By 1943, thanks to aggressive research and development, the Allies had a wide variety of radar systems at their disposal. The technology evolved rapidly during the war, and specialized radar units were developed for early warning, battle management, airborne search, night interception, bombing, and gun aiming. Experiments with terrain-following radar for aircraft presaged the enhanced electronic avionics developed for jets and helicopters after the war. Air defense radar systems, which came to include gun-direction devices, proximity fuzes, and increasingly accurate direction-finding and ranging capabilities, had greatly enhanced the accuracy of antiaircraft fire by the end of the war.

In the postwar years as missiles replaced artillery as the backbone of air defense, radar technology improved still further, and radar systems were adapted for a number of useful purposes. As the systems became even more powerful and sensitive, radar was used in navigation, meteorology, and astronomy (the first radar emissions were reflected back from the moon in 1946).

Raeder, Erich (1876–1960)

German Navy grand admiral. Born in Wandsbek, Germany, on April 24, 1876, Erich Raeder joined the Imperial Navy in 1894. His abilities and ambition brought him into close contact with state secretary of the Imperial Naval Office Admiral Alfred von Tirpitz and Kaiser Wilhelm II and the unique ideology that characterized German navalism. As Admiral Franz von Hipper's chief of staff, Raeder participated with the German battle cruisers in the major operations of the High Seas Fleet during World War I, including the Battle of Jutland.

In 1918, Raeder experienced the trauma of the naval mutinies and revolution, and he resolved never to see such events repeated. His role in the naval command's support of the abortive right-wing Kapp Putsch in 1920 threatened the future of the navy and his own career. Assigned to the naval archives, he wrote a two-volume study of Germany's cruiser warfare in World War I that defined his conception of naval strategy.

In 1925, Raeder was promoted to vice admiral and appointed chief of the Baltic Naval Station in Kiel. He attempted to keep the navy above politics despite charges that he and the navy were engaged in antirepublican activities. In 1928, he was promoted to admiral and appointed chief of the naval command. In 1935, he became commander in chief of the Kriegsmarine (German Navy) and a general admiral. On April 1, 1939, Adolf Hitler promoted him to the rank of grand admiral.

To ensure support for the navy's rebuilding, Raeder established a firm, autocratic administration, demanding obedience and discipline. Initially skeptical about Hitler's support for an expanded navy, he found the führer receptive to building a fleet as an instrument of power for a "greater Germany," which reflected the legacy of the Tirpitz era. Given Hitler's support for a powerful navy, Raeder was willing to accept the criminal excesses of the führer and his regime. Raeder pressed hard for a greater share of resources in building a navy that was directed at Britain after 1938, but he soon found that an impatient Hitler was unwilling to delay the building of battleships rather than U-boats and other ships more suited for a war against merchant shipping.

Grand Admiral Erich Raeder visiting the crew of the battle cruiser *Scharnhorst* in April 1942 to express his appreciation after its escape from Brest through the English Channel. (Library of Congress)

Although the German Navy was unprepared for war in 1939 (Hitler had assured Raeder that there would be no war before 1944), Raeder was determined that the navy "die gallantly" for the future existence of the fleet. He called for a concentration of forces against Britain as the primary enemy and advocated a massive buildup of U-boat forces and intensification of the naval war, even if this meant fighting the United States. Raeder opposed the invasion of the Soviet Union until Britain was defeated and argued vigorously for an alternative Mediterranean strategy.

Following the loss of the battleship *Bismarck* in May 1941 and the failure of the German army in the Soviet Union, Raeder and the fate of his capital ships became increasingly irrelevant to Hitler. Raeder resigned in January 1943. Commander of U-boats Admiral Karl Dönitz replaced him.

Arrested at the end of the war, Raeder was sentenced to life imprisonment at the Nuremberg trials as a war criminal but was released on September 26, 1955. He spent his remaining years crafting his memoirs and attempting to justify his own actions and those of the navy in serving the Third Reich. Raeder died in Lippstadt on November 6, 1960.

Railroads

During the war, railroads were immensely important in supporting and sustaining military operations by moving troops and cargo from rear areas to

railheads behind the battlefronts. Railroads carried the bulk of the load in this regard because they could transport more cargo than trucks and used less fuel and manpower. During the course of the war, the Allied powers, particularly the United States, demonstrated superior techniques in managing their transportation resources, which, coupled with their superior industrial production, proved vital to victory. U.S. Army railroad troops shouldered a major portion of this Allied effort, ultimately operating railways in such areas as Alaska, the Yukon, Morocco, Algeria, Tunisia, Sicily, Corsica, Sardinia, Italy, France, Luxembourg, Germany, Holland, Belgium, Iran, Burma, India, and Luzon and aiding in operations in states such as Egypt and Britain.

In the United States, commercial railroads transported most of the military cargo and personnel as well civilian goods. In January 1939, the American Military Railway Service (MRS) consisted of only a few reserve units. But the first three months of the Pacific and European conflicts brought about marked changes in the organization of army transportation and underscored its importance to eventual victory. In July 1942, the MRS organization, with the exception of major track and bridge construction, was transferred from the jurisdiction of the Corps of Engineers to the army's newly formed Transportation Corps.

The MRS's wartime success can be attributed chiefly to two factors: first, in civilian life a large proportion of the officers and enlisted men had been railroaders, and second, American railroad companies had accepted sponsorship of or affiliation with MRS units and trained them following World War I. The troops were inducted and trained as compact operating units and were quickly readied for active duty in units that were up to battalion size, and the railways' existing civilian management structure became the unit's military chain of command as appropriate.

The first deployment of MRS units was in 1942 to Alaska. There they took over the rehabilitation, operation, and maintenance of the army-leased White Pass & Yukon Railroad. This 110-mile line was the only access to the subarctic areas along the Alaska-Canadian Highway (ALCAN). The line facilitated the completion of the highway on schedule and the construction/expansion of the strategic airfields linking Alaska to northern Canada.

MRS units followed Operation TORCH, the November 8, 1942, Allied landings in North Africa, operating railways in three nets conforming to the

boundaries of French Morocco, Algeria, and Tunisia. These lines were generally single-tracked, with the main lines being standard-gauge (4 feet 8½ inches, or 1.435 meters) and the branches usually being meter-gauge (3 feet 3 $^{3}/_{8}$ inches) along the 1,400-mile length of the system. Both steam- and electricity-driven locomotives were used, and the system was by and large undamaged prior to the invasion.

The North African Campaign served as a primer for solving the rail problems that would be encountered in future campaigns. Following the Axis surrender in North Africa, the Allies focused on rehabilitation of the Tunisian system, and France assumed control of civilian operations. Some MRS units continued to assist the French; others deployed to operations in Sicily, where the 750-mile Sicilian rail net played an important role in supporting the Allied advance, and from there to the European mainland in the September 1943 invasion of Italy.

Allied bombing and Axis demolition had left the Italian railways almost inoperable, but prompt temporary repairs enabled needed ammunition, rations, and petroleum, oil, and lubricants (POL) to leave the port of Salerno three weeks after the initial Allied assault. MRS units, together with British railway units, restored operations that enabled combat units to receive the supplies they needed to push forward despite the extensive destruction of bridges and tunnels and the Germans' use of track destroyers. In October 1943, the MRS assumed control over all Allied railroad troops and the operation of all state and privately held railways in Italy. British and American railroad units were assigned separate zones to support their respective combat troops and worked together to rehabilitate the entire Italian system. Many of Italy's rail lines were operated electrically, with power coming from plants behind German lines, so those lines had to be converted to steam operation. Italy's lack of coal reserves required converting coal-burning locomotives to diesel, as the latter fuel was easier to import. The United States sent in additional diesel locomotives, and this dual system for fuel kept the railways operational. Repairing damaged rail yards was another major challenge.

In January 1943, the MRS took over from the British the operation of the 865-mile Iranian State Railway in order to substantially increase Lend-Lease shipments to the Soviet Union via that route. This undertaking was a

challenge of major proportions, as the railway wound through 126 tunnels, crossed 3,000 bridges, ran through formidable canyons, and climbed to an altitude of 7,200 feet.

A key element of planning for Operation OVERLORD, the June 6, 1944, Normandy Invasion, involved improving the national British railway system, which suffered greatly from a variety of problems during the war. Before D-day, thousands of MRS personnel, many of whom were veterans of other theaters of operation, arrived in England to take the first steps toward establishing railway service to support the Allied invasion. Some of these men helped assemble record numbers of rolling stock prefabricated in the United States and also conditioned American locomotives to run on British rails; others were trained to operate the French railway system, which was similar in structure compared to most European systems and operated over 26,000 miles of track. All of these preparations paid handsome dividends.

For Allied railway units, the major challenge of the invasion was to remedy the massive destruction of French ports, rail yards, and tracks west of Paris, which was caused by German demolition and Allied bombings. Allied railroad personnel made use of captured German and French equipment, and additional U.S. locomotives and rolling stock were shipped into the theater as the Allied front line advanced. Maintenance units worked continuously to reestablish track, living on trains and making repairs from well-equipped shops located on the trains. As the Allies moved forward through France, French railway workers cooperated with Allied railway units in clearing wreckage from yards and from rights-of-way and repairing roadbeds. Just three months after D-day, the rail lines were open to Paris, and in another month MRS railheads were established in Brussels and Liège, Belgium.

In Germany, the government closely controlled the operation of the German state railway, which was always a part of Berlin’s war planning; its personnel were highly trained, and German railway maintenance was effective throughout the war. The system continued to operate despite heavy Allied air attacks, enabling the German Army to prolong hostilities for many months.

Railroads—or the lack thereof—affected both sides involved in combat in the Pacific theater. Railways in China, Burma, and India were limited and not as robust as those in European countries. China had a simple rail net, and Japanese forces captured its rail centers early on; with the Japanese

occupation of northern Indochina, the Yunnan-Indochina railway was closed. Before and during World War II, the Japanese strategy in the Orient was designed to isolate China and deny its armies needed support from outside. The Japanese had great success in this effort in the early stages of combat, closing the Burma Road.

India was the arsenal for the Allied effort in the Middle East, and its rail system was heavily burdened by the demands of war, production, and the growing Indian economy. It also suffered from the handicap of having tracks of different gauges. For example, the rail line from Calcutta to Ledo went through some of the most inhospitable terrain in the world, and the line also switched from standard-gauge to meter-gauge track, which required double handling for all cargo. British and Indian railway personnel worked the standard-gauge portion, and the MRS assumed control of some 800 miles of meter-gauge track, including the branch lines. MRS personnel were superimposed over existing railway staff, ensuring that no one lost his job. Waging a constant battle against the elements and disease, the MRS team focused on railway improvements to meet increasing wartime demands. By

the end of 1944, more than 200 locomotives and 10,000 cars from the United States were in use in the Indian system.

The Japanese completed a railway across the Dawna Range from Thailand to Burma in 1943. The Burma-Siam railway was Japan's principal supply route to its armies in Burma. Lacking construction equipment, Japanese engineers forced some 61,000 Allied prisoners of war and more than 260,000 local nationals to hack a path through the steaming jungles with the most primitive of tools, without medical care and with little food. One estimate held that for every mile of track completed, 325 men died. During the Burma Campaign, the Japanese railways continued to operate, despite heavy Allied bombing. When the Japanese began to withdraw, British rail troops made the necessary repairs to support offensive operations. Although the terrain was difficult, the British imported light locomotives and other equipment from India and adapted the jeep to rail service.

Luzon in the Philippines was the only island in the Southwest Pacific Area where rail lines had any importance in military operations. The MRS took over railroad operations in the Lingayen Gulf area in January 1945, rehabilitating locally available equipment and track that had been severely damaged by the Japanese. American rail equipment was shipped in, and local nationals helped to repair track. By mid-May, eight trains arrived and departed Manila daily. By October 1945, approximately 3,200 MRS officers and men and 6,000 civilians were involved in the Luzon military railroad, and civilian management took over after hostilities ceased. Although railways did contribute substantially to logistical support operations in New Zealand and Australia, the lines were operated for the most part by local nationals who provided shipments on a commercial basis.

The Allied powers' effective worldwide use of rail lines for moving troops and supplies was a key factor to their victory in World War II. And the MRS was the critical element in this effort. The total strength of the MRS as of June 1945 was approximately 44,084 officers and men, which were broken down as follows: European theater, 28,828; Mediterranean theater, 3,207; Persian Gulf Command, 3,473; China-India-Burma theater, 4,036; Southwest Pacific Area, 2,772; and Alaskan Department, 915.

Rainbow Plans

Series of U.S. war plans immediately prior to World War II. Unlike the war plans of the 1920s, which were assigned one-color code names and had been developed for operations against another single nation, the Rainbow Plans anticipated conflicts against one or more opponents and with the cooperation or benevolent neutrality of other powers.

The Army-Navy Joint Planning Committee began work in November 1938 and established five basic scenarios by June 1939. Rainbow 1 provided for the defense of the Western Hemisphere and protection of U.S. territories and trade. Rainbow 2 in addition envisaged a concerted effort with Britain and France in which the United States focused its attention on Pacific Ocean operations while its allies addressed Eastern Hemisphere conflicts. Rainbow 3 entailed the defense of the Western Hemisphere and offensive operations into the Western Pacific by the United States alone. Rainbow 4 added to the defense of the Western Hemisphere the projection of troops as necessary into South America and the Eastern Atlantic. Rainbow 5 considered a substantial U.S. military commitment in Europe, the Eastern Atlantic, and/or Africa in concert with Britain and France.

Rainbow 2 became the focus of the planning effort when war began in Europe. Its parameters generated a far more complex military situation than

the old Plan Orange for a war between the United States and Japan had considered. The involvement of European nations made it highly probable that Japanese operations to the south would spread well beyond the Philippines into Southeast Asia, the East Indies, and the Southwest Pacific, and efforts to contain all of these would entail substantial American military commitments.

The success of the German offensive in Western Europe by June 1940 radically changed the planning situation. War planning was predicated on, at best, German neutralization of Britain. Planning for Pacific operations (Rainbows 2 and 3) was abandoned, and the Rainbow 4 scenario was modified to accommodate the defense of the entire Western Hemisphere and U.S. possessions in the Pacific as far west as Midway and the Aleutian Islands against German, Italian, or Japanese aggression.

Continued active British resistance prompted the initiation of strategic staff conversations between the United States and Britain that stretched from January 29 to March 29, 1941. From these emerged the parameters for Rainbow 5.

Rainbow 5 assumed a conflict between the United States, the British Commonwealth, and their associated powers, on the one hand, and Germany and Italy or Germany, Italy, and Japan, on the other. The basic defensive objectives were to secure the Western Hemisphere, Britain and the British Commonwealth, and U.S. possessions against attack. The offensive objective was the defeat of Germany and its allies. To this end, the Western Allies would use all available means to apply economic pressure, conduct a sustained air offensive against Germany and its allies, seek to eliminate Italy at the earliest opportunity, and conduct limited offensives while building up substantial forces for the eventual assault on Germany. In the Pacific and the Far East, Allied forces would conduct an active defense of their territories through attacks on enemy sea communications and offensives to secure the Caroline and Marshall Islands areas. Rainbow 5 was the basic American strategic plan when the United States entered the war, envisaging an active defense in the Pacific while focusing first on the defeat of Germany.

Ramsay, Sir Bertram Home (1883–1945)

British Royal Navy admiral. Born at Hampton Court Palace in England on January 20, 1883, Bertram Home Ramsay joined HMS *Britannia* in 1898 and served on the North American and Red Sea stations and on Home Fleet destroyers before World War I. During that war, he held commands with the Grand Fleet and the Dover Patrol. Following World War I, Ramsay commanded cruisers and a battleship, and as a rear admiral, he was naval aide to King George V and Home Fleet chief of staff. Ramsey retired in December 1938 at the age of 55, his career apparently over.

When World War II began, Ramsay returned to active duty and was assigned to command the port of Dover. Following the German invasion of France on May 10, 1940, he organized and executed Operation DYNAMO, the successful evacuation of the British Expeditionary Force from Dun-ker-que (May 26–June 4, 1940), for which he was knighted. Ramsay, now with the rank of acting admiral, was assigned to planning for Operation TORCH, the Allied invasion of North Africa, and he directed the landings at Algiers and Oran on November 8, 1942. After the Axis collapse in North Africa, he planned the invasion of Sicily and commanded the eastern task force for the landings that began on July 9, 1943. Reinstated on the active list, he was appointed commander of British naval forces in the Mediterranean.

On December 29, 1943, Ramsay was appointed Allied naval commander in chief for the upcoming Allied invasion of Normandy (June 6, 1944). He planned and executed this huge undertaking—Operation NEPTUNE—that involved more than 2,700 warships and well over 4,000 minor vessels supporting the initial landing of troops on five beaches, plus subsequent

landings of troops and armor. Ramsay was criticized on occasion for his insistence on detailed planning, but he contended that it was necessary given the complexity of the task, and the outcome certainly justified this assessment. For his efforts, he was promoted to full admiral on the active list in June 1944.

Ramsay turned over control of the French ports from Le Havre southward, as they were captured, to the U.S. Navy while retaining responsibility for those to the north and east. He later directed amphibious operations to clear the South Beveland Peninsula and Walcheren Island in October and November 1944, which opened the port of Antwerp. Ramsay died on January 2, 1945, when his plane crashed on takeoff from the airfield at Toussus-le-Noble, near his headquarters at Saint-Germain-en-Laye, France.

Randolph, Asa Philip (1889–1979)

U.S. labor and civil rights leader who worked to end racial discrimination in the defense industry during the war years. Born in Crescent City, Florida, on April 15, 1889, A. Philip Randolph was raised in Jacksonville. After graduating from Cookman Institute in Jacksonville, he moved to Harlem, where he continued his studies at the City College of New York. Following the U.S. entry into World War I, he and a partner founded a magazine, *The Messenger*, that demanded more positions in the war industry and armed

forces for African Americans. Randolph ran unsuccessfully for offices on the Socialist Party ticket in the 1920s.

In 1925, Randolph began organizing the Pullman porters in the railroad industry into the Brotherhood of Sleeping Car Porters and succeeded in gaining that union's admission into the American Federation of Labor (AFL). Later, in protest of the AFL's racially discriminatory policies, he withdrew the brotherhood from the AFL and took it into the Congress of Industrial Organizations.

With the tremendous increase in defense contracts just prior to the U.S. involvement in World War II, Randolph protested racial discrimination in defense industry hiring practices, and he informed President Franklin D. Roosevelt that he was prepared to lead thousands of African Americans on a march to Washington, D.C. In response, the president issued Executive Order 8802, which barred racial discrimination in the defense industry and created the Fair Employment Practices Committee to ensure compliance with the law. Approximately 2 million African Americans ultimately obtained work in war industries.

After World War II, Randolph founded the League for Nonviolent Civil Disobedience against Military Segregation. The organization successfully pressured President Harry S. Truman to issue Executive Order 9981, which ended segregation in the U.S. military in 1948. Randolph spent the remainder of his life fighting workplace discrimination, and he was a director of the August 1963 March on Washington for Jobs and Freedom. Randolph died in New York City on May 16, 1979.

Rankin, Jeannette Pickering (1880–1973)

Pacifist, social reformer, women's rights advocate, the first woman to be elected to the U.S. House of Representatives, and widely known for her opposition to the U.S. entrance into World War I and World War II. Jeannette Pickering Rankin was born in Missoula County, Montana, on June 11, 1880. After graduating from the University of Montana in 1902, she became a schoolteacher before going into social work. Beginning in 1909, she pursued more studies at the University of Washington, where she became a women's suffrage proponent. Rankin was influential in getting legislation passed in Washington State in 1910 that permitted women to vote, and she also successfully led the women's suffrage effort in Montana and North Dakota.

Having gained a national following, Rankin ran for Congress in 1916 as a Republican, and she became the first women to be elected to the House. Already a pacifist, on April 6, 1917, she joined 56 congressmen in voting against the U.S. declaration of war against Germany. Rankin claimed that never before had an American woman had the opportunity to vote against a war, and she felt duty-bound to do so as a woman and a pacifist. Her position did not sit well with her constituents, who voted her out of office.

After leaving office, Rankin continued her social and political activism, and in 1919 she was a delegate to the Second International Congress of Women held at The Hague. During 1929–1939, she lobbied Congress on behalf of the National Council for the Prevention of War. Eyeing with suspicion President Franklin D. Roosevelt's policies that seemed to presage American involvement in World War II, in 1940 Rankin again ran for Congress from Montana. She ran on a decidedly antiwar platform and won the contest. After Japan attacked Pearl Harbor on December 7, 1941, she cast the only vote against war in all of Congress. Her vote alienated many, and she did not seek reelection in 1942.

Thereafter, Rankin remained active in the international peace movement, speaking out against both the Korean War and the Vietnam War. Rankin died

on May 18, 1973, in Carmel, California.

Raskova, Marina Mikhailovna (1912–1943)

Soviet Air Force officer. Born in Moscow on March 12, 1912, Marina Raskova (née Malinina) mastered air navigation as a laboratory employee at the N. E. Zhukovskii Air Force Engineering Academy and was the first Soviet woman to qualify for a navigation diploma. She then taught navigation at the academy while training to fly and studying mechanical engineering at the Aviation Institute in Leningrad as an extramural student.

On September 24–25, 1938, Raskova, with pilot Valentina Grizodubova and copilot Polina Osipenko, took part in a nonstop pioneer flight from Moscow to the Pacific in an ANT-37 aircraft named *Rodina* (Homeland). The three aviators became the first women to receive the Hero of the Soviet Union, the highest Soviet decoration. As a major in the Soviet Air Force, Raskova persuaded Soviet dictator Joseph Stalin to form three women's combat wings at a time when there was no shortage of male aircrews. She then trained her new 122nd Air Group at Engels, near Stalingrad, in 1941 and 1942. In late 1942, she received command of the 587th Dive Bomber Regiment (which was renamed the 125th M. M. Raskova Borisov Guards Dive Bomber Regiment after her death).

Marina Raskova, shown here in 1936, was a pioneer woman aviator and created three women's dive bomber wings during World War II before her death in a plane crash in 1943. (Library of Congress)

On January 4, 1943, Raskova died in a plane crash at an undetermined location while making her way to the Stalingrad Front during a heavy snowstorm. Members of her unit pledged to make it worthy of bearing her name and qualify for the honorific "Guards" designation, attaining both that same year. The tactics of this wing's 2nd Squadron, applied in the air battle of June 4, 1943 (during which the unit shot down several German fighters), became a model for Soviet bomber aviation.

Rawalpindi, Loss of (November 23, 1939)

British armed merchant cruiser sunk after single-handedly engaging the German battleships *Scharnhorst* and *Gneisenau* during their first wartime voyage into the Atlantic. The *Rawalpindi* was built in 1925 by Harland and Wolff of Belfast, Northern Ireland, for the Peninsular & Oriental Steam Navigation Company (P&O) service between Britain, India, and the Far East. At 16,697 tons, it was 568 feet long and could carry 600 passengers in two classes, along with 380 crewmen, at a maximum speed of 17 knots.

In August 1939, the Admiralty requisitioned the *Rawalpindi* as an armed merchant cruiser for use in Britain's naval blockade of Germany, equipping it with eight 6-inch guns. With a crew consisting primarily of naval reservists under the command of Captain Edward Coverley Kennedy, it was assigned to the Northern Patrol between Iceland and the Faroe Islands, there to intercept German merchant shipping and to escort convoys. In the late afternoon of November 23, its crew sighted what Kennedy identified as a pocket battleship of the Deutschland class, but in fact it was the *Scharnhorst,* with a main battery of nine 11-inch guns. The sighting was reported to the headquarters of the Home Fleet. The *Rawalpindi* was then ordered by the Germans to heave to and maintain radio silence, but Kennedy responded by turning toward the German ships and laying a smoke screen.

After the *Rawalpindi* ignored a warning shot across the bow, the *Scharnhorst* opened fire with its large guns at about 8,250 yards and was soon joined by the *Gneisenau*, setting the *Rawalpindi* on fire. Kennedy returned fire and scored one ineffective hit on the *Scharnhorst,* but the rest of his shots fell short by hundreds of yards. After 10 minutes, the Germans disengaged on receiving false reports of torpedo tracks, but the *Rawalpindi* was left burning fiercely. The ship remained afloat another three hours, during which time the Germans searched for survivors. Kennedy and 270

others were lost; of 38 survivors, 27 were rescued by the Germans and the remainder by the British cruiser *Newcastle*.

The *Rawalpindi*'s arrival on the scene reinforced the decision of German task force commander Vice Admiral Wilhelm Marschall to abandon his mission on grounds of poor visibility and British knowledge of his presence. He was criticized for that decision on his return to Germany.

Red Ball Express (August 24–November 16, 1944)

U.S. Army Transportation Corps operation following the Allied breakout in Normandy. Commencing on August 24, 1944, the Red Ball Express was a massive road operation to resupply Allied forces advancing across France. Supplies carried by the Red Ball Express were essential to the continued movement of U.S. units.

After the Allied breakout at Saint-Lô, U.S. forces pushed across the Seine River. The original plan envisioned the supply of 12 U.S. divisions at the Seine by September 4, but by that date 16 divisions were already some 120 miles beyond the Seine. This presented a major logistics challenge. The ruined French port facilities were inadequate to support the Allied advance, and most supplies had to be transported over the beaches.

The main problem lay in getting the supplies forward to the advancing forces. The Allies had also counted on utilizing the French railroad system, but it had been severely damaged by Allied bombing, and parts of it remained

under German control. Most supplies thus had to come by vehicle from the beachheads at Normandy. The Red Ball Express was the truck supply line organized by the army's Transportation Corps to address the logistical shortfall.

Corporal Charles H. Johnson of the 783rd Military Police Battalion waves on a "Red Ball Express" motor convoy rushing material to the forward areas, near Alençon, France, September 5, 1944. (National Archives)

At its peak, the Red Ball Express involved 132 truck companies, composed of some 23,000 men operating 5,958 vehicles. The most common vehicle employed was the six-by-six, 2.5 ton General Motors truck known as the "deuce and a half" or "Jimmy." Trucks transported matériel to the front along French roads paralleling the French rail lines. They ran 20 hours out of 24 and operated at night without blackout lights.

U.S. forces moved so quickly that only the most important supplies, such as ammunition, rations, medical supplies, and gasoline, were carried forward; without these supplies, the Allied advance could not continue. Most truck runs were overnight operations that allowed the drivers little sleep. To ensure safety, rules mandated 60-yard intervals between trucks, 10-minute breaks at the top of the hour, and bivouac sites for long trips.

Nonetheless, the strain of the operation took a heavy toll on drivers and their vehicles. Supplies were also diverted by other U.S. units on the way to the front, and a portion ended up on the French black market. African Americans, who constituted only about 10 percent of the U.S. Army, made up three-quarters of the drivers on the Red Ball Express.

The Red Ball Express officially lasted for 81 days, until November 16, 1944, and in this time span, it transported 412,193 tons of matériel from Normandy to the front. It also met the gasoline demands of the First and Third Armies, a total of 800,000 gallons a day. The Red Ball Express was the lifeline of the most mobile and highly mechanized army the world had ever seen.

Red Sea, Naval Operations in (1940–1941)

The Red Sea extends 1,200 nautical miles from the port of Suez in Egypt to Bab el Mandeb, its narrow outlet, into the Gulf of Aden. At its widest, the Red Sea is only 200 miles across. In peace all of the traffic between Europe and Asia via the Suez Canal traveled the Red Sea, making it one of the world's most strategic bodies of water. Italy's East African base at Massawa was situated astride this critical sea route, and with the Sicilian Channel

closed upon the outbreak of war, Italy theoretically possessed the ability to block maritime access to Egypt.

In June 1940 Italy's East African naval squadron consisted of seven destroyers, eight submarines, two old torpedo boats, five old motor torpedo boats (MTBs), and a large colonial sloop all concentrated at Massawa. Naval command considered that due to the squadron's limited stocks of fuel and ammunition, its mission was to survive and practice sea denial with its submarines for the duration of a six-month war. British Empire forces included three light cruisers, four destroyers, and three sloops. This Red Sea Squadron was tasked with blockading the Italian East African coast, preventing reinforcements from reaching there, and, most important, protecting Allied shipping lanes to Suez and Aden.

Hostilities opened with an Italian submarine offensive, but the British had suspended all shipping two weeks before war, and only one ship of 8,215 gross register tonnage (GRT) fell victim. In return, Allied antisubmarine forces sank four Italian submarines, losing a destroyer in the process.

Operations were complicated by what one participant described as the torture of the region's "blazing heat and incredible humidity" and even by periodic sandstorms in port and at sea. Two Italian submarines were lost as a direct consequence of malfunctions in their inadequate air-conditioning systems.

The first convoy, BN1 (BN for north-bound, while BS stood for south-bound), departed Aden for Suez on July 2, 1940. On six occasions in July, August, and September Italian destroyers made night sorties in response to reports of Allied ships passing Massawa, but they failed to make contact. Submarines and aircraft only sank two merchantman (one each), totaling 9,288 GRT, during this period.

On the night of October 20–21, 1940, four Italian destroyers operating in two sections intercepted Convoy BN7, numbering 34 ships of British, Norwegian, French, Greek and Turkish origin, which was escorted by the light cruiser *Leander*, 1 destroyer, 3 sloops, and 2 minesweepers hailing from the navies of Great Britain, New Zealand, India, and Australia. The convoy escaped damage, but the destroyer *Kimberley* sank the Italian destroyer *Francesco Nullo* on its return to base. An Italian shore battery disabled the *Kimberley*, but the *Leander* eventually towed it to safety.

Although its oil stocks were running short, the *Regia Marina* attempted to

intercept Allied convoys on December 3, January 24, and February 2, 1941. Only during the last sortie did two of three destroyers make contact with Convoy BN14, but all their torpedoes missed.

In March 1941, British forces invading Italian East Africa neared Massawa. On April 2 the five remaining Italian destroyers attempted a desperate raid against Port Sudan, but one dropped out en route because of engine problems, and the other four were intercepted at dawn on April 3 while 30 miles short of their objective by bomber squadrons disembarked from the British aircraft carrier *Eagle*. The aircraft sank two of the destroyers, while the other two were scuttled by their crews on the Arabian coast. The last significant Red Sea naval event of the war occurred on April 8 during the occupation of Massawa, when an Italian MTB severely damaged a British light cruiser.

The destruction of Italian naval forces in the Red Sea relieved the need for convoys, and the last BN convoy arrived in Suez on April 13. British forces captured Assab, Italy's final Red Sea outpost, on June 10. Suez continued to be a serious bottleneck, however, especially when German aerial mines caused its closure. In May 1941, for example, 117 ships waited outside Port Suez to be unloaded, providing rich targets for Axis aircraft. As late as October 1941, the Allied Suez escort force still retained 4 light cruisers, 4 destroyers, and 2 sloops.

Reeves, Joseph Mason "Bull" (1872–1948)

U.S. Navy admiral. Born in Tampico, Illinois, on November 20, 1872, Joseph Mason "Bull" Reeves graduated from the U.S. Naval Academy at Annapolis

in 1894. Beginning his naval career as an engineer, he became a gunnery officer. Reeves interspersed seagoing, staff, and teaching appointments, and he served a tour as naval attaché to Italy. Promoted to commander, Reeves's initial command was the navy's first electricity-driven ship, the *Jupiter*, an experimental collier; during World War I, he commanded the battleship *Maine*.

In 1925, Reeves volunteered to become an aviation observer and learned to fly. In October 1925, he became commander of Aircraft Squadrons, Battle Fleet, including the navy's first aircraft carrier. He switched this force's emphasis from breaking records, performing stunts, and testing to intensive training in aviation warfare tactics, with a special focus on upgrading aircraft carrier capacities. Reeves was promoted to rear admiral in June 1927. In military exercises in 1928 and 1929, Reeves conducted successful mock air assaults on Hawaii and the Panama Canal, demonstrating the effectiveness of airpower and giving new impetus to developing a powerful carrier task force.

In 1933, Reeves commanded the U.S. Battle Fleet, and in 1934, he served as commander in chief of the U.S. Fleet, the first aviation officer ever appointed to that post. As Japan abrogated the Washington Naval Treaty of 1922 and became increasingly assertive in Asia, he stressed fleet security and preparedness for war. Reeves ordered extensive naval maneuvers designed to test U.S. naval effectiveness under wartime conditions, including exercises near Pearl Harbor and Midway Island. Although Reeves retired from the navy in December 1936, his staunch support for naval aviation and efforts to prepare for conflict contributed substantially to his country's fighting success in World War II.

Recalled to emergency duty in 1940, Reeves served in the office of the secretary of the navy on the Roberts Commission that investigated the December 7, 1941, Pearl Harbor disaster. He was also the Navy Department's Lend-Lease liaison officer and a member of the Munitions Assignment Board. He retired for a second time in 1946 and died in Bethesda, Maryland on March 25, 1948.

Regensburg and Schweinfurt Raids

See Schweinfurt and Regensburg Raids

Reichenau, Walther von (1884–1942)

German Army field marshal. Born in Karlsruhe, Germany, on October 8, 1884, Walther von Reichenau joined the 1st Guards Artillery Regiment as an officer candidate in 1903 and became an officer in 1904. During World War I, he served as adjutant to the 1st Guards Reserve Artillery Regiment and then joined the General Staff.

Reichenau continued in the German Army after the war and worked in the General Staff. Promoted to colonel in 1929, he was chief of staff of the East Prussia Military District. After rising to lieutenant general in 1933, he headed the Reichswehr Chancellery. He was one of the few aristocratic officers to support Adolf Hitler and was partly responsible for the führer's selection of General Werner von Blomberg as minister of war. In 1935, he took command of VII Corps at Munich, and he played an important role in the staging of Berlin's 1936 Olympic Games. Promoted to general of artillery in 1938, he took command of the 4th Army Group at Leipzig.

Field Marshal Walther von Reichenau was one of the few aristocratic German army officers to support Adolf Hitler. (Ullstein Bild via Getty Images)

Reichenau commanded the Tenth Army in the invasion of Poland on September 1, 1939, where he enveloped the Polish Kraków Army in Germany's first major encirclement battle of the war. The Tenth Army was then redesignated the Sixth Army, and Reichenau was promoted to colonel general. He led the Sixth Army in the May 10, 1940, invasion of France and the Low Countries, although his vocal protests over German atrocities in Poland and his opposition to the violation of the neutrality of Belgian and the Netherlands permanently alienated him from Hitler.

In the invasion of the west, Reichenau again demonstrated his effectiveness as a field commander. He was known for leading from the front and for his rapport with his men in operations in the Netherlands and northern Belgium. His troops took Paris in mid-June, and he was promoted to field marshal in July 1940.

Reichenau next led the Sixth Army in Operation BARBAROSSA, the June 22, 1941, invasion of the Soviet Union, operating in Ukraine and taking Kiev, Belgorod, Kharkov, and Kursk. He proved to be a master of armored warfare. Reichenau also supported both the execution of Red Army commissars and the killing of Jews. His name surfaced as a possible replacement for the commander in chief of the army, Field Marshal Walther von Brauchitsch, whom Hitler fired, but instead, Reichenau replaced Field Marshal Karl Gerd von Rundstedt as commander of Army Group South in early December 1941. On January 15, 1942, Reichenau collapsed from a cerebral hemorrhage.

Hitler ordered him transported to a clinic in Leipzig, but Reichenau died of heart failure during the flight two days later.

Reichswald, Battle of the (February 8–March 10, 1945)

West European land battle. In early 1945 German forces in the west defended the West Wall (known to the Allies as the Siegfried Line) against Allied attack. General of Paratroops Alfred Schlemm's First Paratroop Army of Army Group H held the line between the Rhine and Maas Rivers. The Allied attack here marked the opening phase of Operation VERITABLE, the advance of Lieutenant General Henry Crerar's Canadian First Army to the Rhine River. This Allied offensive saw the First Army pushing across the German-Dutch border, securing Kleve, and then turning south between the Rhine and the Maas to meet Lieutenant General William H. Simpson's U.S. Ninth Army as

it was driving northeast across the Roer River and toward the Rhine in Operation GRENADE. The Allies hoped to surround and destroy defending German units and secure crossing points over the Rhine. To accomplish this, Canadian forces, reinforced by the British Army's XXX Corps, would have to cross the heavily wooded Reichswald State Forest and eliminate the German pillboxes and bunkers of the West Wall. To this operation, the Allies eventually committed some 200,000 men. Schlemm commanded only 90,000 men. His task was to prevent the Allies from breaking through and seizing the bridgeheads over the lower Rhine.

The Allied attack here was hindered to some extent by the terrain. The land was heavily forested, which somewhat offset Allied advantages in mobility and manpower, and there were only two roads through the Reichswald Forest. The weather was also a significant factor. A thaw just before the attack turned the ground into mud, and the Germans opened floodgates on the Maas, overflowing the river and flooding the countryside. To the south, the Germans also blew the floodgates on the Schwammenauel Dam in the Hürtgen Forest, and the subsequent downstream flooding of the Roer River delayed Simpson's supporting attack by more than a week. As a consequence, the battle, planned to last only a few days, dragged on for several weeks.

The assault commenced on February 8, 1945, with a five-hour artillery barrage by 1,000 Allied guns against the German fortifications. British lieutenant general Sir Brian Horrocks's XXX Corps led the attack, which consisted of (from north to south) the Canadian 3rd and 2nd Divisions and the British 15th (Scottish), 53rd (Welsh), and 51st (Highland) Divisions. Delays in the advance, however, enabled Schlemm to bring up reserves as well as PzKpfw IV tanks and assault guns of the Panzer Lehr Division. The Germans fought with great tenacity in what was some of the most bitterly contested combat of the war.

By opening the gates of the Roer River dams, Schlemm forced Simpson to postpone the Ninth Army's attack for almost two weeks. By the time the Ninth Army launched what was to have been a supporting attack on February 23, the Canadian and British troops had already achieved almost all their objectives. Supported by massive artillery barrages and air support, they slowly forced the Germans from their defensive positions. The Germans fought particularly hard in and around the strategic towns of Kleve, Goch,

and Kalkar. The Canadian II Corps suffered heavy losses advancing east of Kleve, and the British XXX Corps sustained considerable casualties near Goch. Schlemm was able to get his paratroops and most of his heavy equipment across the Rhine before blowing its bridges. The last Fallschirmjäger (paratroops) crossed the Rhine at Bruedrich in boats on March 10, 1945.

British and Canadian forces suffered 15,634 casualties, nearly two-thirds of which were in XXX Corps. Horrocks later wrote that the brutal Reichswald fighting reminded him of the carnage in World War I. The operation had cost the Germans heavier losses, however. The 11 German divisions involved in the fighting lost between 22,000 and 75,000 men; some 16,000 Germans were taken prisoner. The commitment of so many German reserves to the fighting in the Reichswald helped to open the way for U.S. advances farther south.

Reinhardt, Georg Hans (1887–1963)

German Army general. Born at Bautzen, Saxony, Germany, on May 1, 1887, Georg Hans Reinhardt entered the German Army in 1907 as an officer candidate. He fought in World War I and continued in the Reichswehr afterward. Between 1934 and 1937, Reinhardt headed the Army Training Section. Promoted to major general in 1937, he assumed command of the 4th Panzer Division in 1938 and led it in the invasion of Poland on September 1, 1939.

An outstanding panzer leader, Reinhardt was promoted to lieutenant general in October 1939. He then commanded the XLI Panzer Corps (6th and 8th Panzer Divisions) and led it ably in the May 10–June 25, 1940, French Campaign as part of Colonel General Günther von Kluge's Fourth Army.

In June, Reinhardt was promoted to general of panzer troops. He then led the XLI Panzer Corps in the Yugoslavia Campaign (April 1941) and in the invasion of the Soviet Union (June 22). In the latter effort, the XLI Panzer Corps was part of Colonel General Erich Hoepner's Fourth Panzer Group in Army Group North. Reinhardt's corps participated in the drive on Leningrad, penetrating the city's outer defenses in July.

In October 1941, Reinhardt succeeded Colonel General Hermann Hoth as commander of the Third Panzer Army and led it to Kalinin (December 15) and to the Volga-Moscow Canal. In February 1942, Reinhardt was promoted to colonel general. The Third Panzer Army participated in fighting at Vitebsk, the counterattack through Vyasma, and actions in the Moscow sector of the Eastern Front.

Still in command of the Third Panzer Army, Reinhardt took over Army Group Center on August 15, 1944, from Field Marshal Walther Model. Soviet attacks pushed the front back into East Prussia near Königsberg, where Reinhardt denounced the local Gauleiter (Nazi Party regional leader) for not evacuating women and children. Reinhardt's forces were hopelessly outnumbered by the Soviets in terms of manpower and equipment.

Both the Soviet 3rd Belorussian Front and the 2nd Belorussian Front attacked in January 1945. Because Reinhardt's troops initially held their ground, Adolf Hitler transferred the Panzer Corps Grossdeutschland from Reinhardt's command to Army Group A. That move, along with clear weather that worked to the Soviets' advantage, doomed Army Group Center. With the Soviets advancing on both flanks, Reinhardt informed Hitler by phone that he intended to withdraw farther west. Hitler refused permission and dismissed Reinhardt on January 25, 1945.

Reinhardt then was assigned to the Führer Reserve. He was taken prisoner at the end of the war and brought to trial on war crimes charges. Convicted and sentenced to 15 years in prison, he was released in 1952. Reinhardt died in Munich on November 22, 1963.

Reitsch, Hanna (1912–1979)

German test pilot. Born in Hirschberg, Silesia, on March 29, 1912, Hanna Reitsch mastered glider aviation skills as a young woman. She was one of the earliest pilots to soar over the Alps, and she flew a glider for 11.5 consecutive hours, setting a world record. In 1934, she piloted a glider to an altitude of 9,186 feet, the highest any woman had glided.

Adolf Hitler shaking hands with aviator Hanna Reitsch, recipient of the Iron Cross, as Hermann Göring and others look on, March 28, 1941. (Library of Congress)

Reitsch also mastered powered aircraft and became a valued test pilot, with the rank of flugkapitän (flight captain), testing experimental aircraft for the Luftwaffe. In 1937, she became the first woman to pilot a helicopter. During World War II, Reitsch tested a variety of aircraft, including fighter planes, dive-bombers, and the Messerschmitt Me-163 rocket aircraft. She also tested aerial methods to cut barrage balloon tethers. Reitsch was one of just two women to be awarded the Iron Cross First Class and the only civilian so honored.

A fervent supporter of Adolf Hitler, Reitsch proposed establishing a women's pilot squadron, an idea that German military leaders rejected. The incredibly brave Reitsch piloted the final German flight into Berlin, carrying Luftwaffe field marshal Robert von Greim to a meeting with Hitler and landing on a shell-pocked Berlin avenue on April 26, 1945. Reitsch offered to stay with Hitler and share his fate, but she was ordered to fly Greim from the city several days later.

Arrested after the war, Reitsch was held by U.S. authorities for 18 months. When freed, she went first to India and then to Ghana, where she opened an aviation school to teach gliding. She became the first female winner of the World Helicopter Championships in 1971. Many aviation historians consider her to have been the 20th century's most outstanding female pilot. Reitsch died at Frankfurt, Germany, on August 24, 1979.

Religion and the War

With World War II's casualty toll measured in scores of millions, one might initially imagine that the war brought a total eclipse of religious sentiment. Certainly, this partly occurred in both Europe and Asia, as war's barbarity ran to extremes in such atrocities as the systematic destruction of Jews in the Holocaust or the Nanjing (Nanking) Massacre. Yet at both institutional and personal levels, religion continued to shine forth—sometimes erratically, unpredictably, or fleetingly and not always for good but also not always for evil.

Both good and evil characterized the record of the Roman Catholic Church. Priests in Poland heroically resisted Nazi oppression and served with distinction as chaplains at the front, often ministering to both Protestants and Catholics. Churches, monasteries, and individual Catholics helped to shelter Jews from the Holocaust. Yet nationalistic Catholic priests in Slovakia and Croatia sanctioned or participated in ruthless persecutions of non-Catholics, especially Jews and Orthodox Serbians. Meanwhile, Pope Pius XII, elected to the papacy in March 1939, refused to publicly condemn Nazi atrocities against Poles, Jews, and other peoples. One might say charitably that Pius XII took the long view of the war, putting the survival of the apostolic episcopate and the Vatican ahead of the uncertain efficacy of protesting war crimes.

Certainly, the Catholic Church in Germany expressed nearly unqualified support for Adolf Hitler and the war, although these expressions mainly called for German men to serve the Fatherland at the front. Most Catholics agreed with the rhetoric of "crusade" that the Nazis employed against Bolshevism. Open opposition to Nazi policy, such as that in sermons delivered by Archbishop Galen of Münster in 1941 condemning Germany's euthanasia program, was decidedly uncommon. Those few Catholics who dared speak out sometimes paid with their lives, among them the Jesuit Alfred Delp, who, as a member of the Kreisau Circle, sought to define a new Germany after the Third Reich's anticipated demise.

German Protestant opposition to the Nazi war effort was equally rare and could prove just as deadly. Ludwig Müller, a devotee of Adolf Hitler, became Reich bishop of the German Lutheran Church. His plan to meld the church and National Socialism was supported by the Deutsche Christen (German Christians) but rejected by Hitler, who instead sought to curtail Christianity's influence throughout the Reich.

The less numerous Confessionals within the church were more critical of

Nazi policy. Among their members were Martin Niemöller and Dietrich Bonhoeffer, who founded the Pastors' Emergency League to resist Nazi interference in church activities, the subjugation of faith to Fatherland, and the unbending and unreflective obedience to duty.

Arrested in 1943 by the Gestapo, Bonhoeffer penned his famous *Letters and Papers from Prison*, calling for a "religionless" Christianity in which believers could profess the faith as a matter of individual conscience. They could thereby avoid religious institutions that had been irredeemably compromised by Nazism. Bonhoeffer paid for his elevation of individual conscience and his involvement in the July 1944 plot against Hitler's life with his own life in April 1945.

The de facto policy of Nazi Germany was essentially noninterference with organized Christianity as long as religionists supported or acquiesced in the activities of the regime. Those who refused to take oaths of loyalty, such as the Jehovah's Witnesses, were sent to concentration camps, and many perished. (The United States also imprisoned Jehovah's Witnesses for refusing to register for the draft.) The Nazis themselves attempted to undermine Christianity with neo-pagan rituals and hypernationalism. Among more fanatical Nazis, the führer became a new messiah, *Mein Kampf* became a new bible, and iron crosses and swastikas became the new crucifixes. Yet most Christians in Germany experienced little distress in preserving traditional Christian symbols and beliefs while professing allegiance to Hitler and the Nazi Party. Opposition to the war became a force in Germany only after major military setbacks, notably the defeat at Stalingrad in early 1943.

In countries occupied by Germany, religion sometimes served to unify resisters to Nazi rule, as it did in Poland, Holland, Norway, Belgium, Denmark, and other nations. Yet the opposite could be true as well, at least initially. In France, the Catholic Church supported head of state Henri Philippe Pétain and his collaborationist Vichy government, because the latter drew its strength from conservatives sympathetic to Catholicism, a contrast to their republican or socialist counterparts in the interwar period. As Nazi occupation policy grew more oppressive, French Catholics such as Jacques Maritain began calling for heartfelt examinations of individual conscience and resistance to totalitarian forms of government. Maritain's *Christianity and Democracy* (1943) pointed the way toward the Christian Democratic parties of the postwar period.

Where religious identity mattered in deadly earnest, of course, was among Jewish communities scattered throughout Europe. Widespread European anti-Semitism, internecine struggles over the desirability and practicality of Zionism, and debates over orthodoxy and proper observance of Jewish law further fractured an already fragmented Jewish community, which was then systematically annihilated by the Nazis. Yet Judaism persisted. The Nazis could destroy the Jews' synagogues, cut off their beards, and even murder them but could not annihilate their faith. Despite Nazi prohibitions, many Jews practiced their faith surreptitiously in the ghettos, demonstrating fortitude and fidelity to their forefathers and precipitating acts of moral and violent resistance against their nominally Christian German persecutors. The Holocaust led some Jews to reject God, whereas others embraced him more closely. Few Jews were left unchanged by the war.

Chief rabbi Dr. J. M. Hertz preaches in the bombed-out Great Synagogue in Aldgate, London, during National Prayer Day, September 7, 1941. (Eric Harlow/Keystone/Hulton Archive/Getty Images)

Jewish immigration to Palestine in the 1930s and Zionist ambitions had provoked Arab revolts against British rule from 1936 to 1939. In 1939, attempting to appease Arab demands, the British limited Jewish immigration to Palestine to 75,000 for the next five years. By quelling Arab dissent, the British were able to redeploy two divisions from Palestine to the home islands to resist the anticipated Nazi assault on Europe. Dissatisfied with the British response, Amin al-Husseini, the grand mufti of Jerusalem, approached the Nazis, a move that compromised his moral authority and the political credibility of the Palestinian Arab cause. After fleeing to Germany to avoid British arrest, Husseini vocally supported the Holocaust and worked to recruit Muslims for the Waffen-SS.

Yet the Muslim-Jewish split in Palestine was arguably less significant during the war than the shared goal of checking Nazi aggression. Thus it was that the British Eighth Army, which included thousands of Indian Muslim troops, thwarted Nazi ambitions to conquer Palestine, thereby saving the tens of thousands of Jews residing there. After the war, Britain relinquished its mandate over Palestine to the United Nations, whose support of a Jewish state led to Israel's creation but also to inflammatory disputes over Jerusalem and other territories—disputes that remain unresolved to this day.

In Britain and the United States, organized religion lent its moral authority to the holy crusade against Nazi Germany. The Nazi combination of unrelenting territorial ambition suffused with genocidal racial ideology was so transparently evil that few people in the West objected to combating Germany after 1941. Such was not the case earlier in the war, when some viewed fascism as a dangerous but nevertheless more congenial alternative than communism.

In his Four Freedoms, however, President Franklin D. Roosevelt made it clear that democracy best preserved people's freedom to worship. The four chaplains—Catholic, Methodist, Reform Church, and Jewish—who together lost their lives in the torpedoing of the U.S. Army transport *Dorchester* in 1943 set a powerful example of ecumenism and religious unity that served the Western democracies well in prosecuting the war.

Joseph Stalin also recognized the importance of religion to fighting spirit. Soon after the German invasion of June 22, 1941, he suppressed the League of Militant Atheists (an organization founded in 1917). He then permitted the reappointment of a patriarch (Sergius) for the Russian Orthodox Church

(Peter the Great had eliminated the post in 1721). Orthodox priests—now freed from prison, with their rights to preach guaranteed and their churches reopened to the faithful—rewarded Stalin with calls for a holy war to defend the homeland against bloodthirsty and barbarous Nazi "jackals," a call that was answered with considerable enthusiasm by many Soviet citizens.

The Pacific theater witnessed even more intense expressions of religiously inspired nationalism. In Japan, the state Shinto religion merged with militant and nationalistic expressions of the Bushido warrior code to elevate emperor veneration and expansionist rhetoric to unprecedented heights. In such a setting, battle became a Shinto purification rite to cleanse Asia of corrupt, materialistic Westerners. Japan planned to incorporate Asia and the Pacific Basin into a coprosperity sphere ruled by its army and navy, agents of the divine emperor. Militarism extended even to Japanese Buddhist sects, such as the Nichiren sect, which aggressively sought to provoke incidents in China to justify Japanese expansionism and imperial exploitation.

Meanwhile, Western missionaries in China played pivotal roles as witnesses to Japanese war crimes, most notably the infamous Nanjing (Nanking) Massacre (1937). Faced with the fanaticism of Japanese soldiers, sailors, and aviators, the West responded with its own "war without mercy," in John W. Dower's memorable phrase, that caricatured the Japanese as irredeemable, inhuman vermin. With Shintoism viewed in the West as a debased form of primitive nature and ancestor worship, there was little room for Christian accommodation.

Whether it was Japan's divine sense of mission against Western domination or Nazi crusades against godless Bolshevism or Allied efforts against degenerate and murderous Nazism, World War II often became a moral and religious crusade with little tolerance for pacifists and conscientious objectors. Nevertheless, avoiding military service on religious grounds was possible, if suspect—a fact that cast a shadow over even long-term pacifists such as the Society of Friends (Quakers). Conscientious objectors were tolerated most in countries whose existence was threatened least, such as the United States and Canada.

Here, one must note the success of Mohandas Gandhi in pursuing a nonviolent protest against British rule in India. Its tragic denouement in Hindu-Muslim violence that led to Gandhi's assassination and the India-

Pakistan split in 1947 should not obscure the spiritual power of his war of ideas.

Religion was perhaps most crucial in the postwar world in helping to restore morality and human decency after the genocidal catastrophes and horrific casualties of the war. Ecumenicism was plainly more evident; the World Council of Churches, founded in 1948, brought together 147 different churches from 44 countries. Evangelism within Christianity also increased as resistance to communism became the new raison d'être of many European and American Christians. Meanwhile, Jews attempted to recover from the enormity of the crimes against them while simultaneously defending the State of Israel.

Many people, Jews and Christians alike, were left to ponder the question raised and the confession made by Christians such as Emmi Bonhoeffer, who asked how a German population consisting of 95 percent baptized Christians could have supported or acquiesced in unspeakable Nazi war crimes. Many believers confronted (or sometimes actively avoided) this and similar questions of conscience after 1945.

Remagen Bridge, Capture of the (March 7, 1945)

In early 1945 as the Germans withdrew across the Rhine, they destroyed its bridges. Not expecting to find a bridge intact, American forces planned to pause along the Rhine while, to the north, Field Marshal Bernard L. Montgomery's 21st Army Group drove between Düsseldorf and the Dutch frontier to secure the Ruhr. Such a delay was unacceptable to U.S. generals Omar N. Bradley and George S. Patton, who wanted to cross the Rhine as soon as possible and maintain pressure on the German Army. American forces had narrowly missed capturing several bridges over the Rhine.

At noon on March 7, 1945, Task Force Englemann (commanded by Lieutenant Colonel Leonard Englemann), consisting of the U.S. 14th Tank and 27th Armored Infantry Battalions of Combat Command B of the 9th Armored Division, reached the Ludendorff Railroad Bridge at Remagen, 20 miles upriver from Bonn. The bridge, the last still intact over the Rhine, had two rail tracks and a pedestrian walkway. When the French had occupied the region following World War I, they had poured large quantities of cement into the demolition chambers under the bridge, which made it difficult to destroy. Indeed, the Germans had failed to blow it twice before the Americans arrived. The bridge was held by an inadequate force of only a platoon of German soldiers.

On March 7, 1945, Task Force Englemann captured the Ludendorf Bridge. Spanning the Rhine at Remagen, it was at the time the only bridge left standing across that river. (Corbis)

At 4:30 p.m. on March 7, the lead U.S. units received orders to take the bridge at all costs. The Germans detonated charges that cratered the approach to the bridge, but a U.S. tank round had severed the power cables between the electrical source and the main charge on the bridge itself. As the Americans dashed forward, the Germans did detonate a low-quality backup charge, but the explosion only shook the bridge.

During the next 10 days, the United States rushed nearly 50,000 troops and dozens of vehicles across the bridge into Germany. Almost from the moment the bridge was captured, engineers began constructing supplementary crossings, including a large Treadway pontoon bridge. Begun on March 9, the auxiliary bridge was completed 80 hours later.

The Germans tried to destroy the Remagen Bridge with aerial bombing, V-2 rockets, jet aircraft, and even an assault by frogmen. On March 17, 1945, the bridge collapsed with little prior warning, killing 28 Americans. Studies revealed that it had given way due to overuse, especially by heavy vehicles.

The dramatic capture of the Remagen Bridge facilitated the infusion of Allied forces into Germany and likely shortened the war in Europe. Later, General Dwight D. Eisenhower declared that the bridge was "worth its weight in gold."

Rendulic, Lothar (1887–1971)

German Army general. Born at Wiener Neustadt, Austria, near Vienna, on November 23, 1887, Lothar Rendulic joined the Austro-Hungarian Army, became a lieutenant in 1910, and served during World War I. He then studied law at the University of Vienna, earning his doctorate in 1920. During the interwar years, he held several senior positions in the Austrian Army, but because of his membership in the Austrian National Socialist Party, he was dismissed in 1936.

After the German annexation of Austria in 1938, Rendulic joined the Wehrmacht as a major general. From September 1939, he served as a division and corps commander in Poland, France, and the Soviet Union. Between April 1943 and June 1944, he commanded the Second Panzer Army in the Balkans. In the course of conducting antipartisan warfare, Rendulic's army committed numerous war crimes against civilians.

At the end of June 1944, Adolf Hitler appointed Rendulic commander of Twentieth Mountain Army, with the rank of colonel general. He led his retreating army from Finland to Norway and commanded German forces in Norway from December 1944 to January 1945. In October 1944, Rendulic ordered the complete destruction of all means of subsistence and the evacuation of the entire civilian population of northern Norway. During October and November 1944, this order was ruthlessly carried out. Rendulic then demonstrated a remarkable administrative ability as he organized the retreat of 200,000 men across the Arctic, with few roads available.

In succession, Rendulic next commanded Army Group North (January to March 1945), Army Group Kurland (March to April), and Army Group South (April to May). At the end of the war, he fought the Soviets in Austria. Tried and convicted at the Military Tribunals at Nuremberg, he received a 20-year sentence but was released in December 1951. Rendulic died at Linz, Austria, on July 17, 1971.

Rennell Island, Battle of (January 29–30, 1943)

Naval battle fought between U.S. and Japanese forces off Guadalcanal. At the beginning of 1943, the Japanese were gathering shipping at Rabaul, Buin, and Java for the evacuation of their forces from Guadalcanal, but the United States assumed that this buildup was a major Japanese effort to reinforce the island. U.S. Navy South Pacific commander Admiral William Halsey assembled substantial naval assets, and with relief of the last marine elements on Guadalcanal requiring the dispatch of a number of transports to the island, he decided to send five separate task forces with the transports in hopes that the Japanese would challenge the passage. Sufficient fuel was not available for the Japanese to make a major naval effort, but they did commit air units.

The U.S. ships assembled at different points and then moved north in six separate groups. Three of these did not participate in the subsequent battle: one force of four light cruisers and four destroyers, another of the battleships *North Carolina* and *Indiana,* and a third force around the carrier *Saratoga*. A fourth group, centered on the carrier *Enterprise,* did see action. These four trailed the two forward groups—the first consisting of three President-class transports and the *Crescent City* and the second being Task Force (TF) 18, a close-support group of cruisers, escort carriers, and destroyers commanded by Rear Admiral Robert C. Giffen.

TF 18 took the brunt of the subsequent fight. The force included the heavy cruisers *Wichita, Chicago,* and *Louisville;* the light cruisers *Montpelier, Cleveland,* and *Columbia;* the escort carriers *Chenango* and *Suwannee;* and eight destroyers. The transports departed Nouméa on January 27, the same day the support group left Efate. The ships were to rendezvous 15 miles off Cape Hunter on the southwest coast of Guadalcanal at 9:00 p.m. on January 30. To make the rendezvous on time, Giffen was forced to leave behind the two escort carriers with two destroyers at 2:00 p.m. on January 29.

Japanese reconnaissance aircraft and submarines had located Giffen's ships on the afternoon of January 27. The Japanese then sent out some 30 Mitsubishi G4M ("Betty") medium land-based bombers from Munda Field, Buka, and probably Rabaul. The last U.S. combat air patrol aircraft retired at sunset, leaving the six cruisers without air protection.

TF 18 was then about 50 miles north of Rennell Island, moving northwest toward the rendezvous point at 24 knots. Its ships were in a rivet-shaped formation, with the destroyers in a semicircle two miles in advance of the cruisers, which were steaming in two lines 2,500 yards apart. Before sunset, U.S. ship radars identified the approach of the Japanese bombers, but Giffen did not order either a change of course or a different formation to defend against air attack.

The Japanese torpedo bombers circled to the south of the U.S. formation and then split into two groups for a low-level attack. The first Japanese effort was futile and cost one aircraft, but attacks continued after dark, aided by air-dropped flares. The Mark-32 proximity fuze, employed in U.S. antiaircraft shells for one of the first times, helped claim a number of attacking aircraft, but Japanese torpedoes heavily damaged the *Chicago*.

At 10:00 p.m., Giffen ordered a change of course. The Japanese aircraft failed to detect the change, and most then departed for home. The *Louisville* took the stricken *Chicago* in tow and began to move it toward Espiritu Santo at a speed of four knots. Admiral Halsey in Nouméa ordered the escort carriers *Chenango* and *Suwannee* to provide combat air patrol to protect the two cruisers, and he diverted a tug and other vessels to assist. By 3:00 p.m., the tug *Navajo,* screened by six destroyers, had the *Chicago* under tow. There was as yet no combat air patrol when the Japanese struck with a dozen Bettys. Aware of their approach, the *Enterprise* had launched F-4F Wildcats to intercept them. U.S. aircraft shot down some of the Bettys, but nine survived to attack the crippled cruiser, while the *Navajo* made a futile effort to position the cruiser with its bow toward the attackers. Although seven of the last Bettys were shot down, four torpedoes struck the *Chicago*. It sank within 20 minutes, and the escorting ships collected 1,049 survivors.

Although the Battle of Rennell Island was a defeat for the United States and demonstrated Japan's success in night fighting, the Japanese concentration on TF 18 enabled the U.S. transports to continue on

unmolested and land their troops and supplies without incident, as did a second convoy of five transports arriving at Guadalcanal on February 4.

Resistance

Defined here as the act of opposing a foreign occupying power, resistance has existed since the beginning of warfare and conquest. There have always been citizens of an occupied nation who refused to accept the military verdict and attempted to continue the fight against the victor, sometimes with success. During World War II, there was some degree of resistance in every Axis-occupied country not only to the military conquest but also to Axis ideology. The degree varied sharply, depending on the nation and circumstances.

The word "resistance," in the sense of actions taken, encompasses everything from noncooperation to civil disobedience, conducting intelligence activities, committing sabotage and assassinations, running escape lines, and even carrying out hit-and-run raids against small enemy units. Resistance can also mean an organization or a particular movement, such as the Maquis in France. Resistance may be undertaken by individuals or by groups of people organized to work clandestinely against an oppressor. To the occupied people, those who engage in such activities are resisters and are often held up as heroes. To the occupying power, they are considered bandits, criminals, and even terrorists.

To exacerbate the confusion, most nations have created myths concerning their resistance activities. As a consequence, we will never know, even approximately, the numbers of people actually involved in such activities. After the war, for quite understandable reasons, the governments of many countries, including France, sought to magnify the numbers of citizens involved in resistance work and their contribution to victory.

Resistance movements during World War II were sharply fragmented along national lines, and there were even bitter rivalries within groups of resisters in individual nations that often led to bloodshed. These rivalries were the result of deep ideological and religious differences, long-standing ethnic feuds, fiefdoms, and petty jealousies among the leaders themselves.

In Czechoslovakia, Defense of the Nation and the Falcon Organization vied with one another. In the Netherlands, various religious and political groups emerged, but they did not work together until September 1944. In France, resisters were markedly divided at first: not until May 1943 was the National Resistance Council (CNR) formed, uniting all major French Resistance groups. In Greece, infighting among the National Popular Liberation Army (Ellinikós Laïkós Apeleftherotikós Stratós, ELAS), the National Republican Greek League (Ethnikos Dimokratikos Ellinikos Syndesmos, EDES), and the communist National Liberation Front (Ethniko Apeleftherotiko Metopo, EAM) led to a civil war after World War II had ended. In Albania, royalist Zogists fought a prorepublican group of resisters.

The Yugoslavia Resistance was polarized between the royalist Četniks under the leadership of Dragoljub “Draza” Mihajlović and communist Partisans led by Josip Broz (better known as Tito). The Ćetniks were promonarchy and conservative, whereas the Partisans were antimonarchy and sought a postwar communist state. The Četniks were also reluctant to embark on the types of operations that would bring reprisals against the civilian population, such as direct attacks on German troops. The Partisans felt no such compunction. Inside the Soviet Union, many resisters sought not only freedom from the Germans but also freedom from Soviet control as well.

Often, Allied agents who parachuted into an occupied state had difficulty sorting out all these rivalries and making the appropriate determinations as to where Allied financial and military assistance should be directed. Throughout the occupied countries, the communist resistance groups, although they were late to take the field (until the German invasion of the Soviet Union on June

22, 1941, Joseph Stalin advocated close ties with Nazi Germany), tended to be highly effective because they were better trained and organized; with strong ideological motivation, they had no reservations about the use of force.

Geography impacted resistance activities and determined the levels of action and participation. Mountainous, forested, or swampy terrain favored the guerrilla. It was thus easier to conduct resistance activities in Norway, Yugoslavia, Albania, and Greece, all countries with many hills, forests, and caves. In Asia, jungles often worked to the advantage of the resistance forces as well.

Resistance took many forms and was both passive and active. Passive resistance was generally nonconfrontational and a method of coping and asserting one's patriotism. Passive resistance involved many people in occupied Europe and in Asia. It encompassed a wide range of activities and might include nothing more than reading an illegal newspaper, selling or buying goods on the black market, or not handing in materials decreed necessary for the Axis war machine. It might also mean secretly listening to church sermons, praying for a royal family or leaders in exile, listening to broadcasts from the British Broadcasting Corporation (BBC), leaving a public place when a German entered it, or other such actions. At the highest levels, passive resistance might include balking at anti-Jewish legislation or not handing over individuals sought by the occupier and seeking to evade the occupying power's exactions.

Active resistance included intelligence gathering; acting as couriers or radio operators; disseminating information or Allied propaganda, through such means as underground newspapers; printing false identification papers and ration cards; rescuing downed Allied pilots and assisting them to neutral nations; committing acts of sabotage; freeing prisoners; hiding Jews; and even carrying out assassinations of individuals and conducting military actions against small numbers of occupying troops. Active resistance was far more dangerous and often life-threatening, both to the individual involved and to his or her family. For that reason, those who engaged in it were always a minority. Considerable courage as well as clairvoyance were required for a Frenchman to see, in 1940, that Germany might indeed lose the war, let alone for him to be willing to risk all toward that end.

The British Special Operations Executive (SOE), established by Prime Minister Winston L. S. Churchill in 1940, helped finance and train agents

from the nations of Axis-occupied countries to carry out active resistance activities. Its U.S. counterpart, the Office of Strategic Services (OSS), conducted similar activities. The SOE and the OSS enjoyed some successes, but they also experienced a number of failures leading to the deaths of agents. The most dramatic failure resulted from ENGLANDSPIEL (ENGLAND GAME), an elaborate German counterintelligence operation in the Netherlands during 1942–1944 that ended in the deaths of many Allied agents. Resisters had to exercise constant vigilance—and not only against the occupying forces. The governments of their own countries, working with the occupiers, often sent out forces (such as the Milice in France) to hunt them down.

One notable resistance success was the February 1943 strike executed by British-trained Norwegian resisters against the hydroelectric plant at Vemork, Norway. This raid and the subsequent sinking of a ferry delayed German production of the heavy water essential for the production of an atomic bomb.

The Poles, who suffered terribly at the hands of their German and Soviet occupiers during the war, immediately established active resistance operations. They provided immensely useful intelligence on the German development of V weapons, and they created the secret Home Army. Jews in the Warsaw ghetto employed active resistance as well, rising up against the Germans and providing a heroic example of courage against impossible odds.

The French Maquis also fought the Germans. Resistance activities mounted from the Vercors Plateau in the Alps of eastern France provoked a strong reaction in the form of 20,000 German troops who, in June 1944, decimated the Vercors Maquis and mounted savage reprisals against the civilian population. The Germans carried out ferocious reprisals elsewhere as well. Often, they executed innocent civilian villagers or hostages at the rate of 20 or more for each of their own slain. Reprisals were especially fierce after British-trained Czech commandos assassinated the Reich protector of Bohemia and Moravia, Reinhard Heydrich. His death led the Germans to kill most of the inhabitants of Lidice and level the town. Communities in other parts of Europe suffered a similar fate.

Members of the Maquis, French Resistance fighters, moving on a mountain trail, September 18, 1944. The Resistance played an important role in the liberation of France. (Hulton-Deutsch Collection/Corbis)

Resistance activities sharply increased as the Axis powers suffered military reversals, especially when it became clear that they would lose the war. Resisters had to be constantly on guard and regularly change their modus operandi. They also had to contend with double agents, of whom there were a substantial number. For example, French Resistance leader Jean Moulin, head of the CNR, was betrayed to the Geheime Staatspolizei (Gestapo) by an informant.

The effectiveness of resistance activities during the war is difficult to gauge. Such activities may not have greatly sped up the end of the war, but they did affect events in that the occupiers were forced to divert many troops from the fighting fronts to occupation duties and to hunting down the resistance forces. Resistance in all its forms was a vindication of national identity and pride and a statement for freedom. Unfortunately for resistance leaders in many countries, their bright and idealistic hopes that the war would bring new political structures were, for the most part, left unfulfilled. In most nations, these individuals were thanked politely and then shown the door, as the old elites soon reestablished themselves in power.

Some resistance groups, of course, fought not only against the Axis powers but also against colonial forces. Thus, in Vietnam, the Viet Minh led

by Ho Chi Minh fought both the Japanese and the French. As a consequence, the resistance continued in a number of countries after World War II ended, utilizing the methods and weapons supplied to fight the Japanese. Such was the case in Vietnam, in the Philippines, and even in the Soviet Union.

Reuben James, Sinking of (October 31, 1941)

The loss of the U.S. Navy destroyer *Reuben James* (DD 245) to the German submarine *U-552* on October 31, 1941, helped move the United States closer to entering World War II. The *Reuben James* was a Clemson-class "Four Piper" destroyer, named for the U.S. sailor who, interposing his own body, had saved the life of Lieutenant Stephen Decatur during the Barbary Wars. Commissioned in 1920, "the Rube," as the destroyer came to be known,

displaced 1,200 tons, was capable of speeds in excess of 30 knots, and was armed with 4 4-inch guns and 12 21-inch torpedoes.

On the outbreak of the war in Europe in 1939, the *Reuben James* was assigned to patrol duty off the East Coast of the United States. In March 1941, it joined Squadron 31 in the Atlantic as part of the Northeastern Escort Force assigned to escort convoys as far east as Iceland and as far west as the United States.

On October 31, 1914, commanded by Lieutenant Commander Heywood L. "Tex" Edwards, the *Reuben James* was some 600 miles west of Iceland, with 4 other destroyers escorting 44 merchantmen in eastbound convoy HX.156. It was steaming on the port beam of the convoy abreast of the last ship in the column that morning when it was hit without warning on the port side by a torpedo fired by the German *U-552*. The *U-552* was a Type VIIC boat, commissioned on December 4, 1920, and commanded by Corvette Captain Erich Topp. Displacing 1,070 tons and armed with 14 torpedoes, mines, and an 88mm deck gun, it had a crew of 44–52 men.

Evidently, the torpedo explosion touched off ammunition in the destroyer's forward magazine and split the ship in two. The stern remained afloat for about five minutes, and then it too sank. Only 45 men survived; 115 others, including Edwards and all the officers, went down with the ship.

Within days, U.S. president Franklin D. Roosevelt had transferred the Coast Guard to the U.S. Navy. The next week, Congress amended the Neutrality Act by authorizing the arming of U.S. merchantmen and removing restrictions that denied European waters to U.S. shipping. The U.S. Navy could now convoy Lend-Lease goods all the way to British ports. The *Reuben James* was the only U.S. Navy ship lost to the German Navy before the United States entered World War II.

Reynaud, Paul (1878–1966)

French premier early in World War II. Born on October 15, 1878, in Barcelonnette, Alpes-de-Haute-Provence, France, Paul Reynaud earned a doctor of law degree at the Faculté de Droit at the Sorbonne. He joined the bar and built a practice in civil and commercial law. During World War I, he served in the medical corps, winning the Croix de Guerre and the Legion of Honor. Reynaud secured election to the Chamber of Deputies in 1919. He failed to win reelection in 1924 but was again elected to the chamber four years later. He held this seat until the end of the republic.

A major political figure in the Third French Republic, beginning in the 1930s Reynaud was named to the cabinet eight times, three of them in the Ministry of Finance. A maverick on many issues, as early as 1935 he supported the reformist ideas of the army's Lieutenant Colonel Charles de Gaulle for the organization of a powerful armored force to confront the Germans.

As minister of justice from April 1938 in the government of Édouard Daladier, Reynaud opposed the Munich Agreement but then accepted the post of minister of finance. When Daladier was forced to resign as premier for failing to vigorously prosecute the war, Reynaud became the premier on March 20, 1940. He was saddled with having his political rival Daladier as his defense minister but proposed aggressive action against the Germans, including plans to intervene in Norway. Reynaud and British prime minister Neville Chamberlain also discussed means of aiding the Finns in their war against the Soviet Union.

Following the German invasion of France and the Low Countries on May 10, 1940, Reynaud tried to rally the French nation, announcing in a radio address that "The situation is grave; it is not desperate. The Maginot Line is there … intact, robust, unbreakable." He also sought to strengthen the government by bringing into it Marshal Henri Philippe Pétain and General Maxime Weygand.

Reynaud pledged to continue the fight, but by the end of May, with the military situation fast deteriorating, he met with British prime minister Winston L. S. Churchill and warned that he might be unable to keep his

pledge not to negotiate a separate armistice. The government fled to Bordeaux in southwest France, and defeatists in the cabinet gained strength. Reynaud favored continuing the fight, if necessary overseas. When Churchill proposed a merger of France and Britain, Reynaud agreed, but this union was disavowed by a majority of the cabinet.

On June 16, 1940, Reynaud resigned. Arrested by the Vichy government in August, he was held until November 1942, when he was handed over to the Germans. Taken to Germany, he remained a prisoner until he was liberated at the end of the war.

Reynaud returned to France and became a leading politician in the Fourth Republic from 1946. He headed the committee drafting the French Constitution that ended the Fourth Republic and began the Fifth Republic. Reynaud supported Charles de Gaulle until 1962 and was also an early advocate of the unification of Europe. Reynaud died in Neuilly-sur-Seine, France, on September 21, 1966.

Rhine Crossings (March 7–24, 1945)

The Rhine River was a formidable defensive advantage for the German Army and the greatest natural obstacle in the path of the advancing Western Allies after their crossing of the English Channel. Ranging in width from 700 to 1,200 feet and at no point fordable, the river was at flood levels in early March 1945, thanks to spring rains and melting snow. The Rhine was also in

German territory and thus would be defended at great cost. Allied plans called for British field marshal Bernard Montgomery's 21st Army Group to cross the Rhine in the north, while U.S. general Omar N. Bradley's 12th Army Group would cross in the south. The majority of resources were to be assigned to Montgomery, whose forces were then to secure Germany's industrial heartland of the Ruhr Valley.

German defenders had already blown most of the bridges across the Rhine accessible to the advancing Allies when, on the afternoon of March 7, lead elements of the 9th Armored Division of Bradley's army group were able to secure the Ludendorff Railroad Bridge at Remagen. Troops and vehicles were rushed across as combat engineers hurried to construct other bridges. Meanwhile, DUKW amphibious trucks and engineer ferries supplemented the bridge.

Not to be outdone, U.S. lieutenant general George S. Patton sought to secure a crossing for his Third Army. He planned to make a feint at Mainz and then cross at Oppenheim. Late on the night of March 21, elements of the 5th Infantry Division crossed the river at Oppenheim without resistance. To secure surprise, there was no preliminary fire. South of the city, another assault company got across but then met heavy German resistance on the other bank. German artillery fire was only sporadic. Patton's sneak crossing worked well indeed.

Patton's forces then expanded the bridgehead, employing ferries, DUKWs, and landing craft known as LCVPs (landing craft, vehicle or personnel). By evening, the bridgehead was five miles deep. Patton's army made two other assault crossings of the Rhine. Lead elements of the 87th Infantry Division crossed in the early morning hours of March 25 at Boppard, and the following morning the 89th Infantry Division got across at Saint Goar.

Despite the good fortune of the Remagen crossing and Patton's crossing to the south, the Allied plan still called for the northern crossings, code-named Operation PLUNDER, to be the main attack. Montgomery massed nearly 1 million men along the lower Rhine: 21st Army Group units in the crossing included the 9 divisions of the British Second Army and the 12 divisions of the U.S. Ninth Army. The U.S. Navy's Naval Unit 3 supported the 21st Army Group and was the largest of three such supporting units for the Rhine

crossings. It was reinforced by a Transportation Corps harbor company and elements of the Royal Navy.

Operation PLUNDER began late on March 23, with units of the 21st Army Group getting across the Rhine between Wesel and Emmerich. Opposing Operation PLUNDER was General of Paratroops Alfred Schlemm's First Parachute Army of Army Group H. This formation had suffered heavy losses in the Battle of the Reichswald and had only some 85,000 men and 35 tanks. There was little artillery and no air support to speak of. Within one week of the start of the operation, the Allies had taken 30,000 prisoners.

On March 27, when Schlemm was wounded, command passed to General of Infantry Günther Blumentritt. Although under strict orders to stand and fight, beginning on April 1 heavy Allied pressure forced the First Parachute Army to begin to withdrew to the northeast, behind the Dortmund-Ems Canal to the Teutoburg Forest, opening a gap between it and the German Fifteenth Army in the Ruhr.

To support Operation PLUNDER at Wesel and impede any German reinforcement, the Allies planned a massive airborne assault. Operation VARSITY, mounted on March 24, involved 21,692 Allied paratroopers and glidermen of the British 6th Airborne and U.S. 17th Airborne Divisions of Major General Matthew B. Ridgway's XVIII Airborne Corps. The drop zones for Operation VARSITY were east of the Rhine in the Wesel area, close enough to the advancing ground forces to provide for a quick linkup but not deep enough to give any real additional depth to the operation. By March 25, the airborne forces had secured most of their objectives. The defending German 84th Division was virtually destroyed, with 3,500 Germans taken prisoner. Although Operation VARSITY was a success, it was a costly one; casualties were higher for the airborne forces in this operation than for the Allied ground units in their crossings.

Meanwhile, the Ninth Army's 90th Infantry Division crossed all three of its regiments near Wallach shortly after midnight on March 24. The 15th (Scottish) Infantry Division of Lieutenant General Neil Ritchie's British XII Corps got across the river west of Xanten, opposed only by sporadic artillery, mortar, and machine-gun fire. Then early on March 24, the 79th Infantry Division conducted the last amphibious crossing of the river, at points east and southeast of Rheinberg.

The initial assault crossings completed, engineers followed with

additional bridging, constructing in short order a variety of foot, vehicle, railway, and pipeline bridges. For generations, the Germans had considered the Rhine a natural barrier that would protect them from invasion, but superior resources at the points of attack and military engineering gave the Allies access to the German heartland.

Rhineland, Remilitarization of (March 7, 1936)

One of the seminal events on the road to World War II in Europe. The 1919 Treaty of Versailles imposed on Germany by the victorious Allies after World War I had demilitarized the entire Rhineland (the German territory west of the Rhine River) as well as a belt 30 miles east of the Rhine. Then in 1925, the German government voluntarily negotiated and signed the Locarno Pacts. Among their provisions was one guaranteeing continuation of the Rhineland demilitarization.

German chancellor Adolf Hitler chose to violate these treaties, however. Timed to occur in the midst of France's most bitterly contested election campaign after World War I, his move to do so was hastily mounted with the preliminary directive issued on March 2, 1936. On March 7, in Operation WINTER EXERCISE, Hitler sent across the Rhine bridges into the Rhineland 19 battalions of infantry and 13 artillery groups plus 2 antiaircraft battalions and

2 squadrons of 27 single-seat fighter planes without reserves, a total strength of 22,000 men, as well as 14,000 local police. The troops were armed with little more than rifles and machine guns.

To its credit, the weak French government was more inclined to fight than were its generals. Astonishingly, France had no contingency plans for such an eventuality. U.S. Army chief of staff General Maurice Gamelin informed the cabinet that the choices were to do nothing or mount a total mobilization.

The French intelligence services grossly overestimated the size of the German forces inside the Rhineland at 265,000 troops. The British more realistically believed that Hitler had sent in 35,000 men but erroneously accepted his boast that the Luftwaffe had achieved air parity with the Royal Air Force. In reality, the two squadrons of obsolete biplane Arado Ar-65 and Ar-68 and Heinkel He-51 fighter aircraft that Germany put aloft lacked guns as well as synchronization gear to enable them to fire through their propeller arcs and were no match for French aircraft. The sole Luftwaffe aircraft capable of reaching London, the Junkers Ju-52, could not have flown there carrying bombs and returned. But even this prospect was not a realistic one, as the Luftwaffe had few bombs available—a total of perhaps several hundred.

The most that France did was to mobilize 13 divisions and reinforce the Maginot Line. In a vain cover for its own inaction, Paris appealed to Britain for support, but Foreign Secretary Anthony Eden made it clear that Britain would not fight for the Rhineland, which was, after all, German territory. Speaking for the cabinet, Eden announced in the House of Commons that although Germany's action was "inexcusable" as a breach of a freely signed international treaty, it in no way implied a hostile threat to France.

Had the French acted by themselves, their forces would have defeated the Germans. As Hitler later recalled, "We had no army worth mentioning. … If the French had taken any action, we would have been defeated; our resistance would have been over in a few days. And what air force we had then was ridiculous. A few Ju-52s from Lufthansa, and not even enough bombs for them." A French military move probably would have been the end of the Nazi regime. As Hitler noted, "retreat on our part would have spelled collapse."

Acquisition of the Rhineland fortified Hitler's popularity in Germany. It also ensured his ascendancy over his generals, who had opposed the move as

likely to lead to a war with France for which Germany was not prepared. Strategically, the remilitarization of the Rhineland provided both a buffer for the Ruhr and a springboard for invading France and Belgium. It also shook France's allies in Eastern Europe, who now believed that France would not fight to maintain the security system it had created against German aggression. The action had another important negative consequence for France as well, for on October 14, 1936, Belgian leaders denounced their treaty of mutual assistance with France and again sought security in neutrality. Germany promptly guaranteed the inviolability and integrity of Belgium so long as it abstained from military action against Germany. By his action, Hitler had effectively destroyed the post–World War I security system.

Rhineland Offensive (February 8–March 23, 1945)

Allied eastward campaign to reach and cross the Rhine River. Actually a series of offensives—Operations VERITABLE, GRENADE, LUMBERJACK, and UNDERTONE—the Rhineland Offensive was designed to drive the German

Army from the area north of the Mosel River in preparation for the main Allied invasion of Germany by Field Marshal Bernard L. Montgomery's 21st Army Group in the north, across the Rhine north of the Ruhr. The supreme Allied commander in the west, General Dwight D. Eisenhower, also wanted to occupy the Rhineland (the area of Germany west of the Rhine River) south of the Mosel River in order to protect Montgomery's right flank and to provide territory for a secondary invasion of Germany through the Kassel-Frankfurt corridor.

Eisenhower had pledged to Montgomery that his forces would make the primary thrust to the Rhine, and he left Lieutenant General William H. Simpson's Ninth Army under Montgomery's command. Eisenhower also allowed Lieutenant General George S. Patton Jr.'s Third Army to continue its drive toward the city of Trier and the Saar River basin. Ordering elements of Lieutenant General Courtney H. Hodges's First Army to seize the Roer River dams in support of Montgomery's northern thrust, Eisenhower also authorized Lieutenant General Omar N. Bradley to make an additional strike northeast from Saint Vith toward the Rhine. This latter attack began on January 28, but the troops bogged down when confronted with poor weather and stiff German resistance.

Montgomery's attack in the north, Operation VERITABLE, began on February 8. Infantry and tanks of the Canadian I and II Corps, reinforced by the British XXX Corps, assaulted the German West Wall (known to the Allies as the Siegfried Line)—entrenchments in and around the Reichswald State Forest. Despite the attackers' greater numbers and air superiority, stubborn German resistance and poor weather slowed the advance. When the Germans breached the Roer River dams before the Allies could seize them, the flooding of that river postponed Operation GRENADE, a supporting attack by the U.S. Ninth Army, and allowed the Germans to concentrate their reserves against the British and Canadians.

However, having committed almost all their reserves against VERITABLE, the Germans could not hold back the Americans as the First and Third Armies involved in Operation LUMBERJACK began to penetrate the West Wall defenses. Patton, ignoring orders to halt his offensive, sent Major General Manton Eddy's XII Corps toward Bitburg and Major General Troy H. Middleton's VIII Corps on to the Prüm River. Steadily advancing through a heavily fortified German belt, the weary troops reached both objectives by

the end of February. The U.S. First Army north of Patton likewise pressed the defenders ever closer to the Rhine. Launching Operation GRENADE on February 23 after the Roer River flooding had receded, the U.S. Ninth Army broke through the thinned defenses and advanced toward the Rhine.

Operation UNDERTONE was the final stage of clearing the Rhineland, with the goal of removing German forces from the Saar and the Palatinate. Mounted by Lieutenant General Alexander M. Patch's Seventh Army, it began on March 13.

Adolf Hitler's stubborn refusal to permit his armies to retreat or even maneuver contributed greatly to the subsequent German debacle. Standing in place, the German defenders were destroyed in detail or cut off and forced to surrender. Only a relative handful escaped east across the river. By March 24, German forces had been forced back across the Rhine.

The U.S. First Army secured the biggest prize of the campaign. No American commander had expected to capture an intact Rhine bridge, but on March 7 a unit from the U.S. 9th Armored Division took advantage of a confusion in the German defense to seize the Ludendorff Railroad Bridge at Remagen. General Hodges reinforced the coup by rushing divisions of his III Corps under Major General John Millikin over the river. The First Army's bridgehead over the Rhine, reinforced on March 22–23 by Patton's surprise crossing near Oppenheim and Montgomery's set-piece crossing on March 23, wrapped up the campaign.

British and Canadian casualties in these battles approached 16,000 men, and U.S. losses among all the armies engaged were almost twice that number. The collapse of the German defenses west of the Rhine began when pressure was applied at several points simultaneously. Lacking the reserves to meet so many attacks and forbidden by Hitler to fall back, the German armies suffered severely. In the Rhineland Campaign, the Allies took more than 200,000 German prisoners.

Massive Allied ground forces were now in place along the Rhine from Arnhem to Switzerland. The German Seventh Army had been destroyed, and the First Army, the only German force west of the Rhine, was in a desperate situation. Allied forces in the west were poised for the final drive into the Reich.

Ribbentrop, Ulrich Friedrich Willy Joachim von (1893–1946)

German diplomat and foreign minister (1938–1945). Born in Wesel, Westphalia, Germany, on April 30, 1893, Ulrich Friedrich Willy Joachim Ribbentrop ended his education in Germany without taking the Abitur (a national exam to qualify for university study). He and his brother Lothar then studied at a boarding school in Switzerland, where they acquired an international outlook. Ribbentrop next traveled in England and worked for a time as a clerk in a German import firm in London. Between 1910 and 1913, he and his brother were in Canada, where they held a variety of jobs.

In 1914, Ribbentrop underwent surgery to remove a tubercular kidney and returned to Germany to recuperate. When he recrossed the Atlantic afterward, he visited the United States before joining Lothar in Ottawa, where they ran a wine import-export business.

When World War I began in 1914, Ribbentrop managed to return to Germany, where he joined the army and fought as a lieutenant until he was wounded in action. Invalided from line service, he was awarded the Iron

Cross. Later, he served on the staff of German military attaché Colonel Franz von Papen in the United States and followed the latter when he was posted to Turkey.

After the war, Ribbentrop married into the family of a prosperous champagne producer. Always a social climber, he purchased the aristocrat "von" in his name from a maiden aunt who adopted him in return for a cash settlement in 1925. A handsome man of considerable charm, he was also a parvenu and dilettante.

In January 1933, Ribbentrop helped arrange meetings at his villa in Dahlem between Adolf Hitler and Franz von Papen. Ribbentrop joined the Nazi Party relatively late, in May 1932. Although he paid lip service to the movement, he was actually a royalist and a conservative and seemed not to have realized Hitler's true aims. The urbane Ribbentrop never did fit in with old-guard Nazi leaders, who referred to him as "the champagne salesman." From 1934 to 1938, he advised Hitler on relations with Britain and played a key role in negotiating the 1935 naval accord with that country. Ribbentrop also served briefly as German ambassador in London (from 1936 to 1938) before succeeding Konstantin von Neurath as foreign minister on February 4, 1938.

Ribbentrop's great triumph was the German-Soviet Non-Aggression Pact of August 23, 1939. On the outbreak of World War II, Ribbentrop and diplomacy faded into the background. Hitler called Ribbentrop "the New Bismarck" but conducted his own foreign policy.

Ribbentrop held the third-highest Schutzstaffel (SS) rank during the war, and in a vain effort to regain influence, he adopted a rigorous anti-Semitic posture, ordering the Foreign Office to expedite deportations of Jews and others. He remained loyal to Hitler to the end, testifying at the Nuremberg trials that "I could never repudiate him now or renounce him. I don't know why." Found guilty by the International Military Tribunal on four counts of war crimes, most notably for his involvement in the German-Soviet Non-Aggression Pact of 1939 and instigating anti-Jewish measures, he was sentenced to death. Ribbentrop was hanged on October 16, 1946, at Nuremberg.

Riccardi, Arturo (1878–1966)

Italian Navy admiral and naval chief of staff. Born in Pavia, Italy, on October 30, 1878, Arturo Riccardi enlisted in the navy in 1892 and was commissioned on graduation from the Naval Academy at Livorno (Leghorn) in 1897. In 1904, he distinguished himself in rescue operations following a fire on the transport *Marco Polo* and was decorated. Riccardi was aide-de-camp of the Duke of Genoa from 1910 to 1914. During World War I, Riccardi served in torpedo boats. Promoted to lieutenant commander, he was appointed deputy chief of staff of the battle fleet.

In 1924, Riccardi was made chief of staff and chief of operations of the Taranto Naval Command. In 1925, he was chief of the secretariat of the navy minister. He was promoted to commodore in 1931 and commanded the Taranto Navy Arsenal. Promoted to rear admiral in 1932, he next served as director of naval personnel until 1934. During 1934–1935, Riccardi commanded the 4th Division. He was promoted to vice admiral in 1935, and for the next two years he headed the Personnel and Military Service. During 1937–1938, he commanded the Upper Tyrrhenian Sea Naval Department.

During 1938–1939, Riccardi commanded the First Fleet, flying his flag in the battleship *Conte di Cavour*. In September 1939, he took command of a special escort command, Comando Difesa Traffico (Maricotraf). Because of his seniority and his position as a senator, he also served in a series of largely ceremonial posts, including president of the Navy Superior Council and the Admirals Committee and then, days before Italy entered the war, president of

the Technical Services Committee. When Admiral Domenico Cavagnari was relieved following the successful British air assault on Taranto (November 11–12, 1940), Riccardi replaced him as chief of staff of the Italian Navy. Promoted to full admiral on October 29, 1942, Riccardi retained his post until July 26, 1943, when Benito Mussolini was deposed.

There is disagreement about Riccardi's legacy. Some assert that he was not admired in the navy, where it was rumored that his career had benefited from connections and where he was seen as a bureaucrat rather than a commander. Others maintain that he was an excellent sailor and a harsh but fair commander. Riccardi died in Rome on December 26, 1966.

Richardson, Robert Charlwood, Jr. (1882–1954)

U.S. Army general. Born in Charleston, South Carolina, on October 27, 1882, Robert Charlwood Richardson Jr. graduated from the U.S. Military Academy at West Point in 1904. Commissioned into the cavalry, he served in the Philippine Islands during the insurgency there. Until the early 1920s, he alternated between tours as an instructor at West Point and Philippine duty. During World War I, Richardson also served on the staff of American Expeditionary Forces commander General John J. Pershing, helping to plan offensives. After the armistice, Richardson served with the American army of occupation in Germany and at the Paris Peace Conference.

From 1926 to 1928, Richardson was military attaché in Rome, Italy. He also studied at the General Staff School, the École Supérieure de la Guerre

(War College) in Paris, and the U.S. Army War College. From 1929 to 1933, he was commandant of cadets at West Point. Promoted to brigadier general in June 1938, Richardson commanded the 2nd Cavalry Brigade at Fort Bliss, Texas, in 1938 and 1939 and, also at Fort Bliss, the 1st Cavalry Division in 1939 and 1940. After becoming a major general in October 1940, he was director of the War Department's Bureau of Public Relations from February to August 1941.

From 1941 to 1943, Richardson commanded VII Corps in the United States, where he trained troops. In mid-1942, as U.S. Army chief of staff General George C. Marshall's personal representative, Richardson made an inspection tour of the Pacific area. In June 1943, he was promoted to lieutenant general and became military governor of the Hawaiian Department, where he recommended a major military reorganization in the Pacific. When it was implemented in August 1943, he became commanding general of U.S. Army forces in the Pacific Ocean Area, including the Hawaiian Department.

Richardson had no operational responsibilities, but from then until the end of the war, he trained troops and helped plan all the major Pacific campaigns. Unlike General Douglas MacArthur, commander in chief of the Southwest Pacific theater, Richardson enjoyed good relations with Admiral Chester W. Nimitz, commander in chief of the Pacific Ocean Area, and also with Marshall. Richardson retired from the army in September 1946. He died in Upper Village, Bath, New Hampshire, on March 2, 1954, and was promoted posthumously to full general.

Richthofen, Wolfram von (1895–1945)

German Air Force field marshal. Born in Barzdorf, Germany, on October 10, 1895, Wolfram von Richthofen was the cousin of Manfred von Richthofen, the "Red Baron" of World War I. Wolfram Richthofen joined the army in 1913 as a lieutenant in the 4th Hussars Regiment. During World War I, he saw action on both fronts before transferring to the Military Aviation Service. He was posted to his cousin's command, Jagdgeschwader 1 (Fighter Wing 1, or JG 1) in March 1918 and scored eight aerial victories before the end of the war.

Following the war, Richthofen studied engineering at the Hanover Technical Institute. He joined the Reichswehr in 1923 and proved to be a capable, intelligent staff officer. Within two years of Adolf Hitler's rise to power, Richthofen had transferred to the Luftwaffe and been promoted to lieutenant colonel. In 1936, he went to Spain as chief of the Development and Testing Branch to observe firsthand the performance of Luftwaffe equipment. Hugo Sperrle, commander of the Kondor Legion, asked Richthofen to remain in Spain, and he eventually became commander of the Kondor Legion as a major general. In Spain, Richthofen developed such close air support techniques by having air force officers serve with ground troops.

Richthofen departed Spain convinced that ground support should be the primary Luftwaffe role. He became the leading advocate in the Luftwaffe for air-ground cooperation. He commanded the VIII Air Corps in the invasion of Poland in September 1939, and he directed the aerial destruction of Warsaw (September 8–27, 1939). During the invasion of France and the Low Countries in May 1940, Richthofen commanded three squadrons of Junkers Ju-87 Stuka dive-bombers that provided effective aerial artillery support to the advancing German Sixth Army.

Promoted to lieutenant general in May 1940, Richthofen commanded the VIII Air Corps during the Battle of Britain (July 10–September 30) and in the German invasions of Greece (April 1941) and Crete (May 1941). In 1942, he assumed command of Luftflotte 4 (Fourth Air Fleet), supporting German forces in the southern Soviet Union and at Stalingrad. Promoted to field marshal in February 1943 (the youngest in the German military), he took command of Luftflotte 2 in Italy in hopes that he could stem the Allied tide on that front.

In November 1944, Richthofen was diagnosed with a brain tumor and retired. After Germany surrendered in May 1945, he was held by the Americans in Austria. He died of his brain tumor on July 12, 1945, in Ischgl, Austria.

Ridgway, Matthew Bunker (1895–1993)

U.S. Army general. Born on March 3, 1895, in Fort Monroe, Virginia, Matthew Bunker Ridgway graduated from the U.S. Military Academy at West Point in 1917 and was commissioned in the infantry and assigned to the border post of Eagle Pass, Texas. Promoted to captain, Ridgway returned to West Point and served as an instructor there from 1918 to 1924. In 1925, he graduated from the Infantry School at Fort Benning, Georgia. He then held a variety of overseas assignments. In 1932, he was promoted to major.

Ridgway graduated from the Command and General Staff School at Fort Leavenworth, Kansas, in 1935 and from the Army War College in 1937. Between 1939 and 1942, he was in the War Plans Division of the War Department's General Staff.

A protégé of U.S. Army chief of staff General George C. Marshall, Ridgway was promoted to lieutenant colonel in July 1940, to colonel in December 1941, and to temporary brigadier general in January 1942. He was then assigned as assistant division commander of the 82nd Infantry Division assembling at Camp Claiborne, Louisiana, under Major General Omar N.

Bradley. In June 1942, Ridgway assumed command of the 82nd, reorganizing it in August into an airborne division when he was promoted to temporary major general.

Ridgway commanded the 82nd in Sicily in July and August 1943 and in Italy from September to November 1943, during which time the unit captured Naples and fought in the drive to the Volturno River before returning to England to prepare for the Normandy Invasion. He made his only combat jump with his division on June 6, 1944, and he fought with it throughout the Normandy Campaign. In August 1944, he turned over command of the 82nd to Brigadier General James Gavin and subsequently took command of the newly formed XVIII Airborne Corps, leading it in Operation MARKET-GARDEN (September 17–26, 1944); during the December 16, 1944–January 25, 1945, Ardennes Offensive; and throughout the drive into Germany.

Promoted to lieutenant general in June 1945, Ridgway briefly commanded the Mediterranean theater. From 1946 to 1948, he was U.S. representative to the United Nations Military Staff Committee, and from 1948 to 1949 he headed the Caribbean Defense Command. Appointed deputy chief of staff of the army in August 1949, Ridgway took command of the Eighth Army in Korea on the death of Lieutenant General Walton Walker in December 1950. In that post, Ridgway stopped its retreat before Chinese forces, restored its morale, and returned it to the offensive. He subsequently succeeded General of the Army Douglas MacArthur as United Nations commander, in April 1951. Appointed supreme Allied commander, Europe, of the North Atlantic Treaty Organization (NATO) in May 1952, Ridgway was promoted to full general. In August 1953, he was appointed army chief of staff. Declining to serve his full four-year term because of his disagreement with some of President Dwight D. Eisenhower's defense policies that slighted conventional in favor of nuclear forces, Ridgway retired in June 1955. He then wrote his memoirs and served on various corporate boards. Ridgway died in Fox Chapel, Pennsylvania, on July 26, 1993.

Riefenstahl, Leni (1902–2003)

German film director and actress. Born in Berlin on August 22, 1902, Leni Riefenstahl trained as a dancer, and her performances, beginning in 1923, made her a star. Hired by Max Reinhardt, director of the Deutsches theater, she performed throughout Europe. After sustaining a knee injury, Riefenstahl became the foremost actress in the troupe of Arnold Fanck, founder of the Freiburg Mountain and Sport Company. The film *Holy Mountain* launched her acting career in 1926, and she mastered the transition from silent films to sound, as evidenced in *Storms over Mount Blanc* (1930).

In 1931, Riefenstahl founded a film production company and began directing her own projects. *Blue Light: A Mountain Legend from the Dolomites*, the first film she directed, won a silver medal in Venice in 1932 and ran for more than a year in Paris and London.

In June 1933, Riefenstahl concluded an agreement to make films for the Nazi Party. Her first commission, *Victory of Faith*, dealt with the Fifth Party Congress. Renaming her company Reich Party Congress Film, she was assigned the following year to capture on film the Nuremberg party rally. *Triumph of the Will*, made in the style of a newsreel to enliven the endless columns of marching participants, displayed numerous artistic and technical innovations and became one of the most famous documentaries of the century.

Leni Riefenstahl, shown in the foreground (Adolf Hitler is at the rostrum in the background), directed and produced one of the greatest propaganda films ever made. Her *Triumph of the Will* dealt with the Nazi Party rally held at Nuremberg in 1934. (Ullstein Bild via Getty Images)

In 1935, Riefenstahl produced a film about the German Army titled *Day of Freedom*. Consisting largely of scenes of military exercises, its first public showing was attended by Adolf Hitler and more than 200 high-ranking guests. The next year, on the occasion of the Olympic Games held in Berlin, she directed a film about conceptions of the Olympic ideal, *Olympia*, released in 1938. Her second great documentary, it was intended to be a bridge from antiquity to the present but was largely boycotted abroad as Nazi anti-Semitic policies became widely publicized.

During the war, Riefenstahl was expected to contribute to the propaganda offensive. Although she underwent training as a frontline correspondent, she showed little enthusiasm for the war effort. Widely denounced as a faithful

servant of Nazism, Riefenstahl became cinema's principal figure in the discord between morality and art.

After the war, Riefenstahl traveled frequently to Africa and lived for extended periods in the Sudan with primitive tribes. She attracted worldwide attention with her photography of the Nuba. At age 71, she learned to dive and thereafter became a renowned undersea photographer. Riefenstahl died on September 10, 2003, in Pocking, near Munich.

Rifles

The nations that went to war in 1939 were all armed with rifles from World War I, although some modifications had been made during the 1919–1939 period. Germany commenced the war with a shortened, lightened version of the Gewehr 98, which had become the Kar(abine) 98k(urz). The cartridge it fired was virtually the same, the 7.92mm s.S.Patrone (*schweres Spitzgeschoss,* or "heavy-pointed bullet").

Great Britain also went to war with a World War I rifle, the modified Rifle No. 1, Short, Magazine, Lee Enfield in Marks III to V. The Mark VI had also appeared, which was the forerunner of the weapon introduced after the outbreak of war, the Rifle No. 4, Mark I, and its subsequent derivatives. This weapon fired the .303-inch Mark VI, Mark VII, and Mark VIII cartridges. Wartime shortages caused Great Britain to import many rifles from Canada and the United States, but these were issued to the Home Guard, not to regular troops. The British experimented with semiautomatic and self-loading rifles, but they did not bring any into service.

The French had changed their rifle design and were issuing the Fusil 34 and the Fusil 36. These rifles fired a 7.5mm rimless cartridge developed in

1929 for light machine guns. The weapon was bolt-operated and had a five-round magazine. Despite the development of the *Fusil semiautomatique* in 1918, the French Army had not made the change to this weapon by the end of operations in June 1940. The Italian Army chose rifles based on their 1891 design, often called the Carcano. The rifles were redesignated Model 38 and fired either 6.5mm or 7.35mm cartridges. These weapons were characterized by design flaws, and they bear no comparison with later Italian designs.

Japan went to war in 1941 with the type-38 Arisaka 6.5mm rifle. This old design was soon superseded by the type-99 (1939) 7.7mm rifle, which was put into service to overcome the weakness of the 6.5mm cartridge. Although it had strange appendages (to Western eyes), such as antiaircraft sights and a wire monopod, it was nevertheless a well-made and effective weapon although not up to British and U.S. standards. The Arisaka was also too large for the average Japanese soldier to use effectively.

At the time of the German invasion of the Soviet Union on June 22, 1941, Soviet troops were armed with their M-1891/30 rifle, in 7.62mm. Various versions were available, including a special sniper version, but the Soviets soon realized that their massive conscript army needed firepower (rather than accuracy, the product of long periods of training), and the submachine gun rapidly overtook the rifle in both numbers and popularity. Nevertheless, research into automatic weapons produced the Tokarev M-1940 as well as its predecessors from 1936 onward. All were in the Soviet 7.62mm caliber and were well regarded by the Germans, who used the design principles in their own semiautomatic rifles later in the war.

The U.S. Army was still employing the Springfield Cal .30-06 M-1903A3 rifle. In 1936, the army adopted John Garand’s new rifle as the Rifle, Semi-Automatic, M1. The United States became the only country in World War II to have a semiautomatic rifle as a standard infantry weapon. The rugged Garand weighed 9 pounds 8 ounces (unloaded) and was a gas-operated, clip-fed, air-cooled, semiautomatic shoulder weapon that fired .30-06 caliber ammunition from an 8-round clip. It had an effective range of 440 yards and a maximum range of 3,200 yards. The M1 was the standard U.S. infantry firearm from 1936 to 1957. The one problem with this weapon was that it had an unpleasant recoil because it fired the same cartridge as the Springfield.

During the war, while the Soviets placed increased emphasis on the submachine gun, the Germans also made great strides in developing their

own semiautomatic assault rifles. This new genre in the rifle world was intended to provide increased firepower without sacrificing range. Submachine guns are excellent weapons at short (pistol) ranges of up to 50 yards, but beyond that there is a need for accurate and effective fire out to 300 yards. Machine guns were the mainstay of the German Army's infantry tactics, but the sheer weight of numbers in Soviet attacks made it imperative that every infantryman be able to put down effective defensive fire.

Mauser (the main German small-arms manufacturer) had been looking into semiautomatic rifles since the 19th century, but technical problems had ruled out its designs until the German Army began to collect Tokarev semiautomatic rifles on the battlefield. The Germans then went ahead wholeheartedly, seeing their previous mistakes and how the Soviets had avoided them. The first rifle in the new range was the Gewehr 41 W, a weapon with a gas blast cone at the muzzle. The gases trapped at the muzzle operated the action by means of a rod that extended to the rear to the breech mechanism. At the same time, the Germans "borrowed" the Degtyarev machine-gun locking system to close the bolt firmly for firing.

The U.S. Garand system worked by means of a gas port tapped into the barrel that allowed gases in the barrel to operate a rod, which in turn forced the bolt back against a spring. The first German system was much less sophisticated. The next German design was similar to the Garand but imported from the Soviets. Now there was a gas port some 12 inches along the barrel, allowing gas energy to operate the reloading mechanism of the rifle. This system was seen in the Gewehr 43.

The Germans also fielded a revolutionary weapon, the Fallschirmjäger Gewehr 42. This paratroop weapon had a folding bipod, and it was gas-operated and fired from a closed bolt when in single-round mode, which increased accuracy. In automatic mode (for it really was a light machine gun), it fired from an open bolt, allowing better cooling but making it far more dangerous to handle. This system was first seen in the U.S. Johnson light machine gun.

The modern assault rifle had its genesis in the German development of the Sturmgewehr rifles from 1943 onward. In 1938, development of the short 7.92mm cartridge began, and by 1942 both the Hänel and Walther companies were producing test weapons. In 1943 the first weapons were submitted for troop testing, and in 1944 the Sturmgewehr 44 was on limited issue to troops.

This weapon was the first true assault rifle, and it eventually led to the design of the Soviet AK-47 and the Czech Model 58.

Demands from the field led to the adaptation of many standard service rifles for sniping use. The No. 4 British rifle became the No. 4 Mark I(T) and was equipped with a No. 32 telescope. The German Kar 98k was also fitted with a telescopic sight, as was the Soviet M-1891/30. The United States issued the M-1903 in an A4 version, made by Remington. The M-1C and M-1D versions of the Garand were the sniper models but were issued only in limited numbers from 1944 on.

The Soviets adapted their semiautomatic Tokarev M-1938 and M-1940 rifles for sniping purposes. The weapons were sighted to 1,430 yards and weighed just over nine pounds. These were standard rifles, however, for weapons were not specifically designed for sniping until after the war.

The United States also produced the only true carbine of the war, the U.S. Carbine Cal .30 M1. This weapon fired a shortened .30-caliber cartridge, which was designed by Winchester and adopted in October 1941. The weapon was seen as a medium-range, medium-velocity arm, designed for use by junior officers and men who had heavy loads to carry. More accurate than the M-1911 pistol, it nevertheless did not receive unconditional approval from the troops, being considered too light in firepower. However, it was used widely and was even equipped with the first infrared sighting equipment to be fitted to a weapon (the M3). The Carbine was also issued in a fully automatic version (the M2), which was not widely used, and it had a paratroop version with a folding stock. Basically, the weapon did not have the killing power needed in a military weapon, and although it was a good design, it was not as valuable as a good submachine gun.

Rifles were also adapted to fire rifle grenades. The Germans developed their grenade attachment to fit the Kar 98k and fired high-explosive and smoke grenades as well as indicator bombs. The Americans fitted the Garand with the Grenade Launcher M-7, used with a gas propellant cartridge, which was loaded with black powder (the M3 cartridge).

World War II saw a number of extremely effective designs in service, but the days of the bolt action were ending, and the influence of the Sturmgewehr range of rifles in particular caused all nations to look to semiautomatic and assault rifle design. Since 1945, the gas-operated semiautomatic (and even fully automatic) rifle has taken over on the battlefield.

Río de la Plata, Battle of (December 13, 1939)

Naval battle in the South Atlantic and first major surface engagement of World War II. Grand Admiral Erich Raeder, commander of the German Navy, envisioned using his capital ships as commerce raiders and ordered his captains to avoid engaging enemy warships, even inferior forces, because even light damage could be fatal to a raider operating in distant waters, given Germany's lack of foreign bases. On September 1, 1939, the German pocket battleship *Graf Spee,* commanded by Captain Hans Langsdorff, was already at sea, cruising in the South Atlantic in company with the supply vessel *Altmark.*

The *Graf Spee* was one of the three-ship Deutschland class (the others being the *Deutschland* and the *Admiral Scheer*). These capital ships represented the design compromises faced by Germany as a consequence of the Versailles Treaty that ended World War I. Because of caliber and weight restrictions, the ships nominally displaced 10,000 tons and boasted a main battery of six 11-inch guns. Armor was equivalent to that of a typical cruiser, but these ships were slower than most in that class, possessing a top speed of 28 knots. In short, the Deutschland-class vessels were heavily armed, lightly protected warships designed primarily for commerce raiding.

During the course of three months, the *Graf Spee* sank 10 British merchantmen totaling 50,000 gross tons. To combat the German surface raiders, the Royal Navy positioned hunting groups in areas where German cruisers would likely search for prey. One such was Force G, commanded by

Commodore Henry Harwood, operating in the South Atlantic. Harwood's squadron included the heavy cruisers HMS *Exeter* (six 8-inch guns) and *Cumberland* (eight 8-inch guns) and the light cruisers HMS *Ajax* and HMNZS *Achilles,* each armed with eight 6-inch guns.

By early December, Langsdorff decided to return to Germany after one final victory. Intelligence indicated a valuable convoy sailing from the Río de la Plata (Plate River) under escort. Despite standing orders, he decided to engage this enemy force.

On December 13, 1939, lookouts aboard the *Graf Spee* spotted masts on the horizon. They were three of Harwood's cruisers (the *Cumberland* had remained in the Falkland Islands to undergo repairs). Langsdorff ordered his ship to close with the British ships and fired the first salvo at 6:17 a.m. while Harwood divided his force into two sections, with the light cruisers cooperating and the *Exeter* operating from a different quarter to complicate his enemy's targeting. The *Exeter* bore the brunt of the battle, because Langsdorff considered it to be the greatest threat. Langsdorff initially engaged the light cruisers with his 5.9-inch secondary armament, but throughout the battle, he switched the main battery's targets, complicating the *Graf Spee*'s fire control.

In the exchange of fire, the *Exeter* absorbed several 11-inch hits that eventually disabled its main armament. The *Ajax* and the *Achilles* also sustained damage, the former losing use of its aft turrets. Gunnery on both sides was adequate, although the British in particular suffered spotting problems. Nonetheless, the *Graf Spee* took its share of punishment. At least 18 shells caused damage that included a large hole in the ship's bow as well as destruction of the ship's galley and freshwater plant. At 7:40 a.m., Langsdorff disengaged and made for the neutral port of Montevideo, Uruguay.

Langsdorff hoped to make repairs at Montevideo, but Uruguayan officials would only allow the belligerent 72 hours in port. Ironically, the British also wanted to keep the *Graf Spee* there longer to allow time for reinforcements to arrive. Langsdorff despaired that he could not return to Germany, given the condition of the ship. His own expectations, along with British disinformation, led him to believe that the battle cruiser *Renown* and the aircraft carrier *Ark Royal* awaited him outside the harbor. Both were en route, but neither would arrive for several days. After discussions with Berlin, on

December 17, 1939, Langsdorff had the *Graf Spee* weigh anchor and sailed to just beyond Uruguay's territorial limit. There, in the Río de la Plata estuary, Langsdorff scuttled his ship rather than waste the lives of his crew. Tugs transported the Germans to Argentina, where most spent the war in internment.

Total human casualties in the Battle of the Río de la Plata were 37 German and 73 British dead. There was another casualty of the battle. On December 20, Captain Langsdorff took a hotel room in Buenos Aires. There he wrapped himself in his ship's ensign and committed suicide with a pistol.

The *Graf Spee* remains buried in the mud of the Río de la Plata. The battle was the first important victory won by the British in World War II.

Ritchie, Sir Neil Methuen (1897–1983)

British Army general. Born on July 29, 1897, in Georgetown, British Guyana, and educated at Lancing College and the Royal Military College, Sandhurst, Neil Methuen Ritchie was commissioned in the Black Watch in December 1914. During World War I, he served in France, Mesopotamia, and Palestine; he was awarded the Distinguished Service Order in 1917 and the Military Cross in 1918.

Ritchie held several staff appointments during the interwar period. In 1939 and 1940, he was a brigadier and chief of staff of Lieutenant General Alan Brooke's II Corps with the British Expeditionary Force (BEF) in

France. Following the BEF evacuation from Dunkerque (May 26–June 4, 1940), Ritchie held the same post under Lieutenant General Claude Auchinleck in the Southern Command. Promoted to major general, Ritchie then served as deputy to Auchinleck when the latter took over the Middle East Command. Ritchie was the only feasible replacement for Lieutenant General Alan Cunningham when Auchinleck relieved Cunningham from command of the Eighth Army.

Ritchie was an able, vigorous, and cool-headed staff officer, but he was rather slow and unimaginative. He was also very junior to his corps commanders, Lieutenant Generals Charles Willoughby Norrie and Alfred Godwin-Austin, and had no experience in field command since leading a battalion in World War I. Auchinleck intended his appointment as commander of the Eighth Army to be temporary, but Ritchie was fortunate to reap the triumph of victory by relieving the siege of Tobruk (April 1941–January 1942) and driving General Erwin Rommel from Cyrenaica. With these two successes, Ritchie's appointment became permanent.

An unshakable optimist, Ritchie prepared to advance and neglected the defenses at Gazala and Tobruk. When Rommel attacked again in May 1942, Ritchie lost most of the Eighth Army's armor as well as control of the battle. Auchinleck belatedly relieved him from his command on June 25, four days after the fall of Tobruk.

The inexperienced Ritchie was unfortunate to be assigned a command at a desperate moment, but he retained his personal stature and survived this debacle. He was given another chance as commander of the 52nd Division in the United Kingdom, and he led XII Corps under Field Marshal Sir Bernard L. Montgomery in Normandy and Northwestern Europe with some success. Ritchie was promoted to full general in April 1947 and was appointed commander in chief of Far East Land Forces and then commander of the British Army Staff in Washington. He retired in 1951 to become an insurance executive in Canada. Ritchie died on December 11, 1983, in Toronto.

River Plate, Battle of

See Río de la Plata, Battle of

Rogge, Bernhard (1899–1982)

German Navy vice admiral. Born in Schleswig, Germany, on November 4, 1899, Bernhard Rogge served in the merchant marine during World War I and continued in the merchant marine service after the war. Although he had a Jewish grandparent, he was exempted from Nazi racial laws and given command of the training vessel *Albert Leo Schlageter* in February 1938. In July 1939, he was promoted to captain and assumed command of the armed merchant cruiser *Atlantis*.

Designated *Ship 16*, the *Atlantis* began cruising as a commerce raider on March 11, 1940. Rogge sank his first ship on May 5 in the South Atlantic. He soon sailed to the Indian Ocean, where he met with great success. The *Atlantis* sank 22 ships weighing an aggregate 145,697 tons, the most of any commerce raider during the war. On November 22, 1941, while on its return to Germany, the *Atlantis* stopped for repairs and refueling from a U-boat in the South Atlantic; there, the raider was surprised by the British heavy cruiser *Devonshire* and sunk. Rogge and most of his crew survived, and their lifeboats were taken in tow by the *U-126*. The crew of the *Atlantis* set records for 622 continuous days at sea and for sailing more than 102,000 nautical miles.

Rogge made it back to Germany, where Adolf Hitler personally awarded him the Oak Leaves to the Knights Cross of the Iron Cross. In 1942, Rogge was appointed inspector general of training establishments and commander of

fleet training formations. In March 1943, he was promoted to rear admiral and given command of Kampfgruppe (Battle Group) Rogge. In 1945, he was promoted to vice admiral and commanded the 3rd Battle Group in the Baltic.

In 1955, Rogge joined the new West German Bundesmarine (navy) as a vice admiral. He died in Reinbek bei Hamburg, Germany, on June 29, 1982.

Rokossovsky, Konstantin Konstantinovich (1896–1968)

Marshal of the Soviet Union. Born in Velikiye Luki, Poland, on December 21, 1896, Konstantin Konstantinovich Rokossovsky moved with his family to Warsaw in 1900. In 1914 he was drafted into the Russian Army, where he served with the 5th Kargopol Dragoon Regiment and rose to sergeant. He joined the Red Army in 1918 and fought in the Russian Civil War in Siberian Mongolia.

Rokossovsky completed the cavalry short course in 1923 and the Frunze Military Academy in 1929. He commanded the 5th Kuban Cavalry Brigade (1929–1930) and then the 7th Samara Cavalry Division (1930). Rokossovsky next commanded the 15th Cavalry in the Far East until 1935. In 1936 and 1937, he commanded the V Cavalry Corps. In August 1937 during the purge of the Soviet officer corps, Rokossovsky was arrested on a false espionage charge. He was subsequently tortured and twice taken into the woods to be shot. After being imprisoned near Leningrad, he was freed on March 22, 1940. Rokossovsky again commanded the V Cavalry Corps and took part in

the “liberation” of Bessarabia in the summer of 1940. He then assumed command of the newly formed IX Mechanized Corps in the Ukraine.

Following the German invasion of the Soviet Union on June 22, 1941, Rokossovsky commanded the Sixteenth Army in the defense of Moscow. The next year, he organized the reduction of the encircled German Sixth Army at Stalingrad with his Don Front. As a result of his success, he was promoted to colonel general in January 1943 and to army general that April. After a successful defense of the north side of the salient during the Battle of Kursk (July 5–13), his Central Front (later redesignated the 1st Belorussian Front) drove across the Dnieper River.

In Operation BAGRATION, Rokossovsky, promoted to marshal of the Soviet Union in June 1944, led forces that defeated German Army Group Center in Belorussia. His troops captured Minsk (July 3) and Lublin (July 23) before halting at the Vistula River opposite Warsaw (August 1). He next commanded the 2nd Belorussian Front and conducted an effective campaign in East Prussia and Pomerania in 1945, aiding in the Berlin Campaign (March 31–May 2, 1945).

After the war Rokossovsky commanded Soviet forces in Poland from 1945 to 1949, and in November 1949 he was appointed commander in chief of the Polish Army and minister of defense. He remained in these posts until returning to the Soviet Union in 1956. From 1956 to 1962, he was deputy minister of defense of the Soviet Union except for a one-year break to command the Transcaucasus Military District between 1957 and 1958. Rokossovsky retired in April 1962 and died in Moscow on August 3, 1968.

Romania

Romania (also spelled Rumania and, archaically, Roumania) is situated in the northeastern Balkan region of South-Central Europe. In late 1940, when it formally joined the Axis alliance, Romania's population was 15.91 million; this was almost 5 million less than its 1939 census, the result of several forced land cessions made to other powers over the course of 1940. Those powers included the Soviet Union, Hungary, and Bulgaria.

Romania played an important role in World War II. A major producer of both oil and grain, it had the third-largest military establishment of the European Axis powers, and after it switched sides in August 1944, it became the fourth-largest Allied military presence. Romania entered the war for nationalistic reasons—to maintain its independence and reclaim territories lost in 1940.

Following the Balkan Wars and World War I, Romania secured territories from Hungary and Russia that united most Romanian peoples into a single country for the first time in centuries, a source of great national pride. In the acquisition of Transylvania from Hungary, it also secured a restive Hungarian population. Hungary was bent on the return of that territory. The Soviet Union also sought the return of Bessarabia. To shore up his southern flank, Adolf Hitler put heavy pressure on Hungary, Romania, and Bulgaria to join the Axis. On May 29, 1940, the Romanian government announced its acceptance of Hitler's plan for "a new European order." Bereft of French and British support, the Romanian government had no alternative. Under the terms of the German-Soviet Non-Aggression Pact of August 23, 1939, the Soviet Union had been awarded Bessarabia. In the wake of the defeat of France in June 1940, Soviet leader Joseph Stalin cashed in his remaining chips. Both Germany and Italy pressured Romania to accede to the Soviet demands of June 28, 1940, and to cede to the Soviet Union Bessarabia and also northern Bukovina, which had not been Soviet territory before.

Hungary also secured German and Italian support for the return of territory lost to Romania following World War I. Under terms of the Second Vienna Award of August 30, 1940, dictated by Germany and Italy to stabilize the political situation between Romania and Hungary, Romania ceded to

Hungary north-central Transylvania and other Romanian territory north of Oradea. Also under German pressure, Romania ceded to Bulgaria the southern Dobruja in the September 7, 1940, Treaty of Craiova, thereby restoring the pre–World War I boundary between those two states. Almost overnight, Romania had lost half of its territory and a third of its population, greatly reducing its ability to defend itself.

Romanian marshal and dictator Ion Antonescu of Romania meets with German chancellor Adolf Hitler in November 1940 to sign the Tripartite Pact, which allied Romania with Germany, Japan, and Italy. (Keystone/Getty Images)

Romania's King Carol II never had popular support. Married to a Greek princess, he flaunted his longtime love affair with his mistress, Elena "Magda" Lupescu. His government was further destabilized by frequent cabinet turnovers and widespread corruption. National outrage over the loss of Romanian territories to the Soviet Union, Hungary, and Bulgaria allowed the profascist, anti-Semitic Iron Guard to force Carol's abdication on September 6, 1940. He fled Bucharest with his mistress and nine train cars loaded with booty.

Carol's 19-year old son, Michael (Mihai), replaced him but was an impotent figurehead. Real power rested in the recently appointed prime minister and World War I military hero General Ion Antonescu, who proclaimed himself *conductãtor* (leader). Intensely nationalistic, Antonescu managed to maintain significant independence within the Nazi sphere. In October 1940, the first of 500,000 German "advisers" arrived in Romania,

ostensibly to protect Ploieşti, the site of Europe's second-largest oil fields. Romania proved to be an important source of natural (nonsynthetic) oil for Germany and supplied virtually all of fascist Italy's oil during the war.

On November 23, Romania officially joined the Axis powers. Antonescu declined to participate in the subjugation of Yugoslavia in April 1941, but he readily assisted with the invasion of the Soviet Union in order to reclaim Romania's lost territories to the east. When the invasion began on June 22, 1941, he called for a "holy war" against Bolshevism. On July 2–3, Army Group Antonescu, composed of Romanian and German troops, crossed the Prut River. By midmonth, Romania again controlled Bessarabia and northern Bukovina. Most Romanians, including frontline troops, believed that their war was over.

It was not to be. Antonescu agreed to send Romanian troops to capture the Soviet Black Sea port of Odessa. In return, Hitler granted Romania all the territory between Bessarabia and the Black Sea, including Odessa. After taking Odessa at horrendous cost, increasingly demoralized Romanian soldiers fought in the Crimea, the Caucasus, and the southern Soviet Union; their country furnished more troops to the war against the Soviet Union than all other German satellites combined. Antonescu vainly hoped that this effort would be rewarded with the return of Transylvania, as Hungary provided far less support for Hitler's war.

On June 12, 1942, American bombers based in North Africa struck Ploieşti. During the next two years no single raid did exceptional damage, but the cumulative effect significantly diminished the flow of oil.

The wartime anti-Semitic government sanctioned the mass killing of Jews. More than 40,000 Soviet Jews reportedly were killed near Odessa alone, yet about half of Romania's Jews survived the war. Antonescu protected many to utilize their experience in industrial and economic management. Additionally, a long-standing tradition of corruption among Romanian officials made buying fake identity papers and passports relatively simple.

Throughout 1942, Antonescu was under considerable pressure from other Romanian political leaders to withdraw the nation's troops from the Soviet Union, but he refused to do so. He pointed out that the army was more than 900 miles deep inside Soviet territory and that the Germans controlled the lines of communication and would surely wreak vengeance on Romania and

occupy the country. As the military situation deteriorated in 1943 following the Soviet victory in the Battle of Stalingrad (August 23, 1942–February 2, 1943), Antonescu explored peace feelers, but these foundered on Anglo-American insistence of unconditional surrender. On August 23, 1944, with Soviet forces having crossed the eastern border, young King Michael ordered the arrest of Antonescu and announced that Romania was withdrawing from the Axis alliance. Even Romanians were caught by surprise. Antonescu was later tried by the Soviets and was executed in June 1946.

Romania turned on its former allies in hopes of securing cobelligerent status, as Italy had been accorded, and maintaining its independence after the war. But such hopes proved illusory. On October 9, 1944, British prime minister Winston L. S. Churchill and Soviet premier Joseph Stalin agreed that the Soviet Union would have 90 percent "predominance" in postwar Romania.

In February 1945, surrounded by Soviet tanks, King Michael had little choice but to create an essentially communist government. That government forced him to abdicate in December 1947, although Stalin and U.S. president Harry S. Truman both decorated him for personal courage in overthrowing Antonescu. Trapped between major powers, Romania had tried to hold on to its land, people, and independence by allying itself first with one side and then with the other. Instead, it became a communist puppet state. Of all its lost territories, only Transylvania was returned to Romania after the war. Romania remained in the Soviet orbit until the end of the Cold War in 1989.

Romania, Air Force

The Fortele Aeriene Regale ale României (Royal Romanian Air Force [FARR], also known as Aeronauticã Regalã Românã, or Royal Romanian Aeronautics) was still rebuilding when war began in 1940. The Industria Aeronauticã Românã (Romanian Aeronautical Industry) works at Brasov produced several serviceable aircraft, notably the IAR-80 and IAR-80A. Based in part on the Polish PZL-24, the IAR-80 was among the best European fighters when it entered service in 1939 but soon lagged behind newer designs.

Romania reluctantly joined the Axis powers on November 23, 1940, and German Luftwaffe advisers trained and reorganized the FARR along German lines. Romania participated in Operation BARBAROSSA, the June 22, 1941, invasion of the Soviet Union, and in the August–October 1941 Odessa Campaign, fighter strength dropped by a fourth as spare parts for older British, French, and Polish aircraft were depleted. Planes of German or Romanian manufacture replaced them. FARR fighters and bombers aided the Romanian Army's victories against the Soviets in Bessarabia and at Odessa in 1941, losing 862 men in less than 10 months, including ground-support and antiaircraft crews. Romanian pilots flew some 4,000 sorties in the Battle of Stalingrad from October 23, 1942, to February 2, 1943. The FARR lost 79 planes, most of them abandoned when airfields were overrun, while destroying 61 Soviet aircraft. Romanian women pilots of the Escadrilla Aviatie Sanitare won Red Cross medals for braving Soviet fighters and intense flak to airlift out casualties during these campaigns.

FARR pilots blunted the Soviet bombing of Romania, but a stronger enemy appeared beginning on June 12, 1942, when, in Operation HALPRO, U.S. bombers struck Romania's Ploieşti oil fields. When 178 unescorted Consolidated B-24 heavy bombers swept over Ploieşti at low level on August 1, 1943, in Operation TIDAL WAVE, FARR pilots claimed 20 of the 54 bombers

shot down and lost just 2 fighters. Defending Romania's oil fields and cities then became the FARR's top priority.

After Romania changed sides in September 1944, FARR pilots flew 4,300 missions for the Allies and dropped more than 1,000 tons of bombs on its erstwhile Axis partners. Approximately 500 Romanian flyers died in the war, a proportionally heavy total.

Romania's top-scoring ace of the war was Cãpitan Aviator de Rezervã Constantin Cantacuzino, with 43 confirmed and 11 probable victories; FARR's practice of awarding additional points for shooting down bombers raised his total to 69. Despite limitations in both the quality and the quantity of its aircraft, the FARR had been one of the most powerful East European air forces. By August 1947, however, Soviet-imposed restrictions had reduced its postwar strength to fewer than 75 aircraft.

Romania, Army

Romania provided more troops to the German cause than all other Axis satellites combined, and more than 1.2 million Romanian men served under arms by mid-1944. The Armata Românã (Romanian Army) fought first for the Axis powers and then for the Allies.

Most senior officers were political appointees who relied on outmoded tactics of massed frontal assaults—an approach that was reinforced both by the paucity of modern communications equipment and by the fact that the

army was composed primarily of uneducated peasants. Strict boundaries existed between officers and enlisted ranks, and punishments were brutal. Campaigns on foreign soil for dubious benefits diminished morale and efficiency, but the soldiers were tenacious when they believed they were fighting in the interest of Romania instead of for Germany.

The Frontier and Mountain Units were the elite troops, composed of experienced professional border guards. The Cavalry Corps also performed with skill and élan. In fact, Romania fielded the largest horse-mounted cavalry contingent in Europe, and half of the 8 million-head national herd was lost in the war.

Equipment was a hodgepodge, much of it of World War I vintage. Some 1,000 Romanian artillery pieces were fitted with barrel sleeves to standardize on 75mm ammunition. The frontline Romanian infantry was armed with Czechoslovakian ZB30 light machine guns and ZB24 rifles, the Czech version of the German Mauser, and Romania produced many weapons of its own, including the respectable Orita submachine gun. Although the Germans promised modern equipment, they generally delivered only older weapons.

On July 2–3, 1941, following the June 22 invasion of the Soviet Union, Romanian and German troops crossed the flooded Prut River to reclaim lands seized from Romania by the Soviet Union the previous year. The Soviet Ninth, Twelfth, and Eighteenth Armies opposed them. In northern Bukovina, elements of the Third Army encountered weak opposition, and by July 9, they secured that province, which had also been seized by the Soviet Union in 1940. To their southeast, the Romanian Fourth Army lost 9,000 men vainly trying to enlarge a bridgehead at Fălciu, but it successfully crossed into Bessarabia near Jassy and advanced on the capital of Kishinev (Chisinau to Romanians).

The Soviet II Cavalry Corps, led by tanks, counterattacked savagely in the Cornesti Massif highlands on July 10, smashing Romania’s 35th Reserve Division. Crack troops of the Frontier Division halted the breakthrough, and the 1st Armored Division turned the Soviet flank. By July 26, Romania again possessed Bessarabia and northern Bukovina, at a cost of 22,000 casualties. Most Romanians believed that their war was over.

Instead, the Romanian government dispatched 18 divisions to capture the Soviet Black Sea port of Odessa. The siege of Odessa, from early August to mid-October, cost 70,000 to 100,000 Romanian casualties, but it was the

most significant victory ever achieved independently by an Axis satellite. Romanian soldiers fought in the Crimea, the Caucasus, and the southern Soviet Union. The Germans sometimes had to rescue their allies, but on other occasions, Romanians saved German troops, as at the Kuban bridgehead on April 7, 1943.

Romanian engineers helped build the bridge over the Dnieper at Berislav, the longest bridge ever constructed under fire. On September 1, 1942, the Romanian 3rd Mountain Division and the German 46th Infantry Division captured beachheads on the Kerch Peninsula in the largest amphibious assault undertaken by the European Axis powers during the war. Romanian brigadier general Ion Dumitrache won Germany's Knight's Cross of the Iron Cross for capturing Nalchik on November 2, 1942, the farthest point of Axis advance in the Caucasus. At least 16 Romanian officers received the Knight's Cross, more than were awarded to any other non-German Axis power. Additionally, 25 soldiers won the Order of Michael the Brave, Romania's highest award for valor.

Performance declined as disgruntled soldiers increasingly believed that they were fighting Adolf Hitler's war. They failed to construct adequate defenses at Stalingrad, and the Soviet armored counteroffensives tore through their lines. Although they then repeatedly blunted the Soviet advance, they lacked the means to halt it. Flaws in the army had become glaringly apparent after Odessa. Its 75mm artillery and 37mm antitank guns lacked sufficient range and firepower. The infantry had not been trained to cooperate with the tanks, and it did not have motorized transport to keep up with them. The lack of a mobile reserve remained one of Romania's greatest military deficiencies throughout the war, and supplies and equipment were often carried by horses. Although obsolete Czech R-2 and French R-35 tanks were gradually replaced with upgraded German PzKpfw IIIs and a few PzKpfw IVs, plus captured U.S. Lend-Lease M-3 tanks and Soviet T-60s, virtually all were inadequate against Soviet heavy tanks.

Two-thirds of Romania's field army was lost at Stalingrad (August 23, 1942–February 2, 1943). Demoralized replacements, many recruited from prisons, were pushed steadily back toward the Prut. On August 23, 1944, Romania renounced its membership in the Axis pact. Soon, more than half a million Romanian soldiers were fighting against their former allies.

Using outdated tactics and weapons against powerful modern enemies

cost Romania approximately 410,000 casualties, 120,000 of them during the war's final eight months. Another 130,000 troops disappeared into Soviet prison camps, where many died.

Romania, Navy

When Romania began rearmament in the 1930s, Hungary was seen as the nation's most likely opponent in war, and Romanian land and air services were built up at the expense of the navy. In 1939, the Marina Regalã Românã (Royal Romanian Navy, RRN), numbered just 7 destroyers, 3 motor torpedo boats (MTBs), 4 escort and patrol craft, 1 minesweeper, 1 submarine, 7 river craft, and 35 other unarmed ships. Few were of recent construction. Seven Savoia-Marchetti S-55 single-wing and 11 S-62 biplanes comprised the seaplane fleet.

During the war, Germany and Italy provided additional craft, including submarine hunters and 5 Italian Costiero B–class midget submarines. Romania also built 6 Dutch-designed torpedo boats and assembled 2 German-manufactured U-boats (the *Rechinul* and *Marsuinul*) at Galati during the war. By June 1941, the RRN had 40 warships. Its air support had similarly increased. Opposing the RRN was the Soviet Black Sea Fleet. It boasted 1 battleship, 7 cruisers, 10 destroyers, 84 MTBs, and 47 submarines plus 626 naval aircraft.

Outnumbered, outclassed, and outgunned at sea, Romania fought no major naval battles; most actions involved MTBs escorting convoys. Naval planners opted for a defensive strategy. Romania laid thick minefields around the ports of Sulina and Constanta. In the process, the 406-ton Romanian gunboat *Locotenent Lepri Remus* hit a stray mine and sank on January 11, 1940, the largest RRN ship sunk in the war.

The Sea Division guarded the coastline, supported by coastal artillery and 20 aircraft of the 102nd Sea Plane Flotilla. The Sea Division had two destroyers, the *Marasesti* and *Marasti*, built by Italy in 1918 and 1919, respectively, each with a main armament of four 4.7-inch guns. Its gunboats, the *Locotenent-Comandor Stihi Eugen* and *Sublocotenent Ghiculescu*, both of French origin, dated to 1916 and mounted two 3.9-inch main guns each. The Romanian Danube Division consisted of two sections. The River Naval Force had three monitors, two MTBs, a landing company, an underwater defense group, and a service group. The Tulcea Tactical Group had two monitors and four MTBs, an underwater defense group, and a supply convoy. The Sulina Naval Detachment protected the Danube Delta, and the Upper Danube Sector guarded the river from Cazane to Portile-de-Fier. Both depended on seven pre–World War I river monitors and a handful of smaller craft.

On September 1, 1942, on the Kerch Peninsula, RRN and German vessels successfully conducted the largest European Axis amphibious assault of the war. The evacuation of German, Romanian, and auxiliary troops from the Crimea during April and May 1944 earned a German Knight's Cross for the commander of the Black Sea Division, Rear Admiral Horia Marcellariu. Estimates of the number of soldiers saved in this operation vary from 25,000 to more than 118,000.

On the eve of the Soviet invasion of Romania in 1944, the RRN had 54 warships and auxiliaries in the Black Sea. An additional 37 warships and 100 auxiliary craft were in the Danube. On September 5, after the Romanians switched sides in the war, all ships were handed over to the Soviets. Most of the Sea Division was bottled up in port, but the river flotilla fought for the Soviet Union until war's end.

Romania Campaign (August–September 1944)

With 1.2 million men under arms in 1944, Romania fielded the third-largest Axis military force in Europe. By mid-August 1944, Romania's battered troops held the Traian defensive line from the headwaters of the Sereth to the Dniester. The Fourth Army guarded the northern approaches to Bessarabia, and the Third Army defended the lower Dniester. On August 20, a 10-hour artillery barrage from 11,000 Soviet guns opened the Battle of Jassy-Kishinev. The Romanian 5th Infantry Division, pulverized by the bombardment, was quickly finished off by the Soviet Twenty-Seventh Army. Soviet tanks of the Fifty-Second Army annihilated the Romanian 7th Infantry Division and took Jassy. Romanian aircraft flew 161 sorties as ground troops counterattacked in futile efforts to stem the tide. Meanwhile, the German 20th Panzer Division fled, taking with it every Romanian tank it could locate.

Soviet troops with Romanian Army prisoners in Romania, August 1944. (Yevgeny Khaldei/Corbis)

On August 20, waves of Soviet planes broke through heavy antiaircraft defenses protecting Romania's harbor at Constanta, sinking the torpedo boat *Naluca* and damaging three other ships, including the destroyer *Marasesti*. Romania capitulated three days later, and by September 5, the entire Romanian Navy was in Soviet hands. In an attempt to maintain Romania's independence, its figurehead monarch, young King Michael (Mihai)—aided by several army officers and armed communist-led civilians—had staged a coup on August 23, arresting the head of government General Ion Antonescu. That same night, Michael announced by radio that Romania was withdrawing from the Axis alliance.

German troops tried to restore control by seizing the capital of Bucharest, but they were repulsed by the Royal Bodyguard supported by an armored platoon. The Ninth Army enveloped the remaining Germans outside Bucharest on August 27, taking 7,000 prisoners. An outraged Adolf Hitler ordered his top commando, Otto Skorzeny, to lead a parachute battalion in a rescue of Antonescu. The plan was foiled when Antonescu was handed over to the Red Army and hurriedly spirited off to Moscow. Some 20,000 Germans fought to hold the Ploieşti oil fields, but Soviet armor and Romania's 4th Parachute Battalion secured the area. Romanian pilots also shot down 24 German planes.

The Red Army entered Bucharest on August 31. On September 12, Michael signed a formal armistice in which he agreed to wage war on Germany and Hungary, repeal anti-Jewish laws, ban fascist groups, and pay $300 million in goods and raw materials to the Soviet Union. (Moscow calculated those goods at reduced 1938 prices, making the actual reparations closer to $2 billion.)

On August 28, Romania's 1st Armored Division fought its way through the Ghimes Pass, eliminated a German penetration, and seized a bridgehead for the Soviet XXIV Guards Corps near Reghin (Szászrégen). Romanian troops then blocked a Hungarian attempt to seize the Carpathian passes on September 7. A few days later, the First Army helped stop a German-Hungarian thrust out of Yugoslavia, but on October 26, the Soviets reduced the size of the Romanian army and ordered most of its divisions to be kept at the front outside the country, clearing the way for a communist takeover.

Rome, Advance on and Capture of (May–June 1944)

The Allies launched their invasion of Italy in September 1943 with high hopes for the speedy capture of Rome. These hopes were quickly dashed by Italy's poorly handled switch from the Axis side, fierce German resistance,

harsh mountainous terrain, and terrible weather. A renewed offensive in January 1944 to breach the Gustav Line by the British Eighth Army under Lieutenant General Oliver Leese and the U.S. Fifth Army under Lieutenant General Mark Clark, accompanied by a simultaneous amphibious landing at Anzio (January 22, 1944) by the U.S. VI Corps, also met with stubborn resistance from General Heinrich von Vietinghoff genannt Scheel's German Tenth Army, especially at the Benedictine abbey at Monte Cassino.

After three failed attempts to break through and the near annihilation of the Anzio landing, the last opportunity for a decisive victory in Italy was embodied in Operation DIADEM. On the Gustav Line, 16 Allied divisions faced 6 weakened German divisions. At Anzio, 6 Allied divisions faced 5 German divisions with 4 more in reserve, and the Allies were supported by more than 2,000 guns and overwhelming air superiority. For the first time, the Allied forces were used as a combined army group rather than discrete corps, with the aim of destroying the German army south of Rome. The plan entailed the Eighth Army striking the main effort at Cassino and thrusting through the Liri Valley, supported by the Fifth Army, including the French Expeditionary Corps (CEF), attacking across the Garigliano and the Anzio bridgehead to join with the other Allied forces.

The offensive opened on May 11, 1944, with a massive air and artillery bombardment, but initially, the Allies failed to make any headway. The CEF, which lay between the two fronts, was able to fight its way into the mountainous country behind the Garigliano, enabling the U.S. II Corps to push up the coastal road. In a set-piece attack, XIII Corps ruptured the German line, culminated by the extraordinary efforts of the Polish II Corps, which eventually captured Monte Cassino on May 18, and the French Moroccan Goums, who crossed the mountains to pierce the Hitler Line, in front of Rome, from the rear before it could be properly manned. Kesselring, who had been duped into expecting another amphibious landing farther north, was slow to send reinforcements southward to the Liri Valley.

General Harold Alexander, commander of 15th Army Group, was alerted to German movements through Ultra intelligence, and when victory seemed complete, he ordered the Anzio breakout on May 23. Alexander planned for the U.S. VI Corps to strike directly at Valmontone and cut Route 6, the main inland road, and thus trap the German Tenth Army holding the Gustav Line. Rome would thus be ripe for the taking, but more important, the Germans

would be unable to form further organized defenses, enabling the rapid occupation of Italy up to the Alps.

The Fifth Army linked up with VI Corps on May 25, but General Clark, perhaps the most egocentric Allied commander in the war, was enticed by the glory of capturing Rome. He was determined that Americans should be the first to enter the city and that this should be accomplished before the Allied landings in France dominated the headlines. He swung his drive directly to Rome, leaving a gap between the Allied armies through which the Germans escaped. Clark triumphantly entered Rome on June 4, but the spectacle of the first capture of an Axis capital was eclipsed by the Allied invasion of France at Normandy two days later. Clark's impetuous failure enabled Kesselring to withdraw to the Gothic Line, but thereafter, the campaign in Italy assumed a secondary status to the campaign in France.

Rommel, Erwin Johannes Eugen (1891–1944)

German Army field marshal. Born in Heidenheim, Württemberg, Germany, on November 15, 1891, Erwin Johannes Eugen Rommel joined the German Army in 1910 as an officer candidate. He then attended the officers' training school at Danzig (present-day Gdansk, Poland) and was commissioned in January 1912.

During World War I, Rommel was wounded while fighting in France in September 1914. On his recovery, he won renown in service on the Italian and Romanian fronts. At Caporetto, he and his men took 9,000 Italian prisoners and captured 81 guns. Promoted to captain, he was also awarded the Pour le Mérite.

Rommel remained in the Reichswehr after the war and took charge of security at Friedrichshafen in 1919. In January 1921, he was posted to Stuttgart, where he commanded an infantry regiment, and then he was assigned to Dresden in 1929, where he was an instructor at the Infantry School until 1933. There, he wrote *Infantry Attacks*, a textbook on infantry tactics. In 1935, Rommel received command of a battalion of the 17th Infantry Regiment. He taught briefly at the Kriegsakademie (War Academy) in 1938 and then commanded Adolf Hitler's army security detachment.

In 1940, Rommel used his access to Hitler to secure command of the 7th Panzer Division and led it in spectacular fashion in the invasion of France. Promoted to lieutenant general in February 1941, he assumed command of the Afrika Korps, German forces in Libya. An aggressive, bold commander who led from the front, Rommel employed daring attacks and was tenacious in battle. His skill as a field commander earned him the sobriquet "Desert Fox." He was promoted to general of panzer troops in July 1941, to colonel general in January 1942, and finally to field marshal in June 1942.

Rommel was defeated in the October 23–November 4, 1942, Battle of El Alamein, but he conducted a skillful withdrawal west into Tunisia. After returning to Germany for reasons of health, he was assigned as commander of Army Group B with responsibility for northern Italy. In November 1943, he became inspector general of coastal defense in France and worked to strengthen the so-called Atlantic Wall.

German field marshal Erwin Rommel, shown here in 1942. (Heinrich Hoffmann/Ullstein Bild via Getty Images)

On January 1, 1944, Rommel became head of Army Group B in France, subordinate to German commander in chief, west (Oberbefehlshaber West), Field Marshal Karl Rudolf Gerd von Rundstedt. Based on his experiences in North Africa, Rommel believed that if an Allied invasion was to be stopped, it would have to be at the beaches. Rundstedt and Hitler, however, envisioned a cordon on the shoreline and large, mobile German forces inland that would destroy the Allies once they landed. Rommel believed that Allied air supremacy would render that outcome impossible.

Rommel did what he could to improve the coastal defenses, but when the invasion occurred he was in Germany, assuming that the Allies would not attempt a landing owing to marginal weather conditions. On July 17, 1944, he was badly wounded in an air attack that caught his staff car on the road.

Rommel, never a fanatical Nazi, grew despondent over Hitler's estrangement from reality but failed in his efforts to convince the German leader that the war was lost. When Rommel was approached about participating in a plot to overthrow the führer, he refused to join in, but he also failed to inform the authorities. In the aftermath of the unsuccessful attempt on Hitler's life, Rommel was given the choice of a trial for treason or suicide. He chose the latter. Rommel died of a cyanide capsule on October 14, 1944, near Ulm, and was accorded a state funeral. His death was officially announced as a heart attack brought on by his wounds.

Romulo, Carlos Peña (1899–1985)

Philippine journalist, nationalist, and brigadier general. Born in Manila on January 14, 1899, Carlos Peña Romulo graduated from Columbia University in New York City in 1921. A brilliant reporter, he rose to be editor in chief of the Philippine DMHM (Debate-Mabuhay-Herald-Monday) chain of newspapers. He also became a leading citizen of Manila and an unfailing supporter of Philippine president Manuel Quezon. He championed Filipino autonomy, and in 1941 he won a Pulitzer Prize for newspaper articles that warned of the Japanese threat. He stated that the peoples of Southeast Asia,

other than the Filipinos, would not fight the Japanese and in fact would welcome them.

Following the U.S. entry into World War II in late 1941, General Douglas MacArthur placed the then mobilized Major Romulo in charge of the Philippine press and radio. Romulo issued press releases and helped editors select headlines that would simultaneously calm and inform Filipinos, and he established a radio station, the Voice of Freedom, on Corregidor. He defined the war not as a fight for America but as a fight with America for freedom.

MacArthur later sent Romulo to the United States to tell the Philippine story. There, Romulo spoke to factory workers and to Congress, bringing the story of the Philippine resisters to life. Promoted to colonel in August 1942, Romulo embodied Filipino resistance and loyalty. One month after becoming a brigadier general in September 1944, he landed with MacArthur on Leyte. Romulo's stay in the Philippines was short, however, for he was ordered back to Washington, D.C., to talk to members of Congress about the situation in the Philippines.

In April 1945, Romulo went to San Francisco as chairman of the Filipino delegation to the United Nations. There, he became an impassioned champion of the small nations of Asia, especially those still striving for independence. He remained in the United States for 17 years. Between 1945 and 1954, he was the Philippine ambassador to the United Nations, and he was also ambassador to the United States from 1952 to 1953 and again from 1955 to 1962. Romulo was elected president of the Fourth General Assembly of the United Nations in 1949. He served as president of the University of the Philippines from 1962 to 1968 and was his country's foreign minister from 1950 to 1952 and from 1968 to 1984. He also wrote numerous books. Romulo died in Manila on December 15, 1985.

Roosevelt, Anna Eleanor (1884–1962)

First Lady of the United States from 1933 to 1945 and states-person before, during, and after World War II. Born on October 11, 1884, in New York City, a niece of U.S. president Theodore Roosevelt, Anna Eleanor Roosevelt was orphaned at age 10 and raised by her maternal grandmother. Privately educated until age 15, she later studied at Allenswood, a British school. She taught at the Rivington Street Settlement House and later at Todhunter School, both in New York. In 1905, she married her fifth cousin, Franklin D. Roosevelt. They had six children.

First Lady Eleanor Roosevelt visiting the Japanese Internment Center at Gila River, Arizona. She is accompanied by Dillon S. Meyer, director of the War Relocation Authority, April 23, 1943. (PhotoQuest/Getty Images)

After nursing her husband through poliomyelitis in 1921, Eleanor encouraged Franklin to continue his political career. When he was elected governor of New York in 1928, she made suggestions for female appointees. An indefatigable volunteer, she was active in many organizations, including the League of Women Voters and the Democratic National Committee. The

political environment of the late 1920s and 1930s constantly encouraged her to question gender, racial, and social inequality.

Once Franklin became president in 1933, Eleanor traveled extensively representing the White House. She tirelessly championed the cause of the underprivileged, children, women, and minorities. Her interventions led to a number of social improvements. An inexhaustible writer, she also authored several books and articles, including the syndicated column "My Day." In 1940, she also developed the United States Committee for the Care of European Children.

During World War II, Eleanor visited Allied troops worldwide, and her steadfastness brought a level of comfort to many. Throughout the war, numerous social agencies sought her advice and intervention. After the president's death in April 1945, she remained politically active and continued her battle for human rights, especially for war refugees. In response to her universal recognition of human rights, President Harry S. Truman appointed her to the U.S. delegation to the United Nations General Assembly, a position she held from 1945 to 1953. She also served as chairman of the Human Rights Commission and was instrumental in passage of the Declaration of Human Rights. Additionally, she was actively involved with the Peace Corps under President John F. Kennedy. Eleanor Roosevelt died in New York City on November 7, 1962.

Roosevelt, Franklin D. (1882–1945)

U.S. politician and president from 1933 to 1945. Born on January 30, 1882, at his family's Hyde Park estate in Dutchess County, New York, Franklin Delano Roosevelt was educated at home until age 14. He then attended Groton Preparatory School, Harvard University, and Columbia University Law School. In 1905, Roosevelt married his fifth cousin Eleanor Roosevelt, President Theodore Roosevelt's niece.

After passing the bar examination, Franklin Roosevelt joined the law firm of Carter, Ledyard and Milburn. In 1910, he won a seat in the New York Senate, where he served two terms and was a strong advocate of progressive reform. In 1913, he was appointed assistant secretary of the navy, and he worked diligently and effectively in that post. A strong advocate of intervention on the Allied side and military preparedness, he helped prepare the navy for its role in World War I.

In 1920, Roosevelt ran unsuccessfully as the vice presidential candidate of the Democratic Party on the ticket headed by James M. Cox. During the campaign, Roosevelt advocated U.S. entry into the League of Nations. In 1921, he was stricken with polio. Although his suffering was acute and left him permanently disabled, he remained intensely interested in politics. In 1924, he attended the Democratic Convention and nominated Alfred E. Smith, governor of New York, for president. Four years later, Roosevelt was elected governor of New York. His efforts in seeking relief for suffering New Yorkers following the 1929 stock market crash and the onset of the Great Depression led to his reelection in 1930.

In November 1932, Roosevelt was elected president of the United States on the Democratic ticket, triumphing over incumbent President Herbert Hoover. Roosevelt promised the American people a "New Deal" and began regular radio broadcasts to the American people, the first U.S. president to do so. Known as "fireside chats," these addresses were designed to restore morale. Legislative products of his first frenzied hundred days in office included banking reform, the Agricultural Adjustment Act, and the National Industrial Recovery Act (NIRA). Congress allocated more than $3 billion under the NIRA for the Public Works Administration. The National Recovery Administration set minimum wages and limited hours for employees. The Federal Emergency Relief Administration provided funds to relief agencies

run by the state, and the new Civilian Conservation Corps employed thousands of young men to replant forests, build parks, and work on flood-control projects. During this time, Roosevelt also established the Securities and Exchange Commission to oversee stock trading.

In the second phase of the New Deal, the Works Progress Administration was established, extending employment to more than 2 million workers to construct bridges, roads, and buildings. Another measure, the 1935 Social Security Act, provided disability insurance as well as pensions for the aged. The American people welcomed Roosevelt's programs, and in 1936, they overwhelmingly reelected him to office. While Roosevelt's New Deal clearly helped mitigate the effects of the Great Depression and served as a considerable morale booster, in the end it failed to achieve a sustained or robust economic recovery; indeed, the American economy would not completely right itself until rearmament for World War II was under way.

With the beginning of World War II in Europe in September 1939, Roosevelt increasingly turned his attention to foreign affairs and military preparedness, despite strong isolationist sentiments in Congress and among many American voters. On September 8, 1939, he proclaimed a limited national emergency, which allowed expansion of the army from 135,000 men to 227,000. Believing that the security of the United States demanded the defeat of the Axis powers and sensing that Adolf Hitler was a mortal threat to the world, Roosevelt gradually moved the United States from its isolationist stance. Later in September, he called on Congress to amend one of the Neutrality Acts, which it did the next month, allowing the Allies to purchase arms in the United States on a cash-and-carry basis.

Following the defeat of France in June 1940, Roosevelt pledged to support Britain in every manner short of declaring war. In September, he concluded an agreement with Britain whereby that country would receive 50 World War I–vintage destroyers in return for granting the United States rights to bases located in British territory in the Western Hemisphere, chiefly the Caribbean. He also initiated a major rearmament program in the United States and secured passage of the Selective Service Act, the first peacetime draft in the nation's history.

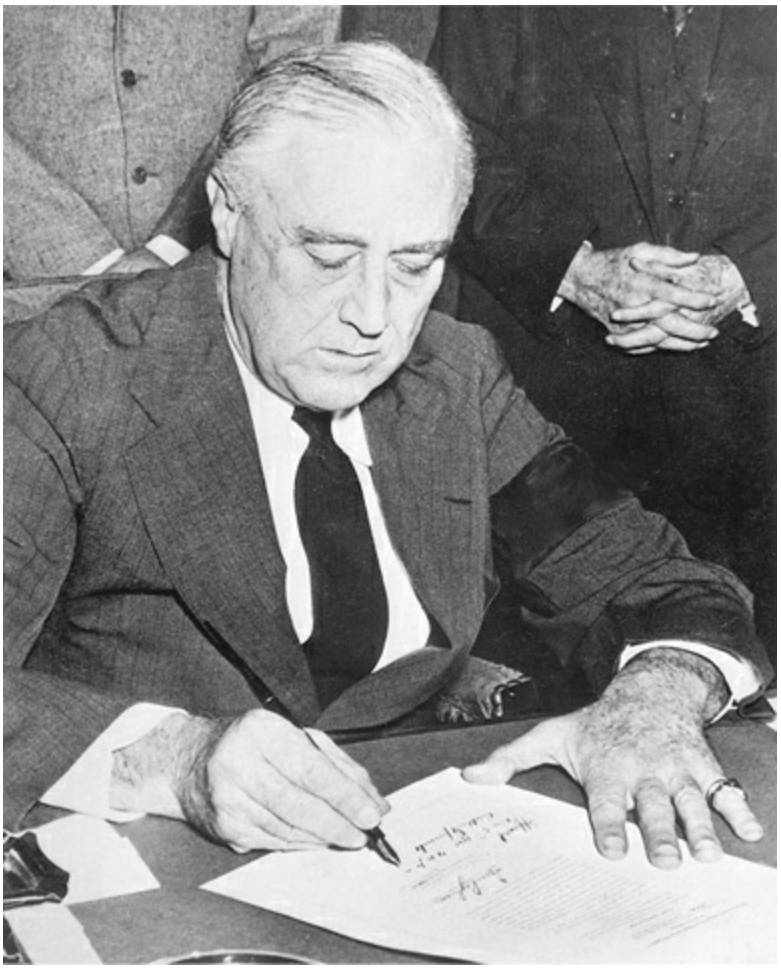
By early 1941, Roosevelt and British prime minister Winston L. S. Churchill were coordinating their nations' policies toward the Axis powers. In the spring of 1941, Roosevelt ordered U.S. destroyers to provide

protection as far as Iceland for the North Atlantic convoys bound for Britain. In March 1941, on his urging, Congress passed the Lend-Lease Act, which extended U.S. aid to countries fighting the Axis powers.

Roosevelt also began pressuring Japan to leave China, which the Japanese had invaded in 1937. When Japanese troops occupied southern Indochina in the spring of 1941, he embargoed scrap metal and oil shipments to Japan. Roosevelt also ordered the Pacific Fleet from San Diego to Honolulu, Hawaii, in order to intimidate Japan, but the embargo caused Japanese leaders to opt for war with the United States. On December 7, 1941, Japanese aircraft attacked the U.S. Pacific Fleet at Pearl Harbor, Hawaii. The following day, Roosevelt called for a declaration of war on Japan, referring to the Japanese attack as “a day which will live in infamy.” No reliable evidence exists to substantiate persistent allegations that the president set up the fleet at Pearl Harbor in order to bring about the U.S. entry in the war.

From 1941 to 1945, Roosevelt skillfully guided the United States through the war and worked to ensure a secure postwar world. During the course of the war, the United States fielded not only a navy larger than all the other navies of the world combined but also the largest air force and the best-armed and most mobile and heavily mechanized army in world history. It also provided the machines of war, raw materials, and food that enabled other nations to continue fighting the Axis powers. Amid these circumstances, full economic recovery was achieved in the United States.

In 1944, Roosevelt ran successfully for an unprecedented fourth presidential term against Republican candidate Thomas Dewey. In February 1945, Roosevelt met Churchill and Soviet dictator Joseph Stalin at Yalta in the Crimea. The Yalta Conference built on decisions already reached at the prior Tehran Conference and was an effort to secure a stable postwar world. Roosevelt gambled that with his considerable charm, he could convince Stalin that he had nothing to fear from the United States and that Britain, the Soviet Union, China, and the United States could cooperate to secure a peaceful postwar world. Although accused of making unnecessary concessions to the Soviet Union at Yalta, Roosevelt really had little choice in these, as the Red Army already occupied much of Eastern Europe, and the U.S. military wished to induce the Soviets to enter the war against Japan.



One of the greatest U.S. presidents, Franklin D. Roosevelt is photographed signing the declaration of war against Japan, on December 8, 1941. (National Archives)

At Yalta, Roosevelt was already gravely ill, and shortly afterward, he sought rest at his second home in Warm Springs, Georgia. He died there of a massive cerebral hemorrhage on April 12, 1945. Vice President Harry S. Truman succeeded him as president. Franklin Roosevelt, one of the best-loved presidents in U.S. history, had successfully led the nation through two of its greatest trials—the Great Depression and World War II.

Roosevelt, Theodore, Jr. (1887–1944)

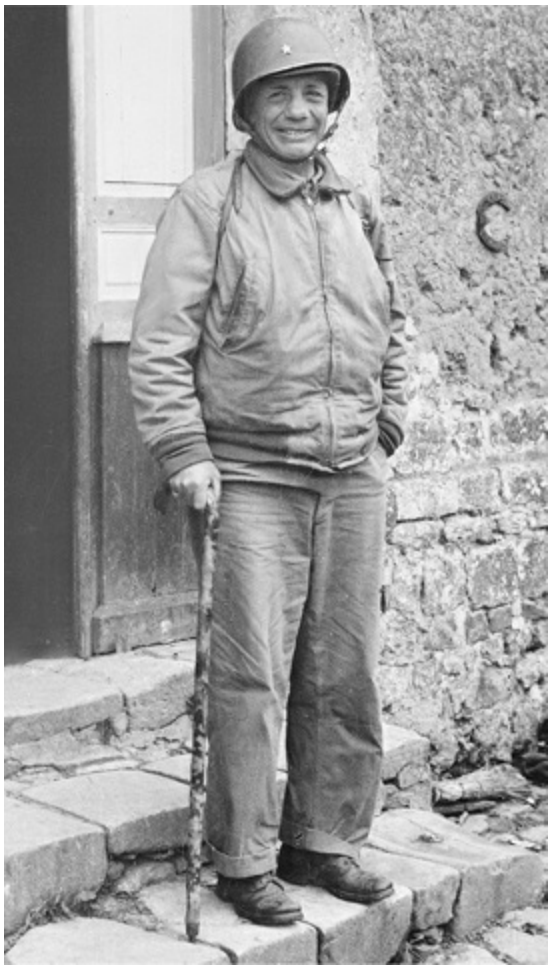
U.S. Army general. Born in Oyster Bay, New York, on September 13, 1887, Theodore Roosevelt Jr. was the son of President Theodore Roosevelt. The younger Roosevelt graduated from Harvard University in 1908 and worked with his father in the preparedness campaign prior to World War I. In that conflict, he was wounded in action and received the Distinguished Service Cross.

Following the war, Roosevelt transferred to the Army Reserve as a colonel. He was one of the founders of the American Legion and was elected to the New York legislature. Roosevelt was assistant secretary of the navy from 1921, and he ran unsuccessfully for governor of New York State in

1924. In that year, he became the chairman of American Express. Roosevelt served as governor of Puerto Rico from 1929 to 1932 and governor-general of the Philippines from 1932 to 1933. He became an editor at Double-day, Doran and Company in 1935 and wrote or coauthored eight books.

Roosevelt returned to active military duty in April 1941, this time as commander of the 26th Infantry Regiment of the 1st Infantry Division. He served in North Africa and Sicily, becoming assistant division commander of the "Big Red One" under Major General Terry de la Mesa Allen. In Sicily, II Corps commander Major General Omar Bradley relieved both Allen and Roosevelt because of the division's sluggish advance across central Sicily and the undisciplined conduct of many of its soldiers.

Roosevelt then served as a liaison officer for the U.S. Fifth Army. In 1944, he was assigned as assistant division commander of the 4th Infantry Division for the Normandy landings. On several occasions, he requested permission to go ashore with the first assault wave, but Major General Raymond O. Barton, the division commander, repeatedly refused because Roosevelt, who had a severe case of arthritis, limped and walked with a cane. Roosevelt finally prevailed when he threatened to put his request in writing and send it up the chain of command.



Brigadier General Theodore Roosevelt Jr. standing by the door to his command post in Normandy, France, July 1944. (Bettmann/Corbis)

Roosevelt was not only the sole general officer to land on Utah Beach on D-day (June 6) but also the only general officer on any beach to land in the first wave. At age 57, he was one of the oldest soldiers there. His son Quentin II also landed on one of the beaches that day, making them the only father and son pair to have come ashore that day. Drifting tides caused the Utah Beach assault force to land in the wrong place, which proved to be fortunate for the Americans because the spot where they did land was far less well defended. Once on the beach, Roosevelt made the tactically correct decision not to try to shift to the planned landing point but rather to direct the follow-on waves to the new landing points. He is said to have stated, “We’ll start the war from right here.”

Roosevelt repeatedly led small groups across the beach and established them inland, and he was under constant enemy fire the entire day. Lieutenant

General Bradley later said that Roosevelt's conduct on Utah Beach was the bravest act he had seen in more than 40 years of military service. Roosevelt died in his sleep of a heart attack on July 12, 1944, most probably brought on in no small measure by the combat stress of D-day. At the time, he had been selected for command of the 90th Infantry Division and promotion to major general. Roosevelt was awarded the Medal of Honor posthumously and was later buried at the World War II American Cemetery at Colleville-sur-Mer, Normandy. With the long-overdue award of the Medal of Honor to Theodore Roosevelt Sr. for his own actions in Cuba in 1898, the Roosevelts became only the second father-and-son pair to be Medal of Honor recipients, after Arthur and Douglas MacArthur.

Rosenberg, Alfred (1893–1946)

German National Socialist Party publicist and "philosopher" of National Socialism. Born in Reval, Russia (today's Tallinn, Estonia), on January 12, 1893, Alfred Rosenberg graduated with a degree in architecture at Riga Technical University in 1918. He soon immigrated to Paris and at year's end settled in Munich. There he joined the German Workers' Party, which became the National Socialist Party. Rosenberg became a German citizen in 1920 and gradually assumed the position of the party's chief ideologist. He participated in the unsuccessful November 1923 Beer Hall Putsch and was Adolf Hitler's personal choice to serve as interim party leader while Hitler was in prison.

Rosenberg headed the new National Socialist Society for Culture and Learning from 1929 and was elected to the Reichstag as a Nazi Party deputy in 1930. In that year, he also published his major work, *The Myth of the Twentieth Century*, which became the most popular party work after Hitler's *Mein Kampf*. A turgid, racial, pseudoscientific study, it claimed that the Germans represented a pure Nordic race destined to rule Europe. It also attacked Jews, Free Masons, the Catholic Church, and others.

Rosenberg held numerous party posts and, after Hitler became chancellor, headed the foreign policy office of the party and was made Hitler's deputy for supervising the spiritual and ideological training of the Nazi Party. In January 1940, Rosenberg was tasked with founding the so-called High School, which was to have evolved into the postwar Central National Socialist University. One of the institutes within the High School was the Institute for Research of the Jewish Question, the libraries of which were filled with looted Jewish art, furniture, and other items.

The peak of Rosenberg's career came in 1941 when he was designated Reichsminister for the Occupied Eastern Territories. In this position, he opposed genocide of the Jews and expulsion of populations, believing that it made more sense to utilize their support against the Soviet Union. Despite his party positions, Rosenberg never achieved the influence or recognition he believed he merited. He was disappointed when Joachim von Ribbentrop became foreign minister in 1938 and was upset with the August 1939 German-Soviet Non-Aggression Pact, which he believed sacrificed ideology to political motives. He was also an inept administrator.

Frustrated by his lack of influence, Rosenberg attempted to resign in October 1944, but Hitler never answered his letter. Arrested at the end of the war, Rosenberg was tried along with the principal Nazi leaders at Nuremberg. He remained unrepentant in his support of Hitler and National Socialism but argued that some of Hitler's intentions had been subverted by bloodthirsty officials. Convicted on all four counts of war crimes, Rosenberg was hanged at Nuremberg on October 16, 1946.

Roslavl, Battle of (August 1–8, 1941)

The Battle of Smolensk ended on August 5, 1941, in a resounding German victory. At that point, however, German chancellor Adolf Hitler and his generals were divided on continuing Operation BARBAROSSA with a drive on Moscow or shifting the objective south to the Ukraine. Colonel General Heinz Guderian, commander of the Second Panzer Group, was one of the main advocates for continuing to Moscow. As early as July 27 at a conference at Army Group Center headquarters in Borisov, Guderian pushed for permission to move immediately to eliminate a large concentration of stragglers from some 21 Soviet divisions in the vicinity of Roslavl, on the Second Panzer Group's right. Roslavl also was an important communications and road center, and its capture would give the Germans control of the transportation network southwest of Moscow. Before Hitler had decided between Moscow and the Ukraine, Army Group Center commander Field Marshal Fedor von Bock approved Guderian's plan.

Army Group Center augmented Guderian's Panzer Group by attaching to it the VII Corps. The combined temporary formation, designated Army Task Group Guderian, had 14 divisions operating under the control of VII and IX Corps and the XXIV and XLVII Panzer Corps. General of Infantry Hermann Geyer commanded IX Corps. During World War I he had been one of the German Army's most important tactical innovators. Ironically, he had also been Guderian's superior on two different occasions during the interwar years.

Guderian launched the attack on Roslavl on August 1, with VII Corps and the XXIV Panzer Corps leading. Guderian was near the front with the 3rd Panzer Division when Luftwaffe aircraft mistakenly attacked. A bomb landed close to Guderian's command car, but he was uninjured. On August 2,

Guderian's two remaining corps joined the attack and completed the encirclement.

On August 4 Guderian returned to Army Group Center headquarters for his first direct meeting with Hitler since the start of Operation BARBAROSSA. Hitler still had not decided between the objectives of Moscow or Ukraine. Nonetheless, when Guderian returned to his own headquarters he ordered preparations begun for a drive on Moscow. On the following day Guderian was back at the front directing operations around Roslavl. The trapped Soviet forces made several unsuccessful attempts to break out but were progressively pinned against the swamps and town. The battle for Roslavl ended on August 8, with the Germans taking 38,000 prisoners, 200 tanks, and as many artillery pieces.

The road toward the northeast and Moscow was now open. On August 12, however, Hitler issued Führer Directive 34, ordering Army Group North to continue its push toward Leningrad and Army Group South to move into the Crimea and the Donets basin. Army Group Center was ordered to halt temporarily and provide support to the efforts on both of its flanks. The advance toward for Moscow now lost its momentum, and the Germans would never again recover it sufficiently.

Rostov, Battle for (November 17–30, 1941)

Important Eastern Front battle. On clearing the Ukraine, German field marshal Karl Gerd von Rundstedt's Army Group South continued its advance east and south. Barring its way was the Soviet city of Rostov on the Sea of

Azov at the mouth of the Don River. Rostov was the gateway to the Caucasus Mountains, the Soviet oil fields to the south, and the road to Persia, through which Britain and the United States were to supply the Red Army.

Between September 29 and October 13, 1941, Rundstedt's armies overran the coal- and iron-rich Donets Basin region, where 20 percent of Soviet steel was produced. They also forced the Mius River and captured Taganrog on the Sea of Azov. General Friedrich Paulus's Sixth Army captured Kharkov on October 24. Rain and mud slowed the German movement, however. The Soviets were then able to evacuate Rostelmash, a large agricultural machinery plant at Rostov, despite German bombing.

To counter the German advance, the Soviet Southern Front (army group) under Colonel General Yakov Cherevichenko had recently been reinforced. Cherevichenko had at his disposal the Thirty-Seventh Army and the Fifty-Sixth Independent Army. On November 9, he submitted a plan to Stavka (the Soviet high command) for an attack against the concentration of German forces in the Rostov area to take place on November 17. Joseph Stalin approved the plan but refused to commit the Southern Front.

On November 17 Cherevichenko's forces struck Rundstedt's spearhead, Colonel General Ewald von Kleist's First Panzer Army, some 40 miles north of Rostov. Timoshenko had hoped to create a diversion and draw the Germans away from Rostov, but this effort failed, and Colonel General Eberhard von Mackensen's III Panzer Corps drove on Rostov, entering the city's northern suburbs on November 19. On November 21, the 1st SS Panzer Division captured Rostov. But a gap had opened between the German forces. Realizing that he was overextended, Kleist withdrew from Rostov on November 22, only to see his order to construct positions behind the Mius River, 45 miles west, countermanded by German Army commander Field Marshal Walther von Brauchitsch, who insisted that Rostov be held.

On November 28, Colonel General Yakov T. Cherevichenko's Southern Front forces composed of 21 divisions of the Thirty-Seventh and Ninth Armies drove into the rear of III Panzer Corps, which was exhausted and seriously short of supplies, manpower, and equipment. Later that same day, Kleist ordered Mackensen to give up the city. The Soviets then succeeded at getting a bridgehead across the iced-over Don on the southern outskirts of Rostov. Night crossings reinforced the Soviet bridgehead, despite German

opposition. By November 29 Soviet units had cleared Rostov, which was heavily damaged and burning as a result of German demolitions.

On November 30 Kleist again ordered a withdrawal behind the Mius River, but this move was more than Adolf Hitler would tolerate, and he ordered Brauchitsch to have Rundstedt countermand the order. Rundstedt refused and offered his resignation. On December 1, Hitler replaced him with Field Marshal Walther von Reichenau, who was unable to influence events. The withdrawal, certainly the correct decision in the circumstances, was completed that night.

The battle marked the first serious setback for the Germans since the start of Operation BARBAROSSA (June 22). It also began the departure of all four of the German Army's top commanders. In December, both Brauchitsch and Army Group Center commander Field Marshal Fedor von Bock resigned, and the commander of Army Group North, Field Marshal Wilhelm von Leeb, followed suit in January. Hitler did not replace Brauchitsch, choosing to take command of the German Army himself.

Rote Kappelle

German opposition organization. A group of loosely affiliated intellectuals and civil servants united only by their opposition to Nazism, the Rote Kappelle (Red Orchestra) became a Soviet espionage tool. Many of the

members, such as Adam Kuckhoff, were longtime communists or communist sympathizers. Some, such as Arvid Harnack and his American wife, Mildred Fish, had previously been Soviet agents. Others, such as Harro Schulze-Boysen, merely opposed Nazism.

Schulze-Boysen's opposition to the Nazis dated from late 1932, and he was sent to a concentration camp in April 1933. Influential family contacts not only arranged his release but also secured him a position on the intelligence staff in the Air Force Ministry. In 1936, Schulze-Boysen passed information about Luftwaffe activities in Spain during the 1936–1939 Spanish Civil War to the Soviet embassy. Although the intermediary was arrested, the Gestapo found no evidence of the spy ring that Schulze-Boysen had created, and the group resumed copying and disseminating anti-Nazi leaflets in Germany. The group dissolved in 1938.

Harnack, who had spied for the Soviet Union from his post in the Economics Ministry since August 1935, broke contact during the Great Purges in the mid-1930s. In September 1940, however, he sent a message warning that an attack on the Soviet Union was imminent, and he established a network of some 60 agents. Harnack had also been in touch with U.S. intelligence since 1938. He insisted that resistance to Nazi leader Adolf Hitler had to take priority over ideology. Harnack's contacts included not only industrial leaders but also several military and political figures later involved in the July 1944 bomb plot against Hitler.

In early 1941, Harnack persuaded Schulze-Boysen to cooperate in passing information to the Soviet Union. Schulze-Boysen was then employed on the Luftwaffe operational staff engaged in planning Operation BARBAROSSA, the June 22, 1941, German attack on the Soviet Union. This recruitment completed the organizational triad that became the Red Orchestra.

Each man headed a separate network. Kuckhoff, an author, wrote pamphlets and served as liaison for the three groups. Most information gleaned concerned the impending attack on the Soviet Union. But as with the numerous other warnings that reached Soviet dictator Joseph Stalin, this vital intelligence was ignored.

Operation BARBAROSSA forced the group to rely on wireless transmissions. None of the members had been properly trained in wireless techniques, however, so Moscow sent an agent to rectify the situation. The German

Sicherheitsdienst (SD, Security Service) intercepted his orders, and in June 1942, it broke the group's code. The Schulze-Boysen group, as it was also known, continued to send reports and also wrote and distributed anti-Nazi pamphlets. In August 1942 when it became apparent that Schulze-Boysen knew that the codes were compromised, the SD arrested 119 people connected with the Red Orchestra. Fifty-five of them, including Mildred Fish-Harnack and 18 other women, were executed for their activities.

Although the Red Orchestra had little immediate impact, it did prove that opposition to Hitler had existed in Germany. Fish-Harnack, though little known in the United States, became a heroine in the communist pantheon, and the Red Orchestra was a staple in the founding myth of the German Democratic Republic.

Rotmistrov, Pavel Alekseyvich (1901–1982)

Soviet Army marshal. Born at Skovorovo in the Kalinin Oblast, Russia, on July 6, 1901, Pavel Alekseyevich Rotmistrov joined the Red Army in 1919, fought in the Russian Civil War, and graduated from the Frunze Military Academy in 1931. Promoted to major general in June 1940, Rotmistrov was chief of staff of the III Motorized Corps in the Baltic Military District when the German Army invaded the Soviet Union on June 22, 1941. In September 1941, he took command of the VII Tank Corps, attached to the Northwest Front, and participated in the defense of Moscow in October.

Rotmistrov was then transferred with his corps to the Leningrad area. As a result of its exemplary performance there, the VII Tank Corps was renamed

the III Guards Corps in January 1942. Promoted to lieutenant general, Rotmistrov commanded a tank corps in the August 23, 1942–February 2, 1943, Battle of Stalingrad, and in December 1942, he halted German major general Erhard Raus's attempt to reach the trapped German Sixth Army. In the subsequent Soviet counteroffensive, Rotmistrov commanded a mechanized group that outfought German colonel general Hermann Hoth's Fourth Panzer Army.

In February 1943, Rotmistrov assumed command of the newly formed Fifth Guards Tank Army. When Stavka (the Soviet high command) assembled a strategic reserve in April 1943, Marshal Ivan Konev's Steppe Military Front (army group), Rotmistrov's army was included. Thereafter, Stavka would utilize this force in crisis situations or as needed in preparation for Soviet offensives. Rotmistrov was a keen student of armored warfare tactics, and he also took on the responsibility of training all armored forces of this reserve.

Rotmistrov's Fifth Guards Tank Army was part of Marshal Nikolai Vatutin's Voronezh Front. Rotmistrov then took part in the largest tank battle of the war, at Prokhorovka near Kursk. From July 10 to 12, 1943, Rotmistrov's 850 tanks held off attacks by German lieutenant general Paul Hausser's II SS Panzer Corps of three divisions. Although many of his own tanks were outgunned by German armor with 88mm guns, Konev was able to offset this disadvantage by ordering that his crews close as far as possible before engaging the Germans.

In August 1943, the Fifth Guards Tank Army was redeployed to Konev's 2nd Ukrainian Front to take part in the Belgorod-Kharkov operation. Rotmistrov was promoted to colonel general in October 1943. Then, at the beginning of 1944, the Fifth Guards Tank Army was transferred to the Soviet 2nd Belorussian Front, where it participated in the Kirovograd (January 8), Korsun-Shevchenkovsky (January 24–February 17), and Uman (March 5) operations.

In February 1944, Rotmistrov was promoted to the newly created rank of marshal of armored forces. Stavka placed his army at the disposal of Marshal Ivan Chernyakhovsky's 3rd Belorussian Front to take part in Operation BAGRATION. So vital was Rotmistrov to the successful outcome of this Soviet plan to destroy German Army Group Center that Joseph Stalin personally urged Lazar Kaganovich, head of railways, and Army General Andrei

Vasilevich Khrulev, head of home front services, to guarantee that the Fifth Guards Tank Army would be in position for the start date of June 22, 1944. At the end of the war, Rotmistrov's forces took part in the drive on Berlin from the south.

In 1953, Rotmistrov resigned from the General Staff, but he remained within that institution as a professor of war sciences and theory. Between 1954 and 1964, he was chief of the Military Academy for Armored Forces, and in April 1962, he was named the first chief marshal of Soviet Armored Forces. From 1964 to 1968, he was deputy minister of defense, and he was appointed inspector general for the Ministry of Defense in June 1968. He also wrote a number of studies on armored warfare. During ceremonies marking the 20th anniversary of the end of war, Rotmistrov was awarded his second decoration as Hero of the Soviet Union. He retired to his birthplace, where he died on April 16, 1982.

Rotterdam, Destruction of (May 14, 1940)

German Air Force attack and one of the most controversial actions of the war, undertaken to pressure the Dutch to capitulate. The Dutch military's stout resistance to the German invasion of May 10, 1940, surprised the Germans, who had expected little fighting. By May 13, Dutch resistance was almost at an end, but the defenders still held Rotterdam. With German forces in the Netherlands ordered to end the resistance quickly to allow ground troops

there to join those fighting in France, Luftwaffe commander Hermann Göring decided to commit the Junkers Ju-87 Stuka dive-bombers of Fliegerkorps IV to destroy the Dutch strongpoints guarding the approaches to Rotterdam. On the evening of May 13, Queen Wilhelmina and the Dutch government departed The Hague aboard two British destroyers, beginning their wartime exile in Britain.

The next morning, a German staff officer entered Rotterdam under a flag of truce to demand the city surrender. Göring, meanwhile, decided against using the dive-bombers and instructed Luftflotte 2 commander General Albert Kesselring to carry out a saturation bombing. At noon, Dutch commander in chief General Henri Winkelman entered into negotiations through an emissary with the German military to prevent just such an attack, but because of faulty communications the air strike took place just as the Dutch were preparing to surrender.

Some 100 Heinkel He-111 medium bombers appeared over central Rotterdam at 2:00 p.m. on May 14. The Germans on the ground tried to signal the aircraft to abort the attack, and 43 of the bombers turned away and attacked other targets; the remainder, however, released their loads over Rotterdam. Their high-explosive bombs demolished the entire center of the city and touched off fires that created additional damage. Some 24,000 houses were destroyed, rendering 78,000 people homeless. In addition, the bombing resulted in the destruction of more than 2,500 shops, 1,200 workshops and small factories, 500 pubs, 70 schools, 21 churches, 20 banks, 12 cinemas, 4 hospitals, and 2 theaters. Some 900 civilians were killed, and thousands of others were wounded; many were children trapped in their schools. In the bombed area, little except the city hall and Laurens Church remained standing.

Early on the morning of May 15, with the Germans announcing that they would next bomb Utrecht, Winkelman issued an order for all Dutch soldiers to lay down their arms. He announced that he had taken the decision to prevent civilian casualties. A partial surrender that excluded the navy was signed that day.

At the postwar Nuremberg war crimes trials, both Göring and Kesselring denied knowledge of the surrender negotiations, but it seems clear that the bombing was undertaken as a deliberate act of force to hasten the surrender,

as had happened with the destruction of Warsaw in September 1939. In this, it succeeded.

ANNETTE RICHARDSON AND SPENCER C. TUCKER

Rotterdam following the devastating German air attack of May 14, 1940. The terror attack set much of the city ablaze and killed nearly 900 people and left some 78,000 homeless. (National Archives)

ROUNDUP, Operation (1943)

Code name for a projected Allied cross-Channel invasion of France in the spring of 1943. Following the U.S. entry into World War II in December

1941, President Franklin D. Roosevelt agreed to concentrate U.S. military efforts on the defeat of Germany, the more formidable Axis power. The Arcadia Conference in Washington (December 22, 1941–January 14, 1942) confirmed this decision, with Roosevelt committing the United States to BOLERO, the rapid buildup of U.S. forces in Britain.

U.S. military planners and especially army chief of staff General George C. Marshall wanted an early U.S.-British invasion of France. They believed that a military diversion was necessary to keep the Soviet Union in the war and that the quickest way to end the war was to concentrate resources for a massive cross-Channel invasion. Toward that end, American planners wanted the earliest possible date for action. British prime minister Winston L. S. Churchill, who feared a repetition of the bloody stalemate in Flanders during World War I, preferred a gradual, more opportunistic approach that would commit major Allied military assets in the Mediterranean theater. Chief of the Imperial General Staff General Sir Alan Brooke supported Churchill.

General Marshall directed Brigadier General Dwight D. Eisenhower and the War Plans Division to devise a cross-Channel invasion plan. Presented to Roosevelt as the Marshall Memorandum in March 1942, it considered two options: SLEDGEHAMMER and ROUNDUP. SLEDGEHAMMER was originally a British contingency cross-Channel invasion for late 1942, to be implemented only if the Soviet Union was in danger of collapsing or if German armies in the east were defeated and France became vulnerable. SLEDGEHAMMER would utilize whatever forces were available. ROUNDUP, another British plan, envisioned an invasion of France by 48 divisions.

It is not clear how seriously the planners regarded SLEDGEHAMMER, but ROUNDUP was actively considered. It called for 18 British and 30 U.S. divisions to invade the French coast somewhere between Le Havre and Calais in the spring of 1943. U.S. planners believed that 1943 was the earliest possible date for a large-scale invasion. They also thought it might be the only time such an invasion was possible, as by 1944, the Soviet Union might either have been driven from the war or else have been victorious and rendered unwilling to cooperate with an Allied invasion of France.

Under heavy U.S. pressure, Churchill agreed to carrying out ROUNDUP no later than April 1943. Privately, however, the British worked to scuttle the cross-Channel plan by diverting resources to more modest and, according to them, more realistic objectives. In the summer of 1942, with Roosevelt

unwilling to risk defeat in Europe, the Americans reluctantly agreed to Operation GYMNAST, a plan to invade French North Africa, supposedly without prejudice to the future of ROUNDUP. The Dieppe Raid of August 19, 1942, however, destroyed any illusions about ROUNDUP. The cross-Channel invasion of France was postponed; its final incarnation, Operation OVERLORD, did not occur until June 6, 1944.

Rowecki, Stefan (1895–1944)

Polish Army general. Born in Piotrków Trybunalski, Poland, on December 25, 1895, Stefan Rowecki was an active member in Polish paramilitary organizations. During World War I, he served as a platoon and battalion commander in the 1st Legionary Brigade of the Polish Legions and was wounded three times. In 1918, Rowecki accepted a commission in the Polish Army and participated in the 1919–1921 Polish-Soviet War. He remained in the army for the rest of the interwar period, eventually attaining the rank of colonel. During this time, he held several key staff positions, including deputy chief of the Scientific Military Institute and chief of the Publishing Department of the army; in the latter post, he published several periodicals.

In June 1939, Rowecki commanded the Warsaw Armored-Motorized Brigade, charged with defense of the middle Vistula, but he could not

organize it in time to defend effectively against the German invasion of September 1. After Warsaw capitulated, he received orders from General Juliusz Karol Rómmel to lead the Służba Zwycięstwu Polski (Service for Poland's Victory, later renamed the Związek Walki Zbrojnej, or Union for Armed Struggle, and then the Armia Krajowa, or Home Army, in 1942)—an underground force created by the Polish government-in-exile to disrupt the occupying Germans. Rowecki unified nearly all underground elements in Poland under his Armia Krajowa and developed it into a powerful resistance movement. His successful coordination of sabotage, intelligence gathering, and disruption of German lines of communication and war production earned him promotion to brigadier general.

Rowecki kept underground operations sporadic while waiting for the occupying German forces to weaken before launching a full uprising. Gestapo agents arrested him on June 30, 1943; tortured him; and sent him to the Sachsenhausen concentration camp. He was murdered there on direct orders from Heinrich Himmler on the first day of the Warsaw Rising, August 1, 1944.

ROYAL MARINE, Operation (May 1940)

British plan to mine the Rhine River. On November 17, 1939, First Lord of the Admiralty Winston L. S. Churchill proposed mining Germany's inland waterways. He suggested introducing mines into the Rhine from French tributaries and between Strasbourg and Lauter, where the left bank was French territory, while Royal Air Force (RAF) bombers dropped additional mines into Germany's other rivers and canals at the same time. Churchill

hoped that thousands of small 20-pound mines might overwhelm German countermeasures and completely halt traffic on Germany's waterways. Such mines would be more than sufficient to damage or sink river barges. To avoid causing problems with the neutral Kingdom of the Netherlands, the mines would deactivate after several days, hopefully before they drifted across the Dutch frontier.

Prime Minister Neville Chamberlain and the War Cabinet approved the plan, and Churchill began assembling the mines. The French government and military, however, remained cool to the idea, especially Premier Édouard Daladier. By March 1940 Britain had assembled more than 6,000 mines, and Churchill wanted to begin deploying them in the Rhine.

The Allied Supreme War Council then endorsed plans to lay mines along the Norwegian coast and bomb the Ruhr in combination with Operation ROYAL MARINE in an effort to shut down German industry. However, newly appointed French premier Paul Reynaud, fearing German retaliation with a possible strike on Paris, rejected ROYAL MARINE and any bombing or mining of German industry, so only the mining of the Norwegian coast went forward in April. Reynaud insisted on a three-month delay before launching ROYAL MARINE in order to give the French Air Force time to prepare for German retaliation. He later agreed that Britain could launch the operation should German forces invade France or Belgium.

Royal Marines hastily implemented the plan after German troops opened their offensive into France on May 10, 1940. In the first week of fighting, they placed more than 1,700 mines into the Rhine. These effectively halted river traffic between Karlsruhe and Mainz and damaged several pontoon bridges. By May 24, British marines had placed more than 2,300 mines, and these drifted into the Rhine, Moselle, and Meuse Rivers. In the closing days of the campaign, the RAF dropped some additional mines in night sorties. As Churchill later wrote, Operation ROYAL MARINE's limited success was "swept away in the general collapse of French resistance." The operation did, however, lay the groundwork for later mine-laying efforts by both the RAF Bomber Command and the RAF Coastal Command. During the next two years, the British placed almost 16,000 mines, which sank some 369 German vessels totaling an estimated 361,821 tons.

Royal Navy Volunteer Reserve

Traditionally, the permanent strength of the Royal Navy was quite small. On January 1, 1939, it numbered fewer than 10,000 officers and only about 109,000 seamen. The Royal Marines added another 12,400 officers and men. The marines manned up to a quarter of the guns aboard ship and were available for landing parties. These permanent personnel were, however, barely sufficient to man the ships of the active fleet. To operate the ships of the reserve fleet that had not undergone modernization in the period between the wars required the calling up of some 71,000 reservists. These included members of Royal Navy Reserve (RNR), consisting of members of the Royal Fleet Reserve who had completed 12 years of service and officers in the merchant service who had joined the RNR and had received some naval training, and some 6,000 men of the Royal Naval Volunteer Reserve (RNVR). The addition of the reserves enabled the Royal Navy to expand to some 200,000 personnel by full mobilization in August 1939.

Wartime losses and the addition of new ships during the course of the conflict led to further personnel expansion, with by far the greatest officer additions occurring in the RNVR. It reached a total of 48,000 officers (comprising three-quarters of the officers in the wartime navy) and 5,000 ratings, the volunteers coming from both Britain and throughout the empire. The RNVR particularly made its mark in the Battle of the Atlantic, where many of its officers commanded destroyers, corvettes, frigates, and submarines. Its impact was also strong in the Fleet Air Arm, where a number of its members commanded squadrons.

At peak strength in mid-1944, the Royal Navy numbered 863,500 officers and men, including 73,400 members of the Women's Royal Navy Service. The vast majority of the additional personnel, however, came as a consequence of the National Service Acts and were to serve for "hostilities only."

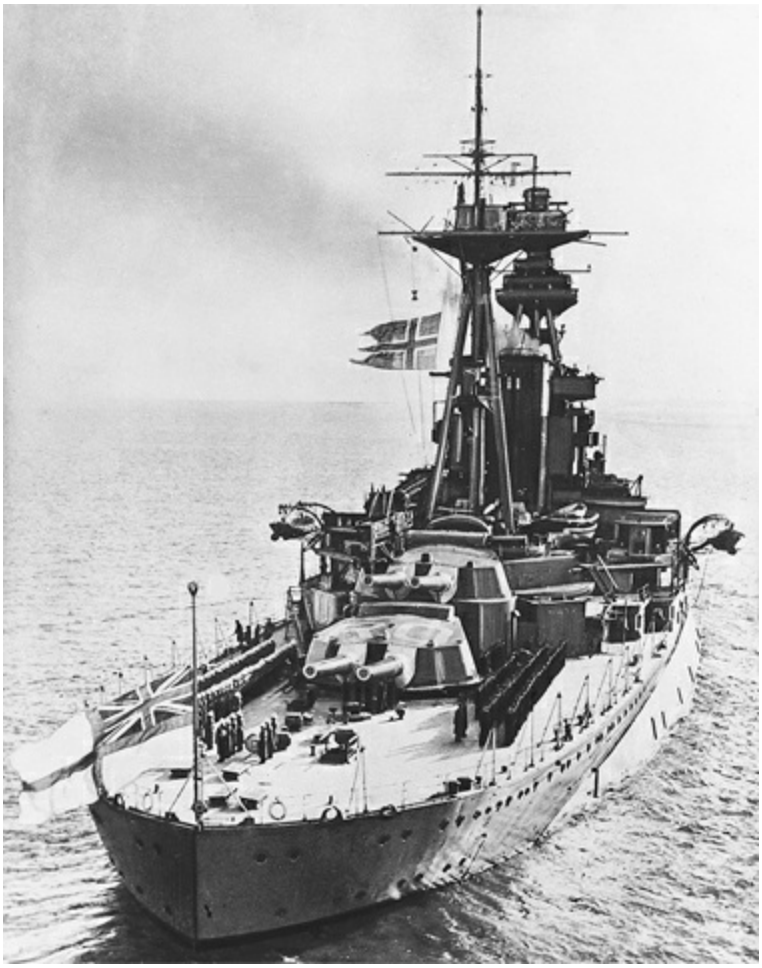
Royal Oak, HMS, Sinking of (October 14, 1939)

Loss of a British battleship to a German submarine attack within the Home Fleet anchorage at Scapa Flow in the Orkney Islands. Built as one of five superdreadnoughts of the Revenge class, the *Royal Oak* was launched in November 1914. On May 31, 1916, two weeks after commissioning, it fought at Jutland. It remained with the Grand Fleet for the rest of the war and served in the Atlantic and the Mediterranean until 1937, when it joined the Home Fleet. The *Royal Oak* and the other ships in its class were 624 feet long, displaced 28,000 tons, and carried a main battery of 8 15-inch guns, with a secondary armament of 14 6-inch guns.

When World War II began in September 1939, the *Royal Oak* was based at Scapa Flow, which, as in World War I, was Britain's main fleet anchorage in war with Germany. Nonetheless, substantial weaknesses in Scapa Flow's defenses led the commander of German submarines, Rear Admiral Karl Dönitz, to conceive an attack within the harbor that might destroy British faith in its security and usefulness. To carry out the mission, he chose

Lieutenant Commander Günther Prien of the *U-47*, who set out in his Type VII-B boat from Kiel on October 8.

German aerial surveys on October 11 and 12 showed 5 battleships and battle cruisers, 1 aircraft carrier, and 10 cruisers at anchor in Scapa Flow, but this low-level reconnaissance, along with an uncoordinated sortie by the battleship *Gneisenau* and other German surface units, persuaded the Admiralty that an attack was imminent. The British dispatched their large ships into the North Sea and then moved almost all of them to Loch Ewe in northwest Scotland. Only the *Royal Oak*, which until then had been used as a convoy escort, returned to Scapa Flow.



The British battleship *Royal Oak*. The ship was riding at anchor at the British base of Scapa Flow in the Orkney Islands when it was sunk by a German U-boat on October 14, 1939. (Roger Viollet/Getty Images)

On the moonless night of October 13, the *U-47* began a surface approach to Scapa Flow through a gap in the sunken blockship barriers revealed by aerial photography. During the four-hour passage, Prien submerged once to avoid detection by a passing merchant ship and learned that even with illumination from the northern lights, targets were not visible through his periscope. Back on the surface, he narrowly escaped entanglement in a blockship's mooring cable but emerged into the main anchorage shortly after midnight.

Prien identified the only suitable targets as the *Royal Oak* and the battle cruiser *Repulse* (he had misidentified the latter vessel, actually the seaplane carrier *Pegasus*). The *U-47* fired four torpedoes, scoring only one hit. The torpedo struck the *Royal Oak* on the starboard bow, causing its crew to believe that a small internal explosion had occurred. After a shot from his stern tube also missed, Prien fired three more reload torpedoes from his bow tubes. All struck the *Royal Oak* amidships, and 13 minutes later the battleship capsized. Of its crew, 833 men were lost and only 424 survived.

Believing that the U-boat had been spotted by destroyers, Prien retired quickly, reaching open water unmolested more than two hours later, following another difficult passage by a slightly different route. The British Admiralty grimly announced the sinking of the *Royal Oak* on October 15, ironically on the same day that an additional blockship ordered weeks earlier arrived at Scapa Flow to close the gap by which Prien had entered.

Prien returned in the *U-47* to Wilhelmshaven on October 17 to a national celebration. The *Royal Oak* remains at the bottom of Scapa Flow and is designated a war grave.

Rudel, Hans-Ulrich (1916–1982)

German Air Force colonel. Born at Seiferdauj, Silesia, Germany, on July 2, 1916, Hans-Ulrich Rudel joined the Luftwaffe in 1936 and was originally commissioned as a reconnaissance pilot. After the start of World War II, he was accepted into dive-bomber pilot training in May 1940 and was posted to Staffel 1, Sturmkampf Geschwader 2 (1.StG-2, or Squadron 1, Dive-Bomber Wing 2) a year later.

Following the German invasion of the Soviet Union on June 22, 1941, Rudel participated in the strike against the Soviet fleet at Kronstadt and was credited with having sunk the battleship *Marat* on September 23, 1941. Between May 1941 and January 1942, he flew over 500 sorties and was awarded the Knight's Cross of the Iron Cross. By February 1943, he had flown 1,000 missions and was a national hero. Rudel fitted a 37mm gun to his Junkers Ju-87G Stuka and used it for "tank busting." His success in this regard led to his assignment in developing tactics for such weapons on Stuka aircraft.

Rudel's unit was attached to the 3rd SS Panzer Division for Operation CITADEL, and at the end of the first day of fighting, Rudel had destroyed 12 Soviet tanks. In October 1943, he was promoted to major and awarded the Knight's Cross of the Iron Cross with Swords. Throughout 1944, he continued to add to his score, and he was awarded the Diamonds to his Knight's Cross in March for his efforts to save a downed crew behind enemy lines. Shot down himself that same month, he made it to friendly lines.

On February 9, 1945, after destroying a Soviet tank, Rudel's Ju-87 was hit by antiaircraft fire. Badly wounded, Rudel was nonetheless able to land the aircraft with instructions shouted to him over the intercom by his radio operator. A man of great determination, he returned to action six weeks later, despite the amputation of his right leg and orders that he not fly.

Rudel ended the war commanding Schlachtgeschwader 2 (Ground-Attack Wing 2). His final tally was 2,530 sorties. He was credited with the destruction of the *Marat,* 1 cruiser, 1 destroyer, 70 landing craft, 150 gun emplacements, 519 tanks and 800 other combat vehicles, and 7 aircraft. For his exceptional service, Adolf Hitler instituted the Knight's Cross of the Iron

Cross with Swords, Gold Oak Leaves, and Diamonds. Rudel was the only recipient of this award.

On May 8, 1945, Rudel led the remaining aircraft from his unit to land at a U.S. airfield and surrender. U.S. authorities rejected demands from the Soviets that he be turned over to them. Held as a prisoner of war, he was released in March 1946. Rudel then immigrated to Argentina to work for its air force. An unrepentant Nazi, he wrote several books supporting the regime and condemning the German General Staff for failing Hitler. In the early 1960s, Rudel returned to Germany, but his extreme right-wing views made him unwelcome in the Federal Republic's armed forces and aviation industry. On several occasions, he ran unsuccessfully for political office as an ultraconservative and ultimately became a ski instructor, despite his artificial leg. Rudel died in Rosenheim, Germany, on December 18, 1982.

Ruge, Otto (1882–1961)

Norwegian Army general. Born on September 1, 1882, in Kristiania (present-day Oslo), Norway, Otto Ruge joined the Norwegian Army and was an instructor at the Military Academy from 1923. In 1930 he headed the Communications Section of the General Staff, and between 1933 and 1938 he was chief of staff of the General Staff. From 1938 to 1940, he was inspector general of infantry.

A colonel at the time of the German invasion of his country on April 9, 1940, Ruge rallied Norwegian forces and halted a German advance at

Midtskogen. Whereas Norwegian Army commander General Kristian Laake lacked confidence in continued resistance, Ruge expressed a determination to fight on. Appointed commander in chief of the Norwegian Army on April 10 and promoted to brigadier general, he hoped to contain the German invasion along the southern Norwegian coast and then slowly withdraw northwest to allow time for mobilization of the rest of the country and British and French military intervention.

Ruge skillfully directed the Norwegian defense in a series of delaying positions. Not having been informed in advance of the British evacuation and with a German victory in sight, he steadfastly refused to abandon his men and capitulated only when King Haakon VII and the government had departed for London. Ruge disbanded the 6th Division on June 9, and the next day a member of his staff signed an armistice with the Germans. Ruge then became a German prisoner of war and was only released at the end of the war.

From 1945 to 1946, Ruge was once again commander in chief of the Norwegian Army, and he served as commander in chief of the armed forces from 1946 to 1948. He died in Mysen, Norway, on August 15, 1961.

Ruhr Air Campaign (March–July 1943)

Air campaign mounted by the Royal Air Force (RAF) Bomber Command. The Ruhr not only produced huge amounts of key war matériel but is situated in a part of Germany that was relatively easy for Allied bombers based in eastern England to reach. The Ruhr had come under attack beginning early in the war and had been the object of Allied bombing thereafter, but beginning

in early March 1943 it became a major target of the British and American Combined Bomber Offensive to destroy German industry.

The Germans were well aware of the vulnerability of the Ruhr to Allied air assault and the importance of the area to their war effort. They thus assembled in its defense large numbers of searchlights, antiaircraft guns, and interceptor aircraft. The Ruhr was also shielded by an almost constant haze of industrial smoke from its many factory chimneys that served to conceal potential targets from air observation.

The Ruhr air campaign began in early March and ended in late July. It certainly inflicted significant damage to a number of Ruhr factories. Essen absorbed almost 12,000 tons of bombs in a four-month period, and Duisburg was bombed 299 times during the war. In May and June 1943, the Battle of the Ruhr saw 16 major raids on the area. In all, Bomber Command flew some 23,000 sorties, the majority of these against the Ruhr, and lost some 1,000 aircraft, or about 4 percent of those committed.

Despite this considerable effort, the air campaign against the Ruhr had only mixed results. In order for factories to be kept out of production, bombing had to be more or less constant. It was not, for the Allies were obliged to strike other targets to prevent the Germans from concentrating all of their antiaircraft effort in the Ruhr area alone, and the Allies had insufficient numbers of bombers to strike all targets at once. Thus, on moonless nights the bombers were redirected against other targets deeper into Germany.

Although bombing accuracy was poor, the raids did inflict significant damage and caused many casualties. At the same time, however, the Germans were able to relocate from the Ruhr much of their vital war industries. They also quickly repaired bomb damage and resumed industrial production in the areas struck. The bombers also paid a heavy price, for the Germans dramatically increased the number of antiaircraft batteries and employed night fighter aircraft and improved radar to excellent effect. Indeed, night fighters soon accounted for more Allied bombers shot down than antiaircraft fire.

Heavy Allied aircraft losses brought an end to the bomber offensive at the end of July. Allied air attacks on the Ruhr continued on an intermittent basis, however, until the area was secured by Allied ground forces in April 1945.

Ruins of a bomb-damaged Krupp factory destroyed in the heavy Allied bombing of the industrial area of the Ruhr Valley beginning in the spring of 1945, photo from July 1945. (Margaret Bourke-White/The LIFE Picture Collection/Getty Images)

Ruhr Land Campaign (25 March–April 18, 1945)

By March 1945, the Western Allies had defeated all German opposition west of the Rhine River and had crossed Germany's last defensive stronghold at several points. British field marshal Sir Bernard Montgomery, commander of the 21st Army Group, advocated that the next Allied advance should come in his own northern zone, where the Allies could push through the north German plain and begin the final assault on Berlin. This route, however, was heavily defended, and supreme commander Allied Expeditionary Force General of the Army Dwight D. Eisenhower favored a broad front approach in which his main thrust would be concentrated in the center against the Ruhr River Valley.

The Ruhr industrial complex was Germany's industrial heartland and the most important Allied military objective after Berlin. Between 1942 and 1945, the Allied air campaign had diminished the Ruhr's productive capacity and forced a 25–30 percent drop in steel production. Allied air forces also enforced some measure of isolation on the Ruhr by crippling 11 of 17 critical rail centers that connected it with the rest of Germany. Still, the Allies recognized that the only way to totally eliminate the Ruhr's contribution to the German war effort was to occupy it.

Sixty-five German divisions defended the Ruhr. These were largely concentrated in the west to defend against a direct assault from the Rhine. Although understrength, these divisions presented a formidable obstacle to any direct American offensive. General Omar N. Bradley, commander of the 12th Army Group, chose to envelop the Ruhr in a classic pincer movement. Lieutenant General Courtney H. Hodges's First Army would advance along the Ruhr's southern boundary while Lieutenant General William H. Simpson's Ninth Army enveloped the Ruhr from the north. The two armies planned to link up at Paderborn.

The Ruhr campaign began on March 25 when the First Army broke out of the Remagen bridgehead over the Rhine and advanced eastward. The forward armored elements advanced rapidly through the Germans' thinly dispersed flank defenses. The 3rd Armored Division reached Marburg and turned north on March 28, the same day that the Ninth Army, led by its 2nd Armored Division, moved out from its bridgehead. The 3rd Armored Division encountered stiff German resistance on the approach to the Paderborn rendezvous. Students and instructors from a local Waffen-SS panzer training camp blocked the U.S. advance with their Tiger and Panther tanks. The 2nd

and 3rd Armored Divisions then bypassed this resistance. At noon on Easter Sunday, April 1, forward armored elements of the First and Ninth Armies linked up in the Lippstadt area west of Paderborn, completing the Ruhr envelopment.

The Ruhr Pocket (Ruhr Kessel) contained Field Marshal Walther Model's Army Group B headquarters, Colonel General Josef Harpe's Fifth Panzer Army, most of General of Infantry Gustav-Adolf von Zangen's Fifteenth Army, and two corps of the First Parachute Army. In all, German forces caught in the pocket included remnants of 18 divisions and seven corps commands. The encircled German forces were unable to muster sufficient strength to break through the U.S. perimeter and could not count on a rescue from outside the pocket. Characteristically, Adolf Hitler ordered Model to defend "Fortress Ruhr" to the last man.

Initially the Americans deployed 13 divisions for the Ruhr battle. Later, with progress slower than expected, 4 additional divisions were committed. Major General John B. Anderson's XVI Corps of the Ninth Army cleared the densely populated industrial area north of the Ruhr River. To the south, Major General James A. Van Fleet's III Corps, Major General J. Lawton Collins's VII Corps, and Major General Clarence R. Huebner's V Corps of the First Army cleared the rugged and forested Sauerland. Meanwhile, three divisions of Lieutenant General Leonard T. Gerow's Fifteenth Army were to keep the Germans occupied along the Rhine River.

German resistance proved to be spotty and unpredictable. The Americans adopted an effective technique for clearing the pocket. Once a town was captured, they would call ahead by telephone to inform the next town that they were coming soon and demand its surrender.

American forces reduced the Ruhr Pocket quickly. Essen, home of the Krupp industrial combine, was taken on April 11, and by the 14th they had effectively cut the area in two when troops from the First and Ninth Armies linked up along the Ruhr River. Major General Matthew B. Ridgway, XVIII Airborne Corps commander, wrote to Model and demanded his surrender, but the German general refused to disobey Hitler's order. Instead, he disbanded his army and on April 21 committed suicide. All organized resistance in the Ruhr Pocket ceased on April 18. During the two-week campaign the Americans captured 317,000 German soldiers, including 30 generals and an admiral, more than the Allies had captured at Tunisia or the Soviets at

Stalingrad. The Western Allies also liberated 200,000 forced laborers and 5,639 prisoners of war.

Ruhr Valley

Highly industrialized and populated area located in northwestern Germany. The Ruhr Valley encompasses 1,760 square miles and is bounded by the Lippe River to the north, the Rhine to the west, the Ruhr River to the south, and the Bergisches Land to the southwest. The Ruhr's natural resources include considerable coal deposits, and by the close of the 19th century the Ruhr Valley had become a thriving industrial region. From that time forward, the Ruhr region contained almost a dozen industrial cities and was one of the most densely populated regions in Europe.

Essen was the most important of its great industrial cities and the center of production for the great Krupp armaments firm. Cannon and other weaponry produced by Krupp in the Ruhr were vital to the German military effort in both World War I and World War II. Indeed, it was in part to protect the Ruhr that German leader Adolf Hitler ordered the remilitarization of the Rhineland in March 1936.

During World War II, the Ruhr became a prime target for intense Allied bombing campaigns, and when Allied land forces advanced on Germany from the west in 1944, the Ruhr was a key ground objective.

The Ruhr not only produced huge amounts of key war matériel, but it was situated in a part of Germany that was relatively easy for Allied bombers based in eastern England to reach. Beginning in March 1943, the Ruhr was a major target of the British and American Combined Bomber Offensive to destroy German industry. In May and June 1943, the Battle of the Ruhr saw 16 major raids on the area.

The Allied air campaign had only mixed results, and heavy Allied aircraft losses brought an end to the bomber offensive at the end of July. Attacks on the Ruhr continued, however.

German ground forces defended the Ruhr until mid-April 1945, when the U.S. First and Ninth Armies, having sealed off the Ruhr, took some 317,000 German prisoners in the so-called Ruhr Pocket.

Rundstedt, Karl Rudolf Gerd von (1875–1953)

German field marshal. Born at Aschersleben, Germany, on December 12, 1875, Karl Rudolf Gerd von Rundstedt joined the army in 1893 and served throughout World War I. Following the war, he rose steadily in the new Reichswehr. He was promoted to lieutenant colonel in October 1920 and colonel in February 1923. Rundstedt was then chief of staff of the 2nd Infantry Division. In March 1925, he assumed command of the 18th Infantry Regiment. In November 1927, he was promoted to major general, and a year later, he commanded the 2nd Cavalry Division.

Promoted to lieutenant general in March 1929, Rundstedt took command of the 3rd Infantry Division and then Group Command I. He was promoted to general of infantry in October 1932 and to colonel general in March 1938. Unhappy with Adolf Hitler's growing power, Rundstedt retired on October 31, 1938. He was recalled to duty at the age of 64, and in September 1939, he led Army Group South into Poland.

In the German invasion of France in May 1940, Rund-stedt commanded Army Group A, composed of 45 divisions. By May 14, his tanks had opened up a broad gap in the Allied front. Rundstedt argued that his tanks should halt until infantry divisions could catch up. Hitler agreed but made the order a fast one, stopping General of Panzer Troops Heinz Guderian's panzer thrust that could have cut off the British escape from Dunkerque. Hitler promoted Rundstedt to field marshal on July 19, 1940. Later, Rundstedt took command of occupation forces and was given responsibility for coastal defenses in Holland, Belgium, and France.

Rundstedt participated in Operation BARBAROSSA, the June 22, 1941, invasion of the Soviet Union, as commander of Army Group South. His forces made slow progress during the first weeks, but in September 1941, he directed the capture of Kiev and 665,000 Soviet troops. Rundstedt strongly opposed continuing the advance into the Soviet Union during the winter and advised Hitler to call a halt, but his advice was rejected.

Rundstedt continued the advance and reached Rostov on November 21, but a Soviet counterattack forced his troops back. When Rundstedt called for withdrawal, Hitler replaced him with General Walther von Reichenau. After the führer recalled him to duty in March 1942, sending him to France as Oberbefehlshaber West (commander in chief, west), Rundstedt organized the construction of the fortifications known as the Atlantic Wall along 1,700 miles of coastline. After the June 6, 1944, Normandy landings, he urged Hitler to make peace. Hitler responded by replacing him with Field Marshal Günther von Kluge, but in September, Rundstedt returned to his former post. Having been in command during the last major German offensive (Ardennes, Battle of the Bulge, December 16, 1944–January 25, 1945), he was sacked as commander in chief, west, in March 1945.

Rundstedt was the prototype, if not the caricature, of the old-style Prussian officer, deeply attached to Germany's imperial traditions. He never failed to contradict Hitler with respect to military matters when he felt it

necessary to do so, but he also never questioned his regime. Captured by the Western Allies on May 1, 1945, Rundstedt was released in May 1949 and lived in Hannover, Germany, until his death on February 24, 1953.

Ruweisat Ridge, Battles of (July 1–27, 1942)

Crucial battles that helped determine the outcome of fighting in North Africa and the Middle East. German field marshal Erwin Rommel and his Axis forces had already won spectacular victories at Gazala (May 26–June 13, 1942) and in the capture of Tobruk (June 20–21), costing the British some 80,000 men and 1,000 tanks. Driving his troops hard, Rommel hoped to rout the retreating imperial forces and capture Cairo and seize the Suez Canal. The British defeat at Mersa Matrûh on June 28 appeared to confirm this course of action.

After months of heavy fighting, however, Axis forces were exhausted and much understrength. At the end of June, the three German divisions of 2,000 infantrymen possessed only 55 tanks, 77 field pieces, and 63 antitank guns. Italian forces included 8,000 infantrymen, 70 tanks, and 200 field pieces. Axis forces were at the end of a rapidly lengthening supply and reinforcement line. Rommel had also outrun his air support, with the Axis air forces struggling to establish new forward bases.

On June 25, General Sir Claude Auchinleck, British commander in the Middle East, took personal control of the Eighth Army. Its defensive positions were almost 100 miles west of Alexandria, Egypt, and ran south for 38 miles from the coastal town of El Alamein to the impassable salt marshes of the Qattara Depression. These positions formed a natural choke point, as they could be penetrated but not outflanked. The terrain was largely flat except for two low east-west ridges—Miteiriya in the north and Ruweisat in the center.

The South African 1st Division occupied the northern positions, the Indian 18th Brigade held the center, and the New Zealand 2nd Division deployed in the south. Rommel's attack plan had his 90th Light Division attacking in the north. It would drive east and then swing left to the sea, encircling the South Africans. The 21st and 15th Panzer Divisions were to move east in the center and then strike right, striking the New Zealanders in the rear.

Confident of victory, Rommel unleashed the Afrika Korps on July 1. The panzers found their path blocked by the Indian 18th Brigade. The Indian defenses were incomplete, and the troops were short of ammunition and even water. Luckily, the day before the German attack, artillery units had arrived with some 40 guns, and the defenders fought tenaciously until overrun that evening. They had, however, destroyed 18 German tanks and stopped the German advance. To the north, the 90th Light Division encountered heavy fire from the South Africans and an artillery reinforcement. Panic erupted among the long-suffering German soldiers, and the officers were fully occupied restoring control.

On July 2, Rommel attempted to use his Panzers to renew the attack in the north. Auchinleck now inserted the 1st Armoured Division, consisting of the 2nd, 4th, and 22nd Armoured Brigades. The 4th and 22nd Brigades, with 38 Grant medium tanks, thrust into the open southern German flank and fought the panzers until nightfall. Rommel resumed the offensive on July 3, sending his tanks forward along both sides of Ruweisat Ridge. The Italian Ariete and Trieste Divisions, which had excellent fighting records, were instructed to attack south. But the 4th and 22nd Armoured Brigades barred the Panzers' path. In the south the Trieste Division failed to move, and the Ariete was split, its tanks entangled in the armor battle. The remaining units

were struck by the New Zealanders, and the Ariete Division fled, with the loss of 531 men and 44 guns.

Auchinleck now unleashed a series of counterstrokes, relying heavily on information garnered through Ultra intercepts. Reinforcements from the Australian 9th Division came into play. The 2nd Armoured Brigade replaced the 4th Armoured Brigade, decimated in the fighting. In the north, on July 10 the South African 2nd and Australian 26th Brigades attacked positions west of El Alamein held by Italian infantry. This assault overran the Italian lines and netted 1,500 prisoners and 30 guns. Only the newly arrived 382nd German Infantry Regiment, a battalion of elite Bersaglieri (marksmen) Italian troops, and additional Italian guns halted the attack.

Auchinleck then mounted an assault in the center of the line, sending his New Zealand 4th and 5th Brigades and Indian 5th Brigade against some 4,000 Italian troops on Ruweisat Ridge. Between July 14 and 15 they seized the ridge, but it was impossible to dig into the rock terrain, and no tanks came forward to help the New Zealanders. In addition, corps commander Lieutenant General William H. Gott failed to coordinate his infantry and armor. In a devastating counterattack, German armor recovered the ridge, and 1,405 New Zealanders were lost.

On July 17, two Australian battalions attacked south against Italian positions on Miteiriya Ridge. The Australians captured 700 prisoners, but they came under fire by Italian guns and were halted by a German task force. Rommel now reluctantly concluded that he must go over to the defensive. German engineers utilized power drills to lay extensive minefields. They also erected strongpoints, where troops were armed with automatic weapons and antitank guns.

In his report of July 21, Rommel exaggerated his losses in order to accelerate reinforcement. This report, decoded by Ultra, strengthened Auchinleck’s resolve to crush Rommel and the Afrika Korps. Strong pressure also came from British prime minister Winston L. S. Churchill, whose government was under parliamentary attack occasioned by a series of military defeats.

Auchinleck planned a three-pronged assault for the night of July 21–22. The Indian 161st Brigade was to seize the western end of Ruweisat Ridge, while the newly arrived 23rd Armoured Brigade (less one regiment in support of the Australians) was entrusted with the major objective of attacking the

center and overrunning Rommel's headquarters. The New Zealand 6th Brigade was to attack from the south in a northwest direction. The 2nd and 22nd Armoured Brigades were to join the New Zealanders by daybreak.

The Indians met stiff resistance from German and Italian infantry, incurring substantial losses in their failure. In the south, the New Zealanders secured their objective, but the 2nd and 22nd Armoured Brigades failed to link up with the New Zealanders. On the morning of July 22, the 15th and 21st Panzers destroyed the 6th Brigade, inflicting 904 casualties. That same morning, the 23rd Armoured Brigade unleashed two regiments of Valentine infantry tanks in a determined assault. Running into vicious antitank gunfire and blundering into uncleared minefields, the British had 40 tanks destroyed and another 40 damaged. Only 7 were still intact. This attack did cause serious concern for the defenders, as it had penetrated German defenses and overrun a key strongpoint.

Auchinleck's last effort came in the northern sector, in an attack against Miteiriya Ridge on July 26–27. One battalion from the Australian 24th Brigade and two battalions from the British 69th Brigade were to seize the ridge. The 2nd Armoured Brigade would then move through gaps cleared in the minefields to support the infantry. The infantry troops gained their objectives and overran two Axis battalions. But the mine clearing went awry, and the Australians and British fell victim to swift German armored counterattacks, losing 1,000 men.

Commonwealth infantrymen, particularly the New Zealanders, emerged from these battles bitter about the lack of British armor support and what they regarded as incompetent British commanders. Although 7,000 Axis prisoners were captured in the Ruweisat battles, British/Commonwealth casualties totaled 13,250. A tactical stalemate, the Battles of Ruweisat Ridge were an operational success for the British. Rommel's drive to the east had reached culmination. The stage was now set for the coming battle at Alam Halfa and El Alamein. Nonetheless, on August 8, Churchill relieved Auchinleck from command.

Rydz-Śmigły, Edward (1886–1941)

Marshal of Poland. Born on March 11, 1886, at Brzeóany in Austrian Galicia, Edward Rydz-Śmigły joined a Polish paramilitary organization in 1907 and graduated from its officer school in 1912. In August 1914, he joined the First Legion organized by Józef Piłsudski and fought in it alongside the Austrians against the Russians until July 1917. Rydz-Śmigły advanced quickly thanks to his leadership abilities, and by 1917, he had reached the rank of colonel and commanded a regiment.

When Piłsudski discovered that the Central Powers did not intend to grant Poland its independence, he and his First Legion refused to swear allegiance to Austria and Germany and went underground. Rydz-Śmigły followed Piłsudski and was appointed commander of the clandestine Polish Military Organization (Polska Organizacja Wojskowa). Following the declaration of Poland's independence in November 1918, Rydz-Śmigły became one of Piłsudski's closest associates and was promoted to the rank of brigadier general. In 1920, during the Russo-Polish War, he commanded the Third Army that spearheaded the Polish-Ukrainian offensive that occupied Kiev. After the peace treaty of Riga in March 1921, he became one of the inspectors of the Polish Army, with the rank of lieutenant general.

Rydz-Śmigły supported Piłsudski in his 1926 coup d'état. In May 1935, when Marshal Piłsudski died, Rydz-Śmigły took power, assuming both Piłsudski's rank and his place as head of the Polish armed forces. Thereafter, he made a considerable but belated effort to modernize Poland's defenses.

Such efforts were halted by the September 1939 invasion of Poland, first by Germany and then by the Soviet Union.

Rydz-Śmigły next turned to Poland's ally Romania. Promised the right of free passage to France for himself and the remnants of his military forces, he sought shelter on Romanian territory. Under pressure from Berlin, the Bucharest government decided to intern him as well as other members of the Polish government. Rydz-Śmigły escaped internment, however, and returned secretly to Poland via Hungary. He died in Warsaw from heart failure on November 28, 1941, while trying to organize Polish underground resistance against German occupation.

S

Saalwächter, Alfred (1883–1945)

German admiral. Born in Neusalz an der Oder, in the German part of Silesia, on January 20, 1883, Alfred Saalwächter entered the German Navy as a cadet in April 1901. He was promoted to ensign in September 1904 and to lieutenant, junior grade, in March 1906. Following initial training, he held various seagoing assignments. Promoted to lieutenant in April 1911, he served in the operations department of the Admiralty Staff in Berlin until 1915.

In March 1915, Saalwächter became flag lieutenant of the battleship *Friedrich der Grosse*, flagship of the High Seas Fleet. In February 1916, he entered U-boat service. Following training, he commanded in succession the *U-25*, *U-46*, and *U-94* until March 1918.

Remaining in the navy after the war, Saalwächter was promoted to lieutenant commander in 1920. Following assignments in naval administration, Saalwächter took command of the light cruiser *Amazone* in 1926. Promoted to commander, he commanded the battleship *Schlesien*. He was promoted to captain in October 1928 and to rear admiral in October 1932. During 1933–1938, he was inspector for naval instruction. Promoted to vice admiral in April 1933 and to admiral in June 1937, he assumed command of the North Sea naval station of Wilhelmshaven in October 1938.

With the beginning of World War II in September 1939, Saalwächter commanded German naval operations in the North Sea. Promoted to general admiral in January 1940, he played a leading role in the planning and execution of Operation WESERÜBUNG, the German invasion of Norway in April 1940. For his contribution he was awarded the Knight's Cross. In the summer of 1940, he took command of Navy Group West, in which post he was responsible for directing operations of German surface units in the North Atlantic and the English Channel, including Operation CERBERUS (the

"Channel Dash") in February 1942. He was replaced in September by Admiral Wilhelm Marschall.

Saalwächter resigned from the navy on November 30, 1942, shortly before the remaining heavy German surface units ceased their activity in the Atlantic. Imprisoned by the Soviets in June 1945, he was convicted that October by a Soviet military tribunal of war crimes and was executed by firing squad in Moscow on December 6. A Russian court exonerated him in 1994.

Saar, French Invasion of the (September 1939)

Ineffectual French offensive at the beginning of World War II. On May 19, 1939, French and Polish military officials agreed that their armies would attack Germany if Germany moved against either state. Supreme commander of French land forces General Maurice Gamelin pledged that he would invade Germany with the majority of his troops not more than 15 days after mobilization began. Britain and France also promised that in the event of a German attack, they would move against Germany immediately from the air.

Despite the Allied pledge, the French military strategy for war with Germany was to remain on the defensive, wearing down the enemy until France's army was strong enough to take the initiative. During World War I, 1.5 million Frenchmen had perished, and it was unacceptable that such a slaughter be repeated.

Gamelin declared that he would not open this war with a new Battle of Verdun, a costly all-out assault on fortified positions. His deputy, General Alphonse Georges, vowed to resign if ordered to lead an invasion. The French military philosophy was summed up in the phrase “Stingy with blood; extravagant with steel.” Given this mind-set, any French military operations on behalf of the Poles were destined to be extremely cautious.

On September 1, Germany invaded Poland. Six days later, the Polish General Staff radioed an appeal for Gamelin to act quickly, in hopes that Germany would divert units from the invasion to the west. The French mobilization had just begun, and most heavy artillery was still in storage. The army’s 85 divisions were dispersed to guard against possible attacks from fascist Spain and Italy while also defending the long border with Germany. Regardless, honor demanded some action on behalf of the Poles.

If France’s troops could pass through Belgium, they might outflank Germany’s West Wall (known as the Siegfried Line by the French) defenses. Belgium, however, insisted on remaining neutral. With the northern route thus closed, Gamelin had little choice but to attack within a 90-mile-wide sector between the Rhine and Moselle Rivers in the Saar, directly into the teeth of what he believed to be strong fortifications. The invasion force was designated 2nd Army Group. General André Prételat was its commander. Chief of staff of the Fourth Army in 1918, Prételat had since 1934 been a member of the Supreme War Council, which was wedded to defensive strategy.

On the night of September 7–8, a few light French units entered German territory along a 15-mile front southeast of Saarbrücken. On September 9, stronger forces from the Fourth and Fifth Armies followed, while the Third Army advanced into the Wendt Forest slightly to the west. Despite Gamelin’s earlier pledge to use the majority of his troops, no more than 15 divisions crossed the frontier; most French authorities believe that only 9 of the 85 divisions on the northeast front took part.

The French advanced against a pitifully inadequate German force in the west. Adolf Hitler had gambled on a Schlieffen Plan in reverse, throwing the bulk of his resources against Poland while leaving only weak covering forces in the west, on the (correct) assumption that the French would be slow to move. The German Army had a maximum of 25 divisions in the west, the bulk of which were inadequately trained and poorly equipped reserves. The

mechanized and motorized troops had all been committed to the fighting in Poland, and artillery had been stripped from the West Wall. German forces in the west had no tanks, little artillery, and virtually no aircraft.

Only light skirmishing occurred. So cautious was the French advance that a single automatic weapon halted an entire platoon. Artillery of both sides lobbed shells in the general direction of the enemy. Modern Char B heavy tanks supported French infantry, but the French government, fearful of retaliation against Paris, refused to authorize bombing, and the Royal Air Force readily complied with French requests to follow the same policy.

While Polish cities shuddered under German bombs, the 2nd Army Group inched forward. It advanced a mere five miles by September 12, capturing 20 deserted German villages. Gamelin then ordered Prételat to halt short of the Siegfried Line and prepare for retreat should the Germans counterattack through Belgium. Five days later, as it was clear that the Poles were collapsing under the German hammer blows, Soviet troops invaded eastern Poland. By the end of the month, the Poles were finished.

Not a single Junkers Ju-87 Stuka dive-bomber or panzer had been diverted from the invasion of Poland by Gamelin's timid "invasion." On September 30, Prételat was ordered to withdraw his troops secretly at night. By mid-October, Germany had 70 divisions in the west. On October 16, a handful of infantry attacked the remaining French troops, and in two days Germany reoccupied all the territory the 2nd Army Group had required two weeks to capture. Casualties on both sides in the ineffectual campaign were light. Most French losses resulted from a thick belt of German mines and booby traps.

The French high command lamented that Poland had not been able to hold out until spring, when a proper offensive might have been undertaken. Gamelin later justified the feeble effort by saying that the governments of France and Poland had not ratified a parallel political treaty to complete their mutual support agreement, although France had signed the political agreement on September 4.

Given France's reliance on large numbers of reservists, its troop dispersions, and its defensive mentality, a stronger offensive may not have been a realistic option, but German observers believed that a more determined French effort would have carried to the Rhine and changed the course of the war. It is worth noting that Britain, which also had a solemn

obligation to defend Poland, did nothing to assist Poland beyond dropping propaganda leaflets. By the time of the French offensive, the British Expeditionary Force had not even completed its assembly. Both states would pay a heavy price for their lack of military preparedness.

Saeki Shizuo (1894–1980)

Japanese Army colonel. Born on February 20, 1894, in Hiroshima, Saeki Shizuo joined the army in 1913 and was initially trained as a cavalry officer. When the Japanese Army reorganized its cavalry scout units into mechanized units, in 1941 Lieutenant Colonel Saeki took command of the 5th Scout Regiment attached to the 5th Division, the mainstay of General Yamashita Tomoyuki's Twenty-Fifth Army.

On December 8, 1941, the 5th Division landed in Singora, Thailand, and moved south to break the British defense line at Jitra in northern Malaya. A detachment was organized around Saeki's 5th Scout Regiment. With 580 infantrymen, 18 tanks and armored vehicles, and 2 artillery pieces, Saeki conducted a miniblitzkrieg on British defenses at Jitra, which was held by 6,000 defenders. This successful attack led to the total collapse of the British defenses in northern Malaya.

Promoted to colonel, in July 1944 Saeki took command of the 29th Tank Regiment. In April 1945, he received command of the 2nd Independent Tank Brigade organized for the defense of the Japanese home islands. Saeki died in Tokyo on May 15, 1980.

Saint-Lô, Battle of (July 11–19, 1944)

Key battle following the June 6, 1944, Normandy Invasion. Saint-Lô was the hub of an extensive road network that allowed the Germans to rapidly shift men and weapons east and west to meet American attacks. Lieutenant General Omar N. Bradley, commanding the U.S. First Army, needed the road from Saint-Lô west to Périers as a line of departure for an offensive (code-named COBRA) to break out of the Normandy bocage of hedgerow country. The bocage consisted of small fields and orchards surrounded by underbrush-covered earthen dikes three to five feet thick and six to nine feet high, with numerous narrow, sunken lanes. These brush-crowned embankments walled in the fields and provided excellent positions for the German defenders.

On July 11, Major General Charles H. Gerhardt's 29th Infantry Division began the attack to take Saint-Lô and the Martinsville Ridge to its east. The 35th Infantry Division attacked on its right, and the 2nd Infantry Division (V Corps) attacked on its left. Defending was the 3rd Parachute Division of General of Parachute Panzer Troops Eugen Meindl's II Parachute Corps plus badly battered Kampfgruppen (battle groups) of varying sizes from the 266th, 352nd, and 353rd Infantry Divisions under command of the 353rd.

The 116th Infantry Regiment attacked on the left and the 115th Infantry Regiment on the right in the 29th Infantry Division's zone, using assault

groups composed of infantry, tanks, and engineers to methodically attack and seize each field. Many tanks were equipped with steel prongs hastily welded to the fronts of their hulls to help them through hedgerows and to punch holes in which to place explosives. By the end of the day, the 116th Infantry decisively penetrated German defenses, but heavier resistance stopped the 115th. However, the 2nd Infantry Division seized Hill 192, which overlooked the Saint-Lô area.

Ruins of St.-Lô, France, the site of fierce fighting in July 1944 between U.S. and German forces during the Normandy Campaign. (Frank Scherschel/The LIFE Picture Collection/Getty Images)

Attacking U.S. forces made little headway between July 12 and 14. On July 15, the Germans stopped both regiments. At 7:30 p.m., however, the 116th Infantry again began making headway, but it was halted for the night by higher headquarters. The 2nd Battalion failed to receive the order, and although it was cut off, it was not attacked. Meanwhile, that same day the

35th Infantry Division seized the north slope of Hill 122 about a mile north of Saint-Lô.

On July 16 the 115th Infantry was again thwarted, and the 116th Infantry defeated two German counterattacks. On July 17 the 115th continued attacking the high ground on the Martinville Ridge, commanding the German rear area. Major Thomas D. Howie's 3rd Battalion, 116th Infantry, attacked southwest, and by 6:00 a.m. it had taken the village of La Madeleine without opposition, relieving the regiment's 2nd Battalion. La Madeleine was about 500 yards from Saint-Lô itself.

The 2nd Battalion was supposed to attack into Saint-Lô, but it had suffered too many casualties to do this. Howie then took the mission. Shortly after Howie issued his orders he was killed, and his executive officer, Captain William H. Puntenney, assumed command. Heavy German artillery and mortar fire followed by a counterattack thwarted the attack plan. U.S. artillery and mortar fire and air strikes then defeated the German counterattack. Both the 2nd and 3rd Battalions of the 116th Infantry were now isolated from the remainder of the division. By the end of the day of July 17, however, the 29th Division was on the inner slopes of hills that led directly into Saint-Lô.

On the morning of July 18, the 35th Infantry Division reported that the Germans had pulled out everywhere in its sector. Task Force C—commanded by Brigadier General Norman D. Cota, assistant division commander of the 29th Infantry Division, and composed of reconnaissance, tank, tank destroyer, and engineer units—was tapped to seize the town. Cota was to obtain infantry support from the nearest available infantry unit just before entering the town. That was 1st Battalion, 115th Infantry (less one platoon designated to contain a small number of German holdouts). By 7:00 p.m., Saint-Lô had been secured. Major Howie's men carried his body into the town and placed it on the rubble surrounding what had been the Cathedral of Notre Dame.

Pockets of resistance still remained, and the Germans poured in mortar and artillery fire. Cota was wounded, and some 200 of the 600-man task force became casualties, but the capture of Saint-Lô and the adjacent high ground solidly protected the U.S. First Army's left flank as it penetrated the German lines and prepared the way for Operation COBRA.

Saint-Nazaire, Raid on (March 28, 1942)

British commando raid on the French port of Saint-Nazaire on the Bay of Biscay. The port of Saint-Nazaire had one of the few dock facilities capable of accommodating the German battleship *Tirpitz* and the only one on the French coast. The plan to raid the port was developed by Captain John Hughes-Hallett of British Combined Operations. Known as Operation CHARIOT, it called for commandos to ram a ship loaded with explosives into the dock to demolish it while other forces landed to destroy additional port facilities. Wrecking the dry dock might prevent the Germans from sending the *Tirpitz* from Norway on a sortie against the Atlantic convoys because it would lack repair facilities in France.

On the afternoon of March 26, 1942, the British strike force sailed from Falmouth. Commander Robert Ryder had charge of the naval forces, and Lieutenant Colonel Augustus Charles Newman commanded the landing party. The naval force centered on the destroyer *Campbeltown* (the obsolete former U.S. Navy *Buchanan* acquired under the Destroyers-for-Bases Agreement) and naval launches. The *Campbeltown* was packed with four tons of timed explosives. The destroyers *Tynedale* and *Atherstone* provided escort. The flotilla, flying the German naval ensign and flashing German recognition signals, entered Saint-Nazaire Harbor early on March 28. At 1:30

a.m. the Germans, although initially fooled, opened fire with shore artillery, but the darkness hampered their accuracy.

At 1:34 a.m., the *Campbeltown* slammed into the dry dock's outer caisson at 18 knots. The impact crushed the bow for 36 feet and drove the ship onto the caisson a full 12 inches into the steel gate, while some 260 commandos poured off the *Campbeltown* and launches to destroy machinery, several buildings, bridges, and smaller vessels. German reinforcements arrived, and the firing soon became intense. Although three motor launches and the two escorting destroyers escaped to Britain under air cover, most of the commandos were left behind.

At 10:30 a.m., high-ranking German officers and engineers were at the dry dock to inspect the damage when the explosives in the destroyer's bow detonated. Another charge aboard a motor torpedo boat destroyed the lock gates of the Saint-Nazaire basin. Some 400 Germans were killed in the raid, most of them in the explosion aboard the *Campbeltown*. Among the dead were two of the commando officers, who had refused to reveal the presence of the explosives. The British lost 2 motor torpedo boats and 14 motor launches. Of 621 raiders who participated, 169 were killed and 200 captured; 5 escaped to Spain. The British had achieved their primary objective, as the Germans were unable to use the dry dock for the remainder of the war. The *Tirpitz* never entered the Atlantic. Operation CHARIOT has been dubbed the "greatest raid of all."

Saint-Pierre and Miquelon, Free French Seizure of (December 24, 1941)

Saint-Pierre and Miquelon, island territories of France off the coast of Newfoundland with a population of fewer than 4,500 people in 1941, became a cause célèbre in the winter of 1941–1942. Following the German defeat of France in June 1940, the government of the Saint-Pierre and Miquelon territory recognized the collaborationist French government of Marshal Henri Philippe Pétain in Vichy. Although there was some Free French agitation, threats to bring in Vichy forces kept most such sentiments under control. At the same time, control over the islands was a minor issue for the governments of Canada, Britain, and the United States. Britain advocated Free French control over the territory, whereas the United States vehemently opposed any change, and Canada attempted to hold a middle ground.

In 1941, increased German U-boat activity in the North Atlantic added greater weight to the matter, as it was feared that the territory's radio station was broadcasting information detrimental to Allied interests. Proposals were circulated among Ottawa, London, and Washington to pressure the territorial government to transfer authority over the station—which received further impetus after the December 1941 attack on Pearl Harbor.

Learning that authority might be transferred, head of Free French forces in London General Charles de Gaulle decided to forestall any Anglo-British action. On December 22, 1941, Vice Admiral Émile Henri Muselier, commander of the Free French Navy, departed Halifax with the three corvettes *Mimosa, Alysse,* and *Acorit* and the submarine *Surcouf,* then the world's largest. Ostensibly on a training exercise, Muselier instead sailed for Saint-Pierre, some 365 miles to the northeast.

Muselier's vessels arrived in the early morning hours of December 24. Security was lax, and Muselier sent ashore a landing party of several dozen men and easily seized control of its strategic locations without a shot being fired. Muselier arrested the leaders of the Vichy government and quickly held a plebiscite on December 25 to demonstrate the wishes of the majority of the people to support the Free French. The vote was 783 in favor of Free France, 14 against, and 215 blank, or null and void ballots.

In Washington, Secretary of State Cordell Hull was enraged, as he believed that de Gaulle had acted with British approval and support. Although Hull was under attack from American media, which was increasingly critical of what it regarded as his appeasement policies toward Vichy, Hull released an inflammatory statement calling for a return to the

status quo in Saint-Pierre and Miquelon and insisting Canada enforce the return of the territory to Vichy control.

The governments of Canada, Britain, and the Free French all refused to follow the American dictates. Although various plans and projects were suggested, the islands remained in Free French hands. The result for de Gaulle, however, was less than he had hoped. He had managed to secure a French territory for his cause, but, contrary to his ambitions, it did not lead to any other territories opting to follow his flag. In addition, this event exacerbated de Gaulle's poor relations with Franklin D. Roosevelt, who was already suspicious of his motives, and hampered de Gaulle's later activities.

Saipan, Battle of (June 15–July 9, 1944)

Important Pacific theater battle. Saipan, part of the Mariana Islands chain that includes Guam and Tinian, had belonged to Germany and passed to Japanese control as League of Nations mandates after World War I. Following the successful U.S. invasions in the Gilbert and Marshall Islands, U.S. chief of naval operations Admiral Ernest J. King pushed for an assault on the Marianas. Despite opposition from General Douglas MacArthur, King's view prevailed.

The invasion force for Saipan included the 2nd and 4th Marine Divisions; the 27th Infantry Division was in reserve. Admiral Raymond Spruance commanded the Fifth Fleet, while Rear Admiral Richmond Kelly Turner was in charge of planning and executing the landing. Marine Major General

Holland (“Howlin’ Mad”) Smith commanded the V Amphibious Corps and would be in charge of the troops once they disembarked.

The attack plan, code-named Operation FORAGER, called for the marines to land along a strip of beach on the western side of the island. American estimates placed up to 15,000 Japanese soldiers on Saipan, but there were actually some 30,000 army and naval personnel there as well as many civilians.

Vice Admiral Nagumo Chūichi commanded the Fourth Fleet, a small area fleet charged with defending the Marianas. He established his headquarters on Saipan, which was also headquarters for the Japanese Twenty-First Army, commanded by Lieutenant General Hideyoshi Obata. Lieutenant General Saitō Yoshitsugu had actual ground command on Saipan. His men were well entrenched in caves and other natural fortifications on the island, and they were well supplied with defensive firepower.

More than 800 ships transported the U.S. invasion force from Eniwetok to the Marianas. Bombardment vessels pounded Saipan for three days before the landing, but this bombardment was insufficient, as many Japanese defensive positions had not been identified. Early on the morning of June 15, the marines went ashore. Contrary tides and Japanese fire prevented the 2nd Marine Division, aiming for the north end of the target beaches, from landing in the preferred location. The 4th Marine Division landed with greater accuracy, but the Japanese mounted an excellent defense and subjected them to withering artillery and mortar fire. Both sides suffered heavy casualties in the first days of the battle.

Despite stubborn Japanese opposition, the marines slowly advanced. The 2nd Marine Division swung north along the western coast of Saipan, while the 4th Marine Division pushed across to the eastern coast of the island before turning northward as well. On June 16 and 17, Holland Smith committed his reserve, the 27th Infantry Division, to the battle, deploying it between the two marine divisions and ordering it to drive northward up the center of the island.

Army reinforcements disembarking from LSTs proceed across a coral reef toward the beach during the Battle of Saipan (June 15–July 9, 1944). (National Archives)

While the marines and infantry were struggling to gain control of Saipan, Spruance learned that the Japanese fleet had sailed from the Philippines for the Marianas. Spruance then departed with most of his ships to engage the Japanese fleet. Vice Admiral Marc Mitscher, who commanded Task Group 58 of the American carriers, successfully defeated the Japanese threat in the July 19–21 Battle of the Philippine Sea. Known to the Americans as the "Great Marianas Turkey Shoot," this battle destroyed Japanese naval airpower, but it also deprived the Americans on Saipan of much-needed naval gunfire and air support.

In the meantime, marines and army troops on Saipan continued to drive north. In a controversial decision, Major General Holland Smith, dissatisfied with army progress, relieved Major General Ralph C. Smith from command of the 27th Infantry Division. This matter, largely the result of different tactical doctrines, led to an interservice dispute that raged well after the end of the war.

On July 7, the Japanese mounted the largest banzai attack of the war, but that desperation charge by 3,000 Japanese soldiers was the last major effort in a lost battle. Most Japanese fought to the death rather than surrender, and their commanders, including Nagumo and Saitō, committed suicide.

Hundreds of Japanese civilians also leaped to their deaths from cliffs at the northern end of Saipan rather than surrender. Organized resistance on the island ended on July 9, and Saipan was declared secure on July 13. U.S. forces suffered 3,126 killed, 13,160 wounded, and 326 missing. Japanese losses were approximately 27,000 killed. Only 2,000 were taken prisoner.

The fall of Saipan brought the resignation of Japanese premier General Tōjō Hideki. Guam and Tinian in the Marianas were also secured by early August. Even as fighting for the three islands went forward, Seabees were clearing runways for B-29 bombers to strike Japan.

Saitō Yoshitsugu (1890–1944)

Japanese Army lieutenant general. Born in Miyagi Prefecture on November 28, 1890, Saitō Yoshitsugu graduated from the Japanese military academy in 1912 and from the war college in 1924. He was promoted to lieutenant colonel in 1932. A cavalry officer, Saitō was a member of the Inspectorate General for Cavalry during 1932–1933. He then held cavalry commands. Promoted to colonel in 1936, he was then chief of staff of a division.

In 1939, Saitō was promoted to major general and appointed chief of the Military Remount Depot of the Guandong (Kwantung) Army. In 1941, he became chief of the Military Remount Department of the War Ministry. Promoted to lieutenant general in 1942, Saitō received command of the 43rd Division and was given charge of the Northern Marianas District of Saipan and Tinian islands in April 1944.

The convoy carrying 7,000 men of the 43rd Division to the Marianas came under U.S. Navy submarine attack, and five of seven transports were sunk. Although most of the men were saved, they arrived at Saipan without their equipment.

Saitō also had little time to prepare for a U.S. invasion of the island. The main Japanese body arrived on May 5 and the remainder on June 7, and U.S. forces invaded on June 15. Saitō had only his 43rd Infantry Division and the 27th Independent Brigade, in addition to naval personnel. Saitō was junior to Admirals Nagumo Chūichi and Takagi Takeo, who had their headquarters on the island but few resources.

Saitō's tactic of trying to defend at the water's edge was not successful, nor were banzai night attacks against the U.S. beachhead. Overwhelming U.S. ground strength and naval and air support steadily reduced the defenders, who were driven into the northern part of the island. On July 6–7, some 3,000 Japanese survivors mounted the war's largest banzai attack, which failed. Saitō committed suicide on July 10; his remains were cremated and given a funeral with military honors presided over by Major General Holland Smith. On July 9, Rear Admiral Richmond Kelly Turner declared the island secure.

Sakai Saburo (1916–2000)

Japanese Navy pilot. Born on August 26, 1916, at Saga on the island of Kyushu, Sakai Saburo joined the navy in May 1933. As a naval aviation pilot, second class, and later an ensign, Sakai became one of Japan's well-trained fighter pilots. After service in China from 1938 to 1941, Sakai fought in the Japanese invasion of the Philippines in December 1941. He then fought in the Netherlands East Indies, New Guinea, and the Solomon Islands. He was credited with 64 aerial victories, placing him fifth among Japanese aces of the war.

Sakai's most intense aerial combats were over Port Moresby, Lae, and Buna from April to July 1942. He was badly wounded over Guadalcanal on August 7. Blinded in his right eye, he was assigned to training duties. Sakai's fellow pilots continued to fly the Mitsubishi A6M Reisen (known as the Zero by the Allies), even as this unarmored aircraft was outgunned by newer and more powerful U.S. aircraft. Japan's training system could not make up for pilot losses, and poorly trained pilots with insufficient hours flew obsolescent planes. Japan's pilot situation was so desperate that Sakai reentered aerial combat at Iwo Jima in the summer of 1944. He then flew as a test pilot in Japan. His last aerial combat was an attack that downed a Boeing B-29 Superfortress on August 13, 1945.

After the war, Sakai wrote his memoirs, *Samurai!,* describing his experiences and gave motivational lectures. He also met with his wartime opponents. Sakai died of a heart attack on September 22, 2000, at Naval Air Station Atsugi, Kanagawa Prefecture, following a banquet in his honor hosted by the U.S. Navy.

Sakai Saburo, who with 64 Allied planes to his credit was a leading Japanese ace during the war, is shown here during a visit to the USS *Boxer* at Yokosuka, Japan, October 3, 1952. (Bettmann/Corbis)

Sakonji Naomasa (1890–1948)

Japanese Navy vice admiral. Born in Kagoshima City on June 6, 1890, Sakonji Naomasa graduated from the Japanese naval academy in 1912 and held several assignments as a communications and torpedo officer. Promoted to commander in 1930 and to captain in 1935, he was assigned as commanding officer of the gunnery training ship *Setsu* in 1936. Sakonji was then director of the Hangzhou Special Service Agency in China.

At the beginning of the Pacific war, Sakonji was Japanese naval attaché in Thailand. He left that post in May 1942 as a rear admiral and was assigned command of the 16th Cruiser Squadron. Later he was chief of staff of the China Fleet.

In February and March 1944, while Sakonji was commanding the 16th Cruiser Squadron, the Southwest Area Fleet carried out surface raiding operations into the Indian Ocean. Sakonji issued orders that all crews and passengers in Allied ships encountered be killed. This came about from a request of German leader Adolf Hitler, who, on January 3, 1942, had suggested to Ambassador Oshima Hiroshi that the Axis powers kill the crews of Allied ships to help counter superior Allied shipbuilding capacity.

Hitler told Oshima that he had ordered his U-boat commanders to carry out this policy. Oshima relayed Hitler's request to Tokyo, and one year later the Japanese Combined Fleet received oral instructions from chief of the Imperial Naval Staff Admiral Nagano Osami to execute crew members of captured ships, except those who might be able to provide useful intelligence.

During the February 1944 operation, Captain Mayuzumi Haruo of the cruiser *Tone* sank the British merchant ship SS *Behar* and rescued 108 survivors, of whom 4 subsequently died. Thirty-two of the captives were disembarked at Batavia in mid-March. En route to Singapore on March 18 on board the *Tone,* Sakonji reprimanded Mayuzumi for not carrying out the orders of the Southeast Area Fleet to kill survivors, whereupon 65 survivors still on board the *Tone* were executed.

Promoted to vice admiral in October 1944, Sakonji became chief of staff of the China Area Fleet. After the war, a British military court in Hong Kong tried both Sakonji and Mayuzumi for the *Behar* incident. The two held that they were carrying out a direct order, but Sakonji was convicted of war crimes and sentenced to death by hanging. He was executed on January 21,

1948. Also convicted, Mayuzumi was sentenced to seven years' hard labor at Sugamo Prison, Tokyo.

Sakurai Seizo (1889–1985)

Japanese Army general. Born in Yamaguchi Prefecture on June 27, 1889, Sakurai Seizo graduated from the Japanese Military Academy in 1911 and was commissioned in the infantry. He graduated from the War College in 1919. Sakurai was posted to the army General Staff during 1915–1916, 1921–1924, 1927–1928, and 1929–1934. A specialist in transportation, he was assigned to the Maritime Transportation Unit of the General Staff, which he headed from 1930 to 1934. From 1924 to 1926, Sakurai was a resident officer in France.

Promoted to colonel in 1934, Sakurai commanded the 77th Infantry Regiment in 1934 and 1935. He served as an investigator in the Cabinet Investigation Bureau and in the Planning Agency in 1936 and 1937. He was assigned to the 1st Shipping Transportation Headquarters in 1937 and to the Army Transportation Department in 1938. Promoted to major general in 1938, Sakurai commanded an infantry brigade in the 22nd Division from 1938 until 1940 during the Second Sino-Japanese War (1937–1945), then was chief of staff of the Thirteenth Army in central China (1940–1941).

Promoted to lieutenant general in 1941, Sakurai took command of the 33rd Division and led it in the invasion of Burma in January 1942. In 1943, he was appointed chief of the Armor Headquarters under the minister of war. He returned to Burma to command the newly established Twenty-Eighth Army and led it in HA-GO (Operation Z) in January 1944, skillfully executing

the Japanese retreat across the Sittang River in March and April. He continued to conduct delaying actions in Burma until the end of the war in August 1945. Sakurai died in Tokyo on July 7, 1985.

Salazar, António de Oliveira (1889–1970)

Portuguese dictator. Born on April 28, 1889, in the village of Vimieiro near the town of Santa Comba Dão, Portugal, António de Oliveira Salazar was educated at the University of Coimbra, where he became a respected professor of political economy. Salazar was elected to the Portuguese Chamber of Deputies, but he soon withdrew because he considered it to be a futile exercise.

In 1926 to end chronic political instability in Portugal (there had been 40 cabinets since the overthrow of the monarchy in 1910), the Portuguese military seized power. Salazar was then briefly minister of finance. Recalled to the same post in 1928, he received the full financial authority he demanded, and in short order he placed Portuguese finances on a firm foundation. During the next few years, Salazar gradually increased his power until, in 1932, he became premier of an authoritarian government. From that point until 1968, Salazar dominated Portuguese affairs.

Under a new constitution ratified in a 1933 referendum, Salazar reorganized Portugal as a corporative unitary republic rather than pluralist state. A national assembly elected by heads of families served as the legislative body. A corporative chamber advised the assembly about social and economic matters and represented syndicates of various corporations. The Catholic Church also had widespread influence. Salazar's National Union Party was the political voice of the so-called Estado Novo (New

State), which combined 18th-century enlightened despotism with Christian morality but also had fascist and democratic trappings. This system came to be known as clerical fascism; it was subsequently a model in Spain and Austria.

Profoundly religious, Salazar was also an ascetic and a bachelor. Unlike most dictators, he lived frugally on a modest salary and was utterly uninterested in the accumulation of personal wealth. Salazar also remained virtually unknown to his people. Although he admired fascism and supported the Nationalist side in the 1936–1939 Spanish Civil War, he also intensely disliked Adolf Hitler and the Nazis and maintained diplomatic relations with Portugal's long-standing ally, Great Britain.

Unlike Francisco Franco in Spain, Salazar kept his country strictly neutral during World War II until, under British and U.S. pressure, he agreed in October 1943 to lease bases in the Azores. These proved vital to the Allied cause in the Battle of the Atlantic. Nonetheless, Salazar maintained that the nation was neutral, and Portugal profited from selling goods to both sides. Portugal emerged from the war in a much better position than Spain and was readily admitted to the United Nations and invited to join the North Atlantic Treaty Organization (NATO).

Although Portugal was a police state, Salazar always tried to preserve some of the elements of a democratic facade. Increasingly, in his last years in power he was forced to devote substantial financial and military resources to maintaining Portuguese control over the overseas empire. A disabling stroke in 1968 finally forced him to give up power. His successor, Marcelo Caetano, introduced some reforms. Salazar died in Lisbon on July 27, 1970.

Salerno Invasion (September 9, 1943)

Allied invasion of southern Italy in September 1943. The Allied plan for the invasion of the Italian mainland called for a three-pronged effort. In Operation BAYTOWN, General Bernard L. Montgomery's Eighth Army would cross the Strait of Messina and land at Calabria on September 3; then it would work its way north. The following day, in Operation SLAPSTICK, 3,600 soldiers of the British 1st Airborne Division would drop on the Italian port of Taranto. The third part of the invasion, Operation AVALANCHE, was the largest. It involved the landing of two corps, the British X Corps and the U.S. VI Corps, at Salerno on September 9. The goal was to then secure the port of Naples 30 miles to the northwest.

U.S. Navy vice admiral H. Kent Hewitt had overall command of AVALANCHE. U.S. rear admiral John L. Hall commanded the mainly American Southern Attack Force, and Royal Navy commodore Geoffrey Nigel Oliver commanded the largely British Northern Attack Force. Royal Navy rear admiral Philip Vian commanded 1 fleet carrier and 4 escort carriers supporting with air cover. In all, 627 vessels participated in the operation.

Lieutenant General Mark Clark commanded the Fifth Army, the ground force for AVALANCHE. The Fifth Army consisted of the British X Corps with the 46th and 56th Divisions and the U.S. VI Corps with the 36th and 45th Infantry Divisions. Two battalions of U.S. Rangers and two of British Commandos were included to secure key passes northwest of Salerno.

The Allies expected no opposition. On September 8, 1943, hours before the assault forces landed, General Dwight D. Eisenhower broadcast that Italy had signed an armistice with the Allies. Clark fully expected to secure Naples quickly and then throw a line across Italy, trapping German units between his army and the British Eighth Army to the south. Clark decided to forgo a preliminary bombardment, which meant that German forces that had occupied the Italian positions were virtually undegraded. As it evolved for the Allies, the battle was confusing and hard to control, developing its own momentum.

At 3:10 a.m. on September 9, the rangers began going ashore to secure the Allied northern flank. They were followed 20 minutes later by men of the U.S. 36th Infantry Division, who secured the southern flank. The British X Corps then landed between the rangers and the 36th Infantry Division. The

56th Infantry Division secured the southern sector of the British corps area, and the 46th Infantry Division secured the north sector. With the support of the rangers and X Corps, British commandos were able to land at the town of Salerno itself.

On the first day, the Germans mounted only sporadic, small-scale counterattacks. German theater commander Field Marshal Albert Kesselring immediately ordered his forces south of Salerno to withdraw from southern Italy to prevent being cut off. The German 16th Panzer Division was to oppose the Salerno landings and prevent any Allied deep penetration there until German troops from the south became available. The Germans concentrated the limited forces initially available against the British X Corps.

On the morning of September 10, General Clark visited both corps' zones. Because VI Corps was making better progress, Clark assigned it four miles of the X Corps' area. This, however, stretched the Americans thin. Meanwhile, more men and equipment came ashore, although a shortage of landing craft hampered operations. Naval gunfire, however, strongly supported the troops ashore. During the Salerno operation, Allied warships fired more than 11,000 tons of shells to assist shore operations. On September 11, German aircraft launched glide bombs at the Allied ships, damaging two cruisers, and other attacks followed. On September 16, two glide bombs badly damaged the British battleship *Warspite*.

On September 13, the Germans launched their first major counterattack, overrunning a battalion of the 36th Infantry Division, but they then encountered stiff resistance along the banks of the Calore River. Tank, tank-destroyer, and artillery units poured fire into the ranks of the attacking Germans, and accurate naval gunfire played an important role. With the beachhead seemingly in jeopardy, on the night of September 13 two battalions (1,300 men) of the U.S. 82nd Airborne Division were air-dropped into the 36th Infantry Division sector and quickly thrown into the line.

Throughout September 14, German units attacked all along the line, probing for weak spots. Meanwhile, Allied aircraft pounded German lines of communication and frontline positions. Elements of the British 7th Armoured Division now landed to reinforce X Corps, and the 180th Infantry Regiment came ashore in VI Corps' sector. That night, another 2,100 paratroopers of the 82nd Airborne Division arrived, further reinforcing the line.

Another airborne operation occurred on the night of September 14 to

insert the 2nd Battalion of the 509th Parachute Infantry Regiment 20 miles north of the X Corps zone. Its assignment was to harass German lines of communications for five days, then either infiltrate back into the beachhead or link up with advancing units. Only 15 of the 40 transport aircraft involved dropped their men near the target area, and most of the paratroopers landed far from their intended drop zones. Although the men of the battalion caused some disruption in the German rear areas, they paid a heavy price. Of the 600 men who participated in the jump, only 400 gained friendly lines.

On September 15, Kesselring ordered another counterattack, which failed in the teeth of the Allied reinforcement. Clark now had more than 150,000 men ashore. Meanwhile, Montgomery's Eighth Army was still 50 miles to the south, making only slow progress against only light German resistance. Kesselring knew he could no longer hope to defeat the Allies at Salerno, and on September 16 the Germans began a deliberate, well-executed withdrawal northward. The Eighth and Fifth Armies finally linked up on September 19. The Allies first entered Naples on October 1.

The Salerno fighting had been costly for both sides. The British had suffered 5,259 casualties and the Americans 1,649. Germans killed, wounded, or missing were 3,472. The next target was to secure Naples. Salerno was a clear indication that much hard fighting lay ahead.

Salmide, Henri (1919–2010)

German Navy noncommissioned officer. Heinz Stahlschmidt was born in Dortmund, Germany, on November 13, 1919. As a German Navy petty officer and bomb disposal expert during World War II, Stahlschmidt was stationed at Bordeaux, France, in August 1944 when his superiors ordered him to destroy the extensive docks of that major port. Stahlschmidt initially followed orders and assembled a large quantity of explosives in a bunker for the demolition work. Realizing that laying the explosives through the extensive dock network and detonating them would result in the deaths of thousands of Frenchmen, Stahlschmidt instead detonated the bunker itself, killing as many as 50 German soldiers.

Sought by both the Gestapo and French authorities, Stahlschmidt was hidden by a French family in Bordeaux in the Resistance. After the war he married a French woman and became a naturalized French citizen as Henri Salmide. Although Salmide acted entirely on his own, after the war members of the French Resistance sought to appropriate the episode, claiming that they had been behind Salmide's actions. In 1994, Salmide was awarded the French Légion d'Honneur. In 1997 he explained to an interviewer, "I acted according to my Christian conscience. I could not accept that the port of Bordeaux be wantonly destroyed when the war was clearly lost."

Sano Tadayoshi (1889–1945)

Japanese Army lieutenant general. Born in Shizuoka Prefecture on March 7, 1889, Sano Tadayoshi graduated from the Japanese military academy in 1911 and was commissioned in the artillery. He graduated from the army war college in 1922. Sano was an instructor at the military academy twice (1924–1927 and 1928–1931). He served in the 4th Field Artillery Regiment from 1931 to 1933 and was on the staff of the 5th Division from 1933 to 1935. Promoted to colonel in 1935, he twice commanded regiments: the 24th Field Artillery in 1935 and the 20th Field Artillery in 1936 and 1937.

During the Second Sino-Japanese War (1937–1945), Sano served as the chief of staff of the 14th Division in northern China from 1937 to 1938. Promoted to major general in 1938, he took command of the 4th Field Heavy Artillery Brigade. In 1940, he was director of the Field Artillery School.

At the beginning of the Pacific war in December 1941, Sano was a lieutenant general and commanded the 38th Division. His division captured Hong Kong in December 1941 and assisted in the capture of Sumatra in the Netherlands East Indies in February 1942. Ordered to Guadalcanal in October 1942, Sano and what remained of his division were evacuated in February 1943. Appointed chief of staff of the Homeland Defense General Headquarters, Sano commanded the Thirty-Fourth Army in central China in 1944 and 1945, where he engaged in the defense of Wuchang and Hankou (Hankow), both in Hubei (Hupeh) Province. Assigned to the China Expeditionary Army Headquarters in 1945, he died on July 3, 1945.

Sansonetti, Luigi (1888–1959)

Italian Navy admiral. Luigi Sansonetti was born in 1888 in Rome. He was appointed a midshipman in 1906 and earned a medal for bravery in the 1911 landings at Tripoli during the Turkish-Italian War. In the 1920s, he acquired a reputation as an organizer and was promoted to captain in 1934.

In the autumn of 1936, Admiral Domenico Cavagnari, the navy's chief of staff, chose Sansonetti as his deputy after Sansonetti demonstrated exceptional ability while commanding the cruiser *Fiume* during the 1936–1939 Spanish Civil War. Sansonetti was promoted to rear admiral in 1938.

In June 1939, Sansonetti accompanied Cavagnari to Germany for the first meeting between the top commands of the Regia Marina and the German Kriegsmarine. In August 1939, however, Italian dictator Benito Mussolini appointed Admiral Odoardo Somigli deputy chief of staff over Cavagnari's objections. As compensation, Sansonetti received command of the 7th (light cruiser) Division, and he led this force at the July 9, 1940, Battle of Calabria, firing the opening salvos of the action.

In December 1940, Sansonetti took command of the 3rd (heavy cruiser) Division. On March 28, 1941, he fought in the Gavdos action, aggressively ignoring fleet commander Admiral Angelo Iachino's instructions to break off his pursuit of a British cruiser squadron. According to his critics, this action compromised the timetable of the entire operation by 50 minutes. Iachino, however, never openly criticized Sansonetti's decision.

The position of deputy chief of staff opened up again in the aftermath of Italy's Cape Matapan defeat on March 28, 1941, and Sansonetti was named to this position on July 15, 1941. A better organizer than his predecessor, Inigo Campioni, and a fine diplomat, Sansonetti was able to manage both the

Germans and Iachino, who was his senior and had aspired to that same position.

Because he exercised operational control at Italian naval headquarters, Sansonetti determined the course of his nation's effort at sea between July 1941 and September 1943. By the spring of 1943, he had come under criticism from the younger admirals and officers for a lack of aggression, a trait Sansonetti's supporters believed was cool strategic vision.

When Admiral Raffaele de Courten became the new chief of staff in July 1943, he stated that he had different ideas, but he retained Sansonetti as his deputy because it was not time for shake-ups in the command, given the change in government and the national crisis sparked by the pending Allied invasion. Moreover, there was no other man available with such a complete understanding of the central command's structure and operations.

Following the armistice and the disintegration of Italy's army and air force, Sansonetti remained in Rome and kept the Supermarina in operation despite the chaos, while de Courten accompanied King Victor Emmanuel III in his flight across the peninsula. On September 9, against de Courten's prior instructions, Sansonetti ordered the battle fleet to sail to an Allied port instead of La Maddalena, after the German attack against that base. He also ordered the squadron at Taranto to Malta when it appeared that German forces were threatening that Italian naval base.

After Rome fell to the Germans, the Supermarina had to shut down. Sansonetti evaded capture and, after a 23-day cross-country trek, made it to Allied lines. He recovered his position, but it was clear that de Courten would have preferred the fleet to scuttle rather than regroup in Allied controlled ports. On April 19, 1944, Sansonetti was relieved and became the president of the admiral's council, a prestigious but powerless position usually reserved for retired admirals. Sansonetti left the navy in 1951 and died on November 7, 1959.

Santa Cruz Islands, Battle of the (October 26, 1942)

Important carrier battle between the United States and Japan off the Santa Cruz Islands. The Battle of the Santa Cruz Islands was the fourth in a series of sea engagements for control of the Solomon Islands. Japanese land forces on Guadalcanal were fighting to regain Henderson Field, and Japanese naval forces sought to establish air supremacy there.

The battle occurred off the Santa Cruz Islands some 250 miles east of the Solomons. Vice Admiral William F. Halsey commanded U.S. South Pacific Forces, while Rear Admiral Thomas C. Kinkaid had operational command of the *Hornet* and *Enterprise*, the only two U.S. aircraft carriers left in the Pacific theater. Vice Admiral Kondō Nobutake’s task force, centered on the carriers *Shōkaku, Zuihō, Junyō,* and *Zuikaku*, sought to gain air superiority over Guadalcanal, assisting Japanese land forces in retaking Henderson Field.

On October 26, Halsey moved to block the Japanese advance. Halsey initiated the battle when he ordered U.S. naval units to search for the Japanese. U.S. reconnaissance aircraft spotted the Japanese first, and at 7:40 a.m., dive-bombers from the *Enterprise* damaged the light Japanese carrier *Zuihō*. The Japanese countered with 62 Kate torpedo planes from the *Shōkaku* and 21 Zero fighters from the *Zuikaku* and *Zuihō*. At 7:45 a.m., Kinkaid sent another force of 19 Wildcat fighters, 29 Dauntless SBD dive-bombers, and 25 Avenger TBF torpedo bombers.

Puffs of flak fill the sky above the U.S. Navy aircraft carrier *Enterprise* during the Battle of the Santa Cruz Islands, October 26, 1942. (National Archives)

The two strike forces spotted one another heading toward their respective targets. Zeros attacked the *Enterprise* strike force and destroyed eight U.S. planes without loss. After this brief fight, the Japanese aircraft continued toward the U.S. carriers. Unfortunately for the Americans, the *Hornet*'s combat air patrol had been vectored to the wrong location, and Japanese torpedo planes and dive-bombers attacked the *Hornet* simultaneously.

The carrier absorbed four bombs, two torpedoes, and a Japanese plane that crashed through the flight deck, whereon two of its bombs detonated. The *Hornet* was left dead in the water. Thirty-eight of 53 Japanese aircraft were shot down. On the other hand, U.S. aircraft hit the *Shōkaku,* forcing it out of the fight, and nearly hit the *Zuikaku*. The U.S. planes also damaged the Japanese heavy cruiser *Tone*.

The *Hornet*'s second wave of aircraft attacked the heavy cruiser *Chikuma* and killed many of its crew at their antiaircraft stations. The second Japanese strike from the *Zuikaku,* divided because the Kate torpedo planes had to rearm, attacked the destroyer *Porter* at 10:00 a.m., leaving it dead in the water. The Japanese planes then struck the carrier *Enterprise,* which had escaped the first attack. At 10:17 a.m., four Japanese bombs hit the *Enterprise*'s port bow and forward elevator. Thirty minutes later, the second part of the strike force struck the *Enterprise* again, with minimal success

because of deadly antiaircraft fire, much of it from the battleship *South Dakota*. Japanese planes also struck the cruiser *San Juan*, but it sustained little damage. Twenty-four of 44 aircraft in the two Japanese strike units were shot down.

By the end of the day, the *Hornet* lay dead in the water, and the *Enterprise* was out of action. Halsey ordered a withdrawal to preserve the *Enterprise*, and Kondō pursued. The *Hornet* was under tow at 2:55 p.m. when the *Junyo*'s second strike wave of Kates attacked and severely damaged it. Kinkaid then ordered the ship scuttled. Despite eight U.S. torpedo hits, the carrier was still afloat when two Japanese destroyers finally sank it with Long Lance torpedoes at 1:35 a.m. on October 27. Kondō then called off the pursuit.

During the withdrawal, U.S. planes hit both the Japanese destroyer *Teruzuki* and the carrier *Junyō*. The destroyer *Mahan* was another casualty of the battle. It collided with the battleship *South Dakota* and had to go to a dockyard.

During the Battle of Santa Cruz, the Japanese lost 99 aircraft. Sixty-eight pilots and 77 crewmen were killed. Aircrew losses continued to affect Japan, which, unlike the United States, had no effective pilot replacement system. The *Zuikaku*, *Zuihō*, and *Chikuma* were all out of action for many weeks. On the other hand, the United States lost the *Hornet* and the destroyer *Porter* (torpedoed by a Japanese submarine, probably the *I-21*), and the *Enterprise* was damaged, although it continued limited service off Guadalcanal while undergoing repairs. Eighty U.S. aircraft, 18 pilots, and 8 crewmen were lost.

Although on paper the Battle of Santa Cruz was a defeat for the United States, it prevented the Japanese from disrupting U.S. land operations on Guadalcanal. Kondō might have achieved a more decisive victory had he continued the pursuit; Halsey probably would have been forced to stand and fight to protect the damaged *Enterprise*.

Sasaki Minoru (1893–1961)

Japanese Army lieutenant general. Born in Hiroshima Prefecture on January 1, 1893, Sasaki Minoru graduated from the Japanese Military Academy in 1914 and from the Military Staff College in 1923. Stationed in Poland and Soviet Russia as a resident officer from 1928 to 1930, he was then assigned as an instructor at the Army War College and served on the General Staff in 1932. He was promoted to lieutenant colonel in 1933 and to colonel in 1937.

Promoted to major general in 1939, Sasaki took command of the 4th Cavalry Brigade before becoming chief of staff of the Sixth Army. In August 1942, he became head of the Army Mechanized Department. In May 1943, he was assigned as commander of the Southeast Detachment at Munda on New Georgia Island, responsible for the defense of the central part of the Solomon Islands, including New Georgia and Kolombangara.

At the end of June 1943, Allied forces assaulted New Georgia before the Japanese could complete construction of their defensive positions. Sasaki nonetheless was able to block the initial U.S. attempt to take Munda Airfield on July 7. Despite reinforcements and a strong effort, Sasaki was forced to give up Munda on August 4 and had no choice but to withdraw to Kolombangara. Under continued attack, the outlying islands were occupied one by one, and Kolombangara was isolated. Short of ammunition and provisions, Sasaki supervised the successful evacuation of some 9,400 Japanese defenders to Bougainville.

Reassigned to Eighth Army Area headquarters in November 1943, Sasaki was promoted to lieutenant general in October 1944. He died at Tokyo on April 27, 1961.

Sasaki Toichi (1886–1955)

Japanese Army lieutenant general. Born in Ehime Prefecture on January 27, 1886, Sasaki Toichi graduated from the Japanese Military Academy in 1905 and the War College in 1917. From 1919 to 1921, he served on the staff of the Siberian Expeditionary Army. From 1922 to 1924, he was assigned as resident officer in Guandong (Kwantung), where he developed a close relationship with Sun Yat-sen and Jiang Jieshi (Chiang Kai-shek).

In 1926 Sasaki was appointed assistant military attaché in China, and in 1927 he was assigned as resident officer in Nanjing (Nanking). That same year, he took part in an operation that overthrew the military government in Beijing (Peking) carried out by the revolutionary government at Guandong. Sasaki had hoped the Nationalist Party would be able to achieve national reunification and sovereignty of China, establishing a cooperative relationship with Japan, but he became disillusioned when Nationalist forces massacred Japanese citizens and ransacked their residences in Nanjing in 1927 and in Jinan (Tsinan) in 1928.

In 1930, Sasaki was promoted to colonel and assigned to command the 18th Infantry Regiment. Following the Second Shanghai Incident, he was assigned to the staff of the Shanghai Expeditionary Army. In 1932, he was appointed military adviser to the Japanese puppet government of Manzhouguo (Manchukuo). He became chief adviser in 1934 and contributed to improvements in the puppet government's armed forces. Promoted to major general in 1935, Sasaki took command of the 30th Infantry Brigade in 1937. In 1938, he was promoted to lieutenant general and commanded the Military Police Corps in China. The next year, he took command of the

Japanese 10th Division. In April 1941, he went on the reserve list. Recalled in July 1945, he was appointed commander of the 149th Division in China. After the war, he was arrested on charges of war crimes. Sasaki was tried and convicted and died in prison in Fushun, China, on May 30, 1955.

Sauckel, Fritz (1894–1946)

German plenipotentiary for labor. Born on October 27, 1894, in Hassfurt, Bavaria, Fritz Sauckel had only a secondary education before working in the merchant marine. Taken prisoner by the French in 1914 during World War I, he was not released until November 1919. Sauckel joined the Nazi Party in 1923 and became Gauleiter (district leader) of Thuringia in 1927, Reich governor in 1933, and Reich defense commissioner for the Kassel Military District in 1940. He also was a Schutzstaffel (SS)-Obergruppenführer without function.

Hitler recognized Sauckel's blind obedience and fanaticism and rewarded him with the position of plenipotentiary general for labor mobilization in March 1942. Sauckel overhauled the erratic administration and applied an efficient system based on the forced deportation of workers from the occupied territories to Germany to work in the war machine. Sauckel boasted openly that of 5 million foreign workers he had secured for the Reich, only 200,000 had come voluntarily. He fully supported the brutal methods by which they were relocated and the terrible conditions in which they lived and worked.

Arrested at the end of the war, Sauckel was brought to trial at the International Military Tribunal at Nuremberg on charges of war crimes and

crimes against humanity. Found guilty on October 1, 1946, he was hanged at Nuremberg on October 16.

Saucken, Dietrich von (1892–1980)

German Army general of panzer troops. Born on May 16, 1892, in the East Prussian village of Fischhausen, Dietrich von Saucken was commissioned a lieutenant in the infantry in 1912. He soon transferred to the cavalry and served honorably in World War I. Wounded seven times, he received the Iron Cross First and Second Class and the Hohenzollern House Order with Swords.

Following the war, Saucken continued in the Reichswehr. As a colonel, he commanded the 2nd Cavalry Regiment (1937–1940) of the 4th Panzer Division in the campaigns for Poland (September 1–October 6, 1939) and France (May 10–June 25, 1940). The 4th Panzer Division attacked in Holland via Maastricht and then fought in France. In December 1941, Saucken commanded the 4th Rifle Brigade of the 4th Panzer Division. For the remainder of the war, Saucken served on the Eastern Front.

Saucken was one of those cavalry officers who made a successful transition to armored units. The 4th Panzer Division was attached to Army Group Center and in the early months of Operation BARBAROSSA, which commenced on June 22, 1941, fought at Minsk, then Gomel, Bryansk, and Vyazma. In December 1941, the division suffered heavy losses in its effort to capture Tula. Saucken remained with the 4th Panzer Division, much of the time as its commander, until the summer of 1944. During the war, the 4th Panzer was the most heavily decorated of all German tank divisions. It was engaged at Kirov, Orel, Kursk, the Dnieper campaigns, Bobruisk, and Kovel.

Seriously wounded in January 1942, Saucken did not return to active duty until that August. He was promoted to major general in January 1942, to lieutenant general in April 1943, and to general of panzer troops in August 1944.

After he left the 4th Panzer Division, Saucken became deputy commander of III Panzer Corps in May 1944. He took over the XXXIX Panzer Corps in July 1944, the Panzer Korps Grossdeutschland in December 1944, and the Second Army in March 1945. His final command was the Special Army Command in the Danzig area. In the last year of the war, Saucken conducted several skillful delaying actions with steadily dwindling resources.

After the war, Saucken spent more than 10 years as a prisoner in the Soviet Union. On his release in 1955, he retired to Bavaria. Well-respected and one of his nation's greatest war heroes, he was the last of only 27 recipients of the Knight's Cross of the Iron Cross with Oak Leaves, Swords, and Diamonds. Saucken died in Pullach, Bavaria, on September 27, 1980.

Saunders, Laverne George "Blondie" (1903–1988)

U.S. Army Air Forces (USAAF) brigadier general. Born in Stratford, South Dakota, on March 12, 1903, Laverne George Saunders graduated from the University of South Dakota in 1924 and then in 1928 from the U.S. Military

Academy at West Point, where he was a star football player. He immediately enrolled for flight training at Kelly Field, Texas, and was in the same class as Curtis LeMay. From 1931 to 1939, Saunders was an instructor and innovative football coach at West Point.

In 1940, Saunders took command of the 23rd Bomb Squadron, and from 1940 to 1943, he commanded the 11th Bomb Group of Boeing B-17 Flying Fortresses. This became the first USAAF bomber formation to serve in the Guadalcanal Campaign in 1942, where its success resulted in Saunders's promotion to brigadier general in December 1942. Saunders transferred to Britain as commanding general of the VII Bomber Command (January to March 1943) and chief of staff of the Seventh Air Force (March to June 1943), surviving a crash landing off the Shetland Islands in which he was badly injured.

In June 1943, Saunders organized the 58th Bomb Wing (Very Heavy), which was activated at Salina, Kansas. He took it to the China-Burma-India theater in 1944. From India, he carried out the first raid by Boeing B-29 Superfortresses on Japan, which was conducted against the iron and steel works at Yawata on June 15, 1944. Saunders temporarily commanded the fledgling XX Bomber Command in July 1944 until LeMay arrived in India to take command in August 1944. Saunders was scheduled to return to the United States to take command of a new Boeing B-29 Superfortress wing, but he agreed to stay on in India on LeMay's urging, a decision that almost cost him his life.

On September 19, 1944, Saunders was returning to Kharagpur from an inspection trip to Piardoba when his North American B-25 Mitchell bomber crashed. Saunders and the crew chief were the only survivors. Saunders spent much of the next three years in military hospitals and underwent numerous operations, being medically retired from the service as a brigadier general in 1947. Saunders died in Aberdeen, South Dakota, on November 16, 1988.

Savoia, Amedeo Umberto di (1898–1942)

Italian Air Force major general and colonial viceroy. Born at Turin on October 21, 1898, Amedeo di Savoia was the son of Emanuele Filiberto di Savoia, the 2nd Duke of Aosta, a prominent World War I Italian Army leader and supporter of protofascist Gabriele d'Annunzio's putative military dictatorship. Despite his youth, Amedeo di Savoia was a decorated soldier in World War I, and after completing his interrupted studies, he joined his uncle, Luigi di Savoia, Duke of the Abruzzi, in establishing a colonial agricultural concern in Somalia.

From 1922 to 1926, Savoia worked in the Congo, obtained a law degree in Palermo, fought in the Italian pacification of Libya, and earned his military pilot's license. On the death of his father in 1931, Savoia became the 3rd Duke of Aosta. He also rose rapidly through the ranks of the Italian Air Force. Promoted to major general in 1936, by late 1937 he was also appointed viceroy of Ethiopia, where besides pursuing more humane "pacification" policies of that territory, he introduced modern agricultural methods and sought to improve public works.

Despite his misgivings regarding Italy's June 1940 entry into the war, the Duke of Aosta's numerically superior forces overran British holdings in Sudan and British Somaliland during the first several months of the conflict. Hampered by sparse supplies and internal dissent, however, they could not hold out against British counterattacks in early 1941. By April 1941 the British had taken Keren, and the Italians were obliged to abandon Addis Ababa.

Making a valiant last stand at Amba Alagi, Amedeo di Savoia and the remains of his force finally surrendered on May 19, 1941. Already ill and fatigued, he was transferred to a British prisoner-of-war camp at Nairobi, where he died on March 3, 1942.

Savo Island, Battle of (August 9, 1942)

Naval battle in the long struggle between Japan and the United States for control of the Solomon Islands. On August 7, 1942, to protect the lines of communication between the United States and Australia, U.S. marines landed on Guadalcanal and captured a nearly complete Japanese airfield. U.S. vice admiral Frank Jack Fletcher commanded the landing support force that included the aircraft carriers *Saratoga, Wasp,* and *Enterprise;* the battleship *North Carolina;* 5 heavy cruisers; 1 light cruiser; 16 destroyers; and 3 oilers. Rear Admiral Richmond Kelly Turner had command of the amphibious force of some 75 transports and support vessels.

On the evening of August 8, claiming inadequate fuel, Fletcher withdrew his carriers. Two days of air operations had also reduced his air strength by 21 percent, but the principal reason for the decision was that Fletcher feared the loss of his carriers in the restricted waters surrounding Guadalcanal.

British rear admiral Victor Crutchley commanded the screening force of cruisers and destroyers. On the night of August 8–9, Crutchley deployed his ships in four main groups to protect the transports. The U.S. cruiser *Chicago* and the destroyers *Bagley* and *Patterson,* along with the Australian cruisers *Australia* and *Canberra,* patrolled the area south of Savo Island. The U.S. cruisers *Vincennes, Astoria,* and *Quincy* and the destroyers *Helm* and *Wilson* patrolled east of Savo Island. The U.S. cruiser *San Juan,* the destroyers *Monssen* and *Buchanan,* and the Australian cruiser *Hobart* patrolled between Guadalcanal and Florida Island. A final group, mostly destroyers, remained near the transports. Finally, the U.S. destroyers *Blue* and *Ralph Talbot* individually acted as pickets seaward of Savo Island.

Within hours of the U.S. landings on August 7, Japanese vice admiral Mikawa Gunichi sailed from Rabaul with the heavy cruisers *Chokai, Aoba, Furutaka, Kako,* and *Kinugasa* along with the light cruisers *Yubari* and *Tenryu* and the destroyer *Yunagi*. He planned to destroy the transports at the landing site.

At 10:45 p.m. on August 8, Turner called a meeting to discuss the withdrawal of Fletcher's carriers. Crutchley sailed to the meeting in the *Australia,* signaling Captain Howard D. Bode of the *Chicago* that he had tactical command. Bode never received the message.

Shortly after midnight, the Japanese superior ability in night operations was confirmed when Mikawa's force slipped past the U.S. destroyer pickets undetected. The Japanese then attacked at high speed and in column. At 1:40 a.m., the *Patterson* was struck by a shell, opening the battle. Over three minutes, the *Canberra* absorbed 24 large-caliber shells and 2 torpedo hits and was put out of the action without firing a shot. The ship sank the next day. The *Chicago* was next. A torpedo struck its bow, and a shell hit the foremast. Confused as to his position, Bode ordered the *Chicago* away from the Japanese.

Unintentionally, the Japanese then divided into two nearly equally strong formations. Both attacked the *Vincennes* group. In 22 minutes, all three U.S. cruisers were out of action, and by the next day all had sunk. Over the course of the battle, the Japanese also damaged the destroyer *Ralph Talbot*. The destroyer *Jarvis,* which had been damaged the preceding day in an air attack, sustained further punishment. Japanese planes sank it on August 9 as it limped to Australia for repairs.

At 2:40 a.m., Mikawa withdrew without attacking the transports at the landing site, which would have had a much more decisive impact on the battle for Guadalcanal. Mikawa feared reprisals from Allied aircraft, not knowing that Fletcher had already departed. In only half an hour, the Allies lost four heavy cruisers and one destroyer. Three other ships were heavily damaged; 1,023 men were dead and another 709 wounded. The Japanese ships suffered some 10 shell hits, 58 dead, and 33 wounded. The only major Japanese loss came on the return, when the U.S. submarine *S-38* torpedoed and sank the *Kako* as it was about to enter Kavieng Harbor.

The Allied disaster in the Battle of Savo Island was due to several causes. First, the Allies ignored reports from an Australian patrol plane that had

spotted Mikawa's group on August 8 and other intelligence indicating a Japanese response to the landings. Furthermore, Crutchley issued patrol plans leaving great gaps that radar could not cover in the restricted waters around Savo Island. Additionally, there was a lack of communication among the Allied ships. Each group was unaware of the location of the others. Allied sailors were also exhausted after two days at general quarters. In contrast, Mikawa concentrated his forces. Japanese sailors were fresh and superbly trained in night-fighting techniques.

There were multiple inquiries into the disaster, but none laid the blame on any individual. Scrutiny fell on Bode, but he was not punished. Nevertheless, he committed suicide in 1943. Pacific Fleet commander Admiral Chester W. Nimitz summed up the defeat succinctly when he attributed it to "lack of battle-mindedness." Naval historian Samuel Eliot Morison called it "probably the worst defeat ever inflicted on the United States Navy in a fair fight."

Scapa Flow

The main base of the British Home Fleet in World War II. Located in the Orkney Islands off northern Scotland, Scapa Flow is one of the great natural

harbors/anchorages in the world. Sheltered by Mainland, Graemsay, Burray, South Ronaldsay, and Hoy Islands, it encompasses almost seven square miles of water with depths suitable for the anchoring of large ships. The British Royal Navy first used and fortified the site as an anchorage in 1812 during the Napoleonic Wars for basing warships to protect merchant ships subject to attack by French privateers. In 1905, the Admiralty became interested in Scapa Flow as a base for the Home Fleet, and during World War I, it was home to both the British Grand Fleet and the Northern Patrol enforcing the naval blockade of Germany.

Scapa Flow was the base for the Home Fleet during World War II because it was geographically well suited for warships protecting the Arctic convoys bound for the Soviet Union as well as for closing the entrance to the North Sea. Additionally, a naval base built during World War I to service warships existed at Lyness on the island of Hoy. The British expanded this facility during the war to store up to 100,000 tons of oil for the fleet. Depot ships anchored in Scapa Flow also supplemented supplies provided from ashore.

The anchorage lacked adequate defense against aerial or submarine attack at the outbreak of the war, and the October 14, 1939, sinking of the British battleship *Royal Oak* by a German submarine led to efforts to increase the defenses. Among these was the construction of what became known as the Churchill Barriers—four causeways that closed Kirk Sound, Skerry Sound, Water Sound, and East Weddell Sound and formed the eastern approaches to Scapa Flow—to render penetration by German submarines of the main anchorage more difficult. While not complete until almost the end of the war, these barriers broke the surface of the water in 1942, thus sealing approaches to Scapa Flow. The British employed some 1,200 Italian prisoners of war in the construction of the causeways, technically a breach of the Geneva Convention that banned the use of prisoners of war in labor associated with a country's war effort.

Buttressing the defense of the anchorage were booms, trawlers for minesweeping duty, and antisubmarine vessels. To protect against air attack, the British added 25 antiaircraft guns, radar facilities, and barrage balloons. Finally, the British extended defensive works on the island that housed gun emplacements to guard the anchorage and port facility. Scapa Flow remained in use as a base for the British Royal Navy until its closure in 1956.

Scheldt, Battles of the (October–November 1944)

A series of battles waged by British forces against German troops to gain control of the Scheldt estuary and open the port of Antwerp. On September 4, after the German Fifteenth Army escaped from the Breskens Pocket (formed on the mainland north of the Leopold Canal and west of Antwerp), it was disposed to hold the Scheldt estuary and prevent the Allies from opening Antwerp. German commander General Gustav-Adolf von Zangen left only a rear guard on the mainland and concentrated his strength on the South Beveland and Walcheren Islands, both of which formed the northern boundary of the estuary. In late September, British field marshal Sir Bernard Law Montgomery assigned clearing the Scheldt to the Canadian First Army, which was already engaged in taking the English Channel ports, including Boulogne and Calais.

The British attacks to clear the Scheldt began in October. Canadian lieutenant general Guy Simonds, commanding the Canadian First Army, designed the plan. Simonds had been temporarily elevated from command of the Canadian II Corps because of the illness of Lieutenant General (promoted to general on November 14) Henry Crerar. A key element in Simonds's plan was the destruction of dikes that protected Walcheren from the North Sea. This action flooded most of the island and restricted German movement and communications. Also important was the use of special equipment, including

flamethrower “wasps” (converted universal carriers) and “buffaloes” (amphibious vehicles).

Belgian villagers salvage what they can following the destruction of their homes in the fighting and the flooding of the Scheldt Estuary in late 1944. (Hulton Archive/Getty Images)

Simonds’s plan had three phases. The first called for the Canadian 2nd Infantry Division to seal off South Beveland while the British I Corps drove northeast to cover the flanks of the Canadian II Corps and the British Second Army. The Canadian 3rd Infantry Division cleared the Breskens Pocket in nearly a month of tough fighting. In the second phase, the Canadian 2nd Division and the Scottish 52nd Lowland Division took South Beveland, reaching the causeway to Walcheren at the end of October. Three attempts by the Canadians to cross the causeway ended in failure, although one did gain the other side. The Scottish Division then relieved the exhausted Canadians. In the final phase that began on November 1, commandos amphibiously assaulted the south and west ends of Walcheren, supported by the 52nd Division in the south and east.

It took a week to clear all pockets of German resistance, but the parts of the island that commanded the Scheldt were taken on November 3. Throughout the campaign, the Germans were both ably led and entrenched, providing a tough fight for the Canadians and British.

The battles to clear the Scheldt estuary cost the Allies 13,000 casualties. The first oceangoing ships arrived on November 29. Denying the Allies use of the port for nearly three months delayed the defeat of Germany considerably. The Germans also harassed Antwerp with V-1 buzz bombs and V-2 rockets, which, however, had little effect on port operations beyond the decision to transfer ammunition resupply to other ports. The terror weapons killed many civilians and caused much damage to the city, however. Montgomery admitted after the war that delaying redirecting the full weight of his forces to clear the Scheldt until October 16 had been a mistake.

Schepke, Joachim (1912–1941)

German Navy lieutenant and submariner. Born on March 8, 1912, in Flensburg, Germany, Joachim Schepke entered the German Navy in 1930. As a junior lieutenant, he commanded the Type II coastal submarines *U-3* and *U-19* before he assumed command of the *U-100*, a Type VIIC oceangoing submarine, on May 30, 1940.

On the evening of September 21, 1940, Schepke attacked the 41-ship Allied convoy HX.72 and succeeded in sinking seven ships with a total of 50,340 gross register tonnage within only 4 hours, earning him the Knight's Cross of the Iron Cross. Schepke further distinguished himself in convoy battles against SC.7 and SC.11. From the latter convoy, he sank seven ships

within 13 hours. For these successes, he was awarded the Iron Cross Knight's Cross with Oak Leaves.

During a wolf pack night attack on March 17, 1941, comprising the *U-37*, *U-74*, *U-99* (Lieutenant Otto Kretschmer), *U-100*, and *U-110* against convoy HX.112, Schepke's boat suffered depth-charging by Royal Navy destroyers *Walker* and *Vanoc*. The *U-100* escaped, but the *Vanoc* used its newly installed Type 286 M radar to detect the boat on the surface at a range of some 1,000 yards. The destroyer rammed and sank the *U-100*, killing Schepke and most of his crew. It was the first recorded sinking of a U-boat attributed to radar detection. Schepke has been credited with sinking 37 ships totaling 145,842 gross register tonnage.

Schindler, Oskar (1908–1974)

German businessman who saved some 1,200 Jews from certain imprisonment or death during World War II. Oskar Schindler was of German heritage but was born in Zwittau, Moravia, Austria-Hungary (now in the Czech Republic), on April 28, 1908. Raised a Catholic, he received only the equivalent of a high school education before becoming a salesman. He held a number of different positions in business thereafter and several times attempted to start his own commercial enterprise, with no success. In 1935, he joined the Sudeten German Party, a separatist group. Within a short period of time, Schindler also began to work clandestinely for the Abwehr—the German military intelligence organization. In the summer of 1938, Czechoslovakian authorities jailed him for his activities, but he was soon released. The

following year, he joined the Nazi Party, chiefly because he believed that he could profit from it rather than having any allegiance to its ideology.

After the German invasion of Poland began on September 1, 1939, Schindler purchased an enamelware factory near Kraków. In the meantime, he continued to work sporadically for German intelligence, which lent the impression that he was at least sympathetic to German war aims. His accountant, a German-speaking Jew by the name of Itzhak Stern, helped Schindler secure the services of some 1,100 Polish Jews to work in his factory. All the while, Schindler ingratiated himself with local German authorities, attending parties and mingling with Schutzstaffel (SS) officers.

Schindler witnessed more and more brutality toward Jews in Kraków, which troubled him greatly. After German soldiers rounded up scores of Jews in 1943 for deportation to concentration camps, Schindler stepped up his efforts to shield his Jewish workers from Nazi atrocities. On several occasions he was arrested or accused of violating the Nuremberg Laws, but each time his charm and cunning prevailed. Increasingly, Schindler defended his workforce and claimed exemptions for them because his business was considered essential to the war effort. Schindler treated his workers fairly and civilly, even permitting them to pray.

Late in the war, as Soviet troops advanced to the west, Schindler learned that German officials planned to close all factories in Poland, including his own. He then convinced SS officials to allow him to operate a factory in Brünnlitz (now in the Czech Republic), where he would manufacture military items. He also received approval to relocate his mostly Jewish labor force of some 1,200 to the new facility, under the premise that the workers were already trained and hence indispensable. Before the move, which took place in October 1944, a list of 1,200 workers—mostly Jews—was drawn up and presented to the authorities.

After setting up shop in the new plant, which was now ordered to produce parts for the V-2 rocket as well as hand grenades, Schindler and his small management team purposely misled authorities by giving them the impression that they were immersed in war work. In reality, few military items were made in the factory, and those that were had been purposely sabotaged. By mid-1945, Schindler and his family had closed the facility and fled to Austria. Almost all of his workers survived.

Upon arrival in Austria, the businessman was nearly broke, but the tales

of his heroic deeds were already known to occupation officials. Schindler later engaged in a number of new business ventures, all of which failed. He ultimately took up residence in West Germany in 1958, where another commercial venture failed. He remained there for the rest of his life, subsisting on a small government pension. Schindler died on October 9, 1974, in Hildesheim, West Germany. His deeds were later brought to light in a book published by Thomas Keneally titled *Schindler's List*. In 1993, Steven Spielberg produced a riveting and popular film rendition of the book, also titled *Schindler's List*. Schindler's remains rest on Mount Zion in Israel, where he had requested burial to be with his "children." He is the only former Nazi Party member interred in Israel. His grave continues to be a popular visitation site and is piled high with Kaddish stones, a sign of love and gratitude of the Jewish people.

Schmid, Anton (1900–1942)

German Army sergeant executed for assisting Jews during the Holocaust. Born in Vienna on January 9, 1900, Anton Schmid enlisted in the German Army in 1938. Following the June 22, 1941, German invasion of the Soviet Union, he was assigned to the Vilnius ghetto in Lithuania that autumn. In Vilnius, Schmid met many Jewish workers who were assigned to perform various tasks in and around his office. Shocked when he witnessed the execution of Jews a few miles from Vilnius, Schmid resolved to assist the Jews in any way possible.

Schmid hid Jews in three houses of which he had charge. He also did everything in his power to free people from the Lakishki jail. In addition,

Schmid was involved with the Jewish underground, transporting members of the Resistance in his truck and supplying them with identity papers.

In January 1942, Schmid was arrested for these activities, and on February 25 he was brought before a military tribunal. Found guilty, he was shot by a firing squad on April 13, 1942. Schmid is credited with saving the lives of more than 250 people. On May 16, 1967, the Israeli government posthumously awarded Schmid the Righteous Among the Nations medal.

Schnaufer, Heinz Wolfgang (1922–1950)

German Air Force major. Born in Stuttgart on February 16, 1922, Heinz Wolfgang Schnaufer entered the Luftwaffe in 1939 and completed flight training in 1941. Trained to fly the Bf-110 twin-engine interceptor, Schnaufer and his radio operator, Fritz Rumplehardt, elected to join the Luftwaffe's night-fighter force. The two remained together throughout the war. In November, they were assigned to Nachtjagd-geschwader 1 (Night-Fighter Wing 1) of II Gruppe (Group, thus II/NJC1) near Hamburg.

Schnaufer did not score his first kill until June 1942, and by the end of the year his score was only 7. In July 1943, he was promoted to first lieutenant and given command of 12th Staffel (Squadron) NJG1. By December 1943, he had shot down 42 Allied aircraft and been awarded the Knight's Cross. In June 1944, when he had increased his score to 84, he was awarded the Oak Leaves. The next month, he was awarded the Knight's Cross with Oak Leaves and Swords for his tally of 89 victories. Following his 100th victory in October 1944, Schnaufer was given Germany's highest award, the Diamonds to the Knight's Cross with Oak Leaves and Sword. He was the last

Luftwaffe pilot to be awarded the Diamonds. Schnaufer ended the war as the commander of IV/NJG1 with a final score of 121 Allied aircraft shot down.

Known to Royal Air Force Bomber Command as the "Night Ghost of Saint Trond" for his exploits from his operational base, Schnaufer surrendered to the British in May 1945 but was released by the end of the year. Following the war, Schnaufer took over the family wine business. He died on July 15, 1950, in Munich, from injuries sustained in an automobile accident two days earlier.

Scholl, Hans (1918–1943) and Sophie (1921–1943)

Members of the German opposition movement. Hans Scholl was born on September 28, 1918, in Ingersheim. His sister, Sophie Scholl, was born on May 9, 1921, in Forchtenberg am Kocher. In late 1933, Hans Scholl joined the Hitler Youth, but he soon became disillusioned with National Socialism. In 1937, he and some of his friends were briefly jailed for "subversive activities" in the Jugendbewegung (Youth Movement).

Although Sophie joined the Bund Deutscher Mädel (Association of German Girls) at the age of 12, her initial enthusiasm gradually gave way to criticism. She was aware of the dissenting political views of her father, of friends, and also of some teachers. The arrest of her brother and his friends in 1937 left a strong impression on her.

In March 1937, Hans was drafted into the Reichsarbeitsdienst (National Labor Service, RAD). Two years of military service with a cavalry unit in

Bad Cannstatt followed. As a member of the armed forces, Hans began studying medicine at the University of Munich in 1939.

In the spring of 1940, Sophie Scholl became a kindergarten teacher. She chose this profession hoping that it would be recognized as alternate service to the RAD, membership in which was a prerequisite for university admission. From the spring of 1941, however, she served six months of auxiliary war service as a nursery school teacher, and the militaristic regimen of the RAD convinced her to practice passive resistance.

In the summer of 1940, Hans was sent as a member of the student medical corps with the German Army when it invaded France. Later that year, he returned to Munich, where he joined with Christoph Probst and others to form the White Rose, a resistance group. From the end of July to October 1940, Hans Scholl served as a medic on the Eastern Front.

In May 1942, Sophie joined Hans at the University of Munich, and she insisted on being included in the White Rose. The group's activities included publishing leaflets calling for the restoration of democracy and social justice. During the summer of 1942, the Scholls' father was imprisoned for making a critical remark about Adolf Hitler to an employee.

Hans Scholl and Alexander Schmorell wrote the *Leaflets of the White Rose*, which were scathing in their criticism of Germans who did nothing to oppose the Third Reich. Three more leaflets titled *Leaflets of the Resistance* were issued, each more hard-hitting than the last. The initial two called for passive resistance in a largely philosophical way. The third leaflet advocated specific measures such as sabotage of armament plants, obstruction of scientific, war-related research, and boycotts of cultural institutions that enhanced the Nazi image.

After publication of the fourth leaflet, the White Rose suspended activities because Hans Scholl and other core members were sent as part of a student medical unit to the Eastern Front. Their experiences in this campaign only hardened their resolve, and on their return to Munich, they expanded White Rose activities to other German universities. The leaflets were at first sent anonymously to people all over Germany. Two final leaflets appeared, one in January and the last in mid-February 1943.

The Geheime Staatspolizei (Gestapo) was soon involved and found it relatively easy to track down the perpetrators. Hans and Sophie Scholl were arrested on February 18, 1943, while distributing the sixth leaflet at the

University of Munich. Probst was taken two days later. On February 22, Sophie, Hans, and Christoph were condemned to death. They were executed by guillotine a few hours later. Both Scholls were later hailed as martyrs by the Federal Republic of Germany and the German Democratic Republic.

Schörner, Ferdinand (1892–1973)

German field marshal. Born in Munich on May 12, 1892, Ferdinand Schörner served in the Bavarian Army before attending the universities at Munich, Lausanne, and Grenoble. Commissioned an officer in October 1914, Schörner specialized in mountain warfare. He served on both the Italian front and the Western Front in World War I and was wounded. Following the war, he fought with the Freikorps before joining the Reichswehr. Although Schörner served on the General Staff, he much preferred line service.

Lieutenant Colonel Schörner took command of the 98th Mountain Regiment in 1937. Promoted to colonel in 1939, he led his unit in the invasion of Poland in September 1939. He commanded the 6th Mountain Division in the invasion of France and the Low Countries in May 1940. Promoted to major general in August, he led the same unit in the April 1941 German invasion of Greece. Schörner's division was then transferred to the Arctic in 1941 and 1942. There he took command of Mountain Corps Norway in January 1942 as a lieutenant general. He was promoted to general of mountain troops, and his force was reorganized as the XIX Mountain Corps in June 1942.

Transferred to south Russia in October 1943, Schörner took command of Army Detachment Nikopol. Following a brief period in staff work with the high command in March 1944, Schörner was promoted to colonel general. He commanded Army Group South Ukraine from March to July 1944 and Army Group North Ukraine from July 1944 to January 1945.

Schörner commanded Army Group Center from January to May 1945, which he managed to keep largely intact until the German surrender. Promoted to field marshal in April 1945 and named in Adolf Hitler's testament to succeed Hitler as head of the German Army (Oberbefehlshaber des Heeres), Schörner had several of his own men executed for cowardice. He was one of the most brutal of German army generals.

Held prisoner by the Soviets after the war, Schörner was sentenced to 25 years in prison as a war criminal, but he was released in January 1955. He returned to the Federal Republic of Germany, where he found himself accused by the Association of Returned Prisoners of War and his former chief of staff, Lieutenant General Oldwig von Natzmer, with ordering the execution of thousands of German soldiers in drumhead courts-martial. In 1957, a Munich court found him guilty and sentenced him to 4.5 years in prison and loss of his military pension for executing without trial a soldier found drunk at the wheel of an army truck.

Veterans of the 6th Mountain Division themselves raised the sum lost in the pension and more to give to their former commander. Following his release, Schörner lived in Munich, where he died on July 2, 1973.

Schuschnigg, Kurt von (1897–1977)

Austrian chancellor. Born in Riva (today Lake Garda, Italy) on December 14, 1897, Kurt von Schuschnigg fought in the Austro-Hungarian Army during World War I. After the war, he studied law at the University of Innsbruck and became a lawyer. Schuschnigg joined the Christian Social Party and was elected to the national legislature in 1927.

In 1932, Schuschnigg was appointed minister of justice. The following year, he also became minister of education in Chancellor Engelbert Dollfuss's cabinet.

Upon the assassination of Dollfuss in July 1934, Schuschnigg became chancellor. He attempted to eliminate the threat from the Heimwehr, a paramilitary rightist defense force, by disbanding it. But it was the illegal Austrian Nazi Party that represented the real danger for his government and Austria's independence. Continuing the authoritarian course of his predecessor, Schuschnigg rejected any reconciliation with the Social Democrats to establish a common defense against German aspirations for Anschluss (union with Austria). Furthermore, Schuschnigg's sympathies with the Hapsburg dynasty isolated his country among the European democracies. The situation turned hopeless when Benito Mussolini, Austria's former protector, aligned himself with Germany in the Axis alliance.

Austrian chancellor Kurt von Schuschnigg addresses a delegation of Boy Scouts in front of the Chancellory in Vienna. An opponent of the German takeover of his country, he was imprisoned for the duration of the war. (Three Lions/Getty Images)

Schuschnigg capitulated to German chancellor Adolf Hitler during a meeting at Berchtesgaden in February 1938, promising to allow the Austrian Nazi Party legal existence. In addition, he was forced to incorporate Nazis into his government, among them Arthur Seyss-Inquart as minister of the interior. A few days later, the Nazis began a seizure of power in the provinces.

On March 9, 1938, Schuschnigg attempted to regain control by arranging for a plebiscite on Austrian independence to be held on March 13. The German Wehrmacht invaded two days before the scheduled plebiscite, and under heavy German pressure, Schuschnigg was forced to resign and to call publicly for no resistance to the invasion.

Schuschnigg was subsequently arrested and sent to Sachsenhausen concentration camp, where he and his family received unusually comfortable treatment until they were liberated in May 1945. Following his release, Schuschnigg immigrated to the United States, where he was a professor of international law at Saint Louis University from 1948 to 1967. Returning to Austria, he wrote *Im Kampf gegen Hitler* (1969), published in English as *The*

Brutal Takeover (1971). Schuschnigg died in Mutters, Austria, on November 18, 1977.

Schweinfurt and Regensburg Raids (1943)

The attack by the U.S. Eighth Air Force on Schweinfurt and Regensburg on August 17, 1943, and the follow-up mission against Schweinfurt on October 14, 1943, were designed to disrupt the German war economy and vindicate U.S. commitment to unescorted daylight precision bombing. Lieutenant General Ira Eaker's Eighth Air Force celebrated the first anniversary of American heavy bomber operations from England in August by striking the two most critical targets on their objective list, the anti–friction-bearing plants at Schweinfurt and the large Messerschmitt aircraft factory complex at Regensburg. This was the deepest penetration into Germany flown to date by U.S. bombers. The attack plan was designed to force the German fighters to meet nearly simultaneous attacks.

The 3rd Bombardment Division, commanded by Brigadier General Curtis LeMay, was supposed to take off first, hit Regensburg, and then proceed to landing fields in North Africa. The 1st Bombardment Division, commanded by Brigadier General Bob Williams, was to follow about 30 minutes later; the hope was that it would find its route to Schweinfurt unobstructed by enemy fighters lured away by LeMay's force.

Heavy fog ruined these well-laid plans. Because of special training and innovative assembly techniques, the 3rd Division took off in the thick cloud cover, but the 1st Division did not. LeMay's bombers could not wait around and were sent off to Regensburg. The other force did not get airborne for

more than three hours, giving defending German fighters a chance to refuel and rearm. Escorting Republic P-47 Thunderbolts did not have the range to protect the bombers past Aachen on the German border, and the Boeing B-17 Flying Fortresses suffered terribly. Of the 376 that began the raid, 60 were shot down; 24 of those belonged to LeMay. Of the 146 aircraft LeMay took to Regensburg, only about half were able to fly back from North Africa. But the feisty air leader did attack Bordeaux on the way home. Bombing at Regensburg had inflicted some damage on most key buildings, but results at Schweinfurt were not as satisfactory, although some essential machinery was destroyed.

Plans for the return to Schweinfurt on October 14 were just as complicated and also foiled by weather. A total of 149 B-17s from the 1st Division and 142 from the 3rd Division would cross enemy defenses about 30 miles apart, while a third force of Consolidated B-24 Liberators attacked from the south. The B-24s could not assemble properly because of bad weather and flew an uneventful feint instead. The B-17s met an unusually well-coordinated fighter defense using rockets, cannons, and bombs. The attacking force lost 59 bombers over Germany. Another bomber ditched in the English Channel, and 5 others were abandoned over England or crashed on landing. Of the 257 B-17s that made it into Germany, only 50 were not damaged by flak or fighters.

The October 14 attack caused the most damage to the ball-bearing plants of any of the 16 such U.S. Army Air Forces missions during the war. Although Allied leaders exaggerated their success, the 10 percent damage inflicted on the factories inspired the Germans to diversify and disperse their ball-bearing facilities. More important was the effect of the raid on the American bomber force.

Leaders realized that they could not sustain such heavy losses, and deep-penetration raids were suspended while force strength was rebuilt and long-range fighter escorts were developed. By the time the Eighth Air Force returned to Schweinfurt four months later, though, its efforts to destroy the dispersed and reorganized industry were doomed to failure.

Seabees

U.S. Navy construction battalions. Organized during the opening days of U.S. involvement in World War II, the Seabees built the infrastructure that enabled the navy to extend its operations globally during the war. Seabees turned the jungles of the Pacific islands into the docks and air bases that allowed the United States to carry out its island-hopping and leapfrogging strategies and to conduct the strategic bombing of Japan.

As U.S. involvement in the war approached in 1941, Rear Admiral Ben Moreell saw that the continued construction of overseas bases, which would be essential to the United States in the event of war with Japan, would be in jeopardy because the civilian crews, which were prohibited from carrying weapons by international law, were at risk from enemy attack. As a solution, he advocated the creation of an organization composed of skilled construction laborers who were naval personnel. After the labor unions protested that these battalions would take work away from civilian construction workers, Moreell agreed that his units would only serve overseas, leaving stateside construction for civilian contractors.

A U.S. Navy Construction Battalion (Seabee for CB) road crew lays a four-lane highway on the island of Guam in late 1944. (PhotoQuest/Getty Images)

On January 2, 1942, Congress authorized the organization of Naval Construction Battalions, the nickname “Seabee” being derived from the initials “C” and “B.” The Seabee symbol was a flying fighting bee wearing a sailor cap and carrying a machine gun, a wrench, and a hammer. The slogan of the Seabees was “Construimus, Batuimus” (We Build, We Fight).

In a change from other navy units, Seabees were commanded by officers of the Civil Engineering Corps (CEC) who were trained for construction work. The 250,000 men and 8,000 officers who became Seabees were men who had built American roads and skyscrapers. Seabees were recruited based on their civilian skills and experience in more than 60 skilled trades.

Because experience was the key factor, normal physical standards applied to fighting men were relaxed. Seabees ranged in age from 18 to 50, with the average being 37. There were reports that some Seabees were as old as 60. Seabees also received higher pay than the average enlisted man; their pay was equivalent at least to that of petty officers. Because their primary mission was to build, not fight, the Seabees spent only three weeks at boot camp and received only basic small-arms training.

Seabees served in all the war theaters and took part in most of the major operations, but the majority of them served in the South Pacific theater. They

built new naval bases and additions to existing ones, docks, staging facilities, warehouses, hospitals, roads, and airstrips. Aided by such innovations as Marston mats, Quonset huts, and prefabricated buildings, Seabee units were able to construct large air bases in a matter of days.

Special battalions were also organized, known as Seabee Special Battalions. The 1st Seabee Special Battalion was composed of enlisted men trained as stevedores and longshoremen to unload the ships in combat zones. Among other units were those that maintained the bases, repaired tires, built pontoon bridges, drove trucks, and handled the transportation and storage of fuel. Although they were not organized as a fighting unit, individual Seabees received 33 Silver Stars and 5 Navy Crosses during the war.

SEA LION, Operation, Planning for (1940)

German preparations for an invasion of Britain. As early as November 1939, commander of the German Navy Grand Admiral Erich Raeder had ordered a study of the feasibility of a landing in Britain. The study was to detail the problems the small German Navy would confront in conducting an invasion in the face of the overwhelming superiority of the Royal Navy. Following the successful German occupation of Norway and the progress of the German Army against France, Raeder ordered a second study and presented the results to a surprised Adolf Hitler on June 4, 1940. The führer had not yet considered the invasion of England a possibility.

Raeder's purpose in this case, unlike his energetic promotion of the occupation of Norway, Operation WESERÜBUNG (WESER EXERCISE), was to

forestall any attempt by others to influence Hitler for a rash descent on Britain. The Naval Command still had reservations about an invasion, especially after heavy losses in the Norwegian Campaign, and Raeder argued that the focus should remain on the surface, air, and U-boat campaign against Britain's maritime supply lines. Even with Germany's improved geographic position as a consequence of its acquisition of the French Atlantic and English Channel ports, available sealift transport and landing craft were both lacking.

Hitler still held to his idea that the British would see reason and be forced to the peace table. He also feared that a total defeat of England would benefit the United States and Japan. The failure of London to respond to Hitler's peace feelers, however, led him to initiate immediate preparations for an invasion. On July 16 Hitler issued Directive 16, "On Preparation for a Landing Operation against England," which placed the navy primarily in a transport role. The key precondition for Operation SEA LION (SEELÖWE), as the invasion of Britain was to be known, projected for September 15, 1940, was German air superiority.

The German Army's demand for a broad-front landing caused an intense debate with naval leaders, who preferred a narrow-front approach. Both services vigorously sought to persuade Hitler to support their proposal. Initially the army won support for its plans, but a compromise was reached on August 26. The army also had no real enthusiasm for an enterprise that, as Raeder lectured them, was not another river crossing. In its planning, the navy estimated that convoying 13 divisions in the initial assault wave against Britain would require 155 transports and 3,350 smaller craft: 1,720 barges, 470 tugs, and 1,160 motorboats. Conflicting interests and rivalries prevented any real collaboration among the army, navy, and air force.

The massive preparations undertaken by the navy to assemble the necessary landing craft have been well documented and indicate that the navy did its best to comply with the führer's decision. The debate lingers as to whether Operation SEA LION was simply a propaganda ploy and a diversion for other military operations, however, especially as Hitler was already contemplating an invasion of the Soviet Union. Certainly, Raeder was skeptical, and he persistently pointed out the impact of the invasion preparations on the navy and maritime transportation as well as the risks of mounting an operation and supplying an invasion force of at least 40

divisions in waters controlled by the enemy. For Raeder, Operation SEA LION remained a last resort, but he loyally continued preparations. Even as he sensed Hitler's equivocation over Operation SEA LION, Raeder spoke positively of the chances for a successful landing.

On August 1, 1940, a Hitler directive ordered the Luftwaffe to switch its preinvasion tactics to a strategic air offensive and to be prepared to switch targets at any time if a new invasion date was set. The failure of the Luftwaffe to control the skies over Britain and the approach of bad weather resulted in the decision to indefinitely postpone the invasion. On October 12, Operation SEA LION was definitively deferred until the spring of 1941. Until 1942, it continued to serve as a deception.

For Hitler, Operation SEA LION became a means of psychological warfare. Raeder continued to report on the navy's planning efforts (e.g., the development of new landing craft), but, as he later reflected, these had been to no effect and had needlessly tied up resources. Yet Operation SEA LION had allowed Raeder to keep the navy and its needs in front of the führer. If the navy's grand building plans in the aftermath of a defeat of the Soviet Union had been successful, no direct attack on Britain would have been necessary.

Had the German invasion occurred and proven successful, commander in chief of the Reichswehr Field Marshal Walther von Brauchitsch had decreed that "The able-bodied male population between the ages of 17 and 45 will, unless the local situation calls for an exceptional ruling, be interned and dispatched to the Continent." Great Britain was then to be plundered for anything of worth, civilian hostages were to be taken, and the death penalty was to be imposed for any act of resistance. Most likely the deported males would have been employed as industrial slave labor in the Reich.

Sedan, Battle of (May 14, 1940)

Engagement in which the German Army broke through French lines on May 14, 1940, during the Battle for France (May 10–June 25). Located north of the Maginot Line and astride the Meuse River, the city of Sedan was in a poorly defended sector, serving as the pivot point for the German envelopment of Allied forces in the Low Countries under the German operations plan SICHELSCHNITT (SICKLE CUT).

While the German attack into the Low Countries drew the British Expeditionary Force (BEF) and principal French armies into Belgium, Panzer Group Kleist under Colonel General Paul von Kleist quietly moved through the Ardennes with the first units of General of Panzer Troops Heinz Guderian's XIX Panzer Corps, arriving opposite at Sedan on the evening of May 12. General Charles Huntziger's French Second Army defended the Sedan vicinity, but it was not unduly alarmed by the German arrival.

Preceded by an accurate and demoralizing five-hour bombing attack of French defensive positions conducted principally by Junkers Ju-87 Stuka dive-bombers, on May 13 German infantry and motorcyclists succeeded in crossing the Meuse east and west of Sedan. The French defenders, consisting mostly of new reservists, were surprised by the rapid German crossing. Despite the lack of reserves in addition to insufficient artillery and air support, the French resisted fiercely but were gradually driven back. By the end of May 13, the Germans had secured a bridgehead three miles wide and six miles deep. German military engineers worked feverishly to construct pontoon bridges and tank ferries.

The commander of the French 55th Infantry Division at Sedan, General of Division Henri Jean Lafontaine, remained calm and prepared to continue the fight. Unfortunately, others were not so determined. To the north, General André Georges Corap's French Ninth Army had already retreated, leaving the Second Army's flank exposed. Within the French Second Army some commanders, believing that the Germans had already penetrated the French positions, ordered their units to retreat. The retreat of these units started a panic within the French forces.

Despite this, the French sent two tank battalions and two infantry regiments to counterattack the bridgehead. The French attempted a two-pronged counterattack on May 14 with their 1st, 2nd, and 3rd Armored Divisions, but only the 3rd was able to reach a part of Guderian's forces. The French armored unit lacked the tactical flexibility to mount an effective attack and suffered heavy casualties, not to German armor but to the antitank guns of the German assault engineers. After losing half their tanks, the French withdrew. Repeated air attacks by French and British bombers throughout the day achieved little and brought heavy air losses for the attackers.

By the end of May 14, the French defenders were in complete disarray. The French 55th and 71st Infantry Divisions sustained heavy casualties and fled the battlefield, causing panic in the neighboring French X Corps. The German bridgehead was now 30 miles wide and 15 miles deep. The Germans also held the key terrain, which denied the French the ability to mount an effective counterattack.

During the course of the battle, the realistic training and combat experience of the German forces proved decisive. German commanders were aggressive and rapidly pursued any advantage they discovered. Their use of combined arms gave them an unmatched tactical flexibility and agility and allowed them to constantly outmaneuver and destroy the French forces piecemeal. By May 15, Guderian's forces were across the Meuse River in strength and ready to exploit the opening they had punched in the French defenses.

Seelow Heights, Battle of (April 16–19, 1945)

Important battle during the Red Army's Berlin Campaign (April 16–May 7, 1945). On April 15, 1945, Soviet marshal Georgi Zhukov's 1st Belorussian Front reached the forward positions of German general of infantry Theodor Busse's Ninth Army. Busse's 100,000 men were positioned on the high ground of the Seelow Heights that dominated the Oder River's floodplain and key approach route to Berlin. They had spent four weeks preparing defensive positions, building bunkers, laying obstacles, and establishing "kill zones." But with the Soviet Air Force commanding the skies and having more than 1 million men, 3,000 tanks, and 16,000 artillery pieces and mortars, Zhukov enjoyed overwhelming numerical and firepower superiority.

Busse's superior, Colonel General Gotthard Heinrici, commander of Army Group Vistula, had decided not to resist the Soviet crossing at the Oder but instead to fortify the Seelow Heights and surrounding terrain, building three lines of resistance. The spring thaw had softened the ground, making it difficult for armored vehicles to maneuver, and Heinrici had his engineers release water from the upstream reservoir, turning the already soggy Oder floodplain to a morass.

Zhukov opened his attack with a massive artillery barrage during the early predawn hours of April 16 but inflicted little initial damage. Heinrici had anticipated the Soviets' timing and withdrawn the bulk of his screen just hours earlier. German artillery, having preregistered major areas of the battlefield, inflicted heavy casualties on the advancing Soviet forces. Zhukov, who was competing with 1st Ukrainian Front commander Marshal Ivan Konev for the honor of taking Berlin, quickly committed his reserves. The initial advance was very slow, with the Soviets gaining only 2.5 to 3.5 miles and penetrating the Germans' first line of defense. The German second line remained intact, with the Germans effectively employing their antiaircraft artillery against the Soviet armor.

Konev's 1st Ukrainian Front had greater success, and Stalin therefore informed Zhukov that he had approved Konev turning north and driving on Berlin. Zhukov now redoubled his efforts, burning up artillery. The Soviets made another 2.5- to 5-mile advance on April 17, with Zhukov's Forty-Seventh Army and Third Shock Army penetrating the German second defensive line. To the south, Konev's forces pushed back the Fourth Panzer Army and Army Group Center. Field Marshal Ferdinand Schörner kept his two remaining panzer divisions in reserve rather than commit them to support Fourth Panzer Army, but with Konev's advance threatening to encircle Army Group Center, Schoerner finally committed his reserves on April 18. By that date, however, the Seelow Heights had been bypassed from the north. By nightfall, the Soviets had advanced another 2 to 5 miles in the German center and 2 to 3 miles on the German right flank, reaching Busse's third line of defense.

Zhukov finally broke through Busse's final line and drove past Seelow Heights at midday on April 19. The gateway to Berlin was now open, with only broken German formations and rear echelons between Zhukov and the German capital. Zhukov's forces enveloped the Fourth Panzer Army and the Ninth Army. The bulk of Konev's 1st Ukrainian Front rushed north to Berlin, while other elements drove west toward the approaching Americans. Germany's Eastern Front had dissolved. Encircled by April 23, Berlin fell nine days later. The Germans lost about 12,300 killed in the Battle of Seelow Heights. Some estimates put Soviet battle deaths as high as 33,000.

Selective Service Act (September 1940)

U.S. conscription legislation passed more than a year before American intervention in World War II. In mid-July 1940, German troops had overrun France and the Low Countries. During a speech accepting the Democratic nomination for a third term, U.S. president Franklin D. Roosevelt expressed support for a draft bill that would make all young American men liable for military service. This action took some political courage, as Roosevelt was running for reelection in a campaign that would be dominated by the issue of peace. Although most Americans supported the Allies, they also feared intervention in the war and hoped that aid to Britain would suffice to check Germany. At this time, Roosevelt publicly argued that substantial increases in U.S. military forces were necessary primarily to defend U.S. interests in the Western Hemisphere and deter aggressors.

The eventual legislation's drafting and passage relied heavily on lobbying and publicity by a small group of dedicated pro-Allied eastern patricians who consciously looked back to the comparable efforts they had undertaken for World War I mobilization. They worked closely with sympathetic politicians, notably Senator Edward R. Burke (Democrat, Nebraska) and Congressman James W. Wadsworth (Republican, New York), who sponsored the bill that eventually emerged, and consulted frequently with military leaders, including army chief of staff General George C. Marshall. After considerable debate, Congress passed the Selective Service Act in September 1940, the first peacetime draft in U.S. history, to raise an army of no more than 900,000 men. Initially, the draft was restricted to men between the ages of 21 and 35. Terms of service were to be 12 months rather than the 18 months the army originally sought, and deployment was to be limited to the Western Hemisphere.

In August 1941 as the international situation deteriorated, Congress, by a one-vote margin, removed these restrictions. Between the December 7, 1941, Pearl Harbor attack and 1945, almost 10 million Americans were inducted into the military under this legislation. The original Selective Service Act expired in 1947, although Cold War tensions prompted the passage of replacement legislation in 1948.

Senger und Etterlin, Fridolin Rudolf von (1891–1963)

German Army general of panzer troops. Born in Waldshut on September 4, 1891, into a noble family, Fridolin von Senger und Etterlin attended Eton College and was a Rhodes Scholar from 1912 to 1914. He was commissioned in the German Army at the outbreak of World War I, and following the war he remained in the Reichswehr as a cavalry instructor.

Senger rose through the ranks, serving at the cavalry school in Hanover (1919–1921) and then as chief of staff of the Cavalry Inspectorate. An opponent of the all-tank theorists, Senger supported development of mechanized infantry (Panzergrenadiers). In March 1939, he was promoted to colonel and given command of a regiment, which he later led in the September 1 invasion of Poland. He commanded a mechanized brigade in the invasion of France on May 10, 1940. Senger's cosmopolitan background led to his appointment as chief of the German delegation to the Franco-Italian armistice commission following the surrender of France in June.

In September 1941, Senger was promoted to major general and commanded the 17th Panzer Division. He led the division in Operation BARBAROSSA, which began on June 22, 1941, and in Field Marshal Erich von Manstein's subsequent offensive in the Ukraine. In 1943, doubts about the capability of Italian troops led to Senger's promotion to lieutenant general and reassignment to coordinate Axis strategy in Sicily. He remained in Italy for the rest of the war and led German troops in several significant battles, including the withdrawal from Sardinia and Corsica and the Battle of Monte Cassino.

Promoted to general of panzer troops in January 1944, Senger oversaw the negotiations that led to the surrender of German forces in Italy in May 1945. Held as a prisoner of war from 1946 to 1948, on his release he became the headmaster of Salem, a public school near Lake Constance. During the 1950s, he advised Federal Republic of Germany president Konrad Adenauer on rearmament and the formation of the new German military, the Bundeswehr. Senger died in Freiburg im Breisgau on January 4, 1963.

Sevastopol, Siege of (October 30, 1941–July 4, 1942)

One of the great battles on the Eastern Front. Sevastopol is located on the southwestern tip of the Crimean Peninsula. In 1941, it was one of the world's most powerful fortresses and home to the Soviet Black Sea Fleet. Its location made any approach to the city difficult, and it was strongly defended by large concrete bunkers, minefields, and a dozen naval gun batteries containing 42 heavy guns ranging from 152mm to 304mm in caliber.

Securing Sevastopol was a major German military objective. By taking the entire Crimean Peninsula with Sevastopol, Adolf Hitler sought to deny the Red Air Force the ability to strike the Ploieşti oil fields, which were vital to the German war effort. He also hoped that destruction of the Soviet Black Sea Fleet might bring neutral Turkey into the war against the Soviet Union. Hitler was determined to have Sevastopol, but Soviet leader Joseph Stalin

was just as determined to hold it. In Soviet hands, it could threaten any further German advance into the southern Soviet Union.

Sevastopol came under air attack in the first hours of the German invasion of the Soviet Union on June 22, 1941. From late September to mid-November, General of Infantry Erich von Manstein's Eleventh Army overran the entire Crimean Peninsula except for Sevastopol. Meanwhile, during the last two weeks of October the Soviets reinforced the base, sending to Sevastopol by sea from Odessa the remains of Major General Ivan Yefimovich Petrov's Independent Maritime Army, some 32,000 men. Petrov, who took command of all ground forces at Sevastopol, immediately set his men to work building three defensive lines, the most northerly of which was 10 miles from the fortress. Vice Admiral Filipp Sergeevich Oktyabrsky had overall command of Sevastopol and used his cruisers and destroyers to bring in supplies from Novorossiysk, which they could reach overnight. In all, Oktyabrsky commanded about 102,000 men. Manstein had the smallest German army on the Eastern Front—seven divisions comprising about 100,000 troops—but with more guns and many more aircraft. There were few tanks on either side.

The siege itself began on October 30, when Manstein mounted the first effort to break through the well-fortified Soviet lines. After three weeks, the attack had barely penetrated the Soviet defenses and was halted. On December 17, the Germans launched a second and more intense attack that breached the three defensive lines and pushed to within five miles of the city. The Soviets, however, fought for every inch of ground. The rainy and cold weather became a serious problem for the Germans, who were ill-prepared in summer uniforms.

The fighting was bitter, and tunnels deep belowground helped the Soviets survive. On December 26, Soviet forces landed on the Kerch Peninsula to the east, diverting German troops. By mid-January, the Germans were again forced to discontinue the attack. For a few months that winter, the population of Sevastopol believed that they had won the battle, and life in the city regained some semblance of normalcy.

Soviet soldiers resting on a pile of rubble in the ruined streets of Sevastopol during the hard-fought battles there in 1942. (Hulton-Deutsch Collection/Corbis)

It was not to be. Stavka, the Soviet high command, activated the Crimea Front under Major General Dmitry Timofeyevich Kozlov and ordered him to deploy three armies on the Kerch Peninsula, which was possible in winter when the Kerch Strait was frozen solid. When good weather returned in the spring, Manstein committed 5 German and 2 Romanian infantry divisions and 1 German panzer division against Kozlov's 21 infantry divisions and 4 tank brigades. A German amphibious landing unhinged Kozlov's defenders and led to the surrender of more than 170,000 Red Army troops. Manstein now returned to the conquest of Sevastopol, which Hitler insisted be taken.

On June 2, the Germans used 700 guns to begin the systematic reduction of the massive Soviet forts. The German artillery included some three dozen heavy siege guns that had been specially developed to reduce the French Maginot Line, ranging in size from 280mm to 800mm (10.9 inches to 31 inches). The largest of these, the "Dora" Gustav gun, was in fact the largest artillery piece of all time.

Manstein opened a third assault by four divisions from the north on June 7, but it failed to break through the defenders, who from tunnels and caves continued an effective resistance with small arms. On June 11, three German divisions attacked on the southeast but also made little headway. After two weeks of fighting, the Germans were on the shore of Severnaya Bay, north of

Sevastopol, and at the Sapun Heights to the southeast. The last Soviet reinforcements arrived between June 22 and 26. Thereafter, the only links between Sevastopol and the outside world were by submarine and air. Waves of German bombers leveled the city and the naval base, dropping some 50,000 bombs in one week.

A surprise German assault by boat across the bay on June 28 shattered the defenders, and beginning on the night of June 30, Oktyabrsky, Petrov, and a few hundred top Soviet military, party, and government personnel were evacuated by air. Fighting ended on July 4, 1942.

The Germans claimed 92,000 Soviet prisoners taken, along with 460 guns, but they suffered 24,000 casualties of their own in the June and July fighting alone. An overjoyed Hitler promoted Manstein to field marshal. Manstein had indeed achieved much, given the difficult terrain and weather and the defenders' determination. Hitler then transferred the Eleventh Army north to Leningrad, a decision that adversely affected the German Army in its drive on Stalingrad later that year.

The Soviets retook Sevastopol in May 1944. Then the situation was reversed, with the German Seventeenth Army defending the city and the Soviets attacking. Although the Germans evacuated 38,000 troops by sea, the Soviets claimed 100,000 others killed or captured. After the long siege and this battle, little was left of Sevastopol.

Seversky, Alexander Procofieff de (1894–1974)

U.S. aircraft designer. Born in Tbilisi, Republic of Georgia, on June 7, 1894, Alexander Procofieff de Seversky was the son of a wealthy Russian sportsman and pilot. In 1914, as a young pilot flying his first combat mission for the Imperial Russian Navy, de Seversky was shot down, losing his right leg. He later flew 57 additional missions, downing 13 German aircraft and becoming chief of Russian naval fighter aviation in the Baltic. In 1917, the Russian provisional government named de Seversky assistant naval attaché for air at its embassy in Washington, D.C.

After the Bolsheviks seized power in late 1917, de Seversky offered his expertise to the U.S. military, serving as a test pilot and consulting engineer. Following the war, de Seversky remained in the United States. He became a U.S. citizen in 1927, whereupon he was commissioned a major in the Air Corps Specialist Reserve. He became a prominent aircraft designer, developing numerous significant technical improvements and innovations. In 1922, de Seversky formed the Seversky Aero Corporation, reorganized and expanded in 1931 as the Seversky Aircraft Corporation.

From the 1920s until his death, de Seversky was a dedicated advocate of the strategic importance of airpower, working relentlessly to enhance U.S. aviation and eventually its missile and satellite capabilities. Between the wars, he collaborated with Brigadier General William "Billy" Mitchell on tests designed to prove the superiority of airpower over battleships.

World War II and its aftermath won de Seversky's message a favorable hearing. Besides lobbying politicians and the military, he published numerous newspaper articles and three books on the indispensability of airpower to modern warfare—all urging that the U.S. Air Force become the world's strongest. *Victory through Air Power* (1942) became a Walt Disney film that both President Franklin D. Roosevelt and Prime Minister Winston L. S. Churchill admired. *Air Power: Key to Survival* (1950) and *America: Too Young to Die!* (1961) reiterated the themes. De Seversky died in New York City on August 24, 1974.

Seyss-Inquart, Arthur (1892–1946)

Leading Austrian Nazi and Reich commissioner in the Netherlands. Born in Stannern, Moravia, on July 22, 1892, Arthur Seyss-Inquart studied law at the University of Vienna before joining the Austro-Hungarian Army. During World War I, he saw action and was badly wounded. After the war he became a lawyer in Vienna, where he developed right-wing views. A strong advocate of Anschluss (union with Germany) in the 1930s, Seyss-Inquart was regarded as the leader of the small Austrian Nazi organization. Publicly he sought to achieve reconciliation with the government headed by Kurt von Schuschnigg, but behind the scenes he eagerly undermined the Austrian state.

Seyss-Inquart became state councilor in May 1937, and in February 1938, following pressure by Adolf Hitler, Schuschnigg appointed Seyss-Inquart the minister of the interior. When Schuschnigg announced a plebiscite on the issue of Anschluss, the German government pressured him to resign on March 13, 1938, in favor of Seyss-Inquart as chancellor. Shortly thereafter, Hitler's German followers took control.

Seyss-Inquart then became the Reich representative in the former Austria and minister without portfolio in Hitler's cabinet. When Germany conquered Poland on September 1, 1939, Seyss-Inquart served as deputy governor there under Hans Frank. Displeased with the atrocities committed by Schutzstaffel (SS) forces and unable to exert any influence over policies, Seyss-Inquart asked for a new appointment.

In May 1940, Seyss-Inquart became Reich commissioner of the newly occupied Netherlands. He tried to come to terms with the Dutch and have them carry out a Nazification program. But instead of achieving

collaboration, Seyss-Inquart found himself dealing with the Dutch Nazi movement. In Seyss-Inquart's view, Dutch Nazi leader Anton Mussert's followers were unsuited for German occupation policy. They were only a small minority with no real support from the Dutch population and no administrative experience.

Therefore, Seyss-Inquart preferred to work with the traditional elites. He sought to resign his post, but Hitler refused his request, believing that Seyss-Inquart's moderate approach would achieve the desired results. Seyss-Inquart was nominally responsible for recruitment of Dutch workers to be relocated in the Reich, the deportation of Jews to the extermination camps, and German exploitation of the Dutch economy, but he never managed to restrain the SS from interfering in the Netherlands.

After the war Seyss-Inquart was charged with war crimes and tried at the International Military Tribunal in Nuremberg. He was found guilty and hanged on October 16, 1946.

Sfax, Action off (April 16, 1941)

Naval action, also known as the Battle of the Tarigo Convoy, fought in the Mediterranean Sea north of the Tunisian port city of Sfax between units of the Italian and British navies. The action resulted from the first nocturnal interception and destruction of an Italian-escorted convoy to Africa by British surface forces.

Faced by an Axis advance toward Egypt and under pressure from London to stop the flow of supplies to Africa, the commander of the Mediterranean

Fleet, Admiral Andrew B. Cunningham, ordered the 14th Destroyer Flotilla of the *Jervis*, *Janus*, *Nubian*, and *Mohawk* under Captain Philip John Mack to reinforce the submarines and aircraft operating from Malta against Axis traffic. The flotilla arrived on April 11, the same day Axis troops laid siege to the port of Tobruk in Libya.

The flotilla's first two sorties were unproductive, but on April 13 a convoy of one Italian and four German transports departed Naples for Tripoli escorted by the Italian 8th Destroyer Squadron under Captain Pietro De Cristofaro of the *Luca Tarigo, Baleno,* and *Lampo*. A Malta-based aircraft sighted the convoy on the morning of April 15, and the British destroyers weighed anchor that evening.

Heavy winds scattered the Axis convoy, and it had fallen four hours behind schedule by the time it regrouped off Cape Bon, Tunisia, at 10:00 p.m. on April 15. The British were searching along the convoy's estimated track and nearly missed it due to the delay, but at 1:58 a.m. on April 16 lookouts aboard the *Jervis* reported shadows six miles ahead. The wind was gusting at 40 mph, and the air was heavy with dust blowing off the continent. While the British maneuvered to position the quarter moon behind the Axis ships, Italian and German lookouts saw nothing of the menace approaching from astern. When it opened fire at 2:20 a.m., the *Jervis* was a mere 2,400 yards off the starboard quarter of the *Baleno,* the rear escort.

Salvos from the *Jervis* and *Janis* quickly disabled the *Baleno,* whose crew thought that their ship was under air attack. Then the rear British destroyers, the *Nubian* and *Mohawk,* pushed up the convoy's starboard side while the other two swung up the port side. The *Luca Tarigo,* which had been in the lead, reversed course as ships blazed up behind it. At 2:35 a.m. the *Nubian* spotted the *Luca Tarigo* as it emerged from the smoke, and the two ships traded salvos from 1,000 yards as they passed.

The *Luca Tarigo* attracted the fire of the other British destroyers, and at 2:40 a.m. the *Jervis* hit the Italian warship with a torpedo. As the Italian flagship went dead in the water, the British destroyers returned to their execution of the transports. Suddenly a torpedo struck the *Mohawk,* blowing away the ship's aft section; an enterprising ensign aboard the *Luca Tarigo* had manually aimed and fired the torpedo just a minute before. At 2:53 a.m. another torpedo struck the *Mohawk,* and the large British destroyer began to settle.

The *Lampo,* located on the convoy's far side, was last to enter the action, ineffectively attacking the *Nubian* with guns and torpedoes. The *Nubian*'s reply inflicted serious damage on the *Lampo,* which eventually grounded on Kerkenah Bank to keep from foundering. After dispatching the *Lampo,* the *Nubian* chased down the last transport, which was fleeing southeast, and set it ablaze. Two transports eventually joined the *Lampo* grounded on the banks, while the *Tarigo* and the other three transports sank outright. The *Baleno* capsized on the morning of April 17. In this debacle, the Axis lost 1,700 men, 300 vehicles, and 3,500 tons of supplies. The British lost the *Mohawk;* the other three destroyers suffered only slight splinter damage. The Axis convoys continued, however. Two arrived in Tripoli without loss four days later, and Italian naval headquarters regarded the destruction of the *Tarigo* convoy as an anomaly based on lucky air reconnaissance.

Shanghai, Battle of (August 13–November 9, 1937)

First major battle of the Second Sino-Japanese War of 1937–1945. Formal war between Japan and China developed rather unexpectedly from a clash on July 7, 1937, between Japanese and Chinese troops near the historic Lugouqiao (Lukouch'iao) Marco Polo Bridge, a major railroad artery 10 miles from Beijing (Peking) in Hebei (Hopeh) Province. Chinese and Japanese officials deadlocked when they tried to reach an appropriate

settlement that would cover not just this particular incident but would also govern overall Sino-Japanese relations.

As the situation deteriorated, Japanese troops seized control of the Beijing-Tianjin (Tientsin) area. On August 7, Jiang Jieshi (Chiang Kai-shek), the Guomindang (Kuomintang, Nationalist, GMD) president of China, decided to retaliate by attacking Japanese forces stationed at the Japanese settlement in Shanghai in Jiangsu (Kiangsu), China's leading port and major international commercial center. Japan and several prominent Western powers each administered part of an area of the city called the International Settlement, where their nationals enjoyed extraterritorial privileges. To protect these rights, the Japanese government had installed its own garrison, a force expanded after the Lugouqiao/Marco Polo Bridge clash.

Meanwhile, top Japanese naval officials urged forceful action in the Shanghai area, a hotbed of Chinese Nationalist sentiment. At this sensitive time, several Japanese warships—together with naval vessels of other foreign nations—were moored in Shanghai Harbor. The situation in Shanghai grew increasingly explosive, and on August 9 Chinese soldiers killed two Japanese marines.

Jiang believed that the constricted conditions of street fighting in Shanghai would minimize Japanese superiority in logistics, tanks, and artillery and that the urban location would prove more advantageous to his own forces than the northern Chinese plains, the focus to date of Sino-Japanese military confrontation. By diverting Japanese attention to central China, he also hoped to allow beleaguered northern Chinese military units to regroup.

On August 11, Jiang ordered his troops to positions within the greater Shanghai area, carefully avoiding the foreign sections of the city. Japanese commanders rushed reinforcements to Shanghai, but when battle began on August 13, a mere 12,000 Japanese soldiers faced 80,000 Chinese. For a week the battle hung in the balance as Chinese units came close to driving their enemy into the Huangpu (Whampoa) River.

From August 20, Japanese reinforcements arrived en masse by sea, landing on the banks of the Chang Jiang (Yangtze) River and mounting what quickly became a siege of Shanghai. The Chinese government likewise poured men into Shanghai, where heavy fighting continued for almost three months as both sides struggled for control of the city. Combat was brutal. On

August 14, Chinese warplanes tried to bomb Japanese naval vessels in Shanghai Harbor but only succeeded in hitting civilian areas of the city. Japanese warships in the Changjiang and Huangpu Rivers responded with heavy point-blank fire against Nationalist positions, which continued throughout the battle. During the siege, a stray shell hit the U.S. cruiser *Augusta*, killing a crewman and wounding 18 others.

Japanese troops fighting in the 1937 Battle of Shanghai. (Corbis)

Hoping that the influential foreign residents of the city's International Settlement might serve as mediators and perhaps win overseas support for China, Jiang ordered Shanghai's defenders to hold out to the end, and for several weeks of bitter house-to-house fighting they did so. Between August and November 1937, 270,000 Chinese troops—constituting 60 percent of the city's Nationalist garrison and the core of Jiang's newly modernized Chinese Army—were killed or wounded in the fighting, along with many thousands of civilians. Japanese casualties totaled some 40,000. Much of Shanghai was devastated, although both sides left the foreign settlements undisturbed.

At the beginning of November, a Japanese amphibious force landed at Hangzhou (Hangchow) Bay 50 miles from Shanghai, threatening the city's rear. In what swiftly became a disorganized rout, Chinese forces evacuated

Shanghai. Instead of retreating to newly built fortifications along the Shanghai-Nanjing (Nanking) railway line, they fell back farther on Nanjing, the Nationalist capital, which became the next Japanese target.

Jiang's decision to launch the Battle of Shanghai marked a deliberate extension to central China of Sino-Japanese conflict. It was a major strategic shift reflecting Jiang's new determination, after the Xi'an (Sian) Incident in Shaanxi (Shensi) and his rapprochement with the Communists, to move to outright opposition toward further Japanese incursions. It also constituted the real beginning of the Second Sino-Japanese War, which would last a further eight years.

Shaposhnikov, Boris Mikhailovich (1882–1945)

Marshal of the Soviet Union. Born in Zlatoust in the southern Urals on October 2, 1882, Boris Mikhailovich Shaposhnikov began his military career in the Russian Imperial Army in 1901. He became an officer two years later upon graduation from the Moscow Military College. In 1910 after graduation from the General Staff Academy, he served in the Tashkent Military District and in Russian Poland. During World War I he served in Galicia, and in 1917 he was promoted to colonel and commanded a grenadier regiment.

Shaposhnikov joined the Red Army in 1918 and served on its field staff during the Russian Civil War. In 1923 he published his first book, and he was an assistant to chief of staff M. V. Frunze by April 1924. In 1926, Shaposhnikov assumed command of the Leningrad Military District. He became known internationally for his three-volume study *The Brain of the*

Army (1927–1929), in which he argued that the General Staff should be the sole agency directing the Red Army.

Shaposhnikov was admitted to Communist Party membership in 1930; the usual probationary period was waived. From 1928 to 1931, he was head of the Red Army staff. He was demoted in 1931, allegedly because he published an account of the civil war that gave Leon Trotsky more credit than Joseph Stalin could abide. From 1931 to 1937, Shaposhnikov was successively commander of the Volga Military District, chief of the Frunze Military Academy, and commander of the Leningrad Military District. Shaposhnikov then served on the board that helped purge the Red Army in 1937.

Appointed chief of staff of the army and deputy commissar of defense in May 1937, Shaposhnikov did what he could to modernize and improve the Red Army, although much of his work in this regard was blocked by Stalin and others. He also was unable to prevent the disbanding of seven mechanized corps in November 1939, despite Colonel General Georgii Zhukov's success with armor in the Battle of Khalkhin Gol in Manchuria.

Shaposhnikov drew up the plans for the Soviet occupation of eastern Poland at the beginning of World War II and the belated successful offensive in the November 30, 1939–March 12, 1940, First Finnish-Soviet War. (Stalin at first ignored his counsel.) Promoted to marshal of the Soviet Union in May 1940, Shaposhnikov relinquished the post of chief of staff because of poor health, although he retained the position as deputy defense commissar.

On the eve of the June 22, 1941, German attack, Shaposhnikov urged Stalin to abandon forward positions in Poland in favor of the Stalin Line along the Soviet Union's former border. Stalin dismissed Shaposhnikov from his posts for this advice. With the German invasion, Stalin reinstated Shaposhnikov as chief of the General Staff on July 29, 1941, in a reorganized Stavka that apparently followed the form suggested by Shaposhnikov in his study *The Brain of the Army*. Although ill, Shaposhnikov played an important role in planning the Soviet defense of Moscow and the subsequent Soviet counterattack. In June 1942, he advised against an attack on Kharkov as being premature.

Shaposhnikov left his post as chief of the General Staff for reasons of health on June 26, 1942. Although still ill, he remained on the Stavka and as deputy commissar of defense. In June 1943, he became commandant of the

Voroshilov Military Academy. Shaposhnikov continued to hold this post and serve on the Stavka until his death in Moscow on March 26, 1945.

Shepherd, Lemuel Cornick, Jr. (1896–1990)

U.S. Marine Corps general. Born on February 10, 1896, in Norfolk, Virginia, Lemuel Cornick Shepherd Jr. graduated from the Virginia Military Institute and was commissioned a second lieutenant in the Marine Corps in April 1917. As a member of the 5th Marine Regiment during World War I, he participated in all the major U.S. actions and was wounded three times.

After the war, Shepherd served in Brazil, China, and Haiti. In 1937, he graduated from the Naval War College and then commanded the 2nd Battalion, 5th Marine Regiment, which developed amphibious tactics and techniques. In June 1939, Shepherd served on the staff of the Marine Corps Schools. In March 1942, he assumed command of the 9th Marine Regiment. After organizing and training the regiment, he deployed with it to the Pacific as part of the 3rd Marine Division. In July 1943, while serving on Guadalcanal, Shepherd was promoted to brigadier general and was assigned as assistant commander of the 1st Marine Division. From December 1943 through March 1944, he participated in the Cape Gloucester operation on New Britain. Shepherd assumed command of the 1st Provisional Marine Brigade in May 1944 and led it in the recapture of Guam from July 21 to August 10, 1944.

Following this operation, Shepherd was promoted to major general and charged with expanding the brigade into the 6th Marine Division, which he led in the assault and occupation of Okinawa from April to June 1945. He next took his division to Tsingtao, China, where he received the surrender of Japanese forces in that area on October 25, 1945.

In 1946, Shepherd was appointed assistant commandant of the Marine Corps. He also headed the 1946 board that recommended the helicopter as the future Marine Corps amphibious assault vehicle. From 1948 to 1950, Shepherd was commandant of the Marine Corps Schools. In 1950, he took command of Fleet Marine Forces in the Pacific and participated in the September 15, 1950, Inchon landing during the Korean War (1950–1953). In January 1952, Shepherd became the commandant of the Marine Corps, a position he held until his retirement in January 1956. Two months after his retirement, he was recalled to active duty and appointed chairman of the Inter-American Defense Board, a position he held until September 1959. Shepherd died in La Jolla, California, on August 6, 1990.

Sherman, Forrest Percival (1896–1951)

U.S. Navy admiral. Born in Merrimack, New Hampshire, on October 30, 1896, Forrest Percival Sherman graduated from the U.S. Naval Academy at Annapolis in 1917. From then onward he won a reputation as a brilliant, cerebral tactician and skilled mediator. In 1922, he became a naval aviator, and his subsequent career assignments focused heavily on aviation. In 1932, Sherman commanded Fighting Squad-ron 1 aboard the *Saratoga*. From 1933

to 1936, he was director of the Board of Ordnance's Aviation Ordnance Section, and from 1937 to 1940 he was aviation officer of the U.S. Fleet.

In 1940, Sherman joined the War Plans Division, drafting plans for hemispheric defense, serving on the U.S.-Canadian Permanent Joint Board of Defense, and attending the August 1941 Atlantic Charter conference. Promoted to captain, in May 1942 Sherman assumed command of the aircraft carrier *Wasp* but lost his ship to the Japanese submarine *I-19* on September 15, 1942, during the Battle of Guadalcanal, earning the Navy Cross for "extraordinary heroism."

Sherman then spent a year at Pearl Harbor as chief of staff to Vice Admiral John H. Towers, commander of the Pacific Fleet's air elements. Sherman's talent for staff work, including operational planning, force deployment, and logistical support, encouraged Admiral Chester W. Nimitz, commander of U.S. Forces, Pacific Ocean Area, to appoint him his planning officer as a rear admiral. As deputy chief of staff (plans), Sherman devised and implemented much of Nimitz's strategy in the Pacific theater, including which specific islands would be attacked or bypassed. He also sometimes represented Nimitz before the Joint Chiefs of Staff in Washington.

Returning to Washington, Sherman was promoted to vice admiral in December 1945. As deputy chief of naval operations, he became heavily involved in formulating both unification of the armed forces and Cold War strategy. After emphasizing to President Harry S. Truman the potential Soviet threat in the Mediterranean, an important influence in the formulation of the Truman Doctrine of February 1947, Sherman became the first commander of the new U.S. Naval Forces, Mediterranean.

In November 1949, Sherman became chief of naval operations as a full admiral. He supported U.S. intervention in the Korean War and proposed the successful naval blockade of North Korea. He also gave cautious approval to the September 1950 Inchon landing and backed Truman in his relief of General Douglas MacArthur and the primacy of Europe in U.S. defense planning. While on a diplomatic assignment to Naples, Italy, Sherman suffered a fatal heart attack on July 22, 1951.

Sherman, Frederick Carl (1888–1957)

U.S. Navy vice admiral. Born in Port Huron, Michigan, on May 27, 1888, Frederick Carl Sherman graduated from the U.S. Naval Academy at Annapolis in 1910 and was commissioned an ensign in 1912. Before World War I, he served on battleships and submarines, and during the war, he commanded a submarine on Atlantic seaboard patrols.

After the war, Sherman rotated between shore and sea assignments, including two stints as a student at the Naval War College. In 1936, he qualified as a naval aviator, and by the time he took command of the aircraft carrier *Lexington* in 1940, he had become an ardent proponent of naval airpower. Shortly after the United States entered World War II, Sherman's pilots carried out raids against Japanese bases on New Britain Island and New Guinea. Sherman was promoted to rear admiral in April 1942. In the Battle of the Coral Sea on May 7–8, 1942, his forces sank the Japanese light aircraft carrier *Shōhō,* although damage from Japanese bombs forced the scuttling of the *Lexington*.

Later that year, Sherman was appointed commander of Task Force 16, and in 1943 he headed Carrier Division 2. In these posts, Sherman participated in operations in the South and Central Pacific theaters, helping to neutralize Japanese airpower in these areas, sinking or damaging many enemy ships, and earning a reputation as an aggressive leader and a skilled tactician. As with other air admirals, he believed that naval air forces, organized into multicarrier task forces, were the key to victory in the Pacific war, and at one point he urged that aviators should be in command of all task forces that included carriers.

Following assignment in the United States from March to August 1944 for a rest, Sherman became commander of Task Group 38.3/58.3. He took part in the Battle of Leyte Gulf (October 23–26, 1944), supported the landings on Iwo Jima (February 19–March 26, 1945) and Okinawa (March–June 1945), and engaged in raids against Japan.

Shortly before the end of the war, Sherman was promoted to vice admiral and given command of the 1st Fast Carrier Task Force and Task Force 58. In January 1946, he was named commander of the Fifth Fleet, his final post before retiring from the navy in March 1947. Sherman died in San Diego, California, on July 27, 1957.

Shigemitsu Mamoru (1887–1957)

Japanese diplomat. Born in ōita on July 29, 1887, Shigemitsu Mamoru graduated from Tokyo Imperial University and became a diplomat in 1911. He was appointed a member of the Japanese delegation to the 1919 Paris Peace Conference. Frustrated by the results of the conference, Shigemitsu joined with other young Japanese diplomats in urging a more forceful Japanese foreign policy.

Shigemitsu was counselor for the Foreign Ministry (1920–1924), chief secretary in the Chinese embassy (1925–1927), and counsel general in Shanghai (1927–1930). He became Japanese minister to China in 1931. In spite of his efforts to improve relations with China, the Japanese Army

escalated the crisis following the Mukden Incident. In April 1932, a Korean nationalist tried to assassinate Shigemitsu with a hand grenade. Shigemitsu was badly wounded, losing a foot.

Shigemitsu served as deputy minister of foreign affairs from 1933 to 1936. He resigned because of the failure of his hard-line approach in negotiations with China. He was then successively ambassador to the Soviet Union (1936–1938), to Great Britain (1938–1941), and to the Wang Jingwei (Wang Ching-wei) government in China during 1942.

Shigemitsu became minister of foreign affairs under Prime Minister Tōjō Hideki in April 1943. In attempting to justify the war, Shigemitsu stressed that Japan sought to liberate Asian peoples from Western oppression. Shigemitsu continued as minister for foreign affairs and minister for Greater East Asia under Prime Minister Koiso Kuniaki.

Shigemitsu resigned in April 1945; in August 1945, he returned as minister of foreign affairs under Prime Minister Prince Higashikuni Naruhiko and signed the official surrender on board the U.S. battleship *Missouri* on September 2, 1945. Arrested as a war criminal, Shigemitsu was sentenced to seven years in Sugamo Prison, but he was released in 1950.

Shigemitsu again became minister of foreign affairs in December 1954, remaining in office until December 1956. Among his accomplishments were the reestablishment of diplomatic relations with the Soviet Union and Japan's entry into the United Nations in 1956. Shigemitsu died in Yugawara, Kanagawa, on January 26, 1957.

Shimada Shigetaro (1883–1976)

Japanese Navy admiral and minister of the navy. Born in Tokyo on September 24, 1883, Shimada Shigetaro graduated from the Japanese Naval Academy in 1904 and participated in the 1904–1905 Russo-Japanese War. Following the war, he entered the gunnery school and became a gunnery officer. From 1916 to 1919, Shimada was in Italy, first as a resident officer, then as assistant attaché, and later as attaché.

In 1904, Shimada joined the navy General Staff and became an instructor at the Naval War College. Promoted to captain in 1928, he commanded first the cruiser *Tama* and then the battleship *Hiei* (1928).

Following promotion to rear admiral in 1929, Shimada became chief of staff of the Second Fleet and then chief of staff of the Combined Fleet in 1930. In 1931, he became the director of the Submarine School, and in 1932, he was chief of staff of the Third Fleet. He next held various posts on the navy General Staff. Promoted to vice admiral in 1934, Shimada became the deputy chief of the Naval Staff until he was assigned as commander of the Second Fleet in 1937. Promoted to admiral in 1940, Shimada became the commander in chief of the China Fleet, and later he served as the commander in chief of the Kure and Yokosuka naval districts.

In October 1941, Shimada became minister of the navy in the cabinet of Prime Minister Tōjō Hideki. Shimada owed his appointment to his ability to get along with those around him. Although he shared the navy's reluctance to go to war against the United States, he found that it was impossible to swim against the tide and followed Tōjō's policies.

In February 1944, Shimada assumed the office of chief of the navy General Staff, tasked with Tōjō's demand to conduct the war at sea more effectively. From that date, Shimada concurrently held the offices of minister of the navy and chief of the navy General Staff. Navy and intellectual circles denigrated him, whispering that "Shimada is Tōjō's puppet." Following the loss of Saipan, in July 1944 Tōjō reluctantly ordered Shimada to resign before resigning himself.

In January 1945, Shimada went on the reserve list. After the war, he was arrested by Allied authorities as a war criminal. Tried and convicted by the International Military Tribunal for the Far East, he was sentenced to life in prison but released in 1956. Shimada died in Tokyo on June 7, 1976.

Shinano, IJN, Sinking of (November 29, 1944)

Imperial Japanese Navy aircraft carrier. Third in the projected four-ship Yamato class of Japanese superbattleships, the *Shinano* was laid down at the Yokosuka Navy Arsenal on May 4, 1940. It had been completed up to the main deck by the June 3–6, 1942, Battle of Midway, in which the Japanese lost four carriers. The Japanese then decided to convert the *Shinano* into an aircraft carrier. Based on experiences in the Battle of Midway, it received an armored flight deck.

The *Shinano* was seen as a floating base for refueling, rearming, and maintaining aircraft from other carriers. As a result, despite its massive size and a 550-foot-long aircraft hangar, it would have carried only 47 aircraft for self-defense (total hangar capacity was about 70 aircraft). Reflecting its new mission, it had large holds for fuel, munitions, and spare parts in the spaces where gun turrets were to have been located.

Launched on October 8, 1944, the *Shinano* displaced 73,040 tons fully loaded and was 872 feet 8 inches in overall length and 119 feet 11 inches in beam. Its design speed was 27 knots. Antiaircraft armament consisted of 16 5-inch and 145 25mm guns, along with 336 5-inch rocket launchers. It had a crew of 2,400 men. The *Shinano* was the largest carrier ever built until the U.S. Navy's Forrestal class of the 1950s.

On November 29, 1944, the *Shinano* was being moved to Kure for its final fitting out when the U.S. submarine *Archerfish* intercepted it in the Inland Sea and hit it with four torpedoes aft. Having retained its battleship triple-hull protection, the carrier continued to travel at 16 knots. However, an

untrained crew and the fact that many of the ship's watertight compartments were not yet complete resulted in the carrier sinking later that day.

SHINGLE, Operation

See Anzio, Battle of

Ship's Combat Information Center

The concept of a command space where all the relevant combat information is integrated and applied to directing a ship's and naval task group's weapons arose from the early battles of World War II's Pacific Campaign, where Allied naval units faced mass waves of Japanese aircraft. The early radars provided adequate warning of the approach of these aircraft, but the early radar plotting rooms were neither well arranged nor large enough to depict the overall tactical picture in a fashion that enabled commanders to deploy their forces effectively.

Naval warfare was now three-dimensional, with threats coming from below and above as well as on the sea surface. Moreover, the advent of radar and naval airpower as a decisive combat arm had transformed naval warfare into engagements involving larger numbers of enemy and friendly force contacts over far greater expanses of ocean. Airpower had also accelerated the pace of battle far beyond that which could be directed from the traditional open bridge.

Early radar plotting rooms enabled commanders to track and command forces against a handful of targets, but the need to detect incoming raids and rapidly direct fighter aircraft to intercept enemy aircraft required something better. The U.S. Navy applied the lessons learned from the battles in the Coral Sea and at Midway to design a new command space where information from all the ship's sensors (e.g., radar, sonar, and visual lookouts) as well as reports from fleet headquarters and other ships were received, plotted, analyzed, and presented to the ship's or task group's commander and from which he issued his orders.

The first Combat Information Center (CIC), as it is known today, was employed during the Gilbert Islands Campaign in November 1943. The captain of the U.S. Navy destroyer *Fletcher* (DD-445), Commander William M. Cole, and his executive officer (XO) LCDR, Joseph C. Wyle, generally are credited with establishing the first operational combat application for using the space. The CO remained on the bridge, while the XO remained in radar plot advising the captain on the tactical situation. The *Fletcher* preformed so effectively in the early battles that it was placed in the van for the Battle of Tassafaronga, leading three other destroyers.

Although that battle was a disaster, the destroyer action was successful. Cole's report and other after-action reports were studied and the lessons applied. Radar plotting rooms were expanded to accommodate the faster and larger volume of information available.

By early 1945 the CIC concept and doctrine had emerged, but it was the Battle for Okinawa that drove it to the form that exists today. The Japanese defenders threw hundreds of kamikaze (suicide) aircraft at the fleet daily, almost simultaneously with the fleet directing several thousand aircraft in strikes ashore and conducting naval gunfire support. It was a complex fleet air defense and battle management problem that nearly overwhelmed the unit commanders' ability to command.

Four months later, the navy issued Radar Bulletin Number 6, the first navy-wide CIC manual. Although technology has changed the method, means, and equipment in the CIC, the principles derived from World War II remain largely unchanged to this day. Aircraft carrier CICs came to be called Combat Direction Centers after 1979, but the most significant change affecting CICs was the development of the Tactical Flag Command Center (TFCC) in the 1980s, when the advent of Soviet supersonic long-range

bombers and antiship cruise missiles expanded the naval task group's area of interest out to several thousand miles and required the task group commander to coordinate his task group's operations with commands ashore.

With his area of interest and span of control far exceeding that of the ship's commander, it became necessary to separate the ship's CIC and the task group commander's command center. All flag-configured U.S. Navy ships now have a TFCC where strategic intelligence information is integrated with reports on the situation overland to enable the admiral to command a joint task group that may include U.S. Air Force, U.S. Army, and U.S. Marine Corps units.

SHŌ Plans

Japanese naval plans developed to meet threats posed by the U.S. Navy. As early as July 21, 1944, the Japanese Naval General Staff in Tokyo issued a directive for subsequent "urgent operations." The Combined Fleet was to maintain the strategic status quo and take advantage of tactical situations to seize the initiative "to crush the enemy fleet and attacking forces." On July 26, the Naval General Staff informed Combined Fleet commander Admiral Toyoda Soemu that the "urgent operations" would be known by the code name SHŌ (VICTORY).

The Japanese developed four SHŌ Plans to combat the next U.S. offensive move; SHŌ ICHI-GO (Operation VICTORY 1) covered defense of the Philippine archipelago. SHŌ-2 was for the defense of the Kuriles and Ryukus, SHŌ-3 was

for southern and central Japan, and SHŌ-4 covered threats against northern Japan and the Kurile Islands.

For SHŌ-1, which Tokyo expected to be the plan implemented, the Japanese planned to commit the entire Combined Fleet. It called for holding the fleet back and letting the Americans make their landings, then launching an all-out naval attack. Toyoda knew this would be a gamble. He said after the war that if things went well, the Japanese might have achieved "unexpectedly good results," but at worst there was a chance of losing the entire fleet. Toyoda believed that chance had to be taken.

He knew all too well that should the Americans retake the Philippines, even with the fleet left intact, Japanese shipping anes to the south—especially to the vital resources of the Dutch East Indies—would be completely cut off. Thus, even if the fleet was able to return to Japanese waters, it would not be able to secure fuel. And if the fleet was to remain in southern waters where it could obtain fuel, it could not receive supplies of ammunition and weapons. Thus, Toyoda concluded, "There would be no sense in saving the fleet at the expense of the Philippines."

Japanese naval air strength, however, had been severely reduced in the June 19–21, 1944, Battle of the Philippine Sea (the "Great Marianas Turkey Shoot"), and during October 12–14, U.S. carrier planes and army B-29s struck Japanese airfields on Formosa, Okinawa, and the Philippines. These attacks had the effect of denying the Japanese Navy badly needed land-based air support; this probably doomed the Japanese plan. The Japanese did add extra antiaircraft guns to their ships in an attempt to offset the lack of airpower, but offensively they would have to rely on naval gunnery and some land-based planes in the Philippines. As it turned out, these assets were completely insufficient in the ensuing Battle of Leyte Gulf on October 23–26, 1943.

Short, Walter Campbell (1880–1949)

U.S. Army lieutenant general. Born in Fillmore, Illinois, on March 30, 1880, Walter Campbell Short graduated from the University of Illinois in 1901 and was commissioned a second lieutenant in the U.S. Army in 1902. He served in the Philippines and participated in the 1916–1917 Punitive Expedition into Mexico. He fought in France during World War I and held staff positions, rising to the rank of temporary colonel.

After the war, Short reverted to his permanent rank of captain. He then served with the Far Eastern Section of the Military Intelligence Division. Short was an instructor at the Command and General Staff College (1919–1922 and 1929–1930) and graduated from the Army War College in 1925. He was promoted to colonel in 1934 and commanded the 6th Infantry Regiment. In 1936, he became the assistant commandant of the Infantry School at Fort Benning, Georgia. Promoted to brigadier general in 1937, he commanded a brigade of the 1st Infantry Division and then commanded that division (1938–1940). Promoted to major general in 1940, he commanded I Corps.

Lieutenant General Walter C. Short, military governor of Hawaii, January 5, 1941. As with his naval counterpart, Short was removed from his command following the Japanese attack of December 7. (Bettmann/Corbis)

Widely respected in the army as an expert trainer, in January 1941 Short was appointed commander of the Hawaiian Department, and the next month he was promoted to temporary lieutenant general. As relations between the United States and Japan deteriorated in 1941, Short worked feverishly to strengthen Hawaii's defenses, focusing on accelerated training of his units and antisabotage measures. Despite warnings from Washington of possible war with Japan, he was caught off guard by the attack against Pearl Harbor on December 7, 1941, apparently because he believed that if war came it would begin in Southeast Asia.

Both Short and Admiral Husband E. Kimmel, commander of the U.S. Pacific Fleet, were blamed for the poor state of U.S. preparedness to meet the Japanese attack, and both men were relieved of their commands shortly

afterward. Short was reduced to major general, and in February 1942, under pressure, he retired from the army. A special investigating committee that year blamed both Short and Kimmel for failing to adequately defend the Hawaiian Islands from attack despite repeated warnings from the War and Navy Departments. Although there were some calls for courts-martial, the secretaries of war and the navy both decided that there was no evidence to justify these.

Congressional hearings into the Pearl Harbor attack continued after the war. In 1947, Short accused the War Department of scapegoating him. He admitted to underestimating the possibility of a Japanese strike, but he blamed officials in Washington for withholding critical intelligence about Japanese intentions.

Following his retirement, Short worked for Ford Motor Company. He died in Dallas, Texas, on September 3, 1949. In 1999, the U.S. Senate passed a resolution exonerating both Short and Kimmel for the Pearl Harbor fiasco.

Shtemenko, Sergei Matveevich (1907–1976)

Soviet Army general. Born into a peasant family in Volgograd Oblast on February 20, 1907, Sergei Matveevich Shtemenko joined the Red Army in 1926 and the Communist Party in 1930. Graduating from the Academy of Motorization and Mechanization, he commanded an independent heavy-tank training battalion near Zhitomir. He went to the General Staff Academy in September 1938. Before graduation in 1940, Shtemenko's class was assigned

in August 1939 to the Operations Department of the General Staff to prepare for the Soviet occupation of eastern Poland and, later, to work on preparations for the Soviet invasion of Finland.

On graduation, Shtemenko was reassigned to the General Staff, despite his request to command a mechanized unit. Shtemenko then worked in the Office of Operations as a senior assistant to the section chief in 1940, moving up to deputy chief by August 1941. When the Germans invaded the Soviet Union on June 22, 1941, he was appointed a section chief. General Alexi Antonov made Shtemenko his deputy in April 1941, and he succeeded Antonov as chief of the Operations Directorate in May 1943, a post he held until April 1946.

Shtemenko successfully organized the operations of the Transcaucasus Front (army group) in 1942 and subsequently for the Black Sea and Northern Fronts. He was involved in planning for all fronts, and he played a key role in the planning for Operation BAGRATION against German Army Group Center and in the campaign against Berlin (March 31–May 2, 1945). By war's end, he was a colonel general.

In his subsequent two-volume work *The Soviet General Staff at War*, Shtemenko stressed the need for creativity in the direction of war and frequently praised Joseph Stalin's role in the war. In November 1948, Shtemenko was promoted to army general. He then served as Soviet deputy prime minister, and in September 1952, he became a candidate member of the Central Committee. Two months later, however, he was assigned to Germany as chief of staff of the occupation forces. Shtemenko was demoted in 1953 after Stalin's death but promoted again in 1956 after three years of obscurity. Shtemenko was demoted again in 1957 and then was again promoted to army general in February 1968. Within six months of that promotion, he was appointed chief of staff of Warsaw Pact forces. Shtemenko retired in 1975 and died in Moscow on April 23, 1976.

Shumilov, Mikhail Stepanovich (1895–1975)

Soviet Army general. Born in Verkhtechenskoye on November 17, 1895, Mikhail Stepanovich Shumilov attended military school and was an ensign during World War I. He joined the Red Army in 1918, and during the Russian Civil War he commanded a rifle regiment. Shumilov attended the Higher Infantry School in 1929 and commanded a rifle corps in the 1939–1940 First Finnish-Soviet War.

At the start of World War II, Shumilov commanded another rifle corps but was soon promoted to deputy commander of the Fifty-Fifth Army on the Leningrad Front. In 1942, he commanded the Sixty-Fourth Army (later the Seventh Guards Army) in the Battle of Stalingrad (August 23, 1942–February 2, 1943). Shumilov also fought in the Battle of Kursk during July 5–13, 1943. He participated in the Soviet invasions of Czechoslovakia, Hungary, and Romania, attaining the rank of colonel general.

After the war, Shumilov commanded the White Sea (1948–1949) and Voronezh (1949–1955) military districts, and in 1958 he became consultant to the group of inspectors general of the Ministry of Defense. Shumilov died in Moscow on June 28, 1975.

Shuttle Bombing, Soviet Union (June–August 1944)

U.S.-Soviet collaboration designed to allow American bombers to hit German targets too deep to be attacked from normal operating bases. The concept of shuttle bombing was tested in 1943 in flights between bases in Britain and North Africa, including the Schweinfurt-Regensburg mission on August 17, 1943. Code-named Operation FRANTIC, the shuttle-bombing operation allowed U.S. bombers to fly missions from bases in Britain and Italy and land at bases in the Soviet Union. The planes could then fly missions from Soviet bases and also carry out missions during their return flights to U.S. air bases in Britain and Italy.

Senior U.S. commanders hoped that these missions would force the Germans to disperse their air defense forces, lead to a better Soviet understanding of the value of strategic bombing, and establish a more collaborative relationship between the U.S. and Soviet militaries. The U.S. Army Air Forces (USAAF) also hoped that an improved relationship with the Soviets might lead to U.S. use of airfields in the Soviet Far East for shuttle attacks against Japan.

Following extended negotiations, including approval from Soviet leader Joseph Stalin at the Tehran Conference in December 1943, the Soviets committed themselves to support the plan by making available airfields at Poltava, Mirgorod, and Piryatin. USAAF personnel worked hard to make the concept of shuttle operations succeed despite considerable restrictions placed by Soviet authorities on support personnel, logistical operations, and communications support.

On June 2, 1944, the Fifteenth Air Force in Italy flew Operation FRANTIC's first mission. It involved 130 Boeing B-17 Flying Fortress bombers and 70 North American P-51 Mustang escort fighters, with a successful strike on rail yards at Debrecen, Hungary, en route to the Soviet bases. A strike from these bases inflicted damage on an airfield at Galatz, Romania, on June 6. During the return flight to Italy on June 11, the bombers successfully attacked an airfield at Focşani, Romania.

The first Eighth Air Force mission from Britain occurred on June 21, 1944. It hit its designated target, a synthetic oil plant near Berlin, but German aircraft shadowed the bombers to Poltava and conducted an air raid on the

base that night, destroying 43 B-17s and damaging another 26. The surviving and repaired bombers attacked a synthetic oil plant near Drohobycz, Poland, on their flight to Fifteenth Air Force bases in Italy on June 26. These aircraft flew a combined mission with Fifteenth Air Force units and then returned to their bases in Britain.

The Eighth Air Force performed shuttle-bombing missions on August 6–8 and September 11–13. The August mission attacked an aircraft plant at Gdynia, Poland, en route to the Soviet bases; successfully hit oil refineries at Trzebinia, Poland, the following day; and then bombed airfields in Romania en route to bases in Italy, followed by return flights to Britain. The September mission involved an attack on an armaments factory at Chemnitz during the flight to Russia and a strike on steel works at Diósgyőr, Hungary, on the leg out to Italy.

The only other Fifteenth Air Force shuttle operations were fighter-bomber sweeps in late July (Lockheed P-38 Lightning and P-51 raids on Romanian airfields) and early August (P-38 raids on Romanian airfields and railroads in support of Soviet operations). Also, 117 F-5 (camera-equipped P-38) photoreconnaissance missions were flown to or from Soviet bases between June 2 and September 19, 1944. The last shuttle operation of FRANTIC was a resupply effort on September 18 to support the Polish Home Army uprising in Warsaw by 107 B-17s with P-51 fighter escorts.

Because of Soviet resistance to continuing the shuttle missions, by late October 1944 U.S. personnel supporting FRANTIC in the Soviet Union were reduced to a small caretaker contingent. Overall, the shuttle operations had little operational effect, and the targets that were struck could have been hit from the home bases in Britain and Italy. Operation FRANTIC did generate increased contacts between the U.S. and Soviet militaries, but it had limited substantive effect on relations between the two states. The operation did not lead to any significant collaboration in the Far East.

Sian Incident

See Xi'an Incident

Siberian Internment of Japanese

Following the Soviet-Japanese conflict during the final stages of World War II, the Soviets interned large numbers of Japanese in Siberian gulags. On August 9, 1945, in a breach of the Soviet-Japanese Neutrality Pact (which was supposed to be valid until 1946), overwhelmingly superior Soviet forces had invaded Manchuria, southern Sakhalin Island, and the Kurile Islands. By the time of the Japanese surrender on August 15, more than 2.7 million Japanese soldiers and civilians were trapped in the Soviet-occupied territories.

Among the captured Japanese, approximately 700,000 prisoners of war (POWs) and civilians were deported to Soviet gulags, most of them in Siberia and some as far as European Russia. Following formal protests from other Allied nations and the Japanese government, some 280,000 POWs were repatriated in 1948. An additional 95,000 were returned by the end of 1949. Some POWs, including General Yamada Otozō and Major Sejima Ryūzō, were detained as late as 1956. Throughout this period, more than 60,000 Japanese internees perished in the harsh conditions of the Siberian gulags.

The Soviet action was motivated by a grave shortage of manpower in the Soviet Union and a quest to secure bargaining chips with the Japanese and Allied nations. It was also rumored that at the time of the capitulation, Guandong (Kwantung) Army headquarters in Manchuria secretly agreed to

hand over Japanese POWs as part of war reparations. Together with the continuing occupation by Russia of the Japanese Northern Territories, resentment over the Siberian internment remains an obstacle to improving diplomatic relations between Russia and Japan.

SICHELSCHNITT, Operation (1940)

German military plan for the invasion of Western Europe in 1940. Following the German invasions of Denmark and Norway, Adolf Hitler's next strike was against France and the Low Countries (the Netherlands, Belgium, and Luxembourg). Hitler believed that defeating France offered the best chance of forcing Britain to the peace table. The balance of forces appeared to be somewhat equal. By the time of the invasion on May 10, 1940, Germany had assembled in the west 2.5 million men in 136 divisions. The Germans were matched on the ground by a combined Allied force of more than 2 million men in three army groups of 138 divisions. The Allies actually outnumbered the Germans in tanks, and the French tanks were generally heavier and better armed than those of the Germans. The most glaring Allied weaknesses were in aircraft and antiaircraft artillery.

The German invasion, originally set for November 12, 1939, was repeatedly postponed because of bitterly cold weather and pleas from Hitler's generals for additional time to prepare. Then on January 10, 1940, an event occurred that may have changed history; the pilot of a German military aircraft flying from Münster to Köln became lost in dense fog and was forced to land near Mechelen-sur-Meuse, Belgium. The passenger, Major Helmuth Reinberger, was a staff officer of the 7th Parachute Division and was carrying

top-secret operational plans for the German attack in the west. Reinberger was to have traveled by train, but delays led him to fly. Although the two Germans tried to burn the papers, the Belgian police secured the bulk of them. That discovery was only one of several indications of a German plan to strike west that caused neutral Belgium to open military talks with France and Britain. When Hitler learned that the invasion plan had been compromised, though, he abandoned it.

The need to recast the plan delayed the German invasion until May. Lieutenant General Erich von Manstein, assisted by General of Panzer Troops Heinz Guderian and Major General Walther Model, drew up the new plan. Known as SICHELSCHNITT (SICKLE CUT), the plan was agreed on in a meeting between Hitler and Manstein on February 17, 1940, and became the basis for German planning of the assault in the west, FALL GELB (CASE YELLOW).

The plan shifted the major effort from central Belgium to just north of the French defensive system known as the Maginot Line. The northern effort would occur first, drawing the Allies into Belgium. Then the major blow would fall to the south, in the hilly and wooded Ardennes—country reputedly impassable for tanks. The plan called for the invading Germans to cross the Meuse River and crack the French lines at Sedan, then swing northwest to the English Channel, cutting off the best British and French divisions, which would in the meantime have moved into Belgium.

German field marshal Erich von Manstein, the key figure in drawing up plans for Operation SICHELSCHNITT. (Hulton Archive/Getty Images)

Colonel General Fedor von Bock's Army Group B, charged with invading Belgium and Holland, was downgraded from 37 divisions in the original plan to only 28 in the Manstein plan, with three rather than eight panzer divisions. Colonel General Gerd von Rundstedt's Army Group A, which was to move through the Ardennes, was upgraded from 17 to 44 divisions, including 7 armor divisions rather than 1. At the point of the breakthrough, the Germans thus would outnumber the defending French 44 divisions to 9.

The original German plan was similar to the Schlieffen Plan of 1914 and would have followed Allied staff predictions. Its axis of advance would have encountered the best Franco-British forces and might thus have ended in failure. Manstein's plan appeared risky, and although he had Hitler's firm backing, many senior military leaders opposed the plan. Apart from the plan,

factors working in Germany's favor were the experiences it had gained in Poland regarding the movement of massed armor and supply columns, clear German superiority in numbers of combat aircraft and antiaircraft guns, and the fact that a single national command system faced four disparate national armies.

Sicilian Channel

See Sicily, Strait of

Sicily, Invasion of (July 9–August 22, 1943)

Allied invasion of Sicily also known as Operation HUSKY, to that point the largest amphibious landing in history. At the January 1943 Casablanca Conference, U.S. president Franklin D. Roosevelt and British prime minister Winston L. S. Churchill and their staffs discussed the next military objective to follow the final defeat of Axis forces in North Africa. The British favored a strike against the Axis southern flank that would avoid the strong German defenses in northern France, whereas U.S. Army chief of staff General

George C. Marshall and the Americans advocated a cross-Channel invasion of France as the shorter road to victory. Ultimately, Roosevelt agreed with the British view that a southern advance would secure Allied Mediterranean shipping lanes, provide bombers with bases from which to strike the Axis in Southern Europe, and perhaps drive Italy from the war. The next big offensive of the Western Allies was therefore the invasion of Sicily, code-named HUSKY.

U.S. general Dwight D. Eisenhower had overall command of Allied forces in the Mediterranean. The ground commander for HUSKY was British general Sir Harold Alexander, commander of the Fifteenth Army Group. British admiral Andrew B. Cunningham commanded the naval forces, and Air Chief Marshal Sir Arthur Tedder commanded the supporting Allied air forces. British and American forces would participate in HUSKY in almost equal numbers.

The Eastern Task Force would put ashore General Bernard Montgomery's British Eighth Army in southeastern Sicily from just south of Syracuse to the end of the southeastern peninsula. The Eighth Army was then to advance along the coast, its final objective being the port of Messina on the northeastern tip of the island. The Western Task Force would land Lieutenant General George S. Patton's U.S. Seventh Army in southwestern Sicily between Licata and Scoglitti. On securing the beachhead, Patton was to move inland to conduct supporting attacks and protect Montgomery's left flank. The newly formed Seventh Army had the supporting role, because Alexander believed that Montgomery's veteran troops were better suited for the chief offensive role. The Allies enjoyed clear air superiority; they had some 3,700 aircraft as opposed to 1,600 for the Axis forces.

A U.S. munitions ship blows up after being hit by a German bomb off Gela on July 11, 1943, during the Allied invasion of Sicily. (Universal History Archive/UIG via Getty images)

Sicily was defended by Italian general Alfredo Guzzoni's Sixth Army (consisting of seven static coastal divisions and four maneuver divisions) and German lieutenant general Hans-Valentin Hube's XIV Panzer Corps, consisting of the 15th Panzergrenadier Division and the Hermann Göring Panzer Division. On July 10, the Germans reinforced with the 1st Parachute Division and the 29th Panzergrenadier Division. Axis strength totaled between 300,000 and 365,000 men.

The Allied invasion was preceded by an elaborate British deception, Operation MINCEMEAT. This was designed to convince the Germans that the Allies planned to invade Sardinia and islands in the eastern Mediterranean. The deception worked, causing Adolf Hitler to shift some resources to those locations.

The invasion of Sicily, preceded by naval and air bombardment, began with airborne landings on July 9, 1943, the first large use by the Allies of such troops in the war. Few of the 144 gliders landed on their objectives, and many crashed into the sea. The paratroopers were also widely dispersed.

Worse, the invasion fleet fired on the second wave of transport aircraft in the mistaken belief that they were German aircraft and shot down 23 C-47s.

Nonetheless, the widely dispersed airborne soldiers created confusion among the Axis defenders, disrupted communications, and, despite their light weapons, prevented some German armor units from reaching the invasion beaches. The seaborne invasion began early on July 10 in bad weather. The second-largest landing undertaken by the Allies in the European theater after OVERLORD, it involved two large task forces and 2,590 vessels. Operation HUSKY was the first Allied invasion of the war in which specially designed landing craft, including the DUKW truck, were employed.

Resistance from the Italian coastal defenses was weak, and by nightfall the Allies had secured the beachheads. At Gela, the Hermann Göring Division attacked the U.S. 1st Infantry Division but was driven off by naval gunfire. Inland, the rugged terrain and Axis resistance slowed the Allied advance, although Patton's forces reached the capital of Palermo on July 22 and, several days later, cut the island in two. The British occupied Syracuse with little resistance.

British and American forces were soon in competition to be first to Messina, and a major controversy erupted when Montgomery expropriated an inland road that had been assigned to the Americans. This shift delayed the advance for two days and prolonged the campaign. Meanwhile, on July 25, Benito Mussolini fell from power in Italy as that government moved toward leaving the war. In Sicily, Axis forces continued a tenacious defense. Allied forces pressed forward, with the Americans aided by a series of small skillfully executed amphibious operations on the north coast east of San Stefano.

On August 11, German field marshal Albert Kesselring ordered the evacuation of Axis forces, the Italians having already begun their exodus across the narrow Straits of Messina to Italy. The Italians brought out 62,000 personnel and 227 vehicles; the Germans evacuated 39,569 troops and 9,605 vehicles. It was thus something of a hollow victory when, on August 17, Patton's forces reached Messina hours after the last Germans had evacuated. Later that day, elements of the British Eighth Army also entered the city.

The conquest of Sicily claimed 11,843 British and 8,781 Americans killed, wounded, missing, or captured. The Germans suffered some 29,000 casualties, including 4,325 killed, 6,663 captured, and an estimated 18,000

wounded. Some 2,000 Italians were killed and 137,000 were captured, most of the latter taken by the Seventh Army. The Axis side also lost up to 1,850 aircraft against only 375 for the Allies.

The invasion of Sicily was one of the most important Anglo-American campaigns of the war. It was the first assault by the Western Allies on Fortress Europe and another important experience in coalition planning. The invasion set important precedents and achieved its goal of driving Italy from the war. On September 3, a new Italian government signed a secret armistice with the Allied powers.

Sicily, Strait of

A relatively narrow channel of water that separates the western Mediterranean Sea and the Tyrrhenian Sea from the eastern Mediterranean Sea. The Strait of Sicily, also known as the Sicilian Channel and the Sicilian Strait, lies between the Italian-controlled island of Sicily to the north and east

and Tunis (North Africa) to the south and west. Italians refer to the strait as the Canale di Sicilia and the Stretto di Sicilia.

The Strait of Sicily is approximately 100 miles across at its widest point and has a maximum depth of some 1,037 feet. The strait is known for its powerful and sometime erratic currents, which make navigating it by ship a challenging task. Oceanographers have discovered that its deeper currents run generally east to west, while shallow and surface currents travel in the opposite direction. There are several islands within the Strait of Sicily, the largest of which by far is Pantelleria, situated about 60 miles southwest of Sicily and 40 miles northeast of Tunis. The Strait has significant geographic and strategic value because it controls the only direct sea access route from Western Europe to North Africa and the Middle East. The island of Malta, another strategically significant landmark, lies just to the east of the strait.

The Sicilian Strait was the locale of numerous naval encounters between Italian vessels and British and U.S. ships during the prelude to the invasion of Sicily (July 9–August 22, 1943). The Italians also mined parts of the waterway to stymie Allied shipping. In May 1943, the Allies used the strait during Operation RETRIBUTION, a naval effort to block an Axis withdrawal from North Africa. The Allies occupied Pantelleria on June 11 as a prelude to their invasion of Sicily.

SICKEL CUT, Operation

See SICHELSCHNITT, Operation

Sidon, Engagement off (June 9, 1941)

Naval engagement between Vichy French and Allied ships off Syria. Concerned that German aircraft had staged through the French mandate of Syria en route to assist an anti-British coup in Iraq and fearing a sudden German strike against the territory with the speed and power of Berlin's attack on Crete, Great Britain, British Empire, and Free French units invaded Syria on June 8, 1941.

Vichy French naval assets in the area consisted of the large destroyers *Guépard* and *Valmy* of the 3rd Scout Division commanded by Captain Raymond Gervais de Lafond, the sloop *Élan*, and three submarines. The British Mediterranean Fleet, gravely weakened by the losses suffered off Crete, initially committed a squadron commanded by Vice Admiral E. L. S. King, consisting of three light cruisers and eight destroyers.

Learning that British forces were off southern Lebanon, the *Guépard* and *Valmy* sortied from Beirut at 7:00 a.m. on June 8 to investigate. They shelled an Australian column on the coast road and then returned north. When King learned that warships had fired on the Australians, he returned to find the French gone. King dispatched the destroyers *Janus*, *Jackal*, *Isis*, and *Hotspur*, under Commander John Anthony William Tothill, to sweep north along the coast while he returned to Haifa.

The Vichy French naval command in Beirut meanwhile ordered Gervais de Lafond's division to return south. It had reached Sidon when, at 3:25 p.m., it sighted destroyer masts to the southwest. The British ships were strung out, with the *Janus* leading the *Jackal* by a mile, the *Hotspur* a mile behind the *Jackal*, and the *Isis* inshore, two miles south of the *Hotspur*. When Tothill sighted the large French destroyers, he rang up full speed without waiting to concentrate. Gervais de Lafond surprised the British commander, however, when his ships loosed their first salvo from 16,000 yards. Although the second broadsides straddled, the *Janus* continued to close range as the *Jackal* steamed hard to catch up.

The French turned west while the straggling British line assumed a parallel heading. At 3:43 p.m. at a range at 10,000 yards, the *Guépard* struck the *Janus* hard with three shells. With steam escaping and a boiler out of

action, the *Janus* drifted to a stop and was hit two more times. At this juncture, the *Jackal* overhauled the *Janus* and wrapped smoke around the stricken ship. At 3:54 p.m., the French ships ceased fire and turned east. A few minutes later, Gervais de Lafond sighted the *Isis* speeding north to join the fight. With half his ammunition already expended, the French captain turned north as the rest of the British flotilla gave chase.

As they steamed up the Lebanese coast, the French hit *Jackal,* igniting a small fire, while a British shell lightly damaged the *Guépard* at 4:21 p.m. The British finally broke off the chase at 4:46 p.m.

The *Janus* was towed to Haifa, where it burned out of control until 5:00 a.m. the next day. The British Admiralty concluded that Tothill should have concentrated and expressed surprise at the accuracy of French gunnery. The French squadron fought minor engagements against Allied warships on June 16 and June 22 before withdrawing to France on July 9, five days before an armistice ended the fighting in Syria.

Siegfried Line, Breaking the (October–December 1944)

Allied penetration of the western defenses of Germany. The Siegfried Line—an Allied label based on German World War I defenses and known to the Germans as the West Wall—was a system of defensive positions in western Germany. The Siegfried Line ran south to north from the Swiss border along the Rhine River to the area of Karlsruhe and then northwest to Saarbrucken;

it followed the Saar River to Trier and then paralleled the German border with Luxembourg, Belgium, and the Netherlands.

The West Wall did not rely on large fortifications but used terrain features and several belts of mutually supporting bunkers, pillboxes, and firing positions. These defenses, combined with minefields and antitank barriers such as “dragons’ teeth” and deep ditches, protected the German border region. The forward defenses were backed by hardened bunkers for troops, supplies, and command-and-control facilities. The operational concept was to slow attacking forces and create opportunities for counterattacks by mobile reserve forces.

The defensive system was initially developed following the German remilitarization of the Rhineland in 1936, and extensive work on it was carried out in 1938 under the direction of Fritz Todt. All construction work stopped in June 1940 after the conquest of France, and the line was stripped of its armaments. Many guns were shifted to the new defenses on the French coast. In August 1944, German leader Adolf Hitler directed that an accelerated program begin to strengthen the West Wall in response to Allied advances in France, but the defenses were limited by shortages of troops, artillery, and ammunition. Nonetheless, the West Wall provided an important shield for reconstituting forces that had retreated from France, and it became the focal point for the defense of the German homeland in the west under Field Marshal Gerd von Rundstedt.

The Siegfried Line was a major concern of Allied planning and operations after the breakout from Normandy (June 6, 1944). German defenses and Allied logistical constraints were the chief considerations in the debate within the senior Allied leadership over a broad-front or narrow-front strategy. By September 11, 1944, the Allied forces were advancing on the German frontier in a relatively continuous front from Switzerland to Antwerp, with Field Marshal Bernard Montgomery’s 21st Army Group in the north, General Omar N. Bradley’s 12th Army Group in the center, and Lieutenant General Jacob L. Devers’s 6th Army Group in the south.

After extensive high-level debate, Allied theater commander General Dwight D. Eisenhower shifted logistical priority to the 21st Army Group and authorized Montgomery to conduct Operation MARKET-GARDEN, an effort during September 17–26, 1944, to flank the German northern defenses, cross the Rhine River at Arnhem, and rapidly penetrate and capture the industrial

heart of Germany. When the MARKET-GARDEN operation failed to cross the Rhine, though, Eisenhower returned to the broad-advance concept to maintain pressure on the German forces and penetrate the Siegfried Line.

British field marshals Bernard L. Montgomery and Alan Brooke (second from left) accompany Prime Minister Winston Churchill (second from right), and U.S. general William H. Simpson (right) inspecting German field fortifications of the Westwall, called by the Allies the Siegfried Line, in March 1945. These obstacles were called “dragons’ teeth” and were intended to halt tanks. (Library of Congress)

Initial contact with the West Wall was made by elements of Lieutenant General Courtney H. Hodges’s U.S. First Army as it advanced to the German frontier in early September in the area north of Luxembourg. Hodges began a reconnaissance in force into the Eifel region of Germany on September 14 in an effort to sustain momentum and rapidly breach the fixed defenses. Although the defensive positions were not fully manned, initial U.S. penetrations of the Siegfried Line were blunted by German counterattacks, and the American forces paused to replenish logistical stocks. On September 29, the First Army began a major offensive against West Wall positions around Aachen, a key defensive stronghold in the Siegfried Line, with the objective of opening a route to the Rhine River. After a vicious urban battle, the Aachen garrison surrendered on October 21.

In October and again in early November, the First Army also attempted to clear the Hürtgen Forest in an effort to open a route to the Rhine and secure the Roer River dams, which potentially allowed the German military to flood crossing areas downstream in the Roer River Valley. After initial successes, aggressive German counterattacks pushed back the attackers, and the Hürtgen Forest Campaign (September 12–December 16) became a bloody contest that held up the First Army. At the same time, the Ninth Army cleared the German defenses to the north and secured the west bank of the Roer River by December 9, but it did not attempt to cross due to the flooding threat posed by the dams.

During September, Lieutenant General George S. Patton's U.S. Third Army fought through the Lorraine border region south of Luxembourg toward the West Wall, battling German forces that used old French defensive positions of the Maginot Line and pre–World War I fortifications (especially those around Metz) to strengthen resistance to the American advance. Patton's offensive then bogged down from a combination of the German defensive effort and logistical shortages.

After resupplying and refitting in late October, the Third Army reinitiated the assault on Metz on November 8, and the city's garrison finally surrendered on November 22. After cleaning out the remaining German positions in Lorraine, the Third Army reached the Siegfried Line on December 15 and quickly seized several river crossings. Patton then paused the advance to resupply his forces before pushing through the West Wall and breaking out toward the Rhine in an attack planned for December 19.

In the south, Devers's 6th Army Group fought to the upper Rhine, capturing Strasbourg on November 23. However, the Germans continued to hold the West Wall defenses and a pocket in rough terrain around the city of Colmar. Although Devers was prepared to force the Rhine, Eisenhower ordered him to consolidate along that river and reduce the Colmar pocket.

The multiple Allied advances on the West Wall were halted on December 16 when the Germans launched an offensive in the Ardennes that became known as the Battle of the Bulge (December 16, 1944–January 25, 1945). As the Allies responded to the German drive in the Ardennes, the Germans launched a second attack out of the Colmar pocket, threatening to retake Strasbourg. Both offensives fit into the operational concept for the West Wall and provided strength for defensive operations and a base for

counteroffensives against the attacking force. Although surprised, the Allies were able to counter the German attacks, and the planned Allied assaults on the Siegfried Line were only delayed.

The final series of advances through the Siegfried Line and into Germany began on February 8, 1945, with an attack from the northern flank of Montgomery's 21st Army Group by the Canadian First Army, with the mission of clearing the west bank of the lower Rhine. This attack was complemented by U.S. attacks into the Roer River Valley and the Hürtgen Forest. The Roer River dams were seized on February 10, and the west bank of the lower Rhine was cleared by March 5. In February after repositioning following its counterattack in the Battle of the Bulge, the Third Army began a series of attacks that penetrated the Siegfried Line and allowed an advance toward the Rhine through the Eifel region. In the 6th Army Group area, the Colmar pocket was eliminated by February 9, and the U.S. Seventh Army captured Saarbrüken on March 19 and broke through the final West Wall defenses on March 20.

The Siegfried Line held up the Allied offensive and allowed the German army to attempt counterattacks, but once the Allied logistical system provided adequate support to the combat forces, the strength of the Allies overwhelmed the German defensive structure.

Signals Intelligence

The collection and analysis of electromagnetic emissions that provide insight into an enemy's technological capabilities. The broader category of signals intelligence (known today as SIGINT) includes both communications intelligence (COMINT) and electronic intelligence (ELINT). COMINT includes the monitoring of radio and telephone traffic, the decryption of coded messages, and analysis of message content. ELINT is the collection and analysis of electromagnetic emissions such as telemetry and radar signals. This entry deals with COMINT.

SIGINT played a key role in World War II. In the 1920s, the knowledge that cryptanalysis had achieved important results in several countries during World War I led to the development of new and improved cipher methods and especially new cipher machines. These were produced not only for diplomatic and military communications but also for use in business. The American Edward Hugh Hebern had been working since 1917 to develop a rotor-driven machine, but he secured a U.S. patent only in 1924.

Also in 1917, the German Arthur Scherbius experimented with a similar machine; he secured a German patent on February 23, 1918. He was followed in October 1919 by Dutch inventor Hugo Alexander Koch and the Swede Arvid Gerhard Damm. In 1923, Scherbius purchased the Koch patents and produced a new rotor-driven cipher machine known as Enigma. Scherbius demonstrated the Enigma machine in 1923 at Bern and in 1924 at the World Postal Congress at Stockholm. He developed several versions of the Enigma; the commercial version, Enigma-D, was purchased by several countries, including the Netherlands, Sweden, Switzerland, Czechoslovakia, the United States, Great Britain, and Japan.

The Enigma influenced production of cipher machines in other countries for military uses. In Sweden, engineer Boris Hagelin began his improved

machine series; in Great Britain, Type X was an improved Enigma. The Japanese constructed a special version, and experiments led to the 97-shiki-O-bun In-ji-ki for high-level diplomatic communications (later identified by the Americans with the code name “Purple”). During the 1936–1939 Spanish Civil War, the nationalist side and their Italian allies employed Enigma-D machines, and the Italians also used their Enigma version known as Alfa. The Poles developed their own cipher machine, Lacida, and the Czechs experimented with a version driven by compressed air rather than electricity. Boris Hagelin successfully marketed his machines in Sweden and France, later to the Italian Navy, and finally in the United States, where 140,000 copies of his M-209 machine were built.

The Germans relied heavily on the Enigma machine for military communications during the war. Only in 1975, with the publication of Frederick Winterbotham’s book *The Ultra Secret*, did it become generally known that Allied cryptanalysts had unlocked the secrets of the Enigma machine and that Allied intelligence had been able to read the most secret German military and diplomatic communications, although not in real time. Winterbotham’s book was only the first in a flood of publications about Allied code breaking. These included work published by the Poles, who in 1932 and 1933 had been the first to crack the secrets of the Enigma; the French, who had delivered to the Poles cipher materials secured from a German agent; the British, who established at Bletchley Park a decryption center; and the Americans, who also came into this operation and worked to break the Japanese codes.

The concentration on Enigma obscured the fact that there was not one Enigma machine but rather several versions. Moreover, Bletchley Park could break only some of the cipher key nets of Enigma, depending on the number of signals sent in the daily settings of the various key nets. Concentration on Enigma also led to neglect of the many other machine- or hand-cipher systems of other nations, which were tackled by the cryptanalysts of many countries with mixed success.

The German defeat of Poland in September 1939 came so rapidly that Polish cryptanalysts had virtually no impact on that campaign. Evacuated by way of Romania to France, however, they joined French intelligence, which was operating in close conjunction with the British. But Allied efforts against the German Enigma key nets only had limited success at first and did not

greatly influence Allied operations until mid-1940. With the defeat of France in June 1940, that nation's cryptanalysts went to the unoccupied southern zone. From there, some Poles were able to join the British at Bletchley Park.

On the Axis side, the German naval decryption service, xB-Dienst, enjoyed considerable success in breaking the hand-cipher systems of the Royal Navy, which at this time did not use machines but rather superenciphered codebooks. This enabled German warships, in most cases, to evade superior British forces. It also provided the Germans with Allied convoy information.

In May 1940 Bletchley Park at last was able, with only short delays, to decrypt the main operational Enigma key net of the German Luftwaffe. This was aided by the introduction of the first "bombes"—devices developed by mathematicians Alan Turing and Gordon Welchman to determine the daily settings of the German machines. These intercepts, now known by the intelligence code name of Ultra, influenced the Battle of Britain (July 10–September 30, 1940), as daily reports by the German air groups revealed their strengths and intended operations. Using this information, Britain's home chain radar, and a system of coast watchers, the British could use fewer fighter aircraft with maximum efficiency, sending fighters aloft at the right time to intercept incoming German bombers.

But Bletchley Park could not then break the Enigma key nets of the German Army. Of special importance at the time was breaking the German Navy key nets, especially those used by the U-boats. The German Enigma machine was known to the British from a replica the Poles had constructed and delivered to France and Britain in August 1939, but the problem was the wiring of the cipher rotors. Only five of these were known, but the German Navy used eight, and these had to be identified together with information about the cipher settings, which changed daily. This was only accomplished in May and June 1941.

Despite decoding delays, the Allies were able to read German radio signals and thus had the means to destroy their surface supply organization in the Atlantic. This in turn forced the Germans to cancel commerce raiding operations by their large surface combatants. Also, from early August 1941, it became possible to decrypt U-boat radio traffic, which made it possible for the Allies to reroute their Atlantic convoys around the German U-boat

dispositions. This prevented the sinking of perhaps 300 merchant ships in the second half of 1941.

Not all German officials had confidence in the security of the ciphers. Commander of submarines Rear Admiral Karl Dönitz tried several times after mid-1941 to improve the system. He introduced a code for the grid map positions and a separate cipher key net for the Atlantic U-boats. Then on February 1, 1942, he ordered the introduction of an improved cipher machine known as M-4 that had a divided Umkehrwalze B (reverse rotation) reflective rotor and an additional fourth, rotor, the so-called Greek Beta. This change produced an 11-month blackout at Bletchley Park in reading German U-boat traffic.

At the same time, xB-Dienst was able—partially in 1942 and more so in 1943—to decrypt the Anglo-American superenciphered codebook Naval Cipher No. 3 used for communication with the convoys. Although there were decoding delays, the decryption led to excellent results for the U-boats in the North Atlantic until the early spring of 1943.

On October 30, 1942, in the Mediterranean, a German U-boat was forced to surface, and a specially trained British boarding party was able to salvage important cipher materials, especially the weather short-signal book. This was used to find "cribs," the cipher/clear text compromises that aided in determining daily settings of the M-4 machine. Thus, from mid-December 1942, Bletchley Park could once again send to the submarine tracking room of the Admiralty the dispositions of the German U-boat wolf packs in order to reroute convoys.

But there were now so many wolf packs that new tactics had to be found to avoid repetition of the heavy losses incurred in mid-March, when the Germans introduced a new weather short-signal book, producing a new blackout. By concentrating the available bombes on U-boat traffic, Bletchley Park was again able after only 10 days to break the U-boat cipher.

Coupled with this, the Allies committed additional anti-submarine forces, very long-range aircraft, hunter-killer groups of destroyers and the first escort carriers, radar in escort ships and lightweight radar in aircraft, high-frequency direction finders, and Leigh lights. The turning point came in late May 1943, when Dönitz redeployed his submarines from the North Atlantic convoy routes to the Central Atlantic and to distant operational areas. At the same time, Bletchley Park decrypted the orders, enabling the British to relocate

their air groups from the convoy routes to Britain over to a strong offensive against U-boat routes in and out of the Bay of Biscay.

In June 1943, the British realized that the Germans had decrypted their signals, and the Admiralty changed to a new superenciphered code, Naval Cipher No. 5, which led to a blackout for xB-Dienst. On July 1, the Germans introduced a new Greek rotor C/Gamma, but this produced only a short interruption in decryption at Bletchley Park because of the introduction of a new high-speed bombe. Development in the United States of high-speed bombes led to the transfer in November 1943 of decryption work on the U-boat cipher to the U.S. decryption organization Op-20G, while Bletchley Park concentrated on the German Enigma ciphers of Germany's air force and army, both of which had substantially increased the number of their key nets.

Bletchley Park's first break into the German Army ciphers had come as the Germans prepared to invade the Soviet Union in June 1941. This provided information about German deployment of forces to Poland and preparation of trains specifically to transport prisoners of war, clear proof that the deployments were not simply an effort to blackmail the Soviet Union.

During the invasion, Bletchley Park was able to intercept and read a great many German signals. Because the British did not trust the security of the Soviet code and cipher systems, decryptions from the German forces on the Eastern Front were transmitted to Moscow in a special secure cipher and only under cover stories. It is as yet unknown if the Soviets were aware from their spies in Britain, including Kim Philby and especially John Cairncross at Bletchley Park, of the source of the information and if so whether Soviet leader Joseph Stalin trusted it. Also, while the decryption services of Germany's army, navy, and air force were able to read Soviet codes and some ciphers and use the information thus obtained in operations, it is not known how extensively and when the Soviets could decrypt German signals.

Signals intelligence was of great importance in the Mediterranean theater. When Italy entered the war on June 10, 1940, the Allies could read many of the Italian codes and ciphers. In addition, some ciphers were captured from Italian submarines forced to surface. But the Italians soon changed many of their systems, and decryption fell off sharply as a result. Then in February 1941, Bletchley Park cracked the German Air Force cipher Light Blue and the Italian version of the Enigma known as Alfa, used for radio communication between Rome and the Dodecanese Islands. These successes

had important consequences, most notably in defeating the Italian Navy at the Battle of Cape Matapan on March 28, 1941.

In May 1941, decryption of the German signals provided excellent intelligence concerning German plans to invade Crete, but the British defense of the island failed because the German Air Force controlled the skies and because the intercepts included misleading information about a German seaborne invasion. As it transpired, this was not a significant German effort and led the British to shift defensive assets to the north away from the airfields, where the main German assault occurred. The Battle of Crete revealed both the advantages and disadvantages of SIGINT regarding enemy intentions.

From June 1941, Bletchley Park's decryption of the Italian Hagelin naval cipher machine C-38m used in communications between Supermarina in Rome and Tripoli had important consequences for Axis resupply of forces in the Western Desert. Axis shipping losses increased dramatically in the second half of 1941 and in 1942, when it became possible to vector Allied submarines and surface warship strike groups from Malta to intercept Italian convoys between Sicily and the Tunisian coast and Tripoli. The British always tried first to send reconnaissance aircraft to report the target so that the signals they sent prevented the Italians from recognizing the true source of the information.

Decrypted signals had to be used judiciously. Thus, Afrika Korps commander General Erwin Rommel exaggerated the evils of his supply situation to gain additional support, causing British prime minister Winston L. S. Churchill twice to order his commanders in the field to begin offensives that then failed in Rommel's counterattacks. Rommel also learned much about British force strengths in Egypt because the U.S. military attaché in Cairo used a code broken by the Italians for his reports. Allied commanders also made different use of SIGINT results in operations extending from El Alamein to Tunisia and during the landing operations at Sicily (July 9, 1943), Salerno (September 9), and Anzio (January 22, 1944). Revelations of the Ultra secret in 1975 did force a reconsideration of the military reputations of several Allied commanders, including Field Marshal Bernard Montgomery.

In connection with the preparation of the June 6, 1944, Normandy Invasion, the Allies in Operation FORTITUDE successfully used radio deception to convince the Germans of the presence in southeast England of a U.S.

Army group commanded by Lieutenant General George S. Patton, a force that did not exist. This false information led Adolf Hitler to believe that the Normandy Invasion was a feint and that the Allies planned to make their major cross-Channel attack in the Pas de Calais area. Hitler thus held back his panzer divisions of the Fifteenth Army from Normandy until too late and then sent them piecemeal into action.

The Western Allies also succeeded in the decryption of the German Army teleprinter cipher machine used for communications between the highest levels from the army high command and field armies. This was made possible by development of the first electronic precursor of the later computers, the Colossus machine, which became operational in the spring of 1944. It proved important in halting the German counterattack against the breakthrough at Argentan and led to the encirclement of strong German forces at Falaise (August 1944). But Allied reliance on Ultra intelligence, as the German decryptions were known, meant that the German December 16, 1944–January 25, 1945, Ardennes Offensive (Battle of the Bulge) took the Allies unawares, as the Germans had observed strict radio silence and used only secure landlines for communication.

Other belligerents and also neutral powers employed SIGINT during the war. The Finns cracked many Soviet codes, and the Swedish mathematician Arne Beurling broke into the German naval teleprinter Siemens T-52 cipher machine. German teleprinter lines running through Swedish territory were tapped there. Swedish intelligence officers, who favored the Allied side, delivered information to the British naval attaché at Stockholm. Thus, the Admiralty learned of the German plan to attack convoy PQ 17 in July 1942 with large surface ships, destroyers, submarines, and aircraft, whereupon British first sea lord Admiral of the Fleet Sir Dudley Pound ordered the convoy to scatter without waiting for the report of the departure of the German task forces. This led to catastrophe for the convoy, as German aircraft and U-boats sank two-thirds of its merchant ships.

The rising number of cipher key nets employed by the Germans also overstretched Bletchley Park capacities. Thus, even by mid-1942, of about 50 key nets then in use, Bletchley Park could only decrypt about 30, and these with varying time delays and gaps.

SIGINT had great influence in the Far East theater. In September 1940, American cryptanalysts under the leadership of William Friedman broke the

Japanese diplomatic Purple cipher. (It has now been revealed that both the Germans and the Soviets were also able to break Purple.) Thus, during negotiations with Japanese in 1941, the U.S. State Department knew not only the documents the Japanese diplomats would present but also their specific negotiating instructions. Purple intercepts provided clear evidence in late 1941 that the Japanese had decided to break off negotiations. But the diplomatic communications gave no hints of Japanese military plans, and the Japanese Army codes were still difficult to decrypt.

The Japanese Navy's superenciphered codes, especially JN.25—an earlier version of which had been broken—could not be read after changes in the codebooks and superenciphering tables. Thus, U.S. military and naval leaders had to depend on traffic analysis and direction finding, which did provide clear evidence, supported by optical observations, of the deployment of Japanese forces for attacks against the Philippines, Malaya, and the Netherlands East Indies. There was, however, no direct indication of an attack against Pearl Harbor, which thus came as a great surprise.

Breaking the new version of JN.25 and other Japanese codes took time, because reconstructing the tables and the codebook was always difficult after changes. In 1942, by clever evaluation of vague indications, Commander Joseph J. Rochefort concluded that the Japanese planned first to invade New Guinea (March 1942) and then to strike at Midway (June 3–6). This conclusion enabled Pacific Fleet commander Admiral Chester Nimitz to counter the Japanese moves, leading to the Battle of the Coral Sea (May 7–8) and the Battle of Midway.

During the struggle for the Solomon Islands in late 1942 and 1943, U.S. cryptanalysts learned to decrypt the Japanese codes more quickly, and by 1944 they could in most cases provide timely decryptions of Japanese signals in support of strategic operations. Of special importance was the success in breaking the so-called Maru cipher for Japanese logistical support to the islands they held in the Pacific. This allowed U.S. submarines to be directed with considerable accuracy to intercept positions, which in turn produced rising losses in the already thinly stretched Japanese merchant ship capacity and in Japanese warships. SIGINT closely supported General Douglas MacArthur's Southwest Pacific Forces from New Guinea to the Philippines and the Central Pacific Forces under Admiral Nimitz against the Marshall, Caroline, and Mariana Islands and finally against Iwo Jima and Okinawa.

In the Indian Ocean area, British cryptanalysts were able to break Japanese Army and Air Force codes. On the other side, the Japanese had only limited success in decryption operations. In consequence, they employed mainly traffic analysis and direction finding for their military and naval operations.

There is no doubt that SIGINT was of great importance to all belligerents in the war. It is also true that the Allies were much more effective in its use. SIGINT alone did not win the war for the Allies, but undoubtedly it significantly shortened the length of the conflict.

Sikorski, Władysław Eugeniusz (1881–1943)

Polish general and prime minister of the Polish government-in-exile. Born in Tuszów Narodowy near Mielec (then Austria) on May 20, 1881, Władysław Eugeniusz Sikorski studied engineering in Lemberg (L'viv) and served in the Austrian Army in 1904 and 1905. Sikorski became chief of the Polish Supreme National Committee's Military Department during World War I and commanded the Polish Fifth Army during the 1919–1920 Polish-Soviet War. Chief of the Polish General Staff in 1921 and 1922, he became prime minister in 1922 and minister for military affairs in 1924 and 1925. A rival of Józef Piłsudski, Sikorski was relieved of his command after 1926. He then gained considerable reputation as a military writer, stressing the importance to Poland of the alliance with France.

When the Germans attacked Poland on September 1, 1939, Sikorski was still without assignment. With the military defeat of his country and internment of the Polish government in Romania, Sikorski arrived in Paris on September 24. There he became prime minister and minister for military affairs of the newly formed Polish government-in-exile. As supreme commander of the Polish armed forces, Sikorski reorganized those Polish soldiers who reached France. When France was defeated in June 1940, Sikorski convinced British prime minister Winston L. S. Churchill to evacuate the Polish troops and the government-in-exile to Great Britain.

Sikorski pushed for the reestablishment after the war of the Polish state in its pre–September 1939 frontiers, and he outlined plans for a Polish-Czech federation. This position was compromised by the fact that Sikorski represented a defeated country, depending on the goodwill of its Western allies. Under these circumstances, Sikorski's attempts to normalize Polish-Soviet relations met with difficulties that were only partly resolved following Germany's invasion of the Soviet Union on June 22, 1941. Relations between the government-in-exile and Moscow then became impossible with the revelation of the Soviet massacre of Polish Army officers in the Katyn Forest in 1940.

In the midst of this crisis, Sikorski was killed in a plane crash at Gibraltar on July 4, 1943; he had been returning to Britain from an inspection of Polish

troops in the Middle East. He was succeeded in authority by much less able men, but in any case the situation for Poland would have been impossible, given the decision by Britain and the United States to maintain harmonious relations with the Soviet Union.

Simonds, Guy Granville (1903–1974)

Canadian Army general. Born on April 23, 1903, at Bury Saint Edmunds, England, the son of a British Army officer who brought his family to Canada, Guy Granville Simonds graduated from the Royal Military College of Canada, Kingston, Ontario, in 1925 and then served with the artillery in the small interwar Canadian Army, where he emerged as a rising star. A brilliant performance at the British Army Camberley Staff College in 1936–1937 confirmed this promise. During World War II, Simonds rose from major to brigadier in September 1942 and to major general in April 1943.

Simonds was naturally aggressive with an intuitive grasp of mobile, armored warfare. Field Marshal Sir Bernard Montgomery considered him a protégé and far superior to the plodding General Henry Crerar. Simonds cut his teeth commanding the Canadian 1st Division in Sicily with great success and then briefly the 5th Armoured Division in Italy. In January 1944 he was promoted to lieutenant general and given charge of the Canadian II Corps, which he commanded in the Normandy Invasion of June 6, 1944.

Simonds's battle plans in the assaults around Caen and particularly in the bloody attritional fighting to close the Falaise gap from the north in August 1944 (Operations TOTALIZE and TRACTABLE) were operational masterpieces but were so complex that they often overmatched the abilities of his

inexperienced corps. Simonds's performance at Falaise remains controversial. Although he sacked subordinates with abandon and relentlessly pressed his exhausted soldiers forward, many historians have criticized him for showing insufficient "resolution." In fact, the task given to Simonds's army was beyond its capacity—at least in the time allotted—not least because most units were well understrength.

The greatest achievement of Simonds and the Canadian First Army (he assumed command from an ailing Crerar in September 1944) was undoubtedly the clearance of the Scheldt estuary in the fall of 1944, which opened Antwerp to shipping and resolved the supply problem that had threatened to strangle Allied mobility. Fighting under the most appalling conditions and despite Montgomery's inexplicable refusal to allocate sufficient troops, at least until General Dwight D. Eisenhower finally intervened, the Canadians prevailed. Simonds displayed more innovation and flexibility, and both commander and men proved that they had absorbed the summer's hard lessons.

Simonds's career went into eclipse after the war. He lost out to the more politically astute Lieutenant General Charles Foulkes in running the postwar army and left little mark except as a critic of Canada's drift into the American military orbit. Simonds died on May 15, 1974, in Toronto.

Simović, Dušan (1882–1962)

Yugoslavian Army general. Born on November 9, 1882, in Kragujevac, Serbia, Dušan Simović joined the Serbian Army and fought in both the Balkan Wars and World War I. After the war, he was commandant of the Officers' Military School. He became chief of the Yugoslavian Army General Staff in 1939 and chief of the Air Force Staff the following year.

In February 1941, Adolf Hitler demanded that Yugoslavia join the Axis, and despite Simović's opposition, Regent Prince Paul agreed to join the Tripartite Pact on March 25. Two days later, Simović led a military coup in Belgrade that deposed Paul and named as king young Peter II. Simović hoped to maintain Yugoslavia's neutrality and carry out internal reform, but German forces invaded the country on April 6 and also attacked Belgrade from the air.

The Germans occupied Yugoslavia within two weeks. Simović and King Peter II evaded capture and fled to Greece. Simović then headed the Yugoslav government-in-exile in London but chose to resign in 1942.

In February 1945, King Peter II appointed Simović to lead the Yugoslav government, but Partisan leader Marshal Josip Broz (Tito) vetoed this because of Simović's anticommunism, and Simović retired in May. Simović died in Belgrade on August 26, 1962.

Simpson, William Hood (1888–1980)

U.S. Army general. Born in Weatherford, Texas, on May 19, 1888, William Hood Simpson graduated from the U.S. Military Academy at West Point in 1909. He then served in the Philippines and in the 1916–1917 Punitive Expedition into Mexico. During World War I, he deployed to France with the

American Expeditionary Forces, ending the war as a temporary lieutenant colonel.

Reverting to captain after the war, Simpson attended the Infantry School (1924), the Command and General Staff School (1925), and the Army War College (1927–1928). Promoted to colonel in 1938, he took command of an infantry regiment. He was promoted to brigadier general in October 1940 and became assistant division commander of the 2nd Infantry Division. In September 1941, he was promoted to major general and assumed command of the 35th Infantry Division.

Simpson commanded XII Corps in September 1942 and was promoted to lieutenant general the next month. He then commanded the Fourth Army in California. Assigned to Europe in May 1944, Simpson organized the new Ninth Army headquarters staff in England. The Ninth Army became operational in France as a single-corps army under 12th Army Group in September 1944.

Simpson's army cleared Brittany and captured the port of Brest. It then occupied a quiet frontline sector in the vicinity of Luxembourg between the First and Third Armies. In the reorganization of army commands in October 1944, the Ninth Army headquarters moved to Maastricht. Simpson had his first major combat test in the November offensive designed to reach the Rhine. The undersized Ninth Army spent nearly four weeks against stiff German resistance before reaching the Roer River. The offensive ended when the Germans launched their December 16, 1944–January 25, 1945, Ardennes Offensive, and the Ninth Army was placed under British field marshal Bernard Montgomery.

Finally up to strength, the Ninth Army cleared the Rhineland (January–March 1945), then crossed the Rhine (March 24) and linked up with the First Army to encircle the Ruhr (April 1). In April, back under General Bradley's control, the Ninth Army reached the Elbe. Elements of the Ninth Army were the first to cross the river (April 12), linking up with Soviet forces. Simpson later claimed that his forces could have reached Berlin within 24 hours had supreme commander, Allied Expeditionary Force, General Dwight D. Eisenhower given the order.

After brief occupation duty in Germany (June 1945), Simpson undertook a mission to China (July). In October he took command of the Second Army in Tennessee and was transferred with it to Baltimore (June 1946). Retiring in

November 1946, Simpson was promoted to general on the retired list in July 1954. He died in San Antonio, Texas, on August 15, 1980.

Singapore, Battle for (February 8–15, 1942)

Capture of the great British base of Singapore was essential to Japanese success in the Far East. Throughout the 1930s, British governments had neglected Pacific defenses, as budgetary constraints forced retrenchment. From 1939 onward, moreover, fighting in Europe and North Africa was Britain's priority, diverting additional men and resources from the Far East, where Singapore was complacently considered impregnable.

The Japanese plan called for an approach to Singapore from the north by land. The British had designed Singapore's defenses primarily to meet a seaborne attack. Although some of its big guns were capable of firing against land targets, they lacked high-explosive shells for use against attacking troops.

The drive on Singapore began with the Japanese invasion of northern Malaya on December 8, 1941. By January 15, 1942, the British Indian III Corps of the 8th and 11th Infantry Divisions had been forced back to the defensive line in Johor, which was held by the Australian 8th Division. By the end of January, the Japanese had driven British forces back across the Straits of Johor into a defensive position on Singapore Island.

The Straits of Johor protected the northern and western shores of Singapore Island. The straits varied in width from 600 to 2,000 yards and were crossed only by a 70-foot-wide causeway that the British cut but could

not destroy. Singapore Island was largely covered by jungle growth and plantations that sharply limited observation and fields of fire. Except for several towns, the population was concentrated on the southeast coast in Singapore Town, a city of 1 million. The key location around Bukit Timah village in the center of the island contained a large depot of military stores and the three reservoirs for the island's water supply.

Lieutenant General Arthur E. Percival commanded 85,000 defending troops. Japanese commander Lieutenant General Yamashita Tomoyuki had only 30,000 men of the Twenty-Fifth Army. The attackers were short of ammunition and other supplies, but their aircraft dominated the skies. Percival deployed the bulk of his troops too far forward, defending 30 miles of front to make his stand on the island's beaches. Most of his men were poorly trained and were exhausted and dispirited after weeks of battle and defeat. Moreover, they had been outfought by a battle-hardened enemy skilled in infiltration and tactics suitable for the jungle terrain. The defending force of Indians (now consolidated into the 11th Division) and the Australian 8th Division had been reinforced on January 29 by the British 18th Division and, a few days earlier, by the partially trained Indian 44th Brigade. The only other troops were fortress troops, with two Malayan brigades and volunteers.

All but one of the island airfields were within reach of Japanese artillery fire, and the few remaining fighter aircraft were thus redeployed to Sumatra, from which they could provide only limited air support. Yamashita planned to throw the British off balance by feinting east of the causeway and making his major attack to the west of it.

On the morning of February 8, the Japanese attacked. Two divisions crossed in landing craft against the Australian 22nd Brigade west of the Kranji River. Although the Australians sank many landing craft, they were too thin on the ground to hold the line. By the next morning, the Japanese had taken Ama Keng and were attacking Tengah Airfield. The defenders then withdrew to establish a line on the narrow neck of land between the Kranji and Jurong Rivers.

Meanwhile, on the evening of February 9, the Japanese successfully attacked the Australian 27th Brigade, creating a gap between the brigade and the Kranji-Jurong line. The Japanese soon bypassed that line, which was never properly prepared or occupied by the defenders. A British counterattack attempting to restore the position failed.

By February 11, the Japanese had seized and repaired the causeway, allowing them to send additional resources, including tanks, onto the island and advance toward Nee Soon village. On February 12, Percival ordered a withdrawal to a perimeter marked by the Bukit Timah Road, the Mac-Ritchie and Pierce Reservoirs, and Paya Lebar-Kallang. Heavy fighting began south of the Bukit Timah Road on February 13, where for 48 hours the Australians held, and along Pasir Panjang Ridge, where Malayan forces stubbornly repulsed the Japanese. On February 14, however, the defenders were forced back to what proved to be their final line.

London had ordered Percival to continue the fight and not surrender. Conditions in the city were shocking, with dead and dying in the streets and loss of the water supply imminent. Reserves of food and ammunition for the troops had been seriously depleted by loss of the depots. Meanwhile, the British evacuated by sea certain key personnel essential to the later war effort, and demolitions destroyed heavy guns, aviation fuel, bombs, and other equipment. Many of Percival's troops simply deserted, including the engineers who were to destroy the naval dockyard.

When it was clear that nothing was to be gained by further resistance, on February 14 Prime Minister Winston L. S. Churchill instructed Field Marshal Archibald P. Wavell, Allied theater commander, to authorize Percival to surrender. Percival also had the welfare of civilians to consider when, on February 15, he surrendered his 70,000 troops unconditionally to Yamashita. The Japanese had taken Malaya and Singapore in only 70 days. The loss of Singapore was the greatest defeat of British forces since the 1781 Battle of Yorktown and had immense repercussions for British prestige in Asia.

Sino-Japanese War (1937–1945)

Struggle between Japan and China for control of China. The Sino-Japanese War, sometimes known as the Second Sino-Japanese War to distinguish it from the war between these two states during 1894–1895, began against the backdrop of repeated efforts of Guomindang (GMD, Nationalist) Party leader Jiang Jieshi (Chiang Kai-shek) to crush Chinese Communist forces led by Mao Zedong (Mao Tse-tung). Japanese efforts to control China flared into all-out war in 1937. Previously, an uneasy truce had held, despite Japanese encroachments into Manchuria, Inner Mongolia, and the Chinese provinces outside the Great Wall. As Japanese forces moved onto the northern China plain, the situation became more volatile, however, and a confusing three-sided conflict emerged until the Japanese surrender of August 1945.

Scholars of the conflict delineate up to four broad phases of the war. The first began with the September 1931 Mukden (Shenyang) Incident, in which intelligence officers of the elite Japanese Guandong (Kwantung) Army in southern Manchuria blew up a portion of track on the rail line at Mukden. They blamed it on the Chinese and used it as an excuse to occupy all of Manchuria, an area roughly the size of Texas and a major resource base. In succeeding years, the Japanese occupied more territory in northern China outside the Great Wall as Jiang concentrated on “extermination campaigns” against Mao’s Chinese Soviet Republic in Ruijin (Juichin) of Jiangxi (Kiangsi) Province in southeastern China.

From October 1934 to October 1935, Jiang pursued Communist forces through China’s hinterlands to Yan’an (Yenan) in what became known as the Long March. When Mao’s forces reached the relative safety of Yan’an in northeastern Shaanxi (Shensi) Province, Jiang ordered local warlords, nominally loyal to him, to continue the campaign against the Communists instead of concentrating on resisting Japanese expansion. The Xi’an (Sian) Incident in December 1936, a coup staged by two Nationalist generals, forced Jiang to accept a United Front against Japan and helped focus Chinese Nationalist fervor against the Japanese.

The Lugouqiao (Lukou-ch’iao) or Marco Polo Bridge Incident began the second phase and the start of the larger conflict. On July 7, 1937, Japanese

Army troops demanded entry into the town of Wanping (Wan-p'ing), about 10 miles west of Beijing (Peking) in Hebei (Hupeh) Province. The town was held by forces loyal to Jiang's Nationalist government. When the GMD troops denied entry to the Japanese, who were supposedly looking for a lost soldier, the Japanese threatened the use of force at the Marco Polo Bridge, where the opposing sides met.

In the aftermath of the Japanese demand for entry into the town and the Chinese refusal, Japanese forces began shelling Wanping and attacking the bridge. Larger Chinese units held their positions and even drove the Japanese back. Negotiations then began, used by both sides to concentrate additional forces in the northern China plain. On July 28, the Japanese attacked and seized control of the bridge; shortly thereafter the Japanese captured both Beijing and Tianjin (Tientsin), local Chinese commanders having decided to abandon these cities rather than risk their destruction. On July 31, Jiang informed the Chinese people that "the hope for peace has been shattered" and that the Chinese people had to fight the Japanese "to the bitter end" and expel the invader.

From July to December, Japanese forces seized most of the territory north of the Huanghe (Hwang Ho, known to Westerners as Yellow) River. Fighting was not confined to northern China, for in August 1937 the Japanese attacked the great commercial city of Shanghai in Jiangsu (Kiangsu). Not until November, after three months of hard fighting involving the best Nationalist troops, did Shanghai fall. Japanese forces then advanced up the Changjiang (Yangtze) River, and in December they took Nanjing (Nanking), also in Jiangsu Province, where they committed wide-scale atrocities. Nationalist forces withdrew deep into the Chinese interior to Chongqing (Chungking), in Sichuan (Szechwan), where Jiang established his new capital.

During the next several years, Japanese forces conquered much of northern and east-central China. The Japanese moved somewhat predictably along railroad lines and major waterways to facilitate troop transport and resupply. In theory, this should have aided the Chinese defenders, because it reduced the element of surprise. China, however, did not present a truly unified front.

Although Jiang possessed the most modern Chinese military force, his armies were less powerful than the Japanese. Other Chinese commanders were really regional military leaders, warlords unwilling to risk their troops

and thereby weaken their position relative to other Chinese warlords. All too frequently, poorly led Chinese troops fought well for a brief time but then fled with escaping civilians.

Chinese soldiers surrendering to the Japanese in September 1938. Japanese forces came to control much of China between 1937 and 1939, despite stubborn Chinese resistance. (Topical Press Agency/Getty Images)

By 1940, the Japanese controlled northern and eastern China, and the Chinese Communists dominated northwestern China. Late that year, the Communists launched the “Hundred Regiments” offensive against Japan, but they were defeated by the better-equipped Japanese. The Communists then switched to guerrilla warfare against Japanese positions in northern and central China. This policy led to Japanese reprisals against both the Communists and the civilian population. Guerrilla warfare did not drive out the Japanese, but it did help disrupt their control and served to establish the Communists as dedicated opponents of Japanese rule, enhancing their postwar political position.

By 1940 the situation had stabilized, and a third, somewhat quieter, phase began. Although few major battles occurred, there were regular skirmishes in the three-sided conflict that had emerged after 1937. The Japanese occupied most of the eastern third of China, its major ports, and the bulk of its industrial areas. The Japanese-controlled territory included the majority of

Han ethnic Chinese people. The Japanese established a puppet regime under Wang Jingwei (Wang Ching-wei), a left-wing member of the Guomindang who had been forced from power in December 1935. With Nationalist forces, Communist guerrillas, and an uncooperative Chinese population, the Japanese military sought to wear down Chinese resistance and cut off China from outside assistance, chiefly from the United States.

None of the three main contending armies could afford a major and costly campaign. Mao's Communist forces carried out a social revolution in the areas under their control, introducing land reform and seeking to improve the lot of the peasantry in health care and education. They also sought to identify landowners and other members of the Chinese upper classes with the hated Japanese occupiers. Mao remained vigilant against Jiang's armies, as the Chinese president continued to keep many of his best military units in a blockade of the Communist base area around Yan'an. Typically, Communist forces attacked troops and sought to convert the peasants to their cause in areas only weakly held by the Japanese.

Jiang also proceeded cautiously, for he intended to conserve Nationalist military strength to continue the civil war and crush the Communists once Japan had been defeated. For a time the Soviet Union and the Western powers provided aid to Jiang, despite logistical challenges. The Soviets sought to keep Japan occupied in China to forestall any invasion of Siberia, but the Japanese-Soviet Neutrality Pact signed in April 1941 eased Moscow's fears of Japanese expansion and enabled Soviet leader Joseph Stalin to concentrate on the greater threat posed by Germany, which invaded in June. Britain, France, and the United States also provided assistance, but the German conquest of France in the spring of 1940 reduced that aid to a trickle, as Great Britain fought Germany alone while the United States gave highest priority to assisting Britain in its time of greatest peril.

The civil war, however, was never far from the surface, as evidenced in the so-called New Fourth Army Anhui (Anhwei) Incident of January 1941. As part of the United Front against Japan, Jiang permitted Mao to reorganize his armed units into the Eighth Route Army and later authorized formation of the New Fourth Army. There was disagreement about its area of operations; Jiang expected the force to operate north of the Huanghe, but the New Fourth Army instead moved south into Shandong (Shantung). Consequently, GMD armies surrounded and attacked the New Fourth Army on January 6, 1941,

badly mauling that smaller force and compelling the surrender of 2,000 of its troops.

In September 1940, meanwhile, Japanese forces moved into northern Indochina, and in July 1941 they moved into southern Indochina. This effort to cut the Chinese off from U.S. aid flowing from India brought U.S. retaliation against Japan in the form of an economic embargo on certain critical war materials, especially oil. In turn, this triggered Japan's decision to go to war against the United States. Japan's December 7, 1941, attack on Pearl Harbor and its war with Britain and the Netherlands broadened the conflict into a general Pacific war and severely strained its capability to conduct offensive operations in China.

Japanese military leaders were forced to reassign divisions from China to carry out the invasions of Hong Kong, the Philippines, Malaya, and Burma. In consequence, Japanese operations in China subsided. Jiang, confident of ultimate Allied victory, continued his policy of largely avoiding pitched battle with major Japanese military units, although he reluctantly agreed to commit some divisions to assist in operations against Japanese forces in Burma.

Meanwhile, Chinese Communist forces continued their pattern of securing the loyalty of the peasants in areas they controlled while engaging in small-unit attacks against the Japanese. The general Nationalist military inactivity against the Japanese aided the Chinese Communists in that it helped them to secure the mantle of Chinese nationalism. The Japanese "three-alls" reprisal policy also assisted the Communists. Following a guerrilla attack, Japanese forces would move into a nearby populated area and "kill all, loot all, burn all." Their policy turned many of the survivors into new recruits for the Communists.

U.S. aid to the Nationalists increased after December 1941, but China was a distant part of the China-Burma-India theater. In April 1942, Japanese forces in Burma (present-day Myanmar) took Lashio and cut the Burma Road, Nationalist China's only land route to the outside world. Thereafter, American aid had to be flown over "the Hump" of the Himalayas to reach Chongqing. Jiang's U.S. military adviser, Lieutenant General Joseph Stilwell, tried to train and organize new Chinese divisions equipped by the United States, but he became increasingly frustrated with Jiang's refusal to commit them to fight the Japanese in Burma or in southeastern China. There was also

disagreement among U.S. generals about aid to China. Major General Claire Chennault wanted to build on the success of the Flying Tigers and their high kill ratio against Japanese pilots to commit most aid to the new U.S. Fourteenth Air Force in China.

In October 1944, Stilwell was recalled at Jiang's request, and the China-Burma-India theater was separated into the China theater and the Burma-India theater. This final phase of the Sino-Japanese War (late 1944 to August 1945) highlighted the corruption and inefficiency of Nationalist forces. The United States had provided sufficient aid to build a modern army of 30 divisions and also created the Fourteenth Air Force. Further, the United States began strategic bombing of Japanese air bases on Formosa some 100 miles from the Chinese mainland.

Throughout 1943, American planners had contemplated using either eastern China or Formosa as a staging point for the men and supplies necessary to launch an invasion of the Japanese home islands. Early planning assumed that the new Chinese Nationalist divisions would reopen the Burma Road and contain Japanese forces in China proper. It also assumed that the Fourteenth Air Force would be able to subject Japanese coastal defenses to attack.

The successes of the U.S. amphibious forces in the Southwest and Central Pacific and of U.S. submarines in cutting the flow of food and raw materials, especially oil, from the Japanese-conquered territories to the home islands somewhat reduced the importance of China as a staging area against Japan. At the same time, Japanese forces in China launched a two-pronged offensive that demonstrated continued Chinese military weakness.

Operation ICHI-GO (VICTORY NUMBER ONE), which Japan conducted from April to December 1944, aimed to cross the Burma-India border through southern China to seize Allied airfields at the western side of the Hump air-transport route, capture key north-south railroads in China, and seize Fourteenth Air Force airfields used to stage attacks on Japanese forces. The attack on Assam failed, as Allied forces in Burma under Lieutenant General Sir William Slim broke the March–July 1944 siege of Imphal and then went on the offensive.

But the Japanese attack in China succeeded. The Japanese first won control of the key north-south railroad between the Huang and Chenjiang Rivers; they then seized the airfields used by the Fourteenth Air Force, and

later in 1944 they secured Guilin (Kweilin), Nanning, and Liuzhou (Liuchow) in Guangxi (Kwangsi) Province. Chinese Nationalist forces not only fought poorly, but peasants attacked them as they retreated, demonstrating the huge divide between the Chinese masses and the government. Interestingly, the Japanese did not strike Communist base areas in northern and north-central China, causing some observers to speculate about a de facto Japanese-Chinese Communist truce that benefited both sides.

The ICHI-GO operation was the high point of Japanese military operations in China. Thereafter, Tokyo began transferring its best divisions from China and Manchuria to meet the U.S. drive across the Pacific into the Philippines and later the Bonin Islands and the Ryukyus. Remaining Japanese forces in China were badly overextended, and Japanese commanders sought to consolidate, especially by the summer of 1945, to face a possible Soviet attack.

Meanwhile, the weight of corruption and inefficiency was beginning to sink Jiang's Nationalist regime. The Chinese government had limited financial resources because Japanese troops occupied the populous and most productive part of China. Corruption and inefficiency also hurt the government.

Jiang's regime responded by printing more and more money, driving down the value of paper and leading to dramatic inflation that wiped out much of the middle class. By contrast, Mao's Communist forces emerged from the war in a much stronger position because of their apparent honesty and commitment to the welfare of the peasants and their resistance to the Japanese.

By the summer of 1945, the war was drawing to a close. In early August 1945, Red Army troops—honoring Soviet leader Joseph Stalin's pledge at the February 1945 Yalta Conference that the Soviet Union would enter the war against Japan "two or three months" after the defeat of Germany—invaded Manchuria in overwhelming force and quickly occupied that Chinese province. On August 14, 1945, Japan surrendered.

The fighting in China had tied down some 1.2 million Japanese troops, with some 396,000 killed. China had sustained military casualties alone of more than 3.2 million, with more than 1.3 million dead. The number of civilian dead is unknown.

Unfortunately for the Chinese, the end of the long Sino-Japanese War did

not bring peace to China. Ignoring American advice, Jiang moved troops to Manchuria to secure that key province before the Communists in northern China could do so. Fighting broke out between the Nationalists and the Communists that ultimately led to a Communist victory in October 1949, bringing the long years of civil war and international war to an end.

Sirte, First Battle of (December 17, 1941)

Important Mediterranean air and naval battle between Great Britain and Italy that occurred because both nations were conducting convoy operations at sea. The British were trying to get a tanker, the *Breconshire*, to fuel-starved Malta. Rear Admiral Sir Philip Vian departed Alexandria on December 16, 1941, with the *Breconshire*, three light cruisers, and eight destroyers. Meanwhile, British Force K of three light cruisers and six destroyers sortied from Malta to meet it.

Simultaneously, Italy dispatched supply ships to North Africa. This effort was particularly important, given heavy Italian shipping losses over the

previous months. Seven destroyers and a torpedo boat provided close escort for two small convoys totaling 4 merchant ships and carrying 400 vehicles, 17 tanks, 10 artillery pieces, and other supplies. The escort, commanded by Vice Admiral Carlo Bergamini, consisted of the battleship *Caio Duilio,* 2 light cruisers, and 3 destroyers. Italian vice admiral Angelo Iachino's covering force was also at sea. It consisted of the battleships *Littorio, Giulio Cesare,* and *Andrea Doria* as well as 2 heavy cruisers and 10 destroyers. Bergamini had developed the battleship convoy, with which he had enjoyed success following earlier Italian convoy disasters. The battleship escort operated near the slow-moving convoys and maneuvered in such a way as to remain close to them. At the same time, Iachino's heavier force was steaming between Vian's force and the main Italian convoy east of Malta.

The Italians learned through radio intercepts that British cruisers had departed Alexandria, and on December 16 their reconnaissance aircraft and German Junkers Ju-52s flying troops from Greece to North Africa sighted the *Breconshire* and reported it as a battleship. Later that day, the British ships came under ineffective Italian air attack. Iachino assumed that British battleships were at sea hunting for his convoys, although in reality the lack of escorts and the threat of German submarines prevented the commander of British forces in the Mediterranean, Admiral Andrew B. Cunningham, from dispatching battleships from Alexandria.

Iachino increased speed to 24 knots, the fastest the *Doria* could manage, and steamed to engage. Vian had been joined by Force K and was aware of Iachino's approach from aerial reconnaissance early in the afternoon. He turned to the south, away from Iachino, to protect the *Breconshire*. Vian was also aware that additional Italian forces were at sea.

On December 17, Vian's ships had again been subjected to Italian air attack, and the British antiaircraft fire had been observed by Iachino's fleet, which then closed. Sunset was approaching when contact was made. The Italians opened fire at extreme range of 35,000 yards, dropping to 24,000 yards. Vian detached the two destroyers, and later all of Force K, to protect the *Breconshire*, which steamed south to escape.

Italian fire for this range was quite accurate, and their shells straddled several British ships. The British destroyers made smoke and advanced on the Italians, who countered by ordering their destroyers forward. The British

destroyers boldly moved forward, but Vian almost immediately ordered them to retire on the main force.

With night coming on, Iachino ordered a withdrawal. Vian, under orders from Admiral Cunningham, did not try to force a night engagement. One British destroyer had suffered one dead and sustained very minor damage. In the morning, Vian ordered Force K to escort the *Breconshire* into Valetta, Malta, while he retired to Alexandria.

Meanwhile, the two Italian convoys arrived safely at Tripoli and Benghazi. In an ancillary development on December 19, Force K, trying to intercept the Axis convoys, ran into an Italian minefield near Tripoli. One cruiser and a destroyer were lost and two cruisers were damaged at a cost of more than 600 dead.

Sirte, Second Battle of (March 22, 1942)

Mediterranean air and naval battle fought between the British and Italians as a consequence of British efforts to resupply Malta. Conditions on the British island were dire in 1942, with the Royal Navy able to pass only a few ships through the gauntlet of Axis air and naval forces dominating the Mediterranean. Admiral Sir Andrew B. Cunningham, Britain's naval commander in the Mediterranean, was determined that the next effort to resupply Malta would be successful.

On March 20, 1942, British convoy MW.10 of four merchant ships, including the tanker *Breconshire,* departed Alexandria for Malta with fuel and provisions. Vice Admiral Sir Philip Vian commanded an escort force of four light cruisers, nine large destroyers, and seven small Hunt-class destroyers. A light cruiser and a destroyer were ordered from Malta to join it. Five British submarines were also on patrol.

German reconnaissance aircraft located the British convoy on the evening of March 21, and the next morning a British submarine off the port of Taranto reported an Italian naval force headed south. Vice Admiral Angelo Iachino commanded the battleship *Littorio,* two heavy cruisers, one light cruiser, and eight destroyers. Two other Italian destroyers ordered to sea failed to arrive in time to participate in the battle. The Axis powers also had six submarines on patrol in the eastern Mediterranean. The Italian ships lacked radar (the first effective set would not be installed until May), but they did have command of the air, and Iachino knew that the British lacked battleships.

By March 22, Vian was nearing Malta and had lost one Hunt-class destroyer, torpedoed by a U-boat. At 2:10 p.m. on March 22, the British sighted the three Italian cruisers and four destroyers. Vian now carried out the procedures decided on earlier. Five destroyers continued on with the convoy, while Vian's remaining cruisers and destroyers made smoke and launched torpedo attacks against the Italian ships. The Italian ships then drew off.

Vian's detached forces had barely regained the convoy when, at 4:37 p.m., the Italian fleet again came into sight. Iachino's intention was to steam to the southwest and cut off Vian from Malta, at the same time positioning himself downwind of the immense smoke screens being laid down by the British ships. Vian's force consistently charged and fell back, feinting and threatening the remainder of the afternoon, as the range slowly closed.

With the approach of darkness, Iachino closed to within 5,000 yards. Fire from the *Littorio* damaged two British destroyers; two other British warships suffered minor shell damage. But with nightfall and lacking radar, Iachino decided to withdraw, despite having suffered only one British shell hit on the *Littorio*. During Iachino's return to Taranto, however, two Italian destroyers foundered in a storm with heavy loss of life.

The Luftwaffe sank two of the British transports short of Malta. The other two reached Malta, but they had been only partly offloaded before they too

were sunk by air attack. One of the British destroyers damaged in the battle on March 22 was later sunk at Malta, again from the air, while undergoing repairs. The success of the Axis blockade of Malta led to another failed British attempt to resupply the island in June.

Sittang, Battle of the (February 18–23, 1942)

Early Japanese victory in Burma. In January 1942, Japanese forces launched an attack by the 55th and 33rd Divisions on Burma (present-day Myanmar) from Thailand. The objective was to take southern and central Burma from the defending British forces and cut off this vital supply line from India to China. The Japanese attack through the Kawkareik Pass began a series of successful minor actions against weakly defended outposts in eastern Burma.

Lieutenant General Thomas Hutton's British forces—the equivalent of two small divisions of poorly equipped British, Indian, and Burmese troops—were unable to halt the Japanese advance. Major General John George Smyth's Indian 17th Infantry Division failed to impede the Japanese at Moulmein and again at Bilin. The division then began a fighting withdrawal in an attempt to fall back across the Sittang and establish a new defensive position.

A small garrison force defended the railway bridge; 17th Division headquarters had already moved across the Sittang while the rest of the division continued to advance by road from the Bilin area. Advancing Japanese forces outflanked and cut off the two brigades east of the river. In

the confusion of the battle, word reached Smyth that the Japanese were about to break through to the river. Recognizing the importance of the bridge to the overall Japanese campaign, he ordered the span destroyed. The two stranded Indian brigades then fought a desperate battle against superior Japanese forces.

The Japanese, no longer able to capture the bridge intact, concentrated on destroying the eight battalions of the Indian 17th Infantry Division, which had no place to retreat to and no hope of reinforcement. Unit order soon collapsed, and small elements crossed the river to safety as best they could. In the process, the brigades abandoned significant amounts of arms, equipment, and motor transport east of the river. Many men were shot or drowned trying to cross the 600-yard-wide swiftly flowing river. Most of those who did escape did so with not much more than their individual weapons. Only about 2,000 officers and men made it to safety.

With the 17th Infantry Division temporarily rendered combat-ineffective, the British were unable to establish a viable defensive position on the west side of the river, and the Japanese soon resumed their offensive. The Battle of the Sittang was critical for the defense of Rangoon. Two weeks later on March 9, Japanese forces captured that important port and Burmese capital.

Denied their primary and most direct military supply route, British forces in the country now had to move farther west and north to reestablish any semblance of a defensive line and new land supply routes from India. The Japanese had also severed the land supply route to China. Japanese forces were now poised to move north and fight for control of all of Burma and to threaten British India.

Sitzkrieg (October 4, 1939–May 10, 1940)

Period of apparent inactivity in ground or aerial combat between Germany and the Allies following the fall of Poland. The Sitzkrieg (Stationary War) was also known as the Phony War, *drôle de guerre*, and the Bore War. Although Adolf Hitler hoped to launch an offensive against France in 1939 before winter began, the Wehrmacht required more time to redeploy its forces before such an undertaking. German generals begged for additional time, and terrible winter weather led Hitler to reluctantly agree to delays that ultimately postponed the invasion until the spring of 1940.

France remained committed to the strategy of passive defense it had adopted from the war's outset. The French Army had completed its mobilization along the German frontier while Hitler's forces seized Poland. Although France had an overwhelming advantage in numbers and equipment, French Army commander General Maurice Gamelin failed to seize the opportunity and invade Germany in strength from the west. On September 30, Gamelin ordered an end to the small foray he had authorized into the Rhineland and a withdrawal to the French frontier. The French also manned the Maginot Line and settled into garrison duty by October 4.

Belgium and the Netherlands maintained their neutrality, and the British —who were slow to commit resources to France and to understand the gravity of the situation—believed that the economic pressure of the Royal Navy's blockade could force a negotiated settlement. As a result, an illusion of peace led to the term "Sitzkrieg"—an ironic reference to the German blitzkrieg (lightning war) campaign in Poland—and settled over the opposing forces. Both sides were reluctant to unleash premature air action that might bring about the bombing of cities, and the British limited their early bombing activity largely to dropping of leaflets (critics called it the "Confetti War").

Civilian trains continued to run along tracks between the German and French lines. Children and soldiers alike played in the open fields separating the combatants. The surreal atmosphere at the front began to take a toll on the morale of the French Army, as defeatism and apathy spread through the French government.

Meanwhile, preparations for further hostilities continued. The British Expeditionary Force (BEF) gradually grew in strength along the Belgian border, but the Allies failed to take advantage of lessons learned in Poland

regarding the use of tanks in divisions. The army largely ignored Colonel Charles de Gaulle's pleas to reform French armor doctrine to reflect Germany's successful demonstration of blitzkrieg warfare in Poland.

As the bitterly cold winter of 1940 gave way to spring, illusions regarding the war continued. Even an American intelligence assessment, correctly noting that Germany would complete its buildup along the French border in May 1940, concluded that no attack would follow. The Norway Campaign of April 1940 did little to weaken that common perception, which lingered in many minds until May 10, when the Germans launched their invasion of France and the Low Countries.

Skerki Bank, Battle near (December 2, 1942)

The naval action resulting from the nighttime interception of an Italian convoy to Tunisia by British warships operating from Algeria. Followin Operation TORCH, the Allied invasion of French North Africa on November 8, 1942, German and Italian troops withdrew into Tunisia and began building up their forces there. During the first critical weeks following the Allied invasion, the Allied naval command headed by the Royal Navy's Admiral Andrew B. Cunningham, commander in chief in the Mediterranean, did not interfere with the stream of Italian shipping crossing the Sicilian Channel. Malta's Force K was not reestablished until November 27 due to concerns about air support. On November 30 Cunningham constituted Force Q, commanded by Rear Admiral C. H. J. Harcourt, with three light cruisers and two destroyers at Bône in Algeria.

Signals intelligence from Luftwaffe Enigma intercepts informed the Allied naval command of an important Italian/German convoy of four transports designated Convoy H en route from Palermo to Bizerte, Tunisia, and at 5:30 p.m. on December 1, Force Q sallied on its first mission. Although Italian intelligence intercepted and decrypted the aerial sighting report that the British deemed necessary to protect the secret of their penetration of Enigma, naval headquarters decided that there was not time to withdraw Convoy H and that it must proceed.

Convoy H had an unusually strong escort under Captain Aldo Cocchia. It consisted of the destroyers *Da Recco, Camicia Nera* and *Folgore* and the torpedo boats *Clio* and *Procione*. When Cocchia learned that enemy warships threatened his force, he decided on a change of course to the south, hoping that this might confuse enemy forces searching for him. Unfortunately, the order confused his force more, as not all ships received the order or executed it correctly. Thus, Convoy H was scattered when Harcourt's ships appeared on the original convoy track. The light cruisers *Aurora, Sirius*, and *Argonaut* led, followed by the destroyers *Quiberon* and *Quentin*. At 12:38 a.m. the cruisers engaged one transport, setting off its cargo of munitions. In response, Cocchia ordered his warships to counterattack.

The *Camicia Nera* advanced and at 12:43 a.m. launched six torpedoes from an estimated range of 2,200 yards and then retired north as British salvos splashed closely around. The *Folgore* also fired six torpedoes at close range before withdrawing. At 12:52 a.m., however, nine 5.25-inch shells pounded the Italian destroyer, resulting in a large fire and extensive flooding. The *Folgore* took on a 20-degree list and at 1:16 a.m. capsized, with the loss of 126 men.

The *Procione* turned to counterattack after sighting the *Sirius* 2,000 yards off its starboard bow, but at 12:53 a.m. a broadside ravaged the torpedo boat, slaughtering the forward gun crew. The *Procione* withdrew southwest and never opened fire. The *Clio* made smoke and fired at British searchlights and muzzle flashes, while the *Da Recco* maneuvered to launch torpedoes.

Meanwhile, British warships were sailing alongside the convoy, firing and launching torpedoes at targets of opportunity. By 1:25 they had reached the head of the formation and began to circle back to the west. All four transports were either sunk or on fire by this time. At 1:30 a.m. the *Da Recco* closed to within 4,500 yards of the British ships, but the destroyer's torpedo

attack failed; concentrated fire from the *Sirius, Quiberon,* and *Quentin* killed 118 crewmen and left the ship dead in the water. Following this, the British column set course for Bône.

Harcourt's force had sunk every merchant ship. It had also sent to the bottom the *Folgore,* heavily damaged the *Da Recco,* and moderately damaged the *Procione*. Nearly 2,200 Axis sailors and troops lost their lives. Harcourt's ships had suffered only splinter damage in return. Force Q did not make it back to base unscathed, however. German aircraft surprised it at 6:30 a.m. and sank the *Quentin*. Nonetheless, the battle was a major setback for the Italian Navy. Although its counterattack was piecemeal and poorly coordinated, it was remarkable that the convoy escort had failed to inflict any damage whatsoever on the British.

Skorzeny, Otto (1908–1975)

German Schutzstaffel (SS) Obersturmbannführer and Waffen-SS lieutenant colonel. Born in Vienna, Austria, on June 12, 1908, Otto Skorzeny studied engineering at Vienna Technische Hochschule (Technical College). His involvement there in a dueling society led to his nickname, "Scar-face." Upon graduation, Skorzeny worked as an engineer. After the 1938 Anschluss (union) of Austria with Germany, Skorzeny volunteered as a pilot for the German Luftwaffe. Rejected because of his age, he joined the SS Leibstandarte Adolf Hitler Division (later the 1st SS Panzer Division).

Transferring to the SS Das Reich Division, he fought in the invasion of France and the Low Countries in the spring of 1940 and as a lieutenant in the invasions of the Balkans (April to May 1941) and the Soviet Union (June 22, 1941). Badly wounded in fighting on the Eastern Front, he was evacuated. On his recovery, he was assigned to a desk job in a supply depot.

In April 1943, Skorzeny was promoted to captain in the SS and placed in charge of German Special Troops. He studied British commando operations and set up a facility at a hunting lodge at Friedenthal near Berlin, where volunteers were trained in special operations techniques. On September 9, 1943, Skorzeny and his commandos gained international attention when they rescued deposed Italian dictator Benito Mussolini in a daring assault on Gran Sasso, a mountain resort where he was being held, freeing him within five minutes without firing a shot. On October 15, 1944, with Hungarian leaders trying to leave the war, Hitler sent Major Skorzeny and his commandos into that country. There they seized Milos Horthy, son of Hungarian regent Miklós Horthy, and the next day they seized the regent himself. A pro-Nazi government then took power in Hungary.

In late October, Hitler personally promoted Skorzeny to lieutenant colonel in the Waffen-SS and charged him with responsibility for covert operations for the upcoming Ardennes Offensive (December 16, 1944–January 25, 1945). Skorzeny took command of the 10th Panzer Brigade, a collection of 2,500 men from different units, some speaking English and dressed in American uniforms to commit sabotage and create havoc behind Allied lines. In Operation GRIEF (GRAB), the brigade experienced limited success creating confusion among U.S. troops.

With the defeat of the Ardennes Offensive, the brigade was disbanded, and Skorzeny fought briefly on the Eastern Front before he was transferred back to the west, where he led an unsuccessful effort to destroy the bridge captured by U.S. forces over the Rhine at Remagen (March 7).

Arrested after the German surrender and charged with war crimes, Skorzeny was acquitted for lack of evidence, but he was not released. He escaped from prison in July 1948 and made his way to Spain, where he married Countess Ilse Lüthje and established a prosperous engineering business. In 1952, the Federal Republic of Germany government declared Skorzeny *entnazifiziert* (denazified). However, he remained stateless until 1958, when he received an Austrian passport. Skorzeny also raised funds to

enable ex-SS men to find refuge in Latin America. He died of lung cancer in Madrid on July 7, 1975.

SLEDGEHAMMER, Operation

Code name for an Allied contingency invasion of France. Following U.S. entry into World War II in December 1941, President Franklin D. Roosevelt decided that the United States would endeavor to contain Japanese expansion in the Pacific while first concentrating on the defeat of Germany. At the Arcadia Conference (December 22, 1941–January 15, 1942), Roosevelt committed the United States to Operation BOLERO, the rapid buildup of U.S. forces in Britain.

American planners, especially U.S. Army chief of staff General George C. Marshall, advocated a cross-Channel invasion as the best means to end the war as quickly as possible. An invasion of France by the Western Allies would also relieve German pressure on the Soviet Union. British prime minister Winston L. S. Churchill, who feared a repetition of the bloody stalemate in Flanders during World War I, sought to commit major Allied military assets in the Mediterranean theater and involve the United States in efforts to contain Soviet power. Chief of the Imperial General Staff General Sir Alan Brooke supported that position.

Marshall directed Brigadier General Dwight D. Eisenhower of the War Plans Division to draw up a plan, which Marshall then presented to Roosevelt in March 1942, for a British-U.S. invasion of the French coast somewhere between Le Havre and Calais. Known as the Marshall Memorandum, it outlined two military options. The first of these was SLEDGEHAMMER. Originally conceived by the British as an emergency invasion of France to prevent a Soviet collapse (or to take advantage of the situation if German forces were defeated in the east and France became vulnerable to invasion), SLEDGEHAMMER was a high-risk operation. It is a matter of debate whether the War Department actually considered SLEDGEHAMMER viable. The second option, ROUNDUP, called for a 48-division invasion in early 1943.

Although the Marshall Memorandum emphasized that ROUNDUP was the preferred solution, it noted that even a failed small cross-Channel invasion of France would be preferable to dispersing Allied military assets elsewhere. The U.S. planners believed that the spring of 1943 was not only the earliest possible date for an all-out invasion of France but also could be the only date, as by 1944 the Soviet Union might have been driven from the war.

Churchill fought against SLEDGEHAMMER and ROUNDUP, believing that a cross-Channel invasion, even in 1943, was too risky. He favored the Mediterranean strategy, known as GYMNAST, in which British and French forces would invade and conquer French North Africa, supposedly without prejudicing ROUNDUP.

The Dieppe Raid of August 19, 1942, destroyed any illusions about the possibility of an Allied invasion of France in 1942 or even 1943. The cross-Channel invasion of France, ultimately known as Operation OVERLORD, did not occur until June 6, 1944.

Slessor, Sir John Cotesworth (1897–1979)

British marshal of the Royal Air Force (RAF). Born in Ranikhet, India, on June 3, 1897, John Cotesworth Slessor joined the Royal Flying Corps in World War I. During the interwar period, he held a variety of RAF positions, including as instructor and as a participant in the Waziristan Operations in 1936–1937. Slessor earned promotion to squadron leader in July 1932, to group captain in July 1937, and to air commodore in September 1937. Concerned with the effective use of airpower, he published a book, *Air Power and Armies,* in 1936.

Slessor played a key role in planning the force structure and strategic concept for the RAF in World War II while serving as director of plans for the Air Staff from 1937 to 1941. An advocate of a heavy bomber force and strategic bombing operations, Slessor was often involved in coordination and planning with senior American leaders throughout the war, including the January 1943 Casablanca Conference and the "ABC" staff discussions among the Americans, British, and Canadians to coordinate Allied plans should the United States enter the war.

In May 1941, Slessor assumed command of the 5 Bomber Group. In February 1942, he returned to the Air Staff and a newly established position, assistant chief of the Air Staff (Policy). In February 1943, he was appointed air officer commanding Coastal Command. In this post, he directed the successful offensive of land-based aircraft against German submarines transiting the Bay of Biscay. In May 1944, Slessor assumed command of RAF Mediterranean and Middle East forces. He was also deputy commander of the Mediterranean Allied Air Forces under U.S. Army Air Forces major general Ira Eaker. Slessor also helped plan and direct the air components of the final phase of the Italy Campaign (1943–1945) and the August 15, 1944, Allied landing in southern France, Operation DRAGOON.

In April 1945, Air Marshal Slessor returned to the Air Ministry as the air member for personnel, with responsibility for planning the demobilization of the wartime force and the development of the peacetime force structure of the RAF. Promoted to marshal of the Royal Air Force in 1950, Slessor ended his military career chief of the Air Staff from 1950 to 1952. He died in Wroughton, England, on July 12, 1979.

Slim, Sir William Joseph (1891–1970)

British Army field marshal. Born on August 6, 1891, in Bristol, William Joseph Slim came from humble stock. He joined the Officer Training Corps, and in August 1914 he was commissioned a second lieutenant. At Gallipoli in 1915, he received a serious wound, but he made a full recovery. He deployed to Mesopotamia in 1916, winning the Military Cross for valor before being wounded again and sent to India to convalesce.

Between the wars, Slim served with the Indian Army, honed his writing in part-time journalism, and distinguished himself as an instructor at the Staff College at Camberley and as a student at the Imperial Defence College.

By 1940, Slim was a brigadier commanding the Indian 10th Infantry Brigade. At Gallabat in the Sudan, his brigade retreated in the face of inferior Italian forces. After this error in judgment, he adopted a marked preference for the offensive. The next year, he was promoted to major general and assumed command of the Indian 10th Division in Iraq and Syria.

With the Japanese invasion of Burma (present-day Myanmar), Slim returned to the China-Burma-India theater in March 1942 to command the Burma Corps. Overwhelmed by the superior skill and mobility of attacking Japanese forces, Slim oversaw a 1,000-mile retreat, the longest in British Army history. Throughout, he kept his demoralized and seriously outclassed corps together, preserving 12,000 men to fight another day.

Promoted to lieutenant general and given command of XV Corps in April 1942, Slim worked to instill in his soldiers resilience and an aggressive attitude. Emphasizing fitness, night and jungle training, small-unit tactics, and self-reliance, he restored the confidence of a badly shaken army. As with the more famous Bernard Montgomery, Slim had the advantage of being not quite a gentleman. He spoke to his troops using their language (he knew Urdu and Gurkhali), and he shared their sacrifices, transmitting his own forceful personality to the units under his command. Slim continued his personal brand of leadership when he assumed command of the Fourteenth Army in May 1943.

General William Slim, one of the ablest British generals of World War II. He is shown here when he was chief of the British Imperial General Staff, August 10, 1948. In 1949 he was promoted to field marshal. (Keystone/Getty Images)

Slim's Fourteenth Army faced its sternest challenge with the Japanese HA-GO and U-GO offensives in March 1944, the latter aiming for Imphal and Kohima. Initially caught off balnce, Slim's army fought doggedly, forcing the Japanese to expend their momentum and limited supplies in costly attacks. Counterattacking, the Fourteenth Army pursued the Japanese across the malarial mountains of Burma during the monsoon season. In headlong retreat, the Japanese Fifteenth Army lost nearly half of its initial force of 150,000 men. Fighting a unified Japanese army with an aura of invincibility about it, Slim's multiethnic and religiously diverse army inflicted the largest land defeat on Japan to that time. Slim then led the reconquest of Burma until war's end.

After the war, Slim served as chief of the Imperial General Staff, and in 1949 he was promoted to field marshal. From 1953 to 1960, he was governor-general of Australia, becoming in 1960 First Viscount Slim. He published his memoirs, *Defeat into Victory*, in 1956. Slim died in London on December 14, 1970.

Sloops

See Corvettes and Sloops

Slovik, Edward Donald (1920–1945)

U.S. Army private and the only U.S. serviceman to be executed for desertion during World War II. Born on February 18, 1920, near Detroit, Michigan, Edward Donald Slovik was classified 4F because of his criminal record but reclassified as draft-eligible in 1943 because of a manpower shortage. In August 1944, Slovik was sent to France to join the 28th Infantry Division as a replacement.

On August 25, Slovik and another soldier became separated from their unit and fell in with a Canadian patrol. They spent six weeks with the Canadians before U.S. military police returned Slovik to his original company on October 5. Slovik told an officer that he was frightened of

combat and would run away again. Believing that his punishment would be the stockade, Slovik deserted the next day.

Returning to his unit, Slovik signed a confession of desertion. He was given a chance to clear himself of the charges, but he refused. He was court-martialed on November 11 and sentenced to be executed by firing squad. Supreme Allied commander General Dwight D. Eisenhower, believing it necessary for morale, approved the sentence, and the execution proceeded on January 31, 1945, near Saint-Marie aux Mines, France. Years later, U.S. president Jimmy Carter officially pardoned Slovik.

Smith, Holland McTyeire (1882–1967)

U.S. Marine Corps general. Born in Seale, Alabama, on April 20, 1882, Holland McTyeire Smith graduated from the Alabama Polytechnic Institute (today Auburn University) in 1901 and then earned a law degree at the University of Alabama in 1903. He then practiced law for two years in Montgomery. More interested in military service than law, Smith received a commission as a second lieutenant in the Marine Corps (1905).

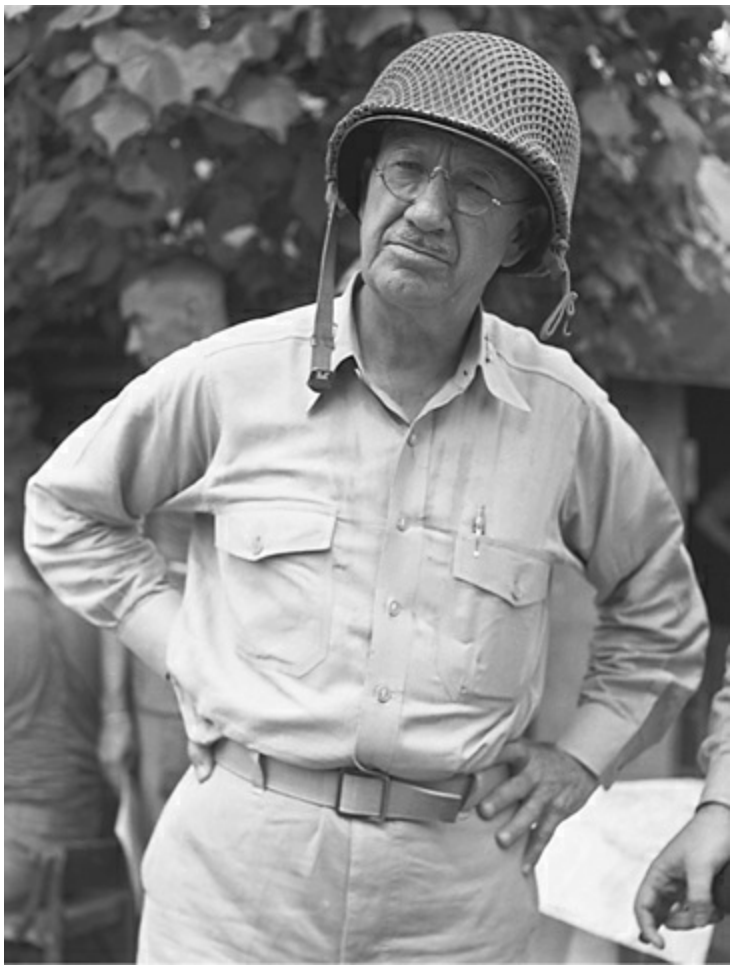
During the next decade Smith served in a variety of land and sea assignments, including in the Dominican Republic (1916–1917), where he experimented with amphibious landing techniques. During this time he also earned the nickname “Howlin’ Mad” for his frequent explosions of temper. Following U.S. entry into World War I, Smith fought in France with the 5th Marine Regiment and then served as adjutant to the 4th Marine Brigade. After postwar occupation duty in Germany, he returned to the United States in 1919.

Smith graduated from the Naval War College in 1921. An enthusiastic advocate and pioneer of amphibious warfare, Colonel Smith became director

of operations and training at Marine Corps headquarters in Washington, D.C. (1927). Here he worked to develop new tactics, landing craft, and amphibious tractors. Smith believed that amphibious warfare would be an essential element of any U.S. Pacific military operations. He was especially concerned about developing efficient amphibious landing craft and worked closely with Andrew J. Higgins on new designs.

Smith served as assistant to the Marine Corps commandant (April–September 1939). Promoted to brigadier general, Smith took command of the 1st Marine Brigade (September). Promoted to major general in February 1941, Smith deployed his brigade to Cuba to practice amphibious techniques. Doubled in size, it became the 1st Marine Division. In June, Smith assumed command of what became the Amphibious Force, Atlantic Fleet.

Smith headed marine amphibious training on the west coast of the United States and then commanded the joint Army-Marine V Amphibious Corps in the Central Pacific (June 1943). Smith's troops executed his amphibious tactics while seizing Japanese-held islands, and his forces took the Gilbert Island atolls of Makin (November 20–23) and Tarawa (November 20–24). Based on lessons learned at Tarawa, Smith urged the deployment of additional amphibious tractors and the development of more effective landing support techniques.



U.S. Marine Corps lieutenant General Holland M. “Howling Mad” Smith at his base on Saipan in 1944. (Corbis)

Smith’s forces then seized the Marshalls and Marianas, capturing Kwajalein (January 19–February 6, 1944) and Eniwetok (February 17–22) in the Marshalls as well as Saipan (June 15–July 9), Tinian (July 24–August 1), and Guam (July 21–August 10). On Saipan, however, Smith relieved army 27th Infantry Division commander Major General Ralph K. Smith for not being sufficiently aggressive. This action led to sharp marine-army recriminations but did not prevent Smith’s promotion to lieutenant general (February 1944), when he took command of the new Fleet Marine Force, Pacific (July 1944–July 1945). Smith directed the assault on Iwo Jima, the penultimate amphibious assault of the war, during February 19–March 26, 1945.

Smith assumed command of the Marine Training and Replacement Command at Camp Pendleton, California, in July 1945. He retired from the

Marine Corps in August 1946 as a full general, the third marine in history to reach that rank. Smith died in San Diego, California, on January 12, 1967.

Smith, Julian Constable (1885–1975)

U.S. Marine Corps lieutenant general. Born in Elkton, Maryland, on September 11, 1885, Julian Smith graduated from the University of Delaware in 1907 and was commissioned in the Marine Corps in 1909. He later participated in several U.S. operations in Latin America and the Caribbean. A 1928 graduate of the Army Command and General Staff School, Smith was an instructor at the Marine Corps Schools, then served in Nicaragua (1930–1933) and was operations officer with the 7th Marine Regiment (1933–1934).

Smith then became director of operations and training at Marine Corps Headquarters (1935–1938). From 1938 to 1940, Colonel Smith was chief of staff of the 1st Marine Brigade. Promoted to brigadier general in March 1941, Smith served as naval observer in London.

On his return to the United States, Smith was promoted to major general in October 1942 and assumed command of Marine Training Schools, Camp Lejeune, North Carolina. In May 1943, Smith commanded the 2nd Marine Division, leading it in the invasion of Tarawa in the Gilbert Islands during

November 20–24, 1943. In some of the war's heaviest fighting, Smith's marines defeated the tenacious Japanese defenders on Betio Atoll.

In April 1944, Smith became commanding general, Expeditionary Troops, Third Fleet. Smith's forces then captured the southern Palau Islands, and in September 1944, they occupied Ulithi, which became the hub of U.S. naval operations in the Western Pacific. In December 1944, Smith assumed command of the Department of the Pacific, a post he held until the end of the war.

In February 1946, Smith assumed command of the Parris Island Marine Base in South Carolina. He retired from the marines as a lieutenant general that December. Smith died at Fort Belvoir, Virginia, on November 5, 1975.

Smith, Ralph Corbett (1893–1998)

U.S. Army general. Born in Omaha, Nebraska, on November 27, 1893, Ralph Corbett Smith was commissioned a second lieutenant in the infantry in 1916. He received his bachelor's degree from Colorado State Teachers College in 1919. Smith participated in the Punitive Expedition into Mexico in 1916 and 1917, and served with the 1st Division in France during World War I.

Between the world wars, Smith was an instructor at the U.S. Military Academy at West Point, a student and an instructor at the Command and General Staff School, a student at the Army War College and the École Supérieure de la Guerre in France, and a member of the General Staff's Military Intelligence Division. In March 1942, Smith was appointed assistant commander of the 76th Infantry Division, and later that year as a major general, he assumed command of the 27th Infantry Division.

During the invasion of Saipan (June 15–July 9, 1944) in the Mariana Islands, Smith's 27th Infantry Division fought alongside two Marine Corps divisions as part of the Army-Marine Corps V Amphibious Corps. In the opinion of Major General Holland M. "Howlin' Mad" Smith, a marine who commanded V Corps, the 27th Infantry Division performed poorly. Before the battle's end, and with the concurrence of Admiral Raymond A. Spruance, commander of the operation, Holland Smith relieved Ralph Smith for a lack of aggressiveness.

The relief of an army general by a Marine Corps general was unprecedented and led to bitter recriminations. An army board of inquiry later exonerated Ralph Smith, and many army officers said that he had been victimized by his reluctance to sacrifice lives in ill-conceived frontal assaults planned by the corps staff. Holland Smith's defenders claimed that the relief was justified and that the army exonerated Ralph Smith to excuse the failings of the 27th Division. Whatever the merits of the arguments, U.S. Army chief of staff General George C. Marshall did not again permit Holland Smith to command army troops.

After his relief, Ralph Smith commanded the 98th Infantry Division and then served as military attaché in France before retiring in October 1946. Smith died in Palo Alto, California, on January 21, 1998.

Smith, Walter Bedell (1895–1961)

U.S. Army general. Born in Indianapolis, Indiana, on October 5, 1895, Walter Bedell Smith was nicknamed "Beetle." He joined the Indiana National Guard in 1910 and briefly attended Butler University. He then earned a

commission in the National Guard and served with the 39th Infantry in France during World War I, where he was wounded in August 1918.

Smith remained in the army after the war and proved himself a capable administrator. Assignments included the Bureau of Military Intelligence, the Bureau of the Budget, and the Federal Liquidation Board. He was also a student and then instructor at the Infantry School at Fort Benning, Georgia; the Command and General Staff School at Fort Leavenworth, Kansas; and the Army War College. His abilities were noted by General George C. Marshall, who became army chief of staff in September 1939. The following month Marshall named Smith assistant secretary of the General Staff and, in August 1941, secretary of the General Staff.

After the United States entered the war, Smith became the U.S. secretary to the Combined Chiefs of Staff in February 1942. Following heavy lobbying from European theater commander Lieutenant General Dwight D. Eisenhower, Marshall reluctantly ordered Smith to Europe in September 1942 to assume his most recognizable role as Eisenhower's chief of staff. Smith earned Eisenhower's trust to handle staff planning and administration, thus allowing his commander to spend more time on operational matters. In a post far less glamorous than battle command, Smith made decisions beyond staff direction, often issuing orders to field commanders in Eisenhower's name.

Eisenhower rejected any notion that Smith should be assigned anywhere but as his chief of staff. Entrusted by Eisenhower with the job of negotiating with Italian emissaries, Smith, through a combination of bluster and intimidation, secured the Italian surrender on September 3, 1943.

As planning for Operation OVERLORD began in earnest, Smith became chief of staff, Supreme Headquarters, Allied Expeditionary Force. The main body of the Operation OVERLORD plan, however, had been developed by British general Sir Frederick Morgan, who had been appointed chief of staff to the supreme Allied commander months before Eisenhower was assigned as that commander. When Eisenhower insisted on Bedell Smith being his chief of staff, Morgan loyally agreed to step down; Morgan served to the end of the war as Smith's deputy.

On June 5, 1944, when Eisenhower turned to Smith for advice on whether he should launch the Normandy landings, Smith urged that the attack proceed, calling it "the best possible gamble." The invasion began the

following day. When the Third Reich collapsed, Eisenhower authorized Smith to accept the German surrender at Rheims on May 7, 1945.

In January 1946, Smith returned to Washington to be chief of the Operations and Planning Division of the Joint Chiefs of Staff. In March, President Harry S. Truman appointed him ambassador to the Soviet Union, where he remained until 1949. Smith was convinced that the United States should take a strong stand against Soviet expansion and that the Soviet Union would back down if confronted by American power. From 1950 to 1953, Smith served as the second director of the Central Intelligence Agency. He was promoted to full general on August 1, 1951. Smith retired from the army on February 9, 1953. He also served as undersecretary of state in the Eisenhower administration.

Smith retired from government service in October 1, 1954. He then entered private business. Smith died in Washington, D.C., on August 9, 1961.

Smolensk, Battle of (July 10–August 5, 1941)

Crucial battle at the beginning of the German invasion of the Soviet Union (Operation BARBAROSSA, June 22). Smolensk was an important rail and communications center 200 miles from Moscow. The historic gateway to Moscow, Smolensk is located at the western exit from the 50-mile gap between the Dnieper and Dvina Rivers. Soviet marshal Semen Timoshenko

took command of the West Front comprising seven armies with weak infantry divisions and virtually no mobile reserves to stem further German advances. He organized his forces on the Dnieper River line anchored by Vitebsk and Mogilev as the first-echelon defense of the heart of the Soviet Union.

The large concentration of Soviet troops served as a magnet for German commanders, who sought to encircle their enemy in a decisive battle. The armored spearheads of Colonel General Heinz Guderian's Second Panzer Group and General Hermann Hoth's Third Panzer Group were to cross the Dvina and Dnieper Rivers, advance on a parallel axis along the Minsk-Moscow highway, and link behind Smolensk to trap the Soviets. Colonel General Alexander Löhr's Fourth Air Fleet provided aerial support. The plan was risky, as the speed it required of the mechanized elements would preclude use of the slower infantry armies needed to secure the vulnerable flanks of the panzer groups.

On July 10, the Second Panzer Group crossed the Dnieper and bypassed Soviet troop concentrations without concern for flank security, heavy rains, or determined Soviet resistance. Guderian drove his forces deep toward Smolensk. At the same time, the Third Panzer Group captured Vitebsk and forced the Soviet defense toward Velikiye Luki. By July 13, three Soviet armies were withdrawing toward Smolensk to establish a defense of the city. To buy time, Timoshenko ordered counterattacks with his remaining armies into the exposed flanks of the Second Panzer Group, which led to bitter fighting and slowed the German mechanized elements.

On July 16, Guderian's Second Panzer Group captured Smolensk, and the Third Panzer Group captured Yartsevo to form an elongated pocket around three Russian armies trapped north of the Dnieper. Instead of trying to close the pocket, however, Guderian sent his panzers toward Yelnya, forfeiting a *Kesselschlacht* (cauldron, or encircling battle) and offering a salient for the Soviets to attack. On July 20, Timoshenko formed new armies to counterattack and pin down German forces, especially those in the Yelnya salient. As 60-mile-long columns of Soviet infantry moved forward and hundreds of trains appeared loaded with vehicles and tanks, the Germans realized that the Red Army had not yet been beaten.

Furious fighting raged around Smolensk as the Soviets counterattacked to hold open a corridor for more than 100,000 men to escape. The Soviets lost the Battle of Smolensk, although fighting continued there until August 5. In the Smolensk pocket, the Germans took more than 300,000 prisoners, 3,000 guns, and 3,200 tanks. The victory strained the German forces at all levels, however, forcing a pause of several weeks. As Adolf Hitler and the German Army high command debated whether the next objective should be Moscow or Ukraine, the Soviets reorganized and prepared their defenses that would halt the Germans at the gates of Moscow.

Smuts, Jan Christian (1870–1950)

South African politician and honorary British field marshal. Born to Afrikaaner parents at the family farm, Bovenplaats, at Riebeeck West, Cape Colony, on May 24, 1870, Jan Smuts won highest honors at Christ's College, Cambridge. He then practiced law in Capetown. During the 1899–1902 South African War (Second Boer War), he fought against the British as a Boer general. Following the war, Smuts, who was a close ally of Louis Botha, helped draft the constitution of the Union of South Africa and sought accommodation with the British.

When World War I began, Smuts was defense minister under Prime Minister Botha and headed the southern offensive that took control of German South-West Africa (the future Namibia) from the Germans. Made a British Army general, Smuts then commanded British operations in East Africa. By the time World War I ended, he had joined the British Imperial War Cabinet as minister of air and helped organize the Royal Air Force, the world's first independent air arm. Smuts represented South Africa during the 1919 Paris Peace Conference, where he supported the League of Nations and helped develop the mandate system.

On the death of Botha, Smuts became prime minister of South Africa in August 1919. He remained in that post until the Nationalists attained power in 1924. In 1933, he formed a coalition with Nationalist Party leader (James) Barry Hertzog and was deputy prime minister. On the outbreak of war with Germany, Hertzog favored South African neutrality. Smuts, who advocated

war with Germany, narrowly defeated Hertzog in Parliament and became prime minister again on September 6, 1939. He was also minister of defense, and from June 1940, he commanded South African armed forces in the war. During the conflict, despite his unprecedented power, Smuts overcame significant opposition to his policies from Nazi sympathizers, although he refused to suppress his opponents completely.

South African prime minister Jan Christian Smuts was a close personal friend of British prime minister Winston Churchill and aligned his nation firmly behind the Allied war effort. Smuts was made a British field marshal for his efforts. (Library of Congress)

Smuts's longtime friend British prime minister Winston L. S. Churchill frequently consulted with him on strategic matters. Smuts was a strong advocate of holding onto Egypt, no matter the cost; thus, South African forces, following their participation in the East Africa campaign, deployed to

Egypt in late 1941. The next year, they helped to take the island of Madagascar. In 1941, Smuts was made an honorary British field marshal.

Smuts was also a staunch advocate of the formation of the United Nations (UN), and he wrote its preamble and helped draft its charter. In April 1945, Smuts attended the San Francisco Conference and was thus one of the UN's official founders. His internationalist outlook undoubtedly cost him political support at home, however, and in 1946 Smuts retired following his defeat in the general elections. Smuts died at his home near Pretoria on September 11, 1950.

Snipers

Highly trained infantry riflemen firing at long range from concealment against selected enemy targets. Sniping was a phenomenon of World War I that did not seem likely to occur in World War II because of the initial rapid advances of invading German and Japanese troops. When military operations began to take on a more static aspect, however, it was realized that sniping could be of great value, especially in affecting morale. The ability of a seemingly invisible sniper to kill individuals at a range of 600 or even 1,000 yards could have a significant effect on the attacked unit. Snipers generally worked in pairs, one acting as a spotter while the other handled shooting.

Heinrich Himmler can be considered the instigator of German sniper training. He began a Waffen-Schutzstaffel (Waffen-SS) sniper training program. The Germans had sold off many of their sniper rifles and had not reordered any telescopic sights, but Himmler rectified this situation. At first

the Germans used any rifle to which a telescopic sight could be fitted, but later they concentrated on the standard infantry rifle, the Kar 98k, fitted with telescopic sights.

When the German Army invaded the Soviet Union on June 22, 1941, it encountered many Soviet snipers and needed to neutralize them. The Soviet snipers were at first more numerous than skilled, but they improved with training and experience. Stories abound of Russian snipers' effectiveness. One sniper killed 75 German soldiers and wounded another 25 from the German 465th Infantry Regiment in September 1941. Russian snipers were armed chiefly with the Mosin-Nagant 1891/30 rifle, which was fitted with a variety of telescopic sights.

As the war progressed, snipers appeared in increasing numbers on both sides on the Eastern Front. The Soviets had snipers who recorded tallies of 400 or even 500 dead. The leading German sniper managed about 300 kills. The movie *Enemy at the Gates* (2001) celebrated the success of Soviet sniper Vasily Zaitsev in the Battle of Stalingrad.

In the Pacific theater, U.S. Army snipers were equipped with the Springfield. 30-caliber M1903 A-3 and A-4 rifles, with a commercial 2.5-magnification telescopic sight. The sight was fragile, having been designed for deer hunting. Because the rifle had no iron sights fitted, if the telescope was damaged the rifle was rendered useless for sniping. In all, the U.S. Army issued some 28,000 Springfield sniper rifles. The M-1 Garand service rifle was also fitted with a telescopic sight and designated as the M-1C or M-1D, but this came too late in the war to have great effect on sniping techniques and practice.

The U.S. Marine Corps has always had a great interest in sniping, and it parted from the commercial telescopic sight to fit a Unertl scope, which had military durability. One marine sniper, Private David Cass, shot down a Japanese machine-gun crew at a range of 1,200 yards. Japanese snipers often, to their own danger, were roped into trees from which they could fire on advancing Allied troops. Many were killed by machine-gun fire, and on one celebrated occasion a Japanese sniper was comprehensively dispatched by a round from a Boys .50-caliber antitank rifle, which went straight through the tree and the sniper.

Sergeant P. Dorzhiev, a Red Army sniper credited with killing 181 German soldiers on the Leningrad front, looking through binoculars and holding his rifle, 1942. (Library of Congress)

The British Army had long been intensely interested in long-range rifle marksmanship, and in February 1940 it established a sniper training school at Bisley Camp in England. Initially, British snipers used the vintage Pattern 1914 Enfield rifle. The British seldom used snipers in the first half of the war; the war of movement in France and the Low Countries in 1940 did not offer opportunities for sniping, and in the Western Desert Campaign, heat distortion and the lack of cover made sniping virtually impossible.

In the campaign in Sicily (July 9–August 22, 1943), however, sniping regained its importance for the British. By this time, snipers were using the new British service rifle, redesignated Rifle No. 4 Mk 1 (T). Originally standard-issue weapons, the rifles were then sent to the London gun makers Holland and Holland for rebuilding. Although there was some criticism of the telescopic sight used, at least one British sniper engaged Germans at a range of 700 yards and scored several hits.

Begun as a minor activity in all armies in World War II, sniping soon accumulated its own lore, and the sight of an oddly dressed rifleman clutching a telescopic rifle and accompanied by another rifleman with a spotting telescope became more and more common. Their impact was

remarkable, and defending troops went about their business in considerable peril of their lives. Sniping continues in today's militaries.

Snorkel

A hollow mast through which a submarine draws air from the surface so that it may operate internal combustion engines while submerged. Although suggestions for such a device emerged in the U.S. Navy as early as 1914 and primitive arrangements were even tested contemporaneously by Imperial Russian Navy submarines, there were no operational installations of snorkels until the late 1930s.

In 1933 Lieutenant Commander Jan J. Wichers of the Royal Netherlands Navy took out a patent for an extensible air mast and subsequently developed his concepts further to incorporate an automatic head valve, intermediate cushioning via a float to compensate for pressure variations, and internal connections and air containers within the submarine. The Dutch knew it as the *snuiver* (sniffer). The first installations were in the Dutch submarines *O-19* and *O-20*, completed in 1939. They incorporated a motor drive to extend or lower the mast, although the exhaust tube was fixed. Both boats sailed to the Netherlands East Indies, where they operated against Japan after December 1941.

The succeeding Netherlands O-21 class carried a fully extensible system. When Germany invaded and conquered the Netherlands in May 1940, the *O-21* through *O-24* escaped to Britain, where Royal Navy designers studied them but took little interest in their breathing devices, which were removed

before the submarines reentered service. German technicians, too, found this equipment of little use when they examined the captured *O-25, O-26,* and *O-27* and also had it removed before deployment.

In 1943, however, German interest in the concept revived, largely at the instigation of designer Hellmuth Walter. He urged its adoption to permit extended submerged U-boat operation while using diesels as a counter to the ever more successful Allied antisubmarine campaign. Wichers's design was modified to use the entire boat interior as an air cushion from which the engines could freely aspirate. After urgent testing, installation began in September 1943, with priority going to equipping boats already operational, followed by new construction vessels. The first submarine fitted with the snorkel was the *U-58,* operating in the Baltic.

In service, snorkel-equipped U-boats proved capable of operations in areas the Allies considered safe from submarines. Nevertheless, they suffered from two operational problems that have continued to concern submariners: restricted speed while snorkeling and a greater detection signature. Wartime installations limited U-boats to five to six knots, while the head float was both a relatively large radar target and a cause of visible spray.

Postwar examination of captured U-boats rapidly inspired the U.S. Navy, the Royal Navy, and the Soviet Navy to install snorkel equipment in submarines, moves quickly followed by other navies. Testing soon revealed a third problem: the diesels transmitted their entire noise signature into the surrounding water and made snorkeling submarines easy to detect. Furthermore, improved designs that allowed greater underwater speed only exacerbated the wake problem. Consequently, most snorkel design efforts since the late 1940s have focused on reducing the size and radar reflectance of the head, careful streamlining to diminish wake formation, and rigorous machinery sound reduction.

Despite disadvantages, the snorkel has equipped almost every operational submarine since the early 1950s. Nuclear boats rely on snorkels to run important auxiliary machinery when submerged, while the very operational efficiency of conventional and closed-cycle vessels requires them.

Sokolovsky, Vasily Danilovich (1897–1968)

Soviet marshal of the Soviet Union. Born in the village of Koz′liki, Grodno Province (then Poland), on July 21, 1897, Vasily Danilovich Sokolovsky joined the Red Army in 1918. During the Russian Civil War, he rose to command the 32nd Rifle Division. He attended the Red Army Military Academy of the General Staff in 1921 and served in Central Asia as deputy chief of the Operations Directorate of the General Staff. Sokolovsky was then chief of staff of a division and corps, commanded a division from 1930 to 1935, was deputy chief of staff of the Volga Military District, and was chief of staff of the Urals Military District and then the Volga Military District.

Promoted to major general in May 1938 and to lieutenant general in June 1940, Sokolovsky was deputy chief of the General Staff in February 1941. In the midsummer of 1941 he became chief of staff of the Western Front, which was responsible for the defense of Moscow. Promoted to colonel general in June 1942, he commanded the Western Front in February 1943. He fought in the Battle of Kursk (July 5–13, 1943) and was promoted to army general in August. As chief of staff of Marshal Georgii Zhukov's 1st Ukrainian Front beginning in April 1944, Sokolovsky alternated between duties in the field and in Moscow. He was deputy commander of the 1st Belorussian Front during the capture of Berlin (March 31–May 2, 1945).

After the war, Sokolovsky was deputy to Zhukov as commander of the Soviet occupation forces in Germany and governor of the Soviet zone of Berlin. Promoted to marshal of the Soviet Union in 1946, he commanded Soviet occupation forces in Germany from 1946 to 1949. He then became first deputy minister of war and then chief of the General Staff from 1952 to 1960. His final assignment was as general inspector and head of a group working to formulate Soviet nuclear war strategy. Sokolovsky died in Moscow on May 10, 1968.

Solomon Islands, Naval Campaign (August 1942–February 1943)

Extended six-month South Pacific naval campaign between Allied and Japanese forces that halted the Japanese Pacific advance. Between May and July 1942, Japan sought to expand its defensive ring into the eastern and central Solomon Islands. As a part of this drive, it sent elements of the Eighth Army to occupy the island of Guadalcanal. On July 6, the Japanese began construction of an airfield there, from which they would be able to bomb the advanced Allied base at Espiritu Santo.

News of the construction project forced U.S. commanders to expedite their plan for the Solomons, known as Operation WATCHTOWER. Conceived and advocated by U.S. chief of naval operations Admiral Ernest J. King, WATCHTOWER called for securing the island of Tulagi as an additional base to protect the U.S.-Australia lifeline and as a starting point for a drive up the Solomons to Rabaul. Vice Admiral Robert L. Ghormley, U.S. commander in the South Pacific under Admiral Chester W. Nimitz, then dispatched an amphibious force under Rear Admiral Richmond K. Turner to lift Major General Alexander A. Vandegrift's 1st Marine Division from Nouméa to the Solomons. Vice Admiral Frank J. Fletcher's three-carrier task force provided protection.

On August 7, 1942, the marines went ashore on Tulagi and Guadalcanal and captured the airfield, which they renamed Henderson Field. The airfield soon became the focal point of fighting on the island. In all, the protracted struggle for Guadalcanal (August 1942–February 1943) included 10 major

land actions, 50 engagements involving warships or aircraft, and 7 major naval battles.

The Japanese did not send their main fleet but rather ships in driblets. The Americans soon had Henderson Field operating; U.S. land-based airpower controlled “the Slot” (the narrow channel through the Solomon Islands) during the day, but the Japanese initially controlled it at night. The Imperial Japanese Navy excelled at night fighting, for which its crews had been intensively trained, as was shown in the Battle of Savo Island (August 9, 1942).

When he learned of the landings at Guadalcanal, Vice Admiral Mikawa Gunichi at Rabaul immediately made plans to reinforce the Japanese garrison on Guadalcanal and attack the vulnerable ships at the landing site. Meanwhile, Vandegrift needed four days to unload all the transports, but Fletcher replied that he could not leave his carriers in position more than 48 hours, and he began removing them on the evening of August 8. On the night of August 8–9, Mikawa arrived off the landing site and proceeded to administer the worst defeat suffered by the U.S. Navy in a fair fight.

In the Battle of Savo Island, Mikawa sank four Allied cruisers (three U.S. and one Australian) and a destroyer. Three other ships sustained heavy damage. Mikawa did not suffer any losses in the battle, although one of his cruisers was sunk by a U.S. submarine in the return to Rabaul. Mikawa, however, had hauled off without attacking the vulnerable transports. The battle clearly demonstrated Japanese superior night-fighting techniques, excellent gunnery, and the effectiveness of Japan’s Long Lance torpedo.

Both sides now reinforced Guadalcanal, but U.S. possession of Henderson Field tipped the balance. Rushed to completion, it ultimately boasted about 100 U.S. aircraft. At night the so-called Tokyo Express of Japanese destroyers and light cruisers steamed down the channel between the islands and into the sound to shell marine positions and deliver supplies. The latter effort was never sufficient and only haphazard. It often consisted of drums filled with supplies pushed off the ships to drift to shore.

U.S. Navy dive bombers attacking Japanese-held Tulagi Island during the Solomon Islands Campaign of August 1942-February 1943. (Iconic Archive/Getty Images)

The next major naval action was the August 22–25 Battle of the Eastern Solomons. Rear Admiral Tanaka Raizo dispatched to Guadalcanal a convoy of destroyers and transports carrying troop reinforcements. Admiral Kondō Nobutake steamed from Truk toward the Solomons with a task force to provide protection. Fletcher's carrier aircraft intercepted the Japanese and sank the light carrier *Ryujo* and several other vessels, but the carrier *Enterprise* suffered damage. On August 31, the Japanese torpedoed and badly damaged the carrier *Saratoga*, reducing U.S. carrier strength to only the *Wasp*. It in turn fell victim to a Japanese submarine on September 15. The carrier was so badly damaged by three torpedoes that it had to be scuttled.

Another major naval encounter, the Battle of Cape Esperance, occurred during October 11–13. The Americans detected a Japanese convoy off the northwest coast of Guadalcanal. In a night engagement on October 12–13, the Japanese lost a cruiser and a destroyer and had a cruiser heavily damaged; one U.S. destroyer was lost, and two cruisers were damaged. The next day, U.S. aircraft sank two other Japanese destroyers that were searching for survivors. Although the battle was not decisive, it was the first U.S. Navy night victory against the Japanese and substantially lifted U.S. morale. In

October, there were important command changes: Vice Admiral William F. Halsey replaced Ghormley, and Rear Admiral Thomas C. Kinkaid replaced Fletcher.

Meanwhile, Kondō's repositioning of ships and Halsey's instructions to Kinkaid to seek out the Japanese fleet brought on a fourth naval battle for control of the Solomons: the Battle of the Santa Cruz Islands. In the ensuing engagement of October 26–27, each side launched simultaneous strikes against the other. In the exchange, U.S. aircraft badly damaged the Japanese light carrier *Zuihō* and fleet carrier *Shōkaku*. The U.S. carrier *Hornet* was also severely damaged and placed under tow, but with Kondō's ships closing in, it was abandoned to be sunk by Japanese destroyers. Japan won the battle, leaving the United States with only one carrier in the South Pacific, but the Japanese sustained such losses that they were unable to exploit the situation.

From November 12 to 15, a series of intense sea fights took place off Guadalcanal. In the first, on November 12–13, U.S. ships and land aircraft blocked reinforcement of the island by Japanese troops in 11 transports protected by destroyers. At the same time, Rear Admiral Daniel J. Callaghan, commanding five cruisers and eight destroyers, moved to intercept a powerful Japanese force under Vice Admiral Abe Hiroaki that included two battleships that sought to shell Henderson Field.

In a night action east of Savo Island, both sides suffered heavy losses. Abe lost the battleship *Hiei* (badly damaged in the fight, it fell prey to U.S. aircraft the next morning) and two destroyers. The United States lost two cruisers and four destroyers. Virtually all other ships on both sides were damaged. Rear Admirals Callaghan and Norman Scott were among the dead, but Tanaka was forced to turn back, and the planned Japanese bombardment of Henderson Field was canceled.

On November 13 and 14, Tanaka returned with his reinforcement convoy, and a force of cruisers under Rear Admiral Nishimura Shoji shelled Henderson Field. It failed to knock out the airfield, however, and U.S. aircraft sank one cruiser and damaged another as Nishimura's force withdrew north. The aircraft then attacked Tanaka's convoy and sank six transports.

During the third phase of the naval Battle of Guadalcanal (November 14–15), Rear Admiral Willis A. Lee with two battleships and four destroyers met and defeated yet another Japanese force under Kondō near Savo Island. The United States lost two destroyers, but Kondō lost the battleship *Kirishima* and

a destroyer. The net effect of this three-day battle was that Tanaka landed only some 4,000 troops. The Japanese lost six transports sunk, but they had to beach another four, representing some 70,000 tons of scarce shipping. Most important from the U.S. standpoint was that U.S. forces now had round-the-clock control of the waters around Guadalcanal.

On November 30, U.S. and Japanese naval forces again clashed in the Battle of Tassafaronga. Rear Admiral Carlton H. Wright moved with five cruisers and seven destroyers to intercept Tanaka's force of eight destroyers carrying supplies to Guadalcanal. In the ensuing fight Japan lost one destroyer, while the United States had one cruiser sunk and three others badly damaged.

As the numbers of U.S. troops ashore steadily grew and Japanese strength dwindled, at the end of December Tokyo decided to abandon Guadalcanal entirely, and the naval battles of the Solomons came to an end. The final battle of the campaign was a skirmish off Rennell Island on January 30, 1943, a victory for Japan. By this time the Japanese had almost completely withdrawn from Guadalcanal, though. The sustained battle for Guadalcanal gave U.S. naval forces the initiative and led to improved U.S. Navy night-fighting and fire-control techniques that served it well in the long years of fighting ahead.

Somalia

Somalia is located on the Horn of Africa (Africa's east-central coast) and currently encompasses 246,200 square miles. Somalia's 1939 population was approximately 1.45 million. Northern Somalia lies on the choke point of the Red Sea and the Gulf of Aden; Italian ports in southern Somalia offered bases for raiding into the Indian Ocean. In 1940, Somalia was divided into three colonies.

Italian Somaliland, the largest territory, had 1,200 miles of coastline. Its capital was Mogadishu. In 1936, Italian Somaliland had been incorporated as an enlarged province (having received much of Ethiopia's southern desert region) into Africa Orientale Italiana (AOI). The AOI consisted of all Italian East Africa.

British Somaliland, with its capital of Berbera, bordered the Gulf of Aden. It lacked a good harbor and resources. French Somaliland was a tiny enclave sandwiched between British Somaliland and Italian Eritrea. Its harbor at Djibouti, however, was the finest of any of the three Somali colonies. All three territories were arid or desert, although British Somaliland did have a high plateau in the interior. Djibouti boasted the only railroad, which wound its way through the Ethiopian highland to Addis Ababa.

In 1939 and 1940, the French reinforced their colony to a total of about 7,000 men under General of Brigade Paul L. Legentilhomme. When Germany defeated France in June 1940, Legentilhomme attempted to have the territory declare for the Free French. French governor Hubert J. Deschamps and local commanders of France's navy and air force opposed him, however, forcing Legentilhomme to flee on August 5, 1940, to British Somaliland with some French troops and several hundred anti-Italian Ethiopian refugees who had been undergoing training by the French. French

Somaliland remained under a weak Allied naval blockade until December 1942, when Free French and Allied forces recaptured the colony.

Following their own entry into the war in June 1940, the Italians successfully invaded British Somaliland that August. An overwhelming force with command of the air led by Lieutenant General Guglielmo Nasi advanced in three columns and fought a sharp action at Tug Argan on August 12, 1940, resulting in the British retreat to Berbera. The Royal Navy evacuated 5,300–5,700 troops and 1,000 civilians, most of them going to nearby Aden. Commonwealth losses in this campaign were 140 killed or wounded and 120 missing. Italian losses were 465 killed, 1,530 wounded, and 34 missing, the vast majority being Somali troops. This Italian military success shortened the AOI defensive perimeter substantially.

At the time, there were few Commonwealth forces on the Kenyan border with Somalia and Ethiopia. Lieutenant General Gustavo Pesenti commanded Italian forces on the Kenyan border. The Italian military effort had focused largely on British Somaliland; now, cut off from home and with limited resources, the Italians went on the defensive. Meanwhile, British Commonwealth strength in Kenya increased under Lieutenant General Alan G. Cunningham, commanding the East Africa Force. This eventually numbered one South African division and two African divisions.

In mid-December 1940, Cunningham began raids on the AOI from Kenya, using effective light South African armor as a key component. A raid on December 16–17, 1940, against El Wak in Somalia not only showed up Pesenti as an incompetent commander but also cost the Italians valuable cipher material that helped Commonwealth forces read Italian radio traffic. Major General Carlo de Simone, who had distinguished himself at the Battle of Tug Argan, now replaced Pesenti.

Relying heavily on South African motorized units, Cunningham launched a major offensive against southern Somalia on the night of February 8–9, 1941. Commonwealth forces advanced with flanking movements up the Somalia coast, quickly collapsing the Italian positions. Mogadishu fell to the British on February 25 without a fight. Using captured ports and supplies and innovative sea and land transport, by March 1, 1941, Cunningham had sent a column to pursue the Italians into the highlands toward Harar.

To complete the Italian debacle in Somalia, naval, air, and land forces, making up the Aden Force, landed at and easily took Berbera on March 16,

1941. This port soon became a key supply point for Cunningham's advancing forces, which captured Addis Ababa on April 16. The fighting in Somalia was over, although warfare continued in Ethiopia in Gondar north of Lake Tana until late November 1941. The campaign in Somalia and the southern AOI was a classic military operation, involving the defeat of an enemy in detail through the use of motorized columns to flank each successive defensive position.

Somervell, Brehon Burke (1892–1955)

U.S. Army general. Born in Little Rock, Arkansas, on May 9, 1892, Brehon Burke Somervell graduated from the U.S. Military Academy at West Point in 1914 and was commissioned a second lieutenant in the engineers. He served in the Punitive Expedition into Mexico (1916–1917) and in engineer and staff posts with the American Expeditionary Forces during World War I.

Somervell graduated from the Command and General Staff School in 1923 and from the Army War College in 1926. He directed a comprehensive study of the Turkish economy in 1933–1934 and headed the sprawling Works Progress Administration (WPA) in New York City from 1936 to 1940. In 1940, Somervell's army superiors, impressed by the managerial skills he had demonstrated in his engineering assignments with the WPA, named him head of the army's floundering Construction Division, which had fallen behind in the building of training camps and munitions plants as the nation rearmed.

A hard-driving leader who had little tolerance for bureaucratic red tape, Somervell had the building program on schedule within a year, expediting its

operation and initiating new projects, including the construction of the Pentagon. In March 1942, after briefly serving as G-4 (assistant chief of staff for logistics) on the War Department General Staff, Somervell was appointed chief of the newly established Services of Supply, later renamed the Army Service Forces, with the rank of lieutenant general.

In this post, Somervell emerged as a major figure in the U.S. Army's conduct of the war, directing the procurement and shipping of supplies and equipment and serving as the army's top logistics adviser. Recognizing the importance of logistics to victory, Somervell spared no effort in seeing that American soldiers were well equipped.

Following his retirement in April 1946, Somervell became president of Koppers Company, and within five years he turned the struggling company into a highly profitable enterprise. Somervell died in Ocala, Florida, on February 13, 1955.

Somerville, Sir James Fownes (1882–1949)

British Royal Navy admiral of the fleet. Born at Weybridge, Surrey, on July 17, 1882, James Fownes Somerville entered the Royal Navy as a cadet aboard HMS *Britannia* in 1897. During World War I, he distinguished himself in the Dardanelles/Gallipoli Campaign in 1915. Assigned to the navy Signal School, he was director of the Signal Department in the Admiralty from 1924 to 1927.

In 1931, Somerville commanded a cruiser. Following service at Portsmouth, he was promoted to rear admiral and commanded destroyer flotillas in the Mediterranean Fleet. He then commanded the East Indies

station but was invalided home in 1938 with tuberculosis and placed on the retired list as a vice admiral in July 1939.

When World War II began, Somerville volunteered his services. He distinguished himself working on the development of radar and then as Vice Admiral Bertram Ramsay's subordinate during the May 26–June 4, 1940, Dunkerque evacuation. After the fall of France, the Royal Navy established a covering force at Gibraltar with Somerville in command.

In Operation CATAPULT (July 1940) Somerville negotiated with French admiral Marcel Gensoul to neutralize French naval units at Mers-el-Kébir. Somerville's Force H launched successive attacks on Oran and Dakar with aircraft and gunfire. The *Ark Royal*'s aircraft then struck Italian bases at Genoa, Livorno, and on Sardinia and Sicily, and Force H covered multiple convoys to Malta from August 1940 to March 1942. Force H fought in the Battle of Cape Teulada on November 26, 1940, and played a decisive role in hunting down the German battleship *Bismarck* in May 1941.

In March 1942, Somerville took command of the Eastern Fleet, conducting holding operations against the Japanese First Air Fleet's Indian Ocean offensive. His carriers covered the Diégo-Suarez (May 5–7, 1942) and Madagascar (September 1942) operations before withdrawing to serve elsewhere. Somerville's Eastern Fleet carriers recommenced offensive operations in 1944 until he relinquished command in August. He was reinstated as an admiral on the active list after five years' war service at sea.

Somerville went to Washington, D.C., in October 1944 to head the British naval delegation. He was promoted to admiral of the fleet in May 1945 and retired permanently the next year. Somerville died at Wells, Somerset, on May 19, 1949.

Sonar

Sonar—known as asdic (for Allied Submarine Detection Investigation Committee) in British and Commonwealth navies until the 1950s—was the most important underwater detection device during World War II. Sonar took two forms: in its active form, it emitted sonic impulses and measured distance and direction through receiving their reflections; in its passive form, it determined bearing and range through comparative analysis of received sound.

The Anti-Submarine Detection Investigating Committee (a British entity) produced an experimental sonar set in 1918, but the first operational units did not go to sea until 1928 (aboard British A-class destroyers). By 1940, most major navies deployed some form of active sonar aboard antisubmarine vessels. All were searchlight units that used high-frequency emissions (20 to 40 kilocycles). They had short ranges (to 3,500 yards) and were ineffective at speeds much above 15 knots. Such sets also had a 200-yard dead zone and slow operating rates, and they determined direction but not depth. Most navies, in consequence, relied heavily on hydrophones for submarine search and used sonar primarily for attack guidance.

Major wartime sonar developments attempted to address these deficiencies. Power rotation and improved displays enhanced operating rates, and streamlined steel domes raised useful search speeds. Dual-frequency sets (operating at either 14 or 30 kilocycles) enhanced ranges, and tilting transducers helped to eliminate, or at least reduce, the dead zone.

Realization of the performance capabilities of German submarines, in particular, drove sonar development. The introduction of heavy depth charges and the monster Mark X* weapon to counter deep-diving U-boats required methods for accurately determining the target’s depth because of the still relatively slow sink rate of these weapons. For accurate depth determination,

Britain developed a specialized sonar (Type 147B) that was fitted from 1943 to some Atlantic escorts in addition to its standard type.

A simultaneous line of development—scanning sonar that used an omnidirectional transmitter coupled to an array of fixed receiving transducers—offered a possible solution to several of the search problems: range, depth determination, and the dead zone. Such equipment required greater power to maintain range. Because rotation was eliminated, however, it could be larger and so could operate at lower frequencies, enhancing performance. The successful operational deployment of such equipment in Allied navies had to wait until after the war though.

Wartime submarines also carried sonar. Most navies relied on active sets for target detection, but Germany pursued a different course with its Gruppenhorchgerät (GHG), a standard installation from 1935. An array of sound-receiving diaphragms on each side of the bow connected to a pulse-timing compensator and provided bearings of received noise. This apparatus could detect single ships out to 16 miles and large groups to 80 miles, but the bearings it provided were insufficiently precise for accurate attacks. At short ranges, however, a supplemental swiveling hydrophone (Kristall-Basisgerät) generated bearings accurate to within one degree. Finally, to obtain ranges, U-boats carried an active sonar (SU-Apparatus) developed from surface-warship sets, although this was rarely used because its emissions revealed a submarine's presence. Trials late in the war, however, using GHG with SU-Apparatus demonstrated that as few as three active pulses sufficed to determine target distance, course, and approximate speed.

At the outbreak of war, sonar was widely—although mistakenly—regarded as rendering the ocean transparent in the search for submarines. Its limitations were rapidly appreciated, however, and major corrections were implemented. By 1942, sonar was an integrated part of a suite of search sensors that included, most important, radar and shipborne high-frequency direction finding.

Song Zheyuan (1885–1940)

Chinese Nationalist general. Born in Leling (Loling), Shandong (Shantung), on October 30, 1885, Song Zheyuan (Sung Che-yuan) enrolled at the Battalion School of the Left Route Reserve Army in Beijing (Peking), Hebei (Hupeh), in 1908. Graduating in 1912, Song joined what later became the National Army of warlord Feng Yuxiang (Feng Yü-hsiang). Song became a Guomindang (GMD, Nationalist) party member in September 1926 when Feng declared allegiance to Jiang Jieshi (Chiang Kai-shek). When Feng and Jiang split in October 1929, Song became commander in chief of the National Army to fight against Jiang. In November 1930, the National Army was defeated and reorganized as the National Government troops, with Song commanding the Twenty-Ninth Army.

After the Mukden Incident of September 18, 1931, Song assumed new responsibilities in northern China. In January 1933, during his term as governor of Chaha'er (Chahar) Province, Song commanded the Twenty-Ninth Army in resisting the Japanese advance into Rehe (Jehol), which fell in May. In December 1935, Song became chairman and pacification commissioner of the newly created Hebei (Hupeh)- Chaha'er Political Affairs Council and governor of Hebei. This temporary measure maintained Chinese territorial sovereignty by reaffirming the Twenty-Ninth Army's control over Hebei and Chaha'er while China prepared for the impending Sino-Japanese armed conflict.

On July 7, 1937, the 37th Division of the Twenty-Ninth Army clashed with the Japanese at Lugouqiao (Lukouch'iao)—the Marco Polo Bridge—near Beijing. Hoping to avert full-scale war, Song went to Tianjin (Tientsin), also in Hebei, to negotiate with the Japanese military commanders. During the July 12–26 negotiations, Song presented four demands: no infringement of Chinese territorial integrity and sovereignty, no alteration of Song's Hebei-

Chaha'er Political Council, no removal of local officials appointed by the GMD government, and no restriction on the position of the Twenty-Ninth Army. The Japanese, however, demanded a northern China autonomous region comprising Hebei, Shandong, Shanxi (Shansi), Chaha'er, and Suiyuan. They also insisted on withdrawal of the Twenty-Ninth Army's 37th Division from Lugouqiao. Unwilling to compromise, Song led his army from Beijing on July 28, formally beginning the Sino-Japanese War.

On August 8, Song was appointed commander of the 1st Army Group, a conglomerate of the Twenty-Ninth Army and other forces. It served in the First War Zone, which covered Hebei and northern Shandong. In February 1938, Song also became deputy commander of the First War Zone. He held himself responsible for the fall of Nanjing (Nanking) in Jiangsu (Kiangsu) Province, of Beijing in November and December 1937, and of the strategic point of Xinxiang (Hsin-hsiang) on the Hebei-Shandong-Henan (Honan) border in February 1938.

Song resigned all his official posts in late 1938 on the grounds of illness. He died on April 4, 1940, in Mianyang (Meingyang), Sichuan (Szechwan). To honor his memory, the National Government granted Song the rank of full general posthumously on April 17, 1940.

Sopwith, Sir Thomas Octave Murdoch (1888–1989)

British aviation pioneer. Born in London on January 17, 1888, Thomas Octave Murdoch Sopwith received training as an engineer. A private income allowed him to pursue wide-ranging interests. A self-taught aviator, he was one of the first in Britain to secure a pilot's license. Flying a Howard-Wright biplane, in 1910 Sopwith won the £4,000 Baron de Forest Prize for the longest flight by a British pilot to a continental destination (169 miles). In 1912, he founded Sopwith Aviation Co., Ltd., and the Flying School at Kingston-on-Thames. Sopwith began producing his own aircraft and by August 1914 had delivered 45 aircraft to the Royal Naval Air Service (RNAS).

During World War I, Sopwith built for the British government, and often test-flew, such aircraft as the Pup, Dolphin, Snipe, Tabloid, and Triplane. His Camel, introduced in 1917, was the finest British fighter aircraft of that war. Sopwith ultimately supplied some 16,000 aircraft to the RNAS and to the Royal Flying Corps and its successor, the Royal Air Force (RAF). He also built the multirole 1–1/2 Strutter, the first British two-seat fighter. In addition to Britain, Sopwith supplied aircraft to France, Russia, Belgium, and the United States. He also manufactured the Baby seaplane and the Cuckoo, the first carrier torpedo plane.

The military drawdown after the war forced Sopwith to liquidate his company in 1920. That November, he founded a new aviation firm, the H. G. Hawker Engineering Company, named for Sopwith test pilot Harry Hawker. In 1928, the highly successful Sydney Camm–designed Hart light bomber brought substantial contracts for the firm and made it the principal supplier to the RAF. Between 1935 and 1938, Sopwith combined several aviation firms, forming the Hawker-Siddeley Group.

Sopwith's arguably most important aircraft, the Camm-designed Hawker Hurricane, first flew in 1935. At the beginning of World War II, it constituted 60 percent of RAF Fighter Command strength and played a vital role in the July 10–September 30, 1940, Battle of Britain. Usually pitted against bombers because they were marginally outclassed by the German Bf-109E fighter, Hurricanes claimed more German aircraft in the Battle of Britain than all other British defenses combined. Hurricanes underwent modification to fill ground-support and tank-attack roles. A naval version, the Sea Hurricane, saw wide service. Hawker also produced the Sea Fury, Tempest, and Typhoon fighters/light bombers.

In 1959, Sopwith took over the De Havilland firm, and in 1963, he took over Blackburn. He retired in 1963, although he remained a member of the board until 1978, shortly after the British government nationalized the firm as British Aerospace. Sopwith died at Compton Manor in Hampshire, England, on January 27, 1989.

Sorge, Richard (1895–1944)

Soviet spy. Born in Baku, Russia (now Azerbaijan), on October 4, 1895, to a German father and a Russian mother, Richard Sorge moved with his family to Germany when he was a child. Sorge enlisted in the German Army at the start of World War I. Badly wounded and disillusioned by his wartime experiences, he joined the Bolshevik Party after the war.

After working as an agitator, Sorge traveled to the Soviet Union in 1925, when he was recruited to become an espionage agent for the Comintern (Communist International), the Soviet-sponsored international organization dedicated to world revolution. In 1930, Sorge arrived in Shanghai and began forming an espionage ring while developing his cover as a freelance journalist. In September 1933, Sorge arrived in Japan on a new assignment and began recruiting agents. The most important recruit was Ozaki Hotsumi, a close associate of future prime minister Konoe Fumimaro.

Still using a journalistic cover, Sorge began to cultivate contacts in the German embassy in Tokyo. Using a mixture of false credentials (at the order of Comintern, he had joined the Nazi Party) and a genuine reputation as an expert on Asian affairs, Sorge eventually became a close confidante of

German military attaché Major General Eugen Ott, who later became German ambassador to Japan.

During the critical year of 1941, Sorge's spy ring provided Moscow with valuable information about Japanese intentions. In August, Soviet leader Joseph Stalin, informed by Sorge that Japan would not invade Siberia but would strike south, was able to transfer divisions from Asia to Europe. These Siberian reinforcements played a vital role in blunting the German drive on Moscow in the winter of 1941. Sorge also kept Moscow informed about the breakdown of negotiations between the United States and Japan until he was unmasked and arrested by the Japanese police in October 1941. Contrary to myth, Sorge did not know of Japan's plans to attack Pearl Harbor; he only predicted war between Japan and the United States.

A Japanese court sentenced Sorge to death for espionage, and he was hanged in Tokyo on November 7, 1944. Belatedly, in 1964 Moscow proclaimed him a Hero of the Soviet Union. Sorge was indisputably one of history's master spies.

Sosabowski, Stanisław (1892–1967)

Polish Army major general. Born on May 8, 1892, in Stanisławów, Galicia, Stanisław Sosabowski served in the Austrian Army from 1913 to 1918. He joined the army of the newly reborn Poland in 1918 and was sent to Paris as an armaments expert on a committee charged with purchasing surplus Allied military equipment.

In 1922 and 1923, Sosabowski studied at the Warsaw Staff College. He then commanded various infantry units. From 1930 to 1937, he was instructor

of military organization and on General Staff service. In 1937, Sosabowski took command of the 9th Infantry Regiment. In 1939, on the eve of the German invasion, he assumed command of the 21st Infantry Regiment stationed in Warsaw and finally of all infantry units of the 21st Division.

After the September 1939 defeat of Poland and its occupation by German and Russian forces, Sosabowski escaped abroad, first to France and then to Great Britain. There he organized and trained the Polish 1st Independent Parachute Brigade. He demanded that the brigade be sent to assist in the Warsaw Rising (August 1–October 2, 1944) staged by Polish Resistance forces to destroy German Army units stationed there. The British government vetoed the idea.

In September 1944, Sosabowski was ordered to participate with his brigade in the airborne phase of Operation MARKET-GARDEN (September 17–26), the effort to secure a crossing over the Rhine River at Arnhem. He protested, arguing that the order was based on faulty intelligence and was bound to end in catastrophe. Consequently, he insisted on a formal, written order. His gloomy prediction proved correct. Dropped into Arnhem on the second day of the operation, his brigade fought well but was decimated by German armor. Following the return to Scotland of Sosabowski and what remained of his brigade, he was dismissed from his post at the insistence of angry British superiors.

Sosabowski published two books of memoirs. He died in Middlesex, England, on September 25, 1967. In 2006, Queen Beatrix of the Netherlands awarded the Military Order of William to the Polish 1st Independent Parachute Brigade and awarded Sosabowski posthumously the Bronze Lion, the Netherland's second highest decoration for combat heroism.

Sosnkowski, Kazimierz (1885–1969)

Polish Army lieutenant general. Born on November 19, 1885, in Warsaw, Kazimierz Sosnkowski graduated from the Lemberg (L'viv) Polytechnical School. From 1914 to 1917 he served as chief of staff to Joseph Piłsudski, commander of the 1st Brigade of the Polish Legion. In July 1917 Sosnkowski was arrested by the Germans for conspiratorial activity and kept at the fortress of Magdeburg until the eve of the capitulation. He returned to Warsaw on November 10, 1918, and, together with Piłsudski, worked to build the reborn country's army. As minister of war during the Russo-Polish War of 1919–1920, Sosnkowski was responsible for establishing the armed forces that defeated the Red Army in the decisive Battle of Warsaw of August 13–15, 1920.

Sosnkowski continued as minister of war from 1920 to 1924 and as inspector of the Polish armed forces from 1927 to 1939. He was a strong supporter not only of an alliance with France but also of close cooperation with Czechoslovakia. During the September 1939 German invasion of Poland, he commanded the southern sector of the front and scored several local successes around L'vov (L'viv). Following the unexpected Soviet invasion of Poland from the east on September 17, Sosnkowski took refuge in Romania. After the internment of the Polish government there, he managed to escape to France and joined the cabinet of General Władysław Sikorski.

Sikorski appointed Sosnkowski minister without portfolio, in charge of relations with the Polish Resistance movement, a post he held during 1940–1943. Sosnkowski succeeded Sikorski as commander in chief of the Polish armed forces following Sikorski's death in July 1943 and continued in this capacity until 1944.

Rather than return to communist Poland, Sosnkowski remained in exile after the war, first in Great Britain and then in Canada. A talented writer, he published two books. Sosnkowski died on October 11, 1969, on his farm in Quebec, Canada.

South Africa, Union of

The Union of South Africa played an important—and often overlooked—role in the Allied victory in World War II. Strategically located at the southern tip of the African continent, in 1939 South Africa was a British dominion with a population of 10.14 million. South Africa controlled vital shipping lanes from the Indian Ocean around the Cape of Good Hope into the South Atlantic. It also possessed important natural resources, including rich deposits of coal, diamonds, iron, gold, and uranium, important to both warring sides.

Sentiment in South Africa toward the war was sharply divided. In 1939, South Africa was home to 7 million native Africans (called blacks), 815,000 racially mixed people (called coloreds), 231,000 Asians (mostly Indians), and 2.1 million people of European ancestry (largely British or Dutch [Boers] called whites). The whites wielded all the power.

To the great majority of black South Africans, the war was of scant interest. Disenfranchised, they saw little to gain in a "white man's war." Many also harbored bitter memories of having fought in the 1899–1902 South African War (Second Boer War) and having being betrayed by both sides. Many white South Africans, especially Boers, sympathized with Adolf Hitler's racist policies and harbored their own resentment against the British.

Indeed, a South African Nazi party was formed in 1932 and was followed by other right-wing groups. The largest of these was the Ossewabrandwag (Ox-Wagon Sentinels, OB), which became committed to the violent overthrow of the government. The majority of white South Africans, disgusted by OB excesses, repudiated the protofascist groups by giving the moderate United South African National Party 73 percent of the vote in 1938—the largest electoral majority in the country's history. Hitler's demands for the return of Germany's former colony, South-West Africa (Namibia), mandated to the Union of South Africa after World War I, contributed to the election result.

Following the British declaration of war against Germany on September 3, 1939, there was sharp debate in the South African parliament whether to follow suit. On September 6, Minister of Justice Jan Christian Smuts, who favored intervention on the British side, won an 80-to-67 vote over Prime Minister (James) Barry Hertzog, who supported neutrality. Hertzog then resigned and was replaced by Smuts. Smuts also was minister of defense and, from June 1940, he commanded South African military forces. In 1945, Smuts was made an honorary field marshal in the British Army. A longtime friend of Winston L. S. Churchill, who frequently consulted him on strategy, Smuts pushed successfully for a British attack on Vichy French–held Madagascar to deny it as a possible Japanese base, and South African forces took part in the later stages of the Madagascar Campaign.

An energetic leader who held an unprecedented concentration of power, Smuts nonetheless proceeded cautiously on the domestic front. He edged extreme nationalists out of his coalition government, but a significant minority of pro-German citizens still resisted supporting Britain. In some schools of the Transvaal, students began the day with the Nazi salute and were told that shortwave radio broadcasts from Germany were their only reliable source of information. A few right-wing terrorist acts occurred, but police rounded up the most dangerous elements by late 1940. Despite calls from his supporters, Smuts adroitly refused to suppress his political opponents completely.

During the war, South Africa built a considerable armaments industry, which also employed thousands of women. It manufactured for South African and Allied use armored cars, howitzers, mortars, and ammunition. South Africa also exported food. Industry of all kinds boomed, and by 1945 South African industrial output had nearly doubled. New employment opportunities drew people into urban areas. By war’s end, blacks outnumbered whites in towns and demanded changes in society. After the war, the reenergized African National Congress became a serious political factor, leading whites to elect a right-wing parliament in 1948 that passed rigid segregation laws and introduced apartheid (separateness).

The Smuts government made no effort to institute conscription. In September 1939, Major General Pierre van Ryneveld commanded the Union Defence Force (UDF), comprising South Africa’s land, sea, and air forces. Its Permanent Force of its regulars numbered only 5,385 men. Coastal defenses

were antiquated, and much of the military equipment was obsolete. The UDF had no tanks or modern artillery. The South African Naval Service (SANS) had no ships, and the South African Air Force (SAAF) possessed exactly six modern aircraft. The same situation prevailed among the reserves.

During the war, South Africa raised three infantry divisions. South African troops won laurels in the campaign in Italian East Africa (Abyssinia) in early 1941, advancing more than 1,000 miles in less than two months. By September 1941, there were nearly 60,000 South African troops in Egypt. South Africans fought at Sidi Rezegh (where the 1st South African Division lost nearly one-third of its strength), at Tobruk (where nearly 11,000 men of the 2nd Division became prisoners on its fall in June 1942), and at El Alamein (October 23–November 4, 1942). Following these engagements, what remained of the 1st South African Division was reconstituted as the new 6th Armored Division. It fought in Sicily and then in Italy until the end of the war.

South African troops on parade at a training camp before leaving to take part in military operations. South African forces distinguished themselves during the war. (Hulton-Deutsch Collection/Corbis)

The SAAF was in combat throughout the war. By the end of the conflict, it numbered four wings and 28 squadrons. South African pilots fought in the July 10–September 30, 1940, Battle of Britain and in East Africa and Madagascar under British command. The SAAF ultimately made up about one-third of the strength of the Western Desert Air Force. The SAAF also

served in the central Mediterranean and played a significant role in training Allied aircrews.

The SAAF used British, German, and U.S. aircraft plus indigenous models such as the Wapiti multipurpose biplane. John Everitt Frost's total of 15 air victories was the highest among SAAF pilots, but three South Africans—Marmaduke T. Saint John Pattle, Adolph Gysbert "Sailor" Malan, and Johannes Jacobus le Roux—were among the five top-scoring aces of Britain's Royal Air Force (RAF). Saint John Pattle's records are incomplete, but he is believed to have achieved 41 victories, more than any other RAF pilot.

The SANS patrolled South Africa's coastline and carried out minesweeping, antisubmarine, and rescue activities (more than 150 Allied merchant vessels and warships were sunk off South Africa by Axis submarines). SANS minesweepers removed mines laid by several German auxiliary cruisers, and South African ships provided support off Sicily and Italy. By 1945, the navy had 78 vessels, including three new frigates, one of which (the *Natal*) sank a German submarine, the *U-714*.

With few exceptions, during the war South African blacks served only in noncombatant roles in the Non-European Army Service, but many came under enemy fire. By far the largest number of black recruits came from rural areas that had been hard-hit by drought. Pay was half that for whites. The Native Military Corps provided mess and hygiene and specially trained support troops for the South African white fighting units.

Thousands of British women and children found wartime haven in South Africa, as did Greece's royal family and former shah of Iran Reza Khan Pahlavi. After hostilities ceased, a stream of German children arrived for adoption; many were *Lebensborn* (Fount of Life) babies, conceived to increase the "Aryan" population and shunned in postwar Germany.

Altogether, 334,224 South Africans volunteered for full-time military service during the war. Of these, 132,194 whites and most of the 123,131 blacks who volunteered served in the South African land forces; 44,569 whites served in the SAAF and another 9,455 in the SANS. A total of 21,265 women served in the various branches of the women's Auxiliary Defence Corps, and 3,710 served in the Military Nursing Service. The war claimed nearly 9,000 South African dead, more than 8,000 wounded, and 14,000 taken prisoner.

Southeast Pacific Theater

The U.S. Navy's strategy for the defeat of Japan by a thrust through the Central Pacific depended on control of the Southeast Pacific, particularly the Panama Canal region through which all shipping destined for the Central, South, and Southwest Pacific theaters transited. In this regard, the Imperial Japanese Navy squandered a huge potential strategic advantage in not challenging the United States in these waters using its large and capable submarine force. Japanese doctrine, however, called for submarines to operate in direct fleet support or as scouting forces, and the carrier strikes envisioned in war plans prior to December 1941 (Rainbow 5) never materialized. Japan never adopted the more aggressive commerce raiding and interdiction roles for its submarines that were employed with great success by both Germany and the United States in the Atlantic and the Western Pacific. Nor did the large 5,200-ton Japanese submarines of the I-400 class carrying three bomber-seaplanes (fielded in late 1944 and clearly designed for operations against the U.S. West Coast and the Panama Canal) ever deploy to the region as anticipated. Once the threat to the Panama Canal failed to materialize, the United States dedicated little in the way of naval protection to shipping in the region.

The March 1941 ABC Conference of Britain, Canada, and the United States established Pacific operational areas that the Joint Chiefs of Staff reconfirmed in March 1942. The agreement gave the navy operational control over the areas of operation in the Central, South, North, and Southeast Pacific; the army was responsible for the Southwest Pacific.

Further, the Pacific Military Council determined in March 1943 that all of the Pacific should be under the strategic command of Admiral Chester Nimitz, commander in chief, Pacific, although General Douglas MacArthur held overall command of the Southwest Pacific. The actual boundaries had been established earlier in Joint Chiefs of Staff directives to MacArthur and Nimitz of April 4, 1942, that outlined the Southeast Pacific as everything east of a line drawn from the Mexico-Guatemala border to the mid-Pacific near Clipperton Island and then southward to the South Pole. To patrol this vast ocean area, Rear Admiral John F. Shafroth Jr. commanded a tiny force of three older light cruisers and several destroyers. As events played out, however, Shafroth's force proved to be more than sufficient, given the lack of Japanese activity.

To protect the canal and transit shipping, the U.S. Army had capable forces but only in the 10-mile-wide Panama Canal Zone. The various Latin American countries offered little in terms of genuine security, even after Mexico and Colombia declared war on the Axis powers in 1942–1943. The U.S. Navy provided minimal resources for Rear Admiral Clifford E. Van Hook's Panama Canal Force, consisting of the elderly destroyers *Borie*, *Barry, Tattnall,* and *Goff* along with the gunboat *Erie*, 2 patrol craft, 2 small converted motor yachts, and 24 Catalina maritime patrol aircraft. Although a few Japanese submarines entered the area as part of the June 1942 Japanese naval offensive against Midway and the Aleutian Islands, they did no damage. German U-boats did tremendous destruction to shipping on the Caribbean side of the canal, however, including two sinkings just outside the eastern entrance.

Despite the lack of a credible Japanese threat to U.S. shipping in the Southeast Pacific, naval commanders in 1942 assigned whatever escort assets were available to open-ocean vessels, particularly troop convoys transiting to the Central and Southwest Pacific theaters and Pearl Harbor. In late January 1942, Shafroth's light cruisers *Trenton* and *Concord* and some destroyers escorted two large convoys from the canal through to Bora Bora with 4,500

men assigned to the construction of a new naval fueling station. At about the same time, the carrier *Lexington* and its assigned force escorted an eight-ship convoy carrying 20,000 troops through the Southeast Pacific (two for Christmas Island, two for Canton Island, and four for New Caledonia).

In retrospect, the failure of the Imperial Japanese Navy to harass Allied shipping or attempt even limited interdiction operations in the Southeast Pacific represented a tremendous missed strategic opportunity. Although such a Southeast Pacific campaign would likely not have changed the eventual outcome of the war, it certainly would have mitigated Allied pressure in other Pacific areas of operation and complicated thrusts against the Japanese defensive perimeter.

Southwest Pacific Theater

Geographical area known to Japan as the Southern Resource Area and also the Southeast Area and to the Allies as the Southwest Pacific Area (SWPA). Major land areas in this theater were the Philippine Islands, the Netherlands East Indies, New Guinea, Australia, the Bismarck Archipelago, and the Solomon Islands. In August 1942, the boundary was redrawn to exclude Guadalcanal and certain others of the Solomon Islands.

Japan entered the SWPA in a quest for natural resources, especially oil. Oil powered Japan's economy and its armed forces, and the U.S. embargo of it helped trigger the Japanese decision to go to war against the United States. Dependent on foreign oil imports and rapidly using up its stocks, Japan needed to secure oil, the absence of which would paralyze Japanese industry within a year and immobilize the fleet within two years. Oil resources in the Netherlands East Indies, Japanese leaders believed, would make Japan self-sufficient in that vital commodity.

Japanese Southern Army headquarters in Saigon, French Indochina, supervised army operations from the Philippines south. Navy leaders meanwhile decided that U.S. airfields and fleet bases could not be tolerated on the flank of this advance. Japanese lieutenant general Homma Masaharu's Fourteenth Army with two divisions invaded the Philippines beginning on December 8, 1941. U.S. resistance officially ended on May 7, 1942. Meanwhile, Lieutenant General Imamura Hitoshi's Sixteenth Army with three divisions invaded the Netherlands East Indies beginning on December 20. Dutch resistance there ceased on March 8.

By May 1942, the Japanese were securing oil from the conquests, but the fleet was only using about 42 percent of its merchant tanker capacity. Iron, manganese, chrome, and copper awaited exploitation in the Philippines. Japan desperately needed bauxite from the Netherlands East Indies for aircraft aluminum. Nickel was available from Celebes. Local Japanese commanders were inefficient at developing these resources, and what materials the Japanese did extract from Borneo, Java, and Sumatra encountered shipping bottlenecks.

As Japan pushed south, its navy engaged in several actions. The Battle of the Java Sea largely destroyed the American-British-Dutch-Australian (ABDA) fleet. The United States won a small victory against Japanese transports in the Battle of Makassar Strait (February 4, 1942). There was fighting at Badung Strait, and the Allied cruisers *Houston* and *Perth* were destroyed in the Battle of Sunda Strait (February 28–March 1). The short-lived ABDA Command collapsed in early March 1942, and the Japanese breached the Malay Barrier.

The startling successes of their initial campaigns encouraged the Japanese Navy leadership to propose that five divisions invade Australia. Shipping and logistics, however, posed insurmountable problems, because Japan, already

short of shipping capacity, lost 700,000 tons of shipping—nearly 12 percent of total capacity—sunk or severely damaged in the first four months of war. The Japanese Army had never considered operating in the SWPA area and had not planned how to campaign over such a large area and with such extended lines of communications. Japanese Army planners estimated that to capture Australia would require 12 divisions and 1.5 million tons of shipping. Japan did not have the military assets and resources for such an operation. Australia was simply one continent too far.

Rather than invade Australia, Imperial General Headquarters in Tokyo ordered six of the divisions that had participated in the southern operations back to the Japanese home islands, China, and Manchuria. Planners redirected their logistical effort to the northwest and west when they should have been building bases—especially air bases—and establishing and supplying garrisons in the south.

On March 30, 1942, the U.S. Joint Chiefs of Staff established the Southwest Pacific Area. General Douglas MacArthur received command. It succeeded the ABDA area formed on January 15 as well as the Australia–New Zealand Area established at the end of January. The first priority was to strengthen lines of communications to Australia and to build up logistics and airpower. The air war here would be primarily land-based.

Japan landed troops on New Guinea in February and March 1942. Japan sought Port Moresby on the south coast as an air base, part of its campaign to cut the lines of communications to Australia and to deny the port as a base for Allied counterattacks. In the May 7–8, 1942, Battle of the Coral Sea, the U.S. Navy deflected the Japanese seaborne invasion attempt. The Japanese then attempted to seize Port Moresby by land, crossing over the Owen Stanley Mountains. Australian forces fought a delaying action south toward Port Moresby that weakened the Japanese and ultimately halted this thrust. The Australians then drove the Japanese back to New Guinea's north coast. A Japanese landing at Milne Bay (August 25–September 6, 1942) failed, boosting Allied morale.

On July 2, 1942, the U.S. Joint Chiefs of Staff ordered MacArthur to begin an offensive to clear the Japanese from New Guinea. This effort was limited by the availability of forces and because the U.S. Army and U.S. Navy were both constrained by the priority given to Europe. The long fight for Buna concluded on January 22, 1943. The Australians and Americans

executed shore-to-shore and ship-to-shore operations up New Guinea's coast. Rabaul on New Britain was initially a target, but the United States chose to bypass that major Japanese bastion, cutting it off from outside resupply.

Although progress was slow, the Allies kept the initiative, imposed a tremendous drain on Japanese resources, and prevented the Japanese from consolidating their conquests. Weather, disease, and inhospitable terrain inflicted heavy losses on all combatants in this theater but especially on the Japanese. Particularly devastating to Japan was the loss of so many of its air assets, and the destruction of Japanese transports in the Battle of the Bismarck Sea (March 2–5, 1943) gave Japan a stark warning of the precariousness of its position.

The Americans launched almost every operation so as to extend their air umbrella and logistics closer to the Philippines. The strategy of island-hopping, which made use of growing U.S. Navy strength in the theater, allowed U.S. forces to advance while bypassing strong Japanese ground forces. Allied shipping constraints and a shortage of service troops were greater impediments to the advance than shortfalls in combat troops.

The SWPA area was the location of one of two major U.S. offensives (comprising mainly land-based air and ground forces) aimed at Japan. The second location was the Central Pacific, in which the U.S. offensives comprised mainly carrier air and sea power. The Japanese had insufficient assets to meet both offensives and were often off balance as they tried to maneuver against the two. Japan was simultaneously heavily committed in Burma and China and had to maintain major forces in Manchuria as a check on potential action by the Soviet Union.

The U.S. SWPA and Central Pacific offensives indirectly supported each other early in the campaigns and then directly supported one another as they converged at the Luzon-Formosa-China coast area. The speed, flexibility, and mass of the two Allied thrusts neutralized the defender's traditional advantage of interior lines of communications. Coordination between the U.S. Army and U.S. Navy of current and future operations was critically important.

The Japanese regarded campaigns in New Guinea (March 8, 1942–September 13, 1945) as a means to delay their enemies, reduce the enemies' resources, and gain time to reorganize for a counteroffensive. Rather than weakening the Allies, however, the campaigns here became a drain on

Japanese manpower, ships, and aircraft. Allied airpower cleared Japanese from the air and sea. Nowhere did the Japanese stop the advance, nor could they sustain the attrition that went with it.

The vast majority of Japanese troop and logistics shipping occurred in SWPA waters. Oil moved north through these waters, and U.S. submarines attacked the vital Malaya/Netherlands East Indies–Japan line of communications. Japan lost half its cargo-carrying capacity in 1944 to air and submarine attacks. Critical oil and raw materials required for war production in the home islands were sent to the ocean bottom.

The Battle of the Philippine Sea during June 19–21, 1944, largely destroyed what remained of Japanese naval aviation. Japanese Navy leaders then developed plans for a decisive battle, depending on the avenue of the U.S. advance. When the United States invaded the Philippines in October, Japan immediately initiated its plan, which resulted in the October 23–26, 1944, Battle of Leyte Gulf—the greatest naval battle, in terms of ships and numbers of men engaged, in history. In the ensuing battle, the U.S. Navy all but destroyed the Japanese Navy as an organized fighting force.

The inability of Japan to transport men and supplies to Leyte and its similar difficulties in supplying and reinforcing Luzon hastened Japan's defeat in the Philippines. The U.S. conquest of the Philippines (October 20, 1944–August 15, 1945) enabled U.S. airpower there to sever the seaborne supply lines between the Japanese home islands and its Southern Resource Area. U.S. Navy forces swept into the South China Sea in January 1945 and severed Japanese lines of communications with Indochina. The U.S. conquest of the Philippines, the ability of carrier task forces to go wherever they pleased, and the strangulation wrought by the submarine fleet completely isolated the Southern Resource Area.

Large Japanese ground forces remained in Indochina and in the Netherlands East Indies, but they could play no role in defense of the home islands, nor could raw materials reach the home islands. This made MacArthur's use of Australian forces in Borneo in mid-1945 all the more questionable. It was a campaign with little strategic value.

The last operations in the SWPA area were U.S. preparations for the invasion of Japan. The Philippines provided staging areas for 18 U.S. Army divisions, large numbers of aircraft, logistics organizations, and hundreds of ships. With Japan's surrender in August, operations in the SWPA area came

to an end. The conclusion of hostilities did not bring peace, however, because wars in which indigenous peoples sought independence from their colonial occupiers soon began.

Soviet Union

In 1939, the Union of Soviet Socialist Republics (Soviet Union) numbered some 193 million people inhabiting an area of more than 8.6 million square miles extending over 11 time zones. The Soviet Union was, in fact, as large geographically as the two next-largest countries—China and Canada—combined and stretched from the Pacific Ocean in the east to Poland and Hungary in the west. Although Great Russians living around Moscow comprised a majority of the population, the country was composed of many different nationalities who spoke nearly 170 different languages. The largest republic by far in the Soviet Union was the Russian Soviet Federation Socialist Republic, which had more than 100 million people.

The alliance between the Soviet Union and Germany of August 23, 1939, had brought advantages to each side. It allowed Adolf Hitler to attack Poland, secure in the fact that he would not have to wage war with the Soviet Union, and it bought time for Soviet dictator Joseph Stalin to rebuild the Red Army, which he had so weakened in the Great Purges. The pact between Germany and the Soviet Union also yielded great economic advantages to the German war machine in the form of Soviet raw materials and the activities of the Soviet Union as a purchasing agent for Germany abroad.

The pact brought far less advantage to the Soviet Union, although the Red Army benefited from establishment of a joint tank training center at Kazan and an air base at Lipetsk. Germany also provided some finished machinery and a few weapons of war. But the German and Soviet division of Poland that flowed from the pact also meant the end of a buffer between the two states.

Stalin was shocked at the speed with which Germany defeated France in 1940. Given the punishment that little Finland had inflicted on the Soviet Union in the Winter War of 1939–1940, it is no wonder that Stalin doubted the ability of the Red Army to stand up to the German military. The Soviet leadership counted on a stalemated struggle similar to that of the Western Front in World War I or at least a war of several years. Critical to a prolonged struggle that would give the Soviet Union a chance to win was denying the Germans the eastern Ukraine, which was the reason why so much Soviet armor was positioned forward in June 1941. Stalin quickly acted on the fall of France to cash in any remaining chips under the pact of August 1939, annexing the Baltic states and taking Bessarabia and northern Bukovina from Romania.

Stalin nevertheless refused to believe warnings, many of which were supplied by the Western powers, that Germany intended to invade. He chose to regard these as attempts to entangle the Soviet Union and Germany in an armed conflict, and he continued to believe that any war between Germany and the Soviet Union lay years in the future. He therefore forbade preparations for a preventative counterattack into the German deployments, which his General Staff proposed.

Stalin was determined not to be tricked into a war with Germany. Not only did the Soviet Union provide no provocation for the Germans, but it continued to make deliveries of goods under the German-Soviet Non-Aggression Pact even as the invasion was in progress. Stalin rejected calls by

his generals in the weeks and days before the attack to put Soviet forces in the border areas on alert. Even when he was informed that German troops were invading and firing on Soviet positions, Stalin refused for hours to allow return fire; he claimed that Hitler must not be aware of what was going on. For more than a week Stalin remained incommunicado, stunned by his failure and hiding from his people. Not until July 3 did he address the nation.

Stalin's refusal to adequately prepare for a German attack was made worse by his subsequent orders that Red Army units stand fast rather than retreat, leading to the cutting off and surrender of vast numbers of Russian soldiers. Decisions such as these almost drove the Soviet Union from the war. But while Hitler unlearned the art of war, Stalin proved that he was capable of learning it, absorbing specialist knowledge and technical information and paying attention to knowledgeable subordinates. He continued to make the major decisions, shifting units and commanders about. Front commanders reported to him at the end of each day and received their instructions directly from him.

During the war, Stalin deliberately downplayed communism, choosing to emphasize Russian patriotism. Toward this end, he even enlisted the services of the Russian Orthodox Church. World War II is known in Russian history as the "Great Patriotic War." The Soviet populace was more used to deprivation and suffering than most peoples, but the war took a huge toll on the population as German and Soviet forces fought back and forth across the Russian heartland and practiced scorched-earth policies.

During the first months of the German invasion, the government exercised total control over the media and withheld any information as to the real losses suffered by the Red Army. There was no hint in the press of hunger or starvation, which were widespread. Even news of the suffering in besieged Leningrad was suppressed. Those spreading rumors were subject to severe punishment under Article 58 of the Soviet criminal code. Strict censorship often delayed evacuation of populations westward ahead of German Army advances.

On June 22, 1941, the Supreme Soviet had declared martial law in all front regions, and two days later it extended martial law to the entire European part of the Soviet Union. Millions of civilians were conscripted to build bunkers, barricades, and tank traps. During July and August 1941 at Leningrad alone, nearly 1 million citizens helped build defensive works. A

decree of December 26, 1941, announced that unauthorized leave would be punished by five to eight years' imprisonment. Even more draconian was a decree of July 28, 1942, stating that all workers who left their jobs without permission would be treated as deserters and handed over to military tribunals.

All facets of ordinary Soviet life were militarized, with civilian activities directed by the Commissariat of Defense and the secret police. War put a severe strain on the state budget, and the Soviet government therefore imposed a "war tax" on all adult citizens that further tightened the already draconian conditions for most of the population.

The Soviet government pursued a scorched-earth policy. As the Red Army withdrew, it destroyed absolutely everything in its path with no regard to the civilian population left behind. Hundreds of thousands of tons of grain and agricultural products were simply burned to prevent them from falling into the hands of the Germans. This suffering was repeated several times over with the ebb and flow of the war.

At the time of the German invasion on June 22, 1941, some 11 million Soviet citizens had undergone some military training during the previous 15 years, and a like number had received some military instruction. Even at the end of the war, after its horrendous casualties, the Red Army had 6 million men under arms, twice the German total.

Increasing industrial production would be vital if the Soviet Union was to have any chance of victory, and it registered great success in this area. In the Third Five-Year Plan (1938–1942), increasing attention had been given to the production of armament, the development of new industry in the east, and the relocation of existing production east of the Ural Mountains, where it would be safe from the Luftwaffe. After the German invasion, whole factories were disassembled, loaded on flatcars, and then shipped east, where they were reassembled and resumed production of tanks, planes, and guns. Unfortunately for the Soviet Union, much of the industrial effort was inefficient, the product of confusion and an inept bureaucracy. On the plus side, much of the conversion from peacetime to wartime production was carried out by local initiative, without central intervention.

German soldiers salvaging belongings left behind by withdrawing Russian civilians, in a village on the outskirts of Leningrad, November 28, 1941. (Bettmann/Corbis)

Not even a majority of production could be relocated so quickly, and in the second half of 1941, the Soviet Union lost 68 percent of its iron production, 63 percent of its coal, 58 percent of its steel, and 40 percent of its farmland. The loss of Ukraine to the Germans was a particularly heavy blow, for it boasted the Soviet Union's most fertile farmland.

Despite this, the Soviet Union registered solid gains in arms production during the war. It emphasized simple yet durable weapons. The Russian Ilyushin Il-2 Shturmovik ground-attack aircraft and the T-34 tank were also easy to manufacture and maintain. Between 1940 and 1945, the Soviet Union far outproduced Germany; in that period, it manufactured 146,929 aircraft, 102,301 tanks, and more than 14.6 million rifles and carbines.

During the war, the Soviet civilian population endured hunger, cold, malnutrition, and disease. The German invasion had far-reaching consequences for the food supply, as a large part of Soviet agricultural production was soon in German hands. Also, in the first months of the war, Soviet authorities were far more intent on relocating industry than on saving agricultural production. The relocation of factories east of the Urals had priority over the shipment of food supplies. The Red Army also requisitioned tractors and horses from agricultural work. Soldiers and workers in

armaments industries received priority in food and medical supplies at the expense of peasants, the old, and children. The cities were hard-hit, and many people there sought refuge in the countryside, where they worked as day laborers to secure bread. Given the lack of machinery, it is not surprising that harvests were poor. Agricultural production fell sharply, resulting in sharp increases in the price of food.

The vast casualties sustained by the Red Army in fighting the Germans, the manpower requirements of the armed forces, and the demands of war industries all led to a severe labor shortage. This shortage was taken up in part by women (who had long been in the industrial workforce in the Soviet Union), by men who were too old for the army, and by teenage boys. Women were the major labor source in the agricultural sector, and by the end of the war they comprised a majority of the workers in the industrial sector as well. The percentage of female labor in agriculture rose from 40 percent in 1940 to 70 percent in 1943, to 82 percent in 1944, and to 92 percent in 1945. The loss of their husbands to the army placed an additional burden on married women, who now had to support both children and aged relatives. Workdays were extended to 16 hours and longer.

The war exacted a frightful human toll on the Soviet Union. Immediate postwar calculations set the toll at 20 million people dead, an estimate raised 60 years later to as many as 27 million or more. This death toll swelled in part because of Stalin's own policies. During the war, the Soviet authorities executed 157,000 of their own soldiers. Stalin wrote off Soviet prisoners of war (POWs) held by the Germans, for surrender was regarded as treason. When Hitler offered to exchange Stalin's only son, Yakov, for Hitler's nephew Leo Raubal, Stalin refused, and Yakov died in captivity. Even Soviet prisoners who managed to escape from the Germans were severely punished, sometimes with death. To add insult to injury, Red Army POWs captured by the Germans who managed to survive the cruel circumstances of imprisonment were treated as traitors at the end of the war. Many were executed out of hand; others were shipped off to the gulags.

The physical and economic damage sustained during the war was equally as devastating. The Soviets claimed that 1,700 towns and some 70,000 villages had been destroyed, while major cities such as Stalingrad, Odessa, Kiev, and Leningrad also suffered catastrophic damage. An estimated 25 million Soviets were left homeless at war's end, and estimates have indicated

that at least 25 percent of the total national wealth of the country had been wiped out between 1941 and 1945.

The war was the seminal experience for generations of Soviet citizens. Its legacy of burned villages and hatred came to be reflected in the brutal Soviet treatment of its zone of Germany at the end of the war.

Soviet Union, Air Force

As part of the reorganization of the Soviet armed forces in 1923, air squadrons were retained under the control of the ground units to which they were attached. Administratively, however, the squadrons came under the control of the Chief Directorate of the Air Force of the Red Army. In 1925, the Soviets established the General Staff of the Air Force. Systematic numbering of squadrons began in 1926, and their formation was standardized as five squadrons—each divided into three sections—for an air brigade. As armed force doctrine evolved, and in 1928 operational control of all air units was placed under the Chief Directorate of the Air Force.

Nikolai Polikarpov produced fighters such as the I-5 by 1924, and Andrei Tupolev created the first Soviet bomber designs, such as the ANT-4, in 1927. Development stalled during the Great Purges in the late 1930s, when the

government ordered the imprisonment of some 450 aircraft designers and engineers, although most were allowed to continue their work from confinement.

During the 1936–1939 Spanish Civil War, the Soviet Union supplied both I-15 and I-16 aircraft and pilot/instructors to the republican side; however, these aircraft were outclassed by the German Messerschmitt Bf-109 fighter. From October 1936 to December 1938, the Soviet Union sent 1,409 aircraft to Spain, of which 1,176 were destroyed. Nevertheless, by January 1937, 17 Soviet pilots had been decorated as Heroes of the Soviet Union.

The Spanish experience spurred the Soviets to develop aircraft specifically for ground-attack and close-support duties. Representative of this effort were the Yakovlev Yak-1, the Mikoyan-Gurevich MiG-1, and the Lavochkin-Gorbunov-Gudkov LaGG-3, which entered service in 1939 and 1940. These three designs were later improved.

Alexander Yakovlev's Yak-1 was powered by a 1,100-horsepower (hp) engine and had a top speed of 360 mph. It was armed with a 20mm cannon and two 7.62mm machine guns. The virtue of this fighter was its simple construction and reliability. The Yak-1 could complete a 360-degree turn in 17 seconds. It enjoyed one of the highest productions of any aircraft of the war; a total of 30,000 were manufactured.

Artem Mikoyan and Mikhail Gurevich combined to produce the 1,350-hp MiG-1, which had a maximum speed of 380 mph. The MiG-1 was best suited to an interceptor role at high altitude. The LaGG-3 was the result of the collaboration of Semyon Lavochkin, Vladimir Gorbunov, and Mikhail Gudkov. The LaGG-3, built entirely of wood, had armament, engine, and speed comparable to that of the Yak-1. It also had a tendency to spin during sharp turns.

Another reorganization of the Soviet Air Force took place in July 1940, with a view toward concentrating air assets. The 20- to 30-plane squadrons were amalgamated into 60-plane regiments. Between three and five regiments made up an air division, each of which supported a ground army. By February 1941, although 106 new air regiments had been authorized, only 19 had actually been formed. Moreover, by the time of the German invasion of the Soviet Union (June 22, 1941), only 20 percent of Soviet Air Force units had been fitted with the new Yak, MiG, and LaGG models.

In April 1942, Lieutenant General Alexander Novikov took command of

the Red Army Air Force. In May, he ordered that all Soviet airpower—heretofore apportioned sporadically among the ground armies and employed without concentration—should be unified. The remnants of surviving postinvasion Soviet airpower thus were gathered to become the First Air Army.

The initial success of Germany's invasion of the Soviet Union owed much to the German Luftwaffe, which destroyed many Soviet aircraft on the ground. In only the first two days 2,500 Soviet planes had been destroyed, and the Germans had achieved air superiority. Another factor contributing to the demise of the Soviet Air Force was poor tactics, as Soviet bombers attempted to attack without fighter protection. When threatened, Soviet bombers formed a tight wedge pattern, while threatened Soviet fighters maneuvered into a defensive circle. At the beginning of the campaign against Germany, frustrated by their lack of tactical training and having to fly outclassed aircraft, many Soviet pilots resorted to ramming German aircraft during engagements.

A ground crew loading bombs on a Red Army aircraft covered with camouflaged netting, 1941. (Library of Congress)

As the German offensive into the Soviet Union continued, the Soviets organized an evacuation eastward of much of their industry, including more than half the aircraft factories. As a result, production fell off dramatically in the second half of 1941. By June 1942, however, 1,000 aircraft per month were once again being produced.

Moreover, the refabricated aviation plants began to produce upgraded aircraft models such as the MiG-3, which had an increased combat radius, and an up-gunned version of the Yak-1 with 12.7mm cannon and a 1,260-hp engine. LaGG production was decreased in favor of a new product that was the creation of Sergei Ilyushin. His Il-2 Shturmovik began to reach the front lines in mid-July 1942. The impetus behind the design was the creation of a “flying tank”: an aircraft with the ability to operate at altitudes of 50 to 500

feet and survive enemy ground fire while supporting Soviet forces by destroying German tanks.

A design revision, Il-2m3, began delivery in November 1942. It added protection from German fighters. The new Shturmovik was a two-seater—the gunner faced rearward and manned a 12.7mm machine gun. The pilot now controlled two 23mm cannon and either a 1,300-pound bomb load or 880 pounds of bombs and 8 rockets. The Il-2 proved so successful that at 35,000 units, it was the highest-production aircraft ever. Soviet leader Joseph Stalin personally prioritized its production. The Germans dubbed the Il-2 “Der schwarze Tod” (The Black Death).

Soviet pilots revised and developed new principles of engagement, following the practices of their top aces such as Alexander Pokryshkin. His formula was “altitude-speed-maneuver-fire.” From a higher altitude, a pilot had the opportunity to select his target and maneuver with speed into an advantageous position for attack. Squadron formations gave way to the “loose pair” of two aircraft operating together, either covering the other (attacking) aircraft. This tactic was first used during the late 1941 Battle of Moscow and resulted in Luftwaffe losses of 1,400 aircraft between October and December 1941. The six Soviet air regiments taking part in the defense of the capital were given the honorific “Guards” designation. From November 15 to December 5, 1941, Soviet pilots flew 15,840 sorties, compared with only 3,500 for the Luftwaffe.

The new air doctrine also stipulated that bombers have fighter escorts: 4 bombers with 10 fighters and 16–24 bombers protected by a group of 20 fighters. The fighters were organized into groups. Each group consisted of 3–4 pairs totaling 6–8 fighters. Normally, four groups would constantly patrol a sector of the combat area. When fighters escorted ground-attack aircraft, the fighters divided into an escort group and an assault group. The escort group remained with the ground-attack aircraft but flew 300 to 1,000 feet higher to engage enemy fighters. The assault group flew 1,500 to 3,000 feet above the escort group and usually a half mile ahead to scout for enemy patrols and act as an advance guard to prevent enemy fighters from closing on the escort group.

In October 1942, Lavochkin produced the La-5 aircraft. Its 1,600-hp engine propelled the aircraft 30 mph faster than the Messerschmitt Bf-109F. Simultaneously, Yakovlev produced the Yak-9, which increased the Yak-1’s

combat radius and was armed with either a 20mm or a 37mm cannon and a 12.7mm synchronized machine gun.

The Soviets had also organized a long-range aviation force in March 1942. The core of this was the Petlyakov Pe-8 four-engine bomber. Soviet emphasis, however, as with the Luftwaffe, was on ground-support aviation.

All major Soviet campaigns after the September 30, 1941–April 1942, Battle of Moscow had substantial air involvement. One-quarter of Soviet airpower was concentrated in the area of Stalingrad by mid-November 1942 for the planned counteroffensive. In the Battle of Kursk (July 5–13, 1943) the Soviets deployed 1,300 aircraft. During the Battle of Berlin (March 31–May 2, 1945), 7,500 Soviet aircraft flew a daily average of 15,000 sorties.

The Soviets also organized foreign-piloted air formations, several of which distinguished themselves in combat. These included Regiment Normandie of French pilots, the 1st Polish Warsaw Fighter Regiment, the 2nd Kraków Night Bomber Regiment, the 3rd Polish Ground Attack Regiment, and the Czechoslovak Fighter Regiment. Noteworthy also is the organization of a 400-woman 588th Night Bomber Regiment, the pilots of which were known by the Germans as the “night witches.” During the course of the war, these women flew some 24,000 sorties. Lidiia Litviak was the first woman pilot in history to shoot down an enemy aircraft in daytime combat.

Soviet aircraft production continued to climb during the war. From June 1941 to December 1944, the Soviets produced some 97,000 aircraft. During the war, the Soviet Air Force also benefited greatly from Lend-Lease deliveries of British and U.S. aircraft. The Soviets received 2,097 P-40 Tomahawks, 1,329 Supermarine Spitfires, 4,746 Bell P-39 Aircobras, 2,400 Bell P-63 Kingcobras, and several transports and bombers. Lend-Lease provided a total of 18,865 aircraft.

By 1945, the Red Army Air Force numbered 17 air armies, each composed of two fighter divisions, two fighter-bomber divisions, a night-bomber regiment, a reconnaissance squadron, and a liaison squadron. These air armies were held in reserve and tasked to support ground operations on a case-by-case basis. They were under the command of air officers who coordinated efforts with ground commanders. Novikov also established an air reserve that could be moved around to achieve local air superiority. By 1945, 40 percent of Soviet air strength was held in a reserve capacity. The Red

Army Air Force grew dramatically in size during the war and certainly played an important role in the Soviet victory in World War II on the Eastern Front, especially—as its name indicates—in ground-support aviation.

Soviet Union, Army

Russia's defeat in World War I gave strong impetus to Soviet dictator Joseph Stalin's industrialization campaign of the 1930s. His emphasis on technological progress, articulated in a speech on February 4, 1931, also implied the need for improvements in military technology to enable the Soviet Union to catch up with the Western powers. Soviet commissar of war Kliment Voroshilov claimed that a future war would be "a war of factories." The Japanese takeover of all Manchuria in the same year provided a compelling reason for Soviet rearmament. Although it enjoyed modern weapons at the beginning of the war, the Red Army remained committed to the concept that wars were won not by training and technology but by the masses and by ideology.

Stalinist purges had sharply affected the military leadership. Perhaps 40 million people were “repressed” during the Stalin era; half that number died. The so-called Great Terror that did away with the old-guard Bolshevik leadership also struck down senior military officers. Among the executed were 3 of 5 marshals, 13 of 15 army commanders, 8 of 9 fleet admirals and admirals grade I, 50 of 57 corps commanders, and 154 of 186 divisional commanders. Undoubtedly, the purges claimed the most aggressive and outspoken officers, and their loss was keenly felt, especially during the German invasion of the Soviet Union, which began on June 22, 1941. Among those purged was Marshal Mikhail Tukhachevsky, who had foreseen in his 1936 “Problems Concerning the Defense of the USSR” the German operational concept for an invasion of the Soviet Union and developed a plan to counter it.

Despite the ruinous purges, the Soviet military under Stalin had a strong influence on military-economic policy as it pushed for an armament-in-depth that implied not only state investment in stocks of weapons but also support for civilian heavy industry. On the eve of World War II, aircraft, tank, and armament plants were concentrated in the western parts of the Soviet Union. Although some efforts were made during the period before the German invasion of June 1941 to relocate military and general industrial production to the less vulnerable area east of the Ural Mountains, advocates of such a policy were often branded as defeatists. The German invasion of the western Soviet territories was in fact an economic disaster, depriving the Red Army of much of its military industrial base.

The success of the German tank divisions in France in 1940 led Stalin to reverse his decision taken in the fall of 1939 to eliminate the five Soviet tank corps. A decree of July 6, 1940, ordered the creation of 9 new Red Army mechanized corps, and in February and March 1941, other decrees called for an additional 20 formations.

In June 1941, on paper at least, the Red Army seemed in an excellent position to resist a German attack. It had some 5.37 million men under arms, and in the two weeks after the invasion, another 5 million were called to the colors. The Red Army enjoyed superiority over its attacker in major areas of military equipment. Germany had some 6,000 tanks, the Soviets 23,140 (10,394 of them in the west). Much of this equipment was also of high quality. By 1941, the Soviets possessed some of the best tanks of the war.

Their BT-series and T-26 were superior in armor, firepower, and maneuverability to the German light PzKpfw I and II and could destroy any German tank. Similarly, the Soviet T-34 medium tank and KV-1 heavy tank were superior to the PzKpfw III and IV and indeed to any German tank in June 1941.

Soviet units also enjoyed superiority in numbers of certain weapons. Thus, a fully equipped Soviet tank division was to have 375 tanks; a German panzer division had only between 135 and 208. A fully equipped Soviet rifle division had 1,304 machine guns, whereas a German infantry division had only 486.

Although Soviet formations in the west were not fully equipped when Operation BARBAROSSA began, they should have been able to repel the German attack. Nonetheless, the Red Army sustained staggering losses early in the invasion. The bulk of Soviet forces in the western areas were in forward positions, where they were easily cut off and surrounded.

On the first day alone, 1,200 Soviet aircraft were destroyed, most of them on the ground. Within two days, 2,000 Soviet aircraft had been lost. Within five days, the Germans had captured or destroyed 2,500 Soviet tanks. Within three weeks, the Soviets had lost 3,500 tanks, 6,000 aircraft, and 2 million men, including a significant percentage of the officer corps.

Others were made the scapegoats for Stalin's own failures. General Dimitri G. Pavlov, commander of the sector that had borne the brunt of the German attack, had pleaded with Stalin a week before the German onslaught to be allowed to establish rearward defensive positions. He and eight other generals and political officials were tried and shot.

In the first months of the invasion, Stalin consistently ignored sound military advice from his generals, with disastrous results. His orders that the army stand and fight merely meant that larger portions of it were surrounded and destroyed. German armored pincers took Minsk in mid-July, along with 290,000 prisoners, 2,500 tanks, and 1,400 guns. Smolensk followed a week later, with 100,000 prisoners, 2,000 tanks, and 1,900 guns taken. During August and September, instead of letting his armies escape a German panzer pincer on Kiev, Stalin ordered the city held. German infantry then sealed off Kiev. It fell on September 19 and with it most of five Soviet armies: 665,000 prisoners and vast quantities of weapons.

Fortunately for the Soviet Union, the campaign was sufficiently

prolonged for Stalin to grow as a war leader. He absorbed specialized knowledge and, if lacking in imagination, by the end of the war had grown into an effective military strategist. He was also famed, and feared, for his frequent and often abrupt interference in the conduct of operations. Front commanders reported to him daily and received orders directly from him. On August 8, Stalin took over the position of supreme commander in chief.

There were frequent changes in the top professional leadership of the General Staff (Glavnokomand). At first, Georgii K. Zhukov was commanding general; from the end of July 1941, it was Boris M. Shaposhnikov; from May 1942, it was Aleksandr M. Vasilevsky; and from February 1945 to March 1946, it was Alexi I. Antonov. Officers who had been imprisoned under the purges were now released to take command. Prominent among some 4,000 so freed was Colonel Konstantin K. Rokossovsky (later marshal of the Soviet Union), who had undergone extensive torture.

Supply remained a serious problem for the army. Early in August 1941, the Main Directorate of the Red Army was established under the General Staff and was responsible for supplying the army. Arms shortages were especially acute in the winter of 1941–1942. By December 1941, only 39 percent of aircraft production goals had been met, and artillery shell production was no more than 20 to 30 percent of targets.

The rapid conversion of Soviet industry to military purposes and the relocation of entire factories east of the Urals both registered considerable results in 1942, when 59 percent of industrial production was devoted to arms manufacture, compared with only 30 percent before 1940. The military share of the state budget on the army also increased dramatically. The General Staff and the government concentrated the Soviet Union’s entire productive capacity on the war effort, and achievements were dramatic. During 1942 Germany produced 9,200 tanks, but the Soviet Union manufactured 24,089; only the United States, with 24,997, built more. Superior military production to that of Germany was a major factor in the Soviet military victory in the war. In 1944, thanks in large part to the organizing genius of Albert Speer, Germany managed to produce 22,100 tanks, but the Soviet Union kept ahead, with 28,963. Artillery production also grew, from 42,300 guns in 1941 to 127,000 in 1942. Other weapons systems underwent similar production increases.

The vast distances in the Soviet Union and the primitive transportation helped to break down the German blitzkrieg, which had prospered on the short distances of Poland and France. Weather also helped to save the Red Army. Hitler believed that the Red Army could be defeated in a short campaign of only six weeks, and the German Army was ill-prepared to deal with the Russian winter and temperatures of –5 degrees Fahrenheit. Eventually, temperatures in the winter of 1941–1942 plunged to –60 degrees Fahrenheit. Soviet forces were able to fight in those conditions, but the German Army was not.

Hitler also miscalculated Soviet manpower resources. In 1941, some 22 million Soviet citizens had experienced some degree of military training. Before the invasion, the Germans had estimated Soviet strength in the west at about 155 divisions: 100 infantry, 25 cavalry, and the equivalent of 30 mechanized. This was not far off the mark; actual Soviet strength was 177 divisional equivalents, but this included air force and border troops, and Soviet divisions were smaller than their German counterparts. By mid-August, the Germans had met and defeated the Soviet force they had expected, but by then another 160 Soviet divisions had appeared. By the summer of 1942, despite catastrophic losses, the Soviet field army numbered 5,534,000 officers and men.

The bulk of Soviet soldiers were poorly trained. The low educational level of the population hampered creation of technically effective combat units. The numerous nationalities and languages of the Soviet Union also worked against an efficient, cohesive military establishment. Women proved to be invaluable in the war effort; some 10 percent of Soviet military personnel and 15 percent of partisan forces were female, many of them serving in combat roles. Women went to the front as pilots, navigators, mechanics, and political officers. In sharp contrast to other armies in the war, there were also all-women ground units, including the 1st Independent Volunteer Women’s Rifle Brigade and the 1st Independent Women’s Reserve Rifle Regiment. Women also were heavily involved in partisan activities in the western portions of the Soviet Union occupied by the Germans.

Improving circumstances enabled the Red Army to take the offensive in November 1942. The winter campaign of 1942–1943 broke the German stranglehold on Leningrad and drove Axis forces west. Stalingrad, Rostov, and Kursk were all liberated. When the Germans began Operation CITADEL in

the summer of 1943, the Red Army halted the German drive in the great Battle of Kursk (July 5–13, 1943). That summer and fall, the Red Army resumed the advance, and from this point the Soviets maintained the initiative for the remainder of the war.

On a 1,200-mile front, Soviet forces destroyed more than 200 Axis divisions and more than 14,000 aircraft. During this period, partisan activity complemented the combat actions of the regular Soviet forces, tying down large numbers of German troops in maintaining lines of communication. In the newly liberated regions, industrial enterprises were set up that increased steadily military production.

Red Army soldiers advancing on the Germans amid the ruins of a workers' settlement on the outskirts of Stalingrad, January 26, 1943. (Bettmann/Corbis)

Soviet forces also received improved arms: the machine pistol (PPS), a new heavy machine gun, the 76mm artillery piece, a 57mm antitank gun, a new 152mm howitzer, and 120mm and 160mm mortars. Furthermore, production was increased of the magnificent T-34 tank with its 76mm gun, and new KV-85 and IS heavy tanks were introduced.

U.S. Lend-Lease aid was certainly important to the Red Army's war effort. The Soviet Union received 375,000 American trucks, 50,000 Jeeps, and 12,000 railroad cars. These greatly enhanced the mobility of the Red Army and allowed it to carry out sustained offensive operations. The United States also supplied 1.75 million tons of food.

If lacking in flair, most Soviet soldiers fought with a dogged persistence, even in hopeless situations. Nonetheless, a staggering 5.25 million Soviet soldiers were taken prisoner during the war. Desertion rates remained high, in part because of the brutal conditions. One source estimates that the Soviet

Union executed 157,000 people during the war on charges of cowardice or desertion.

Soviet military casualties continued to be high, in part because of the costly Soviet practice of attacking without tanks, holding the armor back until a breakthrough was achieved. The Soviets lost more men in the battle for Berlin alone at the end of the war than the United States lost during the war in all theaters combined.

By the end of 1944, the Red Army had almost completely liberated Soviet territory. In January 1945, the Red Army began its offensive against Berlin. The East Prussian Campaign and the Vistula-Oder Operation were the most important strategic operations for the Red Army in the war. In the spring of 1945, the Red Army mounted simultaneous operations on a vast front extending from the Baltic to the Carpathians. On April 25, troops of the 1st Ukrainian Front met the First American Army in Torgau on the Elbe River, symbolizing the end of Nazi Germany. By the end of the fighting in Europe, despite its horrific losses during the conflict, the Red Army had 6 million men under arms, double the number for the German Army.

Three months after the conclusion of fighting in Europe, the Soviet Union declared war on Japan. On August 9, 1945, Soviet forces mounted a large, rapid, and highly successful invasion of Manchuria. Lasting only a week, this bold operation was conducted in difficult terrain against what were considered some of Japan's best troops and ended with Soviet control of Manchuria.

Soviet Union, Navy

When World War II began in September 1939, the Soviet Navy was in the process of implementing significant changes in its naval policies. In late 1935, Soviet leader Joseph Stalin had switched from the strategic concept of a small war at sea and planned to build a large oceangoing fleet. In August 1939, the Naval Staff had finalized a building plan for the next 10 years for 15 battleships, 16 battle cruisers, 2 light aircraft carriers, 28 cruisers, 36 destroyer leaders, 163 destroyers, 442 submarines, and many smaller vessels. Of the new construction, only 1 cruiser, 4 destroyer leaders, 13 destroyers, and 158 submarines had been completed by the time the war began. In addition to these, the Soviet Navy had available only 3 old battleships, 5 cruisers, 17 destroyers, and 7 submarines.

During the November 30, 1939–March 12, 1940, Winter War against Finland, the Baltic Fleet carried out shore bombardment and submarine operations against supply traffic to Finland. The fleet sank only a few Finnish ships, at the cost of one submarine lost. The end of that war, however, pushed the Soviet borders forward in the Arctic by the inclusion of the entire Fisher Peninsula (Poluostrov Rybachiy) and in the Baltic in the Karelian sector. These territorial acquisitions and Hanko at the entrance of the Gulf of Finland as a new naval base greatly improved the defenses of Leningrad, the Soviet Union’s second-largest city.

The nonaggression pact with Germany of August 23, 1939, brought further territorial gains for the Soviet Union. In the summer of 1940, acting under its secret provisions, the Soviet Union incorporated the Baltic states, further improving the base situation for the Soviet Baltic Fleet. In the Black Sea, Soviet territorial gains in Bessarabia created an additional buffer for Odessa and allowed the establishment of a Danube Flotilla.

The rising danger of war with Germany forced the Soviet Navy in October 1940 to scale down its naval building program. Although Soviet intelligence agencies received many reports about German preparations for an attack and British and U.S. leaders also sent warnings based on their intelligence reports, Stalin refused to believe that Adolf Hitler would attack the Soviet Union before subduing Britain. The German attack of June 22, 1941, therefore caused great disorder and led to heavy Soviet losses, especially in the army and air force but also in the Baltic and Black Sea fleets.

The program to build an oceangoing fleet had to be scrapped as well. By that time, 4 cruisers, 7 destroyer-leaders, 30 destroyers, and 204 submarines had been commissioned, and the Soviets had added 4 submarines from the Estonian and Latvian fleets to their own forces. Ships in the Far East yards would be completed, whereas the bigger ships in the western yards were laid up for completion after the war. Of the ships partly completed, only 3 battleships, 2 battle cruisers, 10 cruisers, 2 destroyer-leaders, 42 destroyers, and 91 submarines would be launched.

The Baltic Fleet—now comprising 2 old battleships, 3 cruisers, 2 destroyer-leaders, 19 destroyers, and 70 submarines—had to defend the entrances to the Bay of Riga and the Gulf of Finland by laying mine barrages. At the same time, the Germans and the Finns (in the so-called Continuation War, the Finns had reentered the war as a cobelligerent of Germany to secure the territory lost to the Soviet Union earlier) tried to blockade the Baltic Fleet by laying mines. The German attack forced the Soviets to abandon their Baltic bases and the Finnish harbor at Hanko, incurring great losses in the process.

The German Juminda barrage of mines was particularly effective, augmented as it was by air attacks against Soviet ships in the enclosed harbor fortress at Kronstadt and at Leningrad. In 1941, the Leningrad shipyards managed to complete 7 destroyers and 5 submarines, but the Soviet Union lost 1 battleship, 15 destroyers, and 28 submarines to mine and air attacks, with many more vessels damaged.

From 1942 until October 1944, the Baltic Fleet was confined to the innermost part of the Gulf of Finland by German and Finnish mine barrages. Only the submarines could even try to break out into the open. This tactic met with some success in 1942, when the Soviets launched 31 submarine

operations; 22 of these breached the mine barriers and reached the Baltic, where they sank 25 ships. Twelve submarines, however, were lost. In 1943, all attempts to break through the barriers failed, and 4 more submarines were lost. Only after the Finnish truce of October 1944 did Soviet submarines again try to reach the Baltic Sea.

By the end of the war, the remaining 22 submarines managed to sink 35 ships, including the liners *Wilhelm Gustloff*, *General Steuben,* and *Goya*. The *Wilhelm Gustloff* was the largest German ship ever sunk by a Soviet submarine; some 9,300 people lost their lives. In the case of the *General Steuben*, of 4,000 people aboard (including 2,000 German military wounded), only 300 survived; and in the case of *Goya,* only 183 survived of some 7,000 passengers and crew. Baltic Fleet vessels, operating in conjunction with aircraft, also supported the operations of the Red Army in late 1944 and early 1945. They carried out landing operations in the Gulf of Finland and on the Baltic Islands, and they also attacked German naval forces in the area.

In June 1941, the Black Sea Fleet consisted of 1 old battleship, 5 cruisers, 3 destroyer-leaders, 14 destroyers, and 44 submarines. The German invasion of the Ukraine that month forced the fleet to first support and then evacuate the cities captured by German and Romanian forces in operations beginning in the Danubian estuaries and lasting through mid-1942. Nikolayev, which contained the chief Soviet building yards, had to be evacuated that August. The cruisers, leaders, and destroyers already launched there were towed to Caucasian ports, and the remaining ships were destroyed before the German forces occupied the city.

Between August and October, German and Romanian forces surrounded Odessa by land, and Soviet forces there had to be supported by the fleet, which then evacuated the city. For six months, the Soviet main base at Sevastopol also had to be supplied and supported by naval operations that involved nearly all available naval forces.

In December 1941, the fleet undertook a great amphibious operation against German forces occupying the Kerch Peninsula in an attempt to relieve the defenders at Sevastopol. By May 1942, however, the Germans had annihilated the Soviet ground forces, and only remnants could be evacuated. To the very end of the final German attack on Sevastopol, Soviet surface ships and submarines attempted to supply the fortress and evacuate the wounded. In these operations, which lasted through mid-July 1942, the Black

Sea Fleet lost 1 cruiser, 2 destroyer-leaders, 9 destroyers, and 12 submarines. Five of the submarines were lost during operations to interdict Axis sea traffic on the west coast of the Black Sea, an area heavily mined by both the Germans and Romanians.

From August 1942 until September 1943, the Black Sea Fleet concerned itself primarily with the supply of harbors on the Caucasian coast that were endangered by the continuing German offensive. This allowed the Red Army to hold Taupse, and naval landing operations coordinated with submarine and motor torpedo boat attacks assisted in the Soviet offensive on the Kuban Peninsula as well. Here Soviet forces successfully interrupted sea traffic between Romania and Crimea. The attacks against German sea traffic along the west coast, however, were largely a failure.

The battle for the Crimea began in October 1943 and lasted until May 1944. The Black Sea Fleet again tried to disrupt sea traffic from Constanta to Sevastopol with submarines, light surface forces, and air attacks. On Stalin's order, the larger ships were kept out of these operations.

After a short pause, in August 1944 the Red Army began its offensive into Romania. Once Romania capitulated, Bulgaria was occupied, and the Germans were forced to scuttle the remainder of their naval forces in the Black Sea—effectively ending naval combat in that theater. Between July 1942 and the end of Black Sea naval operations, the Black Sea Fleet lost 1 destroyer-leader, 2 destroyers, and 14 submarines. A few small submarines were transferred via inland waterways from the Arctic and by rail from the Pacific to augment the fleet there, but they arrived too late to participate in operations against German-Romanian shipping.

The Soviet Northern Fleet began the war with 8 destroyers and 15 submarines. Its first task was to support the Red Army in halting the German offensive toward Murmansk. The submarines were then sent to attack German supply traffic along the Norwegian coast from the Lofoten Islands to Kirkenes, although they met only limited initial success. A few British submarines sent to Murmansk for some months achieved slightly better results. The Northern Fleet was soon augmented by the transfer of 8 submarines along interior waterways from the Baltic in 1941. Another 5 submarines came from the Pacific in 1942 and 1943, and 12 new submarines arrived from the Caspian during that time as well.

The fleet carried out operations throughout the war, inflicting some losses

on German shipping and losing 25 submarines, mainly to mine barrages and antisubmarine forces. The fleet also supported Allied convoys over the final portion of the route to Murmansk with destroyers—including 3 sent from the Pacific Fleet via the northern sea route—and naval aircraft. The main defense burden for these convoys, however, fell to the British Home Fleet. In the later years of the war, British and U.S. surface ships and submarines assisted in defending the northern sea route as well. Overall, the Northern Fleet suffered minimal losses beyond the submarines; only 3 destroyers and some escort vessels and auxiliaries were damaged or sunk.

The Soviet Pacific Fleet served as a reservoir of personnel and for the training of naval crews for most of the war. It transferred a few destroyers to the Northern Fleet, however, along with some submarines. In the last month of the war, strengthened by Lend-Lease deliveries of U.S. ships, the Pacific Fleet took part in the war against Japan, conducting landing operations on the east coast of Korea, on Sakhalin Island, and in the Kurile Islands. Lend-Lease played a vital role in securing the route along the Aleutian Islands to Kamchatka and Soviet bases in the Far East, especially Vladivostok. This proved to be a much safer route than either Murmansk or Arkhangelsk for Allied supplies to reach the Soviet Union, not least because of the Soviet-Japanese nonaggression pact of March 1941.

The Pacific Fleet lost only five submarines through accidents during these operations, though two were eventually recovered. One additional submarine, which was en route to the Northern Fleet, was lost to a Japanese submarine attack just off the U.S. West Coast. A submarine also went down in the final days of the war, sunk in all likelihood by a Japanese mine.

Outside of these major theater operations, the Soviet Navy also employed river flotillas. The first flotilla operations came on the Pripyat River in September 1939 against the Poles. Other operations followed: on the Danube and the Dnieper in 1941, on the Volga in 1942, and on the Danube again in 1944 and 1945. Flotillas carried out operations on Lake Ladoga and Lake Onega from 1941 to 1944, and they assisted the Red Army in its operations on smaller seas, rivers, and lakes.

Soviet Women's Combat Wings (1942–1945)

Soviet women's combat aviation regiments evolved from the 122nd Aviation Group, established in Moscow in October 1941 by Marina Raskova. The first of these was the 46th Taman Guards (initially designated 588th) Bomber Regiment. Commanded by Lieutenant Colonel Evdokia Bershanskaia, it remained all female throughout the war and produced 24 Heroes of the Soviet Union. It consisted of one training squadron and three operational squadrons, with two-woman aircrews. The regiment flew converted U-2 biplane trainers (renamed Po-2 in 1944) and became operational in the Ukraine and reached Berlin at the end of the war.

The 125th M. M. Raskova Borisov Guards (initially designated as the 587th) Bomber Regiment was commanded first by Major Marina Raskova and then Major Valentin Markov. It produced five Heroes of the Soviet Union. The unit consisted of two Pe-2 dive-bomber squadrons. These aircraft were armed with five machine guns that were fired by the pilot, the navigator, and the gunner. Initially, the gunners were mostly male. The regiment flew 1,134 medium-range sorties. It became operational near Stalingrad, and by the end of the war it was stationed in the Baltic.

The 586th Fighter Regiment was commanded first by Major Tamara Kazarinova and then Major Aleksandr Gridnev. It included some male technicians and one men's squadron, formed as a replacement for a women's unit sent to Stalingrad. The regiment flew Yak-1 and Yak-9 aircraft and was

charged with protecting Soviet industrial centers, rail junctions, and bridges, including those in Voronezh, Kastornaia, Kursk, Kiev, and Budapest. It became operational in Saratov and by the end of the war had reached to Vienna.

Also noteworthy were Il-2 pilots and senior lieutenants Tamara Fedorovna Konstantinova and Anna Aleksandrovna Timofeeva-Egorova, both Heroes of the Soviet Union. Konstantinova was deputy squadron commander of the 999th Ground Attack Regiment, 277th Ground Attack Division, First Air Army, 3rd Baltic Front. Timofeeva-Egorova was chief navigator of the 805th Ground Attack Regiment, 197th Ground Attack Division, Sixteenth Air Army, 1st Belorussian Front.

By the end of the war, women constituted 12.5 percent of all Soviet fighter aviation personnel, including ground support.

Soviet Writers, Union of

Organization founded by the Communist Party on April 23, 1932, designed to promote literary conformity among Soviet writers. Essentially an official censorship bureau designed to consolidate communist rule and Joseph Stalin’s dictatorship, the Union of Soviet Writers survived until the collapse of the Soviet Union in 1991. The Union of Soviet Writers replaced all existing literary organizations and established firm guidelines for Soviet

literature. The initial membership numbered approximately 1,500 people, and the union eventually sponsored literature in 76 languages.

The approved form of writing was socialist realism, featuring a bland literary style and the promotion of government policies. Writers were compelled to avoid the innovative techniques of modern literature and to emphasize positive role models that were creating the new Soviet society. The Union of Writers also controlled the nation's leading literary periodicals.

Writers acquired membership in the union by application. Because such membership was virtually required to be published, it became obligatory. Membership often brought coveted privileges in a poverty-stricken society, such as special housing and food allowances.

During World War II, some members of the union were evacuated from vulnerable locations such as Moscow and Leningrad to safer regions farther east. Nevertheless, many served at the front either in combat roles or as journalists. More than 900 members received war decorations, and some 400 were killed during the conflict. The work of the organization in restricting and guiding the production of literature receded during the war years, however. As the government built support for the war by permitting the revival of religion and traditional Russian patriotism, it also gave writers a degree of freedom that lasted until 1946. This loosening of restrictions was also a Soviet ruse to demonstrate to its democratic allies that it was an "open" society.

A wave of expulsions from the Union of Soviet Writers signaled the revival of the Stalinist dictatorship that had been established in the late 1920 and 1930s. In 1946 several prominent writers were removed from the organization, and the period from 1946 to 1953, the year in which Stalin died, saw writers placed under the heaviest restrictions.

Following Stalin's death and during the era of Soviet premier Nikita Khrushchev, who was in power until 1964, a number of Union of Soviet Writers branches, notably the one in Moscow, allowed a new level of literary freedom. Some of the union's journals retained their character as bastions of "socialist realist" orthodoxy, but others became outlets for more liberal views.

With the end of the Khrushchev era, the Union of Soviet Writers again closely restricted literature and its subjects. The expulsion of disloyal writers from the organization was once more a signal for the restoration of literary

orthodoxy. The most significant of these expulsions came in 1969, when Alexander Solzhenitsyn was ousted by the Moscow branch. Many members of the union during this time avoided controversy by focusing their work on themes such as nature writing, which did not bring them into the controversial areas of politics and economics.

The Union of Soviet Writers reached a peak membership of 10,000 people by the start of the 1990s. With the reforms undertaken by Soviet leader Mikhail Gorbachev, its influence rapidly declined. The Union of Soviet Writers dissolved with the collapse of the Soviet Union in the autumn of 1991.

Spaatz, Carl Andrew "Tooey" (1891–1974)

General in the U.S. Army Air Forces and later the U.S. Air Force. Born on June 28, 1891, in Boyertown, Pennsylvania, Carl Andrew Spaatz graduated from the U.S. Military Academy at West Point in June 1914 and began his military career as an infantry second lieutenant in Hawaii. In October 1915, he was detailed to the Aviation School in San Diego, California, where he received his wings in May 1916. In June, he joined the 3rd Aero Squadron in the Punitive Expedition into Mexico.

Following U.S. entry into World War I, Captain Spaatz served in France, first as commander of the 31st Aero Squadron and then as an instructor at the American Aviation School. In September 1918, he joined the 13th Squadron, 2nd Pursuit Group, and was credited with downing three German planes.

Following the war, Major Spaatz commanded the 1st Pursuit Group (1921–1924), graduated from the Air Corps Tactical School (1925), and spent three years in the Office of the Chief of the Air Corps (OCAC). During

January 1–7, 1929, Spaatz commanded an army aircraft, the famous *Question Mark*, in a record endurance flight of nearly 151 hours aloft. From 1929 to 1935, he commanded the 7th Bombardment Group and 1st Bombardment Wing in California, subsequently returning to the OCAC. In June 1936, he graduated from the Command and General Staff School at Fort Leavenworth, Kansas, and was promoted to lieutenant colonel. He then served at Langley Field, Virginia, and had a third tour with the OCAC. In early 1940, Spaatz spent several weeks in Britain as a military observer. By July 1941, he had risen to the rank of temporary brigadier general, serving as chief of the Air Staff for the newly established Army Air Forces (AAF).

Following U.S. entry into World War II, Major General Spaatz traveled to Britain in July 1942 to command the U.S. Eighth Air Force. That December, Spaatz transferred to command the Twelfth Air Force in North Africa. Promoted to lieutenant general in March 1943, he assumed command of Allied Northwest Africa Air Forces. During the last six months of 1943, Spaatz served as deputy commander of the Mediterranean Allied Air Forces.

Spaatz returned to Britain in January 1944 to command U.S. Strategic Air Forces in Europe, consisting of the Eighth Air Force in Britain and the Fifteenth Air Force in Italy. These forces proved to be vital in preparation for and then support of the Allies' Normandy Invasion (June 6, 1944).

Major General Carl Spaatz (left) and Brigadier General Ira C. Eaker, 1942. Both men played important roles in the U.S. Army Air Forces' strategic bombing campaigns during the war. (Library of Congress)

Promoted to temporary general in March 1945, Spaatz returned to AAF headquarters in June, only to be assigned to command U.S. Strategic Air Forces, Pacific, in July. He then supervised the final air campaign against Japan. Spaatz remained certain of the efficacy of strategic bombing of industry in the war, and he believed that still heavier bombing might have obviated the need for the Normandy Invasion. In October 1945, he recommended that atomic weapons should form the backbone of U.S. defense strategy.

In February 1946, President Harry S. Truman nominated Spaatz for assignment as commander of the AAF. Spaatz played a leading role in the creation of the separate U.S. Air Force. He was the last commander of the AAF and became the first chief of staff of the Air Force in September 1947. Spaatz retired in June 1948 and died in Washington, D.C., on July 14, 1974.

Spain

Located in the Iberian Peninsula in Southwestern Europe, Spain is bordered by France to the north, Portugal and the Atlantic Ocean to the west, the Mediterranean Sea to the east, and the Strait of Gibraltar to the south. Spain, which encompasses approximately 195,400 square miles, had a 1939 population of 25.64 million.

Following the nationalist victory in the Spanish Civil War (1936–1939), Francisco Franco-Bahamonde ruled Spain as dictator. El Caudillo (the leader) continued his repressive policies with the aim of preserving the values of traditional Catholic Spain. Spain sided early with the fascist states of Germany and Italy. On March 27, 1939, Spain joined the Anti-Comintern Pact (Communist International). Germany, desperate for Spanish exports of wolfram—the source of tungsten and armor-piercing projectiles—actively courted Franco. Spain, economically devastated by its Civil War, needed nitrates for fertilizers and oil, of which it had no domestic supply. Pushed by foreign minister and Falangist leader Ramón Serrano Súñer (his brother-in-law), Franco edged Spain closer to active participation in the war.

Following the German defeat of France, Hitler met with Franco at Hendaye on the French-Spanish border on October 23, 1940, and demanded that Franco enter the war. Hitler was angry at Franco’s noncommittal response, which was accompanied by an impressive shopping list of required military hardware. Franco was displeased at Hitler’s vague reply to the demand for territorial compensation, especially French Morocco.

Although he promised Hitler a quick response, Franco dallied and never brought Spain into the war. He did not wish to entangle his still-prostrate country in a new war, and he believed that his cause was better served if he posed as a neutral. This attitude of nonbelligerency (not neutrality) infuriated Hitler, who even considered invading Spain (Operation FELIX) as part of a Mediterranean strategy following his defeat in the July 10–September 30, 1940, Battle of Britain.

Franco did congratulate Hitler after each of his early victories and sent troops, under the guise of volunteers, to fight Russia after Hitler's invasion of the Soviet Union. This was the Blue Division, so named because the troops wore blue Falange Party shirts with their red Carlist berets and brown Foreign Legion trousers. Commanded by General Agustín Muñoz Grandes, this 18,000-man division was sent to demonstrate Franco's hatred of communism; get rid of Falange hotheads, as a sop to Hitler; and demonstrate to Hitler that Spaniards would fight a German invasion of Spain.

The Blue Division, which joined the German order of battle as the 250th Infantry Division in Army Group North, distinguished itself in fighting around Leningrad. From August 1941 to March 1944, some 47,000 Spanish soldiers served in the division. It sustained 22,000 casualties, a casualty rate of 47 percent, of whom 4,500 died. Fewer than 300 prisoners of war were repatriated in 1945.

The Allies pressed Franco to withdraw the Blue Division, but Hitler released it without being asked to strengthen Franco's hand against the Allies. The last troops returned to Spain in April 1944, although Spanish volunteers continued to fight for Germany afterward. Several were organized into Waffen-Schutzstaffel (Waffen-SS) units, and a Spanish SS battalion helped defend Berlin to the last.

Throughout the war, Franco provided the Germans and Italians with assistance in the form of observation posts in Spanish Morocco to monitor Allied ship movements, and he allowed German submarines to be serviced in Spanish ports. During the Allied buildup at Gibraltar preceding Operation TORCH (November 8, 1942), Franco ordered partial mobilization of the Spanish military but did nothing more. The success of TORCH and especially the toppling of Benito Mussolini from power led Franco to shift to a more neutral position. He reduced the strength of the Blue Division and at the end of 1943 dissolved the Falangist militia.

In February 1944, President Franklin D. Roosevelt also ordered an embargo on fuel and food exports to Spain. On May 2, 1944, with stocks of oil nearly exhausted, Franco signed an agreement with the Allies whereby he promised a strictly neutral stance. He agreed to hand over all interned Italian ships, close the German consulate in Tangier, and expel German intelligence agents from Spain. He also agreed to curtail wolfram shipments to Germany to a token 20 tons a month. Despite this agreement, until the end of the war Spain continued to furnish the Germans with intelligence information. Only in April 1945 did Spain sever diplomatic relations with Nazi Germany and Japan.

When World War II ended, Spain became a primary refuge for leading Nazis and collaborators. The Allies sought to punish Franco's wartime conduct with quarantine treatment. Spain was excluded from the United Nations and condemned for its political nature and close association with the Axis nations. The Cold War changed that, however, and the United States came to view Spain as a bulwark against communism. The boycott of Franco was lifted, U.S. air and naval bases were established in Spain, and U.S. aid helped prop up the regime, a fact remembered with bitterness by many Spanish democrats.

Spanish Civil War (1936–1939)

The Spanish Civil War was fought between the Republican side, which was determined to eliminate an entrenched feudalism and introduce Spain to the reforms enjoyed by the rest of Western Europe, and the Nationalists, who sought to destroy the newly elected government that had expelled the monarchy and threatened Spain's traditional values. Soon Spain's civil war was hopelessly complicated and prolonged by the intrusion of outside forces. The bloodletting went on for nearly three years, from July 1936 to April 1939. Millions died or were maimed. The Republicans and the Nationalists were equally ruthless.

In 1923, King Alfonso XIII copied Italy and called on his confidante, General Miguel Primo de Rivera, to establish an authoritarian corporative state. When this failed to solve problems by 1930, Alfonso XIII dismissed Primo de Rivera, recalled the Spanish Cortes (parliament), and allowed elections. Municipal elections of the spring of 1931 were such a repudiation of the king that he went into exile that year, and Spain became a republic.

The period that followed was marked by continuous unrest. When the leftist Republicans were in power, they pushed through reforms to benefit the workers and the peasants. The Republicans also moved to curtail the special privileges enjoyed by the church and the wealthy. Then in 1933, when the Center and the Right won a majority in the Cortes, they curtailed the reforms and restored special privileges enjoyed by the establishment. They also purged leftists and liberals, and they carried out a purge in the army of those not sympathetic with their cause. Both sides grew increasingly intolerant, and it was clear that the power struggle would not be resolved at the polls.

The Republicans won the hotly contested February 1936 elections. The leftist parties (republicans, socialists, syndicalists, and communists) had combined in a Popular Front and beaten the Nationalist coalition of Conservative Republicans, Clericals, and Monarchists. Demonstrations and political violence on both sides increased. The Nationalists began a rebellion on July 18, 1936, launched prematurely because the government headed by President Manuel Azaña learned that something was afoot. The rebellion began in a revolt of army regiments in Spanish Morocco and was led by the

top echelons in the army, notably Generals José Sanjurjo y Sacanell, Emilio Mola y Vidal, Juan Yagüe, and Francisco Franco.

Spanish Republican soldiers, fighting against General Francisco Franco's Nationalists, line up in a trench in preparation for an attack in 1936 during the Spanish Civil War. (Hulton-Deutsch Collection/Corbis)

At the outset of the civil war, the Nationalists had support from perhaps two-thirds of the army and 90 percent of its officers, the church, the die-hard monarchists, and the conservative old-line families who controlled the majority of the wealth of Spain. They also had support from the Foreign Legion and the many powerful armies of the paramilitary groups, the Carlists and the Falange (the closest Spanish equivalent to the Fascist Party). The government side, known as the Republicans or Loyalists, could count on the navy, which was solidly Republican, and the bulk of the air force; the peasants and workers; and the most industrialized part of Spain, the Madrid-Valencia-Barcelona triangle. The loyalties of the middle class were fairly evenly divided.

Opinions differ as to which side would have won had it been left to the Spaniards to decide, but the Republicans would have to be given the edge. Certainly, the war would have been much shorter; foreign intervention merely heightened and prolonged the suffering.

German and Italian aid came early. Only a week into the fighting, Adolf Hitler agreed to supply the Nationalists with German transports and fighter escorts to ferry Franco's troops from Morocco to Spain. This was crucial to Nationalist hopes because the Republicans controlled the navy. The Nationalist side pressed half a dozen planes into this service, but beginning on July 29, the Germans aided in the transport of 13,000 crack Spanish and Moroccan troops to Nationalist-controlled Seville in southern Spain.

By intervening in Spain, Hitler hoped to tie the Western democracies down and distract attention from his arms buildup. A Nationalist victory would also guarantee a supply of Spanish iron ore and other strategic materials. Spain could also prove to be a testing ground for new weapons. By the end of September, Germany had supplied 73 aircraft to assist the Nationalists; Italy had sent 56.

In November 1936 the Germans formed the Kondor Legion of some 5,000 men and more than 100 aircraft. Ultimately, some 19,000 men and 300–400 planes served in Spain during the course of the war. Spain provided a training school for the coordination of ground troops and tactical air forces that would be so devastatingly effective in Poland and France during World War II. It was the German military intervention, providing air cover for Franco's forces, that proved decisive to the outcome.

The Italian intervention was both larger and less effective than that of the Germans. Perhaps 48,000 Italian soldiers went to Spain in the Italian Corpo Truppe Volontarie, along with several hundred aircraft. During August and September 1937, Mussolini dispatched Italian submarines to the Mediterranean to attack Spanish Republic warships as well as merchant shipping from other nations that were supplying the Republican side.

The Soviet attitude toward the Spanish Civil War was curious. Stalin wished to simulate commitment while believing that victory by either side was undesirable. A Republican triumph would most likely produce a left-wing government unresponsive to Kremlin control. Yet success by Franco would weaken France and free Hitler to concentrate on the east. Simple continuation of the war might even lead to a wider conflict in which France, Britain, Germany, and Italy would destroy one another and the Soviet Union would emerge as the arbiter of Europe.

Soviet aid therefore was always limited in scope and subject to many restrictions, and no Soviet fighting units were ever dispatched to Spain,

although Stalin did send equipment and instructors. The Soviets insisted on payment in cash for goods rendered, and the Republican government shipped several hundred million dollars in gold to Odessa.

The sympathies of the French government and the majority of its people were with the Republicans. Initially Premier Léon Blum promised to supply the Republican government with aircraft and other military equipment. Some aid was sent, but the British government, led by Prime Minister Stanley Baldwin (and then in 1937 by Neville Chamberlain), pursued appeasement and insisted on embargoing military supplies to either side. London made it clear to Blum that if French aid led to an enlarged struggle involving Germany, Britain might not honor its pledge to defend France. France desperately needed British support against Germany, and Blum reversed policy and halted aid to the Spanish Republic.

Ultimately, 27 nations, including all the great powers, signed a nonintervention agreement pushed by London. Yet men and supplies continued to flow to the Nationalist side from Germany and Italy. It was only relatively late that significant military aid reached the Republican side from the Soviet Union. The Franklin D. Roosevelt administration in the United States had no wish to offend the large Catholic vote and adhered to a noninterventionist position, with strong congressional and popular support that opposed any overseas involvement. Mexico was the only Western country to help the Loyalist side, sending 18,000 rifles.

There were those in the West who were appalled by the attitude of their governments, and many volunteered to fight in Spain. The vast majority of these fought on the Republican side, and most were communists. Some 40,000 men came from 54 nations, and 8,000 of them died in Spain. It was rather miraculous that the Republican side managed to hold as long as it did.

Wherever the Nationalists were in control, they slaughtered members of the Popular Front as a matter of official policy. A Red terror also broke out in Republican Madrid, as self-appointed “chekas” set about trying rebels and suspected rebels. Thousands, including many of the rich, were summarily executed after drumhead trials. President Azaña and other leaders were aghast but powerless to stop it; Franco did not lament the deaths of tens of thousands of innocents executed by his troops, which the authorities organized and directed. The militia killings on the Republican side were the work of men running wild without authority.

The rebels had hoped to take Madrid at the offset of the war. Mola's plans had hinged on speed—on storming into Madrid and ending the war quickly. In this he failed. Mola's supply of weapons and ammunition dwindled rapidly as the militia on the Republican side gained in experience. Franco perhaps missed an opportunity to win the war early when he turned away from Madrid, which was still unfortified, to try to relieve Nationalists besieged in the Alcazar in Toledo. The siege there, which lasted for 72 days, was one of the most dramatic episodes of the Spanish Civil War. As it transpired, the Alcazar, which had no strategic significance, fell to the Republicans before the Nationalist relief force arrived.

Madrid's resistance became legendary. When Mola was informed that the resistance was more stubborn than anticipated, he indicated that the four Nationalist columns converging on Madrid from different directions would be joined by a "fifth column"—that is, secret sympathizers or supporters of an enemy who would engage in sabotage or spying within defense lines or national borders. The expression entered the vocabulary. The inhabitants of Madrid vowed "no pasarán" (they shall not pass). Madrid blunted a series of Nationalist attacks between November 1936 and March 1937.

Franco and Mola moved their troops toward Andalusia and Extremadura, depriving the Republican forces of the most important wheat-growing and cattle-raising regions in Spain. On February 8, 1937, the Nationalists took Málaga, although the Loyalists repulsed two Italian divisions at Guadalajara in mid-March.

In the spring of 1937, Franco began the Great Northern Campaign, a two-staged attack that caused the surrender of Asturias and then the Basque area. On April 1, the Nationalists invested Bilbao, crushing the remaining Basque Loyalist resistance. On June 18 Bilbao fell to the Nationalists, who then moved against Santander. By the end of the year, the Nationalists controlled all of northwestern Spain.

In despair, the Republicans turned increasingly to the Soviets, who therefore steadily won greater influence. Gradually, the more moderate leaders were bypassed and ousted until eventually the communists took control under politician and trade unionist Francisco Largo Caballero. Aided by Soviet agents, the Spanish communists then purged the Republican side of Syndicalists, Trotskyites, and others who did not adhere to the Moscow party line.

In April 1937, the world was horrified when German and Italian aircraft bombed Guernica into rubble. The Germans used a new technique known as carpet bombing, which claimed 7,000 civilian casualties. The attack gave an exaggerated impression of the destructiveness of airpower but inspired Spanish artist Pablo Picasso to dramatize the event in a painting. Italian planes also attacked long columns of refugees headed north to France from the stricken cities of Spain. In their offensive in the Basque region, the Nationalists captured Santander on August 25, 1937.

On concluding the campaign in the north, Franco turned his attention east toward Aragon and Catalonia. The battles were hard-fought, but Nationalist forces reached the coast and split Republican-held territory. Before the Nationalist forces could exploit their victories, Republican troops under new Republican leader Juan Negrín staged a great offensive along the Ebro River beginning on July 24–25, 1938. The Republicans committed 100,000 of 400,000 men in their army.

Caught by surprise, Franco halted operations in Catalonia. Nationalist airpower and artillery, which gave the margin of difference throughout the civil war, halted the Republicans and cost them 70,000 casualties. The failure of this summer offensive spelled the beginning of the end for the republic.

On October 10, Franco launched an all-out counteroffensive along the Ebro. The Nationalists quickly regained all territory lost there and followed up by crushing remaining Republican forces in Catalonia. By December, Nationalist forces surrounded Barcelona, causing its capitulation on January 26. The final blows came with the capture of Madrid on March 27 and of Valencia on March 30. The Spanish Civil War was over.

The toll of the fighting has never been accurately determined. The most careful estimates are that about 600,000 Spaniards were killed on both sides, and after the war, another 100,000 were executed by the victorious Nationalists. Half a million more lived on as refugees in camps on the French side of the Pyrenees.

Spain was left with deep wounds that many decades later still had not healed. The West did not come off well in Spain, and its failure to stand up for democracy encouraged other demands by the dictators elsewhere. Perhaps the most important effect internationally of the civil war in Spain was to bring Germany and Italy together in what came to be known as the Rome-Berlin Axis.

Spears, Sir Edward Louis (1886–1974)

British Army general and diplomat. Born on August 7, 1886, in Paris, France, to British parents, Edward Louis Spiers, tired of innumerable mispronunciations, changed the spelling of his last name to Spears in 1918.

In 1903, Spears joined the Irish Militia and rose to second lieutenant. Three years later, he was admitted to the Royal Irish Hussars of the British Army. Spears used his bilingual abilities to translate French texts into English. These skills also made him valuable as a liaison between French and British forces in World War I. The two nations had few guidelines on how to elicit cooperation among their troops, and Spears took the initiative to formulate a blueprint for the position of liaison. He was wounded several times during the war. A friendship with Winston L. S. Churchill, whom he met before the war through a mutual friend, blossomed during the war and afterward.

In 1920 Spears resigned his commission and entered politics. He served in the House of Commons from 1920 to 1922 and from 1931 to 1945. In late

1940, Prime Minister Churchill commissioned Spears a major general and sent him as a personal representative to France. When French premier Paul Reynaud's government fell and General Henri Philippe Pétain established the Vichy regime, Spears was attached to General of Brigade Charles de Gaulle, leader of the Free French. As part of this mission, Spears traveled to the Levant.

Spears's relationship with de Gaulle soured, and in 1942 Churchill appointed Spears minister to Lebanon and Syria. Spears, now knighted, supported local independence over French colonial claims, causing diplomatic tension and local uprisings before the French assented to Lebanese and Syrian independence. De Gaulle's dislike of Spears led Churchill to remove Spears in late 1944.

Spears lost his seat in Parliament in the Labour Party's sweeping victory in the 1945 British elections. He remained active in business interests. Spears died in Windsor on January 27, 1974.

Special Operations Executive

British intelligence agency specializing in overseas sabotage and covert operations. British officials established the Special Operations Executive (SOE) in July 1940, impelled by a much-exaggerated belief that fifth-column activities in Western Europe had contributed greatly to the successful German conquest of those countries.

Intended in British prime minister Winston L. S. Churchill's words to "set Europe ablaze" by promoting resistance activities in occupied countries, the

organization initially combined sabotage, research, and propaganda functions. In August 1941, propaganda operations were transferred to the Political Warfare Executive, a separate agency under the Foreign Office; the SOE remained under the Ministry of Economic Warfare, which was headed by Hugh Dalton.

SOE operations focused primarily on delivering agents to European countries to work with—and, where appropriate, inspire—indigenous resistance movements. Because these activities frequently attracted unwelcome attention from the German Gestapo and local police, they aroused the enmity of the British intelligence agencies, especially MI6, which focused primarily on gathering information and preferred obscurity to ensure the safety of its operations.

At its height, the SOE employed 10,000 men and 3,000 women, many recruited through the British old-boy network. At least half of the men and some women spent periods as agents in hostile or neutral countries. The SOE was normally organized in country sections, although in France it had six sections, each of which worked with a different faction of the French Resistance. Activities of the SOE sections eventually provided arms for half a million French opponents of Germany and so facilitated the success of the June 6, 1944, Allied landings at Normandy.

Although its earlier efforts in Italy had proved fruitless, in 1943 the SOE took part in the unconditional surrender negotiations between General Dwight D. Eisenhower and Marshal Patrice Badoglio; thereafter it assisted Italian partisans who fought the remaining German occupation forces. The SOE's Scandinavian efforts were also largely successful, assisting Danish and Norwegian anti-German resistance efforts, foiling German plans to use Norwegian heavy water to develop atomic weapons, gathering military intelligence in Denmark, and securing valuable seaborne supplies of special steels and ball bearings from Sweden. In Poland, SOE operatives assisted in extensive sabotage efforts by severely damaging 6,000 locomotives, which disrupted German railroad traffic to the Eastern Front. SOE agents in Czechoslovakia helped in the May 1942 assassination of German Obergruppenführer Reinhard Heydrich, a propaganda coup that nonetheless provoked savage reprisals against Czech Jews and the town of Lidice.

SOE efforts in the Netherlands, by contrast, proved disastrous; in 1942 and 1943, German intelligence penetrated SOE communications networks,

capturing—and in many cases executing—more than 50 SOE agents.

The SOE sent a mission to the Soviet Union, where officials welcomed it politely and pointedly excluded it from any operational role. Until late 1941, the British agent Kim Philby, later revealed to be a Soviet double agent, served as a rather effective SOE trainer.

Communist operatives penetrated the large SOE mission in Cairo, which supervised Balkan missions and helped to steer SOE assistance toward communist resistance factions. In Greece, the SOE armed several thousand agents but found that communist partisans often used this weaponry to eliminate rival Greek forces rather than the Germans. In Yugoslavia, the SOE initially supported General Draza Mihajlović's Četnik resistance fighters, but it later switched its support to Josip Broz's (Tito) communist forces, a decision that aided the latter appreciably in winning control of Yugoslavia. In Albania, SOE operatives likewise tended to favor communist over right-wing guerrilla groups.

SOE operations extended far beyond Europe. In 1940 and 1941, SOE agents escorted Emperor Haile Selassie back to Ethiopia. With quiet acquiescence from the United States, in Latin America the SOE secretly established sleeper groups that were ready to take action should pro-Nazi forces seem likely to become predominant.

The most significant non-European SOE operations were in Asia. Australian-based SOE agents of Force 136 clashed, sometimes bitterly, with their counterparts from the U.S. Office of Strategic Services (by contrast, they cooperated well in Europe). In Burma, the SOE contravened its own charter by undertaking intelligence-collecting work. It also helped to organize highly effective bodies of Karen guerrillas, who killed more than 17,000 Japanese troops in the war's final months. In April 1945, the SOE persuaded the Japanese-sponsored Burmese National Army to switch its loyalties to the Allies. SOE operations in Thailand and French Indochina were limited and somewhat ineffective.

Although it was forbidden to operate in China, the SOE secretly sent two missions there. One undertook highly profitable foreign exchange and smuggling ventures that left SOE finances with a surplus when the agency disbanded in January 1946. The other instructed the Chinese Communists of the Eighth Route Army of Mao Zedong (Mao Tse-tung) in SOE sabotage methods.

Although its personnel were relatively few and its resistance and guerrilla efforts in occupied countries could only supplement, not substitute for, full-scale military invasions of those territories, SOE operations proved valuable in boosting Allied morale and dislocating Axis control of subjugated areas.

Speer, Albert (1905–1981)

German minister for armaments. Born on March 19, 1905, in Mannheim, Albert Speer was educated at the Munich Institute of Technology and the Institute of Technology in Berlin-Charlottenburg. He received his architect's license in 1927. He was the protégé and academic assistant of Heinrich Tessenow when he first met Adolf Hitler at a Nazi rally in December 1930.

Speer joined the Nazi Party in March 1931. He also joined the Nazi organization for professional architects and soon began receiving party commissions. In 1933, Speer designed the party's celebrations at Templehof Airport, introducing the "cathedral of light" concept that became a hallmark of party rallies. This brought him to the attention of Minister of Propaganda Josef Goebbels, who put Speer in contact with Hitler. The führer soon commissioned Speer to design his official apartments.

By 1934, Albert Speer was "Hitler's architect," and he held several official posts. In January 1937, Speer added the title of inspector general of construction for Berlin. He reported directly to Hitler and impressed the Nazi

leader by completing the Reich Chancellery in only nine months. In January 1938, Hitler made Speer the first commissioner for the Chancellery. He now controlled all building and industrial materials as well as the transport and labor—some 65 million workers—associated with them.

In 1941, Speer offered his services to the army reserve and became chief of defense construction. When Fritz Todt died in a plane crash in February 1942, Hitler again turned to Speer. On February 15 Speer was sworn in as the new minister for armament and munitions. His position also covered most aspects of construction and transportation.

Between 1942 and 1944, Speer tripled overall German armament output. Ammunition production increased 300 percent, and tank output rose 600 percent. By 1943, he was in charge of naval armaments as well as German rocket and atomic programs. Many saw him as Hitler's successor, as the two shared a close acquaintance based on their mutual interest in architecture.

Albert Speer with Adolf Hitler in 1942. (Library of Congress)

The workload, however, took its toll. It also brought Speer into contact with the concentration camps and the conditions of slave labor, which he later claimed to have found abhorrent. After touring facilities in the northeast, Speer fell gravely ill in the winter of 1943–1944. He remained hospitalized until early May 1944.

When he returned to work, Speer found his influence diminished. His name appeared on the list of putative ministers during the attempted coup of July 20, 1944; his friendship with Hitler and the fact that he was listed as someone to be approached after the attempted coup saved him. Speer remained at his posts and was made responsible for the construction of Germany's western defenses. Yet Speer was now less than committed to the Nazi cause. He spoke publicly of final victory and promised miracle weapons, but he privately doubted both. When Hitler adopted a scorched-earth policy, Speer sought to undermine it, and he involved himself in several wild schemes to eliminate the top Nazi leadership.

On April 23, 1945, Speer visited Hitler in his bunker. He then flew to join Admiral Karl Dönitz's successor government at Flensburg as minister of economics and production. While there, following the German surrender, Speer was debriefed for the U.S. Strategic Bombing Survey before being arrested by the British on May 23, 1945.

Speer became one of the main defendants at the International Military Tribunal in Nuremburg and adopted the strategy of accepting collective responsibility while simultaneously denying personal culpability. Found guilty, he received 20 years' imprisonment and served the full sentence.

While he was in prison, Speer wrote the accounts of his work and experiences in Nazi Germany that would make him both famous and infamous. He remained a significant literary and historical figure until his death in Paddington, England, on September 1, 1981.

Speidel, Hans (1897–1984)

German Wehrmacht lieutenant general and Bundeswehr general. Born in Metzingen, Germany, on October 28, 1897, Hans Speidel joined the German Army in 1914 and was soon commissioned a second lieutenant. He commanded a company during the 1916 Battle of the Somme and served throughout World War I. Following the armistice, Speidel remained in the Reichswehr and graduated from the University of Tübingen with a doctorate in political science and history in 1925. After service as an assistant military attaché in Paris, he joined the General Staff as chief of its Foreign Armies Division.

Speidel was a lieutenant colonel and chief of staff of the Eighteenth Army during the May 10–June 25, 1940, invasion of France, and he was the officer who accepted the surrender of Paris on June 14, 1940. He was subsequently appointed chief of staff to General of Infantry Otto von Stülpnagel, German military governor of France. In March 1942 Speidel was assigned to the Eastern Front, where he served for two years as chief of staff of V Army Corps during the Battle of Vyasma-Bryansk (October 2–20, 1941), the Third Battle of Kharkov (March 1–14, 1943), and the assault on Stalingrad (August 23, 1942–February 2, 1943). Although he distinguished himself and was promoted to lieutenant general during his service in Russia, Speidel became convinced that the war could not be won and that Adolf Hitler's regime had to be overthrown.

In April 1944, Speidel was appointed chief of staff to Field Marshal Erwin Rommel's Army Group B in France, which was responsible for the defense of the French Atlantic coast against an anticipated Allied assault. Speidel's opposition to Hitler led him to endeavor to convince Rommel to back the coup against Hitler. Speidel was not part of the inner circle of officers who carried out the July 20, 1944, assassination attempt against

Hitler, however, which undoubtedly saved Speidel's life. Speidel helped ensure that Paris was not demolished in spite of Hitler's orders to the contrary, and he was arrested by the Gestapo on September 7.

Imprisoned in Berlin, Speidel was acquitted by a court-martial. His expulsion from the army would have brought him to trial before the People's Court. Interrogated about his possible role in the plot against Hitler, he outwitted his questioners and insisted that he and Rommel were not involved. Speidel was held prisoner for seven months and then managed to escape and go into hiding. French troops captured him on April 29, 1945.

After the war, Speidel became a professor of modern history at the University of Tübingen, but he remained a consultant on defense matters. In 1954, he was appointed chief negotiator for the Federal Republic of Germany with France regarding German entry into the North Atlantic Treaty Organization (NATO). Speidel was also appointed a lieutenant general in the new German military force, the Bundeswehr.

In April 1957, Speidel became commander in chief of NATO Land Forces in Central Europe and was promoted to full general. He held that post until September 1963. In March 1964, he retired from the army and resumed academic work and writing. Speidel died at Bad Honnef, Germany, on November 28, 1984.

Sperrle, Hugo Walter (1885–1953)

German Air Force field marshal. Born at Ludwigsburg on February 2, 1885, Hugo Sperrle enlisted in the Württemberg 8th Infantry Regiment as an officer candidate in 1903. When World War I began, he was a captain and was training as an aerial observer. Following the war, Sperrle joined a Freikorps organization before being selected to join the Reichswehr as an infantry officer. During the interwar years, he held a variety of command and staff positions and underwent flight training at the secret German base in Lipetsk, Russia. With the formation of the Luftwaffe in 1935, Sperrle was promoted to lieutenant general. In 1936, he was ordered to organize and command the Kondor Legion to support the Nationalists in the 1936–1939 Spanish Civil War.

Sperrle returned from Spain in 1937 to command Luftflotte (air fleet) 3, a post he would retain until 1944. Luftflotte 3 remained in the west for the Polish Campaign but spearheaded the German Army's attack on France and the Low Countries in the spring of 1940. Sperrle's Luftflotte 3 and Major General Albert Kesselring's Luftflotte 2 bore the brunt of the German air campaign against Britain. Following the July 10–September 30, 1940, Battle of Britain, Sperrle and his command stayed in France when the rest of the Luftwaffe transferred to the east for Operation BARBAROSSA (June 22, 1941).

Promoted to general of aviation in October 1935 and to field marshal in July 1940, Sperrle was known for his voracious appetite for the good life. He established his headquarters in Paris and maintained a lavish lifestyle. As the fortunes of war turned against Germany, Sperrle became increasingly indolent and detached from his responsibilities.

Following the Allied invasion at Normandy (June 6, 1944), Sperrle was blamed for the Luftwaffe's failures and relieved of his command in August 1944. He was captured by the British in May 1945 and tried for war crimes at Nuremberg but acquitted in 1948. Sperrle died in Munich on April 2, 1953.

Spitsbergen

Of tactical and strategic importance, the Norwegian islands of Spitsbergen are located in the Arctic Sea north of the mainland. Extending over some 23,658 square miles, the islands comprise the major share of the larger Svalbard group. During the war, Allied convoys regularly passed through this territory carrying Lend-Lease supplies to the Soviet Union. In 1943, U.S. Army chief of staff General George C. Marshall noted in a public speech that while World War I for him had exemplified the importance of roads, railroads, and rivers, World War II demonstrated the importance of oceans.

Ocean currents and climate gave Spitsbergen strategic importance. The North Atlantic drift, an extension of the Gulf Stream, brings abnormally warm water north of the Arctic Circle directly past the islands, continuing to the ice-free Russian port of Murmansk and dissipating in the vicinity of Novaya Zemlya. Germany conquered Norway in 1940. During the war, both sides established weather stations and port and loading facilities in the islands, and they also mined coal there.

In August 1941, a Canadian raiding party centered on the 49th Battalion of the Edmonton Regiment attacked and destroyed a German meteorological station in the islands, wrecked asbestos and gypsum mines, and destroyed about 450,000 tons of mined coal and 275,000 gallons of oil. The raiders then evacuated the Norwegian population to England; about 2,000 Russian miners were transported to a northern Soviet port. The Allies also established a base there.

Germany carried out a major raid on Spitsbergen on September 8, 1943. Operation SIZILIEN included two battleships, the *Tirpitz* and *Scharnhorst;* five destroyers; and four other vessels. The raiders departed Altafjord on September 6. On September 9, however, they destroyed by naval gunfire Allied coal and port facilities and weather stations.

Sports and Athletics

The value of sports and athletic programs in maintaining combat effectiveness was thoroughly demonstrated in World War I. Spectator sports and fitness programs during that conflict helped to maintain both the morale and productivity of the civilian populace. As a result, many nations promoted official athletic programs and policies during World War II. The preferred sports and the nature of officially sanctioned athletic programs differed from nation to nation, as did their announced purposes. Those variations demonstrate the cultural differences among the combatant nations and the separate paths each had taken in developing sports and athletics.

However different in their particulars, officially promoted sports and athletics programs can be loosely grouped into four functional categories. Physical training programs featured mandatory athletic activities, often specialized, that were intended to develop physical and psychological fitness for military service as part of routine duty. Recreational athletic programs supported morale, discipline, and physical fitness through voluntary but often heavily encouraged leisure activities. Mass-participation sports programs employed competition as a means to foster physical and psychological fitness while improving morale and esprit de corps. Both recreational athletics and mass-participation sports programs were often deliberately promoted as alternatives to less beneficial pursuits. Finally, elite spectator sports programs provided morale-boosting entertainment while encouraging more active participation in sports and athletic pursuits.

Britain established the Army Sport Control Board in 1918 to govern an expanding number of military sports associations, thus regulating and promoting recreational athletics, mass participation, and spectator sports

programs. The board supplemented efforts by the Army Physical Training Corps and its staff of instructors from the Army School of Gymnastics at Aldershot to promote uniform physical training throughout the British Army. When Britain entered World War II, it boasted a well-established and centralized program of military sports and athletics.

Australia, Canada, New Zealand, and South Africa followed the British model to varying degrees. France had its own apparatus for regulating physical training and promoting recreational athletics. The armies of Denmark, Norway, and Sweden each promoted physical training, recreational athletics, and participant and spectator sports. Germany was infamous for its regimented sports military training. The Soviet Union was also known for spreading revolutionary ideals through sports. But Japan may have reaped the earliest substantive benefit from such programs, as it began fighting in China in 1937.

The Japanese armed forces featured systematic physical training and some forms of competitive sport. Physical training played a particularly important role in the development of Japanese fighter pilots. A program of gymnastics, diving, and trampoline exercises incorporated into the lengthy flight training process theoretically improved a pilot's ability to remain oriented and under control during violent aerial maneuvers. While the material contributions of such physical and mental conditioning to the early success of Japanese aviation are anecdotal, the rigorous and unparalleled training did contribute to the mystique and esprit de corps of Japanese fighter pilots early in the war. As the United States began mobilization, American flight training programs adopted some of the same techniques.

U.S. military personnel were the beneficiaries of programs formally established following World War I. Both the army and the navy trained all officers to lead physical training, sports, and athletic activities as part of their routine duties. Specially trained instructors supplemented the officers' efforts, benefiting from the expansion of military athletic facilities undertaken as relief projects during the Great Depression. As the nation mobilized, the growing network of military posts offered such facilities in accordance with both official regulations and public expectations. American men and women entering wartime service generally viewed themselves as civilians temporarily in uniform rather than as military personnel, and their government went to great lengths to support that view by providing them

with familiar civilian comforts. These included provisions for sports and athletics.

As a result, Americans, perhaps more than the people of any other nation, created an extensive sporting infrastructure that extended to frontline areas. Facilities and equipment for baseball, basketball, and other favored sports became commonplace, and American military newspapers devoted substantial space to sports coverage. That coverage linked soldiers and the home front by including major civilian sporting events. Some concessions had to be made, however. American football, with its substantial equipment requirements and high risk of injury, was deliberately de-emphasized in the U.S. military during the war.

Sprague, Clifton Albert Frederick (1896–1955)

U.S. Navy vice admiral. Born in Dorchester, Massachusetts, on January 8, 1896, Clifton Albert Frederick Sprague graduated from the U.S. Naval Academy at Annapolis in 1917, then was assigned to the gunboat *Wheeling* in the Mediterranean (1917–1918). Following shore duty, Sprague qualified as a naval aviator at Pensacola Navy Air Station in 1920. He then served aboard the airship tender *Wright* on the west coast (1920–1923).

From 1926 to 1928, Sprague was stationed at Hampton Roads Naval Air Station, where he helped develop arresting gear for aircraft-carrier landings. He was then assistant air officer aboard the aircraft carrier *Lexington* (1928–1929) before commanding a patrol squadron aboard the *Wright* at San Diego, in the Panama Canal Zone, and at Pearl Harbor. He served once again at the Hampton Roads Naval Air Station before helping to outfit the *Yorktown,* where he was air officer from 1937 to 1939. From 1939 to 1941, he commanded auxiliaries. Sprague was commanding the seaplane tender *Tangier* at Pearl Harbor when the Japanese attacked on December 7, 1941.

In June 1942, Sprague became chief of staff of the Gulf Sea Frontier, helping develop convoy techniques. In 1943, he commanded the Seattle Naval Air Station. Promoted to captain, Sprague outfitted the carrier *Wasp* and brought it into commission that November. He continued as skipper of the *Wasp* through the Battle of the Philippine Sea (June 19–21, 1944). Promoted to rear admiral in August 1944, Sprague commanded escort carrier Task Unit 77.4.3 (“Taffy 3”) in the invasion of Leyte Island in the Philippines (October 20–December 25, 1944).

On the morning of October 25, 1944, Japanese vice admiral Kurita Takeo’s superior force surprised the Americans in Leyte Gulf. Sprague’s command of 6 escort carriers, 3 destroyers, and 4 destroyer escorts was nearest to the advancing Japanese force that numbered 4 battleships, 6 heavy cruisers, 2 light cruisers, and 11 destroyers. While ordering his destroyers to attack the Japanese, Sprague summoned air support from other escort-carrier groups. His defensive efforts eventually led the Japanese to withdraw.

Sprague's handling of the battle and the bravery of the men on the destroyers are credited with preventing the Japanese force from destroying the U.S. transports anchored off the invasion beaches.

In February 1945, Sprague took command of Carrier Division 26, participating in support of the U.S. landings at Iwo Jima (February 19) and Okinawa the following month. He then headed Carrier Division 2.

In the summer of 1946, Sprague commanded Joint Task Group 1.1.2 and Navy Air Group Joint Task Force 1 in the Bikini atomic bomb tests. From 1946 to 1948, he was chief of naval air basic training at Corpus Christi, Texas. He commanded Carrier Division 6 in the Mediterranean in 1948 and 1949, and the 17th Naval District and Alaskan Sea Frontier from 1941 to 1951. Sprague retired in November 1951 as a vice admiral and died of a heart attack in San Diego, California, on April 11, 1955.

Sprague, Thomas Lamison (1894–1972)

U.S. Navy vice admiral. Born in Lima, Ohio, on October 2, 1894, Thomas Lamison Sprague graduated from the U.S. Naval Academy at Annapolis in 1917. Following U.S. entry into World War I, he served in Atlantic convoy duty and then on antisubmarine patrol aboard the destroyer *Montgomery,* commanding it as a lieutenant in 1920.

Sprague next underwent flight training at Pensacola Naval Air Station and was designated a naval aviator. Staff and flight assignments followed. During 1931 and 1932, he commanded Scouting Squadron 6. Sprague then supervised a laboratory at the Philadelphia naval aircraft factory, was air

officer aboard the carrier *Saratoga* in 1935 and 1936, and served as superintendent of naval air training at Pensacola from 1937 to 1940. He was executive officer of the carrier *Ranger* in the Atlantic in 1940 and 1941. Sprague next helped to commission the new escort carrier *Charger* and took command of it during Chesapeake Bay training operations for antisubmarine patrols.

Following a tour of duty as chief of staff to the commander of air units in the Atlantic Fleet in the first half of 1943, Sprague fitted out and commanded the carrier *Intrepid* through operations in the Marshall Islands (January 29–February 22, 1944) and off Truk in February 1944. He was promoted to rear admiral in June 1944 and assumed command of Carrier Division 22, which comprised 18 escort carriers and numerous destroyers and destroyer-escorts, for operations off Guam and the Philippine Islands.

On the morning of October 25, 1944, Sprague's division, designated Task Group (TG) 77.4 ("Taffy 1"), was divided into three groups spread across Leyte Gulf supporting the amphibious operation when a powerful Japanese surface force under Vice Admiral Kurita Takeo surprised the Americans. Sprague ordered all of his aircraft to attack the enemy while two of his groups made smoke and moved away from the foe. The other group (TG 77.4.3, "Taffy 3"), commanded by Rear Admiral Clifton A. F. Sprague (no relation), bore the brunt of the Japanese attack. The ferocity of the U.S. counterattack convinced Kurita that his forces had encountered the bulk of the U.S. fleet, not merely an escort carrier group. Kurita then withdrew, sparing both Thomas Sprague's ships and the vulnerable transports supporting the invasion of Leyte (October 20–December 25).

Sprague next commanded Carrier Division 3 off Okinawa (April–June 1945) and Task Force 38.1 off Japan (July–August 1945). Following the war, Sprague was first deputy chief and then chief of the Bureau of Naval Personnel (1946–1949). He was promoted to vice admiral in August 1949, and he then commanded all air units in the Pacific Fleet until his retirement in April 1952. He returned briefly to duty in 1956 and 1957 to negotiate with the Philippine government about bases in the Philippines. Sprague died in Oakland, California, on September 17, 1972.

Spruance, Raymond Ames (1886–1969)

U.S. Navy admiral. Born on July 3, 1886, in Baltimore, Maryland, Raymond Ames Spruance grew up in Indianapolis, Indiana. He graduated from the U.S. Naval Academy at Annapolis in 1906. Spruance's early assignments included service on the battleship *Minnesota* during the around-the-world cruise of the Great White Fleet. His first command was the destroyer *Bainbridge* in 1913. During World War I, Spruance rose to the rank of commander and commanded a troopship. He then commanded destroyers, attended the Naval War College, served in the Office of Naval Intelligence, taught at the Naval War College, and commanded the battleship *Mississippi*.

Promoted to captain in 1932 and to rear admiral in 1939, in July 1941 Spruance took command of Cruiser Division 5 of four heavy cruisers and support ships at Pearl Harbor. As surface screen commander for Vice Admiral William F. Halsey's carriers, he participated in raids on the Gilbert, Marshall, Wake (December 8–23, 1941), and Marcus Islands and in the raid on Tokyo on April 18, 1942.

When Halsey was confined to a hospital, Pacific Fleet commander Admiral Chester Nimitz, on Halsey's recommendation, assigned Spruance to replace him as Task Force 16 commander. Spruance brilliantly handled the air and naval assets available to him, and his forces won the June 3–6, 1942, Battle of Midway. Nimitz then named Spruance his chief of staff.

In May 1943, Spruance was promoted to vice admiral. In August, he took command of the Pacific Ocean Area and the Pacific Fleet, which became known as the Fifth Fleet in April 1944. Promoted to admiral in February 1944 and operating from the heavy cruiser *Indianapolis* as his flagship,

Spruance led campaigns against Japanese naval forces and island strongholds from the Marshalls (January 29–February 22) through the Battle of the Philippine Sea (June 19–21) and the invasions of Iwo Jima (February 19–March 26, 1945) and Okinawa (March–June 1945).

Spruance also directed Operation HAILSTONE, the highly successful raid on Truk in February 1944 that destroyed 12 Japanese warships and auxiliaries, 26 merchant ships, and some 249 aircraft. Although the Battle of the Philippine Sea was a major defeat for Japan, in which it suffered the loss of 3 carriers, 2 oilers, and more than 600 aircraft, Spruance came under criticism in some quarters for not being sufficiently aggressive.

Spruance took command of the Pacific Fleet from Nimitz in November 1945. Congressman Carl Vinson (D-GA), a strong supporter of Admiral Halsey, blocked efforts to secure Spruance's promotion to fleet admiral (five-star rank). In an unprecedented step, Congress eventually passed a bill providing that Spruance would receive full admiral's pay on retirement for the rest of his life, which was the benefit normally reserved only for five-star officers.

In February 1946, Spruance became the president of the Naval War College. He retired from the navy in July 1948 and served as ambassador to the Philippines during 1952–1955. Spruance died on December 13, 1969, in Pebble Beach, California. The Spruance class of destroyers, the last of which was decommissioned in 2005, was named for him.

Stalin, Joseph (1879–1953)

Secretary-general of the Central Committee of the Communist Party of the Soviet Union, supreme commander of the Soviet armed forces, marshal of the Soviet Union, and Soviet dictator. Stalin was indisputably one of the most powerful rulers in history as well as one of the greatest murderers.

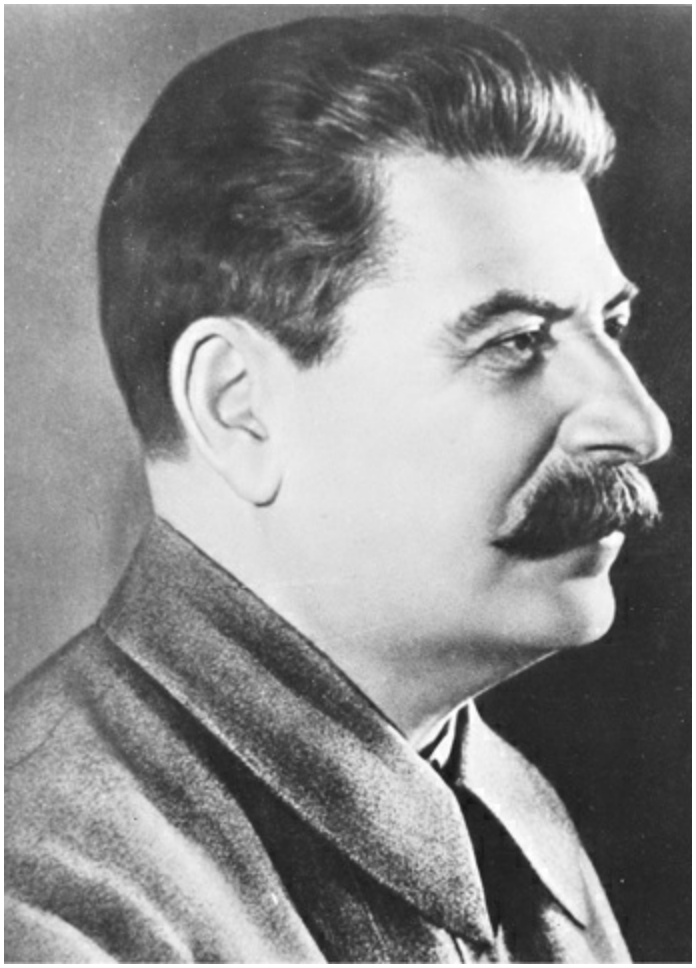
Born Iosif Vissarionovich Dzhugashvili in the Georgian town of Gori on December 21, 1879, Joseph Stalin was the only child of his parents to survive infancy. His parents were semiliterate peasants; his father, an alcoholic, worked as a cobbler, and his mother was a washerwoman and a domestic. Soso, the common Georgian nickname for Iosif, attended the elementary ecclesiastical school in Gori. His mother wanted him to become a priest, and in September 1894 he entered a seminary on a free scholarship.

Stalin's "official" biographies obscure more than they reveal, and they differ for the most part on the cause of Soso's exit from the seminary in 1899. Some say that he was expelled for revolutionary activity, and others claim that he quit, but it was at seminary that Dzhugashvili was introduced to Russian socialism and Marxism. His career as a low-level party functionary began in 1901 under the pseudonym Koba and included "expropriations" (robbery) and counterfeiting in support of the Russian Social Democratic Labor Party (RSDLP). Arrested, he was tried, convicted, and exiled to Siberia in 1903.

Koba escaped from exile in 1904, and the next year he joined the Bolshevik faction of the RSDLP led by Vladimir Lenin. By 1907, he was recognized as an outstanding Bolshevik propagandist in the Caucasus. By 1912, he was sponsored by Lenin to membership in the Bolshevik-controlled RSDLP Central Committee at the Prague conference where the final split between the Bolsheviks and Mensheviks took place.

Stalin (meaning “steel”), as Koba was then known, was freed from Siberian exile by the Russian Revolution of March 1917. He returned to Petrograd and became editor of the party newspaper *Pravda*. His seniority on the Central Committee allowed him a leadership role of the Bolsheviks until Lenin’s return to Petrograd from Switzerland in April 1917. Stalin seems to have played little role in the Bolshevik seizure of power in October 1917.

Stalin’s supposed expertise on the nationalities question led to his appointment as commissar of nationalities in the new Bolshevik government. Through the civil war period, the real government of Russia was the Bolshevik Politburo of Lenin, Leon Trotsky, Lev Kamenev, Nikolai Bukharin, Grigory Zinoviev, and Stalin. To Stalin fell the day-to-day management of the party; in 1922, his power base was expanded when he was appointed secretary-general of the Central Committee, whereby de facto control over party appointments accrued to him.



Joseph Stalin, General Secretary of the Communist Party of the Soviet Union, 1942. Stalin dominated Soviet affairs from the late 1920s until his death in 1953. (Library of Congress)

Following Lenin's incapacitation by stroke in 1923 and his death on January 21, 1924, Stalin was gradually able to parlay his base of power into control of the organs of Soviet governance. By 1929, Stalin had clearly emerged as first among equals and the leader of Soviet Russia. In the 1930s, he began to purge "old Bolsheviks"—his former colleagues—in his quest to maintain and strengthen his hold on power.

Periodic purges were not unprecedented after the Bolshevik seizure of power. Most were directed at subordinate officials and low-ranking party members, who bore the brunt of policy failures. They generally resulted in loss of privileges, demotion in rank, or expulsion from the party. The Great Purges, conducted on Stalin's orders, were characterized by their focus on party and state elites, the use of mass terror, and dramatic public show trials

and “confessions” by the accused. These usually resulted in the execution of the accused or a long prison sentence, which itself often meant death.

Beginning in 1936, in a series of show trials held in Moscow, numerous leading communists and old Bolsheviks were tried; they confessed and were executed or sentenced to hard labor. At the same time, millions of ordinary Soviet citizens simply disappeared in what became known as the “deep comb-out.” Eventually some 8 million people were arrested, 1 million of whom were executed; most of the remainder were sent to the gulags. In 1937, after the destruction of his former adversaries, Stalin began to eliminate potential threats to his power with a purge of military leaders. Eventually, 40 to 50 percent of the senior officer corps disappeared. Not all were executed or died in the gulags; many survived and were rehabilitated during World War II.

Stalin also reversed Lenin’s New Economic Policy (1921–1928), which had introduced a degree of capitalism in order to revive the economy, purged the middle-class peasants who had emerged under that policy (the Kulaks), and carried out the collectivization of agriculture. Reliable casualty figures for the collectivization drive are unavailable, but if one includes the famine fatalities, the number of those who died may exceed 10 million people—a figure that, for whatever it is worth, Stalin gave to Winston L. S. Churchill in Moscow in August 1942. Russian writer Nikolai Tolstoy has put the number who died in the gulags under Stalin at 12 million people. These numbers compare with a total of 15,000 executions in the last 50 years of the czars. In terms of the sheer number of victims, the Soviet Union under Stalin unquestionably outdistanced Adolf Hitler’s Germany.

In addition to the collectivization of agriculture, Stalin implemented a series of five-year plans that set quotas for growth in all areas of the economy. Much of this effort was devoted to the exploitation of Soviet natural resources and development of heavy industry. The last of these plans prior to World War II also emphasized armaments production. Considerable progress was achieved, much of which came at the expense of the living standards of the Soviet people.

In the 1930s, German ambitions alarmed Stalin, who grew interested in collective security. He instructed People’s Commissar for Foreign Affairs Maksim Litvinov to pursue an internationalist course. In 1934, the Soviet Union joined the League of Nations. Stalin also secured defensive pacts with

other nations, including France. In the late 1930s, many western leaders still distrusted the Soviet Union; thus, even though the Kremlin was willing to enter into arrangements with the West against Germany and Japan, no effective coalition was forged, and events during the decade took a course that largely ignored the Soviet Union.

Unsentimental in such matters, in August 1939 Stalin arranged a nonaggression pact with Germany that allowed Hitler to invade Poland without fear of war with the Soviets. Stalin hoped thereby to gain time to strengthen his own military. He also gained territory in eastern Poland and the Baltic states. When Finnish leaders rejected his demands for territory in Karelia, in November 1939 Stalin ordered Soviet forces to invade Finland in order to secure territory and bases against a potential German attack.

Stalin rejected numerous Western warnings in the winter and spring of 1941 that Germany was preparing to attack the Soviet Union. In consequence, Soviet forces were largely unprepared for Operation BARBAROSSA, the German invasion of June 22, 1941. Soviet military units were not even immediately authorized to return fire.

For nearly two weeks after the German attack, Stalin remained incommunicado, but he finally reappeared to proclaim the “Great Patriotic War” and rally his people and the Red Army to the defense of the Rodina (Motherland). During the course of the fighting on the Eastern Front, Stalin grew dramatically as a military commander. All important strategic and operational decisions—and some not so important—required his personal approval as supreme commander. He also absorbed specialist military knowledge, although he held no strategic dogmas or pet operational blueprints. For the most part, Stalin allowed his generals to formulate their own views and develop their own plans following his general ideas, based on well-founded knowledge of the situation. If Stalin bears great responsibility for the early defeats suffered by the Soviet Union in the first two years of the war, he must also be credited for Soviet successes in its last two years.

Besides rallying the Soviet people and armed forces with speeches and rhetoric, Stalin demonstrated his own readiness to stand firm against the German onslaught. On October 15, 1941, with the Germans having driven to within 50 miles of Moscow, the Soviet government and diplomatic community were evacuated to Kuibyshev on the Volga. This caused a panic among the Muscovites, who believed they had been abandoned. The

announcement on October 17 that Stalin was in the Kremlin restored relative calm to the city. Stalin remained in the Kremlin, directing strategic operations throughout the siege of Moscow and, with rare exceptions, for the remainder of the war.

During the war, Stalin had a clear picture of his postwar objectives. As the Western powers had used the new East European states after World War I to isolate communist Russia and contain Bolshevism, so Stalin planned to use the same states—under Soviet control as satellites—to exclude Western influences from his own empire. At no time in the war after June 1941 was less than three-quarters of the German Army committed on the Eastern Front. Stalin used this fact, delays by the Western Allies in opening a true second front, and the great suffering of the Soviet Union (up to 27 million dead in the war, officially) to secure massive amounts of Lend-Lease aid. He also used the actual occupation of Eastern Europe and much of Central Europe by the Red Army to secure major concessions from the West at Tehran, Yalta, and Potsdam.

Stalin continued to rule the Soviet Union with an iron fist almost until the day of his death. He had instigated yet another purge when he died on March 5, 1953, at his dacha in Kuntsevo, near Moscow.

Stalingrad, Battle of (August 23, 1942–February 2, 1943)

Key battle on the Eastern Front. The Battle of Stalingrad, the first large encirclement of a German army in the war, gave the Soviets a psychological lift and the military initiative.

In the spring of 1942, German chancellor Adolf Hitler placed major emphasis in the summer campaign on the southern portion of the German-Soviet Front, code-named FALL BLAU (CASE BLUE). Hitler ordered Field Marshal Fedor von Bock's Army Group South east from around Kursk to secure Voronezh, which fell to the Germans on July 6. Hitler then reorganized his southern forces into Army Groups A and B. Field Marshal Siegmund W. List commanded the southern formation, Army Group A; Colonel General Maximilian von Weichs commanded the northern formation, Army Group B.

Hitler's original plan called for Army Groups A and B to coordinate in a great effort to secure the Don and Donets Valleys and capture the cities of Rostov and Stalingrad. The two army groups could then move southeast to capture the oil fields that were so important to both armies. On July 13, however, Hitler ordered a change of plans, demanding the simultaneous capture of Stalingrad—a major industrial center and key crossing point on the Volga River—and the Caucasus. Dividing the effort placed further strains on already inadequate German resources, especially on logistical support. This also meant that inevitably a gap would appear between the two German army groups, enabling most Soviet troops caught in the Don River bend to escape eastward. Meanwhile, on July 23, Army Group A captured Rostov. It then crossed the Don River and advanced deep into the Caucasus, reaching to within 70 miles of the Caspian Sea.

Hitler now intervened again, slowing the advance of General of Panzer Troops Friedrich Paulus's Sixth Army of Army Group B toward Stalingrad when he detached Colonel General Hermann Hoth's Fourth Panzer Army to join Army Group A to help secure the Caucasus oil fields. Nonetheless, the Sixth Army reached the Volga north of Stalingrad on August 23.

The great city of Stalingrad curved for some 20 miles along the high western bank of the Volga River. Hitler's original intent was merely to control the river by gunfire and destroy the city's arms factories, notably the

Tractor, Red October, and Barricades works, but now he demanded a full occupation of the Soviet dictator's namesake city.

To meet the German thrust toward Stalingrad, on July 12, 1942, the Soviet General Staff had formed the Stalingrad Front. It consisted of the Sixty-Second, Sixty-Third, and Sixty-Fourth Armies, all under the command of Marshal Semen K. Timoshenko, who was replaced by Lieutenant General Vasily N. Gordov on July 27. The Twenty-First Army and the Eighth Air Army were also integrated into the Stalingrad Front. General Vasily Chuikov, a protégé of Marshal Georgii Zhukov, commanded the Sixty-Second Army, which was holding on the west bank of the Volga. Stalin, meanwhile, rushed reinforcements and supplies to Stalingrad.

Angry over the slow progress of the Sixth Army into Stalingrad, Hitler on August 11 ordered Hoth's Fourth Panzer Army from the Caucasus north to that place, leaving a badly depleted Army Group A holding a 500-mile front and stalling the southernmost drive. Hitler also ordered his sole strategic reserve in the area, Field Marshal Erich von Manstein's Eleventh Army, north to Leningrad.

Such wide-ranging shifts of German resources took a terrible toll on men but especially on equipment. They also consumed precious fuel and stretched the German lines far beyond what was reasonable or safe. German Army high command chief of staff Colonel General Franz Halder and other German generals grew more and more alarmed. They pointed out to Hitler that the German army in Russia now had to maintain a front of more than 2,000 miles. Between the two armies of Army Group B, a lone division held a 240-mile gap. North of Stalingrad, Romanian troops protected the single railroad bringing supplies to the Sixth Army. The possibilities open to the Soviets were enormous, providing they had the resources available. Hitler claimed they did not.

Halder continued warning Hitler and tried to get him to break off the battle for Stalingrad. This time, Hitler sacked Halder. Hitler also relieved List and, from a distance of 1,200 miles, took personal command of Army Group A, which was nominally under Colonel General Paul L. E. von Kleist. The irony is that the Germans might have taken Stalingrad in July had Hitler not diverted Hoth south to support Kleist.

Beginning on August 24, a costly battle of attrition raged for Stalingrad. Luftwaffe carpet bombing at the end of August killed some 40,000 people,

but it also turned the city into defensive bastions of ruined buildings and rubble. Stalin refused to allow the evacuation of the civilian population, believing that this would force the defenders, especially local militia forces, to fight more tenaciously.

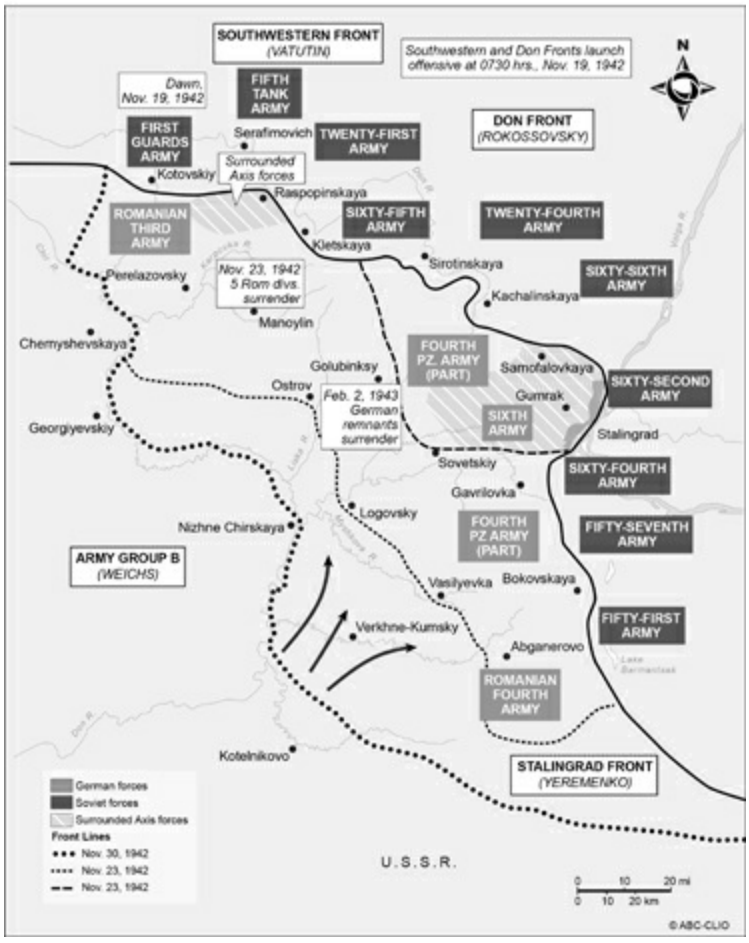
The ruined city posed a formidable obstacle. Germany's strength lay in maneuver warfare, but Hitler compelled the Sixth Army to engage the Soviet strength of static defense. Stalin ordered the city held at all costs, and Soviet forces resisted doggedly. To make things as difficult as possible for German artillery and aviation, Chuikov ordered his troops to keep within 50 yards of the Germans. Zhukov, who had just been appointed deputy supreme commander, second in authority only to Stalin, arrived at Stalingrad on August 29 to take overall charge of operations.

Hitler became obsessed with Stalingrad, and he wore down his army in repeated attempts to capture that symbol of defiance. Taking Stalingrad was unnecessary from a military point of view; the 16th Panzer Division at Rynok controlled the Volga with its guns, closing it to north-south shipping. But Hitler insisted that the city be physically taken.

For a month the Sixth Army pressed slowly forward, but casualties in the battle of attrition were enormous on both sides, with advances measured in yards. The battle disintegrated into a block-by-block, house-by-house, and even room-by-room struggle for survival.

Paulus has been blamed for refusing to disobey Hitler's order to stand firm and extract his army before it was too late, but his and Hitler's greatest failing lay in not anticipating the Soviet encirclement. Nor did Paulus have a mobile tank reserve to counter such a Soviet effort and keep open a supply corridor.

Battle of Stalingrad, 1942–1943



Red Army soldiers fire at the Germans from snow-covered rubble while defending the Krasnye Oktyabr (Red October) factory during the bitterly contested Battle of Stalingrad in the winter of 1942–1943. (Hulton Archive/Getty Images)

While he fed the cauldron of Stalingrad with only sufficient troops absolutely necessary to hold the city, Zhukov patiently assembled 1 million men in four fronts (army groups) for a great double envelopment. This deep movement, Operation URANUS, began on November 19 and was timed to coincide with the frosts that would make Soviet cross-country tank maneuvers possible against Axis infantry.

For the northern pincer, the Soviets assembled 3,500 guns and heavy mortars to blast a hole for three tank and two cavalry corps and a dozen infantry divisions. They encountered Romanian infantry divisions. The Romanians fought bravely, but their 37mm guns and light Skoda tanks were no match for the Soviet T-34s. The southern Soviet prong of two corps, one mechanized and the other cavalry, broke through on November 20 against two Romanian infantry divisions.

By November 23, Operation URANUS had encircled the Sixth Army and had driven some units of the Fourth Panzer Army into the pocket. Hitler now ordered Manstein from the Leningrad Front and gave him a new formation—Army Group Don, drawn from Army Group A—with instructions to rectify the situation.

Hitler forbade any withdrawal, convinced that the Sixth Army could be resupplied from the air. Reich marshal Hermann Göring is usually blamed for assuring Hitler that this could be done, but responsibility is more properly shared among Göring, chief of the General Staff of the Luftwaffe Colonel General Hans Jeschonnek, and Hitler. Hitler was no doubt misled by Luftwaffe success the previous winter in supplying by parachute drops 5,000 German troops surrounded at Kholm near Moscow and 100,000 men at Demyansk.

The decision that Stalingrad could be supplied by air was also taken at a time when the Soviets had air superiority. By November 20, the second day of Operation URANUS, the Soviets committed between 1,350 and 1,414 combat aircraft to Stalingrad. Meanwhile, Colonel General Wolfram F. von Richthofen’s Luftflotte (Air Fleet) 4, flying in support of the Sixth Army, had 732 combat aircraft, of which only 402 were operational. The Soviets used their air superiority to attack German army positions and for bombing raids

on the main Ju-52 base at Zverevo, where they destroyed a substantial number of German transport aircraft. Worsening weather impeded the relief effort, and much of the Luftwaffe's airlift capability was redeployed to resupply Axis troops in North Africa following Allied landings there in early November.

A fair appraisal of air transport available, even in the best weather conditions, was that the Luftwaffe could only bring in one-tenth of the Sixth Army's requirements. By the last week in December, the Luftwaffe delivered only an average 129 tons of supplies a day, condemning the German forces in the pocket to slow starvation and death. The final tally over a 72-day period was 8,350 tons with 488 aircraft and more than 1,000 aircrew lost.

Then on January 16, 1943, the Soviets took Pitomnik, the principal airfield within the Stalingrad pocket. Its loss was the death blow to the airlift operation. During the last days of the battle, supplies were dropped only by parachute, and many of the supplies fell into Soviet hands.

Hitler still refused to authorize any attempt by the Sixth Army to escape. He would allow only a linking up of a relief force. None of the hard-won territory was to be surrendered, but it was simply impossible for the Sixth Army to link up with a relief force and not surrender territory in the process. Paulus favored a breakout, but he was not prepared to gamble either his army or his career. Manstein's force of three understrength panzer divisions managed to reach within 35 miles of Sixth Army positions, and he urged a fait accompli, forcing Hitler to accept it. Paulus replied with a pessimistic assessment of his army's ability to close the short distance to reach Manstein's relief force. There was insufficient fuel, the horses had mostly been eaten, and it would take weeks to prepare. The relieving forces would have to come closer. A linkup could succeed only if the Sixth Army pushed from the other side against the Soviets, but this could not be done without shrinking the Stalingrad pocket, which Hitler expressly forbade.

In mid-December the Volga froze, allowing the Soviets to use vehicles to cross the ice. During the next seven weeks, Zhukov sent 35,000 vehicles across the river along with 122mm howitzers to blast the German defensive works. By then seven Soviet armies surrounded the Sixth Army, and breakout was impossible. Even in this hopeless situation, Paulus refused to disobey Hitler by ordering a surrender. Hitler sought to stiffen his will by promoting Paulus to field marshal (Hitler noted that no Prussian or German field

marshal had ever surrendered). Paulus then surrendered on January 31 (he maintained he had been "taken by surprise"), but he refused to order his men to do the same. The last German units capitulated on February 2.

There may have been 294,000 men trapped at Stalingrad, including Hiwis (Hilfswilligers, volunteer Soviet auxiliaries working with the Germans) and Romanians. Of only 91,000 men (including 22 generals) taken prisoner by the Soviets, fewer than 5,000 survived the war and Soviet captivity. The last Germans taken prisoner at Stalingrad were not released until 1955. Including casualties in allied units and the rescue attempts, Axis forces lost upwards of half a million men. The Stalingrad Campaign may have cost the Soviets 1.1 million casualties, including more than 485,000 dead.

The effect of the Battle of Stalingrad on the German war effort has been hotly debated. It is frequently seen as the turning point in the European theater of war, the decisive defeat from which the Wehrmacht could never recover, but militarily Stalingrad was not irredeemable. The German front lines had been largely reestablished by the time the remnants of the Sixth Army surrendered. Stalingrad was more important for its psychological than its military value. If any single battle denied Germany victory, it was Kursk, still six months and several German successes away.

Standley, William Harrison (1872–1963)

U.S. admiral and later ambassador to the Soviet Union. Born in Ukiah, California, on December 18, 1872, William Harrison Standley graduated from the U.S. Naval Academy at Annapolis in 1895. He saw active service in the Spanish-American War, the Philippine Insurrection, and World War I. Standley was promoted to rear admiral in 1927 and to vice admiral in 1932. He received his fourth star in May 1933, and in July President Franklin D. Roosevelt appointed him the sixth chief of naval operations. Roosevelt, who had great confidence in Standley, would have left him indefinitely in that post had not Standley insisted on retiring in January 1937 at the regulation age of 64.

Well before the December 7, 1941, Japanese attack on Pearl Harbor, Standley was strongly interventionist. He joined the pro-Allied Century Group in June 1940, publicly stating that the United States should recognize that it was already effectively at war with Germany. In 1941, Roosevelt recalled Standley to active duty. His wartime responsibilities included defense planning for the Office of Production Management, service on the Roberts Commission investigating the Pearl Harbor attack, Navy Department public relations assignments, and membership in the Beaverbrook-Harriman mission, which provided Lend-Lease supplies to Soviet Russia.

In April 1942, Roosevelt appointed Standley ambassador to the Soviet Union. Soviet officials and American diplomats alike distrusted Standley's candid and forceful style, especially his insistence that the State Department not restrict the topics he might discuss with Soviet representatives. Apparently, Standley also resented the manner in which W. Averell Harriman, the president's special envoy, often conducted U.S.-Soviet diplomatic negotiations independently of him. In May 1943, these assorted frustrations led Standley to submit his resignation, suggesting that Harriman replace him. Indeed, this occurred when Standley returned to the United States in October.

In March 1944, Roosevelt appointed Standley to the Office of Strategic Services Planning Group, where he remained until he retired from active duty in August 1945. Standley died in San Diego, California, on October 25, 1963.

Stark, Harold Raynsford "Betty" (1880–1972)

U.S. Navy admiral and chief of naval operations. Born in Wilkes-Barre, Pennsylvania, on November 12, 1880, Harold Raynsford Stark graduated in 1903 from the U.S. Naval Academy at Annapolis. There, as a plebe, he acquired the nickname "Betty," after Elizabeth Page Stark, the wife of Revolutionary War hero John Stark, who was being commemorated at that time. Stark was commissioned an ensign in the U.S. Navy in 1905 and participated in the Great White Fleet's 1907–1909 around-the-world cruise, and as a World War I staff officer he helped coordinate Anglo-American naval operations. He then commanded a flotilla in the Mediterranean, and he subsequently captained torpedo boats, destroyers, and an armed cruiser.

Admiral Harold R. Stark, U.S. Navy chief of naval operations during 1939–1942. (Popperfoto/Getty Images)

Stark graduated from the Naval War College in 1924 and then served as an aide to Secretary of the Navy Charles Adams from 1930 to 1933. Promoted to rear admiral in November 1934, Stark was chief of the Bureau of Ordnance from 1934 to 1937. Following promotion to vice admiral, he commanded all cruisers in the Battle Force during 1938–1939. In these years, Stark was a staunch proponent of naval preparedness.

In August 1939 one month before World War II began in Europe, President Franklin D. Roosevelt named Stark chief of naval operations as a full admiral. Stark, who shared Roosevelt's profoundly interventionist outlook, immediately presented a naval building program designed to make the U.S. Navy the world's largest naval force. His memorandum Plan D (Dog), prepared for Roosevelt in November 1940, delineated what became

the fundamental U.S. wartime strategy—that Germany, the greatest threat to the United States, must be defeated first.

Convinced that Britain's survival was essential to U.S. national security, in early 1941 Stark proposed and held staff talks with a high-level British delegation. The resulting ABC-1 (America-Britain-Canada) Rainbow 5 strategic agreement, much of which Stark drafted, became the basis of wartime Anglo-American cooperation. Stark constantly urged Roosevelt to do more to assist Britain, and by the autumn of 1941, U.S. naval forces were effectively at war with Germany in the Battle of the Atlantic.

Although Stark attempted to improve Pacific fortifications and naval strength, he opposed measures (such as an oil embargo) that might provoke a forceful Japanese response. Like other U.S. military and civilian officials, he failed to interpret correctly or transmit to Admiral Husband Edward Kimmel, U.S. commander in chief of the Pacific Fleet, deciphered cable traffic indicating that Japan might attack the U.S. naval base at Pearl Harbor, Hawaii. One subsequent investigation faulted him for this misjudgment.

In March 1942 Roosevelt replaced Stark as chief of naval operations with Admiral Ernest J. King. Roosevelt then dispatched Stark to Britain as commander of U.S. naval forces in the European theater. Stark performed valuable wartime liaison functions between London and Washington, established and later dismantled certain U.S. naval bases in Europe, directed logistical support for U.S. naval forces, and served as Washington's unofficial envoy to Free French leader General Charles de Gaulle. Stark retired in 1946 and died in Washington, D.C., on August 20, 1972.

STARVATION, Operation (March 27–August 15, 1945)

Operation STARVATION was the U.S. aircraft mining of Japan's home waters. By 1945, Japan had withdrawn most of its remaining merchant shipping to the home islands, where it operated principally in coastal waters, which were relatively safe from submarine attack. After some delays and interservice squabbles in which U.S. Army Air Forces major general Curtis LeMay protested the diversion of his aircraft to this mission, on March 27, 1945, Boeing B-29 Superfortresses of the Mariana Islands–based XXI Bomber Command launched Operation STARVATION, a systematic mining campaign designed to disrupt Japan's overseas and interisland trade, complete the submarine blockade, and thus prevent food and raw materials from reaching Japan. B-29s planted mines outside Japan's major ports, in the Inland Sea, and in critical straits, particularly the heavily trafficked Shimonoseki Strait.

Japan proved to be as unprepared for mines as it had been for submarines. It relocated searchlights and antiaircraft batteries in an effort to shoot down the mine-laying B-29s, and it increased research into mine countermeasures, but the efforts were inadequate. Japan never developed effective techniques to sweep acoustic and pressure mines. Instead, the Japanese continued to sail ships into mined waters, hoping to run ships through the minefields faster than the United States could lay additional mines.

In May 1945, U.S. mines sank or disabled more Japanese ships than did submarines. Mines blocked 19 of Japan's 22 principal shipyards, preventing the repair of damaged ships. Arrivals at Japan's industrial ports dropped from 800,000 tons in March to 250,000 tons in July, when food displaced coal and iron as Japan's predominant import. Yet Japan failed to import sufficient food to meet its people's needs, and average daily per capita food intake dropped from 1,900 calories in 1944 to 1,680 calories by the midsummer of 1945. Hundreds of thousands of Japanese (millions, according to some estimates) faced imminent starvation, and growing numbers of Japan's remaining factories were rendered idle for lack of raw materials.

Mining sorties accounted for only 5.7 percent of XXI Bomber Command's sorties that summer. Short of mines and more interested in bombing Japanese cities, XXI Bomber Command never devoted the effort to laying mines hoped for by the navy. Yet at a cost of only 15 planes lost,

1,528 B-29 sorties dropped 12,135 mines into Japanese home waters by the war's end. These damaged or sank at least 750,000 tons of Japanese shipping (possibly as much as 1.25 million tons) and closed most of Japan's ports. Damaged ships piled up in Japanese ports, and mercantile traffic dropped to a trickle. Pacific Fleet commander Admiral Chester Nimitz described Operation STARVATION's results as "phenomenal." It indeed proved to be a vital element of the strategy of blockade and bombing that forced Japan's surrender on August 15, 1945.

Stauffenberg, Claus Philipp Schenk von (1907–1944)

German Army colonel who attempted to assassinate Adolf Hitler in 1944. Born on November 15, 1907, at Greifenstein Castle, Jettingen, into a staunchly Roman Catholic Prussian noble family, Claus Philipp Schenk von Stauffenberg was strikingly handsome and highly intelligent.

In 1926, Stauffenberg joined the 17th Cavalry Regiment as an officer candidate, and he was commissioned in 1930. He attended the War Academy in Berlin in 1936 and, as a captain, became a logistics officer in 1938. He served in the campaigns in Poland in 1939 and France in 1940 and then was posted to the General Staff.

Stauffenberg seriously questioned National Socialism after the virulent anti-Jewish Kristallnacht (Night of Broken Glass) of November 9, 1938.

Service with German forces in the Soviet Union exacerbated his disillusionment.

German Army major Claus Schenk von Stauffenberg who led the July 1944 assassination attempt on Adolf Hitler. (Keystone/Getty Images)

Stauffenberg was badly wounded by the explosion of a mine in April 1943 while serving in North Africa. He injured his knee and left ear and lost his left eye, right hand, and two fingers of his left hand. While convalescing, he came to believe that removing Hitler was the only answer to Germany's dilemma, and he then became a leading figure in the conspiracy to assassinate the German leader.

Promoted to colonel in June 1944, the next month Stauffenberg was appointed chief of staff to Colonel General Friedrich Fromm, commander of the Replacement Army. This position allowed him access to Hitler. As a severely disabled war hero, he was spared the searches of persons who were

admitted to see Hitler. Two assassination attempts, on July 11 and July 15, were aborted, but on July 20, 1944, Stauffenberg placed a bomb hidden in a briefcase beside Hitler at his headquarters, the Wolf's Lair, in Rastenberg, East Prussia, and quickly left the scene to fly to Berlin. The briefcase was moved, and the ensuing blast only slightly injured Hitler, bur Stauffenberg was convinced that the führer was dead.

The subsequent coup in Berlin failed because of delays, poor coordination, and simple bad luck. Stauffenberg and several others were arrested on the night of July 20, court-martialed, and shot in the courtyard of the War Ministry in Berlin. Several thousand others who were also opposed to the regime also subsequently perished. Stauffenberg today is considered one of the heroes and ethical role models of the Bundeswehr.

Steiner, Felix (1896–1966)

German Schutzstaffel (SS) general. Born on May 23, 1896, at Stallupönen in East Prussia, Felix Steiner joined the German army in 1914 and became a lieutenant during World War I. In 1921, he took up active service in the Reichswehr. In 1935, he joined the predecessor to the Waffen-SS.

Steiner fought both in the invasion of Poland in September 1939 and the campaign for France in May and June 1940. In 1940, he formed a motorized SS division based on a recruiting program for volunteers from countries in Western and Northern Europe. Steiner commanded this "Viking Division"

(5th SS Panzer Division) in Operation BARBAROSSA, the June 22, 1941, invasion of the Soviet Union. During the 1942 German summer offensive, the division pushed through the south of Russia and reached Kuban. In 1943, Steiner commanded the III ("Germanic") SS Panzer Corps, and on July 1, 1943, he was promoted to Obergruppenführer and general of the Waffen-SS.

During the final battle for Berlin (March 31–May 2, 1945), Adolf Hitler ordered Steiner to seal a gap through which Soviet forces were pouring, hoping in vain that he might be able to turn the tide. With few men and little equipment, Steiner was unable to accomplish anything. He surrendered to British forces on May 3, 1945. Steiner was not released until April 1948. He died on May 17, 1966, in Munich.

Steinhoff, Johannes (1913–1994)

German Air Force general. Born in Bottendorf on September 15, 1913, Johannes Steinhoff joined the German Navy in 1934. His interest in aviation led him to transfer to the Luftwaffe in 1936, and by the beginning of World War II, he was the Staffelkapitan (squadron leader) of Jagdgeschwader (Fighter Wing) 26. Steinhoff served briefly with the Luftwaffe's fledgling night-fighter force but eventually returned to single-engine day fighters.

Steinhoff served in every theater of war to which the Luftwaffe was deployed, and he ran up the impressive tally of 176 victories. His final assignment was a posting to Jagdverband (Fighter Group) 44, Adolf Galland's "Squadron of Experts." On April 18, 1945, Steinhoff crashed his

Me-262 on takeoff, and the resulting fire left him scarred for the rest of his life.

Steinhoff joined the air force of the Federal Republic of Germany in 1952, rising to the rank of full general. He served as inspector of the Bundesluftwaffe from 1966 to 1970 and chairman of the Military Committee of the North Atlantic Treaty Organization (NATO) from 1971 until his retirement in 1974. Steinhoff died at Bottendorf, Germany, on February 21, 1994.

Stephen Hopkins versus *Stier* (September 27, 1942)

During the war, the German Navy used converted merchant ships as surface raiders or auxiliary cruisers to prey on Allied shipping. Disguised as neutral-flag cargo ships, they were heavily armed. The raiders' profiles were changed frequently by the use of false masts and stacks, with their armament concealed behind panels that could be quickly removed when they encountered prey.

The U.S. Liberty ship SS *Stephen Hopkins*, commanded by merchant marine captain Paul Buck, was on its maiden voyage returning from Cape Town in ballast and bound for Dutch Guiana with 58 people on board (crew of 42, 1 passenger, and a 15-man U.S. Navy guard) when it came on the German commerce raider *Stier* (Ship 23). Under Commander Horst Gerlach, it had departed Germany on May 10, 1942, and had earlier sunk three Allied

merchant ships. Now on September 27, it was taking on supplies from the German blockade-runner *Tannenfels*. Because of heavy fog, the *Stephen Hopkins* closed to only about two miles from the *Stier* when the two German ships opened fire. The *Stier* was armed with four 5.9-inch guns, two 37mm and four 20mm guns, and two 21-inch torpedo tubes. The *Tannenfels* mounted one 5.9-inch gun and several smaller-caliber weapons.

The *Stephen Hopkins* was armed with one 4-inch gun, two 37mm cannon, and four .50-caliber and two .30-caliber machine guns. Its battery was the responsibility of the ship's 15-man U.S. Navy Armed Guard commanded by Navy Reserve lieutenant (junior grade) Kenneth M. Willett. Firing with great accuracy, the crew of the 4-inch gun managed to mortally wound the German raider, hitting it with some 15 shells during the course of a half hour, disabling its rudder and setting its fuel oil bunkers ablaze.

When members of the 4-inch gun crew fell to German fire, others took their places. Both ships were soon sinking. The *Stephen Hopkins* went down at 10:00 a.m. Buck and Willett were among the dead. Nineteen survivors took to one lifeboat, which had little food and water, to begin what would be a 2,200-mile, 31-day journey to Brazil; 15 men survived the voyage.

In the engagement the *Stier* suffered 3 dead and 33 wounded. Gerlach ordered his crew to set detonating charges to scuttle his ship, then transferred to the *Tannenfels*. In his battle report, Gerlach reported that he had fought a "heavily armed cruiser."

Captain Buck was posthumously awarded the Merchant Marine Distinguished Service Medal, as was U.S. Merchant Marine Academy cadet Edwin Joseph O'Hara, who single-handedly fired the last shots from the ship's 4-inch gun. Willett received the Navy Cross. The *Stephen Hopkins* was the only U.S. ship to sink a German surface warship during the war.

Stephenson, Sir William Samuel (1896–1989)

Chief of British security in North America during 1940–1945. Born on January 11, 1896, at Point Douglas, Winnipeg, Canada, William Samuel Stephenson was a pilot in the Royal Flying Corps during World War I. He became an ace but was also seriously wounded. Between the wars, Stephenson's successful business ventures in radio required extensive travel throughout the world. After trips to Germany in the 1930s, he provided British intelligence with information about German rearmament.

In June 1940, Stephenson arrived in New York to direct British intelligence in the Western Hemisphere for the Secret Intelligence Service (MI6). Officially, Stephenson was the passport control officer, with headquarters in Rockefeller Center. His counterespionage operation, British Security Co-ordination, worked with MI5, the Special Operations Executive, and the Political Warfare Executive.

Before the United States entered the war, Stephenson aided J. Edgar Hoover, the director of the Federal Bureau of Investigation, supplying it with information about German, Italian, and Vichy agents in the United States. Stephenson also assisted William J. Donovan's Office of Strategic Services in its organization and training. After U.S. entry into the war, Stephenson's extensive South American operations worked to secure enemy ciphers and expose enemy agents. Stephenson also ran double agents and engaged in propaganda work and special operations.

Stephenson was knighted in 1945, and President Harry S. Truman awarded him the Presidential Medal of Merit. Stephenson died in Bermuda on January 31, 1989.

Stettinius, Edward Reilly, Jr. (1900–1949)

U.S. Lend-Lease administrator (1942–1943), undersecretary of state (1943–1944), and secretary of state (1944–1945). Born in Chicago, Illinois, on October 22, 1900, Edward Reilly Stettinius Jr. was the son of a prominent industrialist who moved to New York in 1914. After attending the University of Virginia, Stettinius joined General Motors, implementing innovative employee benefit programs. He moved to U.S. Steel in 1934, and four years later he became chairman of its board.

In 1940, because of his earlier liaison work on New Deal industrial recovery programs, Stettinius received the government position of chairman of the War Resources Board, which had been established to survey potential American war needs. In 1941, President Franklin D. Roosevelt placed Stettinius on the National Defense Advisory Commission. At that point, Stettinius resigned from U.S. Steel to devote full time to government service. As director of priorities in the Office of Production Management, he encouraged the development of synthetic rubber. Then, in 1942, Roosevelt appointed Stettinius to head the administration of the Lend-Lease program, which he made more effective while successfully winning congressional support for its operations.

In September 1943, Stettinius became undersecretary of state, working under Secretary of State Cordell Hull with a commission to improve and coordinate the State Department’s notoriously inefficient organizational structure and improve its lackluster public image. Stettinius’s other major responsibility was the creation of an international security organization, the United Nations (UN). After laying the groundwork for this organization in

the spring of 1944, Stettinius attended the August 1944 Dumbarton Oaks Conference, where he played a major role in drafting the UN Charter.

When poor health caused Hull's resignation in November 1944, Stettinius succeeded him. The new secretary of state instituted public relations policies that greatly enhanced his department's popularity. He attended the controversial February 1945 Yalta Conference of Allied leaders, helping draft American proposals for a Declaration on Liberated Europe and clarify the UN Charter. Stettinius's greatest diplomatic contributions occurred between April and June 1945 at the San Francisco Conference, which drafted the final UN Charter. His diplomatic skills were instrumental in persuading the numerous delegates to reach consensus.

Many officials considered Stettinius a lightweight, and during the San Francisco Conference, Harry S. Truman, who had succeeded Roosevelt as president in April 1945, decided to replace him with South Carolina Democrat James F. Byrnes. On June 27, 1945, one day after the conference ended, Stettinius resigned to become first U.S. representative to the new UN. Disillusioned with the Truman administration's failure to use UN mechanisms to resolve the developing Cold War, in June 1946 Stettinius resigned to become rector of the University of Virginia. Stettinius died of coronary thrombosis in Greenwich, Connecticut, on October 31, 1949.

Stilwell, Joseph Warren (1883–1946)

U.S. Army general. Born on March 19, 1883, near Palatka, Florida, Joseph Warren Stilwell was commissioned a second lieutenant of infantry on graduation from the U.S. Military Academy at West Point in 1904. Promoted to temporary major in August 1917, Stilwell served with British and French forces before his assignment to the U.S. Army IV Corps in France during World War I. After the war, he studied Chinese and spent several years in China and Siam (Thailand), serving with American units stationed there. He was promoted to colonel in August 1935. Stilwell earned his nickname, "Vinegar Joe," as a result of his brusque manner while an instructor at the Infantry School at Fort Benning, Georgia. Promoted to temporary major general in October 1940, by July 1941 Stilwell was commanding III Corps at Monterey, California.

In February 1942, Stilwell was promoted to temporary lieutenant general and assumed command of all U.S. Army forces in the China-Burma-India theater while also serving as chief of staff to Guomindang (GMD, Nationalist) Chinese leader Generalissimo Jiang Jieshi (Chiang Kai-shek). Charged with coordinating the efforts of Britain, China, and the United States against Japan, Stilwell was also responsible for preparing China for the planned Allied invasion of the Japanese home islands. When the Japanese captured Burma in the spring of 1942, Stilwell personally led an Allied column on a 140-mile march through the Burmese jungle to avoid capture.

U.S. Army lieutenant general Joseph W. Stilwell, 1942. Stilwell commanded U.S. forces in the China-Burma-India Theater as well as serving as chief of staff to Chinese leader Jiang Jieshi until he was removed following policy differences with Jiang. (Library of Congress)

Stilwell's belief that China's best hope for recapturing its territory from the Japanese was through the employment of Western-trained and -equipped Chinese Army forces brought him into direct conflict both with Jiang and Major General Claire Chennault, former commander of the American Volunteer Group (the "Flying Tigers"). As commander of the Fourteenth Army Air Force and a firm airpower proponent, Chennault believed his air force capable of defeating the Japanese without the commitment of significant ground forces; he continually argued that he should receive the bulk of supplies coming over the Himalayas. Jiang, worried that any forces used against the Japanese would not be available for his anticipated postwar conflict with the Chinese Communists, was more than willing to support

Chennault's position. Throughout 1943 and 1944, tensions among Stilwell, Chennault, and Jiang mounted.

Despite the demonstration of the potential of Chinese forces against the Japanese and the gains in Burma, Stilwell was unable to convince Jiang to reform his army. When President Franklin D. Roosevelt urged Jiang to place Stilwell (who had been promoted to temporary general in August 1944) in command of all Chinese forces, Jiang refused and then demanded Stilwell's relief. Unwilling to alienate Jiang, Roosevelt ordered Stilwell's return. On October 18, 1944, Lieutenant General Daniel Sultan replaced him.

After his relief, Stilwell assumed command of the Tenth Army, a command slated for the planned invasion of Japan. Following Japan's surrender, Stilwell returned to the United States and took command of the Sixth Army. Stilwell died of liver cancer at the Presidio in San Francisco, California, on October 12, 1946.

Stimson, Henry Lewis (1867–1950)

U.S. secretary of war. Henry Lewis Stimson was born in New York City on September 21, 1867, into an old and distinguished family. He was educated at Yale University and Harvard Law School. In 1891, he entered the law firm of Root and Clarke. Its leading partner, Elihu Root, a future secretary of war and secretary of state, became one of Stimson's two lifelong role models, the other being future president Theodore Roosevelt.

Like Roosevelt, Stimson found public service more satisfying than practicing law, and he soon became active in New York Republican politics. Appointed secretary of war in 1911, Stimson attempted to modernize the army and improve troop training and the efficiency of the General Staff. He left office when Woodrow Wilson became president, in 1913.

When World War I began in Europe in 1914, the staunchly interventionist and pro-Allied Stimson campaigned ardently for military preparedness. After Congress declared war on Germany in April 1917, Stimson volunteered, serving in France as a lieutenant colonel of artillery. He returned from the war convinced that the United States must assume a far greater international role.

As governor-general of the Philippines in 1928, Stimson ruled in the spirit of benevolent paternalism. Appointed secretary of state in 1929 under President Herbert Hoover, Stimson played a prominent role in negotiating the London Naval Treaty of 1930. He also attempted to strengthen the League of Nations by protesting Japan's establishment in 1931 of the puppet state of Manzhouguo (Manchukuo). He remained at the State Department until 1933.

In the later 1930s, Stimson was among the strongest advocates of firm American opposition to the fascist states. When World War II began in 1939, Stimson, a convinced believer in an Anglo-American alliance, demanded extensive American assistance to the Allies and massive U.S. rearmament. Seeking bipartisan support for his foreign policies, in June 1940 the Democratic president, Franklin D. Roosevelt, recruited Stimson as secretary of war, a position Stimson held throughout the war. With army chief of staff General George C. Marshall, Stimson and his able team oversaw the massive recruitment and industrial mobilization programs the war effort demanded.

Stimson oversaw the Manhattan Project, and in April 1945 he informed new president Harry S. Truman of this initiative's existence. In the summer of 1945, Stimson suggested that the Allies publicly warn the Japanese government that unless Japan surrendered, it faced attack by devastating new weaponry. This advice led the United States, Britain, and the Soviet Union to issue the July 1945 Potsdam Declaration to this effect. Shortly afterward, Stimson urged Truman to share with the Soviets—with appropriate safeguards—the secrets of nuclear power. After retiring in 1945, Stimson endorsed a greatly enhanced American international role. He died in Huntington, New York, on October 20, 1950.

Stirling, Sir Archibald David (1915–1990)

British Army colonel. Born the son of a British general in Kier, Scotland, on November 15, 1915, David Archibald Stirling studied architecture at Trinity College, Cambridge, but he did not complete his academic work, preferring other activities, such as mountaineering. Stirling was in the Canadian Rockies preparing for a Mount Everest climb when war commenced in 1939.

Stirling joined the British Army as a junior officer and served a short stint in the Scots Guards before joining "Layforce," founded by Lieutenant Colonel Robert E. Laycock, whose commandos were soon dispersed as reinforcements. Stirling deployed to the Middle East with Number 3 Commando. Hospitalized for several months following an injury, Stirling formalized plans for a special raiding group. In July 1941 he secured approval from his commander in chief, General Claude Auchinleck, for the plan. Auchinleck designated 66 men of Layforce as L-Detachment, Special Air Service Brigade, under Stirling's command. The unit designation implied the presence of a large formation. The men were to mount parachute operations against Axis airfields in Libya.

This was the beginning of the elite Special Air Service (SAS), which grew to regimental size. The first attack encountered high winds and sandstorms, and only 22 men of the force survived. Stirling then switched to specially equipped ground vehicles of the Long Range Desert Group. His tactics were to make the final approach on foot, strike the target, and then move by vehicle deeper into enemy territory. In 18 months, his SAS

destroyed 350 Axis aircraft and also blew up ammunition dumps, supply depots, and trains. These raids forced the Axis powers to divert frontline troops to provide rear-area security. Captured in Tunisia on January 10, 1943, Stirling escaped four times but was recaptured. He ended the war imprisoned at Colditz Castle, a maximum-security prison near Leipzig.

Stirling's force soon expanded into three regiments. Today, the SAS is recognized as one of the world's premier special operations forces. Following his release at the end of the war, Stirling settled in Southern Rhodesia (now Zimbabwe). He returned to the United Kingdom in 1961, where he became involved in security-related ventures. Stirling died in London on November 4, 1990, having been knighted that year.

STRANGLE, Operation (March 15–May 11, 1944)

Interdiction campaign by Allied air forces during the spring of 1944 directed against German supply lines in central Italy that supported the Gustav Line. Operation STRANGLE was intended to force a German withdrawal through the application of airpower alone.

The Germans established the Gustav Line centered on Monte Cassino to block an Allied northward advance on Rome. By the spring of 1944, three major ground assaults had failed to breach this line, and even the amphibious landing at Anzio on January 22, 1944, had failed. Lieutenant General Ira C. Eaker, commander of the Mediterranean Allied Air Forces, decided to launch a supply interdiction operation to break the stalemate and force a German withdrawal.

Operation STRANGLE was directed mainly against the Italian rail system, Germany's primary means of supply transportation, but it also encompassed

ports and bridges. The campaign involved an interdiction belt running across Italy from east to west as far north of the Gustav Line as possible to force the Germans to use alternate transport means to the front. Medium bombers of the U.S. Army Air Force's Twelfth Air Force and British First Air Force began operations on March 19, and the strongly escorted daylight raids continued until May 11, 1944. The bombers succeeded in inflicting substantial damage on the rail system and coming close to closing down all rail traffic 100 miles north of Rome. Nonetheless, the operation failed to force the Germans to withdraw from the Gustav Line.

The campaign failed for four principal reasons. First, there were no significant ground operations during this period, and the aerial campaign was thus unsupported by other arms. Second, the Allies significantly overestimated (by a factor of close to 10) German supply requirements while they were in the static defenses of the Gustav Line, especially in the absence of any serious ground actions. Third, the German Army minimized the effects of the campaign against the rail system through rapid repair of damage and construction of bypasses around destroyed rail sections, imposition of stricter rationing, movement at night, and diversion of scarce motor vehicles to transport supplies. Finally, the Allies could not deploy an adequate night bombing force, which prevented their air forces from neutralizing the German countermeasures.

By the end of April, the Allies determined that airpower alone would not force a German withdrawal from the Gustav Line, and they launched Operation DIADEM on May 11. The operation combined an aerial interdiction campaign against supply lines with a ground offensive. This air offensive was focused closer to the immediate German rear areas and also targeted their operational reserves and major command-and-control facilities. Within several weeks, Allied ground forces had penetrated the Gustav Line, linked up with the Anzio beachhead, and captured Rome on June 4.

Stratemeyer, George Edward (1890–1969)

Lieutenant general in the U.S. Army Air Forces and, later, the U.S. Air Force. Born in Cincinnati, Ohio, on November 24, 1890, George Edward Stratemeyer graduated from the U.S. Military Academy at West Point in 1915. Commissioned in the infantry, he served along the Mexican border. In 1916, however, Stratemeyer transferred to the Signal Corps and became an aviator.

During World War I, Stratemeyer commanded the School of Military Aeronautics at Ohio State University. He was then chief test pilot at Kelly Field, Texas, and Chanute Field, Illinois. In 1921, he took command of Chanute Field. Stratemeyer was next assigned to Hawaii and then taught tactics at West Point from 1924 to 1929. He graduated from the Air Corps Tactical School at Langley Field, Virginia, in 1930 and the Command and General Staff School at Fort Leavenworth, Kansas, in 1932, where he then taught for several years.

Promoted to lieutenant colonel, Stratemeyer commanded the 7th Bombardment Group at Hamilton Field, California, from 1936 to 1938. He graduated from the Army War College in 1939 and then commanded the Southeast Air Corps Training Center, Maxwell Field, Alabama. He next served as chief of the Air Staff at Washington, D.C., and was promoted to major general in 1942.

In August 1943, Stratemeyer arrived in India to take command of U.S. Army Air Forces in the China-Burma-India theater, where his forces performed important work in the resupply of Chinese troops fighting the Japanese. President Franklin D. Roosevelt approved Stratemeyer's plan to bomb Japanese forces from a base in India and others in China. Stratemeyer

next headed the Eastern Air Command (a joint U.S.-British air organization) and Army Air Forces in China with headquarters in Chongqing (Chungking). His units helped relocate some 200,000 Chinese troops and 5,000 horses from eastern to western China. Stratemeyer was promoted to lieutenant general in May 1945.

From February 1946 to April 1949, Stratemeyer led the new Air Defense Command. A forceful advocate of an expanded air force, he promoted the establishment of an air force academy. He then commanded the Far East Air Force. When the United States entered the Korean War in 1950, Stratemeyer's meager air assets helped prevent the invading North Korean forces from achieving victory. Throughout, his units maintained air supremacy over Korea.

A massive heart attack in May 1951 cut short Stratemeyer's career, and he retired in January 1952. He died in Orlando, Florida, on August 9, 1969.

Stroop, Jürgen (1895–1952)

German Waffen-Schutzstaffel (Waffen-SS) general. Born on September 26, 1895, in Detmold, Josef Stroop joined the 55th Bavarian Infantry Regiment in August 1914. He later blamed the Jews and others for Germany's defeat in World War I. Stroop even changed his first name from the "Jewish-sounding" Josef to Jürgen.

Stroop joined the SS in July 1932, rapidly rising in rank. By 1939, he was a Brigadeführer. Stroop received the assignment of suppressing the uprising

by Jews in the Warsaw Ghetto (April 19–May 16, 1943). Commanding 2,000 men, Stroop ordered the Jewish quarter of Warsaw set on fire to burn out resisting Jews and other dissidents and turned antiaircraft guns on the buildings. Stroop was responsible for the killing and capturing of 56,065 persons. Including those who likely perished at Treblinka and other concentration camps, he was responsible for the deaths of more than 71,000 people. For this slaughter, Stroop was awarded the Iron Cross, 1st Class, and promoted to Gruppenführer.

Stroop later directed SS and police activities in Greece. He surrendered to the Americans at the end of the war and was tried and convicted for the execution of U.S. fliers in Greece. He was then extradited to Poland, where he was tried for crimes there. Sentenced to death on charges related to the Warsaw Rising, Stroop was convicted and hanged in Warsaw on March 6, 1952.

Student, Kurt (1890–1978)

German Luftwaffe general. Born in Birkholz, Brandenburg, on May 12, 1890, Kurt Student was educated at the cadet school at Lichterfelde (1905–1908). He joined the German Army as an officer candidate in 1910 and was commissioned a lieutenant in 1911. Student volunteered for flying school and qualified as a pilot in 1913. On the outbreak of World War I, he was testing aircraft armament. From 1916, he commanded a fighter squadron on the Western Front, where he was wounded in aerial combat.

Student continued in the army after the war and was posted to the Central Flying Office, where he worked with the clandestine German air units

training in Soviet Russia. He then reverted to the infantry (1928–1933), where he was promoted to major and served as a battalion commander. Following Adolf Hitler's accession to power, Student directed air training schools for the Aviation Ministry. Promoted to colonel in August 1933, he headed the test center for aviation equipment and organized Germany's first airborne forces.

Promoted to major general in April 1938, Student was inspector of Parachute Forces. As commander of the 7th Air Division of paratroops and glider-borne infantry, he was chiefly responsible for this major innovation of airborne warfare. Thanks in part to his high standards and his talent in picking capable subordinates, Student soon commanded some of the finest infantry in the world. He was promoted to lieutenant general in January 1940.

Student played a key role in Hitler's May 10, 1940, invasion of France and the Low Countries, directing his elite forces in reducing key strongpoints, most notably Fortress Eben Emael in Belgium. Student suffered a serious head wound while directing an assault at Rotterdam, the Netherlands, and departed on leave. He urged an immediate assault on Britain and establishment of an airhead in the Folkstone area before Britain could recover its balance. Hitler believed that the British would recognize the inevitability of a German victory and negotiate, and he let the opportunity pass. Student returned to duty in September, when he was promoted to major general.

Student participated in operations against Greece and then directed the successful airborne assault on Crete in May 1941. The heavy casualties in this operation, the consequence of Ultra intercepts, convinced Hitler that the days of parachute troops were over. From that point, the German airborne forces were employed as elite infantry. Student's forces carried out the rescue of deposed Italian dictator Benito Mussolini in September 1943 in a raid commanded by Standartenführer Otto Skorzeny.

General Kurt Student, commander of German airborne forces, reviewing his men in May 1940. (Ullstein Bild via Getty Images)

As a lieutenant general, Student commanded the First Parachute Army during the June 6, 1944, Normandy Invasion. As a colonel general from July 1944, he assisted in the defense of Holland during Operation MARKET-GARDEN (September 17–26, 1944). In November 1944, he assumed command of Army Group H in defense of the Rhine. In late April 1945, he commanded Army Group Vistula.

Taken prisoner by the British in Schleswig-Holstein, Student was charged with the mistreatment and murder of prisoners of war by his forces in Crete. Tried by a British court and found guilty on three out of eight charges, he was sentenced to five years in prison. A request by the Greek government that he be extradited for trial on charges of numerous crimes committed against civilians on Crete was denied. Student was released on medical grounds in 1948. He died in Lemgo in the Federal Republic of Germany on July 1, 1978.

Stülpnagel, Karl Heinrich von (1886–1944)

German Army general and opposition leader. Born in Darmstadt on January 2, 1886, Karl Heinrich von Stülpnagel received a classical education and pursued studies in Geneva. In 1904, Stülpnagel entered the German Army as an officer candidate. He served on the General Staff during World War I, rising to major.

Stülpnagel continued in the army after the war and held infantry commands. Promoted to colonel in 1932, he headed the Foreign Studies Branch of the General Staff from 1933 to 1937. Promoted to major general in 1936 and to lieutenant general in 1937, he was appointed head of the Operations Section of the General Staff in 1938.

Stülpnagel impressed his colleagues with his wit and intelligence, and many believed him to be one of the best officers in the German Army. Stülpnagel’s personal opposition to war against Britain, however, would lead him to join his close associates, Generals Ludwig Beck and Franz Halder, in the conspiracy against Adolf Hitler.

Stülpnagel was promoted to general of infantry in April 1939, and he served as deputy chief of the General Staff (August 1938–May 1940). He commanded II Corps in the May 10, 1940, invasion of France, and following the defeat of France, he served as chairman of the Armistice Commission at Wiesbaden from June 1940 to February 1941. He then commanded the Seventeenth Army in Operation BARBAROSSA, the June 22, 1941, invasion of the Soviet Union. Poor health forced him to relinquish this command in November 1941.

In March 1942, Stülpnagel took over from his cousin Otto von Stülpnagel the post of military governor of Paris. In this position, Karl Heinrich von Stülpnagel enforced German occupation policies, including the execution of 29,000 hostages in an effort to end resistance to German rule. Here, he became active in the opposition’s plot to assassinate Hitler. He was the only German general outside of Berlin who actively participated in the coup plans

of July 1944. Believing that the bomb plot of July 20 had been successful, Stülpnagel ordered the arrest of some 1,000 German security personnel in Paris.

Stülpnagel's inability to convince Field Marshal Günther von Kluge (German commander in chief, west) to support the coup doomed his efforts. Kluge ordered Stülpnagel to release the German prisoners and then fired the beleaguered general.

Ordered to report to Berlin on July 21, Stülpnagel stopped en route at Verdun and there attempted suicide by shooting himself in the head. Only blinded, he was arrested by the Gestapo and taken to Berlin. Tried there by the People's Court, he was convicted and sentenced to death. Stülpnagel was hanged at Plötzensee Prison in Berlin on August 30, 1944.

Stülpnagel, Otto von (1878–1948)

German Army general. Born in Berlin on June 16, 1878, into a distinguished military family, Otto von Stülpnagel was commissioned in the German Army in 1898 and served on the Western Front in World War I. After the war, he was extradited to France to stand trial on charges of having murdered civilians, but he was acquitted.

Stülpnagel remained in the Reichswehr after the war. Opposed to democracy, he worked to overthrow the Weimar Republic and became an avid Nazi. In the 1920s, Stülpnagel served as inspector of transport troops and was promoted to major general in 1929. In his post, he feuded with Colonel Heinz Guderian over the utility of tanks and armor. Stülpnagel

issued orders that specifically prohibited the development of tactical plans using concentrations of armor, advocating instead tanks in infantry support. Stülpnagel then joined what would become the Luftwaffe, rising to the rank of general of aviation. He returned to the army in 1939.

Retired from the army that same year in Adolf Hitler's purge of generals, Stülpnagel was recalled to active duty in the rank of general of infantry in 1940. Too old to be assigned a field command, he served on the French armistice committee and was instrumental in convincing Hitler to allow the new Vichy French government some autonomy in its control of France's colonial possessions.

Hitler then appointed Stülpnagel military governor of the German-occupied portion of France. In this post, Stülpnagel served as a moderating force between the French and hard-line German elements led by Heinrich Himmler and the Schutzstaffel (SS). Stülpnagel's goal was to retain military control over police functions. He endorsed harsh measures against the French Resistance, and by March 1941 deportations of French Jews had begun.

After police powers were transferred to the SS, Stülpnagel resigned his post and was succeeded in March 1942 by his cousin, General of Infantry Karl Stülpnagel. Charged after the war with crimes in France, Otto von Stülpnagel hanged himself in Paris on February 6, 1948.

Stump, Felix Budwell (1894–1972)

U.S. Navy admiral. Born on December 15, 1894, in Parkersburg, West Virginia, Felix Budwell Stump graduated from the U.S. Naval Academy at Annapolis, in 1917. He served in the cruiser *Cincinnati* during World War I. Following the war, Stump underwent flight training at Pensacola during 1919–1920, and he earned an MS in aeronautical engineering from the Massachusetts Institute of Technology in 1923. Stump then was assigned to Torpedo Squadron 2 on the experimental aircraft carrier *Langley*. Later, he was navigator of the carrier *Lexington* and then, with the rank of commander, executive officer of the carrier *Enterprise* in 1940 and 1941.

Stump's World War II service began with his transfer in January 1942 from commanding officer of the *Langley* to the staff of the commander in chief of the Asiatic Fleet. After the dissolution of that command the following month, he spent eight months as air officer to the commander, Western Sea Frontier. In December 1942, Captain Stump commissioned the new carrier *Lexington*. He commanded it in operations against Tarawa (November 20–24, 1943), the Gilbert Islands (November 1943), and Kwajalein (January 19–-February 6, 1944).

Stump commanded escort Carrier Division 24 for most of 1944. He was promoted to rear admiral in May 1944. As part of Task Force 52, he supported landings in the Mariana Islands during June–August 1944. Stump commanded Task Unit 77.4.2 (known as "Taffy II") during the invasion of Leyte (October 20–December 25, 1944). In this operation, his escort carriers engaged Admiral Kurita Takeo's powerful Center Force at the battle off Samar and sank the Japanese heavy cruiser *Chikuma*.

Stump commanded Task Unit 77.12.1 in support of the landings at Mindoro in December 1944. He then commanded the San Fabian Carrier Group during the landings on Luzon in January 1945. During March–June 1945, Stump's escort carriers supported the invasion of Okinawa.

Stump became chief of Naval Air Technical Training in June 1945, a post he held until his promotion to vice admiral in December 1948. From 1948 to 1951 he was commander of the Naval Air Forces Atlantic Fleet and from 1951 to 1953 commander of the U.S. Second Fleet. In July 1953, Stump was promoted to admiral and became commander in chief, Pacific Command. Later, in March 1955, he was appointed U.S. military adviser to the South East Asia Treaty Organization. Stump retired in August 1958 and died in Bethesda, Maryland, on June 13, 1972.

Submachine Guns

The submachine gun (SMG) is a pistol-caliber automatic firearm that can be carried by one man in vehicles for local defense. It is also extremely useful in trench fighting and in operations to clear buildings. In the latter form of warfare, the SMG came into its own, able to fire bursts of pistol ammunition in enclosed spaces at short ranges within which the cartridge was still fully effective. On the battlefield, it also had its uses in fighting in bunkers and in wooded areas where ranges were short. All special operating forces used it during World War II.

Bethel Abiel Revelli, an Italian more famous for his machine-gun designs, invented the first SMG. His Villar Perosa weapon of 1915, although a tactical failure, used a pistol cartridge but fired it automatically by the "blowback" principle. This relies simply on the weight of the breechblock to delay rearward movement caused by the explosion of the gases in the cartridge case. These gases push the cartridge case to the rear, with safety ensured by delaying the movement of the breechblock until the pressure in the barrel has dropped after the bullet has left the barrel. Also in World War I, the Germans used their Mauser pistol as an SMG and issued an attachable stock for it, but this weapon was too light to be really effective.

In the interwar period, the Americans developed the highly effective Thompson SMG, which used the .45-caliber automatic Colt pistol cartridge. The Thompson was an important development, for it used a pistol cartridge but was of sufficient weight to fire accurately in short bursts. At the same

time, the Germans further developed their World War I Bergmann SMG. It eventually became well known as the MP38 and MP40 SMGs.

The United States continued to make and issue the Thompson in .45 caliber throughout the war, although a much cheaper variant, the M3 (known as the “grease gun” from its appearance), was also issued. Both weapons were effective at the short ranges for which they were designed, and British troops were often armed with the Thompson, which they preferred to their own Sten gun.

The Sten gun was a weapon born from economic need. British forces needed an SMG, but only rimmed cartridges were in use for the British Army pistol. The 9mm Parabellum round was available, however, and so the design was based on that cartridge. The weapon was initially quite crude, although it developed as the war progressed. It had the unfortunate capability of firing when it was not required to, and British troops often relieved German troops of their MP38 or MP40 SMGs as soon as they could.

The MP38 and MP40 utilized the same ammunition, which simplified supply. The Germans used both as well as some older Bergmann SMGs throughout the war. These solid and reliable weapons were effective to 50 yards. They were steel and plastic throughout, with no wood in their construction, a hallmark of all later examples of SMGs.

German troops in the field often preferred the Soviet PPSh M1941. A much cruder weapon, it had a wooden stock and fired from a 71-round drum magazine (as opposed to the MP38 32-round magazine). Further, the weapon was little affected by the weather and could be fired in dusty, muddy, or icy conditions, a characteristic of immense value to the operator.

The receivers of later PPS 1943 models were stamped out so that tolerances were maximized, allowing the weapon to accumulate dust, dirt, carbon deposits, and other encrustations that defeated the more accurately made German weapons. This fact allowed the Soviet weapons to keep on firing when the Germans were struggling with their weapons.

The Japanese came upon the SMG late in the war, and the Type 100 SMG was used by Japanese paratroops in the attack at Leyte (October 20–December 25, 1944). It was not well made and was considered inferior to European and American standards, but it could also be seen as a simple, cheap weapon, two of the characteristics of the SMG.

A member of the U.S. 1st Marine Division firing on a Japanese sniper with his Thompson submachine gun as a companion runs for cover. The marines were part of the effort to secure Japanese-held Wand Ridge during the April–June 1945 Battle for Okinawa. (Corbis)

The Italians, having invented the weapon, did not fail to develop the idea themselves. Pietro Beretta and his company designed and manufactured the Model 38 SMG, which was followed by the Models 38A and 18/42, all using 9mm Parabellum. These were wooden-stocked weapons and were highly regarded at the time.

A combination of the SMG and the standard rifle evolved into the assault rifle, which was first developed by the Germans in World War II.

Submarines

During the period between the two world wars, the world's major navies constructed small classes of submarines that served the dual purpose of meeting immediate operational needs and providing data for the development of improved vessels. By the mid-1930s, most of these navies had evolved one or two basic types that were well matched to their operational requirements, had attained substantial design maturity, and were suited to large-scale series production. The vast majority of World War II submarines, rather than having radical new designs, were of standardized types that had been modified in light of operational experience.

These standardized submarine types shared many common features. Functionally, they were submersibles rather than true submarines; their designs were optimized for operation on the surface, and they had only limited capabilities while submerged. Underwater, they relied on electric motors powered by large storage batteries for propulsion; on the surface, they used diesel engines for propulsion and to recharge the batteries. The submarines incorporated substantial numbers of torpedo tubes and reload torpedoes, and they also mounted guns for use against surface or aerial targets.

Their operational range was a function of the capacity of their bunkers for diesel fuel; their radius of action while submerged was limited by battery cell capacity. Maximum speed while submerged usually was not much more than half their surface speed, and maintaining high submerged speeds was impossible for any length of time without totally draining the batteries and forcing the submarine to the surface. Consequently, most navies during the conflict primarily operated their submarines as stealthy surface vessels that could submerge for evasion or escape before or after an attack.

Britain

British submarine development was influenced by the cruiser and fleet submarine concepts. The main thrust of early evolution between the wars centered on the overseas patrol type, which displaced 1,475 tons on the surface and had a range of 10,900 miles at eight knots, a submerged endurance of 36 hours at two knots, and a diving depth of 500 feet. Armament included a battery of 8 torpedo tubes with 14 torpedoes and a 4-

inch deck gun. A group of similar-sized mine-laying submarines also was built, as was a small series of fast large submarines for work with the fleet, but both of these developments proved expensive and of limited operational usefulness.

In the early 1930s, a fresh start was made with the Swordfish (S) class, which was designed for offensive patrols in narrow waters. These boats displaced 640 tons standard. They had a cruising range of 3,800 miles at 9 knots on the surface and 36 hours at 3 knots submerged, and they could dive to 300 feet. Armament was 6 torpedo tubes with 12 torpedoes and a 3-inch gun. A larger overseas patrol type, the Triton (T) class, appeared in 1937. These displaced 1,090 tons standard; they had a cruising range of 4,500 miles at 11 knots on the surface and 55 hours at 3 knots submerged, and they could dive to 300 feet. Armament was 10 torpedo tubes with 16 torpedoes and a 4-inch gun. Britain concentrated its production of submarines during the war on these two types, producing a total of 62 of the S type and 53 of the T type.

Just before the war, the Royal Navy developed a small submarine for training not only crews and new commanding officers but also antisubmarine vessels. When war came, the design was quickly adapted for operational use, and it proved to be particularly useful in confined waters such as the North Sea and the Mediterranean. The U class displaced between 540 and 646 tons on the surface, with a range of 3,600 miles at 10 knots on the surface, a submerged endurance of 60 hours at 2 knots, and a diving depth of 200 feet. Armament included a battery of 6 torpedo tubes with 10 torpedoes and a 3-inch deck gun.

A total of 71 boats were constructed of this class and its slightly improved successors of the V class. Although they were useful boats in the early part of the war, the later examples diverted resources from construction of more effective vessels. Britain also built some 36 midget submarines; with four-man crews, these vessels attacked ships at anchor in harbor.

France

France constructed three series of submarines in the period between the wars: large, oceangoing, long-range vessels for worldwide service and for operation with the fleet, smaller boats for offensive patrols in European waters, and a successful group of minelayers. The first postwar French submarines were of

the 1922 and 1923 programs and were based on the study of German U-boats taken as reparations. These nine submarines of the Requin class had a standard surface displacement of 947 tons and were armed with 10 21.7-inch torpedo tubes, 1 3.9-inch deck gun, and 2 25.2mm machine guns. The 31 large submarines of the Redoutable class (launched between 1928 and 1937) generally were regarded as effective boats. They displaced 1,384 tons standard on the surface; their maximum range was 10,000 miles at 10 knots on the surface, and their submerged endurance was 60 hours at 2 knots. They had a battery of 11 torpedo tubes (7 of them in two remotely controlled trainable external mounts) with a total of 13 torpedoes and a single 3.9-inch deck gun.

The French also constructed several smaller seagoing patrol-type submarines. A 1922 building program called for four 600-ton boats. These were the Sirène class, nine of which were eventually built. Several other patrol-type submarine classes were authorized in the years before the war, but not all were complete when France fell in June 1940. These submarines displaced between 600 and 900 tons. The Aurore class, the last series of French submarines being constructed when World War II began, displaced 893 tons and were armed with nine 21.7-inch torpedo tubes (three in an external remotely controlled trainable mount) plus a single 3.9-inch deck gun and two 13mm machine guns.

The French mine-laying submarines of the Saphir class displaced 761 tons on the surface and could cruise for 7,000 miles at 10 knots on the surface. They had a submerged endurance of 48 hours at 2 knots and could safely operate to a depth of 250 feet. They carried 5 torpedo tubes (3 in a trainable external mount) with 7 torpedoes, 32 mines, and a single 3-inch deck gun.

The French Navy also operated the largest submarine in the world at the outbreak of the war. The *Surcouf,* designed for long-range commerce warfare, displaced 2,880 tons standard on the surface and had a range of 10,000 miles at 10 knots on the surface. It had a range of 60 hours at 2 knots submerged and could operate safely at a depth of 250 feet. The *Surcouf*'s battery included no fewer than 12 tubes (8 in external mounts) with 22 torpedoes, two 8-inch guns in a special turret mounting, and a seaplane stowed in a hangar and launched with a catapult. The *Surcouf* also was equipped with a special compartment to accommodate prisoners taken from

intercepted vessels and a small motor launch to transport boarding parties. The submarine proved to be successful in peacetime, but it never operated in combat as designed and was subsequently lost in a collision.

Soviet Union

At the outbreak of war in September 1939, the Soviet Union deployed the world's largest submarine force, with 168 boats in service. Soviet mass production of submarines began early and produced a wide variety of types. There were two basic series of M-type coastal submarines, two basic medium submarine series (the S type, derived from the same basic design as the German Type VII, and the Shchuka [Pike] type of indigenous origin), minelayers of the L type, and long-range boats of the K type.

The final M type displaced 283 tons when surfaced, had a range of 4,500 miles at 8 knots on the surface or 36 hours at 3 knots submerged, could dive to 295 feet, and had a battery of 2 torpedo tubes with 4 torpedoes and a 45mm antiaircraft gun. The S type displaced 856 tons surfaced, had a range of 9,500 miles at 9 knots on the surface or 45 hours at 3 knots submerged, could dive to 330 feet, and had a battery of 6 torpedo tubes with 12 torpedoes and a 4-inch deck gun. Their indigenous rivals displaced 587 tons, had a range of 3,650 miles at 7 knots on the surface or 50 hours at 2.5 knots submerged, could dive to 295 feet, and carried 6 torpedo tubes with 10 torpedoes. The minelayers displaced 1,108 tons, had a range of 10,000 miles at 8.6 knots on the surface or 60 hours at 2.5 knots submerged, could dive to 330 feet, and carried 8 torpedo tubes with 14 torpedoes and 20 mines.

The K-type boats were popular with their crews and regarded as the best Soviet submarines of the war. These displaced 1,480 tons, had a range of 15,000 miles at 9 knots on the surface or 50 hours at 2.5 knots submerged, could dive to 330 feet, and carried 10 torpedo tubes with 24 torpedoes. Despite this variety, the Soviet Union's yards produced a great many submarines, completing some 200 boats during the course of the war.

United States

The U.S. Navy took the process of type standardization the furthest, entering World War II with a single basic design that was improved but never

replaced during the course of the conflict. These fleet boats emerged through the crystallization and synthesis of a series of designs produced to meet requirements for fleet submarines to accompany the battle fleet, cruiser submarines for long-distance raiding, and patrol submarines for offensive operations in the Pacific. Nine vessels (essentially experimental prototypes) in five classes were produced between 1921 and 1934, ranging in size from 1,100 tons to 2,700 tons standard on the surface. Overall, these submarines were not very successful, suffering problems with their diesel machinery, diving ability, and general reliability, but they provided valuable experience and data for an improved design.

The new series that began with the Porpoise class of 1934 were of 1,310 to 1,475 tons standard on the surface. They introduced diesel-electric reduction drive, which proved to be vastly more reliable than previous arrangements. Surface cruising range was 11,000 miles at 10 knots, and they had a patrol endurance of 75 days. They could operate for up to 48 hours submerged at 2 knots and had a safe-operating depth limit of 250 feet. A battery of 6 to 8 torpedo tubes with 16 to 24 torpedoes was fitted, along with a light deck gun. Between 1934 and 1940, 38 submarines of this group were constructed, and they formed the backbone of the U.S. submarine force when the United States entered the war.

The Gato class that followed became the first wartime standard class. Displacement rose to 1,526 tons, the torpedo tube battery increased to 10 tubes, and safe depth increased to 300 feet. They were followed by the similar Balao class; its deeper safe-operating depth of 400 feet was accomplished by substituting high-tensile steel for the mild steel used in earlier boats. The Tench class introduced diesel-electric direct drive that brought about a significant reduction in noise and internal machinery space, leading to the addition of four reload torpedoes to the outfit. A total of 221 submarines from these three classes were completed during or immediately after the war. Significant wartime modifications included reducing superstructure, adding radar, and enlarging the gun armament by fitting 4-inch or 5-inch deck guns and adding multiple light antiaircraft weapons.

Germany

The Germans developed their submarines clandestinely, since the Versailles Treaty prohibited them such weapons. Design work continued for foreign navies, with production undertaken in the customers' yards under German supervision. The first new German submarine, *U-1*, was completed only five weeks after German chancellor Adolf Hitler's repudiation of the Versailles Treaty on June 29, 1935.

The overwhelming majority of the 1,150 U-boats commissioned between 1935 and 1945 belonged to two groups: the 500-ton Type VII medium boats and the 740-ton Type IX long-range submarines. The Type VIIC displaced between 760 and 1,000 tons on the surface; it had a cruising range of 6,500 to 10,000 miles at 12 knots on the surface and 80 miles at 4 knots submerged. It

had a battery of 5 torpedo tubes with 14 torpedoes, an 88mm deck gun, and ever-increasing numbers of light antiaircraft weapons. Almost 700 of these boats in all their variants entered service during World War II.

The Type IXC displaced 1,120 tons; it had a cruising range of 11,000 miles at 12 knots on the surface and 64 hours at 2 knots submerged. It had a battery of 6 torpedo tubes with 22 torpedoes, a 105mm deck gun, and ever-increasing numbers of light antiaircraft weapons. Almost 200 of this type and its variants were commissioned.

Germany also commissioned several other important types of submarines during the war. Among the most important were the Type X minelayers and the Type XIV supply boats. Both variants operated as replenishment vessels for operational boats during the Battle of the Atlantic, providing fuel, provisions, medical supplies, reload torpedoes, and even medical care and replacement crew members. Consequently, they became prime targets for Allied antisubmarine forces, and few survived.

The other major vessels were the radical Type XXI and Type XXIII boats designed for high submerged speed and extended underwater operation. Revolutionary streamlined hull shapes, greatly increased battery space, and the installation of snorkels allowed these boats to operate at submerged speeds that made them difficult targets for Allied antisubmarine forces. Confused production priorities and the general shortage of materials late in the war prevented more than a few from putting to sea operationally.

Italy

Italian submarines were of four basic types: large ocean-going cruiser submarines, large minelayers, large long-range patrol boats, and medium-size vessels. The cruisers were few and proved to be rather unsuccessful, especially because they were slow to dive; they saw little operational service. The minelayers were much more successful. They displaced between 1,054 and 1,305 tons standard on the surface, with a range of 8,500 miles at nine knots on the surface, a submerged endurance of 60 hours at two knots, and a diving depth of 330 feet. Armament included a battery of 6 to 8 torpedo tubes with 8 to 14 torpedoes, 36 mines, and one or two 3-inch deck guns.

Two series of patrol submarines emerged as essentially standard designs immediately before the war began. The larger group displaced between 920

and 1,000 tons standard on the surface, with a range of 9,000 miles at eight knots on the surface, a submerged endurance of 60 hours at two knots, and a diving depth of 330 feet. Armament included a battery of 8 torpedo tubes with 12 torpedoes and one 4-inch deck gun.

The smaller group displaced between 650 and 680 tons standard on the surface, with a range of 5,000 miles at eight knots on the surface, a submerged endurance of 60 hours at two knots, and a diving depth of 330 feet. Armament included a battery of 6 torpedo tubes with 12 torpedoes and one 4-inch deck gun. These smaller patrol submarines performed well in the shallow, clear waters of the Mediterranean. The larger boats performed quite effectively in the Atlantic.

Japan

Japan constructed large submarines intended to operate primarily as integral components of the battle fleet. The Kaidai (admiralty) type design was based on a large German cruiser submarine from World War I, and the type evolved into a series of 24 boats in five classes, constructed between 1921 and 1935. These vessels displaced between 1,390 and 1,635 tons standard, had operating ranges between 10,000 and 14,000 miles at 10 knots, carried a battery of 6 to 8 tubes with 14 to 16 torpedoes, could operate submerged for 36 hours at two knots, and had a safe operating depth of between 200 and 250 feet.

Japan also developed large cruiser submarines of the Junsen (cruiser) type between 1924 and 1938. These eight huge vessels had standard displacements of between 1,970 and 2,231 tons and an operational range of 24,000 miles at 10 knots on the surface. They could dive safely to 300 feet.

In 1939, Japan essentially standardized its large submarine type with a vessel design displacing about 2,100 tons and capable of cruising on the surface for 14,000 miles at 16 knots or 24,000 miles at 10 knots. They could dive to 330 feet. Three models were produced: a headquarters type emphasizing communications and command facilities, an attack type emphasizing torpedo armament, and a scouting type that added hangar space and a catapult for a small reconnaissance floatplane. Some 46 of these large submarines were constructed, plus 3 others that brought together the facilities of all three types into the Sen-toku (special submarine) type, a single monster

hull displacing 3,530 tons standard. Japan also constructed 10 final examples of the Kaidai type early in World War II.

Japan also developed and constructed a series of medium submarines intended for coastal work. In addition, Japan expended considerable effort on the development of midget submarines: small boats with two-man crews intended for stealthy attacks on ports and roadsteads after they were transported close to the scene of operation by larger submarines. Finally, late in the war, Japan was developing submarines with high underwater performance, but these never entered service.

Technology played a major part in determining the effectiveness of submarines. Most navies encountered problems with their torpedoes early, especially those submarine arms that relied on magnetic rather than contact pistols. Radar development conferred a special advantage on Allied submarines in particular, offsetting the edge in optical quality possessed by German and Japanese boats.

U.S. submarines were almost unique in their level of habitability, and they were almost the only boats that featured full air-conditioning and adequate space for their crews to sleep. Sonar developed rapidly, as did countermeasures; some navies put considerable effort into stealth and self-defense measures by emphasizing use of wakeless electric torpedoes and special antiescort homing torpedoes. The course of the submarine war demonstrated that those arms that fell behind in the technological battle suffered disproportionately heavily in combat.

Submarines, Midget

Midget submarines include small submarines, human torpedoes, and submersibles. Although envisioned as a low-cost, mass-producible weapon against both shipping and warships, midget submarines as a group achieved little. First developed by Italy and adopted by Germany, Japan, and Great Britain, midget submarines have had a history of futility with only occasional success. Other than the unprecedented success of the British X-Craft, midget submarines proved costly in terms of human losses and ineffectual in the overall war effort. However, their low production costs made the designs attractive to increasingly desperate nations.

On November 1, 1918, Italian divers riding a modified torpedo sank the ex-*Austrian*, now the Yugoslav dreadnought *Viribus Unitas*. This provided the foundation for the first human-torpedo designs. The Italians continued to experiment with these craft and used them in World War II against the British in the Mediterranean and against the Soviet Union in the Black Sea.

When a prototype of the Siluro a Lenta Corsa (slow-running torpedo) class of submersibles proved hard to handle during testing, its operators cursed the boat with the enduring name of Maiale (pig). A two-man crew straddled the 23-foot-long and 2.5-foot-wide Maiale. Mounted on the nose was a 485-pound warhead that was 5 feet 11 inches long and would be attached underneath the keel of a target. Later, the Maiale employed heavier warheads weighing 550 and 660 pounds. Shrouded propellers afforded propulsion through netted waters.

Operating from one end of a converted tanker, several Maiale boats engaged in assaults against British ships at Gibraltar. Although many of their operators were captured or killed, these efforts nonetheless produced results. Three crews sank more than 20,000 tons of British ships at Gibraltar on September 19, 1941. On December 19, three crews were captured after

heavily damaging the battleships *Queen Elizabeth* and *Valiant* at Alexandria. Similar attacks damaged other ships but at the loss of most of the operators.

However limited their success, the Maiale-class design gave rise to the Forzatori di Basi CB-class craft, the only ones of this type to see action. In these, a four-man crew operated a boat 49 feet 3 inches by 9 feet 10 inches armed with two 17.7-inch (450mm) torpedoes. Most of the operational CB craft were used in a blockade of Sevastopol in the summer of 1942. The Italians planned to conduct a raid on New York Harbor by a refitted version, the CA.2-class boat. On May 25, 1943, however, British warships sank the Marconi-class submarine *Leonardo da Vinci,* which was to shuttle the *CA.2* across the Atlantic.

A German program, hoping to build on the success of the Maiale, was perhaps the most extensive yet least productive effort by the warring powers to build a midget submarine. The Biber (beaver) was a small single-man vessel armed with two torpedoes attached underneath. The Molch (salamander) was its larger cousin. During September 25–26, 1944, Molch boats attacked Allied vessels supporting Operation DRAGOON. Seven of the nine Molch boats involved were sunk, with no Allied vessels lost. During the first months of 1945, 70 Molch and Biber craft were lost, having sunk only seven Allied ships and damaged two.

The Neger (Negro) was a slight improvement with increased range. On July 5, 1944, a flotilla of Neger boats attacked the Allied Normandy Invasion fleet, losing 15 of 24 of their own and sinking only the British minesweepers *Magic* and *Cato*. The flotilla attacked again on July 7–8, losing all 21 Neger boats to antisubmarine forces and sinking only 1 additional minesweeper, HMS *Pylades*. The German Navy ordered more than 1,000 Seehund (seal) design craft, but only 138 were commissioned. Operated by a two-man crew and armed with two torpedoes, 35 Seehund craft were lost in early 1945 over the course of 140 missions, having sunk only 8 Allied ships.

The Japanese counterpart to these, the Ko-Hyoteki, was well designed but had a poor service record. The Type A–class boats had a crew of two aboard a vessel 78.74 feet long by 6 feet wide that was armed with two torpedoes. Piggybacked on C1-class submarines, five Ko-Hyoteki boats took part in Japan’s December 7, 1941, attack on Pearl Harbor. Ensign Sakamaki Kazuo of the Ko-Hyoteki that ran aground near Bellows Field became the first U.S.-held Japanese prisoner of war.

The Japanese also deployed Type B–class boats off their Pacific islands. Slightly larger and slower than the Type A, these boats could carry a three-man crew for two or three days. Seven Type-B Ko-Hyoteki craft were sunk in attacks on Diégo-Suarez and Sydney on May 31, 1942, in which they damaged two British warships and sank a ferry. On January 5, 1945, *No. 82* launched its two torpedoes at the U.S. cruiser *Boise,* which was carrying General Douglas MacArthur and his staff. The cruiser evaded the torpedoes, and one of its escorts rammed and sank the Japanese midget sub.

The naval version of Japanese kamikaze (divine wind) suicide aircraft came in the form of the Kaiten (meaning “heaven-shaker”). Essentially a human-guided torpedo, it had a 3,416-pound warhead. Limited range and dependence on a “mother” submarine severely restricted the effectiveness of these, and 900 men and several mother submarines were lost in largely unsuccessful limited operations from November 1944 through July 1945.

The British, after fortifying their Mediterranean harbors against the Italian and German raiders, designed their own improved midget submarines. On November 21, 1943, the British used four Welmans, a single-man boat with a speed of three knots, against a floating U-boat dock near Bergen, Norway. One man was captured when his Welman became entangled in antisubmarine netting; the other three craft encountered various other problems. They escaped to the north, and all three were scuttled.

A Japanese midget submarine, beached at Bellows Field, Hawaii, following the attack on Pearl Harbor on December 7, 1941. (National Archives)

The Chariot was a much-improved design. It was essentially a hollowed-out 21-inch torpedo with a 600-pound detachable warhead. Only six operations involving Chariots were launched, including an aborted attack on November 1, 1942, against the German battleship *Tirpitz*. The British also sank an Italian cruiser under construction in 1943 and attacked and sank the German (ex-Italian) heavy cruisers *Bolzano* and *Gorizia* at La Spezia on June 21 and June 26, 1944, respectively.

The British X-Craft exemplified the best designs and the most successful midget submarines of the war. Three types saw the most service: the X510, X20, and XE series. Each had a four-man crew aboard a boat 49 feet 3 inches by 5 feet 9 inches, could achieve nearly six knots in speed, and could dive to about 300 feet. Craft *X5* through *X10* were all tasked with sinking the *Tirpitz*. The crews of the *X6* and *X7* successfully placed charges that severely damaged the German battleship in its harbor at Bergen, but both crews were captured.

The *X20* and *X23* served an important role in the Allied invasion of Normandy, placing a navigational beacon just before the invasion of June 6, 1944. In 1945, several of the XE class saw action in the Far East. On July 31, multiple operations achieved success, including the sinking of the Japanese cruiser *Takao* by the *XE1* and *XE3* and the destruction by the *XE4* and *XE5* of the underwater telephone cables connecting Saigon to Hong Kong and Singapore.

Daring in design and operations, midget submarines represented the marriage of technology and desperation. The difficulty of transport and the risks of loss of support craft and personnel outweighed the benefits of these small craft. Although midget submarines and human torpedoes did have some spectacular successes, their limited range, speed, and offensive capabilities rendered them largely ineffectual.

Suez Canal

Canal linking the Mediterranean Sea and the Red Sea. First opened in 1869 and designed to facilitate worldwide commercial and military shipping interests, the Suez Canal is located in northern Egypt and runs on a north-south axis. When the canal began operations, it revolutionized shipping because it offered a short link between Europe and Asia and did away with the need for navigating around the entire African continent.

The canal's northern terminus is at Port Said; its southern terminus is situated at Port Tawfik in the Egyptian city of Suez. The Suez Canal does not have locks; instead, water flows into the waterway from both the Red and Mediterranean Seas. Within the canal is the Great Bitter Lake, where excess seawater can be stored. The lake also helps to offset tidal action, keeping the water level in the canal relatively uniform. The canal can accommodate ships with drafts as deep as 62 feet and maximum beams of 245 feet 3 inches.

At the start of World War II the British controlled the waterway, which was a significant strategic advantage for the Allies. A major Axis war aim was to seize control of Egypt and the Suez Canal. The Axis powers were forced to withdraw from Egypt, however, as a consequence of the Battle of El Alamein (October 23–November 4).

The Egyptian government nationalized the canal in 1956, touching off the Suez Crisis that year. The Suez Canal remains vitally important to the world economy, and considerable quantities of oil from the Middle East pass through it each year. Today, all but the largest supertankers can navigate the canal.

Sugihara Chiune (1900–1986)

Japanese diplomat. Born on January 1, 1900, at Yaotsu, Gifu Prefecture, Sugihara Chiune entered Waseda University in 1918. The next year, he passed an examination given by the Ministry of Foreign Affairs for overseas studies, and he became a student at a language institute in Harbin, Manchuria. After graduation, in 1924 Sugihara entered the Ministry of Foreign Affairs and worked in the Japanese consulate in Harbin.

In 1932, Sugihara was transferred to the Division of Foreign Affairs of Manzhouguo (Manchukuo) and was involved in negotiations with the Soviet Union for the transfer of the Eastern Chinese Railway. He then returned to the Ministry of Foreign Affairs in Tokyo. After working in the ministry's Personnel Section and the Information Bureau, he was assigned in 1937 as a secretary and interpreter of legation in Helsinki, Finland.

Two years later, Sugihara was assigned as a vice consul to the Japanese consulate in Kaunas, Lithuania, where he was acting consul. In July 1940, as the annexation of the Baltic countries to the Soviet Union loomed, many refugees (most of them Jews who had escaped from Poland) asked Sugihara for Japanese transit visas to escape from Lithuania. Sugihara took personal responsibility for issuing visas until the end of August. As a result, 6,000–10,000 Jewish refugees were saved.

Sugihara then worked in the Japanese consulates in Prague and in Königsberg and in the Japanese legation in Romania. After internment following the end of the war, Sugihara returned to Japan. He resigned from the diplomatic service in 1947. In 1978, the Israeli government honored him

with a medal for his services in saving the lives of Jews during World War II. The government also bestowed on him Israel's highest honor as "Righteous among Nations." Sugihara died on July 31, 1986, at his home near Tokyo.

Sugiyama Hajime (1880–1945)

Japanese Army field marshal. Born in Fukuoka Prefecture on January 2, 1880, Hajime Sugiyama graduated from the Japanese Military Academy in 1900. Following routine assignments, he graduated from the Army War College in 1910. During World War I, Sugiyama commanded the 14th Infantry Battalion. In February 1915, he became military attaché in India. He then held several overseas assignments, including with the Japanese mission to the League of Nations.

In 1922, Sugiyama began his rise in the Ministry of War, first as chief of the Aviation Section of the Military Affairs Bureau and then as director of the Military Affairs Bureau. In 1930, he became deputy minister of the army. Appointed army deputy chief of staff in 1934, in February 1937 he joined the cabinet of Senjuro Hayashi as army minister. He was retained in that position in the succeeding cabinet of Fumimaro Konoe. After the July 7, 1937, Marco Polo Bridge Incident, Sugiyama was among the faction that pushed for escalation of the conflict, leading to the 1937–1945 Sino-Japanese War.

In December 1938, Sugiyama assumed command of the northern China theater. Between October 1940 and February 1944, he was army chief of staff. Although Sugiyama's career was capped by conferment of the honorary

rank of field marshal in 1943, he did not distinguish himself for enlightened leadership but excelled only in political maneuvering and following the prevailing political winds within the army. Emperor Hirohito often reprimanded Sugiyama for his evasive statements and his claims that victory over China and then the United States would be easily achieved.

In July 1944, Sugiyama joined the cabinet formed by his former classmate Kuniaki Koiso, who replaced Hideki Tōjō as prime minister. Sugiyama presided over the final mobilization efforts as Japan began preparations for an anticipated Allied invasion of the main islands in early 1945. He responded to the Japanese surrender by committing suicide with a pistol on September 12, 1945.

Sultan, Daniel Isom (1885–1947)

U.S. Army lieutenant general. Born in Oxford, Mississippi, on December 9, 1885, Daniel Sultan graduated from the U.S. Military Academy at West Point in 1907 and was commissioned in the Corps of Engineers. During the next decades, he rose to the rank of colonel while holding a variety of engineer assignments, including assisting in the construction of fortifications on

Corregidor in the Philippine Islands and conducting surveys for a proposed canal in Nicaragua. He also served as a member of the Board of Engineers for Rivers and Harbors; had tours as district engineer for Savannah, Georgia, and Chicago, Illinois; and was engineer commissioner for Washington, D.C. Sultan graduated from the Command and General Staff School and the Army War College.

In December 1938, Sultan, recently promoted to brigadier general, was named commander of the 22nd Infantry Brigade in Hawaii. In April 1941, as a major general, he assumed command of the 38th Infantry Division. A year later, he took command of VIII Corps. In November 1943, Sultan, now a lieutenant general, was appointed deputy commander of the China-Burma-India theater, headed by Lieutenant General Joseph W. Stilwell.

Operating from Delhi, India, Sultan assumed much of Stilwell's administrative and logistical burden, concentrating on getting vitally needed supplies to China by air over the Himalayan Mountains (the Hump) and through the construction of a road (known as the Ledo Road, later renamed the Stilwell Road) and a pipeline across northern Burma ending at Wanting, China. Following the recall of Stilwell in October 1944, Sultan became commander of the India-Burma theater. He commanded all U.S. forces in the theater and personally commanded a combined force of American, British, and Chinese troops that helped drive the Japanese from northern Burma in 1945.

At the end of the war, Sultan was named U.S. Army inspector general. Sultan died in Washington, D.C. on January 14, 1947.

Sunda Strait, Battle of (February 28–March 1, 1942)

Southwest Pacific naval battle between Allied and Japanese forces. By February 1942, the collective Allied defense of the Southwest Pacific, the ABDA (American-British-Dutch-Australian) Command, had largely collapsed.

Following the Battle of the Java Sea on February 27, two major Japanese invasion forces steamed toward the island of Java. The larger of the two, the Western Attack Force, detached 13 transports to conduct landings at Eretan Wetan and Merek. The remaining 43 transports, screened by 2 heavy cruisers, 1 light cruiser, and 7 destroyers approached Bantam Bay just east of the entrance to Sunda Strait. An additional force, which included the aircraft carrier *Ryujo,* 2 heavy cruisers, and 2 destroyers, under the command of Rear Admiral Kurita Takeo, stood off in the Java Sea to support the various operations.

Allied intelligence knew of the Japanese intention to land in the region but did not know the exact timetable. Believing that a landing would not occur until the following day, overall ABDA naval commander Dutch vice admiral Conrad Helfrich ordered the surviving Allied naval forces to reassemble at Tjilatjap in an effort to halt the Japanese.

The U.S. heavy cruiser *Houston* and the Australian light cruiser HMAS *Perth* exited Batavia Harbor at 7:00 p.m. on February 28 as ordered. Their escort, the Dutch destroyer *Evertsen*, was delayed, however, and did not take part in the coming battle. The crews of both Allied ships were exhausted after weeks of incessant action. Morale was also low; Japanese forces had handed the Allies one defeat after another. Neither ship carried a full load of fuel, both were low on ammunition and in need of maintenance, and the *Houston*'s after turret was inoperable following a Japanese air attack on February 4.

At 10:39 p.m. on February 28, the Japanese destroyer *Fubuki* spotted the *Perth* and *Houston* approaching Bantam Bay shortly after the transports had begun discharging their troops. The *Fubuki* reported the sighting and, unseen by the Allied vessels, maintained contact. At this point, only three destroyers, including the *Fubuki*, were in the vicinity. The closest heavy cruisers were 20

miles north of the bay. At 11:14 p.m., the *Perth* spotted the *Harukaze,* recognized it as a Japanese destroyer, and opened fire. This prompted the *Fubuki* to launch nine torpedoes, but all missed. The Allied ships circled to port as the light cruiser *Natori,* followed by three additional destroyers, came into view. It is not certain whether the Allied captains realized they had come upon the main invasion fleet.

The cruisers fired upon the light cruiser and destroyers. Two more Japanese destroyers arrived, bringing the number engaged to eight. Light damage was inflicted on the *Perth, Shirayuki,* and *Harukaze* as the destroyers launched several torpedo attacks and the Allied cruisers circled and successfully avoided 28 torpedoes fired against them.

By 11:46 p.m., the heavy cruisers *Mikuma* and *Mogami,* supported by one destroyer, opened fire from the north. The *Houston* hit the *Mikuma* at 11:55 p.m., inflicting light damage. Captain Waller, his ship down to practice shells, decided to lead the force into Sunda Strait. At midnight, the *Mogami* fired 6 torpedoes while two destroyers launched 18.

At 12:05 a.m. on March 1, *Mogami*'s torpedoes, which had run past their intended targets, entered Bantam Bay at 48 knots and struck three Japanese army transports, the minesweeper *W2,* and the *Ryujo Maru*—headquarters ship of General Imamura Hitoshi, commander in chief of the Sixteenth Army. The explosion threw the general into the water. He reached shore three hours later after swimming through oil-coated water. Four of the destroyer torpedoes, however, struck the *Perth* in quick succession, and the light cruiser sank at 12:12 a.m.

Captain Albert H. Rooks, skipper of the *Houston,* seeing that the way west was blocked, turned his ship east and continued to fight, resorting to firing star and practice shells once the ship's live ammunition had been expended. The heavy cruisers, with ranges less than 7,000 yards, began to punish the U.S. ship. Shrapnel killed Rooks five minutes after he had issued an abandon-ship order at 12:25 a.m. By that time, the *Houston* had absorbed overwhelming punishment. Several torpedoes as well as numerous 8-inch and smaller-caliber shells had struck the U.S. cruiser. A salvo penetrated the after engine room, bursting steam lines and killing the entire engine room crew.

The *Houston* finally rolled over and sank at 12:45 a.m. on March 1. The *Houston* lost 693 men, and the *Perth* lost 351 in the battle; 703 survivors of both Allied ships became prisoners of war. During the battle, the Japanese

ships fired 87 torpedoes. Excluding the transports, damage to the Japanese ships was light. Worst hit was the destroyer *Harukaze*, which had 3 men killed and 5 wounded. The Battle of Sunda Strait finalized the Japanese Navy's victory at sea in the East Indies.

Sung Che-yuan

See Song Zheyuan

Sun Li-jen

See Sun Liren

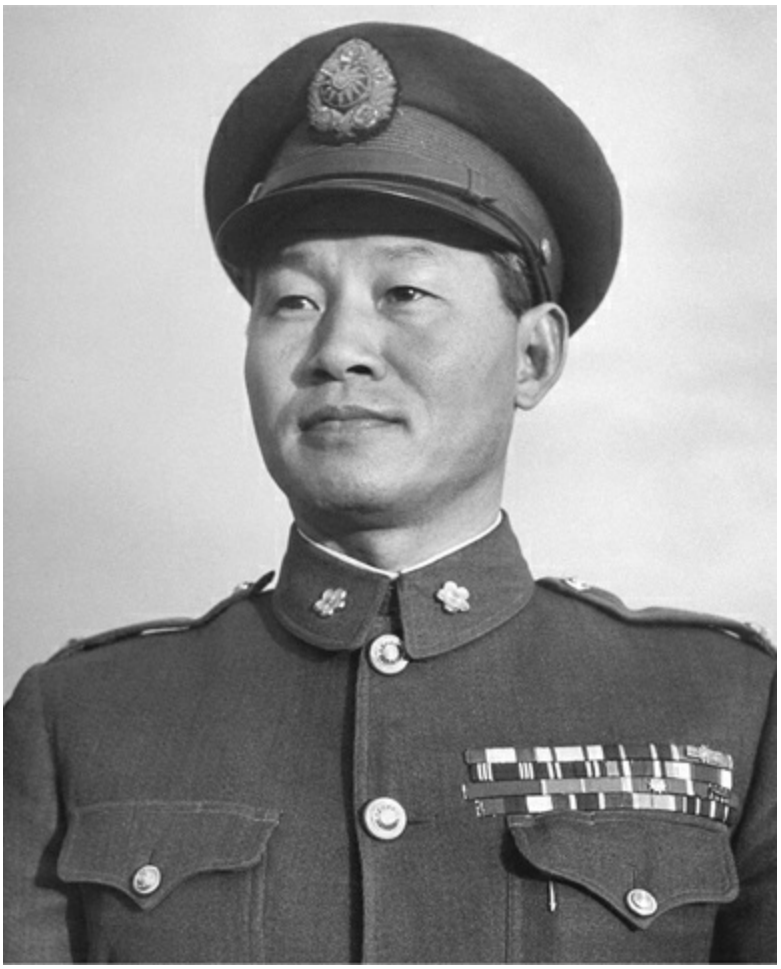
Sun Liren (1900–1990)

Nationalist Chinese general. Born in Lujiang (Lukiang), Anhui (Anhwei) Province, on October 17, 1900, Sun Liren (Sun Li-jen) graduated from Qinghua (Tsinghua) University in 1923. He added an engineering degree

from Purdue University in 1924 and a bachelor's degree from the Virginia Military Institute in 1927. Returning to China, he enlisted as a corporal in the Guomindang (GMD, Nationalist) Army, and by 1930 he commanded a regiment. In the 1937 Battle of Shanghai in Jiangsu (Kiangsu) Province, he was badly wounded by grenade fragments.

Sun recovered, and in 1942 he and his 38th Division gained fame during the Allied retreat in Burma by rescuing a nearly surrounded British division at Yenangyaung (April 10–19, 1942). For this action, London awarded Sun the Commander Order of the British Empire. While other units collapsed before the Japanese onslaught, Sun kept his division together, withdrawing in good order through mountainous northwest Burma and joining Lieutenant General Joseph Stilwell's training operation at Ramgarh as deputy commander of the Chinese army in India—the so-called X-Force.

In late 1943, Sun led his New First Army into northern Burma to help clear the Ledo Road route. In December, he took Yupbang Ga, initiating a six-month drive through the Hukawng and Mogaung Valleys toward Myitkyina. Sun had impressed Stilwell earlier as aggressive and professional. But in January 1944, Stilwell fulminated at apparent Chinese malingering, convinced that Jiang Jieshi (Chiang Kai-shek) had ordered Sun not to risk well-trained Chinese forces in Burma's jungles. Sun countered that American intelligence grossly underestimated Japanese strength, necessitating slowing for more reconnaissance. Scholars substantiate both allegations.



Chinese Nationalist general Sun Liren (Sun Li-Jen), shown here in 1949. (Time Life Pictures/Getty Images)

Still, in March the 38th fought successfully alongside Brigadier General Frank Merrill's Marauders in the first joint Sino-American combat operation. Sun took Kamaing, just west of Myitkyina, in June, and Bhamo, near the Chinese border, on December 15, 1944. Sun's 38th Division led the X-Force across the frontier, linking up with the Yunnan Province–based Y-Force on January 27, 1945. This action ended the three-year blockade of China and opened the way for the newly christened Stilwell Road to Kunming. In August, Sun took the Japanese surrender in Guangzhou (Canton), Guangdong (Kwangtung) Province.

After combat in the Chinese Civil War, Sun became commander in chief of all Nationalist forces in Taiwan in 1950. In 1955, however, he was forced to resign following a subordinate's alleged anti-Jiang plot. Although a secret investigation cleared Sun of any wrongdoing, he was not only forced from his

position but also placed under house arrest from 1955 until 1988, after the end of the Jiang era. A popular figure, Sun died at his home in Taichung, Taiwan, on November 19, 1990.

Suomussalmi, Battle of (December 7, 1939–January 8, 1940)

Battle of the 1939–1940 Finnish-Soviet War (Winter War). After the failure of protracted negotiations between the Soviet Union and Finland, Soviet dictator Joseph Stalin ordered the Red Army to invade Finland. Stalin confidently expected victory within two weeks. Soviet forces, however, were poorly led, and they were equipped and trained for mechanized warfare on open terrain rather than the dense forests of Finland. The Soviets were also not prepared for winter warfare in temperatures that plunged to −43 degrees.

The Finns were badly outnumbered, but they were highly motivated and understood that their national survival was at stake. Finnish soldiers were well trained and adept at small-unit tactics, marksmanship, wilderness navigation, and camouflage. Marshal Carl Gustaf Mannerheim, commander of Finnish forces, had served with distinction in the Russian Army, and many of his officers had fought against the Russians after World War I to secure Finnish independence. During the subsequent fighting, Finnish skills on skis offset Soviet numbers through tactical mobility and elusiveness.

Prior to the war, a Finnish threat analysis anticipated two Soviet thrusts: a major assault on the Karelian Isthmus aimed at Viipuri (Vyborg) and Helsinki and an attack north of Lake Ladoga to outflank Finnish defenses on the isthmus. Thick forests and the scarcity of roads seemed to forbid large-scale operations in central and northern Finland. Consequently, eight Finnish divisions were deployed on the isthmus and north of Lake Ladoga. Only six independent battalions and an understrength division in reserve covered central and northern Finland.

The Russians, however, had secretly built roads and extended rail lines to the border. They committed eight divisions to a major offensive in central and northern Finland, which surprised the Finns. This offensive was designed to cut Finland in half and ravage the agricultural regions bordering the Gulf of Bothnia. As a part of this offensive, the Soviet 163rd Rifle Division was to advance on two forest roads to the town and road junction of Suomussalmi in central Finland as part of the Soviet effort to seize the Bothnian port of Oulu to the west of Suomussalmi. Evacuated by the Finns, Suomussalmi was occupied by the Russians on December 7.

Finnish border guards harassed the Russians until an independent battalion took up positions north of the town. On December 7, Mannerheim committed two battalions of the 9th Division to this front. Colonel Hjalmar Siilasvuo commanded.

Siilasvuo isolated the 163rd, which now was extended some 25 miles on narrow roads, establishing a roadblock on the southern road from Suomussalmi to the border. Some 350 Finnish troops with heavy machine guns occupied an isthmus between two frozen lakes, affording a clear field of fire against attempts to outflank the position.

Bodies of soldiers from the Red Army's 44th Division lie along the roadside following the Battle of Suomussalmi in Finland. (Hulton-Deutsch Collection/Corbis)

To extricate the 163rd, on December 20 the Soviets sent their 44th Motorized Rifle Division along the southern road toward Suomussalmi. This well-trained and well-equipped unit had both artillery and tanks. Finnish interception of Soviet radio signals revealed the Soviet plan, however. On December 22, Mannerheim appointed Siilasvuo commander of the 9th Division and began to send substantial reinforcements to him. Eventually, these units included six infantry battalions, four 76.2mm guns, four 105mm guns, and two 37mm antitank guns. To delay the 44th, Siilasvuo unleashed a series of savage raids on its lead elements. When Soviet attempts to dislodge the Finnish roadblock failed, the 44th halted six miles east of Suomussalmi.

Efforts by Soviet pilots to assist the ground troops were in vain. The Finns concentrated for swift attacks and then dispersed, vanishing into the forests. Bombs dropped on the road were as likely to hit Soviet soldiers as Finns, and the fixed Finnish positions were well camouflaged. While the 44th remained paralyzed, Siilasvuo concentrated on the 163rd. The trapped Soviet soldiers were cut down in droves as they sought to escape, and the unit was annihilated by the night of December 30.

The Soviet 44th Division, strung out in a 20-mile column, proved to be a more difficult foe. Fighting was ferocious, and Finnish losses were substantial. A tank breakout was halted when Bofors antitank gunners

destroyed seven Russian tanks in 15 minutes and following vehicles slid into deep snow in the ditches. The last resistance ended by dawn of January 8 as Russian survivors abandoned their equipment and fled in disorder.

Soviet losses in the Battle of Suomussalmi were 27,500 killed or frozen to death and 1,300 prisoners. The Soviets also lost 43 tanks, 270 other vehicles, and 48 guns. Finnish losses came to 900 killed and 1,770 wounded.

Sutherland, Richard Kerens (1893–1966)

U.S. Army lieutenant general. Born on November 27, 1893, in Hancock, Maryland, Richard Kerens Sutherland graduated from Yale University in 1916. He served in France during World War I and rose to the rank of captain. He remained in the army after the war and graduated from the Command and General Staff School at Fort Leavenworth, Kansas, in 1928 and from the Army War College in 1933. Sutherland was assigned to General Douglas MacArthur's staff in the Philippines in 1938 and became MacArthur's chief of staff in 1939. He was a lieutenant colonel in 1939 and a brigadier general in July 1941.

As MacArthur's chief of staff, Sutherland anticipated, understood, and executed exactly what his commander wanted. MacArthur decided policy, and Sutherland supplied the details. Sutherland counterbalanced MacArthur's verbal eloquence with sharp, unemotional logic. Promoted to major general in December 1941, Sutherland supervised the 1941–1942 Philippines Campaign, planned President Manuel Quezon's evacuation, and convinced MacArthur to comply with President Franklin D. Roosevelt's orders sending

him to Australia. Once they were in Australia, MacArthur sent Sutherland to New Guinea with the authority, if necessary, to relieve Lieutenant General Robert L. Eichelberger. Had Sutherland done so, he would have assumed command of I Corps, a step toward command of an army. Sutherland placed the good of the service above his own ambitions, and Eichelberger remained in command.

Beginning in January 1943, MacArthur employed Sutherland in a strategic planning and liaison role with Washington. That March, Sutherland represented MacArthur at a conference in Washington regarding 1943–1944 Pacific theater operations. By October 1943, Sutherland was the de facto deputy commander to MacArthur and was promoted to lieutenant general in February 1944. Intelligent and yet imperious, Sutherland worked poorly with the navy staff and, indeed, with the army staff in Washington.

Sutherland incurred MacArthur's displeasure when he ignored his commander's orders not to bring his Australian officer-mistress to the Philippines in 1944. Sutherland had hoped for army command, but MacArthur now snubbed him. By February 1945, a depressed Sutherland was performing his duties by rote. He took leave in the United States in the summer but returned to the Pacific on the Japanese surrender to restore order to MacArthur's headquarters.

Sutherland remained in Japan for three months and then returned to the United States and retired in November 1946. He died in Washington, D.C., on June 25, 1966.

Suzuki Kantarō (1867/1868–1948)

Japanese Navy admiral and prime minister of Japan (1945). Born in Osaka in 1867 or 1868, Suzuki Kantarō graduated from the Japanese Naval Academy in 1887 and the Naval War College in 1898. He saw combat in the 1894–1895 Sino-Japanese War and in the 1904–1905 Russo-Japanese War. Following service in a variety of positions at sea and ashore, including command of the Naval Academy, Suzuki was promoted to admiral in 1923.

In 1925, Suzuki became chief of the Naval General Staff. He retired in 1929. Transferring to the reserves, he was appointed grand chamberlain to the emperor and a member of the Privy Council. Suzuki served in that post until he was badly wounded by assassins during a failed coup attempt on February 26, 1936.

On April 5, 1945, Suzuki was recalled from retirement to replace Koiso Kuniaki as prime minister. Faced with Japan's military collapse, Suzuki's cabinet remained deadlocked over whether to surrender or fight a last-ditch battle in defense of the home islands. Although Suzuki continued to maintain a bellicose pose in public, he supported foreign minister Tōgō Shigenori's desperate and ultimately unsuccessful attempt to enlist the help of the Soviet Union as a mediator with the United States.

By August 1945, the situation for Japan had become dire. On August 6, the United States dropped an atomic bomb on Hiroshima; it was followed with an atomic attack on Nagasaki three days later. Meanwhile, on August 8, the Soviet Union declared war on Japan and invaded Manchuria. Nevertheless, the members of Suzuki's cabinet were unable to reach a decision until Emperor Hirohito broke the deadlock. Suzuki and his cabinet resigned on August 17, 1945. Suzuki died in Noda City in Chiba Prefecture on April 7, 1948.

Suzuki Sosaku (1891–1945)

Japanese Army general. Born in Aichi Prefecture on September 27, 1891, Suzuki Sosaku graduated from the Japanese Military Academy in 1912 and was commissioned in the infantry. He graduated from the Army War College in 1919.

Suzuki served on the General Staff twice (1920–1923 and 1925–1928) and was a resident officer in Germany from 1923 to 1925. He then served on the staff of the Military Affairs Section of the War Ministry from 1928 to 1933 and concurrently as an instructor at the Army War College from 1929 to 1933. He also served on the headquarters staff of the Guandong (Kwantung) Army from 1933 to 1935.

Promoted to colonel in 1935, Suzuki commanded the 4th Infantry Regiment. In 1937, he simultaneously became chief of the 2nd Section in the Department of Military Education and a staff member in the Supreme Headquarters. Promoted to major general in 1938, he served as the Central China Area Army vice chief of staff in 1938 and 1939 and as the China Expeditionary Army vice chief of staff in 1939 and 1940. In 1940, he took over as chief of the 3rd Division (transportation and communication) of the General Staff.

Promoted to lieutenant general in 1941, at the beginning of the Pacific war Suzuki was chief of staff of the Twenty-Fifth Army, assisting army commander Lieutenant General Yamashita Tomoyuki in executing the seizure of the Malay Peninsula and Singapore from December 1941 to February 1942. Now assigned to the Department of Weaponry, he took office as the chief of the Department of Transportation and then commander of the Shipping Headquarters in 1943.

In July 1944, Suzuki became commander of the new Thirty-Fifth Army with the mission of defending the vast area of the central and southern Philippines. He had only one division on Leyte Island in the central Philippines when U.S. forces landed there on October 20, 1944. Suzuki moved with his headquarters from Cebu City to Leyte, concentrated his military assets as much as he could, and endeavored to drive back the U.S.

forces. Given overwhelming U.S. command of the air and the sea, this proved to be impossible, and most Japanese forces on Leyte were destroyed.

Committing most of his men to the defense of Mindanao, Suzuki returned to Cebu in late March 1945, but he left there for Mindanao by small boat in early April and was killed in the Mindanao Sea during a U.S. air attack on April 19. Suzuki was posthumously promoted to full general.

Suzuki Teiichi (1888–1989)

Japanese Army general and politician. Born on December 16, 1888, in Chiba, Japan, Suzuki Teiichi graduated from the Army Cadet School and the War College. A typical Japanese army technocrat, Suzuki held various field and staff duties in China and became a leading expert on China in the army.

From the mid-1930s, Suzuki cultivated close relations with General Tōjō Hideki that eventually brought him important government posts. Promoted to lieutenant general in 1940, Suzuki retired from active service in April 1941. However, in the same month he was appointed cabinet minister-cum-director of the National Planning Bureau and was involved in the war mobilization program of the Konoe and Tōjō cabinets. Between November 1943 and October 1944, Suzuki served as an adviser to the Tōjō and Koiso cabinets.

In September 1945, Suzuki was arrested by the Allied occupation authority. Brought to trial before the International War Crimes Tribunal, he was sentenced to imprisonment; he was released in 1955. Suzuki died in Chiba on July 15, 1989.

Sweden

Sweden, a democratic nation, has a land area of 173,745 square miles and had a 1939 population of just under 6.5 million people. Located in Northern Europe, Sweden shares a common border with Norway to the west and Finland to the east. Denmark is across the Baltic Sea to the south. Swedish interests before the war had been served by the balance of great powers in Europe, and Swedes greatly feared that this would be upset during the conflict. Sweden had a tradition of neutrality; it had last been at war during the Napoleonic Wars in 1814.

Despite Nordic solidarity and strong Swedish sympathy for the plight of its neighbors, this sentiment was not allowed to upset Swedish national interests during the war.

Sweden was underprepared militarily in 1939. Although the nation had begun a rearmament program in 1936, it still lacked modern equipment in any significant quantities. Military weakness continued until near the end of the war. In 1937, the Swedish Army had only 403,000 men, with only 79 antiaircraft guns and no tanks. In 1945, the army had grown to 600,000 men, 2,750 antiaircraft guns, and 766 tanks. The air force went from 596 aircraft in 1940 to 1,018 in 1945; the navy increased from 47 vessels of all types in 1939 to 126 by May 1945. The expansion of Sweden's military and the generally deteriorating German military position after 1942 precluded any German invasion of the country.

Sweden had large deposits of high-grade iron ore, and in 1939 it provided half of all German iron-ore imports. This trade was vital for the German war effort. Depending on the season, the ore came either down the Baltic or

through the northern Norwegian port of Narvik. Sweden was less fortunate in other areas, having to import such vital commodities as coal and oil. During the war, Sweden lost 241 ships involved in its foreign trade.

Sweden proclaimed its neutrality at the beginning of the war. When the First Finnish-Soviet War (Winter War) began in November 1939 with the Soviet invasion of Finland, Swedish prime minister Per Albin Hansson, leader of the Socialist Party, established a coalition government that included all political parties except the communists. Its principal goal was to keep Sweden out of a wider war. Swedish sentiment heavily favored Finland, and by the end of the war, some 10,000 Swedes had volunteered to fight with the Finns. Plans to occupy the Åland archipelago between the two countries were never carried out, however.

The Swedish Army employed reindeer to transport reinforcements and food supplies. (Hulton-Deutsch Collection/Corbis)

At the same time, the Swedish government denied Britain and France the right to send troops across its territory to assist Finland. Stockholm correctly assumed that the Western Allies had plans to seize the northern Swedish ore fields in the course of such an operation. Sweden did act as an intermediary between the Soviet and Finnish governments to end the Winter War in March 1940.

In April 1940, when Germany invaded Denmark and Norway, Sweden's military was placed on full alert, but this time the government insisted on absolute neutrality. The national government lengthened military conscription from four months to 450 days and ordered army strength increased to 600,000 men. The failure of Allied arms in Norway and in the campaign for France and the Low Countries effectively cut Sweden off from the west and placed it within the German zone of control. This development caused the Swedish government to yield to German demands that a portion of the Swedish railroad network be made available for the passage of supplies to Norway and the rotation of German troops between Norway and Germany. The Swedish government was also forced to accede to German demands for the transit to Finland of a German division stationed in Norway so it could participate in the German invasion of the Soviet Union.

As the tide of war turned against Germany—and with the Swedish military considerably stronger than it had been at the beginning of the war—under Allied pressure, Sweden canceled its transit agreement with Germany in August 1943. Although Sweden remained neutral until the end of the war, it was generally accommodating to the Allied side. In addition, many Norwegian and Danish volunteers wishing to combat the Germans received military training in Sweden. These forces played little role in the fighting at the end of the war, however. As the war progressed, Sweden also became a haven for Jews fleeing other Nordic nations.

Sweden emerged from the war as the leading Nordic power, although the end of the European balance of power and Soviet domination of Eastern Europe presented a difficult challenge for Sweden's political leadership in the decades that followed.

Swift, Innis Palmer (1882–1953)

U.S. Army major general. Born in Fort Laramie, Wyoming, on February 7, 1882, Innis Swift graduated from the U.S. Military Academy at West Point in 1904 and was commissioned a second lieutenant in the cavalry. He served with the Punitive Expedition into Mexico in 1916 and 1917 and in France during World War I.

Between the wars, Swift graduated from the Command and General Staff School, the Army War College, and the Army Industrial College. In 1936, he took command of the 8th Cavalry Regiment, and in 1939 he was named commander of the 2nd Cavalry Brigade. Two years later, as a major general, he became commander of the 1st Cavalry Division.

A hard-nosed soldier, Swift trained the 1st Cavalry Division to a high standard. From February 29 to May 18, 1944, he led his division (now redesignated the 1st Cavalry Division, Special) in heavy fighting to seize the Admiralty Islands off the coast of New Guinea. Over the next months, Swift turned the islands into a major base for air raids against Japanese forces on New Guinea and at Rabaul on New Britain Island.

Later in 1944, Lieutenant General Walter Krueger, commander of the U.S. Sixth Army and a good friend for many years, named Swift commander of I Corps. In January 1945, Swift's corps landed at Lingayen Gulf on Luzon Island in the Philippines, and during the next weeks it contended with difficult terrain and stubborn Japanese defenders in the mountains northeast of Manila while protecting the flank of XIV Corps as it drove down the central plain to seize Manila. From February through June, Swift fought a grinding battle against the Japanese Shobu Group in the rugged mountains of northern Luzon before turning over the mopping-up operation to XIV Corps to prepare for the invasion of Japan.

Swift retired from the army in February 1946 and died in San Antonio, Texas on November 3, 1953.

Swing, Joseph May (1894–1984)

U.S. Army lieutenant general. Born on February 28, 1894, in Jersey City, New Jersey, Joseph May Swing graduated from the U.S. Military Academy at West Point in 1915 and was commissioned in the field artillery. He served with the Punitive Expedition into Mexico in 1916 and 1917 and with the 1st Division during World War I. During the interwar period, Swing graduated from the Command and General Staff School and the Army War College, was an instructor at the Field Artillery School, and served as chief of staff of the 2nd Infantry Division and artillery commander for the 1st Cavalry Division.

In February 1942, Swing, with the rank of brigadier general, was appointed divisional artillery commander of the 82nd Infantry Division, which was converted into the army's first airborne division that summer. Quickly becoming a disciple of the airborne concept, Swing, promoted to major general, was named commander of the newly established 11th Airborne Division in December 1942. While training the division, Swing headed a special board that recommended numerous changes in the use of airborne troops. During maneuvers at the end of 1943, he demonstrated with his 11th Airborne Division how airborne forces could overwhelm an enemy, ending any doubts about the use of airborne troops in division-size units.

Swing took his division to the Southwest Pacific theater in May 1944. During October 20–December 26, it was committed as light infantry to the struggle for Leyte Island in the Philippines. In 1945, Swing's men, fighting

both as light infantry and airborne troops, participated in the bitter battle for Manila (February 3–March 3), helped clear southern Luzon Island of Japanese, and assisted in mopping-up operations in northern Luzon. In August 1945, Swing's division deployed to Japan as the vanguard of the Allied occupation force there.

Swing remained with the division until the end of 1947. He then served successively as commander of I Corps, commandant of the Army War College, and commander of the Sixth Army. Retiring from the army in February 1954 as a lieutenant general, he headed the Bureau of Immigration and Naturalization from 1954 to 1962. Swing died in San Francisco, California, on December 9, 1984.

Switzerland

Nation located in Central Europe with a 1939 population of approximately 4.2 million. Encompassing 15,940 square miles, Switzerland borders Germany to the north, Italy to the south, Austria and Liechtenstein to the east, and France to the west. At the time of World War II, Switzerland was a federal constitutional republic of 26 cantons.

Switzerland occupied a key position between warring nations during World War II. Switzerland had a strong tradition of neutrality, but the situation was nonetheless delicate because it had substantial German- and Italian-speaking populations. Because Germans comprised a majority of the population, Switzerland could have been the target of German expansionist

policies; likewise, Italian dictator Benito Mussolini had cast his sights on securing the Italian-speaking Swiss canton of Ticino.

The Swiss observed Axis politics in the 1930s with growing alarm, and from 1934 they acted to shore up their national defenses. Germany's absorption of Austria and Czechoslovakia in 1938 confirmed Swiss fears. By 1939, Swiss citizens were used to air-raid drills; they had gas masks and stockpiles of food at home, while the government moved foodstuffs for army use to fortified emplacements in the Alps and relocated the country's gold reserves.

Eligibility for military service was continuously extended. Aside from these precautionary measures, Switzerland adopted a strategy of dissuasion that later would be adapted to the circumstances. For the time being, this meant increased military spending, modernization of equipment, and construction of a defensive line at the national frontiers. Bridges and roads running to the frontiers were mined. Artillery, small arms, and munitions stocks were concentrated along the borders, and antiaircraft batteries protected the industrial centers.

On August 30, 1939, the Swiss parliament elected Colonel Henri Guisan commander in chief of the army, and Colonel Jakob Labhart became chief of the General Staff. On September 2, following the German invasion of Poland and realizing that a German invasion of Switzerland was possible, the Federal Council declared general mobilization and issued a formal declaration of neutrality. The small Swiss Air Force was also mobilized. It consisted of 150 Swiss-built fighters of indifferent quality and 50 modern Messerschmitt Me-109s. Switzerland had the one advantage of being (and remaining) only a secondary objective of the Axis powers. German war plans to outflank the French through Swiss territory were dismissed because of the rugged terrain and potentially stubborn Swiss resistance.

When World War II began, 435,000 Swiss citizens were mobilized for the armed forces, a number that approached 700,000 during the war. The army was organized into three corps, including nine divisions (three of which were specially trained mountain divisions) and three mountain brigades. A fourth corps was created in 1939 and 1940.

When Poland, Denmark, and Norway fell to the German blitzkrieg, Guisan and Labhart planned to mass infantry (and what little artillery existed) behind the Swiss fortified northern borders along a line of rivers, lakes, and

mountains parallel to Germany. The joint orders for resistance issued by Guisan and the Federal Council in April 1940 made it plain that surrender was not an option; an invader would have to fight for every inch of ground.

Switzerland's situation became perilous on the defeat of France in June 1940, when the Axis effectively surrounded Swiss territory (the remaining exit was closed off after the occupation of Vichy France near the end of 1942). Assuming that an invasion from all sides would occur in just a matter of time, Guisan developed the idea of the "Alpine redoubt," relying on a mountain fortress centered on the Saint Gotthard massif. Even though they would be defeated at the borders, Swiss forces could resist from the massif indefinitely, controlling (and, if necessary, destroying) the transportation routes through the Alps and thus defeating the main purpose of any Axis invasion.

A Swiss border post during World War II. (Bettmann/Corbis)

After June 1940, Axis attention to Switzerland became more intense. Plans for occupation were made, but these were never carried out. After Germany turned east and invaded the Soviet Union on June 22, 1941, Switzerland again became an issue only when the Allies began rolling back Axis forces in Italy, and the Alpine republic blocked the German retreat. Eventually, Switzerland was able to avoid invasion until the end of the war.

A meeting point for diplomats and a center for espionage (the Swiss arrested 387 spies and executed 17 of them) as well as for Red Cross relief efforts throughout the war, Switzerland by 1945 was also a venue for diplomatic negotiations to bring the war to an end.

Although Switzerland's effort to establish credible defenses against the Axis powers was remarkable, some aspects of its role in the war became a matter of considerable controversy during the 1990s. The Alpine republic's economic transactions with all belligerents—although permitted by its neutral status—sufficed to tarnish its image as the tiny defender of liberty in fascist-ruled Europe. Switzerland's restrictive refugee policy cast another shadow when the world learned how Germany annihilated Europe's Jews, and some isolated yet notorious remarks made by Swiss politicians advocating acceptance of the "New Order" did not help. The manner in which Swiss banks handled the Nazi gold issue is perhaps the biggest stain on Switzerland's reputation.

In the final analysis, this criticism boils down to the question of whether Switzerland was too accommodating in its relations with the Axis powers. It is probably true that the Swiss avoided invasion partly by cooperating to the extent allowed under the concept of armed neutrality. Then again, German military planners took Swiss defenses seriously and advised against getting entangled in protracted mountain warfare. It is difficult to see what other options Switzerland might have followed.

Sydney, HMAS, Sinking of (November 19, 1941)

The sinking of the Australian light cruiser *Sydney* in November 1941 was the worst naval disaster in that nation's history. Constructed in England for the Australian government, the Perth-class *Sydney* was commissioned in September 1935. At 562 feet 3 inches in overall length and displacing 6,830 to 7,105 tons standard load, it was capable of 32.5 knots. It was armed with eight twin-mounted 6-inch and four 4-inch guns as well as eight 21-inch torpedo tubes.

The *Sydney*'s World War II service was initially limited to patrol and escort duties in the Indian Ocean. After Italy entered the war, the *Sydney* was dispatched to the Mediterranean. There it took part in several engagements, ferried troops and supplies to Crete, and shelled Italian shore positions in North Africa. Returning to Australia in February 1941, the *Sydney* resumed its duties in the Indian Ocean, where German commerce raiders were known to be active.

On November 19, 1941, commanded by Captain Joseph Burnett, the *Sydney* was returning to its base at Fremantle when, more than 100 miles off the west coast of Australia, its crew spotted an apparent merchant ship some 11 miles distant. The ship in question identified itself as a Dutch merchantman but was in fact the disguised German commerce raider *Kormoran*. At 19,000 tons and commissioned in September 1940, the *Kormoran* was armed with six 150mm (5.9-inch), one 75mm, four 37mm, and five 20mm guns. It also had six 533mm torpedo tubes and was carrying several hundred mines.

Apparently assuming the ship in question to be friendly, Burnett closed to about 1,000 yards, thereby nullifying his own ship's advantages in speed and longer-range guns. The *Sydney* was parallel to the *Kormoran* when the German raider suddenly opened fire with its heretofore disguised main guns and torpedoes. One of the latter ripped into the *Sydney*'s bow, inflicting tremendous damage that flooded the forward portion of the ship and rendered A and B turrets useless. In all, the *Kormoran* fired 87 150mm rounds at the Australian ship.

Following an exchange of fire lasting approximately half an hour, the *Sydney* limped away down in the bow with heavy damage to its bridge and

most of its boats destroyed. Two hours later, burning fiercely, it sank with the loss of all its 645 men. Not only was this the greatest loss of life ever suffered by the Australian Navy, but the *Sydney* was also the largest Allied warship sunk in the war with all hands lost.

The *Kormoran* was also damaged fatally. One of the *Sydney*'s shells put its engines out of action and set the ship on fire. With hundreds of mines aboard his ship that might at any time explode, the *Kormoran*'s captain ordered the crew to abandon ship and the ship scuttled. It went down about 14 miles distant from the *Sydney*. Eighty members of the 400-man crew were lost. The rest were recovered and became prisoners of war.

A search for the *Sydney* was undertaken only after a lapse of five days, when the cruiser failed to return to Fremantle. Many Australians doubted the veracity of the accounts of the battle by the *Kormoran*'s crew, leading to wide-ranging conspiracy theories. The remains of both ships were finally located in March 2008. In August 2009, an Australian special commission investigating the sinking largely confirmed the German account but left unanswered the question of why Burnett had brought his ship into such a vulnerable position.

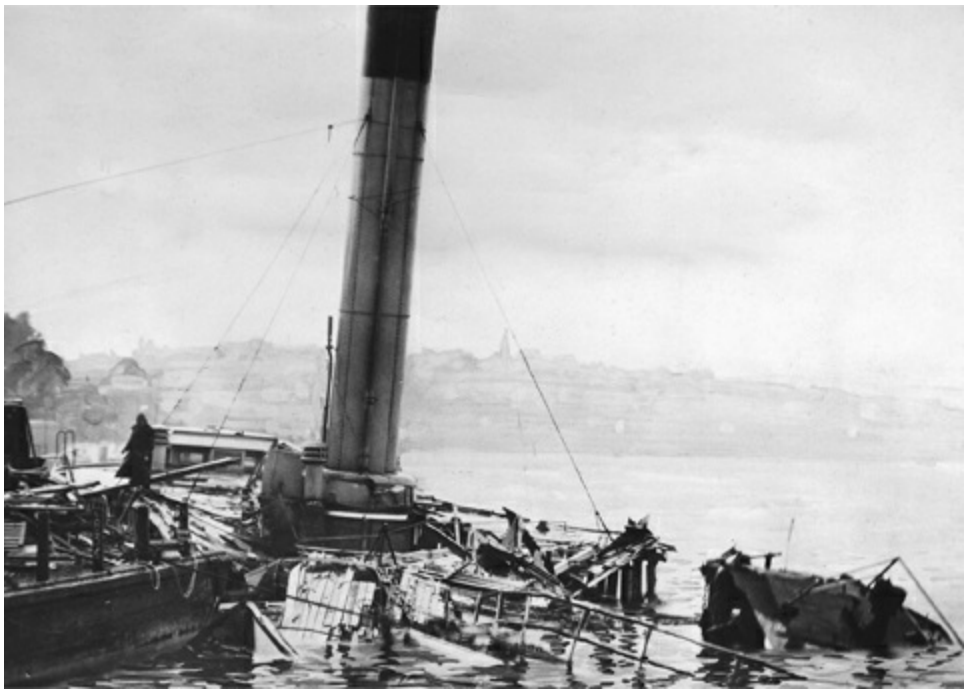
Sydney, Japanese Raid on (May 31, 1942)

Sydney, a major Australian port for Allied merchant shipping, was within striking distance of Japanese oceangoing submarines based in Rabaul and New Guinea. In an attempt to disrupt this vital Allied commerce, Japanese

naval officials ordered submarines to attack the harbor. On the night of May 31, 1942, the *I-22*, *I-24*, and *I-27* arrived at Sydney, and each deployed a Type A two-man midget submarine to penetrate the port's defenses and torpedo shipping that lay at anchor.

The element of surprise was lost when the midget submarines approached antitorpedo netting in the harbor. Allied forces were alerted when one of the Japanese craft became entangled in the nets. The U.S. heavy cruiser *Chicago* then opened fire on the submarine but failed to hit it and only inflicted damage on the shore. The failure to hit the midget submarine notwithstanding, the Japanese crew elected to scuttle their boat.



The aftermath of a Japanese submarine attack against Allied shipping in Sydney Harbor. This ferry was hit by a Japanese torpedo. (Hulton Archive/Getty Images)

A second midget submarine avoided the nets and launched its torpedoes. One failed to detonate, but the other hit an accommodation ship, with the explosion killing 19 servicemen and wounding 11 more. The fate of this midget submarine is unknown, although presumably it sank during the attack. The crew of the third midget submarine, after being hunted for hours by a collection of Australian light warships, chose to commit suicide. Contributing to the attack of their diminutive counterparts, the fleet submarines, joined by the *I-21* and *I-29*, shelled Newcastle and Sydney with their deck guns and

sank three merchantmen with gunfire and torpedoes as they left port, retiring to base.

After the raid, the Allies recovered one of the midget submarines. Following its study by naval architects, it went on a tour of Australia in an effort to raise morale. Today it is on display at the Australian War Museum in Canberra. The Japanese submarine attack against Sydney was the last executed by Japanese naval forces against Australian ports in World War II.

Syria

Formerly part of the Ottoman Empire, after World War I Syria became a League of Nations mandate administered by France. Located in the Middle East, Syria encompasses 71,479 square miles and had a 1939 population of some 2.5 million. Syria is bordered by Turkey to the north, Transjordan (Jordan) to the south, Palestine to the southwest, Iraq to the east, and Lebanon (another French mandate) and the Mediterranean Sea to the west. Following the defeat of France by Germany in June 1940, Syria was controlled by the Vichy government headed by Marshal Henri Philippe Pétain, which appointed General Henri Dentz as high commissioner with a cabinet headed by Khalid al-Azm. Pétain ordered Dentz to allow landing rights in Syria for German and Italian aircraft on their way to support Rashid Ali al-Gaylani’s regime in Iraq.

Australian troops just before their advance into Syria in collaboration with Free French forces, July 10, 1941. (Bettmann/Corbis)

On June 8, 1941, Allied forces commanded by British lieutenant general Maitland Wilson that included the British Ninth Army, Australian troops, and Major General Paul Legentilhomme's Free French forces, along with the Transjordan Arab Legion, crossed from Palestine into Lebanon and Syria. By June 15, they had reached the Syrian capital of Damascus, which fell on June 21. On July 13, Dentz and the Vichy French surrendered and the next day signed the Acre Convention. The fighting had claimed 4,500 Allied and 6,000 Vichy French casualties.

Syria was then turned over to the Free French authorities. On September 27, 1941, the French recognized Syria's independence but within the framework of the League of Nations mandate, and it continued to occupy the country, which was used as an Allied base for the rest of the war. Free French commander General Georges Catroux became Syria's delegate-general and plenipotentiary. French authorities declared martial law, imposed strict press censorship, and arrested political subversives.

In July 1943, following pressure from Great Britain, France announced new elections. A nationalist government came to power that August, electing as president Syrian nationalist Shukri al-Quwatli, one of the leaders of the 1925–1927 uprising against the French. France formally granted Syria independence on January 1, 1944, but the country remained under Anglo-

French occupation for the rest of the war. In January 1945, the Syrian government announced the formation of a national army, and in February it declared war on the Axis powers.

Syria became a charter member of United Nations in March 1945. In early May 1945, anti-French demonstrations erupted throughout Syria, whereon French forces bombarded Damascus, killing 400 Syrians. British forces then intervened. A United Nations resolution in February 1946 called on France to evacuate the country, and by April 15 all French and British forces were off Syrian soil.

Syria and Lebanon, Campaign in (June 8–July 14, 1941)

The growing German commitment in the Balkans and the Mediterranean encouraged those in Iraq who favored the Axis side to stage a coup on April 2, 1941. The coup brought to power Rashid Ali el-Gaylani, who was closely linked with the violently anti-British grand mufti of Jerusalem, Haj Amin el Husseini. The Arab nationalists hoped that a German victory would liberate their country and the Arabs from the yoke of British control and restrict the growing Jewish presence in Palestine. Encouraged by the Germans, who promised air support and also promised to persuade the Vichy French in Syria to provide matériel help, Rashid Ali refused the British the right to transit troops through Iraq and surrounded the British air base at Habbaniya, 25 miles west of Baghdad. With the British fully committed in the Western Desert, Greece, and East Africa, it seemed an opportune time to move.

In desperation, British commander in the Middle East General Sir Archibald Wavell, apprehensive about losing British communications with India and the supplies of Iraqi oil, ordered a minor offensive. The besieged garrison at Habbaniya attacked on May 2. A 5,800-member column, Habforce, was hastily organized from the 1st Cavalry Division in Palestine. Habforce made a 500-mile transdesert dash to reach Habbaniya on May 19, by which time the 10th Indian Division had landed in Basra.

Although Axis planes flew to Syria in support and were involved in the fighting, the Iraqis moved a month too early, before the Germans were able to offer effective assistance. The Germans were too slow in reacting, and the British captured Baghdad on May 31.

British leaders became alarmed by Ultra evidence that Vichy high commissioner in Syria General Henri Fernand Dentz, who buttressed his pro-Vichy patriotism with a strong personal Anglophobia, had supplied weapons to the Iraqis and freely cooperated with the Germans. The British worried that Germany—supported by the vehemently anti-British French admiral Jean Darlan, who was now in control of Vichy France—would extend its victories beyond Crete and through Syria into the Middle East.

This fear, combined with the threat posed to the British base in Egypt by the French Army of the Levant, a force of 45,000 hard-core professional soldiers that included four battalions of Foreign Legionnaires, convinced the British to launch Operation EXPORTER, the invasion of Syria and Lebanon. On June 8, a hastily concocted force consisting of the Australian 21st and 25th Brigades, the Indian 5th Brigade, and the weak 1st and 2nd Free French Brigades, all commanded by General Maitland “Jumbo” Wilson, invaded in three drives—through Deraa to Damascus, through Merjayun to Rayak, and along the coast from Haifa to Beirut.

The British had hoped for a peaceful occupation by guaranteeing the independence of Syria and Lebanon, but Dentz was aware of negotiations between Vichy France and Germany that would culminate in the Paris Protocols, and he was determined to demonstrate solidarity with Germany. By the end of the first phase on June 13, it was evident that the Vichy French showed no sympathy with Free French ambitions, and all advances were stalled by fierce fighting at Kissoué, Mezze, the Litani River, and especially Merjayun. Damascus finally fell on July 22, and with the conclusion of Operation BATTLEAXE in the Western Desert, the British were able to bring up

two fighter and three bomber squadrons. Meanwhile, Habforce and Major General William Slim's Indian 10th Division invaded Syria from Iraq against Palmyra and Aleppo on June 21 to isolate Dentz's force.

The campaign for Syria and Lebanon also involved naval operations. Vice Admiral Edward Leigh Stuart King commanded a British force of three cruisers, eight destroyers, and a landing ship with a small commando unit. Opposing them was a Vichy French force of two large destroyers, a sloop, and three submarines. The naval portion of the campaign consisted of small skirmishes as the British carried out both coastal landings and shore bombardment. The French damaged several of the British warships through both air and naval attacks, necessitating the dispatch of other ships. The French lost to air attack on June 21, just 50 miles from Syria, one of two large destroyers dispatched from Toulon. The other French destroyer made it safely to Beirut on June 21, but it was damaged there in bombing the next day. The Vichy French government considered dispatching the battle cruiser *Strasbourg* from Toulon but, with the campaign too far gone, decided against it.

French cavalry on the march along the frontier between Syria and Palestine, July 1941. (Hulton-Deutsch Collection/Corbis)

After five weeks of bitter fighting, Dentz capitulated on July 11, and an armistice known as the Acre Convention was signed on July 14. Although its terms were generous, the immediate results of the armistice did little to encourage belief in any French desire to see the defeat of Nazi Germany.

Only 5,668 troops (1,006 of whom were native Frenchmen) opted to join Free French forces rather than be repatriated to France.

This tragic, regrettable episode, which cost the lives of 3,500 men, was a short but sour campaign imbued with resentment, particularly between the Vichy and Free French forces who wreaked sacrilegious vengeance on each other. For the British, however, the campaign consolidated their flank and guarded against any German attack through Turkey.

A few weeks later Britain, in unison with the Soviet Union, occupied Iran to guarantee the transfer of Lend-Lease supplies through Iran to Soviet Russia. In the process, Britain secured its position in the Middle East. Thus, in the midsummer of 1941, Germany consolidated its position in the Balkans while Britain dominated the Middle East. The British commander was liberated from all other preoccupations but that of defeating Axis forces in Libya, and for the first time he could concentrate all his force on a single task.

Szabo, Violette Bushnell (1921–1945)

British Special Operations Executive (SOE) agent. Born in Paris on June 26, 1921, to an English father and a French mother, Violette Bushnell grew up in both countries. An avid bicyclist and crack marksman, the tomboyish Bushnell left school at age 14 and held a series of jobs. In 1940, she joined the British Land Army and developed a reputation for fearlessness during air

raids and blackouts. On Bastille Day (July 14) 1940, she met Étienne Szabo, a former French Foreign Legionnaire and Free French soldier, whom she married on August 21 shortly before he shipped out for Africa. She saw Szabo only once more, during a week in Liverpool in March 1941.

British Special Operations Executive (SOE) agent Violette Szabo. (Hulton Archive/Getty Images)

Violette Szabo worked as a telephone operator and then for the Auxiliary Territorial Service as part of an antiaircraft battery. In June 1942 she gave birth to a daughter, Tania. Shortly afterward, Szabo learned that her husband had been killed in action. Szabo's courage and loyalties had been noted by Captain Selwyn Jepson of the SOE, and so he recruited her for intelligence and Resistance work. Assigned to the First Aid Nursing Yeomanry, a cover for SOE female recruits, Szabo underwent screening at Wanborough Manor and attended the commando course, the parachute school, and psychological training at Beaulieu.

Szabo's first mission, a parachute drop outside Paris, took place in April 1944. She then worked with the French Resistance in Rouen. Although police questioned her twice, Szabo's cover as a commercial secretary held. Her second mission, to aid French sabotage during the June 6, 1944, Normandy landings, began the day before. Sent to Limoges to escort Jacques Dufour, a valuable Maquis agent with information about an advancing panzer division, Szabo encountered an unexpected concentration of Germans at Salon La Tour. Covering Dufour's escape, Szabo was captured after engaging the soldiers in a running gun battle through the town. The Gestapo transferred her to Paris, where she was tortured before being shipped to the Ravensbrück concentration camp in Germany. From there, she was sent to Torgau as a factory slave and then to a labor camp at Königsberg in East Prussia.

Szabo returned to Ravensbrück in early February 1945. There she and two Resistance colleagues, Denise Bloch and Lilian Rolfe, were executed by firing squad on the orders of the Gestapo, and their remains were cremated. In January 1947, Violette Szabo was posthumously awarded the French Croix de Guerre and the British George Cross, the first occasion that the latter was awarded to a woman.

Taiwan

Taiwan (Formosa), an island about 14,000 square miles in area, is located 115 miles off China's eastern coast; it was named Formosa (Beautiful) by the Portuguese who visited it in 1590. Taiwan's 1939 population was approximately 5.76 million. As a consequence of the 1894–1895 Sino-Japanese War, China ceded control of the island to Japan. The Japanese subsequently expanded existing military bases on Taiwan while constructing additional facilities.

With the beginning of the Second Sino-Japanese War in 1937, Japan used Taiwan as a base for air attacks against the Chinese mainland. By late 1941, the island was serving as the base for Japan's Eleventh Naval Air Fleet and its Fifth Army Air Force. On December 8, 1941, the Japanese used Taiwan to launch the first air attacks against U.S. bases in the Philippines.

As Taiwan lay deep within Japan's defensive perimeter, it was not subjected to concerted attacks until 1944, when U.S. forces pushed across the Central Pacific toward the Japanese home islands. By that time, many U.S. military officials, including Chief of Naval Operations Ernest J. King and the Pacific Fleet commander, Admiral Chester W. Nimitz, favored an invasion and occupation of the island to sever the Japanese lines of communication south to the Netherlands East Indies. Air attacks by the China-based XX Bomber Command against Japanese installations on Taiwan were largely ineffectual.

Ultimately, these bombing raids proved unnecessary in the context of a prelude to a U.S. amphibious assault, for in July 1944 President Franklin D.

Roosevelt decided to pursue the conquest of the Philippines, followed by Iwo Jima and Okinawa rather than Taiwan. The Japanese air bases on Taiwan, however, maintained aircraft capable of reaching the Philippine Islands. Consequently, between October 12 and 14, 1944, the U.S. Third Fleet launched punishing air strikes against Taiwan to reduce Japanese air strength there prior to the invasion of the Philippines. These assaults destroyed more than 500 Japanese aircraft, with important effects on the subsequent Battle of Leyte Gulf, which began on October 20.

Taiwan was attacked by Allied naval aircraft twice more during the war. The first of these strikes occurred in January 1945, prior to the U.S. invasion of the Philippine island of Luzon. The second was executed in April 1945 by air assets of the British Pacific Fleet to reduce the number of Japanese planes capable of flying kamikaze missions against Allied naval forces off Okinawa.

On October 25, 1945, formal surrender ceremonies took place on Taiwan, and the island reverted to Chinese control in accordance with an agreement reached at the Cairo Conference in November 1943. In 1949, the island became a refuge for Chinese Nationalist forces. Today, Taiwan is officially known as the Republic of China. The People's Republic of China, however, continues to claim Taiwan.

Takagi Sōkichi (1893–1979)

Japanese Navy rear admiral. Born on August 9, 1893, in Kumamoto Prefecture on Kyushu Island, Takagi Sōkichi graduated from the Japanese

Naval Academy In 1915. He served in a number of different ships before graduating from the Navigation School in 1921. Promoted to lieutenant, he then served as navigation officer on the submarine tender *Komahashi* and the patrol vessel *Manshu*.

In 1927, Takagi graduated from the Naval War College and was promoted to lieutenant commander and posted as naval attaché to France until 1930. On his return to Japan, he was assigned as private secretary to the naval minister for two years until his promotion to commander. A weak constitution confined Takagi to land assignments for the remainder of his naval career. From 1933 to 1936, he taught in the Naval War College.

In 1937, Takagi was promoted to captain and assigned to the Navy Department as chief of the research section. Here he developed ties for the navy with the political leadership and Japanese intellectuals. From 1939 onward, Takagi organized study groups of leading experts to discuss policy as well as diplomatic and economic topics in the hopes of preventing an arbitrary decision by the military authorities to go to war. With the Second Sino-Japanese War continuing without resolution, Takagi opposed war with the United States.

In 1942, Takagi was removed from his post in the research section and assigned as chief of staff of the Maizuru Naval District. In May 1943, he was promoted to rear admiral and began maneuvering with his confidants about how to extract Japan from the war. Minister of the Navy Shimada Shigetaro charged Takagi with investigating the reasons for the Japanese defeats of 1942. Going well beyond the scope of his charge, Takagi analyzed all aspects of Japan's strategic situation and reached the conclusion that a Japanese defeat in the war was inevitable. Believing that the only way he could end Japan's involvement was through a change in government, Takagi concluded that the only solution was to assassinate Prime Minister Tōjō Hideki, but he was forced from office in July 1944 before the attempt could be carried out.

In the fall of 1944, Takagi became a member of the research department of the Navy Staff College, and Navy Minister Yonai Mitsumasa ordered him to undertake a study of how Japan might withdraw from the war. Takagi continued to work on this until Japan's surrender in August 1945.

After the war, Takagi served in the Higashikuni Naruhiko cabinet as a secretary and helped revise the Japanese Constitution. Takagi wrote a number of books of military history, but the most important of his publications was

his diary covering the period 1937 to 1945, which provided an insider's view of activities at the highest levels of the Japanese government and navy. Takagi Sōkichi died in Chigasaki, Kanagawa, Japan, on July 27, 1979.

Takagi Takeo (1892–1944)

Japanese Navy admiral. Born in Fukushima Prefecture, Japan, on January 25, 1892, Takagi Takeo graduated from the Japanese Naval Academy in 1911 and from the Navy Staff College in 1925. He then commanded the submarines *Ro 28* and *Ro 68* and later joined the staff of the submarine flotilla. As a captain, he commanded the cruisers *Nagara* and *Takao* and the battleship *Mutsu* between 1933 and 1938. Following his promotion to rear admiral in 1938, Takagi became chief of staff of the Second Fleet and then director of the Second Department of the Naval General Staff. In September 1941, he took command of the 5th Cruiser Squadron.

At the beginning of the Pacific war, Takagi's forces supported the Japanese invasion of the Philippines (December 8, 1941–June 9, 1942) and then headed to the Netherlands East Indies as the covering force for the landing on Java. In the Battle of the Java Sea (February 27, 1942), Takagi's 5th Squadron attacked with torpedoes and sank two Dutch light cruisers and one Dutch and two British destroyers. His force also damaged a British heavy cruiser.

Promoted to vice admiral in March 1942, Takagi commanded a carrier task force, with the fleet carriers *Shōkaku* and *Zuikaku* acting as a cover force for the seaborne invasion of Port Moresby in New Guinea. In the Battle of the Coral Sea on May 7–8, 1942, the Japanese Navy won a tactical victory, exchanging the loss of the light carrier *Shoho* for the U.S. fleet carrier

Lexington and damaging the U.S. fleet carrier *Yorktown*. In a strategic sense, however, Japan lost the battle. Takagi's superior, Vice Admiral Inouye Shigeyoshi, called off the Port Moresby invasion, and Takagi's two fleet aircraft carriers, *Shōkaku* and *Zuikaku*, either were so badly damaged or had lost so many aircraft that both were unavailable for the pivotal Battle of Midway (June 3–6), whereas the *Yorktown* was able to participate. In 1943, Takagi was assigned to command the Sixth (Submarine) Fleet, based in Saipan. He died there by suicide on July 8, 1944, and was promoted to brevet admiral that same day.

Takahashi Ibō (1888–1947)

Japanese Navy vice admiral. Born in Fukushima Prefecture, Japan, on April 20, 1888, Takahashi Ibō graduated from the Japanese Naval Academy in 1908. Commissioned an ensign in 1910 and a lieutenant in 1914, he graduated from the Imperial Naval War College in 1919 and was promoted to lieutenant commander and assigned as chief gunnery officer of the battleship *Iwami*.

From August 1923 to August 1925, Takahashi was naval attaché to the United Kingdom, during which time he was promoted to commander. Returning to Japan, he became the executive officer of the cruiser *Tama,* after which he took command of the light cruiser *Tenryū*. He was also a member of the Japanese delegation to the London Naval Conference in late 1929.

Promoted to captain on November 30, 1929, Takahashi took command of the heavy cruiser *Atago* in 1932, and the next year he commanded the battleship *Kirishima*. Promoted to rear admiral on November 15, 1935, Takahashi served on the Navy General Staff, where he urged that Japan include the Netherlands East Indies within its economic control sphere. Promoted to vice admiral on November 15, 1939, Takahashi commanded the Mako Guard District.

In early December 1941, Takahashi took command of the Third Fleet. In this post he had responsibility for Japanese naval operations in the invasion of the Philippine Islands (December 8, 1941). Takahashi then commanded Japanese naval forces in the February 1942 invasion of Java in the Netherlands East Indies.

On March 10, 1942, Takahashi was transferred to command the newly established 2nd Southern Expeditionary Fleet, and in April he took command of the newly created Southwest Area Fleet. In November 1942, he became commander of the important Kure Naval District in Japan, holding this position until he retired in 1944. Takahashi died on March 18, 1947.

Takamatsu Nobuhito, Imperial Prince of Japan (1905–1987)

Japanese imperial prince and navy officer. Born on January 3, 1905, the third son of Emperor Taishō and younger brother of Emperor Hirohito, Takamatsu

Nobuhito graduated from the Naval Academy and the Naval War College. He then pursued a career as a gunnery officer in the Imperial Navy.

In November 1941, following several line and staff appointments, Commander Prince Takamatsu became a member of the Operation Planning Section of the Navy General Staff. In November 1942, he was promoted to captain, and in August 1944, he was appointed deputy head of the Yokosuka Gunnery School.

Prince Takamatsu Nobuhito, shown here in naval uniform, was the brother of Japanese emperor Hirohito. (Topical Press Agency/Getty Images)

A liberal thinker, Prince Takamatsu was highly critical of the government's decision to go to war with the United States, and during the war, he advocated an early peace with the Allies. Elements in Japan opposed to Premier General Tōjō Hideki, including Prince Konoe Fumimaro, saw in Prince Takamatsu a possible candidate for prime minister, although this did not transpire.

Takamatsu died in Tokyo on February 3, 1987. His posthumously published diaries are an important source for the study of Japanese political history of the 1930s and 1940s.

Tanaka Raizo (1892–1969)

Japanese Navy vice admiral. Born in Yamaguchi Prefecture, Japan, on April 27, 1892, Tanaka Raizo graduated from the Japanese Naval Academy in 1913 and trained as a torpedo specialist. Developing a reputation for excellence in seamanship, he was promoted to captain in 1935 and commanded destroyers, the cruiser *Jintsu*, and then the battleship *Kongo*. In 1937, he took charge of a destroyer squadron.

Promoted to rear admiral in October 1941, Tanaka commanded the 2nd Destroyer Squadron, one of the most highly trained units of the Japanese Navy and especially expert in night action. In his flagship, the cruiser *Jintsu*, Tanaka was involved in most major battles of the first 18 months of the war. He was particularly well known for the so-called Tokyo Express—the nightly supply runs to Japanese Army units on Guadalcanal. Known to the Americans as "Tenacious Tanaka," he regularly carried out his assignments, often in the face of superior Allied naval forces equipped with radar, and

gained a reputation in the West as one of the most brilliant and indefatigable Japanese Navy commanders of the war.

Japanese admiral Tanaka Raizo, known to the Americans as Tenacious Tanaka, commanded the nightly supply runs by the Japanese navy during the campaign for the Solomon Islands and gained the reputation as one of the most brilliant and indefatigable Japanese navy commanders of the war. (Japan Defense Agency)

In the Battle of Tassafaronga on November 30, 1942, a superior U.S. force under Rear Admiral Carlton H. Wright intercepted Tanaka's ships trying to float barrels of supplies ashore to Guadalcanal. His ships were not deployed for combat, and Tanaka lost a destroyer, but his crews used their Long Lance torpedoes to good effect and sank one U.S. cruiser and damaged three others before making their escape. Two weeks later, however, after two successful supply missions, a U.S. patrol-torpedo boat sank Tanaka's flagship, the destroyer *Teruzuki*.

Tanaka was wounded in this incident and on December 27 was reassigned to command of an obscure naval base in Burma, allegedly for criticizing his superiors' decision to squander scant Japanese destroyer assets in trying to supply Japanese island outposts. Although promoted to vice admiral in 1944, Tanaka did not again see combat. Tanaka retired on June 26, 1946, and died in Yamaguchi, Yamaguchi Prefecture, Japan, on July 9, 1969.

Tanaka Shinichi (1893–1976)

Japanese Army lieutenant general. Born in Hokkaido, Japan, on March 18, 1893, Tanaka Shinichi graduated from the Japanese Military Academy in 1913 and from the Army War College in 1923. A resident officer in Riga and Moscow between 1928 and 1931, he served as a staff officer with the Guandong (Kwantung) Army in Manchuria in 1931 and 1932. From 1933 to 1935, he was a resident officer in Berlin. On his return to Japan, Tanaka was promoted to colonel and appointed chief of the Military Service Section of the War Ministry in August 1936. The following March, he became chief of the Military Affairs Section.

At the beginning of the Second Sino-Japanese War in July 1937, Tanaka insisted on dispatching three divisions to China over the objections of General Ishiwara Kanji, chief of the Operations Division in the General Staff. After becoming a major general in 1939, Tanaka was appointed chief of staff of the Inner Mongolia Garrison Army and participated in the May–September 1939 Battle of Khalkhin Gol, in which the Japanese were defeated by the Soviets.

In October 1940, Tanaka became chief of the Operations Division of the General Staff. Promoted to lieutenant general in October 1941, he played a leading role in planning military operations leading to the Pacific war. Contrary to officials in the War Ministry, he favored an attack on the Soviet Union, and in late 1942, he also disagreed with them regarding military operations on Guadalcanal. He insisted on continuing the operations, but the War Ministry favored evacuation. During this controversy, Tanaka slapped General Satō Kenryō, chief of the Military Affairs Bureau, and verbally insulted Prime Minister General Tōjō Hideki. In consequence, he was discharged from his post.

Assigned command of the 18th Division in northern Burma, from 1943 to 1944 Tanaka demonstrated superior leadership in adversity, fighting British forces under Brigadier Orde Wingate and Chinese forces reorganized by U.S. Army lieutenant general Joseph Stilwell. Tanaka's outnumbered forces were gradually driven back.

In September 1944, Tanaka was appointed chief of staff of the Burma Area Army. While traveling to Japan from Burma in May 1945, he was seriously injured in the crash of his airplane near Phnom Penh, Cambodia, and was still hospitalized in Saigon at the end of the Pacific war. Tanaka died in Kawasaki City on September 24, 1976.

Tanaka Shizuichi (1887–1945)

Japanese Army general. Born in Hyogo Prefecture, Japan, on October 1, 1887, Tanaka Shizuichi graduated from the Japanese Military Academy in

1907 and was commissioned in the infantry. Upon graduation from the Army War College in 1916, he was assigned to the Military Administration Division of the War Ministry during 1917–1919. During the next three years, he was a resident officer in Britain, studying at Oxford University. He served on the General Staff beginning in 1922 and was appointed military attaché in Mexico in 1926, returning to the General Staff two years later.

Promoted to colonel in 1930, Tanaka took command of the 2nd Infantry Regiment. He was military attaché in the United States in 1932 and chief of staff of the 4th Division in 1934. After becoming a major general, he took command of the 5th Infantry Brigade in 1935. The next year, he was appointed chief of the General Affairs Division in the Military Police Headquarters.

In 1937, Tanaka commanded the Guandong Military Police Command; he was promoted to lieutenant general and headed the Military Police Command the following year. In charge of the 13th Division in China in 1939 during the Second Sino-Japanese War, he was engaged in defensive operations in central China. One year later, he again headed the Military Police Command. He led the East Army in 1941 and the Fourteenth Army in 1942, endeavoring to maintain public order in the Philippines.

As a full general in 1943, Tanaka was assigned to the General Staff but without a specific post, in deference to his health problems. He became director of the Army War College in 1944 and was, in addition, military counselor to the emperor. As Twelfth Area Army commander from March 1945, he was responsible for the defense of central Honshu Island, including Tokyo and the Imperial Palace.

In August 1945, Emperor Hirohito was determined to surrender to the Allied powers, but prominent Japanese military leaders opposed such a step. Tanaka worked hard to persuade these leaders to accept peace and helped foil a coup d’état. He committed suicide in Tokyo on August 24, taking personal responsibility for the surrender.

Tang, U.S. Navy Submarine

The Balao-class submarine *Tang* (SS-306) was built at the Mare Island Naval Shipyard, California. It was laid down on January 15, 1943; launched on April 17, 1943; and commissioned on October 15, 1943. The *Tang* had two propellers and was powered by both diesel engines and electric motors. It displaced 1,490 tons surfaced and 2,070 tons submerged. It was 311 feet 10 inches in length, with a beam of 27 feet 4 inches and a draft of 16 feet 10 inches. It had a speed of 20.25 knots on the surface and 8.75 knots submerged. Patrol endurance was 75 days.

As with other U.S. submarines, the *Tang* had a deep-dive capability of 600 feet, a closely guarded secret during the war. It had a crew complement of 20 officers and 68 sailors. The *Tang* was armed with 10 21-inch torpedo tubes (6 forward and 4 aft), a 5-inch deck gun, and Bofors 40mm and Oerlikon 20mm cannon.

Ordered to the Pacific, the *Tang* embarked on its first war patrols on January 22, 1944. It sank a number of Japanese ships and rescued two dozen downed American aviators. During the course of its fifth patrol, on October 24, 1944, in one of the more bizarre incidents of the war, the *Tang* under Commander Richard H. O'Kane was off the coast of Taiwan (then known as Formosa) when O'Kane fired two torpedoes at a Japanese transport. The first struck home, but the second torpedo porpoised, circled back, and exploded against the stern of the *Tang*, sinking it. The *Tang*'s patrol had been the most successful ever by a U.S. submarine, with 13 ships sunk.

O'Kane was among those who escaped from the *Tang* utilizing Momsen lungs—the first successful use of these from a sunken submarine—after the sub came to rest on the bottom at 180 feet. The survivors were taken prisoner by the Japanese and subsequently tortured by some of the survivors of the ship they had just sunk. The top-scoring submariner in terms of ships sunk

(31 credited during the war, reduced to 24 afterward), O'Kane survived the war and was subsequently awarded the Medal of Honor.

Tank, Kurt (1898–1983)

German aircraft designer and test pilot. Born in Bromberg-Schwedenhohe, Germany, on February 24, 1898, Kurt Tank wanted to join the air service when World War I began, but his father insisted he follow family tradition and enlist in the cavalry. He ended the war as a captain, with numerous decorations for bravery.

After the war, Tank, a gifted student, graduated in 1923 from the Technische Hochschule in Berlin. A mentor from the university landed him a position in the design department of Rohrbach Metallflugzeugbau, where he worked on flying boats. He gained his fame while employed by the Focke-Wulf aircraft manufacturing firm. His many successful designs included the FW-200 Kondor. Begun as a transport for the German airline Lufthansa, it was employed as a long-range maritime bomber and reconnaissance aircraft.

Tank also designed the FW-189 tactical reconnaissance airplane, but his crowning achievement was undoubtedly the FW-190 fighter. In 1938, he was asked to design a replacement for the Messerschmitt Bf-109, the Luftwaffe's frontline fighter. Tank's design was an air-cooled, radial-engine, wide-track aircraft armed with four 20mm cannon and two machine guns. The FW-190 proved to be a nasty surprise to the British when they first encountered it in 1941, and it outclassed the Spitfire Mk V. Its heavy armament earned it the nickname "Wurger" (Butcher-Bird). The FW-190 became a mainstay of the Luftwaffe and served on all fronts for the remainder of the war.

Tank's last two designs, the FW-190D9 and FW's Ta-152, were improved versions of the basic FW-190 design in an attempt to counter the better Allied fighters appearing in the skies over Germany. At the end of the war, Tank and his engineers surrendered to the Americans and were released after a short internment.

Tank's postwar career included designing jet aircraft for Argentina and India. He returned to Germany in the 1970s as an aviation consultant and died in Munich on June 5, 1983.

Tanks, All Powers

Armored, tracked, armed vehicles, originally developed in World War I. Improved in the years after the war, the tank came into its own as a weapon system in World War II.

After World War I, a number of individuals greatly influenced the structure of armored forces and the design of tanks. They included Ernest Swinton, J. F. C. Fuller, and Basil Liddell Hart in Britain; Jean E. Estienne and Charles de Gaulle in France; Heinz Guderian in Germany; and Adna Chaffee in the United States. These individuals shaped thinking regarding the armored forces of World War II.

Yet even as imaginative military thinkers contemplated what could be done with a properly organized and equipped armored force, some of the senior leaders in each army continued to see tanks only as support to traditional infantry and cavalry elements. Limited military budgets also greatly hindered the development of armored forces, at least until Germany

rose again as a threat to peace. The impact of prewar thinking and actions on tank designs varied among nations.

France

In the 1930s, the French General Staff considered tanks primarily as infantry support. New ideas emerged, however, including the development of mechanized infantry and cavalry. The cavalry concept involved three types of reconnaissance vehicles: one that was wheeled for long-range reconnaissance, a machine-gun-armed light tank for cross-country reconnaissance, and a more heavily armed and armored tank capable of fighting. A four-year rearmament plan in 1936 included the formation of three divisions légères mécaniques (DLM), equipped with S-35 and H-35 tanks, and two divisions cuirasses de réserve (DCR), with B tanks and R-35 and FCM-36 light tanks to accompany infantry forces.

The S-35 (SOMUA) medium tank was designed for cavalry combat. One of the best tanks of the time, it was the first to use an all-cast hull and turret construction. Weighing 20 tons with a crew of three, it boasted an electric-drive turret with a 47mm main gun. Its 190-horsepower (hp) gasoline engine provided a speed of 25 mph. About 500 were manufactured. After the defeat of France in June 1940, both the Germans and Italians employed the S-35 in their armies.

The H-35 (Hotchkiss) light tank, developed for cavalry use, was later also adopted by the infantry. Product improvements—a long-barreled 37mm main gun and a new engine—led to production of the H-39 by 1939. This 10.6-ton tank had a crew of two and was powered by a liquid-cooled gasoline engine. Captured vehicles were used by Germany in the Soviet and Mediterranean theaters of war. Free French forces also used the H-39.

The 1935 production version of the Char B heavy tank was the Char B1, further improved as the Char B-1 *bis*. The main battle tank of the French Army in 1940, it weighed 32 tons, had a crew of four, and mounted a 75mm main gun in the hull and a 47mm gun in the turret. Final production models were powered by 300-hp aircraft engines.

Germany

From an analysis of the writings of British theorists Fuller and Liddell Hart, Guderian led the development of panzer (armored) divisions, three of which were formed in 1935. Based on tanks, they also included infantry, artillery, and other elements. Initially, the divisions were equipped with the specially developed light tanks PzKpfw I and II (PzKpfw is the abbreviation for *Panzerkampfwagen*, or armored fighting vehicle), while two larger designs, the PzKpfw III and IV, were being built. Germany planned to phase out the earlier tanks but kept PzKpfw I and II in service with second-line units into 1945.

Many product improvements of the PzKpfw I, II, III, and IV were incorporated in production. The PzKpfw I, originally intended as a cheaply produced training vehicle, weighed less than 6 tons, had a crew of two, and mounted only two machine guns. Its 60-hp gasoline engine allowed a speed of 25 mph. The main production version of the PzKpfw II weighed 9.5 tons, had a crew of three and a 20mm main gun, and was driven by a 140-hp gasoline engine.

From 1937 through 1942, several versions of the PzKpfw III were produced. The main armament was increased from 37mm to 50mm, with some of these tanks mounting a close-support, short-barreled 75mm cannon. Added armor increased the weight from 15 to 22.3 tons. Gasoline engine power increased from 230-hp to 300-hp.

Late versions of the PzKpfw IV became the backbone of German armor at the end of the war. The most important tank of the series, up-gunned and up-armored from earlier versions, it weighed 23.6 tons, carried a crew of five, and mounted a long-barreled 75mm main gun. Its 300-hp gasoline engine allowed a speed of 25 mph. The main armament of the PzKpfw IV gave it parity in hitting power with later Soviet and American tanks.

When Germany invaded the Soviet Union on June 22, 1941, German armor encountered the Soviet T-34, whose superior firepower, speed, shape, suspension, armor, and maneuverability made all German tanks virtually obsolete. By March 1942, however, Germany had prototypes of the PzKpfw VI Tiger heavy tank. With armor up to 100mm thick and an 88mm main gun, based on the successful antiaircraft gun, the Tiger was superior to any other tank, in spite of poor reliability. It had a five-man crew. The 700-hp gasoline engine could drive the 55-ton tank at 23.5 mph.

A German tank near Grodno, Poland, on its way to the Soviet border in the initial phase of Hitler's Operation BARBAROSSA, the invasion of the Soviet Union in June 1941. (Corbis)

In November 1942, the first production PzKpfw V Panther was delivered. A new tank designed to counter the T-34, it was Germany's best tank of the war. The 1944 version carried a crew of four and mounted a long-barreled 75mm gun. The 44.8-ton vehicle was equipped with a 700-hp gasoline engine.

The final German tank of the war was the PzKpfw Tiger II, with production models appearing in November 1944. Also known as the King Tiger, at 69.7 tons, it was the heaviest operational tank of the war. With a massive turret mounting a long-barreled 88mm gun, the tank's maximum armor thickness reached 150mm. It had a five-man crew. Its 700-hp gasoline engine could drive the tank at 23.5 mph. A total of 484 were produced.

Great Britain

By World War II, the British Army had opted for two categories of tanks: high-speed cruiser tanks and heavily armored but slow infantry tanks. An emphasis on mobility and armor protection, obscuring the importance of gun power, plagued British tanks throughout the war.

In 1940, the army was equipped with the Cruiser Mark I and II and the Infantry Tank Mark I and II (Matildas). The 12-ton Cruiser Mark I had a crew of six men and a 2-pounder main gun. The major production version,

the Cruiser Mark IIA, an improved Mark I, weighed 13.5 tons, held a crew of four to five men, and had a 2-pounder main gun. The Infantry Tank Mark I (Matilda I) quickly proved inadequate. Although well armored, it carried only a crew of two and an armament of one machine gun.

The Mark II (Matilda II), of which 2,987 were manufactured between 1940 and 1943, was the most important British tank in the Western Desert. This 26.5-ton tank carried a crew of four men and a 2-pounder main armament. Two diesel engines drove it at 15 mph.

German tanks armed with more powerful guns led to British attempts to design replacements. However, when the British designs, the Centaur and Cromwell, were ready in 1942, German tanks had even heavier armament. The redesigns, the Challenger and Black Prince, respectively, were either unsuccessful (in the case of the Challenger) or produced too late (the Black Prince).

Meanwhile, British requirements were met by American tanks, originally the M-3 and M-4 medium tanks and the M-3 light tanks. The most effective British tank of the war became the M-4 with a 17-pounder gun, known as the Sherman Firefly.

Britain fielded an effective tank of its own design, the Churchill, before the end of the war. Originally produced in 1941, it was not truly successful until 1944, with the Churchill VII production. This 40-ton version had a crew of five and a 75mm main gun. Its 350-hp engine could drive it at 12.5 mph. Variations were used for many purposes, such as engineer vehicles and for close support.

United States

U.S. tank development and doctrine were hampered before World War II by a decision to assign tanks to the infantry only and the reluctance of the cavalry to give up the horse. By the 1930s, however, the army had formed a mechanized cavalry brigade, leading to the creation of the Armored Force by 1940. A number of tank designs had also been explored.

Based on the earlier M-2 series, the M-3 Stuart light tank was standardized in July 1940. The Stuart weighed 12.3 tons, had a crew of four, and mounted a 37mm gyro-stabilized main gun. Improvements finally

resulted in the M-5A1. With twin gasoline engines, this tank could reach a speed of 40 mph.

Serious tank production began with the 1940 design of the M-3 medium Lee and Grant tanks, in service by mid-1941. Six basic models were eventually produced, with their weight growing from 30 to 32 tons. The crew of six men operated a sponson-mounted 75mm gun and a turret-mounted 37mm gun. Various engines were utilized, both gasoline and diesel, in the 340- to 375-hp range. The limited-traverse 75mm gun was less than ideal, but the M-3 provided a quickly available tank with a large gun.

Production of the M-4 medium Sherman tank, with a 75mm cannon in a fully traversable turret, began in October 1941. The standard U.S. Army medium tank, the Sherman was improved as the war progressed to the M-4A3 version. Almost 50,000 of them were produced. This tank's weight, initially 33.25 tons, grew to 35.5 tons. The most significant improvement was the high-velocity 76mm gun. It had a five-man crew. Engines varied widely, and the maximum speed was 24 to 26 mph. Variants to the standard tank included flamethrowers and recovery vehicles.

The United States was slow to develop a heavy tank, the consequence of Lieutenant General George S. Patton's belief that tank destroyers rather than other tanks should deal with German armor. The heavy M-26 tank was standardized in January 1945, but only a few reached Europe before the end of the war there. With a crew of five men, the Pershing weighed 46 tons and mounted a 90mm main gun. The 470-hp engine could drive the tank at 20 mph.

Soviet Union

In the late 1930s, it was the Soviet Union, rather than Germany, that was most interested in massive armor formations. The Soviet Union also possessed more armored fighting vehicles than any other nation. In June 1941, the Soviets had 23,140 tanks (10,394 of them in the west), whereas the invading Germans had only some 6,000. Moreover, the Soviets had some of the best tanks in the world. During the war, the Soviet Union built more tanks than any other power, including a wide range of armored fighting vehicles, from light to heavy tanks.

At the beginning of World War II, the Soviets possessed a large number of their medium BT-series tanks, chiefly the BT-5s and BT-7s. These and the Soviet T-26 tanks were superior in armor, firepower, and maneuverability to the German light PzKpfw III and IV and could destroy any German tank. The Soviet T-34 medium tank, introduced in 1941, and the KV-1 heavy tank, introduced in 1940, both mounted the 76.2mm (3-inch) gun and were superior to the PzKpfw III and IV and indeed any other German tank in 1941.

The T-34 was probably the best all-around tank of World War II, better armed and armored than the German tanks it faced. The short-barreled 76.2mm gun initially mounted on this tank was replaced by a longer version

that was mounted in most vehicles, followed later by an 85mm version. Weighing 26.3 tons and with a crew of five men, it could reach 31 mph with its 500-hp diesel engine.

The Soviet Union also produced a series of heavy tanks. The Soviets began the war with the KV-1, which entered service in December 1940. Wholly a Soviet design, the KV was named for Defense Commissar Klimenti Voroshilov. Initially the KV-1 had a 550-hp diesel engine, but this was upgraded to 600-hp in the KV-1B. The KV-1B weighed nearly 47.5 tons, carried a five-man crew, and had a maximum speed of 22 mph. The KV-1 mounted the powerful 76.2mm gun and three machine guns. It had a maximum of 100mm armor protection and was proven against the 88mm gun and anything else the Germans might throw against it, except for heavy artillery. The KV-1 disproved the myth that the Soviets were technologically backward.

The KV-1 evolved into the IS-1 through IS-3, the final Soviet heavy tanks of the war and the most powerful tanks in the world for a decade thereafter. (IS or JS stood for the Soviet dictator Joseph Stalin.) The IS-1 was produced beginning in 1944 to counter the new, more powerful German tanks. The IS-1 had an improved transmission and suspension system as well as a redesigned hull and a new larger turret mounted well forward.

The IS-1 weighed nearly 49.5 tons and had a crew of four. Powered by a 600-hp diesel engine, it was capable of 23 mph. The first IS-1 tank mounted the 85mm gun, but shortly thereafter a 100mm gun was used; some IS-1s even mounted the 122mm gun. In addition, this tank had four machine guns. The IS-1 was followed by the IS-2, with an improved hull shape and streamlining throughout. The IS-3 was a complete redesign, based on the experience of the IS-1 and IS-2 in combat. The IS-3 had a lower silhouette, a ballistically shaped hull, and a new “inverted frying pan,” a lower-profile turret shape to provide maximum deflection against incoming shells. It weighed nearly 51 tons and mounted an improved 122mm gun and had two machine guns. The IS-3 entered service in January 1945 and participated in the March 31–May 2, 1945, Battle of Berlin. Although never available in large numbers, it was for a decade the most powerful tank in the world and a major influence on subsequent tank design across the globe.

Czechoslovakia

The Czechs produced LT-34 and LT-35 light tanks for their army. Germany later provided LT-34 tanks to its ally Romania and used LT-35 tanks on the Eastern Front. The LT-38 was chosen as the light tank after the LT-35 and was produced up to 1942 for Germany. All of these vehicles were armed with the 37mm gun. Only prototypes of the medium tank ST-39, armed with a 47mm gun, had been made when Germany took over Czechoslovakia in March 1939.

Italy

The basic Italian light tank of the war was the Fiat Carro Armato L6/40, somewhat equivalent to the German PzKpfw II. It weighed approximately 7.5 tons, had a 70-hp engine, and was capable of 26 mph. It mounted a 20mm main gun and one machine gun. Unsuitable for frontline service because of its light armament, the L-6/40 was utilized in North Africa in cavalry and reconnaissance roles. It also was sent to the Eastern Front in fighting against the Soviet Union, and it served in Italy.

In 1940, the Italians decided on a new tank, the Fiat M-13/40, which became their principal medium tank and the mainstay of Italy's armor force in North Africa. The 15.5 ton M-13/40 had a crew of four men. It carried a new high-velocity 47mm gun in the turret, with a secondary armament of four machine guns in the hull.

Japan

Although no match for Allied tanks, the most successful Japanese tank was the medium tank Type 97, initially produced in 1937. This 15-ton tank had a crew of four and mounted a 57mm main gun. Its 170-hp diesel engine could drive it at 23.5 mph. The tank was based on the light tank Type 95, designed in 1933 and produced until 1942. With a crew of three and armed with a 37mm gun, the light tank weighed 7.4 tons and could reach 25 mph with its 110-hp diesel engine. Japan did some additional work on medium tanks, with larger main guns.

Throughout the war, the trend was to field tanks with larger main guns to counter the other trend of adding heavier armor. These trends continued in

the postwar years.

Tanner, Väinö Alfred (1881–1966)

Finnish politician, Social Democratic Party (SDP) leader, and prime minister (1926–1927). Born in Helsinki on March 12, 1881, Väinö Alfred Tanner completed a year of business school in 1901, then worked for corporations in Hamburg, Turku, and Vyborg before entering law school at the University of Helsinki. Graduating in 1911, he practiced law until 1915 while playing a leading role in the cooperative movement. In 1918, Tanner became chairman of the Finnish Social-Democratic Party. He struggled to defend Finnish freedom and democracy first against the threats posed by the right wing in Finland and then from the Soviet Union during and after World War II.

Tanner was instrumental in concluding the 1920 Tartu Treaty and the 1940 Moscow Treaty, both of which eased Finland's relationship with the Soviet Union. Tanner transformed the SDP into a party that offered a Scandinavian brand of socialism. His pragmatic leadership helped heal the wounds of the civil war following World War I, and he led his party to power

in 1926 and again in 1937. Tanner served as premier of Finland from December 1926 to December 1927.

When the Winter War with the Soviet Union began on November 30, 1939, as foreign minister, Tanner championed his government's resistance to Soviet demands. A cabinet minister throughout World War II, he helped rally the Finnish working class behind the war effort.

Following World War II, Moscow considered Tanner its greatest nemesis. On Soviet insistence, in 1946 a Finnish court sentenced him to five and a half years of imprisonment under the vague charge of "war responsibility." Pardoned in 1949, Tanner made an energetic political comeback and was reelected chairman of his party in 1957. Suspicious of Tanner's attempts to oust Urho Kekkonen from the presidency, in October 1961 Soviet leader Nikita Khrushchev staged the so-called Note Crisis in which he demanded that Finland reaffirm its neutrality. This secured the reelection of the incumbent president after his quick moves to placate the Soviets.

In 1963 Tanner retired; he died in Helsinki on April 19, 1966.

Taranto, Attack on (November 11, 1940)

British Royal Navy raid on the principal Italian naval base, the fortified harbor of Taranto. Admiral Sir Andrew B. Cunningham, British Mediterranean Fleet commander, and Rear Admiral Sir Arthur Lumley St. George Lyster of the carrier *Illustrious* planned the operation, code-named JUDGMENT. The date for the raid was to be October 21, 1940, the anniversary of the Battle of Trafalgar and a night with a full moon. Thirty Fairey Swordfish were slated to make the attack from the aircraft carriers *Illustrious*

and *Eagle*. The Swordfish, although it was a 10-year-old biplane, was nonetheless a reliable, sturdy torpedo platform, especially effective in night operations.

A fire on the *Illustrious*, which destroyed several aircraft, forced postponement of the operation. Then the *Eagle*, which had sustained near misses from Italian bombs, was found to have been more seriously damaged than originally estimated.

As a consequence, the attack was delayed, and the raid was conducted by the *Illustrious* alone. Twenty-one Swordfish aircraft fitted with extra fuel tanks participated, with 11 of them armed with torpedoes and the remainder carrying bombs and flares. The torpedoes were modified to negate the effects of porpoising in the harbor's shallow water.

At 8:30 p.m. on November 11, the *Illustrious* launched its aircraft some 170 miles from Taranto. All six of Italy's battleships were in the harbor, where they were protected by barrage balloons, more than 200 antiaircraft guns, and torpedo nets, although the latter were far short of the number the Italian Navy considered necessary. The British planes set out in two waves an hour apart. The first wave achieved complete surprise when it arrived at Taranto at 11:00 p.m. The pilots cut off their engines and glided in to only a few hundred yards from their targets before releasing the torpedoes against the battleships, which were illuminated by the flares and Italian antiaircraft tracers. The *Conte di Cavour* was the first battleship struck, followed by the *Littorio*. In the second attack at 11:50 p.m., the *Littorio* was struck again, and the *Caio Duilio* was also hit. In the two attacks, the *Conte di Cavour* and *Caio Duilio* each took one torpedo, and the *Littorio* absorbed three.

The Conte di Cavour was the only battleship to sink, and it went down in shallow water. Italian tugs towed the other two damaged ships to shore. The cruiser *Trento* and the destroyer *Libeccio* were both hit by bombs, but they did not explode and caused only minor damage. Fifty-two Italian sailors died in the attack. The British lost two planes; the crewmen of one were rescued by the Italians.

The *Conte di Cavour* was later raised and towed to Trieste to be repaired, but the work was not completed, and it was never recommissioned. The *Littorio* was overhauled by March 1941, and the *Duilio*, which was transferred to Genoa, was repaired and returned to Taranto in May 1941.

The Taranto raid thus deprived Italy of its naval advantage and at least

temporarily altered the Mediterranean balance of power. It also underscored the effectiveness of naval aircraft and was useful to the Japanese. Japan was already working on techniques to employ air-dropped torpedoes in shallow water. Taranto provided confirmation for its plan to strike Pearl Harbor on December 7, 1941.

Tarawa, Battle of (November 20–24, 1943)

One of the bloodiest amphibious assaults in military history. In December 1941, a Japanese task force seized Tarawa—part of the Gilbert Islands, which stretch some 500 miles along the equator. Tarawa is a hook-shaped atoll with a lagoon formed by a coral reef just beneath the ocean surface. The barb in the hook is formed by the 2-mile-long triangular-shaped Betio Island, less than 300 acres of nondescript coral, sand, and coconut palms rising no more than 15 feet above sea level.

The Japanese constructed an airfield there, and by November 1943, they had turned Betio into a fortress. Rear Admiral Shibasaki Keiji commanded 5,000 naval infantry troops who manned reinforced concrete blockhouses, coconut-log bunkers, and gun pits, all connected by a network of tunnels and trenches. Heavy guns in hardened revetments commanded virtually every approach to the island, prompting Shibasaki to remark that Betio could not be taken by 1 million men in 100 years.

The Central Pacific commander, U.S. admiral Chester W. Nimitz, decided to seize the Gilberts in a joint assault by the army and the marines as the first test of offensive amphibious operations. The V Amphibious Corps, commanded by Marine Major General Holland M. Smith, was responsible for the landing, code-named Operation GALVANIC. The 2nd Marine Division, led by Major General Julian C. Smith, would seize Tarawa, while the army's 27th Infantry Division, commanded by Major General Ralph C. Smith, landed at Makin.

V Corps staffers decided that the portion of Betio that faced the lagoon was the least heavily defended terrain, and they designated landing areas there as Red Beaches 1, 2, and 3. A disadvantage to those sites was the precise navigation required for the landing craft to pass into the lagoon and then maintain formation as they approached the beaches. Amphibious doctrine called for landings at high tide so the landing craft could clear defensive obstacles.

Unfortunately, the planners did not have reliable tide charts, and when Holland Smith designated November 20, 1943, as D-day, the tides would not be favorable to the marines. By then, U.S. aircraft had flown hundreds of sorties against Betio, saturating the island with bombs as ships of the Fifth Fleet pounded the island's defenses one last time. Faulty U.S. reconnaissance reports indicated that nothing was left alive on Betio.

At 9:00 a.m. on November 20, almost two hours after the last

bombardment began, Colonel David M. Shoup led three reinforced battalions of his 2nd Marine Regiment toward Red Beaches 1, 2, and 3. Japanese heavy guns then opened up, unleashing a deadly hail of fire into the tightly packed amphibious tractors (amphtracs) as they neared the reef, paused briefly to climb over it, and then landed on the beaches. The shallow-draft Higgins boats that followed could not get over the reef, however, and the marines were forced to debark into the water about 600 yards from the shore. Withering Japanese machine-gun fire met the marines, who were unable to return fire as they slowly waded toward shore laden with equipment. A small seawall afforded little cover from Japanese small-arms fire as navy corpsmen set up aid stations.

By afternoon, the marines had penetrated no more than a few hundred feet in many places. Shoup, who was wounded, still directed the fight and requested that reserves be committed in a message that emphasized the precariousness of the situation, stating, “Issue in doubt.” Of the 5,000 marines who landed that day, almost 1,500 became casualties. During the night, the Japanese threatened with counterattacks, snipers, and infiltrators. Many marines had drained their canteens and emptied their cartridge belts. The wounded could only wait for evacuation in the morning.

The morning of November 21 saw little improvement. Stiff resistance compelled the attackers to destroy each Japanese strongpoint at a heavy price as U.S. Navy destroyers provided fire support at dangerously close ranges. The day ended with more of Betio in marine hands, but the island was not yet secure. At midmorning on November 22, the marines began their final assault on the Japanese command post, where they poured gasoline down air vents and then ignited it, killing those inside, including Shibasaki. Many Japanese committed suicide as the marines cleared the western portion of the island and pushed the remaining defenders into a narrow tail of land in the east.

The final Japanese act entailed a series of night banzai attacks, in which mobs of enemy soldiers charged marine positions with drawn swords and bayonets. They were cut down by artillery and machine-gun fire from the exhausted marines. Commanders declared the battle over on the morning of November 23, after 76 hours of horrendous fighting. The Japanese had 4,690 men killed; only 17 prisoners were taken, along with 129 Korean laborers. The desperate Japanese defense of the island cost the marines and the navy 1,027 dead, 88 missing, and 2,292 wounded.

The casualties shocked an American public that viewed the fight on Tarawa as evidence that there would be no cheap victories as the battles were carried to the Japanese homeland. The Battle of Tarawa brought many changes, including improved naval fire support and significant increases in firepower ashore, to include more automatic weapons, tanks, explosive charges, and flamethrowers. Shoup, who was awarded the Medal of Honor for his actions on Tarawa, later become Marine Corps commandant.

A U.S. marine fires at a Japanese pillbox from behind the remains of a palm tree, during the November 1943 battle for Tarawa. (National Archives)

Tassafaronga, Battle of (November 30, 1942)

Naval battle between Japanese and U.S. forces during the August 1942–February 1943 Guadalcanal Naval Campaign. Responding to intelligence that the Japanese Navy intended to resupply Guadalcanal on the night of November 30, 1942, the South Pacific commander, Admiral William F. Halsey, dispatched Rear Admiral Carlton H. Wright's Task Force 67 (TF 67)—consisting of the heavy cruisers *Minneapolis*, *New Orleans*, *Pensacola*, and *Northampton;* the light cruiser *Honolulu;* and six destroyers—to intercept Rear Admiral Tanaka Raizo's 2nd Destroyer Squadron, which was steaming in a southeasterly direction. Tanaka had eight destroyers, six of which carried supply drums; the other two destroyers were unencumbered.

To avoid enemy identification and detection problems, the Americans formed into one destroyer and two cruiser groups, each having one ship equipped with the new SG surface-search radar. Cruiser scout planes were to provide reconnaissance and night illumination. Destroyers took station on the engaged bow of the cruisers to deliver a torpedo attack prior to the commencement of gunnery.

Tanaka sought to avoid a general engagement. He intended to have his destroyers drop their floating supply drums, to be retrieved by small Japanese craft from the beaches. As TF 67 approached the Lengo Channel on a northwesterly heading, the lack of a U.S. forward destroyer picket proved to be a critical mistake. Tanaka was cruising only two miles off the Guadalcanal beach but remained undetected until radar picked up his column dead ahead

at 23,000 yards. However, no flare planes had been able to launch to illuminate the Japanese ships. Wright delayed in ordering the destroyers to commence their torpedo attack, believing that the range was greater than the 7,000 yards reported by the destroyer *Fletcher* at 11:20 p.m. Thus, the initial tactical advantage provided by radar had been squandered, with the loss of four precious minutes until Wright unleashed the destroyers. The Japanese column had already passed abaft the destroyers' port beam, making hits difficult as the range opened.

At about 9,000 yards, the U.S. cruisers opened fire, hitting the nearest Japanese destroyer, the *Takanami*. Several ships fired illumination star shells, but the U.S. gunfire accuracy was poor. Well drilled in night detection, maneuver, and torpedo tactics, Tanaka's crews executed a column turn and launched 20 torpedoes at the U.S. ships even while sustaining some shell hits themselves. At 11:27 p.m., the *Minneapolis* suffered two torpedo hits, destroying its bow. Putting its rudder over hard right to avoid a collision, the *New Orleans* took a torpedo near a magazine, which blew off its bow back to No. 2 turret. The third ship in line, the *Pensacola,* veered left to avoid the *New Orleans* but took a torpedo hit at 11:39 p.m. that flooded the after engine room and knocked out three turrets and all power.

Steaming behind the three damaged U.S. cruisers, the *Honolulu* avoided any hits, but the *Northampton* was not so fortunate. That ship first turned right with the *Honolulu,* then back to a westerly heading. Two torpedoes struck it at 11:48 p.m., destroying the after engine room and setting the ship afire from the mast to the stern.

Tanaka reformed his squadron for a second but unsuccessful attack and then cleared the area by 1:30 a.m., with the undamaged *Honolulu* in fruitless pursuit. The *Minneapolis* limped safely into Tulagi Harbor, as did the *New Orleans* and *Pensacola*, all heavily damaged. The *Northampton* sank at 3:04 a.m., with the loss of 58 hands. Jury-rigged to make the voyage home, all three damaged cruisers returned to action by October 1943.

The Tassafaronga debacle resulted from superb Japanese night-fighting training and techniques combined with poor U.S. gunnery and the failure to detach destroyers ahead for forward operations.

Taylor, Maxwell Davenport (1901–1987)

U.S. Army general. Born in Keytesville, Missouri, on August 26, 1901, Maxwell Davenport Taylor graduated from the U.S. Military Academy at West Point in 1922 and was commissioned in the engineers. He attended the Engineer School at Fort Belvoir, Virginia, before being assigned to the 3rd Engineers in Hawaii. In 1926, Taylor transferred to the field artillery. A talented linguist, he taught French and Spanish for five years at West Point; graduated from the Command and General Staff School, Fort Leavenworth, Kansas, in 1935; and was then an assistant military attaché in Japan.

In 1937, Taylor was assigned to Colonel Joseph W. Stilwell's staff. Following graduation from the Army War College in 1940, Taylor was appointed to the staff of U.S. Army chief of staff General George C. Marshall and promoted to lieutenant colonel. In July 1942, Taylor became chief of staff of the 82nd Airborne Division as a colonel, and in December, he was promoted to brigadier general as the divisional artillery commander.

Taylor joined the 82nd in Sicily after the July 9, 1943, Allied invasion, and on September 7, he volunteered for a secret mission behind enemy lines, going to Rome to determine if an airborne drop there was feasible. Meeting with Italian officials, he determined that the Germans had quickly secured both Rome and the facilities necessary for such an operation to succeed. On his recommendation, the mission was scrapped just as the first troop-laden aircraft became airborne. Taylor was then senior representative on the

commission that convinced the new Italian government to declare war on Germany.

Taylor returned to the 82nd, and in March 1944 in the United Kingdom, he took command of the 101st Airborne Division (the Screaming Eagles). Promoted to major general in the same month, he jumped with the division during the June 6, 1944, Normandy Invasion, behind Utah Beach. After being rotated back to Britain after more than a month of combat, Taylor and his division next participated in Operation MARKET-GARDEN (September 17–26). On September 17, the division seized Vechel, captured and held the Zon Bridge, and then took Sint Oedenrode and Eindhoven. Taylor was subsequently wounded and was out of action for two weeks. Taylor rejoined his division on December 25 and fought with it for the remainder of December 16, 1944–January 25, 1945, German Ardennes Offensive. The division then helped mop up pockets of resistance in the Ruhr before resuming the advance east. At the end of the war in Europe, the 101st helped seize Berchtesgaden.

In September 1945, Taylor became superintendent of West Point, where he initiated curriculum reforms. Between 1949 and 1951, he headed the Berlin Command. In 1951, he was promoted to lieutenant general and became the U.S. Army's deputy chief of staff for operations and training. In February 1953, Taylor took command of the Eighth Army in Korea as a full general, at a time when an armistice was imminent. He was then commanding general, Army Forces Far East, in 1954 and commander in chief, Far East Command, in 1955.

Taylor served as the army chief of staff between 1955 and 1959, differing sharply with President Dwight D. Eisenhower's strategy of "massive retaliation." Taylor urged greater emphasis on conventional forces and the ability to fight limited wars, which later became known as "flexible response." Retiring in 1959, Taylor expressed his views publicly in his book *The Uncertain Trumpet,* which caught the attention of Senator John F. Kennedy. In 1961, President Kennedy brought Taylor out of retirement to serve as his military adviser during 1961 and 1962; thereafter, he was appointed chairman of the Joint Chiefs of Staff, serving in that post from 1962 to 1964. Taylor opposed the commitment of U.S. ground troops to Vietnam but urged an escalation of the war through the bombing of North Vietnam. During 1964 and 1965, he was ambassador to South Vietnam. For

the remainder of his life, he defended U.S. policies in Vietnam and blamed his country's defeat on the media. Taylor was president of the Institute for Defense Analysis between 1966 and 1969 and president of the Foreign Intelligence Advisory Board from 1965 to 1970. He died in Washington, D.C., on April 19, 1987.

Tedder, Sir Arthur William (1890–1967)

British Marshal of the Royal Air Force (RAF). Born on July 11, 1890, at Glenguin, Scotland, Arthur William Tedder graduated from Magdalene College, Cambridge, in 1913. Commissioned in the British Army later that year, he served in France at the beginning of World War I but was posted to the Royal Flying Corps in 1916. He rose to command 70 Squadron and accepted a commission in the RAF in 1919.

From 1929 to 1931, Tedder was assistant commandant of the RAF Staff College. He then held administrative positions at the Air Armament School and the Air Ministry. He headed up training from 1934 to 1936, then was commander in the Far East. In 1937 he was promoted to air vice marshal. He returned to Britain to become director of research in the Air Ministry in 1938.

In the summer of 1940, Tedder was transferred to North Africa as deputy air commander. He became air commander in chief of the Middle East Air Force in June 1941, directing air operations against the Axis powers in North Africa. Tedder constantly struggled with a shortage of air assets. A forceful airpower advocate along with his subordinate, Air Vice Marshal Arthur

Coningham, Tedder worked to combine and coordinate RAF activities with ground forces in innovative ways. In February 1943 as commander in chief of Allied air assets in the Mediterranean, he was overall air commander for the 1943 Tunisia and Sicily campaigns.

In late 1943, Tedder used the experience gained in these operations to help plan air support for the June 6, 1944, Normandy Invasion as deputy supreme commander, earning high praise from General Dwight D. Eisenhower. Tedder developed a detailed plan to use airpower to disrupt German communications and supply lines prior to the actual landings. In November 1944, he replaced Air Chief Marshal Trafford Leigh-Mallory as commander of tactical air forces. At the end of the war in Europe, Tedder signed the surrender agreement with Germany on behalf of Eisenhower.

General Dwight D. Eisenhower (left), supreme commander of the Allied Expeditionary Force, announcing the unconditional German surrender signed at Reims, France, on May 7, 1945. RAF Air chief marshal Sir Arthur Tedder, deputy supreme commander, is on the right. (Library of Congress

On his return to Britain, Tedder was promoted to marshal of the RAF (five-star rank). In January 1946, he was made a baron and appointed chief of the air staff, a post he held until his retirement in 1950. From 1954 to 1960, he was chairman of the Standard Motor Company. Tedder died in Surrey, England, on June 3, 1967.

Tehran Conference (November 28–December 1, 1943)

One of the most important Allied conferences during the war. Usually overshadowed by the 1945 Yalta Conference, the meeting at Tehran was in fact equally as or more important than Yalta because of the decisions made there. Attending were the "Big Three"—U.S. president Franklin D. Roosevelt, British prime minister Winston L. S. Churchill, and Soviet leader Joseph Stalin. The conference was also the first face-to-face meeting between Roosevelt and Stalin.

The Soviet leader claimed that his wartime responsibilities would not allow him to travel far, so the conference, code-named Eureka, took place at Tehran, Iran; the journey to Tehran was Stalin's first trip abroad since 1912. Held from November 28 to December 1, 1943, the conference was immediately preceded by a meeting at Cairo (code-named Sextant) that involved Chinese Nationalist leader Jiang Jieshi (Chiang Kai-shek) and featured a discussion of the Allied effort against Japan. Because the Soviet

Union was not then at war with Japan, Stalin refused to attend that meeting, necessitating the Eureka conference.

At the Tehran meeting, Roosevelt was convinced that he could win over Stalin and, toward that end, turned on his formidable charm to try to secure the Soviet leader's confidence. At Tehran and later at Yalta, Roosevelt deliberately distanced himself from Churchill, a serious mistake. The British prime minister could not believe that the democracies would take separate paths.

The Western leaders labored under a number of disadvantages at Tehran. The first involved the strategic military situation. British and U.S. troops were then fighting the Germans only in Italy with 14 divisions, whereas the Soviet Union had 178 divisions locked in combat. In addition, the Western leaders feared that Stalin might yet seek a diplomatic accommodation with Adolf Hitler, and Roosevelt was also anxious to secure Soviet assistance in the war against Japan.

At Tehran, Stalin pressured the West on an early date for an Allied invasion of France. The Soviet ambassador to London, Ivan Maisky, had counseled Stalin to press for an immediate second front, which he knew was impossible, in order to secure additional Lend-Lease aid. Stalin insisted on learning the name of the commander of Operation OVERLORD as proof that the Western Allies were indeed serious about a cross-Channel invasion, and in a follow-up meeting in Cairo after Eureka, Roosevelt named General Dwight D. Eisenhower to the post. The three leaders also spent a great deal of time discussing Germany and its possible future division at Tehran. Roosevelt suggested splitting Germany into five states and internationalizing the Ruhr and other areas. Churchill, fearful of potential Soviet expansion into Europe, thought that Prussia might be detached from the rest of Germany.

Discussions over Poland were more controversial. All three leaders agreed on the Oder River as the future Polish-German boundary, but the Western leaders rejected the Soviet demand that a tributary of the Oder, the Western Neisse River, be the southern demarcation line. Nor did they sanction Poland securing the important port of Stettin on the west bank of the Oder. The three did concur that Poland would receive most of East Prussia, although the Soviet Union claimed the Baltic port of Königsberg (the future Kaliningrad) and land to the northeast. The Western leaders could hardly oppose the Curzon Line, established by the victorious Allies at the 1919 Paris

Peace Conference following World War I, as the eastern boundary of Poland. The British did object, however, to the Soviet seizure of the predominantly Polish city of L'vov (L'viv).

Churchill pointed out to Stalin that Britain had gone to war over Poland, but Stalin insisted that the Red Army needed security in its rear areas and that a primary goal of the war was to protect the Soviet Union against future German attack. Obviously, a Poland that had been compensated for the loss of its eastern territory to the Soviet Union by receiving German territory in the west would necessarily have to look to the Soviet Union for security.

Churchill later had the difficult task of promoting all these arrangements to the Polish government-in-exile in London; the large Polish community in the United States was also upset by them. Stalin refused normal diplomatic relations with the London Poles, charging that they were stirring up trouble for the Red Army. No independent Polish government would ever concede changes that put the country at the Soviet Union's mercy. Thus, a Polish government subservient to Moscow was probably inevitable.

Stalin also demanded that the Soviet Union be allowed to keep its 1939–1940 acquisitions of Bessarabia, the Karelian Isthmus, and the Baltic states. Although these acquisitions were clear violations of the Atlantic Charter, the Siege of Leningrad gave Stalin a strong argument for a security zone there. He also insisted that Finland cede its Arctic port of Petsamo, pay heavy reparations, and provide space for a base to protect sea approaches to Leningrad. In return, he promised to respect Finland's independence, assuming that country behaved properly.

Stalin reassured Roosevelt that the Soviet Union would enter the war against Japan after the defeat of Germany. He also stressed the importance of an Allied invasion of France to relieve pressure on the Red Army from German troops on the Eastern Front. Further, Stalin expressed the view that a landing in southern France (the future Operation ANVIL) would be most helpful. He was pleased when the Western leaders told him that the invasion of northern France (Operation OVERLORD) was scheduled for May 1944. He promised to launch a Soviet ground offensive to coincide with it. The three leaders also agreed that after the war, Iran, which was serving as a supply corridor to the Soviet Union and was occupied by Allied troops, would be restored to full territorial integrity and sovereignty and that all troops would be withdrawn.

Marshal Josef Stalin (left), President Franklin D. Roosevelt (center), and Prime Minister Winston L. S. Churchill (right) at the Tehran Conference, November 28–December 1, 1943. (Library of Congress)

Although the Tehran Conference served to dissipate tensions between the two Western leaders and Stalin, sharp differences on the conduct of the war and the composition of postwar Europe remained. These differences were very much in evidence at the February 1945 Yalta Conference.

Templer, Sir Gerald Walter Robert (1898–1979)

British Army field marshal. Born at Colchester, Essex, England, on September 11, 1898, Gerald Walter Robert Templer attended Wellington College and the Royal Military College, Sandhurst. During World War I, he saw action with the Royal Irish Fusiliers in France. Between the wars, he served in Iran, Iraq, Egypt, and Palestine. In 1938, Templer joined the War Office General Staff, assigned to military intelligence and clandestine operations—areas where his work was both imaginative and thorough.

When World War II began in September 1939, Templer served as an intelligence officer in the British headquarters in France under Major General Sir Frank Nöel Mason-MacFarlane. On May 16, 1940, Templer became chief of staff to an ad hoc British force under Mason-Macfarlane intended to assist the French on the British Expeditionary Force's western flank. Templer was evacuated from Dunkerque with other British forces during May 27–June 4. In Britain, he held various staff and command appointments, becoming the army's youngest lieutenant general in October 1942 and commanding II Corps in Newmarket.

In 1943, seeking a combat assignment, Templer requested and was granted a demotion to major general. He successively commanded the 1st Division in North Africa and the 56th Division in Italy under the U.S. Fifth Army. His division saw heavy fighting at Monte Camino in late 1943 and at the Anzio bridgehead in January and February 1944, suffering substantial casualties. In July 1944, Templer transferred to command the 6th Armoured Division. In August, as the division advanced on Florence, he was severely wounded by a mine and evacuated to Britain.

On his recovery, Templer worked briefly for the Special Operations Executive, and in March 1945, he began a year as the energetic director of civil affairs and military government in British-occupied Germany. After War Office assignments as director of military intelligence and vice chief of the

Imperial Staff as well as heading the Eastern Command, he became the British high commissioner and commander in chief in Malaya in October 1951, playing a key role in the suppression of its communist insurgency. From 1955 to 1958, Templer, now a field marshal, was chief of the Imperial General Staff, handling difficult Middle Eastern problems, including the 1956 Suez crisis, and reluctantly but vigorously implementing military cuts. Retiring in 1958, Templer died in Chelsea, London, on October 25, 1979.

Terauchi Hisaichi (1879–1946)

Japanese Army field marshal. Born in Yamaguchi Prefecture on the Japanese island of Honshu on August 8, 1879, Terauchi Hisaichi graduated from the Military Academy in 1899 and the War College in 1903. He was appointed assistant military attaché in Austria in 1911, regimental commander of the 3rd Imperial Guards in 1919, chief of staff of the Imperial Guards Division in 1922, commander of the 19th Infantry Brigade in 1924, and chief of staff of the Korea Army in 1927. Promoted to lieutenant general in August 1929, he commanded the Imperial Garrison Unit in 1929 and then the 5th Division in August 1930. In January 1932, he took command of the 4th Division, and in August 1934, he became Formosa Army commander. In October 1935, he was promoted to full general.

A prominent member of the Control Faction, Terauchi served as minister of war in the Hirota Kōki cabinet (March 1936–January 1937) and was one of the leading figures in the ouster of Hirota. He next served as inspector

general of military training (1937), North China Area Army commander (1937–1938), and military counselor (1938–1941).

In November 1941, he took command of the Southern Expeditionary Army, which, at the start of the Pacific war, conquered the Philippines, Malaya, Burma, and the Netherlands East Indies (December 1941–May 1942). He subsequently became responsible for the defense of an area extending from Burma to western New Guinea. Promoted to the honorary rank of field marshal in June 1943 and briefly considered to succeed Tōjō Hideki as prime minister in July 1944, Terauchi commanded the Southern Expeditionary Army until September 1945. As a commander, Terauchi was essentially a coordinator who typically allowed subordinate officers great latitude in the conduct of operations.

Thanks to the intervention of Lord Louis Mountbatten, Allied supreme commander in Southeast Asia, Terauchi, who had suffered a debilitating stroke in April 1945, avoided prosecution as a war criminal. Allowed to settle near Johore Bahru, Malaya, he died there on June 12, 1946.

ter Poorten, Hein (1887–1968)

Dutch Army lieutenant general. Hein ter Poorten was born on November 21, 1887, in Buitenzorg (now Bogor) on the island of Java in the Netherlands East Indies (present-day Indonesia) and was commissioned an artillery officer in 1911. He subsequently learned to fly at his own expense and helped establish the Netherlands' army air force.

In 1919 ter Poorten studied at the Army Staff College in the Netherlands. Returning to the Netherlands East Indies, he advanced steadily in rank and served on the General Staff during 1926–1931 and 1933–1936 and became inspector of artillery. He became chief of the General Staff in the Netherlands East Indies in July 1939. In October 1941 following the death in a plane crash of Lieutenant General Gerardus Johannes Berenschot, ter Poorten succeeded him as commander of the Royal Netherlands Indies Army as a lieutenant general.

Ter Poorten was regarded by most observers as a competent and skilled officer who got along well with his military associates, although his relations with civilian leaders are said to have been less successful. In January 1942 as the Japanese invaded the Netherlands East Indies, ter Poorten assumed command of all Allied land forces of the ABDA (American, British, Dutch, and Australian) Command in Java. With few resources available to him and no hope of air or naval support, there was little he could do but carry out a fighting withdrawal to protect the Dutch political centers of Batavia and Bandung. Following the rapid Japanese advance and with his men out of ammunition and low on food and water, ter Poorten surrendered all Allied forces to the Japanese on March 8, 1942.

Held prisoner of the Japanese for the remainder of the war, ter Poorten returned to the Netherlands after the Japanese surrender. He retired in 1946 and died in The Hague on January 15, 1968.

Theobald, Robert Alfred (1884–1957)

U.S. Navy rear admiral. Born in San Francisco, California, on January 25, 1884, Robert Alfred Theobald graduated from the U.S. Naval Academy at Annapolis in 1907 and was commissioned an ensign. During the next years, he served in a variety of assignments at sea and in shore posts, impressing his superiors with his skills in gunnery, his seamanship, and his intellectual acumen. During the 1930s, Theobald was both a student and an instructor at the Naval War College. He commanded the battleship *Nevada*, served as a member of the navy's General Board, and commanded a cruiser division and later a destroyer flotilla.

Shortly after the Japanese attack against Pearl Harbor on December 7, 1941, Captain Theobald took command of the destroyers in the Pacific Fleet. In May 1942, he was appointed commander of the North Pacific Force and was promoted to rear admiral that June. Because the force initially had a main body of only five cruisers and four destroyers, Theobald was inclined to be cautious in moving against the Japanese in the Aleutian Islands, an approach that placed him at odds with the more aggressive-minded army commanders in the theater.

The conflict between Theobald and the army, along with the admiral's irritation at being assigned to a backwater in the war, angered Admiral Chester W. Nimitz, commander of the Pacific Fleet. On January 4, 1943, Nimitz relieved Theobald, who then took charge of the First Naval District and the Boston Navy Yard. Theobald retired from the navy in February 1945.

After the war, Theobald involved himself in the Pearl Harbor controversy, arguing that Admiral Husband E. Kimmel, commander of the Pacific Fleet in 1941 and an old friend, and Lieutenant General Walter Short, commander of the Hawaiian Department, were unfairly made the scapegoats for the Japanese success. In his book *The Final Secret of Pearl Harbor: The Washington Contribution to the Japanese Attack* (1954), Theobald charged that President Franklin D. Roosevelt and members of his administration did not adequately warn Hawaiian commanders of a possible attack and had shifted the blame to Kimmel and Short to cover up their own errors in judgment. Theobald died in Boston on May 13, 1957.

Thierry d'Argenlieu, Georges Louis Marie (1889–1964)

French admiral. Born in Brest, France, on August 7, 1889, Georges Thierry d'Argenlieu graduated from the École Navale in Brest in 1906 and was commissioned in the navy. During World War I, he served in the French marines and commanded a patrol boat in the Mediterranean.

In September 1919, Thierry d'Argenlieu left the navy and entered the Carmelite Order as Père Louis de la Trinité (Father Louis of the Trinity). In February 1932, he became provincial superior in Paris. In 1939, he was called back into the navy at Cherbourg, and in February 1940, he was appointed captain. Captured by the Germans on June 19, Thierry d'Argenlieu escaped three days later and joined General Charles de Gaulle's Free French movement in Britain. Thierry d'Argenlieu participated in the ill-fated September 23–25, 1940, Free French attack on Vichy forces at Dakar and was wounded three times. He then took command of Free French naval forces in Equatorial Africa. Operating in conjunction with Colonel Philippe Leclerc on land, he led the naval operations at Gabon.

Between February and May 1941, Thierry d'Argenlieu headed a mission to Canada to rally support for de Gaulle, and by July, he was named high commissioner for the Pacific, which involved, in conjunction with the other Allies, defending French territories in the Pacific and easing diplomatic tensions between Free French administrators in Tahiti and New Caledonia. The following year, in May, Thierry d'Argenlieu helped rally the Wallis and Futuna islands.

In June 1943, Thierry d'Argenlieu was promoted to rear admiral and became commander in chief of all Free French naval forces. Following the

liberation of France, he was promoted to vice admiral in December 1944 and made *chef d'état major general adjoint de la marine*. He had been named a *compagnon de la libération* on January 29, 1941, when he also became the first grand chancellor of that order, serving until 1958.

After the war, the French government sent Thierry d'Argenlieu to San Francisco in April 1945 as a delegate to the meetings that formed the United Nations and then to Indochina as high commissioner to reestablish French control there. His efforts to roll back the colonial clock and his decision to employ force and order the shelling of Haiphong by the cruiser *Suffren* on November 23, 1946, led directly to the outbreak of the First Indochina War.

In June 1946, Thierry d'Argenlieu was promoted to admiral. The following year, he was recalled to Paris, and in 1948, he returned to his monastery in Brest. He died in Le Relecq-Kerhuon (Finistère), France, on September 7, 1964.

Thoma, Wilhelm Ritter von (1891–1948)

German Army general. Born on September 11, 1891, at Dachau, Germany, Wilhelm von Thoma joined the German Army in 1914 as an officer candidate and was commissioned in the infantry. He fought in the Battle of Verdun in 1916 and later that year against the Russian Brusilov Offensive on the Eastern Front. He continued in the Reichswehr after World War I and became a leading theorist of armored warfare, second in the German Army only to Heinz Guderian. In 1934, Major Thoma took command of Germany's only tank battalion. He then had charge of all German ground troops in the Spanish Civil War (1936 to 1939).

Thoma led the 3rd Panzer Regiment in the 2nd Panzer Division during the invasion of Poland on September 1, 1939, where he performed brilliantly. Following the conquest of Poland, he became director of Mobile Forces. Sent to North Africa to report on whether German forces should be dispatched there, he submitted a negative report but urged that if a commitment was to be made, four armored divisions should be sent. Promoted to major general in August 1940, he assumed command of the 3rd Panzer Division.

In July 1941, Thoma replaced Lieutenant General Hans Jürgen von Arnim as commander of the 17th Panzer Division in the Soviet Union and participated in the Battle of Smolensk (July 10–August 5, 1941) and the Battle of Kiev (August 21–September 16). That September, he assumed command of the 20th Panzer Division in the Moscow region, a post he held until January 1942.

In September, Thoma was ordered to North Africa in command of the Afrika Korps. He arrived there in time to participate in the Battle of El Alamein (October 23–November 4, 1943), when British general Bernard Montgomery's Eighth Army took the offensive against Axis forces. On the death of General of Panzer Troops Georg Stumme, Thoma briefly commanded Panzerarmee Afrika and was promoted to general of panzer troops. Adolf Hitler then ordered Field Marshal Erwin Rommel to return to Africa from sick leave and resume command. On his arrival on October 25, Rommel criticized Thoma for his tactics.

Thoma had been slightly wounded in the fighting, and he reported to Rommel that he had only 35 tanks remaining. Rommel ordered a withdrawal, which Hitler countermanded. On November 4, 1942, complaining of Hitler's "unparalleled madness," Thoma donned a clean uniform, put on his medals, and climbed into a tank, racing from one point to another on the front lines in the thick of the battle. His tank was hit several times and caught fire, and Thoma was taken prisoner. That same night, he dined with British general Sir Bernard Law Montgomery but refused to discuss German strategy in the battle. Released from prison in early 1948, Thoma died in Söcking (Starnberg), Germany, on April 30, 1948.

Thomas, Norman Mattoon (1884–1968)

Noted socialist, minister, and pacifist who helped shape much of U.S. isolationist and pacifistic sentiments in the 20th century. Norman Mattoon Thomas was born on November 20, 1884, in Marion, Ohio, and graduated from Princeton University in 1905. He then studied at the Union Theological Seminary in New York City and was ordained a Presbyterian minister in 1911.

Thomas served as an assistant pastor and then pastor of several Presbyterian churches in New York City. While in New York, Thomas was greatly influenced by the Social Gospel movement. Demoralized by what he saw as an intolerably high rate of poverty and discouraged by American militarism, he joined the Socialist Party of America.

Thomas spoke out against the American involvement in World War I and in 1918 founded and edited the *World Tomorrow*, a publication dedicated to pacifism and socialist ideals. In 1920, he cofounded the American Civil Liberties Union with such luminaries as Upton Sinclair and Jane Addams. Thomas now turned toward politics and ran unsuccessfully as the Socialist Party candidate for the governorship of New York in 1924. He sought the office again—unsuccessfully—in 1938 and also ran for mayor of New York City in 1925 and again in 1929. In 1926, when longtime Socialist Party leader Eugene Debbs died, Thomas took up the leadership role of the Socialist Party in the United States. Thomas also ran in six presidential elections (1928, 1932, 1936, 1940, 1944, and 1948) as the Socialist Party candidate but was unsuccessful in each.

Although Thomas was a sharp and consistent critic of American-style capitalism and lambasted both the Democratic Party and the Republican Party

with equal vigor, he also denounced fascism in all its forms and railed against Soviet-style communism. Thus, despite his socialist beliefs, he was firmly anti-Soviet, even though he did not agree with the militaristic implementation of containment that followed World War II. Thomas also believed that America's involvement in World War II was a mistake, at least prior to the December 7, 1941, attack on Pearl Harbor.

In 1940, he cofounded the America First Committee, which was dedicated to maintaining American isolationism and keeping the United States out of World War II. The committee became the largest and most vocal pacifist organization in the nation but was dissolved within days of the Pearl Harbor attack. Thomas backed the war effort after that, although he derided some of President Franklin D. Roosevelt's policies, including the decision to permit big business to control much of the war's military production.

After World War II, Thomas kept up his high profile in the peace movement and spoke out against postwar rearmament and the American involvement in the Korean War. He also spoke out loudly—and often—against the U.S. involvement in the Vietnam War, and spearheaded some of the earliest organized antiwar protests of the conflict. He worked tirelessly for world disarmament throughout the 1950s and 1960s and was particularly vocal in his denunciation of the nuclear arms race. Although Thomas resigned as head of the Socialist Party in 1955, he nevertheless remained its chief spokesman until his health began to fail in the late 1960s. Thomas died in New York City on December 19, 1968.

Three Alls Campaign

Japanese scorched-earth policy in China. First initiated in 1940 by Japanese Army major general Tanaka Ryūkichi, it was recommended as official policy by General Okamura Yasuji, commander of the North China Area Army since July 1941, in retaliation for the communist-led "Hundred Regiments" offensive of December 1940. On December 3, 1941, the policy received the approval of Imperial General Headquarters in Tokyo and reportedly that of Emperor Hirohito himself. The new policy, Sankō Sakusen, became known as the "Three Alls" (for "kill all, burn all, destroy all"). It included the destruction of villages, the confiscation of food stocks, and the mobilization of the Chinese peasantry to build new protected villages with containment walls, moats, and watchtowers. The policy permitted the execution of "enemies pretending to be local people" and all males between the ages of 15 and 60 suspected of being enemies of the Japanese.

This Japanese policy of deliberate destruction sharply reduced both the area under control of the Chinese Communist Party (CCP) and CCP military strength. Communist leader Mao Zedong (Mao Tse-tung) now reasserted his personal authority over both the CCP and military strategy, ending any major CCP challenge to Japanese military control in northern China for the remainder of the war. CCP military forces would engage the Japanese in guerrilla warfare only when there were favorable circumstances and on the initiative of local commanders.

A 1996 study by Japanese historian Himeta Mitsuyoshi claims that the policy led to the deaths of more than 2.7 million Chinese civilians. Ultrarightist groups in Japan have countered by blaming the Chinese and their "Clean Field Strategy," in which Chinese soldiers would destroy civilian homes and crops to prevent shelter and supplies from being used by the Japanese.

Timoshenko, Semen Konstantinovich (1895–1970)

Marshal of the Soviet Union. Born in the village of Furmanka, Ukraine, on February 18, 1895, Semen Konstantinovich Timoshenko was drafted into the Russian Army during World War I in 1915. He served as a machine gunner and was decorated. Timoshenko joined the Red Army in April 1918 and earned his military reputation in the Russian Civil War. A man of great personal courage, he also developed a friendship with Joseph Stalin, to whom he remained intensely loyal.

Virtually illiterate until he began his military schooling, Timoshenko graduated from the Frunze Military Academy in 1922, from cavalry schools, and from the Lenin Political Academy in 1930. He then held a succession of military commands. In August 1933, he was appointed deputy commander of the Belorussia Military District. He went on to command the Northern Caucasus, Kharkov, and Kiev military districts. He escaped persecution in the Great Purges and certainly benefited from the execution of thousands of fellow officers.

Marshal of the Soviet Union Semen Timoshenko. (Sovfoto/UIG via Getty Images)

A member of the Supreme Soviet on its establishment in 1937, Timoshenko retained this position for life. In September 1939, he commanded the Ukrainian Front in the Soviet occupation of eastern Poland. When Soviet forces performed poorly in the Finnish-Soviet War (Winter War), Stalin appointed Timoshenko to command in Finland on January 7, 1940.

The day after being promoted to marshal of the Soviet Union on May 7, 1940, Timoshenko succeeded Marshal of the Soviet Union Kliment Voroshilov as defense commissar. Rough and blunt, he was, in many ways, unsuited for high command. He worked to rebuild the Red Army, although slavishly following Stalin's guidelines. As such, he must bear, along with Stalin, responsibility for the military debacle that followed the German invasion of June 22, 1941. Initially, Timoshenko refused authorization for

Soviet commanders to return fire. On July 21, he yielded the post of defense commissar to Stalin and became commander in chief of the Western Front, where he had some success in delaying the German advance.

Transferred to command the Southwestern Front in September 1941, Timoshenko failed to prevent a German breakthrough to the Crimea and the disaster of the Kiev encirclement (August 21–September 26), which, however, could be blamed on Stalin's refusal to allow a withdrawal. Transferred to the Finnish Front in January 1942, Timoshenko remained there through May, then returned to the Ukraine, where his offensive at Kharkov that month failed. During the remainder of the war, he served in lesser assignments and, at one point or another, commanded operations on the Northern Caucasus, 2nd and 3rd Baltic, and 2nd, 3rd, and 4th Ukrainian Fronts.

After the war, Timoshenko commanded the South Ural Military District between 1946 and 1949 and the Belorussian Military District in 1946 and again from 1949 to 1960. Timoshenko died in Moscow on March 31, 1970.

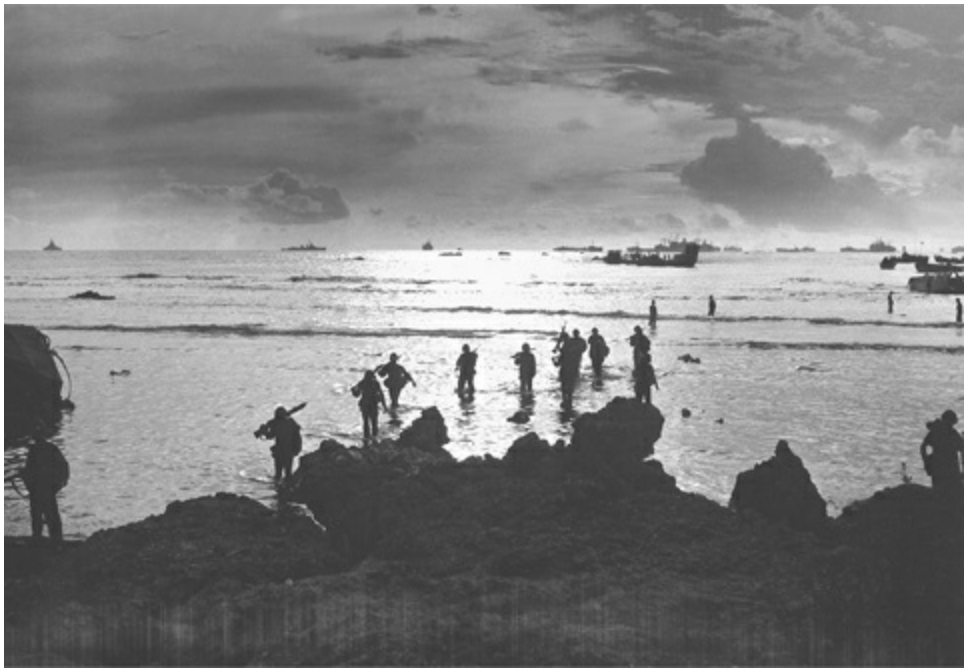
Tinian, U.S. Invasion of (July 24–August 1, 1944)

U.S. battle in the Marianas chain in the West-Central Pacific. Located some 3 miles south of the island of Saipan, Tinian Island is roughly 13 miles long from north to south and 5 miles wide. It was the site of an amphibious landing by the U.S. marines on July 25, 1944, as part of Operation FORAGER, itself part of the U.S. Navy's campaign across the Central Pacific as directed by the Pacific Fleet commander, Admiral Chester Nimitz. The invasion of

Tinian followed U.S. assaults, also part of FORAGER, on Saipan and Guam in the Marianas. Saipan was secured between June 15 and July 9, and Guam—a U.S. territory taken by Japan at the beginning of the war—was recaptured between July 21 and August 12, 1944.

In the summer of 1944, the Marianas were an important part of the Japanese defensive ring, sitting astride the Pacific supply routes to Japan's home islands. U.S. Navy planners decided to seize the islands to provide forward naval bases for the Allied push toward the home islands, interdict Japanese supply lines, and draw out the Japanese fleet so that it might be engaged in decisive battle. This engagement, the July 19–21 Battle of the Philippine Sea, resulted in significant aircraft and ship losses for Japan. U.S. Army Air Forces planners strongly advocated the Marianas operation to provide air bases from which Boeing B-29 Superfortress bombers might strike Japan. Tinian was especially valuable for airfields because it is relatively flat.



U.S. soldiers wade through shallow surf from grounded landing craft to the beach of Tinian Island, June 1944. (National Archives)

General Obata Hideyoshi, the commander of the Japanese Thirty-First Army, directed the defense of the Marianas, and Colonel Ogata Takashi commanded the reinforced 50th Infantry Regiment and other supporting army

and navy forces on Tinian. Ogata had some 8,000–9,000 men. The Japanese expected the assault, and the defenders did what they could with their limited resources to prepare, determined to inflict as many casualties on the Americans as possible.

Vice Admiral Richmond Turner commanded the Joint Amphibious Forces, and U.S. Marine Corps lieutenant general Holland Smith commanded the landing forces. Rear Admiral Henry W. Hill served as the commander of the assault forces for Tinian, and U.S. Marine Corps major general Harry Schmidt led the landing force. U.S. ships and both army and navy aircraft subjected Tinian to a heavy preparatory bombardment, during which napalm was first used. Additionally, because Tinian was only three miles from Saipan, marine and army artillery units there contributed gunfire support to the invasion force.

The landing forces embarked from Saipan several days before the July 24 landing. Turner wanted the landing to take place on the more suitable but more heavily defended southwestern beaches, but the marines insisted that it occur on two small northern beaches (allowing only one division to come ashore at a time), and Turner reluctantly agreed. A feint at the southern beach served to attract much of the defenders' attention, while the V Amphibious Corps, consisting of the 4th Marine Division and then the 2nd Marine Division, went ashore to the north. U.S. aircraft flying from Saipan as well as artillery there provided support throughout the battle.

The marines overcame fierce Japanese counterattacks and were able to declare Tinian secure on August 1. Almost all Japanese defenders died in the fighting. U.S. casualties included 389 killed in action and more than 1,800 wounded.

Navy Seabees quickly converted Tinian into a massive air-support facility. Soon, B-29s of the Twentieth Air Force were striking Japanese cities. Additionally, Seventh Air Force fighters and bombers supported other operations in the Central Pacific. Tinian was also the home base for the two atomic bomb missions at the end of the war.

Tirpitz, Attacks on (1941–1944)

The German battleship *Tirpitz*, sister ship to the *Bismarck*, was commissioned at Wilhelmshaven, Germany, in February 1941. The *Tirpitz* displaced 52,600 tons fully loaded, mounted 8 15-inch guns, and had a crew of 2,340 men. Recognizing the threat posed by this powerful warship, the Royal Air Force (RAF) Bomber Command flew 269 sorties in five separate attacks against Wilhelmshaven during January 1941 in an effort to destroy it. On February 28, Bomber Command flew another 116 sorties with the same goal.

As with the *Bismarck*, the *Tirpitz*, which was based in Norway beginning in January 1942, posed a threat to Allied shipping and tied up many Allied ships in the Home Fleet that could better be deployed elsewhere. As a consequence, between 1942 and 1944, large numbers of Allied ships and aircraft (most of them British), assisted by the Norwegian Resistance, attacked the battleship in Norwegian waters.

On the nights of March 30–31 and April 27, 1942, the RAF struck the *Tirpitz* at Föttenfjord, near Trondheim. The latter strike involved RAF Lancaster bombers and achieved complete surprise, but no bombs hit the battleship. In July 1943, Allied ships, including the U.S. Navy battleship *Alabama*, seeking a diversion for the July 9, 1943, Sicily invasion, tried unsuccessfully to lure the *Tirpitz* from its hiding place in Norway's waters and into the North Atlantic.

On September 6, 1943, the *Tirpitz* saw its only real offensive action of the war when it sortied to shell Spitsbergen. On September 22, the British midget submarines *X-6* and *X-7* slipped through German defenses at Kaa Fjord,

Norway, and their crews managed to plant mines on the battleship's hull. The explosions severely damaged the *Tirpitz,* but the Germans were able to effect repairs. Then on April 3, 1944, 40 Fairey Barracuda torpedo bombers flying from the Royal Navy carriers *Victorious* and *Furious* attacked. The *Tirpitz* took 14 hits. Though disabled, it remained afloat, and again the Germans made repairs.

More powerful bombs were necessary, and the RAF turned to British inventor Sir Barnes Wallis, who had created the skip-bombs used in the Dam Buster raids. Wallis developed a 12,000-pound armor-piercing bomb known as "tallboy." On September 11, 1944, 38 Lancaster bombers left Scotland for airfields in the northern Soviet Union, from which they planned to attack the *Tirpitz*. On September 15, 27 bombers of RAF Squadrons 9 and 617, carrying 20 tallboys, took off from Yagodnik, near Arkhangelsk, for Kaa Fjord. With the mountains screening their approach, they caught the German defenders by surprise. One tallboy went through the *Tirpitz*'s forecastle, exploding in its hull. Several other near misses severely damaged the ship's engines.

The Germans then decided not to repair the *Tirpitz,* and on October 15, they moved it to Tromsø to serve as a semistatic heavy artillery battery. On October 29, the British, unaware of the extent of the damage inflicted on the ship, sent 37 Lancasters equipped with extra fuel tanks from Lossiemouth, Scotland, on a 2,250-mile mission against the *Tirpitz,* but none of their 32 tallboys hit home.

On November 12, 1944, with German fighters now stationed nearby, Wing Commander James Brian "Willie" Tait led his 32 Lancasters on a wide-sweeping route over Sweden, which confused the German defenders. Arriving over the *Tirpitz,* the British scored three direct hits. One tore a 100-foot hole in the *Tirpitz*'s hull, detonating the magazines and capsizing the battleship. A total of 917 men in its crew died.

After the war, a Norwegian salvage company bought the rights to the German battleship and between 1948 and 1957 salvaged most of the hulk for scrap.

Tiso, Jozef (1887–1947)

Slovak nationalist and president of the Slovak Republic (1939–1945). Born on October 13, 1887, at Vel'ká Bytča, Slovakia (then Hungary), Jozef Tiso was ordained a Roman Catholic priest in 1910. In 1918, he helped to found the Slovak People's Party (SPP). Tiso represented the SPP in the Czechoslovakian parliament in 1925 and served as minister of health during 1927–1928. With the death of SPP leader Andrej Hlinka in August 1938, Monsignor Tiso took over as head of the party.

Roman Catholic priest and Slovak nationalist Jozef Tiso was president of Slovakia following the German take over in March 1939. Tiso retained that position throughout World War II, when he cooperated closely with the Germans. Tried and convicted of treason and war crimes, he was executed in 1947. (Corbis)

On October 6, 1938, Tiso became prime minister of an autonomous Slovakia created under the terms of the Munich Pact. In early March 1939, the Czechoslovakian government deposed him for promoting Slovak independence, but Tiso received Adolf Hitler's support during a visit to Berlin on March 13 and the following day proclaimed Slovak independence. The Germans occupied Czechoslovakia on March 15, and on March 16, Tiso placed the new Slovak state under the protection of Germany, primarily to avoid its annexation by Hungary.

On October 26, 1939, Tiso became president of the newly created Slovak Republic. Although he personally opposed Nazism, he was forced to share power with the fascist paramilitary Hlinka Guards, and his government

willingly collaborated with the Germans, allowing some 68,000 Slovakian Jews to be deported to German concentration camps.

Tiso's government survived an internal uprising in August 1944 but fell to the Red Army and Czech partisans in April 1945. Tiso fled to Austria but was extradited to Czechoslovakia, where he was tried and convicted of treason and war crimes. He was executed by hanging at Bratislava, Czechoslovakia, on April 18, 1947. Largely in consequence of Tiso's authoritarian, collaborationist regime, the postwar communist government of Czechoslovakia treated Slovaks as second-class citizens and repressed the Catholic Church.

Tito (1892–1980)

Yugoslav Resistance leader and later premier and president of Yugoslavia. Born into a peasant family in Kumroveć (Croatia), then part of the Austro-Hungarian Empire, Josip Broz was apprenticed to a mechanic and followed this trade, traveling throughout the Dual Monarchy. In 1913, he was drafted into the Austro-Hungarian Army.

An excellent soldier, Broz was a sergeant major commanding a platoon in a Croatian regiment at the outbreak of World War I, and he fought against the Russians until his capture in 1915. While a prisoner of war, Broz became fluent in Russian. Released following the March 1917 Russian Revolution, he joined the Bolsheviks at Petrograd but was then a political prisoner until the Bolsheviks took power in October 1917.

Broz fought in the Red Guard during the Russian Civil War but returned to Croatia in 1920 to take an active role in the Communist Party of

Yugoslavia (Komunistička Partija Jugoslavije, KPJ). His underground work, often conducted from jail, brought his rapid rise in the party apparatus as a member of the KPJ Politburo and Central Committee. He took the pseudonym “Tito” for security reasons.

Imprisoned during 1929–1934, Tito became secretary-general of the KPJ in 1937. Following the German invasion of Yugoslavia in April 1941, he assumed command of the communist Partisan movement, with the twin goals of expelling the Germans and ultimately securing control of the government. Tito and the Partisans employed guerrilla tactics to compensate for their lack of advanced weaponry.

Tito’s Partisans were in competition with the Serbian-dominated Četniks (Chetniks) led by General Dragoljub “Draza” Mihajlović, minister of war in the exiled government. For the most part, the Ćetniks were unwilling to embark on the types of actions that would bring widespread reprisals by the Germans against the Yugoslav population, whereas the Partisans had no such inhibitions. In a controversial decision that had far-reaching repercussions for the political future of Yugoslavia, the British government, which provided the Allied military support for the Yugoslav Resistance, shifted all support to the Partisans in 1943.

Tito’s Partisans grew to a force of 800,000 by the end of the war, tying down a large number of Axis divisions. By then, Tito was in full control of Yugoslavia, and he insisted that the Red Army ask permission to enter Yugoslavia in pursuit of the Germans. Tito’s forces attempted to annex the southern provinces of Austria, moving into Carinthia. Only the timely arrival of the British V Corps prevented the seizure of this territory. The Yugoslavs were finally convinced by threat of force to leave Austria in mid-May 1945.

Tito took his revenge on the Croats, many of whom had been loyal to the Axis powers, as had the Slovenes. Perhaps 100,000 people who had sided with the Germans were executed by the Partisans without trial within weeks of the war’s end. The majority of German prisoners taken in the war also perished in a long “march of hate” across Yugoslavia.

With the support of the Red Army, Tito formed the National Front and consolidated his power. He nationalized the economy and built it on the Soviet model. He often went his own way in matters of foreign policy, however, leading to a break with the Soviet Union in 1948. After that, he became more pragmatic in economic matters and allowed a degree of

decentralization. He claimed that there might be “different paths to socialism,” giving birth to what became known as polycentrism.

Tito traveled widely and became one of the principal leaders of the nonaligned nations. By 1954, however, he had ended reform, and in the mid-1970s, the Yugoslavian economy began to falter, and nationalist pressure from various ethnic groups threatened to break up the state. Tito died on May 4, 1980, in Ljubljana, Yugoslavia. The complicated federated state system that he had put in place did not long survive his death, as the various ethnic groups asserted their independence.

Tizard, Sir Henry Thomas (1885–1959)

British scientist. Born in Gillingham, Kent, England, on August 23, 1885, Henry Thomas Tizard studied math and chemistry at Magdalen College, Oxford, and established his academic reputation with the publication of a paper on the color changes of indicators in 1911. Tizard joined the Royal Garrison Artillery at the start of World War I. In June 1915, he transferred to the Royal Flying Corps as an experimental equipment officer, testing bombsights and then aircraft. In 1917, he published his scientific system for investigating the performance of aircraft. As a lieutenant colonel, he was assigned to the headquarters of the Ministry of Munitions in 1917.

In the spring of 1919, Tizard left the army and returned to Oxford as a lecturer. There he conducted pioneering work on aviation fuel, which led to a new understanding of the internal combustion engine. Tizard accepted an invitation to join the Department of Scientific and Industrial Research in 1920, and by 1927, he was its permanent secretary and largely responsible for

establishing the Chemical Research Lab. Tizard became rector of the Imperial College of Science and Technology in 1929, a post he held until 1942. He was also increasingly involved with defense matters as a member of the Aeronautical Research Committee, which he chaired from 1933 to 1943, as he did the engine subcommittee.

That period saw revolutionary advances in aircraft and engines as well as research into ways to defend against hostile aircraft. The Air Ministry appointed Tizard to head a committee that would apply technical and scientific knowledge to strengthening British air defenses. Known as the Tizard Committee, it first met in January 1935. Its efforts led to the development and deployment of ground and airborne radar by 1939. Britain led the world in such work, and Tizard was knighted in 1937.

Tizard was instrumental in establishing a government group to conduct scientific intelligence, and he also investigated the feasibility of an atomic bomb. His greatest service to the war effort, however, may have been the mission he headed to Canada and the United States in August 1940. Tizard proposed that Britain share its most sensitive technical secrets with the United States. Ultimately, Britain provided full information on radar and the cavity magnetron.

On his return to Britain, Tizard became a semiofficial adviser to the minister of aircraft production and served on the Air Council. He did not get along with Frederick A. Lindemann (later Lord Cherwell), Prime Minister Winston L. S. Churchill's scientific adviser, and he accepted the presidency of Magdalen College, Oxford, in 1942, although two years later, he agreed to chair a new committee to study the potential effects of new weapons on defense policy. Tizard left Magdalen College in 1946 and returned to Whitehall as chairman of the Defence Research Policy Committee and the Advisory Council on Scientific Policy. He retired in 1952. Tizard died in Fareham, Hampshire, England, on October 9, 1959.

Tobruk, First Battle of (January 6–22, 1941)

North African battle between Italian and British forces. The Mediterranean port of Tobruk, located in northeast Libya some 70 miles from the Egyptian border, was an important focal point in the fighting in North Africa during 1941–1942. On December 7, 1940, Major General Richard O'Connor's Western Desert Force launched Operation COMPASS to drive invading Italian forces from Egypt. On December 11 at Sidi Barrani in Egypt, O'Connor's unit soundly defeated the Italians but was unable to capitalize on this victory immediately, as one of its two divisions, the Indian 4th Division, was withdrawn for service in the Sudan several weeks before the arrival of the replacement Australian 6th Division.

Following this necessary pause, O'Connor's forces crossed into Libya, and on January 5, 1941, they took Bardia on the coast, just across the border and east of Tobruk. On January 6, the British 7th Armoured Division (the Desert Rats) and the Australian 6th Division assaulted Tobruk, completely besieging the fortress there three days later.

Italian lieutenant general Pitassi Mannella defended Tobruk with 32,000 men, 220 guns, and 70 tanks along a defensive perimeter of some 30 miles. Following preparations, the Australian 6th Division launched an attack on the morning of January 21. It began with the largest artillery barrage in the Western Desert to that point, on a front about 2,500 yards wide along the southeast portion of the Italian perimeter, and it was supported both by British naval gun fire against the town and by Royal Air Force bombers. Bangalore torpedoes blasted holes in the Italian wire, and the infantry moved forward, supported by Matilda tanks. That portion of the Italian defensive line was secured, and Mannella was taken prisoner. The remainder of the Italian garrison surrendered the next day but not before destroying some of the port facilities.

At a cost of some 500 casualties, the British took 25,000 prisoners. They also captured 208 guns, 23 medium tanks, and 200 trucks. In the campaign thus far, O'Connor's forces had taken 100,000 Italian prisoners.

The British were soon able to get the port of Tobruk back into working order. Most of the city, including two water-distillation plants, was undamaged. O'Connor then continued his drive west.

Tobruk, Second Battle of (April 1941–January 1942)

Important North African land battle between the Afrika Korps (Africa Corps) and British Commonwealth forces in northeast Libya. Spearheaded by German lieutenant general Erwin Rommel's 5th Light Division (later reconstituted as the 21st Panzer Division), Axis forces had driven Commonwealth units back through Cyrenaica to the Egyptian border in March and April 1941. Allied losses had been heavy, but the commander in chief for the Middle East, Lieutenant General Archibald Wavell, had decided to defend the port of Tobruk.

Initially garrisoned by the Australian 9th Division, Tobruk repulsed several Axis attacks during mid-April. Throughout the following siege, Allied naval units and aircraft provided critical supplies and reinforcements to the garrison. During the summer and fall, Germany sent in the nonmotorized Afrika Infantry Division, the remainder of the 15th Panzer Division, and some miscellaneous German units. Italy supplied both regular infantry and Bersaglieri, artillery, and better armor elements, upgrading its previously poor-performing units. All of this was in preparation for an Axis seizure of Tobruk, followed by an advance on Egypt.

The Axis forces also established a line of interlocking fortified posts at Bardia and along the Egyptian border, built around the Italian Savona Infantry Division. Between Tobruk and the border, Rommel, nominally under the command of the Italian governor of Libya, General Ettore Bastico, established armor units centered on the Afrika Korps. The Italian Maneuver Corps was in support; it consisted of the Ariete Armored Division and elements of the Trieste Motorized Division.

In May and June, Wavell conducted Operations BREVITY and BATTLEAXE, respectively, in an attempt to break through the frontier line and to relieve Tobruk. Both failed, and Wavell was relieved and replaced by Lieutenant General Claude Auchinleck. Under him, Lieutenant General Alan Cunningham commanded the Eighth Army. Auchinleck began gathering his growing strength for Operation CRUSADER, scheduled for November, while Rommel brought in siege artillery for a final assault of the now largely British-garrisoned Tobruk.

The Allies struck the first blow, their well-camouflaged preparations being complete by November 17. The two-pronged Allied operation consisted of a slow but steady advance along the coast road by infantry and heavy tanks, while Cunningham’s armor units moved inland. A portion of the Ariete Division repulsed the British 22nd Armour Brigade at Bir el Gobi on November 18, but it was not until two days later that Rommel began to react to the Allied attack.

British tanks on patrol at Tobruk, Libya. (Library of Congress)

As Rommel shifted armored forces to attack and hammer some of the Allied mobile units, the British 70th Division in Tobruk assaulted the largely Italian infantry units holding the siege lines. Rommel wanted to force the Allies back so he might make his “dash to the wire” (the barbed wire along the Egyptian border erected by the Italians in the 1930s), but his advance failed to disrupt the Allies or capture Allied supply dumps.

Believing that Cunningham was moving too slowly, Auchinleck replaced him with Lieutenant General Neil Ritchie. Meanwhile, the New Zealand 2nd Division continued its advance to link up with the 70th Division at Tobruk.

Throughout this period, the Allied naval stranglehold in the Mediterranean kept supplies from arriving in North Africa. The dramatic destruction of the *Duisburg* convoy on the night of November 8–9 resulted in the temporary halt of all Axis convoys to Libya at the same time that Rommel’s battles exhausted his ammunition and tanks. He had no choice but to retreat.

As Axis forces began to pull back near Gazala, just west of Tobruk, and the Allies linked up with Tobruk, the Second Battle of Bir el Gobi occurred on December 4. The Giovani Fascisti (Young Fascists), a two-battalion volunteer unit, held off the advance of a brigade of the 4th Indian Division. After this battle and one other small action, however, Bastico and Rommel

were in agreement by the middle of the month that Axis forces had to fall back through Cyrenaica. The retreat went well, although all of Cyrenaica was lost. Isolated Axis units along the border were forced to surrender. The first German general of the war to be captured, Major General Arthur Schmitt, and 13,800 men marched off to prisoner-of-war camps.

This action was the first major victory by the British against an army with a substantial German element. The Germans and Italians had sustained 38,300 casualties, with almost 30,000 of them prisoners. Allied losses were 17,700 (7,500 prisoners).

The Axis supply situation from Italy soon improved, enabling the shipment of important reinforcements to North Africa. In January 1942, an Axis counterattack penetrated as far as Gazala, where both armies would face each other during the next several months.

Tobruk, Third Battle of (June 20–21, 1942)

The port of Tobruk in eastern Libya held great military significance but had also become a symbol of Allied defiance after it had withstood an eight-month Axis siege. During the winter of 1941–1942, British commander in the Middle East General Claude Auchinleck decided not to defend Tobruk in the event of another Axis advance. At the last moment, however, British prime

minister Winston L. S. Churchill reversed this decision, and in March 1942 the South African 2nd Division took over the defense of Tobruk. The Tobruk garrison consisted of two brigades of the South African 2nd Division, the Indian 11th Brigade, the 201st Guards Brigade, and the British Army's 32nd Tank Brigade with 61 operational Valentine tanks and a few Matildas.

South African major general Hendrik B. Klopper exercised command, but his force had little time to prepare for an approaching Axis assault. The defenses had deteriorated over time, and many of the mines had been removed and placed on the Gazala Line. As Major General Ettore Baldassarre's Italian XX Motorized Corps and Major General Walther Nehring's Afrika Korps approached, overall Axis commander Lieutenant General Erwin Rommel feinted toward the Egyptian border as if in pursuit of Major General Neil N. Ritchie's retreating British Eighth Army; then he wheeled north to the eastern end of the Tobruk defenses, which he reached on June 18. In 1941, Rommel had attacked the western end and failed in a series of bloody assaults. This time, however, he had both momentum and surprise on his side, and he was determined not to leave an enemy's fortified position to his rear as he advanced eastward.

The Axis attack began at dawn on June 20, 1941, led by assault engineers and supported by air attacks. The Afrika Korps had the most success, and the Italian XX Corps followed through a break in the defenses created by the Afrika Korps. A series of rapid movements within the fortress paralyzed the Allied response, and by the evening of June 21, the last of the garrison had surrendered, destroying as many supplies and as much of the port facilities as possible beforehand.

The Allies had 32,220 troops captured, including virtually all of the South African 2nd Division. Axis forces also secured invaluable supplies, including nearly 2,000 tons of fuel, 5,000 tons of food, 2,000 vehicles, and large amounts of ammunition (including both German and Italian stores). This booty was of immense help to Rommel in resuming his eastward drive, although there was considerable squabbling over its distribution.

The fall of Tobruk provided a supply port for the Axis forces close to the front. Moreover, it was a tremendous psychological blow to the Allies. With this and the Axis victory at Gazala (May 26–June 13), Rommel and the Italian commander in chief in Libya, General Ettore Bastico, were promoted to field marshal. Conversely, the Allied defeat led Britain's Middle Eastern commander, Auchinleck, to remove Ritchie from command of the Eighth Army on June 25 and assume that position himself. The fall of Tobruk also led Adolf Hitler to delay an assault against Malta in favor of allowing Rommel to continue his advance eastward toward the Nile.

Todt, Fritz (1891–1942)

German minister for arms and munitions. Born on September 4, 1891, in Pforzheim, Germany, Fritz Todt fought in the German Army during World War I and was awarded the Iron Cross. He subsequently studied engineering before joining Sager and Woerner, a company that specialized in building roads and tunnels.

Todt joined the National Socialist German Workers' Party (Nazi Party) in January 1922 and the Storm Troopers (Sturmabteilungen, or SA) in October 1931. In 1930, he published a paper titled "Proposals and Financial Plans for the Employment of One Million Men." This report impressed Adolf Hitler, and when he came to power in 1933 he appointed Todt to head technology and roadway construction as chief of what became known as the Organization Todt (OT). Fritz Todt was involved in every aspect of autobahn construction, from design to aesthetics, and he was a role model in National Socialist labor relations.

With the outbreak of war, the OT provided German troops with a highly skilled corps of engineers, filling Germany's expanding empire with new roads, bridges, aircraft fields, and fortifications. In 1941, Todt took responsibility for restoring the road and rail system in the Soviet Union. His growing influence in the Nazi Party hierarchy, however, brought him into conflict with Hermann Göring and Martin Bormann.

When Todt was appointed as the Reich's minister for arms and munitions in March 1940 (in addition to his other positions), he controlled all the major technical tasks of the German war effort. Over the next several years, the OT had large numbers of conscript laborers at its disposal. Todt also supervised construction of the Atlantic Wall, intended to repel an anticipated Anglo-American seaborne invasion launched from Britain.

Todt predicted that victory would eventually go to the Soviets. In a meeting with Hitler at Rastenburg in February 1942, alarmed at the attrition of equipment on the Eastern Front, he advised Hitler to end the war with the Soviet Union—counsel that displeased the führer. Todt died when his plane crashed shortly after takeoff from Rastenburg on the morning of February 8,

1942. Sabotage was suspected but could not be proven. Todt was succeeded by his assistant, Albert Speer.

Tōgō Shigenori (1882–1950)

Japanese foreign minister (1941–1942, 1945). Born in Kagoshima Prefecture, on Kyushu, on December 10, 1882, Tōgō Shigenori graduated from Tokyo Imperial University in 1908 and taught at Meiji University. Politically moderate, he joined the Foreign Ministry in 1912. Developing expertise in European and American affairs, he served in a number of increasingly senior posts at home and abroad during the 1920s and 1930s. From the mid-1930s, Tōgō emerged as a vocal, if ineffective, critic of the diplomatic orientation toward Nazi Germany that accompanied the military's growing domination of the Japanese government. He opposed the decision of Foreign Minister Hirota Kōki to conclude the Anti-Comintern Pact with Germany in November 1936.

Ironically, Tōgō became ambassador to Germany in 1937, but his tenure was short, and in 1938, pro-Nazi Ōshima Hiroshi replaced him. That same year, Tōgō became ambassador to the Soviet Union, where he played a major role in settling a long-standing dispute over fishing rights in the North Pacific. He also helped to prevent the Soviet-Japanese border clash at

Nomonhan from becoming a full-scale war in the summer of 1939. Tōgō then launched an initiative to conclude a nonaggression pact with the Soviets. Although unsuccessful at the time, those negotiations helped to lay the groundwork for the Japanese-Soviet Neutrality Pact of April 1941.

In November 1940, two months after the government concluded the Tripartite Pact with Germany and Italy, Tōgō was recalled to Japan. Despite his opposition to the pact, Tōgō became foreign minister in the cabinet of Prime Minister Tōjō Hideki in October 1941. As Japan prepared for war with the United States and other Western powers in Asia and the Pacific, Tōgō continued to conduct last-minute negotiations with Washington.

Japanese foreign minister Tōgō Shigenori. (Corbis)

Following the Japanese attack on Pearl Harbor (December 7, 1941), Tōgō and the Foreign Ministry were increasingly marginalized within the Japanese government. In the summer of 1942, the Tōjō cabinet established the Greater

East Asia Ministry, an umbrella organization charged with coordinating Japanese policy in occupied areas of China and Southeast Asia. Tōgō opposed the creation of the new ministry, not only because it usurped part of the conduct of Japan's foreign relations, but also because it drew personnel away from the Foreign Ministry. He resigned from his post in protest on September 1, 1942, and then took over the foreign ministry portfolio.

After resigning, Tōgō was appointed to the House of Peers, where he remained throughout most of the war. In April 1945, he became foreign minister under Suzuki Kantaro. An advocate of pursuing an early peace, Tōgō hoped at least to be able to preserve the imperial throne. He continued an ultimately abortive effort to secure Soviet mediation with the United States during the summer of 1945.

With Japan facing imminent destruction by August 1945, the Suzuki cabinet remained deadlocked over the issue of accepting unconditional surrender. By that time, Tōgō had emerged as the cabinet's most forceful opponent of the military's plans for a last-ditch defense of the home islands. Following the atomic bombings of Hiroshima and Nagasaki (August 6 and 9, respectively) and the Soviet declaration of war and invasion of Manchuria on August 9, Emperor Hirohito broke the deadlock in favor of peace. On August 15, 1945, Japan surrendered.

After the war, Tōgō was tried for war crimes by the International Military Tribunal for the Far East in Tokyo. He was accused of conspiring with the militarists to wage aggressive war by conducting bad-faith negotiations with the United States. Tōgō acknowledged that he was aware of the plans for the Pearl Harbor attack, but he claimed that he was forced by the military into continuing negotiations with the United States even after the decision for war had been made. Nevertheless, Tōgō was convicted and received a 20-year sentence. He died in Sugamo Prison, in Tokyo, on July 23, 1950.

Tōjō Hideki (1884–1948)

Japanese Army general and prime minister (1941–1944). Born in Tokyo on December 30, 1884, Tōjō Hideki graduated from the Japanese Military Academy in 1905. A career staff officer, he served as an attaché in Europe in the early 1920s. During the early 1930s, he associated himself with the Control Faction, an influential clique within the Japanese military that favored military cooperation with the civil bureaucracy and large corporations to expand Japanese influence in China. The failure of a coup attempt by the rival Imperial Way Faction in February 1936 paved the way for the Control Faction's domination of the army and eventually of Japan itself.

Because of his position as one of the Control Faction leaders, Tōjō's career prospered in the late 1930s. In 1938, he was recalled to Tokyo from Manzhouguo (Manchukuo), where he had been serving on the staff of the Guandong Army, to take up an appointment as an army vice minister. In 1940, he became army minister in the cabinet of Konoe Fumimaro. An ardent militarist determined to advance Japanese power, Tōjō was a keen supporter of the Axis alliance with Nazi Germany and expansion of the war in China.

Following the collapse of the Konoe cabinet in October 1941, Tōjō, still an active army officer, was appointed prime minister in an atmosphere of escalating tension with the United States. As prime minister, he did nothing to alleviate those tensions but rather sought to prepare Japan for a war he considered inevitable. On December 7, 1941, Japan initiated hostilities in the Pacific with its attack on Pearl Harbor.

Following an early succession of victories in Southeast Asia and the Pacific during 1941 and 1942, it became increasingly apparent that Tōjō and other Japanese leaders had grossly underestimated the political will and resources of the United States and its allies. In view of Japan's growing matériel inferiority, Tōjō attempted to centralize and coordinate the war effort by taking personal control of key posts in the cabinet and the army in 1943

and 1944. These actions, however, aroused opposition among members of powerful civil and military circles. Tōjō made a vain attempt to cultivate closer relations with Japan's Asian neighbors by convening the Greater East Asia Conference in November 1943. But the conference, which was attended by Japanese-sponsored puppet rulers from China and Southeast Asia, merely produced a vague declaration of Asian solidarity.

Under increasing pressure from his military and political rivals, who held him responsible for Japan's mounting defeats, Tōjō resigned in July 1944 after the fall of Saipan. Koiso Kuniaki became the new prime minister. Following Japan's surrender on August 15, 1945, Tōjō was tried and convicted of war crimes. He was hanged in Tokyo on December 23, 1948.

Tokyo, Bombing of (March 9–10, 1945)

The B-29 incendiary raid on Tokyo on the night of March 9–10, 1945, was the deadliest air attack of World War II. Conducted as a test of new tactics after disappointing results with precision methods, the raid set the pattern for a new firebombing campaign that devastated Japanese cities over the next five months.

By February 1945, the U.S. Twentieth Air Force's strategic bombing campaign against Japan was in trouble. New commander of its combat operations from the Marianas Major General Curtis LeMay had reorganized the staff, instituted new training, and designed new maintenance programs, but the achievements of his high-altitude precision-bombing attacks remained disappointing. Besides technological problems with the hastily fielded B-29

Superfortress, the biggest difficulty was the weather. Overcast skies and jet stream winds at normal bombing altitudes obscured targets and altered flight patterns. Other theater commanders were trying to gain control of the expensive B-29s, and LeMay knew that he could be relieved just as his predecessor had been if he did not produce significant success.

LeMay had some experience with fire raids in China and had conducted some experiments over Japan. Although unsure how higher headquarters would react to a departure from precision bombing, he and his staff decided to destroy key targets by burning down the cities around them. This would be achieved with low-level mass night raids. Such tactics would avoid high winds, reduce the strain on the B-29s' problematic engines, allow aircraft to carry more bombs, and exploit weaknesses in the Japanese air defenses.

The first raid employing these new tactics, Operation MEETINGHOUSE, was conducted against Tokyo on the night of March 9. The selected zone of attack covered six important industrial targets and numerous smaller factories, railroad yards, and home industries, but it also included one of the most densely populated areas of the world, Asakusa Ku, with a population of more than 135,000 people per square mile. For the first time, the XXI Bomber Command had more than 300 bombers on a mission—325 to be exact—and put more than 1,600 tons of incendiary bombs on the target.

Incendiary bombs dropped by U.S. Army Air Forces Boeing B-29 Superfortresses leveled entire city blocks of downtown Tokyo during air raids in 1945. The raid of March 9, 1945, was the most destructive air attack in history. (Corbis)

Before the firestorm ignited by Operation MEETINGHOUSE had burned itself out, between 90,000 and 100,000 people had been killed. Another 1 million were rendered homeless. Sixteen square miles were incinerated, and the glow of the flames was visible 150 miles away. Victims died horribly in intense fires that consumed the oxygen, boiled water in canals, and sent liquid glass rolling down streets. The B-29 crews fought superheated updrafts that destroyed at least 10 aircraft. They also wore oxygen masks to avoid vomiting from the stench of burning flesh. A total of 14 Superfortresses were lost on the mission.

The attack on Tokyo was judged a great success. It resuscitated the flagging strategic bombing campaign against Japan and restored the hopes of U.S. Army Air Forces leaders that the B-29s could prove the worth of independent airpower by defeating an enemy without the need for an invasion. MEETINGHOUSE set the standard for the incendiary raids that dominated Twentieth Air Force operations for the remainder of the war.

Tokyo Raid (April 18, 1942)

One of a half dozen U.S. carrier raids in the months after the December 7, 1941, attack at Pearl Harbor, the Tokyo Raid (Doolittle Raid) of April 18, 1942, was the first U.S. air strike on the Japanese home islands. Since the Pearl Harbor attack, the United States had suffered a series of costly defeats, and President Franklin D. Roosevelt rarely failed to stress to his military chiefs the need to strike Japan. Captain Francis S. Low, operations officer on the staff of chief of naval operations Admiral Ernest J. King, suggested that army bombers utilize carriers for a raid. King and commanding general of army air forces Lieutenant General Henry W. "Hap" Arnold approved, and Arnold picked Lieutenant Colonel James "Jimmy" H. Doolittle of his staff as army coordinator. Ultimately Doolittle led the mission.

The planners knew that Japanese picket ships were stationed 500 miles off the home islands. For that reason, attacking planes would have to be launched at 550 miles out. Although bombers could take off from carriers, they would not be able to return to them and would thus have to fly on to Zhuzhou (Chuchow), China, a flight of 2,000 miles. There they were to refuel, then fly on to Chungking 800 miles away. The B-25 Mitchell was the only army bomber that could both take off from a carrier and had that range. The plan called for the B-25s to bomb Japan at night and then land at the Chinese fields the next morning. The carrier *Hornet,* commanded by Captain Marc A. Mitscher, would transport them.

On April 2 the *Hornet* sailed from San Francisco, California, with 16 specially modified B-25s aboard. A few days later it rendezvoused with the carrier *Enterprise,* which was to provide air cover. The *Enterprise,* commanded by Captain George D. Murray, also had Task Force (TF) 16 commander Vice Admiral William Halsey aboard. TF 16 included the 2 carriers, 4 cruisers, 8 destroyers, and 2 oilers. Two U.S. Navy submarines also operated near the Japanese coast to report on enemy ship movements and weather conditions.

The Japanese were aware from radio traffic that something was in the offing, perhaps an attack on Japan itself. Combined Fleet Headquarters ordered naval aircraft concentrated in the Tokyo area and alerted picket boats off shore beyond the range of carrier aircraft. At 7:38 a.m. on April 18, about 650 miles off the Japanese coast, picket boat No. 23, *Nitto Maru,* detected the carriers. Although the U.S. cruisers promptly sank it, it was able to get off a radio message reporting the presence of American carriers.

Halsey now jettisoned the plan to fly the B-25s off on the afternoon of April 19 and bomb Tokyo at night. At 8:00 a.m. Halsey flashed this message to the *Hornet:* "Launch planes. To Colonel Doolittle and his gallant command Good Luck and God bless you."

Doolittle's B-25 was the first plane airborne, at 8:20 a.m.; all the planes were away within an hour. This was the only time in the war that U.S. Army Air Forces bombers were launched from a U.S. Navy aircraft carrier on a combat mission. TF 16 then turned about and departed the area at flank speed. Bad weather hid the U.S. warships from Japanese search planes and TF 16 escaped unscathed.

The B-25s achieved total surprise because the Japanese assumed an attack range of 200 miles and thus a later launch. At 12:30 p.m. Tokyo time, Doolittle's aircraft dropped the first bombs. Each bomb load consisted of two 500-pound high-explosive and two 500-pound incendiary bombs. Most of the planes struck Tokyo, although Kobe, Yokohama, and Nagoya were also bombed. No B-25s were downed over Japan, and only one was hit by antiaircraft fire. All, however, were subsequently lost, as the fields in China were unready to receive them. Of the 80 crewmen, 3 died of injuries, 4 were seriously injured, 5 were interned in the Soviet Union until they managed to escape to Iran in 1943, and 8 were captured by the Japanese; 3 of these were executed. Another died in captivity.

The raid inflicted little material damage, but it and the other U.S. carrier attacks had far-reaching effects. The raids led the Japanese to shift four fighter groups to the defense of Tokyo and other cities. It also led to a punitive army expedition in China in which perhaps 250,000 Chinese died. Most important for the course of the war, it increased support in Tokyo for pushing the outer defensive ring farther and adopting Admiral Yamamoto Isoroku's plan to draw out the U.S. fleet and destroy it. This latter led to the decisive Japanese defeat in the Battle of Midway on June 3–6, 1942. The raid also lifted American morale (Roosevelt told the American people it had been launched from "Shangri-La"). For his part in the attack, Doolittle was promoted two grades to brigadier general and awarded the Medal of Honor.

"Tokyo Rose" (1916–2006)

Japanese propagandist during World War II. Toguri D'Aquino achieved notoriety as one of several women who broadcast from Tokyo between 1943 and 1945. "Tokyo Rose" was a moniker created by her listeners, as there is no trace of the name in broadcast records. Born in Los Angeles on July 4, 1916, Iva Ikuko Toguri graduated from the University of California at Los Angeles in January 1940 and pursued graduate work there until June, when she began working with her father's business. In July 1941 she sailed for Japan without a U.S. passport, planning to visit a sick aunt and to begin the

study of medicine. By September 1941, she had decided to return permanently to the United States and applied for a passport, but that application was still in State Department hands when the war began.

By mid-1942, Toguri had worked as a typist for a news agency in Tokyo and then for Radio Tokyo. In November 1943, she began to host *Zero Hour* on Radio Tokyo, part of the Japanese psychological warfare designed to lower U.S. military morale. The 75-minute program was broadcast early each evening and aimed at American troops in the South Pacific. Toguri was variously introduced as Orphan Ann, Orphan Annie, "Your favorite enemy Ann," or "Your favorite playmate and enemy, Ann." The program was popular because it featured recorded big-band music.

Only in early 1944 did Toguri become aware that U.S. troops had given her—and other Japanese women broadcasting over Radio Tokyo—the "Tokyo Rose" title. She was the only American citizen given that nickname; the others were all Japanese. In April 1945, she married Felipe D'Aquino, a Portuguese citizen of Japanese Portuguese ancestry.

Following her postwar admissions to the press about her wartime role as well as inflammatory stories by columnist Walter Winchell, among others, Toguri D'Aquino was arrested by the U.S. Army in September 1948 and taken to the United States to stand trial for treason. Federal Bureau of Investigation (FBI) inquiries into her activities took several years. Her treason trial began in San Francisco on July 5, 1949, and ended on September 29 when the jury delivered a guilty verdict. On October 6, 1949, she was sentenced to 10 years' imprisonment, fined $10,000, and stripped of her American citizenship. She became only the seventh person to be convicted of treason in U.S. history.

Iva Toguri D'Aquino (known as Tokyo Rose) on her release from a federal women's reformatory in 1956. (Library of Congress)

On January 28, 1956, Toguri D'Aquino was released. She fought several efforts at deportation and went to work in the Chicago area.

In November 1976, Toguri D'Aquino filed a third petition seeking a presidential pardon (she had applied unsuccessfully in 1954 and 1968). That same year, an investigation first by the *Chicago Tribune* and then the television program *60 Minutes* determined that two of the star witnesses in Toguri D'Aquino's trial had lied during their testimony, apparently coerced to do so by the FBI. Given these revelations, she received a full pardon on January 19, 1977, from President Gerald Ford. Toguri D'Aquino died in Chicago on September 26, 2006.

Tolbukhin, Fedor Ivanovich (1894–1949)

Soviet Army marshal of the Soviet Union. Born in the village of Androniki, Yaroslavl Oblast, Russia, on June 16, 1894, Fedor Ivanovich Tolbukhin entered the Russian Army in 1915 during World War I and rose to the rank of captain by war's end. He joined the Red Army in 1918 and was a divisional chief of staff in the Russian Civil War. After attending service schools, he graduated from the Frunze Military Academy in 1934. Tolbukhin became chief of staff, first of a division and then of a corps. He next held the same post with the Transcaucasian Military District in 1938, when he also joined the Communist Party.

Promoted to major general in June 1941, Tolbukhin continued as chief of staff in what became the Transcaucasian Front following the German invasion of the Soviet Union. From late 1941, he was chief of staff of the Caucasian Front and then the Crimea Front. He commanded the Fifty-Seventh Army at Stalingrad beginning in July 1942. Promoted to lieutenant general, Tolbukhin led the main effort in the Soviet counteroffensive. He took command of the Sixty-Eighth Army on the Northwestern Front in February 1942 and the Southern Front in March. He was promoted to colonel general in April and to army general in September. Tolbukhin's army was redesignated the 4th Ukrainian Front in October.

Along with General Andrei Yeremenko, Tolbukhin led the Soviet offensive that retook the Crimea in May 1944. Thereafter, he commanded the 3rd Ukrainian Front, which liberated Bulgaria, Romania, Hungary, and Austria, and pushed into Yugoslavia. He was named a marshal of the Soviet Union in September 1944. At the end of the war, Tolbukhin commanded the Southern Group of armies in Bulgaria and Romania. His final army assignment was to command the Transcaucasian Military District, which he did until his death in Moscow on October 17, 1949.

TOLSTOY Meeting

See Churchill-Stalin Meeting

TORCH, Operation (November 8, 1942)

The Allied invasion of North Africa. Following the December 7, 1941, Japanese attack on Pearl Harbor, U.S. president Franklin D. Roosevelt agreed with the British position that the Allies should first concentrate on Germany, the most powerful of the Axis opponents. U.S. planners, especially U.S. Army chief of staff General George C. Marshall, sought the earliest possible invasion of France. They supported GYMNAST, a British contingency plan based on a cross-Channel invasion, and ROUNDUP, a 48-division invasion of France projected to occur by April 1943. However, the failure of the attack on Dieppe, France, on August 19, 1942 (Operation JUBILEE), led the Americans to concede that a cross-Channel invasion lay many months, if not years, in the future. Winston L. S. Churchill and British planners meanwhile attempted to interest the United States in a more opportunistic approach that would include operations in the Mediterranean theater.

Some of the many vessels in the Allied convoy crossing the Atlantic to take part in Operation TORCH, the invasion of North Africa in November 1942. (Time Life Pictures/National Archives/The LIFE Picture Collection/Getty Images)

Roosevelt had promised Soviet leader Joseph Stalin that the Western Allies would undertake an invasion by the end of 1942 and was determined to honor that pledge. But if a cross-Channel invasion was impossible, where might such an assault be mounted? Churchill argued for attacks against what he termed the "soft underbelly of Europe," in the Mediterranean. Even before the Dieppe Raid, Roosevelt and Churchill had settled on an invasion of North Africa, supposedly not to the exclusion of ROUNDUP.

Gaining control of Vichy-administered Morocco, Algeria, and Tunisia would provide bases from which the Allies could conduct both air operations to help protect their Mediterranean shipping and strategic bombing raids against targets in Southern Europe. The area would also offer a location from which to mount invasions of such Mediterranean islands as Sicily, Sardinia, and Crete or even mainland Europe in Italy or Greece. Further, an invasion of Northwest Africa would provide badly needed combat experience for U.S. troops.

Roosevelt became the chief proponent of the operation and insisted on it over the objections raised by many of his own service chiefs, including Marshall. The invasion, code-named TORCH, was timed to coincide with the

planned breakout of British Empire forces at El Alamein in Egypt; the Allies hoped to crush Axis troops in a pincer movement between the two forces. On October 23, British Eighth Army commander General Bernard Montgomery initiated the final contest for control of North Africa in Operation LIGHTFOOT, the Battle of El Alamein (October 23–November 4). Superior British resources carried the day against tenacious Axis resistance, and by November 2 the Eighth Army had broken through. The army then began a pursuit of German field marshal Erwin Rommel's Axis forces, which made good their escape.

On November 8, British and U.S. forces carried out their surprise landings in Morocco and Algeria, the largest amphibious operation in history to that time. The British had favored landings in central North Africa, at Tunis and Bizerte in Tunisia, or at least at nearby Bône in eastern Algeria, but the Americans were more cautious and won the point. The landings occurred at Casablanca in Morocco and at Oran and Algiers in Algeria. U.S. Army lieutenant general Dwight D. Eisenhower, commanding U.S. troops in Britain, was appointed commander in chief, Allied Expeditionary Force. His deputy was another American, Major General Mark W. Clark. Eisenhower saw to it that U.S. and British officers were thoroughly integrated within his staff, and British admiral of the fleet Andrew B. Cunningham directed all naval forces.

The most westerly landing, at Casablanca on the Atlantic, ensured for the Allies a lodgment in North Africa even if the other two landings inside the Mediterranean went awry. Major General George S. Patton commanded the Western Task Force of 38,000 men, escorted by warships led by U.S. rear admiral Henry K. Hewitt. The force had steamed all the way from Norfolk, Virginia, one of the longest expeditionary efforts in history.

The other two invasions were mounted from England and went ashore in Algeria. The Central Task Force, under U.S. Army major general Lloyd Fredendall, numbered nearly 41,000 men (37,100 Americans and 3,600 British), supported by British commodore Thomas H. Troubridge's covering warships. The 55,000-man Eastern Task Force headed for Algiers was largely British in composition (45,000 British troops and only 10,000 Americans), but to give the illusion that it was mostly American, U.S. major general Charles Ryder had command. Once Algiers was secured, British lieutenant

general Kenneth A. N. Anderson took command. British vice admiral Sir Harold M. Burrough commanded its covering warships.

During the landings, the Allies made every effort to emphasize the U.S. role and downplay British participation. Given the British attack against French ships at Mers-el-Kébir, Algeria, on July 3, 1940, and British operations in Syria (June 8–July 4, 1941), Allied leaders rightly assumed that Americans would receive a far friendlier reception from French forces than would the British. Thus, efforts were made to show the American flag, quite literally, wherever possible.

No one knew the extent to which French troops would resist the invasion. U.S. diplomat Robert Murphy made preliminary contacts with Vichy French officials in North Africa, and on October 22 General Clark had a secret meeting near Algiers with French major general Charles Mast, chief of staff of XIX Corps. This meeting did not bring the desired agreement, and for the most part, French troops resisted the landings.

Operation TORCH began early on the morning of November 8. The Casablanca operation was widely dispersed, at Safi, Fedala, Mehdia, and Port Lyautey. Although taken by surprise, the French troops fought well. The unfinished French battleship *Jean Bart* lay at Casablanca. Although it was incapable of movement, its 15-inch guns nonetheless soon began a duel with the U.S. battleship *Massachusetts*. French naval units, including the cruiser *Primauguet*, attempted a sortie, but superior U.S. naval strength beat them back. In the battle, four destroyers and eight submarines of the French Navy were either sunk or missing, and 490 French fighters were killed and another 969 wounded. The French at Casablanca surrendered on November 11.

The two Allied landings east and west of Oran encountered heavy French resistance. An attempt by two former U.S. Coast Guard cutters to run into the port failed, and a U.S. airborne battalion, flying all the way from Britain, was only partially successful in securing nearby airfields. At Algiers the frontal naval assault failed, but the city was soon ringed by Allied troops on the land side. The Allies secured their objectives before long. Overall casualties were light, and the landings provided the Allies with excellent training for their subsequent invasions of Europe.

Adolf Hitler now decided to reinforce North Africa. Had these resources been sent to Rommel earlier, the Axis powers might have secured the Suez

Canal. Hitler's belated decision only delayed the inevitable and ensured that the ultimate Axis defeat in Tunisia would be more costly.

Despite misgivings, Eisenhower negotiated with the commander of Vichy France's armed forces and former premier Admiral Jean Darlan, who was visiting in Algiers at the time of the landings. On November 11, Darlan agreed to assist the Allies by ordering a cease-fire in return for heading the administration of French North Africa. Darlan was, however, assassinated on December 24, allegedly by a monarchist acting alone, a deed that removed a potential embarrassment to the Western governments. The British and French then installed General Henri Giraud, who had escaped from France, as commander of French forces in North Africa, ignoring General Charles de Gaulle. The latter, understandably furious, had not even been informed of the landings beforehand.

On November 9, Marshal Henri Philippe Pétain's Vichy French government responded to the Allied North African invasions by severing diplomatic relations with the United States. Nonetheless, Hitler ordered German troops into "unoccupied" France. Operation ATTILA had been drawn up by the Germans in 1940. Its main objective was to capture the principal French naval units at Toulon. But on November 27, French crews frustrated the German attempt and scuttled 77 ships, including 3 battleships.

Once the Allied forces that had landed in North Africa had secured their initial objectives ashore, they moved to accomplish two key objectives: to secure ports in Tunisia and block the resupply of Axis units and to build up a force in Morocco to occupy Spanish Morocco if Spain—or the Germans acting through Spain—should attempt to take Gibraltar. As it transpired, the latter was unnecessary, because the landings alone forced the Spanish into a more neutral stance.

Allied forces were unprepared for immediate overland operations but nonetheless were forced into conducting a land campaign by Hitler's prompt reinforcement of North Africa. As early as November 9, he had dispatched troops to Tunisia to occupy the important airfield at El Aouina. German and Italian units began arriving in North Africa at a rate of about 1,000 men a day.

Patton's force at Casablanca linked up with units moving west from Oran to threaten Spanish Morocco, and the British moved east to secure airfields in eastern Algeria, necessary for providing air support for ground operations

beyond the range of Gibraltar. On November 12, two British parachute companies dropped on Bône, supported by commandos from the sea. The Souk-el-Arba airfield fell on November 16. The next day, Anderson's I Corps drove from Oran and Algiers into Tunisia, with the objective of securing the port of Bizerte.

Although I Corps had moved from Bône into the mountains only 20 miles southwest of Bizerte, the drive stalled after several weeks. It fell victim to insufficiently aggressive Allied leadership, rainy weather that delayed reinforcements from Algiers some 500 miles to the west, the rapid Axis reinforcement, and aggressive defensive actions by General of Panzer Troops Walther Nehring, whose counterattacks ended the Allied "race for Tunis."

Nehring, who was pessimistic about Axis chances, soon found himself replaced by Colonel General Jürgen von Arnim. Thus, 1942 ended in a temporary stalemate once Rommel's forces successfully linked up with Arnim's Tunisian defenders. Operation TORCH, which many claim delayed the Allied goal of a cross-Channel invasion, had nonetheless proven successful. Subsequent Allied amphibious operations in Sicily (July 9–August 22, 1943), Italy (September 9), and Normandy (June 6, 1944) benefited immensely from the operation.

Torpedoes

Self-propelled weapons armed with explosive charges designed to be launched by ships, submarines, or aircraft against enemy ships. Torpedoes were the deadliest of naval weapons, especially when launched from submarines. The torpedo was invented by Englishman John Whitehead for the Austro-Hungarian Navy in 1866, but those in use by 1939 were far more capable than his seven-knot, flywheel-driven weapon.

Except for Japan, however, no nation entered World War II with torpedoes that differed significantly from those of World War I. All were straight-running and had the same top speeds (39 knots to 47 knots), ranges (2,500 yards to 7,000 yards), and depth-setting mechanisms as those of the earlier war. A few countries had influence warheads that were expected to detonate as they passed under the ship's hull, thereby breaking its back, but those proved unreliable in early operations and had to be withdrawn until their technical faults were corrected. By war's end, though, the most advanced torpedoes had homing guidance and a complex variety of influence warheads, and more important, they had become the critical weapon of war between naval forces on and above the surface and those below.

One of the aerial torpedoes carried by the U.S. Navy's Grumman TBF Avenger torpedo bomber, aboard an aircraft carrier in the South Pacific, January 1943. (National Archives)

Employed principally by submarines, torpedoes were responsible for more than 30 percent of the warship losses and 70 percent of merchant shipping losses during the war. Those statistics are rather ironic, given that before the war submarines were not expected to play a significant role in naval operations and that the three naval powers that employed torpedoes most effectively suffered torpedo reliability problems during the war's early years. U.S. and German difficulties with their weapons' warheads, depth-setting mechanisms, and guidance systems are the best known, but Great Britain suffered similar problems with its own torpedoes. The Royal Navy accepted the fleet's reports, however, and corrected the technical faults within nine weeks of receiving the first report.

The United States and Germany waited nearly a year to examine their problems, and another year passed before they corrected their weapons'

deficiencies. Nonetheless, those two countries best demonstrated the deadly effectiveness of the submarine-torpedo combination in naval warfare. In fact, Germany and the United States possessed the most technologically advanced torpedoes at war's end, with the former having the best antiship torpedo and the latter the world's only antisubmarine torpedo, designated the Mark 24 mine to hide its true nature.

Japan entered the war with the only torpedoes that were significantly better than those of World War I. Some Japanese submarine and ship torpedoes employed an oxygen-alcohol power train that gave their Long Lance torpedoes a speed of almost 50 knots and a range exceeding 42,000 yards with little wake. They also had the war's most powerful warheads (weighing more than 1,000 pounds), which were also extremely reliable, providing Japan's highly trained crews with a critical advantage in ship-to-ship and submarine-to-ship engagements.

Japan wasted that technological advantage by not employing the torpedoes' most deadly platform, the submarine, effectively. Moreover, Japan never developed a homing system to guide its torpedoes toward a ship's engine noises or wake. More important, by 1943, naval airpower and air defenses including radar had increased engagement ranges to the point that in many cases, submarines became the torpedo's only tactically viable delivery platform, rendering Japan's advantage in torpedo range all but irrelevant.

After World War I, France designed a larger, more powerful torpedo, which resulted in the impressive 21.7-inch Model 1923DT. A submarine version, which emphasized speed over range, was also developed. Italian torpedoes were generally reliable. In fact, Italy's aircraft-carried torpedoes were so much better than Germany's that Luftwaffe antishipping squadrons preferred to use Italian models, and Germany imported nearly 1,000 Italian aerial torpedoes during the war. Soviet torpedo development was generally unsuccessful until the 1932 purchase of an Italian 21-inch weapon that formed the basis for the major types used by the Soviets during the war. Whereas Japan had gone to 61cm (24-inch) torpedoes (but only in surface ships, for Japanese submarines used the 21-inch oxygen-driven torpedo), many of the minor navies still employed the smaller and older torpedoes on their ships and submarines, but 45cm torpedoes were carried primarily by Japanese aircraft until 1943, when they also began to carry the larger 533mm models.

Much has been written about the revolutionary changes that torpedoes underwent in the course of the war. Most of this transformation was driven by the Battle of the Atlantic between the Western Allies and the German Navy, where torpedo and antisubmarine detection systems shaped the course of the battles.

By 1942, Germany had homing torpedoes that guided onto the target ship's engine noises and pattern-running torpedoes that made evasion difficult. Research programs included wake-homing, active sonar-based terminal guidance, and even a rocket-propelled high-speed torpedo, which, however, never got past the drawing board. Fortunately for the Allied powers, Germany's research and development effort lacked direction before Admiral Karl Dönitz took command of the Kriegsmarine in January 1943.

As torpedoes proved critical to the German U-boat arm, so too did they figure in the Western Allies' struggle against the U-boat. The Allies developed search and guidance systems for torpedoes to attack maneuvering underwater submarines. The Mark 24 mine employed from Allied antisubmarine aircraft used a descending circular search and passive acoustic homing guidance to seek, find, and attack submerged German vessels by detecting and following the noises made by the U-boats' machinery. The Mark 24 was the precursor to modern antisubmarine torpedoes, as was the German homing torpedo, father to the antiship torpedoes carried by today's submarines.

Toulon, Scuttling of French Fleet at (November 27, 1942)

When British and U.S. forces invaded French North Africa on November 8, 1942, 81 ships of the French Navy were anchored at Toulon, France, under the command of Admiral Jean de Laborde. Only a third of the fleet's ships were ready to sail. Another third required significant work, and the remainder had been decommissioned in accordance with the armistice with Germany.

Even before the July 1940 armistice with Germany, the French government had promised Britain that it would destroy the fleet if necessary to prevent it from falling into German hands. This pledge notwithstanding, London made an effort to secure units of the French fleet, and at Mers-el-Kébir during Operation CATAPULT on July 3, 1940, British ships opened fire on French ships, sinking a number of them and killing nearly 1,300 French seamen.

Despite these actions, France honored its pledge. Two years later, after arranging a cease-fire with the Allies in North Africa on November 11, 1942, French Navy commander Admiral Jean Darlan ordered the fleet to sail from Toulon to North Africa. That same day, German soldiers began occupying the area around the port city and positioned artillery to fire on the fleet should it attempt to depart. While the Germans tightened their noose, the fleet's officers debated their options. They feared both a German effort to capture the French ships from the land and a repetition of the incident at Mers-el-Kébir. Most remained loyal to the Vichy government and opposed the idea of attempting to sail the fleet to Africa, although officers subsequently had to quell anti-German demonstrations on several ships.

Darlan tried to convince Vichy minister of the navy Admiral Paul Auphan to order the fleet to sail, but Vichy officials replaced Auphan with the more pliable Admiral Jean-Marie Abrial. They negotiated an agreement with the Germans that promised the neutrality of the Toulon naval base and handed over the remaining 158 ships of France's merchant fleet (totaling 646,000 tons). The Germans, however, continued preparations to seize Toulon.

On November 14, Laborde ordered all ship crews to make the necessary preparations to scuttle and prevent the capture of their vessels. German troops entered the Toulon base in force at 4:45 a.m. on November 27 but failed to surprise the French. Laborde then ordered the ships scuttled, and most had

sunk by the time German soldiers reached the piers at 6:20 a.m. French crews sabotaged critical systems and heavy guns with explosives to prevent their salvage, and they detonated explosives on those ships in dry dock. Five submarines managed to reach the open sea. Of these, 1 was lost at sea, 3 joined the Allies in North Africa, and 1 was interned in Spain. In all, the French scuttled 77 ships, roughly half the tonnage of the entire French Navy. The total included 3 battleships (the *Strasbourg, Dunkerque,* and *Provence*), 7 cruisers, a seaplane tender, 32 destroyers, 16 submarines, and 18 smaller craft. German and Italian engineers subsequently managed to salvage and repair 4 destroyers, 2 torpedo boats, and 2 submarines.

Tovey, Sir John Cronyn (1885–1971)

British Royal Navy admiral. Born in Borley Hill, Rochester, Kent, England, on March 7, 1885, John Cronyn Tovey entered the Royal Navy's cadet training establishment, HMS *Britannia,* in 1900. As commander of the destroyer *Onslow,* he distinguished himself in the 1916 Battle of Jutland by conducting a torpedo attack under heavy German fire.

After the war, Tovey attended the Royal Naval Staff College and the Defence College, worked in the Admiralty Plans Division, and commanded a destroyer flotilla in 1925. In 1932, he took command of the battleship *Rodney*. Promoted to commodore early in 1935 and then to rear admiral that same year, his first seagoing flag appointment was as rear admiral for destroyers in the Mediterranean Fleet in March 1938.

At the beginning of World War II, Vice Admiral Tovey was commander, Light Forces, Mediterranean Fleet. He led four light cruisers against the Italian main fleet in the Battle of Calabria on July 9, 1940. In October 1940, Prime Minister Winston L. S. Churchill named Tovey to replace Sir Charles Forbes as commander in chief, Home Fleet. In this post, Tovey led the hunt for the German battleship *Bismarck*. He commanded in person aboard the battleship *King George V* when it and the *Rodney* pummeled the *Bismarck* into a burning wreck on May 26, 1941. Despite one mistake when he thought the *Bismarck* was far north of its actual position, he had conducted the operation well.

Following the German invasion of the Soviet Union on June 22, 1941, and the extension of British and U.S. aid to the Soviet Union, Tovey's Home Fleet had to deal with attacks on Allied convoys to Murmansk and Archangelsk by German U-boats, bombers, and surface ships based in Norway. The difficult assignment of defending the convoys was largely accomplished, except for convoy PQ 17 in July 1942. At that time, Tovey was under orders to keep the main fleet clear of German air bases and so could do little as the convoy was savaged.

Tovey was part of another controversial episode, the struggle to secure B-24 bombers for convoy escort. He insisted that the key to an Allied victory was the Battle of the Atlantic, and he harried the Admiralty with calls for long-range aircraft to counter the U-boats. This made him unpopular with Churchill, who was enthusiastic about strategic bombing. In May 1943, just as the Atlantic battle was being won in no small part due to the aircraft Tovey had been demanding, Churchill replaced him as commander in chief of the Home Fleet. Tovey then assumed the post of commander in chief of the Nore, the point where the Thames River meets the North Sea. He was on the short list to be first sea lord in 1945 but was passed over as being "too obstinate," and he retired.

Tovey was made a baron in 1946. He later served four years as a lay official in the Church of England. Tovey died in Funchal, Madeira, on January 12, 1971.

Towers, John Henry (1885–1955)

U.S. Navy admiral. Born in Rome, Georgia, on January 20, 1885, John Henry Towers graduated from the U.S. Naval Academy at Annapolis in 1906. He qualified as a pilot in 1911, only the second U.S. Navy officer to win his wings, and he then helped develop and test early naval aircraft. In 1914, he commanded the naval aircraft in operations at Veracruz, Mexico.

During World War I, Towers served as assistant director of the new Division of Naval Aviation in the office of the chief of naval operations, helping to organize the navy's air effort, including antisubmarine activity. After the war, as an early advocate of naval airpower, he commanded the navy's first aircraft carrier, the *Langley*, between 1927 and 1928. Towers also studied at the Naval War College and commanded the San Diego Naval Air Station and the aircraft carrier *Saratoga*.

In June 1939, Towers was promoted to rear admiral and began a three-year assignment as chief of the Bureau of Aeronautics, where he oversaw the growth of U.S. naval air forces and pilot training. Under his leadership, the air arm of the navy grew from 2,000 aircraft in 1939 to 39,000 in 1942. In October 1942, he became commander of U.S. naval aviation in the Pacific and was promoted to vice admiral. In early 1944, Towers became deputy commander in chief, U.S. Pacific Fleet and Pacific Ocean Area. His fervent advocacy of naval aviation created enemies and kept him from a combat assignment until July 1944, when he assumed command of Task Force 38, too late in the war to see any significant action.

Promoted to full admiral, Towers assumed command of the Fifth Fleet in November 1945 and of the U.S. Pacific Fleet in February 1946. In the immediate postwar years, he consistently opposed the establishment of an

independent air force. He headed the General Board until his retirement in December 1947 and then worked as assistant to the president of Pan American Airways. Towers died in Saint Albans, New York, on April 30, 1955.

Toyoda Soemu (1885–1957)

Japanese Navy admiral. Born in Ōita Prefecture, Japan, on May 22, 1885, into a samurai family, Toyoda Soemu graduated from the Japanese Naval Academy in 1905 and became a gunnery officer. He graduated from Gunnery School, then taught there, before also graduating from the Naval War College.

Between 1919 and 1922 as a lieutenant commander, Toyoda was a resident officer in Britain. Promoted to captain in 1925, Toyoda commanded the cruiser *Yura* and then the battleship *Hyuga*. In 1927, he took command of Submarine Division 7. Promoted to rear admiral in 1931, he was assigned as chief of the Intelligence Department. He next served as chief of the Operations Department of the Naval General Staff, chief of staff of the Combined Fleet (1933), and chief of the Education Bureau of the Navy Ministry (1934).

Promoted to vice admiral in 1935, Toyoda assumed command of the Second Fleet and then command of the Fourth Fleet in 1937. Thereafter, he was assigned as chief of the Naval Affairs Bureau of the Navy Ministry and chief of the Shipbuilding Office. Promoted to admiral in September 1941, Toyoda commanded the Kure Naval District. In 1941, he was recommended for the post of minister of the navy, but General Tōjō Hideki blocked the

appointment because of Toyoda's strong antiarmy sentiments. Toyoda joined the Supreme War Council in November 1942 and assumed command of the Yokosuka Naval Arsenal in May 1943.

In May 1944, Toyoda succeeded Admiral Koga Mineichi as commander in chief of the Combined Fleet. Toyoda was firmly committed to the policy of making a strong offensive strike. His first attempt took place in Operation A-GO and resulted in the June 19–21, 1944, Battle of the Philippine Sea, which turned out to be a catastrophic defeat for Japan. Nonetheless, Toyoda continued his policy of initiating a major offensive fleet action, and he developed a series of contingency plans (the SHŌ operations).

Operation SHŌ-1 culminated in the Battle of Leyte Gulf, waged from October 23 to 26, 1944. The largest naval battle in history, it was a major Japanese defeat. In April 1945, Toyoda instituted steps to save Okinawa, resulting in kamikaze attacks, including that of the battleship *Yamato*.

Toyoda replaced Admiral Ozawa Jisaburo as navy chief of staff in May 1945 and held that position to the end of the war. He was one of the triumvirate of die-hard military leaders, along with Generals Umezu Yoshijiro and Anami Korechika, who rejected unconditional surrender. Following the war, Toyoda was arrested as a war criminal and tried but was acquitted. Released in September 1949, he died in Tokyo on September 22, 1957.

Treasury Islands, Battle of the (October 27–November 6, 1943)

The Allied attack on the Treasury Islands group of the Solomons was part of the strategy of isolating Rabaul and Bougainville. Blanche Harbor would provide an excellent staging area for operations against Bougainville, and a preliminary reconnaissance indicated the presence there of only some 250 Japanese troops.

On October 27, 1943, in Operation GOODTIME, some 4,600 New Zealand troops and 1,966 Americans supported by aircraft and six destroyers came ashore on Mono and Stirling, the two islands comprising the Treasury Islands group. U.S. rear admiral George A. Fort commanded the support group.

A new assault element was the employment of light-draft improvised gunboats, in which two Landing Craft Infantry (LCI) were each armed with three 40mm, two 20mm, and five .50-caliber machine guns. Designated LCI(G)s, these provided close fire support for the landing craft. They proved to be quite successful and were then employed in all the other Pacific theater amphibious operations.

The Japanese were slow to react to the invasion. Only after the Allied troops were ashore did they dispatch 25 Aichi D3A (“Val”) dive-bombers from Shortland Island, 25 miles distant. Twelve of the planes were shot down, but bombs from the remainder badly damaged the U.S. destroyer *Cony*, which suffered 8 dead and 10 wounded and had to be towed to Tulagi.

On November 1, the Allied troops captured Falamae, capital of the Treasury Islands, and 11 days later the islands were declared secure. Although some Japanese resistance occurred thereafter, casualties through this date were 40 New Zealanders killed and 145 wounded. U.S. ground casualties totaled 12 killed and 29 wounded. Japanese losses by this date were 205 killed. A motor torpedo boat base was soon established on Stirling Island.

Tresckow, Henning Hermann Robert Karl von (1901–1944)

German Army major general and key member of the opposition to German chancellor Adolf Hitler. Henning Hermann Robert Karl von Tresckow was born on January 10, 1901, in Magdeburg, Saxon-Anhalt, into a family with a history of military service. At age 16 Henning entered the military as a cadet and saw action in the World War I Second Battle of the Marne in 1918, earning the Iron Cross 1st Class.

Tresckow left the army after the war and became a stockbroker before pursuing a law degree. In 1924 he joined the Reichswehr. He had no great love for the Weimar Republic and welcomed the 1933 Nazi takeover. By 1938, however, Tresckow had moved into opposition as a result of Kristallnacht, the November pogrom against the Jews.

Tresckow completed General Staff Officer training and thereafter served almost exclusively in staff positions. He was chief of staff of the 228th Infantry Division during the September 1939 German invasion of Poland, earning his second Iron Cross 1st Class but was shocked by the atrocities committed by the Schutzstaffel (SS). In December 1940, he was a staff officer in Army Group B, serving under his uncle Field Marshal Fedor von Bock. Tresckow's opposition to the Nazi regime increased with the brutalities that accompanied the German invasion of the Soviet Union in June 1941, especially the execution of captured Red Army soldiers.

Promoted to colonel in 1942, Tresckow used his influence and access to the senior military leadership to recruit officers sympathetic to overthrowing the Nazi regime and Adolf Hitler in particular. Although many of the senior officers were sympathetic, they refused to participate in any plot to overthrow the regime. None, however, reported his activities to the Gestapo.

On March 14, 1943, Tresckow and his adjutant Lieutenant Fabian von Schlabrendorff planted a bomb on Hitler's plane at Smolensk in the Soviet Union, but it failed to explode because of a defective detonator. Tresckow's resolve was unshaken, however.

In September 1943, Tresckow became chief of staff of the Second Army. In January 1944 he was promoted to major general. By that date he had recruited Colonel Claus von Stauffenberg and engaged former Leipzig mayor Carl Friedrich Goerdeler, a key political opposition leader, to plan what became the July Plot or Operation VALKYRIE. On July 20, 1944, Stauffenberg planted a briefcase with a bomb in the vicinity of Hitler at the *Wolfschanse* bunker. The ensuing blast killed four men, but Hitler was only wounded and quickly recovered. The next day, upon hearing of the failed coup d'état, Tresckow committed suicide. His body was cremated at the Sachsenhausen concentration camp.

Tresckow's wife was arrested and his children taken away as part of the Nazi *Sippenhaft*, or collective family punishment, but she was released in October.

Trident Conference (May 15–25, 1943)

Diplomatic conference between British prime minister Winston L. S. Churchill and U.S. president Franklin D. Roosevelt and their political and military advisers. The Trident Conference, held in Washington, D.C., is also known as the Third Washington Conference. The agenda at the conference

involved military activities for the rest of the year and the date of a cross-Channel invasion. The British objective was to convince the Americans to agree to an invasion of Italy after the conquest of Sicily (Operation HUSKY, July 9–August 22, 1943) was completed. The British argued that such a course would deprive Germany of an ally and make the western and central Mediterranean an Anglo-American lake. Churchill hoped that new options for Anglo-American strategy would be opened and perhaps break the U.S. obsession with a cross-Channel attack.

The Americans, particularly U.S. Army chief of staff General George C. Marshall, were prepared for such arguments by the British. They pointed out that Soviet and American public opinion would demand an invasion of France. The Americans insisted that BOLERO, the buildup of men and matériel in England, should take precedence and that it would not prevent an invasion of Italy, although they did not commit to that invasion. Roosevelt and Marshall agreed to follow up HUSKY with the best means to drive Italy from the war and tie down the maximum number of German forces.

Certainly, this position pointed toward an invasion of Italy but left options open. For the first time, Roosevelt had not come down in favor of Churchill's position, and the British leader would never again feel confident that Roosevelt would support him once they had discussed all aspects of a question. The two leaders agreed on a date of May 1, 1944, as the deadline for the cross-Channel attack, splitting the difference between the preferred American date of April 1 and the British date of June 1.

Other topics of discussion included the China-Burma-India theater, which generated much talk but little action, and the atomic bomb. Over British skepticism, the conferees approved (but never implemented) plans for operations in Burma. Churchill and Roosevelt could not agree on whether aiding Chinese leader Jiang Jieshi (Chiang Kai-shek) or forcing the Japanese from Southeast Asia should be the goal. Churchill was further frustrated because no one, not even members of his own delegation, favored his proposal for a landing in Sumatra.

Churchill and Roosevelt also continued their discussion from the Casablanca Conference on developing an atomic bomb, with the British leader protesting the U.S. refusal to share information, a course of action recommended by most of Roosevelt's advisers. The president reluctantly

agreed to reveal secrets to the British but had not done so by the time of the Quebec Conference that August.

Tripartite Pact (September 27, 1940)

Diplomatic agreement among Germany, Italy, and Japan. Negotiated in Tokyo, the pact was signed in Berlin on September 27, 1940, by German foreign minister Joachim von Ribbentrop, Italian foreign minister Galeazzo Ciano, and Japanese ambassador Kurusu Saburo. Primarily designed to forestall the entry of the United States into the war, the agreement stated as its main principle the establishment and maintenance of a new order, calculated to promote the mutual prosperity and welfare of the nations concerned. The pact formalized the Axis partnership.

German, Italian, and Japanese leaders sign the Tripartite Alliance Pact in Berlin, September 27, 1940. (Keystone/Getty Images)

The agreement, which was to last 10 years, contained six articles. In Article 1, Japan recognized the establishment of a new order in Europe under the leadership of Germany and Italy. In Article 2, Germany and Italy recognized Japanese leadership in the establishment of a new order in greater East Asia. Article 3 pledged each partner to cooperate in the processes that would lead to the final goal stated in Articles 1 and 2. Article 3 served as a direct warning to the United States, although there was no mention of that power by name. In it, the three Axis powers vowed to "to assist one another with all political, economic, and military means when one of the contracting powers is attacked by a power not involved in the European war or in the Chinese-Japanese conflict." Thus, Germany and Italy would be bound to fight on the side of Japan were the United States to attack that country. Article 4 called for joint technical commissions from the three powers to implement quickly the agreement. Article 5 stated that the three powers respected agreements that had been concluded by any of the three powers with the Soviet Union. Article 6 set the 10-year limit of the agreement and provisions for its renewal.

Soviet leaders were alarmed by the pact, although Article 5 supported the German-Soviet Non-Aggression Pact of 1939. In November 1940 to allay Soviet concerns, the German government formally asked the Soviet Union to

join the pact, and meetings were held to discuss that possibility. Soviet foreign minister Vyacheslav M. Molotov was invited to Berlin, and talks concerning German-Soviet relations began on November 12, 1940. These negotiations did not result in agreement, as Adolf Hitler, already planning to invade the Soviet Union, rejected the Soviet insistence on concrete agreements concerning territory and spheres of influence.

Other nations were also pressured by Germany to adhere to the Tripartite Pact. Romania signed on November 23, 1940, as did Slovakia the next day. Bulgaria joined on March 1, 1941. Yugoslavia adhered to the pact on March 25, 1941, but renounced its action two days later, after the government of Prime Minister Dragiša Cvetković was overthrown on the issue and replaced by that of General Dušan Simović. Unlike the Allies, the Axis coalition never developed a grand strategy for fighting the war.

Troina, Battle of (July 31–August 6, 1943)

The Battle of Troina occurred during the Allied conquest of Sicily (July 9–August 22, 1943) and lasted from July 31 to August 6, 1943. It was both the largest and most prolonged battle between American and German forces to that point in the war. The 15th Panzergrenadier Division, united for the first time during the Sicilian campaign, defended against the advance of three infantry regiments of the U.S. 1st Infantry Division, two attached infantry

regiments from the U.S. 9th Infantry Division, two troops of the U.S. 91st Cavalry Reconnaissance Squadron, and the 4th Tabor (battalion) of Moroccan Goums.

Located in western Sicily at an elevation of some 3,600 feet (the highest city in Sicily), Troina had a population of some 12,000 in 1943. With half a dozen mostly north-south ridge systems and surrounded by high hills that commanded all avenues of approach, Troina became a linchpin of the Axis Etna Line. The 15th Panzergrenadier Division defending here had two regimental-sized combat units. Group Fullriede occupied Troina proper and the high ground to the north of town. Group Ens covered the terrain to the south.

In late July 1943, Allied intelligence believed that the Axis defenders would withdraw to defensive positions behind Troina. Only slight resistance was expected in the U.S. forces' advance on Troina. Thus, the U.S. 39th Infantry Regiment of the 9th Infantry Division, then attached to the 1st Infantry Division, was surprised when its advance on Troina was abruptly halted, despite heavy American artillery fire, on July 31 by Group Fullriede. During the next five days, the Americans committed more units as attack after attack was repulsed by the 15th Panzergrenadiers. German artillery and mortars, along with machine-gun and small-arms fire, halted every American and Moroccan assault. Any infantry advances faced stiff counterattacks by the German forces. During the battle, American forces suffered more than two dozen German counterattacks.

The Americans now concluded that a large-scale coordinated attack would be required. Three infantry regiments and a troop of reconnaissance cavalry would frontally assault the German positions, while a fourth infantry regiment and the Goums carried out a wide enveloping assault from the north and a fifth infantry regiment and a second troop of reconnaissance cavalry made a similar encircling move from the south.

Faced with this effort on August 3, the German forces grudgingly gave ground while launching numerous counterattacks. On August 4, North American A-36 Apache fighter bombers carried out two large air attacks on the town and surrounding hills. Yet the 15th Panzergrenadier continued to hold. By the end of August 5, American forces had suffered substantial casualties but still had not captured the town or many of the high, dominating German defensive positions.

Now faced with a risk of encirclement and the loss of its avenues of retreat, late on August 5 the German defenders were ordered to withdraw to a new defensive line about 5,000 yards west of Troina. This was accomplished that night. American troops entered the ruins of Troina shortly afterward on August 6. Although it had suffered more than 1,600 killed, some 40 percent of its prebattle strength, the 15th Panzergrenadier Division had stalled the American advance for six critical days.

Truk, Raid on (February 17–18, 1944)

In the fall of 1943, the U.S. Navy unleashed its Central Pacific Campaign, capturing Tarawa (November 20–24) and Makin (November 20–23) in the Gilbert Islands. Early the next year, U.S. amphibious forces seized Kwajalein (January 19–February 6) in the Marshall Islands. These successes allowed an immediate leap forward to Eniwetok Atoll, just 660 miles northeast of Truk, the principal Japanese fleet anchorage in the Central Pacific during the war.

In 1940 the Japanese began fortifying Truk, which was strategically located at the center of Micronesia. While the base never became the "Gibraltar of the Pacific" or a facility comparable to Pearl Harbor, by July 1942 it was headquarters for the Japanese Combined Fleet. Defensive construction continued into early 1944, eventually including four airstrips and two seaplane bases supporting 335 aircraft, three torpedo boat bases, and heavy coastal artillery. There were only 40 antiaircraft guns, however, and

the total garrison of soldiers, sailors, and airmen amounted to fewer than 12,000 men.

In response to the U.S. advances in the Gilbert and Marshall Islands, the Japanese decided to abandon Truk as the principal base for the Combined Fleet, leaving there just the Fourth Fleet with 2 training cruisers and 8 destroyers, along with approximately 50 merchant ships and auxiliaries. Only a week after the Japanese withdrawal, Vice Admiral Raymond Spruance, commander of the U.S. Fifth Fleet, arrived off Truk with three fast carrier groups of 5 fleet carriers, 4 light carriers, 6 battleships, 10 cruisers, and 22 destroyers.

At 6:45 a.m. on February 17, Rear Admiral Marc Mitscher, commander of Task Force 58, began launching 70 Grumman F6F Hellcats from 90 to 100 miles east-northeast of Truk in the first of what would be 30 separate air attacks that day and the next. The Japanese had little warning of the raid, and 30 of their 45 fighters that met the initial onslaught were shot down. As the U.S. aircraft attacked shipping, airfields, and shore facilities on the many islands within the massive lagoon, a number of ships got under way in an effort to flee. The cruiser *Katori*, the destroyers *Maikaze* and *Nowaki*, and the auxiliary *Akagi Maru* cleared the lagoon's north exit at 9:00 a.m.

Spruance learned of this Japanese exodus at 9:42 a.m. Although Grumman TBF Avenger torpedo bombers jumped the fleeing squadron and sank the *Akagi Maru* and crippled the *Katori* and *Maikaze*, Spruance decided to form a surface task group to hunt down the Japanese. This consisted of Battleship Division 7 with the *New Jersey* and *Iowa;* Cruiser Division 6 with the heavy cruisers *Minneapolis* and *New Orleans;* and Destroyer Squadron 46 with the *Izard, Burns, Charrette,* and *Bradford*. Coached by carrier planes (and undergoing a few nuisance attacks from Japanese aircraft), the task group first sighted and sank an armed trawler, the *Shonan Maru,* at 2:46 p.m. It then found the *Katori,* and at 3:16 p.m. Spruance ordered the two heavy cruisers, screened by the *Bradford* and *Burns,* to sink it. Meanwhile, the *Nowaki* and the damaged *Maikaze* appeared. When the topmasts of the battleships rose into view, the *Nowaki* fled to the west.

U.S. naval aircraft attacking the Japanese base of Truk in the Carolines during February 16-17, 1944. (Bettmann/Corbis)

The *Maikaze* and *Katori,* however, launched torpedoes at the battleships rushing down upon them. At 3:34 p.m., one streaked between the *New Jersey* and *Iowa*. Another passed the *Iowa* on its port side, and a third crossed 100 yards astern. Two minutes later, the *Minneapolis* made a hard turn to avoid a fourth torpedo.

Meanwhile, U.S. gunnery was overwhelming. At 3:37 p.m. the *Katori*'s bow rose out of the water, and the ship sank stern first, some guns being served to the end. The *Maikaze* succumbed to a combined bombardment from the *New Jersey, Izard*, and *Charrette* as they raced past as close as 7,000 yards. Meanwhile, the *Nowaki* had sent a salvo of long-running 24-inch torpedoes back toward the U.S. formation.

At 3:45 p.m., the *New Jersey* lofted a three-gun salvo toward the fleeing warship at a range of 32,200 yards. The *Iowa* did the same, its initial range 35,700 yards. Both ships believed that their first broadsides straddled. Then a torpedo streaked across the *Iowa*'s bow. As the *Nowaki* steamed into the glare of the sun, the battleships resorted to radar for aiming and spotting. More straddles followed. Finally, with a range of 39,000 yards they ceased fire, and the Japanese destroyer escaped unharmed.

In the attack on Truk, U.S. aircraft and ships shot down 70 of the 365 Japanese aircraft present and destroyed as many as 200 more on the ground. They also sank 2 light cruisers, an auxiliary cruiser, 4 destroyers, 2 small submarine chasers and 2 submarine tenders, an aircraft ferry, 5 tankers, and 21 other transports/freighters/auxiliaries, all totaling some 191,000 tons of shipping. The United States lost 25 planes, although many more were damaged. On the night of February 17, however, a Japanese torpedo bomber attacked and damaged the carrier *Intrepid*. It was out of action until June.

The U.S. flyers were disappointed that they did not get a chance to hit the Japanese battle fleet, but their efforts still represented the greatest one-day total of shipping sunk during the entire war. The raid also ended Truk's usefulness for the Combined Fleet. The raid was also the only surface action involving the Iowa-class battleships, and their final salvos were the longest-range broadsides ever fired against an enemy by a ship under way at sea.

Another carrier raid on Truk, on April 29, 1944, left only 12 Japanese aircraft serviceable and destroyed nearly all air support facilities. Thereafter heavy bombers from Eniwetok and the Admiralties routinely pounded Truk.

Truman, Harry S. (1884–1972)

U.S. Democratic politician and president of the United States (April 1945–January 1953). Born in Lamar, Missouri, on May 8, 1884, Harry S. Truman grew up on the family farm in Grandview. Poor eyesight kept him from the U.S. Naval Academy and the U.S. Military Academy. Truman never formally attended college, but he read for the bar at night at the Kansas City School of

Law. He enlisted in the National Guard as a young man and served in combat in France during World War I as a field artillery battery commander.

Following the war, Truman entered politics and, with the backing of "Boss" Tom Pendergast, was elected a judge in the court of Jackson County, Missouri. Truman served in that post from 1926 to 1934, when he was elected to the U.S. Senate from Missouri. He remained active as a reserve officer, rising to the rank of colonel and only retiring from the U.S. Army Reserve after he left the presidency.

He was reelected to the Senate in 1940, but he remained relatively obscure until his service as chairman of the Committee to Investigate the National Defense Program, when he helped eliminate millions of dollars of waste in defense contracting. His efforts contributed significantly to the efficiency of the U.S. defense industry on the eve of the U.S. entry into World War II and thereafter.

President Franklin D. Roosevelt selected Truman as his running mate in 1944, and Truman was sworn in as vice president in January 1945. Roosevelt did not share with Truman his thinking on many significant war-related issues, and Truman was thus poorly prepared to become president when Roosevelt died suddenly on April 12, 1945. Despite his almost blind start, Truman made some bold moves virtually immediately. He supported the San Francisco Conference of Nations that established the United Nations, and he mustered popular and bipartisan support for that fledgling organization, with the intention of altering the nation's traditionally isolationist outlook in favor of a postwar internationalist foreign policy.

U.S. president Harry S. Truman, shown here in 1945. (Library of Congress)

When the Germans surrendered only 26 days after he assumed office, Truman appointed General Dwight D. Eisenhower to head the American occupation zone in Germany and supported a vigorous program of denazification and war crimes prosecution. Attending the July 1945 Potsdam Conference, Truman worked with Soviet premier Joseph Stalin and new British prime minister Clement Attlee to build on the agreements that had been reached by Stalin, Roosevelt, and British prime minister Winston L. S. Churchill at Yalta. Truman also decided to employ the atomic bomb against Japan in August 1945, a decision he later said he never regretted or agonized about because he knew that it saved many thousands of American lives.

As it became increasing clear that the Soviet Union was systematically acting contrary to the Yalta and Potsdam agreements, Truman concluded that a strong Anglo-American stand was the only means of preventing a total Soviet domination of Europe. But rapid American demobilization had

reduced U.S. military strength in Europe to 391,000 men by 1946, whereas the Soviets still had 2.8 million troops under arms. Truman used U.S. economic power and the country's momentary nuclear monopoly to blunt the Soviet aspirations in postwar Europe. He also effectively blocked the Soviets from assuming any role in the occupation of Japan.

Truman was wary of Soviet conventional military power in Europe, but he also tried to maintain the wartime alliance that he considered essential to the viability of the United Nations. When Soviet intentions finally became clear—first with the 1948 communist coup in Czechoslovakia and then with the Berlin Blockade—the defining Cold War American policy of containment solidified with three landmark decisions: the Truman Doctrine, the Marshall Plan, and the establishment of the North Atlantic Treaty Organization (NATO).

Truman laid down the principles of the Truman Doctrine in a speech before Congress on March 12, 1947, when he stated his belief that the United States had to adopt a policy to support free peoples resisting subjugation by armed minorities or by outside influences. In response, Congress approved his request for $400 million in economic and military aid for both Greece and Turkey. Greece was then being torn apart in a civil war, and Turkey was under heavy pressure from Moscow over control of the Dardanelles. The support package for Greece also included U.S. military advisers.

The $13 billion Marshall Plan proved to be the engine of economic recovery in Europe, and it effectively prevented Moscow from stoking and exploiting economic chaos. The Soviet Union rejected aid under Washington's conditions and forced what were now its East European satellites to do likewise. In March 1948, Britain, France, and the Benelux countries, with American backing, formed the Brussels Pact, which developed into the Western European Union in 1955.

Truman decided on an airlift as the answer to the Soviet blockade of Berlin, demonstrating U.S. resolve. In April 1949, the United States entered into its first (and still its most durable) standing military alliance since 1800 with the establishment of NATO. Truman also put Moscow on notice that the United States was willing to use its fledgling nuclear arsenal to defend Western Europe. In May 1949, when it became clear that the Soviets had no intention of allowing all of Germany's four occupation zones to reunite under a democratically elected government, Truman supported the establishment of

the Federal Republic of Germany (West Germany), formed from the three western occupation zones. The Soviets retaliated in October by establishing the German Democratic Republic (East Germany).

In what he described as his most difficult decision while in office, Truman authorized the commitment of U.S. forces in Korea in June 1950, within a week of the North Korean invasion of South Korea. He also supervised the reorganization of the U.S. defense and intelligence establishments along the lines that remain familiar today. His administration established the National Security Council, the Department of Defense, the U.S. Air Force, and the Central Intelligence Agency and formally established the Joint Chiefs of Staffs and the global network of joint military commands.

Truman's decision to remove General Douglas MacArthur as U.S. and United Nations commander in Korea and the negative American public reaction to this, together with the stalemate in the war there, led Truman not to run for reelection in 1952. He left office in January 1953.

Truman played an important role during World War II, and his postwar policies rebuilt Western Europe, integrated the greater part of Germany into the West, and prevented the spread of communism in Europe outside the Soviet occupation zone. Truman died in Kansas City, Missouri, on December 26, 1972.

Truscott, Lucian King, Jr. (1895–1965)

U.S. Army general. Born in Chatfield, Texas, on January 9, 1895, Lucian King Truscott Jr. had a limited formal education but taught school in Oklahoma. He joined the army when the United States entered World War I and was selected for officer training. Commissioned into the cavalry in August 1917, he did not see overseas service during the war.

Between 1919 and 1925, Truscott was stationed at Schofield Barracks, Hawaii. He was promoted to captain in 1925, to major in 1926, and to lieutenant colonel in 1935. He was first a student and then an instructor at the Cavalry School (1925–1931) and the Command and General Staff School (1934–1940).

In February 1941, Truscott joined IX Corps as assistant G-3 and profoundly impressed his chief, Colonel Dwight D. Eisenhower. As both men rose in the army, Eisenhower repeatedly selected Truscott for important assignments. Promoted to brigadier general in May 1942, he was assigned to Britain's Combined Operations headquarters, where he developed ranger units that participated in the Dieppe Raid that summer. After becoming a major general in November 1942, he commanded the force that seized Port Lyautey in French Morocco. During the fighting for Tunisia in 1943, Truscott served as Eisenhower's deputy in charge of training, and in March 1943, he took command of the 3rd Infantry Division.

In fighting in Sicily (July 9–August 22, 1943) and again in peninsular Italy, Truscott's division established an exemplary reputation. Truscott became known for his rigorous training, steely leadership, and ability to inspire confidence. A month after the Anzio landing on January 22, 1944, he replaced Major General John P. Lucas as commander of the U.S. VI Corps after Lucas was relieved because of the operation's initial failure. On May 23, Truscott's greatly augmented VI Corps broke out of its beachhead. Had Fifth Army commander Lieutenant General Mark W. Clark not redirected Truscott's advance to Rome, VI Corps might have trapped large numbers of retreating Germans.

On August 15, 1944, Truscott's corps landed on the French Riviera as the vanguard of Lieutenant General Alexander M. Patch's Seventh Army in Operation DRAGOON (launched on August 15), VI Corps drove rapidly up the Rhône Valley and again only narrowly missed making a major entrapment of

German troops. Promoted to lieutenant general in September 1944, Truscott handed over command in the Vosges Mountains in late October. In mid-December, back in Italy, he succeeded Clark as commander of the Fifth Army, and in April 1945, he directed its 19-day final offensive through the Po Valley to the Alps.

Truscott was the only U.S. general of the war to command in battle at four successively higher echelons. Had his superiors in the Mediterranean not blocked his transfer to England—which Eisenhower had requested early in 1944—he, instead of Major General J. Lawton Collins, would have led VII Corps over Utah Beach into Normandy on June 6.

Truscott retired from the army on medical grounds in 1947. He wrote his memoirs and served in various advisory capacities. He was promoted to full general on the retired list in 1954. Truscott died in Washington, D.C., on September 12, 1965.

Tsuchihashi Yuitsu (1891–1975)

Japanese Army lieutenant general. Born in 1891 and commissioned as a second lieutenant in the army in 1912, Tsuchihashi Yuitsu graduated from the Japanese Military Staff College in 1920. Promoted to colonel in 1935 and fluent in French, during 1937–1939 he served concurrently as military attaché to France and Belgium. In early 1939, Tsuchihashi went to Hanoi to meet with French governor-general Jules Brevié to demand the interdiction of American supplies for the Guomindang (Nationalist) government of Jiang Jieshi (Chiang Kai-shek) in China that were being routed through Indochina.

The French refused the request, and the next year the Japanese sent occupation troops into Indochina.

Tsuchihashi was chief of staff of the Japanese Twenty-First Army in 1939 and then headed the 2nd Bureau of the General Staff. In October 1940 he was appointed vice chief of staff of the China Expeditionary Army, and in 1941 he was promoted to lieutenant general and assumed command of the 48th Division, which he led in the Philippines and Dutch East Indies campaigns. In November 1944 he assumed command of the Japanese Indochina Garrison Army, which in December 1944 became the Japanese Thirty-Eighth Army with him still in command.

Tokyo worried that the United States would soon mount an amphibious assault on Vietnam from the Philippines and thought it best to neutralize the French first before having to deal with an American invasion. Well aware that French authorities, whom the Japanese had left in place, were planning to wrest control, in March 1945 Tsuchihashi carried out a preemptive coup against the French administration and military forces in Indochina. With the unconditional surrender of Japan, Tsuchihashi surrendered his own forces north of the 16th parallel to the Chinese at Hanoi on September 28, 1945. This created a political vacuum in Vietnam, into which the Viet Minh, the communist-dominated nationalist organization that had been fighting both the French and the Japanese and was led by Ho Chi Minh, quickly moved. Tsuchihashi retired in June 1950 and died on May 31, 1975.

Tsuji Masanobu (1902–ca. 1968)

Japanese Army colonel and politician. A native of Ishikawa Prefecture, Japan, born on October 11, 1902, Tsuji Masanobu graduated from the Military Academy in 1924 and from the General Staff Academy in 1931. He took part in the Japanese Army's attack on Shanghai in 1932 and then served in a succession of staff positions. Attached to the staff of the Guandong (Kwantung) Army in 1936, Tsuji became a close supporter of the influential general Ishiwara Kanji. Tsuji participated in planning the Guandong Army's disastrous border clash with the Soviet Union at Nomonhan (May–September 1939), and in 1940, he was transferred to the China Expeditionary Army.

Late in 1940, Tsuji, by that time a lieutenant colonel, joined the staff of the Japanese Army on Taiwan. Convinced of the inevitability of war with the Western powers, he began to collect intelligence about Southeast Asia, in particular Malaya. In September 1941, Tsuji was dispatched to the staff of Japanese forces occupying French Indochina, where he stepped up his intelligence-gathering activities in anticipation of a Japanese thrust into Southeast Asia. Subsequently, Tsuji played a major role in planning the successful Japanese 1941–1942 campaign in Malaya, culminating with the surrender of Singapore in February 1942.

After the fall of Singapore, Tsuji took part in the Guadalcanal Campaign (August 1942–February 1943), and during March–July 1944, he helped plan the abortive Japanese offensive at Imphal on the Burma-India border. In Thailand when the war ended, Tsuji went into hiding, possibly to escape indictment for war crimes, until 1948. Still a right-wing nationalist, he was elected to the Japanese Diet (parliament) four times between 1952 and 1959. Two years later, for reasons that have never been explained, Tsuji took a trip to Laos and vanished. He was pronounced legally dead (presumably a casualty of the Laotian Civil War) on July 7, 1968.

Tukhachevsky, Mikhail Nikolayevich (1893–1937)

Marshal of the Soviet Union. Born on the Aleksandrovkoye estate 150 miles southwest of Moscow on February 16, 1893, Mikhail Nikolayevich Tukhachevsky was the son of a nobleman and a servant girl. Debts forced the family to sell the estate and move to Moscow in 1909. There, Tukhachevsky entered the Alexandrovsky Military College. During World War I, as an officer in the elite Semenovsky Guards, he fought in Poland and won six decorations before being taken prisoner in 1915. After three attempts, he managed to escape in 1917.

In 1918 Tukhachevsky joined the Red Army, and as a protégé of Leon Trotsky he became a prominent military commander during the Russian Civil War, leading the First Army and then the Eighth and Fifth Armies. Appointed commander in the west in April 1920, Tukhachevsky led the Russian invasion of Poland. Fighting here, however, laid the seeds for future conflicts and hatreds between him and Joseph Stalin and Kliment Voroshilov.

In March 1921, Tukhachevsky brutally suppressed the anti-Bolshevik uprisings at Kronstadt. Between 1922 and 1924, he headed the Military Academy. In May 1924, he became deputy to Marshal Mikhail Frunze, chief of the General Staff. Following Frunze's death, Tukhachevsky became chief of staff of the Red Army, occupying that post from 1926 to 1928. Following disagreements with Defense Commissar Voroshilov, Tukhachevsky was commander of the Leningrad Military District between 1928 and 1931.

There, Tukhachevsky developed his theories of deep operations, the application of mechanization and armor along with air support to warfare, and the use of airborne troops, carrying out actual maneuvers with these forces. Tukhachevsky saw clearly the nature of the German threat, and he called for forward areas to be lightly held, with large formations remaining back for subsequent reaction and deep-penetration operations. Voroshilov, an old-fashioned proponent of cavalry, opposed his theories.

Tukhachevsky returned to Moscow in 1931 as deputy commissar for military and naval affairs, chairman of the Revolutionary Military Council of the Soviet Union, and director of armaments. In 1936, he was named first deputy commissar for military-naval affairs and director of the Department of Combat Training. Foreign observers recognized Tukhachevsky's contribution in establishing the most advanced armor and airborne divisions in the world. In November 1935, he was promoted to marshal of the Soviet Union.

Tukhachevsky believed strongly in the need to understand thoroughly the defensive aspects of war as a prerequisite for comprehending the operational level of war as a whole; Stalin demanded unilateral adherence to the offensive. Tukhachevsky also predicted that Adolf Hitler would cooperate with Japan and that Germany would invade both the West and the Soviet Union, and he argued for an end to cooperation with the Germans and a defense in depth. His meddling in such areas and the 1935 publication of these views in an article angered Stalin.

That April, Tukhachevsky was removed from his posts and assigned to command the Volga Military District. He was arrested on May 26, 1937. Secretly tried and condemned on charges of spying for the Germans, he was executed by firing squad on the night of June 11–12 in Moscow. A 1956 Soviet investigation concluded that the charges against him had been fabricated, and he was formally rehabilitated in 1963. Almost all of Tukhachevsky's theories were proven correct during World War II.

Tulagi Island, Battle of (August 7–8, 1942)

Engagement between U.S. and Japanese forces, part of the larger Guadalcanal Campaign (August 1942–September 1943). Tulagi is a 2-mile-long and half-mile-wide island in the Solomon chain, located just off Florida Island and 20 miles north of Guadalcanal. It was part of the British Solomon Islands Protectorate until occupied by Japan in May 1942. At the beginning of the war, Tulagi was the site of an Australian-built seaplane base. The Japanese began bombarding the island in January 1942, and with the approach of the Japanese task force in the Coral Sea operation, the Australian government ordered the evacuation of the island on May 1. The Japanese then garrisoned Tulagi with a 350-man detachment of the 3rd Kure Special Landing Force, under Commander Suzuki Masaaki.

Targeted for invasion as part of the U.S. Guadalcanal Offensive, Tulagi had to be cleared of Japanese forces in order to secure the chief U.S. target—the airfield being constructed by the Japanese on Guadalcanal. Transport Group Yoke, consisting of three transports and four destroyer transports, delivered Brigadier General William Rupertus's landing force of the 1st Raider Battalion; the 1st Battalion, 2nd Marines; the 2nd Battalion, 5th Marines; and the 1st Parachute Battalion.

The landing on Tulagi on August 7, 1942, was unopposed, but the marines soon ran into stiff Japanese resistance. Tulagi was the first battle in which U.S. troops had encountered Japanese defensive tactics, including strongly entrenched dugouts and tunnels constructed to withstand heavy naval or air bombardment. These fortifications had to be taken by assault with grenades and high-explosive charges.

It was not possible to secure the small island on the first day, so the marines dug in. During the night of August 7–8, they encountered a Japanese banzai charge. Turning back this attack, the marines secured the island the next day. Some 200 of the Japanese defenders were killed, and only 3 were captured; 40 others escaped to nearby islands. U.S. forces suffered 36 men killed and 54 wounded in the operation.

Tunis, Battle of (May 3–13, 1943)

By the end of April 1943, the converging Allied offensive conducted by General Harold Alexander's 18th Army Group with Lieutenant General Bernard Montgomery's British Eighth Army and Lieutenant General Kenneth Anderson's British Fifth Army had pushed the Axis forces into a pocket around Tunis and Bizerte. Although the two Axis armies in Colonel General Jürgen von Arnim's Army Group Afrika—General Giovanni Messe's Italian First Army and General of Panzer Troops Gustav von Vaerst's Fifth Panzer Army—had linked up for the final defense, their loss of equipment had been so great that defending even the 100-mile arc was impossible in the face of massive Allied superiority. Alexander had 20 divisions with 300,000 men and 1,400 tanks against Arnim's fighting strength of only 60,000 men and up to 100 tanks.

The British had taken the high ground around Medjez-el-Bab, allowing a direct attack against Tunis and Bizerte. Arnim held off the Allied offensive, delivered simultaneously on every sector between April 19 and 25, but in doing so, the Axis forces consumed the last of their scant resources. The tourniquet applied by the Allied air and naval blockade across the Mediterranean from Italy was now so tight that few reinforcements or supplies reached Tunisia. Field Marshal Erwin Rommel and Arnim had reported in February that 140,000 tons per month would be required to maintain the fighting power of the Axis forces, but they received just 23,000 tons in April and a paltry 2,000 tons in the first week of May.

As a result, Axis forces suffered severe shortages of food, ammunition, and fuel. Fuel resources were sufficient to move just 16 miles, which drastically restricted all tactical movement. Despite heroic efforts to transfer even the smallest amounts by air and submarine, Arnim later admitted that he would have been forced to capitulate by the beginning of June regardless of Allied operations simply because of a shortage of food. The complete breakdown of the logistics system explains the collapse of Axis resistance far more clearly than any Allied offensive.

Montgomery's failure to break through the Enfidaville bottleneck led Alexander to devise a new final plan. He switched the Indian 4th and 7th Armoured Divisions and the 201st Guards Brigade from the Eighth Army to the First Army and charged Lieutenant General Brian Horrocks's IX Corps with making the final attack. Operation STRIKE was to be an overwhelming onslaught on a 3,500-yard front by the 4th Indian and 4th British Divisions, supported by a massive phalanx of 470 tanks in the valley south of the Medjerda River. Its goal was the capture of Tunis. American forces, meanwhile, had captured Mateur on May 3 and pushed the German line back to Chouïgui, just 15 miles from Bizerte, preventing the Germans from reinforcing their positions in the Medjerda Valley.

The assault opened at 3:00 a.m. on May 6 with a concentrated barrage by up to 652 guns, which pulverized Axis strongpoints; this was followed by an intense air assault at dawn. Under this massive onslaught, German resistance collapsed, and the Allied infantry broke through almost without opposition so that by 10:00 a.m., tanks of the 6th and 7th Armoured Divisions were pouring through the gap. They failed, however, to grasp the elementary principles of

exploitation that Rommel had earlier demonstrated and advanced with unnecessary caution.

On May 7, the 11th Hussars entered Tunis, the first unit to cross the Egyptian border in 1940, aptly crowning the end of the campaign, and U.S. forces from II Corps entered Bizerte later the same day. The Fifth Army was thus trapped between the British and American spearheads, and Vaerst surrendered on May 8, furnishing 40,000 prisoners. Also on that day, British admiral Andrew Cunningham carried out Operation RETRIBUTION, a rejoinder to the agonies suffered by the British during the evacuation of Greece and Crete in 1941, to prevent any escape of the Axis forces by sea.

Alexander's principal concern thereafter was to prevent the vast bulk of the Axis troops south of Tunis from retreating with Messe's First Army into the Cape Bon Peninsula and establishing a redoubt. Immediately, the 1st and 6th Armoured Divisions drove to Hammam Lif at the neck of the peninsula, but the hills there reach almost to the beach, and a small detachment of Germans held up the Allies for another two days. Without fuel or ammunition or any hope of escape, further resistance was futile, and the remaining Germans were mopped up, the last units surrendering on May 13. In all, the Allies took some 250,000 prisoners in the Battle of Tunis, the largest capitulation yet suffered by the Axis powers.

Tunisia Campaign (November 17, 1942–May 13, 1943)

Allied military campaign leading to the clearing of Axis forces from North Africa. Following the Anglo-U.S. invasion of Northwest Africa on November

8, 1942, German leader Adolf Hitler belatedly recognized that a collapse of Axis power in Africa threatened not just Benito Mussolini's regime in Italy but also Germany by exposing the whole of Southern Europe to Allied attack. Hitler therefore allocated reinforcements to Tunisia on a scale far greater than ever before seen in Africa.

By the end of 1942, commander of the Fifth Panzer Army colonel general Jürgen von Arnim had achieved his short-term objectives. He had prevented the Allies from reaching the central Tunisian coastline and thereby isolating the Fifth Army from General Erwin Rommel's Panzerarmee Afrika, which was withdrawing into southern Tunisia. Arnim had also deepened the Axis bridgehead by pushing back the British around Tébourba in the north, and he had blocked the way to Tunis by tenaciously recapturing Longstop Hill, which the Germans finally took on Christmas Day 1942 and renamed Der Weihnachten Hügel (Christmas Hill). Thereafter, Allied operations ground to a halt as winter rain turned the terrain into a muddy morass.

Allied judgments that German tanks could not operate in the drier mountainous terrain were dramatically proven wrong on January 18, 1943, when Arnim launched an offensive against French forces around Pont du Fahs. By the end of January, the veteran 21st Panzer Division had captured the Faid Pass and the Allies had been pushed back from the Eastern Dorsals, whereas Rommel had withdrawn to the Mareth Line, a prewar French defensive system in southern Tunisia. Rommel now had close to 80,000 troops, and the Fifth Army had risen to 100,000 men, mostly German troops, giving the Axis forces a much better ratio to Allied strength, despite being significantly weaker in tanks.

Moreover, the strategic position had now reversed, as the Axis units were able to concentrate their forces in a strong central position with the advantage of interior lines, and fleetingly, the two panzer armies had the opportunity to strike back. Rommel was not dismayed by the threat of Lieutenant General Lloyd Fredendall's U.S. II Corps poised on the line of his retreat, and indeed, he conceived an ingenious plan to defeat the Americans while Lieutenant General Bernard L. Montgomery's British Eighth Army was still stretched out along a supply line across Libya before turning Axis strength against it.

On February 14, Arnim attacked Sidi Bouzid and Sbeitla with the 10th and 21st Panzer Divisions, while Rommel occupied Gafsa virtually unopposed and then captured the American airfields at Thelepte, 60 miles

beyond. Rommel wanted to exploit the Allied confusion with a combined drive to Tebessa and secure Allied supply dumps, then sweep up behind the British army in the north. Unfortunately for him, he no longer had the freedom that he had enjoyed in the desert to disregard the Comando Supremo's instructions, which were to push on toward Thala and Le Kef.

By February 20, Rommel had broken through the Kasserine Pass instead of farther north, as the Allies had been led to expect through Ultra intelligence. Fredendall's force cracked after losing two tank, two infantry, and two artillery battalions. Nevertheless, increasing Allied resistance, poor terrain for mobile operations, Arnim's lack of cooperation, and growing Axis losses obliged Rommel to call off the operation on February 22.

Rommel's offensive was a brilliant success as a limited objective and came perilously close to driving the Allies from Tunisia, but it had no long-term effect on Allied strategy. The Americans had suffered a humiliating defeat and significant losses of men, matériel, and confidence. Commander in chief, Mediterranean, General Dwight D. Eisenhower replaced Fredendall with the more aggressive Major General George S. Patton Jr.

U.S. forces had, however, gained invaluable battle experience. The Allies quickly retook most of the passes, and on February 20, they formed First and Eighth Armies into the 18th Army Group under General Harold Alexander, with the aim of ending the campaign before May.

Rommel was promoted to commander in chief of Army Group Afrika, and his Panzerarmee was renamed the Italian First Army, under General Giovanni Messe. On February 26, Arnim launched an abortive offensive, which merely delayed Rommel's second strike against the Eighth Army at Medenine until March 6. The interval enabled Montgomery to rush extra divisions forward, which decisively shattered Rommel's attack. The defeat did not end the war in Africa, but it dispelled any hope that the Axis forces could overcome one of the two Allied armies before they developed a combined pressure and therefore decided the final conclusion. Rommel was ill, and on March 9, he flew to Germany in an effort to convince Hitler to evacuate the Tunisian bridgehead. As it turned out, Rommel never returned.

At the end of March, after his initial frontal attack had failed, Montgomery's forces outflanked the Mareth positions and then joined with the First Army in the early days of April. Montgomery, however, failed to prevent Messe from withdrawing to the defensive bottleneck at Wadi Akarit,

north of Gabès. Although the two Axis armies formed a strong force, Allied air and naval actions prevented reinforcements and supplies of food, ammunition, and fuel from reaching Tunisia, and the Axis forces suffered severe shortages, particularly of fuel, which drastically restricted all tactical movement.

Patton's U.S. II Corps now threatened Messe's rear and flank, but Messe withdrew to Enfidaville as the two Axis armies were pressed into a pocket around Tunis and Bizerte. Although both armies had linked up for the final defense, improving their position, their loss of equipment had been so great that defense of even the 100-mile arc was impossible in the face of the massive Allied superiority.

Political and psychological considerations strongly influenced the final assault, as Eisenhower ordered that the Americans, now under Lieutenant General Omar Bradley, should make the main effort in the north. Alexander launched the final offensive on April 22, with the British First Army attacking toward Tunis and Bradley striking against Bizerte and Montgomery on the defensive at Enfidaville. When the advance stalled, two of Montgomery's best divisions were switched to the First Army, and a fresh assault was launched.

Axis prisoners of war being herded out of Tunis as Allied armies enter the city. (National Archives)

Axis defenses quickly collapsed, and Tunis and Bizerte both fell on May 7; the last German and Italian units surrendered six days later. Some 250,000 prisoners were captured, the largest capitulation yet suffered by the Axis powers, depriving them of experienced troops. Coming soon after the German defeat at Stalingrad (February 2), the situation was a further humiliation for Hitler. For Mussolini, however, the Tunisia Campaign was a disaster. The best part of the Italian Army had been lost, and the Italian empire on which he had based the credibility of his regime simply ceased to exist.

Tunner, William Henry (1906–1983)

U.S. Army Air Forces and, later, U.S. Air Force lieutenant general. Born on July 14, 1906, at Elizabeth, New Jersey, William Henry Tunner graduated from the U.S. Military Academy at West Point in 1928. He earned his pilot's wings in 1929 and served in a variety of capacities in the Army Air Corps throughout the 1930s. In 1939 he was assigned to the Ferrying Command, tasked with organizing the delivery of military aircraft from industry to user. Ferrying Command later became Air Transport Command, where Tunner ultimately managed the flow of 10,000 aircraft monthly.

Through his ferrying duties, Tunner, who was promoted to brigadier general in June 1943, won recognition as an innovative organizer and command of the India-China Division of the Air Transport Command in the summer of 1944. He reorganized and made more efficient the operation commonly known as the Hump Airlift, named for the 16,000-foot gap in the Himalayas through which aircraft had to pass. This operation ultimately supplied Nationalist Chinese forces with more than 71,000 tons of cargo. Tunner's crews often operated with dated aircraft in poor conditions, working at the end of a logistical trail in a low-priority theater; nevertheless, the operation's success furthered Tunner's reputation as an efficient and effective commander.

After the war Tunner headed the Atlantic Division of the Military Air Transport Service during 1945–1948. In the summer of 1948 he organized the Berlin Airlift, quickly imposing a highly structured system of air routes

and nearly doubling the number of aircraft flowing into Berlin. The Soviets lifted their blockade in May 1949 after the airlift had delivered over 2 million tons of coal and food to the city.

In the 1950s Tunner headed Combat Cargo Command, responsible for the Korean War's intratheater airlift. He was promoted to lieutenant general in July 1953, and from 1958 he commanded the Military Air Transport Service until his retirement in 1960. Tunner died in Ware Neck, Virginia, on April 6, 1983.

Tupolev, Andrei Nikolayevich (1888–1972)

Leading Soviet aircraft designer. Born on November 10, 1888, in Pustomazovo, Tver Oblast, Andrei Nikolayevich Tupolev demonstrated a special interest in mathematics and physics at an early age. He studied natural sciences at the Imperial Technical Institute in Moscow and, under the supervision of Russian aerodynamics engineer Nikolai Y. Zhukovskii, built a wind tunnel for the institute and exhibited a model airplane, the *Antoinette,* at the aeronautics exhibition in Moscow in 1910. Arrested for anticzarist activities in 1911, Tupolev was released and worked at the Dux aircraft factory in Moscow.

During World War I, Tupolev was a lecturer at the Imperial Technical Institute. He held that military aviation was a prerequisite for prosecuting a successful war. The new Soviet government was then beginning to reconstruct an air arm. As many engineers had left the Soviet Union, the Bolsheviks entrusted Tupolev and others with establishing the Central Aerodynamics and Hydrodynamics Research Institute in Moscow. Tupolev

served as its director from 1918 to 1935, and the institute produced all the leading Soviet aircraft designers.

In 1927 Tupolev designed the first Soviet all-metal aircraft, the ANT-3, and in 1930 he produced the TB-3 four-engine bomber. The most advanced heavy bomber of its day, it was armed with six machine guns, had a maximum speed of 180 mph and a range of 1,800 miles, and could carry 2.5 tons of bombs. TB-3s saw combat in the 1936–1939 Spanish Civil War, in the Battle of Khalkhin Gol (May–September 1939), and in the First Finnish-Soviet War (Winter War). Tupolev also designed the twin-engine SB-2 ground-support bomber, which fulfilled a variety of wartime roles.

Although Tupolev was the most prominent Soviet aircraft designer, he was arrested in October 1937 in the Great Purges and accused of passing technical secrets to the Germans. The NKVD (Soviet secret police) and the government ran their own aircraft design bureau in a Moscow prison, and there Tupolev continued his work. In the summer of 1941 with the German invasion of the Soviet Union, the aircraft design bureau was evacuated to the Siberian city of Omsk, and Tupolev was released from prison.

After the war, Tupolev designed many passenger planes and bombers. The Soviet Union's foremost aircraft designer of World War II, Tupolev died in Moscow on December 23, 1972.

Turing, Alan Mathison (1912–1954)

British mathematician and cryptologist. Born in Paddington, England, on June 23, 1912, Alan Mathison Turing was educated at Cambridge University, where he studied mechanical and mathematical logic. While still an undergraduate, he published a seminal article suggesting a machine that could, by following a prescribed set of rules, move from one "state" to another. Afterward known as the "Turing Machine," this concept was the foundation for the logical structure of modern-day computers.

From 1939, British intelligence collected top mathematicians and code breakers at Bletchley Park outside of London to assist in breaking the German codes of the Enigma machine. There, Turing led the attempt to build on work carried out by the Poles. Bletchley Park was eventually able to read most German encrypted radio traffic, although not in real time. Nonetheless, this work was immensely important; the information it provided, code-named Top Secret Ultra, proved vital to the Allied victory in World War II. Turing left Bletchley Park in 1943 to develop a speech encipherment system.

Following the war, Turing worked on the development of the first electronic computers and wrote papers that are considered the foundation of today's field of artificial intelligence. Arrested, tried, and convicted in 1952 for homosexual activities, Turing acceded to a regimen of estrogen injections in lieu of imprisonment and continued with his research while under observation by members of a security detail, who were vexed when he took a Greek vacation in 1953. Turing, whose mother claimed that he often experimented with poisonous chemicals, died on June 4, 1954, at Winslow, Cheshire, England, after eating part of an apple laced with potassium cyanide; an inquest deemed his death a suicide.

Turkey

Eurasian nation covering 300,948 square miles. Strategically located both in Europe and Asia Minor, European Turkey borders Greece and Bulgaria to the east and north, and in Asia Minor today it shares common borders with Georgia to the northwest, Armenia and Iran to the east, and Syria and Iraq to the south. Turkey's 1939 population was approximately 17.4 million people. The Ottoman Empire had been on the losing side in World War I and had been forced to give up substantial territory at its end; what remained became present-day Turkey. Turkish leaders were understandably reluctant to embark on a new war, especially as their military machine was obsolete. For these reasons, and despite their hatred of their traditional enemy on their border, the Soviet Union (Georgia and Armenia being then both Soviet republics), the Turkish leaders were determined to keep the nation neutral in World War II.

Domestically, Turkey had been a secular state since 1924, but it was hardly a democracy. The father of modern Turkey, Mustafa Kemal (Ataturk), died in 1938. Premier Ismet Inönu, his closest associate, then took over the leadership of the nation and its one political party, the People's Party. Inönu was reelected president in 1943.

Turkish leaders were particularly apprehensive over the German-Soviet Non-Aggression Pact of August 23, 1939, as well as the possibility that Germany and the Soviet Union might combine against their country. In September 1939, they attempted without success to negotiate a mutual security pact with the Soviets. Turkey also kept its large army mobilized throughout the conflict, worried not only by the ambitions of Germany and the Soviet Union but also by those of Italy in the Balkans. The period of greatest threat was from the beginning of the war to the German invasion of the Soviet Union on June 22, 1941.

Although it remained neutral, Turkey was pro-West in its orientation. Once the Germans controlled the Balkans, however, Ankara signed the Treaty of Territorial Integrity and Friendship with Berlin on June 18, 1941, which extended economic concessions to Germany. Nonetheless, Inönu strongly resisted pressure by German ambassador Franz von Papen to enter the war on the German side.

Infantrymen of the Turkish Army, May 1940. (Bettmann/Corbis)

When the tide of war turned against the Axis powers, Turkey resumed its pro-West position, although it also resisted pressure from the United States and Britain to enter the war. Indeed, by 1944, relations between the Allies and Turkey had reached a low point. Although Turkey declared war on Germany on February 23, 1945, this step was taken to ensure membership in the United Nations.

Following the war, the Soviet Union applied tremendous pressure on Turkey in an effort to annex Kars and Ardahan. These two northeast Turkish provinces had long been a source of contention between the two nations. Moscow also demanded a share of control over the defense of the Bosporus and Dardanelles Straits. This Soviet pressure on Turkey and the communist threat to Greece led to the 1947 Truman Doctrine and to Turkish membership in the North Atlantic Treaty Organization (NATO) in 1952.

Turner, Richmond Kelly (1885–1961)

U.S. Navy admiral. Born on May 27, 1885, in Portland, Oregon, Richmond Kelly Turner graduated from the U.S. Naval Academy at Annapolis in 1908. Following service in World War I, he held a variety of posts and qualified as a pilot at the age of 42.

Turner attended the Naval War College in 1935 and remained there until 1938 as head of the Strategy Section. He then became director of the War Plans Division of the Navy Department in Washington, D.C. In March 1941, Turner was promoted to rear admiral.

Following the U.S. entry into World War II, Turner assumed additional duties as assistant chief of staff to Admiral Ernest J. King. In this dual capacity, he played a significant role in strategic planning for the Pacific theater. In July 1942, he became commander of the Amphibious Force, South Pacific, and he directed most U.S. amphibious landings in the Pacific during the war.

Turner, known as "Terrible Turner," had a reputation for being both brilliant and hot-tempered. His first operation involved the amphibious landings at Guadalcanal and Tulagi (August 7–8, 1942). Turner also had charge of amphibious assaults in the central Solomons: the Russell Islands (February 21, 1943) and Rendova Island (June 30, 1943). As U.S. forces readied for their drive through the Central Pacific, he assumed command of the Fifth Amphibious Force, U.S. Fifth Fleet.

Turner planned and commanded the landings against the Gilbert Islands of Makin and Tarawa (November 20, 1943). In early 1944, he also had charge of the landings against the Marshall Islands of Kwajalein (January 29) and Eniwetok (February 22). He was promoted to vice admiral in February 1944.

In March, Turner became commander, Amphibious Forces Pacific, while simultaneously retaining command of the Fifth Amphibious Force. He

directed the invasions of the Mariana Islands of Saipan (June 15–July 9, 1944), Tinian (July 21–August 1), and Guam (July 21–August 10). He also commanded the amphibious forces in the onslaughts against Iwo Jima (February 19–March 26, 1945) and Okinawa (March–June 1945). In May 1945, in the midst of the Okinawa Campaign, Turner was promoted to admiral. He next worked on plans for the invasion of Japan (Operation OLYMPIC), scheduled for the fall of 1945. He attended the Japanese surrender ceremonies on September 2, 1945, in Tokyo Bay.

Following the war, Turner served as U.S. naval representative on the United Nations Military Committee until his retirement in July 1947. Turner died in Monterey, California, on February 12, 1961.

Tuskegee Airmen

Personnel of the all-black combat units of the U.S. Army Air Forces during World War II. No African Americans had ever entered the U.S. Army Air Corps (USAAC), but in 1938 in a farsighted move, the Civil Aeronautics Authority authorized flight training for 20,000 college students yearly, and

soon after its inception, the program was opened to African Americans. The following year, Public Law #18 provided for contracting with civilian aviation schools for the elementary and primary phases of USAAC combat aviation training. This program also was reluctantly opened to blacks.

Tuskegee Institute, Alabama, would emerge as the primary site for training African American military aviation cadets. Air Corps commanders favored Tuskegee, comforted by the belief that the institution still adhered to the accomodationist philosophy of its founder, Booker T. Washington. But contrary to popular opinion, the training at Tuskegee was fully the equal of any white USAAC facility. However, the Tuskegee program was of minor importance in the total air-training effort, and its success or failure would have little effect on the total World War II effort.

On July 19, 1941, the USAAC activated the pioneer all-black 99th Pursuit Squadron. After lengthy training at Tuskegee, the 99th, under the rigorous command of Lieutenant Colonel Benjamin O. Davis Jr., was sent into combat in North Africa and Italy. It was later joined by the 100th, 301st, and 302nd Pursuit Squadrons to form the 332nd Fighter Group, again commanded by Davis. Davis insisted that his men stick close to the bombers that they were to escort, and consequently, the 332nd's "Good Shepherds" compiled an extraordinary combat record, losing only 25 bombers in 179 bomber escort missions, destroying 112 German aircraft in the air and another 150 on the ground. The 332nd's pilots flew a greater variety of fighter aircraft than any other U.S. fighter group: P-39s, P-40s, P-47s, and P-51s.

In the postwar decades, many Tuskegee Airmen pursued distinguished careers in the U.S. Air Force and in the civil aviation industry. Many historians have argued that the effort of American blacks to participate unsegregated in World War II was the catalyst of the U.S. civil rights movement beginning in the 1950s. It is certainly true that the American armed forces ended racial segregation a full decade ahead of civil society in the United States. On March 29, 2007, the Tuskegee Airmen were awarded the Congressional Gold Medal.

Tuskegee Airmen, including Benjamin O. Davis Jr. (the first African American general in the U.S. Air Force, third from left), in Alabama, 1942. The Tuskegee Airmen were the first African American pilots in the U.S. Army Air Forces and distinguished themselves in combat operations during the war. (Library of Congress)

Twining, Nathan Farragut (1897–1982)

U.S. Army Air Forces (USAAF) and U.S. Air Force (USAF) general. Born in Monroe, Wisconsin, on October 11, 1897, Nathan Farragut Twining joined the Oregon National Guard in June 1916. He received an appointment to the U.S. Military Academy at West Point in May 1917 and graduated after an abbreviated wartime course in November 1918 but remained an officer cadet until June 1919.

Twining's early career was in the infantry, but he entered the Primary Flying School at Brooks Field, Texas, in August 1923. He graduated from Advanced Flying School at Kelly Field, Texas, and received his wings in September 1926. Twining transferred to the Air Corps that November. His first operational assignment was to the 18th Pursuit Squadron in Hawaii.

Between March 1932 and August 1935, Twining served with several units and was promoted to captain. He graduated from the Air Corps Tactical School, Maxwell Field, Alabama, in 1936 and from the Command and General Staff School, Fort Leavenworth, Kansas, in 1937. From 1937 to 1940, Twining was stationed at Duncan Field, Texas. Promoted to major in August 1940, he became assistant chief of the Technical Inspection Division, Headquarters Air Corps, Washington, D.C., and was later promoted to lieutenant colonel.

In March 1942, Twining was promoted to brigadier general and became chief of staff to Major General M. F. Harmon, commander of U.S. Army Forces in the South Pacific. In January 1943, Twining took command of the newly formed Thirteenth Air Force, operating in the Solomon Islands and Bismarck Archipelago. Nicknamed the "Jungle Air Force," the unit provided invaluable support to General George C. Kenney's Fifth Air Force. On January 26, Twining's Boeing B-17 Flying Fortress was forced down in the Coral Sea. He and the other 15 survivors spent five days in a life raft before being rescued. In July, Twining, now a major general, assumed command of all Allied air assets in the South Pacific.

In November 1943, Twining took command of the newly formed U.S. Fifteenth Air Force in Italy. Among his command's critical targets were the Romanian oil refineries at Ploeşti. In June 1945, he was promoted to temporary lieutenant general and then given command of the Twentieth Air Force in the Pacific in August. His new command dropped the atomic bombs on Hiroshima (August 6) and Nagasaki (August 9).

In December 1945, Twining assumed command of the Air Material

Command, Wright Field, Ohio. In 1947 he headed the Alaska Command, and in May 1950 he became deputy chief of staff of the air force. Promoted to general in October and made vice chief of staff, Twining oversaw much of the U.S. Air Force's conversion from propeller to jet aircraft.

In June 1953 Twining became chief of staff of the U.S. Air Force, overseeing the reorganization of the service, the introduction of new aircraft, and improvements in training. He also fought against decreases in conventional forces in favor of nuclear forces.

In August 1957, Twining became the first U.S. Air Force general to be chairman of the Joint Chiefs of Staff. His 1957 assertions that there was a "bomber gap" with the Soviet Union led to a substantial increase in air force appropriations from Congress. He retired in 1960 and became vice chairman of the Holt, Rinehart and Winston Publishing company. Twining died at Lackland Air Force Base, San Antonio, Texas, on March 29, 1982.

Two-Ocean Navy Program

Massive U.S. Navy expansion approved by Congress in 1940. Because agreements signed at the Washington Conference in early 1922 had limited most U.S. naval construction, the United States could counter the rising naval power of Japan only by shifting naval assets from the Atlantic to the Pacific. After 1933, however, Germany's rearmament raised new potential dangers in the Atlantic; meanwhile, President Franklin D. Roosevelt, himself a naval enthusiast, viewed naval expansion as one of many economic stimuli

designed to end the Great Depression, and he promoted building programs in 1933 and 1934 to bring U.S. numbers of noncapital ships up to treaty-authorized limits. In 1935, Germany and Britain reached an agreement stipulating that the German fleet could have up to 35 percent of the tonnage of the Royal Navy, and in 1936, Japan abandoned its 1922 limits. A two-ocean war now became a real possibility for U.S. planners.

Early in 1938, Roosevelt proposed a 20 percent increase in U.S. warship tonnage, an increase that Congress approved on May 17. Through the remainder of 1938 and into 1939, as Germany's aggressive moves led to the absorption of Czechoslovakia and prompted Anglo-French guarantees to Poland regarding its security, Roosevelt concluded that the greater danger to U.S. national interests lay in the Atlantic rather than the Pacific, with a special concern for defending the Panama Canal. After World War II began in September 1939, Roosevelt organized a "neutrality patrol" in the Western Atlantic, defined in October 1939 as lying west of a line from the Saint Lawrence River to Trinidad.

Germany's conquest of the Low Countries and France in May and June 1940 affected the Pacific as well as the Atlantic. French possessions in Indochina and Dutch holdings in the East Indies were tempting targets for the Japanese, as were the Philippines. On June 14, 1940, as he was still planning a defensive posture in the Pacific while making the Atlantic the main theater of U.S. naval operations, Roosevelt requested a 25 percent increase in the carrier, cruiser, and submarine tonnage authorized in May 1938, amounting to an 11 percent rise in total U.S. fleet tonnage. Three days later, after German troops had occupied Paris, chief of naval operations Admiral Harold Stark asked Congress to appropriate $4 billion for a two-ocean navy. This represented a 70 percent increase in the combat fleet and would add 1,325,000 tons of new construction, amounting to 257 ships above the 488 that already existed or were being built at that time.

Roosevelt signed the Two-Ocean Navy Act on July 19, 1940. The largest naval appropriation in U.S. history, it authorized construction of 2 new Iowa-class and 5 Montana-class battleships, 6 Alaska-class battle cruisers, 18 aircraft carriers, 27 cruisers, 115 destroyers, 43 submarines, and 15,000 aircraft. It also provided for the purchase or conversion of 100,000 tons of auxiliary ships and the expenditure of $50 million for patrol, escort, and miscellaneous vessels.

Although modified to meet the changing demands of the war, the act created the combat core of the U.S. Navy as it developed from the middle of 1942 through the remainder of the war and for much of the decade that followed. Under its aegis were built the Essex-class carriers, the Baltimore-class heavy cruisers, the Cleveland- and Atlanta-class light cruisers, the Bristol- and Fletcher-class destroyers, and numerous smaller surface vessels and submarines.

U

Udet, Ernst (1896–1941)

German Air Force general. Born on April 26, 1896 at Frankfurt am Main, Germany, Ernst Udet joined the German Army during World War I and became a pilot. In March 1918, he joined Baron Manfred von Richthofen's Flying Circus. After Richthofen's death, Udet temporarily led this military unit until Hermann Göring assumed command. Udet ended the war with 62 victories, the highest-scoring surviving German ace.

Thereafter, Udet remained in aviation as a stunt pilot and explorer. Göring recruited his old comrade into the new German Air Force (Luftwaffe) in 1935. Udet became a general and was the first inspector of fighters, a post for which he was well suited. Later, Göring made him director of armaments, overseeing technical development. Udet was a brilliant flyer and was technically proficient but ill-suited for administration. He constantly clashed with inspector general of the Luftwaffe General Erhard Milch. Udet did oversee the procurement of the Messerschmitt Bf-109 and the Junkers Ju-87 Stuka, and he also pushed for the development of jet aircraft, but overall, he lacked the temperament needed for his position. As a result of his actions, as well as those of Göring, Milch, and chief of staff of the Luftwaffe General Hans Jeschonnek, German industry continually failed to meet production goals. The situation was so serious by the spring of 1941 that Göring replaced Udet with Milch. Having become the scapegoat for the air force's failures over Britain and elsewhere, a despondent Colonel General Udet committed suicide in Berlin on November 17, 1941.

U-505, Capture of (June 4, 1944)

U.S. Navy captain Daniel V. Gallery Jr. commanded antisubmarine Task Group (TG) 22.3, operating out of Norfolk, Virginia. It consisted of the escort carrier *Guadalcanal* (CVE-60) and five destroyer escorts. A hunter-killer group, TG 22.3 sank several German U-boats while providing protection for Allied Atlantic convoys.

Gallery had developed a plan for capturing a German submarine intact, and it was executed to perfection on June 4, 1944. *U-505*, a German type IXC submarine commissioned in August 1941, had previously sunk eight Allied merchant ships totaling some 46,447 tons and was on its 11th patrol under the command of Senior Lieutenant Harald Lange about 150 miles off the coast of Rio de Oro, Northwest Africa, on June 4, 1944, when it was detected by sonar aboard the destroyer escort *Chatelain*. The contact was only about 800 yards distant, and the escorts immediately converged on the contact while the *Guadalcanal* moved away at top speed and launched a Grumman 4F Wildcat to join another Wildcat and a Grumman TBM Avenger torpedo bomber already airborne.

The range was so short that the *Chatelain* first fired hedgehogs at the submarine, then circled back to drop depth charges. One of the aircraft spotted the submarine and fired on it to mark the spot for the *Chatelain*. An oil slick soon surfaced, and the submarine followed. The *Chatelain* opened fire on the submarine with all available weapons, as did other ships in the task force and two of the aircraft.

Believing his boat to be fatally damaged, Lange ordered the crew to abandon ship. This was accomplished so promptly that scuttling procedures had not yet been completed. While the destroyer escorts *Chatelain* and *Jenks* collected survivors, an eight-man party from the *Pillsbury* came alongside the

submarine in a boat and went aboard. One German, the only fatality in the action, lay on the deck, but *U-505* was otherwise deserted. The boarding party secured charts and codebooks, closed scuttling valves, and disarmed the demolition charges.

The *U-505* had taken in a fair amount of water and was down by the stern, but a tow was rigged to the *Guadalcanal*, and an engineer succeeded in using this to move the propellers, recharge the sub's diesel batteries, and then pump out the water. Three days later a fleet tug took over the tow, and the *U-505* eventually reached Bermuda.

That the *U-505* was captured and not sunk posed the risk that the Germans would learn of its capture and that this would endanger the Allied code-breaking operation of the Ultra secret. Chief of naval operations Admiral Ernest King was so angered that he almost ordered Gallery court-martialed. The 58 Germans taken prisoner were then held in isolation, denied access to the International Red Cross, for the remainder of the war. The secret of the capture was not divulged.

The codebooks and other material recovered did yield temporary benefit to the Bletchley Park code breakers, but more important were two technologically advanced G7 acoustic honing torpedoes. The leader of the boarding party, Lieutenant Junior Grade Albert David, subsequently received the Medal of Honor, the only such award in the Atlantic Fleet during the war.

The *U-505* was the first warship captured at sea by the U.S. Navy since the War of 1812 and the only submarine taken by it. In 1954, the *U-505* was donated to the Chicago Museum of Science and Industry, where it remains on display as a museum ship.

Ugaki Matome (1890–1945)

Japanese Navy vice admiral. Born in Okayama Prefecture, Japan, on February 15, 1890, Ugaki Matome graduated from the Japanese Naval Academy in 1912. He served at sea, graduated from the Naval Staff College in 1923, and joined the Naval General Staff. He then studied in Germany, commanded battleships, and was promoted to rear admiral in 1938.

In August 1941, Ugaki became chief of staff of the Combined Fleet under Admiral Yamamoto Isoroku. Ugaki was involved in planning the December 7, 1941, Pearl Harbor attack and all other Combined Fleet operations until he and Yamamoto were shot down in their aircraft over Bougainville on April 18, 1943. Ugaki survived, although he was seriously wounded. He returned to Tokyo to recuperate.

On February 25, 1944, Ugaki took command of the 1st Battleship Division consisting of the superbattleships *Yamato* and *Musashi*. He fought at the Battle of the Philippine Sea (June 19–21, 1944) and throughout the Marianas (June–August) and Leyte campaigns (October 20–December 25). He returned to the Naval General Staff in November, and then, on February 10, 1945, he assumed command of the Fifth Air Fleet, controlling the remaining Japanese naval air forces on Kyushu, the frontline defense of the home islands.

Emulating the example from the Philippines of Rear Admiral Ōnishi Takijirō, Ugaki formed the Special Attack Corps (Tokkotai) to conduct kamikaze attacks against the U.S. fleet. The Tokkotai was heavily engaged at Okinawa (March–June 1945), using both standard-production naval aircraft and specialized rocket-propelled suicide attackers (Ohka) launched from medium bombers, and inflicted significant U.S. losses.

After the U.S. victory at Okinawa, Ugaki was engaged in refitting the Fifth Air Fleet preparatory to repelling an invasion of Kyushu. With the

atomic bombings of Hiroshima and Nagasaki, on August 15, 1945, Emperor Hirohito called on the Japanese to lay down their arms. Determined to die in the Tokkotai spirit, that same day Ugaki joined two others in a Yokosuka D4Y Judy aircraft in an abortive kamikaze attack on the U.S. fleet off Okinawa, which they did not survive.

Ukraine Campaign (November 1943–July 1944)

Soviet campaign to retake Ukraine. During the period between August and November 1943, the Soviet 1st, 2nd, 3rd, and 4th Ukrainian Fronts pushed back German field marshal Erich von Manstein's Army Group South from the Donets River to the Dnieper River. On November 6, General Nikolai Vatutin's 1st Ukrainian Front took the Ukrainian capital of Kiev, and by the beginning of December, Soviet forces had crossed the Dnieper in a number of places, forcing the Germans from their hastily prepared positions. The Soviets then committed massive resources to liberate the remainder of Ukraine, including 70 percent of their armor and more than half of their air strength. The Soviet advantage in the air was especially glaring: a four-to-one superiority in numbers of aircraft over Luftwaffe units supporting Army Group South.

On November 11, 1943, German units launched a counterattack toward Kiev, and on November 20 they retook Zhitomir. Although fighting seesawed back and forth, the 1st Ukrainian Front launched a major assault on the First

and Fourth Panzer Armies on December 24. By December 31, the Red Army again held Zhitomir.

A Soviet soldier runs past a burning German tank during the battle for Kiev. (Corbis)

As Soviet pressure mounted, Manstein feared that Army Group South would be cut off, and he requested permission from Adolf Hitler to withdraw from the Dnieper bend. Hitler refused, and on January 5, 1944, Soviet Army general Ivan Konev's 2nd Ukrainian Front drove southwest from the vicinity of Cherkassy. During the next three weeks, the Soviets trapped 70,000 to 80,000 German troops of XI and XLII Corps in a pocket near Korsun. In a five-day period, the Germans lost 44 Ju-52 transport aircraft in a vain attempt to supply the pocket by air. Manstein's efforts to break through with two panzer corps failed, and the Soviets continued to reduce the pocket. On February 15 Hitler finally authorized a breakout, and on the night of February 16–17 some 30,000 Germans managed to escape in the direction of Lysyanka, although they abandoned their wounded and heavy equipment. The Germans sustained 20,000 deaths in the Korsun pocket, and the Soviets captured another 17,000 German troops, including 1,500 wounded. The victory led to Konev's promotion to marshal of the Soviet Union.

Simultaneous with Konev's attack, part of the 1st Ukrainian Front began the Rovno-Lutsk operation on January 27, 1944, to separate Army Group South from Army Group Center. On February 2 Rovno fell, and nine days

later the Soviets took the major railroad junction at Shepetovka. To the south on February 7, Colonel General Fedor Tolbukhin's 4th Ukrainian Front occupied Nikopol on the east bank of the Dnieper. It then turned south into the Crimean Peninsula, and on February 22 General Rodion Malinovsky's 3rd Ukrainian Front took Krivoy Rog, with its important metallurgical deposits.

On February 29, Vatutin was fatally wounded by Ukrainian partisans while on an inspection tour north of Kiev. Marshal Georgii Zhukov then took command of the 1st Ukrainian Front, and on March 4 he began an offensive from Shepetovka toward the juncture between the First and Fourth Panzer Armies. On March 5 the 2nd Ukrainian Front drove southwest toward Uman, joined the next day by the 3rd Ukrainian Front. Vast quantities of U.S. Lend-Lease trucks provided a degree of mobility that was previously lacking in Soviet offensive operations.

The 1st Ukrainian Front entered Tarnopol on March 9, outflanking the Germans on the Bug River, which Konev's 2nd Ukrainian Front forces reached three days later. Striking south from Tarnopol into the rear of the First Panzer Army, Zhukov's 1st Ukrainian Front reached the Dniester River at the end of March. Meanwhile, the 2nd Ukrainian Front gained the Prut River by March 26, and when tank units of both fronts linked up, they completely isolated the First Panzer Army. Farther south, the 3rd Ukrainian Front drove back the German Sixth Army to the Bug, sealing off the Crimean Peninsula.

On March 25, Manstein flew to Berchtesgaden and managed to convince a reluctant Hitler to allow the First Panzer Army to break free to the west of its encirclement, but on March 30 the führer relieved Manstein and replaced him with Field Marshal Walther Model. Hitler also renamed the two army groups in the south. Army Group South became Army Group North Ukraine, and Army Group A became Army Group South Ukraine. The First Panzer Army managed to break free of its encirclement, and Model then launched a counteroffensive along the Dniester River.

For the next several months, the front remained relatively static. However, Zhukov's armor reached the Carpathian Mountains, effectively cutting the German front in two. Having gained the Romanian border, the 2nd Ukrainian Front now turned south and joined with Malinovsky's 3rd Ukrainian Front in a night attack led by General Vasily Chuikov's Eighth

Guards Army to retake the Black Sea port of Odessa, which the Sixth Army abandoned on April 10. Hitler then relieved Field Marshal Ewald von Kleist of command of Army Group South Ukraine, replacing him with General Ferdinand Schröder.

On April 8, 1944, Soviet forces launched an offensive into the Crimea. Too late, Hitler authorized an evacuation. By the evening of May 9, the Soviets had retaken Sevastopol, capturing another 30,000 Axis troops. The Soviets now controlled most of the Ukraine, including its key industrial and agricultural areas. Stavka (the Soviet high command) had employed all six of its tank armies in the Ukrainian operation but now began to transfer units, including four tank armies, to Operation BAGRATION—the destruction of Army Group Center in Belorussia, which began on June 22, 1944, the third anniversary of Operation BARBAROSSA. The Soviets retook the remainder of the Ukraine following the Battle of Brody-Lwów in July.

Ulithi

Western Pacific atoll. Located in the Caroline Islands some 103 nautical miles east of Yap, Ulithi consists of 40 islets (4 of which are inhabited)

totaling only about 1.7 square miles in area around one of the largest lagoons in the world, approximately 22 miles long and up to 15 miles wide and capable of holding up to 700 ships. Some 1,200 miles from Okinawa and 3,660 miles from Pearl Harbor, Hawaii, Ulithi is about halfway (360 miles from each) on a direct line between Guam and Peleliu.

The first European to arrive at Ulithi was Portuguese navigator Diego da Rocha in 1526. The Japanese established a radio and weather station there early in World War II but evacuated it in the early summer of 1944. Supported by U.S. Navy ships under Rear Admiral William H. P. Blandy, the U.S. Army 323rd Regimental Combat Team of the 81st Infantry Division landed unopposed on September 23, 1944. A few days later a battalion of Seabees arrived. The Americans soon removed the natives to Fedarai and converted the remaining islands into bases to support navy ships and personnel. This included an air base on Falalop islet.

Within a few months there were more than 600 ships at Ulithi staging for Operation ICEBERG, the March–June 1945 invasion of Okinawa. In January 1945, Seabees completed a recreation center on Mogmog Island capable of accommodating up to 9,000 officers and men. The Japanese carried out occasional raids but inflicted only limited damage. On March 11, 1945, the U.S. aircraft carrier *Randolph* was hit and damaged by a kamikaze aircraft that had flown all the way from Japan.

Today Ulithi is administered by the State of Yap in the Federated States of Micronesia. Ulithi's population in 2000 was 773. Falalop is the most accessible islet.

Ulmanis, Karlis (1877–1942)

Latvian nationalist and authoritarian head of state during 1934–1940. Karlis Ulmanis was born on September 4, 1877, in Berze, Latvia (then the Russian Empire). He studied agriculture in Switzerland and Germany and then worked in Latvia as a writer, lecturer, and agricultural manager. Because of his nationalist activities, Russian authorities forced Ulmanis to seek exile in the United States in 1905. Ulmanis studied and taught there and briefly operated a dairy farm.

Ulmanis returned to Latvia in 1913 and founded the Farmers' Union Party. After the October 1917 Bolshevik Revolution, he worked feverishly for Latvian independence. A member of the National Council that proclaimed Latvian independence on November 18, 1918, Ulmanis became the first prime minister. As such, he signed a peace treaty with the Soviets in August 1920, which formally recognized the independent state of Latvia. He served four times as prime minister (1918–1919, 1919–1921, 1925–1926, 1931) before instituting his own authoritarian regime on May 15, 1934. During his paternalist rightist regime, Ulmanis emphasized national unity and rural virtues, arguing that a real Latvian is and must remain a nationalist farmer. He titled himself "Vadonis" (The Leader).

Ulmanis's regime collapsed in 1940 because of the August 1939 German-Soviet Nonaggression Pact, which provided for Latvia's incorporation into the Soviet Union. Ulmanis was deported to the Soviet Union in July 1940. He died in Krasnovodsk, Soviet Union, of dysentery on September 20, 1942.

Umberto II, King of Italy (1904–1983)

Italian crown prince who became king soon after World War II but reigned for only 35 days. Born in the Castle of Racconigi, Italy, near Turin, on September 15, 1904, Umberto Nicola Tommaso Giovanni Maria, Prince Royal of Savoy, was the sole male child of Italian king Vittorio Emanuele III (Victor Emmanuel III). From his birth, Umberto was designated Prince of Piedmont and heir apparent to the Italian throne.

Umberto had a military education, and at age 19, he became an officer in the Italian Army. A profligate socialite during the 1920s and 1930s, he nonetheless received rapid military promotion because of his royal status. He was promoted to brigade general in 1931, to division general in 1934, to corps general in 1936, and to army general in 1938.

In June 1940, Umberto commanded the Army of the Alps in the Italian invasion of southeastern France. This opportunistic attack, begun in the wake of the German blitzkrieg, did not go well. Although Umberto was a mere figurehead commander, with real control over the army exercised by Benito Mussolini and the Supreme Command, his reputation was sharply diminished by the campaign.

Umberto switched allegiance to the Allied side when his father signed an armistice with the Western Allies in September 1943. The king's authority had been tainted by his tacit approval of the fascists, so on June 5, 1944, the apolitical Umberto became lieutenant general of the realm and acting regent for the duration of the war. He attempted to shore up Italy's deteriorating foreign relations and proved to be a much less intransigent and, certainly, more affable head of state than Victor Emmanuel, but the House of Savoy's collusion with Mussolini and fascism for two decades poisoned his prospects for success in establishing a postwar Italian royal dynasty.

In 1946, a national referendum was scheduled to determine whether Italy should remain a monarchy or become a constitutional republic. In an effort to maintain the House of Savoy's royal status, Victor Emmanuel abdicated on May 9, 1946, in favor of his more popular son. Umberto, now the king of Italy, campaigned vigorously with various promonarchist parties to preserve the throne. On June 2, 1946, however, the citizens voted 12.7 million to 10.7 million to abolish the monarchy and make Italy a republic. Dubbed by Italians "the King of May" for his 35 days of official reign, Umberto was forced to leave the country and went to live a luxurious life of exile in

Portugal. Umberto II, the last king of Italy, died in Geneva on March 18, 1983.

Umezu Yoshijirō (1882–1949)

Japanese Army general. Born in Ooita Prefecture, Japan, on January 4, 1882, Umezu Yoshijirō graduated from the Japanese Military Academy in 1903 and the Army War College in 1911. Between 1913 and 1921, he served in Germany and Denmark and was posted as a military attaché in Switzerland. He thereafter quickly advanced through the ranks of the army bureaucracy and was appointed as chief of the General Staff in August 1931.

In 1934, Umezu was transferred to China and assumed command of the China Expeditionary Army. He achieved international notoriety when, with He Yingqin (Ho Ying-ch'in) in June 1935, he negotiated Japan's first formal encroachment into northern China. During the attempted coup by army junior officers on February 26, 1936, Umezu was the only member of the army's leadership to call for its immediate suppression. This decisive action helped bring his appointment as vice minister of the army in March 1937.

While Umezu labored to reequip the army, he also worked to increase its political influence. After the outbreak of full-scale military conflict with China in 1937, he assumed command of the No. 1 Expeditionary Forces. In 1939, he was reassigned to command the Guandong (Kwantung) Army and helped shore up the Japanese Army in the wake of the clash with Soviet forces at Nomonhan (May–September).

With the collapse of the cabinet of Tōjō Hideki in July 1944, Umezu became chairman of the army General Staff and took charge of prosecuting the war. He accepted Emperor Hirohito's decision to terminate the war and

represented the Japanese military during the September 2, 1945, signing of the surrender document on board the battleship *Missouri*. Tried, convicted, and sentenced to life in prison by the International Military Tribunal for the Far East, Umezu died in prison in Tokyo on January 8, 1949.

Unarmored Vehicles

General-purpose and specialized vehicles vital to mobile warfare, sometimes known as "soft" vehicles as opposed to "hard" (armored) vehicles. During World War II, the Allied side produced an overwhelming number of unarmored vehicles, an important factor in its ultimate victory. Most such vehicles were in fact hurriedly evolved from existing commercial designs.

During the war, the United States manufactured 3.2 million military vehicles, a production level previously believed unattainable. Canada made no military vehicles in 1938 but turned out nearly 816,000 between 1939 and 1945, more than were produced by all Axis nations combined. Germany led the Axis powers in production of unarmored military vehicles, but the majority of the German infantry units nonetheless moved on foot or by rail and horse: nearly 3 million horses pulled German supply wagons.

Trucks were especially important in resupply, as a combat division could require up to 750 tons of supplies daily. In the seven-month-long Tunisia Campaign of 1943, for example, 6,000 Allied supply vehicles traveled a total of more than 35 million miles. During the Allied drive through France from August 25 to November 16, 1944, the Red Ball Express hauled more than 412,000 tons of supplies. Even this effort was not sufficient to meet all needs,

however. Britain's equivalent, the Red Lion Express, delivered 500 tons daily to its Second Army. Axis operations, by contrast, often suffered for want of adequate supply transport and fuel.

The war's most notable truck design was the General Motors (GM) CCKW series (C for model year 1941, C for conventional cab, K for all-wheel drive, and W for tandem rear axle); this 22-ton truck was popularly known as the "deuce-and-a-half" or "Jimmy" (for GMC, or General Motors Corporation). One in four was to have a ring for mounting a .50-caliber antiaircraft gun.

The U.S. Army's Quartermaster Corps determined that 22 tons was the maximum weight possible for a truck that could be produced quickly in unlimited quantities. Few such trucks existed in 1939, but more than half a million were made by various manufacturers during the war. The CCKW series featured six-wheel drive and cab-mounted levers to engage the front wheels. About half the trucks were made with Timken split-housing axles, the rest with GM's "banjo"-style axles. On the latter version, front and rear drive shafts turned in reverse rotation of each other. Engine blocks were cast iron. Bodies might be wood or steel or a combination of both. Variants included cargo trucks, flatbed trucks, troop carriers, fuel and water tankers, dump trucks, tractors, and wreckers. Their distinctive Saginaw Steering recirculating ball gear made for exceptionally easy steering.

International Harvester developed the M-5H-6—a 22-ton 6 × 6 for use by the U.S. Navy and the U.S. Marine Corps. Its Hendrickson rear walking-beam suspension was more durable off-road and allowed greater flexibility on uneven terrain than the standard 6 torque rod version. Thornton locking differentials let both rear axles lock together and turn all four rear wheels at the same time for exceptional traction, even on Pacific beaches.

Most Canadian trucks were Canadian Military Pattern (CMP), developed jointly by GM and Ford of Canada from British military specifications and used by all Commonwealth forces. Their cab-over-engine design was a radical departure.

Britain utilized Canadian and U.S. vehicles extensively but also made its own. Vauxhall Motors, Ltd., manufactured more than 250,000 trucks during the war, notably the Bedford 15 cwt (15 hundredweight, or 1,680 pounds) and the 3 ton Model OY. The Soviet Union depended on the U.S. Lend-Lease

program for the bulk of its motor transport, supplemented by its own GAZ and ZIS trucks.

Germany's most successful truck was the Blitz (Lightning), a 1938 design by Opel, Germany's General Motors subsidiary. More than 82,000 were produced between 1937 and 1944. The standard model was a 4 × 2 with 6-cylinder motor and 5-speed gearbox. Some 100 variants served as mobile workshops, laundries, labs, command vehicles, radio vans, and ambulances. A 4 × 4 version, Type A, was a reasonably good cross-country vehicle.

Italy's heavy trucks, such as the 6-ton Autocarro Unificato Pesante (heavy unified truck), won the respect of the British, who captured and used them in North Africa. Among medium trucks, the most modern was the Fiat 665 NL. Tough and powerful, it had very large wheels and front-wheel drive.

Japan's land transport consisted principally of trucks purchased earlier from the United States and captured vehicles. As these broke down, no spare parts were available, but for the most part, the terrain of the Pacific islands and Japanese jungle-infiltration tactics did not lend themselves to extensive motorized transport. The primary Japanese truck was the 4-wheeled, 12-ton Type 97. Other models included the 52-ton Type 2 heavy truck and the 6-wheeled Type 94. All were built by Isuzu, Japan's largest wheeled-transport manufacturer during the war.

China had an estimated 7,000 trucks in 1937, mostly small European models suited to the primitive Chinese road system. Some light American trucks were received through Lend-Lease. Chinese Communist forces also procured unarmored vehicles by capturing them from the Japanese.

U.S. military planners saw the need for a specially designed small truck, something extremely lightweight, high-speed, exceptionally rugged, and dependable in all terrains—essentially, a mule with wheels and an engine. The result became an American icon. Officially designated Truck, 3-ton, 4 x 4, or General Purpose (GP) 4 x 4, it was dubbed "jeep," an existing nickname for any handy utility vehicle, by the troops. Soon, "jeep" was identified exclusively with the GP 4 x 4. The versatile little vehicle hauled supplies and wounded, performed reconnaissance duties, served command and communications roles, and shot up soft targets with its .50-caliber machine gun. Willys-Overland, Ford, and American Bantam produced more than 654,000 jeeps between 1940 and 1945. The jeep inspired a Soviet lookalike,

the GAZ-67B Field Car, a 4 x 4 with a 4-cylinder Ford Model A engine and steel ladder-frame chassis.

Britain also developed a lightweight utility vehicle, the Austin 10. It featured a “pickup” truck body (that term was coined later). Replaced by jeeps in fighting units, it saw extensive service with signal, military police, and headquarters units.

U.S. Army soldiers on Harley-Davidson motorcycles. During World War II, the Harley-Davidson Motor Company built more than 90,000 motorcycles for the U.S. armed forces. (Bettmann/Corbis)

Germany’s KdF Kübelwagen (bucket car), Volkswagen (VW) TYP 82, was based on existing plans for a civilian car. The Kübelwagen had an open, boxy body of flat panels for rapid production and a rear-mounted engine. It had excellent cross-country performance and was easy to handle, although it lacked four-wheel drive. More than 520,000 were built. Japan’s Type 95 by Kurogane was a light, 4 x 4 scout and field car with a 2-cylinder, air-cooled, front-mounted engine. Some 4,700 were made.

Tractors towed antitank and artillery guns cross-country and performed vehicle recovery. Breakdown recovery vehicles often had a trailer that pivoted on a turntable mounted on the tractor.

Britain’s Scammell tractors were famous for their articulating rear bogie. The Soviet Union’s fully tracked agricultural tractors were slow and primitive compared with Western military models, but they were well suited to Soviet

terrain and climate and were readily available due to a prewar Five-Year Plan production drive. The S-65 and S-80 6-cylinder diesel Stalinets saw extensive service.

The U.S. M26 truck-tractor from Pacific Car Foundry Company became the U.S. Army's standard tank-recovery vehicle, used in conjunction with 8-wheeled M15 and M15A1 transporter semitrailers, which had capacities of 40 to 45 tons. Its three winches could pull 35,000 to 60,000 pounds each.

Italy favored compact tractors with big wheels and powerful engines, such as the snub-nose Fiat TM40 Trattore Medio (tractor medium) 4 x 4. Germany developed specialized designs to cope with mud and snow in the Soviet Union. The Ostradschlepper (east wheel tractor) 4 x 4 Skoda 175, designed by the father of the VW Beetle, Ferdinand Porsche, had extremely large wheels with cleats but offered no great advantage and proved hard to handle. The more successful Raupenschlepper-Ost (Caterpillar-east) Steyr RSO/1 could replace its conventional 340mm wide steel tracks with a 600mm version for better traction.

Motorcycles carried messengers, reconnaissance patrols, sharpshooters, and even mortars. Britain's premier wartime cycle was the M20 from Birmingham Small Arms. More than 125,000 served in Allied armies around the world. In the United States, Harley-Davidson received so many government contracts that it eclipsed rival firm Indian for dominance in the U.S. motorcycle market. Harley's WLA, a cheaper, hardier military version of its popular V-twin WL, proved to be the best motorcycle of the war, used in every theater. More than 90,000 were made.

Japanese troops also rode a version of the Harley. In 1935, the Rikuo Nainen Company obtained a Harley-Davidson license, from which it developed the Type 37 motorcycle for military use, with an air-cooled gas engine, a higher body, and magnetic plugs. German motorcycle troops were as much a symbol of blitzkrieg as tanks or dive-bombers. Bayerische Motoren Werke (BMW, Bavarian Motor Works) produced its R-71 model throughout the war. Germany developed a unique crossbreed for paratroopers. First used on Crete in 1941, the Kleine Kettenkraftrad Sd Kfz (small, linked vehicle) placed a tracked rear end behind the front of a motorcycle to create a compact half-track cycle for supply transport.

Amphibious vehicles ran on land and swam through water. The most famous was America's DUKW (D for model year 1942, U for amphibian, K

for all-wheel drive, and W for tandem rear axles), built on the dependable CCKW truck chassis. About 21,000 were built. The Soviet Union's ZIL-485 and Britain's Terrapin were essentially enlarged DUKWs. Japan's Su-Ki was based on Toyota's 4 x 4 truck of the same name, and Germany's Kfz1/20 Schwimmwagen, VW 166, was a Kübelwagen with a propeller and a bathtub-shaped body.

Unconditional Surrender

Total surrender without conditions or terms. At the Casablanca Conference on January 24, 1943, U.S. president Franklin D. Roosevelt announced that "The elimination of German, Japanese, and Italian war power means the unconditional surrender by Germany, Italy, and Japan." Caught off guard by the announcement, British prime minister Winston L. S. Churchill nonetheless supported the president. In his Guildhall Speech of June 30, 1943, Churchill declared that unconditional surrender meant "that [the Axis] willpower to resist must be completely broken, and that they must yield themselves absolutely to our justice and mercy."

German colonel general Alfred Jodl, chief of the Operations Staff of the Armed Forces High Command, signs the unconditional surrender, Rheims, France, May 7, 1945. (National Archives)

The term “unconditional surrender” was identified with Union brigadier general Ulysses S. Grant in 1862 during the American Civil War when he demanded the surrender without terms of Fort Donelson, Tennessee. The demand for unconditional surrender had not been U.S. policy in conflicts with other nations prior to World War II. In this conflict it sprang from the widespread belief in Germany after World War I that the German armed forces had not been defeated on the battlefield but instead had been “stabbed in the back” by the civilian government. This myth greatly assisted the rise to power of Adolf Hitler. To obviate another such legend, Roosevelt demanded unconditional surrender, which would make it clear to all that the Axis powers had been defeated militarily. Unconditional surrender would also allow the victors to dictate peace terms that might destroy the racist, aggressive philosophies extant in the Axis states. In addition, the policy reassured Soviet leader Joseph Stalin that the United States and Great Britain were committed to the war effort and to the complete defeat of the Axis nations.

Under unconditional surrender, there would be no negotiations with members of the Axis. There would also be no “recognition” or “vacuum” rule, meaning that enemy leaders would not be able to act or exercise political

authority. The victorious alliance would install a military government to exercise governmental functions.

In one sense, this declaration played into the hands of the Axis leadership. German minister of propaganda Joseph Goeb-bels told the German people, “Enjoy the war; the peace will be awful.” Some have also charged that it prolonged the war because it precluded negotiations with the German Resistance.

United Nations Declaration (January 1, 1942)

Declaration of cooperation that pledged a concerted effort to defeat the Axis powers and led to the establishment of postwar international institutions. The Atlantic Charter of basic war goals had resulted from the Placentia Bay Conference involving U.S. president Franklin D. Roosevelt and British prime minister Winston L. S. Churchill in August 1941. The Washington Conference, held from December 22, 1941, to January 14, 1942 (code-named Arcadia), brought together Roosevelt and Churchill and their staffs to develop an overall strategic war plan. The resulting United Nations

Declaration was issued by China, Great Britain, the United States, and the Soviet Union on January 1, 1942. Later, 22 other nations signed and were designated “joint declarers.”

Signatory nations agreed to use their full resources to secure the defeat of the Axis powers, continue the war until victory was achieved, and avoid making any separate peace. There was also a concluding declaration that the agreement could be joined by any other nation that provided or in the future would provide “mutual assistance and contributions” for the defeat of the Axis powers. Eventually, 19 other governments signed that accord.

This understanding thus became not only a statement of general principles but also a device for binding diverse governments together. Further, the Washington Conference addressed such topics as an invasion of North Africa, countering the Japanese invasion of the Philippines, and Lend-Lease aid for the Soviet Union. In addition, Roosevelt agreed to send U.S. troops to Iceland and Northern Ireland.

The conference led to the first official use of the term “United Nations,” coined by President Roosevelt and immediately accepted to describe the Allies. This label both implied the impressive diversity of the Allied regimes and encapsulated Roosevelt’s own very comprehensive—critics would argue utopian—vision of the postwar system of international relations. Throughout the war, Churchill and other leaders readily employed the term as a shorthand reference to the great, inclusive military alliance. Immediately after the war, the term would become the title for new global institutions established to encourage international agreements, facilitate international cooperation, and endeavor to prevent a future global war as well as more limited armed conflicts.

Representatives of twenty-six Allied nations gather around U.S. president Franklin D. Roosevelt to sign the Declaration by the United Nations, January 1, 1942. (Bettmann/Corbis)

United Nations, Formation of

The creation of the United Nations represented an attempt by the World War II Allies to establish a postwar international organization that would be more effective than the interwar League of Nations at mediating international disputes and preventing full-scale conflicts. In the war's early months, even before the United States intervened, U.S. secretary of state Cordell Hull established a departmental planning group for this purpose. Meeting off the Newfoundland coast in August 1941, U.S. president Franklin D. Roosevelt

and British prime minister Winston L. S. Churchill included a broad proposal for an international security system in the Atlantic Charter, their declaration of overall war objectives.

On January 1, 1942, the governments of 26 nations fighting Germany, Italy, and Japan issued the United Nations Declaration affirming their alliance against the Axis powers and also stating their commitment to liberal war objectives, as set forth in the Atlantic Charter, and the restoration of the principles of international law. In 1943, both houses of the U.S. Congress also passed resolutions demanding the creation of a postwar international security organization, in which they implied that their own country should take the leading role it had abdicated in the League of Nations.

Meeting in Moscow in October 1943, foreign ministers of the four leading Allied powers—the United States, Great Britain, the Soviet Union, and China—signed the Declaration of Four Nations on General Security, committing themselves in general terms to the creation of a postwar international organization.

More specific proposals emerged from the Dumbarton Oaks Conference of 39 nations held in Washington, D.C., from August to October 1944. These proposals represented a compromise between the ideas of Roosevelt and other devotees of realpolitik—that agreement between the "Big Four" Allied powers that "the four policemen" must be the foundation of postwar international security—and more idealistic popular visions of a world in which all powers, great and small, enjoyed equal status and protection. Participants at the Dumbarton Oaks Conference agreed to create the bipartite United Nations organization, modeled on the earlier League of Nations but reserving ultimate authority to the dominant Allied states. All member states would be represented in the General Assembly, which would debate, discuss, and vote on issues that came before it. Executive authority was to rest with the 11-member Security Council, which would have 5 permanent members—Britain, France, the United States, the Soviet Union, and China. The remaining Security Council representatives were to be drawn from other United Nations states, all of whom would serve two-year terms in rotation. Besides providing an international security mechanism, the United Nations was also expected to promote international cooperation on economic, social, and humanitarian issues.

At the Yalta Conference in February 1945, the Allies agreed, on Soviet

insistence, that each permanent Security Council member should enjoy veto power over all General Assembly decisions. The Soviet Union also obtained separate representation for Belorussia (Belarus) and the Ukraine. Participants at the Yalta Conference further agreed on a United Nations trustee system to administer both former League of Nations mandatory territories—originally colonies taken from Germany and Turkey after World War I—and areas seized from the Axis powers when the ongoing war ended.

The Yalta Conference formally invited all Allied and most neutral powers to attend a meeting that would open in San Francisco on April 25, 1945, to establish the new United Nations organization. Representatives of 50 nations attended this gathering, which ended on July 25, 1945, and hammered out the details of the charter of the new organization. The charter accorded smaller states slightly more authority than had the original Dumbarton Oaks proposals and also incorporated the International Labor Organization established under the original 1919 League of Nations Covenant. To pursue its stated nonsecurity objectives, the charter created the United Nations Economic, Social and Cultural Organization (UNESCO). By the end of 1945, all states represented at San Francisco had ratified the United Nations Charter. In 1946 the body held its first session in London, and a year later it moved permanently to the United States, where its headquarters in New York City were completed soon afterward.

Although sometimes derided as ineffective and handicapped in international crises by its reliance on military forces contributed by member states, the United Nations often provided a valuable forum for the quiet exchange of views and the promotion of humanitarian and social goals. On occasion, it also conveniently furnished a useful alternative channel of communications among powers whose diplomatic relations were otherwise limited or even nonexistent.

Unit 731, Japanese Army

Japanese Army secret biological warfare unit. Established under the command of Lieutenant Colonel Ishii Shiro in Harbin, Manchuria, in August 1936, Unit 731 was officially known as the Epidemic Prevention and Water Purification Department. Some 3,000 personnel worked to produce bacteria for anthrax, bubonic plague, cholera, dysentery, tetanus, typhoid, typhus, and other infectious diseases.

To develop methods to disperse biological agents and enhance their effectiveness, Unit 731 infected prisoners of war, at least 3,000 of whom died in the experiments. Unit personnel referred to the prisoners—mostly Chinese, Koreans, and Soviets—as *maruta* (logs) because the Japanese informed the local Chinese that the Unit 731 facility was a lumber mill. U.S., British, and Australian prisoners were also used as human guinea pigs.

Unit 731's activities were outrageous crimes against humanity. After infecting a prisoner with the virus, researchers might then cut open his body, sometimes while he was still alive, to determine the effects of the disease. No anesthetics were employed, as these might affect the results. Medical researchers also confined infected prisoners with healthy ones to determine how rapidly diseases spread. In addition, Unit 731's doctors conducted experiments on compression and decompression and the effects of extreme cold on the body, subjecting limbs to ice water and then amputating them to determine the effects. The Japanese Army also repeatedly conducted field tests using biological warfare against Chinese villages.

In a more widespread use, Japanese aircraft spread plague-infected fleas over Ningbo (Ningpo) in Zhejiang (Chekiang) Province in eastern China in October 1940, causing 99 deaths. The Chinese government correctly concluded that an epidemic of plague in these areas was caused by Japanese biological weapons, and it publicized its findings. Japanese troops also dropped cholera and typhoid cultures into wells and ponds. In 1942, germ-warfare units deployed dysentery, cholera, and typhoid in Zhejiang Province.

At the end of the Pacific war, Ishii and other researchers escaped to Japan. They left behind their laboratory equipment as well as plague-infected mice that produced outbreaks of the disease in the Harbin area between 1946 and 1948. The U.S. government feared that the Japanese might employ biological warfare against North America via balloon bombs from Japan, but such a plan was never carried out.

After the Japanese surrender, the United States did not bring Ishii and his colleagues before the International Military Tribunal for the Far East (the Tokyo War Crimes Trials) for their crimes. Instead, they were granted immunity in exchange for providing information on the experiments to U.S. authorities, which Washington considered invaluable in its own biological warfare program. The Soviet government did prosecute 12 members of the unit at Khabarovsk in December 1949, all of whom admitted their crimes.

They were convicted and received sentences of from 2 to 25 years in a labor camp.

United States

Following its entry into World War II in December 1941, the United States devoted its considerable resources to the production of industrial goods at previously unimagined levels. This effort allowed the country to become the "arsenal of democracy" envisioned by President Franklin D. Roosevelt. Although the nation's security from direct attack played a considerable role in its remarkable capacity for production, the U.S. achievement was a peculiarly American phenomenon and a function of distinctly American traits.

Still reeling from the effects of the Great Depression, many Americans saw the war as a means to escape hard economic times. In 1940 and 1941, war orders and Lend-Lease contracts had already begun to bring the nation's economy out of a decade-long economic depression. The introduction of peacetime conscription removed thousands of young men from the job market, thereby improving job opportunities for those who remained. The military's preparedness campaign also sparked the economy through construction of new military facilities and orders for goods required by the armed services, from tents to aircraft. Grateful for meaningful, well-paying jobs, Americans threw themselves into war work with enthusiasm and energy.

The war eventually pulled 12 million young men and women out of the civilian labor force and into the armed services, but the United States, owing to its large population, was still able to increase production tremendously.

The U.S. Army, cognizant of the supremely important role that war production would play, opted to have only 90 divisions—the "90-division gamble." This decision placed a ceiling on the number of men called to military service, thereby ensuring that workers with critical industrial skills would be exempt from conscription. The military gamble also permitted the exemption of most miners and agricultural workers, ensuring the continued growth and expansion of those sectors as well.

The United States also had three significant underutilized sources for labor from which it could draw. More than 6 million women entered the workforce. Marginalized by New Deal programs that had emphasized male breadwinners, many women welcomed the chance to work outside the home. They also embraced the opportunity to make direct contributions to the American war effort, although most worked for unequal wages and were discouraged from joining unions or applying for supervisory positions. Most women worked in traditionally female sectors or in newly created industrial jobs, and their share of nonmilitary government jobs nearly doubled during the war. The image of "Rosie the Riveter," sleeves rolled up and bandanna tied in her hair, sent the powerful propaganda message that women in the workforce were crucial to American industrial might.

The United States also called on African Americans, most of whom had not worked in industrial jobs prior to the war. The combination of Jim Crow segregation in the South and the availability of good-paying industrial jobs in the West and North created a "second great migration" (the first occurred during World War I) of nearly 700,000 blacks from the South. Others moved to industrial and commercial jobs in southern cities such as Atlanta, Montgomery, and New Orleans. African American workers found that they could escape Jim Crow in the North and West, but they continued to face endemic discrimination, lower pay, and outbreaks of white violence. Few of these individuals returned to the South after 1945, however. Some white workers protested the modest advances made by black workers, especially in skilled sectors, and race riots in Detroit and Mobile, among other cities, underscored abiding problems in American race relations.

A presidential executive order guaranteeing blacks equal wages and freedom from discrimination did little to create real equality in the workplace. Nor was it lost on black Americans that the United States was fighting a war against fascism while retaining segregation in the military. Many blacks

embraced the Double V Campaign, aimed at achieving victory over fascism abroad while also destroying racism at home, although the United States proved to be more ready to fight the first battle than the second. Despite segregation, the service of African Americans in the armed forces, especially the prestigious Tuskegee Airmen, was a source of great pride to the black community.

Mexicans also helped to solve the nation's need for agricultural labor. Indeed, the labor crisis caused by the war forced the United States to rethink its immigration policies. In 1942, the government admitted 200,000 Mexican workers under the bracero program. Untold thousands of other Mexicans entered illegally as immigration restrictions were informally relaxed to meet labor needs. The braceros worked primarily as fruit pickers in western states, although they also had jobs in construction and maintenance. The bracero program proved to be so beneficial to the American economy that it was continued into the 1960s.

The growth of labor unions, which gained millions of members in the 1930s, also helped U.S. production. Unions provided spokespeople and leaders with whom the government could negotiate. Many unions, such as the American Federation of Labor (AFL), were willing to work with both government and business. They agreed to suppress strikes and work stoppages in return for higher wages and guarantees of overtime pay. As a result, both organized strikes and wildcat strikes (work stoppages called without the support of national organizations) were kept to a minimum. Unions that did strike during the war, such as the United Mine Workers, faced a backlash of public opinion and charges that ranged from antipatriotism to treason. The increase of industrial work, of course, meant more workers and more union members. More than 4 million American workers joined unions during the war years.

As a result of these developments, the United States easily met its labor needs without resorting to coercion. The nation added more than 6 million industrial jobs in three and a half years; General Motors alone added 750,000 workers to its payroll. Careful use of selective service, the 90-division gamble, support from organized labor, and the introduction of new groups to the industrial labor pool gave the United States the workforce required for vastly increased production.

Control of the economy proved to be a contentious issue. Most leaders of

American big business disliked and distrusted Roosevelt and the New Deal. The president first tried to manage the economy through a series of bureaucratic agencies that were based on the New Deal model and appealed to American patriotism and volunteerism. That approach proved ineffective, however, and led to creation of the War Production Board in January 1942. When that in turn failed to resolve all the mobilization issues, the Roosevelt administration created another board under the stewardship of former U.S. Supreme Court justice James Byrnes in 1943, designed to better integrate military production with the larger civilian economy. Roosevelt introduced two dozen separate agencies to enforce centralized control of the economy, but none of these met the government's need for production and business's desire for autonomy. The government eventually secured the cooperation of big business through a "cost-plus" system, by which the federal government paid for the costs of wartime conversion and guaranteed contractors a profit.

The results were amazing. In 1940, Roosevelt stunned leaders in the aviation industry by asking them to produce what seemed an impossible goal of 50,000 airplanes; by the end of the war, the United States had produced nearly 300,000. In 1944 alone, the country built 96,318 airplanes, while Germany and Japan together built 67,987. In the same year, the United States built 2,247 major naval vessels; Japan built just 248. Also by 1944, the United States was producing half of the world's steel. The Ford Motor Company alone produced a greater value of durable goods than did the entire nation of Italy. America's wartime industrial capacity provided the nation tremendous strategic flexibility and allowed the United States to conduct warfare in the European and Pacific theaters simultaneously while also supplying allies such as the British Empire, the Soviet Union, and China through the Lend-Lease program.

The massive war production ended the period of chronic unemployment and underconsumption in the United States. Job security and high wages meant near-universal improvements in American standards of living, and millions of Americans made their way into the middle class. Nutrition levels and housing quality increased dramatically, although the concentration of industry in war production meant that many desirable consumer goods, such as automobiles, were hard to find. Many other consumer goods—including foodstuffs—were rationed by the government, but Americans nevertheless enjoyed more access to goods than any other belligerent nation.

After its entry into the war, the United States completely halted production of civilian vehicles. As a consequence, more money was available for the purchase of war bonds, which were employed to fund the war effort. Individual savings also rose. Thus, despite being involved in a two-front global war, many people remember World War II as “the good war” in part because of its beneficial effects on the economy.

Relative affluence and a common sense of purpose contributed to a national mood of unity. The war also led to a reduction of the divisiveness that had characterized the depression years, and community activism rose amid a sense of shared struggle. Whereas many people experienced the Great Depression as an individual or familial crisis, the war was communal and national. The “Okies” and “Arkies,” reviled as unwelcome migrants to California during the Dust Bowl of 1930s had, by 1942 or 1943, become soldiers or well-paid industrial workers. The War Department’s decision to conscript men into national units, a policy used to great effect in World War I, underscored the idea of the war as an American endeavor, although select National Guard units also went to war as representatives of specific states or regions.

American movie star Rita Hayworth set an example by sacrificing her car's bumpers during the war, turning in the nonessential metal. Hayworth was also active in promoting war bonds. (National Archives)

Some scholars have argued that the American home front was devoid of both ideology and romanticism. The internment of 110,000 Japanese Americans and alliances struck with the Soviet Union and with China under Jiang Jieshi (Chiang Kai-shek) disturbed those Americans who tried to find ideological justifications for the war. But most Americans understood the war more practically as a job that needed to be done. Appeals to Roosevelt's Four Freedoms—freedom from fear and want and freedom of speech and worship—therefore did not carry the same patriotic meaning as similar appeals in World War I.

The persistency of racism notwithstanding, most Americans experienced better economic times and a great deal more optimism in the 1940s than in the 1930s. The sharp contrasts between the war years and the depression

years undoubtedly helped to make the home front a more hopeful place than would have been expected. Government policies that assigned relatively few fathers to combat units helped as well: by sending proportionally fewer fathers into combat, the U.S. military ensured that the nation would have as few widows and orphans as possible. World War II was surely not "the good war" for all Americans, but the U.S. home front did witness dramatic social and economic changes that improved the lives of millions.

When the war ended in 1945, the United States suffered some economic dislocations as the nation converted to peacetime production, mainly in the way of inflation. However, pent-up demand for products that had been unavailable or strictly rationed during the war drove consumer spending during the late 1940s. The nation avoided a postwar recession, which many economists had feared and that had been the case after World War I. Also, because the United States had been the only major belligerent that had not suffered major or catastrophic damage to its productive capacity, it maintained impressive resources to export billions of dollars of goods to other countries struggling to recover from the war. Indeed, by 1945, the United States was by far the world's largest economy (owning more than half of the entire world's economy) and would remain so for decades thereafter.

As millions of American men were demobilized from the military, many women who had held industrial (and traditionally male) positions were urged and even compelled to leave the workforce to open up job opportunities for men. Thus, for women World War II was a transitional era toward more autonomy and equality; not until the 1960s would women again begin to enter the workforce in large numbers, a trend that continues to the present day.

United States Army

When World War II began in Europe, the U.S. Army ranked 19th in the world in size; with only 190,000 men, it was just after that of Portugal in terms of personnel. On September 1, 1939, as the war began in Europe, President Franklin D. Roosevelt named General George C. Marshall to be army chief of staff. Junior to some 60 other general officers when appointed, Marshall proved to be a brilliant choice; he was a superb organizer and staff officer.

In September 1940, Congress passed the Selective Training and Service Act (the Burke-Wadsworth Act), the nation's first peacetime draft. The measure provided for the registration of all males between the ages of 21 and 35 and the induction into the armed forces of 800,000 draftees. Securing men was relatively easy, but training them and mobilizing U.S. military production would take time, and much of the new U.S. weaponry was going to Great Britain to keep that nation in the war. Marshall's draftees trained with broomsticks for rifles and logs representing artillery pieces. Trucks bore signs with the word "tank."

In World War II, the United States deployed a citizen army, mainly volunteers and draftees. Only two regular army divisions in 1940 were sufficiently equipped to be considered real divisions. In any case, most of the

army's regulars were soon scattered to assist in training. At the height of the war, regulars made up only 3.5 percent of the Army Ground Forces, 2.6 percent of the Army Service Forces, and 1.3 percent of the Army Air Forces. The vast majority of the officers—54 for every 1,000 enlisted men—were national guardsmen, reservists, or newly commissioned. Ultimately, 59 percent of army officers were drawn from the ranks.

Men of the 165th Infantry assaulting Butaritari are hampered by the coral and heavy Japanese defending fire, Makin Atoll, Gilbert Islands, November 20, 1943. (National Archives)

By December 7, 1941, the army was training 16 regular army divisions in the continental United States, along with 18 National Guard divisions and 2 Army of the United States divisions (composed of regulars, federalized guardsmen, and reservists). There were also the regular army's Philippine Division and 12 Philippine Army divisions, all of which were destroyed in fighting there early in 1942.

U.S. forces were initially poorly equipped and ineffectively trained, and they lacked supporting weaponry such as tanks and antitank and antiaircraft guns. Ammunition was also scarce. All this changed when the United States fully mobilized for war. By 1944, U.S. steel production was about half the world total. This statistic translated into large numbers of aircraft and ships but also 86,333 tanks, 650,000 Willys jeeps, and 12,573,000 rifles and

carbines. The army had so many vehicles that it could have placed every man and woman in the service in them at the same time and had room left over.

Marshall stressed firepower and maneuver. To him, this meant not only that tanks would play a prominent role but also that the entire army would be mechanized and motorized to a degree beyond that of any other military in the world. This emphasis would also enable the army to make effective use of the triangular concept, worked out while he was deputy commander of the Infantry School at Fort Benning, Georgia, between 1927 and 1932. The army went from large foot-bound, two-brigade (four-regiment) infantry divisions of 22,000 men to highly mobile three-regiment, 15,245-man (14,037 in January 1945) divisions. This triangular concept extended to the lowest level. One maneuver unit would fix an enemy formation in place while another turned its flank and the third maneuver unit remained in reserve.

In July 1941, President Roosevelt called for an estimate of the forces required to defeat “potential enemies.” Tasked with this assignment, Major Albert C. Wedemeyer estimated that by the end of 1943, Germany and its allies might field 400 divisions. Conventional wisdom held that attacking forces needed a ratio of two to one to overcome defenders, and Wedemeyer thus set the requirement at 800 divisions. Leaving out the Soviet Union, which he believed might not be able to withstand the German onslaught, he calculated that other allies could provide 100 divisions, which meant that the United States would have to raise 700.

Counting support troops, this would mean a total U.S. military of 28 million men. But the U.S. population was only 135 million people, and industrial production requirements, which experts believed would limit any military to a maximum of 10 percent of the overall population, meant that the armed forces could comprise no more than 13.5 million men. Of this total, the army would get 8.8 million—2.05 million in the air forces and 6.75 in the ground forces. The latter were to be formed into five armies: three purely offensive task forces and two defensive ones.

Wedemeyer postulated 215 maneuver divisions—61 armored, 61 mechanized, 54 infantry, 4 cavalry, 10 mountain, and 7 airborne. He thought that with overwhelming air superiority, firepower, and heavy armored components as well as a high degree of mechanization and motorization, such a force would be sufficient. Transporting a force of this size to Europe would

require 1,000 ships, and building these alone would take two years, as would raising, equipping, and training the troops.

As it worked out, the U.S. Army fell far short of Wedemeyer's figure. Instead, the so-called 90-division gamble was adopted. Actually, the U.S. Army of World War II numbered only 89 divisions—66 infantry, 1 (dismounted) cavalry, 16 armored, 5 airborne, and 1 mountain. Only 2 divisions did not enter sustained combat, and only 1 failed in combat.

In early 1943, Marshall reorganized the army into three major components: the Army Ground Forces, the Army Service Forces, and the Army Air Forces. In personnel, the army grew to 8,157,386 men and women by April 1945, of whom 1,831,091 served in the 16 Army Air Forces. Many of the army's best soldiers were not in the infantry, however. The Army Air Forces and specialist branches, such as rangers and paratroops, and the service staffs were permitted to skim off too high a proportion of the fittest and best-educated recruits. The infantry rifle companies were, however, called on to fight the Wehrmacht, the most skilled army of modern times.

The army worked on developing new high-firepower weapons. These included remodeled Browning automatic rifles; the Browning air-cooled, lightweight .30-caliber machine gun; the M-2 .50-caliber machine gun (which remains in use); and the superb M1 Garand infantry rifle with an 8-round clip. The M1, designed by John C. Garand and adopted by the army in 1936, fired 40 rounds a minute in the hands of the average rifleman, but an expert could get off twice that in the same time frame. It had 40 percent less recoil than the M-1903 Springfield it replaced and had only 72 parts, compared to 92 for the Springfield. The Garand could be entirely broken down using only one tool, a .30-caliber round. There was also the lightweight (5-pound) M1 Carbine, which was issued to officers instead of a handgun. Later, the army introduced the M3 submachine gun, most of the parts of which were stamped out. This weapon was capable of a rate of fire of 450 rounds per minute.

The artillery developed new techniques to minimize the time necessary for all guns in a battery to fire on a target and to coordinate the fire of several batteries so that their shells rained down on one target simultaneously (the time on target, or TOT, technique). The 105mm howitzer and the 155mm "Long Tom" artillery pieces provided the U.S. Army with remarkably effective firepower. Self-propelled guns also enabled the artillery to keep up with the fast-moving armored and mechanized formations.

The army was not so efficient in other areas. Congress had abolished the Tank Corps in 1920 and relegated tanks to the infantry. Not until 1931 did the cavalry, which still employed horses, receive light "tankettes," known as "combat cars." The U.S. Armored Force came into being only in July 1940 after the defeat of France, but its M-3 Grant, designed hurriedly in 1940, was obsolescent before it was built. Even the M-4 Sherman medium tank, the main U.S. and British tank of the war, had trouble matching up with some of the more powerful German tanks.

The army had no heavy tank in the field until the M-26 Pershing arrived in Europe in January 1945 because its armor commanders, notably Lieutenant General George S. Patton, believed that tanks should not fight other tanks. Between 1944 and 1945, the 3rd Armored Division alone had 648 Shermans completely destroyed in combat and another 700 knocked out of action, repaired, and put back into operation—a loss rate of 580 percent. The U.S. Army lost 6,000 tanks in Europe in World War II, whereas the German Army never had more than 1,500 tanks operable at any one time.

Despite shortcomings, the U.S. Army had greater firepower than any other army in the world. It was not only the quality and quantity of military equipment and supplies produced but also the speed with which new weapons came online. The bazooka antitank weapon, for example, went from development to production of 5,000 units in only 30 days.

The U.S. way of waging war is to use machines if possible to do the killing and to minimize American loss of life. The army carried a strong indirect fire punch, including massive air forces and substantial quantities of field artillery. For Operation COBRA, the Normandy breakout of July 25–31 1944, VII Corps disposed of 43 battalions of field artillery. In December 1944 in Europe alone, the army fired more than 3 million rounds of 105mm ammunition. Artillerymen were able to shift and mass fire on a target on a scale never before seen. The time-on-target technique was a devastating weapon. Air-ground coordination vastly exceeded that of other combatants. Joint and combined operations typified the army's campaigns.

Europe was the U.S. Army's principal theater. It was accorded a priority over the Pacific, which affected all fighting and supply efforts. Seventy-seven percent of army divisions, a total of 68, went to Europe, and there were over 3 million army personnel in Europe and the Mediterranean by April 1945. The Pacific absorbed only 23 percent of all army divisions (21). But despite

the priority of Europe, the Pacific theater claimed half or more of the army forces for the first two years of the war. Only in October 1943 were there more divisions in Europe than in the Pacific; 1.8 million army personnel served in the Pacific by the end of the war.

Although green U.S. Army divisions experienced some problems at first, notably in the Battle of Kasserine Pass (February 14–22, 1943), they also showed a great ability to learn from their mistakes and adapt. As the army gained experience in the late summer of 1944, its units were arguably better, man for man, than the highly touted Germans. Average U.S. infantry divisions could defeat average German divisions and could even match elite German divisions. They were significantly better than Japanese divisions, the tactics of which had deteriorated to digging in and dying in place.

Army doctrine and tactics were also basically sound and flexible. The Germans and Japanese were impressed with how quickly the Americans adapted and how rapidly they replaced unsuccessful tactics with effective ones. Communications, engineering, and medical services were the best in the world. Only at the senior command level in Europe did the army show some debatable weaknesses, with a desire to execute the safe rather than the risky course of action—for instance, the broad-front strategy. Yet even that "cautious" approach presented the Germans with crisis piled on crisis, unsustainable attrition, and too much pressure everywhere to allow recovery.

European combat, especially long multiple-month campaigns, cut heavily into available army manpower. In Europe, 81 percent of all casualties occurred in the divisions, and they were heavily concentrated in the infantry. Units might lose 30 percent of their men in a week, yet they stayed in the line and continued to fight. The 9th Division, for instance, sustained 17,974 casualties in a four-month period, yet it fought on.

The army did not replace combat losses efficiently or in the necessary quantities, despite training 1.1 million men as replacements and despite a peak strength of 99,288 Women's Army Corps personnel to replace men for battle. There were too few divisions to allow frequent rotation off the line for rest and training. Units were usually short of personnel, and replacements from the States could hardly replace battle casualties, let alone nonbattle losses. A flow of replacements from the States was mandatory. But that system did not always work well. Regardless, the personnel system did keep

the divisions fighting for extended periods of time. Units learned how to receive, train, and integrate replacements.

The manpower situation was different in the Pacific. Campaigns were usually relatively short in duration and limited in space, with obvious exceptions such as those on New Guinea (March 8, 1942–September 13, 1945) and Luzon (October 20, 1944–August 15, 1945). Battalions and regiments were the key maneuver units, not divisions and corps as in Europe. And in the Pacific, infantry losses were far higher than expected. During the entirety of the war, the U.S. Army sustained in action 937,259 total casualties —killed, wounded, taken prisoner, and missing (234,874 dead).

The U.S. Army had come a long way since 1939. By 1945, it was the best-armed, most mobile, best-equipped, best-supplied, most educated, and highest-paid army in history.

United States Army Air Forces

World War II witnessed a dramatic change in the scope and use of airpower by the U.S. military. Prior to and during World War II, there was no independent American air force. Instead, the army controlled the employment of aircraft over land, and the navy had charge of them over water. Since World War I, airpower advocates such as Brigadier General William Mitchell had argued for an independent air force (and for his outspoken criticism of the military leadership, a court-martial convicted Mitchell in 1926). Whatever its status, the pre–World War II Army Air Corps remained a relatively small coterie of professionals in which all pilots had to be officers.

By the mid-1930s, Air Corps theory centered around strategic bombing—the use of large bombers to destroy specific industrial targets and thereby cripple an opposing army for lack of essential supplies and win a war without a costly ground assault. Not only was such a campaign relatively inexpensive, but it also created an argument for air force independence, since this was a mission unique to airpower. The strategic bombing theory entailed a number of corollary assumptions. First was the belief that the bomber would always reach the target. The aircraft envisioned by army leaders were large, fast, and heavily armed. As a result, there was little development of long-range fighter aircraft prior to the war, since escorts were held to be unnecessary. Another assumption involved the denigration of tactical aviation—aircraft used to support the immediate needs of the battlefield. Leaders believed that by tying aircraft to ground forces, airpower lost its unique advantage along with the justification for independence. These ideals were epitomized by Major General Henry “Hap” Arnold, who became chief of the Army Air Corps in October 1938 and held that post throughout the war.

Whatever theory existed, tight budgets and isolationist views in Congress limited the growth of American aviation between the world wars. In 1939, even with war clearly on the horizon, the American aviation industry delivered only 921 aircraft to the U.S. Army and the U.S. Navy. Changes quickly ensued following the German invasion of Poland on September 1, 1939, however. European governments placed large orders with American aircraft firms. And earlier, in November 1938, President Franklin D.

Roosevelt, long concerned about the threat posed by Nazi Germany, had privately expressed a desire for an Air Corps of 20,000 aircraft, but publicly, he sought half that number. At the time, the Air Corps only possessed some 1,600 aircraft. Following the fall of France in May 1940, Roosevelt increased his goal to 50,000 aircraft for the army and navy together.

Despite massive orders, the aviation industry mobilized slowly. By 1941, the Air Corps possessed only 5,500 aircraft, and few matched the performance of their European counterparts. Only in heavy bombers, with the Boeing B-17 Flying Fortress, did American equipment approach that of Europe. In March 1941, Robert Lovett became assistant secretary of war for air, and he immediately set about increasing U.S. production. Output rose from 12,000 aircraft annually to 96,000 by the end of 1944. Manpower also increased dramatically. From 43,000 personnel in 1939, the number of people serving in the Air Corps rose to 300,000 by December 1941. To meet increased manpower requirements, the Air Corps lowered its standards, but entering the Air Corps remained much more difficult than entering other services.

The organization of the corps also changed with expansion. In 1941, the Air Corps gave way to the U.S. Army Air Forces (USAAF), with Arnold as chief; it was coequal with the Army Ground Forces and the Army Service Forces. In return for greater autonomy, Arnold verbally promised U.S. Army chief of staff General George C. Marshall, himself a strong supporter of airpower, that he would not seek independent status for the air force for the duration of the war.

Individual theaters each had their own numbered air forces, sometimes further divided by primary mission. For example, the First Air Force remained in New York, provided training, and oversaw the defense of the northeast region of the United States; the Eighth Air Force served in Great Britain and undertook the strategic bombardment of continental Europe; and the Ninth Air Force, which began in the Mediterranean theater, moved to Britain in 1943 as a tactical air force for the invasion of France. By the end of the war, there were 16 numbered air forces.

In 1941, to utilize airpower properly, the Air War Plans Division wrote AWPD/1 as an annex to the army’s comprehensive plan to defeat the Axis powers. AWPD/1 embodied the tenets of strategic bombardment. It called for 1,060 medium bombers, 3,740 heavy bombers, 3,740 very heavy bombers,

and 2,000 fighters to destroy 154 specific industrial targets in Germany—primarily aircraft-manufacturing sites, followed by power plants, the transportation network, and synthetic petroleum plants. In six months, the authors argued, Germany would be unable to resist the Allied armies, and civilian morale would be shattered, making an invasion unnecessary. These attacks were to be carried out in precision daylight strikes.

With the American entrance into the war in December 1941, the USAAF could not immediately launch the kind of offensive action envisioned in AWPD/1. In the Pacific theater, the Japanese advanced so rapidly that American forces found themselves fighting defensive battles for their very survival. It would take time to deploy the kind of force called for in AWPD/1 to defeat either Japan or Germany, however.

Major General Carl Spaatz commanded the Eighth Air Force, charged with carrying the air war to Germany. Activated in January 1942, the Eighth Air Force did not fly its first mission until July 4, 1942, when American medium bombers joined British aircraft attacking German airfields in the Netherlands. On August 17, 1942, American strategic bombardment began when 12 B-17s attacked the railroad marshaling yard in Rouen, France. That November, the Eighth Air Force lost much of its force to the Mediterranean theater, where Allied troops had invaded North Africa. The North African Campaign provided valuable experience to American airmen. Most important, the Americans learned from the British the value of close cooperation between air and ground forces.

In January 1943, President Roosevelt, British prime minister Winston L. S. Churchill, and their respective military staffs met in Casablanca to discuss strategy. Despite British pressure for the USAAF to join the Royal Air Force in its area attacks against German cities at night, the Americans argued for daylight precision strikes, which meant that Germany would be bombed around the clock. From the meeting came a directive for the Combined Bomber Offensive (CBO) that eventually destroyed Germany’s industrial base as well as its civilian morale.

To accomplish the goals of the CBO, Brigadier General Ira Eaker, the new commander of the Eighth Air Force, oversaw the development of the Pointblank Directive, which called for establishing air supremacy first by using the bomber to attack aircraft-manufacturing plants. To protect themselves from enemy fighters, bombers flew in large box formations that

massed defensive firepower. The first large Pointblank raid was against the Schweinfurt ball-bearing works, with a second mission against the Messerschmitt plant at Regensburg on August 17, 1943. Republic P-47 Thunderbolt fighters had only enough range to escort the bombers to the German border. As a result, the Eighth Air Force lost 60 bombers, one-sixth of the attacking force. A second raid in October cost an equal number of bombers during a day referred to as “Black Thursday.” The USAAF could not sustain such losses, and American bombers suspended raids deep into Germany until long-range escorts became available. Meanwhile, Arnold questioned the leadership of the Eighth Air Force and replaced Eaker, whom he sent to the Mediterranean, with Major General James H. Doolittle. Spaatz returned to England to oversee all American air operations as commander of the U.S. Strategic Air Forces in Europe.

Technical changes improved USAAF performance. By January 1944, external fuel tanks and increased capacity permitted P-47 and Lockheed P-38 Lightning fighters to escort the bombers far into Germany. Finally, North American P-51 Mustangs began reaching units in Britain; with external tanks, they could escort bombers as far as Berlin. In February 1944, the Americans launched Operation ARGUMENT, a coordinated attack on the German aircraft industry by both the Eighth Air Force and the Fifteenth Air Force flying from Italy. “Big Week,” February 20–25, 1944, witnessed thousands of sorties. The loss rate was only one-sixth that of the previous year, and U.S. fighter escorts began to take a grievous toll on inexperienced German pilots. In the air battles of 1944, the USAAF gained mastery of Europe’s skies not directly through bomb damage but rather through the attrition of German pilots. In March 1944, Spaatz began the systematic bombing of Germany’s petroleum industry. German fighters had to defend their source of fuel. Attrition among German aircrews could not be replaced, and the lack of fuel meant that replacement pilots had greatly reduced training time.

By the date of the Allied invasion of France on June 6, 1944, the German Air Force could not challenge Allied airpower. The appearance of Germany’s jet and rocket fighters, the Messerschmitt Me-262 and Me-163, caused brief consternation within the USAAF, but these aircraft were too few in number and their pilots were too inexperienced to pose a serious threat.

On the other side of the world, the USAAF provided support for General Douglas MacArthur’s ground forces in the Southwest Pacific. Initially, the

Pacific theater lacked large industrial targets within range; however, heavy bombers did contribute to the ultimate victory. More important were the medium bombers of the Fifth Air Force commanded by Major General George C. Kenney. Operations tended to be directed against Japanese island garrisons and shipping. To meet the low-level operations found in the theater, Kenney modified many North American B-25 Mitchell bombers to carry additional machine guns or cannon in the nose. His pilots also practiced bombing from treetop level using fragmentation bombs slowed by parachutes. Finally, to better strike ships, Kenney's bombers attacked from mast height.

The USAAF also flew missions in the China-Burma-India theater, although operations there were decidedly of secondary importance. Part of the problem involved logistics. The Japanese controlled all of coastal China as well as Burma. To supply China and the American forces there, the USAAF developed an aerial route over the Himalayas, referred to as "the Hump." By July 1944, despite a slow start, the operation was finally delivering sufficient matériel to meet operational needs, although at a very high cost. In China, Major General Claire Chennault led the Fourteenth Air Force in its efforts to push back the Japanese. Always operating at the limits of supply, his forces achieved only moderate success.

By 1944, the U.S. Navy's advance through the Central Pacific included the Mariana Islands. These islands provided bases for the Boeing B-29 Superfortresses then entering service. To ensure the proper use of the new bombers, Arnold maintained operational authority over their employment by controlling the Twentieth Air Force directly from Washington. Though the bombers were initially deployed in India and China, the Marianas proved to be far superior as bases, and all of the bombers eventually flew from there. But initial efforts to strategically bomb Japan did not fare well.

The B-29 was unique in that it was the first aircraft to contend with the jet stream, making bombing accuracy more difficult than normal. Not until early 1945, when Major General Curtis LeMay arrived in the Marianas and introduced new tactics to improve effectiveness, did the B-29s have a vital impact on Japanese industry. Instead of high-altitude precision strikes against industrial targets, the B-29s switched to low-altitude night incendiary attacks against cities. The largely wooden structures in Japan ignited with little help. The most destructive of these raids—and probably the single most destructive

raid in the history of air warfare—occurred on the night of March 9–10, 1945, when B-29s set 16 square miles of Tokyo aflame, killing at least 90,000 people. The destruction of cities peaked on August 6, 1945, when the B-29 *Enola Gay* dropped the first atomic bomb on Hiroshima. A second atomic bomb fell on Nagasaki three days later.

The USAAF fought in every theater of World War II, contributing substantially to the Allied victory. As Germany and Japan surrendered, teams from the United States conducted a survey of the exact impact of the bombing. The U.S. Strategic Bombing Survey (USSBS) concluded that airpower had a notable impact on Germany and Japan, yet bombing itself could not have won the war.

Aircraft played an integral part in the Allied war-fighting capabilities, making victory possible. The most effective uses of bombing were the systematic assault on the German petroleum industry late in 1944 and the assault against transportation. In the Pacific, to avoid conflict with the navy, the USSBS assessed the USAAF campaign as part of the overall force applied against Japan. The report concluded that the atomic bombs simply compelled Japan's leaders to accept reality.

By the end of the war, the USAAF had taken delivery of some 158,800 aircraft, including 51,221 bombers and 47,050 fighters. A total of 22,948 aircraft were lost in action. During the conflict, the USAAF flew 2,363,800 combat sorties and dropped 2,057,000 tons of bombs, 75 percent of them on Germany. By March 1945, the USAAF had more than 1,831,000 personnel, representing 22.4 percent of the army's total strength. USAAF personnel casualties over the course of the war came to 115,382, including 40,061 dead. Even without the unqualified endorsement of the USSBS, the USAAF had proved its worth, leading to its independence from the army in 1947.

United States Coast Guard

U.S. sea service that played a notable role in antisubmarine and escort efforts in the North Atlantic, in domestic port safety and security missions, and in amphibious operations in both the Pacific and Atlantic theaters while maintaining its peacetime search-and-rescue and law-enforcement responsibilities. During World War II, Coast Guard personnel saw worldwide action manning destroyers, transports, and auxiliary vessels as well as cutters, patrol boats, and landing craft.

The late 1930s and early 1940s brought the expansion of the Coast Guard in terms of missions, ships, and personnel. The Lighthouse Service joined the Coast Guard in July 1939, and the Bureau of Marine Inspection transferred to the service in 1942, strengthening its maritime safety and security mission. As war approached for the United States, the service began preparing its 19,000 men and cutter fleet for war.

Even before the United States formally entered the war, the service went on a wartime footing when, in September 1941, Coast Guard commandant Rear Admiral Russell R. Waesche ordered cutters to don wartime paint schemes and, pursuant to President Franklin D. Roosevelt's order, engage German and Italian submarines and aircraft operating west of 26 degrees west longitude. The Coast Guard cutter *Northland* promptly seized a German

weather station and a supporting trawler on the Greenland coast in September 1941. Then on November 1, 1941, Roosevelt ordered the Coast Guard transferred to the Navy Department.

On North Atlantic escort duty, the Coast Guard sank 12 German submarines and rescued over 1,000 Allied sailors while losing the cutters *Escanaba* and *Alexander Hamilton* to hostile action. Notable in this service was the cutter *Bibb*'s rescue of nearly 250 survivors from 3 ships sunk by U-boats in convoy SC.118 during February 1943 and the destruction of *U-175* by the cutters *Spencer* and *Duane* in April 1943. Coast Guard cutters also provided important escort and antisubmarine service in the Greenland Patrol Area, including the October 1944 capture of the German Naval Auxiliary *Externsteine,* the only German surface combatant taken at sea by U.S. forces during World War II.

A Coast Guard-manned LST at Iwo Jima. The Coast Guard performed invaluable service in many theaters during the war. (U.S. Coast Guard)

At home, Coast Guard captains of the port oversaw marine safety and security and assumed responsibility for the inspection of commercial vessels and the administration of professional seamen. Search-and-rescue stations and a wartime beach patrol provided coastal surveillance for Axis submarines and espionage activity. The volunteer Temporary Reserve was also formed and provided numerous civilian vessels for coastal patrol duties. Seaman John Cullen of Station Amagansett on Long Island, New York, helped foil German saboteurs when, conducting a beach patrol in June 1942, he discovered them landing. Cutters, small boats, and aircraft all played an important role in antisubmarine and rescue efforts in the Western Atlantic. During the war, the Coast Guard rescued some 1,500 sailors from vessels torpedoed along the U.S. Atlantic coast.

The Coast Guard manned attack transports and LSTs (landing ships, tank) and applied its small-boat handling skills to operating landing craft in all the major amphibious assaults of the war. Just as significant, Coast Guard surfmen trained others for this dangerous and difficult duty. The Coast Guard crews of the attack transport *Leonard Wood* and the attack cargo ship *Aquarius* each participated in eight amphibious assaults.

Signalman First Class Douglas A. Munro, operating from the Coast Guard–manned attack transport *Hunter Liggett,* led a group of landing craft

evacuating U.S. marines near Matanikau on Guadalcanal in September 1942. Munro beached his Higgins boat between a large Japanese force and the marines on the beach, shielding the other boats from hostile fire and engaging the Japanese with light weapons while the evacuation was completed. In the course of the fighting, he was fatally wounded by Japanese fire. For his actions, Munro was posthumously awarded the Medal of Honor, the only coastguardsman ever to receive America's highest decoration.

Active in numerous assaults in the European theater as well, the Coast Guard had a large presence during the Normandy Landing (June 6, 1944). The 60 83-foot Coast Guard patrol boats assigned to search-and-rescue duties during Operation OVERLORD assault rescued more than 1,500 Allied soldiers whose landing craft had been destroyed on D-day.

As commandant, Waesche piloted the service through the war and oversaw the enlistment of women and African Americans into the Coast Guard. Led by Captain Dorothy C. Stratton, the Women's Reserve—better known as the SPARs (an acronym from the Latin and English versions of the Coast Guard motto)—played an important support role during the war. More than 230,000 men and 10,000 women served in the Coast Guard over the course of World War II. Ultimately, their skill and bravery were the service's major contributions to victory.

United States Marine Corps

Established in 1775 as a shipboard security force for the Continental Navy, the U.S. Marine Corps struggled to maintain its institutional viability while

performing numerous and varied missions around the globe during the first century of its existence. Sustained by its reputation as a rapidly deployable, tenacious combat force, the corps and its civilian proponents argued that U.S. expansionist policies of the late 19th and early 20th centuries demanded a naval infantry force capable of seizing and defending advanced naval bases.

Progressive Marine Corps leaders had begun preparing this new doctrine when World War I interrupted their planning, although the valiant exploits of the corps during this conflict further endeared the service to the American public. Following World War I, the prevalent antimilitarism of the 1920s ushered in a period of military retrenchment, and the resulting scramble for available funds heightened interservice rivalries. The Marine Corps's lack of a clearly defined mission brought tremendous scrutiny on its funding and reductions in its strength that threatened its very existence. A massive public relations campaign featuring Marine Corps service in policing domestic mail routes and protecting American interests in Latin America and China bolstered the corps' public image and political clout with Congress, allowing the marines to withstand meager appropriations and perpetuate the claim of being America's premier fighting force.

In the early 1920s, U.S. military strategists began planning for numerous wartime contingencies, focusing primarily on Japan, the nation's chief Pacific rival. Recognizing the navy's need to secure advance operating bases on islands west of Hawaii in any war against Japan, the Marine Corps adopted amphibious assault as its raison d'être.

Integrating the newly constituted Fleet Marine Force into the U.S. Navy, the marines streamlined their bureaucracy and concentrated on preparations for seizing and defending advance bases in the Pacific. The corps assigned personnel to naval intelligence and planning staffs and began educating its officers in the tactics of amphibious operations. Lieutenant Colonel Earl "Pete" Ellis's exhaustive studies of Japanese-held Pacific islands in the early 1920s formed the nucleus of the marines' amphibious assault doctrine. In 1934, the corps published a more exhaustive guide to amphibious operations, *The Tentative Manual for Landing Operations*, and it held a series of fleet landing exercises designed to test its concepts. These exercises were crucial in highlighting the need for detailed logistical planning, speed in ship-to-shore movement, overwhelming fire superiority from air and naval

bombardment, and specialized equipment to successfully carry out opposed landings.

Although Marine Corps aviation utilized previous experience in Latin America to develop rudimentary close air support tactics based on dive-bombing (which the German Luftwaffe then adopted), the U.S. Navy's ambivalence toward developing close-in naval gunfire support techniques and constraints on the procurement of new equipment severely limited the development of U.S. amphibious warfare prior to 1939.

Between 1939 and 1941 as the U.S. military buildup went forward, the Marine Corps tripled in size from some 25,000 to 75,000 men and improved its amphibious capabilities. However, the corps was spread thinly to cover a wide range of duties in garrisons and aboard ships, from Iceland to the Caribbean to Hawaii and numerous smaller islands throughout the Pacific.

In July 1941 the 1st Provisional Marine Brigade, commanded by Brigadier General John Marston, became the first American troops deployed to the European theater of war when U.S. Navy Task Force 19 landed the unit in Iceland to relieve British forces of the task of securing the vital island astride the Atlantic convoy routes. U.S. Army forces began arriving that August, and by March 1942 all the marines on Iceland had been transferred to the Pacific.

On December 7, 1941, marines aboard battleships at Pearl Harbor and at nearby airfields assisted in defending Hawaii against the Japanese attacks. Elsewhere in the Pacific, isolated marine garrisons on Guam and in China had little choice but to surrender. Marines on Wake Island and in the Philippines valiantly attempted to resist Japanese invasions, but Wake Island fell after two weeks of resistance, and the Philippines surrendered in May 1942.

Marines were at the forefront of early U.S. operations against Japan. In the Southwest Pacific, the 1st Marine Division carried out assaults in the Solomon Islands in August 1942. The long campaign for Guadalcanal (August 1942–February 1943) revealed the complexities of conducting amphibious operations under battle conditions, including the need for increased logistical support and a simplified command-and-control structure. Advancing up the Solomons from 1942 to 1944 toward the Japanese fortress at Rabaul, the marines found themselves engaged in jungle warfare against a fiercely determined Japanese foe.

In 1943, encouraged by success in the Solomons, the Marine Corps played a leading role in the thrust through the Central Pacific toward the main Japanese islands. The atolls of the Gilbert and Marshall Islands proved to be a different kind of challenge than the jungle warfare of the Southwest Pacific. Ineffective fire support, confused communications, and a shortage of proper equipment made the initial assault at Tarawa (November 20, 1943) a bloody and sobering affair.

Applying the lessons learned from Tarawa to refine their amphibious doctrine, the marines advanced through the key Marshall Islands atolls of Kwajalein, Roi-Namur, and Eniwetok. During the summer of 1944, marines landed on Saipan, Tinian, and Guam in the Marianas. They also learned how to conduct sustained combat operations on these larger extensively fortified islands. In the fall of 1944, marine infantry and aviation forces supported General Douglas MacArthur's advance on the Philippines. Marines landed on Peleliu on September 15, 1944, and suffered heavy casualties in a savage weeklong battle. From September 1944 to April 1945, Marine Corps tactical air support became a vital component of army operations on Leyte and Luzon.

On February 19, 1945, the marines invaded the island of Iwo Jima in their most spectacular and costly operation of the war. Nearly the entire 21,000-man Japanese garrison died defending the island while inflicting almost 30,000 casualties on American forces in a 36-day slugfest. During the battle, journalist Joe Rosenthal snapped a photo of 5 marines and 1 navy corpsman raising a flag on Iwo Jima's Mount Suribachi. This image instantly became an icon of Marine Corps valor and esprit de corps as well as a symbol of American fortitude in World War II. In June 1945, marines and army troops secured Okinawa, just 360 miles from Japan, after three months of ferocious combat in the hills and caves across the island.

After the Japanese surrender in August 1945, U.S. marines served throughout the Pacific in occupation duties. World War II was a defining moment for the marines. Their seemingly prophetic development of amphibious assault doctrine in the interwar period proved invaluable to winning the Pacific campaigns, and their prior planning and experience also aided the army-led invasions of Europe. The Marine Corps had grown to 20 times its prewar strength, with approximately 500,000 men in six marine infantry divisions and four air wings. It had honed its amphibious doctrine while expanding its aviation and combat support capabilities. Although the Marine Corps comprised less than 5 percent of the U.S. military in the war, marines constituted nearly 10 percent of all American wartime casualties, with 19,733 killed and 67,207 wounded.

Despite continued and often heated interservice clashes among the army, the navy, and the new U.S. Air Force, marine combat performance during World War II further attached the Marine Corps to the public, thus ensuring that the service would survive demobilization as a separate institution within the navy and an elite component of the U.S. military establishment.

United States Navy

U.S. naval preparations for war were under way long before the Japanese attack on Pearl Harbor on December 7, 1941. The United States had moved away from its post–World War I emphasis on naval arms limitation as a consequence of the outbreak of war between China and Japan in July 1937. On May 7, 1938, Congress passed a naval expansion bill authorizing a 20 percent increase in the overall tonnage of the navy. President Franklin D. Roosevelt and his advisers hoped that this step would deter Japan from further expansion in the Pacific that might threaten U.S. interests there. The Japanese, however, continued their expansionary moves. The concern of the Roosevelt administration over this failure was heightened by the outbreak of war in Europe in September 1939 and the string of Allied defeats there that followed. On June 20, 1940, believing that the United States might soon stand alone in the face of Axis aggression, Congress passed a second naval expansion bill, which called for a two-ocean navy through a 70 percent increase in overall naval tonnage.

Despite the fact that the bulk of the navy was based in the Pacific, the initial deployment of U.S. naval forces in World War II was in the Atlantic theater and took place while the United States was still technically neutral. President Roosevelt aligned the United States with the European Allied powers, and following the fall of France, he sent material aid to Great Britain. This included the Destroyers-for-Bases Agreement of September 2, 1940, that saw 50 World War I–vintage U.S. destroyers transferred to the Royal Navy and ultimately the passage of Lend-Lease legislation that transferred significant military equipment to powers fighting the Axis. The transport of these supplies across the Atlantic via merchant convoys led to the need to protect them against German submarines.

By mid-1941, U.S. naval forces were engaged in escorting convoys to Iceland, where they then became Britain's responsibility. This situation led to an escalation of hostilities with the September 1941 German torpedo attack on the escorting destroyer *Greer*. Roosevelt responded with a shoot-on-sight order regarding Axis warships threatening convoys. On October 31, 1941, a German submarine torpedoed and sank the U.S. destroyer *Reuben James*, the first U.S. warship lost in World War II.

Yet war for the United States came not in the Atlantic but in the Pacific. With the Japanese attack on Pearl Harbor on December 7, 1941, the nation formally joined the Allied side. The U.S. Navy, which by late December was under the direction of the commander in chief of the U.S. Fleet, Admiral Ernest J. King, faced a multiple-theater conflict. In the Atlantic, the war at sea centered on the protection of Allied supply lines to Great Britain. Although the Battle of the Atlantic was fought primarily by British and Canadian forces, the United States contributed through the deployment of convoy escorts largely under the direction of the Atlantic Fleet commander, Admiral Royal E. Ingersoll. In early 1943, the United States assumed responsibility for the protection of convoys in the Central Atlantic.

In addition to the destroyer forces deployed for this duty, special hunter-killer groups based around escort carriers executed search-and-destroy operations against Axis submarines. Through the use of radar and sonar, these forces played an important role in the Allied victory in the critical Battle of the Atlantic. By the close of the war, U.S. naval units had accounted for 25 percent of the 781 German U-boats sunk during the conflict.

In addition to commerce protection, the U.S. Navy also contributed

warships to aid the Royal Navy in fleet surface operations in the Atlantic. In March 1942, the United States sent its first naval task force, centered on the aircraft carrier *Wasp,* into the Atlantic. The navy provided critical gunfire support and sealift in all the Allied amphibious operations of the war, beginning with Operation TORCH (November 8, 1942), the Allied invasion of North Africa, and extending through Operation OVERLORD, the June 6, 1944, Normandy Invasion. As with the U-boat war, the British provided the lion's share of the vessels required for this task.

Initial U.S. involvement in the Mediterranean theater was the result of Allied disagreement over the strategy to attack the European Axis powers. Although the United States favored an attack on German-held France via the English Channel, to take place in mid-1943, the prevailing British view called for a peripheral attack via the Mediterranean. This attack took the form of Operation TORCH. The Royal Navy conducted assaults on the Mediterranean beachheads of northern Africa, and the United States had responsibility for the Atlantic coast. The majority of the naval units covering the landing forces and providing fire support were British, and overall command of the naval force rested with the Royal Navy, but the U.S. Navy employed a task force under Rear Admiral H. Kent Hewitt that included one fleet carrier, three battleships, and four converted escort carriers. Following this operation, U.S. involvement increased through the July 9–August 22, 1943, Allied invasion of Sicily. Hewitt once again commanded a U.S. squadron under the direction of the Royal Navy. This arrangement was repeated in the Allied invasion of mainland Italy.

In Operation NEPTUNE, the naval portion of the Normandy Invasion, of all the Allied gunfire support ships—7 battleships, 23 cruisers, and 80 destroyers—the United States supplied 3 battleships, 3 cruisers, and 31 destroyers. These ships provided invaluable supporting fire for amphibious forces landing on the beaches. The final major Allied landing in the Atlantic theater, Operation DRAGOON—the August 15, 1944, invasion of southern France—was predominantly composed of U.S. units and under the command of Admiral Hewitt. U.S. gunfire support ships included 3 battleships, 3 heavy cruisers, and 59 destroyers.

Although the involvement of the U.S. Navy in both the Atlantic and the Mediterranean was eclipsed by that of the Royal Navy, the chief reason for this was that the United States bore the brunt of the naval war in the Pacific.

This effort faced great challenges from the outset, as the U.S. Pacific Fleet, under the command of Admiral Husband E. Kimmel, was gravely wounded by the Japanese attack on Pearl Harbor, which put all of the fleet's battleships out of commission. In any case, the initial U.S. effort in the vast Pacific centered on U.S. Navy carriers, which had not been in Pearl Harbor at the time of the attack. The denuded U.S. Pacific Fleet was further weakened following the loss of the British capital ships *Prince of Wales* and *Repulse* on December 10, 1941, and the February 1942 destruction of the American-British-Dutch-Australian (ABDA) Command, a collection of Allied warships. As a result of these blows, for most of the war the U.S. Navy was the sole Allied naval force pitted against the Japanese, who seized the U.S. possessions of Wake Island, Guam, and the Philippines.

Gun crews of a U.S. Navy cruiser covering the American landing on the island of Mindoro scan the skies in an effort to identify a plane overhead. Two 5-inch guns and inboard 20mm antiaircraft crews are ready to take action, December 15, 1944. (National Archives)

Amid these disasters, U.S. and British military officials met in early 1942 and resolved that the United States would assume responsibility for the Pacific theater. U.S. strategists realized that to defeat Japan, it was necessary

to recapture lost U.S. possessions and take Japanese Pacific holdings, thus isolating the Japanese home islands and starving their war machine of supplies. Command of the Pacific was divided into two theaters to achieve this end. The Southwest Pacific was under General Douglas MacArthur, who pursued an advance from Australia through the Netherlands East Indies to the Philippines. The North, Central, and South Pacific areas were assigned to Admiral Chester Nimitz, who succeeded Admiral Kimmel as commander of the U.S. Pacific Fleet. Consequently, Nimitz commanded the majority of U.S. naval forces in the Pacific. He pursued War Plan Orange, a prewar strategy that called for an advance toward Japan through the Central Pacific.

These operations, however, could not take place until the country's industrial strength produced more warships to augment the force that remained after Pearl Harbor. War Plan Orange saw the role of submarines as scouts for the U.S. battle line, but after the Japanese attack on Pearl Harbor, the U.S. Navy deployed its submarines with the destruction of Japanese overseas commerce as a key mission. Surface units were charged with preventing further Japanese expansion.

While the submarine war unfolded, a critical concern was the threat posed to Australia, which was both a vital naval base and an area to station troops. The need to protect Australia led to the Battle of the Coral Sea on May 7–8, 1942. This engagement aborted a Japanese landing at Port Moresby in New Guinea. Japan's attempt to take Midway Island and draw out and destroy the U.S. carriers led to the pivotal Battle of Midway (June 3–6, 1942). The loss of four of Japan's finest carriers in this battle was a great blow to further Japanese expansion in the Pacific and, in a very real sense, the turning point in the Pacific war.

The U.S. Navy subsequently implemented its plan to defeat Japan. The amphibious operations that ensued were made possible by the tremendous wartime naval production of the United States. By 1944, the U.S. Navy was larger than all other navies of the world combined, and the Pacific Fleet comprised 14 battleships, 15 fleet carriers, 10 light carriers, 24 cruisers, and hundreds of destroyers and submarines. The Japanese, whose industrial base was much smaller than that of the United States, could not match this production.

One of the keys to Allied victory in the war was the ability of U.S. Navy task forces to operate at great distances across the vast Pacific. To support

this effort, the navy created an extensive logistics network. This Service Force Pacific Fleet, known as a fleet train, included tankers and supply and repair ships moving in the wake of the combat ships. A massive system of reprovisioning and repair, the fleet train markedly reduced the need for combat ships to spend precious time moving to and from their home bases and thus greatly increased the number of combat ships deployed.

In the Central Pacific, the navy lifted army and marine elements to take Japanese-held islands in the Marshall, Caroline, Mariana, and Philippine Islands. In the Battle of Leyte Gulf (October 23–26, 1944), the U.S. Navy eliminated the Imperial Japanese Navy (IJN) as a cohesive fighting force and cut the Japanese off from their southern resources area. The Allied conquest of Okinawa from March to June 1945 signaled to U.S. amphibious forces the completion of Plan Orange. With the destruction of the IJN and the seizure of bases within striking distance of Japan, the home islands were both isolated and subjected to the strategic bombing of cities and the devastation of coastal trade.

Equally important in the isolation of Japan was the submarine campaign, the most successful *guerre de course* (war against trade) in modern history. Of Japan's total of 8 million tons of merchant shipping (at best marginal for meeting Japanese requirements in peacetime), U.S. submarines sank almost 5 million tons, thus crippling Tokyo's ability to supply the home islands, especially with oil.

By the end of World War II, the U.S. Navy had participated in every major theater of the naval war. The cost was high, as the navy lost 36,674 officers and enlisted personnel. In the Battle of Okinawa alone, Japanese kamikaze attacks caused the navy more casualties than it had suffered in all its previous wars combined. Materially, the navy lost 2 battleships, 4 fleet aircraft carriers, 1 light carrier, 6 escort carriers, 12 cruisers, 68 destroyers, and 47 submarines in the course of the war. Nevertheless, the manpower and industrial strength of the United States had not only made good the losses but also augmented the navy to the point that its size in both personnel and ships eclipsed that of all the other naval powers of the world combined. This force was critical to the Allied victory in World War II.

United States Navy Carrier Raids (February 1–April 18, 1942)

Beginning with the surprise Japanese attack on Pearl Harbor on December 7, 1941, the Allies had suffered a series of defeats in the Pacific in December 1941 and January 1942. U.S. Pacific Fleet commander Admiral Chester W.

Nimitz was determined to hit back with his carriers, the only real effective weapons, apart from submarines, he had available. In early January 1942, the carrier *Yorktown* helped escort a convoy carrying marine reinforcements to American Samoa. That mission accomplished, Nimitz ordered Vice Admiral William F. Halsey to take the offensive against the Japanese.

On January 25, the *Yorktown* and its sister ship the *Enterprise* departed Samoan waters. Six days later, they separated into two task forces (TF). TF 8, centered on the *Enterprise* and including the heavy cruisers *Northampton, Salt Lake City*, and *Chester* and three destroyers, would raid the Marshall Islands; TF 17, centered on the *Yorktown,* with the heavy cruiser *Louisville*, the light cruiser *St. Louis,* and four destroyers, would attack both the Marshall Islands and the Gilbert Islands. Halsey sent the *Enterprise* and three screening destroyers against Wotje, Taroa Island in Maloelap Atoll, and Roi and Kwajalein islands in Kwajalein Atoll, all in the Marshalls. He ordered Rear Admiral Raymond A. Spruance with the *Northampton* and the *Salt Lake City* to bombard Wotje, while the *Chester* shelled Maloelap. Meanwhile, the *Yorktown* task force under Rear Admiral Frank Jack Fletcher would attack Jaluit and Mili Atolls in the southern Marshalls and Makin Atoll in the Gilberts.

Aircraft from the *Enterprise* enjoyed the most success. They attacked a number of Japanese ships at Kwajalein and aircraft on the ground. They also struck new Japanese ground installations.

A predawn launch and severe thunderstorms hampered efforts by the *Yorktown*'s aircraft against Japanese installations and shipping at Jaluit Atoll, and seven of its planes were lost. Other planes from the *Yorktown* struck Japanese installations and ships at Makin and Mili. The Japanese were caught by surprise. A patrolling four-engine Kawanishi H6K "Mavis" flying boat attempted to attack the destroyers and then the *Yorktown* but was shot down by Grumman F4F Wildcat fighters. Poor weather, lack of suitable targets, and the approach of darkness led to cancellation of a second attack on Jaluit.

By late afternoon on February 1, both task forces were steaming at flank speed for Pearl Harbor when radar on the *Enterprise* detected six Mitsubishi G3M Nell bombers heading for it. This was their second mission of the day; earlier these same aircraft had bombed and damaged the cruiser *Chester*. Antiaircraft fire from the *Enterprise* shot down one of the Nells. Several others were damaged, but they were able to drop three bombs each. The

Enterprise took evasive action, but one close miss showered the ship with fragments and set off a small fire, mortally wounding one sailor. The Japanese flight leader then attempted to crash his plane into the *Enterprise* but struck only a glancing blow before his aircraft fell into the sea. Later, two other Nells attacked. Their bombs missed thanks to evasive maneuvers, and one of the Nells was shot down.

Halsey returned to Pearl Harbor on February 6. Because of the close proximity of Japanese airfields, he was fortunate to have only the *Chester* receive a bomb hit and to lose only 12 planes. Despite optimistic pilot reports, only one Japanese ship had actually been sunk, although many others had been heavily damaged. Nine Japanese planes had been destroyed on the ground, and three fighters had been shot down. Ninety Japanese had perished, including the area commander, a rear admiral.

The raid also revealed U.S. deficiencies. Aircraft required self-sealing gasoline tanks and armor protection, and there was also a clear need for IFF (identification, friend or foe) to identify returning aircraft. Carrier fighter complements also had to be increased and those of torpedo and dive-bombers reduced. There was no question, however, that the raid was worth its cost. Although Tokyo dismissed it as “aerial guerrilla warfare,” it revealed the vulnerability of the Japanese island outposts to U.S. carrier attack.

Nimitz did not wait long before sending out the carriers again. Thus, while the Japanese were hitting Darwin on February 19, Vice Admiral Wilson Brown led TF 11, centered on the aircraft carrier *Lexington* against the principal Japanese base of Rabaul in the Solomon Sea. Nimitz hoped this attack would divert the Japanese from attacking Port Moresby on the south coast of New Guinea, which had been revealed by radio intercepts as a Japanese objective.

On February 20, the *Lexington* was about 350 miles from Rabaul when radar picked up an unknown aircraft. Wildcats from the *Lexington* shot down this Mavis flying boat. Another was splashed, but a third got away. Soon thereafter, the *Lexington* came under attack from two flights of nine Mitsubishi G4M “Betty” bombers. All their bombs missed. In this largest air encounter of the Pacific theater to date, counting the two Mavises downed earlier, the Wildcats shot down 19 of 20 Japanese aircraft encountered for only 2 of their own lost. Fearing other attacks that would include dive-bombers, however, Brown aborted his mission.

Although the Japanese pilots had saved Rabaul from attack, the abortive U.S. raid paid an important dividend by convincing the Japanese command on Truk that landings scheduled for Port Moresby and Tulagi that March were too risky and should await the arrival of additional carriers sent by Combined Fleet commander Admiral Yamamoto Isoroku. This delayed the Japanese invasion attempt until the end of April, which culminated in the Battle of the Coral Sea (May 7–8, 1942).

Another U.S. carrier strike occurred on February 24, when aircraft from the *Enterprise* attacked Wake Island. Then on March 4, its planes hit Marcus Island, halfway between Wake and Iwo Jima near the Japanese Bonin Islands and only 1,000 miles from Tokyo. Damage inflicted was slight.

On March 6, the *Yorktown* rendezvoused with TF 11 centered on the *Lexington* and, under the command of Vice Admiral Brown, steamed for Rabaul and Gasmata to attack Japanese shipping there in an effort to check the Japanese advance and cover the landing of Allied troops at Nouméa, New Caledonia. The task force was the most powerful assembled by the United States to date. Centered on the two carriers, it contained 8 heavy cruisers (7 U.S. and 1 Australian) and 14 destroyers. As TF 11 was steaming toward Rabaul, it received word that on March 7, Japanese forces had landed in the Huon Gulf on the northeast coast of Papua New Guinea at Salamaua and at Lae.

This led Brown to change his objective from Rabaul to the Salamaua-Lae area. On the morning of March 10, the two carriers launched 104 aircraft from the Gulf of Papua. The planes would thus have to fly north some 125 miles, over the Owen Stanley Mountains, to reach their objective. This difficult route, however, provided both security for the task force and surprise for the attacking aircraft.

Complete surprise was achieved, and there was no Japanese air opposition. After strafing and bombing Japanese ships and troops ashore, the planes returned to the carriers with only one Douglas SBD-2 Dauntless dive-bomber lost to Japanese antiaircraft fire. The Japanese suffered four transports sunk and a number of other vessels damaged.

A month later, the Americans carried out their most ambitious attack to date, the first U.S. bombing raid on the Japanese home islands. The Tokyo Raid of April 18, 1942, usually known as the Doolittle Raid for its commander, U.S. Army Air Forces lieutenant colonel James H. Doolittle,

saw 16 B-25 Mitchell medium bombers fly off the carrier *Hornet*, with the aircraft carrier *Enterprise* along to provide air cover. Although the least successful of the U.S. carrier raids in military terms, it was spectacular in its propaganda value. The Tokyo Raid led the Japanese to shift aircraft for the defense of their home islands, formalized decisions already taken in Tokyo to expand the Japanese outer defensive ring, and silenced critics of Admiral Yamamoto's plan to draw out the U.S. fleet and destroy it. On May 5, Imperial Headquarters directed Yamamoto to carry out his plan to occupy Midway Island and key points in the western Aleutians. This set up the decisive June 3–6 Battle of Midway.

United States Navy Carrier Raid against Japan (February 10–18, 1945)

The first U.S. carrier strike against the Japanese home islands since the Tokyo (Doolittle) Raid of April 18, 1942, the operation of February 10–18, 1945, was intended as a diversion prior to the U.S. assault of Iwo Jima but also to destroy as many Japanese aircraft as possible.

Admiral William F. Halsey, commander of the U.S. Third Fleet, had wanted to hit the Japanese home islands since October, but circumstances would not permit this. On January 16, Admiral Raymond A. Spruance and his staff relieved Halsey and his staff, and the Third Fleet again became the Fifth

Fleet. At the same time, Vice Admiral Mark A. Mitscher relieved Vice Admiral John S. McCain as commander of the Fast Carrier Force, and Task Force (TF) 38 now became TF 58. It thus fell to Spruance to carry out the raid.

TF 58 was organized into five task groups (TG.1 through TG.5), comprising in all 11 fleet carriers, 5 light carriers, 8 battleships, 1 battle cruiser, 5 heavy cruisers, 9 light cruisers, and 77 destroyers. Spruance flew his flag in the heavy cruiser *Indianapolis*. There was some apprehension over the raid, as half of the carrier air groups would be undertaking their first mission. To enhance protection against anticipated kamikaze attacks, the number of fighters aboard the fleet carriers were increased to 73 F4U Corsairs and F6F Hellcats. They also each carried 30 dive-bombers and torpedo bombers.

TF 58 departed Ulithi Atoll on February 10. Everything possible was done to conceal its objective, including radio deceptions and the employment of long-range reconnaissance aircraft. Deception was accomplished thanks to thick weather, which also affected subsequent air operations.

The carriers arrived at their launch position some 60 miles south of Honshu and 125 miles southeast of Tokyo by dawn on February 16. Although flying conditions were poor, air strikes commenced immediately, with the first target being the airfields around Tokyo Bay. Following strikes on these and aircraft factories, the attackers shifted their attention to shipping. Air strikes continued until late on February 17, when deteriorating weather forced Spruance to depart. Japanese reaction was sporadic and light.

Results were substantial although hardly spectacular. TF 58 aircraft claimed a number of ships and small craft sunk in Tokyo Bay. More impressive results were registered against airfields and factories. Although the figures are undoubtedly high, TF 58 claimed 341 Japanese aircraft shot down in the air and 190 destroyed on the ground. U.S. losses were 60 planes in combat and 28 to operational causes from 738 sorties, although a total of 2,761 sorties were flown, including combat air patrols.

TG 58.2 and TG 58.3 arrived off Iwo Jima on February 18, ready to support the marine assault there the next day.

United States Neutrality Acts

During the 1930s, the U.S. Congress passed five neutrality acts, each prompted by isolationists in Congress who hoped to keep the United States out of the expanding conflicts in Europe and Asia. The isolationists were influenced in part by the considerable public disillusionment regarding American involvement in World War I.

The Senate Munitions Committee, more commonly referred to as the Nye Committee (named after Republican senator Gerald Nye) and in existence from 1934 to 1936, spent some 18 months examining the U.S. munitions industries during World War I. The committee's chief task was to prove the "merchants of death" theory: that munitions makers had unduly influenced the U.S. decision to enter World War I in 1917. While the Nye Committee could offer no solid evidence of such influence, its report did little to alter the public perception to the contrary. If anything, the committee's high-profile inquiry only added to the then-prevailing isolationist sentiment.

The Neutrality Acts contained an inherent flaw—they prevented any assistance to "belligerents" without regard to aggression. The Neutrality Act of 1935 prohibited the sale of arms to belligerents but allowed the sale of raw materials and the extension of loans. The 1936 act, however, blocked the sale of raw materials and outlawed extending credit to belligerents.

In 1937, Congress passed two acts. The first redefined belligerents to include civil war combatants, and the second prohibited Americans from booking passage on ships registered to belligerent nations. This act was designed to prevent events such as the German sinking of the British

passenger liner *Lusitania* in May 1915, which had claimed 128 American lives.

Following Germany's September 1, 1939, invasion of Poland, President Franklin Roosevelt called Congress into special session to repeal the arms embargo in order to assist Britain and France in resisting Germany and to include a ban on American citizens and ships sailing into specified danger zones. In the debate, isolationists claimed that the new legislation would change the rules to assist one side against the other and would also mean that the United States would have a vested interest in seeing that side win. Those arguing for repeal pointed out that the prevailing legislation was unneutral in that it discriminated against those powers that were victims of aggression, while the aggressor states were already well armed.

The Fourth Neutrality Act was passed in November 1939. It allowed the sale of arms and raw materials to all belligerents on a "cash-and-carry" basis. It also established the proscribed danger zones in the Atlantic. The act offered a tremendous advantage to Britain, with the largest surface fleet in the world. Extensions of credit remained prohibited, however, and the British treasury was virtually empty by 1941. In November 1941, most of the restrictions of the Neutrality Acts were lifted with passage of the Lend-Lease Act on March 11, 1941.

The Neutrality Acts did not serve to isolate the United States from the growing maelstrom of World War II. If anything, they may have placed the United States in an unnecessarily vulnerable position, as the December 7, 1941, Japanese attack on Pearl Harbor clearly demonstrated. The acts hampered President Franklin Roosevelt's ability to prepare the nation for war and also hamstrung his ability to come to the aid of key U.S. allies. Roosevelt found it increasingly necessary to circumvent Congress and the Neutrality Acts as war crept ever closer in 1940 and 1941. Some critics charge that Roosevelt wrongly usurped congressional prerogatives in doing so, but in the end he was acting as commander in chief, charged with protecting the nation against aggression. If any blame is to be laid, it was Congress—more than the president—that created the situation in which the White House felt the need to clandestinely circumvent congressional authority.

United States Pacific Fleet

Established in 1920, the U.S. Pacific Fleet was commanded in December 1941 by Admiral Husband E. Kimmel and based at Pearl Harbor in Hawaii. The fleet had been moved there by order of President Franklin Roosevelt the previous February. Kimmel was relieved of his command following the December 7 Japanese attack on Pearl Harbor and was followed by Admiral (later Fleet Admiral) Chester W. Nimitz, who assumed command there on December 25, 1941.

Prior to the Pearl Harbor attack, the Pacific Fleet had been organized into a Battle Force and a Scouting Force (there were also a Base Force and an Amphibious Force). Nimitz reorganized it into four task forces, each centered on a fleet aircraft carrier with accompanying cruisers and destroyers. Scouting duties were left to aircraft and submarines. Although there were half a dozen battleships available (three were transferred from the Atlantic), these were a good deal slower than the carriers and thus could not operate with them. They were relegated to convoy, patrol, and shore bombardment duties. The navy's offensive firepower was now centered in the aircraft carriers, the new dreadnoughts. When the fast battleships came into service, they served the additional useful function of providing antiaircraft protection for the carriers.

In March 1942, Nimitz was also given command of all U.S. naval forces in the Pacific Ocean Area. This was divided into the North Pacific, Central Pacific, and South Pacific Areas. Then on March 15, 1943, the Seventh Fleet was formed at Brisbane, Australia. It was first commanded by Vice Admiral Arthur S. Carpenter, but in November Vice Admiral Thomas C. Kinkaid replaced him. Known as "MacArthur's Navy," it operated under General

Douglas MacArthur, commander of the South Pacific theater. The South Pacific command became the Third Fleet, also on March 15, 1943. It was commanded by Admiral William F. Halsey, who answered to Nimitz. In June 1944, its onshore headquarters was moved to Pearl Harbor. The fleet operated in and around the Solomon Islands, the Philippine Islands, Formosa (now Taiwan), Okinawa, and the Ryukyus. It also was stationed in Japanese waters at the end of the war.

To improve efficiency, Nimitz worked out a system whereby staffs rotated in command for major operations. The ships were the same. When Halsey and his staff were in command, it was designated as the Third Fleet. But when Admiral Raymond A. Spruance and his staff were in command, it became the Fifth Fleet. The system extended to some subordinate commanders. Thus, Fast Carrier Task Force (TF) 38 of the Third Fleet was commanded by Vice Admiral John S. McCain, but when the carriers were part of the Fifth Fleet, they became TF 58 under Vice Admiral Marc A. Mitscher. First Australian and then British naval units operated with the fleet under U.S. command.

This system worked perfectly, giving staffs some downtime and the opportunity to plan the next strike, which they would then execute. An ancillary benefit was that this deceived the Japanese into believing that they were two separate fleets operating against them.

United States War Production Board

U.S. government agency responsible for industrial and economic mobilization as well as raw materials allocation and military procurement. The War Production Board (WPB) was established by executive order on January 16, 1942, only weeks after the Japanese attack on Pearl Harbor. The WPB replaced the already-existing Office of Production Management (OPM) as well as the Supply Priorities and Allocation Board (SPAB). The WPB's principal responsibilities were to convert civilian industry to armaments production, establish and assign production priorities, allocate or ration strategic or scarce materials, control prices and wages, and procure military end items for the armed services.

President Franklin D. Roosevelt appointed Donald M. Nelson, who had been the executive vice president of Sears and Roebuck and who had also headed the SPAB earlier, to administer the WPB. In theory, Nelson's powers were sweeping, with the authority to control the entirety of the American economy. In practice, however, Nelson found himself in a continual tug-of-war with military leaders and oftentimes immersed in bureaucratic turf wars that resulted in considerable duplication and waste.

The WPB followed prevailing business models of the day that combined centralized policy making and decision making with decentralized implementation and operations. Thus, the WPB operated 12 regional offices throughout the United States and 120 field offices, which worked directly with local industries. The board also established advisory boards made up chiefly of businessmen and industrialists and created similar groupings to help set and enforce policies and report on war production.

The membership of the WPB included the chairman; the vice chairman; the secretaries of war, navy, and agriculture; the federal loan administrator (who helped businessmen with loans to expand factories and facilities); the chairman of the Economic Warfare Office; the administrator of the Office of Price Administration; an army lieutenant general in charge of military production; and a special presidential assistant who helped supervise the expansion of America's industrial base. Nelson soon realized that a system would have to be developed to prioritize industrial needs and allocate scarce or strategic raw materials in order to meet the needs of the military and provide for some modicum of civilian production.

In the autumn of 1942, Nelson appointed Ferdinand Eberstadt vice chairman of the WPB and chairman of the Army and Navy Munitions Board.

Within months, Eberstadt had devised an efficient system known as the Controlled Materials Plan (CMP), which simultaneously prioritized the needs of the military and industrial manufacturers so that the proper end items were produced at the right time and in the right quantity. This was accomplished principally through the strict allocation of three critical raw materials: steel, aluminum, and copper. The CMP proved to be highly effective and significantly enhanced wartime production.

The WPB also organized scrap metal drives, helped educate consumers on the importance of war production and thriftiness, prohibited nonessential production, and helped businessmen expand or reconvert their factories through government subsidies and low-cost government-backed loans. There are myriad examples of how the war reordered the economy. Auto factories stopped making cars and instead made tanks and airplanes, typewriter makers began to make machine guns, and companies that made silk scarves and ribbons made parachutes; there was even a roller-coaster company that began manufacturing repair platforms for bombers. From 1942 to 1945, the WPB oversaw the production of $185 billion in armaments and military supplies of all sorts. In 1940, about 6,000 aircraft were built in U.S. factories; by 1943, that number had skyrocketed to 85,000.

Despite the quantitative success of the WPB, wartime production was fraught with difficulties. Nelson later reported that the War and Navy Departments as well as the powerful Army and Navy Munitions Board had nearly wrested away from him control of the economy. The system contained much waste, which was heavily criticized by Senator Harry S. Truman’s Committee to Investigate the National Defense Program, and some criticized Nelson for having ceded too many prerogatives to the military. Indeed, by vesting much of the power to procure with the military, Nelson had perhaps unwittingly permitted the military to control the entirety of the process.

Nelson left the WPB in 1944 and was replaced by Julius S. Krug, who had worked for the OPM. The WPB’s work was terminated by executive order on October 4, 1945. It was replaced by the Civilian Production Board (CPB), an agency within the Executive Office of the President. The CPB was charged with supervising demobilization and industrial reconversion.

United States Women Accepted for Volunteer Emergency Service

U.S. Navy Women's Reserve (1942–1948). The acronym WAVES stood for Women Accepted for Volunteer Emergency Service. The WAVES was established on July 30, 1942, under Public Law 689, H.R. 6807, an amendment to the Naval Reserve Act of 1938. The first director of the WAVES, Lieutenant Commander Mildred McAfee, was also president of Wellesley College in Massachusetts.

Public Law 689 specifically stated that the WAVES would remain restricted to the continental United States and not serve on board naval vessels or aircraft. This restriction is, however, misleading, as women did serve on vessels and in combat areas as nurses in the Navy Nurses Corps, established in 1908. The restriction keeping WAVES in the continental United States did not last, and by September 1944, they were allowed to volunteer for duty in Alaska, Hawaii, the Caribbean, and Panama. By the end of the war, women constituted nearly 2 percent of the U.S. Navy. In some areas, such as the Navy Department in Washington, over half the uniformed personnel were WAVES.

A recruiting poster for the U.S. Women Accepted for Volunteer Emergency Service (WAVES), 1943. (Library of Congress)

WAVES served in many noncombat roles during the war. Eighty were naval air navigators. Some trained future naval aviators in instrument flying and served as gunner's mates to teach men antiaircraft gunnery. Others were involved with decoding messages or with the hospital corps. Well over 85,000 women served in the WAVES during World War II. A study conducted in 1944 showed that the WAVES then in service released from noncombat duties enough male personnel to man 10 battleships, 10 aircraft carriers, 28 cruisers, and 50 destroyers. There were also a Coast Guard women's auxiliary, the SPARS (combining the Latin and English versions of the Coast Guard motto, Semper Paratus, meaning "always ready") and the Marine Corps Women's Reserve.

The WAVES became a permanent part of the navy in 1948 when Congress passed the Women's Armed Service Integration Act (Public Law

625). This step eventually led to the full integration into the armed forces of all women's units in the 1970s.

United States Women's Air Force Service Pilots

U.S. organization that trained and utilized women as pilots during World War II. The Women's Air Force Service Pilots (WASP) attracted more than 25,000 female pilots, of whom 1,879 were accepted; 1,074 graduated from the training program. Thirty-eight women lost their lives while performing their duties as military pilots.

On September 10, 1942, Nancy Harkness Love, with the support of the U.S. Air Transport Command, organized 25 women pilots into the Women's Auxiliary Ferrying Squadron (WAFS). The WAFS was charged with delivering aircraft from factories to military bases. By 1943, the Army Air Forces (AAF) recognized the importance of the work being done by this small detachment of WAFS pilots and decided to expand it to include the many qualified women pilots volunteering their services.

On November 16, 1942, Jacqueline Cochran, America's foremost aviatrix, established the Women's Flying Training Detachment (WFTD) in Houston, Texas. When the organization was moved to Avenger Field in Sweetwater, Texas, Cochran began accepting women into an intensive training program. She convinced the chief of the Army Air Forces, General Henry "Hap" Arnold, that she could successfully bring together a corps of

women pilots. She promised that if they were given the same training that male AAF cadets received, the women would be equally capable of flying military aircraft and could relieve male pilots needed for combat duty. The first class began training on November 16, 1942. After graduation, the pilots were stationed at army air bases across the United States.

On August 5, 1943, the WAFS and the WFTD merged to form the Women's Air Force Service Pilots, with Cochran as director of the WASP and its Training Division and Love as director of the Ferrying Division. WASP pilots flew more than 60 million miles in every type of aircraft, from the fastest fighters to heavy four-engine bombers, and on every type of stateside mission flown by the Army Air Forces except combat.

WASP pilots ferried planes, tested them, delivered them for repair, performed check flights, put flying time on new engines, towed targets for antiaircraft gunnery practice, flew searchlight tracking missions, and instructed male pilot cadets. WASP pilots delivered and flew 77 different types of aircraft, with a total of 12,650 planes transported across the United States.

Cochran pressed for full militarization of the WASP. In 1944, she and Arnold went before Congress to promote a bill that would make the WASP a women's service within the Army Air Forces. On June 21, 1944, despite vigorous lobbying efforts, the bill was defeated by 19 votes. On December 20, 1944, the WASP was disbanded.

In September 1977, a select House subcommittee on veteran affairs heard testimony on H.R. 3277, which recognized WASP service as active duty in the armed forces and entitled the women to veterans' benefits. On October 19, 1977, Senator Barry Goldwater attached the bill as an amendment of the GI Bill Improvement Act, H.R. 8701. The bill passed the House, and on November 23, 1977, President Jimmy Carter signed it into law.

United States Women's Army Corps

As the United States moved closer to war, many women expressed an interest in assisting the U.S. military. By the spring of 1941, Edith Nourse Rogers, a U.S. congresswoman from Massachusetts, had prepared legislation that outlined the formation of a women's military corps. She sought legal benefits and protection that had been denied to contract and volunteer nurses in previous wars. However, reluctant to give women military recognition equivalent to that granted to men, the War Department ensured that the bill under consideration did not entitle women to full military benefits.

The Japanese attack on Pearl Harbor on December 7, 1941, underscored the need for women who could perform routine noncombat work and thereby free men for combat duties. U.S. Army chief of staff General George C. Marshall encouraged a resistant Congress to pass a bill creating the Women's Auxiliary Army Corps (WAAC) in May 1942.

Oveta Culp Hobby, head of the Women's Interest Section in the War Department's Bureau of Public Relations, became the WAAC commanding officer. Assigned the rank of major, she oversaw the enlistment of qualified applicants. Recruitment posters for the WAAC featured a uniformed woman standing in front of an American flag and above it the statement "This Is My War Too!" The WAAC was open to women who were 21 to 45 years of age without dependents and who met minimum physical requirements. Marital status was not a factor. Applicants went to army recruitment stations, where interviewers evaluated their abilities and skills. The women also took aptitude tests and had to pass physical examinations.

Every applicant wrote an essay to explain her motivation to join the corps. Many sought service for patriotic reasons and to help bring the war to an earlier end. Economic incentives motivated many, as women enjoyed having employment and professional opportunities unavailable to them in

peacetime. Some considered wartime service as a valuable work experience that would be helpful in acquiring jobs in the future. The potential for adventure lured many.

Initial WAAC officer candidates trained at Fort Des Moines, Iowa, and were commissioned in September 1942. The officers then trained the first 12,200 enlistees for the 150,000 WAAC positions authorized by Congress. Instructors taught the enlistees basic military skills as well as military customs and protocol. Women also practiced first-aid techniques and drilled to acquire discipline and physical fitness. WAACs perfected administrative procedures for assignments to supply and company positions.

At first, WAACs were deployed to assignments such as translation and folding parachutes. Although many WAACs served in nursing or clerical roles, some utilized mechanical skills for radio operation and motor pool duties. Later, WAACs were trained at specialist schools and sent to assignments where their skills were needed. Some attended officer candidate school. Officials often assigned WAACs to U.S. military bases where they could perform routine tasks so that male soldiers could be sent overseas more quickly. WAACs were assigned to such specialty units as the Transportation Corps, the Chemical Warfare Service, the Signal Corps, the Army Medical Department, Army Ground Forces, and the Corps of Engineers (where some worked on the Manhattan Project).

Some WAACs served overseas. The 149th Post Headquarters Company, assigned to Lieutenant General Dwight D. Eisenhower at Algiers, was the first to deploy, in January 1943. Women also served with Lieutenant General Mark W. Clark’s Fifth Army in Africa and Italy, often near the front lines.

WAACs encountered varying attitudes toward their service. Many male officers and soldiers accepted their presence, but some men disliked them and attempted to make their service difficult. WAACs occasionally faced unfair disciplinary actions or endured verbal abuse and hostility. Such treatment, health concerns, fear, disillusionment with military service, or family pressure led some WAACs to ask to be discharged. Others deserted. Military officials could not court-martial these women, because the WAACs did not have full military status.

In July 1943, legislation reorganized the WAAC into the Women’s Army Corps (WAC), granting women the same military status as male troops. WAACs who wanted to transfer to the WAC as soldiers were expected to

meet more demanding standards, including more thorough medical examinations. Each also had to secure the recommendation of her commander. Approximately 75 percent of the WAACs transferred. Oveta Culp Hobby held the highest WAC rank, that of colonel.

Women of the 149th Post Headquarters Company, the first U.S. Women's Army Auxiliary Corps (WAAC) unit in overseas service about to depart for their assignment in North Africa in 1943. (R. Gates/Hulton Archive/Getty Images)

Soon after the establishment of the WAC, the U.S. Eighth Air Force asked for the services of a WAC battalion. The first WACs assigned there went to London in July 1943. Notable WAC service included providing assistance to the June 6, 1944, Normandy Invasion. WACs plotted bomber positions, collected intelligence, censored soldiers' mail, and served as cryptographers. Only women considered sufficiently mature and stable were selected to serve in Europe.

Most commanders recognized the competence and efficiency of the WACs. Ultimately, the army requested as many as 600,000 women in the corps. That demand was never met because many women preferred higher-paying jobs on the home front or joined rival military auxiliaries. Overall, approximately 150,000 served in the corps. Many were awarded Purple Hearts for wounds they received. Others received Air Medals, Bronze Stars, and other citations.

Although it consisted primarily of whites (94 percent), the corps also represented the diverse population of the United States. Some 4,000 African Americans as well as Hispanic, Asian, and Native American women served in the corps. As with other military units at that time, African American units were segregated, but Hobby sought improvements such as the integration of black officers and equitable salaries for WACs.

An estimated 2,000 WACs chose to enlist after World War II. Most of the women, however, were honorably discharged at the end of the conflict. The public reception given to returning WACs was generally apathetic and unappreciative; men, not women, were regarded as war heroes. Because of their military status, WAC veterans were, like their male colleagues, eligible for such benefits as the GI Bill, but they often had to fight legally to receive health care from the Veterans Administration.

The WAC enabled women to seek careers in the postwar military, although many initially encountered difficulties in achieving ranks and pay equivalent to their service achievements. In 1948, the Women's Armed Services Integration Act incorporated the WAC as a corps within the U.S. Army. Thirty years later the separate corps came to an end, and female soldiers joined the army directly instead of the WAC.

United States Women's Land Army

U.S. government program to provide agricultural labor to the nation's farmers, loosely based on the British program of the same name. By mid-1943, an extreme shortage of farm labor forced the government to develop a comprehensive plan to assist farmers. The Emergency Farm Labor Program, Public Law 45, under the control of the Department of Agriculture and Extension Service, created several farm labor programs, including the Women's Land Army (WLA). As part of the Emergency Farm Labor Program, the WLA brought women to the forefront of agricultural labor. Beginning in April 1943 and continuing to the end of 1945, the WLA recruited, hired, and placed more than 3 million farm and nonfarm women over the age of 18, putting them to work in full- or part-time positions on American farms.

Mirroring the New Deal program structure, the WLA established a national office under the direction of home economist Florence L. Hall. It disseminated information and money to state-level organizations run by extension agents. The national WLA mandated federal policy for its members, whereas state programs implemented plans for housing, insurance, local transportation, uniforms, and equitable wages. In 1943, 13 states had full-time WLA supervisors, and 30 states had part-time supervisors. In some states where the WLA organization was quite large, state supervisors were assisted by county supervisors who worked at the local level. Successful state supervisors planned recruitment campaigns, organized camps for women workers, provided training courses, opened child care centers, and monitored farmer/worker opinion of the WLA.

States without the WLA or the Emergency Farm Labor Program in place hired women through local labor initiatives.

Farmers in the western and eastern coastal regions of the United States readily accepted and hired female labor in 1943 and throughout the war.

Continuing a prewar trend, eastern and western states supported the use of women in agricultural labor to harvest perishable crops. But even though much of the nation favored wartime domestic policy, some areas of the country resisted the placement of nonfarm women on farms. States in the South and Midwest, historically opposed to nonfarm and middle-class women in the fields, did not accept the WLA in 1943. In the Midwest, the opposition to nonfarm women in agriculture left farms understaffed and crops unharvested.

In the South, racial issues plagued several states and state labor programs. In 1943, some southern states made a conscious effort to recruit only white women, effectively preventing African American women from joining the organization. In 1944 and 1945 as the labor situation became dire, it proved impossible to hire African American women, as many had left the region or taken jobs in industry.

Most midwestern and southern farmers who protested the WLA in 1943 would ultimately use women as farm laborers by the end of the war; in all, several hundred thousand women would work on farms in these regions. Farmers in the Great Plains and eastern Rocky Mountains, however, remained opposed—sacrificing agricultural production and money—to having women as farmworkers.

By the end of 1945, farmers for the most part had accepted the WLA, and agricultural production goals were met. The Emergency Farm Labor Program continued until 1947, but the WLA ended with World War II.

Upham, Charles (1908–1994)

New Zealander captain who was awarded the Victoria Cross (VC) twice for his service in World War II. Born on September 21, 1908, at Christchurch, New Zealand, Charles Upham was the only British Commonwealth soldier in the war to win the VC and Bar and only the third soldier in history to do so. He was actually recommended for the VC three times, but the last two recommendations were consolidated into a single award.

Upham won his first VC as a second lieutenant in the 20th Battalion, 2nd New Zealand Expeditionary Force, on Crete for actions between May 22 and 30, 1941. At Minqar Qaim in North Africa while in command of a company, he was recommended for his second VC when, on the night of June 27, 1942, he single-handedly attacked a stalled column of German trucks armed with a sandbag full of hand grenades. At Ruweisat Ridge, he was severely wounded twice on the night of July 14–15 but refused evacuation. When the Germans attacked his company for the last time, he led the counterattack, personally destroying a German tank and several guns. He kept going until he passed out from loss of blood.

Captured, Upham spent the rest of the war as a prisoner of war (POW), but he received a third VC recommendation for his conduct at Ruweisat Ridge. After his many attempts to escape, the Germans finally sent Upham to Colditz, where he remained until he was freed by American forces in 1945. Even then, he demanded that his rescuers give him an American uniform and a weapon and allow him to accompany them as they pursued the retreating Germans.

Following his repatriation, Upham's two pending VC recommendations were resurrected from the files where they had sat while he was a POW. For whatever reason, the British military could not accept the idea of a soldier with three VCs, so he essentially received the Bar for the Ruweisat Ridge action. After being decorated in London by King George VI, Upham returned to his native New Zealand and became a sheep farmer. For the remainder of his life, he resisted all urging to enter politics or to exploit in any way his status as one of the greatest Allied heroes of World War II. Upham died in Christchurch, New Zealand, on November 22, 1994.

Urquhart, Robert Elliot (1901–1988)

British Army major general. Born on November 28, 1901, in Shepperton, Surrey, England, Robert "Roy" Elliot Urquhart was educated at the Royal Military College, Sandhurst. He was commissioned into the Highland Light Infantry in 1920 and served in various locations. Urquhart attended the Staff College at Camberley from 1935 to 1937. Assigned to duty with the 1st (Abbottabad) Gurkha Infantry Brigade in India, he was in that post at the beginning of World War II.

In December 1940, as an acting lieutenant colonel, Urquhart was appointed chief of staff of the 3rd Infantry Division. In March 1941, he took command of a battalion in the 4th Infantry Division, and in April 1942, he was assigned to the 51st Highland Division and saw action in North Africa. Promoted to brigadier, Urquhart commanded the 231st Malta Brigade. Redesignated the 231st Infantry Brigade, the unit fought in Sicily and on the Italian Peninsula. Urquhart was wounded in the amphibious operation near Pizzo on September 8, 1943.

Urquhart then served in a staff assignment with XII Corps in the United Kingdom. In January 1944, Lieutenant General Frederick "Boy" Browning selected Urquhart to command the British 1st Airborne Division in Britain as a major general. Not an airborne soldier, he was selected because of his battle experience.

Urquhart's 1st Airborne Division participated in Operation MARKET-GARDEN (September 17–26, 1944), Field Marshal Bernard Montgomery's abortive effort to secure the bridge over the Rhine at Arnhem and end the war in 1944. The 1st Airborne Division, which had jumped in North Africa and in

Italy but not in the June 6, 1944, Normandy Invasion, had the most difficult assignment in the operation: to seize the bridge at Arnhem. Not parachute-qualified, Urquhart flew by glider to the Arnhem landing zone on September 14. The 8,000 British forces there were widely scattered and soon encountered German armor; Urquhart himself barely escaped capture. His force held out much longer than intended, but with the land force not making contact, the 2,200 survivors were evacuated on September 25–26.

Urquhart reverted to his permanent rank of colonel after the war and served in the War Office. Promoted again to major general, he commanded the 16th Airborne Division during 1947 and 1948; thereafter, he was given appointments as commander in Malaya from 1950 to 1952 and commander of British troops in Austria from 1952 to 1955. He then retired and became director of a civilian engineering firm in Glasgow, Scotland. Urquhart died at Menteith, Scotland, on December 13, 1988.

Ushijima Mitsuru (1887–1945)

Japanese Army general. Born on July 31, 1887, in Kagoshima Prefecture, Japan, Ushijima Mitsuru graduated from the Japanese Military Academy in 1901 and the Army War College in 1916. He held major military posts as a staff officer and a commander of troops both within and outside Japan. Promoted to lieutenant general in 1939, he assumed the post of head of the Military Academy three years later.

Arriving in Okinawa in August 1944, Ushijima took command of the Thirty-Second Army. That unit had been established under direct control of the imperial headquarters in March 1944 specifically for the purpose of

defending the Ryukyu Islands. By that time, the Thirty-Second Army numbered four divisions and five mixed brigades. However, its military potential was hugely diminished when the 9th Division, one of the elite units in the army, was relocated to Taiwan (Formosa) in December and not replaced on Okinawa.

Ushijima did what he could to strengthen the island's defenses, but the loss of his best division forced him to change his strategy from pursuing a "fight to the finish" to instigating delaying tactics. The goal of this strategy was to prolong the battle against U.S. forces in order to forestall a landing in the main Japanese home islands as long as possible.

The invasion of Okinawa began on March 26, 1945, when the U.S. forces landed on the Kerama Islands. On April 1, those forces went ashore on Okinawa proper. The landing was deceptively easy, as Ushijima had withdrawn the bulk of his forces to contest the populous interior. Fighting continued into late June. With the battle lost, Ushijima committed ritual suicide on a cliff on June 23 (June 22, according to another account), leaving as his last orders: "Guard your own position, follow the orders of your superiors, and fight bravely to the last breath for your homeland." Ushijima had been promoted to full general on June 20, just prior to his death.

U.S. Submarine Operations against Japan (1941–1945)

One day after the Japanese attack on Pearl Harbor on December 7, 1941, chief of naval operations Admiral Harold R. Stark declared unrestricted

submarine warfare against Japan. On the outbreak of the war, the U.S. Navy's Asiatic and Pacific fleets' submarine forces included 55 large boats and 18 medium-sized ones (out of a total of 111). Some 73 submarines were under construction.

Yet, until April 1, 1942, U.S. submarines sank only a modest 93,300 tons of Japanese shipping, less than one-tenth of what an average of 100 operational German submarines sank in the same period. At this stage of the war, U.S. submarine operations suffered from the early loss of the Philippines, for which the poorly developed Australian submarine bases could not compensate. In addition, the campaign was hobbled by a doctrine that required submarines to concentrate on enemy heavy warships and by the chronic problems of the Mark XIV torpedoes.

Following the erratic performance in 1942 that yielded a total of 620,616 tons of Japanese merchant shipping, the U.S. submarine campaign gathered pace in 1943. The smaller S-class coastal submarine and the T-class fleet submarines were gradually replaced by the larger and more capable submarines of the Gato, Balao, and Tench classes.

Beginning in mid-1942, the U.S. Navy began installing the first SJ (10cm) surface search radars in the submarines, which further enhanced their combat value (German submarines, by comparison, only received radars in mid-1944), and in October 1943, the torpedo problems were finally resolved.

The Japanese mercantile fleet amounted to 6.4 million tons at the time of Pearl Harbor. Following the cessation of neutral shipping to Japan, this volume was barely sufficient to cover the needs for industrial and civilian imports (3 million tons) and the movement of troops and supplies across the sea. The situation was briefly alleviated by the capture of 1 million tons of merchant ships during the Japanese advance in early 1942. By mid-1943, however, the U.S. submarine campaign had already eaten up these small gains made by captures and new construction.

In 1943, the U.S. submarine service was fully committed to the war against the Japanese sea lines of communications, even though an operational order issued by Pacific Fleet commander Admiral Chester W. Nimitz in June 1943 still listed aircraft carriers and battleships as prime targets. Key traffic patterns of Japanese shipping had been identified, and U.S. submarines operating from Pearl Harbor and Australian bases conducted systematic patrols of such choke points as the Luzon bottleneck.

Because the Japanese Navy failed to respond to the increasing threat and organize valuable transports and cargo vessels into convoys, Japan lost 1.668 million tons of merchant shipping in 1943, with submarines accounting for 1.34 million tons of the total. Imports into Japan fell from 35 million tons in 1942 (already down from a peacetime level of 67 million tons) to 27 million in 1943.

In late 1943, the Japanese Navy reluctantly committed itself to convoying some of the more valuable transports and cargo ships, but the assets assigned remained woefully short of what was necessary to stem or even reduce the bloodletting. In addition, Japanese escort ships possessed neither active sonars nor radars, and their depth charges were ineffective. Nonetheless, U.S. submarine losses were substantial.

In response to the Japanese convoys, the U.S. Navy introduced the Coordinated Submarine Attack Groups—small ad hoc wolf packs. Throughout 1944, U.S. submarines continued to inflict crippling losses on the Japanese merchant marine, amounting to 2.43 million tons. In 1944, Japanese imports dropped to a mere 16 million tons. Figures for the key materials were even more alarming. Oil imports fell from 1.75 million barrels per month in August 1943 to 360,000 barrels in July 1944. After September 1943, at best only 28 percent of the petroleum shipped from the southern regions actually made it to the home islands, and during the last 15 months of the war, only an average of 9 percent did.

By the time the massive strategic air attacks began to lay waste to Japan's cities, a substantial part of the industry located therein was already idle due to the lack of materials. The destruction of more than 3 million tons of Japanese merchant shipping in 1944 left barely enough tonnage to cover the basic military requirements of Japan's army and navy, much less those of the civilian sector.

During this phase of intensive war on the enemy's sea lines of communications, the U.S. submarines also achieved some remarkable successes against Japanese warships. During the Battle of the Philippine Sea on June 19, 1944, U.S. submarines claimed 2 Japanese carriers (*Taihō* and *Shōkaku*), and during the prelude to the October 23–26, 1944, Battle of Leyte Gulf (for which no less than 29 submarines had been deployed), they sank 2 heavy cruisers and fatally damaged a third on October 23.

Toward the end of 1944, the diminutive Japanese escort force was raised

to the status of an escort fleet and provided with somewhat better means, including aircraft, simple radar sets, and useful depth charges. Thus, in the last quarter of 1944, the Japanese antisubmarine forces reached their peak efficiency (as did the U.S. submarines), sinking four U.S. submarines in October and another four in November. Thereafter, crushing Allied naval and air superiority and the lack of fuel oil put an end to most organized Japanese naval activities, although not before U.S. submarines had scored further spectacular successes against the Japanese fleet. In November, the U.S. submarine *Archerfish* sank the giant carrier *Shinano* on its shakedown cruise, and the *Sealion* dispatched the battleship *Kongō;* in December, the *Redfish*'s torpedoes claimed the new carrier *Unryū* in the East China Sea.

The number of U.S. submarine successes—of any kind—declined steeply in 1945 for want of suitable targets and because of a highly successful mining campaign in the Japanese home waters that year, which claimed the lion's share of the 1.6 million tons of Japanese shipping lost in 1945. U.S. submarines entered the last sanctuaries of Japanese shipping in the Sea of Japan in June 1945 to ravage the remnants of the Japanese merchant fleet but found targets exceedingly scarce thereafter. During the last months of the war, the submarines were confined to seeking what little coastal traffic had managed to escape the mine barrages and the attention of U.S. aircraft. When the war was over, Japan's merchant fleet had been reduced to 12 percent of its prewar size, and only half of the surviving ships—a paltry 312,000 tons of mostly minor vessels—were in operation due to fuel shortages.

In addition to their economic impact, the U.S. submarines played a decisive role in paralyzing Japan's maritime empire in the Western and Southwestern Pacific by denying the Japanese use of their interior lines of communications for the movement of troops and equipment by sea. Thus, they facilitated the advance of the U.S. amphibious forces, which could safely bypass the immobilized and isolated Japanese island garrisons.

The U.S. submarine service began the war with 111 boats, added 203, and lost 52 (50 of them in the Pacific). Of the 16,000 submariners who sailed on war patrols, 3,506 did not return—a casualty rate of 22 percent, the highest of all arms in the U.S. services during the war. Nevertheless, the U.S. submarine campaign in World War II was the only campaign of its type in the history of naval warfare that can be rated a complete success.

The submarines played a decisive role in the war by incapacitating

Japan's economy. Of the 7.8 million tons of Japanese merchant shipping lost between 1941 and 1945, nearly two-thirds (4.8 million tons) was sunk by U.S. submarines, which were also responsible for one-third of the Japanese warship losses.

Ustinov, Dmitry Fedorovich (1908–1984)

Soviet colonel general and minister of armaments. Born in the city of Samara, Russia, on the Volga River on October 30, 1908, Dmitry Fedorovich Ustinov volunteered for service in the Red Army in 1926, but his one period of active duty was cut short when his unit was demobilized the next year. Ustinov joined the Communist Party in 1927 and worked as a metals craftsman between 1927 and 1929. In 1934, he graduated from the Institute of Military Mechanical Engineering in Leningrad, where he studied artillery design. He was then a design engineer at the Bolshevik Arms Factory in Leningrad, becoming its director in 1938.

The Bolshevik factory produced considerable quantities of weapons for the 1939–1940 First Finnish-Soviet War (Winter War). Ustinov's efficient management of the factory attracted the attention of Joseph Stalin, who made him commissar (minister) of armaments just after the German invasion of the Soviet Union in June 1941. As armaments minister, Ustinov oversaw the

relocation of factories east from the western Soviet cities endangered by the German advance. He also dramatically increased the production of tanks and other military matériel. Commissioned colonel general of military engineers in 1944, Ustinov continued as minister of armaments well after the war, until 1957.

Appointed minister of defense in 1976, Ustinov was named a marshal of the Soviet Union that same year. He was responsible for the deployment of troops to Afghanistan in 1979 and remained minister of defense until his death in Moscow on December 20, 1984.

V

V-1 Buzz Bomb

The first operational cruise missile, produced by the Germans during World War II. On June 13, 1944, a British Observer Corps watch post on the Kentish coast spotted a stubby-winged aircraft with a strange engine inbound from the North Sea. Its engine made a buzzing sound as it flew overhead. This “buzz bomb” was on its way to London and was the first of more than 7,900 to be launched by Germany against Great Britain. Another 4,883 attacked Antwerp late in the war. Although only 4 of the first dozen missiles launched against Britain actually reached the island and only 1 hit its target of London, the campaign drew extensive Allied defensive and offensive reactions and gave birth to today’s cruise missile programs.

Germany’s Vergeltungswaffe 1 (Vengeance Weapon 1, or V-1) had its origins in a 1938 Luftwaffe research program to develop new aircraft propulsion systems. Given the code name Flakzielgerät (antiaircraft training device) 76 to hide its true purpose, the project was centered on the Schmidt pulse-jet engine designed in 1928. Gerhard Fieseler Werke GmbH, the manufacturer, designated it the Fi-103 Reichenberg and intended it as a test platform; however, on June 19, 1942, the Luftwaffe directed that it be developed as a flying bomb.

The first airframe flew successfully on December 24, 1942. Subsequent testing revealed and led to the correction of problems with the autopilot and airframe design. Both surface- and air-launched variants were built. The result was a 25-foot-long midwing monoplane missile with a 17.6-foot wingspan; it was fueled by inexpensive 75-octane gasoline and could deliver a 1,870-pound warhead to a target up to 200 miles away.

Guidance was simple: a gyro-based autopilot ensured that the V-1 stayed on course and at the correct altitude. A nose propeller connected to a counter determined the missile’s flight range. The propeller spun as the missile flew, and the V-1 dived when the counter reached a preset number of rotations.

This system resulted in half of the missiles landing within eight miles of the aim point. Dual fuzing made the warhead one of the most reliable of the war: fewer than 4 out of every 1,200 missiles were duds. A steam-powered catapult system was developed for the surface-launched version.

The V-1 campaign was to have begun on December 13, 1943, but delays were caused by strategy disagreements; the debate concerned whether to launch the new weapons as missiles became available or wait until stockpiles and protective bunker sites could be built to support a sustained campaign. The Allied landings in Normandy on June 6, 1944, forced a decision, and six days later, Adolf Hitler ordered the offensive to commence.

The Western Allies reacted swiftly, as they had anticipated the flying-bomb campaign. They directed hundreds of bombing sorties at the launch sites, V-1 production facilities, and the transport systems that delivered the missiles. The Allies also reinforced their antiaircraft defenses, assigning some 944 heavy guns, 700 rocket launchers, and 1,200 light antiaircraft guns as well as four Mosquito fighter-bomber squadrons and eight single-engine fighter squadrons to defend London and other strategic targets from the V-1. One daring approach was to intercept the V-1 (which was possible because of its 360-mph speed) and then carefully tip up one of its wings, causing the missile to crash.

The Germans launched slightly more than 10,000 V-1s against England. Of these, some 7,488 crossed the English Channel, and 3,957 were shot down. Of the 3,531 that made it past the defenses, 2,419 reached London. About 30 fell on Southampton and Portsmouth, and 1 made it to Manchester. The V-1 offensive killed 6,184 people and injured an additional 17,981. Although the V-1s were relatively ineffective, their use marked the beginning of a new era in weaponry.

V-2 Rocket

German strategic guided missile, first launched against London on September 8, 1944. Germany's Vergeltungswaffe 2 (Vengeance Weapon 2, or V-2) had its origins in the Versailles Treaty imposed on Germany by the Allied powers after World War I. That agreement prohibited Germany from possessing long-range artillery or military aircraft, limitations that ultimately led to a secret German Army program to develop long-range rocket artillery. The program initially focused on relatively simple solid-fuel artillery rockets, but in early 1930, the military's interest shifted to liquid-fueled rockets when Captain Walter Dornberger joined the Heereswaffenamt (Army Weapons Bureau, or HWA). A year later, Dornberger established a small research center at Kummersdorf, south of Berlin, to conduct army-controlled research into liquid-fueled rockets. Progress was slow until he recruited scientist Wernher von Braun and two of his colleagues to the program. The V-2 design team was formed.

Originally designated the Aggregat 4 (or A-4), the V-2 was based on the stated requirement for a 200-mile bombardment rocket to enter service by mid-1943. The team's first liquid-fueled rocket, the A-1, was a static proof-of-concept design that led to the A-2, first launched in 1934 from Borkum Island in the North Sea. The more powerful A-3 followed, and three years later, the project moved to a new test center at Peenemünde on the Baltic coast. Most of the A-3's early flights failed, however, with test rockets rarely getting off the launch pad. The rocket's fins and guidance systems suffered design faults because little was understood about high-speed flight and powerful-thrust rocket engines.

A German V-2 rocket at Cuxhaven on the North Sea in Germany, 1944. (Fox Photos/Getty Images)

The A-5 was built to resolve these problems. Slightly longer than the A-3 at 16 feet, the A-5 incorporated parachute-recovery, telemetry, and radio-control systems to ensure a thorough monitoring of the rocket's flight and problems. These additions and the construction of a supersonic wind tunnel greatly enhanced the designers' ability to discover and correct problems. Progress slowed significantly in 1940, however, when Adolf Hitler suspended any weapons research projects that could not be placed in production immediately.

Work accelerated again in December 1942, when the army General Staff restored the project's pre-1940 funding. In late 1943, it provided increased support, including a program involving a submerged launch from a U-boat. But on August 17–18, 1944, the Royal Air Force (RAF), which had been made aware of the program in large part by the work of the Polish underground, launched a raid on Peenemünde that killed at least 120

personnel and damaged sufficient facilities there to set the program back by some six months. Development decelerated further as equipment and personnel were dispersed to reduce the program's vulnerability. As a consequence, production of the V-2 did not begin until June 1944.

The V-2 weighed 13.6 tons and was 46 feet in overall length. Its gyroscopic autopilot controlled graphite fins located in the rocket-engine exhaust to direct the missile's flight. The early missiles used a radio-controlled fuel cutoff to control range, but most production models incorporated a gyro-integrating accelerometer for that purpose. The last models used a combination of the two systems. The rocket engine employed alcohol and liquid oxygen to generate some 55,000 pounds of thrust. The warhead consisted of 1,605 pounds of cast amatol, a relatively weak explosive that was chosen because it did not detonate when atmospheric friction drove up the missile's skin temperature. As with the V-1, warhead fuzing was extremely reliable. Of 1,150 V-2s hitting Great Britain, only two were duds.

Unlike the V-1, however, the V-2's supersonic speed and ballistic flight profile precluded in-flight intercept, forcing the Allies into an expensive bombing campaign to destroy the missiles before they could be launched. That effort was further complicated by the V-2's reliance on a mobile, quickly set up launch system. The Western Allies directed hundreds of bomber sorties at V-2 production facilities and Germany's transportation network to prevent the missiles from reaching operational units. Hundreds of other fighter-bombers conducted low-level sweeps over suspected launch areas to attack V-2 units before they fired.

The first V-2 fell on Chiswick, near London, on September 8, 1944, killing 3 people and wounding 17. Between that date and March 27, 1945, 1,054 V-2s fell on England, and 517 of these struck London. Slightly more than 2,700 Londoners perished during the V-2 raids. The port of Antwerp also came under heavy V-2 attack, with 900 missiles fired on it in the last three months of 1944.

The V-2 was expensive (one estimate suggests it cost about one-third as much as the Manhattan Project in the United States), and many have argued that resources expended on it would have been better used to develop surface-to-air missile (SAM) systems to protect Germany from Allied bombing. This argument overlooks two critical elements of the V-2 program.

First, it diverted a significant portion of the Allied bombing effort. Second, SAMs require electronic guidance systems that are susceptible to countermeasures, and by 1943, the Allies enjoyed a massive superiority in this area. Viewed in that context, the V-2 was an early asymmetrical warfare system that allowed the Germans to use technologies that circumvented Allied capabilities, forcing them into expensive countermeasures with forces that might otherwise have been employed against German industry or forces on the ground.

Vågsøy Island Raid (December 27, 1941)

A British combined-arms operation, known as Operation ARCHERY, against German-held Vågsøy Island, Norway. It involved the cruiser *Kenya;* the destroyers *Chiddingfold, Offa*, *Onslow*, and *Oribi;* the troop transports *Prince Charles* and *Prince Leopold;* and the submarine *Tuna*. The invasion force of 570 men included No. 3 Commando, two platoons of No. 2 Commando, a medical detachment from No. 4 Commando, and a demolition unit from No. 6 Commando, along with a dozen Norwegians. The Royal Air Force provided air support. As with the earlier Operation CLAYMORE, the chief objective of the raid was Norwegian fish oil factories, the destruction of which would adversely affect German glycerine production for munitions.

Following a preliminary naval bombardment, the commandos went ashore on the morning of December 27. Opposition was light except in the town of Måløy, where a unit of German mountain troops was on leave from

the Eastern Front and bitter house-to-house fighting ensued. The raid concluded in midafternoon.

The commandos destroyed four fish factories, a considerable quantity of fish oil, ammunition and fuel stores, and some military installations. British naval forces also destroyed 10 ships in the harbor. The commandos killed some 120 Germans and captured 98. They also brought off some Norwegian collaborators and Norwegians seeking to join their country's armed forces in exile. The commandos further secured a copy of the German naval code. The attackers suffered 22 men killed and 57 wounded. The Royal Air Force lost eight aircraft.

This raid and the earlier Operation CLAYMORE helped convince German chancellor Adolf Hitler to send an additional 30,000 German troops to Norway and to take steps to upgrade its coastal defenses.

Vandegrift, Alexander Archer (1887–1973)

U.S. Marine Corps general. Born on March 13, 1887, in Charlottesville, Virginia, Alexander Archer Vandegrift attended the University of Virginia from 1906 to 1908 and was commissioned a second lieutenant in the Marine Corps in 1909. Much of his early years in the Marine Corps were spent in Latin America and the Caribbean. He served in the intervention in Haiti in 1915 and again in 1916–1918 and 1919–1923. He subsequently served with the Marine Expeditionary Force in China in 1927–1929 and again in 1935–1937. During 1937–1941 he was secretary and then assistant to Major General Thomas Holcomb, Marine Corps commandant. Vandegrift was

promoted to brigadier general in April 1940 and to major general in March 1942.

Vandegrift assumed command of the 1st Marine Division in April 1942 and led it on Guadalcanal from August to December 1942. The division's success was due largely to the training program that he instituted. In three months of hard fighting and despite the haphazard nature of air and naval support, Vandegrift and his men gradually pushed back the Japanese forces. For his actions in the Battle of Tenaru River (August 21) and the Battle of Bloody Ridge (September 12), Vandegrift received the Navy Cross and the Medal of Honor.

Promoted to lieutenant general in July 1943, Vandegrift commanded the I Marine Amphibious Corps during its assault on Empress Augusta Bay, Bougainville, on November 2, 1943. Using deception and a careful choice of landing sites, his forces surprised the Japanese ashore and quickly established a beachhead. On the successful completion of this operation, Vandegrift returned to the United States to serve as commandant of the Marine Corps from January 1, 1944. He was promoted to full (four-star) general in April 1945 with date of rank from March 21, 1945, becoming the first marine to achieve that rank. Vandegrift was commandant until December 31, 1947, when he left active service. He was placed on the retired list on April 1, 1949. Vandegrift died in Bethesda, Maryland, on May 8, 1973.

Vandenberg, Arthur Hendrick (1884–1951)

Influential U.S. Republican senator and chairman of the Senate Foreign Relations Committee (SFRC) during 1947–1949. Born in Grand Rapids, Michigan, on March 22, 1884, Arthur Hendrick Vandenberg spent one year at the University of Michigan before leaving for financial reasons. He went on to become a politically influential newspaper reporter and editor, loyal to the Republican Party. Appointed senator for Michigan in 1928, he won reelection that year and again in 1934, 1940, and 1946.

Mildly progressive domestically and predominantly isolationist on foreign policy, during the 1930s Vandenberg served on the Nye Committee that investigated the munitions industry's role in precipitating American entry into World War I. He supported, with reservations, American membership in the World Court and some portions of President Franklin D. Roosevelt's New Deal. The senator also supported the Neutrality Acts passed in the last half of the 1930s.

Following the December 7, 1941, Japanese attack on Pearl Harbor, Vandenberg gradually moved to supporting internationalist policies, publicly renouncing isolationism in January 1945. By then a prominent senator, he was crucial in converting the mainstream of his party to internationalism. President Roosevelt made Vandenberg, the ranking Republican on the SFRC, a delegate to the 1945 San Francisco Conference that drew up the final United Nations (UN) Charter. Vandenberg, already suspicious of Soviet motivations, obtained the inclusion of an article permitting the creation of regional security organizations. Vandenberg represented a large Polish constituency, and he therefore took particular interest in the agreements on Poland and Eastern Europe reached at the February 1945 Yalta Conference.

President Harry S. Truman included Vandenberg in the U.S. delegations to postwar meetings of Big Four (U.S., Soviet, British, and Chinese) foreign ministers in New York, Paris, and London intended to resolve remaining questions from World War II, assignments that convinced Vandenberg of the impossibility of dealing with the Soviet Union in the postwar era. He was also a U.S. delegate to the first two sessions of the new UN General Assembly.

The Truman administration's diligent cultivation of Vandenberg proved to be fruitful. As chairman of the SFRC in 1947 and 1948, he worked assiduously to implement the Truman Doctrine aid program for Greece and Turkey and the Marshall Plan. The Vandenberg Resolution, introduced in

1948, paved the way for Senate approval of the creation of the North Atlantic Treaty Organization (NATO). Although ailing, Vandenberg discouraged the excesses of McCarthyism and accepted, albeit reluctantly, Truman's June 1950 decision to send U.S. troops to war in Korea. Vandenberg died in Grand Rapids on April 18, 1951.

Vandenberg, Hoyt Sanford (1899–1954)

U.S. Army Air Forces (USAAF) and U.S. Air Force (USAF) general. Born in Milwaukee, Wisconsin, on January 24, 1899, Hoyt Sanford Vandenberg graduated from the U.S. Military Academy at West Point in 1923 and was assigned to the Air Service. He earned his wings in 1925 and then held various routine assignments. Vandenberg attended the Command and General Staff School at Fort Leavenworth, Kansas, in 1936 and was an instructor at the Air Corps Tactical School in 1936–1938. In 1939 he graduated from the Army War College.

Vandenberg then joined the Planning Division under Chief of the Army Air Corps Brigadier General Henry H. Arnold. Vandenberg was promoted to major in July 1941 and to lieutenant colonel that November. His work in helping to direct the Air Corps buildup following the December 7, 1941, Pearl Harbor attack led to his promotion to colonel in January 1942. In June of that year, he was assigned to Major General Dwight D. Eisenhower's staff

in Britain to assist in the development of air plans for Operation TORCH, the Allied invasion of North Africa (November 8, 1942).

Promoted to brigadier general in December, Vandenberg accompanied Brigadier General James Doolittle to North Africa as chief of staff of the Twelfth Air Force in February 1943. In the summer of 1943, Vandenberg was assigned to Air Force Headquarters as the deputy chief of the Air Staff. In March 1944, he was promoted to major general and assigned to Britain as deputy commander of the Allied Expeditionary Air Forces under British air chief marshal Sir Trafford Leigh-Mallory. In August 1944, Vandenberg assumed command of the Ninth Air Force, which covered the advance of Allied forces across France and into Germany. In the process, he won high praise from army generals for the Ninth Air Force's close support of their forces. In March 1945, he was promoted to lieutenant general.

After the war, Vandenberg held a number of staff assignments, including service as director of the Central Intelligence Group, forerunner to the Central Intelligence Agency. Promoted to full general in 1947, Vandenberg played an important role in making the air force a separate service in September of that year. Spaatz became its first chief of staff, and Vandenberg was vice chief of staff. After Spaatz retired in April 1948, Vandenberg succeeded him. When the Soviet Union imposed a blockade on Berlin that summer, Vandenberg helped convince President Harry S. Truman that the air force could supply West Berlin.

Vandenberg was a forceful and effective advocate for the Strategic Air Command in battles with the navy over strategic deterrence in 1949. The Korean War (1950–1953) saw a doubling of air force strength, to 106 wings. He vigorously defended the need for a flexible and technologically advanced conventional and nuclear air force capable of strategic and tactical missions, which ran counter to the Eisenhower administration's emphasis on nuclear weapons. Vandenberg retired in June 1953. He died of prostate cancer at Walter Reed Army Medical Center on April 2, 1954.

Vasilevsky, Aleksandr Mikhailovich (1895–1977)

Marshal of the Soviet Union and chief of staff of the Red Army. Born in Novaya Golchikha in the Volga region on September 30, 1895, Aleksandr Mikhailovich Vasilevsky attended a seminary before entering the czar’s army and rising to captain. He joined the Red Army in 1919, and during the Russian Civil War he was commander of a rifle regiment. Vasilevsky then commanded the 143rd Regiment of the Moscow Military District and was chief of the Red Army’s Combat Training Directorate from 1931 to 1934.

In 1935, Vasilevsky was appointed deputy chief of staff of the Volga Military District. Between 1936 and 1937, he attended the Frunze General Staff Academy and taught tactics there for several months. Vasilevsky was then attached to the General Staff as chief of the Operations Training Section. Admitted to the Communist Party as a full member in 1938, he was deputy chief of operations of the General Staff in 1939 and 1940 and then chief of the Operational Department in 1941.

Following the German invasion of the Soviet Union on June 22, 1941, Vasilevsky became invaluable to Stavka (the Soviet high command) in his visits to and coordination of the various military fronts. Only General Georgii Zhukov, with whom he worked out the successful 1942–1943 Soviet winter offensives, was more active in this regard. Appointed chief of the General Staff in June 1942, Vasilevsky was promoted to army general in January 1943 and to marshal of the Soviet Union one month later.

Vasilevsky coordinated the 3rd and 4th Ukrainian Fronts from Kursk through the advance from the Dnieper River to the Dniester and Prut Rivers. He subsequently coordinated operations for the 1st Baltic and 2nd Belorussian Fronts in East Prussia. In February 1945, he stepped down as

chief of the General Staff to take command of the 3rd Belorussian Front following the death of its commander, General Ivan Chernyakhovsky.

Less volatile than Zhukov, Vasilevsky is said to have been a rational influence on Joseph Stalin, who selected him in July 1945 for the singular honor of being the first Soviet theater commander against the Japanese. Vasilevsky's Manchurian campaign was a lightning operation that required the coordination of three fronts from three directions, with the object of penetrating central Manchuria to destroy the Japanese Guandong (Kwantung) Army. The campaign was a complete success.

In November 1948, Vasilevsky was reappointed chief of the General Staff, and in March 1949 he became minister of defense. He retired from public life following Stalin's death in March 1953. Vasilevsky was among 11 Soviets to receive the five-star ruby Order of Victory and was twice named a Hero of the Soviet Union. He published his war memoirs, *Delo Vsei Zhizni* (A Lifelong Cause), in 1973. The work revealed Stalin's failure to follow the recommendations of his military advisers in the opening and disastrous stages of the German invasion. Vasilevsky died in Moscow on December 5, 1977.

Vatutin, Nikolai Fedorovich (1901–1944)

Soviet Army general. Born at Chepukhino, Russia, near Belgorod, on December 16, 1901, Nikolai Fedorovich Vatutin enlisted in the Red Army in April 1920 and joined the Communist Party in 1921. He graduated in turn

from the Poltava Infantry School (1922), the Frunze Military Academy (1929), and the General Staff Academy (1937). Vatutin served as chief of staff of the Kiev Military District and went to Poland in 1939 as chief of staff of the Ukrainian Front. He next served on the General Staff Operations Directorate, and by June 1940, he was the first deputy chief of the General Staff.

Shortly after the German Army invaded the Soviet Union on June 22, 1941, Vatutin became chief of staff of the Northwest Front. In September 1941, he represented Stavka (the Soviet high command) at Leningrad. In the critical defense of Moscow, he served as chief of staff to General Ivan Konev, commanding an operational group.

Winning recognition in the Soviet winter counteroffensive, Vatutin returned to the Northwest Front and remained with it until May 1942, when he went back to his post with the General Staff in Moscow. He then commanded the collapsing Voronezh Front, which lost Voronezh in early July 1942, although he was promoted to colonel general less than a week later.

Vatutin received command of the new Southwest Front at Stalingrad in October 1942. The next month, his men drove 75 miles in three days on the north side of the double envelopment of the German Sixth Army at Stalingrad. Vatutin then commanded the outer encirclement forces and advanced into the Donets Basin to fight Field Marshal Erich von Manstein's Fourth Panzer Army.

Promoted to army general in February 1943, Vatutin boldly advanced his forces at great cost to the outskirts of Zaporozhye before being struck by Manstein's counterattack. He commanded the Voronezh Front and stopped Manstein's attack in the July 5–13, 1943, Battle of Kursk with the help of the reserve Steppe Front. He brought his front across the Dnieper, where it became the 1st Ukrainian Front on October 20. The front recaptured Kiev on the night of November 4–5, 1943, and participated in the Korsun-Shevchenkovsky operation that encircled 57,000 Germans in the Cherkassy bulge. Shortly thereafter, on February 28, 1944, Vatutin was shot and seriously wounded by Bandera guerrillas (Ukrainian partisans) in the Korosten area, 75 miles north of Kiev, while on a trip to visit his Sixtieth Army. He died of his wounds on April 15, 1944, in Kiev.

Vella Gulf, Battle of (August 6–7, 1943)

Battle fought on the night of August 6–7, 1943, when a U.S. destroyer force under Commander Frederick Moosbrugger intercepted a Japanese transport group off northwest Kolombangara. Following the Battle of Kula Gulf (July 6, 1943) and the Battle of Kolombangara (July 13), the Japanese had switched to the Vella Gulf–Blackett Strait supply route. On the night of August 1–2, the Japanese made a successful run by this route, the only opposition coming from an unsuccessful attack by U.S. patrol-torpedo boats.

Against the advice of his ship captains, who worried that the Americans would be waiting, Japanese commander Captain Sugiura Kaju decided to try it again. This time, however, the South Pacific Command had intelligence concerning the operation, and on August 5 Moosbrugger received orders to sweep Vella Gulf on the night of August 6–7 with a force of six destroyers.

Moosbrugger, with Destroyer Division 13—the *Dunlap*, *Craven,* and *Maury*—and Commander Roger R. Simpson's Destroyer Division 15—the *Lang, Sterett,* and *Stack*—led his force in two columns into the gulf. The sky was overcast, and rainsqualls reduced visibility to less than 4,000 yards. Moosbrugger hugged the shore of the high volcanic cone of Kolombangara.

At 11:33 p.m. on August 6, U.S. radar picked up the Japanese destroyers: Sugiura in the *Hagikaze,* followed by the *Arashi, Kawakaze,* and *Shigure*. The Japanese ships, crammed with 50 tons of supplies and 900 troops, sailed into an ambush. Moosbrugger had been privy to Captain Arleigh Burke's planning for a night destroyer action and executed the attack to near perfection. At 11:41 p.m., with Simpson's division covering, Moosbrugger

commenced a torpedo attack on the unsuspecting Japanese column, which bore 6,300 yards off his port bow. The 12th Destroyer Division then turned away to avoid any Japanese torpedoes. Simpson turned to port to cross the Japanese T, and a few minutes later as the three leading Japanese destroyers exploded in flames that lit up the dark night, he opened fire. Only the *Shigure,* lagging behind because of engine problems, escaped—and then only because the torpedo that struck its rudder failed to detonate.

For Japan, the Battle of Vella Gulf marked the first time it had been bested in a night destroyer action. The second time—in the November 25, 1943, Battle of Cape St. George—Burke, in an action remarkably similar to Vella Gulf, would administer the defeat.

Vella Lavella, Battle of (October 6–7, 1943)

The last surface action of the July–October Battle of New Georgia. The Naval Battle of Vella Lavella resulted from Japan's decision to evacuate 600 of its troops on Vella Lavella Island. For this purpose, the Japanese put together at Rabaul a transport group of three old destroyers, five subchasers, and eight smaller craft supported by the destroyers *Akigumo, Isokaze, Kazagumo, Yūgumo, Shigure,* and *Samidare,* under the command of Rear Admiral Ijuin Matsuji.

Allied aircraft promptly reported the Japanese operation, but the only U.S. Navy force available consisted of the destroyers *Selfridge, Chevalier,*

and *O'Bannon,* under the command of Captain Frank R. Walker. Three additional destroyers under Captain Harold O. Larson were detached from convoy duty and sent speeding to reinforce Walker, but they arrived too late to participate in the action.

The sea was calm, and a brilliant half-moon made for excellent visibility when a Japanese search plane reported at 8:58 p.m. that Walker's force consisted of one cruiser and four destroyers, the first of a number of mistakes the Japanese were to make. Ijuin allowed the subchaser group to proceed on to Vella Lavella (this group had departed earlier and was ahead of the main body), but he ordered the destroyer-transports (which were also ahead of the main body) back to the Shortlands. Their two escorts, the destroyers *Samidare* and *Shigure,* were to join the main group.

Walker made contact at 10:31 p.m., and his radar picked up the two Japanese groups just before they joined. Walker made for the larger group. Ijuin mishandled his force. He missed a chance to cross the T and ended up with his ships staggered and the *Yūgumo* masking the torpedo tubes of the other three ships. In the exchange that followed, U.S. gunfire and a torpedo sank the *Yūgumo* but not before a torpedo from the latter struck the *Chevalier* a mortal blow. The *O'Bannon,* following through thick gun smoke, collided with the *Chevalier,* and although it was able to back clear, it was also out of the fight.

The *Selfridge* continued on alone as all five Japanese ships headed west. (Japanese aircraft had reported Larson's force coming up from the south as cruisers.) At 11:06 p.m., a torpedo caught the *Selfridge* on its port side. Ijuin fled the scene, leaving the U.S. destroyer *Chevalier* damaged so badly that it had to be scuttled; the other two ships were barely able to limp home to Tulagi. The subchaser group meanwhile rescued the stranded Japanese troops and escaped unnoticed.

The final chapter was written the next morning, when four U.S. patrol-torpedo (PT) boats were sent in five miles west of Vella Lavella to look for survivors. The *PT 163* picked up 33 of the *Yūgumo*'s crew and put in at Biloa to transfer them to the army; at that point, one of the Japanese men killed a sailor with his own gun and was in turn slain, along with 3 other prisoners who joined in the fray.

Vella Lavella, Land Battle of (August 15–October 7, 1943)

Vella Lavella is the northwestern island of the New Georgia group in the Solomons chain. The costly fighting at New Georgia (July–October 1943) had made South Pacific theater commander Admiral William F. Halsey reluctant to assault the nearby and strongly defended Kolombangara. But Vella Lavella, which lay beyond Kolombangara, was only lightly held by the Japanese and offered superior prospects as an Allied air base. Because it was only about 35 nautical miles from the recently captured Munda Airfield on New Georgia, planes from the latter could easily provide cover for a landing on Vella Lavella.

A small U.S. landing party reconnoitered Vella Lavella in late July and found, at Barakoma on the southeast coast, suitable sites for both a landing beach and an airstrip. Several days before the scheduled invasion on August 15, an advance landing party of about 100 men slipped ashore with orders to mark the landing beaches. Most of the few Japanese troops on the island proved to be emaciated refugees from the New Georgia fighting.

The main landing on August 15 was executed by Task Force 31, commanded by Rear Admiral Theodore S. Wilkinson. Once the landing was completed, overall command of the Vella Lavella force passed to Major General Oscar W. Griswold, commander of XIV Corps and the New Georgia

Occupation Force. A marine defense battalion was included, but the principal ground component was the army's 35th Regimental Combat Team, led by Brigadier General Robert B. McClure, assistant commander of the 25th Division. The landing force totaled about 4,600 soldiers, marines, and Seabees.

Confronted with such a strong invasion force, General Imamura Hitoshi, commander of the Eighth Area Army at Rabaul, decided not to mount a counterlanding at Vella Lavella. Instead, he would fight a delaying action to evacuate as many men as possible north to Bougainville. Thus, most of the fighting in and around Vella Lavella—and most of the 198 Allied casualties in the operation—resulted from Japanese aerial attacks against the landing force and its supporting ships. Ground combat was essentially limited to patrolling and skirmishing.

On September 18, McClure and his American troops turned over their operation to elements of Major General Harold Eric Barrowclough's New Zealand 3rd Division. While U.S. Navy Seabees completed the Barakoma Airfield, the New Zealanders worked their way up both the east and west coasts of the island. Although they failed to trap the escaping Japanese, the island was fully in Allied hands by October 7.

The Allies also failed to prevent the withdrawal of nearly 10,000 Japanese from bypassed Kolombangara. Nevertheless, the air bases at Barakoma and at Munda and Ondonga on New Georgia brought all of Bougainville within the combat radius of Allied fighters and greatly facilitated the landings that began there on November 1. The capture of Vella Lavella marked the first time that the Allies successfully bypassed a major Japanese position in the South Pacific.

Vereker, John Standish Surtees Prendergast (1886–1946)

British Army field marshal. Born in London on July 10, 1886, John Standish Surtees Prendergast Vereker, Sixth Viscount Gort, was educated at Harrow and the Royal Military College, Sandhurst. He served in World War I first as an operations officer and then with the Grenadier Guards, winning the Victoria Cross. Between the wars, Vereker rose steadily in rank and responsibility. He commanded the Staff College, Camberley, and then a brigade. Promoted ahead of other officers in his class, he was appointed chief of the Imperial General Staff (CIGS) in December 1937 and promoted from major general to full general.

Vereker's appointment as CIGS was a mistake, for he did not work well with the secretary of state for war, Leslie Hore-Belisha, who was both unorthodox and flamboyant. Vereker, the traditional soldier, was neither. He did develop plans for cooperation with the French in the event of war, but he failed in key areas of modernization, including the development of armored forces and air-ground coordination.

When World War II began, Vereker assumed the job of commander in chief of the British Expeditionary Force (BEF) in France, even though he lacked experience in high command. He was glad to escape the bureaucracy and openly anticipated the excitement of war. Vereker built up the BEF in France from 4 to 13 divisions, and as a commander, his dependability and determination stood him in good stead. But he was frequently criticized for his penchant for details; even as the German blitzkrieg drove into France on May 10, 1940, he was discussing uniforms. Vereker's relationship with Hore-Belisha worsened when the war minister, during an inspection trip to France, was critical despite the real progress that had been made on defensive positions. Vereker may not have been directly involved in the subsequent

campaign that led Hore-Belisha to resign from office, but his friends certainly were.

Following the German invasion of May 10, 1940, Vereker took personal command of BEF troops in the field. This was a mistake, because his place was at headquarters, not in the field directing specific operations, and he only worsened the situation by taking many experienced staff officers with him. He did manage to mount a counterattack on May 21.

Prime Minister Winston L. S. Churchill ordered Vereker to provide two British divisions to support a last-ditch French counterattack, but on May 27 Vereker disregarded the order, believing that the attack would fail. Anticipating the impending surrender of Belgian forces, he took the decision to use the two divisions to protect his flank. Disregarding Churchill's orders and those of French Army commander Maxime Weygand, Vereker ordered the BEF to fall back on the port of Dunkerque (Dunkirk), through which it was evacuated to England. He intended to stay to the end, but on June 1 he was ordered home.

Vereker's next two assignments were as inspector general of training forces (1940–1941) and governor of Gibraltar (May 1941–May 1942). In May 1942, he was appointed governor of Malta, a vital British outpost then under heavy attack. There, his proclivity for details and his leadership paid off. He organized both military and civil defenses, and in January 1943 he was promoted to field marshal.

Vereker remained in Malta until July 1944. Later that year, he was sent to Palestine as high commissioner and commander in chief. In 1945, King George VI made him a viscount, but he was already mortally ill. Vereker returned home in November 1945 and died of cancer in London on March 31, 1946.

Versailles, Treaty of (June 28, 1919)

Peace treaty at the end of World War I concluded between the victorious Allied powers and Germany. Rarely did the treaty not intrude in discussions of international affairs in the 1920s and 1930s. Arranged by the Paris Peace Conference and signed in the Hall of Mirrors at the Château of Versailles (where Prussian minister-president Otto von Bismarck had proclaimed the German Empire in September 1870), the treaty contained 438 articles, one-fourth of them dealing with Germany's future borders.

One of the major issues to be resolved at the peace conference was French and Belgian security, a central issue for any German peace treaty. France had twice been invaded by Germany from the east since 1870, and Premier Georges Clemenceau of France demanded a military frontier along the Rhine River. Clemenceau and his aides wanted all German territory west of the Rhine (the Rhineland) taken from Germany and made into one or more independent states. They also demanded that these states maintain forever a joint Allied military force to guarantee the peace settlement. British prime minister David Lloyd George and U.S. president Woodrow Wilson opposed detaching German territory, however, and wanted an immediate withdrawal of military forces once a peace treaty had been signed.

Certain aspects of the Rhineland settlement were easily resolved. The treaty provided for the return to France of Alsace and Lorraine, which Germany had taken in 1871 at the conclusion of the Franco-Prussian War. France was also awarded the coal production of the Saar basin for a 15-year period to compensate it for the deliberate German damage and destruction of many of France's coal mines. The Saar would be under administration of the League of Nations, and in 1935 the inhabitants would vote to determine their future. If, as expected, the Saarlanders voted to rejoin their fatherland, Germany was to repurchase the mines at a price to be determined by outside experts. To enhance its security, Belgium received the two small border enclaves of Eupen and Malmédy. Luxembourg was placed outside the German customs union and secured control of its railroads.

There was sharp confrontation, however, over the Rhineland itself. Warning of an “Alsace-Lorraine in reverse,” Wilson and Lloyd George opposed taking it from Germany. Clemenceau denied that France wanted to annex the Rhineland, saying that the territory could be one or more states and could adopt any form of government it wished.

The impasse was finally broken in March 1919, when Lloyd George and Wilson agreed to secure France’s eastern border with a treaty of guarantee if France would drop its demand for an independent Rhineland. Furthermore, Britain and the United States agreed to come to the assistance of France if Germany ever invaded. Some French leaders accused Clemenceau of selling out French security, but the French premier hoped that by compromising he would at least maintain Anglo-U.S.-French cooperation. The treaty provided that the Rhineland would remain German, but it was to be permanently demilitarized. In addition, the right (east) bank of the Rhine would be demilitarized by an area of 50 kilometers (about 30 miles).

The Allies agreed on a staggered withdrawal from the Rhineland. British forces would occupy for five years a northern zone around the Rhine bridgehead at Köln (Cologne), U.S. forces would occupy a center zone at Koblenz (Coblenz) for 10 years, and French forces would occupy a southern zone, with its Rhine crossing at Mainz, for 15 years.

In the east, a new Polish state came into being, the result of Wilson’s call in his Fourteen Points for “a free and independent Poland with access to the sea.” Germany ceded Poznań, parts of East Prussia, and Upper Silesia, while the Baltic port of Danzig (Gdansk) became a “free city” inside the so-called Polish Corridor. To provide Poland access to the Baltic, the Allies separated East Prussia, with its 1.5 million Germans, from the rest of Germany. Although the Germans were given free transit across it, in 1939 Adolf Hitler used the Polish Corridor as a pretext to begin World War II.

Poland also received Upper Silesia. After German protests, a plebiscite was held in March 1920, and the districts of Marienwerder and Allenstein were awarded to Germany. Poland retained the rich coal districts, however. Germany also had to give up the port of Memel to newly independent Lithuania and the Hultschin district to newly independent Czechoslovakia. Two other plebiscites that same year awarded the northern part of the former duchy of Schleswig to Denmark. In all, Germany lost some 27,000 square miles of territory and 6.5 million inhabitants.

Germany also had to give up its Pacific islands north of the equator and its Shandong (Shantung) Peninsula concession to Japan. Australia received as mandates the former German islands south of the equator. Germany further had to relinquish its African empire as mandates: German East Africa to Great Britain, German South-West Africa to South Africa, and the Kamerun (Cameroon) to France.

The Treaty of Versailles also required Germany to pay war reparations. The Allies had told the Germans that they would be liable for war damages, the precedent for assessing reparations having been set by the Germans in the Treaty of Frankfurt of 1871, when they had imposed an indemnity of 5 billion francs on France (twice the cost of the war and a sum that the French paid) and in the more recent punitive Treaty of Brest-Litovsk of March 1918, which they had imposed on Russia. Article 231 of the treaty justified the collection of reparations by placing blame for the war on Germany and its allies, which both dismayed and outraged most Germans.

British electoral politics, meanwhile, drove up the amount of reparations by adding pensions and widows' benefits to the total. The exact amount was to be determined later. Following a series of conferences in 1920, reparations were finally set at $33 billion, a sum that resulted in great economic instability for Germany and, in the long run, hamstrung much of Europe's postwar economic recovery.

Another controversial provision dictated the precise size and nature of the German military. Britain and the United States wanted Germany to have a small professional army modeled after their own military establishments. The French disagreed, however, fearing that this would simply be a cadre army, rapidly expandable later. But the new German Army, or Reichswehr, following Anglo-Saxon suggestions, was restricted to a 100,000 all-volunteer force, with its men serving 12-year enlistments. The officer corps was strictly limited to just 4,000 active-duty officers. Germany was denied any military aircraft, tanks, and heavy artillery. The German Navy, meanwhile, was limited to 6 predreadnought battleships, 6 light cruisers, 12 destroyers, and no submarines.

The treaty also demanded the indictment of former kaiser Wilhelm II for having perpetrated "supreme offense against international morality and the sanctity of treaties." His trial was to be conducted by a five-judge panel composed of jurists selected by the Allied powers. The Americans did not

support this, however, as Wilson believed that it would make the kaiser a martyr among most Germans. The stipulation was rendered moot, however, because the Netherlands—where Wilhelm had sought asylum—refused to extradite him. The Versailles Treaty also demanded that Germany turn over some 900 people—mostly German officers—for trial as war criminals. Only 12, however, were actually tried. Six of them were acquitted, while the remaining 6 were given short prison terms.

No other modern treaty has evoked as much controversy as the Versailles Treaty. Rarely in the 1920s or 1930s did it fail to enter into discussions of European security. The treaty, while harsh, certainly did not seriously affect German power, as Adolf Hitler's regime demonstrated. Debate over whether it was too hard on Germany abounds. Certainly it handicapped the leaders of the new democratic Weimar Republic. It was they, rather than the kaiser or the leaders of the German Army, who were forced to sign the treaty and bear its shame in the eyes of the German people.

The important point to remember about the Versailles Treaty is that it was never fully enforced. The U.S. Senate never approved it (or the Anglo-American Treaty of Guarantee for which France had bartered away the Rhineland), and Britain soon retreated into isolation, leaving France alone to enforce its provisions.

The German government announced in 1923 that it was ending war reparations, and the French government, then headed by Premier Raymond Poincaré, sent troops into the Ruhr. Although this action brought a sharp change in policy on the part of Berlin, it also incurred the wrath of London and Washington. Never again did a French government attempt to go it alone against Germany.

Ultimately the Germans paid only about $9 billion in reparations, and in the 1930s, as Adolf Hitler steadily whittled away at the other treaty provisions, Britain, France, and the United States made no move. Nevertheless, while it is difficult to argue with any certainty that the Treaty of Versailles was too harsh or too lenient, many Germans perceived it as unduly punitive. This helps explain—in part—the rise of ultranationalism, militarism, and rightist radicalism in Germany during the 1930s, which led to the ascendance of Nazism under Hitler. The incontrovertible result of that was World War II.

Vian, Sir Philip Louis (1894–1968)

British Royal Navy admiral of the fleet. Born in London on June 13, 1894, Philip Louis Vian entered the Royal Navy in 1910. Educated at the Hillside School and the Royal Naval colleges of Osborne and Dartmouth, he served in destroyers and cruisers during World War I and the interwar years.

At the beginning of World War II, Vian was commanding a reserve destroyer flotilla on Atlantic convoy duty. He soon distinguished himself as an aggressive and effective leader of light forces. As commodore commanding the 4th Destroyer Flotilla of four modern Tribal-class destroyers and a cruiser, he seized the German Navy supply ship *Altmark* in Norwegian territorial waters on February 16, 1940, and freed 299 British prisoners held in it.

Vian also distinguished himself in the 1941 Norwegian Campaign, and in the chase of the German battleship *Bismarck*, which led to his early promotion to rear admiral that July. Vian then led Force K, a squadron of light cruisers, in offensive operations along the Norwegian coast until he was transferred to command Cruiser Squadron 15 in the Mediterranean in October 1941.

There, Vian further demonstrated his skill as his ships covered resupply convoys to Malta, most notably during the Second Battle of Sirte on March 22, 1942. In 1943, he commanded a squadron of five escort carriers charged with providing fighter cover and close air support for Operation AVALANCHE, the September 9, 1943, Salerno landings. Force V, operating in light winds and confined waters, provided more than half of all air support during the operation's first four days. This success was tempered, however, by Vian's inexperience in carrier operations, which showed in extraordinarily high operational losses.

British admiral Sir Philip Louis Vian (left) shown here during a meeting with U.S. admiral William F. Halsey. (Corbis)

Vian then led the Eastern Task Force covering the June 6, 1944, Normandy Invasion (Operation NEPTUNE) before taking command of the British carrier squadron destined for the Pacific. He was promoted to vice admiral in November 1944. After preliminary strikes against oil refineries in Sumatra, the carriers joined the U.S. Pacific Fleet at Okinawa in March 1945. After two months providing important air support to U.S. land operations on that island, the British Pacific Fleet withdrew to refit, then rejoined the U.S.

Third Fleet for the final attack on the Japanese home islands. Vian's adaptability to carrier warfare requirements supported the integration of U.S. practice into the Royal Navy, and his drive was manifest in the fleet's accomplishments.

Following World War II, Vian served ashore and afloat until his retirement in 1952, when he was promoted to admiral of the fleet. Vian died at Ashford Hill, Berkshire, England, on May 27, 1968.

Vichy France

The government organized in the area of France not under German occupation. The armistice of June 25, 1940, divided France into occupied and unoccupied zones. Germany occupied three-fifths of the country, including northern and western France, and the entire Atlantic coast. A new government under 84-year-old Marshal Henri Philippe Pétain, the last premier of the Third Republic, administered the remaining two-fifths of metropolitan France, including most of the Mediterranean coastline. French citizens needed a pass to cross from one zone to the other. Vichy France was left with its colonies (although Japan established de facto control over French Indochina during 1940–1941).

Beginning on July 9, the French National Assembly convened in the resort town of Vichy, about 250 miles south of Paris, to consider Pétain's plans for the future of France. Meanwhile, several dozen politicians who had left metropolitan France to try to set up a new government in North Africa

and continue the fight were arrested and returned to France, where they were charged with plotting against the security of the state.

In July 1940, Pétain enjoyed overwhelming popular support. The vast majority of the French assumed that the war was lost and that Britain would soon also be defeated. They were disillusioned with the leaders of the Third Republic, and the defeat produced strong support for new leadership and authoritarian government. Vice Premier Pierre Laval assumed the key role in the cabinet to draft and carry through Pétain's program. In a completely legal procedure, on July 10, 1940, the French National Assembly voted 567 to 80 (most of the latter were socialists) to terminate the Third Republic and hand full authority to Pétain to recast the state and promulgate a new constitution to be ratified by the nation.

The task of creating a new constitution was never completed, but a series of decrees issued by Pétain dissolved the parliament and eliminated the office of president. Pétain assumed the functions of "chief of the French State." Further decrees set up a court at Riom to try those "responsible for the war" and prescribed loyalty oaths for government officials and the military. The National Revolution, as Pétain described his regime to the French people in a broadcast on July 12, never in fact established its political institutions, although in 1941 the government convened a National Council of nominated notables to serve as an advisory body.

The conservative Vichy regime claimed that it swept away the old corruption and factionalism that had marked the Third Republic, replacing it with a new morality under the slogan "Work, Family, and Fatherland"—rather than the "Liberty, Equality, Fraternity" of the old republic. Vichy was, in fact, marked by factions, cliques, and considerable infighting and was notable for its constantly changing parade of officeholders.

Vice Premier Pierre Laval, the marshal's designated successor, favored active collaboration with the Germans. The key figure in the government during the early months of the new regime, Laval arranged a meeting between Pétain and Adolf Hitler on October 24, 1940, at Montoire, France. Hitler sought French participation in the war against Britain; Pétain wanted a final peace treaty and an end to the German occupation. Neither side made the necessary concessions, and the meeting ended unsatisfactorily, but many French were appalled by the marshal's meeting with Hitler and his announcement that he accepted, in principle, collaboration with Germany.

In December 1940 Pétain abruptly dismissed Laval, who had for some time been the object of intrigues by the advisers around the marshal. Following the brief tenure of Pierre Flandin, in February 1941 Pétain appointed as his chief minister Admiral Jean Louis Xavier François Darlan, commander of the French Navy but a man with a passion for politics and intrigue. Darlan lasted 14 months but was unsuccessful in his effort to turn France into Germany's favorite ally. Summing up the difference between Laval and Darlan, one German officer later said, "When we asked Laval for a chicken, he gave us an egg; and when we asked Darlan for an egg, he gave us a chicken."

Darlan, who hated the British—especially following the Royal Navy's July 3, 1940, attack on the French fleet at Mers-el-Kébir—followed a policy of everything short of war against Britain. He even sought to negotiate an arrangement with the Germans that would have given them a base at Dakar and French-convoyed supplies to assist the Axis effort in North Africa. Darlan accorded the Germans and Italians basing rights in Syria that brought British military intervention and fighting by Frenchmen against Frenchmen.

In April 1942, Darlan departed and Laval returned to power. This time the situation was different. The outcome of the war was now in doubt, and Laval pursued a double game in which he tried to dissemble and delay on German demands and preserve some French autonomy. Initially, the majority of the French population passively accommodated the German occupation. As the war wore on, however, Britain survived, and Germany suffered reversals in the Soviet Union; support for Vichy began to ebb away. This was abetted by the system of forced labor in Germany (the Service du Travail Obligatoire), in which some 700,000 French men and women were relocated to work in the Reich. Laval also cooperated with the Germans to a degree in rounding up Jews, who were then transported to the death camps. Of some 76,000 French Jews deported, only about 2,500 survived the war.

A small but vicious war developed within France, pitting growing numbers of members of the French Resistance against the Germans and their Vichy allies. Laval established a special police force, the Milice, to arrest and punish "terrorists," thus freeing up the Gestapo for work elsewhere. About 8,000 Frenchmen also joined the German armed forces—most notably a legion of anti-Bolshevik volunteers that fought on the Eastern Front and became the 33rd Waffen-SS (Schutzstaffel) Charlemagne Grenadier Division.

The British government had no formal diplomatic relations with Vichy, as it officially supported the Free French movement headed by General Charles de Gaulle; however, it kept contact with Vichy through the Canadian embassy. The U.S. government maintained diplomatic ties with Vichy and entertained the vain hope that France could be persuaded to reenter the war against Germany.

Vichy's weak resistance to Operation TORCH, the Allied landings in North Africa beginning on November 8, 1942, resulted in the German occupation of the unoccupied zone and the disbanding of the French Army and the French Air Force. On November 27, 1942, the French Navy scuttled its ships in

Toulon Harbor to prevent the Germans from capturing them, rebuffing an order by Darlan (then in Algiers) on November 11 that the ships should sail to North Africa if they were in danger of capture by the Germans. Admiral Jean Abrial, who commanded at Toulon, decided that the fleet's loyalty was to the Pétain government, and 77 ships—roughly half the tonnage of the French Navy—went to the bottom.

Pétain remained in office after the Germans occupied the rest of France following TORCH, but any pretense of independence was gone. The marshal failed to place himself at the head of the remaining armistice French forces or even attempt to escape to Algiers. Removed to Sigmaringen, Germany, in the summer of 1944, the Vichy government no longer had any relevance. Postwar, some 10,000 French were executed for collaboration with the Germans, including Laval. Pétain, stripped of his rank, was condemned to death, but de Gaulle commuted the sentence to life in prison. Despite de Gaulle's efforts to cast France during the war as a nation of resisters, the four-year-long Vichy regime left a legacy of shame and controversy that still haunts France today.

Victor Emmanuel III, King of Italy (1869–1947)

Italian monarch (1900–1946). Born in Naples on November 11, 1869, the only child of Umberto I and Margherita of Savoy, Victor Emmanuel, Prince of Naples, was tutored in a rigorous Prussian-style military regimen despite his diminutive size. He inherited the Italian throne after his father's assassination on July 29, 1900. Presiding over a liberal constitutional monarchy and playing Italy's Triple Alliance position against overtures to the Triple Entente, Victor Emanuel III secured Libya following the 1911–1912 Italo-Turkish War and entered World War I in 1915 on the side of the Entente. Fascist Party leader Benito Mussolini made a bid for primacy in ruling Italy in 1922, and the king failed to remove him by invoking his cabinet's martial law decree; in 1924, he sealed the fascist triumph by allowing the embattled Duce to stay on despite widespread furor over the murder of socialist leader Giacomo Matteotti by fascist operatives.

The attentive yet reticent figurehead acquiesced in the 1935–1936 Italian war with Ethiopia, the intervention in the Spanish Civil War (1936–1939), Mussolini's inchoate anti-Semitic laws, the 1939 invasion of Albania, the Pact of Steel approved later that year, and Italy's ill-advised declaration of war on the Allies on June 10, 1940.

Witnessing his country's abysmal military efforts, the king did not relish being swept away in the inevitable fascist defeat. Retaining his authority over Italy's armed forces, Victor Emmanuel arrested Mussolini after his ouster by the fascist Grand Council on July 25, 1943, replacing him with Marshal Pietro Badoglio.

Following the September 8, 1943, armistice with the Western Allies, the king, with his family and aides, fled Rome for Brindisi as German troops surrounded the capital, provoking the ire of his subjects in liberated and occupied Italy alike. Urged by the Allies to abdicate, he nonetheless clung to his title but relinquished power as his son, Crown Prince Umberto, was installed as the ruling "lieutenant of the realm" following the June 4, 1944, liberation of Rome. On May 9, 1946, the stubborn Victor Emmanuel III formally passed the throne to Umberto II, but it was too late to save the monarchy. Victor Emmanuel then went into exile in Egypt and died in Alexandria on December 28, 1947.

Victory Ship

An improved Liberty cargo ship design produced in U.S. and Canadian yards. A total of 531 Victory ships were built during World War II; three others were constructed in 1946. Commissioned by the United States War Shipping Administration shortly after its formation in February 1942, the Victory was an improved Liberty design with higher speed (15 to 17 knots as opposed to 11 knots for the Liberty). The first ship was SS *United Victory*. Completed on February 28, 1944, it entered service a month later.

Most Victory ships were oil-fired, although some produced in Canadian yards were capable of utilizing either oil or coal. Their hulls were also strengthened, and to reduce stress (several Liberty ships had experienced hull fractures), their frames were 36 inches apart as opposed to 30 inches in the Liberty design. They were also slightly larger than the Liberty ships. Displacing 15,200 tons, they were 455 feet in overall length and 62 feet in beam (versus 441 feet 6 inches and 57 feet in the Liberty). They also presented a very different appearance, with a raked bow and a cruiser stern for higher speed.

Most Victory ships were armed with an antisubmarine 5-inch gun mounted at the stern and antiaircraft armament consisting of a single bow-mounted 3-inch gun and 8 20mm cannon. These weapons were manned by U.S. Naval Armed Guard personnel, who were members of the navy. Some of the Victory ships were armed with the 5-inch stern-mounted gun and antiaircraft protection of a quad 40mm Bofors cannon, 4 dual 40mm Bofors cannon, and 10 single 20mm cannon. These ships were manned exclusively by U.S. Navy personnel.

Of Victory ships built during the war, 414 were standard cargo ships and 117 were attack transports. Because they entered service late in the conflict, only 5 Victory ships were sunk during the war. Following the war, most were placed in reserve, although a number served thereafter in a wide variety of roles. For example, SS *Simmons Victory* became the electronic intelligence collection ship USS *Liberty* (AGTR-5), which was attacked and severely damaged by Israeli forces during the Six-Day War of June 1967. Some Victory ships remain in the National Defense Reserve Fleet, and 3 are museum ships: SS *American Victory* at Tampa, Florida; SS *Lane Victory* at Los Angeles, California; and SS *Red Oak Victory* at Richmond, California.

Vietinghoff genannt Scheel, Heinrich Gottfried von (1887–1952)

German Army general. Born on December 6, 1887, at Mainz, Germany, Heinrich Vietinghoff genannt Scheel joined the Garde-Grenadier Kaiser Franz Regiment in 1906 and was commissioned a year later. In 1914 he was promoted to senior lieutenant and the next year to captain. During World War I, he served on both the Western and Eastern Fronts and was awarded the Iron Cross, both First and Second Class. In December 1916, he was assigned to the Oberste Heeresleitung (Army Supreme Command, OHL); in April 1917, he was posted to the General Staff, where he remained until the end of the war.

Vietinghoff remained in the Reichswehr after the war and served on the staff of army commander Colonel General Hans von Seeckt and later at the War Ministry. He also held various troop assignments. In November 1938, as a lieutenant general, Vietinghoff assumed command of the 5th Panzer Division, and from October 1939 he commanded the XIII Army Corps. He served ably in these positions, and in June 1940, he was promoted to general of panzer troops and given command of the XLVI Panzer Corps under Colonel General Heinz Guderian on the Russian Front until June 1942. After briefly leading the Ninth Army in the Soviet Union on an interim basis, Vietinghoff took command of the Fifteenth Army on the Channel coast.

In August 1943, Vietinghoff assumed command of the Tenth Army in Italy and the next month was promoted to colonel general. He temporarily

replaced the wounded Field Marshal Albert Kesselring as commander of Army Group C and the Southwest Front. In January 1945 Vietinghoff assumed command of Army Group Kurland in East Prussia. In early March 1945, he returned to Italy as commander of German forces in that country. That same month, he and Schutzstaffel (SS) general Karl Wolff met in Switzerland for secret talks with the Allies regarding a separate surrender of German forces in Italy. Following discussions at his headquarters at Recoaro and pressed by his chief of staff, General of Panzer Troops Hans Röttiger, Vietinghoff dispatched the special envoys who signed the surrender on the Italian Front that went into effect on May 2, 1945.

Taken prisoner by the Allies, Vietinghoff was held until 1948. Following the war he served as an adviser to the Konrad Adenauer government on the issues of German rearmament. In October 1950 he wrote the Himmeroder Memorandum, one of the key documents that led to the establishment of the Bundeswehr and to German membership in the North Atlantic Treaty Organization (NATO). He died at Pfronten-Ried, Bavaria, on February 25, 1952.

Visconti-Prasca, Sebastiano (1883–1961)

Italian Army general. Born in Rome on February 27, 1883, Sebastiano Visconti-Prasca was commissioned in the army from the Military School in 1904. He served in the Italo-Turkish War and in World War I, being promoted to lieutenant colonel in November 1917. Following graduation from the War College, he joined the General Staff.

In January 1920, Visconti-Prasca was assigned to Germany as a member of the Inter-Allied Commission for Upper Silesia. In 1921 he joined the War Ministry and in 1922 the Army Council. Appointed military attaché to Yugoslavia in March 1924, he was recalled in 1930 following Yugoslav allegations of spying.

Visconti-Prasca then rejoined the General Staff. After a period commanding the 36th Infantry Regiment, he was appointed to the Bologna army headquarters. In October 1933, he was assigned to the office of the army chief of staff but was dismissed from that post by chief of the General Staff Pietro Badoglio because he was suspected of having disclosed a secret agreement between Badoglio and French general Maurice Gamelin.

From December 1934, Visconti-Prasca commanded Italian troops in the Saar as part of the supervising League of Nations administration there. In January 1935, he was promoted to brigade general and became an honorary aide-de-camp to King Victor Emmanuel III. That September, Visconti-Prasca assumed command of the 2nd Cosseria Infantry Brigade.

In July 1937, Visconti-Prasca became military attaché in Paris, and in September of the same year, he was promoted to division general. In December, he was recalled to Italy; he was then assigned to the General Staff in March 1939. In June, Visconti-Prasca was appointed to command XXVI Corps in Albania, and the following month, he was promoted to corps general. That December, he commanded the Eleventh Army in Albania and worked on the plan for the Italian invasion of Greece that called for four divisions attacking along a 60-mile front. Visconti-Prasca was absolutely convinced that Italy would be victorious, a view he expressed to Italian dictator Benito Mussolini.

The Italian invasion of Greece in October 1940 quickly turned into a disaster, and Visconti-Prasca was relieved of his command on November 8. In December, he was forced to retire altogether from the military. Following the 1943 armistice with the Allies, he was deported to Germany. Freed at the end of the war, Visconti-Prasca defended his actions in a book and several articles. He died in Monte Porzio Catone on February 25, 1961.

Vlasov, Andrei Andreyevich (1901–1946)

Soviet Army general. Born on December 16, 1901, in Lomakino, Nizhny-Novgorod Province, Russia (now Kursk Oblast), Andrei Andreyevich Vlasov fought in the Red Army during the Russian Civil War. In 1930, he became an instructor at the Leningrad Officers' School. Between 1937 and 1938, Vlasov was a military adviser to Chinese Nationalist leader Jiang Jieshi (Chiang Kai-shek). Vlasov returned to the Soviet Union and, as a major general, led the 90th Infantry Division into Bessarabia.

After Germany invaded the Soviet Union on June 22, 1941, Vlasov assumed command of the IV Mechanized Corps positioned around Przemyśl and L'viv (Lvov). In August, he commanded the Thirty-Seventh Army in the defense of Kiev. In December 1941, Vlasov, now a lieutenant general, commanded the reinforced Twentieth Army before Moscow and was regarded as one of the principal heroes of the battle that drove the Germans from the Soviet capital city.

Vlasov was one of Joseph Stalin's favorite generals, and in March 1942, the Soviet dictator sent him to beleaguered Leningrad as second-in-command of the new Volkhov Front. The next month, Vlasov took over the Second Guards Army. Under heavy German attack, their supply lines severed, and permission to withdraw denied until it was too late, he and his men were surrounded. Vlasov ordered his troops to split into small units and fend for themselves. He was taken prisoner in July 1942.

Vlasov's hatred of Stalin for his disastrous mismanagement of the military situation led German intelligence officers to seek his cooperation in heading an army formed of Soviet prisoners of war (POWs) to fight against the Soviet Union. Hundreds of thousands of Soviet POWs were already serving as auxiliaries to the German Army in noncombat roles, many of them doing so simply to stay alive. Vlasov worked out a political program for a

noncommunist Russian state, but this flew in the face of Adolf Hitler's policy of subjugating the Soviet Union. Although German intelligence officers established the Russian Liberation Army (Russkaya Osvoboditel'naya Amiya, ROA), Hitler refused it any combat role, and it became only a device to encourage Red Army desertions.

German Schutzstaffel (SS) chief Heinrich Himmler met with Vlasov in September 1944 and promised him a combat role. Himmler also arranged for the establishment of the multiethnic Committee for the Liberation of the Peoples of Russia (Komitet Osvobozhdeniye Narodov Rossii), which was announced in Prague that November. Two divisions of the ROA came into being, one of which was sent along the Oder River in mid-April 1945 but retreated before the Red Army.

The "Vlasov Army" then changed sides. Cooperating with the Czech Resistance, it helped liberate Prague and disarmed 10,000 German soldiers, hoping to be recognized by the Western Allies.

At the end of the war, Soviet authorities demanded Vlasov's return in accordance with repatriation agreements reached at the Yalta Conference, and on May 12, 1945, U.S. units handed him over, together with other ROA prisoners of war. On August 13, 1946, the Soviet Supreme Court condemned Vlasov as a "German collaborator" and an "enemy of the Russian people" and imposed the death penalty on him the same day.

Voronezh, Battle of (June 28–July 13, 1942)

Important Eastern Front battle. In June 1942, German chancellor Adolf Hitler ordered a resumption of offensive operations against the Red Army. The objective was to secure the lower Don River, capture the oil fields of the Caucasus and Caspian regions, and interdict Lend-Lease shipments on the Volga. Führer Directive 41 called for the destruction of Soviet forces west of the Don. The German summer offensive, code-named Operation BLAU (BLUE), was along a front from the seaport city of Taganrog on the eastern coast of the Black Sea to Kursk in the north. Field Marshal Fedor von Bock's Army Group South was to carry out the German offensive.

The key to securing the eastern bank of the Don was capturing Voronezh, a major rail conduit connecting the Urals and Siberia with Ukraine and the Caucasus. In the early hours of June 28, Army Group von Weichs, commanded by Colonel General Maximilian von Weichs zu Glon, supported by the VIII Air Corps, attacked Colonel General Filipp Golikov's Bryansk Front. Weichs had his Second Army, the Hungarian Second Army under Colonel General Gustzav Jany, and Colonel General Herman Hoth's Fourth Panzer Army quickly drive a wedge between Red Army lieutenant general Nikolai Pukhov's Thirteenth Army and Lieutenant General Mikhail Parsegov's Fortieth Army. This gap increased owing to Parsegov's piecemeal deployment of his armor assets.

Two days later, General of Panzer Troops Friedrich Paulus's Sixth Army attacked General Vasily Gordov's Twenty-First and General Dmitry Ryabyshev's Twenty-Eight Armies of the Southwest Front. The Sixth Army's rapid advance spearheaded by the XL Panzer Corps forced a hasty Soviet retreat toward the Don. By July 1 the Southwest Front along the Oskal River had been largely destroyed, and the road to Voronezh was open for the Germans. On July 2, German forces under Weichs and Paulus met at Staryy Oskol, neutralizing the Soviet Twenty-First and Fortieth Armies.

On June 30, Hoth's Fourth Panzer Army engaged the Red Army's I, IV, XVII, XVIII, and XXIV Tank Corps at Voronezh. Although the Soviets had more tanks, they failed to hold off Hoth's attack owing to poor coordination and logistical support and piecemeal deployment of their armor. The experienced German commanders and their tank crews and well-coordinated German air support resulted in heavy Soviet losses.

The Luftwaffe maintained air superiority against the Red Air Force by attacking airfields and harassing Soviet defense lines. It also acted as a

spearhead, attacking Soviet defensive positions in advance of the German tank and infantry formations. The Germans lost 175 aircraft, the Soviets 783.

On July 4, the 24th Panzer and Gross Deutschland Divisions secured two bridges over the Don west of Voronezh. Two days later they entered that city, meeting moderate resistance. Although Hitler wanted to avoid a costly urban battle, Bock assured the führer that the city could be taken easily.

Convinced that Voronezh would be the launching point for a German drive on Moscow, Soviet premier Joseph Stalin ordered a concentration of forces to hold the city. On July 7 he established a new Voronezh Front under General Nikolai Vatutin. Fighting intensified the next week. With a continuation of the fighting, Hitler ordered a withdrawal from Voronezh, but Bock ignored the order, whereupon Hitler dismissed Bock. Stavka (the Soviet high command) ordered reinforcements into the city to hold it at all costs. General Pavel Rotmistrov, commanding the Fifth Tank Army, led the defense. Although he initially experienced some success, Rotmistrov was forced to withdraw from the city on July 15, losing half of his tanks in the process.

The fighting for Voronezh delayed the commencement of Operation BRAUNSCHWEIG, the German advance on the Caucasus. On July 9, Army Group South was split into Army Group A under Field Marshal Wilhelm von List and Army Group B under von Weichs. Resupply soon became an issue for the Germans, as vital supplies had to be flown in by Junkers Ju-52 transport aircraft. Fighting died down after July 13, and the Germans withdrew to the south of the city, with the main road and railway remaining under Soviet control.

Although Red Army losses particularly in aircraft and tanks were heavy compared to those of the Germans, the struggle for Voronezh denied the Germans vital road and rail links and delayed the Fourth Panzer and Sixth Armies in their advances on the Caucasus and Stalingrad. In January 1943, the Soviets liberated all Voronezh.

Voronov, Nikolai Nikolaevich (1899–1968)

Soviet Army marshal. Born in Saint Petersburg on May 5, 1899, Nikolai Nikolaevich Voronov joined the Red Army in 1918 and the Communist Party in 1919. A specialist in artillery, he rose to command a battery during the Russian Civil War (1918–1924). He was taken prisoner during the 1919–1921 war with Poland. Voronov then held a variety of assignments, including battalion and regimental commands.

Voronov graduated from the Frunze Military Academy in 1930 and served as director of the Leningrad Artillery Officers' School from 1934 to 1936. He served as a military adviser to the Republican side during the Spanish Civil War (1936–1939) and commanded the artillery of a front during the 1939–1940 First Finnish-Soviet War (Winter War). A favorite of Soviet premier Joseph Stalin, Voronov served as chief of artillery of the Soviet army, deputy commander of the artillery directorate, and commander of national air defense forces as well as assistant commissar of defense.

As commander of artillery from 1943, Voronov played a key role in planning all major Soviet campaigns. To maximize artillery effectiveness, he insisted on concentrating artillery rather than scattering it among smaller units. Voronov introduced both artillery divisions and artillery brigades for assault divisions, and he pushed mechanization. He was the first of three officers promoted during the war to the rank of marshal of artillery in 1943.

Following the war, Voronov became a strong advocate of missiles and, as president of the Academy of Artillery Sciences between 1950 and 1953, he oversaw the development of strategic nuclear weapons. He then commanded

the Artillery Academy until his retirement in 1958. Voronov died in Moscow on February 28, 1968.

Vörös, János (1891–1968)

Hungarian Army general and minister of defense (1944–1945). Born in Csabrendek, Hungary, on March 25, 1891, János Vörös graduated from a military prep school in 1911 and joined the joint army of the Dual Monarchy. He distinguished himself during World War I as a first lieutenant and was decorated. On graduation from the Hungarian Military Academy in 1921, Vörös joined the General Staff. Between 1931 and 1936, he taught strategy at the Military Academy. In May 1941, he was promoted to brigadier general, and in November 1943, he took command of II Corps.

Appointed chief of staff of the Hungarian Army under pressure from the Germans after their occupation of Hungary, he served between April 19 and October 16, 1944. That May, he was promoted to full general.

It was partly Vörös's fault that Governor Miklós Horthy's attempt to surrender failed on October 15, 1944. Although Horthy made a proclamation requesting an armistice, Vörös ordered the continuation of military operations. A day later, Hungarian fascists took power in Budapest, appointed a prime minister friendly to Germany, and relieved Vörös, who had concluded that Hungary must leave the war. Vörös fled, disguised as a Franciscan monk, and surrendered to the Soviets on November 1. He was taken to Moscow, and he served as a member of the Hungarian delegation that negotiated an armistice with the Soviet Union. On his return from Moscow, Vörös was appointed minister of defense in the new interim

government (December 1944–November 1945) and was a member of the Hungarian government delegation that signed the peace treaty with the Soviet Union on January 20, 1945. Vörös resigned as chief of staff on March 2, 1946.

On March 25, 1949, Vörös was arrested by the Hungarian government on charges of spying for the United States. Tried and convicted, he was sentenced to life in prison, but he was freed during the 1956 Hungarian Revolution. He died in Balatonfüred, Hungary, on July 23, 1968. In 1992, the Hungarian Supreme Court annulled the charges against Vörös and rehabilitated him.

Voroshilov, Kliment Efremovich (1881–1969)

Marshal of the Soviet Union. Born in Verkhneye, Bakhmut Region, Yekaterinoslav Province, Russia, on February 4, 1881, Kliment Efremovich Voroshilov joined the Bolshevik Party in 1903 and participated in the November 1917 Russian Revolution. He served as a military commander in the civil war that followed. Voroshilov was a member of the Ukrainian provisional government and organized the defense of Tsaritsyn (later Stalingrad), where he became acquainted with Joseph Stalin. Voroshilov's close relationship with Stalin rather than his military competence led to his rapid advance to prominence.

In 1925, Voroshilov was appointed people's commissar for army and navy affairs and chairman of the Revolutionary Military Council of the Soviet Union. In 1934, he was appointed people's commissar for defense (minister of defense), a post he held until 1940, when he was removed for

serious Soviet military deficiencies in the war with Finland. When the Red Army reinstituted officer ranks in 1935 and established the rank of marshal of the Soviet Union, Voroshilov was one of the first five appointed. He was also one of only two marshals who survived the Great Purges of the military in 1937, supporting the tribunal that condemned his colleagues and announcing their fate. The Soviet KV-1 heavy tank, which entered service in December 1940, was named for him.

When the Germans attacked the Soviet Union on June 22, 1941, Voroshilov was appointed commander of the strategic Northern Axis defending Leningrad. In August of that year when Leningrad was seriously threatened because of Voroshilov's incompetence, Stalin relieved him of command and replaced him with General Georgii Zhukov. Voroshilov was shortly thereafter appointed to the State Defense Committee, where he served for the remainder of the war.

In 1945 as Stalin's representative, Voroshilov supervised the establishment of the communist regime in Hungary as the chairman of the Allied Control Commission. On Stalin's death in 1953, Voroshilov became the chairman of the Presidium of the Supreme Soviet. Voroshilov died in Moscow on December 2, 1969.

Vosges, Advance to (August 29–September 15, 1944)

Allied campaign following the August 15, 1944, ANVIL-DRAGOON landings in southern France. The Allied landings here opened a new phase in the war in the European theater of operations. One day after the surrender of Toulon and Marseille (August 28, 1944), American and French troops commenced a campaign northward up the Rhône River Valley.

Lieutenant General Alexander M. Patch, commanding the U.S. Seventh Army, led the American troops. Directly under Patch was Lieutenant General Lucian K. Truscott Jr., who commanded VI Corps. Truscott's corps consisted of three American infantry divisions—the 3rd, 36th, and 45th. General Jean de Lattre de Tassigny commanded the French First Army, which was organized into I and II Corps. Facing this array of Allied forces was the German Nineteenth Army under General of Infantry Friedrich Wiese, with eight divisions, the most reliable of which was the 11th Panzer Division (the "Ghost Division").

The Allied plan was to strike quickly up the Rhône River Valley, trapping as many Germans as possible in southern France and closing off the Rhône as an escape route. By forcing Wiese's troops northward, the Allies hoped to either push them into Lieutenant General George S. Patton's advancing Third Army or place themselves between the Germans and the Reich. By August 25, Patch had finalized his plans for the campaign. The American VI Corps was to drive up the east bank of the Rhône to Lyon, proceed on to Dijon, and then head northeastward toward Strasbourg on the Rhine. The French II Corps was to advance up the west bank of the Rhône, and the I Corps would guard the right flank of VI Corps.

VI Corps jumped off on August 29, and by September 1 the 36th Infantry Division reached the high ground overlooking Lyon. By September 2 the Germans had all but abandoned Lyon, and on the next day the French 1st Infantry Division had the honor of liberating France's third-largest city. By September 3 it was obvious that the German Nineteenth Army was in full retreat, so Truscott requested permission to press on without pause and close off the Belfort gap in the Vosges Mountains. The 3rd Division accepted the surrender of Besançon on September 7, and on September 10 the French II Corps captured Dijon.

Later that evening, elements of the American Seventh and Third Armies linked up, forming a united Allied front. Truscott then ordered his troops to wheel eastward to take Vesoul, which the Germans evacuated on September

12. On September 13–14 VI Corps pivoted again, this time in the direction of the Belfort gap, then halted at the Vosges Mountain passes on September 15.

A French woman exclaims to her neighbor and to an American soldier, “Tout Belfort est libre” (All Belfort is Free). (Popperfoto/Getty Images)

The advance against the Belfort gap was not carried out, as the U.S. Seventh Army and the French First Army came under the command of General Dwight D. Eisenhower and Supreme Headquarters, Allied Expeditionary Force (SHAEF). The troops were realigned so that Truscott’s three divisions were on the left, connected to Patton’s forces, and the French troops were on the extreme right of the Allied line. The campaign to the Vosges Mountains was over.

Vyazma-Bryansk, Battle for (October 2–20, 1941)

Important Eastern Front land battle. After German forces encircled Leningrad in the north, Adolf Hitler turned his attention to the center part of the Soviet front. His Führer Directive 36 on September 6, 1941, focused German preparations on a drive against Moscow in Operation TAIFUN (TYPHOON), entrusted to Field Marshal Fedor von Bock's Army Group Center. Bock commanded five field armies consisting of 14 panzer divisions, 9 Panzergrenadier divisions, and 44 infantry divisions. He planned to use his armor to seize two key towns, Vyazma (some 150 miles west of Moscow) and Bryansk (220 miles southwest of Moscow) to open the road to the Soviet capital for his infantry. The leading German units involved were Colonel General Heinz Guderian's Second Panzer Group, Colonel General Hermann Hoth's Third Panzer Group, Colonel General Erich Hoepner's Fourth Panzer Group, and Colonel General Maximilian von Weichs's Second Army.

To defend Moscow, the Soviets had assembled six armies under Colonel General Ivan Konev's Western Front. They were backed by four second-echelon armies. To Konev's immediate south were two additional armies of Marshal Semen Budenny's Reserve Front. Three more reserve armies were eventually brought forward. All the armies were badly understrength; though totaling 80 divisions, they had, in fact, the equivalent of only 25 full-strength divisions. The Germans had more than twice the number of tanks as the Soviets (an estimated 1,000 to 479), and the Soviets had only about 360

aircraft to at least twice as many German planes. The Soviets also suffered from a shortage of trained officers, as many had been pulled out of their units in August and September to organize new formations in the rear. In addition, the Soviets were short of modern antitank and antiaircraft weapons.

Lieutenant General Andrei Yeremenko commanded Soviet forces in the Bryansk area where the Germans planned to attack. On September 2, Stavka (the Soviet high command) ordered Yeremenko's Bryansk Front to move in two different directions, toward Roslav and southwest on Starodub in an effort to halt the German advance. The Soviet effort ended in failure, necessitating a return to defensive operations by September 13. German forces also moved into a gap of some 36 miles between the Bryansk and Southwestern Fronts.

On September 30, Guderian's Second Panzer Group began an advance that carried it 50 miles the first day and 100 miles during the next three days. Guderian took the key rail junction of Orel, 150 miles in the Soviet rear, on October 8. Two days earlier, the Second Panzer Group had surrounded Bryansk. At the same time, Weichs's forces moved from the west, trapping the Soviet Third, Thirteenth, and Fiftieth Armies, although some of Yeremenko's forces escaped to the east on October 25.

To the north, meanwhile, Hoth's Third Panzer Group drove into the gap between the Soviet Nineteenth and Thirtieth Armies northwest of Vyazma, while the Fourth Panzer Group penetrated a vulnerable area between the Reserve and Bryansk Fronts. Konev countered by sending his deputy, Lieutenant General Ivan Vasilevich Boldin, with three divisions and two tank brigades to strike the flank of the Third Panzer Group on October 3–4, but these efforts came too late. Boldin's force was caught in the German encirclement, along with the greater part of Konev's Nineteenth, Twentieth, Twenty-Fourth, and Third-Second Armies west of Vyazma.

General Konstantin Rokossovsky had been sent to Vyazma with his staff to gather five reinforced divisions there for a counterattack on October 6, only to find no Soviet divisions and German tanks already on the scene. He fled the town but soon discovered that he was between the inner and outer rings of the encirclement; he decided to break out to the northeast, picking up units along the way, including the 18th Infantry (the Home Guard Division) and an NKVD unit. These units broke out and joined Konev in Mozhaisk, 40

miles west of Moscow, where surviving elements of the Western and Reserve Fronts were forming a new 135-mile line to Kaluga.

Lieutenant General Mikhail Fedorovich Lukin, Nineteenth Army commander, also broke out of the encirclement to the east with two-plus divisions on the night of October 12–13. The Germans were hampered by the onset of the rainy season, which turned the roads into quagmires. But Stalin's penchant for linear defense with fronts deployed in single operational echelon had been pierced by German armor supported by artillery and Junker Ju-87 Stuka dive-bombers, resulting in the encirclement and capture of as many as 660,000 Soviet troops, 1,242 tanks, and 5,412 artillery pieces. Vyazma surrendered on October 14 and Bryansk on October 20. This engagement was, however, the last of the great German encirclements.

When word reached Moscow of the defeat, a great many citizens took flight, necessitating the proclamation of martial law in the capital on October 19. Konev received the blame for the defeat; he was replaced by General of the Army Georgii Zhukov, who was charged with the final defense of Moscow.

W

Wachi Takaji (1893–1978)

Japanese Army lieutenant general. Born in Hiroshima on February 1, 1893, Wachi Takaji graduated from the Japanese Military Academy in 1914 and from the Army War College in 1922. He worked in the China Section of the General Staff and then was a resident officer in southern China from 1925 to 1927. He was resident officer in Tsinan from 1928 to 1929, on the staff of the Guandong (Kwantung) Army during 1931 and 1932, resident officer in Canton from 1932 to 1934, head of the Taiyuan Special Service Agency from 1935 to 1936, and on the staff in the China Garrison Army from 1936 to 1937. Wachi was promoted to colonel in 1937.

Before the Second Sino-Japanese War began in 1937, Wachi encouraged warlords in southern China to revolt against the National Government of Jiang Jieshi (Chiang Kai-shek) in Nanjing (Nanking). After the start of the war, Wachi headed the Ran (Orchid) Organization. He engaged in efforts to negotiate with the Chinese to end the war and tried to communicate with Chinese chief of staff General Ho Yingqin (Ho Ying-chin) via a Chinese agent in 1938, but these efforts failed.

Promoted to major general in 1940, Wachi became chief of staff of the Taiwan Army in March 1941 and simultaneously headed its Research Division, supervising the study of land warfare. In February 1942, he became chief of staff of the Fourteenth Army, which assaulted Corregidor Island in the Philippines during April and May. Afterward, he had charge of the military government in the Philippines. He was promoted to lieutenant general in 1943.

In March 1944, Wachi was appointed vice chief of staff of the Southern Expeditionary Army and was made chief of staff of the Thirty-Fifth Army fighting on Leyte that November. After the war, he was arrested on war crimes charges and held in Sugamo Prison, Tokyo. Tried and convicted by the Yokohama Military Tribunal for crimes committed by Japanese troops in

the Philippines, he was sentenced to six years at hard labor but released in 1950. Wachi died in Tokyo on October 30, 1978.

Waesche, Russell Randolph, Sr. (1886–1946)

U.S. Coast Guard admiral and commandant. Born on January 6, 1886, at Thurmont, Maryland, Russell Randolph Waesche was educated at Purdue University and the U.S. Revenue Cutter Service School of Instruction (later the U.S. Coast Guard Academy). After commissioning in October 1906, he served aboard and commanded several cutters. In 1915, Waesche was assigned to Coast Guard Headquarters in Washington, D.C., as the chief of the Communications Division, where he served throughout World War I. During the 1920s, he commanded several patrol cutters and destroyers and returned to headquarters in 1928 as the chief ordnance officer. In 1932, he was appointed as the aide to the new commandant, Rear Admiral Harry G. Hamlet. In June 1936, he succeeded Hamlet as commandant and was promoted to rear admiral.

From 1936, Waesche oversaw the growth, reorganization, and modernization of the Coast Guard, its vessels, and its facilities, and in the latter half of 1941, he prepared the service for war. In September, he transmitted President Franklin D. Roosevelt’s order for all cutters to engage German and Italian aircraft and submarines west of 26 degrees west longitude. Then on November 1, Roosevelt ordered the transfer of the operational control of the Coast Guard to the Navy Department.

During the course of the war, Waesche worked closely with both chief of naval operations Admiral Ernest King and Treasury Secretary Henry

Morgenthau to ensure that the Coast Guard successfully prosecuted both its wartime and peacetime missions. While diligently preserving his service's identity, he pursued a policy of unprecedented cooperation with the navy and army in which coastguardsmen served with distinction in every theater of operations. He ensured that the Coast Guard's unique capabilities in such areas as small-boat handling and Arctic operations were recognized and utilized in the war effort.

U.S. Coast Guard admiral and commandant Russell R. Waesche. (U.S. Coast Guard)

Waesche shaped the postwar Coast Guard as he worked diligently to have the service returned to the Treasury Department and to retain several missions acquired during the war, including marine inspection and licensing. The Coast Guard's first four-star admiral and arguably its most important commandant, Waesche retired from active service in December 1945. Waesche died in Bethesda, Maryland, on October 17, 1946.

Waffen-SS

Military component of the German Schutzstaffel (SS) that fought alongside the Wehrmacht (German armed forces) as an elite and politically reliable National Socialist force. The Waffen-SS (Armed Schutzstaffel) was one of the major branches of the Schutzstaffel. The SS itself was established in 1925 as a special unit of the Sturmabteilung (SA). The SS initially functioned as a bodyguard unit for the Nazi hierarchy and contained the most ideologically fervent party members. Party leader Adolf Hitler appointed Heinrich Himmler as the leader of the SS (Reichsführer-SS) in 1929, and Himmler increased membership from 280 to 50,000 and endowed members with a distinctive black uniform as well as the skull and double runic "SS" symbols. Himmler's aim was to transform the SS from its security function within the Nazi Party into a separate and powerful bureaucratic organ of the German state.

Between 1933 and 1936, Himmler combined all state police functions, merging the Gestapo (Geheime Staatspolizei, or secret state police) with the Nazi Party's security organization (Sicherheitsdienst, SD) to create the Reichssicherheitshauptamt (RSHA). He ensured his organization a more pervasive role in 1939 after his appointment as Reichskommissar for the Strengthening of German Ethnicity. Through this post, the SS was assured economic and political control of occupied Europe, especially in the east, where Nazi ideology envisaged a German territorial expansion (*Lebensraum*) and the subordination or elimination of the Slavic and Jewish populations. To

achieve this goal, Himmler created a separate economic office for the SS, the Wirtschafts und Verwaltungshauptamt (WVHA), and oversaw the Race and Population Resettlement Office (Rasse und Siedlungshauptamt, RuSHA).

Himmler had much higher ambitions for the SS than mere police functions. He wanted it to be a professional military body that might one day subsume the German Army. As its political and bureaucratic functions expanded, the SS formed illegal military units, originally known as Verfügungs-truppe, or special assignment troops. On March 17, 1933, Josef "Sepp" Dietrich established, on Hitler's direct order, a personal armed guard, the Leibstandarte. Early on, members of the unit served, among other things, as honor guards and color guards at parades and other events, such as the 1934 Nuremberg rally. The rally involved Dietrich's SS Leibstandarte Adolf Hitler, of 2,600 men. But Himmler also employed such units in liquidating the leadership of the Sturmabteilung (SA, or storm troops) during the Blood Purge of June 1934 (Night of the Long Knives).

To qualify for the Verfügungstruppe, males had to be between 17 and 22 years old and at least 5 feet 11 inches tall. These units were supposed to be superior to army formations in training and morale and were to receive the best weapons. Early armed SS personnel also included concentration camp guards, the SS Totenkopfverbände (Death's Head formations), organized by Theodor Eicke. By March 1936, the SS was subdivided into five Sturmbanne (battalions) totaling 3,500 men: No. 1 Oberbayern, No. 2 Elbe, No. 3 Sachsen, No. 4 Ostfriesland, and No. 5 Brandenburg. After Germany introduced conscription in 1935, the SS organized two 5,000-man regiments, the Deutschland and the Germania.

On October 1, 1936, the SS Inspectorate was created to supervise the two SS officer training schools in operation at Bad Tolz and Braunschweig, under the supervision of Oberstgruppenführers Paul Hausser and Felix Steiner. Early applicants had to have served at least two years in the army. Training emphasized physical fitness and endurance rather than parade-ground drill so that fully equipped troops could march/run 1.86 miles within 20 minutes. There was also a rigorous combat training course. Steiner's demanding standards meant that in 1937, only 15 of every 100 SS applicants were accepted.

Steiner also sought to instill a sense of family in each SS unit, encouraging officers to consort with noncommissioned officers and not to

address one another by rank but rather as “comrade.” In addition, the SS oath contained a sense of elitism and personal bond to the führer: “I swear to Adolf Hitler, as Führer and Chancellor of the German Reich, loyalty and bravery. I vow obedience to you and to the superiors whom you shall appoint, obedience unto death, so help me God.”

The SS motto was “Loyalty Is My Honor” (*Meine Ehre Heisst Treue*). Mystique and symbolism were used to entice and muster group solidarity. Only those who had graduated from the two officer training schools and possessed the rank of Untersturmführer or above were permitted to carry a special dagger. SS recruits were also tattooed in their armpits, and the first 10,000 received an SS ring (later, only officers who had served three years might wear the ring). Himmler also created a pseudo-Arthurian court at Wewelsburg Castle, near Paderborn in Westphalia, where he organized a roundtable of favorite officers (the Circle of Friends of the SS-Reichsführer), with a runic coat of arms for each member.

On August 17, 1938, a decree by Hitler set up a separate headquarters for the military training of these SS units and established their military character as armed (Waffen) SS. For obvious reasons, the leaders of the Army Supreme Command (Oberkommando des Heeres, OKH) rejected the idea of another military establishment independent of its authority and had some success in limiting its size. By the eve of the war, there were only about 23,000 men in the SS formations, including the Death’s Head groups.

But with the coming of the war, the size and scope of SS activities increased dramatically. During the Polish Campaign of September 1939, Waffen-SS regiments were merged within regular Wehrmacht divisions. In October, the first three SS divisions were formed, one each from the Verfügungs-truppe (later known as SS Das Reich Division), the Death’s Head units (SS Totenkopf Division), and the police (Polizedivision). Hitler’s Leibstandarte, initially a motorized regiment, became a fourth SS division (SS Leibstandarte Adolf Hitler). In November, the various SS branches were united under the name Waffen-SS.

SS divisions were fully integrated into the regular army command structure, but this did not mean that there was no tension between regular army and SS commanders. The SS divisions were highly politicized and supported the National Socialist credo and its racial policies, especially in Eastern Europe. There was also anger in the army over the fact that the SS

units had claim on the best weaponry. Sharp tensions and inefficiencies also existed within SS headquarters, where Himmler mirrored his master in practicing a divide-and-rule style of leadership.

The Waffen-SS role was greatly expanded after the German invasion of the Soviet Union began on June 22, 1941. It was a foregone conclusion that the SS would play a paramount role during this ideological war of annihilation. In addition to the 1st SS Panzer Division (Leibstandarte Adolf Hitler), there were five other Waffen-SS divisions at this time: the 2nd SS Panzer Division (Das Reich), the 3rd SS Panzer Division (Totenkopf), the 4th SS Pol*i*zei Panzergrenadier Division, the 5th SS Panzer Division (Viking), and the 6th SS Gebirge Division "Nord" (composed largely of Norwegians). The SS Einsatzgruppen (special action groups), death squads to murder Jews and communists, were also formed, a third of their membership being recruited from Waffen-SS units.

Four of these groups of about 3,000 men each were formed by July 1941 to follow Army Groups North, Center, and South into the Soviet Union. Their role of exterminating Jews and Soviet officials had been decided prior to the Soviet invasion and was sanctioned by Hitler through his Commissar Order (Komissarbefehl) of May 1941 as well as the operational orders to the Wehrmacht stipulating that no German soldiers were to be disciplined for any action against the civilian Soviet population.

SS formations fought on all battlefronts in which Germany was engaged, with the exception of the Western Desert campaigns. As casualties mounted and following the general army reform of May 1943 that reduced divisional size, Waffen-SS units were amalgamated and renamed. By the end of the war, when the total number in the SS mounted to more than 800,000 men in 38 divisions, some 200,000 were foreign volunteers (Freiwilligen). This practice of recruitment was accepted despite the SS pretense of representing only the most racially pure Germanic elements. Among the militarily effective new formations were the 9th SS Panzer Division (Hohenstaufen), the 10th SS Panzer Division (Frundsburg), and the 12th SS Panzer Division (Hitlerjugend, composed largely of Hitler Youth).

A German Waffen-SS mortar squad manning a Leichte Infanterie geschütz 18, a small 75mm infantry support weapon. (Corbis)

Paradoxically, the early Waffen-SS units suffered higher casualties than their regular Wehrmacht counterparts, specifically as a result of their ideological zeal to fight the enemy. As the war progressed, anti-Semitic and anticommunist elements of the occupied populations formed their own Waffen-SS units, for example Nordland, which was the first non-German-organized (Norwegian and Danish); Lettisches (Baltic); Skanderbeg (Albanian); Maria Theresa (Austrian); Kama (Croatian); Nederland (Netherlands); Hunyadi (Hungarian); Charlemagne (French); Bohmen-Mahren (Czech and Slovak); Kalevala (Finnish); Galicia (Ukrainian); and Kaminski (Ukrainian and Russian).

Some Waffen-SS units were among the most effective German military formations, and there were a number of capable commanders. Undoubtedly, the most effective of the latter was Hausser, who became the first SS general to command a German field army and directed the Normandy defenses beginning in late June 1944. But Waffen-SS formations were also the most brutal German military units in their treatment of enemy prisoners and conquered peoples, and they committed numerous atrocities. The growing strength of the SS also posed a real threat to the ascendancy of the

Wehrmacht, especially in the last year of the war. Hitler despised many of the army generals, and it is clear that had Germany won the war, the Waffen-SS would have replaced the Wehrmacht as the army of the Reich. In all, as many as 250,000 Waffen-SS members may have been killed during the course of the war.

Wainwright, Jonathan Mayhew (1883–1953)

U.S. Army general. Born on August 23, 1883, at Fort Walla Walla, Washington Territory, Jonathan "Skinny" Mayhew Wainwright graduated from the U.S. Military Academy at West Point in 1906 and was commissioned in the cavalry. During his early career, he fought against Moro rebels in the Philippines (1906–1908) and was assigned to various military posts in the western United States. Following the U.S. entry into World War I, he served with the American Expeditionary Forces (AEF) in France, ending the war as a brevet lieutenant colonel.

Wainwright then reverted to his permanent rank of captain and held a variety of command and staff assignments. Promoted to lieutenant colonel in 1929, he graduated from the Command and General Staff School (1931), and the Army War College (1936). Promoted to colonel, he commanded the 3rd Cavalry Regiment at Fort Myer, Virginia (1936–1938). After being promoted

to temporary brigadier general (1938), he assumed command of the 1st Cavalry Brigade. In September 1940, Wainwright was promoted to temporary major general and assigned to the Philippines to command the Philippine Division.

U.S. Army lieutenant general Jonathan M. Wainwright in Yokohama, Japan, following his release from Japanese captivity, 1945. (Corbis)

Following the Japanese landings there on December 8, Wainwright commanded the North Luzon Force. General Douglas MacArthur, confident that his forces could throw back any Japanese invasion, had scrapped the original plan to meet a Japanese invasion by withdrawing into the Bataan Peninsula. Wainwright's Filipino and American U.S. forces fought well but were ultimately forced from the Lingayen Gulf onto Bataan. Much of their equipment and supplies was lost in the withdrawal.

With a Japanese victory in sight, Washington ordered MacArthur to leave the Philippines for Australia, and he was awarded the Medal of Honor. On MacArthur's departure on March 11, 1942, Wainwright took over as commander of U.S. forces in the Far East, with the rank of lieutenant general. Forced off Bataan to Corregidor and with supplies running out and no hope of relief, he had no choice but to surrender on May 6, 1942. MacArthur protested U.S. Army chief of staff General George C. Marshall's recommendation that Wainwright receive the Medal of Honor.

Treated harshly as a prisoner of war in camps in northern Luzon, Formosa, and Manchuria for the next three years, Wainwright was liberated by the Soviets in August 1945. He witnessed the formal Japanese surrender on September 2 and traveled to the Philippines to receive the surrender of Japanese forces there.

Wainwright returned to the United States and, despite MacArthur's opposition, was awarded the Medal of Honor. In September 1945, Wainwright was promoted to full general. He took command of the Fourth Army at Fort Sam Houston, Texas, in 1946 but retired in August 1947. Wainwright died in San Antonio, Texas, on September 3, 1953.

Wakabayashi Tōichi (1912–1943)

Japanese Army officer. Born in Yamanashi, Japan, on March 27, 1912, Wakabayashi Tōichi was promoted to lieutenant from the enlisted ranks. He was a brilliant tactical commander in the field. On December 9, 1941, his company of the 228th Infantry Regiment of the 38th Division carried out a

surprise attack on the British Gin Drinker's Line at Hong Kong, helping to force the British capitulation.

Transferred to Guadalcanal in November 1942, Wakabayashi's company was assigned the duty of delaying the advancing Americans to facilitate a Japanese evacuation from the island. Wakabayashi carried out this duty skillfully before he was killed in action on Mount Austin on January 14, 1943. Posthumously promoted to captain, he became a wartime icon of the Japanese Army.

Wake Island, Battle for (December 8–23, 1941)

Military engagement between U.S. and Japanese forces over control of Wake Island. Strategically located in the Central Pacific and a U.S. possession since 1899, Wake Island is actually a small atoll of three islets—Wake, Peale, and Wilkes—comprising only 2,600 acres of sand and coral. Wake Island is located some 2,000 miles west of Hawaii and 600 miles from the Marshall Islands, in 1941 a Japanese stronghold. Wake served primarily as a refueling stop for the transpacific Pan American Airways Clipper Service, but as war loomed between the United States and Japan, both sides recognized its value as a reconnaissance base.

The United States began fortifying Wake in early 1941. That December, the island had some 1,221 civilian workers and 530 military personnel, including 449 members of the 1st Marine Defense Battalion under Major James P. S. Devereux. Navy commander Winfield S. Cunningham exercised overall command. The defenders had 6 5-inch naval guns, 12 3-inch antiaircraft guns, 18 .50-caliber machine guns, and 30 .30-caliber machine

guns. On December 4, 12 Grumman F-4F Wildcats flew off the carrier *Enterprise* and landed at Wake's partially completed airstrip.

Within a few hours of its December 7, 1941, attack on Pearl Harbor, Japan also moved against Guam and Wake. Guam fell quickly, but at Wake Island the Japanese received their first military rebuff of the war. At noon on December 8, 18 Japanese land-based bombers from the Marshall Islands struck Wake, destroying eight of the Wildcats on the ground and inflicting other damage. They also killed 23 marine aviation personnel and wounded another 11. Ten civilian employees of Pan American Airways were also killed. Although riddled by Japanese machine-gun fire, the Pan-Am Clipper was able to take off with a capacity load of civilians that afternoon. Japanese air attacks continued for two more days.

Convinced the defenses on Wake Island had been sufficiently reduced, a Japanese invasion force arrived off the island on the morning of December 11. It consisted of the light cruisers *Yubari, Tenryu,* and *Tatsuta;* six destroyers; two patrol boats; and two transports with 450 men of the Special Naval Landing Force (Japanese marines). The defenders held their fire until the Japanese were at point-blank range. After a short, sharp fight, the Japanese withdrew—but not before they had lost the destroyers *Hayate* (literally blown from the water, it was the first Japanese warship sunk in the Pacific war) and *Kisaragi*. The cruiser *Yubari* was badly damaged, and other Japanese ships were also hit and damaged.

In Hawaii, meanwhile, Pacific Fleet commander Admiral Husband E. Kimmel was preparing a relief expedition that would commit all three of his aircraft carriers. The *Saratoga* was to make the relief attempt, while the *Enterprise* and *Lexington,* with other ships, carried out diversionary raids against the Marshall Islands and stood ready to support. The expedition was delayed and did not sail until December 16, however.

Commanded by Rear Admiral Frank Fletcher, it consisted of the *Saratoga;* the cruisers *Astoria, Minneapolis,* and the *San Francisco;* 10 destroyers; the seaplane tender *Tangier* (carrying a marine battalion); and the fleet oiler *Neches*. The task force was forced to travel at only 13 knots, however—the top speed of the *Neches.*

In Pearl Harbor, meanwhile, Vice Admiral William S. Pye temporarily replaced Kimmel (who had been relieved) as new Pacific Fleet commander Admiral Chester W. Nimitz made his way to Hawaii. Pye ordered the

Lexington task force under Vice Admiral Wilson E. Brown to reinforce Fletcher and insisted that Fletcher refuel before entering a possible battle zone. This imposed further delay so that the relief forces were still some 600 miles from Wake when a second Japanese expeditionary force arrived at the island on December 23. With reports of Japanese carriers and battleships near Wake Island, aware that Washington considered Wake Island "a liability, not an asset," and informed by radio message from Cunningham that the Japanese had come ashore and that "the issue is in doubt," Pye ordered the relief expedition to return to Pearl Harbor.

This second Japanese expeditionary force was much stronger than the first. It included four heavy cruisers and about 1,500 marines. The aircraft carriers *Hiryū* and *Sōryū,* which had participated in the Pearl Harbor raid, were detached to provide distant support in the form of air strikes. Following a preliminary bombardment, the Japanese landings began before dawn. Most of the defenders were tied down manning the heavy guns, and few were available to act as infantry. Superior Japanese numbers told, and informed that no help would be forthcoming, Cunningham decided that morning that he had no choice but to surrender.

In the two battles for Wake Island, the Japanese lost 820 killed, one light cruiser heavily damaged, two destroyers and two patrol boats sunk, and at least seven or eight aircraft shot down and another 20 damaged. U.S. losses totaled 130 killed, 49 wounded, two missing in action, and 12 aircraft destroyed. A total of 433 military personnel and 1,104 civilians were taken prisoner.

All the defenders, except for about 100 civilians, were sent to prison camps. The Japanese put the remainder to work finishing the air station. They were executed in October 1943. The Japanese commander, Rear Admiral Shigematsu Sakaibara, was later convicted of war crimes and executed.

Although the heroic marine defense of Wake Island provided a boost to U.S. morale, Japan now controlled the line of communications across the Central Pacific and was free to move against the Philippines.

Walker, Frederick John (1896–1944)

British Royal Navy captain and one of the most important Allied exponents of antisubmarine warfare. Born at Plymouth, England, on June 3, 1896, Frederick John Walker entered the Royal Navy in 1909. He served with the Grand Fleet during most of World War I.

In 1921, Walker began seriously studying antisubmarine warfare. He attended the first specialist course at the navy's Anti-Submarine School and then became fleet antisubmarine officer aboard battleships in the Atlantic and Mediterranean fleets. In 1933, he was promoted to commander and took command of the asdic-equipped (known as sonar by the U.S. Navy) destroyer HMS *Shikari* but then had charge of the yacht of the commander in chief, China Station, for three years. In 1937, Walker became experimental officer at the Anti-Submarine School, the appointment he held at the outbreak of World War II. Walker's career was apparently at a dead end, because the Royal Navy held that antisubmarine warfare was a solved problem.

Walker joined Vice Admiral Bertram Ramsay's staff in Dover as operations officer and was heavily engaged in Operation DYNAMO, the evacuation of the British Expeditionary Force from Dunkerque (Dunkirk, May 26–June 4, 1940). He pleaded to return to sea and finally received command of the sloop *Stork,* flagship of Escort Group 36, in September 1941. The group's first assignment was to escort Convoy HG.76, composed of 31 merchantmen and a naval auxiliary, from Gibraltar. During an epic battle on December 14–23, Walker's group fought off air and submarine attacks, losing two merchantmen, an escort, and the escort carrier *Audacity* but sinking five U-boats in the process. Walker demonstrated the skillful

combination of effective deployment of surface and aerial assets with relentless determination and aggressive hunting that became his trademark.

Promoted to captain in June 1942, Walker received a shore assignment at Liverpool shortly afterward, but he returned to sea in February 1943 in command of the sloop *Starling*, flagship of Support Group 2. While ashore, he had convinced Admiral Sir Max Horton of the potential value of hunter-killer groups of fast, modern antisubmarine vessels, and this command was his opportunity to prove it. For the next year, Walker's group hunted U-boats relentlessly, destroying 16 and conclusively demonstrating the validity of his concept.

Walker drove himself hard. The most successful antisubmarine warfare commander in history, he died of a stroke in Liverpool on July 9, 1944.

Walker, Walton Harris (1889–1950)

U.S. Army general. Born in Belton, Texas, on December 3, 1889, Walton Harris Walker attended the Virginia Military Institute (1907–1908) before graduating from the U.S. Military Academy at West Point in 1912. Commissioned in the infantry, he commanded a machine-gun battalion in the 5th Infantry Division in France during World War I. He finished the war as a brevet major but reverted to captain on his return to the United States.

Between 1919 and 1923, Walker was both a student and an instructor at the Field Artillery School, Fort Sill, Oklahoma, and the Infantry School, Camp (now Fort) Benning, Georgia. He was then posted to West Point as an instructor and a tactical officer until 1925. Walker graduated from the

Command and General Staff School in 1926 and was then infantry representative at the Coast Artillery School until 1930. Between 1933 and 1935, he served as a battalion commander in the 15th Infantry Regiment in Tianjin (Tientsin), China. Walker then served at Headquarters, III Corps Area, Baltimore, Maryland. Promoted to lieutenant colonel in 1936, he graduated from the Army War College that year and was assigned as executive officer to Brigadier General George C. Marshall at Vancouver Barracks, Washington.

Having impressed Marshall, Walker moved to the War Plans Division of the War Department General Staff in 1937. Shortly before U.S. entry into World War II, he was promoted to colonel and took command of the 36th Armored Infantry Regiment. In January 1942, he assumed command of the 3rd Armored Division and was promoted to major general. That September, he assumed command of the IV Armored Corps at Camp Young, California. There, he established the Desert Training Center, responsible for training armored units for desert warfare in North Africa.

In February 1944, Walker's IV Armored Corps was redesignated XX Corps and ordered to Britain. In July, the corps was committed in Normandy as part of the Third Army, commanded by Walker's mentor, Lieutenant General George S. Patton Jr. XX Corps became known as the "Ghost Corps" for the speed of its advance. In August 1944, Walker was awarded the Distinguished Service Cross for battlefield heroism. Pushing into France from the Loire River to the Moselle, XX Corps reduced German fortifications at Metz in November 1944. Walker was criticized during this time for an apparent lack of concern about taking heavy casualties.

Major General Walton H. Walker, who distinguished himself during World War II as commander of XX Corps (known as the “Ghost Corps” for the speed of its advance), in the campaign to liberate France. (Keystone/Getty Images)

During the December 16, 1944–January 25, 1945, Ardennes Offensive (Battle of the Bulge), Patton swung the bulk of his Third Army north to counterattack into the southern flank of the German thrust. Walker’s XX Corps remained to cover the front that had been previously held by an entire army. In April 1945, his units liberated the Buchenwald concentration camp. By May 1945, the units reached Linz, Austria, the farthest advance east of any of Patton’s units.

Promoted to lieutenant general in April 1945, Walker ended the war as commander of the 8th Service Command in Dallas, Texas. In June 1948, he assumed command of the Fifth Army, headquartered in Chicago. That September, he assumed command of the Eighth Army in Japan, the ground force element of General Douglas MacArthur’s Far Eastern Command (FEC).

The four divisions there were at two-thirds of their authorized wartime strength. Although Walker instituted a training program, it had reached only the battalion level when the Korean War began in June 1950.

The Eighth Army was committed to the defense of South Korea, and Walker had the daunting task of stopping the rapidly advancing North Korean army. To add to his problems of insufficient strength and lack of equipment, only three of his four U.S. division commanders and none of the Republic of Korea (ROK) division commanders had ever previously commanded a division. ROK and American troops carried out delaying actions back to the Naktong River, where the Pusan Perimeter was formed. There, Walker led the longest, largest, most complex, and most successful mobile defense in U.S. military history. He combined a magnificent sense of timing with a judicious employment of his meager reserves and threatened, coerced, and exhorted his American and ROK commanders, refusing to yield ground without a fierce struggle, justifying his "Bulldog" nickname. Failure in the campaign would have ended the war.

The Eighth Army then took the offensive but was forced to withdraw from North Korea following the Chinese military intervention. Walker had Patton's weakness for driving at high speeds, and on December 23, 1950, while racing to inspect units north of Seoul, his jeep was struck by a truck, and he was killed. Walker was posthumously promoted to full general.

Wallace, Henry Agard (1888–1965)

U.S. politician, New Deal administrator, and vice president of the United States (1941–1945). Henry Agard Wallace was born on October 7, 1888, on his family's farm in Adair County, Iowa. Wallace's father served as agriculture secretary for the Warren Harding and Calvin Coolidge administrations. The younger Wallace broke with his family's Republican leanings and, as editor of *The Farmer*, endorsed Franklin D. Roosevelt for president in 1932. Wallace was subsequently rewarded with his father's old job in the Department of Agriculture. For the next eight years, Wallace was a fiercely loyal member of the New Deal elite, using the powers of the Agricultural Adjustment Administration and the Farm Security Administrations to shore up crop market prices and modernize small farms.

Wallace's visibility in office persuaded Roosevelt to choose him as his vice presidential running mate in 1940, despite the misgivings of conservative Democratic Party members who claimed that he was too intellectual. Such suspicions deepened during World War II as Wallace espoused an increasingly radical left-wing agenda, particularly in international matters, in which he was accused of being naively sympathetic toward the Soviet Union. During the war, Wallace kept a relatively low profile, but he did tour Asia and Latin America several times to build support for the Allies. He also headed the Board of Economic Warfare for a short time.

A combination of southern Democrats and urban northeasterners prevented Wallace's renomination at the 1944 party convention. Also, Roosevelt's inner circle, who feared that the ill president would not complete a fourth term, pushed for the more conservative Harry S. Truman as the vice presidential candidate. Shortly before his death in April 1945, Roosevelt appointed Wallace to be secretary of commerce.

Wallace refused to stay quiet, however, and he soon became a leading critic of President Truman's hard line toward the Soviet Union, forcing the president to dismiss him in September 1946. Recognizing that his future as a prominent Democrat had ended, Wallace decided to run in the 1948 election as a third-party candidate on a platform that advocated socialist-style reform, racial integration at home, and rapprochement with the Soviet Union. This platform did not attract many American voters. Wallace's national support slipped away under a barrage of criticism, and his 2.7 percent of the

November 1948 vote left him in fourth place behind Strom Thurmond, a humiliating defeat that shattered the anti-Truman Left.

Wallace then withdrew from public life and spent his remaining years as a gentleman farmer. He died in Danbury, Connecticut, on November 18, 1965.

Wallis, Barnes Neville (1887–1979)

British engineer. Born at Ripley, Derbyshire, England, on September 26, 1887, Barnes Neville Wallis decided to become an engineer but could not afford to go to university. Apprenticeships to engineering works followed. Wallis designed dirigibles such as the R-100 and adapted a revolutionary concept to aircraft design. He discovered that an airframe could be made lighter yet stronger through geodetics, a cross-bracing system of stress balancing whereby one side in tension is stabilized by its opposite being in compression. He employed this technique in the Wellesley (later Wellington) bomber; the 1935 prototype caused the British government to rescind an order for biplanes in favor of the new design. The Wellington became the Royal Air Force's most durable bomber.

Wallis's theoretical work, including early tests involving catapulting marbles across his family's bathtub, led him to believe that a single bomb might destroy a dam. He designed a 5-ton cylindrical bomb that, when released at low altitude with a certain forward rate of airspeed and a certain rate of backspin, would literally bounce across the surface of the water, hit the dam, and drive itself down to the base of the structure before exploding,

thus maximizing its effectiveness/damage. His hypotheses proved to be correct when, on the night of May 16–17, 1943, newly formed No. 617 Squadron's Lancaster bombers destroyed the Möhne and Eder dams, causing widespread flooding of Germany's industrialized Ruhr area.

Wallis's "tallboy" (12,000-pound) and "grand slam" (22,000-pound) bombs were employed against targets such as the *Tirpitz,* the Bay of Biscay U-boat pens, and the German V-rocket sites. His talent for seeing a complex problem, formulating a solution, and bringing it to fruition proved to be invaluable to the Allied war effort. Despite receiving little recognition in his own time, Wallis continually advanced design engineering.

Knighted in 1968, Wallis did important and innovative design work after the war, including work on variable-geometry (swing-wing) aircraft and supersonic aircraft. He died in Effingham, England, on October 30, 1979.

Wang Ching-wei

See Wang Jingwei

Wang Jingwei (1883–1944)

Chinese politician. Born in Guangzhou (Canton) in Guangdong (Kwangtung) Province, China, on May 4, 1883, Wang Jingwei (Wang Ching-wei) studied law in Tokyo in his youth, but his avocation was politics. An early ally of Sun Yixian (Sun Yat-sen), he quickly rose to a prominent position in Sun's revolutionary movement devoted to overthrowing the ruling Qing (Ch'ing) dynasty. Imprisoned for participating in a plot to assassinate the regent Prince

Qun (Ch'ün) in 1910, Wang was released after the fall of the Qing Dynasty in 1911. He then spent the period from 1912 to 1917 in exile after Sun's movement collapsed.

Wang's revolutionary credentials and his role in rebuilding the Nationalist Party—the Guomindang (Kuomintang, GMD)—made him the logical candidate to succeed Sun after the latter's death in 1925. Nevertheless, Wang was pushed aside by Jiang Jieshi (Chiang Kai-shek), who controlled the army. Wang attempted to form his own government, but he failed and eventually mended fences with Jiang in a show of unity following the Japanese invasion of Manchuria in 1931.

Appointed titular head of the Nationalist government in 1932, Wang was forced to bear the onus of appeasing the Japanese while Jiang led the army in a campaign to exterminate the Communists. Disillusioned, Wang resigned and left China in 1935 to recover from an assassination attempt. He returned following the outbreak of the Sino-Japanese War in 1937, but he quickly grew pessimistic about China's military prospects. After failing to persuade Jiang to make peace with Japan (which led Nationalist agents to make another attempt on his life), Wang fled to Japanese-occupied China.

In March 1940, the Japanese Army installed Wang as head of the puppet Reorganized Nationalist Government in Nanjing (Nanking), Jiangsu (Kiangsu) Province. Wang's hopes of presenting himself as a credible alternative to Jiang were ultimately doomed by the harsh reality of Japanese military domination. Wang died in Nagoya, Japan, on November 10, 1944, while undergoing medical treatment.

Wang Jingwei, who led the puppet government of the territory of China that was occupied by the Japanese. (Corbis)

Wanklyn, Malcolm David (1911–1942)

British Royal Navy lieutenant commander and the first submariner to win the Victoria Cross in World War II. Born in Kolkata, India, on June 28, 1911, Malcolm David Wanklyn joined the Royal Navy in 1925. Trained at Dartmouth Naval College, he was assigned in 1930 as a midshipman first to the battleship *Marlborough* and then to the battle cruiser *Renown*. From 1932 he served in submarines in the Mediterranean Fleet and then at Portsmouth. In 1936 he was promoted to first lieutenant. At the beginning of World War II, Wanklyn commanded the submarine *H-32*. In August 1940, he took command of the *Upholder,* then still under construction, a small 630-ton U-class submarine armed with four 21-inch torpedo tubes (eight torpedoes) and a 76mm (3-inch) deck gun with a crew of 31–33 men.

Promoted to lieutenant commander and having already torpedoed and sunk an Italian tanker and a merchant ship, Wanklyn won the Victoria Cross for an action on the evening of May 24, 1941. He was south of Sicily on his seventh patrol in the *Upholder* when he sighted an Italian troop convoy with a strong destroyer escort. Although the submarine's listening gear was inoperative and fading light made periscope observation difficult, Wanklyn was able to work to a favorable position to torpedo and sink the 18,000-ton troopship *Conte Rosso* and then escape after evading 37 depth charges dropped by the destroyers.

Wanklyn was lost, along with his entire crew, when the *Upholder* was sunk on its 25th patrol, becoming overdue on April 14, 1942. Most likely, it was sunk by depth charges dropped by the Italian torpedo boat *Pegaso* northeast of Tripoli that day, but it may have been damaged or sunk by German aircraft that attacked a supposed submarine in the same area on April 14, just before the *Pegaso* attack. It may also have been lost three days earlier, when a submarine reportedly encountered a minefield near Tripoli.

Wanklyn is considered the most successful British submarine commander of the war in terms of total tonnage sunk, having been credited with sinking 21 Axis ships totaling some 140,000 tons and including a destroyer, troopships, tankers, and storeships.

Wannsee Conference (January 20, 1942)

Daylong conference of German leaders to discuss the bureaucratic demands of arranging for the emigration, deportation, concentration, and elimination of the Jewish population within Germany and the occupied territories. The conferees also confirmed policies for the treatment of Jews who were of mixed blood or in mixed marriages.

The conference was convened and organized by Chief of the Security Police Reinhard Heydrich, who invited 15 top Nazi bureaucrats and Schutzstaffel (SS) officers to plan for the concentration of Jews and their execution. It took place in a villa in Wannsee, a suburb of Berlin on January 20, 1942.

The German invasion and occupation of much of Eastern Europe, especially Poland and the Soviet Union, presented a demographic challenge to the German government because of the large Jewish populations in those areas, especially in Poland and the western Soviet Union. By the end of 1941, the head of the SS, Heinrich Himmler, recognized that deportation and emigration were no longer adequate for the task of eliminating the Jewish population. He authorized Heydrich to create the bureaucracy and arrangements for a "final solution to the Jewish question." The Wannsee Conference dealt with these matters. Jews were to be "evacuated" to the east, with the "Jewish question" to be resolved first in the General Government.

The organizational challenges of identifying, transporting, housing, and eventually eliminating what the conferees (over)estimated as a population of 11 million European Jews (this number included those in neutral nations, such as Ireland and Switzerland) demanded that the Nazi government establish an infrastructure and clear procedures for implementing the goals of the regime.

Although much of the discussion focused on forced emigration and deportation to Eastern Europe, the underlying objective of the conference was to legitimize the "Final Solution," the systematic murder of the Jewish population in Europe. Specific topics discussed at the conference included estimating the size of Europe's Jewish population, organizing a systematic sweep of Europe to eliminate all Jewish remnants, and confronting local resistance in occupied countries.

Using the Nazi racial laws (the Nuremberg Laws), those attending the Wannsee Conference confirmed criteria for dealing with mixed-blood Jews and mixed marriages. Mixed-blood individuals were divided into a complex classification system based on "Mixed Blood of First Degree" and "Mixed Blood of Second Degree." This juridical understanding of race was designed to bring about the complete extermination of Jews in Europe.

Stenographers carefully documented the day's events in an outline of the conversations. In 1984 a German documentary concerning the Wannsee Conference appeared, based on this source and letters written by Hermann Göring and Adolf Eichmann.

Warlimont, Walter (1894–1976)

German Army general of artillery. Born in Osnabrück, Germany, on October 3, 1894, Walter Warlimont was commissioned a second lieutenant in the army in June 1914. During World War I, he served as an artillery battery officer, adjutant, and battery commander. Following the collapse of the monarchy at the end of the war, Warlimont joined one of the new Freikorps

formations. He transferred to the new German Army, the Reichswehr, in 1922 and was the second adjutant to General Werner von Blomberg, chief of the Truppenamt (the covert General Staff).

His gift for foreign languages gave him a broader exposure to other countries than many of his army contemporaries. Warlimont studied the English language for three months in England in 1926, and in May 1929, he began a year with the U.S. Army while studying American methods of industrial mobilization. He also married an American. War Minister Blomberg sent Warlimont to Spain between 1936 and 1937 as military attaché to General Francisco Franco. In 1938, Warlimont assumed command of the 26th Artillery Regiment in Düsseldorf as a colonel.

In September 1938, he was appointed to head the National Defense Section (L Section) while also serving as deputy chief of the Operations Staff of the recently established Oberkommando der Wehrmacht (Armed Forces Supreme Command, OKW). Colonel General Wilhelm Keitel was chief of staff, and Major General Alfred Jodl was the chief of the OKW Operations Staff. Warlimont became chief of the Operations Staff when Jodl was transferred to a command position in October 1938. Keitel ordered Jodl's return to the OKW in August 1939, thereby restoring Warlimont to his former post.

Warlimont was promoted to major general in August 1940, to lieutenant general in April 1942, and to general of artillery in April 1944.

Warlimont attended most of the major command conferences and drafted the bulk of the principal operational plans and directives. The latter included the infamous Commissar Order (Komissarbefehl); despite the fact that he was able to reduce its severity, his role in regard to this document was held against him after the war. Warlimont also drafted papers on Spain, Gibraltar, and Malta, and in November 1940, he went to France to discuss methods to strengthen Vichy France against the influence of Charles de Gaulle's Free French forces.

Warlimont was injured in the July 20, 1944, bomb plot against Hitler. Warlimont remained on duty, but by September 1944, he was diagnosed with a serious concussion. Transferred to the Führer Reserve of general officers, he was never recalled to duty.

Warlimont was cautious and reserved. Known as "the Fox" by some, he was not trusted by Hitler. Warlimont was arrested by the Americans in 1945,

tried at Nuremberg for alleged war crimes and crimes against humanity, and sentenced to life imprisonment. His sentence was reduced in 1951, and he was released six years later.

During his incarceration and after his release, Warlimont worked on a number of historical projects, including his major work, *Inside Hitler's Headquarters, 1939–1945* (1962). He died on October 9, 1976, in Kreuth, Bavaria.

Warsaw, Battle of (September 8–27, 1939)

On September 1, 1939, German forces invaded Poland from three directions, with the bulk of German forces deployed on the flanks in Army Groups North and South. Only weak German forces to the west connected the two army groups. The meeting point for the German northern and southern pincers was to be the capital of Warsaw, which with 1.3 million people was Poland's largest city.

On September 5, the government began evacuating its offices in the city, and the next day, Marshal Edward Rydz-Śmigły and his commanders departed for Brest in the east. On September 8, as German troops closed on Warsaw, Lord Mayor Stefan Starzyński formed a defense committee composed of both civilian and military leaders; its Order No. 1 proclaimed that the city would be defended. All public transport was commandeered, rationing was begun, and the populace was organized into guard and labor battalions. Polish general Juliusz Rommel was in command, and General

Walerian Czuma was responsible for the actual defense of the city with some 120,000 Polish Army troops.

The Poles did what they could, utilizing old Russian city defenses, turning city blocks into strongpoints, covering intersections with artillery, and taking advantage of rubble for ambush positions. They also made use of makeshift weapons, including gasoline bombs used against German tanks. The Polish defensive positions were difficult to detect, and the German formations, organized for rapid movement, would have little advantage in city fighting at close quarters.

Defending against the Luftwaffe was another matter altogether. The city had 54 fighter aircraft, which had some success against the Germans in the first days. But their numbers were steadily reduced both through aerial combat and lack of spare parts. Those that remained were withdrawn entirely on September 8, leaving only 40mm and 75mm antiaircraft guns and machine guns, and these were spread thin. German air strength was so dominant that the Poles were forced to restrict ground counterattacks to night actions.

In addition to shortages of military equipment, particularly for use against air attack, Warsaw had little in the way of food. By September 14, even with rationing, stocks were sufficient only for two weeks. Despite this, people in the city were defiant, and morale remained high. But on September 8, German ground units entered the fray. On that day, Polish troops repulsed an attack by the 4th Panzer Division in the Ochota suburb, destroying some 60 German armored vehicles. This rebuff convinced the Germans that a direct ground assault on the city would be costly and that the best course would be a protracted siege. That day also, the Germans began what would be a growing artillery bombardment, probably the key factor in the city's eventual surrender.

Warsaw had been under intermittent terror bombing from the first day of the invasion, but on September 13, the Germans announced their intention to bomb cities, and Adolf Hitler ordered that civilians be prevented from leaving Warsaw. These decisions were based on the belief that terror bombing would hasten the Polish surrender. The next day, September 14, the bombing of Warsaw was especially severe. That day was the Jewish New Year for Warsaw's 400,000 Jews, who were specially targeted by German bombers while in the streets and in the synagogues of Nalewki, the Jewish quarter.

German troops parade through Warsaw, Poland, following its capture in September 1939. (National Archives)

Hitler rejected any talk of a siege, and German Army units were sent into the city on September 15. Five days later, 12 German divisions supported by more than 1,000 artillery pieces began an assault that reached its peak on September 25, when the Germans launched Operation COAST, an air attack expressly ordered by Hitler that involved some 400 bombers and dive-bombers. They dropped 72 tons of incendiary bombs, causing fires throughout the city. On September 26 the Germans captured two of the three Polish defensive lines, and the Poles opened negotiations with the German Eighth Army commander, General of Infantry Johannes von Blaskowitz.

On September 27, Warsaw surrendered unconditionally. The Germans took 140,000 Poles prisoner, 36,000 of them wounded. In addition, some 2,000 Polish troops died in the battle, along with 60,000 civilians. Damage to the city itself was immense, with an estimated 12 percent of the structures destroyed. Warsaw was the first capital to suffer such devastation in the war.

Warsaw Ghetto Uprising (April 19–May 16, 1943)

Armed attempt by Jews living in the Warsaw ghetto to defy the Germans. Through the summer of 1942, the Germans deported or executed more than 300,000 Jews from the Warsaw ghetto, leaving between 55,000 to 60,000 there. Aware through authenticated reports of the mass killings that were taking place and resolved to fight back against the Germans, inhabitants of the ghetto formed the Jewish Fighting Organization (Żydowska Organizacja Bojowa, ŻOB) and prepared to obstruct future German deportations.

Lightly armed and poorly trained for combat, the ŻOB saw its first action against a small German *Aktion* (the German euphemism for an operation to round up and deport those destined for death camps) in January 1943. Surprised by the opposition and suffering several casualties, the Germans withdrew from the ghetto to regroup their forces and evaluate the situation.

Shocked that the Jews would arm themselves and fight another round of deportations, the Germans returned in force in April to liquidate the ghetto completely. On April 19, 1943, Waffen-SS, police, and Wehrmacht units moved into the ghetto to complete the January operation. To ensure success, they sent in columns of troops, a tank, and two armored cars. Shortly after the Germans reentered the ghetto and started to fan out to round up the deportees, the ŻOB struck with pistol fire, homemade hand grenades, and Molotov cocktails.

Despite facing an overwhelming superiority of equipment and firepower, the ŻOB forced the Germans from the ghetto within two hours in a noteworthy, though short-lived, achievement. Chagrined and angered by the resistance, SS-Brigadeführer Jürgen Stroop, the police chief of Warsaw, ordered his troops back into the ghetto. Using their superior firepower, the Germans forced the ŻOB fighters from the rooftops and into the buildings and below the streets into the sewers. Desiring a rapid conclusion to the *Aktion*, Stroop petitioned and received permission from SS-Reichsführer Heinrich Himmler to use whatever means necessary to eliminate resistance. Unable to quell the ŻOB, the Germans set about systematically destroying each building in the ghetto with explosives and fire.

Jewish civilians taken by the Germans during the destruction of the Warsaw Ghetto, Poland, 1943. (National Archives)

Despite the destruction of its headquarters building at 18 Mila Street on May 8, which also took the life of ŻOB leader Mordechai Anielewicz, the ŻOB continued to engage the German troops. Increasingly frustrated by his units' inability to subdue the resistance completely, Stroop ordered the main synagogue destroyed. On May 16, with sporadic fighting continuing as small bands of ŻOB fighters persistently engaged the German troops, Stroop declared the operation complete when Warsaw's most prominent synagogue collapsed into a pile of rubble. In his report to his superiors, he acknowledged

that 16 of his men had been killed and 85 wounded. Deaths among the ghetto's inhabitants ran into the thousands, with roughly 50,000 taken into custody and either shot outright or deported.

Although some members of the underground Polish Home Army (Armia Krajowa) assisted the ŻOB during the ghetto uprising, the majority did not participate in the fighting, waiting instead for their own planned revolt, which would come in August 1944.

Warsaw Rising (August 1–October 2, 1944)

Attempt by Polish insurgents to wrest Warsaw from German control. The Poles mustered fierce resistance from August 1 to October 2, 1944. By the summer of 1944, the Red Army had pushed the German Army almost completely out of the Soviet Union and continued moving west across German-occupied Poland. The Soviets, however, had pushed aside the London-based Polish government-in-exile and established their own communist provisional government. As they advanced, Soviet forces disarmed the Polish Home Army (Armia Krajowa, AK), responsible to the London-based government. On July 26, the London Poles ordered AK commander General Tadeusz Bór-Komorowski to capture Warsaw from the Germans before the Soviets arrived.

The AK had some 40,000 fighters in Warsaw, but they were desperately short of arms and ammunition. Although there were some clandestine arms

factories in the city, the AK's total armament amounted to little more than 2,000 pistols, 1,000 rifles, 25,000 homemade grenades, and a handful of antitank rifles. The German garrison in Warsaw numbered more than 21,000 well-equipped, combat-experienced troops, including three Waffen-SS divisions and two Wehrmacht panzer divisions. Lieutenant General Reiner Stahel commanded the German combat units around Warsaw. The overall German commander was Schutzstaffel (SS) Obergruppenführer Erich von dem Bach-Zelewski.

Operation BURZA (TEMPEST) began on August 1, 1944. The lead units of the Red Army were only about 12 miles away, closing in on the east bank of the Vistula River. On the first day of the rising, the AK gained control of most of the west bank of the Vistula, but the Poles never managed to take the bridges. Fighting back almost immediately, the Germans took Warsaw's Old Town on August 2. By the next day, German reinforcements were pouring into the battle, and the Luftwaffe had begun round-the-clock bombing of the Polish-controlled areas.

The savage street fighting ground on for weeks, with the Polish insurgents using the city's sewers for lines of communication and as routes of escape. SS Reichsführer Heinrich Himmler ordered that the entire city be "razed to the ground" and all its inhabitants killed as an object lesson to all other cities under German occupation.

On September 10, Red Army units under General Konstantin Rokossovsky finally moved into Warsaw's Praga district on the east bank of the Vistula. After five days of heavy fighting, the Soviets consolidated their positions on the east bank and ceased to advance. Not only did the Soviets provide no further support to AK forces fighting desperately on the other side of the river, but they also refused permission for Western Allied aircraft to land on Soviet airfields after making supply drops to the beleaguered insurgents. Under pressure from U.S. president Franklin D. Roosevelt, the Soviets finally allowed a single wing of 110 U.S. B-17 bombers to refuel at Poltava for a supply drop on September 18.

On September 30 as the Germans systematically reduced the pocket of Polish resistance, Bór-Komorowski appointed General Leopold Okulicki as his successor in command of the AK. Bór-Komorowski and his surviving fighters finally surrendered on October 2, after 63 days of fierce resistance. Some 15,000 insurgents and 150,000 Polish civilians died during the rising.

Another 700,000 of Warsaw's inhabitants were sent to concentration or slave labor camps, where 245,000 later died. Approximately 93 percent of the city was an unrecognizable pile of rubble. The Germans lost about 10,000 killed during the fighting.

Soldiers of the Polish Home Army fighting the Germans during the Warsaw Uprising of August–October 1944. (Hulton Archive/Getty Images)

Shortly after suppressing the rising, the German Army withdrew from Warsaw at its own pace, and the Red Army followed it into the city. Soviet commanders later claimed that stiff German resistance and the lack of supplies had prevented them from giving the AK any more support. Many historians, however, have suggested that the Soviet commanders were following specific orders from their leader, Joseph Stalin, who wanted the German Army to eliminate any Polish opposition to the establishment of a postwar communist government under Moscow's control.

Watson-Watt, Sir Robert Alexander (1892–1973)

British scientist who developed radar. Robert Watson Watt (who hyphenated his name after being knighted in 1942) was born in Angus, Scotland, on April 13, 1892. He graduated in engineering in 1912 from University College, Dundee (University of St. Andrews), where he won medals in mathematics and electrical engineering. His interest in radio waves began thereafter, when he was an assistant to professor of natural philosophy William Peddie.

During World War I, Watson Watt worked as a meteorologist at the Royal Aircraft Factory, Farnborough, applying his knowledge of radio to locate thunderstorms that posed hazards to airmen. In 1916, he proposed the use of cathode ray oscilloscopes to record and display such information, a project that led to his development of cathode ray direction finders in the mid-1920s, by which date Watson Watt was superintendent of the Radio Research Station at Slough, part of the National Physical Laboratory.

Sir Robert A. Watson-Watt, the British scientist credited with the development of radar. (The LIFE Picture Collection/Getty Images)

In 1933, Watson Watt took over a new radio department in Teddington, where he elucidated the theoretical basis for radar, conducting early experiments in using radio waves to locate aircraft. By 1938, he was director of communications development in the Air Ministry, and in 1940, he was appointed scientific adviser on telecommunications to the Ministry of Aircraft Production.

Watson Watt's assorted inventions proved their worth in the July 10–September 30, 1940, Battle of Britain, which might have been lost without them. Certainly they made major contributions to the ultimate Allied victory. In 1938, Chain Home, a pioneering early-warning system of fixed radar stations, was installed along Britain's east coast, where incoming German aircraft might be expected, and the system was later refined to detect low-flying airplanes. Watson Watt also developed airborne interception radar for installation in aircraft to allow them to locate other airplanes and also seaborne vessels; these proved invaluable in the Battle of the Atlantic. And he developed identification, friend or foe (IFF), devices that could distinguish between friendly and hostile aircraft and could be installed on antiaircraft artillery as well as radio navigation for bomber airplanes. These greatly facilitated the massive Allied bombing raids on Germany and Japan.

The British shared these technological innovations with the Americans, and they represented the most significant instance of reverse Lend-Lease except perhaps for Ultra intercepts.

Watson-Watt received a substantial financial award from the British government after the war for his work on radar and was recognized with numerous other professional honors and prestigious appointments. He established a consulting firm and lived in Canada for some years before returning to Britain. He died in Inverness, Scotland, on December 5, 1973.

Wavell, Sir Archibald Percival (1883–1950)

British Army field marshal. Born in Colchester, England, on May 5, 1883, Archibald Percival Wavell graduated at the top of his class from the Royal Military College, Sandhurst, in 1901 and was commissioned in the Black Watch. He established his military reputation during the South African War (Second Boer War, 1899–1902) and in service on the Northwest Frontier in India. Wavell graduated, again at the top of his class, from the Staff College of Camberley and then studied the Russian language for two years in Russia.

During World War I, Wavell served in France, losing an eye in combat. After his recovery and eight months with the Russian army in the Caucasus, he served in Palestine under Lieutenant General Edmund Allenby as a brigadier general. He held a variety of posts in the 1920s and 1930s and returned to Palestine in 1937 to command British forces there during the Arab-Jewish riots.

Promoted to lieutenant general in 1938, Wavell was appointed commander in chief, Middle East, in August 1939. He had to establish the command virtually from scratch in Cairo, with few resources. His heavily outnumbered forces halted the Italian invasion of Egypt from Libya, and he then launched Operation COMPASS (December 7, 1940–February 7, 1941). It was a spectacular success, destroying more than a dozen Italian divisions and clearing all Cyrenaica. Empire forces operating under his command also had considerable success in Ethiopia and against anti-Allied elements in Syria and Iraq.

Reversals followed, however, largely due to the arrival in North Africa of German reinforcements under Lieutenant General Erwin Rommel and to Prime Minister Winston L. S. Churchill's decision to strip resources from Wavell's command for an ill-fated intervention in Greece. Following the British defeat in Greece and Crete (over which Wavell had no control) and

the failure of Operation BATTLEAXE to drive the Germans from Egypt and relieve Tobruk, Churchill replaced Wavell with General Claude Auchinleck in July 1941 and transferred Wavell as commander in chief in India.

With the U.S. entry into the war, Wavell was briefly Allied commander in the Far East. Following the loss of Malaya, Singapore, and Burma, he prepared India for invasion, then mounted a counterattack against Japanese forces in Burma, which the Japanese repulsed. Promoted to field marshal in January 1943 and raised to the peerage in July, he was named viceroy of India in June 1943, a post he handled well until replaced by Admiral Louis Mountbatten in 1947. Made an earl with the title Viscount Keren of Eritrea and Winchester, Wavell returned to Britain and settled in London. A prolific and talented writer, he wrote *The Palestine Campaigns* (1928), *Allenby* (two volumes, 1940 and 1943), *Generals and Generalship* (1941), *Allenby in Egypt* (1943), *Speaking Generally* (1946), and *The Good Soldier* (1948). He also edited a poetry anthology. Wavell died in London on May 24, 1950.

Wedemeyer, Albert Coady (1897–1989)

U.S. Army general. Born in Omaha, Nebraska, on July 9, 1897, Albert Coady Wedemeyer graduated from the U.S. Military Academy at West Point in 1918 in an accelerated program and was commissioned in the infantry. Between the wars, he served in the United States, the Philippines, and China

and attended the Command and General Staff School, being promoted to captain in 1936.

From 1936 to 1938, Wedemeyer attended the German War College (Kriegsakademie), producing a lengthy final report on the German military. This document strongly impressed Major General George C. Marshall, then assistant chief of staff in the War Department General Staff War Plans Division; in 1941 after he became chief of staff, Marshall placed Wedemeyer, a major at the time, in the same division. Wedemeyer contributed heavily to the War Department's "Victory Plan," which governed overall planning for wartime mobilization. In 1942 and 1943, promoted to brigadier general, he served in the War Department Operations Division, where he advocated an early cross-Channel invasion of Western Europe and opposed British prime minister Winston L. S. Churchill's alternative proposals for Mediterranean operations.

U.S. Army Major general albert C. Wedemeyer. (Corbis)

In the fall of 1943 Wedemeyer, now a major general, became deputy chief of staff to the new South-East Asia Command. In that capacity, he helped to develop plans for future operations and unsuccessfully attempted to resolve differences between China's Jiang Jieshi (Chiang Kai-shek), president of the Nationalist Party—the Guomindang (Kuomintang, GMD)—and Lieutenant General Joseph W. Stilwell, commander of American military forces in the China-Burma-India theater and Jiang's chief of staff.

In October 1944, Wedemeyer replaced Stilwell and soon developed a far less antagonistic working relationship with Jiang. Although critical of corruption and ineptitude within the GMD, Wedemeyer, who was promoted to lieutenant general in early 1945, energetically helped reorganize the Chinese Army and enhance its fighting abilities, drafting plans—never implemented—to retake southern China's coast from Japanese forces. He urged greater levels of U.S. aid for Jiang's government and the denial of such assistance to Chinese Communist leaders.

Following the Japanese surrender in August 1945, Wedemeyer supervised the demobilization of Japanese troops in China and their replacement by Jiang's forces. Despite continuing to criticize corruption and inefficiencies within the Nationalist government, Wedemeyer believed that the United States should give it staunch backing and much-expanded economic and military aid, and he expressed misgivings over Marshall's yearlong 1946 effort to establish a coalition Chinese government that would include Communist leaders.

In April 1946, Wedemeyer left China. After Marshall sent him on a two-month fact-finding mission to China and Korea the following year, Wedemeyer repeated these recommendations while also forcefully urging the Chinese government to institute major reforms. The Harry S. Truman administration ignored Wedemeyer's advice and deemed his report too politically sensitive, suppressing it for two years.

After serving on the War Department General Staff and commanding the Sixth Army, Wedemeyer retired in 1951 to become a business executive. In 1954, he was promoted to full general on the retired list. He was active in conservative Republican politics, and he openly condemned the Truman administration's failure to provide greater assistance to China. Wedemeyer died at Fort Belvoir, Virginia, on December 17, 1989.

Wei Lihuang (1897–1960)

Chinese Nationalist military commander. Born in Hefei (Hofei) in Anhui (Anhwei), China, on February 16, 1897, Wei Lihuang began his military career as a volunteer in the revolutionary army of his native province in 1912. In 1916, Wei went to Guangzhou (Canton) in Guangdong (Kwangtung), where he joined the Nationalist Party—the Guomindang (Kuomintang, GMD)—and participated in the 1925–1928 Eastern and Northern Expeditions and the antiwarlord and anti–Chinese Communist "bandit extermination campaigns" of the early 1930s. In late 1935, Wei became commander in chief of GMD forces on the border between Hunan, Hubei (Hupeh), Anhui, and Jiangxi (Kiangsi), a position second only to Chen Cheng (Ch'en Ch'eng).

After the Sino-Japanese War began in July 1937, Wei led the Fourteenth Group Army to defend Beijing (Peking) in Hebei (Hupeh), and in October, he became deputy commander of the Second War Area of Shanxi (Shansi) and the two defunct provinces of Chaha'er (Chahar) and Suiyuan. There, he engaged the Japanese in the Battle of Xinkou (Hsinkow) near Taiyuan in Shanxi, which fell in November. In January 1939, Wei also became commander of the First War Area of Hebei, northern Shandong (Shantung), Henan (Honan), and Anhui and, in October, also governor of Henan.

Between September and December 1940, Wei joined the Chinese Communist Eighth Route Army to launch the "Hundred Regiments"

offensive against the Japanese in northern China. At year's end, he received the concurrent command post of the Hebei-Chaha'er War Area. Because of his growing connections with the Eighth Route Army, Wei was relieved of all of his posts at the end of 1941 and assigned to the GMD Military Affairs Commission's Xi'an (Sian) office in Shaanxi (Shensi). In October 1943, he succeeded Chen Cheng as commander of the Chinese Expeditionary Force, with headquarters at Kunming in Yunnan, where he participated in the joint Anglo-American–Chinese campaign for the recovery of Burma.

In the Second Burma Campaign of May 1944 to January 1945, Wei, as deputy commander of the Chinese ground forces, led five Chinese armies across the Nu River, captured Wanting, and reopened the Burma Road through Tengchung and Lungling in coordination with Allied forces stationed in India. The Chinese mission then ended, and Wei was militarily inactive throughout the remainder of the war.

In January 1948, Wei succeeded Chen as acting director of the Northeastern Headquarters and commander of "bandit suppression" in the northeast region, which fell to the Chinese Communists in October. Subsequently relieved of all his titles and posts, Wei was then imprisoned at Nanjing (Nanking) in Jiangsu (Kiangsu), awaiting trial on charges of corruption. Released after Li Zongren (Li Tsung-jen) became acting president in January 1949, Wei retired in Hong Kong until March 1955, when he returned to Beijing and there served on various committees of the People's Republic of China. Wei died in Beijing on January 17, 1960.

Weichs zur Glon, Maximilian Maria Joseph Freiherr von (1881–1954)

German Army field marshal. Born in Dessau, Germany, on November 12, 1881, Maximilian Maria Joseph Weichs zur Glon joined the 2nd Bavarian Heavy Cavalry Regiment in July 1900 and would maintain an association with the cavalry for most of his military career. He attended the Kriegsakademie (War College) in 1910 and served in several positions as a General Staff officer during World War I.

Weichs remained in the Reichswehr, the new German Army, after the war, holding several cavalry-related positions. Promoted to major general in April 1933, he took command of the 3rd Cavalry Division at Weimar, which became the 1st Panzer Division in 1935. Weichs was promoted to lieutenant general in April 1935 and to general of cavalry in October 1936. His career suffered a temporary setback when he and 15 other generals were "retired" by Adolf Hitler following the Fritsch Affair.

Weichs was recalled to duty for the 1939 Polish Campaign that began World War II. He commanded XIII Corps and enjoyed success at Warsaw (September 8–27). Given command of the new Second Army, he participated in the May 10–June 25, 1940, Battle for France and was promoted to colonel general in July 1940. He commanded the forces invading northern Yugoslavia in April 1941, and after occupying Zagreb, Sarajevo, and Belgrade, he received the Yugoslav surrender on April 18.

The Second Army then moved east and participated in Operation BARBAROSSA, the June 22, 1941, invasion of the Soviet Union, as part of the southern flank of Army Group Center. Weichs fell ill in November and did not return to duty until January 1942, at which time his Second Army was on the northern wing of Army Group South. His forces captured Voronezh in July 1942.

Weichs assumed command of Army Group B in July 1942. It eventually consisted of the German Second and Sixth Armies, the Fourth Panzer Army, the Hungarian Second Army, the Italian Eighth Army, and the Romanian Third and Fourth Armies. Not only was Weichs short of German troops, but Hitler stripped half his motorized transport to support Army Group A. As the Sixth Army invested Stalingrad, Weichs worried about the ability of his Axis allies to protect his flanks.

In November, when the Soviets launched their encirclement of Stalingrad, Weichs had no reserves, and Hitler refused his request to withdraw the Sixth Army westward. Although restoring the situation was beyond the means Weichs had available, Hitler showed his lack of confidence in him by assigning most of Army Group B in late November to the newly created Army Group Don. Weichs was promoted to field marshal in February 1943, but his remaining forces were distributed between Army Group Center and Army Group Don. He was transferred to the Führer Reserve on July 10.

Weichs's retirement was short-lived. He was recalled on July 26 and named both commander in chief, southeast, and commander in chief, Army Group F. With responsibility for all Axis forces in the Balkans, he was forced to contend with both growing guerrilla activity and the Italian surrender in September 1943. Weichs performed well, conducting several successful antipartisan operations. He also kept open supply lines for vital raw materials to the Reich.

With the collapse of Romania and the defection of Bulgaria in August and September 1944, Weichs successfully extricated German forces in the Balkans with minimal losses. By January 1945, the remnants of Army Group F were fighting in Hungary. Hitler retired him again in March.

Weichs was held as a prisoner after the war and was one of the defendants at the American Military Tribunals in Nuremberg, but he was released because of ill health before the trial. Weichs died in Burg Rösberg near Bonn on September 27, 1954.

Welles, Benjamin Sumner (1892–1961)

U.S. undersecretary of state (1937–1940). Born in New York City on October 14, 1892, into a socially prominent family, Benjamin Sumner Welles attended Harvard University, acquiring a strong interest in history and literature. In 1915, on the advice of family friend Franklin D. Roosevelt, Welles applied to join the Foreign Service. Assigned to Buenos Aires in 1917, he decided to specialize in Latin America. Welles resigned from the department in 1922, but within three months, Secretary of State Charles Evans Hughes appointed him commissioner to the Dominican Republic. Welles's mandate was to implement the withdrawal of U.S. troops and the restoration of the indigenous government there.

Appointed assistant secretary of state by President Roosevelt in 1933, Welles implemented the administration's "Good Neighbor" policy toward Latin America. In 1937, Roosevelt promoted him to undersecretary, annoying Secretary of State Cordell Hull, who resented Welles's close relationship with the president. When World War II began in Europe, Welles won Latin American nations' acquiescence in the declaration of a neutral zone around the entire continent.

In February and March 1940, Roosevelt dispatched Welles on a well-publicized peace mission to Rome, Berlin, Paris, and London, purportedly to explore the possibility of negotiating peace before Germany launched its anticipated spring offensive and, if this proved to be impossible, to detach Italian dictator Benito Mussolini from German leader Adolf Hitler. Another objective of this unsuccessful venture was almost certainly to demonstrate to American voters that the president had made every possible effort to bring about peace.

Welles attended Roosevelt's August 1941 meeting with Winston L. S. Churchill off the Canadian coast, where he helped to draft the Atlantic Charter. In January 1942, shortly after the Axis powers declared war on the United States, he met with all Latin American foreign ministers at Rio de Janeiro, winning their consent to a proclamation recommending a break with the Axis nations. For the sake of maintaining unanimity, Welles accepted this measure rather than the outright declaration of a diplomatic break preferred by Hull.

Welles was heavily involved in postwar planning undertaken jointly by the State Department and the Council on Foreign Relations. After the United States entered the war, he began an extensive speaking campaign to win popular support for the creation of a postwar international organization, which would eventually become the United Nations. In 1943, Hull, prompted by his antagonism toward Welles, used reports of his subordinate's involvement in a homosexual incident as a reason to insist on his resignation. Welles retired that September. He then wrote and spoke extensively on foreign affairs. Welles died in Bernardsville, New Jersey, on September 24, 1961.

WESERÜBUNG, Operation (April 1940)

Code name for the German invasion of Norway and Denmark, Operation WESERÜBUNG (WESER EXERCISE, the Weser being a river in Germany) was the first and only joint operation of German armed forces in the war. On the order of German chancellor Adolf Hitler, commander of the German Navy Grand Admiral Erich Raeder initiated plans to occupy Norway in order to protect Swedish iron ore imports and to forestall an expected Allied invasion. Norway would also provide the German Navy with bases for surface raiders and U-boats to break out into the Atlantic for its commerce war.

The *Altmark* Incident of February 1940 provided strong evidence, in German eyes at least, of a pro-British stance in the Norwegian government on the grounds that the Norwegians had not defended their territorial waters against the British. Hitler was convinced that the British intended to invade Norway, a move he sought to forestall. Psychological considerations also played a role, but Raeder warned Hitler that such a venture would violate all the rules of naval warfare and force the commitment of virtually the entire German Navy.

Until this point in the war, the navy had made no significant contribution, and it was not slated to have a major role in the upcoming campaign against France. Hitler placed operational planning for the first time under his Oberkommando der Wehrmacht (Armed Forces Supreme Command). His stipulation that forces for WESERÜBUNG, the code name for the invasion, be placed under a "special command" threatened the autonomy of both the army and the Luftwaffe.

For the invasion of Denmark and Norway, Hitler committed a total of some 120,000 troops, with the vast majority assigned to Norway. The initial invasion force sent to Norway was to be transported in six separate groups: (1) 10 destroyers would move some 2,000 mountain troops to occupy the northern port of Narvik, with the battleships *Scharnhorst* and *Gneisenau* providing distant cover; (2) the heavy cruiser *Admiral Hipper* and 4

destroyers would lift 1,700 troops to Trondheim; (3) the light cruisers *Köln* and *Königsberg*, the artillery training ship *Bremse*, the transport *Karl Peters*, 2 torpedo boats, and 5 motor torpedo boats would transport 1,900 men to Bergen; (4) the light cruiser *Karlsruhe*, 3 torpedo boats, 7 torpedo boats, and the mother ship *Tsingtau* would carry 1,100 men to Kristiansand; (5) the heavy cruiser *Blücher*, the heavy cruiser *Lützow*, the light cruiser *Emden*, 3 torpedo boats, and 8 minesweepers would move to Oslo with 2,000 troops; and (6) 4 minesweepers would transport 150 troops to Egersund.

On April 4, 1940, Hitler decided that the operation would begin five days later. On April 8, the British began their own mining operation in Norwegian waters, which was to be followed by the landing of troops. German naval units were, however, already at sea and successfully stole a march on the British. Strong Norwegian resistance, assisted by Allied forces, led to sharp fighting, particularly at Narvik on April 10 and 13, where 10 German destroyers were trapped by British naval units, including the battleship *Warspite*, and destroyed. At one point, Hitler lost his nerve and ordered the Narvik forces to seek internment in Sweden. Raeder instead convinced Hitler to send reinforcements to Oslo instead of using the more dangerous sea routes to Trondheim and Bergen.

The successful German campaign against France and the Low Countries, begun on May 10, caused the British and French to withdraw their forces from Norway on June 5–8. On June 10, the Norwegian armed forces surrendered.

Raeder ordered his battleships to attack enemy shipping and protect supply shipments for German relief forces linking up with German forces at Narvik (Operation JUNO, June 4–9). On June 8, the German battleships *Scharnhorst* and *Gneisenau* encountered the British aircraft carrier *Glorious* at sea, steaming for Scapa Flow, and sank it with gunfire. The *Glorious* had, in addition to Hurricane fighters, a half dozen Swordfish torpedo bombers on board, but for some reason, none of its aircraft were aloft. The German battleships also sank both of the escorting British destroyers, but one, the *Acosta*, succeeded in torpedoing and damaging the *Scharnhorst*. As a result, Admiral Wilhelm Marschall chose to return to base, perhaps saving several nearby British convoys steaming without battleship escort.

Royal Navy losses in the campaign had been serious: a fleet carrier and 2 cruisers as well as a number of smaller ships. In addition, 8 large

merchantmen, including 2 troopships and 2 tankers, were lost, but the destroyers suffered the most. Nine were sunk, and another 12 were damaged.

During Operation WESERÜBUNG, the German Navy lost its new heavy cruiser *Blücher*, 2 light cruisers, and 10 destroyers. Other ships were damaged. These losses created serious operational problems for the German surface navy. Moreover, Operation WESERÜBUNG had revealed serious command problems, leading to the replacement of Marschall, the second fleet commander of the war. In addition, a large number of torpedo failures had cost the U-boats opportunities to inflict more serious damage on the Royal Navy.

Yet WESERÜBUNG was the German Navy's major feat of arms of the war. Hitler considered Norway as Germany's "zone of destiny," to be defended at all costs, especially after the invasion of the Soviet Union on June 2, 1941, but this created a considerable drain on German resources, as the navy and army were forced to commit major resources to defend Norway.

West European Theater of Operations

In accordance with its military pact with the Poles, France was to invade Germany two weeks after any German attack on Poland, thereby forcing the Germans into a two-front war. Following the German invasion of September 1, 1939, however, the best the French could manage was a token drive into the Saar region by nine divisions. French forces advanced a maximum of five miles on a narrow front. Casualties were negligible, but the French then

halted, and when Poland collapsed, they withdrew to the Maginot Line. A more vigorous French thrust would have driven forward to the Rhine, with untold consequences for the course of the war. German forces manning the West Wall had little ammunition, no tanks, and virtually no air support.

But if the French effort in response to the German invasion of Poland was pathetic, Britain's was worse. The Royal Navy did impose a naval blockade on Germany, but the effects of this were far different from those caused by a similar blockade in World War I. This blockade was nullified by Germany's nonaggression pact with the Soviet Union, the secret terms of which promised Germany strategic natural resources. Germany could also secure necessary supplies from Italy, and both countries acted as purchasing agents for Berlin abroad. Two weeks into the war, the British Expeditionary Force (BEF) had not even completed assembling, and London rejected pleas for the Royal Air Force (RAF) bombing raids against Germany that had been agreed to before the war.

Following the German victory over Poland and the rejection by Britain and France of his terms for peace on a "forgive-and-forget" basis, Adolf Hitler prepared to move west. In late November 1939, he informed his military chiefs that Germany could deal with the Soviet Union only when it was free in the west. Hitler was determined to attack France and Britain "at the earliest moment."

All was then quiet in the west. This period of the war came to be known as the "Sitzkrieg," the "Phony War," and the "Bore War." France carried out a full mobilization, and its forces manned the Maginot Line, but Britain imposed only a partial conscription, and by mid-October it had only four divisions in France. Hardly any air action took place, with both sides reluctant to bomb cities. Bad weather and the pleas of his generals for additional time caused Hitler to postpone the German invasion of France.

The Allies had no wish to take the offensive themselves. The commander of the French Army, General Maurice Gamelin, said, "The first one who comes out his shell will be in peril." Meanwhile, British first lord of the admiralty Winston L. S. Churchill developed a scheme to mine the coastal waters of neutral Norway to deny Germany access to high-grade Swedish iron ore shipped from the port of Narvik. Allied Scandinavian plans, including discussions of sending troops to aid Finland in its war against the Soviet Union, were soon an open secret.

Initially, Hitler had no intention of opening a new front in Northern Europe, for in mid-December he set January 14, 1940, as the start date for the western offensive, which was then postponed again. In February, however, Hitler concluded that the British intended to move against Norway and that Germany would have to move first. The German invasion of Norway began on April 9, 1940, catching the Allies by complete surprise.

The Germans took Denmark in only one day, but Norway proved more difficult to subdue. The Allies landed troops in the north and occupied Narvik, but mounting aircraft losses, the unsatisfactory situation elsewhere in Norway, and the German invasion of France brought evacuation in early June. The Norwegian Campaign badly hurt the German surface navy; it lost 3 cruisers and 10 destroyers, half of its total, but Hitler secured additional food production for the Reich and protection for his northern flank on the Baltic. Most important, the Kriegsmarine (German Navy) secured locations for naval bases nearer to the Allied Atlantic convoy routes. Thus, it could now launch attacks into the North Atlantic and later strike Allied convoys bound for the Soviet Union. But Hitler also suffered the consequences of strategic overreach; by 1944, he had 365,000 of his best troops in Norway, a serious drain on his badly stretched resources.

Hitler's next stroke was the oft-delayed invasion of France and the Low Countries. On January 10, 1940, a German military aircraft was forced to land in Belgium. Its passenger was carrying the operational plans for the German attack in the west. Compromise of this plan led Hitler to abandon it and caused the German invasion to be delayed until May. The old plan would have seen the Germans encountering the best British and French divisions, but the new plan, SICHELSCHNITT (meaning "the cut of the sickle"), shifted the major effort from central Belgium to just north of the Maginot Line.

The northern effort would occur first, drawing the Allies into Belgium. Then the major blow would fall to the south, in the hilly and wooded Ardennes. The Germans planned to cross the Meuse River and crack the French lines at Sedan, then swing northwest to the English Channel and cut off the best British and French divisions in Belgium.

The campaign for France and the Low Countries began on May 10, 1940. The Allies matched the German invading forces on the ground and outnumbered the Germans in tanks. Their problem lay in tactical deployment. The first three French tank divisions did not assemble for training until

January 1940, and the majority of French tanks along the eastern frontier were split into isolated packets as infantry support. The Germans dominated the air, a vital factor in their success, and the Allies were sadly deficient in antiaircraft weapons. Other important factors in the outcome of the campaign included appallingly inadequate senior French military leadership, catastrophic failures in French military intelligence, and the lack of adequate reserves to deal with the German breakthrough.

German airborne forces in the north secured vital bridges and the Belgian bastion of Eben Emael. The Allies followed the German script by pouring their forces into Belgium. On May 13, German forces to the south crossed the Meuse. For all intents and purposes, the struggle for France was over on May 15, when the Germans penetrated the Meuse defenses.

Once the panzer divisions were free, the way was clear to drive to the English Channel and cut off the main Allied armies in Belgium. By May 24, the Germans had captured Boulogne and isolated Calais, forcing the BEF to rely on Dunkerque (Dunkirk) for resupply. Allied forces in Belgium were now cut off from the bulk of the French forces to the south. As British forces withdrew northward to the coast, King Leopold III surrendered his armed forces on May 28, despite promises that his nation would not undertake any such unilateral action. This opened a gap between the BEF left flank and the sea into which the Germans now poured, threatening to cut off the BEF entirely. At this point, Hitler intervened. For five days, he kept the German armored thrust from the south in place, saving the BEF and probably enabling Britain to continue in the war.

Between May 26 and June 4, the British carried out an epic evacuation at Dunkerque. In Operation DYNAMO, they evacuated some 365,000 troops, of whom about 225,000 were British. The BEF was forced to abandon virtually all its equipment in France, but it did extract almost all its remaining personnel. In Britain, the evacuation swept away the “phoniness” of the war, but many Britons were oblivious to the facts that in May 1918 there had been 10 times the number of British divisions in France as in May 1940, that they had left the French in the lurch, or that the French First Army had held the Germans from the beaches and allowed the BEF to escape.

On June 5 after consolidating, the Germans struck south, cutting through French forces and reaching the Seine River west of Paris four days later. Stunned by these developments and unprepared for improvised action, much

of the French army simply disintegrated. On June 13 the government declared Paris an open city to spare it air attack, and the next day German troops took peaceful possession of the French capital.

On June 12, new French Army commander General Maxime Weygand had concluded that the situation was hopeless and so informed the cabinet. Two days earlier, Italian dictator Benito Mussolini, convinced that the war was all but won, had brought his country into the conflict on the German side by invading southeastern France. Thirty-two Italian divisions attacked five French divisions along the Italian border but made little headway.

On June 16, French premier Paul Reynaud was forced to resign, and a majority of the cabinet voted to ask Hitler for terms. The new premier was 84-year-old Marshal Henri Philippe Pétain, a World War I hero who had been brought into the government as deputy premier to bolster French resolve but now favored an immediate armistice. On June 17, the Pétain government opened negotiations with the Germans. Fighting ceased on the battlefields of France on June 25.

France was divided into occupied and unoccupied zones, and its army was reduced to 100,000 officers and men. The navy, almost entirely intact, remained under French control but was to be disarmed in French ports. France also had to pay for the German occupation of three-fifths of its territory.

Paris was included in the German occupation zone, so the new French government established itself at Vichy, in south-central France. Vichy France was frankly totalitarian and, to a considerable degree, collaborationist. Pétain and his advisers believed that Germany had won the war and that, at least for the foreseeable future, France would be under German control.

It took something akin to clairvoyance in the dark days of June 1940 to see a possible Allied victory, but a small number of Frenchmen and Frenchwomen vowed to continue the fight and took the lead in forming resistance groups. In London, on June 18 young General of Brigade Charles de Gaulle, who had been undersecretary of war only a few days before, announced over the British Broadcasting Corporation (BBC) the establishment of the Free French. He soon secured British military assistance and, ultimately, recognition of his government.

Winston Churchill, who had become British prime minister on May 10, feared that the Germans would acquire the French fleet, although the French

government had promised London that it would scuttle its ships rather than see them fall into German hands. This pledge was not sufficient for Churchill, who ordered Operation CATAPULT (June 1940). The British would offer French naval commanders a cruel choice between continuing the fight, disarming in neutral ports, or scuttling their ships.

The British rather easily acquired some 130 French vessels of all types, but at Mers-el-Kébir in Algeria on July 3, there was fighting in which the British sank a number of French ships and killed nearly 1,300 French seamen. Despite this, the French government honored its pledge more than two years later. In November 1942, the Germans tried to seize the bulk of the French Navy—80 ships assembled at Toulon—but the French scuttled 77 of them.

The Germans now dominated the continent. They were emphatically the senior partner in the German-Italian combination, they were on good terms with Francisco Franco in Spain, and the Soviet Union was benevolently neutral. History seemed to repeat itself, for the Germans now controlled almost exactly the same geographic area as had Napoleon, and in 1940, as in 1807, only Great Britain remained at war with the would-be conqueror.

Britain now awaited a German attack. In early June, there was only one properly equipped and trained division to defend the British Isles. BEF equipment abandoned in France included 600 tanks, 1,000 field guns, 500 antiaircraft guns, a vast number of small arms, and half a million tons of stores and ammunition. The fleet was far to the north, away from the Luftwaffe. If German forces could have landed in Britain in the weeks following Dunkerque, there would have been little means of stopping them.

Hitler and his military chiefs, however, were caught off guard by the speed of the French defeat and had no plans for a follow-up invasion of Britain. Not until late July did they begin planning for a descent on England, code-named SEA LION (SEELÖWE).

Following the defeat of France, Hitler had postponed any decision regarding Britain. He hoped and expected that the British people would recognize that Germany had won and agree to a negotiated peace. Some of his generals urged him to strike Britain before it could reorganize and consolidate its strength, but he refused. In early June, the RAF Fighter Command had only about a sixth the number of aircraft that the Germans could send against Britain. Yet when formal orders were issued for Operation

SEA LION, German preparations were halfhearted. In any case, command of the air was the prerequisite for any invasion.

The Battle of Britain raged from July 10 to September 30, 1940. The Germans, however, never achieved their goal of driving the RAF from the skies. Ineffective German leadership, intelligence failures resulting in poor targeting decisions, radar and Ultra in the hands of the British, the lack of a strategic bomber on the German side, superior British pilot and aircraft replacement, and the German concentration on London all contributed to the German defeat.

Finally, on November 1, with the Luftwaffe sustaining prohibitive losses, the Germans shifted to night bombing—what Londoners called "the Blitz." Heavy bombing continued into May 1941. Although savage and relentless, night area bombing had no strategic result. The German air offensive had failed, in what was the first serious German military setback of the war. In mid-October 1940, Operation SEA LION was officially shelved until the spring, when it was postponed indefinitely.

Hitler failed to recognize the need to maintain the pressure on Britain. He could have intensified aircraft and submarine attacks against shipping to the British Isles, which might have brought an eventual British collapse, but his attention was increasingly drawn eastward, to the Soviet Union. The commander of the German Navy, Grand Admiral Erich Raeder, and the commander of the German Air Force, Hermann Göring, both believed that the defeat of Britain would leave Germany in a much stronger position vis-à-vis the Soviet Union.

Hitler contended that the Soviet Union was preparing to attack Germany and that Britain was holding out only because its leaders hoped that Germany and the Soviet Union would go to war. If he could eliminate the Soviet Union, then Britain would capitulate. Hitler lacked patience and failed to understand the limitations of the blitzkrieg in terms of distance and resupply. He also did not appreciate interdiction or an indirect approach. Finally, Hitler was driven by ideological and political factors. In June 1941 after shoring up his Balkan flank, he sent his armies against the Soviet Union.

In December 1941, the United States joined the conflict as an active participant. Hitler and Mussolini then declared war on the United States, resolving a possible strategic dilemma for President Franklin D. Roosevelt concerning the Allied policy of concentrating first on Germany. Soviet leader

Joseph Stalin called for an immediate invasion of Western Europe by British and U.S. ground forces, but it would take many months for the vast U.S. industrial base to shift to war production, for armed forces to be raised and trained, and for the Battle of the Atlantic to be won. In 1942, the U.S. contribution to the war in Europe came in the form of strategic bombing, and there was little of that.

The Americans sought the earliest possible cross-Channel invasion of northern France. U.S. Army chief of staff General George C. Marshall was a strong supporter of an invasion of Northwestern Europe in the fall of 1942. The British were leery, fearful that such a move would lead to a repeat of the situation in northeastern France in World War I. Proof that the Western Allies were not ready to undertake a cross-Channel invasion was provided in Operation JUBILEE, the raid on Dieppe on the coast of Normandy on August 19, 1942. The raid buried the myth that a cross-Channel invasion was feasible in 1942 and cast grave doubts on the Allied plan for a cross-Channel invasion in 1943.

Roosevelt had promised Stalin that the Western Allies would undertake an invasion by the end of 1942 and was determined to honor that pledge. Roosevelt met that commitment with Operation TORCH, the Allied invasion of French North Africa on November 8, 1942. With success there, U.S. military leaders, most notably General George Marshall, attempted to secure British approval for a cross-Channel invasion in 1943. Churchill demurred and convinced Roosevelt to pursue operations in the Mediterranean against Italy. The British leader wanted an Allied concentration in the Mediterranean, which he termed the “soft underbelly of Europe.” The Americans reluctantly agreed to invasions first of Sicily and then of Italy, but they insisted on the cross-Channel invasion of France for the spring of 1944.

The Allies developed precise and elaborate plans for the invasion of Normandy (Operation OVERLORD), which eventually began on June 6, 1944. Prior to the landing, Allied air forces would conduct a massive bombing campaign to isolate the region. The landing itself would be preceded by a night drop of three divisions of paratroops. The next morning, five infantry divisions would go ashore along the 50-mile stretch of coast. Some 10,000 aircraft would secure the skies, while hundreds of ships provided naval support.

Success was probable if the Allies could establish a bridgehead large

enough to build up their strength. Once they broke through the German lines, the Allies would have the whole of France for maneuver because their armies were fully mechanized, and the bulk of the defending German forces were not. Field Marshal Erwin Rommel, who commanded the coastal defenses, believed that the German defense was doomed unless it could destroy the invaders on the beaches.

Hitler did not agree and indeed welcomed the invasion as an opportunity to destroy the British and U.S. forces. In Britain, the Allied armies were immune to attack; in France, they could be destroyed. “Let them come,” he said. “They will get the thrashing of their lives.”

The only possibility of German success was to introduce panzer reserves rapidly, but this was fatally delayed by Allied air superiority and Hitler’s failure to immediately commit resources available elsewhere. Operation FORTITUDE, the Allied deception plan, had convinced Hitler that the Normandy Invasion was a feint and that the main thrust would come in the Pas de Calais sector.

The Allies put ashore 1 million men within a month following D-day, but a great storm severely damaged one of two artificial harbors that had been towed across the Channel. The Germans then turned the French ports into forts, destroying them when they had to surrender. Supply became a major problem and remained so until near the end of the war. The Normandy countryside also proved to be ideal defensive terrain, and not until the end of July were the Allies able to break out in Operation COBRA (July 25–31), when Lieutenant General Omar Bradley’s U.S. First Army forced the German line west of Saint-Lô, with Major General J. Lawton Collins’s VII Corps making the main effort. Lieutenant General George S. Patton Jr. arrived in France on July 6, and two days after the start of COBRA, Bradley ordered him to take command of VIII Corps.

On August 1, the U.S. command was reorganized. Bradley moved up to command the 12th Army Group, Lieutenant General Courtney Hodges assumed command of the First Army, and Patton’s Third Army was activated. In the British zone of operations, General Bernard Montgomery’s mostly British Commonwealth 21st Army Group consisted of Lieutenant General Henry Crerar’s Canadian First Army and Lieutenant General Miles C. Dempsey’s British Second Army. Patton’s Third Army scored the greatest success, although the general was fortunate to arrive in command when the

static warfare of the previous two months had finally passed into the mobile warfare at which he excelled. The weather was also dry, and the flat terrain of northern France was ideal tank country.

Patton took full advantage of the circumstances and was certainly the outstanding general of the campaign for France. The Third Army displayed instant efficiency and soon had parlayed the local breakthrough of COBRA into a theater-wide breakout. The Third Army first turned west to clear out the Brittany peninsula and then, after taking Brest, turned to the east. In a single month, it had liberated most of France north of the Loire River.

Meanwhile, the Allies launched Operation DRAGOON on the Côte d'Azur, near Cannes in southern France, on August 15. The operation had been planned largely to secure the French Mediterranean ports for a rapid Allied buildup in France. Originally code-named ANVIL and planned to coincide with D-day, this effort had to be postponed because of a shortage of landing craft as a consequence of OVERLORD and the British reluctance to divert assets from Italy.

Crossed rifles in the sand serve as a comrade's tribute to this American soldier who died in the Normandy Invasion of June 6, 1944. (National Archives)

On August 15, some 86,000 men went ashore on a 30-mile front 20 miles east of the French naval base of Toulon. German ground forces were thinly spread and inadequate in numbers and resources. Lieutenant General Alexander Patch's Seventh Army ultimately consisted of 10 divisions: 7 U.S. and 3 French. The Allies pushed up the Rhône River Valley. By the time of the linkup with Bradley's 12th Army Group near the Swiss border in the fall of 1944, the southern Allied force had grown into the 6th Army Group of 23 divisions under Lieutenant General Jacob Devers. In Toulon and Marseille, DRAGOON provided him with two large intact French ports that could be used to help supply the expanding Allied buildup in France.

The Allies squandered a golden opportunity. Montgomery was making little progress, while Patton and the Third Army swung wide in an enormous enveloping movement that prevented German forces from consolidating along the Seine. Patton's rapid drive made it possible to trap large numbers of two German field armies, including seven panzer divisions, in the so-called Falaise Pocket. The destruction of these German forces was within Allied reach, but Eisenhower and Bradley did not grasp the significance of the

situation and refused to authorize Patton to span a 15-mile-wide gap between Argentan and Falaise, the former having been assigned as a British objective.

The pocket was finally closed during August, and 60,000 Germans were killed or captured, with substantial amounts of arms and equipment seized, yet some 100,000 Germans escaped during August 13–18. German forces in France now fought their way homeward under Allied pursuit. Paris was liberated on August 25, a task wisely left to the French. By August 31, Patton's Third Army reached the Meuse at Verdun, and the following day it gained the Moselle River. In the north, Montgomery drove into Belgium, all the while complaining of shortages of supplies and fuel and pressing for a single thrust into Germany under his command.

Between the two Allied spearheads, there was little resistance. Facing Patton's six strong divisions were five weak German divisions with few tanks or antitank guns. Opposing the British was the hastily assembled German First Parachute Army, a scratch force of some 18,000 men, boys, and walking wounded. In the sector between Aachen and Metz, the Germans had only eight infantry battalions. On the whole front, the Germans fielded some 100 tanks and 570 aircraft. In tanks and in aircraft, the Allies had a 20-to-1 advantage.

Yet the Allied advance stalled. The supply lines of the Allies were lengthening even as those of the Germans were contracting. The original Allied plan had been to consolidate on the Seine while opening the Brittany ports and establishing a sound logistical base, but that plan had been nullified by their unanticipated rapid advance after the Saint-Lô breakout. Much of the French railroad system had been destroyed by Allied air strikes, and the bulk of the supplies had to move from the Normandy beaches to the front by road.

Despite the best efforts of the Allies, supplies were simply insufficient for the broad-front strategy on which Eisenhower insisted. The supply situation was made worse by the need for essential services in liberated French cities and towns, and there were natural obstacles in the Vosges Mountains, the Ardennes, and the Hürtgen Forest.

By the end of August, the German Army had suffered more casualties than at Stalingrad—losing roughly 500,000 soldiers and 1,600 tanks in what was one of the greatest defeats in the history of warfare. One daring thrust through the north, south, or center might have proved decisive. There were two competing schools of Allied operational strategy: the narrow front and

the broad front. Montgomery and Patton were the two leading proponents of the narrow front, provided that it was for their own forces; Eisenhower wanted the broad front.

Arguing that there were only sufficient resources for one major thrust, Montgomery pressed Eisenhower to halt Patton's Third Army and concentrate resources behind his troops. Montgomery believed that he could make a quick end to the war, and he wanted the British to lead the charge and take Berlin. Patton wanted, above all else, to beat Montgomery to that prize. Eisenhower controlled the flow of supplies and made the ultimate decision for a broad front.

While this discussion was in progress, though, Montgomery missed a chance to shorten the war. British tanks took Brussels on September 3 and Antwerp the next day, so rapidly that the Germans were unable to destroy its port facilities. Only the opening of the 45-mile-long Scheldt estuary stood between the Allies and relief of their growing supply difficulties. But Montgomery preferred to concentrate his troops for a thrust across the Rhine into northern Germany and overlooked the enormous logistical implications of Antwerp. The British were well positioned to take the German Fifteenth Army fleeing northeastward up the coast. An advance of less than 10 miles beyond Antwerp would have sealed off the Walcheren and South Beveland peninsula, but Montgomery halted at Antwerp. Consequently, the Fifteenth Army escaped across the Scheldt at night and then went back into Holland.

Eisenhower now had to decide between concentrating on a narrow front or launching a broad-based attack in which the Allies would attack, regroup, and then attack again. Although Allied headquarters had always known that no major thrust could be made into Germany until Antwerp had been secured as a supply base, Eisenhower allowed Montgomery to ignore opening Antwerp in favor of securing a bridgehead across the Rhine and perhaps ending the war in one bold stroke. Also affecting the plan was pressure to use the airborne divisions that had participated in the Normandy Invasion and were now recuperating in Britain. Unfortunately, Montgomery failed to carry out the detailed staff planning to make the plan work.

The operation was code-named MARKET-GARDEN. MARKET, the airborne segment, involved three paratroop divisions; GARDEN, the ground portion, was centered on the British Second Army. The operation occurred during September 17–26, 1944. The airborne forces were to secure key bridges over

the Maas (Meuse), Waal, and Lek (lower Rhine) Rivers, then the Second Army would race up from Belgium along a 60-mile-long narrow causeway, cross the rivers, and secure Arnhem on the lower Rhine. The plan involved a high degree of risk, but outflanking the Siegfried Line (called the West Wall by the Germans) and gaining entry into northern Germany seemed worth it.

Factors involved in the failure of the operation included the refusal to modify the hastily developed plan, a lack of coordination with the Dutch underground, and the ignoring of Dutch warnings as well as Ultra intercepts and late photographic evidence of the presence of two battle-hardened panzer divisions transferred from the Eastern Front and reconstituting around Arnhem. The operation also suffered from insufficient numbers of men and logistical support. The greatest tactical mistake, however, was to drop the British 1st Airborne Division seven to eight miles from Arnhem, allowing German panzers to isolate it. The operation, which Montgomery later termed "90 percent successful," was in fact a total failure.

By mid-September the Allied opportunity had been lost, and the Germans had recovered sufficiently to slow the advance almost to a standstill. The task of forcing the Germans from the Scheldt fell chiefly to Lieutenant General Guy Simonds's Canadian First Army. This consumed two months of hard fighting. Patton was also held up in bloody fighting before the fortress of Metz (September 19–November 22). With the onset of bad weather, any chance for the Allies to win the war in 1944 was gone.

The Germans not only managed to rebuild their shattered divisions but also transferred new units into the battle so that they actually enjoyed a manpower advantage over the Allied Expeditionary Force, although they were numerically inferior in tanks, artillery, and above all airpower. Between September 12 and December 16, 1944, the U.S. Army suffered one of its worst defeats in the Hürtgen Forest, ideal defensive terrain. The Germans, who were now defending their homeland, resisted with great tenacity.

Hitler now proposed a final offensive in the west. In September 1944, with the Eastern Front static for several months and the Allied offensive in the west gaining ground, he conceived of a sudden offensive to take the Allies by surprise, break their front, and recapture Antwerp. He hoped at least to buy three to four months to deal with the advancing Soviets. Western Front commander Field Marshal Karl Gerd von Rundstedt thought that the plan was unrealistic, as did other high-ranking officers. Hitler refused to change his

mind, though, and substantial German forces were transferred from the Eastern Front for what would be the biggest battle fought on the Western Front in World War II and the largest engagement ever fought by the U.S. Army.

On December 16, the Germans launched their Ardennes Offensive, also known as the Battle of the Bulge. It caught the Western Allies completely by surprise, and bad weather restricted the use of Allied airpower. The German force of divisions pushing against three divisions of Hodges's First Army drove a "bulge" 50 miles deep and 70 miles wide into the American defenses, which gave the engagement its name.

Allied resources diverted to the battle and clearing skies that permitted the intervention of Allied aircraft turned the tide. The battle dragged on until January 16, 1945, and before the Germans could switch resources to the east, the Soviets launched their last great offensive. In effect, the Ardennes Offensive hastened the end of the war. Both sides suffered heavily, but the Western Allies quickly made up their losses, whereas the Germans could not.

Deaf to reason, Hitler categorically forbade retreat. Everything that could be of use to the enemy had to be destroyed. The fate of his people was irrelevant, for he concluded that if the Germans were unable to win, they did not deserve to survive.

On March 7, 1945, U.S. forces captured intact a German bridge across the Rhine at Remagen and immediately put forces across. In the west, the Germans now had fewer than 60 understrength and poorly equipped divisions to oppose 85 well-equipped Allied divisions. With both Patton and Hodges making solid progress, Eisenhower ordered Bradley's 12th Army Group to make the main thrust, pushing through central Germany and ignoring Berlin, on which the Soviets were advancing.

The Ninth Army would encircle the Ruhr while the remainder of Montgomery's 21st Army Group covered Bradley's drive by moving northeast, cutting off German forces in Denmark and Norway. Lieutenant General Jacob Devers's 6th Army Group, meanwhile, provided right-flank security for Bradley, advancing down the Danube to secure the so-called Alpenfestung (literally, Alpine fortress), or National Redoubt. The Ruhr was encircled on April 1. The Seventh Army, in the meantime, took Nuremberg, crossed the Danube, and moved into Austria, joining up in the Brenner Pass with elements of the Fifth Army from Italy. On April 11, the Ninth Army

reached the Elbe near Magdeburg. German resistance now rapidly collapsed. Soviet forces took Berlin, and on May 8 Admiral Karl Dönitz, Hitler's successor, surrendered German forces unconditionally. The war in Europe was over.

Westphal, Siegfried (1902–1982)

German Army general of cavalry. Born in Leipzig, Germany, on March 28, 1902, Siegfried Westphal entered the military as an officer candidate in the 12th Grenadier Regiment in November 1918. He remained in the army after World War I, and in December 1922, he was commissioned as a lieutenant in a cavalry regiment. He attended the Kriegsakademie (War College) and qualified as a General Staff officer.

At the start of World War II, Westphal was operations officer of the 58th Infantry Division. Promoted to lieutenant colonel in 1941, he became operations officer of General Erwin Rommel's Panzerarmee Afrika that November and was promoted to colonel in August 1942 and then, as one of the youngest generals in the German Army, to major general in March 1943. In June, Westphal became chief of staff to Field Marshal Albert Kesselring, commander in chief, south, and as such he played an important role in the Sicily and Italy campaigns. Westphal was promoted to lieutenant general in April 1944.

In September 1944, Westphal became chief of staff to Oberbefehlshaber West (commander in chief, west) Field Marshal Karl Gerd von Rundstedt. He helped plan the German Ardennes Offensive that led to the December 16, 1944–January 25, 1945, Battle of the Bulge. Promoted to general of cavalry in February 1945, Westphal returned to his prior position as chief of staff to Kesselring a month later, a post he retained until the end of the war.

Westphal was hardworking and decisive, and his chiefs had only high praise for his abilities. Westphal rejected all involvement with National Socialism and firmly believed in the separation of politics from the military.

Westphal was captured by Americans in May 1945. He testified for the prosecution at the International Military Tribunals in 1946 and was released in December 1947. Westphal died at Celle, Germany, on July 2, 1982.

West Wall, Advance to the (August 17–September 10, 1944)

Allied pursuit of German forces from the Seine to the German border. The breakout of the Allied armies from the Normandy beachheads in Operation COBRA on July 25, 1944, was followed by a rapid pursuit of the retreating German forces to the Seine River. On August 19, supreme Allied commander General Dwight D. Eisenhower decided to continue the advance east of the Seine, despite growing logistical difficulties.

Allied plans called for the main effort to be made northeast of the Ardennes Forest by Field Marshal Sir Bernard Montgomery's 21st Army Group (Canadian First Army and British Second Army), supported by Lieutenant General Courtney Hodges's U.S. First Army of Lieutenant General Omar Bradley's 12th Army Group. Montgomery's forces were to move northeast from the lower Seine through Liège to cross the Rhine and seize the Ruhr industrial area. Meanwhile, Lieutenant General George S. Patton Jr.'s U.S. Third Army (also part of 12th Army Group) was to make a secondary effort south of the Ardennes and east from the upper Seine across the Moselle between Metz and Nancy and into the Saarland. Intermediate Allied objectives were to clear the English Channel ports; seize the German

V-weapons sites in the Pas de Calais area; liberate northwestern France, Belgium, and Holland; and destroy German forces between the Seine and Germany. The ultimate Allied objectives were a quick crossing of the Rhine and seizure of the Ruhr.

Speed was essential if the Allied forces were to reach the Rhine before the Germans could organize an effective defense of the West Wall, a fortified line on Germany's western border running some 300 miles from Cleves on the Dutch-German border to Basel, Switzerland. Known by the Allies as the Siegfried Line, this barrier consisted of mutually supporting pillboxes, concrete antitank obstacles, and extensive barbed-wire entanglements. Constructed between 1936 and 1938, the West Wall had been neglected after the German victories in 1940, and parts of it had been dismantled to construct the Atlantic Wall.

The general German retreat in the west began on August 17. Leaving behind the garrisons in the channel ports, Field Marshal Walther Model's Army Group B (elements of 46 divisions of the First, Seventh, Fifth Panzer, and Fifteenth Armies) withdrew to the northeast. Closely pursued by the Allies, the retreating German forces conducted an orderly withdrawal but were unable to reestablish a continuous line of defense until they reached the West Wall. By September 10, Army Group B and Army Group G (7 divisions of the Nineteenth Army withdrawing from southern France) had met at the West Wall and formed a continuous front with some 63 understrength divisions spread from the North Sea to Switzerland.

Paris was liberated on August 25, and the Allied pursuit east of the Seine achieved quick success. General Sir Henry Crerar's Canadian First Army advanced up the channel coast, overrunning the German V-weapon sites in the Pas de Calais on September 6 and taking Ostend on September 9. Farther east, General Sir Miles Dempsey's British Second Army rapidly advanced to the Albert Canal between Antwerp and Hasselt, taking Brussels on September 3, Antwerp on September 4, and Ghent on September 5. The Germans retained the Scheldt estuary, however, thus preventing Allied use of the Belgian ports.

On the British right, Hodges's First Army attacked from Melun on August 26 and captured Laon on August 30, Tournai on September 2, and Mons on September 3, taking some 25,000 German prisoners in the so-called Mons Pocket. The First Army then crossed the Meuse on September 4–5,

liberating Liège on September 7 and Luxembourg two days later. By September 10, the First Army was deployed from Hasselt on the Albert Canal through Liège, Verviers, and Malmédy to Luxembourg.

Despite logistical restrictions, Patton's Third Army also made good progress, and by September 1 it had crossed the Meuse between Verdun and Commercy and was in position to attack toward the Moselle and the West Wall between Metz and Nancy when its advance ground to a halt for lack of gasoline and other supplies. On September 2, Alexander Patch's U.S. Seventh Army, advancing northward from southern France, linked up with Allied forces near Lyon, thereby completing the Allied line from the channel to the Swiss border and ending the great pursuit.

The Normandy Invasion and breakout and the subsequent pursuit to the West Wall were costly for both sides. From June 6 to September 11, 1944, the Germans lost about 500,000 men. In the same period, the Allies suffered some 224,000 casualties. The continuation of the Allied drive into Germany would be much slower and even more costly.

Wever, Walter (1887–1936)

German Air Force lieutenant general. Born in Posen, Prussia (today's Poznan, Poland), on November 11, 1887, Walter Wever joined the army as an officer candidate in 1905. He served as platoon leader early in World War I. Promoted to captain in 1915, he was assigned as a staff officer in the Oberste Heeresleitung (German Supreme Command) two years later. Following the war, Wever continued to serve in the Truppenamt, the clandestine German General Staff. In 1933, his name and that of Erich von Manstein were submitted to Hermann Göring to fill the position of chief of the Air Command Office, essentially chief of the Luftwaffe General Staff. Göring selected Wever, who was known for his keen intellect, hard work, and ability to quickly grasp the key concepts of complex problems.

An ardent Nazi, Wever threw himself into his work and became one the architects of the Luftwaffe. He deduced that the Soviet Union was the real enemy and believed that the Luftwaffe would need a long-range bomber to strike Soviet bases and factories. Wever remained the chief advocate of a four-engine, strategic "Ural" bomber. He believed that the other central tasks for the Luftwaffe were achieving air superiority and providing ground support. Toward this end, he set about developing and organizing a balanced air force.

As chief of the newly created Oberkommando der Luftwaffe (Air Force Supreme Command), Wever was constantly visiting units to learn firsthand of their problems. He insisted on flying himself as an example to his subordinates. On June 3, 1936, during a visit to Dresden, Wever's plane crashed on landing and he was killed. With his death, the Luftwaffe lost one of its leading strategic visionaries. His death also brought a shift in Luftwaffe priorities to tactical airpower.

Weygand, Maxime (1867–1965)

French Army general. Born on January 21, 1867, in Brussels, Belgium, Maxime Weygand was probably of distinguished parentage; rumor had it that he was the illegitimate son of Belgian king Leopold II. Weygand arrived in France under mysterious circumstances at age six. He graduated from the French Military Academy of Saint-Cyr in 1887 and from the Cavalry School at Saumur the following year.

During the next two decades, Weygand worked hard and enjoyed rapid promotion. In 1902, he returned to Saumur as an instructor. In 1912, he was promoted to lieutenant colonel and selected to attend the Centre des Hautes Études Militaires (Center for Advanced Military Studies), where he performed brilliantly and caught the attention of the French Army commander, General of Division Joseph Joffre.

In mid-August 1914, Weygand became chief of staff to General Ferdinand Foch's new Ninth Army. He continued as Foch's chief of staff for the next nine years and was the only officer on the general's staff to have his full confidence—the two men were virtually inseparable. At the end of the war, Weygand was a general of division.

In 1920, Foch sent Weygand to head the French military mission to Poland during its war with Russia. Weygand returned to France after the Polish victory and was promoted to lieutenant general. Between 1923 and 1924, he was high commissioner to the Levant. Removed as a "rightist general" after the victory by the Left in the 1924 elections, he next headed the Centre des Hautes Études Militaires.

In January 1930 Weygand succeeded Marshal Henri Philippe Pétain as chief of staff of the French Army. In his new post, Weygand advocated mechanization instead of the construction of the Maginot Line. He managed

to push through the motorization of 7 of the 20 peacetime French divisions and in 1933 secured the creation of light mechanized divisions.

Weygand retired from the army in 1935. Recalled to service four years later on the eve of World War II, he assumed command of French forces in the Middle East. On May 19, 1940, in the midst of the May 10–June 25 Battle for France, Premier Paul Reynaud ordered the 73-year-old Weygand to return to France and replace General Maurice Gamelin as supreme Allied commander in Flanders.

Weygand arrived too late to save France. He failed in his effort to get the British to attack from the north in a joint effort to pinch off the German armored thrust to the sea, the last hope of an Allied victory at that point. Realizing the hopelessness of the French position, he urged the government to capitulate. Following the French surrender on June 22, Weygand was briefly defense minister of Vichy France, in which position he worked to transfer military assets from the occupied zone to the unoccupied zone and to North Africa. Removed from his office on suspicion of being anti-Vichy, he was sent to Algeria. His connections with anti-German forces there brought his forced retirement to Cannes, where he was under constant police surveillance.

French general Maxime Weygand, shown here in 1939. His appointment to command French forces during the 1940 Battle for France came too late to alter the outcome. (Pictorial Parade/Getty Images)

After the November 8, 1942, Anglo-American landings in North Africa, Weygand urged the Vichy regime to break with Germany and join forces with the Allies. That same month, he attempted to fly to North Africa to meet with the Americans, but the Gestapo arrested him and imprisoned him in Germany. Released at the end of the war, Weygand was flown to Paris, where General Charles de Gaulle ordered his arrest as a member of the Vichy government. He was, however, released from prison in 1946 and rehabilitated in 1948. Weygand lived a quiet retirement and wrote many books, including his memoirs. He died in Paris on January 28, 1965.

Weyland, Otto Paul (1902–1979)

U.S. Army Air Forces (later U.S. Air Force) general. Born in Riverside, California, on January 27, 1902, Otto Paul Weyland graduated from Texas A&M University in 1923 with a degree in mechanical engineering and a commission in the U.S. Army Air Corps Reserve. After flight training at Kelly Field, Texas, he served with the 12th Observation Squadron as flight instructor at Kelly Field from 1927 to 1931. Weyland was promoted to first lieutenant in June 1930 and subsequently commanded the 4th Observation Squadron.

Weyland returned to Kelly Field as an instructor in November 1934, becoming chief of the Observation Section in 1935. He was promoted to captain that March. Weyland graduated from the Air Corps Tactical School in 1938 and the Army Command and General Staff School in 1939. That June, he was appointed assistant to the chief of the Aviation Division, National Guard Bureau.

Weyland was promoted to major in March 1940, and while commanding the 16th Pursuit Group in the Panama Canal Zone, he was promoted to lieutenant colonel and made chief of staff of the Sixth Air Force. Promoted to colonel in March 1942, he was appointed deputy director of air support in June at army headquarters in Washington, D.C. In September 1943 he was promoted to brigadier general, and in November he went to Europe to command the 84th Fighter Wing in Britain. In February 1944, Weyland commanded the XIX Tactical Air Command (Ninth Air Force), supporting Lieutenant General George S. Patton's Third Army. Weyland established his

command post next to that of Patton and had his intelligence and operations officers maintain contact with Patton's counterparts, setting new standards for joint service teamwork. Advancing to major general in January 1945, Weyland commanded the Ninth Air Force.

In September 1945, Weyland became deputy commandant of the Army Command and General Staff School. When the U.S. Air Force became a separate service, he was charged with devising plans and operations for this new branch. He was then deputy commandant of the National War College, Washington, D.C. In July 1950, he became commanding general, Tactical Air Command.

At the outset of the Korean War, Weyland was on temporary duty as Far East Air Force (FEAF) vice commander for operations. When FEAF commander General George E. Stratemeyer suffered a heart attack, Weyland —promoted to lieutenant general in April 1951—replaced him in June. He retained that post to the end of the war. Promoted to full general in July 1952, he returned to the United States in 1953 and once again commanded the Tactical Air Command at Langley Air Force Base, Virginia, from 1954 until his retirement in July 1959. He was then a consultant for Douglas Aircraft Corporation and director of a life insurance company. Weyland died in San Antonio, Texas, on September 2, 1979.

White, Isaac Davis (1901–1990)

U.S. Army general. Born in Peterborough, New Hampshire, on March 6, 1901, Isaac Davis White (usually referred to as I. D. White) graduated from

Norwich University in 1922 and was commissioned in the cavalry. As World War II approached, he became an early and influential proponent of the fledgling armored force.

Joining the 2nd Armored Division in January 1942, White first commanded the division's reconnaissance squadron as a major, then served at successively higher levels. He commanded the 67th Armored Regiment in fighting in North Africa, then commanded the 2nd Armored Division's Combat Command B in Sicily (July 9–August 22, 1943) and, as a brigadier general, in the fighting across Europe. During the Battle of Celles the 2nd Armored Division surrounded and destroyed much of the 2nd Panzer Division during December 16, 1944–January 25, 1945, Ardennes Offensive, cutting off the German penetration at its farthest advance. By early 1945, White was a major general in command of the division.

After the war, White commanded the Cavalry School at Fort Riley (1945–1946), the U.S. Constabulary in the Army of Occupation in Germany (1948), and then the Armored Center and School at Fort Knox (1949–1950). An ardent horseman, he also managed the army equestrian team that competed in the 1948 Olympic Games.

During the latter stages of the Korean War in 1952, White took command of X Corps, then returned to command the Fourth Army as a lieutenant general at Fort Sam Houston, Texas. His next assignments were the command of Army Forces, Far East, and the Eighth Army (1955–1957), during which he was promoted to full general. Then, following reorganization in the region, he became commander of U.S. Army, Pacific.

Retiring in 1961, White served as a trustee of Norwich University, as president of the U.S. Armor Association, and as a defense consultant. He died in Hanover, New Hampshire, on June 11, 1990.

White, Thomas Dresser (1901–1965)

U.S. Army Air Forces (later U.S. Air Force) general. Born in Walker, Minnesota, on August 6, 1901, Thomas Dresser White graduated from the U.S. Military Academy at West Point in 1920 and served in the infantry until 1924, when he transferred to aviation. During the 1920s and 1930s, his natural intellect and language skills led to assignments, primarily in attaché positions, including duty in China, the Soviet Union, and Italy. White graduated from the Air Corps Tactical School in 1938, followed by the Army Command and General Staff School. He was then assigned to the Office of the Chief of the Air Corps. In April 1940, White became military attaché in Brazil and was promoted to lieutenant colonel in July 1941.

In March 1942, White returned to the United States to serve on the Third Air Force staff, including duty as its chief of staff as a colonel. He was promoted to brigadier general in November 1942. He was reassigned to the Army Air Forces Headquarters as the assistant chief of staff for intelligence in January 1944 and participated in the planning for the June 6, 1944, Normandy Invasion. In September 1944, White moved to the Southwest Pacific as deputy commander of the Thirteenth Air Force. In this capacity, he participated in the campaigns in New Guinea (March 8, 1942–September 13, 1945) and the Philippines (October 20, 1944–August 15, 1945). In June 1944, White assumed command of the Seventh Air Force, leading operations in Okinawa (March–June) and the Mariana Islands (June–August) and preparing for the planned invasion of Japan.

After the war, White served as chief of staff of the Pacific Air Command and commanded the Fifth Air Force in Japan. He was promoted to major general in November 1946. He returned to Washington, D.C., in October 1948, serving in a series of air staff and joint staff positions, with promotion to lieutenant general in July 1951. He was promoted to full general in June 1953 when he was appointed vice chief of staff of the U.S. Air Force. He served as chief of staff of the air force from July 1957 until his retirement in June 1961. White died in Washington, D.C., on December 22, 1965.

White Rose

German resistance group. At the center of the White Rose group were a brother and sister, Hans and Sophie Scholl (ages 24 and 21 at the time of their deaths). They were both bright and attractive and had been leaders in Nazi youth groups, but they and their friends became disillusioned with the course of events in Germany.

Formed in Munich, the White Rose actually began in the Wehrmacht. Hans was a sergeant in the army, as were others in the conspiratorial group. These young men had served briefly on the Eastern Front and were aware of the full bestiality of the Nazi regime. When they returned to Munich to pursue medical studies at the University of Munich, they decided to act. Most members were in their early 20s. A professor, Kurt Huber, was also associated with the group. The Scholls and their friends refused to remain indifferent to what was happening in the world around them. Hans had not planned to involve his sister, also a student at the university, but she found out about the group's activities and insisted on being included.

The White Rose organization printed a number of carefully worded leaflets attacking the Third Reich and calling for resistance against it. These were circulated around the universities and mailed to prominent individuals in a half dozen cities. In addition, slogans against the regime were painted on walls in Munich. These activities were all the more courageous because they began as a moral protest: in the fall of 1942, Germany was not yet losing the war.

By early 1943, the Geheime Staatspolizei (Gestapo) was closing in on the organization, but Hans Scholl did not seem to notice or care. Most members of the group believed that the end of the war was near. In February, the Gestapo arrested three members of the White Rose. Four days later, they were taken before Roland Freisler, the notorious chief justice of the People's Court for the Reich. There was no trial in any acceptable meaning of the term, and that same day they were condemned and beheaded by guillotine. Soon other members of the group were located, and three of them—including a university professor—were also executed.

The defiant acts of the White Rose hardly disturbed the authority of the Reich. There would eventually be memorials to the Scholls in Germany, but it is doubtful that they would have wanted such recognition or thought it proper. That their actions were not influential was unimportant; what mattered was that they stood up for what they believed. As Sophie Scholl wrote in a letter to a friend, "I think that right and justice are superior to other loyalties."

Whittle, Sir Frank (1907–1996)

British air commodore and aviation engineer. Born on June 1, 1907, at Coventry, England, Frank Whittle entered the Royal Air Force (RAF) in 1923 as a cadet at the RAF College at Cranwell. He graduated from its Air Apprentices Wing in 1926 and from the RAF College, Cranwell, in 1928. He

dreamed of an aircraft able to fly at enormous speed and altitude, and his 1928 senior thesis was on jet propulsion. Whittle qualified as a pilot, and in 1928, he joined a fighter squadron. Three years later, he became a test pilot. Whittle attended both RAF Engineering School and, from 1934 to 1937, Cambridge University.

Although the Air Ministry challenged the idea of jet propulsion as impractical, Whittle persevered and secured a patent for his turbojet engine in 1930. Obtaining a leave of absence from the RAF, he tested his first jet engine on the ground in April 1937, the year after he and his backers formed Power Jets, Ltd. With the beginning of World War II, the British government supported his project.

Whittle's first flight-worthy engine, the W.1, took to the sky in May 1941 powering an experimental Gloster E.28/39 aircraft. This effort led to the twin-engine Gloster Meteor, which first flew in March 1943. The Gloster Meteor ultimately flew at nearly 600 mph and went into service in July 1944, only weeks after the debut of the German Messerschmitt Me-262. The first RAF jet aircraft, the Meteor played a major role in intercepting and downing German V-1s, and several improved Mk III Meteors performed ground-attack missions in Europe in the last weeks of the war. Subsequently, the U.S. Air Force copied Whittle's centrifugal jet engine in the twin-engine Bell P-59A.

In 1948, Whittle was knighted after having retired from the RAF as an air commodore. In 1977, he became a research professor at the U.S. Naval Academy. Whittle died in Baltimore, Maryland, on August 8, 1996.

Wilhelm Gustloff, General von Steuben, and *Goya,* Sinking of

The sinking of three ships evacuating German personnel from the Baltic during January to April 1945 included history's worst maritime disaster. The 25,000-ton *Wilhelm Gustloff* was launched in 1937 as the flagship of Adolf Hitler's "Strength through Joy" movement, which provided low-cost vacations for German workers. The *Wilhelm Gustloff* was employed as a cruise ship until World War II, when it became a floating barracks for German submariners training in the Baltic.

With the advance of the Soviet Army on the Eastern Front, the *Wilhelm Gustloff* was pressed into service to evacuate German personnel from the Baltic. On the night of January 30, 1945, it was sunk in the Baltic Sea by the Soviet submarine *S-13* (commanded by Captain Third Rank Alexander Marinseko). When it went down, the ship was carrying nearly 1,000 submariners and other military personnel, but just before it sailed, it had taken on a large number of refugees, so there were probably more than 8,000 people on board. The ship sank quickly, and only 964 survivors were picked from the sea. Some of these later died of their wounds or exposure, so the total number of people who perished in the tragedy probably exceeds 7,000.

The *Wilhelm Gustloff* was the largest German vessel ever sunk by a Soviet submarine. More people were lost in that ship than in the sinking of either the *Titanic* in 1912 or the *Lusitania* in 1915. On February 10, 1945, the *S-13* sank another German liner—the *General von Steuben*—with 3,000 people on board, including 2,000 wounded German troops. Only 300 of them survived. A third German liner, the *Goya,* with more than 6,000 people on board, most of them wounded German soldiers, was sunk by another Soviet submarine on April 15, and only 183 survived.

Many Germans erroneously believed that the *Wilhelm Gustloff* was marked with red crosses and was a noncombatant. In reality, the ship mounted antiaircraft guns and was transporting naval personnel as well as refugees. It should not have been permitted to sail virtually unescorted. A footnote to its sinking is the speculation that the ship may have been carrying a priceless art treasure—the carved amber panels commissioned by King Frederick I of Prussia in the early 18th century.

The German passenger ship *Wilhelm Gustloff*, shown here in April 1938. As many as 7,000 people aboard, most of them German refugees from the Baltic region, died when the ship was sunk by a Soviet submarine on the night of January 30, 1945. (Topical Press Agency/Getty Images)

The *Wilhelm Gustloff*, *General Steuben*, and *Goya* had been taking part in what was the largest seaborne evacuation in history. The sinking of the three liners, with the loss of more than 15,000 people, obscured the fact that only 1 percent of the refugees the Germans evacuated from the Baltic by sea perished. This operation, carried out from January to May 1945, was the greatest German Navy success of the war and also a personal triumph for Grand Admiral Karl Dönitz, who directed the operation. Despite shortages of fuel and shipping and threats from mines, air attacks, and submarines, the German Navy transported more than 2 million Germans by sea to the west ahead of the advancing Red Army.

Wilhelmina, Queen of the Netherlands (1880–1962)

Monarch of the Netherlands (1890–1948). Born at The Hague on August 31, 1880, Wilhelmina Helena Paulina Maria was the only child of King William III of the Netherlands (1817–1890) and his second wife, Queen Emma of Waldeck-Pyrmont. After William's death on November 21, 1890, Wilhelmina became queen, but Queen Emma acted as regent for her until 1898. Wilhelmina was educated by private tutors. She often toured the Netherlands with her mother so that her subjects would know her before she reached her majority. Wilhelmina married Heinrich Vladimir, the duke of Mecklenburg-Schwerin. They had one daughter, Juliana.

Wilhelmina played an important role in keeping her country neutral during World War I, but maintaining neutrality during World War II proved to be unsuccessful. Germany invaded the Netherlands on May 10, 1940, and it was immediately clear that the country would be defeated. Wilhelmina arranged the evacuation of Crown Princess Juliana and her husband, Prince Bernhard, together with their two infants, Beatrix and Irene, on May 13. The next day, Wilhelmina escaped along with senior members of her government. She established a government-in-exile in London, a step that infuriated Adolf Hitler.

In radio addresses to her people, Wilhelmina justified her flight abroad on the grounds that she needed the freedom to act in the best interests of her country. Her stirring, patriotic radio speeches strengthened the people's resolve over the long period of German occupation. Wilhelmina steadfastly encouraged the Dutch resistance movement and appointed her son-in-law, Prince Bernhard, as its chief. She personally received Netherlanders who reached Britain during the war. In 1942, she visited both Canada and the United States.

Wilhelmina returned to liberated southern Holland on March 13, 1945, where she was welcomed enthusiastically. In September 1948, she abdicated in favor of her daughter, Juliana. Wilhelmina died at Het Loo Palace, Apeldoorn, Holland, on November 28, 1962.

Wilhelmshaven, Raid on (June 11, 1943)

Wilhelmshaven was the first German city attacked in the coordinated American and British bombing known as the Combined Bomber Offensive. Submarine pens, bases, and construction yards were all located at the port of Wilhelmshaven. Destruction of German submarine construction yards was a top priority of the American Eighth Air Force, given the destruction being wrought by the Germans in the Battle of the Atlantic.

The end of the North African Campaign in early 1943 freed resources needed to resume the bomber offensive against Germany, and on June 10, 1943, the Combined Chiefs of Staff issued the Pointblank Directive, which, among other things, called for a united effort to destroy Germany's industrial base. Springing from decisions reached at the January 1943 Casablanca Conference, Pointblank marked the beginning of a coordinated air offensive against major German cities by the U.S. Eighth Air Force, flying precision-bombing missions by day, and the Royal Air Force (RAF) Bomber Command, conducting area bombing missions by night.

The first of these missions was a raid by 252 B-17s of the Eighth Air Force against the German naval yards at Bremen and Wilhelmshaven on June 11, 1943, while the RAF attacked Münster and Düsseldorf. As clouds obscured Bremen, 168 B-17s attacked Wilhelmshaven, and 30 struck the port area of Cuxhaven.

The bombers lacked fighter support because the targets were too distant for the available escorts. Over Wilhelmshaven they encountered flak, which scattered some of the groups. The German fighters waited until the bombers executed their bombing runs, a period when pilots and bombardiers focused on the ground target and not on evasive maneuvers and defensive nose fire.

Employing head-on attacks, notably against the 379th Bomb Group in the "high group" position, the German fighters disrupted the lead bombardiers' efforts. None of the 417 tons of bombs that were dropped hit the primary target. Eight bombers were lost and another 62 damaged.

The Wilhelmshaven raid demonstrated the difficulty of conducting strategic bombing beyond the range of fighter escorts. Nevertheless, the increased coordination by the Allied air forces meant that from that time forward, German cities would be subjected to round-the-clock bombing.

Wilkinson, Theodore Stark "Ping" (1888–1946)

U.S. Navy vice admiral. Born in Annapolis, Maryland, on December 22, 1888, Theodore Stark "Ping" Wilkinson graduated at the top of his class in 1909 from the U.S. Naval Academy at Annapolis. In 1912, he earned an MS degree from George Washington University. He was subsequently awarded the Medal of Honor for U.S. operations at the port of Veracruz, Mexico.

During World War I, Wilkinson served in the Bureau of Ordnance, designing mines and antisubmarine depth charges. Between the wars, Wilkinson, a gunnery specialist, captained a destroyer, was fleet gunnery officer for the Scouting Force, and served in shore assignments as an ordnance officer and secretary to the navy's General Board from 1934 to 1937.

A battleship captain for most of 1941, Wilkinson became director of Naval Intelligence in October of that year. He escaped blame for the December 7, 1941, Pearl Harbor attack because the evaluation and

dissemination of intelligence was another bureau's responsibility, even though his office gathered intelligence information. Promoted to rear admiral in April 1942, Wilkinson took command of Battleship Division 2 that August, and in January 1943, he became deputy commander of the South Pacific Force, under Admiral William F. Halsey. During the Solomon Islands Naval Campaign (August 1942–February 1943), Wilkinson not only solved numerous operational problems but also exercised his considerable diplomatic skills on often-contentious Allied colleagues.

From July 1943 to late 1945, Wilkinson commanded the III Amphibious Force, with headquarters at Guadalcanal. He firmly advocated a leapfrogging strategy of avoiding heavily fortified Japanese-held islands and concentrating on easier targets. Wilkinson successfully organized numerous landings in the Pacific theater, including those at New Georgia (June 1943), Vella Lavella (October 6), and Bougainville (November 1). He was promoted to vice admiral in September 1944 and commanded the Third Amphibious Force during 1944–1945 in landings at Leyte (October 1944) and the Lingayen Gulf (January 1945).

Returning to Washington at the end of the war, Wilkinson became a member of the Joint Chiefs of Staff joint strategic survey committee. He drowned when his automobile accidentally plunged off the car ferry at Norfolk, Virginia, on February 21, 1946.

Willkie, Wendell Lewis (1892–1944)

U.S. industrialist and Republican politician. Born on February 18, 1892, in Elwood, Indiana, Wendell Lewis Willkie earned a law degree from Indiana University in 1916. After serving in the U.S. Army during World War I, he practiced law in Ohio and New York before he became president of the Commonwealth and Southern Utility Company. Willkie left the Democratic Party as a result of New Deal policies and joined the Republicans. As his party's nominee in the 1940 presidential race, he polled more than 22 million votes but lost to incumbent President Franklin D. Roosevelt, who garnered 27 million.

A supporter of Roosevelt's foreign policy, Willkie was offered but refused positions in the cabinet and the War Department. He played an active role, however, in pushing for passage of the Lend-Lease Act, even though most of the Republican Party leadership opposed it. In January 1941, Roosevelt sent Willkie to England on a fact-finding mission. The trip received significant press coverage and helped secure the bill's passage. Willkie also backed Roosevelt's efforts to extend the peacetime draft and repeal the Neutrality Act of 1935. In August 1942, Roosevelt sent Willkie as a special envoy on a 50-day trip to more than a dozen countries on three continents to confirm the U.S. commitment to defeat the Axis powers; the junket was a great success.

Willkie was in great demand as a speaker throughout 1943 and 1944, and his books, *One World* (1943) and *An American Program* (1944), were highly influential. Although popular, he was not among the leaders of the Republican Party and withdrew from the 1944 presidential primary. Willkie died of a massive heart attack in New York City on October 7, 1944.

Willoughby, Charles Adolphe (1892–1972)

U.S. Army general. Born in Heidelberg, Germany, on March 8, 1892, Charles Adolphe Willoughby was of disputed ancestry. He claimed he had a German aristocratic father and an American mother. Educated at the University of Heidelberg in Germany and the Sorbonne in Paris, he immigrated to the United States in 1910. That same year, he enlisted in the U.S. Army as Private Adolphe Weidenbach, rising to sergeant in 1913, and thereafter he enrolled as a senior at Gettysburg College, graduating the next year.

Originally commissioned in the reserves as a major, Willoughby relinquished that rank for a regular army commission as a second lieutenant in 1916, changing his name to Charles Willoughby. He served on the Mexican border and then in France. At the end of World War I, he was a pilot in the Army Air Service, but after the war, he returned to his original branch of infantry.

Willoughby then served successively on the Mexican border, in Puerto Rico, and as military attaché in Venezuela, Colombia, and Ecuador. He graduated from the Infantry School at Fort Benning, Georgia, in 1929 and the Command and General Staff School at Fort Leavenworth, Kansas, in 1931. He also managed to find time to write a history of the Infantry School, a study of U.S. participation in World War I, and a biography of Simon Bolivar.

Willoughby met General Douglas MacArthur in the mid-1930s at Fort Leavenworth, and in 1940 the general arranged for his assignment to the Philippines. MacArthur appointed Willoughby as his chief of military intelligence in August 1941. When the Philippines fell to Japan in the spring of 1942, the two men escaped together to Australia. Willoughby remained with MacArthur throughout the war and was promoted to brigadier general and then to major general.

Historians have not been kind to Willoughby. One noted that a contemporary stated that he had "the best hindsight of any intelligence officer in the army." Many of his intelligence coups were based on the U.S. success in breaking the Japanese codes, and he had a habit of ignoring information that did not accord with his preconceived view of situations.

After the war, Willoughby remained with MacArthur in the occupation of Japan. He was much criticized for failing to provide warning of the June 1950 North Korean invasion of South Korea, although he did apparently send reports to Washington regarding a possible North Korean invasion of South Korea in the spring of 1950. Certainly he grossly overestimated the ability of the South Korean forces and underestimated that of the North Koreans. He also misread the intentions of the Chinese regarding intervention in the Korean War and their initial military strength in North Korea.

Following MacArthur's recall in April 1951, Willoughby also retired from the military. He then became editor of the *Foreign Intelligence Digest* and wrote a laudatory study of MacArthur. Willoughby died in Naples, Florida, on October 26, 1972.

Wilson, Henry Maitland (1881–1964)

British Army field marshal. Born in Stowlangtoft Hall, Suffolk, England, on September 5, 1881, Henry Maitland Wilson was educated both at Eton, where he acquired the nickname "Jumbo" for his impressive frame, and at the Royal Military College, Sandhurst, where he was commissioned in 1901. He then saw military action in the South African War (Second Boer War, 1899–1902). Promoted to captain in April 1908, he was appointed adjutant of the Oxford University Officer Training Corps in October 1911. In October 1914, he was appointed brigade major of the 48th Infantry Brigade. Wilson served with his unit on the Western Front in World War I, winning the Distinguished Service Order.

In January 1919, Wilson was promoted to brevet lieutenant colonel and attended the Staff College, Camberley. Between 1920 and 1923, he was a company commander at Sandhurst. He next commanded a battalion of the Rifle Brigade in India. In 1930, Wilson was promoted to colonel and appointed a senior instructor at the Staff College. He then commanded the 6th Rifle Brigade. After being promoted to major general in 1935, Wilson went on half pay until August 1937, when he took command of the 2nd Division at Aldershot.

In June 1939, Wilson was promoted to lieutenant general and assigned to command the British Army of the Nile in Egypt. As such, he oversaw the 1940 campaign of Lieutenant General Richard O'Connor against Marshal Rodolfo Graziani's Italian forces in Egypt and Libya. Following the British victories against the Italians in Libya, Wilson became military governor of Cyrenaica in February 1941. The next month, however, he assumed command of the four-division Allied force sent to Greece. His skill in the delaying action and retreat that ensued did much to reduce losses and allowed the Royal Navy to extricate most of the expeditionary force.

In May 1941, General Archibald Wavell, commander in chief of British forces in the Middle East, appointed Wilson to command British troops in Palestine and Transjordan. With a two-division force, Wilson quelled a pro-German coup in Iraq that same month, and in June he launched a campaign against Vichy French forces in Syria. In July, he concluded the armistice that gave the Allies control of Syria and Lebanon.

Wilson then commanded the Persia-Iraq theater and the Ninth Army before succeeding General Harold Alexander as commander in chief, Middle East, in January 1943, conducting an operation against the Dodecanese Islands. In January 1944, Wilson replaced General Dwight D. Eisenhower as commander in chief of the Mediterranean theater and thus had overall responsibility for Allied operations in Italy. Wilson also helped plan the landing at Anzio (January 22, 1944) and Operation DRAGOON, the Allied landing in southern France (August 15, 1944).

After the death of General Sir John Dill in November, Wilson was promoted to field marshal in January and dispatched to Washington as head of the British Joint Staff Mission. In this capacity, he attended the final wartime conferences at Yalta (February 4–11, 1945) and Potsdam (July 17–August 2). Elevated to the peerage in 1946 as First Baron Wilson of Libya and Stowlangtoft, Wilson retired from the army in April 1947 and wrote his memoirs. He died in the Chilterns (Aylesbury), England, on December 31, 1964.

Winant, John Gilbert (1889–1947)

U.S. Republican Party politician, federal government official, and ambassador to Great Britain (1941–1946). John Gilbert Winant was born on February 23, 1889, in New York City and graduated from Princeton University in 1912. After teaching school, in 1916 he was elected to the New Hampshire House of Representatives; the following year he enlisted in the military and saw action as a captain and pilot in France. In 1919, Winant returned to his former teaching position, and in 1920 he was elected to the New Hampshire Senate.

A progressive Republican who supported many of President Franklin Roosevelt's New Deal programs, Winant was the first person to serve more than one term as New Hampshire's governor—a testament to his popularity. In 1935, Roosevelt selected Winant to be the first administrator of the new Social Security Administration, a post he held until 1937. From 1939 until 1941, Winant headed the International Labor Office in Geneva.

In January 1941, Winant became U.S. ambassador to Great Britain, arguably the most important American diplomatic post overseas. Winant was immediately faced with distrust by many in Britain because of his predecessor's stormy and unpopular tenure. Indeed, Joseph P. Kennedy, who had resigned under great pressure in November 1940, had made numerous alarming and impolitic statements concerning Great Britain and World War II. Winant made it clear—from the start—that he disagreed vociferously with Kennedy's defeatism. Winant was soon embraced by Britons, including the royal family. Prime Minister Winston L. S. Churchill and Winant became close personal and political allies, and Winant helped facilitate the extraordinary wartime relationship between Churchill and Roosevelt. At the same time, Winant was engaged in a long affair with Sarah Churchill, the prime minister's second daughter.

Winant remained in London until 1946, at which time President Harry S. Truman appointed him to be America's representative to the United Nations Educational, Scientific and Cultural Organization (UNESCO). Winant, however, had hoped to become secretary-general of the United Nations and remained on the job for only a few months before writing a book about his experiences titled *Letter from Grosvenor Square*. Exhausted and distraught over the abrupt end of his relationship with Sarah Churchill, Winant

committed suicide at his home in Concord, New Hampshire, on November 3, 1947.

Wingate, Orde Charles (1903–1944)

British Army general. Born in Nainital, India, on February 26, 1903, Orde Charles Wingate was educated at Charterhouse School and the Royal Military Academy, Woolwich, from which he was commissioned in the Royal Artillery in 1923. In 1927 he was posted to Khartoum, where he served with the Sudan Defence Force until 1933.

In 1936, Wingate was sent to Palestine, then in the throes of the Arab Revolt. Despite his Arabist training and the pro-Arab sentiment of Palestine's British rulers, Captain Win-gate became a fanatical Zionist and by 1938 had secured official permission to organize the Special Night Squads, joint Anglo-Jewish units that conducted small-unit operations against Arab terrorists. In 1939, however, his extreme views led to his transfer back to England.

The following year, Wingate went to the Sudan to help organize the effort to drive the Italians from Ethiopia and restore Haile Selassie to his throne. The troops Wingate raised, the Gideon Force, ultimately played a key role in achieving success in ousting the Italians and restoring Haile Selassie, and he and the emperor entered Addis Ababa on May 4, 1941. But Wingate's outspokenness angered his superiors. Exhausted, ill with malaria, and probably suffering from depression, Wingate attempted suicide in June 1941.

In early 1942, Sir Archibald Wavell, who had high regard for Wingate's abilities, requested his transfer to the Far East. In India, Wingate raised the Chindits, an irregular force designed for operations in the enemy rear in Burma. The first Chindit operation, from February to April 1943, was conducted by a brigade-sized force. It achieved limited success but raised morale in a theater that had seen only Japanese victories to that point.

British Army general Orde Wingate, one of the most unorthodox British officers of modern times and a staunch proponent of guerrilla warfare. (Popperfoto/Getty Images)

Wingate, now a major general, secured the personal support of Prime Minister Winston L. S. Churchill for further operations. The second Chindit operation, conducted by three brigades and supported by an American air contingent ran from March to July 1944, but its results were also mixed, in part because of Wingate's untimely death in a plane crash on March 24, 1944, near Imphal in India.

Winkelman, Henri Gerard (1876–1952)

Netherlands Army general and commander of Dutch forces at the onset of World War II. Born at Maastricht, the Netherlands, on August 17, 1876, Henri Gerard Winkelman was appointed a cadet at the Royal Military Academy in 1892. In 1894, he joined the infantry in the Netherlands. Two years later, he was promoted to second lieutenant and assigned to the 4th Infantry Regiment. Between 1902 and 1905, he studied at the Advanced Military Academy.

In 1913 Winkelman was promoted to captain and in 1923 to major. From 1909 to 1913 and from 1917 to 1924, he served with the General Staff of the Ministry of Defense. By 1931, he was chief of staff of the field army. That same year, Winkelman was promoted to major general and took command of the 4th Military Division.

In 1934 Winkelman retired, but with a German invasion impending and on the mobilization of Dutch forces, he was recalled into active service in 1939 and appointed commander of Dutch air defenses. On February 6, 1940, Winkelman was also made commander of the army and navy. On May 10, German forces invaded the Netherlands. It was clear that Dutch forces could not long resist, and with the departure of Queen Wilhelmina and her ministers to Britain, Winkelman became the highest authority on Dutch territory. The government empowered him to capitulate at what he judged to be the proper time. On May 15, Winkelman signed the instruments of surrender at Rijsoord. He then oversaw the demobilization of the Dutch Army.

In July 1940, Winkelman was deported to Germany as a prisoner of war, where he remained until the end of the war. On May 12, 1945, he returned to the Netherlands, and he formally retired from the army in October. In 1946, he served as a military councilor in the Special Court of Annulment. Winkelman died in Soesterberg, the Netherlands, on December 27, 1952.

Wisborg, Count of

See Bernadotte, Folke

Witzleben, Erwin von (1881–1944)

German field marshal. Born in Breslau, Silesia (now Wrocław, Poland), on December 4, 1881, Erwin von Witzleben joined the German Army in 1901 as a lieutenant. He spent much of World War I on the Western Front, where he was decorated for valor. After the war, he rose steadily in rank and responsibility.

When Adolf Hitler came to power in 1933, Witzleben was named to command the Berlin Military Area. He was promoted to major general in

February 1934 and to lieutenant general that December. In 1935, he took command of III Corps. He was promoted to general of infantry in October 1936.

Witzleben became an opponent of Hitler as early as 1934 and an active conspirator in 1938 as a result of Hitler's purge of senior generals and threat of war against Czechoslovakia. Witzleben commanded Army Group C in the September 1939 Polish Campaign. Promoted to colonel general that November, he commanded the First Army in the 1940 Campaign for France. On July 19, 1940, Hitler promoted him to field marshal, and until March 1941, Witzleben commanded Army Group D. He then became oberbefehlshaber West (commander in chief, west) in France, but his attitude toward Hitler became known. In March 1942 Witzleben went on medical leave for an operation, and Hitler used this as an excuse to assign him to the Führer Reserve on March 21. Witzleben was never reassigned to an active position.

The bomb plot to assassinate Hitler was to be carried out on July 20, 1944, with Witzleben assuming the position of commander in chief of the armed forces thereafter. Witzleben dallied, however; when the plot failed, he was arrested and tried for treason by the Nazi People's Court. As the principal army officer among the accused, Witzleben was treated with special ridicule. Condemned to death on August 8, 1944, he was strangled with piano wire that same day.

Wöhler, Otto (1894–1987)

German Army general of infantry. Born on July 12, 1894, in Grossburgwedel, Germany, Otto Wöhler entered the army in January 1913. He served in World War I, ending the war as a staff officer. In 1938, he was sent to Vienna as a staff officer of the newly established 5th Army Group, commanded by Colonel General Wilhelm List.

In December 1939 Wöhler, then a colonel, was appointed chief of staff of XVII Corps. In early 1942, he was transferred to the Eleventh Army as chief of staff to Field Marshal Erich von Manstein. In April 1942, Wöhler became chief of staff of Army Group Center, commanded by Field Marshal Günther von Kluge.

Wöhler assumed command of a corps under General of Panzer Troops Werner Kempf in April 1943. That August, Manstein relieved Kempf and placed Wöhler in command of Armeeabteilung Kempf (Army Department Kempf), a group of divisions in the Ukraine that were later redesignated the Eighth Army of Army Group South. Charged with the defense of Kharkov, Wöhler cited shortages of artillery ammunition and overextended lines and pulled the Eighth Army out of Kharkov. On August 25, 1943, two divisions of the Eighth Army launched a successful counterattack against the Red Army, stabilizing the German lines.

On December 23, 1944, Wöhler replaced Colonel General Johannes Friessner as commander of Army Group South, giving him command over much of the Hungarian front. Wöhler's immediate concern was preventing the Soviet encirclement and capture of Budapest. He proposed defending the city from the west bank of the Danube River. Adolf Hitler overruled this plan and ordered Budapest held in its entirety. Wöhler was able to withdraw some of the Eighth Army before the city was encircled and eventually taken.

Wöhler commanded the last major German counteroffensive of the war, code-named FRÜHLINGSERWACHEN (AWAKENING SPRING) (March 6–16, 1945). This operation called for the Sixth Panzer Army to attack and push the Soviets away from the Nagykanizsa oil fields in Hungary. The assault was doomed because of inadequate supplies and overwhelming Soviet numbers. Soon after this failure, Wöhler was forced to retreat from Hungary into Austria, prompting Hitler to relieve him from command on April 7, 1945.

In 1948, Wöhler was tried by the American Military Tribunal for war crimes committed by his subordinates while he was chief of staff of the Eleventh Army. Found guilty, he was sentenced to eight years in prison but

was released in the autumn of 1951. Wöhler died in 1987 in Grossburgwedel, West Germany.

Wolff, Karl Friedrich Otto (1900–1984)

German Schutzstaffel (SS) Obergruppenführer and Waffen-SS general. Born in Darmstadt, Germany, on May 13, 1900, Karl Friedrich Otto Wolff joined the army in 1917 during World War I. After the war, he formed his own advertising company but went bankrupt in 1931. That same year, he joined the Nazi Party and the SS. In June 1933, SS chief Heinrich Himmler appointed Wolff as his adjutant. Three years later, Wolff became chief of Himmler's personal staff, a position of immense influence, as he determined who had access to Himmler.

In the summer of 1939, Wolff began working at Adolf Hitler's headquarters as Himmler's representative. Wolff served as an intermediary between the SS and the state administration. Easing administrative friction caused by the Endlösung, or "Final Solution" (the Holocaust), was one of his primary tasks. Wolff secured transport to deport millions of Jews to the death camps.

On January 30, 1942, Wolff was promoted to SS-Obergruppenführer and general of the Waffen-SS but, isolated in Hitler's headquarters, he lost control of Himmler's entourage. In September 1943, he became the highest

SS and police official in Italy. In charge of fighting the Italian Resistance, he was therefore responsible for the massacres of civilians.

By early 1945, Wolff became convinced that the war was lost, and he made contact with the Allies. He signed a treaty of unconditional surrender at the Italian front on May 2, 1945, one week before the general capitulation. Arrested after the war and charged with minor crimes, he was sentenced to four years but spent only a week in prison. Recent scholarship has suggested that Allied intelligence personnel—particularly those from the United States—may have prevented Wolff from being indicted on major charges, including war crimes and crimes against humanity.

Wolff was working as a businessman in Köln (Cologne) when new evidence against him emerged. In 1962, he was arrested and charged with committing genocide. Found guilty in 1964, he was sentenced to 15 years in prison but released in 1971. Wolff died in Rosenheim, Bavaria, Germany, on July 15, 1984.

Wolf Pack Tactic

German submarine tactic involving coordinated attacks against Allied convoys. The Battle for the Atlantic hinged on the Allied ability to produce sufficient ship tonnage to move supplies and matériel to strategic points, whereas the Germans sought to sink as much of that tonnage in as short a time as possible. Early in the war, German U-boats operated mostly as lone raiders, partly because of the small numbers available for operations. To counter the U-boats, the Allies turned to convoys with armed escorts for

protection, causing the U-boats to focus on evasive tactics to survive rather than sinking merchant tonnage.

Rear Admiral Karl Dönitz, commander of the German submarine force, recognized that unless the U-boats could overcome the defenses of Allied merchant convoys, the tonnage war would inevitably be lost. His solution was a concept that came to be called *Rudeltaktik*, or wolf pack attack—a method for U-boats to penetrate a convoy's antisubmarine defenses and destroy the merchant ships. Once a U-boat located an Allied convoy, other submarines would be vectored to that location. Groups of U-boats would then attack on the surface at night at relatively high speeds, maximizing the effect. U-boats operated in a hit-and-run manner, launching their attack and then fleeing on the surface before the convoy's surface escorts could react.

Dönitz's intelligence staff also broke the British convoy codes and was able to supply specific information concerning departure and arrival schedules, escort strength, and weather reports from all ocean areas. Success in the intelligence war was critical in locating targets for U-boat concentrations.

By late 1942, Dönitz had more than 200 operational U-boats with which to implement wolf pack operations. Some Italian submarines also participated. A wolf pack generally consisted of 6 to 9 U-boats, but some utilized as many as 20 to 30. Wolf packs were identified with code names, such as Löwenherz (Lion Heart) or Streitaxt (Battle Axe), giving the submariners a sense of cohesion and collective focus for the operation. Each pack deployed into a concave patrol line with about 10 miles between each pack member.

Using darkness, the U-boats would operate on the surface to lessen the effectiveness of the Anti-Submarine Detection Investigating Committee of the British Naval Staff with asdic (early sonar), and the compact silhouette of the U-boat helped provide camouflage. The patrol line combed the Atlantic in an eastern or western direction while under control by radio from Dönitz's command post at Lorient, France.

When an individual submarine sighted a convoy, its crew would immediately radio the convoy's position and course to Dönitz's headquarters, which would then relay orders for the pack to concentrate the line on the projected course of the convoy. The U-boat that originally established contact would shadow the convoy at a safe distance and keep headquarters advised of

any change in the convoy's course. When at least three U-boats came in contact with the convoy, the attack began, and Dönitz turned immediate control of the battle over to the individual U-boat commanders.

The wolf pack had little opportunity to cooperate tactically, as Allied radio detection prohibited communications between individual boats. The multiboat attack would confuse and disrupt the escorts, however, thereby improving each boat's chance of gaining an effective position from which to launch an attack. The U-boats would fire a salvo of three or four torpedoes along several paths to increase the chances of a hit. Because the convoy formed a compact target, a single salvo might result in several hits on different ships within the formation. After their attacks, the U-boats submerged to escape counterattack.

Unless the convoy managed to elude the wolf pack by a radical change of course, the merchant ships might be hounded by the pack over several successive nights. The action would be broken off only when the U-boats had exhausted their torpedoes or the convoy reached a point where continuous air cover could be provided. These tactics resulted in the sinking of almost 400,000 tons of Allied shipping per month during late 1942, with a peak occurring in November, when 118 ships were sunk for a total of 743,321 tons.

Radio communications between the U-boats and Dönitz's headquarters, however, were the Achilles' heel of the wolf packs. The Allies introduced high-frequency direction-finding equipment in faster Allied escort vessels to drive away the shadowing U-boat, forcing it to submerge or destroying it with depth charges or air attack. Allied technical superiority, the use of long-range aircraft, and code breaking culminated in May 1943, when the Allies destroyed over 40 German submarines. "Black May" signaled the defeat of the wolf packs as the ratio of Allied tonnage produced to tonnage sunk by the U-boats tipped against the Germans.

During World War II, more than 130 wolf packs operated against Allied shipping, sinking more than 2,759 Allied merchant ships and 138 warships and killing almost 60,000 seamen. Of the 1,170 U-boats Dönitz employed throughout the war, 753 were lost, along with some 29,000 crewmen.

Women in World War II

In spite of a wealth of new scholarship on women and World War II, the contributions and experiences of women remain understudied and undervalued. Perhaps this reflects the fact that the number of women who enlisted during the war was relatively small in comparison to men, military historians (predominantly male) tend to focus on combat units, little attention has been given to the role of women on the home front or in resistance movements, and the inclination of many writers is to suggest that women who engaged directly in combat were so rare that their wartime experiences can be dismissed as peripheral.

Specialists in the field have argued against each of these trends, and as their work continues, we may yet reach a point when the contributions of women are consistently woven into accounts of every aspect of World War II. Until then, however, we are left primarily with overviews and with the knowledge that historians have a great deal more to do before women are accorded a balanced and proper place in accounts of World War II.

The best place to begin a summary of women's experiences during the war is on the home front, where women served as traditional guardians of the family and culture in every country and in a wide variety of nontraditional roles created in the crucible of war. In Allied countries, millions of women worked as volunteers for government agencies and distributed ration books, assisted with salvage projects, joined blood and scrap drives, planted victory gardens, served in the Civil Air Patrol, sold war bonds, or worked as air raid wardens and ambulance drivers. In the United States, many of the more than 36 million Americans who joined the Red Cross and the over 5 million who served as volunteers were women. The Red Cross employed 6,500 women in

the United States by 1945 and thousands more in Australia, Canada, and the United Kingdom.

Women also played a key role in the United Service Organizations (USO), which operated over 3,000 clubs worldwide that catered to the social and entertainment needs of Allied soldiers. The USO included 1.5 million volunteers, most of whom were women, and more than 7,000 performers, who conducted 428,521 performances by 1947.

Alice McLean's American Women's Voluntary Services (AWVS) also served a vital support role, training 18,000 women to drive ambulances, give first aid, and set up field kitchens. Between 1940 and 1945, the AWVS carried out relief work at military bases and shoveled snow during winter months to free soldiers for training. Similar services were performed in Britain by the Navy, Army, and Air Force Institute (NAAFI) and the Entertainment National Service Association (ENSA), both of which included a high percentage of women workers and volunteers, and other organizations such as the Young Women's Christian Association (YWCA) and a wide array of religious groups.

In government, women conducted much of the official business and administrative details in the United States, Great Britain, and the Soviet Union. They worked in such agencies as the U.S. Office of War Information, which produced propaganda and translated enemy broadcasts and publications.

The Allies also recruited women for industrial work. In Britain, where more than half the population served in the armed forces or in key war industries (5 million in uniform and 21 million in agriculture or manufacturing), women represented 38 percent of the workforce by 1945. More than 6 million women took jobs in war-related industries in the United States, and they proved especially adept at aircraft construction and welding. They were generally superior to men in repetitive skilled jobs such as riveting and parachute construction, and they were encouraged to work by government advertising campaigns that urged them to support their loved ones at the front by working at home for victory. In the Soviet Union, 1 million women worked in industrial jobs by December 1941, and before the war ended, they constituted 55 percent of the overall civilian workforce. By 1945, women constituted 92 percent of the agricultural workforce.

In most countries, women struggled with housing shortages, sexism, and

lower wages than men. Women in the United States suffered from a lack of any national service legislation that might have organized their wartime contributions at home and provided child care. Two-thirds of American men stayed at home during World War II—a great many of them working in war-related industries—and millions of women remained homemakers, but few men saw the need to help provide child care for the women the government was encouraging to take war-related jobs. Instead, many people criticized women who left their children at home while they worked and lambasted the decay of the traditional family under the exigencies of war.

In contrast, Great Britain passed a law in December 1941 that required unmarried young women to enlist in war work of some kind. The British proved much more adept at organizing women for war. At least 125,000 women were drafted and given a choice of service (which was denied to drafted men) in auxiliary units, civil defense, or the Women's Land Army (WLA), and eventually more than 470,000 women served in the armed forces or uniformed auxiliary units; another 80,000 joined the WLA and worked in agriculture to release men for war services between 1939 and 1945.

Efforts to recruit women were much weaker in Germany, Italy, and Japan, where more conservative cultures and racial ideology emphasized the importance of women as homemakers and the primary transmitters of culture. Still, large numbers of German, Italian, and Japanese women worked in war-related industries. Young single German girls had to work as nurses, on farms, or as domestics for terms ranging between 6 and 12 months. By the end of the war, 1.5 million German women had entered the workforce, along with another 1.5 million foreign women brought into Germany to toil in forced-labor camps. Efforts to mobilize women in Japan were delayed until the war was clearly being lost, but more than 1.5 million Japanese women took jobs outside the home by 1945.

In occupied countries, women were less likely to be involved in industrial labor, but they were vulnerable to detention in labor, concentration, or death camps and exposed to sexual exploitation, in addition to food and housing shortages. Millions died during the Holocaust, and many women were raped by soldiers in China, the Soviet Union, Germany, and other countries as the fortunes of war changed. Thousands more were compelled by some occupying armies or by economic need to become prostitutes, and although accurate statistics are difficult to determine, it is known that the Japanese forced 200,000 *ianfu* (comfort women) from Korea, China, the Philippines, and Malaya to serve as prostitutes for their soldiers. Following the Allied invasion of Italy, for example, an estimated 42,000 prostitutes were working the streets of Naples in 1944, and almost all of them catered to soldiers.

It will never be known how many millions more were compelled by circumstance to sell themselves or become virtual concubines for their captors or liberators, but it is certain that those who lived in countries that changed hands were vulnerable to charges of treason. French women suspected of overfamiliarity with German forces had their heads shaved after

their liberation, and the Soviets called women suspected of collaboration "German bed straw" and sent them to the gulags.

Women in occupied countries and Great Britain were also subjected to blackouts and bombardment. Of the estimated 1.3 million civilian casualties of strategic bombing in Germany, Japan, and the United Kingdom during the war, more than half were women, a ratio that almost certainly holds true for the 15 million to 25 million Soviet and 20 million Chinese civilians who died as well. These figures reflect both the higher ratio of women in cities where the male population had been reduced by conscription and the danger faced by civilians generally. Significantly, more civilians died in Britain between 1939 and 1941 (approximately 45,000) than members of the British armed forces, and in countries that saw strategic bombing longer than Britain (Germany and Japan, in particular), civilians were killed in staggering numbers as the war progressed.

Beyond the home front, all the major combatants in World War II utilized female nurses, and all except Japan made use of uniformed women's auxiliaries to help support their war machines and to free men for combat. These units were typically distinguished by military branch and performed virtually all noncombatant roles, and most were patterned after those formed by the British in the early years of the war. Women eventually composed more than 10 percent of the British armed forces, a ratio over five times higher than that in the United States.

By 1943, the British were utilizing 7.75 million women in private industry or in the military. The Women's Voluntary Service for Civil Defense (WVS) enlisted more than 1 million women to help clear rubble, organize relief shelters, and fight fires, and more than 470,000 other women served as nurses, while 2 million worked in munitions; some 400,000 served full- or part-time in the Home Guard or the Royal Observer Corps. More than 207,000 women in the Auxiliary Territorial Service (ATS) supported the British Army, including 57,000 who served in the Anti-Aircraft Command as spotters, searchlight operators, and radar technicians. In the Air Transport Auxiliary (ATA), women pilots from all over the Commonwealth and the world ferried aircraft between bases and from factories to the front; 15 of them died in the line of duty.

In Canada, 45,000 women served in the Women's Division of the Royal Canadian Air Force, the Canadian Women's Army, or the Women's Royal

Canadian Naval Service. Similarly in Australia, 64,833 women served in various military auxiliaries.

Even occupied countries with governments-in-exile followed the British example, as in the case of Poland. The Poles formed the Pomocnicza Lotnicza Służba Kobiet (Auxiliary Air Force, PLSK) in 1942, and as many as 1,653 officers and enlisted women joined up to support Polish Air Force units in the field by performing noncombatant office, supply, and repair duties.

Women in the United States responded in similar fashion, forming the Women Accepted for Voluntary Emergency Service (WAVES), the Women Airforce Service Pilots (WASPs), the Women's Army Corps (WAC), the women's Coast Guard arm known as the SPARS (from the Coast Guard motto "Semper Paratus," or "always ready"), and the Women Marines. The WAVES organization was formed in 1942 as part of the U.S. Naval Reserve and trained women for a wide array of technical and support specialties. At its height, the WAVES numbered 8,000 officers and 76,000 enlisted women, most of whom were stationed in the continental United States—equivalent to the manpower of an entire carrier task force. The WASPs were formed in 1943 by combining the Women's Auxiliary Ferrying Squadron (WAFS) and the Women's Flying Training Detachment (WFTS). They served with, but not as a part of, the U.S. Army Air Forces (AAF).

WASP pilots ferried military aircraft from factories to bases and filled aviation support roles stateside. The number of WASPs eventually peaked at 1,074, but despite an outstanding record that included 12,650 ferrying missions in 27 different types of aircraft, they were disbanded late in 1944 because of protests from Congress and from male pilots who feared competition with women during and after the war.

In contrast to the WASPs, the WAC (which began as the Women's Army Auxiliary Corps) existed from 1942 to 1978 and served during World War II as a separate corps of women that performed all levels of support work for the army, including military intelligence and air-traffic control. WACs were eventually stationed at more than 225 bases worldwide, and 150,000 of them (including 6,500 African Americans) served in every theater of the war by 1945. These were the first American military women to formally serve apart from nurses, and they amassed 3 Air Medals, 16 Purple Hearts, 10 Soldiers' Medals, and 565 Bronze Stars.

More than 32,000 WACs served with the AAF in 200 enlisted and 60

officer specialties; 7,530 WACs were deployed to Europe, and 5,500 went to the Southwest Pacific. Their record of success led U.S. Army leaders to ask Congress to make the WAC permanent in 1946. Women's units were rounded out by the SPARs, which enlisted almost 11,000 women to help free men for sea duty with the Coast Guard, and the Women Marines, the last women's reserve unit formed by the U.S. armed forces.

U.S. Marine Corps commandant Thomas Holcomb opposed enlisting women for a long time, but when he relented, he insisted on giving them the title "Women Marines" and making them a regular part of the corps. By 1945, 800 officers and 14,000 enlisted Women Marines were in uniform, and their service freed enough men from support duty to form the 5th Marine Division. All told, more than 350,000 U.S. women served in uniform, including over 74,000 army and navy nurses, a handful of whom were captured by the Japanese and became prisoners of war.

Four American women pilots, graduates of the four-engine school at Lockbourne Field, Ohio, walking past a Boeing B-17 Flying Fortress in 1944. The Women's Air Force Service Pilots (WASP) division was a noncombat organization but performed a vital wartime function in the transport of aircraft. (U.S. Air Force)

Neither Germany nor Japan utilized auxiliaries or military women to the same extent as the Allies, but a number of women and organizations still played an important part in the war. In Germany, Hanna Reitsch flew helicopters, gliders, an experimental version of the V-1 rocket, the Me-163 Komet rocket plane, and bombers as a test pilot for the Luftwaffe; in addition, she landed a light plane in the streets of Berlin during a mission to Adolf Hitler's underground bunker during the final days of the war. Melitta Schenk von Stauffenberg also flew as a test pilot and won the Iron Cross Second Class and the Gold Pilot badge before being shot down by a U.S. fighter in April 1945. The largest number of German women (100,000) served in Luftwaffe flak (antiaircraft) units from 1944 onward, and a handful joined SS units and guarded women at concentration and death camps. A small number of those guards were executed after the war. In Japan, the most important mobilization of women was conducted by the Greater Japan's Women's Association, which trained volunteers for civil defense and military training.

Although most countries took steps to limit the participation of women in combat, the Soviet Union (as in World War I) broke with broad cultural convention by placing them in or near the front lines. More than 800,000 women served in the Soviet Army, including approximately 400,000 in the Air Defense Forces and another 400,000 in ground units. Air Defense women began in traditional support roles, and eventually a small number served in combat with both single-sex and integrated units by 1945.

Women manned thousands of antiaircraft batteries, completely replaced men in barrage balloon units, and manned searchlights throughout the war. On the ground, women served in tank and artillery crews, as mechanics and cooks, and in medical or headquarters units on all fronts. The most famous women were those who fought as snipers or as fighter and light bomber pilots, including Lidiya V. Litviak, who racked up 11 individual kills, 3 group kills, and 1 balloon kill prior to being shot down in August 1943. The first female ace in history, she fought with integrated units.

Among Soviet women snipers, the most famous was Lyudmila Mikhailovna Pavlichenko, who is credited with 309 kills; wounded four times, she became the first Soviet citizen to visit the White House. She eventually visited 43 U.S. cities as well as Britain and Canada, then returned home and became a master sniper instructor and trained 80 snipers who were

collectively credited with killing more than 2,000 Germans. Her expertise encouraged the Soviets to form the Central Women's School for Sniper Training in 1943, and by the end of the war, 1,885 snipers had graduated and claimed 11,280 German kills. Pavlichenko was ultimately named a Hero of the Soviet Union, an honor shared by 94 other Soviet women who fought during World War II.

Alongside the Soviets, liberated or exiled Poles formed the Emilia Plater Independent Women's Battalion in 1943, and between 8,000 and 14,000 women fought with Polish armies under Soviet command.

Although the Western powers were unwilling to follow the Soviet example, they did enlist women for espionage operations. The most important of these missions were conducted by the British Special Operations Executive (SOE) and the U.S. Office of Strategic Services (OSS). At least 50 women were dropped into occupied France to work with Resistance forces, and others worked with intelligence agencies such as the British MI-6. One of the most legendary was the American Amy Thorpe, who worked for both MI-6 and the OSS. Among other activities, she secured both Italian naval and Vichy French ciphers, leading the MI-6 chief of station in Washington to say she had saved at least 100,000 lives.

Thorpe survived the war, but a number of OSS and SOE women did not, including Noor Inayat Khan, an SOE operative killed in 1944 at Dachau, who was posthumously awarded the British George Cross and the Croix de Guerre with Gold Star. Other famous female operatives include Virginia Hall and Jeanette Guyot, who received Distinguished Service Crosses for their work with the OSS, and Violette Szabo, an SOE operative who was arrested in France and executed by the Germans on February 5, 1945. She was posthumously awarded the Croix de Guerre and the George Cross.

Women also fought behind the lines as members of the resistance in occupied countries. Women composed 12 to 20 percent of the French Resistance; many performed support work by decoding messages, serving as couriers, and operating Resistance newspapers. Others fought directly against the Germans, utilizing assassination, bombing, and sabotage to support the Allied war effort. As in most cultures, their ability to fight was limited by men, though communist cells often gave women more latitude to engage in direct combat. Famed female Resistance fighters include Lucie Samuel, who was awarded the Croix de Guerre; Marie-Madeleine Fourcade, who led a

Resistance network of more than 3,000 people; and Georgette “Claude” Gerard, who led more than 5,000 men and women in the Forces Françaises de l’Intérieur (French Forces of the Interior, FFI), better known as the Maquis. The number of women who served in the Resistance is difficult to determine with any precision, but the French government did recognize more than 200,000 women after the war for their service.

In Poland, Resistance leaders formed the Armia Krajowa (Home Army), and one-seventh of its members were women. They served as couriers and medics and in some specialized units, including one designed for fighting in the Warsaw sewers during the uprising of 1944. Women also served in the resistance forces of all other occupied countries, including Belgium, the Netherlands, Norway, and Denmark. More than 20 percent of the 150,000 people in Allied intelligence networks in Western Europe were women, and they helped rescue 5,000 Allied airmen and 1,600 other soldiers. Women were especially valuable in this role because couples were far less suspicious when traveling than men walking alone. These women also assisted with the June 6, 1944, Normandy Invasion, and they paid a high price when they were captured. Between 200 and 300 French women are known to have been executed by the Germans, and 8,500 were sent to the infamous female concentration camp at Ravensbrück. Only 400 survived.

In the Soviet Union, an estimated 200,000 women fought with the partisans, and in Italy, 35,000 women (one-third of the Resistance) fought against the Germans in support roles or in small squads. Some were members of the all-female Novella Albertazzi, and by the end of the war, 5,000 women had been imprisoned by the Germans; 3,000 were deported to Germany, and at least 650 died in combat or were executed.

Mussolini’s Italian Social Republic (Repubblica Sociale Italiana, RSI) also recruited women support units. In the Balkans, women fought with the Greek Resistance in large numbers, and about 100,000 served with the Yugoslav National Liberation Army under Josip Broz (Tito). They trained and fought in integrated units, and the death rate for women was 25 percent, twice that of the men.

This litany of sacrifice and service is hardly complete, for it omits the thousands of women who were taken prisoner by the Japanese when Singapore fell and the thousands more who experienced some aspect of the war in Africa, the Middle East, Burma, and Indonesia. It also neglects the

handful of women captured when Japanese forces seized or sank civilian ships in the opening days of the war and the women on Soviet and Scandinavian merchant ships who helped fight the Battle of the Atlantic. These and other women remain largely unknown to history, and until their stories are told, our knowledge of World War II will remain incomplete.

What we can determine at this juncture is that virtually all women who served in the war were demobilized in 1945 and encouraged to go home. They had confounded social and military expectations of the prewar years, which made no allowances for the importance of women to national war efforts, and in many ways, their societies were ungrateful for their service. France (in 1944) and Italy (in 1946) extended suffrage to women as a reward for their sacrifices, but other gains were few and far between. Most men and many women wanted to return to traditional roles, and in the rush toward peace, many valiant women were slighted. They were not eligible for the Victoria Cross, were banned from some Italian Resistance group parades, and were denied admittance into the American Veterans of Foreign Wars. Some women found their wartime experiences such a social liability that they hid them for the rest of their lives, much to the dismay of historians.

We are left today with the discomfiting knowledge that male-dominated political systems created World War II and that the vital contributions of women during the war were forgotten by most men afterward. Although much has improved over recent decades in terms of our knowledge and our appreciation, much work remains to be done. After all, the victors of the war were those countries that most successfully mobilized their women.

Wood, Edward Frederick Lindley (1881–1959)

British statesman. Born at Powderham Castle, Devonshire, England, on April 16, 1881, Edward Frederick Lindley Wood graduated from Oxford University in 1903 and entered Parliament in 1910. His career was undistinguished until 1925, when he was appointed viceroy of India and given the title Baron Irwin. Convinced that India must eventually have Dominion status, Irwin was also determined to maintain civil order. His conversations with Indian nationalists offended much of British opinion, and his forceful administration alienated most Indians. In 1931, he returned to England.

Irwin became Viscount Halifax in 1934, and for five months in 1935 he served as British secretary for war. On Anthony Eden's resignation in February 1938, Prime Minister Neville Chamberlain appointed Halifax foreign secretary. By then, Halifax had ample opportunity to observe Britain's military weakness, and a semiofficial visit to Germany in late 1937 exposed him to that country's military and territorial aspirations. He believed,

however, that Adolf Hitler's regime would negotiate sincerely, if aggressively, and that, in any event, British and French obstruction of German aims in Central Europe was impracticable.

Halifax's willingness to appease German demands weakened after Germany occupied the Czechoslovak rump state in March 1939. His readiness to guarantee Polish sovereignty and support British rearmament exempted him from much of the condemnation that later fell on Chamberlain. Some, including King George VI, preferred Halifax above Winston L. S. Churchill to succeed Chamberlain as prime minister in May 1940, a prospect that horrified Halifax himself. He remained foreign secretary until December 1940, when Churchill persuaded him to become the British ambassador to the United States.

In Washington, strong isolationism confronted Halifax until the December 7, 1941, Japanese attack on Pearl Harbor. Despite Halifax's friendships with President Franklin D. Roosevelt and members of Roosevelt's circle, his ambassadorial role was eclipsed by the far more powerful relationship between Roosevelt and Churchill. Serving until May 1946, Halifax participated in the conferences that established the United Nations, and he worked alongside John Maynard Keynes to negotiate a U.S. loan to Britain after the Lend-Lease program ceased in 1945.

In retirement, Halifax, a devout Anglo-Catholic, dedicated himself to his lifelong avocations of church work, scholarship, hunting, and estate management. He died at Garrowby, Yorkshire, England, on December 23, 1959.

Xi’an Incident (December 12, 1936)

Coup d’état staged by two Chinese Nationalist (Guomindang, GMD) generals against their leader, resulting in united war resistance against Japan. The undeclared Sino-Japanese War began after the Mukden (Shenyang) Incident of September 1931 in Liaoning, one of the three northeastern provinces that comprised Manchuria; the other two were Jilin (Kirin) and Heilongjiang (Heilungkiang). Preoccupied with exterminating the Chinese Communists in order to consolidate his rule over the whole country, Jiang Jieshi (Chiang Kaishek), the president of China, devised the policy of “internal pacification before resistance against external aggression,” which frustrated many Nationalist Chinese, including some of his military generals.

By the end of 1935, Jiang’s lack of resistance enabled the Japanese to occupy Manchuria and Rehe (Jehol), an old province made up of parts of today’s northeast Hebei (Hopeh), southwest Liaoning, and southeast Inner Mongolia. The Japanese were about to advance into Chaha’er (Chahar, an old province west of Rehe comprising the northern part of today’s Hebei) and Suiyuan (a defunct province west of Chaha’er comprising the central part of current Inner Mongolia). Under steadily mounting pressure, Jiang stubbornly refused to declare war on Japan. This stance led some leaders to conclude that coercion was the only way to force him to reverse his stance, precipitating the Xi’an (Sian) Incident of December 1936 in Shaanxi (Shensi) Province.

On December 4, 1936, Jiang flew to Xi’an to discuss with Zhang Xueliang (Chang Hsüeh-liang) and Yang Hucheng (Yang Hu-ch’eng), commanders of the Northeastern and Northwestern Armies, respectively, the last “extermination campaign” against the Chinese Communists, who had settled in Yan’an (Yenan), north of Xi’an, a year earlier after the 1934–1935 Long March. Zhang seized this opportunity to try to persuade Jiang to cooperate with the Chinese Communists in a united front against the Japanese. Unable to convince Jiang, Zhang and Yang decided to stage a coup.

In the early morning of December 12, Zhang marched his army to Lintong (Lin-t'ung), west of Xi'an, where Jiang's villa was located, and kidnapped Jiang, while Yang seized all Jiang's establishments and personnel in Xi'an.

Zhang took Jiang back to Xi'an, where he was held in detention, then invited the Chinese Communists to visit to negotiate for a united front against the Japanese. The Chinese Communist delegation included Zhou Enlai (Chou En-lai), Li Kenong (Li K'o-nung), and Ye Jianying (Yeh Chien-ying). Madam Jiang Soong Meiling traveled from Nanjing (Nanking), Jiangsu (Kiangsu) Province, to represent her husband in negotiations with Zhou. Their discussion was based on Zhang's proposal for ending the civil war and forming a united front to resist the Japanese invasion, to which Jiang finally gave his verbal agreement on Christmas Eve. On December 25 Jiang was released, and he flew back to Nanjing, immediately beginning work on a united front for the forthcoming Sino-Japanese War.

Zhang, who accompanied Jiang back to Nanjing, was arrested by Jiang's agents, tried on charges of insubordination, and sentenced by a military court to a 10-year prison term. On January 4, 1937, Jiang granted him amnesty and placed him under the National Military Council's close surveillance, a face-saving measure. The next day, Jiang relieved Yang all of his military posts and still held him in detention at year's end. The sacrifice of the individuals involved in the coup was widely appreciated as a pivotal point in the bitter anti-Japanese resistance effort of the Chinese.

Xu Xiangqian (1901–1990)

Chinese Communist general. Born in Wutai (Wut'ai), Shanxi (Shansi) Province, China, on November 8, 1901, Xu Xiangqian (Hsu Hsung-ch'ien) became a teacher. He went to Guangzhou (Canton), Guangdong (Kwangtung) Province, in 1924, where he joined the Nationalist Party—the Guomindang (Kuomintang, GMD)—and enrolled at the newly opened Huangpu (Whampoa) Military Academy, commanded by Jiang Jieshi (Chiang Kai-shek). After graduation in 1925, Xu took part in the First Eastern Expedition against Guangdong warlord Chen Jiongming (Ch'en Chiung-ming) and was sent to Henan (Honan) as a political worker in the GMD's National Revolutionary Army as a result of an agreement between the GMD and warlord Feng Yuxiang (Feng Yü-hsiang). Xu campaigned in several northern China provinces against warlords Zhang Zuolin (Chang Tso-lin) and Yan Xishan (Yen Hsi-shan). Because of illness, Xu joined the Northern Expedition belatedly in the fall of 1926; he soon became an instructor at the Central Political and Military Academy. There, he joined the Chinese Communist Party (CCP).

After the split between the GMD and the CCP (1927), the party assigned Xu to work in the labor movement in Quangzhou. When the Quangzhou Commune was destroyed and driven from the city, Xu was among those who created the ill-fated 4th Division of the Red Army, which was annihilated in the GMD assault on the Hailufeng (Hai-lu-feng) soviet in early 1928. Xu fled to Shanghai and then to a Communist guerrilla base in Hubei. He was one of the earliest Communist military men to arrive at the base, which was soon to grow into the Eyuwan (O-yü-wan) soviet along the borders of Hubei, Henan, and Anhui (Anhwei) Provinces and came to be second only to the base formed by Zhu De (Chu Te) and Mao Zedong (Mao Tse-tung) in Jiangxi (Kiangsi).

In the face of Jiang's "extermination campaigns," Xu's Fourth Front Red Army reeled across western China until it arrived in north Shaanxi (Shensi) in mid-1937, just before the Sino-Japanese War began. The Communists immediately reorganized its units into the Eighth Route Army. In the spring of 1938, Xu advanced into south Hebei (Hopeh), where he established contact with Communist guerrillas and opened communications with anti-Japanese forces in Shandong (Shantung). The following year, Xu was sent

into Shandong to coordinate the activities of several guerrilla units, which became known as the First Column.

Because of poor health, Xu left the front lines in 1941 and for the next year was without an assignment. From 1942 to 1946, he was in Yan'an (Yenan) in Shaanxi as a deputy commander. He is also reported to have been president of the Anti-Japanese Military and Political Academy in 1945.

During the Chinese Civil War, Xu led Communist forces in combat against GMD troops in Shanxi. As commander of the First Army Group of the North China Military Region, he scored a notable victory at Taiyuan over the forces of General Yan Xishan and several thousand Japanese "volunteers." Chronic ill health sidelined him again for the next several years, but during the 1950s and 1960s he reemerged as a prominent political figure and was named among the 10 marshals of the People's Republic in 1955. Xu retired in 1985 and died in Beijing on September 21, 1990.

Yahara Hiromichi (1902–1981)

Japanese Army colonel. Born in Tottori Prefecture, Japan, on October 2, 1902, Yahara Hiromichi graduated from the Japanese Military Academy in 1923 and was commissioned in the infantry. Six years later, he graduated from the Army War College. Yahara served in the Personnel Bureau of the War Ministry twice: from 1930 to 1933 and from 1935 to 1937. He was a resident officer in the United States between 1933 and 1935 and was three times an instructor at the Japanese War College: in 1937, from 1938 to 1940, and again from 1942 to 1944.

Unlike many Japanese Army officers, Yahara had the reputation of being realistic in his appraisals. During the 1937–1945 Second Sino-Japanese War, he served on the staff of the newly established Second Army Headquarters and then in the Fifth Army Headquarters. Yahara was engaged in offensive operations in northern and central China between 1937 and 1938. Assigned to Supreme Headquarters in Tokyo, he secretly traveled in Thailand and Malaya to gather military intelligence. He then served successively in the Operations Section of Supreme Headquarters in Tokyo, was assistant attaché in Thailand, and served on the staff in Fifteenth Army Headquarters in 1941.

At the beginning of the Pacific war, Yahara was engaged in operations to seize Burma during 1941 and 1942. From 1942 to 1944, he taught at the War College. Promoted to colonel in 1943, he was appointed to the staff of the Thirty-Second Army on Okinawa in 1944. Yahara carefully planned a protracted defensive strategy for the island to secure time for the Japanese to prepare the home islands for invasion. His plan of operations was duly approved by the headquarters of the Tenth Area Army on Taiwan, which had overall control of Okinawa. It was also approved by the commander of the Thirty-Second Army on Okinawa, Lieutenant General Ushijima Mitsuru, and by his chief of staff, Lieutenant General Cho Isamu.

Soon after U.S. forces landed on Okinawa on April 1, 1945, however, certain elements of the Supreme Army Headquarters, the Tenth Area Army, the Eighth Air Division (kamikazes), and the Grand Fleet all urged that the Thirty-Second Army mount a general offensive and retake airfields lost to the Americans. In spite of Yahara's objections, Ushijima then ordered costly counterattacks, which were unsuccessful and had the effect of accelerating the Japanese defeat. Although pockets of resistance remained, the Americans declared Okinawa secure on June 21. It seems certain that the defense of Okinawa would have lasted longer had Yahara's plan of defending and making the Americans pay for every bit of ground been followed.

Yahara was taken prisoner during the Okinawa engagement, and after the war, he published an account of the battle. He also entered private business. Yahara died in Kanagawa Prefecture, Japan, on May 7, 1981.

Yalta Conference (February 4–11, 1945)

In January 1944, the Allied powers' European Advisory Commission on Germany began meeting in London. It was decided that Germany's postwar government would be an Allied control council in Berlin, composed of commanders of the occupying forces of the various powers. But the commission members needed clarification from the Allied leaders on other matters. Between August and October 1944, delegates at the Dumbarton Oaks Conference in Washington worked to draft proposals for a postwar United Nations international organization. They too needed to decide several issues. To resolve these and other matters, a second and last meeting of the Big Three—British prime minister Winston L. S. Churchill, U.S. president

Franklin D. Roosevelt, and Soviet leader Joseph Stalin—and their staffs (some 700 people in all) occurred from February 4 to 11, 1945, in the Soviet Union at Yalta in the Crimea.

The meeting at Yalta (code-named Argonaut) was less significant than either its detractors or supporters have alleged. Many of the decisions confirmed there had already been taken during the earlier 1943 Tehran Conference and other meetings. At the time, its outcome generated considerable satisfaction. Only with the developing Cold War during the late 1940s and the realization that Soviet help had not been necessary in the Pacific war did Yalta became such a fractious issue in U.S. politics, with Republican Party leaders charging that there had been a Democratic Party "giveaway" to the communists.

The bargaining position of the Western leaders had not appreciably improved since the Tehran Conference. Indeed, they had just suffered the humiliation of the initial German successes in the December 16, 1944–January 25, 1945, Ardennes Offensive (Battle of the Bulge). The Red Army, by contrast, had smashed German Army Group Center and was then only 50 miles from Berlin.

Another factor at Yalta was Roosevelt's determination to draw Stalin "out of his shell" and bring the Soviet Union into postwar cooperation with the Western powers. Convinced that Stalin was "getatable," Roosevelt continued the conciliatory tactical approach he had employed at the Tehran Conference by making every effort to accommodate the Soviet leader. It did not enhance the Western bargaining position when Roosevelt announced that U.S. troops were unlikely to remain long in Europe. He also continued his practice of distancing himself from Churchill, most notably on colonial issues. Another factor at work was that Roosevelt and the United States had chosen to seek the speediest possible conclusion to the war with the least expenditure of American lives rather than wage the war for certain geopolitical objectives, as Churchill had preferred.

Stalin, however, knew exactly what he wanted. After World War I, the Western Allies had sought to construct a cordon sanitaire (protective barrier) to contain Bolshevism. Stalin's goal was now the reverse—he wanted a belt of East European satellite states to exclude the West. This arrangement was to provide security against another German invasion; insulate the Soviet orbit from Western political, economic, and cultural influences; and protect a

severely wounded Soviet Union, which had suffered the deaths of as many as 27 million citizens and terrible material losses.

Roosevelt secured Soviet agreement to the Declaration on Liberated Europe. The leaders pledged that the provisional governments of liberated areas would be "representative of all democratic elements" and that there would be "free elections … responsive to the will of the people." But events would prove that such lofty phrases were subject to completely different interpretations.

In discussions on Germany, the Big Three agreed to government by an Allied control council. German occupation zones were also set, and at the suggestion of the Western leaders, France was allowed a zone, although Stalin insisted that it be carved from territory already assigned to Britain and the United States. The three leaders also agreed on steps to demilitarize Germany, dissolve the National Socialist Party, and punish war criminals. Further, in what would later be regarded as a controversial decision, they agreed that all nationals accused of being "deserters or traitors" were to be returned to their countries of origin.

The Soviets insisted on exacting heavy reparations from Germany for damages inflicted by that nation on the Soviet Union. The Western Allies, remembering the trouble caused by reparations after World War I and fearful that they would be subsidizing Soviet exactions, refused to set a specific amount but tentatively agreed to discuss the sum of $20 billion. The Soviet Union was to receive half of any reparations.

Particularly important to Roosevelt was the establishment of a postwar United Nations organization. Well aware of this and not greatly interested in the organization himself, Stalin used it to secure concessions on other matters. The Big Three adopted recommendations from the Dumbarton Oaks Conference that the United Nations be organized on the lines of the old League of Nations, complete with the General Assembly, Security Council, and Secretariat. The Big Three also set the composition of the Security Council. Roosevelt agreed that the Soviet Union might have three votes in the General Assembly. The most difficult matter to resolve was that of the veto in the Security Council. This became an issue in U.S. politics later, when the Soviet Union exercised that privilege so liberally. The U.S. Senate would not have approved American participation without the veto provision, however.

British prime minister Winston L. S. Churchill (left), U.S. President Franklin D. Roosevelt (center), and Soviet premier Josef Stalin (right) at the Yalta Conference during February 4–11, 1945. (National Archives)

The disposition of Poland was an especially vexing matter for the Western leaders, but the Red Army already occupied the country. Regarding boundaries, Stalin demanded and succeeded in establishing the Curzon Line, with slight modifications, as Poland's eastern border. The Allies were more strenuous in objecting to the Oder-Neisse Line as Poland's western boundary, and there was no agreement on this matter at Yalta. Regarding the Polish government, Moscow only a month before Yalta had recognized the Lublin Poles as the official government of Poland. Stalin agreed to broaden this puppet government on a "democratic basis," and he pledged to hold "free and unfettered elections as soon as possible on the basis of universal suffrage and secret ballot." The Western Allies secured the same concessions for Yugoslavia, Romania, and Bulgaria.

Perhaps the most controversial decisions taken at Yalta concerned the Far East. These decisions were kept secret from China. Stalin had already made it clear that the Soviet Union would enter the war against Japan sometime after the defeat of Germany. This matter was, in fact, never in doubt. The problem lay in the timing. Here, Stalin was in the same position enjoyed by the Allies before the invasion of northern France. Tardy Soviet entry into the Pacific

war might mean heavy U.S. casualties in an invasion of the Japanese home islands. No one knew whether the atomic bomb would work and, even if it did, whether it would be decisive in bringing about Japan's defeat.

Stalin pledged to enter the war against Japan "two or three months" after the defeat of Germany. In return, the Soviet Union would receive South Sakhalin Island, concessions in the port of Dairen, the return of Port Arthur as a naval base, control over railroads leading to these ports, and the Kurile Islands (which had never been Russian territory). Outer Mongolia would continue to be independent of China, but China would regain sovereignty over Manchuria. In effect, these concessions would replace Japanese imperialism with that of the Soviet Union, but the Western leaders believed they were necessary to secure the timing of the Soviet entry into the Pacific war. In future years, what Americans disliked most about Yalta was that these concessions turned out to be unnecessary.

Yamada Otozō (1881–1965)

Japanese Army general. Born in Nagano Prefecture, Japan, on November 6, 1881, Yamada Otozō graduated from the Japanese Military Academy as a cavalry officer in 1902. In 1904, he participated in the Russo-Japanese War. He graduated from the Military Staff College in 1912 and then served on the army General Staff. From 1914 to 1922, he was an instructor at the Cavalry Command. Between 1922 and 1926 Yamada commanded a cavalry regiment, and he was promoted to colonel in 1925. From 1926 to 1927, he was chief of staff of Japanese forces in Korea.

Yamada commanded the 4th Cavalry Brigade between 1931 and 1935. He was promoted to major general in 1934. He was then chief of the Third Department and chief of the General Affairs of the army General Staff. In 1935, Yamada also became a director of the Military Staff College. In 1937, he took command of the 12th Division in Manchuria. A year later he was appointed to command the Third Army and then the Central China Area Army during the 1937–1945 Second Sino-Japanese War. In 1939, he became director of the Education Department of the War Ministry; he was promoted to full general the following year.

In July 1944, Yamada assumed command of the Guandong (Kwantung) Army in Manchuria. As the American offensive in the Pacific placed Japan under increasing pressure, the Guandong Army lost 20 ground divisions and 2 air divisions, all transferred to the Pacific theater and the Japanese home islands between February 1944 and March 1945. Yamada recruited 75,000 Japanese civilians living in Manchuria to supplement his military forces, but their training and equipment were both deficient.

Following the Soviet invasion of Manchuria on August 9, 1945, Yamada surrendered his forces on the order of the Japanese government. The Soviets did not accept a cease-fire until September 5, however. Before the cease-fire, about 60,000 Japanese had been killed in combat, and 185,000 Japanese were killed or died in Manchuria after the cease-fire. Arrested by the Soviets after his surrender, Yamada was sentenced to 25 years of imprisonment at hard labor. He was released in 1956. Yamada died in Tokyo on July 18, 1965.

Yamaguchi Tamon (1892–1942)

Japanese vice admiral. Born in Shimane Prefecture, Japan, on August 17, 1892, Yamaguchi Tamon graduated from the Japanese Naval Academy in 1912. Trained as a torpedo officer, he was promoted to senior lieutenant in 1918. He was then assigned to assist in the effort to return to Japan the submarines that formed part of the German reparations in 1919.

Yamaguchi attended Princeton University in the United States between 1921 and 1923 and then graduated from the Naval Staff College in 1924. He next served on the Naval General Staff. Promoted to commander in 1928, he was a member of the Japanese delegation to the 1929–1930 London Naval Disarmament Conference.

Yamaguchi was promoted to captain in 1932 and served as naval attaché in the United States between 1934 and 1937. Thereafter, he commanded the battleship *Ise* and the First Combined Air Fleet in China, engaged in air operations over China. Promoted to rear admiral in 1940, Yamaguchi assumed command of Carrier Division 2, composed of the aircraft carriers *Hiryū* and *Sōryū*. A close confidant of Admiral Yamamoto Isoroku, Yamaguchi was an outspoken supporter of Yamamoto's plan to attack Pearl Harbor (December 7, 1941) and, later, his plan to confront American naval forces at Midway (June 3–6, 1942).

Yamaguchi and the cautious Vice Admiral Nagumo Chūichi were often at odds. During the Japanese attack on Pearl Harbor, Yamaguchi urged Nagumo to make follow-up strikes on Pearl Harbor facilities and to destroy the U.S. carriers absent on December 7, 1941, but Nagumo refused. In early 1942, Yamaguchi took part in actions against the British in the Indian Ocean.

Yamaguchi and his carriers next participated in the Battle of Midway. Again, he and Nagumo disagreed on tactics. Yamaguchi stressed the necessity for the Japanese to strike first, and on the sighting of the U.S. carriers, he urged that the Japanese launch an immediate dive-bomber attack without the torpedo bombers, but Nagumo refused. Nagumo's decisions left his carriers vulnerable, and three of the four were sunk by U.S. Navy dive-bombers. With his own carrier *Akagi* sinking, Nagumo transferred command of air operations to Yamaguchi.

Yamaguchi launched attacks against what he thought were two different U.S. carriers; actually, there was only one, the *Yorktown*. Although Yamaguchi lost 24 aircraft, his attacking planes badly damaged the *Yorktown*, and it was later sunk by a Japanese submarine. As Yamaguchi prepared a third strike that evening, U.S. dive-bombers from the carriers *Enterprise* and *Yorktown* mortally damaged the *Hiryū*. Yamaguchi assumed blame for the loss of his ship and refused to leave it. His staff tried to dissuade him, but Yamaguchi rejected their appeals. The 800 survivors then abandoned ship, and *Hiryū* was scuttled, sinking on June 5. Yamaguchi was last seen reciting poetry and sipping tea.

Yamamoto Isoroku (1884–1943)

Japanese Navy marshal admiral. Born in Nagaoka, Honshu, Japan, on April 4, 1884, Yamamoto Isoroku was the biological son of the former samurai Takano Sadayoshi and the adoptive son of Yamamoto Tatewaki. Educated at

the Japanese Naval Academy (1901–1904), Yamamoto Isoroku saw service in the 1904–1905 Russo-Japanese War. He attended the Naval Staff College in 1915 and 1916.

Initially trained in gunnery, Yamamoto became a leading advocate of naval airpower during the 1920s and 1930s, in part because of his experiences as chief executive officer at Kasumigaura Naval Flight School between 1924 and 1926, when he became a pilot as well. Also significant in forming Yamamoto's perceptions were his two periods as a resident officer in the United States. Between 1919 and 1921, he studied English at Harvard University. Promoted to captain in 1923, he served as naval attaché in Washington, D.C., from 1926 to 1928. Yamamoto's time in the United States persuaded him of that country's unlimited economic potential and the relatively low quality of the U.S. Navy.

On returning to Japan from the United States, Yamamoto took command of the aircraft carrier *Akagi* and used it as a platform to test new concepts in naval aviation. He was a delegate to the 1929–1930 London Naval Conference and became chief of the navy's technical service in 1930. Yamamoto was promoted to rear admiral the next year. In this position, he pushed the development of modern aircraft for the navy. In 1933, Yamamoto took command of the 1st Naval Air Division. He headed the Japanese delegation to the 1935–1936 London Naval Conference, where he announced that Japan would no longer abide by the 5-5-3 naval ratio with the United States and Britain. He returned home a national hero.

Appointed vice minister of the navy in 1936, Yamamoto opposed his government's decision to proceed with construction of the giant Yamato-class battleships, believing that they were a waste of precious resources. Unable to overcome the reliance on traditional battleships, he nonetheless pushed the construction of aircraft carriers, long-range bombers and flying boats, and the new Zero fighter. His opposition to the increasingly belligerent official position led to his removal from his government post.

Appointed commander in chief of the Combined Fleet in August 1939 and promoted to full admiral in November 1940, Yamamoto opposed Japan's adherence to the Tripartite Pact and the movement toward war with the United States. Nonetheless, he also rejected the navy's original plan to lie in wait for the U.S. Pacific Fleet in the Far East after the U.S. ships had been savaged by submarine and torpedo attacks. Instead, Yamamoto devised a

preemptive strike against the Pacific Fleet at Pearl Harbor. He hoped that by crippling U.S. naval power at the war's outset, Japan might use the breathing spell that would ensue to conquer the Southern Resource Area and erect an impregnable defensive barrier.

Yamamoto did what he could to prepare his fleet for war, purging ineffective officers and insisting on realistic, rigorous—even dangerous—training, both day and night, so that when war came, the fleet was the best trained in the world, certainly at night fighting. He ignored technological advances such as radar, which Japanese ships did not receive until 1943.

The success of the Pearl Harbor attack on December 7, 1941, enhanced Yamamoto's prestige, which he used to persuade the Naval General Staff to accept his overly complex Midway plan in April 1942. Designed to draw out the remnants of the U.S. Fleet—specifically the carriers absent from Pearl Harbor on December 7—Yamamoto's Midway campaign ended in disaster on June 3–6 with the Combined Fleet's loss of four fleet carriers, a blow from which the Japanese Navy never recovered.

Although the tide of the Pacific war clearly shifted in favor of the Allies after Midway, U.S. leaders remained wary of Yamamoto's leadership. Accordingly, when U.S. intelligence learned that Yamamoto intended a one-day inspection trip to the northern Solomons in April 1943, the Pacific Fleet commander, Admiral Chester Nimitz, with the approval of President Franklin D. Roosevelt, dispatched aircraft to intercept his plane. On April 18, U.S. Army Air Forces P-38 Lightning fighters shot down Yamamoto's aircraft near Buin in the southern Bougainville Island, killing the admiral. He was posthumously promoted to marshal admiral.

Yamamoto Isoroku, U.S. Ambush of (April 18, 1943)

Aerial ambush and killing of Admiral Yamamoto Isoroku over Bougainville in the South Pacific. On April 14, 1943, U.S. intelligence intercepted and decoded the inspection trip travel schedule for Yamamoto, revealing an opportunity to intercept his flight over Bougainville four days later. Yamamoto had been the architect of the attack on Pearl Harbor and was commander in chief of the Combined Fleet.

There was some hesitation about such an effort, stemming from concerns that the move might compromise U.S. code-breaking operations. Also, Yamamoto, although a superb officer, had proved to be a disaster as a strategist. Nonetheless, the order for the attack came from Secretary of the Navy Frank Knox through Admiral Chester Nimitz to Admiral Marc A. Mitscher, air commander in the Solomons area.

Mitscher assigned the mission to the U.S. Army Air Forces 339th Fighter Squadron of the Thirteenth Air Force on Guadalcanal because of the long-range capability of its Lockheed P-38 Lightning fighters. The operation, code-named Y-MISSION, was carefully planned and carried out at low altitude under radio silence to ensure surprise. Major John W. Mitchell, the squadron commander, led the 400-mile mission. The 16 aircraft that performed the mission conducted a successful flight and interception, arriving over Bougainville just as 2 Japanese G4M Betty medium bombers and 6 Mitsubishi A6M Reisen Zero fighter escorts approached to land at Kahili Field at Buin in southern Bougainville. Both Japanese bombers were shot down, along with three of the Zeros, and Yamamoto was killed. Captain Thomas G. Lanphier and Lieutenant Rex Barber shared the credit for downing Yamamoto’s aircraft, although a debate over the actual pilot responsible for shooting down the plane continued after the war.

Yamashita Tomoyuki (1885–1946)

Japanese Army general. Born in Osugi Nara, Kochi, Shikoku, on November 8, 1885, Yamashita Tomoyuki may have been Japan's greatest general of World War II. He graduated from the Japanese Military Academy in 1908 and the War College in 1916. Trained as an infantry officer, he distinguished himself early on in a variety of assignments.

Yamashita served on the General Staff in 1918 and then was resident officer in Germany from 1919 to 1921. Promoted to major in 1922 and to lieutenant colonel in 1923, he served concurrently as military attaché to Austria and Hungary (1927–1929). Promoted to colonel in 1929, he then commanded a regiment before serving in the Army Ministry (1932–1936). He next commanded a brigade in the Korea Army (1936–1937) and was promoted to lieutenant general in 1937. He was chief of staff of the North China Area Army between 1937 and 1939 in the Second Sino-Japanese War (1937–1945) before commanding the 4th Division (1939–1940).

Recalled to Tokyo in July 1940, Yamashita became inspector general of army aviation. In November of that year, minister of war General Tōjō Hideki, who saw Yamashita as a rival, sent him on a six-month military mission to Germany and Italy. On his return to Japan in June 1941, Yamashita warned against going to war with Great Britain and the United States until Japanese forces could be modernized—unwelcome advice that produced his exile to command the Guandong (Kwantung) Army in Manzhoudiguo (Manchoutikuo).

Japanese lieutenant general Yamashita Tomoyuki (left) with a U.S. Army MP following his surrender of the Philippines. (National Archives)

In November 1941, just weeks before Tokyo launched the Pacific war, Yamashita received command of the Twenty-Fifth Army, which he proceeded to lead to the greatest land victory in Japanese history. In a campaign lasting 70 days (December 7, 1941, to February 15, 1942) and outnumbered by the British, Yamashita conquered Malaya and Singapore and earned the nickname “Tiger of Malaya.”

Largely because Prime Minister Tōjō saw him as a rival, in July 1942 Yamashita was sent to command the First Army in northern Manchuria. Following Tōjō’s fall from power in July 1944, Yamashita was assigned to command the Fourteenth Army in the Philippines, arriving there only a week before the U.S. invasion of Leyte on October 20. Plagued by divided command with little authority over Japanese naval and air assets, Yamashita was unable to prevent the fall of Leyte that December.

Following the U.S. landings on the big island of Luzon in January 1945, Yamashita gave Rear Admiral Iwabuchi Sanji charge of the defense of Manila. Iwabuchi ignored Yamashita’s orders to withdraw and staged a suicidal defense of the Philippine capital.

Yamashita then withdrew his remaining forces into the northern mountains and, despite lack of supplies, held out there until August 15. Charged with war crimes the next month for atrocities committed by

Iwabuchi's Naval Defense Force, Yamashita claimed both ignorance of them and inability to control his subordinate. In a controversial decision, the U.S. military court rejected this position, which became known as the "Yamashita defense," holding that the crimes were sufficiently widespread that Yamashita must have known of them and that he was responsible for the actions of his subordinate commander. Found guilty, Yamashita was hanged in Tokyo on February 23, 1946.

Yamato Class, Japanese Battleships

The Japanese Yamato-class battleships were the largest battleships ever built. Of five of its class originally planned, only the *Yamato* and its sister *Musashi* were finished as battleships. A third ship, the *Shinano,* was completed as an aircraft carrier.

The *Yamato* was built in great secrecy. Its keel was laid at the Kure Naval Yard on November 4, 1937; the ship was launched on August 8, 1940, and commissioned on December 16, 1941. The Yamato-class ships displaced 62,315 tons standard load and 69,990 tons full load (in contrast, the U.S. Iowa class displaced 57,540 tons at full load). The vessels measured 862 feet 9 inches in length and 121 feet 1 inch in beam. The armor belt was 16.1 inches thick, and the deck armor was 9.1 inches thick. Armament consisted of 9 18.1-inch main guns in three triple turrets, 12 6.1-inch guns, 12 5-inch antiaircraft guns, 24 25mm antiaircraft guns, and 4 13mm machine guns.

Each ship also carried seven float-planes, launched from two catapults. The ships had turret armor of 25.6 inches. They were capable of speeds up to 27.7 knots. Crew size was some 2,500 men.

The *Yamato* had a rather uneventful career. Assigned as fleet commander Admiral Yamamoto Isoroku's flagship in February 1942, it was part of the Japanese Midway operation (June 3–6, 1942) but saw no action in that battle. The *Yamato* might have played an important role in the fighting for control of the Solomons, but Japanese leaders were reluctant to risk such a national symbol. With subsequent activities curtailed by the shortage of oil, the ship's actions were severely limited, and it saw little combat.

On December 24, 1943, the U.S. submarine *Skate* attacked the *Yamato* near Truk, damaging it on the starboard side near turret 3, which resulted in the flooding of a magazine. The *Yamato* returned to Japan for repairs, which were completed at Kure by April 1944. During the October 23–26, 1944, Battle of Leyte Gulf, the *Yamato* and *Musashi* formed the core of Vice Admiral Kurita Takeo's Force A. Kurita sailed from Brunei with a powerful force that included 5 battleships and 10 heavy cruisers.

The *Yamato* sustained two bomb hits in the Sibuyan Sea while under way to San Bernardino Strait, where the ship and what remained of Kurita's force encountered a force of six escort carriers, three destroyers, and four destroyer escorts of escort carrier group Taffy 3, at the Battle of Samar (October 25). Although the *Yamato* escaped intact from this encounter, it also did not inflict any damage.

The *Yamato*'s next and final mission was an attempt to disrupt the U.S. landing on Okinawa, which began on March 16, 1945. In response to the invasion, on April 5, 1945, Admiral Toyoda Soemu ordered Operation TEN-GO, committing the Second Fleet to the battle. With no carriers and aircraft to protect his ships, Second Fleet commander Vice Admiral Itō Seiichi initially refused the order, which he considered a suicide mission. Vice Admiral Kusaka Ryūnosuke ultimately prevailed on Itō to agree, however.

The plan called for the *Yamato,* supported by the light cruiser *Yahagi* and eight destroyers, to steam to Okinawa and attack Allied shipping there. The *Yamato* would then be run aground and, as a stationary battery, provide gunfire support to the Japanese defenders on Okinawa. The *Yamato* was only provided sufficient fuel for a one-way mission. Itō Seiichi, aware that it was a

suicide mission, had overall charge of the operation and was aboard the *Yamato,* which was commanded by Rear Admiral Aruga Kosaku.

U.S. Navy forces off Okinawa were alerted to the approaching sortie by signals intelligence, and the Japanese task force was quickly detected by U.S. submarines as it emerged from the southernmost exit of Japan's Inland Sea on April 6. Because all available Japanese aircraft were targeted at naval forces around Okinawa, the *Yamato* was left exposed and vulnerable to air attack. U.S. carrier-based aircraft commenced their attacks on the Japanese task force on April 7 at 12:32 p.m.

The Japanese warships were subjected to repeated air attacks, but they only shot down 10 of 386 attacking aircraft. Amid massive explosions, the *Yamato* sank at 2:23 p.m., less than two hours after the air attacks began. The U.S. report on the ship's sinking claimed hits by at least 11 torpedoes and 8 bombs; Japanese survivors put the total at nearer to 16 torpedoes and 18 bombs. Only 269 of the *Yamato*'s 2,767 crew members survived. The light cruiser *Yahagi* and four of the destroyers were also sunk, but four damaged destroyers escaped back to Japan.

The *Musashi,* built by Mitsubishi at Nagasaki, was laid down on March 29, 1938; launched on November 1, 1940; and commissioned on August 5, 1942. It joined the *Yamato, Nagato,* and *Mutsu* in the 1st Battleship Division, and, following trials and gunnery drills, was declared fully operational in December.

The *Musashi* saw even less combat than the *Yamato*. In February 1943, it replaced the *Yamato* as Yamamoto's flagship. In mid-May 1943, the *Musashi* deployed as part of a task force to the North Pacific but failed to encounter U.S. forces. It subsequently was part of a task force dispatched to the Aleutians but returned to Japan when the Americans recaptured Attu Island before its arrival. At the end of July, after receiving upgrades in fire control and radar in Japan, the *Musashi* steamed for Truk. It remained there until February 1944 and took part in several attempts to intercept U.S. carrier forces that were, however, unsuccessful.

Departing Palau on March 29, the *Musashi* came under attack by the U.S. submarine *Tunny*. The *Musashi* managed to evade five of the six torpedoes fired at it, but the sixth damaged the forward area of the ship and caused 18 casualties. After repairs at Kure, when it also received upgrades that included

enhanced antiaircraft protection, it sailed for Okinawa to join the Second Fleet under Vice Admiral Ozawa Jisaburo.

During the Battle of the Philippine Sea (June 19–21, 1944), the *Musashi* escorted the Japanese fast carriers. In October, the battleship was at Brunei preparing as part of Admiral Kurita's force for the counterattack of the U.S. landings at Leyte that led to the Battle of Leyte Gulf. On October 24, in the Sibuyan Sea, Kurita's task force came under heavy U.S. air attacks. The *Musashi* was damaged forward in the first attacks, forcing it to reduce speed to only 10 knots. It sank that same evening, overwhelmed by 17 bombs and 10 to 19 torpedo hits. A total of 1,023 of its 2,399-man crew died; the others were rescued by Japanese destroyers. Eighteen U.S. aircraft were lost in the attack.

Yanagawa Heisuke (1879–1945)

Japanese Army lieutenant general. Yanagawa Heisuke was born in Nagasaki Prefecture, Japan, on October 2, 1879. He graduated from the Japanese Military Academy in 1900 and was commissioned in the cavalry. Yanagawa participated in the 1904–1905 Russo-Japanese War. In 1912, he graduated

from the Military Staff College and was an instructor there between 1915 and 1918. He was then an instructor at the Chinese Military Staff College (1918–1920). From 1920 to 1923, he was in Geneva as a member of the Japanese delegation to the League of Nations.

On his return to Japan, Yanagawa was promoted to colonel and assigned to command the 20th Cavalry Regiment. Between 1925 and 1927, he was chief of the Maneuver Section of the army General Staff. Promoted to major general in 1927, he commanded a cavalry brigade (1927–1929) and then became the director of the Cavalry School (1929–1930). During 1930 and 1931, he was inspector general of cavalry. Following his promotion to lieutenant general in 1931, Yanagawa served as vice minister of war (1932–1934). He commanded the 1st Division (1934–1935) and the Taiwan Army (1935–1936) and then served on the General Staff.

In the early 1930s, two competing groups emerged within the Japanese Army: the Kodo-ha (Imperial Way) group, which advocated the importance of character building, and the Tosei-ha (Control) faction, which emphasized the importance of military modernization. Yanagawa was a member of the Kodo-ha group. Both factions were in agreement, however, that Japanese political and social systems had to be reformed by a strong military government. On February 26, 1936, a number of young army officers attempted a coup d'état, which failed. Yanagawa sympathized with the plotters and was slated to be vice minister of war if the coup had succeeded. With its failure, Yanagawa was placed on the reserve list.

Only a year later, in October 1937, Yanagawa was reactivated and assigned as commander of the Tenth Army, sent to China to fight in the Second Sino-Japanese War. When the Tenth Army landed at Hangchow Bay to support the Shanghai Expeditionary Army, Chinese forces were already in retreat toward Nanjing (Nanking). Yanagawa insisted on a pursuit of the Chinese, and troops under his command committed many atrocities in the Japanese occupation of Nanjing.

In 1940, Yanagawa became minister of justice; the next year, he was made minister of state in the second and third cabinets of Prime Minister Konoe Fumimaro. Yanagawa retired from public service in October 1941 and died in Tokyo on January 22, 1945.

Yan'an, Dixie Mission to

See Dixie Mission to Yan'an

Yang Hucheng (1893–1949)

Chinese Nationalist general. Born in Pucheng, Shaanxi (Shensi) Province, China, on November 20, 1893, Yang Hucheng (Yang Hu-ch'eng) began his military career by joining his native provincial forces after the 1911 Revolution, fighting first the remnants of the Qing (Ch'ing) forces and then warlords for control of Shaanxi. In January 1924, Yang joined the Nationalist Party—the Guomindang (Kuomintang, GMD).

In 1925, when Shaanxi came under the control of warlord Feng Yuxiang (Feng Yü-hsiang), the provincial forces were reorganized as the National Army's Third Army, with Yang as commander of its 3rd Division. After Feng declared allegiance to Jiang Jieshi (Chiang Kai-shek) in September 1926, the National Army became the Second Army Group of the GMD National Revolutionary Army, with Yang commanding its Tenth Army and the Eastern Route Army in the 1926–1928 Northern Expedition. When Feng-Jiang cooperation broke down in early 1929, Yang became commander of the new 14th Division, stationed at Nanyang in Henan (Honan). In mid-1930, Yang, as commander of the Seventh Army and the Punish-the-Rebel Army's Seventeenth Route Army, marched into Shaanxi to crush Feng's elements, and at year's end, he occupied Xi'an (Sian).

During his Xi'an years, Yang served as governor (1931) and pacification commissioner (1932–1936) of Shaanxi while continuing in the command post

of the Seventeenth Route Army. Meanwhile, he grew increasingly dissatisfied with Jiang's nonresistance toward Japanese aggression in northern China, which he had been following since September 1931. Beginning in late 1935, Yang opened communications with Zhang Xueliang (Chang Hsüeh-liang), commander of the Nationalist Northeastern Army, and the Chinese Communists, who had just arrived at Yan'an (Yenan) in northern Shaanxi after the 1934–1935 Long March.

These talks led to the Xi'an Incident of December 1936. On December 12, Yang and Zhang arrested Jiang, who had gone to Xi'an a week earlier to discuss the anti–Chinese Communist "extermination campaign," and compelled him to negotiate with the Chinese Communists for a common anti-Japanese policy. The discussion between Jiang and the Chinese Communist delegation, led by Zhou Enlai (Chou En-lai), resulted in a Nationalist–Chinese Communist united front. On December 25, Jiang was released and flew back to Nanjing (Nanking) in Jiangsu (Kiangsu), accompanied by Zhang, who never returned.

On January 5, 1937, Jiang removed Yang from his official posts and sent him on a tour of Europe and the United States in June. When Yang returned to China and arrived at Nanchang in Jiangxi (Kiangsi) on November 30, he was arrested and detained by GMD authorities; he was held throughout the Sino-Japanese War and the Chinese Civil War.

On September 17, 1949, Yang was shot by GMD special agents who were about to evacuate to Taiwan, in their headquarters in Chongqing (Chungking), Sichuan (Szechwan). In February 1950, in honor of his patriotism, the Chinese Communists located his remains and shipped his body back to Xi'an for burial.

Yan Xishan (1883–1960)

Chinese warlord and general. Born into a wealthy family in Wutai (Wut'ai), Shanxi (Shansi) Province, China, on October 8, 1883, Yan Xishan (Yen Hsi-shan) attended the military college of his native province between 1901 and 1904 and then went to Japan on a government scholarship. He graduated from the Japanese Military Academy in 1909. Returning to Shanxi thereafter, Yan was a colonel and regimental commander by 1910.

On the outbreak of the October 1911 Revolution, Yan joined the revolutionaries and was appointed military governor of Shanxi. By 1917, he was the sole ruler of the province. During the turbulent decade that followed, Yan proved adroit at navigating among the various warlord coalitions that were constantly battling for control of China. At the same time, his social and economic reforms turned Shanxi into a model province that contrasted sharply with the depredations of other warlords. In 1927, Yan joined the Guomindang (Nationalists), led by Jiang Jieshi (Chiang Kai-shek). After the Nationalist reunification of China the following year, Jiang rewarded Yan by confirming him as governor of Shanxi.

In the 1930s, Yan's position was threatened by pressure from the Japanese, who seized Manchuria in 1931, and from the Chinese Communists, who had relocated to the city of Yan'an (Yenan) in Shanxi Province. Yan responded by implementing a massive economic reform program in 1934 and by strengthening his ties to the Nationalists, but he had little success because of his inadequate financial resources and his history of isolation. Within a few months of the outbreak of the Second Sino-Japanese War in July 1937, Yan's army was barely maintaining a foothold in Shanxi. His relations with the Communists were also poor. Following an open clash with them in 1939, Yan attempted to establish connections with the Japanese, prompting accusations of treason.

After the Japanese surrender in 1945, Yan continued to resist the advance of the Communists in northern China, but his efforts, including the use of Japanese troops, ultimately failed. Forced from Shanxi in April 1949, he fled to Taiwan. Yan died in Taipei on May 24, 1960.

Yeh Chien-ying

See Ye Jianying

Ye Jianying (1897–1986)

Chinese Communist general. Born in Meixian (Mei-hsien), Guangdong (Kwangtung) Province, China, on April 28, 1897, Ye Jianying (Yeh Chien-ying) enrolled at the Yunnan Military Academy in 1917. Graduating in 1919, he joined his native provincial army, where he became a member of the Nationalist Party—the Guomindang (Kuomintang, GMD)—in 1920. In 1924, Ye became deputy director of the Instruction Department of the Huangpu (Whampoa) Military Academy, where he met Zhou Enlai (Chou En-Lai).

In mid-1927, Ye secretly joined the Chinese Communist Party (CCP) while remaining chief of staff of the GMD's National Revolutionary Army's Fourth Army. Ye helped plan the two abortive Communist uprisings at Nanchang in Jiangxi (Kiangsi) and Guangzhou (Canton) in Guangdong, in August and December, respectively. At year's end, Ye fled abroad. He returned to China in 1931, serving in the Soviet base in Ruijin (Juichin), Jiangxi, as chief of staff of the Red Army and president of the Red Army Academy.

In October 1934, Ye participated in the Long March as chief of staff of the Third Red Army Group and reached Yan'an (Yenan) in Shaanxi (Shensi) a year later. In Shaanxi, Ye worked closely with Nationalist generals Zhang Xueliang (Chang Hsüeh-liang) and Yang Hucheng (Yang Hu-ch'eng), an

alliance that resulted in the GMD-CCP united front against Japan, a key product of the Xi'an (Sian) Incident of December 1936.

From the beginning of the Sino-Japanese War in July 1937 until early 1941, Ye worked closely with the GMD in Xi'an, at Nanjing (Nanking) in Jiangsu (Kiangsu), at Wuhan in Hubei (Hupeh), at Changsha in Hunan, and at Chongqing (Chungking) in Sichuan (Szechwan) coordinating the war efforts of the Chinese Communist Eighth Route and New Fourth Armies. In August 1937, he became chief of staff of Zhu De's (Chu Teh) Eighth Route Army, renamed the Eighteenth Army Group under the GMD forces in September. In January 1939, Ye became head of the Nationalists' Guerrilla Warfare Training Center in southern Hengshan in Hunan.

After the New Fourth Army Incident of January 1941, Ye returned to Yan'an, where he stayed until the war's end; during this period, he resumed his post as chief of staff of the Eighth Route Army and helped train Chinese Communist forces. Ye also continued his liaison work with both Chinese and foreign correspondents and foreign military delegations, including the July–August 1944 U.S. Dixie Mission.

After the war, Ye headed the CCP side of GMD-CCP negotiations to avert civil war. During the Chinese Civil War, he was chief of staff of the People's Liberation Army until January 1949, when Beijing (Peking) in Hebei was liberated. Ye then moved south to organize CCP control over his native province, holding important posts in Guangzhou. In 1955 he returned to Beijing, where he was rewarded by being named among 10 marshals of the People's Liberation Army. He then undertook diplomatic assignments in several foreign countries. Ye died in Beijing on October 22, 1986.

Yenangyaung, Battle of (April 10–19, 1942)

Important battle in Burma between Allied and Japanese forces. With the capture of Rangoon (Yangon) in March 1942, the Japanese were able to establish effective supply lines and bring reinforcements into Burma. Although the Royal Air Force (RAF) and the American Volunteer Group (AVG, Flying Tigers) were inflicting losses, the Japanese held air superiority.

Japanese Fifteenth Army commander General Iida Shōjirō now turned his 33rd and 55th Divisions north. His objective was to seize the oil fields and refinery at Yenangyaung on the Irrawaddy, north of Prome. Supported by Burmese dissidents in a growing unconventional warfare capability, the Japanese employed frontal assaults, small-unit infiltrations, guerrilla operations, and sabotage to keep Allied forces on the defensive.

Lieutenant General William Slim's I Burma Corps held a defensive line with the Indian 17th Infantry Division forward of Prome on the Irrawaddy River and the 1st Burma Division near Toungoo and the Sittang River. Three Chinese armies—the Fifth, Sixth, and Sixty-Sixth—were moving south to reinforce. U.S. lieutenant general Joseph Stilwell, who arrived in China in March to lead the U.S. effort to train the Nationalist Chinese Army, planned to reopen the land supply routes to China.

The Japanese captured Prome and Toungoo in early April. The British then concentrated their resources near Allanmyo, on the Irrawaddy, redeploying the 17th and 1st Divisions from Toungoo. Slim's mission was to prevent the Japanese from taking the oil fields and to defend northern Burma. Critical to this effort was the ability of the Chinese to hold in the east in the Sittang Valley and the speed with which they could bring in reinforcements to allow the British to redeploy and form a reserve force large enough to conduct large-scale offensive operations to stop the Japanese advance up the Irrawaddy. On April 8, Slim moved I Burma Corps headquarters from Taungdwingyi to Magwe, just south of Yenangyaung. The oil fields were still

producing fuel for the Allied forces, but as a precaution, they were to be destroyed.

This forest of derricks that marked the great oil fields of Yenangyaung, Burma, the immediate objective of the Japanese invasion up the Irrawaddy Valley, April 16, 1942. (Bettmann/Corbis)

The main Japanese effort against Yenangyaung began in earnest on April 10 with direct assaults against forward British brigades and attempts to infiltrate small elements and units disguised as Burmese forces and Chinese. By April 14, the Japanese had split the defending British forces. The next day, Slim ordered the destruction of the oil fields and the refinery as heavy fighting continued in the Yenangyaung area.

British forces, now supported by the Chinese 38th Division, continued to engage the Japanese 33rd Division. Slim prepared an offensive thrust in which the 38th Division would reduce pressure on the 1st Burma Division, allowing elements of the Indian 17th Infantry Division to counterattack the Japanese. As the Battle of Yenangyaung continued, however, the collapse of Chinese forces in the Sittang area put the entire British effort in the west at risk.

At the same time, the Japanese cut off the 1st Burma Division, but British counterattacks, coupled with attacks by the Chinese 38th Division, allowed Slim to extract it. By April 25, however, Allied forces had begun a general withdrawal. The complete loss of Burma and the retreat of all British forces to India were now only a matter of time.

Yeremenko, Andrei Ivanovich (1892–1970)

Soviet Army marshal of the Soviet Union. Born in Markovka, Russia, on October 14, 1892, Andrei Ivanovich Yeremenko was drafted into the Russian Army in 1913 and fought in World War I as a junior officer. He joined the Red Guards in October 1917 and the Red Army and the Bolshevik Party in 1918. Yeremenko fought as a cavalry officer in the Russian Civil War, ending that conflict as deputy commander of a regiment. He then commanded a regiment and attended the Military Political Academy and the Frunze Military Academy in 1935. Yeremenko commanded a cavalry division between 1935 and 1938 and then the VI Cossack Cavalry Corps, which he led in the Soviet invasion of eastern Poland in September 1939.

In June 1940, Yeremenko took command of a mechanized corps and was promoted to lieutenant general. When the German Army invaded the Soviet Union in June 1941, he was commanding the First Red Banner Far Eastern Army. Recalled to the west, he replaced General Dimitri Pavlov as Western Front commander, helping to restore a degree of stability. An outstanding tactician, Yeremenko understood the importance of airpower and the need to mass armor.

In August 1941 Yeremenko assumed command of the new Bryansk Front, where he was seriously wounded in October. After his recovery, he was promoted to colonel general and put in command of the Fourth Shock Army in the defense of Moscow. Again seriously wounded in February 1942, Yeremenko took command of the Southeast Front, defending Stalingrad, in August. In January 1943 he assumed command of the Southern Front, pushing the Germans out of the Caucasus. Transferred to command the Kalinin Front in April 1943, he was promoted to army general in August.

Yeremenko commanded the 1st Baltic Front in October and November 1943 for the advance on Smolensk. He then led the Independent (Black Sea) Maritime Front in the eastern Crimea before heading the 4th Ukrainian Front from March to July 1945.

Following the end of the war, Yeremenko commanded, in turn, the Carpathian, West Siberian, and North Caucasus military districts until 1958. In 1955 he was promoted to marshal of the Soviet Union. He next served as inspector general of the Ministry of Defense until his death in Moscow on November 19, 1970.

Ye Ting (1896–1946)

Chinese Communist general. Born in Huiyang (Hui-yang), Guangdong (Kwangtung), China, on September 10, 1896, Ye Ting (Yeh T'ing) enrolled at the Baoding (Paoting) Military Academy in 1916, withdrawing in 1918; he then joined his provincial army, where he became a member of the Nationalist Party—the Guomindang (Kuomintang, GMD)—in 1920. In 1924, Ye went to Moscow for advanced training, where he met Nie Rongzhen

(Nieh Jung-chen) and joined the Moscow branch of the Chinese Communist Party (CCP).

Returning to Guangdong in 1925, Ye was assigned to command and train what later became the Independent Regiment, an attachment of the GMD National Revolutionary Army's Fourth Army. After the GMD-CCP split in 1927, Ye participated in the two abortive Communist uprisings in Nanchang, Jiangxi (Kiangsi), and Guangzhou (Canton), Guangdong, in August and December, respectively. At the end of 1927, Ye went abroad.

When the Second Sino-Japanese War began, Ye returned to China in October 1937 to command the newly created New Fourth Army, which was formally established in January 1938, with headquarters in Nanchang. After the Japanese took Xuzhou (Hsüchow), Jiangsu, Ye's forces operated behind Japanese lines north of the Chang Jiang River in May.

Ye's rapid extension of operations in the Jiangsu-Anhui area and his victories over the Japanese mopping-up campaigns in southern Anhui in 1939 and 1940 aroused Nationalist suspicions. The GMD leaders feared growing CCP power that might undermine its rule after the war. The situation culminated in the New Fourth Army Incident of January 1941. Ye was charged with insubordination and imprisoned for the remainder of the war until March 4, 1946, when he was set free. He then requested reinstatement of his CCP membership, which was immediately granted. Ye died on April 8, 1946, when a plane in which he was traveling crashed in northwest Shaanxi (Shensi).

Yokoyama Shizuo (1890–1961)

Japanese Army lieutenant general. Born in Fukuoka Prefecture, Japan, on December 1, 1890, Yokoyama Shizuo graduated from the Japanese Military Academy in 1912 and was commissioned into the infantry. He graduated from the Army War College in 1925. After assignment to the General Staff, he was transferred to the Korea Army Headquarters in 1929. In 1932, he was doubly assigned as chief of the Railway Division of the Railway and Shipping Section of the General Staff and to the Naval General Staff. Yokoyama became commander of the Guandong (Kwantung) Army Railway District in 1935. Promoted to colonel in 1936, he served in the Guandong Army Headquarters in 1937.

During the 1937–1945 Second Sino-Japanese War, Yokoyama commanded the 2nd Infantry Regiment in offensive operations in northern China. Promoted to major general in 1939, he next took charge of the 2nd Field Railway Headquarters and then the 1st Field Railway Headquarters in 1940. Having been promoted to lieutenant general in 1941, Yokoyama assumed command of the 8th Division in eastern Manchuria and, from 1942 to 1944, he prepared for possible fighting with the Soviet Far East Command.

Yokoyama and his division were sent to Luzon in the Philippines in October 1944, where he commanded the Shimbu Group, later known as the Forty-First Army. Its mission was to defend central and southern Luzon under the overall authority of General Yamashita Tomoyuki, commander of Fourteenth Area Army. Yokoyama prepared to hold the mountainous region east of Manila City.

The issue of the defense of Manila was never resolved, as orders from the Fourteenth Area Army were unclear and the chain of command was complicated. Rear Admiral Iwabuchi Sanji's Manila Naval Defense Force, nominally under Yokoyama, had authority in the Manila area. General Yamashita did not want to fight for Manila, but Iwabuchi defied his orders and staged a bitter contest for the city that claimed an estimated 100,000 civilian lives.

Yokoyama surrendered his surviving forces to U.S. authorities in September 1945. Arrested as a war criminal for atrocities committed by Japanese troops in Manila, he was sentenced to death by a Philippine military tribunal in 1948. His sentence was later reduced to life imprisonment. Removed to Tokyo's Sugamo Prison, he was released on amnesty in December 1953. Yokoyama died in Tokyo on January 6, 1961.

Yonai Mitsumasa (1880–1948)

Japanese Navy admiral and statesman. Born in Iwate Prefecture, Japan, on March 2, 1880, Yonai Mitsumasa graduated from the Japanese Naval Academy in 1901 and served in the 1904–1905 Russo-Japanese War. Following his graduation from the Naval War College in 1914, he held various posts, including military attaché, staff officer, and commander of a battleship. In 1925, he was promoted to flag officer. Appointed commander of the Second Fleet, Yonai became commander in chief of both the Combined Fleet and the First Fleet in 1936. In February 1937, he assumed the post of minister of the navy in the cabinet of Premier Hayashi Senjūrō and was promoted to admiral of the navy in April 1937. Yonai remained in this post in both Konoe Fumimaro's first cabinet and Hiranuma Kiichiro's cabinet.

In the first negotiations for the Tripartite Pact among Germany, Italy, and Japan in the summer of 1938, Yonai foiled efforts to conclude the alliance, working in cooperation with Japanese Navy vice minister Yamamoto Isoroku and strongly opposing its main supporters, who included army leaders. In August 1939, Yonai was discharged because the Hiranuma cabinet was compelled to resign en bloc, but his previous post brought him appointment to the position of military councilor. In January 1940 Yonai assembled a new cabinet based on the support of Emperor Hirohito, but Yonai opposed Japan's plans to go to war with the United States. Army leaders therefore forced the cabinet to resign en bloc.

In July 1944 with Japan's military situation fast deteriorating, Yonai and Koiso Kuniaki formed a new cabinet on the resignation of Premier General Tōjō Hideki. By special order of the emperor, Yonai was reappointed minister of the navy in the Koiso cabinet. Yonai remained in this post in Suzuki Kantarō's cabinet in April 1945 to help lay the groundwork for the postwar period and in the cabinets of both Higashikuni Naruhiko and Shidehara Kijuro. Yonai died in Tokyo on April 20, 1948.

Yorktown Class, U.S. Aircraft Carriers

The three ships of the U.S. Navy's Yorktown class of large aircraft carriers were, in effect, the first modern aircraft carriers. The *Yorktown*, *Enterprise*, and *Hornet* had been designed from experience with other carriers and were the forerunners of the formidable Essex-class carriers that joined the fleet at the end of 1942.

All three Yorktown-class ships were built at Newport News, Virginia, and commissioned during 1937–1941. They displaced 19,875 tons standard load and 25,484 tons full load. They were 809 feet 4 inches in length (824 feet 9 inches on the flight deck) and 83 feet in beam (109 feet 6 inches at maximum width of the flight deck). Capable of 32.5 knots, they were protected by an armor belt ranging in thickness from 2.5 to 4 inches, with only 1.5 inches of deck armor. Initial armament consisted of 8 5-inch guns in single mounts, 16 1.1-inch guns in four mounts, and 24. 50-caliber machine

guns (from February 1942, the machine guns were replaced with 30 20mm Oerlikon cannon; antiaircraft capability underwent continued expansion during the war so that by its end the *Enterprise* mounted 11 quadruple-mounted 40mm, eight twin-mounted 20mm, and 16 single 20mm guns). The Yorktown-class carriers operated 96 aircraft. (The 1938 air group consisted of 18 fighters, 36 torpedo bombers, 37 dive-bombers, and 5 utility aircraft.) They had a crew complement of 2,175 men.

The *Yorktown* (CV-5) was laid down on May 21, 1934; launched on April 4, 1936; and commissioned on September 30, 1937. It was operating in the Atlantic at the time of the Japanese attack on Pearl Harbor on December 7, 1941. Ordered to the Pacific, in January 1942 it escorted a convoy carrying marine reinforcements to American Samoa, then took part in the Marshall and Gilbert Islands carrier raids and, in mid-March, joined the carrier *Lexington* in attacking Japanese forces that had landed at Lae and Salamaua in eastern New Guinea.

The *Yorktown* participated in the Battle of the Coral Sea (May 7–8), when its aircraft and those of the *Lexington* sank the light Japanese carrier *Shōhō* and damaged the fleet carrier *Shōkaku*. Japanese aircraft from the *Shōkaku* and *Zuikaku* found both U.S. carriers and so severely damaged the *Lexington* that it had to be scuttled. The *Yorktown* was hit by a single bomb that penetrated the flight deck and exploded below, killing or badly wounding 60 men.

The *Yorktown* was put back in service at Pearl Harbor in only three days, enabling it to participate with the *Enterprise* and *Hornet* in the Battle of Midway (June 3–6, 1942), when its aircraft fatally damaged the Japanese carrier *Sōryū*. The *Yorktown* was badly damaged by Japanese aircraft, however. Protected by a screen of destroyers, the carrier was in tow when it was sunk by the Japanese submarine *I-168* on June 7.

The *Enterprise* (CV-6), known affectionately as “The Big E,” was laid down on July 16, 1934; launched on October 3, 1936; and commissioned on May 12, 1938. Its aircraft provided the air cover for the Tokyo (Doolittle) Raid of April 18, 1942. During the Battle of Midway, its SBD Dauntless dive-bombers helped account for the loss of the Japanese carriers *Akagi*, *Kaga*, and *Hiryū*. The *Enterprise* was damaged in the battles off Guadalcanal (August 1942–February 1943) but repaired in time to take part in the Battle of the Santa Cruz Islands on October 16, 1942. Again damaged, it was

repaired at Pearl Harbor and returned to action, and its air group helped to sink the Japanese battleship *Hiei*.

After undergoing a major refit in the second half of 1943, the *Enterprise* then took part in the U.S. strikes against the Japanese Pacific islands, and its aircraft helped sink the Japanese battleship *Musashi* in the Battle of Leyte Gulf (October 23–26, 1944). Hit by a Japanese kamikaze in May 1945, the *Enterprise* was out of action the remainder of the war. Repaired, it was nonetheless decommissioned on February 17, 1947, and assigned to reserve as an antisubmarine warfare carrier (CVS-6) in July 1953. Although there was an effort to have the ship preserved as a memorial, it was sold to be broken up for scrap on July 1, 1958.

The U.S. Navy Yorktown-class aircraft carrier *Enterprise* (CV-6) was launched in 1936. The ship earned 20 battle stars for its wartime service, the most of any U.S. warship of World War II. (Hulton Archive/Getty Images)

The *Hornet* (CV-8) was laid down on September 26, 1939; launched on December 14, 1940; and commissioned on October 20, 1941. The *Hornet* carried the 16 B-25 Mitchell medium bombers that struck Tokyo and other Japanese cities on April 18, 1942. Later, its aircraft initiated the Battle of Midway. It then took part in the naval battles off Guadalcanal. In the Battle of the Santa Cruz Islands (October 26–27, 1942), the *Hornet* was struck by two Japanese bombs. After several more hits, the ship’s engines and communications went dead. Although efforts were made to take it in tow, the damage was too extensive; this and closing Japanese forces led to its

abandonment. The *Hornet* was sunk by torpedoes from Japanese destroyers on the morning of October 27. It had been in service little more than a year.

Yoshida Shigeru (1878–1967)

Japanese diplomat and postwar prime minister. Born in Tokyo on September 22, 1878, the son of Takeuchi Tsuna, leader of the Jiyūtō (Liberal Party), Yoshida graduated from Tokyo Imperial University and became a diplomat in 1906. He served as the Japanese consul general in Mukden (Shenyang) (1925–1928), deputy minister of foreign affairs (1928–1930), and ambassador to Great Britain (1936–1939).

Yoshida Shigeru in 1945. Yoshida served as Japanese prime minister after the war. (Library of Congress)

While in Mukden, Yoshida believed that Japan should colonize China, and he supported the army's aggressive policies there. In the 1930s, however, he criticized the army for its anti-Western attitude. A candidate for minister of foreign affairs in 1936, Yoshia was not appointed because army leaders objected. He retired in 1939.

Yoshida worked with his father-in-law, Count Makino Nobuaki, and Prince Konoe Fumimaro to try to end the Pacific war, activities that brought his arrest in April 1945 and his imprisonment for 40 days. After the war, Yoshida became minister of foreign affairs in the cabinets of both Prince Higashikuni Naruhiko and Shidehara Kijūrō. He himself served as prime minister (May 1946–May 1947 and October 1948–December 1954).

Yoshida played a key role in the reconstruction of the Japanese economy after the war in cooperation with the United States, but in 1950 when

negotiating the peace treaty he signed in San Francisco on September 8, 1951, together with the U.S.-Japan Security Pact, he rejected the demand of U.S. special emissary John Foster Dulles for Japanese rearmament. Yoshida's administration, however, fixed the basic pro-Western Japanese orientation in the Cold War era. Yoshida retained considerable political influence after his retirement. He died in Ōiso, Kanagawa, on October 20, 1967.

Yoshida Zengo (1885–1966)

Japanese Navy admiral. Born in Saga, Japan, on February 4, 1885, Yoshida Zengo graduated from the Japanese Naval Academy in 1904. Commissioned an ensign the following year, he was a student at the Torpedo School in 1907. He was promoted to lieutenant commander in 1915 and was appointed a staff officer of the Third Fleet.

Promoted to captain in 1923, Yoshida commanded, in turn, the battleships *Kongo* and *Mutsu*. He was promoted to rear admiral in 1929, and he was chief of staff of the Combined Fleet in 1931 and made head of the Naval Affairs Bureau in the Naval Ministry in 1933. Promoted to vice admiral in 1934, Yoshida was appointed commander in chief of the Combined Fleet in 1938.

From August 1938 to September 1940, Yoshida served as minister of the navy. During this period, he strongly opposed the Tripartite Pact, which he believed would lead to war against the United States and Great Britain.

Leaders of the Japanese Army and Foreign Minister Matsuoka Yosuke, however, pressured Japanese naval leaders, and the pact was signed in Berlin on September 27, 1940. Yoshida was so shocked by this decision that he resigned his post.

Yoshida suffered a brief period of mental illness, but he returned to the navy. Promoted to admiral in November 1940, he commanded the China Area Fleet in 1942 and 1943 and then served as head of the Naval War College from December 1943 until his retirement from the navy in June 1945. Yoshida died in Tokyo on November 14, 1966.

Yugoslavia

Nation located in the western Balkans encompassing about 99,000 square miles. In 1939, Yugoslavia had a population of some 16 million and bordered the Adriatic Sea and Italy to the west; Austria to the north; Hungary, Romania, and Bulgaria to the east; and Greece and Albania to the south. During War II, Yugoslavia was the setting not only for Europe’s greatest resistance struggle but also a bloody civil war.

Yugoslavia was one of the new states formed at the end of World War I. Serbia, which had been on the winning (Allied) side in the war, was its nucleus, with the addition of territories from the defunct Austro-Hungarian Empire. Unfortunately, the new state consisted of nationalities that had been on opposing sides in the war and had strong religious, linguistic, and cultural differences. The nation began as the Kingdom of Serbs, Croats, and Slovenes, but in 1929 it was renamed Yugoslavia, the “land of the South Slavs.” The

country was held together not so much by common ties as by outside pressures and by the fact that its peoples believed that they had a better chance of surviving together rather than separately.

The Serbs were the largest single nationality in Yugoslavia, and their king, Alexander, became head of the new state. Many non-Serbs complained of being second-class citizens, and in 1934 King Alexander was assassinated by Croatian terrorists (Ustaše) while on a state visit to France. In September 1939 World War II began, and Yugoslavian leaders declared the country neutral. They hoped to keep their state out of the war, although Serb sentiment, at least, was heavily pro-Allied. Serbs also dominated the army officer corps.

In late 1940 to counter Russian moves and to solidify his flanks before attacking the Soviet Union in Operation BARBAROSSA (June 22, 1941), German leader Adolf Hitler forced the Balkan states to join the Axis alliance. Prince Paul, regent for the young King Peter II, tried to stall for time, but in March 1941 following a meeting with Hitler at Berchtesgaden, the prince concluded that resistance was futile and might lead to the extermination of the Yugoslav state.

On March 25, Yugoslav leaders traveled to Berlin to sign the Tripartite Pact. In taking this step, they hoped that they were preserving their country's independence; however, Yugoslav public opinion was sharply opposed to the Axis alliance, and this opposition found expression in nationwide demonstrations that prompted a coup on March 27 by Yugoslav Air Force officers, headed by General Dušan Simović. He formed a new government under Peter II.

Although the new government assured the Germans that there would be no immediate change of course in Yugoslav foreign policy, Hitler interpreted the coup as a personal affront and planned a military reprisal. Code-named Operation RETRIBUTION, the reprisal began on April 6 and included heavy air strikes against the Yugoslav capital of Belgrade. The operation also involved troops from Italy, Hungary (Hungarian premier Pál Teleki committed suicide rather than dishonor himself by participating in such an act), and Bulgaria, for a total of 52 Axis divisions.

Axis forces easily defeated Yugoslavian regular forces, overrunning the country in only 11 days. The Yugoslav government leaders and King Peter fled to London, arriving there in mid-June. Despite the poor performance of

their armed forces, Yugoslav leaders found themselves acclaimed as heroes for having resisted Hitler. Soon they had established a government-in-exile.

Defeated Yugoslavia was now partitioned among the Axis states. Slovenia was divided between Germany and Italy, Croatia and Bosnia-Herzegovina were combined into the independent state of Croatia under the direction of the Ustaše government of Ante Pavelić, Italian forces occupied the Dalmatian coast and Montenegro, Albania annexed the Kosovo region and Macedonia, Bulgaria received Macedonia east of the Vardar River, Hungary took the Bachka and Baranya regions, and Serbia and the Banat fell under German military control.

All ethnic Croatians among the 300,000 Yugoslav prisoners of war taken in the invasion were freed, and by August 1941 the Germans had established a Serb collaborationist government under General Milan Nedić. In Croatia, meanwhile, the Ustaše began the mass murder of minorities and forced Serbs to convert to Catholicism from Orthodox Christianity. In 1941, the Croatians killed at least 200,000 Serbs, Jews, and Gypsies, most of them at the Jasenovac concentration camp.

Yugoslav resistance to the Germans began immediately. Centered among the Serbs, it was divided in two factions. Colonel Dragoljub “Draza” Mihailović retreated with a small force to the mountains and set up the Četniks (named for Serb guerrillas who had fought the Turks). The Četniks began receiving assistance from the British Special Operations Executive in June 1941. Mihailović hoped to build up his strength, avoiding reprisals by the Germans against the civilian population, and at the opportune time lead an uprising against the Germans. He strongly supported restoration of the monarchy.

Josip Broz (Tito), leader of the Yugoslav Communist Party since 1937, headed the second major resistance group. Known as the Partisans, the group favored immediate attacks on the Germans regardless of the cost to the civilian population in German reprisals. Following the German invasion of the Soviet Union, the Wehrmacht redeployed all but four of its divisions from Yugoslavia. Tito capitalized on this situation, and the Partisans were particularly active in Montenegro, Serbia, and Bosnia. By the autumn of 1941, Tito's Partisans numbered 50,000 people and contested the Germans for control of much of the countryside. In contrast to Mihailović, Tito favored a Pan-Yugoslav platform after the war, stressing participation of all ethnic groups and establishment of a federated Yugoslav state.

Tito and Mihailović met on two separate occasions in September and October but failed to develop a cooperative approach against the Germans. Hostilities between these two groups began in November 1941 when Četniks attacked the Partisan base at Uzice. Moreover, the Četniks often collaborated with Italian troops and the Nedić government in attempts to rid Serb and Montenegrin areas of Partisan influence. An agreement with German forces

concluded on November 11 allowed the Četniks freedom of movement in return for taking action against the Partisans.

Partisan strength continued to grow, however. During 1942 their numbers reached 100,000 people, and by 1943 they had swelled to 250,000. By the end of the war, Tito claimed nearly 800,000 followers. So effective were their activities that the Germans recalled their 113th Division from the Eastern Front and the 342nd Division from France to help contain the Partisans. The Yugoslav resistance is thus credited with tying down a large number of Axis troops who would otherwise have been available for deployment elsewhere.

German forces mounted six major anti-Partisan operations between 1941 and 1944; the chief consequence of these sweeps was to force Tito to abandon any fixed base of operations. German reprisals against civilians, sometimes at the rate of 20 civilians killed for every dead German, usually generated still greater Partisan support. By 1943, both the Nedić government in Serbia and the Ustaše government in Croatia were unstable, and Tito's strength had grown to the point where he transformed the Partisans into the National Liberation Army of Yugoslavia. Also in 1943, Tito created a shadow Yugoslav provisional government known as the Anti-Fascist Council for the Liberation of Yugoslavia (Antifašističko Vijeće Narodnog Oslobođenja Jugoslavije, AVNOJ). Located in Bosnia, the AVNOJ established a network of district committees in Partisan-controlled areas of Croatia, Montenegro, and Serbia.

The British continued to support Mihailović and his Četniks until December 1943, when, falsely convinced by a communist agent that the Serb-dominated Četnik resistance group was not fighting the Germans, Winston L. S. Churchill's government decided to channel all its aid to the Partisans. On November 29, 1943, the AVNOJ created the National Committee for the Liberation of Yugoslavia (Nacionalni Komitet OsloboĐenja Jugoslavije) as a shadow government. It banned King Peter from returning to Yugoslavia and announced its intent to create a postwar federated state.

When Italian troops withdrew from Yugoslavia at the end of 1943, Tito's force seized the Italian arms depots. Faced with surprisingly successful resistance movements in the hills of Serbia and Bosnia, the Germans launched a number of operations, two of the largest coming in 1943, in an increasingly futile attempt to crush the Partisan movement. Accounts of

Partisan survival and heroism in the midst of these assaults assumed mythic dimensions in postwar Yugoslavia.

When the Germans pulled out many of their troops, the Partisans, largely recruited from the peasantry, already held most of the countryside and the main lines of communication. In a coordinated effort on October 20, 1944, the Soviet army and Partisan forces moved into Belgrade. On March 7, 1945, Tito's provisional government formally declared itself the legitimate leadership of the Federal People's Republic of Yugoslavia.

For Yugoslavia, the toll of World War II had been heavy. By its end, an estimated 1.7 million Yugoslavs had been killed, both in combat and in atrocities committed by and against civilians.

At the end of the war, Yugoslavia attempted to annex Italian Istria and Trieste and the southern provinces of Austria. Tito's forces moved into Carinthia and tried to take it by coup de main. The speedy advance of the British V Corps prevented this, but there was a tense standoff. In mid-May 1945, the threat of force finally convinced the Yugoslavs to leave Austria. Clearly, Tito had hoped to seize any area where there was a blood tie to any ethnic group in Yugoslavia, including Carinthia, Istria, and Slovenia.

Tito did exact vengeance on the Croats, many of whom had been loyal to the Germans, as had many Slovenes. Within weeks of the war's end, the Partisans executed without trial up to a quarter of a million people who had sided with the Germans, most of them Croats. In addition, the majority of German prisoners taken in the war perished in a long "march of hate" across Yugoslavia. German soldiers captured in Yugoslavia worked as slave laborers; 60 percent of them were dead within a year. Also, despite protests by Western governments, the new Yugoslav government tried and executed General Mihailović.

The fact that the Yugoslav resistance had fought so well against the Germans and that it had liberated most of the country placed Tito in a strong position to demand and secure a Red Army withdrawal from those parts of Yugoslavia it occupied. In 1948, however, Yugoslavia was expelled from the international communist movement.

Yugoslavia, Axis Conquest of (April 6–17, 1941)

German-led Axis conquest of Yugoslavia in April 1941. On December 13, 1940, German chancellor Adolf Hitler issued orders for the conquest of Greece (Operation MARITA) to support the Italians in Albania and protect Germany’s southern flank during the planned invasion of the Soviet Union. Use of the Belgrade-Nis-Salonika railroad line was essential for German operations in Greece, and thus the cooperation of Yugoslavia was needed. Accordingly, Hitler pressured Yugoslavia to join the Tripartite Pact on March 25, 1941.

This precipitated a bloodless military coup in Belgrade on March 26–27. Prince Regent Paul fled to Greece, 17-year-old King Peter II took the throne, and the Yugoslav Air Force’s General Dušan Simović formed a new government. Although Simović assured Hitler that Yugoslavia would remain friendly, the führer was enraged by the coup, and on March 27 he issued Directive No. 25 ordering the German conquest of Yugoslavia, which assigned supporting roles in the operation to both Italy and Hungary.

The German high command quickly prepared plans for the operation and began to assemble the necessary forces. The latter included Colonel General

Maximilian von Weichs zu Glon's Second Army, then in Austria and southwest Hungary (11 divisions in four corps); Lieutenant General Georg-Hans Reinhardt's XLI Panzer Corps, near Timisoara, Romania (1 Schutzstaffel [SS] motorized infantry division plus 1 infantry and 1 panzer regiment); and Colonel General Paul Ludwig Ewald von Kleist's First Panzer Group (5 divisions in two corps), assembling in Bulgaria for the planned invasion of Greece. Luftwaffe assets assigned to the operation included some 1,148 aircraft of the Fourth Air Fleet in Austria, the VIII Air Corps in Bulgaria, and the X Air Corps on Sicily.

The weak Yugoslav Army was no match for the Germans. Mobilized on March 29, it totaled fewer than 1 million men in 35 divisions, other troops under three army groups, one independent field army headquarters, and the Coastal Defense Command. The Yugoslavs had few modern tanks and little artillery and relied on animal transport. Most Yugoslav war matériel had been obtained from Germany, and there were few reserves of ammunition or other supplies. The Yugoslav Air Force had some 459 military aircraft, its airfields were vulnerable, and it lacked spares and other equipment. The Yugoslav Navy consisted of 1 old training cruiser, 4 modern destroyers, 4 submarines, 2 river monitors, and 16 old motor torpedo boats. Its ships were manned largely by Croats. Politically unreliable, the navy would play no role in the coming campaign.

German infantrymen engaged in mopping up operations in a small town on the Drau River in Yugoslavia, May 9, 1941. (Bettmann/Corbis)

After only 10 days for planning and preparations, the Germans began their assault on April 6, 1941, with a massive air attack on Belgrade that killed some 17,000 civilians, destroyed much of the Yugoslav Air Force, and cut communications between the Yugoslav Supreme Command and its units in the field. The same day, Field Marshal Siegmund Wilhelm List's Twelfth Army launched Operation MARITA. The German XL Panzer Corps took Skopje on April 7, thereby cutting off the Yugoslav line of retreat toward Salonika, and the Twelfth Army continued into Greece.

Directive No. 25 called for a three-pronged attack aimed at Belgrade. The First Panzer Group attacked from Bulgaria on April 8 on the Nis-Kragujevac-Belgrade axis, overcame stiff resistance by the Yugoslav Fifth Army, and took Nis on April 9. At the same time, the XLI Panzer Corps attacked from Romania and plowed through the Yugoslav Sixth Army. Using bridges over

the Danube, Drava, and Sava Rivers seized by the Second Army between April 1 and 7, the XLVI Panzer Crops attacked toward Belgrade on April 10, routing the Yugoslav Fourth and Second Armies and reaching Novi Sad on April 11. That same day, Zagreb fell to the LI Infantry Corps, aided by the 14th Panzer Division detached from the XLVI Panzer Corps. Meanwhile, the XLIX Mountain Corps forced the surrender of Yugoslav forces in Slovenia, and the Italian Second Army attacked from Trieste down the Yugoslav coast, meeting little resistance.

German forces advancing during the April 1941 Axis invasion of Yugoslavia. (Ullstein Bild via Getty Images)

On the evening of April 12 the three converging German corps surrounded Belgrade, and the next morning German forces entered unopposed. The Second Army then assumed responsibility for all operations in Yugoslavia and acted to prevent the withdrawal of Yugoslav forces into the Serbian mountains. Weichs's two pursuit groups moved toward Sarajevo from Zagreb and from Belgrade via Uzice. On April 14, the Yugoslav government was evacuated to Greece, and negotiations for an armistice began.

Sarajevo fell the next day, and on April 17 Yugoslavia surrendered unconditionally at Belgrade. The armistice went into effect on April 18, ending a 12-day campaign in which the Germans had only 558 casualties,

including 151 killed. Yugoslavia was then annexed or occupied by the victorious Axis powers except for Croatia and Bosnia-Herzegovina, which formed the pro-Axis Independent State of Croatia.

Yugoslavia Campaign (1944–1945)

Campaign to drive German forces from Yugoslavia by communist-led Partisans. By mid-1944, the Partisans led by Josip Broz (Tito) were poised to achieve both of their principal objectives: the annihilation of the royalist Četniks led by Dragoljub "Draza" Mihailović and the expulsion of Axis occupation forces from Yugoslavia. The Italian capitulation in September 1943 provided the Partisans with enormous quantities of arms and other equipment, and in December 1943 the Allies cut off aid to the Četniks and increased their support for the Partisans. Having survived several German assaults on his headquarters in early 1944, Tito saw his prestige enhanced when he was named minister of war in the new government-in-exile formed by King Peter II on May 17, 1944. In June 1944, Tito launched the Partisans against the Četnik stronghold in Serbia, aiming to destroy his rival and deliver a significant blow against the Axis occupation forces.

The Germans managed to hold the Partisans in eastern Serbia, and in July 1944 Tito asked Soviet leader Joseph Stalin to divert the Soviet Red Army toward Belgrade to hasten the defeat of the 60,000 to 70,000 remaining Četniks and the Axis occupation forces. On August 2 the Partisans advanced into Macedonia, and on August 20 the Red Army launched a drive deep into Romania, which surrendered on August 24. The Soviets declared war on Bulgaria on September 5, and three days later the Bulgarians asked for an armistice, declared war on Germany, and moved forces from Sofia toward the Yugoslav border.

German commander in chief, southeast, Field Marshal Maximilian von Weichs zur Glon commanded German forces in both Greece and Yugoslavia. Principal forces available to him in Yugoslavia were the Second Panzer Army (9 divisions in 4 corps but no panzer units), with headquarters at Kragujevac, and Military Command Southeast (3 divisions under 2 corps headquarters), with headquarters in Belgrade. The situation at the end of August 1944 made it necessary for German Army Group E (11 divisions under 6 corps-level headquarters) to begin the withdrawal of all troops from Greece (except for garrisons on Crete and Rhodes) to Macedonia.

Yugoslavian leader Marshal Tito (right) and his staff at his secret mountain retreat during the campaign against German forces in Yugoslavia, 1944. (Hulton Archive/Getty Images)

With the Bulgarian declaration of war on September 8, the German 1st Mountain Division moved north, occupied Skopje, and secured the critical Belgrade-Nis-Salonika railroad line. On October 14, Army Group E headquarters assumed responsibility for a 375-mile defense line in southeastern Yugoslavia facing 13.5 Soviet and Bulgarian divisions of the Soviet 3rd Ukrainian Front (Thirty-Seventh and Fifty-Seventh Armies) and the Bulgarian First, Second, and Fourth Armies. On September 8–9 a general uprising in Greece hastened the German withdrawal, and by November 2 the last organized German units had left Greece.

By late September Soviet forces advancing from Romania were fighting north of Belgrade, and on September 29 the Red Army entered Serbia. On October 20, Belgrade was "liberated" by the Red Army and Tito's I Partisan Corps. The Red Army subsequently moved on toward Hungary, leaving the Partisans to mop up the remaining Četnik forces and hasten the withdrawal of German occupation forces.

At this point, the guerrilla war fought by the Partisans against the Axis occupation forces became a conventional campaign. The combined onslaught of the Partisans and the Red Army brought about the collapse of the Četniks. In September, Mihailović had called for a general mobilization to rid Serbia of Partisans and Axis occupation forces, but attacked on three sides, the Četniks were forced to retreat and regroup in Bosnia. They subsequently ceased to be a major factor in the Yugoslav equation. Mihailović returned to Serbia in April 1945 hoping to organize resistance to the communists, but he was captured by the Partisans and executed in July 1946.

After the fall of Belgrade, German forces withdrew from Macedonia, Albania, and Montenegro, moving in good order to the northwest. Unable to mount a major counterattack, they also abandoned Serbia to form a defensive line in Bosnia and western Croatia. In March 1945 a new communist-dominated coalition government was formed with Tito as premier, and on March 20 the Partisan forces were redesignated as the Yugoslav National Army and began a general offensive against the Germans. The Germans held in central Bosnia and eastern Croatia until April 10, when they began a

headlong retreat toward Austria, where the bulk of the German units surrendered to the British.

On May 9 the Partisans took Zagreb, having smashed the Ustaše and the Independent State of Croatia. By May 15 all of Yugoslavia had been retaken, and the Partisans exacted a terrible revenge on the remaining Axis troops and their Yugoslav collaborators. Those Germans taken prisoner by the Partisans were severely mistreated, and some 50,000 of them died in captivity.

Z

Zaibatsu (Japan)

Japanese term that referred to a relatively small number of large and powerful business and financial cartels that controlled entire industries and exerted much influence on Japan's economy and politics prior to World War II. The term *zaibatsu* can be translated as "financial (or commercial) clique." The Zaibatsu played an important role in Japanese industrialization and militarization beginning in the late 19th century and became an integral part of Japanese expansion into Korea and China in the 20th century.

The origins of the Zaibatsu can be traced to the Meiji Restoration in Japan (ca. 1868–1910), but their growth and influence did not accelerate until the early 1920s, when the term was first used to describe these companies. The largest and most important of these early enterprises were Sumitomo, Mitsubishi, Yasuda, and Mitsui. After the 1904–1905 Russo-Japanese War, several newer companies were added, including Nakajima and Okura.

Almost all of the Zaibatsu entities, which were owned and controlled by a small number of wealthy families, were vertically integrated businesses that consisted of a holding company, an affiliated financial subsidiary, and a number of secondary and tertiary industrial subsidiaries that gave that one enterprise virtual control over an entire industry or sector of the economy. These included banking, steel making, chemical manufacturing, mining, etc. The families retained sole or majority control over the holding companies, which set policies for the firms underneath them. By the late 1930s, the four top Zaibatsu entities alone controlled 30 percent of Japan's chemical, mining, and metal fabrication industries and nearly 50 percent of the heavy equipment and machinery industries.

The Zaibatsu had important connections with the Japanese government and the military, which gave it considerable clout in political and military decision making. These connections were at once semifeudal in origin and structure but were also indicative of quasi-corporatist business-government

relations, not dissimilar to what existed in fascist Italy after 1922 and in Nazi Germany beginning in the early 1930s. Most Zaibatsu entities prospered during the global depression of the 1930s by exploiting business opportunities in Korea and China, garnering lucrative military contracts, engaging in financial and currency manipulation, and exploiting cheap or slave labor in Japan's newly acquired colonies.

The Zaibatsu played a major role in the Second Sino-Japanese War (1937–1945) and profited handsomely from it. Nissan became an important Zaibatsu operating in Manchukuo (Manchuria) after 1939. Although the Japanese government nationalized a number of Zaibatsu entities during World War II, this did not dampen the controlling families' willingness to work with the government; indeed, many Zaibatsu heads were often part of government decision making between 1940 and 1945.

After the defeat of Japan in 1945, Allied occupation officials initially sought to dismantle the Zaibatsu in the belief that it had contributed to Japan's prewar militarism and was fundamentally monopolistic and inefficient. By late 1947, however, severe economic hardship in Japan and the accelerating Cold War prompted a major reassessment of occupation and reconstruction policies known as the "reverse course." Now occupation officials sought to promote Japanese industrialization and speed up economic reconstruction. This policy change essentially stopped plans to disassemble the Zaibatsu. In the end, of the more than 1,000 Zaibatsu firms existing in 1945, fewer than 30 were dissolved.

To encourage economic modernization and diversification, however, occupation authorities compelled the Zaibatsu to do away with interlocking directorates and divest itself of privately held holding companies. Today vestiges of the Zaibatsu remain in Japan, although they are less likely to be vertically integrated and more likely to engage in horizontal business cooperation. It is also far less likely that one family controls an entire corporation.

Zeitzler, Kurt von (1895–1963)

German Army general. Born in Cossmar-Luckau, Germany, on June 9, 1895, Kurt von Zeitzler joined the German Army and rose to command the 72nd Infantry Regiment in World War I. He continued in the army after the war and qualified as a General Staff officer.

Zeitzler was an early supporter of Adolf Hitler and in 1934 was one of the first to join the panzer forces. As a lieutenant colonel on the army General Staff (Oberkommando des Heeres, OKH), he helped plan the German military takeover of Czechoslovakia in March 1939. Promoted to colonel, Zeitzler briefly commanded a regiment before becoming chief of staff of Lieutenant General Ewald von Kleist's XII Corps in the September 1, 1939, invasion of Poland and of Army Group Kleist (later the First Panzer Group) in the invasion of France and the Low Countries in May 1940.

Zeitzler continued as chief of staff of the First Panzer Group during the invasions of Greece and Yugoslavia and for Operation BARBAROSSA, the invasion of the Soviet Union, on June 22, 1941. He also played important roles in organizing the German drive through the Ardennes in 1940 and in Kleist's panzer operations in Greece and the Ukraine in 1941. Zeitzler proved especially adept at logistical matters, ensuring that supplies kept up with the fast-moving tanks.

In April 1942, Zeitzler was assigned as chief of staff to commander in chief, West, Field Marshal Karl Gerd von Rundstedt and promoted to general of infantry. Zeitzler played a major role in defeating the Allied raid at Dieppe on August 19. In September, Hitler named Zeitzler to replace Colonel General Franz Halder as chief of the OKH and promoted him to colonel general. An aggressive officer with the nickname "Kugelblitz" (Lightning Ball), Zeitzler seemed to be the type of officer Hitler desired.

As the senior General Staff officer of the German Army, Zeitzler made a number of changes to improve procedures. Effecting change in Hitler's strategic thinking proved more difficult, although he did stand up to the

führer on a number of occasions. The August 23, 1942–February 2, 1943, Battle of Stalingrad drove a wedge between the two men, however. Once the Sixth Army was cut off, Zeitzler urged that it be allowed to break out, whereas Hitler demanded that it remain in place. Zeitzler went so far as to predict that an airlift of supplies to the beleaguered army would not be successful, angering Hitler further. Zeitzler also proposed a major restructure of the high command, suggesting that the OKW (Armed Forces Supreme Command) and the OKH be merged and that Generals Wilhelm Keitel and Alfred Jodl be replaced. Zeitzler also argued that the Waffen-Schutzstaffel (Waffen-SS) should be placed under direct OKH command. Hitler rejected these suggestions.

Following the failure at the Battle of Kursk (July 5–13, 1943), which he had largely planned, Zeitzler fell out completely with Hitler. Having gained the enmity of Keitel and Jodl, dumbfounded by Hitler's prosecution of the war, and frustrated at his own inability to affect decisions, Zeitzler simply walked off the job on June 30, 1944, for "reasons of health."

In January 1945, an angry Hitler took the extraordinary step of dismissing Zeitzler from the army. Imprisoned after the war, Zeitzler was released in 1947. He died at Hohenaschau in Upper Bavaria on September 25, 1963.

See Absolute National Defense Zone

Zhang Fakui (1896–1980)

Chinese Nationalist leader. Born in Shixing (Shihhsing), Guangdong (Kwangtung) Province, China, on July 25, 1896, Zhang Fakui (Chang Fa-k'uei) joined his native provincial forces after the 1911 Revolution. In 1912, he became a member of what became the Guomindang (Kuomintang, GMD), the Nationalist Party. In 1925, the GMD organized the National Government at Guangzhou (Canton) in Guangdong and reorganized the various armies into the National Revolutionary Army. Zhang took command of the Fourth Army's Independent Regiment, participating in the Eastern and Northern Expeditions of 1925–1928.

During his service, Zhang became involved in the political struggle between Wang Jingwei (Wang Ching-wei) and Jiang Jieshi (Chiang Kai-shek) as to who should be the leader of a reunified China. Zhang cooperated with Wang and staged a coup in November 1927 to recapture Guangdong, at that time in the hands of the pro-Jiang Guangxi (Kwangsi) clique. At this juncture, the Chinese Communists staged the abortive Guangzhou uprising in early December. Defeated by the Guangxi clique and alleged to have a role in the Communist coup, Zhang left the army and retired to Japan. In early 1929, Zhang returned to China, commanding several divisions against warlord forces. Nevertheless, Zhang was again involved in anti-Jiang coalitions centered around Wang in Guangzhou.

The Japanese invasion of Manchuria in 1931 brought the reconciliation of Jiang and Wang. Zhang traveled abroad beginning in 1932 until being recalled in 1935. He was then assigned the tasks of pacifying Chinese Communist areas and preparing for a full-scale Japanese invasion. When the Second Sino-Japanese War erupted in 1937, Zhang took command of the Eighth Army Group in the unsuccessful defenses of Shanghai in Jiangsu (Kiangsu) Province, Wuhan in Hubei (Hupeh), and Guangzhou.

In late 1938, Zhang was made commander of the Fourth War Zone of Guangdong and Guangxi. The situation in southern China remained relatively stable until 1944, when the Japanese launched the devastating ICHI-GO Offensive (April–December), which forced Zhang's forces into major retreats. At year's end, Zhang relocated the Fourth War Zone to western

Guangxi, reorganizing the military forces and resisting any further Japanese advance. In May 1945 Zhang retook Guangxi, and he returned to Guangzhou in September to receive the Japanese surrender.

Following the war, Zhang became the director of Jiang's headquarters at Guangzhou until late 1947, when he served as commander of the Chinese land forces in the Chinese Civil War. In June 1949 Zhang went to Hong Kong, where he was associated with the so-called Third Force Movement. He avoided politics thereafter. Zhang died in Hong Kong on March 10, 1980.

Zhanggufeng/Khasan, Battle of (July 29–August 11, 1938)

Armed clash along the border between the Soviet Maritime Province and Japanese colonial Korea. The border dispute between the two sides led to fighting, beginning on July 29, 1938, on a small hill known as Zhanggufeng (Chang-ku-feng) and the adjacent Lake Khasan.

On August 6, Soviet lieutenant general Vsevolod Nikolaevich Sergeev's XXXIX Rifle Corps of 23,000 infantry troops, with tanks and armored vehicles and supported by heavy artillery and air cover, attacked units of Japanese lieutenant general Suetaka Kamezō's 14th Division of 7,000 infantry troops defending Zhanggufeng. By August 9, lacking heavy artillery and armor, the Japanese were driven from the hill. The Soviet forces then broke off contact except for reconnaissance. The Japanese refrained from a counterattack on the eve of their Wuhan operation in China. A truce was arranged between the two sides on August 11, 1938. The Japanese sustained

1,440 casualties (526 killed). The victorious Soviets paid a higher price, with 792 killed or missing and 3,279 wounded.

As a consequence of the battle, the Soviets gained confidence in their combat effectiveness. The battle also revealed glaring Japanese weaknesses in firepower and tanks, but the army did nothing to rectify these shortcomings.

Zhang Xueliang (1901–2001)

Chinese Nationalist general. Born in Taian (T'aian), Liaoning Province, China, on June 3, 1901, Zhang Xueliang (Chang Hsüeh-liang) was the eldest son of the Manchurian warlord Zhang Zuolin (Chang Tso-lin). Graduating from the Fengtian (Fengtien, old name of Liaoning) Military Academy in 1920, Zhang Xueliang joined his father's army, resisting the growth of Japanese and Russian influences in Manchuria and defending Manchuria against other warlords.

In June 1929 the elder Zhang was assassinated, allegedly by the Japanese Guandong (Kwantung) Army. The younger Zhang became commander in chief of the Northeast Peace Preservation Forces. That December, he declared allegiance to the government of Jiang Jieshi and his Nationalist Party—the Guomindang (Kuomintang, GMD), believing that national unity was essential to halt the Japanese advance in Manchuria.

The Zhang-Jiang relationship developed strains after the Mukden (Shenyang) Incident of September 1931 in Liaoning. Following Jiang's nonresistance policy toward the Japanese advance, Zhang led his Northeastern Army out of Manchuria. At year's end, Zhang became pacification commissioner of Beijing (Peking), Hebei (Hopeh). In January

1933, he engaged the Japanese along the Great Wall, defending the Rehe (Jehol) Province. Held responsible for the loss of Rehe in March, Zhang resigned his military posts and went abroad on an inspection tour.

Zhang returned in early 1934 and became deputy commander in chief of the Henan-Hubei-Anhui (Honan-Hupeh-Anhwei) "Bandit Suppression" Office, responsible for crushing the Chinese Communists. In October 1935, Zhang became head of the Northwest "Bandit Suppression" Office and was stationed in Xi'an (Sian), Shaanxi (Shensi) Province, where he began communicating with the Chinese Communists who had just completed the 1934–1935 Long March and settled in the northeastern part of Shaanxi. In mid-1936, Zhang and Chinese Communist leader Zhou Enlai (Chou En-lai) finally agreed on an anti-Japanese united front.

Jiang remained the chief obstacle, which precipitated the Xi'an Incident of December 1936. In early December, he went to Xi'an to discuss the last anti–Chinese Communist campaign. Unable to convince Jiang to drop this plan, Zhang, in cooperation with Shaanxi's pacification commissioner, Yang Hucheng (Yang Hu-ch'eng), kidnapped Jiang on December 12. Zang then invited Zhou to discuss the Nationalist-Communist cooperation.

On Christmas Day after securing Jiang's agreement on a united front, Zhang accompanied Jiang back to Nanjing (Nanking), Jiangsu (Kiangsu). On arrival, Zhang was arrested for insubordination and put under the National Military Council's strict surveillance, thereby ending his public life. In November 1946, he was taken to Taiwan and held in detention until 1991, when he went to the United States. Zhang died in Honolulu, Hawaii, on October 14, 2001.

Zhou Enlai (1898–1976)

Chinese Communist Party (CCP) leader. Born into a wealthy family in Shaoxing (Shaohsing), Zhejiang (Chekiang) Province, on March 5, 1898, Zhou Enlai (Chou En-lai) studied at Waseda University and, from 1917 to 1919, at Japan University in Tokyo. He returned to China to continue his studies at Nankai University and joined the May Fourth Movement demonstrations in Beijing (Peking) in 1919 that called for modernization and democracy in China. Imprisoned briefly for this activity, Zhou left China in late 1920 for France on a work-study plan. There, he helped organize a branch of the CCP.

Zhou Enlai (Chou En-lai), shown here in 1938, was one of the important leaders of the Communist Party in China. A veteran of the Long March and close associate of Mao Zedong (Mao Tsetung), Zhou was premier of the People's Republic of China from 1949 until his death in 1976. (Earl Leaf/Michael Ochs Archives/Getty Images)

Returning to China in 1924, Zhou embarked on his revolutionary career, directing the Guangdong (Kwangtung) Province CCP Military Affairs Department. He then served as director of the Political Department of the Huangpu (Whampoa) Military Academy under Jiang Jieshi (Chiang Kaishek), leader of the Nationalist Party, the Guomindang (Kuomintang, GMD). Zhou secretly helped plan the Shanghai uprisings of 1925, 1926, and 1927 in Jiangsu (Kiangsu) Province, narrowly escaping arrest by the GMD.

From April 1927, Zhou directed the CCP Central Committee's Military Affairs Department. He assisted in the planning for the Nanchang Uprising of August 1927 and was an important figure in the formation of the Red Army. He participated in the Long March but was removed from the Central Military Commission at the 1935 Zunyi (Tsunyi) Conference.

Zhou supported the idea of a conventional army to oppose Jiang's GMD and disagreed with Mao Zedong's (Mao Tse-tung) concept of guerrilla warfare. Zhou initially outranked Mao in the party leadership but later assumed a subordinate role. During the next four decades, the two men worked closely together, despite their great differences in approach and outlook. Zhou proved to be an indefatigable and gifted administrator, a masterful diplomat, and an adroit politician. He was also the ultimate survivor.

Zhou was the chief CCP negotiator with Jiang following the Xi'an Incident in 1936 and helped form the united front with the GMD against the Japanese. Following World War II, Zhou tried without success to negotiate a coalition government with the GMD.

Named China's prime minister on October 1, 1949, Zhou remained in that post for more than 26 years until his death. For the first 8 years, he served concurrently as foreign minister. Zhou played a key role during the Korean War (1950–1953), paving the way for China's entry into the conflict. Zhou headed China's delegation to the 1954 Geneva Conference to end the Indochina War and deal with other Asian problems. He worked to stabilize the mercurial Mao and to keep China's government functioning through the constant upheavals of Mao's Great Leap Forward and the Cultural Revolution. The urbane and sophisticated Zhou served as China's chief emissary to the outside world. He died in Beijing on January 9, 1976.

Zhu De (1886–1976)

Chinese Communist marshal. Born into poverty in Yilong (Yi-lung), Sichuan (Szechwan) Province, on December 18, 1886, Zhu De (Chu Teh) passed the civil service entrance examination. By 1906 he had transferred to the Yunnan Military Academy, graduating in 1911, whereupon he participated in the Chinese Revolution. Until the end of World War I, Zhu served in warlord armies in Yunnan and Sichuan (Szechwan) Provinces, apparently acquiring both wealth and an addiction to opium that he ultimately defeated before traveling to Germany to study in Berlin and Göttingen. An encounter with the young Chinese revolutionary Zhou Enlai (Chou En-lai) converted Zhu to communism, which brought Zhu’s expulsion from Germany.

Returning to China in 1926, Zhu concealed his new sympathies and joined the army of the Guomindang (Kuomintang, GMD), the Nationalist Party. In August 1927, he joined the unsuccessful Communist uprising in Nanchang, later considered the birth of the communist Red Army. Subsequently, he took his troops to join the Communist guerrilla forces of Mao Zedong (Mao Tse-tung) in Hunan Province. Zhu became commander and Mao political commissar of their combined force, the Fourth Red Army, which moved to Jiangxi in 1929, expanding to 200,000 men by 1933. The two men developed strategies for modern large-scale Chinese guerrilla warfare, focusing on control of the country.

In 1934 after repeated Nationalist attacks, Zhu’s forces escaped encirclement in what became the epic 6,000-mile Long March to a new base at Yan’an (Yenan) in northwestern Shaanxi (Shensi) Province, during which Mao, with Zhu’s support, won control of the Chinese Communist movement.

When Communist forces allied with Nationalist troops after the 1937 Japanese invasion of China, Zhu commanded all Chinese Communist troops in what had become the Eighth Route Army. After directing the disastrous "Hundred Regiments" Campaign against Japanese troops in late 1940, Zhu returned to guerrilla operations in Japanese-controlled areas. By 1945, he had built the Red Army into a force of 800,000, controlling much of northern China's countryside.

During the 1945–1949 Chinese Civil War, Zhu directed Communist military strategy. From 1949 to 1954 he served as China's defense minister, and in 1955 he was among 10 marshals of the People's Republic of China. Persecuted for several years during the Cultural Revolution, he was subsequently rehabilitated. When he died in Beijing (Peking) on July 6, 1976, Zhu was head of the Standing Committee of the National People's Congress.

Zhukov, Georgii Konstantinovich (1896–1974)

Marshal of the Soviet Union. Born in Strelkovka, Kaluga Province, Russia, on November 19, 1896, Georgii Konstantinovich Zhukov was the son of peasants. He was apprenticed as a furrier at age 12. Conscripted into the Russian Army in 1915, Zhukov served in the cavalry during World War I. After recovering from wounds received in combat, he joined the Red Army in 1918.

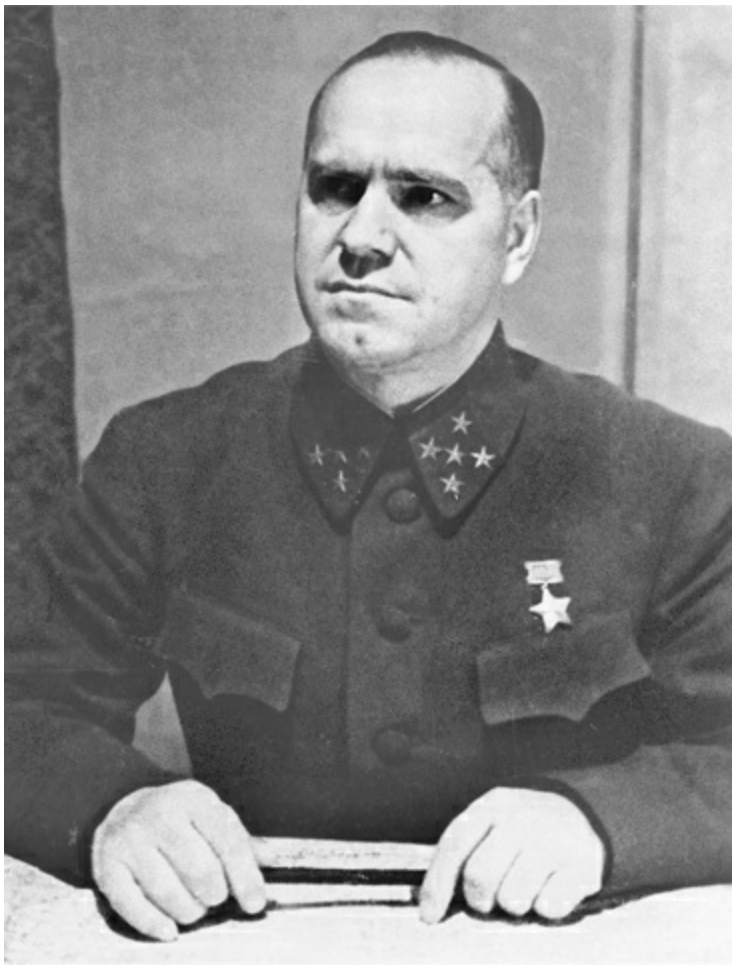
Zhukov commanded from platoon through squadron levels in the Russian Civil War, joining the Bolshevik Party in 1919. He took charge of a cavalry regiment in 1922 and a brigade in 1930. In 1932, he assumed command of a

cavalry division; four years later, he commanded a corps. Zhukov was one of the few senior officers to survive the military purges of 1937.

Serving as deputy commander of the Belorussian Military District, Zhukov was sent to the Far East in June 1939 to deal with Japan's attempted invasion of Mongolia. By the end of August, he had decisively repulsed the Japanese in the Battle of Khalkhin Gol. In 1940, he was promoted to army general and appointed chief of the General Staff. After the Germans invaded the Soviet Union on June 22, 1941, Zhukov asked to be relieved from that post when Joseph Stalin rejected his suggestion that Kiev be abandoned before it was lost to the Germans. Stalin's decision cost the Soviets some 665,000 soldiers captured by the Germans.

During the course of World War II, Zhukov was involved in the planning and execution of nearly every major campaign of the Eastern Front. In October 1941, he replaced Marshal Kliment Voroshilov at Leningrad and galvanized the defense there. Then, as commander of the West Front that same month, he organized the defense of Moscow; in November and December, he launched the counteroffensive that forced the Germans back from Moscow. In the fall of 1942, Zhukov and General Aleksandr Vasilevsky planned the counteroffensive at Stalingrad that trapped General Friedrich Paulus's German Sixth Army.

Promoted to marshal of the Soviet Union and appointed deputy supreme commander of the Red Army, Zhukov returned to Leningrad in 1943 and lifted the siege there. Then in July as special representative for Stavka (the Soviet high command), again along with Vasilevsky, Zhukov supervised the defense of the Kursk salient and the subsequent offensive that swept across the Ukraine.



Soviet marshal Georgii Zhukov, ca. 1942. Known as “Stalin’s Fireman,” Zhukov took part in almost every major Soviet battle of the war. (Library of Congress)

During June 22–August 29, 1944, Zhukov commanded the Belorussia Offensive, which destroyed German Army Group Center and ended the German occupation of Poland and Czechoslovakia. In April 1945, he personally commanded the final assault on Berlin; he took the official German surrender for the Soviet Union on May 8, 1945, and remained to command Soviet occupation forces in Germany.

In 1946, Zhukov assumed command of all Soviet ground forces, but one year later, he fell victim to Stalin’s paranoia and was relegated to command of the Odessa Military District. After Stalin’s death in 1953, Zhukov became deputy minister of defense and then in 1955 defense minister. During the Nikita Khrushchev years, Zhukov’s fortunes rose and fell but rose again when Khrushchev was deposed in 1964. Zhukov died in Moscow on June 18, 1974.

Zoot Suit Riots (May–June 1943)

Series of violent clashes that occurred chiefly in Los Angeles, California, during May–June 1943, pitting U.S. servicemen—chiefly sailors and marines—against Mexican Americans. The rioting later spread to other cities, including New York, Chicago, Detroit, Philadelphia, San Diego, Oakland, and San Jose; these latter occurrences were not, however, on the same scale as the riots in Los Angeles.

The riots took their name from the zoot suit, a particular style of clothing that featured long suit coats, baggy pegged pants, a porkpie hat, shoes with high soles, and often a long key chain dangling from the coat pocket. These suits were often worn by the city's Mexican American youths, who called themselves pachucos. Because of wartime restrictions, however, the manufacture of such suits had been banned in 1942 to save fabric for the war effort. Nevertheless, there was a brisk business in the continued illicit manufacture and sale of the suits.

Since the United States entered the war in late 1941, the Los Angeles area had become the temporary home to thousands of soldiers, sailors, and marines. The city also became a favorite spot for servicemen to indulge themselves with women and drink while on leave or with shore passes when

their ships were at Los Angeles for resupply. The local press meanwhile added to racial and ethnic tensions by consistently portraying the city's Mexican American youths as troublemakers and would-be gangsters.

Tensions increased when a group of Latino youths were falsely accused of having murdered a Mexican man during the summer of 1942; the local newspapers only accelerated the rush to judgment. This incident outraged many in the Mexican American community but seemed to give credence to the white community's distrust of the Latino community.

The first major occurrence of violence was on the night of May 30, 1943, when a group of 12 sailors and soldiers began harassing a small group of Mexican American women on the street. A group of young pachucos then confronted the servicemen, and a melee ensued. Several individuals were seriously hurt. Thereafter servicemen targeted zoot suiters, further escalating tensions.

On the evening of June 3 another fight between servicemen and Mexican Americans erupted, this time involving several dozen people. The Los Angeles police did virtually nothing to stop the violence. On June 4, as many as 200 sailors, soldiers, and marines went into the Barrio in East Los Angeles and began assaulting Mexican American youths, some as young as 12 years old, in zoot suits. After beating them, the servicemen stripped off their suits and burned them. The local press portrayed the growing violence as originating solely from the Mexican American community.

After senior military officials revoked passes to military personnel and confined them to barracks, the violence died down by June 8. By midmonth, however, rioting had erupted in other California cities as well as those farther to the east.

In the aftermath, much criticism was aimed at military officials and civilian authorities for having failed to end the rioting sooner. Local officials and the press, however, continued to portray the unrest as being a problem emanating from the Mexican American community. On June 16, First Lady Eleanor Roosevelt commented on the riots in her weekly syndicated column. Among other things, she wrote that "The question goes deeper than just suits. It is a racial protest." The *Los Angeles Times* lashed out at Roosevelt, accusing her of stirring up a race war and exhibiting communist leanings.

Some believed that the unrest had been part of a Nazi disinformation campaign, but there is no evidence to suggest that. The riots clearly

demonstrated the high level of racial animosity in the United States during the war; indeed, they were among a number of riots and other violence that erupted between 1941 and 1945 involving racism.

Z Plan

German naval construction program initiated prior to World War II. The Z Plan had its origins in the early 1930s and was based on Adolf Hitler's assertion that no major military undertakings would be initiated until 1944 or 1945. Under restrictions imposed by the Versailles Treaty following World War I, the German Navy was limited to 6 predreadnought battleships, 6 cruisers, 12 destroyers, 12 torpedo boats, and no submarines. The Z Plan, which clearly violated the Versailles Treaty, called for a powerful balanced fleet and was eagerly supported by the commander of the German Navy, Grand Admiral Erich Raeder, and his fellow admirals, who were then in competition with the army and air force for scarce strategic resources.

Hitler approved the Z Plan on January 27, 1939, three months before he revoked the British-German Naval Agreement of 1935 that had limited his navy to a maximum of 35 percent of its British counterpart; that move itself was a violation of the Versailles Treaty. The Z Plan received supreme priority and called for a powerful fleet of surface ships and submarines centered on 6 superbattleships of 56,000 tons (H class), 12 small battleships of 20,000 tons, 4 aircraft carriers, 44 light cruisers, 68 destroyers, 90 torpedo boats, and 240 U-boats. Four battleships of the Bismarck and Scharnhorst classes (2 each) and 5 heavy cruisers as well as the 3 Deutschland-class pocket battleships already completed or under construction would join this planned fleet. The

total program would include 800 vessels of all types and was scheduled to be completed in 1948. Later, the completion date was advanced to 1944.

At the beginning of World War II the program was canceled, but it was revived in July 1940 after the defeat of France. The plan was even expanded, with schemes for a postwar German Navy of some 1,200 ships, including 25 battleships, 8 aircraft carriers, 100 cruisers, and 400 U-boats. At that time, the program also foresaw a massive buildup of harbors in many of the newly occupied territories, among them the French Atlantic coast and Norway. Trondheim was to become the largest German naval base in Europe. Colonies overseas would provide additional bases, with control of the Atlantic to follow in a second phase.

Little construction was actually undertaken because of the lack of human and industrial resources. After the German defeat in the Battle of Stalingrad (August 23, 1942–February 2, 1943), the Kriegsmarine (German Navy) suspended all construction of heavy surface warships in favor of submarines. Since September 1939, industrial facilities had been geared to the rapid completion of the battleships *Bismarck* and *Tirpitz,* the cruisers *Prinz Eugen* and *Seydlitz,* and the aircraft carrier *Graf Zeppelin* as well as the buildup of submarines. The *Seydlitz* and *Graf Zeppelin* were never completed.

German Navy warships at Hamburg, February 1939. (Bettmann/Corbis)

Hitler saw the Z Plan as a means for Germany to challenge Great Britain and the United States for world naval mastery. The plan remains one of the most striking examples of the lack of realism in German military planning.

From its inception, the program wasted enormous resources and, up to 1943, worked against a buildup of submarines, the major threat to British and U.S. mastery of the Atlantic.

Medals and Decorations of World War II

All of the major militaries of World War II conferred symbolic badges of distinction upon their soldiers, sailors, and airmen to recognize gallantry, combat valor, distinguished service, meritorious achievement, or war service. Those military awards took the form of orders, decorations, and medals.

Membership in an order conferred a distinction of chivalry or nobility upon the recipient. Such orders had their origins in medieval Europe hundreds of years ago, and most countries in the mid-20th century had a wide range of such orders. Some were exclusively military, some were exclusively civilian, and some were combined. (This essay will consider only those national orders most commonly awarded to the military.) Orders were awarded for distinguished service, sometimes for gallantry and valor in combat, and quite frequently for simply holding high rank. Most orders had multiple classes or degrees, which generally was a function of the rank of the recipient. For the most part only officers were eligible to receive chivalric and nobility orders. The first modern military decorations evolved from those chivalric and nobility orders.

Like orders, military decorations are awarded to recognize gallantry, valor, distinguished service, or meritorious achievement but without conferring any special social status upon the recipient. As recognition for enlisted soldiers became increasingly common during the 19th century, some countries established decorations that could be conferred regardless of rank.

Some countries through the end of World War II, however, had a dual system of decorations—one for officers and one for enlisted men.

Ranking below orders and decorations in precedence, medals were first introduced during the 19th century to recognize service in a war, a campaign, a battle, or periods of long service. In most but not all countries that fought in World War II, the badge of campaign and service medals had a round shape, whereas the badges of decorations tended to take on a variety of shapes, with stars and crosses predominating.

Although not military medals or decorations in the strictest sense, badges for weapons and equipment qualifications and special skills were also awarded; they comprised a widely developed system in most countries. Some of these badges, such as the U.S. Army's Combat Infantryman Badge and Combat Medic Badge and the German Infantry Assault Badge and Close Combat Badge, often carried greater prestige than most campaign medals and many decorations.

Some countries, including Great Britain and the United States, had specific decorations that were awarded only for combat valor and others that were awarded only for distinguished or meritorious service. In Germany and France, by contrast, most decorations could be awarded for either valor or service, and it was impossible to tell the difference once the award was on a soldier's uniform. The Soviet Union, which had the widest array of medals and decorations, had a composite system. Some countries, such as France, Belgium, and the United States, also had a system of awards for entire units, both for valor and meritorious service.

In the United States and Germany, all ranks were eligible for all decorations. In Britain and to a lesser degree France and the Soviet Union, certain decorations were only for officers, and others were only for enlisted personnel. In most countries with a dual system, however, the highest combat decoration could be awarded to both officers and enlisted soldiers. Some countries, including France, had a system of decorations that could be awarded to civilians as well as to military personnel. Others, such as Britain and Germany, generally had separate awards for civilians. The United States had a mixed system in which certain military decorations could be awarded to civilians and some could not.

The full medal of an award, consisting of a badge and a suspension ribbon, was normally worn only on dress uniforms and for special occasions.

For daily wear on service uniforms, the medals and decorations were represented by ribbon bars in the same pattern as the award's suspension ribbon. Soldiers of most countries during World War II did not wear full medals or ribbon bars on their combat or field uniforms. German and Soviet soldiers, and especially officers, did wear ribbon bars on their field uniforms, and German soldiers holding the Knight's Cross of the Iron Cross invariably wore that decoration suspended from a neck ribbon on their uniforms, regardless of the situation.

The numbers of the highest military decorations awarded by the various belligerents during World War II are summarized in Table 1. Tables 2 through 10 list for the specified country their orders and decorations in order of precedence, followed by a listing of campaign and service medals. The dates in parentheses after the orders and decorations indicate when the award was established. The dates in parentheses after the campaign medals indicate the periods of service for which the medal was awarded.

Table 1. Statistics of Highest Decorations Awarded during World War II

United States	Medal of Honor	464
	Distinguished Service Cross	5,057
	Navy Cross	3,958
Great Britain	Victoria Cross and Bar	1
	Victoria Cross	181
	George Cross	158
	Distinguished Service Order	5,444
Soviet Union	Hero of the Soviet Union 3rd Award	4
	Hero of the Soviet Union 2nd Award	104
	Hero of the Soviet Union	11,066
	Order of Victory	22
Germany	Grand Cross of the Iron Cross	1
	Knight's Cross of the Iron Cross	7,365

United States

The United States has never had orders of chivalry or nobility. The Medal of Honor is America's oldest continuous military decoration. It was established for the U.S. Navy on December 12, 1861, and for the U.S. Army on July 12, 1862. Because the Medal of Honor is awarded "in the name of Congress," it frequently but erroneously is called the "Congressional Medal of Honor." Since its introduction it has been America's highest military decoration for battlefield heroism. It is awarded by the president to members of the U.S. Armed Forces who distinguish themselves by gallantry and intrepidity at the risk of their lives above and beyond the call of duty while engaged in combat against an armed enemy of the United States. Originally it was authorized only for enlisted personnel. Officers became eligible for the army version of the Medal of Honor in 1863 and for the navy version in 1915.

The Army and Navy Medals of Honor differed initially in that the Army Medal of Honor from the start could be awarded only for acts of combat valor. Until 1942 the Navy Medal of Honor was awarded for both wartime and peacetime acts of heroism. Between 1917 and 1942 the navy actually had two different designs for the Medal of Honor, one for combat and one for noncombat. The suspension ribbon was the same for both navy versions, while the badge of the medal was different.

During World War II the Army Medal of Honor was awarded 324 times, including 38 awards to members of the U.S. Army Air Forces. The Navy Medal of Honor was awarded 140 times, including to 82 U.S. marines and one U.S. coastguardsman. The most Medals of Honor awarded for a single World War II battle was 27, for Iwo Jima. The most Medals of Honor within a single unit was 21, awarded to soldiers of the 442nd Regimental Combat Team (including the 100th Infantry Battalion), a unit consisting of Japanese Americans.

In 1918 and 1919 the modern system of American military decorations came into being when the U.S. Congress established the Distinguished Service Cross, the Navy Cross, and the Distinguished Service Medal. The concept of the Pyramid of Honor for the first time in American history recognized respective levels of military service to the nation. The Distinguished Service Cross and the Navy Cross are America's second-highest decorations and are awarded only for combat heroism. Although they have different names and completely different ribbons and badges, they are on the same level. Civilians are not eligible for the Medal of Honor but are eligible for the Distinguished Service Cross and the Navy Cross. Virginia Hall, a World War II Office of Strategic Services operative (and technically a civilian), was the only woman ever awarded the Distinguished Service Cross. Foreigners were also eligible for the Distinguished Service Cross. French colonel Raoul Salan was awarded the Distinguished Service Cross for his role in Operation DRAGOON, the Allied southern France landings.

Also established at the end of World War I was the Distinguished Service Medal, America's third-highest decoration overall and the highest for service other than direct combat. Although the name of the award is the same, the army and navy versions of the Distinguished Service Medal have completely different ribbons and badges.

American soldiers wounded in action in World War I were authorized to wear for each wound a Wound Chevron, a small inverted chevron on the lower right uniform sleeve. In 1932 the Wound Chevron was superseded when the Revolutionary War–era Badge of Military Merit was reestablished as the Purple Heart. Awarded for wounds received in combat, the Purple Heart was retroactive to April 5, 1917, but initially the recipient still had to be alive to receive it. During the early days of World War II, eligibility for the Purple Heart was extended to those who received mortal wounds.

Second and subsequent awards of U.S. Army decorations are indicated by a Bronze Oak Leaf Cluster device on the suspension ribbon or the ribbon bar. Fifth subsequent awards are indicated by a Silver Oak Leaf Cluster device. For navy and marine decorations, the second and subsequent awards are indicated by a $^{5}/_{16}$-inch Gold Star Device on the ribbon and the fifth subsequent award by a $^{5}/_{16}$-inch Silver Star Device.

America awarded four campaign medals during World War II and a Victory Medal at the end of the war. A $^{3}/_{16}$-inch Bronze Star Device affixed to the medal ribbon indicated each individual campaign in which a soldier participated. One $^{3}/_{16}$-inch Silver Star Device represented five campaigns. Separate Occupation Medals for the army and the navy were awarded for occupation duty in Germany and Japan starting in 1945. But since Berlin remained technically an occupied city until the end of the Cold War and the reunification of Germany, both medals were awarded to American soldiers and sailors stationed in Berlin through 1990.

Determining the most decorated American serviceman of World War II is an inexact process at best. Three U.S. Navy officers are certainly among the leading contenders. Submarine commander Samuel D. Dealey received the Medal of Honor, four Navy Crosses, an Army Distinguished Service Cross, a Silver Star, and a Purple Heart (posthumously). PT boat commander John D. Bulkeley received the Medal of Honor, two Army Distinguished Service Crosses, the Navy Cross, two Silver Stars, and two Purple Hearts. Submarine commander Eugene B. Fluckey received the Medal of Honor and Four Navy Crosses. The most decorated ground combat soldier was Audie L. Murphy, who received the Medal of Honor, the Distinguished Service Cross, two Silver Stars, and three Purple Hearts.

United Kingdom and the British Commonwealth

All of the countries of the British Commonwealth that committed forces to World War II used the British military awards system. British subjects who receive orders and decorations are entitled to use postnominal initials for those specific awards. Of the eight British orders in use during World War II,

two were most frequently conferred upon military officers. The Most Honorable Order of the Bath was established in 1399 as a purely military order of knighthood. In disuse for many years, it was revived in 1725, and a Civil Division was added in 1847. It had three classes: Knight Grand Cross (GCB), Knight Commander (KCB), and Companion (CB). The Order of the Bath was only conferred on general and flag officers. At a lower level, the Most Excellent Order of the British Empire was established in 1917. It had five classes. Knight Grand Cross (GBE), Knight Commander (KBE), and Commander (CBE) were usually awarded to general officers. The Officer (OBE) and Member (MBE) classes could be awarded to field grade officers.

Britain's highest decoration for combat gallantry is the Victoria Cross (VC). Established in 1856, it can be awarded to both officers and enlisted. New Zealand captain Charles Upham was the only soldier of World War II, and one of only three ever, to win a Victoria Cross and Bar. He was actually recommended for the VC on three separate occasions, but his second and third nominations were consolidated. A bar attached to the suspension ribbon of a decoration is the British method of indicating subsequent awards.

In 1940 Britain introduced the George Cross (GC) as its second-highest award for heroism. Actually considered the equivalent of the VC, the GC is awarded to both civilians and military personnel for acts of extreme heroism not involving direct enemy fire. While the American Medal of Honor can be awarded for acts of heroism as a prisoner of war, similar acts by British soldiers are recognized with the George Cross. The GC is also awarded for nonwar acts of heroism, such as those performed by policemen and firemen. During World War II the island of Malta was awarded the George Cross for its staunch resistance against a prolonged Axis sea blockade and relentless air attacks. Malta today displays the badge of the George Cross in the upper left corner of the country's flag.

Below the level of the Victoria Cross and George Cross, British decorations split into two parallel systems, one for officers and the other for enlisted. The British only consolidated the two systems in 1993. For British officers of all services the Distinguished Service Order (DSO), established in 1886, was second in precedence to the Victoria Cross. It could be awarded for either exceptional service or gallantry, but during both world wars it was frequently awarded for heroism. Awarded also to foreign officers, Major General Robert T. Frederick was among the American recipients. The

equivalent decoration for army other ranks was the Distinguished Conduct Medal (DCM), established in 1854, and for navy other ranks the Conspicuous Gallantry Medal (CGM), established in 1855. In 1943 the Conspicuous Gallantry Medal (Flying) was added for the Royal Air Force.

Established in 1914, the second level below the Victoria Cross included the Military Cross (MC) for army officers and the Distinguished Service Cross (DSC) for navy officers. When the Royal Air Force became a separate service in 1918, the Distinguished Flying Cross (DFC) was established to recognize heroism in aerial combat, and the Air Force Cross (AFC) was established for noncombat aerial heroism. The other ranks' equivalent decorations were the army's Military Medal (MM), established in 1916; the Royal Navy's Distinguished Service Medal (DSM), established in 1914; and the Royal Air Force's Distinguished Flying Medal (DFM) and Air Force Medal (AFM), established in 1918.

Britain awarded 10 campaign medals during World War II. Eight of those medals deviated from standard practice in that their badges were in the shape of a six-pointed star rather than round. Soldiers from the Commonwealth nations also received the British campaign stars, but in many cases those countries also augmented the British awards with their own service medals. Such countries included India, Canada, South Africa, Australia, New Zealand, and Southern Rhodesia.

France

Although France fell on June 17, 1940, the Free French under General Charles de Gaulle used the same system of decorations as the Third Republic, and after the war the newly formed Fourth Republic instituted several awards for World War II service. France's highest decoration, which was also an order, was and still is the Legion of Honor. Established by Napoleon in 1802, it was awarded to both military and civilians. Although it could be awarded for battlefield heroism, it most frequently was awarded for distinguished service. It had five classes: Grand Cross, Grand Officer, Commander, Officer, and Knight. The class of the award was a function of the recipient's rank. Enlisted soldiers during World War II generally were not eligible.

France’s highest purely military decoration was the Medaille Militaire (Military Medal). Established in 1852, it was an award primarily for soldiers and NCOs and also for general officers. The rationale behind such apparently odd criteria was that by the time a French officer reached the general officer ranks, he would already have the Legion of Honor. Even in the French military today it is very rare for a colonel or above not to have the Legion of Honor. The same criteria for the Medaille Militaire therefore still applies in the modern French military. The Medaille Militaire was also awarded to foreigners; General of the Army Dwight Eisenhower and Field Marshal Bernard Montgomery were among the World War II recipients.

The combat decoration below the Medaille Militaire was the 1939–1945 Croix de Guerre (War Cross), awarded to both officers and enlisted. With the same badge and a similar ribbon to the 1914–1918 Croix de Guerre, a device attached to the suspension ribbon indicated the level of the headquarters authorizing the award: Bronze Palm for field army, Gilt Star for corps, Silver Star for division, and Bronze Star for brigade or regiment.

The limited nature of France’s participation in the war also limited the scope of its campaign and service medals, which focused on resistance activities and combat service as part of larger Allied formations. Most of the French campaign medals were established in the 1950s. Some, such as the Medal for Those Deported or Interred for Acts of Resistance and the Medal for Those Deported or Interred for Political Acts, recognized French civilians during the German occupation.
