totensonntag (Sunday of the Dead), British forces suffered heavy losses, and Cunningham was forced to evacuate by plane. On November 26, Auchinleck relieved him and replaced him with General Neil M. Ritchie. Cunningham then commanded the Staff College at Camberley (1942–1943) and the Eastern Command (1944–1945).

Promoted to general, Cunningham retired in October 1946. Between 1945 and 1948, he served as the last British high commissioner to Palestine and Transjordan. Knighted a second time on his return to Britain, Cunningham died on January 30, 1983.

Cunningham, Sir Andrew Browne (1883–1963)

British admiral of the fleet and first sea lord from 1943 through 1945. Born in Dublin January 7, 1883, Andrew Browne Cunningham enrolled at Stubbington House near Portsmouth to prepare for entry into the Royal Navy.

Rated a midshipman in 1898, he saw action with the Naval Brigade in the 1899–1902 South African (Second Boer) War. Although Cunningham later served in a variety of warships, he was happiest in destroyers and torpedo boats. In 1911, Cunningham took command of the destroyer *Scorpion*, remaining with it until early 1918 and spending most of World War I in the Mediterranean, the theater that became inseparably identified with his career.

Promoted to captain in 1920, Cunningham thereafter held staff positions in the Baltic, the Mediterranean, and the West Indies. After being promoted to rear admiral in 1934, he commanded the destroyer flotilla in the British Mediterranean Fleet from 1934 to 1936. He then commanded the battle cruiser squadron and was second-in-command of the Mediterranean Fleet during 1937–1938. From September 1938 until June 1939, he was deputy naval chief of staff. Promoted to vice admiral and universally called "ABC," Cunningham assumed command of the Mediterranean Fleet in June 1939.

The military collapse of France and Italy's entry as an Axis belligerent in June 1940 prompted Cunningham's first significant actions in the war—the peaceful neutralization of the French fleet at Alexandria and an engagement with the Italians on July 9, 1940, off Calabria; in the latter, he pursued a powerful force returning from North Africa into Italian home waters, damaging its flagship. Four months later on November 11, 1940, with his fleet strengthened by the addition of the carrier *Illustrious*, Cunningham launched a night air attack on the Italian base at Taranto, sinking three battleships, two of which were later raised and repaired. On March 28, 1941, he fought the Italians off Cape Matapan, sinking three heavy cruisers and two destroyers and damaging a battleship. Soon afterward, however, British armies in Greece and Crete required evacuation, and Cunningham's full support of them brought severe losses to his ships from German air attacks.

In June 1942, Cunningham became the Admiralty's representative to the Combined Chiefs of Staff in Washington. Promoted to admiral of the fleet, he became Allied naval commander in chief in the Mediterranean in October 1942 and oversaw the naval aspects of Operation TORCH, the Allied landings in North Africa on November 8, 1942, as well as the Allied assaults on Sicily in July 1943 (Operation husky) and at Salerno five months later, followed by Italy's surrender and internment of the Italian fleet at Malta.

When First Sea Lord Sir Dudley Pound died in October 1943, Cunningham succeeded him and served in that post for the rest of the war. Often at odds with Prime Minister Winston L. S. Churchill, Cunningham also faced growing U.S. naval dominance and a very different war in the Pacific. Ennobled in September 1945, he retired in June 1946, recognized as one of the last British admirals in the Nelson tradition. Cunningham died in London

on June 12, 1963. His younger brother, Alan Gordon Cunningham, was a much-decorated British Army general.

Cunningham, Sir John Henry Dacres (1885–1962)

British Royal Navy admiral of the fleet. Born on April 13, 1885, at Demerara, British Guiana, John Henry Dacres Cunningham joined the British Royal Navy in 1900 and specialized in navigation. During World War I, he served in the West Indies, in the Mediterranean, and with the Grand Fleet. Promoted to captain in 1924, Cunningham held a variety of staff and seagoing positions between the wars, acquiring an intimate knowledge of Mediterranean waters while serving there during the Abyssinian crisis (1934–1935). In 1938, he became fifth sea lord and chief of naval air services. He was promoted to vice admiral in 1939.

In early 1940, Cunningham's squadron took part in the Norway Campaign and then participated in the ill-fated Anglo-French expedition to Dakar (September 23–25). In early 1941, Cunningham was appointed fourth

sea lord, responsible for supplies and transport—a vital position in which he remained for two years, winning a knighthood in 1941. In June 1943, he became commander in chief of the Levant, one of the two Mediterranean commands; later that year, he was made commander in chief and Allied naval commander of both commands, directing British, U.S., French, and Greek vessels. Cunningham's forces were responsible for amphibious assaults at Anzio (Operation ANVIL, January 22–May 25, 1944) and in the south of France (Operation DRAGOON, August 15, 1944).

In May 1946, Cunningham took over as first sea lord from Lord Cunningham of Hyndhope (the two men were not related), thereby becoming the first navigation officer to attain the navy's highest position. As part of the British postwar economy drive, he supervised drastic cuts in the wartime fleet, including the scrapping of many serviceable vessels. In January 1948, he was promoted to admiral of the fleet, retiring in September 1948 to become chairman of the Iraq Petroleum Company, where he remained for 10 years. He died in London, on December 13, 1962.

Cunningham, Winfield Scott (1900–1986)

U.S. Navy rear admiral. Born in Rockfield, Wisconsin, on February 16, 1900, Winfield Scott Cunningham entered the U.S. Naval Academy at Annapolis in 1916. His class graduated in 1919 because of World War I, and Cunningham was commissioned an ensign. He then held a variety of sea assignments. In 1924, Cunningham was accepted for flight training. His aviation career began

in scout planes and culminated with command of VF 5 (Fighting Five) Squadron aboard the carrier *Yorktown.*

On November 28, 1941, Commander Cunningham took charge of the naval air station under construction at Wake Island in the Pacific. His command consisted of 500 marines from the 1st Defense Battalion, 12 F-4F Wildcat aircraft of marine fighter squadron VMF 211, and various support personnel. There were also more than 1,100 civilian contractors assisting in the construction.

The Japanese attacked Wake Island beginning on December 8 (December 7 in Hawaii). For 15 days, the defenders held them off, but faced with overwhelming odds and concerned about the fate of the civilians on the island, Cunningham chose to surrender. He and his men spent the next four years in Japanese captivity. During this time, Cunningham twice attempted escape.

Cunningham was freed at the end of the war. In 1946, he took command of the seaplane tender *Curtiss.* From June 1947 until his retirement from the navy as a rear admiral in June 1950, he commanded the Naval Technical Training Center, Memphis, Tennessee. Cunningham died on March 3, 1986, in Memphis, Tennessee.

Currie, Lauchlin (1902–1993)

Economist, diplomat, and adviser to President Franklin D. Roosevelt. Born on October 8, 1902, in West Dublin, Nova Scotia, Canada, Lauchlin Currie studied at the London School of Economics and Harvard, where he taught for several years. He moved to Washington, D.C., in 1934 to work at the U.S.

Treasury and Federal Reserve Board and was Roosevelt's White House adviser on economic affairs from 1939 to 1945.

Sent to Chongqing (Chungking) in January 1941, Currie met there with Chinese leaders. He recommended that China be added to the Lend-Lease program, despite the fact that Generalissimo Jiang Jieshi (Chiang Kai-shek) was more interested in building up his strength vis-à-vis the communists than in fighting the Japanese. He helped set up the American Volunteer Group (AVG, the Flying Tigers) under Brigadier General Claire Chennault as well as a training program in the United States for Chinese pilots, and he expanded the China National Aviation Corporation.

Currie's paper to the Joint War Board in May 1941 on Chinese aircraft requirements stressed the role a Chinese air force could play in defending Singapore, the Burma Road, and the Philippines against Japanese attack and pointed out China's potential for air strikes on Japan. Currie recommended Owen Lattimore as political adviser to Jiang and argued against concessions to Japan.

In 1942, when British prime minister Winston L. S. Churchill diverted supplies from China to North Africa and Jiang threatened to discontinue the war with Japan, Roose-velt dispatched Currie to Chongqing to assuage the generalissimo and to patch up strained relations between Jiang and his chief of staff, U.S. lieutenant general Joseph W. Stilwell. Currie recommended Stilwell's recall, but this action was delayed until 1944.

By 1943, when he moved to the Foreign Economic Administration, Currie had come to share Churchill's view of China as a relatively unimportant theater. In early 1945, Currie headed the Allied delegation to Bern to persuade the Swiss to block Nazi bank balances and halt the flow of German supplies through Switzerland to Italy.

Part of Currie's work involved negotiating with the Soviets on wartime and postwar loan agreements and other matters. When his name appeared in partially decrypted Soviet cables between Moscow and Washington—the so-called Venona Papers—some believed that Currie was a Soviet agent. He appeared before the House Un-American Activities Committee in August 1948 to deny these allegations. Although no charges resulted, U.S. authorities refused to renew Currie's passport in 1954 because he had taken up residence in Colombia following his appointment as the head of a World Bank mission there between 1949 and 1950 and his subsequent marriage to a Colombian. In

1958, Currie became a Colombian citizen; he was that government's chief economic adviser until his death in Bogota on December 23, 1993.

Curtin, John Joseph (1885–1945)

Australian politician and prime minister (1941–1945). Born at Creswick, Victoria, Australia, on January 8, 1885, John Joseph Curtin became a printer and trade union activist. During World War I, he was imprisoned for his activities as secretary of the Anti-Conscription League. In 1917, Curtin switched to journalism, editing the Perth-based weekly *Westralian Worker*. Eleven years later, he was elected a Labour Member of Parliament from Fremantle, a position he held with only one break—between 1931 and 1934—until his death; he also became head of the Labour Party in 1935.

In the crisis-ridden late 1930s, Curtin's party split over foreign policy, but he favored extensive rearmament and closer alignment with the United States. When World War II began in 1939, he refused to join the coalition government headed by Sir Robert Menzies but pledged his party's support for the war effort. On October 3, 1941, Curtin became prime minister; he remained in that post until his death almost four years later.

Curtin emphasized his country's growing autonomy from Britain by making a separate Australian declaration of war on Japan following that country's attack on Pearl Harbor (December 7, 1941). Curtin infuriated both Winston L. S. Churchill and Franklin D. Roosevelt by refusing to allow Australian troops returning from the Middle East to divert to Burma. He called for greater Australian reliance on the United States and, from the

spring of 1942, worked closely with U.S. commander in the South Pacific General Douglas MacArthur in demanding more British and U.S. resources for the Pacific theater. Curtin nonetheless resented Australia's exclusion from many critical wartime decisions. He died at Canberra, Australia, on July 5, 1945.

Curzon Line

Boundary between Poland and Russia drawn after World War I that figured in discussions during and after World War II concerning Poland's eastern frontier. The Curzon Line was a major factor in the tangled issue of Poland's post–World War II borders.

In the fluid situation in the east following World War I, leaders of the Big Four powers of Britain, France, Italy, and the United States decided to leave the boundary between Poland and Russia to subsequent demarcation. In December 1919, a commission headed by British foreign secretary Lord Curzon proposed a boundary line. Known as the Curzon Line, in the north it divided Suvalki Province between Poland and Lithuania, then extended southward toward Grodno before running west to the Bug River. It followed the Bug past the great city of Brest-Litovsk to Sokoly, then ran west around the fortress city of Przemysl before heading south to the Carpathians and the border of the new state of Czechoslovakia.

Neither Poland nor Russia accepted the Curzon Line. Poland won the Russo-Polish War (1919–1921) and, in the resultant Treaty of Riga of March

1921, pushed its border well to the east of the Curzon Line, near to what had been the Polish-Russian frontier of 1792. Recovering territory to the Curzon Line was a major goal of post–World War I Soviet diplomacy.

In late August 1939 Germany and the Soviet Union concluded a nonaggression pact that made it possible for Germany to invade Poland, beginning World War II. The treaty also included a territorial division of Poland and the Baltic states, in which the Soviet Union received much of eastern Poland. Soviet troops invaded and seized this territory in mid-September 1939, but the Germans took it themselves during their June 1941 invasion of the Soviet Union.

In subsequent discussions between the Soviet Union and its Western allies, Soviet leader Joseph Stalin insisted that the Curzon Line be the western boundary for the Soviet Union. It was difficult for the Western powers not to agree with this, for the line had been drawn by the Western powers, but such an agreement would sanction Soviet incorporation of its 1939 gains at the expense of Poland. At the Tehran Conference of November–December 1943, there was much discussion of Poland's borders. Stalin, British prime minister Winston Churchill, and U.S. president Franklin Roosevelt all agreed on the Oder River as the future boundary of Poland with Germany.

There was, however, no agreement by the Western leaders on a tributary of the Oder, the Western Neisse River, as the southern demarcation line. Nor did the West sanction Poland taking from Germany the important port of Stettin on the west bank of the Oder. The three did agree that Poland would receive most of East Prussia, although the Soviet Union claimed the Baltic port of Königsberg (later renamed by them Kaliningrad) and land to the northeast. There was no major opposition from Western leaders to the Curzon Line as the eastern boundary of Poland, although the British did object to Soviet seizure of the predominantly Po-lish city of L'viv (Lvov, Lwow, Lemberg).

Stalin insisted that the Soviet Union required security against a future German attack. Obviously a Poland that would be compensated for the loss of eastern territory to the Soviet Union by being given German territory in the west would necessarily have to look to the Soviet Union for security, and Churchill had the difficult task of having to sell all these arrangements to the Polish government-in-exile in London. Stalin refused normal diplomatic

relations with the so-called London Poles, because no independent Polish government could ever concede changes that put the country at the mercy of the Soviets. A Polish government subservient to Moscow thus proved inevitable.

The Yalta Conference of February 1945 confirmed the decisions reached early at Tehran regarding Poland's eastern border, with but slight modification. This meant the loss to Poland of some 52,000 square miles of territory in the east. The Allies were more strenuous in objecting to the Oder-Neisse line as its western boundary, and there was no agreement on this matter at Yalta.

Czechoslovakia

Central European nation established in late 1918 after the defeat of the Hapsburg Empire in World War I. In the years leading up to World War II, Czechoslovakia bordered Germany to the west and north, Poland to the north, Romania to the east, and Austria and Hungary to the south.

In 1938, the Republic of Czechoslovakia had the highest standard of living and was the only democracy in Central Europe. It also had an intractable minorities problem that made it vulnerable to neighboring states, especially Germany. Czechoslovakia had a population of about 15 million, but only about 7 million—not even a majority—were Czechs. Three million were Germans, 2.5 million were Slovaks, and 1 million were Hungarians. In

addition, there were about half a million Ukrainians living in Ruthenia and a number of Poles.

Czechoslovakia had been formed from a union of Bohemia and Moravia, which had long been part of the Hapsburg and Holy Roman Empires, and Slovakia, which had been part of the Kingdom of Hungary. The 1919 Paris Peace Conference also awarded it Ruthenia to provide a land connection with Romania. With Romania and Yugoslavia, Czechoslovakia formed the so-called Little Entente. The Czechs had a firm alliance with France as well as one of Europe's most important arms-manufacturing centers in the Skoda Works at Pilsen. It also had an excellent 400,000-man army. These facts, however, counted for little when the French and British, under heavy pressure from German leader Adolf Hitler at the September 1938 Munich Conference, forced the Czech government headed by President Edvard Beneš to yield to Germany the Sudetenland, with its largely German population. This area contained the natural defenses of the new state. Hungary and Poland also seized territory, and Slovakia proclaimed its independence on March 14.

German troops entering Waldhaeusl in Czechoslovakia, October 3, 1938. (Keystone/Getty Images)

Then, on March 15, 1939, Hitler broke his pledge to respect what remained of Czechoslovakia and occupied the remainder of the state. Acquiring it was a tremendous boost to the Germans militarily, for 35 highly trained and well-equipped Czechoslovak divisions disappeared from the anti-German order of battle. Hitler had also eliminated the threat from what he had referred to as “that damned airfield,” and the output of the Skoda arms complex would now supply the Reich’s legions.

In Bohemia and Moravia, the Wehrmacht absorbed 1,582 aircraft, 2,000 artillery pieces, and sufficient equipment to arm 20 divisions. Any increase in armaments that Britain and France achieved by March 1939 was more than counterbalanced by German gains in Czechoslovakia. There, the Germans secured nearly a third of the tanks they deployed in the west in the spring of 1940, and between August 1938 and September 1939 Skoda produced nearly as many arms as all British arms factories combined.

The Germans organized their new acquisition as the Protectorate of Bohemia-Moravia. The Slovak lands became the Republic of Slovakia, a vassal state ruled by the Slovak People’s Party headed by Roman Catholic priest Monseigneur Jozef Tiso. The eastern province of Ruthenia (Trans-Carpatho-Ukraine) was ceded to Hungary.

The Germans immediately disbanded the Czech military, allowing President Emile Hácha only a small ceremonial guard. Although long-term German plans for the protectorate included the removal of the Slavic population and its replacement by Germans, initial German occupation policies were much more lenient than in the remainder of Central and Eastern Europe, inspired by the goal of exploiting Czechoslovak industry and resources without inciting revolt. Student protests against German rule in October 1939, on the anniversary of the independence of Czechoslovakia, did bring closure of the universities and the execution of nine students.

On April 16, 1940, Baron Konstantin Hermann Karl von Neurath became reichsprotector of Bohemia-Moravia after the departure of the military governor, Colonel General Johannes von Blaskowitz. Berlin became dissatisfied with Neurath’s lack of harsh measures to curb protests, however, and on September 27, 1941, he was replaced by head of the Reich Security Office (Reichssicherheitshauptamt) Reinhard Heydrich. The latter declared martial law and carried out a series of arrests that destroyed the leadership of the student protests and other Czechoslovak national opposition.

On March 27, 1942, a group of British-trained Czechoslovak commandos ambushed Heydrich's car in Prague and mortally wounded him. He died on June 4. The German Gestapo (secret police) then instituted a wave of terror during a period of martial law that lasted until July. Acts included the destruction of the villages of Lidice and Lezaky and the murder of most of their inhabitants.

On August 20, 1943, Wilhelm Frick was appointed reichs-protector. Hans Frank, minister of state for Bohemia and Moravia, exercised real authority. The level of active Czech resistance remained relatively low and consisted chiefly of providing intelligence information.

Czechoslovak president Edvard Beneš had gone abroad in October 1938, and he established a Czech government-in-exile, first in Paris and then in London. In the summer of 1942, he secured official British and Free French repudiation of the 1938 Munich Agreement. But Beneš stressed accommodation with the Soviet Union. Thus, he traveled to Moscow to sign a formal treaty of alliance with the Soviets on July 18, 1941. He sought a democratic, independent Czechoslovakia that would be a bridge between East and West.

During the war, the Czechoslovak government-in-exile contributed an armored brigade to the Allied cause—some 5,000 men who fought with British forces in the Normandy Campaign. Czechoslovak pilots participated in the 1940 Battle of Britain, and four Czechoslovak squadrons (three fighter and one bomber) served with the Royal Air Force during the war. Czechoslovak military units were also formed on Soviet territory, including by the summer of 1943 the 1st Czechoslovak Parachute Brigade of some 2,500 men. The 2nd Czechoslovak Parachute Brigade was formed in 1944, and it participated in an uprising in Slovakia against the government there in August 1944. Czechoslovak military units in the Soviet Union ultimately established the I Czechoslovakian Corps, which distinguished itself in the fighting to cross the Carpathian Mountains. The Soviets also formed the 1st Czechoslovakian Fighter Regiment, which evolved into the 1st Czechoslovakian Air Division by the end of the war.

On May 5, 1945, a general uprising occurred in Bohemia and Moravia against the Germans, centered on the city of Prague as Soviet marshal Ivan Konev's 1st Ukrainian Front approached from the east and U.S. lieutenant general George S. Patton's Third Army drove on the capital from the west.

The Czechoslovak government-in-exile appealed to supreme commander of Allied Expeditionary Force General Dwight D. Eisenhower for assistance, but he refused to allow Patton to intercede. The Germans reinforced with two divisions, but they had no tanks or artillery and were halted by General Andrei Vlasov's 1st Division, which had deserted from the Germans. On May 9, Vlasov's troops cleared the remaining Germans from Prague, taking some 10,000 prisoners. The next day, Konev's troops entered the city. The Germans formally surrendered on May 11. During the war, an estimated 350,000 people in the protectorate died as a result of the German occupation.

Meanwhile, Tiso's Slovak People's Party ruled Slovakia. Tiso's wartime independent Slovak government was dominated by fascist, anti-Czech, anti-Semitic elements, represented by personalities such as Karol Sidor and Alexander Mach, who were supported by a paramilitary organization known as the Hlinka Guards. The war stimulated economic growth in Slovakia, and on November 24, 1940, Slovakia signed the Anti-Comintern and Tripartite Pacts. Its military commitment to the Axis was two divisions, comprising some 50,000 men. Slovakia adopted a resettlement program for its Jewish population in August 1940, and it enacted a Nuremberg-type anti-Jewish code on September 10, 1941.

An uprising by Slovaks against the Tiso government was crushed by German military intervention in the form of 40,000 troops by October. The Soviets were unable to provide military assistance to the resistance. At the end of the war, Tiso's government retreated with German forces into Austria in April 1945, and Tiso surrendered there to U.S. forces on May 8, 1945.

Beneš's cherished hopes of an independent democratic Czechoslovakia after the war were not realized. In 1948, the communists seized power in the country.

D

Dai Li (1896–1946)

Chinese Nationalist chief of intelligence and security. Born in Jiangshan (Kiangshan), Zhejiang (Chekiang), on May 28, 1896, Dai Li (Tai Li) spent his 20s with the Green Gangsters in Shanghai, where he met Guomindang (GMD, Nationalist) leader Jiang Jieshi (Chiang Kai-shek). In September 1926, Dai enrolled at the Huangpu (Whampoa) Military Academy. Expelled in June 1927 for corruption, Dai returned to Shanghai and continued to serve Jiang as an intelligence officer, ensuring the success of the Nationalists' Northern Expedition of 1926–1928 through his connections with the gangsters.

In December 1931, following the September 18 Japanese invasion of Shenyang in Liaoning Province, Jiang appointed Dai as director of the newly created Second Department of the Investigation and Statistics Bureau under the Guomindang Military Affairs Commission. The agency engaged in anti-Japanese espionage, counterespionage, and clandestine operations against domestic opponents, including the Chinese Communists.

During the Sino-Japanese War (1937–1945), Dai was in complete control of the Nationalist government's intelligence apparatus, earning the nickname "China's Himmler." In March 1938, Dai was invited to join the GMD. He became director of the Second Bureau of Investigation and Statistics under the Military Affairs Commission. In 1940, Dai also directed the Bureau of Control for Communications, the Anti-Smuggling Bureau, and the Commodity Transport Control Bureau. In these capacities, he had charge of the training of secret police and special agents, guerrilla operations behind Japanese lines, infiltration into the Japanese puppet regime in Nanjing (Nanking), and subversive activities in Japanese-occupied areas as well as assassinations of Japanese agents and Chinese traitors.

Dai's other important duty was to continue anti–Chinese Communist operations. In the summer of 1939, he ordered the murder of a Chinese

Communist general stationed in the Eighth Route Army's office in Xi'an (Sian), Shaanxi (Shensi). He also ordered Ye Ting's detention after the New Fourth Army Incident of January 1941.

Meanwhile, Dai opened contact with the Americans; this action led to the establishment of the Sino-American Special Technical Cooperative Organization (SACO) in April 1943. Dai served SACO as commander. Captain Milton E. Miles, U.S. Navy observer at Chongqing (Chungking) in Sichuan (Szechwan) and director of the operations of the Office of Strategic Services in China, was deputy commander, specializing in intelligence and security works. SACO established 12 training camps and 14 weather stations in China, which substantially aided the Allied military effort against Japan.

Following the war, Dai was responsible for the persecution of more than 3,000 former Japanese puppet officials and national traitors. On March 17, 1946, Dai died in a plane crash near Nanjing. Jiang ordered a day of national mourning on May 30, reflecting Dai's important status.

Dakar, Attack on (September 23–25, 1940)

The Allied effort to capture the Vichy-held West African port of Dakar. Following the defeat of France by the Germans in June 1940, the French government, now based in the spa town of Vichy, retained control of the French colonial empire. On August 26, however, the governor of French Equatorial Africa, Félix Eboué, proclaimed his allegiance to General Charles de Gaulle's Free French, based in London. Shortly thereafter, Free French agents secured the Middle Congo. Encouraged by these events, de Gaulle

convinced British prime minister Winston L. S. Churchill that he could occupy Dakar, the capital of French West Africa, with little or no bloodshed.

Strategically located in the most westerly part of Africa, Dakar boasted an excellent deepwater port and was equidistant from Europe and Brazil. The British feared that the Germans might pressure the Vichy French to allow them to use Dakar as a base to attack British shipping. De Gaulle pressed for an attack, eager to expand his power base in Africa, show himself a key Allied leader, and encourage other French African territories to rally to his cause. The resulting joint British–Free French plan was named Operation MENACE.

Previously on July 8, British aircraft flying from the carrier *Hermes* had attacked and immobilized the modern French battleship *Richelieu* at Dakar. This operation followed the British attack on the French fleet at Mers-el-Kébir in Algeria on July 3–4 and caused great bitterness, particularly within the French Navy. Despite these aggressive actions, both Churchill and de Gaulle believed that the French authorities at Dakar were sympathetic to their cause.

Operation MENACE involved 24 warships, including the battleships *Barham* and *Resolution*, the aircraft carrier *Ark Royal*, 3 heavy cruisers, 2 light cruisers, 11 destroyers, and 5 sloops, 3 of which were Free French. These warships escorted 11 transports carrying 7,900 troops, 3,600 of whom were Free French. If the authorities at Dakar failed to rally to the Free French, the Free French troops would go ashore; British forces were to be employed only in an emergency.

Soldiers in the ruins of a government building in Dakar, after the Allied attack of September 23–25, 1940. (Keystone/Getty Images)

Operation MENACE was plagued with problems from the beginning. The Allies lacked a clear picture of the strength of the Dakar defenses, which included the battleship *Richelieu*, 2 light cruisers, 3 large destroyers, 1 fleet destroyer, 6 sloops, and 3 submarines. The cruisers and large destroyers had sailed from Toulon to put down the rebellion in French Equatorial Africa and arrived at Dakar just in advance of the Allied force.

On September 23, the French administrator at Dakar, Pierre Boisson, refused to talk to the Free French negotiators, and the French coastal batteries at Dakar opened fire on the British ships when they came into view. The British ships returned fire. The shore batteries inflicted heavy damage on one cruiser and light damage on another and on two destroyers. The heavy cruiser HMAS *Australia* disabled the large French destroyer *L'Audacieux*, and

destroyers sank the French submarine *Persée.* The defenders repulsed a halfhearted landing attempt by Free French troops.

The British resumed their bombardment on the second day, September 24, but despite the heavy shelling, the *Richelieu* took only one light hit; in return, shore batteries landed four shells on the *Resolution.* The French submarine *Ajax* was sunk.

In the battle's third day, the French submarine *Beveziers* torpedoed and severely damaged the battleship *Resolution.* After the *Australia* and *Barham* suffered hits, the British commander called off the attack. Demonstrating that there was a danger of all-out war against Vichy, French bombers raided Gibraltar on September 24 and again the next day—dropping 105 tons of bombs but causing little damage.

The failure of Operation MENACE was a blow to British and Free French prestige and demonstrated British inexperience in combined operations. It also revealed that the French did not believe that the British cause was their own and severely damaged the relationship between de Gaulle and Churchill. The Vichy French government regarded Dakar as a great victory. As a result of Operation MENACE, Adolf Hitler saw some utility in Vichy France's assistance. It also convinced him that Vichy would defend French Africa against the Allies and the Free French.

Daladier, Édouard (1884–1970)

French politician and premier. Born on June 18, 1884, at Carpentras, Department of Vaucluse, Édouard Daladier was educated at the École Normale and at the Sorbonne before becoming a history teacher at the Lycée Condorcet in Paris. He served in the French Army during World War I and fought at Verdun.

In 1919, Daladier was elected to the Chamber of Deputies from the Vaucluse as a radical socialist. He was minister of colonies in 1924 and premier from January to October 1933. Daladier formed another cabinet in January 1934 but resigned the next month over the Stavisky Scandal.

Daladier helped bring the Radicals into the leftist Popular Front coalition with the socialists and communists during the 1936 national elections. On the collapse of the Popular Front, he again became premier in April 1938. Under heavy pressure from British prime minister Neville Chamberlain and despite France's treaty obligations to Czechoslovakia, Daladier agreed at the September 1938 Munich Conference to Adolf Hitler's demands for the cession of the Sudetenland to Germany. Unlike Chamberlain, he had no illusions that the agreement had secured peace.

Daladier then did what he could to prepare France for war. On the German invasion of Poland in September 1939, he led France into war against Germany. Angered by the German-Soviet Non-Aggression Pact of August 23, 1939, he reacted by outlawing the Communist Party and arresting its leaders. Criticized for France's military inaction during the so-called Phony War and its failure to assist Finland in that nation's war against the Soviet Union, Daladier was forced to resign on March 20, 1940, replaced by Paul Reynaud. Daladier remained in the cabinet, however, as minister of war until the defeat of France in June 1940.

On June 21, 1940, Daladier and other cabinet ministers sailed from Bordeaux for North Africa in an effort to set up a government-in-exile, but new chief of state General Henri Pétain ordered them arrested. Daladier was among those brought to trial at Riom in 1942 by the collaborationist Vichy government on charges of having caused the French defeat. The trial turned

into an embarrassment for the government and was suspended, but Daladier remained in custody. In 1943 he was removed as a prisoner to Germany.

Released in April 1945, Daladier was one of the few leaders of the Third Republic to continue in politics during the Fourth Republic. Reelected a deputy, he served in the National Assembly from 1946 until 1958. Daladier died at Paris on October 10, 1970.

Darby, William Orlando (1911–1945)

U.S. Army officer credited with establishment of the U.S. Rangers. Born on February 9, 1911, at Fort Smith, Arkansas, William Orlando Darby graduated

from the U.S. Military Academy, West Point, in 1933 and was commissioned a second lieutenant of field artillery. During the next seven years, he held several routine assignments and was promoted to captain in October 1940. He then commanded a battery of the 99th Field Artillery Regiment (1941–1942).

In June 1942, Brigadier General Lucian K. Truscott Jr. selected Darby to put together an elite force similar to the British commandos. The name "Rangers" derived from the force of the same name led by Major Robert Rogers during the French and Indian War (1754–1765). Promoted to temporary major, Darby trained his men at Achnacarry, Scotland, under the guidance of British commandos.

The U.S. Rangers were seen as elite troops to be employed in hit-and-run commando raids. A charismatic person, Darby believed in leadership by example, from the front. Officially, he commanded only the 1st Ranger Battalion, but he also trained and led the 3rd and 4th Battalions. In December 1943, Darby was promoted to colonel and given command of all three battalions.

Darby's Rangers, as his force came to be known, were first committed in combat during the ill-fated August 19, 1942, raid on Dieppe. In November 1942, six companies performed well in Operation TORCH, the Allied invasion of French North Africa, then under Vichy control. The companies also participated in Operation HUSKY, the invasion of Sicily. In the September 9, 1943, invasion of Italy at Salerno, four U.S. Ranger battalions and the British 41st Commando secured the coast at Maiori. After the destruction of the 1st and 3rd Battalions at Anzio (January 22–May 25, 1944), Darby was assigned to the Operations Division of the War Department's General Staff.

Lieutenant Colonel William O. Darby (right) congratulated by Lieutenant General George S. Patton Jr., in Gela, Sicily, August 1943. (Bob Landry/The LIFE Picture Collection/Getty Images)

Darby returned to Italy in March 1945 as deputy commander of the 10th Mountain Division. On April 30, 1945, only a week before the end of the war in Europe, he was struck and killed in northern Italy by a German shell fragment. Darby was posthumously promoted to brigadier general.

Darlan, Jean Louis Xavier François (1881–1942)

French Navy admiral. Born on August 7, 1881, in Nérac, Lot-et-Garonne Department, France, Jean Louis Xavier Darlan graduated from the École Navale in 1902. A specialist in naval gunnery, he served in the Far East on cruisers and then in the Mediterranean. Promoted to commander in 1912, Darlan was then an instructor on the training cruiser *Jeanne d'Arc*. During World War I, Darlan commanded heavy naval artillery on land. He was promoted to commander in July 1918 and took charge of the Rhine Flotilla.

Promoted to captain in August 1920, Darlan was assigned to the Far East, where he commanded cruisers. He was promoted to rear admiral in November 1929 and played an important role in the reorganization of the navy. He next commanded naval forces in Algeria and then a cruiser division in the Mediterranean. Promoted to vice admiral in December 1932, Darlan took charge of the Atlantic Squadron during 1934–1936. He was then chief of the French naval staff.

Darlan was promoted to admiral of the fleet in June 1939 and took command of the French Navy. Following the June 1940 defeat of France, he joined the collaborationist Vichy government of Marshal Henri Philippe Pétain as navy minister. In February 1941, Darlan also became vice premier and minister of the interior, and in August 1941 he was made minister of defense. He was also Pétain's designated successor.

An Anglophobe, especially after Operation CATAPULT (July 1940) and the killing of French sailors by the British at Mers-el-Kébir on July 3, 1940, Darlan hoped to win concessions for France through military agreements with the Germans. His May 1941 meeting with Adolf Hitler led to an agreement with German ambassador Otto Abetz. In the Paris Protocols, France granted major concessions to Germany in Africa and the Middle East, but the Germans gave little in return.

By April 1942, Darlan's rival Pierre Laval forced him to relinquish his cabinet posts, except that of commander of the armed forces. Darlan traveled frequently to North Africa and was in Algiers when, on November 8, the Allies invaded in Operation TORCH. Darlan agreed to cooperate with the

Allies and to order a cease-fire on November 10 in return for recognition of his authority. The deal was confirmed on November 11 with U.S. major general Mark Clark and Ambassador Robert Murphy. President Franklin D. Roo-se-velt approved it, although some Allied leaders denounced the agreement as an immoral act that gained little.

Many people, including Allied leaders, wanted to see Darlan removed, and on December 24, 1942, 20-year-old French royalist Fernand Bonnier broke into Darlan's office in Algiers and shot him twice with a pistol. Darlan died two hours later. Bonnier was captured, tried, and executed two days afterward. The assassination of Darlan is shrouded in mystery and has been variously attributed to the United States, Britain, the Free French, French monarchists, and even the Germans.

Darwin, Raid on (February 19, 1942)

First direct Japanese attack on Australia during the war. In early 1942, Japanese forces moved inexorably down through the Philippines and the Malay Peninsula and into the Netherlands East Indies. To secure Java and protect landings at Timor, the Japanese high command decided to attack Darwin, a port city on Australia's north coast used by the Allies to ferry aircraft, troops, and equipment to the East Indies. Commander Fuchida Mitsuo planned the raid, centered on the four aircraft carriers of Vice

Admiral Nagumo Chūichi's First Air Fleet and a covering force of two battleships and three heavy cruisers under Vice Admiral Kondō Nobutake. It was the most powerful Japanese strike force since the December 7, 1941, attack on Pearl Harbor.

On February 19, 1942, the Japanese carriers in the Timor Sea launched 188 aircraft against Darwin in two waves. Fifty-four land-based bombers joined them. A U.S. Navy PBY Catalina radioed a warning of the first wave but was then shot down. News reached Darwin just as 10 U.S. Army Air Forces P-40s of 33rd Pursuit Squadron returned following an aborted attempt to reinforce Java. Five P-40s remained airborne to face the Japanese. The remaining five attempted to take off just as the Japanese planes arrived at about 10:00 a.m. Japanese Zeros claimed 9 of the P-40s in the air; the survivor landed with severe damage. The second Japanese raid occurred two hours later.

The aftermath of a raid by Japanese aircraft on Darwin, Australia, February 19, 1942.

(Bettmann/Corbis)

The Japanese sank eight ships, including the U.S. destroyer *Peary*, and damaged another nine. Wharves and jetties suffered extensive damage, and 18 Allied aircraft were destroyed. The human toll was also high: some 500 to 600 people were killed or wounded. The Japanese accomplished all this at a cost of only 10 aircraft lost. This raid succeeded in its objective of assisting the Japanese conquest of the Dutch East Indies. Japanese attacks on Darwin continued during the next several months.

Davis, Benjamin Oliver, Jr. (1912–2002)

U.S. Air Force general. Born on December 18, 1912, in Washington, D.C., Benjamin Oliver Davis Jr. was the son of Benjamin O. Davis Sr., the first U.S. African American general officer. The younger Davis attended Western Reserve University and the University of Chicago. He then secured an appointment to the U.S. Military Academy at West Point, where he endured four years of isolation because of racial discrimination. He graduated in 1936 and was commissioned a second lieutenant of infantry.

In July 1941 as a captain, Davis was one of the first members of a new pilot training program for African Americans at Tuskegee, Alabama. He completed training in March 1942. Tuskegee graduates formed the basis for Lieutenant Colonel Davis's 99th Pursuit Squadron, which flew Curtiss P-40N

Warhawks. Following four months of combat in the Mediterranean theater, Davis returned to the United States to assume command of the 332nd Fighter Group with North American P-51 Mustangs, which he led in Italy in January 1944. Davis flew 60 missions and was promoted to colonel in March 1944.

After the war, Davis returned to the United States to command the racially troubled 477th Composite Group at Godman Field, Kentucky. In 1949 he attended the Air War College, and he was then assigned to Washington, D.C., as deputy chief of operations in the Fighter Branch. In October 1954 Davis was promoted to brigadier general, the first African American U.S. Air Force officer to hold that rank. He served as vice commander, Thirteenth Air Force, and then headed the Twelfth Air Force in Germany from 1957 to 1959. Promoted to major general in June 1959, Davis returned to Washington in July 1961 as the director of Manpower and Organization. In April 1965 he was promoted to lieutenant general and became chief of staff of U.S. forces in Korea and the United Nations Command. He then became deputy commander of the U.S. Strike Command.

Davis retired in February 1970. In 1971 he became assistant director of the Department of Transportation to establish the Sky Marshals program until 1975. He then served on various corporate boards. Promoted to general on the retired list in December 1998, Davis died in Washington, D.C., on July 4, 2002.

Davis, Benjamin Oliver, Sr. (1877–1970)

U.S. Army brigadier general and the first African American general in the U.S. military. Born on July 1, 1877, in Washington, D.C., Benjamin Oliver Davis enrolled at Howard University in 1897 but left school the next year to join the U.S. 8th Volunteer Infantry Regiment. As a lieutenant during the Spanish-American War in 1898 he saw no action, but in 1899 he enlisted as a private in the regular army. Davis was commissioned a second lieutenant in the 10th Cavalry in 1901. He was military attaché to Liberia (1909–1911), professor of military science at Wilberforce University (1906–1911, 1915–1917, 1929–1930, and 1937–1938), supply officer for the 9th Cavalry in the Philippines (1917–1920), instructor with the Ohio National Guard (1924–1928), and professor of military science at Tuskegee Institute (1921–1924 and 1931–1937).

At the beginning of World War II, Davis was one of only two African American officers in the combat arms branches of the U.S. Army. The other was his son, Benjamin O. Davis Jr. In October 1940 on the recommendation of President Franklin D. Roosevelt, Davis Sr. was promoted to brigadier general, the first African American in U.S. military history to reach general officer rank.

Davis retired from the army in 1941 but was recalled to active duty as an assistant to the inspector general of the army, serving in the European theater of operations as an adviser on race relations. At the same time, he fought to end segregation and discrimination within the armed forces. Davis remained in the inspector general's office until his final retirement in 1948. He continued to urge desegregation in the military, which was achieved when President Harry S. Truman ordered full integration of the U.S. armed forces in July 1948.

In the years following his retirement, Davis served on numerous civilian boards and the Battle Monuments Commission. He died in Chicago on November 26, 1970.

Da Zara, Alberto (1889–1951)

Italian Navy admiral. Born in Padua on April 8, 1889, into a family of Jewish background, Alberto Da Zara entered the Italian Naval Academy in 1907 and was commissioned in 1911. He participated in the 1911–1912 Italo-Turkish War and in World War I, earning promotion for his service and two Silver Medals for bravery as commander of motor torpedo boats.

Promoted to lieutenant commander in 1923, Da Zara commanded a naval detachment in China from 1924 to 1925 and then served in the headquarters of the Venice Naval Command. In 1927 he was promoted to commander, and in 1930 he was appointed deputy commander of the battleship *Duilio.* Later he commanded other warships, including the cruiser *Montecuccoli*, in which he made a long cruise in the Far East during 1933 and was promoted to captain. He commanded the cruiser *Aosta* during its February 12, 1937, shelling of Republican positions at Valencia during the 1936–1939 Spanish Civil War.

Promoted to commodore in 1939, Da Zara then commanded the Albanian Naval Command. When Italy entered the war in June 1940, Da Zara commanded the *Di Giussano* group of the IV Division, in which he participated in the Battle of Calabria on July 9, 1940. Da Zara then received command of the Venice Arsenal, and from August 1941 to March 1942, he headed the Anti-Submarine Inspectorate.

Promoted to division admiral (rear admiral), in March 1942, Da Zara took command of the VII Division with his flag in the cruiser *Eugenio di Savoia.* He commanded the Italian forces in the Battle of Pantelleria on June 15, 1942, during Operation HARPOON, for which he was awarded the Military Order of Savoy. He then carried out several actions with light vessels.

In August 1943, Da Zara became commander of the V Division, with his flag in the battleship *Duilio.* He held the command during the armistice with the Allies, and, upon receiving orders from the Italian naval command, he

proceeded to Malta with his division. On March 10, 1944, Da Zara was promoted to vice admiral and became inspector of naval forces, with his flag in the battleship *Giulio Cesare.*

With his notable service at sea and his recognized bravery under fire, Da Zara was arguably the most effective Italian admiral of the war. He retired in September 1946, wrote his war memoirs, and died in Foggia on June 4, 1951.

De Bono, Emilio (1866–1944)

Italian marshal and government figure. Born on March 16, 1866, at Cassano d'Adda, Emilio De Bono graduated from military schools in nearby Milan and in 1883 began a long army career, which he chronicled in many diaries. A self-styled warrior, De Bono sought challenging commands in the 1911–1912 Italo-Turkish War and during World War I. He was promoted to major general and twice decorated for valor in 1916. Friction with a superior led to an inactive posting in Albania until he was recalled to corps command in Italy. He turned back an Austrian attack at Grappa in 1918.

Restive after the war, De Bono, who had never evinced interest in politics, was tempted by the bombast of Gabriele D'Annunzio's nationalistic expedition to occupy Fiume in 1919 to join that campaign. However, ambivalent careerist instincts held him in check. Still lacking any warrior role or prospects, by 1921 De Bono settled for membership in the Fascist Party as a vehicle for self-promotion. Although his military skills were pivotal in organizing the October 1922 March on Rome, they did not advance him politically, despite his appointments as chief of public security in November 1922 and commander of the fascist militia in January 1923.

After his perceived failure to prevent the June 1924 murder of socialist leader Giacomo Matteotti by the militia, De Bono was indicted but refused to implicate his superiors. Acquitted in 1925 and rewarded with the governorship of Tripolitania, by 1928 De Bono was planning the eventual war with Ethiopia. He had some success early in that war, including a victory at Adowa, but his slow pace irked Italian dictator Benito Mussolini, who replaced him in November 1935 with his rival, Pietro Badoglio. De Bono demanded and received promotion to marshal immediately thereafter.

Serving ignominiously in largely ceremonial or honorary posts for the remainder of his career, De Bono soon soured on Mussolini, decried Italian-German war plans, and eventually joined in the fascist Grand Council's July 1943 ouster of Il Duce, for which he was arrested by the German occupiers October 4, 1943. Tried at Verona, the old general was sentenced to death with, among others, Mussolini's son-in-law Galeazzo Ciano, whom De Bono joined before a firing squad on January 11, 1944.

Deception

A long-established and often essential element of warfare, deception consists of actions designed to deliberately mislead enemy decision makers as to one's capabilities, intentions, and operations. Deception causes an enemy to take specific actions that will contribute to the accomplishment of the friendly mission and weaken the enemy's strategic or tactical position. All major participants carried out deception operations during World War II.

Deception supports military operations by causing adversaries to misallocate resources in time, place, quantity, or effectiveness. A deceptive operation generally appears to be real to make the enemy believe that pretended hostile activities are genuine. By inducing a false sense of danger in one area, an enemy is forced to strengthen defenses there, weakening them where the real assault is intended to occur.

Deception theorists cite these overarching principles: the decision maker is the target; the deception must cause a specific action (simply having an enemy believe something is not sufficient); centralized control avoids self-confusion and conflict with other friendly operations; security is required so that the enemy does not discover the ruse; timeliness is key, as an enemy requires time to collect and analyze the deception-supporting signs; and friendly intelligence must confirm the desired enemy actions. Finally, integrating the deception with an actual operation adds credibility and enemy uncertainty.

A cover operation is a form of deception that leads the enemy to decide that genuine hostile activities are harmless. Cover induces a false sense of security by disguising the preparations for the real attack so that when it comes, the enemy will be taken by surprise. A rumor campaign suggesting to the enemy that troops embarking to invade a tropical country are in fact bound for the Arctic is a simple example of a cover operation.

At the other end of the complexity spectrum, a deceptive plan may involve months of careful preparation and the movement of thousands of troops, hundreds of aircraft, and scores of warships—all to convince an enemy that a major assault is being mounted. If an enemy believes that an amphibious assault is planned against beachhead A, for example, gathering ships within striking distance of beachhead A will reinforce this perception, while the ships are also within range of the true objective at beachhead B. A cover plan may be on the same scale, designed to conceal real preparations for a massive assault.

Preparations for the June 6, 1944, Normandy Invasion were surrounded by an extensive and detailed deception operation plan. The overall deception scheme, known as BODYGUARD, consisted of 36 subordinate plans designed to convince Adolf Hitler that the Allies were going to continue with peripheral attacks until at least July 1944, beyond the actual invasion date. The key suboperation FORTITUDE SOUTH was intended to draw attention away from

NEPTUNE, the actual Normandy Invasion. Operation FORTITUDE NORTH suggested an invasion of Norway by combined American, British Commonwealth, and Soviet forces, which kept 27 German divisions in Norway and idle. Once it became obvious that France, not Scandinavia, was the objective, Operation FORTITUDE SOUTH was designed to convince the Germans that the Allied invasion of northern France would come in the Pas de Calais area. This required the creation of a fictitious 1st U.S. Army Group in the Dover region under Lieutenant General George S. Patton, with bogus radio traffic, dummy equipment, and supporting hearsay evidence.

Operationally, the deception included more actual aerial bombardment of Calais than the actual target. Little was beyond the scope of the deception planners. On one occasion before the Normandy Invasion, for example, Lieutenant Clifton James, a British Army Pay Corps officer who bore a striking resemblance to General Bernard Montgomery, met with troops in Gibraltar and Algeria dressed in Montgomery's uniform so German intelligence would believe that the real general was in the Mediterranean instead of in London.

Large-scale defensive decoys were also employed during the war, particularly in Britain during the July 10–September 30, 1940, Battle of Britain and thereafter. These decoys fell under the purview of the Air Ministry's Colonel J. F. Turner under the anonymous name "Colonel Turner's Department" (CTD). Thirty-six daytime airfield decoys called "K sites," with mowed runways, wood and canvas aircraft, and dummy trenches, each a decoy for a particular Royal Air Force (RAF) station, were completed by the summer of 1940. A German reconnaissance plane shot down in October 1941 contained a map that identified 50 percent of the decoy sites, however, and they were all subsequently closed by June 1942.

In tandem with K sites, nighttime Q sites were constructed using deceptive airfield lighting that was occasionally augmented by hand-moved lights to simulate taxiing aircraft. Q sites proved much more successful. Eventually, 171 Q sites were constructed throughout Britain, with 359 of 717 Luftwaffe bomber attacks targeting these decoys by 1942. The success of the Q sites led to variations: QL sites (L for lighting) simulated the presence of marshaling yards, naval installations, armament factories, and so on. Various devices emitted sparks to resemble electric train flashes; orange lights shone down onto sand, conjuring furnace glows; and doors opened and closed. QF

sites (F for fire) were created in response to the knowledge that a fire in the target area often drew more bombers to it. Thus, several important factories were provided with their own decoy installation. Oil QF, an effort to protect oil reserves by simulating a refinery fire, foundered under the combined difficulties of excessive oil consumption (up to 2,500 gallons of oil per hour were needed to keep the fires going realistically) and lack of support by the oil companies, which believed that the decoys would attract bombers.

After the German raid on Coventry, large urban decoys called Starfish sites appeared. These were the war's largest and most sophisticated decoys. Assorted fire-producing decoys were produced, soaked variously with boiling oil, paraffin, or creosote to create convincing fire effects. Depending on the fires' color and intensity, burning houses, factories, and power stations were accurately simulated. The Starfish sites were immediately successful, and by January 1943 more than 200 had been built. By June 1944, British decoy sites had drawn 730 attacks that otherwise would have killed British people or destroyed valuable infrastructure.

The Soviets routinely emphasized deception in military operations and often in political operations. The military staffs incorporated the complementary concepts of *maskirovka* (deception and camouflage) and *khitrost* (cunning and stratagem) into all planning levels. Although deception had been doctrinally accepted since the early 1920s, the shock of the rapid German advance to the outskirts of Moscow and Leningrad painfully reinforced its practical utility.

The Soviets crudely but successfully hid the creation and deployment of three small armies during their Moscow counteroffensive, although this was due more to poor German intelligence and bad weather than skillful deception operations. However, the Soviets soon learned the requirements of integrating tactical deception (such as having individual tank units adhere to radio silence) with operational deception (such as moving several units to an unexpected front, creating new corps to attack where no Soviet formations had been reported).

By 1944, deception planning had evolved so that strategic capabilities were possible. For example, by conducting numerous operations toward western Ukraine, the Soviets habituated the Germans into believing that the Soviet Union's strategic axis was through Ukraine into southern Poland and Romania. The spring of 1944 saw an elaborate *maskirovka* operation that

concealed the redeployment of actual forces while surreptitiously creating forces for the major offensive through Belorussia, progressing against German Army Group North and eventually dislocating the entire front. By this point, Soviet use of secrecy, ruses, and disinformation provided the Soviet Union with an operational advantage for the remainder of the war. Even when the Germans did detect the deception, it was usually too late to counter the Soviet moves.

Deception was not limited to the European theater. The Japanese supported their initial strategic campaign through deception. Before the Japanese attack on Pearl Harbor (December 7, 1941), Allied military attachés and other sources were shown only antiquated aircraft and were intentionally misinformed regarding pilot proficiency at night flying and shallow-water torpedo attacks. This depicted incompetency readily reinforced preconceptions that Western attachés and intelligence analysts held regarding the Japanese.

Early Japanese parachute operations, such as the capture of Menado airfield on Celebes on January 11, 1942, succeeded superbly, but these actions informed the Allies of Japanese paratroop procedures and allowed the Allies to develop ways to counter Japan's weaker airborne forces. The Japanese responded with deception. Thus, the Japanese February 21 airborne assault on Timor commenced with a feigned paratroop assault several miles from the actual drop zones. With the Dutch defenders reacting to the deceptive attack, the main body of paratroops easily secured and held the Allied communications lines.

The Americans routinely used deception in their fight in the Pacific theater. For example, before the United States attacked Tinian Island on July 24, 1944, two dozen warships of Carrier Task Force 58 targeted Tinian Town and nearby road junctions with naval gunfire. This misled the Japanese as to the actual amphibious sites, allowing the assault ashore with greatly reduced casualties. Such deception operations played a major role in World War II.

Declaration on Liberated Europe (February 1945)

Declaration issued by leaders of the United States, Great Britain, and the Soviet Union—the so-called Big Three—during the February 4–11, 1945, Yalta Conference. At Yalta, the bargaining position of the Western Allies was weak. They had recently suffered a major embarrassment in the December 16, 1944–January 25, 1945, Ardennes Offensive (Battle of the Bulge), while Soviet armies were poised to drive on Berlin. Soviet leader Joseph Stalin seemed to hold all the cards, at least as far as Eastern and Central Europe were concerned. Soviet troops occupied most of that territory, including Poland. Stalin's goal was to secure control of a belt of East European satellite states, both to provide security against another German invasion and to protect a severely wounded Soviet Union against the West and its influences.

British prime minister Winston L. S. Churchill pointed out at Yalta that the United Kingdom had gone to war to defend Poland, and U.S. president Franklin D. Roosevelt was influenced by the Atlantic Charter and the United Nations Declaration but also by a large Polish constituency at home. Roosevelt pressed Stalin to agree to applying the Atlantic Charter to the limited area of "liberated Europe." This, of course, excluded both the British Empire and the Soviet Union.

Stalin agreed to the resulting Declaration on Liberated Europe. It affirmed the right of all peoples "to choose the government under which they will live" and called for the "restoration of sovereign rights and self-government" to peoples who had been occupied by the "aggressor nations." The Big Three

pledged that in the liberated nations, they would work to restore internal peace, relieve distress, form governments that were “broadly representative of all democratic elements in the population,” and ensure that there would be “free elections” that were “broadly representative of all democratic elements in the population” as soon as possible. But such lofty phrases were subject to different interpretations.

No institutional arrangement was established to enforce the ideas embodied in the declaration. As it transpired, the Soviets chose to regard “democratic elements” as meaning all communist and procommunist factions and “free elections” as excluding all those they regarded to be fascists. The result was Soviet control over much of Eastern and Central Europe—at first indirect, then, with the development of the Cold War, direct. The Soviet Union did pay a price for the declaration in the court of world opinion, as Stalin’s promises to respect human rights were proven utterly false.

de Courten, Raffaele (1888–1978)

Italian Navy admiral. Raffaele de Courten was born in Milan on September 23, 1888. He became a midshipman in 1910 and volunteered for the naval air branch. During World War I on August 5, 1915, his airship, the zeppelin *Città di Jesi*, was shot down over Pola, and de Courten became a prisoner of war. He was exchanged in June 1917.

De Courten remained in the navy after the war, and in 1923 he was assigned to submarines, where he developed a reputation for expertise in that branch. Promoted to captain, he served as naval attaché in Berlin from July 1933 until February 1936. He had a German mother and spoke the language fluently and enjoyed good relations with German chancellor Adolf Hitler. From December 1937 to May 1938, de Courten was special naval liaison officer with the Imperial Japanese Navy in Tokyo.

Promoted to rear admiral in June 1938, de Courten was appointed head of the newly created Ispettorato Armi Subacquee (Inspectorate of Underwater Weapons), tasked with increasing the efficiency of submarines, torpedoes, and mines. He was also responsible for developing the special attack craft and selecting the personnel for Italy's naval commandos. In May 1940, he was reassigned to Supermarina, the naval headquarters, and was promoted to admiral in October 1940. In August 1941, de Courten assumed command of the VIII (light cruiser) Division where he gained a reputation for luck, not losing a single freighter under his escort.

In March 1943, de Courten became deputy chief of staff, the number three posting in the Supermarina after Admirals Arturo Riccardi and Luigi Sansonetti. De Courten assumed administrative responsibilities so that Sansonetti, the number two, could concentrate on naval operations.

On July 25, 1943, King Victor Emmanuel III appointed de Courten naval minister. De Courten asked for and received the post of chief of staff two days later and thus assumed full command of the navy. Although he did not participate in the negotiations leading up to the Italian armistice of September 8, 1943, he ensured that the navy followed government policy and that it remained a cohesive force, much to the disappointment of the Germans, who had considered him their most reliable member of the Italian high command. In October 1943, de Courten signed an accord with British admiral Sir Andrew Browne Cunningham for Italian naval cooperation against Germany.

On December 31, 1946, de Courten resigned from the navy to protest the insistence of the Allied powers in claiming Italian ships as war reparations. In 1947, de Courten became president of the Navigazione Generale Italiana shipping company. He died at Frascati, near Rome, on August 23, 1978.

Decoy Ships

Special ships deployed specifically to operate against enemy submarines. During World War I, the British deployed such decoys as part of their response to German submarine warfare. The first were trawlers armed with concealed weapons that sailed with the fishing fleet, but the vast majority of the decoys were deployed in the Western Approaches and based at Queenstown, Ireland (hence the designation "Q-ships").

Posing as merchant ships and assigned to areas where U-boats were known to be operating, the decoys sought to persuade submarine captains to engage them on the surface with their deck guns rather than having to fire expensive and limited torpedoes. The Q-ships mounted several guns, concealed behind false works and so arranged that they could be put into action quickly at the right moment. Their "cargoes" might be light wood (balsa or cork) so that the ships could stay afloat if torpedoed. The ships also made use of false national colors until they were ready to fire, when the White Ensign (Royal Navy flag) would be hoisted. Q-ships might also use "panic parties" of supposedly fleeing crewmen to distract a U-boat crew until they were themselves ready to strike.

Although the British may have operated as many as 400 mercantile conversions and 60 purpose-built decoys during the war, their success was limited. One authority claims that only 11 U-boats were sunk by Q-ships, although other authors claim up to 30 submarines. Germany, the Ottoman Empire, and the United States also operated limited numbers of these ships.

Because decoy ships were not cost-effective in an environment of unrestricted submarine warfare, far fewer numbers of them were employed

during World War II. The Royal Navy deployed 10 such ships during the war. Ranging from 510 to 5,119 tons displacement, they included the *Chatsgrove, Maunder, Prunella, Lambridge, Edgehill, Brutus, Cyprus, Looe,* and *Antoine.* The *Edgehill* and *Prunella* were both sunk in June 1940, and the remainder were paid off in March 1941.

The last British Q-ship of the war was the 2,450-ton *Fidelity.* Converted in September 1940, it carried an antitorpedo net, four 4-inch guns, four torpedo tubes, two OS2U Kingfisher float planes, and a motor torpedo boat. Sailing with a French crew, the *Fidelity* was sunk in the course of a North Atlantic convoy battle on December 30, 1942.

When the Germans initiated Operation PAUKENSCHLAG (DRUMBEAT), concentrating submarines off the Atlantic U.S. coast with ensuing heavy U.S. merchant ship losses, the U.S. Navy converted five ships into decoys at Portsmouth, New Hampshire. These were the *Eagle* (subsequently the *Captor*), *Asterion, Atik, Big Horn,* and *Irene Forsyth.* The *Eagle*, a former fishing trawler, 133 feet in overall length, was armed with one 4-inch gun, two .50-caliber machine guns, four depth charge launchers, two .30-caliber machine guns, and a number of small arms to include hand grenades. It had a crew of 47. The *Atik* and *Asterion* were larger. These former cargo ships were of 3,209 tons displacement and 318 feet in overall length. They carried four 4-inch guns, four .50-caliber machine guns, six depth charge launchers, and an assortment of small arms.

The decoy ships were not successful. The *Atik* was sunk on its first patrol by *U-101*, and patrols by the others were uneventful. All such efforts ended in 1943.

Several U.S. Q-ships also operated in the Pacific, one being the *Anacapa.* While it did not sink any Japanese submarines, the *Anacapa* is believed to have damaged two U.S. submarines with depth charges. It was withdrawn from service in 1943.

Defensively Equipped Merchant Ships

Defensively Equipped Merchant Ships (DEMS) was the name of a British program to arm and man the armament on British merchant ships during World War II. The program was established in June 1939, just before the start of the war, with the goal of arming some 5,500 British merchant ships. A total of 3,400 ships had been armed by the end of 1940; all were armed by 1943.

At the beginning of World War II, most merchant ships equipped with guns carried obsolete weaponry left over from World War I. In time, the equipment was upgraded to include an antisubmarine gun (usually a 3-inch or 5-inch) on the stern and, in many cases, a second gun of similar caliber on the bow. Several antiaircraft guns were provided elsewhere. A typical Liberty ship carried four .50-caliber machine guns on the flying bridge, in addition to two on the foredeck and two on the afterdeck. DEMS and Armed Guard crews were usually service personnel, although they were frequently augmented by members of the ship's merchant crew.

Neutrality legislation prevented the arming of U.S. merchant ships until November 17, 1941. The United States began supplying Armed Guard personnel and weapons to the merchant ships of other nations on January 24, 1942. The United States followed the British practice of mounting a large gun at the stern (at first 4-inch guns removed from obsolete destroyer classes, then 5-inch guns on ships of more than 10,000 tons). Most Victory ships were armed with one 5-inch gun mounted at the stern for antisubmarine use, with antiaircraft armament of a single bow-mounted 3-inch gun and eight 20mm cannon. These weapons were manned by U.S. Navy Armed Guard personnel.

The effectiveness of DEMS and the U.S. program are difficult to assess, but they did reduce the number of German submarine attacks and added to the number of aircraft shot down.

de Gaulle, Charles (1890–1970)

French Army general, the leader of Free French forces, and the president of France. Born on November 22, 1890, in Lille, Charles de Gaulle demonstrated from an early age a keen interest in the military. He graduated from the French Military Academy at Saint-Cyr in 1913 and was commissioned a lieutenant.

De Gaulle's first posting was with Colonel Henri P. Pétain's 33rd Infantry Regiment. During World War I, de Gaulle was promoted to captain, exhibiting a high degree of leadership and courage. Wounded twice, he was captured by the Germans at Verdun in March 1916 after being wounded a third time. Later he received the Legion of Honor for this action. Despite five escape attempts, he remained a prisoner of war until the end of the war.

After the war, de Gaulle returned to teach history at Saint-Cyr, and in 1920 he was part of the French military mission to Poland. He returned to France to study and teach at the École de Guerre. De Gaulle then served as an aide to French Army commander Marshal Pétain, but the two had a falling-out, apparently because Pétain wanted de Gaulle to ghostwrite his memoirs. De Gaulle also became an important proponent of the new theories of high-speed warfare centered on tanks. In his 1934 book *Vers l'armée de métier* (published in English as *The Army of the Future*), de Gaulle proposed formation of six completely mechanized and motorized divisions with their own organic artillery and air support. Another book, *Le fil de l'epée* (The Edge of the Sword) revealed much about de Gaulle's concept of leadership

and his belief that a true leader should follow his conscience regardless of the circumstances.

Promoted to major and then to lieutenant colonel, de Gaulle served in the Rhineland occupation forces, in the Middle East, and on the National Defense Council. Although he was promoted to colonel in 1937 and had important political friends such as future premiere Paul Reynaud, de Gaulle's views placed him very much on the outside of the military establishment.

When World War II began, de Gaulle commanded a tank brigade. His warnings about the German use of tanks in Poland fell on deaf ears in the French high command. De Gaulle commanded the French 4th Armored Division in the 1940 Battle for France. Although the division was still in formation, he secured one of the few French successes of that campaign. Promoted to general of brigade on June 1, 1940, five days later de Gaulle was appointed undersecretary of defense in the Reynaud government. De Gaulle urged Reynaud to fight on, even in a redoubt in the Brittany Peninsula or removing the armed forces to North Africa. De Gaulle's resolve won the enthusiastic support of British prime minister Winston L. S. Churchill.

De Gaulle and Jean Monnet visited London and suggested to Churchill a plan for an indissoluble Anglo-French union that the French government had rejected. Returning to Bordeaux from the mission to London, de Gaulle learned that the defeatists had won, and France would sue for peace. On June 17, he departed France on a British aircraft bound for England. The next day, this youngest general in the French Army appealed to his countrymen over the British Broadcasting Corporation (BBC) to continue the fight against Germany.

From this point forward, de Gaulle was the most prominent figure in the French Resistance. With Churchill's support and because no prominent French politicians had escaped abroad, de Gaulle then set up a French government-in-exile in London and began organizing armed forces to fight for the liberation of his country. The Pétain government at Vichy declared de Gaulle a traitor and condemned him to death in absentia.

Initially, de Gaulle's position was at best tenuous. Most French citizens did not recognize his legitimacy, and relations with the British and Americans were at times difficult. De Gaulle insisted on being treated as head of state of a major power, whereas American leaders, especially President

Franklin D. Roosevelt, and even Churchill persisted in treating him as an auxiliary and often did not consult him on major decisions.

The British attack on the French fleet at Mers-el-Kébir (July 3, 1940) further undermined de Gaulle's credibility. Relations with the United States were not helped by a Free French effort to secure Saint-Pierre and Miquelon off Canada. The United States recognized the Vichy government and continued to pursue a two-France policy even after the United States entered the war in December 1941.

With time, de Gaulle solidified his position as leader of the Resistance in France. Bitter over British moves in Syria and Lebanon and not informed in advance of the U.S.-British invasion of French North Africa, de Gaulle established his headquarters in Algiers in 1943, where he beat back a British and American effort to replace him with General Henri Giraud. De Gaulle's agent, Jean Moulin, secured the fusion of Resistance groups within France. The French Resistance rendered invaluable service to the British and Americans during the June 6, 1944, Normandy Invasion, and French forces liberated Paris that August.

De Gaulle then returned to Paris and established a provisional government there. Full U.S. diplomatic recognition came only with the creation of the new government. De Gaulle secured for France an occupation zone in Germany and a key role in postwar Europe. But with the return of peace, the former political parties reappeared, and hopes for a fresh beginning faded. De Gaulle's calls for a new constitutional arrangement with a strong presidency were rejected, and he resigned in January 1946 to write his memoirs.

A revolt among European settlers and the French army in Algeria, who feared a sellout there to the Algerian nationalists, brought de Gaulle back to power in 1958. A new constitution tailor-made for de Gaulle established the Fifth Republic. De Gaulle's preservation of democracy was his greatest service to his country, but he also brought an end to the Algerian War, and he worked out a close entente with Konrad Adenauer's Federal Republic of Germany (West Germany). De Gaulle was also controversial, removing France from the North Atlantic Treaty Organization's military command, creating an independent nuclear strike force, encouraging Quebec to secede from Canada, and lecturing the United States on a wide variety of issues. He remained president until 1969, when he again resigned to write a new set of

memoirs. Unarguably France's greatest 20th-century statesman, Charles de Gaulle died at his estate of Colombey-les-Deux-Églises on November 9, 1970.

Degrelle, Léon (1906–1993)

Belgian fascist leader and Waffen-Schutzstaffel (Waffen-SS) commander. Born in Bouillon on June 15, 1906, Léon Degrelle attended the University of Louvain, where he became interested in journalism and was active in student politics. Invited by Catholic authorities to take over a small Catholic publishing house, Christus Rex, in Louvain, Degrelle produced a series of successful mass-circulation magazines combining popular articles with short stories on Catholic themes. Soon Christus Rex was publishing pamphlets about major news events.

In 1933, Degrelle assumed sole control of the firm and soon was holding political rallies marked by his own powerful oratory promoting both a populist program and a purge of corrupt officials. The Catholic Church

disassociated itself from the movement, which became a political party, Rex, by 1934. It remained for several years a dissident movement within the Catholic Party of Belgium.

In 1936, Degrelle broke with the Catholic Party. Rex contested the Belgian elections that year and touted itself as an independent party and a haven for those unhappy with the status quo. Degrelle attempted to appeal to the Belgian middle class and spoke of emphasizing Catholic values of solidarity and community.

Degrelle's praise of Adolf Hitler brought his arrest and that of other potential fifth columnists by Belgian authorities in May 1940, when the Germans invaded. On his release in France in July, Degrelle promptly proclaimed to German authorities his wish for a greater Belgium to include parts of the Netherlands and northern France. In July 1941, following the German invasion of the Soviet Union, Degrelle founded the Walloon Legion, although few Belgians were attracted to join.

Listed on the Waffen-SS order of battle as the 28th SS Division, the legion actually numbered no more than 2,000 men. Degrelle led the Walloon Legion in fighting in the Soviet Union. Awarded the Iron Cross Knight's Cross with Oak Leaves, he was the highest-decorated foreigner in German service.

Degrelle was in Belgium from December 1942 to January 1943. Although he claimed that he and his legionnaires were Belgian patriots fighting to secure a place for their country in Hitler's New Order, in discussions with SS leaders he expressed a commitment to restoring the Walloons (as opposed to the Flemish) to their "rightful" place as a Germanic people within the Reich.

More than half of the men of the Walloon Legion died in the war. Degrelle abandoned the survivors in the defense of Berlin. In late April 1945, he fled north to Oslo, Norway, which was still under German control and where he commandeered an aircraft. He and five others then flew to San Sebastian in northern Spain, where they crash-landed. Negotiations for Degrelle's extradition to Belgium foundered on Spanish demands for a quid pro quo.

In 1946, Degrelle vanished from the hospital where he had been recuperating. The Spanish government denied knowledge of his whereabouts, but he was protected by influential Spaniards. A decade later, Degrelle

resurfaced in public but did not leave Spain. He remained an unabashed admirer of Adolf Hitler until his death in Malaga on April 1, 1993.

De Guingand, Sir Francis Wilfred (1900–1979)

British Army major general. Born at Acton, Middlesex, England, on February 28, 1900, Francis Wilfred de Guingand joined the West Yorkshire Regiment in 1919 following graduation from the Royal Military College, Sandhurst. He first met Bernard Montgomery (then a brigade major) while serving as a second lieutenant in southern Ireland in 1921. Following a regimental depot tour at York from 1922 to 1925, de Guingand served in Africa with the King's African Rifles (Canal Brigade, Ismailia), and he commanded troops in Nyasaland (Malawi) from 1930 to 1931.

De Guingand then returned to regimental duties, graduating from the Staff College, Camberley, in 1935. In 1939, he was appointed military assistant to Leslie Hore-Belisha, the secretary of state for war. On the latter's removal in 1940, de Guingand was virtually banished from major assignments. He was then instructor at Haifa Staff College, with a short interregnum as the commandant of the new Combined Operations School.

In December, de Guingand joined the Joint Planning Staff at Cairo, where he was intimately involved in operational planning and early reconnaissance for the April 1941 Greece Campaign. De Guingand remained a lower-level staff officer until he was appointed director of military intelligence for the Middle East in February 1942. In August when General Montgomery assumed command of the Eighth Army, de Guingand became chief of staff. He remained with Montgomery in this capacity for the rest of the war.

Although the two men were opposites in temperament, they worked well together, and de Guingand labored to remove points of friction between Montgomery and other Allied leaders. More important, de Guingand functioned as a real chief of staff, as in the German Army and the U.S. Army, rather than as a more narrowly focused senior operations officer, as was typical of the British staff system. Thus, de Guingand is considered the British Army's first modern chief of staff.

Promoted to acting major general in April 1943, de Guingand commenced planning for the Sicily Campaign (July 9–August 22). He supported Montgomery throughout the campaign and during early Allied operations in Italy. De Guingand returned to Britain as chief of staff of Montgomery's 21st Army Group on January 10, 1944, and served in that position throughout the Northern Europe campaigns. A falling out with Montgomery began in late 1944 when Montgomery claimed all the credit for Allied successes and treated General Dwight D. Eisenhower poorly. The loyal de Guingand worked hard to maintain good relations with his American counterparts and to smooth over hard feelings caused by Montgomery's abrasiveness. At one point when Eisenhower was seriously considering Montgomery's relief, de Guingand managed to patch this up. On May 6, 1945, de Guingand escorted Colonel General Alfred Jodl to Rheims to formalize the German surrender.

De Guingand retired from the army in May 1946. He moved to Southern Rhodesia (now Zimbabwe) in 1947, where he became active in international finance. He wrote several books during his retirement and died near Harare, Rhodesia, on June 29, 1979. Although largely unremembered today, de Guingand was one of the key figures cementing the U.S.-British Grand Alliance.

De Havilland, Sir Geoffrey (1882–1965)

British aircraft designer and manufacturer. Born on July 27, 1882, near High Wycombe, England, Geoffrey De Havilland trained at the Crystal Palace Engineering School and then worked for several transportation companies. He built his first airplane in 1909. Although it crashed, he flew an improved design a year later. From 1911 to 1914, De Havilland was employed at the Balloon Factory at Farnborough designing aircraft. He began working at the Aircraft Manufacturing Company (Airco) in August 1914 and designed several two-seat day-bombers (the DH4, DH9, and DH9A) and a trainer (DH6) that were manufactured in the thousands. Some remained in service for a decade.

De Havilland formed his own company in September 1920 and was soon manufacturing light civil aircraft and airliners. In 1934, the company's main headquarters were relocated to Hatfield north of London. De Havilland built some of the fastest interwar aircraft, including the DH 88 Comet racer and DH 91 Albatross four-engine airliner, learning in the process the value of streamlining and improved airframe design.

During World War II, the De Havilland Company manufactured more than 14,000 aircraft, of which by far the most famous was the Rolls-Royce Merlin–powered twin-engine wooden DH98 Mosquito. This airplane first flew November 25, 1940, and eventually served as a fighter, reconnaissance aircraft, and bomber. During much of the war it was the fastest aircraft, with a maximum speed of 425 mph. More than 7,700 had been manufactured by the time production ceased in November 1950.

In addition, the company manufactured more than 11,500 engines and 100,000 aircraft propellers during the war. De Havilland designed and built one of the earliest British jet fighters, the DH100 Vampire, powered by the pioneering DH Goblin engine. It first flew in September 1943.

De Havilland's company developed more than 50 basic types of aircraft in its 39 years as an independent firm, manufacturing a total of 31,000 airplanes. As the British industry contracted, the firm became part of

Hawker-Siddeley in 1959 and eventually part of British Aerospace. De Havilland was knighted in 1944 and received the Order of Merit in 1962. He died on May 21, 1965, at Watford, England.

De Lattre de Tassigny, Jean Joseph Marie Gabriel (1889–1952)

Marshal of France, commander of Free French forces in World War II, and one of France's greatest soldiers. Born in Mouilleron-en-Pareds in the Vendée, France, on February 2, 1889, Jean de Lattre de Tassigny graduated from the French Military Academy at Saint-Cyr in 1911 and was commissioned in the cavalry. In September 1914, he received the first of six wounds he suffered during World War I. He fought the remainder of the war in the infantry, ending in command of a battalion. He was cited eight times for bravery.

De Lattre subsequently served four years in Morocco in pacification campaigns and was again wounded. In 1932, he was selected to join the staff of the Supreme War Council and promoted to lieutenant colonel. In 1935 he was promoted to colonel and took command of a regiment at Metz. In March 1939, de Lattre commanded the 14th Infantry Division, which acquitted itself well during the Battle for France (May 10–June 25, 1940), at Sedan (May 14), at Rethel, on the Marne, and on the Loire, ending the campaign near Clermont-Ferrand.

De Lattre continued in command of the 14th Division in the Armistice Army before becoming commandant at Puy-de-Dôme Depot. He then

commanded the 13th Military Region and worked to retrain what was left of the French Army. In September 1941, de Lattre was posted to command French forces in Tunisia. In fighting between British and Free French forces and the Germans in Libya, de Lattre maneuvered his own troops so as to cut off the German retreat. Alarmed, the Vichy government ordered his return to France, where he took command of the 16th Military District at Montpellier in January 1942.

When the Germans entered unoccupied France in November 1942, de Lattre contravened Vichy orders and began defensive operations, allowing many anti-German French to escape to the Mediterranean coast. Subsequently arrested, he was sentenced to 10 years' imprisonment. In September 1943, de Lattre, with the aid of his son Bernard, escaped from Riom Prison, evading capture with the help of the Maquis (guerrillas), until he was evacuated to England on October 17.

On reporting to General Charles de Gaulle, head of the Free French government in Algiers, de Lattre took command of training French forces in North Africa. He then commanded French troops in the June 1944 invasion of Elba before leading the Free French First Army into southern France in Operation DRAGOON (August 15, 1944). His subsequent capture of the fortified ports of Toulon and Marseille proved to be a brilliant feat of arms. He was awarded the American Distinguished Service Cross. The First Army fought on the Allied right flank through Alsace. By occupying territory technically within the Allied boundaries, de Lattre reached the Franco-German border abreast of the Americans, rather than behind them as he had been ordered. Among his successes was the capture of the fortress of Belfort at a cost of only 1,000 French casualties. He pushed nine divisions into Germany by the armistice, helping to secure for France a substantial role in the postwar occupation of Germany.

Following the armistice, de Lattre served on the Allied Control Council for Germany. He then was inspector general of the French Army, overseeing its modernization and retraining. From 1948 to 1950, he commanded the land forces of the Western European Union.

In December 1950, as a gesture of its determination, the French government sent de Lattre, its greatest living soldier, to Indochina as high commissioner as well as commander of French military forces. De Lattre infused new vigor in the French military effort and won a series of pitched

battles against the Viet Minh. His son Bernard was killed in action during one of de Lattre's successful battles for the Red River Delta. Consumed by cancer, de Lattre returned to Paris in December 1951 and died there on January 11, 1952.

Delestraint, Charles Georges Antoine (1879–1945)

French Army lieutenant general. Born in Biache-Saint-Waast (Pas-de-Calais) on March 12, 1879, Charles Delestraint graduated from the French Military Academy at Saint-Cyr in September 1900 as an infantry officer. He transferred to a cavalry unit in 1910. Delestraint was taken prisoner early in World War I and spent four years in captivity, during which time he learned German, English, and Russian. In the years after the war, he became an outspoken advocate of tank warfare along with Charles de Gaulle, with whom he shared many discussions. A critical, tradition-bound military leadership forced Delestraint into the reserves in March 1939, but he was almost immediately recalled to active duty.

In early 1940, Delestraint took command of an armored group of three tank divisions that included Colonel de Gaulle's own. Delestraint directed the French counterattack at Abbeville of June 3–4, 1940. His exemplary leadership brought him a promotion to major general. Rejecting the armistice with Germany, Delestraint resigned from the army on July 8, 1940, settling in unoccupied Bourg en Bresse. There he headed an association of former armor officers.

Delestraint secretly organized a military headquarters complete with staff sections, and he settled on the Vercors Plateau as a site for a national redoubt. On the recommendation of Resistance leaders Henri Frenay and Jean Moulin, de Gaulle selected his former commander to head the Armée Secrète (Secret Army) in France. Under the code name Vidal, Delestraint made significant progress in amalgamating diverse Resistance groups into a military force. Internal disputes remained, notably with the communists over issues of weapons distribution and support for de Gaulle's overall strategy.

Learning of Delestraint's activities, Gestapo chief in Lyon Klaus Barbie engineered a trap for him in Paris, and the Gestapo arrested him outside La Muette subway station on June 9, 1943. Under Barbie's interrogation, Delestraint admitted his position. Shortly thereafter, Moulin was also taken, and the organization was bereft of its leadership just as it was gathering strength.

Delestraint arrived in Dachau in September 1944 following 15 months' questioning and internment in a series of camps. He was shot on April 19, 1945, two weeks before the end of the war.

Del Valle, Pedro Augusto (1893–1978)

U.S. Marine Corps major general. Born in San Juan, Puerto Rico, on August 28, 1893, Pedro Augusto Del Valle was commissioned a second lieutenant in the marines on graduation from the U.S. Naval Academy, Annapolis, in 1915. He served in Santo Domingo, in the Dominican Republic, and then

with the marine detachment on the battleship *Texas* in European waters after U.S. entry into World War I.

After the war, Del Valle held a variety of assignments, and from 1935 to 1937 he was the naval attaché in Rome. In this capacity, he was the only official U.S. military observer of the Italian invasion and conquest of Ethiopia (1935–1936). In 1937, he returned to the United States to attend the Army War College, and in 1940 he published a book, *Roman Eagles over Ethiopia.*

Promoted to colonel, Del Valle took command of the 11th Marine Regiment. Promoted to brigadier general in August 1942, he deployed that month to Guadalcanal with the 1st Marine Division under Major General Alexander Archer Vandegrift. He commanded the divisional artillery until the end of December. Del Valle then commanded the ground forces during the final stages of the Solomon Islands Campaign (August 1942–February 1943). He also led the III Amphibious Corps artillery during the invasions of Guam (July 21–August 10, 1944) and Tinian (July 24–August 1, 1944). Promoted to major general in January 1945, he then commanded the 1st Marine Division in operations on Okinawa from March to June.

After the war, Del Valle served as inspector general of the Marine Corps until his retirement in 1948. He became a vice president of the International Telephone and Telegraph Company (ITT) and then the president of IT&T in South America. Del Valle died in Annapolis, Maryland, on April 28, 1978.

Dempsey, Miles Christopher (1896–1969)

British Army general. Born in New Brighton, Cheshire, on December 15, 1896, Miles Christopher Dempsey graduated from the Royal Military College, Sandhurst, in 1915. He saw action on the Western Front and in Iraq in World War I. He served at Sandhurst from 1923 to 1927. Dempsey was on the staff of the War Office from 1932 to 1934 and at Aldershot from 1934 to 1936. He was promoted to lieutenant colonel in 1938.

In 1940, Dempsey commanded the 13th Infantry Brigade (Royal Berkshires) in France as an acting brigadier, leading it with distinction during the retreat to and evacuation from Dunkerque (Dunkirk, May 26–June 4). Dempsey then helped train new British forces, was promoted to major general in January 1941, and was assigned command of the 42nd Armoured Division. In December 1942 at the request of Lieutenant General Bernard Montgomery, Dempsey took command of XIII Corps of the British Eighth Army and was promoted to lieutenant general. Dempsey helped plan the invasion of Sicily (Operation HUSKY, July 9–August 22, 1943) and then commanded his corps in the assault. He also directed the assault crossing to Italy of the Canadian 1st Infantry and 5th Armoured Divisions.

By January 1944, Dempsey had returned to Britain to command the British Second Army, and with his staff he helped develop the OVERLORD plan for the invasion of northern France. Dempsey is credited with the decision for and planning of Operation GOODWOOD (July 18–20, 1944). In the fall of 1944, the Second Army participated in the breakout from the Normandy beachhead and the campaigns for France and Belgium, liberated Brussels and Antwerp, and penetrated into Holland in Operation MARKET-GARDEN (September 17–26), which was a failure. Dempsey had opposed the Eindhoven-Arnhem route, preferring instead an offensive closer to the U.S. First Army near Aachen. He was created knight commander of the Bath (KCB) in June 1944 and knight commander of the British Empire (KBE) in July 1945. In March 1945, the Second Army crossed the Rhine and then pushed to the Baltic. Dempsey personally took the surrender of Hamburg on May 3, 1945.

British Army general Miles Dempsey. (Corbis)

Dempsey kept close control of his subordinates, often placing his tactical headquarters close to theirs and keeping reserves under his own control in the early phases of a battle. He sought to avoid high casualties, arranging maximum fire support and emphasizing the use of tactical airpower. Many scholars consider Dempsey's influence in the war to be minimal, dismissing him as Montgomery's cipher. Dempsey's introverted nature and his shunning of both publicity and self-promotion aided this impression. The close working relationship between Montgomery and Dempsey obscures the latter's authorship of operational decisions, as does their shared tendency to rely on verbal orders. They worked together for so long that they thought along similar lines and anticipated each other's reactions and decisions.

In August 1945, Dempsey succeeded General Sir William Slim as commander of the Fourteenth Army for the reoccupation of Singapore and Malaya. Dempsey followed Slim again as commander in chief of Allied Land

Forces in Southeast Asia. Dempsey was promoted to full general on leaving that post and was commander in chief in the Middle East during 1946–1947. He retired at his own request in July 1947 and entered the private sector. Dempsey died in Yattendon, Berkshire, on June 5, 1969.

Demyansk Pocket (February 8, 1942–February 28, 1943)

Following the failed German effort to capture Moscow in December 1941, Adolf Hitler ordered in his Führer Directive 39 that the Wehrmacht consolidate a defensive position along the entire Eastern Front. Before defensive positions could be stabilized, Marshal Georgi Zhukov launched a massive attack against Field Marshal Fedor von Bock's Army Group Center, sending the Germans reeling. In January 1942, to prevent a rout, Hitler issued another order to his forces to "stand their ground regardless of consequences." Commanders who disobeyed or disagreed with this ordered were cashiered. These included Generals Wilhelm von Leeb, Fedor von Bock, Gerd von Rundstedt, Heinz Guderian, and Erich Hoepner. Hitler's order did stabilize the line and brought Zhukov's counteroffensive to a halt.

The Soviets quickly recovered, and on January 7, 1942, they deployed the Eleventh, Thirty-Fourth, and First Shock Armies against the German Sixteenth Army south of Lake Ilmen. At the same time, the Third Shock

Army coming from Lake Seliger swung north, and by February 8 the Red Army had completed the pocket, trapping the Sixteenth Army's II Army Corps and much of X Corps. Surrounded in the Demyansk pocket were the 12th, 30th, 32nd, 123rd, and 290th Infantry Divisions and the 3rd SS Division (Totenkopf), in all more than 90,000 troops.

Assured by Reichsmarshall Hermann Göring that the Luftwaffe would resupply the entrapped Germans at Dem-yansk, Hitler ordered II and X Corps to hold their ground, forbidding any retreat westward. X Army Corps command staff was outside the pocket; II Army Corps commander General of Infantry Walter von Brockdorff-Ahlefeldt assumed command of all divisions within the pocket. Brockdorff deployed 3rd SS Division commander Gruppenführer Theodor Eicke with a mixture of his own Waffen-SS troops and other divisional units toward the west to shore up the 290th Infantry Division while he led a battle group northeastward against the Soviet Thirty-Fourth Army.

Meanwhile, the First Air Fleet launched a massive aerial resupply operation. This was the first time an army was resupplied entirely by air. The airlift was largely successful, although the Luftwaffe lost 265 aircraft against 408 lost by the Soviets.

By February 12, the Soviets launched attacks on the pocket against X Army Corps, commanded by General of Artillery Walter von Seydlitz-Kurzbach. Determined German resistance, coupled with successful aerial resupply, prevented collapse of the pocket. Eicke's forces, holding high ground, stabilized Army Group North's right flank, preventing a major breach between it and Army Group Center.

On March 21, the first day of spring, the Germans launched Operation FALLREEP (GANGWAY). X Army Corps drove the Soviet Eleventh Army east over the Lovat River to Ramushevo. Stiff Soviet resistance then stalled the German offensive, yet X Army Corps captured Ramushevo on April 14. At the same time Eicke's forces attacked from the east, with one 3rd SS Division tank unit reaching the Lovat River on April 20. By April 22, the remainder of Eicke's battle group had reached the river and established a secure bridgehead. After 73 days the pocket was opened, and Seyd-litz dispatched fresh troops and supplies. Two days later, the three-mile-wide Ramushevo corridor was established along the Demyansk–Staraya Russa road.

On May 5, to secure the corridor and keep it open, Hitler placed 14,000

troops within the Demyansk area under Eicke to defend a 40-mile front along the corridor. Beginning in May, Red Army infantry units attacked the corridor in increasing frequency and ferocity through June, pointing to an imminent major assault. That began on July 17, with Soviet forces capturing Vasilyevschina. Brockdorff then committed his 8th Jäger Division and recaptured the village. The German line held, and the Soviets broke off their assault on July 30. On August 6, with fresh troops, tanks, and artillery supported by the Red Air Force, the Soviets renewed their assaults on the corridor, extracting a heavy German toll. Only bad weather on August 15–16 halted this and allowed the Germans to reinforce the corridor. By August 19, Soviet momentum had again been lost.

Fighting continued until the end of February 1943, however. On March 1, the Soviets retook Demyansk following the withdrawal of German forces. The German unit most responsible for preventing the collapse of the Demyansk Pocket was Eicke's 3rd SS Division. Many of the Waffen-SS units had fought to the last man, and Eicke's division sustained an astonishing 80 percent casualty rate at Demyansk. When the remnants of the division were finally pulled from the Eastern Front in October 1942, the division required a complete reconstitution.

One legacy of Demyansk was that the equivalent of a reinforced corps could be resupplied by air. This led Hitler to believe that encircled pockets could hold out and be sustained until relieved through aerial resupply. This proved disastrous in Hitler's calculations at Stalingrad when the Luftwaffe was unable to save the Sixth Army. Indeed, II Army Corps at Demyansk required 265 metric tons of supplies per day, and toward the end before the breakout that amount could not be met. To resupply the Sixth Army at Stalingrad, at a much greater distance than Demyansk, required 800 tons per day.

Denmark

Small nation located in Northern Europe encompassing 16,639 square miles. Mainland Denmark borders Germany to the south, the Baltic Sea to the east, and the North Sea to the west and north. Also within the Kingdom of Denmark were the Faroe Islands (540 square miles), Iceland (39,770 square miles) and Greenland (836,330 square miles). Denmark, a constitutional monarchy, had a total population of some 5 million people in 1939 and had since 1815 sought security in neutrality. Indeed the country was neutral during World War I. As additional insurance, it signed a non-aggression pact with Germany on May 31, 1939.

Although Denmark's chief trading partner was Great Britain, which received Danish chief exports of dairy products, geographically Denmark lay within Germany's sphere of influence. Its conquest by Germany was a natural extension of Operation WESERÜBUNG, Adolf Hitler's plan to take Norway in April 1940. German occupation of Denmark was essential if Germany was to control Norway.

At the time of the German invasion, Denmark had an army of 14,000 men, 8,000 of whom had been recently drafted. The small navy had only 3,000 men and 2 coast-defense warships (built in 1906 and 1918). The air force, split between the army and navy, had 50 obsolete aircraft. The German invasion, mounted before dawn on April 9, 1940, was over in only two hours. The government ordered a cease-fire after the occupation of Copenhagen, leaving insufficient time for the government or King Christian X to escape abroad.

Germany initially employed a soft approach in Denmark, reaching an accord with the Danish government wherein most governmental functions remained under Danish control. Denmark provided important military bases to Germany and exported essential foodstuffs, such as dairy products and

meat, to Germany. These latter amounted to some 10 percent of German requirements. This arrangement worked well for three years, 1940–1943, with only sporadic resistance. The official Danish policy was to collaborate with Germany to the extent necessary, a policy supported by most of the population.

Danish collaboration was predicated on the assumption that the Germans would honor their pledge not to interfere in Danish internal affairs, but time and again the Germans broke the agreement, demanding certain military equipment and insisting on the removal of specific government officials. The Germans also demanded that Denmark make a greater contribution to the German war effort, and Danish authorities urged some 100,000 of Denmark's citizens to work in Germany to prevent them from being conscripted.

Following the German invasion of the Soviet Union on June 22, 1941, the Germans forced the Danish government to ban the Communist Party and accept German recruitment of a Danish Free Corps to fight on the Eastern Front. In November 1941, Germany insisted that Denmark join the Anti-Comintern Pact.

There were Danes who took up cause against Germany from the beginning. On the German conquest of Denmark, 232 Danish merchant ships were at sea with some 6,000 seamen. Most of the latter helped to crew ships in the Atlantic and Arctic convoys. Ultimately, 1,500 of these men lost their lives, and 60 percent of the fleet was lost. By 1944, Danes formed the crews of 2 British minesweepers. Another 1,000 Danish nationals served with various Allied forces fighting the Axis powers.

In 1940 a Danish Council was formed in London, which in 1942 became the Free Danish Movement. Henrik Kauffmann, Danish ambassador to the United States, disassociated himself from the Danish government and signed a treaty in 1941 granting the United States military bases in Greenland. British forces also occupied the Faroe Islands in April 1940. In May 1940, the Allies also occupied Iceland, which declared itself independent in 1944.

In the spring of 1942, Berlin appointed Werner Best as Reich commissioner for occupied Denmark. A hard-line German officer, Lieutenant General Hermann Hanneken, took command of German troops in Denmark and was encouraged by Hitler "to rule with an iron hand." Such actions infuriated the Danes and led to an uprising in August 1943. The changing

German military fortunes, British radio broadcasts, and the Danish illegal press all helped shift public opinion away from collaboration to resistance.

The occupying Germans did not confiscate radio sets, and many Danes listened to the British Broadcasting Corporation (BBC) daily. The August demonstration and associated strikes demanded an end to collaboration. Attempts by Danish authorities to crush the demonstrations ended in fatalities and were unsuccessful. There were also violent clashes between Danes and German soldiers in some provincial cities. Consequently, the Germans declared a state of emergency on August 29, arrested most members of the Danish military, and in effect took over rule of the country.

In September 1943, the Gestapo arrived in Denmark and initiated a reign of terror that lasted to the end of the war. Some 6,000 Danes were sent to concentration camps, and hundreds more were executed outright. Many Danes sought refuge in Sweden. The Danish Freedom Council became the de facto clandestine government, an underground army was formed, and more than 2,000 acts of sabotage were carried out, some 30 percent of these in Copenhagen. The Danish Freedom Council divided the nation into six regions, exercising central authority through its Command Committee. By the end of the war, the Danish Resistance numbered about 40,000 people. The sabotage acts had little effect on the German war effort, although news of them had a positive psychological impact on the Danish population as proof that Denmark was no longer collaborating with Germany.

Danes of all walks of life actively resisted German efforts to round up Jews. Although Best ordered the arrest of all Jews in Denmark, more than 7,000 escaped the Nazi net; 5,500 were transported to Sweden by boat. Only 472 were caught and sent to Theresienstadt. Danes did not forget those who had been sent there; they regularly sent packages of foodstuffs and clothes, and only 52 of the Danish Jews there perished.

The Germans surrendered Denmark on May 4, and the Danish Resistance took control of the country the next day. On May 5, a company of the British 13th Battalion, Parachute Regiment, arrived in Copenhagen by plane along with Major General R. H. Dewing, head of the Supreme Headquarters, Allied Expeditionary Force (SHAEF), mission to Denmark. British infantry troops marched into Denmark on May 7. The following day, troops from the British 1st Parachute Brigade took the formal surrender of all German forces.

When the German commander on the island of Bornholm refused to

surrender, Soviet aircraft on May 7 and 8 bombed the towns of Rønne and Neks, causing great damage but few deaths. On May 9, Soviet ships arrived at Rønne, and the Germans there surrendered. However, Soviet troops occupied the island until April 1946. Following the war, the Danish government ordered the arrest and punishment of some 34,000 Nazi collaborators.

After the war, the Danes would have preferred establishing a league of armed neutrality with Norway and Sweden, but they reluctantly followed Norway into the North Atlantic Treaty Organization (NATO). In 1951, the Danes agreed without particular enthusiasm to having U.S. naval and air bases in Greenland. Whatever hesitancy the new Danish policy might have indicated, it was a major switch from prewar neutrality and the feeling that no amount of military preparation on their part would deter their much more powerful neighbors.

Denmark Campaign (April 9, 1940)

Code-named Operation WESERÜBUNG SUD (WESER EXERCISE SOUTH), the German invasion of Denmark began at approximately 4:15 a.m. on April 9, 1940. It formed an integral part of the much larger German assault on Norway (Operation WESERÜBUNG) that began the same day. German units

quickly overran the Danish Peninsula, abrogating a nonaggression pact signed between Germany and Denmark in May 1939.

Although Danish intelligence learned of the German plans to invade as early as April 4, the accounts were contradictory and in any case were not believed. Certainly, the Danes had no chance whatsoever of defeating the German invaders. The poorly trained and inadequately equipped Danish Army numbered only some 14,000 men, 8,000 of whom had enlisted within eight weeks prior to the German attack. The Danish Navy consisted of just two small vessels and approximately 3,000 men. The navy surrendered without going on alert, allowing a German troopship to arrive at Copenhagen. The air force had only 50 obsolete planes and a handful of pilots, no match for the vaunted Luftwaffe.

On April 9, German seaborne forces moved into the capital of Copenhagen and secured the city by 6:00 a.m. Meanwhile, German paratroopers conducted the first airborne operation of the war when they seized the undefended fortress of Madnedø and, shortly thereafter, the airport at Aalborg in north Jutland. At the same time, German Army units raced across the Jutland Peninsula in motorized columns.

Although Danish Army units briefly contested the Germans in northern Schleswig, the outcome was never in doubt.

German minister to Denmark Cecil von Renthe-Fink presented an ultimatum to the Danish government, demanding surrender and threatening the destruction of Copenhagen by Luftwaffe squadrons already en route if it refused. There was absolutely no chance of victory over the Germans, and eager to avoid further loss of life, King Frederik IX and Premier Thorvald Stauning believed they had no choice but to order surrender at 7:20 a.m. The campaign for Denmark was over. Danish casualties amounted to 26 dead and 23 wounded; the Germans lost 20 dead or wounded.

The German invasion provided the excuse for the Allied occupation of Iceland, which then belonged to Denmark. Allied possession of strategically located Iceland proved vital in the Battle of the Atlantic. German forces occupied Denmark until the end of the war in May 1945.

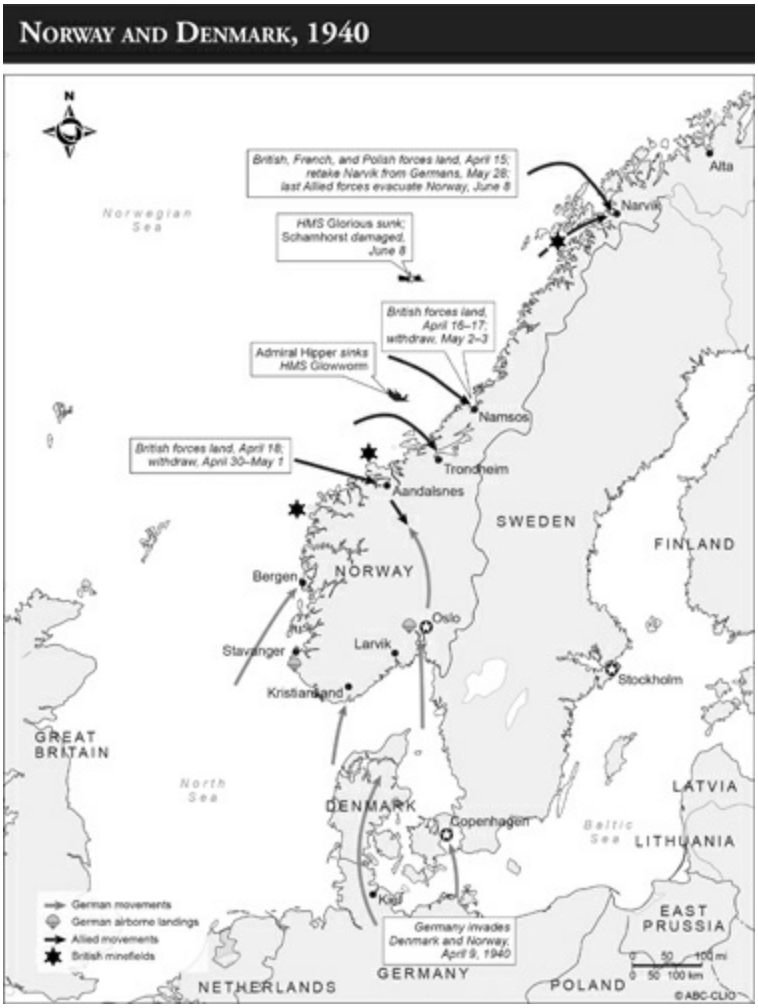
Dentz, Henri Fernand (1881–1945)

French Army general. Born in Roanne on December 16, 1881, Henri Fernand Dentz entered the French Military Academy at Saint-Cyr in 1900. On graduation he was assigned to Tunis, and later (1920–1923) he headed the army's Information Services in Syria. In December 1927 he was promoted to lieutenant colonel and in June 1931 to colonel. From 1934 to 1937, Dentz commanded the 54th Brigade, earning promotion to general of brigade in December 1935. He was then vice chief of the General Staff the following two years and was promoted to major general in December 1937. In September 1939, he was promoted to general of corps and commanded first XV Corps and then XII Corps. On June 14, 1940, as military governor of Paris, Dentz surrendered the city to the Germans.

In December 1940, the collaborationist Vichy government appointed Dentz high commissioner of the Levant (Lebanon and Syria). On May 11, 1941, Adolf Hitler met with French admiral Jean François Darlan and General Maxime Weygand to demand use of Syrian airfields. Acting on orders from Darlan, Dentz permitted German aircraft to fly from Syrian airfields to support the uprising of Rashid Ali in Iraq against the British. He also allowed the Germans to use Syrian ports, roads, and railroads to move supplies. Dentz rejected Allied appeals that he switch sides and receive their military support. British and Free French forces under Lieutenant General Maitland Wilson counterattacked on June 8, 1941. Lacking reinforcements, Dentz was obliged to ask for an armistice.



On July 14, 1941, Dentz signed terms at Saint Jean d'Acre that allowed Vichy forces to evacuate without their equipment. Dentz returned to France with 33,000 men, including some 1,400 injured; about 1,000 others had been killed during the month of fighting. British forces had lost 3,600, while Free French casualties were some 800 men in one of the fiercest fraternal struggles of the war between French forces.

Promoted to full general by Vichy in June 1941, Dentz retired from the army, primarily because of his age, in June 1943. Brought to trial after the war on charges of collaboration with the enemy, Dentz was found guilty by the High Court of Justice on April 20, 1945, and condemned to death. In October, Charles de Gaulle commuted this sentence to life in prison. Dentz died in prison at Fresne near Paris on December 13, 1945.

Depth Charges

Explosive devices designed to sink a submarine by detonating in its vicinity when triggered by water pressure, the target's magnetic or acoustic signature, or a variety of timers. From 1916 until 1943, the depth charge was the principal antisubmarine weapon of all navies, after which more sophisticated weapons with greater range came to the fore.

In 1939, most navies used weapons similar to the British Type D Mark III (which entered service in 1916). The Mark III had a charge of approximately 200 pounds and a sink rate of 6–10 feet per second and was triggered hydrostatically to explode at depths between 25 and 300 feet. Such charges had a lethal radius of 20 feet and, exploding at 40 feet, could force a submarine to surface.

Antisubmarine vessels discharged depth charges from roll-off racks and mortars (launchers) that projected them some 40 yards to the side. At the beginning of the war, the normal procedure for antisubmarine attacks was to use depth charges in patterns of five—three dropped in a line using gravity from the roll-off racks at the stern and two fired (one to each side) by launchers to produce a diamond-shaped pattern intended to bracket the target submarine.

Development during World War II concentrated on four main areas: larger charges, faster sink rates, greater fuzed depths, and more effective patterns. More powerful explosives such as Minol and Torpex, which were

50 percent more effective than TNT, replaced guncotton, and charges also increased. The U.S. Navy and the Royal Navy introduced weapons with 600-pound explosive charges in 1941. In 1942, the Royal Navy introduced the massive Mark X weapon, with a 2,000-pound charge. It was so large that it was fired from 21-inch torpedo tubes retained on destroyers and escorts for this specific purpose.

Sink rates rose to 22 to 50 feet per second, either by adding weights to conventional charges (heavy charges) or by streamlining the cases. Modified fuzes also allowed depth charges to explode deeper, doubling the maximum depth to 600 feet (at 50-foot intervals). The modified Mark X* sank faster because one buoyancy chamber was deleted and could be fuzed to explode down to 900 feet, while the Mark X** (which did not enter operational service) could be set to explode as deep as 1,200 feet.

Equally important were more effective dropping patterns. Modified casings resulted in more reliable and predictable underwater trajectories, newer projectors that increased surface ranges to 150 yards, and mathematical analysis that generated patterns having greater kill probabilities. First, the addition of another launcher on each beam allowed for the use of a seven-charge pattern in the form of a hexagon, increasing the danger zone. Mixing standard and heavy charges created a new highly effective 10-charge pattern that layered 2 diamond-shaped five-charge patterns, one above the other.

The final development was a three-layer 14-charge pattern using four launchers on each side and six charges dropped from the stern racks. Operational experience, however, demonstrated that although the pattern was theoretically much more lethal than the 10-charge pattern, in practice the explosion of the first charges countermined the later charges and rendered them ineffective. Therefore, the antisubmarine force reverted to the 10-charge pattern and replaced the additional launchers with stowage for extra charges.

Air-dropped depth charges played an important role during and after World War II. First designs were modifications of existing surface types, which limited their efficacy, since their weight reduced the number that could be carried and they were also subject to restrictions on dropping height and speed. The purpose-designed types that followed were lighter and less subject to dropping restrictions. Scientific analysis of attack camera records contributed mightily to the effectiveness of air-dropped depth charges.

Scientists learned that charges were dropped too low and with depth fuze settings that were too deep to be effective. The ultimate fuze setting for aerial depth charges of 25 feet and new bomb sights and tactics transformed the weapons' effectiveness.

During 1944, newer weapons such as the Hedgehog, the Squid, and homing torpedoes surpassed depth charges in the sinking of submarines. Nevertheless, the depth charge was still an important antisubmarine weapon until after the war's end.

Destroyer Escorts and Frigates

Warships smaller than regular destroyers and designed primarily for antisubmarine warfare. Great Britain first built this type of warship to address the shortage of regular destroyers engaged in the defense of its shipping lanes against German submarines, as they were cheaper to construct and shipyards could produce them more rapidly than larger warships. After entering the war in December 1941, the United States also built both types for use in the Battle of the Atlantic.

The destroyer escort, being the more capable of the two designs, first appeared in 1939 in the British Hunt class. The Hunt-class escort destroyer displaced 1,175 tons and was 296 feet in overall length with a beam of 33 feet 4 inches. Its engines were capable of producing a speed of 26 knots. Armament consisted of 6 4-inch quick-firing guns, 4 2-pounder pom-pom

guns for antiaircraft defense, 3 21-inch torpedo tubes, and up to 70 depth charges. It had a crew of 170.

By the end of the war and owing to its far greater industrial capacity, the United States had built far more of these ships than had Britain. The last American variants, built during 1943 and 1944, were the DET and FMR classes, designed primarily for antisubmarine warfare but also capable of antiaircraft defense. The DET and FMR classes displaced 1,253 tons, were 306 feet in overall length by 36 feet 7 inches in beam, and were capable of 20.2 knots. Armament consisted of 3 3-inch guns, 3 21-inch torpedo tubes, and an antisubmarine battery of 1 Hedgehog, 8 depth charge launchers, and 2 depth charge racks. These classes also mounted 2 40mm Bofors and between 8 and 10 20mm Oerlikon guns for antiaircraft defense. These ships had a crew of 186.

As with destroyer escorts, Great Britain also pioneered the design of frigates, which were ships solely for use against submarines while escorting merchantmen. The first frigates were those of the River class, launched beginning in 1942. A River-class frigate displaced 1,310 tons and was 301 feet 4 inches in overall length and 36 feet in beam. It was capable of a speed of 21 knots. Its armament consisted of only 2 4-inch guns, but it possessed a large antisubmarine warfare battery of a Hedgehog and 126 depth charges mounted in racks. Britain subsequently built several classes of frigates based on the River class, while the United States built one class of the same design but armed with 3 3-inch guns, 4 40mm, and 9 20mm antiaircraft guns. Antisubmarine armament consisted of 1 Hedgehog, 8 depth charge launchers, and 2 depth charge racks.

By the end of the war, the numbers of escorts, being primarily destroyer escorts and frigates, eclipsed that of conventional destroyers. Great Britain commissioned 349 of them, while the United States produced 499 escorts.

Destroyers

Small warships that are lightly armed and protected and capable of high speed. The destroyer originated in connection with the self-propelled torpedo, which was introduced in the late 1860s, and the consequent construction in the following decade of torpedo boats to carry the new weapon. These small, inexpensive warships offered the potential to destroy battleships, which were then the most powerful and most costly vessels afloat. Most naval powers of the age, as they based their fleet strength on the battleship, endeavored to devise a defense against the torpedo boat.

In 1893, Great Britain produced an answer in the *Havock*, the first modern torpedo-boat destroyer. Torpedo-boat destroyers were essentially enlarged torpedo boats that carried light guns and torpedoes. They were charged with hunting down and destroying enemy torpedo boats before the latter could launch their weapons against the capital ships of a battle fleet. Development in all maritime nations yielded vast improvements over the first torpedo-boat destroyers. By World War I, there were more of these warships (known by this time simply as destroyers) than of any other ship type in the world's navies.

The role of destroyers changed because of their increasing design capabilities in the years before World War I and from wartime experience. Destroyers became superior in all respects to the torpedo boats they were designed to destroy. As a result, naval powers in the prewar years largely discontinued the production of torpedo boats in favor of destroyers. The destroyer assumed the offensive role of torpedo boat while retaining the role of defending against torpedo attacks launched by enemy destroyers.

World War I added extensively to the duties of these vessels. By the end of that conflict, destroyers had acted not only in the roles envisioned for their type but also as surface combatants and bombardment ships in amphibious

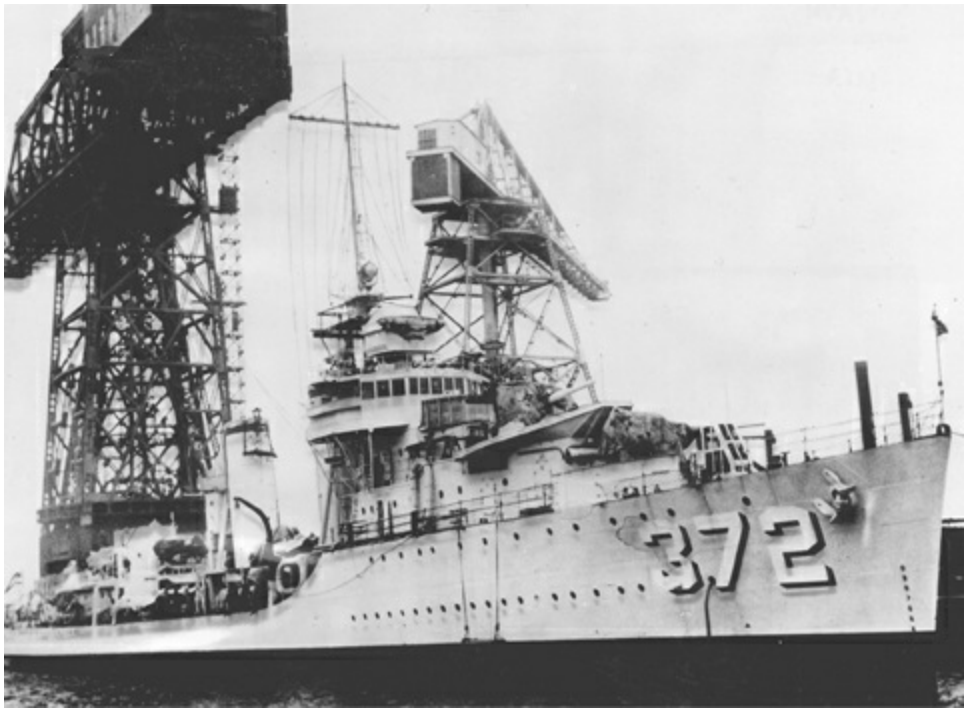
operations. More important than these uses, however, was their use by Great Britain, France, and later the United States as convoy escorts to defend against submarine attack. Destroyers were particularly effective in this capacity after the wartime introduction of depth charges and underwater listening devices such as hydrophones and sonar.

World War I demonstrated the importance of destroyers, and the same basic types continued during the interwar years. Great Britain had such large numbers of the craft that fresh designs were not initiated immediately after the close of the war in 1918. However, destroyer construction in Italy led France to respond, because French politicians and naval officials viewed Italy as France's principal naval competitor in the Mediterranean. In 1923, France built large vessels that began a trend toward superdestroyers in the world's navies. Great Britain and Japan returned to destroyer production in the late 1920s; the United States did not initiate new construction until the early part of the next decade. Germany, although restricted by the Treaty of Versailles after World War I, began building new vessels at the same time as the United States.

This destroyer construction took place in an era of naval disarmament as the world's great powers sought to limit production as a means to prevent future wars. Unlike most other warships, few restrictions were put on the design and number of destroyers during the naval disarmament talks of the period. The 1930 London Conference limited destroyers to a maximum displacement of 1,850 tons and their guns to 5 inches or smaller, but these stipulations meant little. Until the late 1930s, the largest and most heavily armed designs met these requirements, and the limit was increasingly ignored after 1934, when the Japanese withdrew from the Washington Treaty and declared that they would not support future arms limitations discussions.

The U.S. Somers class is an example of destroyer design in the years immediately before the outbreak of World War II. Completed in 1937, the *Somers* measured 381 feet in length by 36 feet 11 inches in beam and displaced 2,047 tons. It had exceptionally heavy armament: 8 5-inch guns, 8 1.1-inch guns, 2 half-inch weapons, and 12 21-inch torpedo tubes. The *Somers* had no armor protection and could steam at a maximum speed of 37 knots. The largest destroyers belonging to other naval powers loosely approximated the size, displacement, and armament of this class. France remained the exception, as it continued to design destroyers that dwarfed

those of other nations. The *Mogador*, launched in 1937, measured 451 feet 1 inches by 41 feet 7 inches, displaced 2,884 tons, and carried no armor protection. It was armed primarily with 8 5.5-inch guns and 10 21.7-inch torpedo tubes and was capable of 39 knots.



The USS *Cassin*, one of the three destroyers sunk at Pearl Harbor during the Japanese attack on December 7, 1941. (Hulton Archive/Getty Images)

Despite the increase in the size and armament of destroyers, they were, in most respects, technologically the same as their World War I predecessors—although in some destroyer classes, the largest guns were mounted in gun houses rather than open mounts to provide protection for crews. Another difference from the past was the incorporation of antiaircraft guns to fend off air attack.

By 1940, as during World War I, destroyers were the most numerous warships in the world's navies. Great Britain operated 247 destroyers of varying types and ages. The United States counted 149, and Japan had 116. Italy operated 90 destroyers. The other naval powers of the world also possessed large fleets: France maintained 66, the Soviet Union had 62, and Germany, through a naval policy that had violated the Treaty of Versailles, possessed 32.

World War II proved the continued importance of the roles destroyers had performed in the previous world conflict and introduced a new vital duty. In the Atlantic theater, the primary task of British and Canadian destroyers was as convoy escort to guard against attack of merchant vessels by German submarines. This effort proved so important that the destroyer formed the basis for one of the first diplomatic agreements between Great Britain and the United States during the war. This 1940 Destroyers-for-Bases Agreement transferred 50 aging World War I–era U.S. destroyers to Great Britain in return for basing rights in the Western Hemisphere.

Throughout the war, destroyers fought and helped to win the Battle of the Atlantic. Despite heavy losses in merchant vessels, ultimate Allied success in this effort allowed Great Britain to continue in the war. In addition, it enabled the transport of U.S. troops to the European and Mediterranean theaters after 1941.

Destroyers also served as escorts for fleet units, as surface combatants, in support of amphibious operations, as troop transports, and as resupply ships. An example in the Atlantic theater of the first four of these roles is Germany's April 1940 invasion of Norway. Destroyers escorted the German battleships and cruisers involved in the operation and not only bombarded areas earmarked for the landing of troops but also attempted to fend off attacks from opposing British warships, and they transported a portion of the German ground force. The same roles existed for destroyers in the Mediterranean, where they routinely bombarded enemy ports and troop positions, and Allied units supported all the major amphibious operations starting with Operation TORCH, the November 8, 1942, Allied invasion of North Africa. British vessels also acted as resupply ships for Tobruk. and Italian destroyers acted as fast emergency transports for North Africa.

These same roles were prevalent in the Pacific theater, involving largely the forces of the United States and Japan. The Japanese used the destroyers both as surface combatants and resupply vessels. Destroyers armed with the Long Lance torpedo were a key element of Japanese tactical operations and proved their effectiveness, especially in early night actions. The best example of a resupply effort was the famous Tokyo Express, which supplied Japanese troops during the August 1942–February 1943 contest for Guadalcanal. Destroyers were well suited for this resupply role because they were fast enough to make the voyage to Guadalcanal and depart while still under cover

of darkness. Early U.S. deficiencies in night fighting were overcome, and U.S. destroyers soon matched their Japanese counterparts in surface combat. In the August 6–7, 1943, Battle of Vella Gulf, U.S. destroyers sank three Japanese destroyers with no losses. The Japanese also used destroyers to protect convoys that supplied the home islands with war matériel.

In addition, use of destroyers in an antiaircraft role was widespread in the Pacific theater. Both the Japanese and the United States sought ways to effectively defend their most important capital ships, the aircraft carriers. Destroyers partly filled the need for antiaircraft defense. This critical duty was reflected in the significant increase in the antiaircraft gun batteries of both Japanese and U.S. destroyers during the war.

The 12 Japanese Akitsuki-class ships, launched between 1941 and 1944, mounted only 4 25mm guns in addition to their primary armament of 8 3.9-inch guns, which could be used against surface targets or elevated and used against aircraft. By the end of the war, the complement of 25mm guns had risen to 40 to 51 each for the surviving ships of the class. U.S. destroyers showed the same shift to greater antiaircraft armament over the course of the war based on combat experience. By 1944, the 58 vessels of the Allen M. Sumner class mounted a primary armament of 6 5-inch guns that could be used for surface combat or against aircraft and a smaller battery of 12 40mm guns specifically devoted to antiaircraft defense.

The large number of critical roles performed by the destroyers and their consequent frequent use led to wartime construction that yielded an additional 633 destroyers among the principal naval combatants. The vast majority of these vessels were produced in the United States and Great Britain, which completed 392 and 165 ships, respectively. An example of wartime construction is the 150-ship U.S. Navy Fletcher class. Launched between 1942 and 1944, these ships measured 376 feet 5 inches in length by 39 feet 7 inches in beam, displaced 2,325 tons, and were protected by light side and deck armor. They were armed with 5 5-inch guns, 4 1.1-inch weapons, 4 20mm guns for antiaircraft defense, and 10 21-inch torpedo tubes. They could make 38 knots.

The necessity for vessels to fulfill convoy escort roles also led to the production of a new type of destroyer that was cheaper and faster to build. Known as the destroyer escort, this ship was an essentially smaller, less capable destroyer with greater antisubmarine warfare capability. An example

is the U.S. TE-class escort, which measured 306 feet by 37 feet and displaced 1,432 tons. These were armed with three 3-inch guns and an assortment of antisubmarine weaponry.

During the war, the belligerent powers constructed 915 destroyer escorts. The United States and Great Britain accounted for the majority of this production with 499 and 349 ships, respectively. The design of both the destroyers and destroyer escorts of the Allies and Germany and Italy benefited from the incorporation of radar, which was retrofitted to vessels produced before the war.

World War II exacted a heavy toll of destroyers lost. By the end of the conflict, the belligerents had suffered a combined loss of 490 destroyers of varying types: among these, Japan lost 147; Great Britain suffered 133 sunk, largely in the Battle of the Atlantic; Italy lost 69 vessels; the United States counted 68 destroyers sunk; the Soviet Union lost 26; and France lost 14.

Destroyers-for-Bases Agreement (September 2, 1940)

An agreement between U.S. president Franklin D. Roosevelt and British prime minister Winston L. S. Churchill in September 1940 that provided Great Britain with World War I–vintage U.S. destroyers, in return giving the United States access to British bases in North America and the Caribbean.

Following the May 26–June 4, 1940, evacuation of the British Expeditionary Force from Dunkerque (Dunkirk), Britain was virtually naked militarily, and the nation awaited a German attack. When Churchill appealed to Roosevelt for military assistance, the U.S. reaction was immediate and extraordinary. Within days, 600 freight cars were on their way to U.S. ports filled with military equipment to be loaded aboard British merchant ships. These included half a million rifles and 900 old 75mm field guns.

On June 15, Churchill directly appealed to Roosevelt for 35 old U.S. destroyers. With Germany controlling both the English Channel ports and Norway, Britain faced the prospect of defending against German invasion with only 68 destroyers fit for service, a stark contrast to the 433 destroyers possessed by the Royal Navy in 1918. Britain's shipping lanes were even more vulnerable to German submarines with the fall of France in June 1940, and Italy's entry into the war had made the Mediterranean an area of difficult passage. As Churchill put it to Roosevelt, "We must ask therefore as a matter of life or death to be reinforced with these destroyers."

During the course of the next days and weeks as the number of these British warships continued to dwindle, Churchill's appeal grew to 50 to 60 destroyers. Roosevelt's insistence on proceeding with the aid went against the advice of army chief of staff General George C. Marshall and chief of naval operations Admiral Harold Stark, who believed that Britain was doomed and that such a step would strip the United States bare militarily before new production could materialize.

With U.S. public opinion still strongly opposed to U.S. intervention, Roosevelt masked the transfer in a deal announced on September 3, 1940, in the form of an executive order, not subject to congressional approval. Britain received 50 World War I–vintage destroyers from the United States, in return granting the United States rights of 99-year leases to British bases in North America and the Caribbean Islands. The United States claimed that the

agreement did not violate U.S. neutrality because the British were providing access to naval bases and facilities deemed essential for U.S. defense, including those in Newfoundland, Bermuda, British Guiana, Jamaica, Saint Lucia, and Trinidad. The Roosevelt administration maintained that the deal was an important step in ensuring national security and preventing the spread of the European war to the Americas.

Actually, the United States got far more than it gave. The destroyers were in wretched condition; some barely made it across the Atlantic. But the deal gave a tremendous boost to British morale at a critical juncture, and Churchill viewed this as another step by the United States toward outright participation. Privately, German leader Adolf Hitler saw this in much the same light. Anxious to unleash Japan in Asia to occupy the United States, he ordered talks opened with Japan that culminated in the Tripartite Pact of September 27.

The long war, a clash involving continents that would give advantage to nations with superior sea power, drew closer to realization. One of the destroyers, HMS *Campbeltown* (formerly USS *Buchanan*) played a major role in the British destruction of the dry dock at Saint-Nazaire, France, on March 28, 1942.

Devereux, James Patrick Sinnott (1903–1988)

U.S. Marine Corps brigadier general. Born on February 20, 1903, in Cabana, Cuba, to a military family, James Patrick Sinnott Devereux attended numerous preparatory schools and studied in Switzerland before enlisting in the Marine Corps in 1923. Commissioned a second lieutenant in 1925, he served in a variety of assignments afloat and ashore, including in Nicaragua and Cuba. Promoted to captain in 1935, he was assigned to the Base Defense Weapons School, where he assisted in writing the basic doctrine for defense battalions.

Promoted to major, in October 1941 Devereux arrived on Wake Island to assume command of some 450 marines there under the overall command of U.S. Navy commander Winfield S. Cunningham. The marines were still in the process of improving their defenses when the Japanese attacked on December 8 (December 7 in Hawaii). For 15 days, the defenders held off the Japanese, sinking two destroyers (the first being the first Japanese warship sunk by the Americans in the war) and two patrol boats and damaging a Japanese cruiser as well as shooting down 28 Japanese aircraft and killing some 820 Japanese and wounding another 1,000.

Finally overcome by sheer force of numbers, Devereux and his marines were forced to surrender on December 23, 1941. Devereux and the other survivors spent the next four years in captivity. Although a defeat for the United States, the heroic example of the defenders of Wake Island nonetheless served as a great boost to American morale.

All of the surviving Wake Island prisoners of war were released in September 1945. While in captivity, Devereux had been promoted to lieutenant colonel, and he was promoted to colonel in January 1946. After some time in rehabilitation, Devereux attended the Senior Amphibious Warfare School. He ended his military career with the 1st Marine Division. He was promoted to brigadier general on his retirement in August 1948. Devereux served eight years as a U.S. congressman from Maryland and ran

unsuccessfully for governor. He died on August 5, 1988, in Baltimore, Maryland.

Devers, Jacob Loucks (1887–1979)

U.S. Army general. Born on September 8, 1887, in York, Pennsylvania, Jacob Loucks Devers graduated from the U.S. Military Academy at West Point in 1909 and was commissioned a second lieutenant in the field artillery. During 1912–1916, he returned to West Point as an instructor.

During World War I, Devers was assigned to the School of Fire (later the Field Artillery School), Fort Sill, Oklahoma, as a staff officer, attaining the temporary rank of colonel. In 1919, he served in the occupation of Germany and attended the French artillery school at Treves before again teaching at West Point (1919–1924). Devers graduated from the Command and General Staff School (1925) and the Army War College (1933). From 1936 to 1939 he was again assigned to West Point as an instructor and was promoted to colonel.

After World War II began in Europe in September 1939, U.S. Army chief of staff General George C. Marshall selected Devers to place the Panama Canal Zone on a wartime footing. In May 1940 he was promoted to brigadier general. He was promoted to major general in October 1940 and commanded the 9th Infantry Division at Fort Bragg, North Carolina, from November to July 1941. When Major General Adna R. Chaffee Jr. was fatally stricken with cancer, Marshall named Devers—then the youngest army major general but well recognized in the army for his organizational and training ability—to

replace Chaffee in August 1941 as commander of the Armored Force at Fort Knox, Kentucky.

There Devers supervised the rapid expansion of U.S. armored forces from 2 to 16 divisions and 63 separate tank battalions. He soon became an enthusiastic advocate of mobile combined-arms warfare. One of his innovations was the addition of light aircraft to field artillery battalions to enhance the firepower of armored divisional artillery. Devers was promoted to lieutenant general in September 1942.

In May 1943, Devers took command of U.S. Army ground forces in the European theater of operations. In this role he supervised the rapid buildup of U.S. forces and their training in Britain for the invasion of France, which he hoped to lead. Instead, in January 1944 he was assigned to the Mediterranean theater as deputy supreme Allied commander there, replacing General Dwight D. Eisenhower, who took his place in Britain.

On September 15, 1944, Devers finally received the combat command he had long sought: the 6th Army Group of 23 divisions, consisting of Lieutenant General Alexander Patch's Seventh Army and General Jean de Lattre de Tassi-gny's French First Army, which had invaded southern France in Operation DRAGOON. With his 12 American and 11 French divisions he cleared German forces from Alsace and reduced the Colmar Pocket. In March 1945, Devers was promoted to general, and that same month his 6th Army Group crossed the Rhine and drove into southern Germany and Austria, where he accepted the surrender of German forces on May 6.

Devers commanded U.S. Army Ground Forces from 1945 to 1949. He retired from the army on September 30, 1949. Devers died in Washington, D.C., on October 15, 1979.

Dewey, Thomas Edmund (1902–1971)

U.S. politician and twice Republican Party candidate for president. Born on March 24, 1902, in Owosso, Michigan, Thomas Dewey graduated from the University of Michigan in 1923, received his law degree from Columbia University in 1925, and in 1926 was admitted to the New York bar. Dewey launched his government career five years later as chief assistant to the U.S. attorney for the Southern District of New York. He became U.S. attorney for the Southern District in 1935. Between 1935 and 1937, he garnered national attention as special prosecutor in an investigation of organized crime in New York, securing 72 convictions out of 73 prosecutions of long-established racketeers.

Dewey was district attorney of New York County in 1937 and 1938. Unsuccessful as the Republican candidate for governor of New York in 1938, Dewey won the state office for three successive terms beginning in 1942. As governor, he earned a reputation for political moderation and administrative efficiency, putting the state on a pay-as-you-go basis for capital building, reorganizing departments, and establishing the first state agency to eliminate racial and religious discrimination in employment.

The Republican nominee for U.S. president in 1944, Dewey was not able to overcome the enormous prestige of incumbent president Franklin D. Roosevelt, nor had he been expected to. Dewey refused to make an issue of the Pearl Harbor disaster of December 1941, but he charged the Democrats with inefficiencies in rearmament, an antibusiness stance, extravagance, and corruption. He also condemned Roosevelt's support of the Soviet Union. Roosevelt won the 1944 election with 25.6 million popular votes and 432 electoral votes to Dewey's 22.3 million popular votes and 99 electoral votes.

Dewey ran again for the presidency in 1948 against Roo-se-velt's successor, incumbent Harry S. Truman. Although the pollsters predicted victory for Dewey, Truman won. Dewey then returned to private law practice. He died on March 16, 1971, in Bal Harbor, Florida.

Dhistomo Massacre (June 10, 1944)

Located in central Greece some 85 miles northwest of Athens, the small village of Dhistomo was one of many villages during World War II that suffered reprisals for providing aid and cover to guerrillas fighting the German occupying forces. On June 10, 1944, Waffen-Schutzstaffel (Waffen-SS) soldiers under the command of SS-Hauptsturmführer Fritz Lautenbach entered Dhistomo and systematically put the villagers to death. A total of 214 people, from babies only a few months old to men and women in their 80s, were killed. Lautenbach reported that his troops had first come under fire from the village, but agent Georg Koch of the Geheimfeldpolizei (secret field police, a branch of the SS), who was also present, filed a conflicting report stating that these were reprisal killings. Nonetheless, a subsequent investigation by German authorities cleared Lautenbach of wrongdoing.

The brutality of this particular attack, during which the village priest was beheaded and infants were reportedly bayoneted in their beds, is widely acknowledged. It is also representative of other German attacks, such as those on the village of Kalavrita and on Kondomari, Crete. The Dhistomo Massacre is commemorated in the village by a monument that lists the names and ages of all those killed. Their bones were collected and rest within the monument.

The current inhabitants of Dhistomo, including families of survivors, have made repeated attempts to gain reparations in German, Greek, French, and international courts. Those efforts are ongoing, but the German government has to date refused to pay any reparations for the incident.

Diégo-Suarez, Battle of (March 5–7, 1942)

British operation designed to capture Diégo-Suarez (now Antsiranana), the main French sea and air base on Madagascar. In early 1942, the British government feared that the Japanese might occupy Vichy French–administered Madagascar as they had occupied Indochina. Sea and air forces stationed on that island would be in a position to cut the only available shipping routes to Egypt and India. At the urging of Prime Minister Winston L. S. Churchill, the British Chiefs of Staff decided on March 7 to proceed with Operation IRONCLAD.

Major General R. C. Sturges of the Royal Marines commanded the land force of three infantry brigades and No. 5 Marine Commando. The British refused Free French assistance. The escorting naval force was drawn largely from Force H at Gibraltar. Ships there were replaced by others from the Home Fleet, which in turn received a loan of U.S. Navy warships. Convoys carrying the invasion force sailed on March 13 and 23 from Great Britain. Rear Admiral Edward Neville Syfret of Force H had overall naval command of a force that included the aircraft carriers *Illustrious* and *Indomitable*, the battleship *Ramillies*, and the cruisers *Devonshire* and *Hermione*.

The invasion force was staged from Durban, East Africa. The center of French strength was Diégo-Suarez, at the northern tip of Madagascar. To avoid French defenses there, the British planned to land on the west coast of the Andrakaka Peninsula, 10 to 12 miles from their objective of Diégo-Suarez. The approach occurred in the predawn darkness of May 5. The large liners carrying the assault troops safely anchored, having managed to avoid

both the reefs and mines in the channels. Several mines were detonated by sweepers, but the defenders failed to notice the explosions.

At 4:30 a.m. on May 5, elements of the 29th Independent Brigade and No. 5 Marine Commando went ashore, quickly overcoming light resistance. To distract the French, the *Hermione* mounted a noisy but harmless display east of Diégo-Suarez. At dawn on May 6, aircraft from the British carriers attacked French aircraft on the ground. They also sank a French submarine in the harbor and disabled other warships.

Most of the invading troops and their supplies were unloaded by the end of May 5, although a rising wind hampered efforts. By the afternoon of May 6, the advance was stopped just short of Antsirane. The destroyer *Anthony* landed 50 marines on the quay at Antsirane at 8:00 p.m., and the Vichy defenders quickly surrendered, ending resistance at Diégo-Suarez early on May 7. Further operations on Madagascar continued until November, but the occupation of Diégo-Suarez effectively ended the threat to Allied supply lines.

Diégo-Suarez, Japanese Raid on (May 30, 1942)

Japanese midget submarine attack on shipping in the harbor of Diégo-Suarez (now Antsiranana), Madagascar. At the time, the British were in control of

the harbor, having seized it from the Vichy French in early March 1942 to protect shipping routes to the Middle East and India.

During March 1942, the Japanese planned a two-part operation by midget submarines in Australian waters and the Indian Ocean. The Indian Ocean operation was to be carried out by the 8th Submarine Group, commanded by Commodore Ishizaki Noboru. Ishizaki sortied from Penang, Malaysia, on April 30 with five submarines. Two carried one reconnaissance seaplane each, while the other three each carried one Type A midget submarine. After refueling from the armed merchant cruiser *Hokoku Maru* on May 5, the submarines searched for shipping up and down the African coast.

Following their successful invasion of Madagascar, the British fleet had dispersed. Only the battleship *Ramillies*, three destroyers, and two corvettes remained at Diégo-Suarez. On the night of May 29, one of the Japanese seaplanes flew over Diégo-Suarez and reported the presence of a Queen Elizabeth–class battleship in the harbor. The British spotted the plane but could not intercept it. They believed that it was a Vichy French aircraft scouting for French submarines known to be in the area.

The *Ramillies* was ready to get under way by 5:00 a.m. on May 30 and sailed around the bay to foil an expected attack. During daylight, Fleet Air Arm planes flew antisubmarine patrols over Diégo-Suarez. At dusk, the *Ramillies* again anchored.

Ishizaki, meanwhile, ordered the midget submarines, which were 10 miles out to sea, launched at dusk on May 29. Only two were launched, and only one entered the harbor. At 8:34 p.m. on May 30, Lieutenant Saburo Akeida and Petty Officer Masami Takemoto fired a single torpedo that struck the *Ramillies*, blowing a large hole in the battleship's port bulge and causing it to immediately sink by the bow. An hour later, Saburo and Masami launched their remaining torpedo at the oil tanker *British Loyalty*, sinking it. The corvettes dropped depth charges throughout the night, damaging the submarine, which ran aground.

Saburo and Masami made it ashore and began walking across northern Madagascar toward a prearranged rendezvous. The British believed that a French submarine had attacked them. Not until three days later, when a British patrol encountered and killed both Saburo and Masami, did the British realize who had attacked them.

The *Ramillies* was the largest victim of any Japanese midget submarine

attack. Temporarily repaired, on June 3 it sailed for Durban, where complete repairs took nearly a year.

Dieppe Raid (August 19, 1942)

Abortive World War II Allied raid against the northern French port of Dieppe. From a British perspective, there were good reasons for such a raid. In early 1942 Prime Minister Winston Churchill was under heavy political pressure as a result of a series of major military reverses. Churchill hoped that such a raid might provide a convincing military success and blunt Soviet and U.S. criticism of the failure to open a second front in Europe. Soviet leader Joseph Stalin had dropped not-so-subtle hints that his country might leave the war, and German chancellor Adolf Hitler was certain that Churchill would try to bolster Stalin's resolve by attempting a raid against the northern coast of France. The range of British fighter aircraft determined the likely point of attack.

Dieppe was strongly defended. German colonel general Kurt Hesse was in overall command. Dieppe was held essentially by the 57th Infantry Regiment. While this was not a top unit, its men nonetheless took full advantage of the terrain.

In planning the operation, chief of Combined Operations Vice Admiral Louis Mountbatten modified it without formal approval from Churchill and the British chiefs of staff. Later Mountbatten was able to mask his personal responsibility in the disaster. Minesweepers cleared a path across the English

Channel for the sizable naval forces committed to the operation. Commanded by Captain J. Hughes-Hallett, it consisted of 237 vessels of all types, 179 of them landing craft. These transported some 6,100 Allied troops (4,963 Canadians, about 1,075 British Army commandos, and 50 U.S. Army rangers). Some 730 aircraft, the majority of them Spitfire fighters, provided air cover and ground support.

Just before dawn on August 19, 1942, the troops came ashore. Code-named JUBILEE, the operation may have been the largest raid in history. The initial landing began at 4:50 a.m., and the attackers withdrew by 2:00 p.m. Some German coastal guns were destroyed but at prohibitive cost. The Allies suffered 3,367 casualties, including 1,946 captured and 907 killed. German losses were 314 killed and 294 wounded. The Canadians suffered the worst. Their high casualty rate led to much bitterness afterward. Overall, casualties were the highest in the war for any major offensive involving all three services. In addition to vehicles and tanks destroyed, the Allies also lost 98 aircraft; Luftwaffe losses totaled 48. The Royal Navy also lost 34 vessels: 33 landing craft and the destroyer *Berkeley*, which was scuttled to prevent it from being taken by the Germans.

The Dieppe Raid led to bitter recriminations between Britain and Canada and further strained relations with the United States and Soviet Union. It also produced its share of historical controversies and myths, including the belief, since disproved, that the Germans were aware of it in advance.

One of the chief mysteries surrounding Dieppe is why the raid was even attempted. The evidence that it had virtually no hope of success was subsequently concealed under the patent lie that it provided vital future lessons. The raid did serve to convince even diehards among the Americans that the Western Allies were not ready to assault Festung Europa (Fortress Europe) in 1942 and demonstrated the need for strong naval and air preliminary bombardment along with thorough training of assault forces. The raid also demonstrated the difficulty of attacking ports and led to the decision to develop artificial harbors (Mulberries) for the eventual cross-Channel invasion (Operation NEPTUNE). Even today, the Dieppe Raid remains a useful lesson on how not to conduct military planning.

Dietl, Eduard (1890–1944)

German Army general. Born on July 21, 1890, at Bad Aibling (Bavaria), Eduard Dietl served as a lieutenant in the German Army during World War I and joined the *Freikorps* in 1919. He remained in the army after 1918 and was the first officer who permitted Adolf Hitler to speak to his soldiers, in June 1919.

After the Nazi assumption of power in 1933, Dietl took command of the 3rd Mountain Division. During April 24–June 7, 1940, he was assigned the task of capturing Narvik in northern Norway, the most difficult aspect of the German invasion of Norway and Denmark. Dietl's troops occupied Narvik, but a few days later Allied forces began the reconquest of the area. Allied superiority forced him to withdraw, but he continued resistance even when Hitler was willing to accept surrender.

Shortly before a likely German defeat at Narvik, the Allies recalled their troops from Norway to France because of the German offensive there. Nazi propaganda made Dietl a hero. In July 1940, Hitler awarded him the Oak Leaves to the Knight's Cross of the Iron Cross. On June 29, 1941—one week after the beginning of Operation BARBAROSSA, the German invasion of the Soviet Union—Dietl's division drove toward Murmansk. Dietl's task was to cut the railway connecting the Murmansk harbor with the interior of the Soviet Union, but this effort failed.

In June 1942, Dietl was promoted to colonel general and given command of the Twentieth Mountain Army in Finland. On June 23, 1944, after visiting

with Hitler, Dietl died when his airplane crashed near Hochwedel (Austria). Hitler delivered the funeral oration for Dietl, one of his most devoted followers within the Wehrmacht.

Dietrich, Josef "Sepp" (1892–1966)

German Schutzstaffel (SS) general and commander of Leibstandarte, a bodyguard unit responsible for Chancellor Adolf Hitler's personal safety. Born on May 28, 1892, in Hawangen, Bavaria, Josef Dietrich volunteered for the army in 1914 and became a crewman in one of Germany's first tanks. After the war, he was active in the Freikorps before joining the National Socialist Party and the SS in 1928. He was selected as one of Hitler's bodyguards and was in charge of the buildup of the Leibstandarte. In the Blood Purge of July 1934, Dietrich led an execution squad in the elimination of the Sturmabteilung (SA, Storm Troopers) leadership.

German generals Josef Dietrich, former commander of the Sixth SS Panzer Army (11); Fritz Kraemer, chief of staff to Dietrich (33); and Herman Priess, former commander of the I SS Panzer Corps of the Sixth Panzer Army (45), and others on trial at Dachau for the massacre of American troops at Malmédy, Belgium. (Bettmann/Corbis)

In early 1940, Dietrich was assigned command of the Leibstandarte SS Adolf Hitler (LSSAH), which became a Panzergrenadier division in 1942. With it he took part in the invasions of France, Greece, and the Soviet Union. When the Western Allies landed in Normandy on June 6, 1944, Dietrich commanded I SS Panzer Corps, and in September Hitler gave him command of the Sixth Panzer Army. Dietrich was awarded the Reich's highest decoration, the Oak Leaves, Swords, and Diamonds to the Knight's Cross of the Iron Cross, and in August 1944 he was promoted to the rank of Oberstgruppenführer. His Sixth Panzer Army was the designated main effort in the December 16, 1944–January 25, 1945, Ardennes Offensive (Battle of the Bulge), but it was unable to realize Hitler's far-reaching expectations.

Dietrich then fought on the Eastern Front. His last operation, in Hungary during March 1945, failed. To that point the prototype of the National Socialist soldier, Dietrich lost Hitler's confidence because he questioned Hitler's directives and ordered the retreat of his exhausted troops.

After the war, Dietrich was found guilty of being responsible for the

execution of U.S. prisoners of war (the December 17, 1944, Malmédy Massacre) and was sentenced to 25 years' imprisonment. He served only 10 years but was later arrested again and charged for murders committed in 1934. He was sentenced to only 18 months in prison. Dietrich died in Ludwigsburg, Bavaria, on April 21, 1966.

Dill, Sir John Greer (1881–1944)

British Army field marshal, chief of the Imperial General Staff (CIGS), and Churchill's personal representative to the Combined Chiefs of Staff (CCS). Born in Belfast, Ireland, on December 25, 1881, John Greer Dill was commissioned in the British Army on graduation from the Royal Military College, Sandhurst, in 1901. He fought in the latter stages of the 1899–1902 South African (Second Boer) War.

On the outbreak of World War I, Dill was a student at the Staff College of Camberley. He then held staff positions with units on the Western Front, but he also saw action and was wounded. Considered an exceptional staff officer, Dill was transferred to the Operations Branch, General Headquarters, and he ended the war as the head of that branch and a temporary brigadier general.

Dill served in a variety of posts after the war. In 1930 he was promoted to major general, and the next year he was appointed to head the Staff College. In 1934, he became director of operations and intelligence at the War Office. At the outset of World War II in 1939, Dill received command of I Corps but

did not see action. In April 1940, he was appointed vice chief of the Imperial General Staff and succeeded Field Marshal Sir Edmund Ironside as CIGS in late May 1940. His term as CIGS was a rough one. He presided during the British military withdrawal from continental Europe and the Battle of Britain (July 10–September 30, 1940), when the United Kingdom seemed on the brink of destruction.

Dill never got along well with Prime Minister Winston L. S. Churchill, who regarded him as overly cautious. In November, the government announced that Dill would retire the next month when he reached age 60 and be named governor-designate of Bombay, India. In recognition of his services, he was promoted to field marshal. This was done to make room for General Alan Brooke to become CIGS. As CIGS, Brooke was Dill's staunch supporter and friend. He convinced Churchill in a meeting on December 11, 1941, that Dill should accompany the prime minister to the United States and then remain for duty with the British Joint Staff Mission.

As the Combined Chiefs of Staff were formed in January 1942, Dill became the available man to chair the British Joint Staff Mission in Washington, a new strategic organization charged with coordinating British and American strategy and logistics within the CCS. Despite his poor health, Dill soon found his way into the hearts and minds of his American colleagues, and he succeeded in a demanding assignment. He got along well with President Franklin D. Roosevelt and U.S. Army chief of staff General George C. Marshall. Dill became the resilient link—and the buffer—between two nations joined in a sometimes uneasy partnership at war.

Dill died in Washington on November 4, 1944, and was buried in Arlington National Cemetery, the only foreign officer ever afforded that distinction. The U.S. Congress honored him with a joint resolution in December 1944. On November 1, 1950, a magnificent equestrian statue of Dill was dedicated in Arlington Cemetery. He was awarded the American Distinguished Service Medal posthumously and had been knighted in 1937 by his own nation.

Displaced Persons

The term "displaced person" (DP) was often used for refugees who at the end of the war in Europe were living outside their prewar national boundaries and needed assistance. In 1942, Great Britain and the United States solicited support from the other Allied powers for help in dealing with the expected masses of slave laborers, prisoners of war, and political prisoners in Germany and its conquered territories. These efforts culminated in November 1943 when 44 nations signed the Agreement for United Nations Relief and Rehabilitation Administration (UNRRA), the first international organization created to help wartime refugees. As the United States would be contributing about 40 percent of the UNRRA's budget, an American, former New York governor Herbert Lehman, became its first director.

The UNRRA planned to provide DPs with housing, food, clothing, and other necessities until each person could be repatriated to his or her home nation. This did not take into account the fact that many DPs, especially Jews and ethnic Germans from Eastern Europe, could not safely return home. Others, particularly Poles and Czechs, did not want to return to home nations occupied by the Soviet Army. The estimated two-year time frame for the UNRRA to carry out its tasks was also wildly optimistic.

UNRRA field teams for dealing with DPs were made up of multinational groups of about a dozen men and women per team. They were selected for language skills and backgrounds in administration, social work, medicine, or various mechanical abilities. In 1944, these teams began to assume administration of refugee camps that Allied military forces had established in North Africa and Italy. Teams had to rely on the Allied military for additional

personnel, transportation, and assistance in enforcing UNRRA regulations at the camps. Some local commanders were quite helpful; others were indifferent or even hostile to the UNRRA. This problem was addressed to some extent when the Supreme Headquarters, Allied Expeditionary Force (SHAEF), named U.S. major general Allen Gullion, former provost marshal general of the army and an efficient organizer, as the head of its own DP branch.

By the end of the war in Europe, SHAEF and the UNRRA had identified more than 10 million refugees in and around Germany. Others in Soviet-controlled areas were never accurately counted. Most DPs, primarily the former prisoners of war and slave laborers from Western Europe, were repatriated before the end of 1945. But nearly 800,000 others remained and were housed in DP camps across occupied Germany.

DP camps were built from German Army barracks, depots, and even some former concentration camps. In some areas, neighborhoods and entire villages became “DP towns.” The UNRRA organized most camps by nationality, having learned that mixed camps too often led to violence. Because DPs were permitted to move freely, over time camps took on specific national and cultural identities. This ethnic concentration was reinforced by the practice of allowing each camp to elect a governing council and maintain its own police force. The UNRRA and the military enforced occupation regulations against black marketing and the like.

Throughout 1946, the DP population fluctuated; many Poles and others returned to their home countries. There were still several hundred facilities housing DPs in 1947, when the International Refugee Organization replaced the UNRRA as the administrator of refugee matters. Conditions in the camps were crowded—an average of 100 square feet or less of space was allotted to families of five or more people. Food remained scarce, and daily diets in the camps seldom exceeded 2,000 calories and were often less. Food packages from America and the International Red Cross helped somewhat. As the Cold War intensified, DP populations grew again when individuals and families fled Poland and the other East European nations for the west.

Finding permanent homes for these masses of men, women, and children taxed the energies of Europe and the world well into the 1950s. At first, nations such as Belgium, Australia, and Canada accepted only single men who were willing to work in mining, forestry, and other heavy-labor jobs.

Great Britain, albeit with some reluctance, permitted Jewish survivors of the Holocaust into Palestine and made room at home for Polish soldiers who had fought with the United Kingdom during the war.

The United States moved slowly in passing legislation to accept DP immigrants. The resulting 1948 law had long waiting periods, quotas, and other restrictions similar to those of the 1930s, but through it increasing numbers of former DPs came to the United States. Ethnic Germans obtained a plurality of American visas because they received considerable help from American church groups. Ultimately, more than 580,000 DPs settled in the United States between 1949 and 1957—more than half of the total number of DPs who went to some 113 countries by the end of the 1950s. The last DP camp closed in 1957. Those who had not found a home elsewhere, mostly the old and infirm, then became the responsibility of the government of the Federal Republic of Germany.

The DP program was an extraordinary experiment in international cooperation to salvage wrecked lives. At the camps, many refugees received the first decent treatment they had known in years. Some were able to take advantage of educational opportunities and learn new trades that increased their chances for immigration. Most of these men, women, and children eventually found new homes somewhere in the world. But it took far longer to achieve this than the originators of the program had expected, and by then new struggles had been ignited in the Middle East and in Korea that produced new refugee populations. These made it clear that the world had not seen the end of the problem of DPs.

Dixie Mission to Yan’an (July 1944–March 1947)

U.S. Army Observer Group sent to Yan’an (Yenan), China, to establish a liaison with Chinese Communist forces. The Dixie Mission began in July 1944 when a nine-man U.S. Army team flew to the headquarters of Chinese Communist leader Mao Zedong (Mao Tse-tung) at Yan’an in Shaanxi (Shensi) Province in north-central China. Colonel David D. Barrett, a “China hand” who had studied the language and served as a military attaché to China, headed the mission, which would continue through 1947. It included officer and enlisted personnel from all three services as well as representatives of the U.S. State Department. Barrett’s mission was to collect information about Japanese and their puppet Chinese forces order of battle and operations. He was also to determine the extent of the Communist military effort in the war against Japan and to coordinate the search and rescue of downed Allied pilots in Communist-controlled areas.

A U.S. military mission to the Communists had first been suggested in mid-1943. Lieutenant General Joseph Stilwell’s political adviser, John Paton Davies, believed strongly that U.S. advisers to Mao’s headquarters could make a difference by coordinating with Chinese Communists who were fighting the Japanese. Davies drew parallels to the effort of the Allies to assist the Partisans of Tito (Josip Broz) in Yugoslavia. Fearing that American supplies and equipment would be diverted to the Communists and that U.S. leadership might develop a more favorable view of the Chinese Communist movement and operations in the territories held by them, Generalissimo Jiang Jieshi (Chiang Kai-shek) strongly opposed the mission to Yan’an. During the next year, the United States continued to pressure Jiang to allow this mission to go forward, but not until after the June 1944 visit of U.S. vice president Henry A. Wallace could sufficient pressure be exerted on Jiang to allow the liaison mission to begin.

Communist official representative to the national government at Chongqing (Chungking) Zhou Enlai (Chou En-lai), who saw potential in a future collaboration between the United States and the Red Army in the fight against the Japanese, supported an increase in American presence and the liaison effort. By August 1944, Barrett and a team that eventually numbered more than 20 people, including State Department officials John S. Service

and Raymond P. Ludden, began to meet with the most senior political and military leadership of the Communist movement and gather information about the Japanese and their allies as well as the Chinese Communists. The mission also provided the opportunity in November for Major General Patrick J. Hurley, in his capacity as a special emissary of U.S. president Franklin D. Roosevelt, to begin an effort to get the two Chinese factions to focus their efforts on fighting the Japanese rather than each other. During the course of the mission, the Dixie group secured the rescue and return of more than 100 American pilots.

The mission served perhaps its most important function after the war as a bridge between the United States and the Chinese Communists. A mission headed by General George C. Marshall brought the two sides to the negotiating table in an effort to secure a solution to the infighting in China that had been going on for decades. The collapse of the Marshall mission in January 1947, however, led to the end of the observer mission.

Dodecanese Islands Campaign (September–November 1943)

The islands of the southern Aegean Sea off the southwest coast of Anatolia were known through much of their history as the eastern or southern Sporades (meaning "scattered"). The islands include Rhodes, Karpathos, Kassos, Haliki, Kastellorizo (Castlerosso), Alimia, Tilos, Symi (Simi), Nissyros, Kos (Cos), Pserimos, Astypalea, Kalymnos, Telendhos, Leros,

Lipsi, Patmos, Arki, and Agathonissi. Early in the 20th century, the Young Turks revoked the historic privileges enjoyed by the islanders, who were part of the Ottoman Empire. Twelve islands (*dhodkeka nisia;* i.e., *dodecanese*) joined in a failed protest against the loss of these privileges, and the name "Dodecanese" stuck as a term for all these islands, even though they exceeded 12 in number.

In 1912 as a consequence of the Italo-Turkish War, the Dodecanese Islands passed to Italian control. In 1941, the Germans joined their Italian allies in garrisoning the islands, which were inhabited chiefly by Greeks. The Italians had naval and air bases on Rhodes, the strategic key to the area. There was also an airfield on Kos, a seaplane and naval base and naval batteries at Leros, and an air base on Scarpanto.

When Italy signed an armistice with the Allies on September 8, 1943, the Dodecanese were occupied by two poorly equipped Italian divisions; along with air force, naval, and auxiliary troops, the Italian garrison totaled 37,000 men, but their morale was low. The Germans had one division of 7,000 men, which was well equipped with tanks and artillery. The local Greek population, meanwhile, was excited at the prospect of liberation by the Allied powers.

British prime minister Winston L. S. Churchill ordered that operations be conducted against the Dodecanese Islands. He believed that success there would open the way to the Dardanelles and the Balkans. He also sought to induce Turkey to join the war and to remove the stain of Britain's defeat in World War I at Gallipoli. The original plan for an invasion of the Dodecanese, prepared by the Middle East Command, was known as Operation MANDIBLES, but it was subsequently renamed Operation ACCOLADE. Churchill appealed to President Franklin D. Roosevelt and to General Dwight D. Eisenhower for aid to liberate the Dodecanese. The Americans, who were preparing a landing on the Italian Peninsula at Salerno, rebuffed him. Roosevelt also suspected that the British hoped to open a new front in the Balkans. Coincidentally, the Combined Chiefs of Staff meeting in Quebec ordered most of the landing ships in the Middle East to the Indian Ocean, which starved the operation of needed assets.

On September 9, 1943, three British operatives led by Major Lord George Jellicoe parachuted onto Rhodes. They contacted Italian authorities there and urged them to take the Germans prisoner. The governor, Admiral Inigo

Campioni, hesitated. The Germans, meanwhile, acted swiftly, and on September 11 the Italians on Rhodes surrendered to the Germans.

The British nonetheless proceeded with some landings, and by October 1943—deploying a force of 5,000 men, six Royal Air Force squadrons, a destroyer flotilla, and six submarines—they secured several islands, among them Kos, Samos, Patmos, and Leros. They were not able to either gain air superiority or take Rhodes, however, and as long as the Germans were secure at Rhodes, the British could not hold the Dodecanese.

On October 3, 1943, the Germans went on the offensive, landing a force on Kos. Supported by heavy bombing of the island by Stuka aircraft, German troops quickly reduced the defenses, and the British and Italian forces there surrendered the same evening. Churchill refused to consider a withdrawal, instead ordering that Leros and Samos be held at all costs. Indeed, the British reinforced Leros. On November 12, the Germans attacked Leros with overwhelming force, taking it four days later. British troops remaining in the Dodecanese then withdrew.

Among British units involved were the Long Range Desert Group, the Special Boat Squadron, the Raiding Forces' Levant Schooner Flotilla, the King's Own, the Royal Irish Fusiliers, and the Durham Light Infantry. The Greek Navy provided seven destroyers to assist the more numerous British ships. In the campaign, the British lost 4 cruisers damaged and 2 submarines, 6 destroyers, and 10 small coastal vessels and minesweepers sunk. The Royal Air Force flew 3,746 sorties and lost 113 aircraft out of 288 involved. The British Army lost in all about 4,800 men, while the Italians lost 5,350. German casualties totaled some 1,184 men, 35,000 tons of shipping (between late September and late November 1943), and 15 small landing craft and ferries. The operation failed as a consequence of Campioni's hesitation, German aggressiveness and air superiority, lack of cooperation by the Americans, and the inadequacy of British resources. Holding the islands, however, stretched German resources, ultimately tying down some 60,000 troops who might have been better employed elsewhere.

After the war, the British governed the Dodecanese until 1947. The islands were then turned over to Greece.

Doihara Kenji (1883–1948)

Japanese Army general. Born in Okayama Prefecture on August 8, 1883, Doihara Kenji graduated first in his class from the Japanese Military Academy in 1904 and from the Army Staff College in 1912. Posted to China in 1913, Doihara served there as an intelligence officer. He was promoted to major in 1919 and returned to Japan in 1920. In 1922, Doihara again went to China to serve in military intelligence and as an adviser to Manchurian warlord Zhang Zuolin (Chang Tso-lin) until the latter's assassination in June 1928.

In 1931 Doihara, now a colonel, became the head of Japan's military intelligence bureau in Shenyang (then Mukden), the capital of Manchuria. In that capacity, Doihura played a major role in planning and executing the Mukden Incident of 1931, which led to the Japanese seizure of Manchuria by the Guandong (Kwantung) Army, the Japanese garrison force stationed in south Manchuria. During the "Manchurian Incident" (the Japanese takeover of Manchuria), Doihara engaged in several covert activities, the most significant of which was arranging to bring the last Qing (Ch'ing) emperor, Aixinjueluo Puyi (Aisingioro P'u-i/P'u-yi, known to the Americans as Henry

Pu-yi), to Manchuria to be installed as puppet emperor of the Japanese-controlled state of Manzhouguo (Manchukuo) in 1933.

Doihara's accomplishments earned him promotion to major general in 1933 and the nickname "Lawrence of Manchuria." Doihara continued to play a major role in the Japanese Army's expansion on the Asian continent. In June 1935, he concluded a local agreement with Chinese general Qin Dechun that led to the withdrawal of Chinese troops and subsequent entry of the Japanese army into northern China.

Promoted to lieutenant general in 1936, Doihara commanded an infantry division in China until 1940, when he was recalled to Japan. During the Pacific war, Doihara served in several senior posts in the home islands and overseas. After Japan's surrender in August 1945, Doihara oversaw the army's demobilization. In 1946 he was arrested and brought to trial by the International Military Tribunal for the Far East. Convicted of war crimes, Doihara was hanged in Tokyo on December 23, 1948.

Dollman, Friedrich (1882–1944)

German Army general. Born on February 2, 1882, at Würzburg, Bavaria, Friedrich Dollman joined the Bavarian Army as an officer candidate in 1899, and in 1901 he was commissioned as a second lieutenant in the 7th Field Artillery Regiment. During World War I, he served as a captain on the General Staff. Dollman continued in the Reichswehr after the war, and between 1932 and 1936 he rose from colonel to general of artillery. In late August 1939, he took command of the Seventh Army, a post he held until his death.

The Seventh Army did not participate in the 1939 campaign against Poland and played only a minor role in the Battle for France (May 10–June 25, 1940). Nevertheless, Dollman was promoted to colonel general. The Seventh Army occupied France from 1940 to 1944.

Dollman did not get along with Field Marshal Erwin Rommel, who had charge of the defenses against an Allied invasion. In early June 1944, both men expected that poor weather conditions would postpone the Allied invasion of France. Dollman was at Rennes; he had ordered a map exercise there and required all divisional and regimental commanders to attend. Rommel was also away when the Allies invaded Normandy on June 6. Dollman unwisely ordered the Panzer Lehr and 12th SS Panzer divisions to the front in broad daylight. This exposed them to relentless Allied air attack and delayed any effective German armored counterattack until June 9.

On June 26 Dollman learned that Allied forces had penetrated Seventh Army defenses at Saint-Lô. Dollman was far to the rear in a château at Le Mans. In a panic he ordered II SS Panzer Corps commander SS-Obergruppenführer Paul Hausser to launch an immediate counterattack. Hausser asked for time to prepare, but Dollman refused the request. Dollman died on June 29, 1944, either of a heart attack or of self-inflicted poison. Hausser succeeded him in command of the Seventh Army.

Dönitz, Karl (1891–1980)

German Navy grand admiral who commanded the U-boats and later the entire Kriegsmarine and then succeeded Adolf Hitler as president of the Third

Reich. Born in Grünau-bei-Berlin on September 16, 1891, Karl Dönitz joined the German Navy in 1910. During World War I, he served on the cruiser *Breslau*, but he transferred to U-boats in 1916, commanding several submarines in the Mediterranean. In October 1918, his *U-68* attacked an Allied convoy, sinking one of the ships. The submarine was forced to the surface when it developed mechanical problems, and Dönitz was taken prisoner.

Released after the end of the war, Dönitz continued in the navy. He held a variety of shore and sea assignments, including command of a torpedo-boat flotilla, during which he experimented with tactics that he would later develop into the *Rudeltaktik* (wolf pack) concept. German chancellor Adolf Hitler named Dönitz commander of the fledgling German submarine force in 1935. As captain and commodore, Dönitz sought to build additional submarines to expand the fleet to 300 boats. He believed that this number would be decisive in winning the next war.

Dönitz's passionate advocacy of submarines led to friction between him and the commander of the navy, Grand Admiral Erich Raeder, who preferred to allocate scarce naval resources to a long-range program of conventional large surface ships. Their differences became moot when World War II began before either type was fully ready for decisive employment.

Promoted to rear admiral in October 1939, Dönitz struggled to overcome the problems of insufficient numbers of U-boats and ineffective torpedoes, difficulties that nearly wrecked his operations. To combat Allied convoys, Dönitz implemented wolf pack tactics: centralized control over groups of U-boats that struck Allied convoys at night in surface attacks. In January 1943, Hitler, frustrated by the performance of his surface navy, removed Raeder and replaced him with Dönitz as head of the navy with the rank of grand admiral. Dönitz endeavored to continue the U-boat war, but during "Black May" in 1943, his U-boats were essentially defeated through Allied antisubmarine countermeasures, including aircraft, convoys, searchlights, radar, sonar, and the ability to read Germany's encoded radio messages.

Unlike virtually all other senior German military officers, Dönitz managed to retain Hitler's confidence and favor. Dönitz's final military success was the evacuation of hundreds of thousands of Germans from the Baltic states by sea. As the Allied armies entered Germany on April 15, 1945, Hitler appointed Dönitz as commander of all forces in northern Germany. On

April 30, the day that Hitler committed suicide, Dönitz was informed that Hitler had appointed him to serve as president of the Reich and supreme commander of the armed forces. Dönitz then led the crumbling Third Reich, hoping to delay Soviet advances to allow millions of German troops and civilians to flee westward to British and U.S. lines to avoid falling into Soviet hands. Dönitz surrendered Germany unconditionally to Allied representatives on May 7, 1945.

The British arrested Dönitz on May 23. Tried by the International War Crimes Tribunal at Nuremberg, Dönitz was found guilty of crimes against peace and violation of the rules of war and was sentenced on October 1, 1946, to 10 years in Spandau Prison. He was released in 1956 and later wrote several books about his career and about submarine warfare. Unrepentant about his role in the war, Dönitz died in Aumuhle, Federal Republic of Germany, on December 24, 1980.

Donovan, William Joseph (1883–1959)

Head of the U.S. Office of Strategic Services. Born on January 1, 1883, in Buffalo, New York, William Joseph Donovan graduated from Columbia University with a law degree in 1907 and afterward practiced law in Buffalo. He also served as a captain in the New York National Guard. Donovan was stationed along the Mexican border in 1916 when the guard was called up to

assist in the unsuccessful effort to capture notorious Mexican bandit and revolutionary leader Pancho Villa.

After the United States entered World War I, Donovan was sent to Europe with the American Expeditionary Forces (AEF). As a major, he commanded the 1st Battalion of the 165th Infantry Regiment (formerly the 69th New York Infantry Regiment) in the 45th Infantry Division. Donovan took part in the September 1918 Saint-Mihiel offensive. Then a lieutenant colonel, he was wounded but refused evacuation and stayed to lead his men. His actions brought him the Distinguished Service Cross and the Medal of Honor and the nickname of “Wild Bill.”

After the war, Donovan returned to Buffalo to practice law. From 1924 to 1929, he was an assistant U.S. attorney general. He ran unsuccessfully for state political office and in 1929 moved to New York City. Much interested in international affairs, Donovan undertook several overseas missions for the Rockefeller Foundation and the Franklin D. Roosevelt administration. Donovan tried to convince Roosevelt and others that the United States needed a centralized intelligence-gathering organization similar to that run by the British. His efforts finally led to his appointment, in July 1941, as head of the Office of Coordinator of Information, which after the Japanese attack on Pearl Harbor on December 7, 1941, became the Office of Strategic Services (OSS). The OSS gathered intelligence, conducted propaganda and sabotage, and assisted partisans. Donovan finished World War II with the rank of major general.

Director of the Office of Strategic Services (OSS) William Joseph Donovan. The OSS was the forerunner of the Central Intelligence Agency (CIA). (Library of Congress)

Following World War II, Donovan lobbied President Harry S. Truman to set up a permanent intelligence organization. Truman initially rejected this step, but the coming of the Cold War led in 1947 to the formation of the Central Intelligence Agency (CIA), loosely modeled on the OSS. Donovan's hope of heading the CIA was not realized, although he briefly returned to government service as ambassador to Thailand during 1953 and 1954. Donovan died on February 8, 1959, at Walter Reed Army Medical Center, Washington, D.C.

Doolittle, James Harold "Jimmy" (1896–1993)

U.S. Army Air Forces (later U.S. Air Force) general. Born on December 14, 1896, in Alameda, California, James Harold Doolittle grew up in Nome, Alaska. He attended Los Angeles Community College and the University of California, Berkeley, where he studied in the School of Mines, but he left school following the entry of the United States into World War I and enlisted as a flying cadet in the Signal Corps Reserve. He attended flight school, became a pilot, and was commissioned a second lieutenant. He then served as a flight-gunner instructor at Rockwell Field in San Diego, California. His request for assignment to France was denied because of the armistice of November 1918.

In 1920 Doolittle secured a regular army commission, and on September 4, 1922, he made the first transcontinental flight in less than 24 hours. He then studied at the Massachusetts Institute of Technology (MIT), where he received MA and ScD degrees in aeronautical engineering. A pioneer in both military and civilian aviation, Doolittle helped develop horizontal and directional gyroscopes and perfected instrument flying.

Doolittle gained prominence through stunt flying, racing, and demonstrating aircraft. In 1930, he left the army to become aviation manager for Shell Oil, where he helped develop new high-octane aviation fuels that greatly benefited the United States in World War II. He won the Harmon (1930) and Bendix (1931) trophies, and in 1932 he broke the world airspeed record.

In July 1940, Doolittle returned to the army as a major. Following U.S. entry into World War II, in January 1942 he was promoted to lieutenant colonel. On April 18, 1942, Doolittle commanded the first American air strike on the Japanese mainland, flying U.S. Army Air Forces B-25 medium

bombers off the flight deck of the aircraft carrier *Hornet.* The raid was a great boost for U.S. morale, and for it he was awarded the Medal of Honor and promoted to brigadier general.

In July 1942, Doolittle took command of the Twelfth Air Force in Britain, which he led in Operation TORCH in North Africa (November 8, 1942). In November 1943, he was given command of the Fifteenth Air Force in the Mediterranean theater, directing raids against German-held Europe. In January 1944, he assumed command of the Eighth Air Force in the European theater, and that March he was promoted to temporary lieutenant general. On Germany's surrender in May 1945, Doolittle moved with the Eighth Air Force to Okinawa, although the Eighth Air Force arrived in the Pacific theater too late to see much action.

In May 1946, Doolittle returned to the civilian sector as a vice president for Shell Oil, and later he became its director. He also served on the National Advisory Committee for Aeronautics, the Air Force Science Advisory Board, and the President's Science Advisory Committee. In June 1985 by act of Congress, Doolittle was promoted to general on the retired list. He died on September 27, 1993, in Pebble Beach, California.

Doorman, Karel Willem Marie (1889–1942)

Dutch admiral. Born on April 23, 1889, in Utrecht, the Netherlands, Karel Doorman entered the Royal Netherlands Naval College in Den Helder in 1906. Commissioned in August 1910, he then served on several ships in the Far East and at home. In 1915, he joined the air division of the navy at Soesterberg and served at the De Kooy Naval Airfield from 1918 to 1921. After attending the Higher Naval School in The Hague, Doorman became one of the first flying instructors in the Netherlands naval air service.

Doorman returned to the Far East at the end of 1923, and from 1928 to the end of 1931 he was the first officer at De Kooy. He began his third tour in the Far East in 1932 and served as a commanding officer on destroyers and cruisers. He held several positions in the naval department in Batavia (now Jakarta) in the Netherlands East Indies (NEI).

Doorman served in the Netherlands from June 1934 to September 1937 as chief of the naval staff and then returned for his fourth tour in the Far East, where he commanded a cruiser. He then headed the Royal Netherlands Naval Air Service in the NEI from August 1938 to May 1940. Promoted to rear admiral in May 1940, Doorman was appointed commander of the Netherlands Squadron in the East on June 17. Because of his close connection with the naval air service, he was well aware of the importance of aircraft and aerial reconnaissance.

To try to stop the Japanese forces moving toward Singapore and the NEI, the Allies formed the ABDA (American-British-Dutch-Australian) Command in mid-January 1942. Dutch vice admiral Conrad E. L. Helfrich took overall command of the naval elements on February 14, and Doorman held tactical command of the naval strike force. As Japanese intentions became clearer, Helfrich combined the naval elements available to him into the Combined Striking Force under Doorman. The fleet departed Surabaya on the evening of February 26 following reported sightings of Vice Admiral Takagi Takeo's Eastern Invasion Force as it approached Java.

The Combined Striking Force consisted of two heavy cruisers, two light cruisers, and nine destroyers. Outgunned by Takagi's ships, Doorman's command faced heavy odds even before it entered battle. It had never trained

together as a unified force and lacked a common doctrine and common communication system. The men were also suffering from fatigue the day of the battle, and the command had nothing to match the excellent Japanese Long Lance torpedo. More important, although Doorman had requested aerial reconnaissance, none was available.

As a consequence, Japanese reconnaissance aircraft discovered Doorman's fleet first. In the Battle of the Java Sea on February 27, 1942, the Japanese sank the light cruisers *De Ruyter* (flagship) and *Java* and three destroyers. Three cruisers and five destroyers (four of them U.S.) survived. The Japanese lost no ships. Doorman perished aboard the *De Ruyter*.

Although some have criticized Doorman for his tactics in the battle, no one can question his bravery or his decision to attack. In order to defend Java, his fleet had to give battle. Doorman was posthumously awarded the Militaire Willemsorde 3rd class, the highest Dutch military decoration during the war. Two Netherlands aircraft carriers were later named for him.

Dorman-Smith, Eric "Chink" (1895–1969)

British Army major general. Born at Bellamont Forest, Cootehill, Ireland, on July 24, 1895, Eric Dorman-Smith entered the Royal Military College, Sandhurst, and graduated at the beginning of 1914 as a lieutenant in the 1st

Battalion, Northumberland Fusiliers. Dorman-Smith was nicknamed “Chink” after the regimental mascot, the Chinkara antelope. He served throughout World War I, during which he was wounded three times and was awarded the Military Cross. He had attained the rank of major by the end of the war, when in Italy he met American writer Ernest Hemingway. They became close friends, and Hemingway based many of his characters on Dorman-Smith.

After the war, Dorman-Smith served in Ireland when the British Army was involved in the political turmoil concerning Irish independence. He expressed the view that the professional soldier should be removed from politics, however, even those of his own country. He also was an instructor at Sandhurst and director of military training in India.

Dorman-Smith was unorthodox and controversial and possessed a cutting wit. He had a fertile and original mind and was widely considered to be one of the best military thinkers in the British Army, though his rabbit teeth and soft mustache made him the caricaturist’s dream of a languid British officer. When World War II began, Dorman-Smith was a brigadier and deputy chief of the General Staff in India, but in 1940 he became commandant of the Middle East Staff College in Haifa. From there he gave invaluable tactical advice to Lieutenant General Richard O’Connor that helped bring the sensational defeat of the Italians at Beda Fomm. General Claude J. Auchinleck valued Dorman-Smith’s perceptive and analytical appreciations of the Eighth Army’s operations and appointed him director of military operations in April 1941 and deputy chief of the General Staff in May 1942.

When Auchinleck assumed direct command of the Eighth Army in June 1942, he appointed Dorman-Smith, promoted to major general, as his personal chief of staff. Dorman-Smith was responsible for planning the fluid, mobile defense strategy of the first battle of El Alamein in July 1942 that stopped the Axis advance. Dorman-Smith then wrote a study that outlined the tactical situation and recommended a period of training for battle. This was adopted by Auchinleck’s successor, Lieutenant General Bernard L. Montgomery, as the basis for his operations at Alam Halfa (August 31–September 7, 1942) and in the Battle of El Alamein (October 23–November 4, 1942).

Just a week later, British prime minister Winston L. S. Churchill sacked Dorman-Smith as part of his change of the Middle East command structure. The great controversy surrounding this issue resurfaced after the war when

Dorman-Smith forced the publishers of Montgomery's memoirs to include acknowledgments crediting Auchinleck. He also sued Churchill for libel, forcing him to publish an acknowledgment in his memoirs absolving Dorman-Smith of responsibility for the defeats at Gazala (May 26–June 13, 1942) and Tobruk (June 20–21, 1942).

Dorman-Smith's career had always been sufficiently contentious to make him enemies, but after his dismissal he was treated disgracefully for reasons that have never been properly explained. Reverting to his permanent rank of colonel, he was assigned command of an infantry brigade and ended up fighting in Italy, where he was involved in the capture of Rome. Although Dorman-Smith's command was faultless, he was soon removed from his post because of friction with his subordinate commanders and was retired involuntarily in November 1944, disillusioned and bitter.

After the war, Dorman-Smith retired to the family estate at Bellamont Forest, where he took the name O'Gowan, the Irish version of the surname Smith; began a new career as a lawyer; and assumed the persona of country gentleman and military adviser to the Irish Republican Army. He died on May 11, 1969, in Cavan, Ireland. No representative of the British government or army attended his funeral.

Dornberger, Walter Robert (1895–1980)

German Army major general. Born in Giessen, Germany, on September 6, 1895, Walter Robert Dornberger was studying to be an architect when World War I began. He entered military service in August 1914 as an officer candidate with a foot artillery regiment and was commissioned a second lieutenant in December 1915. During the war, he was both a platoon and battery commander until he was taken prisoner by the French in October 1918.

Released in March 1920, Dornberger remained in the Reichswehr and was promoted to first lieutenant in 1925. He held various assignments related to artillery during the early 1920s and studied mechanical engineering at the Technical University in Berlin, where he received his engineering degree in 1930. Dornberger was promoted to captain in March 1930 and in April 1931 was appointed to the Ballistics and Munitions Branch of the Army Weapons Department, which oversaw development of liquid-fuel rockets for military use.

Dornberger received an honorary doctorate in engineering in 1935. Promoted to major in November 1935, he then commanded the army experimental facilities at Kummersdorf. In July 1936, he became department chief in the Army Weapons Department with responsibility for special experiments at the Army Experimental Station at Peenemünde. He was promoted to lieutenant colonel in June 1938 and to colonel in August 1940.

At Peenemünde, work on the A-Series of rocket missiles resulted in the V-2 (A-4), which made its first successful test flight on October 3, 1942. Dornberger was promoted to major general in June 1943. A British air raid on the night of August 17–18, 1943, destroyed part of Peenemünde and forced dispersal of the project, which Dornberger estimated set back production six months. The first V-2 hit London on September 8, 1944.

By early February 1945, the Schutzstaffel (SS) controlled the entire V-2 program. The SS evacuated Dornberger and some 450 others from Peenemünde on April 6, 1945. Dornberger was taken prisoner by U.S. forces on May 3, 1945, and turned over to the British, who imprisoned him at the Island Farm prisoner-of-war camp in Wales until 1947. Dornberger was charged as a war criminal for launching the V-2s against London, but he was never brought to trial.

Following his release in 1947, Dornberger immigrated to the United States and became a U.S. citizen. He first worked for the U.S. Air Force’s Air

Material Command as a consultant on rocket programs. He joined Bell Aircraft Corporation in 1950 as a missile-design consultant and participated in work on the Rascal air-to-surface guided missile and the Dyna-Soar project, which evolved into the space shuttle program.

Dornberger's wartime memoirs, *V-2*, were published in 1954. Dornberger never wavered from his belief that the V-2 program was a more effective use of scant resources than jet aircraft. Albert Speer, on the other hand, maintained that production of the Me-262 and the "Waterfall" ground-to-air antiaircraft rocket would have given Germany a better chance.

Dornberger became vice president of Bell Aircraft in 1959, and in 1960 he held the same office with Bell Aerosystems Company. He retired in 1965. Dornberger died in Obersasbach, Baden-Württemberg, West Germany, on June 27, 1980.

Douglas, William Sholto (1893–1969)

British marshal of the Royal Air Force (RAF). Born on December 23, 1893, at Headington, Oxfordshire, William Sholto Douglas was raised in London. He attended Oxford University but left to join the Royal Field Artillery at the start of World War I. Douglas soon transferred to the Royal Flying Corps, where he qualified as a fighter pilot. By the end of the war he rose to squadron commander.

In 1919, Douglas left the military to become a test pilot with the Handley Page Aircraft Company. Dissatisfied with civilian life, he returned to the

RAF in 1920 as a squadron commander. He then attended the Imperial Defense College. In 1936, Douglas was named director of staff studies at the Air Ministry as the only fighter pilot on the senior staff. Promoted to air vice marshal, in 1938 he became assistant chief of the air staff with responsibility for training.

Douglas was a leading critic of the tactics employed by head of Fighter Command Air Chief Marshal Hugh Dowding. On November 25, 1940, Douglas succeeded Dowding as head of Fighter Command as air marshal. Among innovations was his "Big Wing" concept of large formations of fighters employed in massive sweeps. Douglas also encouraged development of night-fighting equipment and techniques. Although his new tactics enjoyed some success, critics complained that they left much of the British homeland unprotected.

In December 1942, Douglas was promoted to air chief marshal and assigned to the Middle East Air Force (MEAF) as deputy to Air Chief Marshal Arthur Tedder. With the reorganization of Allied air forces in April 1943, Douglas assumed command of the MEAF. During the June 6, 1944, Allied landings in Normandy, Douglas was chief of the Coastal Command and commander of the British Expeditionary Air Force with the mission of securing control of the English Channel.

With the return of peace, Douglas commanded the British Air Forces of Occupation. He was knighted in 1941, when he received the KCB. In 1946 he received the GCB. Promoted to marshal of the RAF, in June 1946 he followed Field Marshal Bernard Montgomery as commander of British forces in Europe and military governor of the British occupation zone in Germany.

Douglas retired from active duty in 1948 and was awarded a peerage as First Baron Douglas of Kirtleside. He assumed a seat in the House of Lords and served on the boards of the two British state airlines. He also wrote two autobiographies. Douglas died in Northampton on October 29, 1969.

Douhet, Giulio (1869–1930)

Italian Air Force general and pioneer of strategic air doctrine. Born on May 30, 1869, in Caserta, Italy, Giulio Douhet was commissioned in the Italian Army in 1892. An early advocate of military aviation, he led Italy's first air bombardment unit during the Italo-Turkish War (1911–1912). During World War I, his unbridled criticism of Italy's General Staff led to his court-martial and dismissal. Recalled to active service after the defeat at Caporetto, which vindicated much of his comment, Douhet took charge of the Central Aeronautical Bureau (1918). After the war he retired, and in 1921 he wrote *Il dominio dell'aria* (Command of the Air), a seminal work on airpower strategy. That same year he became a brigadier general. A strong supporter of fascism, Douhet was appointed in 1922 by Benito Mussolini as chief of Italy's aviation program.

Having witnessed Italy's costly and futile World War I campaigns on the Isonzo and in the Alps, Douhet argued that strategic bombing attacks by heavily armed and armored "battleplanes" promised quick and decisive victories in future wars. Such a thrusting and offensive-minded approach conformed well to fascist beliefs. Douhet believed that civilian populations would panic under sustained attack.

Disregarding the legality and morality of sneak attacks and the utility of graduated approaches to warfare, Douhet called for all-out preemptive air strikes to destroy an enemy's air force and bases, followed by concerted attacks on industry and civilians. Douhet concluded that a combination of high-explosive, incendiary, and poison gas bombs would generate psychological uproar and social chaos, fatally weakening the enemy's will to resist.

In arguing that airpower was inherently offensive and uniquely efficacious, Douhet dismissed escort planes as superfluous enemy interceptors as ineffectual and interservice cooperation as unnecessary because "battleplanes" would render navies and armies obsolete. Results of the Allied Combined Bomber Offensive, however, proved Douhet wrong. He had vastly overestimated the destructive power and accuracy of bombing, the ability of bombers to fight their way unescorted to targets, and the fragility of democratic populations, who proved resilient under attack. Nevertheless, Douhet's call for independent air forces and offensive-minded strategic bombing proved influential, especially in Britain and the United States. Douhet died in Rome on February 15, 1930.

Dowding, Sir Hugh Caswall Tremenheere (1882–1970)

British air chief marshal. Born on April 24, 1882, in Moffat, Scotland, Hugh Caswall Tremenheere Dowding was educated at Winchester and the Royal Military Academy, Woolwich. Commissioned a second lieutenant of artillery in 1900, he then served in India and the Far East. He attended the Royal Staff College, Camberley (1910–1912), and learned to fly. Dubbed "Stuffy" for his seemingly aloof manner, Dowding switched to the Flying Corps in 1914, rose to become a squadron commander in World War I, and was promoted to brigadier by war's end.

After the war and command of No. 1 Group in southern England (1922–1925), Dowding served in the Middle East. Promoted to air vice marshal in 1929 and air marshal in 1933, from 1930 to 1936 he was a member of the Air Council, which was concerned with supply and research (including fighter aircraft design and planning for radar installations). He became the first chief of Fighter Command in July 1936 and worked from his Bentley Priory headquarters to integrate fighter pilots, radar, and ground control facilities. Scheduled for retirement in June 1939, Dowding stayed on when his designated successor was injured.

Air Chief Marshal Dowding's fighter aircraft were heavily outnumbered by the German Luftwaffe when active fighting began in France and the Low Countries on May 10, 1940. Dowding stoutly resisted calls by the French and Prime Minister Winston L. S. Churchill to send additional fighter squadrons to support the doomed Allied effort to halt the German invasion, knowing that they would soon be needed for the defense of Britain itself. Thus, when the Battle of Britain (July 10–September 30, 1940) began, he was able to maintain the narrow margin of air superiority over the British Isles that prevented implementation of the planned German invasion, Operation SEELÖWE (SEA LION).

British air chief marshal Sir Hugh Dowding. As the head of Fighter Command, Dowding played a pivotal role in the Battle of Britain. (Library of Congress)

Dowding tried to overcome a growing conflict between his two most important commanders, Keith Park at 11th Fighter Group in the southwest of England and Trafford Leigh-Mallory at 12th in the Midlands. Leigh-Mallory favored the Big Wing concept of using fighters to overpower the Germans, whereas Park and Dowding insisted on smaller group formations and more flexible tactics.

At the same time, Luftwaffe attacks on British airfields, radar, and manufacturing centers were taking a growing toll on the thinly spread defense forces. Dowding was fortunate when Adolf Hitler turned the Luftwaffe against London—and thus away from the Royal Air Force (RAF) ground facilities—in reprisal for an RAF bombing raid on Berlin. By the end of October the battle was largely over, won by Dowding's "few" for "so many."

Dowding was now well past normal retirement age. He was relieved of command in a poorly handled fashion, for which he felt understandably aggrieved, in November 1940 and replaced by William Sholto Douglas. Dowding retired in 1942 and was made a baron the next year. He died at Tunbridge Wells, England, on February 15, 1970.

DOWNFALL, Operation

U.S. plan for the invasion of Japan. On May 25, 1945, the U.S. Joint Chiefs of Staff in Washington provided a general outline of a plan to invade Japan but left the details to the two Pacific theater commanders, General Douglas MacArthur and Admiral Chester W. Nimitz. MacArthur issued his plan, code-named DOWNFALL, three days later. It foresaw two operations. The first, to be initiated following "extensive air preparation," had the code name OLYMPIC. It consisted of a landing on the southern part of the island of Kyushu by the 14 to 17 U.S. divisions already available in the Pacific theater. The second invasion, code-named CORONET, would begin with a landing on the main island of Honshu and have as its objective the capture of Tokyo and the Yokohama areas as a base for further operations.

X-day, the invasion of Kyushu, was scheduled for November 1, 1945, and was to involve some 766,700 men lifted in 1,315 amphibious vessels. Before the actual invasion, beginning on X-5, the Japanese offshore islands of Tanegashima, Yakushima, and the Koshikijimas would be taken to secure nearby anchorages for ships not needed in the actual landing and those that

had become damaged. The Sixth Army would be the principal ground element. For the invasion of southern Kyushu, MacArthur envisioned four corps of three divisions each. The follow-on force would add another two divisions. Three other divisions would be the strategic reserve.

Nimitz saw aircraft carriers as the principal naval strike weapon and envisioned using 16 fleet and 6 light carriers of the U.S. Navy and 6 fleet and 4 light carriers of the British Pacific Fleet embarking a total of some 1,914 aircraft. Once southern Kyushu was secured, MacArthur planned to turn it into a gigantic naval and air base for 40 air groups with approximately 2,800 aircraft.

Both OLYMPIC and CORONET faced daunting problems. The invasion of Kyushu was predicated on the assumption that the invaders would encounter only three Japanese divisions in southern Kyushu and three more in the northern part of the island. Yet Purple signal intercepts by the early summer of 1945 revealed that the Japanese were substantially reinforcing Kyushu. MacArthur dismissed out of hand intelligence estimates based on Purple intercepts of a higher Japanese troop strength on Kyushu. He claimed such evidence was “erroneous” and suggested that the Japanese had managed to hoodwink Purple.

Historian Edward Drea has pointed out that MacArthur routinely dismissed Purple evidence that “failed to accord with his own preconceived strategic vision.” The last estimate by MacArthur’s intelligence chief, Lieutenant General Charles Willoughby, of Japanese troop strength on Kyushu was 195,000 men (up from an initial estimate of 137,400), whereas actual Japanese strength was 287,000.

Y-day, the invasion of Honshu in Operation CORONET, was scheduled for March 1, 1946. MacArthur planned to command CORONET in person. The invading force would consist of the Eighth and Tenth Armies with a total of 14 divisions, 3 of which would be marines. The First Army of 10 divisions from Europe would be the follow-on force. MacArthur planned to hold one airborne division of his own, presumably the 11th, in strategic reserve, augmented by a corps of 3 divisions deployed from Europe. In all, CORONET was projected to involve 1,036,000 personnel. As the date for the projected invasions drew closer, plans changed. For example, the Tenth Army, formed for the conquest of Okinawa, was dropped from CORONET and replaced by the First Army.

Estimates of casualties from the invasions, had they gone forward, vary considerably. Historian Ray Skates has concluded that Operation OLYMPIC alone would have taken two months and resulted in 75,000 to 100,000 U.S. casualties. This estimate, which approximates the figure presented by MacArthur based on casualties taken in the securing of Luzon in the Philippines, may have been low. Others then and since have postulated a much higher figure on the basis of the March–June 1945 Battle of Okinawa, in which 130,000 Japanese defenders inflicted some 66,000 casualties on attacking American forces, not counting Allied naval personnel losses to kamikazes.

In addition to the much higher troop strength on Kyushu than on Okinawa, Japanese authorities were assembling thousands of kamikaze aircraft and watercraft and mobilizing the civilian population for a fanatical defense. The Imperial Japanese Navy (IJN) had been reduced to an operational force of 1 battleship, 6 aircraft carriers, 4 cruisers, 20 destroyers, and perhaps 40 submarines. But there was insufficient fuel to put the capital ships to sea, and the best the IJN could hope for was several days of operations for the destroyers and submarines. The Japanese had readied large numbers of what were essentially suicide craft: some 100 Kairyū-class midget submarines, 250 smaller Kairyū-class midget submarines, 1,000 Kaitens (manned torpedoes), and 800 Shin'yō suicide boats.

It would seem logical that the Japanese would have fought even more fiercely for their home islands than they did for Okinawa. Although heavy U.S. losses would not have affected the ultimate outcome of the war, they might have brought some modification in U.S. conditions for peace.

MacArthur's revised plan of August 15 for CORONET also would have faced problems. It called for an assaulting force of 20 divisions, including 2 armored and 3 marine. Five divisions would be in immediate reserve, with 3 others in the Philippines in strategic reserve. The total troop commitment came to 1,171,646 men.

Even this revised plan faced problems. The assault would be beyond the range of most land-based aircraft, and MacArthur estimated defending forces of seven army divisions, 160,000 naval troops, and supporting units and civilian volunteers. But the contemporary Joint Intelligence Committee estimated actual Japanese forces at perhaps double that figure, or 560,000 men.

In any case, MacArthur's plans were never tested. Operation DOWNFALL proved unnecessary, for on August 15, 1945, after the U.S. atomic bombings of Hiroshima and Nagasaki, Emperor Hirohito announced to the Japanese people the decision to surrender.

DRAGOON, Operation (August 15, 1944)

Allied amphibious operation in southern France. Commencing on August 15, 1944, Operation DRAGOON was originally intended to support and coincide with OVERLORD, the June 6, 1944, invasion of northern France, but it could not be mounted until August 1944. Operation DRAGOON had its genesis under the code name ANVIL during strategic planning in 1942, as the Allies considered operations to invade continental Europe. Tied to operation SLEDGEHAMMER, a contingency cross-Channel plan for 1942, ANVIL was to be a diversionary attack on the Mediterranean coast of France to either draw German forces there or, at a minimum, hold those already there so they could not reinforce the defense against an attack on the Channel coast.

Operation DRAGOON was also entangled in European strategic discussions related to Allied planning, which involved the direct route across the Channel pressed by the Americans or the peripheral approach through North Africa and Southern Europe urged by the British. When British Eighth Army forces

were defeated at the Battle of Gazala (May 26–June 13, 1942) and the Third Battle of Tobruk (June 20–21, 1942), pressure built to act against the immediate threat. Thus, the Western Allies decided on Operation GYMNAST (later renamed TORCH), the Allied assault on North Africa that began on November 8, 1942. This decision canceled SLEDGEHAMMER and delayed planning and consideration for Operation ROUNDUP, the autumn 1943 cross-Channel operation with which ANVIL was still loosely associated.

Debate continued between the Americans and British over the timing and even the feasibility of a cross-Channel attack into northwest France, to which ANVIL was always linked. As operations first in Sicily and then in Italy evolved from TORCH and as Operation ROUNDUP gave way to OVERLORD, debate continued as the British pressed to reinforce Italian operations at the expense of ANVIL and delay OVERLORD. Finally, at Combined Chiefs of Staff discussions in the Cairo Conference in late November 1943, the decision was made to take Soviet views into account.

At the November 28–December 1, 1943, Tehran Conference, Soviet leader Joseph Stalin argued forcefully for a cross-Channel attack against Germany in northwest France. Stalin believed that ANVIL, considered a diversionary attack in southern France by the Western Allies, was an integral part of the overall pincer movement against German forces. When British prime minister Winston L. S. Churchill suggested that operations in the eastern Mediterranean might take immediate pressure off the Soviets even if it meant delaying OVERLORD, Stalin replied that it was not worth scattering British and American forces. Before leaving Tehran, the Allies committed themselves to mounting OVERLORD with a supporting operation against southern France during May 1944. The problem then became how to conduct both OVERLORD and ANVIL with the resources available.

As planning proceeded, it became apparent that the limiting factor would be the shortage of landing craft. Seizing the opportunity, the British again pushed for cancellation of ANVIL not only to provide landing craft for OVERLORD but also to divert manpower to the Italian campaign, which had bogged down. So severe was the landing craft shortage that supreme commander, Allied Expeditionary Force, General Dwight D. Eisenhower found himself in favor of at least postponing ANVIL until after OVERLORD. This weakened the U.S. argument that ANVIL was necessary to divert German troops from Normandy’s beaches. But the British argument for needing

additional forces in Italy evaporated with the Allied liberation of Rome. The Americans still argued that they required the major Mediterranean port of Marseille to bring resources ashore for the drive against Germany.

On August 10, 1944, the British reluctantly agreed to give ANVIL the go-ahead. Renamed because of security problems, DRAGOON (Churchill said the name was apt because he had been dragooned into agreeing to it) began five days later on August 15. Vice Admiral H. Kent Hewitt, commander of the Eighth Fleet, commanded the landing, and four naval task forces supported the invasion. Participating ships included 5 battleships (the British *Lorraine* and *Ramilles* and the U.S. *Texas, Nevada*, and *Arkansas*), 24 cruisers, 7 escort carriers, and numerous smaller ships from the navies of Britain, the United States, France, and Greece. A total of 881 ships took part, along with 1,370 landing craft. In the skies, 4,056 Allied aircraft provided support.

At dawn, contingents of the U.S. 3rd, 45th, and 36th Infantry Divisions and a French armor task force came ashore on beaches between Saint-Tropez and Cannes on the French Riviera. Meanwhile, a combined British and American airborne task force landed to seize bridges and cut roads inland. U.S. Seventh Army commander Lieutenant General Alexander M. Patch Jr. led the Allied force. Major General Lucian Truscott Jr., VI Corps commander, was the ground force commander. Seven Free French divisions under General Jean de Lattre de Tassigny came ashore within the next several days and headed west to seize the ports of Toulon and Marseille.

Although DRAGOON was dwarfed by the Normandy Invasion two months earlier, the Allies nonetheless ultimately landed 250,000 American and French ground troops. German forces in southern France amounted to no more than 210,000 troops in eight and two-thirds divisions, and these were mostly second-rate formations. By the end of the first day, all three Allied divisions had secured their beachheads, and 86,000 men, 12,000 vehicles, and 46,000 tons of supplies had come ashore.

By August 17, the Allied advance had reached 20 miles inland. Facing the possibility of substantial Germany Army units being trapped in France, German leader Adolf Hitler ordered Army Task Group G commander General Johannes Blaskowitz to withdraw, leaving sufficient troops behind to deny the major ports to the Allies. The most serious fighting took place at the two ports of Toulon and Marseille. Within two weeks, on August 28 both fell

to the French divisions of General de Tassigny's newly designated French First Army.

Operation DRAGOON cost the Allies more than 13,000 casualties (more than half of them American). Nevertheless, it resulted in a 400-mile advance that liberated virtually all of southern France. It also hurried the introduction of Free French troops into combat and opened additional ports for supporting the drive across France into Germany. In addition, it netted 79,000 German prisoners and sped the collapse of the Third Reich.

Dresden, Air Attack on (February 13–15, 1945)

Allied strategic bombing raid against the German city of Dresden. This operation, conducted on February 13–15, 1945, has become the most commonly evoked image to illustrate the excesses and horror of conventional bombing of cities. The firestorm caused by Royal Air Force (RAF) Bomber

Command on the night of February 13 rivaled that of the raid on Hamburg of July 27, 1943. The immediate controversy about the raid contributed to the end of Allied strategic bombing. Cold War rhetoric and sensationalist presentations in history books and movies have clouded the facts ever since.

At the Yalta Conference on February 4, 1945, the Soviets asked for Allied air attacks on communication centers to prevent the shifting of German troops to the Eastern Front. They specifically mentioned Berlin and Leipzig, but Allied planners also identified Dresden and Chemnitz as appropriate objectives to meet Soviet needs. On February 8, Supreme Headquarters, Allied Expeditionary Force (SHAEF), instructed RAF Bomber Command and the U.S. Strategic Air Forces to prepare an attack on Dresden because of its importance in relation to movements of military forces to the Eastern Front.

Contrary to later reports, Dresden did contain many important industrial and transportation targets, and it was defended, although many of its guns had been sent east to fight the Soviets. The allocation of effort was also shaped by the prodding of British prime minister Winston L. S. Churchill, although he later tried to distance himself from the operation and the atmosphere engendered by the pursuit of Operation THUNDERCLAP.

The latter was a British plan to break German morale with a massive Allied assault on the German capital of Berlin and on refugee centers. The attack on Berlin was conducted on February 3 over the protests of U.S. Eighth Air Force commander James Doolittle. Other Americans in the U.S. Strategic Air Forces headquarters and in Washington were also uneasy over concentrating on cities such as Dresden, but that did not stop the operation from proceeding.

The operation opened on the night of February 13 with two separate British raids. The first blow was delivered by 244 Lancasters dropping more than 800 tons of bombs. This attack was moderately successful. The inhabitants of the city were surprised with a second attack three hours later, this time by 529 Lancasters delivering a further 1,800 tons of bombs. The concentrated accuracy of the bombing against so many wooden structures and during ideal weather conditions produced a terrible conflagration. The smoke and flames made aiming difficult the next day for the more than 300 American B-17s attempting to drop another 700 tons of bombs on the city’s

marshaling yards. Obscuration of the target area was even worse for a similar attack on February 15.

When news of the destruction of Dresden reached Britain, there was considerable public outcry over the destruction of such a beautiful city when the war seemed to be virtually won. American air leaders were worried by similar reactions in the United States, especially after careless remarks by a SHAEF briefing officer inspired such nationwide newspaper headlines as "Terror Bombing Gets Allied Approval as Step to Speed Victory." Secretary of War Henry Stimson ordered an investigation of the "unnecessary" destruction but was satisfied by the resulting report explaining the background of the operation. Public reaction in the United States was muted. The controversy contributed to the Allied decision to suspend strategic bombing in April.

The casualty figures reported by German fire and police services ranged between 25,000 and 35,000 dead. Thousands more were missing, and there were many unidentified refugees in the city. It is probable that the death total approached the 45,000 killed in the bombing of Hamburg in July–August 1943. Some careless historians, encouraged by Soviet and East German propaganda, estimated figures as high as 250,000. Although David Irving later recanted his claim of 135,000 dead, one can still find that number cited in many history books. Public impressions of the excesses of Dresden were reinforced by Kurt Vonnegut's novel *Slaughterhouse Five* and the movie it inspired.

Driscoll, Agnes Meyer (1889–1971)

U.S. cryptographer. Born in Geneseo, Illinois, on July 24, 1889, Agnes Meyer moved to Westerville, Ohio, as a young girl. She graduated from Ohio State University in 1911 with a triple bachelor's degree in mathematics, languages, and music. She taught math and music in Amarillo, Texas, at the Lowry Philips Military Academy from 1911 to 1917. She then enlisted in the U.S. Navy as a chief yeoman, serving from July 1917 to September 1919. Meyer's fluency in German, French, and Japanese and her mathematical skills proved invaluable to the process of cryptography, and she was asked to remain in the Code and Signal section of the Department of Naval Communication as a civilian clerk.

From 1921 to 1922, Meyer worked at the Riverbank Laboratories in Chicago in the Cipher Department and probably attended training at the "Black Chamber" at New York Laboratories. She codeveloped a cipher machine in 1922, for which she was later paid $15,000. During 1923 and 1924, Meyer acted as liaison to the navy and technical adviser to the Hebern Electrical Code Company. When that company went bankrupt, she returned to the Cryptographic Research Desk (OP-20-G) under U.S. Navy lieutenant Laurence Safford. Meyer married lawyer Michael Bernard Driscoll in 1924.

Driscoll, known as "Miss Aggie," trained many of the U.S. Navy's top cryptanalysts. She also excelled at breaking Japanese ciphers, in 1925 accomplishing the initial solution of the "Red Book" codes used for Japanese fleet maneuvers until 1930. In 1931, she used IBM machines to crack the "Blue Book," a breakthrough that revealed Japanese battleship speed in 1936 as well as the identities of two Pacific Fleet moles working for the Japanese, Harry Thompson and John Farnsworth.

In 1940, Driscoll's recognition that the Japanese code JN-25 was generated by a machine (M-1) gave the United States a head start in building its own decryption machine (M-3). Although briefly assigned to the Enigma codes, Driscoll concentrated on Japanese cipher traffic throughout World War II, providing crucial information in the days leading to the June 3–6, 1942, Battle of Midway and training most of the U.S. Navy's cryptographers.

Driscoll moved to the Armed Forces Security Agency in 1949 and to the National Security Agency in 1957, from which she retired in 1959. She died in Fairfax, Virginia, on September 16, 1971.

Drum, Hugh Aloysius (1879–1951)

U.S. Army lieutenant general. Born on September 19, 1879, at Fort Brady, Michigan, Hugh Aloysius Drum was attending Boston College when his father, an army captain, was killed in the 1898 Spanish-American War. Drum left school that year and joined the army. He was commissioned from the ranks and served in the Philippines.

Drum graduated from the General Staff College at Fort Leavenworth, Kansas, in 1912 and then saw service on the Mexican border. In May 1917, he joined General John J. Pershing's staff in the American Expeditionary Forces (AEF) in France, assigned to the Operations Division. In July 1918, Pershing named Drum, then a major, chief of staff of the nascent American First Army. For his outstanding performance, Drum was promoted to temporary brigadier general.

After the war, Drum reverted to his regular grade as major. In 1922, he was promoted to permanent brigadier general. He then commanded an infantry brigade and the 1st Infantry Division (1927–1930). Inspector general of the army in 1930 and 1931, he was promoted to major general in December 1931. Drum commanded the First Army from 1931 to 1933. He was deputy chief of staff of the army (1933–1935) and then commanded both the Hawaiian Department (1935–1937) and the Second Army (1937–1938).

He then resumed command of the First Army, headquartered on Governors Island, New York. He was promoted to lieutenant general in August 1939.

Drum expected to have field command of the army if the United States entered World War II. Offered the post of adviser to the Nationalist government of China, he declined (the post ultimately went to Lieutenant General Joseph Stilwell). His refusal and his criticism of his superiors, notably of Generals George C. Marshall and Lesley J. McNair, led to Drum remaining on Governors Island and his retirement from the army in October 1943.

Following his retirement, Drum headed the New York National Guard until 1948. He was also president of the Empire State Corporation, which owned and operated the Empire State Building, and he served as military adviser to Thomas E. Dewey during Dewey's 1944 presidential campaign. Drum died in New York City on October 3, 1951. Pine Camp, home of the U.S. Army's 10th Mountain Division in upstate New York, was renamed Fort Drum in 1951.

DRUMBEAT, Operation

See PAUKENSCHLAG, Operation

Dulles, Allen Welsh (1893–1969)

U.S. Office of Strategic Services operative and director of the Central Intelligence Agency. Born on April 7, 1893, in Watertown, New York, Allen Welsh Dulles earned both a bachelor's degree and a master's degree in international law from Princeton University, and in 1916 he joined the U.S. foreign service. His first assignment was in Vienna, Austria. By the time the United States entered World War I, Dulles was in Berne, Switzerland, where he acquired an early baptism in espionage, nurturing embassy contacts with anticommunist Austro-Hungarian and Balkan exiles. Dulles was a member of the U.S. delegation at the 1919 Paris Peace Conference and held various posts overseas in the early 1920s. In 1926, financial constraints led him to join the prominent New York law firm Sullivan and Cromwell, of which his brother John Foster Dulles, the future secretary of state, was a leading partner.

Dulles remained deeply interested in foreign affairs, focusing on international business and becoming active in the New York–based Council on Foreign Relations. In the 1930s, he coauthored two books with Hamilton Fish Armstrong, editor of the council's journal *Foreign Affairs*, in which a dominant theme was that the United States could not hold aloof from European and world affairs.

In 1942, Dulles joined the newly created American intelligence agency, the Office of Strategic Services (OSS), headed by Colonel William J. Donovan. Dulles spent most of the war based in Berne, in neutral Switzerland. Here he ran a network of German intelligence agents, who brought him clandestine copies of numerous secret German documents. He was privy to—and encouraged—the failed German effort in July 1944 to assassinate Adolf Hitler. In early 1945, Dulles obtained copies of the diaries of Count Galeazzo Ciano, son-in-law of Italy's dictator, Benito Mussolini, giving important insight into the workings of the fascist regime.

In the spring of 1945, Dulles helped to negotiate the surrender of Germany's remaining forces in northern Italy. The independent initiation of this option by the U.S. and British forces alarmed Soviet leader Joseph Stalin, who feared that his allies intended to negotiate a separate peace with Germany, and this situation has sometimes been perceived as the opening move of the Cold War. By 1944, the prospect of communist and Soviet expansion in Europe greatly disturbed Dulles.

Shortly after Dulles returned to the United States in the summer of 1945,

President Harry S. Truman disbanded the OSS. Dulles remained a strong advocate of a permanent foreign intelligence service and helped to draft the 1947 National Security Act, which created the Central Intelligence Agency. From 1950 Dulles was its deputy director, and from 1953 to 1961 he served as the agency's third director, his record including both triumphs and fiascos. Dulles died in Washington, D.C., on January 29, 1969.

Dumbarton Oaks Conference (August 21–October 7, 1944)

Conference held in Washington, D.C., to decide on specifics in connection with the creation of a postwar international security organization. In the last half of 1944, as the Allies began to anticipate victory, representatives of 39 nations met in the U.S. capital to devise detailed plans for creation of the United Nations (UN), a security organization the assorted states opposing the Axis powers had committed themselves to forming. In recognition of the fact that the Soviet Union had not yet entered the Far Eastern war against Japan, the conference took place in two stages. From August 21 to September 28, 1944, Soviet delegates attended, but for the final 10 days, September 28 to October 7, the Soviets left the gathering, yielding their place to a Chinese delegation.

The Big Three Allied powers—the United States, the Soviet Union, and Great Britain—dominated the conference, as they did the wartime coalition.

This was reflected in the blueprint for the new UN that the meeting produced. The draft proposals were heavily influenced by the view of U.S. president Franklin D. Roosevelt, which British prime minister Winston L. S. Churchill and Soviet premier Joseph Stalin effectively shared, that agreement among the Big Four Allied powers (“the four policemen”) must be the foundation of postwar international security. In obeisance to international public opinion and to adhere to their more idealistic pronouncements about the rights of all nations and peoples to determine their own governments, the conferees decided on a scheme that showed some respect for more idealistic visions of a world in which all powers, great and small, enjoyed equal status and protection.

After lengthy deliberations, the Dumbarton Oaks delegates agreed to create a bipartite UN organization modeled on the earlier League of Nations but reserving ultimate authority to the dominant Allied states. All member states were entitled to representation in the General Assembly, which would debate, discuss, and vote on issues that came before it. Executive authority rested with the 11-member Security Council, which had 5 permanent members: Great Britain, France, the United States, the Soviet Union, and China. The remaining Security Council representatives, selected from among other member states of the UN, served two-year terms in rotation. The 5 permanent Security Council members therefore could effectively dominate the new organization, and their position was enhanced by the organization’s dependence on their financial contributions. Besides providing an international security mechanism to mediate and settle disputes among member states, the UN was also expected to promote international cooperation on economic, social, and humanitarian issues.

The Dumbarton Oaks conference left several important issues still unsettled, largely because these were so sensitive that they were deferred for personal decision by the Big Three leaders: Roosevelt, Stalin, and Churchill. Among such matters were Soviet requests for independent representation in the General Assembly for Belorussia and the Ukraine and a Soviet suggestion that each separate permanent Security Council member should enjoy veto power over any UN decision.

Participants in the August 21–October 7, 1944 Dumbarton Oaks Conference meeting, held in Washington, D.C., to create a post-war international security organization, which became the United Nations. (Iconic Archive/Getty Images)

Dumbarton Oaks also neglected to establish appropriate mechanisms to administer former League of Nations mandatory territories and those areas seized from the Axis powers, an omission repaired at Yalta, where the Big Three agreed to establish a trusteeship system for the purpose. Existing colonies of Allied nations fell outside this mechanism's purview unless the imperial power itself chose to hand the colonies over to UN administration.

From May to July 1945 the Allies held another conference at San Francisco, which drafted the actual charter of the UN. Although this gathering made some minor modifications granting slightly more power to small nations, the Dumbarton Oaks conference had already effectually settled the fundamental operational structure of the new international organization.

Dunkerque, Evacuation of (May 26–June 4, 1940)

Extraction of the British Expeditionary Force (BEF) and some French forces from the English Channel port of Dunkerque (Dunkirk), France. After the German invasion of France and the Low Countries and the rapid collapse of Allied forces there, contingency planning was begun in Britain on May 19, 1940, under the supervision of Vice Admiral Bertram Ramsay, naval commander of Dover, for the possible evacuation of British forces from France. By May 25, the Germans had already taken the French port of Boulogne, leaving only Dunkerque and Calais among the channel ports from which an evacuation might be attempted. Calais fell the next day. Naval planners hoped that they might be able to extract 40,000 members of the BEF, but in Operation DYNAMO they actually evacuated 364,628 troops, of whom 224,686 were British.

On May 26 as the German armored thrust from the south was closing in on Dunkerque, the commander of German Army Group A, Colonel General Karl Gerd von Rundstedt, ordered it halted, believing that the panzers were overextended. German leader Adolf Hitler made this into a hard-and-fast order and kept the panzers in place until May 29 to allow the German infantary to join them. Hitler's stop order was critical, allowing the BEF to escape and Britain to continue in the war. Head of the Luftwaffe Marshal Hermann Göring, who believed that the German Air Force had not received sufficient credit for its role in the war to date, then secured Hitler's permission to destroy the British forces on the ground with his dive-bombers. Göring even requested that the panzers be moved back several miles. The dive-bombing was not effective; the German bombs burrowed deep into the soft sand before exploding.

Meanwhile, the evacuation, Operation DYNAMO, began. All manner of vessels, including a number manned by civilian volunteers, participated in the

evacuation. Royal Air Force (RAF) fighter pilots flying from bases in southern England did what they could to protect the evacuation and disrupt the Luftwaffe, and they probably made the evacuation possible.

Among the evacuation ships, British and French destroyers rescued the most men, but they were also the chief targets for Luftwaffe attacks. By the fourth day of the evacuation, 10 destroyers had been sunk or put out of action. This led the Admiralty to take the difficult decision to remove all of its modern destroyers from the operation. The same reasoning limited the number of fighter aircraft that were available. In addition, head of Fighter Command Air Chief Marshal Hugh Dowding refused to sacrifice valuable aircraft in a battle already lost, believing that the planes would soon be required for the defense of Britain, which was certain to be the next target.

The Dunkerque evacuation was assisted by bad weather and fires from burning equipment on the beaches that inhibited Luftwaffe operations. The BEF lost more than 2,000 men during Operation DYNAMO. RAF Fighter Command lost 106 aircraft and 80 pilots, and Bomber Command lost an additional 76 aircraft. Of 693 British vessels of all types that took part in the operation, one-third (226) were sunk, including 6 destroyers; 19 other destroyers were put out of action.

Other nations also participated; France provided the most vessels (119), and Belgium, Norway, Poland, and the Netherlands also provided assistance. The other Allies lost 17 of their 168 vessels taking part. The BEF lost 30,000 men, including prisoners, to the Germans, and was forced to abandon virtually all of its equipment in France. The 50,000-man French First Army had played a key role, holding the advancing Germans from the beaches and allowing the British to get away. The French contested every bit of ground, and ultimately between 30,000 and 40,000 men of their troops were forced to surrender.

The evacuation was hardly a victory, but it did sweep away the halfheartedness that had marked the British war effort to that point. It also elevated the stature of Prime Minister Winston L. S. Churchill, who in a speech to Parliament on June 4 as the last British troops were being evacuated vowed that come what may, Britain would continue the fight.

E

Eaker, Ira Clarence (1896–1987)

U.S. Army Air Forces general who assumed command of the Mediterranean Allied Air Forces (MAAF) in 1944. Born on April 13, 1896, at Field Creek, Texas, Ira Clarence Eaker graduated from Southeastern State Normal School in Durant, Oklahoma, in 1917 and enlisted in the army. He completed officer training camp and was commissioned a second lieutenant in 1918. He then transferred to the Signal Corps and underwent aviation training. From 1919 to 1922, he was stationed in the Philippines.

In 1923, Eaker received permission from the army to attend law school. He studied law at Columbia University while also serving as post adjutant at Mitchell Field, Long Island, New York. In 1926, he was selected among 10 pilots to fly on a goodwill tour of South America.

Eaker took a leading role in the development of a long-range bomber for the army. In 1928, he made a record-breaking flight from Texas to the Panama Canal Zone in the new Boeing P-12. During these early years, he also became friends with fellow officers Henry "Hap" Arnold and Carl A. "Tooey" Spaatz. In January 1929, Captain Eaker flew in the Fokker C-2A *Question Mark* with Major Spaatz (mission commander), Second Lieutenant Elwood Quesada, and two others to set a world endurance record and pioneer in-flight refueling. The next year, Eaker piloted the first transcontinental flight to be refueled in the air.

From 1933 to 1935, Eaker commanded the 34th Pursuit Squadron. Promoted to major in 1935, he graduated from the Air Corps Tactical School, Maxwell Field, Alabama, in 1936 and from the Army Command and General Staff School, Fort Leavenworth, Kansas, in 1937. As a colonel, he commanded the 20th Pursuit Group from 1940 to 1941. He was then sent to Britain as a liaison to the Royal Air Force.

In February 1942, Eaker was promoted to brigadier general and sent back to Britain to command the VIII Bomber Command of Lieutenant General

Spaatz's Eighth Air Force; Eaker was soon conducting strategic bombing of German-occupied France. On August 17, 1942, he led the first mission in person, against Rouen, France. The attempt to conduct daylight precision bombing did not go as well as hoped, but Eaker's B-17s struck vital targets. Promoted to temporary major general, he took command of the Eighth Air Force in December and directed attacks against Schweinfurt and Regensburg in August 1943.

Publicity over high casualty rates in such raids, caused by a lack of long-range fighter protection, led to his reassignment. Promoted to temporary lieutenant general, Eaker took command of the MAAF, consisting of the U.S. Twelfth and Fifteenth Air Forces, in January 1944. He led the MAAF with great success in a variety of missions.

At the end of the war, Eaker returned to Washington to become deputy commander of the U.S. Army Air Forces. He retired in August 1947 after helping plan the formation of an independent air force. He was then a consultant for Douglas Aircraft, and in 1972 he became president of the U.S. Strategic Institute. Eaker remained active in the promotion of airpower through numerous books and lectures. In 1985, he was promoted to full general on the retired list by an act of Congress. Eaker died on August 6, 1987, at Andrews Air Force Base, Maryland.

East Africa Campaign (January–May 1941)

British Commonwealth campaign to defeat Italian forces in East Africa. Italian East Africa was formed after the 1936 Italian conquest of Abyssinia (Ethiopia), which combined with the colonies of Eritrea and Italian Somaliland into a single entity. When Italy entered the war on June 10, 1940, the governor-general of Italian East Africa, Amedeo Umberto di Savoia, Duca d'Aosta, commanded some 350,000 troops in the colony, vastly outnumbering the 40,000 British levies available. Aosta easily captured British outposts on the borders of Sudan and Kenya, and in August he occupied British Somaliland, the first British colony to fall into Axis hands.

The Italians beat back British brigadier William J. Slim's counterattack from Sudan on November 6, but Aosta was demoralized by a lack of supplies and Italian defeats in the Western Desert. He was also occupied suppressing Abyssinian rebels, known as the Patriots. At the moment of Britain's greatest weakness, he failed to take the initiative and unwisely adopted a defensive posture.

On January 19, 1941, Major General William Platt launched an offensive into Eritrea with the 4th and 5th Indian Divisions. Aided by intelligence from Italy's broken army and air force codes, Platt captured Keren on March 27 after hard fighting, in the decisive battle of the campaign. He entered Massawa on April 8. There, the Italians scuttled one destroyer, and five others sortied into the Red Sea for an attack on Port Sudan. In the ensuing actions, the Italians had four of their destroyers sunk; the fifth was scuttled.

Meanwhile, on February 11, Lieutenant General Alan Cunningham drove into Italian Somaliland from Kenya using the 11th and 12th African and 1st South African Divisions with startling success. After capturing Mogadishu, the capital of Italian Somaliland, on February 25, he struck north and took Harar in Abyssinia on March 26. A small force from Aden also captured Berbera on March 16 and quickly reoccupied British Somaliland, with little opposition, to shorten the supply line. It then joined with Cunningham's force to capture Addis Ababa on April 6. In just eight weeks, Cunningham's troops had advanced over 1,700 miles and defeated the majority of Aosta's troops, at a cost of 501 casualties.

Even more spectacular were the achievements of Lieutenant Colonel Orde Wingate, who commanded a group of 1,600 Patriots christened the "Gideon Force." Through a combination of brilliant guerrilla tactics, great daring, and sheer bluff, he defeated Italian forces at Debra Markos on April 6

and returned Emperor Haile Selassie to his capital, Addis Ababa, on May 5. British troops pressed Aosta's forces into a retreat at Amba Alagi until he finally surrendered on May 16, ending Italian resistance in that theater, apart from two isolated pockets rounded up in November 1941.

The campaign in East Africa was important, because for the first time, a country occupied by the Axis had been liberated; another 230,000 Italian and colonial troops had been taken prisoner, and British forces were released for vital operations in the Western Desert. It was also the first campaign in which the code breakers at Bletchley Park played a decisive role, providing an invaluable lesson on the contribution intelligence could make to an operation. Success in East Africa also had an important strategic consequence, as U.S. president Franklin D. Roosevelt was able to declare, on April 11, that the Red Sea and the Gulf of Aden were no longer war zones. U.S. ships could thus deliver supplies directly to Suez, relieving the burden on British shipping.

Eastern Front

On June 22, 1941, German forces invaded the Soviet Union in Operation BARBAROSSA. The two states then became locked in a death struggle raging on a front of more than 1,800 miles, involving millions of men and tens of thousands of tanks, artillery pieces, and aircraft and resulting in the deaths of tens of millions of combatants and civilians.

In the fall of 1940, following the German Luftwaffe's failure to drive the Royal Air Force from the skies over Britain, Adolf Hitler ordered plans drawn up for an invasion of the Soviet Union. He postulated a quick, three-month campaign. "You have only to kick in the door," he told Field Marshal Karl Gerd von Rundstedt, "and the whole rotten structure will come tumbling down." Defeat the Soviet Union, he reasoned, and Britain would have to sue for peace.

Overconfidence marked German planning. The Germans had little accurate intelligence on the Soviet Union, including few adequate maps. They also had little concern for the impact on the fighting of winter weather and little understanding of the influence of the great distances and how these would render blitzkrieg, at least as it was practiced in Poland in 1939 and against France and the Low Countries in 1940, wholly impractical.

German resources were certainly inadequate for the task that lay ahead, and in the Soviet Union, Hitler's strategic overreach at last caught up with him. On June 22, 1941, the German Army deployed 205 divisions, but 60 of these were in garrison or fighting elsewhere: 38 in France, 12 in Norway, 1 in Denmark, 7 in the Balkans, and 2 in North Africa. This left just 145 divisions available for operations in the east. The Germans invaded the Soviet Union with 102 infantry divisions, 19 armored divisions, 14 motorized divisions, and 1 cavalry division. In addition, the Germans deployed 9 divisions to maintain lines of communication as the invasion progressed. There was virtually no strategic reserve. Finland, Romania, and Hungary supplied perhaps 705,000 men in 37 divisions.

The disparity in military hardware was even more striking. The Luftwaffe, still waging operations against Britain and also supporting the Afrika Korps in North Africa, was forced to keep 1,150 combat aircraft in these theaters, leaving only 2,770 available for use against the Soviet Union. By contrast, the Soviets had 18,570 aircraft, 8,154 of which were initially in the west. The bulk of these were tactical aircraft. Germany had some 6,000 tanks, the Soviets 23,140 (10,394 in the west), and even in 1941, the Soviets possessed some of the best tanks of the war. Their T-34 was the top tank in the world in 1941.

The German invasion plan called for three axes of advance. Field Marshal Gerd von Rundstedt's Army Group South of four armies (one Romanian) and one panzer group would drive on Kiev and the Dnieper to destroy Soviet

armies between the Pripet Marshes and the Black Sea. Field Marshal Fedor von Bock's Army Group Center of two armies and two panzer groups was to strike east, taking Smolensk and Moscow. Field Marshal Wilhelm Ritter von Leeb's Army Group North of two armies and one panzer group would thrust north, capture Leningrad (St. Petersburg), and pin the Soviet forces there against the Baltic Sea. Finland would act in concert with the Germans, reentering the war to reoccupy the Karelian isthmus and threatening Leningrad from the north. Farther north, German colonel general Nikolaus von Falkenhorst's Norway Army would carry out an offensive against Murmansk to sever its supply route to Leningrad.

Hitler had intended to invade in May, but circumstances caused him to put off the attack until late June. In the spring of 1941, German forces invaded Yugoslavia, went to the rescue of Italian troops in Greece, and drove British forces from Crete. In the process, Hitler secured his southern flank against the possibility of Allied air strikes during the German invasion of the Soviet Union. Historians have argued about the impact of this on delaying the invasion of the Soviet Union. In any case, rainy weather and appalling road conditions in the western Soviet Union imposed delay. The tanks required firm, dry ground.

The invasion commenced at 3:00 a.m. on June 22, 1941, the longest day of the year, with only two hours of total darkness. The Germans and their allies moved into the Soviet Union along a 2,000-mile front. The bulk of the Red Army's western forces were in forward positions, where they were cut off and surrounded. On the first day alone, 1,200 Soviet aircraft were destroyed, most of them on the ground. Within two days, 2,000 Soviet aircraft had been lost. Within five days, the Germans had captured or destroyed 2,500 Soviet tanks. Within three weeks, the Soviets had lost 3,500 tanks, 6,000 aircraft, and 2 million men, including a significant percentage of the officer corps. Army Group North broke through the frontier defenses, wheeled left to trap and destroy many Soviet divisions against the Baltic, and appeared to have an open route to Leningrad.

Meanwhile, Army Group Center, with the bulk of German tanks, attacked north of the Pripet Marshes, completed two huge encirclements, and destroyed vast amounts of Soviet war matériel while taking hundreds of thousands of prisoners. Unexpectedly strong Soviet defenses slowed the advance of Army Group South to Kiev, the Crimea, and the Caucasus.

This revealed a great problem in German invasion planning. Chief of the General Staff Colonel General Franz Halder and many senior generals wanted to concentrate German resources in the center for a drive on Moscow, with supporting movements to the north and south. A thrust there would mean a shorter front, and its advocates believed that Moscow was so important that Soviet dictator Joseph Stalin would commit many troops to its defense and thus make it easier for the German Army to locate and destroy the remaining Soviet military formations before the onset of winter. Hitler was fixated on taking Leningrad, though, and, more important, the vast resources of the Ukraine. The compromise solution was to make a decision after the pause in August to refit and rest.

German military intelligence, meanwhile, underestimated Soviet military strength. In December 1940, it had estimated 150 Soviet divisions in the

western Soviet Union; by June 1941, that estimate had grown to 175; and now, in late summer, German intelligence concluded that the Soviets still had 250 divisions, despite their huge losses. Moreover, Soviet soldiers did not give up when surrounded. Nazi racism and German violence made them realize that capture meant death, so many Soviet troops fought to the last bullet and attempted to break free rather than surrender.

The vast distances and the onset of a severe winter also posed tremendous logistical challenges for German Army planners because their army had only a small mechanized/motorized force and largely relied on human and animal muscle power. While leaders at home prepared for the Soviet collapse, troops on the front lines gained a grudging respect for their Soviet adversaries.

In August the Germans paused, and Hitler ordered the tank units of Army Group Center to help with the attack on Leningrad and to complete the encirclement of Soviet forces defending Kiev. Finally, in October, Army Group Center began Operation TAIFUN (TYPHOON), the attack on Moscow. By November it had come close to success, but few tanks were still operational. There was little fuel, and the men lacked winter clothing in one of the coldest Soviet winters of the 20th century.

During the fall campaigning, Stalin prepared to defend Moscow. While troops defended a series of lines on the way to the capital, Moscow's citizens were organized to construct antitank ditches and concentric defenses. Secure in the information that Japan would not take advantage of Soviet weakness but intended to move into South Asia, the Red Army brought divisions from Asia and, having studied German tactics, prepared a counterblow against Army Group Center.

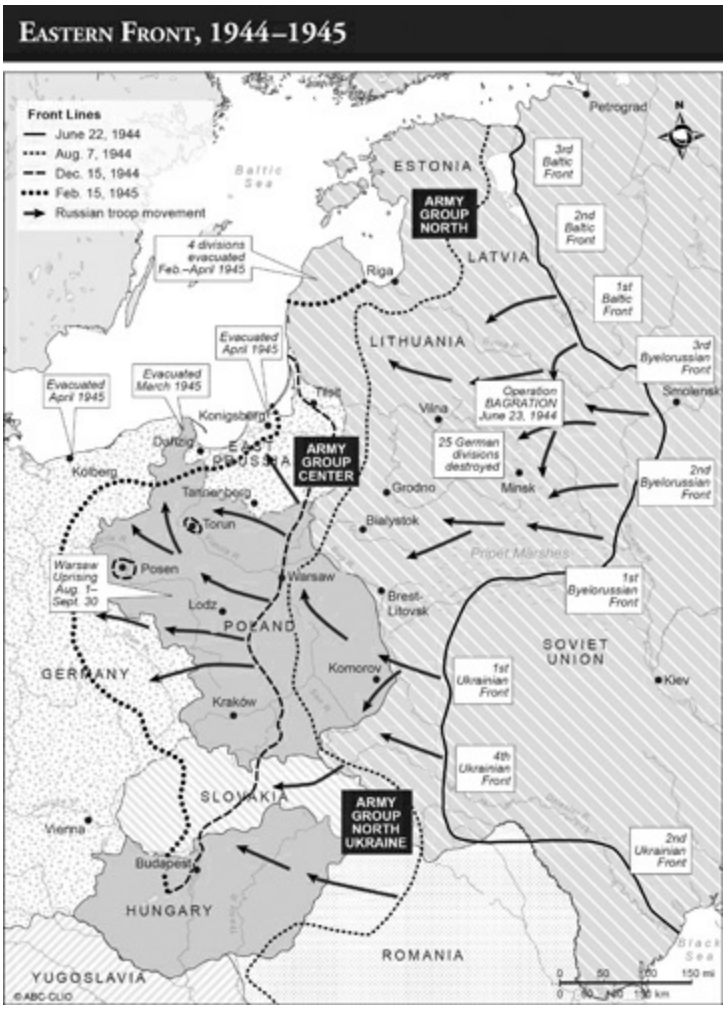
On December 5, 1941, the Soviet attack began, stunning the tired, cold, and hungry German troops. Some German generals wanted to retreat all the way to the preinvasion borders, but Hitler insisted that the troops remain in place; his resoluteness and the limited capacity of Soviet logistics helped stem the Soviet winter offensive. Then came the spring thaw and a temporary lull in the fighting.

The relative force ratio had changed in a year of fighting. A summer, fall, and winter had weakened the German Army so that it no longer had the striking power of a year before. The Red Army, on the other hand, encouraged by its winter victories, was preparing to take the offensive in 1942.

Hitler believed that the Soviet state could not afford another year of manpower losses like those of 1941. He thought that if German forces could drive a wedge between the Dnieper and Don Rivers, using the Volga River as a shoulder, they could interrupt Soviet supplies moving up that broad transit way and fight their way to Soviet oil resources in the Caucasus region and the Caspian Sea. The German high command estimated that it would need 80 new divisions to replace losses and provide the striking power for a summer offensive, but Germany could only supply 55 divisions. Hitler obtained troop contributions from reluctant Romanian, Hungarian, and Italian allies, but it was unclear how these troops would perform in the desperate fighting conditions of the Eastern Front. To meet the requirements for mechanized equipment, the German Army refitted Czech tanks taken in 1938 and French tanks seized in 1940.

Consequently, the German supply system had to carry spare parts for hundreds of truck models and tens of tank models, greatly complicating logistics. The Soviets had no such problems. Finally, the panzer units had to move fast enough to fight around defenders and once again surround and capture huge numbers of Soviet troops. Otherwise, the Germans would have to travel as much as 1,200 miles from the offensive's jumping-off point to reach the most productive oil-producing area around Baku.

The Soviets struck first. The Red Army launched an attack in the Southern Front that coincidentally exposed its flank to Germans massed for the drive to the southeast. Stalin initially refused to end the attack, and losses were heavy. The German summer offensive that finally began in late June 1942 never captured the vast numbers of Soviet soldiers of 1941. Hitler kept reassigning units and thereby violating the principles of mass and economy of force. He sent key elements of the Eighteenth Army on the Crimean Peninsula north to Leningrad, he routed and rerouted the Fourth Panzer Army, and in September, when it was clear that Germany could not achieve its overarching goal of seizing the Soviet oil fields, he ordered the Sixth Army to batter its way into Stalingrad against three defending armies.



The desperate battle for Stalingrad, a major industrial city on the Volga, captured the world's imagination. Stalin was as determined to hold his namesake city as Hitler was to take it. The fighting was a block-by-block, house-by-house, and room-by-room affair, with the Soviets sometimes defending from across the river. As Lieutenant General Vasily I. Chuikov's Sixty-Second Army held, the Soviets prepared a massive counterstroke, building up armies of troops and many tanks and artillery pieces against the weakly defended flanks held by Romanian and Hungarian troops.

On November 19, in Operation URANUS, the Soviets attacked and quickly broke through. Within days, the Soviet pincers met at Kalach, and more than 300,000 German troops were trapped. The German commander, Field Marshal Friedrich Paulus, did not attempt to break out, and Field Marshal Erich von Manstein failed to break through and relieve the Sixth Army. With only three divisions, Manstein managed to get within 35 miles of the trapped

Sixth Army but could move no farther. German troops held on until the end of January, when 90,000 survivors marched off into captivity. The long battle did at least provide time for the Germans to extricate forces that had penetrated deep into the Caucasus.

The Soviets then followed this great victory with a winter offensive, but eventually their goals outran their logistical capacity, and there was the typical pause forced by the spring thaw in 1943. As summer approached, Hitler approved a plan to pinch off a huge bulge in German lines north of Kharkov near Kursk, destroy Soviet armies trapped there, and restore the balance on the Eastern Front.

The Germans postponed the attack on the Kursk salient, Operation CITADEL, again and again into May, June, and eventually early July. Hitler wanted more of the new models of heavy German tanks, especially the Tiger, but as Germany delayed, the Soviets acted, bringing up reinforcements and constructing extensive, deep defenses, including wide belts of minefields, that were up to 60 miles deep. They also positioned reserve armies on the shoulders of the bulge and additional tanks and artillery behind them.

Finally, on July 5, the long-awaited attack began. Although German units made little progress in the north, the attacking force from the south bludgeoned its way forward. But on July 10, British and American forces invaded Sicily, clearly threatening to drive Italy from the war. This forced Hitler to end the offensive at Kursk—the greatest tank battle in history.

Within a few weeks, the Soviets began their late-summer offensive in the south, which they followed up with a winter offensive that drove German forces out of the eastern Ukraine and trapped German troops on the Crimea. As the spring mud in 1944 brought the usual pause in operations, the German lines stretched from near Leningrad in the north, and along the southern edge of Army Group Center, the lines curved inward. The Soviets achieved a great tactical surprise, as they fooled the Germans into expecting a summer attack against positions in the Ukraine. The Soviets then repositioned their tanks and artillery and prepared for a massive offensive against Army Group Center in Operation BAGRATION, which would coincide with the Allied invasion of France.

On July 20, 1944, the Soviets struck, and within weeks, they had largely destroyed Army Group Center. The Soviets followed this up with attacks to end the siege of Leningrad and to expel German troops from all Soviet

territory. Pausing in the center before Warsaw—which allowed the Germans to destroy the Polish underground army that had joined the fighting—Soviet forces moved into the Balkans as Romania and Bulgaria desperately sought to avoid Soviet vengeance.

The end was drawing near, and the Soviets continued to advance. One axis aimed at Berlin, while the other struck through Hungary. By January 1945, the Soviets had secured most of East Prussia, and in the south, they were at the gates of Budapest. In April, they brought up supplies and reserve troops for the final drive into Germany proper. The Germans conducted a desperate defense of Berlin, using old men and young boys, and the Soviets took huge casualties as Marshal Georgii Zhukov and Colonel General Ivan Konev fought for the honor of liberating the city. On April 25, Soviet and American troops met at Torgau on the Elbe, and several days later, Soviet forces occupied Berlin while Hitler committed suicide in his underground bunker.

Finally, on May 7, 1945, Germany signed a surrender document that went into effect on all fronts the next day. The Eastern Front had absorbed the lion's share of German military resources from 1941 onward, and the Soviet ability to stave off defeat and then achieve victory there was critical to the war's outcome.

Eastern Solomons, Battle of the (August 22–25, 1942)

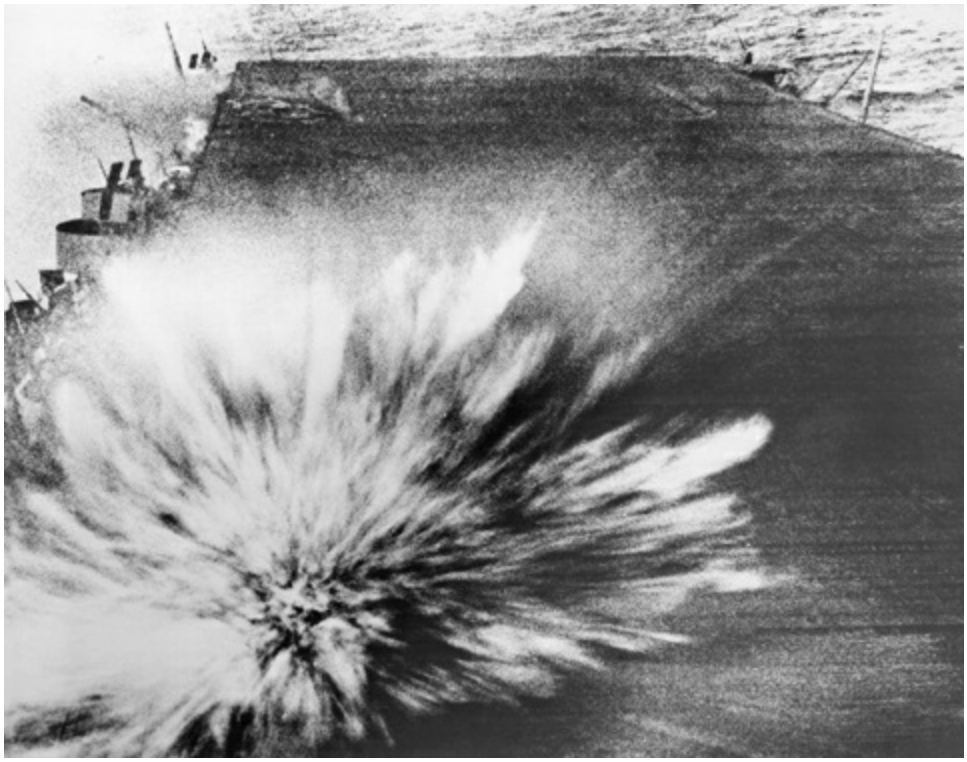
Naval battle fought off Guadalcanal. Henderson Field, captured by U.S. marines following their surprise landing on Guadalcanal on August 7, 1942, was the only U.S. air base in the Solomon Islands chain. The Japanese were determined to retake the field, and they subjected the U.S. marines there to ground attacks and to frequent night bombardment from destroyers offshore. Japanese admiral Yamamoto Isoroku devised Operation KA, a plan to land reinforcements on Guadalcanal and at the same time eliminate the defending U.S. carriers. As in the Battle of Midway (June 3–6, 1942), however, Japanese forces failed to concentrate on a single objective.

On August 19, the Japanese launched a major ground attack against Henderson Field but failed to take it. The next day, a convoy from Rabaul with 1,500 reinforcements sailed for Guadalcanal, escorted by the light cruiser *Jintsu* and six destroyers, all commanded by Rear Admiral Tanaka Raizo. To provide air cover for the landing, Yamamoto ordered Admiral Kondō Nobutake to steam from Truk with a task force centered on the fleet carriers *Shōkaku* and *Zuikaku* and the light carrier *Ryūjō.* Also on August 20, the marines at Henderson Field received 31 aircraft from the escort carrier *Long Island.*

Although Japan had changed its codes after Midway, its radio traffic indicated that something was in the offing, and on August 21 Admiral Chester Nimitz, commander of U.S. forces in the Pacific, ordered Vice Admiral Frank Fletcher, commanding the *Wasp, Saratoga,* and *Enterprise* carrier task forces, to oppose the Japanese operation. On August 22, U.S. patrol bomber (PBY) Catalina aircraft spotted Japanese submarines, prompting an air strike from the *Saratoga,* which, however, failed to locate the Japanese fleet. The following day, Nimitz received faulty intelligence indicating that the Japanese attack force remained at Truk, and Fletcher released the *Wasp* to refuel.

On August 24, a PBY spotted the *Ryūjō,* and Scout Bomber Douglas (SBD) dive-bombers from the *Enterprise* reported 15 Zeros and 6 Kate torpedo planes from the carrier headed toward Guadalcanal. The *Saratoga* then launched a strike on the *Ryūjō.* The SBDs located the carrier and scored three hits, setting it on fire. During the attack, a PBY located the main

Japanese task force, centered on the aircraft carriers *Shōkaku* and *Zuikaku* under Vice Admiral Nagumo Chūichi.



The explosion of a Japanese bomb striking the flight deck of the U.S. Navy aircraft carrier *Enterprise* during the Battle of the Eastern Solomons, August 24, 1942. The photographer was killed while taking this picture. (Underwood Archives/Getty Images)

Fletcher then ordered the planes attacking the *Ryūjō* to strike instead the larger Japanese carriers, but this message never reached the attacking aircraft, which went on to sink the *Ryūjō.* They also badly damaged the Japanese heavy cruiser *Tone*, a specially modified aircraft cruiser armed with eight 8-inch guns and carrying eight seaplanes.

Meanwhile, U.S. radar revealed the incoming strike of aircraft from the *Shōkaku* and *Zuikaku* heading toward the U.S. carriers. The *Enterprise* and *Saratoga* were operating independently, and the Japanese first located the *Enterprise*, which launched its Grumman F-4 Wildcat fighters in defense. Soon, 30 Japanese Val dive-bombers began attacks on the *Enterprise.* Their bombs pierced its flight deck in three places, seriously damaging it. Fires soon raged belowdecks as the crew of the *Enterprise* fought valiantly to save their ship. The *Saratoga* escaped, in part thanks to highly effective antiaircraft fire provided by the battleship *North Carolina.*

On August 25, Tanaka's convoy bound for Guadalcanal came under attack by U.S. Boeing B-17 Flying Fortress bombers from Espiritu Santo and aircraft from Henderson Field. U.S. dive-bombers scored two hits on one of the transports, which later sank. For the first time in the campaign, the B-17s also scored a hit on a Japanese escorting destroyer and sank it. The convoy, far from its objective and vulnerable, now returned to Rabaul.

The Battle of the Eastern Solomons was a U.S. victory, securing, for the time being, the U.S. position on Guadalcanal. Japan lost one light carrier, one destroyer, and one transport along with 75 aircraft; the United States lost 25 planes. The *Enterprise* returned to Pearl Harbor and was repaired within a month. Fletcher was slightly wounded, and Nimitz selected Vice Admiral William Halsey to replace him.

One of the great what-ifs of the Pacific war involves Yamamoto's decision not to commit the giant battleship *Yamato* off Guadalcanal. It was available, and its guns might have made a difference in the fight for Henderson Field, but Yamamoto was unwilling to risk such a powerful national symbol.

Eben Emael, German Capture of (May 10–11, 1940)

Belgian frontier fort and site of a German special operation to seize the Belgian frontier defenses at the opening of Germany's campaign in the west on May 10, 1940. FALL GELB (CASE YELLOW) involved three army groups poised to split the British, Belgian, and French forces and gain the English Channel coastline for continuing operations against Great Britain.

Eben Emael was a reinforced concrete-and-steel bunker system located on the Albert Canal at its junction with the Meuse River north of Liège, Belgium, and about three miles south of Maastricht in the Netherlands. The fort's plateau top was wedge-shaped, 1,100 yards long on its north-south axis and 800 yards across the southern baseline. The entrance was at the southwest corner at Casemate Number 3. The fort guarded the bridges over the canal and the routes to the interior of the Low Countries and France beyond.

At the time of the attack on May 10, about 700 soldiers manned the fortress bunkers, which were designed for a detachment of 1,200. Belgian regular army officer Major Jean Fritz Lucien Jottrand was in command. The garrison of Fort Eben Emael had been alerted to activity across the German border shortly after midnight on May 9–10, but it took several hours to put things in order. Alerts were common, and the troops were quartered in villages near the fort.

The Germans, already skilled in assault tactics from their World War I experiences, had developed special teams to reduce fortifications. The secret operation against the fort, code-named GRANITE, had Adolf Hitler's personal interest. Captain Walter Koch, an officer in Major General Kurt Student's airborne forces, was chosen to lead the attack. Artillery preparations cratered the ground around the fort to provide cover for the advancing German troops, and they suppressed the fire of the fort's guns.

The glider attack was to occur at the same time as other events on the ground, but flight problems required the Junkers Ju-52 tow planes to penetrate Dutch airspace to get to the required release altitude. The Dutch were alerted and commenced antiaircraft fire.

On the early morning of May 10, 10 DFS-230 gliders, each carrying a squad of seven or eight men, landed silently on top of the fort. Lieutenant Rudolf Witzig's command glider had prematurely disconnected and landed in a field near Köln (Cologne). Sergeant Helmut Wenzel took charge, until Witzig's arrival at 6:30 a.m.

The assault force used shaped-charge explosives to penetrate the casemates and cupolas. Throughout the afternoon and night of May 10, the Germans and Belgians fought inside the dank passageways of the fort. Rubber assault boats and the employment of flamethrowers helped the attack group cross the canal and close on the fort. While the engineers of the assault detachment kept the bunker garrison occupied, Koch's other airborne forces attacked the bridges over the Albert Canal.

The next day, a German division arrived to complete the capture of the remaining bridges and forts. Witzig's assault force suffered only 26 casualties in the mission. After resisting for just more than one day, Jottrand and his captured Belgian soldiers were marched off to a prison camp in Germany to sit out the war. Vital bridges at Veldwezelt and Vroenhoven were also secured, and the German Sixth Army was able to advance. Its tanks took Liège the next day.

Eberstadt, Ferdinand (1890–1969)

Wall Street financier, U.S. mobilization official, and influential adviser to several U.S. presidents. Born in New York City on June 19, 1890, Ferdinand

Eberstadt graduated from Princeton University in 1913 and served in the U.S. armed forces during World War I. In 1923 he began what would become a legendary career in investment banking by joining Wall Street's most prestigious investment firm, Dillon, Read & Company. In 1929 Eberstadt served as assistant to Owen D. Young on the War Reparations Committee that convened in Paris. Eberstadt continued his investment work during the Great Depression, garnering acclaim for his attempts to keep smaller businesses afloat. He is credited with establishing one of the first successful Wall Street investment funds, the precursor to today's popular mutual funds. During his many years on Wall Street, Eberstadt came to know future high-level government officials such as Paul Nitze and James V. Forrestal. Eberstadt remained a close and lifelong friend of Forrestal.

An uncanny problem solver, Eberstadt joined the World War II mobilization effort in September 1942 at the request of Donald M. Nelson, chairman of the War Production Board (WPB). Eberstadt held the dual—and critically important—positions of chairman of the Army and Navy Munitions Board and vice chairman of the WPB. He excelled in these positions and devised the Controlled Materials Plan (CMP), a successful and ingenious scheme whereby military production could be prioritized according to need and then synchronized with private industry. This was achieved by carefully controlling and allocating according to need the three most important raw materials for military production: steel, copper, and aluminum. The result was a boom in military production that many observers of the day claimed had shortened the war by many months.

The CMP was announced in November 1942 and implemented on July 1, 1943. It was so successful that the Harry S. Truman administration resurrected it in 1951 for the Korean War mobilization program. In spite of Eberstadt's organizational successes, some mobilization officials, including Nelson himself, came to believe that Eberstadt had become too close to military planners, thus endangering civilian control of the economy.

As World War II drew to a close, Forrestal, at the time secretary of the navy, urged Eberstadt to draft a memorandum for the president that outlined the many deficiencies in U.S. intelligence and military operations. Eberstadt correctly understood that the lack of a centralized intelligence agency was a significant detriment to U.S. defensive capabilities. Thus, he proposed a single agency to coordinate military intelligence with domestic intelligence

and State Department directives. He also suggested that the military services be better coordinated and supervised. The resulting 1945 report provided the framework for the 1947 National Security Act, which incorporated many of Eberstadt's suggestions, including the establishment of the Central Intelligence Agency.

In 1946 Eberstadt served as Bernard Baruch's assistant on the United Nations Atomic Energy Commission, and in 1948 he authored another influential report on the deficiencies of the National Security Resources Board, an arm of the National Security Council. Eberstadt's recommendations fostered revisions to the agency within months. That same year, he became chairman of the Commission on National Security Organization, part of the Hoover Commission. Thereafter, Eberstadt continued to work on an ad hoc basis for subsequent administrations and remained one of the nation's most respected financiers. Eberstadt died in Washington, D.C. on November 11, 1969.

Eden, Sir Robert Anthony (1897–1977)

British politician and foreign secretary who served as a cabinet minister during World War II. Born in Windlestone, England, on June 12, 1897, Anthony Robert Eden served in France during World War I as a brigade major. He then took a degree in Oriental languages at Cambridge University. He entered Parliament in 1924 and became Stanley Baldwin's foreign secretary at age 38, in December 1935. A staunch supporter of the League of

Nations, Eden resigned in February 1938 in disagreement over Neville Chamberlain's appeasement of Italian dictator Benito Mussolini.

With the outbreak of war, Eden returned to Chamberlain's cabinet as Dominions secretary (September 3, 1939) and helped to develop the Empire Air Training Scheme that trained thousands of pilots and aircrew in Canada and Africa. When Winston L. S. Churchill became prime minister, he named Eden war minister (May 10, 1940); shortly thereafter came the disastrous British Expeditionary Force (BEF) and its Dunkerque evacuation as well as British setbacks in the Middle East.

Eden again became foreign secretary (on December 23, 1940) and attended virtually all the Allied wartime conferences. Patient and urbane, he was a superior diplomat who effectively represented British interests to the other Allies—especially the often difficult Charles de Gaulle, whose Free French cause Eden often defended. Churchill appointed Eden leader of the House of Commons in November 1942, a role he played well but at a cost to his health. Churchill also named Eden, by now part of his inner circle, his successor in the event of his death. Eden worked hard on the formation of the United Nations, and he left office only when the Labour Party won the British elections (July 27, 1945). He retained his seat in the House of Commons, though.

Eden served a third time as foreign secretary in Churchill's second government (1951–1955) but never fully recovered from abdominal surgery in 1953. He was knighted in 1954 and, on Churchill's retirement, served as prime minister (April 6, 1955–January 9, 1957), resigning after the mishandled 1956 Suez Crisis. Eden was made Earl of Avon in 1961 and died on January 14, 1977, in Alvediston, England.

Egypt

Strategically located in Northeast Africa, Egypt had a 1939 population of some 16 million people. Encompassing 387,048 square miles, Egypt borders the Mediterranean Sea to the north, the Red Sea to the east, Libya to the west, and Sudan to the south. Egypt was vital to the British effort in World War II to protect the Suez Canal and lines of communication to Middle East oil fields.

The British had taken control of Egypt in 1882 to secure the Suez Canal. Supposedly, they had intervened to "restore order," but the British stayed. London ended its protectorate in 1922 and granted Egypt independence as a constitutional monarchy with adult male suffrage, but it did not relinquish authority in key areas. Great Britain retained control over defense, imperial communications (the Suez Canal), protection of foreign interests and minorities, and the Sudan. In August 1936, the same year King Farouk came to the throne, Britain signed a treaty with Egypt whereby it retained the right to defend the Suez Canal until the Egyptian Army could do so. The Egyptian government also agreed that in the event of war, it would grant the British full use of Egyptian facilities.

Throughout World War II, Port Said and Alexandria remained major British bases for operations in the eastern Mediterranean. As headquarters of the Middle East Supply Center, the Egyptian capital of Cairo was the transit point for half a million British and Commonwealth troops. Cairo was also the headquarters of the Middle East Command, and the city remained a haven for agents and spies. Egyptian nationalists were active, with many Egyptians, including Farouk and Prime Minister Ali Mahir, hoping for an Axis military victory in the war and full independence for Egypt.

Although Farouk was the constitutional monarch, British ambassador Miles Lampson exercised real power. At the beginning of the war, the British insisted on the imposition of martial law, strict censorship, and the arrest of German nationals. The Egyptian government ended diplomatic relations with

Germany, but Egypt did not declare war against Germany or, later, Italy. Only reluctantly did Ali Mahir allow the confiscation of Italian property in Egypt. He also refused permission for border guards to fire on Italian troops. In June 1940, the British insisted that Farouk replace Ali Mahir. His replacement was Hasan Sabri, a moderate.

On September 17, 1940, Italian forces invaded Egypt. Despite a pledge that it would declare war if this happened, the Egyptian government merely declared a state of nonbelligerency. In November 1940, Prime Minister Sabri died and was replaced by Husayn Sirry, who headed a coalition government. Axis air attacks on Cairo in June 1941 killed some 600 people, but Egyptian sentiment remained heavily anti-British. That winter, conditions in Egypt worsened with severe shortages of many goods, including food. Bread riots occurred in Cairo in January 1942. With German general Erwin Rommel's forces closing on Cairo, nationalist demonstrations in favor of an Axis victory occurred in the capital, and Sirry resigned in early February.

The British then insisted that Farouk appoint as prime minister Mustafa Nahas, the pro-British head of the Wafd nationalist party. When Farouk hesitated, British armored cars and troops surrounded the palace, and Lampson demanded his abdication. Farouk acquiesced, and Nahas formed a government.

Throughout 1942, pro-Axis sentiment remained strong, even among the elites and the Egyptian Army. Following the October 23–November 4, 1942, Battle of El Alamein, both the Axis threat to Egypt and British authority subsided. Despite Farouk's repeated efforts to remove him from office, Nahas remained as prime minister until October 1944, when the British allowed Farouk to replace him with Saadist leader Ahmad Mahir. The new prime minister secured Egyptian declarations of war against Germany and Japan, but he was assassinated shortly thereafter, in February 1945. The declarations of war were formally proclaimed on February 26, 1945, allowing Egypt to become a founding member of the United Nations.

As elsewhere in Africa and the Middle East, World War II heightened nationalism and anticolonialism in Egypt. Following Farouk's abdication in 1952, the last British troops departed the country in 1954. Egypt did not gain its full sovereignty, however, until 1956 and the Suez Crisis debacle.

Eichelberger, Robert Lawrence (1886–1961)

U.S. Army general. Born on March 9, 1886, in Urbana, Ohio, Robert Lawrence Eichelberger attended Ohio State University for two years before attending the U.S. Military Academy at West Point, graduating in 1909. He served in a variety of assignments before becoming assistant chief of staff of the Siberian Expeditionary Force (1918–1919), where he was promoted to temporary lieutenant colonel.

Eichelberger served in the Philippines and in China and then on the War Department General Staff (1921–1924). He graduated from the Command and General Staff School (1926) and the Army War College (1930). Eichelberger then served at West Point (1931–1935), where he was promoted to permanent lieutenant colonel (1934). He became secretary to the General Staff (1935–1938), and after promotion to colonel (1938), he commanded the 30th Infantry Regiment. Promoted to brigadier general in 1940, he was appointed superintendent of West Point.

Lieutenant General Robert Eichelberger, one of the more capable U.S. Army commanders in the Pacific Theater in World War II. He is shown here as a brigadier general. (Library of Congress)

In March 1942, Eichelberger became a temporary major general and took command of the 77th Infantry Division. He commanded XI Corps and then I Corps, in Australia, and then led I Corps in New Guinea in September 1942. Promoted to temporary lieutenant general the next month, he directed the successful assault of Buna-Gona (November 16, 1942–January 22, 1943) and then operations in New Guinea and New Britain (January 1943–July 1944).

Eichelberger assumed command of the Eighth Army in September 1944 and led it to Leyte Island in the Philippines that December. He directed operations on Luzon (January–April 1945), including the liberation of Manila, and his forces also liberated the southern Philippine Islands, including Mindanao. He assumed command of all Philippine operations in July. His Eighth Army carried out 14 major and 24 smaller landings.

Between 1945 and 1948, Eichelberger commanded the Eighth Army in Japan. He returned to the United States in September 1948 and retired from the army. Two years later, he published a book titled *Our Jungle Road to Tokyo*. During the 1950–1953 Korean War, he was briefly a special adviser in the Far East. Eichelberger was promoted to full general on the retired list in July 1954 and died in Asheville, North Carolina, on September 26, 1961.

Eichmann, Karl Adolf (1906–1962)

German Schutzstaffel (SS) Obersturmbannführer and major figure in the destruction of European Jewry during World War II. Born on March 19, 1906, in Solingen in the Rhineland, Germany, Karl Adolf Eichmann moved with his family to Linz, Austria, in 1914. He left the Linz Higher Institute for Electro-Technical Studies after two years and became a salesman. In 1932, he joined the Austrian National Socialist movement but fled to Germany in 1934 when it was outlawed. Sent to Berlin, he joined the SS Sicherheitsdienst (Security Service) and was assigned to its Jewish Office. There, he became the Nazi expert on Jewish affairs and handled negotiations concerning the immigration of German Jews to Palestine, which he visited briefly in 1937. Following the Anschluss (union) with Austria and the absorption of Bohemia and Moravia, he headed the Office for Jewish Emigration.

With the beginning of World War II in 1939, Eichmann transferred to the Gestapo (secret police) and created the Reichzentralstelle für Jüdische Auswanderung (Reich Central Office for Jewish Emigration) to handle the

relocation of European Jews to Poland. That office was then combined with the Jewish Affairs Office to form Department IV-A-4B, known as the Dienststelle Eichmann (Department Eichmann). He helped organize the Wannsee Conference of January 1942 that coordinated the mechanics of the "Final Solution" and was put in charge of the transportation of Jews to the death camps of Poland. Eichmann later told an associate that he would "die happily with the certainty of having killed almost six million Jews."

After the war, Eichmann lived in various places under aliases until he escaped to Argentina, where he lived and worked near Buenos Aires under the name Ricardo Klement. On May 11, 1960, the Israeli Mossad captured him and smuggled him from the country illegally to stand trial in Israel. Eichmann claimed that he was only following orders and in any case could be accused only "of aiding and abetting" the annihilation of the Jews, not killing them. Found guilty by an Israeli court on December 15, 1961, he was sentenced to death. Unrepentant, he was hanged at Ramleh Prison on May 31, 1962. His body was cremated, and the ashes were scattered.

Eicke, Theodor (1892–1943)

German Waffen-SS general. Born in Hampont in Alsace (then in Germany) on October 17, 1892, Theodor Eicke served in World War I as a paymaster. After the war, he joined the border police and served in the Freikorps before entering the police force in Thuringia in 1920. Active in right-wing politics, Eicke joined the National Socialist Party in December 1928. He initially

achieved prominence in Adolf Hitler's Third Reich as a member of the Schutzstaffel (SS), serving as commandant of the Dachau concentration camp in 1933 and 1934 and as inspector of concentration camps and leader of SS guards formations between 1934 and 1939. Eicke played a leading role in the Blood Purge of the party, when he and a subordinate shot to death storm troop (Sturmabteilungen) leader Ernst Röhm on July 1, 1934.

Eicke set ruthless standards in the concentration camps, warning guards that they would be punished for showing any compassion for the inmates. He centralized SS control of all concentration camps, established uniform regulations for the treatment of inmates, and organized the elite guard formations known as the Totenkopfverbände (Death's Head units). He also oversaw their expansion into five battalions, which became the Obeybayern, Brandenburg, and Thuringian regiments. With the beginning of World War II, he formed the SS-Totenkopf (Death's Head) unit for service in Poland.

In November 1939, Eicke took command of the 1st SS-Totenkopf Division, a motorized unit and one of three original Waffen-SS (armed SS) divisions. He personally led it in combat in both France and the Soviet Union. Brutal, fanatical, and violently anti-Semitic, Eicke molded the Death's Head Division in his own image, a development that helps explain both its military effectiveness and its perpetration of numerous atrocities. His unit committed the first SS atrocity in France—the May 27, 1940, murder of 100 British prisoners of war at Le Paradis. During the German invasion of the Soviet Union that began on June 22, 1941, his division served with Army Group North. Eicke died when an aircraft in which he was flying was shot down behind Soviet lines in Mikhailovka, Ukraine, on February 26, 1943.

Einsatzgruppen

German special extermination units deployed on the Eastern Front during World War II. In June 1941, the German Army invaded the Soviet Union in Operation BARBAROSSA. Following closely behind the main fighting force were four small units known as Einsatzgruppen (Special Task Forces). Their assignment was the extermination of Jews, communists, Gypsies, and anyone else deemed racially or politically undesirable.

Einsatzgruppen were divided into four units (A, B, C, and D) that were attached to the army groups involved in the invasion (except D, which operated independently of all army groups). Each Einsatzgruppe numbered between 600 and 1,000 men drawn from the Waffen-SS, the Gestapo, the Sicherheitsdienst, and the regular police. Membership was voluntary, and any member could be reassigned if requesting a transfer.

The Einsatzgruppen were established by and subordinate to director of the Reich Main Security Office Reinhard Heydrich. His Commissar Order of July 17, 1941, commanded the Einsatzgruppen to execute any captured communists and to "further treat" all Jews.

The commandos operated by moving into a recently captured area and issuing orders for all Jews or Gypsies to assemble in the main town square early the next morning for resettlement. The victims were then loaded into trucks and transported to an area outside of town that had already been prepared with large trenches. They were then shot, either individually or as a group, and their bodies were buried. Each unit was required to keep an exact record of its activities and report regularly to Heydrich. These "Situation Reports" were captured intact at the end of the war and provide a precise record of Einsatzgruppen activities. According to these documents, almost 1.5 million men, women, and children were executed, the vast majority of them Jews.

The emotional strain on the killers was considerable. Many performed their duties drunk, with liquor freely provided. This convinced Heydrich and Heinrich Himmler, the Reichsführer of the Schutzstaffel (SS), that another way had to be found to solve the "Jewish problem." This led to the

extermination camps of Auschwitz, Treblinka, Chelmno, Sobibor, and Belzec.

Following the war, Einsatzgruppen leaders who could be found were brought to trial. Of 24 defendants, 14 were sentenced to death and 8 to prison. Only 4 individuals, including Otto Ohlendorf, who headed one group and provided compelling testimony regarding the activities of the Einsatzgruppen, were actually executed, on June 7, 1951; the others had their sentences reduced. Four other Einsatzgruppen leaders were later tried and executed by other nations.

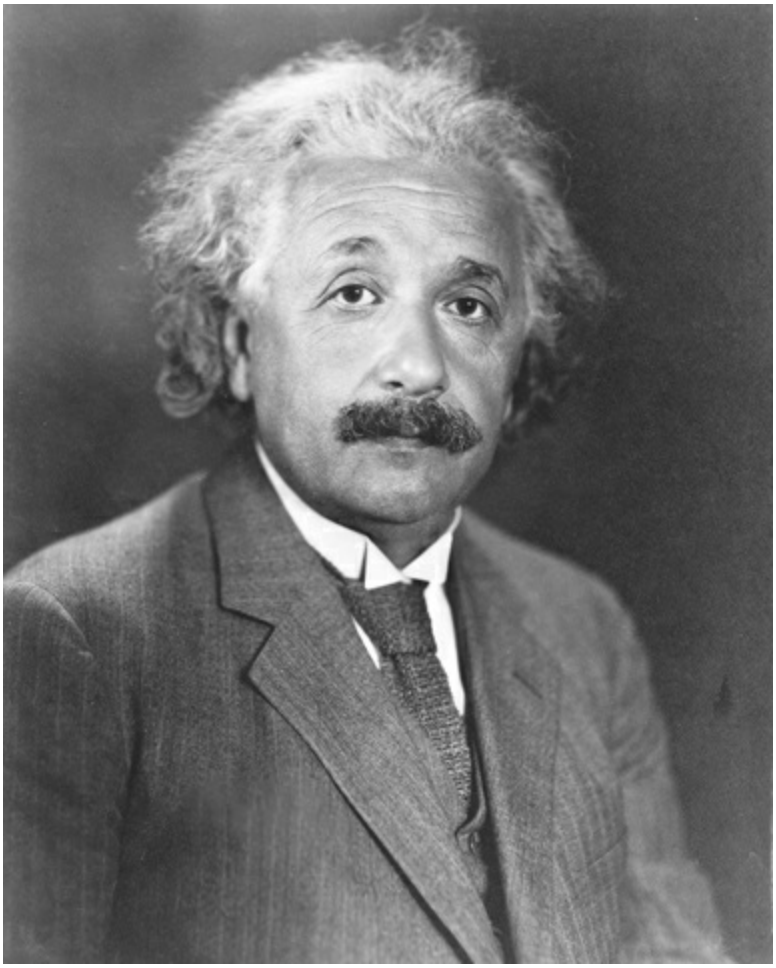
Einstein, Albert (1879–1955)

Physicist, Nobel laureate, and pacifist who urged the United States to begin research into the feasibility of constructing atomic bombs. Born in Ulm, Germany, on March 14, 1879, Albert Einstein renounced German citizenship in 1896 and became a Swiss citizen in 1901. While working as a patent clerk, he developed his special theory of relativity and the famous equation $E = mc^2$ that demonstrated the equivalency of mass and energy. In 1914, he returned to Germany after being appointed director of the Kaiser Wilhelm Institute for Physics and a professor at Humboldt University, Berlin. With the rise of Nazism and Jewish persecution, he left Berlin in 1933 for the Institute of Advanced Study in Princeton, New Jersey.

In 1939, leading physicists, including Hungarian émigrés Leo Szilard and Eugene P. Wigner as well as Italian expatriate Enrico Fermi, concluded that

Germany was working on an atomic bomb. Szilard approached Einstein with a letter for President Franklin D. Roosevelt, urging that the U.S. government begin an atomic bomb project of its own to deter Adolf Hitler (assuming German efforts succeeded).



Albert Einstein was one of the most renowned scientists of the twentieth century. Convinced of the viability of an atomic bomb, he urged President Franklin Roosevelt to have the United States take the lead in its development. (Library of Congress)

Einstein was apotheosized as perhaps the world's greatest physicist since Isaac Newton, and his signature on this letter carried considerable weight. Dated August 2, 1939, the letter warned that it was now likely that scientists would establish and sustain a chain reaction in uranium, which could lead to the construction of "extremely powerful bombs of a new type." Einstein urged the president to form a partnership among government officials, industry specialists, and scientists to conduct feasibility studies; he also recommended securing supplies of uranium ore.

Alexander Sachs, economist and presidential confidant, delivered the letter on October 11, 1939. Sufficiently alarmed by Sachs's précis of its contents, Roosevelt appointed the Uranium Committee to begin preliminary

studies, which became the basis for the Manhattan Project organized in 1942 to build atomic bombs.

Einstein's letter served as the catalyst for the Manhattan Project, but Einstein himself was excluded from the project. His pacifism, his Zionism, and a supposedly lackadaisical attitude regarding military secrecy made him suspect to army intelligence. After the war, he campaigned unsuccessfully for a "world government" consisting of the United States, Great Britain, and the Soviet Union that would restrict further development and construction of atomic weapons. Einstein died in Princeton, New Jersey, on April 18, 1955.

Eisenhower, Dwight David (1890–1969)

U.S. Army general and supreme commander, Allied Expeditionary Force, European theater of operations, and later president of the United States. Born in Denison, Texas, on October 14, 1890, Dwight David "Ike" Eisenhower grew up in Abilene, Kansas. Graduating from the U.S. Military Academy at West Point in 1915 as a member of the "class the stars fell on," he was commissioned a second lieutenant of infantry. His first posting was Fort Sam Houston, Texas.

Eisenhower commanded the fledgling tank corps training center at Camp Colt outside Gettysburg, Pennsylvania, during World War I. Following service in Panama, he graduated first in his class at the Command and General Staff School, Fort Leavenworth, Kansas, in 1926. He also graduated from the Army War College in 1928. During the interwar period, Eisenhower

served under a number of the army's finest officers, including Generals Fox Conner, John J. Pershing, and Douglas A. MacArthur. Following his return from the Philippines in 1939, Eisenhower served successively as chief of staff of the 3rd Infantry Division, IX Corps, and the Third Army, where he was promoted to temporary brigadier general in October 1941 and captured U.S. Army chief of staff General George C. Marshall's attention for his contributions to the Third Army's "victory" in the Texas-Louisiana war maneuvers of 1941.

Assigned to the War Department in the aftermath of the December 7, 1941, Japanese attack on Pearl Harbor, Eisenhower headed the War Plans Division and then the Operations Division of the General Staff before being promoted to major general in April 1942. Marshall then appointed Eisenhower commanding general of the European theater of operations in June 1942. Promotion to lieutenant general followed in July 1942. His appointment was met with great skepticism from senior British military officers because of his lack of both combat and command experience.

Eisenhower commanded Allied forces in Operation TORCH (the invasion of Northwest Africa) in November 8, 1942, and in Operation HUSKY (the invasion of Sicily) during July 9–August 22, 1943. In the interim, he was promoted to full general in February 1943. The efficient operation of his headquarters—Allied Forces Headquarters—became a model of Allied harmony and led to increased responsibilities in the Mediterranean theater of operations. In September 1943, his forces invaded the Italian mainland.

Eisenhower's generalship during this phase of the war has long been the subject of controversy, but his adept management of diverse personalities and his emphasis on Allied harmony led to his appointment as supreme commander, Allied Expeditionary Force, for the invasion of Northwestern Europe.

As commander of Operation OVERLORD, the Normandy Invasion of June 6, 1944, Eisenhower headed the largest Allied force in history. Following the expansion of the lodgment area, he took direct command of the land battle on September 1, 1944. As the Allied forces advanced along a broad front toward the German border, he frequently encountered opposition from senior Allied generals over command arrangements and logistical support. He displayed increasing brilliance as a coalition commander, but his operational decisions remained controversial. His support of British field marshal Bernard L.

Montgomery's abortive Operation MARKET-GARDEN (September 17–26, 1944) is evidence of Eisenhower's unflinching emphasis on Allied harmony in the campaign in Northwestern Europe. In mid-December 1944, Eisenhower was promoted to general of the army as his forces stood poised to strike into the heartland of Germany.

When Adolf Hitler launched the Battle of the Bulge (Ardennes Offensive) on December 16, 1944, it was Eisenhower, among senior Allied commanders, who first recognized the scope and intensity of Germany's attack and also the key vulnerability in the German scheme of maneuver. Marshaling forces to stem the German advance, he defeated Hitler's last offensive in the west. By March 1945, Eisenhower's armies had crossed the Rhine River and encircled the Ruhr industrial area of Germany. As Soviet armies stood on the outskirts of Berlin, Eisenhower decided to seek the destruction of Germany's armed forces throughout southern Germany and not to launch a direct attack toward the German capital. On May 7, 1945, the mission of the Allied Expeditionary Force was fulfilled as he accepted the unconditional surrender of Germany's armed forces.

Following the war, Eisenhower succeeded General Marshall as chief of staff of the U.S. Army. In February 1948, Eisenhower retired from the military and assumed the presidency of Columbia University before being recalled to active duty by President Harry S. Truman in 1950 to become the first supreme Allied commander, Europe (SACEUR), in the newly formed North Atlantic Treaty Organization (NATO). In 1952, Eisenhower resigned from active military service and accepted the Republican Party's nomination for president.

Elected by a wide majority in 1952 and again in 1956, Eisenhower stressed fiscal restraint and nuclear over conventional forces, supported expanded U.S. military commitments overseas so long as they did not involve unilateral commitment of American forces, and warned of the dangers of a military-industrial complex. He left office in 1961 as one of this nation's most popular chief executives. His two administrations were marked by peace, although the U.S. economy suffered three recessions in less than eight years. After Eisenhower left the White House, his successor, John F. Kennedy, restored him to the Army List as a five-star general. In 1961, Eisenhower retired to his farm in Gettysburg, Pennsylvania. He died in Washington, D.C., on March 28, 1969.

El Alamein, Battle of (October 23–November 4, 1942)

Major Allied victory against German and Italian forces in Egypt. By the fall of 1942, there were signs that the war in North Africa was turning in favor of the British. Axis forces under Field Marshal Erwin Rommel had failed to break through the British lines at Ruwiesat Ridge in July and at Alam Halfa Ridge in September. British Eighth Army commander Lieutenant General Bernard Montgomery gradually built up his forces' strength to strike an offensive blow. Although Prime Minister Winston L. S. Churchill repeatedly pressed for an earlier attack, Montgomery set the operation, code-named LIGHTFOOT, to begin on the night of October 23–24 under a full moon. General Sir Alan Brooke, chief of the Imperial General Staff, and General Harold Alexander, British commander in chief in North Africa, managed to placate Churchill.

By late October, Montgomery's Eighth Army numbered 195,000 men and had 1,029 tanks (including 300 U.S.-built M-4 Sherman mediums), 2,311 artillery pieces, and some 750 aircraft. Ranged against them were 104,000 Axis troops (50,000 Germans and 54,000 Italians), 489 tanks, 1,219 guns, and 675 aircraft. The Germans had, however, faced worse odds and won in North Africa. The Axis defense was based on some 450,000 mines laid from the sea to the Qattara Depression, including corridors designed to funnel attackers into traps, although Rommel had no confidence that he could hold against a determined British attack.

Montgomery planned to feint an attack to the south while Lieutenant General Sir Oliver Leese's XXX Corps delivered the major blow in the north against the strength of the Axis positions. The elaborate British deception efforts convinced Axis intelligence that the main blow would occur in the south.

Montgomery planned to use armor to blast his way through the German positions and then carry out an envelopment of Axis forces. His own armor commanders, particularly Lieutenant General Herbert Lumsden of X Corps, thought that this was a misuse of tanks. Montgomery adapted his plan so the armor would cover an initial infantry attack and then seize defensive ground. The infantry would "crumble" the German line, and when panzers moved forward to assist, the British armor would strike.

The attack commenced at 9:40 p.m. on October 23, 1942, almost totally surprising the Germans. (Rommel was in Germany at the time, recuperating from an illness.) British air attacks and artillery fire from 1,000 guns disrupted Axis communications and rained down on a six-mile front in the Axis lines near the Mediterranean coast. Then XXX Corps began its attack in the north, while Lieutenant General Sir Brian Horrocks's XXX Corps began the southern attack near the Qattara Depression to fix German forces there.

XXX Corps opened two corridors through the Axis minefields, and Lumsden's X Armoured Corps then moved through them. Italian forces holding this sector fought well, however, and the 15th Panzer Division's counterattack almost halted the British advance. Montgomery found that reports of progress had been overly optimistic. The commanders of his armored divisions feared that crossing the key Miteiriya Ridge would expose their tanks to the deadly fire of German 88mm antitank guns, and they had not moved. The Germans were busy extending and reinforcing their

minefields. An angry Montgomery now halted the southern thrust and concentrated his resources in the north. He also stated that he would relieve commanders who failed to advance.

Progress resulted, and by late afternoon on October 24 the 1st Armoured Division reported one of its brigades on and around Kidney Hill, part of Miteiriya Ridge. Once again, however, reports were overly optimistic, and the 7th Armoured Division bogged down entirely at Himeirat.

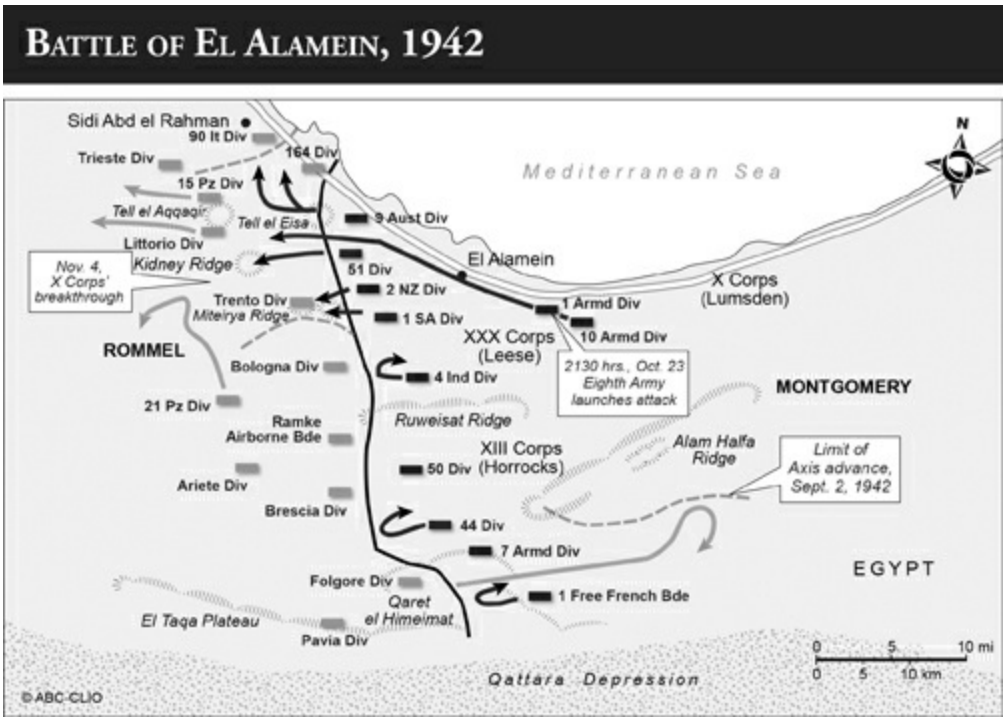
Montgomery was awakened at 2:00 a.m. on October 25 with the bad news and quickly saw that his whole plan was threatened. With British forces holding only part of Kidney Hill to the north and making no progress at Hineimat in the south, the Germans would have little reason to launch counterattacks, and thus the British armor would have no chance to destroy the panzers. Montgomery's infantry, although more successful than the armor, was also taking heavy casualties, and only his Australian division had replacements. Montgomery began to revise his plan again—the first of several changes made over the next few days. Ultimate success came, in part, from his flexibility during the battle.

The first effort was on the British far right at midnight on October 25, but although the Australian infantry did well, the 1st Armoured Division again failed to move beyond Kidney Hill. This time, the problems were map reading and failure to coordinate with the artillery. Thus far Rommel, who had returned earlier on October 25, continued to hold his ground, which was what Montgomery wanted. Then because of casualties, Montgomery shifted the offensive burden to Lumsden's X Armoured Corps, which was to move west and northwest from Kidney Hill. Not completely trusting Lumsden, Montgomery stayed in close touch with the operation and found that his corps commander was not keeping his artillery commander informed of plans and operations. Not wishing to risk his armor by leaving it unsupported, Montgomery again changed plans.

His new approach was to create an armored reserve to use for a decisive thrust, although the infantry would have to do the initial fighting with even less shield available than previously. At least Montgomery knew from Ultra intercepts that even though Rommel was thinking about breaking off, fuel shortages would not allow the Axis side to seek a battle of movement. Meanwhile, Churchill was more worried about winning a victory over all of Panzerarmee Afrika before the Allied landings in western North Africa

(Operation TORCH). The Vichy French were more likely to stand aside or even cooperate in these attacks if Axis forces in eastern North Africa were on the run. Churchill was thus not pleased to learn that armored units were being withdrawn from the Battle of El Alamein.

As the fighting evolved, the target shifted from the northern coast road, where German troops were being brought in, to the Miteiriya Ridge area, where the attack would hit mostly Italian units. Again, the start was delayed when the armor commanders failed to coordinate plans. The basic idea now called for two regiments of armored cars to drive behind the Axis defenders and envelop them.



Early on November 2, the attack began. Again the infantry did well, quickly gaining 4,000 yards, but the armor failed to advance. Although slow to react because he was convinced that the main attack would come farther north, Rommel organized a full-scale counterattack. This played into the hands of the British, for their armor and antitank weapons could now take defensive positions and destroy the panzers. By the evening of November 2, Rommel had only 35 German and 20 Italian tanks capable of combat.

Montgomery, however, had two armored divisions in reserve and spent November 2 gathering infantry reserves. He used this reserve force to break

out to the southwest. By the evening of November 2, Rommel was planning to fall back—news made available to Montgomery via Ultra intercepts. When Hitler learned of Rommel's plan, however, he ordered his North African forces to fight to the death. Rommel later claimed this order resulted in the destruction of his army, but since it reached him more than half a day after his withdrawal started, it had little effect on the outcome.

In any case, British attacks continued, and Allied air bombardment added a new destructive element. By the afternoon of November 4, the victory was clearly won. The Italian XX Corps had been destroyed, and the Afrika Korps on its left had been shattered. On the afternoon of November 4, Rommel ordered a retreat. Several days later, the Allies landed in western North Africa.

Casualty figures for the Battle of El Alamein vary widely. The British claimed to have inflicted 50,000 casualties, but the actual number is probably closer to 2,300 killed, 5,500 wounded, and 27,900 captured. Rommel had also lost almost all his tanks and artillery. Eighth Army casualties amounted to 4,600 killed and 9,300 wounded. The British also lost 432 tanks destroyed or disabled.

Despite the battle's outcome, historians have been critical of Montgomery for attacking the strength of the Axis line; his subsequent claim that everything had gone according to plan is simply not true. Although Africa was not cleared of Axis forces for another six months, the end was plainly in sight.

Elba, Recapture of (June 17–18, 1944)

Following Italy's surrender to the Allies in September 1943, German forces seized the Italian island of Elba, located between Corsica and the western coast of Italy. The Germans then used the island as a screen for their coastal traffic. Following the recapture of Corsica by Italian and Free French forces in October 1943, the Allies developed Operation BRASSARD, which assigned French forces to take Elba. With the fall of Rome on June 5 and the Allied advance north of the Eternal City, the chief justification for the operation disappeared. Free French leaders were determined to proceed with BRASSARD nonetheless, because it would serve as a useful rehearsal for the subsequent Allied invasion of southern France and would prove the worth of their forces to the Allied cause.

Three days before the planned invasion, French commander General Jean De Lattre de Tassigny received word that no air transport would be available for the French commandos; he decided to proceed nonetheless. British rear admiral Thomas H. Troubridge had charge of the naval forces, which included some 220 vessels, including landing craft. French lieutenant general Henri Martin commanded the land forces. The French attackers included the 9th Colonial Infantry Division, Goumiers (North African troops); the Shock Battalion; and commandos. Some 2,700 German troops under Lieutenant General Franz Gall defended the island.

The invasion began at 1:00 a.m. on June 17, 1944, when French commandos stormed ashore at six different points and swiftly seized the major German shore batteries. The main landing followed in Campo Bay. Although there was some intense fighting, the entire island was in French hands by the evening of June 18. The battle for Elba cost French forces 201 dead, 51 missing, and 635 wounded. The Germans lost several hundred dead and 2,300 prisoners. Although it was of questionable military value, the

operation heightened German fears of another Allied landing in northern Italy.

Electronic Intelligence

The collection and analysis of electromagnetic emissions that provide insight into an enemy's technological capabilities. The broader category of signals intelligence (SIGINT) includes both communications intelligence (COMINT) and electronic intelligence (ELINT). COMINT encompasses the monitoring of radio and telephone traffic, the decryption of coded messages, and the analysis of the contents contained in those messages. ELINT is the collection and analysis of electromagnetic emissions, such as telemetry and radar signals, with the expectation that the successful analysis of ELINT will provide information about enemy technology and lead to the development of effective countermeasures.

During World War II, signals intelligence played an important role in strategic decision making. Its best-known successes were in COMINT and included breaking the Japanese and German codes in Magic and Ultra. The Axis powers also had some success in breaking Allied codes, especially those regarding the Atlantic convoys.

Signals intelligence activities during World War II were not limited to intercepting and reading communications, however. ELINT activities during the war included monitoring radar signals to determine the transmitting power, range, and accuracy of the air defense systems built by both the Allies and the Axis powers. In the Atlantic and Pacific Oceans, Great Britain and

the United States used sophisticated radio receivers to approximate the positions of submarines, merchantmen, and surface warships by means of triangulation (interpreting the strength and point of origin of radio transmissions). As the war progressed, ELINT techniques became more sophisticated. Because of the role played by both COMINT and ELINT in the conflict, World War II has sometimes been referred to as the SIGINT war.

El Guettar, Battle of (March 23–April 7, 1943)

Battle during the Tunisian Campaign pitting U.S. forces against those of Germany and Italy. The U.S. Army II Corps had been badly mauled in its initial encounters with the Afrika Korps, culminating in the Battle of Kasserine Pass (February 19–22, 1943). In the aftermath of this U.S. defeat, on March 6, 1943, Major General George S. Patton Jr. replaced Major General Lloyd Fredendall as commander of II Corps. Patton immediately began reorganizing his new command for an offensive toward the Eastern Dorsal chain of the Atlas Mountains to threaten the right flank of the Axis Mareth Line against the British Eighth Army.

On March 17, against only light opposition from Italian troops in the area, Major General Terry de la Mesa Allen's 1st Infantry Division took the town of Gafsa, while the next day Colonel William O. Darby's 1st Ranger Battalion occupied El Guettar Oasis. The Italians withdrew into the mountain passes, defending access to the coastal plain. On the night of March 20, the

rangers scaled the cliffs and secured one of the key Italian positions, taking 700 prisoners.

German colonel general Hans Jürgen Dieter von Arnim, commander of Army Group Africa, held a low opinion of American fighting abilities and assigned the task of clearing out the U.S. units to the 10th Panzer Division, commanded by Lieutenant General Friedrich Freiherr von Broich. The Germans launched their attack at 6:00 a.m. on March 23. Fifty tanks, followed by tank destroyers and Panzergrenadiers, moved through the pass into the El Guettar Valley, sweeping aside the American frontline positions. However, the Germans were slowed by a minefield. As they paused to clear it, American artillery and antitank guns, including those of 31 M10 tank destroyers, opened up on the German armor, destroying or disabling 30 of the tanks. By 9:00 a.m. the Germans had withdrawn from the valley. Late that afternoon the Germans mounted a second attack, but it too was broken up. Part of the 10th Panzer Division then took up defensive positions in the hills, while the remainder withdrew to Gabès.

Already on March 19, the British Eighth Army had commenced an assault on the Mareth Line. While this attack initially was unsuccessful, on March 26 an Allied flanking attack to the north of the line rendered that line untenable, and the Axis troops withdrew to Wadi Akarit, north of Gabès.

II Corps units, meanwhile, succeeded in securing the remainder of the interior plain, although Axis resistance was pronounced and fighting was heavy. By March 30, however, American forces were in position to launch an offensive. Attacking forces consisted of the 1st and 9th Infantry Divisions and Benson Force, a Combat Command of the 1st Armored Division.

To break free, the Americans first had to seize the Italian strongpoints of Hills 369 and 772. The attack began on the afternoon of March 30 with an assault on Hill 369. After some success, the Americans were driven back. An attempt on March 31 also failed. Patton then shifted the attack to Hill 772. On April 3 the 1st Infantry Division finally took Hill 369, but fighting on Hill 772 continued, the effort slowed by the arrival of elements of the 21st Panzer Division.

On April 6 the Eighth Army broke through the new Axis lines, causing a full retreat. The next day, Benson Force moved through the positions held by the 1st and 9th Infantry Divisions and raced down the road to Gabès, where late that afternoon it linked up with the lead elements of the Eighth Army.

The fighting from March 23 to April 7 had cost the Americans some 4,000–5,000 casualties and 35–55 tanks lost; the Germans and Italians had suffered 4,000–6,000 casualties and 40 or more tanks lost. Although U.S. forces had demonstrated their ability to defend against German armor, they had been less successful in showing effective offensive capabilities.

Ellis, Earl Hancock “Pete” (1880–1923)

U.S. Marine Corps lieutenant colonel who laid the foundations for modern amphibious doctrine. Earl Hancock “Pete” Ellis was born in Iuka, Kansas, on December 19, 1880. He enlisted in the Marine Corps as a private in 1900 and in December 1901 was commissioned a second lieutenant. Ellis served at the naval base at Cavite on Luzon during the Philippine-American War and was posted to the West Indies and to Guam before serving as aide to Marine Corps major general Commandant George Barnett.

Ellis was promoted to first lieutenant in 1903 and to captain in 1908. During 1911–1913 he was first a student and then a faculty member at the Naval War College. Ellis became closely associated with Colonel John A. Lejeune in the Philippines in 1908. Promoted to major in 1916, during World War I Ellis served as a principal staff officer to Brigadier General then Major General Lejeune when the latter commanded first the 4th Marine Brigade and then the U.S. Army's 2nd Division in France. Ellis took part in the Saint-Mihiel and Meuse-Argonne offensives in late 1918. Then a lieutenant colonel, Ellis was awarded the French Croix de Guerre with gold star for exemplary combat service.

Following World War I, Ellis reverted to his permanent rank of major. He served in the Dominican Republic during 1920 with the 4th Marine Brigade and was awarded the Navy Cross.

In the 1920s many, especially army leaders, thought that the Marine Corps was superfluous and wanted it disbanded. But with the belief that Japan and the United States were on a collision course and that defense of the Philippines and war with Japan would necessitate amphibious operations, commandant of the Marine Corps Major General Lejeune saw the future of the corps in such operations and entrusted Major Ellis with the job of translating concepts into concrete plans.

The single-minded Ellis, whose entire life revolved around the corps, immediately plunged into the task, often working on little or no sleep and until physically and mentally exhausted. His work habits, and alcoholism, put him in the hospital with mental breakdowns on more than one occasion.

Because the largest amphibious operation of World War I, the Allied invasion of the Gallipoli Peninsula in Turkey in 1915, had been a failure, many observers concluded that assaults of fortified positions from the sea were over. Ellis disagreed, stressing that the key to winning a Pacific war would be base seizure and defense. War with Japan meant that the marines would have to fight their way back across the Pacific, retaking outpost bases. Ellis believed that the marines should prepare to "execute opposed landings and attacks on denial positions … with the greatest rapidity."

By 1921 Ellis had outlined the problems of conducting assaults in the Marshall and Caroline islands, but he was also confident that with proper training the Marine Corps could storm defended beachheads. Opposed landings could succeed if ship-to-shore movement by assault craft was rapid

and supported by concentrated naval gunfire and airpower. Securing the beach would be the key, and Ellis recommended special teams to remove underwater obstacles before the landing. Assault troops would require high-firepower weapons and also new landing craft or amphibious vehicles armed with machine guns and light artillery. Close-in naval gunfire could help neutralize enemy shore positions.

Ellis disagreed with those who advocated night assaults to minimize casualties. He believed that attacks would have to occur in the daytime to minimize confusion. To be successful the assaults would require careful planning, preparation, and coordination. All this was summed up in his "Operations Plan 712-H: Advanced Base Operations in Micronesia" (1921). It essentially laid the foundations for U.S. Marine Corps amphibious warfare.

Ellis then submitted an undated resignation to the Marine Corps and embarked on a secret map-making, intelligence-gathering mission to Papua New Guinea. While in Papua, he married a Papuan woman. The Japanese subsequently announced that he had died on the Micronesian island of Koror on May 12, 1923. The mysterious circumstances of his death have led some to conclude that he was assassinated on the orders of Japanese officials, but most probably the cause was alcohol-related and may have been cirrhosis of the liver. The Japanese confiscated his maps and papers. Ellis had provided the doctrine. All that was now required by the Marine Corps was the will to implement it, proper training, and new specialized landing craft.

Emilia Plater Independent Women's Battalion (1943–1945)

First Polish all-female combat unit to fight as a cohesive group. Consisting of volunteers forcibly resettled in the Soviet Union and, ironically, named after a leader of an insurrection in 1830 directed against Russia, the Emilia Plater Independent Women's Battalion fought against the Germans. Initially attached to the 1st Tadeusz Ko¥ciuszko Division, the battalion swore the oath of allegiance on July 15, 1943. It was directly subordinated to the Polish I Corps in August 1943 and to the Polish First Army in July 1944. Unlike women's auxiliary units in the West, the battalion lacked special military regulations. Its command personnel were men, and its political officers were women.

In August 1943, the battalion included five companies (two infantry and one each of fusiliers, machine guns, and handheld antitank grenade launchers) and six platoons (mortar, reconnaissance, signals, medical, engineer, and logistics). In late 1943, one transport platoon was added. Because the battalion also provided basic training to women subsequently assigned elsewhere, its strength fluctuated.

Women subsequently trained at the Infantry Officers' School in Ryaza», and they commanded companies and platoons of the new Polish Army because of the drastic shortage of male Polish officers (15,000 had been killed in the Katyn Forest Massacre alone). Among these women was Second Lieutenant Emilia Gierczak, platoon commander of the 10th Infantry Regiment. She distinguished herself in the fighting on the Pomeranian Rampart while leading an assault group in Kołobrzeg (Kolberg).

About 70 women in the battalion died in the war. In May 1945, its strength of roughly 500 women was only a small percentage of the total number of women serving in two Polish armies formed in the Soviet Union, with estimates ranging from 8,500 to 14,000.

Empress Augusta Bay, Battle of (November 2, 1943)

Naval battle between U.S. and Japanese naval forces during the November 1, 1943–August 15, 1945, Bougainville Campaign. On November 1, 1943, Major General Alan Hal Turnage’s 3rd Marine Division, which had been reinforced, landed at Empress Augusta Bay, about halfway up the west coast of Bougainville Island in the northern Solomon Islands. The landing was part of Operation CARTWHEEL, which was designed to neutralize the major Japanese air and naval base at Rabaul, on New Britain Island to the north.

In addition to air attacks from Rabaul, which were thwarted by Allied fighter aircraft, the Japanese dispatched a scratch naval task force to attack the Torokina beachhead on Bougainville. Commanded by Rear Admiral Omori Sentaro, the force consisted of the heavy cruisers *Myoko* and *Haguro,* two light cruisers, six destroyers, and five destroyer transports carrying 1,000 troops to be landed on Bougainville. Rear Admiral Ijuin Matsuji commanded Destroyer Squadron 3, the left flank screen with the light cruiser *Sendai* and three destroyers, and Rear Admiral Osugi Morikazu had the right with Destroyer Squadron 10, the light cruiser *Agano* and three destroyers.

The transports turned back late in the evening on November 1 after Omori concluded that the task force had been sighted by U.S. planes. Omori, however, continued to Bougainville with his other ships in the expectation that he could destroy the Allied transports and cargo vessels in a night battle. Unknown to him, the transports had been quickly unloaded and had left Empress Augusta Bay earlier that day.

Learning of Omori’s task force from U.S. Army reconnaissance aircraft, Rear Admiral A. Stanton Merrill, whose Task Force 39 had been providing bombardment support for the Bougainville landing force, moved to intercept the Japanese about 20 miles north of Empress Augusta Bay. Task Force 39 was centered on Merrill’s Cruiser Division 12, consisting of the light cruisers

Montpelier (flagship), *Cleveland, Columbia*, and *Denver*. Captain Arleigh Burke's Destroyer Division 45 made up the van, and Commander B. L. Austin's Destroyer Division 46 comprised the rear. Merrill hoped to engage the Japanese ships at long range to avoid a torpedo attack while making use of his radar-controlled 6-inch guns.

The two task forces encountered each other at 2:27 a.m. on November 2 and fought a complicated battle that was really three engagements in one: Merrill's cruisers against Omori's cruisers and individual battles waged, respectively, by the two destroyer divisions. Although the Japanese were superior in gunfire and torpedoes and although Omori thought he had inflicted serious losses on the Americans, he broke off the battle after an hour, at 3:27 a.m.

Merrill's cruisers sank the Japanese light cruiser *Sendai,* and Destroyer Division 46 sank the Japanese destroyer *Hatsukaze,* which already had been badly damaged in a collision with the cruiser *Myoko,* Omori's flagship. Task Force 39 suffered damage to six ships, most seriously to the destroyer *Foote,* which had its stern blown off by a torpedo. Merrill abandoned pursuit of the Japanese ships at dawn to await the inevitable Japanese air response from Rabaul.

It came at about 8:00 a.m. in the form of 100 Japanese aircraft, which were met by a smaller number of Allied fighters. The Japanese planes inflicted only minor damage, with the cruiser *Montpelier* taking two bomb hits on its starboard catapult. Omori was subsequently relieved of command for failing to carry out his orders.

The Battle of Empress Augusta Bay did not end the Japanese naval threat to the Allied lodgment on Bougainville. The prompt U.S. Navy reaction prevented Japanese disruption of the landing and, along with massive air raids against Rabaul over the next days and the naval battle of Cape St. George on November 25, helped ensure the success of the Bougainville Campaign.

Engineer Operations

Like earlier conflicts, World War II revealed the multiple roles that military engineering plays in war, both in direct support of combat operations and in engineering and construction activities. The war saw engineering operations on a scale theretofore unrealized.

As it had for centuries, the thrust of military engineering during World War II focused essentially on breaching and building. There are two types of military engineers. The function of construction engineers is construction (building), either vertical or horizontal. The functions of combat engineers are mobility and countermobility, which include far more than simply breaching operations.

Combat engineers engaged in a variety of offensive tasks, such as conducting river-crossing operations, breaching minefields, and countering other enemy defensive measures. They also provided defensive support to combat elements by laying minefields and other obstacles to hamper or channel enemy troop movements; on occasion, they performed the secondary mission of fighting as infantry. Construction engineers were involved in larger and more permanent projects—roads, railroads, airfields, pipelines, depots, camps, training facilities, and other works designed to sustain their nations' war efforts at home and elsewhere.

For the most part, all nations recruited military engineers from the experienced civilian sector whenever possible, but they also counted heavily on induction pools, after which active military engineers trained inductees to needed skill levels. The efforts of the military engineers of belligerent nations other than the United States were considerable, and those engineers also

played key roles in supporting their nations' war aims and fighting forces. Their activities were on a much smaller scale, in terms of both volume and geographic setting, compared with those of U.S. military engineers. In this effort, the U.S. Army Corps of Engineers was the most important. It conducted operations on a worldwide stage from the Arctic to the tropics in terrain that included jungles, deserts, and mountains.

The Axis Powers

Germany's march to war saw the formation of the Todt Organization in 1933, named for its head, Fritz Todt. Initially, the organization constructed the Third Reich's Autobahn road system and provided the German Army with engineers and construction specialists to support the country's war aims. In 1938, it worked on Germany's West Wall (Siegfried Line) defenses, designed to hold back any French Army attack so that Germany could concentrate its military resources in the east against Poland.

Among its World War II missions, the Todt Organization built and repaired bridges, railroads, dams, airfields, and fortifications as well as factories. It had charge of exploiting the minerals of the Balkans and shipping them to the Reich and assumed responsibility for the reconstruction and maintenance of the Soviet Union's transportation network. The Todt Organization made use of vast numbers of conscript laborers throughout German-occupied Europe, mobilizing almost 1.5 million persons, 80 percent of whom were non-Germans and many of whom were prisoners of war (POWs). The organization's most ambitious task was constructing, together with German Army engineer troops, the Atlantic Wall from Norway to the Bay of Biscay, which constituted the German defenses designed to prevent the Allied invasion of France.

Engineer troops were key elements in the German Army's planning for the September 1, 1939, invasion of Poland as well as Germany's other blitzkrieg campaigns. They were organized into infantry-engineer assault teams in the attacking divisions. German pontoon bridge units and sappers were especially active in offensive operations. Special engineer staffs were established at the army and army group levels to provide technical direction for bridging and other engineer work, including placing captured rail lines back in operation. Defensively, the Germans used extensive minefields in the

fighting in North Africa as well as on the Eastern and Western Fronts, and German sappers were on point in clearing minefields during offensive operations. Typical of German engineering's defensive design prowess, the Normandy beaches provided an imposing array of multiple belts of obstacles (including millions of mines) that were covered at high tide and exposed at low tide as well as extensive minefields inland.

Italian military engineering played a vital role in that nation's invasion of Ethiopia, moving men, equipment, and supplies across difficult terrain. Japan also employed military engineers extensively. Japanese expansion brought about airfield construction and the heavy fortification of occupied areas, and airfields and naval base facilities on Formosa, Truk, and Rabaul were important in supporting Japanese island operations elsewhere in the Pacific. Japanese engineers were also active in defensive operations in the Pacific islands. In addition to constructing beach obstacles, they designed blockhouses, pillboxes, and other defensive works. They utilized reinforced concrete, coral, coconut logs, caves, and tunnels dug into volcanic formations with great effectiveness against bombing, naval gunfire, and infantry assaults in the Marshall, Gilbert, and Solomon Islands as well as at Okinawa and Iwo Jima. The Japanese frequently used forced labor and prisoners of war in these efforts.

Japan's principal supply route to its armies in Burma was the railway across the Dawna Range from Thailand to Burma. In a vast construction effort, the Japanese Army employed thousands of Allied POWs and local nationals. A large number of the workers died when they were forced to hack a path through the jungle, utilizing the most primitive of tools and working with little food and virtually no medical care.

The Allied Powers

In mid-1939 when Adolf Hitler was pressing his territorial demands in Central Europe and the Japanese were already at war in China, the U.S. Army Corps of Engineers had about 800 officers and 6,000 enlisted men in active service, with eight to nine combat engineer regiments, two engineer squadrons, and a topographic battalion staffed at some 70 percent of authorized strength. During the 1920s and 1930s engineer officers spent most of their time involved in the branch's civil works program in districts that

were aligned geographically with the nation's major watersheds. Regular army engineer officers were limited in their troop experience, but for those in the corps, the large civil works projects and contract construction experiences would stand them and the army in good stead in planning for and meeting the engineering and construction demands during mobilization and the succeeding war years. To support amphibious operations in the war, the army formed six engineer amphibious brigades. Three served in the Pacific, and three operated in Europe (two of these brigades later participated in the March–June 1945 invasion of Okinawa in the Pacific). By the spring of 1945, the engineers numbered more than 500,000 officers and enlisted men, comprising 8 percent of U.S. Army strength.

In January 1941, the Corps of Engineers undertook, in addition to ongoing civil works missions, all construction for the army's war effort, including military as well as industrial projects. The corps oversaw "construction of a wide range of factories, most notably for aircraft and tank assembly and the production of ammunition. Military installations included camps for 3.5 million soldiers, depots, training facilities, ports, and the Pentagon. All told, the wartime mobilization program involved more than 27,000 projects and cost $15.3 billion" (U.S. Army Corps of Engineers, 1998). Perhaps the crown jewel for the corps was the Manhattan Project, under the leadership of Brigadier General Leslie R. Groves.

By the summer of 1941, large naval bases were under construction at Guam, Midway, Wake, Pearl Harbor, Iceland, Newfoundland, Bermuda, Trinidad, and many other places, carried out by civilian contractors under the engineering supervision of the navy's Bureau of Yards and Docks. Following the December 7, 1941, Japanese attack on Pearl Harbor, it became impractical to use civilian labor in war zones, and there was a need for a militarized naval construction force to build advance bases in the war zone. This situation resulted in the establishment of the Seabees (whose name was derived from the acronym for "construction battalions," CBs).

The Seabees quickly made their mark, particularly in the Pacific theater but also in the Atlantic theater of operations. They constructed over 400 advanced bases along five strategically important routes beginning in the continental United States. The South Atlantic route went through the Caribbean Sea to Africa, Sicily, and up the Italian Peninsula; the North Atlantic route went through Newfoundland to Iceland, Great Britain, France,

and Germany; the North Pacific route went through Alaska and along the Aleutian Island chain; the Central Pacific route went through the Hawaiian, Marshall, Gilbert, Mariana, and Ryukyu Islands; and the South Pacific route went through the South Sea islands to Samoa, the Solomons, New Guinea, and the Philippines. All the Pacific routes converged on the final destination of the Japanese home islands.

The standard Seabee unit was the construction battalion, but special units were formed, such as stevedores and longshoremen as well as maintenance, dredging, trucking, and pontoon assembly. At war's end, the Seabees were organized into 151 regular construction battalions, 39 special construction battalions, 164 construction battalion detachments, 136 construction battalion maintenance units, 5 pontoon assembly detachments, 54 regiments, 12 brigades, and (under various designations) 5 naval construction forces.

In recognition of airpower's impact on modern warfare, the Army Corps of Engineers developed the concept of an engineer aviation regiment to construct airfields that would be needed for any foreign deployment by the army air forces. By the time the war was over, engineer aviation units had built untold numbers of airfields in every theater. Critical to this effort was airfield construction throughout the United States. By mid-1943, the corps had completed some 1,100 domestic military and civil airfield projects. Between 1940 and 1941, engineer aviation units as well as corps districts were involved in construction in Newfoundland, Greenland, Iceland, Bermuda, and the Azores (the North Atlantic air routes) that provided the means to ferry aircraft to Britain. The South Atlantic air route from Miami, Florida, to the Middle East utilized airfields in the Caribbean, Brazil, and Africa. It began operations in September 1941, and following the U.S. entry into the war, it became the preferred all-weather route to theaters of operation in the Mediterranean, Eastern Europe, and Asia.

Beginning in 1941 in the Middle East, British and U.S. Army engineers constructed a road and rail supply line to the Soviet Union through Iran, including port expansion in the Persian Gulf. This supply route, which provided a steady flow of Lend-Lease aid, was instrumental in the Soviet Union's victory on the Eastern Front. Soviet engineers were masters of minefield operations and accomplished all the usual combat engineer tasks. For example, they built corduroy roads (a roadway built of logs or wood laid

perpendicular to the direction of the road, usually covered with sand or dirt) as alternate means to support frontline troops along the Stalin Line.

In the Allied invasion of Normandy that commenced on June 6, 1944, France saw the result of imaginative Allied planning in the construction, principally by U.S. and British engineers, of Mulberries (artificial harbors) together with bombardons and phoenixes (floating steel and concrete caissons); there were also pier heads—platforms that raised and lowered mechanically with the tide and provided still-water conditions around the clock, enabling supplies and equipment to be moved across the beach to support the advancing troops in the absence of available ports. U.S., British, and Canadian engineers in the initial assault waves cleared routes through minefields and fought as infantry to secure avenues of advance through the German positions overlooking the beaches. As combat moved inland, Allied engineers rehabilitated damaged port facilities, such as that at Le Havre, and repaired the railroads as well as the roads and bridges to enable supplies to move from other French and Belgian ports to the front.

In the Pacific, U.S. Army and Canadian engineers built the 1,450-mile Alaska-Canada (ALCAN) Highway, which went through British Columbia and the Yukon Territory to Alaska as a counter to potential Japanese control of the North Pacific; it was completed in November 1942. The airplane played a vital role in the Pacific campaigns, where existing facilities were few, and engineers carved airfields out of jungle and coral. In the Mariana Islands, for example, they provided bases for the Boeing B-29 Superfortress bombers to conduct the strategic bombing of the Japanese home islands and drop the atomic bombs on Hiroshima and Nagasaki in August 1945.

The U.S. Pacific strategy called for an abundance of facilities (in addition to airfields) that did not exist, such as ports, huge logistical depots, camps, and roads. American engineers, both army and navy, provided the needed military infrastructure that the island-hopping Pacific campaigns demanded. The engineering effort was so important that Southwest Pacific theater commander General Douglas MacArthur, himself a serving engineer officer for many years, referred to the fighting in his theater as an engineer’s war.

In the China-Burma-India theater, the Burma (Ledo) Road was another joint Allied engineering project. After the Japanese capture of Rangoon in March 1942 cut off the last Allied land route to China, the British and Americans developed a plan to build a new resupply route from Assam,

India, across northern Burma to a junction with the old Burma Road. U.S. Army engineers, together with Chinese and Indian labor, began construction in December 1942, crossing 430 miles of jungle, mountains, and rivers. The road was formally completed on May 20, 1945, the longest invasion pipeline ever built.

Not to be overlooked, the U.S. Corps of Engineers' long-standing civil works responsibility to develop, operate, and maintain the inland waterway system played a key role in the war effort within the United States. Barge traffic carried petroleum products and other strategic materials. The improved waterways of the Mississippi River system provided a highway for thousands of vessels, including the destroyer escorts, submarines, frigates, minesweepers, landing craft, and small cargo vessels that would be built at inland shipyards, thus enabling the large coastal shipyards to focus on building the larger combatant and merchant vessels.

Military engineering was a vital component of the war effort on both sides. Without doubt, engineering operations, particularly those of the United States, played an important role in the Allied victory in the war.

England, U.S. Navy Destroyer Escort

A Buckley-class destroyer escort credited with sinking six submarines, the most of any U.S. warship during World War II. USS *England* (DE-635) was built at Bethlehem Shipbuilding, San Francisco, and commissioned on December 10, 1943. It was of flush-deck design with a high, open bridge. The *England* was 306 feet in overall length with a beam of 37 feet. Its turboelectric power plant was capable of driving it at 24 knots. It was armed with 3 3-inch single guns, 1 1.1-inch quadruple machine cannon, 8 (later 10) 20mm guns, 2 21-inch torpedo tubes, 8 depth charge launchers, 2 depth charge racks, and a British-designed Hedgehog ASW mortar.

The *England* arrived in the Pacific war zone in March 1944, and in May it was assigned to a hunter-killer group ordered to intercept a Japanese submarine scouting line, revealed through U.S. code breaking, north of the Admiralty Islands. During May 19–31, the *England* sank five submarines (the *I-16*, *RO-106*, *RO-104*, *RO-116*, and *RO-108*) with hedgehog patterns and administered the hedgehog coup de grace to a sixth (the *RO-105*), shattering Japanese attempts to reconnoiter U.S. movements in the Central Pacific. For this achievement, the *England* received a Presidential Unit Citation.

The *England* returned to convoy duty throughout the balance of 1944 and into early 1945 until assigned to Operation ICEBERG, the invasion of Okinawa (March–June 1945). While patrolling off Kerama Retto on May 10, 1945, the *England* was struck by a kamikaze, which killed 37 men. After receiving temporary repairs, it steamed to the United States. Plans to convert it into a high-speed transport were canceled; the ship was decommissioned on October 15, 1945, and sold for scrap.

English Channel

A shallow sea, part of the Atlantic Ocean, that separates France and Great Britain and connects the Atlantic with the North Sea. The French refer to the English Channel as La Manche (The Sleeve). The waterway is approximately 350 miles long. Its width varies from about 150 miles at its widest point to just 21 miles at the Strait of Dover, which separates Dover, England, from Calais, France. In all, the English Channel encompasses some 29,000 square miles.

The boundary of the Channel begins at Land's End to the far west (southwestern England) and stretches to the Strait of Dover to the east. Water depth is relatively shallow, averaging about 350 feet. The deepest point is an underwater trough known as Hurds Deep, about 30 miles northwest of the Isle of Guernsey, where the water is approximately 600 feet deep. There are numerous islands located within the Channel, the most significant of which are the Isle of Wight and the Channel Islands.

The English Channel is strategically significant because it controls ingress and egress to the North Sea and has long borders along southern England and northern France. Indeed, control of the English Channel could easily serve as a blockade of much of Western Europe.

Tides and currents within the English Channel can be treacherous and are subject to frequent changes of direction and intensity, depending upon weather conditions. This makes the waterway a particularly challenging one to navigate. Tidal ranges between low and high tides can be extreme, as high as 42 feet in some locations during the spring equinox. Westerly winds prevail, and gales—some of which rise suddenly and can be highly destructive—are frequent occurrences, particularly from October to February.

The frequency of gales is at its low ebb during May to July, which explains in part why the Allies chose to launch the 1944 Normandy Invasion on June 6. Some of these storms and squalls can reach the intensity of low-level hurricanes.

The English Channel played a pivotal role in World War II. It saw numerous attacks on ports along the Channel as well as German attacks on civilian shipping. German submarine activity remained high, and for much of the conflict the waterway proved too dangerous for surface ships. Realizing that the Allies would have to mount an invasion of France via the English Channel to dislodge them from French soil, the Germans erected stout defenses along France's northern and western coasts. During most of the war, the Germans occupied the Channel Islands, the only part of the British Commonwealth to be controlled by Germany. In June 1944, the Allies launched Operation OVERLORD—the invasion of Normandy via the English Channel. Today, France and England are connected via tunnels under the Channel that link Folkestone and Calais.

Enigma Machine

The Enigma was an encoding machine invented by a German, Dr. Arthur Scherbius. He demonstrated it at the 1923 International Postal Congress as a commercial encoding device. The Enigma resembled a typewriter in appearance and had a series of rotors or wheels, the settings of which could

be changed. Early versions of the device enabled the operator to encode a plain text in any of 150 million possible ways. An operator with a second Enigma machine identical to the sending machine read the encoded radio message and decoded it. Settings were changed regularly according to a prearranged schedule to confound any interception and decoding.

The Germans sought a secure means of military communications, and they assumed that messages encoded by Enigma were unbreakable. By 1928 the German military was using the Enigma machine. Japan and Italy also bought and utilized it. Other countries, such as the United States, purchased the Enigma but did not attempt to unlock its secrets.

The Poles, concerned about a resurgent Germany as a threat to their own security, in 1928 formed a special cryptography group at the University of Poznan. They also purchased the commercial model of Enigma, and by 1935 they had broken into the German radio codes, information that they largely shared with the British and French in 1938. Late that same year, however, the Germans added a sixth rotor, which helped to convince the Poles that the Germans were about to make an aggressive military move. The Poles modified their own machines to keep up with the German advances and continued to break into the German codes, but the defeat of their country in September 1939 came too quickly for Enigma to be of utility to them.

On the defeat of Poland, the Polish code breakers and their machines were spirited out to France and to England. At Bletchley Park outside of Buckingham, the British assembled a mixed group of experts to continue the work begun by the Poles, and over time they developed additional devices that could sort through the possible variations of an encoded text, although the Enigma's changeable settings meant that most messages could not be read in real time. Intelligence gathered from Enigma traffic was given the code name Ultra.

The Germans continued throughout the war to make refinements to the Enigma machine. Secure in their belief that its messages could not be read, they continued to rely on Enigma throughout the war. Obviously, land-line communication was even more secure, and Adolf Hitler's proscription on radio communication concerning the December 16, 1944–January 25, 1945, Battle of the Bulge (Ardennes Offensive) and Allied complacency led to its concealment from the Allies until the attack began. One of the great myths of the war, however, was that British prime minister Winston Churchill knew

from Ultra intercepts that the Germans intended to bomb the city of Coventry but did not act to prevent it for fear of making the Germans aware of the successful code-breaking operation.

Ultra intelligence proved invaluable in the Allied military effort on a variety of fronts and undoubtedly shortened the war. Information on Ultra was not made public until 1974, when Group Captain Frederick William Winterbotham published *The Ultra Secret.* Its revelations forced the rewriting of many earlier histories of the war.

Eniwetok, Capture of (February 17–22, 1944)

Eniwetok Atoll lies on the northwestern edge of the Ralik chain in the Marshall Islands, some 2,000 miles west of Pearl Harbor, Hawaii. Thirty small islands comprise this coral atoll, mostly on the western edge of a circular lagoon. The three major islands are Eniwetok to the south, Parry to the southeast, and Engebi to the north. Following the capture of islands in the Gilbert chain in November 1943, U.S. vice admiral Raymond A. Spruance took command of operations against the Marshalls.

Because of the rapid success in securing Kwajalein Atoll in the Marshalls, American planners decided to proceed with Operation CATCHPOLE to take Eniwetok. The assault force of just under 8,000 men centered on the 22nd Marine Regiment and soldiers of the army's 27th Infantry Division and attached troops. Brigadier General Thomas Eugene Watson was in overall command, with Rear Admiral Harry W. Hill commanding the landing group. Unlike assaults in the Gilberts, adequate numbers of LVTs (landing vehicles, tracked) were available, and this operation saw the first extensive use of the

DUKW amphibious trucks. Initially, fewer than 60 naval personnel defended Eniwetok Atoll, but on January 4, Major General Nishida Yoshimi's 1st Amphibious Brigade, a veteran fighting unit, arrived, bringing total Japanese strength on the atoll to nearly 3,500 men.

The Eniwetok Expeditionary Group sortied from Kwajalein Lagoon on February 15, covering the 326 miles to Eniwetok by two different routes. Engebi was the main U.S. objective because it had the atoll's only airfield. Including soldiers of the 27th Infantry Division and attached units, there were fewer than 8,000 men in the assault force. The invasion began at 8:44 a.m. on February 17, 1944, with the 1st and 2nd Battalions, 22nd Marine Regiment, landing on the southeastern beach. The attackers were supported by medium tanks of the 2nd Separate Tank Company. Initial Japanese resistance was light, and the only organized resistance occurred near Skunk Point. By 2:50 p.m., the island was declared secured, although mopping up continued into February 18.

Operations against Parry and Eniwetok Islands would be more difficult. At 7:19 a.m. on February 19, U.S. naval gunfire pounded Eniwetok Island, which was defended by 808 Japanese troops. The fire expended was minimal compared with that on the other islands, and few Japanese positions were damaged. At 9:17 a.m., the 1st and 3rd Battalions of the army's 106th Infantry Regiment landed. Things went badly from the start. The terrain prevented many of the LVTs from moving inland, and the Japanese covered the beach with automatic weapon and mortar fire.

At midday on February 19, the Japanese launched a spirited counterattack with 300 to 400 men. The 106th was able to defeat the counterattack but at heavy cost. Shortly after 12:00 p.m., the 3rd Battalion, 106th Infantry, was committed but failed to influence the course of the battle. An hour later, the 3rd Battalion, 22nd Marines, was ordered ashore and directed to support the army's left flank. That night, the American units completed the capture of the western edge of the island and consolidated a defensive line near the beach.

The battle to secure the eastern side of Eniwetok was similar to the western battles. The 3rd Battalion, 106th Infantry, landed on Yellow Beach 1 beginning at 9:17 a.m. on February 19. Many of the Japanese beach defenses had been destroyed by naval gunfire, but once they were inland, the attackers were delayed by bunkers, pillboxes, and spider holes. Supported by carrier aircraft, the attacking troops secured the island on February 21.

Parry Island was defended by 1,347 Japanese. Fortunately for the attackers, prisoner interviews and intelligence material captured on Engebi and Eniwetok revealed the Japanese defensive positions and provided U.S. planners a framework for a detailed preinvasion bombardment. Beginning at 10:00 p.m. on February 20 and continuing until the landing two days later, the battleships *Tennessee, Pennsylvania,* and *Colorado,* assisted by two heavy cruisers, pounded the island. Aircraft from three escort carriers also joined the assault.

Beginning at 9:08 a.m. on February 22, the 1st and 2nd Battalions, 22nd Marines, landed abreast and were met by Japanese machine-gun and mortar fire at the water's edge. At 10:00 a.m. the Japanese opened up with 77mm field guns, which were quickly silenced by naval gunfire. Meanwhile, the 3rd Battalion, 22nd Marines, went ashore. The marines fought to the ocean side of the island and then formed two lines. Each line battled to the opposite end of the island. By 7:30 p.m. that day, Parry was declared secure.

The battles to capture Eniwetok Atoll were the last major battles of the Eastern Mandates Campaign. Although planners expected this effort to be easy, stiff Japanese resistance from well-prepared positions slowed the progress of the U.S. forces. American casualties were 195 killed or missing and 521 wounded. Of the total Japanese force of some 3,431 men, only 64 prisoners were taken. No American ships were lost during the operation, although there was some damage from friendly fire. No Japanese surface ships contested the landing, but four submarines were sunk, along with a number of small supply ships and patrol craft.

Escape and Evasion

Efforts of uniformed military personnel to return to friendly forces after being captured by the enemy or to avoid capture when isolated in enemy-controlled territory. The Geneva Convention defined an evader as an uncaptured military member, isolated in enemy territory, trying to find his way back to friendly control. Under the convention, he was a legal combatant, subject to being interned by a neutral country for the war's duration; an escapee who had been captured, had escaped, and had then evaded was regarded as a noncombatant who could be returned home.

Escape and evasion (E&E) and related activities became a major focus of British and then American intelligence organizations early in the war. Escaped prisoners of war (POWs) and returned evaders could serve as intelligence assets, morale boosters for friendly forces, and a nuisance to the enemy, who would have to divert troops from normal duties to look for them. The British MI-9, established in 1939, and the American MIS-X, begun in 1942, each supported essentially the same E&E-related mission.

Both Allied units functioned in strict secrecy while providing training and E&E kits for servicemen whose missions made them particularly susceptible to capture. MI-9 and MIS-X were also involved in interrogating enemy POWs and maintaining clandestine networks of agents in Axis-occupied territory to assist evaders in reaching home. They built an impressive array of covert devices designed to help with E&E, including compasses built into uniform buttons, hacksaws hidden in shoelaces, and clandestine radios concealed in baseballs.

The Allied covert E&E networks in Europe and the Far East eventually assisted in returning to Allied control more than 35,000 officers and enlisted men who might otherwise have spent the remainder of the war behind barbed wire or never returned at all. By 1944, MI-9 ran four different escape lines in France alone, returning hundreds of Allied aircrews at tremendous cost to the French Resistance. Similarly, American agents in China organized "safe

areas" in extremely difficult terrain, despite Japanese occupation. Official efforts notwithstanding, an escapee's initiative, courage, and simple luck all played important roles.

One of the most famous escapes of the war was that organized by the prisoner escape committee in Germany's Stalag Luft III at Sagan, Poland. In this "Great Escape," 76 Allied POWs escaped in one night. Adolf Hitler later ordered 50 of the recaptured POWs shot. Despite terrible circumstances, many POWs considered it their duty to escape and continued trying to do so throughout the war.

World War II E&E laid the groundwork for current Survival, Evasion, Resistance, and Escape (SERE) programs in the United States and the North Atlantic Treaty Organization (NATO), designed to help future escapees and evaders "return with honor."

Essex Class, U.S. Aircraft Carriers

Essex-class aircraft carriers formed the major carrier element of the U.S. Navy task forces in the Pacific theater during World War II and served well into the postwar period. Part of the Two-Ocean Navy building program passed by Congress in 1940 and the first U.S. aircraft carriers to be built freed from post–World War I naval treaties restrictions, these ships were essentially improved and enlarged versions of the Yorktown-class carriers. They boasted improved underwater protection, enhanced antiaircraft

armament, an improved power plant, more powerful catapults, and a second armored deck on the hangar-deck level to prevent enemy armor-piercing bombs from passing into the ship's vitals below.

The fourth U.S. warship to bear that name, the *Essex* (CV-9) was laid down at the Newport News Shipbuilding Company on April 28, 1941; launched on July 31, 1942; and commissioned on December 31, 1942. Twenty-six Essex-class ships were ordered, but only 24 were commissioned (the *Reprisal* [CV-35] and *Iwo Jima* [CV-46] were never completed). Other Essex-class carriers included the *Yorktown* (CV-10), *Intrepid* (CV-11), *Hornet* (CV-12), *Franklin* (CV-13), *Ticonderoga* (CV-14), *Randolph* (CV-15), *Lexington* (CV-16), *Bunker Hill* (CV-17), *Wasp* (CV-18), *Hancock* (CV-19), *Bennington* (CV-20), and *Boxer* (CV-21). The Essex class was the largest class of capital ships ever built, at least in modern times.

The *Essex* displaced 27,208 tons at standard load and 34,881 tons at full load. It was 820 feet in overall length and 93 feet in beam (147 feet 6 inches in maximum width on the flight deck). It had a top speed of 32.7 knots. The ship's armor belt was 2.5 to 4 inches, and hangar deck armor was 2.5 inches. Although armament for the class varied somewhat, the *Essex* had 12 5-inch guns (4 more than the Yorktown-class ships) as well as 32 40mm and 46 20mm antiaircraft guns. It could carry 91 aircraft (later upgrade allowing it to carry 100) and a crew of 2,682.

The *Essex* and others of its class spent most of World War II supporting the U.S. campaigns in the Pacific. For the *Essex*, these included Tarawa, Saipan, Tinian, Guam, Peleliu, Leyte, Iwo Jima, and Okinawa, during which time it weathered three typhoons and numerous air attacks. In late October 1944, while covering the Leyte landings, it was struck by a Japanese kamikaze aircraft on the port edge of its flight deck and suffered extensive damage as well as 16 killed and 44 wounded. In December, following quick repairs, it rejoined the Third Fleet off Luzon. Returning to the United States in September 1945, it was deactivated on January 9, 1947.

With the Korean War of 1950–1953, the *Essex* and some of its class were renovated, receiving new and better antiaircraft armaments, hydraulic catapults for jet aircraft, and new jet-capable arresting gear. In the upgrade, the *Essex* received a new deck and a streamlined island superstructure. Recommissioned in January 1951, it served effectively during the Korean War supporting United Nations Command ground forces and launching air

strikes against North Korea. On October 1, 1952, the *Essex* was reclassified CVA-9.

Undergoing a second overhaul at Bremerton Navy Yard from July 1955 to January 1956, the *Essex* received a new hydraulic/steam catapult and an angled flight deck. During 1956–1957, it served with the Pacific Fleet. Transferred to the Mediterranean, it supported the U.S. intervention in Lebanon in 1958. In March 1960, the *Essex* was converted into an antisubmarine support carrier. Redesignated CVS-9, it operated from Quonset Point, Rhode Island, as the flagship of Carrier Division 18 and Anti-Submarine Carrier Group 3. It was decommissioned to reserve status on June 30, 1969, and designated for disposal on June 1, 1973. The last Essex-class ship stricken was the *Lexington*, which continued in service until the 1990s as CVT-16 at Pensacola, Florida. The Essex-class carriers *Intrepid* and *Yorktown* are today preserved as museum ships.

Esteva, Jean-Pierre (1880–1951)

French Navy admiral and colonial administrator in North Africa. Born in Reims, France, on September 14, 1880, Jean-Pierre Esteva entered the École Naval in 1908 and was commissioned an ensign in 1903. He then held a number of assignments aboard ships in the Far East and the Mediterranean. When World War I began, Esteva was a professor of navigation in the cruiser

school's ship *Jeanne d'Arc* and participated in the 1915 Dardanelles Campaign, during which he was wounded. He then commanded an antisubmarine vessel. In 1918, he was promoted to lieutenant commander and named an ordnance officer.

In September 1919 Esteva was promoted to commander, and the next year he attended the École Supérieure de la Marine. In 1922 and 1923 he commanded a cruiser in the Far East. Promoted to captain in 1924, he commanded a cruiser in the Mediterranean Squadron. In 1927, he was named deputy head of naval aviation. Promoted to rear admiral in 1929, Esteva held a succession of commands, including that of French naval forces in the Far East in 1935. Promoted to vice admiral in February 1935 and full admiral in May 1937, he was inspector general of the French Navy. In September 1937, Esteva was appointed admiral south—that is, commander of French naval forces in the Mediterranean at Toulon.

With the beginning of World War II, Esteva worked closely with his British counterpart, Admiral Sir Andrew Browne Cunningham. Under the threat of Italy's entry into the war, Esteva moved his headquarters to Bizerte in French North Africa in May 1940. Although initially eager to continue fighting Italian forces, he acquiesced, albeit reluctantly, in France's June 1940 armistice arrangements with Germany and Italy and supported the Vichy government. Appointed resident general of the North African French protectorate of Tunisia, a strategically critical area further complicated by the growing strength of Arab nationalism, the politically inexperienced Esteva initially tried to maintain neutrality in the face of both Allied and Axis demands.

Despite his personal detestation of German and Italian meddling in North Africa, Esteva reluctantly permitted the limited Axis passage of military supplies through Tunisia to General Erwin Rommel's forces. In early November 1942, however, following the November 8 Anglo-American landings (Operation TORCH) in North Africa, he followed Vichy orders and permitted the landing of German and Italian troops, equipment, and aircraft at Tunis and Bizerte, canceling orders by his colleague Admiral Louis Derrien that French troops should welcome the Americans but forcibly oppose any Axis landing. This vacillation also permitted German forces to capture those vessels of the French Mediterranean fleet in Bizerte harbor.

When Allied forces neared Tunis in May 1943, the Germans flew Esteva

back to France, where he was placed on the list of inactive officers. After the liberation of Paris in June 1944, he became the first French military commander arrested for collaboration, charged with failure to resist the Germans in 1942. In September 1944, he was dishonorably dismissed from the navy and his pension rights were revoked. Six months later, the High Court of Justice sentenced him to "military degradation" and life imprisonment. Esteva remained in prison until August 1950, when he was released for health reasons. He died at Reims on January 11, 1951.

Estonia

Small Baltic state bordered by the Gulf of Finland to the north, the Baltic Sea to the west, Latvia to the south, and Russia to the west. Estonia had a 1939 population of approximately 1.134 million. Estonia received its independence as a consequence of World War I but feared both Germany, because of dispossessed German landowners, and Russia. On February 2, 1920, however, the Russian Soviet Federated Socialist Republic recognized Estonia as an independent country. The Estonian government in Tallinn subsequently negotiated nonaggression pacts with the Soviet Union in June 1932 and Germany in June 1939. In 1939, the country was ruled by the nationalist

Peasant Party, headed by Konstantin Päts. Estonia was a member of the League of Nations.

Another nonaggression pact, this one between Germany and the Soviet Union in August 1939, proved to be Estonia's downfall. Arrangements under this pact consigned the country to Soviet influence. After the German invasion of Poland in September 1939, the Soviet Union increasingly encroached on Estonian sovereignty. On September 28, Estonian officials reluctantly signed a mutual assistance pact with the Soviet Union, which allowed the Soviets to station troops and establish naval and air bases on Estonian soil.

By June 17, 1940, Estonia was occupied by Soviet troops, and the process of Sovietization began. Soviet officials then managed, through coercion and violence, to secure the election of favorable candidates to the legislature, which then voted to make Estonia a Soviet republic. On August 6, 1940, the Estonian Soviet Socialist Republic was formally admitted to the Soviet Union. The Estonian government also nationalized industry and large banks and collectivized land. It also imposed censorship and restructured the schools. The Soviet regime dealt brutally with any opposition, executing more than 2,000 Estonians and deporting 19,000 others to isolated areas of the Soviet Union.

Adolf Hitler's decision to invade the Soviet Union in June 1941 brought the German occupation of Estonia. German troops were on Estonian soil by July 5, 1941, and they controlled the majority of the country by August. Stiff resistance by Soviet troops in northern Estonia devastated the region.

German efforts to recruit an Estonian Schutzstaffel (SS) division had only limited success, as did attempts to convince Estonians to volunteer for labor in Germany. German racial policies also impacted Estonia: the vast majority of the country's small Jewish population was murdered. The Germans requisitioned much of Estonia's food and livestock, causing great hardship among the Estonian population. German occupation forces also maintained the strict control over industry and land that had been imposed by the Soviets.

The westward advance of the Soviet army in February 1944 again turned Estonia into a battleground, and tens of thousands of Estonians fled to Western Europe. During the war, the country lost approximately 20 percent of its prewar population. After the war, Soviet officials deported some 31,000 others suspected of opposition to communist rule. This loss of population was

made up by an influx of more than 500,000 Soviet citizens. Estonia did not regain its independence until August 1991.

Euthanasia, Nazi Program

Euthanasia normally refers to the inducement of death at the request of, or with the consent of, someone who is chronically or terminally ill. The Nazi euthanasia program did not comply with this accepted definition of euthanasia, however. Rather, in Germany "euthanasia" was used as a cover to commit murder. The Nazi euthanasia program, known as T-4, took its name from the address of the building where the program's offices were housed, Tiergartenstrasse 4, in central Berlin.

The T-4 program was a part of the Nazi government's centralized public health administration established under the Law for the Consolidation of the Health System, which went into effect on July 3, 1934. The T-4 program evolved out of racial and bureaucratic initiatives that first legalized forced sterilization of the mentally and physically disabled under the July 14, 1933, Law for the Prevention of Progeny with Hereditary Diseases. While this law did not establish the euthanasia program, it legalized euthanasia sterilization of parties deemed likely to produce "diseased progeny." In May 1938 following a personal request from a German father to Chancellor Adolf Hitler that his deformed child's life be mercifully ended, Doctor Karl Brandt, of the notorious Schutzstaffel (SS), was sent to assess the case with the authority to end the child's life if he deemed it in the public interest. Brandt carried out the father's request.

Several months later, sensing a greater need to institutionalize such a program, Brandt teamed with Philipp Bouhler, head of the Reich Chancellery, to form an ad hoc group known as the Reich Committee for the Scientific Registration of Serious Hereditarily and Congenitally Based Illness. This group collected reports of deformed births and forwarded them to one of three pediatricians, who determined whether or not the child would live. In communicating their assessments, the pediatricians marked the top of the report with either a red plus sign if the child was to die or a blue minus sign if the child was to survive. The children who received a positive mark were transferred to a special pediatric clinic, where they were killed. There are indications that Hitler was interested in clearing hospital beds for wounded soldiers by mid-1939; he had made several comments to that effect earlier.

After the start of World War II, in October 1939 Hitler formally established an adult euthanasia program administrated by Bouhler and his deputy, Viktor Brack. It was at this point that the euthanasia program was given its code name T-4. An assessment process similar to the children's program was implemented, with projected 65,000–70,000 killings to be administered annually. Careful attention was given to the program's administration so that there were few traces of its existence. Physicians used false names, and a bogus transportation company was established to transfer the patients to the designated death asylums located in five remote communities: Grafeneck, Sonnenstein, Brandenburg, Hadamar, and Bernberg.

Once inside the asylums, the victims received a medical examination, had their photo taken, and were killed by injection, deliberate overdoses, or, for children especially, starvation. Later the standard procedure was death in either a gas chamber disguised as a shower room or in a van, where the victims were subjected to carbon monoxide poisoning. The Nazis then burned the corpses in a crematorium. The victims' families received a deceiving string of letters beginning with one outlining their loved one's safe transfer, followed by a notice of condolence regarding the sudden or unexpected death of the individual. According to the letters, those victims with prior medical complications usually suffered sudden death resulting from the condition. Other victims were said to have died of illnesses with unrecognizable symptoms.

It is important to note that German euthanasia was not based on any kind of benevolent concern for an individual's condition. Rather, it was based on Nazi ideology that crudely and bizarrely identified racial hierarchies and genetics founded not in science but rather in pseudoscience that bolstered Nazi ideology. It should be noted, however, that many countries, including the United States, carried out sterilization programs based on the same pseudoscience. Furthermore, euthanasia was seen strictly as the purview of the state. Individuals were to have no say in which persons lived or died. That decision was to be made exclusively by the government in an effort to purge all "impure" elements from society.

The program's secrecy did not last. The entire program became the source of public debate and outcry on August 3, 1941. In a sermon delivered that day, Catholic bishop of Münster Cardinal Clemens August Count von Galen denounced the euthanasia program on the grounds of "inhumanity." Copies of the sermon were widely distributed, forcing Hitler to abandon the program. By the time the euthanasia program officially ended on August 24, 1941, 70,273 patients had been subjected to involuntary extermination.

Despite Hitler's public order to end the euthanasia programs, it continued surreptitiously. What began as a request for mercy from a disfigured child's father evolved into a systematic program of extermination. It is estimated that over 160,000 people died in the Nazi euthanasia program, most of them in the concentration camps.

F

Fair Employment Act, U.S.

Executive order signed by President Franklin D. Roosevelt on June 25, 1941, that forbade racial discrimination among defense industries that received federal contracts. Executive Order 8802 created the Fair Employment Practices Committee (FEPC), which was empowered to investigate complaints related to discrimination in defense-related hiring. The committee would also recommend corrective or punitive action against employers who violated the spirit of the order. It is important to note that neither the Fair Employment Act nor the FEPC had any jurisdiction over companies or employers involved in non–defense-related work.

In technical terms, the act was not a piece of legislation passed by Congress; Roosevelt in all likelihood would not have been able to persuade Congress to pass such a law at that time. Instead, he acted by issuing an executive order, arguing that such a step was essential for preparing the United States for war. The act was the first step ever taken at the federal level to address discrimination in the United States.

In reality, however, Roosevelt's action was not taken solely on his own initiative. In early 1941, several African American labor leaders—including A. Philip Randolph, president of the Brotherhood of Sleeping Car Porters; Walter White, executive secretary of the National Association for the Advancement of Colored People (NAACP); and Mary McLeod Bethune, minority affairs director of the National Youth League—met with the president to express their concern about employment discrimination toward African Americans in defense industries. They also urged the president to desegregate the U.S. armed forces. Roosevelt was initially noncommittal, although he privately acknowledged the group's concerns.

When it appeared that Roosevelt was not prepared to act, Randolph began planning a massive march on Washington during the summer of 1941 in which thousands of African Americans would descend upon Washington and

protest for their employment rights. Randolph and others also engineered a highly effective publicity campaign, which put considerable pressure on Roosevelt to act. Even First Lady Eleanor Roosevelt inserted herself into events, meeting with the march's organizers and urging her husband to accede to African American demands because it was the right thing to do.

Roosevelt narrowly averted the march by issuing his executive order, although he knew that he would face a storm of controversy if he attempted to desegregate the armed forces at the same time. Randolph agreed to cancel the march, although he continued in private to counsel the president to deal with discrimination in the armed forces. Desegregation of the armed forces would not be implemented until 1948.

The FEPC, which began its operations in the summer of 1941, included various African Americans, labor leaders, and industry representatives and several at-large "public" members. It operated within the Office of Production Management. Although the committee was not entirely successful in eliminating all discrimination in defense industries, its existence buoyed the hopes of many African Americans who hoped to find better-paying factory jobs in the North and Midwest.

It is estimated that between 1941 and 1945, some 1.5 million African Americans moved from the South to the North, West, and Midwest, the largest internal migration in American history. African Americans made up 3 percent of the workforce in defense plants in 1942; by 1945, that number had increased to 8 percent. It is important to note, however, that African Americans were not usually paid the same amount of money as whites for the same work, and their access to jobs was still quite limited. Most were not, for example, given supervisory or managerial positions, regardless of their experience or talent.

In 1943, Roosevelt increased the FEPC's budget to allow it to investigate more discrimination claims; the committee's part-time staff also became a full-time one. In 1946, about a year after Roosevelt's death and with the war over, the FEPC was disbanded because Congress refused to continue funding it. Two years later, President Harry S. Truman tried to persuade Congress to fund a permanent FEPC, pass an antilynching law, and eliminate the poll tax, but his efforts were rebuffed, chiefly by white southerners in Congress. Truman did, however, issue an executive order in 1948 that called for the desegregation of the armed forces, which would not be fully implemented

until the early 1950s. Roosevelt's initial order also set the stage for Title VII of the 1964 Civil Rights Act and Executive Order 11246 of 1965, which put into place permanent antidiscrimination policies for all government contractors.

Falaise-Argentan Pocket (August 1944)

Failed attempt of Allied forces in France to trap a significant portion of retreating German forces. During July 25–31, 1944, U.S. Operation COBRA broke the monthlong stalemate in Normandy and shattered the German defensive lines, creating a war of movement. Third Army commander Lieutenant General George S. Patton Jr. envisioned a drive on the Seine River and the liberation of Paris, but a politically less dramatic and strategically more important opportunity soon developed: trapping German forces west of the Seine. If this could be accomplished, the Allied advance east to Germany would be greatly eased and the war shortened.

On August 7, 1944, German forces counterattacked with elements of four panzer divisions at the express order of Adolf Hitler and against the recommendation of Field Marshal Günther Hans von Kluge, commander of Army Group B and commander in chief, west. Kluge was convinced that the attack was doomed from the start. It would drive German forces into the heart of the planned Allied envelopment. Unfortunately for the Allies, it did slow the Canadian push to Falaise.

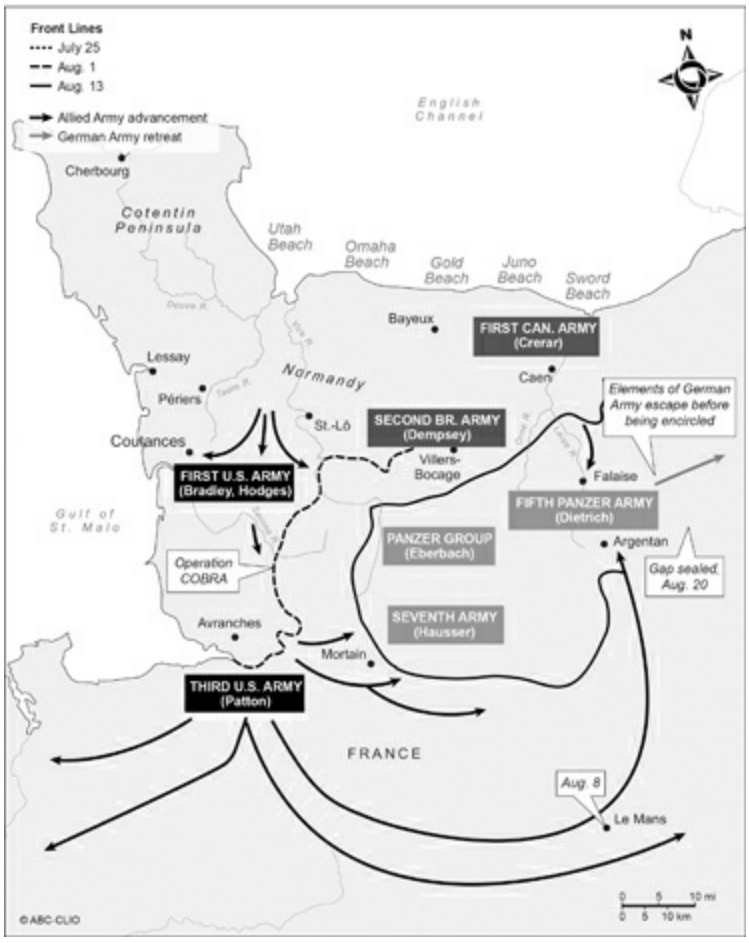
At this point, however, Allied planning began to break down. Patton suggested a deeper envelopment that would net all the Germans west of the Seine. However, his superior, Lieutenant General Omar N. Bradley, commander of the 12th Army Group, rejected this and insisted on a shorter hook. On August 10, Patton then turned units north from Le Mans, and by August 12 he had taken Alençon. The speed of Patton's movements surprised all concerned. The opportunity to close the Falaise Pocket seemed in the offing.

Excluding forces in the Brittany Peninsula, there were then some 350,000 German troops west of the Seine. About half were caught in the Falaise Pocket, their only route of escape the 15-mile-wide Falaise gap. If Allied forces could close this, the envelopment would be complete.

With success apparently in hand, the cautious Bradley ordered Patton to hold at Argentan. Officially, this was to avoid a chance head-on meeting between the two converging Allied armies. But Bradley was clearly concerned about Patton's willingness to leave his flanks open. Patton regarded the risk as both limited and worth taking. Continued slow movement by British and Canadian forces from the north left the pocket open. Allied ineptness, more than German courage and skill, was the primary reason the trap was not closed in time.

Primary responsibility for this failure rests with Bradley, 21st Army Group commander General Bernard L. Montgomery, and supreme commander, Allied Expeditionary Force, General Dwight D. Eisenhower. Bradley wanted to take no chances, and Eisenhower preferred to let his subordinates work out operational and tactical decisions on their own. Eisenhower failed to step in and bring the three competing generals—Montgomery, Bradley, and Patton—to consensus or to order a common plan. Montgomery failed to push his subordinate commanders hard enough, but there were also logistical problems. Other Allied military leaders, including commander of the British Second Army Lieutenant General Sir Miles Dempsey, Canadian First Army commander Lieutenant General Henry Crerar, and Free French 2nd Armored Division commander Major General Jacques Leclerc, contributed to the disjointed nature of the Allied operation. A subsequent proposal by Patton to turn from his drive to the east and make a deeper envelopment was slow to reach Bradley, who ultimately rejected it.

Operation COBRA and the Falaise-Argentan Pocket, 1944



U.S. soldiers pose in front of a wrecked German tank at Chambois, France, the last German stronghold in the Falaise Gap area, August 20, 1944. (National Archives)

In the Falaise Pocket, the Germans lost approximately 200 tanks, 300 heavy guns, 700 artillery pieces, 5,000 vehicles, and a great many carts and horses. But German personnel losses were considerably less than hoped for—no more than 10,000 killed and 50,000 captured. Some 115,000 well-trained German troops escaped the pocket. More important, almost all of the key higher level staff managed to get out, which made it possible for the Germans to reconstitute their devastated units faster than the Allies believed possible.

In all, 240,000 German soldiers crossed the Seine in the last week of August and established a solid defensive line protecting the western approaches to Germany. The Allied Operation MARKET-GARDEN (September 17–26), a combined-arms assault to cross the lower Rhine River into Germany, was stymied by German units that had escaped from Normandy.

Falkenhorst, Nikolaus von (1885–1968)

German Army general. Born as Nikolaus von Jastrzembski on January 17, 1885, in Breslau, Germany, Nikolaus von Falkenhorst was commissioned in a West Prussian infantry regiment in 1904. In 1911, the family changed its name to Falkenhorst. During World War I, Falkenhorst served on the Western Front, but he spent the last months of the conflict in the German expedition to Finland. He remained in the Reichswehr after the war and served in the War Ministry from 1925 to 1927. Colonel Falkenhorst was German military attaché in Prague, Belgrade, and Budapest in the mid-1930s. He then commanded a division, and just before World War II, as a general of infantry, he took command of XXI Army Corps.

Falkenhorst led his corps in the invasion of Poland in September 1939. In February 1940, Adolf Hitler assigned him the task of planning the German invasion of Norway and Denmark, partly because of the general's earlier experience in Finland. Told he would have five divisions and to produce a plan in four hours, Falkenhorst used a commercial travel guide in his preparations.

On the success of that operation during April–June 1940, Falkenhorst was promoted to colonel general and made commander of all German forces in Norway, where he became known for brutal occupation policies. In the summer of 1941, Falkenhorst planned and attempted an invasion of the Soviet port of Murmansk on the Barents Sea. Following a disagreement with commissioner of the Nazi Reich Josef Terboven in Norway, Falkenhorst was relieved of his command in December 1944 and assigned to the Führer Reserve the following month.

Captured by the British and placed on trial for war crimes in July 1946, Falkenhorst was found guilty of ordering the deaths of prisoners of war and sentenced to death by firing squad. The sentence was subsequently commuted to life in prison. Falkenhorst was released on July 23, 1953, for health reasons. He died at Holzminden, Germany, on June 18, 1968.

Fast-Attack Craft

Small warships armed with torpedoes (usually) and light machine guns or automatic cannon and largely powered by internal combustion engines or by diesel engines (as with most German models). Many navies during World War II operated fast attack craft, but only the fleets of Great Britain, Germany, Italy, the Soviet Union, and the United States deployed them in large numbers.

Most fast-attack-craft designs employed planing hulls—either hydroplane forms with one or more steps—or hard chine V-bottom shapes. A significant minority employed round-bottom displacement hull forms capable of planing when given sufficient power. Planing hulls required less power to achieve high speed but were appreciably less seaworthy and could not carry heavy armaments without sacrificing speed and sea keeping.

Both Italy and the Soviet Union devoted considerable effort to developing fast-attack craft before World War II, focusing their efforts mainly on small hydroplanes. The Soviet design derived from captured World War I–era British coastal motor boats. They had high speed (49–56 knots) but limited sea-keeping qualities. One unusual feature of the Soviet boats was their all-aluminum construction. The Type G5 remained in production from 1934 to 1945 (more than 400 were built). It was 56 feet in length and displaced 14–16 tons. It was armed with two 21-inch torpedoes, launched from rails over the stern, and light machine guns. The Soviets also introduced a large wooden hard chine design (Type D3) in 1941. Some 130 were built during 1941–1945. The D3 was 71 feet in length and displaced 32 tons. It carried two 21-inch torpedoes, one or two 20mm cannon, and up to four light machines

guns. Capable of 32–39 knots, it could operate in conditions up to Force 6 on the Beaufort Scale.

Until the mid-1930s, Italian production of fast-attack boats (*motobarca armata siluranti* or *motoscafo anti sommergibili* [MAS]) concentrated on small hydroplanes developed from the type introduced in 1915 that had achieved some spectacular successes during World War I. These boats were 52 feet 6 inches in length and displaced 13–15 tons. Capable of 40 knots, they carried two 450mm torpedoes and light machine guns. A new series of hard chine stepped hull boats entered service during 1936–1941. Most were 61 feet 4 inches in length and displaced 25–27 tons. They carried two 450mm torpedoes and a 20mm cannon and were capable of speeds up to 44 knots.

Efforts to develop larger, more capable models were advanced by exposure to captured Yugoslav Lürssen-type boats. These led Italy to construct similar high-speed displacement hull *motosiluranti* (MS) boats from 1942. These more seaworthy craft were 91 feet 10 inches in length, displaced 63–67 tons, and carried two 533mm torpedo tubes, two to four 20mm cannon as well as light machine guns and sometimes two additional 450mm torpedoes (in dropping cradles), operating at speeds of 31–32 knots.

Germany began building fast-attack boats in 1930. Unlike all other navies, the Kriegsmarine considered its Schnellboote (S-boats) as significant surface warships rather than expendable craft. Built by Lürssen, the unique design was a large planing displacement hull of composite construction (aluminum framing with a wooden skin) powered by three high-speed diesel engines. By 1940 a standardized type emerged. These boats were 114 feet 8 inches in length, displaced about 95 tons, and were capable of 40 knots. They were armed with two 533mm torpedo tubes (with reloads) and two 20mm cannon. Later series boats (and wartime upgrades) added armored bridges and a heavier gun armament of up to one 40mm and three to four 20mm cannon. Germany also built many experimental boats (including several radical hydrofoil types), but all operations were conducted by the 240 Lürssen-type S-boats commissioned between 1933 and 1945.

The Royal Navy’s first new fast-attack craft (motor torpedo boats [MTBs]) entered service in 1936. This British Power Boat design was a planing hull of double diagonal plywood construction 60 feet 4 inches in length, displacing 18 tons and armed with two 18-inch torpedoes (launched from stern troughs) and four light machine guns. It was followed by a new

design from Vosper (but also built by White) for a planing hull of 71 feet 9 inches in length, displacing 37–40 tons standard load (46–53 tons deep load) and capable of 40 knots. It became the standard British short-hull type. Most were armed with two 21-inch torpedo tubes and light weapons—initially .50-caliber and 0.303-inch machine guns but later two or three 20mm cannon and, on some examples, a single 6-pounder gun.

The British quickly discovered that German S-boats heavily outgunned their MTBs. In response, the British developed motor gunboats (MGBs). British Power Boat produced the standard MGB. With a planing hull 71 feet 9 inches in length, displacing 37–46 tons, and capable of 38 knots, it was armed with one 2-pounder power-operated gun, two 20mm cannon, and two .303-caliber machine guns. Later in the war, these boats added up to two 20mm cannon, two .303-caliber machine guns, and two 18-inch torpedo tubes as combined MTB/MGBs.

A separate line of development was the long-hull type MGB. These evolved from a Fairmile design for a highly prefabricated wooden displacement hull motor launch for harbor and coastal defense. The Fairmile Type “C” was an MGB 110 feet in overall length. It displaced 69 tons standard load (75 tons deep load) but was capable of only 27 knots. It was armed with two 2-pounder guns and two twin .50-caliber machine guns on power-operated mounts (the latter subsequently replaced by six 20mm cannon) and four light machine guns. The following Fairmile Type “D” was an innovative design combining a hard chine fore body with a displacement hull after body. With a hull 115 feet long and displacing 102 tons standard load (118 tons deep load), it was only capable of 29 knots but was heavily armed. Initial boats were MGBs, but most were completed as combined MTB/MGBs armed with two 21-inch or four 18-inch torpedo tubes, two 6-pounder guns, and two twin .50-caliber machine guns on power-operated mounts; two to three 20mm cannon; and four light machine guns.

The United States became interested in fast-attack craft in the late 1930s. In 1939 the U.S. Navy held an open competition for a patrol-torpedo (PT) boat prototype, which was won by a 70-foot British Power Boat design. The type was put into production by Elco of Bayonne, New Jersey. A small group of 70-foot boats was followed by a larger series of 77-foot craft and, finally, by the definitive 80-foot type displacing 38 tons, with a speed of 39 knots.

Initially, armament was four 21-inch torpedo tubes and two twin .50-caliber machine guns.

Later, lighter aircraft type torpedoes discharged from launching racks replaced the tubes, and a 37mm and a 40mm cannon were fitted fore and aft. Many boats added 20mm cannon, either in addition to or in place of the machine guns, and other weapons such as rocket launchers and mortars were added as PT boats assumed antibarge operations in the South Pacific and Mediterranean theaters.

In addition to the Elco boats, Higgins of New Orleans produced a 78-foot hard chine type for the navy. It was actually 78 feet 6 inches in length, displaced 35 tons, and attained 39 knots. The armament of Higgins PT boats matched that of the Elcos. The United States also produced quantities of Vosper-type MTBs of 72 feet 6 inches, displacing 39 tons, with a speed of 38 knots, almost all of which were transferred to other navies under Lend-Lease.

Fast-attack craft operated extensively in European and Mediterranean waters. Most operated in night attacks on enemy merchant shipping, served as convoy escorts and naval auxiliaries (such as minelayers, minesweepers, and patrol craft), and operated against their counterparts. These operations required both sides to devote considerable resources to countermeasures, and there were some notable successes: Italian MS boats sank the British cruiser *Manchester*, and both Allied and Axis fast-attack craft sank several enemy destroyers and other small warships; German S-boats caused havoc with one of the preinvasion convoys prior to D-day. Nevertheless, actual results were limited to losses of roughly 250,000 tons of merchant shipping apiece.

The U.S. Navy made considerable use of PT boats in the Pacific, especially in the Solomons and New Guinea campaigns. Here their primary mission rapidly evolved from attacking surface warships to interdiction of Japanese barge traffic engaged in delivering supplies and reinforcements to their scattered garrisons.

Fast-attack craft in World War II brought together visions of stealthy attack, powerful offensive punch for limited resource investment, and rapid egress. In the event, 40 to 60 percent of each navy's force became casualties, accomplishments were relatively limited, and the glamour of fast-attack craft far outweighed the reality.

Fechteler, William Morrow (1896–1967)

U.S. Navy admiral. Born in San Rafael, California, on March 6, 1896, William Morrow Fechteler graduated from the U.S. Naval Academy at Annapolis in 1916. Following U.S. entry into World War I, he served on the battleship *Pennsylvania* as an aide to the Atlantic Fleet commander. After the war, Fechteler held seagoing assignments and staff and administrative assignments in Washington and was an instructor at the U.S. Naval Academy.

When World War II began, Fechteler was operations officer for Destroyer Command. From 1941 to 1943, he served as assistant director of the Bureau of Naval Personnel, and from 1943 to 1944 he commanded the battleship *Indiana* in the Pacific. In January 1944, Fechteler was promoted to rear admiral and took command of Amphibious Group 8 of the Seventh Fleet Amphibious Force. During the New Guinea Campaign (March 8, 1942–September 13, 1945), he directed amphibious operations in Biak (May 1944) and Sansapar (July 1944), and he oversaw the landings on Luzon and Palawan during the campaign to recapture the Philippines (October 20, 1944–August 15, 1945).

Promoted to vice admiral after the war, Fechteler served from 1946 to 1947 as commander of battleships and cruisers in the Atlantic Fleet. He then

spent three years in Washington as deputy chief of naval operations for personnel. Appointed commander in chief of the Atlantic Fleet in 1950, the following year he unexpectedly became chief of naval operations and subsequently was promoted to full admiral when the incumbent, Admiral Forrest Sherman, suffered a fatal heart attack. From 1953 until he retired in July 1956, Fechteler was commander in chief of North Atlantic Treaty Organization (NATO) Forces Southern Europe. He died at Bethesda, Maryland, on July 4, 1967.

Fedorenko, Yakov Nikolayevich (1896–1947)

Soviet Army marshal who established the first Soviet tank armies. Born in the village of Tsareborisovo, Kharkov Oblast, on October 22, 1896, Yakov Fedorenko was drafted into the navy in 1915 during World War I. He took part in the October 1917 revolt at Odessa and joined both the Red Guard and the Bolshevik Party that same year.

During the Russian Civil War, Fedorenko commanded Red forces' armored trains. He then graduated from the Kharkov Higher Artillery School and the Frunze Military Academy and commanded a tank regiment in 1934. He next commanded the 15th Mechanized Brigade. Fedorenko commanded armor formations in the Kiev Military District from 1937 to 1940 before becoming chief of the Main Armored Directorate in Moscow in June 1940.

During that period, production increased of the new T-34 medium tank and the KV-1 heavy tank.

Following the June 22, 1941, German invasion of the Soviet Union, Fedorenko took command of Soviet armored and mechanized troops and was deputy commissar of defense. He showed great understanding of armored warfare, in 1942 establishing the first Soviet tank armies for deep-penetration operations. In August 1944, he and Pavel Rotmistrov became the only Soviet marshals of armored troops. Fedorenko held his posts until his death in Moscow on March 26, 1947.

Fedyuninsky, Ivan Ivanovich (1900–1977)

Soviet Army general. Born in Gilevo, Sverdlovsk Oblast, on July 30, 1900, Ivan Ivanovich Fedyuninsky joined the Red Army in 1919. He fought in the Russian Civil War, completing training at the Vladivostok Infantry Academy in 1924, and commanded an infantry company during the 1929 Soviet-Chinese conflict over the Chinese Eastern Railroad. Next he commanded first a battalion, then two regiments. He joined the Communist Party in 1930.

While commander of the 14th Motorized Rifle Regiment, Fedyuninsky distinguished himself in fighting in the Battle of Khalkhin Gol (Nomonhan Incident) in August 1939 during the Soviets' undeclared war with Japan. As a colonel, he took command of the XV Rifle Corps at Kovel in April 1941. Promoted to major general soon after the June 22, 1941, German invasion of the Soviet Union, Fedyuninsky commanded the Thirty-Second Army.

Fedyuninsky served as General Georgii Zhukov's deputy in the defense of Leningrad in September, where he assumed command of the Forty-Second Army. Briefly head of the Leningrad Front that October until succeeded by General Mikhail Khozin, Fedyuninsky took over Khozin's Fifty-Fourth Army. He went to the Moscow sector in April 1942 to command the Fifth Army and in June was promoted to lieutenant general.

One of the most effective Soviet field commanders of the war, Fedyuninsky served as senior deputy commander at the Volkhov Front from October 1942 to May 1943. He held the same position at the Bryansk Front from May through July 1943. Fedyuninsky commanded the Eleventh Army and then the Second Shock Army in December 1943—helping to break the siege of Leningrad in January 1944—and then he drove with this unit into East Prussia. He was promoted to colonel general in October 1944. His army then joined General Konstantin Rokossovsky's 2nd Belorussian Front, which attacked north into Pomerania.

After the war, Fedyuninsky was deputy commander of Soviet occupation forces in Germany from 1945 to 1952 and then commander of the Transcaucasian and Turkestan military districts. He was promoted to army general in October 1955. Fedyuninsky died in Moscow on October 17, 1977.

Fegen, Edward Stephen Fogarty (1891–1940)

British naval captain. Born at Southsea, Hampshire, on October 8, 1891, Edward Stephen Fogarty Fegen joined the Royal Navy as a cadet at Osborne

in 1904. He served in World War I, commanding a torpedo boat and destroyers. Between the wars, Fegen commanded a training ship and several destroyers and cruisers, served in both British and Chinese waters, headed the Naval College at Jervis Bay in Australia, and held various staff positions.

At the beginning of World War II, Fegen became an acting captain and took command of the 14,000-ton armed merchant cruiser *Jervis Bay*, which had been converted from a passenger liner. It had a crew of 254 seamen drawn from the Royal Navy, the Naval Reserve, and the merchant marine. The *Jervis Bay* mounted seven 6-inch guns, adequate to tackle submarines and other armed merchant cruisers and perhaps to ward off destroyers.

On October 28, 1940, the *Jervis Bay* was serving as escort for convoy HX 84, a group of 38 merchant ships bound from Halifax, Nova Scotia, to Britain. Three German capital ships were then loose in the Atlantic, and German naval intelligence informed Captain Theodor Krancke, commander of the pocket battleship *Admiral Scheer* (with six 11-inch guns), of HX 84's departure, ordering him to attack it. Krancke hoped to surprise and destroy the entire convoy, thereby justifying German naval demands for construction of more battleships rather than submarines.

On November 5, the *Admiral Scheer* made contact with the convoy. The merchant ships promptly scattered, and Fegen immediately attempted to lay a smoke screen from his ship and close to gunnery range with his powerful adversary. The *Admiral Scheer* concentrated its guns on the *Jervis Bay*, but Fegen kept his own ship on collision course toward its opponent. He maintained command even when he had one arm blown off, but he died when the bridge took a direct hit.

The battle lasted 22 minutes, giving the convoy vital time to disperse before the *Jervis Bay* sank. A total of 189 of its crew died. Although the *Admiral Scheer* did sink 6 merchant ships in the convoy with the loss of 251 more lives, 32 ships escaped. Fegen was posthumously awarded a Victoria Cross, the highest British award for gallantry in battle.

Feng Yuxiang (1882–1948)

Chinese warlord and Nationalist Army general. Born in Qianxian (Ch'ing-hsien), Hebei (Hopeh) Province, on November 6, 1882, Feng Yuxiang (Feng Yü-hsiang) joined Yuan Shikai's (Yuan Shih-k'ai) army in his native province in 1902. In 1914, Feng became commander of the 16th Mixed Brigade, an independent unit receiving orders directly from the Beijing (Peking) government. This arrangement enabled Feng to establish his regional power in Henan (Honan), Shaanxi (Shensi), Gansu (Kansu), and Shandong (Shantung) during the decade-long contest for power between Beijing and the Guomindang (GMD, Nationalists) in the south and among the warlords following Yuan's death in 1916.

In September 1926, Feng declared his allegiance to Jiang Jieshi (Chiang Kai-shek) and joined the GMD. He was commander of his forces, which were reorganized as the National revolutionary army's Second Group Army. Feng and his army participated in the 1926–1928 Northern Expedition to reunite China.

In May 1929, upset over what he perceived as Jiang's concentration of power in his own hands, Feng declared his independence of the Nationalist government. In February 1930, Feng and another warlord, Yan Xishan (Yen Hsi-shan), known as the northern coalition, rebelled against Jiang. They received support from the so-called Guangxi (Kwangsi) clique of Bai Chongxi (Pai Ch'ung-hsi), Li Zongren (Li Tsung-jen), Wang Jingwei (Wang Ching-wei), and Zhang Fakui (Chang Fa-k'uei) from Guangdong (Kwangtung). Defeated in October, Feng was forced to relinquish control of his forces, which came under the Nationalist government, and he went into seclusion.

After the September 1931 Mukden (Shenyang) Incident in Liaoning, Feng returned to public life, denouncing Jiang's failure to resist the Japanese

advance in northern China. In 1933 Feng commanded a voluntary army to fight the Japanese, but it was quickly disbanded because of Jiang's opposition and increased Japanese military pressure. Feng retired to Shandong until 1936, when he was appointed vice chairman of the GMD's Military Affairs Commission, serving in Nanjing (Nanking), Jiangsu (Kiangsu).

With the beginning of the Second Sino-Japanese War in 1937, Feng became commander in chief of the Third War Zone (southern Jiangsu and Zhejiang [Chekiang]), defending Shanghai, which fell at the year's end. In February 1938, Feng became commander of the Sixth War Zone to defend the communication route between Nanjing and Hebei's Tianjin (Tientsin), which the Japanese took that autumn. In October, Feng followed the Nationalist government to Chongqing (Chungking), Sichuan (Szechwan), where he remained militarily inactive until the war's end.

In September 1946, Feng was sent to the United States to study irrigation and conservation facilities. He then took up residence in Berkeley, California, giving public lectures in which he held Jiang responsible for the Chinese Civil War. On September 1, 1948, Feng died in a fire aboard a ship in the Black Sea while returning to China to serve the newly established Communist government.

Fermi, Enrico (1901–1954)

Nuclear physicist, atomic scientist, and one of the lead scientists involved in the Manhattan Project. Enrico Fermi was born in Rome, Italy, on September 29, 1901. His great aptitude for mathematics and physics manifested itself at

an early age, and encouraged by his father, he received a scholarship at the age of 17 to the University of Pisa. In 1922, the brilliant Fermi earned a doctorate in physics from the University of Pisa.

Fermi went to work in Germany until 1924, then took a position as a lecturer at the University of Florence. In 1926 he discovered the statistical laws governing particles, also known as "Fermi Statistics." In 1927 he was elected to the prestigious post of professor of theoretical physics at the University of Rome. He stayed in that post until 1938, when he won the Nobel Prize in physics. By then, Fermi was the world's undisputed expert on neutrons. That same year, he fled fascist Italy for the United States and took a professorship at Columbia University, which he held from 1939 to 1942.

In 1942 Fermi began work on the top-secret Manhattan Project, which produced the world's first atomic bomb in 1945. Under Fermi's direction, the first controlled nuclear chain reaction was achieved at the University of Chicago in December 1942. Fermi went on to help lead the quest for an atomic weapon, which was finally achieved on July 16, 1945, when the United States detonated the world's first atomic bomb at Alamogordo, New Mexico. Less than a month later, the United States dropped two nuclear bombs on Hiroshima (August 6) and Nagasaki (August 9), hastening the end of World War II.

In 1946 Fermi accepted a faculty position at the University of Chicago and turned his attention to high-energy physics. In 1946 he was appointed to a panel charged with advising the newly established Atomic Energy Commission. In 1949 he joined a number of other scientists in voicing opposition to the development of a hydrogen (thermonuclear) bomb, but a year later he assisted in that project, although continuing to raise concerns about the efficacy of employing such a weapon. Fermi died on November 28, 1954, in Chicago.

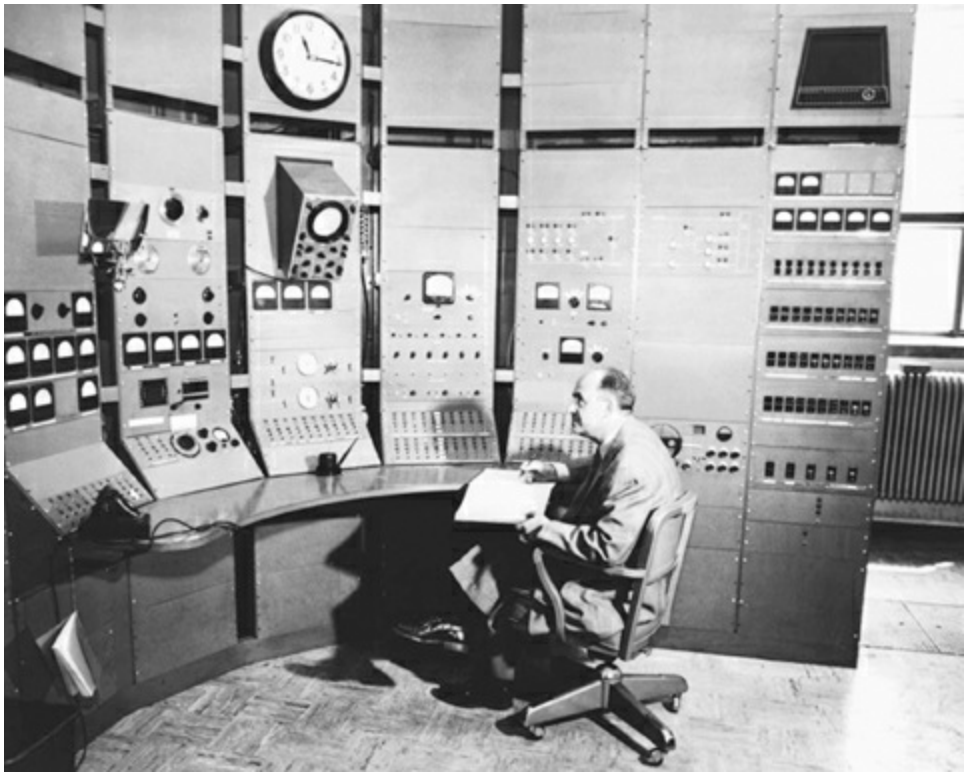
Festung Europa

Festung Europa is German for “Fortress Europe,” the generic term for the fortifications ringing German-occupied Europe, especially the massive defenses erected on the Atlantic coast from Norway to Spain, the so-called Atlantic Wall. Designed to guard against the possibility of an Allied amphibious invasion, these static defenses stretched from Norwegian outposts on the Arctic Ocean all the way to the more integrated beach and harbor defenses along the Bay of Biscay. In modern military terms, this series of engineering works was an exercise in force multiplication in that by constructing strong defensive works, the Germans expected to be able to use inferior military units to man them, freeing up more capable troops for open warfare elsewhere.



Enrico Fermi, winner of the 1938 Nobel Prize in physics, seated at control panel of a particle accelerator, the “world’s most powerful atom smasher.” (Library of Congress)

The Germans built the defenses largely by forced and conscripted labor. Under the control and direction of Fritz Todt, German minister of armaments

and munitions (and Albert Speer, Todt's successor after February 1942), hundreds of thousands of workers labored to build the fortified positions. The work began slowly, however, only gaining momentum after the tide of war had definitively shifted against the Germans. The plans originated at the direction of Adolf Hitler, who ordered the construction of some 15,000 defensive positions to be defended by 300,000 men.

Although Hitler's construction objective was never reached, the numbers were nonetheless impressive. By the time of the Allied invasion of Normandy on June 6, 1944, the Germans had placed 6.5 million mines, erected 500,000 beach obstacles, and expended 1.2 million tons of steel to reinforce 13.3 million tons of concrete in the thousands of positions that were completed.

When Field Marshal Erwin Rommel was assigned to command the likely invasion area, however, he decried the state of the defenses as he found them. Doubling and tripling the workload, Rommel greatly strengthened the defenses. Nevertheless, his professional opinion was that these works would never be sufficient to keep the Allies off the beaches. He believed that if the Allies came ashore and could establish a lodgment, there would be no way to defeat them. Recognizing the threat not only of amphibious assault but also of parachute and glider-borne attacks, Rommel seeded the open fields and meadows behind the beaches that the Allies might use as landing zones with stout iron bars linked with barbed wire. These obstacles became known as "Rommel's asparagus." In the end, the static defenses erected by the Germans proved no more effective than the French Maginot Line had been four years earlier.

Fight for Freedom (1940–1942)

Interventionist, pro-Allied U.S. lobbying organization established before the December 7, 1941, Japanese attack on Pearl Harbor. Fight for Freedom was formally launched in New York City on April 19, 1941, by prominent Americans who believed that the United States was effectively already at war with Germany and should behave accordingly. Its members found insufficiently forthright the noninterventionist stance adopted by the Committee to Defend America by Aiding the Allies (CDAAA), the leading pro-Allied group. Fight for Freedom advocated measures liable to cause outright war with Germany, such as attacks by American ships on German naval patrols.

Fight for Freedom developed from an earlier amorphous group of about 30 well-connected Americans who, from June 1940, met irregularly, their attendance shifting somewhat, at the Century Club in New York and were known as the Century Group. Among them were Francis Pickens Miller of the New York–based Council on Foreign Relations; Whitney H. Shepardson, also prominent in the council; Lewis W. Douglas, a former congressman; Admiral William H. Standley, a past chief of naval operations; and William Joseph Donovan, who would later head the Office of Strategic Services (OSS). After the defeat of France in June 1940, several of these people publicly demanded American intervention. Century Group adherents spearheaded the public campaign favoring the Destroyers-for-Bases Agreement, which would exchange obsolete American destroyers for British naval bases in the Caribbean.

Allegations are exaggerated that British officials effectively created and manipulated Fight for Freedom and, subsequently, the U.S. government’s Office of War Information. Nevertheless, Century Group members undoubtedly enjoyed close ties with representatives of the New York–based British Information Service, the intelligence organization British Security Coordination, and Britain’s Washington embassy, enabling them to synchronize their own and British efforts. As the United States moved closer to war with Germany in 1941, Fight for Freedom initiatives overshadowed CDAAA ventures, and the two organizations discussed a merger. After the

Japanese attacked Pearl Harbor, Fight for Freedom's members accepted a wide variety of wartime assignments, and the organization, its mission accomplished, soon disbanded.

Film and the War

While film was still a relatively new technology during World War I, the years before, during, and after World War II saw movies and films rise to a new level of importance and sophistication. In a sense, World War II has never ended, for its themes and scenes are constantly resurrected, particularly in light of newer conflicts. Film played four major roles during the war: first, as propaganda that spurred sentiments of national unity and patriotism; second, as a means to train and educate the military and public; third, as a vehicle to inform filmgoers—albeit in strongly censored ways—of war developments; and fourth, as diversion to boost the public spirit. During the postwar era, World War II topics have served mainly as entertaining plots for suspenseful blockbusters but also as a means of questioning and reassessing the conflict, particularly as hitherto unknown details of the war have emerged and as the global public becomes increasingly aware of its immense and long-lasting repercussions as a prelude to later conflicts in the 20th and 21st centuries.

An overview of films addressing the complexities of World War II can hardly do justice to the depth and breadth of the subject matter. It can only aim at presenting the most important cinematic landmarks from two periods:

first, films produced shortly before and during the conflict, and second, postwar films from the immediate aftermath until the present. Films designed to increase morale and unit cohesion played a major role in military training on all sides of the conflict, ranging from shorts on hygiene, literacy, and knowing the enemy to detailed elucidations of artillery, aircraft, or naval operation and maintenance.

A number of American training films, geared to soldiers with little formal education, were written by famous children's author Theodore "Dr. Suess" Geisel and voiced by Mel Blanc, known for his Looney Tunes characters; Private Snafu, the main character, was created by Frank Capra. Others informed the infantry on German small arms, while the Germans released extensive film instructions on topics such as sniper training. Addressing the civilian workforce, films such as Great Britain's *A Call for Arms* (1940) inspired women to work for the war effort, while *Miss Grant Goes to the Door* (1940) was designed to educate the public about the threats of invasion and espionage.

In the years leading to war, most of the United States tended toward isolationism. A significant change thus occurred when Hollywood, with its influential Jewish contingent, reflected a concern with the growing Nazi and fascist threat in Europe. For instance, Charles Chaplin portrayed a buffoonish Adolf Hitler–like character in *The Great Dictator* (1940), and the horrors of life in Nazi Germany were revealed in Sherman Scott's *Beasts of Berlin* (1939), which harked back to a sensationalist World War I–era film, *The Kaiser, Beast of Berlin.* Hollywood's anti-Germany/pro-Britain stance is most clearly seen in Henry King's *A Yank in the RAF* (1941), starring Tyrone Power as an American who joins the Royal Air Force.

After the United States entered the war in December 1941, the Franklin D. Roosevelt administration mobilized Hollywood with the creation of the Office of War Information (OWI) in 1942. Directors and movie stars alike assisted the war effort in a wide variety of ways, from producing training films to making an increasing number of war epics for the general viewer. Frank Capra created an important seven-part documentary series intended for both military and civilian audiences, *Why We Fight* (1942–1944). Films portrayed the heroic efforts of the American armed services, including John Farrow's *Wake Island* (1942), Ray Enright's *Gung Ho!* (1943), Lloyd Bacon's *Action in the North Atlantic* (1943), Tay Garnett's *Bataan* (1943),

Lewis Seiler's *Guadalcanal Diary* (1943), Delmar Daves's *Destination Tokyo* (1943), Zoltan Korda's *Sahara* (1943), John Stahl's *Immortal Sergeant* (1943), and Mervyn Le Roy's *Thirty Seconds over Tokyo* (1944). The studios also raised American audiences' spirits with patriotic comedies and musicals, including Michael Curtiz's *Yankee Doodle Dandy* (1942), Charles Vidor's *Cover Girl* (1944), Bruce Humberstone's *Pin-Up Girl* (1944), and George Sidney's *Anchors Aweigh* (1945).

While Disney produced training films, it also released a popular cartoon in 1943 called *Der Führer's Face or Donald Duck in Nutzi Land.* Similarly, Warner Brothers released many propaganda cartoons featuring Bugs Bunny and Daffy Duck. Other films explored the war's personal impact, such as Curtiz's *Casablanca* (1943) and Alfred Hitchcock's *Lifeboat* (1944). As the war ground toward its end, grimmer depictions of real combat emerged from Hollywood, among them John Ford's *They Were Expendable* (1945), William A. Wellman's *The Story of GI Joe* (1945), Edward Dmytryk's *Back to Bataan* (1945), and Lewis Milestone's *A Walk in the Sun* (1946).

In the United Kingdom, the film industry's response to the war mirrored its American counterpart. Before 1937, mainstream British cinema addressed little in the way of international politics or foreign policy, but with the onset of war in 1939—and under heavy government censorship from the Ministry of Information—Britain began one of the most aggressive propaganda film efforts of any warring power. Newsreels abounded, and dramatized documentaries such as *Target for Tonight* (1941), *Coastal Command* (1942), *Fires Were Started* (1943), and *Western Approaches* (1944) had widespread and enthusiastic audiences.

Feature films such as Penrose Tennyson's *Convoy* (1941), Anthony Asquith's *Freedom Radio* (1941) and *The Demi-Paradise* (1943), Bernard Miles's *Tawny Pipit* (1944), David Lean's *This Happy Breed* (1944), Michael Powell and Emeric Pressburger's controversial *The Life and Death of Colonel Blimp* (1943) and the morality story *A Canterbury Tale* (1944), and Asquith's RAF tribute, *The Way to the Stars* (1945), personified the resolute British determination to see the war through to victory.

Heroic acts of British warriors—not always in World War II—were portrayed in numerous movies, including Powell's *The Lion Has Wings* (1939) and *One of Our Aircraft Is Missing* (1942), Harold French's *The Day Will Dawn* (1942), Charles Friend's *The Foreman Went to France* (1942), Noel Coward's *In Which We Serve* (1942), Frank Launder and Sidney Gilliat's *Millions Like Us* (1943), Sergei Nolbandov's *Undercover* (1943), Carol Reed's *The Way Ahead* (1944), and Sir Laurence Olivier's *Henry V* (1944). Michael Powell's *49th Parallel* (1941) served as a special call for American involvement by moving the Nazi threat in a fictional context to the American border in Canada.

The Soviet film industry, under the firm grip of Stalinist censors by the mid-1930s, produced a string of propaganda works preceding the war that glorified traditional Russian and Soviet heroes. Director Sergei Eisenstein anticipated the coming war with Germany in his epic *Alexander Nevsky* (1938) and obliquely depicted Joseph Stalin's dictatorship in his sprawling two-part *Ivan the Terrible* (1944–1946).

Most wartime films, however, were documentaries or fiction with strong documentary elements. Newsreels were released every three weeks: for

instance, *Our Moscow* (1941) and *Moscow Fights Back* (1942). Fridrikh Ermler directed *She Defends the Motherland* (1943), which, along with Mark Donskoi's *The Rainbow* (1944), celebrated Soviet women partisans. Ukrainian Mark Dovzhenko confined his output to *Battle for Our Soviet Ukraine* (1943) and *Victory in Right-Bank Ukraine* (1945). Vsevolod Pudovkin addressed the war with *In the Name of the Motherland* (1943).

With the German occupation of France in 1940, directors and actors who did not emigrate (many went to the United States) were able to find work in the Vichy-governed free zone or with the German-controlled industry in Paris. Production by the latter rapidly outstripped that of the cash-strapped south. Continental Films, established in 1940 under the leadership of Alfred Greven, served as the central producer. Free from Hollywood competition, the French film industry thrived during the occupation, but to escape censorship it produced much escapist fare, including Marcel Carne's *Evening Visitors* (1942) and *Children of Paradise* (1943–1945) and Jean Cocteau's *Eternal Return* (1943).

"Women's films," mostly melodramas such as Gance's *The Blind Venus* (1940), Jean Gremillon's *The Sky Is Yours* (1943), and *The Well-Digger's Daughter* (1942) were ambiguous, on the one side reinforcing ideals of womanhood touted by fascists but, on the other, portraying powerful female characters. More controversially, Henri-Georges Clouzot's *The Raven* (1943) enjoyed popularity among Occupation filmgoers but was immediately banned after the liberation, with punishments for most of the people involved in the film—this in spite of many thematic ambiguities.

The Italians also made a number of notable war-related films. Francesco de Robertis' *Alfa Tau* (1942) detailed the attack on and sinking of the British submarine *Triad* in the Mediterranean on October 15, 1940; the same year, Carmine Gallone's *Odessa in Flames,* a joint Italian-Romanian production, featured the fighting at Odessa in 1941, and Roberto Rossellini's *A Pilot Returns* detailed a young Italian pilot's escape from a British prison camp in Greece. Piero Costa's *Aeroporto* (1944) is a profascist film about a fighter pilot who, after Otto Skorzeny's rescue of the imprisoned dictator on July 27, 1943, flies his fighter plane to Mussolini's puppet state in the north of Italy. On a less jingoist note, Rossellini's *Paisan* (1946) consists of six vignettes of the Allied invasion from July 1943 to the winter of 1944. Further reflecting Italy's complex shifts during the war years, Pietro Francisci's *Christmas at*

Camp 119 (1947) reflects the reminiscences of Italian prisoners of war in an American camp.

It is not surprising that the German Third Reich, which American film critic Eric Rentschler has described as a "sustained cinematographic event," relied heavily on the power of the cinema to sway public opinion. By 1937, the National Socialist Party exercised total control over the German film industry. Joseph Goebbels took charge of monitoring production, advising executives about what constituted a "good" film and banning those he believed ran counter to Third Reich values. Of the more than 1,000 films made in Germany under the Nazi regime, however, fewer than 15 percent constituted pure propaganda. Some of these were powerfully conceived, such as Leni Riefenstahl's prewar *Triumph of the Will* (1935) and *Olympia* (1938). The ubiquitous newsreels were designed to promote the Nazi Party as Germany headed toward war. Fritz Hippler's overtly anti-Semitic pseudodocumentary *The Eternal Jew* (*Die ewige Jude,* 1940), filmed shortly after the occupation of Poland, focused on Jews as parasites; similarly, Veit Harlan's *Jude Süss* (1940) continued the anti-Jewish campaign, enjoying considerable box office success throughout Europe and becoming a staple film viewed by the Hitler Youth, SS conscripts, and others.

The Nazis also made use of the militarist past in films such as Wolfgang Liebeneier's *Bismarck* (1940), which lionized the Prussian spirit, and Hans Steinhoff's *Uncle Kruger* (1941), about the nobility of the Afrikaner resisting British dominion in South Africa. Other prominent films included Kurt Hoffmann's *Quax, der Bruchpilot* (1941), a comedy about a fool who eventually becomes an accomplished pilot, and Rabenalt's *Riding for Germany* (1941), about an equestrian wounded during World War I but determined to prepare himself for new conflicts. Eduard von Borsody's *Request Concert* (1940) presented a cavalcade of German musical figures in support of the war effort.

As the tide of war turned against the Third Reich, audiences were entertained by fantasy in Josef von Báky's *Münchhausen* (1943). Harlan's *Kolberg* (1945), the most expensive German film of World War II, harked back to the conquest of Breslau in 1813. Ironically, this tale of victory premiered amid the steady bombing of Berlin, and shortly after its release, Soviet forces encircled and captured the eponymous town in Pomerania.

Scores of Japanese films lionized the military after that nation's early

conquests. As in other states, the Japanese government acted to control media so that by 1936, the film industry operated under the Media Section of the Japanese Imperial Army. Strict laws enacted in 1939 governed the production of films to ensure that they reflected national policy.

Films designed to portray the dedication and bravery of Japanese warriors and their supporters on the home front included Tomotaka Tasaka's *Mud and Soldiers* (1939), Naruse Mikio's *The Whole Family Works* (1939), Ozu Yasujiro's *Brothers and Sisters of the Toda Family* (1941), Tetsu Taguchi's *Generals, Staff, and Soldiers* (1942), and Yamamoto Kajiro's *The War at Sea from Hawaii to Malaya* (1942). Kurosawa Akira's debut *Sanshiro Sugata* (1943) was followed by his industrial paean *The Most Beautiful* in 1944. Period epics such as Uchida Tomu's *History* (1940) and Kinugasa Teinosuke's *The Battle of Kawanakajima* (1941) bolstered reverence for Japanese tradition, and Uchida's *Earth* (1939) portrayed simple farmers. Kurosawa's *They Who Tread on the Tiger's Tail* (1945) inspired criticism from both Japanese and U.S.-occupation censors and was not officially released until 1954.

Films Released after World War II

Immediately after the war, films such as William Wyler's *The Best Years of Our Lives* (1946) and Fred Zinnemann's *The Men* (1950) depicted the trauma of servicemen returning to civilian life in the United States. Heroism and bravery characterized William Wellman's *Battleground* (1949), Allan Dwan's *Sands of Iwo Jima* (1949), and Henry King's *Twelve O'Clock High* (1949). More complex in tone were Zinneman's *From Here to Eternity* (1953) and David Lean's *Bridge on the River Kwai* (1957). The 1960s and 1970s brought several epic historical dramas to the screen, including *The Longest Day* (Andrew Marton, Ken Annakin, and Bernhard Wicki, 1962), Otto Preminger's *In Harm's Way* (1965), Annakin's *The Battle of the Bulge* (1965), Franklin Schaffner's *Patton* (1970), and the Japanese and American collaboration *Tora! Tora! Tora!* (Masuda Toshio, Fukasaku Kinji, Ray Kellogg, and Richard Fleischer, 1970).

American and British audiences also responded favorably to cinematic war stories such as J. Lee-Thompson's *The Guns of Navarone* (1961), John Sturges's *The Great Escape* (1963), Robert Aldrich's *The Dirty Dozen*

(1967), Guy Hamilton's *Battle of Britain* (1969), Brian G. Hutton's *Where Eagles Dare* (1969), Mike Nichols's irreverent *Catch-22* (1970), and Richard Attenborough's *A Bridge Too Far* (1977). Two films revealed an increasing awareness of the German experience: Sirk's *Time to Love and a Time to Die* (1958), based on a sentimental novel by Erich Remarque, and Sam Peckinpah's *Cross of Iron* (1977), based on German writer Willi Heinrich's 1956 novel, *Days of Glory*.

As the 21st century approached, the horrors of combat were startlingly revisited to great realistic effect, notably in Terrence Malick's *The Thin Red Line* (1998) and Steven Spielberg's *Saving Private Ryan* (1999). Overblown and historically inaccurate blockbusters such as Michael Bay's *Pearl Harbor* (2001) and Jeran-Jacques Aemand's *Enemy at the Gates* (2001) have contributed little to the cinematic record of the war.

Other more recent blockbusters include Hemingway's *Redtails* (2012) and the British documentary *Age of Heroes* (2011), featuring the formation of elite UK commando forces. On a farcical level, Tarantino's *Inglourious Basterds* (2009) tells a bizarre tale of Jewish American soldiers who plan to assassinate Nazi leaders.

Even though film memorialized the Soviet experience during the Great Patriotic War, as it was known by the Soviets, with ravaged cities and perhaps 27 million deaths, Soviet studios were hamstrung by ideology that slowed film production during the immediate postwar period. In Mikhail Chiaureli's two-part *The Fall of Berlin* (1949–1950), for instance, the Stalinist cult of personality blended with the glory of the recent victory over Germany. In the years after Joseph Stalin's death in 1953, a cultural thaw gradually yielded more expressive and complex war films such as Mikhail Kalatozov's *The Cranes Are Flying* (1957), Grigorii Chukhrai's *Ballad of a Soldie*r (1959), and Andrei Tarkovsky's *Ivan's Childhood* (1962).

The stagnant Leonid Brezhnev years of the late 1960s to the early 1980s produced a string of mostly forgettable panegyrics to the war's memory, most significantly Iurii Ozerov's *Liberation* (1972). Yet the war still loomed large in Ozerov's *Stalingrad* (1989) and Mikhail Ptashuk's *August 1944* (2000).

With the artistic freedom afforded them beginning in the late 1980s by Soviet leader Mikhail Gorbachev's perestroika and glasnost policies, Soviet directors indulged in social and cultural criticism as never before. Elem Klimov's *Come and See* (1985) presaged this new openness by addressing

the 1943 Nazi occupation of the Belorussian Soviet Socialist Republic. More recently, Nikolai Lebedev's massive production *The Star* (2002) is about Soviet scouts working behind enemy lines during the Belorussia Offensive (Operation BAGRATION). In 2012, Sergei Loznitsa's *In the Fog* dealt with themes of collaboration on the Belorussian front.

In France, postwar films tended to ignore collaboration and to promote themes of the resistance. For instance, René Clement's *The Battle of the Rail* (1946) shows self-sacrificing railway workers combating the Nazi stranglehold. Only in the 1960s did the French cinema try to tackle the many facets of the occupation with Marcel Ophuls' *The Sorrow and the Pity* (1969), a two-part documentary that involves participants from all sides.

Acknowledgment of the German occupation and the Vichy era further emerged in the work of French directors, including Claude Chabrol's *Line of Demarcation* (1966), Louis Malle's *Lacombe Lucien* (1974), François Truffaut's *The Last Metro* (1980), Malle's *Au Revoir les Enfants* (1987), Ophuls's *Hotel Terminus* (1987), and Chabrol's *The Story of Women* (1988) and *Eye of Vichy* (1993). Other films that explore countermyths of the occupation include Malle's *Lacombe Lucien* (1974), Jean-Pierre Melville's *Army of Shadows* (1969), and Alain Resnais' *Hiroshima Mon Amour* (1959). More recently, Rachid Bouchareb's French-Algerian *Days of Glory* (2006) addresses the discriminatory treatment meted out to colonial troops during World War II.

Similarly, the Italian cinema initially propagated a resistance myth in films such as Carlo Lizzani's *Attention! Bandits*! (1951) and Roberto Rosselini's *Open City* (1945), *Paisa* (1946) and *Germany, Year Zero* (1948). The urban and economic ruins of postwar Italy informed classics such as Vittorio de Sica's *Shoeshine* (1946), *The Bicycle Thief* (1947), and *Umberto D.* (1952). The fascists and the war receded from mainstream cinematic view until renewed interest was revealed in such films as Bernardo Bertolucci's *The Conformist* and *The Spider's Strategem* of 1970, de Sica's *Garden of the FinziContinis* (1971), Federico Fellini's nostalgic *Amarcord* (1973), Ettore Scola's *A Special Day* (1977), Paolo and Vittorio Taviani's *The Night of the Shooting Stars* (1982), Gabriele Salvatore's *Mediterraneo* (1991), and Guido Chiesa's *Johnny the Partisan* (2000). Enzo Monteleone's *El Alamein—The Line of Fire* (2002) takes the war to North Africa in 1942.

After a faltering start with filmmaking firmly controlled by postwar

occupation forces, World War II gradually assumed its present-day importance on the German screen. Initially, East Germany was the base of the film industry: for instance, Wolfgang Staudte depicted the postwar situation in *The Murderers Are Among Us* (1946), while Slatan Dudow offered tribute to the new socialist order in *Our Daily Bread* (1949) and Gerhard Klein offered a study of love divided by politics in *Berlin Romance* (1956).

In West Germany, Peter Lorre directed *The Lost Man* (1951), Robert Siodmak exposed the Gestapo in *The Devil Strikes at Midnight* (1957), and Bernhard Wicki questioned the war in *The Bridge* (1959). From the 1980s onward, more and more films by leading directors probed both the German military and civilian experience. István Szabó's *Mephisto* (1982), based on Klaus Mann's eponymous novel, traces the fortunes of a German stage actor who sells out to the Nazi state. Perhaps the most outstanding film ever produced about submarine warfare was the German film *Das Boot* (1982), directed by Wolfgang Petersen, and in 1984 Schirk's *Wannsee Conference* traced the infamous conference that decided the fate of European Jewry. In 1993, Joseph Wilsmeier produced *Stalingrad*, a harrowing depiction of the great military debacle. More recently, Max Färberböck's *A Woman in Berlin* (2008) relates the story of a woman desperately trying to survive the Soviet invasion during the last days of the war. Also worthy of mention are Margarethe von Trotta's *Rosenstrasse* (2003), depicting the Rosenstrasse protest of 1943; Oliver Hirschbiegel's 2004 film *Downfall* (German, *Der Untergang*), depicting the last days of Adolf Hitler; and a film directed by Marc Rothemond, *Sophie Scholl, The Final Days* (2005).

In Japan, copies of more than 200 films on topics forbidden by the Americans were rounded up and burned in 1946, creating almost a tabula rasa for film. Ichikawa Kon directed moving Japanese war stories in *The Burmese Harp* (1956) and *Fires on the Plains* (1959), Kumai Kei explored Japanese treatment of American prisoners of war in *The Sea and Poison* (1986), and Japan's nuclear trauma was expressed in Imamura Shohei's *Black Rain* (1989). *Spy Sorge* (2003), about a Soviet spy and directed by Masahiro Shinoda, enjoyed only modest success. Themes of Emperor Hirohito and his confrontation with General Douglas MacArthur emerge in the Japanese-made *The Sun* (2005), the fourth part of Aleksandr Sokurov's tetralogy.

Polish filmmaker Andrzej Wajda directed significant films about the war: *Generation* (1955), *Kanal* (1957), and *Ashes and Diamonds* (1958). Janusz

Zaorski's *Mother of Kings* (1976) examined Poland's history from the period of World War II to Stalinist times. The effects of the war on India were explored in Satyajit Ray's *Distant Thunder* (1973). In presenting the theme of a controversial romance between a Thai woman and a Japanese officer in wartime Thailand, director Euthana Mukdasanit's *Sunset at Chaopraya* (1996) moved almost full circle in echoing the similar tension of Japanese director Fushimizu Osamu's notorious propaganda film of 1940, *China Nights.* A recent Czech film, Ondrej Trojan's *Zelary* (2003), concerns a nurse and a surgeon who are part of a resistance movement in the 1940s.

Whether triumphant, tragic, sentimental, dispassionate, or cynical in tone, these postwar films bear witness to the persistence of World War II in collective human memory and the questions the war continues to provoke.

Finally, while space in the present essay does not permit a full exposition of the subject, no history of the war would be complete without some treatment of the leading films that the Holocaust has inspired. Among the hundreds of films, Alain Renais's documentary *Night and Fog* (1955), made 10 years after the liberation of the concentration camps, focuses on the lives of prisoners in Auschwitz and Majdanek. Not surprisingly, another early movie is George Stevens's *The Diary of Anne Frank* (1959), an Academy Award–winning movie based on the most famous diary of the Holocaust era. *The Night Porter* (1974), directed by Italian director Liliana Cavani, figures as one of the most controversial films on the topic, featuring the ambiguous relationship between a Nazi prison guard and a female inmate. Also portraying ambiguous relationships between oppressor and the oppressed, Alan Pakula's *Sophie's Choice* (1982), based on William Styron's eponymous novel, relates the story of a Polish immigrant tormented by her Auschwitz past.

In an interesting twist of plot, German director Agnieszka Holland's *Europa Europa* (1990), based on the biography of Solomon Perel, deals with a Jewish boy who escapes the Holocaust by pretending to be a non-Jew who joins the Nazi Party. In another controversial film, Constantinos Gavras's (Costa-Gavras) *Amen* (2002), a Waffen-SS officer tries to inform Pope Pius XII about the Holocaust, only to have his message fall on deaf ears. Coming from a nation that has produced a host of Holocaust films, Polish director Roman Polanski created one of the all-time classics with *The Pianist* (2002), about the tribulations of a Polish Jewish musician who struggles to survive in

Warsaw under Nazi occupation. Other Holocaust films have met with popular reception but have been criticized for historical inaccuracies. These include Steven Spielberg's *Schindler's List* (1993), perhaps the largest cinematic blockbuster to date, that relates the activities of German industrialist Oscar Schindler, who saved the lives of some 1,200 Jews by employing them in his factories, and a juvenile favorite, Mark Herman's *The Boy in the Striped Pyjamas* (2008), which explores the friendship between the son of a Nazi prison guard and a Jewish inmate. Another recent movie, Lajos Koltai's *Fateless* (2005), is based on the semiautobiographical novel *Fatelessness* by Hungarian Nobel Prize winner Imre Kertész, who relates the experiences of a teenage boy in various concentration camps.

Finland

Nation situated in Northern Europe (Scandinavia) encompassing 136,596 square miles. Finland borders Sweden to the west, Russia (Soviet Union in 1939) to the east, Norway to the north, and the Gulf of Finland to the south. The country's 1939 population was approximately 3.7 million. Finland had secured its independence from Russia in 1917, but the Finns had to fight to maintain it. Concerned about the growth of German military power, in the late 1930s Soviet dictator Joseph Stalin applied pressure on Finland for territory in the Karelian Isthmus and for the naval base of Hanko on the Gulf of Finland to provide protection for Leningrad, the Soviet Union's second-largest city. In return, Stalin was prepared to yield more territory than he sought, but it was far to the north. The Finnish leadership, believing that the Soviets were bluffing, rejected the demands.

Soviet forces invaded Finland on November 30, 1939, and the First Finnish-Soviet War (known as the Winter War) lasted until March 13, 1940. The governments of both Great Britain and France discussed the possibility of military intervention, in large part to cut Germany off from Swedish iron ore, but both Norway and Sweden denied transit rights to the Allies. Commander of Finnish armed forces Marshal Carl Mannerheim led a spirited Finnish defense. However, the Finns were overwhelmed by sheer weight of Russian numbers and military hardware.

On March 12, 1940, the Finns signed the Treaty of Moscow. Under its terms, which went into effect at noon the next day, Finland lost one-tenth of its territory, including the entire Karelian Isthmus. The country then had to absorb 400,000 refugees, as virtually all the Finns moved out of the surrendered territory rather than live under Soviet rule.

New Soviet pressure angered the Finns, who signed a secret transit agreement with Germany in August 1940 allowing German troops to pass through Finland to northern Norway. Discussions began between the German and Finnish staffs regarding Operation BARBAROSSA, the German June 22, 1941, invasion of the Soviet Union, but the Germans never told the Finns details of the plan until the invasion was about to commence. The Germans began arms shipments to Finland in 1941, particularly artillery and antitank weapons. By June 1941, the Finnish government of President Risto Ryti committed to the plan but resisted a formal alliance with Germany,

maintaining that the Finns were merely fighting a defensive war against Soviet aggression and were a cobelligerent. The Finns managed to evade every request for such an alliance throughout the war.

Finland never defined war aims for this Second Finnish-Soviet War, known as the Continuation War. The clearest statement of its aims was a self-imposed halt in Finnish offensive military operations 50 to 90 miles beyond the 1939 borders, with the additional territory taken for defensive reasons. Mannerheim hoped that by limiting its advance into Soviet territory, Finland might retain its friendship with the United States and Great Britain. The Finnish government endeavored to convey the impression that Finland had been drawn into the conflict, although this was hard to accomplish with German troops in Finland before the commencement of BARBAROSSA, with naval cooperation between Finland and Germany and with the German Air Force flying in Finnish air space and refueling at Finnish airfields. Britain warned Finland at the end of September to advance only to the 1939 frontiers and declared war on Finland on December 6, 1941, the same day Finland halted its advance into Soviet territory.

The front with the Soviet Union was stable from May 1942 until June 1944, when the Soviets launched a powerful offensive with vastly superior manpower and firepower. The Ribbentrop-Ryti Agreement between the German foreign minister, Joachim von Ribbentrop, and Ryti was signed in late June 1944, promising that in exchange for weapons, Finland would not seek a separate peace. Finland had earlier in the year rejected peace terms from the Soviet Union because of their harshness and because Finland hoped that an Allied invasion of Germany would cause the Red Army to race to Berlin.

By July, the Red Army was doing exactly that; President Ryti resigned, and Mannerheim assumed office. Mannerheim repudiated Ryti’s agreement and negotiated a cease-fire with the Soviet Union. As part of the cease-fire, concluded on September 19, 1944, Finland had to expel or intern all German troops on its soil. This went peacefully until the Germans tried to seize Suursaari Island, which led to bitter fighting there and in Lapland in northern Finland. Although the campaign was virtually over at the end of November 1944 (the date established by the cease-fire agreement for Finnish demobilization), the last German troops did not depart Finland until April 1945.

The cease-fire and later armistice with the Soviet Union reaffirmed the 1940 borders, accepted Soviet reparations demands for raw materials and machinery, and limited the Finnish military in numbers and types of weapons. Finland suffered nearly 92,000 dead (including 2,700 civilians) during World War II. Soviet forces did not occupy Finland, and Finland's political institutions were left intact—the only eastern enemy of the Soviet Union so treated.

Finland, Air Force

In the 1930s, two controversies hindered Finnish aircraft acquisition. The first was whether fighters or bombers should have priority (the need for fighters seeming paramount). The second was from which country to purchase aircraft. The head of the Defense Council, Carl Mannerheim, favored Germany, and the air force commander, Colonel Jarl Lundquist (later a lieutenant general), favored Britain. Mannerheim stressed the danger of air attacks on Finnish cities when arguing for more funds for the air force, but he gave priority to air support for ground forces when war came.

In September 1939, the Finnish Air Force (FAF) had only 36 modern interceptors (Dutch Fokker D-XXIs) and 21 bombers (14 Bristol Blenheims and 7 Junkers K430s). Lundquist deployed his limited fighter assets forward to protect the army and defend as much Finnish air space as possible. Following the Soviet invasion of Finland on November 30, 1939, Finnish bombers attacked airfields and supported ground forces. In late December

1939, the FAF was able to purchase additional Fokker fighters, but its best aircraft came in the form of Morane-Saulnier MS-406s purchased from France. The Finns purchased additional Blenheims, U.S. Brewster F2A Buffalos (the Finns enjoyed considerable success with this much-maligned aircraft), Italian Fiat G-50s, and MS 406s. Most arrived too late for the war.

During the First Finnish-Soviet War of 1939–1940, also called the Winter War, the FAF supposedly accounted for some 200 Soviet aircraft, and more than 300 others were destroyed by antiaircraft fire or on the ground. Finnish losses during the war totaled 62 aircraft.

On June 25, 1941, when Finland again went to war with the Soviet Union (the Second Finnish-Soviet War of 1941–1944, also called the Continuation War), the FAF had increased substantially. It possessed 144 modern fighters (a mixture of U.S., British, French, Dutch, and Italian planes), 44 British and ex-Soviet bombers, and 63 mostly British and German reconnaissance planes. Once the Continuation War began, Finnish access to aircraft from other nations except Germany was cut off. The Finns did have their own aircraft industry, which produced limited numbers of aircraft including the VL Myrsky II fighter.

FAF strategy stressed aggressiveness; isolated fighters usually attacked no matter the number of Soviet aircraft. The FAF employed a blue swastika marking (no relation to the Nazi version) for national identification. The Luftwaffe and the FAF cooperated in this conflict, although neither could prevent Soviet air raids into Finnish territory or completely screen the Finnish Army from air attacks.

Finland, Army and Navy

In September 1939, Finland had a small military establishment. The nation's war mobilization plan dated from May 1934 and divided the country into nine military regions. Depending on its size and population density, each region had two or three districts. Each district furnished one infantry regiment of three battalions and a field artillery battalion of 12 guns. The more populous districts provided additional support troops or regiments. On full mobilization, Finland could call up some 337,000 men. Carl Gustav Mannerheim, commander of the Finnish armed forces, designed the mobilization plan. Despite his best efforts, however, the military services were constantly underfunded, underequipped, and plagued by a government that insisted on relying on domestic sources that often did not exist.

When the First Finnish-Soviet War (Winter War) began on November 30, 1939, the Finns concentrated their forces in key areas along the Soviet border, much of it impassable wilderness. The army fought hard and well, uninhibited by any rigid military doctrine or tactical theory. It used initiative and guile in exploiting terrain to its advantage—making fierce, sudden attacks according to *motti* tactics (*motti* is the Finnish word for a pile of logs held together by stakes ready to be chopped into firewood) to ambush and destroy road-bound Soviet columns. Finnish military thought had stressed encirclement tactics since the 1930s. The *motti* tactics were highly successful, involving mobile Finnish ski troops trained to fight in winter conditions who took advantage of their familiarity with the terrain.

By February 1940, however, in consequence of Soviet air supremacy, the Finns could hold their lines only by withdrawing during the day and counterattacking at night. Finally, the Finnish Army was ground down by vastly superior Soviet numbers and firepower. During the Winter War, which ended on March 12, 1940, the Finnish military sustained 22,425 killed, 1,424 missing, and 43,557 wounded.

On the conclusion of peace, Mannerheim immediately began making plans to rebuild the military. His new mobilization plan provided for 16 divisions with a total strength of 475,000 troops, or 13 percent of the entire population. Because of the limited Finnish economic base, any future war

would have to be concluded speedily. Mannerheim also increased the amount of artillery in the army, forming a tank battalion equipped with tanks captured from the Soviets and acquired from Britain, plus a heavy-tank platoon and seven independent-tank platoons.

The Second Finnish-Soviet War (June 25, 1941–September 4, 1944), known as the Continuation War, began in late June 1941. In this war, the Finns took back their 1939 borders and a slight amount of additional territory. The Soviets fought stubbornly, and the Finns suffered unexpectedly high casualties. After reaching those borders in late September, the Finns advanced into Soviet territory to shorten their three front lines on the Karelian Isthmus, but they refused to take part in operations against Leningrad as the Germans wished.

Finnish infantry in action during World War II. (Hulton-Deutsch Collection/Corbis)

A lull in the fighting allowed 20 percent of the troops to be demobilized and returned to industry and agricultural pursuits in the early months of 1942. When the tide of war on the Eastern Front turned decisively against Germany, the Soviets renewed their attacks against the Finns in June 1944, and with vastly superior resources they soon overwhelmed the Finnish positions. Fighting was concluded by a cease-fire in early September. During the Continuation War, the Finns suffered approximately 65,000 military dead

against the Soviets and a further 2,000 against the German forces following the end of fighting with the Soviets.

The Finnish Navy was quite small, and its activities were largely limited to mine laying. At the start of the Winter War, Finland had 5 submarines, 2 armored coastal vessels, 4 gunboats, and 10 motor torpedo boats. Operations in the Gulf of Finland halted in the winter when it froze. The Finnish Navy cooperated with German naval units during the Continuation War to confine the Soviet Baltic Fleet to the eastern end of the gulf and mined the Soviet coast. Throughout the Continuation War, Finnish naval strategy was defensive, designed to prevent the Soviets from interfering with trans-Baltic shipping or intervening in the land battles.

Finnish-Soviet War, First (November 30, 1939–March 13, 1940)

Regional conflict between Finland and the Soviet Union, also called the Winter War (1939–1940). In late 1939, Soviet leader Joseph Stalin was concerned with the sharp increase in German power following the conquest of Poland, and he sought to acquire additional territory to protect portions of the Soviet Union from a possible German attack through Finland. He was especially anxious to protect approaches to Leningrad, which was only 20 miles from the Finnish border on the Karelian Isthmus. These security concerns prompted Stalin to demand that Finland cede much of the isthmus,

destroy all fortifications there, and cede certain islands in the gulf as well as grant the Soviet Union land for a naval base to the west on the Hanko Peninsula. Stalin was prepared to grant more territory than he demanded—2,134 square miles in return for 1,066—although the Soviet territory offered was in the less desirable north, in East Karelia above Lake Ladoga.

In 1941 Finland had a population of only some 3.7 million people, while the Soviet Union's population was some 197 million. Finland thus hardly seemed in a position to reject Stalin's demands. Although the Finns were open to some compromise regarding territory above Leningrad, they were upset about demands for the destruction of their fortifications and for a naval base on the Hanko Peninsula. Tough negotiations continued for two months without result. Finnish leaders believed that Stalin was bluffing, but after a contrived border incident on November 26, 1939, Stalin ordered an invasion, which began on November 30, 1939. It was not one of Stalin's finer military exploits.

Despite overwhelming superiority in manpower, resources, and equipment, it took the Red Army nearly four months to crush its tiny opponent. About the only advantages for Finland were the harsh climate, soldiers' familiarity with the area, superior leadership and training, and high morale; after all, the Finns were fighting for their homeland. The abundant forests provided good cover and concealment amid sparse settlements and poor trails. Only the Karelian Isthmus had developed towns and farming areas with roads. This environment worked against mechanized operations and gave the advantage to mobile forces equipped with skis. Marshal Carl Gustav Mannerheim, commander of the Finnish forces, possessed keen insight regarding the strengths and weaknesses of the Red Army (having served in the prerevolutionary Russian Army), and Finnish commissioned and noncommissioned officers were well trained and demonstrated considerable initiative.

In all the Finns fielded about 300,000 men, but they had only 422 artillery pieces, 32 tanks, and just a few aircraft. Many independent battalions and separate companies were dispersed throughout the country. The Finns lacked equipment of all sorts, and what they had was a variety from different countries. The soldiers were well acclimated and wore white camouflage uniforms to facilitate swift movement. The Finns also did what they could to

strengthen their natural defensive line on the Karelian Isthmus by constructing obstacles, trenches, and bunkers.

For the initial invasion, Stalin employed only 20 Soviet divisions against 16 Finnish divisions, and he must bear responsibility for the initial Soviet military failure in Finland. Fresh from the Red Army's relatively bloodless triumph in Poland, Stalin personally intervened to reject the plan advanced by his chief of staff, Marshal Boris M. Shaposhnikov, which entailed a careful buildup and use of the best Soviet troops, even those from the Far East. Stalin rebuked Shaposhnikov for overestimating the Finns and underestimating the Red Army. The new plan, worked out on Stalin's orders and confirmed by him, led to the fiasco of the early Soviet defeats, leaving Shaposhnikov to remedy the situation.

The Soviet military was in wretched shape. Recent purges had decimated the officer corps and had left in command unqualified men who were reluctant to take the initiative. The soldiers were poorly trained in winter fighting and breaching fortified lines. The standard Soviet rifle division was well manned and well equipped, but the heavy material was not suited to such a primitive operational environment. The Soviets did have an advantage in heavy artillery, but little coordination had been developed between the arms, so attacks were not synchronized for effectiveness. A severe lack of communications equipment added to the problems of coordination and tactical flexibility. Among the rank and file, morale was poor. These factors mitigated overwhelming Soviet advantages in manpower and quantities of equipment.

In December 1939, the Finns halted the main Russian thrust across the Karelian Isthmus at the so-called Mannerheim Line. The Finns gained an early advantage when they obtained the Soviet tactical codes through the corps level. Thus, they could monitor Soviet radio communications and decrypt Soviet units' locations. This intelligence became a force multiplier and helped the Finns to detect, outmaneuver, and defeat far larger Soviet formations. The Finns would cut off the enemy line of communications, separate the road-bound columns into pockets called *mottis* (*motti* is the Finnish word for a pile of logs held together by stakes ready to be chopped into firewood), and then destroy them piecemeal. By moving quickly, firing from concealed positions, and rapidly eliminating Soviet patrols, the Finns produced fear that reduced the ability of Soviet forces to react. The Finns also

showed great ability in improvisation (as with the gasoline bomb in a bottle hurled at Russian tanks and dubbed the “Molotov cocktail”), by their effective use of ski troops, and by fitting largely antiquated biplane aircraft with skis so they could operate in snow.

After major defeats destroyed several of their divisions at Tolvajärvi and Suomussalmi, the Soviets brought in new divisions and spent almost a month training intensively in tactics to develop better coordination among infantry, tanks, and artillery. In addition, they focused on better close air support and the development of mobile reserves to exploit breakthroughs. At the small-unit level, special assault groups were organized to destroy Finnish bunkers efficiently.

Not until February 1940 did Soviet forces mount an effective assault on the Mannerheim Line. They doubled their strength against the Mannerheim Line with the Northwest Front, commanded by Marshal Semyon K. Timoshenko, and concentrated more than 35 divisions, which included heavy artillery and new-model tanks, against the weakened Finns. Sheer weight of numbers enabled the Soviets to break through the Finnish line at Summa on February 11, and by March 8 they had captured part of the key Finnish defensive anchor at Viipuri (Vyborg).

Stalin then dictated a peace settlement. He did not annex Finland or even Helsinki, but he exacted territorial concessions well in excess of those sought before the war. The Finns were forced to yield some 25,000 square miles of territory, including the Karelian Isthmus. The war also displaced some 400,000 Finns, for virtually all left the territory ceded to the Soviet Union.

Although Soviet terms were regarded as harsh by the Finns and by Finland’s many international supporters, they were mild compared with those the Soviet Union imposed on the three Baltic countries. In the case of Finland, Stalin may have been deterred by the strong anti-Soviet sentiment that the invasion had aroused throughout the world. Indeed, 11,500 volunteers went to Finland to fight against the Soviets. Britain and France actually considered military intervention against the Soviet Union, including bombing strikes against the Caucasian oil fields and an “uninvited landing” in Norway as a preliminary step to sending troops to Finland. Seen in retrospect, such a step would have been disastrous to the Allied war effort.

Stalin may also have been restrained by his desire to keep open the option of a possible alliance with the West against Hitler and to minimize the many

disadvantages resulting from the Soviet aggression. One consequence for the Soviet Union of its invasion—expulsion from the League of Nations—was not a major blow.

Ultimately, the Soviets had hurled 1.5 million men (almost half their army in Europe), 3,000 aircraft, and nearly as many tanks against Finland. The Soviets suffered 230,000 to 270,000 dead—many the result of the cold and because of poor Soviet medical services—and a comparable number of wounded. They also lost 1,800 tanks and 634 aircraft. The Finns sustained far fewer casualties (22,425 killed and 43,557 wounded), and 62 of the 162 planes of their largely antiquated air force were lost.

One of the war's most important effects was the damage to Soviet military prestige. Many observers, including Hitler, believed that the Soviet Union was incapable of waging a large-scale war. Another consequence was the Soviet decision to adopt the Finnish automatic sidearm, which saw extensive use during World War II and the Korean War. After the German invasion of the Soviet Union in June 1941, Finland waged war against the Soviet Union as a cobelligerent of Germany, a decision that led to Finland unfairly being branded as an Axis power and to its second defeat in 1944.

Finnish-Soviet War, Second (June 25, 1941–September 4, 1944)

Renewal of warfare between Finland and the Soviet Union, also called the Continuation War (1941–1944), with the fighting occurring mainly northwest and northeast of the Soviet city of Leningrad. Finland's rejection of Soviet demands for territory and bases to protect access to Leningrad—including the cession of Viipuri (Vyborg), Finland's second-largest city, and the surrounding Karelian Isthmus—had led to the First Finnish-Soviet War, known as the Winter War. That war began in November 1939, and although the Finns fought well, the odds against them were hopeless. In March 1940, Finland was obliged to sue for peace, in which it had to cede even more territory than the Soviets had originally demanded.

Fearing additional Soviet demands and resenting Soviet interference in its policies, Finland aligned itself with Germany. In the fall of 1940, chief of the Finnish General Staff Lieutenant General Erik Heinrichs held talks in Berlin with German leaders, who requested Finnish assistance during Operation BARBAROSSA, the planned German invasion of the Soviet Union (chiefly in operations against Leningrad and Murmansk) that would begin on June 22, 1941. The Finnish government welcomed this as an opportunity to recover territory lost to the Soviet Union in the Winter War.

As planning progressed, the Germans and Finns agreed that German forces would secure the nickel-rich Petsamo region and attack Murmansk in the far north, while the Finns would be responsible for operations in the southeast toward Leningrad and Soviet Karelia, centered on Petrozavodsk. General Carl Mannerheim (promoted to field marshal in 1942) commanded the Finnish forces, as he had in the Winter War of 1939–1940. Mannerheim had 16 divisions: 11 along the frontiers, 1 opposite the Russian base at Hanko, and 4 in reserve.

On June 22, 1941, the Germans launched their massive invasion of the Soviet Union. Finland had already secretly mobilized its forces and declared war on June 25, but as a cobelligerent of Germany rather than as an ally. The German drive in the far north from Petsamo eastward fell short of both Murmansk and the large Soviet naval base at Polyarny. German forces also had little luck driving east from the northern city of Rovaniemi, failing to cut the Soviet rail line running from Murmansk south along the White Sea coast.

In the south, however, the Finns made much better progress. Preoccupied with the massive German onslaught, Red Army forces north of Leningrad were outnumbered.

Mannerheim divided his forces into two armies: one drove down the Karelian Isthmus between the Gulf of Finland and Lake Ladoga; the other marched southeast between Lake Ladoga and Lake Onega toward the Svir River to take Petrozavodsk, capital of Karelia. On June 29, the Finnish Karelian Army (II, IV, VI, and VII Corps) attacked to the west and east of Lake Ladoga, crossing the Russo-Finnish border of 1940, recapturing Finnish Karelia, and driving on Leningrad. Aided by German contingents, Army Group Mannerheim attacked Soviet Karelia. Farther north, combined Finnish and German forces recaptured lost Finnish territory around Salla while the German mountain troops, coming from Norway, reached as far as the Litsa River on their drive toward Murmansk.

The Finns had originally planned to unite their troops with German Army Group North around Leningrad. On September 1, the Finns reached the old Russo-Finnish border. Despite heavy fighting, the Soviets were able to withdraw, but by late August the Finns had recovered all territory lost to the Soviet Union in the Winter War. The Finnish attacks stalled north of Lake Ladoga in September.

Although the Finns were not eager to take non-Finnish land, they did advance somewhat beyond the pre–November 1939 borders for defensive purposes. Much to Germany’s displeasure, however, they refused to cooperate with German troops against the city of Leningrad. Finnish and German commanders disliked each other, and the Luftwaffe failed to provide as much air cover as had been promised. German troops did not perform well in the northern part of the front. In the dense forests and swamps that marked the terrain in the north, tanks, heavy artillery, and aircraft were often ineffective. Finnish casualties were not light, and Finland had a small population and insufficient resources for a long war. Given these points, the Finns only undertook those operations that suited them, and that did not include Leningrad. The Finns were nonetheless disappointed that the German Army was unable to secure a rapid defeat of the Soviet Union.

After capturing Petrozavodsk and Medweschjegorsk on the western and northern shore of Lake Onega, in December the Finns established a defensive position somewhat inside Soviet territory and about 20 miles from Leningrad.

Had the Finns advanced farther, Leningrad would probably have fallen to the Germans, with uncertain consequences for the fighting on the Eastern Front. The Finnish Front remained largely static from early 1942. Despite some Soviet counterattacks toward Petsamo, the battle lines changed little in the months to follow.

In August 1942, Moscow offered the Finns extensive territorial concessions in return for a separate peace, but the Finns, confident of an ultimate German victory, refused. In September 1941, London and Washington made it clear to Helsinki that any Finnish effort to advance beyond its prewar frontiers would mean war. Indeed, Britain declared war on Finland in December 1941.

As the war continued into 1942 and then 1943, the Finns lost enthusiasm for the struggle, especially when German military fortunes changed. In

January 1944, a Soviet offensive south of Leningrad broke the blockade of that city. With the tide fast turning against Germany, the Finns asked the Soviets for peace terms, but the response was so harsh that Finland rejected it. Not only would Finland have to surrender all its territorial gains, but it would have to pay a large indemnity.

Soviet leader Joseph Stalin then decided to drive Finland from the war. The Soviets assembled some 45 divisions with about half a million men, more than 800 tanks, and some 2,000 aircraft. Using these assets, in June 1944 the Soviets began an advance into Finland on both flanks of Lake Ladoga on the relatively narrow Karelian and Leningrad fronts. While the Finns were well-entrenched along three defensive lines, they could not withstand the Soviet onslaught. Viipuri fell on June 20 after less stubborn resistance than during the Winter War. Heavy fighting also occurred in eastern Karelia. Although they failed to achieve a breakthrough, Soviet forces caused the Finns to retreat and took the Murmansk Railway.

After the fall of Viipuri, the Finnish government requested German assistance. The Germans furnished dive-bombers, artillery, and then some troops, but it demanded in return that Finland ally itself firmly with Germany and promise not to conclude a separate peace. Finnish president Risto Ryti, who had been forced to provide a letter to that effect to German foreign minister Joachim von Ribbentrop (which bound him, but not his country, to such a policy), resigned on August 1 in favor of Marshal Mannerheim.

On August 25, 1944, Helsinki asked for terms. Moscow agreed to a cease-fire to take effect on September 4, but Soviet forces actually fought on for another day after that. Among the cease-fire terms were that the Finns should break diplomatic relations with Berlin and order all German troops from Finnish soil by September 15. German leader Adolf Hitler refused the Finnish request for an orderly departure of his forces and ordered German troops in northern Finland to resist expulsion and, if forced to retreat, to lay waste to the countryside. The German troops followed this order to the letter. Because there were 200,000 Germans in Finland, the damage to Lapland, where they were located, was considerable. During October, the Russian Fourteenth Army threw back German forces at Liza, supported by a large amphibious landing near Petsamo, and by the end of the month the Germans had withdrawn completely into Norway.

The war ended for Finland on October 15, 1944. The Continuation War

cost Finland some 200,000 casualties (55,000 dead)—a catastrophic figure for a nation of fewer than 4 million people. Finland also had to absorb 200,000 refugees. Finland agreed to withdraw its forces back to the 1940 frontiers, placed its military on a peacetime footing within two and a half months, granted a 50-year lease of the Porkkala District, allowed the Soviets access to ports and airfields in southern Finland, and provided the Soviet Union use of the Finnish merchant navy while the war continued in Europe. Finland also paid reparations of U.S. $300 million in gold over a six-year period. Stalin did refrain from absorbing the entire country, but in the coming decades Western-oriented democratic Finland was obliged to follow policies that would not alienate the Soviet Union.

Fiske, William "Billy" Meade Lindsley, III (1911–1940)

Olympic gold-medal bobsled driver and perhaps the first American killed in combat during World War II. William ("Billy") Meade Lindsley Fiske III was born on June 4, 1911, in Brooklyn, New York, the son of a wealthy New England banking tycoon. After attending boarding school in Chicago, Fiske took up studies in France, where he became interested in bobsledding. In 1928, he entered Trinity Hall, Cambridge University, while training for the bobsledding competition at the 1928 Winter Olympics. Representing the

United States, Fiske and his team won the gold medal at the St. Moritz, Switzerland, games. At age 16, Fiske held the record as the youngest winter-sport gold medalist until 1992. He and his team repeated their performance at the 1932 Winter Games in Lake Placid, New York.

Fiske chose not to participate in the 1936 games, instead beginning a career with the investment firm of Dillon, Reaed & Co. in London. In mid-1939, Fiske returned to the New York headquarters, but in late August, just days prior to Germany's invasion of Poland, he boarded a ship bound for England.

Hitler's Polish invasion triggered World War II in Europe, a development that caused Fiske much concern. Determined to help the British, he entered the Royal Air Force Volunteer Reserve on March 23, 1940, masquerading as a Canadian. He began pilot training almost immediately, and by all accounts he was a quick and eager study. The Battle of Britain commenced on July 10, 1940; two days later, Fiske was assigned to 601 Squadron at Tangmere, West Sussex. He undertook his first flying mission against the Germans on July 20, when he engaged in patrol sorties.

On August 16, 1940, Fiske's squadron was scrambled to intercept German dive-bombers. Piloting a Hawker Hurricane fighter, Fiske had his fuel tank punctured, and part of the plane caught on fire. Fiske did not bail out and landed his crippled aircraft at Tangmere. Having received serious burns to his hands and legs, he was transported to a hospital in Chichester, where he died on August 17. Fiske was interred in England. On July 4, 1941, the British government unveiled a plaque in his honor in St. Paul's Cathedral, London. Fiske had claimed that he was the first U.S. citizen to serve in the Royal Air Force, and he is believed to have been the first American killed in World War II.

Fitch, Aubrey Wray (1883–1978)

U.S. Navy admiral. Born in Saint Ignace, Michigan, on June 11, 1883, Aubrey Wray Fitch graduated from the U.S. Naval Academy at Annapolis in 1906. Commissioned an ensign in 1908, he ended World War I as a temporary commander. During the 1920s, Fitch specialized in naval gunnery and torpedoes. He served as executive officer on a battleship, was a member of a naval mission to Brazil, and held various ship commands.

Fitch became a naval aviator in 1930. Promoted to captain in 1931, he commanded three naval air stations and also the aircraft carriers *Langley* and *Lexington.* He graduated from the Naval War College in 1938. In April 1940, Fitch took command of Patrol Wing 2 at Pearl Harbor and was promoted to rear admiral that July. In November, he assumed command of Carrier Division 1, with his flag in the carrier *Saratoga.*

Fitch served under Rear Admiral Frank Fletcher in the aborted Wake Island relief expedition. Transferring his flag to the carrier *Lexington* in the Battle of the Coral Sea (May 7–8, 1942), Fitch exercised tactical control over U.S. carriers. He then took command of U.S. Naval Air Forces, Pacific Fleet, and in September he commanded all ground-based naval and marine aviation in the Guadalcanal Campaign (August 1942–February 1943). As such, he played an important role in the U.S. victory in the Solomon Islands Campaign (August 1942–February 1943).

Promoted to vice admiral in December 1943, Fitch became deputy chief of naval operations for air in August 1944. In 1945, he was the first naval aviator to serve as superintendent of the U.S. Naval Academy. Fitch retired as a full admiral in July 1947. He died in Newcastle, Maine, on May 22, 1978.

Flamethrowers

Modern flamethrowers were first employed by the German Army in World War I. A flamethrower is a pressure-operated device that shoots a stream of combustible liquid. The liquid is ignited as it leaves a nozzle, which can be placed at the end of a handheld tube or mounted on a tube projecting from an armored fighting vehicle. Flamethrowers consist of four elements: the fuel container, a mechanism to force the fuel from the container, a projecting tube and nozzle, and an igniting system that will set the stream of fuel on fire. Ignition systems are based on powder cartridge, electric coil, and electric spark designs.

Flamethrowers can be used in both antimatériel and antipersonnel roles. Typically, they are used in complex terrain with short standoff distances, such as in trench, city, and jungle fighting. They are used against hard targets such as bunkers, pillboxes, and mobile and dug-in tanks. German forces also used flamethrowers as defensive mines. Although these weapons possess combat advantages, these are balanced by disadvantages including short burn times, the fact that the user immediately becomes a priority target, and the vulnerability of their fuel cylinders, which can explode if struck by a bullet or shell fragmentation.

U.S. military forces used the 70-pound M-1 model fielded in 1942 and also used the M1-A1 model. The M-1 could generate a 10-second stream of fire, carried four gallons of fuel, and was man-portable. It had a range of 82 feet. The improved M1-A1 model had a range of 131 feet.

In addition to using flamethrowers in infantry assault forces and ad hoc mechanized forces, the U.S. Army established the 713th Tank Battalion (Armored Flame Thrower) in November 1944. It consisted of 54 M-4 Sherman tanks. Each Sherman was retrofitted with a Ronson flamethrower gun and had a 300-gallon fuel capacity and a flame-throwing range of 75–100 yards. The unit saw action during the invasion of Okinawa (March–June 1945) and reportedly killed more than 4,500 Japanese soldiers.

British man-portable flamethrowers were based on the 1940 No. 1 Mk-II “Marsden” and 1942 No. 2 Mk-II “Lifebuoy” models. The Marsden was an 85-pound unit with a 98-foot range. The Lifebuoy (also called the “ack-pak” unit) was a 64-pound doughnut-shaped device with a 131-foot range. The British also fielded a flamethrower tank built on the tank chassis of a Churchill tank. Known as the Crocodile, it carried 10 minutes’ worth of fuel and could tow a trailer holding fuel for an additional 30 minutes. The tactical disadvantage of the trailer was that if hit by enemy fire, it could explode like a massive bomb, killing the tank crew. Crocodile tanks were organized in three battalions of the 79th Armored Division and operated in platoons attached to other military units.

French flamethrowers were incidental to the war, given France’s early defeat. They were based on the World War I man-portable Schilt model. Early Soviet models were variants of German designs, but the Soviets introduced improved flamethrowers in 1943 with the 50-pound ROKS-2 and 75-pound ROKS-3 man-portable models. They had effective ranges of 115 feet and 230 feet, respectively. A triple-tank man-portable model known as the LPO-50 also existed. The Russians used numerous armored fighting vehicle–mounted flamethrowers during the war. Typically, they were retrofitted to the turrets and chassis of older tanks.

German forces employed a wide variety of flamethrowers. Man-portable systems were the Model 35, Model 40, Model 41, and Model 42. They ranged in weight from 35 to 79 pounds and projected a stream of fire about 25–35 yards. A lighter and highly accurate paraflamethrower used by Schutzstaffel (SS) troops and a “field gun” trailer flamethrower with a weight of 900 pounds also emerged.

The Germans placed flamethrowers on the Sd Kfz 251 3-ton half-track, the Panzerjäger 38 chassis, and the Pz. Kpfw. II and III tank series. Typical fuel capacity was 150 to 200 gallons with flame-throwing ranges out to 65 yards. The static flamethrower (Abwehrflamenwerfer 42) was used as a defensive mine and fired by electrical squibs. It shot a flame 5 yards wide by 3 yards high out to 30 yards.

Italian flamethrowers were the Lanciaflamme Models 35 and 40, introduced in 1935 and 1940, respectively. Guastori (Italian combat engineers) employed them in fighting in Ethiopia, North Africa, and the Soviet Union. The Italian flamethrowers lacked the range of German

flamethrowers, but these manpacks were simple in design and effective. A larger version built for the small Italian L3 tank pulled a fuel wagon.

Japanese flamethrowers were based on the Type 93 and Type 100 man-portable models. The Type 93 had a weight of 55 pounds and a range of 25–30 yards. It could shoot a stream of fire lasting 10–12 seconds and relied on a revolving 10-cylinder blank cartridge ignition system. The Type 100 was a shorter and lighter variant of the Type 93, with a removable, rather than a fixed, nozzle outlet tip. Flamethrowers were not normally mounted in Japanese armored fighting vehicles.

Fleet Train

One of the greatest advantages possessed by the U.S. Navy in the final years of World War II was its fleet train—the assortment of auxiliary vessels that made possible the wide-ranging forays of the Pacific Fleet. Although the limelight never fell on the fleet train, these unsung forces demonstrated once again the primacy of logistics in modern warfare.

On oceans, as on land, logistical considerations have always dictated the pace of operations. In the days of sail, ships could remain at sea for extended periods—sometimes as long as a year. With the introduction of steam propulsion, warships found themselves on a shorter tether. Both the Russian Baltic (Second Pacific) Fleet in 1905 and America’s Great White Fleet of

1907–1909 made their epic voyages fueled by coal and supplied with stores bought from friendly powers.

Given the need to operate during World War I in European waters, the U.S. Navy experimented successfully with colliers and destroyer tenders. When the fleet moved to San Diego in 1919, the Base Force was formed to support the combatant craft. By 1925 this flotilla, numbering 75 ships, included fleet tugs, colliers, storeships, a hospital ship, and tankers. The last category became increasingly important as the navy made the transition from coal to oil. At-sea refueling, at first experimental and labeled “an emergency stunt,” became routine. By 1940, the Base Force had grown to 120 auxiliaries.

Long-distance replenishment of the fleet became increasingly important in planning as the possibility of war with Japan loomed. Following the Japanese attack on Pearl Harbor on December 7, 1941, the command was renamed in March 1942 the Service Force, under the command of Vice Admiral William L. Calhoun. His sailors soon developed mobile service squadrons, the first (Service Squadron 4) being based at Funafuti in the Ellice Islands. As the drive across the Central Pacific gained momentum, the new Service Squadron 10 set up at Majuro in the Marshalls but soon moved to Eniwetok, then to Ulithi, and finally, at the end of 1944, to Leyte. By this stage of the war, the Service Force consisted of 30 different types of auxiliaries, to include repair ships, submarine tenders, salvage ships, floating dry docks, ammunition ships, and seaplane tenders.

The numbers of ships also rose markedly, with oilers increasing from 14 in 1940 to 62 by 1945; 19 repair ships joined the original 2, while hospital ships went from 1 to 6. In aggregate, the Service Force counted 324 ships assigned in September 1943. By March 1944, the figure was 990. In February 1945 it was 1,432, and by the end of the war it was 2,930. The personnel manning this armada grew proportionally. By the end of the war in August 1945, crew members of the Service Force numbered 456,314. One out of every 6 sailors in the U.S. Navy served in the arm.

The Service Force enabled the Pacific Fleet to advance on the Japanese home islands. Replenishment groups and escorts, remaining always out of reach of enemy airpower, trailed the task forces by a few hundred miles. Every few days, the combatants would drop back to refuel and take aboard the myriad items necessary for continued operations. Then the replenishment

group would return to a forward base to replenish from merchant ships while another group took its place. Thus, the Service Force conferred on Admiral Chester W. Nimitz's warships the ability to remain at sea almost indefinitely and to engage in prolonged offensives without returning to port.

Additionally, repair ships could often return damaged warships to service without their visiting a yard. At Ulithi, Service Squadron 10 counted 9 destroyer tenders, 14 floating dry docks, and 13 repair ships, along with many other craft. As one example, the new battleship *Iowa*, continuously at sea from January to December 1944, was forced by a machinery failure to Ulithi, where a floating dry dock made the necessary repairs and thereby quickly returned the battleship to its task force.

In 1945, the Service Force was tasked with the additional responsibility of assisting the Royal Navy in supporting its British Pacific Fleet. Until this point in the war, British warships had usually operated within easy range of the many shore establishments maintained in Britain's overseas empire. These had sufficed in the Atlantic, the Mediterranean, and the Indian Ocean, but as Britain assembled its largest naval force of World War II for the drive on Japan, its logistical shortcomings became quickly apparent.

By agreement with the U.S. Navy, the British Pacific Fleet was to be self-sufficient, which meant that it would require 158 supporting ships. However, some of the auxiliaries on hand proved unsuitable for the purpose, the tankers being ill-equipped for alongside refueling, to give one example. Fortunately, U.S. logisticians in the theater interpreted the requirement for British self-sufficiency with considerable latitude and rendered great assistance in the establishment of a forward British base at Manus in the Admiralty Islands. In return, the British Pacific Fleet afforded substantial reinforcement to the U.S. Fleet in the closing months of the war.

In contrast to these Allied efforts, the Japanese never developed a logistical arm adequate to support the excellent warships of the Imperial Japanese Navy. Factors contributing to this surprising oversight include the Japanese supposition that any war would be short as well as the samurai disdain for the mundane matter of supply as not worthy of a warrior. In consequence, the Japanese conducted even their earliest offensives on a logistical shoestring. In telling contrast to the mobility of the most powerful U.S. warships, the giant battleship *Yamato* spent the crucial six months of the Guadalcanal Campaign (August 1942–February 1943) anchored at Truk, in

large part because of the Japanese inability to satisfy its prodigious appetite for fuel. By 1944, the Japanese were forced to base the bulk of the Combined Fleet in the East Indies to keep their major warships close to their oil supply.

Fleischer, Carl Gustav (1883–1942)

Norwegian Army general. Carl Gustav Fleischer was born on December 28, 1883, at Bjørnør Rectory (Sør-Trøndelag), Norway. His ancestors had immigrated to Norway from East Prussia beginning in the 17th century. Fleischer graduated from the Norwegian Military Academy in 1905, and by 1917 he had been promoted to captain. From 1919 to 1923, Fleischer was chief of staff of the 6th Division. He took command of the 14th Regiment in 1934 and commanded the 6th Military District in 1939 and 1940. He made major in 1930 and colonel in 1934.

In April 1940 when German forces invaded Norway, Fleischer, now a major general, was commanding the 6th Infantry Division. Ordered to lead Norwegian ground troops against German forces at Narvik in northern Norway, Fleischer managed to contain the Germans in the mountains north of the town. Although suspicious of Britain and France, Fleischer operated in conjunction with the British naval bombardment of German forces and with French and Polish land forces on the coast. Fleischer finally defeated the Germans at Narvik, forcing their withdrawal. After the fall of Norway, Fleischer was appointed commander in chief of the Norwegian army-in-exile, now in Great Britain. Later in 1940, he was made chief of the army high command.

Angry at the British for their withdrawal from Norway, Fleischer found himself in constant disagreement with London over military policy. In 1942 he was sent to Ottawa, Canada, as military attaché. On December 14, 1942, severely discontented with Norwegian military policy and dejected over his perceived shabby treatment by the Norwegian government-in-exile, Fleischer committed suicide in Ottawa.

Fletcher, Frank Jack (1885–1973)

U.S. Navy admiral. Born in Marshalltown, Iowa, on April 29, 1885, the son of Rear Admiral Thomas Jack Fletcher, Frank Jack Fletcher graduated from the U.S. Naval Academy at Annapolis in 1906. Commissioned an ensign in 1908, Fletcher commanded the destroyer *Dale* in the Asiatic Torpedo Flotilla in 1910. Fletcher saw action in the 1914 U.S. intervention at Veracruz, Mexico. For overseeing the movement of more than 350 refugees to safety, he was awarded the Medal of Honor. Lieutenant Fletcher then served in the Atlantic Fleet.

Following U.S. entry into World War I in 1917, Fletcher was promoted to lieutenant commander and commanded the destroyer *Benham* on convoy escort and patrol operations. Fletcher's postwar commands included submarine tenders, destroyers, and a submarine base in the Philippines, where he helped suppress an insurrection in 1924.

Fletcher attended both the U.S. Naval War College (1929–1930) and U.S. Army War College (1930–1931). From 1933 to 1936, he served as aide to the secretary of the navy. From 1936 to 1938, Fletcher commanded the battleship *New Mexico* and then served in the Bureau of Naval Personnel. Following his

promotion to rear admiral, Fletcher commanded Cruiser Division 3 in the Atlantic Fleet.

U.S. Navy vice admiral Frank Jack Fletcher. (Corbis)

On December 15, 1941, Fletcher took command of the Wake Island relief force centered on the carrier *Saratoga,* but he moved cautiously, and the island fell on December 23, before he arrived. In January 1942, Fletcher assumed command of Task Force 17, centered on the carrier *Yorktown.* He participated in carrier raids on the Marshall and Gilbert Islands and joined Task Force 11 in attacks on Japanese shipping in the Solomon Islands. Fletcher commanded U.S. forces in the May 7–8, 1942, Battle of the Coral Sea. Following his return to Pearl Harbor for hasty repairs to the *Yorktown,* Fletcher raced back with the carrier to join U.S. forces near Midway, where he helped orchestrate the dramatic U.S. victory on June 3–6, 1942, in which the Japanese lost four aircraft carriers and the Americans only one, the *Yorktown.*

Fletcher then commanded the three-carrier task force supporting 1st Marine Division assaults on Tulagi and Guadalcanal (Operation WATCHTOWER). Unwilling to risk his carriers, Fletcher took the controversial decision to withdraw them before the transports had completed unloading supplies to the marines, forcing the transports to depart as well. He then

committed his forces against the Japanese counterattack toward Guadalcanal, resulting in the Battle of the Eastern Solomons (August 22–25, 1942). Wounded when his flagship, the carrier *Saratoga*, was torpedoed, Fletcher returned to the United States.

Upon his recovery, Fletcher commanded the 13th Naval District and the Northwestern Sea Frontier. Fletcher's reputation for caution led chief of naval operations Admiral Ernest J. King in 1943 to assign him to command the North Pacific area. Following Japan's surrender in August 1945, Fletcher participated in the occupation of Japan, overseeing northern Honshu and Hokkaido.

In 1945, Fletcher was assigned to the navy's General Board, which advised the secretary of the navy; he served as its chairman from May 1946 until May 1947, when he was promoted to full admiral and retired. Fletcher died in Bethesda, Maryland, on April 25, 1973.

Fluckey, Eugene Bennett (1913–2007)

U.S. Navy officer, submariner, and recipient of the Medal of Honor and four Navy Crosses. Eugene Bennett Fluckey was born in Washington, D.C., on

October 5, 1913. Commissioned an ensign upon graduation from the U.S. Naval Academy at Annapolis in June 1935, Fluckey served in the battleship *Nevada* and the destroyer *McCormick* before being assigned to the Submarine School at New London, Connecticut. Upon completion of the course there, he was assigned first to *S-42* and then to the submarine *Bonita* (SS-165), in which he completed five World War II patrols. In August 1942, he returned to Annapolis, where he completed graduate instruction in naval engineering.

In November 1943, Fluckey reported to the submarine base at New London, where he graduated from the Prospective Commanding Officer's School. Following one war patrol as prospective commander of the submarine *Barb* (SS-220), Fluckey assumed command of that submarine on April 27, 1944. He soon established himself as one of the most effective submarine commanders of all time. Fluckey revolutionized submarine tactics and he carried out the single U.S. landing in the Japanese home islands during the war. While cruising off Otasamu on the east coast of Karafuto, Fluckey noted a railroad on the coast and sent ashore a landing party with demolition charges, who then blew up a 16-car Japanese train. He also fired what he termed "ballistic missiles"—5-inch rockets—into the towns of Shiritori and Kashiho and bombarded two other towns, destroying a lumberyard and sampans.

Fluckey was awarded four Navy Crosses, one each for his 8th, 9th, 10th, and 12th war patrols. On his 11th war patrol of December 19, 1944, to February 15, 1945, he attacked two convoys, sinking a large ammunition ship in the first. The second convoy, which he attacked on January 25, 1945, consisted of 30 Japanese ships anchored in Nankuan Chiang (Mamkwan) Harbor in only five fathoms of water. Despite knowing full well that his escape would entail a risky passage through shallow, mined waters, he attacked and obtained eight direct hits on 6 of the merchant ships. He then cleared the area in a high-speed run and escaped 2 pursuing Japanese destroyers. Fluckey was subsequently awarded the Medal of Honor for this daring attack.

Known as the "Galloping Ghost of the China Coast," Fluckey was fourth on the list of most Japanese ships sunk (16 and one-third) but first in shipping tonnage sunk, at 95,360 tons. This latter figure is more than any other U.S. warship captain achieved during the war.

In August 1945, Fluckey returned to Groton, Connecticut, to oversee completion of the submarine *Dogfish* (SS-350) and become its commanding officer, but on its commissioning he was ordered to the office of Secretary of the Navy James V. Forrestal. In December 1945, Fluckey became the personal aide to Fleet Admiral Chester W. Nimitz. In June 1947, Fluckey assumed command of the submarine *Halfbeak* (SS-352) before helping establish the Submarine Naval Reserve Force. During 1950–1953, he was U.S. Naval Attaché in Portugal. In September 1953, he took command of the submarine tender *Sperry.* He commanded Submarine Flotilla 7 during 1955–1956 before becoming chairman of the Electrical Engineering Department at the Naval Academy. In July 1960, Fluckey was promoted to rear admiral and then assumed command of Amphibious Group 4. During 1966–1968, he was director of Naval Intelligence before heading the Military Assistance Advisory Group in Portugal.

Fluckey retired from the navy as a rear admiral in 1972. He later ran an orphanage in Portugal for a number of years. Fluckey died in Annapolis, Maryland, on June 28, 2007. On January 24, 2008, his remains were buried in the South China Sea from the U.S. Navy nuclear attack submarine *Pasadena*, near the site of his daring rescue on September 17, 1944, of 14 Australian and British prisoners of war who were being transported to Japan when their ship sank. Some 450 miles distant at the time of the sinking, the crew of the *Barb* managed to locate and rescue these survivors despite a typhoon.

Flying Tigers

Group of American volunteer pilots officially named the American Volunteer Group (AVG) who flew for China in the early months of 1942. The Flying Tigers were commanded by Claire Lee Chennault, who, after retiring from the U.S. Army Air Corps as a captain in 1937, went to China as an aviation adviser to Nationalist leader Jiang Jieshi (Chiang Kai-shek). Chennault also served as a colonel in the Chinese Air Force. Following several frustrating years of trying to build up a Chinese air force while China was fighting one war against Japan and a civil war against the Communist forces of Mao Zedong (Mao Tse-tung), Chennault finally developed a plan to form a volunteer group of American pilots and ground crews to be recruited directly from the U.S. Army and U.S. Navy.

Chennault overcame great obstacles to implement his plan. He was aided by the fact that China had powerful friends within the U.S. government, including Secretary of the Navy Frank Knox. On April 15, 1941, President Franklin D. Roosevelt issued an unpublished executive order authorizing reserve officers and enlisted men to resign from the U.S. military for the purpose of joining the AVG. In another deal, the British government agreed to waive its rights to a production run of 100 almost obsolete Curtiss P-40B fighters in exchange for guaranteed priority on another order of a later model. The tiger-shark jaws that AVG pilots painted on the noses of their P-40s contributed to their nickname, which was bestowed on them by *Time* magazine in its December 27, 1941, issue.

Members of the AVG signed a one-year contract with the Central Aircraft Manufacturing Company, a U.S. firm that had the contract with the Chinese government to provide pilots, planes, and crews. Pilots' salaries ranged from $250 to $750 per month. Not part of the written contract was an agreement that pilots were also to receive $500 for each Japanese plane shot down.

The first contingent of AVG pilots departed for China by ship in July 1941. The next month, they commenced training at the British air base in Toungoo, Burma. Training focused on air-combat theories, then somewhat unconventional, that Chennault had developed during his years in the U.S. Army Air Corps and tested in China after 1937. Chennault's tactics were built on the two-plane element and a careful analysis of the relative strengths and weaknesses of the opposing aircraft. Chennault stressed, for example,

that his pilots should never try to turn with the more maneuverable Japanese aircraft. Instead, they should take advantage of the P-40's heavier weight to attack from above and then dive to break contact with the enemy. Chennault insisted that his pilots learn their enemy's fighter tactics better than the Japanese pilots themselves.

When the entire contingent arrived in Asia, the AVG was organized into three squadrons: the 1st ("Adam and Eves"), the 2nd ("Panda Bears"), and the 3rd ("Hell's Angels"). The AVG first went into combat over Yunnan Province in China on December 20, 1941, almost two weeks after the Japanese attacked Pearl Harbor. The AVG then had 82 pilots and 79 operational P-40s.

As soon as the United States entered World War II, plans were developed to bring the AVG personnel back into the U.S. military. Chennault returned to active duty in the U.S. Army Air Forces (USAAF) on April 7, 1942, as a colonel. The AVG was to be reintegrated by July 4, 1942, to become the 23rd Fighter Group, which would be commanded by Colonel Robert L. Scott, newly arrived from India. The 23rd would be part of the larger China Air Task Force (CATF), which would be commanded by Chennault as a brigadier general and subordinate to the U.S. Tenth Air Force in India. The CATF later grew to become the Fourteenth Air Force, commanded by Chennault as a major general.

The pilots and ground crew of the AVG were offered assignments in the USAAF and were strongly encouraged to accept them or face the draft board back home. Many objected to the strong-arm tactics. In the end, only 5 AVG pilots agreed to rejoin the U.S. military and fly for the CATF. Another 19 stayed in China and continued to fly for China National Airways. To help Chennault with the transition, however, 20 pilots and 24 ground crew agreed to serve two weeks beyond July 4. Two of those volunteer pilots were killed during that period. Other AVG pilots who did not stay in China later made significant contributions in other theaters of war. They included James Howard, who flew with the 354th Fighter Group in Europe, and Gregory Boyington, who flew with the marines in the Pacific. Both subsequently earned the Medal of Honor.

A Chinese soldier guards a line of American P-40 fighter aircraft, painted with the shark-face emblem of the Flying Tigers, at an airfield in China, ca. 1942. (National Archives)

Although some military experts predicted at the time that the AVG would not last three weeks, it achieved one of the more impressive records in air warfare. In less than seven months in combat, the unit certainly destroyed 299 Japanese aircraft and probably destroyed another 153. The AVG lost only 12 P-40s and 4 pilots killed in air-to-air combat. It lost another 6 pilots to ground fire: 3 were captured and 3 were killed on the ground by enemy bombs. Another 10 pilots died in flying accidents.

Despite the fact that most members of the AVG came from the U.S. military (and many returned to the military to serve in World War II), they were branded as mercenaries for many years following the war. In 1991, a U.S. Air Force panel concluded that all members of the AVG had been fighting for the United States at the time and were eligible for veterans' benefits on the basis of that service. On December 8, 1996, the air force further recognized the AVG by awarding the Distinguished Flying Cross to the pilots and the Bronze Star Medal to the ground crews.

Forbes, Sir Charles Morton (1880–1960)

British admiral and commander of the Home Fleet. Born in Colombo, Ceylon, on November 22, 1880, Charles Morton Forbes joined the Royal Navy as a cadet at age 14 and graduated two years later. A gunnery specialist, he received advanced training on HMS *Excellent,* the Royal Navy’s gunnery school. He favorably impressed one of the officers, Sir Roger Blackhouse, a future first sea lord, who furthered his career. During World War I, Forbes was a staff officer to Admiral Sir John Jellicoe, who commanded the Grand Fleet at the 1916 Battle of Jutland, where, as Jellicoe’s flag commander on the *Iron Duke,* Forbes won the Distinguished Service Order. From 1917 to 1919, Forbes commanded the light cruiser *Galatea.*

Following two years at the Royal Staff College at Greenwich, in 1923 Forbes became director of naval ordnance. In October 1928 he was promoted to rear admiral, and in 1932 he was appointed third sea lord and controller, a post that gave him responsibility for naval warship design and construction. Two years later, he became a full admiral, commander of the 1st Battle Squadron, and second-in-command of the Mediterranean Fleet. In 1938, Forbes took command of the Home Fleet.

Forbes’s leadership came under much scrutiny during the Norwegian Campaign of April 1940. He and a divided Admiralty could not decide whether the Germans were more likely to invade Norway or attempt to move their capital ships into the Atlantic. Forbes ordered the battleship *Rodney* and battle cruiser *Repulse* to sea, hoping to match the German battle cruisers *Scharnhorst* and *Gneisenau,* but this move left the southern North Sea

unguarded and the Home Fleet unable to check the German invasion of Norway. The entire Norwegian Campaign was plagued by indecision and inadequate forces, and his actions earned Forbes the nickname "Wrong-Way Forbes."

Although Forbes was promoted to admiral of the fleet in May 1940, he was removed from command of the Home Fleet in December in favor of Admiral John Tovey following a dispute over the transfer of fleet assets to England's southern coast. Forbes thought an invasion unlikely and suggested that German U-boats presented a graver threat. Forbes then commanded the Portsmouth navy base, overseeing planning and assaults against German shipping along the French coast and the U-boat pens at Brest and at Saint-Nazaire. Forbes retired from the navy in August 1943. He died in London on August 28, 1960.

Force H

British naval task force established at Gibraltar in late June 1940, created in an effort to offset the loss of French naval power in the Mediterranean occasioned by the German defeat of France and the entry of Italy into the war. For obscure reasons it was named Force H, and it was something of an anomaly in command structure, as it reported directly to the first sea lord in London rather than to the flag officer commanding in the North Atlantic, already at Gibraltar.

Commanded first by Vice Admiral Sir James Somerville (July 1940–January 1942), then Rear Admiral Edward Neville Syfret (January 1942–January 1943), Vice Admiral Sir Harold Burrough (January 1943–March 1943), and Vice Admiral Algernon Usborne Willis, Force H initially consisted of the aircraft carrier *Ark Royal*, the battleships *Resolution* and *Valiant*, the battle cruiser *Hood*, and a small number of cruisers and destroyers. During the next three years, it was the chief British naval force in the western Mediterranean Sea and the Atlantic Ocean.

The first principal engagement for Force H was the July 1940 Operation CATAPULT, the British attack on French naval units at Mers-el-Kébir in Algeria. Force H also played a leading role in numerous engagements in the Mediterranean, particularly the resupply operations to Malta, during which it fought the Battle of Cape Spartivento on November 27, 1940. Its ships also took a leading role in the operation to hunt down the German battleship *Bismarck*, and they bombarded Genoa in February 1941. Force H participated in the May 5, 1942, invasion of Madagascar, and it provided cover for the Allied landings in North Africa (Operation TORCH) on November 8, 1942; Sicily (Operation HUSKY) during July 9–August 22, 1943; and Salerno, Italy (Operation AVALANCHE) in September 1943. For all practical purposes, Force H ceased to exist after the surrender of the bulk of the Italian fleet that September and the dispersal of its assets elsewhere.

Force K (1941)

British Royal Navy Mediterranean task force based at Malta. In November 1941, with events in North Africa reaching a climax and the British Eighth Army preparing to attack Axis forces there, London dispatched additional naval units to harass German and Italian cross-Mediterranean supply efforts. Known as Force K and commanded by Commodore William Gladstone Agnew, it consisted of the light cruisers *Aurora* and *Penelope* from the Home Fleet and the destroyers *Lance* and *Lively* from Gibraltar.

Force K reached Malta on October 21, 1941, and, early on the morning of November 9, 1941, it scored a great success against a Brindisi-to-Benghazi convoy (the Beta or Duisburg Convoy). Force K sank one of four escorting Italian destroyers, damaged another, and sank all seven of the merchant ships. The British submarine *Upholder,* which had closed during the night, sank another of the Italian destroyers.

Force K registered other successes on November 24, when it sank 2 important supply ships, 1 German and 1 Italian. Indeed, Force K accounted for 10 of the 12 Axis resupply ships lost in November. On December 1, it sank 2 more Axis ships also bound for Africa, an Italian supply ship and a tanker. Meanwhile, Force K was strengthened by the addition of the cruiser *Neptune.*

Force K provided security for British supply efforts to Malta, most notably by the fast supply ship *Breconshire* in mid-December. On its safe arrival, Force K immediately departed to attack another reported convoy. But on the night of December 18 off Tripoli, Force K ran into a minefield recently laid there by Italian destroyers. The cruiser *Neptune* hit four mines and went down; only one man of its crew was saved. The cruisers *Aurora* and *Penelope* hit one mine each. Damaged, they managed to regain Malta safely. The destroyer *Kandahar* also struck a mine and was badly damaged and had to be scuttled.

Force K continued to operate from Malta with the *Penelope* and five to six destroyers, but it mostly escorted empty transports from Malta and met full ones coming in. It achieved its last success against Axis shipping on February 7, 1942, when two of its destroyers sank a pair of small Italian

coasters. It also participated in the Second Battle of Sirte on March 22, 1942. Finally, in April 1942, intensified air attacks on Malta forced all surface ships to withdraw from Malta.

Forrestal, James Vincent (1892–1949)

U.S. Secretary of the Navy and later secretary of defense. Born in Beacon, New York, February 15, 1892, James Vincent Forrestal entered Dartmouth College in 1911. The next year he transferred to Princeton, but he left school without graduating in 1914. Two years later, Forrestal secured a position with the investment-banking corporation of William A. Read and Company (later known as Dillon, Read & Company). When the United States entered World War I in April 1917, Forrestal enlisted in the navy. Soon afterward, he transferred to the aviation branch; he trained in Canada with the Royal Flying Corps but never saw combat. At the end of the war, he left the navy as a lieutenant and returned to Dillon, Read & Co., becoming its vice president in 1926 and president in 1938.

In 1940, Forrestal resigned his position to join the Franklin D. Roosevelt administration as undersecretary of the navy. His primary role was in procurement, which was vital in preparing the U.S. Navy for World War II. Forrestal worked closely with his army counterpart, Undersecretary of War Robert P. Patterson, to streamline contracting and purchasing policies. Forrestal oversaw the rapid expansion of the navy in the early years of the war, including not only number of ships but also facilities and training. On the sudden death of Secretary of the Navy William F. Knox, Forrestal succeeded to the post in May 1944 and continued in the position until 1947.

In September 1947, Forrestal became the first secretary of defense. In this capacity he is sometimes referred to as the "godfather of the national-security state." Forrestal was a staunch proponent of efforts to halt what he saw as Soviet expansionist policies, and he lobbied hard for George F. Kennan's containment doctrine and the North Atlantic Treaty Organization (NATO). Forrestal also supported the concept of a balanced military establishment.

The immense strain of his position weighed heavily on Forrestal and led to irrational behavior. In January 1949, President Harry S. Truman informed Forrestal that he was replacing him as defense secretary with Louis Johnson. On March 1, 1949, Forrestal resigned his post. Admitted to Bethesda Naval Hospital, Maryland, for psychiatric care, on May 22, 1949, Forrestal leaped to his death from the 16th floor of that facility.

Fort Drum, Manila Bay

The U.S. Army's "concrete battleship," part of the Corregidor (Philippines) fortifications guarding Manila Bay. The unique shape of this coastal fortification, which indeed resembles a dreadnought battleship, was dictated by the narrow island on which it rests. With a length of 350 feet and a maximum width of 144 feet, Fort Drum's main deck towered 44 feet above low water. The exterior walls were some 20 feet thick. Fort Drum was armed with four twin-turret–mounted 14-inch rifles in a superfiring configuration. Secondary armament was four 6-inch rifles in two double-decked steel casemates.

When Japan invaded the Philippines on December 8, 1941, Fort Drum's guns swung into action. The fort's effectiveness was limited by the fact that it was primarily stocked with armor-piercing shells to fight enemy battleships that never came. Nonetheless, Drum's batteries fired continuously at the Japanese invaders; until late 1942, Fort Drum had the largest guns on land or sea on any front firing at America's enemies. On one occasion, the guns of Fort Drum were supposed to have broken up a Japanese division-sized assault on U.S. forces dug in on Bataan.

During the Japanese attack on Corregidor (April–May 1942), not a man of the Fort Drum garrison was killed, and only one was slightly wounded, although the fort was pounded steadily by Japanese shells that ranged up to 240mm howitzers. The great concrete structure shook under Japanese pounding, but it suffered no major damage.

On May 6, 1942, as a part of the general U.S. capitulation in the Philippines, Fort Drum was ordered to surrender along with the remainder of the Corregidor forts. Filipino American forces on Bataan had already surrendered the previous month. Fort Drum's garrison had just 20 minutes to disable the fort but did it so well that the Japanese were never able to put it back into commission, even though one of the main batteries still had its carriage and recoil system intact and its breechblock lying on the turret floor.

With the return of the Americans to the Philippines, Fort Drum became a major target. After intense U.S. air bombardment and one repulsed reconnaissance by a U.S. Navy party that thought the fort was abandoned, an American landing party poured diesel oil into the structure and touched it off.

The resulting explosion killed the entire Japanese garrison of 70 survivors of the Japanese superdreadnought *Musashi*.

Fort Drum still exists, the victim more of inveterate scrap-metal merchants (although the fort is a protected landmark for both the Philippines and the United States) than of the weather or World War II.

FORTITUDE, NORTH and SOUTH, Operations (1944)

Deception operations in support of Operation OVERLORD, the Allied invasion of Normandy that began on June 6, 1944. Operation OVERLORD was a vast operation that was impossible to conceal. It involved more than 150,000 troops and 5,000 ships. Operation FORTITUDE was the elaborate deception plan designed to mislead the German defenders as to the timing and location of the Allied invasion.

Operation FORTITUDE had two components: FORTITUDE NORTH and FORTITUDE SOUTH. Operation FORTITUDE NORTH was designed to convince the Germans that the Allies planned to invade Norway in cooperation with a Soviet offensive designed to drive Finland from the war. It also tried to deceive the Germans into thinking that the Norwegian invasion would take place prior to an invasion in France. The intent was to cause the Germans to shift divisions from France to Norway or to have these forces in transit so they could not take part in the battle. To achieve this, the British in Scotland

employed dummy vehicles, inflatable tanks and aircraft, fake radio transmissions, and dummy subordinate headquarters simulating the Fourth Army Group in "preparations" for an invasion of Norway. German reconnaissance aircraft were allowed to fly over the "assembly points" and report this information to Berlin. Operation FORTITUDE NORTH worked, as the Germans actually reinforced Norway.

As the time for Operation OVERLORD approached, the second component of the deception plan, Operation FORTITUDE SOUTH, became critical. Knowing that the Allied buildup in southern England could not be kept hidden, the British and Americans planned to persuade the Germans that the chief Allied assault would fall in the Pas de Calais (across the English Channel from Dover) rather than in Normandy (the actual landing area). The Pas de Calais was the most obvious choice for a major amphibious operation. It was the closest point on the French coast to England and would minimize the length of Allied supply lines as well as offer an extensive road network that could be exploited in follow-on attacks through the Low Countries toward Germany once the beaches were taken.

The first step was to leak plans of the sham invasion of Calais. This was done, as during Operation FORTITUDE NORTH, through the British secret services, which planted stories and documents with double agents. Incredibly, the British seem to have identified or turned (recruited as a double agent) every German agent in Britain during the war. Double agents were particularly useful for providing small bits of information, which the Germans could then piece together. The British also arranged to leak sham information through neutral diplomats with Axis sympathies.

To build the desired perception on the part of German intelligence, a fictitious First U.S. Army Group (FUSAG) was portrayed directly across from Calais in Kent and Sussex. Lieutenant General George S. Patton, whose reputation as a hard-driving army leader was well known by the Germans, was repeatedly identified as FUSAG's commander. This fictitious force was composed of the U.S. Fourteenth Army and British Fourth Army. With the exception of three real British divisions included in the fictitious British army, all of these formations were bogus. The ghost divisions had elaborate stories woven around them to make their existence more believable. The Allies even created shoulder patches for the nonexistent FUSAG and its subordinate divisions. The Allies also had real soldiers wear the ghost

division patches in case enemy agents were in a position to report their existence.

Special Allied signal units were used to transmit false radio transmissions from FUSAG and to simulate division, corps, and other army-level communications; these were transmitted in easily breakable ciphers so the Germans could decode the messages. In addition, false references to the fake headquarters were mentioned in bona fide messages.

As in Operation FORTITUDE NORTH, dummy tanks and airplanes built of inflatable rubber were placed in realistic-looking "camps" where German aerial reconnaissance was bound to see them. The deception was made even more believable by FUSAG troop movements in southeast England. Some were elaborate hoaxes, but in most cases they corresponded to actual preinvasion movements by real British and Canadian divisions. Even though the "real" movements were being made to support the Normandy Invasion, they were close enough to the FUSAG area to convince German aerial photo interpreters that they were seeing the imminent invasion of Calais.

A fleet of landing craft deemed unseaworthy but still usable bobbed in British ports across from Calais. Instructions for acts of sabotage were radioed to the French Resistance in the Calais area. In addition, to reinforce the notion that FUSAG would debark on the short route to Calais, the Allied air forces in their program of bombardment prior to OVERLORD dropped three times the tonnage east of the Seine as they did to the west.

In all these activities, Allied intelligence, knowing what picture it wanted the Germans to see, had carefully taken apart FUSAG and sent bits and pieces about it where they knew the German intelligence services would pick them up. The Allies relied on the Germans to put the pieces of the puzzle together for themselves.

Soon it became apparent that the deception was bearing fruit. Ultra signals intercepts of German classified message traffic made reference to FUSAG. This was the proof the FORTITUDE operators needed. They could not expect to fool the Germans forever, but they hoped to minimize German anticipation of a Normandy landing until it was actually under way—and thereafter to keep alive anxiety that the "real" invasion would follow in the Pas de Calais at a later stage.

German intelligence arrived at the desired conclusion. German Army maps captured following the Normandy Invasion indicated the presence of

FUSAG in southeast England. Division areas and corps headquarters corresponded almost exactly with the areas indicated by the Allied deception plan. However, Adolf Hitler was only partly deluded. On March 4 and 20 and April 6, he alluded to the likelihood of a Normandy landing in messages to his senior commanders. Still, apart from allocating the Panzer Lehr and 116th Panzer Divisions to Normandy in the early spring, he made no decisive alteration of German defensive dispositions. Indeed, until he allowed divisions to cross the Seine into Normandy from the Pas de Calais at the very end of July, he himself remained prisoner to the delusion of a second "main" invasion in the Calais area throughout the critical weeks following the initial landings at Normandy.

Foulkes, Charles (1903–1969)

Canadian Army general. Born on January 3, 1903, at Stockton-on-Tees, England, Charles Foulkes grew up in Canada and enlisted in the Permanent Force (army) in 1926. There he amply displayed both the administrative and political skills necessary to win promotion in the cash-strapped, minuscule Canadian regular army of the interwar years.

Foulkes was a major when Canada declared war on September 10, 1939. As an officer trained primarily in staff work, his rise was little short of

meteoric, from brigade major of 1st Division to brigadier, general staff, with the First Army by August 1943. Promoted to major general in January 1944, by June 6, 1944, Foulkes commanded the 2nd Canadian Infantry Division at Normandy, where his performance was less than stellar. Lieutenant General Guy Simonds wanted to replace Foulkes after Operation SPRING in July. This failed Allied effort to capture high ground south of Caen resulted in heavy Canadian casualties.

But Lieutenant General Henry Crerar, who admired Foulkes and feared Simonds as a rival, balked. When Crerar's illness led to his temporary replacement by Simonds during the Battles of the Scheldt (October–November 1944), Foulkes assumed command of II Corps, again with mixed results. But Foulkes was a survivor, and when Lieutenant General Eedson Louis Millard "Tommy" Burns was finally sacked as commander of I Corps in Italy in November 1944, it was Foulkes whom Crerar and Simonds sent to assume command. Perhaps they made this decision because until younger divisional commanders had gained more experience, there was no one better.

Foulkes continued to command I Corps after its move to Holland in March 1945, and it was he, after Crerar's blunt refusal to be present, who accepted the surrender of German forces in Holland at Wageningen on May 5, 1945. (Crerar had fought the Germans in both world wars and had an intense dislike of senior German officers and the regime; he did not wish to acknowledge them in any formal way.)

Although a mediocre field commander, Foulkes was nonetheless an able administrator, skilled at influencing military superiors and politicians. He became the first postwar Canadian Army chief of staff and, in 1951, the first chairman of the newly formed chiefs of staff committee. In the latter post, he oversaw the rebuilding of the Canadian armed forces during and after the 1950–1953 Korean War, and he successfully advocated close military ties with the Americans. Foulkes retired from the army in 1960 and died in Ottawa, Ontario, on September 12, 1969.

Fourcade, Marie-Madeleine Bridou (1909–1989)

French Resistance leader. Born in Marseille on November 8, 1909, Marie-Madeleine Bridou married in 1929, had two children, and was divorced by the time World War II began. She sent her children to safety in Switzerland shortly after she became involved in the Resistance movement in June 1940.

Fourcade was recruited for the French Resistance by Georges Loustaunau-Lacau, the leader of the Navarre network, which was primarily involved in gathering information for the British. When he was arrested in May 1941, Fourcade assumed command under the code name POZ 55. She was the only woman to run a major resistance network in France during the war. The Navarre network later became known as the Alliance. The Germans knew it as Noah's Ark, for its members were assigned animal names. Fourcade was then known as Hedgehog.

The Alliance reported German troop movements and monitored submarine activities and German military operations within France. It also published propaganda tracts and journals. Members of the network also helped identify launch facilities for V-1 buzz bombs and V-2 rockets. Under Fourcade's guidance and supported by British money and equipment, the network grew to more than 3,000 members. Arrested by the Gestapo twice, Fourcade escaped each time. The first time she was caught because a wireless operator sent by the British turned out to be a double agent working for the Germans.

In 1941 and 1942, Fourcade's network helped conceal British airmen who had been shot down and then smuggle them out to Spain and safety. In July 1943 after 30 months of leading the Navarre network, Fourcade was evacuated by the British along with some of the downed airmen. She continued to run the network from a house in Chelsea until July 1944, when

she returned to France. During the course of the war, 438 members of her network were caught and executed.

After the war, Fourcade was active in organizing the Union for the New Republic, the political party of Charles de Gaulle. She also championed recognition for former Resistance members. Fourcade died in Paris on July 20, 1989.

France

Located in Western Europe, metropolitan France today encompasses 260,558 square miles and had a 1939 population of approximately 41.75 million. On the eve of World War II, France also possessed a large overseas empire, including sizable portions of North Africa as well as Indochina. France borders Spain and the Mediterranean Sea to the south; Italy, Switzerland, Germany, and Luxembourg to the east; Belgium and the English Channel to the north; and the Bay of Biscay (Atlantic Ocean) to the west.

On September 3, 1939, for the second time in a generation, France found itself at war with Germany. In sharp contrast to August 1914, this time the mood in the Third Republic was one of somber resignation. Although France was among the victors in World War I, it had been devastated by the war, with 1,385,300 dead and 4,329,200 wounded (690,000 permanently disabled). One-quarter of all French males of military age lay dead. Much of the fighting had been on French soil, and large stretches of northeastern France had been scarred by the fighting. Buildings and railroads had to be rebuilt and farms put back in cultivation. The costs were staggering, and

finances remained a major problem for French governments of the 1920s. Political instability caused by frequent changes of cabinet and the lack of a strong executive were other major problems.

Denied the genuine national security in terms of protection from Germany that it had sought in the Paris Peace Conference following World War I, France played a Cassandra role in the 1920s and 1930s, warning of the German threat and finding little support in this from Great Britain and the United States, its World War I allies. When the German government defaulted on war reparations, in 1923 French troops occupied the Ruhr. Although this action forced the German government to live up its treaty obligations and French troops then departed, the financial cost of the operation was high, and it brought condemnation of France from Britain and the United States. It also brought the Left to power in France in 1924.

The Ruhr occupation was the last such independent French action before World War II. Thereafter, France followed Britain's lead regarding Germany in return for a guarantee of Britain's support in the event of a German invasion. Successive British governments, however, refused to commit themselves to collective security arrangements regarding Eastern Europe that might have prevented war.

Meanwhile, German leader Adolf Hitler tore up the Treaty of Versailles and the Locarno Pacts, the latter of which Germany had voluntarily signed. In 1936, Hitler sent German troops into the Rhineland. The French Army was then regarded as the world's most powerful military force, and France might have acted unilaterally and halted this step, which could have meant the end of Hitler. When the British refused to support military intervention, however, French leaders took this as an excuse to do nothing.

In September 1938, France and Britain permitted Hitler to seize the Sudetenland from Czechoslovakia, a French military ally. In March 1939, Hitler secured the whole of Czechoslovakia, prompting Britain, in the worst possible circumstances, to extend a guarantee to Poland—Germany's next target and already a French ally—that Britain would defend it against attack. Following the German invasion of Poland on September 1, 1939, the French government joined Great Britain in declaring war two days later.

The Popular Front that had come to power in France in 1936 had launched a major disarmament program, but on the eve of war France had begun to rearm. It made substantial outlays in arms expenditures and sharp

increases in weapons, especially tanks, of which the French Army had more than the German Army. Time was vital if France (and Britain) were to catch up with German rearmament. The most glaring French military weaknesses, even by May 1940, were in modern aircraft and in antiaircraft guns.

Both London and Paris were confident of military victory, but both governments and their military establishments embarked on the war in leisurely fashion. While the French called up reservists and retrieved artillery from storage, the German Army rolled over Poland. The French Army carried out only a halfhearted offensive in the Rhineland. Had the offensive been on a larger scale and more forcefully prosecuted, it would have carried to the Rhine. Britain was even slower to mobilize and dispatch the British Expeditionary Force (BEF) to the continent. France and Britain expected to blockade Germany and use their control of the seas to secure the means to match the Germans in terms of their military establishment, especially in numbers and quality of aircraft. The seven months of inactivity after the German conquest of Poland—known as the Sitzkrieg or Phony War—seemed to suggest that time was on the side of the Allies.

Meanwhile, there was sharp dissension on the French home front. From 1935 to 1939, the French Communist Party had been in the forefront of the antifascist crusade and urged rearmament. The German-Soviet Non-Aggression Pact of August 1939, however, converted the French communists overnight into advocates of neutrality. The government of Premier Édouard Daladier then unwisely moved against the French Communist Party, outlawing it and interning many of its leaders, including those in the National Assembly. Communist agitation against the war continued, however, helping produce doubt and defeatism, particularly among industrial workers conscripted into the army.

This led to the myth that a fifth column had been responsible for the French military defeat in 1940. Dissatisfaction concerning the lack of aggressive military activity also led to a cabinet crisis and change of premier in March 1940; Paul Reynaud replaced Daladier. The new premier projected energy and optimism, but politics forced Reynaud to keep Daladier as minister of war, and the continuing rivalry between the two men handicapped the war effort.

The Phony War ended on April 9, 1940, when German forces invaded Denmark and Norway. The French joined the British in sending troops to

Norway, but these troops could not halt the German conquest and were withdrawn on the opening of the May 10–June 25 Battle for France. On May 10, 1940, German forces invaded the Low Countries and France. The French Maginot Line, built at great cost beginning in 1929, served its intended purpose of channeling the German invasion to the north through Belgium. However, several elements led to disaster: the failure of France and Britain to work out detailed plans with Belgium, which had declared its neutrality and was fearful that cooperation with the Allies would be the excuse for a German invasion; serious flaws in the Allied command structure; inept French senior military leadership; the inability of the Allies to understand the changed tempo of battlefield conditions that represented the German blitzkrieg; and the misuse of superior armor assets.

British and French military deficiencies, especially in the air, were soon all too evident. Too late, the French attempted major command changes. Only a month after the start of the campaign, on June 10, 1940, the French government abandoned Paris for Bordeaux. To spare the city destruction by the German Luftwaffe, the government declared Paris an open city; four days later German troops moved in. On June 16 at Bordeaux, Reynaud suggested that the government and its armed forces move to French territory in North Africa and continue the fight from there. His vice premier, 84-year-old Marshal Henri Phillipe Pétain, opposed this step, as did the new commander of the French Army, 73-year-old General Maxime Weygand. Both men considered the war lost and sought to end fighting that they believed could only lead to additional lives lost for no gain. When a majority of the cabinet voted to ask the Germans for terms, Reynaud resigned on June 16.

Ironically, Reynaud had brought Pétain, hero of the World War I Battle of Verdun, into the government on May 18 to stiffen French resolve following initial Allied setbacks in the campaign for France. On June 16, Pétain became premier and immediately opened negotiations with Germany to end the fighting. The Germans delayed to improve conditions, but the French government signed an armistice with Germany on June 22 and another with Italy on June 24. Fighting ceased on the battlefields of France on June 25. The campaign had lasted but six weeks. Never before in its military history had France been as broken militarily and psychologically.

The armistice of June 25, 1940, divided France into occupied and unoccupied zones. A pass was necessary for French citizens who desired to

move between the two. German forces occupied three-fifths of the country, including northern and western France and the entire Atlantic coast. France had to pay “administrative costs” to the Germans at the absurdly high sum of 20 million reichsmarks a day, calculated at a greatly inflated rate of exchange of 20 francs per reichsmark. This amounted to some 60 percent of French national income. Except for a few units to maintain order, all French military formations were disarmed and demobilized. Ships of the French Navy were to assemble in designated ports and be demobilized. The armistice also called for all German prisoners of war to be immediately released, whereas Germany would retain until the end of the war the 1.5 million French prisoners it had captured. France was also forced to surrender German refugees on French territory.

A new French government was then established at Vichy in central France under Pétain to administer the remaining two-fifths of metropolitan France, which included the Mediterranean coast. Vichy France was left with control of its colonies, although Japan sent in troops and established de facto authority over French Indochina during 1940 and 1941. France then played a schizophrenic role until the end of the war. Most French citizens, convinced that for the indefinite future Germany would rule Europe and disgusted with the infighting and weak leadership that had characterized the Third Republic, rallied to the Vichy regime and its calls for a conservative revolution.

Meanwhile, young Brigadier General of Brigade Charles de Gaulle, the only figure of some consequence to escape abroad following the defeat, sought to rally the French to the then dim hope of eventual victory. He called on French people in Britain, or those who could reach there, as well as the French Empire to join him in continuing the fight. De Gaulle’s Free French, soon recognized by the British government, slowly grew in numbers and support as the war wore on and as Germany failed to defeat Britain and suffered rebuff in its invasion of the Soviet Union. The Resistance was an amalgamation of several diverse groups that finally coalesced in May 1943 as the Conseil National de la Résistance (National Resistance Council), headed by Jean Moulin. Its military arm was the Forces Françaises de l’Interieur (French Forces of the Interior, FFI).

Although some French men and women were active in the Resistance, most of the population simply tried to endure the German occupation. Many actively collaborated with the German occupiers for financial gain, and a few

fervently supported the Nazi policies opposing communism and persecuting the Jews. The Vichy government organized a force known as the Milice to combat growing numbers of the FFI.

British prime minister Winston L. S. Churchill's government recognized de Gaulle's government as the legitimate representative of France, but Churchill also created strong Anglophobia in France by his decision to move to secure the French fleet, most notably at Mers-el-Kébir, where fighting occurred with considerable loss of French life. This affair still rankles the French today, as the French government had promised that it would not let the Germans seize the fleet and ultimately scuttled its main fleet to honor that pledge, even after the events of Mers-el-Kébir.

U.S. president Franklin D. Roosevelt strongly distrusted de Gaulle, and the United States maintained diplomatic relations with Vichy until the Allied invasion of North Africa—Operation TORCH—in November 1942. French resistance to the Allied landings and devious dealings by Vichy representatives ended Allied attempts to negotiate with Pétain's government.

De Gaulle's Free French forces greatly expanded after the Allied invasion of North Africa. Rearmed and reequipped by the United States, a French Expeditionary Corps of five divisions was sent to Italy in late 1943, and it made a major contribution to the Allied military efforts there. What became

the French First Army landed in southern France in August 1944 as part of Operation DRAGOON. Its 10 divisions fought through France into Germany and Austria. Meanwhile, Allied forces had come ashore in Normandy, and the French Resistance played a key role in isolating the beachheads and preventing German resupply. Everywhere, French men and women assisted the Allied armies. Paris was liberated on August 25, with the 2nd French Armored Division leading the Allied units into the city to join with those fighting the Germans and saving the city's honor.

De Gaulle soon established his government in Paris, and French troops continued with the liberation of French territory. Following the war, nearly 40,000 French citizens were imprisoned for collaboration, including Marshal Pétain and his vice premier, Pierre Laval. Both men were sentenced to death, although de Gaulle commuted Pétain's sentence to life imprisonment in recognition of his World War I service. At least 10,000 people were executed for collaborating with the Nazis. Collaboration was then and still is a highly sensitive topic in France.

The high hopes and idealism of the Resistance were soon dashed. Although an overwhelming 96 percent of Frenchmen voting in an October 1945 referendum rejected the constitutional structure of the Third Republic, sharp political divisions ensured that the Fourth Republic that followed it was virtually a carbon copy. Not until 1958, when the Fourth Republic was overthrown and de Gaulle returned to power, would France have a constitution that ensured a strong executive and avoided political deadlock. Despite de Gaulle's wartime promises of a new relationship with the colonies, the government in Paris pursued a short-sighted policy of trying to hold on to its major colonies, believing that only with its empire could France still be counted as a great power. Such grandiose and outdated notions led to disastrous wars in Indochina and later in Algeria, ultimately toppling the Fourth Republic.

France, Air Force

Recriminations over the poor performance of the French Air Force (Armée de l'Air) in 1940 began even before the armistice with the Germans and were a key element in the notorious Riom Trial held by the Vichy authorities in 1942 to prosecute the alleged saboteurs of France's war effort. Postwar historiography was scarcely less politically charged, and it is only with the passage of more than half a century that the history of France's wartime air force can be examined with some detachment. Whatever the cause, the air service's accomplishments in the May 10–June 25, 1940, Battle for France were extremely disappointing, and its contribution to the national catastrophe was significant.

Why this should have been so, when France in 1940 boasted an experienced cadre of fighter and bomber pilots and many aircraft comparable in quality to the best fielded by the German Luftwaffe and British Royal Air Force, will probably always remain something of a mystery. It can be better

understood, however, by looking at the air service's convoluted and often tempestuous development between World War I and World War II.

In many respects, France led the world in aviation technology in the 1920s and 1930s. Its aircraft manufacturers produced many combat machines, and half of the world's airspeed records were set in French-built planes. But the country did not establish an independent air service until 1928, and the motivation for its creation was more political than strategic. From its inception, the Armée de l'Air was a pawn in the long-standing intrigue between the Third Republic's political class and its generals, many of whom had never reconciled themselves to civilian authority. The air force was intended as a counterweight to the war ministry, and this atmosphere of interservice rivalry was exacerbated by the country's most influential prewar air minister, Popular Front appointee Pierre Cot, who served from 1933 to 1940. For all his undoubted administrative skill, Cot's overbearing style only deepened military suspicions that the Armée de l'Air was "the armed service of the Left," with all the ideological contamination that implied.

As with many of their contemporaries, the French air chiefs between the wars were intrigued by the strategic bombing theories of Giulio Douhet and other airpower advocates. Not only was an independent strategic role a fashionable concept in aviation circles, but it also entrenched the Armée de l'Air's autonomy from the War Ministry. Cot was an enthusiast, but in trying to simultaneously placate both the strategic bombing advocates and army commanders who urged him to create a tactical support arm for the ground forces, he proposed the ill-fated BCR (Bomber Combat Reconnaissance) aircraft, a multirole fighter-bomber aircraft that was necessarily mediocre in all its capacities and a waste of much time and money. After Cot's replacement by Guy La Chambre in 1938, the strategic bombing plan was theoretically sidelined, but its influential proponents within the air service felt betrayed by the government and began a policy of tacit noncooperation with both state and army. Despite official doctrine, little or no progress was made on genuine collaboration between the ground and air forces prior to the outbreak of World War II.

In principle, neither supply nor quality of aircraft was a key problem. By May 1940, the Armée de l'Air possessed no fewer than 4,360 machines, of which approximately 2,900 were modern combat aircraft, with 67 fully equipped fighter squadrons, 66 bomber squadrons, and 30 observation

squadrons (escadrilles). Some 619 new aircraft were arriving from French factories each month, and there were regular shipments of Curtiss 75A (export version of the Curtiss P-36 Hawk) fighters from the United States. The chief problem lay in lack of pilots, technical support, and trained ground crews rather than lack of aircraft.

The best of France's own fighters, in particular the brand-new Dewoitine 520 (which went into service a few days after the German assault in the west), were on a par with their chief adversary, the Messerschmitt BF-109E. But scarcely one-quarter of this force was deployed on the crucial Northeastern Front. Explanations for this critical waste of resources have frequently focused on accusations of personal incompetence or even treachery, but the real culprit appears to have been France's inadequate supply of pilots. The aviation training program had not kept pace with the expansion in combat machines, so that even by calling up middle-aged reservists, the service's wartime commander, General Joseph Vuillemin, was unable to crew nearly the number of planes that were available. Far too many excellent aircraft remained uselessly crated up in storage while the air battle over France intensified.

Nor were the aircraft committed to France's defense well used. In February 1940, Vuillemin had relented to a demand that his frontline units be subordinated in command to General Alphonse Georges's individual army groups, maintaining for Vuillemin's personal direction only the strategic bomber reserve. Neither the airmen nor their peers in the land forces were properly trained in close-support techniques, and the resulting air/ground "cooperation" proved tragically inept: aircraft and pilots were wasted in piecemeal assaults on the German spearheads that lacked any coherent choreography with the army's counterattacks. Individual skill and bravery could not overcome such clumsy organization, and the withdrawal of the best squadrons to North Africa, which started five days before the armistice, indicates how profoundly the air force had lost confidence in its own ability to resist.

In the Vichy settlement, the army took its revenge on the Armée de l'Air, stripping it of its ministerial independence and reducing it once more to a branch of the regular ground forces. The surviving 19 metropolitan squadrons were equipped with obsolescent machines; the superior escadrilles were posted mostly to Algeria and Morocco, where in time they would be absorbed

into Free French leader Charles de Gaulle's forces after the November 8, 1942, Operation TORCH Allied landings in North Africa.

Despite its undoubted weaknesses, the air force's contribution to the Allied war effort should not go unrecognized. The 600–1,000 German aircraft it destroyed in May and June 1940 were sorely missed by the Luftwaffe during the ensuing Battle of Britain (July 10–September 30, 1940). But perhaps Cot's postwar eulogy concludes the story best: "The French did not lose the air battle; bad organization did not even let them fight it."

France, Army

The "strange defeat" of the French Army in the May–June 1940 Battle for France invites some of the most intriguing counterfactual assumptions of World War II. Was France's enervated and demoralized military fated to suffer catastrophe against the German Ardennes Offensive, or could sounder deployment, more energetic leadership, and a little more luck in the field have forestalled the sudden German victory? When did the slow decay within the antebellum army become truly critical? To address such questions, one must acknowledge the dual importance of contingency and determinism in matters of war.

Certainly the success of German leader Adolf Hitler's May 1940 CASE YELLOW (FALL GELB), the assault on France and the Low Countries, relied to some extent on specific errors of judgment by the French and British political-military leadership that greater forethought might well have prevented. However, the collapse of the Third Republic was symptomatic of deep and profound flaws within its army's prewar preparations that would have inevitably compromised France's defense no matter how spirited or ingenious its commanders had been in 1940.

The dilemma for France's military planners in the 20 years after the World War II armistice of 1918 was how to provide effective national security from a resurgent Germany when France faced a now permanently weakened manpower base and diminishing prospects of allied support. The horrific casualties of World War I began their demographic payoff in the mid-1930s as the "hollow classes" of conscripts fell 140,000 people short of target each year. At the same time, political considerations demanded the reduction of the traditional three-year draft into the army regiments to a single year, and although the draft was increased to two years in 1935, the new law was not uniformly enforced.

One option was to consider a smaller but better-equipped and better-trained army of career professional soldiers. Such was the case sketched by young Major Charles de Gaulle in his provocative 1934 work *Vers l'armée du métier* (The Army of the Future), in which he proposed the creation of six heavily armored divisions that would form an elite cadre for future offensive operations. Quite apart from cost, the civilian ministers recoiled at the thought of this potential Praetorian Guard; relations between the army and the Republican political class were still bad enough in the 1930s for the possibility of a military coup to be taken seriously.

The army, then, would remain a mass conscripted force. France's deficiency in manpower would be made up by defensive works, applying the lessons of Verdun—however incompletely understood—to the Maginot Line, a series of sophisticated frontier fortifications along the Franco-German border named for Minister of War André Maginot. The line was designed to canalize any German attack to the north, and it accomplished this in 1940. Comfortably ensconced behind this apparently impregnable fortress wall, the field army's task would be to stand in reserve and repel intrusions between the main Maginot forts while thrusting into Belgium to engage any German

assault north of the Ardennes. With a heavy concentration on defense and a battlefield this time mercifully removed from France's industrial heartland, the hope was to oppose and halt a westward attack despite the significant numerical advantage the Germans would enjoy.

At the outbreak of war, the Armée Metropolitaine mobilized 94 frontline and reserve divisions for the defense of France, with 215 infantry regiments all told—less than two-thirds the number mustered in August 1914. These divisions were organized into nine field armies and four army groups, with supreme command vested in General Maurice Gamelin, chief of staff of national defense. Gamelin's authority was, however, compromised by the unclear chain of responsibility between him and General Alphonse Georges, his commander on the crucial Northeast Front. Personal antagonism between the two men did nothing to dispel this ambiguity.

Georges's 1st and 2nd Army Groups of three armies apiece were disposed along the Franco-Belgian border along with the newly arrived British Expeditionary Force (BEF), while the 3rd Army Group under General Antoine Besson kept watch in Alsace-Lorraine. General René Henri Olry's Army of the Alps commanded the mountainous frontier against Italy. As it turned out, it accomplished this task magnificently after Italy's clumsy offensive in June 1940, the only redeeming chapter in France's agony that year. Scattered units of General Henri Honoré Giraud's Seventh Army guarded the French coasts.

A quartet of bureaus administered this great force: 1st (personnel and organization), 2nd (intelligence), 3rd (operations), and 4th (transport and services). Their staffs were located with neither Gamelin nor Georges, a characteristic multiplicity of headquarters that abetted the natural confusion caused by the commander in chief's refusal to take wireless communications seriously. The delays in transmitting and receiving messages to and from the respective commands—messages usually dispatched by motorcycle courier—would have been tardy by World War I standards; they were inexcusable in a war of portable radios and high-speed maneuver.

General Lattre de Tassigny, commander in chief of the French armies in France, inspecting Allied M4 Sherman tanks that liberated the French city of Colmar, February 11, 1945. (Horace Abrahams/Keystone/Getty Images)

A typical infantry division out of the 63 at Gamelin's disposal would consist of 17,500 men: 9 battalions of infantry (870 men each); 2 regiments of artillery, many of them equipped with the famous but now obsolete 75mm World War I field gun; and individual companies of antitank, reconnaissance, pioneer, engineer, signals, transport, medical, and supply troops. *Divisions légères mécaniques* (DLMs, light mechanized divisions), created in the scramble after the BEF evacuation at Dunkerque, had only six battalions and a single artillery regiment each. About half of this force was reserve divisions, divided into type A and type B according to age. There were also several miscellaneous reserve units judged unfit for combat duty that performed light communications and security duties behind the line.

As part of War Minister (from 1936 to 1938) Édouard Daladier's massive rearmament program from 1936 onward, a small number of modern armored divisions (*divisions cuirassées de réserve* [DCRs]) were planned, which would each boast four battalions of more than 150 heavy and light tanks. The most powerful of France's armored vehicles, such as the 30-ton Char B1 bis with 75mm and 47mm armament, could comfortably outgun any German tanks of the period and were generally better armored, although they tended

to lack speed, range, and radio equipment. Supply shortages and ministerial penny-pinching meant that the first two DCRs were not, however, created until January 1940, and only then at half strength. A third division appeared in March, while the fourth, commanded by Colonel Charles de Gaulle, did not make its entrance until the Battle for France was well under way.

Partly compensating for this shortfall were the three DLMs, former cavalry divisions that had been totally upgraded with Somua and Hotchkiss medium tanks as well as motorized dragoon and reconnaissance elements. Three *divisions légères de cavalerie* were a less successful variant on this. They were hybrid formations consisting of one mounted brigade and two battalions of motorized dragoons each. Those vehicles operated by the *chars de combat,* the army's tank arm, that were not delegated to one of the armored or mechanized divisions—more than half of France's tanks—were instead scattered across the various army groups in small packets for infantry support, sometimes at battalion level but more often to companies or platoons.

In addition to its metropolitan army, France could also call on its two imperial forces: the Armée d'Afrique, raised in Algeria, Tunisia, and Morocco, and the Troupes Coloniales, who guarded France's sub-Saharan territories, Madagascar, and Indochina. Each force was a combination of European French–only *zouave* and African *tirailleur* infantry regiments. The Tirailleurs Sénégalais of the Troupes Coloniales were especially prized for their fearsome reputation. The Armée d'Afrique also included *spahis*—irregular mounted troops and the 12-regiment-strong French Foreign Legion. Many colonial units were shipped to France at mobilization so that by May 1940 there were 21 regiments of Algerian and Tunisian Tirailleurs at the front line and several brigades of African cavalry.

Following the armistice with Germany, the rump Vichy regime was allowed only 100,000 men for metropolitan defense (presumably in conscious mimicry of the allowance given the Reichswehr in the Treaty of Versailles following World War I). This Armée de l'Armistice was organized into eight divisions, which because of the army's modest size were quite well provided with personal infantry weapons but lacked all motorized transportation and heavy equipment. By contrast, the Germans were sufficiently impressed by the vigorous defense of Dakar by Free French forces in late 1940 that they allowed the two imperial armies to expand. The

Armée d'Afrique grew first to 127,000 and later to 225,000 men and was allowed the use of tanks, heavy guns, and other modern weaponry.

Unfortunately for their German sponsors, however, neither of Vichy's colonial armies was willing to use its windfall of hardware when it encountered more substantial opposition, such as the Anglo-American TORCH landings on November 8, 1942. It was these landings that precipitated the winding up of the Vichy independent government and the final dissolution of the vestiges of the Third Republic's army. France's military future then lay elsewhere.

France, Battle for (May 10–June 25, 1940)

Germany's sudden strike west in May 1940 through neutral Holland and Belgium caught the Allies by surprise, leading to military defeat and the collapse of the French government. Despite Germany's successful April 1940 invasions of Norway and Denmark, France remained committed to the defensive posture it had assumed on mobilization. The French and the British Expeditionary Force (BEF), increased to nearly 400,000 men, could not

occupy their intended defensive positions in neutral Belgium until events forced that nation into the war. When the blow came, the Allied failure to prepare a realistic defense strategy, France's weak government, Germany's blitzkrieg tactics, and the lingering influence of the Phony War (Sitzkrieg) period combined to produce a rapid German victory.

The Germans did not have significant numerical or technological superiority over their opponents. Against Adolf Hitler's 141 divisions of some 3.35 million men, the French, British, Belgians, and Dutch could field 144 divisions of 3.3 million men. The Allies and neutral powers also had more tanks (perhaps 3,600, compared with 2,500 for the Germans). The Allies were sadly deficient, however, in numbers of antiaircraft guns and aircraft. Against 1,444 German bombers, the Allies could send up only 830 fighters. These would have to cope with 1,264 German fighter aircraft, more than 1,000 of which were Bf-109s. Overall, the German air fleets deployed in the west numbered 3,226 combat aircraft, whereas the British and French had half that number.

Well aware of this rough parity, the German General Staff was reluctant to undertake any assault in the late fall of 1939, instead producing the Phony War, when both sides were largely idle. Hitler's insistence on striking into France forced the issue, producing a series of changing operational plans that eventually invalidated the assumptions underlying the French defensive strategy. That strategy, and France's ability to execute it, suffered substantial defects by May 1940.

The prolonged period of inactivity along the front since the fall of Poland had seriously eroded both Allied military morale and confidence in France's military and civilian leadership. Defeatism and internal political struggles divided Premier Paul Reynaud's government. The French high command deliberately overestimated German strength in its pronouncements to provide an excuse in the event of disaster, and bureaucratic inertia and stubbornness hampered efforts by Colonel Charles de Gaulle and others to concentrate France's greater number of tanks into armored units capable of opposing Germany's panzer divisions. The first three French tank divisions did not assemble until January 1940, and they lacked radios. Most of France's tanks were parceled out in small packets along the front to act in support of infantry.

Allied strategy predicted that any German assault would bypass the

fortified Maginot Line by moving through the neutral Low Countries and then pivoting north of Liège to fall upon the English Channel ports and move against France from the north. But following the January 1940 compromise of the original German plan, which would have met Allied strength, Generals Erich von Manstein and Heinz Guderian convinced Hitler to abandon this approach in favor of concentrating the bulk of the resources on a more southern axis. Under the new plan, while other units extended the line to the sea, the main German force would drive through the Ardennes Forest south of Liège to strike the French army as it moved to defend Belgium.

General Fedor von Bock's Army Group B, charged with invading Belgium and Holland, was downgraded from 37 divisions in the original plan to only 28 in the Manstein plan and to 3 rather than 8 armor divisions. General Gerd von Rundstedt's Army Group A, which was to move through the Ardennes, was upgraded from 17 to 44 divisions, including 7 rather than a single armor division. Thus, at the point of the breakthrough, the Germans would outnumber the French 44 divisions to 9.

By early May, the signs of an impending attack were obvious, but its direction, speed, and success caught the Allies by surprise. French intelligence services, usually among the world's best, completely misread German intentions and strengths. Manstein's plan capitalized on the French tendency to anticipate a repetition of the World War I offensive inspired by the Schlieffen Plan. Therefore, the operation began on May 10 with an attack into Holland by Bock's Army Group B. Although some positions held for two or three days, German blitzkrieg tactics drove the bulk of the Dutch army back in short order. The French Seventh Army raced across Belgium to the rescue, arriving on May 12 only to join the retreat.

The great fortress of Eben Emael anchored Belgium's defenses on the south. A German glider assault took the allegedly impregnable position in just 28 hours, opening the path for German tanks. Similar airborne assaults carried bridgeheads and lesser defensive positions, overwhelming Belgian defenses. There, too, help arrived on May 12. British and French forces executing the planned strategy managed to slow the German advance through Belgium by May 14, but the concurrent German strike through the Ardennes obliterated that strategy.

Quickly overrunning Luxembourg, Rundstedt's Army Group A advanced through the Ardennes to reach the main French line along the Meuse River on

May 12. French Army commander General Maurice Gamelin's belated efforts to stem the tide with reinforcements came too late to prevent German forces from crossing the Meuse. The Germans took Sedan and punched a 50-mile gap in France's defenses. By May 16, they were on the Aisne River in open country.

The BEF and many French armor forces were already committed to battle in the north. Gamelin now ordered up reserves and formed the new Sixth Army under General Robert Auguste Touchon to try to seal the gap. General Henri Giraud took over command of the Ninth Army, but his forces were badly mauled by the Germans on May 17, and Giraud was captured. From May 17 to 19, Colonel Charles de Gaulle scored the only French successes of the battle when he flung his 4th Armored Division in three successive thrusts against the southern flank of the German advance from Laon. Aided by airpower, the Germans blunted the Allied attacks and swept on.

The speed of the German advance caught even Rundstedt by surprise, as his armor commanders subverted instructions to slow down, slipped around areas of heavy resistance, and reached the English Channel by May 21. Germany's spectacular success broke General Gamelin's ability to respond. French communications were abysmal, and there was no strategic reserve. Convinced of France's inevitable defeat, Gamelin ceased to exercise effective command. Premier Reynaud dismissed him on May 19 and replaced him with General Maxime Weygand, but the situation was too far gone for Weygand to stave off disaster.

The BEF was trapped in the north, and cooperation between it and the French First Army broke down. Forced to choose between supporting an increasingly unlikely French breakout (which both Weygand and British prime minister Winston L. S. Churchill ordered) or maintaining his line of retreat to the sea, on May 24 BEF commander General Sir John Gort ordered the BEF to withdraw to the north and the port of Dunkerque.

This proved to be one of the important decisions of the war, for it saved the BEF to fight another day. Hitler now committed his first major military mistake of the war, which allowed the BEF to escape. On May 26, Rundstedt, worried about the speed of the advance, halted the panzer divisions when they were within striking range of the last Channel ports open to the British. Hitler then converted this temporary halt into a firm order. He wanted to allow time for the infantry to come up and was convinced by Luftwaffe commander General Hermann Göring that the Luftwaffe could destroy the

British on the beaches, preventing their escape. Not until May 29 did Hitler release the tanks again, and by that time the BEF was in place, protected in large part by the French First Army. In the weeklong Operation DYNAMO, the British evacuated some 365,000 men from France, of whom nearly 225,000 were British.

Reynaud's new cabinet proved to be unable to deal with the deteriorating situation. The French government disintegrated into rival factions and descended into defeatism. Although much of the army was still intact, it was bereft of leadership and sound strategy and was psychologically defeated. Although Churchill proposed a union of Britain and France to keep the latter in the war, he refused, under pressure from the RAF, to commit the remainder of his fighter aircraft to the Battle for France. It appeared to Paris that Britain was withdrawing from the war, leaving France to fight alone.

By June 5, the Germans had repositioned the bulk of their forces in preparation for the final conquest of France. France opposed the onslaught with a greatly weakened military and an already defeated government. On June 8, Bock's Army Group B reached the Seine. One of his generals, Erwin Rommel, pushed on to Rouen before turning back up the coast, encircling the remaining British and French units along the seashore. East of Paris, French forces held out, perhaps in response to Weygand's futile (and foolish) June 8 order to hold without thought of retreat. But on June 12, Rundstedt's forces broke through the French line at Châlons. That same day, the French government abandoned Paris for Bordeaux in the southwest. On June 13, the government declared Paris an open city to spare it the fate of Warsaw and Rotterdam, and the next day German troops took peaceful possession of the capital.

For a full week, the French government struggled to find a solution while its demoralized forces fought an unorganized withdrawal without any clear strategy. The cabinet rejected alternatives ranging from a retreat to North Africa and the still-secure resources of the colonies to the outright union of France and Britain. The premier summoned Marshal Henri Philippe Pétain, hoping he could restore morale and reinvigorate resistance. Unfortunately, the aged hero believed that the war was lost and added his voice to the defeatists opposing Reynaud. On June 10, Italy entered the war on Germany's side, although Italian forces did not attack France in the southeast until June 20.

Late on the evening of June 16, with the Germans having taken Verdun and beginning to cut off the Maginot Line from the rear, Reynaud resigned. With his departure, any hope of France remaining in the war disappeared. Pétain succeeded him as premier, proclaiming in a radio address to the French people the next day that the country had lost the war and "the fighting must stop." Many army commanders interpreted this as an order, and the German advance continued largely without resistance. General of Brigade de Gaulle and a few other Frenchmen escaped to Britain.

France and Germany signed a cease-fire on June 22, 1940, but operations continued at Hitler's insistence until the Italians agreed to the armistice on June 25. Signed at Compiègne—at the same site and in the same railway carriage that had witnessed the signing of the armistice with Germany in 1918—the 1940 armistice allowed Germany to occupy northern France and the Atlantic coastal regions to the Spanish border, with France to pay for the German costs of administration. French prisoners of war remained under German control. The French fleet, much of which had escaped to North Africa, would remain under French control but be demobilized. The French government, having fled Paris, continued to rule the unoccupied zone from Vichy under the leadership of Pétain.

France, Navy

In September 1939 France possessed a powerful battle fleet. The navy had been largely rebuilt beginning in the 1920s and was generally regarded as the world's fourth most powerful maritime force. Georges Leygues, a National Assembly French deputy who had served as minister of marine, was a chief architect. Admiral Jean Darlan, the personification of a political admiral, commanded it. The navy was undoubtedly the most pro–United States and anti-British of the three French services during World War II.

In the pre–World War II era, French naval planning was guided by the formula that the navy should be equal in strength to the combined German and Italian navies. In addition, while the bulk of the French fleet was stationed in the Mediterranean, the navy was to be capable of operating elsewhere in the world, primarily in the Atlantic. Between 1925 and 1937, the French laid down new warships at the rate of 32,426 tons a year. With the approach of war, however, this increased to 41,000 tons annually, severely straining France's shipyard capacity.

The French fleet was centered on the battleship. France's two oldest battleships were seized by the British in July 1940 during Operation CATAPULT, but they were of so little worth that they would not see further naval action. Its next three older—but slow—battleships of the Bretagne class had been reconstructed in the interwar period. The *Bretagne* was sunk at

Mers-el-Kébir during CATAPULT, and the *Provence* was damaged there and later scuttled at Toulon. The *Lorraine* joined the Free French fleet in 1943.

In the 1930s, the French built two fast battleships, the *Dunkerque* and *Strasbourg.* Displacing 35,500 tons fully loaded, they were rated at 29 knots and were armed with eight 13-inch guns in the distinctive French quadruple turrets. Under construction the French had two of the best battleships in Europe in armor design, the *Jean Bart* and *Richelieu.* Both were armed with eight 15-inch guns in two quadruple turrets. Both would see action as Vichy and Free French warships and would survive the war. France also had one aged aircraft carrier, the *Béarn,* that would remain idle in the West Indies for most of the war. Two aircraft carriers were under construction but were never completed.

France maintained a cruiser force centered on 7 heavy ships. With the exception of the *Algérie,* they were probably the worst-armored heavy cruisers of any major navy. France also possessed 12 modern light cruisers, of which 6 were Gloire-class ships: fast, well armed, and well armored. France also developed a unique destroyer force. It had built 32 large destroyers of a type designated as *contre-torpilleurs.* Fast, long-ranged, and almost light cruisers in concept, the best known were the 6 ships of the Le Fantasque class. Capable of maintaining 37 knots at full load, they were for the whole of their careers the fastest flotilla craft afloat (*Le Terrible* made 45 knots in its trials). Displacing 2,800 tons (3,400 tons fully loaded), they were armed with five 5.5-inch guns. These superdestroyers were designed to operate in squadrons of 3 ships each. France also had 26 destroyers designed for fleet operations (*torpilleurs d'escadre*) and 12 light destroyers, the latter being 610-ton torpedo boats similar to the Italian Spica-class vessels. A total of 23 destroyers of all types were under construction in 1940, but none would be completed.

With the exception of the legendary monster submarine *Surcouf,* France's submarines consisted of three types. France had 38 first-class submarines of 900 to 1,800 tons displacement, 32 second-class submarines of approximately 600 tons displacement each, and 6 mine-laying submarines. Rounding out the fleet were numerous sloops, patrol boats, and other small craft; many trawlers and similar small vessels were requisitioned during the war for coastal work.

The French Navy did not have sonar until after the outbreak of the war in 1939, and during the Vichy era, there was only limited introduction of radar. Free French naval units were dependent for advanced equipment on Great Britain and the United States, chiefly the latter. Meanwhile, the greatest gift by Vichy France to the Axis war effort may have been Darlan’s presentation to the German Navy of the Metox device for detection of radar.

The French Navy had no role during the 1939 Poland Campaign that began the war, but it did participate in the Norway Campaign (1940). The latter included a destroyer raid into the Skagerrak, an arm of the North Sea between Norway and Denmark. The navy also conducted convoy and antisubmarine operations as well as operations in the Atlantic against German raiders. French naval units also participated in the Dunkerque (Dunkirk) evacuation (May 26–June 4, 1940), losing several destroyers to German aircraft.

With the fall of France, the majority of the ships passed to Vichy government control. After the British attack at Mers-el-Kébir (July 3, 1940),

most of the now-truncated fleet was relocated at Toulon, where virtually all were lost in a mass scuttling on November 27, 1942. Seventy-seven ships went down: 3 battleships (the *Strasbourg*, the *Dunkerque*, and the old *Provence*), 7 cruisers, 32 destroyers, 16 submarines, and 19 other craft. A few destroyers and smaller ships were raised and towed to Italy, but the Axis powers gained little from them. Five submarines escaped; 1 was badly damaged by bombing and had to be scuttled, another was interned in Spain, and 3 arrived in Algeria.

Some Vichy warships participated in actions against the Allies, primarily off Syria, Madagascar, and Dakar and during Operation TORCH (November 8, 1942). The French warships also conducted convoy operations to France. The successful Vichy defense of Dakar on September 23–24, 1940, was an important factor in Adolf Hitler's decision to continue backing the Vichy regime in 1940–1941.

Charles de Gaulle placed the few mostly smaller warships of the Free French under Vice Admiral Émile Muselier. As late as January 1943, this modest force had only 5,314 men, but it would expand as the war progressed to include several small British- and U.S.-built warships. They would operate in all oceans, participate in operations against the Vichy territories, and later take part in Operation OVERLORD (June 6, 1944) and in Pacific Ocean battles with Japan.

Major wartime losses for French ships were 4 battleships, 4 heavy cruisers, 6 light cruisers, and 58 destroyers and large torpedo boats. Unfortunately for France, its navy was little able to influence events at the beginning of the war, and the defeat of France in June 1940 came too soon for the navy to contribute in a meaningful way.

France Campaign (1944)

Allied campaign to liberate France from Axis control. The campaign to drive the Germans out of Western Europe began with the June 6, 1944, Allied landing in Normandy, the largest amphibious operation in history. U.S. general Dwight D. Eisenhower had overall command; British general Bernard L. Montgomery commanded the landing force of the 21st Army Group, which consisted of Lieutenant General Miles Dempsey's British Second Army and Lieutenant General Omar N. Bradley's American First Army.

Even with stiff resistance by German defenders, especially the German 352nd Infantry Division at Omaha Beach, Allied forces expanded the beachhead from 5 to 20 miles inland and joined all five beaches into a single continuous front by June 12. French Resistance forces supported the Allied effort by providing intelligence, sabotaging bridges and railways, and conducting harassment operations. Dempsey's Second Army began the drive toward Caen but met heavy resistance from German forces, including two panzer divisions. Meanwhile, Bradley's First Army moved up the Cotentin Peninsula toward the important port city of Cherbourg. Units of the U.S. VII Corps assaulted Fort du Roule and, guided by the French Resistance, scaled the cliffs. By June 27 Cherbourg was secure, but the Germans had heavily damaged the port facilities there, and they were unusable for more than a month.

By the beginning of July, Allied progress in Normandy had been slowed by the hedgerows of the bocage country, strong German positions at Caen, and the logistical challenges of supplying the Allied forces over the beaches. Enjoying the advantage of overwhelming air superiority, the eight corps of the 21st Army Group pushed south, seizing Caen on July 10 and Saint-Lô on July 18. The capture of these two important cities set the stage for the Allied breakout west into the Brittany Peninsula and east toward Paris.

The slow pace of their advance in France concerned Allied commanders, who feared that fighting would bog down, resulting in trench warfare resembling World War I. Bradley believed that the weak link in the German Army defenses was General Paul Hausser's Seventh Army, south of Saint-Lô. Bradley's breakout plan, code-named Operation COBRA (July 25–31), was temporarily put on hold so vital supplies could be sent to support the British Second Army's July 18–20 Operation GOODWOOD, an attempt to penetrate German lines outside of Caen. Although GOODWOOD did not achieve a breakout, it assisted COBRA by holding two German panzer divisions in place and preventing their redeployment to the Saint-Lô area.

Heavy saturation bombing along a four-mile corridor preceded COBRA, as elements of Major General J. Lawton Collins's VII Corps attacked west of Saint-Lô on July 25. Concurrently, Major General Troy H. Middleton's VIII Corps, located west of VII Corps, struck toward Countances. Within two days, VII Corps had pushed the German defenders back 10 miles, and on July 28 elements of the 4th Armored Division secured Countances. Sensing that the breakthrough was decisive, Bradley ordered Collins to continue the drive south toward the strategic city of Avranches. By the end of July it too was in Allied hands, and the German Seventh Army was in a precarious position, with its left flank exposed.

The capture of Avranches opened the Brittany Peninsula to the Allies. Meanwhile, Lieutenant General George S. Patton's U.S. Third Army became operational on August 1 as part of an overall restructuring of the Allied command. Montgomery's 21st Army Group was now composed of the British Second Army and Lieutenant General Henry Crerar's Canadian First Army. Bradley assumed command of the new 12th Army Group composed of the American First and Third Armies. Patton's Third Army gained the greatest success, and Patton was certainly the outstanding general of the campaign for France.

The Third Army displayed instant efficiency and turned Operation COBRA, a local breakthrough, into a theater-wide breakout. The Third Army immediately exploited the opening at Avranches: Patton sent his VIII Corps to clear the Brittany Peninsula, XX and XII Corps south to the Loire River, and XV Corps east toward Le Mans. These objectives were secured by August 13.

While the Third Army moved against limited opposition, the German Seventh Army hastily reorganized to launch a counterattack toward Avranches, hoping to cut off the Third Army. Not only did this attack fail, but it also put the Seventh Army in a position where it might be surrounded by the Allies. To accomplish this, Montgomery, who was still overall ground commander, ordered the Canadian II Corps to attack south as Patton's XV Corps drove north.

The objective for both corps was the town of Argentan. Major General Wade Haislip's XV Corps reached Argentan on August 13, but the Canadian II Corps progressed slowly and was more than 20 miles from the objective. Patton pleaded with Bradley to allow XV Corps to press northward, but the 12th Army Group commander refused, fearing that XV Corps might be cut

off or that excessive casualties from friendly fire might result from XV Corps moving into a zone reserved for the Canadian II Corps.

Even though the gap between the towns of Falaise and Argentan was not closed until August 19, the area was turned into a killing ground by constant Allied air attack, artillery bombardment, and direct ground fire from armored and infantry units. Although the German Seventh Army was savaged in these attacks, a great many German soldiers escaped. Failure to close the gap was one of the major mistakes of the war. Had the gap been sealed and the Seventh Army annihilated, the Western Allies would have faced far less resistance as they pushed east toward Germany. Operations following COBRA were so successful that most German forces in northwest France had to retreat to the Seine River. Paris was liberated on August 25.

German garrisons doggedly held out in the northern port cities of Saint-Malo, Brest, Lorient, and Saint-Nazaire. Combat commands from the 4th and 6th Armored Divisions were insufficient to secure these heavily fortified ports quickly. Repeated assaults supported by air attacks and naval bombardments failed to dislodge the defenders. Saint-Malo was not taken until September 2, and Brest fell on September 19. In both cases, the Germans had demolished their port facilities. On the basis of these experiences, Supreme Headquarters, Allied Expeditionary Force (SHAEF), canceled planned assaults on Lorient and Saint-Nazaire, and German garrisons there held out until the end of the war.

The Western Allies addressed concern about the exposed southern flank of their armies, the need to secure a large functioning port, and interest in cutting off what German forces remained in southern France in Operation DRAGOON, the invasion of southern France. British prime minister Winston L. S. Churchill strongly opposed the plan because Operation COBRA had proven such a huge success, but Eisenhower prevailed, and DRAGOON commenced on August 15.

Lieutenant General Alexander Patch’s American Seventh Army landed in southern France just east of Toulon. Major General Lucian Truscott’s VI Corps spearheaded the landing and by August 17 had established a 20-mile beachhead. The French II Corps followed with the task of driving west to secure Toulon and Marseille, which it accomplished by August 28.

VI Corps moved rapidly west and then north up the east side of the Rhône River—except for an armored group, Task Force Butler, that moved east of

the Rhône River Valley in an effort to envelop German forces gathering at Montelimar. By this time, the German Nineteenth Army, led by General of Infantry Friedrich Wiese, was pulling out of southern France. Truscott's corps inflicted severe material damage on the retreating Germans, however, capturing 57,000 of them and liberating Montelimar by August 28.

By September 3, the Seventh Army had driven north almost 250 miles up the Rhône River. The 1st Airborne Task Force was used to seal the Swiss border; the French I Corps took up a position to the right of Truscott's VI Corps, and the French II Corps flanked the left. On September 14, Patch's Seventh Army linked up with Patton's Third Army, sealing the open southern flank. On September 15 the 6th Army Group was formed, with Lieutenant General Jacob Devers commanding. It was composed of the American Seventh Army and General Jean de Lattre de Tassigny's French First Army. Besides securing the Allied southern flank, DRAGOON greatly aided the logistical situation by making available the large port at Marseille. Finally, southern France was cleared of German forces.

By the middle of September 1944 France had been liberated, and German forces had withdrawn into the Netherlands and to the West Wall, along the western German border. Although it had been severely bloodied, the German army in the west was not annihilated but was reorganizing and entrenching for a long fight. Unfortunately, the Allied drive east was so fast that lines of communication and supply could not keep up with the tactical advance. With insufficient supplies to advance all his army groups at once, Eisenhower now decided to support Montgomery's plan to cross the lower Rhine into Germany, Operation MARKET-GARDEN (September 17–26).

Franco-Bahamonde, Francisco Paulino Hermenegildo Teódulo (1892–1975)

Spanish Army general and dictator. Born into a middle-class family in El Ferrol in Galicia on December 4, 1892, Francisco Paulino Hermenegildo Teódulo Franco-Bahamonde did not enter the navy, as was family tradition, because budget cuts had led to the closing of the Naval Academy following the 1898 Spanish-American War. Rather, in 1907, Franco entered the Infantry Academy at Toledo, graduating in 1910. Commissioned a second lieutenant, he refused a comfortable posting in El Ferrol for one in Spanish Morocco.

Franco's leadership, courage, and ruthlessness, demonstrated during the Riff Rebellion in Morocco, brought rapid promotion, and in 1920 he became deputy commander of the Spanish Foreign Legion in Morocco. In June 1923, King Alfonso XIII personally promoted him to lieutenant colonel and gave him command of the Spanish Foreign Legion. That same year, the young colonel married María del Carmen de Polo, from one of Spain's most influential families; the king served as best man by proxy. In 1926, Franco was promoted to brigadier general, the youngest soldier to hold that rank in any European army at that time.

An archconservative, Franco was closely identified with General Miguel Primo de Rivera, who governed Spain in the name of Alfonso XIII from 1923 to 1930 and appointed Franco commander of the General Military Academy of Zaragoza (Saragossa). In 1931, on the proclamation of a republic, the Left came to power and transferred Franco to the Balearic Islands, where he served from 1931 to 1934. He returned to Spain to play a role in crushing a revolt by miners in Asturias in 1935. Later that year, he accepted the post of chief of staff of the army offered him by the conservative government.

The leftist Popular Front won the hotly contested national elections of February 1936, and the new government sent Franco to command the Canary Islands garrison. As expected, the conservative Nationalists defied the mandate, and Franco was in the forefront of the revolt that began in July 1936. The untimely deaths of Generals José y Sacanell Sanjurjo and Emilio Mola Vidal left Franco as the military leader.

Thanks to German assistance, Franco was able to airlift units of the Spanish Foreign Legion from Morocco to Spain, and he launched a drive on Madrid. In September 1936, Franco became chief of the Nationalist government, and in April 1937 he assumed leadership of the Falange Party. Franco was de facto head of Spain on the fall of Madrid in March 1939, marking the end of the civil war. Franco then carried out a ruthless purge of the opposition. Throughout his long years in power, he remained undeviatingly true to his mission of preserving traditional Spain.

When World War II erupted in 1939, Franco openly sided with Adolf Hitler and Benito Mussolini. The Caudillo (leader), as he became known, met with Hitler at Hendaye, France, on October 23, 1940. He pledged his loyalty to Hitler but then refused to bring Spain into the war because he believed that his cause was better served in "nonbelligerency" (not neutrality), a stance that

infuriated Hitler. Franco did send troops—the well-equipped 18,000-man Blue Division—to fight in the Soviet Union. Throughout the war, Franco provided the Germans with observation posts in Spanish Morocco for use in monitoring Allied ship movements, and he allowed German submarines to be serviced in Spanish ports. After the Allied landings in North Africa in November 1942, Franco shifted to a strictly neutral stance. But when the war was over, Spain became a primary refuge for leading Nazis and Quislings (Nazi collaborators).

After the war, the Allies punished Franco's wartime conduct with quarantine treatment. Spain was kept out of the United Nations and condemned for its nature and for its close association with the Axis states. With the coming of the Cold War, however, the United States came to regard Franco's Spain as a bulwark against communism. In the revisionist version, Franco became the shining knight who had saved Europe from atheist communism. The United States established air and naval bases in Spain, and U.S. aid propped up the Franco regime, a position remembered with bitterness by many Spanish democrats.

Franco declared Spain a monarchy in 1947 but remained its leader until his death in 1975. Franco relaxed his authoritarian regime somewhat in the 1950s, but unrest in the 1960s led to renewed repression. Having selected Prince Juan Carlos de Bourbon, grandson of Alfonso XIII, as his heir, Franco died in Madrid on November 20, 1975. The new king presided over the transition to democracy in Spain.

Franco-Thai War (November 1940–January 1941)

Undeclared war between Thailand and Vichy France. Thailand began the Franco-Thai War to regain the three rich rice-growing provinces of Battambang, Siemréap, and Sisophon, which the Thais had annexed in 1862 from Cambodia but the French had forced them to restore in 1907. Thailand also claimed territory in Laos, which the French had forced it to return in 1904.

In early June 1940, Thailand concluded a nonaggression pact with France. After Germany defeated France, however, the Thais lost interest in ratifying the pact. The pro-Japanese military government of Marshal Pibul Songgram saw an opportunity to capitalize on French weakness, and in October it called up military reservists.

The Thai Army numbered 26,500 men, but reservists brought it to nearly 50,000. The Thai Air Force had about 270 aircraft, of which 150 were combat types mostly of U.S. manufacture. The Thai Air Force also had several dozen obsolete land-based aircraft, but in December 1940 Japan delivered 93 modern aircraft. The Thai Navy had 10,000 men who manned royal yachts, a British-built World War I destroyer, and two British-built small gunboats and eight motor torpedo boats (MTBs). Italy supplied nine small torpedo boats, two minesweepers, and nine minelayers. Two light cruisers under construction in Italy for Thailand were not available for the war and were indeed sequestered by Italy in 1941. Japan also delivered two armored coastal defense antiaircraft vessels, four small submarines, two escort/training ships, and three small torpedo boats. The Thai Navy suffered from serious shortcomings. Its sailors were poorly trained, the older vessels were of limited value, the modern Italian torpedo boats were too flimsy for service in rough seas, and the Japanese submarines could not dive.

The French army in Indochina was comparable in size to the mobilized Thai force: 50,000 men. But 38,000 of these were Indochinese troops of questionable loyalty. The heart of the French military was the 5,000-man 5th Foreign Legion Regiment. The French possessed 30 World War I–vintage tanks. Much of their artillery was also outdated, and they were short of

artillery ammunition. The French had fewer than 100 aircraft. French naval units in Indochinese waters were old and for the most part poorly armed. They consisted of the light cruiser *La Motte-Picquet,* two gunboats, two sloops, two auxiliary patrol craft, and several noncombatants.

France was extremely vulnerable. It had already been defeated by Germany in Europe, and Japan was applying pressure in Indochina. In September 1940 Japanese troops invaded Tonkin, killed 800 French troops, and secured concessions and airfields. Bangkok decided to take advantage of these circumstances to reassert its claims.

In mid-November 1940, the Thais sent military units across the Mekong River into Cambodia, producing immediate military skirmishes with French troops. The French military was temporarily sidetracked by the November 22 Indochinese Communist Party uprising in Cochin China, which it crushed in the first week of December. French high commissioner of Indochina Admiral Jean Decoux then decided to go on the offensive.

On land, a mixed French brigade attacked Thai positions at Yang Dom Koum on January 16, 1941. The assault failed because of insufficient manpower and heavy weapons. The Thais, who had planned their own offensive for the same day, then counterattacked. French Foreign Legionnaires beat back this attack, which included tanks. Both sides then withdrew from the immediate area, although Bangkok claimed victory.

At the same time, the French took the offensive at sea. The French Navy planned an assault on the Thai naval detachment at Koh Chang and the principal Thai Navy base at Sattahib. The initial strike was to be carried out by virtually the entire French flotilla: the cruiser, two gunboats, and two sloops. On January 16, the fleet sailed for the Gulf of Siam to Koh Chang, which guarded the passage to Sattahib. Early on January 17, the French surprised the Thais. In the ensuing 90-minute action at Koh Chang, the French sank two Thai torpedo boats; they also sank a Thai coastal defense vessel and mortally damaged another. With no direct hits or losses to their own ships, the French then returned to Saigon on January 19.

There was little air action during the war, although the Thais did use their Curtiss Hawk III biplanes in a dive-bombing role. The French also had a plan, which they did not implement, to firebomb Bangkok from the air.

The indecisive land and naval actions of January 1941 did not end the war. The Japanese then applied diplomatic pressure on France, threatening to

intervene on the side of Thailand. On January 31, 1941, at Saigon, French and Thai officials signed a Japanese-dictated armistice aboard the Japanese cruiser *Natori.* In March the Vichy government, which was also being intimidated by Germany, accepted Japanese mediation. Under Japanese pressure, on May 9, 1941, France signed a peace treaty with Thailand in Tokyo whereby France transferred to Thai control three Cambodian and two Laotian provinces on the right bank of the Mekong River—about 42,000 square miles in area.

After the end of World War II, France forced the Thais to return this territory in September 1945 and to accept the Mekong as the boundary separating Thailand from Laos and Cambodia to the east. But border clashes along the Mekong occurred in 1946 and with Cambodia as late as the 1980s.

Fraser, Bruce Austin (1888–1981)

British Royal Navy admiral of the fleet and first sea lord. Born into a military family (his father was an army general) at Molesey, Surrey, on February 5, 1888, Bruce Austin Fraser was educated at Bradfield Junior School. He entered the fleet training school of HMS *Excellent.* His early service was in battleships and destroyers, and he became known as a gunnery officer, holding that post on the cruiser *Minerva* in the Mediterranean during World War I.

In the following years, Fraser served as gunnery officer for the Mediterranean Fleet. From 1929 to 1932, he commanded the cruiser *Effingham* and then served as director of naval ordnance, playing an important role in helping to design the King George V–class battleships. Following command of aircraft carrier *Glorious* in 1936 and 1937, Fraser was promoted to rear admiral in 1938 and became chief of staff of the Mediterranean Fleet. In March 1939, Fraser was appointed controller of the navy and third sea lord. Early in World War II, he was responsible for the development of a new class of corvettes. In May 1940, Fraser was promoted to vice admiral, and a year later he was knighted. Fraser was appointed second-in-command of the Home Fleet in June 1942, and in May 1943 he assumed its overall command.

In his position, Fraser oversaw the adoption of new antisubmarine tactics against German U-boats and increased cooperation with U.S. naval forces during the height of the Battle of the Atlantic. In December 1943, he commanded British Task Force 2, which engaged and sank the German battleship *Scharnhorst* during its sortie against an Allied Arctic convoy.

The Allied successes in the Atlantic and the resultant reduction of the German U-boat and surface raider threat led British prime minister Winston L. S. Churchill to assign Fraser to command the Pacific Fleet in late 1944. Fraser led the return of British naval units to the Pacific with a force built around aircraft carriers. For the remainder of the war, he maintained excellent relations with U.S. commanders and led British forces in support of U.S. amphibious and naval operations. Fraser was the British representative at the formal Japanese surrender aboard the battleship *Missouri* in Tokyo Bay on September 2, 1945.

Rewarded with the title of First Baron Fraser of North Cape, in 1948 Fraser was promoted to admiral of the fleet and appointed first sea lord and chief of naval staff. He held this post until his retirement in 1951. Fraser died in London on February 12, 1981.

Fredendall, Lloyd Ralston (1883–1963)

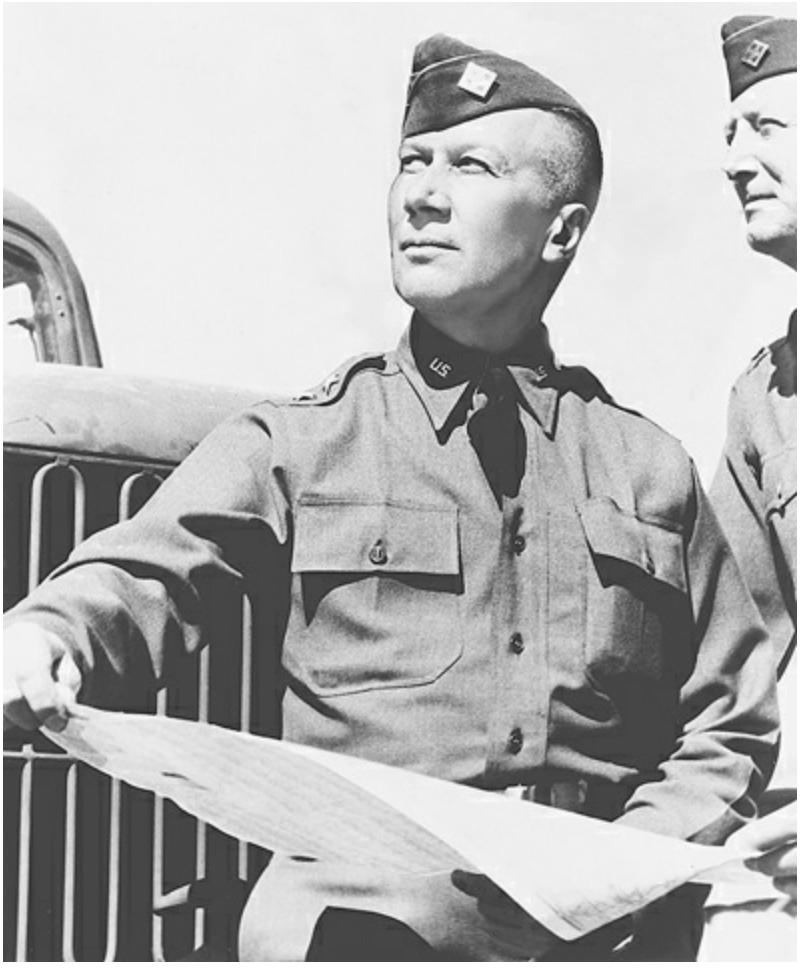
U.S. Army lieutenant general. Born in Cheyenne, Wyoming, on December 28, 1883, Lloyd Fredendall attended the U.S. Military Academy at West Point in 1902 and 1903 but dropped out because of poor grades. He next attended the Massachusetts Institute of Technology (MIT). In 1907, he obtained a direct commission as a lieutenant of infantry and then served in the Philippines and Hawaii. Following U.S. entry into World War I, Fredendall commanded a training center in France.

Fredendall was an instructor at the Infantry School from 1920 to 1922. He graduated from the Command and General Staff School in 1923 and the Army War College in 1925. Following a tour as professor of military science and tactics at the University of Minnesota, Fredendall commanded the 57th Infantry Regiment in the Philippines during 1936–1938. From August 1938 to December 1939, he served in the office of the chief of infantry.

Promoted to brigadier general in December 1939, Fredendall served with the 5th Infantry Division. In October 1940, he was promoted to major general. He then commanded the 4th Infantry Division from October 1940 to

July 1941. Known as an effective troop trainer, he took command of II Corps in August 1941 and XI Corps on its activation in June 1942.

Again commanding II Corps that October, Fredendall commanded the U.S. landing at Oran, Algeria, on November 8, 1942. Reportedly, he did not leave his command ship until the fighting was over. By early 1943, elements of his corps held the exposed right flank of a combined British, French, and U.S. force facing eastward into Tunisia. Short of troops, Fredendall foolishly ignored the advice of Major General Orlando Ward, commander of his 1st Armored Division, with whom he was barely on speaking terms; Fredendall widely scattered the combat elements of Ward's division. Fredendall himself remained some 70 miles behind the front at his fortress-like command post.



Major General Lloyd R. Fredendall, shown here in 1941. Removed from command of II Corps following the debacle of the Battle of Kasserine Pass, Fredendall was replaced by Major General George S. Patton, Jr. (Library of Congress)

On February 19, 1943, German columns under Colonel General Hans von Arnim and Field Marshal Erwin Rommel initiated an offensive against Fredendall's forces that resulted in the Battle of Kasserine Pass. This first major clash for the Americans with German troops resulted in a major U.S. defeat. Fredendall apparently suffered a temporary breakdown during the battle. The Allied forces rallied, however, and the Germans were unable to exploit their victory and soon withdrew.

This defeat, combined with Fredendall's abrasive manner and his habitual absence from the front, cost him the confidence of subordinates and superiors alike. On March 6, General Dwight D. Eisenhower replaced Fredendall with Major General George S. Patton Jr. Sensitive to public opinion, the War Department decided not to disgrace Fredendall. Instead, he was recalled to the United States, promoted to temporary lieutenant general in June 1943, and assigned first as deputy commanding general and then commanding general of the Second Army from March 1943 until his retirement in March 1946. Fredendall died in La Jolla, California, on October 4, 1963.

Frederick, Robert Tryon (1907–1970)

U.S. Army major general. Born in San Francisco, California, on March 14, 1907, Robert Tryon Frederick graduated from the U.S. Military Academy at West Point in 1928 and was commissioned in the Coast Artillery Corps.

Prewar postings included stints in the Panama Canal Zone and Hawaii and study at the Coast Artillery School. Frederick graduated from the Command and General Staff School in 1939.

Promoted to lieutenant colonel in 1941, Frederick was assigned to the War Plans Division of the War Department. In 1942, he was appointed to prepare and lead the 1st Special Service Force (SSF), an elite unit composed of specially selected U.S. and Canadian soldiers and trained for mountain, amphibious, and airborne operations. Later dubbed the "Devil's Brigade" by its German adversaries (and made legendary as the subject of a 1968 Hollywood motion picture starring William Holden as Frederick), the 1st SSF became the model for modern special forces.

After receiving intensive training in often harsh conditions, the 1st SSF's initial assignment came during the Aleutian Islands Campaign in 1943. Transferred to the Italian Front, the brigade participated in a series of impressive mountain engagements, which highlighted its special training and resulted in Frederick's promotion to brigadier general in January 1944. During January 22–May 25, 1944, the brigade participated in the stalemate at Anzio, again drawing praise for its outstanding performance in an otherwise dismal episode.

In July 1944, Frederick took command of the 1st Airborne Task Force (promotion to major general followed the next month), which jumped during Operation DRAGOON, the August 15, 1944, invasion of southern France. In December, at age 37, Frederick assumed command of the 45th Infantry Division, which he led into Germany and until the end of the war. In addition to being one of the youngest division commanders in the U.S. Army, Frederick was also the most frequently wounded of any American general officer of the war, receiving eight Purple Hearts. He also earned two Distinguished Service Crosses, the Silver Star, and the British Distinguished Service Order. Throughout the war, Frederick's force was never defeated in battle.

During the postwar years, Frederick commanded occupation forces in Europe and later the 4th and 6th Infantry Divisions. In 1951, he led U.S. support efforts in Greece, retiring because of disability in March 1952. Frederick died in Palo Alto, California, on November 30, 1970.

Free French

On June 18, 1940, French Army general of brigade Charles de Gaulle—until the previous day undersecretary of war in the Paul Reynaud government—appeared before the microphones of the British Broadcasting Corporation in London and broadcast an appeal for Frenchmen to rally to him and continue the fight, saying that "France has lost a battle, but France has not lost the war."

Of nearly 100,000 French troops in England at that time—most of whom had been evacuated from the area around Dunkerque—only 1,300 volunteered to stay in England and join de Gaulle; the remainder returned to France. Of the volunteers, 900 were Foreign Legionnaires of the 13th Demi-Brigade who had recently been evacuated from Norway. Undeterred by the limited response, de Gaulle recruited forces and established the "Fighting French" (Free French forces). On August 2, a court-martial initiated by Marshal Henri Philippe Pétain's Vichy French government sentenced de Gaulle to death in absentia for treason. On August 7, de Gaulle signed an agreement with the British government regulating the French forces and placing them under the "general directives of the British High Command."

General Charles de Gaulle inspecting members of the newly formed Free French command unit at Wellington Barracks in England in 1942. (Keystone/Getty Images)

During the next year, de Gaulle's small force steadily increased in number. In August 1940, sufficient troops to form four battalions joined from Equatorial Africa (Chad, Cameroon, Middle Congo, and Gabon). Hoping to enlist units in West Africa, de Gaulle mounted a 1,445-man expedition with British naval support against Dakar in West Africa, but the city remained loyal to Vichy France and the operation failed.

Other Free French forces served abroad. Volunteers from Syria were formed into the 1st Marine (Naval) Infantry, which was attached to the British 7th Armoured Division. These troops assisted in the capture of Tobruk, Libya, during January 6–22, 1941. In December 1940, Colonel Raoul-Charles Magrin-Vernerey (aka Monclar) formed the Brigade d'Orient of 1,200 men from several units of infantry (including the 13th Demi-Brigade) and a horse cavalry squadron. The brigade fought in Eritrea from January to May 1941, the cavalry unit making the last French cavalry charge in history (against Italian cavalry).

On May 25, 1941, Major General Paul Louis Legentilhomme formed the 5,400-man 1st Free French Light Division from several units of French Legionnaires, Africans, and Arabs. On June 8, operating with British

Commonwealth forces, the division invaded Syria, meeting bitter resistance from Vichy forces there. The campaign ended on July 11. Of the 38,000 Vichy troops in Syria, 5,331 (including 1,000 Legionnaires) joined the Free French; the remaining soldiers were allowed to return to France. On August 20, 1941, the Light Division was disbanded; with additional reinforcements, it became several independent brigade groups, some of which remained in Syria for garrison duties.

The French 1st Brigade, commanded by General of Brigade Marie Pierre Koenig, was formed in December 1941. It consisted of the 13th Demi-Brigade and several naval infantry battalions. These Fusiliers-Marins provided a bit of color, as the sailors retained their red pom-pom naval caps, and the chief petty officers wore their peaked caps. Assigned to the British XIII Corps, the 1st Brigade was posted to the "box" at Bir Hacheim at the left end of the Gazala Line in Libya.

Attacked by the Italian Ariete Division and elements of the German 90th Light Division on May 27, 1941, the 1st Brigade held, despite continuous combat and constant Luftwaffe attack. Ordered on June 11 to withdraw, it broke through to British lines. Bir Hacheim was the defining battle for the Free French. Prior to it, British support had been lukewarm. After the brigade withstood German Afrika Korps assaults longer than any of the Commonwealth boxes on the Gazala Line, however, there were no longer any doubts that the Free French would fight and fight well.

By the time of the Battle of El Alamein (October 23–November 4, 1942), Free French units were fighting with the British 7th Armoured Division, 50th Infantry Division, and the Long-Range Desert Group. The 1st Free French Division was formed on February 1, 1943, for the campaign in Tunisia under Koenig, who was now a major general. After a brief resistance to the Allied landings on November 8, 1942 (Operation TORCH), eight divisions of the French North and West African Armies went over to the Allied side. The XIX Algerian Corps under Major General Alphonse Pierre Juin fought alongside the British First Army in Tunisia, although Juin refused to take orders from the British commander. Additional political problems arose when some elements of the Free French forces refused to associate with the North African ex-Vichy troops.

On August 4, 1943, a new French army came into being, consisting of eight infantry divisions, four armored divisions, four regiment-sized groups

of French North African troops, six commando battalions, and one parachute regiment. Under the terms of an inter-Allied agreement, the United States assumed responsibility for rearming, reequipping, training, and supplying the French forces. Language problems and the emphasis on fielding the greatest number of combat units possible at the expense of support units were the most prominent obstacles encountered. Other problems arose over weapons (the French never received the excellent U.S. M1 Garand rifle) and supplies (the French never received tanker jackets and, more seriously, initially received a smaller ration scale than American troops). Eventually, most problems were resolved.

A French Expeditionary Corps of five divisions was formed on May 18, 1943. Commanded by Juin and sent to Italy in late 1943 and early 1944, it was instrumental in winning the Fourth Battle of Cassino, outflanking the German position by moving through the mountains as Juin suggested. A reinforced Free French division liberated the Mediterranean islands of Corsica (September 8–October 4, 1943) and Elba (June 17–18, 1944).

On August 15, 1944, what became the French First Army under Major General Jean Marie Gabriel de Lattre de Tassigny landed in southern France as part of the U.S. Sixth Army in Operation DRAGOON (August 15, 1944). Its eight divisions and 200,000 men fought their way up the Rhône Valley, arriving on the right flank of U.S. lieutenant general George S. Patton's Third Army. The French First Army advanced into southwest Germany, and by the end of the war it had reached the Tyrol in western Austria. In addition, Major General Philippe Leclerc's Free French 2nd Armored Division served with the U.S. First Army; liberated Paris during August 19–26, 1944; and joined the French First Army in February 1945.

By the end of the war, the rebuilt French Air Force consisted of 25 fighter, bomber, and reconnaissance squadrons equipped with American and British aircraft. The Free French Navy, which initially consisted of only three ships, had grown by war's end to a total of 240 warships.

At a cost of 23,500 killed and 95,500 wounded, Free French forces demonstrated a will to fight that impressed their Allied counterparts. Although it was significant, the Free French contribution to the Allied victory in Europe is not generally recognized.

Frenay, Henri (1905–1988)

French Army officer and Resistance leader. Born in Lyons on November 19, 1905, Henri Frenay graduated from the French Military Academy at Saint-Cyr. A captain in 1940, he fought and was captured by the Germans in the Battle for France (May 10–June 15, 1940) but escaped on June 27, 1940, and made his way to Marseilles, where he became a Vichy garrison officer.

Regarded as an expert on the Third Reich because of his studies at the Centre d' Études Germaniques at Strasbourg, Frenay was attached to the military intelligence division. He soon came to realize that the Vichy regime, headed by Marshal Henri Philippe Pétain, was intent on collaboration with the Germans. By early 1941, Frenay had become involved in the Resistance, creating the Mouvement de Libération Nationale, which produced three clandestine newspapers.

In November 1941, Frenay merged both his publications and Resistance organization with those of François de Menthon, to become *Combat,* the name of both publication and the largest Resistance group in France. Frenay, code-named "Charvet," went on to pioneer most of the techniques used within the French Resistance. A staunch anticommunist who had little time for any prewar French political grouping, Frenay was initially suspicious of the directing role that London-based Free French leader Charles de Gaulle claimed within the Resistance. Although Frenay eventually accepted de Gaulle's authority, his relationship with Jean Moulin, de Gaulle's representative in France, was strained. He distrusted Moulin's achievement in creating a fusion of the French Resistance groups, the National Council of the Resistance, although he eventually joined it.

In June 1943, the German military arrested most of the top French political and military Resistance leadership, including Moulin. Frenay fled to Algiers on June 19 to request additional support from the newly created Comité français de Libération nationale (French Committee of National Liberation). Concerned for his safety, Free French representatives persuaded him to remain, and in November 1943 Frenay became Free French minister of prisoners, deportees, and refugees, a position he retained for a further year after returning to Paris with de Gaulle in 1944.

In 1945 Frenay entered business, representing the French film industry until 1958 and holding various directorships. Frenay was a legendary figure in France, and his memoir, *The Night Will End*, not published until 30 years after the war, was a best seller in France. Frenay died at Porto Vecchio, Corsica, on August 6, 1988.

French Indochina

On the outbreak of World War II in Europe in September 1939, France ruled Indochina. Strictly speaking, only Cochin China (southern Vietnam) was an outright colony; Annam (central Vietnam), Tonkin (northern Vietnam), Laos, and Cambodia were officially protectorates. For all practical purposes, however, France completely controlled all five entities that constituted French Indochina. In 1939, Indochina was France's richest overseas possession, producing rice, rubber, and other important raw materials.

When war broke out in Europe, Governor-General Georges Catroux, who came to favor a more liberal policy toward nationalism in the French colonies, ordered a general mobilization throughout Indochina and outlawed the Indochinese Communist Party (ICP), arresting several thousand suspected communists. The Sixth Plenum of the Communist Party Central Committee, meeting secretly outside Saigon, proclaimed a new anti-imperialist National United Front to struggle for independence.

Following the defeat of France in Europe in June 1940, French Indochina came under pressure from Japan and Thailand. Although France had 50,000 troops in Indochina, 38,000 of these were poorly trained indigenous troops of questionably loyalty. Japan had been at war with China since 1937 and was anxious to secure bases from which to strike the Burma Road and cut off assistance to China's Nationalist government. Tokyo now brought heavy pressure on Catroux to close the Sino-Vietnamese border and halt shipment of supplies to China. Catroux tried to stall for time, but he had no bargaining strength and was forced to accede to Japanese demands.

Catroux's protest of Vichy France's armistice with Germany and his independence in dealing with the Japanese led the Vichy government to replace him with Vice Admiral Jean Decoux, French commander of naval forces in the Far East. On September 24, 1940, Decoux was forced to grant Japan three air bases in Tonkin and the right to station 6,000 troops there. Then in July 1941, similarly pressed by the Japanese, France yielded bases and concessions in southern Indochina. This placed Japanese long-range bombers within striking range of Malaya, the Netherlands East Indies, and the Philippines. This action, however, brought economic pressure on Japan by Britain, the Netherlands, and the United States that resulted in the Japanese decision to attack Pearl Harbor.

Soon the Japanese had 35,000 men in Indochina. Although Tokyo left the French administration intact, it was clear to the Vietnamese that Japan was calling the shots. The result was an irreparable blow to the French position in Indochina.

Bangkok also sought to take advantage of French weakness to secure several provinces it claimed in Laos and Cambodia. From November 1940 to January 1941, Thailand and France fought a war on land and sea that France largely won. Tokyo, then influential in Bangkok, interceded to impose a

settlement. In May 1941, France agreed to turn over to Thailand three Cambodian and two Laotian provinces on the right bank of the Mekong River —some 42,000 square miles of territory. This settlement did not last, however. In September 1945, when the French returned in force to Indochina, they demanded and secured from Thailand the seized provinces, forcing Thailand to recognize the Mekong River as the boundary separating Thailand from Laos and Cambodia.

The French had to address Vietnamese nationalism. In 1940, French authorities crushed abortive rebellions led by local communists in the area bordering China and in Cochin China. Then in February 1941, Ho Chi Minh, a member of the executive committee of the Communist International (Comintern), returned to northern Vietnam after 13 months' imprisonment in southern China, bearing with him financial support from Chinese authorities in return for his pledge to cooperate against the Japanese.

Ho now presided over the Eighth Plenum of the ICP at Pac Bo. Here on May 19, the communists established another front organization—Viet Nam Doc Lap Dong Minh Hoi (League for Independence of Vietnam, or Viet Minh)—to fight both the Japanese and French. Although their tactics led Viet Minh leaders to conceal their communist goals and focus on national liberation to secure the widest possible support, the organization was led and dominated by the ICP. Former schoolteacher Vo Nguyen Giap became the Viet Minh's military leader.

The Chinese Nationalist government grudgingly provided limited support for the Viet Minh, as did the United States through the Office of Strategic Services (OSS, the forerunner of the Central Intelligence Agency). The OSS gave the Viet Minh some light weapons, medical supplies, communications equipment, and training in return for Viet Minh aid in saving downed U.S. pilots and cooperation against the Japanese. By 1945, the Viet Minh had secured control over northern Tonkin.

Until nearly the end of World War II, the French authorities and army still were in place in Indochina, the Japanese exercising only indirect control. That changed in March 1945. French authorities, anxious to liberate Indochina themselves, began active plotting to that end. The Japanese learned of the French plans, and on March 9, 1945, they arrested all the French officials and military personnel they could find. By announcing on March 11 the independence of Vietnam under previously French-controlled Emperor

Bao Dai of Annam, Tokyo exacerbated the postwar situation. This was the situation when Japan surrendered in August 1945.

Ho Chi Minh then stepped into the vacuum. At the end of the war starvation gripped much of Vietnam, and as many as 2 million Vietnamese died, chiefly in the north. The Viet Minh made great strides with the people by seizing rice stocks held by the Japanese and distributing them to the people. Then, on August 16, Ho proclaimed the independence of Vietnam, and three days later the Viet Minh took power in Hanoi, capital of Tonkin. On September 2, Ho announced establishment of the Democratic Republic of Vietnam.

Decisions taken during the Potsdam Conference in July 1945 had the Nationalist Chinese receiving the Japanese surrender in northern Vietnam and the British doing the same in the south. Ho appealed to the United States and the Soviet Union for assistance, but he received no response and was forced to negotiate first with the Chinese to secure their withdrawal and then with the French. Meanwhile, the British in the south let the French out of prison. A Viet Minh uprising there was soon crushed, and French control was reestablished in the south and then in Laos and Cambodia.

The north was another matter, however. On March 6, 1946, French representative Jean Sainteny negotiated the Ho-Sainteny Agreement, in which France recognized Ho's Democratic Republic of Vietnam within the French Union and promised a plebiscite in the south to see whether the south also wanted to join. The agreement also allowed the return of some French troops to the north. The failure of the French government to implement the provisions of this agreement led directly to the First Indochina War, which began in November 1946.

Freyberg, Bernard Cyril (1889–1963)

New Zealand Army lieutenant general. Born in Surrey, England, on March 21, 1889, Bernard Cyril Freyberg moved with his family in 1891 to New Zealand. In 1911, Freyberg qualified as a dentist, a profession he rarely practiced. A few years later, he served as a volunteer for Pancho Villa during the revolutionary upheaval in Mexico. By August 1914, Freyberg was in London, where he met First Lord of the Admiralty Winston L. S. Churchill. Through Churchill, Freyberg obtained a commission as a temporary lieutenant in the Royal Navy Volunteer Reserve.

During World War I, Freyberg commanded a company in the Hood Battalion of the Royal Naval Division during the disastrous Gallipoli Campaign. In November 1916, he led the battalion in the last major attack of the Somme Campaign. Although wounded four separate times, Freyberg refused to relinquish command. For his actions, he was awarded the Victoria Cross. Wounded at least six times during the war, Freyberg also received the Distinguished Service Order (DSO) with two bars.

Following World War I, Freyberg remained in the British military, transferring to the army. In 1937, a heart condition resulted in his medical discharge as a major general. When World War II began in September 1939, Freyberg was recalled and given a training command. That position was too tame a job for Freyberg, who offered his services to New Zealand. With Churchill's support, Freyberg was appointed commander of the New Zealand Expeditionary Force.

Freyberg commanded Commonwealth forces on Crete in 1941, conducting the fighting withdrawal from the north to the south coast and then the evacuation. Freyberg then commanded the New Zealand Division in North Africa, where he often clashed with General Sir Claude Auchinleck, commander in chief of British Commonwealth forces in the Middle East.

Following a short mission to Syria, Freyberg and his New Zealanders returned to face German general Erwin Rommel at Minqar Qaim (June 27, 1942), Alam Halfa (August 31–September 7), and El Alamein (October 23–November 4). During the pursuit across Africa following El Alamein, Freyberg's New Zealanders—reinforced with armor to corps size—swung wide to the left of the Mareth Line to hit the Germans at the Tebaga Gap. Throughout most of these actions, Freyberg was at the front in his mobile tactical headquarters, an M3 Stuart tank with a dummy wooden gun.

In 1942, Freyberg was promoted to lieutenant general, which was almost unprecedented for an Allied divisional commander. Freyberg continued to lead the New Zealand Division through Sicily (July 9–August 22, 1943) and the landings on the Italian mainland. In January 1944, the New Zealand Division came under the U.S. Fifth Army. Freyberg received control of two additional British divisions and a U.S. armored regiment to become the commander of the New Zealand Corps—while simultaneously retaining command of his own division. His mission was to break through at Cassino, which led to one of the most controversial Allied actions of the war, the bombing of the medieval monastery known as Monte Cassino. Cassino and Crete were regarded as Freyberg's two major "failures" in World War II, but it is doubtful that any other general could have done better in either case. Freyberg probably saw more direct combat than any other Allied senior commander. Churchill once called him "the salamander of the British Empire."

During the war, Freyberg won an almost unprecedented fourth DSO. He was knighted in 1942 and raised to the peerage in 1951 as 1st Baron Freyberg. His identification with his New Zealanders was so strong that he was appointed governor-general of New Zealand in 1945. In 1950, his term in office was extended another two years at the request of the government in Wellington. In 1952, Freyberg became the lieutenant governor of Windsor Castle. He died at Windsor on July 4, 1963.

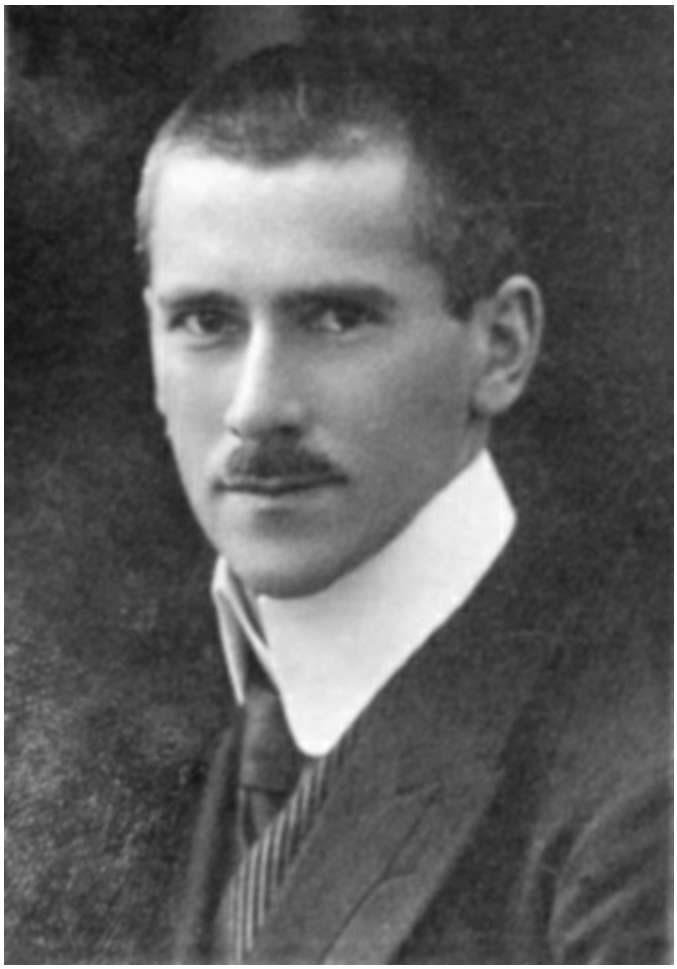
Frick, Wilhelm (1877–1946)

German minister of the interior. Born on March 12, 1877, in Alsenz, Wilhelm Frick studied law from 1896 to 1901 at Göttingen, Munich, Berlin, and Heidelberg (where he received his doctorate). From 1904 to 1924, Frick worked in the Munich police department, heading the political police section after 1919. An early adherent of Adolf Hitler, Frick participated in the 1923 Munich Beer Hall Putsch, Hitler's abortive effort to seize power in Munich, and was arrested, tried, and sentenced to 15 months' imprisonment. He was able to avoid a prison term when the newly renamed National Socialist Freedom Party picked him as one of its representatives to the Reichstag in 1924. He served in the Reichstag from that point forward.

On January 23, 1930, Frick became the first National Socialist minister in a provincial government, responsible for education and the Ministry of the Interior in Thuringia. Under his administration, the Thuringian police force was purged of officers who supported the Weimar Republic; Nazi candidates for office were illegally favored; the antiwar film *All Quiet on the Western Front* was banned, as was jazz music; and rabidly militaristic, anti-Semitic propaganda was allowed to flourish unchecked. On Frick's instruction, special German freedom prayers were instituted in Thuringian schools, glorifying the German *Volk* and German national honor and military power while denouncing "traitors." Frick used his influence as interior minister to grant Hitler German citizenship by implementing a provision of the law that extended citizenship to anyone named to an official post in Germany. Frick managed to have Hitler named a councilor for the state of Braunschweig.



Wilhelm Frick, German politician and participant in Adolf Hitler’s Munich putsch of November 1923. (Hulton Archive/Getty Images)

When the Nazis came to power in Germany in January 1933, Frick was appointed minister of the interior, a key position that he held until August 1943. In this post, he was directly responsible for many measures taken against Jews, communists, Social Democrats, dissident churchmen, and other opponents of the regime. Frick also had charge of drafting and then administering the laws that gradually eliminated the Jews from the German economy and public life, culminating in the Nuremberg race laws that reduced Jews to second-class status in the Reich. It was Frick who framed the extraordinary law that declared all Hitler’s actions during the Blood Purge of the Sturmabteilung (SA, storm troops) in June 1934 to be legal and statesmanlike. Although nominally Heinrich Himmler’s superior, Frick singularly failed to impose any legal limitations on the power of the Gestapo

and the Schutzstaffel (SS). Nor did he seriously interfere with their encroachment on his area of jurisdiction.

On August 24, 1943, Frick was appointed Reichsprotektor (administrative head) of Bohemia and Moravia, a position he held until the end of the war, although real authority was concentrated in the hands of his subordinate, Karl-Hermann Frank. At the Nuremberg Trials, Frick was charged with and found guilty of crimes against peace, war crimes, and crimes against humanity committed in concentration camps in the Protectorate (Bohemia and Moravia). The dedicated Nazi bureaucrat and loyal implementer of Hitler's ruthless aims was hanged at Nuremberg on October 16, 1946.

Friedeburg, Hans Georg von (1895–1945)

German admiral and commander of the German Navy. Born on July 15, 1895, in Strassburg (then Germany; now Strasbourg, France), Hans Georg von Friedeburg joined the German Navy in 1914 and became a submariner. He participated in World War I and was promoted to lieutenant in 1917. Friedeburg continued in the navy after the war, and from 1932 to 1934 he was a military adviser to General Kurt von Schleicher, who was German chancellor in 1932–1933. Promoted to lieutenant commander in 1933, Friedeburg in June 1936 assumed command of the light cruiser *Karlsruhe.* He then was assigned to the staff of Minister of War General Werner von Blomberg.

In 1939, Friedeburg became an assistant to commander of German submarines Commodore Karl Dönitz. From 1939 to 1941, Friedeburg was in

the Operations and Organization Department of the German submarine forces. He then took command of *U-27*, and in February 1943 he succeeded Dönitz as commander of all German submarine forces. In May 1945, Friedeburg was promoted to general admiral (full admiral).

Friedeburg assumed command of all German naval forces on May 1, 1945. On May 7, he signed the instrument of surrender of German forces in northern Germany. Friedeburg committed suicide in Flensburg, Germany, on May 23, 1945.

Friessner, Johannes (1892–1971)

German Army general. Born in the Saxon city of Chemnitz on March 22, 1892, Johannes Friessner joined the German Army in March 1911 as an officer candidate and was commissioned a lieutenant of infantry in August 1912. He fought in World War I and thereafter continued in the army, with promotions to lieutenant colonel in April 1935 and colonel in March 1938. He was appointed chief inspector of military schools in March 1938 and then inspector for education and training of the army in September 1939. Promoted to major general in August 1940 and lieutenant general in October 1942, he was assigned to command the 102nd Infantry Division in May 1942.

Friessner commanded the XXIII Army Corps from January to December 1943 and was promoted to general of infantry in April 1943. He briefly commanded Army Group Friessner in February 1944 and Army Detachment Narva later that month before assuming command of Army Group North at the beginning of July 1944, when he was promoted to colonel general. Friessner's forces soon came under heavy Soviet attack; the manpower odds

against it were as great as eight to one. His sensible request to withdraw his exposed forces angered Adolf Hitler. Colonel General Heinz Guderian, chief of the army General Staff, then proposed that Friessner and Colonel General Ferdinand Schörner, a favorite of Hitler, switch assignments.

On July 25, 1944, Friessner went south to command Army Group South Ukraine. Although Guderian's calculated move helped shield Friessner from Hitler's wrath, Friessner received the worst of the deal. Army Group South Ukraine consisted of four armies: the German Sixth and Eighth (23 divisions) and the Romanian Third and Fourth (23 divisions). Together they totaled about 600,000 men, of whom some 340,000 were German. Twenty-one of the German divisions were infantry, however, and the Romanian units lacked the will to fight.

The massive attacks by the Soviet 2nd and 3rd Ukrainian fronts on August 20 quickly smashed the two Romanian armies, isolating the German Sixth Army under General of Artillery Maximilian Fretter-Pico in the Kishinev area. As with its predecessor at Stalingrad, the reconstituted Sixth Army suffered a disastrous encirclement. Soviet spearheads penetrated miles behind the German lines before Hitler gave permission for a withdrawal. It was far too late.

Within a few days the Romanian government, headed by Ion Antonescu, was overthrown, and Romania left the war—its armies opening their remaining lines to the advancing Soviets. Few German units, many of them rear-area troops, escaped. The new Romanian government declared war on Germany on August 25, and Romanian troops joined the Red Army against the Germans. German casualties (killed and captured) numbered about 250,000 men. By the end of September, the Germans retained only a part of Transylvania, and by the end of October the Red Army had cleared the mountains and entered the Hungarian plain, overrunning the major eastern Hungarian cities of Debrecen and Szeged.

Friessner several times reconstituted his forces and stabilized his lines, even launching a successful counterattack at Nyiregyháza in late October. By late December, the Red Army was approaching Budapest. On December 23, Friessner recommended its abandonment to Hitler, whereupon the führer sacked both him and Fretter-Pico that same day. Friessner did not again hold a command. He briefly served as chairman of the Verband Deutscher

Soldaten (German Soldiers' Association) in 1951 and wrote his memoirs in 1956. Friessner died at Bayrisch-Gmain, Bavaria, on June 26, 1971.

Fritsch, Werner Thomas Ludwig von (1880–1939)

German Army general. Born on August 4, 1880, at Benrath, near Düsseldorf, Werner Thomas Ludwig von Fritsch was educated at Düsseldorf, Posen, and Hanau. In January 1900, he received a commission in the army as a lieutenant. Fritsch attended the War Academy (Kriegsakademie) in Berlin from 1907 to 1910 and qualified as a General Staff officer. A highly regarded officer, Fritsch served as a General Staff officer to various armies and divisions during World War I. He was promoted to major in 1917.

Following the war, Fritsch continued as a General Staff officer, including service with General Rudiger von der Goltz in the Baltics. Fritsch became part of the Reichswehr Ministry in 1920, there attracting the attention of chief of the German command General Hans von Seeckt. Commander of a battalion of the 5th Artillery Regiment in 1922, Fritsch was promoted to lieutenant colonel in 1923. He served as chief of staff to the 1st Division at Königsberg from 1924 to 1926 until he became director of operations in the Truppenamt (the disguised General Staff). Fritsch was promoted to colonel in 1927; to major general in 1930, when he took command of the 1st Cavalry

Division; and to lieutenant general in October 1932 as commander of Wehrkreis III, the Berlin area military district.

On February 1, 1934, Fritsch was promoted to general of artillery when he became commander in chief of the army. He was promoted to colonel general in April 1936. Fritsch was not Adolf Hitler's choice; aging president Paul von Hindenburg selected him. Fritsch strengthened and expanded the army but sought to avoid conflict with Britain and France. He made no effort to conceal his disdain for the Nazis, the Schutzstaffel (SS), and even Hitler. Fritsch had only limited contact with Hitler; he had no right of direct access, and meetings with the führer were usually in the company of minister of war Field Marshal (from April 1936) Werner von Blomberg.

When in November 1937 Hitler laid out his plans for further territorial expansion, Fritsch and Blomberg expressed their opposition. By this time, Hermann Göring, Heinrich Himmler, and Reinhard Heydrich were all actively plotting to remove Blomberg and Fritsch. Blomberg was forced to resign in January 1938. This left the honorable and respected Fritsch as the remaining obstacle to Hitler's control of the army.

Himmler then trumped up charges of homosexuality against Fritsch, who did not help his case by remaining silently indignant as opposed to mounting a vigorous defense of his innocence. Fritsch chose to resign and demanded a court-martial. With Blomberg and Fritsch removed, Hitler then established the Oberkommando der Wehrmacht (Supreme Command of the Armed Forces) to replace the former War Ministry. Hitler became commander in chief of the armed forces and appointed the more pliable General Walther von Brauchitsch as new commander of the army.

Fritsch finally received his desired military court hearing and was acquitted on March 18, 1938, with witnesses confirming that he had been framed. Formal rehabilitation came on August 18, 1938, with reinstatement of his rank of colonel general and an appointment as honorary colonel in chief of his old unit, the 12th Artillery Regiment. Fritsch accompanied his old regiment during the 1939 Poland Campaign. He died on September 22, 1939, from a bullet wound as his unit was approaching Praga, a suburb of Warsaw. Rumors that he deliberately sought death or was murdered by the SS have since been discounted.

Frogmen

Popular term for members of underwater demolition teams (UDTs), which played an important role in World War II. Italy was at the forefront in training combat swimmers; the Italian 10th Light Flotilla was composed mostly of sailors who manned small surface and underwater craft with explosive warheads. Their mission was to sink Allied warships and merchant shipping, a role in which they enjoyed some success.

The United States also devoted attention to such activity, training and deploying frogmen in demolition and commando tactics. The first unofficial U.S. frogmen were organized in September 1942 as a detachment of sailors who received a week of training in underwater demolition tactics before being sent to North Africa as part of Operation TORCH (November 8, 1942). They destroyed nets blocking the entrance to the Sebou River in Morocco, allowing U.S. assault ships to enter the river and offload rangers to assault Vichy-held Port Lyautey Field.

This success led chief of naval operations Admiral Ernest J. King to issue orders on May 6, 1943, for the formation of UDTs. The first Naval Combat Demolition Unit consisted of 13 volunteers who trained at the Naval Amphibious Unit at Solomon Island, Maryland. They were instructed in the

destruction of underwater obstacles and use of explosive charges to make channels through sandbars.

These newly designated frogmen took part in the invasion of Sicily (July 9–August 22, 1943). They destroyed roadblocks near the coast, used Bangalore torpedoes to remove barbed wire along the beach, salvaged stranded boats, and cleared channels through sandbars. On completion of their mission, most of the frogmen were sent back to the United States to work as instructors following further training at the Naval Amphibious Training Base at Fort Pierce, Florida. In the European theater, frogmen also participated in the June 6, 1944, invasion of Normandy, where they were tasked with the destruction of steel girders and heavy timbers on the Omaha and Utah Beaches, clearing the way for the landing craft.

Frogmen also played a key role in the war in the Pacific, participating in the many amphibious operations in that theater. The British also employed frogmen in the war. In the United States, frogmen were the forerunners of the U.S. Navy SEAL (sea, air, land) elite special-operations commando teams.

Fromm, Friedrich (1888–1945)

German Army general. Born in Berlin on October 8, 1888, Friedrich Fromm joined the German Army and served as a lieutenant during World War I. He

remained in the Reichswehr after the war, holding a series of staff positions. Promoted to colonel in February 1933, Fromm headed the General Army Office in the Reich War Ministry. On July 13, 1939, Fromm was promoted to colonel general and named commander of the Ersatzheer (Replacement Army) and chief of army equipment. In his posts, Fromm worked closely with Albert Speer and promoted research into new weapons that might win the war.

Fromm is best remembered for his role in the July 20, 1944, plot against Hitler. From late 1941, Fromm believed that the war was lost and urged negotiations to end it. When he was approached by his chief of staff, Colonel Count Klaus von Stauffenberg, Fromm agreed to join the conspiracy against Hitler. When he learned that Hitler had survived the bomb blast of July 20, Fromm lost his nerve and promptly ordered the arrest and execution of Stauffenberg and other conspirators. This action, designed to conceal his own participation in the conspiracy, failed to save Fromm from Nazi vengeance. He was arrested the next day on orders of Schutzstaffel (SS) chief Heinrich Himmler and was imprisoned. Fromm was subsequently brought before the People's Court on a charge of failing to reveal what he knew of the conspiracy. Found guilty, he was executed at the Brandenburg-Görden Prison, Berlin, by firing squad on March 12, 1945.

Frost, John Dutton (1912–1993)

British Army major general. Born on December 31, 1912, at Poona, India, the son of an army general, John Dutton Frost returned to England with his

family in 1921. Graduating from the Royal Military College at Sandhurst, Frost was commissioned a lieutenant in the infantry in 1932. Assigned to the Cameronians (Scottish Rifles), he served in Britain and Palestine and later with the Iraq Levies. As a captain with homeland units, Frost tired of monotonous duties and volunteered for the new Special Air Service Brigade, becoming one of Britain's first airborne soldiers. As a major, he commanded the newly formed Parachute Regiment's 2nd Battalion.

In February 1942, Frost led 120 men in a daring night parachute jump against the German radar installation at Bruneval in Normandy, France. Dismantling key components of the radar unit, the force then evacuated by sea. Frost subsequently commanded a parachute battalion in Tunisia and then in Sicily and Italy. However, he is best remembered for his role as a lieutenant colonel in command of a parachute battalion at Arnhem during the failed September 17–26, 1944, Operation MARKET-GARDEN. His battalion of 600 men suffered heavy casualties in fighting at Arnhem while resisting German attacks on four consecutive nights and three days. Frost, who was severely wounded, was taken prisoner. During the war he received the Distinguished Service Order and Bar and the Military Cross.

Freed in March 1945, Frost continued in the British Army after the war and retired as a major general in 1968. He then raised cattle. Frost died in West Sussex, England, on May 12, 1993.

Fuchida Mitsuo (1902–1976)

Japanese Navy officer and aviator. Born at Nagao in Nara Prefecture on December 3, 1902, Fuchida Mitsuo graduated from the Japanese Naval

Academy in 1924 and completed flight training in 1927. While he was posted to the Yokosuka Kokutai (Air Corps), he developed the coordinated dive-bombing techniques intended to saturate target defenses that subsequently became standard Japanese tactics.

In 1939, Fuchida became the bomber group leader of the 1st Carrier Division aboard the aircraft carrier *Akagi*. He was a major participant in planning for the December 7, 1941, Pearl Harbor attack and was selected as overall strike commander for that mission, commanding the 330-plane force from Vice Admiral Nagumo Chūichi's First Air Fleet. Fuchida also participated in the attacks on Rabaul and Port Darwin (February 19, 1942) and the devastating raid by the First Air Fleet into the eastern Indian Ocean during the spring of 1942. Fuchida was incapacitated by appendicitis during the June 3–6, 1942, Midway operation. When the *Akagi* was attacked and sunk by U.S. Navy dive-bombers he was severely wounded, barely managing to survive.

Following his recovery, Fuchida was posted as a staff officer and undertook a series of planning assignments before transferring to operational posts in the Mariana Islands and the Philippines. He returned to Japan with the rank of captain to participate in planning for the final defense of the home islands. Fuchida claimed to have escaped death at Hiroshima by leaving the city the day before the atom bomb was dropped. He also claimed to have attended the surrender ceremony aboard the U.S. battleship *Missouri* on September 2, 1945, although some historians consider this a fabrication.

Japanese Navy captain Fuchida Mitsuo, photographed here in 1945. Fuchida was the strike force flight commander of the Japanese attack on Pearl Harbor, December 7, 1941. After the war, Fuchida emigrated to the United States and became an American citizen. (AP Photo)

After the war, Fuchida took up farming and converted to Christianity with such fervor that he became a globe-circling evangelist. He immigrated to the United States in 1966 and became a citizen. Fuchida died while visiting Osaka, Japan, on May 30, 1976.

Fukutome Shigeru (1891–1971)

Japanese Navy vice admiral. Born in Tottori, Japan, on February 1, 1891, Fukutome Shigeru graduated from the Japanese Naval Academy in July 1912 and later from the Naval War College. He became a specialist in navigation. Fukutome's various posts included vice chief of staff of the China Expeditionary Fleet (1938) and captain of the battleship *Nagato* (1938–1939). He was promoted to rear admiral in November 1939, and until March 1941 he was chief of staff of the Combined Fleet. In this position, he supported Admiral Yamamoto Isoroku. In April 1941, Fukutome was appointed head of the operations planning section of the navy General Staff, and until April 1943 he took part in most of the strategic planning for the war.

In November 1942, Fukutome was promoted to vice admiral, and in May 1943 he again became chief of staff of the Combined Fleet, this time under Admiral Koga Mineichi. In March 1944, the Combined Fleet headquarters staff left Palau for Davao in two flying boats. On March 31, 1944, they were caught in a typhoon. The first plane, with Koga on board, was lost; the second plane crashed into the sea with Fukutome, who was badly injured. Local Filipino guerrilla forces took Fukutome and some of his staff prisoner. Although Fukutome and his staff were later rescued by the local Japanese Army garrison, the guerrillas had taken the codebook and operation plans of the Combined Fleet and sent them to the United States. For whatever reason, Fukutome did not report this loss to the authorities, a failure that contributed to the Japanese defeat in the June 19–21, 1944, Battle of the Philippine Sea.

After recovering from his injuries, Fukutome commanded various air fleets until the end of the war. He was arrested as a war criminal in October

1947 but was later released. Fukutome died in Tokyo on February 6, 1971.

Fushimi Hiroyasu (1872–1946)

Japanese imperial prince and admiral. Born in Kyoto on October 16, 1872, Prince Fushimi Hiroyasu studied in Germany from 1890 to 1895. He entered the German Naval School (Marineschule) in 1892, and in 1895 he graduated from the Marineakademie (German Imperial Naval Academy). Promoted to lieutenant commander in 1903, Fushimi served in the battleship *Mikasa* during the 1904–1905 Russo-Japanese War and was in the flagship during the October 1905 Battle of Tsushima, when he was wounded in action.

Fushimi held various line and staff duties, and he was promoted to full admiral in 1922. He occupied the post of chief of the navy General Staff from 1932 to 1941. Fushimi opposed the naval tonnage ratio fixed at the Washington Conference of 1921–1922. His support of the so-called Fleet Faction encouraged the hard-liners to push to increase their influence in the navy during the late 1930s.

During this period, Fushimi took over many of the functions traditionally under the jurisdiction of the navy ministry. He also saw to it that many high-ranking naval officers who had supported the Washington Naval Treaty of 1922 were dismissed from the service. Replaced by Nagano Osami in April 1941, Fushimi thereafter had no practical influence on affairs of state or the war. He died in Tokyo on August 16, 1946.

G

Galland, Adolf Joseph Ferdinand (1912–1996)

German Air Force pilot and lieutenant general. Born on March 19, 1912, in Westerholt, Westphalia, Adolf "Dolfo" Joseph Ferdinand Galland began flying gliders at age 19. In 1931, he was accepted to train as a pilot at the Deutsches Verkehsflieger Schule. As a Staffelkapitan (squadron leader), Galland flew 300 ground-support missions in the Kondor Legion during the 1936–1939 Spanish Civil War.

Galland commanded a ground-attack squadron during the September 1939 invasion of Poland but transferred to fighters in the spring of 1940. During Germany's invasion of France (May 10–June 25, 1940), Galland was the adjutant for Jagdgeschwader (fighter wing) 27 (JG-27). Although his opportunities for combat were limited, he ended the campaign with 17 victories and the Knight's Cross of the Iron Cross. Major Galland commanded III.JG-26 (Third Group, JG-26) in the Battle of Britain (July 10–September 30, 1940). At the end of that campaign, he had a total of 40 victories, the Oak Leaves to the Knight's Cross, and command of JG-26. The majority of the Luftwaffe transferred to the east for Operation BARBAROSSA, but Galland and JG-26 remained on the English Channel coast to defend the homeland.

Following the death of Galland's friend and rival Werner Mölders in November 1941, Galland was named to replace him as general of fighters (an office, not a rank). Promoted to major general in 1942, he was the youngest general in the German armed forces. Although Galland commanded German fighter defenses against the bombing campaign of the Royal Air Force and the U.S. Army Air Forces, he remained at odds with Luftwaffe commander Hermann Göring and Chancellor Adolf Hitler on how to prosecute the air war. He was relieved of his command in January 1945, but his reputation was such that he was allowed to form his own Jagdverband 44 (JV-44). It was

known as the “squadron of experts,” because “expert” was the German term for what the Allies called an ace.

Shot down and seriously wounded, Galland ended the war in a hospital. His official tally was 104 kills. Taken prisoner at the end of the war, he was released in 1947. Galland served as adviser to Argentina’s air force, but returned to Germany in 1955 to run an aerospace consulting firm. He died in Oberwinter, Germany, on February 9, 1996.

Gallery, Daniel Vincent, Jr. (1901–1977)

U.S. Navy rear admiral. Born in Chicago, Illinois, on July 10, 1901, Daniel Vincent Gallery Jr. graduated from the U.S. Naval Academy at Annapolis in 1920. Following service on several ships, he underwent pilot training and was certified a naval aviator in 1927.

Gallery was a flight instructor and then commanded a scouting squadron. From 1938 to 1941, he was chief of the aviation section of the Bureau of Ordnance. Gallery next participated in antisubmarine patrols in the North Atlantic as commander of the U.S. Fleet Air Base, Reykjavik, Iceland, from 1941 to 1943. In mid-1943, Captain Gallery took command of antisubmarine Task Group (TG) 22.3 operating out of Norfolk, Virginia, a hunter-killer

force consisting of the escort carrier *Guadalcanal* (CVE-60) and five destroyer escorts. TG 22.3 sank several German U-boats while providing protection for Allied Atlantic convoys.

While he was in command of TG 22.3, Gallery developed a plan for capturing a German submarine intact. That plan was executed to perfection on June 4, 1944, when the German submarine *U-505* was forced to the surface and captured with valuable cryptographic materials. Following the war, the *U-505* was placed at the Museum of Science and Industry in Chicago, where it is still on display. When the actions of Gallery and TG 22.3 were made public at war's end, the navy emphasized that the *U-505* was the first enemy vessel captured on the high seas by the U.S. Navy since the War of 1812. In 1944, however, the navy worried that Gallery's exploit would cause the Germans to change the radio codes, but the Germans never learned of the capture.

Following the war, Gallery was chief of the navy's Guided Missile Division. He became involved in the so-called Revolt of the Admirals in 1949 and publicly argued the navy's case in the mass media. Retiring as a rear admiral in 1960, Gallery wrote numerous books and articles. Two of his brothers also retired from the U.S. Navy as rear admirals. Gallery died at Bethesda, Maryland, on January 16, 1977.

Gamelin, Maurice Gustave (1872–1958)

French Army general and commander in chief at the beginning of the 1940 Battle for France. Born in Paris on September 20, 1872, Maurice Gustave Gamelin was commissioned in the army in 1893 on graduation from the

French Military Academy at Saint-Cyr. His rise in the army was closely linked to French commanding general Joseph Joffre. Gamelin was serving as Joffre's operations officer at the beginning of World War I and remained with him until the latter's dismissal in 1916. During the rest of the war, Gamelin served with distinction as a brigade commander (1916) and then a division commander (1918). After the war, Gamelin commanded French forces in the Middle East, where he helped pacify the Druze in Lebanon. He became chief of the General Staff in 1931 and commander in chief designate in 1935, replacing Maxime Weygand.

Gamelin benefited from the patronage of Radical Party politician Édouard Daladier, who was three times premier in the 1930s. The two men, both veterans of the Battle of Verdun, agreed on the need to modernize French forces. Gamelin supported both mechanization and investments in airpower. Against his wishes, the French government proceeded with the construction of the Maginot Line, leaving little money for the reforms he championed.

As with his mentor Joffre, Gamelin isolated himself and had little contact with his men, refusing even to have a telephone installed at his headquarters at Vincennes. Gamelin urged France to fund emergency modernization measures in 1938, but French politicians, including Daladier, disagreed. In the first months of World War II, Gamelin advocated waiting for the British to rearm fully before assuming the offensive. He assumed (correctly) that Germany would not attack the Maginot Line. He also assumed (incorrectly) that the Germans would not attempt to cross the Ardennes Forest, believing they would attack through Belgium as they had done in 1914.

Gamelin bears primary responsibility for the disastrous Dyle Plan, which called for Allied forces to move into Belgium to meet an anticipated German invasion. This plan underestimated the strength of the Maginot Line, devoting half of French effectives there. It also left 100 miles of the Ardennes virtually unguarded. Gamelin learned nothing from the September 1939 Polish campaign and thus failed to fully appreciate the speed and strength of the German army. The Dyle Plan placed French troops in an untenable position in Belgium and northeastern France. Worse, the Germans anticipated its broad outlines and planned to defeat it by moving through the Ardennes and then north and west toward the English Channel ports.

Maurice Gustav Gamelin (1935), French army general and chief of staff of the army, 1935–1940. (Library of Congress)

On March 21, 1940, Paul Reynaud replaced Daladier as premier. Daladier remained in the government, first as defense minister and then as foreign minister, but his patronage could not save Gamelin. On May 10, the day of the German invasion of France, Reynaud was involved in discussions designed to remove Gamelin, in whom he had little confidence. Reynaud finally replaced him on May 19 with General Maxime Weygand, the man Gamelin had succeeded in 1935. Following the defeat of France on June 25, the Vichy government arrested Gamelin and brought him to trial at Riom, where he refused to defend himself. Deported to Germany in 1943, Gamelin was released by the Allies at the end of the war.

After the war, Gamelin wrote his three-volume memoir, *Servir*. He died at Paris on April 18, 1958.

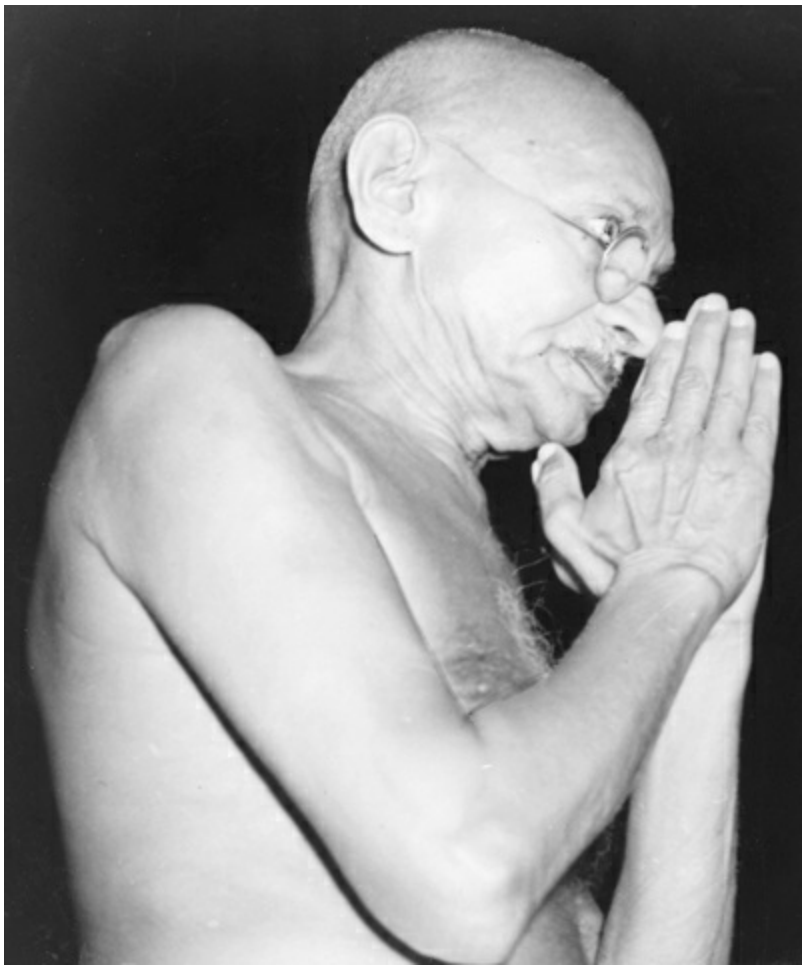
Gandhi, Mohandas Karamchand (1869–1948)

Indian nationalist and spiritual leader, known as Mahatma meaning "great soul." Mohandas Karamchand Gandhi, a thin, short man with bowed shoulders and thick spectacles, was more than any other single individual responsible for bringing an end to the British Empire. Born on October 2, 1869, in Porbandar, Kathiawar, India, Gandhi went to England at age 19 to study law at University College, London. On being admitted to the bar, he returned to practice in India but had only modest success.

In 1893, Gandhi left India to practice law in South Africa. There he encountered strong racial prejudice against the Indian population that had settled in Natal. The mild-mannered, passive Gandhi became an activist, protesting unjust laws through a nonviolent campaign of civil disobedience and noncooperation with the authorities. Gandhi eschewed his social position and lived a life of poverty and self-denial. During both the Second Boer War (1899–1902) and the Natal revolt of 1908, Gandhi organized and served with Red Cross units.

Gandhi returned to India in July 1914. He supported the British recruitment of Indian soldiers for World War I, but in 1919, with the passage of antisedition laws (the Rowlatt Acts), he began a protest against British rule. He called off the campaign, however, when violence flared. By 1921, Gandhi was the acknowledged leader of the Indian National Congress (INC), which he transformed from a party of the upper class into a mass movement. Meanwhile, Gandhi was jailed numerous times.



Indian nationalist leader Mohandas Karamchand Gandhi, popularly known as Mahatma Gandhi, whose policy of peaceful protests led India from British rule to independence after World War II. (Library of Congress)

In 1930, Gandhi launched a campaign against the hated salt tax, and he also campaigned against prejudices toward the lowest social caste, the "untouchables." His program of passive resistance was a brilliant move because although the British had ample power to crush any armed rebellion, they were never able to devise an answer to nonviolent resistance. British rule in India and elsewhere rested primarily on the consent of the governed.

Gandhi dressed in a simple loincloth (*dhoti*) and worked at his spinning wheel daily, stressing his devotion to a life of simplicity. Although Gandhi condemned Adolf Hitler and fascism as well as the persecution of the Jews, he hated war more, and he naively advised nonviolent protest as the best course of action even in the event of a Japanese invasion of India. He broke with more pragmatic INC leaders over the degree to which India should

support the Allied effort in World War II. But after a March 1942 British mission headed by Stafford Cripps failed to agree on a program that would secure Indian independence in return for support against the Japanese, most INC leaders supported Gandhi.

On August 8, 1942, the INC passed a resolution calling on Britain to "quit India," which prompted British authorities to arrest Gandhi and other INC leaders. Following considerable violence, in which some 2,500 people were killed or wounded and considerable property was damaged, the British managed to restore order. Gandhi, in poor health, was held under house arrest near Poona for two years, but with doctors reporting him to be near death, the authorities released him on May 6, 1944. He had spent a total of 2,089 days in Indian prisons and another 249 in prisons in South Africa.

Gandhi recovered and took a leading role in negotiations with Clement Attlee's Labour Party in Britain at the end of World War II. Attlee appointed Lord Louis Mountbatten to carry out the unwelcome task of ending British rule. The intransigence of Muslim leader Mohammad Ali Jinnah over the creation of a Muslim state led to the partition of India, despite Gandhi's great opposition. India and Pakistan were proclaimed independent states on August 14, 1947.

Independence brought near anarchy in both India and Pakistan. The problems of partition were staggering, and millions of people were uprooted and forced to move from one state to another. Religious hatred mingled with sheer greed, and perhaps a quarter of a million people died in the violence. In volatile Calcutta, Gandhi kept the peace but only by offering his own person as a hostage and by beginning a fast unto death. Gandhi's reward for telling Hindus and Muslims that they had to learn to live together as brothers was his assassination by a young Hindu fanatic in Calcutta on January 30, 1948. Fortunately, Gandhi's death marked the end of the insensate communal killings.

A prolific writer, Gandhi influenced many others through his teachings of nonviolence. He inspired many activists, including Martin Luther King Jr., leader of the civil rights movement in the United States.

Garand, John Cantius (1883–1967)

Inventor of the U.S. Garand rifle. John Cantius Garand was born on January 1, 1883, near Saint Remi, Quebec, Canada, and moved to Connecticut in 1894. He dropped out of school to work in a steel mill and by 1897 had filed for his first patent for a new type of jack screw. Garand became a machinist at the mill in 1901.

Helping his father at a shooting gallery led to Garand's interest in firearms. A few years later, he moved to Providence, Rhode Island, where he worked for the Federal Screw Corporation. He took up motorcycling and designed his own engine. Firearms, however, became his passion.

Garand then moved to New York City, where he worked in a micrometer plant and continued his education via correspondence courses. In 1917, Garand learned that the U.S. Army was searching for a reliable machine gun, and he designed such a weapon and sent the plans for it to the U.S. Bureau of Standards. By 1919, Garand was the consulting engineer for the army's arsenal in Springfield, Massachusetts. He became a U.S. citizen in 1920.

In the 1920s, the Ordnance Department wanted to develop a semiautomatic rifle to replace the superb but difficult-to-master M-1903 Springfield bolt-action rifle. In 1923, Garand submitted his design for Bureau of Standards testing, and over the next 11 years he refined and improved the design until it met army standards for field testing. In 1936, the U.S. Army adopted Garand's weapon, describing it as "Rifle, Semi-Automatic, M1." The United States became the only country in World War II to have a semiautomatic rifle as a standard infantry weapon. The Garand, 43.6 inches long and weighing 9 pounds 8 ounces (unloaded), was a gas-operated, air-

cooled, semiautomatic shoulder weapon that fired .30-06 ammunition from an 8-round clip. It had an effective range of 440 yards and a maximum range of 3,200 yards. A total of 4,040,000 M1s were produced, and it was the standard U.S. infantry firearm from 1936 to 1957.

The M1 had many advantages, including its accuracy, superior rate of firepower, and user-friendly sights. The Garand fired 40 rounds a minute in the hands of the average rifleman. It had 40 percent less recoil than the bolt-action Springfield it replaced and only 72 parts. The Garand could be entirely broken down using only one tool, a .30-caliber round.

Although Garand never received what many believe to be his financial due for the M1, he was awarded the Government Medal of Merit in 1944. He retired as chief ordnance engineer in 1953 and died in Springfield, Massachusetts, on February 16, 1967.

Gavin, James Maurice (1907–1990)

U.S. Army lieutenant general, airborne pioneer, and statesman. Born on March 22, 1907, in Brooklyn, New York, James Maurice Gavin was abandoned by his biological mother and subsequently adopted. At age 16, he enlisted in the army and eventually earned an appointment to the U.S. Military Academy at West Point. Graduating in 1929, he was commissioned in the infantry.

Gavin attended the Infantry School at Fort Benning, Georgia; served in the Philippines; and then was an instructor at West Point. He transferred to duty with parachute troops and, promoted to colonel in July 1942, rose to command the 505th Parachute Infantry Regiment, which eventually became part of the 82nd Airborne Division. In 1943, Gavin's 505th jumped into

Sicily, where Gavin led elements of his regiment during a fight on Biazza Ridge and stopped troops of the Hermann Göring Panzer Division from breaking through to the invasion beaches. After Sicily, Gavin led the 505th in another combat jump into Salerno on September 14, 1943. Promoted to brigadier general in October, he was appointed assistant division commander.

Gavin left Italy for Britain in November 1943. There he headed the airborne planning effort for Operation OVERLORD, the invasion of France. He then rejoined the 82nd Airborne Division and made his third combat jump—into Normandy on June 6, 1944, as commander of Task Force A.

In August 1944, Gavin assumed command of the 82nd and led it on its fourth combat jump in September into Nijmegen, Holland, during Operation MARKET-GARDEN (September 17–26). He continued in command of the division for the remainder of the war, fighting through the December 16, 1944–January 25, 1945, Battle of the Bulge (Ardennes) and the subsequent drive into Germany. By the end of the war, Gavin had made more combat jumps than any other general in history.

U.S. Army major general James Gavin, commander of the 82nd Airborne Division, in February 1945. (MPI/Getty Images)

Gavin continued to command the 82nd Airborne Division until March 1948. He was then, in succession, chief of staff of the Fifth Army; chief of staff, Allied Forces South; commander of VII Corps; and deputy chief of staff of the U.S. Army. Promoted to lieutenant general in March 1955, Gavin was in line for promotion to general when he retired in 1958 because of differences with the defense policies of the Dwight D. Eisenhower administration—specifically what he regarded as its overreliance on nuclear forces. Gavin returned to public life during the John F. Kennedy administration, serving as ambassador to France (1960–1961). He died in Baltimore, Maryland, on February 23, 1990.

Gazala, Battle of (May 26–June 13, 1942)

Key North African battle between Axis and Allied forces. The Battle of Gazala of May 26–June 13, 1942, sprang from Operation VENEZIA, in which Adolf Hitler sought to tie down as many Allied troops as possible in North Africa while German forces fought the decisive battle in the Soviet Union. Hitler also wanted to capture Allied forward airfields so that Axis forces might reduce Malta. Axis forces for VENEZIA, formed into Panzerarmee Afrika or Armata Corazzata Africa, consisted of two Italian infantry corps, one Italian armor corps, and the German Afrika Korps.

The Afrika Korps had recently received reinforcements and new equipment, and Italy had sent some of its best units and equipment to North Africa. It had also retrained its units and altered some of their structures to replicate German tactics. An Italian infantry division now numbered only 7,000 men, but it had a heavier artillery component. Although its tanks were still of limited value, Italy sent some self-propelled artillery armed with 75mm guns, and some Italian divisions boasted both 90mm and German 88mm antitank guns.

German Afrika Korps commander General Erwin Rommel, nominally under Italian general Ettore Bastico, head of Comando Superiore Forze Armate Africa Settentrionale (Supreme Command Armed Forces in North Africa), planned to attack the Allied forces entrenched with the protection of heavy minefields along the Gazala Line. Rommel hoped to outflank the line from the south and then drive on and capture Tobruk, all within 10 days. He

could call on 332 German and 228 Italian tanks. Rommel also had the advantage in the air.

Lieutenant General Neil Ritchie commanded the British Eighth Army. Ritchie had an armored corps of two divisions and an infantry corps built around three divisions. Another division was in reserve, attached to army headquarters. All were numerically larger then the Axis divisions. The Eighth Army had recently received 242 U.S.-built M3 Grant tanks as well as improved 6-pounder antitank guns. Ritchie could call on 839 Allied tanks, with a further 145 moving up. Both sides added tanks during the battle. Each side also had a small amphibious element, but neither was deployed in that capacity during the battle.

Ritchie had hoped to mount an attack to relieve Axis pressure on Malta, but Rommel struck first. On May 26 while Axis infantry held the line, Axis motorized units poured around the southern Allied flank. Achieving some small successes, they stalled at the Free French fort of Bir Hacheim. Positioning themselves in the Allied rear, the Axis motorized units then took up defensive positions while also operating against Bir Hacheim, which fell on June 11 after a heroic French defense. Meanwhile, Eighth Army tanks mounted a series of assaults against Axis armor in the so-called Cauldron, but the British were repulsed with heavy losses from Axis antitank artillery guns.

The Axis forces having opened a supply line and the Eighth Army reeling from heavy tank losses, Rommel resumed the offensive on June 12. At Knightsbridge, he ambushed British armor, destroying 120 tanks and forcing a general Allied retreat. In less than three weeks, the Axis offensive had forced the Allies to withdraw into Egypt, paving the way for a third assault on the port of Tobruk during June 20–21, 1942. Ritchie was relieved of command, and General Claude Auchinleck took command of the withdrawal.

Gehlen, Reinhard (1902–1979)

German Army general. Born on April 3, 1902, at Erfurt, Germany, Reinhard Gehlen completed his secondary education in Breslau, and in 1921 he joined the 6th Light Artillery in Schweidnitz as an officer candidate. He was commissioned a second lieutenant in 1923. From 1933 to 1935, he attended the Army Staff College; promoted to captain, he was posted to the General Staff and held a series of staff positions. In 1942, Gehlen was promoted to colonel.

Despite his lack of experience in intelligence, Gehlen was assigned as head of Fremde Heere Ost (FHO, Foreign Armies East), the Wehrmacht's Eastern Front intelligence service. In that capacity, he supervised German Army intelligence operations on the Eastern Front and recruited more than 100,000 Soviet prisoners of war into the anti-Soviet "Russian Liberation Army." Gehlen's unit worked separately from the Schutzstaffel (SS) and Sicherheitsdienst (SD), collecting information on Soviet partisans and regular troops, and on Soviet intelligence methods of infiltration and interrogation.

Gehlen cultivated an extensive network of spies, mostly recruiting Soviet citizens with German ethnic backgrounds. Soviet codes and ciphers were also broken. Gehlen's intelligence reports were accurate and dependable, and they helped the German Army, especially in the period after the August 23, 1942–February 2, 1943, Battle of Stalingrad.

Adolf Hitler tersely commended Gehlen's precision but was constantly annoyed by his dim view of prospects for the conquest of the Soviet Union. In December 1944, Gehlen was promoted to major general, but in April 1945 Hitler dismissed him as head of the FHO, telling his generals that Gehlen was "an unreliable defeatist." As early as 1943, Gehlen had planned to offer his information and expertise to the United States. Predicting a U.S.–Soviet Union rupture, he microfilmed all his files.

In May 1945, Gehlen surrendered to U.S. forces. Generals Edwin Sibert and Walter Bedell Smith developed a relationship with him without

informing General Dwight D. Eisenhower. After the war, the "Gehlen Organization" subsequently became the most effective agency of the Central Intelligence Agency in Eastern Europe and the Soviet Union. In April 1956, it was transferred to the government of the Federal Republic of Germany (West Germany), and Gehlen became the head of the Bundesnachrichtendienst (German Federal Intelligence Service) until his retirement in April 1968. He died in Berg am Starnberger See, Germany, on June 8, 1979.

Geiger, Roy Stanley (1885–1947)

U.S. Marine Corps general. Born on January 25, 1885, in Middleburg, Florida, Roy Stanley Geiger earned a law degree from Stetson University in DeLand, Florida, but he only briefly practiced law. He enlisted in the Marine Corps in November 1907 and received a commission in 1909. Geiger first served with marine detachments aboard battleships and then saw constabulary duty ashore in Panama, Nicaragua, the Philippines, and China.

In 1916, as a captain, Geiger became the fifth Marine Corps aviator. Following U.S. entry in World War I, as a major he commanded Bomber Squadron A of the 1st Marine Aviation Force in France. After the war,

Geiger's career centered on marine aviation and advanced schooling. He served with Marine Corps air units, and from 1931 to 1935 he headed Marine Corps aviation, playing a major role in its development.

Geiger was promoted to colonel in 1935. He graduated from the U.S. Army Command and General Staff School (1925), the Army War College (1929), and the Naval War College (1941). Promoted to brigadier general in 1941, Geiger took command of the 1st Marine Aircraft Wing, Fleet Marine Force, that September.

From September 1942, Geiger led the 1st Marine Aircraft Wing at Henderson Field on Guadalcanal. He returned to the United States in May 1943 to direct Marine Corps aviation. Promoted to major general, in November 1943 he assumed command of the I Marine Amphibious Corps on Bougainville in the Solomon Islands, which he led—following its redesignation as III Amphibious Corps—in fighting on Guam, Peleliu, and Okinawa. Following the death of Lieutenant General Simon Bolivar Buckner in the Okinawa Campaign (March–June 1945), Geiger briefly (June 18–23) commanded the Tenth Army on Okinawa, the first Marine Corps officer ever to head a numbered field army. Following promotion to lieutenant general in June 1945, Geiger became commanding general of the Fleet Marine Force in the Pacific. He returned to Headquarters Marine Corps in November 1946 and died on January 23, 1947, in Bethesda, Maryland. By act of Congress in July 1947, Geiger received posthumous promotion to full general.

Genda Minoru (1904–1989)

Japanese Navy captain and aviator and postwar general and chief of staff. Born in Hiroshima on August 16, 1904, Genda Minoru graduated from the Japanese Naval Academy in 1924. Following sea service, he took flight training at Kasumigaura in 1928 and 1929, graduating at the head of his class. He served with the Yokosuka Kokutai (Air Corps) and aboard the carriers *Akagi* and *Ryujo* before becoming a fighter flight instructor at Yokosuka in 1934. There he gained national fame as leader of the Genda Circus, an aerobatics team. While at Yokosuka and subsequently at the Naval Staff College in 1937, Genda developed and expounded on his concepts of massed air attacks under fighter umbrellas and the central role of naval aviation in future warfare. Following combat service in China and command of the Yokosuka Kokutai, he became assistant naval attaché in London from 1938 to 1940.

When Genda returned to Japan in 1940, he joined the staff of the 1st Carrier Division. On its formation in April 1941, he became chief air officer of the First Air Fleet, which concentrated all of Japan's carriers into a single force to maximize their combat effectiveness, much as he had advocated since the mid-1930s. In February 1941, Genda drafted an aggressive plan for an air assault on Hawaii, expanding on Admiral Yamamoto Isoroku's initial tentative suggestion for a preemptive strike to neutralize the U.S. Pacific Fleet. Genda played a leading role in designing the tactical plan for the December 7, 1941, Pearl Harbor attack. Although Genda's demands for concentration of force and surprise were heeded, his emphasis on destroying the U.S. carriers and following up with an invasion to eliminate Hawaii as a U.S. forward base were not part of Yamamoto's eventual plan.

During the Pacific war, Genda served in carriers in the Pearl Harbor attack, in the Indian Ocean, in the Battle of Midway (June 3–6, 1942), and in the Solomon Islands Campaign (August 1942–February 1943). He was on the staff of the Eleventh Air Fleet at Rabaul until his promotion to captain in late 1944, when he became senior aviation officer in the Naval General Staff. In 1945, Genda was charged with the air defense of the Japanese home islands as commander of Kokutai 343, a large formation equipped with the best navy

interceptor aircraft that were flown by the most experienced available crews. He served in this capacity until Japan's surrender.

Following World War II, Genda was first in private business; he then headed the Japanese Air Self-Defense Forces from 1955 to 1962, retiring as a full general. He was elected to the upper house of the Japanese Diet in 1962, serving there until 1982. Genda died in Tokyo on August 15, 1989.

George II, King of Greece (1890–1947)

Greek monarch who reigned from 1922 to 1924 and again from 1935 to 1947. King George II was born on July 20, 1890, in Tatoi Palace, near Athens, the eldest son of King Constantine I and Princess Sophia of Prussia. Like many future Greek kings, George entered the military and received training in the Prussian Guard, and he saw action during the 1912–1913 Balkan Wars.

In 1913, upon the assassination of his grandfather, George became crown prince. During World War I, Constantine was deposed because of his alleged

pro-German sentiments, and George followed him into exile in 1917. George's brother Alexander was then installed as king. After Alexander's untimely death in 1920 and a national plebiscite, Constantine was returned to the throne. Crown Prince George remained in the military, eventually rising to major general. When the Greeks were defeated in the Greco-Turkish War (1919–1922), Constantine was again deposed, and George now became king.

King George's first reign was not a happy one. In 1923, a coup nearly deposed him, and a Revolutionary Committee requested that he leave Greece so that the future of the Greek government could be determined. Although George II left the country, he would not abdicate. In 1924, while in exile in Romania, the new Greek republic formally deposed him. George II and his family eventually took up residence in London.

Greece was plagued by political chaos in the succeeding years. Between 1925 and 1935 alone, there had been 23 different governments, including a dictatorship, and 13 coups d'état. In November 1935, a plebiscite indicated overwhelming support for a reinstatement of the monarchy, so George II returned to Greece within days of the vote. A year later, however, George II essentially underwrote Ioannis Metaxas's attempt to establish a rightist, quasi-fascist dictatorship. By the time Italian troops invaded Greece in October 1940, though, the king had expressed pro-British sentiments. When the Germans came to the aid of the Italians in Greece in April 1941 and occupied that country, George II was again driven out. He eventually resettled in London.

Between the time of his departure and the end of World War II, George II remained the internationally recognized head of the Greek state. As the liberation of Greece appeared imminent in 1944, the king shrewdly denounced Metaxas's regime and called for the restoration of a republican monarchy. Many Greeks, however, distrusted the king because of his earlier support of Metaxas. This began a period of great political contention, and the decision to return the king to his throne was a contributing factor to the Greek Civil War of 1946–1949.

A March 1946 plebiscite supported a return of the monarchy, and George II returned to Greece in September. The embattled king faced an economically prostrate nation being torn apart by a civil war and under siege by communist partisans. He was unable to restore stability to Greece before dying of a heart attack in Athens on April 1, 1947.

George VI, King of England (1895–1952)

King of Great Britain and Northern Ireland and constitutional head of the British Empire (1936–1952). Born on December 14, 1895, at Sandringham, England, the second son of King George V and Queen Mary, George was by nature unpretentious and modest. He also suffered from a severe stammer. No intellectual, he was educated by private tutors. Following family tradition, he entered the navy at 13 and attended the Royal Navy College at Dartmouth. George saw action in the 1916 Battle of Jutland, and in 1918 he joined the Royal Flying Corps and became a wing commander.

George married Lady Elizabeth Angela Marguerite Bowes-Lyon in 1923. They had two daughters, the future Queen Elizabeth II and Princess Margaret. As Duke of York, George helped set up summer camps for young men in industrial slums in the cities.

George succeeded to the throne on December 12, 1936, following the abdication of his brother, King Edward VIII. George made numerous state visits in 1938 and 1939, including to the United States, which cemented valuable friendships. He was the first British monarch to visit the United States.

Despite the fact that military personnel swore allegiance to him and that military orders were issued in his name, George VI had no real powers as king. His role in World War II was to provide an example to the nation. In frequent radio broadcasts, George VI encouraged his people to remain calm, firm in resolve, and united behind the war effort. His popularity soared because he refused to leave London, despite the fact that Buckingham Palace

was hit by German bombs. He also toured the bombed areas. George VI had an excellent relationship with Prime Minister Winston L. S. Churchill.

George VI established the George Cross, for both wartime and peacetime heroism, the civilian equivalent of the Victoria Cross. His frequent wartime visits to factories and hospitals and to the troops boosted morale. He also strongly supported monarchs in exile in Britain. At the end of the war, the popular bond with the monarchy had never been as strong in modern times. George VI lived to see dramatic changes in Britain's world position at the end of the war and the breakup of the British Empire, especially the independence of India in 1947. He died at Sandringham, England, on February 6, 1952, and was succeeded by his daughter, crowned queen as Elizabeth II, who continues as monarch.

Georges, Alphonse Joseph (1875–1951)

French Army general. Born on August 19, 1875, at Montluçon, Alphonse Joseph Georges graduated third in his class in 1897 from the French Military Academy at Saint-Cyr and was posted to Algeria. During World War I, he was seriously wounded in 1914 while commanding a battalion. Following his recovery, he was posted to the army General Staff. Georges ended the war as chief of operations for Marshal Ferdinand Foch.

After the war, Georges served as chief of staff to Marshal Henri Philippe Pétain during the Rif War in Morocco. Georges was a division commander in Algeria from 1928 to 1932 and was then assigned to the Supreme War

Council in Paris. He was wounded during the assassination of both King Alexander of Yugoslavia and French foreign minister Louis Barthou at Marseille in 1934. This aggravated the wound he had received in 1914.

Georges's physical condition may have played a critical role in his deteriorating abilities during the late 1930s. He expected to be named chief of staff of the French Army in 1935, but the French premier, Édouard Daladier, suspected him of right-wing tendencies. Georges was also closely linked to Paul Reynaud, Daladier's political rival. Daladier thus named General Maurice Gamelin to the position instead and installed Georges as Gamelin's assistant.

The troubled professional and personal relationship between Gamelin and Georges severely weakened French preparations for war during the last half of the 1930s. Georges assumed responsibility for northeast France, placing him in direct command of the units most likely to meet a German invasion. In 1940, these units included two French Army groups and the British Expeditionary Force. Fully confident of the abilities of his force, Georges was stunned by its subsequent poor performance.

French general Alphonse Georges. (March of Time/The LIFE Picture Collection/Getty Images)

Georges bears partial responsibility for the decision to implement the Dyle Plan, which placed substantial Allied units on the road to Belgium rather than in the Ardennes, the main axis of German attack. As the military situation collapsed, so did any semblance of professionalism between Georges and Gamelin. On May 17, 1940, both men were relieved of command in favor of General Maxime Weygand.

Georges refused to play any role in the subsequent collaborationist Vichy government, but he also had no real role in the French Resistance because he did not enjoy the confidence of Charles de Gaulle. Georges briefly served as minister without portfolio in the French Committee of National Liberation in 1943. Georges died in Paris on April 24, 1951.

German Armed Merchant Ship Commerce Raiders

At the beginning of World War II, the Germans converted selected merchantmen into armed commerce raiders. These were charged with sinking enemy ships, laying mines, upsetting British merchant shipping schedules, and forcing the Royal Navy to shift assets from more vital theaters, dissipating and wearing out machinery and ships.

The first of these raiders, and the most successful, was the *Atlantis.* It departed Germany on March 31, 1940. Five other raiders followed by early July and one more in December. There were nine in all: the *Atlantis, Orion, Wilder, Thor, Pinguin, Komet, Kormoran, Stier,* and *Michel.* The *Komet* reached the Pacific through the Northeast Passage, thanks to the assistance of two Soviet icebreakers, for which service the Soviet Union was paid some $300,000. The others all broke out through the Denmark Strait. The ships ranged in displacement from 3,300 to 8,800 tons.

Painted gray, brown, or black to render them less visible at night, these ships would sail under whatever flag was convenient at the moment. Their raked bows hinted at additional speed if required, but that was the only indication that they were not innocent merchantmen. Hidden behind hinged steel ports, however, were six 5.9-inch guns, the raiders' primary weapons. They also carried torpedo tubes, both above and below water. False topside works concealed lighter guns, searchlights, range finders, and smoke generators.

The raiders also had float aircraft for reconnaissance purposes. None of the ships had catapults, so these aircraft could only be used in calm seas. Two of the raiders carried small motor torpedo boats. Most of the raiders also

carried mines, which were laid in widely scattered areas of the world, including off the Cape of Good Hope and Auckland, New Zealand.

Some of the prizes taken were valuable, and a number of these were gotten safely back through the British blockade to France. The prizes also provided fuel and supplies, enabling the raiders to extend their cruising time.

The raiders were hard to locate, and the Germans shifted them around and altered their appearance. Because of their heavy armament, only cruisers were sufficiently armed to deal with them. Although most of the raiders remained in the Atlantic, some reached the Indian Ocean and the Pacific.

The raiders had their greatest success in 1940. Gradually thereafter they were hunted down and destroyed or succumbed to mechanical problems. The *Michel* was the only raider left at sea at the beginning of 1943. It continued to sink Allied shipping through most of that year. On October 18, 1943, it was about 60 miles from its new base of Yokohama, Japan, when it was attacked at night by the surfaced U.S. submarine *Tarpon.* The *Michel* tried to ram the submarine but was in turn torpedoed and sunk.

In all, the German raiders sank some 129 ships totaling more than 800,000 tons, a figure equal to a year's normal British peacetime construction. This figure does not include an unknown tally of ships sunk by mines or the indirect cost to the British war effort and the value of the prizes sent to Germany for its war economy.

German-Soviet Peace Feelers

Even as Germany and the Soviet Union were locked in their death struggle on the Eastern Front, there were those who urged—and others who feared—a separate peace between the two nations. U.S. and British leaders were afraid that Soviet dictator Joseph Stalin might decide that the cost of expelling the German invader from the Soviet Union and the long delay by his Western Allies in opening a second front justified a separate peace, much as Bolshevik Russia had concluded a separate peace with Imperial Germany during World War I in March 1918. U.S. president Franklin D. Roosevelt hoped that substantial Lend-Lease shipments would convince the Soviet ally to remain in the war.

Italian and Japanese leaders repeatedly tried to convince Adolf Hitler and other German officials to seek a separate peace with the Soviet Union. They pointed out that peace with the Soviet Union would permit Germany to reallocate resources against the Western Allies in North Africa and in the Atlantic and thus shore up the flagging Italian and Japanese war efforts. After all, some three-quarters of the German Army and two-thirds of Luftwaffe strength were assigned to the Eastern Front, sharply limiting German military efforts elsewhere. Italian dictator Benito Mussolini made the case strongly with Hitler during meetings held between December 18 and 20, 1942, after the Allied invasion of French North Africa the previous November and again after the Axis surrender in Tunisia in May 1943. The Japanese became increasingly convinced of the need for peace between Germany and the Soviet Union following their defeat at Midway (June 3–6, 1942). Because Japan was allied with Germany and had a nonaggression pact with the Soviet Union, Japan was an ideal intermediary. The United States was able to read Japanese diplomatic traffic, and U.S. and British strategists followed Japanese peace efforts with great concern.

It is not clear that Stalin or Hitler ever seriously entertained thoughts of a separate peace. Some scholars believe that in the winter of 1941–1942, Stalin authorized secret police head Lavrenti Beria to sound out Germany on peace terms. Historian Gerhard Weinberg believes that Stalin may have considered the possibility of peace after the end of the Soviet winter offensive in early 1942. Weinberg and other scholars believe that Stalin may have been interested in such discussions up to the conclusion of the Battle of Kursk

(July 5–13, 1943), when he became convinced that the Soviet Union could defeat Germany with or without the long-sought second front.

There are also indications of informal contacts between German and Soviet intermediaries in Stockholm, Sweden. Although Soviet leaders believed that the war had turned in their favor, they were worried by the German counterattack to regain Kharkov (March 1–14, 1943). Stalin may also have wished to use peace feelers to impel his U.S. and British allies to expand matériel aid and become more accommodating in meeting Soviet territorial demands. Moreover, Soviet officials did not offer Germany a generous peace, at one time indicating that they would only guarantee Germany's 1937 borders—namely, those prior to the 1938 Anschluss (union) with Austria and the dismemberment of Czechoslovakia.

Hitler also resisted the entreaties of his Italian and Japanese allies. Despite the surprising power of the Soviet winter offensive in 1941–1942, Hitler believed that heavy Soviet casualties had brought the Soviet Union near the breaking point, and he refused suggestions from many of his generals that he switch to defensive warfare. At least until after the Battle of Kursk, Hitler believed that he could defeat the Red Army, and therefore he opposed any negotiated peace. Some generals and several of Hitler's closest advisers, including Foreign Minister Joachim von Ribbentrop and Propaganda Minister Joseph Goebbels, urged Hitler to investigate the possibility of a separate peace, but he never encouraged such talk.

In the fall of 1944 following the destruction of German Army Group Center in the Soviet Union and the Western Allies' breakout from Normandy, Japanese officials again tried to convince Hitler to seek peace. Even though Germany had already yielded its 1941 gains to the Soviet Union, Hitler decided instead to build new divisions, equip them with new Tiger tanks, and attack the Western Allies in the December 16, 1944–January 15, 1945, Ardennes Offensive (Battle of the Bulge).

Germany

Nation located in North-Central Europe with a 1939 population of 69.6 million (not including Austria and Czechoslovakia, both of which had been annexed in 1938). Germany proper encompassed approximately 137,000 square miles. Germany bordered Denmark, the North Sea, and Baltic Sea to the north; Switzerland and Austria to the south; Czechoslovakia and Poland to the east; and Belgium, France, and Luxembourg to the west.

The popular assumption that Nazi Germany was a well-organized war machine on the eve of World War II is patently false. It is true, however, that no time was likely to be as favorable as September 1939 for German leader Adolf Hitler to go to war with the Western powers. Britain and France were only then rearming, and Germany had a larger population than its western neighbors, a strong industrial base, and the world's most powerful army and air force. The economy was unbalanced, however, with imports running well in excess of exports, but Hitler planned to redress the imbalance by seizing in war all that the Reich required.

The National Socialist state controlled the media, with Propaganda Minister Joseph Goebbels adroitly manipulating the press, radio, film, and party rallies. Informers on every block and the Gestapo (Geheime Staatspolizei or State Secret Police) kept a close watch on activities, but most Germans accepted the führer's policies. Sullen resignation over the start of the war in September 1939 turned to euphoria after Germany's victories over France and the Low Countries in the spring of 1940. In the winter of 1941 when the military situation began to deteriorate on the Russian plains, Germans settled into a sort of stoic determination that lasted until near the end. Most Germans were aware of the price their nation was exacting from

the rest of Europe and thus could believe that the Allies would repay them in kind.

To ensure the loyalty of the Reich's citizens, however, Hitler ordered that judges ignore established law and procedure and dispense only "National Socialist justice." Hitler expressly approved the Gestapo's use of torture. The complete subversion of the German legal system to Nazi rule came with the appointment in August 1942 of Roland Freisler as president of the Volksgerichthof (People's Court).

Once he had secured power in 1933, Hitler sought to harness the German economy for war preparation. He well understood that his desire for new lands in the east (*Lebensraum*, or living space) had to be realized through a series of swift and decisive military victories. The German economy could not sustain a long, drawn-out war. Thus, the blitzkrieg (lightning war) was born of economic necessity.

In 1936, Hitler instituted his Four-Year Plan for the economy under Reichsmarshal Herman Göring. The idea was designed to centralize the economy. As with everything else in the Third Reich, however, the rivalry of higher-ranking officials, encouraged by Hitler, meant that the economy remained a battlefield for various competing interests, even within the armed forces. Despite these inefficiencies, the German military was rebuilt. Spending on the armed forces, however, consumed 50 percent of the budget, or approximately 60 billion reichsmarks, per year. Hjalmar Schacht, head of the Reichsbank, pointed out that this level of expenditure could not be sustained.

Besides military growth, another goal of the Four-Year Plan was German economic autarky in such key areas as the petrochemical industry and reduction of imports of other raw materials necessary for war production, including rubber and minerals. From 1936 to 1938, the Four-Year Plan concentrated on production of raw materials; after 1938, attention was focused on production of finished goods such as tanks, aircraft, and artillery pieces for immediate war use. Between 1936 and 1942, the Four-Year Plan represented 50 percent (13.25 billion reichsmarks) of total German industrial investment.

Memories of World War I, when the British naval blockade starved Germany of raw materials and foodstuffs, underpinned German planning. The August 1939 Nazi-Soviet Non-Aggression Pact, however, removed

much of the impact of the blockade during World War II, as did the addition of Romania—with its important oil fields of Ploieşti to the Axis alliance after the war began.

Despite emphasis on military production, the Nazi hierarchy feared the impact on home front morale of shortages of consumer goods. Production of consumer goods from 1936 to 1939, when Germany was straining to increase its armaments, actually went up by 25 percent. This continued during the war; thus Germans enjoyed both "guns and butter" and a relatively high standard of living until 1944. After the successful military campaigns of 1939 and 1940, Hitler recommended a reduction in arms production in order not to affect civilian morale. The government sought to pacify the population with incentives such as bonuses for night shifts and overtime pay on holidays. Despite an official decree to freeze salaries, average wages from September 1939 to March 1941 rose by 10.4 percent.

Even in 1942, consumer expenditures were maintained at about the 1937 level, and few new economic restrictions were imposed. Raw materials were in short supply, but these were deliberately depleted in the expectation of a quick victory over the Soviet Union. This optimistic outlook changed with the German reverses in the winter of 1941–1942. In February 1942 when Fritz Todt, minister of armaments and production, died in a plane crash, Hitler named Albert Speer as Todt's replacement.

An organizational genius with a keen interest in efficiency rather than ideology, Speer created a centralized machinery of control in the Central Planning Board. By 1943, Speer had nearly complete control of the national economy and was able to substantially boost production. He also enacted industrial policies to standardize production by limiting the number of different types of armaments produced and promoting efficient factory assembly-line methods. In fact, German war production was at its height in 1944, despite Allied bombing, and production of consumer goods dropped only slightly. In March 1944, German aircraft plants went on double shifts and a seven-day workweek. Thus, Germany attained its highest levels of aircraft, tanks, and munitions production in late 1944 while bearing the full brunt of Allied bombing. By then it was too late. When the Allies shifted their bombing emphasis to lines of communication and petroleum production, the transportation system collapsed, and there was no fuel to operate the tanks and new jet aircraft.

Speer might have accomplished more had he not been handicapped by jealous rivals, such as Göring and Reichsführer-SS Heinrich Himmler. Himmler was a major hindrance. Constantly scheming to enhance the power of the SS within the Reich, he actually undermined the economy. The SS grew to be a state within a state, and Hitler even approved Himmler's proposal to build an SS-owned industrial concern to make it independent of the state budget.

Major factors in Speer's success, of course, were the substantial territory and resources that Germany had acquired by 1942. Germany could exploit the resources of this new empire—skilled labor, industry, and metallurgical resources from France and Belgium and foodstuffs and other resources from Denmark, Norway, and the Balkans. There were also substantial resources in the vast stretches of the Soviet Union occupied by the German Army from June 1941 onward, although many of these resources were simply those that Germany had depended on in the past.

Spain was a friendly neutral country, and Sweden, Portugal, and Switzerland continued to trade with the Reich and conduct its business abroad. In addition, ruthless German economic exactions helped finance the war. German-occupied Western Europe provided substantial raw materials and money to fuel the German war machine. Of the total German war expenditure of 657 billion reichsmarks, the German people paid only 184.7 billion. France alone paid "administrative costs" to Germany at the absurdly high sum of 20 million reichsmarks a day, calculated at the greatly inflated rate of exchange of 20 francs per reichsmark and amounting to some 60 percent of French national income.

The National Socialist regime failed to use two readily available sources of labor, however. The Nazis had done all in their power to reverse the emancipation of women during the Weimar Republic. Restricting women to the "three Ks" of *Kinder, Kirche,* and *Küche* (children, church, and kitchen) meant that during the Great Depression jobs were secured only for men. This system carried forward into the war with serious implications for the war economy. Speer claimed that mobilizing the 5 million women capable of war service would have released 3 million German males for military service. Such a step might have altered the results of battles and campaigns, although it probably would not have affected the overall outcome of the war.

As early as 1942 Speer recommended that women be recruited for

industry, but Hitler rejected this advice. Not until 1943 were women between 17 and 45 years of age required to register for compulsory work. Later the upper age limit for women was raised to 50, and the age span for men was set at 16 to 65. By 1944, German women actually outnumbered men in the civilian labor force at 51.6 percent.

Jews were another available source of skilled labor that had served the Fatherland well during World War I. Numbering about 600,000 when Hitler came to power, many German Jews soon escaped abroad. Virtually all who remained and were identified perished in the "Final Solution." Not only was this valuable labor pool lost to the Reich, but the systematic extermination of European Jewry took its toll on the war effort, as considerable manpower was absorbed simply in rounding up and transporting European Jews to the death camps.

The Third Reich sought to compensate for labor shortages by using foreign workers. In March 1942, Fritz Sauckel became general Reichsdirektor for labor, or minister of labor. In 1942, there were 3.8 million fewer people employed in the German economy than in 1939. The Germans tried to attract foreign skilled workers with financial incentives. When this approach failed, the occupiers simply rounded up those they thought necessary and shipped them to Germany to work in appalling conditions. By the end of 1942, the total number of people working in the German arms industry had risen by 1.3 million. By September 1944, there were 7.5 million foreign and 28.4 million German workers, and at the end of the war there were upwards of 10 million foreign workers in the Reich.

Such labor was hardly efficient. Speer noted that in October 1943, some 30,000 prisoners working in armaments production produced during a seven-month period only 40,000 carbines, whereas 14,000 U.S. workers turned out 1.05 million carbines in the same amount of time. Until 1944 most German factories ran only a single shift per day, and only 10 percent of employees were working a second or third shift.

Only at the end of the war, when it was clear even to the German leadership that the war was lost, did the regime risk disrupting the German home front. By then, of course, German cities were being devastated by Allied strategic bombing. The suffering of his people did not disturb Hitler, though. He held that Germans had proven "unworthy" of him and thus deserved to perish.

Germany, Air Force

The German Air Force, the Luftwaffe, existed officially for barely a decade, but during that time it was the pride of Nazi Germany. Before the war, the Luftwaffe proved useful in coercing concessions from other countries. It was the world's most powerful air force in 1939, and once World War II began, it became an essential element of blitzkrieg, or lightning war. The Luftwaffe was, however, basically a tactical force, and it came apart under the strain of the German invasion of the Soviet Union, which began on June 22, 1941.

The Versailles Treaty after World War I denied Germany an air force. Nevertheless, the Germans continued experimenting with aviation, and the military developed air doctrine and training programs, monitored technological developments, and built an industrial infrastructure for civilian

aviation. At the same time, the German military established clandestine air facilities in the Soviet Union to build and test aircraft and train personnel. When Adolf Hitler came to power in January 1933, he pushed development of aviation and in 1935 openly began building an air force. The Western Allies were reluctant to employ force to halt this development, even though it was in direct violation of German treaty obligations.

A formation of Luftwaffe Junkers Ju-87D Stuka dive-bombers during the war. (Keystone/Getty Images)

Unlike the army and navy, the Luftwaffe was purely a Nazi creation and became the primary focus of Hitler's rearmament program. He was much impressed with theories, notably those of Italian Giulio Douhet that future wars could be won by air forces alone. Hitler selected Hermann Göring, a World War I ace pilot, as minister of aviation and Luftwaffe commander in chief.

In 1936, Hitler sent the Kondor Legion, essentially a Luftwaffe force, to fight in the 1936–1939 Spanish Civil War. Here the Germans gained invaluable experience in testing aircraft, in tactical concepts, and in strategic bombing (as at Guernica). Hitler's boasts about German airpower, although many of them were empty, helped face down the French and British in his

March 1936 remilitarization of the Rhineland and in the 1938 crisis over Czechoslovakia.

As with so many other agencies in the Reich, the Luftwaffe suffered from organizational weaknesses and overlap at the top. Göring, one of Hitler's inner circle from the early days, was Hitler's designated successor, and Hitler allowed him to run the Luftwaffe without any real interference. The Reich Air Ministry consisted of the office of state secretary for air Field Marshal Erhard Milch; it supervised aviation matters apart from operations. Milch was also inspector general of the Luftwaffe. In addition, there was chief of staff Colonel General Hans Jeschonnek. Until his suicide in 1943, Jeschonnek headed the air force's organization, operations, intelligence, training, quartermaster, and signal branches. Milch and Jeschonnek did not get along, however, and Jeschonnek only had access to Göring on operational matters and no control over personnel, which Göring made his own province.

Colonel General Ernst Udet, chief of the Technical Office and World War I ace, proved to be an incompetent administrator. Udet reported to Milch, who took over Udet's office after his 1941 suicide. Too late, in May 1944, the administrative structure was streamlined with the creation of the Oberkommando der Luftwaffe (Air Force Supreme Command, OKL). Also in 1944, Albert Speer's Armaments Ministry gained control of all German aircraft production, and Milch's ministry was abolished.

The Luftwaffe, the newest of the military services, was the least professional and suffered the most from promotions not based on merit. Göring surrounded himself with advisers whose principal qualification was that they were Nazis, as opposed to experienced aviation military officers. Many times they either offered poor advice or, not wishing to anger him, agreed with whatever ideas he developed. Increasingly, Göring, who held numerous offices in the Reich, largely abandoned his command of the Luftwaffe, intervening only in fits and starts, and often with disastrous results, as during the July 10–September 30, 1940, Battle of Britain. During the war, the Luftwaffe was also the agency least conscious of communications security.

The Luftwaffe controlled all air services but had little interest in naval aviation. Airborne troops were Luftwaffe personnel, and the air force also had charge of antiaircraft artillery. Eventually, it even fielded 22 ground divisions, including the Hermann Göring Panzer Division.

The Luftwaffe was organized into Luftflotten (Air Fleets), constituted so as to perform a variety of roles and consisting of a wide variety of aircraft types. At the beginning of the war, Germany had four Luftflotten, and during the course of the conflict three more were added. The next operational division was the Fleigerkorps (Flier Corps), and below that was the Fleigerdivision (Flier Division). These last two each contained several Geschwader (Squadrons) that were designated as to types (including fighters, bombers, night fighters, training, and so on). Each division controlled three to four Gruppen (Groups) comprising three or four Staffeln (Flying Teams). In September 1939, the Luftwaffe had 302 Staffeln.

At the start of the war, Germany's chief advantage was in the air, for the Luftwaffe was then certainly the world's most powerful air force. In September 1939, Göring commanded more than 3,600 frontline aircraft. The death on June 3, 1936, of strategic bomber proponent Lieutenant General Walther Wever, however, had brought a shift in emphasis to tactical airpower. This remained the case throughout the war. Although Germany developed four-engine bomber prototypes, these were never placed in production. It could be argued, however, that a tactical air force was the best use of Germany's limited resources.

The German Air Force was essentially built to support ground operations. It suited ideally the new blitzkrieg tactics, and the Junkers Ju-87 Stuka dive-bomber was a highly accurate form of "flying artillery." Impressed by U.S. Marine Corps experiments with precision dive-bombing, the Germans embraced this technique; indeed, all German bombers had to be capable of dive-bombing. This entailed considerable aircraft structural change with attendant production delays and a decrease in bomb-carrying capacity. The flying weight of the Junkers Ju-88 twin-engine bomber went from 6 to 12 tons, sharply reducing both its speed and its bomb-carrying capacity.

Nonetheless, the Germans developed some exceptional aircraft. They had a superb air-superiority fighter in the Messerschmitt Bf-109, certainly one of the best all-around aircraft of the war. And before the end of the war, the Germans had introduced the Messerschmitt Me-262, the world's first operational jet aircraft. But Hitler also wasted considerable resources on the development of terror or "vengeance" weaponry, the V-1 and V-2.

The Luftwaffe played key roles in the German victories over Poland in 1939 and over France and the Low Countries in 1940. Its limitations first

became evident during the Battle of Britain, when Göring attempted to wage a strategic bombing campaign with a tactical air force. Germany's defeat in this battle was its first setback of the war. The Luftwaffe was also impressive in the fighting against the Soviet Union, at least until the Battle of Stalingrad (August 23, 1942–February 2, 1943).

But in the fighting on the Eastern Front, the superb combined-arms instrument that had been the German military to that point began to come unhinged. By the fall of 1941 Germany was overextended, and the Luftwaffe's small airlift capacity of Junkers Ju-52 trimotor transports was unable to fulfill all the missions required of it.

Although Germany increased its aircraft production during the war, as the conflict continued and under relentless Allied bombing, it suffered from lack of aviation fuel. This was the key factor in the defeat of the Luftwaffe rather than inferior or too few aircraft.

By 1944, the Luftwaffe was feeling the effects of the Allied bomber offensive. In the first half of the year, pilot losses were averaging 20 percent a month, and the scarcity of fuel forced the routine grounding of aircraft not only for operations but also for training. In a period when replacement aircrews were desperately needed, flight time for trainees had been reduced to less than half that for their Allied counterparts. This in turn led to increasing numbers of accidents. By the time of the June 6, 1944, Normandy Invasion, the much-vaunted Luftwaffe had been largely silenced.

Germany, Army

At the tactical level of warfare, the German Army—the Reichsheer—of World War II may well have been the best ground force in the history of warfare to that time. On the strategic level, though, the Germans had major blind spots that go a long way toward explaining why they lost two world wars despite having the best army in the field. At the middle level of warfare—that of operations—historians continue to argue. One school holds that the German doctrine of blitzkrieg was the most sophisticated example of the operational art to that time. The other school holds that what passed for operational art in the German Army was little more than tactics on a grand scale.

The Reichsheer of World War II (the Wehrmacht was the entire German military, not just the army) grew out of the 100,000-man Reichswehr that was allowed to Germany following World War I under the terms of the Treaty of Versailles. On October 1, 1934, Adolf Hitler ordered the threefold secret expansion of the Reichswehr. Conscription was reintroduced in March 1935, establishing a further increased objective base strength of 38 divisions and approximately 600,000 troops.

By 1939, the two main components of the German Army were the field army (Feldheer) and the replacement army (Ersatzheer). The field army had more than 2 million soldiers and was organized into 120 divisions—99

infantry, 9 panzer, 6 motorized, 1 cavalry, 3 mountain, and 2 parachute. The replacement army consisted of a force of approximately 100,000 men in training or transit. From 1942 on, the numbers of replacements became progressively insufficient to keep frontline units up to authorized strength levels.

The infantry division was the primary tactical element of the German Army. In 1940, the standard German infantry division had 17,200 troops, 942 motor vehicles, and 5,375 horses. By 1944 there were 226 infantry divisions, but the size of each had shrunk to 12,352 troops, 615 motor vehicles, and 4,656 horses. Despite its reputation as the master of mechanized and mobile warfare, the German Army relied heavily on horses right up until the end of the war. Almost all field artillery in the infantry divisions was horse-drawn.

The German divisions were organized according to a triangular structure, with three infantry regiments of three battalions of three companies each; a divisional artillery command with a field artillery regiment of three battalions of three batteries each, a heavy artillery battalion, and an observation battalion; reconnaissance, engineer, signals, and antitank battalions; and the divisional (supply) trains. Each division also generally had an antiaircraft battalion attached to it from the Luftwaffe.

The Germans did, however, field various forms of motorized or mechanized units. By 1941, they had a total of 10 motorized infantry divisions and light infantry divisions. Later in the war, these units were redesignated as Panzergrenadier divisions. Germany ultimately fielded 22 of these units. They were organized along the general lines of the infantry divisions, but they had more motor vehicles and an organic tank regiment. In 1940, the standard motorized/light division had 14,000 troops, 3,370 motor vehicles, 158 tanks, and more than 1,500 horses. The 1944 Panzergrenadier division had 13,833 soldiers, 2,637 motor vehicles, 48 tanks, and more than 1,400 horses.

The Germans had several specialized divisions. Mountain divisions were essentially smaller and lighter versions of the infantry division. Germany had 3 mountain divisions in 1940 and 13 in 1944. Fortress divisions and security divisions were divisions in name only; they could not be seriously equated with other divisions in the army’s order of battle. The fortress divisions were little more than stationary garrisons, seldom larger than a regiment in strength. The security divisions were used to secure rear-area lines of

communication and to conduct antipartisan operations on the Eastern Front. In a last act of desperation late in the war, Germany created Volksgrenadier (people's grenadier) divisions for defense of the Reich itself. Heavily manned by old men and young boys with almost no military training, these units were armed with a high proportion of automatic and antitank weapons. Because of the weapons' high firepower and the fact that the units were defending their home ground, these units sometimes gave a surprisingly good account of themselves.

The Germans began the war with one (horse) cavalry division, which fought in the Poland Campaign in 1939. By 1944, Germany actually had four such divisions, all operating on the Eastern Front. Late in the war, Germany fielded its single artillery division, which was based on the Soviet model. The Red Army, which had hundreds of thousands of artillery pieces, fielded almost 100 artillery divisions. But for the Germans, who were chronically short on artillery throughout the war, fielding an artillery division was an almost pointless exercise. The Germans did not have sufficient artillery to equip their infantry and panzer divisions, let alone form more artillery divisions.

Organizationally, all German parachute divisions were part of the Luftwaffe, but operationally they fought under army command. The Germans had 2 parachute divisions in 1940 and 11 in 1944. After the near-disaster on Crete in May 1941, German parachute divisions never again jumped in combat. They spent the remainder of the war fighting as light infantry, but their traditional paratrooper élan remained, and they were fierce opponents, especially in Italy.

The German Air Force also fielded land divisions that operated under army command. The formation of these air force field units was another desperate measure. As attrition ground down the Luftwaffe's aircraft, especially on the Eastern Front, excess personnel were hastily grouped into these field divisions. Often, the new ground soldiers had little or no infantry training. Germany had 19 such divisions in 1944.

The panzer division was the mailed striking fist of the German Army. The first three panzer divisions were raised as completely new units in the fall of 1935, but they were not fully operational until September 1937. Thereafter, new panzer divisions were created by converting infantry or other divisions. There were 9 panzer divisions by 1939 and 26 by 1944. From 1941, the

panzer divisions were in action almost constantly and continually being ground down by attrition. A panzer division in 1940 had some 14,000 troops, 1,800 motor vehicles, and 337 horses. The standard panzer division had 324 tanks, and a variation known as a light panzer division had 219 tanks. By 1944, the typical panzer division had 13,700 troops, but the number of motor vehicles had decreased to 48, whereas the number of horses had increased to almost 1,700. On paper, at least, a 1944 panzer division had 150 tanks; however, in the last year of the war many panzer divisions could only field a handful.

The Waffen-Schutzstaffel (Waffen-SS) was separate from the army and even from the Wehrmacht. It was essentially the Nazi Party's army, and it fielded combat divisions that fought under army command and control, much like the Luftwaffe's field and parachute divisions. By 1944, there were seven SS panzer divisions and 11 SS Panzergrenadier divisions. The organization of the Waffen-SS divisions was similar to the organization of their Reichsheer counterparts, but because of their unquestioning loyalty to Hitler they were often better equipped.

The echelon of command above the division was the corps, which consisted of two or more divisions and additional corps support troops and artillery. The two basic types of corps were the army corps, consisting primarily of infantry divisions, and the panzer corps, consisting primarily of panzer divisions. The XCI Armeecorps was the highest-numbered corps. The next-higher echelon of command was the field army, comprising two or more corps. Field armies normally were designated by numbers, but in a few instances they were designated by a name. Field armies also had their own pools of combat assets such as artillery and separate heavy tank battalions.

The German Army's largest operational unit was the army group (Heeresgruppe), which controlled several field armies or corps directly. The army group also was responsible for providing support to all units in its area as well as for the rear-area lines of communication and logistical services. Army groups were designated by their locations, by their commander's name, or by a letter.

The Germans had several elite units designated only by their name. Grossdeutschland (greater Germany)—also called "the bodyguard of the German people"—was first formed in 1938 as a ceremonial battalion. By 1939 it had expanded to the size of a regiment, and by 1942 it was an

oversized division. At the end of the war, Panzerarmee Grossdeutschland commanded five divisions under two corps. The Panzer Lehr Division, which was the most powerful German armored division in Western Europe at the time of the June 6, 1944, Allied landings in Normandy, was formed in the winter of 1943–1944 with instructors and troops from the German armored school. The Infantrie-Lehr Regiment was an elite unit formed from instructors and infantry school troops. In 1944, Hitler personally ordered the Infantrie-Lehr to Anzio to block the Allied landings there. The result was the January 22–May 25, 1944, Battle of Anzio.

Army command and control suffered from a confused structure at the top, which only compounded the German weaknesses at the strategic and operational levels. Three different high command headquarters were seldom in agreement and often in competition. The Oberkommando des Heeres (army high command, OKH), the Oberkommando der Wehrmacht (armed forces high command, OKW), and the supreme commander (Hitler) and his staff often issued conflicting orders to the same units. In theory, the OKH ran the war in the Soviet Union, and the OKW ran the war everywhere else. Hitler's Führerhauptquartier (headquarters) issued all the key strategic orders.

Despite the popular stereotypes, reinforced by countless Hollywood movies and television programs, the common German soldier of World War II was anything but stupid and unimaginative, and his officers and noncommissioned officers (NCOs) were neither machinelike nor inflexible autocrats. Rather, the German Army encouraged initiative among its subordinate leaders and stressed flexibility and creativity to a degree far greater than any other army prior to 1945. This was the key to its tactical excellence. German combat orders, rather than dictating detailed and rigid timelines and specific instructions on how to accomplish missions, tended to be short and as broad as possible. The principle under which the German command system operated was called *Auftragstaktik*, which can only loosely be translated into English as "mission orders."

For *Auftragstaktik* to work, a subordinate leader had to understand the intent of his higher commander at least two echelons up. This meant that the subordinate had the right to ask his superior why something was being done, and the superior was obliged to explain. Such a practice was virtually unheard of in almost all the other armies of World War II.

Despite superb organization and tactical tools at the lower levels, the

confused high command structure and Germany's incoherent strategy doomed the German Army over the long run. Hitler did a great deal personally to subvert solid military command and control. He distrusted his generals, and for the most part they distrusted him. During the early years of the war, 1939 and 1940, Hitler was the beneficiary of outrageously good luck and inept opponents. This only served to reinforce his belief in his divinely inspired military genius. When the commander in chief of the German Army, General Walther von Brauchitsch, retired for medical reasons in late 1941, Hitler—the former World War I lance corporal—assumed direct command of the army. By that time, however, Hitler had led Germany once again into its worst strategic nightmare, a two-front war.

The German Army also suffered from several internal and external handicaps that were beyond its ability to control. Germany was chronically short of virtually every vital resource necessary for modern warfare. A panzer division in 1940 still had more than 300 horses, and four years later that number had risen to 1,700. Roughly only 10 percent of the army was ever motorized. In 1940, OKH planners estimated that it would require at least 210 divisions to execute the invasions of France and the Low Countries while simultaneously garrisoning Poland and Norway. At the time, they were 20 divisions short. The chronic shortages of manpower and motorized transport only worsened as the war progressed. The situation did not improve even after German industry was mobilized in 1944. By then, of course, it was far too late.

Germany, Collapse of (March–May 1945)

Adolf Hitler's failed Ardennes Offensive (Battle of the Bulge) during December 16, 1944–January 25, 1945, far from stalling the Western Allies as Hitler had hoped, actually hastened the German military collapse. By March 1, 1945, Allied supreme commander in the west General of the Army Dwight D. Eisenhower had assembled sufficient forces for a full frontal assault. By April, it would be the largest coalition army ever assembled in war. Several hundred miles to the east, Soviet leader Joseph Stalin had massed three fronts (army groups) for the final drive on Berlin. The Soviets were consolidating their positions for a final assault and ensuring that their Baltic flank was not exposed. Supporting the Allied armies were their air forces, which now had complete control of the skies. Large numbers of British and U.S. aircraft continued the strategic bombing campaign against the German heartland. During the period March 1–21, more than 10,000 American and British bombers dropped in excess of 31,000 tons of bombs on the industrialized Ruhr area alone.

Undaunted by the overwhelming odds, German leader Adolf Hitler conducted operations from the troglodyte atmosphere of his Berlin bunker, surrounded by sycophants. The führer relied on his so-called V (for "vengeance") weapons—the V-1 buzz bomb and V-2 rocket—as well as new jet aircraft. He also hoped for some miracle, such as Allied dissension, to turn the tide. The only military realist in headquarters was army chief of staff

General Heinz Guderian. Clashes with Hitler, however, led to his departure at the end of March.

The onslaught from the west began with a drive to the Rhine River. From north to south, Field Marshal Bernard Montgomery commanded the 21st Army Group. It consisted of General Henry Crerar's Canadian First Army, Lieutenant General Miles Dempsey's British Second Army, and Lieutenant General William H. Simpson's U.S. Ninth Army, temporarily assigned to Montgomery's command from that of General Omar N. Bradley's 12th Army Group. In the center was Bradley's 12th Army Group, the largest American field force ever commanded by a U.S. general. Bradley's army group comprised the U.S. First Army under Lieutenant General Courtney Hodges, Lieutenant General George S. Patton's U.S. Third Army, and Major General Leonard Gerow's U.S. Fifteenth Army, whose forces were engaged in occupation duty and the elimination of bypassed pockets of German resistance. In the south was the 6th Army Group of Lieutenant General Jacob Devers, which consisted of Lieutenant General Alexander Patch's U.S. Seventh Army and General Jean de Lattre de Tassigny's French First Army. The 6th Army Group eliminated the Colmar pocket and advanced toward the Rhine between the Belgian and Swiss borders.

Elements of Hodges's First Army discovered the railroad bridge at Remagen intact and pushed forces across it to establish a bridgehead on the eastern side of the Rhine. German troops were everywhere withdrawing toward the Rhine. In typical fashion, Hitler replaced his commander in the west, Field Marshal Gerd von Rundstedt, with Field Marshal Albert Kesselring. The Western Allies then launched Operation UNDERTONE, an assault on the Saar-Palatinate region wherein the U.S. Third and Seventh Armies broke through the German Siegfried Line and destroyed Schutzstaffel Oberstgruppenführer Paul Hausser's German First Army. On March 22–23, Montgomery launched Operation PLUNDER, a large-scale attack on the lower Rhine. Meanwhile, Patton's troops crossed the Rhine at Oppenheim on March 22. All along the front, Allied forces moved relentlessly eastward.

In April, the XVIII Airborne Corps encircled Field Marshal Walther Model's Army Group B, resulting in the surrender of 300,000 German troops. German cities capitulated rapidly; many streets were lined with white flags. On April 20, Nuremberg fell to Patch's U.S. Third Army.

On March 31 on the Eastern Front, three Soviet fronts (army groups)

opened the Berlin Campaign to take the German capital. They were Marshal Ivan Konev's 2nd Ukrainian Front, Marshal Georgii Zhukov's 1st Belorussian Front, and Marshal Konstantin Rokossovsky's 2nd Belorussian Front. Konev's troops, supported by massive artillery barrages, cut across the Neisse River, destroying the German Fourth Panzer Army. Zhukov faced stiff German resistance and sustained heavy casualties, although his forces wore down the defenders. By this time, the German armies were only shadows of their former selves and included many young untrained draftees. The Soviets steadily drove Army Group Vistula back near Berlin.

Hitler, meanwhile, insisted on a scorched-earth policy; he also called on German citizens to act as "werewolves." He dared to hope that the miracle of the House of Brandenburg of the Seven Years' War—in which the coalition against Prussian king Frederick II came undone on the death of Russian

czarina Elizabeth—might be repeated. He even seized on the death of U.S. president Franklin D. Roosevelt on April 12, 1945, as an omen that Germany would yet survive. As propaganda minister Josef Goebbels exhorted the people of Berlin to defend their city, Hitler called up Volkssturm troops (the largely untrained older civilian militia) and the Hitler Youth to defend his dying Third Reich.

At the same time, millions of German refugees were fleeing westward to avoid falling into the hands of the Soviets. The German Navy evacuated hundreds of thousands of Germans from the Baltics. Many others made their way west on foot. Ultimately, perhaps 20 million Germans were displaced from their homelands in Poland, Czechoslovakia, and elsewhere. More than 2 million may have been killed in the exodus that followed. Those who escaped or were forced to leave added yet another burden on already-strained German social services.

On Hitler's birthday, April 20, 1945, Zhukov's troops pierced through three German defensive lines defending Berlin. On April 22, Soviet troops were fighting in the city itself, and three days later they had surrounded Berlin. That same day, April 25, elements of Bradley's 12th Army Group linked up with Soviet troops of Konev's 1st Ukrainian Front at Torgau on the Elbe River.

The last significant German counterattack of the war occurred on April 25–26, when General of the Waffen-SS Felix Steiner's Eleventh Army struck at Soviet forces driving on Berlin near Oranienburg, to no avail. Almost 500,000 Soviet troops were now battling for Berlin. Hitler refused to leave his capital and committed suicide in his bunker on April 30. To the end, he refused to accept responsibility and blamed others for Germany's defeat. Hitler's designated successor as chief of state, Grand Admiral Karl Dönitz, then took over what remained of German forces. Meanwhile, the Allies had overrun northern Italy. Remaining German forces there surrendered on May 2.

In the west, Lieutenant General Walton Walker's XX Corps of Patton's Third Army reached the Austrian border opposite Braunau. Then on May 2, Lieutenant General Helmuth Weidling, commander of Berlin, surrendered the German capital to Soviet colonel general Vasily Chuikov. On May 3, elements of Montgomery's 21st Army Group linked up with Rokossovsky's 2nd Belorussian Front at Wismar. Marshal Rodion Malinovsky's 2nd

Ukrainian Front moved from Hungary into Austria and Czechoslovakia and prepared to link up with Patton's Third Army, which was advancing down the Danube near Linz.

Remaining German forces under Dönitz still controlled Norway, Denmark, western Holland, and portions of Germany, Yugoslavia, Austria, and Czechoslovakia. Although Dönitz realized that defeat was certain, he briefly stalled for time to rescue additional German refugees fleeing westward. On May 7, Dönitz surrendered all German forces unconditionally to the victorious Allies. A formal ceremony was held the next day, and the guns finally fell silent. Germany lay prostrate and in ruins, its social services a shambles and its cities great wastelands of twisted girders and rubble.

Germany, Navy

After Adolf Hitler came to power in January 1933, Germany embarked on a major program to rebuild its navy. The German Navy (Kriegsmarine) began this major effort after the signing of the Anglo-German Naval Treaty in June 1935. The goal was the creation of a balanced fleet that would serve as the core of a future blue-water navy dominated by battleships. This so-called Z Plan envisioned a powerful fleet that would one day challenge Great Britain and the United States for world naval mastery.

In 1938, Hitler's increasingly aggressive foreign policy forced the navy to consider the possibility of a future naval war against Great Britain. The navy's commander, Grand Admiral Erich Raeder, designed a strategy to attack the British sea-lanes. His proposal to build ships more suited to a commerce war, including additional U-boats, was rejected by Hitler, who was intent on building a battleship-dominated navy that would serve as an instrument of political and military force commensurate with a world power. Shortages of resources contributed to delays in naval construction, and Raeder's blind confidence in the führer's diplomatic successes and promises that war would not come before 1942 or 1943 found the navy unprepared for war in September 1939.

At the beginning of the war, the German Navy numbered 79,000 men. It possessed 2 battleships, 3 pocket battleships or *Panzerschiffe* (small, fast, strongly constructed armored ships later reclassified as heavy cruisers), 1 heavy cruiser, 6 light cruisers, and 32 destroyers and torpedo boats. Fewer than half of the 57 U-boats available were suitable for Atlantic operations. Despite Raeder's initial pessimism that the navy could only "die gallantly," thereby creating the foundations for a future fleet, he intended to carry out an aggressive naval strategy that would attack British sea communications on a global basis using his concept of diversion and concentration in operational areas of his choosing and timing. Raeder persistently argued with Hitler that only total economic warfare against the British could have decisive impact.

Hitler's restrictions on naval operations, particularly on those of the U-boats, frustrated Raeder's attempts to seize the initiative and achieve early successes. In late 1939, concerned that the British were planning to invade Norway, Raeder instigated planning for the successful German occupation of Norway and Denmark (Operation WESERÜBUNG). This April 1940 operation was for the navy its "feat of arms"—justifying its contribution to the war effort and future existence. Although the navy did secure important port

facilities for surface raiders and U-boats in Norway as well as the shipping route for iron ore from Sweden, it also suffered substantial losses in the operation in the form of 3 cruisers and 10 destroyers. In June 1940, with the defeat of France, the navy acquired additional ports on the Atlantic and the Bay of Biscay for surface ships and submarines. But the navy also now had to protect an extended coastline from occupied France to Scandinavia. From 1940 to 1943, Germany also sent to sea 9 armed auxiliary cruisers.

Raeder's intent to prove the worth of the surface fleet—in particular, the battleships—led him to demand of his commanders that they take risks yet avoid unnecessary combat that could lead to losses. Two fleet commanders lost their jobs when they failed to exhibit the necessary aggressiveness. The scuttling of the pocket battleship *Graf Spee* in December 1939 and Hitler's displeasure over this loss further reinforced the inherent contradictions in Raeder's orders to strike boldly but avoid damage to the navy's ships.

With new battleships *Bismarck* and *Tirpitz* joining the fleet, Raeder envisioned a new phase of the Atlantic surface battle, with task forces that would engage Allied convoys protected by capital ships. In an effort to prove the value of the battleships, Raeder pressed the *Bismarck* into service before the other battleships were available for action. Its loss in May 1941 represented the end of the surface war in the Atlantic and Hitler's increasing interference in the use of Germany's remaining capital ships.

Unable to achieve the conditions for a cross-Channel invasion (Operation SEE LION) in September 1940, Raeder tried to divert Hitler from his plans to attack the Soviet Union. Raeder advocated an alternative strategy in the Mediterranean to defeat Britain first, especially given the growing cooperation between that nation and the United States. After the Japanese attack on Pearl Harbor (December 7, 1941), Raeder saw an opportunity to link up with the Japanese in the Indian Ocean and use the French African colonies and the Atlantic islands of Portugal and Spain to expand the bases for a long-term war against the Anglo-American naval forces in the Atlantic. These plans never materialized, as Germany was forced to come to the aid of Italy and secure its southern flank in the Balkans, and then the invasion of the Soviet Union faltered.

Nervous about British threats to Norway and Allied support to the Soviets in the north, Hitler ordered that the two battleships in Brest—the *Gneisenau* and *Scharnhorst*—and the heavy cruiser *Prinz Eugen* be either moved to

Norway or scrapped. The “Channel Dash” during February 11–13, 1942, was a tactical success but a strategic defeat for the navy. With the fleet relegated to Norway as a fleet-in-being, the U-boat arm, under the command of Admiral Karl Dönitz, continued its role as the navy’s primary weapon. The lack of Luftwaffe support, however, continued to seriously hamper all operations. The navy never resolved the issue of whether the U-boat war was a tonnage war or a commerce war in which U-boats attacked targets that had the greatest potential for a decisive impact. Dönitz continued to argue that all resources should go to the U-boat war and disagreed with the diversion of U-boats to other theaters such as the Mediterranean or to the defense of Norway.

In late December 1942, the failure of the *Hipper* and *Lützow* to close with a weakly defended convoy in the Barents Sea (Operation RAINBOW) led an angry Hitler to attack Raeder and the surface fleet. Raeder resigned, and Dönitz succeeded him. Although Dönitz was determined to prosecute the submarine war ruthlessly, as with the surface fleet, the defeat of the U-boats in May 1943 resulted from Allied technology and successes in code breaking that reflected the shortcomings in the naval leadership and military structure of the Third Reich. As the military situation of Germany deteriorated, the navy provided support to the army, particularly in the Baltic, where it conducted a massive and highly successful evacuation effort of troops and civilians.

In sharp contrast to the navy’s collapse after World War I, the German Navy during World War II enforced strict discipline until the end. In April 1945, Hitler named the loyal Dönitz as his heir and successor.

Germany, Postwar Occupation of

Admiral Karl Dönitz, who succeeded Adolf Hitler as head of the German state after Hitler's suicide on April 30, 1945, surrendered unconditionally to the Allies on May 7, 1945. The task of governing Germany fell to the occupying armies of the Soviet Union, the United States, and Great Britain, which were soon joined by France's army. The Allies retained the Dönitz government until May 23 to facilitate the transfer of power and to fulfill a pledge that the Germans be forced to dissolve the Nazi regime themselves.

The Allied powers assumed extraordinary authority in Germany. The Hague Convention of 1907 had limited occupiers to the maintenance of law and order, but the Allies went far beyond that, attempting a complete reorientation of German thinking—in what would come to be called "nation building." The Allied powers' European Advisory Commission (EAC) had recommended that Germany's postwar government be an Allied Control

Council in Berlin composed of commanders of the occupying forces of the various powers.

At the February 1945 Yalta Conference, British prime minister Winston L. S. Churchill, U.S. president Franklin D. Roosevelt, and Soviet leader Joseph Stalin accepted that recommendation. Occupation zones were also set. At the suggestion of Churchill and Roosevelt, France was allowed a zone, although Stalin insisted that it be carved from that area already assigned to Britain and the United States. The three leaders also agreed on steps to demilitarize Germany, dissolve the National Socialist Party, and punish war criminals. In May 1945, however, the military establishments of the occupying powers were in charge, and each occupying nation had a different notion of how occupation policies should be implemented.

Germany was devastated. Its cities were piles of rubble, bridges had been blown up, and rolling stock had been destroyed. Inland shipping was blocked, and the merchant marine was down to only 100,000 tons from a prewar total of 4 million tons. In 1946, industrial production was only one-third the volume of a decade earlier. Large numbers of Germans were homeless and out of work. The population was also swollen by Allied prisoners of war, foreign laborers forced to work in the Reich, and a great influx of refugees from the east, many having little more than the clothes on their backs. Although the Allies agreed that there was to be equitable distribution of German refugees coming from Czechoslovakia, Poland, Hungary, and other states, this did not occur. The British and French zones absorbed the majority of refugees. Simply feeding the population was a tremendous problem, and shortages of fertilizer exacerbated the loss of key food-producing areas taken by Poland.

For several years the problems centered on food, housing, and employment. As it turned out, war damage was not as extensive as had initially been thought. Much factory machinery was still operational once the rubble was removed, and modern techniques and systems were employed in rebuilding the cities that had been subjected to Allied bombing. Full public disclosure of the Holocaust, meanwhile, lessened compassion for the German civilian population and led Allied occupation authorities to proceed rapidly with denazification. The first Allied directives forbade fraternization between soldiers and civilians, set living standards quite low, and provided for full disarmament.

According to Allied agreements reached during the war, Germany lost some 40,000 square miles of territory in which before the war 9.5 million people had lived. Most of this area became part of Poland. The 138,000 square miles of territory of Germany that remained were divided for occupation purposes as follows: the Soviet Union's section had some 20 million people in 43,000 square miles, including all or part of Pomerania, Mecklenburg, Saxony, and Thuringia; Great Britain had 42,000 square miles and 12 million people in Schleswig-Holstein, Lower Saxony, Hamburg, the Ruhr, and the lower Rhineland; the United States had 36,000 square miles and 17 million people consisting of Bavaria, Hesse, and parts of Württemberg-Baden; and France had 17,000 square miles and 6 million people in the Palatinate and the Upper Rhine Valley. As U.S. lieutenant general Lucius D. Clay put it, the Soviets received the agriculture, the British the industry, and the Americans the scenery. The German capital of Berlin was also divided into four Allied zones.

In 1946, the U.S. Army formed three constabulary brigades of three regiments each and one separate regiment specifically for occupation duties. To a considerable degree, a civil affairs function for the U.S. military began in connection with the occupation of Germany after World War II.

Although the Allied Control Council met regularly, there were sharp disagreements on policy. The Soviet Union and France, for example, sought to keep German industrial production low, whereas Britain wanted it set high so the occupation would not burden already stressed British taxpayers. In the spring of 1946, the Allies agreed on a level of industrial production of 50–55 percent of the 1938 level except for the building industry, which was critical to recovery.

Efforts at central planning for the economy ran afoul of Soviet exactions. Soviet authorities, stymied in their effort to secure agreement on a precise reparations figure, had ordered that entire industrial plants and virtually everything else movable be removed from its zone and shipped back to the Soviet Union. The refusal of the Soviet Union to treat Germany as an economic unit ultimately led the Western Allies to decide to move toward a unified administration for their zones. The French also sought to detach the Ruhr and integrate the Saar into France. Work did proceed on denazification. Its centerpiece was the International War Crimes Tribunal (the Nuremberg Tribunal).

American occupation policy in Germany was governed by Joint Chiefs of Staff Directive 1067. It prohibited any fraternization between U.S. military personnel and civilians and denied food distribution to the civilian population except in extraordinary circumstances. The directive remained in effect until 1947. It took Soviet policies and the harsh winter of 1946–1947 to change this. British occupation policies were less doctrinaire and considerably easier on the civilian population. The British took the lead, for example, in organizing their zone into Länder (states), although they were slower than the Americans in granting self-government. The French had major problems of their own and so did not devote too much attention to Germany. The chief French interest, which remained in force for a decade, was the economic integration of the Saar into the French economy. The French government also worked to try to prevent German reunification. The Soviet Union was determined to extract reparations from its zone and also sought to carry out land reform and try to sovietize its zone. The latter effort, however, was more than countered by the brutal behavior of the Red Army toward the German civilian population.

Signs of frustration by the Western Allies concerning the control machinery and the failure of the Soviet Union to treat Germany as an economic unit were obvious by 1946. That September, the British and Americans merged their zones economically to form Bizonia. The same month, U.S. secretary of state James Byrnes announced at Stuttgart the U.S. intention to restore self-government in its zone of Germany.

The culmination of inter-Allied tension concerning Germany occurred during the 1948–1949 Soviet blockade of Berlin. A number of items helped precipitate this crisis. They included acute German suffering during the harsh winter of 1946–1947, the obvious need for currency reform (the Western powers were merely subsidizing the Soviet financial system in eastern Germany), the formation of Trizonia (France reluctantly joined the economic zone in the summer of 1947), efforts of the Western powers to move toward German self-government, and finally the announcement by the Western Allies that they intended to introduce a new currency in their zones. This in turn sped up the creation of a West German government in May 1949. Under the terms of an Occupation Statute, Allied military forces remained in the new Federal Republic of Germany (West Germany), and Soviet troops

remained in the new German Democratic Republic (East Germany). Berlin and Germany remain divided between east and west.

Germany, Surrender of (May 8, 1945)

German leader Adolf Hitler resolutely refused appeals from his subordinates for an end to the war. Claiming that the German people were unworthy of him, Hitler asserted that they must suffer the consequences. On April 30, 1945, with much of Germany in ruins and Berlin under siege, Hitler committed suicide in his underground bunker. His handpicked successor, Grand Admiral Karl Dönitz, assumed the office of president of the Reich. Dönitz established a new government at Flensburg in Schleswig-Holstein.

This administration, dedicated to preserving the Third Reich, was compelled by the sharply deteriorating military situation to surrender German forces to the Allied powers. Dönitz's chief consideration at the beginning of May was to negotiate an armistice with only the Western Allied powers in order for German forces in the east to conduct a fighting withdrawal that would save them from Soviet captivity. This goal, however, was frustrated by the insistence of the Western Allies that Germany surrender unconditionally to all of the Allied powers.

Dönitz tried to stave off absolute capitulation through the piecemeal surrender of portions of the Third Reich and occupied Europe. On May 3, Admiral Hans-Georg von Friedeberg surrendered German forces in Denmark, Holland, and northern Germany to British field marshal Sir Bernard Montgomery. Dönitz was able to avoid complete surrender for several additional days after Friedeberg's action, which allowed 3 million German troops to escape the Soviets. Unable to postpone action any longer, however, on May 7, 1945, Colonel General Alfred Jodl signed a surrender document at supreme commander of Allied Expeditionary Force General Dwight D. Eisenhower's headquarters in Rheims, France. Lieutenant General Walter Bedell Smith and Major General Ivan Susloparov represented the Western Allies and the Soviet Union, respectively. Also in attendance was Major General François Sevez of the French Army. The agreement specified the unconditional surrender of all German land, sea, and air forces to the supreme commander, Allied Expeditionary Force, and also to the Soviet high command.

The terms of the German surrender stipulated that all German military forces would cease fighting at 11:01 p.m. Central European time on May 8, 1945. The final terms of the agreement stated that the surrender could be superseded by any similar legislation passed by the United Nations and promised swift retaliation if any German forces resumed combat operations. This document signaled the end of fighting, but the actual surrender of German troops in German-occupied regions stretched until a capitulation on May 11 at Heligoland, an island located in the North Sea off the coast of Germany.

At the insistence of Soviet premier Joseph Stalin, a second formal surrender instrument containing largely the same stipulations was signed in Berlin just after midnight on May 9, despite the fact that the cease-fire had

already gone into effect. Acting on behalf of the German high command were Admiral Hans-Georg von Friedeburg, Field Marshal Wilhelm Keitel, and Colonel General Hans Jürgen Stumpff. Marshal Georgii Zhukov and Air Marshal Sir Arthur W. Tedder represented the Soviet Union and the Western Allies, respectively. Also in attendance were French general Jean de Lattre de Tassigny and U.S. Army Air Forces general Carl Spaatz.

Although the agreement signed at Rheims signaled the end of Germany's participation in World War II, it did not terminate the Third Reich. The Allies retained Dönitz's government initially to deal with the immediate postwar problems of food distribution to German citizens and refugees. On May 23, 1945, however, Dönitz and his cabinet were removed and arrested by the Allies. The new rulers of Germany, as of June 5, were the Allied powers. They soon implemented plans for postwar Germany determined during wartime diplomatic conferences.

Gerow, Leonard Townsend (1888–1972)

U.S. Army general. Born in Petersburg, Virginia, on July 13, 1888, Leonard Townsend Gerow graduated from the Virginia Military Institute in 1911 and was commissioned a second lieutenant of infantry. He took part in the 1914

occupation of Veracruz, Mexico. Following U.S. entry into World War I, Gerow served in France from April 1918 with the Signal Corps, fighting in the Second Battle of the Marne and the Saint-Mihiel and Meuse-Argonne Offensives.

After the war Gerow served on the staff of the Signal Corps in France (1918–1920). He was promoted to permanent major in June 1920 and alternated staff assignments in Washington, tours in Shanghai and the Philippines, and training courses at Fort Benning, Georgia and Fort Leavenworth, Kansas, where he excelled. From 1935 onward, Gerow served in the War Department's War Plans Division. Promoted to brigadier general in October 1940, he became chief of the War Plans Division in December 1940. From December 1941, he served simultaneously as assistant chief of staff.

In February 1942, Gerow was promoted to major general and took command of the 29th Infantry Division, which began advanced training in Britain the following October. Gerow was a leading member of the talented group of top American officers whom General Dwight D. Eisenhower gathered around himself when he was supreme commander in Europe. In July 1943, Gerow assumed command of V Corps in what became Lieutenant General Omar N. Bradley's First Army, which experienced heavy fighting in the Normandy Campaign commencing on June 6, 1944.

On August 25, 1944, Gerow was the first Allied general to enter Paris. He then led V Corps in campaigns through northern France and the Rhineland. In January 1945, Gerow was promoted to lieutenant general and took command of the new Fifteenth Army, which secured the western French coast, taking the ports of Saint-Nazaire and Lorient. The area was also a staging ground for training and equipping units to join the 12th Army Group, which carried the battle into Germany.

From October 1945 to January 1948, Gerow was commandant of the Command and General Staff College. He then commanded the Second Army at Fort Meade, Maryland, retiring in July 1950. A special Act of Congress promoted Gerow to general on July 19, 1954. He died in Petersburg, Virginia, on October 12, 1972.

Gervais de LaFond, Raymond-Émile (1890–1968)

French Navy rear admiral. Raymond-Émile Gervais de Lafond was born at Felletin in central France on October 31, 1890. He entered the French Naval Academy in October 1907 and was commissioned an ensign in October 1909. Assigned to the cruiser *Iberville* in the Far East Division in 1910, he took part in operations ashore in defense of French interest at Hankou, China. In 1917 following additional service in the Atlantic and as second-in-command of a torpedo boat, he participated in the protection of Allied convoys in the English Channel against German submarines. In March 1918, he was promoted to lieutenant.

In March 1919, Gervais de Lafond was assigned to the French naval mission to Romania and was subsequently named assistant to the French naval attaché. Returning to France in 1921, he was assigned to the Intelligence Section of the French Navy. In December 1923, he took command of the dispatch boat *Agile* in the Levant Division. He returned to the Intelligence Section in 1925.

Promoted to lieutenant commander in January 1927, Gervais de Lafond commanded a squadron of torpedo craft in the Mediterranean. He again returned to the Intelligence Section in January 1931 and was promoted to commander that April. After other assignments afloat and study at the French Naval War College, in August 1936 he became French naval attaché in Rome. He was promoted to captain in April 1937.

In August 1939, Gervais de Lafond took command of the 3rd Scout Division. His ships participated in the French naval bombardment of Genoa in June 1940. During the Allied June 8–July 14, 1941, invasion of French Syria, the 3rd Scout Division, which then consisted of the large destroyers *Valmy* and *Guépard,* was based at Beirut along with three submarines and a sloop. Gervais de Lafond's division, which faced an Allied naval force of three cruisers and eight destroyers, proved to be an effective nuisance, shelling Allied positions on the coast. Gervais de Lafond also fought surface engagements against heavy odds, disabling the British destroyer *Janus* off Sidon, Lebanon, on June 8, 1941.

Promoted to rear admiral in August 1941, Gervais de Lafond commanded the Vichy France 2nd Light Squadron of 1 cruiser and 7 destroyers at Casablanca. He took part in the defense of Casablanca against vastly superior U.S. invasion forces on November 8–9, 1942, leading his squadron in a desperate attack against the U.S. landing site at Fédala, in what has been described by one historian as "the last sally of the French navy against ships at sea." Gervais de Lafond was among the wounded, and only the destroyer *L'Alcyon* remained operational after a seven-hour battle against 1 battleship, 3 heavy cruisers, 1 light cruiser, and 14 destroyers.

Named commander of French naval forces at Algiers in May 1943, Gervais de Lafond was furloughed in October 1945 and retired from the navy altogether in March 1946. He died in the priory at Remeneuil-par-Usseau on March 11, 1968.

Ghormley, Robert Lee (1883–1958)

U.S. Navy vice admiral. Born in Portland, Oregon, on October 15, 1883, Robert Lee Ghormley graduated from the University of Idaho in 1902 and from the U.S. Naval Academy at Annapolis in 1906. Ghormley's first assignments were in cruisers. During World War I, he served as aide to the commander of the Battleship Force, Atlantic Fleet. He was then assistant director of the Overseas Division, Naval Overseas Transportation Service.

Between the wars, Ghormley held a variety of staff positions. In 1935 and 1936, Captain Ghormley commanded the battleship *Nevada*. He then directed the War Plans Office and, in 1939, became assistant to the chief of naval operations. In August 1940, now a rear admiral, Ghormley was sent to London as a naval observer and to recommend possible U.S. naval aid to Britain.

U.S. vice admiral Robert L. Ghormley. (Keystone/Getty Images)

In June 1942, newly promoted to vice admiral, Ghormley was named commander to the South Pacific Area and Force. He assumed this new command as plans for the invasion of the U.S. Guadalcanal (August 1942–February 1943) were in progress. Believing his forces to be unready, he requested a postponement in the operation, which was denied. He then seems to have distanced himself from the operation, while tensions between his subordinate commanders were left unresolved.

After the Allied defeat in the Battle of Savo Island (August 9, 1942), Ghormley feared that the entire Guadalcanal operation would fail. As a result, he continued to maintain strong garrisons on other islands in the event of future Japanese advances rather than using those forces to assist in the protracted struggle on Guadalcanal. Ghormley suffered from a severely abscessed tooth at the time, which may have interfered with his decision

making. In October 1942, following the Battle of Cape Esperance (October 11–12, 1942), Admiral Chester W. Nimitz, commander of the Pacific Fleet, replaced Ghormley with Vice Admiral William F. Halsey Jr., who infused an offensive spirit into the campaign that Ghormley seemed incapable of maintaining.

In 1943 Ghormley commanded the Hawaiian Sea Frontier, and in 1944 he took charge of the 14th Naval District, Hawaii. At the end of the war, Ghormley assumed command of U.S. Naval Forces in Germany (Task Force 124), which was charged, among other things, with demobilizing the German Navy. Ghormley retired from the navy as a vice admiral in August 1946 and died in Bethesda, Maryland, on June 21, 1958.

Gibbs, William Francis (1886–1967)

U.S. naval architect. Born in Philadelphia on August 24, 1886, William Francis Gibbs grew up fascinated with ship design and marine engineering, but at his father’s insistence he studied economics and law at Harvard and Columbia Universities. During two years of unsatisfying legal practice, he joined his younger brother, Frederic Herbert Gibbs, in speculative plans for a fast, 1,000-foot transatlantic liner. In 1915 Gibbs abandoned the law to pursue this project, winning financial backing from John Pierpont Morgan Jr. American involvement in World War I prevented the ship’s construction, but the proposal and Morgan’s support attracted attention from both military and

civilian shipping authorities, leading to Gibbs's service as a shipping expert in the War Department and an adviser to the United States Shipping Board.

In 1922, Gibbs and his brother organized a company to recondition the 54,300-ton *Leviathan,* formerly the German liner *Vaterland.* Success in this difficult undertaking made the firm's reputation, and in 1929 the brothers joined another naval architect, Daniel H. Cox, to form Gibbs and Cox. The new company became noted for its yachts and passenger ships, but it also profoundly influenced naval design through development of high-pressure, high-temperature propulsion systems, which were first used in 16 Mahan-class destroyers ordered by the U.S. Navy in 1933.

World War II prompted Gibbs and his company to phenomenal productivity; 63 percent of oceangoing merchant ships and 74 percent of naval vessels constructed in the United States during the war were built to Gibbs and Cox specifications.

Resuming government work, Gibbs served as controller of shipbuilding for the War Production Board in 1942 and 1943 and subsequently as chairman of the Combined Shipbuilding Committee of the Combined Chiefs of Staff. He simplified and standardized shipbuilding through economies of scale and a relentless emphasis on time saving and efficiency. From 1943, he also represented the Office of War Mobilization on the U.S. Navy's Procurement Review Board. His most striking single accomplishment was his dominant role in designing the Liberty ship, a basic cargo vessel derived from British precedents, of which more than 2,700 examples were built under his direction.

Following the war, Gibbs returned to his early vision of an American superliner, finally realized in the construction of SS *United States* in 1952. Gibbs died in New York City on September 6, 1967.

GI Bill of Rights

U.S. social welfare program for World War II veterans. Officially known as the Serviceman's Readjustment Act of 1944, the GI Bill of Rights (commonly referred to as just the GI Bill) remains one of the most popular and effective government programs in American history. Although federal law protected the right of veterans to return to their prewar jobs, many wanted and expected more than a return to their 1941 positions. The GI Bill was born partly out of a desire to reward the men of America's military for their service. President Franklin D. Roosevelt had originally envisioned a much larger program that included job retraining. However, he agreed to a slightly less ambitious plan that was advanced by an alliance of Democrats and progressive Republicans.

Signed on June 22, 1944, the GI Bill paid for college tuition and vocational training and provided students with housing and medical benefits. Other aspects of the bill made available low-interest loans guaranteed by the federal government for mortgages and business ventures. Unemployed veterans received cash payments. Supporters sought to use the program to empower veterans through education and training, thus making them less dependent on corporations, unions, or—in the long run—the federal government. The bill had the support of veterans' groups such as the American Legion, which helped draft the legislation, and the Veterans of Foreign Wars. The Hearst newspaper group also lent its support.

The GI Bill had motives beyond showing the nation's gratitude to returning veterans. Remembering the plight of World War I veterans and the ignoble episode of the 1932 Bonus Army—when some 20,000 World War I veterans converged on Washington in the hope of collecting their adjusted compensation bonuses immediately rather than in 1945 as legislated—the bill aimed to ease veterans into the workplace slowly. Many economists and politicians feared that if 12 million veterans descended on the job market at the same time, the United States would plunge into an economic depression.

By placing some veterans in schools and supporting the desires of others to start small businesses, the GI Bill sought to lessen these pressures.

The GI Bill had a long and lasting influence on American society. More than 1 million veterans attended colleges and universities using the bill's benefits, and more than 8 million used one or more of its programs. The bill underwrote more than 3.5 million mortgages, and in 1947 it funded almost 40 percent of all housing starts in the United States. The GI Bill thus helped fuel the postwar economic boom by stimulating the construction industry and all of its subsidiaries. It also provided enormous cash infusions for American colleges and universities. Since World War II, the U.S. government has enacted various legislation offering GI Bill–type benefits to veterans of the Korean War, the Vietnam War, and the Iraq and Afghanistan Wars as well as to some members of the peacetime military.

Gibraltar

Key British naval base that guarded the strait between the Mediterranean Sea and the Atlantic Ocean. Gibraltar, a 2.5-square-mile promontory attached to the southern coast of Spain, has as its most distinctive geographic feature a formation of limestone 1,396 feet high known as "The Rock." The British seized the area from Spain in the early 18th century, and its possession was formally recognized as British in the 1714 Treaty of Utrecht ending the War of the Spanish Succession. The British subsequently began construction of fortifications on The Rock and also harbor facilities, but the latter were of poor quality in comparison to the Mediterranean base of Malta. In the early

20th century, the British installed breakwaters to improve the harbor as well as three dry docks. Shortly after the beginning of World War II, the British also built an airstrip and further fortified The Rock through the inclusion of miles of tunnels along with barracks and offices within the limestone structure.

Gibraltar was vastly important during the war, mostly because of its strategic position. Because it guarded the entrance to the Mediterranean, the British were able to control naval traffic entering and leaving the sea. The base was consequently essential as a staging point for convoys to supply and maintain Malta—the island base in the central Mediterranean that suffered frequent air attacks from Axis forces. Gibraltar became the base for Force H, initially commanded by Vice Admiral Sir James Somerville, which escorted convoys to Malta and also was responsible for operations in the Atlantic, such as the search for and destruction of the German battleship *Bismarck.* Gibraltar also served as a command post for General Dwight D. Eisenhower during Operation TORCH, the November 8, 1942, Allied invasion of North Africa.

The Axis powers were fully aware of the importance of Gibraltar to the Allied war effort. In late 1940, German planners formulated a plan code-named Operation FELIX that called for two German Army corps to move through Spain and seize Gibraltar. Opposition from Spanish dictator Francisco Franco led to the plan being dropped, however. Attacks to disrupt operations there did take place, among the first of these an air raid by Vichy French aircraft following the British attack on ships of the French Navy in Operation CATAPULT (July 1940). In 1942, Italian Air Force planes also bombed Gibraltar with limited effect, and between 1940 and 1943, the Italians maintained a commando unit in the Spanish port of Algeciras that sank or damaged 14 ships in Gibraltar's harbor over a two-year period.

Following the completion of the North African Campaign and the invasion of Italy in 1943, Gibraltar's importance diminished, although it continued to be a major base for Mediterranean operations.

Gibraltar, Strait of

Narrow channel of water that connects the Atlantic Ocean with the Mediterranean Sea and separates Spain from Morocco. At its narrowest point, the passageway between Europe and Africa is just 7.7 nautical miles, although its waters are deep, ranging from 985 feet to nearly 3,000 feet. Ferries and relatively swift craft can cross the Strait of Gibraltar in about 35 minutes. The two points of land flanking the entrance to the Gibraltar Strait (one of which is the Rock of Gibraltar in southern Spain) have been known since antiquity as the "Pillars of Hercules." There are several small islets within the channel. The strategic importance of the strait cannot be overemphasized, as it provides the only entrance into and exit out of the Mediterranean in the west and is the only direct link between the Atlantic and the Mediterranean.

The waters within the strait move in both an eastward and westward direction, although there is more aggregate movement to the east (into the Mediterranean) because the waters of the Atlantic are cooler and less saline than those of the Mediterranean. Wave action at the surface tends to be moderate, but shipping interests using the strait must nevertheless be careful, as water moving over a shallow underwater sill that separates the two bodies of water can create unpredictable currents. The climate of the region tends to be warm and arid, meaning that the strait is not usually subjected to severe storms or unpredictable weather.

The British bastion at Gibraltar was a critically important stronghold for the Allies during World War II. The Allies, especially the British, struggled mightily to keep the strait open to shipping, no easy task given German submarine warfare during 1941–1944, repeated Italian attempts to wage

underwater warfare and harass Gibraltar during 1942–1943, and a Vichy French attack of July 3, 1940.

Gibson, Guy Penrose (1918–1944)

Royal Air Force (RAF) officer. Born in Simla, India, on August 12, 1918, Guy Gibson traveled to England at age six for schooling and later entered St. Edward's, Oxford. He left school early and joined the RAF in November 1936. Promoted to acting pilot officer in January 1937, Gibson joined Bomber Command No. 83 Squadron. With the start of World War II, he took part in the July 1940 strike against the Kiel Canal and went on to fly 172 missions and be awarded the Distinguished Service Order.

Following the July 10–September 30, 1940, Battle of Britain, Gibson transferred to Fighter Command as a night-fighter pilot. He flew 99 missions and was credited with 6 enemy aircraft downed. In 1943, Gibson was selected to train a new unit for "special duties." The unit became No. 617 Squadron, popularized as the "Dam Busters" and formed to drop Sir Barnes Wallis's skip-bombs on the Möhne, Eder, Schwelme, and Sorps dams in Germany. On May 16, 1943, Gibson personally led the first squadron of 19 Lancaster aircraft in five attempts to breach the Möhne River dam. He made his bomb run first and then descended low, circling to draw German antiaircraft fire. Only 11 of the bombers survived this mission and another mission the following day, and only two of the dams were destroyed, but Gibson became an international celebrity and was awarded the Victoria Cross.

Beginning in August 1943, Gibson promoted the British war effort in a four-month publicity tour of the United States. He returned to No. 5 Bomber Group, Bomber Command, in June 1944. On September 19, 1944, Gibson was piloting a de Havilland Mosquito on a pathfinding mission when he was shot down and killed in action near Bergen-op-Zoom, the Netherlands.

Enemy Coast Ahead, Gibson's account of the Dam Busters, was published in 1946 and sold hundreds of thousands of copies. That book and the 1954 motion picture *The Dam Busters*, based on the book by Paul Brickhill, further enhanced Gibson's reputation as an effective and resourceful commander.

Giffen, Robert Carlisle "Ike" (1886–1962)

U.S. Navy vice admiral. Born on June 29, 1886, in West Chester, Pennsylvania, Robert Carlisle "Ike" Giffen graduated from the U.S. Naval Academy at Annapolis in 1907. During World War I, he commanded a destroyer on antisubmarine patrols in the North Atlantic. After the war Giffen alternated seagoing commands with shore assignments. In 1940 and 1941, he served on the staff of the chief of naval operations.

Assigned as commander of Cruiser Destroyer Division 7 in March 1941 and promoted to rear admiral in October, Giffen escorted supply convoys between Britain and the Soviet Union. He then commanded a naval task force in Operation TORCH, the November 8, 1942, invasion of North Africa. Transferred to the Pacific, Giffen took part in the battle for Rennell Island (January 29–30, 1943) and then in the Aleutian (1942–1943) and Marshall Islands (January 29–February 22, 1944) campaigns. Giffen's command

provided fire support in the invasions of Makin Island (November 20–23, 1943) and Kwajalein (January 19–February 6, 1944). He was promoted to vice admiral in March 1944. From February to August 1944, he commanded Cruiser Division 6 during the bombardments of Truk (February 17, 1944), Saipan (June 25–July 13), Guam (July 21–August 10), and Tinian (July 21–August 10). He took command of the Caribbean Sea Frontier in the autumn of 1944 and of the Atlantic Fleet Service Force in 1945, retiring in September 1946. Giffen died in Annapolis, Maryland, on December 10, 1962.

Gilbert Islands Campaign (November 1943)

U.S. amphibious campaign in the Central Pacific (November 1943) and an important advance toward the Japanese home islands. The 16 atolls that constitute the Gilbert Islands lie astride the equator. The Americans invaded the Gilbert Islands in late November 1943. Approximately 200 ships and more than 30,000 troops seized the atolls of Makin, Tarawa, and Abemama in Operation GALVANIC. Fifth Fleet commander Vice Admiral Raymond A. Spruance had overall command of the operation, and Rear Admiral Charles A. Pownall commanded Task Force 50.

Following preparatory air strikes against Rabaul, the 11 fleet carriers in Task Force 50, which was divided into four different carrier groups,

neutralized Japanese bases in the Marshall Islands and pounded Makin and Tarawa in preparation for landings there. At the latter two atolls, seven battleships and accompanying cruisers bombarded the shore for more than an hour the morning of the invasion. On November 20, Rear Admiral Richmond K. Turner's Task Force 54 landed elements of the army's 27th Infantry Division on Butaritari Island while 2nd Marine Division troops landed on Betio Island.

At Butaritari, four battalions from the army's 27th Infantry Division assaulted Beach Yellow in the lagoon and Beach Red on the western face of the island. Although the reef line forced the men in the lagoon to wade the last 300 yards to shore, initial resistance was light because only 300 Japanese combat troops defended the island. The attack became bogged down by enemy snipers and small counterattacks, however, and it took three days to secure the island. The army suffered 64 killed and 150 wounded.

Resistance was heavier on Betio, a small but well-fortified island defended by 4,000 Japanese troops. Initially, three marine battalions landed on Beach Red along the wide lagoon side of the island. These troops ran into heavy fire, and as low tide prevented heavy equipment from crossing the reef line, the attack stalled in the face of determined Japanese resistance. Two additional battalions landed as reinforcements later that day, and a sixth battalion landed the following morning. All suffered heavy casualties in the process.

The situation improved late on the second day when destroyers and aircraft supported the landing of a seventh battalion at the narrow western end of Betio. Using tanks, grenades, TNT blocks, and flamethrowers, the marines secured most of the island by November 22. Two Japanese counterattacks were repulsed that evening, and the entire atoll was cleared six days later. The United States lost 980 marines and 29 sailors killed, while 2,106 troops were wounded. Only 17 Japanese survived the battle. They were taken prisoner along with 129 Korean laborers.

Although the Japanese surface navy did not intervene, Japan's air and submarine units did strike the American invasion force. At dusk on November 20, 16 twin-engine "Betty" bombers attacked a carrier group off Tarawa and torpedoed the light carrier *Independence.* The explosion killed 17 sailors and wounded 43. It also forced the carrier to retire for repairs. At least three similar raids followed over the next week, although none scored hits

because American air cover—including the first use of night-combat air patrols—broke up the attacks. More deadly were Japanese submarines, one of which torpedoed and sank the escort carrier *Liscombe Bay* on November 24, killing 642 sailors.

Overall, the Gilbert landings cost the lives of roughly 1,800 Americans and 5,000 Japanese, including the crews of four lost Japanese Navy submarines. The Gilbert Islands Campaign provided important lessons in amphibious operations and paved the way for the next U.S. amphibious operation, which was conducted against the Marshall Islands in January and February 1944.

Giraud, Henri Honoré (1879–1949)

French Army general. Born in Paris on January 18, 1879, Henri Honoré Giraud graduated from the French Military Academy at Saint-Cyr in 1900. During World War I, he fought on the Western Front. Captain Giraud was taken prisoner by the Germans near Guise in late August 1914, but he escaped that October and returned to France in February 1915. Giraud

distinguished himself in later fighting and, at the end of the war, commanded a battalion.

Giraud was stationed in Turkey from 1918 to 1922 and in Morocco from 1922 to 1934. He played an important role in the Rif Wars in Morocco, and his forces captured Moroccan nationalist leader Abd-el-Krim in 1926. Giraud was promoted to colonel in 1927, to general of brigade in 1930, to general of division in 1934, and to general of corps in 1936. He commanded the VI Military Region at Metz from 1936 to 1939. On the French military mobilization for World War II on September 2, 1939, he took command of the Seventh Army as a general of army. He had little comprehension of the new theories of high-speed warfare with tanks operating en masse.

When the Germans invaded France and the Low Countries in May 1940, Giraud led the Seventh Army into Belgium in accordance with the Allied plan. On May 15, he assumed command of the collapsing Ninth Army. Captured on May 18 at Wassigny, he was imprisoned at Königstein in Saxony. Giraud escaped on April 17, 1942, and crossed Germany to Switzerland and then to Vichy France, embarrassing Vichy officials, who had been attempting to improve relations with the German occupiers. At a meeting on May 2, 1942, attended by Admiral Jean François Darlan and Pierre Laval, Giraud refused German ambassador Otto Abetz's invitation to return to prison.

In November 1942, Giraud was spirited out of France and transported by the British submarine *Seraph* to North Africa. (An Anglophobe, Giraud had insisted on an American boat, but none was available, and so he was tricked into believing that the *Seraph* was a U.S. submarine.) U.S. and British officials, hoping that Giraud might replace Charles de Gaulle as leader of the Free French forces, made him commander of French forces in North Africa in December 1942. On May 30, 1943, de Gaulle arrived in Algiers, and on June 3 agreement was reached whereby Giraud became copresident with de Gaulle of the French Committee of National Liberation. De Gaulle was easily able to elbow the politically inept Giraud aside, and the arrangement only lasted until November 9, 1943, when Giraud resigned.

As commander in chief of French armed forces until April 4, 1944, Giraud continued to play an important role in rebuilding the French military forces before being forced to retire. In June 1946, he won election to the French National Assembly from Moselle, and he continued to serve as vice

president of the Supreme War Council until 1948. Giraud died at Dijon on March 11, 1949.

Glide Bombs

Precursor to modern-day precision-guided munitions. First developed by the Germans, glide bombs were used primarily against Allied warships. The Germans developed two types, the first of which was the free-fall FX-1400 bomb. Designed by Max Kramer of the Ruhrstahl AG, it weighed 3,460 pounds and had a 771-pound warhead. The FX-1400 had 5-foot 3-inch wings to enable it to glide, and it was radio controlled by means of an electrical tail unit. Glide bombs were carried by such German aircraft as the Dornier Do-217, Heinkel He-117, and Junkers Ju-88 and Ju-290.

On September 9, 1943, after Italy had announced an armistice with the Allies, the Germans used FX-1400 glide bombs to sink the Italian battleship *Roma;* 1,252 members of its crew were lost. Another bomb exploded off the bow of the battleship *Italia*, causing minor flooding. The FX-1400 could be dropped from an altitude of 18,500 to 22,700 feet and at a distance of up to three miles from the target.

The second glide bomb was the Hs-293, designed by Herbert Wagner of the Henschel Company. It was a rocket-assisted guided winged bomb initially designed for use against ships. It was fitted with a Walter 109–507B rocket motor with 1,323 pounds of thrust, giving it a speed of about 360 mph. The Hs-293 was 13 feet 4 inches long with a wingspan of 10 feet 7 inches. It

weighed about 2,140 pounds, of which about 165 pounds were in the rocket and 1,124 in the warhead—a substantial ratio of warhead to delivery system. The Hs-293 employed a Dortmund/Duisburg wire-guided system for control, and it had an effective range of almost 10 nautical miles.

Modifications to the Hs-293 included the Hs-294 (16 feet 5 inches in length with a 14-foot 2-inch wingspan), Hs-295, Hs-296, Hs-297, Hs-298, and Hs-344. The Hs-298, a smaller version of the Hs-293, was designed to be launched from night fighters against Allied bombers. It had a two-stage rocket motor and could operate at heights up to 20,000 feet. Its warhead weighed about 150 pounds. The Hs-344 was another lightweight version designed for use by fighters against other aircraft. These versions were largely just tested.

The Germans first used the Hs-293 on August 24, 1943, in the Bay of Biscay. During Allied Operation PERCUSSION, an antisubmarine air and surface attack on German U-boats, the Canadian 5th Support Group came under air attack from 14 Dornier Do-217 and 7 Junkers Ju-88C bombers. The attackers employed Hs-293s to damage the sloop *Landguard* in four near hits and the sloop *Bideford* in one near hit. On August 28, 18 Do-217s attacked the relieving 1st Support Group, sank the British sloop *Egret,* and heavily damaged the Canadian destroyer *Athabaskan.*

Kampfgeschwader 100 mounted further attacks with the Hs-293 in the Mediterranean in September 1943. During the U.S. landing at Salerno on September 11, Kampfgeschwader 100's Do-17s attacked and heavily damaged the cruiser *Savannah* and narrowly missed the cruiser *Philadelphia.* On September 13, the British cruiser *Uganda* was hit and heavily damaged, while the *Philadelphia* and the British destroyers *Loyal* and *Nubian* were both damaged. The hospital ship *Newfoundland* was sunk, probably by an Hs-293. On September 16, the British battleship *Warspite* sustained heavy damage from two Hs-293 hits. Among other Allied warships that were struck and sunk were the British destroyer *Intrepid* and the Greek destroyer *Vasillissa Olga* on September 26, the Italian destroyer *Euro* on October 1, and the British destroyer escort *Dulverton* on November 13, 1943.

During the landing at Anzio on January 22, 1944, Do-217s and Ju-88s again attacked Allied ships with Hs-293 glide bombs. On January 23, these glide bombs sank the British destroyer *Janus* and damaged the destroyer

Jervis. On January 29, Hs-293s sank the British cruiser *Spartan,* and on February 25 they sent to the bottom the British destroyer *Inglefield.*

Some 2,300 glide bombs were used in combat, but production was limited by the many other demands on the German armaments industry at the time. The Germans claimed that the glide bombs sank or damaged 400,000 tons of Allied shipping, but this was an exaggeration. The Germans also sent plans for their rocket motors by submarine to the Japanese, who used these to develop their Oka manned rocket bomb.

Late in the war, the United States tested several types of air-to-surface missiles, including the Fletcher XBG-1, Fletcher XBG-2, Cornelius XBG-3, Pratt-Reed LBE, Piper LBP, and Taylorcraft LBT. The term "glomb" was employed as shorthand for "glide bomb." The Eighth Air Force used the GB-1 series of glide bombs beginning on March 28, 1944. Some 1,000 were launched, but they lacked accuracy. Later versions incorporated television guidance, but only one version (Project Batty, a GB-4) was used in combat. Instead, bombs without wings but with a guidance system were employed. One was the Azon (for "azimuth only"); another was the Razon (azimuth and range guidance). Azons were used successfully in combat. A later version, the Tarzon, was employed successfully during the 1950–1953 Korean War.

The most advanced winged missile of World War II was the Bat, a glide bomb with a 1,000-pound bomb and semiactive radar homing. Employing PBY-42s Privateer aircraft, the U.S. Navy used the Bat with great success against Japanese shipping. The Bat had a 10-foot wingspan, was a little longer than 11 feet, weighed 1,880 pounds, and achieved 300 mph in the glide. Range depended on the release height; a Bat sank a Japanese destroyer 20 miles distant from the drop aircraft.

Glubb, Sir John Bagot (1897–1986)

British soldier. Born on April 16, 1897, in Preston, Lancashire, John Bagot Glubb graduated from the Royal Military Academy, Woolwich, in 1915 and served on the Western Front during World War I and was wounded. After the war he served in Iraq during the Arab revolt there in 1920, and in 1926 he left the British Army for a civilian position with the Iraqi government.

In 1930, Glubb left his Iraqi government post and served as brigadier (second-in-command) of Transjordan's Arab Legion. He was promoted to command this 1,350-man internal constabulary in 1939 and made it into a well-disciplined, modern military force. During World War II, the Arab Legion was a source of support for the Allies in the volatile Middle East and took part in Lieutenant General Sir Archibald Wavell's invasion of Syria and Lebanon during June 8–July 14, 1941.

Following World War II and the emergence of the state of Israel, Glubb built the Arab Legion into a 6,000-man motorized force. It was by far the most effective of Arab units fighting in the 1948–1949 Israeli War of Independence. Bias against the lingering British presence in the region led to Glubb's dismissal in 1956. He then returned to Britain and was knighted. Glubb was the author of numerous historical and autobiographical works and was widely known as "Glubb Pasha." He died in Mayfield, East Sussex, on March 17, 1986.

Godfrey, John Henry (1888–1971)

British Royal Navy admiral. Born in Handsworth, Birmingham, on July 10, 1888, John Henry Godfrey entered the Royal Navy in 1903. During World War I, he served with distinction in the Mediterranean. Between the wars, seagoing duty—including cruiser commands on the China Station and in the Mediterranean—alternated with appointments at the Staff College, Greenwich, and in the naval plans division.

Promoted to rear admiral, Godfrey was named director of naval intelligence in February 1939. He energetically set about remedying two decades of neglect. He expanded the division tenfold, enrolling numerous talented civilians. He also integrated intelligence with the conduct of the war at sea; took full advantage of the Ultra cryptographic breakthrough and established the decoding center at Bletchley Park; introduced procedures to facilitate intelligence analysis, evaluation, and distribution; and established the Joint Intelligence Committee. Unfortunately, Godfrey's inflexibility caused frequent confrontations with Prime Minister Winston L. S. Churchill and other colleagues, and in December 1942 he was relieved of his post.

Godfrey then took command of the Indian Navy (vastly expanded since 1939), improving its training, recruitment, infrastructure, and staff and enabling the force to contribute substantially to the fighting in Asia. When World War II ended in August 1945, mutiny broke out in the Indian Navy and other military forces, which Godfrey, with Field Marshal Sir Claude Auchinleck, suppressed within a few days. Neither the British Labour government nor Indian nationalists applauded his achievement. Admiral Godfrey retired in March 1946 and for 15 years chaired a group of London hospitals. He died at Eastbourne on August 29, 1971.

Godfroy, René Émile (1885–1981)

French Navy admiral. Born in Paris on January 6, 1885, René Émile Godfroy attended the École Navale and was commissioned an ensign in 1904. He served in various ship assignments and participated in a scientific expedition to the South Pole from 1908 to 1910. During World War I, he served first as a gunnery officer aboard cruisers in the Mediterranean. In 1920, he commanded a dispatch boat.

Promoted to commander in 1921, Godfroy developed an interest in naval aviation and secured his observer's license in 1923. He then commanded the Naval Aviation Center at Saint-Raphaël and headed a commission to study the practical application of aviation. Promoted to captain in 1931, Godfroy commanded cruisers in the Mediterranean. In 1936, he headed French naval aviation, and he was promoted to rear admiral that February.

Godfroy assumed command of the 4th Cruiser Division in the Far East in 1937. In January 1940, he was named naval commander at Marseille and charged with the defense of the Mediterranean coast of France. In April, he took command of Force X in the eastern Mediterranean to cooperate with British forces. In June, he was promoted to vice admiral.

When France and Germany signed an armistice on June 22, 1940, British prime minister Winston L. S. Churchill was determined to prevent French naval vessels from falling into German hands and thereby augmenting Germany's ability to harass the Royal Navy. He therefore insisted that British naval commanders offer their French counterparts the choice of continuing the fight against Germany, taking their ships to a neutral port they would not be permitted to leave, or having them sunk.

At the time the Royal Navy launched this plan, code-named Operation CATAPULT (July 1940), Godfroy was with Force X at Alexandria, Egypt, along with British ships commanded by Admiral Andrew Cunningham.

Cunningham had no wish to preside over bloodshed and loss of life resembling that which had occurred the same day (July 3) at Mers-el-Kébir in Algeria. He therefore exercised exceptional tact in presenting Churchill's ultimatum to Godfroy, who agreed to permit British forces to demobilize and demilitarize his ships and leave them in Alexandria Harbor.

After the November 1942 Allied liberation of North Africa, Godfroy joined the Free French forces, but he was not trusted by them. In December 1943, he was removed from command and retired. He was not rehabilitated until April 1955. Godfroy died at Fréjus in southern France on January 16, 1981.

Goebbels, Paul Joseph (1897–1945)

German minister of propaganda. Born on October 29, 1897, at Rheydt in the Rhineland, Paul Joseph Goebbels (he went by Joseph) was physically small with a clubfoot. He grew up in a deeply Catholic setting, but on graduation from the University of Heidelberg with a doctorate in literature in 1921, he renounced his faith.

Unsuccessful in his desired literary career, Goebbels temporarily worked in a bank. In 1924, he formed a close association with Adolf Hitler. After spreading Nazi propaganda as the editor of the *Völkische Freiheit* (People's Freedom) at Elberfeld, "the Little Doctor," as he came to be called, moved up in the Nazi Party hierarchy.

Hitler recognized Goebbels's abilities and appointed him Nazi Gauleiter (regional leader) of Berlin in November 1926, charging him with rebuilding the party organization there. From 1927 to 1935, Goebbels edited the weekly newspaper *Der Angriff* (The Attack), which eventually became a daily and a financial success. Goebbels displayed considerable organizational skill and ability as a motivational speaker. He also ordered the Sturmabteilungen (Storm Troops, SA) to use physical force in the streets against the leftist opposition.

In 1928, Goebbels won election to the Reichstag (parliament), and in 1929 he took charge of Nazi Party propaganda, playing an important role in building Nazi political strength throughout Germany. Goebbels successfully used American advertising tools, psychology, and modern propaganda techniques to spread the message of Nazism. He made Horst Wessel, a thug who was killed in a barroom brawl, into a Nazi martyr, and he pushed the use of the Nazi stiff-arm salute and of "Heil Hitler" as a mandatory greeting. Goebbels also advanced new slogans and myths, including the *Führermythos*, which held that Hitler was the one savior of the German nation. Goebbels also engaged in rabid anti-Semitism.

German Nazi propagandist and politician Paul Joseph Goebbels. (Keystone/Getty Images)

Hitler rewarded Goebbels in March 1933 by appointing him to the cabinet as minister of propaganda. Goebbels exercised complete control over mass communication—the press, films, theater, radio, and sports—organizing all of it to work for the Nazi cause and later the war effort. He lived up to his own slogan, “Propaganda has nothing to do with truth.” Throughout the war, Goebbels worked to buoy the confidence of the German people. He trumpeted claims of a “final victory” and in a speech in February 1943 invoked “total war.” Appointed plenipotentiary for total war in July 1944, Goebbels called on the German people for more and more sacrifices, imposing longer working hours and reducing benefits. He also proclaimed the advent of German “miracle weapons” that would win the war.

At war’s end, Goebbels and his family joined Hitler in the *Führerbunker* in Berlin. On May 1, 1945, a day after Hitler’s suicide, Goebbels and his wife Magda also committed suicide, having first poisoned their six small children.

Goebbels's diaries are an important source of information about the National Socialist regime.

Goerdeler, Carl Friedrich (1884–1945)

German political figure and opposition leader. Born in Schneidemühl, Pomerania, on July 31, 1884, Carl Friedrich Goerdeler studied law and entered the civil service. An army officer in World War I, he became deputy mayor of Königsberg in 1922 and lord mayor of Leipzig in 1930. In 1932, German chancellor Heinrich Brüning appointed Goerdeler commissioner of prices, a post he held until July 1935.

After Adolf Hitler came to power in January 1933, the traditionalist Goerdeler initially supported the new government, especially its centralization of authority. Goerdeler believed that Hitler might solve Germany's pressing economic problems. However, it soon became apparent that the new government insisted on total submission. In protest, Goerdeler resigned as mayor of Leipzig in 1937. He was troubled not only by the regime's domestic policies but also by its aggressive foreign policy, which he feared would lead to a general European war. Goerdeler became one of the first to publicly speak out against the Nazi government and soon emerged as one of the leaders of the German opposition to Hitler.

Once war began in September 1939, Goerdeler became a leading member of a conspiracy to overthrow Hitler. Goerdeler wrote documents spelling out the goals of the opposition and what should take place politically following Hitler's removal from office. Throughout, Goerdeler maintained a close relationship with General Ludwig Beck, leader of the army officers who opposed Hitler. Although Goerdeler vigorously urged Hitler's removal from office, he initially opposed an assassination that might make Hitler a martyr. Goerdeler argued that the führer should be arrested and his guilt exposed in a public trial. Others in opposition, however, believed that assassinating Hitler was the certain course of action, and by early July 1944 Goerdeler reluctantly agreed. According to opposition plans, Goerdeler was to become the chancellor in a post-Hitler Germany.

On the failure of the July 20, 1944, bomb plot against Hitler, Goerdeler went into hiding. Arrested on August 12, he endured lengthy interrogation and was then sentenced to death. Goerdeler wrote several essays and letters before his execution at Plötzensee Prison, Berlin, on February 2, 1945.

Golikov, Filip Ivanovich (1900–1980)

Soviet Army marshal. Born in Borisovo (Kurgan Oblast), east of the Ural Mountains, on July 29, 1900, Filip Ivanovich Golikov joined the Red Army and the Bolshevik Party in 1918. He underwent political indoctrination in Petrograd in 1919 and from that August served as a political officer in the

51st Infantry Division to the end of the Russian Civil War. By 1919, he had completed advanced leadership training. He was involved primarily in political work until 1931, when he assumed command of an infantry regiment. Golikov graduated by correspondence from the Frunze Military Academy with a specialty in armor in 1933. He commanded the 8th Mechanized Brigade during 1936 and 1937 and the Mechanized Corps of the Kiev Military District during 1937 and 1938.

Golikov held commands in the Soviet invasion of Poland in September 1939 and perhaps that of Finland (Winter War). He was promoted to major general in May 1940 and assigned as deputy chief of the General Staff and chief of military intelligence. Reporting only to Joseph Stalin, Golikov passed along information from Russian spy Richard Sorge that Japan would strike south in 1941 rather than drive north into the Soviet Union. Shortly after Germany invaded the Soviet Union on June 22, 1941, Golikov led missions to London and Washington to negotiate aid.

Golikov took command of the Tenth Army in October 1941 in the defense of the city of Moscow, participating in the desperate fighting there in December. He headed the Fourth Shock Army in the winter counteroffensive of February and March 1942 and then commanded the Bryansk Front opposing German Army Group South's summer offensive in June 1942. During the August 23, 1942–February 2, 1943, Battle of Stalingrad, Golikov commanded first the Voronezh Front and then the First Guards Army. He was also deputy commander of the Southeast and Stalingrad Fronts. He commanded the Voronezh Front from October 1942 to March 1943 and took part in the Soviet push through Kharkov (March 1–14, 1943) and Kursk (July 5–13, 1943).

Promoted to colonel general in January 1943, Golikov was deputy commissar of defense for cadres and chief of the personnel directorate of the Red Army from 1943 to 1950. In 1945, he was promoted to army general. Golikov was then commander of the Special Mechanized Army from 1950 to 1956 and commandant of the Military Academy of Armored Troops in 1956. From 1957 to 1962, he was chief of the Main Political Administration of the Soviet Armed Forces. In 1961, he was promoted to marshal of the Soviet Union. Following disagreement with Nikita Khrushchev over the latter's handling of the 1962 Cuban Missile Crisis, Golikov was quietly relieved of his posts and shunned by his fellow officers. He served out his remaining

active duty in a succession of administrative positions until 1966. Golikov died in Moscow on August 8, 1980.

GOODWOOD, Operation (July 18–20, 1944)

British Second Army attack in an attempt to break out of the Normandy beachhead near Caen, France. Operation GOODWOOD was originally suggested as an operation supporting Lieutenant General Omar Bradley's July 25–31 Operation COBRA, the breakout of his American 12th Army Group from Saint-Lô. British general Bernard Montgomery later saw GOODWOOD as an opportunity for his 21st Army Group to achieve a breakthrough or even perhaps a double breakout by both U.S. and British forces. Operation GOODWOOD involved three corps: three armored divisions of the British VIII Corps in the east provided the main effort to gain the rolling plain southeast of Caen rising toward Falaise, the Canadian II Corps was to secure the southern half of Caen, and the British XII Corps would conduct diversionary attacks on the right several days before the July 18, 1944, kickoff.

The concept for GOODWOOD, developed by commander of the British Second Army lieutenant general Miles Dempsey, was to use massed airpower and artillery followed by an armor breakthrough of the German defensive crust. Prior to the ground attack, 1,700 heavy bombers from the Royal Air Force (RAF) Bomber Command and the U.S. Eighth Air Force plus nearly 400 medium bombers and fighter-bombers of the U.S. Ninth Air Force

dropped 7,700 tons of bombs on the German defenses. Only fighter-bombers attacked in the zone of the main effort to prevent the massive cratering that had slowed British armor in its earlier attacks to seize Caen.

The air and ground bombardment began at 5:30 a.m. on July 18, and the ground attack by the three armored divisions of VIII Corps occurred on schedule at 7:30 a.m. The effects of the bombardment and tactical surprise allowed the ground elements to advance more than three miles in slightly over an hour. In only about three hours, VIII Corps was nearing a clean breakthrough when it encountered the final German defensive line of antitank and flak guns. In an oversight, this defensive line had not been targeted for air bombardment, and it, combined with dogged German defense, brought the advance to a halt. Limited local attacks continued on July 19 and 20, but a heavy thunderstorm on July 20 turned the landscape into a quagmire, and GOODWOOD came to an end.

During the four-day operation, the Canadian II Corps captured the rest of Caen and part of the plain to the southeast, and the British VIII Corps secured nearly 35 square miles of terrain. However, the operation cost VIII Corps more than 4,000 casualties and the loss of 500 tanks—36 percent of all British armor on the continent at that time. Although General Montgomery declared that the purposes of GOODWOOD had been achieved, the results were disappointing. Some in the higher levels of Allied command, even on the British side, hinted that it might be time for Montgomery's removal. The failure of GOODWOOD focused Allied hopes for a breakout in Normandy on Operation COBRA.

Göring, Hermann Wilhelm (1893–1946)

German Reichsmarshal and commander of the German Air Force, the Luftwaffe. Born on January 12, 1893, in Rosenheim, Bavaria, Hermann Wilhelm Göring was educated in the cadet school in Karlsruhe. He then entered officers' training school at Gross Lichterfelde, and on graduation in 1912 he was commissioned in the infantry. He served in the German Army and fought in World War I with the infantry until 1915, when he joined the air service. Göring succeeded Baron Manfred von Richthofen on the latter's death as commander of the Richthofen Squadron in July 1918. Credited with 22 aerial victories in World War I, Göring was awarded the coveted Pour le Mérite. After the war, he moved to Scandinavia, where he took up show flying and married a Swedish baroness.

Göring returned to Germany in 1921 and became a close associate of Adolf Hitler. In 1922, Hitler gave him command of the Sturmabteilungen (SA, Storm Troopers), which grew dramatically in strength. Seriously injured in the 1923 Beer Hall Putsch, Göring fled Germany but returned in 1927. In 1928, he was elected to the Reichstag (parliament), and in 1932 he was its president. Göring had easy access to influential individuals in industry, banking, and the military, and he acted as liaison between them and Hitler, playing a key role in the Nazi accession to power.

German reichsmarshall Hermann Göring. One of the most powerful figures of the Third Reich, Göring was found guilty of war crimes by the International Military Tribunal at Nuremberg but cheated the hangman by committing suicide only hours before his planned execution. (Library of Congress)

After Hitler became German chancellor in January 1933, Göring secured even more power and influence. Among his many offices were minister without portfolio, minister of the interior for the state of Prussia, and minister of the air force (Luftwaffe). Göring soon began rebuilding the Luftwaffe, and he was instrumental in all major policy decisions affecting its composition and training. In April 1933 Göring established the Geheime Staatspolizei (Gestapo, Secret Police), a force designed to crush all resistance to Nazism. In 1936, he was appointed to oversee the Four-Year Plan, which gave him virtual control over the economy. As far as the Luftwaffe was concerned, Göring supported the notion of a tactical air force at the expense of strategic bombing, arguably the correct decision given the heavy military demands on Germany's industrial base.

In 1938, Hitler promoted Göring to field marshal and designated him as his heir. Göring was also instrumental in the development of concentration camps, and he worked with Reinhard Heydrich, chief of Reich security, in formulating an Endlösung, or "Final Solution," to the "Jewish question." Göring also amassed a large fortune and, especially during World War II, indulged his passion for collecting fine art.

Göring's Luftwaffe was influential in the early Nazi victories in Poland in 1939 and France in 1940. Following the German victory over France, Hitler promoted Göring to the rank of Reichsmarshall, the first officer to hold that rank since the time of the Holy Roman Empire. His interventions in the Battle of Britain (July 10–September 30, 1940), however, negatively affected the German effort and led to a loss of his influence with Hitler.

Göring opposed Operation BARBAROSSA, Hitler's June 22, 1941, invasion of the Soviet Union, favoring a Mediterranean strategy instead. He was blamed, probably falsely, for having suggested that the Luftwaffe, with only a limited transport capacity, could supply the Sixth Army at Stalingrad. Popular opinion also turned against him as Allied air raids on the Reich became increasingly effective. Increasingly marginalized, Göring spent more time at his estate of Karinhall, where he indulged his interests in hunting and art collecting.

Although Hitler had designated Göring as his successor, the latter's impatience at the end of the war—portrayed by Martin Bormann, head of the Party Chancery, and others as an attempt by Göring to wrest power from Hitler—led the führer to order that Göring be stripped of his posts and arrested. Göring surrendered to elements of the U.S. 9th Infantry Division on May 9, 1945. He was tried at the International Military Tribunal at Nuremberg. Unrepentant, he was found guilty and sentenced to death. Göring committed suicide by swallowing poison on October 15, 1946, only hours before his planned execution.

Gorshkov, Sergei Georgievich (1910–1988)

Admiral of the Fleet of the Soviet Union. Born in Kemenets-Podolsky, Ukraine, on February 16, 1910, Sergei Georgievich Gorshkov entered the Russian Navy in 1927 and graduated from the Frunze Naval Academy in 1931. His early service was with the Black Sea Fleet. In 1939, Gorshkov took command of a cruiser squadron in the Pacific Fleet.

Gorshkov undoubtedly benefited in his rise in the service from the purges of the Soviet military in 1937 and 1938. When Germany invaded the Soviet Union on June 22, 1941, Gorshkov, only 31 years old, was a rear admiral in command of the Sea of Azov Flotilla. He then became deputy commander of the Novorossisk Defense Area, where he was placed in the unusual circumstance of commanding the Forty-Seventh Army in defense of the Caucasus. Gorshkov then resumed command of naval forces in the Sea of Azov, assisting in the liberation of the Taman Peninsula and Crimea. Gorshkov next commanded the Danube Flotilla and played an active role in the liberation of Ukraine and the Soviet invasion of Romania, Bulgaria, Hungary, and Austria. He ended World War II in command of the Black Sea Fleet.

Following the war, Gorshkov became chief of staff and then commander of the Black Sea Fleet until 1955, when he was appointed deputy commander of the Soviet Navy. Gorshkov was a close associate of Soviet leader Nikita Khrushchev, who appointed him commander in chief of the Soviet navy in 1956, a post he held until his death. Khrushchev initially charged Gorshkov with carrying out reductions in defense expenditures, but this policy ended

with the intensification of the Cold War following the 1962 Cuban Missile Crisis, one of the great lessons of which for the Soviet leadership was the inadequacy of Soviet naval power. Khrushchev and his successor, Leonid Brezhnev, embarked on a considerable increase in defense expenditures, especially in the naval sphere, allowing Gorshkov to transform the Soviet Navy from essentially a coast-defense and submarine-centered force into one capable of projecting naval power around the globe. In 1967 Gorshkov was promoted to admiral of the fleet of the Soviet Union, the naval equivalent of marshal of the Soviet Union.

Gorshkov oversaw construction of the Soviet Navy's first aircraft carriers and of new nuclear submarines and battle cruisers comparable to Western designs. His theories of naval tactics and strategy were embodied in his major book, *The Sea Power of the State*, in 1976. Gorshkov died in Moscow on May 13, 1988.

Gott, William Henry Ewart "Strafer" (1897–1942)

British Army general. Born on August 13, 1897, in Leeds, England, William Henry Ewart Gott was educated at Harrow and the Royal Military College, Sandhurst. Commissioned into the King's Royal Rifle Corps (KRRC) in February 1915, Gott fought in France during World War I, where he was wounded, awarded the Military Cross, and taken prisoner. Gott continued in the army after the war, serving in the 13th London Regiment. He was promoted to major in January 1934 and saw service in India. Promoted to lieutenant colonel in 1938, Gott commanded a battalion of the KRRC.

In 1940, Gott was promoted to brigadier and appointed as a staff officer in Major General Percy Hobart's Mobile Force in Egypt, which was rapidly developed into an armored division. As commander of the Support Group of the 7th Armoured Division, Gott took part in Operation COMPASS (December 7, 1940–February 7, 1941), and in May 1941 he led the composite armored strike force for Operation BREVITY, the first Allied attempt to relieve Tobruk (April 1941–January 1942). Gott was then promoted to major general and given command of the 7th Armoured Division, which he led with great daring during the November 18–December 30, 1941, Operation CRUSADER.

As with most other British officers, Gott—an infantry officer—initially failed to comprehend the concept of mobile mechanized warfare. However, on the basis of his experience fighting the Germans, who coordinated antitank guns, artillery, and infantry with their tanks, Gott suggested using 25-pounder field artillery to support British tanks. He was primarily responsible for the belated British policy of breaking down the traditional and rigid divisional organization into combined all-arms brigade groups, which became standard throughout the British Army.

Gott built a reputation as a brilliant and energetic armored commander, and he was widely recognized as knowing more about the desert than any other senior British officer. Certainly he was one of the most inspiring commanders in the Middle East theater. Gott had an unrivaled knowledge of the exigencies and possibilities of desert warfare and a reputation for a lightning-quick grasp of a situation and a faculty for making rapid decisions. A legend in the desert fighting, Gott was known as a "British Rommel," tirelessly roaming the battlefield to rally and drive on the shaken troops.

Promoted to lieutenant general in 1942—one of the youngest officers of that rank in the British Army—Gott took command of XIII Corps and led it through the battles at Gazala (May 26–June 13, 1942) and Mersa Matrûh

(November 7, 1942). His reputation was not tarnished during the British withdrawal to El Alamein. In August 1942, British prime minister Winston L. S. Churchill selected Gott to replace General Sir Claude Auchinleck as commander of the Eighth Army. Although Gott protested that he was tired and depressed by fatigue and defeat and would like nothing more than three months' leave in England to recuperate, he agreed to take on the new assignment.

On August 7, 1942, Gott flew to Cairo to assume his command. His aircraft was intercepted and attacked by a lone German fighter. Although his plane managed to land safely, Gott had been shot and killed. Churchill then appointed his second choice, Lieutenant General Bernard Montgomery, as commander of the Eighth Army. Gott's death therefore had a great impact on succeeding events in the desert and subsequently in Europe.

Govorov, Leonid Aleksandrovich (1897–1955)

Marshal of the Soviet Union. Born in the village of Butyrki, Kirov Oblast, on February 22, 1897, Leonid Aleksandrovich Govorov was drafted into the Russian Army in 1916 during World War I. Commissioned from the Konstanin Artillery School in 1917, Govorov was then drafted into anti-Bolshevik forces commanded by Admiral Aleksandr Kolchak but deserted and joined the Red Army in 1920. During the Russian Civil War, Govorov

commanded an artillery battalion, but because he had served in Kolchak's forces, he was denied membership in the Communist Party until 1942.

Govorov attended staff schools, the Frunze Military Academy, and the General Staff Academy. He commanded an artillery corps in 1936 and, during the 1939–1940 First Finnish-Soviet War, served as the artillery commander of the Seventh Army. There he initiated the technique of using heavy guns for direct fire against fortifications. Govorov then commanded the Dzerzhinsky Artillery Academy.

Following the June 1941 German invasion of the Soviet Union, Govorov commanded the Fifth Army in October 1941 in the defense of Moscow and was promoted to lieutenant general in November. He played an important role in the counterattack around Moscow of December 1941. Govorov then commanded the Leningrad Front from June 1942 to July 1945.

Promoted to colonel general in January 1943, to army general in November 1943, and to marshal of the Soviet Union in June 1944, Govorov broke the German siege of Leningrad, pursuing the Germans through the Baltic states. In February 1945, he took command of the 2nd Baltic Front. After the war, he headed the Leningrad Military District, and he was chief inspector of the Soviet Army from 1946 to 1947. Govorov later commanded the Air Defense Forces and became deputy minister of defense in 1954. He died in Moscow on March 19, 1955.

Graziani, Rodolfo, Marchese di Neghelli (1882–1955)

Italian Army marshal. Born at Filettino near Rome on August 11, 1882, Rodolfo Graziani joined the Italian Army and served in Libya in 1914 before being posted to the Italian front during World War I. There he commanded a brigade, was wounded twice, and was promoted to major. A colonel at the end of World War I, Graziani earned a reputation as Italy's most successful colonial general.

Distinguishing himself in Tripolitania in the 1920s, for which he was promoted to brigadier general in 1923, Graziani was dispatched to Cyrenaica, where he conducted a brutal but effective pacification campaign against the Senussi during 1930–1932. Promoted to major general in 1930 and to lieutenant general in 1932, Graziani commanded a corps and then was appointed governor of Somalia in 1935. Graziani participated in the attack on Ethiopia in 1936 and destroyed the remnants of the Ethiopian army in February 1937.

Graziani's successes earned him promotion to marshal and viceroy of Ethiopia on the departure of Marshal Pietro Badoglio. His savage rule provoked a widespread insurgency, however. Graziani was severely wounded in an assassination attempt on February 29, 1937, and the Italian Army crushed the uprising only with great difficulty. The Italians employed poison gas and were guilty of other atrocities.

Graziani left Ethiopia in January 1938 and was made honorary governor of Italian East Africa. In October 1939, Italian dictator Benito Mussolini appointed Graziani army chief of staff, then ordered him to Libya to replace Italo Balbo, who was killed in an airplane crash on June 28, 1940.

Although the 250,000 Italian forces in North Africa vastly outnumbered the small British troop deployment there, Graziani refused to launch an offensive into Egypt, citing serious deficiencies in supplies and equipment. Infuriated by Graziani's timidity, Mussolini ordered him to attack. The subsequent tentative Italian offensive sparked a devastating British counteroffensive that drove the Italians from Cyrenaica in February 1941, and Graziani returned to Italy in disgrace and resigned from the army.

Because Graziani was the only general of note to remain loyal to the fascist regime after its collapse in 1943, that September Mussolini appointed him defense minister and chief of staff of the rump Italian Social Republic. Graziani spent the remainder of the war attempting unsuccessfully to rebuild the army in an atmosphere of intensifying civil warfare and German domination. In 1950, Graziani was sentenced to 19 years in prison for war crimes, but he was released after only a few months. He then headed the neo-fascist Italian Socialist Movement. Graziani died in Rome on January 11, 1955.

Great Britain

Island nation situated off the northwestern coast of continental Europe. The British Isles (which included England, Wales, Scotland, and Northern Ireland) encompass some 95,000 square miles of land; however, on the eve of World War II, the British also reigned over a far-flung empire that encompassed many thousand more square miles in various portions of the world. The metropolitan population (British Isles) in 1939 was approximately 47.76 million. Great Britain borders the English Channel to the South (immediately beyond which lies France), the Atlantic Ocean to the west and north, and the North Sea to the east.

Prime Minister Neville Chamberlain headed a coalition republican government on the outbreak of war; Great Britain was then, as it is now, a constitutional monarchy.

When Britain declared war on Germany on September 3, 1939, the public mood was one of resignation rather than the enthusiasm that had greeted entry into World War I. Indeed, during the period September 1939–May 1940, the so-called Phony War, there was a rather nonchalant attitude toward the war. The nation had been battling the worldwide economic depression, and although the government had belatedly begun rearmament, much of the economy remained stagnant, and unemployment was high. Britain sustained few casualties in the early fighting, although the war was brought home by the mass evacuation of children from the cities, especially London, and the imposition of blackouts at night. On the whole, however, domestic life was not much disturbed.

Although Parliament passed an Emergency Powers Act in September 1939 granting the government control of the economy, Chamberlain sought a more limited effort than was essential to bring victory. Aerial attack was a great concern, and the government endeavored to relocate families, especially those in London, to rural areas of the country. But Britain was slow to mobilize its assets for the war, especially its land forces. In the spring of 1940, Britain was still producing civilian automobiles, and unemployment was at 1 million people. Not until the German invasion of France and the Low Countries in May 1940 did the government and the people discover the true seriousness of the situation.

The Allied debacle in Norway precipitated a political crisis. Despite the fact that the Conservatives held a large majority in Parliament, Prime Minister Chamberlain was forced from office on May 10, 1940, the same day the German Army invaded France and the Low Countries. Former first lord of the admiralty Winston L. S. Churchill became prime minister.

Completely committed to total victory, Churchill was one of history's great war leaders. Perhaps more at home in the 19th century as far as spheres of influence and his attitude toward colonialism were concerned, Churchill was both eloquent and effective in rallying the British people behind the war effort. Flashing his famous "V for victory" sign, he later took it on himself to visit the bombed-out areas of London. To the rest of the world, Churchill was the embodiment of British pluck and resolve.

Despite the efforts of his service chiefs to keep him at arm's length, Churchill insisted on a hands-on approach to the war, often intervening in military matters. The one sin for Churchill was inaction, but his decisions

often had deleterious effects. Churchill also took a lively interest in scientific developments, in code breaking, and in a wide range of schemes and gadgets that might be employed against the Axis powers.

Early on, Churchill developed a close relationship with President Franklin D. Roosevelt of the United States, but the British leader's vision of the world, in which Britain was a major imperial power, was fading. Churchill's influence over strategy also waned in the course of the war as the military strength of the United States grew dramatically vis-à-vis that of Great Britain.

With the German invasion of the west in May 1940, all the "phoniness" of the war disappeared. The government rapidly expanded the Emergency War Powers Act of the year before, giving it "complete control over persons and property." The nation survived the debacle of the German conquest of Western Europe and the subsequent Battle of Britain (July 10–September 30, 1940), thanks to the English Channel, the Royal Navy, and the Royal Air Force (RAF). Citizens were proud of their defiant stand against Germany—what Churchill referred to as the nation's "finest hour." Despite depredations by Axis submarines, Britain continued to access world resources, and the next year both the Soviet Union and the United States entered the war on its side, ensuring an eventual Allied victory.

With the nation at last committed to total war, economist John Maynard Keynes supervised a survey of British resources. Completed in 1941, it greatly aided the government in assuming the direction of the entire economy. The government introduced strict price controls and rationing and mobilized its civilian population fully for the war effort. The National Service (Armed Forces) Act of December 2, 1941, authorized conscription of all males ages 18 to 50 for the military, industry, or other national service. In June 1944, some 22 percent of adults were in the military and another 33 percent were in civilian war work. Women also played a key role; by 1944 they comprised 37.9 percent of the civilian labor force.

The British government enjoyed great success in increasing its production of armaments. In 1940, for example, Britain produced more aircraft than Germany (15,049 to 10,249). Labour Party member Ernest Bevin was a highly effective minister of labor. There was little unrest among British workers, especially as burdens were seen to be shared and the standard of living was not seriously depressed.

A Women's Voluntary Services stall in Kingston upon Thames, Surrey, in southeast England, where scrap metal was turned in to be melted down for use in Britain's war industry, June 1940. (Popperfoto/Getty Images)

About half of national resources went into the war effort as exports dropped off and imports, especially of food, rose. The government sharply raised taxes to avoid as much borrowing as possible. The basic tax rate was 50 percent, whereas excess business profits were taxed at 100 percent. Some called this tax policy "war socialism." Without Lend-Lease aid from the United States and assistance from Commonwealth nations, however, it would have been difficult for Britain to survive.

Britain suffered far less material damage than most other warring states. It sustained in the war 244,723 military and 60,595 civilian deaths. But Britain's massive wartime effort, the expenditure of capital at home, the recall of overseas investment, the disruption of trade, and deficit spending all hastened a national economic decline already in progress. The hardships of war that imparted the sense of a shared national effort also heightened interest in reform at the end of the war. As early as 1942, the Beveridge Report called for establishment after the war of a minimum income level, medical

insurance, and cradle-to-grave security for all citizens. Even during the war, Parliament extended to the entire population the right to a secondary school education.

Popular interest in wide-ranging reform was not understood by Churchill, who focused almost exclusively on the war, but this mood led the Labour Party leadership to demand elections after the defeat of Germany in May 1945. Held in July 1945 while the war against Japan was still in progress, the elections produced a surprising Labour upset; the party won 393 of the 640 seats in the House of Commons. In a nearly seamless transition, Labour leader and Deputy Prime Minister Clement Attlee replaced Churchill in the midst of the Potsdam Conference.

Although the United Kingdom experienced the exhilaration of victory, the country was hard-hit economically and socially. Indeed, to finance long overdue social legislation, the Labour government was forced to cut many other areas. The government also began a program of retrenchment abroad, and this meant giving full independence to much of the British Empire—India being the most dramatic example. The Labour government also soon determined that Britain could no longer continue as the world's policeman, and by 1947 it had largely passed that burden to the United States.

Great Britain, Air Force

The future of the Royal Air Force (RAF) appeared bleak at the end of World War I. With extensive personnel and aircraft reductions, the RAF's existence as an independent service remained in doubt until the appointment of Major General Sir Hugh Trenchard as chief of the Air Staff in January 1919. As dogged as he was visionary, Trenchard proved the viability of the third service, and by the mid-1920s he secured the RAF's future. In search of a mission, the RAF proved invaluable in imperial policing, especially in Somaliland, Aden, Palestine, India, and Iraq.

Growth in force size was slow, however, because of economic difficulties and an ever-shrinking defense budget. Of the 52 squadrons approved in 1923, only 42 had been established by 1934. In 1935 the transition to monoplane designs began, a process resulting in the most successful British fighter aircraft of the early war years. They were the Hawker Hurricane designed by Sydney Camm, which entered service in 1937, and the Supermarine Spitfire, designed by Reginald Joseph Mitchell, which appeared in 1938. In 1936, future manpower needs were addressed with the establishment of the RAF Volunteer Reserve. By January 1939, the RAF numbered 135 squadrons.

Despite advancements in fighter types as defense against strategic bombers, the prevailing attitude throughout European air services reflected the airpower theories of such visionaries as Brigadier General Billy Mitchell in the United States and Giulio Douhet in Italy, both of whom argued the primacy of the bomber. To overcome the loss of strategic mobility, a difficulty that was suffered by the armies of the Western Front in World War I, Britain embraced the concept of strategic bombing. This concept was based on the theory that long-range bombing would inevitably undercut an opponent's will and civilian morale as well as cripple his economic ability to wage war.

The beginning of World War II in September 1939 found the RAF considerably better prepared than it had been only four years earlier. The Bomber Command order of battle included 54 squadrons equipped with Bristol Blenheims, Vickers Wellingtons, Armstrong Whitleys, and Handley Page Hampdens. The critical weakness lay in the match between air strategy and the instruments of war available in 1939. The RAF had no heavy bomber capable of delivering the crippling physical and economic blows necessary for strategic bombing success. Not until the Handley Page Halifax heavy bomber entered service in late 1940 did Bomber Command possess a heavy bomber that could carry the air war deep into enemy territory.

Fighter Command entered the war considerably better prepared in terms of equipment capability. The 35 home-based fighter squadrons with first-line Hurricanes and Spitfires were enhanced by a series of coastal radar stations known as Chain Home. Although relatively primitive, the radar network soon proved robust and difficult for the German Luftwaffe to destroy. Thus, with a total of 1,466 aircraft, of which roughly 1,000 were first-line aircraft, the RAF faced Reichsmarshal Hermann Göring’s Luftwaffe.

A Royal Air Force Handley Page Halifax III heavy bomber, January 28, 1944. Flown by other air forces during the war as well, the Halifax served in a variety of roles and could carry 13,000 pounds of bombs. (Charles E. Brown/Royal Air Force Museum/Getty Images)

The first months of the war can best be characterized as a sparring match of mainly frustrated attempts by the RAF to attack German Navy warships. In

France, Air Chief Marshal Sir Hugh Dowding, commander in chief of Fighter Command, insisted on sending only squadrons for the Advanced Air Striking Force (AASF) that were equipped with older, less robust aircraft such as the Gloster Gladiator. He feared losing first-rate aircraft and stripping home defense of fighting capability. Despite Dowding's conservatism, the RAF lost nearly 1,000 aircraft in the Battle for France, half of them fighters.

The Luftwaffe had high hopes of quickly dispatching the undermanned and outgunned RAF when, as a precursor to invasion, it launched Operation ADLERANGRIFF (EAGLE ATTACK), Germany's main air offensive against Britain, on August 8, 1940. However, Dowding's prewar innovations soon showed their worth. Fighter Command employed the group/area command-and-control system, in which each group was subdivided into sectors encompassing forward and primary airfields. Initially, Groups 11 and 12 covered the country. They were later further divided into four groups. Within each sector and group, an operations room controlled activities; the whole enterprise was coordinated at Fighter Command Headquarters.

Connected by telephone to the Chain Home system and the Observer Corps, the command-and-control system allowed for a reaction to a raid in a matter of minutes, with an appropriate number of aircraft being vectored to target. The system allowed Fighter Command to husband resources, identify incoming raids, scramble appropriate units, vector aircraft to target, and essentially ambush incoming German raids. This combination—all due in large measure to the prewar efforts of Dowding—proved to be the decisive factor that led the United Kingdom to win the July 10–September 30, 1940, Battle of Britain.

In the first phase of the Battle of Britain, the Germans sought to draw the RAF into the air and destroy its fighting strength by attrition. By late August that strategy had failed, and the Germans turned to destroying British airfields south of the Thames. This far more dangerous threat to RAF viability took a great toll on RAF men and machines by early September. Dowding estimated that three more weeks of such assaults would destroy Fighter Command's ability to mount any viable defense.

Then on the night of August 24, German bombers were dispatched to strike an oil storage depot near London. Their navigation was faulty, and they dropped their bombs on London. Churchill immediately ordered the bombing of Berlin on the night of August 25. One hundred three British aircraft took

off that night for Germany, 89 of them for Berlin. Only 29 bombers actually reached Berlin because of clouds and poor navigation equipment. The raid was certainly not a success, but it led Adolf Hitler to order a concentration on London. The Luftwaffe's primary target became the destruction of London rather than the vastly more important RAF airfields and production facilities.

The shift to bombing London on September 7 allowed Fighter Command to repair airfields and facilities. For the next several months, British cities suffered through an almost nightly bombing campaign dubbed "The Blitz," a failed strategy to attack civilian morale. Although the Chain Home radar network did not operate especially well at night, improved radar and night fighters, including the Bristol Beaufighter, proved capable of challenging German night bombing, and German losses mounted. On September 17, 1940, Hitler canceled Operation SEE LION (the cross-Channel invasion of England), and by May 1941 the air assault abated. Of the more than 3,000 pilots who flew in the RAF in the Battle of Britain, some 500 died in combat.

In the initial stages of the war, the RAF had been loath to attack German industrial targets, despite the doctrine of strategic bombing. During the battles for France and Britain, Bomber Command had been reduced to attacking German shipping and to invasion force transport. Some successful raids against Luftwaffe airfields occurred with good results. The turning point for the strategic air campaign occurred on the night of September 23, 1940, when 84 bombers attacked Berlin. Although bomb damage and RAF losses were minimal, RAF's practice had commenced night bombing first industrial (especially oil) and infrastructure and later civilian targets.

In 1942 the Avro Lancaster heavy bomber arrived in numbers. Having a range of more than 1,600 miles and capable of carrying 22,000 pounds of bombs, the Lancaster was Britain's mainstay heavy bomber of World War II and enabled Bomber Command to carry the air war deep into Germany. The Lancaster Mark II, which appeared in 1943, had a range of 2,250 miles and could carry 14,000 pounds of bombs. However, night navigation and target identification proved highly problematic. With no visual reference aids at night, bomber crews relied on Pathfinders. First fielded in August 1942, Pathfinder aircraft flew ahead of the formations, identified targets, and dropped color-coded marker flares.

As the war progressed, electronic navigation improved, including the relatively primitive radio set known as Gee, followed by the more

sophisticated blind-bombing device called Trinity. The latter was a precursor of the advanced Oboe system, which employed a ground-distance measuring station. The H2S system provided a radar display indicating prominent geographic features such as rivers, coastlines, and urban structures, thus providing the hitherto missing navigational landmarks.

Night-bombing accuracy always suffered compared with the daylight assaults carried out by the B-17s and B-24s of the U.S. Army Air Forces (USAAF) Eighth Air Force beginning in 1943. To counter the night bombing, the Luftwaffe developed efficient night fighters and relied on massed antiaircraft artillery. When the Blitz ended, Bomber Command increased the intensity of night strategic bombing. Three hundred bombers took part in a night raid on Hamburg on May 8, 1941.

On February 22, 1942, Air Chief Marshal Sir Arthur Harris assumed command of Bomber Command. An energetic and enthusiastic advocate of terror bombing, Harris resolved to bludgeon Germany into submission. Night bombing of industrial targets increased immediately. To underscore the new attitude (and the advantage of the Lancasters with improved electronic navigation and targeting gear), Harris ordered the first 1,000-bomber raid, an attack on the German city of Köln (Cologne) on May 30, 1942.

Simultaneously, the newly fielded and capable De Havilland Mosquito quickly established itself as an extraordinary melding of mission capabilities, including reconnaissance, bomber, fighter-bomber, and night fighter aircraft. Under Harris, British strategic night bombing increased in intensity, capability, and destructive force for the next three years.

Italy’s entry into the war on June 10, 1940, found the RAF in the Middle East and Mediterranean dispersed over 4 million square miles of mainly desolate and hostile terrain. Its 300 first-line aircraft were organized into 29 operational squadrons. Most of the aircraft represented previous generations of fighters. Whereas this was suitable for imperial policing against tribesmen and ill-organized rebels, the Italian Air Force and later the German Air Force presented a difficult problem. The Italians could send up to 1,200 additional aircraft from Sicily and Italy to augment the 500 already in Africa.

With imperial strategic interests threatened, notably the tenuous India–Far East supply line through the Suez Canal, Britain embarked on rapid air and troop reinforcement. Because few aircraft could make the journey completely by air, a scheme developed for shipping aircraft by sea to the Gold Coast.

The planes then made a difficult flight across Africa to Egypt. Gradually, the Desert Air Force established air superiority in North Africa and aided Field Marshal Archibald Wavell's advance through Libya. Additionally, Malta, a linchpin of British Mediterranean power, was heavily reinforced. The island and its RAF garrison withstood furious, concerted Axis air assaults.

With the injection into North Africa in February 1941 of German ground forces supported by the Luftwaffe, the air advantage temporarily swung back to the Axis. As more Hurricanes, Spitfires, and American-made Curtiss P-40E Kittyhawks arrived, the Desert Air Force slowly overwhelmed the Axis air forces. By the time of the Battle of El Alamein (October 23–November 4, 1942), RAF aircraft outnumbered Axis aircraft by 1,200 to 690. Because it had more aircraft and was reinforced by top-of-the-line fighters and because many of its pilots were veterans of the Battle of Britain, the RAF gained air superiority and contributed heavily to the eventual Allied North African victory.

The war effort of the RAF Coastal Command is often overlooked, yet it played a tremendous part in subduing the submarine threat and keeping the sea lifeline open. In the early months before Germany could mount a credible U-boat threat, the RAF concentrated maritime defense efforts against enemy commerce raiders. With only 19 home-based squadrons operating outdated aircraft, Coastal Command could do little more than close-in coastal patrol. As equipment and numbers improved, particularly with the arrival of the Short Sunderland and the American B-24 Liberator, Coastal Command's reach extended to practically the entire world. By late 1940, Coastal Command aircraft had begun mine-laying operations and raids on the coast of France and in the North Sea.

By 1941 the German submarine threat intensified, and Coastal Command took up the challenges of shipping protection in the approaches and submarine hunting. The most dangerous area lay in a reconnaissance gap halfway across the Atlantic that land-based aircraft could not reach. In this area, U-boats inflicted great casualties until the wide-scale employment of the Liberator, which operated from bases in Scotland, Iceland, and Canada and closed the gap in aerial coverage. Additionally, new airborne radar, the ASV, improved air-dropped depth charges, and the organization of antisubmarine warfare (ASW) forces into hunter-killer groups of combined air and ship units all contributed to the growing effectiveness of ASW air operations.

By late 1943 the Battle of the Atlantic had been won, and Coastal Command had played a major role in that victory. Of German U-boat losses in the Atlantic, 55 percent are believed to have been the result of air attack (although many of these losses were to aircraft flown from escort carriers). A further 19 percent of U-boat losses were the result of combined aircraft-warship actions.

In short, the RAF grew from a relatively small force wedded to strategic bombing and imperial policing in the early 1930s to a highly capable multimission force by the end of the war. Aircraft design advanced measurably with attendant gains in effectiveness and lethality. By 1943, the RAF deployed thousands of aircraft to every theater of operations and simply wore down the enemy through superior technology and weight of numbers. Advances in technology—particularly bomber navigation, targeting, and ASW radar—far outstripped Axis technological development, giving the RAF not only a decisive quantitative advantage but also a qualitative advantage by 1943.

In many respects, the RAF had established itself by 1945 as a coequal partner with the Royal Navy in defense of the British Empire and home islands. Certainly, the RAF consumed a huge portion of Britain's war economy, and its role and sacrifice in the war cannot be discounted. Fighter Command saved the nation in 1940, and Coastal Command challenged and eventually helped nullify the U-boat maritime trade threat. Although the effectiveness and morality of the strategic bombing offensive may be debated, its destruction of key German industrial targets, notably those of oil production and transportation, contributed significantly to the eventual Allied victory.

From an initial 175,692 personnel in the RAF, including the Women's Auxiliary Air Force (WAAF), on September 1, 1939, the RAF reached a peak of 1,079,835 personnel of all ranks, branches, and nationalities (including Allied personnel serving in the RAF and imperial/dominion forces) by May 1, 1945. Of that number, 193,313 served as aircrew. The RAF had 9,200 aircraft of all types in all theaters in an operational status as of May 1, 1945.

The cost was high, however. Relative to all other British services and branches, the RAF suffered the greatest personnel losses. From 1939 to 1945, the RAF lost 70,253 personnel killed or missing. Bomber Command flew 372,650 sorties, losing 8,617 aircraft and 47,268 men killed in combat or

taken prisoner and a further 8,305 killed in training accidents. Deaths from other causes cost Bomber Command ground crews and WAAFs a further 1,570 deaths. Fighter Command lost 3,690 aircrew killed in action and 1,215 seriously wounded.

Great Britain, Army

For many of the British Army's commanding officers who had served as infantry subalterns during World War I some 20 years earlier, the events of September and October 1939 must have conjured up a powerful sense of déjà vu. Then, as in 1914, a small expeditionary force of two corps assembled to

take up position on the left of the French line in Flanders, awaiting the inevitable German advance across the Belgian plain. Decades-old plans for entrenchment and the tactics of a static war of attrition were dusted off and reissued.

However familiar the first months of World War II may have been to these veterans, though, their army's war was to take a dramatically unexpected turn less than a year later when the British Expeditionary Force (BEF) was ignominiously ejected from the continent after only a few weeks of sharp, mobile combat. They were not to return for another four years. Of the seven army-strength formations raised by Britain during the period 1939–1945, only one, the Second Army, was to fight in Northwestern Europe again. The bulk of Britain's land operations were conducted far from northwestern France—in the Western Desert of North Africa; in Sicily and Italy; in the Balkan Peninsula; in Norway, Malaysia, Burma; and on the northeast frontier of India. Such a fast-paced global struggle required a different kind of army from that of World War I, with much greater technical specialization and more attention paid to the thorny problems of supply, communications, and control.

Although many key aspects of army life, such as the centuries-old regimental system, were carried forward mostly unaltered into World War II, the British Army of 1939–1945 was to a large degree a hurriedly reinvented institution. This ad hoc metamorphosis was a necessary reaction to the new conditions of warfare, for which the interwar years had inadequately prepared the army's leaders and structures.

After the demobilization that followed the 1918 armistice, the British Army had quickly returned to its traditional role as a small imperial security force made up of long-service regulars, the part-time home reserve of the Territorial Army, and a variegated auxiliary of colonial troops overseas. The problems of policing such trouble spots of the empire as Palestine and India were far removed from the new theories of mechanized breakthrough warfare being discussed by forward-thinking military strategists in Europe, and the army languished in its attachment to the bayonet and the quick-firing rifleman—important for crowd control in overseas colonies but less useful on the modern battlefield.

There were, in spite of this, significant attempts to bring the army up to date. Captain Basil Henry Liddell Hart's revised infantry manual stressed the

“expanding torrent” tactics of mobility and exploitation, and Colonel John Frederick Charles Fuller called for fresh thinking on tank warfare. The Experimental Mechanized Force established briefly in the late 1920s was the world’s first prototype for the armored division. But a combination of Treasury parsimony and knee-jerk opposition from the “Colonel Blimps” who dominated the army’s upper echelons prevented any profound reform until the eve of war, when—prompted by the dynamic but ill-fated Minister of War Leslie Hore-Belisha—the government finally accepted the need for rearmament funding and a peacetime conscription bill. The doubling in size of the Territorial Army in March 1939 and passage of the National Service Act a month later provided for hundreds of thousands of new recruits, but in the short term these developments only added to the administrative confusion of a force hurriedly trying to reequip for a new continental commitment in alliance with France.

At the outbreak of war, the army’s manpower stood at 897,000, the regular army and the Territorial Army having merged by government decree. Five regular infantry divisions were available in the United Kingdom for transportation to France. Two infantry divisions were deployed in Palestine suppressing the Arab revolt, the Western Desert Force (WDF) in Egypt had a fledgling armored division (another was forming in the United Kingdom and would eventually join the BEF), and the remainder of the empire was garrisoned either by individual battalions of regulars, units from the 300,000-strong Indian Army, or indigenous militia like the King’s African Rifles (KAR) in Kenya and Uganda.

From these modest beginnings, the government of Prime Minister Neville Chamberlain proposed to recruit an army of 55 divisions (32 British, the remainder Indian and Dominion) for what it suggested would be at least a three-year war. There was as yet little clear plan as to where these divisions would be employed or when.

Political control of the armed forces was exercised during hostilities through the War Cabinet, a subset of the full cabinet that liaised with the Chiefs of Staff Committee (COS) representing the uniformed heads of the army, the Royal Navy, and Royal Air Force (RAF). The chief of the Imperial General Staff (CIGS) was the army’s representative on the COS and, after the appointment of General Sir Alan Brooke in 1941, its permanent chairman.

The CIGS had a vice chief responsible for operations, plans, intelligence,

and training and a deputy chief in charge of general organization. With the adjutant general (personnel), quartermaster general (logistics), and master general of ordnance, these men collectively made up the Army Council, which was chaired by the secretary of state for war. The War Office retained nominal ministerial responsibility for the army. However, Winston L. S. Churchill, appointed prime minister and minister of defense in May 1940, preferred to deal with the uniformed chiefs directly, and so Whitehall was relegated to a purely administrative function.

Operational control in the United Kingdom was vested in General Headquarters (GHQ) Home Forces, and the country was divided into a series of command districts: Southeastern, Southern, Western, Northern, Scottish, Eastern, London, and Northern Ireland. Various overseas GHQs were established in the Middle East, East Africa, Persia, and Iraq and in other theaters according to the vagaries of war; the commander in chief of the Indian Army held sway across the Indian subcontinent. In 1939 and 1940, there was an unsuccessful attempt to create a viable Anglo-French Supreme War Council, but as the multinational character of the war developed with the entry of the United States in December 1941, command of British forces was increasingly delegated to Pan-Allied authorities such as the Combined Chiefs of Staff at the strategic level and Supreme Headquarters, Allied Expeditionary Force (SHAEF), and South-East Asia Command (SEAC) at the operational level.

The spiritual core of the army remained 5 guard and 64 line infantry regiments that performed a unique administrative, but nontactical, function. Following the pattern established in World War I, the army expanded not by creating new regiments but by adding battalions to existing regiments, some of which traced their origins to the 17th century. The heart of the regiment was an organizational depot located at the home barracks, while its component field battalions served scattered across the world in various brigade formations. It was uncommon for two or more of the same regiment’s battalions to serve closely together at the front.

Regimental tradition was a powerful reinforcement of esprit de corps, particularly as most regiments had a regional recruitment base. As the war progressed and manpower became scarcer, the territorial associations of each regiment were weakened, with a corresponding loss of group identity. The

remainder of the army was similarly divided into administrative units with regimental or corps-level designations but no tactical roles.

The Royal Armoured Corps was a composite of the old cavalry regiments, now mechanized, and the Royal Tank Regiment. The Royal Corps of Signals handled communications for the entire army down to individual battalion levels, where company signalers took over. Some of the services, such as the Royal Artillery and the Royal Engineers, had traditions and battle honors every bit as distinguished as those of the infantry; others, such as the Reconnaissance Corps, were newly created and short-lived. The most important noncombat services were the Royal Army Service Corps, which carried supplies to troops in the field; the Royal Army Ordnance Corps (RAOC), responsible for the procurement and maintenance of equipment; and the Royal Army Medical Corps, which handled the sick and wounded.

The greater emphasis in World War II on technical and logistical matters caused a much larger proportion of manpower to be allocated to the "tail" (as opposed to the "teeth") of the army than was the case during World War I. Some support formations became so unwieldy that they gave birth to spin-off services of their own, such as the Royal Electrical and Mechanical Engineers, which was formed from the RAOC in 1942. Other notable services handled pay, military policing, spiritual affairs (the Royal Army Chaplains), intelligence, catering, physical training, and education—the last being accused by many conservative officers of foisting socialist ideology onto the rankers, precipitating the Labour Party's 1945 election victory. Eventually, the General Service Corps was created to process incoming recruits and to provide basic training and ultimate service allocation. The all-women's Auxiliary Territorial Service played an increasingly critical role in support of the regulars, as did the Queen Alexandra's Imperial Nursing Service and the First Aid Nursing Yeomanry on the medical front.

Tactically, each late-war British army was divided into four corps, each with two infantry divisions and one armored division. An infantry division of 18,000 men consisted of three brigades of three battalions apiece, an independent machine-gun battalion, three Royal Artillery (RA) field regiments, and an antitank and antiaircraft regiment plus the usual supporting attachments of signalers, engineers, and so on. Tank brigades were often temporarily attached to infantry divisions on an as-needed basis. The full-

strength infantry battalion had four rifle companies of three platoons apiece, a headquarters company, and a support company.

The structure of armored divisions changed markedly throughout the war as experiments to find the best mixture of tanks to other services evolved. In 1939, there were two armored brigades per division, each of three regiments, with a motorized infantry battalion, a field artillery regiment, and accompanying support units. By D-day (June 6, 1944), this had changed to a single armored brigade of three tank regiments (78 tanks per regiment) plus a fully mechanized infantry battalion in armored personnel carriers, a motorized infantry brigade in trucks, an armored reconnaissance regiment, one or two RA field regiments, and a plethora of antitank, antiaircraft, and other support formations, for a total of 343 armored vehicles at full strength.

Two forces existing out of the standard army structure, special services and the Home Guard, deserve mention. The special services or commando brigades were established after the Battle for France (May 10–June 25, 1940) as Britain's only way of directly striking back at the Germans on the European continent. Although their hit-and-run tactics were of limited utility in the absence of an Allied second front, they played an important propaganda role in the testing years before Operation OVERLORD and later became a useful auxiliary to the conventional armies fighting in France and the Low Countries. Certain theaters of war spawned their own commando-like units, such as the Special Air Service in the Western Desert and Orde Wingate's Chindits in Burma. The Parachute Regiment, which by the end of the war was two divisions strong, was originally a part of special services.

The Home Guard, formed by a call for underage and overage volunteers after Dunkerque (May 26–June 4, 1940), was originally intended as a last-ditch militia in the event of a German invasion of the British Isles. As the threat of attack receded, the Home Guard's function adapted to take over security and antiaircraft duties in the home islands from the regular army and to act as a training service for those about to be conscripted. At its peak in 1943, there were 1.7 million home guardsmen in 1,100 battalions.

By the end of the war, more than 3.5 million men and women had served in the regular forces, with the peak of 2.9 million reached in 1945. Eleven armored, 34 infantry, and 2 airborne divisions had been created. Other imperial forces had expanded at an even greater rate: the Indian Army was over 2.5 million men strong by V-J day (August 15, 1945). Despite its early

muddles and campaign disasters, the army had matured to become one of the world's preeminent fighting forces and a signal contributor to the ultimate Allied victory. It had accomplished this with casualties of 264,443 killed, 41,327 missing, and 277,077 wounded.

Great Britain, Auxiliary Territorial Service

Women's unit of the British Army that provided ancillary and support services. The origin of the Auxiliary Territorial Service (ATS) can be traced to the World War I Women's Army Auxiliary Corps (WAAC), a quasi-military female support unit created in January 1917 with the aim of freeing

more men for fighting. Its 57,000 members served in clerical positions and as telephone operators, cooks, and waitresses, but its women “officers” were not granted military commissions or titles. It disbanded in 1921.

In September 1938 as European war seemed ever more likely, the British government decided to establish a women’s auxiliary army to be attached to the existing territorial army. The new ATS incorporated the venerable First Aid Nursing Yeomanry (FANY), formed by Lord Horatio Herbert Kitchener in 1907, whose members constituted most of the ATS Transport Section. ATS recruits received two-thirds of the pay of men. Initially, numbers were small, and most new enlistees served as cooks or storekeepers or in clerical positions. In the spring of 1940, 300 volunteered to accompany the British Expeditionary Force (BEF) to France, and ATS telephonists were among the last British service personnel evacuated from Dunkerque (Dunkirk), France (May 26–June 4, 1940).

With the April 1941 introduction of national civilian or military service for all childless and single British women aged between 18 and 30, ATS numbers rose dramatically, reaching 65,000 within six months. Only women between the ages of 17 and 43 were eligible to enlist, a provision waived for female WAAC veterans of the previous war. In July 1941, ATS enlistees were granted full military status, although no woman could be compelled to serve in situations where she might be subject to physical attack or to operate a weapon without her prior consent.

The range of ATS duties also expanded enormously. Among other duties, women functioned as mechanics, drivers, stevedores, orderlies, dental clerks, masseuses, photographers, munitions inspectors, and military police. They administered postal services and operated antiaircraft batteries, guns, and radar installations. Women were banned from active combat duty, but their ancillary functions were often physically hazardous, especially when they took part in overseas campaigns in Egypt, North Africa, Italy, France, and Asia.

A total of 198,000 women joined the ATS, of whom 335 were killed on duty. Another 302 were wounded, 94 went missing in action, and 22 became prisoners of war, a rate proportionately higher than that in either the women’s naval or aviation auxiliary services. In part, these figures reflected the fact that appreciable numbers of ATS women were recruited as agents for the

dangerous Special Operations Executive, which mounted covert operations in occupied Europe and elsewhere.

Although the ATS continued in existence after 1945, its numbers fell precipitously as all British armed forces experienced substantial postwar demobilization. In 1949 the ATS was disbanded, and its remaining members were absorbed in the new Women's Royal Army Corps, which in 1992 finally amalgamated completely with the British army. Among prominent British women who served in the ATS during World War II was the oldest daughter of King George VI, the future Queen Elizabeth II.

Great Britain, Navy

The somewhat disappointing performance of the Royal Navy during World War I led to considerable improvements in many tactical and operational areas by 1939. In that year, despite the treaty limitations of the interwar years, the Royal Navy was widely regarded as the world's dominant naval force. Significant improvements in tactical and operational doctrine occurred in the 1920s and 1930s, especially in surface action and night-fighting techniques. In contrast to the lack of offensive-mindedness with a reluctance to risk assets that characterized the Royal Navy in World War I, the Royal Navy of 1939 was imbued with a reinvigorated offensive spirit.

Weaknesses did hamper operations, notably the poor state of naval aviation, particularly when compared with naval aviation in the United States and Japan. Of the seven aircraft carriers in service at the start of 1939, only

the *Ark Royal* (laid down in 1935) could be considered modern. Four of the other six had been modified earlier from battleship or battle cruiser hulls. The five new fleet carriers under construction would not begin operational service until well into 1940.

Despite the lessons of antisubmarine warfare learned by 1918 and the need to protect merchant shipping and convoys, the Royal Navy had relatively poor commerce protection capabilities in 1939. Warship design had primarily emphasized coastal protection and submarine hunting, resulting in the short-range corvette ship type, which first came into service in 1939, and small escort destroyers. Although these ships had long-endurance capabilities, they proved unsuitable for open-ocean convoy escort primarily because of their size. Open-ocean convoy protection had been neglected, especially in training programs, and larger destroyers capable of transatlantic convoy protection were in short supply.

Despite the drawbacks, Britain managed to improve antisubmarine warfare capability and assets fairly quickly in response to the German U-boat threat. Although the smaller corvettes proved minimally effective for long-range midocean operations, their successor—the larger, more seaworthy frigate, particularly the River class dating from the 1940 building program—proved especially effective for convoy escort after 1942.

The initial German threat came from a three-part German offensive against commerce (*Handelskreig*) based on submarines, mines, and surface raiders. The Royal Navy quickly and effectively addressed each threat, although significant casualties did occur. Germany began the war with not many more submarines than it had at the start of World War I—just 51 operational U-boats, about half of them coastal vessels. The organization of British convoys in the Western Approaches, combined with the Straits of Dover mine barrage, resulted in 9 U-boats sunk by the end of 1939.

Although some vessels were lost to German mines, the navy reduced this menace with new technology, including degaussing against magnetic mines. Surface raiders threatened British commerce, particularly in the remote waters of the Indian Ocean and the South Atlantic. Although Germans raiders such as the *Atlantis* and the pocket battleship *Graf Spee* provided some tense moments early in the war, by late 1941 most had been hunted down and sunk.

In April 1940, Germany attacked Norway primarily to secure its northern flank and the vital iron ore trade with Sweden. The Royal Navy opposed the

German landings, but a daring run of 10 German destroyers into Narvik subdued the Norwegian defenses. The combination of the entire German surface fleet with German land-based airpower quickly resulted in the occupation of Norway. Reacting to the German moves, a Royal Navy force of destroyers attacked the Germans at Narvik, but it suffered heavy losses. A follow-on attack three days later by a large force centered on the battleship *Warspite* devastated the Germans and severely hampered future German surface operations. Ultimately, however, the Royal Navy could not prevent German victory, especially in the face of effective enemy airpower. Additionally, the German fast battleships *Scharnhorst* and *Gneisenau* sank the fleet carrier *Glorious.*

The fall of France on June 25, 1940, and the loss of French ports heralded a realignment of Royal Navy forces, because prior to World War I, Britain had relied on France for the bulk of Mediterranean sea power. With the appearance of a hostile Vichy government, however, the navy established Force H based at Gibraltar under Vice Admiral Sir James Somerville and charged him with controlling the western Mediterranean. Force H carried out a distasteful duty in the bombardment of the French Fleet at Mers-el-Kébir on July 3, 1940. Force H also played a central role in the destruction of the German battleship *Bismarck* in May 1941 as well as in hunting down and destroying Atlantic commerce raiders. But the defeat of France and the German occupation of much of that country allowed Germany to base long-range U-boats in Bay of Biscay ports such as Brest and Lorient. The toll on British and Imperial shipping dramatically increased by the autumn of 1940 as Adolf Hitler declared (on August 17, 1940) a total blockade of the British Isles.

By the autumn of 1941, the tide in the commerce war had turned in favor of Britain. Escort ships provided by the United States (50 World War I–era destroyers), and the increasing number of Royal Canadian Navy escorts, improved detection equipment (including radar, high-frequency direction-finding sets, and asdic, the latter named for Anti-Submarine Detection Investigating Committee of the British Naval staff and also known as sonar), implementation of a cohesive and effective enemy submarine tracking system based on radio intercepts and code breaking, and better cooperation with Royal Air Force Coastal Command all contributed to the reduction of the German submarine threat and effectiveness.

The British aircraft carrier *Ark Royal,* seen from an accompanying destroyer, ca. 1940. (Keystone/Getty Images)

Additionally, Germany's loss of the *Bismarck* and the relatively ineffective German effort to use heavy surface units to interdict the convoys to the northern Soviet Union across the Arctic above Norway all helped to lessen the threat to British maritime commerce by the middle of 1943. The Soviet convoys began receiving more robust escort following the destruction of the PQ 17 convoy in the summer of 1942. This enhanced escort included greater destroyer strength and escort carriers. The destruction of the battleship *Scharnhorst* off the Norwegian North Cape in December 1943 by a British battleship and cruiser force essentially ended the German surface threat to British and Allied maritime shipping.

Finally, despite a high number of U-boats operating in the Atlantic by March 1943 (up to 70 at any given time), the increasing skill of Allied submarine hunters and the closing of the "black hole" area south of Greenland, where air cover had not been previously available, meant a diminishing submarine threat and higher German losses in U-boats. Escort carriers provided air cover, while long-range maritime patrol aircraft (primarily modified B-24 Liberator bombers) made U-boat operations less effective. Additionally, hunter-killer escort groups attached to vulnerable convoys mauled the Germans.

In the Mediterranean, Italy's entry into the war in May 1940 required reinforcement of the theater naval forces under Admiral Sir Andrew Cunningham. With some modernized older battleships and the new carrier *Illustrious,* Cunningham defeated the Italians in fleet engagements at Calabria on July 9, 1940, and Cape Matapan on March 28, 1941, and raided the Italian anchorage at Taranto on November 11, 1940, with naval aircraft. Cunningham stressed the improvement of antiaircraft protection, which paid off as the naval war in the Mediterranean increasingly devolved into attacks on shipping and naval vessels by Axis aircraft.

Faced with substantial damage to their supply convoys by British destroyers and submarines, the Germans dispatched U-boats to the Mediterranean in October 1941, resulting in the sinking of the battleship *Barham* and the carrier *Ark Royal.* At the fleet anchorage in Alexandria, the battleships *Queen Elizabeth* and *Valiant* were sunk at their moorings by Italian Maiale human torpedoes.

Faced with the loss of capital ships and the threat of enemy aircraft and submarine attack, British resources in the Mediterranean were stretched dangerously thin. Malta, the linchpin of Britain's efforts to hold the Mediterranean, came under horrendous air attack. Convoys to resupply and reinforce the island suffered substantial casualties, among them the aircraft carrier *Eagle.*

The entry of the United States into the war in December 1941 had a profound impact on the Mediterranean theater. Operation TORCH, the Allied landings in North Africa on November 8, 1942, resulted in the eventual destruction of Axis forces in North Africa. Reinforced and reconstituted, the Mediterranean Fleet conducted an ambitious and destructive assault on Italian shipping throughout 1942 and 1943 that crippled enemy resupply efforts. Cunningham admonished his sailors and airmen to "sink, burn and destroy: let nothing pass." By the end of 1942, Britain had again established maritime supremacy in the Mediterranean, despite substantial losses.

In the Pacific theater, Japan entered the war against Britain concurrent with the December 7, 1941, assault on the United States. Quickly overrunning Hong Kong, the Japanese Army forced the capitulation of Singapore, Britain's "Gibraltar of the Pacific." Faced with the loss of basing facilities, the Royal Navy withdrew from Southeast Asian waters, particularly after the loss of the battleship *Prince of Wales* and the battle cruiser *Repulse*

to air attack on December 10, 1941 (Force Z under Admiral Sir Tom Phillips). The admiral's disregard of the air threat coupled with woefully inadequate antiaircraft protection greatly aided the land-based Japanese aviators, who easily sank both capital ships.

Following the crippling of the U.S. Pacific Fleet at Pearl Harbor on December 7, 1941, Japan's main striking force—Vice Admiral Nagumo Chūichi's First Air Fleet—wreaked havoc on the remnants of British sea power in the Indian Ocean in the spring of 1942. In carrier-based air attacks against British surface units, the veteran Japanese naval aviators sank detached portions of Admiral Sir James Somerville's forces based in Ceylon, including two cruisers and the carrier *Hermes.* However, Somerville avoided a general action and preserved his force as the Japanese withdrew to support their thrust into New Guinea and the Solomon Islands. Naval action in the Pacific theater after May 1942 involved mainly U.S. and Australian naval units, but with the defeat of Germany in May 1945, the Royal Navy again engaged Japan with substantial forces.

Under Admiral Sir Bruce Fraser, the Pacific Fleet of four carriers (later joined by two additional carriers) and two battleships with substantial escort destroyers and cruisers arrived in the Pacific in March 1945, where they joined the Americans in the assault on the Japanese home islands and Okinawa (March–June 1945). Equipped with the U.S. F6F Hellcat and F4U Corsair fighters, Royal Naval aviators did great destruction to the Japanese. U.S. aircraft proved greatly superior to earlier British Seafire (modified from the Spitfire), Martlet, Fulmar, and Sea Hurricane models. The heavily armored British carrier decks proved worthwhile as a defense against Japanese kamikaze aircraft (the lightly armored U.S. carriers suffered more extensive damage).

From strategic and operational viewpoints, the Royal Navy performed exceptionally well in the war. Although losses were heavy (1,525 warships of all types, including 224 major surface units of which 5 were battleships or battle cruisers and 5 were fleet carriers, and some 50,000 personnel dead), the aggressiveness and risk-taking nature of senior and individual ship commanding officers overcame the tenacious and highly competent Axis opponents.

In the Atlantic, the Axis commerce warfare offensive failed to starve the country into submission or impede the arrival of overwhelming U.S. forces

and personnel. In the Mediterranean, the Royal Navy kept British and Imperial ground and air forces supplied and reinforced while simultaneously attacking the Axis supply lines to North Africa. In the Pacific, despite initial defeats by the Japanese, British sea power returned late in the conflict and helped the U.S. Navy carry the fight to the Japanese home islands.

As it had not done in the previous war, the navy at all levels showed exceptional ability to rapidly adapt to technological and methodical innovations and advances in doctrine, organization, and training. To man the new ships of more than 900 major combatants and the supporting shore establishment (training, research, logistics, support, and administration), by war's end Royal Naval personnel had increased from the prewar 129,000 to 863,500, which included 72,000 women in the Women's Royal Naval Service. In short, the navy vindicated itself following the disappointments of World War I. British sea power both kept Britain in the fight until the United States arrived in force and subsequently provided the domination needed to attack the Axis powers at all vulnerable points with little interference.

Great Britain, Women's Auxiliary Air Force

Women's arm of the Royal Air Force that provided support services. The Women's Auxiliary Air Force (WAAF), an auxiliary branch of the Royal Air Force (RAF) with a mission to provide support services tailored to RAF needs, was established in September 1939. Its precedent was the Women's Royal Air Force (WRAF), which came into existence on April 1, 1918, during World War I and was disbanded exactly two years later.

Personnel of the British Women's Auxiliary Air Force (WAAF) performing maintenance work on a Westland Lysander liaison aircraft. (Getty Images)

On April 10, 1941, the WAAF was formally incorporated as an official part of the armed services of the British Crown. Theoretically, only women

aged between 18 and 43 could serve in the WAAF, but some members, especially those with World War I service credentials, were older, and in one case a young woman who managed to join at the age of 14 was allowed to remain. A total of 171,200 women served in the WAAF, 187 of whom were killed in service. Another 420 were wounded, and 4 went missing while on duty.

Although British women aged between 18 and 30 were subject to conscription for war work from 1941 onward, they were permitted to choose agriculture, industrial work, or the armed services. Even in the women's auxiliary units of the armed forces, moreover, no woman could be compelled to serve in a situation in which she might have to wield a weapon. As with their female naval counterparts, members of the WAAF had a particularly glamorous reputation, which their relatively smart uniforms and association with the much-admired pilots enhanced.

Although supposedly restricted to noncombat roles, WAAFs often had important responsibilities, especially when functioning either as radar plotters to track incoming hostile airplanes and warn of forthcoming air raids or as radar controllers directing formations of British fighters and bombers. Many young women relished the independence and freedom that such employment conferred on them. WAAFs also served in a wide variety of clerical and other support roles—as drivers and mechanics, for example—freeing up men for active duty. A small minority of women became pilots, although to do so they had to join the Air Transport Auxiliary (ATA) and become civilians. They were also restricted to ferrying and delivering airplanes and could not undertake combat duties.

Thousands of WAAFs served overseas in the Egyptian and North African campaigns and in Europe, controlling air operations as Allied forces advanced. Some WAAFs were also recruited for dangerous clandestine work in the Special Operations Executive, which mounted covert operations in countries occupied by Axis powers. Others took part in Ultra code-breaking operations at Bletchley Park. The British Dominions, Canada, New Zealand, and Australia all established similar women's auxiliary air forces.

In recognition of WAAF wartime contributions, the service remained in existence after World War II, although by 1950 only 517 of the wartime recruits remained in the service. In 1948, however, 14 WAAFs who were ex-ATA members became flying officers. In February 1949, the WAAF reverted

to its old name and once again became the WRAF, and in 1994 it finally merged completely with the RAF.

Great Britain, Women's Land Army

The Women's Land Army (WLA) was a British wartime program to provide female laborers to help overcome labor shortages in agriculture. As war clouds gathered in the 1930s, British government officials realized that if war should occur, the country would require numerous additional workers. For agricultural work, officials made plans to find more laborers from a variety of sources including older and younger workers, seasonal labor from nearby towns, and, as the war progressed, prisoners of war. The most widely publicized effort, however, was the WLA.

In April 1938, the government asked Lady Gertrude Denman, the dynamic head of the Women's Institutes, to lead the new organization. Using the Women's Land Army formed in World War I as a guide, Lady Denman, her coworkers, and local authorities were able to launch a national recruiting campaign in the spring and summer of 1939. By the time the call came in September, more than 1,000 volunteers had signed up, and soon afterward WLA recruits began arriving at British farmsteads.

The "land girls," as they were called, had to be at least age 17 to join. They were primarily from cities and underwent four weeks of training. They

were then sent to individual farms or lived under supervision in hostels. They were given uniforms consisting of a green sweater, brown knee-length trousers, high black boots, a light brown overcoat, and a brown felt hat. The women usually worked 11-hour days and were to have half a day per week and Sundays off, but often that was impossible because of the nature of their jobs. They did all kinds of work, from weeding and threshing to cleaning ditches and milking cows. Some eventually became tractor drivers. They were paid the equivalent of about $3.50 per week, half of it for room and board.

Farmers at first were reluctant to hire WLA workers. By the spring of 1940, however, with the labor market tighter, farmers became more receptive. By the end of the year, 6,000 women were working in rural areas. The number reached a peak of 87,000 in July 1943, and a total of 250,000 had enrolled by war's end.

Shirley Joseph has written movingly about her life as a land girl. She recalled being interviewed and asked, among other things, whether she realized that cows had to be milked every day. She was then trained and sent out to work. Her first job was at Warborough farm in Oxfordshire, where she worked from 6:15 a.m. to 5:00 p.m., and her most important task was to assist with morning and late-afternoon milking. On Wednesdays, she received a half day off and often used the time to hitchhike to her home nearby. She lived part of the time in a cottage with no electricity and no running water. Later she worked out of three different hostels, and although she did some milking, her main jobs were threshing and hoeing crops, which she described as hard work. Her experiences were probably typical.

The WLA gained increasing acceptance from the public, partly because it was well organized. Lady Denman and other WLA leaders gave talks over the radio about the WLA's service, kept local supervisors informed, and even published a magazine, *The Land Girl*, that was distributed to the workers. Denman was also able to enlist influential patrons. Queen Mary, for example, was a major supporter, and she employed land girls at one of her country estates. Although the WLA may not have played as large a role in solving the agricultural labor problem as its backers have claimed, it did help.

Great Britain, Women's Royal Naval Service

Women's arm of the British Royal Navy, reconstituted in 1939. The Women's Royal Naval Service (WRNS) was first established in 1917 during World War I. Before the organization was disbanded on October 1, 1919, 6,000 British women had undertaken naval support duties, during the course of which 23 died.

In 1938, on the approach of another war, planning began to reestablish the WRNS. The organization was reconstituted in April 1939 under the direction of Vera Laughton Mathews. Enlistment was initially voluntary, but under the April 1941 Registration of Employment Order, all single and childless British women between ages 19 and 30 and not yet engaged in work "essential to the war effort" became subject to conscription and were offered the choice of factory work, service in one of the auxiliary service units, or enrollment in the Women's Land Army.

As with the other female auxiliary services, especially the Women's Auxiliary Air Force, the WRNS (its members were called "Wrens") constituted something of a prestigious and elite service. In the course of the war, 74,620 women enlisted in the WRNS; 102 were killed and 22 wounded. Government regulations prevented female civilian volunteers and military personnel from serving without their consent in hazardous circumstances in which they were liable to come under physical attack—manning antiaircraft guns, for example—nor could they be compelled to operate weapons. Even in the auxiliary armed forces, women were restricted to noncombat roles, and the primary function of WRNS members was perceived as releasing male naval personnel from shore jobs. As the war progressed, however, the WRNS

and other female auxiliary military units undertook an increasingly wide range of duties—more than 200 jobs by 1944.

Many served in clerical positions or as wireless telegraphers, electricians, fitters, radio mechanics, photographers, technicians, cooks, stewards, gardeners, dispatch riders, or stokers; others helped to plan and organize naval operations. Thousands served overseas, often in hazardous conditions. A small minority qualified as naval pilots, although, as with those in the quasi-civilian Air Transport Service, they were normally barred from combat duties and restricted to ferrying planes.

Thousands of women also enlisted in associated naval units, including the Fleet Air Arm, Coastal Forces, Combined Operations, and the Royal Marines. In all, 303 British women died during World War II while on active duty in the various naval services. Canada, Australia, and New Zealand established similar women's naval auxiliary services. British women's naval contributions were highly respected, and the WRNS became a permanent service arm in February 1949. In 1993, the WRNS disappeared as a separate unit when it became fully integrated into the Royal Navy.

Greater East Asia Conference (November 5–6, 1943)

Conference convened by the Japanese government in Tokyo during November 5 and 6, 1943, which included representatives from China, the Japanese puppet state of Manchukuo, the Philippines, Burma, and Thailand. The “liberation” of Asian nations from Western colonial rule and the creation of a Dai-tō-a Kyōeiken, or Greater East Asia Co-Prosperity Sphere, was the official Japanese rationale for going to war with the United States and Britain in 1941. Suffering military reversals during World War II, the Tokyo government sought a political manifesto to secure the support of populations under Japanese military occupation. The Dai Tōa Kaigi, or Greater East Asia Conference, was intended as a counter to the Allied Cairo and Tehran conferences that took place around the same time.

Japanese foreign minister Shigemitsu Mamoru conceived the idea for the conference. He believed that Japan needed a powerful statement of policy goals to compete with British and American statements regarding the future of Asia. This explains the extent to which the declaration that conferees approved resembled the Allied Atlantic Charter.

The conference gathered leaders from throughout Japanese-occupied territory in Tokyo. Official delegates were Wang Jingwei (Wang Ching-wei) from China; Zhang Qing-hui (Chang Ching-hui), president of Manzhouguo (Manchukuo); José Laurel, leader of the Philippines; Ba Maw, leader of Burma; and Prince Wan Waithayakon, representing Prime Minister Phibun Songkhram of Thailand. Subhas Chandra Bose, head of the Japanese-sponsored Free India Provisional Government, was also present as an observer. National leaders from Indonesia and Malaya were not invited because Japan secretly planned to annex these territories.

With Japanese prime minister General Tōjō Hideki chairing the proceedings, the delegates discussed the general war situation and political agenda. At the conference’s conclusion, the delegates adopted Dai-tōa kyōdō sengen, the Greater East Asia Declaration, which called for the establishment of a regional order based on the principles of coexistence and coprosperity, respect for mutual autonomy and independence, mutual respect of traditional cultures, promotion of economic interdependence, the abolition of racial discrimination, and open access by member nations to natural resources.

Although Japan granted Burma and the Philippines nominal independence, Japan’s continued occupation of Southeast Asia and its harsh exploitation of both the local populations and natural resources undermined

the Pan-Asiatic ideal of the declaration. A second conference was planned in 1944, but the deteriorating Japanese military situation rendered it impossible.

Great Purges

Ostensibly an internal "cleansing" of the Soviet hierarchy in the middle to late 1930s, the Great Purges were in fact repressive measures taken to remove any and all potential threats to the continuance of the Communist Party and to control by Soviet leader Joseph Stalin.

Periodic purges were not unheard of in Soviet Russia after the Bolshevik seizure of power in November 1917. Most were directed at subordinate officials and low-ranking party members, who bore the brunt of policy failures, and they usually ended with expulsion from the party. The Great Purges (Yezhovshchina in Russian), however, were characterized by their focus on party and state elites, mass terror, and dramatic public show trials and "confessions" by the accused. Those purged were either executed or sentenced to hard labor in the Soviet gulag.

The Great Purges began in earnest with the assassination on December 1, 1934, of Sergei M. Kirov, Stalin's chief lieutenant in Leningrad. Kirov, it is alleged, received more votes than Stalin in the Central Committee elections during the Seventeenth Party Congress of 1934, as many party members desired Stalin's removal from his post as secretary-general. Kirov's assassin, Leonid V. Nikolaev, and 13 so-called accomplices were arrested, given a

sham trial, and executed on December 30. Eventually, 49 people were directly implicated in the alleged plot; all were shot. Supposedly these individuals implicated others, who implicated still others. Although never proven, there is considerable evidence that Stalin arranged Kirov's murder and then had those who carried out the deed executed to cover his tracks. In any case, Kirov's assassination became the justification for the Great Purges.

Beginning in 1936 in a series of show trials held in Moscow, numerous leading communists and old Bolsheviks—members of the former so-called Left and Right oppositions—were tried, convicted, and sentenced either to execution or to hard labor in the gulags (concentration camps). The spillover effect on the general population was horrendous, and the purge soon extended to the Red Army.

In June 1937, the secret summary arrest and trial of several Red Army leaders took place. Charged with Trotskyism and with conspiring with Germany and Japan, three of the five marshals of the Soviet Union—Michael N. Tukhachevsky, chief of the Soviet General Staff; Alexander I. Yegorov; and Vasily K. Blücher—were summarily tried and executed. The purges then descended to the lower echelons of the Soviet armed forces. In addition to the marshals, they claimed 14 of 16 army commanders, all 8 admirals, 60 of 67 corps commanders, 136 of 199 division commanders, and 221 of 397 brigade commanders. All 11 vice commissars of defense and 75 of 80 members of the Supreme Military Council, all military district commanders, and all air force commanders also were executed.

This devastating decapitation of the Soviet armed forces eliminated more than 75 percent of the senior officer corps, including the most aggressive, outspoken, and capable. Some observers consider the purge of the officer corps the chief cause of the disastrous performance of the Red Army early in the German invasion of the Soviet Union, which began on June 22, 1941.

Not all were executed or died in the gulags, however. Many survived to be rehabilitated in the wartime emergency. Some, such as Konstantin Rokossovsky, later a marshal of the Soviet Union, became national heroes. For others, the path to prominence was opened by the purges. Little-known regional commander Georgii K. Zhukov became chief of the Soviet General Staff in three years; during the same period, Nicholas G. Kuznetsov rose from cruiser commander to chief of the Soviet Navy.

At the same time that the great show trials were going forward, millions

of ordinary Soviet citizens simply disappeared without benefit of trial in what became known as the "Deep Comb-Out." Approximately 8 million people were arrested; 1 million were executed, and the rest were sent to the gulags.

Grechko, Andrei Antonovich (1903–1976)

Marshal of the Soviet Union. Born in the village of Golodayevka, Ukraine, on October 17, 1903, Andrei Antonovich Grechko joined the cavalry of the Red Army in 1919 and fought in the Russian Civil War. He joined the Communist Party in 1928 and graduated from the Frunze Military Academy in 1936. He then commanded a cavalry regiment and was chief of staff of the 36th Cavalry Division. He participated in the September 1939 invasion of Poland, and as a colonel he was assigned to the General Staff in Moscow just before Operation BARBAROSSA, the June 22, 1941, German invasion of the Soviet Union. Grechko next commanded the 34th Cavalry Division at Kharkov.

Promoted to major general, Grechko headed the V Cavalry Corps beginning in January 1942 and then the Eighteenth Army from October 1943 to January 1943, both on the Southern Front. Promoted to lieutenant general, he commanded the Fifty-Sixth Army in Ukraine until October 1943 and then was second-in-command of 2nd Ukrainian Front, where he developed

friendships with future Soviet leaders Nikita Khrushchev and Leonid Brezhnev. In December 1943, Grechko took command of the First Guards Army. Promoted to colonel general, he led this army for the rest of the war, helping liberate Kiev, the remainder of Ukraine, and Prague.

After the war, Grechko commanded the Kiev Military District from 1945 to 1953. Promoted to army general in March 1953, he was made commander in chief of Soviet troops in East Germany from 1953 to 1955, where he was in charge of putting down the June 1953 Berlin Uprising. Promoted to marshal of the Soviet Union in 1955, he was then commander in chief of Soviet Ground Forces (1957–1960). Grechko was next first deputy minister of defense and commander in chief of Warsaw Pact Armed Forces from 1960 to 1967, when he became minister of defense. Grechko orchestrated the 1968 Warsaw Pact invasion of Czechoslovakia. He died in office in Moscow on April 26, 1976.

Greece

South European nation with a 1939 population of approximately 7.2 million. At that time, Greece was bordered to the northwest by Albania, to the north by Yugoslavia, to the northeast by Bulgaria, and by Turkey to the east. The Ionian Sea lies to the west of Greece, the Mediterranean to its south, and the Aegean Sea to the east. Much of mainland Greece is mountainous. Greece also includes a great many islands (today some 1,400, of which only 227 are populated), the largest of these being Crete.

Greece was drawn into World War II by Italy's invasion from Albania on October 28, 1940. Greek dictator General Ioannis Metaxas had sought to

maintain his nation's neutrality, but that policy ended when an Italian invasion began a Balkan campaign that drew in Britain as well as Germany and other Axis powers. The result of these developments was Axis control of the Balkans until the last months of the war. Greece suffered horribly in the war and continued to suffer during a costly civil war from 1946 to 1949.

In October 1940, without informing his ally Adolf Hitler, Italian dictator Benito Mussolini launched an invasion from Albania. Having both superior numbers and greater military hardware, Mussolini expected to complete the conquest before winter set in. The Greeks, however, resisted valiantly. They not only held the Italians but also went on the offensive and drove them back, while the British bombed Albania and neutralized the Italian Navy. Mussolini's invasion of Greece turned into a disaster from which neither he nor his regime recovered.

Determined to shore up his southern flank before he began an invasion of the Soviet Union, Hitler stepped in. Metaxas died at the end of January 1941, and in April the führer sent the German Army against both Greece and Yugoslavia, quickly overwhelming both. Neither the courage of the Greeks nor British Army reinforcements sufficed to withstand the Luftwaffe and the panzers.

The Axis occupation of Greece involved German, Italian, and Bulgarian troops and lasted three years. It was a dark period in the history of a nation that had undergone much suffering since Roman times. The Germans set up a puppet government and insisted that the Greeks pay the full cost of the occupation, which resulted in catastrophic inflation. The Germans also requisitioned resources and supplies, with no concern for the fate of a population that, even in the best of times, was obliged to import most of its food. Famine and disease decimated Greece and killed perhaps 100,000 people in the winter of 1941–1942 alone. The suffering was such that British prime minister Winston L. S. Churchill agreed—under pressure from the Greek government-in-exile and the United States—to partially lift the blockade so the International Red Cross might bring in food supplies. Greeks living in Western Thrace and Eastern Macedonia also had to undergo forced Bulgarianization.

The flourishing Jewish community in Salonika was devastated in the Holocaust; fewer than 10,000 of an estimated 70,000 Greek Jews survived the war. The Greek underground fought back with sabotage and ambush and

tied down 120,000 Axis troops. In reprisal, the Germans and Italians burned whole villages and executed large numbers of Greek hostages for every Axis soldier slain.

Greek king George II and his ministers went into exile in Egypt with the retreating British forces in 1941. Almost immediately, Greek resistance groups formed. Of the various resistance movements that had appeared during the German occupation, the largest was the National Liberation Front (Ethniko Apeleftherotiko Metopo, EAM), with the Greek People's Liberation Army (Ellinikós Laïkós Apeleftherotikós Stratós, ELAS) as its military wing. Relations were strained between it and the National Republican Greek League (Ethnikos Dimokratikos Ellinikos Syndesmos, EDES). Actual fighting broke out between the two groups in the winter of 1943–1944, although a truce was arranged in February 1944.

The communist-dominated EAM apparently enjoyed wider support than the nationalist underground. When the Germans pulled out of Greece, the EAM held the vast majority of the country. Greek society was now fractured into three factions: the monarchists, republicans, and communists.

At approximately the same time, in October 1944 Churchill journeyed to Moscow to meet with Soviet leader Joseph Stalin. Churchill struck a bargain with Stalin concerning predominance in various Balkan states, under the terms of which Britain was to have 90 percent predominance in Greece. The Greek communists, who had carried the brunt of resistance against the Axis and now controlled the majority of territory, understandably resented this imperial arrangement struck in Moscow and were unwilling to submit to it.

When the Nazis withdrew, George Papandreou, a left-of-center statesman, headed a government of national unity. Fearing the communist underground, however, he requested British troops, who began arriving early in October 1944. When the British called on the guerrilla forces to disarm and disband, the EAM quit the cabinet, called a general strike, and held protest demonstrations. In this serious situation, Churchill took the impetuous decision to fly with Foreign Secretary Anthony Eden to Athens on Christmas Day 1944. Although the government and the EAM reached accord early in 1945, it quickly broke down, and EAM members took to the hills with their weapons.

Civil war raged in Greece from 1946 to 1949 and was as costly as the tormented years of World War II. Although the communists were defeated,

unfortunately for Greece, further upheaval fanned by other nations and dictatorship lay ahead before true democracy could be achieved.

Greece, Air Force

In 1940, Greece's Air Ministry administered the Royal Hellenic Air Force (Vassiliki Aeroporia). The navy controlled the naval cooperation squadrons, and the army controlled fighters, bombers, and ground-support squadrons. The Greek Air Force's modern aircraft were grouped into four fighter squadrons and three bomber squadrons. At the start of the war with Italy in October 1940, Greece deployed 216 first- and second-line aircraft of all types, including liaison. Greece also had about 60 obsolete aircraft dating back to World War I.

At the beginning of its invasion of Greece, Italy operated 187 modern aircraft from Albania, and it could also draw on hundreds of aircraft operating from Italy. The Greek Air Force was composed of a mélange of Czech, Polish, German, French, and later British aircraft. Greece had no reserves and was totally dependent on the British for resupply. Securing replacement parts was a nightmare, and the lack of parts meant that many aircraft became inoperable.

During 1940 and 1941, the Greek Air Force aggressively operated with some success in support of army operations on the Albanian front. As the

army advanced into mountainous Albania, however, flying distances became longer and more problematic, whereas Italian aircraft were able to operate closer to their bases. By the time Germany invaded Greece in April 1941, the Greek Air Force was down to 41 operational aircraft. Following the Axis victory at the end of April, the Greek government-in-exile maintained an air force of two fighter squadrons and one bomber squadron in the Mediterranean under British control.

Greece, Army

In October 1940, at the time of the Italian invasion, the Greek Army, commanded by General Alexandros Papagos, numbered some 430,000 men in 18 divisions. By April 1941, when the Germans invaded Greece, army strength was some 540,000 men. Each division numbered at full strength approximately 18,500 men, formed in three regiments of three battalions each.

Most of the divisions were organized along World War I lines and were lightly armed mountain divisions. The army had almost no tanks, although in the course of the fighting the Greeks captured some Italian L3 tankettes and formed a weak motorized division. The Greeks also had little in the way of antiaircraft artillery, and much of the army's equipment was also antiquated. Although the Greeks had few mortars, they possessed more machine guns and more effective heavy artillery than did the Italians. Greek supply services were poor, leading to much hardship among the troops in the mountains and during the winter.

In October 1940, when the Italian Army invaded from Albania, the Greek Army had four first-line divisions on the Albanian frontier. The Greek Army fought well against the Italians; in its counterattack, it expelled the Italian Army from Greece and penetrated into Albania. The Greeks were overwhelmed when the German Army entered the fighting in April 1941, however. During the 1940–1941 campaign, the Greek Army sustained 13,408 killed and 42,485 wounded. Some 9,000 soldiers were evacuated to Crete, and others escaped through Turkey to Egypt. Ultimately, the Greeks formed the 18,500-man Royal Hellenic Army, which fought under British command in the Middle East. It consisted of three infantry brigades, an armored car regiment, an artillery regiment, and the Greek Sacred Regiment, composed entirely of officers.

One brigade of the Royal Hellenic Army fought in the Battle of El Alamein (October 23–November 4, 1942), but most of the force saw little action, the consequence of political infighting. A mutiny in 1944 led to the internment of much of the army, although part of it was used in nonoperational duties. A newly formed unit, the 2,500-man Third Mountain Brigade, did fight with distinction in the 1943–1945 Italian Campaign, where it was known as the Rimini Brigade.

Greece, Navy

In late 1939, the Royal Hellenic Navy (RHN) was a relatively small force of mostly obsolescent warships, some of which dated to before World War I. The navy consisted of the armored cruiser *Giorgios Averoff* (built in Italy in 1910), 10 destroyers (6 modern and 4 outdated), 6 modern submarines, 1 old cruiser/minelayer, 10 old torpedo boats, and an assortment of auxiliary vessels. No warships were under construction, although the RHN planned to take delivery of two additional (British-built) destroyers. As well as possessing generally obsolete equipment, the RHN suffered from the national political schism of the 1930s that brought purges of the officer corps.

In the mid-1940, Italy began a period of harassment that included air attacks on Greek ships at sea and the sinking by the Italian submarine *Delfino* of the anchored cruiser/minelayer *Helle* on August 15, 1940. Once Italy declared war on Greece on October 28, 1940, the RHN was active in supporting the army and in conducting destroyer sweeps in the Ionian Sea.

The RHN experienced serious losses from air attacks following the April 1941 German invasion. The surviving Greek ships, their bases seized by German troops, withdrew first to Crete and then to Egypt, where they were integrated into the British Royal Navy. The Royal Navy had operational control of the Greek ships, and the RHN was responsible for their administration. The Greek ships were in need of refit and modernization, and they received from the Royal Navy modern fire-control systems and antiaircraft and antisubmarine armaments. The British also transferred to the RHN a variety of destroyers, corvettes, submarines, and smaller craft, including minesweepers.

RHN ships then served throughout the eastern Mediterranean. Beginning in 1942, the RHN experienced nearly continual political unrest concerning the composition of the Greek government-in-exile. This culminated in the April 1944 mutiny of virtually the entire RHN at Alexandria and Port Said. Although the mutiny was crushed, the Greek ships were out of action for some four months while units were purged of mutineers.

Following the German retreat from the Balkans, in October 1944 the RHN returned to Greek waters. It spent the remainder of the war reestablishing itself in its home territory, opening ports, engaging communist

groups that resisted the return of the government from Egypt, and containing German garrisons on the larger Aegean islands.

Greece Campaign, German (April 6–30, 1941)

Important Balkan theater campaign that pitted Greek and British Empire forces against German and Italian forces. In the spring of 1941, German leader Adolf Hitler sent forces into Greece. His decision was prompted by his desire to eject the British from the Aegean and the eastern Mediterranean; protect his southern flank—especially the Romanian oil fields at Ploieşti—before launching the June 22, 1941, Operation BARBAROSSA, the invasion of the Soviet Union; and assist Italy, his faltering ally. During the winter of 1940–1941 and into March 1941, German troops were stationed first in Romania and then in Bulgaria, threatening the Greek Second Army. Greece was led by General M. Alexander Koryzis, who succeeded dictator General Ioannis Metaxas on the latter's death in late January 1941. General Alexander Papagos commanded the Greek Army.

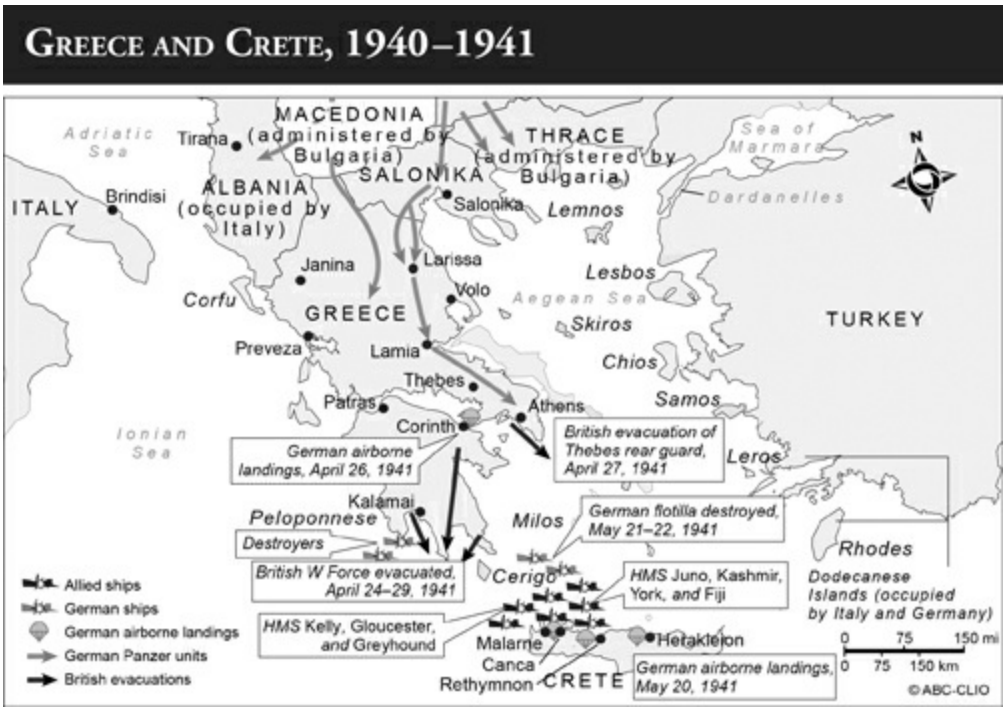
Greece was already at war, having been invaded by Italy in October 1940. The Greeks had not only repelled that invasion but had launched a counterinvasion of Albania. Papagos had committed the majority of the Greek army on that front in the northwest, where Lieutenant General Georgios Tsolakoglou's First Greek Army of 16 divisions faced 28 Italian

divisions of the Eleventh and Ninth Armies in Albania and had repulsed a large Italian offensive in March.

Lieutenant General K. Bacopoulus's weaker Second Greek Army held the Greek frontier, with Yugoslavia and Bulgaria to the northeast. However, the army was dangerously split. Three divisions were strung out along the Metaxas Line of defensive works east of the Struma River in Macedonia facing Bulgaria. Three other Greek divisions were with the British contingent, including the weak 19th Division, the Greek army's only motorized division. The 19th Division was equipped with a few captured Italian L3 tankettes, some worn-out British Bren carriers, and trucks.

British prime minister Winston L. S. Churchill had ordered to Greece from North Africa some of the best British Empire troops there, commanded by Lieutenant General Henry Maitland Wilson. Known as Force W, they took up position along the Aliakmon Line, named for the Greek river just southwest of Salonika. Force W consisted of a New Zealand division, an arriving Australian division, and a British armor brigade. Royal Air Force (RAF) units had been fighting in Greece from early November 1940. Altogether, slightly more than 60,000 British Empire forces were in Greece when the Germans struck.

The German invasion of Greece from Bulgaria began on April 6, 1941. Field Marshal Wilhelm List had command. His Twelfth Army was made up of the equivalent of six corps (a seventh was transferred to the Second Army, which invaded Yugoslavia on April 12) and included three panzer divisions. Leading the assault were the 2nd Panzer Division (known as the "Vienna Division" for the number of Austrians in it), the 9th Panzer Division, and the 5th and 6th Mountain Divisions. List's aim was to smash through the Metaxas Line and drive on Athens.



Because the bulk of the Greek army was located on the Albanian front, the highly trained, much stronger, and more technologically advanced German army sliced through Greek forces to the east without much difficulty. The Axis powers enjoyed overwhelming air superiority. Italian Air Force units operating from Albania alone were equal to the total Allied air strength in Greece, and the German Air Force had as many Stuka dive-bombers in the theater as the total number of Allied first-line aircraft.

One of the most dramatic attacks of the campaign occurred on the morning of April 7, when German aircraft bombed the Greek port of Piraeus and hit two freighters loaded with ammunition. The resulting blasts, heard 150 miles away, destroyed 41,942 tons of shipping and demolished docks. Axis air superiority confined most Allied movements to nighttime and was perhaps the key factor in the Axis victory.

Within three days of the start of their offensive, German forces had seized the port city of Salonika and breached the Metaxas Line. They also had taken 60,000 Greeks prisoner. On April 12, the Greek high command ordered General Tsolakoglou to withdraw his First Army from Albania. Lacking mobility and with much of its equipment worn out, the First Army fell back slowly, only to surrender on April 23 to a joint German-Italian military commission.

The 2nd Panzer Division, meanwhile, was advancing along the Greek eastern coast toward the British forces, which were only just arriving and taking up defensive positions. The 2nd Panzer Division engaged the 2nd New Zealand Division and forced it to retreat. Additional German forces advanced through Yugoslavia and into central Greece from Bitolj, isolating eastern Greece. The Greeks fought hard with what resources they had, but they were simply overwhelmed. General Papagos promised Wilson that the Greeks would do their best to protect the British forces while they evacuated.

With the defeat of his country imminent, Greek prime minister Alexandros Koryzis committed suicide on April 18. His successor, Emanuel Tsouderos, pledged to assist British Empire troops in evacuating Greece. On April 23, the same day the Greek army surrendered, King George II fled Greece for Egypt and there set up a government-in-exile.

On April 24, the British abandoned Thermopylae and began withdrawing into the Peloponnesus. Royal Navy ships, meanwhile, braved Luftwaffe attacks to carry out night evacuations of British forces from ports in eastern Greece. On April 26, the Germans carried out a daring paratroop operation to cut off the British withdrawal. Using gliders, they successfully seized the only bridge over the Corinth Canal. Although the British destroyed part of the bridge with artillery fire, the Germans quickly rebuilt it and used the bridge to press into the Peloponnesus. Wilson managed to fight his way through, however, evacuating most of his troops.

More than 50,000 British Empire forces were evacuated in Operation DEMON, although most of their equipment had to be abandoned. The last formal evacuation took place on April 30; many of the troops were then sent to Crete. Some resistance continued in the Greek islands until May 4. British naval losses were 2 destroyers and 4 merchant ships; the Greeks lost in the campaign 3 destroyers and a torpedo boat as well as 43 merchant ships of 63,975 tons.

In the entirety of the Greek Campaign, the Germans lost 2,559 killed (including 200 aircrew) and 5,820 wounded. The Greek Army sustained 13,408 killed, 42,485 wounded, and 270,000 prisoners. Italian losses during April were 13,775 dead, 54,874 wounded, and 25,067 missing. The British suffered 5,100 dead, wounded, or missing and some 7,000 taken prisoner.

General Tsolakoglou then headed a collaborationist Greek government in Athens, with Greece divided into German, Italian, and Bulgarian occupation

zones. In May, the Germans took Crete by airborne assault. German troops then controlled that island as well as Lemnos, Lesbos, and Chios; some smaller islands in the Aegean; the Turkish border region; Salonika; and the port of Athens and its surrounding area. Bulgarian forces occupied much of Macedonia, and Italy controlled the remainder of the Greek mainland as well as most of the Greek Mediterranean islands.

Some historians have suggested that Germany's invasion of Greece and Yugoslavia delayed Operation BARBAROSSA. Other factors, though, especially the need to wait for dry weather for the panzers, were more important. Nonetheless, the panzer divisions that had seen service in Greece had to undergo refit and were thus not immediately available for BARBAROSSA. The campaign also exacted a toll in equipment and in precious stocks of fuel.

Greece Campaign, Italian (October 28, 1940–March 1941)

In April 1939, Italian dictator Benito Mussolini ordered the Italian Army to invade Albania and secure control of the Adriatic Sea. On taking over

Albania, Italy began a major engineering project there to improve roads to the Greek border. This was accompanied by assurances that Italy would not attack Greece. Simultaneously, on April 13, Britain and France extended territorial guarantees to both Greece and Romania.

Italy was planning an invasion. Code-named CASE G, the plan received major impetus from Mussolini's son-in-law, Foreign Minister Galeazzo Ciano, who was much involved in Albanian affairs and sponsored this operation to expand his influence over Greece. Mussolini also resented Adolf Hitler's decision to send German troops to Romania to protect the Ploieşti oil fields, a move destroying Italian influence in Romania. Mussolini was determined to redress the Balkan balance.

On October 15, 1940, Mussolini met in Rome with his military leaders, including chief of the General Staff Marshal Pietro Badoglio and deputy chief of the army staff General Mario Roatta, to discuss the attack on Greece. Also present was General Sebastiano Visconti-Prasca, commander of the Eleventh Army in Albania and author of the invasion plan, a much-reduced CASE G. Although questions were raised during the meeting, none of those present seriously opposed the decision to begin the invasion in a few days. At this time Mussolini wrote to Hitler seeking advice and informing him of his intentions, but by delaying sending this letter, Mussolini hoped to surprise his ally, just as Hitler had surprised him with his timing of the invasion of France. Hitler, who had accurate information about Italian intentions, made no effort to restrain his ally.

Before dawn on October 28, 1940, the Italian ambassador in Athens presented an ultimatum to Greek prime minister and dictator General Ioannis Metaxas accusing Greece of allowing British ships to use Italy's territorial waters and demanding free passage of Italian troops on Greek soil. Athens rejected the ultimatum, and at 5:30 a.m. that same day Italian forces began the invasion.

The Italians had deployed in Albania six infantry divisions (two regiments each, reinforced with a lightly armed Blackshirt Legion, with a total of 12,500 to 14,500 men in each division). These were the Siena, Ferrara, Piemonte, Parma, Venezia, and Arezzo divisions. In addition, the Italians had the Centauro Armored Division and the 3rd Alpine Division Julia. In all, the army deployed some 150,000 men—giving them only a

slight numerical superiority over the Greek army before mobilization, instead of the two-to-one advantage that Visconti-Prasca claimed.

The weather was poor, with torrential fall rains. The main body of Italian troops, consisting of the Ferrara, Centauro, and Siena Divisions, advanced near the Adriatic coast, where the terrain was more favorable, trying to push across the Kalamas River and reach Janina. The Julia Division attacked toward Metsovon Pass to penetrate between Epirus and Macedonia. To the extreme Italian left, the Parma and Piemonte Divisions were on the defensive at Korcë.

In defense along the Albanian border, the Greeks had deployed four infantry divisions of three regiments each. These resisted the invaders while King George II of Greece appealed to Britain for assistance. His request won friendly reception from British prime minister Winston L. S. Churchill. Although Metaxas, not wanting to offend Hitler, requested only weapons and equipment, Churchill favored sending an expeditionary force. In any case, London immediately dispatched five Royal Air Force (RAF) squadrons and an interservice mission.

On October 31, British forces arrived on the islands of Crete and Lemnos, placing British bombers within range of the Ploieşti oil fields. In response, on November 4, Hitler ordered his army high command to begin preparations for a German attack on Greece.

The same day that the Italian invasion began, on October 28, Mussolini met with Hitler in Florence and proudly informed him of the event. Mussolini’s triumph was short-lived, however, as the Greek army, commanded by General Alexandros Papagos, offered stiff resistance. By the end of the month, the Italian offensive had ground to a halt. The Greeks mobilized reserves for a total force of 18 divisions, with French-supplied artillery superior to that of the Italians. They were, however, inferior in air assets.

By November 1, the Greeks had launched a series of counterattacks that stopped the Italians on the Kalamas River. The Italians made no progress on the Epirus Front, whereas the Julia Division arrived at the Metsovon Pass, only to be counterattacked and cut off as the Greeks advanced toward the Korcë basin, there overrunning the Parma and Piemonte Divisions. The Italian high command ordered the Venezia and Arezzo infantry divisions, deployed on the Yugoslavian border, to reinforce the front.

On arrival, however, they were obliged to retreat in chaos before a spirited Greek advance that aimed to cut the road from Korcë to Perati and envelop the invaders-turned-defenders. The only option for the Italians was to withdraw their entire line into Albania. This took place on November 8, a bleak time for the Italian Army in the campaign. The following day, Visconti-Prasca was replaced by deputy chief of the Italian high command General Ubaldo Soddu, who then formed the Italian forces into the Albanian Army Group.

Although Mussolini boasted on November 19 that he would "break Greece's back," a day later he received a sharply worded letter from Hitler that criticized Mussolini's move, which had opened a new front that allowed the British to operate in the Balkans. The Germans were already preparing Operation BARBAROSSA, an invasion of the Soviet Union, for June 22, 1941, and for security reasons did not wish to disclose their plans to the Italians.

As a consequence of the Italian failure, on November 26 Marshal Badoglio and other military leaders were forced to resign. On December 4, General of the Army Ugo Cavallero replaced him. Cavallero demanded more power for the chief of the General Staff and directly helped facilitate the crisis on the Albanian Front. Cavallero would shortly take over command of the Albanian Army Group from Soddu, who retired in disgrace.

In early December, the Italian retreat from Greece back into Albania continued, forcing Mussolini to seek assistance from Hitler. The Italian "parallel war" now came to an end, along with the illusion that Italy was a great power. With the help of German transport aircraft, the Italians flew in reinforcements and shipped equipment to Valona, but this caused great confusion; units that had hurried to the front quickly disintegrated under Greek pressure and the effects of the winter weather. Moreover, it was difficult for the Italians to transport supplies to the front lines, as all had to be shipped from Italy, and there were not enough pack mules. To make things worse, on December 9 British Commonwealth units under Lieutenant General Archibald Wavell launched a successful offensive in North Africa that overran the more numerous Italian troops. By January 6, 1941, the British had seized the Libyan border town of Bardia.

The British now faced the strategic problem of having to choose between exploitation of their North African successes and stiffening Greek resistance. On January 6, 1941, Churchill told the chiefs of staff that it would be better to

delay exploiting the situation in North Africa in order to help Greece seize Valona and avoid military defeat. Churchill therefore informed Wavell that Tobruk would be taken, but follow-up operations would depend on the situation in Greece, which would be the priority. This was also partly because intelligence revealed that German forces were concentrating for a possible offensive in the Balkans. Apparently the Greeks did not need much outside assistance, as they attacked Klisura and forced the Italians to abandon it. At that point the Greek drive died, meeting stiffening Italian resistance, which successfully defended Berat and therefore Valona but at a high price.

On January 19, 1941, Mussolini met Hitler and asked him for assistance to check the British Commonwealth advance in North Africa. Mussolini did not, however, request any help in the Greek theater of operations. Meanwhile, for propaganda purposes, Mussolini demanded that senior Fascist Party leaders join Italian troops at the front. Thus, Foreign Minister Ciano took command of a bomber group, and the ideologue Bruno Bottai joined an Alpini battalion.

A British military mission arrived in Athens on February 22 to study the situation and propose shipment by sea of an expeditionary corps to Greece. The following day the Greeks accepted the offer, whereon Britain dispatched some of its best North African forces to Greece: 60,000 men with 240 field artillery pieces, 32 medium artillery guns, 192 antiaircraft guns, and 142 tanks under Lieutenant General Henry Maitland Wilson.

Under German pressure, Bulgaria signed the Tripartite Pact on March 1, and German Army units began to flow in force into Bulgaria to deploy for the future campaign. A few days later the first British convoy to Greece sailed from Alexandria, and by March 7 British troops began to disembark at Piraeus.

The Italians tried to force the situation to avoid the impression that they had been “saved” by the Germans. In March, General Cavallero launched 27 divisions in an offensive to reach Klisura. It failed and cost 12,000 Italian casualties. On March 28 in an effort to check the British convoys bringing military aid to Greece, the Italian Navy suffered an important naval defeat at the Battle of Cape Matapan.

Meanwhile, on March 25 under heavy pressure, Yugoslavia adhered to the Tripartite Pact. But on the night of March 26–27, a military coup d’état forced Prince Regent Paul into exile, and General Dušan Simović formed a

new government. This event prompted German military intervention. On April 6 with Italian and Hungarian assistance, German forces invaded both Yugoslavia and Greece.

During the Italo-Greek War of October 1940–April 1941, the Greek Army suffered 13,408 killed and 42,485 wounded. The Italians lost 13,775 dead, 50,874 wounded, and 25,067 missing. In addition, the campaign cost Italy reinforcements to North Africa, especially in equipment, which went instead to Albania. Thus, the British successes in North Africa in large part resulted from the Italian invasion of Greece.

Greer, Attack on (September 4, 1941)

The attack by the German submarine *U-652* on the U.S. Navy destroyer *Greer* in the North Atlantic on September 4, 1941, marked the beginning of a de facto naval war between the United States and Germany. The *Greer* (DD 145) was built in 1918 in Philadelphia, one of a class of 21 flush-deck, four-funnel destroyers displacing 1,165 tons, with a length of 314 feet, and armed with four 4-inch guns, one 3-inch gun, and 12 torpedo tubes. It was rated at

35 knots and carried a crew of 133. After initial service in the Atlantic, from November 1919 until June 1936 the *Greer* served in the Pacific. In reserve at Philadelphia after January 1937, it was recommissioned in October 1939 and assigned in February 1940 to the Neutrality Patrol to protect U.S. shipping.

At 8:47 a.m. on September 4, 1941, while proceeding independently from Argentina to Reykjavik, Iceland, the *Greer,* captained by Lieutenant Commander Laurence H. Frost, was about 175 miles from Reykjavik when it was signaled by a British plane that a German submarine was 10 miles ahead in the *Greer*'s path. This was the *U-652.* The *Greer* made sound contact at 9:20 a.m. At 10:32 a.m., having been informed by Frost that the *Greer* did not intend to attack, the British aircraft dropped four depth charges in the vicinity of the submarine and then departed to refuel. The *Greer* maintained contact, possibly for practice or possibly to mark the U-boat's location pending arrival of other British forces.

At 12:48 p.m., its commander probably having identified the *Greer* as similar to 50 destroyers recently transferred by the United States to Britain, the submarine fired a torpedo, prompting the *Greer* to drop eight depth charges. At 1:00 p.m., the *Greer* evaded a second torpedo. The Americans lost sound contact, and although a British destroyer appeared, the *Greer* continued searching. It regained contact at 3:07 p.m. and dropped 11 more depth charges before finally disengaging at 6:40 p.m.

On September 11, President Franklin D. Roosevelt made this encounter the subject of a fireside chat on U.S. radio, calling the German action "piracy" and issuing a shoot-on-sight order for U.S. ships on North Atlantic convoy duties as far as Iceland against German submarines. The *Greer* incident thus brought the United States and Germany substantially closer to war.

In October 1941, the *Greer* escorted the U.S. destroyer *Kearny* to Iceland after the latter had been torpedoed by *U-568* and suffered the war's first U.S. casualties at German hands. The *Greer* continued convoy and patrol duties in the Atlantic and the Caribbean until February 1944 and provided training and plane guard service in home waters until June 1945. The ship was decommissioned in July 1945 and sold for scrap the following November.

Greim, Robert Ritter von (1892–1945)

German Air Force field marshal and last commander of the Luftwaffe. Born on June 22, 1892, in Bayreuth, Robert Ritter von Greim joined the Bavarian artillery in October 1912 and transferred to the air service in August 1915. In June 1917 he took command of Jagdstaffel 34 (Fighter Squadron 34), a Bavarian fighter squadron of single-seated aircraft, winning 28 aerial victories and the Pour le Mérite.

From 1924 to 1927, Greim was an adviser and instructor to the Chinese Guomindang (Kuomintang, Nationalist, GMD) air force. On his return to Germany, he became director of the Bavarian gliding federation. Greim joined the German Air Force in 1934 as a major and was appointed inspector of fighters and dive-bombers. Colonel Greim headed the Personnel Section of the Air Ministry in 1937. In 1938 he was promoted to major general and assigned command of Jagdgeschwander 132 Richthofen, named for the World War I expert (ace).

In 1939, Greim became commander of V Flieger Korps as a lieutenant general, leading it in the invasion of Poland (September 1, 1939), the Battle for France (May 10–June 25, 1940), and the Battle of Britain (July 10–September 30, 1940). He was promoted to lieutenant general on January 1, 1940, and six months later to general of flyers. Greim's unit was then sent to the Eastern Front. From February 1943 to April 1945 as a colonel general, Greim commanded Luftflotte (air fleet) 6 on the Eastern Front.

On April 24, 1945, Adolf Hitler summoned Greim to the besieged city of Berlin. Greim flew into the city with test pilot Hanna Reitsch two days later. Their plane was hit by antiaircraft fire, and Greim was badly wounded in the right foot, although Reitsch landed the plane safely. Hitler then met with Greim, promoting him to field marshal (the last so appointed) and head of the Luftwaffe, replacing the dismissed Hermann Göring. Hitler then ordered Greim and Reitsch to leave Berlin, despite their stated wish to remain with the führer. On April 28 the two flew out of the city in a training plane.

Following capture by the Americans, Greim, a rabid Nazi who feared he would be handed over to the Soviets for trial, committed suicide on May 24, 1945, in Salzburg, Austria.

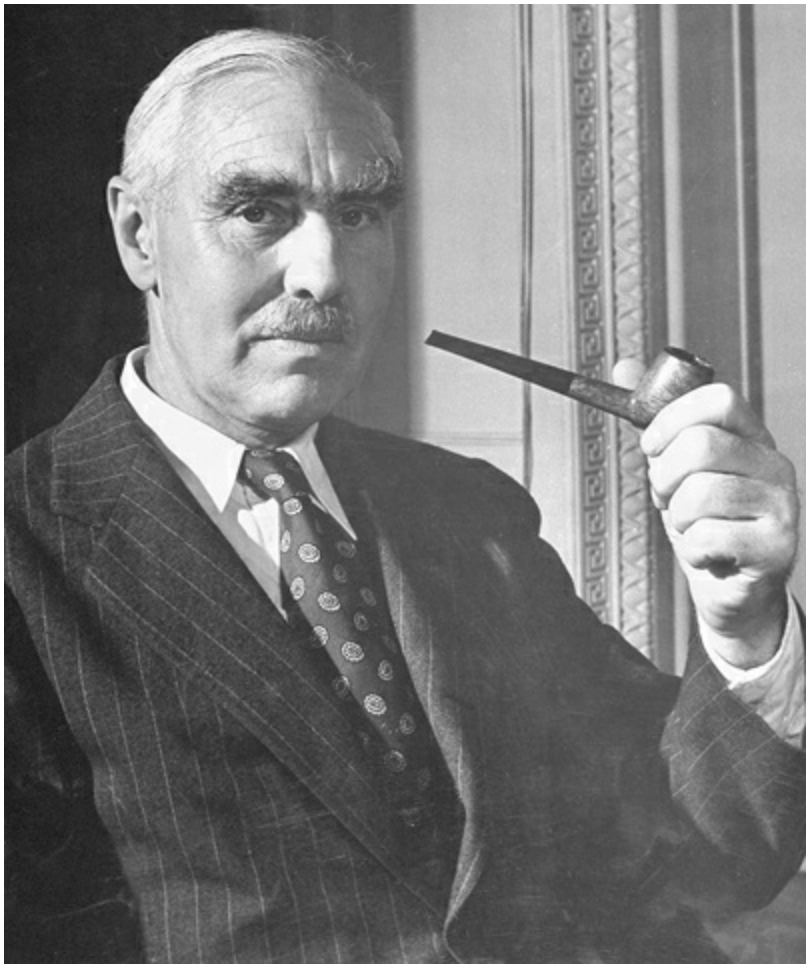
Grew, Joseph Clark (1880–1965)

U.S. diplomat and undersecretary of state. Born on May 27, 1880, in Boston, Massachusetts, into a prominent family, Joseph Clark Grew attended Harvard University and then joined the U.S. diplomatic service, transferring from the consular to the foreign service in 1904. Grew's influential contacts, including Presidents Theodore Roosevelt and Franklin D. Roosevelt, facilitated his career.

Grew's postings included Cairo, Mexico City, Russia, Berlin, Vienna, and Denmark. After serving as undersecretary of state from 1923 to 1927, in which capacity he helped to implement the reorganization of the Foreign Service, Grew became ambassador to Turkey. In 1932, he was appointed the

first career U.S. ambassador to Japan, remaining in Tokyo until Japan declared war on the United States in December 1941.

Grew's wife, Alice Vermandois Perry, was descended from Commodore Matthew Perry, who had opened Japan to Western influence in 1853. She had spent her youth in Japan and knew many of its leading figures. Grew firmly hoped that Japan's growing antagonism toward the United States might be reversed. He urged greater American sympathy for Japan's economic problems and sought more latitude as ambassador in handling U.S.-Japanese relations. Grew's regular swings from optimism to pessimism during successive Japanese governments and his eagerness to conciliate the Japanese brought clashes with Stanley K. Hornbeck, head of the State Department's Division of Far Eastern Affairs.



Acting U.S. secretary of state Joseph C. Grew, 1943. (Marie Hansen/The LIFE Picture Collection/Getty Images)

Seeking to avoid what increasingly seemed to be an inevitable conflict, in October 1939 Grew publicly warned Japan that if it wished to avoid serious American retribution, it must alter its increasingly bellicose international stance. This precipitated harsh Japanese press attacks on him. Grew subsequently unsuccessfully urged a personal meeting between President Franklin D. Roosevelt and Japanese premier Prince Konoe Fumimaro, which he later unconvincingly claimed might have averted war.

Interned after the Japanese attack on Pearl Harbor (December 7, 1941) and repatriated to the United States in the spring of 1942, Grew returned to Washington as a special assistant to Secretary of State Cordell Hull, becoming director of the Division of Far Eastern Affairs in 1944. As undersecretary of state from December 1944 to August 1945, Grew opposed

further collaboration with Soviet Russia, unsuccessfully sought to prevent the use of nuclear weapons against Japan by urging American acceptance of a negotiated peace settlement rather than unconditional surrender and helped to preserve the Japanese emperor's status as nominal head of state. Grew retired in August 1945 and died at Manchester-by-the-Sea, Massachusetts, on May 25, 1965.

Griswold, Oscar Woolverton (1886–1959)

U.S. Army lieutenant general. Born in Ruby Valley, Nevada, October 22, 1886, Oscar Woolverton Griswold graduated from the U.S. Military Academy at West Point in 1910 and was commissioned in the infantry. He served in China from 1914 to 1917. As a major in the 84th Division in World War I, Griswold fought in the 1918 Meuse-Argonne Offensive and was wounded. He then served in the postwar occupation of Germany until 1919.

Griswold graduated from the Command and General Staff School in 1925 and the Army War College in 1929. He served with the War Department General Staff (1929–1931), was a member of the Infantry Board (1932–1936), served in the office of the chief of infantry (1936–1939), and commanded the 29th Infantry Regiment (1939–1940).

Promoted to brigadier general in October 1940, Griswold served with the 4th Infantry Division (1940–1941). Promoted to major general in August 1941, he commanded the Infantry Replacement Training Center at Camp Croft in South Carolina in 1941. Griswold then commanded first the 4th

Motorized Division (1941–1942), then IV Corps (1942–1943). In 1943 he was assigned to command XIV Corps in the South Pacific. Griswold then became the senior army ground officer in the Solomon Islands.

In July 1943, with U.S. forces stalled during the July–October 1943 Battle of New Georgia, Griswold took personal command of the assault force. Bringing in substantial reinforcements, he soon secured the island. In December, his XIV Corps replaced a marine landing force at Empress Augusta Bay, Bougainville, and built a strong defensive perimeter there. In March 1944, his men successfully repulsed strong Japanese attacks during the Bougainville Campaign (November 1, 1943–August 15, 1945).

Turning over their base to Australian troops beginning in March 1944, Griswold and his corps were absorbed into General Douglas MacArthur's Southwest Pacific command. Assigned to Lieutenant General Walter Krueger's Sixth Army, Griswold's corps was one of two landing on Luzon in the Philippines on January 9, 1945. After a lengthy battle and at heavy cost to combatants and civilians alike, XIV Corps liberated Manila that March. Griswold's command then cleared the southern part of Luzon. Promoted to lieutenant general in April 1945, Griswold was MacArthur's choice in June to replace the slain Lieutenant General Simon Buckner in command of the Tenth Army on Okinawa, an assignment that went instead to Lieutenant General Joseph Stilwell.

Returning to the United States, Griswold commanded the Third Army from 1945 to 1947. He retired from the army in October 1947. Griswold died in Colorado Springs on September 28, 1959.

Grizodubova, Valentina Stepanovna (1909–1993)

Russian Air Force colonel and sole woman commanding officer of a men's wing during World War II. Born in Kharkov (Kharkiv) on May 10, 1909, the daughter of an aircraft designer, Valentina Stepanovna Grizodubova graduated from the Penza Flying Club in 1929, the Kharkov Flying School, and the Advanced Flying School in Tula in 1933. She mastered many types of aircraft, setting seven world records in the process. On September 24–25, 1938, Grizodubova flew nonstop from Moscow to the Pacific in an ANT-37 aircraft. For this pioneering flight she, her copilot, and her navigator—both also women—received the award of Hero of the Soviet Union, the highest Soviet decoration. They were the first Soviet women thus honored.

In May 1942, Grizodubova was appointed commanding officer of the 101st Long-Range Air Regiment (renamed the 31st Krasnosel'sky Guards Bomber Regiment in 1944). She successfully demonstrated the suitability of the Li-2 (modified DC-3) for use as a night bomber. In June 1942, Grizodubova led her unit in delivering supplies to the besieged city of Leningrad (July 10, 1941–January 27, 1944). She was noted for flying more than her male colleagues and sometimes flew as copilot to monitor her pilots' performance.

In September 1942, Grizodubova's unit was placed at the disposal of Central Partisan Headquarters. Overcoming dense flak and engaging German fighters, her aircrews flew more than 1,850 supply missions, also evacuating wounded partisans and children. In 1943, Grizodubova prevailed on her superiors not to decrease these flights.

Grizodubova flew some 200 wartime missions and was awarded many prestigious decorations. A senior civil aviation official after the war, she was also the sole woman on the Extraordinary State Commission for the Establishment and Investigation of the Crimes of the Fascist German

Invaders and Their Accomplices, and of the Damage They Caused to Citizens, Collective Farms, Public Organizations, State Enterprises, and Institutions of the Soviet Union. She also served on the executive board of several veterans' organizations, assisting numerous former prisoner-of-war camp inmates who were persecuted by Soviet authorities. Grizodubova died in Moscow on May 1, 1993.

Groves, Leslie Richard (1896–1970)

U.S. Army general who oversaw the Manhattan Project. Born in Albany, New York, on August 17, 1896, Leslie Richard "Dick" Groves attended the University of Washington and the Massachusetts Institute of Technology. He secured an appointment to the U.S. Military Academy at West Point, graduating in 1918, and entered the Army Corps of Engineers.

After initial training at the Engineer School at Fort Humphreys (later Fort Belvoir), Virginia, Groves served in Hawaii; Texas; Nicaragua; Washington, D.C.; and Missouri. Assigned to the War Department in 1939, he became chief of the Corps of Engineers Operations Branch and in 1941 deputy head of the Construction Division. In these capacities, Groves oversaw the vast expansion of military camps and training facilities across the United States. He then supervised construction of the Pentagon, the world's largest office building.

Major General Leslie Groves, who was in charge of the MANHATTAN Engineer District and oversaw the building of facilities for testing the first atomic weapons. (National Archives)

Success in a variety of engineering projects led to Groves's promotion to brigadier general and assignment in September 1942 to head the Manhattan Project, charged with development and construction of an atomic bomb. Groves controlled 129,000 personnel and $2 billion in spending. He was promoted to major general in March 1944. This vast effort resulted in the explosion of the first atomic device at Alamogordo, New Mexico, on July 16, 1945. Groves advised President Harry S. Truman to employ the bomb and assisted in the selection of Japanese target cities.

After the war, Groves sought international control over atomic energy. When this did not occur, he organized the Army Forces Special Weapons Project to study military uses of atomic energy. Promoted to lieutenant general in January 1948, Groves retired from the army that same month and

became vice president for research of the Rand Corporation. He retired altogether in 1961. Groves died in Washington, D.C., on July 13, 1970.

Guadalcanal Land Campaign (August 1942–February 1943)

Bitter contest between Japanese and American forces that marked a turning point in the Pacific theater. The struggle on Guadalcanal was protracted and between August 1942 to February 1943 saw some of the most intense fighting of the war. In all, there were some 50 actions involving warships or aircraft, 7 major naval battles, and 10 land engagements.

Guadalcanal is an island in the Solomon chain northeast of Australia. It lies on a northwest-southeast axis and is 90 miles long and averages 25 miles wide. Guadalcanal's southern shore is protected by coral reefs, and the only suitable landing beaches are on the north-central shore. Once inland, invading troops faced dense jungle and mountainous terrain, crisscrossed by numerous streams. The Guadalcanal Campaign encompassed not only Guadalcanal but also Savo and Florida Islands as well as the small islands between Florida and Guadalcanal: Tulagi, Tanambogo, and Gavutu.

In January 1942, Japanese amphibious forces had landed in the Bismarck Archipelago between New Guinea and the Solomon Islands. They quickly wrested Kavieng on New Ireland Island and Rabaul on New Britain from the Australians. The Japanese consolidated their hold and turned Rabaul into their principal Southwest Pacific base. By early March, they landed at

Salamaua and Lae in Papua and on Bougainville. Their advance having gone so well, the Japanese decided to expand their defensive ring to the southeast to cut off the supply route from the United States to New Zealand and Australia. On May 3, the Japanese landed on Tulagi and began building a seaplane base there. Between May and July, the Japanese expanded their ring farther in the central and lower Solomons. These operations were carried out by Lieutenant General Imamura Hitoshi's Eighth Army from Rabaul. The first Japanese came ashore on Guadalcanal on June 8. On July 6, their engineers began construction of an airfield near the mouth of the Lunga River.

The discovery of the Japanese effort on Guadalcanal led to the implementation of Operation WATCHTOWER. Conceived and pushed by U.S. chief of naval operations Admiral Ernest J. King, it called for securing Tulagi as an additional base to protect the U.S.-Australian lifeline and as a starting point for a drive up the Solomons to Rabaul. On April 1, 1942, the Pacific was divided into two commands: U.S. vice admiral Robert L. Ghormley, commanding in the South Pacific, was to take the southern Solomons, including Guadalcanal, and General Douglas MacArthur's forces were to secure the remainder of the Solomons and the northwest coast of New Guinea, the final objective being Rabaul.

If the Japanese were allowed to complete their airfield on Guadalcanal, they would be able to bomb the advanced Allied base at Espiritu Santo. U.S. plans to take the offensive were now stepped up, and a task force was hurriedly assembled. From Nouméa, Ghormley dispatched an amphibious force under Rear Admiral Richmond K. Turner, lifting Major General Alexander A. Vandegrift's 19,000-man reinforced 1st Marine Division. A three-carrier task force under Vice Admiral Frank J. Fletcher provided air support. This operation involved some 70 ships.

On August 7, 1942, the marines went ashore at Tulagi, Florida, Tanambogo, Gavutu, and Guadalcanal, surprising the small Japanese garrisons (2,200 on Guadalcanal and 1,500 on Tulagi). On the same day, the marines seized the harbor at Tulagi, and by the next afternoon they had also secured the airfield under construction on Guadalcanal, along with stocks of Japanese weapons, food, and equipment. Supplies for the marines were soon coming ashore from transports in the sound between Guadalcanal and Florida Islands, but this activity came under attack by Japanese aircraft based at

Rabaul. Vandegrift told Fletcher he would need four days to unload the transports, but Fletcher replied that he was short on fuel and in any case could not risk keeping his carriers in position off Guadalcanal for more than 48 hours.

Stakes were high for both sides. The fiercest fighting occurred for the airfield, renamed Henderson Field for a U.S. Marine Corps aviator killed in the June 3–6, 1942, Battle of Midway. Vandegrift recognized its importance and immediately established a perimeter defense around it. Eating captured rations and using Japanese heavy-construction equipment, the U.S. 1st Engineer Battalion completed the airfield on August 17. As early as August 21, the day the Japanese mounted a major attack on the field, the first U.S. aircraft landed there. The Japanese now found it impossible to keep their ships in waters covered by the land-based American aircraft during the day, and they found it difficult to conduct an air campaign over the lower Solomons from as far away as Rabaul.

The lack of a harbor compounded U.S. supply problems, as did Japanese aircraft attacks. Allied coast watchers on islands provided early warning to U.S. forces of Japanese air and water movements down the so-called Slot of the Solomons. The battle on Guadalcanal became a complex campaign of attrition. The Japanese did not send their main fleet but rather vessels in driblets. American land-based airpower controlled the Slot during the day, but the Japanese initially controlled it at night, as was evidenced in the August 8 Battle of Savo Island. Concern over the vulnerability of the U.S. transports led to their early removal on the afternoon of August 9 along with most of the heavy guns, vehicles, construction equipment, and food intended for the marines ashore. The Japanese sent aircraft from Rabaul, while initially U.S. land-based aircraft flying at long range from the New Hebrides provided air cover for the marines as fast destroyer transports finally brought in some supplies. American possession of Henderson Field tipped the balance, and U.S. air strength there gradually increased to about 100 planes.

At night the so-called Tokyo Express—Japanese destroyers and light cruisers—steamed down the Slot and into the sound to shell marine positions and deliver supplies. The latter effort was haphazard and never sufficient; often, drums filled with supplies were pushed off the ships to drift to shore. One of the great what-ifs of the Pacific war was the failure of the Japanese to

exploit the temporary departure of the U.S. carrier task force on August 8 by rushing in substantial reinforcements.

Actions ashore were marked by clashes between patrols of both sides. Colonel Ichiki Kiyonao, who had arrived with his battalion on Guadalcanal in early August, planned a large-scale attack that took little account of U.S. marine dispositions. His unit was effectively wiped out in the August 21, 1942, Battle of the Tenaru River. Ichiki's men refused to surrender, and they and their commander were killed in the fighting. Marine losses were 44 dead and 71 wounded; the Japanese lost at least 777 killed. From September 12 to 14, strong Japanese forces attempted to seize U.S. marine positions on Lunga Ridge overlooking Henderson Field from the south. The Japanese left 600 dead; American casualties were 143 dead or wounded. Both sides continued building up their strength ashore as naval and air battles raged over and off Guadalcanal.

From October 23 to 25, the Japanese launched strong land attacks against Henderson Field. Fortunately for the marine defenders, the attacks were widely dispersed and uncoordinated. In these engagements, the Japanese suffered 2,000 dead, while U.S. casualties were fewer than 300.

Immediately after halting this Japanese offensive, Vandegrift began a six-week effort to expand the defensive perimeter beyond which the Japanese could not subject Henderson to artillery fire. Meanwhile, Admiral Kond Nobutake's repositioning of vessels and Vice Admiral William F. Halsey's instructions to Rear Admiral Thomas Kinkaid to seek out the Japanese fleet resulted in the October 26 Battle of the Santa Cruz Islands.

Fighting on land continued on Guadalcanal. On December 8, Vandegrift turned command of the island over to U.S. Army major general Alexander M. Patch, who organized his forces into XIV Corps, including the 2nd Marine Division, replacing the veteran 1st Marine Division, which was withdrawn, and the 25th Infantry Division. At the beginning of January 1943, Patch commanded 58,000 men, whereas Japanese strength was then less than 20,000.

Ultimately, the Americans won the land struggle for Guadalcanal thanks to superior supply capabilities and the failure of the Japanese to throw sufficient resources into the battle. The Americans were now well fed and well supplied, but the Japanese were desperate, losing many men to sickness

and simple starvation. At the end of December, Tokyo decided to abandon Guadalcanal.

Meanwhile, on January 10, Patch began an offensive to clear the island of Japanese forces, mixing army and marine units as the situation dictated. In a two-week battle, the Americans drove the Japanese from a heavily fortified line west of Henderson Field. At the end of January, the Japanese were forced from Tassafaronga toward Cape Esperance, where a small American force landed to prevent them from escaping by sea. Dogged Japanese perseverance and naval support, however, enabled some defenders to escape. The Japanese invested in the struggle 24,600 men (20,800 troops and 3,800 naval personnel). In daring night operations during February 1–7, 1943, Japanese destroyers evacuated 10,630 troops (9,800 army and 830 navy).

The United States committed 60,000 men to the fight for the island; of these, the marines lost 1,207 dead and the army 562. U.S. casualties were far greater in the naval contests for Guadalcanal; the U.S. Navy and the U.S. Marine Corps lost 4,911 and the Japanese at least 3,200. Counting land, sea, and air casualties, the struggle for Guadalcanal had claimed 7,100 U.S. dead or permanently missing. The Japanese advance had now been halted, and MacArthur could begin the long and bloody return to the Philippine Islands.

Guadalcanal Naval Campaign (August 1942–February 1943)

Significant and prolonged South Pacific sea-land-air campaign. The campaign for Guadalcanal comprised a number of separate naval engagements and land battles fought from August 1942 to February 1943. On Guadalcanal (an area 90 miles by 25 miles) in the Solomon Islands, U.S. marines and army troops attacked Japanese land forces, while the U.S. Navy battled the Japanese Navy offshore.

Before the battle, U.S. planners were able to build up Pacific theater resources more quickly than anticipated and take the offensive against the Japanese. This campaign, Operation WATCHTOWER, was the brainchild of U.S. chief of naval operations Admiral Ernest J. King. It had as its objective the seizure of the islands of Tulagi and Gavutu as a preliminary step in securing the Solomons and then the recapture of the Philippines and the eventual defeat of Japan.

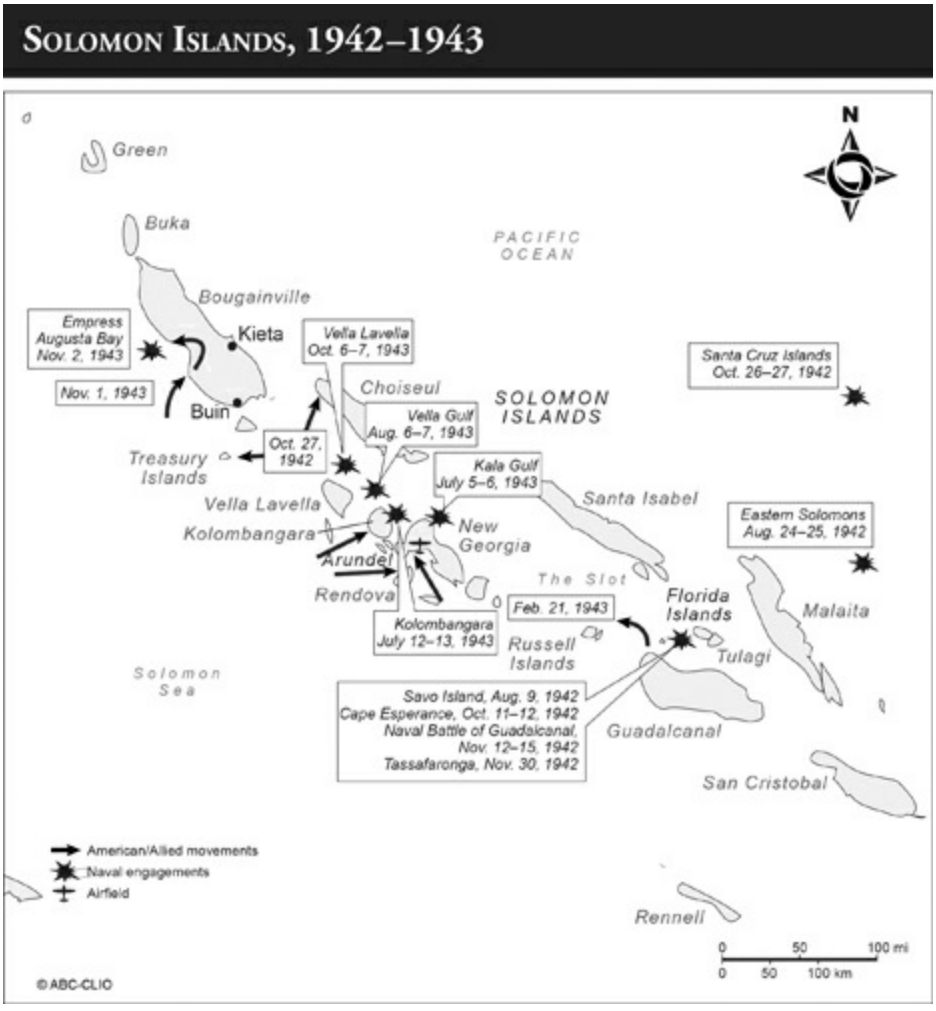
These plans changed when intelligence revealed that the Japanese were building an airstrip on the nearby island of Guadalcanal. Such a base would pose a serious threat to Allied operations in the South Pacific, and its seizure became the primary objective of the campaign.

Although hamstrung by a lack of resources because of the sealift required for Operation TORCH (November 8, 1942), Vice Admiral Robert Ghormley pieced together forces from the United States, Australia, and New Zealand for the invasion. Major General Alexander A. Vandegrift commanded the 1st Marine Division landing force, and Vice Admiral Frank Jack Fletcher commanded the naval support element.

The U.S. Navy’s tasks were to sustain forces ashore and to provide naval and air protection for the marines defending the airfield, which was captured shortly after the landing and renamed Henderson Field in honor of U.S. Marine Corps major Lofton Henderson, killed during the Battle of Midway.

The lack of a harbor compounded supply problems. The Japanese operated aircraft from Rabaul and later from other closer island airfields, but Allied coast watchers on islands provided early warning of many Japanese air and naval movements.

The marines went ashore beginning on August 7, but the sealift was so limited that they were without much of their heavier equipment and heavy artillery. The first naval engagement with the Japanese occurred on the night of August 8–9, 1942, in the Battle of Savo Island. A Japanese cruiser squadron overwhelmed an Allied force of equal size, sinking one Australian and three U.S. cruisers and damaging several destroyers, losing none of its own ships. The battle was the worst defeat ever suffered by the U.S. Navy in a fair fight, but it was only a tactical success, because the Japanese failed to go after the vulnerable U.S. troop transports off Guadalcanal and Tulagi.



Nonetheless, the Battle of Savo Island and Japanese air attacks led Fletcher and Rear Admiral Richmond K. Turner to withdraw supporting naval forces from Guadalcanal, leaving the marines ashore isolated, bereft of naval support, and short of critical supplies. Long-range aircraft and destroyers did bring in some resources. The Japanese made a critical mistake in not capitalizing on the U.S. vulnerability to commit their main fleet assets. For the most part, they sent only smaller units in driblets, chiefly in the form of fast destroyers. The so-called Slot (New Georgia Sound, the water supply route to Guadalcanal) was controlled by the United States during the day, but the Japanese owned it at night.

The next major confrontation at sea off Guadalcanal came on the night of August 24–25 in the Battle of the Eastern Solomons. Fletcher's carrier-based aircraft intercepted and attacked the covering group for a Japanese convoy of destroyers and transports carrying 1,500 troops to Guadalcanal. The Americans sank the Japanese light carrier *Ryujo* and damaged another ship, but the U.S. fleet carrier *Enterprise* was located and attacked by Japanese aircraft and badly damaged. The Japanese destroyers and transports delivered the reinforcements and the destroyers and then shelled Henderson Field, although a U.S. Army B-17 sank one of the Japanese ships.

On August 31, a Japanese submarine torpedoed the U.S. carrier *Saratoga*, putting it out of action for three months. That left only the carrier *Wasp* available for operations in the South Pacific. On September 15, the *Wasp* was in turn torpedoed and sunk while it was accompanying transports lifting the 7th Marine Regiment to Guadalcanal from Espiritu Santo. A Japanese torpedo also damaged the battleship *North Carolina.* Nonetheless, Turner continued to Guadalcanal, delivering the 7th Marine Regiment safely three days later.

Heavy fighting, meanwhile, was occurring on Guadalcanal. The next big naval encounter off Guadalcanal was the Battle of Cape Esperance during the night of October 11–12. The Japanese sent in their supply ships at night (the so-called Tokyo Express). U.S. ships equipped with radar detected a Japanese convoy off the northwest coast of Guadalcanal. In the ensuing fight, the Japanese lost a cruiser and a destroyer, with another cruiser heavily damaged. The Americans lost a destroyer and had two cruisers damaged. This first Allied success against the Japanese in a night engagement was a great boost to U.S. morale. A few days later, Admiral Chester W. Nimitz replaced the

methodical Ghormley with the offensive-minded Vice Admiral William "Bull" Halsey.

A major engagement occurred on October 26–27 in the Battle of the Santa Cruz Islands. Rear Admiral Thomas Kinkaid and his Task Force 16, centered on the carrier *Enterprise,* followed Admiral Halsey's instructions to engage Japanese forces under Admiral Kondō Nobutake. Each side conducted carrier strikes against the other. U.S. aircraft inflicted severe damage on the heavy carrier *Shōkaku,* putting it out of action for nine months, and damaged the light carrier *Zuihō.* On the U.S. side, the heavy carrier *Hornet* was badly damaged and had to be abandoned while under tow; it was soon sunk by Japanese destroyers. Kondō then withdrew. In the battle, Kondō had also lost 100 aircraft and experienced pilots, half again as many as the Americans.

During November 12–15, a series of intense sea fights occurred in what became known as the Naval Battles of Guadalcanal. These took place near the entrance to Iron Bottom Sound (so named for being the resting place of many Allied and Japanese ships) off Savo Island between Guadalcanal and Tulagi. In the first, U.S. ships and aircraft fought to block reinforcement of the island by 13,000 Japanese troops in 11 transports escorted by destroyers, all commanded by Admiral Tanaka Raizō. At the same time, a powerful squadron under Abe Hiroaki arrived to shell Henderson Field.

In a confused engagement, both sides suffered heavily. The Japanese lost the battleship *Hiei* and two destroyers sunk; four other Japanese destroyers were damaged. The Americans lost two cruisers and four destroyers. A cruiser and a destroyer were close to sinking, and all other ships except one were damaged. Among those killed were Rear Admirals Daniel Callaghan and Norman Scott and the five Sullivan brothers, killed in action aboard the same ship, the light cruiser USS *Juneau.*

On November 13–14 the Japanese returned, and their heavy cruisers shelled Henderson Field. But the Americans sank seven Japanese transports and damaged two cruisers. During the third phase near Savo Island on November 14–15, U.S. warships under Rear Admiral Willis A. Lee met and defeated yet another Japanese force under Kondō. The Americans lost two destroyers, while the Japanese lost the battleship *Kirishima* and a destroyer. The net effect of the engagements was that Tanaka landed some 4,000 troops, whereas the Americans regained control of the waters around the island.

The last major naval battle for Guadalcanal occurred on November 30 at Tassafaronga Point. The Japanese again attempted to land reinforcements on Guadalcanal and were surprised by a larger U.S. Navy task force. However, the Japanese once more demonstrated their superior night-fighting ability. In the exchange Japan lost a destroyer, and the United States lost a cruiser and had three more cruisers severely damaged.

Japanese leaders now concluded that they could no longer absorb such losses in trying to hold on in Guadalcanal. The final battle of the campaign was a skirmish off Rennell Island on January 30, 1943. In early February 1943, the Japanese evacuated their remaining ground forces from Guadalcanal.

The United States won the naval campaign for Guadalcanal thanks largely to its superior supply capability and Japan's failure to throw enough resources into the battle. The campaign for Guadalcanal proved to be as much a turning point for the United States as the Battle of Midway (June 3–6, 1942). The Japanese advance had been halted, opening the way for the long island-hopping advance toward Japan.

Overall, the Japanese lost 1 light carrier, 2 battleships, 3 heavy cruisers, 1 light cruiser, 14 destroyers, and 8 submarines. Particularly serious was the loss of 2,076 aircraft (1,094 to combat) and many trained pilots. U.S. Navy losses were 2 heavy carriers, 6 heavy cruisers, 2 light cruisers, and 15 destroyers, but new U.S. naval construction more than offset the losses. The campaign also destroyed the myth of Japanese naval superiority.

Guam, Battle for (July 21–August 10, 1944)

U.S. invasion and recapture of the largest of the Mariana Islands. Some 100 miles south of Saipan, Guam is at its greatest extremity some 34 miles long and 7 miles wide. The only one of the Marianas group controlled by the United States before the war, Guam had been acquired in 1898 as a consequence of the Spanish-American War. Little had been done to prepare the island against attack, and its 200-man U.S. Marine Corps garrison, supported by Guamanian police and volunteers, was overwhelmed on December 10, 1941, following three days of fighting by a 5,500-man Japanese brigade.

U.S. admiral Ernest King, chief of naval operations, argued as early as January 1943 for an invasion of the Mariana Islands. Although originally planned for June 18, 1944, the invasion of Guam was delayed by more than a month because operations against Saipan took longer than anticipated, and the task force reserve of the 27th Division had to be ordered there. Consequently, commander of the Fifth Fleet Vice Admiral Raymond A. Spruance rescheduled the operation for July 21. Marine Corps lieutenant general Roy S. Geiger commanded the landing force of the 3rd Marine Division, 1st Provisional Marine Brigade, and the army's 77th Infantry Division.

Its limestone terrain veiled in labyrinthine vegetation, Guam was well suited for defense. The island's numerous ridges, hills, valleys, and caves allowed Lieutenant General Takashina Takeshi's 18,500 defenders to magnify their limited artillery resources. In close proximity to one another on

the western shore were the two most important military installations: the fortified air base on Chote Peninsula and the navy yard at Apra Harbor.

The invasion was preceded for two days by the longest sustained naval bombardment of the Pacific Islands campaigns to that point. The invasion force came ashore on the morning of July 21 in a two-pronged assault five miles apart. The 3rd Marine Division landed on the beach north of Apra Harbor to capture the nearby navy yard; the 1st Provisional Marine Brigade joined with the foremost elements of the 77th Infantry Division below the harbor to take the large airfield on the Orote Peninsula. Poor maps and stiff Japanese resistance prevented an advance of more than a few miles beyond the two designated American beachheads for four days. Enough Japanese guns survived the preliminary naval bombardment to inflict numerous casualties on the exposed American troops.

Late in the afternoon of July 25, the 1st Provisional Marine Brigade finally seized the road bisecting the neck of the Orote Peninsula, severing Japanese access to the island's interior. That night, the trapped Japanese troops attempted to escape via Takashina's ill-conceived banzai attack, only to be shattered by concentrated marine artillery fire. Surviving Japanese were gradually eliminated over the next few days.

In an attempt to splinter the American beachhead north of Apra Harbor, at about 3:00 a.m. on July 26 Takashina mounted a well-planned 3,900-man counterstrike against the unsuspecting 3rd Marine Division. Exploiting an unintended gap between two marine regiments, the attackers swiftly penetrated the American position. Heavy fighting ensued, involving support personnel as well as frontline defenders. Despite initial gains and having inflicted 800 marine casualties, after three hours the Japanese attack ground to a complete halt. It had cost an astounding 3,500 (95 percent) of the attacking force dead.

Takashina's expensive counterattack proved catastrophic to his already inadequate force. Intermittent fighting continued for several weeks across much of the island's thickly forested interior as organized Japanese resistance slowly dissolved in the face of the Americans' steady northward advance. With the bulk of the island under American control, on August 10 Geiger pronounced active combat operations on Guam at an end.

The loss of Guam and the remainder of the Marianas deprived the Japanese Navy of airfields and anchorages and cut Japan's major supply

artery with the South Pacific and its large air and naval base at Truk in the Caroline Islands.

Guandong Army

Elite Japanese military force in Manchuria comprising Heilongjiang (Heilungkiang), Jilin (Kirin), and Liaoning Provinces. The Guandong (Kwantung) Army was formed in April 1919 to protect Japanese interests in the part of southern Manchuria that Japan had leased from China after the 1904–1905 Russo-Japanese War. Japan stationed one division there to defend the so-called Guandong Leased Territory and the South Manchurian Railway zone. For several years, the territory had been administered by the Guandong governor-general, who also commanded Japan's expeditionary forces. In April 1919, a new joint civil/military administration was instituted, and the Guandong Army was charged with maintaining security. The Guandong Army consisted of an independent garrison of six battalions, along with a division rotated every two years.

Facing a rising tide of Chinese nationalism and anti-Japanese sentiment in Manchuria, a handful of activist Guandong Army staff officers undertook unauthorized initiatives, such as the assassination in June 1928 of Manchurian warlord Zhang Zuolin (Chang Tso-lin). Also, on September 18, 1931, Lieutenant Colonel Ishihara Kanji and Colonel Itagaki Seishiro arranged to blow up a section of Japanese railway track outside Mukden

(Shenyang), Liaoning Province, which they then falsely blamed on the Chinese. This became the excuse for the Guandong Army to initiate fighting with local Chinese forces.

In this so-called Mukden Incident, the Guandong Army (without the approval of the Tokyo government) embarked on the conquest of most of the rest of Manchuria, leading to the establishment on March 1, 1932, of Manzhouguo (Manchukuo), a puppet Japanese state. In 1934, the Japanese installed as ruler Aixinjueluo Puyi (known to Westerners as Henry Pu-yi), the last emperor of China's Qing (Ch'ing) dynasty.

The leaders of the Guandong Army regarded the Soviet Union as Japan's chief enemy. Throughout the 1930s, the two sides increased their forces in the border area of Korea, Manchuria, and the Soviet Far East, and border clashes between Japanese and Soviet troops increased. These confrontations included some heavy fighting in the Changkufeng Incident (Battle of Lake Khasan, July 29–August 11, 1938) and the Nomonhan Incident (Battle of Khalkhin Gol, May 11–September 16, 1939).

Following the German invasion of the Soviet Union on June 22, 1941, the Guandong Army expected a German victory. It conducted a mobilization exercise to prepare for an attack on the Soviet Union between August and October, as soon as the Soviets had transferred forces from Manchuria to the European front. Twelve Japanese divisions in Manchuria, two in Korea, and two from Japan participated in this exercise. Much to the disappointment of Guandong Army leaders, however, Tokyo decided instead to move into resource-rich South Asia. Supreme Headquarters in Tokyo enjoined Guandong Army leaders to avoid all border conflicts. Following Japan's string of early victories in Southeast Asia and the Pacific, and again anticipating a German victory, Japan withdrew forces from the Pacific theater to reinforce the Guandong Army for war against the Soviet Union.

In conjunction with U.S. advances in the Pacific from February to July 1944, however, Supreme Headquarters withdrew 10 army divisions and 2 air divisions from Manchuria to the Pacific. The Guandong Army became a hollow force and fell easy prey to Soviet forces, which invaded Manchuria at the end of the war. Within two weeks of the Soviet strike into Manchuria, commander of the Guandong Army General Yamada Otozō surrendered, and the Guandong Army was disarmed. Some 60,000 men of the Guandong Army were killed in the fighting. After the cease-fire, another 185,000 died in

Manchuria. About 600,000—including Japanese troops from North Korea, Sakhalin, and the Kurile Islands—were detained in prisoner-of-war camps, where they were forced to work as slave labor through 1950. The last group of prisoners was not released until 1956. In the labor camps, more than 55,000 died of illness or malnutrition.

Guderian, Heinz (1888–1953)

German Army general. Born in Kulm, Germany, on January 17, 1888, Heinz Guderian attended cadet schools and was commissioned a lieutenant in the Hanoverian 10th Jäger Battalion in January 1908. During World War I he became a communications specialist, serving as assistant signals officer in Fourth Army headquarters until 1918, when he was appointed to the General Staff.

Guderian served in a Freikorps unit during 1919 and as chief of staff of the "Iron Division," and he was later selected to be retained among 4,000 officers in the 100,000-man Reichswehr. He was assigned to the transport troops in 1922. Returning to the General Staff in 1927, he became an advocate of mechanization based on British and French theories.

Guderian was given command of an experimental motorized battalion in 1931 with which he demonstrated armored reconnaissance techniques. He was promoted to colonel in 1933, and in October 1935 he took command of the 2nd Panzer Division, one of only three being formed. He was promoted to major general in August 1936.

In 1937 Guderian published *Achtung-Panzer!*, a treatise on armored warfare that espoused the combination of tanks, dive-bombers, and motorized infantry that is characterized as blitzkrieg (lightning war). Rapid promotion followed as Guderian helped expand Germany's armored forces. As a lieutenant general he participated with his division in the 1938 occupation of Austria. In October, Guderian was promoted to general of panzer troops and appointed chief of mobile troops with direct access to Adolf Hitler.

During the September 1939 invasion of Poland, Guderian commanded the XIX Panzer Corps. During the Battle for France (May 10–June 25, 1940), he led his panzer corps across the Meuse River at Sedan and raced to the English Channel to cut Allied forces off in Belgium.

During Operation BARBAROSSA, the June 22, 1941, invasion of the Soviet Union, Guderian, now a full general, commanded the Second Panzer Group in Army Group Center, where he coordinated with General Hermann Hoth's Third Panzer Group to encircle large Soviet forces at Minsk on July 10. Guderian then was ordered south to support General Paul Ewald von Kleist's Fourth Panzer Group, encircling more than 600,000 Russians in the Kiev pocket in September. Guderian's short temper and disdainful disposition toward superiors, however, eventually led him to be relieved of command in December concerning tactical disputes.

German General Heinz Guderian, regarded by many as the father of German armored warfare. (Keystone/Getty Images)

Following a year of inactivity, Guderian was recalled to duty by Hitler as inspector general of panzer troops in March 1943. Guderian made great efforts to rebuild the worn panzer forces. After the assassination attempt against Hitler in July 1944, Guderian was appointed chief of the General Staff. He stood up to Hitler on numerous occasions, leading to his dismissal on March 28, 1945.

Taken prisoner by U.S. forces at the end of the war, Guderian was not prosecuted for war crimes, although he remained a prisoner until June 1948. Guderian died at Schwengen, Bavaria, on May 14, 1953. A headstrong and aggressive battlefield commander, Guderian turned mechanized theory into practice and established a somewhat overstated legacy as the father of blitzkrieg warfare.

Guernica, Kondor Legion Attack on (April 26, 1937)

German and Italian aircraft attack on the town of Guernica, located in the Basque region of northern Spain, during the Spanish Civil War of 1936–1939. When the Nationalists rebelled against the Republican government of Spain in July 1936, Germany and Italy sent aid to the Nationalist side. Chancellor Adolf Hitler provided aircraft collectively known as the Kondor Legion, commanded by Major General Hugo Sperrle.

By early 1937, the Nationalists' failure to capture Madrid shifted attention to the Basque provinces in the north. Spanish general Emilio Mola commanded the assault on the ground, promising to raze the region if it did not surrender. The air component was largely independent, under German control. By late April 1937, Sperrle's chief of staff, Colonel Wolfram von Richthofen, discerned an opportunity to cut off the Republican retreat by bombing the Renteria bridge at Guernica. Guernica was the spiritual center of the Basques—a distinct ethnic group with their own language, customs, and tradition of representative government. It was also the home of their parliament and of El Árbol, a sacred oak under which Spanish kings had traditionally promised to respect Basque rights.

On April 26, 1937, Richthofen ordered air assaults on the Renteria bridge as well as the surrounding suburbs to block the retreat of Basque troops. At approximately 4:40 p.m., the first German bomber appeared over Guernica and dropped its payload on a plaza near the bridge. Some 25 minutes later

three more bombers arrived, followed by fighters that strafed the panicked population. Shortly after 6:00 p.m., waves of German and Italian bombers reached the town. Because crews had primitive bombsights and smoke and dust blanketed the target, the aircraft simply dropped their bombs randomly into the city. More than 100,000 pounds of high explosives and incendiaries rained down on Guernica.

Normally Guernica numbered 5,000 permanent inhabitants, but uncounted refugees and soldiers had swollen the population. As a result, exact casualty figures remain elusive, but the dead certainly numbered in the hundreds. Although the raid razed more than half of the town's structures, the Renteria bridge survived, as did the Basque parliament and El Árbol. Even so, Richthofen expressed pleasure with the results.

That evening, press reports reached the major European capitals concerning the bombing, many depicting it as a premeditated terror attack. The Nationalist press claimed that the city was burned by the Republicans to discredit the Nationalist cause. Not until the 1970s did the Spanish government admit Nationalist involvement in Guernica's destruction.

Learning of the tragedy in Paris, Spanish artist Pablo Picasso began work on a mural depicting the anguish and devastation. Scholars often credit this work, *Guernica,* for connecting the Basque town with the indiscriminate destruction of modern war.

Guerrillas/Partisans

See Partisans/Guerrillas

Guisan, Henri (1874–1960)

Swiss Army general and commander of the army during World War II. Born on October 21, 1874, in Mézières, Switzerland, Henri Guisan was educated at Swiss and foreign universities and earned a degree in agriculture. He joined the Swiss Army in 1894 and was promoted to captain in 1904. During World War I, he was an observer on both the Eastern and Western Fronts.

Promoted to colonel in 1921, Guisan took command of the 1st Division in 1926. In 1932, he took command of II Corps, and the following year he became commander of I Corps. In August 1939, Guisan was promoted to general (only the fourth Swiss to hold that rank) and became commander in chief of the army, a force that would come to number 800,000 men and women.

On July 25, 1940—with Italy in the war on the side of Germany, France defeated, and the possibility of an Axis invasion looming—Guisan rallied the nation in a speech at Rutli Meadow, the site of the 1291 Swiss pact of confederation. To meet the threat of an invasion, Guisan strengthened the natural Swiss defensive system of the Alps and the plateau between Lakes Constance and Geneva by mining bridges, roads, and highways. He also ordered military training expanded and arms stockpiled. The Germans knew that an invasion would be costly and did not attack. In 1945 Guisan retired from active service. He died at Lausanne, Switzerland, on April 8, 1960.

Gustav Gun

The German Krupp 80cm K(E), known as the Schwere Gustav (Heavy Gustav), was the largest artillery piece ever built. A railway gun that had to move over a specially laid double track, it was supported by two bogies, each with 20 axles. The gun weighed 1,344 tons and had a bore diameter of 31.5 inches. Using a 3,000-pound propellant charge, it fired two different types of projectiles. The 10,560-pound high-explosive round had a maximum range of nearly 30 miles. The 15,600-pound concrete-piercing shell had a maximum range of 23 miles.

The German Army ordered three 80cm K(E) guns in 1937 for the specific mission of demolishing the French forts on the Maginot Line. By the time the first gun was delivered in late 1941, though, France had long since fallen.

In January 1942, Heavy (Railway) Artillery Unit 672 was formed to man the gun; the unit moved to the Crimea in April. The gun, nicknamed "Dora" by the crew, was not ready to fire its first round in the siege of Sevastopol until June 5. Between then and June 17, it fired a total of 48 rounds in combat. The rounds landed anywhere from 197 feet to 2,400 feet from their targets. Nonetheless, the shells were large enough that their destructive power contributed to the fall of Forts Stalin, Lenin, Siberia, and Maxim Gorki.

After the fall of Sevastopol, the Gustav gun returned to Germany to receive a new barrel. Plans to send the gun to Leningrad were preempted by the Soviets having raised the siege. Some sources report that the gun fired against the Poles during the Warsaw Rising in August 1944, but that has never been confirmed.

The second 80cm K(E) was completed and delivered, but the crew was never raised. The third gun was still incomplete when the war ended. In April 1945, the German Army destroyed both completed weapons.

The Gustav gun was a technical masterpiece but a tactical white elephant. Under the best of conditions, it never fired more than seven or eight rounds per day. Once the gun reached its designated firing position, it required three

to six weeks to assemble and place into battery. Its entire detachment numbered 1,420 men, commanded by a colonel with his own headquarters and planning staff. The main gun crew numbered 500, most of whom moved, prepared, and serviced the ammunition. The remainder of the unit consisted of an intelligence section, two antiaircraft artillery battalions, and two guard companies.

Gyro Gun Sight

A computing gun sight that calculates the correct amount of deflection to allow for a crossing target. Air-to-air gunnery is a difficult art to master, as it involves shooting projectiles that are constantly decelerating and subject to gravity from a moving platform at a moving target. The pilot or gunner must aim ahead of the target by some angle (the deflection angle) and allow for gravity drop, wind, and so on, so that bullets and target arrive at the same point simultaneously. The required deflection angle reduces with crossing speed and range and increases as muzzle velocity reduces. With a few exceptions, the average World War II pilot was not a good shot, and many aces closed to point-blank range before firing to reduce deflection to a minimum.

In 1936, Dr. Leslie Bennet Craigie Cunningham, a scientist at the Royal Aircraft Establishment (RAE) Farnborough, suggested a “predictor” gun sight using the principle that a gyroscope resists any rotation of its axis. If the device is attached to a normal gun sight, any attempt to follow a crossing target will be resisted with a force proportional to the crossing speed. This

idea was not adopted until World War II, when scientists at RAE Farnborough were ordered to produce such a device.

The first preproduction Mark I Gyro Gun Sights (GGSs) were installed on Spitfire and Defiant aircraft for trials in 1941. The tests on the resulting GGS Mark I were satisfactory, but there were several operational problems; a redesigned Mark II GGS went into production late in 1943. The pilot selected the type of enemy aircraft on a dial and then adjusted the size of the sighting reticule to match the target's wingspan. This gave an estimate of range, and while the pilot tracked the target, an analog computer in the sight calculated target range and offset the reticule to give the correct deflection. A Mark IIC was employed in bomber turrets.

The GGS was an important technology. Operational experience showed that it approximately doubled the effectiveness of the average squadron; some pilots were five times more likely to score a kill. The GGS Mk II was used by the U.S. Army Air Forces as the K-14 and by the U.S. Navy as the Mk 18.

H

Haakon VII, King of Norway (1872–1957)

Born on August 3, 1872, at Charlottenlund Castle near Copenhagen, Denmark, Prince Carl was the second son of the future King Frederik VIII of Denmark. Carl was educated by private tutors and entered the Danish Navy at age 14. In 1893 he became an officer, and in 1896 he married Princess Maud of Great Britain, daughter of King Edward VII. They had one son, Alexander, later renamed Olaf. Norway declared independence from Sweden in 1905, and Carl was elected its constitutional monarch, choosing the Norwegian title of Haakon VII.

Haakon worked to establish a modern monarchy. His motto was “All for Norway.” He hoped that Norway could remain neutral during World War II, and when the Germans invaded in April 1940, Haakon rejected demands that he appoint pro-Nazi Vidkun Quisling as premier and urged his people to resist. Haakon reluctantly left Norway aboard a British warship on June 7, 1940, with his son Olaf and members of the Storting (parliament) for exile in Britain.

As head of the Norwegian government-in-exile, Haakon spoke to his people via radio, explaining that the Norwegian Constitution allowed him to wage war against the Germans from abroad and refusing to abdicate. Haakon strongly supported he Norwegian resistance to Nazi rule; he became both Norway’s symbol of resistance and its rallying point.

Haakon was warmly welcomed on his return to Oslo on June 7, 1945, exactly five years from his departure and the 40th anniversary of Norway’s independence. His spirited wartime activities had created a strong bond with his people. Haakon spent the immediate postwar years helping with reconstruction. He also dispensed with the formalities of court life, endearing himself further to the Norwegians. This beloved “people’s king” died at Oslo on September 21, 1957. He was succeeded by his son, who reigned as Olaf V.

Haguro, Japanese Navy Cruiser, Sinking of (May 16, 1945)

The Imperial Japanese Navy cruiser *Haguro* was the fourth and last of the Myōkō class of heavy cruisers. Constructed at the Mitsubishi Shipyard in Nagasaki, it was laid down in March 1925 and commissioned on April 25, 1929. All four ships of the class were extensively refitted during 1934–1936. They were 661 feet 9 inches in length with a beam of 68 feet. They displaced 13,300 tons and were fast, at 36 knots. They were armed with 10 8-inch guns (five double turrets), 6 4.7-inch guns, and 12 24-inch torpedo tubes and carried two float planes. The ships had a crew complement of 773 officers and men.

During World War II, the *Haguro* took part in the Battle of the Java Sea (February 27, 1942) and in the sinking of the cruisers HMS *Exeter* and HNLMS *De Ruyter* and the destroyer HMS *Encounter* off South Borneo on March 1. The *Haguro* participated in the Battle of the Coral Sea (May 7, 1942) and the Battle of the Eastern Solomons (August 22–25, 1942) as well as the evacuation of Japanese forces from Guadalcanal in January 1943. It was slightly damaged in the Battle of Empress Augusta Bay (November 2, 1943). The *Haguro* also took part in the Battle of the Philippine Sea (June 19, 1944) and in the Battle of Leyte Gulf (October 23–25, 1944), when it again sustained damage.

Commanded by Captain (promoted to rear admiral on May 1, 1945) Sugiura Kaju from December 1, 1943, the *Haguro* was on its way from

Singapore to evacuate the Japanese garrison in the Andaman Islands in the company of the destroyer *Kamikaze* when it was spotted in the Malacca Strait on May 16, 1945, and attacked by a Grumman TBF Avenger torpedo bomber from the escort carrier *Shah*, without effect. In Operation DUKEDOM, British vice admiral Harold T. C. Walker dispatched Captain Manley L. Power and his 16th Destroyer Flotilla to ambush the Japanese ships. The *Haguro* and its escort were located and attacked just after midnight on May 16 by the British destroyers *Saumarez* (flagship), *Venus*, *Verulam*, *Vigilant*, and *Virago*. Power sought to offset the speed and superior hitting power of the *Haguro* by attacking the Japanese ship from different directions simultaneously. Although the *Kamikaze* was only lightly damaged in the engagement, the *Haguro* was hit both by gunfire and three torpedoes.

The *Haguro* began to go down about 2:32 a.m. The *Kamikaze* picked up 320 members of its crew, but some 900 men perished, including Admiral Sugiura and Vice Admiral Hashimoto Shintarō. Sugiura was honored with a posthumous promotion to vice admiral. The sinking of the *Haguro* was the last naval surface action of the war.

Haile Selassie, Emperor of Ethiopia (1892–1975)

Haile Selassie was emperor of Ethiopia (also known as Abyssinia) from 1930 until 1974. He was born at Ejersagoro on July 23, 1892, as Tafari Makonnen,

the son of Ras Makonnen, a Coptic Christian and leading general and political figure. Tafari was a grandnephew of Emperor Menelik II (r. 1889–1913).

An excellent student, Tafari attended both the Capucin school and the palace school. From age 13, he governed Harer, Selale, and Darass. On Menelik's death, his grandson Lij Iyasu succeeded to the throne, but he Islamized the government. The Christians denounced this policy, and Iyasu was deposed. Menelik's daughter, Empress Sawditu I (r. 1916–1930), made the progressive-minded Tafari regent and heir. From 1917 to 1928 he traveled in the West to absorb the culture and ideas. Tafari was proclaimed emperor on Sawditu's death in 1930.

Declaring himself a direct descendant of King Solomon and the Queen of Sheba, Tafari adopted the name Haile Selassie, meaning "might of the trinity." His suppression of slavery was a matter of personal pride, and he established the Bank of Ethiopia and promulgated a new criminal code. Selassie soon earned a worldwide reputation as a humanitarian, although he centralized power in his person and was in fact a royal dictator.

During the 1930s, Selassie took his country's disputes with Italy to the League of Nations. Italy's invasion in 1935 found the Ethiopians no match for the invaders, who had complete air supremacy and employed poison gas. Selassie fled to Britain in 1936, appealing for support in a masterful but unsuccessful address to the League of Nations. Following Italy's entry into World War II in June 1940 and the extension of the fighting to Africa, British forces liberated Ethiopia, and Selassie returned to his capital in triumph in 1941.

Selassie's progressive policies after the war included political and social reforms and the establishment of a national assembly in 1955. His focus in the 1960s and 1970s was Pan-African. In 1960, he crushed a revolt of army officers and intellectuals who advocated further reforms. Selassie was overthrown on September 12, 1974, and placed under palace arrest. He died on August 17, 1975.

Haile Selassie, Emperor of Ethiopia (1930–1936 and 1941–1974). (Library of Congress)

Halder, Franz (1884–1972)

German Army general. Born on August 30, 1884, in Würzburg, Germany, Franz Halder joined a Bavarian field artillery regiment in 1902 and attended the Bavarian Kriegsakademie in Munich before the outbreak of World War I and then served throughout the war as a General Staff officer at the division through army group levels on both the Western and Eastern Fronts. His performance during World War I secured him a position in the postwar

Reichswehr. Serving in both command and staff positions, he was promoted to colonel in December 1931, to major general in October 1934, to lieutenant general in August 1936, and to general of artillery in February 1938. In October 1938, Halder was appointed chief of the army General Staff.

Halder played a crucial role in the planning and execution of Germany's military campaigns before World War II and during its first years. By the end of the 1939 Poland Campaign, he had convinced German army commander in chief Colonel General Walther von Brauchitsch to place overall responsibility for operations in his hands. Halder's claims to sole authorship of the Battle for France (May 10–June 25, 1940) were unjustified, although he was at the center of the campaign's successful execution. Halder was promoted to colonel general in July 1940.

As chief of the German army's general staff, General Franz Halder played a key role in the planning and execution of Germany's military campaigns before and during the early years of World War II. (Ullstein Bild via Getty Images)

Anticipating future operations in the east, Halder established a planning group in the summer of 1940 to develop a campaign against the Soviet Union. His lack of vision and unwillingness to encourage innovation among his subordinates, however, resulted in a plan that did not fully address the Red Army's capabilities or clearly identify the campaign's objectives. Failing to defeat the Red Army in the summer of 1941 in Operation BARBAROSSA, which had begun on June 22, Halder maintained his belief that the German Army would decide the campaign at the gates of Moscow.

Through the spring of 1942, Halder became increasingly disillusioned with Adolf Hitler's conduct of operations, particularly the 1942 offensive on the Eastern Front. By September 1942, the führer had had enough of the army chief of staff's intransigence and summarily relieved him on September 24.

Halder remained on the inactive list, keeping in contact with Colonel General Ludwig Beck, former chief of the General Staff and a leader of the opposition to Hitler. As a result of these exchanges, Halder was imprisoned in the Flossenbürg concentration camp in the aftermath of the July 20, 1944, attempt on Hitler's life. After the war, Halder's association with Beck was sufficient to prevent his conviction at the International Military Tribunal at Nuremberg. Halder then spent 14 years with the U.S. Army Historical Division and received the Meritorious Civilian Service Award in 1961. Halder died on April 2, 1972, in Aschau, West Germany.

Halifax, Lord

See Wood, Edward Frederick Lindley

Hall, Charles Philip (1886–1953)

U.S. Army general. Born in Sardis, Mississippi, on December 12, 1886, Charles Philip Hall graduated from the U.S. Military Academy at West Point in 1911 and was commissioned in the infantry. During World War I, he served with the 2nd Division in France.

Between the world wars, Hall earned an excellent reputation as an officer while serving with the Infantry Board and as an instructor at the Infantry School. He also graduated from the Command and General Staff School and the Army War College. Promoted to brigadier general in January 1941, he served as assistant divisional commander of the 3rd Infantry Division during 1941 and 1942. In March 1942, promoted to major general, he took command of the 93rd Infantry Division.

In October 1942, Hall was named commander of XI Corps in the Southwest Pacific Area (SWPA). His first major operation in the war came in New Guinea. The Japanese Eighteenth Army, which had been bypassed by the fast-moving offensive of SWPA commander General Douglas MacArthur, advanced on the U.S. base at Aitape in July 1944 to divert men and supplies from MacArthur's drive toward the Philippines. Fighting for six weeks along the Driniumor River to the east of Aitape, Hall's XI Corps defeated the Japanese, ending the threat to Aitape. Later in 1944, Hall established a lodgment on Morotai, providing flank protection for MacArthur's Philippines invasion.

During 1945, Hall participated in the liberation of Luzon in the Philippines. Landing on Luzon on January 29, XI Corps helped clear the Manila Bay area by seizing the Bataan Peninsula and Corregidor Island. From March into the summer of 1945, Hall fought in the mountains east of Manila to neutralize the Japanese Shimbu Group.

After the war, Hall, promoted to lieutenant general in June 1945, served with the U.S. occupation force in Japan. He returned to the United States in 1946 to take charge of the army training program, a post he held until his retirement in December 1948. Hall died in San Antonio, Texas, on January 26, 1953.

Halsey, William Frederick, Jr. (1882–1959)

U.S. Navy admiral of the fleet. Born in Elizabeth, New Jersey, on October 30, 1882, William Frederick Halsey Jr. was a naval officer's son. Halsey graduated from the U.S. Naval Academy at Annapolis in 1904 and was commissioned an ensign in 1906. He served in the Great White Fleet that circumnavigated the globe during 1907–1909 and was then assigned to torpedo boats. When the United States entered World War I in April 1917, Halsey was a lieutenant commander and captain of a destroyer. He then commanded destroyers operating from Queenstown, Ireland.

Following World War I, Halsey's service was mostly in destroyers, although he also held an assignment in naval intelligence and was a naval attaché in Berlin. Promoted to captain in 1927, he commanded the *Reina Mercedes*, the Naval Academy training ship, and became fascinated by naval aviation. Halsey attended both the Naval War College and the Army War College, and in 1935, despite his age, he completed naval flight training and

took command of the aircraft carrier *Saratoga.* Promoted to rear admiral in 1937, Halsey assumed command of Carrier Division 2 of the *Enterprise* and *Yorktown.* He was promoted to vice admiral in 1940.

Halsey was at sea on December 7, 1941, when Japanese aircraft attacked Pearl Harbor. In early 1942, Halsey's carriers raided Japanese Central Pacific installations and launched Colonel James Doolittle's raid on Tokyo on April 18. Acute skin disorders requiring hospitalization removed Halsey from participation in the Battle of Midway (June 3–6, 1942).

In October 1942, Halsey replaced Admiral Robert Ghormley as commander of the South Pacific and began the most successful phase of his career. Halsey was promoted to admiral in November. Despite severe tactical losses, he retained strategic control of the waters around Guadalcanal in late 1942, and during 1943 he supported operations in the Solomon Islands and into the Bismarck Archipelago. Halsey came to be known as "Bull" for his pugnacious nature.

U.S. Navy admiral William Frederick Halsey, Jr. A controversial figure, Halsey also epitomized the aggressive spirit of the U.S. Navy in World War II. (Library of Congress)

In March 1943, Halsey took administrative command of the Third Fleet, although he continued his command in the South Pacific until June 1944. In the October 23–26, 1944, Battle of Leyte Gulf, the Japanese battle plan and the flawed U.S. command system combined with Halsey's aggressiveness to shape one of the more controversial episodes of the war. On October 24–25, a Japanese force under Admiral Ozawa Jisaburo centered on four fleet aircraft carriers that were largely bereft of aircraft decoyed Halsey and his entire Task Force 38 away from the U.S. landing sites, leaving the sites vulnerable to a powerful Japanese surface force under Kurita Takeo.

Although Halsey destroyed most of Ozawa's force in the Battle of Cape Engaño, disaster for the support ships off Leyte was only narrowly averted when Kurita, affected by fatigue and poor intelligence, prematurely withdrew his strike force. Widely criticized for not coordinating his movements with Vice Admiral Thomas Kinkaid, who commanded the Seventh Fleet invasion force, Halsey never admitted responsibility. He instead blamed the system of divided command.

Halsey endured further condemnation when he took the Third Fleet into damaging typhoons in December 1944 and June 1945. Still, his flagship, the *Missouri*, hosted the formal Japanese surrender on September 2, 1945. Promoted to admiral of the fleet in December 1945, Halsey retired in April 1947. He then served on the boards of several large corporations. Halsey died at Fisher's Island, New York, on August 16, 1959.

Hamburg, Raids on (July 24–August 3, 1943)

The air battle of Hamburg, Operation GOMORRAH, consisted of a series of six raids in July and August 1943 that destroyed a large portion of the city and killed more than 45,000 people. Most of them died in the horrendous firestorm of the night of July 27, the first such conflagration induced by bombing. More than half of the residential units in the city were destroyed, and 900,000 people lost their homes. The Americans and British bombed the city many times later in the war, but none of those raids approached the results or notoriety of the July attack.

Four of the attacks were mounted at night by the Royal Air Force (RAF) and two in daylight by the U.S. Army Air Forces (USAAF) Eighth Air Force. The initial British operation, which began the night of July 24, featured the first use of chaff, code-named Window, in combat. The cloud of metallic strips blotted out large segments of enemy radar screens and provided cover for aircraft that stayed within the pattern, cloaking the bomber stream. This helped keep losses relatively low during RAF operations; only 87 British bombers were lost out of more than 3,000 sorties.

The USAAF sent 252 Boeing B-17 Flying Fortresses over Hamburg on July 25 and 26 but lost 17 aircraft. In addition, the American bombing accuracy was poor, because primary targets were often obscured by smoke from the earlier RAF raid. The Americans dropped only about 300 tons of bombs on the city, whereas RAF bombers delivered more than 8,000 tons.

The second British attack combined concentrated bombing with ideal weather conditions of high temperature and low humidity to produce an unexpected firestorm, which was helped along because most of Hamburg's firefighters were in distant sectors of the city dealing with the results of the earlier attacks.

Most of the dead had heeded the advice of local authorities to stay in basement shelters, where they were asphyxiated by carbon monoxide or crushed by collapsing buildings. However, taking to the streets was no guarantee of safety. Those who fled the shelters sometimes met even more horrible deaths, sucked into fires by high winds or caught in molten asphalt.

German armaments minister Albert Speer feared that if the Allies could quickly follow up with six similar devastating firestorms, the German economy might collapse. Although RAF Bomber Command tried, it could not achieve the same result until its February 1945 assault on Dresden. Hamburg itself recovered surprisingly quickly, and the Luftwaffe changed its defensive tactics to counter the RAF night-bombing campaign.

Research conducted 50 years after the bombing of Dresden has considerably lowered the casualty figures from that bombing; it appears that the July 27 attack on Hamburg, not the Dresden bombing, was the deadliest air raid in the European theater. The raids on Hamburg set a standard that RAF Bomber Command found difficult to duplicate and still provide a vivid symbol of the horrors of bombing cities and of total war.

Hanaya Tadashi (1894–1957)

Japanese Army lieutenant general. Born in Okayama Prefecture on January 5, 1894, Hanaya Tadashi graduated from the Japanese Military Academy in 1916 and from the Army War College in 1922. Promoted to major in 1929, he commanded an infantry battalion. In 1930, he was assigned to the Special Services Agency at Mukden (now Shenyang) of the Japanese Guandong (Kwantung) Army in Manchuria. Hanaya was involved in planning the Mukden Incident of September 18, 1931, which the Guandong Army used as the pretext for taking the remainder of Manchuria in 1931 and 1932. When Japanese military operations were criticized, Hanaya developed a plan for provoking a riot in Shanghai (the First Shanghai Incident) to divert attention there.

Assigned as resident officer in Jinan (Tsinan), China, in 1933, in 1935 Hanaya joined the staff of the Guandong Army Headquarters. Promoted to colonel in 1937, he commanded the 43rd Infantry Regiment. In 1939, he was assigned as military adviser to the Japanese puppet state of Manzhoudiguo (Manchoutikuo or Manchukuo).

Promoted to major general in 1940, Hanaya took command of the 29th Infantry Brigade. In 1941, he was chief of staff of the First Army in China. Promoted to lieutenant general in October 1943, he assumed command of the 55th Division in Burma.

In Burma, Hanaya's division defended the port of Akyab on the Bay of Bengal and supported the Imphal operations. Hard on his subordinates but an effective commander, Hanaya had great success in the Second Arakan Campaign (December 1943–July 1944). His troops defeated British forces at the Indian border and then laid siege to Shinzeiwa, but efforts to take that place by storm failed against the strong British defensive line, and a lack of supplies and ammunition for his forces and superior British air resupply forced Hanaya to lift the siege.

Hanaya's attacks along the Sittang River in south Burma in May and June 1945 allowed the Japanese Twenty-Eighth Army to escape. Following this operation, in July 1945 Hanaya was appointed chief of staff of the Thirty-Ninth Army and then chief of staff of the 18th Army Group on Rabaul in the same month. He was in Thailand when the war ended. Hanaya retired from the army in 1946 and died in Tokyo on August 28, 1957.

Hand Grenades

Hand grenades are small bombs thrown by hand. Numerous types of hand grenades were used by military forces during World War II. The U.S. military used offensive, defensive, and special-use grenades. The MkIII A1, a can-shaped grenade filled with 8 ounces of flaked TNT, was used for offensive purposes because no fragmentation took place after the initial explosion. The MkII "pineapple" grenade was for defensive use and was based on the old British Mills bomb design. Troops could not assault forward because of the fragmentation of its serrated shell, which created a 10-yard killing radius. The M15 WP white phosphorous (WP for "Willie Pete") grenade, used for smoke generation and the assaulting of caves and pillboxes, saw limited use. In tight quarters, the almost 2-pound M15 WP created severe eye, respiratory, and skin injuries.

The standard hand grenade for British forces was the revised M36 Mills bomb. It had a serrated cast-iron body filled with TNT and was used defensively. Of note was the screw-in fuze, which was put in place prior to combat. To use the grenade, the user pulled the pin and then threw the grenade. When the grenade left the user's hand, the spring-loaded lever was released, activating the fusing sequence. A more specialized grenade was the Gammon bomb (No. 82), a 20-ounce cloth bag filled with plastic explosive. It had an attached screw-off metal cap that was removed to arm the device. The Gammon bomb was effective against pillboxes and bunkers.

The French military relied on the venerable F1 defensive grenade. This grenade had a serrated body and used a five-second delay fuze activated by a

pin-and-lever system similar to that found in the British M36.

The standard German hand grenades were the high-explosive stick grenade (Stielhandgranate 24) and the high-explosive hand grenade (Eierhandgranate 39). The offensive Stiel. 24, universally known as the "potato masher" grenade, contained a bursting TNT charge and could be fitted with a fragmentation sleeve for defensive use. The igniter was activated by pulling the porcelain bead found in the handle behind the metal cap. A heavier Stiel. 43 variant existed; it contained almost twice the TNT charge and could also be fitted with a fragmentation sleeve. The offensive Eier. 39 was egg-shaped, and its older and newer designs differed slightly. The TNT filler was initiated by a detonator and a friction igniter. More specialized German grenades were the offensive wooden and concrete improvised hand grenades (Behelfshandgranate-Holz and -Beton) and numerous forms of smoke grenades (Nebelhandgranate) based on stick, conventional, egg, and glass body designs.

The Italian Army used three main types of grenades, known as "Red Devil Grenades" for their color. All used a pull firing pin. The Breda Model 35 (introduced in 1935) weighed 7 ounces and had only 2 ounces of TNT; the SRCM Model 35 also weighed 7 ounces but had only 1.5 ounces of TNT. The OTO Model 35 weighed 7.4 ounces and had 2.5 ounces of TNT. Italian grenades tended to have too little explosive filler and broke into large fragments, so they often did little damage to their targets. The Breda Model 42 with a handle (potato-masher style) was developed to attack enemy tanks and contained 1.5 pounds of TNT.

Hand grenades in use by Japanese forces were the Model 91 (1931), Model 97 (1937), Model 99 (1939), and Model 23. The Model 91 had a serrated body and was for defensive use. Its fuze had to be struck against a hard object, such as a helmet, to ignite it. The Model 97 was a newer variation of the Model 91. It had a shorter fuze delay time of 4–5 seconds rather than 7–8 seconds, could not be fired from a discharger, and was carried by all frontline troops. The lighter Model 99 Kiska had a smooth, cylindrical body and a flange at either end. It also used an impact fuze, and because it was smaller, it could be used for offensive purposes. The Model 23 looked like the Model 91 but had two lugs and rings on the side for mooring so it could also be used in booby traps. It had a pull-type friction igniter fuze and was filled with granular TNT.

Other more specialized grenades included the 18-ounce incendiary grenade, the incendiary stick grenade, and the high-explosive stick hand grenade.

Soviet hand grenades were based on the Type-1933, Type-1942, and F-1 models. The Type-1933 (RGD-33) was composed of a grenade head and a throwing handle. It could be used in either a defensive or an offensive mode, depending on whether the fragmentation jacket (normal and lightened types) was used over the grenade head. Detonation time was 3.2 to 3.8 seconds after fuze ignition. The can-shaped Type-1942 (RG-42) was for offensive and defensive use. Its lethal bursting radius was somewhat smaller than average because of the lighter scored squares found in its internal metallic belt. The F-1 was for defensive use. Externally it resembled the U.S. MkII pineapple grenade, but it was based on either the standardized (UZRG) or Koveshnikov fuze. Because it expelled heavy fragments out to 656 feet, the F-1 was only thrown from trenches or other covered positions.

Harmon, Ernest Nason (1894–1979)

U.S. Army major general. Born in Lowell, Massachusetts, on February 26, 1894, Ernest Nason Harmon attended Norwich University in Vermont for a year before being accepted to the U.S. Military Academy at West Point, from which he graduated in 1917. Commissioned a second lieutenant of cavalry,

Harmon served in France as a captain during World War I and fought in the 1918 Saint-Mihiel and Meuse-Argonne offensives.

After the war, Harmon graduated from the Cavalry School (1921), served as an instructor at West Point (1921–1925), and competed in the pentathlon at the 1924 Summer Olympics. After service as plans and training officer for the 6th Cavalry Regiment (1925–1927), he taught military science at Norwich University (1927–1931). In 1931 he was selected to attend the Command and General Staff School (CGSS). Promoted to major in 1932, he graduated from the CGSS (1933) and then the Army War College (1934). Harmon spent a year commanding the 1st Squadron, 8th Cavalry, at Fort Bliss, Texas, then served on the War Department General Staff as assistant chief of staff for supply (1935–1939). Promoted to lieutenant colonel in 1939, he assumed command of the 1st Squadron, 1st Cavalry Regiment (mechanized), in the new Armored Force at Fort Knox, Kentucky, where he fell under the tutelage of brigade commander Brigadier General Adna R. Chaffee. In the spring of 1941 Harmon was assigned to the War Plans Division of the General Staff. Following Chaffee's death in August 1941, the new chief of the Armored Force Major General Jacob L. Devers requested Harmon as his chief of staff. Harmon was promoted to brigadier general in March 1942.

In July 1942, Harmon took command of the 2nd Armored Division. Promoted to major general the next month, he led the division in the invasion of French Morocco in November 1942. Following the American defeat at Kasserine Pass in Tunisia (February 14–22, 1943), General Dwight D. Eisenhower sent Harmon to advise Major General Lloyd Fredendall at II Corps. Harmon recommended that Eisenhower relieve Fredendall, but Harmon turned down, on ethical grounds, the opportunity to assume command of the corps, which went to Major General George S. Patton Jr. In April, Harmon returned to Tunisia to command the 1st Armored Division, which he led both there and in the landing at Salerno (Operation AVALANCHE) in Italy (September 9, 1943).

In Italy, weather and terrain initially prevented Harmon from using his tanks effectively. Beginning on January 22, 1944, the division redeployed to the Anzio beachhead, where it shored up Allied defenses. When the Battle of Anzio ended on May 25, the division led the Allied breakout and drive on Rome (May–June). In July, Harmon rotated back to the United States, but in

September he received an unexpected summons to Northwestern Europe to head the 2nd Armored Division again. In the German Ardennes Offensive (Battle of the Bulge, December 16, 1944–January 25, 1945), Harmon's division helped turned the tide by smashing the German spearhead 2nd Panzer Division at the Battle of Celles. Harmon then took command of XXII Corps, which saw no significant action. Three times previously he had been passed over for corps command, apparently because of his reputation for tactlessness. Nonetheless, Harmon ranks among the finest U.S. armor commanders of World War II.

After the war, Harmon assumed occupation duties in the Rhineland and in Czechoslovakia as commander of XXI Corps (April 1945 to January 1946), and from 1946 to 1948 he commanded VI Corps—which became known as the U.S. Constabulary—in the U.S. occupation zone of Germany. He was deputy commander of Army Ground Forces, 1947–1948. Frustrated by his career prospects, Harmon chose to retire as a major general in March 1948. He was president of Norwich University from 1950 to 1965. Harmon published his memoirs, *Combat Commander,* in 1970. He died in White River Junction, Vermont, on November 13, 1979.

Harpe, Josef (1887–1968)

German Army colonel general. Born on September 21, 1887, in Recklinghausen, Westphalia, Josef Harpe joined the army as an officer candidate in 1909 and served in the infantry in World War I. He remained in the German Army after the war and became interested in mechanized warfare. In 1931, he was assigned to direct the Reichswehr's clandestine tank training center in the Soviet Union. In April 1934, Harpe set up a gunnery training course that soon evolved into the Panzer Gunnery School. Harpe was promoted to lieutenant colonel in 1935 and commanded the 12th Cavalry Regiment, which evolved into the army's first motorized infantry regiment (later, with the addition of tanks, it became the 3rd Panzer Regiment).

Harpe was promoted to colonel in January 1937 and commanded the 1st Panzer Brigade at the outbreak of the war in September 1939. He was promoted to major general in August 1940 and commanded the newly formed 12th Panzer Division from its creation in 1940 to 1942. In July and August 1941 during the invasion of the Soviet Union (Operation BARBAROSSA), the division participated in the great encirclement operations at Minsk (June 27–July 9, 1941) and Smolensk (July 10–August 5, 1941). Harpe's division was transferred to the Leningrad front in September 1941 and suffered heavy losses.

Harpe was promoted to lieutenant general in January 1942 and was assigned command of the XLI Army Corps. Six months later, he was promoted to general of panzer troops. In October 1943, he succeeded General Walther Model in command of the Ninth Army southeast of Minsk. Promoted to colonel general in April 1944, Harpe took command of the Fourth Panzer Army (Model's Army Group South) in May 1944. The next month, he succeeded Model as commander of Army Group South, renamed Army Group Northern Ukraine. It was renamed again as Army Group A in August 1944. To defend a long, thin front from the Carpathians in northeast Hungary to north of Warsaw, Harpe had only 400,000 troops and 1,136 tanks and assault guns.

The Red Army's massive Vistula-Oder Offensive that opened on January 12, 1945, quickly smashed through Harpe's overextended lines. Warsaw fell on January 17, and Adolf Hitler, seeking a scapegoat, replaced Harpe with Colonel General Ferdinand Schörner, one of his favorite officers. Harpe was recalled to duty on March 9, 1945, and assigned command of the Fifth Panzer Army, recently commanded by General of Panzer Troops Hasso E. von

Manteuffel. This marked the only time Harpe did not have a command on the Eastern Front. The Fifth Panzer Army, a skeleton of its former self, was entrapped in the Ruhr Pocket, and the Americans captured Harpe on April 17, 1945. He was released from captivity in 1948 and died in Nuremberg on March 14, 1968.

Harriman, William Averell (1891–1986)

U.S. businessman, financier, and key U.S. diplomat posted to Great Britain and the Soviet Union during World War II. William Averell Harriman was born on November 15, 1891, in New York City. He was the son of Edward Henry Harriman, owner of the Union Pacific Railroad and one of the wealthiest men in the United States. The younger Harriman initially pursued a career as a venture capitalist and with Union Pacific. In 1920, he invested in German shipping, Soviet manganese mine concessions, and aviation. In 1931, he merged his investment firm with an established merchant bank to form Brown Brothers Harriman. From the late 1920s onward, a burgeoning interest in politics caused Harriman to support the Democrats and back President Franklin D. Roosevelt's New Deal policies. Harriman held several posts in the National Recovery Administration and sought a World War II government job.

In March 1941, Roosevelt sent Harriman to London as a "defense expediter" to coordinate and facilitate the anticipated flood of American wartime supplies to Britain under the new Lend-Lease program. Harriman quickly established a warm and confidential relationship with Britain's wartime prime minister Winston L. S. Churchill. Harriman often bypassed U.S. ambassador John G. Winant to report directly to White House aide Harry Hopkins and serve as an unofficial liaison between Churchill and Roosevelt. In London, Harriman, although married, began a clandestine love affair with Churchill's daughter-in-law, Pamela Digby Churchill, who become his third wife in 1971.

When Germany invaded Russia on June 22, 1941, the United States extended Lend-Lease aid to the Soviet Union, and dealings with Moscow likewise fell within Harriman's purview. In 1943, Harriman replaced Admiral William H. Standley as U.S. ambassador to the Soviet Union, where he remained until 1946. He attended the major wartime Allied conferences at Tehran, Yalta, and Potsdam. In late 1944, when Soviet troops allowed occupying German forces to suppress Polish rebels in Warsaw before themselves mopping up the remaining Germans, Harriman sent diplomatic dispatches to Washington sounding one of the earliest official warnings against future Soviet designs for the nations of Eastern Europe. The Soviet move was clearly deliberately designed to eliminate future opponents of a Soviet-backed Polish regime.

Harriman subsequently held numerous other government positions under Democratic presidents. Over the years, he gained the reputation of advocating a firm but flexible and nonalarmist stance toward the Soviet Union. Harriman died in Yorktown Heights, New York, on July 26, 1986.

Harris, Sir Arthur Travers (1892–1984)

Royal Air Force (RAF) air chief marshal and commander of RAF Bomber Command. Born on April 13, 1892, in Cheltenham, England, Arthur Travers Harris joined a Rhodesian regiment at the beginning of World War I. In 1915, he transferred to the Royal Flying Corps and became a pilot, and by the end of the war he commanded the 44th Squadron. After the war, he served in India and Iraq and commanded a training school. He completed the Army Staff College (1927), again served in the Middle East, and then held posts at the Air Ministry (1933–1937).

On the outbreak of World War II, Harris commanded Number 5 Bomber Group. He then was deputy chief of the Air Staff and headed a mission to Washington. Dissatisfaction with the course of British strategic bombing led to his appointment in February 1942 as head of Bomber Command and his promotion to air chief marshal.

Harris committed himself to maintaining Bomber Command as an independent strategic arm. During May 30–31, 1942, he launched the first of the thousand-plane raids against Köln (Cologne), which did much to raise morale at home. Harris, who was nicknamed “Bomber,” maintained that massive bombing would break German civilian morale and bring about an end to the war. He ordered Bomber Command to conduct massive night raids against German cities. Among other missions, Harris directed the May 1943 raid on the Ruhr dams by the 617th Squadron; the July 24–August 3, 1943, raids against Hamburg; attacks against German rocket factories at Peenemünde during August 17–18, 1943; the November 1943 attacks against Berlin; and the destruction of Dresden (February 13–15, 1945).

Sir Arthur Harris, Royal Air Force air chief marshal and commander of Bomber Command. “Bomber Harris” argued that the Allied bombing of German cities would shorten the war. (Library of Congress)

Harris remains a controversial figure, especially because of his seeming lack of concern over collateral bomb damage. He was at odds with his superior, chief of the Air Staff Air Marshal Charles Portal, and others who sought to target specific industries considered essential to the Nazi war effort. What appeared to be indiscriminate bombing of cities also brought harsh criticism on Harris at the end of the war. His aircrews, however, remained fiercely loyal to him.

Harris retired from the RAF in September 1945 and headed a South African shipping company. His memoir, *Bomber Offensive*, was published in 1947. Made a baronet in 1953, Harris died on April 5, 1984, at Goring-on-Thames, England.

Hart, Thomas Charles (1877–1971)

U.S. Navy admiral. Born in Davison, Michigan, on June 12, 1877, Thomas Charles Hart graduated from the U.S. Naval Academy at Annapolis in 1897 and was commissioned an ensign in 1899. He served during the 1898 Spanish-American War and commanded a force of seven submarines based in Ireland during World War I.

After the war, Hart commanded submarine and cruiser forces and the battleship *Mississippi.* He graduated from the Naval War College in 1923 and the Army War College in 1924. In 1929, Hart was promoted to rear admiral and took command of submarines in the Atlantic and Pacific fleets from 1929 to 1931. He was superintendent of the Naval Academy from 1931 to 1934. He commanded a cruiser division of the Scouting Force from 1934 to 1936 and served as a member of the navy's General Board from 1936 to 1939.

U.S. admiral Thomas C. Hart. (Bernard Hoffman/The LIFE Picture Collection/Getty Images)

In June 1939, Hart was promoted to full admiral and given command of the small U.S. Asiatic Fleet. During the next years, he accelerated fleet training and drills and made plans to defend the Philippine Islands and to cooperate with the British and Dutch in the event of war with Japan. Lacking the resources to counter the Japanese invasion of the Philippines in December 1941 and denied air support from the U.S. Army's Far East Air Force, Hart sent his surface units to the Netherlands East Indies at the end of the month and moved his headquarters to Java.

In January 1942, Hart was appointed commander of the naval forces of the American-British-Dutch-Australian (ABDA) Command, which was charged with defending the Netherlands East Indies. With his resources limited and no prospect of reinforcements, Hart had no chance of success. Moreover, the British and Dutch disagreed with his plans for using his ships.

At the end of January, Hart sent his cruisers and destroyers against Japanese forces in the Battle of Makassar Strait (February 4, 1942), but the Dutch wished to concentrate the ABDA Command's ships for the defense of Java. As a result, in February 1942, Hart relinquished his command to Vice Admiral C. E. L. Helfrich of the Netherlands navy and returned to the United States. Most of ABDA Command's ships were soon lost in the February 27, 1942, Battle of the Java Sea.

Hart served with the General Board until his retirement in February 1945, when he was appointed a U.S. senator from Connecticut, a position he held until 1947. Hart died in Sharon, Connecticut, on July 4, 1971.

Hartmann, Erich Alfred (1922–1993)

Luftwaffe fighter pilot, captain, and highest-scoring ace of all time. Born in Weissach, Germany, on April 19, 1922, Erich Hartmann grew up in an aviation-minded family. His mother learned to fly in 1929, and Hartmann was an avid glider pilot as a young man.

Hartmann joined the Luftwaffe in October 1940 and began his flight training in March 1941. At the time, the Luftwaffe was not desperate for pilots, and Hartmann was the beneficiary of nearly 19 months' training before his first posting. In October 1942, he reported to Staffel (squadron) 7, III Gruppe (group), Jagdgeschwader (fighter wing) 52 (7.III/JG52) on the

Eastern Front. The veterans nicknamed the youthful Hartmann “Bubi” (lad). Hartmann spent the next two and a half years in various units in JG52.

On his 19th sortie, Hartmann scored his first victory. He continued to score steadily, although he was shot down and captured after his 19th victory. He managed to escape and return to German lines. Hartmann continued to run up his score, and he was awarded the Knight’s Cross of the Iron Cross in October 1943 after 150 victories. By August 1944, he had doubled his total. He was awarded every level of the Knight’s Cross—Oak Leaves, Swords, and eventually Diamonds, Germany’s highest military award.

Known as the “Black Devil of the Ukraine” by his Soviet opponents in recognition of his skill and the paint scheme of his aircraft, Hartmann scored his 352nd and last victory on May 8, 1945. He surrendered his fighter group to a U.S. Army unit but was handed over to the Soviets. Tried and convicted as a war criminal, Hartmann was imprisoned until his repatriation in late 1955.

Hartmann joined the Federal Republic of Germany’s new Bundesluftwaffe in 1956 and was appointed commander of the newly formed JG71 Richthofen. He retired in 1970 as a colonel. In retirement, Hartmann remained active in German civilian aviation. He died on September 19, 1993, at Weil im Schönbuch.

Harwood, Sir Henry (1888–1950)

British Royal Navy admiral. Born in London on January 19, 1888, Henry Harwood joined the Royal Navy in 1903 and quickly distinguished himself academically. A torpedo specialist, between the wars he held numerous staff posts, studied at various service schools, and was fleet torpedo officer in the Mediterranean. In 1936 Harwood, who was promoted to captain in 1928, became commodore in chief of the South American division of the fleet's America and West Indies station.

When World War II began in 1939, the Admiralty sent Harwood additional ships and ordered him to seek out the German pocket battleship *Admiral Graf Spee,* which was raiding British merchant shipping in the South Atlantic. On December 13, 1939, Harwood located the German raider off the Uruguayan coast in the Río de la Plata estuary, and his ships—the heavy cruiser *Exeter* and the light cruisers *Ajax* (flagship) and *Achilles*—closed in from different directions. Although theoretically outclassed, in 20 minutes the British attackers scored more than 20 hits on the *Admiral Graf Spee,* causing more than 100 casualties, including 37 dead. Harwood's ships sustained major damage, particularly the *Exeter,* and the British lost 71 men.

German captain Hans Langsdorff then took the *Admiral Graf Spee* into the neutral Uruguayan port of Montevideo to effect repairs. Bluffed into believing that a larger British force awaited him, a few days later Langsdorff scuttled his ship and committed suicide.

Harwood was promoted to rear admiral on December 13, 1939, and knighted for this action. A year later, he returned to Britain as assistant chief of naval staff. He impressed British prime minister Winston L. S. Churchill, who in April 1942 appointed him—above his rank—to commander in chief of Mediterranean naval forces. Harwood provided aggressive flank cover and logistical support to the British Eighth Army in North Africa in its campaigns against German field marshal Erwin Rommel's forces, on occasion entering and occupying ports abandoned by German troops even before the arrival of Allied land forces.

Harwood was promoted to vice admiral in February 1943. By that time his health was fragile, and the Admiralty transferred him to the less demanding Orkney Islands and Shetland command. Invalided from the navy in 1945 with the rank of admiral, Harwood died at Goring-on-Thames on June 9, 1950.

Hasbrouck, Robert Wilson (1896–1985)

U.S. Army major general. Born in Kingston, New York, on February 2, 1896, Robert Hasbrouck graduated from the U.S. Military Academy at West Point in 1917 and was commissioned in the coast artillery. He served with the American Expeditionary Forces in France in 1918. Hasbrouck was an instructor at the Field Artillery School from 1921 to 1924 and a professor of military science and tactics at Princeton University from 1927 to 1932. He graduated from the Army Command and General Staff School in 1934 and from the Army War College in 1937. He then served on the War Department General Staff (1937–1941).

Assigned to the 1st Armored Division, Hasbrouk was promoted to brigadier general in September 1942. He served with the 8th Armored Division at Fort Knox, Kentucky, and at Fort Polk, Louisiana (1942–1943). He was then deputy chief of staff of the 12th Army Group in Britain in 1943 and 1944.

Hasbrouck then commanded the 7th Armored Division, which he led in the Ardennes Offensive (Battle of the Bulge, December 16, 1944–January 25, 1945). On December 16, Hasbrouck was ordered to move his division some 60 miles southward to reinforce Lieutenant General Courtney Hodges's First Army. The following day, Hasbrouck's division reached the village of Saint Vith, a strategic crossroads near the Belgian-German border and on the

northern shoulder of the bulge created by the German thrust. Junior to two other officers in the area, Hasbrouck nevertheless stepped forward to take de facto command of a force composed of his own division and elements of the 28th and 106th Infantry Divisions and the 9th Armored Division. During the next several days, his skillful defense of Saint Vith greatly impeded the German westward advance. But Hasbrouck also reminded his superiors that his beleaguered troops needed to be either strongly reinforced or withdrawn before they were overwhelmed. Eventually, Hasbrouck secured approval to evacuate Saint Vith on December 23.

Promoted to major general in January 1945, Hasbrouck led the 7th Armored Division in the recapture of Saint Vith, the Remagen bridgehead breakout, the reduction of the Ruhr Pocket, and the advance from the Elbe River to the Baltic.

Hasbrouck returned to the United States after the war and became deputy chief of staff for Army Ground Forces (1945–1946). He retired in 1947 and died in Washington, D.C., on August 19, 1985.

Hasegawa Kiyoshi (1883–1970)

Japanese admiral. Born on May 7, 1883, in Fukui Prefecture on Honshu, Hasegawa Kiyoshi entered the Japanese Naval Academy in 1900. During the Russo-Japanese War of 1904–1905, he served in the battleship *Mikasa* (flagship) and took part in the Battle of Tsushima. Hasegawa graduated from

the Naval War College in 1914 and was appointed captain of the destroyer *Mikazuki.* He was then a staff officer of the Second Fleet, a member of the Personnel Section in the Naval Ministry, adjutant to the minister of the navy, and a secretary to Prime Minister Katō Tomosaburō.

From 1917 to 1920 and from 1923 to 1925, Hasegawa was a naval attaché in the Japanese embassy in Washington. After serving as captain of first the cruiser *Nisshin* and then the battleship *Nagato,* he became chief of staff of the Yokosuka Naval District in 1927.

In 1937, Hasegawa assumed command of the Third Fleet. When in July the Sino-Japanese War began, he held the dual command of the Third Fleet and the China Area Fleet. His forces took a leading role in the August 13–November 9, 1937, Battle of Shanghai. In 1938 he was assigned as commander of the Yokosuka Naval District. He was promoted to full admiral in 1939.

From 1940 to 1944, Hasegawa served as governor-general of Formosa (now Taiwan). In this post, he promoted Kominka-Kyoiku (Japanization) in an effort to assimilate the Taiwanese into Japanese culture. In 1944 he became a member of the Gunji Sangikan (the Supreme War Council advising the emperor) and inspector of the navy. In this position in February 1945, Hasegawa undertook a detailed study of navy morale and resources. His bleak report, presented to Emperor Hirohito that June, is believed to have greatly influenced the latter's decision to surrender.

Hasegawa was arrested with the end of the war. Initially charged as a Class A war criminal, he was soon released. Hasegawa died in Tokyo on September 2, 1970.

Hashimoto Kingoro (1890–1957)

Japanese Army colonel. Born in Okayama City on February 19, 1890, Hashimoto Kingoro joined the army in 1911 and graduated from the Army Staff College in 1920. He then served in Manchuria with the Guandong (Kwantung) Army from 1922 to 1925. Hashimoto believed that Japan's future demanded territorial expansion, and he was attracted to nationalist organizations promoting that cause. While in Manchuria, Hashimoto helped to plan the Mukden Incident, in which elements of the Japanese military staged an attack on their own interests, then used it as an excuse to seize most of Manchuria. This led to the establishment by Japan of the puppet state of Manzhoudiguo (Manzhouguo, Manchukuo).

Hashimoto held various regimental assignments in Japan between 1931 and 1935. During this time, he continued his extremist nationalist activities. In 1930, Hashimoto and Captain Isamu Cho founded the Sakurakai, or Cherry Blossom Society, to promote Japanese imperialism. Hashimoto also published widely; his writings became the philosophical basis for most Japanese extreme nationalists. Hashimoto attracted many followers, especially among midlevel army officers. He was cashiered from the Japanese Army for his involvement in the attempted coup on February 26, 1936.

When war with China began in July 1937, Hashimoto was recalled to active duty. Promoted to colonel, he received command of the 13th Heavy Field Artillery Regiment. Hashimoto was implicated in atrocities committed in Nanjing (Nanking) during December 13, 1937–January 22, 1938. He also ordered his troops to fire on the British gunboat *Ladybird* and on the U.S. Navy gunboat *Panay*. Despite Western protests, Hashimoto retained his command until 1939.

On his retirement from the army, Hashimoto dedicated himself to political activities. He organized and led the Dai Nippon Seinen-to (Great Japan Youth Party), later known as the Dai Nippon Sekisei-kai (Great Japan Sincerity Association). Hashimoto also became executive director of the Imperial Rule Assistance Association in 1940. He was elected to the Diet (parliament) in 1944.

After World War II, Hashimoto was tried as a war criminal for his part in atrocities in China and in promoting aggressive war. Sentenced to life imprisonment, he was paroled in 1954. Hashimoto died in Tokyo on June 29, 1957.

Hashimoto Mochitsura (1909–2000)

Japanese Navy officer who rose to the rank of commander. Born in Kyoto, Japan, on October 14, 1909, Hashimoto Mochitsura graduated from the Japanese Naval Academy in 1931. His first assignment to submarine duty came in 1934, followed by tours in destroyers and escort vessels. Hashimoto attended torpedo school in 1938 and submarine school in 1939. He served as torpedo officer in the *I-24*, one of Japan's newest ocean-cruising submarines.

On November 18, 1941, the *I-24* sailed under secret orders. Arriving off Hawaii on December 6, it launched its midget submarine early on December 7 as part of the Pearl Harbor attack force. The crew of the *I-24* spent the following days looking unsuccessfully for targets and then returned to Japan.

Hashimoto next attended advanced courses at the Submarine School. On his graduation in July 1942, he took command of the *RO-31*, a coastal defense submarine. He spent the next two years in training and other noncombat duties. In May 1944, Hashimoto was given command of the *I-58*, a new boat that was modified in the fall of 1944 to carry six Kaitens (manned torpedoes). Commissioned on September 13, 1944, the *I-58* then commenced sea trials. Hashimoto's first war patrol was in January 1945. Along with other Japanese submarines, the *I-58* attacked U.S. shipping off Guam on January

11, 1945. Following the launch of four Kaitens, Hashimoto claimed a tanker sunk, although the attack had in fact failed.

Hashimoto's next patrol was off Okinawa. His submarine was unable to attack U.S. shipping because of the many U.S. planes, but the *I-58* was the only Japanese submarine to return from Okinawa. The *I-58*'s final patrol began on July 16. With six Kaitens, Hashimoto was ordered to harass U.S. communications. He patrolled along the Guam-Leyte shipping routes, and on July 30 he spotted what turned out to be the heavy cruiser *Indianapolis,* commanded by Captain Charles McVay III. It was steaming unescorted after delivering parts of atomic bombs and was not zigzagging. Hashimoto launched six torpedoes and scored three hits. The *Indianapolis* sank quickly. Of 1,200 men in its crew, more than 900 survived the sinking; but they were not discovered by rescuers for four days, by which time 600 more had died, largely from shark attacks. Hashimoto later testified at McVay's court-martial that he would have been able to sink the *Indianapolis* even if it had been taking evasive action.

Hashimoto retired from the navy at the end of the war and became a Shinto priest. He died at Kyoto on October 25, 2000.

Hata Shunroku (1879–1962)

Japanese Army field marshal. Born in Fukushima Prefecture on July 26, 1879, Hata Shunroku was at age 14 accepted into the prestigious First Tokyo Middle School, but when his father died that year, the family was unable to afford the tuition, and Hata transferred to the Army Cadet School. In 1901 he

graduated from the Japanese Military Academy as a second lieutenant of artillery.

Hata saw service in the Russo-Japanese War (1904–1905) and graduated with honors from the Army War College in 1910. Assigned to Germany in 1912 as a military attaché, Hata remained in Europe throughout World War I as a military observer. He was promoted to major in 1914 and to lieutenant colonel in 1918. He was then a member of the Japanese delegation to the 1919 Paris Peace Conference.

Returning to Japan, Hata was promoted to colonel in 1921 when he took command of the 16th Field Artillery Regiment. Promoted to major general in 1926, he took command of the 4th Heavy Field Artillery Brigade. In 1927 he joined the Imperial General Staff as chief of the Fourth Bureau, then headed the First Bureau in 1928. He was promoted to lieutenant general in 1931, when he became inspector general of army artillery training. In 1933 he assumed command of the 14th Division, and in 1935 he headed the Army Air Service before taking command of Japanese forces in Taiwan in 1936.

Hata played a prominent role in the Second Sino-Japanese War of 1937–1945. Promoted to full general in late 1937, he assumed command of the Central China Expeditionary Army in February 1938 following the Nanjing Massacre. In May 1939 he became senior aide-de-camp to Emperor Hirohito before serving as minister of war from August 1939 to July 1940, when by his resignation he brought down Prime Minister Yonai Mitsumasa's cabinet.

In March 1941 Hata assumed command of the China Expeditionary Army. Promoted to field marshal in June 1944, Hata assumed command of the Second General Army headquartered at Hiroshima, charged with preparing for the anticipated Allied invasion of the Japanese Home Islands. Hata was a key figure in supporting Hirohito's decision to accept the Potsdam Declaration and surrender. Hata informed the imperial conference of August 9, 1945, that he had no confidence in being able to repulse an Allied landing. He also requested to be removed from the rank of field marshal because of the army's failures in the war.

Arrested after the war by U.S. authorities and charged with war crimes, Hata was tried in 1948 and sentenced to life imprisonment but paroled in 1955. From 1958 he headed a charitable foundation established to aid former Japanese soldiers. Hata died in Tokyo on May 10, 1962. He was the last

surviving Japanese field marshal. His brother, Hata Eiraro, was also a general and commanded the Kwantung Army.

Haushofer, Karl Ernst (1869–1946)

German geopolitical theorist. Born in Munich on August 27, 1869, Karl Haushofer was the son of a university professor of political economy. He joined the army in 1887 and attended the Bavarian Kriegsakademie, eventually becoming an instructor there. In 1899, he was appointed to the Bavarian General Staff. Four years later, he went to Tokyo as an artillery adviser to the Imperial Japanese Army. Haushofer earned his doctorate from the University of Munich in 1913 with a dissertation based on his analysis of Japanese military expansion. In doing so, he virtually created the field of geopolitics, which examines the influence geographic factors exert on national power.

Haushofer commanded a reserve division during World War I, attaining the rank of major general. After the armistice, he resigned from the army, and in 1921 he became a professor of geography at the University of Munich. Within two years, he had established the Institute for Geopolitics, which published several internationally respected journals.

In 1924, Rudolf Hess, one of Haushofer's former students, convinced him to visit Adolf Hitler, who was serving a prison term in Landsberg Fortress for his leadership of the abortive 1923 Beer Hall Putsch. Throughout the summer and fall, Haushofer repeatedly met with Hitler, educating him in the nuances of geopolitics. Hitler directly incorporated these ideas into his book *Mein*

Kampf, especially the notion that Germany needed to acquire *Lebensraum* (living space) to ensure its national survival.

With Hitler's rise to power, however, professional geographers at the Institute for Geopolitics were replaced by political hacks, and its scientific journals were transformed into mouthpieces for Nazi propaganda. Haushofer became increasingly disenchanted as his discipline was hijacked. The final break occurred in 1941, when Hitler ordered an invasion of the Soviet Union before Britain was defeated, violating Haushofer's sternest admonition against fighting a two-front war.

As the war turned against Germany, Haushofer's son Albrecht became involved with the secret opposition movement against Hitler. When the July 20, 1944, assassination attempt failed to kill Hitler, the Gestapo executed Albrecht and sent most of the Haushofer family to the Dachau concentration camp. Grief-stricken over the loss of their son, guilt-ridden for his role in causing Germany's destruction, and fearing punishment in a war crimes trial, Haushofer and his wife committed suicide at Hartschimmelhof, Bavaria, on March 10, 1946.

Hausser, Paul "Papa" (1880–1972)

German Schutzstaffel (SS) general. Born on October 7, 1880, in Brandenburg, Paul Hausser joined the army and was commissioned a lieutenant in 1899. He served during World War I as a staff officer on both the Western and Eastern fronts and rose to the rank of major in 1918. Hausser joined the Reichswehr after the war but retired in 1932 as lieutenant general.

He joined the Nazi SS in 1934 and, as an inspector for its academies, helped train the armed SS units, the nucleus of the Waffen-SS.

In October 1939, Hausser commanded one of the two new SS combat divisions (Waffen-SS) and led this division, known as Das Reich, in campaigns in France (May 10–June 25, 1940) and Yugoslavia (1941) and on the Eastern Front in the June 22, 1941, invasion of the Soviet Union (Operation BARBAROSSA), where he was wounded and lost an eye. Returning to active duty, from June 1942 to June 1944 he commanded the first SS corps formation, I SS Panzer Corps (later II Panzer Corps). During the Third Battle of Kharkov (March 1–14, 1943), Hausser ignored Adolf Hitler's directives and ordered a retreat. Hausser was criticized for this decision, but was able to save his troops from annihilation and then retake Kharkov, which contributed significantly to the stabilization of the German front. He also participated in the July 5–13 Battle of Kursk.

Transferred to France in June 1944, Hausser took command of the Seventh Army, which defended against the Allied invasion of Normandy (June 6). Hausser was seriously wounded in August during the desperate escape of his army at Falaise. He was promoted to Oberstgruppenführer and full general of the Waffen-SS in January 1945.

Hauser's last command, dating from January 28, was of Army Group G in the southern part of the German Western Front. He tried to organize an effective resistance against the advancing Allies, but it was impossible to meet Hitler's expectations, and the führer removed him from command on April 4, 1945. Hausser spent the remainder of the war on the staff of Field Marshal Albert Kesselring, commander in chief, west. Hausser is generally regarded as the most militarily accomplished of the Waffen-SS generals.

Imprisoned in May 1945, Hausser was not released until 1948. In the postwar Federal Republic of Germany, he became the leader of Waffen-SS veterans. An author, Hausser insisted in his books that his men had been "soldiers as any others." Hausser died at Ludwigsburg, Germany, on December 21, 1972.

See Leclerc, Jacques Philippe

Hazelhoff Roelfzema, Erik (1917–2007)

Highly decorated Dutch soldier and best-selling author. Born in Surabaya, Netherlands East Indies (Indonesia), on April 3, 1917, Erik Hazelhoff Roelfzema later moved with his family to the Netherlands. Days after the German invasion in May 1940, Hazelhoff Roelfzema was on a freighter bound for New York. When his ship was a stopped by a British warship, he persuaded its captain to allow him to go to Britain instead. There he volunteered for the Dutch section of MI6, the British Secret Intelligence Service and was soon assigned to lead a series of 15 highly dangerous small-boat missions off the Dutch coast that inserted and extracted Allied agents. In the summer of 1942 Queen Wilhelmina, head of the Dutch government-in-exile in Britain, awarded Hazelhoff Roelfzema the Militaire Willemsorde (the Military Order of William), the highest Dutch award for valor.

Hazelhoff Roelfzema then joined Britain's Royal Air Force (RAF), attended flight school in Canada, and learned to fly the wooden construction twin-engine De Havilland Mosquito, piloting this aircraft beginning in 1944

on 72 Pathfinder missions over Germany. The Pathfinder missions involved firing rockets to illuminate targets for British bombers. Twenty-five of these missions were over Berlin. For this work, he received the RAF's Distinguished Flying Cross.

In April 1945, Hazelhoff Roelfzema became aide-de-camp to Queen Wilhelmina. He moved to the United States in the early 1950s. Becoming a citizen, he wrote for both the National Broadcast Corporation (NBC) and Radio Free Europe before moving to Hawaii, where in 1977 he joined the board of Barnwell Industries, an oil and gas exploration company.

In 1971 Hazelhoff Roelfzema published a book on his wartime experiences that included information on turmoil within the Dutch government-in-exile. Titled *De Soldaat van Oranje zwaait af* (Soldier of Orange) and so named for the ruling House of Orange, the book made him an instant celebrity and became an international best seller, with more than 1 million copies printed. Later it was made into a movie of the same title. Hazelhoff Roelfzema died in Anualoa, Hawaii, on September 26, 2007.

Hedgehog

Antisubmarine weapon. The hedgehog was an important British development in the Battle of the Atlantic during World War II between the Allies and German U-boats. Instead of depth charges being dropped astern of a warship at the point where sonar contact with the U-boat was lost, the hedgehog was installed ahead of the bridge. Much thought had been given to the possibility of a forward-throwing depth charge launcher, and the Department of

Miscellaneous Weapons Development eventually came up with a multiple mortar to project 24 bombs, each with a 31-pound high-explosive charge. The projectiles were fired electrically from a platform on the ship's deck from inclined spigots; it was the appearance of the 24 spigots that gave the weapon its nickname.

When fired, the bombs spread out in a circular arc about 130 feet in diameter over the bows of the launching ship and fell into the water some 215 yards ahead. The bombs were fitted with contact fuzes so that only a submarine hit would produce an explosion. The remaining bombs sank to the bottom of the sea.

Conceived by Royal Navy commander Charles Goodeve, the hedgehog was pushed by a group of young British naval officers and scientists. Neither the director of naval ordnance nor the director of naval construction was enthusiastic about the new weapon. The hedgehog finally went to sea operationally in January 1942. For security reasons, it was first known as "anti–dive-bombing equipment."

Early hedgehogs had problems. The charges of one exploded prematurely, heavily damaging a British ship. On occasion a projectile would not fire, presenting a potential danger for crewmen trying to remove it. For sailors used to the explosion of depth charges the new weapon was a disappointment, since even depth charges that missed shook the morale of U-boat crews and bolstered that of merchant seamen and naval personnel. Escort captains were so reluctant to use hedgehogs in early 1943 that the Royal Navy was forced to issue an order instructing captains to report why they did not use the weapon on an underwater contact.

Based on British 1943–1945 experience in the Atlantic, a single hedgehog salvo had a 20 percent chance of sinking a U-boat. Hedgehogs claimed 50 submarine kills by 1945. In the Pacific theater, the U.S. destroyer escort *England* sank 6 Japanese submarines with 12 hedgehog salvos.

Heinrichs, Axel Erik (1890–1965)

Finnish Army general and chief of staff of the armed forces. Born on July 21, 1890, at Helsinki, Axel Heinrichs was selected in 1915 for infantry training with the Finnish Jäger Battalion in Germany. In 1918 Heinrichs joined others at Vaasa, Finland, and fought in the Russian Civil War on the side of the Whites. As a major, Heinrichs commanded an infantry battalion that captured Tampere and Viipuri (Vyborg). After the civil war, Heinrichs held several administrative positions including command of a regiment in central Finland, commander of the Savo Brigade, head of the War College in Helsinki, governor of Vaasa Province, and commander of the 1st Division.

At the start of the Winter War with the Soviet Union (the First Finnish-Soviet War of 1939–1940), Heinrichs commanded III Corps and helped to stop the invading Red Army at Taipale. In February 1940, he assumed command of the Karelian Army and liberated the Karelia-Ladoga region. The next month he was promoted to commander of Finnish land forces. In January 1942, Heinrichs was promoted to chief of the General Staff for the Second Finnish-Soviet War (Continuation War, the resumption of fighting with the Soviet Union that lasted from 1941 until 1944). In 1944, he was awarded the Mannerheim Cross and promoted to general of infantry.

In August 1944, Marshal Carl G. Mannerheim became president of Finland. At the end of 1944, he gave Heinrichs complete charge of military affairs as commander in chief of Finnish armed forces. Heinrichs served in that post for less than a year before being forced to resign in the summer of 1945, accused of hiding significant weaponry and creating an organization for guerrilla war as part of the “underground defense policy” immediately after the war.

Closely associated with Mannerheim, Heinrichs was the ghostwriter for the marshal’s memoirs covering the civil war, the 1930s, and the

Continuation War. He also wrote two books on the Napoleonic Wars. Heinrichs died in Helsinki, Finland, on November 16, 1965.

Heinrici, Gotthard (1886–1971)

German Army general. Born in Gumbinnen, East Prussia (today Gusev, Kaliningrad Oblast, Russia), on December 25, 1886, Gotthard Heinrici entered the German Army with the Thuringian 95th Infantry Regiment and was commissioned a lieutenant in August 1906. He was promoted to senior lieutenant in 1914 and to captain in 1915. During World War I, he served on both the Eastern and Western Fronts in both line and staff duties.

Following the war, Heinrici remained in the army, and he returned to East Prussia as a company commander in the 13th Infantry Regiment. He was promoted to major in 1926, to lieutenant colonel in 1932, to colonel in March 1933, and to major general in January 1936. He commanded the 16th Infantry Division at Münster from October 1937 to February 1940 and was promoted to lieutenant general in March 1938. The division fought in the invasion of Poland in September 1939.

Heinrici was promoted to general of infantry in April 1940 and commanded XII Army Corps from April to June 1940, participating with his unit in the May 10–June 25 Battle for France. He then commanded XLIII Army Corps (June 1940–January 1942), first on the Western Front and then in Operation BARBAROSSA, the invasion of the Soviet Union that began on June 22, 1941.

In January 1942, Heinrici replaced Field Marshal Günther von Kluge as commander of the Fourth Army when Kluge was elevated to command Army

Group Center. Promoted to colonel general in January 1943, Heinrici commanded the Fourth Army until June 1944. Heinrici's forces held a line from Orsha to Rogachev, and between October and December 1943 he successfully halted several Soviet offensives, bringing in a fresh battalion every day to an endangered area. Heinrici was considered a master of defensive warfare, and his army is believed to have withstood forces six times greater in size.

Heinrici contracted hepatitis in May 1944 and was transferred to the Führer Reserve in June, escaping the disaster that befell Army Group Center during Operation BAGRATION. On his return to active service in mid-August 1944, he took command of the First Panzer Army. The so-called Army Group Heinrici consisted of this unit and the Hungarian First Army. Heinrici quickly put his defensive stamp on events and kept the Red Army from capturing Dukla Pass until October 6, 1944, by which time the Germans had crushed a Slovak uprising and stabilized the front. During the next few months, Heinrici withdrew his forces in good order into Silesia during the Vistula-Oder Campaign.

Heinrici replaced SS chief Heinrich Himmler as commander of Army Group Vistula on March 20, 1945, following Himmler's brief but disastrous tenure. With the decimated Third Panzer Army and Ninth Army, Heinrici held the Oder River line and masterfully defended Seelow Heights against overwhelming odds, but he was unable to stem the Soviet tide. He disagreed with Adolf Hitler's führer order to hold at all costs and, following an unauthorized withdrawal of forces, was dismissed on April 29, 1945.

Heinrici surrendered to British forces. Released from imprisonment in May 1948, he contributed two reports in the postwar German Military History Program. Many regarded him as one of the best German generals of the war. Heinrici died in Waiblingen, Baden-Württemberg, on December 13, 1971.

Heisenberg, Werner (1901–1976)

German nuclear physicist. Born in Würzburg, Germany, on December 5, 1901, Werner Heisenberg graduated from the University of Munich in 1923 with a doctorate in physics. Heisenberg subsequently established a reputation as a talented scientist. One of his greatest accomplishments was his theory of quantum mechanics, for which he won the Nobel Prize in Physics in 1932. By the late 1930s, despite being an opponent of the Nazi regime, Heisenberg was the leader of the German project to manufacture an atomic weapon.

This endeavor, known as the Uranverein, occupied Heisenberg throughout the war. The project was not successful, but the cause of its failure is still a matter of debate. Heisenberg claimed after the war that he had tried to impede the project to deny Germany an atomic bomb, which many scholars contest. A principal cause of the project's failure was a lack of resources. The dearth of material and the resulting slow progress in research led to a mid-1942 report to Adolf Hitler that projected the development of a German atomic bomb as several years in the future. Convinced that Germany would not be able to deploy such a weapon during the war, Hitler took little interest in the project.

German physicist Werner Heisenberg directed the German World War II effort to build an atomic bomb. (Library of Congress)

Following the defeat of Germany, Heisenberg was among those German physicists briefly imprisoned in Britain by the Allies. In 1946 he was allowed to return to Germany and resume his scientific endeavors at the Institute for Physics (Göttingen), later known as the Max Planck Institute for Physics (Munich). Heisenberg died in Munich on February 1, 1976.

Helicopters

Helicopters are a type of aircraft supported by the aerodynamic lift created by one or more engine-driven rotors, essentially rotating wings or blades that allow the craft to take off and land almost vertically. The interest in helicopters came about because of their highly valued ability to ascend and descend in relatively small areas.

A canteen worker handing a cup of tea to the pilot of a Sikorsky R-4 helicopter hovering overhead at the RAF Helicopter School in Andover in January 1945. (Fox Photos/Getty Images)

Certainly one of the first designs for a helicopter-like craft was by artist and inventor Leonardo da Vinci in the 15th century. Three hundred years later, in 1783, inspired by a "flying top" toy brought from China, two Frenchmen—Christian de Launoy and his mechanic—built a working model

of a vertical-flight machine. In the mid-19th century, British nobleman Sir George Cayley built a full-size, unpowered heloglider that flew a few feet with his coachman aboard.

These early designs had two problems: their flight was uncontrolled, and they lacked a source of power for sustained flight. With the advent of gasoline engines and shortly after the first heavier-than-air flight of Orville and Wilbur Wright, French inventor Charles Renard built a small helicopter that flew pilotless. He was followed in 1907 by Louis Breguet and Paul Cornu, who each built a manned machine that lifted off the ground, but both suffered from control problems. In 1909, before turning his inventive powers to producing large fixed-wing aircraft for the Russian czar, Igor Sikorsky experimented with rudimentary helicopters, but he was unable to solve control and stability problems.

Between 1916 and 1918, Austrian lieutenant Stefan Petroczy and Theodore von Karman designed and built two prototype vertical-lift machines for the Central Powers during World War I. The second made more than 30 successful flights before it crashed. The war ended before a third could be built. The designers of these machines handled problems of control and stability by tethering the machines to cables anchored to the ground.

During the 1920s, a Frenchman named Douhéret, the American father-and-son team of Emile and Henry Berliner, and George de Bothezat, a Russian under American contract, all produced vertical-lift machines. Their efforts were disappointing because of stability and control problems. In 1923, Spanish engineer Juan de la Cierva solved one instability problem—caused by the retreating blade producing less lift than the advancing blade—by hinging the blades for more flexibility. Although Cierva’s invention was a rotary-wing aircraft, it was not a true helicopter. It was an autogiro or gyroplane that depended on a propeller to provide horizontal movement while the unpowered rotating wings provided the lift. As working rotary-wing aircraft, autogiros held the field through the late 1920s and early 1930s.

The first true helicopters appeared in the 1930s in the United States, France, and Germany. In France, Louis Breguet and René Dorand built a twin-rotor helicopter that set the speed record in 1935 and the endurance and distance records in 1936. In 1937, Heinrich Focke’s helicopter set new records for time aloft, speed, distance, and altitude. Igor Sikorsky, who had

immigrated to the United States in 1919, made his maiden helicopter flight in a craft of his own design in 1939.

Despite these successes, more autogiros than helicopters were used during World War II. Japan and the Soviet Union used autogiros in a limited role in support of their ground forces, and the Japanese employed some in service with their navy for antisubmarine warfare and liaison. Britain deployed a few to France for observation and communications duties in 1939, but the defeat of France ended those activities.

The U.S. military program to develop helicopters began in the late 1930s and fell under the direction of the Army Air Corps. While other services—primarily the navy—looked into the possibility of helicopter use, in May 1942 the Army Air Forces took delivery of the first practical helicopter put into military service, a Sikorsky R-4.

Helicopters had no real impact in World War II. The German Army used a small number of them for reconnaissance, supply, transport, and casualty evacuation, and the navy employed them for shipboard reconnaissance and antisubmarine patrol. By the end of the war, more than 100 Sikorsky R-4 helicopters had been delivered to the U.S. Army Air Forces, the U.S. Navy, and the U.S. Coast Guard and to Britain's Royal Air Force and its Fleet Air Arm. These were used in experiments, primarily antisubmarine warfare, and for search-and-rescue operations. In April 1944, one of the four U.S. Army Air Forces R-4s sent to India for experimentation rescued four men from an airplane crash site in Burma behind Japanese lines.

By the end of the war, many believed that the helicopter was too fragile and vulnerable for the battlefield and too difficult to maintain. Despite its tentative beginnings, in later wars the helicopter would revolutionize military operations by providing entrance to and exit from the battlefield by air while nearly uninhibited by terrain.

Hell Ships (1944–1945)

Japanese ships used to transport U.S. and other Allied prisoners of war at the end of World War II. Although the Japanese had previously transferred prisoners by ship, in the fall of 1944, U.S. forces led by General Douglas MacArthur invaded the Philippine Islands, and the Japanese dispatched ships to remove the Allied prisoners of war (POWs) from the islands to concentration camps in Japan, Manchuria, Taiwan, and Korea. These prison ships, referred to later by the Americans as hell ships, were but one example of the inhumane conditions in which the Japanese kept Allied POWs during the war.

In violation of the rules of war, Japanese troop- and weapons-carrying ships often were marked with a red cross to shield them from attack. The hell ships, which should have been so marked, carried no designation that they were transporting prisoners of war, and consequently several of them fell victim to Allied submarine and aircraft attack.

Conditions on these ships were indeed hellish. In many instances, the Japanese packed as many as 1,000 prisoners into a ship that should have carried perhaps 250. The holds were so crowded that it was impossible to lie down, and there was insufficient fresh air, food, and water. The heat in the holds was often unbearable, and the small number of buckets allotted for human waste quickly overflowed, causing hundreds of cases of dysentery. In these circumstances, many prisoners suffocated or went insane. The Japanese often refused to allow the prisoners to bury their dead at sea.

Casualties on the unmarked hell ships were often horrendous, the consequence of Allied attacks. Only 8 men out of 1,782 survived the October 24, 1944, torpedo attack on the *Arisan Maru.* Prisoners attempting to swim away from the sinking ship were shot by their Japanese captors from above decks. On September 18, 1944, only 200 prisoners of 750 survived a British submarine torpedo attack on the *Shinyo Maru.* In the autumn of 1944, more

than 4,000 Allied prisoners were killed or drowned aboard hell ships sunk by Allied submarines.

He Long (1896–1969)

Chinese Army general. Born in Sangzhi (Song-chih), Hunan Province, on March 22, 1896, He Long (Ho Lung) began his military career in 1914 by raising a voluntary revolutionary army in his native province. In 1920 the personal army became a part of the National Revolutionary Army and participated in the Northern Expedition. In late 1926 He joined the Chinese Communist Party (CCP) and in April 1927 took command of a corps in the Red Army. In July 1927 He attended a meeting in Jiujiang (Kiukiang) in Jiangxi (Kiangsi) Province with Zhu De (Chu Teh), Zhou Enlai (Chou En-lai), Mao Zedong (Mao Tse-tung), and others to plan a response to the anti-Communist program begun by Jiang Jieshi (Chiang Kai-shek). They planned the unsuccessful Nanchang Uprising in Jiangxi, which marks the beginning of an independent Chinese Communist military tradition.

After suffering defeat in the Guomindang (Kuomintang, Nationalist, GMD) Fourth "Encirclement Campaign," He's forces belatedly joined the Long March to northwest China in 1935, a year after Zhu and Mao had broken out. When the Eighth Route Army was formed in 1937, He commanded its 120th Division. During the Second Sino-Japanese War his command responsibilities grew steadily. In 1943 He was named commander

of the United Defense Headquarters at Yan'an (Yenan) in Shaanxi (Shensi) province and given overall responsibility for the defense of the Shaanxi-Gansu (Kansu)-Ningxia (Nainghsia) and the Shanxi (Shansi)-Suiyuan (an old province constituting today's central Inner Mongolia) border areas. He was concurrently commander of the 120th Division and the Yan'an Garrison Army.

As with many Communist military commanders in the 1930s and 1940s, He came to question Mao's emphasis on ideological guerrilla warfare in the face of the conventional tactics of both GMD and Japanese opponents. He was able to expand Communist control of territory by taking advantage of the confusion brought about by the Japanese ICHI-GO offensive of 1944. More frequently, however, expansion was achieved by alliance with local guerrillas.

In 1945 He was elected to the Party Central Committee and served as commander of the First Field Army in southwest China during the civil war. He rose in both the political and military hierarchies of the new regime and in 1955 was named a marshal of the People's Republic of China. He retired in January 1967 and died in Beijing (Peking) on June 9, 1969.

Hermann, Hans-Joachim "Hajo" (1913–2010)

German Air Force colonel. Born in Kiel on August 1, 1913, Hans-Joachim Hermann grew up with an interest in sailing but was unable to secure a naval commission. He then turned to the army and began training as an infantry officer before transferring to the newly formed Luftwaffe in 1935. His first

combat experience was with the Kondor Legion flying Junkers Ju-52s during the 1936–1939 Spanish Civil War. He returned from Spain in 1937 and joined Kampfgeschwader (bomber wing) 4 (KG4). During the July 10–September 30, 1940, Battle of Britain, Hermann was promoted to captain and took command of Staffel (squadron) 7 KG4 (7.KG4). He was then promoted to major and took command of III Gruppe (group) KG30 (III/KG30).

By the summer of 1943, the Royal Air Force Bomber Command had discovered how to jam German radar and in consequence had gained the upper hand in the night skies over Germany. Hermann suggested that the Germans counter this by allowing single-engine fighters, without benefit of radar, to attack the bombers over the cities where searchlights would illuminate the bombers. Hermann called his unit the Wilde Saus (Wild Boars) for its slashing, aggressive attacks. These proved so successful that Reich Marshal Hermann Göring authorized the formation of three Jagdgeschwaders (fighter wings) of Wilde Saus. This change in tactics could not turn the tide of the air war, however.

Hermann ended the war in command of Rammkommando Elbe, an experimental organization intended to ram bomber formations. Taken prisoner by the Soviets at the end of the war, he was held by them until 1955. Hermann earned a law degree in 1965 and became a prominent lawyer in Düsseldorf, where he died on November 5, 2010.

Hershey, Lewis Blaine (1893–1977)

U.S. Army general and director of the Selective Service System. Born in Angola, Indiana, on September 12, 1893, Lewis Blaine Hershey graduated from Tri-State College in Angola in 1914. He was then principal of Flint High School in Indiana. Hershey had joined the National Guard in 1911, and he was promoted to first lieutenant in 1916. After the United States entered World War I, Hershey was mobilized and served on the Mexican border and then in France but too late to see combat. Promoted to captain, he returned to the United States in September 1919 and received a regular army commission in July 1920.

During the next decade, Hershey held a variety of routine assignments. He was left permanently blind in his left eye from a polo accident in 1927. Hershey graduated from the Command and General Staff School in 1931 and the Army War College in 1933. Promoted to major in 1935, Hershey was assigned to Washington that September as secretary of the Joint Army and Navy Selective Service Committee of the War Department General Staff, tasked with developing a system for raising military manpower in the event of need. This undertaking led to the Selective Service Act.

Hershey became deputy director of Selective Service in 1940. In July 1941, President Franklin D. Roosevelt appointed him the director. During World War II, Hershey oversaw the mobilization of more than 10 million men for the U.S. armed forces gathered from a network of 6,400 local draft boards. He was promoted to major general in April 1942.

The original Selective Service Act expired in 1947, but with the coming of the Cold War, Congress reinstated it the next year, and President Harry S. Truman reappointed Hershey the director of Selective Service. The system functioned effectively during the Korean War and again during the Vietnam War. President Richard M. Nixon pledged to dismiss Hershey; Nixon favored centralized and nationalized draft classifications, which ran counter to Hershey's locally run system. Nixon relieved Hershey in 1970, promoting him to full general in compensation and reassigning him as presidential adviser on manpower. Hershey retired from the army in April 1973 and died in Angola, Indiana, on May 20, 1977.

Hess, Walter Richard Rudolf (1894–1987)

German deputy führer. Born on April 26, 1894, in Alexandria, Egypt, to a German merchant family, Walter Richard Rudolf Hess volunteered for the 1st Bavarian Infantry Regiment in August 1914 during World War I, but in the last weeks of the war he became an officer pilot. Following the war, Hess settled in Munich and began university studies in history, economics, and geopolitics. An early member of the National Socialist Party, he became a close associate of Adolf Hitler and participated in the abortive Beer Hall Putsch of November 1923. Hess was sentenced to prison for 18 months, during which time he acted as private secretary to Hitler, working on *Mein Kampf.* On his release, Hess secured a position with the geopolitician Karl Haushofer.

In December 1932, Hess became head of the Central Political Committee of the National Socialist (Nazi) Party, already having the reputation of a slavish follower of Hitler. Power mattered little to Hess; Hitler's approval was all. In April 1933 three months after becoming German chancellor, Hitler named Hess deputy führer. Although a member of the Nazi inner circle, Hess was not up to the tasks demanded of him. Traces of mental illness surfaced, and he was not well physically.

On May 10, 1941, six weeks before the June 22 German invasion of the Soviet Union (Operation BARBAROSSA), Hess, having learned to pilot the Messerschmitt Bf-110 long-range German fighter, flew solo from Germany to Scotland. In a rather extraordinary feat of navigation, he piloted the aircraft to within 10 miles of his objective, the estate of the Duke of Hamilton, where he bailed out and was taken prisoner.

Much speculation remains as to the reason for Hess's flight. Most likely, Hess hoped to broker a peace agreement between Britain and Germany, but this had no authority from Hitler. The German government admitted the

event but denied any official backing. In any case, Hess was immediately imprisoned by the British.

Hess remained in prison in Britain for the rest of the war. One of the major defendants before the International War Crimes Tribunal at Nuremberg, he was found guilty of conspiracy to wage aggressive war and crimes against peace and was sentenced to life in prison. During his trial, Hess revealed to the world the secret agreements of the Soviet-German Non-Aggression Pact of August 23, 1939, that had provided for the partition of the Baltic states and Poland between Germany and the Soviet Union. The Soviets never forgave Hess for this and refused repeated British requests that he be released on medical grounds, especially when he was the only inmate of Spandau Prison in Berlin. Hess served the longest time of any of the Nuremberg defendants, dying at Spandau on August 17, 1987.

Hewitt, Henry Kent (1887–1972)

U.S. Navy admiral. Born in Hackensack, New Jersey, on February 11, 1887, Henry Kent Hewitt graduated from the U.S. Naval Academy at Annapolis in 1906. He then joined the global cruise of President Theodore Roosevelt's Great White Fleet (1907–1909). During World War I, Hewitt commanded destroyers in European waters. Between the wars, he alternated shore duty as an instructor at the Naval Academy, battleship tours, staff assignments, and study at the Naval War College (1929).

In 1933, Hewitt took command of Destroyer Division 12. He was promoted to captain the next year. Hewitt then commanded the cruiser *Indianapolis.* In December 1939, he took over Cruiser Division 8. He was promoted to rear admiral in December 1940 and commanded task groups on neutrality patrols in the Atlantic. Following U.S. entry into the war in December 1941, in April 1942 Hewitt assumed command of the Amphibious Force, Atlantic Fleet. As such, he was responsible for U.S. amphibious forces in the Atlantic and Europe. Hewitt was the U.S. naval officer most involved in the development of amphibious doctrine in the Mediterranean and European theaters during the war. He commanded every major Allied amphibious operation in the Mediterranean theater during the war.

Hewitt was promoted to vice admiral in November 1942, and in March 1943 he assumed command of the U.S. Navy Eighth Fleet. Working within an Allied command structure in which he was subordinate to British admiral Sir Andrew Browne Cunningham and forced to coordinate military and naval operations and deal with such forceful individuals as Major General George S. Patton, Hewitt demonstrated considerable diplomatic ability. Hewitt's skills were tested in planning and directing complicated large-scale landing operations, reinforced by naval gunfire support, in North Africa (November 8, 1942), Sicily (July 9, 1943), Salerno (September 9, 1943), and southern France (August 15, 1944). His most difficult decision was whether to go forward with Operation TORCH, the North African landings, despite adverse weather conditions. He elected to proceed, a difficult choice that led to military success.

Promoted to full admiral in April 1945, shortly afterward Hewitt assumed command of the Twelfth Fleet, U.S. naval forces in European waters. He returned to the United States in October 1946 and took a special assignment at the Naval War College in Rhode Island before becoming naval representative to the United Nations Military Staff Committee. Hewitt retired in March 1949 and died in Middlebury, Vermont, on September 15, 1972.

Heydrich, Reinhard Tristan Eugen (1904–1942)

Chief of the German security police and Sicherheitsdienst (SD, Security Service). Born in Halle, Germany, on March 7, 1904, Reinhard Tristan Eugen Heydrich believed in the stab-in-the-back legend that the German Army had not been defeated militarily in World War I but instead had been undone by the collapse of the German home front and the myth of Aryan supremacy. He joined a Freikorps unit at age 16 and the German Navy in 1922.

Planning to make the navy his career, Heydrich was forced to resign in 1931 following an indiscretion with another officer's daughter. That same year, Heydrich joined the National Socialist Party and became active in the Sturmabteilung (SA, Storm Troops) in Hamburg. Heydrich's managerial abilities and Germanic appearance led Schutzstaffel (SS) chief Heinrich Himmler to appoint him as head of the SD. Heydrich soon built the SD into a powerful organization, and by 1933 he was an SS-Brigadeführer.

After directing the opening of Dachau, the first of many Nazi concentration camps, Heydrich helped to organize the 1934 purge ("Night of the Long Knives"), in which the SA leadership was liquidated. Feared even within party ranks for his ruthlessness and known as the "Blond Beast," Heydrich helped create the Nazi police state. He also played a leading role in the November 9, 1938, Kristallnacht (Night of Broken Glass), an orgy of violence against the German Jewish community.

Following the invasion of Poland, Heydrich assumed command of the Reichssicherheitshauptamt (RSHA, Reich Main Security Office), which was responsible for carrying out Hitler's extermination of the Jews. Heydrich

established the Einsatzgruppen, killing squads charged with executing Jews and members of opposition groups in German-controlled Poland and later in the Soviet Union. Heydrich was also a leading participant at the Wannsee Conference on January 20, 1942, when top Nazis planned the extermination of European Jewry.

Although he still retained his other duties, Heydrich in late 1941 became the Reich protector of Bohemia and Moravia. On May 27, 1942, British-trained Czech commandos ambushed Heydrich's car, seriously wounding him. Heydrich died on June 4, 1942. In retaliation for his death, the Germans destroyed the village of Lidice and murdered most of its inhabitants.

He Yingqin (1890–1987)

Nationalist Chinese Army general. Born into a landowning family in Xinyi (Hsing-i), Guizhou (Kweichow) Province, on April 2, 1890, He Yingqin (Ho Ying-ch'in) received a thorough military education in both Chinese and Japanese military schools. With the beginning of the 1911 Revolution, he returned to China and joined the revolutionary forces in Shanghai. Following the ill-fated Second Revolution in 1913, he returned to his studies in Japan which he completed in 1916.

Chinese Nationalist general He Yingqin (Ho Ying-Ch’in). (Leonard McCombe/The LIFE Images Collection/Getty Images)

In 1924 He was appointed chief instructor at the newly founded Huangpu (Whampoa) Military Academy and participated in the Northern Expedition. He became a close associate of Jiang Jieshi (Chiang Kai-shek) and directed military operations against dissident Guomindang (Kuomintang, Nationalist, GMD) forces as well as the Red Army in the Extermination Campaigns of the 1930s.

He was ordered to appease the Japanese in the humiliating Tanggu (Tangku) Truce of 1933 and the He-Umezu Agreement of 1935, resulting in widespread student demonstrations against GMD policy. After the Lugougiao (Lukou-ch’iao) Marco Polo Bridge Incident and the onset of a full Sino-Japanese War in 1937, He was appointed chief of staff of the Chinese Army. Between 1942 and 1944 he had a prickly rivalry with U.S. lieutenant general Joseph W. Stilwell, commander of forces in the China-Burma-India theater

and Allied chief of staff to Jiang. He also clashed with General Chen Cheng (Ch'en Ch'eng), Stilwell's choice for Chinese commander. When Stilwell was relieved of command in 1944, He was relieved of his war portfolio but not his military position.

On September 9, 1945, He formally received the Japanese surrender in Nanjing (Nanking) in Jiangsu from General Okamura Yasuji, commander of Japanese forces in China. During the civil war period He's political fortunes waned. In 1949 he joined the Nationalists on Taiwan and served as chief Chinese delegate to the United Nations Military Advisory Committee (1946–1948) and then as chairman of the Strategy Advisory Committee in Taiwan (1950–1958). He died in Taipei on October 21, 1987.

Higashikuni Naruhiko, Prince of Japan (1887–1990)

Japanese Army general, politician, and member of the imperial family. Born in Kyoto on December 3, 1887, Prince Higashikuni was a younger brother of Prince Asaka Yasuhiko. Higashikuni graduated from Tokyo Army Cadet School in 1908 and the Military Academy in 1914. He then studied at the French Defense Academy from 1920 to 1922. Following various staff and line posts, Higashikuni was promoted to lieutenant general in 1933. He was appointed commander of the 2nd Division in 1933 and of the 4th Division in 1934.

Promoted to full general in 1939, Prince Higashikuni served as commander in chief of the Home Defense Command between December 1941 and April 1945. Higashikuni was one of the pivotal figures opposing the Tōjō Hideki cabinet and in favor of an early peace with the Allies. Following the resignation of the Suzuki Kantarō cabinet, in the immediate aftermath of the Japanese surrender Higashikuni led a transitional Japanese cabinet between August 17 and October 9, 1945. He then retired from politics altogether. Higashikuni died in Tokyo on January 20, 1990.

Higgins, Andrew Jackson (1886–1952)

U.S. businessman and naval constructor. Born on August 28, 1886, in Columbus, Nebraska, Andrew Jackson Higgins moved to Alabama in 1906, where he worked in the timber industry, becoming familiar with shallow-draft boats. In 1923, he started the Higgins Lumber and Export Company in New Orleans. By 1926, Higgins had moved away from timber and was focused on manufacturing boats.

During the 1930s, Higgins Industries built a variety of shallow-water boats. Higgins sold vessels to the Coast Guard and the Army Corps of Engineers, and in 1939 he received contracts to build a boat for amphibious operations and to manufacture fast patrol-torpedo boats.

Higgins Industries designed and manufactured for the U.S. armed forces in World War II the LCP (landing craft, personnel), LCPL (landing craft personnel, large), LCVP (landing craft vehicle, personnel), and LCM (landing craft, mechanized). Higgins also oversaw the construction of other products, including an airborne droppable lifeboat and secretly manufactured

items required by the Manhattan Project. During the war, Higgins Industries expanded to eight plants around New Orleans. The firm built more than 20,000 vessels for the Allies. General Dwight D. Eisenhower said of Higgins, "He is the man who won the war for us."

Following the war, Higgins's company experienced financial difficulties, but during the 1950–1953 Korean War, it again thrived. Andrew Higgins died in New Orleans on August 1, 1952.

Higuchi Kiichiro (1888–1970)

Japanese Army lieutenant general. Born in Mihara County, Hyogo Prefecture, on August 20, 1888, Higuchi Kiichiro was the son of Hisahachi Okusawa but was adopted by Higuchi Yuuji. Higuchi Kiichiro graduated from the Japanese Military Academy in 1909 and from the War College in 1918. Following service on the General Staff, Higuchi undertook duties as staff officer in the Korean Army (Japanese forces in Korea), military attaché to Poland, and chief of staff of the 3rd Division. In 1937, Higuchi was assigned as a major general with the Guandong (Kwantung) Army headquarters in Manzhoudiguo (Manchoutikuo), the Japanese puppet state in Manchuria, and as chief of the secret military agency in Harbin.

As a consequence of anti-Semitic activities undertaken in Europe, chiefly by Germany, Jews living in the Far East organized a conference in Harbin, Manzhoudiguo. The Japanese military supported this effort. Higuchi not only participated in the conference but also made a speech supporting the Jewish people. Although it delighted Jews, his speech angered the German

government, which registered a formal protest. Higuchi was not disciplined, however.

In 1938, Higuchi was assigned as chief of the 2nd Bureau of the General Staff, and the next year he was promoted to lieutenant general. He then commanded in succession the 9th Division, the Northern District Army, and the Northern Army. In 1943, Higuchi assumed command of the Fifth Army (the upgraded Northern Army), and later that year he commanded the operation evacuating Kiska Island in the Aleutian chain. After the war, Higuchi retired from public life and wrote his memoirs. He remained in seclusion after 1947 and died in Tokyo on October 11, 1970.

Himmler, Heinrich (1900–1945)

German political figure and leader of the Schutzstaffel (SS). Born on October 7, 1900, in Munich, Heinrich Himmler attended secondary school in Landshut. During World War I, he progressed from clerk to officer candidate in the 11th Bavarian Infantry Regiment. He then studied agriculture at the Munich Technical High School from 1918 to 1922. Himmler joined the National Socialist Party and played a small role in the abortive 1923 Munich Beer Hall Putsch. He then married and purchased a farm but remained politically active.

In January 1929, Adolf Hitler appointed Himmler as head of the SS, which at the time was Hitler's personal security detail and part of the Sturmabteilung (SA, Storm Troops). Within a few years, Himmler enlarged it from 200 men into an organization of 50,000 men, with its own distinctive black uniform, ethos, and personal devotion to Hitler. In 1934, Reichsführer (leader) of the SS Himmler gained control of the Gestapo (secret police).

Hitler rewarded him for his active role in the 1934 Blood Purge of the SA by making the SS an independent organization subject only to his own immediate authority. In June 1936, Himmler also gained control of all the police forces of Germany.

Although he was physically far removed from the ideal Aryan type, Himmler was a fanatical adherent of Nazi racial theories. He busied himself with far-fetched schemes to breed a new race of "pure Aryans"—an SS version of the medieval knights—who would rule Europe from the Atlantic to the Urals.

Despite his promise to the German Army, Hitler allowed Himmler to establish armed SS formations, known as the SS Verfügungstruppen (emergency troops), from which came the divisions of the Waffen-SS (Armed SS) during World War II. The SS also came to have considerable economic interests, including armaments factories. By 1939, Himmler's influence overshadowed the Nazi Party; thus, many high-ranking officials, even in the military, found it prudent to hold SS ranks. Himmler was one of the most important figures in Germany, and perhaps the most dreaded.

Controlling Germany's racial policies, Himmler directed the "Final Solution"—the extermination of the Jews along with the incurably ill, the disabled, Gypsies, and homosexuals. The SS already ran the concentration camps. It now established and ran the death camps as well.

After the failed July 1944 bomb plot against Hitler, Himmler took command of the Ersatzheer (Replacement Army). In November 1944, Hitler gave Himmler command of Army Group Rhine, and during January–April 1945 he commanded Army Group Vistula—two positions for which he was utterly unqualified. In April 1945, Himmler attempted to negotiate a surrender with the Western Allies. A furious Hitler stripped him of his posts. Himmler attempted to flee but was captured by British troops. Identified on May 23, 1945, Himmler committed suicide by means of a hidden cyanide capsule.

Hirohito, Emperor of Japan (1901–1989)

Japanese emperor. Born at the Aoyama Palace in Tokyo on April 29, 1901, the oldest son of Emperor Taisho, Japan's future emperor was named Hirohito by his grandfather, Emperor Meiji. His imperial title was Michinomiya. During a six-month period in 1921, Hirohito traveled in Europe, and his meeting with Britain's King George V profoundly shaped his view of constitutional monarchy.

On December 25, 1926, Hirohito acceded to the throne on the death of his father, ushering in the Shōwa period in Japanese history. His reign spanned more than six decades. The new emperor's close advisers included political moderates who desired close relations with Britain and the United States. They also hoped that Hirohito might reverse the decline in popular reverence for the imperial throne that had occurred under his father.

In his early years as emperor, Hirohito and his imperial entourage found Prime Minister Tanaka Giichi's hard-line China policy at best problematic. This was one reason why Hirohito harshly reprimanded the military officer turned politician over his response to the June 1928 assassination of Zhang Zuolin (Chang Tso-lin) in Manchuria. When Tanaka's successor Hamaguchi Osachi was placed in a politically untenable position over the 1930 London Naval Disarmament Treaty, Hirohito did voice unequivocal support for cooperation with Britain and the United States and threw the weight of his support behind the beleaguered civilian prime minister. Although these actions no doubt illustrated Hirohito's desire for peace, they inexorably enmeshed him in the rough-and-tumble political process and made his entourage vulnerable to attack by hard-liners.

Hirohito was emperor of Japan from 1926 until 1989, the longest-reign in Japanese history. Certainly, as a head of state, he acted to try to win the war. In August 1945, he decided to accept the Potsdam Declaration, risking a possible coup d'état in his decision to surrender. (Library of Congress)

These experiences in the early years of his reign and his observations of European governments led Hirohito to conclude that he must defer to cabinet decisions. On the basis of this particular understanding of his constitutional function, Hirohito chose, despite personal reservations, to accept policies presented to him by the cabinet at key historical junctures, such as the outbreak of the military conflict with China in 1937 and the December 7, 1941, Japanese attack on Pearl Harbor.

Hirohito rendered an independent political judgment only twice: when the cabinet was unable to act effectively on the attempted coup by army junior officers on February 26, 1936, and when Japan accepted the Potsdam Declaration and Hirohito called on the Japanese people to surrender at the end of World War II. Such studied self-restraint did not make him a hapless

stooge. As head of state under the Meiji constitutional system, Hirohito often expressed his concerns and opinions to those who made policy recommendations to him, but he usually upheld the cabinet's decision.

After the war, some Western historians, notably David Bergamini, alleged that Hirohito had been deeply in sympathy with Japanese expansionist policies, but the available documentation largely contradicts this. During the war, Hirohito's role as commander in chief became more pronounced, but his reprimands and exhortations to the military during the conflict should be understood in their proper historical context. As a wartime head of state, he acted to try to win the war. Although threatened with military revolt, Hirohito decided to accept the Potsdam Declaration, risking a possible coup d'état when he made the decision to surrender.

In the new postwar Japanese constitution, the emperor became the symbol of the nation. In keeping with the new constitutional principle of popular sovereignty, the emperor carried out certain ceremonial duties with the advice and approval of the cabinet. Hirohito died in Tokyo on January 7, 1989.

Hiroshima, Bombing of (August 6, 1945)

The U.S. bombing of the Japanese city of Hiroshima on August 6, 1945, was the first combat use of the atomic bomb. On July 25, 1945, commander of U.S. Strategic Air Forces General Carl Spaatz received orders to employ the

509th Composite Group, Twentieth Air Force, in a “special bomb” attack on selected target cities in Japan, specifically Hiroshima, Kokura, Niigata, or Nagasaki. Following rejection of conditions promulgated by the Potsdam Proclamation on July 26, a declaration threatening Japan with total destruction if unconditional surrender was not accepted, President Harry S. Truman then authorized use of the special bomb.

Assembled in secrecy and loaded on the Boeing B-29 Superfortress *Enola Gay,* the bomb consisted of a core of uranium isotope 235 shielded by several hundred pounds of lead, encased in explosives designed to condense the uranium and initiate a fission reaction. Nicknamed “Little Boy,” the bomb possessed a force equivalent to 12,500 tons of TNT (12.5 kilotons).

The *Enola Gay,* commanded by Colonel Paul Tibbets, departed Tinian at 2:45 a.m. on August 6. Two B-29s assigned as scientific and photographic observers followed, and the three aircraft rendezvoused over Iwo Jima for the run over Japan. Captain William Parsons of the U.S. Navy completed the bomb’s arming in the air shortly after 6:30 a.m. The flight to Japan was uneventful, and Tibbets was informed at 7:47 a.m. by weather planes over the targets that Hiroshima was clear for bombing. Japan’s eighth-largest city (it had about 245,000 residents in August 1945), Hiroshima was an important port on southern Honshu and headquarters of the Japanese Second Army.

The *Enola Gay* arrived over the city at an altitude of 31,600 feet and dropped the bomb at 8:15:17 a.m. local time. After a descent of some nearly 6 miles, the bomb detonated 43 seconds later some 1,890 feet over a clinic and about 800 feet from the aiming point, Aioi Bridge. The initial fireball expanded to 110 yards in diameter, generating heat in excess of 300,000 degrees centigrade, with core temperatures over 50 million degrees centigrade. At the clinic directly beneath the explosion, the temperature was several thousand degrees. The immediate concussion destroyed almost everything within 2 miles of ground zero. The resultant mushroom cloud rose to 50,000 feet and was observed by B-29s more than 360 miles away. After 15 minutes, the atmosphere dropped radioactive black rain, adding to the death and destruction.

The ruins of the Japanese city of Hiroshima after the dropping of the atomic bomb on August 6, 1945. (Library of Congress)

Four square miles of Hiroshima's heart disappeared in seconds, including 62,000 buildings. More than 71,000 Japanese died, another 20,000 were wounded, and 171,000 were left homeless. Some estimates place the number of killed at more than 200,000. About one-third of those killed instantly were soldiers. Most elements of the Japanese Second General Army were at physical training on the grounds of Hiroshima Castle when the bomb exploded. Barely 900 yards from the explosion's epicenter, the castle and its residents were vaporized. Also killed was an American prisoner of war in the exercise area. All died in less than a second. Radiation sickness began the next day and added to the death toll over several years.

Following three observation circuits over Hiroshima, the *Enola Gay* and its escorts turned for Tinian, touching down at 2:58 p.m. The bombing mission, 12 hours and 13 minutes long and covering 2,960 miles, changed the nature of warfare but did not immediately end the war. Truman released a statement on August 7 describing the weapon and calling on Japan to surrender, but his message was ignored by most Japanese leaders as propaganda. The United States dropped another atomic bomb on August 9, this time on Nagasaki.

Hirota Kōki (1878–1948)

Japanese diplomat and politician. Born on February 14, 1878, in Fukuoka, Japan, Hirota Kōki graduated from the law faculty of Tokyo Imperial University and joined the Ministry of Foreign Affairs in 1906 to pursue a career as diplomat. He was posted to China, Great Britain, and the United States before becoming ambassador to the Soviet Union in 1930. During the 1931–1933 Japanese takeover of Manchuria, Hirota worked to prevent Soviet intervention in the Sino-Japanese dispute.

Between 1933 and 1936, Hirota was foreign minister in the Saitō and Okada cabinets. During his tenure Hirota made concessions (Hirota's Three Principles) to army hard-liners who sought to pursue annexationist policies in northern China, thus paving the way for the Sino-Japanese War of 1937–1945. Following the attempted army coup of February 26, 1936 (the 226 Incident), which brought the resignation of Prime Minister Okada and his entire cabinet, Hirota was appointed prime minister in March 1936. Although he yielded to hard-liners in the military and the cabinet and approved additional expansionist policies, Hirota was forced to resign after a clash between a Diet member and war minister in a Diet session in January 1937.

In the first cabinet of new prime minister Konoe Fumimaro of June 1937–May 1938, Hirota was once again foreign minister but failed to prevent the

outbreak of the Sino-Japanese War. After the infamous Nanjing Massacre of December 1937, Hirota resigned in May 1938.

Thereafter, Hirota only held nominal posts as a senior politician. In the final stage of the Pacific war, Foreign Minister Tōgō Shigenori asked Hirota to sound out the possibility of a negotiated peace with the Allies through Soviet mediation. However, Hirota's meetings during June and July 1945 with Soviet ambassador to Tokyo Yakov Malik resulted in deadlock.

Former Japanese prime minister Hirota Kōki listens to his death sentence being handed down by the International Military Tribunal for the Far East on November 12, 1948. Hirota was prime minister during 1936–1937. A trained diplomat, he also served as foreign minister. (National Archives)

In the aftermath of the war, Hirota was arrested and brought to trial by the International War Crimes Tribunal in Tokyo. He was found guilty of helping to cause the war with China and the atrocities committed by the Japanese

Army in China. Among seven sentenced to death, Hirota was the only civilian. He was hanged in Tokyo on December 23, 1948.

Hitler, Adolf (1889–1945)

Leader (führer) of Germany. Born on April 20, 1889, in Braunau am Inn, Austria, Adolf Hitler had a troubled childhood. He was educated at primary school and Realschule in Linz, but he dropped out at age 16. Hitler aspired to become an artist, and on the death of his mother Klara in 1907 (his father Alois had died in 1903), he moved to Vienna. He attempted to enroll at the Viennese Academy of Fine Arts but was unsuccessful. Hitler lived in flophouses and made some money selling small paintings of Vienna scenes to frame shops. It was in Vienna that Hitler developed his hatred of Jews, who had assimilated into Viennese society. But he also developed an aversion to internationalism, capitalism, and socialism. He developed an intense sense of nationalism and expressed pride in being of German descent.

Probably to avoid compulsory military service, Hitler left Austria in May 1913 and settled in the south German state of Bavaria. On the outbreak of World War I in 1914, he enlisted in the Bavarian Army and served with distinction. Here he found the sense of purpose he had previously lacked. He saw extensive military action, was wounded, and served in the dangerous position of *meldegänger* (dispatch runner). Temporarily blinded in a British gas attack, Hitler ended the war in a military hospital. He had risen to the rank of lance corporal and won the Iron Cross First Class, an unusual distinction for someone of his rank.

After the war, Hitler returned to Munich and remained in the military as a counterintelligence agent, reporting on political groups, and he then became involved in politics full time. In the summer of 1919 and on the order of his commanding officer, Hitler joined the Deutsche Arbeiterpartei (German Worker's Party), later known as the Nationalsozialistische Deutsche Arbeiterpartei (NSDAP, National Socialist German Workers' Party or Nazi Party). His oratorical skills, combined with generous financial support from the German Army, soon made him one of its leaders. Disgruntled by Germany's loss in the war, Hitler became the voice of the dispossessed and angry. He blamed Germany's defeat on the "November criminals"—the communists, the Jews, and the Weimar Republic.

Taking a cue from Benito Mussolini's march on Rome the previous year, on November 8, 1923, Hitler and his followers attempted to seize power in Bavaria as a step toward controlling Germany. This Beer Hall Putsch was put down by the authorities with some bloodshed. Hitler was then arrested and brought to trial for attempting to overthrow the state. He used his trial to become a national political figure in Germany. Sentenced to prison, he served only nine months (1923–1924). While at the Landsberg Fortress, he dictated his stream-of-consciousness memoir, *Mein Kampf* (My Struggle). Later, when he was in power, royalties on sales of the book and his images made him immensely wealthy, a fact he deliberately concealed from the German people.

Hitler formed few female attachments during his life. He was involved with his niece, Geli Raubal, who committed suicide in 1931, and later with Eva Braun, whom he hid from the public. Deeply distrustful of people, Hitler was a vegetarian who loved animals and especially doted on his dogs. He was also a severe hypochondriac, suffering from myriad real and imagined illnesses.

Hitler restructured the NSDAP, and by 1929 the party had emerged as a political force in Germany, winning representation in the Reichstag. In April 1932, Hitler ran against Field Marshal Paul von Hindenburg for the presidency of Germany. Hitler railed against the Weimar Republic for the Versailles Treaty at the end of World War I, the catastrophic inflation of 1923, the alleged threat posed by the communists, and the effects of the Great Depression. Hindenburg won, but Hitler received 13 million votes in a

completely free election, and by June 1932 the Nazis were the largest political party in the Reichstag.

German chancellor Adolf Hitler in a 1939 photograph. (Roger Viollet/Getty Images)

On January 30, 1933, Hindenburg appointed Hitler chancellor. Hitler quickly acted against any political adversaries. Fresh elections under Nazi auspices gave the Nazis in coalition with the Nationalists a majority in the Reichstag. An Enabling Act of March 1933 gave Hitler dictatorial powers. On the death of Hindenburg in August 1934, Hitler amalgamated the office of president and chancellor, with the combined title of führer. He also took direct control of the armed forces. In the “Night of the Long Knives” of July 1934, Hitler purged the party and especially the SA and removed several political opponents. Hitler also reorganized Germany administratively, dissolving political parties and labor unions and making Germany a one-party state.

Opposition to the Nazis soon was crushed, and many dissidents were sent to concentration camps. The ubiquitous Gestapo kept tabs on the civilian population, but the state was not characterized solely by repression by any means. In the first several years, Hitler was carried forward on a wave of disillusionment with the Weimar Republic, and a plebiscite showed that a solid majority of Germans approved of his actions.

On assuming political power, Hitler initiated actions against and introduced legislation to isolate the Jews. They were turned into a race of "untouchables" within their own state, unable to pursue higher education, certain careers, or a full public life. The Nuremberg Laws of 1935 defined as Jewish anyone with at least one Jewish grandparent and classified them as noncitizens, without rights. Hitler remarked that war in Europe would lead to the "extinction of the Jewish race in Europe."

In 1934, Hitler took Germany out of the League of Nations and the Geneva disarmament conference. Germans were put back to work, and rearmament, albeit at first secret (it was announced in 1935), began. Hitler's most daring gamble was in March 1936, when he marched German troops into the Rhineland and remilitarized it. He sent German forces to aid the Nationalist insurgency in Spain during 1936–1939 and formed an alliance with Mussolini's fascist Italy. In November 1937, he announced plans to his top advisers and generals for an aggressive foreign policy and war, and in March 1938 he began his march of conquest with the Anschluss (union) with Austria. That fall, he secured the Sudetenland of Czechoslovakia, and in March 1939, he took over the remainder of Czechoslovakia. Poland was the next pressure point. To secure his eastern flank, in August 1939 Hitler concluded a nonaggression pact with the Soviet Union (the Molotov-Ribbentrop Pact). On September 1, 1939, German forces invaded Poland, touching off World War II in Europe.

Applying new tactics of close cooperation between air and ground elements centered in a war of movement that came to be known as blitzkrieg (lightning war), the German military enjoyed early success on the battlefield. Poland was taken within one month. When Britain and France, which had gone to war with Germany on the invasion of Poland, rejected peace on a forgive-and-forget basis, Hitler invaded the west. Norway and Denmark were taken beginning in April 1940. France and the Low Countries fell in May and June. Hitler's first rebuff came in the July 10–September 30, 1940, Battle of

Britain, when the Luftwaffe failed to drive the Royal Air Force from the skies, a necessary precursor to a seaborne invasion. After next securing his southern flank in the Balkans by invading and conquering Greece and Yugoslavia in April 1941, Hitler invaded the Soviet Union on June 22, 1941. When the United States entered the war against Japan in December 1941, Hitler declared war on the United States, in keeping with agreements he had made with Japan.

Increasingly, Germany suffered the consequences of strategic overreach: German troops not only had to garrison much of Europe, but they also were sent to North Africa. Hitler's constant meddling in military matters, his changes of plans, and his divide-and-rule concept of administration all worked to the detriment of Germany's cause. On Hitler's express (but rarely written) orders, millions of people, mainly Jews, were rounded up and systematically slaughtered.

On July 20, 1944, Colonel Claus von Stauffenberg, a leader of the German opposition to Hitler, placed a bomb in the Wolfsschanze, Hitler's headquarters in East Prussia. Although Hitler survived the blast, he was thereafter a physical and psychological wreck.

From mid-January 1945, Hitler took up residence in Berlin. He refused negotiation to the end, preferring to see Germany destroyed and claiming that the German people did not deserve to continue. He married Eva Braun on April 29, 1945, and—rather than be taken by the Russians, who were closing in on Berlin—he and his new wife committed suicide in the bunker of the Chancellery on April 30, 1945. After the fall of the Soviet Union in 1991, the Russians confirmed that they had his remains, ending myths that Hitler had escaped to South America.

Hitler-Franco Meeting at Hendaye (October 23, 1940)

The only meeting between German dictator Adolf Hitler and Spanish dictator Francisco Franco, it took place on October 23, 1940, at Hendaye, a small French town on the Atlantic coast near the border with Spain. The meeting occurred at Hitler's instigation following Germany's June defeat of France but with Britain stubbornly holding out against German air attacks. It resulted from a proposal put forward to Hitler by German Navy commander Grand Admiral Erich Raeder and others for a Mediterranean option.

Correctly predicting that British and U.S. forces would land in Northwest Africa, Raeder proposed that Germany and Spain seize Gibraltar and close the western entrance to the Mediterranean. With the assistance of Vichy France and Italy, Germany could then seize British interests in the eastern Mediterranean, cut the British lifeline to India through the Suez Canal, and gain control of the Persian oil fields. According to Raeder, at least, Hitler agreed but said that he would have to meet first with Franco, Vichy leader Henri Philippe Pétain, and Italian dictator Benito Mussolini.

Hitler was to meet with Franco on October 23 and with Pétain the next day. Hitler had high hopes for the meeting, especially as the Germans had provided critical military assistance to Franco during the 1936–1939 Spanish Civil War in the form of the Kondor Legion. On the German defeat of France, Franco had assured Hitler that Spain would enter the war in return for

much of the French African empire, including Morocco and western Algeria, as well as substantial supplies of food, arms, and gasoline.

Hitler arrived at Hendaye in his special train, and the meeting between the two leaders took place over some nine hours. Hitler opened it with a monologue trumpeting Germany's successes in the war and claiming that Britain was "decisively beaten." The führer explained that securing the support of Vichy France on the Axis side would ensure a quick, decisive campaign and the France would thus have to receive territorial compensation. He was quite vague over Franco's demands for French Morocco, and Franco was infuriated by this attitude. Hitler wanted Spain to enter the war in January 1940 with an attack to take Gibraltar, promising to send German forces to assist Spanish forces.

Franco responded with his own monologue, emphasizing the historical Spanish presence in Morocco. He rejected German assistance in the taking of Gibraltar, which he said Spain could accomplish alone. Franco also cited a long list of aid requirements that would have to be met before Spain could consider joining the war. What particularly irritated Hitler was the caudillo's assertion that even if Germany occupied England, the British fleet could continue the war from America and Canada. Such impertinence upset Hitler so much that the meeting almost ended at that point. However, following a break for dinner in Hitler's special dining car, discussions continued well into the night.

Hitler left the meeting frustrated and without a commitment from Franco and later told Mussolini that he would rather have several teeth pulled than endure another meeting with Franco. Hitler's conversations with Pétain the next day went better. The French leader agreed to go to war against Britain in return for a place in the "New Europe" to which France was "entitled." Hitler used the excuse of the failure of the meeting with Franco to push his own plans for an invasion of the Soviet Union.

Hitler Youth

German paramilitary organization for German boys age 10–18; a girls' counterpart organization, which did not stress military affairs, was developed several years after the founding of the organization for boys. The Hitler Youth (Hitlerjugend) traces its origins to 1922, when it became the youth section of the German Workers' Party and a sort of junior grouping of future storm troopers.

Adolf Hitler was influential in the formation of the Hitler Youth, the original name of which was the Jungsturm Adolf Hitler (Adolf Hitler's Young Storm Troopers). After Hitler's abortive Beer Hall Putsch in 1923, the group was officially dissolved, although that did not stop its work—many cells continued to operate throughout Germany as underground organizations. By the late 1920s, the youth group, which underwent numerous name changes, had rebuilt its numbers and essentially reconstituted itself; in 1928, a separate girls' group, the League of German Girls (Bund des deutschen Mädels) was established.

The chief purpose of the boys' section of the Hitler Youth was indoctrination in Nazi ideology, including the cultivation of hyperpatriotism, racial pride, and the teaching of military principles. Part of this ideology stressed rabid anti-Semitism. The Hitler Youth was organized along military lines, and its members routinely wore military-style uniforms. Organizationally, it also followed military prescriptions by being divided into squads, platoons, and companies. The boys' section was further divided into groupings of 10–14-year-olds and 14–18-year-olds. Many viewed membership in the Hitler Youth as a precursor to military service. The largest gathering in one place of the Hitler Youth occurred at the yearly Nuremberg Rally.

The young women's section of the Hitler Youth was similarly divided according to age, although its focus was quite different. German girls were instructed to follow the traditional gender values of the era, which stressed duty, obedience, self-sacrifice, and physical and emotional discipline. During World War II, the girls' section of the Hitler Youth was more overtly ideological than that for boys and was enlisted in propaganda work.

After Hitler came to power in 1933, the Hitler Youth underwent enormous growth. In 1932, its membership was some 108,000; just a year later, its numbers had swelled to 2.3 million. This had been achieved in part by outlawing other youth organizations and merging them with the Hitler Youth. By 1936, membership had crossed the 5 million mark, at which time all "Aryan" German youths were compelled to join.

For some German boys, their training in the Hitler Youth proved invaluable to their future military careers, and a sizable number of those serving in the elite Schutzstaffel (SS) had been full participants in the Hitler Youth. As the war progressed, especially after 1943, when German military fortunes were plummeting, the government began directly drafting Hitler Youth members, some of whom had not yet reached age 18.

With the end of the war in 1945, Allied leaders began the denazification of Germany, and what remained of the Hitler Youth was officially disbanded. Some adult leaders of the movement, including the organization's head, Baldur von Schirach, were tried for war crimes.

Hobart, Sir Percy Cleghorn Stanley (1885–1957)

British Army major general. Born in Naini, India, on June 14, 1885, Percy Cleghorn Stanley Hobart excelled in studies at Clifton College, then graduated from the Royal Military Academy at Woolwich. He was commissioned in the engineers in 1904 and posted to India in 1906, where he distinguished himself. Sent to France with the Indian Expeditionary Force during World War I in January 1915, Hobart fought on the Western Front and in Mesopotamia, where he was wounded in April 1916. By the end of World War I, he was a major. Hobart next graduated from the Staff College, Camberley, and then returned to India in 1921.

Convinced that the future of ground warfare lay in tanks, Hobart joined the Royal Tank Corps in 1923. An instructor at the Staff College at Quetta from 1923 to 1927, he was brevetted lieutenant colonel in 1922 and colonel in 1928. In 1927 and 1928, he was second-in-command of 4th Battalion, and in 1931 and 1932 he commanded the 2nd Battalion of the Tank Corps. First inspector and then commander of the corps in 1933 and 1934, Hobart raised the 1st Tank Brigade and commanded it during 1934–1937. Promoted to major general and assigned to head military training in 1938, he went to Egypt to raise what became the 7th Armoured Division, championing its use apart from infantry formations.

Hobart retired from the army in 1939, largely because of his outspoken nature and zealous championing of tanks in armored doctrine and tactics. Early in World War II, Hobart was serving as a colonel in the Home Guard when Prime Minister Winston L. S. Churchill recalled him to active duty to command first the 11th Armoured Division in England in 1941 and 1942 and then the 79th Armoured Division, with its unique engineering equipment. These assignments gave Hobart the opportunity to showcase his innovative talents. Equipment included forerunners to the modern combat engineer vehicle, specialized vehicles for mine laying and clearing, an amphibious tank, and a flamethrower tank (the Crocodile). Such special tanks were known as “Hobart’s Funnies” or “Hobo’s Funnies,” playing on Hobart’s nickname of “Old Hobo.”

Hobart commanded his division in the 21st Army Group through the campaign in Northern Europe to the end of the war. He retired for a second

time in 1946 but served as lieutenant governor of the Royal Hospital, Chelsea, during 1948–1953. Hobart died at Farnham, Surrey, on February 19, 1957.

Hobby, Oveta Culp (1905–1995)

U.S. Army colonel and commander of the Women's Army Corps. Born on January 19, 1905, in Killeen, Texas, Oveta Culp attended Mary Hardin Baylor College in Killeen and then studied law at the University of Texas at Austin. From 1925 to 1931 and from 1939 to 1941, she was parliamentarian of the Texas House of Representatives. In 1931, Culp married *Houston Post* publisher and former Texas governor William P. Hobby.

During the 1930s, Oveta Hobby was an editor for the *Houston Post.* In June 1941, she was appointed head of the Women's Activities Section of the U.S. Army to coordinate matters concerning the wives and dependents of army personnel. She then became director of the subsequent Women's Interest Section, War Department Bureau of Public Relations.

Following the December 7, 1941, Japanese attack on Pearl Harbor, Hobby was asked to head a task force to determine how a possible volunteer women's corps could assist the army. U.S. Army chief of staff General George C. Marshall and Secretary of War Henry Stimson supported her work, and after Hobby recommended establishment of the Women's Auxiliary Army Corps (WAAC), Marshall asked her to command it.

Hobby had to overcome numerous problems, such as lack of funds and supplies and lack of cooperation from other army organizations, particularly the engineers. Hobby and staff members drew barracks plans and attempted to redesign the standard-issue WAAC uniform to be more appealing to women, but the Quartermaster Corps rejected the design as too wasteful. Hobby was successful, however, in securing equal pay for women. In July 1943, the WAAC received full army status, and "Auxiliary" was dropped from the name, making it the Women's Army Corps (WAC). Hobby also oversaw the integration of female African American officers and became the first woman colonel in the U.S. Army.

During Hobby's tenure, the number of jobs approved for WACs expanded from 54 to 239. Hobby traveled to Europe and Africa to inspect WAC units, and she traveled with Eleanor Roosevelt to England to review Great Britain's women's auxiliary forces. Hobby's WACs proved their competence doing military work that freed men for frontline service.

Hobby resigned her post in the summer of 1945 and was hospitalized for exhaustion. Among her many honors, she was awarded the Distinguished Service Medal, the first woman to receive this highest noncombat decoration.

Hobby continued to support civil rights and humanitarian issues. A lifelong Democrat, she nonetheless backed Dwight D. Eisenhower for president, and in 1953 he named her the first secretary of the Department of Health, Education, and Welfare. She resigned the position in 1955 and returned to help her husband with the *Houston Post.* Hobby died in Houston, Texas, on August 16, 1995.

Ho Chi Minh (1890–1969)

Revolutionary Vietnamese leader who aided the Allies against the Japanese in World War II. Born Nguyen Sinh Cung on May 19, 1890, in the Annam region of French Indochina, Ho Chi Minh was the son of a scholar and government official; he would use some 100 different aliases. After graduation from high school, Nguyen became a teacher. In 1911 he hired on as cook's assistant on a French merchant ship. He then held a variety of jobs, finally settling in London.

When World War I began, Nguyen moved to Paris. There he changed his name to Nguyen Ai Quoc ("Nguyen the patriot") and busied himself organizing the Vietnamese community in France, which had swollen in numbers during the war. Nguyen joined the French Socialist Party and became its spokesman in colonial matters. Ignored in his efforts to secure a hearing for Vietnamese independence at the Paris Peace Conference (1919), Nguyen was one of the founders of the French Communist Party in 1920. He then participated in the Vietnamese underground independence movement and in activities of the Communist International (Comintern) in the Soviet Union and China. In 1930, he helped fuse various Vietnamese communist groups into the Indochinese Communist Party.

Vietnamese Nationalist leader Ho Chi Minh, who led the Viet Minh against the Japanese during World War II and then the French and Americans afterward. (Library of Congress)

In the 1940s, Nguyen took the name Ho Chi Minh (“he who enlightens”). During World War II, Ho fought against both the French and the Japanese (who had arrived in Indochina in 1940). In 1941, Ho founded the Viet Minh (League for the Independence of Vietnam), a nationalist front organization to end foreign control of Vietnam. In 1942, he was arrested in China by the Nationalist government but was released in 1943 to organize anti-Japanese intelligence activities throughout Indochina.

Ho’s Viet Minh worked with the U.S. Office of Strategic Services (OSS) to supply intelligence on Japanese activities, provide tactical support to Allied operations, and rescue downed American pilots. By war’s end, the Viet Minh had succeeded in liberating much of northern Vietnam from Japanese control. The Japanese had arrested the French officials and military

personnel in March 1945, so when Japan surrendered in August, the Viet Minh was the only effective organized force in the northern part of Vietnam. The Viet Minh then seized control of Hanoi, where Ho proclaimed the independence of the Democratic Republic of Vietnam (DRV) on September 2, 1945.

Despite an arrangement worked out with Ho by French representative Jean Santigny, Paris persisted in attempting to reestablish French control over all of Vietnam, and fighting broke out in November 1946. In 1954, following its military defeat in the Battle of Dien Bien Phu, the French government agreed at the Geneva Conference to recognize the independence of the DRV in northern Vietnam, with a plebiscite to be held in 1956 in the southern part of the country on the issue of independence. With the failure to hold the plebiscite, fighting resumed, this time involving the United States, which supported the southern Republic of Vietnam government. Ho died in Hanoi on September 3, 1969, not living to see the DRV victorious and Vietnam reunited in 1975.

Hodges, Courtney Hicks (1887–1966)

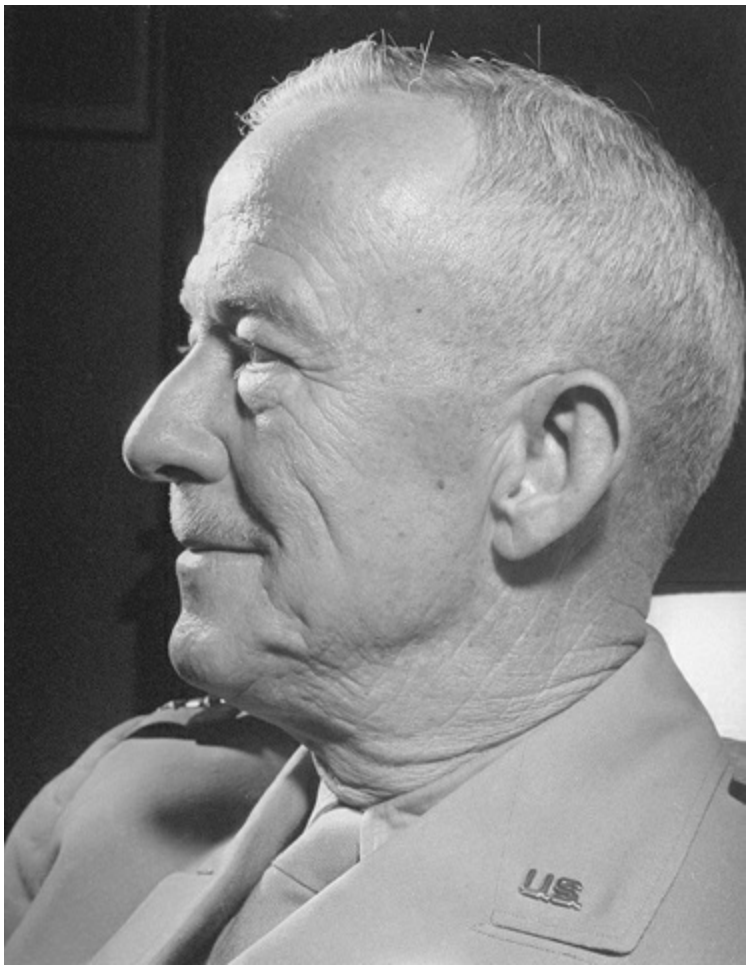
U.S. Army general. Born in Perry, Georgia, on January 5, 1887, Courtney Hicks Hodges attended the U.S. Military Academy at West Point for one year but dropped out for academic reasons and enlisted in the army. In 1909, Hodges earned a commission. He then served in the Philippines and in the 1916 Punitive Expedition into Mexico. During World War I, he fought in France, ending the war as a temporary lieutenant colonel.

Hodges attended the Field Artillery School in 1920 and then served as an instructor at West Point. He graduated from the Command and General Staff School in 1925, taught at the Infantry School, and graduated from the Army War College. In 1938, he was assigned as assistant commandant of the Infantry School at Fort Benning, Georgia.

Promoted to major general in May 1941, Hodges was assigned as chief of infantry. He assumed command of X Corps in May 1942. In February 1943, he was promoted to lieutenant general and took command of the Southern Defense Command and the Third Army. In January 1944, Hodges joined the First Army in Britain, which was then preparing for the Normandy Invasion, as deputy commander under Lieutenant General Omar Bradley.

In August 1944, Hodges succeeded to command of the First Army when Bradley moved up to command the 12th Army Group. The First Army then defended against the German counterattack at Mortain, reduced the Falaise-Argentan Pocket (August 1944), helped in the liberation of Paris (August 19–26, 1944), penetrated the Siegfried Line (October–December 1944), captured Aachen (September 13–October 21, 1944), and suffered heavy casualties in the Hürtgen Forest (September 12–December 16, 1944).

In December 1944, the First Army bore the brunt of the December 16, 1944–January 25, 1945, German Ardennes Offensive (Battle of the Bulge). To deal with the crisis, General Dwight D. Eisenhower temporarily reorganized his command structure and placed a portion of the First Army—and Hodges—under British field marshal Bernard Montgomery, who thought that Hodges was at his breaking point. Eisenhower refused any suggestion that Hodges be relieved, and Hodges's performance in the Battle of the Bulge vindicated Eisenhower's view. The First Army rallied to hold the northern shoulder of the Bulge and then played an important role in the successful counterattack. First Army soldiers crossed the Rhine at Remagen (March 7, 1945), joined in the closing of the Ruhr Pocket (March 25–April 18), and, at the end of the war, linked up with Soviet forces on the Elbe River.



General Courtney Hodges commanded the U.S. First Army during the Battle of the Bulge in 1945. (Gabriel Benzur/The LIFE Images Collection/Getty Images)

In April 1945, Hodges was promoted to general. Following V-E day, he and the First Army were under orders for the Pacific theater to lead the invasion of Honshu when the Japanese surrendered. After the war, Hodges remained in command of the First Army until his retirement in 1949. He died in San Antonio, Texas, on January 16, 1966.

Hoepner, Erich (1886–1944)

German Army general. Born in Frankfurt an der Oder on September 14, 1886, Erich Hoepner was commissioned in the army in 1906. He fought in World War I as a company commander and served as a General Staff officer. He remained in the army after the war and participated in the 1920 Kapp Putsch. He then served in different troop and staff commands. In 1933, Hoepner became chief of staff in the I Military District, continuing in the military despite his opposition to Adolf Hitler and National Socialism. Promoted to major general in 1936, Hoepner was part of a plot by the German opposition during the 1938 Czechoslovakian crisis to remove Hitler from power. His orders were to lead his 1st Light Division to prevent Schutzstaffel (SS) troops from reaching Berlin, but the plot collapsed with the signing of the Munich Agreement.

Taking command of the XVI Army Corps, Hoepner led his men in the occupation of Bohemia and Moravia in March 1939. Promoted in April to general of cavalry, he led XVI Corps in the September 1, 1939, invasion of Poland as part of the Tenth Army, advancing 140 miles to Warsaw in only a week. In the invasion of France and the Low Countries in May 1940, his corps spearheaded the advance of the Sixth Army to Liège and then on to Dunkerque, later taking Dijon. Hoepner was promoted to colonel general in July 1940.

Hoepner commanded the Fourth Panzer Group in Operation BARBAROSSA, the June 22, 1941, invasion of the Soviet Union. A leading exponent of armored warfare, Hoepner favored a bold thrust to seize Leningrad during the 1941 advance, but Hitler ordered his forces to join Army Group Center under Field Marshal Fedor von Bock with the mission of taking Moscow from the north. Hoepner's panzers got to within 20 miles of the city when they were stalled by Soviet resistance and the onset of winter.

Following the December 1941 Soviet counterattack, Hoepner put his career in jeopardy when in early January he began withdrawing some of his

units to save them from certain annihilation. Hitler removed several of his generals on the Eastern Front, but he made a special example of Hoepner, who was court-martialed and cashiered. Publicly humiliated, Hoepner was denied the right to wear a uniform or his decorations, turning him into an active conspirator against the Nazi regime.

Hoepner was deeply involved in the failed July 20, 1944, plot against Hitler, and he was designated to take command of the Replacement Army should General Friedrich Fromm prove unreliable. Hoepner was also considered as a possible minister of war. With the failure of the plot, he rejected an opportunity to commit suicide, preferring to go on trial. Arrested and tried by the People's Court, Hoepner, having been tortured by Gestapo interrogators, appeared uncertain during the trial before Judge Roland Freisler. Found guilty, Hoepner was hanged by wire suspended from meat hooks at Plotzensee Prison in Berlin on August 8, 1944.

Hoge, William Morris (1894–1979)

U.S. Army general. Born on January 13, 1894, in Booneville, Missouri, William Morris Hoge was commissioned in the engineers on graduation from the U.S. Military Academy at West Point in 1916. During World War I, he served with the 7th Engineer Regiment in France, rising to command a battalion.

After the war, Hoge served in engineering assignments in the United States. He was also an instructor at the Engineer School and the Infantry School. He graduated from the Massachusetts Institute of Technology in 1922 with a bachelor's degree in engineering and from the Command and General Staff School in 1928, and he organized the Corps of Engineers for the Philippine army in 1937.

Following U.S. entry into World War II, Hoge was charged with constructing the northern segment of a highway across northwestern Canada to Alaska, the ALCAN Highway. By September 1942 when he left that post, he and his engineers had cut a road through 1,030 miles of uncharted wilderness, and supplies had begun to move along it to Alaska.

Hoge then transferred to the armored training force at Fort Knox, Kentucky. In late 1943, he was again assigned to the engineers, and in the Normandy Invasion of June 6, 1944, he commanded the Provisional 1st Engineer Special Brigade, which landed with the invasion forces and cleared beachhead obstacles. Later that year, Hoge took command of Combat Command B of the 9th Armored Division, leading it through heavy fighting around Saint Vith during the Ardennes Offensive (Battle of the Bulge, December 16, 1944–January 25, 1945). On March 7, 1945, his units seized the Ludendorff Railroad Bridge across the Rhine River at Remagen, Germany, just minutes before it could be destroyed by the retreating Germans, thus providing the Allies with a vital bridgehead across Germany's last major defense line. Hoge ended the war commanding the 4th Armored Division as a major general, spearheading the U.S. Third Army's drive into Czechoslovakia.

During the postwar years, Hoge commanded the Engineer Center at Fort Belvoir, Virginia; IX Corps in Korea in 1951; the Seventh Army; and U.S. ground forces in Europe before retiring as a full general in January 1955. Thereafter he was chairman of the board for Interlake Iron Company in Cleveland, Ohio. Hoge died at Fort Leavenworth, Kansas, on October 29, 1979.

Holcomb, Thomas (1879–1965)

U.S. Marine Corps general and commandant. Born on August 5, 1879, in New Castle, Delaware, Thomas Holcomb joined the U.S. Marine Corps in 1900, serving with the North Atlantic Fleet, at Beijing, and in the Philippines in the early 20th century. An excellent instructor, he always emphasized marksmanship training, reflecting his own skills as a world champion in long-range shooting and a member of the Marine Corps Rifle Team and contributing to his unit's success in World War I. From November 1917 to August 1918, Holcomb commanded the 2nd Battalion, 6th Marine Regiment, in France, fighting at Belleau Wood in 1918. As executive officer of the 6th Marine Regiment, he took part in other combat actions.

After the war, Holcomb was assigned to Germany, Cuba, and Beijing. He graduated from the Army Staff College, the Naval War College, and the Army War College; served in the Office of Naval Operations; and was promoted to brigadier general in 1935. The following year, he was promoted to major general and assigned as commandant of the Marine Corps above more senior officers.

As commandant, Holcomb undertook initiatives that would bear fruit during the Pacific war. He greatly enhanced the marines' growing capacity for amphibious warfare, developing several new types of landing craft. He supervised Marine Corps expansion from 16,000 officers and men in 1936 to 50,000 in mid-1941, 143,000 six months later, and more than 300,000 by 1945, comprising six combat divisions and four air wings.

In December 1940, Roosevelt appointed Holcomb to a second term as commandant, and in February 1942, Holcomb was promoted to lieutenant general. But while he trained and equipped the marines, he had no

operational control over their operations in the field. After disputes in 1942 at Guadalcanal between Rear Admiral Richmond Kelly Turner and Marine Corps commander Major General Alexander Vandegrift, Holcomb insisted on the definition of clear lines of authority in joint amphibious operations. He won the decision that navy and Marine Corps commanders would enjoy equal authority and that superior officers would resolve any disputes. He resisted racial integration of the Marine Corps, however, on the grounds that it would detract from combat efficiency.

Holcomb reached mandatory retirement age in August 1943, but Roosevelt retained him in the post. Holcomb insisted on making way for a younger successor and retired on January 1, 1944, when he was promoted to full general on the retired list, the first Marine Corps officer to hold that rank. He then spent four years as ambassador to South Africa, seeking modest mitigation of that nation's regressive racial policies and returning to the United States in 1948. Holcomb died in New Castle, Delaware, on May 24, 1965.

Holland, Lancelot Ernest (1887–1941)

British Royal Navy vice admiral. Born on September 13, 1887, Lancelot Ernest Holland entered the Royal Navy and trained as a gunnery specialist. He was promoted to captain in 1926 and to rear admiral in January 1938.

From 1930 to 1931, Holland headed the British naval mission to Greece. During 1937 and 1938, he served as assistant chief of the naval staff, in which position he was responsible for naval doctrine and strategy.

In 1939 and 1940, Vice Admiral Holland was the Admiralty's representative to the Air Ministry and commanded the Home Fleet's 2nd Battle Squadron from January through August 1939. In November 1940, Holland commanded cruisers attached to Force H during Operation COLLAR, and he participated in the November 27, 1940, Battle of Cape Spartivento.

In May 1941, Holland was assigned as commander of the Battle Cruiser Squadron and second-in-command of the Home Fleet. His force comprised his flagship and the navy's largest capital ship, the battle cruiser *Hood*, along with the new battleship *Prince of Wales* and six destroyers. Holland's squadron was deployed in the North Atlantic, where British convoys between Britain and North America faced German U-boats, mines, and surface vessels.

On May 24, 1941, Holland's force engaged the German battleship *Bismarck* in the Northeast Atlantic. A 15-inch shell from the *Bismarck* hit and ignited a magazine and blew up the inadequately armored *Hood*, killing Holland and all but 3 of the *Hood*'s crew of 1,418 men, an enormous blow to British morale. The *Bismarck* temporarily drove off the *Prince of Wales* and eluded pursuing British ships, but three days later additional units of Admiral Sir John Tovey's Home Fleet battered it into a wreck.

Hollandia, Battle of (April 22–26, 1944)

Allied amphibious landing at New Guinea. In early 1944, General Douglas MacArthur's Allied forces in the Southwest Pacific Area (SWPA) were advancing along the northeastern coast of New Guinea. Following the capture of Saidor, MacArthur planned to seize Hansa Bay, about 120 miles to the northwest. But after the seizure of the Admiralty Islands in early March, he decided to bypass Hansa Bay and leap nearly 600 miles northwest to Hollandia in New Guinea.

Hollandia (now Sukarnapura), a major Japanese air and supply base, held two crucial advantages for the Allies. The port of Hollandia in Humboldt Bay was the best-sheltered anchorage along a lengthy stretch of the New Guinea coast, and the surrounding area had four airstrips. These assets could provide a major staging base for future operations in western New Guinea and the Philippine Islands. In addition, SWPA's intelligence determined that Hollandia was garrisoned only by a small force of 11,000 Japanese troops from the 6th Air Division, most of them service personnel. By attacking Hollandia, MacArthur could avoid potentially bloody battles to the east at Hansa Bay and Wewak, both of which were more strongly defended.

MacArthur and his staff were compelled to include a simultaneous attack at Aitape, 140 miles east of Hollandia. Airstrips there would provide a permanent staging area within range of Hollandia, enabling the Allies to seize command of the air. The Hollandia and Aitape invasions together required a flotilla of more than 200 ships and 80,000 personnel.

During late March and early April 1944, Allied pilots destroyed most of the 6th Air Division's aircraft, paving the way for the landing of ground troops on April 22. At the same time, Japanese lieutenant general Adachi Hatazō, commander of the Eighteenth Army headquartered on Rabaul, regrouped his battered forces near Hollandia. U.S. forces, meanwhile, carried out a remarkable counterintelligence scheme to divert Adachi. False radio transmissions, decoy raids, patrols, and bombing convinced the Japanese that an Allied assault at Hansa Bay was imminent.

The landing, dubbed Operation RECKLESS, was entrusted to Lieutenant General Robert L. Eichelberger's I Corps. One regiment from the 24th Infantry Division went ashore at Tanahmerah Bay, and another regiment from the 24th Division and two regiments from the 41st Infantry Division

landed at Hollandia about 25 miles to the east. Simultaneously, a regiment from the 41st Division and a regiment from the 32nd Infantry Division landed at Aitape, 125 miles to the southeast, to secure a fighter strip. Their chief opposition came in the form of the marshy beaches themselves. Later that day, the 163rd Regimental Combat Team took Aitape against only limited resistance, demonstrating the effectiveness of the Hansa Bay ruse. With Aitape in hand, the ground forces at Hollandia trudged through trackless marsh and bog to encircle the three main Japanese airfields. Confusion, fear, and lack of weaponry prompted a large-scale Japanese retreat west.

Suppressing remaining resistance, U.S. forces secured Hollandia on April 26, 1944, only four days after the initial landings, although mopping-up operations continued for several weeks. The most telling evidence of the Allied air attacks before the landings was the wreckage of more than 340 Japanese aircraft on Hollandia’s runways. Allied casualties were 159 killed and 1,100 wounded. The Japanese lost 3,300 dead and 600 prisoners. At Aitape, all objectives were secured by April 25 at a cost of 3 American dead. About 600 Japanese were killed, and 27 were taken prisoner. Another 6,000 Japanese were either killed by units from the 24th Division or died from starvation and disease as they retreated from Hollandia to Wadke-Sarmi, 140 miles to the west.

U.S. Army Fifth Air Force planes attacking the Japanese base at Hollandia (now Jayapura) in New Guinea, 1944. (Hulton-Deutsch Collection/Corbis)

Operation RECKLESS was a major triumph for MacArthur. It split the Japanese forces defending New Guinea in half, leaving the Eighteenth Army isolated in eastern New Guinea. It also gave MacArthur a superb base from which to increase the tempo of operations in the Southwest Pacific theater, and before long U.S. engineers had turned Hollandia into a vast complex of military, naval, and air facilities occupied by 140,000 men.

Holocaust

Nazi effort to exterminate the Jews of Europe during World War II. Historians have developed several interpretations of the Holocaust. While some see it as the last most horrible manifestation of historical anti-Semitism, others view it as the outcome of factors inherent in Western civilization, such as economic rationalization, technocracy, and the eugenics movement. Intentionalists see Adolf Hitler as the crucial factor in the Holocaust, determined on the destruction of the Jews from the beginning. A straight line supposedly runs from his earliest anti-Semitic comments through World War II and his final testament of April 1945. Functionalists, on the other hand, see the persecution of the Jews as a slowly developing process, exhibiting no overall plan. This debate has now largely been settled in favor of the intentionalists by research during the last decade. Attempts have been made to reconcile these positions, for example, emphasizing the fusion of anti-Semitism with bureaucratic techniques of mass extermination.

Although it began in 1938 either with the Anschluss or (more commonly) Kristallnacht, not until after the beginning of World War II, when the Nazis found themselves in control of well more than 3 million Jews, did the full implementation of the Holocaust occur. The French Revolution of 1789 saw the beginning of the process of emancipation of the European Jews and their increasing assimilation into European society. As the century progressed, traditional Christian anti-Judaism gave way to modern racial anti-Semitism, fostered by hypernationalism, social Darwinism, and pseudoracial "science." Anti-Semites made the Jews the scapegoat for all the supposed ills of the modern world, including capitalism, socialism, and the press.

Anti-Semitism was a Pan-European phenomenon, as is exemplified by the Dreyfus Affair in France. Eastern Europe (especially Russia) was the scene of violent pogroms and ritual murder trials into the 20th century. In about 1900, agents of the czarist secret police, the Okhrana, wrote the *Protocols of the Elders of Zion*, stemming from an earlier French play, a forgery proclaiming a Jewish conspiracy to dominate the world.

By 1900, there were some 600,000 Jews in a German population of 60 million. Jews were prominent in such areas as banking, journalism, and medicine. Some 85 percent were assimilationists and enthusiastically supported Germany during World War I. Nonetheless, Germany's defeat in World War I and the accompanying economic turmoil of the early 1920s allowed extremist right-wing groups such as the National Socialist German Workers' Party, led by Adolf Hitler, to spread. These groups held Jews responsible for everything from betraying Germany on the home front during World War I to causing the evils of urban life. Whether it stemmed from his Vienna years, as portrayed in *Mein Kampf,* or developed essentially after his entry into politics at the end of World War I, Hitler's obsessive and pathological anti-Semitism, its identification with Bolshevism, and a crude social Darwinism became the core of his and Nazism's ideology.

Hitler's overall role and guilt in fostering the persecution of the Jews is clear. After 1934, however, he gradually withdrew from domestic politics, fostering power struggles among various party agencies. In this atmosphere, his lieutenants attempted to anticipate his wishes—a process that led to increasingly radical anti-Jewish measures.

The Nazis' assumption of power in 1933 led to increased random attacks on Jews. The Nazis did not appear to have a coordinated plan to deal with the "Jewish question." Indeed, the years 1933 to 1938 saw tension between party radicals such as Joseph Goebbels and Julius Streicher and moderates such as Foreign Minister Konstantin von Neurath and Economics Minister Hjalmar Schacht, who feared that anti-Semitic actions would damage Germany's international position and economic recovery. Some level of anti-Semitism was common among many Germans, but there is little evidence that most Germans were imbued with an eliminationist anti-Semitism, ready to murder Jews once they were given the opportunity, as some scholars have argued.

The opening of the Nazi attack included a one-day largely unsuccessful boycott of Jewish stores on April 1, 1933, and the April 7 Law for the

Restoration of the Professional Civil Service, which dismissed non-Aryans from government service. Although the boycott was unpopular with large sections of the public and the civil service law included exemptions such as World War I veterans, these actions began a gradual process that by 1939 would lead to the exclusion of Jews from German life.

On July 14, 1933, the Law for the Prevention of Genetically Diseased Offspring was promulgated. By 1937 it had led to the sterilization of some 200,000 people. Although the Nazi eugenics program was not aimed specifically at Jews and indeed was influenced by the general European and American eugenics movement, it ran on a parallel track with the anti-Jewish legislation. During World War II, the two tracks would merge in a program of euthanasia and mass murder.

Other legislation withdrew the voting rights of Jews, their access to education, and their ability to own businesses and to hold particular jobs. In 1934 Jews were banned from university examinations; in 1936 they were forbidden from using parks or public swimming pools and from owning electrical equipment, typewriters, and bicycles. Jews were also subject to cultural and artistic restrictions, forcing many to leave their jobs in the arts.

In September 1935, the so-called Nuremberg Laws were passed by a special session of the Reichstag convened during the Nazi Party rally of that month. The laws were drawn up in great haste during the rally itself, indicative of the unsystematic nature of Nazi policy concerning the Jews during the 1930s. Jews became subjects, not citizens; it became illegal for Jews to marry or have extramarital relations with non-Jews. On November 14 a supplementary law was enacted, defining a “full Jew” (having three or four Jewish grandparents) and the categories of first-degree and second-degree *Mischling* (mixed race).

In 1938 there was another major escalation of anti-Jewish persecution. In Austria after the Anschluss in March, a wave of humiliations, beatings, and murders occurred that were worse than anything else seen so far in Germany. The Nazis quickly set up agencies to forcibly expropriate Jewish businesses and expedite emigration, the latter effort led by Adolf Eichmann, Zionist expert of the Sicherheitsdienst (SD, Security Service). Some scholars see this sequence of violence, expropriation, and emigration as a model for how the Nazis would later attempt to handle the “Jewish question,” with emigration replaced by something far worse.

During the spring and summer of 1938, violent attacks on Jews in Germany increased, culminating in the pogrom of November 9–10. In retaliation for the murder of the third secretary of the German embassy in Paris, Ernst von Rath, committed by a Jewish youth by the name of Herschel Grynspan, Jews were attacked all over Germany, businesses were vandalized, and synagogues were burned. The streets were so covered with glass that they appeared to be made of crystal, hence the term Kristallnacht, or "Night of Broken Glass," to describe the event. Party, police, and governmental offices all were complicit in the pogrom. Estimates hold that some 91 Jews died, 30,000 were arrested, and a like number were sent to concentration camps. A total of 267 synagogues were burned, and 7,500 businesses were vandalized. The Jews received no insurance payments and in fact were fined more than 1 billion reichsmarks for "damage to the German economy."

The period from November 1938 to the outbreak of World War II saw the removal of Jews from virtually all aspects of German society. During a Reichstag speech in January 1939, Hitler made his infamous threat that if international Jewry succeeded in starting another world war, the result would not be its victory but "the annihilation of the Jewish race in Europe."

By the time the war began, more than half of German and Austrian Jews had departed Germany, the official policy of which still promoted emigration. Emigrants were subject to expropriation and payment of flight taxes. Few countries were willing to increase their quota of Jewish immigrants, however. International conferences such as that held in Évian, France, in July 1938 proved fruitless. The United States, which had convened the conference hoping to find an outlet for Jewish emigration, refused to increase quotas for Jews; only the Dominican Republic offered to take any German Jewish immigrants.

After their conquest of Poland in the fall of 1939, the Nazis found themselves in control of some 2 million additional Jews. Another million were in the Soviet sphere of occupation. Nazi treatment of Poles and Jews, considered inferior races, was brutal. Western Poland was annexed to Germany, and the eastern part was turned into the General Government under Nazi lawyer Hans Frank. To facilitate the implementation of Nazi policies, head of the Schutzstaffel (SS) Heinrich Himmler on September 27 amalgamated all police and security services in the

Reichssicherheitshauptamt (Reich Security Main Office, RSHA) under Reinhard Heydrich.

On September 21, Heydrich issued instructions to Einsatzgruppen (mobile strike forces) leaders in which he distinguished between the "final aim" (*Endziel*) of Jewish policy and the steps leading to it. Jews were to be moved from the countryside and concentrated in cities near rail lines, implying the ghettoization of Polish Jews. Each ghetto was to elect a Jewish Council (Judenrat) that would be responsible for carrying out Nazi orders. In October, Jews were expelled from the annexed area of Poland, called the Warthegau, into the General Government. In addition, Frank ordered that all Jews must perform compulsory labor and wear a Star of David on the right sleeve of their clothing.

Despite the mention of the "final aim" and the brutality of these measures, most scholars do not believe that the Nazis had yet adopted the idea of mass extermination. Their main goals during 1940 were either fostering emigration by Jews or deporting them to a colony in Africa (they had a plan to use Madagascar as a huge prison for Jews) or the Near East.

The first major ghetto was established in Lodz in February 1940. The Warsaw ghetto, the largest, was established in October 1940. Ghettos were in older sections of cities, with inadequate living space, housing, and food. They were surrounded by walls and barbed wire, and attempts to leave were punished by death. Disease and starvation were common. Jewish Councils had their own police forces, which were often brutal in enforcing Nazi orders. The 1940 Nazi film *Die Ewige Jude* (*The Eternal Jew*) cynically portrayed these conditions as normal Jewish living habits.

Despite the terrible conditions, Jews secretly practiced their religion, educated their children, and maintained cultural activities. In Warsaw, the historian Emmanuel Ringelblum started Oneg Shabbat (meaning "in celebration of the Sabbath"), a secret organization that chronicled life in the ghetto. Its records, partly recovered after the war, are an invaluable picture of ghetto life. Many Jews kept diaries, and the Nazis thoroughly documented the ghettos.

In a speech to senior army officers on March 30, 1941, preceding the June 22 invasion of the Soviet Union (Operation BARBAROSSA), Hitler maintained that in contrast to war in the west, the war against the Soviet Union would be a war of annihilation, a brutal campaign to subjugate inferior Slavs and to

exterminate Jewish Bolshevism. Hitler's Barbarossa Decree of May 13, 1941, and the Commissar Order of June 6, 1941, as well as orders issued by various generals called for liquidation of the Bolshevik leadership without trial, reprisals against whole villages for partisan actions, and the freeing of military personnel from prosecution for crimes against civilians. These orders paved the way for military complicity in war crimes against Russian soldiers and civilians and especially against the Jews.

Following the German invasion of the Soviet Union on June 22, 1941, four Einsatzgruppen (deployment groups), each numbering 600–1,000 men, swept through the conquered territories in the wakes of the invading armies, shooting Communist Party functionaries and especially male Jews. The Einsatzgruppen were drawn primarily from various security and SS units. The German army provided no obstacles to their actions and in some cases actively cooperated with them. After their numbers were augmented in August, the Einsatzgruppen rapidly expanded their killing of Jews, including women and children. Between June and August the Einsatzgruppen killed approximately 50,000 Jews; in the next four months some 500,000 would perish. On October 29 and 30 alone at Babi Yar near Kiev, some 33,000 Jews were shot, and their bodies were dumped in a ravine. Hitler had undoubtedly given the overall approval to widen the killing in August, and he regularly received reports of Einsatzgruppen activities.

Collaborators throughout Eastern Europe actively aided—and in some cases outdid—the Nazis in mass killings. For example, the German invasion of Lithuania was accompanied by horrendous butchery of Lithuanians against Lithuanians. Germany's Romanian allies actively murdered Jews. On October 22, the Romanian military headquarters in Odessa was blown up and 60 lives were lost. In reprisal, Romanian Army units massacred 19,000 Jews and locked another 20,000 in warehouses in a nearby village, which were then set on fire and machine-gunned. Babi-Yar and Odessa were perhaps the two worst massacres of the war.

Although no written order has come to light and Hitler confined himself to murderous ranting about the Jews, there can be no doubt that the Holocaust proceeded with his express knowledge and desire. Scholars are divided, however, about when exactly the "final solution" (*Endlösung*) was put into effect. Some authorities place the decision as early as the spring of 1941 during the planning for Operation BARBAROSSA, and others argue that there

was a gradual escalation of measures throughout the summer and fall of 1941. Hitler's final decision may have come on December 12, 1941, in a talk to party leaders at the Reich Chancellery, one day after his declaration of war on the United States. Hitler now saw the events he had described in his speech of January 30, 1939, as coming to pass: the Jews had started a world war, and now they would perish.

On January 20, 1942, the much-postponed Wannsee Conference, held for the purpose of coordinating activities by various agencies with regard to the "final solution," took place. Chaired by Reinhard Heydrich, it included major SS and government agency representatives. Europe's Jewish population was set at an exaggerated figure of 11 million. The Jews—even those not under Nazi control—were to be "evacuated" to the east. This "final solution to the Jewish question" would be implemented first in the General Government. Hitler's hatred of the Jews, the realization that the war against the Soviet Union would not be over quickly, the huge number of Jews in Eastern Europe augmented by deportations from the west, and killing actions initiated by local commanders all combined to replace deportation with systematic mass murder.

Since execution by shooting was too inefficient and was stressful for the executioners, the Nazis began gassing victims. The model for mass murder came from the euthanasia program, which had been ordered by Hitler on September 1, 1939, and officially ended in August 1941, after strong protests from German churches. Known as the T-4 program (named after its headquarters at Tiergartenstrasse 4 in Berlin), it had been responsible for killing some 5,000 children and 70,000 to 80,000 adults, at first by starvation, then by lethal injection, and finally with carbon monoxide and other poison gasses. Several T-4 staff members were transferred to the extermination program of Eastern Europe.

In December 1941, Chelmno, near Lodz in the Warthegau, was the first extermination center to begin operation. Between March and July 1942, in connection with Operation REINHARD (the plan to kill the Jews of the General Government), three more death camps were set up: Belzec, Sobibor, and Treblinka. Deportations to these camps from Polish ghettos took place throughout 1942 and into the fall of 1943.

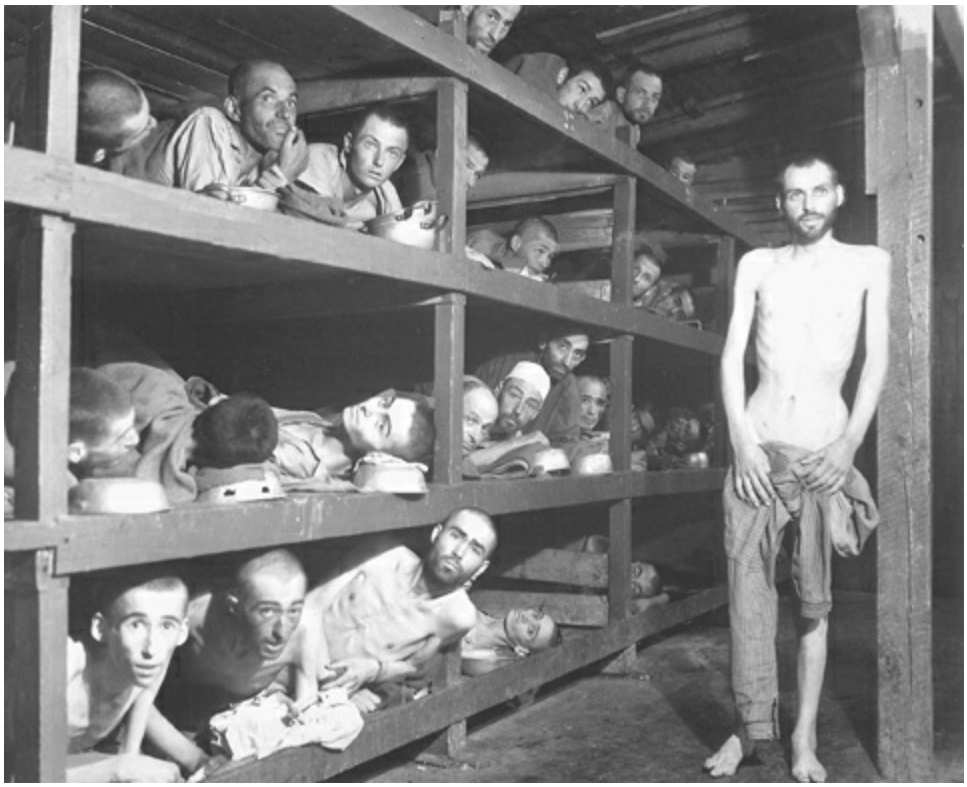
As Jews were rounded up, they were told that they were being resettled to labor camps in the east. When the Jews arrived in the camps, their belongings

were confiscated, and they were then forced to undress and move down a ramp (“the tube”) into gas chambers falsely labeled as showers. The Jews were then killed with gas fed into the chamber. Special units of Jewish prisoners called Sonderkommandos removed the dead from the gas chambers, collected their possessions, and then buried the corpses in mass graves or incinerated them in crematoria. Eventually, the Sonderkommandos too were killed. Jews from all over occupied Europe as well as Romas (Gypsies) were killed in these camps. Authorities estimate the approximate death toll at 1.9 million.

Majdanek (near Lublin in the General Government) and Auschwitz (in a section of southern Poland annexed to Germany) operated as concentration, extermination, and forced-labor camps. Exterminations in gas chambers began in Majdanek in the fall of 1942 and greatly increased in November 1943, when the Nazis launched Operation ERNTEFEST (HARVEST FESTIVAL) to kill off the remaining Jews in the General Government. By the time Soviet forces overran Majdanek in July 1944, some 360,000 people had died.

Auschwitz I was established as a concentration camp in May 1940. Here the Nazis brutally murdered thousands at the “Black Wall” and carried on gruesome pseudoscientific medical experiments, including sterilization, castration, and hypothermia. Auschwitz II, or Auschwitz-Birkenau, was essentially an extermination camp. It began operations on September 3, 1941, when 900 Soviet prisoners of war died after being gassed with Zyklon B, crystallized hydrogen cyanide. By 1943, four large gas chamber/crematoria were at work as Jews from all over Europe were brought to Auschwitz. Work to expand the facility continued essentially until the summer of 1944. During the spring and summer of 1944, more than 400,000 Hungarian Jews were deported to Auschwitz and gassed. A conservative estimate puts the overall death toll here at 1.1 million Jews, 75,000 Poles, 21,000 Romas, and 15,000 Soviet prisoners of war.

Prisoners destined for the camps were packed into unheated and unventilated cattle cars with no food and, perhaps, one bucket for a toilet. Many died before reaching the camp. Upon arrival, prisoners underwent “selection”: those unfit for work were immediately sent to the gas chambers, which were disguised as showers. Sonderkommandos cleaned the gas chambers, cremated the corpses, and collected valuables.



Slave laborers in the Buchenwald concentration camp near Jena, Germany, April 16, 1945. Many had died from malnutrition by the time U.S. troops of the 80th Division entered the camp. (National Archives)

In the fall of 1941, I. G. Farben decided to build a Buna (synthetic rubber) plant at Auschwitz to exploit cheap slave labor. The so-called Auschwitz III expanded into a 40-square-mile area with numerous subcamps. Periodic selections singled out weak and sick workers for extermination.

Numerous survivors, including Elie Wiesel and Primo Levi, have described the brutal Auschwitz camp regime, which was intended to dehumanize its victims. “Kapos”—usually incarcerated criminals—enforced order. Hunger was all-pervasive. Finally, on January 27, 1945, Soviet forces liberated the few remaining prisoners in Auschwitz. Some 60,000 had been forced on death marches to camps in Germany. Many died on the marches or before the German camps were liberated.

Between 1942 and early 1945, the Nazis extended the Holocaust to occupied Western, Central, and Southern Europe. Researchers have now identified some 42,500 Nazi ghettoes and camps throughout German-controlled areas of Europe. Numerous government agencies including the RSHA, the Transport Ministry, and the Foreign Office lent their assistance.

Adolf Eichmann, head of RSHA Jewish Affairs and Evacuation Affairs (coded IV-B-4), coordinated the deportations. The European rail system was taken over and used to move Jews east to the killing sites.

In many places the Nazis were assisted by collaborationist authorities, but elsewhere, such as in Denmark and in Italian-held areas, they were actively resisted by local officials. The result was that thousands of Jews went into hiding or were assisted in escaping the Nazi dragnet. Although exact numbers will never be known, it is estimated that 3.5 million to 4 million people died in the six death camps. When victims of pogroms, the Einsatzgruppen, and those who died of overwork, starvation, and disease in the camps and ghettos are added, the Holocaust claimed some 6 million lives.

Resistance was made difficult by numerous factors—the impossibility of believing the reality of what was happening, the hostility of local populations, the difficulty of obtaining weapons, the deception of the Nazis, and the decision of Jewish councils to obey Nazi demands in hopes of saving the lives of the remnant Jewish population that worked in defense industries.

Most Jews who were rounded up for execution or transport to a camp went without resistance. In some cases, however, open rebellion occurred. The most famous example is the Warsaw Rising, beginning on April 19, 1943, in which 700 to 1,000 resistance fighters in the Warsaw ghetto held off several thousand heavily armed German and Baltic auxiliaries under SS-Brigadeführer Joseph (Jürgen) Stroop for almost four weeks. Revolts in Treblinka in August 1943 and in Sobibor in October 1943 led to the closing of these camps. On October 7, 1944, the Sonderkommando at Auschwitz revolted, killing several SS men and blowing up one of the crematoria. All were killed in the ensuing escape attempt. In several cases, Jews were able to escape the ghettos and either join or form their own partisan groups that fought against the Nazis.

Allied officials were clearly aware of the Holocaust by late 1942, but like the Jews themselves, they had difficulty believing what they were hearing. In addition, anti-Semitism was still strong in many countries. U.S. State Department official Breckinridge Long worked actively to keep Jewish refugees out of the United States. In the Allied countries, winning the war was the first priority, and American Jewish organizations were hesitant to make waves or press President Franklin D. Roosevelt for fear of stirring up even more anti-Semitism. In a still-controversial decision, the Allies refused

to bomb the Auschwitz camp or the rail lines leading to it. Not until early 1944 did Roosevelt create the War Refugee Board, after the Treasury Department had exposed the State Department's duplicity in trying to keep Jews from immigrating to the United States.

Some governments or individual diplomats resisted the Nazis. The Danish people ensured the rescue of more than 95 percent of Danish Jews. The Bulgarian government refused to give over its native Jews, although it handed over Jews in occupied territories. The Italian fascist government refused cooperation with the Nazis, and Francisco Franco's government allowed Jewish refugees to travel through Spain. Diplomats defied their orders by issuing visas to Jews. The Swede Raoul Wallenberg and other diplomats in Budapest rescued thousands of Jews in the summer and fall of 1944 by issuing false papers and setting up safe havens. Citizens from France to Poland sheltered Jews, in some cases for years, at tremendous risk to themselves. In 1940, Chiune Sugihara, a minor diplomat in the Japanese consulate in Kaunas, Lithuania, quietly defied his government's orders and issued illegal visas to more than 2,000 Jewish families.

In the case of the churches, it was more often individuals than institutions that did rescue work. Numerous Protestant, Eastern Orthodox, and Catholic clergy and laymen intervened to help Jews, whereas others remained silent or backed Nazi actions. Controversy still surrounds the role of Pope Pius XII, who never publicly condemned the Holocaust even when the Jews of Rome were being rounded up in October 1943.

As the Nazi empire crumbled in late 1944 and early 1945, Himmler and others carried out increasingly desperate negotiations, attempting to trade Jewish lives for ransom. As the Soviet Army moved westward, hasty attempts were made to dismantle camps and burn victims' bodies. Prisoners were forced on death marches back to camps within Germany. By May 1945, the last of the camps had been overrun. Some 50,000 prisoners were liberated, but many were so sick and emaciated that they died soon after. In his political testament of April 29, 1945, Hitler blamed the war on the Jews and called on Germans to continue the struggle against international Jewry.

The pre–World War II Jewish population of Europe had been approximately 9 million. At the end of the war, only 3 million remained. In Poland, some 45,000 survived out of a prewar population of 3 million, many of whom were Hasidic Jews. In the words of the sect's founder, Israel Ba'al

Shem Tov: “In forgetfulness is the root of exile. In remembrance the seed of redemption.”

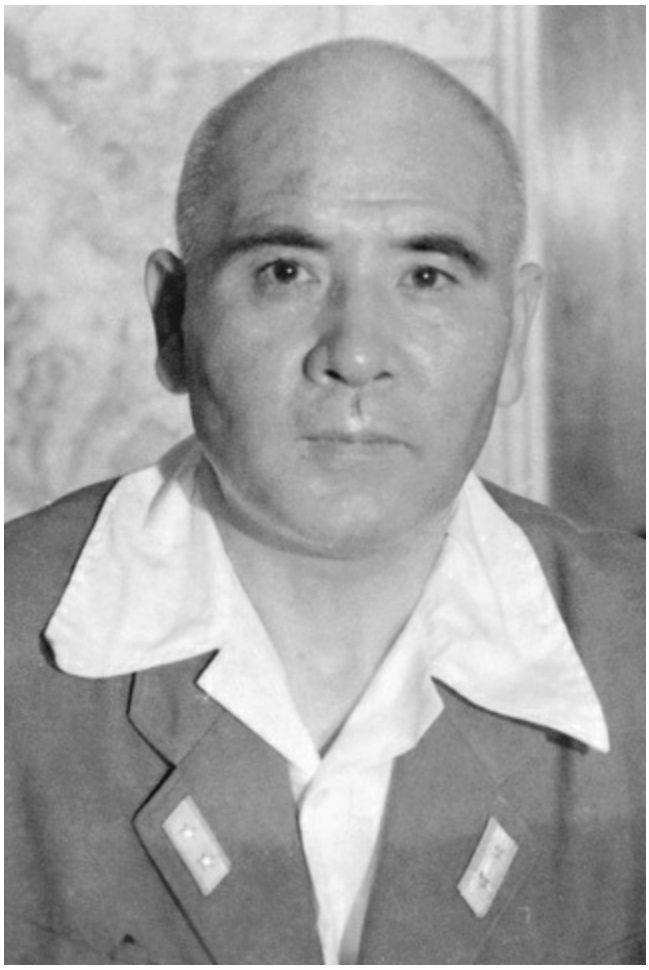
Homma Masaharu (1887–1946)

Japanese Army lieutenant general. Born in Niigata Province, Sado Island, on November 27, 1887, Homma Masaharu graduated from the Japanese Military Academy in 1907 and the War College in 1915. In 1918, during World War I, he was posted as an observer with the British Army on the Western Front. During the 1920s, Homma was an instructor at the War College, resident officer in India, General Staff officer, and aide-de-camp to Prince Chichibu, Emperor Hirohito's younger brother.

Promoted to colonel in 1930, Homma served as military attaché to Great Britain from 1930 to 1932. On his return to Japan, Homma authored Tokyo's response to the Lytton Commission's report on Japanese aggression in Manchuria. He subsequently held regimental, brigade, and divisional commands. Promoted to major general in 1935, Homma headed the army's Intelligence Bureau in 1937 and 1938. In 1938 he was promoted to lieutenant general, and in December 1940 he assumed command of the Formosa Army.

On November 2, 1941, as war against the Western powers loomed, Imperial Headquarters entrusted Homma with the 43,000-man Fourteenth Army and the task of conquering the Philippines in only 50 days. Although the Fourteenth Army achieved victory, a variety of factors—including U.S. and Filipino resistance, Homma's failure to anticipate an American-Filipino withdrawal into the Bataan Peninsula on Luzon, and his hesitancy to push his forces—resulted in the campaign lasting four months longer than anticipated.



Japanese Army general Homma Masaharu commanded Japanese forces in their conquering of the Philippines in World War II. (Bettmann/Corbis)

Homma's inability to conclude the Philippine Campaign within the established time frame and his leniency toward the Filipino people discredited him in the eyes of his superiors, who relieved him of command in August 1942. Transferred to Tokyo, Homma spent the rest of the war on the reserve list.

At the war's conclusion, U.S. authorities arrested Homma and charged him with war crimes, including the Bataan Death March. Tried and convicted by the U.S. Military Commission in Manila, he was sentenced to death. Homma was executed by firing squad at Los Baños in the Philippines on April 3, 1946.

Honda Masaki (1889–1964)

Japanese Army lieutenant general. Born on May 17, 1889, in Nagano Prefecture, Honda Masaki attended the Military Academy and the Army Staff College. He was an army attaché in France from 1921 to 1924 and was assigned to the Army Ministry from 1927 to 1929. Honda was assigned to the Infantry School during 1930–1932 and 1936–1937. In 1937 he was promoted to major general, and in 1939 he became the commandant of the Infantry School.

Honda then was promoted to lieutenant general and appointed chief of staff of the China Expeditionary Army in Manchuria. In 1940, he took command of the 8th Infantry Division. He continued to be involved in training as chief of the Armored Warfare Division of the Military Education Department in 1941. In April 1943, he assumed command of the Twentieth Army in Manchuria.

In April 1944, Honda took command of the newly formed Thirty-Third Army in north Burma (present-day Myanmar). By this time, the Japanese position in Burma was deteriorating under Allied attacks. Honda's outnumbered forces were nearly destroyed by troops under U.S. general Joseph Stilwell in October 1944. In January 1945, Honda made a desperate attempt to prevent the Allies from seizing the Burma Road, but his army was defeated, and Burma was lost to the Japanese. The remnants of Honda's army continued to fight on sporadically until their formal surrender on August 28, 1945. Honda retired after the war and died in Tokyo on July 17, 1964.

Hong Kong, Battle of (December 8–25, 1941)

Battle for the British Asian colony of Hong Kong whose capture by Japan symbolized the defeat of Western imperialism in Asia. The colony of Hong Kong, 400 square miles of islands and an adjacent peninsula on the coast of Guangdong, southern China, was both the headquarters of the Royal Navy's China Squadron and a significant entrepôt and commercial center. From the mid-1930s onward, the British Joint Chiefs of Staff believed that in the event of attack by Japanese forces, Hong Kong would be indefensible.

In 1935, Major General Sir John Dill, director of military operations, ranked Hong Kong's strategic significance far below that of Singapore, Britain's other naval base. A 1939 strategic review also assigned Britain's interests in Europe much greater importance than those of Hong Kong. British leaders nonetheless feared that a failure to defend Hong Kong or even the evacuation of civilians would signal their country's intention of abandoning its Asian position and damage the morale of the embattled Chinese Guomindang (Kuomintang, Nationalist, GMD) government in its struggle to resist Japanese invasion.

By June 1940, sizable Japanese forces blocked Hong Kong's access to the Chinese mainland. That August, Dill—now chief of the Imperial General Staff—recommended the withdrawal of the British garrison. Although Prime Minister Winston L. S. Churchill accepted this recommendation, it was not implemented. Some women and children were evacuated to Manila in the Philippines, and in October 1941 Britain accepted the Canadian government's ill-considered offer to send two Canadian battalions to reinforce the two Scottish and two Indian battalions already manning Hong Kong's defenses.

Even with this assistance, Hong Kong's defenses remained decidedly inadequate: 12,000 troops, augmented by the Hong Kong and Singapore Royal Artillery and the civilian Hong Kong Volunteer Defense Force, were too few to man the colony's lengthy main defense line (Gin Drinker's Line), which ran three miles north of Kowloon in the New Territories. Air and naval forces comprised a pitiable seven airplanes, eight motor torpedo boats, and four small gunboats. It was generally known that many Japanese civilians in the colony were fifth columnists, agents only awaiting the opportunity to facilitate a Japanese assault. London had no intention of sending any further assistance and merely expected its defenders to stave off inevitable defeat as long as possible.

British prisoners of war departing Hong Kong for a Japanese prison camp, December 1941. (Keystone/Getty Images)

On December 8, 1941, as Japanese forces simultaneously attacked Pearl Harbor (December 7 in Hawaii), a surprise raid on the Kai Tak airfield by Taiwan-based Japanese bombers destroyed all seven British airplanes. Twelve battalions of the 38th Division of the Japanese Twenty-Third Army, commanded by Lieutenant General Sano Tadayoshi, crossed the Shenzhen

River separating the New Territories and mainland China. Churchill urged Hong Kong's defenders to resist to the end, but within 24 hours Japanese forces had breached Gin Drinker's Line. British commander Major General Christopher M. Maltby ordered a retreat to Hong Kong island, and by December 12, Japanese troops held Kowloon.

Sano's artillery began heavy bombardments of British positions on Victoria, the central district, but Maltby refused a December 14 ultimatum to surrender and the following day repulsed a Japanese attempt to land troops on Hong Kong island. A second attempt three nights later succeeded, and Japanese forces swiftly advanced across the island to its southern coast, splitting British forces. Despite heavy losses, British troops fought fiercely, on December 20 compelling Sano to halt temporarily to regroup. The advance soon resumed, however, and by December 24 Japanese units had destroyed the water mains, leaving their opponents as short of water as they were of ammunition. On December 25, 1941, the British governor agreed to an unconditional surrender.

The Japanese victors treated their defeated foes with great brutality, massacring many of the defending forces, Chinese and Western, including hospitalized wounded men. They raped and sometimes killed hospital nurses and other captured women. Surviving prisoners of war and Allied civilians were interned for the duration of the war, often in severe conditions, while the supposedly liberated Chinese population likewise experienced harsh and arbitrary rule and numerous atrocities.

Hong Kong remained under Japanese occupation until August 1945 when, despite the hopes of Chinese Nationalist leader Jiang Jieshi (Chiang Kai-shek) that it would revert to China, British forces reestablished control. Hong Kong subsequently remained a British colony until its 1997 reversion to China.

Hopkins, Harry Lloyd (1890–1946)

U.S. diplomat and influential presidential adviser to Franklin D. Roosevelt. Born on August 17, 1890, in Sioux City, Iowa, Harry Hopkins graduated from Grinnell College in 1912. He subsequently became a social worker in New York City and then joined President Roosevelt's New Deal administration first as head of the Federal Emergency Relief Administration (1933–1935) and then, from 1935 to 1938, as head of the Works Progress Administration. Hopkins also supervised the Civil Works Administration (CWA). His visions of social justice and structural economic reforms made him one of the chief architects of the New Deal. He was a great proponent of the creation of government-sponsored jobs as a means to mitigate unemployment and help American workers retain their dignity and self-reliance. Roosevelt named Hopkins secretary of commerce in 1938.

Stomach cancer and ill health forced Hopkins to leave the Department of Commerce in 1940. He then became a trusted adviser to the president, with whom he had great influence. Hopkins also served as an intermediary between Roosevelt and other Allied leaders. In January 1941, Hopkins flew to Britain as Roosevelt's personal envoy to coordinate the Lend-Lease Act. He also convinced the president to ignore U.S. ambassador to Great Britain Joseph P. Kennedy's pessimistic reports regarding Britain's ability to remain in the war. Hopkins prevailed upon Roosevelt to deploy navy ships to undertake convoy duty in the North Atlantic prior to the American entrance into the war in December 1941.

To secure an agreement in discussions about the Atlantic Charter on August 14, 1941, Hopkins helped smooth over differences between Roosevelt and British prime minister Winston L. S. Churchill on the issue of colonialism. Another example of Hopkins's influence was his ability in 1944 to convince chairman of the Joint Chiefs of Staff Admiral William Leahy to continue supplying British forces in Greece, even though the United States

disagreed with London's policy toward communist rebels there. Hopkins was not always successful in his diplomatic efforts, as in Moscow in June 1945, when he failed to secure Soviet leader Joseph Stalin's support for democratic reforms in Poland that had been agreed to at the Yalta Conference the previous February.

After Roosevelt's death in April 1945, Hopkins assisted the new president, Harry S. Truman, in arrangements for the July–August 1945 Potsdam Conference. Hopkins also played a leading role in the formation of the United Nations. Forced by ill health to retire from public life in the fall of 1945, Hopkins died in New York City on January 29, 1946.

Hore-Belisha, Isaac Leslie (1893–1957)

British Liberal politician and secretary of state for war. Born on September 7, 1893, in Kilburn, London, Isaac Leslie Hore-Belisha was from a prominent British Sephardic Jewish family. His father died before Leslie reached his first birthday, and he later added the surname of his stepfather, Sir Adair Hore, to his own. Hore-Belisha attended Saint John's College, Oxford, becoming president of the Union. He won military distinction in World War I. In 1923, he was called to the bar and also won parliamentary election as a Liberal from Devonport, Plymouth, which he represented until 1945. In 1931,

he became chairman of the National Liberal Party, which supported the national government.

In 1934, Hore-Belisha became minister of transport, and in 1937 he succeeded Alfred Duff Cooper, 1st Viscount Norwich, as secretary of state for war. Instructed by Prime Minister Neville Chamberlain to introduce "drastic changes"—as war seemed increasingly likely—Hore-Belisha improved conditions and training for ordinary soldiers, raised soldiers' pay, retired many inefficient senior officers, upgraded officer training, and enhanced the army's mechanized warfare capabilities and its ability to resist air attack. In April 1939, he prevailed on a reluctant Chamberlain to introduce conscription and to prepare a British Expeditionary Force (BEF) to fight in France if necessary. Although Hore-Belisha demonstrated innovation, decision, and vision within the army and outside it, his tactless style alienated many who essentially shared his views.

When war began in September 1939, Hore-Belisha criticized the hesitant preparations and progress of the BEF under the leadership of General Lord John Gort, chief of the Imperial General Staff. Hore-Belisha accurately predicted that unless weak spots on the front were reinforced, Germany would probably attack successfully in the Ardennes sector. Gort and his allies, who included French Army commander in chief General Maurice Gamelin, complained to King George VI, and in January 1940 Chamberlain reluctantly decided to remove Hore-Belisha from office. Hore-Belisha preferred to resign, however.

For the duration of the war, Hore-Belisha was one of Prime Minister Winston L. S. Churchill's strongest backbench critics, unsuccessfully urging Churchill's resignation after the fall of Tobruk in June 1942. From May to August 1945, Hore-Belisha served briefly as minister of national insurance, but he lost his seat in that year's elections. In 1954, he accepted a peerage, and his incisive parliamentary speeches regained him some political influence. Hore-Belisha died suddenly on February 16, 1957, while leading a British parliamentary delegation in Reims, France.

Hori Eizo (1913–1995)

Japanese Army major general. Born in Nara on October 16, 1913, Hori Eizo graduated from the Army Cadet School in June 1934 and the War College in November 1942. He was originally trained as a cavalry officer. Promoted to major in October 1943, Hori was appointed as a staff officer in the Intelligence Section of the Imperial General Headquarters (IGHQ).

Through his thorough analysis of the facts, Hori demonstrated his outstanding talent in predicting American offensive moves in the Pacific theater. However, operational planners in the IGHQ ignored Hori's assessments. Sent to the Philippines in October 1944 as a staff officer of the Fourteenth Area Army, Hori assisted General Yamashita Tomoyuki. Hori returned to Tokyo in early 1945 on the staff of the Intelligence Section of the IGHQ. He accurately predicted the scheduled dates and locations of Allied plans to invade the Japanese home islands. Since June 1945, Hori had even detected the unusual activities of some U.S. air units in the Marianas. These subsequently turned out to be training activities in preparation for the atomic bomb attacks on Hiroshima and Nagasaki in August 1945. Because he was able to predict the American moves, Hori became known in the IGHQ as "MacArthur's staff officer." Hori ended the war as a major.

In postwar Japan, Hori served in the Ground Self Defense Force (JGSDF) from 1954 to 1957. As an intelligence specialist, his posts included military attaché to West Germany and head of the Intelligence Section of the Combined General Staff. He retired in 1967 as a major general. Thereafter, he taught German and also served as head administrator of his native village of Nishiyoshino. Hori died in Nara on June 5, 1995.

Horii Tomitaro (1890–1942)

Japanese Army lieutenant general. Born in Hyogo Prefecture on November 7, 1890, Horii Tomitaro was commissioned in the Imperial Japanese Army in December 1911. Following several staff and line postings, Horii commanded a battalion beginning in August 1932. He was promoted to colonel in August 1937, and in July 1938 he was attached to headquarters of the 8th Depot Division. Horii then took command of the 82nd Infantry Regiment. By August 1940, he was a major general commanding the 55th Regimental Group. This formation consisted principally of the reinforced 144th Infantry Regiment and was better known as the South Seas Detachment.

At the start of World War II, Horii's force quickly captured Guam. On January 4, 1942, Imperial General Headquarters ordered Horii to prepare to take Rabaul. Escorted by the aircraft carriers *Kaga* and *Akagi*, the invasion force landed in the predawn darkness of January 23. The Australian garrison there was quickly overwhelmed, and Horii's soldiers then tortured and executed many of the prisoners.

The South Seas Detachment formed most of the Japanese invasion force for the planned capture of Port Moresby in May 1942. This operation triggered the May 7–8 Battle of the Coral Sea, the first naval battle fought only with carrier aircraft. To Horii's disappointment, the transports carrying his soldiers turned back to Rabaul on May 9.

Horii's South Seas Detachment was then ordered to advance by land southward over the Owen Stanley Mountains to Port Moresby. Japanese forces went ashore at Buna beginning on July 20. The Japanese drove off the few defenders and soon reached Kokoda. Horii reached Buna by mid-August. By August 21, he had more than 8,000 combat troops and 3,000 construction workers under his command. Riding his white horse, Horii was soon at the

head of the Japanese advance, and by mid-September the Japanese had pushed to within 30 miles of Port Moresby.

The American landing on Guadalcanal in August 1942 drew away Japanese reinforcements intended for New Guinea. At the same time, disease, malnutrition, and combat severely reduced Horii's command. The terrain also proved to be a formidable obstacle. In addition, a Japanese supporting attack on Milne Bay (August 25–September 6) was defeated, allowing the Allies to pour reinforcements into Port Moresby. On September 24, 1942, Horii was ordered to withdraw toward Buna. An Allied counterattack soon turned the retreat into a rout. Horii was inspecting rearguard positions on November 12 when his party was cut off by an Australian attack near Wairopi. That night, Horii and his aides tried to cross the Kumusi River on a raft of logs, which came apart in the turbulent water. Horii, his chief of staff, and two others were drowned. His death was confirmed 10 days later.

Horrocks, Sir Brian Gwynne (1895–1985)

British Army lieutenant general. Brian Gwynne Horrocks was born on September 7, 1895, in Ranikhet, India. Educated at the Royal Military College, Sandhurst, he was commissioned in 1914. Wounded at Ypres in October 1914, Horrocks was captured and spent the next four years as a prisoner of the Germans. He then volunteered to take part in a mission to support White forces in Siberia. Taken prisoner by the Red forces, he was held from January to October 1920. An outstanding athlete, Horrocks competed in the 1924 Olympic Games in the pentathlon.

In the 1930s, Horrocks attended the Staff College of Camberley and was subsequently an instructor there. In 1939, he commanded a battalion in the 3rd Division in France, where he made an excellent impression on his commander, Bernard Montgomery. Promoted to brigadier in June 1940 during the May 26–June 4 Dunkerque Evacuation, Horrocks then commanded the 9th Armoured Division. In August 1942 when Montgomery took over the Eighth Army, he named Horrocks, now a lieutenant general, to head XIII Corps. It played a key role in repelling the Afrika Korps attack in the crucial Battle of Alam Halfa (August 31–September 7) and fought against the 21st Panzer Division at El Alamein (October 23–November 4). Horrocks then took command of X Corps and led it during the successful flanking maneuver at Mareth during March 20–26, 1943. During April and May 1943, he commanded IX Corps during the final drive against Tunis.

In June 1943 while preparing for the invasion of Italy, Horrocks was badly wounded during an air raid on Bizerte. This kept him out of action for a year. In August 1944 Horrocks took command of XXX Corps, which he led until the end of the war in General Miles Dempsey's Second British Army. Accomplishments of XXX Corps included the capture of Amiens, Brussels, Antwerp (September 4–October 2, 1944) and Bremen and helping to reduce the Ardennes salient (December 16, 1944–January 25, 1945). Horrocks is best remembered for his role during Operation MARKET-GARDEN (September 17–26, 1944), when XXX Corps failed to relieve the British 1st Airborne Division at Arnhem. Horrocks called this "the blackest moment of my life."

After the war, Horrocks commanded the British Army of the Rhine before his war wounds forced his retirement in 1949. He later wrote his autobiography, *A Full Life* (1960), and became a television commentator. Horrocks died in Fishbourne, England, on January 4, 1985.

Horthy de Nagybánya, Miklós (1868–1957)

Hungarian admiral, last commander of the Austro-Hungarian Fleet, and regent of Hungary during 1920–1944. Born in Kenderes, Hungary, on June 18, 1868, into a family of landed gentry, Miklós Horthy de Nagybánya entered the Naval Academy at Fiume (now Rijeka, Croatia) at age 14. Upon graduation in 1886, he was commissioned a sublieutenant in the Austro-Hungarian Navy, where he served for the next 32 years. He was promoted to lieutenant in 1900, to lieutenant commander in January 1909, and to commander in November 1911. During 1909–1914 he was at the court in Vienna as naval aide-de-camp to Emperor Franz Joseph. On January 20, 1914, Horthy was promoted to captain. He held a series of high-profile commands during World War I and was wounded in May 1917 during a raid on the Otranto Barrage. The success of that operation brought him fame in Austria-Hungary, and new emperor Karl I promoted Horthy to rear admiral on February 27, 1918.

Naval unrest and mutiny at Cattaro in February 1918 served to discredit the commander of the navy, Maximilian Njegovan, and on February 27, 1918, Emperor Karl named Horthy commander in chief of the fleet over 11 other admirals. Horthy received promotion to vice admiral on October 30, 1918, shortly before the end of the war, and it was his task to preside over the end of the Austro-Hungarian Navy. On November 1, 1918, Karl ordered him to hand over the entire fleet to control of the Yugoslav National Council. Horthy then retired from the navy.

Horthy soon entered politics as the leader of the conservative "White" forces against the communist government of Béla Kun. On March 1, 1920, Horthy became regent of Hungary and head of the executive authority. At first he had little power, but this increased sharply after 1937 when he refused to be bound by decisions of the Hungarian parliament. In domestic policy, Horthy rejected universal and secret suffrage, and land reform. In foreign policy, his chief aim was revision of the Treaty of Trianon of 1920, by which

Hungary had lost two-thirds of its territory and population. For this reason, although he was strongly antifascist, Horthy sought the support of, and an alliance with, Germany and Italy. His diplomatic efforts were successful in that between 1938 and 1940, Hungary recovered some of its former territory.

Horthy successfully managed to avoid involvement in World War II in September 1939. By April 1941, however, pressure from Adolf Hitler, coupled with promises of additional territory and access to the Adriatic, led to Hungarian military operations against Yugoslavia on the Axis side. Horthy was also forced to send troops to fight on the Eastern Front against the Soviet Union, but he resisted German efforts to deport Hungarian Jews.

In 1943 Horthy was already considering escaping from Hitler's grasp and negotiating with the Allied powers. Aware of this activity and determined to keep Hungary in the war on his side, Hitler sent German troops to occupy the country on March 19, 1944, although Horthy was allowed to remain in his post.

In September Soviet troops invaded Hungary from Romania, and on September 28, Horthy dispatched representatives to Moscow, where they signed a preliminary armistice agreement on October 11, which Horthy announced four days later. A lack of coordination with army chief of staff General János Vörös led to a continuation of the fighting. The German Army then occupied Budapest, and, taking his son hostage, the Germans forced Horthy to appoint Ferenc Szálasi, head of the Hungarian Arrow-Cross (fascist) Party, as "Leader of the Nation."

The Germans then removed Horthy to Bavaria, where he was captured by the Americans. In 1946 Horthy appeared as a witness at the postwar Nuremberg War Crimes Tribunal. The Yugoslav government requested his extradition so that he might be tried there for war crimes, but U.S. authorities refused. Horthy then moved to Portugal. The Soviet occupation and subsequent communist government of Hungary made it impossible for him to return there. Horthy wrote his memoirs in 1953, but they were not published in Hungary until 1990. He died in Estoril, Portugal, on February 9, 1957.

Horton, Sir Max Kennedy (1883–1951)

British Royal Navy admiral. Born in Anglesey, Wales, on November 29, 1883, Max Kennedy Horton entered the Royal Navy in 1898. He joined the fledgling submarine service in 1904, acquiring a reputation for both technical expertise and independence of mind. Horton's first command was the submarine *A-1,* in 1907.

Horton played a considerable role in developing British submarine doctrine before World War I. On September 13, 1914, he became the first British submarine commander to sink an enemy ship when the *E-9* torpedoed the German cruiser *Hela* near Heligoland. In October, his was one of two British submarines in the Baltic operating successfully from Russian bases against ships carrying iron ore from Sweden to Germany. After his return in December 1915, Horton commanded submarines in the North Sea before taking over a submarine flotilla in 1919.

Promoted to captain in 1920, Horton acquired a reputation for ruthless efficiency as he assumed increasingly senior posts. In 1932 he was promoted to rear admiral; in 1936 he was a vice admiral and took command of the Mediterranean Fleet's 1st Cruiser Squadron during the Spanish Civil War.

In 1938, Horton led the Northern Patrol, which was charged after the start of World War II with sealing the northern exit from the North Sea as part of Great Britain's economic blockade of the European Axis powers. He was then flag officer, submarines, from January 1940 until November 1942. Horton directed submarine operations during the Norwegian Campaign and deployed his forces in the Atlantic Ocean, the Arctic Ocean, and the North Sea to support the blockade of Germany. After Italy joined the war, he provided maximum possible support to British Mediterranean submarine forces in their assault on Italian and German supply lines to North Africa, operations that played a crucial role in the ultimate defeat of Axis forces there.

Horton was promoted to full admiral on January 9, 1942. In November, he became commander of the Western Approaches, leading the fight against German submarines that resulted in their defeat in the Battle of the Atlantic. Horton benefited greatly from the valuable work of his precursor, Sir Percy Noble. Horton efficiently integrated and deployed his growing forces of well-trained convoy escorts, roaming support groups, and hunter-killer groups centered on escort carriers, all supported by shore-based very long-range aircraft. Technological advances in radar, high-frequency direction finding, and antisubmarine weaponry increased his forces' effectiveness, while Ultra intelligence greatly aided both offensive and defensive strategic deployments.

Horton retired in August 1945. He died in London on July 30, 1951.

Hosogaya Boshiro (1888–1964)

Japanese Navy vice admiral. Born at Nagano on June 24, 1888, Hosogaya Boshiro graduated from the Japanese Naval Academy in 1908. After World War I, he held a variety of cruiser and then battleship commands. In 1934, Hosogaya was the captain of the battleship *Mutsu,* and the following year he was promoted to rear admiral. He then commanded first the Naval Communications School and then the Torpedo School. In 1939, Hosogaya was promoted to vice admiral and took charge of the Port Arthur naval base in China. He commanded Japan's Central China Fleet beginning in November 1940.

During the June 3–6, 1942, Battle of Midway, Hosogaya commanded the diversionary force that attacked the Aleutian Islands. His assaults, beginning on June 3, the day before the strike on Midway, were successful, and

Japanese troops occupied Attu and Kiska islands. This occupation of U.S. territory had little more than propaganda value, however.

In July 1942, Hosogaya's command became the Fifth Fleet with responsibility for protecting the North Pacific. The Japanese increased their garrisons on Attu and Kiska to more than 8,000 men, and Hosogaya was responsible for their resupply. During the winter of 1942–1943, however, U.S. forces began making offensive moves toward these Japanese bases.

At the end of March 1943, the Fifth Fleet undertook the escort of an important convoy to Kiska. On March 26, Hosogaya's force, consisting of two heavy cruisers, two light cruisers, and four destroyers, was escorting two transports near the Komandorski Islands when they were intercepted by a U.S. Navy task force commanded by Rear Admiral Charles H. McMorris of one heavy cruiser, one light cruiser, and four destroyers.

In the ensuing Battle of the Komandorski Islands, one of the last daytime surface battles not involving naval aviation, Hosogaya failed to press his advantage in numbers. The U.S. heavy cruiser *Salt Lake City* was hit several times, but the Japanese cruiser *Nachi* was hit twice, and Hosogaya broke off the action and ordered his transports to return home. The next month, Hosogaya was relieved of duty for lack of aggressiveness.

Hosogaya was later recalled from retirement to serve as governor of the South Seas Agency at Truk. Hosogaya died at Atami in Shizuoka Prefecture on February 8, 1964.

Hospital Ships

The world's major navies had used ships to house and transport wounded for a century and a half prior to World War II, but there were relatively few of them in commission in 1939. Geographic differences between the European and Pacific theaters dictated quite different roles for hospital ships in the two areas. Transports were used to move wounded soldiers from France to England in May 1940 and were again employed in North Africa and Italy and after the D-day landings. The fact that battles in the Pacific were fought in areas with no resident medical facilities and the great distances between those areas and fixed base hospitals created immense difficulties in transport and often necessitated treatment on the spot. Medical ships had to be able to serve as both ambulances and floating hospitals. The United Kingdom, Germany, Australia, Japan, and the United States all deployed hospital ships.

Germany commissioned eight Lazarettschiffe vessels during World War II. All were converted merchant ships designated alphabetically from A to H, and all were deployed in the Baltic. The first of these was the converted passenger liner *Berlin*, commissioned as Lazarettschiff A in 1939 and stationed off Norway. It had a crew of 165 and carried 400 beds. It remained in commission until January 31, 1945, when it struck a mine while transferring patients from the eastern Baltic to Germany. While under tow to Kiel, it struck another mine and was abandoned. Salvaged by the Soviet Navy in 1949, it returned to passenger service and was employed as a troop transport during the 1962 Cuban Missile Crisis. The renamed *Admiral Nakhimov* sank after a collision at sea in 1986 in which 423 passengers and crew were lost.

Two of the greatest marine disasters of the war involved former German hospital ships and occurred within days of each other. The *Wilhelm Gustloff* and the *General von Steuben* both had been converted to hospital ships early in the war and then reconverted to personnel transports later. In 1945, they were employed transporting personnel from East Prussia to Germany in Operation HANNIBAL, when both were torpedoed by the Soviet submarine *S-13*. The *Wilhelm Gustloff* was sunk on January 30 and the *General von Steuben* on February 10. As many as 10,000 lives may have been lost in the two sinkings.

Italy deployed 12 hospital ships during the war. These included the *Aquileia, Gradisca, Arno, Città di Trapani, California, Po, Principessa Giovanna, Sicilia, Tevere, Virgilio,* and *Toscana* in the Mediterranean and the *Ramb IV* in the Red Sea. All were attacked at least once. Torpedo bombers sank the *Po* and *California* in port at night when the ships had their lights switched off. The *Città di Trapani* was mined, while the sinking of the *Sicilia* occurred during a high-altitude attack against Naples by U.S. Army Air Forces bombers. The *Arno,* however, was sunk and the *Principessa Giovanna, Virgilio,* and *Toscana* were damaged in daylight air attacks conducted in good weather off Tunisia during April and May 1943. Italy protested these attacks, which the British and Americans denied, each blaming the other.

The Royal Navy deployed a number of ships dedicated primarily to transport of wounded, although they were staffed by naval physicians and nurses from Queen Alexandra's Imperial Military Nursing Service. They transported wounded from France and then moved wounded from Tobruk to Alexandria. They were again used to treat and move wounded at Anzio and transported wounded from Normandy after D-day (June 6, 1944). The *Oxfordshire* not only served in the Mediterranean but was loaned to the U.S. Navy and cared for wounded during the invasion of Okinawa (March–June 1945). Despite the fact that they carried clear markings (white hulls with a circumferential green stripe and red crosses that were illuminated at night), the Royal Navy lost 10 hospital ships to mines, torpedoes, and Luftwaffe bombs during the war.

Australia operated three hospital ships. The *Manunda* was converted in 1940 and served in the Middle East and New Guinea. It was damaged in the February 19, 1942, Japanese attack on Darwin. The ship lost 13 crew members in that attack but was repaired and returned to duty. It reverted to passenger service in 1946. The *Wanganella* was converted from passenger service in 1941 and transported 13,385 wounded personnel before returning to civilian service in 1946. The *Centaur* was converted in 1943 but was torpedoed and sunk on its second voyage after only two months of service. The sinking of the obviously marked hospital ship and the resulting loss of 268 medical personnel caused outrage, especially in Australia. Attempts to prosecute those involved for a war crime were rendered moot when the *I-177* that sank the *Centaur* was itself sunk before the war ended.

Five Royal Netherlands Navy hospital ships operated under Australian command, although with Dutch and Javanese crews. The Dutch government-in-exile placed the *Oranje* in the Netherlands East Indies under Australian control in February 1942. It operated in the South Pacific through the end of the war. The *Maetsuyker* also joined the Australians, although the ship continued to fly the Dutch flag. The *Tasman* was, like the *Maetsuyker,* the property of KPM Lines before its conversion to a hospital ship. The *Tasman* escaped from Singapore and was converted at U.S. expense. Although the ship served with the Australian Navy, it carried U.S. Army nurses in its complement and was crewed by Dutch and Javanese. As with the other Dutch ships, it served in the South Pacific. Two other KPM ships, the *Ophir* and *Melchoir-Treub,* were also turned into hospital ships and served primarily in the Indian Ocean.

Although it had deployed two sophisticated hospital ships in the 1904–1905 war with Russia, the Imperial Japanese Navy never built dedicated hospital ships. Instead, it relied on 19 converted merchant ships and the *Op Ten Noort,* a Dutch ship captured in the Battle of the Java Sea on February 27, 1942, and refitted as the hospital ship *Teno Maru.* An artificial second smokestack was added to disguise the ship in 1944, and its name was changed to *Hikawa Maru No. 2.* Late in the war the ship was used to transport mines, in violation of the Hague Convention protecting hospital ships. It was scuttled in 1945. The Japanese government paid the Dutch 100 million yen in damages after losing a lawsuit over the ship's ownership in 1977.

The *Asaki Maru,* a former Italian passenger liner, was converted to hospital duty in 1937 and served until 1944, when it was irreparably damaged in a collision with an oiler. The *Tachibana Maru* was converted in 1938 and served throughout the war. The *Hikawa Maru* served through the war and is currently a floating restaurant in Yokohama. The *Takasago Maru* served in Rabaul, Truk, and other parts of the South Pacific and was stopped and boarded several times by the U.S. Navy but always released under terms of the Hague Convention. Once, the *Takasago Maru* was attacked by a U.S. submarine; a torpedo struck the ship but failed to explode. The *Muru Maru* was not as fortunate. It was sunk in Manila Harbor in November 1944 by U.S. aircraft.

The U.S. Navy entered World War II with only two hospital ships in

commission: the *Relief* (AH-1) and *Solace* (AH-2). The *Relief,* launched in 1919, was the first U.S. vessel specifically designed as a hospital ship and was intended to be as much a floating hospital as a floating ambulance. Both ships were deployed in the Pacific throughout the war. In all, nine dedicated hospital ships were built during the war: the *Comfort*, *Hope,* and *Mercy* (the Comfort class, AH-6 to AH-8) and the *Repose*, *Consolation*, *Tranquility*, *Benevolence*, *Sanctuary*, and *Haven* (Haven class, AH-12 to AH-17). This class carried between 750 and 802 beds and complete surgical and X-ray facilities and was air-conditioned. Construction of the new ships was delayed, and they entered service during 1944–1945. Initially they operated primarily as hospitals, but by the time of the Iwo Jima invasion (February 10–March 26, 1945), the volume of casualties overwhelmed their capacity, and they were again forced to move wounded to base hospitals for treatment. At the end of the war, they were employed as transports for repatriated prisoners of war. In addition to the *Solace,* the *Rescue* (AH-18), *Refuge* (AH-11), *Samaritan* (AH-10), and *Bountiful* (AH-9) were conversions from either commercial or troop transport service.

Following the Allied invasion of France in June 1944, ships were employed as cross-Channel transports rather than to provide on-site treatment of the wounded. The U.S. Navy converted a class of large LSTs (landing ship, tanks) and redesignated them as LST(H). Each was staffed with 4 surgeons and 27 corpsmen and could carry up to 350 wounded.

Hossbach, Friedrich (1894–1980)

German Army general of infantry. Born at Unna in Westphalia on November 21, 1894, Friedrich Hossbach joined the German Army in 1913 and served on the Eastern Front during World War I. He remained in the Reichswehr after

the war and, as a captain, was assigned to the General Staff in 1927. As a major, in August 1934 he became adjutant to Chancellor Adolf Hitler while continuing his position as chief of the Central Section of the General Staff. Promoted to colonel in March 1937, Hossbach is chiefly remembered for his notes—what became known as the "Hossbach Memorandum"—during a key meeting between Hitler and his military chiefs in Berlin on November 5, 1937, in which the führer spelled out his plans for an aggressive foreign policy leading to war. This became important evidence at the postwar Nuremberg trials. Immune to intimidation, Hossbach also warned commander of the armed forces General Werner von Fritsch of impending charges of homosexuality against him. Refusing to go along with the plot against Fritsch, Hossbach was dismissed from his adjutant post in February 1938, although he retained his staff position.

Hossbach commanded the 82nd Infantry Regiment of the 31st Infantry Division in the invasion of France and the Low Countries in May 1940. Promoted to major general in March 1942, Hossbach the next month commanded the 82nd Division and then briefly in May 1943 the 31st Division on the Eastern Front. That August, he took over the LVI Panzer Corps as a lieutenant general. Promoted to general of infantry in November 1943, he commanded the Fourth Army in July 1944. Hitler relieved him from command on January 30, 1945, when, in East Prussia and under Russian pressure but without authority, Hossbach withdrew his forces. He was captured in Göttingen by U.S. forces on April 8, 1945. Only an hour earlier Hossbach had engaged in a shootout with Gestapo agents who had tried to arrest him. Hossbach published his memoirs in 1949. He died in Göttingen on September 10, 1980.

Hoth, Hermann (1885–1971)

German Army general. Born in Neuruppin near Berlin on April 12, 1885, Hermann Hoth joined the army in 1904. He graduated from the Prussian Kriegsakademie in 1913 and became an intelligence officer. A General Staff officer during and after World War I, Hoth became a specialist in armored warfare.

In 1935, he took command of the 18th Division and was promoted to major general. Promoted to lieutenant general, in November 1938 he commanded the XV Motorized Corps and distinguished himself in the invasion of Poland in September 1939.

With his panzer group, Hoth also distinguished himself in the invasion of France and the Low Countries in May 1940. In this campaign, he pushed through the Ardennes Forest to the English Channel and then into Normandy and Brittany. Hoth was promoted to colonel general in July.

Hoth's formation was redesignated the Third Panzer Group in November. He led it in the invasion of the Soviet Union on June 22, 1941. Hoth commanded the Seventeenth Army in Ukraine from October 1941 to June 1942, when he informed his men of the need for "harsh punishment" of Jews. He next commanded the Fourth Panzer Army. Hoth's mission was to encircle Voronezh and then drive south to the lower Don River. He led this army across the Don and toward the Caucasus and lower Volga.

Although Hoth subsequently failed to break through Soviet defenses to Stalingrad, he subsequently carried out a successful counteroffensive that helped open an escape route around Rostov for Army Group A. The Fourth Army helped restore the German lines and participated in the Battle of Kursk in July 1943. That November, Adolf Hitler dismissed the capable and well-liked Hoth for his "defeatist attitude."

Tried by a U.S. military court after the war for crimes against humanity committed by subordinates, Hoth was found guilty and sentenced at Nuremberg in October 1948 to 15 years in prison. He was released in 1954 and then wrote on armored warfare. His memoir *Panzer-Operationen* was published in 1956. Hoth died at Goslar/Harz on January 25, 1971.

Hull, Cordell (1871–1955)

U.S. secretary of state from 1933 to 1944. Born in the community of Star Point in Pickett County, Tennessee, on October 2, 1871, Cordell Hull studied law at the National Normal University in Lebanon, Ohio, and the Cumberland Law School in Lebanon, Tennessee. In 1892, he entered Tennessee state politics as a Democrat. During the 1898 Spanish-American War, Hull volunteered and spent several months in the army. He was elected to Congress in 1903, and in 1930 he became U.S. senator for Tennessee until 1933, when President Franklin D. Roosevelt appointed him secretary of state.

An old-fashioned Jeffersonian Democrat and progressive, Hull had greatly admired President Woodrow Wilson and had supported U.S. membership in the League of Nations following World War I. As secretary of state, Hull favored free trade, peace agreements, international conferences,

and reliance on legal principles and institutions. During the 1930s, Hull negotiated numerous reciprocal trade agreements with other nations. He also devoted particular attention to revitalizing U.S. relations with Latin America through the “Good Neighbor” policy, whereby the United States renounced the right to intervene in Latin America and instead sought to negotiate hemispheric security agreements.

President Roosevelt, who preferred to retain personal control of American foreign policy, frequently bypassed Hull. This tendency became more pronounced as World War II approached, and Hull found it both irritating and frustrating. Even so, because the two men fundamentally shared the same perspective on international affairs, Hull chose not to resign. He believed that the European dictators posed a dangerous threat to all free nations, and believing that arms embargoes were ineffective and generally favored aggressors, he opposed the various neutrality acts passed by Congress between 1935 and 1939. He was inclined to be slightly less conciliatory than Roosevelt and was unenthusiastic toward Roosevelt’s 1938–1939 peace messages to European powers.

Once war began in Europe, Hull staunchly supported Great Britain and France against Germany and Italy. However, he was virtually excluded from the Anglo-American Destroyers-for-Bases Agreement of the summer of 1940 and the drafting of Lend-Lease legislation some months later. Nor did he attend the Anglo-American military staff conversations held in Washington early in 1941 or the mid-August 1941 Argentia Conference that drafted the Atlantic Charter.

Roosevelt, preoccupied with European affairs from April to December 1941, delegated to Hull responsibility for protracted American negotiations with Japan. The objective of the negotiations was to reach a modus vivendi in Asia, where Japan had been at war with China since 1937. In the negotiations, Japan also sought further territorial gains from British, French, and Dutch territorial possessions. Despite the expressed concern of American military leaders that the United States was unprepared for a Pacific war, by late November 1941 Hull—who was privy to intercepted Japanese cable traffic—believed that war was inevitable, and he refused to contemplate further American concessions.

After the Japanese attack on Pearl Harbor (December 7, 1941), Hull was often excluded from major meetings, including the 1942 Casablanca

Conference, the 1943 Cairo and Tehran Conferences, and the 1944 Quebec Conference, a summit meeting of Allied leaders. Hull opposed Roosevelt's decision, announced at Casablanca, to demand unconditional surrender of the Axis nations, believing that this would encourage them to continue the war. Hull also opposed the 1944 Morgenthau Plan to partition a defeated Germany and eradicate its industrial capacity, and with the assistance of Secretary of War Henry L. Stimson, he succeeded in obtaining the scheme's ultimate rejection.

Hull put great effort into establishing the 1942 United Nations alliance of anti-Axis nations. Following his Wilsonian instincts, he then concentrated on planning for the postwar United Nations, an international security organization that would replace the defunct League of Nations. Under Hull's guidance, the State Department drafted the proposals for the United Nations Charter accepted at the 1944 Dumbarton Oaks Conference and adroitly won bipartisan congressional support for these. Addressing Congress in late 1943, Hull optimistically stated that the projected new organization would eliminate spheres of influence, the balance of power, and international alliances and rivalries. He shared Roosevelt's anticolonial outlook and his belief that the United States should treat China as a great power and thereby encourage it to become one.

Increasingly poor health led Hull to resign after the November 1944 presidential election. Consulted on the terms of the July 1945 Potsdam Declaration urging Japan to surrender, he insisted that it include no promise to retain the emperor. Hull was awarded the Nobel Peace Prize in 1945 and lived quietly in retirement, producing lengthy memoirs. Suffering from strokes and heart problems, he died in Bethesda, Maryland, on July 23, 1955.

Human Torpedoes

Torpedoes ridden by humans to their targets. In the 1890s, U.S. submarine pioneer John P. Holland envisioned midget submarines, but the first to submit plans for human torpedoes were the Italian naval engineers Teseo Tesei and Elios Toschi in October 1935. Although the Italians were the first to develop them, human torpedoes were also employed by the British, Germans, and Japanese.

The Italian 22-foot human torpedo was known as the Maiale (pig) because of its unruly behavior and the difficulty steering it. The torpedo was taken to the vicinity of the target by specially equipped submarines. Its two-man crew, wearing rubber suits and using oxygen breathing equipment, sat astride the torpedo. After directing the torpedo to its target vessel, they detached the torpedo's explosive nose, secured it to the target, and set a timing device to cause the nose to explode after their departure. On December 19, 1941, Italian Maiales crippled the British battleships *Queen Elizabeth* and *Valiant* at Alexandria, putting them out of action for many months. The Italians also used Maiales to attack Allied shipping at Algiers, Gibraltar, and Malta.

The British 25-foot Chariot was modeled on a Maiale captured at Gibraltar, although it was not until after the Italian attack at Alexandria that the British undertook serious study of it. It had a 700-pound detachable warhead and was developed specifically to attack the German battleship *Tirpitz* at Norway. This operation in October 1942 failed. The two Chariots, towed across the North Sea by the Shetland fishing boat *Arthur,* broke free in a sudden storm just as their crews were preparing to board them. The British did have some success, however, in subsequent attacks with Chariots against Palermo and Sicily and elsewhere, sinking two Italian cruisers and damaging a third.

The Germans also developed a 25-foot human torpedo. Known as Mohr (moor), it consisted of two electrically propelled torpedoes fastened together vertically. The top torpedo had a small Plexiglas cockpit instead of a warhead. Released close to its target, the Mohr was used with little success against the 1944 Allied landings at Anzio (January 22, 1944) and Normandy (June 6, 1944).

Japanese human torpedoes, known as Kaitens (meaning "divine faith"), were modified Type 93 Long Lance torpedoes 24 inches in diameter and fitted with a cockpit. Some 300 Type I Kaitens were produced. Launched from special submarines, they were used for the first time on November 20, 1944, against U.S. Navy ships at Ulithi Atoll, and one hit the fleet tanker *Mississinewa*, detonating its cargo of aviation gasoline. Wild claims of its success led the Japanese to mount eight other such operations, but only one other ship was sunk by a Kaiten, the U.S. Navy destroyer escort *Underhill.* They were also employed later with little success at Iwo Jima (February 19–March 26, 1945) and Okinawa (March–June 1945).

The unmanned torpedo fired from a submarine at periscope depth was a more effective and inexpensive weapon. It could be released from distances of more than 10,000 yards and did not involve risking a human crew.

Allied air transport route supplying China from India. With Japanese forces controlling all of coastal China even before the U.S. entry into World War II, supplies to the Nationalist Chinese trickled along the Burma Road into western China. Recognizing this inadequate rate of supply, in November 1941 the Chinese National Aviation Corporation (CNAC) successfully devised a route through the Himalaya Mountains between Kunming, China, and Assam, in upper India.

In 1942, the Japanese captured Burma (present-day Myanmar), thereby cutting off all overland access to the Nationalist government headed by Generalissimo Jiang Jieshi (Chiang Kai-shek). U.S. president Franklin D. Roosevelt believed it vital to support Jiang, and military planners wanted to use China as a base for strategic bombing of the Japanese home islands as well as the jumping-off point for their eventual invasion. The U.S. Army Air Forces (USAAF) used the route pioneered by the CNAC to accomplish these tasks, although it was not ideal. A single narrow-gauge railroad connected Assam to the Indian coast.

The air route itself was more than 500 miles and very dangerous. Japanese air activity, unpredictable weather, the lack of navigational aids, unmapped territory, and peaks rising above 20,000 feet all made flying especially treacherous. Conflicting demands by U.S. generals Claire Chennault and Joseph Stillwell—and also from Jiang—confused the supply situation. The deployment of B-29s to China in 1944 further strained the logistical chain, but the aircraft available were inadequate.

Initially, the twin-engine Douglas C-47 Skytrain was the main aircraft used, but it could only carry 2.5 tons of supplies. The twin-engine Curtiss C-46 Commando entered service before it had been fully tested. It could carry 5 tons of supplies, but early mechanical problems led to numerous accidents. Finally, late in the war the Douglas C-54 Skymaster, a four-engine transport capable of carrying 10 tons of cargo, became available.

Infrastructure also had to be created from scratch. Thousands of laborers built crushed-rock runways in China by hand. Trucks were scarce, so fuel was often transported in cans, and aircraft were fueled by lines of people passing these containers. In July 1942 only 85 tons of supplies were delivered. Not until 1944 did transport over the Hump become rationalized,

when that September Major General William Tunner assumed command of the China-India Air Transport Command, directly answerable to U.S. Army Air Force commanding officer General Henry H. (Hap) Arnold in Washington.

The Hump operation marked the first time air transport was autonomous from the local or theater commander. Tunner regularized crew rotation, aircraft maintenance, and loading and unloading procedures. Largely through his work, during July 1945 Allied aircraft flew more than 70,000 tons of cargo over the Himalayas. The Hump route was costly, however. More than 500 aircraft were lost, and more than 1,300 pilots and crewmen were killed or missing in action in the course of the Allied operation, which ended in September 1945.

A Curtiss U.S. C-46 Commando military transport flying over “the Hump,” the name given by the Americans to the Himalayan Mountains during World War II. This dangerous air route from India was essential for the supply of Chinese forces against the Japanese during World War II. Hungary

Nation located in Central Europe encompassing some 35,900 square miles. Hungary, which had a 1939 population of approximately 10 million people, bordered Yugoslavia to the south, Romania to the southeast and east, Austria to the west, and Czechoslovakia to the north. On the eve of World War II, at least half of Hungary's population still made a living from agriculture. The government—headed by Regent Miklós Horthy de Nagybánya, who had wide powers—steadfastly rejected calls for land reform, and more than half the arable land of Hungary was owned by some 10,000 landowners. Horthy, who remained head of the government from 1920 to 1944, also beat back proposals for universal suffrage.

The chief Hungarian foreign policy objective between the two world wars was revision of the 1920 Treaty of Trianon. Virtually all Hungarians saw the treaty as a national humiliation. It had destroyed the economy and the national territorial integrity of Hungary by stripping away some two-thirds of the national territory and population. It also consigned 3 million Hungarians to foreign rule.

Revisionist sentiment meant that the Horthy government became easy prey to German promises of territorial aggrandizement if Hungary joined the Axis. As a result of the Munich Conference and the First Vienna Decision in the autumn of 1938, the German occupation of Czechoslovakia on March 15, 1939, and the Second Vienna Decision in August 1940, Hungary received some of the territories lost after World War I without having to take part in any military operations. In return, Hungary provided Germany with increasing amounts of raw materials and food. During the war, Hungary also emerged as a major source of oil for the Reich, ultimately surpassed only by Romania.

In December 1940, the Hungarian government concluded a friendship agreement with Yugoslavia. A few months later, however, Adolf Hitler decided to attack Yugoslavia, and he insisted that Hungary participate in the military operations. Rather than dishonor himself with such an act, Hungarian prime minister Pál Teleki committed suicide. Regent Horthy, new prime minister László Bárdossy, and chief of staff of the army General Henrik Werth were all committed to Hungarian participation, however. They hoped thereby to gain additional territory and to cement the alliance with Germany. Hungary formally entered the war on April 11, 1941.

When Germany invaded the Soviet Union in June 1941, it called on

Hungary to participate fully in the war effort. Hungary suspended diplomatic relations with the Soviet Union, and on June 27 after a northern Hungarian city was bombed by aircraft identified as Soviet (but were in fact of unknown origin), Hungary declared war on the Soviet Union. Hungarian Army leaders expected a rapid German victory over the Soviet Union.

By the end of June, Hungarian troops were deployed on the Eastern Front. Hungarian forces were split: offensive units advanced with German forces into Soviet territory, and an occupying force provided security for the German rear areas. Much to its chagrin, Hungary ultimately found itself at war with Britain and the United States. The United States declared war on Hungary on June 5, 1942.

In January 1942 under heavy German pressure, Bárdossy promised to send additional troops to the Eastern Front. On March 9, 1942, largely because the Germans had failed to secure a quick victory over the Soviets, Horthy replaced Bárdossy as prime minister with Miklós Kállay. The new prime minister sought to continue his predecessor's policy of open cooperation with Germany while also conducting secret negotiations with the Anglo-Saxon powers in the hope of extricating Hungary from the war.

Meanwhile, between April and June 1942, the Second Hungarian Army of 200,000 men was sent to the Eastern Front to bolster German forces there. Hungarian forces in the Soviet Union suffered from obsolete and insufficient equipment, poor logistics, and insufficient ammunition. The tragic defeat of the Second Hungarian Army near Voronezh in the Battle of the Don River during the winter of 1943 was a catastrophe for Hungary that resulted in the deaths of some 120,000 troops.

Following this loss, Kállay was more determined than ever to extricate Hungary from the war. This angered Hitler, who demanded nothing less than full Hungarian participation in the war. Hitler was also upset by secret Hungarian negotiations with the Western Allies to withdraw from the war, an activity about which pro-German individuals within the Budapest government kept him well informed. On March 19, 1944, Hitler therefore sent German troops to occupy the country and force its continued participation on the German side. Under German pressure, Horthy also appointed Döme Sztójay, a pro-German former Hungarian ambassador to Berlin, as the new prime minister. Anti-Nazi parties were banned, and politicians opposed to German policy were arrested. The Hungarian

government was also forced to deploy additional soldiers to the Eastern Front to fight against the Soviets. One irony of the German occupation was the reduced economic value of Hungary to the Reich, thanks to the occupation costs, the mass arrests and deportation of Jews, and increased Allied bombing.

In an attempt to decrease German influence, on August 29, 1944, Horthy appointed a new prime minister, Géza Lakatos, who ordered Hungarian Army units to attack southern Transylvania to halt a Soviet-Romanian invasion. Understanding that the war was lost, Horthy dispatched a delegation to Moscow to negotiate an armistice with the Soviet Union, the terms of which were agreed to on October 11, 1944.

On October 15, 1944, Horthy announced over the radio Hungary's unconditional surrender. Because of a lack of coordination with Hungarian Army chief of staff János Vörös, the army continued to fight, and Horthy's attempt at surrender failed. The Germans then took over Budapest and forced Horthy to step aside in favor of Ferenc Szálasi, leader of the Arrow-Cross, the Hungarian fascist party, as prime minister and head of state. Horthy was then arrested by the Gestapo and removed to Germany with his family. During Szálasi's brief tenure, a reign of terror swept Hungary. Thousands of people, including many Jews who had sought refuge in Budapest, were arrested and executed or sent to concentration camps.

Meanwhile, the Soviet army continued to advance, and by December 1944 it laid siege to Budapest. Two and a half months later, the remaining German forces in Buda (the western mountainous side of the city) surrendered. Meanwhile, Hungarian representatives signed an armistice in Moscow on January 20, 1945. Most fighting in the country ended in February 1945, and the last German troops were forced from Hungarian soil on April 13, 1945. The country then passed from German to Soviet Army control.

Hungary, Air Force

Under the terms of the Treaty of Trianon following World War I, Hungary was forbidden to maintain a military air service. Between the two world wars, however, the Hungarian government secretly worked to establish, develop, and modernize an air force. The Hungarian Air Force came into being as an independent arm on January 1, 1939. For financial reasons but also because it lacked the industrial infrastructure (especially machine tools) and raw materials required, Hungary did not attempt to produce its own combat aircraft but purchased them from abroad, chiefly from Italy. In the late 1930s, however, it did begin production of an excellent short-range biplane reconnaissance aircraft, the Weiss Manfred 32 Sólyom (Hawk).

The Hungarian Air Force was first deployed in April 1941 during the invasion of Yugoslavia. At the time, it had on paper 302 aircraft, but only 189 of them were operational, and most were obsolete. After Hungary declared war on the Soviet Union in late June 1941, the air force was deployed to the Eastern Front. In 1942, the 2nd Air Force Brigade was established with 76 aircraft to support operations of the Second Hungarian Army in the Soviet Union. Almost half of its aircraft were gone by early 1943, and those that remained were integrated into German squadrons.

In 1943 under terms of an agreement with the German government, Hungary began production of the Messerschmitt Bf-109 fighter to offset production from German factories destroyed by Allied bombing. Hungary also produced the Messerschmitt Me-210. The terms of the agreement provided that 40 percent of aircraft production was to remain in Hungary, but this pledge was not kept. Nonetheless, Hungary was able to add some 170 modern aircraft to its inventory by 1944.

The revitalized Hungarian Air Force suffered devastating air raids by the Allied powers beginning in 1944. Remaining aircraft were then removed to

Austria. Ammunition and fuel shortages meant that no Hungarian aircraft participated in the last weeks of the war. Those that remained were either destroyed by their crews or handed over to Allied forces.

During the war, Hungary produced 1,182 aircraft and 1,482 aircraft engines. Among the aircraft were 488 Bf-109s and 279 Me-210s. Of these, Hungary received only 158.

Hungary, Army

The Treaty of Trianon between the Allied powers and Hungary following World War I limited both the quantity and quality of Hungary's armed forces. The army was restricted to a maximum of 35,000 officers and men and was not allowed any heavy artillery, tanks, or military aircraft. Hungary was also forbidden to organize and train reservists. The armed forces, consisting of seven mixed brigades and a river flotilla, could take up arms only for the maintenance of internal order or to oppose a foreign invasion of Hungary. Having been stripped of two-thirds of its territory and population following World War I, Hungary was also deficient in war-related industry and resources.

Hungarian army soldiers attempting to recover a disabled Soviet tank. It had been captured by Hungarian forces fighting alongside the Germans on the Eastern Front. (Corbis)

In 1938, an agreement between Hungary and the neighboring “Little Entente” states of Czechoslovakia, Romania, and Yugoslavia recognized Hungary’s right to rearm. The Hungarian government increased the military budget, but in September 1939 the army numbered only 9 light divisions or brigades. In 1941, it had 27 light divisions or brigades of 2 regiments each. Each regiment numbered about 4,000 men, so the effective size of the infantry force was only 216,000 men. There were also 2 cavalry brigades and 2 motorized brigades. Most of the equipment was obsolete; its rifles were old and frequently jammed, and the army had no antitank guns.

Although Hungary produced its own tanks, it had only 190 of these, and they were too light for combat operations on the Eastern Front, where the army would do most of its fighting. Even by 1943, the army had only one-third of the motor transport required and had to use civilian vehicles.

In the spring of 1941, Hungary conducted its first military operation since World War I when it sent a mechanized army corps to support the German invasion of Yugoslavia. The army was still underequipped when Hungary officially entered the war on June 26, 1941, with a declaration of war on the Soviet Union.

For operations in the Soviet Union, the army assembled an expeditionary force designated the Mobile Corps and commanded by General Ferenc Szombathelyi. Numbering some 44,000 men, it consisted of 2 infantry brigades (a mountain brigade and a border guard brigade), a cavalry brigade, and 10 Alpine battalions, 6 of which used bicycles. Nonetheless, the Mobile Corps contained the army's best-trained and best-equipped troops. The Mobile Corps was assigned to the German Seventeenth Army, and partly because Soviet forces were then retreating, the Mobile Corps reached the Donets River. In the autumn of 1941, some Hungarian Army light infantry divisions were assigned the task of guarding German rear areas in the central part of the front. Although poorly armed and equipped, these divisions effectively carried out their assignment and were not withdrawn until the autumn of 1944.

Under heavy German pressure, Hungary made a major military effort in 1942, deploying Gusztáv Jány's Second Hungarian Army to the Eastern Front. Consisting of three army corps, an armored division, and a mixed air force regiment and numbering about 200,000 men overall, the Second Army fought with General Maximilian von Weich's Army Group B in the Ukraine. Between June and September 1942, the Second Army helped drive back Soviet forces behind the Don River, suffering losses of nearly 22,000 men in the process.

Although the Germans provided the Second Army with some equipment, including tanks, much of this was obsolete and, in any case, inadequate in quantity. The Germans supplied only a few antitank guns, and the Hungarians did not have the heavy-caliber guns necessary to stop Soviet tanks. Opposing Soviet forces enjoyed a vast superiority in manpower, guns, tanks, artillery, and stocks of ammunition. Moreover, there had been no effective resupply since the summer campaign of 1942. Weapons and equipment would not work in the bitter cold of winter, there was no winter clothing, and even food was in short supply.

On January 12, 1943, Soviet forces—which outnumbered Hungarian forces by three to one in manpower and had a decided edge in military equipment, including tanks, aircraft, and artillery—launched a massive offensive across the Don River and pushed the Hungarians back, causing heavy casualties and material losses. Perhaps 160,000 men in the Second Army died in the battle or the subsequent retreat. The Don catastrophe

confirmed the Hungarian government's worst fears, and the government used the excuse that its war industries were unable to manufacture new equipment and arms fast enough to equip additional troops to avoid dispatching the men to the Eastern Front. The light divisions in occupation duties remained, however.

In March 1944, German forces occupied Hungary and put additional pressure on Hungary to assist with the war. As Soviet forces advanced west, the government deployed the First Hungarian Army to the Ukraine. Part of the German Army Group South, it consisted of four infantry divisions, one light division, one armored division, and two mountain brigades. The First Army held its positions until the end of July 1944, when it was forced to withdraw to the Carpathian Mountains. By early autumn, it became obvious that the weak Hungarian forces would be unable to stop Soviet and Romanian troops from invading the country. Army morale plummeted, especially when the Germans took control in Budapest and the fascist Arrow-Cross Party seized control of the government. Whole Hungarian units melted away.

Planned new military units were not organized in time to see action. The leaders of the army hoped to be able to hold out until they could surrender to U.S. and British forces, but this proved impossible. For most of the Hungarian military the war ended in February 1945, although some Hungarian formations withdrew with German units into Austria and Germany.

Hunter, Charles Newton (1906–1978)

U.S. Army colonel. Born in Oneida, New York, on January 11, 1906, Charles Newton Hunter graduated from the U.S. Military Academy at West Point in 1929. Commissioned in the infantry, he served with the 20th Infantry Regiment and then with the 4th Infantry Regiment of the Philippine Scouts. He graduated from the Infantry School and then served with the 7th Infantry Regiment and with the 14th Infantry Regiment in Panama.

Shortly after the United States entered World War II, Hunter was assigned to the Infantry School. In 1943, he was promoted to colonel and sent to India, where he helped organize and train the 5307th Composite Unit (code-named GALAHAD), a force of 3,000 army volunteers trained for deep-penetration operations in Burma. Hunter was executive officer to GALAHAD commander Brigadier General Frank D. Merrill. Because his chief was ill, Hunter in effect commanded "Merrill's Marauders" much of the time.

Hunter led GALAHAD's operations in the Hukwang Valley in conjunction with Chinese General Li Jen's New First Army from January to August 1944. Hunter took actual command in April when Merrill suffered heart problems, leading GALAHAD in a deep-penetration operation over difficult terrain that culminated in the capture of Myitkyina in August 1944. This fighting nearly destroyed his force. Hunter then trained replacements.

From 1945 to 1947, Hunter served in the G3 Section of Army Ground Forces in Washington. He then was assigned to Third Army Headquarters, attended the Armed Forces Staff College, served in Korea and Japan as regimental commander and chief of staff of the 7th Infantry Division, and served as chief of staff of IX Corps. Hunter subsequently attended the National War College, served on the faculty of the Armed Forces Staff College, and was deputy chief of staff of the Sixth Army. He was chief of the Army Branch Military Assistance Division of the U.S. European Command from 1954 to 1958 and then deputy chief of staff of the Fourth Army at Fort Sam Houston, Texas, before retiring in August 1959 as a colonel. In

retirement, he wrote a book about his wartime experiences. Hunter died in Cheyenne, Wyoming, on June 14, 1978.

Hunter-Killer Groups

Specialized antisubmarine units formed to hunt and destroy submarines before they could attack and to provide support for convoy escort groups. In late 1942 as production and delivery of antisubmarine vessels increased, the British began forming support groups—permanently established formations charged with reinforcing hard-pressed convoy escorts. Unlike escort groups, these units trained and exercised intensively to develop and master techniques for hunting and destroying Axis submarines. Their existence and the imminent arrival of large numbers of escort carriers from U.S. shipyards spurred the deployment of specialized hunter-killer units in the navies of the British Commonwealth and the United States.

The Atlantic Convoy Conference of March 1–12, 1943, mandated the formation that year of 10 hunter-killer groups, each centered on an escort carrier. Five British and Canadian groups would support operations in the North Atlantic, and five U.S. groups were to attend to the needs of the Middle Atlantic.

Although convoy support was a significant role, the most important mission of these groups was to locate, intercept, and destroy German U-boats before they could attack the slow merchantmen. Central to implementation of this mission were advances in three areas: code breaking, high-frequency direction finding (HF/DF, or "huff-duff"), and radar. By mid-1943, even though significant changes had occurred in the German naval cipher, Allied

decoders were able to read 80 percent or more of the U-boat arm's traffic. Furthermore, the British and U.S. submarine tracking rooms were able to predict submarine movements with a fair degree of accuracy on the basis of types of traffic, even if the message itself was unreadable.

HF/DF also was important in tracking and locating submarines. Shore-based installations became sufficiently sophisticated to give close fixes, whereas advances in miniaturization produced sets suitable for installation aboard ships. From late 1942, half of all U.S. destroyer and escort production was fitted with HF/DF. The British followed suit in the spring of 1943.

Code breaking, direction finding, and tracking ashore provided the hunter-killer groups with close approximations of the positions of U-boats at sea. Shipborne HF/DF, the new centimetric radar sets, and improved sonar equipment and procedures, together with the groups' organic aircraft, substantially enhanced their location rates. Better depth charges, ahead-throwing weapons, and aircraft-launched rockets or homing torpedoes eased the task of sinking the target. Hunter-killer groups trained together thoroughly, developed new coordinated tactics, and, above all, focused on locating and destroying U-boats rather than protecting convoys.

From the time of their deployment, Allied hunter-killer groups played a major role in the destruction of Germany's U-boats. For example, between May and December 1943, the group formed around the U.S. escort carrier *Bogue* sank 10 U-boats in the Atlantic; between June 1943 and January 1944, the Royal Navy's 2nd Support Group destroyed 14 submarines. The attack on *U-358* illustrates the significance of persistent attack made possible by adherence to a single mission: the British 1st Support Group maintained continuous contact for 38 hours and expended 530 depth charges before forcing the submarine to the surface and destroying it.

Huntziger, Charles Léon Clément (1880–1941)

French Army general and minister of war. Born in Lesneven near Brest, Brittany, France, on June 25, 1880, Charles Léon Clément Huntziger graduated from the French Military Academy of Saint-Cyr in 1901 and joined the colonial infantry. He served in Madagascar (1902–1904), in Senegal (1905–1907), and in Tonkin (1912–1914). Huntziger attended the École de Guerre (War College) from 1909 to 1911. During World War I, he fought chiefly on the Western Front, but in 1918 he was sent to the Balkans and ended the war in command of a battalion in Bulgaria.

Huntziger served in Asia from 1918 to 1920. He studied at the Centre des Hautes Études Militaires (Center for Advanced Military Studies) in 1921 and was promoted to colonel in 1922. He then served in China during 1924–1928 and was promoted to general of division in 1926. He was chief of the French military mission to Brazil during 1930–1934. Promoted to general of corps in 1933, he commanded French troops in the Levant (1934–1938).

Huntziger was recalled to France as a member of the Conseil Supérieur de la Guerre (Higher War Council) in 1938 and was designated to command an army in time of war. He was regarded as one of France's most promising general officers. On the outbreak of World War II, he commanded the Second Army.

In May 1940, the Second Army was part of the 1st Army Group, holding a front that ran from the end of the Maginot Line north to the junction of the Bar and Meuse Rivers at Mézières west of Sedan, where the Ninth Army's front began. French planning had envisioned a German Army sweep from Belgium into the area behind the Maginot Line. In this situation, Huntziger's forces formed the first line of defense. Following the Polish Campaign of

September 1939, however, the French command followed the Dyle Plan, with British and French forces advancing into Belgium and the Netherlands.

With the Second Army now assigned a less important role, it received less qualified reservists to fill its ranks. On May 10, 1940, Huntziger's forces consisted of two active infantry divisions, two low-grade reserve (Series B) infantry divisions, two cavalry divisions, and one Spahi cavalry brigade. Not only did Huntziger consider these forces inadequate in overall numbers, but he was less appreciative of some of the reservists and draftees. None of his units were motorized, and he considered his armament inferior. He was also short equipment. Although he requested 10,000 land mines, he received only 200.

When the Germans began their invasion, the preponderance of their forces operated against Huntziger's Ardennes sector. Moreover, the main blow of the German armored attack, which began on May 13, fell on the boundary between the Ninth and Second Armies. Huntziger knew little of mechanized warfare, and he made his situation worse by parceling out his few tanks to act in support of infantry. Huntziger's forces were shattered by the German armor formations around Sedan.

On June 3, Huntziger took command of the newly established French 4th Army Group, which met defeat around Châlons-sur-Marne. In early June, undersecretary of war General of Brigade Charles de Gaulle urged Premier Paul Reynaud to replace General Maxime Weygand (who had succeeded General Maurice Gamelin as supreme commander) with Huntziger.

Huntziger, however, headed the French delegation that concluded an armistice with Germany on June 22, 1940, and another on June 24 with Italy. His only guidance from the French government was to refuse dishonorable terms and not to surrender the fleet or any colonial territory.

Following the armistice, Huntziger commanded the French Army, limited by the Germans to 100,000 men. In September 1940, he was appointed minister of defense in the new collaborationist Vichy government of Marshal Henri Philippe Pétain and played a key role in policy decisions. Huntziger appears to have favored closer contacts with the British, and he supported the mission of Georges André Groussard to Britain in June 1941. Huntziger inherited the newly created post of minister of war in August 1941.

Huntziger died in a plane crash in Le Vignan (Gard Departement, near Nîmes), France, on November 12, 1941.

Hürtgen Forest Campaign (September 12–December 16, 1944)

Although little remembered today, the Battle of Hürtgen Forest was one of the worst defeats ever suffered by the U.S. Army. In three months of combat operations, the Americans sustained almost 33,000 casualties while accomplishing almost nothing tactically or operationally.

By late August 1944, the apparently defeated German Army had been pushed out of France and back to the borders of the Reich. Many believed that the war would be over by Christmas. But the situation changed as the Allies reached German territory and the defenses of the German West Wall (called the Siegfried Line by the Americans). In the central sector of the West Wall defensive line lay the dark and almost impenetrable Hürtgen Forest.

At that point in the war, the Allied logistics system was stretched to the breaking point, and the advancing armies were on the verge of running out of ammunition and fuel. Allied military planners were faced with the two strategic options of attacking Germany—on a broad front or on a narrow front. Lieutenant General George S. Patton Jr. and Field Marshal Sir Bernard Montgomery were the two leading advocates of the narrow-front approach, but each general thought his forces should execute the "dagger thrust" into the heart of the Reich.

Pressed hard by Montgomery, supreme commander of Allied Expeditionary Force General Dwight D. Eisenhower agreed in September 1944 to support the British plan for a combined ground and airborne thrust into Holland and then across the Rhine River at Arnhem. Launched on September 17, Operation MARKET-GARDEN soon failed. With supplies now dwindling, the Western Allies had no real choice other than to revert to the broad-front strategy of applying even pressure against the Germans all along the line.

Just prior to the start of MARKET-GARDEN, the U.S. First Army, commanded by Lieutenant General Courtney H. Hodges, breached the West Wall in two places and attacked the city of Aachen immediately north of the Hürtgen Forest. Hodges's 250,000-man force consisted of eight veteran divisions in the U.S. VII, V, and VIII Corps. After taking Aachen, Hodges planned to attack around the north end of the Hürtgen Forest across the flat open Rhine plain toward the city of Köln (Cologne). But Hodges also believed that he had to first secure the Hürtgen Forest to avoid dangerously exposing his southern flank.

The Hürtgen Forest is a classic piece of defender's terrain. It is an interlaced network of bald, exposed ridgelines and deeply wooded ravines, with the Roer River running through the middle of the forest and then out across the Rhine plain. The small river itself was not a significant military obstacle, but a series of dams high in the forest had created a huge artificial lake holding millions of gallons of water. By releasing that water at the right moment, the Germans could flood the Rhine plain, which would slow, disrupt, and channelize Allied military movement for weeks. Those dams, in the vicinity of the town of Schmidt, were the one significant military operational objective in the Hürtgen Forest, but ironically, neither side appeared to recognize that significance until the battle was almost over.

Although the German Army had a reputation as the master of mobile, offensive warfare, it also was tenacious and resourceful in the defense. The army group commander in that sector, Field Marshal Walther Model, was a master defensive tactician.

The Hürtgen Forest campaign began on September 12 when the veteran 9th Infantry Division attacked the southern end of the forest in an attempt to move through a passage known as the Monschau Corridor. The 9th Infantry Division took the town of Lammersdorf in the south, but it was stopped just

short of Germeter in the center of the forest. In late October, the 9th Infantry Division was withdrawn from the line after suffering 4,500 casualties. The 28th Infantry Division replaced it.

U.S. tanks moving up to the front lines in the Hürtgen Forest, November 1944. (US Signal Corps/The LIFE Picture Collection/Getty Images)

The U.S. First Army planned another attack, this time with VII Corps, commanded by Major General J. Lawton Collins. It was to move through the northern passage called the Stolberg Corridor. As a diversionary effort to draw off German forces, Major General Leonard Gerow's V Corps to the south would attack with one division against Schmidt on the far side of the Kall River gorge. The supporting attack was scheduled for November 2, and the main attack was to follow on November 5. VII Corps could not get ready in time, though, and the main attack was postponed—first until November 10 and then until November 16. For some reason, the timing for the supporting attack never changed.

The 28th Infantry Division launched the attack toward Schmidt with all three of its infantry regiments attacking in diverging directions, which dissipated rather than concentrated its combat power. The most notable feature of that battle was the struggle to get a handful of M-4 Sherman tanks

and M-10 Wolverine tank destroyers down the steep and narrow forest trail into the Kall River gorge and back up the other side to the open ground near the towns of Kommerscheidt and Schmidt. The 112th Infantry Regiment took Schmidt on November 3. The Germans counterattacked immediately, supported by PzKpfw-V Panther tanks.

Despite a gallant fight against superior odds, in which antitank platoon leader Lieutenant Turney Leonard earned a posthumous Medal of Honor, all American armor east of the Kall River was destroyed. By November 8, the 28th Infantry Division was pushed back almost to its starting positions, having sustained 6,184 casualties in only seven days of fighting. Major General Norman Cota, the 28th Infantry Division commander, was widely criticized for the tactically stupid offensive scheme, a plan that actually had been imposed on him by V Corps. Cota had protested it.

The 28th Infantry Division was relieved in the line by the 8th Infantry Division on November 13. Three days later, the Americans launched the postponed main assault, with VII Corps' 104th, 1st, and 4th Infantry Divisions attacking through the north of the forest. South of VII Corps and just to the north of where the 28th Infantry Division had been mauled, V Corps' 8th Infantry Division launched a supporting attack. Once again, the Americans encountered determined and skillful German defenses. The attackers suffered heavy casualties in exchange for mere yards of ground. The GIs fought under terrible conditions of snow, rain, mud, cold, and almost impenetrable woods in fierce infantry combat reminiscent of World War I.

The Americans were still trying to punch their way through the Hürtgen Forest and making almost no progress when, on December 16, the Germans launched their Ardennes Offensive (Battle of the Bulge) to the south. The almost complete tactical and operational surprise the Germans achieved brought the Hürtgen Forest campaign to a halt, as all Allied forces focused on containing the Germans in the Battle of the Bulge.

Even after the major German offensive was turned back, the Americans did not take Schmidt and the Roer River dams until early February 1945. Just before the Germans withdrew, they managed to blow up the valves controlling the spillway of the Schwammenauel Dam, the major dam in the system. The resulting flooding downstream delayed the U.S. Ninth Army's crossing of the Roer River to link up with the Canadian First Army, which in

turn contributed to the bloody (albeit successful) Canadian-British Battle of the Reichswald in February and early March 1945.

The Hürtgen Forest campaign was a brilliantly executed economy-of-force operation by the Germans. Most of the German records from that period did not survive, but Germany probably suffered more casualties than did the United States. Nonetheless, the Germans held the vastly better-supplied and -equipped attackers to a dead standstill for three months, while just a few miles to the south three German field armies assembled in almost complete secrecy for the Ardennes Offensive.

The Hürtgen Forest area today is little different than it was in late 1944 before the battle started. Very few markers or memorials exist to indicate the prolonged and savage fighting there.

Hu Tsung-nan

See Hu Zongnan

Hu Zongnan (1896–1962)

Chinese Nationalist general, known as the "King of the Northwest." Born in Zhenhai (Chenhain), Zhejiang (Chekiang), on May 16, 1896, Hu Zongnan (Hu Tsung-nan) received a primary education in the Confucian classics and became a teacher. In 1924, he studied at the newly founded Huangpu (Whampoa) Military Academy. As a Jiang Jieshi (Chiang Kai-shek) loyalist, Hu participated in the 1926–1928 Northern Expedition and continued to fight warlords and Communist forces through the 1930s.

On the outbreak of the Sino-Japanese War in 1937, Hu participated in the defense of Shanghai in Jiangsu (Kiangsu) Province as commander of the First Army. In 1938, he received command of the Seventeenth Army Group and was responsible for military training in northwest China, with headquarters at Xian (Sian), Shaanxi (Shensi). He was assigned the dual task of resisting the Japanese in northern China and containing the Communists in northern Shaanxi, where he became the center of the powerful Huangpu Clique in Chinese military politics. In 1939, he commanded the Thirty-Fourth Group Army. In 1943 he received command of the First War Area comprising Hebai (Hopei), Northern Shandong (Shantung), Henan (Honan), Anhui (Anhwei), and Shaanxi.

In April 1944, the Japanese began their ICHI-GO Campaign, which was aimed at removing China from the war. Hu's forces were hit hard but prevented the Japanese from entering Shaanxi Province. In 1945, at war's end, Hu traveled to Zhengzhou (Chengchow) in Henan Province to accept the surrender of the Japanese forces.

After the war and Jiang's order to go on the offensive against the Communists, Hu marched into northern Shaanxi and captured Yan'an (Yenan) in March 1947. This victory marked the high-water mark of Nationalist achievement in the civil war. As his forces became isolated from other GMD troops and supplies, they were eventually routed and then wiped out during 1949 by the Communists. Hu and a small group of advisers

escaped to Hainan Island and eventually made their way to Taiwan. He served the Nationalist government in Taiwan as commander of the guerrilla forces on Dachen (Tach'en) Island and ended his career commanding Nationalist forces in the Penghus (Pescadores). Hu retired in late 1959 and died in Taipei on February 14, 1962.

Hyakutake Haruyoshi (1888–1947)

Japanese Army general. Born in Saga Prefecture on May 25, 1888, Hyakutake Haruyoshi was commissioned in the army in December 1909 and became one of its leading signal communications specialists. Colonel Hyakutake commanded the 78th Infantry Regiment beginning in March 1935. He was promoted to major general in March 1937, and the following August he was appointed superintendent of the Army Signal School. After commanding the 4th Independent Mixed Brigade, Hyakutake, who had been promoted to lieutenant general in August 1939, accepted a two-year posting as inspector general of signal training in 1940.

Hyakutake assumed command of the Seventeenth Army at Rabaul on May 18, 1942. His new command consisted of scattered infantry regimental groups in that area. Hyakutake was to work with the navy to establish new airfields and positions in New Guinea, the Solomon Islands, and points east. The Japanese canceled their seaborne attack on Port Moresby after the Battle of the Coral Sea (May 7–8, 1942). Instead, in July 1942, Hyakutake ordered Major General Horii Tomitaro to advance overland with his South Seas Detachment in New Guinea to capture Port Moresby.

Hyakutake's attention was diverted to the Solomons when U.S. marines landed on Guadalcanal on August 7, 1942. Hyakutake underestimated both the number and fighting abilities of the Americans, and he continued to feed in units on a piecemeal basis. When Major General Kawaguchi Kiyotake's 6,000 men came to grief on Bloody Ridge on Guadalcanal during September 13–14, Hyakutake at last realized his error and put a hold on further operations on New Guinea.

Hyakutake then built up a force of 30,000 men on Guadalcanal and left Rabaul on October 8 to take personal command. His complicated plan involved separate columns intended to concentrate near American positions. This offensive opened on October 24. Despite the bravery of the attackers, superior U.S. firepower inflicted heavy losses and drove off the Japanese. By early November, the Japanese on Guadalcanal were desperately short of supplies.

The Japanese now reorganized their command in the South Pacific. General Imamura Hitoshi took command of the new Eighth Area Army. Hyakutake's forces in the Solomons remained the Seventeenth Army; those on New Guinea were renamed the Eighteenth Army. Although Imamura promised Hyakutake two fresh divisions, he was unable to deliver because the Japanese Navy could not control the sea around Guadalcanal.

After Imperial General Headquarters decided to evacuate Guadalcanal, in February 1943 Hyakutake assumed command on Bougainville. The Americans invaded that island on November 1, 1943, forcing Hyakutake's men into defensive positions, especially around Buin. To support the isolated garrison, Hyakutake spent much time organizing vegetable gardens. His attempt to break out during March 8–24, 1944, was unsuccessful. Imamura then ordered Hyakutake to adopt a live-and-let-live attitude toward the Americans.

Hyakutake's remaining forces on Bougainville surrendered at the end of the war. Hyakutake had been disabled by a stroke in early 1945. He returned to Japan in February 1946 and died in Hiratsuka on March 10, 1947.

I

Iachino, Angelo (1889–1976)

Italian Navy admiral. Born on April 24, 1889, in San Remo, Italy, Angelo Iachino graduated from the Italian Naval Academy in 1908. A specialist in naval gunnery, he commanded a torpedo boat in the Adriatic during World War I. Iachino was naval attaché to Britain from 1931 to 1934, and in 1936 he commanded Italian naval forces in Spain.

In June 1940, when Italy entered World War II, Iachino commanded the 2nd Cruiser Squadron. A month after the British raid on Taranto on November 11, 1940, Italian dictator Benito Mussolini made the fleet commander, Admiral Inigo Campioni, deputy chief of staff and named Iachino to replace Campioni. Iachino, who in 1938 had supported Mussolini's "Italy as aircraft carrier" arguments against proponents of Italian naval aviation, backed such development in later years, particularly after his country's grievous losses (three cruisers and two destroyers sunk and 2,300 dead) during the Battle of Cape Matapan (March 28, 1941). The near total lack of Italian Air Force support and of Luftwaffe air cover transformed an offensive Italian naval venture against the British into a defensive retreat that, because of miscalculations on Iachino's part, precipitated a confused, one-sided night battle.

The Matapan disaster haunted Iachino. Despite his superb theoretical grasp of naval strategy and tactics, he had proved irresolute in this and other encounters with the Royal Navy, notably the two battles in the Sirte Gulf on December 17, 1941, and March 22, 1942. Relieved of fleet command in April 1943, Iachino served without further command until retiring as a full admiral in 1954. He died in Rome on December 3, 1976.

Iba Field, Attack on (December 8, 1941)

Japanese air attack in the Philippines Islands, simultaneous with their raid on Clark Field. The Japanese planned to fly at night from Formosa (Taiwan) to avoid interception, arriving at first light to strike Nichols and Clark Fields, the main U.S. fighter and bomber bases in the Philippines. Early-morning fog on Formosa, however, grounded the aircraft of the Japanese Navy's Eleventh Air Fleet. With no prospect of surprise, planners decided to ignore Nichols Field in favor of Iba, a pursuit-aircraft base northwest of Manila on Luzon's west coast. An attack on Iba would cover the flank of the Japanese force attacking Clark. When the fog lifted on the morning of December 8, 54 twin-engine navy Mitsubishi G4M1 Type medium bombers (Allied code name Betty) of the Takao and Kanoya Air Groups and 50 Mitsubishi A6M Reisen (Zero) fighters of the 3rd Air Group took off from Formosa for the Philippines.

At Iba, the U.S. 3rd Pursuit Squadron flew 16 Curtiss P-40E Kittyhawks off the grass strip about 11:45 a.m. to intercept the Japanese planes, reportedly heading for Manila. This action was the Americans' second scramble of the morning. Failing to encounter the Japanese, the planes raced back when they heard Iba Field's radio warn of a hostile force approaching from the sea. The American fighters reached Iba low on fuel and, in any case, failed to locate the Japanese aircraft. The squadron entered the landing pattern at 12:45 p.m. Six aircraft landed just as the Japanese bombers and fighters struck. Japanese bombs tore into barracks, service buildings, and

maintenance equipment. A bomb also destroyed Iba's radar, a fatal blow to subsequent U.S. air-defense efforts.

A few American pilots turned their aircraft against the Zeros, despite nearly empty fuel tanks. The nimble Japanese shot down 5 P-40s, and swirling dogfights ran 3 more Americans out of gas. These desperate American attacks prevented the Zeros from strafing Iba. Ultimately, however, the 3rd Pursuit lost 16 P-40s in the air and on the ground—nearly the entire squadron—as well as 45 trained pilots and mechanics. Damage to the field and equipment was also significant.

The unexpected success of the Japanese raids on Clark and Iba stunned both the Japanese and the Americans. The attacks crippled General Douglas MacArthur's air force and made possible the safe approach of the Japanese invasion convoys.

ICEBERG, Operation

See Okinawa, Invasion of

ICHI-GO, Operation (April–December 1944)

Last major Japanese offensive in China during the war. In the spring of 1944, the war was going badly for the Japanese. With Lieutenant General Joseph W. Stilwell's forces progressing in northern Burma (present-day Myanmar), the Japanese launched their last offensive in China. Known as Operation ICHI-GO (VICTORY NUMBER ONE), it was aimed primarily at China's Nationalist forces and the American air bases in eastern China.

The Japanese strategic objectives were to destroy those forces, capture air bases in southeast China, consolidate control over eastern China, and secure control of the Beijing-Hankow-Canton railroad line. The Japanese also hoped to relieve some of the pressure on their forces in Burma and establish a stronger base in China from which to resist any potential Allied invasion of the Japanese home islands.

The first phase began in March and lasted until July 1944, with the offensive being mounted on a broad front across central and southern China. Japanese aims were to press toward the Nationalist capital of Chongqing (Chungking), open up direct communications with French Indochina, and capture airfields in southeast China being used by U.S. aircraft to attack Japanese ground forces and shipping. From the beginning the operation went well for the Japanese, with Nationalist forces quickly collapsing. This ended whatever hopes remained among Western leaders that China might play a major role in the defeat of Japan.

In northern China during April and May, the Japanese cleared the Beijing-Hankow railway and took Henan Province, even though they had to move at night to avoid constant attacks from Major General Claire Chennault's Fourteenth Air Force. Despite their air superiority, the Chinese Nationalist forces lost almost every time they met the Japanese. Some Chinese soldiers were even attacked by their own people, enraged by earlier mistreatment, and on occasion, starving peasants actually killed retreating Chinese troops and welcomed the Japanese.

Nationalist military failures exacerbated the already rocky relationship between Nationalist Chinese leader Jiang Jieshi (Chiang Kai-shek) and Stilwell as well as that between Chennault and Stilwell. Stilwell was convinced that the key to restoring China lay in reopening a land supply route to Chongqing through Burma, whereas Chennault feared for the preservation of his airfields in eastern China. Jiang, realizing that the Americans were going to defeat the Japanese in due course, seemed more concerned with the

threat posed to his regime by the Chinese Communists. In fall 1944, the rift led to Stilwell's dismissal.

Phase two of Operation ICHI-GO began in July with a pincer movement by two Japanese armies, one from Wuhan and one from Canton, attempting to take Guilin and open a land route between central China and Southeast Asia. By November, all of Guangxi and eastern Hunan had been overrun, and the Japanese were threatening Guiyang, the capital of Guizhou Province. In the process, the Japanese captured all but three U.S. airfields in southern China. The Allies feared that if Guiyang fell, the Japanese might capture Kunming and Chongqing. But the Japanese were not able to advance farther, and in December they attacked Guiyang but were repulsed. ICHI-GO was over.

In early 1945, the Japanese began limited offensives to consolidate the gains of 1944, but these failed to accomplish much, because the threat of war with the Soviet Union forced them to transfer several divisions to defend Manchuria and the Japanese mainland. Between May and July, the Nationalist Chinese used this situation to recover Guangxi and western Guangdong, but most Chinese lands captured by the Japanese during ICHI-GO remained in their hands until the end of the war. The Japanese offensive also greatly benefited Communist forces in China, who took advantage of the Nationalist defeats to occupy more territory and greatly expand their army.

Ichiki Kiyonao (1892–1942)

Japanese Army major general. Born in Shizuoka, Japan, on October 16, 1892, Ichiki Kiyonao graduated from the Japanese Military Academy in 1916 and was commissioned in the infantry. In 1927, he took command of an infantry company. Between 1928 and 1931, Ichiki was a drill instructor at agricultural and trade schools. In 1935, he was appointed an instructor at the Army Infantry School and studied infantry tactics that might be applied in the event of war with the Soviet Union.

In May 1936, Ichiki took command of an infantry battalion in the 1st Regiment of the China Garrison Army. When a company of his battalion held an exercise near Beijing (Peking) on the night of July 7, 1937, it was fired on by the Chinese. The 1st Regiment's commander, Colonel Mutaguchi Renya, then ordered Ichiki to take his entire battalion to the spot and attack the Chinese. The resulting clash, known as the Marco Polo Bridge Incident, marked the beginning of the Second Sino-Japanese War.

Promoted to colonel in 1941, Ichiki took command of a regiment just before the beginning of the Pacific war. His regiment was to have been a garrison force on Midway Island, but when the Japanese Navy lost the June 3–6, 1942, Battle of Midway, Ichiki's unit was sent to Guadalcanal in August 1942. In planning to attack U.S. marine positions, Ichiki developed tactics that took little account of U.S. troop dispositions, and his unit was annihilated in the August 21, 1942, Battle of the Tenaru River. Ichiki's men refused to surrender, and they and their commander were killed in the fighting. Marine losses were 44 dead and 71 wounded, whereas the Japanese had at least 777 killed. Ichiki was posthumously promoted to major general.

Ichimaru Rinosuke (1891–1945)

Japanese Navy vice admiral. Born on September 20, 1891, in Saga Prefecture on the island of Kyushu, Ichimaru Rinosuke entered the Japanese Naval Academy in 1910. In 1919, he joined a naval aviation unit and underwent pilot training. In 1926, when he was testing an experimental aircraft as commander of the unit, the plane crashed and he sustained serious injuries, leaving him with a limp and forcing his resignation from the navy. He then became president of the Yokaren, a naval aviation academy for high school students established in 1930 in Oppama.

Ichimaru proved to be a capable administrator, and the Yokaren produced well-trained pilots who established an enviable reputation during the Second Sino-Japanese War and World War II in the Pacific. Returning to active service, Ichimaru commanded a succession of naval aviation training units.

In 1939, Ichimaru was in command of the bombing of Wuhan in China. During the Pacific war, he saw action in the South Pacific, particularly in the Solomon Islands (August 1942–February 1943) and the bombing of U.S. positions on Guadalcanal. In 1943, Ichimaru returned to Japan and, now a rear admiral, assumed command of the 13th Aviation Wing.

In August 1944, Ichimaru was assigned to the island of Iwo Jima as the commander of some 2,000 naval personnel, but his men of the 27th Naval Aviation Wing had no aircraft. Although he believed that he would die on the island, Ichimaru gladly accepted the assignment. During the subsequent Battle of Iwo Jima (February 19–March 26, 1945), Ichimaru's men fought alongside the Japanese Army troops on the ground. Ichimaru was killed, presumably by U.S. machine gun fire, while leading a charge of his men, on March 17, 1945.

Before his death, Ichimaru wrote a letter to U.S. president Franklin D. Roosevelt. It was discovered on March 26 and published by the *New York Herald Tribune* on July 11, 1945. In it, Ichimaru sought to explain the Japanese point of view on the causes of the Pacific war. He claimed that the Japanese drive for the Daitoa Kyoeiken (Greater East Asia Co-Prosperity Sphere) did not threaten the United States and that Japan did not want war but was forced into it by the economic sanctions imposed by the United States.

Identification, Friend or Foe

As radars moved from prototype to production, designers immediately began to consider ways to give the new sensor the ability to identify the targets it detected. The British adopted the term "identification, friend or foe" (IFF) to define the system incorporated in aircraft to enable radar operators to separate enemy from friendly aircraft. "Fratricide"—also known as "amicide" and commonly, if incorrectly referred to as "friendly fire"—has been a recurrent problem since the beginning of organized military conflict, and the increasingly accelerated pace of aerial operations made it especially critical for air defense personnel to identify incoming aircraft rapidly. The same applied to naval operations, where the first to open fire enjoyed a tactical advantage, but a friend-on-friend engagement could be costly and give the advantage to the enemy.

Thus, during World War II, German and Allied navies and air forces dedicated extensive training and technical research to ensuring their personnel could identify enemy aircraft and ships before their opponents. The radar-deficient Japanese and Italians focused on visual identification training. To this end, military trainers employed models, printed silhouettes, and even playing cards (with vehicle profiles printed on the faces) as training aids. Special focus was often placed on distinguishing Allied and Axis craft with similar visual characteristics, such as the early models of the Grumman F-6 Hellcat and the Japanese A6M2 Zero.

During the North African (1940–1943) and Sicilian (July 9–August 22, 1943) campaigns, there were a large number of fratricides. This occurred especially in surface-to-air situations, as in the Allied invasion of Sicily,

when nervous antiaircraft gunners in the invasion fleet, having earlier suffered a German air attack, shot down 23 Douglas C-47 Skytrain transport aircraft carrying the second wave of Allied paratroopers. To ensure that nervous friendly air-defense gunners on the ground or in ships would not shoot at Allied planes during the cross-Channel invasion of France on June 6, 1944, Allied planners decided to forgo some elements of camouflage. The so-called invasion stripes were a series of broad bands of alternating black and white paint applied to the wings and fuselages of U.S. and British fighters, tactical bombers, and transport aircraft operating in support of the invasion.

IFF was also a device fitted to aircraft and ships to prevent attacks on other friendly units and to let radar stations identify them as friendly. The British initially employed a shaped dipole mounted in the aircraft to enhance the radar return, but this passive system proved unreliable, so they resorted to a repeater that retransmitted the radar pulse. The resulting stronger echo made friendly aircraft appear larger on the scope than enemy aircraft. Introduced into service in November 1939, the Mark I IFF proved quite successful during the July 10–September 30, 1940, Battle of Britain, although its limited range and other shortcomings often caused problems.

The more flexible Mark II IFF, which was designed to respond to naval and mobile radars, was introduced in May 1940. It utilized a separate transceiver that operated on its own frequency separate from that of the individual radar. Therefore, the Mark III could be mounted on any Allied air or naval platform, while its related interrogation system could be added to any radar system as a kit. It was installed on all Fleet Air Arm and Coastal Command aircraft by that October and was shared with the United States. Production of its successor, the Mark III, began in March 1941; it quickly became the standard Allied IFF system employed in the war. It was installed on all Allied aircraft, ships, and submarines beginning in late 1941.

The Germans developed IFF systems that were unique to each radar, resulting in a plethora of IFF systems that would identify the aircraft only if it was detected by a specific radar system. More important, German airborne radars never acquired IFF equipment and therefore were not capable of aircraft-to-aircraft IFF interrogation. Nor were German ships and submarines equipped with IFF.

The Allies’ standardization in IFF equipment and cross-service identification training did not eliminate friend-on-friend engagements in the

war at sea, particularly at night, but it did give their navies and air forces an advantage over their Axis counterparts in most naval theaters of war by reducing their detection to identification times of any contacts they encountered.

Japanese and Italian air force and naval personnel were trained only to recognize their own service's equipment. This and the refusal of their military services to share operational information or coordinate activities led either to confusion or attacks on their own forces during key points in battles in the Mediterranean and Pacific theaters. Thus, Japanese ground defenses on Iwo Jima could not identify their own aircraft by their signals. Similarly, German naval forces also suffered losses as a result of their country's shortcomings in identification procedures. Their ships and submarines lacked onboard IFF systems, and the Luftwaffe's ship identification training was limited and inadequate.

As the pace of naval warfare accelerated and battles came to be fought under all-weather and limited visibility conditions, crews came increasingly to rely on electronic IFF systems. Superior IFF equipment, training, and employment were major contributors to the Allied success in the war at sea. The basic procedures and technological principles developed during the war dominated postwar IFF developments until the 20th century's final decade.

I-400–Class Japanese Submarines

Japan's largest submarines, produced between 1944 and 1945. The I-class submarines were 296 feet 6 inches in length and displaced about 5,223 tons. They were the world's largest submarines until the U.S. Navy's *Triton* nuclear submarine of 1959.

Designed in 1942, the I-400–class submarine was to carry three to four light Aichi Type 17 Special Fighter aircraft (M6A1) to strike the U.S. mainland. The idea of a submersible aircraft carrier was unique to the Japanese Navy of World War II. The I-400–class submarines were powered with four diesel engines, generating 7,700 horsepower. Their maximum speed was 18.7 knots on the surface and 6.5 knots submerged, with a cruising radius of 42,000 nautical miles at 14 knots. An I-400–class submarine was thus capable of steaming around the world without refueling.

The I-400s carried a standard armament of one 144mm gun and three 25mm machine guns. It took 30 minutes to catapult an airplane from the submarine. Each aircraft could carry two 550-pound bombs or one 1,760-pound bomb. This type of submarine and the Japanese balloon bombs were the only real means available for Japan's military to attack the mainland United States during the Pacific war.

The development concept behind the I-400 was similar to that of the superbattleship *Yamato,* in which the Japanese Navy pursued the goal of having the largest guns and ships rather than the greatest number of vessels. However, the I-400 could not be mass-produced. In 1942, the Japanese Navy planned to build 18 I-400s, but only three were completed during the war. Nor could the Japanese Navy use them effectively, given Allied control of the Pacific.

In 1945, the navy developed a plan to utilize the I-400s in an attack on the Panama Canal. The attack was scheduled for August 25, 1945, but canceled with Japan's surrender. After the war, two I-400 submarines were handed over to the U.S. Navy, examined, and later sunk as targets off the coast of Hawaii. The remaining I-400 was broken up for scrap by the Japanese in 1946.

Iida Shōjirō (1888–1975)

Japanese Army lieutenant general. Born in Yamaguichi Prefecture, Japan, on August 8, 1888, Iida Shōjirō joined the army in 1908. He graduated from the War College in December 1915 and was promoted to captain in December 1918. Iida participated in Japan's Siberian Intervention and served two terms as an instructor at the Infantry School between postings to infantry regiments. By August 1934 he commanded 4th Infantry Regiment, Guards Division.

Promoted to lieutenant general in August 1939, Iida then commanded the Guards Division. In July 1941, his Twenty-Fifth Army occupied French Indochina. He then established his headquarters in Saigon and prepared for an invasion of Thailand.

In December 1941, Iida took command of the newly formed Fifteenth Army, consisting of the 33rd and 55th Infantry Divisions, charged with occupying Thailand. Beginning on December 8, his superior forces easily overcame light Thai resistance. The Thai government then accepted occupation and signed a mutual defense pact with Japan.

On January 20, 1942, Iida's divisions crossed into Burma (today Myanmar). Iida had only 35,000 men and limited supplies. The terrain sharply circumscribed Japanese operations, forcing the troops to abandon most of their heavy weapons and vehicles and utilize animals to carry their provisions. Although Japanese air attacks on the capital city of Rangoon (today Yangon) failed to close that port, Iida quickly outmaneuvered British forces. The Japanese force-marched along jungle trails, often outdistancing the motorized British.

On March 8, his men took Rangoon, and Iida immediately used that port to receive reinforcements and supplies. The fall of Rangoon also cut the

Burma Road and isolated China from Western aid. By May, British and Chinese forces in Burma had been driven back to India and China, respectively. The Japanese had inflicted some 30,000 casualties, with their own ground force losses numbering only some 7,000.

In April 1943, Iida was assigned to the General Defense Command. He retired in December 1944 but was recalled to command the Thirtieth Army in Manchuria in July 1945. He had barely taken up his post before his army was overrun by the Red Army in August. Iida was taken prisoner and not released until 1950. He died in Tokyo on January 23, 1975.

Ijuin Matsuji (1893–1944)

Japanese Navy rear admiral. Born in Tokyo on April 21, 1893, Ijuin Matsuji was the son of a future commander of the Combined Fleet. He joined the navy in December 1915 and served on a number of destroyers before commanding a destroyer flotilla in the years preceding World War II. In 1932, Ijuin was an aide-de-camp to the puppet emperor of Manzhouguo (Manchukuo), Aixinjueluo Puyi (Henry Puyi). During the Battle of the Eastern Solomons on August 22–25, 1942, Ijuin was captain of the heavy cruiser *Atago.*

In October 1943, Ijuin was promoted to rear admiral and assumed command of 3rd Destroyer Squadron at Rabaul. His early skirmishing with U.S. Navy forces while supplying isolated Japanese garrisons proved inconclusive. On October 6–7, 1943, Ijuin led nine destroyers to evacuate Vella Lavella. Intercepted by an inferior U.S. naval force, he completed his

mission. Each side lost one destroyer, and two U.S. destroyers were damaged.

On November 1, 1943, U.S. marines landed at Empress Augusta Bay on Bougainville. A Japanese force sortied from Rabaul, with Ijuin commanding the left flank of the screen made up of the light cruiser *Sendai* (flagship) and three destroyers. Altogether, the Japanese had two heavy cruisers, two light cruisers, and six destroyers. A slightly larger U.S. Navy force defended the U.S. transports. In the early morning of November 2, the two sides collided near Empress Augusta Bay, and the *Sendai* was sunk. Ijuin was rescued by a submarine and returned to Rabaul. He was not criticized for his role in the battle. He was then assigned to Singapore. He died when his escort ship *Iki* was torpedoed by an American submarine north of Saipan on May 24, 1944.

Ilyushin, Sergei Vladimirovich (1894–1977)

Soviet general and aeronautical engineer. Born in the village of Dilyalevo in the lower Vologoda region of Russia on March 30, 1894, Sergei Vladimirovich Ilyushin served in the Russian Army during World War I as an aircraft mechanic and learned to fly. He joined the Red Army in 1919 and commanded an aircraft maintenance unit during the Russian Civil War.

Ilyushin graduated from the Zhukovsky Air Force Engineering Academy in 1926 and became an aircraft designer. In 1931, he was chief of the Central Design Office and a colonel general. Ilyushin's two-engine bomber, the DB-3F, entered service in 1937. Redesignated the Il-4, it was the mainstay of the Soviet Union's medium bomber fleet in the early years of World War II. The

first Soviet bomber to reach Berlin, it was employed as both a torpedo bomber and a strategic bomber.

Ilyushin is also credited with designing the superb Il-2 Shturmovik. Appearing in March 1941, it was a highly effective, well-armored (about 15 percent of empty weight) ground-attack aircraft known to the Germans as "the black death." Armed with two 30mm cannon (and later, a 37mm gun), the Il-2 was a most successful tank killer. The Soviets manufactured some 36,000 Il-2s through 1955, more than any other wartime aircraft. Soviet leader Joseph Stalin described the Shturmovik as being "as essential to the Red Army as bread and water," and Ilyushin received the Hero of Soviet Labor award for its design. In 1943, Ilyushin developed the Il-10, a smaller but faster and more aerodynamic bomber based on the Il-2. It saw service well past the war, including in many Soviet satellite states. He also developed a four-engine bomber, the Il-20.

Ilyushin continued to design aircraft after the war, when he also taught at the Zhukovsky Academy. He developed the jet ground-attack Il-40 aircraft and, in 1948, the twin-engine Il-28 attack bomber, the Soviet Union's first jet bomber. He also designed the Il-38, the Soviet Union's first long-range antisubmarine aircraft. Among his civilian aircraft designs were the four-engine Il-12 in 1946 and the Il-14 in 1954. In 1957, Ilyushin developed the large turboprop Il-18. He also designed the intercontinental passenger jet known as the Il-62 and the larger transport aircraft Il-76 and Il-86 that served in both the Soviet Air Force and Aeroflot, the Soviet state airline. Ilyushin died in Moscow on February 9, 1977.

Imamura Hitoshi (1886–1968)

Japanese Army general and commander of the Eighth Area Army at Rabaul. Born in Miyagi Prefecture, Japan, on October 4, 1886, Imamura Hitoshi was commissioned in the Imperial Japanese Army in December 1907. He graduated from the War College in 1915 and then was an observer in Britain and India. In April 1932, Imamura took command of the 57th Infantry Regiment, followed in March 1935 by command of the 40th Infantry Regiment. He served as deputy chief of staff of the Guandong (Kwantung) Army in Manchuria and then was commandant of the Army Infantry School. Imamura commanded the 5th Infantry Division in China during November 1938–March 1940. He returned to China as commander of the Twenty-Third Army in June 1941.

In December 1941, Imamura took command of the Sixteenth Army, which was intended to conquer the Netherlands East Indies. During the invasion of Java on March 1, 1942, the transport that was carrying him, the *Rujo Maru,* was sunk in the Battle of Sunda Strait (February 28–March 1). Clinging to a piece of wood, Imamura managed to reach shore. His force soon after overran the Dutch defenders on Java, and on March 9, Imamura accepted the surrender of all remaining Allied forces in the Netherlands East Indies. As military governor of the former Dutch colony, he established a liberal occupation policy and freed Indonesian dissidents from prison.

In November 1942, Imamura took command of the new Eighth Area Army at Rabaul, Imperial General Headquarters, having realized that General Hyakutake Haruyoshi could not adequately direct operations on both Guadalcanal and New Guinea. Hyakutake thus took direct control of the Seventeenth Army on Guadalcanal, and General Adachi Hatazō took over the units on New Guinea, now designated the Eighteenth Army. Imamura was unable to deliver two new divisions to Hyakutake when the Japanese Navy failed to control the sea around Guadalcanal. Instead, he had to order Hyakutake to evacuate Guadalcanal.

Imamura’s efforts to reinforce New Guinea were also hampered by growing Allied airpower. The complete destruction of a Japanese convoy in the Battle of the Bismarck Sea during March 2–5, 1943, convinced Imamura that New Guinea would also be lost. Within weeks, operations on New

Guinea were transferred to the Second Area Army, and Imamura was left with only the Seventeenth Army.

Hyakutake and his Seventeenth Army were cut off on Bougainville by an American invasion in November 1943. On March 25, 1944, Imamura ordered the aggressive Hyakutake to cease offensive operations and adopt a purely defensive stance. Imamura himself was isolated at Rabaul with 70,000 troops when Australian forces captured the rest of New Britain. He hoped his presence would provide a strategic benefit to Japan, and he surrendered in 1945 only after Emperor Hirohito ordered him to do so. Tried and convicted of war crimes after the war, Imamura was imprisoned until 1954. He died in Tokyo on October 4, 1968.

Imphal and Kohima, Sieges of (March–July 1944)

Crucial battles that marked the turning point in the British defense of India. In February 1944, Lieutenant General Mutaguchi Renya, commander of the Japanese Fifteenth Army in Burma, undertook an invasion of eastern India, partly in response to raids by the British. Mutaguchi hoped to forestall a British offensive and perhaps spark a revolt against British rule in India. He mustered about 220,000 men for the campaign, but his effort was hampered by a lack of heavy artillery and a tenuous supply line. The campaign was made more difficult by the mountainous terrain of eastern India, where the towns and villages were usually situated on saddles connecting high, rugged ridges.

Mutaguchi's plan was to cut the road running south to Imphal from the supply depot at Dimapur. Then, after his troops had infiltrated the British-Indian positions, he planned to seize the high ground, force his opponents to retreat, and utilize captured supplies to march farther west.

The Japanese offensive opened in earnest on March 11–12, 1944, after Mutaguchi feinted south of Imphal and then surrounded it with his 33rd and 15th Divisions, cutting off supplies and laying siege to 150,000 British and Indian defenders. British lieutenant general William Slim, commander of the defending Fourteenth Army, had expected an attack but was surprised by the speed of the Japanese advance. He countered by flying ammunition, provisions, fuel, and the 5th Indian Division into Imphal to reinforce the defenders. The British also benefited from having the 254th Tank Brigade at Imphal. The only armor in the battle, the British tanks played a decisive part in reopening the road and placing the Japanese infantry around Imphal on the defensive by the beginning of the monsoon season in May.

Meanwhile, Japanese lieutenant general Satō Kōtoku's 31st Division had surrounded the key village of Kohima, north of Imphal. If Kohima fell, all British units to the south would have been forced to withdraw. But the 161st Indian Brigade at Kohima held, and once again, Slim turned to his air transports, flying the 2nd Infantry Division into Dimapur; that unit then pushed down the road to relieve Kohima. When the troops broke the circle around the village on April 18, Slim went over to the attack.

Satō held his ground, forcing the British and Indian troops to evict the Japanese from their positions yard by yard. Finally, on June 2, ignoring orders from Mutaguchi to stand to the last man, Satō withdrew his battered division. Mutaguchi ordered the remainder of his army to retreat a month later.

British and Indian casualties in the campaign were about 15,000 men, but Japanese losses exceeded 90,000. The latter included several thousand troops of Subhas Chandra Bose's Indian National Army. The Japanese defeat at Imphal and Kohima paved the way for the British and Chinese offensives into Burma the next year.

Incendiary Bombs and Bombing

Air-delivered ordnance used to damage or destroy physical structures by means of fire and a form of strategic bombing intended to cause widespread damage to industrial and population centers. Incendiary bombing is often referred to as firebombing.

During the early days of World War II, proponents of strategic bombing advocated large-scale air attacks against vital enemy military and industrial targets. These air raids were to be carried out during the day to facilitate precision bombing and maximize damage. However, both the Luftwaffe during the July 10–September 30, 1940, Battle of Britain and the Royal Air Force (RAF) Bomber Command during raids over Germany suffered such great losses of men and material that both turned to night area attacks. To compensate for the inherent loss of accuracy, they also turned to the use of incendiary bombs. In addition to the physical destruction these bombs caused, the use of incendiaries was calculated to have a devastating effect on civilian morale.

The Luftwaffe employed chiefly the 2.2-pound B1 El, containing a mixture of magnesium and thermite, in raids against Great Britain. One of the most infamous Luftwaffe firebombing raids was conducted against the city of Coventry on November 14–15, 1941. In that one raid, the Germans dropped more than 56 tons of incendiaries, causing extensive damage and casualties.

RAF Bomber Command began experimenting with incendiary bombing in the early months of 1942, and on May 2, 1942, the head of Bomber Command, Air Chief Marshal Sir Arthur Harris, ordered the first thousand-plane raid against the German city of Köln (Cologne). Using a mixture of high-explosive and incendiary bombs, the attack on May 30–31 destroyed over eight square miles of the city. Assessment of these early attacks convinced Harris that widespread devastation could be achieved with the

right combination of ordnance in strikes conducted over several successive days and nights.

The RAF would launch the night attacks, with high explosives creating the fuel for the incendiaries that followed. The British 4-pound magnesium and 30-pound phosphorous incendiary bombs would then begin the fires. More high explosives would follow to disrupt firefighting and rescue units, concluding with another round of incendiaries.

The U.S. Army Air Forces (USAAF) Eighth Air Force would also participate with "precision" (actually, area) daylight bombing on areas missed by the previous night's raid. The most famous of these perfected raids were against the cities of Hamburg and Dresden. Beginning on the night of July 24, 1943, and lasting until August 2, the attack on Hamburg, code-named Operation GOMORRAH, created a firestorm that destroyed over 6,000 acres of the city and killed at least 40,000 Germans. Then, on February 13–14, 1945, 1,400 RAF bombers attacked the city of Dresden at night, with 1,350 U.S. bombers following the next day. The resulting firestorm destroyed much of the city and killed tens of thousands of people. Following the Dresden raid, firebombing came under close scrutiny by the British and American governments and was suspended for the remainder of the European conflict.

In the Pacific theater, the USAAF began experimenting with incendiary bombing in early 1945. Major General Curtis LeMay, who took over command of the Marianas-based bombing campaign against the Japanese home islands in January 1945, was under pressure from Washington to reduce the loss rates for the Boeing B-29 Superfortress bombers in missions over Japan and increase the effectiveness of the high-altitude, daylight, precision-bombing attacks against major Japanese cities. LeMay decided on low-level night bombing runs with aircraft stripped of much of their protective armament to maximize bomb loads.

On the night of March 9–10, 1945, 334 B-29s dropped more than 2,000 tons of incendiaries on central Tokyo. Unlike the magnesium-thermite and phosphorous bombs commonly used in Europe, the B-29s carried 100-pound, oil-gel M47 bombs and 6-pound, gelled-gasoline M69 bombs, calculated to be most effective against the wood and paper building materials so common in Japanese cities. The resulting firestorm destroyed 16 square miles of the city and killed an estimated 100,000 Japanese. During the next weeks, B-29s firebombed the major Japanese cities except the shrine city of Kyoto. The

damage to Japan's major industrial cities was so extensive that LeMay was convinced he had found the means to end the war in the Pacific without an invasion of Japan itself.

The tactical potential of incendiary bombing was only beginning to be realized. Allied aircraft employed napalm—jellied gasoline ignited by thermite—against Japanese positions throughout the island-hopping campaigns. Incendiary bombing continued to be used on a wide scale in the Korean and Vietnam wars.

India

South Asian nation currently encompassing 1,269,219 square miles. India is bordered by the Indian Ocean to the south, the Arabian Sea to the southwest, and the Bay of Bengal to the southeast. India presently shares land borders with Pakistan to the west; China, Nepal, and Bhutan to the northeast; and Burma and Bangladesh to the east. With an estimated population of approximately 311.82 million people in 1939, India was then still part of the British Empire. The territory under British control, commonly known as India, included those areas directly administered by the British government (known as British India) as well as princely states ruled by individual rulers under the paramountcy of the British Crown. After 1876, the political entity officially known as the Indian Empire included present-day India, Pakistan, Bangladesh, and Myanmar (formerly Burma).

India’s location, population, vast extent, and resources all made it vital to the Allied war effort. India became the base for British operations against Burma and for resupply efforts to China. It was also a key source of manpower, important raw materials, and finished goods.

In September 1939, Lord Linlithgow (Victor Alexander John Hope, 2nd Marquess of Linlithgow), the viceroy of India from 1936 to 1943, declared war on Germany and Italy on behalf of India and suspended the Government of India Act of 1935. Although this move was constitutionally correct, Linlithgow’s failure to consult with the Indian legislature proved politically disastrous, as the British government had been endeavoring to encourage representative government by Indian elites. In response to Linlithgow’s action, a large number of Congress Party members resigned their government posts. This was ironic, as most Indians, including many princes and Congress Party leader Jawaharlal Nehru, opposed the Axis. A small number of Indian politicians, most notably Mohandas K. Gandhi, opposed all wars as a matter of principle.

In March 1942, Sir Richard Stafford Cripps arrived in India with a proposal for granting immediate self-rule after the war ended. The Congress Party rejected this offer and answered with the Quit India movement, announced on August 8, 1942. The movement called for an immediate end to British rule in India and involved mass struggle by nonviolent means. The British responded by arresting 60,000 members of the Congress Party, including both Nehru and Gandhi. Although the Muslim League also rejected the Cripps Plan, it benefited from its more moderate stance, and the influence of its leader, Mohammed Ali Jinnah, grew.

The rapid acceleration of the Indian war effort, especially following the Japanese attack on Pearl Harbor (December 7, 1941), spurred tremendous economic growth and led to a major expansion of India’s industrial base. India contributed vast amounts of material to the British Empire’s war effort, including raw materials, steel, locomotives and rolling stock, assault craft, and electrical components. Batteries produced in India were a vital component of air-to-ground communications, and India took the lead in manufacturing parachutes and uniforms and in assembling tens of thousands of armored vehicles from Canadian and U.S. components.

India also supplied more than 50,000 stretchers, in excess of 1 million blankets, 250,000 mosquito nets, 1.5 million water-testing tablets, and 160

tons of mosquito-repellent cream. To cope with the Allied rubber shortage, India established rubber plantations, experimented with reclaimed rubber, and produced considerable quantities of tires and hoses. It also produced alloy steels for guns and small arms, bayonets, shells, primers, and explosives as well as steel for the manufacture of antiaircraft guns, antitank shells, and light machine guns.

In addition, Indian princes contributed on an individual basis to the war effort, donating material goods such as blankets, woolen cloth, silk for parachutes, and rubber products. Hamidullah Khan, the nawab (Muslim leader) of Bhopal, liquidated his investments in the United States and used the money to purchase a squadron of Spitfire aircraft.

The war brought restrictions on movement, civil rights, and food supplies. As the threat of a Japanese attack increased, the viceroy ordered a scorched-earth policy that mandated the confiscation of all bicycles and boats in major coastal cities such as Calcutta. These seizures threatened the livelihood of many Indians and made food distribution more difficult. Between 1940 and 1942, prices of basic consumer goods increased an average of 250 percent, and the government began rationing grain, sugar, and cloth.

Bengal was especially hard-hit, for a famine there in 1943 claimed between 700,000 and 1.5 million lives; it was brought on, in part, by Japanese attacks against shipping along India’s east coast. In addition to the high prices for food, India was unable to secure food imports from Burma after it was controlled by the Japanese.

Once the war had ended, it was apparent that the British could not long retain their control of India: the war had strengthened indigenous nationalist movements. Consequently, on February 20, 1947, the Labour Party government in London announced that it would transfer power to India no later than June 1948. Despite Gandhi’s pleas, religious animosity led to the partition of India. The Muslim eastern and western portions became Pakistan on August 14, 1947; a day later, the remainder of India became independent. Since then, tensions have run high between India and Pakistan, including several wars.

India, Army

India was an important source of manpower for the Allied war effort. In 1938, British war secretary Leslie Hore-Belisha recommended that the Indian Army be reorganized, since he believed that too many British soldiers were deployed there. But in June 1939, the Chatfield Commission held that a wholly Indian military was not feasible. The commission members believed that British troops were necessary to keep peace between Muslims and Hindus—and, not incidentally, to maintain British control.

In consequence, no major reorganization or modernization of the Indian Army occurred. In 1939, the army numbered 189,000 men, of whom 65,000 were in administrative or communication positions. Much of the army's equipment was obsolete. Moreover, the army had no antitank units and only eight antiaircraft guns; there was also a serious shortage of artillery, let alone modern types.

The British government in India believed that the country would not be heavily involved with the war, especially overseas. Consequently, in the first eight months of the conflict, the government accepted only 53,000 volunteers to supplement existing forces. Even so, two brigades of the Indian Army were deployed to Egypt in October 1939. In 1940, Indian troops were dispatched to the Afghan border, Iraq, Malaya, Burma, and East Africa.

In the Japanese capture of Singapore in February 1942, 60,000 Indian troops became prisoners of war. Radical Indian nationalist politician Subhas Chandra Bose and the Japanese convinced some 25,000 of them to join the

Indian National Army (INA, Azad Hind Fanj) and fight to end British rule in India. The Japanese viewed this force as an effective tool against British power, whereas its members saw themselves as an army of national liberation. Ultimately, some 7,000 INA troops were attached to Japanese units and fought in the Imphal Offensive into India. The remainder were used as auxiliaries. Most of the poorly trained and poorly equipped INA forces were either taken prisoner or deserted.

In April 1942, to counter a possible Japanese invasion of India from Burma, the British commander in chief, General Archibald P. Wavell, reorganized the Indian Army structure of independent commands and formed it into Central Command and three armies: Northwestern, Central, and Eastern. In December 1942, the Eastern Army attacked into the Arakan in Burma, and the next year, it became General Sir William J. Slim's Fourteenth Army. In 1943, the British command placed more emphasis on jungle training, which stood Indian forces in good stead when they engaged the Japanese.

The Indian military grew considerably during the war. Defense spending increased from 49.5 million rupees in 1939–1940 to 395.3 million in 1945–1946. The army also expanded apace. A total of 2,644,323 men served in the Indian Army during the war, of whom approximately 2 million were combatants. Indian forces fought in Syria, North Africa, East Africa, the Middle East, Malaya, Greece, Sicily, and Italy. Indian casualties would total 179,935, including prisoners of war. Indians formed the bulk of Allied fighting troops in Southeast Asia; of 1 million British troops in the region, more than 700,000 were Indian. Although Muslims were only 27 percent of the total Indian population, they formed two-thirds of the Indian troops in North Africa, Italy, Malaya, and Burma.

India, Navy

The Royal Indian Marine became the Royal Indian Navy (RIN) in 1934, and its ships were identified with the prefix of HMIS, for His Majesty's Indian Ship. The RIN grew rapidly in the course of the war, from 1,708 men manning 8 small coastal sloops in September 1939 to 30,478 men with 7 sloops, 5 frigates, 2 corvettes, 16 minesweepers, and numerous small warships to include 41 landing craft in July 1945. From 1939, the navy took responsibility for Indian coast defense, and during World War II, it was involved in convoy duty as far as the Mediterranean Sea and the Atlantic Ocean. Two Indian sloops, the *Sutlej* and *Jumna,* took part in Operation HUSKY, the Allied invasion of Sicily during July 9–August 22, 1943.

Although the RIN was the most neglected of the armed forces following independence in 1947 because the military threats to the new nation were land-based from Pakistan and China, it is today the world's fifth-largest naval establishment.

Indianapolis, Sinking of (July 30–August 2, 1945)

The sinking of the U.S. heavy cruiser *Indianapolis* by a Japanese submarine in the Philippine Sea two weeks before the end of the war remains controversial. Built in Camden, New Jersey, and commissioned in 1932 at the Philadelphia Navy Yard, the *Indianapolis* (CA-35) carried President Franklin D. Roosevelt as a passenger during three cruises in the 1930s and served with distinction in the Pacific theater throughout the war.

While shelling Okinawa prior to the invasion of the island, the *Indianapolis* was severely damaged by a Japanese bomber in late March 1945, necessitating repairs at Mare Island, California. After the work was completed, the ship, under the command of Captain Charles B. McVay III, was ordered to carry to the island of Tinian the internal components of the two atomic bombs to be dropped on Hiroshima and Nagasaki. The *Indianapolis* arrived at Tinian on July 26. It next stopped at the island of Guam and departed on July 28 with orders to proceed to Leyte. While traveling without escort, under radio silence at 17 knots in moderate seas with good visibility, the *Indianapolis* was torpedoed by the Japanese submarine *I-58,* under Lieutenant Commander Hashimoto Mochitsura, in the early morning hours of July 30; it sank in only 12 minutes.

Survivors were spotted by a U.S. Navy aircraft on August 2. Of some 800 members of the 1,199-man crew that initially survived the sinking, only 316 were eventually rescued. The vast majority of those who died fell victim to sharks and exposure. The incident remains the worst case of shark attack in history.

Following a court of inquiry into the loss of the *Indianapolis,* Fleet Admiral Chester Nimitz proposed reprimanding McVay. Secretary of the Navy James Forrestal, however, followed the advice of the chief of naval operations, Fleet Admiral Ernest King, and ordered McVay court-martialed. Hashimoto testified at McVay's court-martial that he would have been able to sink the *Indianapolis* even if it had been taking evasive action. Despite this, McVay was subsequently found guilty of an error of professional judgment in unreasonably placing the *Indianapolis* at risk by failing to steer a zigzag course; he was acquitted of inefficiency in ordering his crew to abandon ship. The court unanimously recommended clemency, and Forrestal remitted the sentence of the court-martial. McVay retired as a rear admiral in 1949; he committed suicide in 1968.

In recent years, crew members of the *Indianapolis* have endeavored to

clear McVay's name. They have pointed out the poor visibility at the time the ship was sunk, the ship's engine problems, and the fact that McVay had not been informed of Japanese submarine activity. Also, McVay's request for escorts had been refused, even though the *Indianapolis* lacked antisubmarine detection devices. In 2001, the U.S. Congress passed a resolution exonerating McVay of any wrongdoing.

Indian Ocean Campaign (March–May 1942)

By late March 1942, the Japanese had placed primary importance on the elimination of British naval forces in the Indian Ocean that might threaten the oil-rich East Indies. Imperial Headquarters therefore decided to attack Colombo and Trincomalee on Ceylon (Sri Lanka), off India. The Japanese hoped that this would force the British westward, spread panic in India and cause the British to divert resources there from Burma, and open the way to the conquest of Madagascar, which would enable them to cut Allied supply lines to the Pacific, Egypt, and the Soviet Union.

British vice admiral James Somerville commanded the Eastern Fleet, with 29 ships. He split his ships into Force A and Force B. The main body, Force A, consisted of his fastest ships: 2 fleet aircraft carriers, 1 battleship, 2 heavy cruisers, 2 light cruisers, and 6 destroyers. Force B consisted of 1 light carrier, 4 old R-class battleships, and a hodgepodge of 11 old cruisers and destroyers. Somerville faced a superior Japanese force under Vice Admiral

Nagumo Chūichi. His First Air Fleet consisted of 5 large aircraft carriers (the *Kaga* remained in Japan), 4 battleships, 2 heavy cruisers, 1 light cruiser, and 11 destroyers.

En route to Ceylon, the Japanese attacked Port Darwin in Australia and, on February 27, sank the U.S. seaplane tender *Langley*, bound for Java with aircraft. On March 23, the Japanese took the Andaman Islands, securing the sea route to Rangoon from Singapore. Two days later, Nagumo's ships entered the Indian Ocean.

Earlier, on March 7, the battleships *Haruna* and *Kongo* had shelled Christmas Island, located 190 miles southwest of Java and considered important for its phosphate resources. A Japanese task force, commanded by Rear Admiral Kyuji Kubo and consisting of three cruisers, two destroyers, and transports, then arrived, and Japanese troops forced the island's surrender on March 31. The U.S. submarine *Seawolf* scored a hit on Kubo's flagship, the light cruiser *Naka,* which had to be towed to Singapore for repairs. Several months later, Japan withdrew from Christmas Island because it was unsuitable for any military facilities.

The attack on Ceylon, code-named Operation C, consisted of a strike against Colombo on April 5 and another on Trincomalee on April 9. The British believed that the Japanese planned to attack Ceylon beginning on April 1, and Somerville stationed his ships south of Ceylon on March 31.

Late on April 2, however, Somerville, who feared a Japanese submarine attack and a daylight air attack on his ships, split his fleet. He sent the majority to Addu Atoll, a small refueling base in the Maldives some 600 miles southwest of Ceylon. He also dispatched the cruisers *Dorsetshire* and *Cornwall* to Colombo and the light carrier *Hermes* and the destroyer *Vampire* to Trincomalee.

Immediately after the British ships reached Addu Atoll on April 4, the Japanese were sighted 360 miles south of Ceylon. The main British force was now too far away to attack the Japanese, but bases on Ceylon were put on high alert. Somerville realized that he had blundered and recalled the two cruisers to Addu Atoll. The *Hermes* and *Vampire* were to rendezvous once they were finished fueling.

At 8:00 a.m. on Easter, April 5, Japanese aircraft struck Colombo. Forty-two British fighters met the attackers, which were protected by escorting fighters. The Japanese planes destroyed shipping and paid particular attention

to shore installations: railroad yards, repair shops, and the airfield. High-altitude Japanese bombers sank an immobilized armed merchant cruiser and a destroyer, and they severely damaged a submarine tender. The raid, completed by 8:35 a.m., cost the Japanese 7 aircraft, whereas the British lost 25.

Once the Japanese had recovered their planes, a floatplane spotted the *Dorsetshire* and *Cornwall* at sea, and Nagumo launched 88 aircraft against them. The Japanese sank both British heavy cruisers in short order. Somerville had set out from Addu Atoll to engage the Japanese but failed to locate them. When Force B joined him the next day, he regarded it as a liability and promptly dispatched it to Kenya.

Nagumo, meanwhile, moved his ships toward Trincomalee. Believing that the Japanese were next going to attack Addu Atoll, Somerville positioned his ships off the atoll, 1,000 miles from the Japanese fleet. With the threat to India's coast and the sinking of merchant ships, the British decided to cede the eastern Indian Ocean to the Japanese and sent Force A to the western coast of India. The *Hermes* and *Vampire* were ordered to hug the coast and join Force A.

The Japanese raid on Trincomalee, beginning at 7:25 a.m. on April 9 and conducted by 91 bombers and 38 fighters, was met by 23 British aircraft. The Japanese planes found no warships in the harbor, but they did sink a merchant ship there. They concentrated on the shore installations and airfields and shot down 9 British Hurricane fighters as well as 5 Blenheim bombers sent against the Japanese carrier *Akagi* as it retired (the British bombers scored no hits). That afternoon, Japanese aircraft spotted the *Hermes* and *Vampire* at sea. Nagumo sent 90 aircraft against them, and the *Hermes,* with no planes aboard, and its escorting destroyer were promptly sent to the bottom.

As part of this same operation, the Japanese convoyed their 18th Infantry Division to Rangoon without incident. It arrived there on April 7. Also, a Japanese raiding force attacked the sea-lanes off India's east coast. This Malaya Force, commanded by Vice Admiral Ozawa Jisaburo, consisted of the light carrier *Ryujo,* 5 heavy cruisers, 1 light cruiser, and 4 destroyers. Between April 5 and 6, it sank 19 merchant ships (92,000 tons) and damaged 3 others. Air strikes by Japanese aircraft flying from Burma brought this total

up to some 185,000 tons of shipping sunk, and Japanese submarines operating off India's west coast sank an additional 32,000 tons.

By April 10, the Japanese had pushed the Royal Navy out of most of the Indian Ocean, created a buffer against British naval raids on the East Indies and other Japanese possessions, and destroyed significant British military assets. Nagumo concluded that he had achieved his objectives and ordered the First Air Fleet to return to Japan. His fleet had been at sea for many months, and its ships badly needed refitting.

Ultimately, their Indian Ocean victory fueled a belief in their invincibility among the Japanese and led to the overexpansion of their empire. The extended Japanese Indian Ocean operation also meant that many of the ships were unavailable for the next big sea fight, the Battle of the Coral Sea on May 7–8, 1942.

Infantry Tactics

Firepower and maneuver are the two primary elements of applied combat power. Firepower delivers the destructive force necessary to defeat an enemy's ability and will to fight. Maneuver is the movement of combat forces to gain positional advantage, usually to deliver or threaten to deliver fire by direct or indirect means. Artillery and aircraft deliver fire on the

modern battlefield. The tank, although considered a maneuver weapon, really combines both elements: firepower and maneuver. The infantry is primarily a maneuver force.

Infantry is defined traditionally as the branch of an army made up of units trained to fight on foot. Despite the appearance of large-scale mechanization in World War II, infantry dominated the battlefield as it has since the dawn of human history—and as it is likely to do so well into the high-tech future.

The World War II infantryman had much in common with his counterpart in the Roman legions 2,000 years earlier. In both eras, the individual infantryman lived and fought on the ground, day or night, in all weather, on all types of terrain. In both eras, he carried almost everything he needed on his back; he fought with handheld weapons, and his primary mission was to close with and destroy an enemy. The World War II infantryman, however, had far greater destructive power, reach, and staying power than his ancient counterpart. A World War II infantry company was more lethal than an entire infantry regiment of Napoleon's era. This advance resulted not only from the reach and rate of fire of modern weapons but also from communications technology that allowed an infantry company commander or even a platoon leader to call in the fire of an entire divisional artillery or air force fighter-bombers.

American infantrymen were the best equipped of World War II. The German infantrymen arguably were the best trained and best led. Soviet infantrymen were probably the toughest and most inured to physical hardship. The question of which army fielded the best infantrymen overall is open to debate, but the battlefield performance of the Australians, the New Zealanders, and the Gurkhas was consistently outstanding.

As with the tactics of the other arms, infantry tactics have always been a function of the technology and culture of the times. Most armies entered World War I with tactical doctrines that assumed mobile operations would be the norm. But infantrymen on both sides of the front lines in 1914 encountered previously unimaginable levels of firepower delivered by the new technologies of quick-firing artillery, the magazine-fed rifle, and especially the machine gun. Unable to survive the withering fire at ground level, the troops dug in.

With the onset of trench warfare, the military planners on all sides spent the rest of the war searching for the tactical methods that would break the

deadlock and restore mobility to the battlefield. They were close to achieving the solution by the time the war ended in 1918.

Contrary to popular belief, most armies did not spend the period between the two world wars training and organizing for a repetition of trench warfare. The majority of professional soldiers concluded soon after World War I that positional warfare had been an anomaly. But during the 1920s and the early part of the 1930s, an almost universal revulsion to all things military combined with the social, political, and economic factors of the era to retard advancements in military technology and doctrine. France, which had suffered more than any other of the Western Allies, especially adopted a defensive strategy and entrenched behind the Maginot Line.

The Allied armies ended World War I with massive stockpiles of weapons and equipment, which also tended to retard advancements in military technology. For economic reasons, political leaders insisted that the existing stocks be consumed before new weapons were developed and fielded. Germany, however, was in a different situation. The draconian provisions of the Versailles Treaty ironically worked to Germany's longer-term military advantage. Deprived of virtually all its armaments in 1919, the German military was forced to make a fresh start, both technologically and doctrinally.

Many of the technologies that had their primitive origins in World War I matured in the interwar years and radically altered the face of ground combat in World War II. Doctrinally, the modern concept of combined-arms operations also emerged in World War I. Combined-arms operations are those in which the effects of infantry, artillery, armor, air support, engineers, communications, and the like are all brought to bear on an objective in a coordinated and synchronized manner that produces a multiplier effect greater than the sum of its parts.

Each of the combat arms has particular strengths and weaknesses. In a combined-arms effort, the strength of one arm compensates for the weakness of another. Tanks, for example, are vulnerable to light infantry armed with antitank weapons such as the bazooka or the Panzerfaust. By combining infantry with tanks, the infantry protects the tanks from enemy infantry, while the tanks provide their own infantry with increased firepower and mobility.

Motorization was one of the major technological differences between World War I and World War II. During the earlier conflict, the primary

source of battlefield motive power was human and horse muscle, as it had been for thousands of years. By the start of World War II, however, the U.S. Army and the British Army were completely motorized. The Soviet Army and the German Army were partially motorized, but they—and the Japanese and Italian forces—continued to use horses and mules on a large scale. Despite the popular image of Germany's fast-moving mechanized armies, the Germans' field artillery and much of their infantry supply trains were horse-drawn right up to the end of the war.

The requirement for infantry to keep up with armored vehicles in fast-paced combat led to the development of motorized infantry and then mechanized infantry, also called armored infantry. Motorized infantry units, which first appeared near the end of World War I, were transported in trucks to assembly areas, where they dismounted and then deployed for combat. Mechanized infantry troops moved in various types of armored personnel carriers that usually were tracked or half-tracked. The armored personnel carriers mounted machine guns and heavier weapons that provided additional firepower. Mechanized infantry units usually dismounted from their vehicles to fight but sometimes fought from them. German mechanized infantry troops, known as Panzergrenadiers, were an integral element of their panzer divisions.

German commanders always tried to avoid launching set-piece frontal attacks, the most costly form of combat. They preferred, wherever possible, to attack around an enemy's flanks, using the operational principles articulated by Field Marshal Helmut von Moltke in the late 19th century: *Umfassen, Einschliessen, Vernichten* (fix, encircle, destroy). When a deliberate attack was unavoidable, the Germans usually opted for a penetration with conventional infantry, supported closely by engineers, artillery, and tactical air support.

Once a penetration or flanking movement succeeded, the German panzers exploited by encircling the enemy, from two directions in a pincer if possible. After the jaws of the pincer closed, the attacking force formed two concentric rings, one facing inward to hold and destroy the trapped enemy force and the other facing outward to prevent any relief efforts. The Germans called this tactic a *Kesselschlacht*—a cauldron battle—and used it successfully and on a large scale in many of the early battles in the Soviet Union in the summer of 1941. Later on the Western Front, the Germans themselves fell victim to the

Kesselschlacht at Falaise (August 1944) and the Ruhr Pocket (March 25–April 18, 1945).

A key element of German tactics was the concept of *Auftragstaktik,* which loosely translates into English as "mission tactics." Despite the popular stereotypes, reinforced by countless Hollywood movies and television programs, the common German soldier of World War II was anything but stupid and unimaginative, and his officers and noncommissioned officers (NCOs) were neither machinelike nor inflexible autocrats. German leaders, down to the most junior officers and NCOs, were encouraged to be flexible and innovative in their approach to accomplishing their assigned missions. German operations orders generally described what subordinate units had to accomplish and the time in which it needed to be done. The question of how to carry out the task was left to the subordinate leaders, who were supposed to understand the overall intentions of their commanders at least two levels up. The result was that German units, even large units such as divisions, could react quickly to changes in the tactical situation, often acting on only verbal, fragmentary orders.

The primary document for German operations and tactics was a manual called *Truppenführung* (Unit Command), which was issued in 1934 and remained in force until the end of the war. It remains to this day one of history's most influential milestones in the development of tactical doctrine. Yet for all its tactical sophistication, the German Army became overextended and ground down by the demands of waging a two-front war.

To maintain their massive armies in the field, the Germans were forced to decrease training times progressively and even to commit training units to combat during emergencies. The decline in infantry quality meant that infantry units survived for shorter periods in combat and thus had to be replaced at a faster rate. It was a vicious cycle. In response, German commanders tried to rely more heavily on firepower as the conflict wore on, but the German Army was chronically short of artillery throughout the war.

Combat in the Soviet Union was more infantry-intensive than in North Africa or in Western Europe. After the initial successes of 1941, the Germans' so-called blitzkrieg began to fail because the panzer forces and even more so the Luftwaffe became more and more thinly spread over the vast spaces in the east. As that happened, the advantage slowly shifted to the Soviets, with their vast numbers of infantry divisions and their overwhelming

superiority in artillery tubes. Although some battles, such as Kursk (July 5–13, 1943), were classic clashes of armor, the foot soldier dominated the set-piece urban fight for Stalingrad (August 23, 1942–February 2, 1943).

Early in the war, Soviet attacks had great difficulty breaking through German defenses. The Soviet solution was to put the bulk of a unit's combat power as far forward as possible, with as many as 19 of a division's 27 infantry companies in the front line for a typical divisional deliberate attack. Later in the war, the German defenses developed much greater depth as they were being pushed back from Soviet territory. In response, the Soviets developed echeloned attack tactics.

German infantry supported by three infantry fighting vehicles (Sd.Kfz.251) advance on a village in the Soviet Union in July 1941. (Ullstein Bild via Getty Images)

Infantrymen do not fight as individuals. They fight as part of a carefully synchronized team, and each member of that team performs a specialized function. The basic infantry tactical unit is a squad—or section—of 8 to 15 soldiers commanded by a junior-ranking NCO. The squad is the largest unit that a leader can command by direct personal influence on the individual soldier. As the building blocks of larger combat units, the squads' organization and structure were a direct reflection of the tactical doctrine of the larger army.

At the start of World War II, the German infantry squad consisted of 10 men organized into two groups. The 4-man machine-gun group (gunner, assistant gunner, and 2 ammunition bearers) was armed with the excellent MG-34 light machine gun. The 5-man rifle group supported the machine-gun group. The two groups advanced by mutually supporting fire and movement, coordinated and synchronized by the squad leader. The Germans placed particular emphasis on selecting and training squad leaders. But by 1943, manpower shortages forced the Germans to reduce the infantry section to 9 men.

The organization of the French infantry squad was superficially similar to that of the Germans, but its method of maneuvering reflected the overwhelming defensive mentality of the French Army. The Germans believed that fire and movement complemented each other, but the French thought that movement was only possible once fire superiority was established. The French squad had 12 men, organized into a 6-man light machine gun or automatic rifle team, and a 5-man rifle team, plus the squad leader. Rather than maneuvering individually and providing mutual support to each other, the two teams were linked rigidly to the machine gun. The function of each member of the squad was defined in terms of the gun—fire it, move it, feed it, and protect it.

The Soviets and the British had the smallest infantry squads. The Soviet squad had 9 men and a light machine gun. The British infantry squad consisted of a corporal, 7 men, and the Czech-designed Bren gun as the automatic weapon. The Bren, which was much lighter than the Lewis gun it replaced, facilitated an increased emphasis on fire and movement within the British infantry.

The U.S. Army did not become involved in ground combat operations until late 1942. The American infantryman, armed with the outstanding semiautomatic Garard M1 rifle, could produce a far greater rate of fire than either his Axis enemies or his Canadian and British allies, all of whom generally were armed with bolt-action rifles. The 12-man American infantry squad was organized into three teams. The squad leader (a sergeant) usually moved with the 2-man scout (Able) team.

Once an enemy objective was located, the squad leader ordered the four-man fire (Baker) team, which was based on a Browning Automatic Rifle (BAR), to lay down a base of fire. The five-man maneuver (Charlie) team

then attacked the objective in short rushes. In practice, the unbalanced teams and especially the low rate of fire of the BAR made the American infantry squad particularly vulnerable to casualties. After World War II, American infantry squads were reconfigured into two evenly balanced teams.

Many popular beliefs about the infantry and infantrymen are false. Infantrymen, for example, are not the intellectual underclass of an army. Modern infantry combat has become so technical, so fast-paced, and so lethal that only the quick-witted, physically fit, and highly trained can survive it. Nor did the infantry suffer the highest casualty rates in World War II. Combat aircrews and, above all, submarine crews had higher rates. Few would argue, however, that the "poor bloody infantry"—as the British called them—led the hardest lives in the war. Regardless of the overall scheme of maneuver of the larger unit, every attack is a frontal attack at the level of the individual infantry soldier.

Ingersoll, Royal Eason (1883–1976)

U.S. Navy admiral whose logistical skills contributed to the success of the June 6, 1944, Normandy Invasion. Born in Washington, D.C., on June 20, 1883, Royal Eason Ingersoll was the son of a distinguished admiral. Graduating from the U.S. Naval Academy at Annapolis in 1905, he participated in the final portion of the Great White Fleet's voyage around the world. Quietly intellectual, unobtrusive, and a superb administrator and skilled seaman, Ingersoll filled assorted staff, teaching, and seagoing assignments. Heading the Navy Department Communications Office during World War I, he ably directed its enormous wartime expansion and subsequently directed U.S. communications at the Paris Peace Conference in 1919.

Following tours as the executive officer of two battleships, Ingersoll headed the branch of naval intelligence responsible for code-breaking efforts against the Japanese. In 1927, he graduated from the Naval War College and was promoted to captain. He then held staff assignments and commanded cruisers. For three years, from 1935 to 1938, Ingersoll headed the Navy War Plans Division, where he helped revise Plan Orange against Japan. In 1937, he launched informal discussions with Great Britain on potential Anglo-American cooperation in any future conflict with Japan.

Promoted to rear admiral in 1938, Ingersoll commanded Cruiser Division 6. He was recalled from sea duty in 1940 to become assistant to chief of naval operations Admiral Harold R. Stark. Ingersoll played a crucial role in helping prepare the U.S. Navy for war. In January 1942 as a vice admiral, he took command of the Atlantic Fleet, based at Norfolk, Virginia; his mission was to counter the German U-boat campaign, thereby safeguarding Atlantic lines of communication and protecting convoys bound for Europe, and to secure the Western Hemisphere. His only son and namesake, a naval lieutenant, died in action at the Battle of Midway (June 3–6, 1942). Ingersoll was promoted to full admiral the following month. That November, he organized the movements of the ships that transported the U.S. Western Task Force to Morocco in Operation TORCH (November 8, 1942).

U.S. Navy admiral Royal E. Ingersoll. (Planet News Archive/SSPL/Getty Images)

From May 1943, Ingersoll worked closely with the new Tenth Fleet, established under the direct command of chief of naval operations Admiral Ernest J. King (he relieved Stark on March 18, 1942). Ingersoll's logistical and managerial skills proved particularly valuable in deploying U.S. forces to maximum effect and, by substantially neutralizing German submarine forces, greatly facilitated the June 1944 Normandy landings.

In November 1944, Ingersoll became commander, Western Sea Frontier, to implement the complex transfer of U.S. naval forces from the Atlantic to the Pacific for the projected invasion of Japan, a task effectively obviated by the sudden end of the war in August 1945. He retired one year later. Ingersoll died in Washington, D.C., on May 20, 1976.

Ingram, Jonas Howard (1886–1952)

U.S. Navy admiral. Born in Jeffersonville, Indiana, on October 15, 1886, Jonas Howard Ingram graduated from the U.S. Naval Academy at Annapolis. A gunnery specialist, he served at sea in the Atlantic during World War I on Admiral Hugh Rodman's staff. Between the wars, Ingram held seagoing commands, taught football and athletics at Annapolis, directed naval public relations in Washington, learned to fly as a naval aviator, and took staff courses.

In 1940, Rear Admiral Ingram assumed command of Cruiser Division 2, subsequently redesignated Task Force 23 and then the Fourth Fleet, stationed in Brazilian waters to secure the South Atlantic against Axis ships and submarines. Promoted to vice admiral in 1942, he worked closely with Brazilian officials, winning their consent to the construction of U.S. air, naval, and military facilities on Brazilian territory while helping to upgrade Brazilian naval and air capabilities. Under Ingram's supervision, Ascension Island, 1,000 miles from Brazil's coast, became one of the largest air bases in existence, supporting naval operations and aerial attacks on German U-boats.

In late 1943, Ingram declared the South Atlantic secure from Brazil to West Africa. In November 1944, he was promoted to full admiral and took command of the Atlantic Fleet, protecting shipping routes between North America and the European theater—and especially troop convoys—against the final German submarine sorties.

Ingram retired from the navy in 1947 to become commissioner of the short-lived All-American Football Conference and a vice president of Reynolds Metal Company. He died in San Diego, California, on September 10, 1952.

Inland Sea, U.S. and British Carrier Operations in (July 1945)

In July 1945, Admiral William F. Halsey Jr.'s Third Fleet, supported by Admiral Bruce A. Fraser's British Pacific Fleet, carried out attacks on the Japanese home islands. On July 1, Task Force (TF) 38, commanded by Vice Admiral John H. Towers and organized into three task groups of four fast carriers each, sortied from Leyte. After refueling east of Iwo Jima on July 8, Halsey launched the first strikes against Tokyo on July 10.

Although there was heavy antiaircraft fire, U.S. aviators were surprised to find no opposition from Japanese aircraft over the capital. The Japanese leadership had concluded that it could not destroy the fast carriers and should husband its remaining available aircraft for an anticipated October invasion of Japan. Although most aircraft had been widely dispersed from the Tokyo area, Allied aviators claimed to have caught and destroyed 100 Japanese planes on the ground.

Moving north, TF 38 carried out attacks in northern Honshu and Hokkaido, although bad weather prevented strikes until July 15. With no aerial opposition, the planes sank more than 50,000 tons of coastal shipping and small warships. At the same time, battleships and cruisers shelled the Kamaishi and Muroran iron factories.

After refueling on July 16, the Third Fleet was joined by the British Pacific Fleet TF 37 under Vice Admiral Sir Bernard Rawlings, with two task groups of four carriers each, which had sailed from Sydney on June 28. Although the British lacked the logistical support of the U.S. Navy and Halsey expected them to be able to launch only two strikes for every three by the United States, the British matched the Americans strike for strike.

On July 24, 25, and 28, Halsey mounted the last carrier air strikes of the war against the Imperial Japanese Navy's remaining large warships located at Kure Naval Arsenal, where the Japanese Mobile Fleet was in fact

immobilized from lack of fuel and functioning as a stationary antiaircraft platform. The last strike, on July 28, was accompanied by 79 Consolidated B-24 Liberator bombers flying from Okinawa.

Although Admiral John S. McCain Sr., commander of the Far East Carrier Task Force, opposed the strike at Kure as unnecessary, Halsey was determined to proceed. In his memoirs, Halsey claimed that it would be a boost to U.S. morale and payback for the Japanese attack on Pearl Harbor, would ensure that the Japanese fleet would not interfere with a planned U.S. invasion, and would prevent the Japanese from using its remaining capital ships as bargaining chips to secure better peace terms and that Pacific Fleet commander Fleet Admiral Chester W. Nimitz had ordered it. Halsey was also determined that this final destruction of the Japanese fleet would be accomplished by the Americans alone, so he directed that British aircraft attack airfields and the port of Osaka, while the Americans moved against Kure alone.

The U.S. Navy attacks on Kure, which were among the largest of the war, resulted in the sinking of the aircraft carrier *Amagi;* the battleships *Ise, Hyuga,* and *Haruna;* five cruisers (including the heavy cruisers *Tone* and *Aoba*); and several smaller warships. Damage was also inflicted on three uncompleted Japanese carriers. The British, meanwhile, damaged the escort carrier *Kaiyo* and sank three frigates and several smaller ships. These carrier strikes in effect removed the remaining Japanese capital ships. They also enabled the Soviet Pacific Fleet to operate with far greater freedom in the Sea of Japan when the Soviet Union entered the war.

Japanese antiaircraft fire and Japanese fighter aircraft defending Kure nonetheless inflicted heavy U.S. aircraft losses. Two B-24s were shot down, and 14 others were damaged. Although no Japanese aircraft reached the Allied ships, the attacks of late July claimed 133 Allied carrier aircraft (102 aircrew lost) lost in combat and in accidents.

Inouye Shigeyoshi (1889–1975)

Japanese Navy admiral. Born in Miyagi Prefecture, Japan, on December 9, 1889, Inouye (Inoue) Shigeyoshi graduated from the Japanese Naval Academy in 1909. His early career included both sea duty and staff assignments. Inouye attained flag rank in 1935. Two years later, he was appointed chief of the Naval Affairs Bureau. Inouye shared Japanese Navy minister Admiral Yonai Mitsumasa's belief that radical elements in the officer corps posed a threat to Japan's future. In 1939, Inouye was promoted to vice admiral and appointed chief of staff of the China Area Fleet.

Convinced that naval aviation would play a vital role in any future conflict, Inouye successfully lobbied for appointment as chief of the Naval Aeronautics Bureau in 1940 to gain practical experience. In that position, he drafted a memorandum titled "Modern Weapons Procurement Planning" in which he attacked the construction of battleships and called for greater emphasis on aircraft carriers and naval aircraft.

Inouye's views caused him to lose favor. In August 1941, he was transferred to command the Fourth Fleet on Truk, a backwater assignment. When the Pacific war began, he led the forces that captured Guam and Wake Island from the United States. As other islands fell to the advancing Japanese, Inouye's area of responsibility expanded to include Rabaul and the Gilbert Islands.

In April 1942, Inouye was charged with planning and executing the invasion of Port Moresby. He remained in Rabaul while in early May seven naval task forces, as well as land-based naval aircraft, moved against Tulagi,

Guadalcanal, and Port Moresby. The resulting Battle of the Coral Sea (May 7–8, 1942) was a Japanese tactical victory, but the unavailability of close air support due to the loss of an aircraft carrier in the battle led Inouye on May 8 to postpone the landing at Port Moresby. The commander of the Combined Fleet, Admiral Yamamoto Isoroku, was furious at this decision but was unable to reverse Inouye's orders.

Inouye's Fourth Fleet was then largely relegated to logistical duties, and operations in the South Pacific were turned over to the Eighth Fleet. Inouye was relieved in October 1942 and took command of the Japanese Naval Academy. He was recognized as an advocate of peace, and when Admiral Yonai was recalled as navy minister after Tōjō Hideki's fall from power in August 1944, Inouye became vice minister. In May 1945, he was promoted to full admiral and became a member of the Supreme War Council. He spent the next months working for an end to the war. Inouye died in Miyagi on December 15, 1975.

International Military Tribunal, Far East

U.S. general of the Army Douglas MacArthur, heading the military occupation of Japan, established the International Military Tribunal for the Far East, popularly known as the Tokyo War Crimes Trials. It held sessions in Tokyo from May 3, 1946, to November 12, 1948. Trials conducted by the tribunal were similar to those held at Nuremberg, Germany. The defendants

were 28 senior Japanese military and civilian leaders, chosen from among 250 Japanese officials originally accused of war crimes. General Tōjō Hideki, who held various posts including prime minister and chief of the General Staff, was the best-known defendant among the 18 military officers and 10 civilians charged.

MacArthur, with President Harry S. Truman's support, exempted Emperor Hirohito from trial because of concerns over potential Japanese resistance to military occupation. More than 2,200 similar trials, including some held in Tokyo that preceded the tribunal, were conducted in areas formerly occupied by Japan, ranging from China to Pacific islands including Guam. The trials generated strong emotions and remain controversial to this day.

The Tokyo tribunal consisted of 11 judges, 1 each from Australia, Canada, China, Great Britain, the Netherlands, New Zealand, the Soviet Union, the United States, France, India, and the Philippines. The Philippine justice was a survivor of the April 1942 Bataan Death March. The tribunal's chief prosecutor, Joseph B. Keenan, was appointed by Truman. Keenan's staff included 25 lawyers. The tribunal was not bound by technical rules of evidence normally observed in a democracy and could admit any evidence it chose, including purported admissions or statements of the accused.

The tribunal sought to clearly establish the principle that aggressive war was a crime and prevent or deter future crimes against peace. Those who planned and initiated aggressive war in contravention of treaties, assurances, and international agreements were to be considered common felons. The tribunal also claimed jurisdiction over conventional war crimes and crimes against humanity, such as murder, mass murder, enslavement, deportation of civilian populations, and persecutions based on political or racial grounds in connection with other crimes under tribunal jurisdiction.

Some defendants were accused of being responsible for the actions of personnel under their command who had committed crimes against prisoners of war and civilian internees. These offenses included murder, beatings, torture, ill treatment (including inadequate provision of food and clothing, and poor sanitation), rape of female nurses and other women, and the imposition of excessive and dangerous labor. Charges of murder were also leveled in cases involving the killing of military personnel who had

surrendered, laid down arms, or no longer had means of defense, including survivors of ships sunk by naval action and crews of captured ships.

Seeking to conduct a fair trial, the tribunal gave each of those accused a copy of his or her indictment in Japanese, and trial proceedings were conducted in both English and Japanese. Defendants had a right to counsel, and the defense could question witnesses. Subject to court approval, the defense could also request the appearance of witnesses and the provision of documents. The mental and physical capacity of the accused to stand trial was also considered. After a conviction, the tribunal had the power to impose a death sentence or other punishment on a defendant.

Of the 28 original defendants, 25 were convicted. Seven (including Tōjō) were sentenced to death by hanging, 16 to life imprisonment, 1 to 20 years of incarceration, and 1 to 7 years in prison. Of the 3 not convicted, 1 was declared mentally unstable, and 2 died before their trials ended.

As with the Nuremberg trials, the tribunal has been accused of promulgating "victors' justice," and some have called the proceedings racist. But fueled by horror at continuing military atrocities in places such as Bosnia and Cambodia, the chief legacy of the Tokyo and Nuremberg trials has been the widespread international support for a permanent war crimes tribunal.

International Military Tribunal, Nuremberg Trials (October 16, 1945–November 20, 1946)

The Allied governments were determined to hold German leaders, civilian and military, accountable for the war and the mass killings that had taken place in German-occupied Europe. British prime minister Winston L. S. Churchill and Soviet leader Joseph Stalin agreed in 1941 to try those guilty of war crimes. The logistics and framework needed to carry out this policy were discussed throughout the war. At Moscow in October 1943, a declaration signed by British, Soviet, and U.S. representatives stated that war criminals would be brought to trial. Such a procedure was further discussed at important meetings at Tehran (November–December 1943), Yalta (February 1945), and Potsdam (July 1945). Finally, the London Agreement of August 8, 1945, set forth the method—a court trial—and identified jurisdiction. Although the Soviets proposed that the trials be held within their zone of occupation, in Berlin, the Western Allies insisted on Nuremberg.

Nuremberg was selected because the Palace of Justice there had received only minimal damage during the war. The large stone structure had 80 courtrooms and over 500 offices and thus offered sufficient space for a major international legal proceeding. An undestroyed prison was part of the justice building complex, so all prospective defendants could be housed on-site. Moreover, the proclamation of the Third Reich's racial laws against the Jews had been made at Nuremberg, so the city had symbolic importance. U.S. Army personnel prepared the Palace of Justice for the trial, repairing damage and laying thousands of feet of electrical wire.

Broadly speaking, the Nuremberg proceedings fell into two categories. The first set—and the subject of this entry—took place between November 1945 and October 1946 and involved the trial of 22 defendants before an international military tribunal (IMT) established by Britain, France, the Soviet Union, and the United States. Subsequently, a series of other trials were held at Nuremberg until the spring of 1949 before U.S. tribunals in the American zone of occupation involving nearly 200 other defendants.

The Nuremberg IMT opened on October 8, 1945. Judges from France, Great Britain, the Soviet Union, and the United States presided. The Western judges dressed in traditional robes, whereas the Soviet judge wore a military

uniform. Judge Iola T. Nikitschenko, a Russian, presided during the first session.

The prosecution presented indictments against 24 major criminals and 6 organizations. The individuals were Martin Bormann, deputy führer after 1941 (tried in absentia); Karl Dönitz, admiral and commander of the navy from 1943 to 1945; Hans Frank, governor-general of Poland; Wilhelm Frick, minister for internal affairs; Hans Fritzsche, head of the Radio Division of the Ministry of Propaganda; Walther Funk, minister of Economic Affairs; Hermann Göring, Reichsmarshal and commander of the Luftwaffe; Rudolf Hess, deputy führer until May 1941; Alfred Jodl, army general and head of Operations, Army Supreme Command (Oberkommando der Wehrmacht, OKW); Ernst Kaltenbrunner, head of the Sicherheitsdienst (Security Service, SD); Wilhelm Keitel, army field marshal and chief of the OKW; Gustav Krupp von Bohlen und Halbach, industrialist and head of Krupp Armaments; Robert Ley, head of the Labor Front (he committed suicide on October 26, 1945); Konstantin Neurath, protector of Bohemia and Moravia from 1939 to 1943; Franz von Papen, former vice chancellor and ambassador to Turkey; Erich Raeder, grand admiral and commander of the navy until 1943; Joachim von Ribbentrop, foreign minister; Alfred Rosenberg, minister for the Occupied Territories in the East until 1941; Fritz Saukel, plenipotentiary for the mobilization of labor; Hjalmar Schacht, president of the Reichsbank from 1933 to 1939 and minister of economics from 1934 to 1937; Baldur von Shirach, leader of the Hitler Youth and Gauleiter (area commander) of Vienna; Arthur Seyss-Inquart, commissioner for the Netherlands from 1940 to 1945; Albert Speer, minister of armaments from 1942 to 1945; and Julius Streicher, publisher of the newspaper *Der Stürmer*.

The indicted organizations were the Nazi Party (Nationalsozialistische Deutsche Arbeiterpartei), the Schutzstaffel (SS), the SD, the Geheime Staatspolizei (Gestapo), the General Staff, and Hitler’s cabinet.

The charter governing the proceedings declared that the IMT’s decisions would be made by majority vote. British lord justice Geoffrey Lawrence, president of the court, would cast the deciding vote in the event of a tie among the four sitting judges. The charter identified four categories of crimes:

(1) conspiracy to wage aggressive war: planning and/or preparing a war of aggression and violating international agreements;
(2) crimes against peace: participating in a conspiracy to plan a war of aggression;
(3) war crimes: a violation of custom and laws of war, use of slave labor, and killing of hostages; and
(4) crimes against humanity.

The trial itself lasted 218 days, and some 360 witnesses gave either written or verbal testimony. A new simultaneous translation system allowed the trial to proceed efficiently and swiftly in four languages. Although the defense was given the right to call its own witnesses, it was not allowed to bring forth any evidence against the Allies.

The 21 defendants at the Nuremberg War Crimes Trial in the dock awaiting sentencing, Nuremberg, Germany. Among the defendants are (front row; left to right): Hermann Göring, who received the death penalty; Rudolf Hess, life imprisonment; and Joachim von Ribbentrop, who also received the death penalty. (Keystone-France/Gamma-Keystone via Getty Images)

The proceedings at Nuremberg laid bare before the world the horrific crimes committed by the Third Reich. Most revealing were testimonies regarding the brutalities of the death camps. When shown German films of concentration camps, some of the defendants wept or became noticeably upset.

One aspect of the trial that caused debate at the time was the legality of trying military officers. Some suggested that it was the role of military officers to carry out orders, but this defense was disallowed at Nuremberg. The prevailing view held that German military leaders had knowingly approved and planned aggressive war and had sanctioned war crimes.

On October 1, 1946, U.S. Army colonel Burton Andrus led 21 defendants into the somber courtroom. (Martin Bormann was tried in absentia, Robert Ley had committed suicide, and Gustav Krupp von Bohlen und Halbach was too weak to be present.) Sir Geoffrey Lawrence announced that the verdicts would be delivered first, followed by the sentencing. Twelve defendants were sentenced to death by hanging (the counts on which they were found guilty

are in parentheses): Hans Frank (3 and 4), Wilhelm Frick (2, 3, and 4), Hermann Göring (all four), Alfred Jodl (all four), Ernst Kaltenbrunner (3 and 4), Wilhelm Keitel (all four), Robert Ley (all four), Joachim von Ribbentrop (all four), Alfred Rosenberg (all four), Fritz Saukel (3 and 4), Arthur Seyss-Inquart (2, 3, and 4), and Julius Streicher (1 and 4).

Göring escaped the hangman's noose by committing suicide with poison smuggled into the prison. Franz von Papen, Hans Fritzsche, and Hjalmar Schacht were the only defendants to be acquitted. Charges against Gustav Krupp von Bohlen und Halbach were dropped on the grounds that he was physically unable to stand trial. The remaining defendants received various terms, ranging up to life in prison: Karl Dönitz, 10 years (counts 2 and 3); Walter Funk, life imprisonment (2, 3, and 4); Rudolf Hess, life imprisonment (1 and 2); Konstantin Neurath, 15 years (all four); Erich Raeder, life imprisonment (1, 2, and 3); Baldur von Schirach, 4 to 20 years (1 and 4); and Albert Speer, 4 to 20 years (3 and 4). Of those imprisoned, Rudolf Hess lived the longest. He died in Spandau Prison in 1987 at age 93.

Even before the trial ended in 1946, debate began on the validity of the tribunal. Although some have argued that the IMT was merely a case of the victor trying the vanquished, it nonetheless exposed the horrors of the Third Reich, most especially the Holocaust, the use of slave labor, and the heinous war crimes.

Iowa-Class U.S. Navy Battleships

Last class of U.S. Navy battleships to be commissioned and among the most famous of all warships. Since construction of the five 60,000-ton Montana-class battleships was canceled in July 1943, the four Iowa-class vessels remain the largest battleships in U.S. history. Six were originally scheduled: the *Iowa* (BB-61), *New Jersey* (BB-62), *Missouri* (BB-63), *Wisconsin* (BB-64), *Illinois* (BB-65), and *Kentucky* (BB-66).

The Iowa-class ships were the finest U.S. battleships ever built. Their design was similar to the South Dakota class except that the hull was lengthened 200 feet to improve hydrodynamics and provide more space for machinery to gain higher speeds. They were designed to confront the fast Japanese Kongo-class battleships. Their main armament was 3 16-inch .50-caliber guns in each of three turrets. They also had 20 5-inch dual gun turrets.

The Iowa-class ships provided highly effective service with the Fast Carrier Task Force in the Pacific theater in the last years of the war. With their excellent communications capabilities, modern radars, and spacious command facilities, they frequently served as flagships. Their powerful antiaircraft armament provided close-in support for aircraft carriers, and with their large oil bunkers, the battleships kept destroyers topped off in contested waters. Although smaller than the Yamato-class Japanese battleships (57,540 tons versus 69,990 tons full load), the Iowa-class ships were faster (33 knots to 27 knots) and fully a match for the largest Japanese battleships.

The keel for the battleship *Iowa*, the third U.S. warship of that name, was laid at the New York Navy Yard on June 27, 1940. It was launched on August 27, 1942, and commissioned on February 22, 1943. With minor

variations, all four Iowa-class ships had a 45,000-ton design standard but displaced about 48,000 tons standard and 57,540 tons fully loaded. They measured 887 feet 3 inches (overall length) by 108 feet in beam by 38 feet in draft and had a top speed of 33 knots and crews of 1,900 to 2,900 men.

In the fall of 1943, the *Iowa* carried President Franklin D. Roosevelt to the Casablanca Conference and then on the first leg of his journey to the Tehran Conference. The *Iowa* joined the fighting in the Pacific on January 2, 1944, as the flagship of Battleship Division 7. As with other U.S. battleships, it participated in all campaigns from the Marshalls to the formal Japanese surrender in Tokyo Bay. During the September 2, 1945, surrender ceremony, it served as the flagship of Admiral William F. Halsey.

The *Iowa* sailed to Seattle in October, only to return to Japan in January 1946 as flagship of the Fifth Fleet. It returned to the United States in March and was decommissioned in March 1949. It was reinstated in August 1951 to support U.S. operations in Korea. The *Iowa* spent April–October 1952 in Korean waters, returning to Norfolk for an overhaul. From July 1953 until its decommissioning in February 1958, it served in the Atlantic and the Mediterranean and in cadet training.

In the early 1980s all four Iowa-class ships were modernized with antiship and shore-attack cruise missiles and new electronics and support systems. The *Iowa* was back in service in April 1984. High operating costs eventually sent them back into reserve. The *Iowa* sustained a serious turret accident on April 19, 1989, in which 47 crewmen were killed. It was placed in reserve in October 1990 and stricken for disposal in January 1995 but retained for parts. In January 1999, it was reinstated and returned to reserve status at Newport, Rhode Island. In 2001 the *Iowa* was relocated to San Francisco. It is now a museum ship at Los Angeles.

The *New Jersey* was laid down on September 16, 1940. It was launched on December 7, 1942, and commissioned on May 23, 1943. It spent World War II in the Pacific. It was decommissioned in June 1948 and reinstated for Korea in November 1950. The *New Jersey* deployed to Korea twice. It was again decommissioned in August 1957 but overhauled and recommissioned in April 1968 for a tour in Vietnam, which ended with its decommissioning in December 1969.

Modernized at Long Beach, the *New Jersey* returned to service in December 1982 and conducted operations off Lebanon in 1983–1984. The

ship returned to reserve status in September 1991. Donated for preservation in January 1997, the *New Jersey* was towed to Camden, New Jersey, later that year and in early 2000 became a museum ship.

The *Missouri* (nicknamed "Mighty Mo") was laid down at the New York Navy Yard on January 6, 1941. Launched on January 29, 1944, it was commissioned on June 11. The formal Japanese surrender was signed aboard the *Missouri* on September 2, 1945. In a much-publicized event and considerable embarrassment for the navy, the *Missouri* ran aground near Hampton Roads, Virginia, in 1950. It participated in the Korean War, playing a diversionary role during the September 15, 1950, Inchon Landing. Decommissioned in February 1955, it was modernized at Long Beach in the 1980s and recommissioned in May 1986. It served during Operation DESERT STORM in 1991 and participated in the Pearl Harbor 50th Anniversary ceremonies. Stricken for disposal in January 1995, it was donated as a museum ship to Ford Island, Pearl Harbor, in May 1999.

The *Wisconsin* was laid down on January 25, 1941, at the Philadelphia Navy Yard. It was launched on December 7, 1943, and commissioned on April 16, 1944. It too spent the remainder of World War II in the Pacific. Decommissioned in July 1948, it returned to service during the Korean War in March 1951. Following a collision in May 1956, it was repaired using the bow of its sister ship, the unfinished *Kentucky*. Decommissioned in March 1958, it was modernized and returned to duty in October 1988, joining the *Missouri* in the Persian Gulf War. It was decommissioned again in September 1991 and scheduled for disposal in January 1995 but was returned to reserve status in February 1998. It is berthed at Norfolk, Virginia, as a museum ship, although still in reserve status.

The two remaining ships of the class were never completed. The *Illinois* was laid down on December 6, 1942, at Philadelphia, but canceled on August 11, 1945, and scrapped. The *Kentucky* was laid at the Norfolk Navy Yard on June 12, 1942, but work was soon suspended until December 1944. With the ship 72 percent complete, work was again halted in February 1947. Work resumed in August 1948, and the hull was launched in January 1950 to make room for repair work on the *Missouri.* Although thought was given to turning the *Kentucky* into a missile ship, in May 1956 its bow was removed to repair the *Wisconsin.* The *Kentucky* was canceled in June 1958, sold in September 1958, and scrapped in February 1959.

Iran

Middle Eastern nation with a 1939 population of 14.34 million. On the eve of World War II, Iran bordered the Soviet Union to the north, Turkey and Iraq to the northwest, the Persian Gulf to the southwest, the Arabia Sea to the south, and India and Afghanistan to the east.

During World War II, Iran was occupied by British and Soviet troops, with the United States becoming an important new factor in Iranian politics. Germany had a significant economic influence and presence in Iran prior to the outbreak of the war, for in the 1930s, Reza Shah Pahlavi, founder of the new dynasty, had turned to Germany for economic assistance. The shah's sympathy toward Germany, which had no tradition of imperial intervention in Iran or the Middle East, was well known, along with his distrust of Britain and the Soviet Union, both of which had dominated Iran in the 19th and early 20th centuries.

When the war began in Europe in September 1939, Reza Shah declared Iran's neutrality. After the Germans attacked the Soviet Union in June 1941, however, Iranian involvement became inevitable. The Soviet Union and Great Britain again formed an alliance. As German troops pushed eastward and threatened the Caucasus, the strategic significance of Iran for the Allies grew. The Allied objectives in Iran were to protect the British-controlled oil fields in Khuzestan Province; employ Iran and, in particular, its newly built Trans-Iranian Railroad to channel military supplies to the Soviet Union; and curb the activities of German agents in Iran.

The British and Soviet representatives in Iran demanded that the government expel German nationals and allow the Allies to utilize the railroad to transport war materials. When Reza Shah refused to comply on grounds of Iran's neutrality, the Allies invaded and occupied the country.

On August 25, 1941, Soviet forces entered Iran from the northwest, and the British entered from Iraq. The Allied forces suppressed Iranian military and naval resistance in just three days. Left with no choice, Reza Shah abdicated on September 1941, and his 22-year-old son, Muhammad Reza,

succeeded him. Reza Shah was sent into exile and died in 1944 in South Africa.

The Soviet and British zones of occupation were consistent with the spheres of influence into which Iran had been divided by the humiliating Anglo-Russia Convention of 1907. The Soviets occupied the north, the British took control in the south, and Tehran and other central areas were put under joint Anglo-Soviet protection. In January 1942 Iran, the Soviet Union, and Great Britain signed the Tripartite Treaty of Alliance, whereby the great powers promised to respect the territorial integrity, sovereignty, and political independence of Iran; safeguard the Iranian economy from the effects of the war; and withdraw from Iranian territory within six months of the cessation of hostilities.

By the spring of 1942, Iran had severed diplomatic relations with Germany, Italy, and Japan and expelled their nationals. On September 9, 1943, Iran declared war on Germany. Two months later, one of the most important Allied meetings of the war, the Tehran Conference, was held, with the participation of U.S. president Franklin D. Roosevelt, British prime minister Winston L. S. Churchill, and Soviet leader Joseph Stalin. Recognizing the help provided by Iran to their war effort, the three Allied leaders promised during the meeting to provide economic assistance to Iran and address its problems after the war.

The war had a devastating impact on Iran. It lost effective sovereignty to the domination of the occupying powers, and the central government that had been strengthened by Reza Shah became ineffective. Political instability and social disintegration grew, and economic hardship developed. Further, the use of major roads and the Trans-Iranian Railroad for the transport of supplies to the Soviet Union disrupted Iranian trade, the demands of Allied troops aggravated inflation, and a poor harvest in 1942 led to widespread famine. Short-lived cabinets were unable to deal with the emergency situation, resulting in social unrest and the rise of separatist movements.

All of these factors and the new political freedom resulting from the paralysis of a dysfunctional government led to a surge in political activity by various groups and parties. Political conflict among them was encouraged by the occupying powers.

During the course of their involvement, the Soviet Union and Britain revived and intensified their rivalry in Iran, a contest that was an integral part

of what had been known as the “Great Game” in the late 19th and early 20th centuries. Each side tried to expand its own influence and limit the other’s. The Soviets closed their zone of occupation to free entry. They supported left-wing trade unions in the north and the Communist Party, which had been banned in 1937 but was revived in 1941 under the new name of Tudeh (Masses).

The Soviets also patronized the separatist leftist movements in Iranian Kurdistan and Azerbaijan. One result of these Soviet activities was the establishment of an autonomous state of Azerbaijan in December 1945. Meanwhile, the British in the south supported conservative elements, including the tribes, Muslim clerics, and the proponents of monarchy. They also sponsored the right-wing, pro-Western, and anticommunist National Will Party.

Washington was aware of the economic importance of Iran stemming from its oil and its strategic location. After the United States entered the war, American troops arrived in Iran. The Persian Gulf Command, which eventually numbered 30,000 men, helped orchestrate the movement of supplies from the gulf to northern Iran, where they were handed over to the Soviets. American financial and military advisers were also sent to Iran at the request of the Iranian government. Between 1942 and 1943, a financial mission headed by Arthur Millspaugh worked on reorganizing Iran’s finances. A mission headed by Colonel H. Norman Schwarzkopf (father of the 1991 Persian Gulf War joint commander of the same name) took charge of the reorganization of the Gendarmerie (rural police).

In the first half of 1944, two American oil companies and then the Soviet government attempted to receive oil concessions from the Iranian government and undermine the monopoly of the Anglo-Iranian Oil Company. The Majles (parliament), however, passed a bill, authored mainly by Mohammad Mossadeq, that prohibited oil-concession agreements with any foreign company until after the end of the war.

British and American troops withdrew from Iran in January 1946, whereas the Soviet occupation of the northern provinces of Azerbaijan and Kurdistan lasted until May 1946 when, under pressure from the United Nations, the Soviets also withdrew.

Iraq

Middle Eastern nation with a 1939 population of 3.7 million. On the eve of World War I, Iraq bordered Turkey to the north, Iran to the east, the Persian Gulf and Saudi Arabia to the south, and Transjordan and Syria to the west. Iraq encompasses 169,234 square miles.

By 1941, Iraq had become the object of a peripheral but critical struggle between Great Britain and the Axis powers. Iraq was a major oil producer (2.5 million metric tons in 1940), and were that nation to side with the Axis, its location on the Persian Gulf would also have enabled Germany to threaten British trade, supplies, and troop movements to and from India. Granted nominal independence by Britain in 1930, Iraq was a Hashemite monarchy. The 1930 treaty that established Iraq's de jure independence also protected British oil interests there and granted Britain military bases at Habbaniya, about 55 miles west of Baghdad.

Iraq was unstable, and there were numerous coups and coup attempts. In December 1938, pro-British general Nuri al-Said came to power as prime minister. Instability in Iraq increased, however, when King Ghazi I died in an accident in April 1939. As the new king, Faisal II, was only four years old, his uncle Abdul Illah acted as regent.

Meanwhile, Nuri put down an attempted coup by a group of army officers in March 1939 and another in February 1940. He wanted to declare war on Germany but encountered opposition from Iraqi nationalists who sought concessions from Britain first. In consequence, Nuri followed Egypt's lead and declared Iraq's neutrality, severing relations with Germany but not with Italy.

Axis successes in the Mediterranean beginning in the fall of 1940 encouraged Iraqi nationalists, who believed that the circumstances were right for Iraq to end British control. Another issue involved the long-standing Iraqi opposition to British policies in Palestine.

In March 1940, Rashid Ali replaced Nuri, although Nuri remained in the government as foreign minister. Rashid Ali now came under the influence of four nationalist, pro-Axis Iraqi Army generals who called themselves the "Golden Square." In March 1941, however, the regent secured Rashid Ali's

resignation because of the latter's pro-Axis connections and reluctance to break relations with Italy. Taha al-Hashimi then became prime minister. Axis military successes emboldened the Golden Square, which staged a coup on April 2 that reinstated Rashid Ali. He immediately formed a cabinet that contained a number of individuals known to have Axis connections. The regent and Nuri fled.

Encouraged by hints of Axis aid, Rashid Ali refused to honor British demands to enforce provisions of the 1930 treaty that allowed the transportation of British troops from Basra across Iraq. The Iraqi government also positioned troops and artillery around the British bases in Iraq. Fighting broke out at the British air base at Habbaniya on May 2, 1941, when Iraqi troops opened fire. The Royal Air Force immediately went into action, and Britain dispatched some 5,800 troops, including the 1,500-man Arab Legion from Transjordan under the command of Major General John B. Glubb. It was soon obvious that the British would triumph over the poorly trained and inadequately equipped Iraqi Army unless the Axis powers immediately dispatched assistance.

The German government now brought pressure to bear on the Vichy government of France, which then ordered French high commissioner of the Levant General Henri Dentz to allow the transit of Axis aid through Syria. Axis arms and equipment then began to be transported via Aleppo to Mosul to assist Rashid Ali, albeit it in insufficient quantities to affect the outcome of the fighting.

Meanwhile, British forces broke the siege at Habbaniya. The British occupied Fallujah on May 20 and surrounded Baghdad by the end of the month. Rashid Ali, some supporters, and the German and Italian ministers then fled to Iran. In deference to Nuri and Regent Abdul Illah, the British did not enter Baghdad. This allowed the remnants of the Golden Square to attack Baghdad's Jewish community and kill some 150 Jews there.

Nuri again became prime minister, with a pro-British administration. Following its return to the British side, Iraq became an important supply center for Allied assistance to the Soviet Union until the end of the war. The government broke diplomatic relations with Vichy France on November 18, 1941, and declared war on Germany, Italy, and Japan on January 16, 1943.

Ireland

Island nation immediately west of Great Britain and separated from it by the Irish Sea. Ireland, which encompasses 31,520 square miles, had a 1939 population of approximately 2.9 million. Irish nationalists had long demanded independence from Great Britain. Following bloodshed and the passage of home rule legislation in Britain, the Irish Free State came into being in December 1921. In 1937, with the promulgation of a new constitution, the new state became known as Eire (Gaelic for "Ireland"). Not included in this sovereign nation were the six largely Protestant counties in the north; these are collectively known as Northern Ireland or Ulster, and they remained part of the United Kingdom.

Parliamentary elections in 1932 had brought the Fianna Fáil Party to power, and Eamon de Valera became president of the executive council. In April 1938, de Valera negotiated agreements with London that removed British naval installations and troops from the republic, making Eire responsible for its own defense. Other agreements provided for Ireland to pay a final settlement of the land annuities as well as annual payments to compensate Britain for losses sustained in the violence of the 1920s. Each nation was also accorded favored-nation status in trade with the other. All causes of difference between Great Britain and Eire were thus removed except the vexing question of partition. Benefiting from popular support for

the diplomatic agreements, de Valera won the elections of June 1938, giving Fianna Fáil a decisive majority.

The outbreak of World War II provided de Valera an opportunity to show that Eire was independent of Great Britain. In contrast to other members of the British Commonwealth, Eire at once declared its neutrality, a stance supported by the majority of its people. In any case, the country was in no position to make a major military contribution in troops. In September 1939, its army numbered about 7,500 men, its navy consisted of two patrol boats, and its air service had only four effective fighter aircraft. However, the inability of the Royal Navy to use the ports returned to the Irish in 1938 was a serious handicap for the Allies in the Battle of the Atlantic. During the war, de Valera steadfastly rejected British government offers, tendered even by Prime Minister Winston L. S. Churchill, to resolve partition in return for an end to Irish neutrality.

There was also some pro-German sentiment among the Irish. Anti-Semitic bills were brought before the Dail (the Irish lower house of parliament), and de Valera refused to expel Axis diplomats. Further, on Adolf Hitler’s 1945 death, de Valera went in person to the German embassy to express his condolences.

Eire did allow British overflights of its territory and returned downed Allied pilots to Northern Ireland instead of interning them; it also allowed British patrol craft in its waters. Thousands of Irish also volunteered for service in the Allied armies. During the war, more than 180,000 people left Eire for Northern Ireland or the United Kingdom; 38,544 Irishmen volunteered for service with the British armed forces, including some 7,000 deserters from the Irish Army and several thousand Irish citizens living in the United Kingdom.

The arrival of the first U.S. troops in Northern Ireland, January 24, 1942. (Getty Images)

Acts of violence by the illegal Irish Republican Army (IRA) were a problem for the Eire government, which feared that the British might use them as an excuse to intervene. During the war, de Valera sharply increased the size of the Irish Army and auxiliary forces to some 250,000 men (albeit poorly armed and trained) to forestall this possibility. Ireland suffered economically during the war, but de Valera doggedly pursued his policies. In 1948, Eire became the Republic of Ireland.

Northern Ireland was an important base for Allied operations during the war. Soon after the Japanese attack on Pearl Harbor, U.S. president Franklin D. Roosevelt and Churchill agreed that Northern Ireland and Scotland would provide bases for the Allied troop buildup for the invasion of France. The Americans agreed to take over the defense of Northern Ireland, thus allowing British soldiers to be deployed elsewhere. Ireland officially protested this agreement.

The first of hundreds of thousands of American soldiers arrived in Northern Ireland in late January 1942. During the course of the war, the United States constructed new bases and airfields and improved the naval facilities at Derry. Troops deployed to Northern Ireland trained and took part in the November 8, 1942, Operation TORCH and the North Africa campaigns.

Northern Ireland also played a major role in the massive buildup for the Normandy Invasion (June 6, 1944). U.S. troops at bases in Armagh, Cookstown, Lurgan, Newcastle, Newry, and Omagh trained for the D-day landings, and units of the Eighth Air Force of the U.S. Army Air Forces operated out of the air base at Greencastle. Aircraft assembly, testing, service, and repair stations were also built in Langford and Lodge. Airfields and ports were also used to protect the convoys ferrying troops and materials across the Atlantic Ocean.

Recognizing the importance of Northern Ireland to Allied plans, the German Luftwaffe bombed targets in Belfast as well as the Greencastle airfield. Throughout the war, however, the people of Northern Ireland accommodated American soldiers by building cinemas and clubs. As in Britain, local groups arranged entertainment and hospitality events. Unfortunately for the people of Ireland, sectarian violence continued on the island after the war, as the IRA sought to bring about the union of Northern Ireland with the Republic of Ireland.

IRONCLAD, Operation (May 5, 1942)

With Japanese submarines operating freely in the Indian Ocean and Japanese carriers raiding into the Indian Ocean, the British Eastern Fleet was driven from the northeastern Indian Ocean. Royal Navy units were forced to relocate

to a new base at Kilindini (Mombasa), Kenya. The Japanese carrier foray into the Indian Ocean also raised alarm bells in London that Tokyo might mount an operation to seize the island of Madagascar, which had declared for Vichy France, and use bases there for attacks against the British Eighth Army's vital supply route from the Cape of Good Hope to Egypt. In any case, if the British could secure Madagascar themselves, this would enable them to base ships there and provide better protection for their convoys.

Major General Robert Sturges of the Royal Marines commanded the expeditionary force of British, British East African, and South African troops. Rear Admiral Edward Neville Syfret commanded the naval forces. Some 8,000 Vichy troops, 27 aircraft, 2 armed merchant cruisers, 2 sloops, 5 submarines, and 8 coastal batteries defended the island

The invasion force and its equipment departed England in March for Durban, South Africa. Covering warships were drawn largely from Force H at Gibraltar, along with some ships from England and others from the Eastern Fleet. Syfret was appointed combined commander of all naval forces. These consisted of the battleship *Ramillies,* the aircraft carriers *Illustrious* and *Indomitable,* the cruisers *Hermione* and *Devonshire*, and 13 destroyers (2 of them Australian) as well as frigates, corvettes, and transports. Everything was in place at the end of April, but the British cabinet did not give final approval for the assault until May 1, when the expeditionary forces had already sailed from Durban for their objective.

The chief British objective was the northern port city and naval base of Diégo-Suarez (now Antsiranana). The British decided to approach it from the rear by landing on the west coast of the island. The invasion, the first major British amphibious assault of the war, began before dawn on May 5, 1942.

Although the invasion achieved surprise, the French resisted. Fleet Air Arm aircraft flying from the carriers *Indomitable* and *Illustrious* attacked and neutralized French airfields and warships, and the expeditionary forces went ashore. Diégo-Suarez was secured on May 7, but fighting to secure the entire island continued for some months.

On May 30, a Japanese midget submarine attack sank a tanker and badly damaged the battleship *Ramillies,* putting it out of action for nearly a year. On September 10, another British landing took place, at Mahajanga (Majunga). An armistice was arranged with Vichy French authorities on November 5.

Ironside, Sir William Edmund (1880–1959)

British Army general. Born on May 6, 1880, in Edinburgh, William Ironside graduated from the Royal Military Academy, Woolwich, and was commissioned into the Royal Artillery in 1899. He served in the Second Boer War (1899–1902) and on the Western Front in World War I, commanding a brigade by 1918. Ironside commanded British forces in Arkhangelsk, Russia, during 1918–1919 and was knighted. A large man (6 feet 4 inches), he was widely known as "Tiny."

British general William Edmund Ironside, 1940. (Corbis)

After the war Ironside served in India and was named to command the Eastern District of Britain in 1936. Early in 1938, Ironside became governor of Gibraltar, but he was called home as inspector general of Overseas Forces in May 1939.

On September 3, 1939, Secretary for War Leslie Hore-Belisha named Ironside Chief of the Imperial General Staff (CIGS), despite the fact that Ironside had never held any staff position in the War Office. Although convinced that the Middle East would be the critical theater of war, Ironside understood the need to bolster French defenses. However, his impatient and brusque manner limited his effectiveness during the trying period of the "Phony War." In early 1940, he worked closely with First Lord of the Admiralty Winston L. S. Churchill to promote a Scandinavian strategy to outflank the Germans. The relationship between the two men cooled when the Norwegian Campaign ended in disaster.

On May 27, 1940, as the Germans swept through northern France, Ironside was replaced as CIGS and shifted to command the Home Forces. He readily admitted that he had been ill-suited for the CIGS post and welcomed a return to a real command. Less than two months later, however, Alan Brooke replaced him, and Ironside retired. He was promoted to field marshal and created Baron (Lord) Ironside of Archangel in 1941. Ironside died on September 22, 1959, in London.

Ishiwara Kanji (1889–1949)

Japanese Army lieutenant general. Born in Akita Prefecture, Japan, on January 18, 1889, Ishiwara Kanji graduated from the Japanese Military Academy in 1909. Following routine service in Korea, he entered the Army Staff College and graduated second in his class in November 1918. He spent the years from 1922 to 1924 in independent study in Germany, which exposed him to European military thought and gave him an opportunity to observe the results of World War I.

Ishiwara's experience in Europe as well as his adherence to the Nichiren sect of Buddhism led him to theorize that in the future, Japan would engage in an apocalyptic war with the United States. This struggle, which he dubbed "the Final War," would be a protracted total war in which airpower would play a decisive role. Ishiwara believed, however, that Japan could overcome its material inferiority by harnessing the economic resources of the Asian

mainland, especially Manchuria and Mongolia. He published his theories in a book titled *Thoughts on the Final Global War.*

In 1928, Ishiwara was posted to Manchuria, where he served as chief of operations for the Japanese Guandong (Kwantung) Army. Impelled by his sense of the urgency of preparing for the Final War, Ishiwara played a major role in planning and carrying out the Japanese Army's seizure of Manchuria beginning in 1931. Shortly before the establishment of the puppet state of Manzhouguo (Manchukuo) in 1932, he returned to Japan. Promoted to colonel, he headed the Operations Section of the army General Staff.

After becoming a major general, Ishiwara was in charge of the General Staff's Operations Division. Nonetheless, Ishiwara's considerable earlier influence as a military theorist waned during the 1930s. Marginalized for his tacit support of a failed officers' rebellion in February 1936 as well as for his increasingly outspoken criticism of Japan's war with China (he was chief of staff of the Guandong Army in 1937 and 1938), he was promoted to lieutenant general in 1939 but also forced into retirement in 1941.

Ishiwara headed the Toa Remmei (East Asian League), which opposed Premier Tōjō Hideki's policies during the war. Ishiwara briefly returned as an adviser to the "Surrender Cabinet" and urged that Japan conclude peace.

Following the war, Ishiwara was investigated by the Allied occupation authorities, who briefly considered trying him as a war criminal. Instead, he testified as a prosecution witness at the Tokyo War Crimes Trials in 1947. Ishiwara died in Akita Prefecture on August 15, 1949.

Ismay, Hastings Lionel (1887–1965)

British Army general. Born on June 21, 1887, in Naini Tal, India, Hastings Lionel Ismay graduated from the Royal Military College, Sandhurst, and was commissioned in the British Army in 1905. He was then posted to the cavalry in India. During World War I, Ismay served in British Somaliland. He returned to India between 1922 and 1925 and again as military secretary to the viceroy, from 1931 to 1933.

Lord Hastings Lionel Ismay, secretary-general of NATO (1952–1957), with the newly adopted NATO emblem behind him. During World War II, General Ismay served as chief of staff to British prime minister Winston Churchill. (Keystone/Getty Images)

Ismay served in the War Office in Britain as assistant secretary (1925–1930), deputy secretary (1936–1938), and secretary (1938–1939) of the Committee of Imperial Defense. He was then named deputy military secretary to the War Cabinet (1939–1940). When Winston L. S. Churchill became prime minister on May 10, 1940, Ismay served as his military chief of staff. Ismay was promoted to lieutenant general in 1942 and to general in 1944. All with whom he worked during the war attested to his invaluable and essential efforts as well as his administrative efficiency and ability to keep channels of communication open.

Ismay attended virtually all the summit conferences and acted as the primary channel between the service chiefs of staff and the cabinet. Both

patient and informed, he was also not afraid to express the truth and could be critical when necessary and supportive at other times. Ismay admired Churchill greatly but could disagree with him; similarly, Ismay was evenhanded with the chiefs of staff, sometimes adopting their viewpoints and at other times disagreeing or suggesting alternatives.

Retiring from the army in 1946, Ismay served as chief of staff to the viceroy of India, Lord Louis Mountbatten, from March to November 1947 and was then made a peer (becoming First Baron Ismay of Wormington). In Churchill's second government, Ismay served as secretary of state for Commonwealth relations (1951–1952). He became the first secretary-general of the North Atlantic Treaty Organization (NATO) in 1952, retiring five years later. Ismay died in Broadway, England, on December 17, 1965.

Isogai Rensuke (1883–1967)

Japanese Army lieutenant general. Born in Hyogo, Japan, on September 3, 1883, Isogai Rensuke graduated from the Japanese Military Academy in 1904 and from the Army War College in 1915. He served on the General Staff from 1916. In 1920, he was appointed military attaché in Guangzhou (Canton), Guangdong (Kwangtung) Province, China. One of the few pro-Chinese officers in the Japanese Army, he worked with Chinese Nationalist leader Sun Yixian (Sun Yat-sen), who influenced his view of China. Isogai sympathized with Chinese nationalism but did not support the government of Jiang Jieshi (Chiang Kai-shek) and his Nationalist Party—the Guomindang (Kuomintang, GMD).

Isogai was promoted to major general in 1933. In March 1936, he was appointed head of the Military Affairs Bureau of the Ministry of War, and he was promoted to lieutenant general in December. After the outbreak of the 1937–1945 Second Sino-Japanese War, Isogai was sent to China in August 1937 to command the 10th Infantry Division. He paired with Lieutenant General Itagaki Seishiro's 5th Infantry Division for an offensive along the Tianjin (Tientsin)-Shanghai railroad. The 10th Division was ambushed at Taierzhuang (T'ai-Erh-Chuang) in April 1938. Itagaki's division broke through and relieved Isogai but at a heavy cost in lives and prestige. Isogai took the blame for the debacle and never again held combat command.

In June 1938, Isogai was appointed chief of staff of the Guandong (Kwantung) Army. In December, following the defeat of the Guandong Army by Soviet forces, Isogai was dismissed. In January 1942, he was appointed governor of Japanese-occupied Hong Kong. After the war, Isogai was tried as a war criminal at Nanjing (Nanking) in Jiangsu and was sentenced to life imprisonment on July 22, 1947. He was released in August 1952. Isogai died in Chiba on June 6, 1967.

Itagaki Seishirō (1885–1948)

Japanese Army general. Born in Iwate Prefecture, Japan, on January 21, 1885, Itagaki Seishirō graduated from the Japanese Military Academy in 1904 and served in the 1904–1905 Russo-Japanese War. After graduating from the army's General Staff College in 1916, he was posted to China, where he served most of his career as an attaché or in staff positions.

In 1929, Itagaki was attached to the operations planning staff of the Guandong (Kwantung) Army, the Japanese garrison force in southern Manchuria. After joining the Guandong Army, he and a fellow staff officer, Ishiwara Kanji, became the main instigators of a plot to manufacture an incident to use as a provocation to seize all Manchuria for Japan. On September 18, a section of Japanese-owned railroad track was sabotaged just outside Shenyang (Mukden), the capital of Manchuria. Although Japanese officials on the spot immediately blamed local Chinese troops, the Guandong Army itself had sabotaged the track. This "Mukden Incident" provided the pretext for the Guandong Army to conquer Manchuria and establish the Japanese puppet state of Manzhouguo (Manchukuo). In March 1936, Itagaki became chief of staff of the Guandong Army. He was promoted to lieutenant general in April.

Itagaki remained in Manchuria until March 1937, when he took command of the elite 5th Infantry Division at Hiroshima, leading it in fighting against the Chinese in northern China. In June 1938, he was recalled to Japan and served as war minister from January to August 1939. Itagaki then became chief of staff of Japanese forces in China. In 1941, he was promoted to full general and assumed command of Japanese forces in Korea. He remained in Korea until the last few months of the war, when he took command of the Seventh Area Forces in Singapore. On September 12, 1945, Itagaki formally surrendered Singapore and all Japanese southern armies to the British. Charged with war crimes, he was brought to trial before the International Military Tribunal for the Far East, found guilty of conspiracy to wage aggressive war and wartime atrocities, and executed in Tokyo on December 23, 1948.

Italian Social Republic, Navy

The Repubblica Sociale Italiana (Italian Social Republic, RSI) was proclaimed on September 23, 1943, with Benito Mussolini as head of state. Its territory corresponded to German-occupied Italy, with the exception of several provinces such as Trento and Trieste, which the Germans administered or annexed outright. The new government had little independence and served chiefly as an instrument of German occupation. Its formal capital was Venice, but the little spa town of Saló on Lake Garda, between Milan and Venice, was the actual seat of most of the ministries.

The RSI's naval service, called the Marina Repubblicana (Republican Navy), was officially founded on October 27, 1943, but was active from September 10, 1943. Its first secretary and chief of staff was Admiral Antonio Legnani, the Regia Marina's former commander of submarine forces.

Most of the Regia Marina obeyed the orders of the royal government and honored the terms of the armistice reached between Italy and the Allies on September 3, 1943, by seeking refuge in Allied ports and joining the fight against the Germans, but some Italian naval units, particularly in the Adriatic and Aegean Seas, followed locally negotiated agreements to cooperate with the Germans.

The principal arrangement for Italo-German cooperation was reached by Commander Julio Valerio Borghese, leader of Italy's naval special forces, the Decima MAS (Mezzi d'Assalto). He brought his force largely intact into the German camp as volunteers and proceeded to recruit thousands of additional men (and women) in the months following the armistice. After the Germans postponed early plans to commission a destroyer and three torpedo boats in the Marina Repubblicana, these volunteers mostly served in land units that fought first at Anzio (January 22–May 25, 1944) and, after July 1944, mostly in an antipartisan role.

Although the Decima MAS was not under the direct command of Mussolini's navy because Commander Borghese's special relationship with the Germans allowed him to act as an independent warlord, it formed that service's principal strength. On February 15, 1944, the navy was reorganized,

and Borghese became the deputy chief of staff and effectively the navy's head as the nominal chief of staff, with Admiral Giuseppe Sparzani limiting himself to administrative matters.

The Germans assigned units to the Marina Repubblicana at their whim, and Germany's needs always took priority. The Decima MAS began with three MAS boats (a 28-ton motor torpedo boat [MTB] smaller and faster than those operated by the Allies and Germans) and later received another six MTBs (two large and four small) on November 8, 1943. Between December 1943 and May 1945, the Decima MAS commissioned dozens of new MTSMs (Motoscafo turismo silurante modificati, motor tourism torpedo boat) and MTSMAs (Motoscafo turismo silurante modificato allargato, modified and enlarged tourism torpedo boat), small eight-ton truck-transportable two-man torpedo boats armed with a single torpedo, and MTM (Motoscafo turismo modificato, modified tourism torpedo boat) explosive boats; a dozen 30-ton midget submarines were added in 1944–1945, all except one in the Adriatic Sea.

In the Adriatic, the Marina Repubblicana operated old torpedo boats, MAS boats, minesweepers, armed freighters, and minor vessels. Through December 1943, these played a decisive role in the Axis recovery of most of the Dalmatian islands seized by Yugoslavian partisans. The first major area of operation for the Decima MAS (and consequently the Marina Repubblicana) was the Tyrrhenian Sea. Here it manned from late December 1943 the only Axis fast coastal forces in the western Mediterranean.

The Marina Repubblicana claimed a number of successes. On February 20, 1944, Decima MAS MTSMs sank the British *LST-305* and damaged a U.S. minesweeper; on August 19, 1944, an Italian MTSM damaged the large French destroyer *Le Fantasque;* and on April 15, 1945, an explosive motorboat crippled the French destroyer *Trombe.* Overall, the Decima MAS undertook 111 patrols and republican naval units engaged Allied forces 38 times.

Although the Marina Repubblicana fought until May 1945, no more than 10,000 sailors ever served under Italian (RSI) colors. Excluding auxiliary escorts, it never operated surface warships larger than MTBs; although some conventional submarines were assigned to the Marina Repubblicana to ferry attack craft and frogmen, they were sunk in bombing raids shortly before entering service. Nonetheless, the Marina Repubblicana played a significant

role within the context of Germany's Mediterranean Campaign. It supplemented the Reich's overstretched naval forces, engaging in mundane but necessary tasks such as minesweeping; coastal escort work; training; manning batteries and auxiliary vessels; and handling many logistical and service tasks. Italian naval personnel also supplemented German crews aboard the ex-Italian torpedo boats and corvettes that Germany completed or repaired after the armistice and placed in service.

Italo-Ethiopian War (1935–1936)

Major colonial conflict leading to World War II that demonstrated the impotence of the League of Nations in collective action to preserve international security. It was also known as the Second Italo-Ethiopian War and the Second Italo-Abyssinian War.

Italy had a long-standing interest in colonizing Ethiopia (Abyssinia), and in 1896, a sizable Italian army was defeated at Adowa by the Ethiopians. Italian dictator Benito Mussolini took advantage of this humiliating event in his country's history to stir nationalist sentiment against Ethiopia and endeavor to make Ethiopia part of a greatly expanded Italian African empire.

On December 5, 1934, Italian and Ethiopian border patrols clashed at Walwal (Ualual), an oasis in a disputed area between Ethiopia and Italian Somaliland. Ethiopia immediately filed a protest with Italy and requested that the affair be arbitrated under terms of an Italo-Ethiopian treaty from 1928. Italy refused and demanded a formal apology, an indemnity, and the arrest and punishment of the Ethiopians involved.

On January 3, 1935, Ethiopia formally appealed to the League of Nations under Article 11 of its covenant. This action probably sealed Mussolini's intention to invade. In its January meeting, the League Council postponed consideration of the incident, hoping that it might in the meantime be settled by an arbitration commission, and urged direct negotiation between the two governments. The arbitration commission's unanimous decision, announced on September 3, 1935, found that neither side was to blame for the Walwal clash because each believed it was fighting on its own soil. Meanwhile, the British and French governments began negotiations with Italy to reach a solution, but Mussolini rejected the Anglo-French proposal that would have secured for Italy an economic mandate under the League of Nations for the financial and administrative organization of Ethiopia.

Italy instead proceeded to build up its troops and supplies in Africa, and on October 3, 1935, the Italians invaded Ethiopia. Adowa fell to them on October 6. The next day, the League Council declared Italy an aggressor state in violation of Article 12 of the covenant, marking the first time the league had applied this provision to a European great power. The council's decision was then referred to the League of Nations Assembly for action. That body concurred in the verdict and appointed a committee to consider appropriate measures under Article 16, which treated sanctions.

The sanctions selected, which were adopted by most states, included an immediate arms embargo against Italy, financial sanctions, a ban on the importation of Italian goods, a ban on the exportation to Italy of key war materials, and a call on member states to try to replace imports from Italy by imports from states that normally had profitable markets in Italy. The assembly committee eventually decided that all sanctions against Italy would go into effect by November 18, 1935.

These sanctions were never applied with full force, and a ban on oil imports, the one export commodity that might have halted Italy, was approved but held in abeyance. Indeed, French foreign minister Pierre Laval and British foreign secretary Sir Samuel Hoare agreed to limit the sanctions even before they were applied. The two were, in fact, playing a double game, hoping not to drive Mussolini into the arms of Adolf Hitler. Publicly, the diplomats argued that sanctions on oil, which probably would have brought the Italian war machine to a halt, would not be effective because Germany and the United States were not bound by them. Most Italians did not

comprehend their new status as an outlaw nation, and they instead rallied behind Mussolini.

While incomplete sanctions were being applied to Italy, the French and British governments tried to appease Mussolini. The result was the notorious December 1935 Hoare-Laval Proposals, which planned the cession to Italy of areas in Ethiopia in the vicinity of Eritrea and Somaliland and the establishment of an extensive zone of expansion and colonization in southern Ethiopia in which Italy should have a monopoly of economic rights. In effect, Hoare and Laval were prepared to cede most of Ethiopia to Italy. Public condemnation of the plan was so widespread and vigorous in Britain and France, however, that both men were forced to resign.

With the League Council again considering the adoption of oil sanctions, Adolf Hitler sent German troops into the Rhineland in March 1936. His decision to violate the Treaty of Versailles and the Locarno Pacts further complicated the situation and definitely ended the possibility that France would support an oil embargo.

While the diplomats talked, Italian forces had been carrying on military operations in Ethiopia. Before the war, Emperor Haile Selassie had done what he could with limited resources to improve his army, but his air force consisted of only 12 aircraft on the outbreak of the war. Belgian military advisers worked to train the army, and Swedes ran an Ethiopian officer cadet school, but time was too short for them to accomplish much. What few radios the Ethiopians had worked to their disadvantage in that the Italians intercepted their communications and were thus aware of all their tactical moves. More than any other single factor, this helped win the war for the Italians.

Complete Italian command of the air was another decisive factor. The Italians also employed mustard gas, which, because it was absorbed through the skin, severely affected the Ethiopian soldiers, most of whom went barefoot. Italian military engineering was another key, overcoming considerable natural obstacles in advancing the Italian war machine. The Italians also exploited the tribalism and factionalism of Ethiopia. Neither side was eager to take prisoners.

General Emilio De Bono commanded Italian troops in East Africa. However, he refused to advance beyond Makele to Amba Alagi as Mussolini had demanded, and as a result, on November 17 Marshal Pietro Badoglio

took over for De Bono and reorganized the Italian forces. General Rodolfo Graziani commanded the southern prong of the Italian offensive from Italian Somaliland. His motorized column, including tanks, took Ethiopia's second city, Harar. He too was made a marshal for his actions, and he replaced Badoglio as viceroy of Ethiopia in late May 1936.

Following a lull, fighting was renewed on a more intense scale, and in April 1936, the primitive Ethiopian resistance collapsed before the modern Italian military. Emperor Haile Selassie, his armies demoralized and his retreat to the west cut off by disaffected tribal chiefs, fled on May 2 to French Somaliland, where he boarded a British warship.

Meanwhile, 30,000 Italian troops, in what was perhaps the greatest motorized column yet organized, moved by two main routes toward the Ethiopian capital of Addis Ababa, which they entered on May 5. In Rome that same day, Mussolini announced that "Ethiopia is Italian." On May 9, Il Duce decreed that all of Ethiopia was under Italian sovereignty and that King Victor Emmanuel III was now the emperor of Ethiopia. On June 1, 1936, Italian East Africa was reorganized as Africa Orientale Italiana, an area of some 666,000 square miles and a population estimated at some 12 million people in 1939.

The one-sided nature of the conflict was shown in the casualty totals. In the war, Ethiopia lost 760,000 dead, both military and civilian, whereas the Italian government claimed losses of some 2,000 dead, with another 1,600 lost from among its Eritrean allies. In postwar fighting and the Italian pacification effort, Ethiopia suffered an additional several hundred thousand killed.

In June 1936, Britain took the lead in dismantling the sanctions, despite the fact that the small neutral states wished to continue them. British prime minister Neville Chamberlain described the continuance of a policy of sanctions as the "very midsummer of madness." This pronouncement was followed on June 18 by a statement from Foreign Minister Anthony Eden confirming the cabinet's decision to propose to the League of Nations that sanctions should be abandoned. Other nations followed suit, and after a polished and moving address on June 30 by Haile Selassie, pleading his cause in person before the league, the assembly adopted a resolution on July 4, 1936, recommending the ending of sanctions. Italy had won: none of the big powers was prepared to use force to preserve Ethiopian independence, and

another crushing blow had been dealt to the belief in the efficacy of collective action to halt aggression. The war also served to give Mussolini an exaggerated sense of Italy's military effectiveness.

Ethiopian resistance to Italy continued nonetheless and, in July 1936, Ethiopian patriots attacked Addis Ababa. Their attempt to seize power failed, and most of them were executed. Intermittent Ethiopian resistance continued, and in 1941, British Commonwealth troops liberated the country.

Italo-Greek War

See Greece Campaign, Italian

Italy

South-Central European nation. Italy, with a 1939 population of 44.4 million, encompassed 116,346 square miles, not including its overseas possessions, chiefly in North Africa. Italy borders the Mediterranean Sea to the west, France to the northwest, Switzerland and Austria to the north, the Adriatic

Sea to the east, and the Ionian Sea to the south. Italy also possesses Sicily and Sardinia, the two largest islands in the Mediterranean.

After Benito Mussolini became premier in 1922, Italy was a constitutional monarchy in name only. Mussolini and his Fascist Party exercised de facto power, which became increasingly dictatorial as time went on. Adolf Hitler would later copy many of Mussolini's political arrangements.

In foreign affairs, Mussolini took a belligerent stance early, openly pursuing a nationalist and imperialist course. As early as 1923 he threatened war with Greece over Corfu, and he strongly supported Austria against Germany in 1934. Mussolini also sought expansion of Italy's overseas empire, which he claimed would be an outlet for the large number of Italians immigrating abroad and would also furnish strategic raw materials. Although Italy went to war with and conquered Ethiopia in 1936, no material benefits flowed from this. Indeed, it has been observed that the Italian empire was a "splendid collection of deserts" (Libyan oil having not yet been discovered).

Mussolini's aggressive policies served only to drive a wedge between Italy and its erstwhile allies of Britain and France. His decision to support the nationalist side in the Spanish Civil War (1936–1939) helped bring Italy and Germany together in what was later called the Pact of Steel (1936). Mussolini also sent Italian troops into Albania in April 1939 who took over that country, but he held back at the last minute from joining Hitler in a general European war in September 1939.

Mussolini claimed a shortage of raw materials and made impossible demands on Germany to avoid having to go to war, but in truth he was uncertain as to the outcome and was hedging his bets. Only with the defeat of France certain did Mussolini join Hitler and declare war, on June 10, 1940, in the expectations of joining in the spoils, especially in North Africa.

There was little enthusiasm among the Italian people when Italy entered the war. At the same time, there was little opposition. During the nearly two decades that Mussolini had held power, his fascist secret police and judicial system of special courts had silenced the internal opposition. The minority of Italians who opposed war were mostly abroad.

Initial Italian military failures in France but also in an invasion of Greece later in 1940 were offset in the public eye by the overall Axis successes that extended into the fall of 1941. Weekly propaganda newsreels trumpeted Axis

battlefield victories. Such claims were tempered in October 1942, however, when the Western Allies began bombing northern Italian cities.

At the same time, the tide clearly was turning against the Axis powers in North Africa. The war at last became a grim reality in urban Italy, with many people forced to abandon the cities. The destruction of the Italian Eighth Army in the Soviet offensives in the Stalingrad area during the 1942–1943 winter only strengthened the public mood. Despite the fascist regime's eavesdropping and censorship, opposition to Mussolini's policies grew. Strikes in the northern industrial cities in March 1943 surprised the authorities.

For political reasons, Mussolini sought to maintain, insofar as possible, the appearance of normalcy on the domestic front. Morale plummeted, however, with the introduction of rationing in 1941. Coffee, sugar, and soap had already been rationed since 1939. But with the war, the Italian average daily caloric intake progressively declined because Italy was not self-sufficient in food, especially wheat. Per capita daily calorie intake went from 2,100 in 1943 to 1,800 in 1944–1945, although some Italians were able to supplement this with black market purchases. Only those who worked in heavy labor might have more. These conditions further depressed morale, especially because rations for nonworking Italians, primarily the elderly and disabled, were well below the national average and totally inadequate. The overall situation deteriorated thanks to an inefficient distribution system and increased Allied bombing of railroad lines.

By 1942, newspapers were reduced to four pages (and later to two). Essentials were in short supply. Rationing meant that one might purchase one pair of new shoes or a few articles of clothing per year. Repeated increases in wages were more than offset by inflation, which, although rampant, was not so severe as to wreck the economy. Government deficits ballooned, and the government printed money; circulation of paper money quadrupled between 1940 and 1943, and a lively black market flourished, thanks to the fact that farmers refused to bring their food products to the government collection points. Following the Allied invasion of Italy proper in September 1943 and German occupation of much of the country, the food situation worsened for most Italians, especially in the more populous urbanized northern part of the country, where the standard of living fell back to the levels of 1861.

Labor was in short supply, given the country's needs for military

manpower. Agricultural requirements compelled Mussolini to recall 600,000 soldiers from the front on the eve of the October 28, 1940–March 1941, Greece Campaign to assist with the harvest, with obvious military consequences.

In three years of war, Italy mobilized some 5 million men for military service, and an additional 3.85 million workers of military age were employed in war production at the end of 1941. In 1943, this figure was reduced to 3.638 million, but it was still high.

Italy was handicapped by having few natural resources; its industry lacked even the most basic raw materials. The nation consumed 12 million tons of coal per year, but only 1 million tons came from domestic production. Iron ore was scarce, and Italy had no oil of its own, being forced to rely on Germany, where supplies were also short. Civilian automobile travel was largely forbidden, and Italy had to make do with a limited quantity of natural gas from the Po River Valley.

Despite problems, Italian industry managed to produce 7,000 artillery pieces, although half of these were of 47mm or smaller caliber; 10,545 aircraft; and some 60,000 trucks of rather high quality. This last figure may be compared with a total of 71,000 private and commercial vehicles produced in 1939. Much of this military equipment, however, was obsolescent. Industry emphasized quantity and older designs rather than switching to newer designs with potential dips in production. Thus, in 1943, Italy continued to produce biplanes at the expense of modern aircraft designs. The same approach was followed in Italy’s rather small production run of some 2,500 tanks. The country never attempted to produce under license the far better German models. In sum, Italy’s war industry was less effective than it had been in World War I.

Homeland defense was organized in 15 corps areas and centered on coastal batteries manned by the Milizia Artiglieria Maritima (MILMART, naval artillery militia) and Guardia alla Frontiera (GAF, border guards). Along its Alpine border, Italy already maintained an old fortified line. Between 1938 and 1943 it added a new one, which could only have been directed against its German ally.

Protection against amphibious assault was difficult, given the country’s long coastline. When Italy entered the war, it had only 200 modern antiaircraft batteries (all lacking fire-direction systems) with which to defend

the cities and industrial areas as well as strategic targets such as bridges, rail lines, and the like.

For defense against invasion, Italy also fielded some 400 battalions of territorial units of various types, but they were poorly armed; some were equipped with 19th-century Vetterli rifles. During the war, a few mobile units were added. Regular army units resting or training in Italy were also available. The government sought to counter the threat of paratroopers and saboteurs by the formation of some 350 platoon-level army units, often motorized or equipped with bicycles. These were reasonably successful in tracking down British paratroops dropped in Calabria on February 10, 1941. To these forces should be added the three main police corps—the police, the military police (the Carabinieri), and the Financial Guard.

A U.S. soldier shares his food rations with hungry villagers in the Cassino area of Italy in 1944. (Hulton-Deutsch Collection/Corbis)

Mussolini’s disastrous policies and the Allied invasion of Sicily (July 9–August 22, 1943) brought about the dictator’s fall, engineered not by outside pressures but within his own party from the fascist Grand Council, which deposed him on July 25, 1943. The new government, headed by Marshal Pietro Badoglio, signed an armistice with the Allies, which was announced

on September 8, after Allied forces invaded Italy itself. The Germans then occupied much of the country and disarmed many Italian military units that were left without orders. Italy became the battleground for outside powers, with bitter fighting persisting until May 2, 1945.

After the armistice, there were several different administrations: the Allied military government in the south (which printed its own occupation money); the Italian government under King Victor Emmanuel III, which became a cobelligerent from October 1943 on and took over many liberated areas from the military; and German-occupied Italy to the north. The Germans rescued Mussolini from imprisonment and installed him in the north as head of the puppet Italian Social Republic (Repubblica Sociale Italiana, RSI). Some provinces of northern Italy, however, were directly controlled by the Third Reich. The German Armaments Ministry took control of northern industries, which produced surprisingly well, given the difficult conditions.

As the Allies struggled with the Germans in Italy, Italian Resistance fighters also fought the Germans and other Italians. The Resistance in the north liberated some mountainous territories and proclaimed them to be independent. The north suffered from the civil war, hunger, and Allied bombing. The south was far better off. Although it had little in the way of industry, it could at least rely on Allied help in the form of food and goods.

Italy entered the war hoping to expand its overseas empire and win military glory. Instead, the nation lost its existing empire, was invaded, and became a battlefield and the scene of a civil war. The prolonged fighting and the slow Allied advance up the length of the Italian Peninsula severely damaged Italy. The war destroyed some 8 percent of the nation's industrial plants, demolished a considerable amount of housing (mostly in the cities), and severely dislocated the railroads (60 percent of the nation's locomotives were lost, along with half of the rolling stock). Some 5,000 bridges were also destroyed, and agricultural production fell by 60 percent. Nonetheless, by 1948 the nation was able to regain the economic levels of 1938, and it experienced considerable growth in the 1950s and 1960s.

Italy, Air Force

In the period between World War I and World War II, the Royal Italian Air Force (Regia Aeronautica) was regarded as one of the world's most advanced, winning 96 international aviation awards. In 1939, Italy also had the third-largest European commercial air fleet, behind only Germany and the United Kingdom. Moreover, with the possible exception of Japan, Italy had more interwar combat experience than any other nation, from the suppression of the Senussis in Libya to the Italo-Ethiopian War (1935–1936) and culminating in the 1936–1939 Spanish Civil War, where the Italians contributed more aircraft than did Germany. Between 1935 and 1939, Italy expended 1,500 aircraft in combat, and an additional 925 planes were exported. The Royal Italian Air Force was also the most fascist of the three Italian armed services and the favorite of Italian dictator Benito Mussolini and the Fascist Party.

Yet in World War II, the Italian Air Force was found wanting. When Italy entered the war in June 1940, its air force had almost 1,000 frontline aircraft, backed by about 2,000 second- and third-line aircraft. But these figures were deceptive. Italy had a few high-performance planes—those that had set a number of aviation records—but most of its aircraft were, in fact, obsolete.

Chief of staff and undersecretary of the Regia Aeronautica General Giuseppe Valle commanded the air force. Italy was organized into three air zones, with several regional commands and army-air cooperation units and land- and sea-based naval reconnaissance units. The air force retained control

of all pilots, and coordination among the three military branches was poor at best. The lack of a coherent air philosophy and an effective building program compounded problems. Valle was relieved of his command on October 31, 1939, charged with responsibility for the poor state of the air force when it was mobilized at the beginning of the war. He was placed on trial, and although he was later freed, the public held him responsible for the state of unpreparedness. General Francesco Pricolo commanded the air force from October 31, 1939, to November 14, 1941, when he was replaced by General Rino Corso Fougier until July 26, 1943.

Italy fought in the Battle for France (May 10–June 25, 1940) for several weeks, after which it received some French aircraft. Later, Mussolini insisted on sending aircraft to Belgium to assist in the July 10–September 30 Battle of Britain. The Germans thought the planes would be far more useful in North Africa, and indeed they proved hopelessly inadequate in the skies over Britain and had to be withdrawn. In 1941, Italy sent a more effective air contingent to fight in the Soviet Union.

In the Mediterranean theater, the Italian Air Force was employed for air strikes against Malta and targeted British merchant ships and naval units operating near Italy. It also conducted raids against Gibraltar and Palestine and even as far afield as the Persian Gulf. However, the Italians soon learned that aircraft that had been successful against stationary merchant ships docked in harbors during the Spanish Civil War were ineffective in high-altitude bombing attacks against warships. Indeed, early in the war, the aircraft occasionally attacked Italian warships by mistake, although recognition improved as the war unfolded. Not until March 1941 did the air force place liaison officers on board warships at sea.

The Italian Air Force was more successful in the Balkan fighting against Greece and Yugoslavia. It also fought in the Western Desert from 1940 to 1943 as well as in Ethiopia. When fielding modern machines—the later models with German engines—the air force was effective. But despite the fact that the Italian Air Force had operated in Libya since 1911, on the eve of war its aircraft still lacked dust filters, and its tactics were reminiscent of the acrobatics of World War I.

With the exception of three fighters embarked on two battleships late in the war, the only sea-based air effort (apart from ship-launched reconnaissance aircraft) involved the crash conversion of two passenger ships

into aircraft carriers. Neither was completed by the armistice. The failure to develop aircraft carriers seriously affected Italian naval operations in the war, largely because of the short range of Italy's land-based fighters.

On the whole, Italy's aviation industry was badly organized and inefficient, producing a wide variety of aircraft types in small numbers. The various companies involved resisted manufacturing each other's more successful designs, and the almost artisan production methods resulted in production times that were more than 50 percent longer than for comparable German aircraft. The Italian Air Force largely depended on radial engines, but these low-powered machines seldom exceeded 1,000 horsepower. Adoption of the bulkier but much more powerful German-designed Daimler-Benz in-line engine helped solve that problem.

The fact that the Fiat CR-42, a wood-and-canvas biplane fighter with nonretractable landing gear, was still in production in 1944 (and a serious candidate for the Daimler-Benz engine) reveals the sad state of Italian aircraft production. Italian fighters were almost all underarmed because of financial considerations and were poorly designed, with weak wings. Radios were not installed in all aircraft until 1942. Fuel was stored in thinly lined, leaking tanks; most airfields were dirt runways, and pilots were slow to adapt to closed canopies. On any given day, operational efficiency was rarely higher than 70 percent. Ground-support aircraft, based on precepts developed by General Amedeo Mecozzi, were so poorly designed that early in the war, Italy simply retired its ground-attack planes and purchased 159 Junkers Ju-87 Stuka dive-bombers from Germany.

One area in which the Italian Air Force excelled was the torpedo bomber. Although use of this plane was hindered by interservice rivalry before the war, the torpedo bomber was deployed to units by late 1940. German air units later successfully emulated Italian torpedo-bombing tactics and purchased torpedoes from Italy. Yet the Italians chose to simply adapt a three-engine Savoia-Marchetti SM-79 level bomber for torpedo-bombing rather than design a true torpedo bomber.

Although Italy formally embraced the concept of strategic bombing developed by General Giulio Douhet, it did not practice it. Ironically, Douhet had more influence on British and U.S. air policies than at home. Italy did produce a partially successful four-engine bomber, the Piaggio P-108, but only in small numbers.

With the armistice in September 1943, there were two Italian air forces. One was for the fascist state in the north. The other, utilizing many different Allied aircraft, fought for the Allied government in the south.

Italy, Army

When Italy entered World War II on June 10, 1940, the Regio Esercito (Royal Army) had 1,630,000 men under arms. This figure would rise during the war to 2,563,000. King Victor Emmanuel III was nominal commander in chief, with the title of *comandante supremo delle Forse Armato dello Stato* (supreme commander of the Royal Army of the Kingdom of Italy), but Italian dictator Benito Mussolini exercised actual authority.

Contrary to popular misconceptions, some units of the army fought well in World War II, but the army itself was basically a light infantry force lacking in equipment and poorly prepared for a modern European war. In 1940, it numbered 73 divisions—43 infantry, 5 Alpine, 3 light, 2 motorized, 3 armored, 12 “self-transportable” with a regiment of truck-drawn artillery, 3 militia, and 2 Libyan. Many military formations were understrength, and much of the army’s equipment was obsolete at best. Morale was not always optimal, for many Italians thought that their nation was on the wrong side in the war. The men were often indifferently led, as many officer appointments were made on the basis of party loyalty rather than ability.

An Italian infantry division was composed of two infantry regiments, an artillery regiment, an engineer company, and occasionally an attached Blackshirt (Voluntary Militia for National Security [MSVN], or Milizia Volontaria per la Sicurezza Nazionaleor) legion. The “binary” division had only about 10,000 men at full strength. The royal infantry regiments pledged allegiance to the king, but the highly motivated Blackshirt legions, which numbered about 1,300 men each, swore loyalty to Mussolini.

Many regular army officers deeply resented the inclusion of Blackshirt regiments in the army. In 1940, the equivalent of four MSVN divisions were destroyed in fighting in North Africa. Eventually, “M battalions” made of Blackshirts fought in the Soviet Union and in Yugoslavia. They also manned antiaircraft artillery batteries throughout the Italian Empire.

In 1940 the Italian Army had more than 8,000 artillery pieces, which were classified as divisional (field), corps (medium), and army (heavy). Much of the artillery was left over from World War I, and some guns were modernized World War I prizes, such as pieces manufactured at Skoda. In 1940 Italy had more than 1,200 tanks, but most were only two-man light tankettes. Many of the larger models were too thinly armored to stop armor-piercing bullets, let alone stand up to North European armor.

On June 20, 1940, Mussolini entered the war by attacking France in the western Alps with 32 divisions. The Italians did poorly, being largely held at bay by 5 French divisions. When the leaders in Paris surrendered on June 24, the Italians took a small portion of southeastern France. The French admitted to having 37 soldiers killed in the campaign; Italian losses were 631.

On October 28, 1940, on short notice, Mussolini sent Italian troops into Greece from Albania. The invasion involved fewer than 100,000 Italian troops, and by late November, the Greek army had driven the Italian army back into Albania, where both forces suffered heavily in a bloody stalemate during the winter. Hitler came to the rescue of his ally on April 6, 1941, when German forces invaded Greece and conquered it in a few short weeks. Italian forces, chiefly the Second Army, also participated in the invasion and conquest of Yugoslavia that same month.

Italy’s subsequent occupation of portions of Yugoslavia, France, Corsica, and Greece tied down numerous divisions. Resistance efforts created an ever-growing list of casualties. During their occupation of Yugoslavia, the Italians

raised a number of units usually organized on religious lines—Catholic, Orthodox Christian, and Muslim—from men seeking to fight the Partisans.

After Hitler invaded the Soviet Union on June 22, 1941, Mussolini eagerly offered Italian forces. Eventually, Italy sent more than 250,000 men to the Soviet front. Most of the Italian Eighth Army was lost in the August 23, 1942–February 2, 1943, Battle of Stalingrad. Included in Italian forces operating mainly in the Ukraine was a Croatian legion raised in Croatia. The Italians also helped organize a small Cossack anticommunist volunteer group. If the units sent to the Soviet Union had been added to forces in North Africa, they might well have affected the outcome of the struggle there.

Italy made a major military effort in North Africa to fulfill Mussolini's dream of establishing a great Italian empire. Before the war, Italy had colonized Libya, Eritrea, Somalia, and Ethiopia (Abyssinia). Italian forces there were, however, underequipped and undergunned compared with the British.

Amedeo Umberto di Savoia, the duke of Aosta, commanded forces in Italian East Africa (Somalia, Ethiopia, and Eritrea). Of his 256,000 men, 182,000 were "indigenous" levies. European colonists, including some Blackshirt troops, formed part of the units under the duke's command. Fighting there began in early July 1940 when the Italians captured a number of small British posts, but they halted their offensive in the Sudan when intelligence estimates magnified the actual British forces arrayed against them.

On August 4, the Italians invaded British Somaliland from Ethiopia. They were able to overwhelm the small British forces defending that colony. The British withdrew to Aden, and their losses were only one-tenth those of the Italians. During the winter of 1940–1941, the British built up their resources, and beginning on January 19, 1941, they went on the offensive. By the end of 1941, the British had secured control of Italian East Africa.

In North Africa, Field Marshal Rodolfo Graziani commanded some 236,000 Italian troops. After the defeat of France, Italian forces were shifted to eastern Libya to face the British in Egypt. British commander in Egypt Major General Richard O'Connor had only 31,000 men—largely from the 4th Indian Division and the 7th Armoured Division, later reinforced by the 6th Australian Division. Graziani appeared to be in position to overwhelm the outnumbered British; however, his troops were short of heavy artillery, tanks,

and antitank and antiaircraft weapons as well as transport and logistical support. A shortage of radios often reduced communications to relaying information by messenger.

On September 13, 1940, pressed to act prematurely by Mussolini, Graziani launched an offensive against the British. The Italians fared badly, and by December the British had penetrated the Italian chain of forts protecting the Libyan border but set too far apart to be mutually supporting. Many Italian units fought effectively but to no avail. By January 1941, the British had taken some 100,000 Italian prisoners.

In February 1941, General Erwin Rommel arrived in Libya with his Afrika Korps (Africa Corps). Although smaller in number than the Italian force and officially under Italian control, the Afrika Korps quickly became the dominant partner. The Germans were far better equipped and more effectively organized and led. The Italians lacked mobility, adequate staffing, and an effective system of command and control.

The Italians fought back and forth across Northern Africa until they were finally defeated at Tunis in May 1943. A major factor in the Axis defeat was Britain’s control of Malta, which enhanced the British ability to intercept by sea and air supplies destined for Axis troops in North Africa. British communications intelligence, notably Ultra intercepts, also played a role in the Allied victory.

On July 9, 1943, the British and Americans invaded Sicily, held by 190,000 Italians and 40,000 Germans. The performance of Italian units varied widely. The newly formed and indifferently equipped coastal divisions, composed of middle-aged home guards, often surrendered without a fight. Certain defeat in Sicily led the fascist Grand Council to strip Mussolini of power in July. Marshal Pietro Badoglio then formed a new government, and on September 3 he signed a secret armistice with the Allies, to go into effect five days later.

The Germans, well aware of Italian efforts to switch sides, immediately implemented plans to take control of Italy. When the Germans occupied Rome on September 10, King Victor Emmanuel III and Badoglio fled south and made Brindisi the new seat of government. Meanwhile, German troops arrested and disarmed Italian Army units. More than 600,000 Italians were deported to labor camps in Germany.

German commando units rescued Mussolini on September 12, 1943, and set up the Italian Social Republic (Repubblica Sociale Italiana, RSI), with its capital at Saló in the north. Many fascists joined the new RSI Army. New units and those from the former Italian Army that remained loyal to fascism were formed into various bodies. The first of these was the Esercito Nazionale Repubblicano (National Republican Army, ENR), arranged into four divisions composed of formations newly raised by officers still loyal to Mussolini and mixed with some autonomous older units. Many men were recruited into the ENR divisions from among Italian soldiers interned by the Germans. These formations were usually trained in Germany and then deployed to Italy. They fought chiefly against partisans.

The Guardia Nazionale Repubblicano (National Republican Guard, GNR) replaced the old Blackshirts. Basically a policing unit, it ultimately numbered 80,000 men. It was assigned to local security duties and fighting the partisans. Some GNR units in occupied France and Yugoslavia continued occupation duties in cooperation with the Germans.

As the struggle with the partisans intensified, all able-bodied fascists were organized into a new militia, the Brigate Nere (Black Brigades). Formed in June 1944 as an armed branch of the RSI’s new Fascist Party, this militia eventually numbered some 30,000 men. Composed of fanatical fascists, it engaged in a no-holds-barred struggle with the partisans. The members of the

Black Brigades were motivated by the belief that they would be killed in the event of a fascist defeat.

The X MAS (Decima Mas) unit was an autonomous force organized by Prince Julio Valerio Borghese. Composed of 25,000 volunteers, it gained a reputation for effective and hard fighting against the partisans, primarily Tito's Yugoslav Partisans in Istria. It also included a women's unit. In addition, the Germans recruited Italian volunteers into the Waffen-SS. These units had both Italian and German names and usually were commanded by German officers. They performed well on the Anzio front and against partisans.

In the south of Italy, the newly reorganized government led by King Victor Emmanuel III and Badoglio established the Army of the South, with the status of a cobelligerent force. It was organized as the Corpo Italiano di Liberazione (Italian Liberation Corps, CIL). Composed of old Italian Royal Army men and units to which new recruits were added, the CIL was formed into six weak divisions, known as combat groups. With the transfer of some Allied units to participate in the Riviera landings in France, four of these divisions were brought into the line and saw combat. They fought well and sustained casualties of 1,868 dead and 5,187 wounded.

Many Italians also served with the Allied forces in support units, handling transportation and ammunition and other supplies. Some of these units were muleteers working in the rugged mountain tracks. Partisan forces also fought in the north, behind German lines. As the war drew to a close, thousands joined partisan groups in order to sanitize their pasts or ensure their futures.

The Italian Army suffered substantial casualties in the war. The total of those in the army who died fighting the Allies, in German reprisals following the armistice with the Allies, and in fighting the Germans probably exceeded 300,000 men. In addition, an unknown but large number were wounded, and some 600,000 were taken as prisoners.

Italy, Navy

In the period after World War I, the Royal Italian Navy (Regia Marina) planned for warfare against the French Navy with surface naval battles similar to the 1916 Battle of Jutland. On the eve of World War II, the navy began transforming itself, albeit unsuccessfully, into an oceanic navy that would not be confined by the British-controlled Mediterranean choke points of Gibraltar and the Suez Canal. In the unlikely event that funding and resources were made available, the Italian Navy by 1942 would include 9 battleships, 3 aircraft carriers, 36 cruisers (including 12 small Capitani Romani–class vessels, of which 3 were completed before the armistice), and 84 oceangoing submarines. The navy had 5.4 officers for every 100 sailors (France had 7.5 and Britain 9.2 per 100). Many of the sailors were volunteers.

On the eve of Italy's June 10, 1940, entry into the war, the navy's percentage of the annual military budget had dropped to 12 percent, well behind the army's 74 percent and the air force's 14 percent. The core of the

navy was built around the new massive 30-knot Littorio-class battleships armed with nine 15-inch guns. Two were being completed when war was declared, and a third was added during the war. Italy also had two small older completely rebuilt and speedy World War I–era battleships ready for sea and two others that were almost ready. Although they were the weakest Axis battleships of the war, they were more powerful than any cruiser.

Italy also had 7 heavy cruisers, 12 modern and 2 old light cruisers (adding 3 during the war), 59 destroyers (adding 12), 67 large torpedo boats (adding 17), and 115 submarines (adding 32). Major fleet units also included escorts, raiders, MAS motor torpedo boats, and successful war-built corvettes—the 700-ton Gabbiano class, of which 28 were completed before the armistice.

Although it was a substantial force on paper, the Italian Navy suffered from fundamental problems. Italy lagged in several key areas of naval technology. One area was sonar, which was just beginning to be introduced at the start of the war. Then, in the disastrous March 28, 1941, Battle of Cape Matapan, the Italians discovered to their dismay that the Allies had deployed radar on their warships. The Italians did not deploy their first warship radar until a year later, in March 1942. Ironically, Italy's scientific community had been working on radar in the mid-1930s, but the Italian government did not fully support its efforts. Of Ultra intercepts the Italians knew nothing, although they assumed that the Germans were letting the Allies know about Italian operations, and the Germans assumed that the Italians were doing the same.

Italian ship armor plate was inferior by Allied standards. Italian heavy ships relied on long-range gunnery, but guns in cruiser and destroyer turrets were mounted too close to each other, thus interfering in the flight of shells. Also, in an attempt to outrange the ships of their potential opponents, the Italians initially sought high muzzle velocities. These factors resulted in high salvo spreads, compared to the much tighter British salvos.

The Italians sought to avoid night fighting by their heavy ships, and the navy lacked flashless night charges for ships with 8-inch or larger guns, an error not rectified until 1942. The navy dropped night-fighting training for large ships in the 1930s, precisely when the Royal Navy was adopting such tactics for its large ships, including battleships. Italian losses in night surface actions during the war would be heavy and almost completely one-sided.

Italy also experienced problems with its submarines. There were three

classes of subs. The large oceangoing submarines were part of the new oceanic navy. Many were based out of Bordeaux, France. In 189 patrols, they sank more than 500,000 tons of Allied ships, with another 200,000 tons damaged. They also carried out mostly ineffective runs to Japan for key war supplies, and they operated in the Indian Ocean and the Red Sea.

Medium and small submarines hunted closer to home. In the Mediterranean Sea, these classes conducted 1,553 patrols with dismal results when contrasted to the successes tallied by far fewer German submarines dispatched to that theater. This outcome was, in part, due to the Italian doctrine that called for submarines to submerge during daytime and wait for a target to come within range. The Italians eschewed attacks on the surface in wolf packs at night. Their torpedoes were reliable but had smaller warheads than those of most other nations, thus causing less damage. Despite its long coastline and overseas colonies, Italy had only 25,000 mines in 1939, and most of these dated from World War I.

In the 1920s, the Italians experimented with the snorkel, a tube to the surface that allowed submarines to secure air while submerged, but they ultimately dropped its development as a dead end. Their submarines also suffered from slow submerging speeds—they were two or three times slower than German boats. Italy also had to rebuild many of its submarines during the war because their large sails (the superstructure where the surface bridge and periscope were located) were easily picked up by radar. Italian periscopes were too short, and the Mediterranean itself was a much clearer sea then the Atlantic, which made it easier for Allied pilots to locate submerged submarines.

Italy failed to develop the aircraft carrier. Italian dictator Benito Mussolini and the navy high command believed that the country’s long coastline and the many Italian islands and bases in the central Mediterranean rendered aircraft carriers unnecessary. But the slow communication and response between the Italian Navy and the Italian Air Force, fueled by interservice rivalries, meant that too few planes arrived too late too often: early in the war, Italian aircraft actually attacked Italian ships several times. High-level bombing of warships under way also proved to be ineffective. Mussolini changed his mind about the aircraft carrier, and during the war, he twice intervened personally to secure the conversion of two passenger ships to carriers, although neither was completed before the end of the war.

Italy also failed to develop torpedo bombers before the war, in large part because of interservice jealousy. The air force, with only limited funds, opposed development of torpedo bombers, preferring to use the money for high-altitude bombers. So although the Italian Navy developed a torpedo for air launch, it was not until several months into the war that the air force carried out its first torpedo attack. In the course of the war, the Italians achieved several successes with these airplanes.

The most innovative naval arm was the Decima MAS. This unit was made up of midget submarines, underwater swimmers trained in sabotage, surface speedboats filled with explosives and piloted by crewmen who jumped off shortly before the vessels hit their targets, and the slow-moving torpedo, or SLC, which was ridden by two men underwater into enemy harbors. The most successful of these weapons was the SLC, directly developed from a World War I weapon that was employed against Austria-Hungary with good results; it was usually launched from a submarine. The most spectacular success for the SLCs occurred on December 18, 1941, when three of them entered Alexandria Harbor and crippled the British battleships *Queen Elizabeth* and *Valiant.*

With the exception of the midget submarines, the naval high command ignored these weapons until 1935 and then only grudgingly supported junior officers involved in innovative development. A more forceful development program begun after World War I might well have made an important difference in World War II.

Despite these limitations, the fuel-strapped Italian Navy fought bravely during the war and transported to Africa the vast majority of the supplies and troops that left port. In numerous battles above, on, and below the seas, the navy sank many Allied warships and forced the British to maintain a powerful naval force at both ends of the Mediterranean. In September 1943, when Italy switched sides in the war, the bulk of the Italian fleet joined the Allies.

Italian naval losses before the armistice consisted of 1 battleship, 11 cruisers, 44 destroyers, 41 large torpedo boats, 33 MAS boats, 86 submarines, and 178 other vessels. After the armistice, Italy lost 1 battleship, 4 destroyers, 5 large torpedo boats, 25 MAS boats, 3 submarines, and 23 other vessels. Germany, which took over or completed many Italian warships after the armistice, also assigned some ships to the navy of Mussolini’s

Italian Social Republic, organized in northern Italy—the largest being the damaged heavy cruiser *Bolzano.* Most of these were subsequently sunk.

Total wartime personnel losses for the Italian Navy came to 28,837, with 4,177 of this number occurring after the armistice. Up to the armistice, Italy also lost 2,018,616 tons of merchant shipping.

Italy Campaign (1943–1945)

At the Casablanca Conference in January 1943, with a cross-Channel invasion of France no longer an option for that year, British prime minister Winston L. S. Churchill and U.S. president Franklin D. Roosevelt and their military staffs agreed to follow the Axis defeat in North Africa with an invasion of Sicily. Several weeks later, the Americans also agreed to a subsequent invasion of the Italian Peninsula. This campaign would allow the Allies to retain the strategic initiative, expand their control in the Mediterranean, open a second front on the mainland of Europe to relieve pressure on the Soviets, and provide air bases closer to strategic bombing targets in Austria, Romania, and parts of Germany.

In a six-week campaign commencing on July 9, 1943, in their largest amphibious assault in the war to date, Allied troops defeated Axis forces in Sicily. The Allied conquest of Sicily had a profound effect in Italy, where, faced with growing unrest and the reluctance of Italian forces to oppose the Allies, the fascist Grand Council carried out a coup d'état that overthrew Italian dictator Benito Mussolini and installed a new government led by Marshal Pietro Badoglio. Secret negotiations between the Allies and the new Italian government for an armistice began immediately but soon became bogged down by the Allied insistence on unconditional surrender. A short military armistice was eventually signed on September 3. Adolf Hitler used the interlude, however, to move another 16 German divisions to Italy, including the crack 1st SS Panzer Division from the Soviet Union.

The Germans then occupied the entire country and took control of most of the Italian Army. Much of the Italian fleet escaped to Malta. On September 12, 1943, German commandos led by Schutzstaffel (SS) standartenführer Otto Skorzeny rescued Mussolini from captivity in the mountains at Grand Sasso in a daring airborne raid. Hitler then installed Mussolini as head of the puppet Italian Social Republic (Repubblica Sociale Italiana, or RSI) in northern Italy.

The strategic logic for continuing the Allied campaign in the Mediterranean appeared obvious to the British chiefs of staff, who saw an invasion of Italy as an opportunity to accomplish several goals: to continue the ground war against Germany utilizing experienced troops who would otherwise remain idle for a year, to draw Axis troops away from France and the Soviet Union, and possibly to create opportunities elsewhere in the eastern Mediterranean. The members of the U.S. Joint Chiefs of Staff,

however, were far less convinced and believed that Allied efforts should be directed to the cross-Channel invasion of France, now sanctioned for the spring of 1944. They were also skeptical of British motives, fearing that the postwar preservation of colonial interests was a high priority for Britain—a goal they vehemently opposed.

A final decision to invade the Italian mainland was not made until the Trident Conference in Washington in May 1943, but there was no strategic plan other than to continue the existing operations. The Americans were reluctant to commit to a new Italian campaign, and there was no new large-scale amphibious landing in northern Italy. Any such operation would have been beyond the range of Allied fighter aircraft, and it is an open question whether that type of operation and an airborne raid to capture Rome would have brought the campaign to a rapid conclusion.

The Allied invasion plan envisaged a pincer movement across the Straits of Messina by General Sir Harold Alexander's 15th Army Group, with the first objective being the important southern Italian port of Naples. In Operation BAYTOWN, Lieutenant General Bernard Montgomery's Eighth Army crossed from Sicily to Reggio di Calabria on September 3, 1943, followed by the British 1st Airborne Division, which landed by sea at Taranto six days later. The main assault, by 165,000 troops of the Anglo-U.S. Fifth Army under Lieutenant General Mark W. Clark, went ashore at Salerno in Operation AVALANCHE, 35 miles south of Naples, on September 9. Salerno was chosen chiefly because it was the farthest point in the north for which air support could be provided from Sicily. The Allies hoped that once ashore, their invading forces would somehow find a way to open the road to Rome before the end of the year.

German field marshal Albert Kesselring had convinced Hitler that Italy could be easily defended because of its ideal terrain. The central mountainous spine of the Apennines rises above 10,000 feet and has lateral spurs that run east and west toward the coast, between which are deep valleys containing wide rivers flowing rapidly to the sea. The north-south roads were confined to 20-mile-wide strips adjacent to the Adriatic and Tyrrhenian coasts, where the bridges that carried them were dominated by natural strongpoints.

Kesselring formed the six divisions in the south of Italy into the Tenth Army under General Heinrich von Vietinghoff, but he had anticipated a landing at Salerno and stationed the 16th Panzer Division in the area. At

Salerno, the Fifth Army attacked with two corps abreast: the U.S. VI Corps and the British X Corps. Initial resistance was light, but the Germans reinforced by September 11 and, despite their weakness, launched a counteroffensive that almost split the Fifth Army between the two invading corps. By September 15 the beachhead was secure, in large part because of an overwhelming weight of firepower in the form of accurate naval gunfire and massive air support and because more reserves were landed. The Fifth Army then began an advance on Naples, 30 miles away. Montgomery, disappointed that he had only been assigned a secondary role, was needlessly cautious in his advance—so much so that a group of war correspondents drove themselves through German-occupied territory to contact the Fifth Army more than a day before Montgomery's advanced units managed to do so on September 16.

U.S. soldiers come ashore at Salerno, Italy, in Operation AVALANCHE, part of the Allied invasion of Italy, September 1943. (Sem/UIG via Getty Images)

Two days later, Kesselring ordered a fighting withdrawal to the first of the series of mountainous fortified defensive lines, from which the Germans planned to defend the approaches to Rome. On October 1, the Fifth Army captured Naples while the Eighth Army advanced up the Adriatic coast and captured the airfields at Foggia; there, the Allies installed the U.S. Fifteenth Air Force to launch strategic bombing raids against the Reich. By early October, the two Allied armies had formed a continuous 120-mile line across

the peninsula running along the Volturno and Biferno Rivers. But in the previous three weeks, the Fifth Army alone had taken 12,000 casualties.

Henceforth, the campaign in Italy became a slow, remorseless, and grinding battle of attrition, and as the rain and snow turned the battlefield into a muddy quagmire, the appalling struggles resembled battles of World War I. Kesselring had fortified a series of defensive lines, known collectively as the Winter Line, between Gaeta and Pescara. The western end based on the Garigliano and Rapido Rivers, known as the Gustav Line, was particularly strong and hinged on the great fortress of the Benedictine abbey at Monte Cassino.

On October 12, the Allies began the Volturno River Campaign, with the objective of seizing the approaches to Rome. The plan was too ambitious, given the Germans' skill at defending the mountainous terrain. Between the Volturno and Rome lay 120 miles of rugged country. The Fifth Army's VI Corps successfully attacked across the line of the Volturno River, and X Corps seized two crossings. To exploit the success, Clark ordered an advance across the entire Fifth Army front. Particularly in the VI Corps area, poor roads, demolished bridges, and the difficulties of bringing supplies forward combined with German resistance to slow the advance.

Meanwhile, in a series of bitterly contested actions, the Eighth Army crossed the Trigno River and advanced to the Sangro River. By November 15, however, the Germans had stopped the advance along the Winter Line, a position that extended along the Garigliano River to Mount Camino, the Mignano gap, the mountains to the northeast, and the Sangro River to the Adriatic Sea.

The Winter Line Campaign, from November 15, 1943, to January 15, 1944, marked the failure of the Allied plan for a major winter offensive. The Eighth Army was to break through on the Adriatic coast and then swing left behind the Germans, at which time the Fifth Army would advance. When the two came within supporting distance, the Fifth Army was to launch an amphibious operation south of Rome.

Although its efforts to break into the German position were initially successful, the Eighth Army fell victim as much to weather as to the German defense. In early December, the Sangro River, vital to Eighth Army communications, rose eight feet, and bridges were underwater or washed away.

By mid-December, it was clear that the efforts to break through the German defenses were futile. Meanwhile, the Fifth Army successfully cleared the heights dominating the Mignano gap after much hard fighting but was stopped at the Rapido River. Allied forces had reached the defensive position of the Gustav Line, which generally ran along the Garigliano, Rapido, and Sangro Rivers. One of the key points was the town of Cassino on the Rapido. However, four successive attacks by the Fifth Army failed to make any significant headway. The winter campaign had degenerated into a situation in which two separate armies were attempting to penetrate the Gustav Line.

In four months, the Allies had slogged just 70 miles from Salerno and were still 80 miles from Rome. The Fifth Army alone had incurred 40,000 casualties, far exceeding German losses, and a further 50,000 men were sick; meanwhile, six experienced divisions were withdrawn for the June 6, 1944, cross-Channel invasion of France, Operation OVERLORD. Montgomery and supreme Allied commander of the European theater of operations and U.S. forces in Europe General Dwight D. Eisenhower also departed to lead the cross-Channel invasion. In recognition of British predominance in Italy, General Maitland “Jumbo” Wilson was appointed to head the Mediterranean Command, and Lieutenant General Oliver Leese became commander of the Eighth Army.

Kesselring, who was appointed commander of Army Group C on November 21, now had 15 (albeit weakened) divisions in the Tenth Army vigorously holding the Gustav Line. On January 22, 1944, in an attempt to unhinge this force, the Allies launched another amphibious landing, Operation SHINGLE, at Anzio, 30 miles south of Rome. The U.S. VI Corps, under Major General John Lucas, achieved complete surprise and safely landed 70,000 troops within a week but failed to exploit the advantage. Churchill later wrote, “I had hoped that we were hurling a wild cat on to the shore, but all we got was a stranded whale.”

Kesselring hastily improvised eight divisions into the Fourteenth Army, commanded by General Eberhard von Mackensen. This force resolutely counterattacked at Anzio, employing Goliath remote-controlled, explosive-filled miniature tanks for the first time in the war. The beachhead was saved only by the excellent tactical use of intelligence in one of Ultra’s most

important triumphs. Major General Lucian K. Truscott replaced Lucas but for three months could do no more than hold the defensive ring.

Meanwhile, Allied forces to the south were unable to break through the Gustav Line. Losses were heavy on both sides as the Allies battered against the line. VI Corps held on at Anzio but was unable to break out of the beachhead. A stalemate persisted until spring.

On January 17, 1944, V Corps launched an attack on the Gustav Line but was forced to call it off within a month after the badly exhausted troops had advanced just seven miles, at a cost of 17,000 casualties. The New Zealand Corps then attempted a direct assault on Monte Cassino, preceded by the questionable bombing by 145 Boeing B-17 Flying Fortresses that destroyed the famous and ancient monastery. The 1st Parachute Division troops defending the heights were some of the German Army's finest, and they did not flinch. They now took up positions within the ruined monastery. A third attack by New Zealand and Indian infantry, using even heavier air and artillery bombardments, also failed to break through, not least because the rubble created an impregnable defensive position.

On May 11 the Allies launched a fourth attack, Operation DIADEM, in which General Harold Alexander coordinated the Fifth and Eighth Armies as an army group for the first time. The aim was to destroy the German armies. In an astonishing feat of arms, Polish and Free French troops seized Monte Cassino, and XIII Corps broke the Gustav Line in a set-piece battle. Moreover, Kesselring, who had been duped into expecting another amphibious landing farther north, was slow to send reinforcements southward.

Alexander was alerted to the German movements through Ultra intelligence, and when victory seemed complete, he ordered the Anzio breakout on May 23. He planned for the U.S. VI Corps to strike directly inland to encircle the German Tenth Army. Rome would thus be ripe for the taking, but more important, the Germans would be unable to form any organized defenses in the rest of Italy, enabling the rapid occupation of the country right up to the Alps. However, Clark, perhaps the most egocentric Allied commander in the war, was enticed by the glory of capturing Rome and altered the direction of his thrust toward the city. The Fifth Army linked up with VI Corps on May 25 and made the triumphant march into Rome on

June 4, but the spectacle of the first capture of an Axis capital was eclipsed by the Allied invasion of France two days later.

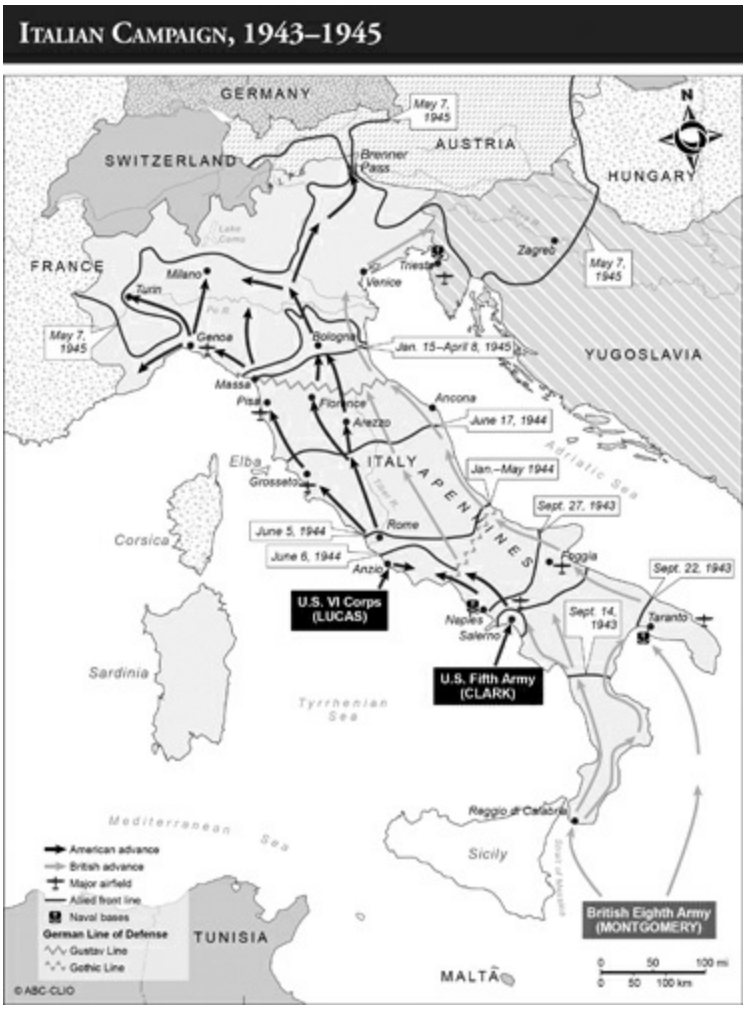
Clark's change of objective from Alexander's intent enabled Kesselring to withdraw to the Pisa-Rimini Line, 150 miles north of Rome. This line was the first of the next series of defense lines across the peninsula that were known collectively as the Gothic Line, which the Allies reached in August. Alexander still hoped to make for Vienna, but the Italian Campaign had assumed a definite secondary status to the invasion of France. Six divisions were withdrawn in the summer, and when the autumn rains and mud forced operations to be suspended at the end of the year, another seven divisions were withdrawn.

A prolonged Allied tactical air-interdiction program during the autumn and winter of 1944 effectively closed the Brenner Pass and created an acute German fuel shortage that drastically reduced the mobility of Army Group C in northern Italy (commanded by Vietinghoff after Kesselring was severely injured in a road accident in October). Although the Germans still had over half a million men in the field, the Allies had been invigorated in both spirit and outlook by substantial reinforcements, including the Brazilian Expedition Force, and an abundant array of new weapons.

On April 9 after the ground had dried, Alexander launched his spring offensive, with the Eighth Army attacking through the Argenta gap. The Fifth Army struck on April 15, and just 10 days later both Allied armies met at Finale Nell'Emilia, after having surrounded and eliminated the last German forces. The Allies then advanced rapidly northward, the Americans entering Milan on April 29 and the British reaching Trieste on May 2. The Fifth Army continued to advance into Austria, linking with the U.S. Seventh Army in the Brenner Pass on May 6.

The isolated and hopeless position of German and RSI forces led Waffen-SS general Karl Wolff, military governor and head of the SS in northern Italy, to initiate background negotiations for a separate surrender as early as February 1945. The talks, facilitated by Allen Dulles, head of the U.S. Office of Strategic Services in Switzerland, held much promise, although they were complicated and took place in an atmosphere of mutual suspicion and mistrust. Wolff wished to avoid senseless destruction and loss of life and to repel the spread of communism; he also hoped to ingratiate himself with the West in case war crimes trials were held in the future.

From the Allied perspective, Wolff offered the prospect of preventing the creation of a Nazi redoubt in the Alps. The head of the SS, Heinrich Himmler, halted the talks in April, before the Allied spring offensive, but by April 23, Wolff and Vietinghoff decided to disregard orders from Berlin. Wolff ordered the SS not to resist the Italian partisans on April 25, and an unconditional surrender was signed four days later, to be effective on May 2, six days before the German surrender in the West.



The Italian Campaign gave the Allies useful victories in the interval between the reconquest of the Mediterranean and the reconquest of Northwestern Europe. In a theater of increasingly secondary importance, Kesselring’s position was merely a defensive one, and the best the Allies could claim was that they kept 22 enemy divisions from fighting in another theater. Allied casualties came to 188,746 for the Fifth Army and 123,254 for

the Eighth Army, whereas German casualties were about 434,646 men. The Italian Campaign did, however, afford the Allies experience in amphibious operations and the stresses of coalition warfare, all of which proved invaluable during the invasion of France.

Itō Seiichi (1890–1945)

Japanese Navy admiral who ordered the December 7, 1941, attack on Pearl Harbor and later commanded Japan's Second Fleet. Born in Fukuoka, Japan, on July 26, 1890, Itō Seiichi graduated from the Japanese Naval Academy in 1911 and the Naval War College in 1923. After study at Yale University in the United States in 1928, he was promoted to captain in 1930. Itō held cruiser commands before assuming command of the battleship *Haruna* in 1936. Promoted to rear admiral in 1937, he became chief of staff of the Second Fleet. Itō was assigned to the Navy Ministry during 1938–1940. In November 1940, he took command of Cruiser Division 8.

In April 1941 Itō became chief of staff of the Combined Fleet, and in September he was appointed vice chief of the navy General Staff under Admiral Nagano Osami. Itō was promoted to vice admiral that October and played a key role in the development of Japanese naval strategy in the Pacific war. Reluctant to see Japan go to war against the United States, he opposed the Pearl Harbor attack, but Admiral Yamamoto Isoroku, commander of the Combined Fleet, urged Nagano to authorize the plan. On December 1, 1941, with the fleet already at sea, Itō ordered the attack on Pearl Harbor to proceed. He held his staff post for more than three years but desired a naval command.

In December 1944, Itō was appointed to command the Second Fleet. The Japanese Navy had already been crushed in the Battle of Leyte Gulf the previous October, and Itō's fleet was the only operative Japanese Navy force. On April 5, 1945, Admiral Toyoda Soemu ordered Operation TEN-GO, whereby the Second Fleet would join the March–June 1945 Battle for Okinawa, which had recently been invaded by U.S. forces. This operation was so reckless that Itō refused the order. His fleet lacked both aircraft carriers and aircraft, essential to protect its ships from air attack. Moreover, the fleet would be provided only enough fuel for a one-way trip from Kyushu to Okinawa. It was obvious to Itō and others that Toyoda intended to send the 7,000 men of the fleet on a suicide mission.

Ultimately, Vice Admiral Kusaka Ryūnosuke prevailed on Itō to obey the order, and on April 6 Itō set out with the battleship *Yamato* and eight destroyers. The plan called for the *Yamato* to fight its way to the U.S.

invasion site, destroy as many U.S. ships as possible, and then be beached as a stationary battery.

On April 7, 1945, the Second Fleet ships were attacked by U.S. vice admiral Marc A. Mitscher's Fast Carrier Task Force 58 in the East China Sea, and the *Yamato* was sunk. Itō perished along with 3,700 of its crew.

Iwabuchi Sanji (1893–1945)

Japanese Navy vice admiral. Born in Niigata Prefecture, Japan, on March 2, 1893, Iwabuchi Sanji graduated from the Japanese Naval Academy in 1915. Trained as a pilot, he then became a gunnery specialist and entered gunnery school in 1923. Between 1930 and 1933, he served as a gunnery officer on cruisers and battleships.

Promoted to captain in 1937, Iwabuchi was assigned to command the training cruiser *Kashii* in 1941, then the battleship *Kirishima* in April 1942. His ship took part in the June 3–6, 1942, Battle of Midway and the campaign for the Solomon Islands during August 1942–February 1943. On November 15, 1942, in the naval battle at Guadalcanal, the *Kirishima* was hit by gunfire from the U.S. battleship *Washington* and had to be scuttled.

Promoted to rear admiral in May 1943, Iwabuchi was appointed commander of the 31st Naval Special Base Force in Manila. In November 1944, he was also assigned 4,000 army personnel and named commander of

the Manila Naval Defense Force. General Yamashita Tomoyuki, commander of Japanese forces in the Philippines, ordered Iwabuchi to evacuate Manila and conduct a protracted struggle in the mountainous regions of northern and central Luzon as well as east of Manila, but Iwabuchi refused to carry out the order.

Commanding 15,000 navy and 4,000 army personnel, Iwabuchi was determined to defend Manila to the last. During three weeks in February 1945, there was fierce house-to-house fighting in Manila, and most Japanese forces chose to fight to the death rather than surrender. Iwabuchi died near the end of the battle, on February 26, at Intramuros; he received a brevet promotion to vice admiral after his death.

Iwabuchi's decision resulted in the deaths of some 16,000 Japanese troops, 1,000 U.S. forces, and perhaps 100,000 civilians. Some of the latter were deliberately massacred by Japanese troops, but most were killed by U.S. artillery fire. Iwabuchi's actions also resulted in the trial and execution of Yamashita, who was convicted of being a war criminal for the actions of his subordinate, Iwabuchi.

Iwakuro Hideo (1897–1970)

Japanese Army major general. Born in Hiroshima, Japan, on October 10, 1897, Iwakuro Hideo graduated from the Japanese Military Academy in 1918. He served in the Expeditionary Forces sent to Siberia in 1919 and 1920

and was promoted to captain in 1927 and to major in 1933. Iwakuro became a staff officer in the Guandong (Kwantung) Army in Manchuria in 1933 and was promoted to colonel in 1939. He was one of the founders of the Nakano School, the Japanese Army institution that trained intelligence and sabotage operatives.

Prior to the December 7, 1941, Japanese attack on Pearl Harbor, Japanese ambassador to the United States Nomura Kichisaburo asked Minister of War Tōjō Hideki to send him an officer who was familiar with Chinese affairs to assist in negotiations with the United States. Tōjō sent Iwakuro to Washington in March 1941. Iwakuro negotiated with two Catholic priests, James E. Walsh and James M. Drought, in an effort to ease tensions between the United States and Japan. This attempt failed, and after the outbreak of the Pacific war, Iwakuro was appointed commander of the 5th Imperial Guards Regiment in Malaya.

In February 1942, Iwakuro became the liaison officer to the Indian National Army, which the Japanese were encouraging to take up arms against the British. He established the Iwakuro Kikan (later known as the Hikari Kikan), an organization to subvert British rule in India. Major Fujiwara Iwaichi also ran F Kikan (Special Branch) to encourage Indian nationalism. Both officers assisted Subhas Chandra Bose as leader of the Indian national movement.

In March 1944, Iwakuro was promoted to major general and appointed chief of staff of the Twenty-Eighth Army in Burma, where he helped to plan operations after the Imphal debacle. Iwakuro retired from the army at the end of the war and died in Tokyo on November 22, 1970.

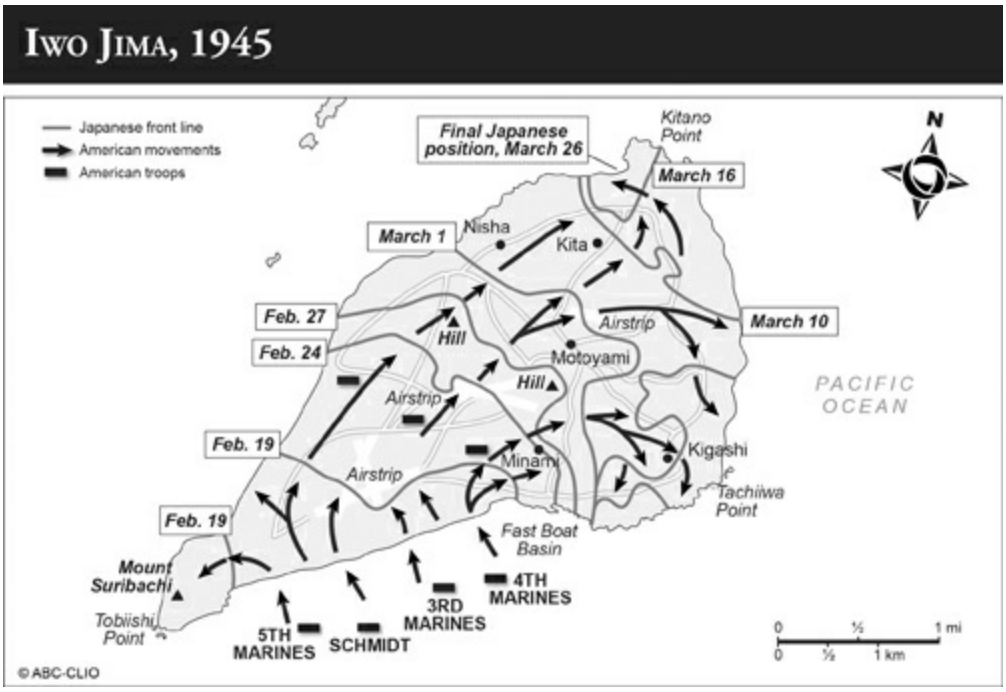
Iwo Jima, Battle for (February 19–March 26, 1945)

The invasion of Iwo Jima, code-named Operation DETACHMENT, was the penultimate test of the U.S. Marine Corps World War II amphibious doctrine and practice. By the end of 1944, American forces had secured from Japan control of the Mariana Islands to provide air bases for Boeing B-29 Superfortress strategic bombers that could strike Japan. En route to Japan, these bombers flew over Iwo Jima (Sulphur Island). Located in the Japanese Bonin Islands, halfway between the Marianas and Japan, the pork chop–shaped volcanic island of Iwo Jima is from 800 yards to 2.5 miles wide and 5 miles long, with a total area of some 8 square miles.

Iwo Jima housed a large radar facility that gave Tokyo advance notice of impending air attacks as well as three airstrips for fighter aircraft that harassed the U.S. bombers. As a consequence, U.S. commanders formulated Operation DETACHMENT to seize Iwo Jima. In American hands, the island's airstrips would provide emergency landing facilities for U.S. bombers raiding Japan and allow fighters stationed there to escort bombers the entire length of their missions.

Japanese leaders understood the strategic importance of Iwo Jima and began reinforcing it a year prior to the American invasion. Lieutenant General Kuribayashi Tadamichi, the island's commander, disregarded the traditional Japanese defensive doctrine of meeting the enemy at the shoreline and implemented a new strategy that relied on 1,500 interlocking strongpoints inland, designed for a battle of attrition. His 21,000-man force dug out thousands of yards of tunnels in the soft volcanic rock to connect natural caves, underground bunkers, and man-made "spider traps" from which concealed defenders could infiltrate and attack any enemy positions. These extensive subterranean complexes would also shield the defenders from extensive preliminary air and naval bombardment by U.S. forces. Japanese artillerymen also preregistered the beachheads to maximize their artillery effectiveness.



Kuribayashi ordered the defenders to die in place and to kill at least 10 Americans before dying themselves. He was, however, handicapped by a lack of potable water. The absence of a natural harbor also limited Japanese reinforcement, and U.S. submarines sank a number of Japanese supply ships, including one transport with a regiment of Japanese tanks.

Beginning in August 1944, U.S. Army aircraft in the Marianas subjected Iwo Jima to air strikes, and from December 8, the island came under daily attack. Three heavy cruisers bombarded Iwo Jima three times in December and twice in January. Then, for two weeks beginning in late January, the Seventh Air Force bombed Iwo Jima day and night, and B-29s struck it twice. In all, U.S. forces dropped 6,800 tons of bombs prior to the invasion.

Admiral Raymond A. Spruance, commander of the Fifth Fleet, cut back the naval bombardment of the island, begun on February 16, 1945, to only 3 days. This was a far shorter period than the 10 days sought by V Marine Amphibious Corps commander Lieutenant General Holland M. “Howlin’ Mad” Smith. Spruance concurred with invasion commander Vice Admiral Richmond Kelly Turner that he lacked both ships and ammunition for the longer bombardment.

Smith led a force of 80,000 men, supported by Spruance’s Fifth Fleet. Turner had overall command of the invasion.

The bombardment force included 6 battleships, 4 heavy cruisers, a light cruiser, and 16 destroyers, while the invasion force totaled 880 ships of all types. Rear Admiral William H. P. Blandy had command of the Amphibious Support Task Force (TG 52), charged with all prelanding activities, including shore bombardment, minesweeping, and underwater demolition. In all, the navy fired 22,000 rounds of 5- to 16-inch shells prior to the invasion, the heaviest bombardment of the Pacific war.

The American flag being raised on Iwo Jima, February 23, 1945. The Marine Corps Memorial in Arlington, Virginia, is based on this iconic image. (National Archives and Records Administration)

On February 19, 1945, 30,000 U.S. marines from the 3rd, 4th, and 5th Marine Divisions stormed ashore, only to encounter Iwo Jima's coarse, black volcanic sand. Heavy surf smashed the landing craft against the island's shelf, and the deep sand immobilized many vehicles on the beach. The resulting logjam of men and equipment on the beachhead provided prime targets for highly accurate Japanese artillery fire. With little or no cover, the marines had no choice but to fight their way inland. One group wheeled south, toward the island's most prominent terrain feature, the 556-foot Mount Suribachi, while the majority of the marines attacked northward toward the first airfield.

On the fourth day after the initial landing, marines reached the crest of Mount Suribachi, and although still under fire, they raised a small American flag. A few hours later, another group raised a second larger flag as Associated Press reporter Joe Rosenthal impulsively snapped a photo. Rosenthal's picture of these five marines and one navy corpsman planting the second flag became a Marine Corps icon and the symbol for American victory in the Pacific. The photograph remains one of the most widely reproduced images of all time.

Marines assaulting the main line of resistance to the north waded through rain-soaked sand into a maze of Japanese pillboxes, bunkers, and caves. Using flamethrowers, demolition charges, bazookas, tanks, and air support, they pushed their way through Kuribayashi's defenses for 36 days, sometimes advancing only a few feet per day. By March 26, nearly 70,000 marines had conquered most of the island, at a cost of approximately 6,500 dead and 20,000 wounded. More than 95 percent of the Japanese defenders died during the same period, and pockets of Japanese resistance continued as individual defenders emerged from concealed cave complexes throughout April and May, resulting in 1,600 additional Japanese deaths. Fewer than 300 Japanese were taken prisoner.

Was the capture of Iwo Jima worth the high cost? With the island firmly in U.S. possession, U.S. bombers pounded the Japanese homeland unabated. In the midst of the heaviest fighting on March 4, U.S. bombers made emergency landings on the island. In addition to serving in this capacity, the U.S. Army Air Forces (USAAF) VII Fighter Command moved to Iwo Jima and sent its long-range Republic P-47 Thunderbolts and North American P-51 Mustangs as escorts with the B-29s to Japan. The bombers now mixed medium-level daytime raids with the low-level night attacks. With the USAAF fighters along, losses of Japanese planes mounted rapidly, while those of the B-29s continued to decline.

The struggle for Iwo Jima epitomized the courage and esprit of the Marine Corps during the war. Twenty-two marines, four navy corpsmen, and one navy officer on Iwo Jima earned the Medal of Honor (almost half of them posthumously), accounting for one-third of all such medals earned by marines during the entire war. Fleet Admiral Chester Nimitz testified to the level of courage and bravery among the Americans fighting on Iwo Jima in

stating that “Among the Americans who served on Iwo Jima, uncommon valor was a common virtue.”

J

Jány, Gusztáv (1883–1947)

Hungarian Army general. Born in Rajka, Hungary, on October 21, 1883, Gusztáv Jány graduated from the Hungarian Military Academy as a lieutenant in 1905. He was promoted to major in 1919, to lieutenant colonel in 1921, and to colonel in 1925. Assigned to duties with the General Staff, he commanded the 2nd Brigade at Szombathely in 1929 and then, during 1932–1936, the Ludovika Military Academy in Budapest. In 1937 and 1938, he commanded II Corps at Szombathely, and from February 1939 to March 1940, he commanded I Corps in Budapest as a major general.

In 1940, Hungarian Regent Miklós Horthy appointed Jány commander of the Second Hungarian Army, with the rank of full general. In May 1942, the Second Army was sent to the Eastern Front to participate in fighting against the Soviet Union. Jány had only limited authority while under German command. His troops were ordered to defend the front along the Don River, an unrealistic assignment given the army's small size (200,000 men) and inadequate equipment. Jány repeatedly requested additional resources, but none came. He informed the Hungarian political and military leadership about the potential for disaster, but there was neither support from home nor authorization to withdraw if necessary.

Jány's exhausted and poorly supplied soldiers simply could not hold back Red Army forces, which broke through their lines on January 14, 1943. In spite of considerable losses and the catastrophic circumstances, Jány never was allowed to withdraw, and on January 24, he issued a general order blaming his soldiers for the tragedy. Six weeks later, he admitted that his officers and men had done their best, but this was kept from many of his soldiers and the public. In the Battle for the Don, Jány's army suffered 120,000 killed, captured, or missing.

Jány returned to Hungary with his staff on May 1, 1943. That August, he was relieved of command and retired from the army. When Soviet troops

reached Hungary, he moved to Bavaria, where he was taken prisoner by U.S. forces. In October 1946, Jány was returned to Hungary, arrested, and charged with war crimes. Tried, he was found guilty, sentenced to death, and executed in Budapest on November 26, 1947. In 1993, the Hungarian Supreme Court annulled the charges against Jány and rehabilitated him.

Japan

East Asian nation with a 1939 population of 71.3 million. The Japanese home islands encompass approximately 145,925 square miles and border the Pacific Ocean to the east, the Sea of Japan to the west, and the East China Sea to the southwest. To Japan's north is the Soviet Union; to the west is the Korean Peninsula and China. The population of the home islands has remained remarkably homogenous, and on the eve of World War II more than 95 percent of Japan's inhabitants were of Japanese descent. Highly mountainous, the islands were also largely bereft of natural resources.

Japan's governmental arrangement was complex and often contradictory. Technically a constitutional monarchy under the Meiji Constitution of 1899, Japan in theory invested all sovereignty with the emperor; this made the executive and legislative branches as well as the military subordinate to him. In practice, however, the emperor did not possess absolute powers. The constitution diluted his prerogatives by delegating much of his authority to an executive cabinet, the bicameral Diet (parliament), and to the supreme military command and its administrative bureaucracy. Thus, Emperor Hirohito had little to do with the direct establishment of foreign, domestic, or military policies and little say over the execution of those policies. National

policies were set by the cabinet, which was beholden only to the emperor. Cabinet officials and advisers were responsible for appointing prime ministers and key government and military officials.

During the 1920s and 1930s, the conservatives and ultranationalists came to dominate the cabinet and military, and coups against and assassinations of uncooperative prime ministers became almost routine. After 1932, governments could only be formed with the assent of the military. As the military—especially the army—accrued more control over Japan's governmental apparatus, it became clear that conservative officers and commanders sought to impose a de facto military dictatorship on Japan. By the late 1930s, moreover, the navy had succeeded in propelling Japanese influence southward, into Southeast Asia.

By the end of the decade, the army and navy were essentially setting all Japanese policies, and military officials had absolute veto power over both the cabinet and legislature. By the time of the Japanese attack on Pearl Harbor on December 7, 1941, the Japanese military had largely transformed Japan into a perpetually mobilized, highly nationalist and militarist nation bent on controlling large swaths of East Asia.

Japan experienced the demands of total war as intensely as any principal combatant in World War II. In 1931, the Japanese Guandong (Kwantung) Army had staged an incident and used this as the excuse to conquer Manchuria, and in 1937, the Sino-Japanese War began. It has become customary among Japanese to associate the era of total war for their country with the decade preceding World War II.

Although Japan was a major industrial nation in 1939, it was decidedly deficient in natural resources and not even self-sufficient in food. Virtually everything Japan needed had to come by sea, a vulnerability the United States was quick to exploit during the Pacific war. Deficiency in raw materials drove Japan's expansionary policies. The men who took Japan into the Pacific war believed that the conflict afforded the opportunity to redress the geographical accident of a paucity of natural resources. These could be found in Southeast Asia, especially the Dutch East Indies.

Japan also lacked the industrial base of its Western enemies. In 1941, for example, it produced 6.7 million tons of steel, whereas the United States produced 73.9 million tons. To some extent, too, Japan was already

exhausted by years of fighting in China when its government undertook yet another war with an even more formidable opponent in the United States.

As during World War I, the world's preoccupation with European events allowed Japanese leaders an opportunity to expand their power in the Far East. In October 1938, Tokyo announced its intention to create a New East Asian Order that would end Western colonialism in the region and replace it with Japanese leadership. Already in the Anti-Comintern Pact (1936), Japan had aligned itself with Germany against the Soviet Union, and in 1938 and 1939 Japanese and Soviet forces clashed in Manchuria and Mongolia, culminating in August 1939 in a major Soviet victory at the Battle of Khalkin Gol (Nomonhan Incident) on the Manchurian border.

On September 27, 1940, Japan allied itself with Germany and Italy in the Tripartite Pact. This recognized Japanese leadership in "Greater East Asia" and German-Italian leadership in establishing "a new order" in Europe. Aimed directly at the United States, the pact pledged mutual assistance if any of the signatories was attacked "by a power at present not involved in the European war or the Sino-Japanese conflict." Thus, it did not obligate Japan's partners to go to war should Japan attack the United States.

When Germany defeated France in June 1940, Japan demanded and obtained military bases in Indochina. The United States—the one power that stood in the way of Japanese expansion—responded by applying crippling economic sanctions, to include freezing credit and embargoing scrap metal and—especially important—oil, of which Japan had only a limited supply. Washington also demanded that Japan quit both Indochina and China. Tokyo refused.

On April 13, 1941, Japan and the Soviet Union concluded a neutrality pact, although the treaty did not prevent Tokyo from contemplating an attack on the Soviet Far East after the German invasion of that country in June. For a time Japan's military leaders debated whether to attack the Soviet Union or the United States, but the weather and lack of the resources Japan most needed (i.e., oil) as well as the military rebuff suffered by Japan at the hands of the Soviets in the earlier fighting all inclined Japan toward war with the United States.

Japan hoped in going to war against the United States to mount a preemptive strike and cripple the U.S. Pacific Fleet sufficiently that it would provide time to secure the desired essential resources, including the oil of the

Dutch East Indies, and then establish a defensive ring sufficient to hold the U.S. Navy at bay. Army leaders were confident of victory; navy leaders were not.

This was the situation when Tōjō Hideki, premier since October 17, 1941, took Japan into war. Japan attacked the U.S. Pacific Fleet on December 7, 1941, but Japan simply lacked the resources to wage war in China while also defending the territories it would acquire in Southeast Asia. Fanaticism in battle was insufficient to overcome shortages in matériel.

The period of warfare from at least 1937 to 1945 is customarily referred to by the Japanese as a "dark valley" of unrelieved misery and pain. The Great Depression of the 1930s had brought widespread hardship to Japan, exacerbated by sharp increases in military expenditures even prior to 1937 that created a serious balance-of-payments problem and an inflationary crisis. Between 1937 and 1940, real wages fell by 17 percent. By 1939, Japan was spending about 36 percent of its gross national product (GNP) on the military, as opposed to only 23 percent in Germany and 8 percent in Britain.

The Japanese government took early action to control and allocate its dwindling resources effectively. In preparation for total war, it instituted full-scale mobilization measures, whereby it directed systematic programs to put more people to work in agriculture and in ammunition plants. One way to facilitate this was by employing women. Initially the government rejected this as a sign of national weakness, but it had no other choice. By 1945, women constituted nearly 42 percent of the labor force, a figure higher than that in the United States. By the 1940s, girls as young as 12 were deemed eligible for the workforce.

Japan did have some success in increasing industrial production. From 1940 to 1944, production increased 25 percent, although much of this occurred because the government consolidated production in larger firms. Even so, Japanese efforts in this regard paled beside the achievements of the United States.

The demands of total war went beyond economics to include a variety of efforts to strengthen the national will. The nation underwent political restructuring that brought both the dissolution of political parties and the establishment of the Imperial Rule Assistance Association (IRAA) in October 1940. Although the IRAA failed to achieve its goal of restructuring Japanese society along the lines of the European fascist states, its establishment

symbolized increasing domestic repression. Simultaneously, governmental monitoring of dissidents increased. The Special Higher Police and the Military Police carefully monitored religious sects, Koreans, and suspected leftists and pacifists.

The Japanese people fully supported war with the United States, which they believed had been forced on their nation by American economic policies designed to cripple Japan. Nonetheless, the government instituted rigid censorship and used propaganda and the state-controlled education system to strengthen national spiritual mobilization. As the diarist Kiyoshi Kiyosawa noted, the Japanese were bombarded with appeals to remember their "spiritual" superiority over their enemies.

Ultranationalist societies, all to some extent proclaiming Japan's destiny to expand its territory on the Asian continent, proliferated. In addition, the government established several women's patriotic societies designed to improve civil defense, welcome soldiers home from the battlefront, visit hospitals to comfort the sick and wounded, and raise money for the relief of bereaved families. Small communities were also organized so that everyday life was systematized to impose a shared social unity in which people might monitor their neighbors; privacy became a thing of the past.

Perhaps the saddest manifestation of Japan's response to total war was the decision late in the war to utilize suicide missions. The so-called kamikaze played on the courage and fatalism of young men who believed that their country faced destruction and hoped their deaths would serve family and country.

Food shortages became apparent early, and in December 1940 the government began food rationing on a ticket system. Often, basic necessities such as cotton and soy sauce were also strictly rationed. The scarcity of food encouraged black markets and caused serious malnutrition.

Even while Japanese society was reorganizing, actions by Japan's military enemies forced increasing disruptions of the emerging total war system. One particular concern was the vulnerability of Japan's major cities to aerial attack, as the strategic bombing of civilian centers became part of the new era of total war. Doolittle's April 18, 1942, Tokyo Raid first demonstrated this vulnerability to the Japanese people. Although the raid inflicted little physical damage, it had a pronounced psychological effect.

From June 1944, the United States began a strategic bombing campaign

directed against Japanese industry, the bulk of which was located in the cities. Constructed largely of wooden buildings, the cities were appallingly vulnerable to firebomb attack, as shown in the great March 9–10, 1945, raid on Tokyo, probably the most destructive in the history of air warfare; it claimed some 120,000 lives and was followed by other attacks. One by one, the Japanese cities became burned-out shells. Americans justified these attacks as essential to reach and destroy the largely dispersed Japanese industrial base, but civilians paid a horrific price. By the time Japan surrendered in August 1945, every major city except the shrine city of Kyoto had been torched, and some 10 million Japanese had fled the cities to escape the raids.

The government began this resettlement in August 1944 by moving 350,000 urban schoolchildren between the ages of 8 and 12 into village temples, shrines, and inns. In 1945, a further 450,000 elementary school students were evacuated. Although Germany's surrender in May 1945 seemingly offered Japan a chance to extricate itself from a clearly worsening situation, the government refused to take the initiative, and U.S. forces stepped up their firebombing of what was left of Japan's major cities. In some cases, this bombing merely rearranged the rubble. Meanwhile, submarine attacks on Japanese shipping and aerial mining of Japanese harbors and coastline destroyed the already marginal Japanese shipping capacity, cutting off the flow of vital imports of food and oil and further damaging the economy.

Finally, in August 1945 the United States dropped atomic bombs on Hiroshima and Nagasaki. At the same time, the Soviet Union honored its pledge at Yalta and declared war on Japan. Hundreds of thousands of lives were lost as a result of this twin shock, and Japan finally surrendered. The nation was devastated both physically and psychologically.

Japan, Air Forces

During World War II, Japan did not possess an independent air force; the army and navy each had its own air service. In the interwar period, the two had different hypothetical enemies. The army planned to fight against the Soviet Union, and the navy expected to fight the United States and Britain in the Western Pacific. As a consequence, each service developed its own air arm, tailored to meet its particular needs.

Unfortunately for the Japanese war effort, neither service cooperated with the other. Army and navy aircraft employed different electrical systems. When the Japanese developed an identification, friend or foe (IFF), capability, army operators on Iwo Jima in 1944 could not identify Japanese Navy aircraft as friendly. Aircraft factories were divided between those areas that made army planes and those producing naval aircraft, with each keeping design developments secret. There was no exchange of data. The navy's Zero fighter was superior to the army's Hayabusa, but the navy did not want to share the Zero with the army. If the army had adopted the Zero, the number of Japanese fighter aircraft produced during the war would have been greatly increased. There was also little standardization between the Zero and the Hayabusa, even in small screw parts.

Japan also failed to develop heavy bombers comparable to those of Britain and the United States. Not until January 1944 did the army and navy agree to develop a joint six-engine heavy bomber, dubbed the “Fugaku,” but this project came too late and had to be abandoned. Finally, each service concealed its weaknesses from the other. Thus, it was 1945 before army leaders discovered how catastrophic the June 3–6, 1942, Battle of Midway had been for the Japanese naval air arm.

At the beginning of the Pacific war, in December 1941, the Japanese Army possessed 4,800 aircraft. Most army fighters were of the obsolete Nakajima Ki-27 Type 97 (“Abdul” in the Allied recognition system). The army had just 50 first-class fighters, the Nakajima Ki-43 Hayabusa (“Oscar”), which made its debut over Malaya in December 1941. The Ki-43 gradually became the army’s most numerous fighter; 5,751 were built during the war.

Later, the army introduced new fighters: the Nakajima Ki-44 Shoki (“Tōjō”), with initial deliveries in September 1942; the Kawasaki Ki-61 Hien (“Tony”), in August 1942; and the Nakajima Ki-84 Hayate (“Frank”), in April 1944. The best of Japan’s wartime army fighters to reach mass production, the Ki-84 was superior to the North American P-51 Mustang and Republic P-47 Thunderbolt in certain respects. The Japanese Army had no heavy bombers or dive-bombers and only three medium types: the Mitsubishi Ki-21 Type 97 (“Gwen”), the Nakajima Ki-49 Donryu (“Helen”), and the Mitsubishi Ki-67 Hiryu (“Peggy”).

As of December 1941, the Imperial Japanese Navy air arm, which played a major role in the early battles in the Pacific, possessed 3,000 airplanes, 1,300 of which were with the fleet in 1941. Most numerous of its aircraft was the excellent highly maneuverable Mitsubishi A6M Zero fighter (“Zeke”). Others included the Nakajima B5N Type 97 torpedo bomber and light bomber (“Kate”), the Aichi D3A Type 99 carrier dive-bomber (“Val”), and two twin-engine, land-based medium bombers, the Mitsubishi G3M (“Nell”) and the G4M Type 1 (“Betty”). Zero fighters took part in every major Japanese operation of the war. In the first six months of the war, the Zero was superior to any Allied fighter aircraft. Japan produced a total of 10,370 Zeros during World War II. As new Allied aircraft were introduced, the Japanese Navy developed new aircraft, such as the Kawanishi NIK2-J Shiden (“George”) and the Nakajima B6N Tenzan (“Jill”).

In the 1937–1945 Sino-Japanese War and the first stage of the 1941–1945

Pacific war, Japan's air forces enjoyed considerable success. They dominated the skies over China and instituted strategic bombing of Chinese cities in 1938. The Japanese naval air arm was undoubtedly the best in the world, and Japanese pilots were among the best trained. In 1941, first-line Japanese pilots had 500 to 800 flying hours, and 50 percent of army pilots and 10 percent of navy pilots had combat experience against China and/or the Soviet Union.

On December 7, 1941, the naval air arm executed the attack on Pearl Harbor, conclusively demonstrating the supremacy of airpower in modern naval warfare and establishing the effective combination of carriers and aircraft. A few days later, navy land-based aircraft sank the British battleship *Prince of Wales* and the battle cruiser *Repulse* off Malaya. For the first time, a self-defending battleship had been sunk while under way by aircraft, which showed that in the future, ships would require air protection. In 1942, however, Japan's air forces suffered heavy losses in the Battle of Midway and the Battle of Guadalcanal (August 1942–February 1943). These battles spelled the ruin of the fine Japanese naval air arm and revealed the serious flaw of an inadequate pilot replacement system. The army also sustained heavy aircraft and pilot losses over New Guinea in 1943, and navy air squadrons were badly hurt at Truk and the Caroline Islands from February to April 1944.

The Battle of the Philippine Sea (the "Great Marianas Turkey Shoot") on June 1–21, 1944, and the Battle of Leyte Gulf on October 23–26, 1944, finished off the Japanese naval air arm as an effective fighting force. The army and navy delivered new planes, such as the Hayate and Tenzan, but shortages of adequately trained pilots and fuel negated any advantage. By 1944, Japan was so short of aviation fuel that it could scarcely train its pilots; Japanese aviators had only about 120 hours of flying time before combat.

Japan produced some excellent highly maneuverable aircraft during the war, but they tended to be lightly armored and caught fire easily. The Zero fighter was essentially unarmored, and Allied pilots dubbed the G4M Type 1 ("Betty") bomber "the flying cigarette lighter" because it so readily caught fire. Japanese aircraft simply could not sustain heavy damage. The planes also tended to be more lightly armed than their U.S. counterparts. When the Boeing B-29s began the strategic bombing of Japan, Japanese fighters had

difficulty shooting them down. The Japanese planes also lacked airborne radar.

As Japan faced overwhelming Allied forces by late 1944, the military instituted kamikaze attacks. Such strikes were ordered by Vice Admiral Ōnishi Takijirō during the Battle of Leyte Gulf, and they reached their culmination in the Battle of Okinawa between March and June 1945. The kamikaze strikes proved highly effective. The U.S. Navy sustained greater personnel losses from these attacks during the Battle of Okinawa than in all its previous wars combined.

Yet even this new tactic could not turn the tide for Japan. Between 1940 and 1945, the United States produced 297,199 aircraft. During the same period, Japan produced 74,656. In the Pacific war, the Japanese Army lost 15,920 planes, and the Japanese Navy lost 27,190.

Japan, Army

The Imperial Japanese Army (Dai Nippon Teikoku Rikugun) defies easy or simple recounting, in no small measure because Japanese official histories of World War II begin in September 1931 with the start of the Manchurian

Campaign. Thus, any account of the Japanese Army and the war really has to cover a 14-year period and be divided into two parts. The first part concerns the process by which the army came to dominate the political process in Japan and, in effect, control the Japanese state. The second part treats military campaigns both on the ground and in the air because the army, as with the navy, had its own air force. Also, the army was involved in two wars, one in East Asia and the other in the Pacific and Southeast Asia, that were largely separate; both contained a number of campaigns that again were largely separate. Thus, the war in East Asia divides into the campaign in Manchuria, 1931–1932; the Sino-Japanese War, 1937–1945; and the final phase of the war, after December 1944, which saw major Japanese withdrawals throughout southern China and then defeat at Soviet hands in August 1945 in northern China and Manchuria.

The process by which the military came to dominate the Japanese state is the most important dimension of Imperial Japanese Army activity. It was the product of developments that reached back into the 1920s. In the course of these two conflicts, Japanese military formations undertook operations without direct control and guidance from authorities in Tokyo. This bred a habit of independent action, which came to be identified with the belief that action could and would not be repudiated by Tokyo.

The first real example of this came in 1928, when Japanese military personnel from the Guandong (Kwantung) Army, the garrison force in Manchuria, murdered the local warlord, but the Army Ministry blocked all moves to have those responsible tried by courts-martial, on the grounds that such proceedings would be damaging to the army’s prestige. The cabinet gave way and, having surrendered on such a crucial matter, had no real basis to oppose deliberate insubordination when events revealed powerful support within Japan for the Guandong Army’s action in 1931 and 1932 in overrunning Manchuria.

The Manchurian episode was crucial to the process whereby the Imperial Japanese Army effectively came to control the state. Officers of the Guandong Army staged the Mukden (Shenyang) Incident on September 18, 1931, and what followed amounted to a coup by the Guandong Army. After an emergency cabinet meeting in Tokyo, the Japanese government announced that it was committed to a policy of nonaggression in Manchuria,

but the Army Ministry declared that it would not consult the cabinet about policy but would be bound by the Guandong Army's decisions.

The cabinet immediately denied the Guandong Army's request for three divisions and ordered the Korean command not to provide reinforcements, whereupon the Korean command did just that on September 21. The government found itself confronted with a fait accompli and outmaneuvered at every turn by a military that played the card of public opinion against any attempt to halt proceedings inside Manchuria. The government fell in December; then on May 15, 1932, the new premier, Inukai Tsuyoshi, was assassinated by a group of naval officers and army cadets.

This marked the beginning of the military's domination of the political process within Japan, because in its aftermath, governments could only be formed with the assent of the military and only if they were prepared to accede to the military's demands. When Hirota Kōki became prime minister in July 1936 in the wake of the army mutiny on February 26, 1936, he found that the army minister had effective veto power over all appointments. In practice, the army could refuse to appoint an army minister or use the threat of resignation to ensure compliance. There was no basic change in such arrangements until Japan was overwhelmed by national defeat in 1945.

In terms of the major military commitments in this 14-year period, the Manchurian Campaign was of minor importance. There was no serious, sustained, or coherent resistance within Manchuria, set up by the Japanese as a puppet state known as Manzhouguo (Manchukuo and after 1934 Manzhoudiguo [Manchoutikuo], the Manzhou [Manchu] Empire).

The Sino-Japanese War, which began in 1937, was another matter altogether. The ease with which Japanese forces overran northern China after July 1937 was testimony to the extent of Japanese success over the previous five years, but the real point was that the Imperial Japanese Army found itself involved in a protracted war it had not sought that tied down its resources. As in 1932, the Japanese Navy instigated fighting in Shanghai in Jiangsu (Kiangsu) Province, and again, the army had to be deployed to rescue its sister service; it could only do so by extensive mobilization and escalation of a crisis it would have preferred to resolve through threat, intimidation, and a series of piecemeal Chinese surrenders.

The Japanese military effort quickly widened. There were some defeats along the way, the most notable being in front of Tai'erzhuang (Tai'erh-

Chuang) on April 6–7, 1938. The next day, Imperial General Headquarters formally sanctioned an escalation by ordering the capture of Xuzhou (Hsuchow), Jiangsu Province. This enabled the Japanese military to link what had been separate efforts in northern and central China and develop the offensive that would result in the capture of the Wuhan cities of Hubei (Hupeh) Province in October.

The period after 1938 was notable for the rice raids that began in Hubei Province in late 1940 and the "Three Alls"—"Kill All, Burn All, Destroy All"—campaigns in Communist-dominated areas in northern China. In the course of this and subsequent Japanese operations, the population of Communist base areas was reduced from an estimated 44 million to 25 million by a policy of mass deportations, murder, and deliberate starvation. The Communists were neutralized as a threat, with no major guerrilla activity in northern China for the remainder of the war, but as in all matters Japanese in this war, success was an illusion.

By 1938, if not before, the Japanese Army, with 1 million troops in China, found itself learning again the truth of the Clausewitzian dictum that it is easy to conquer but hard to occupy. The reason was the adoption by the Chinese of a policy of protracted resistance that precluded negotiations. The Japanese countered with a strategic bombing offensive, but this did not bring the Nationalist (Guomindang, GMD) leadership to surrender. Perhaps the only point of real interest in these campaigns was the first attempt by any armed force to use airpower to kill a head of state. On August 30, 1941, army bombers attacked a villa in Chongqing (Chungking) in Sichuan (Szechwan), where Jiang Jieshi (Chiang Kai-shek) was known to be taking part in staff talks.
