distinguished military historian, exemplary colleague, and friend.

About the Editors

Spencer C. Tucker, PhD, has been senior fellow in military history at ABC-CLIO since 2003. He is the author or editor of 56 books and encyclopedias, many of which have won prestigious awards. Tucker's last academic position before his retirement from teaching was the John Biggs Chair in Military History at the Virginia Military Institute in Lexington. He has been a Fulbright scholar, a visiting research associate at the Smithsonian Institution, and, as a U.S. Army captain, an intelligence analyst in the Pentagon. His recently published works include *World War I: The Definitive Encyclopedia and Document Collection, Wars That Changed History: 50 of the World's Greatest Conflicts*, and *U.S. Conflict in the 21st Century: Afghanistan War, Iraq War, and the War on Terror*, all published by ABC-CLIO.

Priscilla Mary Roberts received her PhD from King's College, Cambridge. She is an associate professor of history at the University of Hong Kong and is also the university's honorary director of the Centre of American Studies. Dr. Roberts has received numerous research awards, including a Fulbright Fellowship to George Washington University in 2003. Well published in 20th-century diplomatic and international history, she is the author, editor, or coeditor of 24 books, among them *The Cold War; Window on the Forbidden City: The Chinese Diaries of David Bruce, 1973–1974; Behind the Bamboo Curtain: China, Vietnam, and the World beyond Asia;* and *Lord Lothian and Anglo-American Relations, 1900–1940.*

Foreword

After the huge number of casualties and the massive destruction in what was called the Great War before it came to be referred to as World War I, most people in most countries were quite certain that one such disaster was more than enough for the century, perhaps for all time. The commemoration of the signing of the armistice on November 11, 1918, could be seen as one indication of this feeling. On all other days of the year, people in most communities in Europe and some in North America, Australia, New Zealand, and other parts of the world could visit local memorials erected in innumerable towns with the names of those who had lost their lives in that conflict. In the European countries that had participated in the war it would afterward have been quite difficult to find a family in which no members had been killed or wounded, and that search would have had to exclude my own family in which my father had been wounded serving in the German Army during the fighting in what became Latvia after the war.

The fact that after the armistice and the peace treaties there would be local struggles between individual countries that turned into open hostilities, internal quarrels that rose to the level of civil wars, and the resumption of prior expansionist efforts by some countries that also produced open conflicts is not terribly surprising given the troubles and ambitions in the international arena and within some states. An example of the first category would be the war between the Soviet Union and Poland in 1919–1921. The Spanish Civil War of 1936–1939 is an example of the second category, and the Italian conquest of Abyssinia/Ethiopia and Japan’s seizure of Manchuria in 1931

and open war with China starting in 1937 are examples of the third category. The suffering and destruction caused by these conflicts and the legacies of hatred they left behind were indeed substantial. But how could the world essentially as a whole descend into another global war that in dimensions and effects substantially exceeded those of the war of 1914–1918?

Of those defeated in the prior great conflict, the Austro-Hungarian and Ottoman Empires had dissolved, while the czarist Russian Empire had been displaced after two revolutions by a Bolshevik regime that supported communist parties in many countries but was primarily concerned about a possible capitalist coalition against itself. Germany, though defeated, had been left united, was occupied by Allied forces only in part and that only for some years, and in spite of having had to return some pieces of territory to those from whom they had been taken was in a relatively stronger position in Europe than before 1914, since there were now small countries rather than powerful empires on its southern and eastern borders. There were, however, several developments in the Germany of the postwar years that contributed to the new descent into worldwide conflict.

The reality of defeat at the front was obscured for many Germans. Unlike the end of the Napoleonic Wars and the Franco-Prussian War of 1870–1871 when the victorious armies of France's enemies had marched the streets of the French capital, 1918 had seen instead of a parade of Allied soldiers one of German soldiers in Berlin. The willingness of the Allies to forgo such an event and instead allow an armistice to preclude the further casualties that a drive into Germany would have involved facilitated the spread inside Germany of what came to be known as the stab-in-the-back legend. Assiduously spread by German military leaders and some politicians and increasingly actually believed by them, the legend implied not only that domestic groups, especially socialists and Jews, had cheated Germany of the victory its armed forces had earned but also that a different internal structure that precluded any development of a similar nature would guarantee victory for a country that had come so close the last time. The intellectual isolationism of the time kept the German leadership and public from recognizing that in reality the German home front of World War I had been generally more solid and less affected by domestic dissent than that of any other major belligerent power.

A second factor was that the effort of the peacemakers at the end of the

war to implement the transition from states based on the dynastic principle to states based on the national principle was bitterly resented by most Germans. Especially hated was the obvious implication of such a restructuring of Europe: the revived independence of a Polish state that had been partitioned in the 18th century by Prussia, Russia, and Austria. The establishment of an east-west corridor connecting the Prussian and Brandenburg territories of King Frederick II of Prussia through the intervening Polish lands in 1772 was one of the accomplishments of that ruler that contributed to his being referred to in Prussia and later Germany as Frederick the Great. The 1919 Treaty of Versailles that returned much of this land to a Poland that had held it for half a millennium before 1772 was considered an absolute outrage by most Germans. As would become clear in World War II, many Germans thought it far better to adjust people to boundaries instead of boundaries to people—and would be even more outraged when the victors applied that principle to them—but there was a further aspect of the Po-lish issue that must be included in any effort to grasp what happened two decades after 1919.

In the thinking of large numbers of Germans, Poles were a form of inferior beings. The racial concepts that dominated in the German academic world and had spread widely in the population insisted on a racial hierarchy in which Slavic peoples, such as Poles, were inherently inferior to the racially categorized Germanic or Aryan people. The inclusion in the peace treaty of plebiscites in areas of doubt, where the locals would vote as to whether they thought of themselves as Germans or Poles, implied an equivalence that was deeply resented. Would one ask a human being and a cockroach which nationality one belonged to? This facet of the situation in postwar Germany needs to be seen in connection with the continuing spread of anti-Semitic attitudes according to which Jews were even lower in the scale of beings than the despised inferior Poles.

It is with this context in mind that it may be easier to understand how in one of the countries that had been very much involved in World War I a political party that called publicly for more wars to gain living space at the expense of inferior races could attain an increasing number of supporters until it became the largest in the country. In his speeches and writing, Adolf Hitler called for a one-party state, praising fascist Italy and communist Russia for having already adopted that brilliant concept. He also promised that he would be willing to lead the German people to where Germany would shed

its blood not for the little bits of territory lost by the peace treaty—advocating that this was the obvious sign of how stupid other parties and their leaders were—but for hundreds of thousands of square kilometers of land to settle German farmers. Before Hitler became chancellor of Germany, Theodor Heuss, who would become postwar West Germany's first president, published a book titled *Hitlers Weg* (Hitler's Path). It illuminated the road to war that a National Socialist government would pursue, but not enough Germans were persuaded at the time that this would be an extremely dangerous path to follow.

Once installed in power, Hitler drastically increased the rearmament of Germany already secretly under way to a small extent and, until 1933, assisted by the Soviet Union. The rearmament program was keyed to a series of wars, first against Czechoslovakia, then against France and Britain, thereafter against the Soviet Union, and then against the United States. Once the development and production of the weapons systems for what he believed would be the most difficult war, that against France and Britain, was well under way in 1937, he ordered the designing and subsequent production of the weapons systems he believed was needed for war against the United States. In his view of the inherent weakness of the Soviet Union, no new weapons systems would be needed to crush it. By what Hitler considered the fortunate Bolshevik Revolution, the prior partly Germanic ruling elite had been replaced by incompetents trying to hold together racially inferior peoples. While the United States was also considered a weak mixture of peoples and races, it was far away and had a substantial navy. Intercontinental bombers and superbattleships would take care of these obstacles, and since it would take considerable time to design and develop them, work on them needed the earliest possible start.

World conquest was the object of the program that Hitler set for Germany, and at least some of his advisers and assistants understood that, regardless of the extent to which the cheering masses of Germans who mostly held to him until 1945 believed and understood it. In that new world, there would be only Germanic and allegedly related peoples, as others were eliminated either by killing or mass sterilization. The handicapped and all Jews on Earth would have to be killed first while the rest of the demographic revolution on the globe proceeded in a series of wars.

Hitler greatly regretted turning back from the first of the series, that

against Czechoslovakia, in 1938. He considered the Munich agreement not a triumph for Germany but instead the worst mistake of his career as chancellor and made certain that no one cheated him of war in 1939, as he believed British prime minister Neville Chamberlain had done in 1938. Since Poland, unlike Hungary and Lithuania, would not subordinate itself to Germany as it struck in the west, it would be attacked first with the turn of the French and British coming either thereafter or simultaneously if they so decided. German foreign minister Joachim von Ribbentrop was sent to Moscow to sign a nonaggression pact with the Soviet Union and a secret protocol that divided Eastern Europe between the two powers. To obtain Soviet aid as Germany fought Poland and the Western powers, Ribbentrop was authorized to give Joseph Stalin even more than the latter asked for, since the Germans were expecting to take it all when the time came to crush their temporary partner. The absence of Germany's ambassadors from Warsaw, London, and Paris in the last days of peace was no coincidence. Hitler was taking no chance of anything happening to deprive him of war. As he had explained to his military commanders a few days before ordering war, his only worry was that at the last moment some "Saukerl," some SOB, would come along with a compromise or other proposal.

Hitler got the war he so desperately wanted, and at first it appeared to go well for Germany. He very much hoped to strike in the west still in the fall of 1939, but a variety of factors, primarily the weather, forced a postponement to 1940. That year again all appeared to go as he had hoped, and with what looked like victory in the west he intended to invade the Soviet Union that fall. Once again technical issues obliged him to postpone that move into 1941. The first serious setback came at the same time: Britain would not give in, had won the battle against Germany's effort to gain the complete control of the sky needed to protect an invasion of the British Isles, and was clearly determined to continue to fight. In this context, Hitler looked to the Japanese as possible allies against Britain, as he had earlier been pleased to have the Soviet Union assist Germany in the crushing of Poland and the war in the west. The Tokyo authorities agreed with Berlin that this was a great opportunity to seize the colonial empires of defeated Holland and France and a threatened Britain but explained that they planned to move in 1946. Understanding that this was Japanese concern about the American intention to let the Philippines become independent in 1944 but maintain bases there

until 1946, Hitler assured Tokyo that if they moved promptly, Germany would join them in war against the United States. Since Germany was going to fight the United States anyway and the superbattleships and intercontinental bombers were not yet ready, there was from Hitler's perspective the obvious alternative to act as soon as possible by recruiting an ally who already had a big navy. It is not known at this time whether in 1940–1941 he knew that, in the same calculation as his own, the way to cope with America's large navy and ability to build more was to build superbattleships and that the Japanese were completing the three biggest warships ever constructed until then, but he did know that Japan had a very large navy.

After much discussion within government circles and after reassuring themselves that Germany and Italy were indeed going to join them in war with the United States, the Japanese struck in December 1941. With Canada, Australia, New Zealand, the Union of South Africa, and the British and French colonial empires already in the conflict and with fighting taking place in North and Northeast Africa and the Middle East and on the world's oceans, the conflict was already no longer simply a European war. But with Japan drawing the United States into hostilities and almost all Central and South American countries also becoming belligerents, the war had become global, with only the most minimal exceptions.

The two alliances that fought each other operated quite differently. The discussion in public at the time and the literature afterward recounted and stressed the differences among the Allied powers, but these were nothing like those on the Axis side. The Allies did have different aims, interests, and ambitions, but they managed to work together in spite of this until victory was achieved. The Americans and the British came to be especially close in their plans and operations at a time when the Axis powers never came sufficiently close to each other to quarrel seriously. In the military the most important issue is rank, but next to it comes the question of decorations. Examples from the two sides may illustrate the difference between them. In the summer of 1945 between the surrenders of Germany and Japan, the British released some of their officers and men. Churchill's liaison to the British Chiefs of Staff Committee, General Sir Hastings Ismay, wrote a letter to General Walter Bedell Smith, General Eisenhower's chief of staff, complaining about the failure of his government to award an appropriate

medal to a senior officer who was going home after six years of war without a decoration. Could Eisenhower help? General Smith responded that he remembered the officer who was not on the list of British officers that Eisenhower had sent forward but would be recommended for the appropriate medal: a general in one country's army complaining about his own government to a general in another country's army and asking that the situation be remedied and then placing the correspondence, conducted with first names, in his files where snooping historians, such as this one, can find it. This is a clear contrast to what happened when the German naval attaché in Tokyo suggested that the German government award a major decoration to Admiral Yamamoto Isoroku at the funeral ceremony in Tokyo after he had been killed in a targeted American 1943 air strike. The collection of decoded intercepts in the United States National Archives has the text of this document and the answer from Berlin: a request for a biography of Yamamoto. German World War II headquarters did not have such on the commander in chief of the Combined Fleet of its major ally!

The victory of the Allies did leave them divided in the developing Cold War but saved the world from the horrors of a system that planned a demographic revolution on the globe, a revolution of which they had made a start by killing about a third of the world's Jews, slaughtering or letting die of starvation or disease several million Soviet prisoners of war, and murdering hundreds of thousands of handicapped people, including many of their own seriously wounded veterans. Germany's generals could not blame the home front for their defeat this time, so they blamed their beloved leader Hitler instead. Having managed to have almost three times as many of their soldiers killed compared to the prior conflict, some excuse was again needed. Through their initiating war, the Germans and Japanese had brought about a major expansion of Soviet influence in Europe and prepared the way for the communists to triumph in China. At the same time, the conflict accelerated the process of decolonization and brought advances in medicine and transportation that would save lives and improve travel in the postwar world. While the Japanese in 1945 were set on a path that in effect picked up where the military had shot their way into power 15 years earlier, the Germans had to learn the hard way a lesson they had not learned after World War I: if you do not want your house to burn, don't set the world on fire.

Because the conflict had involved almost all countries on Earth, affected

quite considerably the few states that had remained neutral, cost somewhere in excess of 50 million dead, and completely altered the international landscape, it has been a subject of constant interest ever since. Books and articles about it appear almost daily, and television regularly has programs dealing with it. Vast quantities of sources have become available, sometimes in big piles, such as from the war crimes trials, sometimes in a steady stream from declassification programs, and sometimes in delayed trickles as Soviet, Chinese, and more Japanese sources become accessible. The encyclopedia in these volumes is designed to reflect the current state of knowledge for those who look for information on individuals and specific events. Because all countries generally utilized the poorest-quality paper during the war in order to save resources for more important war-related purposes, whatever remains closed will, unless microfilmed, be as inaccessible to its custodians as to all others because the paper is deteriorating into dusty and illegible fragments. New perspectives will no doubt be put forward, new questions will be asked and answered, and hitherto neglected topics will find dedicated authors, but very little new documentary material is likely to become accessible in the future.

GERHARD L. WEINBERG
UNIVERSITY OF NORTH CAROLINA EMERITUS

Preface

World War II, often heralded as “The Good War” for its presumed match of good versus evil, continues to excite our interest today perhaps more than any other world conflict. Although World War I was arguably more important in its consequences for the world than World War II, the latter conflict certainly embraced more territory and claimed many more lives. It also largely set the international borders in place today, although efforts continue to change these, as we have seen all too recently in Ukraine.

This work is the revised edition of the encyclopedia published in 2004. More comprehensive and of greater length, it has in addition to front and back matter 1,639 entries totaling some 1,220,000 words. Virtually all entries carried forward from the first edition have been revised to some extent and many have new references. There are also 212 new entries that did not appear in the first edition. We also have included additional documents in the revised edition.

This encyclopedia treats the causes, course, and effects of World War II. All entries are arranged alphabetically, with the exception of the introductory essays as well as the glossary of terms, the chronology, an explanation of military awards and decorations of the various countries involved, an explanation of military organizations, tables of ranks, and a selective bibliography. Entries treat the states involved, the major theaters of war, the campaigns, the individual battles, the major weapons systems, diplomacy, and influential individuals on both sides of the conflict. The reader will find

entries on the home fronts, the role of women in the war, and art, literature, and film. Virtually every first-edition entry has been revised.

A few words on ranks. For the most part we have used an English translation. Thus, the German “general der infanterie” appears as “general of infantry.” We follow this with other countries as well. We also use the British designation of brigadier for the equivalent U.S. rank of brigadier general. The reader will find full explanations of ranks in the back matter of ranks and tables showing equivalents.

We have throughout employed the Japanese system of expressing names; that is, the family name precedes the given name. For Chinese proper names and locations we use both pinyin and the older Wade-Giles system.

I am greatly indebted to my fine associate editor, Dr. Paul G. Pierpaoli Jr., who assisted in the selection of new entries and helped keep track of and edit the entire work, no easy task. Dr. Priscilla Mary Roberts of the University of Hong Kong produced her usual excellent work in the documents volume, which she assembled for the first edition and has now added to in the revised version. She has also written the fine introductions to the individual documents.

Three assistant editors have read all the entries and proved invaluable in their suggested changes and recommendations for additional entries. Dr. Timothy Dowling is professor of history at the Virginia Military Institute specializing in the history of 20th century Central and East European history; he is the author of a well-received study of the World War I Brusilov Offensive. Dr. David Zabecki is a retired U.S. Army major general and an author of several highly acclaimed books on World War I. He was Dr. Leo A. Shifrin Distinguished Professor in Military History at the U.S. Naval Academy in 2012 and is currently honorary senior research fellow in war studies with the University of Birmingham (England) and senior historian of the Wieder History Group. Mr. William Van Husen came to me justifiably highly rated by General Zabecki, having collaborated with him on a number of projects. Van Husen is a 24-year veteran of the U.S. Air Force, has master’s degrees from the University of Maryland and Troy State University, has taught history for the University of Maryland in its overseas division, and is currently an information technology specialist at Edwards Air Force Base, California.

I am also indebted to many individuals who contributed new entries as

well as to the assistant editors of the initial encyclopedia, who must again be mentioned here: Mr. Jack Greene; Dr. Malcolm Muir Jr.; Dr. Priscilla Mary Roberts; Colonel Cole Kingseed, USA, Retired, PhD; and General Zabecki. Dr. Law Yuk-fun of the History Department at the University of Hong Kong read all the Chinese entries and assisted with their editing and the pinyin and Wade-Giles spellings. Retired rear admiral Hirama Yoichi, PhD, located Japanese authors for many entries, checked their work, and answered many inquiries.

We are pleased to have a large number of foreign authors in this project, including scholars from such nations as Austria, Australia, Britain, China, France, Germany, Hungary, Italy, Japan, and Russia. We believe that these authors provide unique perspectives and in many cases information that is not available in other sources. This reference work certainly has the most complete biographies of Chinese, Japanese, and Soviet individuals of any general encyclopedia of the war to appear in English.

Finally, I am most indebted to my wife, Dr. Beverly B. Tucker, who, while entreating me to retire, continues nonetheless to give me her full support in my writing and editing endeavors.

All of us who have labored on this encyclopedia trust that it will be an asset both to scholars researching the war and students seeking to learn more about it. We hope that it will also contribute to our understanding of how wars occur and might thereby be avoided.

Origins of the War

On September 1, 1939, German forces invaded Poland. Two days later, Britain and France declared war on Germany to begin World War II. Some historians date the war from 1937, with the Japanese invasion of China. Japanese official histories, however, begin with 1931, when their forces overran Manchuria, but perhaps the most accurate place to begin is with the end of World War I. That conflict exacted a horrible human and economic cost, destroyed the existing power structure of Europe, and toppled all the continental empires. It also sowed the seeds for a new conflict.

In January 1919, representatives of the victorious Allied (Entente) powers met in Paris to impose peace terms on the defeated Central Powers. The centerpiece of the settlement, the Treaty of Versailles, was the worst of all possible worlds—too harsh to conciliate but too weak to destroy. It was also never enforced, making almost inevitable a renewal of the struggle.

The Paris peace settlement was drafted chiefly by Britain, France, and the United States. The Germans claimed that they had assumed that the November 1918 armistice would lead to a true negotiated peace treaty, yet in March and May 1918 when they were winning the war, their leaders had imposed a truly harsh settlement on Russia. In the Treaty of Brest-Litovsk, Russia lost most of its European territory, up to a third of its population, and three-quarters of its iron and coal production. It was also required to pay a heavy indemnity.

Far from being dictated by French premier George Clemenceau, as many Americans still believe, the Paris peace settlement of 1919 was largely the

work of British prime minister David Lloyd George and U.S. president Woodrow Wilson, who repeatedly blocked proposals advanced by Clemenceau. The irony is that the British and American leaders prevented a settlement that, although punitive, might have brought actual French and Belgian security and prevented war in 1939.

The most novel creation of the conference was undoubtedly the League of Nations. Clemenceau did not place much stock in a league, but if there had to be one he wanted mandatory membership and an independent military force. The Anglo-American league relied primarily on moral suasion; its strongest weapon was the threat of sanctions.

The most contentious issue at the peace conference, and arguably its most important matter, was that of French and Belgian security. Alsace and Lorraine were returned to France, and for security purposes Belgium received the two small border enclaves of Eupen and Malmédy. France was granted the coal production of the Saar for 15 years in compensation for Germany's deliberate destruction of French mines at the end of the war. The Saar itself came under League of Nations control, with its inhabitants to decide their future at the end of the period.

A storm of controversy broke out over the Rhineland, the German territory west of the Rhine River, however. France wanted this area to be reconstituted into one or more independent states that would maintain a permanent Allied military presence to guarantee that Germany would not again strike west, but Lloyd George and Wilson saw taking the Rhineland from Germany as "an Alsace-Lorraine in reverse." They also wished to end the Allied military presence on German soil as soon as a peace treaty was signed.

These vast differences were resolved when Clemenceau agreed to yield on the Rhineland in return for an Anglo-American Treaty of Guarantee, whereby Britain and the United States promised to come to the aid of France should Germany ever invade. The Rhineland would remain part of the new German Republic but would be permanently demilitarized, along with a belt of German territory east of the Rhine 30 miles deep. Allied garrisons would remain for only a limited period: the British would occupy a northern zone for 5 years, the Americans a central zone for 10 years, and the French a southern zone for 15 years. Unfortunately for France, the pact for which it traded away national security never came into force. The U.S. Senate refused

to ratify it, and the British government claimed that its acceptance was contingent on American approval.

Germany lost some other territory: northern Schleswig to Denmark and a portion of Silesia and the Polish Corridor to the new state of Poland—both of which the Allies justified along ethnic lines. The Polish Corridor allowed Poland access to the sea but also separated East Prussia from the remainder of Germany and became a major rallying point for German nationalists. Despite these losses, German power remained largely intact; it was still the most powerful state in Central and Western Europe. Nonetheless, Germans keenly resented the territorial losses.

The Treaty of Versailles also limited Germany in both the size and nature of its military establishment. The new German Army, the Reichswehr, was restricted to 100,000 men (with only 6,000 of these officers) in 12-year enlistments. It was denied heavy artillery, tanks, and military aviation, and the German General Staff was to be abolished. The navy was limited to 6 predreadnought battleships, 6 light cruisers, 12 destroyers, and no submarines. From the beginning the Germans violated these provisions. The General Staff remained, although clandestinely in the guise of the Truppenamt (Troop Office); Germany maintained military equipment that was to have been destroyed and worked out arrangements with other states, notably the new Soviet Union, to develop weapons and train military personnel.

Other major provisions of the settlement included Article 231, the “war guilt clause.” It blamed the war on Germany and its allies and was the justification for reparations, which were fixed at $33 billion in 1920, well after Germany had signed the treaty on June 28, 1919. British economist John Maynard Keynes claimed that reparations were a perpetual mortgage on Germany’s future and that there was no way the Germans could pay them, yet Adolf Hitler’s Germany subsequently spent more in rearming. In any case Germany, unlike France following the Franco-Prussian War in 1871, was never really forced to pay.

The breakup of the Austro-Hungarian Empire and the peace treaties following the war led to the creation of a number of new states in Central Europe, most notably Poland but also Czechoslovakia and Yugoslavia. Resolving the boundaries of Poland proved difficult, especially in the east; it was not until December 1919 that a commission headed by Lord Curzon

drew that line. Neither the new Po-lish government nor Soviet Russia recognized it, however. Romania was greatly enlarged with the addition of Transylvania, which was taken from Hungary, the other principal loser at the peace conference; it was left with only 35 percent of its prewar area. The much reduced rump states of Austria and Hungary were now confronted by Yugoslavia, Czechoslovakia, and Romania. The latter three, the so-called Little Entente, allied to prevent a resurgence of their former masters. They were linked with France through a treaty of mutual assistance between that nation and Czechoslovakia.

The Allied solidarity of 1918, more illusion than reality, soon disappeared. When the peace treaties were signed, the United States was already withdrawing into isolation, and Britain was disengaging from the continent. This left France alone among the great powers to enforce the peace settlement. Yet France was weaker in terms of population and economic strength than Germany. In effect, it was left up to the Germans to decide whether they would abide by the treaty provisions, which all Germans regarded as a vengeful *Diktat.* Moreover, the shame of the Versailles settlement was borne not by the kaiser or the army—who had been responsible for the decisions that led to the defeat—but rather by the leaders of the new democratic Weimar Republic.

The new German government deliberately adopted obstructionist policies, and by 1923 it had halted major reparations payments. French premier Raymond Poincaré acted. He believed that if the Germans were allowed to break part of the settlement, the remainder would soon unravel. In January 1923 Poincaré sent French troops, supported by Belgian and Italian units, into the Ruhr, the industrial heart of Germany. German chancellor Wilhelm Cuno’s government adopted a policy of “passive resistance,” urging the workers not to work and promising to pay their salaries. The German leaders thereby hoped to secure sufficient time for the United States and Britain to force France to depart. Although that pressure was forthcoming, Poincaré refused to back down, and the result was catastrophic inflation in Germany.

The mark had already gone from 4.2 to the dollar in July 1914 to 8.9 in January 1919. It then tumbled precipitously because of deliberate German government policies. By January 1920 it was 39.5 to the dollar, and in January 1922 it was 191.8 to the dollar. Then came the French occupation of the Ruhr and Cuno’s ruinous policy. In January 1923 the mark was 17,972 to

the dollar, but by July it was 353,412. In November when the old mark was withdrawn in favor of a new currency, the mark was 4.2 trillion to the dollar. The ensuing economic chaos wiped out the German middle class, many of whom now lost all faith in democracy and voted for Adolf Hitler a decade later.

Germany now agreed to pay reparations under a scaled-down schedule, and French troops withdrew from the Ruhr in 1924. Although Frenchmen generally approved of Poincaré's action, they also noted its high financial cost and the opposition of Britain and the United States. These factors helped bring the Left to power in France in 1924, and the new government reversed Poincaré's go-it-alone approach. The new German government of Chancellor Gustav Stresemann, moreover, announced a policy of living up to its treaty obligations. "Fulfillment" and "conciliation" replaced "obstruction" and led to the Locarno Pacts of 1925, by which Germany voluntarily guaranteed its western borders as final and promised not to resort to war with its neighbors and to resolve any disputes through arbitration. For at least half a decade international calm prevailed.

By the 1930s national boundaries were still basically those agreed to in 1919. Italy, Germany, and Japan were still dissatisfied with this situation, however, and in the 1930s the economic difficulties resulting from the Great Depression enhanced popular support in those nations for politicians and military leaders who supported drastic measures, even at the risk of war, to change the situation in the "revisionist" powers' favor. The status quo powers of France, Great Britain, and the United States saw no advantage in making changes but were simultaneously unwilling to risk war to defend the 1919 settlement. They therefore acquiesced as, step by step, the dissatisfied powers dismantled the peace settlement. From the Japanese invasion of Manchuria in 1931 to the outbreak of war in Europe in 1939, those who wanted to overturn the status quo used force but not those who sought to maintain it.

The Western democracies seemed paralyzed. This was partly because of the heavy human cost of World War I. France alone had lost 1,397,800 dead or missing in the conflict. Including wounded, 73 percent of French combatants had been casualties. France could not sustain another such bloodletting, and the defensive military doctrine it adopted came to be summed up in the phrase "Stingy with blood; extravagant with steel." In 1929 France began construction of a defensive belt along the frontier from

Switzerland to Belgium. Named for Minister of War André Maginot and never intended as a puncture-proof barricade, the Maginot Line nonetheless helped fix a defensive mind-set in the French military.

By the 1930s, attitudes toward the Great War had changed. German people believed that their nation had not lost the war militarily but had been betrayed by communists, leftists, pacifists, and Jews. Especially in Britain and the United States, many came to believe that the Central Powers had not been responsible for the war, that nothing had been gained by the war, and that the settlement had been too hard on Germany.

In Britain there was some sympathy in influential upper-class circles for fascist doctrines and dictators, who were seen as opponents of communism. British member of Parliament Winston Churchill, for example, praised Italian dictator Benito Mussolini. The British government avoided continental commitments, and its leaders embraced appeasement, the notion that meeting the more legitimate demands of the dictators would remove all need for war. Prime Minister Neville Chamberlain (1937–1940) was the principal architect of this policy. There was also great concern in Britain, as elsewhere, over the possible air bombardment of cities in any future war.

The United States had been one of the few powers actually to benefit from the war. At modest cost in terms of human casualties, it had emerged from the struggle as the world's leading financial power. Yet Americans were dissatisfied with their involvement in European affairs; they believed that they had been misled by wartime propaganda and that the arms manufacturers (the so-called merchants of death) had drawn the nation into the war to ensure payment for sales to the Entente side. In the 1930s the United States adhered to rigid neutrality, and Congress passed legislation preventing the United States from loaning money or selling arms to combatants in a war. Unfortunately, such legislation benefited the aggressor states, which were already well armed, and handicapped their victims. U.S. president Franklin D. Roosevelt (1933–1945) understood the threat that the aggressors posed to the world community, but most Americans eschewed international involvement.

The Soviet Union was also largely absorbed in its internal affairs. Following World War I, Russia experienced a protracted and bloody civil war as the communist "Reds," who had seized control in November 1917, fought off the "Whites," who were supported by the Western Allies. War

communism ended with the Russian Civil War in 1921 and was replaced by the New Economic Policy, which was a mixed economy and brought the country back to stability and, by 1928, prewar levels of production and consumption. If any era qualifies in Soviet Russia, this period (1921–1928) was its golden age. In the 1930s Soviet leader Joseph Stalin pushed both the collectivization of agriculture, bringing the deaths of millions of Soviet citizens and the industrialization essential for modern warfare.

In foreign policy, Stalin was a revisionist who did not accept the new frontiers in Eastern Europe as final. Particularly vexing to him was the new Poland, which had been partially carved from former Russian territory. Russia had also lost additional lands to Poland following its defeat in the 1919–1920 Russo-Polish War.

After 1933 and Adolf Hitler's accession to power, Stalin became especially disturbed over Germany, for the German führer (leader) had clearly stated his opposition to communism and his intention of bringing large stretches of Eastern Europe under German control, even by the sword. The German threat led Stalin to turn to collective security and to pursue an internationalist course. In 1934 the Soviet Union joined the League of Nations.

Simultaneously, Stalin launched unprecedented purges against his own people, largely motivated by his own paranoia and desire to hold on to power. The number of victims may have been as high as 40 million, with half of these killed. The so-called Great Terror consumed almost all the old guard Bolshevik leadership and senior military officers. The consequences of the latter were felt in 1941 when the Germans invaded the Soviet Union.

Negotiations between Western leaders and the Soviet Union continued. The problem was that the West could offer nothing Stalin wanted. Thus, despite the fact that the Kremlin was willing to enter into arrangements with the West against Germany and Japan, no effective international coalition was forged.

In 1931 Japan seized Manchuria. Japan had been one of the chief beneficiaries of World War I. At little cost, it had secured the German islands north of the equator and concessions in China. Riding the crest of an ultranationalist wave, Japanese leaders sought to take advantage of the chaos of the worldwide economic depression and the continuing upheaval in China after the 1911 revolution to secure the natural resources their country lacked.

The Japanese sought these not only in Manchuria but also in Mongolia, China proper, and Southeast Asia.

Although Japan had many of the trappings of a democracy, it was not one. The army and navy departments were independent of the civilian authorities; from 1936 onward the ministers of war and navy had to be serving officers, giving the military a veto over public policy, as no government could be formed without its concurrence. Army leaders had little sympathy for parliamentary rule or civil government, and in the 1930s they dominated the government and occasionally resorted to political assassinations, even of prime ministers.

On the night of September 18, 1931, Japanese staff officers of the elite Guandong (Kwantung) Army in southern Manchuria set off an explosion near the main line of the South Manchuria Railway near Mukden, an act they blamed on nearby Chinese soldiers. The Japanese military then took control of Mukden and began the conquest of all Manchuria. Tokyo had been presented with a fait accompli by its own military, but it supported the action.

The Japanese held that they had acted only in self-defense and demanded that the crisis be resolved through direct Sino-Japanese negotiation. China, however, took the matter to the League of Nations, the first major test for that organization. The League Council was reluctant to embark on tough action against Japan, and Japan ignored its calls to withdraw its troops, continuing military operations. In February 1932 Japan proclaimed the “independence” of Manchuria in the guise of the new state of Manzhouguo (Manchukuo). A protocol that September established a Japanese protectorate over Manchukuo. In 1934 the Japanese installed China’s last Manchu emperor, deposed in 1911, Aixinjuelo Puyi (Aisingioro P’u-i, known to Westerners as Henry Pu-Yi) as emperor of Manchukuo.

A League of Nations investigating committee blamed Japan and concluded that only the presence of Japanese troops kept the government of Manchukuo in power. On February 24, 1933, the League Assembly approved the report of its committee and the Stimson doctrine, named for Secretary of State Henry L. Stimson, of nonrecognition of Manchukuo. Of 42 member states, only Japan voted no. Tokyo then gave notice of its intention to withdraw from the League of Nations.

Manchukuo was larger than France and Germany combined, but in March Japanese troops added to it the province of Rehe (Jehol). Early in April they

moved against Chinese forces south of the Great Wall to within a few miles of Beijing (Peking) and Tianjin (Tienstin). In May Chinese forces evacuated Beijing, then under the authority of pro-Japanese Chinese leaders. The latter concluded a truce with Japan that created a demilitarized zone administered by Chinese friendly to Japan.

Germany was the next to move. In January 1933 Adolf Hitler became German chancellor, by entirely legitimate means, and in October 1933 he withdrew Germany from both the League of Nations and the international disarmament conference meeting in Geneva. In July 1934 Austrian Nazis, acting with the tacit support of Berlin, attempted to seize power in Vienna and achieve Anschluss (union) with Germany. Ultimately Austrian authorities put down the putsch without outside assistance, although Mussolini, who considered Austria under his influence, ordered Italian troops to the Brenner Pass.

Germany was then still largely unarmed, and Hitler denied responsibility for the coup attempt, expressed regret at the murder of Austrian chancellor Engelbert Dollfuss, and assured the world that Germany had no role in the failed coup. The attempted Nazi takeover of Austria was clearly a setback for Hitler. Secure in French support, that September Mussolini met with new Austrian chancellor Kurt von Schu-schnigg in Rome and announced that Italy would defend Austrian independence. A French pact with Italy rested on agreement with Yugoslavia, and on October 9, 1934, King Alexander of Yugoslavia arrived at Marseilles for discussions with the French government. Croatian terrorists assassinated him and French foreign minister Louis Barthou. This event was a great embarrassment for France, although Barthou's successor, Pierre Laval, did secure the pact with Italy. The January 1935 French-Italian accords called for joint consultation and close cooperation between the two powers in Central Europe and reaffirmed the independence and territorial integrity of Austria. They also recommended a multilateral security pact for Eastern Europe. In secret provisions Italy promised to support France with its air force in the event of a German move into the Rhineland, and France agreed to provide troops to aid Italy if the Germans should threaten Austria. France also transferred land to the Italian colonies of Libya and Eritrea, and Laval promised Mussolini that France would not oppose Italy's efforts to realize its colonial ambitions. Thereafter Mussolini behaved as if he had France's approval to wage aggressive war.

Only a week later, with Hitler declaring the Saar to be his last territorial demand in Europe (the first of many such statements), 90 percent of Saarlanders voting chose to rejoin Germany. On March 1, 1935, the League Council formally returned the Saar to German control. A fortnight afterward on March 16, Hitler proclaimed the rearmament of Germany. Secret rearmament had been under way for some time, including an air training center at Lipetsk, a gas warfare school at Torski, and a tank school at Kazan, all in the Soviet Union, but Hitler now announced publicly that the Reich would reintroduce compulsory military service and increase its army to more than 500,000 men, moves he justified on the grounds that the Allies had not disarmed. France, Britain, and Italy all protested but did nothing further to compel Germany to observe its treaty obligations. In April 1935 Laval, Prime Minister J. Ramsay MacDonald of Britain, and Mussolini met at Stresa on Lake Maggiori and formed the so-called Stresa Front, agreeing "to oppose unilateral repudiation of treaties that may endanger the peace" (with "of Europe" being added at Mussolini's request).

On May 2, France and the Soviet Union signed a five-year pact of mutual assistance in the event of unprovoked aggression against either power. The French rejected a military convention that would have coordinated their military response to any German aggression, however. On May 16 the Soviet Union and Czechoslovakia signed a similar mutual assistance pact, but the Soviet Union was not obligated to provide armed assistance unless France first fulfilled its commitments.

Britain took the next step in the appeasement of Germany, shattering the Stresa Front. On June 18, 1935, the British government signed a naval agreement with Germany that condoned the latter's violation of the Versailles Treaty. In spite of having promised Paris in February that it would take no unilateral action toward Germany, London permitted the Reich to build a surface navy up to 35 percent that of Britain, in effect a force larger than the navy of either France or Italy. London also allowed Germany 45 percent of the Royal Navy strength in submarines, armaments prohibited Germany by the Treaty of Versailles. British leaders were unconcerned. The Royal Navy had only 50 submarines, and this would mean that the Germans could build only 23. Moreover, the British were confident that asdic, later known as sonar, would enable them to detect submarines out to a range of several thousand yards. The Anglo-German Naval Agreement was the first occasion

when any power sanctioned Germany's misdeeds and won Britain the displeasure of its ally France.

On October 3, 1935, believing with some justification that he had Western support, Mussolini invaded Ethiopia (Abyssinia). Long-standing border disputes between Italian Somaliland and Ethiopia were the excuse. Mussolini's goal was to create a great Italian empire in Africa and to avenge Italy's defeat by the Ethiopians at Adowa in 1896. The outcome of the Italo-Ethiopian War was a foregone conclusion. In May 1936 Italian forces took Abbis Ababa, and Mussolini proclaimed the king of Italy as the emperor of Ethiopia.

On October 7, 1935, the League of Nations condemned Italy, the first time it had branded a European state as an aggressor. But behind the scenes British foreign secretary Sir Samuel Hoare and French foreign minister Pierre Laval devised the infamous Hoare-Laval Proposals to broker away Ethiopia to Italy in return for Italian support against Germany. Public furor in these two countries swept both men from office when the deal became known.

Ultimately the League of Nations voted to impose some economic sanctions but not on oil, which would have brought an Italian withdrawal. In the end, even those ineffectual sanctions that had been voted for were lifted. Italy, like Japan, had gambled and won, dealing another blow to collective security.

Probably the seminal event on the road to World War II occurred in early 1936, when Hitler remilitarized the Rhineland. On March 7, 1936, some 22,000 lightly armed German troops marched into the Rhineland, defying not just the Treaty of Versailles but also the Locarno Pacts, which Germany had voluntarily negotiated. Hitler deliberately scheduled the operation to occur while France was absorbed by a bitterly contested election campaign that brought the leftist Popular Front to power.

Incredibly, France had no contingency plans for such an eventuality. French intelligence services also grossly overestimated the size of the German forces in the operation and believed Hitler's false claims that the Luftwaffe had achieved parity with the French Armée de l'Air. Vainly seeking to disguise its own inaction, Paris appealed to Britain for support, but Foreign Secretary Anthony Eden made it clear that Britain would not fight for the Rhineland, which was after all German territory.

Had the French acted, their forces would in all likelihood have rolled over

the Germans, which would probably have meant the end of the Nazi regime. Remilitarization of the Rhineland provided Germany protection for the Ruhr and a springboard for invading France and Belgium. It also led Belgian leaders that October to renounce their treaty of mutual assistance with France and seek security in neutrality.

Almost immediately after the German remilitarization of the Rhineland another international crisis erupted, this time in Spain, where civil war began on July 18, 1936. The issue centered on whether Spain would follow the modernizing reforms of the rest of Western Europe or maintain its then-present structure, favored by Spanish traditionalists. When the Republicans won a narrow victory in the Spanish elections of 1936, the traditionalists, known as the Nationalists, took to arms.

It is probable, though by no means certain, that the Republicans would have won the civil war had Spain been left alone to decide its fate. Certainly the conflict would have ended much sooner. Germany and Italy intervened early, providing critical air support that allowed the airlifting of Nationalist troops and equipment across the Strait of Gibraltar from Morocco to Nationalist-held territory in Spain, in effect the first large-scale military airlift in history.

Germany even formed an air detachment, the Kondor Legion, to fight in Spain, a key factor in the ultimate Nationalist victory. The Germans also tested their latest military equipment under combat conditions, developed new fighter tactics, and learned the necessity of close coordination of air and ground operations, along with the value of dive-bombing. Italy also provided important naval support and sent three divisions of troops, artillery, and aircraft.

Surprisingly, the Western democracies did not support the Spanish Republic. France initially sent some arms but, under heavy British pressure, reversed its stance. British leaders devised a noninterventionist policy. Although all the great powers promised to observe it, only the Western democracies did so. This agreement, which made it impossible for the Republicans to obtain the arms they needed, was probably the chief factor in their defeat.

Only the Soviet Union and Mexico provided military aid to the Republic. Stalin apparently hoped for a protracted struggle that would entangle the Western democracies and Germany on the other side of the European

continent. During the war the Soviet Union sent advisers, aircraft, tanks, and artillery. Eventually this Soviet aid permitted the Spanish communists, not a significant political factor in 1936, to take over the Republican government. Finally, in March 1939 Nationalist forces, led by General Francisco Franco, entered Madrid, and by April hostilities ended.

The Western democracies emerged poorly from the test of the Spanish Civil War. Although tens of thousands of foreign volunteers had fought in Spain, most of these for the republic, the governments of the Western democracies had remained aloof, and many doubted that the West had any will left to defend democracy. Internationally, the major effect of the fighting in Spain was to bring Germany and Italy together. In October 1936 they agreed to cooperate in Spain, to collaborate in matters of "parallel interests," and to work to defend "European civilization" against communism. Thus was born the Rome-Berlin Axis.

On November 25 Germany and Japan signed the Anti-Comintern Pact to oppose activities of the Comintern (Third International), created to spread communism. Germany and Japan also signed a secret agreement the same day that provided that if either state was the object of an unprovoked attack by the Soviet Union, then the other would do nothing to assist the Soviet Union. On November 6, 1937, Italy joined the Anti-Comintern Pact. Shortly afterward Mussolini announced that Italy would not assist Austria against a German attempt to consummate the Anschluss. Italy also withdrew from the League of Nations and recognized Manchukuo as an independent state in November 1937, followed by Germany in May 1938.

Japan meanwhile continued to strengthen its position in the Far East, asserting its exclusive right to control China. Tokyo demanded an end to Western loans and military advisers to China and threatened the use of force if such aid continued. In 1935 Japan began encroaching upon several of China's northern provinces. The Chinese government at Nanjing (Nanking), headed by Generalissimo Jiang Jieshi (Chiang Kai-shek), initially pursued a policy of appeasement vis-à-vis the Japanese, but students and the Chinese military demanded action. The Chinese Communists expressed themselves willing to cooperate with the Nationalist government and place their armies under its command if Nanjing would adopt an anti-Japanese policy. The rapid growth of anti-Japanese sentiment in China and the increasing military

strength of the Nationalists alarmed Japanese military leaders, who worked to establish a pro-Japanese regime in China's five northern provinces.

On the night of July 7, 1937, a clash occurred west of Beijing between Japanese and Chinese troops. Later that month after Nanjing rejected a Japanese ultimatum, the Japanese invaded the coveted northern provinces. In a few days they had occupied both Tianjin (Tientsin) and Beijing (Peking), and by the end of the year Japan had extended its control into all five Chinese provinces north of the Yellow River. In mid-December Japan also installed a new government in Beijing. Japan never declared war against China, however, enabling it to evade U.S. neutrality legislation and purchase American raw materials and oil. This also permitted Washington to send aid to China, though.

The fighting was not confined to northern China, for in August 1937 the Japanese attacked the great commercial city of Shanghai. Not until November, after three months of hard fighting involving the best Nationalist troops, did the city fall. Japanese forces then advanced up the Changjiang (Yangtse) River and in December took Nanjing, where they committed wide-scale atrocities.

As scholars have noted, Japan after the war developed a collective amnesia over its actions at Nanjing and its atrocities in the war through South Asia in general. This Japanese evasion of responsibility stands in sharp contrast to German attempts to come to terms with the Holocaust and has affected Japan's relations with China and other nations in Asia right up to the present.

While trying to clear the Changjiang River of all Western shipping, on December 12, 1937, Japanese forces attacked a U.S. Navy gunboat, the *Panay.* Other American ships belonging to an oil company were also bombed and sunk, and British vessels were shelled. Strong protests from Washington and London brought profuse apologies from Tokyo. The Japanese, falsely claiming that they had not realized the nationality of the ships, stated their readiness to pay compensation and give guarantees that such incidents would not be repeated. Washington and London accepted these amends, and the episode only served to convince Tokyo that it had little to fear from Western intervention.

Again China appealed to the League of Nations, which once more condemned Japan. Again, though, the West failed to withhold critical

supplies and financial credits from Japan, so once more collective security failed. By the end of 1938 Japanese troops had taken the great commercial cities of Tianjin, Beijing, Shanghai, Nanjing, Hankow, and Guangzhou (Canton); the Nationalists were forced to relocate their capital to the interior city of Chongqing (Chungking), which Japan bombed heavily. In desperation, the Chinese demolished the dikes on the Huang He (Hwang Ho, known to Westerners as the Yellow River), costing hundreds of thousands of lives and flooding much of northern China until 1944.

Japan was also confronting the Soviet Union. Fighting between Japanese and Soviet troops began in 1938 in the poorly defined triborder area normally referred to as Changkufeng where Siberia, Manchukuo, and Korea met. Although no state of war was declared, significant battles were fought, especially at Changkufeng Hill in 1938 and Khalkhin Gol (Nomonhan) in 1939. The fighting ended advantageously for the Soviets. A cease-fire in September 1939 preempted a planned Japanese counterattack, and the dispute was resolved by treaty in June 1940. The fighting undoubtedly influenced Stalin's decision to sign a nonaggression pact with Germany in August 1939. It also gave Tokyo a new appreciation of Soviet fighting ability and in 1941 helped to influence Japanese leaders to strike not north into Siberia but against the easier targets of the European colonies in Southeast Asia.

In the West, by 1938 the situation was such as to encourage Hitler to embark upon his own territorial expansion. Mussolini was now linked with Hitler, while France was experiencing another period of ministerial instability. In Britain "appeasement" was in full force, so much so that in February 1938 Anthony Eden, a staunch proponent of collective security, resigned as foreign secretary.

Austria was Hitler's first step. In February 1938, Austrian chancellor Schuschnigg traveled to Berchtesgaden at Hitler's insistence to meet with the German leader. Under heavy pressure, Schuschnigg agreed to appoint Austrian Nazi Arthur Seyss-Inquart as minister of the interior and other Austrian Nazis as ministers of justice and foreign affairs. On March 9, however, in an attempt to maintain his nation's independence, Schuschnigg announced a plebiscite on the issue of the Anschluss to be held in only four days, hoping that the short interval would not allow the Nazis to mobilize effectively.

Hitler was determined that no plebiscite be held, and on March 11 Seyss-

Inquart presented Schuschnigg with an ultimatum demanding his resignation and postponement of the vote under threat of invasion by German troops, already mobilized on the border. Schuschnigg yielded, canceling the plebiscite and resigning. Seyss-Inquart then took power and invited in the German troops “to preserve order,” although German forces had already crossed the frontier. Germany’s military was hardly ready for war; hundreds of German tanks and vehicles of the German Eighth Army broke down on the drive toward Vienna.

On March 13 Berlin declared Austria to be part of the Reich, and the next day perhaps 1 million Austrians gave Hitler an enthusiastic welcome to Vienna. France and Britain lodged formal protests with Berlin but did nothing more. After the war Austrian leaders denied culpability for their association with the Third Reich and claimed that their country was the first victim of Nazi aggression.

The Anschluss greatly strengthened Germany’s position in Central Europe. Germany was now in direct contact with Italy, Yugoslavia, and Hungary and controlled virtually all the communications of Southeastern Europe. Czechoslovakia was isolated, and its trade outlets were at German mercy. Militarily, Germany outflanked the powerful western Czech defenses. It was thus not surprising that despite Hitler’s pledges to respect the territorial integrity of Czechoslovakia, he should next seek to bring that state under his control.

In Austria, Hitler had added 6 million Germans to the Reich, but another 3.5 million lived in Czechoslovakia. Germans living there had long complained about discrimination in a state that had only minority Czechs, Germans, Slovaks, Hungarians, Ukrainians, and Poles. In 1938, however, Czechoslovakia had the highest standard of living east of Germany and was the only remaining democracy in Central Europe.

Strategically, Czechoslovakia was the keystone of Europe. It had a military alliance with France, a well-trained 400,000-man army, and the important Skoda munitions complex at Pilsen as well as strong fortifications in the west. Unfortunately for the Czechs, the latter were in the Erzegeberge (Ore Mountains) bordering the Bohemian bowl, where the population was almost entirely German. From the German point of view, it could now be said that Bohemia-Moravia, almost one-third German in population, protruded into the Reich. Hitler now took up and enlarged the past demands of Konrad

Henlein's Sudetendeutsch (Southern German) Party to relieve legitimate complaints into a call for outright separation of the German regions from Czechoslovakia and their union with Germany.

In May 1938 during key Czechoslovakian elections, German troops massed on the border and threatened invasion. Confident of French support, the Czechs mobilized their army. Both France and the Soviet Union had stated their willingness to go to war to defend Czechoslovakia, and in the end nothing happened. Hitler then began to construct fortifications along the German frontier in the west. Known to Germans as the West Wall, these were clearly designed to prevent France from supporting its eastern allies.

Western leaders, who believed that they had just averted war, now pondered whether Czechoslovakia, which had been formed only as a consequence of the 1919 Paris Peace Conference, was worth a general European war. British prime minister Chamberlain concluded that it was not. In July he sent an emissary to Prague as a mediator and, on September 7, based on his suggestions, Prague offered Henlein practically everything the Sudeten Germans demanded, short of independence.

A number of knowledgeable Germans believed that Hitler was leading their state to destruction. During August and early September 1938 several opposition emissaries traveled to London with messages from head of the Abwehr (German military intelligence) Admiral Wilhelm Canaris and chief of the German General Staff General of Artillery Ludwig Beck. They warned London of Hitler's intentions and urged a strong British stand. Beck even pledged, prior to his resignation in mid-August, that if Britain would agree to fight for Czechoslovakia, he would stage a putsch against Hitler. Nothing came of this, however, as London was committed to appeasement.

By mid-September Hitler was demanding "self-determination" for the Sudeten Germans and threatening war if it was not granted. Clearly, he was promoting a situation to justify German military intervention. France would then have to decide whether to honor its pledge to Czechoslovakia. If it chose to do so, this would bring on a general European war.

In this critical situation Chamberlain asked Hitler for a personal meeting and on September 15 flew to Germany and met with Hitler at Berchtesgaden. There Hitler informed him that the Sudeten Germans must be able to unite with Germany and that he was willing to risk war to accomplish this. London and Paris now decided to force the principle of self-determination on Prague,

demanding on September 19 that the Czechs agree to an immediate transfer to Germany of those areas more than 50 percent German. When Prague asked that the matter be referred to arbitration, as provided under the Locarno Pacts, London and Paris declared this unacceptable. The Czechs, they said, would have to accept the Anglo-French proposals or bear the consequences alone.

The British and French decision to desert Czechoslovakia resulted from many factors. The peoples of both countries dreaded a general war, especially with air attacks, for which neither nation believed itself adequately prepared. The Germans also bluffed the British and French into believing that their Luftwaffe was much more powerful than was the case, and both Chamberlain and French premier Édouard Daladier feared the destruction of their capitals from the air. The Western leaders also thought they would be fighting alone. They did not believe they could count on the Soviet Union, whose military was still reeling from Stalin's purges. It also seemed unlikely that the United States would assist even with supplies, given its neutrality policies. Nor were the British dominions of Canada, Australia, New Zealand, and South Africa likely to support Great Britain in a war for Czechoslovakia. In France and especially in Britain there were also those who saw Nazism as a bulwark against communism and hoped that Hitler could be diverted eastward and enmeshed in a war with Soviet Russia in which communism and fascism might destroy one another.

Chamberlain, who had scant experience in foreign affairs, hoped to reconcile differences and prevent a general European war. He strongly believed in the sanctity of contracts and could not accept that the leader of the most powerful state in Western Europe was a blackmailer and a liar. But the West also suffered from a moral uncertainty. In 1919 it had touted "self-determination of peoples," and by this standard Germany had a right to all it had hitherto demanded. The transfer of the Sudetenland to the Reich did not seem too high a price to pay for a satisfied Germany and a peaceful Europe. Finally, Hitler stated repeatedly that once his demands upon Czechoslovakia had been satisfied, he would have no further territorial ambitions in Europe.

Under heavy British and French pressure, Czechoslovakia accepted the Anglo-French proposals. On September 22 Chamberlain again traveled to Germany and met with Hitler, who, to Chamberlain's surprise, demanded that all Czech officials be withdrawn from the Sudeten area within 10 days and that no military, economic, or traffic establishments be damaged or removed.

These demands led to the most serious international crisis in Europe since 1918. Prague informed London that Hitler's demands were absolutely unacceptable. London and Paris agreed and decided not to pressure Prague to secure its acceptance. It thus appeared that Hitler might have to carry out his threat to use force and that a general European war might result.

Following appeals by Roosevelt and Mussolini to Hitler, however, the German leader agreed to a meeting. Chamberlain, Daladier, and Mussolini then repaired to Munich to meet with Hitler on September 29. The Soviet Union was not invited, and Czechoslovakia was not officially represented. There were no real negotiations, the object being to give Hitler the Sudetenland in order to avoid war.

The Munich agreement, dated September 30, gave Hitler everything he demanded, and early on October 1, 1938, German troops marched across the frontier. Other neighboring states joined in. Poland demanded, and received, an area around Teschen of some 400 square miles with a population of 240,000 people, only 100,000 of whom were Poles, and in November Hungary secured some 4,800 square miles of Czechoslovakia with about 1 million people.

In retrospect, it would have been better for the West to have fought Germany in September 1938. The lineup against Germany might have included the Soviet Union and Poland, but even discounting them, the German Army would have been forced to fight against France and Britain as well as Czechoslovakia. Hitler's claims to the contrary, Germany was not ready for war in September 1938. The Luftwaffe had 1,230 first-line aircraft, including 600 bombers and 400 fighters, but nearly half of this number was earmarked for use in the east, leaving the rest too thinly stretched over the Reich frontier to counter any serious offensive by the French Air Force and the Royal Air Force (RAF). The Luftwaffe was also short of bombs. Worse, on the ground only five German fighting divisions and seven reserve divisions were available to hold eight times that number of French divisions.

Britain too was far from ready, its rearmament program having begun only the year before. France had many more artillery pieces than Germany but was weak in the air. According to one estimate, France had only 250 first-quality fighters and 350 bombers out of perhaps 1,375 frontline aircraft, but France could have counted on 35 well-armed and well-equipped Czech

divisions, backed by substantial numbers of artillery and tanks, and perhaps 1,600 aircraft.

Later those responsible for the Munich debacle advanced the argument that it bought a year for the Western democracies to rearm. Winston Churchill stated that British fighter squadrons equipped with modern aircraft rose from only 5 in September 1938 to 26 by July 1939 (and 47 by July 1940), but he also noted that the year "gained" by Munich left the democracies "in a much worse position compared to Hitler's Germany than they had been at the Munich crisis."

The September 1938 crisis had far-reaching international effects. Chamberlain and Daladier were received with cheers at home, the British prime minister reporting that he believed he had brought back "peace in our time." But the agreement effectively ended the French security system, since its eastern allies now questioned French commitments to them. Stalin, always suspicious, was further alienated from the West. He expressed the view that Chamberlain and Daladier had surrendered Czechoslovakia to Hitler to facilitate Germany's Drang nach Osten (Drive to the East) and a war between Germany and the Soviet Union.

Despite Hitler's assurance that the Sudetenland was his last territorial demand, events soon proved the contrary. The day after Munich, Hitler told his aides that he would annex the remainder of the country at the first opportunity. Within a few months Hitler took advantage of the internal situation in Czechoslovakia. In March 1939 he threw his support to the leader of the Slovak Popular Party, Jozef Tiso, who sought complete independence for Slovakia. On March 14 Slovakia and Ruthenia declared their independence. That same day Hitler summoned elderly Czech president Emil Hácha to Berlin, where the commander of the Luftwaffe, Hermann Göring, threatened the immediate destruction of Prague unless Moravia and Bohemia were made Reich protectorates. German bombers, he alleged, were awaiting the order to take off. Hácha signed, and that same day, March 15, Nazi troops occupied what remained of Czechoslovakia. The Czech lands became the "Protectorate of Bohemia and Moravia," while Slovakia became a vassal state of the Reich.

Thirty-five highly trained and well-equipped Czech divisions disappeared from the anti-Hitler order of battle. Hitler had also eliminated what he had referred to as "that damned airfield," while the output of the Skoda arms

complex would now supply the Reich's legions. In Bohemia and Moravia the Wehrmacht acquired 1,582 aircraft, 2,000 artillery pieces, and sufficient equipment to arm 20 divisions. Any increase in armaments that Britain and France achieved by March 1939 was more than counterbalanced by German gains in Czechoslovakia, which included nearly one-third of the tanks they deployed in the west in the spring of 1940. Between August 1938 and September 1939 Skoda produced nearly as many arms as all British arms factories combined.

Hungarian troops crossed into Ruthenia and incorporated it into Hungary. Later in March Germany demanded from Lithuania the immediate return of Memel, with its mostly German population. Lithuania had received the Baltic city after World War I to gain access to the sea but had no recourse but to comply.

Hitler's seizure of the rest of Czechoslovakia demonstrated that his demands were not limited to Germans and were rather determined by the desire for *Lebensraum* (living space). His repudiation of the formal pledges given Chamberlain at Munich did serve to convince the British that they could no longer trust Hitler. Indeed, Britain and France responded with a series of guarantees to the smaller states now threatened by Germany.

Clearly Poland would be the next pressure point, as the German press orchestrated charges of Polish brutality against its German minority. On March 31 Britain and France extended a formal guarantee to support Poland in the event of a German attack. At the 11th hour and under the worst possible circumstances, with Czechoslovakia lost and the Soviet Union alienated, Britain had changed its East European policy and agreed to do what the French had sought in the 1920s.

Mussolini took advantage of the general European situation to strengthen Italy's position in the Balkans. In April 1939 he sent Italian troops into Albania. King Zog fled, whereupon an Albanian constituent assembly voted to offer the crown to King Victor Emanuel III of Italy. On April 13 Britain and France extended a guarantee to defend Greece and Romania.

The Western powers began to make belated military preparations for an inevitable war, and they worked to secure a pact with the Soviet Union. Unfortunately, the guarantee to Poland gave the Soviet Union protection on its western frontier, virtually the most it could have secured in any negotiations.

On May 23 Hitler met with his leading generals at the Reich Chancellory. He reviewed Germany's territorial requirements and the need to resolve these by expansion eastward. War, Hitler declared, was inevitable, and he announced that he intended to attack Poland at the first suitable opportunity.

The same month Britain and France initiated negotiations with the Soviet Union for a mutual assistance pact. Although negotiations continued until August, these failed to reach agreement. Poland, Latvia, Lithuania, and Estonia were all unwilling to allow Soviet armies within their borders, even to defend against German attack. Many in these countries feared the Soviets more than the Germans, and Polish leaders refused to believe that Hitler would risk war with Britain and France. But due to the 1920 Russo-Polish War, Poland's eastern border extended almost to Minsk, and the Soviets believed that the French and British wished them to take the brunt of the German attack. The Poles also had an exaggerated sense of their own military power. In any case, the Anglo-French negotiators refused to sacrifice Poland and the Baltic states to Stalin as they had handed Czechoslovakia to Hitler.

While the Kremlin had been negotiating more or less openly with Britain and France, it concurrently sought an understanding with Germany, even to the point of Stalin dispatching personal emissaries to Berlin. On March 10, 1939, in an address to the Eighteenth Party Congress of the Soviet Union, Stalin had said that the Soviet Union did not intend to "pull anyone else's chestnuts out of the fire." He thus signaled to Hitler his readiness to abandon collective security and negotiate an agreement with Berlin. Within a week Hitler had annexed Bohemia and Moravia, confident that the Soviet Union would not intervene. Another consideration for Stalin was that the Soviet Union potentially faced war on two fronts. Japanese pressure on Mongolia and the Maritime Provinces may well have played a significant role in predisposing Stalin to make his pact with Hitler.

In early May 1939, Stalin gave further encouragement to Hitler when he dismissed Commissar for Foreign Affairs Maksim Litvinov and appointed Vyacheslav Molotov in his place. Litvinov was both a champion of collective security and a Jew. Hitler later said that the dismissal of Litvinov made fully evident Stalin's wish to transform its relations with Germany. Contacts begun in May culminated in the Nazi-Soviet pact of August, signed on August 23 in Moscow by Molotov and German foreign minister Joachim von Ribbentrop.

The Soviet-Nazi agreement signed that night consisted of an open 10-year

nonaggression pact together with two secret protocols, which did not become generally known until Rudolf Hess revealed them during the proceedings of the International Tribunal at Nuremberg after the war. These secret arrangements, never publicly acknowledged by the Soviet Union until 1990, partitioned Eastern Europe between Germany and the Soviet Union in advance of the German invasion of Poland, for which Hitler had now in effect received Stalin's permission. Any future territorial rearrangement of the area would involve its division between the two powers. The Soviet sphere included eastern Poland, the Romanian province of Bessarabia, Estonia, Latvia, and Finland. Lithuania went to Germany; a month later Hitler traded it to Stalin for further territorial concessions in Poland. In addition, a trade convention accompanying the pact provided that the Soviet Union would supply vast quantities of raw materials to Germany in exchange for military technology and finished goods. This economic arrangement was immensely valuable to Germany early in the war, as Churchill later made quite clear to Stalin.

Certainly Stalin expected that Hitler would face a protracted war in the west that would allow the Soviet Union time to rebuild its military. All indications are that Stalin welcomed the pact with Germany, while he regarded the subsequent wartime alliance with Britain and the United States with fear and suspicion. This becomes understandable when one realizes that Stalin's primary concern was with the internal stability of the Soviet Union. The Non-Aggression Pact nevertheless had the impact of a thunderbolt upon the world community. Communism and Nazism, supposed to be ideological opposites on the worst possible terms, had come together, dumbfounding a generation more versed in ideology than power politics.

On August 22 Hitler summoned his generals and announced his intention to invade Poland. Neither Britain nor France, he said, had the leadership necessary for a life-and-death struggle: "Our enemies are little worms," he said, "I saw them at Munich." British and French armament did not as yet amount to much. Germany therefore had much to gain and little to lose, for the Western powers probably would not fight. In any case, Germany must accept the risks and act with reckless resolution.

The German invasion of Poland, set for August 26, occurred on September 1, a delay caused by Italy's decision to remain neutral. Prompted by his foreign minister and son-in-law Galeazzo Ciano, Mussolini lost faith

in a German victory. Ciano proposed that Mussolini tell Hitler that Italy would enter the conflict only if Germany would agree to supply certain armaments and raw materials. On August 25 the Germans rescinded their plans and engaged in frenzied discussions. The next day Mussolini asked for immediate delivery of 170 million tons of industrial products and raw materials, an impossible request. Hitler then asked that Mussolini maintain benevolent neutrality toward Germany and continue military preparations so as to fool the English and French, and Mussolini agreed.

On September 1 following false charges that Polish forces had crossed onto German soil and killed German border guards—an illusion completed by the murder of concentration camp prisoners who were dressed in Polish military uniforms—German forces invaded Poland. On September 3 following expiration of ultimatums to Germany, Britain and France declared war on Germany.

Overview of World War II

World War II was the most destructive enterprise in human history. It is sobering to consider that more resources, material, and human lives (as many as 75 million to 100 million dead) were expended on World War II than on any other human activity. This conflict was so all-encompassing that few side wars took place simultaneously, the Russo-Finnish War of 1939–1940 being one of the exceptions.

The debate over the origins of World War I had become something of a cottage industry among historians in the 1920s and 1930s. The question rarely arises over World War II except on the narrow issue of whether U.S. president Franklin Roosevelt had advance knowledge of the Japanese attack on Pearl Harbor. Whatever their grievances (certainly minor in comparison to the misery they inflicted on their victims), Germany and Japan are almost universally considered the aggressors of World War II.

World War II is historically unique in that it represents if not necessarily a crusade a conflict of good against evil. More than 70 years after the end of this war, no mainstream or serious historians defend Nazi Germany's policies. Perhaps more surprisingly, there are also few if any scholars who would do likewise for militaristic Japan. In practically all previous conflicts, historians find sufficient blame to give all belligerents a share. For example, no prominent historian takes seriously the Versailles provision that Germany was somehow completely responsible for the outbreak of World War. German führer Adolf Hitler and his followers have thus retained mythic

status as personifications of pure evil, something not seen since the Wars of Religion of 17th-century Europe.

The starting date of World War II, however, is disputed. Some have gone as far back as the Japanese seizure of Manchuria in 1931. Others date its outbreak to the opening of the Second Sino-Japanese War in 1937. But these were conflicts between two Asian powers, hardly global war.

The more traditional and accepted date for the start of World War II is September 1, 1939, with the quick but not quite blitzkrieg (lightning warfare) German invasion of Poland. This action brought France and Great Britain into the conflict on September 3 in accordance with their guarantees to Poland. (The Soviet Union's invasion of eastern Poland on September 17 provoked no similar reaction.)

The Germans learned from their Polish campaign and mounted a true blitzkrieg offensive against the Low Countries and France, commencing on May 10, 1940. In blitzkrieg, the tactical airpower of the German Air Force (Luftwaffe) knocked out command and communications posts as integrated armor division pincers drove deep into enemy territory, bypassing opposition strongpoints. When all went well, the pincers encircled the slow-moving enemy. Contrary to legend, the armored forces were simply the spearheads; the bulk of the German Army was composed of foot soldiers and horses. Further, the French Army and the British Expeditionary Force combined had more and usually better tanks than the Germans, and those nations' forces were not too seriously inferior in the air.

The sluggish Allies were simply outmaneuvered, losing France in six weeks, to the astonishment of the "experts." France remains the only major industrial democracy ever to be conquered, and that after a single campaign. It was also the only more or less motorized nation to suffer such a fate; many French refugees fled the rapidly advancing Germans in their private cars. The Germans found that the French Routes Nationales, designed to enable French forces to reach the frontiers, could also be used in the opposite direction by an invader. The Germans themselves relearned this military truth on their autobahns in 1945.

Germany suffered its first defeat of the war when its air offensive against Great Britain, the world's first great air campaign, was thwarted in the Battle of Britain. The margin of victory was small, for there was little to choose between the Royal Air Force's Hurricane and Spitfire fighters and the

Luftwaffe's Bf-109 or between the contenders' pilots. The main advantages of the Royal Air Force in this battle were radar and the geographic fact that its pilots and their warplanes were shot down over Britain; German pilots and aircraft in a similar predicament were out of action for the duration and also had farther to fly from their bases. But Great Britain's greatest advantage throughout this stage of the war was its prime minister, Winston Churchill, who gave stirring voice and substance to Allied defiance of Hitler.

Nonetheless, by the spring of 1941 Nazi Germany had conquered or dominated all of the European continent with but few exceptions. Greece, which had beaten back an inept Italian offensive, finally capitulated to the German Balkan blitzkrieg in the spring of that year. At the same time the Battle of the Atlantic raged, with German submarines seeking to starve out Britain.

Nazi Germany then turned on its erstwhile ally, the Soviet Union, on June 22, 1941, in Operation BARBAROSSA, the greatest military campaign of all time, in order to fulfill Hitler's enduring vision of crushing "Judeo-Bolshevism." (How far Hitler's ambitions of conquest ranged beyond the Russian East is still a matter of dispute.) If he had any introspective moments then, Soviet dictator Joseph Stalin must have wished that he still possessed the legions of first-rate officers he had shot or slowly destroyed in the Gulag in the wake of his bloody purge of 1937. Stalin's own inept generalship played a major role in the early Soviet defeats, and German forces drove almost to within sight of the Kremlin's towers in December 1941 before being beaten back.

Early that same month war erupted in the Pacific, and the conflict then became truly a world war, with Japan's coordinated combined attacks on the U.S. naval base at Pearl Harbor and British, Dutch, and American imperial possessions. With the Soviet Union holding out precariously and the United States now a belligerent, the Axis had lost the war, even though at the time few recognized that fact. America's "Great Debate" as to whether and to what extent to aid Britain vanished in a national outpouring of collective wrath.

Pearl Harbor was bad enough, with 2,280 Americans dead, four battleships sunk, and the remaining four battleships damaged; much worse was to follow. As with the Germans in France, more professional Japanese forces surprised and outfought their opponents by land, sea, and air. Almost

before they knew it, British and Dutch forces in Asia, superior in numbers alone, had been routed in one of the most successful combined-arms campaigns in history. (The French had already yielded control of their colony of Indochina, whose rice and raw materials were flowing to Japan, while the Japanese military had the use of its naval and air bases until the end of the war.) The course of the Malayan-Singapore campaign was typical. British land forces scarcely even delayed the Japanese army, Japanese fighters cleared the skies of British aircraft, and Japanese naval bombers flying from land bases quickly sank the new battleship *Prince of Wales* and the elderly battle cruiser *Repulse.* This disaster made it obvious that the aircraft carrier was the capital ship of the day. Singapore, the linchpin of imperial European power in Asia, surrendered ignominiously on February 16, 1942.

The British hardly made a better fight of it in Burma before having to evacuate that colony. Only the Americans managed to delay the Japanese seriously, holding out on the Bataan Peninsula and then at the Corregidor fortifications until May. The end of imperialism, at least in Asia, can be dated to the capitulation of Singapore, as Asians witnessed other Asians with superior technology and professionalism completely defeating Europeans and Americans.

And yet on Pearl Harbor's very "Day of Infamy," Japan had lost the war. Its forces had missed the American aircraft carriers as well as the oil tank farms and the machine shop complex. The Japanese killed many Americans, destroyed mostly obsolete aircraft, and sank a handful of elderly battleships, but they outraged Americans, who were determined to avenge the attack so that Japan would receive no mercy in the relentless land, sea, and air war that the United States was now to wage against it. More significant, American industrial and manpower resources vastly surpassed those that Japan could bring to bear in a protracted conflict.

And yet oddly, in view of its own ruthless conduct of warfare and occupation, Japan was the only major belligerent to hold limited aims in World War II. Japan basically wanted the Western "colonial" powers out of the Pacific, to be replaced, of course, by its own Greater East Asia Co-Prosperity Sphere (a euphemism for "Asia for the Japanese"). No unconditional surrender demands ever issued from Tokyo. To Japan's own people, of course, the war was presented as a struggle to the death against the arrogant "Anglo-Saxon imperialists."

Three days after the Pearl Harbor attack, Hitler decided to declare war on the United States, a blunder fully as deadly as his invasion of the Soviet Union and even less explicable. But the Nazi dictator, on the basis of his customary “insights,” dismissed the American soldier as worthless and the industrial power of the United States as vastly overrated. This decision meant that the United States could not focus exclusively on Japan.

The tide would not begin to turn until the drawn-out naval-air clash in the Battle of the Coral Sea (May 7–8, 1942), the first naval battle in which neither side’s surface ships ever came within sight of each other. The following month the U.S. Navy avenged Pearl Harbor at the Battle of Midway (June 3–6), sinking no fewer than four invaluable Japanese carriers, again without the surface ships involved ever sighting each other. The loss of hundreds of superbly trained combat-experienced naval aviators and their highly trained maintenance crews was as great a blow to Japan as the actual sinking of its carriers. The Americans could make up their own losses far more easily than the Japanese, who did not deviate from their high prewar standards until the last months of the war.

Although considered a sideshow by the Soviets, the North African campaign was of the utmost strategic importance and until mid-1943 the only continental land campaign that the Western Allies were strong enough to mount. Had North Africa, including Egypt, fallen to the Axis (as almost occurred several times), the Suez Canal could not have been held, and German forces could have gone through the Middle East, mobilizing Arab nationalism, threatening the area’s vast oil fields, and even menacing the embattled Soviet Union itself. Not until the British commander in North Africa General Bernard Montgomery amassed a massive superiority in armor was German general Erwin Rommel defeated at El Alamein in October 1942 and slowly pushed back toward Tunisia. American and British landings in Rommel’s rear, in Algeria and Morocco, were successful, but the raw American troops received a bloody nose at Kasserine Pass. The vastly outnumbered North African Axis forces did not capitulate until May 1943.

Four months earlier the German Sixth Army had surrendered at Stalingrad, marking the resurgence of the Soviet armies. One should nonetheless remember that the distance between Casablanca and Cape Bon is much the same as that from Brest-Litovsk to Stalingrad, and more Axis troops surrendered at “Tunisgrad” than at Stalingrad. (One major difference

was that almost all Axis prisoners of the Western Allies survived their imprisonment, while fewer than 1 in 10 of those taken at Stalingrad returned.)

By this time, U.S. production was supplying not only its own military needs but also those of most of its allies and on a scale moreover that by comparison to all other armed forces (except possibly the Canadians) was simply lavish. Everything from the canned meat product Spam to Sherman tanks and from aluminum ingots to finished aircraft crossed the oceans to the British Isles, the Soviet Union, the Free French, the Nationalist Chinese, the Fighting Poles, and so forth. To this day Russians refer to any multidrive truck as a *studebork* (Studebaker), a result of the tens of thousands of such vehicles shipped to the Soviet Union.

Moreover, quantity was not produced at the cost of quality. Although some of America's allies might have felt some reservations toward Spam, the army trucks, the boots, the small arms, and the uniforms were unsurpassed. British soldiers noted with some envy that American enlisted men wore the same type of uniform material as did British officers. The very ships that transported the bulk of this war material, the famous mass-produced Liberty Ships ("Rolled out by the mile, chopped off by the yard"), could still be found on the world's oceanic trade routes decades after they were originally scheduled to be scrapped.

After the North African campaign ended in 1943, the Allies drove the Axis forces from Sicily and then in September 1943 began the interminable Italian Campaign. It is perhaps indicative of the frustrating nature of the war in Italy that the lethargic Allies allowed it to begin with the escape of most Axis forces from Sicily to the peninsula. The Germans were still better at this sort of thing. Winston Churchill to the contrary, Italy was no "soft underbelly"; the Germans conducted well-organized retreats from one mountainous fortified line to the next. The Italian Campaign was occasionally justified for tying down many German troops; it tied down far more Allied forces, British, American, Free French, Free Poles, Brazilians, Canadians, Indians, British and French African colonials among them. German forces in Italy ultimately surrendered in late April 1945, only about a week before Germany itself capitulated.

The military forces of World War II's belligerents, as might be expected in so historically widespread a conflict, varied wildly. The French Army in 1939, considered by "experts" the world's best, was actually a slow-moving

mass, often supplied with very good equipment and led by aged commanders who had “learned the lessons” of World War I. No other such powerful army was so completely defeated in so short a period of time. The French Air Force and the French Navy likewise had some excellent equipment and more progressive commanders than did the army, but France fell before they could have any great impact on the course of battle.

The German Army, by general agreement, was superb, so much so that some authorities would venture that the Germans traditionally have “a genius for war.” Obviously, Germany’s greatest and traditional failing has been denigration of the fighting ability of its opponents. But on the ground at the operational and tactical levels, the combination of realistic training, strict discipline, and flexible command made the German Army probably World War II’s most formidable foe.

One need only look at a map of Europe from 1939 to 1945 and calculate Germany’s enemies compared to its own resources. The Luftwaffe had superbly trained pilots, although their quality fell off drastically as the war turned against Germany. German fighters were easily the equal of any in the world, but surprisingly, given that Hitler’s earlier ambitions seemingly demanded a “Ural bomber,” the Luftwaffe never put a heavy four-engine bomber into production. Germany led the world in aerodynamics, putting into squadron service the world’s first jet fighter (Me-262), with swept wings, and even a jet reconnaissance bomber. German jet engines lagged somewhat behind those of the British. The Luftwaffe also fielded the Me-163 rocket-powered interceptor, but this craft was as great a menace to its own pilots as to the enemy.

The German Navy boasted some superb surface vessels, such as the battleship *Bismarck*, but Hitler found the sea alien, and he largely neglected Germany’s surface fleet. Submarines were an entirely different matter. U-boat “wolf packs” decimated Allied North Atlantic shipping, and the Battle of the Atlantic was the only campaign that the eupeptic Churchill claimed cost him sleep. German U-boats ravaged the American Atlantic coast, in the first months of 1942 ranging into Chesapeake Bay to take advantage of inexcusable American naval unpreparedness. As in World War I, convoy was the principal answer to the German U-boat, a lesson that had to be learned the hard way in both conflicts.

The British Army, on the whole, put in a mediocre performance in World

War II. As with the French, although to a lesser degree, the British feared a repetition of the slaughter on the World War I Western Front, and, except for elite units, rarely showed much dash or initiative. Montgomery, the war's most famous British general, consistently refused to advance until he had great superiority in men and material over his enemy. The British Expeditionary Force fought well and hard in France in 1940 but afterward moved sluggishly. By far the worst performance of the British Army was in Malaya-Singapore in the opening months of the war.

For all of their commando tradition, moreover, the British undertook few guerrilla actions in any of their lost colonies. Churchill was moved to wonder why the sons of the men who had fought so well in World War I on the Somme, with such heavy losses, suffered so badly by comparison to the Americans still holding out on Bataan. As late as 1943, the Japanese easily repulsed a sluggish British offensive in the Burma Arakan.

This situation changed drastically when General William Slim took command of the beaten, depressed Anglo-Indian forces in Burma. His was the only sizable Allied force not to outnumber the Japanese, yet he inflicted the worst land defeat in its history on Japan and destroyed the Japanese forces in Burma. Unlike so many Allied generals, he led from the front in the worst climate of any battle front. Slim managed to switch his army's composition from jungle fighters to armored cavalry. His only tangible advantage over the enemy was his absolute control of the air, and with this he conducted the greatest air supply operation of the war. Although the modest Slim, of lower-middle-class background, achieved the highest rank in the British Army and then became one of Australia's most successful governor-generals, he is almost forgotten today. Yet considering his accomplishments, with limited resources and in different conditions, William Slim should be considered the finest ground commander of World War II.

The Royal Navy suffered from a preponderance of battleship admirals at the opening of the war, most notably Admiral Sir Tom Phillips, convinced that "well-handled" capital ships could fight off aerial attacks. He was proved emphatically and fatally wrong when Japanese torpedo bombers rather swiftly dispatched his *Prince of Wales* and *Repulse* on the third day of war in the Pacific. The Royal Navy also labored under the handicap that not until 1937 did it win control of the Fleet Air Arm (FAA) from the RAF, which had little use for naval aviation and starved the FAA of funds and attention

through the interwar years. Although the Royal Navy's carriers were fine ships and their armored flight decks gave them a protection that the U.S. Navy envied, albeit at the cost of smaller aircraft capacity, Fleet Air Arm aircraft were so obsolete that the service had to turn to U.S. models. Even so, the FAA made history on November 11, 1940, when its obsolete Fairy Swordfish torpedo bombers sank three Italian battleships in Taranto Harbor, a feat that the Japanese observed carefully but the Americans did not.

British battleships and carriers kept the vital lifeline through the Mediterranean–Suez Canal open through the darkest days of the war and, together with the Americans and Canadians, defeated the German submarine menace in the North Atlantic. Significant surface actions of the Royal Navy included the sinking of the German battleship *Bismarck* in May 1941 by an armada of Royal Navy battleships, cruisers, carriers, and warplanes and the destruction in December 1943 of the pocket battleship *Scharnhorst* by the modern battleship *Duke of York.*

The Soviet Army almost received its deathblow in the first months of the German invasion. Caught off balance and shorn of its best commanders by Stalin's maniacal purges, their successors Stalin's obedient creatures, it suffered heavier losses than any other army in history. Yet spurred by the bestiality of the German war of enslavement and racial extermination and by Stalin's newfound pragmatism, the Red Army was able to spring back and, at enormous cost at the hands of the more professional Germans, fight its way to Berlin.

The Red Air Force developed into one of the most effective tactical airpowers of the war. (The Soviets constructed few heavy bombers.) The Sturmovik was certainly one of the best ground-attack aircraft of the time. The Red Navy, in contrast, apparently did little to affect the course of the war; its main triumph may have been in early 1945 when its submarines sank several large German passenger ships crammed with refugees from the east in the frigid Baltic in early 1945, the worst maritime disasters in history.

The United States emerged from World War II as the only nation since the time of the Romans to be a dominant power on land and sea, not to mention in the air. In 1945 the U.S. Air Force and the U.S. Navy could have defeated any combination of enemies, and only the Russian Army could have seriously challenged the Americans on land. In 1939 the U.S. Army was

about the size of that of Romania; by 1945 it had grown to some 12 million men and women.

World War II in the Pacific was the great epic of the U.S. Navy. From the ruin of Pearl Harbor, that service fought its way across the vast reaches of the Pacific Ocean to Tokyo Bay and eventually had the satisfaction of watching the Japanese surrender on board a U.S. Navy battleship in that harbor. Immediately after Pearl Harbor it was obvious that the aircraft carrier was the ideal capital ship for this war, and the United States virtually mass-produced such warships in the Essex class. The U.S. Navy had much to learn from its enemy especially in night-fighting techniques, as demonstrated in the Battle of Savo Island (August 9, 1942), when Japanese cruisers sank one Australian and three U.S. cruisers in the worst sea defeat in U.S. naval history.

By the end of the war, though, almost all of Japan's battleships and carriers had been sunk, most by naval airpower. U.S. Navy submarines succeeded where the German Navy had failed in two world wars, as U.S. unrestricted submarine warfare strangled the Japanese home islands, bringing near starvation. Equally impressive, the U.S. Navy in the Pacific originated the long-range sea train, providing U.S. sailors with practically all their needs while thousands of miles from the nearest continental American supply base.

The U.S. Marine Corps was a unique military force. Alone among the marine units of the belligerents, it had its own air and armor arms under its own tactical control. U.S. marines were the spearhead that stormed the Japanese-held islands of the Pacific, and the dramatic photograph of a small group of marines raising the American flag over the bitterly contested island of Iwo Jima became an icon of the war for Americans.

The Japanese Army was long on courage but shorter on individual initiative. A near-medieval force, its men often were led in wild banzai charges by sword-flourishing officers against machine-gun emplacements. The entire nation of Nippon was effectively mobilized against the looming Americans under the mindless slogan "Our Spirit against Their Steel." But the history of the Japanese Army will be stained for the foreseeable future by the bestial atrocities it practiced against Allied troops and civilians alike; untold numbers of Chinese civilians, for example, were slaughtered during Japanese military campaigns in China, which continued to tie down substantial Japanese military resources. Only two-thirds of Allied troops unfortunate enough to fall into Japanese hands survived to the end of the war.

Yet the Japanese Army was probably the best light infantry force of the war and was certainly the only World War II army that, on numerous occasions, genuinely fulfilled that most hackneyed order: “Fight on to the Last Man!”

The Imperial Japanese Navy and the air arms of the army and navy were superb in the early stages of the Pacific war. Both had extensive combat experience in the Chinese war and modern equipment. Japanese admirals were best in their class in 1941–1942, and Japanese air and naval forces, along with the Japanese Army itself, quickly wound up European colonial pretensions. Only the vast mobilized resources of the United States could turn the tide against Japan. And except for their complete loss of air control, only in Burma were the Japanese outfought on something like equal terms.

The aftermath of World War II proved considerably different from that of World War I’s prevailing disillusion. Amazingly, all of World War II’s belligerents, winners and losers alike, could soon look back and realize that the destruction of the murderous, archaic, racialist Axis regimes had genuinely cleared the way to a better world. All enjoyed peace and the absence of major war. Even for the Soviets the postwar decades were infinitely better than the prewar years, although much of this measure of good fortune might be attributed simply to the death of Joseph Stalin. Except for Great Britain, the British Commonwealth nations and even more so the United States emerged from the war far stronger than when they entered it after enduring a decade of the Great Depression.

By the 1950s, both war-shattered Western Europe and Japan were well on their way to becoming major competitors of the United States. The uniquely sagacious and foresighted Western Allied military occupations of Germany, Japan, and Austria in many ways laid the foundations for the postwar prosperity of these former enemy nations. (For the most part, similar good fortune bypassed the nondeveloped nations.) Within a few years former belligerents on both sides could agree that despite its appalling casualties and destruction, World War II had been, if not perhaps “The Good War,” at least something in the nature of a worthwhile war.

Legacy of the War

Across the globe, people greeted the end of World War II with a profound sense of relief. By virtually any measurement, the war had been the most devastating conflict in human history. All nations were touched by it to some degree. The war's economic cost alone has been calculated at perhaps five times that of World War I. In human terms, World War II claimed half again as many military lives: 15 million versus 10 million for World War I. Including civilians, between 75 million and 100 million people died in the war, a figure that would have been much higher without the advent of sulfa and penicillin drugs and blood plasma transfusions.

When the war finally ended, vast stretches of Europe and parts of Asia lay in ruins. Whole populations were utterly exhausted, and many people were starving and living in makeshift shelters. Millions more had been uprooted from their homes and displaced; many of them had been transported to the German Reich to work as slave laborers in industry and agriculture. Transport—especially in parts of Western and Central Europe and in Japan—was at a standstill. Bridges were blown, rail lines were destroyed, and highways were cratered and blocked. Ports, particularly those in Northwestern Europe and Japan, were especially hard-hit, and many would have to be rebuilt. Most of the large cities of Germany and Japan were piles of rubble, their buildings mere shells.

Some countries had fared reasonably well. Damage in Britain was not too extensive, and civilian deaths were relatively few; Denmark and Norway escaped with little destruction. The rapid Allied advance had largely spared

Belgium, although the port of Antwerp had been badly damaged. The United States emerged from the war virtually unscathed in terms of physical damage and civilian casualties. The Netherlands, however, sustained considerable destruction, and portions of the population were starving. The situation in Greece was also dire, and Poland suffered horribly from the brutal German and Soviet occupation policies and armies sweeping back and forth across its territory.

Among the major powers, the Soviet Union was the hardest hit. With upwards of 40–50 million of its people killed in the war, national demographics were dramatically affected, a shift that has persisted even to the present. In 1959, Moscow announced that the ratio of males to females in the Soviet Union was 45 to 55. Aside from the catastrophic human costs, the Germans had occupied the Soviet Union's most productive regions, and the scorched-earth policy practiced by both sides resulted in the total or partial destruction of 1,700 towns, 70,000 villages, and 6 million buildings, including 84,000 schools. The Soviet Union also lost 71 million farm animals, including 7 million horses. There was widespread destruction in such great cities as Kiev, Odessa, and Leningrad. Perhaps a quarter of the property value of the Soviet Union was lost in the war, and tens of millions of Soviet citizens were homeless. Simply feeding the Soviet population was a staggering task. All of these factors help to explain the subsequent policies, both internal and external, of the Soviet Union.

Relief efforts in Europe and Asia centered for several years on the pressing problems of providing food, housing, and employment. As it turned out, the damage was not as extensive as initially thought, and many machines were still operational once the rubble was removed. In one perverse sense, Germany and Japan benefited from the bombing in that they rebuilt with many of the most modern techniques and systems.

With the end of the war, the liberated nations carried out purges of fascists and collaborationists. Many of these individuals were slain without benefit of trial. In France, 8,000 to 9,000 people were executed; subsequently, 1,500 more were sentenced to death and executed following regular court procedures. The victorious Allies were determined to bring to justice the leaders of Germany and Japan, whom they held responsible for the war. Two great trials were held, in Nuremberg and Tokyo. Punishment varied greatly according to nation and circumstance, and it proved virtually

impossible to work out acceptable formulas that might punish the guilty when so many people had to some degree collaborated with the occupiers.

At the end of the war, it appeared as if the idealistic, left-leaning resistance movements might realize their goals of forging new political, economic, and social institutions to bring about meaningful change. Although most people thought a return to prewar democratic structures was impossible, bright hopes for building new structures were soon dashed as well. Resistance leaders fell to quarreling among themselves, and the fracturing of the Left, as occurred in France and Italy, made room for the return of the old but still powerful conservative elites. The political structures that ultimately emerged from the war, at least in Western Europe, were little changed from those that had preceded it. In much of Eastern and Central Europe, where the Soviet Union now held sway, there was significant change, including land reform. Soviet rule also brought widespread financial exactions in the form of reparations and the stifling of democracy.

The war did intensify the movement for European unity. Many European statesmen believed that some means had to be found to contain nationalism, especially German nationalism, and that the best vehicle for that would be the economic integration of their nations, with political unification to follow in what some called the "United States of Europe." They believed that a Germany integrated into the European economy would not be able to act alone. Although Europe was slow in taking steps in that direction, such thinking led, a decade after the end of the war, to the European Common Market.

Asia was also greatly affected by the war. In China, the bitter prewar contest between the Chinese Nationalist Party—the Guomindang (GMD), or Kuomintang—and the Chinese Communist Party resumed in a protracted civil war when Nationalist leader Jiang Jieshi (Chiang Kai-shek) sent troops into Manchuria in an effort to reestablish Nationalist control of that important region. The conflict ended in 1949 with a communist victory. To the west, British imperial India dissolved into an independent India and Pakistan.

The United States granted the Philippines delayed independence, but in other areas, such as French Indochina and the Netherlands East Indies, the colonizers endeavored to continue their control. Where the European powers sought to hold on to their empires after August 1945, there would be further bloodshed. The French government, determined to maintain the nation as a

great power, insisted on retaining its empire, which led to the protracted Indochina War. Fighting also erupted in many other places around the world, including Malaya and the Netherlands East Indies.

Even where the European powers chose to withdraw voluntarily, as with Britain in Palestine and the Indian subcontinent, there was often heavy fighting as competing nationalities sought to fill the vacuum. Nonetheless, independence movements in Africa and Asia, stimulated by the long absence of European control during the war, gathered momentum, and over the next two decades much of Africa and Asia became independent.

One of the supreme ironies of World War II is that Adolf Hitler had waged the conflict with the stated goal of destroying communism. In the end he had gravely weakened Europe, and rather than eradicating his ideological adversary, he had strengthened it. In 1945 the Soviet Union was one of the two leading world powers, and its international prestige was at an all-time high. In France and Italy, powerful communist parties were seemingly poised to take power. The Soviet Union also established governments friendly to it in Eastern and Central Europe. Under the pressure of confrontation with the West, these states became openly communist in the years after World War II. In 1948, the communists made their last acquisition in Central Europe in a coup d'état in Czechoslovakia. Communists also nearly came to power in Greece.

Far from destroying the Soviet Union and containing the United States, Germany and Japan had enhanced the international position of both. Western and Soviet differences meant that although treaties were negotiated with some of the smaller Axis powers, there were no big-power agreements concerning the future of Germany and Japan. Germany, initially divided into four occupation zones, became two states in 1949: the western Federal Republic of Germany (FRG, West Germany) and the communist German Democratic Republic (GDR, East Germany). Korea also had been "temporarily" divided at the 38th parallel for the purposes of administering the Japanese surrender. Unlike Germany, which was reunited in 1990, Korea remains divided—another legacy of World War II.

Despite the continued importance of secondary powers such as Britain and France, the year 1945 witnessed the emergence of a bipolar world in which there were two superpowers: the United States and the Soviet Union.

Added to the confrontational mix was the threat of nuclear war as both governments embarked on a new struggle known as the Cold War.

A

Aachen, Battle of (September 13–October 21, 1944)

Located on the western border of Germany, the city of Aix-la-Chapelle (later Aachen) had been the capital of the Holy Roman Empire during the reign of Charlemagne in the early ninth century. Because German dictator Adolf Hitler considered Charlemagne the founder of the first German Reich (empire), the city held special status for him. Aachen was the first major German city encountered by U.S. troops, and the five-week-long battle for it gave notice to U.S. forces that the war against the Third Reich was far from over. Lieutenant General Courtney Hodges, commander of the American First Army, had hoped to bypass Aachen to the south, quickly break through the defenses of the West Wall (Siegfried Line), and reach the Rhine River.

In September 1944, German lieutenant general Gerhard von Schwerin's understrength 116th Panzer Division defended Aachen. Schwerin entered the city on September 12 and quickly concluded that Aachen was lost. He halted the evacuation of the city so that the population might be cared for by the Americans. Only local defense forces prevented occupation of the city on the morning of September 13. Unaware of this, the commander of U.S. VII Corps, Major General J. Lawton Collins, continued his attack on the Siegfried Line. Late on September 15, troops of Major General Clarence R. Huebner's 1st Infantry Division began to surround Aachen from the south and southeast. Hitler ordered the city evacuated, but Schwerin refused that order and was relieved of command; as many as 145,000 of the population of 160,000 fled the city.

Meanwhile, the pause in Allied operations along the Siegfried Line during Operation MARKET-GARDEN (September 17–26) allowed the Wehrmacht the chance to reinforce its West Wall defenses. By the end of September with the collapse of MARKET-GARDEN, operations around Aachen resumed.

From October 7 to 20, elements of the U.S. VII and XIX corps strengthened their hold around the city, now defended by the I Panzer Korps (116th Panzer Division), 3rd Panzergrenadier Division, and 246th Volksgrenadier Division under Colonel Gerhard Wilck.

On October 8, U.S. forces began their attack on Aachen. On October 10, Huebner sent a message into Aachen threatening the destruction of the city if the Germans did not surrender. When this demand was rejected, 300 P-38s and P-47s of the Ninth Air Force dropped 62 tons of bombs on Aachen on October 10. U.S. artillery also pounded the city.

On October 12, Wilck assumed command of some 5,000 German defenders in Aachen. The German troops, supported by assault guns and tanks (mostly Mark IVs), held their positions tenaciously. On October 12, the U.S. fighter-bombers returned and dropped another 69 tons of bombs, and U.S. artillery fired 5,000 rounds into the city.

On October 13, troops of the 26th Infantry Regiment assaulted the city proper. The fighting was house to house, with the U.S. infantry accompanied by tanks and self-propelled artillery to knock out German armor and reduce strongpoints. Infantry blasted holes in the outer walls of buildings with bazookas and then cleared resistance room by room with small arms and hand grenades. Many Schutzstaffel (SS) troops died at their posts rather than surrender.

A seemingly endless procession of German soldiers, captured with the fall of Aachen, marching through the ruined city streets to captivity, October 1944. (National Archives)

When German troops west of Aachen tried to relieve the siege in hastily organized counterattacks, American artillery beat them back. Aachen was completely surrounded, and gradually the German defensive position shrank to a small section of the western part of the city. Wilck's efforts to break out on October 18 and 19 failed, and he surrendered what remained of Aachen on October 21.

The Allied rebuff in Operation MARKET-GARDEN and German resistance at Aachen prevented a quick Allied crossing of the Rhine and bought Hitler time to strengthen his West Wall defenses, but the costs were high. U.S. forces took some 12,000 German prisoners, and thousands more German soldiers were killed. Several hundred civilians also died. U.S. losses of 3,700 men (3,200 from the 30th Infantry Division and 500 from the 1st Infantry Division) were also high, particularly among experienced riflemen.

Remarkably, amid all the ruin and destruction, Aachen's magnificent medieval cathedral survived.

Abadan, Iran, British Attack on (August 25, 1941)

British attack on an Iranian port 50 miles east of Abadan, at the head of the Persian Gulf and the terminus of the Iranian State Railway. With the German invasion of the Soviet Union on June 22, 1941, the British War Cabinet became concerned about German influence in Iran. British leaders feared that Berlin might intervene in Iran, as it had in Iraq in April 1941. The Allies invaded Iran on August 25, 1941, after the Iranian government headed by Shah Reza Pahlavi refused to move against German interests as demanded by the British and Soviet governments.

Anticipating the need to intervene, the Royal Navy had assembled a scratch flotilla based at Basra under Commodore Cosmo Graham. This included an armed merchant cruiser, four sloops (including one Australian and one Indian), a corvette, a gunboat, an armed yacht, a trawler, and a number of river steamers, tugs, motorboats, and dhows. The Royal Iranian Navy, which had its main base at Khorramshahr, 40 miles up the Shatt-el-Arab waterway, consisted of a pair of 1,000-ton sloops and four 330-ton patrol boats. All six of these warships were Italian-built and had Italian

crews. Six Axis freighters—five German and one Italian—and two Italian tankers were sheltering at Bandar Shahpur with two of the Iranian patrol boats.

On August 23, Commodore Graham received orders to proceed with Operation COUNTENANCE and attack Bandar Shahpur, Abadan, and Khorramshahr at dawn on August 25. The force assigned to Bandar Shahpur was anchored in the Persian Gulf south of the Shatt-el-Arab's mouth. The armed merchant cruiser HMAS *Kanimbla* had on board two companies of infantry as a landing force. Supporting it were a gunboat, a sloop, a corvette, an armed trawler, two tugs, two dhows, and a pinnacle.

This flotilla navigated up the Khor Musa inlet, which narrows to a width of three miles, without incident, arriving at 4:15 a.m. The German ship crews sounded the alarm, and several ignited large fires in an attempt to scuttle their ships. Landing parties, however, managed to contain the damage in most instances and captured seven of the eight Axis vessels, totaling 44,000 tons. The Iranian gunboats offered no resistance, and the *Kanimbla* proceeded to land its troops. By evening, Bandar Shahpur had been secured.

The force assigned to capture Khorramshahr and Abadan set out from Basra, with the exception of the sloop HMS *Shoreham* at Fao at the mouth of the Shatt-el-Arab. The sloop HMAS *Yarra* arrived at Khorramshahr first and lay unseen alongside a British merchantman until the sound of firing from downstream at Abadan. The *Yarra* then illuminated the Iranian sloop *Babr* and shelled it from close range, preventing its surprised crew from manning their guns. The Iranian warship quickly sank at its dock. Boarding parties then captured the two patrol boats. The sloop HMS *Falmouth* arrived several hours later, having grounded in transit, and its troops went ashore. There was heavy fighting, but the naval base was secured that evening.

The Abadan flotilla arrived at 4:10 a.m., joined by the *Shoreham*, which had made its way upstream. It achieved complete surprise. The *Shoreham*'s first salvo disabled the Iranian sloop *Palang* and caused a large explosion. Iranian ground forces, however, put up a stiff resistance. The *Shoreham* provided gunfire support to the Indian troops until they finally secured the refinery and the town that afternoon.

ABDA Command

First attempt by the Allied powers to establish a joint command for the defense of Southeast Asia. The attempt resulted from the Arcadia Conference (December 22, 1941–January 14, 1942). Both U.S. president Franklin D. Roosevelt and British prime minister Winston L. S. Churchill appreciated the need for a joint effort to protect their strategic interests in the Pacific from the Japanese. A key goal was protection of the resource-rich Dutch East Indies. In addition to the United States and Britain, the command included Australia and the Netherlands—hence the name ABDA (American, British, Dutch, and Australian) Command.

On January 15, 1942, the ABDA Command was established when British general Sir Archibald Wavell took command of all Allied forces in Burma, Malaya, the Dutch East Indies, western New Guinea, and the north and northwest coasts of Australia. Admiral Thomas C. Hart had command of its naval assets, consisting of 2 heavy cruisers (USS *Houston* and HMS *Exeter*), 4 light cruisers (USS *Marblehead*, HMAS *Perth*, and HNLMS *De Ruyter* and *Java*), and 19 destroyers.

The ADBA naval force was wholly inadequate to defend against Japanese attacks. On January 24, 1942, four ADBA destroyers sank four Japanese transports and a patrol boat off Balikpapan in the Dutch East Indies, but this success only delayed Japanese operations. Subsequently, the ABDA Command suffered setbacks on sea and land.

On February 4, Japanese air strikes crippled the cruiser *Marblehead*, while on February 15, Singapore fell to the Japanese Army. Amid the declining fortunes of the command, both Wavell and Hart were replaced by Dutch officers in charge of all remaining land and sea assets of the command.

In effect, by late February, the ABDA Command existed more in theory than in fact, as it was entirely Dutch-controlled.

Subsequent efforts to stem Japanese advances resulted in the near destruction of the naval forces of the ABDA Command. On February 27, 1942, in the Battle of the Java Sea, Rear Admiral Karel Doorman, commanding 5 cruisers and 9 destroyers, attempted to intercept a Japanese invasion force bound for Java escorted by 4 cruisers and 14 destroyers. The Allies lost 2 cruisers and 4 destroyers. Then on February 28–29, 1942, in the Battle of Sunda Strait, the cruisers USS *Houston* and HMAS *Perth* were sunk while attacking a Japanese landing force. On March 1, Japanese warships and aircraft sank the heavy cruiser HMS *Exeter* and 2 destroyers off Surabaya. Ultimately, only 4 destroyers of the ABDA Command managed to reach safe harbor in Australia.

Abe Hiroaki (1890–1949)

Japanese Navy admiral. Born on March 15, 1890, in Ehima Prefecture, Japan, Abe Hiroaki graduated from the Naval Academy in 1911. He held various positions and commands in the 1920s and 1930s and graduated from the Naval Staff College. On December 1, 1932, he was promoted to captain. He commanded the battleship HIJMS *Fusō* in 1937 and was promoted to rear admiral on November 15, 1938. In December 1941, Abe led Cruiser Division

8 in the attack on Pearl Harbor. Later that month, his forces assisted during the attack on Wake Island.

On June 3–6, 1942, Abe commanded the cruiser and battleship screen in the Battle of Midway; that August, he led the Vanguard Group in the Southwest Pacific. This force, consisting of the Japanese battleships *Hiei* and *Kirishima* and the cruisers HIJMS *Kumano, Suzuya*, and *Chikuma*, was involved in the carrier battles off the eastern Solomon Islands. During October 26–27 the Vanguard Group, augmented by destroyers, fought in the Battle of the Santa Cruz Islands, which was a tactical victory for Japan but at some cost. The *Chikuma* was especially hard-hit.

In early November, the Japanese planned a direct assault on Guadalcanal. Abe was ordered to shell the U.S. air base, Henderson Field, to prepare for an amphibious assault. As his ships moved southward, they met the defending Allied force commanded by U.S. rear admiral Daniel Callaghan on the night of November 12–13, 1942. The resulting battle was one of the fiercest in naval history, and although Callaghan lost two cruisers and four destroyers and was himself killed, he forced Abe and 13,000 Japanese troop reinforcements to turn back. Abe lost two destroyers in the battle. His flagship, the *Hiei*, was also crippled and succumbed to subsequent U.S. air attack.

Abe took the blame for the unsuccessful mission. He was relieved of his command on December 20, 1942, and resigned from the navy in March 1943. Abe died in Kamakura, Kanagawa Prefecture, on February 6, 1949.

Abe Koso (1892–1947)

Japanese Navy admiral. Born in Yamagata, Japan, on March 24, 1892, Abe Koso became a career naval officer. He specialized in naval gunnery and served as a naval gunnery officer on ships ranging from destroyers to battleships. Later he commanded cruisers and battleships. Abe was promoted to lieutenant in 1918, lieutenant commander in 1925, and commander in 1930. On November 15, 1934, he was promoted to captain, and on November 15, 1940, he was promoted to rear admiral.

During Operation mo, the planned invasion of Port Moresby, Abe commanded the Port Moresby Transport Force. It consisted of 12 transports carrying the army's South Seas Detachment and the navy's Kure 3rd Special Naval Landing Force. Abe's convoy left Rabaul on May 4, 1942.

On May 7, the first day of the Battle of the Coral Sea (May 7–8), Abe lost his close air support when U.S. aircraft sank the light carrier *Shoho.* The Transport Force retired to the north while the main forces slugged it out. Although the Japanese won a tactical victory in the battle, Admiral Inouye Shigeyoshi could no longer provide close air support to Abe and ordered the invasion postponed until July 3. Later events caused the invasion to be canceled.

Abe was promoted to vice admiral and assigned command of the Marshall Islands to prepare for an American invasion there. Ten days after U.S. marines landed on Guadalcanal, the 2nd Marine Raider Battalion, known as Carlson's Raiders, landed on Makin Atoll. They wiped out its small garrison and then withdrew to the two submarines that had carried them to the island. Nine Raiders did not make it back to the submarines. They were captured on August 21 by the Japanese relief force. The American prisoners were transferred to Kwajalein, where they were well treated.

In early October 1942, Abe met with a staff officer from Truk. The officer informed Abe that a revised policy allowed him to deal with prisoners locally and not transport them to Japan. Abe ordered Captain Obara Yoshio, commander of the Kwajalein garrison, to execute the prisoners. Despite Obara's protests, Abe insisted.

The commander ordered four of his officers to perform the executions. Obara selected the day of Japan's annual memorial to departed heroes, the Yasukuni Shrine festival, as the execution date. On October 16, 1942, in the presence of Abe, the nine Americans were led to a large grave and beheaded.

The Japanese attempted to cover up the crime, but after the war Marshall Islanders told U.S. authorities about the executions. Abe was arrested and tried on Guam for war crimes. Convicted, he was hanged there on June 24, 1947.

Abe Nobuyuki (1875–1953)

Japanese Army general and prime minister (1939–1940). Born in Ishikawa, Japan, on November 24, 1875, Abe Nobuyuki was trained as an artillery officer. As the commander of the 3rd Field Artillery Regiment between 1918 and 1919, Colonel Abe took part in the Siberian Intervention. Promoted to lieutenant general in 1927, he held several important posts, including vice war minister (1928–1930), deputy war minister (1930), commander of the 4th Division (1930–1932), and commander in chief of the Taiwan garrison (1932–1933). Promoted to full general in 1933, Abe served as a member of the Military Council until his retirement in 1936.

When Baron Hiranuma Ki'ichirō resigned as prime minister in the political crisis following the surprise conclusion of the German-Soviet Non-

Aggression Pact in August 1939, Abe was appointed prime minister, effective August 30. He tried to change the course of national policy toward rapprochement with Britain and the United States, but on January 16, 1940, army hard-liners brought about the collapse of the cabinet. Thereafter, Abe held diplomatic assignments, including ambassador to the Republic of China (April–December 1940), minister of the House of Peers (May 1942–February 1946), and the last Japanese governor-general of Korea (July 1944–September 1945) while retaining his seat in the House of Peers. Abe died in Tokyo on September 7, 1953.

Abrams, Creighton Williams (1914–1974)

U.S. Army colonel, later general. Born in Springfield, Massachusetts, on September 15, 1914, Creighton Williams Abrams graduated from the U.S. Military Academy at West Point in 1936 and was commissioned in the cavalry. Assigned to Fort Bliss, Texas, he joined the famed 7th Cavalry Regiment.

An early convert to the armored force, Abrams during World War II commanded the 37th Tank Battalion of the 4th Armored Division in fighting across Europe, performing brilliantly and earning a battlefield promotion to colonel in April 1945 and two Distinguished Service Crosses. His command was the first to cross the Moselle River, and he led the advance that resulted

in the relief of Bastogne. His unit was also the first element in the Third Army to reach the Rhine.

Following the war, Abrams headed the Department of Tactics at the Armor School, Fort Knox, Kentucky. Later, he commanded the 63rd Tank Battalion in Germany and then the 2nd Armored Cavalry Regiment. During the 1950–1953 Korean War, he served in succession as chief of staff of all three U.S. Army corps there. He was promoted to brigadier general in February 1956 and then served a Pentagon tour before returning to Germany as assistant commander of the 3rd Armored Division.

Promoted to major general in June 1960, Abrams soon after commanded the 3rd Armored Division. He became a lieutenant general in August 1963 and commanded V Corps in Europe. In September 1964, he was named army vice chief of staff and promoted to full general. In 1967 Abrams went to Vietnam as deputy U.S. commander, and in 1968 he succeeded to the top command. During four years in that post, he radically revised the way the war was conducted, discarding body count as a measure of merit and emphasizing security for the rural population.

In 1972, Abrams became chief of staff of an army in desperate need of rebuilding and leadership. He served in that post for two years, stressing combat readiness and taking care of the soldier. Abrams died in Washington, D.C., on September 4, 1974. Subsequently, the U.S. Army named its new main battle tank in his honor. Former chairman of the Joint Chiefs of Staff General John W. Vessey Jr. observed that the success of U.S. armed forces in the 1991 Persian Gulf War was largely attributable to reforms initiated by Abrams.

Abrial, Jean Marie Charles (1879–1962)

French Navy admiral. Born at Réalmont, Tarn, France, on December 17, 1879, Jean Marie Charles Abrial entered the French Naval Academy in 1896 and commanded an antisubmarine patrol boat during World War I. During the early 1920s, he commanded a squadron of torpedo boats in the Mediterranean. He was promoted to captain in 1925. Abrial then studied at the Naval War College, commanded a cruiser, and held various staff positions. He was promoted to rear admiral in 1930 and to vice admiral in 1936. From 1936 to 1938, he commanded the Mediterranean Squadron. On May 23, 1940, shortly after German forces invaded France, he became commander of Northern French Naval Forces.

Five days later as Allied troops retreated to the French channel port of Dunkerque, Allied supreme commander General Maxime Weygand ordered Abrial and his deputy commander, Lieutenant General Maurice Fagalde, to organize a beachhead there. The two French officers believed that Dunkerque could be held successfully against German forces, but on May 20 France's British allies, having decided that retreat from the continent was inevitable, began to organize the withdrawal effort.

Abrial learned of this decision when the evacuation began on May 26, and he quickly organized all available French maritime vessels into an evacuation fleet. Requisitioning all private boats in the area, he began to embark both British and French troops on May 29. He also demanded equal space for beleaguered French troops aboard British vessels. Altogether, by June 4, British and French ships had taken off some 364,000 troops, including some 140,000 French.

Abrial, one of the last to leave Dunkerque, moved to Cherbourg, and on June 19 he surrendered that port to German forces. Remaining in France with the Vichy government following the defeat of France, Abrial was governor-general of Algeria from July 1940 to July 1941, and from November 1942 to March 1943 he was secretary of the navy in the Vichy government.

Abrial was charged with collaboration after the liberation, and in August 1946 he was sentenced to "national indignity" and 10 years of hard labor, which was later commuted to 5 years' imprisonment. Released provisionally in December 1947 and amnestied in 1954, Abrial died at Dordogne in the Tarn on December 19, 1962.

Absolute National Defense Zone

Plan adopted in September 1943 for a Japanese defensive line in the Pacific against the Allied counteroffensive. At the beginning of 1943, Japan lost Guadalcanal in the Solomon Islands in the Southwest Pacific, and in August and September 1943, the United States took back the Aleutian islands of Attu and Kiska. These developments led Imperial General Headquarters in Tokyo to reexamine the planned defensive perimeter in the Pacific Ocean area. Imperial General Headquarters now judged that it would be difficult to hold an overextended front line against an Allied counteroffensive and thus decided to withdraw forces from some areas to shrink the defensive zone and make better use of available resources.

On September 25, 1943, Imperial General Headquarters drew a line that included the Kurile Islands, the Ogasawara Islands, the Mariana Islands, the Caroline Islands, western New Guinea, and the Sunda Islands to Burma. This area was labeled the Absolute National Defense Zone (Zettai kokubo ken). The new defensive perimeter thus excluded the Marshall Islands, the Solomon Islands, and eastern New Guinea. The army and navy General Staffs planned to reorganize and build up the military and naval forces inside the zone for a decisive battle with U.S. forces.

On September 30, the plan was declared officially in effect during a meeting where Emperor Hirohito was in attendance. The plan called for the

following: (1) the establishment of the Absolute National Defense Zone to meet an Allied counteroffensive, (2) the improvement of relations with the Soviet Union, (3) the conclusion of the war in China on terms favorable to Japan, (4) the strengthening of relations with Germany, (5) the education of the peoples of Japanese-occupied areas and the development of the Greater East Asia Co-Prosperity Sphere, (6) the reorganization of the nation for total war, and (7) the intensification of propaganda against the Allies.

Despite this, the Japanese Army continued to be preoccupied with China to the detriment of the defense of the Pacific islands, and the navy persisted in holding Truk Island in the Central Pacific, which was outside the defense zone. The failure of the army and navy to reach consensus regarding the defense zone was of considerable benefit to the Allies during 1944 and 1945.

Adachi Hatazō (1890–1947)

Japanese Army general. Born in Chiba on June 17, 1890, Adachi Hatazō graduated from the Japanese Military Academy in 1910 and the Army War College in 1922. Promoted to major in 1926 and to lieutenant colonel in 1930, he was district commander of the Guandong (Kwantung) Army Railway Unit in 1933. He was promoted to colonel in 1934, and he commanded the 12th Infantry Regiment in 1936.

At the beginning of the Sino-Japanese War (1937–1945), Adachi commanded the 37th Infantry Division. As chief of staff of the North China Area Army, he played a prominent role in defeating Chinese forces during Operation CHŪGEN in May 1941. He was promoted to major general in 1938 and lieutenant general in 1940.

Following the death of Lieutenant General Horii Tomitaro in November 1942, Adachi was appointed commander of the newly formed Eighteenth Army at Rabaul, designated for the defense of New Guinea and numbering at peak strength some 140,000 men. The Eighteenth Army's first full-scale landing attempt on New Guinea shattered in the March 2–5, 1943, Battle of the Bismarck Sea when U.S. air attacks sank all of Adachi's eight transports, resulting in the loss of 3,000 men and a great amount of supplies and equipment.

Allied air superiority forced Adachi to bring his troops ashore in small scattered formations along more than 400 miles of the north New Guinea coast. A lack of transports and air cover inhibited the concentration of Eighteenth Army forces and led to many deaths among Adachi's men from hunger and disease.

When on April 22, 1944, Allied forces went ashore at Hollandia and Aitape, key strategic points on the north-central New Guinea coast, Adachi skillfully assembled his remaining 60,000 troops and moved them 300 miles overland to contest the Allied forces. Adachi ordered an all-out attack on July 10, 1944, and his forces successfully broke through the Allied front lines in place. The early attacks soon lost momentum, forcing Adachi to withdraw.

In the struggle for Aitape, Adachi lost more than 10,000 men. Thereafter, the Eighteenth Army simply struggled to survive Australian Army mopping-up operations. On September 13, 1945, Adachi surrendered with only about 10,000 of his force alive.

Although Adachi was an officer of great personal integrity and fighting ability, especially in adversity, his offensive tactics have been called into question and contrasted with those of his superior, General Imamura Hitoshi, commander in chief of the Eighth Area Army at Rabaul. Adachi's repeated attempts to attack superior Allied forces led to unnecessarily heavy casualties. In contrast, Imamura on New Britain Island prepared his men for sustained defensive operations and followed a force-in-being strategy throughout the remainder of the war.

After the war the Australian government prosecuted Adachi for war crimes, specifically the mistreatment of Allied prisoners of war at Rabaul. He was convicted and sentenced to life imprisonment. Adachi committed suicide in prison at Rabaul on September 10, 1947.

Adam, Wilhelm (1877–1949)

German Army general. Born in Ansbach in Bavaria on September 15, 1877, Wilhelm Adam joined the German Army in 1897. He began his military career in a communications unit but then transferred to the engineers. In 1899 he was commissioned a lieutenant. He was promoted to captain in 1911 and at the end of World War I served as a staff officer in a Bavarian reserve division. Adam was promoted to major in 1919 and to colonel in 1927.

During the interwar period Adam served in staff positions, including chief of staff of the 7th Infantry Division. In 1930 he headed the Truppenamt, the secret German General Staff. That same year he was promoted to major general, and in 1931 he was promoted to lieutenant general. In late 1933 after Adolf Hitler came to power, Adam was assigned to Bavaria as commander of its military district. In 1935, he was promoted to general of infantry and named commander of the newly created Wehrmachtakademie (War Academy) in Berlin. He served there until March 1938, when he became commander of Army Group 2, which had headquarters at Kassel and was responsible for the defense of western Germany. Adam expressed concern

that German fortifications along the western border were inadequate to protect against a combined British-French attack, a view that brought him into conflict with Hitler.

That summer at Hitler's insistence, German military planners began preparing an invasion of Czechoslovakia, which necessitated pulling troops from the Rhineland. Adam and others, including army chief of staff General Ludwig Beck, argued strongly against the invasion, fearing that it would provoke French and British action. In July, Adam went so far as to characterize the planned attack on Czechoslovakia as a "war of desperation."

Hitler was well aware of these sentiments. Beck was relieved of his command in August 1938 and replaced by General Franz Halder. In November Adam also was sacked, replaced by General Erwin von Witzleben. Adam retired in December 1938. His removal was part of Hitler's effort to secure complete control of the army. Portions of Adam's unpublished memoirs were used after the war as background information at the International Military Tribunal at Nuremberg. Adam died in Garmisch-Partenkirchen on April 8, 1949.

Admiralty Islands Campaign (February 29–May 18, 1944)

Allied military offensive in early 1944 that resulted in the seizure of the Admiralty Islands, an island group off of New Guinea. Located 200 miles

north of New Guinea, the Admiralty Islands were an attractive target for commander of the Southwest Pacific Area General Douglas MacArthur. Seeadler Harbor, an enclosed harbor formed by Manus and Los Negros Islands, and airstrips on the islands provided a base complex that could support subsequent operations against Japanese strongpoints in New Guinea and complete the isolation of Rabaul. The latter, a major Japanese air and naval base on New Britain Island, had been the major objective of Allied operations in the South Pacific since the summer of 1942.

MacArthur planned to invade the Admiralties in a division-size operation on April 1, 1944, but air reconnaissance in February 1944 indicated that the islands were lightly defended. Ignoring the estimates of his intelligence staff that there were more than 4,000 Japanese troops in the islands who would likely put up stiff resistance, MacArthur decided to gamble and advance the landing to the end of February, even though all the forces earmarked for the operation would not be ready by that point. He planned to land a reconnaissance force on Los Negros and then rush in reinforcements faster than the Japanese could react.

Men of the U.S. 1st Cavalry Division storm ashore at Los Negros, the third largest of the Admiralty Islands. (Bettmann/Corbis)

The Admiralties operation began on February 29 with the landing of 1,000 assault troops from the 1st Cavalry Division at Hyane Harbor on the east coast of Los Negros. Although there were 2,000 Japanese on Los Negros, their commander had expected a landing on the other side of the island, and Hyane was only lightly defended. The attackers quickly captured Momote Airfield and set up a defensive perimeter. During the next days, aided by air support, they beat back piecemeal Japanese counterattacks. MacArthur poured in reinforcements, and by the morning of March 4 the last Japanese counterattack had been defeated.

On March 9, U.S. troops went ashore at Salami Plantation on the other side of Los Negros, and in 10 days of heavy fighting, the island was secured. In the meantime, American troops landed on Manus Island west of Lorengau Airfield, and with the seizure of the airfield on March 18, the important part of that island was in American hands.

The last Japanese stronghold in the Admiralties, Pityilu Island, was captured on March 31. Except for a few stragglers in the jungles of Manus, all of the Japanese defenders in the Admiralties had been wiped out. U.S. casualties were 330 killed and 1,189 wounded. Japanese losses included some 3,280 killed or wounded and 75 captured. MacArthur's gamble to advance the date of the Admiralties landing had paid off. The initial invaders had fought well even though outnumbered on February 29, and once MacArthur could bring to bear all of the 1st Cavalry Division, the Japanese were doomed.

With the capture of the Admiralties, MacArthur could now extend his operations. Most important, at a time when the Joint Chiefs of Staff were deliberating future strategy in the Pacific war, the successful Admiralties operation helped convince them to underwrite MacArthur's ambition to liberate the Philippine Islands by an offensive along the north coast of New Guinea.

Adriatic Sea, Naval Operations in

The Adriatic Sea runs southeast 420 nautical miles between the Italian and Balkan Peninsulas and is 90 miles at its widest point. In 1940, Italy and Yugoslavia had the only navies on this narrow body of water. The main Italian bases were Venice, Pola, Brindisi, Taranto, and Durazzo in Albania, while Yugoslavia's main base was Kotor (Cattaro) on its south coast.

Hostilities commenced in the Adriatic with Italy's invasion of Greece on October 28, 1940. The Brindisi-Valona route was critical for maintaining Rome's expeditionary army, and convoys ran on a daily basis. A British cruiser-destroyer force destroyed a four-ship Brindisi convoy on November 12, 1940, as part of the far-flung movements associated with the air raid on Taranto, but nine other raids up through the end of the year, mostly by Greek destroyers, had no effect.

There was little naval activity associated with the Axis invasion of Yugoslavia on April 6, 1941. One destroyer, 4 small torpedo boats, and 10 motor torpedo boats (MTBs) of the Yugoslav Navy deployed to assist in an attack on the Italian enclave at Zara, but Italian bombers put this force to flight. The Italians improvised several battalion-size (and many smaller) landings in the Dalmatian Islands.

In the end, Italy captured nearly the entire Yugoslav Navy. Only four ships escaped this fate; one destroyer was blown up in harbor, while one submarine and two MTBs escaped to join the Allies. They formed the nucleus of the Royal Yugoslavian Navy in exile.

From this point, the Adriatic became an Italian lake with the exception of minor activity by Tito's partisan naval service. Nearly 2 million tons of matériel and 1 million men were transported across the narrow sea from June

1940 through September 1943, with 99.9 percent of the men and 99.6 percent of the matériel arriving safely. This phase ended with the Italian armistice concluded with the Allies on September 8, 1943.

Germany reacted with predictable violence to news of the armistice, and Italian and German forces fought down the length of the sea for two weeks as Italian naval units reacted to the changed situation and regrouped to the south. The *Regia Marina* also evacuated more than 25,000 troops from the Balkans to safety in southern Italy through the end of September.

Thereafter, Germany needed to secure the Adriatic Sea to guard its Balkan flank, and the Kriegsmarine established naval forces on the Adriatic using captured Italian vessels and coastal forces already present (along with a minor and ineffective Croatian naval service). Control of the Adriatic allowed Germany to meet army supply requirements along the Italian and Balkan coasts, since land transport was inadequate.

While indispensable supplies went south, resources flowed north: Albanian crude and chrome and Croatian bauxite were especially invaluable to Germany’s war economy. The Kriegsmarine’s first actions, starting on November 13, 1943, were to evict partisans from the northern islands of Krk, Cherso, and Lussino, which they had occupied following the collapse of the Italian army.

The British, meanwhile, established a destroyer force at Bari and joined the partisans holding Vis Island in mid-November, basing two MTB flotillas there. Notwithstanding British interference, the Germans proceeded with landing operations on the middle archipelago, assaulting Korcula on December 23; Solta on January 12, 1944; Brac on January 13; and Hvar on January 19. Most of these landings involved battalion-size forces delivered by *Marinefährprähme* (MFPs; armed landing barges), motor sailboats, and other auxiliaries.

British destroyers patrolled the middle and upper Adriatic, sinking an MTB off Hvar on January 12 and bombarding Durazzo on January 15, Korcula on January 16 and 18, Recanati and Pesaro on February 1, and Korcula again on February 4, 12, and 27. At the same time, the Kriegsmarine was commissioning torpedo boats captured in Italian yards to serve as the capital ships in its Adriatic mosquito fleet. In total the Kriegsmarine commissioned 19 torpedo boats and corvettes in the Adriatic from the Italian armistice to the end of the war.

On February 29, 1944, the French 10th Light Squadron, consisting of the large destroyers *Le Terrible*, *Le Malin*, and *Le Fantasque*, attacked a German freighter in the upper Adriatic and sank it along with a torpedo boat and a corvette from the escort and badly damaged another torpedo boat. On March 8, British destroyers shelled Korcula again. *Le Terrible* and *Le Fantasque* raided into the northern Adriatic during March 2–4 and then, on the night of March 7, bombarded Zante in the Ionian Sea. These powerful warships attacked three Siebel ferries and an MFP on March 19. They sank two vessels and crippled the other two, suffering light damage in return.

During the summer of 1944, Yugoslavian partisans gained territory and strength, while German naval forces suffered steady attrition. The Dalmatian Islands were frequent battlegrounds, subject to British commando raids, such as against Hvar on July 11 and 12. In September after Romania signed an armistice with the Soviet Union, the Germans began evacuating the southern Dalmatian archipelago. British coastal craft attacked this traffic and destroyed two small coastal convoys off Vir on the night of October 11.

The torpedo boats and corvettes of the German 2nd Escort Division operated out of Fiume during this period. These warships shelled partisan positions and kept the British MTBs and partisan naval forces at bay. Partisan advances forced further evacuations. Early on October 31, barges and landing craft lifted a German regiment from Zara to Sibenik. This provoked the other major naval action that occurred in the Adriatic. Acting on signals intelligence, two British Hunt-class escort destroyers ambushed and sank two corvettes and one torpedo boat of the 2nd Escort Division off Pag Island on November 1, although they missed the convoy.

Throughout the winter and into the spring of 1945, the Kriegsmarine, assisted by units of Mussolini's small but efficient republican navy, kept to the upper Adriatic. A shortage of fuel and suffocating Allied air and sea superiority limited the time that German ships spent at sea; however, the Axis powers continued to undertake operations to the limits of their abilities. For example, six German explosive boats attacked the British light cruiser *Delhi* at Split on February 12, 1945.

The Allies destroyed Germany's last operational destroyer-size warships during the war's final weeks. MTBs torpedoed the *TA45* in the Gulf of Fiume on April 13, 1945, while the *TA43* scuttled at Trieste on May 1. The final mission of the eight surviving German MTBs involved sailing from Pola to Ancona crammed with 100 men who preferred to surrender to the British rather than to Yugoslavian partisans.

Aegean Sea Naval Operations

The Aegean Sea is an arm of the eastern Mediterranean separating Greece and Turkey, providing access to the Black Sea and the southern Balkans. The Aegean Sea extends more than 300 miles north from Crete and varies in width from 100 to 200 miles. In 1940, Greece controlled the archipelagos scattered across that sea except for the Italian Dodecanese to the southeast, which included the major islands of Rhodes, Kos, and Leros. There the Italian Regia Marina based two destroyers, four torpedo boats, and eight submarines.

Naval activity in the Aegean began from the second day after Italian entrance in the war (June 10, 1940), when French warships probed the Dodecanese. In July, an Italian attempt to base two light cruisers at Leros to raid British shipping into the Bosporus ended in failure when they encountered an Allied cruiser/destroyer force and lost the cruiser *Bartolomeo Colleoni.*

The British occupied Crete at the beginning of November 1940 and thereafter regularly ran convoys through the Kaso Strait along the island's eastern edge. The Italians patrolled this route, but their surface forces enjoyed only one success, when a torpedo boat torpedoed a tanker north of Crete on January 31, 1941. Their submarines had no substantive successes during this period, and supply shortages limited Italian activities.

On February 25, 1941, the British landed on Castelorizzo, the most easterly of the Dodecanese, but an Italian counterinvasion two days later drove them off. The German invasion of Yugoslavia and Greece in April 1941 and the subsequent attack on Crete sparked a flurry of naval activity that ended with heavy British losses and the expulsion of Allied power from the Aegean.

Between June 1941 and September 1943, the Axis powers completely occupied the Aegean. By the end of this period, the Germans controlled Milos, Lemnos, Chios, Skiros, Metelino, and nearly all of Crete. The Italians occupied the balance of the Aegean islands. Allied submarines patrolled the sea, but it was a target-poor environment because much of the area's traffic consisted of small schooners and caiques. The Italians maintained three destroyers and three torpedo boats in the Aegean, while the Germans built a brown-water fleet of *Unterseebootsjäger* (submarine hunters) consisting of

converted minesweepers, fishing trawlers, and yachts; they also deployed motor minesweepers, motor torpedo boats, and *Marinefährprähme* (MFP) barges.

Following the Italian armistice in September 1943, against the advice of his own navy's leaders, German chancellor Adolf Hitler ordered the Aegean held for reasons of prestige and to deny the Allies access to the Black Sea. Germany quickly seized the Italian destroyers and torpedo boats in Greek ports and commissioned five of them by the end of October.

British prime minister Winston L. S. Churchill saw the Aegean as a prize and an opportunity, and the British tried to snatch the archipelago, despite the concurrent operations under way in Italy and a lack of U.S. support. The British deployed a scratch force of destroyers, landing craft, a few fighter and bomber squadrons, and an infantry brigade then being refitted. In the confused aftermath of the Italian armistice, the British occupied several of the larger Italian-held islands, including Kos (which had the only airfield outside of Rhodes), Leros, Kalymnos, Samos, Symi, and Stampalia. The Italians were generally cooperative but were also demoralized and confused.

The Germans were quick to rally, however, and brought to bear superior airpower. They also proved remarkably adept at improvising an amphibious campaign. Although several small convoys fell afoul of British or Greek surface forces, German air superiority restricted Allied warships to night operations. The British deployed a Spitfire squadron on Kos, but the Luftwaffe overwhelmed the British fighters. On October 1, Kos fell to a German assault.

The British responded to this disaster by reinforcing their Aegean naval forces with four light cruisers and three destroyers. On October 7, these destroyed another German convoy. Later that same morning, however, Luftwaffe bombers badly damaged one of the British cruisers, and German troops landed on Kalymnos, just south of Leros.

Back-and-forth attrition continued as each side delivered reinforcements and supplies by night and suffered air attacks by day. Although British signals intelligence provided many details of Axis operations, the Germans slowly gained the upper hand. On November 12 a German flotilla, which included ex-Italian torpedo boats, assaulted Leros in conjunction with a paratroop drop. At the critical moment the Royal Navy failed to control the nighttime waters surrounding Leros, and the Allies capitulated on November

16. This embarrassing defeat cost the Allied navies 6 destroyers, 2 submarines, and 10 smaller ships sunk; 5 cruisers, 4 destroyers, and 11 other ships were seriously damaged.

By winter 1943, eight British, Dutch, and Greek submarines were active in the Aegean. Unfortunately, their greatest success came on February 8, 1944, when a British submarine sank a transport carrying 3,173 Italian prisoners of war, of whom 2,600 drowned. In September 1944, Soviet advances into the Balkans threatened to isolate Greece, and on September 5, the Germans began withdrawing from portions of Crete and some of the Aegean islands. For this task, the Kriegsmarine deployed 52 merchant ships and more than 200 caiques and landing craft.

The British retained a strong interest in the Aegean, now fearing Soviet domination of the Dardanelles and Balkans. Churchill sought to interest the Americans in a Balkan invasion but to no avail. Even as the Germans began evacuating, the British assembled a flotilla of 7 escort carriers at Malta. It then sailed for Alexandria. Accompanied by 7 cruisers and 20 destroyers, this force rampaged through the Aegean and, in a series of engagements and air attacks, savaged the German warships remaining there. On October 10, Soviet troops cut the rail line between Athens and Berlin. Germany evacuated Piraeus on October 12. British paratroopers descended on Athens's airport that same day.

By the end of October, the Germans had evacuated more than 37,000 troops, losing only 380 men in the process. Allied forces sank 29 merchant ships, 5 torpedo boats, a minelayer, a motor minesweeper, and 3 submarine hunters. The remaining German ships were scuttled when Germany evacuated Salonika on October 31, leaving behind cut-off "fortress" garrisons on Crete, Rhodes, Leros, and Kos. British and Greek destroyer flotillas remained in the Aegean harassing these isolated garrisons to the end of the war.

Afghanistan

A landlocked state in Central Asia located between British-held India to the south and the Soviet Union to the north. Afghanistan, which had a 1939 population of approximately 7.49 million, encompasses 272,772 square miles. Throughout much of the 19th and early 20th centuries, Afghanistan served as a traditional buffer state between the British and Russian Empires, although the British exercised considerable influence in Afghanistan, particularly after the Second Anglo-Afghan War (1878–1880).

Afghanistan was formally nonaligned during World War II, but there were nonetheless complex diplomatic, political, and military developments of consequence in and around that country.

Afghanistan was effectively positioned for neutrality. The February 1921 Soviet-Afghanistan treaty of mutual recognition was followed in 1926 by a formal nonaggression pact between the two countries. The government in Kabul clearly saw the Soviet Union as an effective counterweight to British power and influence in the region. The November 1921 Anglo-Afghanistan Treaty had accorded Afghanistan full and formal independence, and the Afghanistan Constitution, adopted in April 1923, declared the country free and independent, with a free press and a free economy. Other democratic guarantees were made explicit in writing, although they were not always followed in actual practice. A constitutional monarchy governed the country, with Islam as the established religion.

Moderate rule dating from the 1930s was an advantage in dealing with the turmoil and uncertainty of the period, and Afghan leaders also established broader ties with Germany. In 1935, they decided to rely mainly on Germany for economic and military modernization. Weekly air service between Berlin and Kabul commenced in 1938. The German Todt Organization also began construction and improvements of airfields, bridges, roads, and industrial

plants. German officers began training the Afghanistan military and introduced modern equipment, techniques, and weapons.

The British government, irritated by Kabul's partnership with Germany, refused to aid Afghanistan in territorial and related disputes with the Soviet Union. Despite this, Afghan leaders generally saw Britain in positive terms, and after World War II began, developments pressed Afghanistan toward the Allied camp. The August 1941 British-Soviet invasion of Iran meant that Afghanistan was virtually surrounded by Allied-controlled territory. In preparation against a German invasion, antitank mines were laid in the Khyber Pass, and other defensive measures were taken. At Allied insistence, Afghanistan expelled German and Italian representatives in the country and severed all ties with the Axis powers.

Africa

Africa was an important theater of operations in World War II. The continent offered war materials and important routes for air and sea communications. Control of the Suez Canal in Egypt was essential to Allied strategic planning, and during the Battle of Britain (July 10–September 30, 1940), British prime minister Winston L. S. Churchill diverted scant British military resources there. Had the Axis powers taken that vital waterway, all British shipping to India would have been forced to detour around the Cape of Good Hope, doubling the length of the voyage.

Securing the vital oil supplies of the Middle East was another important consideration for Allied planners. From Cairo, the British Middle East Command directed operations to secure the Suez Canal and then to take the

offensive against Italian forces invading from Libya and resident in East Africa.

World War II saw no fighting in Southern Africa, though the Union of South Africa, a British dominion, rallied to the British cause and made major contributions to the Allied war effort. The French African empire was another situation entirely. Following the defeat of France, most of the empire remained loyal to the new collaborationist Vichy regime, although Chad declared early for Free French leader General Charles de Gaulle.

Allied operations occurred at Dakar and Madagascar and in the Horn of Africa (Italian East Africa), but most of the fighting took place in French North Africa and in Northeast Africa. The road from Tripoli, in western Libya, through Benghazi and east to Alexandria, Egypt—the Benghazi Handicap—was the primary scene of fighting as Allied and Axis ground forces advanced and retreated along the narrow coastal band of desert.

Benito Mussolini's Italian forces invaded Egypt from Libya in September 1940. The fighting there seesawed, with both sides increasing the stakes. Finally, with the British offensive at El Alamein (October 23–November 4, 1942) and simultaneous British and U.S. landings in French North Africa, Axis forces there were caught in a vise. The continent was cleared of Axis troops in the Battle of Tunis during May 3–13, 1943.

A U.S. Army Air Transport Command Douglas C-47 Skytrain loaded with war supplies flies over the pyramids in Egypt in 1943. (National Archives)

The war had tremendous influence on African nationalism, often because of the role African troops played in the war effort. General Charles de Gaulle acknowledged during the conflict that France owed a special debt of gratitude to its African empire for providing the base and resources that enabled France to reenter the war in its final phases. It was thanks to the French colonial empire, moreover, that the independent existence of France was preserved. De Gaulle therefore pledged to establish a new relationship between metropolitan France and its colonies after the conflict.

Although Churchill was very much an imperialist, he could not override the strong anticolonial attitudes expressed by the governments of the United States and the Soviet Union. U.S. president Franklin D. Roosevelt had often declared himself opposed to European colonialism, and when he attended the Casablanca Conference in early 1943, he denounced French imperial practices. Soviet leader Joseph Stalin often denounced Western imperialism, although this did not prevent him from imperialist practices himself in Eastern and Central Europe or from requesting bases in Libya.

Nationalism found fertile ground in those African states that had been cut off from the mother countries during the war, especially the French and Belgian African possessions. Serious uprisings against French rule occurred both in Madagascar and at Sétif, in Algeria. French authorities put these down with significant loss of life. Repression only temporarily quieted nationalism, which fed on the lack of meaningful political reform. Nationalism also affected the colonial African empires of Britain, Belgium, France, and Portugal.

In 1945, Ethiopia, Egypt (nominally), Liberia, and the Union of South Africa were the only free states in Africa. During the course of the next two decades, however, most of the African states secured independence. Sometimes this occurred peacefully and sometimes with significant loss of life. Italy lost its African empire except for Italian Somaliland as a mandate; Libya became independent.

World War II was a watershed for Africa. It led to the fulfillment of nationalist dreams that had first washed over the continent during World War I. Unfortunately, the governments of many of the newly independent states

seemed incapable of managing effectively the development of the continent's vast resources and the education and betterment of their people.

See Afrika Korps

African Americans in World War II

During World War II, African Americans represented approximately 10 percent of the U.S. population. They lived predominantly in the South, with some large African American concentrations in major northern cities such as Detroit and New York. The vast majority of African Americans worked in agricultural jobs or as domestic laborers.

Socially and legally, African Americans were treated as second-class citizens, and discrimination against them was rampant. Jim Crow laws, primarily in the South, dictated the strict segregation of public facilities. Most

of the time, the segregated facilities for African Americans were patently inferior to those reserved for whites.

During the war, white southerners moving north to seek employment in war-related industries pushed for expanded segregation policies in the North. Although much of the North did not have Jim Crow laws per se on the books, discrimination was nevertheless widespread.

Franklin Delano Roosevelt's victory over President Herbert Hoover in the November 1932 presidential election was primarily due to Hoover's inability to deal with the Great Depression. For the first time, however, African American voters began shifting their allegiance to the Democratic Party in 1932. In 1936, they voted in even larger numbers for Democrats.

By 1940, African American leaders realized their impact as a voting bloc, as did Roosevelt when he ran for a third term that year. Realizing that he had to make concessions to keep the African American vote, Roosevelt nominated Colonel Benjamin O. Davis Sr. for promotion to brigadier general in the U.S. Army. Davis's promotion was approved on October 25, 1940, making him the first African American general officer in U.S. history.

Although such relatively minor gestures were welcomed, African American leaders sought more significant change in America's racial policies, namely full and equal civil rights. This became part of the so-called Double V Campaign during World War II, during which African Americans sought victory against America's enemies abroad and victory at home in the form of full civil rights.

Even before the United States entered the war in December 1941, the American industrial base had begun gearing up for war. This required large influxes of workers to keep up with demand, but many African Americans were shut out of this labor pool as factory owners and managers refused to employ them. In 1941, the president of the Brotherhood of Sleeping Car Porters, A. Philip Randolph, challenged the Roosevelt administration to end discrimination against African Americans in war-related industries. Randolph threatened to lead a massive march on Washington, D.C., if Roosevelt did not eliminate racial discrimination in government, in defense industries, and in the military. Randolph called off his march when Roosevelt signed Executive Order 8802, the Fair Employment Act, forbidding discrimination in government employment or in defense industries, on June 25, 1941.

Roosevelt did not believe that he had sufficient strength to tackle discrimination in the armed forces, however.

To carry out the mandates of Executive Order 8802, Roosevelt established the Fair Employment Practices Committee (FEPC) to investigate any discrimination claims in government or defense-industry employment. Despite much fanfare, the FEPC had less impact than many had hoped. Furthermore, the military assiduously opposed further attempts to integrate the armed services.

The entry of the United States into the war on December 8, 1941, significantly affected African Americans. As war industries lost more and more employees to military service, they were forced to replace them with African Americans and other minorities as well as white women. African American workers in defense industries increased from 3 percent of the workforce in 1942 to 8 percent by 1945. Defense industries hired African Americans mainly as unskilled laborers, however, partly due to discrimination but also because of the lack of proper training and education among African Americans. Some firms were cowed into hiring only unskilled African American workers because of pressure from organized labor.

The American Federation of Labor (AFL) rarely recognized African American unions or accepted African American members. The Congress of Industrial Organizations (CIO), the other major American labor union, accepted African Americans in large numbers, however, continuing a trend begun in the 1930s. African American union membership grew to about 1.5 million during the war.

Some unions and locals only grudgingly accepted African Americans in the labor force, and some locals went on strike to oppose the hiring or promotion of African Americans for skilled or supervisory positions. Furthermore, although the federal government required equal pay for the same job, not all companies abided by the requirement, nor did all unions support equal pay for African Americans. Still, defense jobs paid much better than other jobs for African Americans.

Better employment opportunities and wages in the North, the Midwest, and the West resulted ultimately in some 1.5 million African Americans migrating from the South during the 1940s, one of the largest population shifts in U.S. history. Between 1940 and 1950, the African American population in the North, the Midwest, and the West increased dramatically.

New York State's African American population grew by 347,000 people, that of Michigan by 234,000, and that of California by 343,000. Cities were unprepared for such rapid population growth during the war, however.

African Americans faced great difficulties in their new locales, especially in regard to housing. They could generally find only limited, often substandard, and significantly more expensive accommodations. Other public facilities, such as hospitals, schools, and public parks, were limited in number and often segregated. These factors, in addition to continued discrimination in hiring practices and police harassment, intensified African Americans' frustrations and led to some racial violence.

Racial violence in the United States occurred sporadically but still rather routinely during the war. Most violent acts occurred on a small scale especially in the South, where African American uniformed military personnel became victims of crime, ranging from harassment to murder, at the hands of white locals, including the police. African American newspaper reports of these incidents only increased the animosity toward the police.

Several large race riots occurred during the war. The Detroit Race Riot, the largest and deadliest of all the wartime riots, began on the evening of July 20, 1943, when African American and white youths confronted each other at Belle Isle. Quickly escalating out of control, the riot spread throughout the city. Because the police were unable to control the rioters, the federal government sent in army troops. The mayhem ended on July 21. The rioting claimed 34 deaths: 25 African Americans and 9 whites. Hundreds more were injured, and property damage came to an estimated $2 million.

During August 1–2, 1943, another race riot occurred in Harlem, the African American section of New York City, after unfounded rumors that a police officer had shot and killed an African American soldier spread throughout the area. Quick action by African American leaders and New York City mayor Fiorello LaGuardia prevented the riot from spreading, thus limiting casualties to six dead, several hundred wounded, and property damage estimated at between $250,000 and $1 million. Different groups placed the blame on various factors, yet both sides noted that discrimination played a role in the riots.

Prior to America's entry into the war, military policies governing the use of African Americans had focused on limiting their number in the military and restricting them to segregated units. The Navy and War Departments

believed that wartime was not an appropriate time for social experiments in integrating the armed forces. As of September 1939 the majority of African American service members were in the army, excluding the U.S. Army Air Corps and the Signal Corps, which had none. The navy had few African Americans, the majority working as stewards, while the U.S. Marine Corps had none at all. The U.S. Coast Guard's few African Americans mostly worked as stewards, although some were assigned to lighthouse duty or lifesaving stations.

Political pressure before and during the war forced Roo-se-velt to open more areas of military service for African Americans. By July 1941, the Army Air Corps began accepting African Americans and created several segregated combat units; in January 1942, Roosevelt ordered the Department of the Navy to enlist African Americans in general service positions.

When the United States entered World War II, African Americans volunteered to enlist in large numbers and were subject to the draft. Out of the 2.5 million African Americans eligible for service, however, only about 1 million served. The army had the only African American regular line officers in the military—Brigadier General Davis and Captain Benjamin O. Davis Jr., the latter promoted to lieutenant colonel on March 21, 1942. This lack of African American officers and large numbers of African American noncommissioned officers (NCOs) initially meant that most African American units were commanded by white officers and staffed by white NCOs. Segregated officer training during World War I and after had resulted in poorly trained African American officers. As a result, African American officer candidates during World War II, except for those in the Army Air Corps, underwent integrated basic officer training.

Basic training was segregated at the base or unit level. The army sent African Americans to various training bases throughout the United States; the Army Air Corps initially trained ground crew at Chanute Field in Illinois and pilots at Tuskegee Army Airfield in Alabama. Seamen trained at Camp Robert Smalls, a part of the Great Lakes Training Center in Illinois. Marines established a separate camp at Montford Point, North Carolina, and coastguardsmen trained at Manhattan Beach Training Station, New York.

Most African Americans serving in the military were assigned to segregated support or combat support units. African American army combat units included the 92nd and 93rd Infantry Divisions; the 758th, 761st, and

784th Tank Battalions; the 351st Field Artillery Battalion; and other units. The Army Air Corps activated several African American combat units composed of the Tuskegee Airmen, who had been trained at Tuskegee Institute.

Civil rights advocates increased pressure on the U.S. Marine Corps to accept its first African American volunteers on July 1, 1942. Although they trained and served in segregated units, the men performed well in Pacific Theater fighting. (Library of Congress)

The most celebrated Tuskegee units were the 99th Pursuit Squadron and the 332nd Fighter Group. The 99th, commanded by Lieutenant Colonel Davis Jr., arrived in North Africa on April 24, 1943, and participated in actions in the North African and Mediterranean theaters. The 99th later merged with the 332nd Fighter Group, which was also commanded by Davis. The 332nd, operating out of Italy, was primarily assigned to bomber escort missions. The Tuskegee Airmen were highly effective, losing only 25 bombers to hostile enemy aircraft out of the hundreds they escorted.

Navy policy generally restricted African Americans from serving at sea and abroad. Minor policy changes beginning in mid-1943 resulted in African Americans being deployed to the Pacific theater, many in support units such as the various all–African American construction battalions (CBs, or Seabees). Additionally, the Evarts-class destroyer escort *Mason* (DE-529)

and a PC 461–class submarine chaser, *PC-1264*, were temporarily integrated and later primarily manned by an almost completely African American crew. In August 1944, integration of the navy's auxiliary fleet occurred slowly and remained policy until the war's end.

Two African American marine composite defense battalions were also formed, the 51st and 52nd. Neither saw combat, yet a number of the Marine Corps' 63 African American depot or ammunition units were involved in combat operations. Although the Coast Guard still had segregated units, at least two ships, the weather ship *Sea Cloud* (IX 99) and the Tacoma-class frigate *Hoquiam* (PF-5), were integrated.

Segregationist policies in the military during the war proved inefficient and costly. Yet the military still refused to completely integrate after the war, despite the fact that African American military personnel had proven equally capable as whites when given equal opportunities and training. To reduce military expenditures and retain support for the Democratic Party, President Harry S. Truman issued Executive Order 9981, which fully desegregated the armed forces, on July 26, 1948.

Integration of the armed forces would take time, however. The air force and the navy integrated quickly, but the army did not fully desegregate until the Korean War (1950–1953). The Double "V" campaign had been only partially successful. African Americans contributed greatly to the military victory against America's foreign enemies but made only minimal gains in civil rights.

Unlike the post–World War I era, in which African Americans had failed to make any substantial gains toward achieving full civil rights, after World War II they refused to let their wartime sacrifices be wasted and pushed harder. The limited but successful integration experiments during the war proved that African Americans could perform as well as whites. The success of the African American community in persuading Roosevelt to make some changes in segregationist policies during the war gave African Americans hope that further changes would occur. This combined with the political, organizational, and managerial skills gained by African Americans in the military and government during the war provided the raw material for the civil rights movement, which would begin in earnest in the late 1950s.

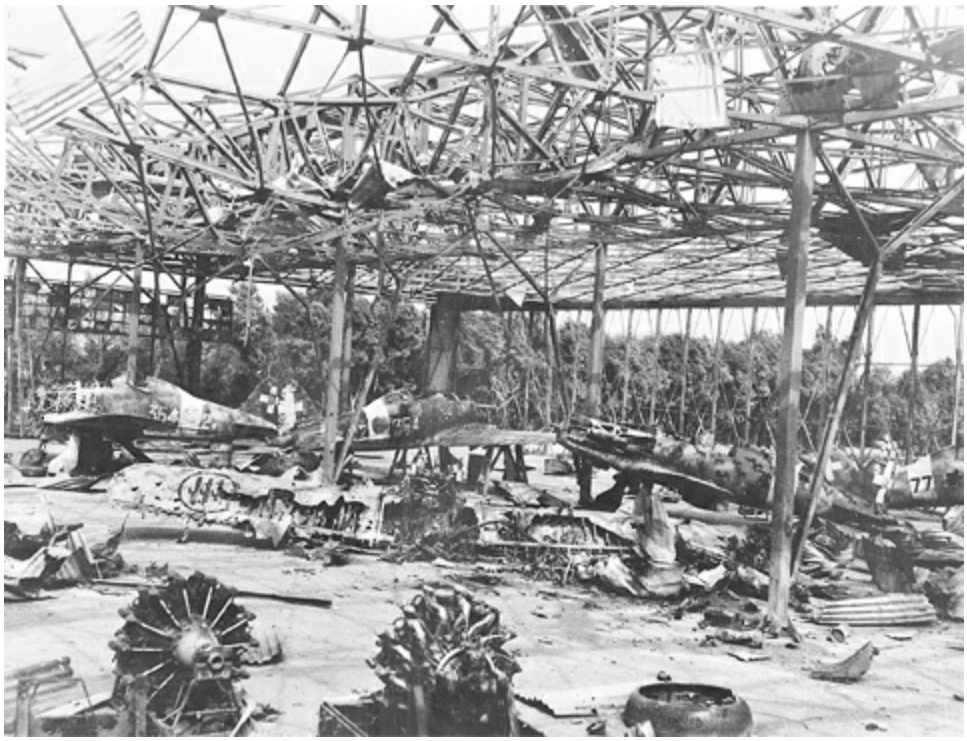
Afrika Korps

The Deutsches Afrika Korps (DAK), better known as the Afrika Korps (Africa Corps), was the name given to the initial two German armor divisions sent to Libya in 1941 as part of Operation SONNENBLUME (SUNFLOWER). Commanded by Lieutenant General Erwin Rommel, the Afrika Korps grew and changed in character as Rommel received promotions and as other commanders took over, but its mystique would forever be associated with Rommel, known as “the Desert Fox.”

The DAK’s 5th Light Division began to arrive in Libya in February 1941 (in August it was officially reconstituted as the 21st Panzer Division). Elements of the 15th Panzer Division arrived in April. At various times other units were added to or subtracted from the Afrika Korps. Thus, at the time of Operation CRUSADER (November 18–December 30, 1941) the then-nonmotorized Afrika Division was attached, as was the Italian Savona Division. During the Battle of El Alamein (October 23–November 4, 1942), the DAK consisted of the 15th and 21st Panzer Divisions, the 90th and 164th

Light Motorized Infantry Divisions, the Ramcke Parachute Brigade, the (Italian) Giovanni Fascisti Regiment, and assorted supporting units. During the 1943 Tunisia Campaign, the 10th Panzer Division was added.



Axis air equipment and installations took a heavy pounding from bombers of the U.S. Army Air Forces as they pursued Field Marshal Erwin Rommel's retreating Afrika Korps through Libya and Tripoli to the Tunisian coast. This former hangar was located at Castel Benito Airdrome. (Library of Congress)

Because North Africa was an Italian theater, the DAK was technically subordinate to the Italian high command and thus was affected by the variables of coalition warfare. DAK commanders often exceeded their authority and could always (and frequently did) appeal directly to Berlin.

The DAK was largely dependent on supply convoys. Thus, the ebb and flow of the naval war in the Mediterranean directly influenced DAK operations, especially fuel supplies. As a consequence of a deteriorating naval situation for the Axis powers in the Mediterranean, most of the officers and men arrived in or departed from Africa by air, especially after 1941. By the end of October 1942, the DAK was critically short of fuel and ammunition. Resupply efforts were thwarted by Allied interdictions in the Mediterranean. What supplies arrived came by submarine and were just a trickle of what was needed.

Joining with the better-trained and better-led Italian units shipped to Libya in early 1941, the DAK went on the offensive, advancing quickly to the Egyptian border and laying siege to Tobruk. It was involved in Britain's Operations brevity (May 15–16, 1941), battleaxe (July 15–17, 1941), and crusader and in the Battle of Gazala (May 26–June 13, 1942) and the Battle of El Alamein.

The DAK formed the core of Axis forces in the retreat across Libya to Tunisia and in the ensuing battles there including Kasserine Pass (February 12–22, 1943) and El Guettar (March 23-Aoril 7, 1943). The DAK ended the war serving under Italy's best general, Marshal Giovanni Messe, who commanded the First Italian Army. The DAK's last commander, General of Panzer Troops Hans Cramer, surrendered with the DAK on May 13, 1943.

More than 1 million Axis soldiers served in Africa, 260,000 of them German. In the North African fighting, 18,594 Germans died, with another 3,400 missing in action and presumed lost. Approximately 101,784 Germans became prisoners following the Allied conquest of Tunisia.

Although the wisdom of sending German forces to Africa may be questioned, certainly the major mistake Adolf Hitler made was in not sending sufficient resources early on. Major General Wilhelm Ritter von Thoma's study, prepared for Hitler before the dispatch of the DAK, recommended that Germany send either four divisions or none to North Africa.

This recommendation was based on the difficulty of supplying forces in North Africa and on all that would be required to conquer Egypt. Had four divisions been sent at the beginning, Rommel in all probability could have secured the Suez Canal and had a major impact on the course of the war. Hitler only made a halfhearted effort in a theater he always considered to be secondary, though. The majority of German forces arrived during the Tunisia Campaign, and only a small percentage of them belonged to the DAK.

Ainsworth, Walden Lee "Pug" (1886–1960)

U.S. Navy vice admiral. Born on November 10, 1886, in Minneapolis, Minnesota, Walden Lee "Pug" Ainsworth graduated from the University of Minnesota in 1905 and from the U.S. Naval Academy in 1910. Ainsworth participated in operations against Veracruz, Mexico, in 1914. During World War I, he served on transports as a gunnery officer.

In February 1919 Ainsworth was appointed inspector of ordnance at the navy's Armor Plate Plant and Projectile Factory, where he served two years ashore before returning to sea as an executive officer of a transport and a light cruiser and as captain of the destroyer *Marcus.* Ainsworth was then an inspector of ordnance at Pittsburgh, Pennsylvania, and he served at the New York Navy Yard. In 1925 he was made gunnery officer for destroyers, Asiatic Fleet, and then became commander of the destroyer *Paul Jones.*

Ainsworth left this billet in 1928 to serve for three years as an instructor in navigation at the Naval Academy. Various assignments afloat and ashore followed, including a stint at the Naval War College before returning to sea as executive officer of the battleship *Mississippi* in 1936. Ains-worth headed the Naval Reserve Officers' Training Corps unit at Tulane University from 1938 to 1940.

Promoted to captain, Ainsworth commanded Destroyer Squadron 2 in the Atlantic in 1940 and 1941 and then was assigned to Vice Admiral William F. Halsey's staff. In December 1941, Ainsworth took command of the battleship *Mississippi.* Promoted to rear admiral in July 1942, he became commander, destroyers, Pacific Fleet. He took a leading role in the August 1942–February 1943 Solomon Islands Campaign, commanding the bombardment of the

Japanese airfield at Munda during January 4–5, 1943, long considered a textbook operation.

As commander of Cruiser Division 9 (January 1943–October 1944), Ainsworth commanded three cruisers and five destroyers escorting the U.S. invasion force to New Georgia. He fought in the Battle of Kula Gulf (July 5–6, 1943), for which he was awarded the Navy Cross. He also fought in the Battle of Kolombangara (July 12–13, 1943). In these two actions, Cruiser Division 9 suffered one ship sunk and three damaged by Japanese torpedoes. Ainsworth also saw action in the Marianas, Guam, and the Leyte Gulf and at Peleliu. He then commanded the cruisers and destroyers of the Pacific Fleet (October 1944–July 1945).

After the war, Ainsworth commanded the Fifth Naval District (August 1945–December 1948) until his retirement as a vice admiral. He died on August 7, 1960, in Bethesda, Maryland.

Airborne Forces, Allied

The concept of airborne forces originated in 1918 during World War I, when Colonel William Mitchell, director of U.S. air operations in France, proposed landing part of the U.S. 1st Division behind German lines in the Metz sector of the Western Front. Thus was born the idea of parachuting, or air-landing troops behind enemy lines to create a new flank, what would be known as vertical envelopment. The concept was put into action in the 1930s.

The U.S. Army carried out some small-scale experiments at Kelly and Brooks fields in 1928 and 1929, and in 1936 the Soviets demonstrated a full-blown parachute landing during Red Army maneuvers. Some 1,500 men took part in the exercise. One observer—British major general Archibald P. Wavell—commented that the previous year vehicles had also been landed by aircraft.

During World War II, the Soviets maintained an airborne corps and numerous Guards airborne divisions. These elite troops were never employed for strategic purposes. On several occasions, however, the Soviets dropped parachute troops behind German lines to aid partisan operations or disrupt German lines of communication. Ominously for the paratroopers, there were no operations in which drives of ground troops were coordinated to relieve these troops once they had been committed to battle.

British reaction to the reports of experiments with airborne forces in the Soviet Union was mild interest only, although some antiparachutist exercises took place in the Eastern Command; Lieutenant Colonel Frederick A. M. Browning, commanding the 2nd Battalion of the Grenadier Guards, took part. (Later in the war as a lieutenant general, Browning would command all British airborne forces.) The matter then rested until the Germans showed how effective parachute and air-landing troops were when they carried out their spectacular landings in 1940 in Norway, Denmark, and the Netherlands.

Although manpower demands in Britain in 1940 were such that it should have been impossible to raise a parachute force of any significance, at the urging of Prime Minister Winston L. S. Churchill, 500 men were undergoing training as parachutists by August 1940. Fulfillment of Churchill’s order that the number be increased to 5,000 had to await additional equipment and aircraft.

Glider-borne troops were part of the plan, and various gliders were considered as troop-carrying aircraft. Inevitably such a new branch of infantry was beset with problems, mainly of supply, and there was also resistance to the concept in the regular units of the British Army. This often led battalions to post their least effective men to such new units merely to get rid of them; the best men were jealously guarded by their commanding officers.

The War Office (representing the British Army) and the Air Ministry (representing the Royal Air Force [RAF]) had to agree on aircraft. Because

Bomber Command was becoming aggressively conservative of aircraft, however, the only plane initially available for training and operations was the Whitley bomber. Aircraft available to airborne forces were initially severely limited until a supply of Douglas C-47 Dakota (Skytrain, in U.S. service) aircraft was established, whereupon the parachute troops found their perfect drop aircraft. The British were also the first Allied nation to develop gliders.

Progress in developing British airborne forces was slow; RAF objections were constant, in view of the pressure to carry the continental war to Germany via the strategic bombing campaign. Once the United States entered the war in late 1941, the situation eased enormously, and equipment that Britain was unable to manufacture became readily available.

To provide more men for the airborne forces, the War Office decided in 1941 that whole battalions were to be transferred, even though extra training would be needed to bring many men up to the standards of fitness for airborne troops. At the same time, the Central Landing Establishment became the main training center for airborne forces. The 1st Parachute Brigade, consisting of four parachute battalions, was established under the command of Brigadier Richard N. “Windy” Gale. Initially three battalions were formed, which exist to this day in the British Army as the 1st, 2nd, and 3rd Battalions, Parachute Regiment.

At an airfield in England, U.S. Army brigadier general Anthony C. McAuliffe, artillery commander of the 101st Airborne Division, gives last-minute instructions to glider pilots before take-off on D plus 1 in Operation MARKET-GARDEN, September 18, 1944. (National Archives)

The Glider Pilot Regiment, also formed in 1941, was based at Haddenham, near Oxford, having moved from Ringway (now Manchester Airport). Pilots were selected from army and RAF volunteers, but they were part of the army once trained. Airborne forces were infantry but had to be fitter than the average soldier, so training was rigorous. Troops were trained to endure in the cold, in wet weather, and in heat. They also had to be fit to withstand the impact of the landing, to fight alone with light weapons, and to fight without support for some days.

The airborne concept at that time was twofold: to raid, in which case troops would be extracted by land or sea after the operation (such as the attack on the German radar station at Bruneval in northern France on February 27–28, 1944), or to land at the rear of the enemy to capture a strategic target. Two examples of the latter are the Orne bridge landing on D-day in June 1944 and the September 17–26, 1944, Operation MARKET-GARDEN (market was the airborne portion), when the 1st Airborne Division tried to capture the bridges across the Rhine at Arnhem in Holland.

Airborne forces were regarded, justifiably, as an elite force, but they were a force of considerable strength by the end of the war. Despite the losses suffered at Arnhem, where the 2nd Battalion of the 1st Parachute Regiment held the northern end of the road bridge for four days against two German Schutzstaffel (SS) panzer divisions, the 1st Airborne Division was again up to strength for the Rhine crossing operation in March 1945.

British airborne forces were also engaged in the Far East, and the 44th Indian Airborne Division came into being there. In the Pacific theater, airborne operations were on a smaller scale than in Europe because the jungle limited the ability to drop large numbers of troops.

U.S. Army chief of staff General George C. Marshall was an enthusiastic advocate of airborne forces. The first U.S. airborne division was the 82nd, a conversion of the 82nd Infantry (all-America) Division, formed in March 1942. Major General Omar N. Bradley commanded the division, with Brigadier General Matthew B. Ridgway as his assistant. Ridgway was appointed divisional commander as a major general in June 1942, and the division became the 82nd Airborne Division that August.

The 82nd went to North Africa in April 1943, just as German resistance in that theater was ending. It took part in operations in Sicily and Normandy, and under the command of Major General James M. Gavin it participated in

Operation MARKET-GARDEN in the Nijmegen-Arnhem area and also in the Ardennes Offensive (December 16, 1944–January 25, 1945).

The 101st Airborne Division was activated in August 1942 with a nucleus of officers and men from the 82nd Division. The 101st was commanded by Major General William C. Lee, one of the originators of U.S. airborne forces. The division left for England in September 1943. Lee had a heart attack in the spring of 1944, and the division was taken over by Major General Maxwell D. Taylor, who led it through D-day and Operation MARKET-GARDEN, when it secured the bridge at Eindhoven. The division distinguished itself in the defense of Bastogne during the German Ardennes Offensive.

Three other U.S. airborne divisions were established: the 11th, which served in the Pacific, jumped onto Corregidor Island and fought in the February 3–March 4, 1945, Battle for Manila; the 17th, which was rapidly moved to Europe for the German Ardennes Offensive and then jumped in the Rhine crossing with the British 6th Airborne Division; and the 13th, which arrived in France in January 1945 but never saw action.

Cooperation between British and U.S. airborne forces was close. When the U.S. 101st Airborne arrived in England, it was installed in a camp close to the training area for the British 6th Airborne Division, which had prepared much of the camp in advance. Training and operational techniques were almost identical, and there were common exercises and shoots to create close bonds among troops. There were also frequent personnel exchanges to cement friendship. Similar arrangements were made between the U.S. 82nd Airborne and the British 1st Airborne Division. Parachute training in the United States was centered at Fort Benning, Georgia, and in 1943, some 48,000 volunteers commenced training, with 30,000 qualifying as paratroopers. Of those rejected, some were kept for training as air-landing troops.

One great contribution made by the United States to the common good was the formation and transfer to England of the U.S. Troop Carrier Command. As noted previously, transport aircraft shortages had bedeviled airborne forces' training and operations from the outset. The arrival of seemingly endless streams of C-47 aircraft was a major assist. Further, the RAF in 1944 had nine squadrons of aircraft, or a total of 180 planes, dedicated to airborne forces.

In Britain, Polish troops were also trained as parachutists to form the

Polish 1st Parachute Brigade, which fought at Arnhem in MARKET-GARDEN. Contingents from France, Norway, Holland, and Belgium were also trained, many of whom served operationally in the Special Air Service Brigade. The British Commonwealth also raised parachute units. Australian paratroopers (the 1st Australian Parachute Battalion) served in the Far East, and the Canadian 1st Parachute Battalion served in Europe.

Several small-scale operations had been carried out before 1943 with mixed success, but the big date for airborne forces was June 6, 1944. Plans for D-day (June 6, 1944) required the flanks of the invasion beaches to be secured in advance, and only airborne forces could guarantee this. In Britain for the invasion were two British airborne divisions (the 1st and 6th) and two American airborne divisions (the 82nd and 101st). The plan was to use all the available airborne and glider-borne troops in the initial stages of the operation. Unfortunately, even in June 1944 transport aircraft available were insufficient for all troops to be dropped at once. All aircraft were organized in a common pool so that either British or American troops could be moved by mainly American aircraft. This was another fine example of the cooperation that existed at all levels within the Allied airborne forces.

Operation OVERLORD (D-day) began for the paratroopers and gliders in the dark, early morning of June 6. To the west, American paratroopers dropped at the base of the Cotentin Peninsula to secure the forward areas of what were to be the Omaha and Utah beaches. Despite many dispersal problems, the troops managed to link up and were soon in action, denying the Germans the ability to move against the beachheads. The troops fought with great gallantry despite their weakened strength (caused by air transport problems), and by the end of the day contact had been established with the shipborne forces from the beachheads.

In the east, Britain’s 6th Airborne Division was charged with controlling the left flank of the British invasion beaches. Perhaps the most startling operation (for the Germans) was the coup de main attack by glider-borne air-landing troops of the 11th Battalion, Oxford and Buckinghamshire Light Infantry, who landed so close to their target that they were able to capture bridges over the Caen Canal and the River Orne. On a larger scale, the 3rd Parachute Brigade was ordered to take out the Merville Battery, which posed a threat to the invasion beaches. The 9th Parachute Battalion, which planned to attack with 700 men, was so spread out on landing that only 150 men were

available. With virtually no support, the men attacked the battery and captured it. The battalion lost 65 men and captured 22 Germans; the remainder of the German force of 200 were either killed or wounded.

The essence of airborne forces is morale; training inculcates a feeling of superiority among the men, and their distinctive headgear and equipment mark them as men apart. All Allied parachute and glider troops in the war were of a high standard, and their fighting record bears this out. Even when things went wrong, as often happened when troops were dropped from aircraft, the men made every effort to link up and carry out the task they had been given.

Airborne Forces, Axis

An initial German airborne force was formed in the spring of 1936 as an experiment after German observers had watched Soviet airborne troops in an exercise. Set up at Stendhal, the force was made up of men from the General

Göring Regiment of the Luftwaffe. Within a year of the establishment of the first parachute regiment, the Schutzstaffel (SS) was also training a platoon, and the army was evaluating parachute troops. Luftwaffe commander Hermann Göring, however, ensured that air force troops only were to form the parachute force.

The first German exercises took place in the autumn of 1937, followed later that year by the first use of cargo gliders. Expansion was rapid, and in 1938 Major General Kurt Student was organizing the first airborne German division to take part in the “liberation” of the Sudetenland of Czechoslovakia. This 7th Fallschirmjäger (Parachute) Division had two parachute battalions, one airborne infantry battalion and an airborne infantry regiment, three airborne SS battalions, and airborne artillery and medical troops. The division was not needed in 1938, and it was decided that the 7th Parachute Division would be all-parachute, whereas the 22nd Infantry Division would be glider-borne.

In the German invasion of Norway (April 1940), a parachute battalion dropped on Stavanger Airfield and secured it in 35 minutes. On May 10, 1940, Germany captured bridges and an airfield in Holland, while glider-borne troops attacked and captured Fort Eben Emael in Belgium, which opened the German route into the Low Countries during the invasion of France. Airborne operations had proved their worth, so much so that the British immediately began to form their own parachute units.

These successes encouraged the German high command to expand its airborne assets. It soon formed XI Flieger Korps, which included three parachute regiments of three battalions each plus parachute signals, medical, artillery, antiaircraft, antitank, machine gun, and engineer battalions and the necessary supply troops. These troops were originally seen as the spearhead of the invasion of Britain, but that operation never took place.

The Germans next employed paratroops in their 1941 Balkan Campaign to capture the island of Crete (May 1941). Student saw this as the forerunner of other more ambitious airborne operations. The largest airborne operation to that point in history, it involved 9,000 men and 530 Junkers -Ju-52 transport aircraft flying from Greece.

Thanks to Allied Ultra intercepts, the defenders knew the drop zones in advance. Although by rushing in reinforcements the Germans were able to secure their objectives, they paid a heavy price. They sustained 6,700

casualties (3,000 killed) and lost some 200 transport aircraft in the operation. Student wanted to go on and try to take Malta, but Hitler refused. Crete was the graveyard of the German airborne forces; thereafter they fought as elite ground troops only, though their fighting abilities were recognized by all who met them in battle.

The Italians started early in their evaluation of airborne forces. Their first experiments occurred in 1927, when nine men dropped on Cinisello Airfield. Some 250 paratroops then began training and took part in a training drop at Gefara, in Libya. A training center was set up at Tarquinia, in central Italy, and in April 1941, Italian paratroops captured the island of Cephalonia, off the west coast of Greece. Although a small number of parachute troops continued thereafter, the planned Italian assault on Malta never took place, and Italian paratroops fought in a ground role for the rest of the war.

The Japanese began parachute training in 1940 with four training centers in the Japanese home islands. In the autumn of 1941, some 100 German instructors arrived, and soon there were nine training centers and 14,000–15,000 men under training. Both the Japanese Army and Navy had paratroops, all of whom were ready for operations at the start of the war.

German Junkers Ju-52 transport aircraft. Powered by three radial engines, the Ju-52 was employed by the Luftwaffe as a military transport and to drop paratroopers. (Berliner Verlag/Archiv/DPA/Corbis)

Japanese Army paratroops numbered about 6,000 men and were known as raiding units. They were divided into parachute and glider-borne units.

Their first mission was to capture Menado Airfield in the Celebes Islands on January 11–12, 1942. They then attacked the airfield and oil refineries at Palembang on February 14–16. Although the Japanese managed to capture the airfield, the refineries were destroyed before they could take them over. A week later the Japanese successfully struck Timor, in coordination with seaborne troops.

Operations after this were mainly tactical, especially an assault on Leyte in December 1944. This attack was a total failure; however, Allied intelligence summaries noted that the Japanese parachute troops were part of a well-organized, well-trained force that could have proved extremely effective had the emphasis in the Pacific war not been on manpower and ships to capture the many islands of this area.

Aircraft, Bombers

Aircraft designed to attack enemy targets including troop concentrations, installations, and shipping. During the 1930s, bomber designs underwent something of a revolution; performance increased to the point that many bombers were faster than the fighters in service. The prevailing wisdom, according to Italian general Giulio Douhet, was that “the bomber will always

get through.” It was assumed that the bomber would be fast enough to evade most defending fighters and that defensive armament could deal with any that did intercept. The bomber was therefore seen as something of a terror weapon. Events in the 1936–1939 Spanish Civil War, including the German bombing of Guernica, and early German experience in World War II tended to reinforce this view.

At the start of the war, most combat aircraft were not equipped with self-sealing fuel tanks, and most did not have adequate protective armor. Operational experience during 1939 and early 1940 led the European powers to retrofit their aircraft with armor and self-sealing fuel tanks. Some aircraft designers took this to extremes: for example, about 15 percent of the weight of the Russian I1–2 Shturmovik (1941) was armor plate. On the other hand, many Japanese aircraft had no protection of any sort until late in the war; they were known to their crews as “flying cigarette lighters” and were easy to shoot down.

Other changes also affected bomber capabilities. The Germans embraced dive-bombing, and all their bombers had to be able to dive-bomb. The necessary structural changes greatly added to the bombers’ weight and decreased bomb loads. The flying weight of the Ju-88, for example, went from 6 to 12 tons, sharply reducing both its speed and bomb-carrying capacity.

Defensive armament of the majority of bombers in service at the start of the war was inadequate in terms of the number and caliber of weapons and/or their field of fire. This situation came about partly because of the assumption that interceptions at 300-plus mph were difficult and would therefore be rare. The early B-17Cs, for example, were quite vulnerable because their few defensive weapons had several blind spots and were single manually aimed weapons. Later B-17Es had much better defensive armament deployed as multiple weapons in power turrets, making them much more difficult to shoot down. An alternative tactic was to dispense with all defensive weapons and rely on speed and performance to evade the defenses. The De Havilland Mosquito, which carried out many pinpoint attacks from 1942 onward, epitomized this approach.

The following text describes the most significant bombers employed by both sides during World War II. See also Table 1.

Germany

The Heinkel He-111 entered service in 1935, and the B model served with distinction in the Spanish Civil War, where it was fast enough to fly unescorted. Nearly 1,000 He-111s were in service at the start of the war; they formed a significant part of the Luftwaffe’s medium bomber strength early in the conflict, although they were roughly handled during the Battle of Britain in spite of carrying nearly 600 pounds of armor. Later versions had better defensive armament and were used in various roles, including torpedo bombing. Approximately 7,450 He-111s were built before production ended in 1944.

The Junkers Ju-87 Stuka dive bomber virtually ruled the skies in World War II until the 1940 Battle of Britain, but then continued to perform useful service on the Eastern Front against the Soviet Union. (Bettmann/Corbis)

The prototype Junkers Ju-87 Stuka dive-bomber flew in 1935, entering service with the Luftwaffe in the spring of 1937. Examples sent to Spain with the Kondor Legion in 1938 were able to demonstrate highly accurate bombing under conditions of air superiority. Stukas were highly effective in the invasions of Poland in 1939 and France in 1940. During the July 10–September 30, 1940, Battle of Britain, they suffered such heavy losses from opposing British fighters that they were withdrawn from operations partway through the campaign. They continued to serve in the Mediterranean theater, however, and on the Eastern Front in dive-bombing and close ground-support roles. A total of 5,709 Ju-87s of all versions were built.

Table 1. Bombers, All Powers—Specifications

Name	*Year of Introduction*	*Crew*	*Engine*	*Span*	*Length*	*Takeoff Weight (lb)**	*Maximum Speed (mph)*	*Operational Ceiling (ft)*	*Range (mi)†*	*Armament/Payload*
Germany										
Junkers Ju-87 B-1 (late 1938)	Early 1937	2	1 × 900-hp Junkers Jumo v-type	45 ft 3.25 in.	36 ft 5 in.	9,370	242 mph at 13,410 ft	25,250 ft	342 mi with 1,102 lb bombs	3 × 7.9-mm machine guns, up to 1,542 lb bombs
Heinkel He 111 H-3 (late 1939)	1935	5	2 × 1,200-hp Junkers Jumo v-type	74 ft 1.75 in.	53 ft 9.5 in.	24,912	258 mph at 16,400 ft	25,590 ft	758 mi with maximum bomb load	1 × 20-mm cannon, 5 × 7.9-mm machine guns, 4,409 lb bombs
Junkers Ju-88 A-4 (1942)	Late 1939	4	2 × 1,340-hp Junkers Jumo v-type	65 ft 7.5 in.	47 ft 3 in.	26,700	269 mph at 14,765 ft	25,900 ft	650 mi with maximum bomb load	9 × 7.7-mm machine guns, up to 3,306 lb bombs
Great Britain										
Handley Page Hampden I (late 1938)	Late 1938	4	2 × 980-hp Bristol Pegasus radials	69 ft 2 in.	53 ft 7 in.	18,756	265 mph at 15,500 ft	22,700 ft	1,095 mi with maximum bomb load	6 × 0.303-in. machine guns, 4,000 lb bombs
Bristol Blenheim IVL (early 1939)	Early 1939	3	2 × 920-hp Bristol Mercury radials	56 ft 4 in.	42 ft 9 in.	13,500	266 mph at 11,800 ft	27,260 ft	1,950 mi maximum	5 × 0.303-in. machine guns, 1,000 lb bombs
Short Stirling I (late 1940)	Late 1940	7 or 8	4 × 1,590-hp Bristol Hercules radials	99 ft 1 in.	87 ft 3 in.	59,400	260 mph at 10,500 ft	20,500 ft	1,930 mi with 5,000 lb bombs	8 × 0.303-in. machine guns, up to 14,000 lb bombs
Vickers Wellington III (early 1941)	Late 1938	6	2 × 1,500-hp Bristol Hercules radials	86 ft 2 in.	64 ft 7 in.	29,000	255 mph at 12,500 ft	19,000 ft	2,200 mi with 1,500 lb bombs	8 × 0.303-in machine guns, 4,500 lb bombs
Avro Lancaster B.I (early 1942)	Early 1942	7	4 × 1,280-hp Rolls Royce Merlin v-type	102 ft	69 ft 4 in.	68,000 maximum	287 mph at 11,500 ft	24,500 ft	1,730 mi with 12,000 lb bomb load	8 × 0.303-in. machine guns, up to 18,000 lb bombs
Handley Page Halifax B.II (late 1943)	Early 1941	7	4 × 1,615-hp Bristol Hercules radials	104 ft 2 in.	71 ft 7 in.	54,400	282 mph at 13,500 ft	24,000 ft	1,985 mi with 7,000 lb bombs	9 × 0.303-in. machine guns, up to 13,000 lb bombs
De Havilland Mosquito B.XVI (early 1944)	Late 1941	2	2 × 1,680-hp Rolls Royce Merlin v-type	54 ft 2 in.	40 ft 6 in.	19,093	408 mph at 26,000 ft	37,000 ft	1,370 mi with 4,000 lb bombs	Up to 4,000 lb bombs
Italy										
Savoia-Marchetti S.M.79-II Sparviero (early 1940)	1937	6	3 × 1,000-hp Piaggio radials	69 ft 6.5 in.	53 ft 1.75 in.	25,133	295 mph at 13,120 ft	27,890 ft	1,243 mi with 2,756 lb bombs	3 × 12.7-mm machine guns, 2 × 7.7-mm machine guns, 2 × 450- mm torpedoes, or 2,756 lb bombs
CANT Z.1007bis (late 1940)	1937	5	3 × 1,000-hp Piaggio radials	81 ft 4.5 in.	60 ft 11 in.	38,206	283 mph at 15,100 ft	26,500 ft	1,243 mi with 2,430 lb bombs	4 × 12.7-mm machine guns, 2,430 lb bombs, or 2 × 450-mm torpedoes
Japan										
Mitsubishi Ki-21-IIb (1942)	1937	5–7	2 × 1,500-hp Mitsubishi Ha-101 radials	73 ft 10 in.	52 ft 6 in.	21,407	302 mph at 15,485 ft	32,810 ft	1,350 mi with maximum bomb load	5 × 7.7-mm machine guns, 1 × 12.7-mm machine gun, 2,205 lb bombs

Name	Year of Introduction	Crew	Engine	Span	Length	Takeoff Weight (lb)*	Maximum Speed (mph)	Operational Ceiling (ft)	Range (mi)†	Armament/Payload
Japan (*continued*)										
Mitsubishi G4M2a Betty (mid-1944)	Early 1941	7	2 × 1,850-hp Mitsubishi Kasei	81 ft 8 in.	64 ft 5 in.	33,069 maximum	272 mph at 15,090 ft	29,365 ft	1,497 mi with normal bomb radials	4 × 20-mm cannon, 1 × 7.7-mm machine gun, up to 2,205 lb 1 × 1,764-lb torpedo
Soviet Union										
Ilyushin Il-4 (1940)	1940	3–4	2 × 1,100-hp M-88B radials	70 ft 4 in.	48 ft 6.5 in.	22,046 maximum	255 mph at 21,000 ft	29,530 ft	2,647 mi with 2,205 lb bombs	3 × 7.7-mm or 12.7-mm machine guns, up to 5,512 lb bombs
Petlyakov Pe-2	Early 1941	3	2 × 1,100-hp Klimov v-type	56 ft 3.5 in.	41 ft 6.5 in.	18,734	336 mph at 16,400 ft	28,900 ft	700 mi with maximum bomb load	3 × 7.7-mm machine guns, 2,645 lb bombs
Ilyushin Il-2m3 Shturmovik (late 1942)	Mid-1941	2	1 × 1,770-hp Mikulin v-type	47 ft 11 in.	38 ft 2.5 in.	12,147	251 mph at 4,920 ft	19,685 ft	373 mi with normal load	2 × 23-mm cannon, 2 × 7.62-mm machine guns, 1 × 7.62-mm machine gun, 1,323 lb bombs or 8 rockets
United States										
Douglas A-20 C Havoc (1941)	1940	3	2 × 1,600-hp Wright Cyclone radials	61 ft 4 in.	47 ft 5 in.	24,500 maximum	342 mph at 13,000 ft	24,250 ft	1,050 mi with maximum bomb load	7 × 0.303-in. machine guns, 2,000 lb bombs
Martin B-26B Marauder (early 1942)	1941	7	2 × 1,920-hp Pratt and Whitney radials	71 ft	58 ft 3 in.	37,000	282 mph at 15,000 ft	21,700 ft	1,150 mi with 3,000 lb bombs	11 × 0.5-in. machine guns, 11 × 0.3-in. machine gun, up to 5,200 lb bombs
Boeing B-17F (mid-1942)	1939	9–10	4 × 1,200-hp Wright Cyclone radials	103 ft 9.5 in.	74 ft 8.75 in.	55,000	299 mph at 25,000 ft	37,500 ft	1,900 mi with 6,000 lb bombs	8 or 9 × 0.5-in. machine guns, 1 × 0.303-in. machine gun, 12,800 lb bombs
North American B-25 J Mitchell (1943)	Late 1940	5	2 × 1,700-hp Wright Cyclone radials	67 ft 7 in.	52 ft 11 in.	33,450	275 mph at 15,000 ft	25,000 ft	1,275 mi with 3,200 lb bombs	13 × 0.5-in. machine guns, up to 4,000 lb bombs
Consolidated B-24J Liberator (1944)	Early 1941	8–12	4 × 1,200-hp Wright Cyclone radials	110 ft	67 ft 2 in.	56,000	290 mph at 25,000 ft	28,000 ft	1,700 mi with 5,000 lb bombs	10 × 0.5-in. machine guns, 5,000 lb bombs
Boeing B-29 Superfortress (mid-1944)	Mid-1944	10	4 × 2,200-hp Wright Cyclone radials	141 ft 3 in.	99 ft	120,000	357 mph at 30,000 ft	33,600 ft	3,250 mi with 10,000 lb bombs	1 × 20-mm cannon, 10 × 0.5-in. machine guns, up to 20,000 lb bombs
Douglas A-26 B Invader (late 1944)	Late 1944	3	2 × 2,000-hp Pratt and Whitney radials	70 ft	50 ft	35,000 maximum	355 mph at 15,000 ft	22,100 ft	1,400 mi with maximum load	10 × 0.5-in. machine guns, up to 4,000 lb bombs

(London: Book Club Associates, 1979); Philip Jarrett, ed., *Aircraft of the Second World War* (London: Putnam, 1997); Kenneth Munson, *Bombers, Patrol and Transport Aircraft, 1939–45* (Poole, UK: Blandford, 2002).

* Weight is normal takeoff weight unless specified otherwise.

† Range is maximum flyable distance, including reserves.

The Junkers Ju-88, one of the most effective and adaptable German aircraft of the war, entered Luftwaffe service in September 1939. The Ju-88 had good performance for a bomber, particularly the later versions, which were used as night fighters. Specialized variants were also produced for dive-bombing, antishipping, reconnaissance, and training. Ju-88C fighter variants were used in daylight during the Battle of Britain, but they were unable to cope with attacks by modern British single-engine fighters. A total of 14,980 Ju-88s were built, including 10,774 bomber variants.

Italy

The principal Italian bomber and one of the most capable Italian aircraft of the war was the trimotor Savoia-Marchetti SM.79 Sparviero (Sparrow). The Italians used it as a bomber, torpedo bomber, and reconnaissance aircraft. Originally designed by Alessando Marchetti as a high-speed, eight-passenger transport, it had retractable landing gear. The SM.79 entered service in 1936 and first saw service in the Spanish Civil War. A total of 1,217 were produced during World War II. Reconverted to military transports after the war, Sparvieros served with the Italian Air Force until 1952.

The CANT Z.1007 Allcione (Kingfisher) was Italy's second most important bomber of the war. Entering production in 1939, it was both a medium conventional bomber and a torpedo bomber. It was of largely wooden construction with weak defensive armament. It appeared both in single- and twin-rudder configurations without differing designations and often in the same squadron. The CANT Z.1007 was widely used all over the Mediterranean theater. Of good design and easy to fly, it was nonetheless poorly defended and suffered heavy losses from Royal Air Force (RAF) fighters. CANT Z.1007s continued in service until the end of the war on both sides after the Italian surrender of 1943. A total of 560 were built.

The Italians had only one four-engine bomber, the Piaggio P.108. Designed by Giovanni Casiraghi, it entered service in May 1941 and was only intermittently used. It had a crew of six, a maximum speed of 261 mph, and a range of 2,190 miles. Armed with eight machine guns, it could carry 7,700 pounds of bombs. Only 33 were produced, however, 8 of which went to the Germans for use as transports.

A formation of Japanese Army Mitsubishi Ki-21 medium bombers (known as “Sally” in the Allied reporting system) during a mission against China in November 1943. (Ullstein Bild via Getty Images)

Japan

The Mitsubishi Ki-21 medium bomber (“Sally” in Allied designation) was the winner of a 1936 bomber design competition run by Japan’s army air force. It entered service in 1937 as the Ki-21-Ia and was replaced shortly afterward by the Ki-21-Ic, which had additional armament and defensive

armor as a result of combat experience in China. The Ki-21 was the standard Japanese air force bomber at the end of 1941, encountered throughout the Pacific and the Far East. When production ended in 1944, 2,064 had been built by Mitsubishi and Nakajima as well as about 500 transport versions by Mitsubishi.

The Mitsubishi G4M medium bomber ("Betty") entered service with the Japanese Army early in 1941 and was involved in pre–World War II operations in China. It was designed in great secrecy during 1938–1939 to have the maximum possible range at the expense of protection for the crew and vital components, and it was mainly used in the bomber and torpedo bomber roles. G4M1s were mainly responsible for sinking the British battleship *Prince of Wales* and the battle cruiser *Repulse* off Malaya in December 1941. The G4M had an extraordinary range, but more than 1,100 gallons of fuel in unprotected tanks made the aircraft extremely vulnerable to enemy fire. The G4M2 appeared in 1943 and was the major production model, with more powerful engines and even more fuel. Losses of the aircraft continued to be heavy, and Mitsubishi finally introduced the G4M3 model late in 1943 with a redesigned wing and protected fuel tanks. A total of 2,479 aircraft in the G4M series were built.

Great Britain

The Bristol Blenheim was developed from the private-venture Bristol 142, and the short-nosed Mk 1 entered service as a light bomber in March 1937, although some were completed as fighters. The Blenheim was an effective bomber, but lacking adequate defensive armament and armor, it was vulnerable to fighter attack. The most numerous versions were the long-nosed Mk IV and V, but their performance suffered from significant weight growth, the Mark V in particular suffering heavy losses. The Blenheim nevertheless filled an important capability gap in time of need, and it was exported to Finland, Romania, Turkey, and Yugoslavia. A total of 5,213 Blenheims of all versions were built.

The Vickers Wellington entered service with the RAF late in 1938 and (with the Whitley and Hampden) bore the brunt of the RAF bomber offensive for the first two years of the war. Its light but strong geodetic structure enabled it to carry a respectable bomb load, and it could withstand a

significant amount of battle damage. The Wellington was one of the first monoplane bombers to be fitted with power turrets, but (in common with all early World War II bombers) it was vulnerable to fighter attack when flown unescorted in daylight. The Wellington was mainly employed as a medium bomber, although some were used for maritime reconnaissance, torpedo-bombing, mine-laying, and transport duties. Wellingtons were in production throughout the war, with 11,461 being built up to October 1945.

The Handley Page Hampden entered RAF service late in 1938. Of imaginative design, it delivered a reasonable performance on only average engine power, but the cramped fuselage caused crew fatigue, and the defensive field of fire was limited. Hampdens were used as medium bombers and minelayers until late 1942, and they served as torpedo bombers and maritime reconnaissance aircraft until the latter part of 1943. A total of 1,430 Hampdens and variants were built.

The Short Stirling, the first of the RAF's four-engine "heavies" to see combat, entered service in late 1940. It was built to specification B.12/36, which unfortunately meant that the wingspan should be less than 100 feet to fit in a standard hangar; this compromised the aircraft's altitude capability to the extent that attacks on Italy required British pilots to fly through the Alps rather than over them. The Stirling was nonetheless outstandingly maneuverable for such a large aircraft. It was used as a bomber, a minelayer, a glider tug/transport, and (with 100 Group) an electronic countermeasures aircraft. A total of 2,381 Stirlings were built.

The Handley Page Halifax I entered service early in 1941 and was found to be a good bomber, but it lacked adequate defensive armament. The Halifax B.II had a dorsal gun turret but suffered from weight growth and a tendency to spin when fully loaded. Later B.IIs underwent a weight- and drag-reduction program and had larger fins fitted to correct these faults. The B.III version was the most numerous, using more powerful Bristol Hercules engines in place of the Merlins. Although the Halifax's main role was as a bomber, it was also employed as a transport, glider tug, and maritime reconnaissance aircraft. A total of 6,176 Halifaxes were built.

The Avro Lancaster was a successful development of the Rolls-Royce Vulture-powered Manchester, entering operational service with the RAF in early 1942. The Lancaster remained in service until the end of the war and rapidly became the primary strategic bomber for the RAF. It lost fewer

aircraft per ton of bombs dropped than either the Halifax or Stirling. The Lancaster had a large bomb bay and was designed to take 4,000-pound bombs; successive modifications enabled it to carry 8,000- and 12,000-pound weapons, and the B.I (special) carried a single 22,000-pound “grand slam” armor-piercing bomb. The Lancaster participated in several special operations, including the Dam Busters raid in May 1943, when specially adapted Lancasters of 617 Squadron attacked dams in the Rhine Valley using a skipping bomb designed by Barnes Wallis. A total of 7,366 Lancasters were built.

The De Havilland Mosquito was constructed largely from a plywood/balsa sandwich and was designed to be fast enough to outrun enemy fighters. It had excellent handling characteristics. It began operations with the RAF in the bomber role early in 1942 and quickly demonstrated that it could carry out extremely accurate attacks, including the daring low-level attack on the Gestapo headquarters in Oslo, Norway, in late 1942. Mosquitoes originally equipped the RAF’s pathfinder force, and they were able to roam across Germany largely unmolested. Operationally, the Mosquito had by far the lowest loss rate of any aircraft in Bomber Command (about 0.6 percent), as its speed enabled it to avoid interception and its structure tended to absorb cannon hits. A total of 6,439 Mosquitoes of all marks were built.

Soviet Union

The Ilyushin Il-4 was the most widely used Soviet medium bomber of the war. Initially designed as the DB-3 in 1935, it entered service in that form in 1938. The updated DB-3F was redesignated Il-4 in 1940, and many examples were built. Following Soviet entry into the war, a force of Soviet Navy Il-4s carried out the first Soviet attack on Berlin in August 1941. As a result of shortages of strategic materials, parts of the airframe including the outer wing panels were redesigned to use wood instead of metal. The Il-4 was a maneuverable aircraft in spite of its size, and approximately 5,000 were built up to 1944.

The Petlyakov Pe-2 entered service early in 1941. It was originally designed as a fighter and therefore had unusually responsive controls for a bomber. It turned out to be one of the most versatile aircraft produced by the Soviet Union in the war, being used as a heavy fighter, light bomber, dive-

bomber, ground-attack, and reconnaissance aircraft. More than 11,000 Pe-2s were built.

The Ilyushin Il-2 Shturmovik was probably one of the most effective ground-attack aircraft of World War II, entering service on the Eastern Front in mid-1941. Initial versions were single-seaters, but the higher-performance Il-2m3 introduced in mid-1942 had a gunner and was highly effective in aerial combat at low altitude, even against single-seat German fighters. Later versions of the Il-2m3 had a more powerful engine and a 37mm cannon against German Panther and Tiger tanks. The Shturmovik was remarkably tough; about 15 percent of its empty weight was armor plate that protected the engine, fuel systems, and crew, and it had few weak points. Approximately 35,000 Shturmoviks were built.

United States

The Boeing B-17 Flying Fortress was designed in 1934 and sold to Congress as a U.S. Army Air Corps requirement for an offshore antishipping bomber. The B-17B entered service late in 1939; it was fast and had a high operational ceiling, but the initial versions were not particularly capable. The B-17E, which entered service early in 1942, had much-improved defensive armament, including a tail-gun turret, and the B-17G (late 1943) introduced an additional chin turret, which was later fitted to some F models. The B-17 E, F, and G models formed the mainstay of the U.S. heavy day-bomber force in Europe and remained in service until the end of the war. There were 8,685 B-17s built.

The Consolidated B-24 Liberator heavy bomber was designed with a high aspect-ratio wing that, together with its Davis high-lift airfoil, gave good range/payload performance. The first Liberators entered service with RAF Coastal Command in mid-1941, and the type went on to serve with the U.S. Army Air Forces (USAAF) and the U.S. Navy. USAAF B-24s conducted the ill-fated raid on the Ploieşti oil field on August 1, 1943. The Liberator developed a reputation for fragility in the European theater and was prone to catch fire when hit, but its long range made it the preeminent strategic bomber in the Pacific theater. The B-24 was employed as a reconnaissance, antisubmarine, and transport aircraft as well as in its primary strategic

bombing role, and it was produced in greater quantities than any other American aircraft, with 18,188 being built up to May 1945.

A U.S. Army Air Forces Consolidated B-24 Liberator bomber. The B-24 performed a variety of roles in the war and saw extensive service in both the European and Pacific Theaters. (Corbis)

The Douglas Aircraft Company built the A-20 attack bomber as a private venture, albeit with the help of U.S. Army Air Corps technicians at the specification stage. It entered service early in 1940 with the French Armée de l'Air, with outstanding orders being transferred to the RAF when France capitulated to the Germans. The A-20 (designated Boston or Havoc, depending on the role) was an excellent airplane. Fast, docile, and pleasant to fly, it had a commendably low loss rate. It was adaptable and was produced in both solid-nose and transparent-nose versions. Used in many roles including low-level attack, strafing, torpedo-bombing, reconnaissance, and night fighting, it remained in frontline service until the end of hostilities. A total of 7,385 variants were built.

North American was awarded a contract to build the B-25 Mitchell without the usual prototypes, relying instead on experience with the NA-40 design and feedback from the Army Air Corps. Self-sealing fuel tanks and armor protection were incorporated on the production line following combat reports from Europe. The Mitchell had good handling characteristics and was

probably the best all-around medium bomber of the war. The B-25 achieved lasting fame when 16 of them attacked Tokyo on April 18, 1942, flying from the carrier *Hornet.* The Mitchell was adapted to multiple missions including ground strafing, torpedo-bombing, antisubmarine work, and reconnaissance, mounting a variety of main armament including up to 18 .50-caliber machine guns in the B-25J and a 75mm cannon in the B-25H. Mitchells were used by most Allied air forces, and approximately 11,000 were built.

The Boeing B-29 Superfortress, the heaviest bomber of the war, evolved from a 1940 Army Air Corps requirement for a "hemisphere defense weapon." The resulting XB-29, which first flew late in 1942, had several innovative design features including a pressurized fuselage and remote-controlled gun turrets. The B-29 entered service in the first half of 1944 and mounted increasingly heavy attacks against the Japanese mainland from bases in the Mariana Islands. Operationally, the B-29 was successful largely as a result of its speed and altitude capabilities. B-29s forced the Japanese surrender following attacks with atomic bombs on Hiroshima and Nagasaki on August 6 and 9, 1945, respectively. A total of 3,970 were built.

The Douglas A-26 Invader was a worthy successor to the Douglas A-20 Havoc. It entered service late in 1944. The A-26B had a solid attack nose carrying six .50-caliber machine guns, and the A-26C had a more conventional transparent nose for a bombardier. The A-26 was fast and well-armed, and it had a low loss rate (about 0.6 percent), even allowing for low enemy fighter activity toward the end of the war. A total of 2,446 Invaders were built, and they continued to serve well into the 1960s. After World War II when the Martin B-26 was retired, the Douglas A-26 was redesignated the B-26.

The Martin B-26 Marauder entered service early in 1942 and initially gained a reputation as a difficult aircraft to fly, partly because of its weight and high landing and takeoff speeds. Certainly it required skill and practice to master. In later models (B-26F onward), the wing incidence was increased to reduce the landing and takeoff speeds. The B-26 could absorb a lot of damage and was an effective bomber; its final combat loss rate was less than 1 percent. A total of 5,157 Marauders were built.

Aircraft, Fighters

Aircraft designed to shoot down other aircraft. World War II was a period of transition for fighters; by 1945 aircraft weight, armament, and performance had increased dramatically, and jet fighters were approaching the speed of sound.

Throughout the 1920s and early 1930s, most air forces were equipped with biplane fighters that were little more advanced than their twin-gunned ancestors that had fought on the Western Front in World War I. By the mid-1930s, aero engine design and airframe construction techniques had advanced dramatically, and newer prototypes were appearing with stressed-skin construction, retractable undercarriages, and top speeds of over 300 mph. These aircraft entered service in the late 1930s, just in time for World War II.

Many of these new designs had flush-fitting cockpit canopies (e.g., Bf-109, Spitfire), partly for reasons of aerodynamic efficiency but also because it was thought (incorrectly) that the classic World War I dogfight would be impossible at speeds of over 300 mph. Visibility from the cockpit turned out to be very important; about 80 percent of pilots shot down during the war never saw their attackers. Some fighters received bulged cockpit hoods to alleviate the problem, but later aircraft were fitted with clear Perspex canopies that gave unrestricted rearward vision.

Most fighters are defined by performance and maneuverability. Of the two, performance was probably more important during World War II. A speed advantage over an opponent (ignoring surprise attacks and tactical advantage) enabled a fighter to dictate the terms on which combat was joined and also enabled an easy escape if the fight was not going well. Comparisons tend to be problematic because performance varied dramatically with altitude; an aircraft that had a significant advantage against an opponent at sea level could find the position dramatically reversed at 30,000 feet. In any case, in-service improvements could change performance characteristics, and new aircraft usually had the latest equipment and engine variants, further complicating the issue.

Maneuverability is essentially a measure of the ability of an aircraft to change direction and is dictated to a large extent by the wing loading of the aircraft. Some lightly loaded aircraft (particularly the early Japanese fighters) were capable of remarkably tight turns, but the ability of the aircraft to roll and establish the turn also played a part. Some fighters, such as the Focke-Wulf FW 190, had an excellent rate of roll that to some extent compensated for their average rate of turn. An aircraft's handling qualities degrade to a greater or lesser extent as the weight inevitably increases with each new version, and heavier aircraft tend to be less agile than lighter ones. Twin-engine aircraft are particularly disadvantaged in roll, as more mass is distributed around the centerline than with a single-engine aircraft.

Many early fighters had tactical limitations because of control difficulties. There is a relationship between the size and shape of a control surface and the effort required to move it; it becomes progressively more difficult to deflect as speed increases and may in some cases exceed the ability of the pilot to apply sufficient force. For example, the Messerschmitt Bf-109 had very heavy stick forces at normal speeds, Spitfires had metal-covered ailerons fitted late in 1940 to make high-speed rolls easier, and the Mitsubishi Zero had (in common with most other Japanese fighters) huge control surfaces that gave outstanding agility below about 200 mph (as with the F4U Corsair and the Tempest) but almost none above 300 mph. Much later in the war, new designs had spring tabs fitted on control surfaces to balance the extra air resistance at high speeds.

In 1939 few, if any, aircraft had self-sealing fuel tanks or armor. Operational experience in the European theater showed that aircraft were

very vulnerable unless so equipped, and in 1940 crash programs were instituted to retrofit fuel tank liners and armor plate to most aircraft. This added weight reduced performance slightly, but most air arms were prepared to accept the price; however, the Japan's army and navy were not.

As a result, most Japanese aircraft, which were lightly constructed anyway, were extremely vulnerable even to machine-gun fire, and cannon hits caused immediate and catastrophic damage. The use of armor and other protection on bombers had already obliged designers to fit heavier weapons, and continuing development encouraged the adoption of cannon. The Messerschmitt Me-262 was probably the ultimate World War II bomber-killer with four 30mm cannon, only three hits from which were usually required to down a four-engine bomber.

The increased performance of fighters brought compressibility effects into play. As speeds increased at high altitude, airflow over parts of the structure could reach the speed of sound (Mach 1.0) even in quite shallow dives, leading to buffeting, nose-down trim changes, and eventually loss of control of the aircraft. Recovery from the dive was difficult, and reducing power usually led to the nose dropping farther. Sometimes, the only solution was to wait until the aircraft reached warmer air at lower altitudes and the local speed of sound increased above the critical value. These effects were not well understood at the time and caused tactical limitations to some aircraft: the Lockheed P-38 ran into serious compressibility effects above Mach 0.68, and the Messerschmitt Me-262 could reach its limit of Mach 0.83 only in a shallow dive.

World War II was a fascinating period for fighter development; the following aircraft were the most significant fighters of the conflict. See also Table 1.

Germany

The Messerschmitt Bf-109 entered service in its earliest form (Bf-109B) in 1937 and remained in service throughout the war. It continued to be modified during the conflict. It received progressively more powerful engines, and in common with many other aircraft, its handling qualities and maneuverability degraded with successive versions. The Bf-109 could not turn tightly (although the 109E and 109F models were better than commonly supposed),

but it was an effective fighter when handled correctly, possessing excellent dive and zoom-climb capabilities. The later versions in particular were better at high altitude, but the controls became stiff at high speeds, and visibility from the cockpit was poor. Approximately 35,000 examples were built.

* Weight is normal takeoff weight unless specified otherwise.

† Combat ceiling is the maximum height at which the aircraft would fight and maneuver. The service ceiling would typically be 2,000 or 3,000 feet higher than this.

‡ Range is maximum flyable distance on internal fuel, including reserves. Combat radius would typically be 30 percent to 35 percent of this value.

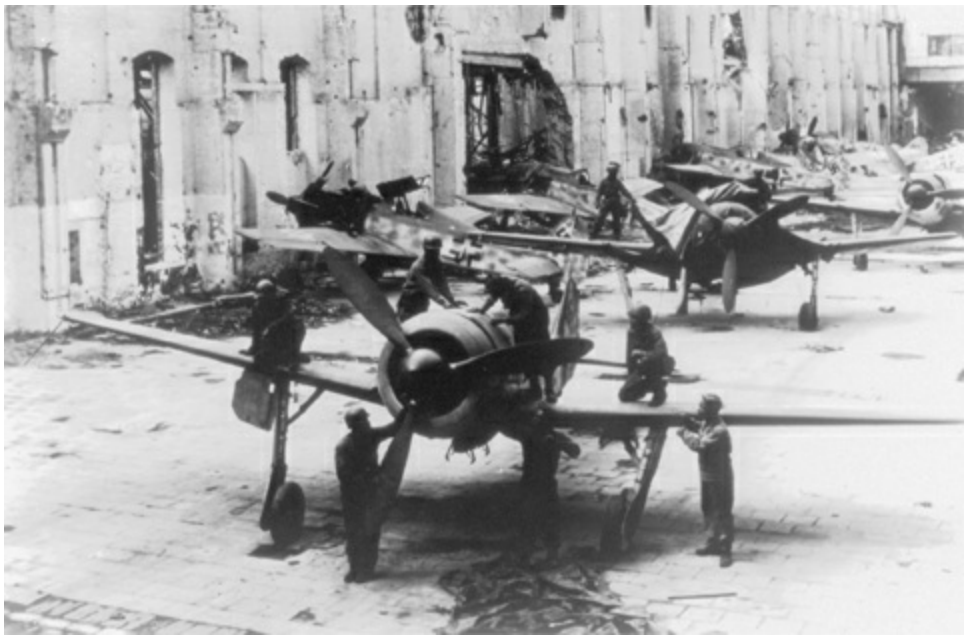
The Messerschmitt Bf-110 was designed as a long-range escort fighter, entering service with the Luftwaffe in 1939. It had a useful top speed and was well armed, but it could not meet contemporary single-engine fighters on equal terms. It was not a success as an escort fighter, but it was first used as a fighter-bomber during the Battle of Britain, and from 1943 the Bf-110 G-4 enjoyed much success as a radar-equipped night fighter. Approximately 6,150 were built.

The Focke-Wulf FW-190A entered service in mid-1941 and became one of the best low- and medium-altitude fighters of the war. It had light and effective controls and possibly the best rate of roll of any World War II

fighter, attaining 160 degrees per second at about 260 mph. It was superior to the contemporary Spitfire Mk V in all areas except turning circle and was generally regarded as a strong and rugged aircraft. The 190F and 190G were similar to the 190A, but they had extra armor for ground-attack missions, and the 190D had a 2,240-horsepower (hp) Junkers Jumo liquid-cooled engine for better high-altitude performance. A total of 20,001 Focke-Wulf FW 190s were built.

Italy

The Fiat CR-42 entered service with the Italian Air Force in 1939 and was exported to Belgium, Sweden, and Hungary. It was a highly maneuverable fighter with (for a biplane) good dive acceleration. It was lightly armed and quite vulnerable to enemy fire, however, and not really capable of taking on modern fighters on equal terms. A total of 1,781 were built.



U.S. Army Quartermaster troops inspect German Focke-Wulf FW-190 fighter planes grounded either by rubble or lack of gasoline at Oschersleben, Germany. The FW-190 saw wide service in a variety of roles with the Luftwaffe during World War II. (Library of Congress)

The Macchi Mc 200 first entered service during 1940. A well-built and extremely maneuverable fighter with finger-light controls, it could outturn most of its opponents. It was, however, lightly armed with only two machine guns. The Macchi Mc 202 was a Mc 200 airframe with a license-built

Daimler-Benz DB601 engine. It was probably the most effective Italian fighter of the war, retaining most of its predecessor's maneuverability, and was able to meet the Spitfire Mk V on at least equal terms. A total of 2,251 Mc 200 and Mc 202 aircraft were built.

Japan

The Nakajima Ki.43 ("Oscar" by the Allied identification system) entered service late in 1941 and was highly maneuverable but not particularly fast (304 mph at 13,120 feet). It had extremely sensitive controls that unfortunately stiffened significantly at speed. Allied fighters found that they could not turn with the Oscar but could outdive and outzoom it. Its armament was weak; pilot armor and self-sealing tanks were introduced with the more powerful Ki.43-IIa late in 1942, but the Oscar remained vulnerable to enemy fire. It continued to undergo development throughout the Pacific war, with 5,751 examples being built.

The Kawasaki Ki.45 ("Nick") was designed to a 1937 specification for a long-range escort fighter and entered service early in 1942. The Ki.45 was increasingly used as a night fighter from early 1944 using two 12.7mm or 20mm weapons firing obliquely upward. It was relatively successful against U.S. B-29 night raids, and it later became the first Japanese Army Air Force type to be used on a kamikaze mission. A total of 1,701 were built.

The Nakajima Ki.44 interceptor ("Tojo") first appeared in service late in 1942, although some of the 10 prototypes were evaluated on operations during 1941 and early 1942. The Tojo was reasonably maneuverable with a good climb, but its high takeoff and landing speeds made it unpopular with pilots. The Ki.44-IIc appeared in mid-1943; armed with two 40mm cannon and two machine guns, it was quite effective against high-flying U.S. B-24 and later B-29 bombers. A total of 1,233 were built.

The Kawasaki Ki.61 ("Tony") appeared early in 1943 and was the only Japanese fighter powered by a liquid-cooled engine to see operational service. It carried self-sealing fuel tanks and armor and was more maneuverable than heavier opponents. Its dive characteristics were also good, comparable to the best U.S. fighters. The Ki.61 was one of few Japanese fighters able to engage the U.S. B-29 bombers at high altitude. A total of 3,078 Ki.61s were built. Engine production was slow and the power plant

gave problems in service, so early in 1945 many Ki.61 airframes were refitted with a 1,500-hp Mitsubishi Ha 112 radial to produce the Ki.100. Only 272 were built by war's end, but it was the best Japanese fighter during the conflict.

The Kawanishi N1K1-J ("George") evolved from a floatplane and was one of the best fighters of the Pacific theater. Entering service early in 1944, it had automatic combat flaps and was outstandingly maneuverable, its pilots coming to regard even the F6F Hellcat as an easy kill. Its climb rate was, however, relatively poor for an interceptor, and the engine was unreliable. The later N1K2-J was redesigned to simplify production, and limited numbers entered service early in 1945. A total of 1,435 aircraft of the N1K series were built.

The Nakajima Ki.84 ("Frank") was one of the best Japanese fighters of the war. It entered service late in 1944. The Ki.84 could outmaneuver and outclimb late-model P-51 and P-47 fighters and had excellent maneuverability. It was well armed, strong, and well protected, and it was easy for novice pilots to fly. Production examples were beset with manufacturing faults and engine difficulties, causing performance to suffer, particularly at high altitude. A total of 3,470 Ki.84 aircraft were built.

France

The Dewotine D.520 was designed as a private venture and entered service with the French Air Force in 1940. It was probably the most effective French-designed fighter of the war, shooting down 100-plus enemy aircraft in exchange for 54 losses during the Battle for France. After the fall of France, the D.520 continued in Vichy French service and was encountered by the Allies in Vichy North Africa. A total of 905 were built.

Great Britain

The Hawker Hurricane entered service in 1937 and was the first monoplane fighter of the Royal Air Force (RAF), serving on all fronts. The Hurricane Mk I was the major RAF fighter during the Battle of Britain. On paper it was average, but it had hidden strengths; it was an excellent gun platform and was more maneuverable than the Spitfire. Its controls did not stiffen appreciably

at high speed, and it was strong, able to withstand maneuvers that would literally pull the wings off its contemporaries. Later versions (MK IID, Mk IV) were mainly built as fighter-bombers. A total of 14,233 Hurricanes were built.

The Supermarine Spitfire was an advanced design when the Mk I entered service in 1938 and was able to accept progressively more powerful engines and heavier armament as the war progressed, with only a slight reduction in handling qualities. The “Spit” was fast and maneuverable and was widely regarded as a pilot’s aircraft. In performance terms, it was usually considered superior to its direct opponents, although the FW-190 gave Spitfire Mk V pilots a hard time until the Mk IX redressed the balance in mid-1942. The Spitfire was continuously updated and revised with many specialist high- and low-altitude versions, and the late-war marks had a particularly impressive performance. It remained in production until after the war. A total of 20,351 were built.

A Royal Air Force Supermarine Spitfire fighter over the English countryside in 1939. Produced in greater numbers than any other British aircraft of the war, the “Spit” was certainly one of the best fighter aircrafts. (Bettmann/Corbis)

The Bristol Beaufighter was designed as a private venture using components from the Beaufort torpedo bomber. The Mk IF entered service as a radar-equipped night fighter late in 1940. It operated successfully in Europe, the Western Desert, the Mediterranean, the Far East, and the Pacific as a night fighter, long-range fighter, ground-attack aircraft, and torpedo bomber. It was a big, heavy aircraft with a good performance at low level and a heavy armament. A total of 5,562 Beaufighters were built.

The Hawker Typhoon was rushed into service late in 1941 to combat the German FW-190 threat, but it suffered from teething troubles. Its performance at low altitude was good, particularly its acceleration and dive, but its performance above about 20,000 feet was poor because of its thick wing. The Typhoon was used later in the war as a ground-attack aircraft. The Hawker Tempest appeared early in 1944 and was an aerodynamically cleaner Typhoon with a thinner laminar-flow wing. The Tempest was fast and one of the best late-war fighters. It could be maneuvered easily at high speed and had outstanding dive acceleration and zoom-climb capabilities. It was, however, not easy to fly to its limits. A total of 3,300 Typhoons and 800 Tempests were built.

The De Havilland Mosquito was conceived as a bomber but was also produced in radar-equipped night-fighter and fighter-bomber versions. The NF.II entered service with the RAF in May 1942 and was successful on night-intruder missions; Mosquito night fighters were used over Germany from late 1944 onward and seriously hampered German night-fighter operations. A total of 1,053 Mosquito night fighters of all versions were built; the most numerous fighter version was the FB.VI, of which 2,718 were built.

Soviet Union

The Polikarpov I-16 Rata entered service late in 1934, the first of the new generation of monoplane fighters. More than 450 machines were operationally tested in the Spanish Civil War, and I-16s bore the brunt of the initial German assault on the Soviet Union. The Rata was marginally stable at best but was outstandingly maneuverable; it had a good zoom climb but poor

diving characteristics. Approximately 20,000 were built, the type remaining in service until 1943.

The Yakovlev series of fighters began with the Yak-1 in early 1942. It was fast at low altitude, but both the Yak-1 and the more powerful Yak-7 were slightly short on range. The Yak-9 appeared late in 1942 with a more powerful engine and particularly effective ailerons; it was capable of outturning all its opponents at low altitude. The Yak-3 was a specialized low-altitude fighter, entering service early in 1944. It had excellent performance below about 10,000 feet and was the preferred mount of the Normandie-Niemen Groupe de Chasse. Approximately 30,000 Yak fighters were produced, of which 16,700 were Yak-9s.

The Lavochkin La-5 was a successful adaptation of the problematic LaGG-3 airframe to take a 1,330-hp Shvetsov M-82 radial engine. The La-5 entered service late in 1942 and was an immediate success as a highly maneuverable low-altitude fighter. The more powerful La-5FN appeared in mid-1943; it was faster and lighter with improved controls that gave better handling qualities. It is thought that about 15,000 Lavochkin fighters were built, although the total may well have been nearer 20,000.

United States

The Curtiss P-40 entered service in 1940. The aircraft was based on the Curtiss P-36, which was itself a reasonable fighter; French P-36 variants (Hawk 75A) accounted for approximately 70 percent of French Air Force kills during the May 10–July 11, 1940, Battle for France. The P-40 had reasonable dive acceleration but a poor ceiling and climb. It was average in most departments, its major attribute being that it was available in numbers when required. It was, however, continuously developed until December 1944, when the last of 13,738 P-40s, a P-40N, rolled off the production line.

The Bell P-39 Airacobra entered service in 1941. It was fast at low altitudes and pleasant to fly, but its performance fell away above 12,000 feet. Together with the P-40, the P-39 bore the brunt of the early fighting in the Pacific until later U.S. types appeared. The P-39 was rejected by the RAF but was used with some success as a low-altitude fighter by the Soviet Union, which took more than half the production total of 9,558 machines. The P-39

was used by at least 20 Soviet aces, including Aleksandr Pokryshkin (59 kills) and Grigorii Rechkalov (56 kills).

The Lockheed P-38 Lightning entered service in numbers early in 1942 and was possibly the ultimate long-range tactical fighter of the war. Its long range and twin engines made it the primary U.S. Army Air Forces fighter in the Pacific theater. Not as maneuverable as a single-engine fighter, it was fast with effective armament and an outstanding zoom climb. Compressibility problems handicapped diving maneuvers, however. A total of 9,923 Lightnings were built.

The North American P-51 Mustang was one of the most successful fighters of World War II. Offered to the British Air Purchasing Commission in April 1940 as an alternative to the Curtiss P-40, the P-51A entered service early in 1942. Using the same Allison engine as in the P-40, it was appreciably faster than the P-40 because of its laminar-flow wing and efficient cooling system. It had an excellent dive and zoom climb and was quite maneuverable, but it lacked performance at high altitude. The Mustang’s performance was transformed by the substitution of a 1,620-hp Rolls-Royce Merlin engine in the P-51B, increasing the ceiling by nearly 10,000 feet and providing a marked performance advantage over Luftwaffe piston-engine fighters, particularly above 20,000 feet. A total of 15,686 P-51s were built.

A North American P-51 Mustang. With drop tanks (shown here), the P-51 could accompany bombers to Berlin and back. Fast and highly maneuverable, the P-51 was perhaps the best all-around fighter aircraft of World War II. (U.S. Air Force)

The Republic P-47 Thunderbolt was designed for high-altitude combat and was the heaviest single-engine fighter of the war. Entering service early in 1943, the P-47B was at its best at high speed and altitude. Maneuverability was quite good at high speed, but it became ponderous at lower speeds. Although its climb rate was poor, it had exceptional dive acceleration and was very rugged. The major production model was the P-47D, which had provision for bombs and rockets and was an effective ground-attack aircraft. A total of 15,683 Thunderbolts were built.

Aircraft, Gliders

A glider is an aircraft without an engine that is most often released into flight from an aerial tow aircraft. During World War II, both the Axis and Allied militaries developed gliders to transport troops, supplies, and equipment into battle. Although this technique had been discussed prior to the war, it had not been implemented. Gliders were to land behind enemy lines, often at night, and the men carried by them would then become infantrymen on the ground.

The Germans were first to recognize the potential of gliders in the war, in large part because of extensive pre–World War II scientific research and sporting use. The Germans embraced gliding because it did not violate

military prohibitions in the 1919 Treaty of Versailles. Gliding clubs, which developed in other countries as well, increased interest in gliding worldwide. Sport gliders used air currents to climb and soar for extended periods, while military gliders simply descended on release from aerial tows.

By the late 1930s, Germany had developed a military glider, the DFS-230. Built of plywood, steel, and fabric, it had a wingspan of 68 feet 5.5 inches, a length of 36 feet 10.5 inches, and a height of 8 feet 11.75 inches. It weighed 1,896 pounds empty and had a maximum weight loaded with troops and cargo of 4,630 pounds. A total of 1,022 were produced.

This glider was designed to mount a machine gun, which the crew could use for defense. DFS-230 gliders were employed in the invasion of Belgium and the Netherlands in May 1940, especially in securing Fort Eben Emael (May 10), which was the key to overrunning Belgium. The Germans also used gliders in the invasion of Crete (May 21–June 1, 1941) and during fighting in the Soviet Union in the Battle of Stalingrad (August 23, 1942–February 2, 1943).

The Gotha 242 glider was larger than the DFS-230 and could carry more men. The Gotha 242 had a wingspan of 80 feet 4.5 inches, a length of 51 feet 10 inches, and a height of 14 feet 4.5 inches. It weighed 7,056 pounds empty and 13,665 pounds fully loaded. A total of 1,528 were built, of which 133 were adapted into G0–242s with twin engines. Some were launched by rockets, but most were simply towed by aircraft.

The huge Messerschmitt Me-321 glider had a wingspan of 180 feet 5.5 inches, a length of 92 feet 4.25 inches, and a height of 33 feet 3.4 inches. It weighed 27,432 pounds empty and 75,852 pounds fully loaded. It could perform level flight after rocket-assisted takeoff. A total of 200 were built. The Me-321 could transport 200 troops but was difficult to launch, and most were transformed into the six-engine Me-323.

Great Britain was the first Allied nation to deploy gliders. The Air Ministry’s Glider Committee encouraged the use of the Hotspur to transport soldiers in late 1940. The Hotspur had a wingspan of 61 feet 11 inches, a length of 39 feet 4 inches, and a height of 10 feet 10 inches. It weighed 1,661 pounds empty and 3,598 pounds fully loaded. The Hotspur was designed to transport two crewmen and six soldiers. A total of 1,015 were built.

In 1941, the British developed the Horsa. It had a wingspan of 88 feet, a length of 68 feet, and a height of 20 feet 3 inches. It weighed 8,370 pounds

empty and 15,750 pounds fully loaded. It was capable of carrying 2 crewmen and 25–28 passengers or two trucks. In all, Britain manufactured some 5,000 Horsas. They were employed in Operations OVERLORD (June 6, 1944) and MARKET-GARDEN (September 2–26, 1944).

The largest Allied glider was the British Hamilcar. With a wingspan of 110 feet, a length of 68 feet 6 inches, and a height of 20 feet 3 inches, it weighed 18,000 pounds empty and 36,000 pounds fully loaded. It could transport 40 troops, a light tank, or artillery pieces. A total of 412 were built. The Hamilcar was employed during Operation OVERLORD.

The Soviet Union introduced the A-7 glider in 1939. It had a wingspan of 62 feet 2 inches and a length of 37 feet 7 inches. It weighed 2,000 pounds empty and carried a pilot and eight passengers. A total of 400 were manufactured. The Soviets, however, had few aircraft available for glider tows, and following the German invasion of the Soviet Union, their priority was with other weaponry. They used the A-7 chiefly to transport supplies to partisans working behind German lines.

The U.S. Navy explored the possibility of military applications for gliders as early as the 1930s. In February 1941, chief of the Army Air Corps Major General Henry H. “Hap” Arnold ordered that specifications be drawn up for military gliders. The Waco Aircraft Company in Troy, Ohio, received the first U.S. government contract to build training gliders, and the army began organizing a glider training program.

Constructed of plywood and canvas with a skeleton of steel tubing, the Waco CG-4A had a wingspan of 83 feet 6 inches, a length of 48 feet 4 inches, and a height of 12 feet 7 inches. Its empty weight was 3,300 pounds, and its loaded weight was 7,500 pounds. It could carry 15 troops or 3,800 pounds of cargo, including artillery pieces, a bulldozer, or a jeep. The Ford Motor Company plant at Kingsford, Michigan, manufactured most of the U.S. gliders, although 15 other companies also produced the Waco. In all 13,908 Wacos were built, making it the most heavily produced glider of the entire war by any power.

Because the gliders were so fragile, soldiers dubbed them “canvas coffins.” Men and cargo were loaded through the wide, hinged nose section, which could be quickly opened. Moving at airspeeds of 110–150 mph at an altitude of several thousand feet, C-47s towed the gliders with a 300-foot

rope toward a designated landing zone and then descended to release the glider several hundred feet aboveground.

En route to the release point, the glidermen and plane crew communicated with each other either by a telephone wire secured around the towline or via two-way radios. Glider duty was hazardous indeed; sometimes gliders were released prematurely and did not reach the landing zones, and on occasion gliders collided as they approached their destination.

The U.S. 11th, 13th, 17th, 82nd, and 101st Airborne Divisions were organized with two glider infantry regiments, a glider artillery battalion, and glider support units. U.S. gliders were sent to North Africa in 1942 and participated in the July 9–August 22, 1943, Sicily invasion, accompanied by British gliders. High casualties sustained in that operation led General Dwight D. Eisenhower to question the organization of airborne divisions and threaten to disband glider units. A review board of officers convinced the military authorities to retain them, however. Improvements were also made in structural reinforcement of the glider and in personnel training.

A U.S. Waco CG-4A glider with a Griswold Corey nose skid, seen here under tow. (Corbis)

By mid-1944, gliders had become essential elements of Allied invasion forces. Occasionally they were used to transport wounded to hospitals. During the invasion of Normandy that began in June 6, 1944, U.S. glidermen with the 82nd and 101st Airborne Divisions flew across the English Channel in 2,100 gliders to participate in the D-day attack. Many gliders and crews

were lost during that mission. New gliders were manufactured for Operation MARKET-GARDEN, the assault on the Germans in the Netherlands, three months later.

Initially, the military did not authorize hazardous-duty pay for glidermen. These soldiers also did not qualify for wing insignia worn by parachutists. Some of the men created posters; one read "Join the Glider Troops! No Jump Pay. No Flight Pay. But Never A Dull Moment." By July 1944, glider wings were authorized for glider soldiers, and they received hazardous-duty pay. Also in 1944, the modified Waco CG-15A appeared, offering improved crash absorption. The Waco CG-18A could carry 30 soldiers and was deployed during the 1945 Rhine campaign.

Gliders were also used in the Pacific and China-Burma-India theaters. The final U.S. glider mission of the war occurred on Luzon Island in the Philippines in June 1945. In July, IX Troop Carrier Command commander Brigadier General Paul L. Williams issued an order to grant the Air Medal to Normandy glider pilot veterans. Gliders were gradually phased out of military inventories after the war, although the Soviets retained them through the 1950s.

Aircraft, Jet and Rocket

Aircraft propelled by gas turbines or rocket engines. Compared to the piston engine, the gas turbine (or jet engine) (see Table 1) promised to offer unrivaled power-to-weight ratios, provided that the metallurgical, mechanical, and aerodynamic design problems could be solved.

While still a Royal Air Force cadet in 1928, Frank Whittle argued that the gas turbine was a practical power unit. He continued to work on the idea and formed his own company, Power Jets, in 1935. In Germany, Hans-Joachim Pabst von Ohain developed a jet engine that first ran in 1937, flying it in a Heinkel 178 test aircraft in August 1939. Whittle's prototype engine flew in the Gloster E28/39 in May 1941.

The Germans also experimented with rocket fighters, with the Messerschmitt Me-163 entering service in June 1944 against U.S. bombers. The Me-163 had an incredible climb but used a highly corrosive fuel that was inclined toward instability, and many pilots were lost in landing accidents. Fewer than 50 Me-163s were operational at any one time; they had limited success, but their effect was mainly psychological.

The first operational jet fighter was the British Gloster Meteor, which entered service in July 1944. The Meteor I was distinctly underpowered and had serious limitations as a fighter, being difficult to control at speeds greater than Mach 0.67. It was armed with four 20mm cannon. All World War II jet and rocket aircraft had compressibility problems at high speeds and were generally slow to accelerate at low speeds, but they were much better than propeller-driven rivals at high speed, easily outclassing them in acceleration and zoom climb.

The German Messerschmitt Me-262 first flew on jet power in July 1942 and also entered operational service in July 1944, but it was a much better fighter than the Meteor. Like most jets, it was vulnerable during landing and takeoff. It was armed with four 30mm cannons. A total of 1,200 were built, but only about 200 entered squadron service.

The Heinkel He-162 jet fighter utilized nonstrategic materials and required an experienced pilot during takeoff and landing. Armed with two 20mm cannons, it was prone to catastrophic structural failure if carelessly handled. A handful of He-162s became operational in April 1945.

Table 1. Jet and Rocket Aircraft Specifications

Plane	*In Service*	*Engine*	*Span*	*Length*	*Wing Area*	*Normal Takeoff Weight*	*Maximum Speed*	*Combat Ceiling (500 ft/min)*	*Range**	*Armament/ Payload*
Messerschmitt Me-163B-1 (mid 1944)	Mid-1944	1 × 3,748 lb thrust Walter Liquid rocket	30 ft, 7.5 in.	19 ft, 2.5 in.	199.0 sq ft	9,502 lb	597 mph at 29,500 ft	37,500 ft (estimated)	80 miles (estimated)	2 × 30 mm MK 108 cannon
Gloster Meteor Mk I (mid 1944)	Mid-1944	2 × 1,700 lb thrust Rolls-Royce Welland turbojet	43 ft, 0 in.	41 ft, 3 in.	374.0 sq ft	11,800 lb	410 mph at 30,000 ft	37,500 ft	750 miles (estimated)	4 × 20 mm Hispano cannon
Messerschmitt Me-262A-1a (mid-1944)	Mid-1944	2 × 1,984 lb thrust Junkers Jumo turbojet	40 ft, 11.5 in.	34 ft, 9.5 in.	233.6 sq ft	14,101 lb	541 mph at 19,685 ft	35,000 ft	652 miles	4 × 30 mm MK 108 cannon
Arado Ar-234B (late 1944)	Mid-1944	2 × 1,984 lb thrust Junkers Jumo turbojet	46 ft, 3.5 in.	41 ft, 5.5 in.	284.0 sq ft	20,870 lb	461 mph at 19,500 ft	30,000 ft (estimated)	1,012 miles	Typically, 1 × 1,102 lb or 2 × 551 lb bombs
Yokosuka Ohka (early 1945)	Early 1945	3 × 588 lb thrust Type 4 solid rocket	16 ft, 9.75 in.	19 ft, 10.75 in.	64.6 sq ft	4,720 lb	534 mph at sea level	not applicable	37 miles maximum	Nose-mounted warhead of 2,646 lb
Heinkel He-162A-2 (early 1945)	Early 1945	1 × 1,764 lb thrust BMW 003 turbojet	23 ft, 7.5 in.	29 ft, 8.5 in.	120.6 sq ft	6,184 lb	562 mph at 19,690 ft	34,500 ft (estimated)	385 miles	2 × 20 mm MG 151 cannon

*Range is maximum flyable distance on internal fuel, including reserves. Combat radius for jet aircraft would typically be 30 to 35 percent of this value at high altitude, 15 to 18 percent if at sea level.

Source: Eric M. Brown, *Wings of the Luftwaffe* (Shrewsbury, UK: Airlife, 1993); Jeffrey Ethell, and Alfred Price, *World War II Fighting Jets* (Shrewsbury, UK: Airlife, 1994); and Philip Jarrett, ed., *Aircraft of the Second World War* (London: G. P. Putnam, 1997).

The German Arado 234 “Blitz” was the world’s first jet bomber. A prototype flew for the first time in June 1943, but delays in securing its engines meant that it did not enter service—and then, in only limited numbers

as a reconnaissance variant—until August 1944. The first bomber version was operational in December 1944. A total of 210 were built.

The Japanese also built such aircraft. Their Yokosuka Ohka MXY 7 Oka ("Cherry Blossom"), produced at the Yokosuka Naval Arsenal, was essentially a rocket-propelled, man-guided missile, carried to the target area under a specially converted Mitsubishi G4M Betty bomber. Once the pilot was in position, the canopy was sealed shut. Employed in combat from March 1945, most of these planes were shot down by Allied navy fighters, although one did sink the U.S. destroyer *Monnert L. Abele* in April.

The Bell P-59 Aircomet was the only jet aircraft of the U.S. Army Air Forces to see combat in the war. The twin-engine, straight-wing P-59 flew for the first time in October 1942. It had a top speed of only 400 mph and offered few advantages over the piston-powered U.S. aircraft then in service. Fifty production models were initially deployed with the 412th Fighter Group in 1945. Although the P-59 proved to be a valuable testing platform, the first mass-produced U.S. jet fighter was the Lockheed P-80 Shooting Star. Utilizing the British H-1 turbojet engine, it first flew in January 1944 and exceeded 500 mph on its first flight. The U.S. Army ordered 5,000 P-80s, but with the end of the war, production was scaled back to 917 aircraft. Ultimately, 1,714 were built.

Aircraft, Lighter-Than-Air

Lighter-than-air (LTA) craft included barrage balloons, blimps, dirigibles, and zeppelins. A number of disasters during the interwar period, combined

with ever-advancing airplane technology, caused most nations to move away from using LTA craft for military purposes by World War II. The U.S. Navy lost three dirigibles between the wars: the *Shenandoah* (1923) and *Akron* (1933), both due to adverse weather, and the *Macon* (1935), due to structural failure.

Many countries employed barrage balloons in defending cities or military installations against low-level air attacks. The British staged some 450 large kite balloons around London that were sent aloft while trailing large steel cables that had to be avoided by incoming aircraft. British sources claimed 200-plus kills of German V-1 buzz bombs from these barrage balloons. The Soviet Union employed similar technology against German air attacks.

During World War I and in the interwar period, the United States tried several types of LTA technology with varying degrees of success. By 1939, the U.S. Navy had determined that rigid airships were not effective in military applications.

Nonrigid airships, or blimps, saw the most extensive wartime use. The navy registered 167 blimps, most of which were used to patrol the North American coastline or as long-range air support for convoys in the Atlantic and Mediterranean. Of more than 89,000 total ships escorted by blimps in convoy in two world wars, only 1, the tanker *Persephone*, was lost (May 25, 1942) while under airship protection. LTA craft could patrol in more varieties of weather than airplanes could and were capable of remaining aloft far longer; however, they had extremely limited offensive uses. No submarine kills by blimps have been confirmed, but the blimps were an effective deterrent, forcing the submarines to stay submerged and inactive.

Three different types of blimps were employed during World War II by the U.S. Navy. The G-series came from the navy's 1935 purchase of the Goodyear *Defender*. The next seven G-series airships held six crewmen, measured 192 feet in length and 45 feet in diameter, and had a volume of 196,000 cubic feet and a speed of 60 mph. The K-series comprised the majority of the Navy's LTA fleet. These blimps housed a 12-man crew, measured 251.7 feet in length and 62.5 feet in diameter, and had a volume of 425,000 cubic feet; they had a top speed of 75 mph and a range of 2,000 miles.

Only a few M-Series craft were built. They had distinctive 117-foot-long cars. These held 10-plus crewmen, had a volume of 647,000 cubic feet

(refurbished to 725,000 cubic feet), and a top speed of 75 mph. These craft were posted along both U.S. coasts and in the South Atlantic, the Caribbean, and the Mediterranean.

In the postwar years, LTA technology was never again so widely employed in military use. By the 1960s, nearly all LTA craft were retired from military service.

Aircraft, Naval

Most naval aircraft fall into one of four main classifications: spotters, patrol aircraft, land-based attack aircraft, and carrier-based aircraft. Battleships and cruisers usually carried catapult-launched spotter aircraft to correct gunfire against enemy vessels or shore targets. Most spotter aircraft tended to be relatively slow floatplanes (e.g., the Mitsubishi F1M2 [“Pete” in the Allied identification system] and the Vought OS2U Kingfisher) because the design parameters were restricted by the launch and recovery mechanism. These aircraft were also useful in search and rescue missions.

Patrol aircraft were designed to keep track of enemy ships and—in some cases—to attack small vessels such as submarines. The major performance requirements for patrol aircraft were range and endurance; the sea covers a vast area, and an enemy fleet occupied a relatively tiny part of it, so the abilities to search large areas and remain on station for a long time were important. Flying boats were widely used as patrol aircraft (e.g., the Consolidated PBY Catalina, Kawanishi H8K, and Short Sunderland), but land-based patrollers with longer ranges (e.g., Lockheed Hudson, Ventura,

and Consolidated B-24 Liberator) were used toward the latter part of the war, initially to patrol colder areas such as the Aleutians and Iceland, where flying boats found operation difficult.

Land-based attack aircraft were employed by most combatants and were sometimes successful, provided that they employed special antiship attack techniques. Torpedo-bombing was probably the most effective form of attack, but results varied depending on the efficiency of the weapon. American torpedoes suffered from a number of problems and were largely ineffective until the second half of 1943, whereas the Japanese 18-inch “Long Lance” torpedo was extremely effective with a large warhead. Italian, German, and British torpedoes were all moderately effective. Dive-bombing and skip-bombing were also effective, but attacks by high-level bombers were universally unsuccessful against moving ships, as the target vessel had plenty of time to take evasive action.

Great Britain employed purpose-designed torpedo attack aircraft (the Beaufort and Beaufighter). The United States mainly used conversions of existing aircraft as torpedo carriers (the B-25 Mitchell and B-26 Marauder) but usually employed skip-bombing rather than torpedoes. Medium bombers were also used as torpedo-aircraft by Japan (the GM-4 “Betty”), Germany (He-111H), Italy (SM.79), and the Soviet Union (Ilyushin DB-3T/Il-4). German and Japanese bombers were particularly effective.

Two specialized torpedo bombers were widely used during World War II: the Italian Savoia-Marchetti SM.79 and the Bristol Beaufort. The Italian Savoia-Marchetti SM.79, originally designed as a commercial transport, was adapted for use as a bomber when its excellent performance became known. The SM.79-I entered service in 1936 and was used with some success during the 1936–1939 Spanish Civil War. The more powerful SM.79-II was employed throughout World War II in the Mediterranean theater as a torpedo bomber (carrying two 17.7-inch torpedoes), a medium bomber, reconnaissance aircraft, close-support aircraft, and transport/training aircraft. A total of 1,330 were built between 1936 and 1944.

The Bristol Beaufort was the standard British land-based torpedo bomber until it was replaced by the Bristol Beaufighter TF.X in 1943. Entering service late in 1939, the Beaufort was also used for bombing and mine-laying operations. It was reasonably successful although occasionally ineffective

because of malfunctioning torpedoes. A total of 1,429 were built in the United Kingdom, and 700 were built under license in Australia.

Flying an aircraft off and onto an aircraft carrier places many more stresses and strains on the aircraft's structure than comparable activities on land. As a consequence, carrier-based aircraft were generally heavier and more robust—and thus slower and less maneuverable (at least in theory)—than their land-based counterparts. Parts of their structure usually folded to allow the aircraft to be taken below to the hangar, further increasing the weight. On top of that, landing characteristics had to be superior, which required a light wing loading, large flaps, good stall behavior, and a compliant undercarriage. Combining all of these characteristics in a single aircraft was not easy; many of the aircraft that served on carrier decks during World War II had flaws.

Of the major combatants, only the United States, Japan, and Great Britain had aircraft carriers, and each had a different approach to design of carrier-based aircraft (see Tables 1, 2, and 3 for carrier-based attack aircraft, fighters, and bombers, respectively).

United States

In 1941, the United States had several large carriers and well-organized carrier operational procedures; it used scout/dive-bombers (SBD Dauntless), torpedo/level bombers (TBD-1 Devastator), and fighters (F4F Wildcat). Generally speaking, U.S. carrier aircraft were rugged and quite suitable for maritime use. The Douglas TDB-1 Devastator carrier-based torpedo bomber entered service late in 1937 and was largely obsolete when the United States entered the war. Its combat career was terminated by the June 3–6, 1942, Battle of Midway, where it proved vulnerable to fighter attack while unescorted. A total of 129 TBD-1s were built.

The Douglas SBD Dauntless entered service with the U.S. Marine Corps in mid-1940 and with the U.S. Navy later in 1940. It was the standard navy carrier-borne dive-bomber in December 1941. Operationally, the Dauntless

was successful and could absorb a lot of battle damage, having the lowest attrition rate of any U.S. carrier aircraft in the Pacific theater. It played a major part in the Battle of the Coral Sea (May 7–8, 1942) and the Battle of Midway and later flew off escort carriers on antisubmarine and close-support missions. A total of 5,936 Dauntless were built.

The Grumman F4F Wildcat entered service with the Royal Navy late in 1940 and became operational with the U.S. Marine Corps and the U.S. Navy at the beginning of 1941. The F4F-3 was the standard navy shipboard fighter when the United States entered the war and was generally inferior to the Japanese A6M2 Zero in performance and maneuverability. The F4F was rugged and had good dive performance, however, giving a good account of itself when using the correct tactics. Later in the war, the Wildcat gave sterling service on escort carriers. Approximately 8,000 Wildcats were built.

The Grumman TBF Avenger first flew in August 1941 and became the standard navy carrier-based torpedo bomber. It entered service in mid-1942 in time for the Battle of Midway. It could take a lot of punishment, and although it was not very maneuverable, it was easy to land on a deck. A total of 9,836 Avengers were built; most served with the U.S. Navy, but 958 were supplied to the Royal Navy.

The Curtiss SB2 Helldiver was the most successful carrier-based dive-bomber in U.S. Navy service, in spite of its handling faults and a reputation for structural weakness. Entering service early in 1943, its first major action was the Rabaul Campaign during November 2–11, 1943, and it took part in almost every major naval/air action during the remainder of the war. The navy was the major user of the Helldiver, although some were flown by the

U.S. Marine Corps and the Royal Navy. A total of 7,200 Helldivers were built in the United States and Canada.

The Vought F4U Corsair entered service with the Marine Corps early in 1943; it was not an easy aircraft to deck-land and was initially rejected by the U.S. Navy in favor of the Hellcat. The gull-winged F4U operated from land bases in the Pacific and flew off Royal Navy carriers from late 1943. The Corsair was a good fighter, convincingly superior in performance to the Mitsubishi Zero and much better than the North American P-51B Mustang below about 20,000 feet. Eventually the Corsair matured into a reasonable deck-landing aircraft, and it began to supplant the F6F Hellcat as the standard U.S. Navy carrier fighter by the end of the war. It saw extensive service after the war and continued in production until 1952. A total of 12,571 were built.

The Grumman F6F Hellcat entered service early in 1943. It was the most successful carrier-based fighter of the war, accounting for 76 percent of enemy aircraft destroyed by U.S. Navy carrier pilots. It was extremely rugged and had much better speed and dive capabilities than the Mitsubishi Zero, which it could normally beat in an even fight. Many of the U.S. Navy aces flew Hellcats. The Hellcat was also employed with some success at night; approximately 1,300 of the 12,272 produced were dedicated radar-equipped night-fighter versions.

Japan

The Imperial Japanese Navy (IJN) had several carriers at the start of the war, the air groups of which were weighted toward attack aircraft rather than fighters. Its aircraft were lightly built and had very long range, but this advantage was usually purchased at the expense of vulnerability to enemy fire. The skill of Japanese aviators tended to exaggerate the effectiveness of the IJN’s aircraft, and pilot quality fell off as experienced crews were shot down during the Battle of Midway and the August 1942–February 1943 Solomon Islands Campaign.

A Curtiss SB2C Helldiver dive bomber in upper landing circle above the aircraft carrier *Yorktown* in July 1944. (National Archives)

The Nakajima B5N ("Kate" in the Allied designator system) first entered service in 1937 as a carrier-based attack bomber, with the B5N2 torpedo bomber appearing in 1940. The B5N had good handling and deck-landing characteristics and was operationally successful in the early part of the war. Large numbers of the B5N participated in the June–August 1944 Mariana Islands Campaign, and it was employed as a suicide aircraft toward the end of the war. Approximately 1,200 B5Ns were built.

The Aichi D3A ("Val") carrier-based dive-bomber entered service in mid-1940 and became the standard IJN dive-bomber. It was an effective bomber, capable of putting up a creditable fight after dropping its bomb load. It participated in the attack on Pearl Harbor and the major Pacific campaigns, including Santa Cruz (October 26–27, 1942), Midway, and the Solomon Islands. Increasing losses during the second half of the war took their toll, and the D3A was used on suicide missions later in the war. Approximately 1,495 D3As were built.

When it first appeared in mid-1940, the Mitsubishi A6M Zero was the first carrier-based fighter capable of beating its land-based counterparts. It was well armed and had truly exceptional maneuverability below about 220 mph. Its capabilities came as an unpleasant shock to U.S. and British forces.

It achieved this exceptional performance at the expense of resistance to enemy fire, with a light structure and no armor or self-sealing tanks. Its Achilles' heel was the stiffness of its controls at high speed, with control response being almost nil at indicated airspeed over 300 mph. The Zero underwent continued development throughout the war, with a total of 10,449 being built.

The Nakajima B6N ("Jill") carrier-based torpedo bomber entered service late in 1943 and was intended to replace the B5N, but the initial B6N1 was plagued with engine troubles. The B6N2 with a Mitsubishi engine was the major production model, appearing early in 1944. Overall, it was better than its predecessor but not particularly easy to deck-land. It participated in the Marianas Campaign and was encountered throughout the Pacific until the end of the war. A total of 1,268 were built.

The Yokosuka D4Y ("Judy") reconnaissance/dive-bomber entered service on Japanese carriers early in 1943 and was fast for a bomber. Initially assigned to reconnaissance units, it was intended to replace the D3A, but it was insufficiently armed and protected and suffered from structural weakness in dives. In common with most other Japanese aircraft, it was used for kamikaze attacks, and a D4Y carried out the last kamikaze attack of the war on August 15, 1945. A total of 2,819 D4Ys were built.

The motion of its props causes an "aura" to form around this U.S. Navy Grumman F6F Hellcat on the carrier *Yorktown*. Rapid change of pressure and drop in temperature create condensation. Rotating with

the blades, the halo moves aft, giving depth and perspective. November 1943. (National Archives)

Great Britain

During the 1930s, Great Britain had a limited number of air assets with which to patrol a far-flung empire; the Admiralty was therefore obliged to buy multirole aircraft and accept the inevitable compromises in performance. The Royal Navy entered the war with low-performing aircraft, and its efforts to introduce better aircraft were compromised by conflicts in engine supply. In 1943 it was only too pleased to have the use of F4U Corsairs that were surplus to the requirements of the U.S. Navy.

The Fairey Swordfish carrier-based torpedo/spotter/reconnaissance aircraft entered service late in 1936 and participated in the night raid on Taranto (November 11, 1940), the Battle of Cape Matapan (March 28, 1941), and the sinking of the *Bismarck* on May 27, 1941. It was slow but astonishingly agile, with excellent flying qualities. Easy to deck-land, it was a natural choice for use on Atlantic convoy escort carriers. It remained in service until mid-1945, outlasting its replacement (the Fairey Albacore). A total of 2,391 Swordfish were built.

The Blackburn Skua came on line late in 1938 as a carrier-based fighter/dive-bomber. It was not easy to deck-land and had poor stall characteristics, but it was an effective dive-bomber, sinking the German cruiser *Königsberg* in Bergen Harbor in April 1940. A total of 190 were built.

The Fairey Albacore carrier-based torpedo/dive-bomber/reconnaissance aircraft entered service as a replacement for the Swordfish early in 1940 and took part in many of the Middle East operations. The Albacore had only a slightly better performance than the Swordfish and few redeeming features, and its service with the Royal Navy ended late in 1943. A total of 800 were built.

The two-seat Fairey Fulmar carrier fighter entered service in mid-1940 and was principally designed to combat unescorted bombers and maritime patrol aircraft. It had adequate range but was underpowered, and its performance was insufficient to deal with contemporary fighters. Nevertheless, it filled a gap until better aircraft became available. A total of 600 were built.

The Hawker Sea Hurricane was first used on catapult-assisted merchantmen (CAM) ships during early 1941. Many were conversions of existing land-based fighters. Sea Hurricanes were operational on carriers from late 1941; they were maneuverable and well armed but usually had a lower performance than their adversaries. Approximately 800 Sea Hurricanes were built or converted.

The Supermarine Seafire was an adaptation of the land-based Supermarine Spitfire VB fighter. When it appeared in mid-1942, it was the fastest operational carrier fighter in the world, but it was difficult to deck-land and not sufficiently robust for use at sea. Later versions were effective at low altitude, the Seafire LIIC having an outstanding climb and roll performance. Approximately 1,900 were built or converted before the end of the war.

The Fairey Barracuda carrier-based dive/torpedo bomber entered service early in 1943. It was usually used as a dive-bomber and was not popular with its crews; its performance was mediocre and its defensive armament poor. It was, however, a reasonably good dive-bomber and easy to deck-land. A total of 1,718 were built.

Aircraft, Production of

Key aspect of World War II industrial production that tipped the scales in the air war decisively in favor of the Allied powers. Although Germany and

Japan entered the war with advantages in numbers and quality of aircraft because they had begun military rearmament earlier than the Allies, the combined industrial potential of the Allies far exceeded that of the Axis nations. Even though Axis aircraft production increased during the course of the war, it paled in comparison to that of the Allies, especially the United States. To the extent that World War II was a total war that depended on industrial output, the Allied advantage in manpower and industry ultimately proved decisive, and aircraft production is a key indicator of that advantage (see Table 1).

Axis Powers

Although Germany had entered the war in September 1939 as the world's leading airpower, with 4,840 frontline aircraft and an aircraft industry producing 1,000 airplanes a month, the Luftwaffe's arsenal had serious defects. Germany had never developed a satisfactory long-range bomber, in part because the German military's focus on blitzkrieg (lightning war) emphasized production of medium-range bombers and ground-attack aircraft, which had proven so successful in the 1936–1939 Spanish Civil War.

Germany's defeat in the Battle of Britain (July 10–September 30, 1940) revealed the flaw of this policy from a strategic standpoint, as aircraft such as the Heinkel He-111, the Dornier Do-17, and the Junkers Ju-87 proved ineffective against technologically advanced British fighters. Likewise, Germany's lack of long-range bombers prevented it from conducting long-range air operations at sea or later striking manufacturing centers that had been relocated deep within the Soviet Union.

Despite the damage inflicted by the Allied air campaign, the German armaments industry, ably led by Fritz Todt and Albert Speer, not only managed to increase production from 8,295 aircraft in 1939 to 39,807 in 1944 but also introduced the world's first jet fighter, the Messerschmitt Me-262, in the second half of 1944. These successes, however, proved too little and too late to make a difference, and the Allies had unquestioned air supremacy in the last two years of the war.

Japan also entered the war with a powerful air arm, which included some 2,900 combat-ready aircraft on December 7, 1941, the day Japanese air assets attacked Pearl Harbor. Yet Pearl Harbor was a desperate gamble designed to

cripple the U.S. Navy and purchase time for Japan to build a defensive perimeter before U.S. industrial might reached heights that Japanese leaders knew their country could never equal. Japanese industry produced just 5,088 aircraft in 1941, compared with 26,277 for the United States.

Failure to destroy the U.S. carriers in the surprise attack on Pearl Harbor was a clear strategic failure for Japan. Once it lost the Battle of Midway (June 3–6, 1942), Japan was forced into a defensive war in which it could not compete with the American war machine. Despite Allied attacks that crippled its shipping industry and weakened its industrial infrastructure, Japan still managed to produce 28,180 aircraft in 1944, a testament to the perseverance of its workers on the home front. That the United States produced 96,318 aircraft during the same year is proof of the futility of Japan's challenge to American industrial might.

Table 1. Aircraft Production in World War II

	Axis Powers			
Year	*Germany*	*Japan*	*Italy*	*Axis Totals by Year*
1939	8,295	4,467	1,692	14,454
1940	10,826	4,768	2,142	17,736
1941	11,776	5,088	3,503	20,367
1942	15,556	8,861	2,818	27,235
1943	25,527	16,693	967	43,187
1944	39,807	28,180	x	67,987
1945	7,544	8,263	x	15,807
Axis totals (all years)	119,331	76,320	11,122	206,773

	Allied Powers			
Year	*Great Britain*	*Soviet Union*	*United States*	*Allied Totals by Year*
1939	7,940	10,382	5,856	24,178
1940	15,049	10,565	12,804	38,418
1941	20,094	17,735	26,277	64,106

1942	23,673	25,436	47,836	96,945

Although Italy's Benito Mussolini had built a powerful air force in the late 1920s and early 1930s, by the beginning of World War II in September 1939, Italy's air force was largely obsolete. This decline was in part a reflection of Italy's weak economy. When Italy joined the war on June 10, 1940, barely half of its 3,296 aircraft were of combat quality. While assistance from Germany (particularly in supplying aircraft engines) allowed the Italian aircraft industry to make modest increases from 2,142 aircraft produced in 1940 to 3,503 aircraft in 1941, Italy's weak industrial sector could not withstand the impact of the Allied bombing campaign, and production dropped to 2,818 aircraft in 1942 and just 967 aircraft by the time Italy switched sides in September 1943.

Allied Powers

Although Germany enjoyed a great lead in the number of combat-ready aircraft at the start of the war, Great Britain had an advantage in that its industry was in the process of introducing aircraft such as the Hawker Hurricane and Supermarine Spitfire that were more technologically advanced than their German counterparts. This qualitative advantage proved critical to defeating Germany in the Battle of Britain.

Secure from the threat of German invasion, British industry succeeded not only in increasing productive capacity with each passing year of the war but also in introducing aircraft such as the Handley Page Halifax and the Avro Lancaster that played a critical role in the Allied bombing campaign against Germany. Great Britain's highest annual production total reached 26,461 aircraft in 1944, compared with 39,807 aircraft for Germany that year. Nevertheless, Great Britain's overall production of 131,550 aircraft during the war exceeded that of Germany, which produced 119,331 aircraft.

The Soviet Union possessed large numbers of aircraft at the outbreak of the war, but most were inferior to their German counterparts. Making matters worse, when Germany launched its invasion of the Soviet Union on June 22, 1941, it destroyed 1,200 Soviet aircraft in the first nine hours of the attack. The Soviet Union managed not only to sustain this loss but also to recover because of its monumental efforts in transferring industries eastward, beyond the reach of Germany's army and air force.

In the first three months after the German invasion, the Soviet Union relocated 1,523 factories. The primary production line for the Yakovlev Yak-1, for example, was moved more than 1,000 miles and returned to production in less than six weeks. The success of these efforts allowed the Soviet Union to exceed German production for each year of the war, including 1941, for a total of 159,261 Soviet aircraft compared with 119,331 German aircraft.

In 1939 the U.S. economy was still suffering from the effects of the Great Depression, with 8.9 million unemployed workers. The success of the German blitzkrieg against Western Europe in 1940 spurred the American war machine into action. The Burke-Wadsworth Act of September 16, 1940, introduced peacetime conscription for the first time in American history, and massive military spending got the American economy working again. Unlike Germany and Japan, the United States not only had a large population base and abundant natural resources that could be mobilized for production but also enjoyed an industrial infrastructure far removed from its enemies. By 1944, 18.7 million Americans, approximately 50 percent of whom were women, had entered the American workforce.

Long lines of A-20 attack bombers roll ceaselessly off the assembly line, night and day, through the Douglas Aircraft plant at Long Beach, California, in October 1942. (Franklin D. Roosevelt Library)

Of all of their industrial achievements, none was more spectacular than aircraft production. From just 5,856 aircraft produced in 1939, the United States would produce the staggering total of 96,318 in 1944—almost one-third more than that produced by Germany and Japan combined for that year. For the war years as a whole, the United States manufactured 324,750 aircraft, compared with a combined total of 206,773 for Germany, Japan, and Italy. The U.S. output, combined with that of the British and the Soviet Union, gave the Allies an advantage greater than three to one, with 615,561 aircraft. With such an advantage, it is little wonder then that the Allies won the war in the air.

Aircraft, Reconnaissance and Auxiliary

Aircraft that provide support for land, sea, and air forces. From the beginning of military aviation, air reconnaissance of enemy positions and movements has been crucial not only for defense against attack but also in preparation for offensive action. Just as improvements in aviation technology during the 1920s and 1930s greatly expanded the capabilities of fighters and bombers by the beginning of World War II, the same was true of reconnaissance and auxiliary aircraft. High-altitude photoreconnaissance was crucial to successful planning for military invasions such as the Normandy landings on June 6, 1944. Long-range reconnaissance was also crucial for naval operations in the Atlantic and Pacific.

Three main types of reconnaissance and auxiliary aircraft were employed during World War II: land-based aircraft, floatplanes, and flying boats designed to conduct reconnaissance missions; army cooperation aircraft designed for multipurpose roles such as liaison or tactical support; and training aircraft designed to train pilots and crewmen for service.

In addition to aircraft specially designed for reconnaissance or auxiliary service, numerous bombers and fighters were either converted to take on these roles or were relegated to these purposes after becoming obsolete in their intended roles. Such aircraft include France’s Bloch 131 and Latécoère Laté 298; Germany’s Arado Ar 234 Blitz, Junkers Ju-86, Ju-88, and Ju-188 and the Messerschmitt Me-210; Great Britain’s De Havilland Mosquito, Fairey Swordfish, Supermarine Spitfire, and Vickers Wellington; Italy’s Cant

Z. 506 Airone and Savoia-Marchetti S.M.79; Japan's Yokosuka D4Y Suisei; Poland's PZL P.23 Karas; the Soviet Union's Petlyakov Pe-2; and the U.S. Lockheed Hudson, Martin Maryland, and North American P-51 Mustang.

The following describes the most significant aircraft employed primarily for reconnaissance and auxiliary purposes by both sides during World War II (see also Table 1).

Germany

Entering service in September 1940, the twin-engine, three-seat Focke-Wulf Fw-189 Uhu (Owl) served as the primary tactical reconnaissance aircraft of the German Army, especially on the Eastern Front. Although its maximum range of 584 miles limited it to tactical reconnaissance, its rugged construction enabled it to absorb heavy punishment from antiaircraft fire, and its armament of three to four 7.9mm machine guns afforded protection from Soviet fighters. These qualities also allowed it to provide close support for German troops on the ground. A total of 894 were produced.

Introduced in August 1939, the single-engine, two-seat Arado Ar. 196 proved to be one of the most versatile reconnaissance seaplanes in the German Navy's arsenal. Designed as a catapult-launched aircraft, it was carried aboard Germany's major capital ships to provide reconnaissance at sea. It also conducted coastal and maritime patrol, antisubmarine hunting, and convoy escort operations in the North Sea, the English Channel, and the Bay of Biscay while operating out of coastal bases. A total of 546 were produced.

Germany relied during the war on three flying boats for reconnaissance and auxiliary purposes. Originally designed for passenger service by Hamburger Flugzeugbau, the three-engine, six-seat Blohm und Voss Bv-138, of which 279 were constructed, entered military service in late 1940. With a maximum range of 2,500 miles, the Bv-138 was capable of remaining aloft for up to 18 hours, enabling it to conduct long-range patrols in the North Atlantic, where it reported the positions of Allied convoys to German U-boats.

Fredriksen, *Warbirds: An Illustrated Guide to U.S. Military Aircraft, 1914–2000* (Santa Barbara, CA: ABC-CLIO, 1999); John C. Fredriksen, *International Warbirds: An Illustrated Guide to World Military Aircraft, 1914–2000* (Santa Barbara, CA: ABC-CLIO, 2001); and Stewart Wilson, *Aircraft of WWII* (Fyshwick, Australia: Aerospace Publications, 1998).

Designed prior to the war as a transatlantic mail carrier, the twin-engine, four- or five-seat Dornier Do-18, of which 152 were constructed, was quickly adopted for military use when Germany began its rearmament program and was used primarily in the Baltic and the North Sea for maritime patrol and air-sea rescue operations. Larger, faster, and possessing greater range than the Do-18, the three-engine, six-seat Dornier Do-24, of which 294 were constructed, entered service in 1937. In addition to maritime patrol and air-sea rescue operations, it served as a transport and troop evacuation aircraft.

The two-seat Fieseler Fi-156 Storch and Henschel Hs-126 were small light aircraft that served effectively as army cooperation and utility aircraft. Noted for its short takeoff and landing capabilities—it required just 213 feet for takeoff and just 61 feet for landing—the Fi-156 Storch (Stork) was a liaison and staff transport, air ambulance, and tactical reconnaissance aircraft. It was also used in the daring rescue by the Germans of Benito Mussolini in September 1943. A total of 2,834 were produced by war's end.

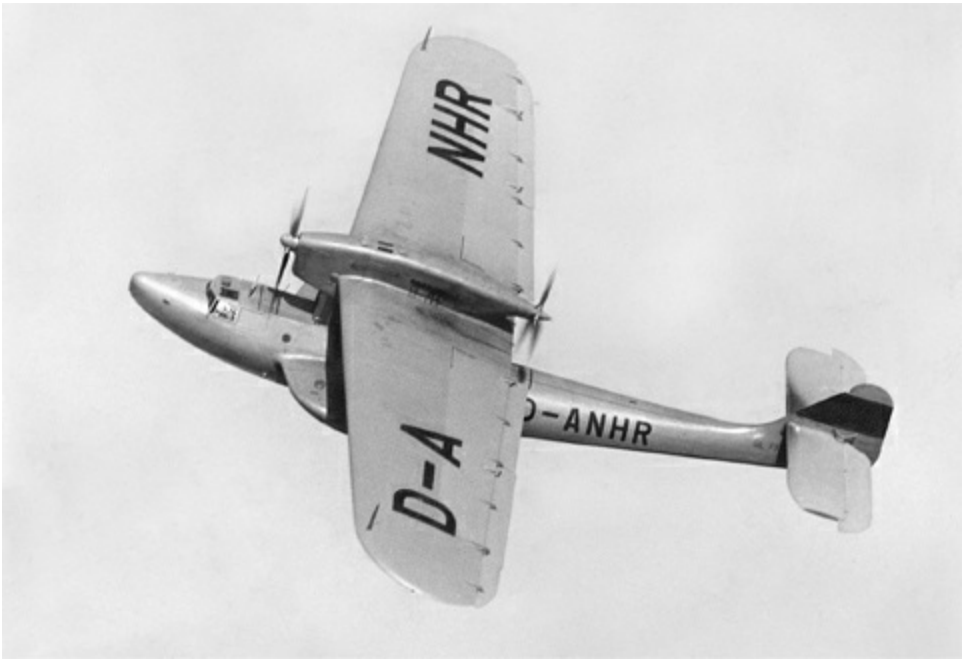
The Hs-126 had proved its usefulness in the Kondor Legion during the 1936–1939 Spanish Civil War in tactical reconnaissance, as an artillery spotter, and for strafing enemy positions. It continued in these roles in the

early stages of World War II until it was withdrawn from frontline service by early 1943. A total of 803 were produced.

Introduced in 1939, the two-seat Arado Ar-96 was the Luftwaffe's primary trainer throughout the war. Its unarmed version served as a basic trainer, while its armed version (with a single 7.9mm machine gun) served as an advanced trainer. It also performed other auxiliary roles, such as liaison transport, glider towing, and reconnaissance. A total of 11,546 were produced.

Great Britain

Designed in 1935, the twin-engine Avro Anson entered service with the Royal Air Force (RAF) in 1936 as an armed coastal patrol aircraft. While it continued in that role until 1941, it was as an aircrew trainer that it made its primary contribution to the British war effort, training navigators, radio operators, and air gun operators. One variant, the Mk.X, was used for transporting freight or up to eight passengers. A total of 10,996 were produced until 1952, and it remained in service until 1968.



A Dornier Do 18 flying boat. Obsolete by the beginning of World War II, it was nonetheless employed on North Sea reconnaissance missions as well as in air/sea rescue. Only one squadron was still operational by mid-1941, however. (Ullstein Bild via Getty Images)

The four-engine Short Sunderland was a maritime patrol and antisubmarine flying boat with a maximum range of 2,690 miles. Nicknamed the “Flying Porcupine” because it was equipped with eight .303-caliber machine guns, the Sunderland was more than capable of defending itself. In addition to its reconnaissance and antisubmarine roles, it was also employed in transport and air-sea rescue operations and played an important role in successfully evacuating forces from Norway, Greece, and Crete. A total of 749 were constructed, and it remained in service with the RAF until 1959.

First introduced in 1935 by Australia, where it was known as the Seagull V and intended as a maritime patrol and antisubmarine aircraft, the single-engine Supermarine Walrus entered British service in 1936 as an amphibious biplane used for search and air-sea rescue operations. Capable of operating in rough seas, it rescued as many as 5,000 downed pilots in the waters around Britain and another 2,500 in the Mediterranean. A total of 771 Walrus aircraft were constructed.

Introduced originally as a passenger liner (the D.H.89 Dragon Rapide), the twin-engine De Havilland Dominie served primarily as a radio and navigator trainer and as a communications aircraft. With the outbreak of the war, civilian versions were pressed into military service in an effort to supply the British Expeditionary Force in France. A total of 730 of all varieties were constructed.

The De Havilland Tiger Moth, a single-engine, open-air–cockpit biplane, served as one of the primary trainers for Allied pilots who flew in World War II. In addition to the 8,796 trainers produced, 420 radio-operated, wooden-constructed versions, known as queen bee drones, were manufactured to serve as antiaircraft gunnery targets.

Italy

Introduced in 1934, the single-engine, four- to five-seat Cant Z. 501 Gabbiano served as Italy’s only flying boat during World War II. Intended as an armed reconnaissance/maritime patrol aircraft, the wooden-constructed Gabbiano had set numerous long-distance records in the mid-1930s. With Italy’s entry into the war, however, it proved extremely vulnerable to enemy fire and so was relegated primarily to coastal patrol service. By the time Italy

surrendered in September 1943, only 40 remained out of the 445 that had been produced.

Introduced in 1941, the twin-engine Fiat R.S. 14 was originally designed as a coastal reconnaissance floatplane. Although its performance soon proved far better than that of the Cant Z.506 and Savoia-Marchetti SM.79, allowing it to be used as a torpedo bomber, only 187 were produced.

Japan

In addition to transporting troops and supplies, the four-engine Kawanishi H6K and four-engine Kawanishi H8K flying boats served important roles as long-range reconnaissance aircraft, with the former having a maximum range of 4,210 miles and the latter 4,460 miles.

Japan relied on three primary reconnaissance floatplanes during the war. The three-seat Aichi E13A, of which 1,418 were produced, was Japan's most widely used floatplane of the war. Entering service in early 1941, it was employed for reconnaissance leading up to the attack on Pearl Harbor (December 7, 1941), and it participated in every major campaign in the Pacific theater, performing not only reconnaissance but also air-sea rescue, liaison transport, and coastal patrol operations. Introduced in January 1944 as a replacement for the E13A, the two-seat Aichi E16A Zuiun offered far greater performance capabilities but came too late in the war to make a significant difference, primarily because Japan's worsening industrial position limited production to just 256 aircraft.

Based on a 1936 design that underwent several modifications, the two-seat Mitsubishi F1M biplane, of which 1,118 were produced, proved to be one of the most versatile reconnaissance aircraft in Japan's arsenal. Operating from both ship and water bases, it served in a variety of roles throughout the Pacific, including coastal patrol, convoy escort, antisubmarine, and air-sea rescue duties. It was even capable of serving as a dive-bomber and an interceptor.

The three-seat Nakajima C6N Saiun, of which 463 were produced, was one of the few World War II reconnaissance aircraft specifically designed for operating from carriers. With a maximum speed of 379 mph, a maximum range of 3,300 miles, and a service ceiling of 34,236 feet, the C6N proved virtually immune from Allied interception. Unfortunately for Japan, it did not

become available for service until the Mariana Islands Campaign (June–August 1944).

The twin-engine, two-seat Mitsubishi Ki-46, of which 1,742 were produced, served as Japan's primary strategic reconnaissance aircraft of the war. Entering service in March 1941, the Ki-46 was one of the top-performing aircraft of its type in the war and had a service ceiling of 35,170 feet, a range of 2,485 miles, and a maximum speed of 375 mph.

Although the two-seat Tachikawa Ki-36 served as an effective army cooperation aircraft against the Chinese when it entered service in November 1938, it proved vulnerable against better-equipped Allied forces after the outbreak of war in the Pacific. The Ki-55 was an advanced trainer version that became available in 1940. Both were later used as suicide aircraft toward the end of the war. A total of 2,723 of both types were constructed.

Soviet Union

When it entered service in 1928, the two- to three-seat Polikarpov U-2/Po2 biplane was intended as a basic trainer. By the time of the German invasion of the Soviet Union in June 1941, approximately 13,000 had been constructed for both military and civil use. The U-2/Po2 performed a wide variety of roles besides training, such as tactical reconnaissance, air ambulance, night artillery spotting, and close ground support. One version, the U-2GN, was equipped with loudspeakers and used for propaganda purposes. Production continued in the Soviet Union until 1948 and in Poland until 1953; more than 33,000 were ultimately produced.

The five-seat Beriev MBR-2 (Be-2) flying boat was first introduced in 1931 for coastal patrol service. Incorporating a wooden hull and metal wings and utilizing a single pusher engine, it proved to be one of the most versatile flying boats of its time. In addition to its reconnaissance role, it was employed in air-sea rescue, light transport service, and mine-laying operations. More than 1,500 of all varieties were produced.

United States

The single-seat Lockheed F-4 and F-5 Lightning were modified versions of the Lockheed P-38 Lightning, which had cameras and clear panels installed

in place of its guns in the nose section. First deployed in the Pacific in early 1942, these were among the most widely used photoreconnaissance aircraft of the war. Of the 1,400 employed during the war, 500 were new, and the remaining were converted from existing stocks of P-38s.

Designed to operate from land or be catapulted from a ship, the two-seat Vought OS2U Kingfisher, of which 1,519 were produced, first entered service in August 1940 and served as the U.S. Navy's primary observation aircraft in every theater of the war. In addition to its reconnaissance duties, it performed air-sea rescue, antisubmarine patrol, and liaison transport missions.

A U.S. Navy Vought OS2U Kingfisher reconnaissance aircraft. The principal shipboard observation aircraft used by the United States Navy during World War II, the Kingfisher had a crew of two: the pilot and a radio operator/gunner. (Frank Scherschel/The LIFE Picture Collection/Getty Images)

Entering service in 1936, the twin-engine, seven- to nine-crew Consolidated PB2Y Catalina was the most widely used flying boat of World War II. A total of 3,290 were produced in the United States, Canada, and the Soviet Union. With a maximum range of 3,100 miles, the Catalina served on all fronts of the war primarily for long-range maritime reconnaissance. Other duties included air-sea rescue, mine laying, and transport.

The two- to three-seat Grumman J2F Duck, of which 641 were produced, was an amphibious biplane that entered service in 1936 with the U.S. Navy

and the U.S. Coast Guard as a coastal patrol aircraft. After Pearl Harbor, the Duck was pressed into a variety of roles in both the European and Pacific theaters, including air-sea rescue, target towing, coastal patrol, and maritime reconnaissance.

Utilizing a three-tiered system of training—primary, basic, and advanced—for its pilots, the United States relied on training aircraft that corresponded to each level. The two-seat Boeing-Stearman Kaydet, of which approximately 10,000 were constructed, was an open-air biplane that served the U.S. Army Air Forces (USAAF) and the U.S. Navy as a primary trainer throughout the war. The two-seat Vultee Valiant, of which a total of 11,525 were produced, served as the most important basic trainer for the USAAF and the U.S. Navy. Finally, the two-seat North American AT-6 Texan/Harvard, of which over 17,500 were produced in the United States and Canada, served as the most important Allied advanced trainer of World War II.

Other prominent American auxiliary aircraft included the Cessna AT-17/UC-78 Bobcat, which was used as an advanced trainer and a light utility transport; the Piper L-4 Grasshopper, which served as an artillery spotter, a trainer, and a liaison transport; and the Beechcraft Kansan, a military version of the Beechcraft Model 18 that served as a navigation, bombing, and gunnery trainer.

Aircraft, Transport

Aircraft the primary purpose of which is the movement of personnel and supplies. Although fighters, bombers, and reconnaissance aircraft played major roles in World War I, the technology of the time did not allow aircraft to play a meaningful role in transporting troops and supplies. By the early 1930s, however, improvements in aircraft design and, more important, aircraft engines resulted in the emergence of civil aviation aircraft, such as the Douglas DC-3, for commercial passenger service. Military planners were quick to note these developments, which raised the prospect of rapidly deploying large numbers of men and a large amount of supplies to the battle zone, including behind enemy lines. By the outbreak of World War II, most of the powers that would become involved in the war had either already developed military variants of these civil aircraft or had introduced specially designed military transport aircraft.

Two main types of transport aircraft were employed during the war: large multiengine land-based aircraft or flying boats designed to move many troops or supplies (some of these also served in bombing and reconnaissance roles) and assault or transport gliders designed to be towed and then released so they could glide silently to a landing behind enemy lines.

The following are the most significant aircraft employed primarily for transport by both sides during World War II (see also Table 1).

Germany

Designed originally in 1930 as a three-engine passenger carrier for Deutsche Lufthansa, the Junkers Ju-52/3m served as the primary transport aircraft of the German Army in World War II. Including the approximately 200 civil models constructed prior to the war, a total of 4,800 Ju-52/3ms were built by the end of 1944. The aircraft made its military debut as a bomber and troop transport during the 1936–1939 Spanish Civil War. Successive versions of the Ju-52/3m incorporated more powerful engines that provided greater load capacity (approximately twice its empty weight of 12,600–14,300 pounds) and interchangeable wheel, ski, or float landing gear that allowed it to operate in a variety of conditions. In addition to its transport duties, the Ju-52 served as a bomber, an air ambulance, a glider tug, and a paratrooper transport.

Intended as a replacement for the Ju-52/3m, the Junkers Ju-252 Herkules relied on the same three-engine configuration as the Ju-52/3m but featured

improved interior and exterior design and more powerful engines, which not only made it faster and capable of bearing heavier loads but also gave as much as twice the range of the Ju-52/3m. Unfortunately for Germany, shortages of resources and manpower forced the Luftwaffe to limit production of the all-metal Ju-252 to just 15 aircraft. A mixed wood and tube-steel version, the Ju-352 entered service in 1944, but it came too late in the war to make a difference. Just 45 of the Ju-352s were constructed.

NA = not applicable

Originally designed for Deutsche Lufthansa to serve as a transatlantic flying boat, the six-engine Blohm und Voss Bv-222 Viking was the largest flying boat, and the largest aircraft of any kind, to serve in World War II. Although only 13 were produced, the Bv-222, which could carry up to 110 troops in addition to its 11-man crew, played an important role in transporting troops in the Mediterranean and North African campaigns.

Germany employed three types of gliders as transports during World War II: the DFS-230, the Gotha Go-242, and the Messerschmitt Me-321 Gigant. Entering service in 1938, the DFS 230 could carry eight airborne troops and

proved to be the standard assault glider used by the German Army during the war, with approximately 1,500 being constructed.

Introduced in late 1941, the Gotha Go-242 could carry up to 23 airborne troops or the equivalent weight in supplies. As one of the largest aircraft of the war, the Messerschmitt Me-321 Gigant was capable of carrying up to 120 troops, 21,500 pounds of freight, or 60 wounded soldiers. The Go-242 and Me-321 served primarily on the Eastern Front to bring food and supplies to German soldiers. Powered versions, the Go-244 and Me-323, were also developed for transport service.

Great Britain

Although the twin-engine Bristol Bombay was designed as a troop transport carrier in 1931, the economic conditions of the Great Depression delayed production until early 1939. While only 51 were produced, the Bristol Bombay, which was capable of carrying up to 24 troops or a payload of 7,200 pounds, saw significant action for the Royal Air Force (RAF) during the first half of the war, ferrying troops and supplies across the English Channel in 1940, evacuating British forces from Crete in 1941, and dropping paratroopers behind enemy lines in North Africa.

Originally intended as a bomber, the Armstrong Whitworth Albemarle was instead converted to transport service. A total of 310 were used as transports for special operations, such as inserting paratroopers behind enemy lines. An additional 247 served as the standard tug for the Airspeed Horsa assault glider, seeing action in the invasion of Sicily in 1943 and the D-day landings in June 1944. At least 10 were shipped to the Soviet Union.

Great Britain produced two primary transport gliders during the war: the Airspeed Horsa and the General Aircraft Hamilcar. The Horsa came in two varieties: the Mk.1, which was configured for carrying up to 25 troops, and the Mk.2, which could carry up to 7,000 pounds of freight and featured a hinged nose section for easier loading and unloading. Approximately 3,800 of the Horsa gliders were constructed.

The Hamilcar was the largest Allied glider of the war, capable of carrying a payload of 17,500 pounds. It first saw action in the D-day landings (June 6, 1944) and proved immensely significant because it could provide heavy

equipment, such as the British Tetrarch Mk.IV tank, to airborne troops operating behind enemy lines.

Other British aircraft employed in a transport role included those that also served as bombers or reconnaissance aircraft, such as the Handley Page Halifax, the Short Stirling, and the Vickers Warwick.

Italy

Although Italy relied on several aircraft for transport duties, such as the Caproni CA 309–316, the Piaggio P.108, and the Savoia-Marchetti SM.81 Pipistrello, their primary role was as bombers or reconnaissance aircraft. The Savoia-Marchetti SM.75 and the Savoia-Marchetti SM.82 Canguru were exceptions. The SM.75 had originally been designed for passenger service for Ala Littoria in 1937. Requisitioned for military service when Italy entered the war in June 1940, the SM.75 could carry up to 30 troops. It saw action throughout the Mediterranean until the end of the war. A total of 98 were constructed.

The three-engine SM.82 proved to be one of the best heavy transports available to the Axis powers. It was capable of carrying up to 40 fully equipped troops or almost 9,000 pounds of freight. Of approximately 400 SM.82s constructed between 1941 and 1943, at least 50 entered service with the Luftwaffe in the Baltic area of the Eastern Front. Those that survived the war continued in service with the Italian Air Force into the 1950s.

Japan

Although Japan employed a variety of multipurpose aircraft, such as the Nakajima G5N Shinzan and the Tachikawa Ki-54, for transporting troops and supplies, it relied primarily on four main transport aircraft during World War II: the Kawanishi H6K and Kawanishi H8K flying boats, the Kawasaki Ki-56, and the Mitsubishi Ki-57.

When Japan entered the war, the four-engine Kawanishi H6K served as the navy’s primary long-range flying boat. Although used at first primarily for long-range reconnaissance, it was soon relegated to transport duty because of its vulnerability to Allied fighters. Capable of carrying up to 18

troops in addition to its crew, the H6K remained in production until 1943. Of the 217 constructed, 139 were designed exclusively for transport.

The four-engine Kawanishi H8K entered service in early 1942 and gradually replaced the Kawanishi H6K. While it also served in a variety of roles, its transport version, the H8K2-L, of which 36 were built, could carry up to 64 passengers. With a cruising speed of 185 mph and a range of up to 4,460 miles, it was well suited for the Pacific theater, and its heavy armament afforded better protection than the H6K.

Ironically, Japan's primary light transport aircraft, the twin-engine Kawasaki Ki-56, was a military version of a license-built American plane, the Lockheed 14 Electra. It was capable of carrying a payload of up to 5,290 pounds or 14 passengers and had a range of approximately 3,300 miles. A total of 121 were constructed between 1941 and 1943.

Originally intended for passenger service with Nippon Koku KK, the twin-engine Mitsubishi Ki-57 was quickly adapted for service with both the Japanese Army and the Japanese Navy beginning in 1940. After Japan entered the war, the original production series, of which 101 were built, was modified by adding more powerful engines. Between 1942 and early 1945, 406 of the new version (Ki-57-II) were constructed. These were capable of carrying a crew of 4 and up to 11 passengers or a cargo of approximately 7,000 pounds to a range of up to 1,835 miles.

Soviet Union

While the Soviet Union relied heavily on American aircraft, such as license-built Douglas C-47 Skytrains, for transport purposes, the four-engine Tupolev TB-3 (ANT-6), originally designed in the early 1930s as a heavy bomber, had been converted primarily for troop and freight transport by 1941. Later versions fitted with four 1,200-horsepower engines were capable of carrying more than 12,000 pounds of cargo. In addition to carrying airborne troops and supplies, it also served as a glider tug. Some were even modified to carry a tank or truck between their undercarriage legs.

United States

Of all the powers in World War II, the United States had by far the largest number and variety of transport aircraft, in part because it was conducting simultaneous campaigns in the European and Pacific theaters.

Without question, the twin-engine Douglas C-47 Skytrain was the most famous transport aircraft of World War II. Along with the DC-3, it had revolutionized civil air travel before the war. Once the United States entered the war, the Skytrain went into full-scale military production; 10,665 were produced by war's end, including 4,878 in 1944 alone. Of its variants, the C-47 Skytrain (known as the Dakota in British service), accounted for more than 9,000 of the total produced, approximately 1,800 of which went to Great Britain through Lend-Lease. An additional 2,500 were constructed on license by the Soviet Union as the Lisunov Li-2. Even the Japanese built 485 as the Nakajima L2D through a 1938 license. With a range of 1,500 miles and capable of carrying 28 troops or a cargo of 10,000 pounds, it saw service in every theater of the war.

The four-engine Consolidated Liberator Transport C-87 was a transport version of the Consolidated B-24 Liberator bomber. A total of 287 C-87s were produced and served with the U.S. Army Air Forces (USAAF) and the RAF as a transport and a tanker. As a transport, it was capable of carrying up to 25 passengers and up to 10,000 pounds of freight. As a tanker, it could carry up to 2,400 gallons of fuel, which proved useful in a variety of theaters but especially in support of Boeing B-29 Superfortresses operating in China.

Originally designed in 1936 as the CW-20 (a 36-passenger pressured airliner), the twin-engine Curtiss C-46 Commando entered service in 1942 after undergoing extensive modifications for military service. These included the installation of a large cargo door, a strengthened floor, and folding troop seats. It was capable of carrying up to 50 troops, 33 wounded soldiers, or 10,000 pounds of cargo. These characteristics, combined with its excellent climbing ability, made it ideally suited for flying over the Himalayas ("the Hump") from India to China. A total of 3,341 were produced.

As with the Douglas C-47 Skytrain, the Douglas C-54 Skymaster was originally designed for passenger airliner service as the DC-4. After Pearl Harbor the U.S. military quickly adopted it, with the first C-54 Skymaster entering service in February 1942. With a maximum range of 3,900 miles, Skymasters flew almost 80,000 transatlantic flights during the course of the war with a loss of just three aircraft. It was capable of carrying 50 troops or

28,000 pounds of cargo. It would remain in service until 1974 and is famous for its role in the Berlin Airlift of 1948–1949.

The Waco CG-4A Hadrian was one of the most effective transport gliders produced in the war. Designed for mass production, the Hadrian featured fabric-covered wooden wings and a steel tube fuselage, which was easily replicated by the 15 firms involved in constructing the 13,910 Hadrians produced during the war. Its most notable feature was a hinged nose section that raised and allowed cargo to be loaded directly into the cabin. It was capable of carrying 15 troops or 3,800 pounds of cargo, which could include a jeep or a 75mm howitzer and its crew. It proved effective in landings in Sicily (July 9–August 22, 1943), the D-day invasion, and the Rhine crossings (March 7–24, 1945), and it would have been an integral part of an Allied invasion of the Japanese mainland had the atomic bombings not ended the war.

Other successful U.S. transport aircraft of the war included the twin-engine Lockheed Lodestar, of which 625 were produced, a military version of the civil Lockheed Model 14 Super Electra; the twin-engine Beechcraft C-45

Expeditor, of which 1,391 were built, a military version of the civil Beechcraft Model 18 light transport; and the Martin PBM Mariner Flying Boat, of which 1,405 were produced, that served in a variety of roles besides transport, including antisubmarine warfare, air-sea rescue, and maritime patrol.

Aircraft Carriers

Ships capable of launching and recovering fixed-wing aircraft. Almost without exception, the aircraft carriers commissioned by combatant navies during World War II owed their origins to designs developed between the two world wars. Furthermore, because this warship type was so new, most of the first generation of semiexperimental vessels remained in frontline service at the outbreak of hostilities. These included the British carriers *Eagle* (converted from an incomplete ex-Chilean battleship into a flush-deck carrier

with an offset island), *Furious* (a World War I battle cruiser converted into a carrier during the course of that conflict), and *Hermes* (the first vessel constructed as a carrier from the keel up, also flush-decked with an island) and the similar Japanese carrier *Hosho.*

Provisions of the 1922 Washington Treaty had freed large U.S., British, French, and Japanese hulls for conversion into carriers. The United States and France converted two battle cruisers and a battleship, respectively, into the flush-deck carriers *Lexington, Saratoga*, and *Béarn.* British and Japanese concepts emphasizing rapid aircraft launching led both navies to develop designs incorporating multiple flight deck levels to permit several aircraft to fly off simultaneously. Britain rebuilt the *Furious* with a three-quarter-length flush deck and a forward flying-off deck at a lower level, and it similarly converted two near-sister ships, the *Courageous* and *Glorious.* Japan took this idea still further and configured a battleship and a battle cruiser, the *Kaga* and the *Akagi*, as carriers with two forward flying-off decks beneath the main deck. Both navies learned through experience that efficient deck-handling procedures were more effective in increasing launch rates. Japan subsequently rebuilt its two carriers with conventional flush decks and greatly enlarged air groups, but the British ships still served unaltered in the front line at the outbreak of war.

Operational experience with these large converted carriers had a profound influence on subsequent carrier doctrine and designs. Their speed allowed them to operate with the battle fleet, and their size and aircraft capacity gave commanders invaluable opportunities to appreciate the importance of efficient deck-handling procedures, rapid launch and recovery, and concentrated mass attacks. They also served as development platforms for crucial operational equipment, including effective arresting gear using transverse wires, safety crash barriers, hydraulic catapults, and fast elevators to move aircraft between the hangar and the flight deck.

During the 1930s, Japan and the United States added new carriers to their fleets. Although constrained by provisions of the 1922 Washington Treaty, both navies produced effective designs that became the basis for later construction. Their first treaty vessels, the Japanese *Ryujo* and the U.S. Navy's *Ranger*, were not entirely satisfactory but formed the basis for the two ships of the Sōryū class and the three-vessel Yorktown class, respectively. They were ships that combined large flight decks, substantial air

groups of 60 to 80 aircraft, strong defensive armament (for the period), high speed, and long range in vessels suitable for extended oceanic operations. Britain was a latecomer to new carrier construction in the 1930s. The *Ark Royal*, commissioned in 1939, incorporated internal hangars, an enclosed bow, and a flight deck that was also the vessel's principal strength deck—all features that characterized subsequent British carrier designs—and embarked a similar-size air group to those of its U.S. and Japanese contemporaries.

The large fleet carriers commissioned by Britain, Japan, and the United States during World War II derived from their earlier 1930s designs. Japan commissioned two ships of the enlarged Shōkaku class in 1941 with greater offensive and defensive capabilities, followed by the *Taiho*, a variant incorporating an armored flight deck (although at the cost of a reduced air group). During 1942–1943, Japan laid down the six-ship Unryu class, which was derived directly from the Sōryū class, although only two of these vessels entered service. The United States standardized on the Essex class, an expansion of the Yorktown class. No fewer than 32 units were ordered, of which 24 were completed to serve as the backbone of U.S. carrier forces from 1943. They combined a powerful offensive air group of as many as 100 aircraft, substantially augmented defensive armament, long range, and high speed in hulls the size of which conferred great adaptability to changing operational requirements.

The six British wartime carriers of the Illustrious type introduced armor protection for both flight decks and hangar sides. Incorporating this feature into the basic Ark Royal–class design produced vessels that proved effective in the confined waters of the Mediterranean and in the face of kamikaze attacks, but it also incurred severe penalties. Air group capacity was slashed substantially (the original design accommodated only 36 aircraft; modified to carry 54, it still fell short of the *Ark Royal*'s embarked 72 machines), hangars were cramped, and it proved difficult and expensive to upgrade these ships postwar.

Both the U.S. Navy and the British Royal Navy developed a third generation of carrier designs from their wartime experience. These emphasized the importance of large air groups, efficient layout for fast aircraft operation, and strong defensive features—both passive in the form of armor at hangar and flight-deck level and active by means of large batteries of antiaircraft guns. None of these carriers served during World War II. The

U.S. Navy commissioned the three ships of the Midway class just after the war, but the Royal Navy's Malta class was canceled, although two vessels of the intermediate Audacious class entered service postwar as the *Ark Royal* and the *Eagle.*

The U.S. Navy aircraft carrier *Lexington* (CV-2). Commissioned in 1927, "Lady Lex" was lost in the May 1942 Battle of the Coral Sea. (The Mariners' Museum/Corbis)

Both Britain and the United States studied small, austere carrier designs before World War II, but only the Royal Navy seriously considered vessels for trade protection (the U.S. Navy's XCV projects envisaged second-line fleet duties). In 1935–1936, the British Naval Staff agreed on sufficiently firm requirements to earmark five specific merchant vessels for conversion should war break out. No action was taken until December 1940, when work began to create Britain's first escort carrier, the *Audacity*, commissioned in June 1941.

U.S. Navy planning for austere mercantile conversions began in October 1940, resulting in the completion of the *Long Island*, its first escort carrier, also in June 1941. The *Long Island* was converted from a completed diesel C-3 cargo ship, the *Mormacmail*, but 45 subsequent conversions used

partially completed hulls and steam turbines rather than the mechanically unreliable diesel plants featured in the first five U.S.-built escort carriers. More than half of these vessels went to Britain under the Lend-Lease Act, and all 50 were in service before the end of 1943.

The United States also converted 4 fleet tankers into escort carriers. These larger twin-shaft turbine vessels were successful, but a general shortage of tanker hulls prevented further conversions. Nevertheless, they formed the basis for the U.S. Navy's first purpose-designed escort carriers, the 19 Commencement Bay–class ships. These were the only escort carriers to continue to operate postwar, because their size and speed suited them for the larger antisubmarine warfare aircraft then entering service.

The 50 Casablanca-class ships, however, formed the bulk of the U.S. Navy escort carrier force, even though they were outside the mainstream of U.S. Navy design. All came from the Kaiser Vancouver yard and were commissioned within one year starting in July 1943. Their design was by Gibbs and Cox, and their construction was under the auspices of the Maritime Commission. Shortages of both turbines and diesels forced the use of reciprocating machinery, but the ships were faster and more maneuverable than the original C-3 conversions, had longer flight decks, and had larger hangars than even the Sangamon-class converted tankers.

Other than the *Audacity*, Britain completed only five escort carriers of its own, all conversions from mercantile hulls. They were similar to contemporary U.S. C-3 conversions although generally somewhat larger. Thirty-eight of these, transferred under the Lend-Lease Act, formed the core of the Royal Navy's escort carrier force throughout the war.

Escort carriers, initially conceived as platforms providing air cover for convoys, soon expanded their activities into a wide variety of tasks. In the U.S. Navy, escort carriers formed the core of specialized antisubmarine hunter-killer groups, provided close air support for landings, served as replenishment carriers and aircraft transports, and operated as training flight decks. In addition, during 1942 the *Sangamon* took on fleet carrier assignments to compensate for shortages of first-line ships.

The Royal Navy employed its escort carriers in much the same way. Its own shortage of large carriers, however, and its operational responsibilities within more confined waters led it to assign escort carriers additional frontline duties. The small carriers operated in strike roles either within a

larger force or as autonomous units in the East Indies, in the Aegean, and off the Norwegian coast, including attacks on the German battleship *Tirpitz.* Escort carriers also provided night-fighter coverage for the British Pacific Fleet.

To circumvent 1922 Washington Treaty quantitative limitations, Japan designed several fast naval auxiliaries and passenger liners for quick conversion into carriers. Beginning in 1940, conversions from five auxiliaries and three liners joined the Combined Fleet as frontline light fleet carriers. Japan also completed several mercantile conversions similar in capability to the British and U.S. escort carriers. Unlike the Allied ships, however, these were designed and usually deployed as integral components of Japan's main carrier force. In addition, Japan converted one Yamato-class battleship hull, the *Shinano*, into a huge carrier that never entered operational service and commenced conversion of an incomplete cruiser as a light fleet carrier.

The United States also deployed converted warships—the nine Independence-class light fleet carriers based on Cleveland-class cruiser hulls formed an integral part of the fast carrier force from early 1943. Although conceived as first-line units, their design owed much to plans for the escort carriers, and their operational limitations made them suitable only for emergency service.

Britain also appreciated the need for smaller, less sophisticated carriers that could enter service more quickly, but it chose to construct new vessels rather than convert existing hulls. The design was similar to that of the larger fleet carriers, but the carrier was unarmored. Britain also deliberately conformed to mercantile rather than naval standards, because the Admiralty contemplated selling these ships for conversion into passenger liners or fast cargo ships after the war—an interesting reversal of procedures. Four of this Colossus class of light fleet carriers served with the British Pacific Fleet late in 1945, and they joined six sister ships to form the core of British carrier power into the later 1950s, as they proved economical to operate.

France's converted carrier *Béarn* remained its only example throughout the war, serving mainly as an aircraft transport because of its low speed. France began building a pair of new carriers, the *Joffre* and the *Painlevé*, just before war began, but the fall of France in 1940 terminated construction. The final design incorporated a flight deck offset to port to minimize

superstructure intrusion, a feature that has reappeared in several designs in recent years.

Before and during the war, Germany undertook some carrier construction. Its prewar design, the *Graf Zeppelin*, reached an advanced stage of construction by 1940, but subsequent reductions in priority, design changes, and disputes among the Kriegsmarine, the Luftwaffe, and the Reichsluftfahrtministerium (Reich Air Ministry, RLM) over provision of aircraft and aircrew combined to prevent carrier completion before the war's end. A similar fate befell several conversion projects from merchant vessels and warships.

Italy's government and air force, subscribing to the position that geography would permit shore-based aircraft to provide entirely sufficient air cover and offensive strike potential for its fleet, opposed funding of any of the carrier designs that the navy proposed in the late 1920s and early 1930s. Wartime experience led to a change in this view, and the Italian Navy began two conversions from mercantile hulls to create the fleet's first carriers.

The *Aquila* was a sophisticated, nearly total reconstruction of the liner *Roma* that was virtually complete when Italy surrendered in 1943. The Italians sabotaged the *Aquila* to prevent its use by Germany, and the ship subsequently was seriously damaged at Genoa by Allied bombing and an attack using manned torpedoes. The hulk was scrapped after the war. Conversion of the liner *Augustus* into the *Sparviero*, a more austere vessel similar to Allied escort carriers, began in 1941, but it too was never completed.

Airpower at sea came of age during World War II. The combination of unprecedented striking power (both in volume of ordnance and range of delivery), mobility, and flexibility of use transformed the aircraft carrier into the world's major fleets' new capital ship, a position it retains today.

Airlift

Use of aircraft to transport personnel, equipment, and supplies. Airlift provided the capability to move critical resources rapidly and over great distances, providing important support to combat forces in all theaters of operation during the war. Airlift operations were restricted by practical realities, however, including the need for airfields and maintenance facilities, restricted capabilities in bad weather, and vulnerability to enemy air defenses. Additionally, the limited payload of aircraft restricted the role of airlift; surface transportation was essential to move and sustain large combat forces. Beyond the limitations, however, the speed and range of transport aircraft made airlift a critical component of military operations. Basic airlift concepts and capabilities existed before World War II, and wartime demands stimulated the rapid growth of airlift forces and the refinement of operational missions.

The first airlifts were primarily for liaison purposes, moving key personnel about. As aircraft capabilities grew, air transportation came to include the rapid delivery of logistical support for air and surface forces. Additionally, during World War I, supplies were dropped to ground forces, and agents were inserted by parachute behind enemy lines. Airlift potential grew as aircraft capabilities for payload and range increased during the interwar years because of the development of enhanced bomber designs and improved aircraft produced for the rapidly growing commercial air transportation industry.

Several military experiences illustrated the expanding potential of airlift, including the movement of ground units from North Africa to Spain during

the 1936–1939 Spanish Civil War, which was critical for the Nationalist side at the beginning of the war. Additionally, both Germany and the Soviet Union experimented with the use of parachute forces and gliders in airborne assaults and with the air-landing of combat forces and supplies to support rapid-offensive ground operations.

From the early phases of World War II, airlift played an important role—in a mission commonly referred to as tactical airlift—by providing routine and emergency logistical support for combat forces in all major theaters of operation. The importance of aerial logistical support for ground forces, tactical air forces, and naval forces in all theaters grew significantly during World War II. This support included the rapid movement of key personnel, delivery of critical equipment and supplies, movement of mail, and evacuation of wounded or ill personnel. The German military demonstrated the exceptional value of airlift during its rapid ground operations, especially in the Eastern theater in the vast expanses of the Soviet Union. The Soviet Union also used airlift to support its widely dispersed and often isolated and cut-off forces.

U.S. and British forces also relied heavily on airlift support, both in geographically remote locations—such as the China-Burma-India theater and the Southwest Pacific islands—and in support of mobile combat operations. The aerial resupply of China by flying over the Himalayas—"the Hump"—was a high point in large-scale airlift support operations during the war. U.S. and British airlift was also important in mobile operations in North Africa and Western Europe. In the drive across France, supplies delivered by British and American transports and bombers were especially important in helping ground forces and tactical air units continue offensive operations under the logistical constraints imposed by limited port facilities.

Aircraft also provided for the rapid movement and air landing of small units, delivery of airborne assault forces, and the rapid reinforcement or resupply of units in isolated locations or in dangerous combat situations.

The Germans had a well-developed operational concept at the start of the war, demonstrating remarkable effectiveness in the early seizure from the air of key facilities during the 1940 Norwegian Campaign and in securing the fortress of Eben Emael (May 10, 1940) in Belgium during the invasion of France and the Low Countries. German landings in Crete during May 1941 also demonstrated the value of aerial envelopment as well as the inherent

dangers and risks of such activities. Later, the Germans employed aerial logistical support to supply their forces trapped in Stalingrad and under pressure in North Africa. These efforts had limited effect; however, the Germans' airlift capability was restricted and aircraft losses were high in these missions compared with the needs of the forces being supplied.

Soviet doctrinal concepts for airborne and air-landing support of offensive operations were well developed and openly demonstrated in exercises during the 1930s. The impact of early losses, however, and German control of the air limited Soviet assault operations. Nonetheless, in the final campaign of the war, the Soviets conducted extensive air assault operations against Japanese forces in Manchuria and Korea, often seizing airfields and key facilities.

In the Pacific theater, the Japanese employed airborne forces early in the war. U.S. and British forces effectively used airborne landings in Burma and often supplied ground forces that were operating away from fixed supply lines. In the Southwest Pacific, airborne assaults and aerial resupply efforts were important for American operations in the widely dispersed islands of that theater. American and British forces conducted a series of increasingly sophisticated large airborne operations in North Africa, Sicily, Normandy, southern France, Operation MARKET-GARDEN (the September 17–26, 1944, attempt to cross the Rhine at Arnhem), and Operation VARSITY (March 24, 1945, the final Rhine crossing). Some Allied bombers were also used during September 1944 in an attempt to supply the Polish Home Army in its uprising in Warsaw.

For special missions that supported covert and guerrilla operations, airlift resources were used to insert personnel, deliver supplies, and extract personnel from enemy-occupied territory. The Soviets conducted extensive operations in support of partisan activities in German-held territories. British and U.S. aircraft regularly worked with Allied agents and local resistance organizations in occupied Europe, especially in France and the Balkans. Similar activities were conducted to support local guerrilla bands in the China-Burma-India theater and observer operations in the Pacific islands. An additional innovative development was the use of helicopters for the first time in rescue roles.

The significant development of tactical airlift during the war was matched by the equally impressive growth of the use of long-distance aerial routes

between theaters in a mission that has become known as intertheater airlift or strategic airlift. The long-distance airlift grew from the prewar commercial transportation systems, including the flying boat services in the Atlantic and Pacific Oceans. Airlift allowed key personnel and critical supplies to be delivered in a timely fashion, especially compared with the time needed for surface travel on a global scale.

The most extensive system was the U.S. airlift network that stretched from the continental United States to every theater of operations, covering all continents except Antarctica. During the early period of the war, the U.S. Army Air Forces (USAAF), in addition to absorbing airline operations under contract, developed its long-range delivery capability in the Ferrying Command. This organization delivered aircraft under the Lend-Lease program and developed operations for passengers and high-value freight.

In June 1942, the USAAF established the Air Transport Command, which had responsibility for all ferrying and air transportation activities to the combat theaters. The American air routes grew into a global web: routes included from the northeast United States to Canada and across the North Atlantic to England and Europe (paralleled by British routes); to Canada and Alaska and on to the Aleutian Islands and to Soviet Siberia; from southeast U.S. bases to Brazil and on to Africa and the Middle East, continuing on to the Soviet Union or India and China (the longest leg of the network); and from West Coast bases to Hawaii and on to the Pacific islands and Australia.

These flights moved matériel and key personnel to all theaters and allowed the rapid return of wounded personnel and returning combat-experienced aircrew members, who became trainers for new flying personnel. Additionally, senior commanders and staff members were able to quickly visit theaters for on-the-scene assessments and conferences with the theater commanders and staffs. By the end of the war, the Air Transportation Command included approximately 210,000 military and 105,000 civilian personnel. The extensive global coverage provided routine and regular flights as well as responsive emergency missions over the entire system.

The Air Transportation Command provided the foundation for the Military Air Transport Service, the long-range transport capability of the U.S. Air Force after the war. The evolution of airlift missions during World War II established the patterns of airlift for all major military forces in the postwar period.

Air-Sea Rescue

The rescue of aircrews forced to bail out or ditch their aircraft at sea as well as shipwrecked mariners. With the advent of long-range aircraft, it became apparent that some system was necessary to increase the chances of survival for pilots whose aircraft went down during long-distance flights over water. The development of air-sea rescue (ASR) programs was hampered by technological limitations and interservice rivalries, but the rewards of such a program were apparent, especially with mounting casualties of the air war and a shortage of aircrews. Aside from simple lifesaving, rescue meant that personnel could return to the flight line, saving the cost and time of training replacements. Such programs also improved the morale of flight crews.

Sometimes a downed crew would send out a Mayday (from the French *m'aidez*, or "help me") radio signal with a location. The crew would either

bail out of their aircraft with parachutes, or the plane would be ditched—meaning that it would crash-land on the water and the crew would endeavor to get out before it sank. Fighters such as a P-51 Mustang sank almost immediately, but large bombers such as the Boeing B-17 could often remain on the surface for 30 minutes.

After leaving their aircraft, aircrew would endeavor to stay afloat in the water using a life preserver or a rubber raft until an airplane or boat could locate them by following a radio signal, seeing a large puddle of dye in the ocean, or spotting the men in the water. Crews needed to be prepared for long waits; especially in the Pacific theater, it could take a week or more for a downed crew to be rescued.

Germany was the first country to develop an ASR program. In 1936, Seenotdienst (air-sea rescue service) units were organized as part of the Luftwaffe and employed floatplanes and flying boats for rescues in the North Sea. German aircraft on overwater missions were equipped with collapsible rubber dinghies with radio transmitters. During the July 10–September 30, 1940, Battle of Britain, Seenotdienst units operated in the English Channel.

The Allies were slower to develop ASR operations. During the Battle of Britain, downed pilots had only life preservers until they were rescued. Eventually, they were provided with dinghies and dye markers. In 1942, the British introduced a lightweight radio transmitter for downed crewmen, nicknamed the “Gibson Girl” and based on a captured German model. In addition to aircraft operated by Fighter Command, rescue motor launches (RMLs) operated near the coast.

German and British rescue aircraft were painted white and marked with the large red cross of the International Red Cross. The decks of the RMLs were painted yellow, another sign of neutral craft. Both sides considered their ASR vehicles immune from enemy attack and rescued all downed pilots, regardless of their side in the conflict. Because a rescued pilot would return to duty, though, both sides frequently shot down ASR aircraft, leading to protests from each side in turn.

In January 1941, the British Air Ministry created the Directorate of Air-Sea Rescue to coordinate operations among the Royal Air Force, the Royal Navy, and Coastal Command. In the first six months of 1941, of 1,200 pilots who ditched 444 were rescued. The British also assumed primary

responsibility for all rescue operations in the European and Mediterranean theaters, relieving their allies from developing their own programs.

The United States organized ASR operations based on the British system, even using British officers in training. Because the British had taken primary responsibilities for rescue operations in the European and Mediterranean theaters as well as for all planes departing India, the Americans were able to concentrate on the Pacific theater. Such efforts were hampered by interservice rivalries, however. Each U.S. service went its own way, conducting its own operations and duplicating labor and equipment.

This cumbersome arrangement was finally resolved with the establishment early in 1944 of the Air-Sea Rescue Agency, which was charged with overseeing all such operations. A school for training crews was established in Gulfport, Mississippi, but by the time trained crews began to graduate, the need for them was almost over. The U.S. Navy also played an important role in the rescue of B-29 crews flying from the Mariana Islands late in the war. The navy set up submarines stationed at intervals between the Marianas and Japan that acted as lifeguards for downed crewmen.

Although air-sea rescue saved many lives during World War II, its practices, operations, and equipment were constantly improvised and sometimes inefficient. Lessons learned during the war, however, led to improved ASR techniques thereafter.

Air Warfare, Fighter Tactics

Methods and procedures for employing fighter aircraft against enemy aircraft.

The sky offers extremes of visibility and no natural cover except clouds. The victor in any fight is usually the one who sees his opponent first. Spotting enemy aircraft was generally difficult; visibility from the cockpit of a typical World War II fighter varied from very bad to good, and there were always blind areas to the rear and below. Early fighter aircraft such as the Messerschmitt Bf-109E had particularly poor cockpit visibility; later aircraft such as the Typhoon and the P-51D had bubble canopies that afforded better visibility, but their pilots could still be surprised from behind and below.

Assuming that the cockpit framing and bulletproof windscreen did not get in the way, individual fighter-sized aircraft could usually be seen perhaps two miles away, four-engine bombers at three or four miles away. A formation or group of aircraft sometimes could be seen six or seven miles away. Visual detection range could be doubled if enemy aircraft were maneuvering. Aircraft could not be seen by anyone looking directly at or close to the sun, however, and clouds could provide concealment.

To mount a coordinated attack on a target, it was necessary for a group of fighters to fly in formation. The number of aircraft in the formation and their positions had a large influence on effectiveness and survivability.

Before World War II, the basic formation used by many air forces, including the British Royal Air Force (RAF), was a V or "vic" of three aircraft flying about a wingspan apart. A squadron was typically composed of four vics. This was fine for air displays and flying in clouds, but every pilot except the formation leader was concentrating on maintaining formation, leaving little time to look for enemy aircraft. Considering that about 80 percent of all pilots shot down never saw their attackers, the folly of this type of formation can be readily understood. Several instances are recorded of a single enemy plane shooting down two or three aircraft without the rest of the formation noticing anything.

The German Luftwaffe had learned from combat experience in the 1936–1939 Spanish Civil War; at the urging of Werner Mölders, a leading German fighter pilot in Spain, it adopted a widely spaced *Rotte* (pair) as the basic tactical unit, the two aircraft flying a few hundred yards apart. Each pilot was then free to search for enemy aircraft without worrying about avoiding collision and could easily check the other's blind area, making a surprise attack less likely.

When the formation leader attacked a target, the wingman's duty was to

guard his leader’s tail. The basic unit of maneuver was two pairs arranged side by side like the four fingers of a hand, with the leaders of the pairs at positions two and three. When the RAF and most other air forces eventually adopted this formation during 1941 and 1942, it was usually known as the Finger Four.

The U.S. Navy adopted a variation of this in which the pairs flew farther apart (about one turn radius). When either pair was attacked, the two pairs turned toward each other, providing one with a head-on shot at the attacker. This was known as the Thach Weave after its originator, Lieutenant Commander John S. “Jimmy” Thach. A variant was used by the Soviet Air Force later in the war. The Soviet Air Force also learned lessons from the Spanish Civil War, but many of the officers who might have made a systematic change were victims of Soviet leader Joseph Stalin’s purges.

The nature of fighter-versus-fighter combat is such that the greatest chance of success is obtained by gaining a positional advantage, making a single unobserved attack, and then breaking off. This was essentially the technique used by German ace Erich Hartmann on the Eastern Front. There are numerous recorded instances of this technique working for a single attacker against a large formation of aircraft. The fact is that a single aircraft is much more difficult to spot than a formation, and a formation is more difficult to control than a single aircraft.

A positional advantage is really any position that allows an aircraft to launch an attack, the precise nature of which will vary depending on the characteristics of the fighter and target aircraft. When attacking single-seaters, this was somewhere in the rear hemisphere of the target, preferably positioned so that the target would have to look into the sun to see the attacker, and usually higher, so that the fighter could dive on the target with a speed advantage.

The fighter would then open fire in the dive or dive below the target and shoot in a shallow climb. This variation was favored by German ace Adolf Galland. Many aces were good shots; some went very close to their targets—within a few yards, in some cases—to be sure of a kill.

The art of air-to-air gunnery is to ensure that the projectiles and target arrive at the same point in space simultaneously. To accomplish this, the pilot must aim some distance in front of the target; this is called the deflection angle. This applies unless the shooter is immediately behind the target or

attacking head-on. Some pilots were able to instinctively apply the correct amount of deflection, but most could not. The British introduced the gyro gun sight in 1944, which dramatically increased the number of hits scored by the average squadron pilot.

Having delivered the attack, the pilot could either break off or convert his speed advantage into an altitude advantage and attack again. This latter tactic could be particularly effective if the fighter had good dive acceleration and zoom-climb capabilities (e.g., Messerschmitt Bf-109, P-51 Mustang).

The usual counter to a fighter attack was a hard (break) turn toward the attacking aircraft to present a difficult firing solution. After the attacker had fired, several possible courses of action were open to the defender—assuming that the attacker had failed to do significant damage on his first pass. If the attacker was forced to overshoot, a roll back toward the attacker could yield a firing solution for the defender, but this would probably be fatal if the attacker had a wingman.

This maneuver could degenerate into what is called a “scissors”; in it, each aircraft repeatedly turns hard toward the other to try to force an overshoot. The advantage would usually be with the aircraft that had the lower wing loading, although pilot skill played a part.

Alternatively, if the attacker continued turning to get a firing solution and was flying a significantly more maneuverable aircraft (e.g., Spitfire IX versus Messerschmitt Bf-109G or Mitsubishi Zero versus Curtiss P-40), the defender’s best option was to break off the engagement. The preferred method varied with the aircraft’s relative capabilities. If the attacker did not have a significant top speed or dive advantage, a favored technique was to half-roll and enter a full-throttle vertical dive (the “split-s” or *Abshwung*). This could lose as much as 10,000 feet in altitude quickly, and if the attacker did not also immediately dive, the defender would get sufficient separation and speed to break off the engagement.

Finally, if the defender had a maneuverability or performance advantage, he could elect to fight it out by turning hard to get onto his opponent’s tail. If his aircraft had a significantly lighter wing loading, three or four circles were usually enough to gain a firing position.

If a formation of disadvantaged aircraft was attacked by enemy aircraft, a viable tactic was to form a defensive circle, or Lufbery, named for a famous American World War I fighter pilot Major Raoul Lufbery. In this tactic, the

defenders flew in a circle so that each aircraft covered the one in front. An attacker would then have to fly through the field of fire of the following aircraft to attack any aircraft in the formation.

The defensive circle could be a double-edged sword, though; during the July 10–September 30, 1940, Battle of Britain, British Spitfires were able to get inside defensive circles of Messerschmitt Bf-110s flying in the opposite direction and engage each aircraft in turn without exposure to significant enemy fire. In June 1942, German ace Hans Joachim Marseille managed to shoot down six South African P-40 Tomahawks over Libya by making repeated dives and zoom-climb passes inside a defensive circle and shooting at high deflection angles.

If the target aircraft had a second crew member, the priority was to approach such that the target was not aware of the presence of the fighter. In the case of a two-seater, this usually meant attacking from below and behind, out of the field of fire of defensive weapons. If an unobserved approach was impossible (e.g., for a well-armed four-engine bomber), the choices came down to approaching either from a direction that had poor defensive coverage (e.g., from the beam if the target only had nose and tail weapons) or in such a way as to present a difficult target for defensive weapons (e.g., with a large speed advantage from the rear quarter).

If the attacking pilots could shoot accurately, however, the frontal attack was a better and possibly safer option. Bombers usually had fewer and less effective weapons firing forward, so the attackers were exposed to defensive fire for a much shorter period of time, and the bomber’s defensive armor was designed to protect from attacks originating from below and behind rather than from the front.

If the target had defensive armament and was flying in formation, the other aircraft in the formation could contribute defensive fire, and attacking became significantly more hazardous. The effect of defensive fire could be reduced by making multiple simultaneous attacks or by selecting a target on the edge of the formation. Some antibomber weapons (e.g., the German Wgr-21 rocket) were designed to break up formations and allow individual targets to be picked off.

Late in the war German jet fighters were used against bombers, and the amount of excess speed generated in a dive made sighting extremely difficult. To cope with this, a roller-coaster–type attack was developed whereby the

attacking jets approached from the rear of the formation, dived through the fighter screen at speed to a position 1,500 feet below and behind the bombers, then pulled up into a steep climb to bleed off most of the excess speed before selecting a target and opening fire.

The tactics employed by radar-guided night fighters were concerned more with accurate interception techniques and visual acquisition before firing than with violent maneuvering, although there were exceptions. The tactics were dominated by the target-acquisition performance of onboard radar; the British AI Mk IV had an effective range of three to four miles at 15,000 feet, degrading to half a mile at 3,000 feet. The minimum usable radar range was usually about 1,000 yards, and the maximum visual acquisition range was usually about 1,400 yards, although this varied depending on moon and cloud conditions.

Most home-defense night fighters relied heavily on ground controllers, although both sides had electronic devices that allowed a fighter to home in on a target from many miles away. The Germans had a Flensburg receiver that homed in on the Monica tail-warning radar and also had Naxos, which detected H2S bombing radar; the British had Serrate, which homed on to German airborne radar transmissions, and Perfectos, which triggered German aircraft IFF (identification, friend or foe) equipment.

Ground control and radar operators usually aimed to approach the target from astern and from slightly below so that the target was silhouetted against the night sky, maximizing the chance of visual acquisition. Low targets, however, usually were approached from above to maximize radar detection range. German night fighters fitted with *Schräge Musik* (upward-firing cannon, literally “shrapnel music”) could attack from almost directly below the target and were effective against RAF bombers until the tactic became known.

Air Warfare, Ground-Attack Aviation

Ground-attack aviation refers to the dedicated use of combat aircraft to attack ground combat units and their supporting echelons on or near the front lines to support friendly ground forces. By the end of World War I, the practice of supporting infantry ground attack with aircraft was gaining acceptance. Air attacks increasingly were employed both in immediate support of ground operations at the front and upon rear-echelon enemy units.

During the interwar period, military theory and doctrine bifurcated, and two distinct schools of thought developed about the proper use of airpower. One school, following the precepts of Italian theorist Guilio Douhet, advocated concentration on strategic bombing by heavy self-defending "battle planes" on targets far behind the battle lines, with the intent of collapsing an enemy nation's will to continue. Most British and U.S. airpower advocates supported this concept.

The second school of thought, generally adhered to by the Soviet Union, France, and Germany, advocated airpower as direct support for ground operations. In this vision, aircraft primarily attacked targets on the front lines or behind the front, which might extend as much as 150 miles. These theorists saw air forces enabling ground forces to move farther in the attack or to yield less terrain in the defense.

Each school drove aircraft design in particular directions. Thus, the United States and Great Britain came up with four-engine "strategic" bombers such as the American Boeing B-17 Flying Fortress (Douhet's self-defending "battle plane") and the British Avro Lancaster. The Germans, however, concentrated on fast fighters such as the Bf-109 (also known as the Me-109) to secure air superiority over the battlefield for fast, medium-size, dual-engine bombers such as the Heinkel He-111 and the Dornier Do-17.

The Germans, having learned from U.S. Marine Corps operations, also embraced dive-bombing, developing their important single-engine Junkers Ju-87 Stuka, which could deliver its ordnance with great accuracy and proved vital during the war's early campaigns. The Luftwaffe was essentially intended for close air support, geared to ground operations.

The multiple German blitzkriegs against Poland (1939), Norway (1940), and France (1940) demonstrated the great importance of the ground-attack school of thought. Luftwaffe units, working in close coordination with advancing columns of German infantry and armor, were a key element in allowing those columns to cut through opposing forces with seeming ease. We now know that German air-to-ground coordination was far from perfect and that German soldiers became casualties of friendly fire.

First with the British in fighting in eastern North Africa and then with the Americans in French North Africa, the Western Allies developed their own system of close air support. Almost immediately, the Americans discovered that their own system of command and control for ground-attack operations, developed before the war, was inefficient and could not keep pace with rapidly shifting operations on the ground.

Capitalizing on their great strength of adapting to circumstance, the Americans jettisoned their own doctrine nearly wholesale and adopted a modified version of the British system. Thereafter their efficiency in ground-attack operations increased markedly.

At the same time, the Soviet Air Force, which had suffered heavily in the German invasion during June 1941, perfected its own system of ground support aviation. The Soviet Union developed some highly successful ground-attack fighters and fighter-bombers in the Yakovlev Yak-4 and especially the Ilyushin Il-2 Sturmovik. Flying low and employing rockets, Sturmoviks were efficient tank killers. Sturmoviks, purpose-built for the ground-attack role, were heavily armored at crucial points to protect against German antiaircraft fire. The Il-2 was perhaps the best ground-attack aircraft of the war. In testimony to its success, the Sturmovik remained in production until 1955; the Soviets produced some 36,000 of them.

Simultaneously, the Western Allies began to specialize—in use if not in design—their own aircraft. Both Great Britain and the United States entered the war with credible, if not outstanding, medium bombers such as the North American B-25 Mitchell and the British Bristol Blenheim. The British added

other aircraft, including the versatile De Havilland Mosquito, while the Americans produced excellent fighters in the ground-attack role, such as the Vought F4U Corsair, the twin-engine Lockheed P-38 Lightning, the Republic P-47 Thunderbolt, and the North American P-51 Mustang.

The P-38, P-47, and P-51 were originally designed as bomber escorts or classic conventional pursuit planes (hence the “P” in the nomenclature). The P-51 Mustang, a superb aircraft, may have been the best all-around fighter of the war, but the P-38 and P-47 each had characteristics that made them more suited to lower-level work and the rigors of close air support.

For the Thunderbolt, it was the fact that the aircraft could absorb significant damage and continue flying. Its air-cooled engine was less susceptible to failure from damage than the Mustang engine, and ground-attack work generally meant taking ground fire while flying at low altitude. The Lightning had twin engines on twin booms with a pod for the pilot slung between them, and it combined decent range with the heavy punch of five .50-caliber machine guns that fired straight ahead from the central pod. (The guns of most conventional aircraft were aimed inward to a single point.) This gave it lethal accuracy; the dual air-cooled engines gave the pilot a decent chance to make it home even if one engine shut down. On the British side was the Hawker Typhoon, an underappreciated contender for the title of best ground-attack aircraft of the war.

The air-ground team for the Western Allies in the European theater of operations truly came into its own in the summer of 1944 during the Allied push across France. The penultimate display of this was the complete linkage between Lieutenant General George S. Patton’s Third Army, the widest-ranging and fastest-moving element of the Allied sweep across France, and Major General Elwood “Pete” Queseda’s IX Tactical Fighter Command. Patton, with no spare forces to cover his right flank, committed the security of that increasingly vulnerable edge to the air units under Queseda’s command.

Ground-attack aviation was also important in the Pacific theater, although it was marginally less effective in jungle terrain. U.S. airpower proved vital in the struggle for Guadalcanal (August 1942–February 1943), for example; both the Japanese and the Americans saw control of Henderson Field as the key to the campaign. Overwhelming air support proved immensely important to Allied forces in the subsequent island-hopping campaigns in the Southwest

Pacific along the New Guinea coast (March 8, 1942–September 3, 1945) and at Bougainville (November 1, 1943–August 15, 1945). The introduction of napalm in 1944 gave another potent weapon to close air support fighters such as the F4U Corsair—the combination was used to great effect in the Marianas (June–August 1944) and the Philippines (October 20, 1944–August 15, 1945) and on Okinawa (March–June 1945). Ground-attack aviation, which began in World War I, came into its own in World War II.

Air Warfare, Naval

On November 14, 1910, flying a Curtiss pusher aircraft, American Eugene B. Ely made the first flight from a ship, the light cruiser *Birmingham*, at Hampton Roads, Virginia. On January 18, 1911, Ely landed the same Curtiss pusher on the armored cruiser *Pennsylvania* in San Francisco Bay for the first landing of a plane on a ship. Britain's Royal Navy later conducted similar tests.

The world's major navies developed four major roles for naval aircraft: reconnaissance, spotting for naval gunnery, attacking enemy fleet and shore installations, and defending the fleet from enemy aircraft. Navies first relied on seaplanes and land-based aircraft, but during World War I, Britain began the conversion of several ships into aircraft carriers. This undertaking came to include the battle cruisers *Furious*, *Courageous*, and *Glorious*, all of which

served in World War II. The U.S. Navy commissioned its first aircraft carrier, the *Langley*, in 1922, the same year Japan commissioned its first carrier, the *Hosho.*

Following World War I, the world's navies deployed catapult-launched seaplanes on their battleships and cruisers for reconnaissance and spotting. Many navies considered building aircraft carriers, but only Great Britain, Japan, and the United States built them in significant numbers. During the 1920s and 1930s, aviators in all three of these navies solved the many technical problems of carrier operations despite low budgets, some opposition, and the Washington and London treaties limiting the size, number, and armament of the carriers. Large new aircraft carriers joined the three navies' fleets in the late 1930s and early 1940s.

Each nation developed a force suited to its particular needs. The United States and Japan planned for operations across the vast and relatively empty stretches of the Pacific Ocean, where land air bases would be few. Both nations developed long-range seaplanes, such as the U.S. Consolidated PBY Catalina, to extend their search range, although only the Japanese Navy developed land-based bombers to support its carrier aircraft. Japan also sought to maximize the number of planes on its aircraft carriers. Limited by the size of their internal hangars, Japan's larger carriers generally carried between 70 and 80 planes. On U.S. carriers, planes were parked on the decks, and hangars were used only for repair and maintenance. This enabled the United States to bring as many as 100 planes into battle. The U.S. Navy also took better advantage of folded-wing airplanes to fit large complements on its carriers. Keeping planes on deck also substantially increased the pace of operations on the U.S. carriers, allowing planes to be launched at a much higher rate than from their Japanese and British counterparts.

Britain planned for war in Europe, where its fleet was likely to confront land-based airpower. The British therefore favored heavily protected aircraft carriers with armored flight decks capable of withstanding 500-pound bombs. Although this scale of protection reduced the British aircraft complement to half that of comparably sized U.S. aircraft carriers, it paid off repeatedly when British aircraft carriers survived damage that likely would have sunk a U.S. or Japanese carrier. On January 10, 1941, while protecting a convoy bound from Alexandria to Malta, the carrier *Illustrious* survived hits by 500-pound and 1,000-pound bombs as well as further damage inflicted while

under repair at Malta. Later in the war, several British carriers withstood hits from Japanese kamikaze aircraft with minimal damage.

Unlike the case in Japan or the United States, the Royal Air Force, rather than the navy, had authority over naval aviation until 1937. This divided leadership slowed innovation, and the Royal Navy entered the war with obsolete aircraft such as its Fairey Swordfish biplane torpedo bomber.

Japan developed its aviators into an elite strike force, selecting only 100 new aviators each year from its rigorous training program. In 1941, they flew the best naval aircraft in the world: the Mitsubishi A6M2 Reisen ("Zero") fighter, so named because it entered service in 1940, the Japanese year 5700, and was henceforth known as the type 0; the Aichi D3A "Val" dive-bomber; and the Nakajima B5N "Kate" torpedo bomber. These aircraft sacrificed protection for speed and maneuverability, and they considerably outperformed and outranged U.S. naval aircraft. Japanese fleets sent their search planes out to almost 600 miles, compared with 350 miles for the U.S. Navy, and their strike aircraft had a combat radius of 300 miles, compared with 200 miles for most U.S. aircraft.

The Zero established a deadly combat reputation, and Americans flying Grumman F4F Wildcats could only best it with careful tactics and teamwork. The U.S. Douglas SBD Dauntless proved to be an excellent dive-bomber and served through much of the war, but the obsolete Douglas TBD Devastator torpedo bomber was slow and vulnerable. The U.S. Navy replaced it as soon as it could with the more modern Grumman TBF Avenger following the great carrier battles of 1942.

During the first two years of war, aircraft did little to fulfill the promises of prewar aviation advocates. German aircraft rarely hit British warships during the 1940 Norwegian Campaign, and the German battle cruisers *Gneisenau* and *Scharnhorst* sank Britain's aircraft carrier *Glorious* with gunfire. In November 1940, British carrier aircraft surprised the Italian fleet anchorage at Taranto and torpedoed three battleships, but this proved little to critics, who argued that battleships at sea would evade bombs and torpedoes and devastate attacking aircraft with their heavy defensive armament.

Critics were also unimpressed by the battering by land-based aircraft that British carriers sustained while escorting convoys through the Mediterranean; however, carrier aircraft proved critical in bringing the German battleship *Bismarck* to battle. On May 16, 1941, torpedoes dropped by Swordfish

aircraft launched from the *Ark Royal* jammed the *Bismarck*'s rudder. Yet it required the heavy guns of British battleships to actually sink the ship. Similarly, Japan's brilliantly conceived and executed attack on Pearl Harbor proved only that bases and stationary ships were vulnerable to surprise air attack. Three days later, though, Japanese Navy Mitsubishi G4M land-based bombers located and sank the newest British battleship, the *Prince of Wales*, and the battle cruiser *Repulse* in an hour-long battle off the coast of Malaya. The British warships shot down only 3 of 129 attacking aircraft. Aircraft would dominate many future sea battles.

Japanese and U.S. aircraft carriers engaged each other in four battles in 1942. The first of these, the Battle of the Coral Sea (May 7–8), ended with roughly equal losses for both sides. At Midway (June 3–6), though, Japan lost four carriers and sank only one U.S. carrier, the *Yorktown.* There followed a series of grueling battles around Guadalcanal in which both navies suffered heavily: the Eastern Solomons (August 24–25), which cost the Japanese one light carrier and the Americans damage to the carrier *Enterprise*, and the Santa Cruz Islands (October 25), where the U.S. carrier *Hornet* was sunk and two Japanese carriers were damaged.

Aircraft carriers, loaded with fuel and ordnance, proved particularly vulnerable to even minor damage, and few survived the first year of war in the Pacific. The United States lost five of its seven carriers in these battles, and the sixth suffered heavy damage. Japan suffered similar losses to its carrier fleet; more than 400 of the 765 airmen who attacked Pearl Harbor had died in battle by the end of 1942, in part the consequence of a poor Japanese pilot-replacement and -training system.

In an effort to replace lost aircraft carriers, the United States converted light cruisers into small aircraft carriers, such as the 33-aircraft *Independence*, which joined the fleet in June 1943. Japan also added partial flight decks to two battleships, allowing them to launch but not recover planes, and it converted a Yamato-class battleship to an aircraft carrier, the 64,800-ton *Shinano.*

Yet U.S. industry easily won the naval building race. During the war Japan completed 15 fleet, light, and escort car-riers, while the United States commissioned 139, including 17 of the large Essex class; 9 of the light Independence class; 113 escort carriers of the Bogue, Sangamon, Casablanca, and Commencement Bay classes; and 4 conversions. Of these, 37 escort

carriers served with the Royal Navy. By mid-1944, the United States was launching a large aircraft carrier every month.

U.S. carrier operations became increasingly sophisticated after the 1942 battles. Improving radar, which by early 1944 could detect even low-flying aircraft, and new control and communications systems allowed U.S. fighters to intercept attacking aircraft with great success. New ships, increasing antiaircraft armament, and the proximity fuze considerably improved fleet defense. Radar-equipped TBF Avengers proved adept at locating targets at sea and in the air, allowing the U.S. Navy to intercept attacking aircraft at night. Whereas the Japanese Navy continued to rely on its prewar aircraft designs, the United States developed several new airplanes, which began joining the fleet in 1943. These included the excellent Grumman F6F Hellcat and Vought F4U Corsair, both of which completely outclassed Japan's Zero in combat.

U.S. aircraft also joined the British Royal Navy—first Wildcats and later Corsairs, Hellcats, and Avengers. By 1943, the United States was supplying most of the Royal Navy's aircraft. U.S. industry also churned out dozens of small escort carriers for both its own navy and the Royal Navy. Carrying two dozen aircraft, these "baby flattops" provided continuous air cover for convoys crossing the Atlantic. Other escort carriers formed the core of antisubmarine hunter-killer groups that prowled the ocean in search of German U-boats and reinforced convoys under attack. Combined with land-based airpower, the escort carriers provided the answer to the threat from Germany's U-boats and, in mid-1943, turned the tide of the Battle of the Atlantic. They also provided vital air support for numerous amphibious invasions.

A series of U.S. carrier raids and air offensives further wore down Japanese air strength in the Pacific during 1943. By November, when the United States invaded Tarawa and began its drive across the Central Pacific, 11 U.S. carriers faced only 6 Japanese carriers. U.S. Navy carriers, supported by an enormous fleet train and logistical system, raided throughout the Central Pacific. They isolated Japanese-held islands before invasion, protected amphibious landings, and provided close air support for the invading soldiers and marines. U.S. training and combat performance continued to improve, and an excellent submarine and seaplane rescue

service saved the lives of many American pilots shot down during these missions.

The Japanese carrier fleet, rebuilt from the 1942 battles and supported by land-based planes, confronted a far larger U.S. fleet in June 1944 during the Battle of the Philippine Sea. The result was the “Great Marianas Turkey Shoot,” as the better-trained and better-equipped Americans shot down scores of poorly trained Japanese pilots who failed to press home their attacks and often missed their targets. Japan lost 475 planes and almost as many pilots; the United States lost 100 planes and 16 pilots. Japanese naval airpower never recovered from this defeat.

In the Battle of Leyte Gulf in October 1944, Japan used one heavy aircraft carrier and three light carriers (with a total of only 116 planes on board) as a diversion to draw away the U.S. battle fleet so Japanese battleships and cruisers could attack the landing beaches. Instead of the superbly trained pilots who attacked Pearl Harbor, Japan relied on kamikazes, whose suicidal attacks sank dozens of U.S. ships. In the March–June 1945 Battle for Okinawa, the kamikazes inflicted more casualties on the U.S. Navy than it had sustained in all of its other wars combined. But the Japanese were unable to stem the U.S. Navy advance across the Pacific. Throughout the Pacific, from the Mariana Islands to the Philippines, Iwo Jima, and Okinawa, U.S. naval aircraft smashed Japanese defenses, destroyed Japanese aircraft, supported invasions, sank Japanese ships, and raided Japanese positions.

By 1945, four British aircraft carriers operated in the Pacific, and these joined more than a dozen U.S. carriers in launching a series of devastating air attacks on Japanese positions in July and August. All told, 1,000 U.S. and 250 British carrier aircraft destroyed more than 3,000 Japanese aircraft in the air and on the ground, adding to the damage that B-29 bombers had already inflicted on Japan’s home islands. New aircraft carriers continued to join the U.S. fleet, although the first of large 47,000-ton Midway-class battle carriers were not commissioned until September 1945, after the end of the war. Of Japan’s carriers, only the old experimental *Hosho* survived the war. Japan’s fortunes in the Pacific war had risen and then sunk with its aircraft carriers.

Air Warfare, Strategic Bombing

Strategic bombing may generally be defined as air attacks directed at targets or systems capable of having a major impact on the will or ability of an enemy nation to wage war. Airpower proponents have touted strategic bombing as a unique war-winning capability and used it to justify independent air services.

When World War II began, only two nations had coherent and committed strategic bombing programs: Great Britain and the United States. Although most states with advanced militaries had interest in airpower, continental concerns, resource limitations, or misguided procurement policies hindered most aspirants to powerful long-range bombing forces. Only relatively protected naval powers such as the United States and Britain could afford much attention to strategic bombing, lured by the strong political appeal of its

promise of quick victory at low cost. Both efforts had roots in the experience of the Royal Air Force (RAF) in World War I, when Sir Hugh Trenchard developed tactics and policies for the world's first independent air service and talented subordinates such as Hardinge Goulburn Giffard, 1st Viscount Tiverton (subsequently 2nd Earl of Halsbury), pioneered target analysis for morale and material effects to assault the foundations of the German war economy.

Although airmen in both countries became aware of the ideas of General Giulio Douhet during the interwar years and used them to support arguments for strategic airpower, Douhet had little impact on the evolution of the RAF or the U.S. Army Air Corps. The RAF continued to pursue Trenchard's ideal of a massive aerial offensive, assisted by politicians who were willing to fund an aerial deterrent instead of large expensive land armies that could become involved in more bloody continental wars. Targeting priorities remained vague, however, and the war would reveal the large gap between claims and capabilities.

The Americans took a different approach that can be traced back to Tiverton. Although the subordinate army air service's primary mission remained ground support, a group of capable young officers at the Air Corps Tactical School (ACTS) developed a theory of precision daylight bombing of carefully selected targets in the industrial and service systems of enemy economies. Pinning their hopes on the capabilities of new aircraft such as the Boeing B-17 Flying Fortress, these airmen expected unescorted, self-defending bombers to destroy vital nodes of the enemy's war economy that would grind it to a halt.

Bombing examples before and during the early days of World War II—in Spain and China and even the German Blitz on London—appeared to demonstrate the ineffectiveness and drawbacks of indiscriminate attacks on cities and to support the superiority of precision tactics. When U.S. president Franklin D. Roosevelt asked the army and navy for munitions estimates for a potential war in 1941, many of those ACTS instructors had joined the Air Staff in Washington. They soon developed a plan, known as AWPD/1, that envisioned a precision bombing campaign as a key component of the American war effort. When a larger plan that included AWPD/1 was accepted, the U.S. Army Air Forces (USAAF) finally had a justification for

pursuing independent strategic bombing. It proved difficult to put theory into practice though.

Early British attacks moved from a Tivertonian focus on key systems such as power plants or oil to a more Trenchardian reliance on widespread morale effects. Daylight raids proved deadly for RAF Bomber Command, revealing critical deficiencies in the number and quality of their bombers. Operations shifted to the night, but the August 1941 Butt Report concluded that only about one in five aircrews were bombing within five miles of their intended targets.

Adapting to the reality of their capabilities, in February 1942 Bomber Command was directed to attack area targets—that is, cities—with the objective of undermining German civilian morale, particularly that of industrial workers. Under the direction of Air Chief Marshal Sir Arthur "Bomber" Harris, Bomber Command built up its strength and obtained better aircraft, especially Halifax and Lancaster four-engine bombers.

A Boeing B-17 Flying Fortress drops bombs on Nuremberg in 1945. The B-17 was the principal U.S. strategic bomber in the European Theater during World War II. (Library of Congress)

On May 30, 1942, Bomber Command mounted the first "thousand bomber raid" on Cologne, and in July 1943 it achieved the first bombing-induced firestorm against Hamburg, killing some 45,000 people. German

night defenses adapted, however. When Harris decided to mount a full-scale assault on Berlin in late 1943, the Luftwaffe shot down so many British aircraft and bombing results were so disappointing that the utility of the whole night area campaign was brought into question.

Meanwhile, the Americans also encountered difficulties. At Casablanca in January 1943, Allied leaders had agreed to a Combined Bomber Offensive (CBO) of round-the-clock attacks. It was rather poorly coordinated, but it did allow each air force to pursue its preferred approach. The most significant USAAF strategic attack of that year was General James Doolittle's July 1943 attack on Rome from North Africa, which heavily damaged the marshaling yards, limited collateral damage with impressive accuracy, and contributed to the fall of Benito Mussolini's government.

Elements of the Eighth Air Force began bombing the continent from England in August 1942, although they did not fly deep-penetration raids into central and eastern Germany until a year later. Losses among unescorted B-17 and B-24 "Liberator" bombers were horrendous, especially during attacks against ball-bearing plants at Schweinfurt in August and October 1943. Although the Fifteenth Air Force in Italy joined the daylight campaign in November 1943, the Americans were unable to sustain such attrition.

By the end of the year, such deep attacks on Germany were suspended, and it appeared that the Luftwaffe was on the verge of winning the strategic air war in Europe.

Everything changed, however, with the advent of the Allied long-range escort fighter, most notably the P-51 "Mustang." In mid-February 1944, the U.S. Strategic Air Forces (USSTAF) began their "Big Week" attacks against German aircraft factories. The air battles that ensued decimated the Luftwaffe, and by the time of the D-day landings in June, the Allies achieved air supremacy over France and air superiority over Germany. The escort fighters began by sticking close to their bombers, but they proved most effective when they were released to sweep against enemy aircraft in the air and on the ground. Because of the American adoption of radar-directed bombing methods through overcast skies, the Germans had little respite even in poor weather, and their losses were increased by many accidents.

Although the strategic bombers had an initial priority to operations in support of the coming invasion, Allied airpower had built up to the point that USSTAF commander General Carl Spaatz could begin sustained attacks

against oil targets in May. By the fall of 1944, Luftwaffe and Wehr-macht operations were severely crippled by fuel shortages, and concentrated attacks against transportation networks further limited German mobility and economic activity.

During this period, Harris resisted diversions against “panacea targets” such as oil and remained committed to “de-housing” German workers. British bombers did sometimes assist with attacks on oil and transportation targets, though, and their larger loads of bombs could cause considerable damage. The RAF greatly improved its ability to navigate and bomb at night or in bad weather, and it usually achieved greater accuracy than the Americans under such conditions.

Even in clear weather, precision bombing did not approach the image often portrayed in the press of bombs dropping down smokestacks. Usually, all aircraft in the B-17 and B-24 formations dropped their loads together, with intervals set between bombs so they would fall a few hundred feet apart. The pattern therefore covered a wide area. As USSTAF strength increased and targets became scarcer, planners became more tolerant of civilian casualties, adopting less accurate radar-directed bombardment methods in bad weather and hitting transportation objectives in city centers.

At least in Europe, American air leaders remained committed to attacks aimed primarily at economic and military targets instead of at civilian morale, a policy that sometimes caused friction with their British allies. There were also differences over bombing in occupied countries, where the British were particularly sensitive to political repercussions. The Americans were willing to bomb any Axis factory regardless of the nationality of the workers, whereas the British preferred to strike any German anywhere. The British also favored heavy attacks on the capitals of Axis allies in the Balkans, although the Americans successfully blocked what they saw as an inefficient and ineffective diversion of valuable airpower. Debates about the relative success and morality of RAF and USAAF bombing continue to the present day.

The differing national approaches also played a role as the war in Europe approached its end, and both air forces sought an aerial death blow to finish the war. The British plan, code-named thunderclap, was based on shattering morale by destroying Berlin. That major assault was conducted by the Eighth

Air Force on February 3, 1945. Allied concerns about assisting the Soviet advance helped produce the firestorm that devastated Dresden 10 days later.

The corresponding American plan, code-named clarion, aimed to awe the German populace with widespread attacks on targets in every village. It was eventually changed into primarily a transportation assault because of concerns for efficiency, public image, and even morality. The controversy in Great Britain over the Dresden attack was one factor in the suspension of the strategic air war against Germany in April, although it was not as important as the simple fact that Allied bombing forces were running out of suitable targets.

American air leaders such as USAAF commanding general Henry H. "Hap" Arnold, who had hoped to build support for service independence by demonstrating the ability of air forces to win wars on their own, still had a chance against Japan. The USAAF referred to the B-29 Superfortress either as a very heavy bomber or a very long-range bomber, and by World War II standards it was assuredly both. Every theater wanted to receive the B-29s, but the aircraft's impressive capabilities and late availability destined it for the Pacific. The Joint Chiefs of Staff established the Twentieth Air Force and named Arnold its "executive agent" to command the B-29s. Although operational control of the aircraft supposedly remained in Washington, in practice the commanders of the subordinate XX and XXI Bomber Commands enjoyed a great deal of independence.

The XX Bomber Command, based in India and China, mounted its first raid against Japan in June 1944. Operation MATTERHORN had little success, even after Arnold assigned his leading troubleshooter, Major General Curtis LeMay, to command it. Bases were too far from key Japanese targets, were difficult to supply, and were hard to protect from Japanese ground attacks. Additionally, the B-29s had been deployed a year early, and testing had to be completed in combat.

More was expected from the XXI Bomber Command based in the Mariana Islands, which was within range of the most important enemy industrial complexes in Honshu. Initial attacks were launched from Saipan in November 1944, but again results were disappointing. Besides technical and logistical problems, the command faced severe weather over target areas that made normal high-altitude precision bombing impossible. Although the vulnerability of Japanese cities to fires was well known and had inspired

some USAAF planning for incendiary bombing, there was no meaningful pressure from Washington for such tactics.

Impatient for a better payoff on a huge investment, however, Arnold decided in January 1945 to concentrate all the B-29s in the Marianas under LeMay. Although the feisty and innovative air commander received little specific guidance from Washington, LeMay knew that he too could be relieved if he proved ineffective.

After trying to make daylight precision bombing work, on his own initiative LeMay adopted a new approach to destroy key industrial targets. His first low-level nighttime area incendiary raid in March 1945 was a spectacular military success, incinerating 16 square miles of Tokyo and killing 90,000 people. Although he would mount some periodic day- and night-precision attacks, the fire raids dominated LeMay’s air campaign

against Japan. Eventually he burned 178 square miles of some 66 Japanese cities, killing hundreds of thousands of people and causing millions to flee to the countryside. B-29s also dropped the two atomic bombs on Hiroshima and Nagasaki.

MacArthur's Far East Air Forces contributed three attacks against Kyushu before the Japanese surrender, but the last American bombs that fell on Japan came from the Twentieth Air Force. More than 1,000 planes hit Japan on August 14, some even after the Japanese radio had announced acceptance of the terms of surrender.

Both the British and the Americans conducted postwar assessments of the strategic bombing campaign. The massive U.S. Strategic Bombing Survey compiled an impressive collection of data, although differing personalities and agendas within the survey committees produced several conflicting conclusions. They agreed, however, that the American approach to targeting was superior to RAF area bombing. The British Bombing Survey Unit relied on the American data along with some of its own, but overall it was not as thorough or comprehensive. It was also critical of the city attacks, but it gave much credit to the RAF-USAAF campaign against transportation.

In retrospect, the most important contribution that strategic bombing made in Europe was to defeat the Luftwaffe and ensure that when Allied troops driving across Northwestern Europe saw aircraft, they could be certain that the planes were friendly. The CBO did not prevent the late-mobilizing German economy from peaking in 1944, but the oil and transportation campaigns had a major impact on degrading it thereafter. Civilian morale did not break, but some British observers have noted that the city bombing motivated German industry to disperse, thus making it more vulnerable to transportation interdiction. More than 700,000 German civilians died from Allied bombing, about the same number who succumbed to the effects of the British naval blockade in World War I.

The cost of the CBO was also high for the air forces involved. The USSTAF lost 9,949 bombers, 8,500 fighters, and 64,000 airmen killed. RAF Bomber Command lost 57,000 killed or missing from all causes. In the Pacific, the incendiary attacks and atomic bombs were an important component of the series of shocks that produced the Japanese surrender, although the significance of other factors such as the submarine and naval blockade as well as Soviet entry into the war cannot be underestimated.

The World War II strategic bombing experience had several legacies. In the United States, the new U.S. Air Force was born in 1947, espousing a doctrine of air warfare based on the perceived lessons of the U.S. air campaigns against Germany and Japan along with the awesome power of nuclear weapons. "Vertical" targeting approaches against key Soviet industries resembled the German oil and transportation attacks, whereas "horizontal" methods based on LeMay's incendiary campaign were aimed at Soviet industrial concentrations in cities. One planner described the Strategic Air Command's early war plans as "precision attacks with area weapons."

Since that time, the U.S. Air Force has dedicated itself to the pursuit of real precision, and the extreme accuracy of its contemporary munitions as well as current targeting doctrines have roots in the ideas developed at ACTS in the 1930s. While Americans trumpet their ongoing commitment to the principles of precision bombing, however, the rest of the world also remembers the images of Tokyo, Hamburg, and Dresden.

Aitken, William Maxwell (1879–1964)

Canadian-born British business press magnate and member of the 1940–1942 cabinet. William Maxwell Aitken was born on May 25, 1879, in Maple, Ontario, Canada. Soon thereafter his family relocated to Newcastle, New Brunswick, Canada, which he considered “home” for the remainder of his life. He briefly attended the University of New Brunswick but never earned a college degree. Aitken was a gifted writer (he authored 11 books) who focused early on amassing a fortune. After making several trips to London, he moved there in July 1910. He became active in politics and business, buying and selling control of the Rolls-Royce Company. In 1911 Aitken was elected to the British Parliament on a platform of promoting British Empire trade, serving until 1916. A member of the Liberal Unionist Party, he was knighted in 1911 and became Lord Beaverbrook in 1917.

Aitken purchased control of the *Daily Express* newspaper in December 1916 and set about building its circulation. Two years later he began the *Sunday Express*, and he took control of the *Evening Standard* in 1924, giving him control of morning, evening, and Sunday London papers. This editorial base made him a powerful figure in British political circles.

Maxwell Aitken, First Baron Beaverbrook (Lord Beaverbrook), was a Canadian-born businessman, politician, and newspaperman who became a forceful figure in the political scene of Great Britain. During 1940–1941 he played an important role as minister of aircraft production. (Baron/Getty Images)

Aitken quickly became one of Winston Churchill's closest advisers when Churchill became prime minister on May 10, 1940. Churchill gave Aitken the post of minister of aircraft production in the War Cabinet. He served just less than a year (May 14, 1940, to April 30, 1941), but in that crucial period he marshaled Britain's aircraft industry to turn out thousands of fighters and bombers. His forceful methods made many enemies in the cabinet, the Air

Ministry, and the Royal Air Force (RAF). Aitken attempted to resign several times on grounds of health, but Churchill dissuaded him. Residing at 12 Downing Street, he became a minister of state on April 30, 1941, continuing to advise Churchill but without specific ministerial portfolio.

On June 22, 1941, Aitken was named minister of supply to supervise broader wartime production. Here his impact was less sensational than in the aircraft sector. He accompanied Churchill to the Placentia Bay meeting with U.S. president Franklin D. Roosevelt (August 8–11, 1941) and to subsequent meetings in Washington, D.C. Aitken also traveled as Churchill's emissary to meet with Soviet leader Joseph Stalin in October 1941.

Aitken resigned as a minister on February 28, 1942, ostensibly over some of the personnel decisions made in a cabinet reshuffle. He continued to serve as an informal adviser to Churchill for the remainder of the war, however, often championing Soviet interests. Returning to publishing after the war, Aitken died in London on June 9, 1964.

Aixinjueluo Puyi (1906–1967)

Last emperor of China, more commonly remembered as the puppet ruler of Japanese-controlled Manzhouguo (Manchukuo, formerly Manchuria) from 1932 to 1945. Born in Beijing (Peking) in Hebei (Hopeh) on January 14, 1906, and nicknamed Henry by his English tutor (he was known to Westerners as Henry Puyi), Aixinjueluo Puyi (Aisingioto P'u-i) ascended the throne in December 1908, at age two, as Xuan Tong (Hsuan T'ung).

During the Chinese Revolution of 1911–1912, the emperor's mother negotiated frantically with General Yuan Shikai (Yuan Shih-k'ai) for a settlement that would guarantee their lives and financial security. Ignoring the claims to the throne of Sun Yixian (Sun Yat-sen), Puyi abdicated in favor of Yuan, who was authorized to create a provisional republic and establish national unity by embracing all antiimperial forces.

Briefly restored in 1917 by the intrigues of warlord politics, Puyi soon was again deposed, and he finally sought refuge in the Japanese concession in Tianjin (Tientsin) in Hebei Province by 1924. In July 1931 his brother visited Japan and met with various rightist politicians. Shortly after the 1931 Mukden (Shenyang) Incident in Liaoning, representatives of the Guandong (Kwantung) Army visited Puyi to discuss the future of Manchuria, assuring him that they were merely interested in helping the people of Manchuria establish an independent nation. The Japanese military was vague about whether the new state would be a monarchy or a republic. Negotiations continued through the fall and winter of 1931–1932, and Puyi finally agreed to be smuggled to Manchuria by sea and to accept the title of chief executive of the state of Manzhouguo (Manchukuo). Tokyo belatedly recognized the army's creation in August 1932.

Aixinjueluo Puyi, the last emperor of China and then the puppet ruler of Japanese controlled Manzhouguo (Manchukuo, formerly Manchuria) from 1932 to 1945. Pictured here in 1934. (Illustrated London News Picture Library)

In 1934 the Guandong Army allowed Puyi to ascend to the throne as emperor of Manzhoudiguo (Manchoutikuo), the Manzhu (Manchu) Empire, wearing imperial dragon robes sent from the museum in Beijing. As "emperor," Puyi served the Greater East Asia Co-Prosperity Sphere loyally until 1945, including undertaking a state visit to Tokyo.

When Soviet forces invaded Manzhouguo in August 1945, Puyi was dethroned and imprisoned. Released to Mao Zedong's (Mao Tse-tung) China in 1950, Puyi was again imprisoned and subjected to reeducation programs until his "rehabilitation" in 1959. He spent his final years as a gardener in Beijing's botanical gardens until his death from cancer on October 17, 1967.

Alamein, First Viscount Montgomery of

See Montgomery, Sir Bernard Law

Alam Halfa, Battle of (August 31–September 7, 1942)

Battle in North Africa between German field marshal Erwin Rommel's Afrika Korps and British lieutenant general Bernard Law Montgomery's Eighth Army. Fearful that he would permanently lose the initiative to the Eighth Army after his advance was halted at the First Battle of El Alamein during July 1–27, 1942, Rommel reorganized his forces with the intention of resuming his advance toward Suez. Meanwhile, Montgomery assumed command of the British Eighth Army on August 13 and began planning for the offensive, all the while expecting Rommel to attack first.

Late on the evening of August 30, Rommel attempted—as at Gazala, although his force was weak in armor—to get around the Eighth Army's left flank. With diversionary attacks designed to hold British forces along the coast, Rommel ordered the Afrika Korps east and south of Alam Halfa Ridge, aiming to swing north to the Mediterranean coast behind Montgomery and thus enveloping the Eighth Army.

The Eighth Army had established a defense in depth, including strong positions on the Alam Halfa and Ruweisat ridges, and Montgomery rejected any withdrawal. The 10th Armored Division, 22nd Armored Brigade, and the 44th Division defended Alam Halfa, while the 7th Armored Division was south of the ridge. Montgomery ordered his armored units to defend from their current positions rather than advancing to meet Rommel's panzers.

Slowed by British minefields and fuel shortages, Rommel's tanks did not reach Alam Halfa until the evening of August 31. Daylight brought vicious Desert Air Force attacks against the Axis advance, and the 7th Armored Division's placement forced Rommel to swing north prematurely, into the teeth of a tank brigade on Alam Halfa Ridge. Fuel shortages prevented the Afrika Korps from outflanking Alam Halfa to the east, forcing Rommel onto the defensive there.

On September 1, after a flank assault on the 22nd Armored Brigade failed and having suffered severe losses, Rommel ordered his forces to retire to their original positions. The withdrawal, which began the next day, exposed the Afrika Korps to further devastating British aerial attacks. Rommel repulsed a counterattack by the 2nd New Zealand Division on the evening of September 3, and Montgomery believed that he lacked the resources to force a general Axis withdrawal, so he decided not to press his advantage for the time being. Certainly Rommel's past successes made Montgomery wary of pushing too far forward.

Montgomery nonetheless had fought his first battle as commander of the Eighth Army with great skill. Rommel now had no choice but to go on the defensive. He established positions between the Mediterranean and the Qattara Depression as both sides prepared for the Eighth Army's upcoming offensive: the Second Battle of El Alamein (October 23–November 4, 1942).

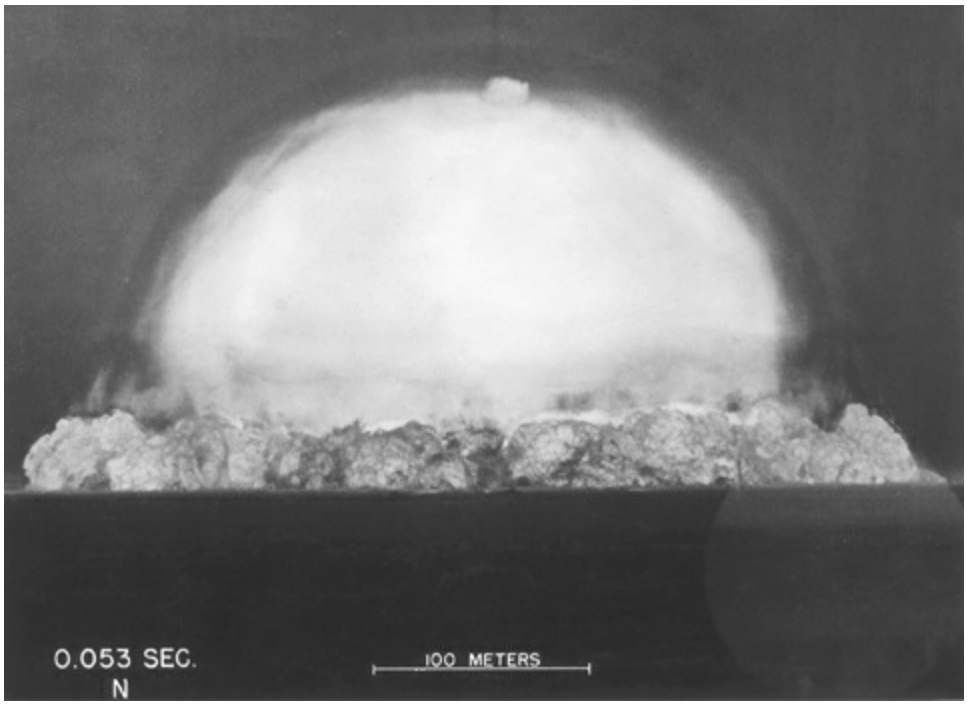
Alamogordo (July 16, 1945)

Site of the first successful test of an atomic device. By the spring of 1945 the ongoing Manhattan Project had produced sufficient plutonium for several fission bombs, but scientists were unsure of the reliability of the implosion technique required to initiate a nuclear chain reaction and an explosion. Small-scale experiments were unrevealing, because nothing below critical mass can explode. Thus, Major General Leslie R. Groves, overall director of the Manhattan Project, authorized a full-scale test (known as Trinity) of the implosion technique.

The Jornada del Muerto (Dead Man's Trail) near Alamogordo, New Mexico, was chosen as ground zero for the explosion. Remote and ringed by high peaks, the site helped to preserve secrecy and contain radioactive fallout, the effects of which were not yet then fully known.

Secured atop of a 100-foot steel tower, the device exploded at 5:30 a.m. on July 16, 1945. With a predicted minimal yield of 500 tons of trinitrotoluene (TNT) and an optimal yield of 5,000 tons if all parts functioned synergistically, the device actually produced a yield of 20,000 tons of TNT. Accompanied by a blinding flash of light, a powerful shock wave, and an awesome roar, the device vaporized the tower, creating a crater some 400 yards in diameter and 10 to 20 feet deep. A mushroom cloud rose to 41,000 feet; the explosion was heard 100 miles away, and the light produced was seen from 200 miles away. To allay concerns of local residents, army officials reported that an ammunition dump had blown up.



The first test of an atomic bomb, near Alamogordo, New Mexico, July 16, 1945. (Fotosearch/Getty Images)

Scientists were awestruck by the power of the explosion. Julius Robert Oppenheimer, a theoretical physicist who had labored for many months on the Manhattan Project, famously recalled the god Vishnu's line from the Bhagavad Gita: "I have become death, shatterer of worlds." Groves simply predicted, "The war's over."

A report on the success of the detonation was quickly passed to President Harry S. Truman, who was then at Potsdam, Germany, meeting with newly elected British prime minister Clement R. Attlee and Soviet leader Joseph Stalin. Truman's negotiating stance with Stalin hardened considerably based on the stunning results of the Trinity test, although Stalin certainly knew of the Manhattan Project because his spy network had long ago penetrated the top-secret program.

The Trinity test site is located on White Sands Missile Range. It is open to the public twice a year: the first Saturday in April and the first Saturday in October.

Alanbrooke, First Viscount

See Brooke, Sir Alan Francis

Alaska-Canadian Highway

Overland military highway completed on October 28, 1942, that connected Alaska with the lower 48 U.S. states via Canadian-held Yukon and British Columbia. The Alaska-Canadian (ALCAN) Highway was a joint U.S.-Canadian venture, although the U.S. government funded it and provided most of the manpower and equipment to build it. When completed, the ALCAN covered nearly 1,700 miles; today, the highway is considerably shorter (1,387 miles) because it has undergone continual improvement and rebuilding. The ALCAN begins in Dawson Creek, British Columbia, where several Canadian highways converge, and meanders northwestward, terminating at Delta Junction, Alaska, about 100 miles to the south of Fairbanks, Alaska.

As early as the 1920s, American officials sought to construct a road that would link Alaska with the lower 48 states, but the Canadian government showed little interest in such a venture because only a few thousand Canadians in the Yukon would have benefited. The December 1941 Japanese attack on Pearl Harbor, however, coupled with fears that the Japanese might menace the U.S. and Canadian west coasts and the Aleutian Islands, made the

construction of an Alaskan-Canadian link a military necessity. The Franklin D. Roosevelt administration approved the project in early February 1942, with the official start of construction on March 8, 1942. The Canadian government readily agreed to support the project, although the U.S. Army Corps of Engineers did the vast majority of the work.

The ALCAN was a massive undertaking not only because of the distances involved but also because of the rugged terrain and harsh climate of the region. The route was scheduled to be completed by the autumn of 1942, as the arctic cold and deep snows would have precluded any construction during the winter months. The U.S. Army commandeered Canadian heavy equipment and trains to move supplies and equipment to Dawson Creek. To hasten completion, construction crews worked from both the northern and southern ends of the route, meeting near the British Columbia-Yukon border at approximately the 60th parallel.

The initial route was not terribly direct and traversed rugged terrain, but it represented the best way to move goods and military supplies from the United States to airfields in Alaska, the Yukon, and British Columbia. From there, U.S. military transports were able to move Lend-Lease supplies to Russian Siberia with much greater ease and speed. The route could be perilous, with steep grades, sharp drop-offs, no guardrails, dangerous curves and switchbacks, and poor pavement. Most bridges were initially built of pontoons or logs; steel bridges were built only when necessary. During the spring of 1943, a 100-mile portion of the ALCAN became impassable as the permafrost melted, which necessitated the building of a temporary corduroy road (made of logs laid perpendicular to the roadbed).

The ALCAN proved to be of major military importance, chiefly because of its role in the conveyance of Lend-Lease goods to Soviet Russia. After the war, the Canadian portion of the ALCAN was turned over to the Canadian government. By the 1980s, most of the roadway had been paved with asphalt, and large portions of the ALCAN have been incorporated as sections of newer major highways, including Alaska Route 2 and Canadian Highways 1 and 97.

Albania

Located in the western Balkans on the Adriatic Sea, Albania proclaimed its independence from the Ottoman Empire (Turkey) in November 1912, following the First Balkan War. Albania, which encompasses approximately 11,100 square miles, had a 1939 population of 1,073,000.

Prior to and during World War I (1914–1918), Albania descended into anarchy. In 1915, Italy established a virtual protectorate over much of Albania, a development that was secretly underwritten by the other Allied powers. The tiny nation was left in ruins as a result of the war, but in 1925, a republic was established there; however, in 1928 it was replaced by a monarchy under King Zog I that finally brought some stability to the country.

Having dominated Albania politically and economically for some time, Italian dictator Benito Mussolini planned a formal annexation of Albania in the spring of 1939. Italian troops invaded on April 7, 1939, and met only light resistance, although a small force led by Colonel Abas Kupi held the Italians at Durazzo for 36 hours, sufficient time for King Zog and his family to escape.

On April 16, 1939, King Victor Emmanuel III of Italy accepted the Albanian throne, and a profascist government was installed. The British government, still hoping to prevent an alliance between Mussolini and Adolf Hitler, acceded to the annexation, but the Greeks prepared to resist an Italian invasion of their own country from Albania, which occurred on October 28, 1940.

After Italy's entrance into the war on the side of Germany, Britain's Special Operations Executive (SOE) had attempted to create a united front movement under Abas Kupi and to stimulate a revolt against the Italians in northern Albania. The effort began well but faltered after the German conquest of Yugoslavia in April 1941 and the subsequent transfer of Kosovo

Province from Yugoslavia to Albania. As Axis fortunes waned in 1943, however, Albanian resistance revived.

In the mountains of southern Albania, the communists, encouraged by Tito (Josip Broz), leader of the Yugoslav Partisans, coalesced under Enver Hoxha. Liberal landowners and intellectuals formed the Balli Kombëtar (National Front) resistance movement. In central and northern Albania, Abas Kupi and various tribal leaders also established resistance groups. SOE agents Colonel Neil McLean and Major David Smiley were sent into southern Albania, and they subsequently recommended that the British provide aid to both Hoxha's Partisans and the Balli Kombëtar.

The disintegration of the Italian forces in Albania following the overthrow of Mussolini in September 1943 provided the Albanian guerrillas with arms and other supplies captured from or abandoned by the Italians. The Germans quickly sent in troops to clear out the remaining Italian forces, savagely repressed the local population, and "restored Albanian independence." The Germans established a new Albanian government under Mehdi Frasheri, but it was able to control only the main towns and coastal plain. The rest of the country descended into chaos as various guerrilla chieftains vied for power.

The British Balkan Air Force headquarters at Bari controlled support to anti-Axis guerrillas in the Balkans and was decidedly pro-Partisan, in both Albania and Yugoslavia. The British hoped to use all of the Albanian resistance forces to harass the German withdrawal from Greece, which began in September 1944. But when Hoxha's communists attacked the Balli Kombëtar and Abas Kupi instead, the British cut off aid to the noncommunist resistance groups, thereby ensuring their defeat. Kupi and the Balli Kombëtar leaders were evacuated to Italy with the McLean SOE mission, and the communists took over Albania.

With Yugoslav support, Hoxha seized power on November 29, 1944, and the People's Republic of Albania was recognized by the Allies. Albanians subsequently developed anti-Western views and supported a highly insular Stalinist regime for nearly half a century. Not until 1992 were the communists swept from power; the year prior, a constitutional republic had been proclaimed.

Aleutian Islands Campaign (1942–1943)

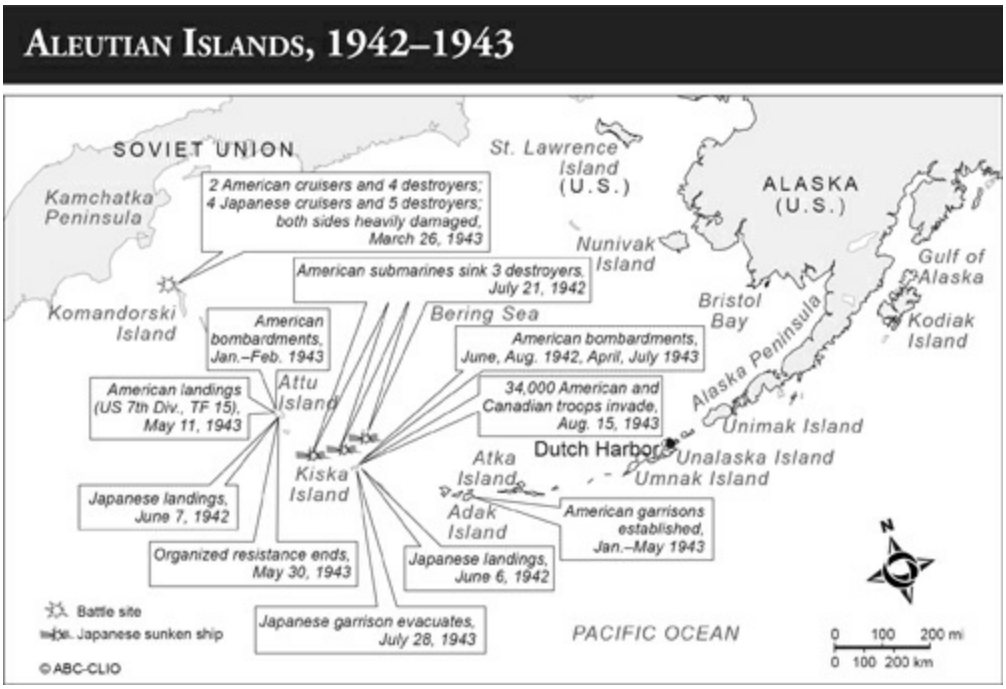
Military campaign for a 1,100-mile-long chain of U.S. islands stretching west from Alaska in the Bering Sea toward northern Japan. Although the Aleutians had a negligible population, no useful resources, and extreme climatic conditions that made them unsuitable for major military staging bases, they were nonetheless the scene of bitter fighting between U.S. and Canadian forces on the one hand and those of Japan on the other.

On June 7, 1942, elements of Japanese vice admiral Hosogaya Boshiro's Northern Naval Task Force seized the Aleutian islands of Attu and Kiska. The Japanese aim was twofold: to support Japan's advance on Midway Island by luring U.S. forces north and to gain bases in the Aleutians to deter U.S. attacks on the Japanese Kurile Islands. By May 1943 the Japanese had more than 2,500 men on Attu and more than 5,400 on Kiska.

This Japanese foothold on U.S. soil triggered a substantial response from the United States and Canada, which together would eventually commit more than 100,000 troops to this remote region. Rear Admiral Robert A. Theobald commanded Task Force 8, an array of sea, air, and land units charged with expelling the Japanese from the Aleutians. Theobald intended to interdict Japanese lines of communication into Attu and Kiska by isolating the Aleutian waters and engaging Japanese transports and warships where possible.

Initially, the Allies employed submarine attacks in the western Aleutians. When Rear Admiral Thomas C. Kinkaid replaced Theobald in January 1943, he doubled the effort to interdict Japanese supply convoys. On March 26, 1943, a small U.S. Navy task force intercepted and defeated a larger Japanese

force of cruisers, destroyers, and transports in the Battle of the Komandorski Islands (March 26, 1943). This action ended further Japanese surface resupply efforts.



Along with naval interdiction, U.S. and Canadian aircraft harassed the Japanese from bases in Alaska and the eastern Aleutians. In August 1942, U.S. forces established an airfield on Adak Island, from which bombers could strike Japanese forces in the western Aleutians. By September, Allied aircraft bombed targets on Kiska nearly every day for three weeks. The Japanese were forced to rely on submarines to ferry minimal subsistence supplies. By April 1943, the Allies had succeeded in tightening an air-sea noose around the Japanese bases.

Even so, U.S. commanders determined that invasions of Attu and Kiska were necessary. One consideration focused on unpredictable weather, especially fog, which could cloak naval activity and allow the Japanese to reclaim control of the seas. The U.S. 7th Infantry Division was designated as the landing force. It received amphibious warfare training at Fort Ord, California until April, when it deployed north for operations. Attu was chosen as the first objective, because intelligence estimated Japanese troops there to be only 500 men, considerably fewer than on Kiska.

The 7th Division, commanded by Brigadier General Eugene Landrum, landed on Attu on May 11, 1943, with almost 11,000 men. At first, U.S. commanders thought they had surprised the Japanese when they met no resistance at the shoreline. As American troops traversed through marshy tundra and ascended mountains ranging from 2,000 to 3,000 feet above sea level, however, they discovered more than 2,500 Japanese waiting in trenches along ridgelines, using the inhospitable terrain to their advantage.

The supply-starved Japanese troops conducted a stubborn defense that exacted a heavy toll on the U.S. force. After 19 days of attrition defense, the Japanese carried out a final banzai suicide attack with more than 600 soldiers, many of whom blew themselves up with grenades rather than surrender. U.S. losses were 561 killed and 1,136 wounded. Only 28 Japanese were taken prisoner.

Following the loss of Attu, the Japanese decided to evacuate the 5,400 troops remaining on Kiska. On the night of July 28, while U.S. ships were off refueling in foggy weather, two Japanese cruisers and six destroyers entered Kiska Harbor and in one hour evacuated their troops from the island. Not knowing about the evacuation, on August 16 the Allies conducted the planned amphibious assault on Kiska with more than 34,000 U.S. and Canadian troops. It took the Allies several days to realize the Japanese had departed, but the operation cost some 300 casualties from friendly fire and Japanese booby traps.

The campaign in the Aleutians was an indecisive one that challenged both Japanese and Allied planners. In the end, the Allies removed the Japanese from the two islands, but at great cost in resources committed for questionable gain.

Alexander, Sir Harold Rupert Leofric George (1891–1969)

British Army general. Born on December 10, 1891, in London, Harold Rupert Leofric George Alexander was educated at Harrow and Sandhurst and commissioned in the Irish Guards in 1911. He served on the Western Front during World War I and rose to command a battalion and, temporarily, a brigade, ending the war a lieutenant colonel. Following the war, he helped organize military forces in Latvia in 1919. He then graduated from the Staff College at Camberley and the Imperial Defence College and held staff assignments, first at the War Office and then in the Northern Command. From 1934 to 1938, he commanded the Nowshera Brigade of the Northern Command in India as a brigadier. On his return to Britain in 1938, he was promoted to major general and received command of the 1st Division.

General Sir Harold Alexander (left), Lieutenant General George S. Patton Jr. (center), and Rear Admiral Alan G. Kirk (right) during the inspection of an Allied invasion task force off the coast of North Africa in 1943. (Library of Congress)

Alexander's division was sent to France, where he distinguished himself during the May 10–June 25, 1940, Battle for France by commanding the British rear guard in the retreat to Dunkerque, I Corps. Promoted to lieutenant general in December 1940, Alexander had charge of the Southern Command in Britain. In February 1942, Alexander received command of British forces in Burma. Recalled to Europe, that July he became commander of British forces in the Middle East. There he worked well with Eighth Army commander General Bernard Law Montgomery as well as other Allied leaders and played a key role in building up British forces for the Battle of El Alamein (October 23–November 4, 1942).

Alexander attended the Casablanca Conference in January 1943, after which he became deputy supreme commander of Allied forces in North Africa and commander of 18th Army Group. Alexander initially had a low opinion of U.S. Army generals and thought that American forces were poorly trained. He realized that cooperation with the Americans was vital but gave greater latitude to British commanders.

Appointed commander in chief of the 15th Army Group for the July 9, 1943, invasion of Sicily, Alexander failed to maintain adequate control over his subordinates, Montgomery and U.S. lieutenant general George S. Patton Jr., each of whom sought the preeminent role.

Alexander then directed the Allied invasion of Italy in September 1943. Again the command was hindered by rivalries between his subordinates and grandstanding by Lieutenant General Mark W. Clark. His command in Italy, however, brought Alexander promotion to field marshal in November 1944 and elevation to the position of supreme Allied commander in the Mediterranean.

On May 1, 1945, German forces in Italy surrendered unconditionally, and that October Alexander handed over his Italian command. In January 1946 he was named Viscount Alexander of Tunis.

From 1946 to 1952, Alexander was the appointed governor-general of Canada. Named Earl Alexander of Tunis in January 1952, he then served as British minister of defense (February 1952–October 1954). Alexander died in Slough, England, on June 16, 1969.

Allen, Terry de la Mesa (1888–1969)

U.S. Army general. Born on April 1, 1888, at Fort Douglas, Utah, Terry de la Mesa Allen grew up in Texas. He entered the U.S. Military Academy, West Point, in 1907 but was discharged after five years for academic deficiency. He continued his studies at Catholic University in Washington, D.C.; graduated in 1912; and obtained a cavalry commission that November. During World War I, Captain Allen commanded a battalion in the 90th Division in France and was wounded several times. He returned from France as a major and attended army schools, the last being the Army War College in 1935. On August 1, 1935, Allen was promoted to lieutenant colonel.

On October 1, 1940, Allen, who never held the rank of colonel, was promoted to brigadier general, and in June 1942, he was promoted to major general. He took command of the 1st Infantry Division in August. Allen led his division through the training buildup for Operation TORCH (the invasion of North Africa on November 8, 1942) and in the subsequent campaigns in Tunisia during 1943 and Sicily (July 9–August 22, 1943). Known as a tough, inspirational commander, Allen was revered by the men of the 1st Infantry Division (the “Big Red One”). As a result of his unswerving advocacy of his division and incidents that suggested toleration of lack of discipline, however, Allen and his assistant division commander, Brigadier General

Theodore Roosevelt Jr., were removed from command following the attack on Troina, Sicily (July 31–August 6, 1943).

Allen then returned to the United States to organize and train the 104th Infantry Division (Timberwolves). He took the division to France in September 1944, where they fought alongside his beloved Big Red One. Allen was restored to division combat command because he was an effective fighter and a distinguished soldier. After successful campaigns in Central Europe, Allen took his Timberwolves home in June 1945. Allen retired in August 1946 and died in El Paso, Texas, on September 12, 1969.

Allied Military Tribunals after the War

Following the conclusion of World War II, leading figures of the German and Japanese governments and armed forces were prosecuted on war crimes charges. The trials of the principal figures took place at Nuremberg in Germany and Tokyo in Japan.

In August 1945, representatives of the British, French, U.S., and Soviet governments, meeting in London, signed an agreement creating the International Military Tribunal and set ground rules for the trial. To avoid using words such as "law" or "code," the document was named "The London Charter of the International Military Tribunal." It combined elements of Anglo-American and continental European law. Defendants' rights and the rules of evidence differed in several ways from those in American courtrooms.

The four nations issued indictments against 24 persons and six organizations in October 1945. The counts of the charges were as follows: (1) conspiracy to wage aggressive war; (2) waging aggressive war, or crimes against peace; (3) war crimes; and (4) crimes against humanity. Of 21 defendants (it was decided that Hitler, Himmler, and Goeb-bels would not be tried posthumously), 3 were acquitted, 12 were sentenced to death, and the remainder received prison terms.

At the conclusion of this trial, six Nazi organizations were charged: the Sturmabteilungen (SA), the Reichsregierung (cabinet of the Reich), the General Staff and high command of the German armed forces, the Schutzstaffel (SS, bodyguard units), the Gestapo, and the Corps of the Political Leaders of the Nazi Party. The first organization was not convicted, and the next two had so few members that the Allies decided simply to deal with the individuals who had belonged to these organizations. The last three organizations were found guilty, making it possible later to convict individuals on the basis of having belonged to them.

On December 9, 1946, the so-called Doctors' Trial opened, conducted by the Allies. It dealt with individuals associated with the Nazi euthanasia program (T4). A total of 23 individuals were indicted for their involvement. On August 20, 1947, the court proclaimed 16 of them guilty; 7 were sentenced to death and executed on June 2, 1948. In secondary trials before that, 22 of 31 doctors charged were found guilty and sentenced to death at Buchenwald, the concentration camp where many of their crimes were committed.

The Allied occupying powers also conducted individual war crimes trials in their zones of occupation. The Americans scheduled more than 169,000 trials. Although fewer were actually held, the Americans did sentence 9,000 Germans to prison terms, and others were fined. The British and French were not greatly interested in prosecuting war criminals; the British held 2,296 trials in their zone. The Soviet Union was perhaps the least interested in such legal proceedings but executed by far the most individuals.

Trials continued under the Federal Republic of Germany (West Germany) but with little punishment for the guilty. Alfred Krupp served only three years in prison for conscripting slave labor in his industrial enterprises, and on his release his business empire was restored to him. The chemical firm I. G. Farben was not broken up. (It was, however, liquidated in 1952.) From 1975

to 1981, the government prosecuted 16 individuals associated with the Majdanek concentration camp. Only 1 person was found guilty of murder, and 5 were acquitted.

In January 1946, General Douglas MacArthur approved a charter to inaugurate the International Military Tribunal for the Far East (IMTFE), which was dominated by the United States. On May 3, 1946, the IMTFE opened with the trial of 28 of 80 Class A Japanese war criminals at Tokyo. The hearings covered crimes that occurred between 1928 and the Japanese surrender in August 1945. The indictments were based on the concept of war crimes that had been stipulated at Nuremberg—that is, crimes against peace, crimes against humanity, war crimes, and aggressive war. In the Tokyo proceedings, however, there was no assumption of collective guilt as in the case of Germany, and thus no organizations were charged.

Of the 28 defendants, 19 were professional military men and 9 were civilians. The prosecution team was made up of justices from 11 Allied nations: Australia, Canada, China, France, Great Britain, India, the Netherlands, New Zealand, the Philippines, the Soviet Union, and the United States. Indictments accused the defendants of promoting a plan of conquest, and the commission of both war crimes and crimes against humanity.

On November 4, 1948, the sentences were meted out: 2 defendants had died, 1 was considered insane, 7 were sentenced to death, 16 were sentenced to life imprisonment, and the rest were given jail terms. Japanese emperor Hirohito, in whose name so many war crimes had been committed, was not charged. A second group of 23 men and a third group of 19 men were never brought to trial; they were released in 1947 and 1948, respectively. All those sentenced to prison were released over the next several years. No trials of the infamous Japanese Unit 731, which would have been akin to the Doctors' Trial in Germany, were conducted. This was because of a bargain struck by the U.S. government to drop prosecution in return for all information on experiments in germ and biological warfare on human guinea pigs, including U.S. prisoners of war.

The British carried out minor war crimes trials of Japanese nationals in Southeast Asia, and other countries also held war crimes trials for individuals guilty of these offenses in their national territories. In China, there were trials in 10 locations.

ALPHABET, Operation (June 5–8, 1940)

Evacuation of Allied troops from Norway. Although the Allies had retaken Narvik on May 28, the overall Norwegian Campaign was going poorly for them, and more important, the Germans had invaded the Low Countries and France on May 10 and were overrunning both. This prompted the Allied decision on May 24 to evacuate the 25,000 men remaining in northern Norway. The evacuation force included the British aircraft carriers *Ark Royal* and *Glorious*, the British cruisers *Southampton* and *Coventry*, 16 destroyers, and numerous other smaller warships, transports, and cargo vessels. The evacuation began on June 5 and was completed by June 8. Another British cruiser, the *Devonshire*, evacuated the Norwegian royal family and government, and it sailed under radio silence independently for Scapa Flow.

Captain Guy D'Oyly-Hughes of the *Glorious* requested and received permission to proceed independently at greater speed, with the justification that his ship was short of fuel. Unknown to the British, however, the Germans had powerful forces at sea. Escorted by the destroyers *Acasta* and *Ardent*, the *Glorious* was intercepted by the German battleships *Scharnhorst*

and *Gneisenau* some 280 miles west of Harstad, Norway. The carrier had on board six Swordfish aircraft, but for reasons that will never be known, D'Oyly-Hughes did not have them aloft and was thus caught by surprise.

Homing on smoke from its stack, the two German capital ships opened fire on the *Glorious* at a range of some 27,000 yards. Before any aircraft could be launched, a German shell hit the forward hanger, destroying the Hurricanes there and preventing passage of torpedoes. The *Glorious* was soon listing and went down within 20 minutes. Although the two British destroyers were also sunk, the *Acasta* heavily damaged the *Scharnhorst* with a torpedo, and both German ships were hit repeatedly by 120mm shells. Damage was sufficient to cause the German commander, Vice Admiral Wilhelm Marschall, to order the two German battleships to steam for Trondheim, which allowed the safe passage of the *Ark Royal* and the remainder of the British evacuation transport and store convoys later that same day, sailing without battleship protection.

The eventual loss in lives from the three British warships was 1,519 men (1,474 Royal Navy and 49 Royal Air Force); only 45 men survived, 39 of them picked up by a Norwegian ship, while 6 others became prisoners of the Germans. The remaining British forces made it safely to Scapa Flow.

One consequence of the evacuation was increased German pressure on both Sweden and Finland, leading to an agreement in June whereby the government in Stockholm permitted unarmed German troops to transit Sweden on its railroads, that country's major departure from neutrality during the war.

Alsace Campaign (November 1944–January 1945)

Allied campaign to capture Alsace from German forces. Formidable barriers to the east and west protected the plains of Alsace from invasion; to the east was the Rhine River and to the west the Vosges Mountains. The two primary gaps in the Vosges were the Belfort Gap and the Saverne Gap, with the former defying capture by the German Army both in 1870 and 1914. The vaunted Wehrmacht did what past German armies failed to do when Panzer Group Guderian penetrated the Belfort Gap in the French Campaign of 1940. German forces occupied Alsace until the Allied campaign of winter 1944–1945.

French troops during the fighting to secure Alsace in 1944. (Keystone/Hulton Archive/Getty Images)

The Alsace Campaign was a joint American-French campaign to capture Alsace and reach the Rhine River. Supreme Headquarters, Allied Expeditionary Force (SHAEF), had low expectations for the campaign in Alsace; its attention was focused on the battles to the north involving the 12th and 21st Army Groups. Lieutenant General Jacob Devers, commander of the Allied 6th Army Group, exercised overall control. His forces consisted of the U.S. Seventh Army under Lieutenant General Alexander Patch and the

French First Army under General Jean de Lattre de Tassigny. The VI and XV Corps made up the Seventh Army, and the First French Army consisted of the I and II Corps.

Opposing was the German Nineteenth Army under General of Infantry Friedrich Wiese. His army consisted of eight infantry divisions, six of which would be nearly destroyed in the campaign. Wiese's most reliable unit was the 11th Panzer Division. Ultimate control of the German forces, however, was in the hands of Army Group G commander General of Panzer Troops Hermann Balck.

General Devers was to clear the Germans from his front and secure crossings over the Rhine River. In the 6th Army Group zone, General Patch's XV Corps, commanded by Major General Wade Haislip, held the left, or northern, flank and was linked up with Lieutenant General George S. Patton's Third Army of the 12th Army Group. Next in line was VI Corps under Major General Edward Brooks, who took over when Lieutenant General Lucian Truscott was reassigned. Holding the southern flank was the First French Army; this was also the southern flank of the entire Allied line.

The campaign was to begin in coordination with the fighting to the north. XV Corps was to jump off on November 13, 1944, and capture Sarrebourg and the Saverne Gap and then exploit its gains eastward while at the same time protecting Patton's flank. (Patton's offensive started on November 8.) VI Corps was scheduled to begin its campaign two days after XV Corps started, or November 15. It would attack in a northeasterly direction, break out onto the Alsatian plains, capture Strasbourg, and secure the west bank of the Rhine.

Farther south, the First French Army was to commence operations on November 13. The I and II Corps would force the Belfort Gap, capture the city of Belfort, and exploit its success. There was ample opportunity for spectacular success.

XV Corps attacked in a snowstorm on November 13 with the 79th and 44th Infantry Divisions and the French 2nd Armored Division. The 79th captured Sarrebourg on November 21 and advanced so quickly that General Patch directed XV Corps to capture Strasbourg if it could get there before VI Corps. On November 23, though, elements of the French 2nd Armored Division liberated Strasbourg, capital of Alsace.

VI Corps began its attack on November 15 with the 3rd, 36th, 100th, and

103rd Infantry Divisions and achieved similar success. Crossing the Meurthe River, the 100th Infantry Division penetrated the German “Winter Line” on November 19; the position quickly crumbled.

The attack in the First French Army sector began on November 13. The French troops successfully breached the Belfort Gap, and elements of the 1st Armored Division of I Corps reached the Rhine on November 19, the first Allied troops in the 6th Army Group zone to do so.

In the midst of this success in the 6th Army Group zone, General Dwight D. Eisenhower, supreme commander of the Allied Expeditionary Force, and General Omar N. Bradley, commanding the 12th Army Group, met with Devers and Patch on November 24. The result was an order for the Seventh Army to turn northward and attack the West Wall (the series of fortifications protecting Germany’s western frontier) along with Patton’s Third Army. The XV and VI Corps, minus two divisions, were subsequently turned northward while the First French Army and the 3rd and 36th Infantry Divisions focused their attention on German troops around the city of Colmar.

The attack northward began on December 5, with XV Corps on the left and VI Corps on the right. After 10 days of heavy fighting, elements of VI Corps entered Germany on December 15. The 100th Infantry Division’s effort around the French city of Bitche was so fierce that it was given the sobriquet “Sons of Bitche.” The Seventh Army offensive was halted on December 20 to enable it to cooperate with the Allied defense in the Ardennes.

The German troops in the 6th Army Group front planned an offensive for late December 1944, known as Operation NORDWIND. Just before midnight on New Year’s Eve, the onslaught commenced. Through much of January 1945, the attack forced Allied troops to give ground. Eisenhower even toyed with the idea of abandoning Strasbourg, but General Charles de Gaulle vehemently opposed such a plan. The city was held, and by January 25, the offensive petered out and the German forces withdrew.

With the attack defeated, the only Wehrmacht troops remaining in Alsace were located around Colmar. The First French Army was assigned the responsibility of reducing the Colmar pocket, and it began this task on January 20, 1945. I Corps attacked the southern flank of the pocket, while II Corps assaulted the northern flank. The plan was for the two forces to meet at the Rhine, enveloping the pocket. On February 2, Colmar was captured, and

by February 5 German resistance had ended. The campaign in Alsace was over. Although overshadowed by the 12th and 21st Army Groups to the north, General Devers's 6th Army Group had achieved an important accomplishment.

Altmark Incident (February 16, 1940)

World War II Royal Navy seizure of a German merchant ship within Norwegian territorial waters. The *Altmark* was a supply ship serving the German pocket battleship *Graf Spee* in the South Atlantic. The *Altmark* also became a prison ship, taking aboard survivors from the nine ships sunk by the *Graf Spee.*

Since the outbreak of war, ships of the Royal Navy had been searching for the *Graf Spee* and its supply ships. On December 13, 1939, in the Battle of Río de la Plata, British cruisers located the *Graf Spee* and damaged it. Believing that the British had assembled a superior force, Captain Hans W.

Langsdorff of the *Graf Spee* scuttled his ship. The *Altmark*, which had refueled the pocket battleship just prior to its last fight, departed the South Atlantic in late January 1940 for Hamburg. Commanded by Captain Heinrich Dau, it reached the Norwegian coast on February 12, 1940.

On February 14, the *Altmark* entered Norwegian territorial waters at Trondheim. Although Norwegian naval vessels twice stopped the *Altmark*, Dau hid his ship's guns below and claimed he had no prisoners on board. He resisted any effort to search his ship on grounds it was a German naval ship, immune to search. Despite misgivings and suspecting the nature of the cargo, the Norwegians allowed the *Altmark* to proceed. Norwegian officials did not want to create an incident that might be used to precipitate a German invasion of their neutral country.

Word of events, however, reached the British embassy at Oslo, and the naval attaché there informed the British Admiralty of the situation. On February 16, 1940, after British planes had located the *Altmark*, Captain Philip Vian's destroyer flotilla cornered the *Altmark* near Jössing fjord within Norwegian territorial waters. The Norwegian gunboat *Skarv* hampered the British ships' efforts to force *Altmark* to sea, and the German supply ship then slipped into the fjord.

In London, meanwhile, the War Cabinet met concerning the situation and the reports that the *Altmark* had on board some 300 British seamen, who were in fact being held belowdecks in difficult conditions. First Lord of the Admiralty Winston L. S. Churchill personally authorized the boarding and search of the *Altmark* and the liberation of its prisoners.

At 11:00 p.m. on February 16, Vian's flagship, the destroyer *Cossack*, entered the fjord. Dau tried to ram the British destroyer, but expert British ship handling saved the *Cossack* from damage. As the two ships brushed together, some of the boarding party leaped across to the German ship. The *Cossack* then again closed and the remainder of the boarding party followed, while the *Cossack* backed clear. In a brief fight, 7 crew members of the *Altmark* were killed and 299 British prisoners were freed.

The *Altmark* incident was certainly an infringement of Norway's neutrality by Britain. Neutral countries could no longer be certain of their inviolability in this war. This incident caused German chancellor Adolf Hitler on February 19 to order an acceleration in his plans to invade Norway, Operation WESERÜBUNG. After they had conquered Norway, the Germans

erected a commemorative marker at Jössing fjord reading (in German), “Here on February 16, 1940, the *Altmark* was attacked by British sea-pirates.”

Amau Doctrine (1934)

Japanese foreign policy tenet enunciated on April 17, 1934, that preserved Japan’s right to act unilaterally to keep peace and order in East Asia and to assert its predominance in China. The Amau Doctrine, named after Foreign Ministry spokesman Amau Eiji, was viewed as Japan’s version of the 1823 Monroe Doctrine, by which U.S. policy makers announced that their nation would not tolerate foreign meddling in the Americas.

The Amau Doctrine in fact codified trends in Japanese foreign policy that dated back to the turn of the century. An up-and-coming world power certainly since the Russo-Japanese War of 1904–1905, which resulted in a decisive Japanese victory, Japan had systematically begun to assert its supremacy over large portions of East Asia, beginning with Korea in 1910. Before long, Japan had also begun seeking preferential and exclusive rights in China. In 1931, Japan unilaterally annexed Chinese Manchuria, renaming it Manchukuo. This was accomplished amid the dire dislocations of the Great Depression, a time in which the Western powers were mired in isolationism. Thus, there was little more than rhetorical opposition to the bold Japanese move.

The Amau Doctrine was designed chiefly to solidify Japan’s hold on Manchuria and to announce its intention to penetrate China more deeply in the future, thus helping to complete its “Greater East Asia Co-Prosperity”

sphere. The doctrine was also quite clearly meant to repudiate the old "Open Door Policy" in China, which was first conceptualized by the British in the aftermath of the First Opium War (1839–1843). That policy was formally codified by U.S. secretary of state John Hay at the turn of the 20th century via his "Open Door Notes" to the major world powers then vying for influence in China. In essence, Hay announced that all nations should have equal access to commerce and trade within China. Clearly, the Japanese no longer intended to abide by Hay's antiquated tenet.

The Amau Doctrine was also prompted by the global economic downturn of the early 1930s, during which Japan had seen its international trade shrink dramatically as trade barriers went up worldwide. By turning China into a client state, the Japanese hoped to shore up their finances and use China as a wellspring of raw materials that the resource-poor Japan badly needed. In addition, the doctrine was meant as a warning to the Soviets, who had begun to move troops into areas adjacent to Manchuria.

Specifically, Amau announced that the Chinese did not have the right to ask for foreign assistance or to actively resist Japanese control. Further, any outside power seeking to do business in China had to consult Japan first. The other major world powers did not act to reverse the annexation of Manchuria, nor did they actively protest the Amau Doctrine. Instead, they hoped—rather quixotically—that the Soviets would act as a check on Japanese imperialism. The Soviets, however, did little more than protest. In the end, the Amau Doctrine cleared the way for Japan's full invasion of China in 1937, another move that went largely unanswered by the other world powers.

Ambrosio, Vittorio (1879–1958)

Italian Army general. Born in Turin on July 28, 1879, Vittorio Ambrosio joined the army in 1901 and served in the cavalry during the 1911–1912 Italo-Turkish War. From 1915 to 1918 he was in charge of the 3rd Cavalry Division. His postwar career advanced steadily, culminating in command of the Second Army in 1939.

Ambrosio commanded Italian occupation forces in Yugoslavia following the German invasion of that country in April 1941. Appointed army chief of staff in January 1942, Ambrosio became involved in efforts to oust Marshal Ugo Cavallero, the inept supreme command chief of staff. In February 1943, Italian dictator Benito Mussolini finally sacked Cavallero and replaced him with Ambrosio.

As the new chief, Ambrosio established three major goals: to pull back to Italy proper as much of the overextended army as possible, dig in his heels against the Germans and their demands, and lighten the top-heavy high command. He failed to achieve any of the three. Although the broken remnants of Italian forces in the Soviet Union were eventually repatriated, Mussolini refused to sanction an Italian withdrawal from North Africa or from the Balkans. Ambrosio's attempts to adopt a firmer posture vis-à-vis the Germans only antagonized Italy's ally, and his attempts to restructure the high command foundered on the firmly embedded military bureaucracy.

Meanwhile, Italy's war effort staggered toward collapse. In May 1943, remaining Axis forces in North Africa surrendered in Tunisia, and in July, the Allies invaded Sicily. Skeptical both of Italy's prospects for victory and of the alliance with Germany, Ambrosio urged Mussolini to stand up to Adolf Hitler and quit the war. Rebuffed, Ambrosio played a major role in the coup against Mussolini on July 24–25, 1943, by ensuring the army's support. Subsequently, Ambrosio supported Marshal Pietro Badoglio's attempts to conduct armistice negotiations with the Allies while also trying to persuade the Germans that Italy would remain in the war.

The Allied armistice proclamation on September 8, 1943, forced Ambrosio to flee from Rome with Badoglio. He escaped German vengeance but left the army leaderless. He resigned on November 18, 1943, and became army inspector general until his retirement in November 1944. Ambrosio died in Alessio, Italy, on November 20, 1958.

America First Committee (1940–1942)

Leading U.S. anti-interventionist organization prior to the December 7, 1941, Japanese attack on Pearl Harbor. The America First Committee was established in July 1940 as the presidential election approached. Both Republicans and Democrats nominated pro-Allied candidates, but some prominent Americans were convinced that the United States was in grave danger of being needlessly and foolishly drawn into World War II. The organization's founders included several midwestern businessmen, including Robert E. Wood of Sears, Roebuck & Company and Robert Douglas Stuart of Quaker Oats, who provided much of the organization's financial support.

Most America First members were midwestern Republicans, many from the party's conservative wing. Some, however, such as Governor Philip La Follette of Wisconsin and Senator Gerald P. Nye, were political liberals or even leftist radicals. America First also included a contingent of liberal Democrats, such as Chester Bowles and Kingman Brewster of Connecticut and the radical historian Charles A. Beard. Colonel Charles A. Lindbergh, the famed aviator, was its most celebrated member, and former president Herbert Hoover, although he held aloof so as not to compromise his efforts to feed children in occupied Western Europe, sympathized strongly with the group's stance.

America First members generally united around the belief that the European crisis did not threaten the security of the United States sufficiently to justify intervention. They also believed that American involvement in war would be highly detrimental domestically. While supporting measures to

strengthen U.S. defenses, they generally opposed, albeit with little success—especially after President Franklin D. Roo-se-velt's electoral victory in November 1940—many measures the administration introduced. The latter included the establishment of the Selective Service (September 1940), the 1940 Destroyers-for-Bases Agreement, Lend-Lease (March 1941 military aid program to various nations), and the administration's aggressive naval policies against Germany in the Atlantic. America First members opposed these on the grounds that they were moving the United States ever closer to war with Germany. After Pearl Harbor, America First members, despite lingering private misgivings over past administration policies, largely rallied around the wartime president. On April 22, 1942, the organization was officially dissolved.

American Battle Monuments Commission

Independent agency of the U.S. government created by Congress in 1923 to commemorate and memorialize the service and sacrifice of America's armed forces since 1917. General of the Armies John J. "Black Jack" Pershing was the prime mover behind the establishment of the American Battle

Monuments Commission. He believed that the United States should formally memorialize its soldiers who had served in World War I. The commission was designed to begin its work retroactively to April 6, 1917, the day on which the United States formally entered the conflict.

Since its founding in 1923, the commission has established and maintained 24 permanent military cemeteries overseas and has designed or supervised the design of memorials and shrines to America's fallen soldiers on foreign soil. The commission deals principally with soldiers lost during World War I and World War II; it also maintains one small cemetery in Mexico City that holds the remains of approximately 750 U.S. soldiers who died during the 1846–1848 Mexican-American War.

In all, the cemeteries under the commission's purview include nearly 125,000 graves, while an additional 94,000 soldiers missing in action are memorialized on tablets, markers, and other monuments. The American Battle Monuments Commission currently supervises European cemeteries in France, Belgium, Great Britain, Italy, Luxembourg, and the Netherlands dedicated to soldiers killed in both world wars. In Asia, the commission operates the Manila American Cemetery and Memorial in the Philippines, dedicated to World War II soldiers. In Tunisia, North Africa, it maintains a cemetery and memorials to World War II soldiers. Finally, it operates a cemetery in Panama.

In addition to cemeteries, the commission has established and continues to maintain battle and other monuments in Belgium, Cuba, France, Gibraltar, Mariana Islands, Morocco, the Philippines, New Guinea, the Solomon Islands, and the United States (New York City, Honolulu, and Washington, D.C.). From 1923 until his death in 1948, Pershing served as chairman of the commission. Thereafter, all subsequent chairmen have been four-star U.S. Army officers. Besides its chairman, the commission has 11 other members, appointed by the president at regular intervals, and a secretary-general, also appointed by the president.

Virtually all of the cemeteries are visually stunning, located in prime locations, and feature large white granite or marble monuments and row upon row of perfectly aligned white headstones usually in the form of a cross or the Star of David. In nearly all of the cemeteries, separate memorials list the names of those missing in action.

Burial grounds dedicated specifically to those who served in World War

II include five in France (Brittany, Epinal, Lorraine, Normandy, and Rhone), one in Great Britain (Cambridge), two in Belgium (Ardennes and Henri-Chapelle), two in Italy (Sicily-Rome and Florence), one in Luxembourg, one in the Philippines (Manila), and one in Tunisia. The commission also maintains a number of monuments to World War II soldiers in the United States, the Philippines, the Solomon Islands, France, New Guinea, the Mariana Islands, and Morocco.

Amphibious Warfare

The projection of sea-based ground forces onto land. Amphibious warfare was more widely conducted in World War II than in any previous conflict and on a greater scale than ever before or since. Involving all aspects of naval and military operations—from mine warfare to air and ground combat—amphibious operations are the most complex and risky of all military endeavors. The basic principles had been established during World War I and the postwar period, but the lessons were largely ignored by most military leaders, except those in the Soviet Union, the U.S. Marine Corps, and Germany's Landungspionieren (Landing Pioneers). The Royal Navy

concluded that the British Gallipoli operation had demonstrated the great difficulty of a successful amphibious assault in modern war.

Meanwhile, the Japanese Navy and Japanese Army developed separate procedures, forces, and equipment to conduct amphibious operations, and they had the good fortune to carry out their early assaults from 1937 against undefended beaches in China and at the beginning of the Pacific war. The German Navy had no interest in amphibious operations before the war, but, ironically, Germany initiated the war's first large-scale amphibious operation when it invaded Norway in April 1940. It was the Allies, however, who demonstrated true mastery of the amphibious art. In the end, they landed more than 4 million troops in five major amphibious assaults, dozens of tactical landings, and countless raids along German-occupied coasts of Europe. Amphibious operations provided the Western Allies with their only means of taking the ground war to the European Axis countries. In the Pacific theater, there could be no Allied victory without amphibious warfare.

Amphibious operations come in three levels—strategic, operational, and tactical—depending on the intended objectives. The Allied landings in France, the Philippines, and Italy and the planned invasion of Japan are examples of strategic landings intended to have decisive impact on the war. The November 8, 1942, North African landings (Operation torch), the German assaults in the Dodecanese Islands beginning on October 3, 1943, and most of the Allied assaults in the Pacific were operational-level landings that supported a specific campaign, each part of an overall strategic effort. Soviet landings and most Allied commando raids were tactical-level operations for limited objectives, although some had a strategic impact (capturing German codes, radars, and so on). The Dunkerque (May 26–June 4, 1940) and Crete (May 1941) evacuations are difficult to categorize, but most observers would describe them as operational-level efforts.

Amphibious operations fall into four types: raids, assaults, evacuations, and administrative (noncombat) landings. The first of these is the most dangerous, as it generally is executed against superior enemy forces and involves elements of both an assault and an evacuation. An administrative landing is the safest, being conducted in a benign environment with no enemy ground, air, or naval forces present. Assaults and evacuations face varying levels of risk, depending on the defender's strength and support. The 1940 German invasion of Norway is an example of an assault, although many of its

forces came ashore in circumstances approaching that of an administrative landing. Britain's Dunkerque evacuation was the war's first major combat evacuation, while Germany's naval evacuation of its forces from the Baltic in the war's final months was the conflict's largest such operation.

An LVT-2 Water Buffalo amphibious tractor loaded with marines churns its way through the water for Tinian Island in the Marianas, July 1944. (National Archives)

In 1939 the German Army was the only service to recognize the need to rehearse landings and procedures for a specific landing. By 1943, every major military leader realized the necessity to practice for a specific landing. Then, as today, amphibious operations were broken down into five phases: (1) planning, (2) embarkation, (3) rehearsal, (4) movement to the objective area, and (5) the assault. Soviet doctrine added a sixth phase, the landing of the follow-on army forces.

Germany did not generate a capacity to land troops against determined opposition until well into 1942. By then, Germany's strategic situation precluded such operations except in limited and special circumstances, such as the landings on Kos and Leros during the Dodecanese Campaign. Despite its prewar aversion to amphibious operations, the German Navy conducted the war's largest amphibious evacuation.

Conducted during the war's final six months under desperate circumstances of Soviet air superiority and naval parity, Germany's withdrawal of more than 2 million troops, civilians, and critical equipment from the Baltic area is one of the war's more remarkable military achievements. Nonetheless, amphibious warfare was never more than a useful adjunct to German military operations and usually was conducted as an ad hoc affair before 1942.

Necessarily, the Japanese military was much interested in amphibious warfare in the 1930s. The Japanese pioneered development of ramp-front-end landing craft, later copied by other countries, including the United States. The Imperial Japanese Army used amphibious landings to outflank British forces in Malaya and to invade the Philippines, the Netherlands East Indies, and other Pacific islands. In Malaya and the Philippines, the army used its own ships and land-based aircraft to support operations, receiving little or no assistance from the navy other than to have its ships attack those of enemy naval forces. The Japanese Navy had its own specialized naval landing troops to execute its amphibious assaults on Wake Island and other Pacific islands. The assault on the Dutch East Indies was the only time Japan's two services cooperated in executing an amphibious invasion, and there, as in Malaya, the landing beaches were not defended. In cases where the beaches were defended, the Japanese suffered heavy losses, as at Wake.

The Soviet Union had a specialized amphibious force of naval infantry at war's start, but it lacked equipment and training. Soviet amphibious forces were expected to land on the beach using ships' boats or other improvised transport. Soviet doctrine called for naval infantry to conduct amphibious raids and support the army's landing by seizing and holding the beachhead while conventional forces disembarked behind them. Although this approach economized on the number of troops requiring specialized amphibious assault training, it proved costly in combat, because any delays in the follow-on landing left the naval infantry dangerously exposed to counterattack. As a result, Soviet naval infantry suffered heavy casualties in their amphibious assaults, but one can argue that they led the Allied way in these operations.

On September 23, 1941, the Soviet Black Sea Fleet conducted the Allies' first amphibious assault, when Captain Sergei Gorshkov landed a naval infantry regiment against the coastal flanks of the Romanian forces besieging Odessa. The action temporarily eliminated the Romanian threat to the city's

harbor. In fact, amphibious raids and assaults figured prominently in Soviet naval operations along Germany's Black and Arctic Sea flanks, with the Soviets conducting more than 150 amphibious raids and assaults during the war.

There was little to no cross-fertilization of ideas or lessons learned among the Allied powers regarding amphibious landings, particularly between the European and Pacific theaters. This largely was due to the respective service leaders' antipathy and parochialism, but the primary contributing factor was the differing military challenges posed by the Japanese and European Axis countries. The Japanese Army had few mechanized units, no heavy tanks, and little artillery, but it was much better at camouflage and improvised defenses than the Germans or Italians. The Germans, conversely, rapidly reinforced their beach defenders with heavily mechanized forces and heavy artillery, and they employed more extensive minefields and beach obstacles than did the Japanese. These differences shaped Allied doctrine and tactics in their respective theaters.

Prime Minister Winston L. S. Churchill forced Britain to develop an amphibious warfare capability with the formation of Combined Operations Command. Beginning in June 1940, this organization conducted amphibious commando raids along the coasts of German-occupied Europe. Gradually, such amphibious raids became more effective as lessons were learned, expertise expanded, and training improved.

Britain's assault tactics and equipment were driven primarily by lessons learned from the unsuccessful Dieppe Raid on August 19, 1942. The beach obstacles, extensive minefield belts, and overlapping antitank and artillery fire proved devastating, suggesting to the British a need for specialized vehicles and equipment. Those "funnies," as they came to be known, were ready by the June 6, 1944, Normandy landings but not in time for the earlier Allied landings in North Africa (1942) and Italy (1943).

The U.S. Army, present in only a limited capacity at Dieppe, saw little requirement for specialized amphibious equipment other than landing craft, but it did see a need to remove beach obstacles and isolate the beachhead from enemy reinforcement. The smaller land areas and the lack of a heavily mechanized counterattack threat obviated the need to isolate Pacific assault beaches from reinforcements. Hence, airborne operations were not endemic

to Pacific theater amphibious assaults, although they were planned for the invasion of Japan.

Operation torch in North Africa on November 8, 1942, was the Western Allies' first amphibious assault against a defended beach in the European theater, albeit not a heavily contested one; however, it did provide the foundations for U.S. amphibious warfare doctrine in Europe. The torch landings saw the first employment of underwater demolition teams (UDTs) and the specialized amphibious landing ships that were so critical to getting forces ashore quickly. The tank landing ships were particularly important since they enabled tanks to land directly on the assault beach.

Although many mistakes were made in the planning and execution of torch, it established the basic foundations for all future Allied assaults in the west. All subsequent landings were preceded by special forces, such as UDTs and commandos, to remove obstacles and seize key terrain and defensive features before the main assault force approached the beach. Operation TORCH also exposed the need to rehearse the actual landings well in advance of the assault to ensure a smooth and rapid disembarkation.

Costly Allied naval antiaircraft fire against Allied aircraft carrying the airborne assault force during the Sicily landing (Operation husky) of July 9–August 22, 1943, demonstrated the need for reliable coordination and identification procedures. The operation involved two armies—one British and one U.S.—of two corps each. The six-week battle for Sicily opened the 1943–1945 Italian Campaign and drove Benito Mussolini from power; however, it was a close-run affair.

The Germans launched an armored counterattack on the landing's second day, July 10, that nearly cut the beachhead in half and was stopped only by intensive naval gunfire support. The Germans' near success convinced Allied planners that the early assault waves needed tanks, placing a premium on tank-landing ships in naval construction.

Additional lessons about air and naval support were gained there and at the September 9, 1943, Salerno landings (Operation avalanche), where naval gunfire support proved critical to stopping German armored counterattacks. More significantly, procedures and equipment were developed to accelerate the pace of force buildup ashore. That it was a successful effort can best be measured by the success of the Normandy landings (Operations NEPTUNE and OVERLORD) on June 6, 1944, that placed six divisions ashore in less than 24

hours and nearly 1 million men and their equipment in France in less than a week—a phenomenal accomplishment. The subsequent August 15, 1944, landings in southern France (Operation DRAGOON) were not as large, landing fewer than 250,000 troops, but were equally impressive and, coming only two months after the Normandy landings, highlighted the Allies' growing amphibious capacity.

The U.S. Marine Corps landings at Guadalcanal and Tulagi in August 1942 marked the first U.S. offensive actions in the war. The Japanese failure to defend the beaches masked the planning and execution errors that marked early U.S. amphibious operations. Ships were loaded for an administrative landing rather than an assault. U.S. Navy and U.S. Marine Corps planners applied the lessons learned about combat loading their assault ships to their later assaults. Unfortunately, they did not learn about the importance of prelanding reconnaissance due to the absence of reefs and beach obstacles that enabled the landings at Tulagi and Guadalcanal to go smoothly. The Americans would learn that lesson at Tarawa (August 20–24, 1943) but at much greater cost.

The almost-disastrous Tarawa landing was the pivotal experience that shaped the U.S. Navy–Marine Corps team's amphibious warfare doctrine. The failure to chart and survey the offshore waters meant that hundreds of marines had to wade half a mile in shoulder-deep water under heavy Japanese fire. Casualties in the first wave amounted to more than 85 percent killed or wounded. Naval air and gunfire support was poorly planned and coordinated, leaving the marines to win by sheer force of will and superior combat cohesion ashore.

All subsequent landings employed extensive preassault UDT beach surveys. Fire-support plans were refined, and preassault advanced-force operations became more extensive and powerful. Firepower for the assaulting troops was substantially increased in terms of automatic weapons, demolitions, and flamethrowers. After Tarawa, as in Europe after Sicily, amphibious assaults in the Pacific enjoyed extensive preassault rehearsals and practice landings.

In contrast to the army's practice in Europe, the marines developed specialized amphibious vehicles and equipment to facilitate their movement ashore and to provide some armored-vehicle support to the first landing wave. Japan's adroit use of camouflage, obstacles, booby traps, and terrain

made such equipment critical to the landing's success. At a minimum, it reduced marine casualties against a determined and innovative opponent.

The U.S. Marine Corps also developed special tactics. Squads were broken down into three four-man fire teams centered on an automatic weapon to ensure more flexible employment and firepower in combat. Special teams incorporating flamethrowers and satchel charges were used to take out bunkers. More critically, the marines developed tactics to isolate fortified positions for later destruction so the landing's momentum could be maintained.

In the Pacific theater, the U.S. Army also developed its amphibious operations along different lines from its European theater counterparts and that of the marines. The U.S. Navy's VII Amphibious Force applied the lessons learned from Guadalcanal throughout the Solomon Islands and New Guinea campaigns, but Southwest Pacific theater commander General Douglas MacArthur's preference for assaulting undefended beaches away from the main objective precluded the need for extensive advanced preparation for operations. Much of this was also due to his Southwest Pacific landings on larger islands with more operational depth and landing options than those taken by the marines. Also, by the time MacArthur's forces landed at Leyte in the Philippines (October 20, 1944), the Japanese had learned not to defend at the beach, where they would give away their positions and face overwhelming U.S. naval gunfire.

The U.S. Marine Corps February 19–March 26, 1945, invasion of Iwo Jima (Operation detachment) saw the Japanese defenders adopt this new tactic. Lieutenant General Kuribayashi Tadamichi, the island's commander, implemented a new strategy that relied on some 1,500 interlocking strongpoints inland, designed for a battle of attrition. The 21,000 Japanese defenders dug out thousands of yards of tunnels in the soft volcanic rock. The high cost of securing the island for the marines—6,500 dead and 20,000 wounded—is testimony to its deadly success.

Operation iceberg, the U.S. invasion of Okinawa (March–June 1945), marked the Western Allies' final amphibious operation, applying the lessons learned from all the previous landings in the Pacific. More than 5,000 ships delivered two corps of more than 100,000 men onto the main island of Okinawa after a prolonged air and naval bombardment. Again, Japan chose to conduct the fight inland, making a determined stand at virtually every piece

of high ground. It was the first time the army troops had faced concentrated Japanese fortifications with only limited room to maneuver around them. Additionally, Japan mounted an unprecedented suicide campaign by kamikazes against the amphibious fleet.

The Battle of Okinawa claimed more than 107,000 Japanese and Okinawan military and civilian personnel dead. It was also the costliest battle of the Pacific war for the United States. The army lost 12,520 killed in action and 36,631 wounded. Marine casualties totaled 2,938 dead and 13,708 wounded, while the navy lost 4,907 men killed and 4,874 wounded, primarily from kamikaze attacks.

The navy was the only service in the battle in which the numbers of dead exceeded the wounded. Indeed, navy casualties for this battle were greater than those for the navy in all U.S. wars to that date. Although the U.S. Navy lost no capital ships, it did suffer 34 ships sunk and 368 damaged (of these, 43 had to be scrapped). The comparatively heavy losses of the Iwo Jima and Okinawa campaigns were the basis of the heavy casualty estimates for Operation DOWNFALL, the planned invasion for Japan that influenced the decision to employ the atomic bombs.

Amphibious operations were critical to the Allied victory in the war. Lacking a land border with Axis territory after 1940, the Western Allies could never have contributed to Germany's defeat or beaten Japan had they not mastered amphibious operations, the most complex of all military activities. The war firmly established the amphibious operations procedures that are employed by all Western nations to this day.

Anami Korechika (1887–1945)

Japanese Army general and army minister. Born in Oita on February 21, 1887, Anami Korechika graduated from the Japanese Imperial Military Academy in 1905. He was advanced to major in February 1922 and to lieutenant colonel in August 1925. From 1929 to 1930, Anami served as military aide to Emperor Hirohito. Promoted to colonel in August 1930, Anami commanded the Imperial Guards Regiment during 1933–1934 and headed the Tokyo Military Preparatory School from 1934 to 1936.

Anami was promoted to major general in 1935 and to lieutenant general in March 1938, when he took command of the 109th Division. During 1940–1941, he was vice minister of war. Anami commanded the Eleventh Army in central China from April 1941 to July 1942. He next headed the Second Army in Manchuria and was promoted to full general in May 1943.

In December 1944, Anami became inspector general of army aviation. Highly regarded within the army, in April 1945 he became army minister in the government of Prime Minister Suzuki Kantarō. Anami was one of those who urged that Japan continue the war. Even after the atomic bombing of Hiroshima on August 6, 1945, and the Soviet Union's declaration of war on Japan two days later, Anami urged Emperor Hirohito to remain in the war. Anami believed that Japan could negotiate more satisfactory terms if it could inflict heavy losses on Allied forces invading the Japanese home islands. Foreign minister Tōgō Shigenori and minister of the navy Admiral Yonai Mitsumasa opposed Anami's position.

In any case, Emperor Hirohito decided to accept the Potsdam Declaration and surrender. Anami and other hawks in the army then plotted a military coup d'état, but Anami finally agreed to accept the surrender, and this

development led to collapse of plans for a coup. Anami committed suicide in Tokyo on August 15, 1945, shortly before Hirohito's broadcast to the Japanese people announcing the Japanese surrender.

Anders, Władysław (1892–1970)

Polish Army general. Born to a peasant family in Blonie near Warsaw on August 11, 1892, Władysław Anders graduated from Saint Petersburg Military Academy in 1917. He served in the Polish Army Corps during World War I and, during the Poznan Rising of 1918–1919, as chief of staff in the Poznan Army. He commanded a cavalry regiment during the Russo-Polish War of 1919–1920 and during 1921–1923 studied at the École Supérieure de Guerre in Paris. An opponent of Józef Pisudski's coup d'état in 1926, Anders did not become a general until 1930.

In September 1939, when Germany invaded Poland, Anders commanded the Nowogródek Cavalry Brigade of the Polish Modlin Army at the East Prussian border. During his brigade's subsequent withdrawal to southeastern Poland, the Soviet Union invaded Poland from the east, and Anders was captured.

Imprisoned in Moscow's Lubyanka Prison, Anders was released following an understanding between the Polish government-in-exile and the Soviet Union. On July 30, 1941, General Władysław Sikorski and the Soviet ambassador to Great Britain, Ivan Majsky, agreed to restore diplomatic relations and form a Polish army on Soviet territory. That army was to be

composed of Polish soldiers detained in the Soviet Union since 1939. Anders was appointed its commander in chief with the rank of lieutenant general.

Establishing his first headquarters at Buzuluk on the Volga, Anders continued to insist on the liberation of Po-lish prisoners held by Soviet authorities, but he had only limited success. In 1942 he was allowed to move his army to Yangi-Yul, near Tashkent, and then to Pahlevi in Persia, where his troops were no longer subordinate to the Soviet Supreme Command. Linking up with the British in Iran, Anders's newly formed II Polish Corps was transferred to North Africa and Italy. There it distinguished itself as part of the British Eighth Army at Monte Cassino in May 1944. Victory here helped open the way to Rome for the Allies.

In the last stages of the war, Anders commanded all Po-lish forces in the west. After the war, he refused to return to communist-ruled Poland and became a prominent member of the Polish émigré community. Anders died in London on May 12, 1970.

Anderson, Frederick Lewis, Jr. (1905–1969)

U.S. Army Air Forces general. Born in Kingston, New York, on October 4, 1905, Frederick Lewis Anderson Jr. graduated from the U.S. Military Academy, West Point, in 1928 and was commissioned in the cavalry. He transferred to the Air Corps and graduated from flight school at Brooks Field,

Texas, in 1929. He then served in the Philippines and at various posts in the United States, mostly with observation squadrons.

In 1931, Anderson transferred to bombardment aviation and helped to develop strategic bombardment practices and training methods. He was promoted to captain in May 1935. In 1940, he became the first director of the Bombardiers Instruction School. During that time, he also served as head of the Bombardment Tactics Board. In January 1941, he was promoted to major.

Following a tour in Britain in 1941 studying Royal Air Force bombing operations, Anderson became deputy director of bombardment for the Army Air Forces in 1942 and was promoted to lieutenant colonel in January 1942. Anderson was promoted to brigadier general on February 7, 1943, and that July he was appointed commanding general of the VIII Bomber Command in England, serving under Lieutenant General Carl Spaatz. Anderson oversaw U.S. bombing of German U-boat pens in France and of industrial targets, including the Messerschmitt plants at Regensburg (August 17, 1943) and the ball-bearing plants at Schweinfurt (October 14, 1943). He also oversaw the massive bombing raids of the "Big Week" of February 20–25, 1944. Although there were heavy losses and disappointments in these raids, adjustments such as shuttle-bombing, twilight raids, and bombing through clouds helped to reduce the loss rate.

Promoted to major general on November 4, 1943, Anderson served as deputy commander of operations for Strategic Air Forces, European theater of operations, during 1944 and 1945.

Following the war, Anderson served as chief of staff for personnel of the Army Air Forces until he retired in 1947. He then worked in investment banking and served as the U.S. ambassador to the North Atlantic Treaty Organization (NATO) during 1952–1953. Anderson died in Houston, Texas, on March 2, 1969.

Anderson, Sir Kenneth Arthur Noel (1891–1959)

British Army general. Born in Madras, India, on December 25, 1891, Kenneth Arthur Noel Anderson was commissioned in the British Army upon graduation from the Royal Military College, Sandhurst, in 1911. He served in India and was a captain by 1915. During World War I, Anderson was badly wounded in the 1916 Battle of the Somme in France. Following his recovery, he took part in campaigns in Palestine and Syria.

After the war, Anderson attended the Army Staff College at Camberley, commanded a regiment on the Northwest Frontier of India, and served in Palestine from 1930 to 1932. Promoted to lieutenant colonel in 1930 and to colonel in 1934, he commanded the 11th Infantry Brigade as part of the 3rd Infantry Division of the British Expeditionary Force (BEF) in France at the beginning of World War II, having been promoted to acting brigadier in 1938. During the Dunkerque (Dunkirk) evacuation (May 26–June 4, 1940), he took command of the 3rd Division. Promoted to major general, he held a variety of posts in the United Kingdom during the next two years, culminating in heading the Eastern Command.

In the autumn of 1942, Anderson became the senior British officer in Lieutenant General Dwight D. Eisenhower's U.S. headquarters in London. Although he was unpopular with many U.S. officers, Anderson was well liked by Eisenhower. Anderson commanded the Eastern Task Force in the Allied invasion of North Africa, Operation TORCH, beginning on November 8, 1942. Anderson's units landed at Algiers, although in respect to French sensibilities, an American, Major General Charles Ryder, had charge of the actual landing. Anderson took over the day after the landing, and on November 11, 1942, he became head of the newly constituted British First Army and was concurrently promoted to lieutenant general. Anderson's

acerbic nature and dour personality tinged with pessimism did not suit him for command of an Allied force, however.

Ordered to advance quickly eastward to Tunis, 500 miles away, Anderson had only four brigades at his disposal. Rugged terrain, poor weather, stiffening Axis defenses, and lack of transportation thwarted his offensive, which was stopped 12 miles short of its goal. In January 1943, Eisenhower added to Anderson's command the Free French XIX Corps and Major General Lloyd Fredenhall's U.S. II Corps. German field marshal Erwin Rommel and Colonel General Hans Jürgen von Arnim then launched a series of counterattacks, most notably at Kasserine Pass during February 14–22, that threw the Allied armies into disarray. Although there were efforts to replace Anderson, he remained in command of the First Army, and his troops entered Tunis in May 1943.

Anderson returned to Britain to assume command of the British Second Army in June 1943 and began to plan for the invasion of France. In January 1944, however, he was shifted to the Eastern Command. From January 1945 to October 1946, Anderson headed the East Africa Command. During 1947–1952, he was governor and commander in chief of Gibraltar. Promoted to full general in 1949, he retired in 1952. Anderson died at Gibraltar on April 29, 1959.

Andrews, Frank Maxwell (1884–1943)

U.S. Army Air Forces general. Born in Nashville, Tennessee, on February 3, 1884, Frank Andrews graduated from the U.S. Military Academy, West Point, in 1906 and was commissioned in the cavalry. He then held routine assignments in the American West, Hawaii, and the Philippines. In July 1916, he was promoted to captain. When the United States entered World War I in 1917, Andrews transferred to the Signal Corps, and in 1918 he qualified as a military aviator, although too late to see active service in France. That same year he was promoted to temporary lieutenant colonel. On July 1, 1920, Andrews was promoted to major (permanent). In mid-1920, he succeeded Brigadier General William Mitchell as the Air Service officer of the American Army of Occupation in Germany.

Returning to the United States in 1923, Andrews then commanded the 1st Pursuit Group. He established several speed and altitude records until transferred to staff assignments. Andrews was promoted to lieutenant colonel on January 13, 1930. On March 1, 1935, he was promoted to temporary brigadier general and assigned to command General Headquarters (GHQ), Air Force. The new organization placed for the first time all the U.S. Army's air-strike elements under a single commander. Andrews became a strong advocate of the four-engine strategic bomber that became the Boeing B-17 Flying Fortress, and he was certainly one of the leading architects of American military airpower in the years before World War II.

Andrews molded GHQ, Air Force, into the offensive combat arm that became the model for the U.S. Army Air Forces in World War II. GHQ, Air Force, was also the model of the U.S. Air Force's post–Cold War Air Combat Command. On December 26, 1935, Andrews was promoted to temporary major general.

In 1937, Andrews clashed with elements in the army General Staff when he forcefully advocated an air force as an independent service during testimony before the House Military Affairs Committee. In 1939, he was reassigned to an insignificant staff position at Fort Sam Houston, Texas, and reduced from his temporary rank of major general to the permanent rank of colonel. Just a few months later, though, General George C. Marshall became chief of staff of the army; Marshall brought Andrews back to Washington

and made him assistant chief of staff of the army for training and operations. Andrews was the first aviator to hold that key General Staff position.

U.S. Army Air Forces lieutenant general Frank M. Andrews was an articulate and vocal proponent of American air power, particularly with respect to strategic aircraft and the heavy bombers that demolished German and Japanese industry in World War II. (Library of Congress)

In 1941, Andrews took over the Caribbean Defense Command, becoming the first American air officer to command a theater. In November 1942, he assumed command of U.S. forces in the Middle East. On February 5, 1943, Andrews became the supreme commander of U.S. forces in the European theater of operations (ETO). Three months later on May 3, Lieutenant General Andrews died at the controls of a B-24 bomber while attempting a landing at Kaldadarnes, Iceland, in conditions of poor visibility.

Andrews's appointment to command the ETO was a tacit recognition that most of the American forces in Europe at the time were air rather than ground

units. Many contemporary observers at the time of his death considered him, rather than Dwight Eisenhower, the leading candidate for supreme Allied command of the invasion of the continent. Andrews had the complete confidence of General Marshall and possessed an almost ideal balance of intellect, character, courage, and military skill. Andrews Air Force Base (now Joint Base Andrews) in Maryland was later named for him.

Angelis, Maximilian de (1889–1974)

German Army general. Born on October 2, 1889, at Budapest, Hungary, into a military family, Maximilian de Angelis graduated from the Theresian Military Academy in 1910. He was then commissioned a second lieutenant in the Austro-Hungarian Army. Angelis first served and fought with the 42nd Field Artillery Regiment in 1914. During 1915–1916, he served on the staff of the Kaiserjägerdivision. From October 1916 to the end of the war, Angelis served in the 2nd Kaiserjäger Brigade as a staff officer, and he was detached to the 1st Kaiser Jäger Brigade and the 88th Infantry Division.

Taken prisoner by the Italians in November 1918, Angelis was not released until October 1919. He then held a variety of different billets in the Austrian Army. Following the German absorption of Austria in March 1938, Angelis joined the German Army. He was promoted to major general on March 15, 1938.

Angelis commanded the 76th Infantry Division from September 1939 to January 1942. On June 1, 1940, he was promoted to lieutenant general. Following the defeat of France, his division participated in the 1941 campaign in the Balkans and the invasion of the Soviet Union that began on June 22, 1941. In January 1942, Angelis took command of the XLIV Army Corps. He was promoted to general of artillery in March 1942. As chief artillery officer on the Eastern Front, Angelis reported directly to the General Staff. Angelis fluctuated between command of the XLIV Army Corps and the Sixth Army until 1944.

In September 1944, Angelis took command of the Second Panzer Army, and he held this post until the end of the war. The Second Panzer Army fought Soviet forces at the Battle of Lake Balaton in Hungary during the March 6–15, 1945, Operation SPRING-AWAKENING. The operation was an attempt to cut off the Red Army and seize Budapest from the rear, along with the rest of eastern Hungary. The plan was a failure, and German forces were progressively driven back after each counterattack as the war came to a close.

Taken prisoner by the Americans at the end of the war, Angelis was turned over to Yugoslavia in April 1946. There he was tried and sentenced to prison for 20 years followed by a double sentence of 25 years in prison upon transfer to the Soviet Union in March 1949. Freed in 1955, he settled in Graz, Austria, where he died on December 6, 1974.

Anglo-German Naval Agreement (June 18, 1935)

Important naval agreement between Britain and Germany preceding World War II. According to Article 190 of the Versailles Treaty of 1919, which was negotiated at the end of World War I, Germany was not permitted any naval aviation or submarines. Its navy was limited to 6 predreadnought battleships of the *Deutschland* or *Lothringen* type, 6 light cruisers, 12 destroyers, and 12 torpedo boats.

In November 1934, however, German chancellor Adolf Hitler communicated to London his desire to secure a naval agreement with Britain; in March 1935 he announced Germany's rearmament in defiance of the Versailles Treaty. Despite the fact that the British government had in February 1935 promised that it would take no action toward Germany without first consulting with the French government, it proceeded to reach a naval arrangement with Germany. The Anglo-German Naval Agreement was signed on June 18, 1935.

The British hoped that this was the opening step in a series of arms limitations agreements that would contain German power, while the Germans saw in it the beginning of an alliance against France and the Soviet Union. The agreement was of great advantage to Germany, for it gave that country the right to build a surface navy up to 35 percent the size of the British Commonwealth aggregate fleets. This would mean that the German Navy might now be larger than the fleets of either France or Italy. The percentage would apply to each individual class of ship, except submarines, where Germany was granted parity with Britain, although it did agree not to go beyond a proportional strength of 45 percent of that possessed by members of the British Commonwealth, except in the event of a situation arising that would make a higher percentage necessary, in which case the German government would notify the British. Submarines, of course, had been specifically prohibited to Germany under the Treaty of Versailles.

Because Germany's own fleet at the time was almost negligible, the promise was only another predated German check, and it cost Great Britain the open hostility of its principal ally, France. It also brought the collapse of the so-called Stresa Front of British, French, and Italian opposition to

Germany's rearmament and marked another step in the appeasement policy of Nazi Germany.

British leaders believed that they had contained a threat to Britain's security, and in the House of Lords, Admiral David Beatty declared that Britain had cause to be grateful to the Germans for agreeing to limit their naval strength. But the agreement shattered the Versailles Treaty and was a promise Hitler was not prepared to honor. He repudiated the agreement on April 28, 1939.

Anglo-Soviet Treaty (May 26, 1942)

Diplomatic agreement between the Soviet Union and the United Kingdom finalized in London on May 26, 1942, in which both nations agreed not to seek an armistice or peace with any of the Axis powers without consulting the other first. The Anglo-Soviet Treaty, which was negotiated chiefly by British foreign secretary Anthony Eden and his Soviet counterpart Vyacheslav Molotov, was more an agreement of understanding dictated by the exigencies of war. It was signed only after months of often contentious negotiations.

Talks began in earnest in December 1941, only days after the United States entered the war, when Eden traveled to Moscow to hammer out a wartime agreement with the Soviets. British prime minister Winston L. S. Churchill and U.S. president Franklin D. Roosevelt were by then quite

concerned that the Soviets might exit the war early or sue for a separate peace, leaving virtually all of Europe open to German occupation and ending Nazi leader Adolf Hitler's ill-advised two-front war. There was precedence for such a scenario, as Russia had exited World War I in early 1918, well before the fighting was over.

Soviet leader Joseph Stalin and Molotov drove a hard bargain. Stalin insisted that no treaty would be forthcoming unless the British officially recognized the Soviet Union's sizable territorial acquisitions made after the German-Soviet Non-Aggression Pact (August 23, 1939) and before the German invasion of the Soviet Union, which had begun on June 22, 1941. These included the Baltic states, eastern Poland, northern Romania, and part of Finland.

Churchill, in constant communication with Roosevelt, refused the Soviet demands, and when Molotov traveled to London to continue talks, the negotiations remained deadlocked. In midwinter 1942, with the war going badly in Europe and the Pacific, Churchill cabled Roosevelt and hinted that for the sake of the so-called Grand Alliance, perhaps the Soviet demand should be met. Roosevelt, however, steadfastly refused to bow to Stalin's wishes and counseled Churchill not to give in.

In the end, Molotov—still in London—decided to sign the Anglo-Soviet Treaty without having secured recognition of the Soviet Union's prior territorial acquisitions. Other parts of the treaty included agreement that neither nation would seek further territorial expansion or interfere in the other's internal affairs. Ancillary clauses dealt with specific actions to be taken during the war. Although the treaty accomplished little of great substance, it clearly indicated the precarious and ad hoc nature of the Grand Alliance. It also heightened Churchill's growing distrust of the Soviets and their motives.

Animals

During the war, animals fulfilled unique military support roles that humans and machines could not perform. Probably more horses were employed in the war than any other animal. Although a number served in cavalry or dragoon units in the war, horses were chiefly used for transport—to pull artillery or transport supplies. The German Army, often viewed as being highly mechanized, in fact relied on large numbers of horses: a German infantry division of 1939 required between 4,000 and 6,000 horses, and even the panzer divisions used them. As late as 1944, an estimated 85 percent of German infantry divisions were horse drawn, with few motor vehicles. Millions of horses were employed, and died, during the German invasion of the Soviet Union. The Japanese also used horses in Burma, and the Chinese soldiers often traded ponies captured from the Japanese to the Americans.

Many horses were killed for their meat in the Soviet Union and elsewhere, as was the case of the U.S. Army's 26th Cavalry's mounts in the Philippines. After the war, animals deemed in poor shape were destroyed, and their meat was distributed to the local population. Many healthy horses, mules, and oxen that had been captured were sent to countries to help develop agricultural programs for reconstruction.

Mules were also invaluable as pack animals during the conflict, and they saw service on many fronts. Mules could carry one-third of their half-ton weight. The military prized mules for being steady on their hooves despite rocky conditions and for their ability to follow trails even when paths seemed nonexistent. U.S. forces employed mules first in North Africa at the end of 1942 and the next year in Sicily and Italy, where they proved particularly useful in mountainous terrain.

Most U.S. military mules were assigned to the China-Burma-India theater, however. Shipped to the war zones via Liberty ships, mules were

then sent on to base camps via the railroads. Mules transported artillery, crew-served weapons, and ammunition. Mules were distributed among transportation, demolition, communication, and reconnaissance platoons, and some were selected for use by medics and for casualty evacuation.

Mules could be cantankerous, especially when being loaded into aircraft to fly from India over “the Hump” to China. Mules sometimes kicked soldiers and expressed fear when encountering elephants. Because mules could alert an enemy that Allied troops were approaching, veterinarians sometimes surgically removed their vocal cords.

Elephants proved useful to Allied and Japanese troops in the China-Burma-India theater. Elephants could perform heavy work equivalent to that of a dozen people. Elephants were employed to transport supplies and to load cargo planes. One elephant, called Elmer, was often featured in the press and was shown lifting 55-gallon fuel drums with his trunk to adjacent airplanes. Elephants were also used to string communication lines, especially in swampy locations where vehicles could not navigate.

Pigeons, cared for by various signal corps, carried messages between units and were essential during periods when radio silence was imposed. Thousands of soldiers, many of them pigeon fanciers, worked in the U.S. Army Pigeon Service, tending to some 54,000 pigeons. The British, Canadians, and Australians also organized pigeon units. Some Allied pigeons were trained to fly messages at night in an attempt to evade enemy fire. The Axis powers also used bird messengers.

U.S. Marine Raiders and their dogs, which were employed in scouting and running messages, starting off for the jungle front lines on Bougainville Island, 1943. (National Archives)

Pigeons accompanied ground troops and were also deployed from submarines and seaplanes. Paratroopers often carried pigeons on their jumps. Pigeons flew hundreds of miles over land or water from behind enemy lines to their lofts. Messages carried by pigeon alerted officers to downed aircraft, grounded ships, and the need for plasma supplies. News pigeons carried timely dispatches from the front written by war correspondents. Communication by pigeon only worked one way, however, from the front to the rear areas.

War pigeons faced death not only from enemy weapons but also because of disease and birds of prey. Because of difficult jungle climates and high humidity, the militaries bred pigeons in those areas so that the offspring would be accustomed to tropical conditions. Pigeons were essential in some areas where jungle prevented line and wireless communications from being effective. Many World War II pigeons received ranks and service awards. Some were buried with military honors, while others were mounted for display in museums.

Both Allied and Axis forces mobilized war dogs. British handlers and dogs prepared at the War Dogs Training Schools. The Soviets trained sledge

dogs and placed mines on dogs that crawled underneath tanks prior to detonation. After the December 7, 1941, Japanese attack on Pearl Harbor, dog fanciers in the United States discussed the idea of establishing a system to identify and train war dogs for the military.

World War I veteran Harry I. Caesar and poodle breeder Alene Erlanger communicated with quartermaster general Major General Edmund B. Gregory to form Dogs for Defense. This group encouraged patriotic Americans to donate dogs of suitable size and temperament for military service. Newspaper advertisements, posters, and movie reels promoted U.S. war dogs. Regional and state Dogs for Defense representatives recruited and evaluated the animals. Many people donated their dogs because they could not afford to feed them during the war. In any case, donors were not allowed any information as to the disposition of the dogs.

American Kennel Club dog shows sponsored war dog exhibitions and classes to raise funds and identify dogs with qualities the military sought. War dogs were also featured at the prestigious Westminster Kennel Club Dog Show. Throughout the country, war dog demonstrations and rallies were held, with themes such as “Back the Attack.” On the home front, war dogs guarded prisoner-of-war camps and defended industries from saboteurs. Other breeds, such as beagles, were used to assist in the rehabilitation of wounded veterans.

German-born trainers such as Willy Necker introduced effective training regimens at American war dog training and reception centers. Such facilities were distributed throughout the United States, with significant sites located at Front Royal, Virginia; San Carlos, California; and Fort Robinson, Nebraska. Necker left no doubt about his allegiance, teaching one dog to place its paw over its snout whenever it heard the name “Hitler.”

U.S. Marine Corps war dog platoons trained at Camp Lejeune, North Carolina, and Camp Pendleton, California. Their mission was to locate enemy forces, mines, and booby traps. These dogs, mostly Doberman pinschers, guarded soldiers on patrol and alerted them to approaching enemy soldiers. The marine dogs also transported supplies and messages. Each marine division had an attached war dog platoon.

Germany mobilized an estimated 200,000 war dogs. Japan trained war dogs at Nanjing (Nanking) in China, and it had 25,000 trained before its attack on Pearl Harbor. The Japanese used black dogs for night service and white dogs to serve in snow.

After their service was completed, American war dogs were shipped to war dog centers for training to readjust to civilian life before returning to their families. Even after war dogs returned home, their owners did not know where their pets had served. War dog handlers formed closed attachments to their charges, and they often asked the dogs' owners if they could keep the dogs with which they had served. Heroic animals were often praised in newspaper accounts. Chips, perhaps the war's most famous dog, who assisted in the capture of Italian soldiers, gained notoriety for biting General Dwight D. Eisenhower.

World War II motivated strange uses of animals. Camels provided the power for mills used to mix mortar. Mice in the Soviet Union chewed through German tank engine wires; the Germans responded by procuring cats to eat the mice. Canaries and mice helped soldiers determine whether poisonous gases were present in tunnels. Among the more bizarre use of animals was a U.S. Army Air Forces plan to place incendiary bombs on bats, which would then be released to fly in kamikaze-style raids against Japanese military sites. Millions of animals and birds served in the war, and numerous memorials around the world testify to their contributions.

Antiaircraft Artillery and Employment

Antiaircraft artillery (AAA) is ground defense against aircraft. The Germans knew antiaircraft fire by the term *flak* (German acronym for *Flugzeug* [aircraft] *Abwehr* [defense] *Kanonen* [cannon]; the British knew antiaircraft artillery as “ack-ack”). The Americans used these two terms and also “Triple A.” In the latter half of the 1930s, new equipment appeared in antiaircraft units around the world. Countries adopted slightly larger-caliber and more effective guns with higher rates of fire.

Introduced in 1928 and modified in 1935, the German 88mm gun became perhaps the most feared artillery weapon of the war. Widely used as a tank gun, it was also a powerful antitank gun and a coast-defense and antiaircraft weapon, although it required purpose-designed ammunition for each role. With a practical ceiling of 35,000 feet, the 88mm posed a great threat to enemy bombers. A 105mm gun also saw widespread use, and in 1942, with Allied bombing intensified, Germany fielded a 128mm gun as an interim system (pending development of a superheavy 150mm gun, which, however, never entered service). Lighter German antiaircraft guns ranged from 20mm to 55mm.

A Bofors antiaircraft gun overlooking the Algerian coast and manned by a U.S. artillery crew, 1943. (Library of Congress)

Germany used 20mm and 37mm antiaircraft guns in a variety of configurations on several motorized platforms. The effectiveness of German antiaircraft defenses was reduced by a lack of precision radar control (RPC) systems and the fact that its antiaircraft projectiles lacked proximity fuzes. The Italians also used a wide range of antiaircraft guns up to 90mm in size.

Beginning in 1938, the British produced a 3.7-inch gun, which many came to believe was their best gun of the war. It had a ceiling of 28,000 feet. Its effectiveness was greatly increased by the introduction of RPC in 1944. This combination of radar, predictors, and proximity-fuzed ammunition gave it a high rate of success against German V-1 flying bombs. The U.S. Army began to replace its 3-inch gun with a 90mm gun in 1940.

The Soviets also employed a wide range of antiaircraft weapons. They reproduced both the Swedish Bofors 25mm and 40mm guns, retooling the latter to fire a 37mm projectile. The largest Soviet field antiaircraft weapon was the 76.2mm gun; for home defense the Soviets relied on the 85mm gun. Produced in large numbers, it was the principal Soviet antiaircraft gun of the war.

As with the smaller 76.2mm gun, the 85mm piece saw widespread service as main tank armament. The Soviets claimed that antiaircraft guns shot down 2,800 Axis aircraft, 40 percent of the total downed.

Operating on the generally held belief in the 1930s that bombers would always get through, the British focused their aviation efforts on developing a strategic bomber force at the expense of air defense. At war’s outbreak, antiaircraft artillery was directed by predictors that followed the path of aircraft mechanically; they were useless at night or in poor visibility. Although all major powers experimented with new direction devices, the British made the primary strides in the field of operational radar. This interception device established the height, course, and speed of enemy aircraft. Throwing up shell barrages through which aircraft flew was no more successful as a tactic in World War II than it had been in World War I, but ground-fire threats increased substantially when the speed and height of a bomber stream could be ascertained by radar.

In the autumn of 1939, Britain still had only 540 antiaircraft guns larger than 50mm. During the Battle of Britain (July 10–September 30, 1940), antiaircraft artillery took second place to fighter aircraft. Most sources place the number of aircraft shot down by antiaircraft artillery at fewer than 300 of the nearly 1,800 Luftwaffe planes destroyed. Yet ground fire forced aircraft to higher elevations, unnerved aircrews, and diminished bombing accuracy.

Flak was the principal defense against night attack. Night fighters were still being developed, although the requisite technology would evolve rapidly. Artillery sighting was largely visual until October 1940, when the British began to equip their forces with gun-laying radar, which increased the accuracy of artillery fire in all weather.

Reliance in Britain on lesser-trained territorial forces for antiaircraft defense foreshadowed personnel difficulties the Axis powers would later encounter in the war. Experienced men usually deployed to distant fronts or to sea, and so air defense depended on women, those too old to qualify for military service, or the physically restricted. During the war about 70,000 women served in British antiaircraft units.

When the Royal Air Force (RAF) and U.S. Army Air Forces (USAAF) strategic bombing campaigns gained impetus in 1942, German flak posed a serious threat. Aircraft coming in below 8,000 feet often suffered grievous losses from ground fire. Damage from flak continued to rise in the air war, and gunfire from the ground shot down more Allied bombers than did fighter aircraft.

Technological developments moved at a staggering pace as the fighting continued. By 1941, German flak units began deploying incendiary shells, gun-laying radar, and grooved projectiles that fragmented into small pieces, causing dreadful damage to aircraft. By 1943, most antiaircraft artillery shells had been converted from powder to mechanical fuzes. Flashless propellants augmented the efficiency of the guns, as did automatic fuze-setters that improved accuracy and amplified the rate of fire two or three times. Use of electric predictors became fairly common. In 1944, the Germans introduced double fuzes, both contact and timed, that boosted the efficacy of guns severalfold. By then, the Allies were customarily arming their shells with the U.S. Navy–developed proximity fuzes, a technology the Germans never successfully developed.

For all that, the Germans put to trial several innovative antiaircraft

techniques, such as squeeze-bore and sabot mechanisms designed primarily to increase the muzzle velocity of guns. During the course of the war, Germany developed four types of flak rockets, some guided, some not. The effect of flak rockets was in the main psychological, though, since German forces lacked operational proximity fuzes, and radio-controlled guidance systems were rudimentary and subject to degradation.

In several urban areas, such as Berlin, Vienna, and the "flak alley" around Köln (Cologne), Germany constructed large flak towers to serve as gun platforms. Some covered an entire city block and were more than 130 feet high (corresponding to a 13-story building) with reinforced concrete walls up to 8 feet thick. Batteries sited on the roofs mounted heavy antiaircraft artillery and multiple-barreled pom-pom cannon in the structures' turreted corners.

As the war progressed and Allied air raids occurred almost daily, German antiaircraft defenses faced challenges in growing measure. The quality of flak personnel plummeted as youngsters, women, disabled veterans, foreigners, and even prisoners of war serviced the artillery. At war's end, nearly half of all German gun crews were auxiliaries or civilians. Ammunition shortages manifested themselves in a big way in 1944, necessitating firing restrictions during air raids. Shortages would eventually reduce firing potential by more than half.

Nonetheless, German flak units caused about one-third of Allied aircraft losses and inflicted at least two-thirds of total aircraft damage through 1944. As German fighter protection became weaker, antiaircraft artillery invariably took on a larger role, continuing to impair Allied aircraft and to degrade bombing accuracy. According to U.S. reports, the USAAF lost 18,418 aircraft in European combat, 7,821 of them downed by flak. Follow-on studies credited antiaircraft artillery for as much as 40 percent of bombing errors.

After the June 1944 Allied invasion of Europe, Germany launched its V-1 buzz bomb campaign in earnest. These low-altitude weapons, flying at nearly 400 mph, were tricky to locate and even harder to down. Fighters had little time to spot and destroy a buzz bomb. Antiaircraft artillery constituted the final line of defense against the V-1s.

Increasing motorization of land forces fostered a need for self-propelled antiaircraft artillery. Although U.S. ground forces used the .50-caliber Browning machine gun in various configurations for basic air defense, these

were frequently mounted with the 37mm antiaircraft gun, so the latter could aim with the Browning's tracer fire. After 1943, the army's chief heavy antiaircraft artillery piece, the 90mm gun, was often mounted on a multipurpose carriage for antiaircraft or field artillery use. In early 1944, the army adopted the 120mm antiaircraft stratosphere gun, which was nearly twice the size and weight of the 90mm gun.

Beginning in 1940, the U.S. Navy devoted considerable attention to improving its antiaircraft defenses. Experience showed that 20mm cannon of Swiss design were many times more effective against aircraft than machine guns. By 1945, the navy had deployed about 13,000 20mm artillery tubes aboard ship and had inflicted nearly one-third of all Japanese aircraft losses with these weapons. In due course, the navy deployed some 5,000 40mm guns of Swedish design in single, dual, and quad mounts. Also widely used shipboard was the 5-inch/38-caliber dual-purpose—that is, antiaircraft and antiship—gun, and some 3,000 were eventually mounted on ships. Proximity fuzes in the 5-inch weapon greatly increased antiaircraft effectiveness.

Throughout the war, technological constraints and manufacturing hindrances beset Japanese antiaircraft-antiartillery capabilities. In 1941, the Japanese deployed just 300 guns in defense of the home islands, and by 1945, even in the face of the American air onslaught, Japan had only 2,000 guns earmarked for homeland defense. The standard Japanese antiaircraft gun throughout the war was the 75mm type that first saw service in the 1920s. In the Japanese Navy, the 25mm was the standard light antiaircraft gun, and the 5-inch was the standard heavy. Some 500 heavy artillery pieces were committed to the defense of Tokyo by 1944, but fire-control and radar capabilities for most weaponry remained inadequate.

Compared with that of the Germans, Japanese flak was far less effective against Allied air attack. During the entire war, Japanese antiaircraft artillery was credited with destroying just 1,524 American aircraft. Japanese naval vessels, perennially lacking in shipboard antiaircraft defense, suffered accordingly.

In sum, during the war, flak was often quite lethal and cost-effective, downing many enemy aircraft and complicating air missions. It made low-altitude bombing and strafing operations a risky business. Evolving technology—above all, radar—increased gun efficacy exponentially.

Antiaircraft Defense of Surface Ships

Prior to World War II, most navies regarded the aircraft threat with a mixture of unconcern and overconfidence. The U.S. Navy was typical. In 1933, the chief of naval operations admitted that ranking officers simply did not have time to study antiaircraft gunnery. In the 1934 edition of the *General Tactical Instructions*, less than 1 page (out of 292) dealt with antiaircraft fire. The navy vastly overestimated the effectiveness of its existing defenses, as it relied on the 5-inch gun firing under local control and especially on the .50-caliber machine gun for close-in defense.

Despite this general complacency, some storm warnings were flying. As aircraft performance improved toward the end of the decade, the chief of the Bureau of Aeronautics warned that bomb hits might well be more numerous than shell hits in the next war. In 1939, Admiral Ernest J. King, then commander of a carrier unit in the Annual Fleet Problem naval exercise, dedicated his postexercise comments solely to the question of antiaircraft defense, with special emphasis on fire control.

The outbreak of war brought the issue squarely to the fore. On April 17, 1940, the British destroyer *Gurkha* became the first ship ever to succumb to hostile air attack. Other losses quickly followed. The rapidly expanding capabilities of military aircraft proved especially challenging. Although some

pessimists suggested that henceforth capital ships would not dare steam into range of land-based planes, navies scrambled to remedy the situation.

Some services were in a better position than others in facing the threat. For instance, the design of many large ships, even the newest, made too little provision for antiaircraft defense. Modern battleships of the Axis navies carried two secondary batteries: one for defense (about 6-inch low-angle) against surface craft, the other (4.1-inch for Germany, 5-inch for Japan, and 90mm for Italy) for antiaircraft work. Designers in Britain and the United States had been more farsighted in mounting dual-purpose secondary guns (about 5-inch) useful for either role.

So dangerous was the aircraft menace that at least two navies (those of the United States and Japan) experimented with shooting heavy projectiles into the sea to throw up columns of water in front of torpedo planes. Only the Japanese put these ideas into practice. They developed a special 18.1-inch shell filled with almost 10,000 bursting charges, and the battleship *Yamato* fired these unsuccessfully in April 1945. The basic problem was the difficulty of tracking a fast-moving plane with the ponderous turret guns. Also, the blast from these huge weapons made it impossible to man the smaller antiaircraft guns in exposed positions.

Suitable gun batteries were only part of the solution. Prewar fire-control systems, such as the Japanese Type 94, the German Type 1937, and the British Mk IV, encountered severe problems in compensating for the increasing speed of aircraft. Of these navies, only the Royal Navy deployed an adequate replacement in the Mk VI. Most successful was the U.S. Navy, which had under development in 1940 an advanced antiaircraft director, the Mk 37. Although this design was basically sound, it was heavy (at 16 tons), susceptible to vibration, and required a crew of seven. Nevertheless, variants of the Mk 37 were fitted to ships as small as destroyers and made to serve throughout the entire war by constant updating, with one model undergoing 92 modifications. As aircraft speeds went up, the Mk 37 director proved amenable to the addition of radar. The British considered the Mk 37 the best heavy director in the world.

No matter how excellent the guns and fire-control equipment, a weak link remained in the system. Standard antiaircraft shells were detonated by time fuzes, which were inherently inaccurate due to variations in manufacture and to the necessity to set them manually. In 1940, the U.S. Navy’s Bureau of

Ordnance embarked on a most ambitious project to produce a fuze that would detonate automatically when the shell passed close to an airplane. The ultimate result was the proximity or variable time (VY) fuze that was, in effect, a tiny radar set in the nose of a 5-inch shell. It first saw action in January 1943; from that date on, VT-fuzed projectiles proved four times as deadly as conventional ones.

For close-in defense, navies relied on lighter weapons with their high rate of fire. Wartime experience quickly showed that machine guns, such as the .50 caliber, firing solid bullets lacked the necessary range and lethality. Much more promising were rapid-fire cannon with their explosive projectiles. The Japanese concentrated their efforts on the 25mm Type 96, derived from the French Hotchkiss. Under local control, this weapon, with a rate of fire of 220 rounds per minute, was fitted in triple, dual, and single mountings. Similarly, the British invested in the 2-pounder, produced in a variety of mounts from single- to six-gun.

Allied navies also came to rely heavily on guns produced under license from arms manufacturers in two neutral nations: the 20mm Oerlikon developed in Switzerland and the Swedish 40mm Bofors. The U.S. Navy tested the latter weapon in both twin and quadruple mounts early in 1942 and began large-scale production in the summer. The Oerlikon was fitted in both single and twin mounts, and this gun proved to be the most effective antiaircraft weapon until the fall of 1944, when the heavier 40mm accounted for 50 percent of all kills by antiaircraft fire. Unfortunately, miniaturization had not developed to the point that the VT fuzes could be fitted to 40mm or 20mm shells.

From 1941, all navies added these lighter guns to their warships in unprecedented numbers. By end of the war, the British and Dominion navies had taken delivery of almost 55,000 20mm Oerlikons. The largest warships carried huge antiaircraft batteries. In 1944, the German battleship *Tirpitz* mounted 16 37mm and 84 20mm guns, and the Japanese *Yamato* mounted 166 25mm guns. The British battleship *Duke of York* carried 55 20mm and 8 40mm guns, in addition to 88 2-pounders.

The evolution of the U.S. Navy’s last class of battleships is instructive. In 1941, the original plans of the battleship *Iowa* called for 24 40mm and 40 20mm guns. By October 1942, the number of Bofors grew to 40 guns and a month later to 16 quadruple mounts in addition to 60 20mm guns. In June

1943 as the *Iowa* was fitting out, the ship's captain asked for a considerable increase in the already heavy antiaircraft battery. By this point, though, deck space was a limiting factor. There were antiaircraft guns crammed into every corner and even on turret tops. Ultimately, this class of ships carried up to 80 40mm and 52 20mm guns.

To increase the flexibility of the antiaircraft armament, U.S. officers in 1942 began interconnecting the heavy and light directors so that the 5-inch/38 mounts could be employed for close-in work and the 40mm Bofors could fire at night using the radar equipment of the larger gun. These arrangements became so complex that the crew often rigged an electric status board to keep up to date on which mounts were controlled by which computer and which director. These samples of Yankee improvisation served well enough. Ordnance experts concluded after the war that the U.S. Navy had the best antiaircraft fire control in the world.

In addition to vastly expanding the number of lighter guns on existing warships, some navies modified or constructed ships especially configured for the antiaircraft mission. The British as early as 1940 operated off Norway older cruisers that had been converted for this work, and by May 1940 the Royal Navy regarded the ships as "worth their weight in gold." The British built 16 ships of the Dido class, the majority armed with 10 5.25-inch dual-purpose guns. During the war, the U.S. Navy took delivery of the eight Atlanta-class cruisers equipped with up to 16 5-inch guns.

By midwar, all ships of destroyer size and smaller featured dual-purpose batteries. Typical were the Japanese Terutsuki-class destroyers with 8 100mm guns, the U.S. Fletcher-class with 5 5-inch guns, and the British Hunt-class escorts armed with the 4-inch gun. Of course, such ships also carried close-in antiaircraft cannon.

The attention lavished on antiaircraft defenses paid dividends in battles such as Santa Cruz and the Philippine Sea. Military analyst Bernard Brodie calculated that by the end of 1943, the effectiveness of the U.S. battle fleet's antiaircraft gunfire had increased a hundredfold in two years. But the race between ship defenses and aircraft was constant. Aircraft improved in capability as well, with kamikazes (essentially missiles guided by humans) and standoff weapons such as the German Hs-293 adding a new order of lethality. Following the war, navies would turn to missiles to defend their surface warships.

Anti-Comintern Pact (November 25, 1936)

Formal alliance between Germany and Japan. Signed in Berlin on November 25, 1936, the Anti-Comintern Pact was ostensibly a response to the activities of the Communist International (Comintern), the Soviet organization that claimed leadership of the world communist movement. Nominally intended to oppose the existence and expansion of international communism, the agreement was really a diplomatic tool directed at achieving other goals.

German special ambassador plenipotentiary Joachim von Ribbentrop first proposed such an agreement in 1935, but the Foreign Office and the army opposed it. Since World War I, the Germans had worked to develop a close relationship with China. This pact would nullify these efforts, as Japan and China were at loggerheads over the Japanese takeover of Manchuria. Nevertheless, German chancellor Adolf Hitler's approval ended discussion. Hitler hoped that the pact would pressure Great Britain not to interfere with Germany's military buildup and his plans for eastward expansion. In any case, British leaders were concerned about the escalating Japanese threat to their interests in the Far East.

Developed from conversations between Ribbentrop and Japanese military attaché Major General Hiroshi Ōshima, the pact was Hitler's effort to tie Japan to Germany. Japanese leaders saw it as an important step toward finding an ally in an increasingly hostile world. Alienated from the West by its takeover of Manchuria, Japan was also involved in armed clashes with

Soviet forces in the Far East. The Japanese hoped that a pact with Germany would strengthen its position vis-à-vis the Soviet Union. Thus, the wording of the pact was more important to the Japanese than to the Germans.

On the same day, Germany and Japan signed another agreement providing that in case of an unprovoked attack by the Soviet Union against Germany or Japan, the two nations would consult on what measures to take "to safeguard [their] common interests," and in any case they would do nothing to assist the Soviet Union. They also agreed that neither nation would make any political treaties with the Soviet Union. Germany also recognized Manzhouguo (Manchukuo), the Japanese puppet regime in Manchuria.

Germany later employed the Anti-Comintern Pact as a litmus test to determine the loyalty of minor allies. Italy adhered to the pact on November 6, 1937. The pact was renewed in 1941 with 11 other countries as signatories.

To many observers, the pact symbolized Germany's resurgence as the most powerful country in Europe. The threat of global cooperation between Germany and Japan directly imperiled the overextended empires of France and Great Britain. Much like Germany's actual capabilities, however, the pact was more illusion than reality. Both signatories failed to cooperate, and rarely did one even inform the other of its intentions. An even greater indication of the pact's worthlessness was Hitler's breaking of its terms when he signed the German-Soviet Non-Aggression Pact in August 1939.

Antishipping Campaign off Norway

Between April 1944 and May 1945 the Royal Navy and Royal Air Force Coastal Command conducted an intensive campaign against German merchant shipping, light warships, and submarines off the Norwegian coast. The three principal objectives were to relieve German pressure on the Allied Arctic convoys bound for the Soviet Union, disrupt and destroy the important ore trade to Germany, and interdict U-boats attempting to reach the North Atlantic.

Aircraft conducted the bulk of the campaign. Royal Navy carrier aircraft launched over 30 operations during this period. Fleet carriers engaged in strikes against the battleship *Tirpitz* in April and August 1944 (operations tungsten and goodwood) also undertook missions against German coastal shipping while on station off the Norwegian coast. Individual fleet carriers also conducted specific antishipping operations in June, September, October, and December 1944, after which they transferred from home waters to the British Pacific Fleet. In total, aircraft from the fleet carriers sank almost 100,000 tons of shipping, damaged an equal amount, and destroyed numerous small escort vessels and flak ships.

Escort carriers undertook many more antishipping operations, usually individually but occasionally as a squadron of two or three carriers. Over this period 12 escort carriers deployed off the Norwegian coast, sufficient to ensure at least two strikes per month. Their smaller air groups militated against duplicating the success of the fleet carriers, but their aircraft still sank almost 80,000 tons of shipping, a depot ship, 2 U-boats, numerous smaller auxiliary warships, and more than 15,000 tons of shipping in a simultaneous mining campaign.

Royal Air Force Coastal Command’s land-based antishipping squadrons cooperated closely with the carrier campaign. In late 1943, it opened a base at Banff in Canada and, by the spring of 1944, four squadrons were operational, a force that soon expanded to eight squadrons of Mosquito fighter-bombers and Beaufighter strike aircraft with the addition of an airfield at Dallachy.

The Banff and Dallachy strike wings maintained an intensive tempo of operations against Norwegian coastal shipping, averaging more than 20 strike

packages a month from September 1944 onward. The wings sank over 80,000 tons of shipping during the campaign and numerous warships, including a minesweeper and seven U-boats in April–May 1945 alone.

Antisubmarine Warfare

The effectiveness of submarine attacks made the development of antisubmarine warfare (ASW) tactics one of the most important challenges for both sides during World War II. At the beginning of the war, both the Allied and Axis powers underestimated the potential impact of submarine warfare. The British were confident that asdic (acronym for Anti-Submarine Detection Investigating Committee), later known as sonar (*so*und *na*vigation and *r*anging), would enable them to detect submarines out to a range of several thousand yards and that they would thus be able to sink German submarines at will. Then, too, at the beginning of the war Germany had few submarines. On September 1, 1939, commander of German submarines, Commodore Karl Dönitz, had available 57 submarines, of which 27 were oceangoing types.

Nonetheless, submarines quickly emerged as potent weapons in the European theater because of the domination of the British surface navy and improvements in both weapons and tactics. During the first two months of the war, U-boats were able to sink 67 Allied naval and merchant vessels. Italian submarines also participated in this effort, in the course of the war sinking half a million tons of Allied Atlantic shipping. Allied losses continued to

climb, and at the peak of the Battle of the Atlantic, in March 1943, U-boats sank 96 ships in only 20 days.

Meanwhile, after overcoming deficiencies in armament and strategy, U.S. Navy submarines extracted a significant toll on Japanese shipping in the Pacific theater. By the end of the war, U.S. submarines had accounted for 57 percent of all Japanese naval and merchant losses.

Initially, the principal tactics and weapons used in antisubmarine efforts by both sides during the war were those that had been developed and honed during World War I. Soon after the outbreak of World War II, the British reintroduced the convoy system. This had proved successful in World War I, and it minimized losses during World War II. At the outbreak of World War II, for instance, ships traveling in convoys between North America and Great Britain suffered only 2 percent losses until the Germans developed improved tactics.

The *Rudeltaktik* (wolf tactic, which the Allies referred to as the "wolf pack") developed by Dönitz involved simultaneous attacks at night by many submarines. It diminished the effectiveness of the convoy system, which was in any case initially hampered by a lack of escort ships. Not until 1943 could the Allies deploy sufficient numbers of escorts to optimize the convoy system, which worked best with a ratio of at least one escort for every three merchant ships.

One exception to the convoy system in the Atlantic was the use of fast liners to carry troops. Liners such as the *Queen Elizabeth* and *Queen Mary* were able to steam at more than 26 knots and outrun U-boats. Throughout the war, the superliners sailed without escorts and ultimately without loss. Concurrently, in the Pacific, U.S. submarine success was partly attributable to Japan's failures to pay attention to the protection of sea transport, develop the specialized tools such as forward-thrown ASW weapons, and construct the specialized escorts required to effectively convoy their traffic. In December 1941, the Japanese had only four Shimushu- or Type A–class ships, their only purpose-built escort warships, and they were not equipped with hydrophones until the autumn of 1942, when the Royal Navy had some 2,100 vessels of all types equipped with sonar.

British defenses of the vital Atlantic trade routes were strengthened in May 1941, when the U.S. Navy began escorting convoys between the United States and Iceland. Then, in June 1941, Canada created the Canadian Escort

Force for the same purpose. The Royal Canadian Navy played a key role in the Battle of the Atlantic. Comprising only 6 destroyers and 5 minesweepers at the beginning of the war, the Royal Canadian Navy grew by war's end to include 2 light carriers, 2 light cruisers, 16 destroyers, 63 frigates, 109 corvettes, 89 minesweepers, and many other vessels. Virtually all these were committed to the Battle of the Atlantic.

Antisubmarine weapons existed in two broad forms: passive and active. Passive weapons included underwater mines and impediments, such as submarine nets, designed to prevent submarines from moving into certain areas. Underwater contact mines exploded when they touched a hull; magnetic mines exploded when a ship or submarine was in their vicinity. Mines could be placed at a variety of depths to make them more effective.

To protect their ships against torpedoes, the Allied powers developed several countermeasures. One of the most successful was the noisemaker. Towed behind a ship, it could disable advanced acoustic torpedoes. Another was the degausser, which discharged an electronic current at regular intervals through a cable around the hull of a ship. The current helped to reduce the ship's magnetic field, reducing its vulnerability to the magnetic detonators in certain torpedoes.

Active antisubmarine weapons included depth charges, torpedoes, aerial bombs, and other explosive devices designed to rupture the hull of a submarine and sink it. The depth charge was a waterproof bomb that could be set to explode at a particular depth. The charge did not have to come into contact with a submarine to be effective; at close range, its concussion could breach a submarine's hull.

Depth charges improved during the course of the war. Such weapons could be either rolled off the stern of a ship or fired from projectors. The Italians had a multirack system that could deliver 48 depth charges in a single pass. Weapons such as the hedgehog, fired from a ship, delivered many smaller charges ahead of the escort vessel. Depth charges and torpedoes could also be delivered by aircraft. As the war progressed, the crews of Allied planes and ships became more adept at developing patterns to enhance the effectiveness of depth charge runs.

U.S. Navy sailors loading hedgehog bomb projectors employed aboard ships for antisubmarine warfare. (Corbis)

Key to the success of a surface attack on submarines was the escorting ships' ability to use their superior speed to keep enemy submarines contained within a certain area and then deliver successive depth charge attacks. Submarines usually had a smaller turning ratio than escort vessels, so containment of the submarine was especially important to a successful attack.

Antisubmarine weapons were most commonly deployed by escort ships and airplanes. The escorts were usually small, lightly armed, fast craft ranging from destroyers and corvettes to frigates and small motor launches. Some merchant ships were also equipped with depth charges or other antisubmarine weapons. Aircraft proved especially useful in antisubmarine warfare. They could spot submarines from long distances and either attack the submarines themselves or report a submarine's presence to surface units. Aircraft could also use a variety of weapons to attack the submarine. Because of the Battle of Britain and the subsequent concentration on strategic bombing, however, British and U.S. air commanders were reluctant to allocate aircraft for antisubmarine roles. Large flying boats and later the long-

range Consolidated B-24 Liberator equipped with radar proved critical in closing the mid-Atlantic gap, a wide area in the Central Atlantic that had lacked air protection.

In 1943, the German Navy began equipping U-boats with significant antiaircraft defenses made up of rapid-fire 20mm and 37mm cannon. These German antiaircraft defenses were subsequently overcome as the Allies began to deploy additional long-range bombers. During one week in the summer of 1943, Allied aircraft sank nine U-boats in the Bay of Biscay alone.

The increased use of aircraft along the coasts of the United States and Great Britain reduced the number of submarine attacks in these regions. To improve the convoys' chances, the British began modifying ships into escort carriers—merchant or naval ships that had the capability to launch one or more aircraft.

Critical in antisubmarine warfare was the ability to locate the submarine and therefore render its stealth meaningless. Sonar devices sent out sound pulses and then ranged underwater using the echoes. Using detection devices and direction finders, the Allies were able to detect and attack submarines before they came in range of the merchant vessels. Ships could also be fitted with hydrophones or other listening devices that detected the sounds emitted by a submarine. Although the Germans endeavored to develop rubber sheathing for their U-boats, sonar remained the most important detection device in antisubmarine warfare.

Surface radar could also be used to detect submarines, since the subs had to surface periodically to recharge their electric batteries. British Coastal Command aircraft were also equipped with lightweight 10cm radar developed by the Massachusetts Institute of Technology radiation laboratory; working with Royal Navy corvettes, such aircraft played a key role in the Battle of the Atlantic. Radar enabled Allied aircraft or surface ships to locate Axis submarines and attack them, even at night. The widespread installation of radar in Allied aircraft brought increasing numbers of U-boat kills. In response, the U-boats began using their own acoustic detection devices, called Biscay crosses, to warn of approaching aircraft. However, the devices often did not provide the U-boat crews sufficient time to react before an attack.

Even before the United States entered the war, the United States and

Great Britain had initiated a variety of cooperative programs to protect merchant ships. German successes added urgency to these efforts, which led to establishment of the Anglo-American integrated convoy system. As a result of the Allied Convoy Conference in 1943, lines of control over convoys were split: the United States controlled the Central and South Atlantic, and Canada and Great Britain controlled the northern convoy routes.

In May 1943, U.S. chief of naval operations Admiral Ernest King created the Tenth Fleet. Although it did not have ships attached to it, the Tenth Fleet maintained the submarine tracking room (covertly classified as unit F-21), which used radar and sonar reports and cryptologic intelligence—of immense importance in this campaign—to plot the movement of Axis submarines in the Atlantic and Pacific. F-21 coordinated U.S. antisubmarine efforts with the British tracking section at the Admiralty in London and with a much smaller unit attached to the Canadian naval command.

The combination of aircraft, better intelligence, increased use of radar and sonar, and improved coordination and tactics led to massive losses among the German U-boat force. In May 1943, the Germans lost 43 subs. The average monthly losses, due to all causes, were 12 for the last six months of 1942 and 19 in 1943. By the summer of 1943, the Battle of the Atlantic was being won. In 1943 and 1944, the Allies sank 453 U-boats, and Allied merchant losses were dramatically reduced.

Aircraft proved vital in antisubmarine warfare. Early in the war, in order to provide fighter protection, the British equipped several merchantmen with a forward catapult that held a modified Hurricane fighter. After launch and intercept, the fighter would try to make landfall or else would land in the water.

A more satisfactory solution was to fit a flight deck to the hull of a merchant ship. The German cargo/passenger ship *Hannover*, taken in March 1940, was converted into the first escort carrier, the *Audacity*, and entered service in June 1941 carrying 6 fighters. Additional escort carriers soon appeared in the form of U.S.-built conversions. They entered service with the Royal Navy in the first half of 1942. Designed to carry 15 aircraft each, the escort carriers proved invaluable.

Unlike their British counterparts, U.S. captains of escort carriers late in the war enjoyed complete freedom of action to mount hunt-and-kill missions. Teams composed of an escort carrier and half a dozen destroyers or new

destroyer escorts sank 53 U-boats and captured 1; the teams may have been the single most important U.S. contribution to the war against the U-boats.

German U-boats succeeded in shattering a special convoy designated TM I that sailed from Trinidad for Gibraltar at the end of December 1942 and inflicted 77 percent losses. This led British prime minister Winston L. S. Churchill and U.S. president Franklin D. Roosevelt to concentrate on the U-boat menace during their meeting at Casablanca in January 1943. Churchill urged that priority be given to the Battle of the Atlantic, and the Allied leaders decided to provide for the effort additional convoy escorts, aircraft assets (including the VLR Consolidated B-24 Liberator, which was to be based at Newfoundland for the first time to close the Greenland air gap), and escort carriers. Unfortunately, nearly three months passed before these assets were diverted to the battle.

Carrier-based aircraft were essential in closing the mid-Atlantic gap, and long-range aircraft flying from Britain also were important, although the preoccupation of the Royal Air Force with strategic bombing meant that Coastal Command possessed few long-range aircraft. Only grudgingly did Bomber Command's Air Marshal Arthur Harris make such air assets available. The U.S. Consolidated PBY Catalina and PB2Y Coronado and the British Short Sunderland flying boats proved invaluable, as did long-range B-24 Liberator and British Lancaster bombers.

In August 1944, Royal Air Force Bomber Command Squadron 617 (the "Dam Busters") mounted attacks with special "tallboy" bombs against the concrete-reinforced U-boat pens of the Bay of Biscay. These raids were highly effective, and in the last year of the war, 57 U-boats were destroyed by bombing, compared with only 5 destroyed by bombers in the previous five years. This shows what might have been accomplished had the bombers been directed against the submarines earlier.

After March 1943, aircraft were probably the chief factor in the defeat of the U-boats. Between March 1943 and May 1945, a total of 590 U-boats were destroyed, compared with only 194 in the previous three and a half years of war. Of the 590 destroyed, 290 were by airpower, 174 by ships, and the remainder through a combination of the two or from other causes.

A number of factors brought the Allies victory in the Battle of the Atlantic. The convoy system was important, but so too was technology, primarily the 10cm radar sets, sonar, improved depth charges, rockets fired

from aircraft, and forward-thrown shipborne antisubmarine hedgehogs, or “mousetraps” (small depth charges known to the British as squids). The high-intensity Leigh light on aircraft illuminated the submarines on the surface at night. Radio detection equipment was vital, and long-range aviation helped narrow the so-called black hole in the Central Atlantic. Intelligence also played a role, chiefly Ultra intercepts of U-boat communications that guided aircraft to the submarines. The hunter-killer groups operating independently of the convoys also carried the war to the submarines. It is true, however, that Allied and interservice cooperation was far too long in coming.

In the Pacific theater, Allied success came in part because the Japanese never developed effective antisubmarine techniques. The Japanese also failed to use their submarines effectively. Although they developed some fine, large, long-range types, the Japanese never really deployed their submarines against Allied merchant ships. The Imperial Japanese Navy subscribed to the doctrine that submarines were an ancillary weapon of the main battle fleet. The early ineffectiveness of U.S. submarines in the Pacific because of faulty torpedoes only reinforced the Japanese attitude that submarines were not a key weapons system.

The Japanese often used their own submarines as long-range transports and supply vessels, and some Japanese submarines carried aircraft. In addition, design problems (the Japanese submarines were large and easily detectable) further minimized Japanese submarines’ effectiveness.

Because they lacked radar detection and avoidance systems, Japanese submarines were especially vulnerable to antisubmarine efforts. The Japanese deployed 190 submarines during the course of the war, and the Allies sank 129 of them. For their part, Japanese submarines sank 184 merchant vessels during the entire war, and they made little effort to attack Allied transport and supply convoys from the mainland United States. The most significant danger to Allied merchant shipping in the Pacific theater actually came from the handful of German U-boats and raiders based in Sumatra and operating mainly in the Indian Ocean or from Japanese air units. In the Pacific theater, the Allies also successfully employed the antisubmarine tactics developed in the Atlantic Campaign to further minimize merchant losses.

Ineffective Japanese antisubmarine warfare techniques led to the lowest percentage of losses for U.S. submarines of any of the submarine forces of the major powers during the war. Still, the U.S. Navy lost 52 subs—hardly a

small number. It was not until the end of 1943 that the Japanese Navy established its first escort squadron and not until 1944 that significant air units began to engage in antisubmarine patrols. It was a case of too little, too late. The first Japanese depth charges, which used a time fuze rather than a pressure-activated detonation device, were also ineffective. More significantly, the Japanese lacked antisubmarine sonar and lightweight radar sets. These considerations and the loss of so many Japanese aircraft in combat reduced the effectiveness of Japan's antisubmarine patrols. Finally, U.S. submarines could detect Japanese radar emissions.

Antisubmarine warfare came into its own in World War II. It was certainly a key factor in the war at sea, at least in the Atlantic theater.

Antitank Guns and Warfare

The evolution of antitank (AT) warfare in World War II was a continual trade-off between technology and tactical doctrine. At the start of the war,

most armies believed that the tank itself was the most effective AT weapon. In the earliest days of the fighting, however, it became clear that the smaller-caliber guns on most tanks were ineffective against opposing armor. The light, towed antitank guns that were supposed to be the backup system were even more ineffective.

Thus, field artillery firing in the direct-fire mode became the primary antitank system in 1941 and 1942 on the Eastern Front and in North Africa. Field artillery was only able to return to its primary direct-support mission in late 1942 after large numbers of heavier AT guns had been fielded. Infantry armed with AT rifles, supposed to be the third line of AT defense, proved mostly worthless and were quickly replaced with projector-type weapons, such as the U.S. bazooka, the British PIAT, and the German Panzerfaust.

For a good 10 years before the war, German doctrine recognized that high-velocity, flat-trajectory antiaircraft guns could be used in an antitank role in emergency situations. In North Africa, the Germans quickly discovered that their 88mm flak guns were devastatingly effective against British tanks. The Soviets, meanwhile, also believed that the enemy's infantry, rather than its tanks, should be the primary target of Soviet tanks. Therefore, in 1942 the Soviets revived the German World War I practice and assigned an antitank role to all artillery weapons. By the final two years of the war, Soviet gun production rates widely outmatched that of the Germans, and the balance tipped in favor of the Soviets.

Most armies used field artillery crews to man antitank units. As the war progressed, antitank guns became larger and more powerful, and many were mounted on self-propelled (SP) carriages to give them mobility equal to the tank. The Germans on the Eastern Front pioneered the use of SP antitank guns in an offensive role. The Soviets also developed a wide range of SP weapons. Distinctions blurred among the Soviet Union's field, assault, and antitank SP guns. Almost all American SP antitank guns were turret-mounted, but the Germans and especially the Soviets favored turretless vehicles. They were simpler and cheaper to build, and the lack of a turret produced a lower profile that made the vehicles smaller targets.

The Soviets spent the first two years of the war on the defensive, and as a result they mastered defensive AT tactics. At Stalingrad, they deployed four sets of antitank belts, to a depth of 6.2 miles. Soviet tanks only counterattacked after all forms of their artillery had stopped the German tank

attack. The tactics that the Soviets developed at Stalingrad were refined and applied with devastating effect later in the July 5–13, 1943, Battle of Kursk, the graveyard of the German panzers.

The U.S. Army organized AT guns into tank-destroyer (TD) battalions. In 1942, a TD battalion had three companies of three platoons with four guns each, either towed or self-propelled. American SP tank destroyers did not do well in North Africa. The operational area was too vast for the guns to mass effectively, and the terrain was too open for the SP vehicles to find good defensive hull-down positions.

Many American commanders shifted to the British system of towed antitank guns, but these proved far less effective when combat operations later moved to Western Europe. In that more restricted terrain, the towed guns moved too slowly, and they were too close to the ground to shoot over hedgerows. By July 1944, the U.S. Army started reequipping all TD battalions with SP guns, but some units still had towed guns by the time of the Battle of the Bulge (Ardennes Offensive) of December 16, 1944–January 25, 1945.

As World War II progressed, the balance shifted back and forth between heavier and more powerful AT guns and thicker and heavier tank armor. Tank designers were faced with the challenge of developing tanks with guns powerful enough to defeat enemy armor yet with armor strong enough to resist the fire from enemy tanks and AT guns. Larger guns produced more recoil, which required a larger and heavier turret. This combined with stronger armor added to the overall weight of the tank, decreasing the tank’s mobility and creating a larger target. Most World War II tanks had heavier armor on the front and sides, where the tank was more likely to be attacked.

Soviet antitank guns, preparing to fire on Axis forces, June 1942. (Sovfoto/UIG via Getty Images)

Tanks can be defeated in differing degrees, with correspondingly different results. In a mobility kill, a tank becomes immobilized because of damage to its treads or drive train. Many mobility kills resulted when a tank hit a mine. An immobilized tank can still fire, but it can no longer maneuver. The advantage from the attacker's standpoint is that the tank becomes more vulnerable to subsequent attack. A firepower kill happens when the tank's main gun system can no longer fire. Although the tank has almost no combat power at that point, it still has the mobility to withdraw from the action, where it can be repaired and returned to combat. A total kill results when the tank is completely destroyed and the crew is killed or severely wounded. In some situations, a trained tank crew may be more difficult to replace than the tank itself.

There are two basic categories of AT projectiles: kinetic energy and chemical energy. A kinetic energy round is a solid-shot projectile that depends on weight and velocity to penetrate and defeat opposing armor. As weight and velocity increase, so does penetrating power. The distance to the target is also a factor. As the round travels farther, its velocity and penetrating power decrease accordingly. The German 88mm PAK 43 could penetrate 207mm of armor at a range of 1,640 feet but only 159mm at a range of 6,562 feet.

The angle of impact also affects a round's penetrating power. At a 30-degree angle of impact, the penetrating power of the PAK 43 at 1,640 feet dropped to 182mm. Thus, beginning with World War II, most tanks have had sloped armored fronts. The earlier kinetic energy rounds also had a tendency to ricochet off the sloped surfaces. The solution to that problem was a special soft nose cap that allowed the round to stick to the armor surface just long enough for penetration to begin.

Tapering the bore of the gun also could increase the velocity of a kinetic energy round. The squeeze-bore guns fired a round with a plastic driving band that wore away as the round moved forward through the bore. As the bore narrowed, the pressure behind the round increased, which in turn increased muzzle velocity. As the round left the gun's muzzle, the remnants of the driving band fell away. The Germans used this technique on their smaller 42mm and 75mm PAK 41 antitank guns, but technical factors limited the effectiveness of the squeeze-bore technique in larger calibers.

Dense and heavy material such as tungsten made the best kinetic-energy rounds. But at 1.4 times the density of steel, a projectile made completely from tungsten would have been too hard and too heavy for the bore of the gun to survive more than a handful of firings. In 1944, the British solved that problem with the introduction of the armor-piercing discarding sabot (APDS) round. A relatively small but heavy main projectile was encased completely in a plastic casing that fell away as soon as the round left the muzzle. This system had the advantage of placing the pressure produced by a large-bore gun behind a smaller projectile. The result was greater velocity and penetrating power. The APDS remains the primary AT round today.

Chemical-energy rounds defeat armor through a blast effect. The effectiveness of the round depends on its size, composition, and physical configuration rather than on its velocity. Chemical energy rounds tend to travel more slowly and have a more arched trajectory than kinetic energy rounds. Thus, their aiming is far more dependent on an accurate estimate of the range to the target.

Chemical-energy projectiles that produce a uniformly distributed blast effect, such as conventional high-explosive (HE) field artillery rounds, were effective against tanks only in the early days of World War II. As the war progressed and armor became heavier and stronger, riveted tank hull construction gave way first to welding and then to whole casting. In response,

rounds known as hollow-charge or shaped-charge rounds were developed based on the so-called Monroe Effect.

In a hollow-charge round, the explosive material is configured in the shape of a recessed cone, with the base of the cone toward the front of the round. The surface of the inverted cone is lined with light retaining metal such as copper. When the round first hits the target, the explosive is detonated from the rear of the round forward.

The hollow cone has the effect of focusing the entire force of the blast onto a small spot on the tank's skin exactly opposite the apex of the cone. The result is a hot, concentrated jet of gas that punches its way through the tank's armor and sends red-hot fragments into the tank's interior. The tank crew is killed by its own armor. The shaped-charge chemical-energy rounds were designated "high-explosive antitank" (HEAT).

When a HEAT projectile is fired from a conventional gun tube, the stabilizing spin imparted by the bore's rifling tends to degrade the round's penetrating power. This led to the development of fin-stabilized projectiles fired from smoothbore launchers, such as the bazooka and the Panzerfaust. These close-range infantry weapons proved relatively effective. The HEAT warheads did not depend on velocity, so they could be fired from relatively light weapons. HEAT projectiles do depend on warhead weight, however, and in these weapons that was limited to what an infantryman could carry.

No single system stood out in World War II as the premier tank killer, although certain systems predominated at certain times and in certain theaters. Overall for the war, some 30 percent of British tanks that were knocked out fell victim to antitank guns, 25 percent were knocked out by enemy tanks, 22 percent hit mines, 20 percent fell victim to artillery indirect fire and air attack, and the rest were knocked out by infantry AT weapons. In North Africa, Axis AT guns accounted for 40 percent of the British tanks knocked out, whereas in Italy it was only 16 percent. Throughout the war, German tanks were generally better armed and more powerful than their British and American counterparts. This meant that Allied tanks destroyed far fewer panzers than the other way around.

Antonescu, Ion (1882–1946)

Romanian marshal and dictator. Born in Piteşti on June 14, 1882, to an aristocratic military family, Ion Antonescu graduated from Romanian military schools in Craiova (1902) and Iaşi (1904). A cavalry lieutenant during the 1907 Peasant Revolt, he fought in the Second Balkan War (1913) and was an operations officer during World War I. From 1922 to 1927, he was military attaché in Paris, Brussels, and London. He was chief of the army General Staff in 1933 and 1934.

Like most others among the nationalist Romanian military elite, Antonescu favored British and French political influence. He closely monitored both the Third Reich's ascendancy and the Soviet Union in his vigilance regarding Romanian territorial integrity, however, pragmatically preparing to accomodate the Germans should this become necessary. As minister of defense, Antonescu became embroiled in and frustrated by the corrupt governing vicissitudes of King Carol II, especially after 1937. Protesting Carol's February 1938 establishment of the Royal Dictatorship and his suppression of the fascist Legion of Saint Michael (the Iron Guard), Antonescu defended the Iron Guard's leaders in court, was briefly jailed, and then was posted to Chisinau (Kishinev) near the Soviet border.

Romanian premier Ion Antonescu, during a July 1943 visit to Munich to confer with Adolf Hitler. Six days later Germany declared war on the Soviet Union, with Romanian forces fighting alongside those of Germany. (Heinrich Hoffmann/Ullstein Bild via Getty Images)

Following the Soviet Union's occupation of Bessarabia and the ceding of Transylvania to Hungary in the summer of 1940, in September Carol was coerced into naming Antonescu head of the troubled government before abdicating, under pressure, in favor of his son Michael, age 19.

Antonescu's title, Conducător, was the Romanian equivalent of Duce or Führer (leader), and he used his broad powers to oust the Iron Guard from government in January 1941. That June, he assigned 14 Romanian divisions to Germany's invasion of the Soviet Union, Operation BARBAROSSA, which began on June 22, 1941. For reclaiming Romanian lands from the Soviets, Antonescu was proclaimed marshal by King Michael I on August 23, 1941. Antonescu continued to supply the German war effort with troops (ultimately, Romania lost substantially more men than Italy) in exchange for

German military favor, but on the home front he sought to temper his ally's overbearing appetite for Romania's oil and agricultural production.

In coming to terms with Romania's "Jewish question," Antonescu—like Benito Mussolini—preferred his own solution to anything dictated by Berlin, employing policies that (officially) allowed Jews to emigrate in exchange for payment or to face deportation to Romanian-administered work camps in the Ukrainian region of Transdnistria. Despite its refusal to join Germany's "Final Solution" outright, Antonescu's regime was responsible for the deaths of more than 250,000 Romanian and Ukrainian Jews and Romas (Gypsies) from its "romanization" policies during 1940–1944.

Antonescu was deposed by a coup that installed King Michael as the real power on August 23, 1944, and turned over to the occupying Soviet forces. His war crimes show trial, held in Bucharest on May 4–17, 1946, led to a death sentence; he was executed there on June 1, 1946.

Antonov, Alexei Innokentievich (1896–1962)

Soviet general. Born the son of a czarist artillery officer in Grodno, Belorussia, on September 15, 1896, Alexei Antonov attended the Pavlovsky Military School in Petrograd. He was commissioned as an ensign in the Russian Army in 1916 during World War I and was wounded in the last great Russian offensive of 1917. In 1918, Antonov joined the Red Army and had his first experience with staff work as chief of staff of a brigade in the Russian Civil War. He graduated from the Frunze Military Academy in 1931 and was then posted to the Kharkov Military District. In 1937, he graduated

from the General Staff Academy, and from 1938 to 1940 he was a lecturer at the Frunze.

Following the German invasion of the Soviet Union in June 1941, Antonov was promoted to major general and became chief of staff of the Kiev Military District. He was chief of staff of the Southern Army Group from August 1941 to July 1942. In December 1941, Antonov was promoted to lieutenant general, and during 1942 he was chief of staff first of the North Caucasus Army Group, then of the Transcaucasus Army Group. Appointed chief of operations of the General Staff in December 1942, after April 1943 Antonov was also deputy chief of the General Staff and thus at the center of events for the remainder of the war. Antonov was promoted to general of the army in August 1943, a rank he held for the remainder of his military career.

Because chief of the General Staff Aleksandr Vasilevsky was frequently absent, Antonov assumed that role much of the time. A meticulous planner, he helped to orchestrate the major Soviet offensives of the war, including Operation BAGRATION (June 22–August 29, 1944), the encirclement of the German salient in Belorussia and East Prussia that brought the Red Army to the Elbe.

In February 1945, Antonov replaced Vasilevsky as chief of the Soviet General Staff. He was a member of the Soviet delegation to both the Yalta and Potsdam Conferences. Demoted in 1946 to first deputy chief of the General Staff and then to first deputy commander of the Transcaucasus Military District, Antonov became commander of that same military district in 1950. In April 1954, he was again first deputy chief of the General Staff, and in 1955, he also assumed the post of chief of staff of Warsaw Pact forces. He held these posts until his death in Moscow on June 16, 1962.

Antwerp, Battle of (September 4–October 2, 1944)

Western Front battle for the key Belgian port of Antwerp. Port facilities there made Antwerp an important strategic city in Europe. Antwerp is about 54 miles from the open sea, connected by the Scheldt River, which is narrow below the city and then broadens into a wide estuary. The southern bank of the estuary is formed by the European mainland. The northern side is formed by the South Beveland Peninsula and Walcheren Island, which is connected to the peninsula by a narrow causeway. The port had 600 hydraulic and electric cranes as well as numerous floating cranes, loading bridges, and floating grain elevators. Its clearance facilities included extensive marshaling yards and excellent linkage with the Belgian network of railroads and navigable waterways. It was thus essential for the Anglo-American forces to secure Antwerp as a supply port to sustain their eastward offensive.

The British Second Army took Brussels on September 3 and managed to cover the 60 miles to Antwerp on September 4. The British 11th Armoured Division entered the city to find that the port was relatively intact, largely thanks to activities of the Belgian Resistance. Commander Major General George Philip Roberts of the 11th Armoured Division ordered a pause for two days, neglecting to secure the bridges over the Albert Canal on the northern edge of the city. Had the bridges been secured on September 4, the way would have been open to the eastern base of the South Beveland Peninsula, some 17 miles distant. This would have trapped the remaining units of Colonel General Gustav von Zagen's Fifteenth Army of some 100,000 men in a pocket. By September 6, however, German resistance had rallied to permit the British only a small bridgehead that was subsequently destroyed.

The German Fifteenth Army was sealed off in the Calais-Flanders region in what was known as the "Breskens Pocket." On September 4, Zagen ordered an evacuation across the estuary, in which the troops were ferried to Walcheren. By the time the evacuation was completed on September 23, the Germans extracted some 86,000 men, 616 guns, 6,200 vehicles, and 6,000 horses. Had the Beveland Peninsula been cut off, the evacuation would have

taken a different route, a 12-hour journey to reach safety, allowing for more Allied interference.

Field Marshal Bernard Montgomery did not bring the full force of his 21st Army Group to bear on clearing the surrounding countryside to allow traffic on the Scheldt River. He did not even order the First Canadian Army to clear the Scheldt estuary until late September, even while that force was still tasked with clearing the Channel ports. Not until October 16 did Montgomery order that the Scheldt be cleared with the utmost vigor, irrespective of casualties. The port itself did not open for traffic until November 26.

British soldiers lay down covering fire as others dash across a bridge during the fighting to secure Antwerp, Belgium, in September 1944. (Bettmann/Corbis)

Most scholars believe that Montgomery's failure at Antwerp influenced his concern that the maximum amount of force and effort be applied in the subsequent Operation MARKET-GARDEN (September 2–26, 1944). Certainly the Battle of Antwerp was a lost opportunity for the Allies to open a major port early, trap a large German force, and potentially end the war sooner.

Anzio, Battle of (January 22–May 25, 1944)

Fighting in Italy that followed the Allied invasion of early September 1943 was some of the most bitter of the war and at times resembled World War I trench warfare. German field marshal Albert Kesselring had charge of German forces in Italy and made skillful use of the ideal defensive terrain. The central mountainous spine of the Apennines rises above 10,000 feet, with lateral spurs running east and west. Between these, there are deep valleys with wide, rapidly flowing rivers. In 1943 the few north-south roads were confined to 20-mile strips adjacent to the Adriatic and Tyrrhenian coasts, where the bridges were dominated by natural strongpoints.

Kesselring formed German divisions in southern Italy into the Tenth Army under Colonel General Heinrich von Vietinghoff genannt Scheel. Following successful Allied landings by British general Sir Bernard Montgomery's Eighth Army at Calabria and Taranto and by U.S. lieutenant general Mark Clark's Fifth Army at Salerno, Vietinghoff succeeded in holding up the Fifth Army at the rain-swollen Volturno River by blowing its bridges. Skillful German delaying actions allowed them time to bring up reinforcements and consolidate behind a formidable defensive line. Known as the Winter Line and the Gustav Line, it was some 10 miles deep and ran from the mouth of the Garigliano River on the Gulf of Gaeta west along its swift-running tributary, the Rapido River, and then over the mountains to the Adriatic, north of the Sangro River.

A shell explodes in the water as the Germans try to prevent Allied landing craft from resupplying the beachhead at Anzio, Italy, in January 1944. The Anzio landing, designed to flank the German defensive line to the south and secure Rome, failed to achieve its objective. (Hulton Archive/Getty Images)

The Fifth Army eventually got across the Volturno but soon found itself crowded into a small attack zone along the Rapido. German resistance, difficult terrain, constant rain or snow, and a morass of mud all produced a stalemate on the ground. The town of Cassino, astride the main road from Naples to Rome, was the hub of the German defenses.

The Allies now tried to outflank the Gustav Line by a landing north of it at Anzio on the west coast of Italy, just 25 miles from Rome. British prime minister Winston Churchill was the plan's chief advocate. The Allies hoped to divert German units from the Gustav Line, allowing a breakout there and permitting the two Allied pincers to converge on Rome. Anzio, however, turned out to be an incredible opportunity thrown away.

General Clark had overall command of the Anzio operation, but VI Corps commander U.S. major general John Lucas led the actual invasion force. The landing began on January 22, 1944. The invaders consisted principally of British major general W. R. C. Penney's 1st Division on the left flank and U.S. major general Lucian K. Truscott's 3rd Infantry Division on the right.

U.S. lieutenant colonel William Prescott's 509th Parachute Infantry Battalion had the task of securing the port of Anzio.

Code-named Operation SHINGLE, the landing proceeded virtually unopposed. By the end of the day, more than 36,000 men, 3,000 vehicles, and large quantities of supplies had come ashore at a cost of only 13 dead, 97 wounded, and 44 missing or captured. Unfortunately for the Allies, a captured soldier was carrying a copy of the operation plan.

Two days before the invasion, the Allies launched their planned diversionary strike against Cassino. Kesselring immediately rushed two reserve divisions there from Rome. Consequently, when the Anzio invasion occurred there were no German reserves to meet a swift Allied thrust to Rome. Although Lucas did get valuable amounts of supplies ashore quickly, which enabled the Allies to beat back subsequent German counterattacks, he was overly cautious at first and failed to take advantage of the temporary German weakness to secure the critical nearby Alban Hills. Although Colonel Reuben Tucker's U.S. 504th Parachute Regiment was available for that purpose, Clark had vetoed an airborne drop. The 504th came ashore by LST (landing ship, tank) to fight as infantry.

After the successful landings, nothing went right for the Allies. The chief reason for the failure of the Anzio operation was insufficient resources in the initial assault. Landing craft and other assets from Italy had been sent to prepare for the upcoming Normandy Invasion. Lacking adequate resources at Anzio, the Allies would have been better off to have mounted a decisive operation along the Gustav Line.

The Anzio beachhead soon developed into a precarious situation whereby the Germans constantly rushed up more men, ultimately committing Colonel General Eberhard von Mackensen's entire Fourteenth Army there. It soon threatened to drive the Allied forces into the sea. Ultimately the Allies were forced to commit more than 110,000 men to the beachhead.

The more aggressive 3rd Infantry Division commander, U.S. major general Lucian K. Truscott, took over from Lucas as VI Corps commander in late February, but extremely cold weather and stiff German resistance led to a 125-day stalemate. Not until May 25 and after more than 40,000 casualties were the Allied able to break out from Anzio and drive on Rome.

Arakan Campaign, First (October 1942–May 1943)

First British offensive to regain land lost to the Japanese in Burma. In January 1942, Japanese forces drove into Burma (present-day Myanmar) from Thailand to sever Allied lines of communication into China, gain a dominant position in Southeast Asia, and threaten British India. By May, British forces—along with allied Indian, Burmese, and Chinese units—were being pushed north and east into China and north and west into India. In June, the British-controlled forces were holding along the Indian border forward of Ledo, Imphal, and Chittagong, where they began to rebuild and refit their battered forces. In July, commander of the British Eastern Army Lieutenant General N. M. Irwin began planning for an offensive operation against Arakan, a northwestern coastal province of Burma separated from the rest of Burma by mountainous jungle terrain.

The offensive was to begin in the late fall and was designed to clear elements of Japanese lieutenant general Takeuchi Hiroshi's 55th Division from the Mayu Peninsula and Akyab Island. In December, Major General W.

L. Lloyd's 14th Indian Division conducted a two-pronged assault down the peninsula. Initially successful, the British were in striking distance of Akyab when General Iida Shōjirō, commander of the Japanese Fifteenth Army, reinforced and strengthened the defensive positions near Donbaik and Rathedaung. The British then reinforced the stalled 15th Indian Division with five infantry brigades and a troop of tanks. The March 1943 assault on Donbaik failed, and the Japanese quickly began a counteroffensive that drove Allied forces back up the peninsula. The 55th Division struck from Akyab, while other Japanese units worked their way over the supposedly impassable mountains to hit the British left flank and rear areas during March 13–17.

In early April, Major General C. E. N. Lomax relieved Lloyd, with the mission of stemming the Japanese attack. British lieutenant general William Slim, commander of XV Corps, and his staff were redeployed from Ranchi to Chittagong, although Slim did not receive command of the operation until mid-April. The 26th Division headquarters deployed to relieve the staff of the 14th Division. Fighting on the Mayu Peninsula raged as Japanese units used their proven jungle warfare tactics to outmaneuver and cut off British units at multiple points.

Lomax attempted to entrap the rapidly advancing Japanese forces; although his plan was sound, the battle-weary British forces were overcome and were again forced to retreat, having suffered significant losses of transport and equipment. The Japanese reoccupied Arakan on May 12. British forces were finally able to disengage and establish a stable defensive position near Cox's Bazaar. The first campaign for the Arakan area was over. The British offensive to regain Burmese territory had failed, and the reputation of Japanese forces as unmatched jungle fighters continued to grow.

Arakan Campaign, Second (December 1943–July 1944)

Allied Burma theater campaign. Arakan is the northwest coastal province of Burma (present-day Myanmar) and is separated from the rest of Burma by mountainous jungle terrain. In early 1944, Allied forces in the China-Burma-India theater were preparing to go on the offensive. U.S. Army lieutenant general Joseph Stilwell, chief of staff of the Nationalist Chinese Army, planned to direct Merrill's Marauders and Chinese forces against Myitkyina in northern Burma, supported by British brigadier Orde Wingate's Chindits. At the same time, Lieutenant General William Slim's British forces would attack from Assam to regain control of the Irrawaddy Valley. An attack in the south by the British XV Corps would secure the Arakan region by again moving down the Mayu Peninsula toward Akyab. Similar in design to the 1942–1943 operation, which had ended in a major British defeat, this offensive had a different result.

In late 1943, three divisions of the British XV Corps were ready to move into the Arakan. The 81st West African Division deployed into the Kaladan Valley to the east of the Mayu Peninsula. The 5th and 7th Indian Divisions relieved the 26th Indian Division forward of Chittagong. A brigade of tanks, the 25th Dragoons, moved forward to provide additional offensive punch. The 55th Japanese Division, supported by units of the Indian National Army, was defending the Arakan. These formations were later reinforced with elements of the 54th Division. The British aim was to move down the coast of Burma, take the island of Akyab, and prepare to continue the offensive, supporting the overall campaign to retake Burma.

In late December 1943, the Second Arakan Campaign began with the 7th Indian Division attacking on the eastern side of the peninsula and the 5th Indian Division attacking in the west to secure the port of Maungdaw. The initial British objective was to secure the Japanese fortifications guarding the Maungdaw-Buthidaung road that crossed the mountainous spine of the peninsula. The British secured land routes, airfields, and coastal ports to support the offensive, as there was little doubt that the Japanese would

counterattack. To forestall this, the British 26th and 36th Indian Divisions were alerted for movement to the Arakan.

The British advance was halted by Lieutenant General Hanaya Tadashi's 55th Division, which was dug in along a mountain spur extending west to the sea near Maungdaw. This Japanese position blocked land access to Akyab. For nearly two months, the British tried without success to break the Japanese defenses, which Burma Area Army commander Lieutenant General Kawabe Masakazu reinforced with the 54th Division. In early February 1944, the 55th Division counterattacked. One element attacked to fix the 5th and 7th Indian Divisions in place, while a second smaller force moved against the 81st and a third force infiltrated into the XV Corps and attacked the rear area. Designed to cut off supplies and destroy the British divisions when they retreated, this was the identical strategy the Japanese had used successfully in the same area a year earlier.

The Japanese plan was stymied when General Slim refused to authorize a withdrawal, and the Allied units dug in. Resupply efforts by air were successful, and the units held. The Japanese then found themselves encircled by the Indian 26th and British 36th Divisions, which came forward, while at the same time the two frontline British divisions reestablished contact with the Japanese. Although the 81st Division was not able to hold in Kaladan, in the Mayu area British units went on the offensive.

Allied troops clambering up a rough, precipitous hillside in typical Arakan hill country during a daylight attack of the Second Arakan Campaign in Burma (December 1943–July 1944). (Keystone/Getty Images)

In fierce fighting, the British XV Corps drove through the Maungdaw position. Fighting continued through May, but with the British about to continue on to Akyab, they were obliged to break off the attack to send reinforcements to the Imphal area. Nonetheless, for the first time in Burma, British forces had decisively defeated a major Japanese attack. With victory in the Arakan, the tide in Burma had decisively turned.

Arcadia Conference (December 22, 1941–January 14, 1942)

Post–Pearl Harbor conference between U.S. president Franklin D. Roosevelt and British prime minister Winston L. S. Churchill. This meeting, code-named Arcadia, took place in Washington, D.C., from December 22, 1941, to January 14, 1942. It came only two weeks after the Japanese attack on Pearl Harbor and U.S. entry into the war, and its purpose was to hammer out joint strategy and cooperative agreements to achieve victory over the Axis powers.

Roosevelt was determined that the direction of the Allied war effort would come from Washington, and the meeting was designed to underscore that end. Churchill, however, saw the meeting as a means of bringing about

full U.S. commitment to the war effort. Members of the British delegation entered the talks believing they would show the Americans how things should be run. It did not work out that way, and there were sometimes heated exchanges. The British delegation was appalled by the lack of organization and procedure on the U.S. side.

The U.S. representatives sought to establish a council similar to World War I's Supreme Allied War Council with many participants, which the British opposed. At a meeting early on Christmas Day, U.S. Army chief of staff George C. Marshall made a strong appeal for unity of command of the South Pacific area. The British concurred, but the issue then arose of which entity the American-British-Dutch-Australian commander (General Archibald Wavell) should report to. Ultimately they decided that the authority would be the American military chiefs in Washington with representatives of the British chiefs but leaving the authority of both intact.

This decision, approved by Roosevelt on January 1, led to the establishment of the Combined Chiefs of Staff, involving the military chiefs from the British and U.S. sides. This also created, without executive order, the Joint Chiefs of Staff, the U.S. component of the Combined Chiefs of Staff. In effect, the Americans had won, and the war would be run from Washington. The establishment of the Combined Chiefs of Staff marked the beginning of perhaps the closest-ever collaboration between two sovereign nations at war.

Toward the end of the conference, Roosevelt and Churchill agreed to set up an agency for munitions allocation with equal bodies in Washington and London. Marshall strongly opposed this, insisting that there be only one entity. Roosevelt agreed, and the U.S. side prevailed.

The conferees also discussed the possibility of an invasion of North Africa, General Douglas MacArthur's appeal for assistance to the Philippines, and the issue of Lend-Lease aid to the Soviet Union. The conferees also agreed that U.S. troops would be sent to Iceland and Northern Ireland.

The Arcadia Conference also led to agreement on the epochal Declaration of the United Nations, signed on January 1, 1942, by representatives of 26 countries. It called for the overthrow of the Axis powers and peace on the basis of the Atlantic Charter. But perhaps the chief result of Arcadia was that the war would be managed from Washington rather than London.

See Vågsøy Island Raid

Arctic Convoys

Convoys transporting war matériel from the United States and Britain to the Soviet Union. After Germany invaded the Soviet Union on June 22, 1941, the British government made the decision to support the Soviet Union with armaments, and almost simultaneously, the United States extended the benefits of the Lend-Lease Act to include supplying Russia. The first convoy, seven merchant ships in Operation DERVISH, left Liverpool on August 12, 1941, and the final round-trip transit (convoys JW/RA 67) occurred on May 12–30, 1945, just after the surrender of German forces in Europe.

Shipping headed to or from Soviet Arctic ports faced a quadruple German threat in addition to the hazards of navigation in stormy, fog-bound, icy seas. Germany based large numbers of U-boats in Norway, and from the spring of

1942, most of its modern heavy surface warships transferred there, too. The Luftwaffe stationed substantial forces in Norway and transferred specialist antishipping units there as the Allied convoy system became more established. Finally, Germany conducted a steady mining campaign against the ports themselves.

The proximity of the convoy route to Norway and the deployment of German heavy surface units and antishipping aircraft had a profound influence on the conduct of convoy operations. Almost all Arctic convoys were more heavily escorted than regular trade convoys. In addition to the usual small escort vessels, the close escort usually included several fleet destroyers. Furthermore, the British Home Fleet often deployed heavy covering forces for the convoys, ranging in size from one or two cruisers (plus escorts) to large squadrons that also included battleships and fleet and escort carriers.

Actual sorties or threats of excursions by German heavy surface warships precipitated several notable actions. Intelligence that the German battleship *Tirpitz* had sortied led to convoy PQ 17 being ordered to disperse on July 4, 1942. The unescorted merchantmen were easy targets for German aircraft and submarines; 23 of the 34 ships in the convoy were sunk. Other significant actions were the Battle of the Barents Sea (December 31, 1942), in which a British combined cruiser-destroyer force fought off an attack by the pocket battleship *Lützow*, the heavy cruiser *Hipper*, and destroyers, allowing the entire convoy to reach the Soviet Union unscathed, and the Battle of the North Cape (December 26, 1943), in which the German battleship *Scharnhorst* was sunk. In addition, the presence of the *Tirpitz* precipitated a series of underwater and air attacks between September 1943 and its sinking on November 12, 1944.

A total of 848 merchantmen sailed to Russia in 42 convoys and one major unescorted operation, of which 65 were sunk. Of 735 ships that sailed from Russia in 36 convoys and one major unescorted operation, 40 were sunk. Overall, this loss rate was slightly higher than that of North Atlantic convoys although distorted by the very high casualties of PQ 17.

Ardeatine Massacre (March 24, 1944)

Atrocity committed by the Germans in Italy in reprisal for an Italian partisan bombing in Rome. On March 23, 1944, the communist-led Gruppi Azione Patriotica (Patriotic Action Group, GAP) commanded by Carlo Salinari exploded a bomb in the Via Rasella in the center of Rome. The bomb detonated just as a group of 156 German Schutzstaffel (SS) were marching by. The survivors were attacked with automatic weapons and grenades. As many as 42 Germans were killed outright, as were 10 Italian civilians. Another 60 Germans were badly wounded.

British Army military police escort SS Obersturmbannführer Herbert Kappler to trial in November 1946. Kappler ordered the World War II Ardeatine Massacre in which 335 civilians were executed in retaliation for a partisan bomb that killed 44 German policemen and 10 Italians. (Corbis)

In retaliation, the German high command in Berlin ordered the immediate execution of 50 Italians for each German killed in the Via Rasella incident. German commander in chief in Italy Field Marshal Albert Kesselring reduced the number to 10 Italians for each German and directed that those to be executed should be prisoners already under sentence of death. Sufficient condemned prisoners were not located, however, and SS-Obersturmbannführer Herbert Kappler, Nazi police chief of Rome, ordered additional arrests. The details of the operation were arranged by SS-Hauptsturmführer Erich Priebke.

In all, 335 Italians, 75 of whom were Jews and most of whom had no connection with the Via Rasella bombing, were taken from various Roman prisons and transported to the caves on the Fosse Ardeatine (Via Ardeatine)

in the southern part of Rome, near the catacombs of Saint Calixtus. There the Germans shot them in groups of five and buried them in the caves. Most victims died by a single shot to the head, but some were no doubt buried alive when the caves were dynamited. Among the Italians executed were several women and two teenaged boys.

In postwar trials, Kesselring, German commandant of the city of Rome Lieutenant General Maeltzer, and Colonel General Eberhard von Mackensen, German Fourteenth Army commander, were tried and sentenced to death for their parts in the Ardeatine massacre. The sentences of all three were later commuted to terms of imprisonment. Through a quirk in Italian law, Kappler, the principal perpetrator of the massacre, could not be sentenced to death but was imprisoned. He escaped from a prison hospital in 1977 and died in Germany the following year. Priebke was extradited from Argentina to Italy in 1995 and was eventually convicted and sentenced to life in prison in 1998; he died, unrepentent, in 2013.

The Ardeatine massacre has become a symbol of German wartime atrocities in Italy, and the historical realities have been obscured by myth and conjecture. The actual number of Germans killed in the Via Rasella, for example, and whether Adolf Hitler actually issued a *Führerbefehl* (führer order) for the reprisal are still unclear. It has also been alleged that the Via Rasella bombing was planned by the GAP specifically to provoke a reprisal that would fall most heavily on the many noncommunist antifascists in German prisons. Only three of the Ardeatine victims were communists, including Antonello Trombadori, who until February 2, 1944, had commanded the GAP.

Ardennes Offensive (December 16, 1944–January 25, 1945)

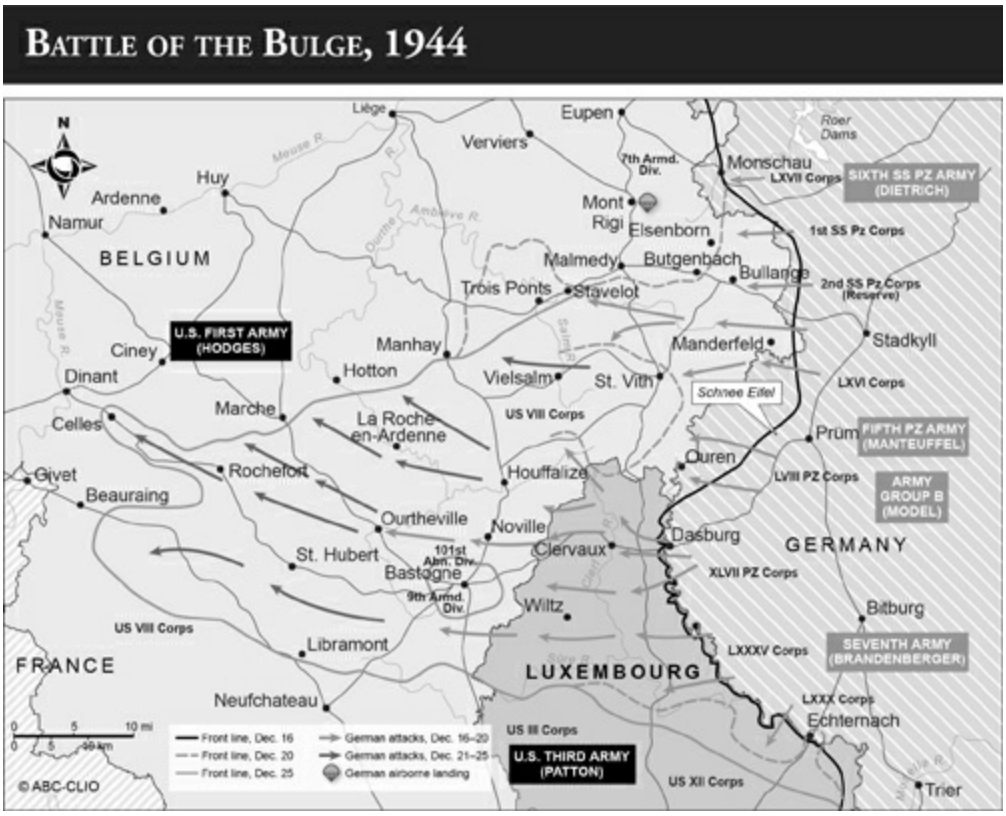
By the autumn of 1944, Germany's fate was largely sealed. The Western Allies were driving on Germany from the west, and the Soviets were closing from the east. German leader Adolf Hitler, however, rejected the rational course for his people of surrender; his alternative was a desperate gamble. The resulting monthlong German Ardennes Offensive, popularly known as the Battle of the Bulge, only speeded the German military defeat.

With the Eastern Front static for several months and the Allied offensive in the west gaining ground, in September 1944 Hitler conceived a sudden offensive in the Ardennes region to take the Western Allies by surprise, break their front, and recapture the Belgian port of Antwerp. Hitler hoped at the least that such an attack would purchase three to four months to deal with the advancing Soviets. Commander of German forces in the west Field Marshal Gerd von Rundstedt thought that the plan was unrealistic, as did other high-ranking officers. Hitler refused to budge, though, and substantial German forces were transferred from the Eastern Front for what turned out to be the largest battle fought on the Western Front in the war and the largest single engagement ever for the U.S. Army. The German code name for the offensive was Operation WACHT AM RHEIN (WATCH ON THE RHINE), after the German patriotic hymn of the same name.

Hitler could not have selected a better location for his attack than the Ardennes. Allied forces there were weak because supreme commander of the Allied Expeditionary Force General Dwight D. Eisenhower had deployed most of his strength northward and southward. The 80-mile-wide central sector in the Ardennes was lightly defended by Major General Troy Middleton's VIII Corps of the 4th, 28th, and 106th Infantry Divisions; the 9th Armored Division (less Combat Command B); and the two-squadron 14th Cavalry Group. Neither the 9th Armored Division nor the 106th Infantry Division had experienced combat, and the 28th and 4th Infantry Divisions were absorbing thousands of replacements after suffering massive casualties in fighting in the Hürtgen Forest.

From south to north on the VIII Corps front were the 4th Infantry Division and part of the 9th Armored Division, the 28th Infantry Division on a 25-mile front, and the 106th Infantry Division, holding a front of almost 16

miles. The 14th Cavalry screened a 5-mile sector between Major General J. Lawton Collins's VII Corps to the south and Major General Leonard T. Gerow's V Corps to the north.



The timing could not have been better for the Germans either, as poor weather initially restricted the use of Allied airpower. German security was excellent, with Hitler having restricted all communication to secure landlines, which Allied Ultra radio intercepts could not pick up.

The Western Allies were complacent, because the difficult Ardennes terrain mitigated against a German attack, because Ultra revealed nothing of the German plans, and because they believed that only they could launch an offensive. Telltale signs were disbelieved. In an exceptional achievement, the Germans secretly marshaled 410,000 men, 1,420 tanks and assault guns, 2,600 artillery pieces and rocket launchers, and just more than 1,000 combat aircraft. While this was considerably greater than the Allied forces in the Ardennes, it was also dwarfed by what the Allies could ultimately bring to bear.

In the predawn darkness and fog of December 16, 1944, the Germans began their offensive, catching the Allies by surprise. Initially, 12th Army Group commander General Omar N. Bradley and his subordinate, Third Army commander Lieutenant General George S. Patton, did not believe it to be a major operation. Eisenhower did, and on its second day he ordered the battle-weary 82nd and 101st Airborne Divisions to the front from a reconstitution camp in France. Traveling in trucks, the 101st arrived at midnight on December 18 near the important road hub of Bastogne. This small Belgian town would play a key role in the battle.

The attacking German force of 24 divisions, moving against 3 divisions of Lieutenant General Courtney Hodges's First Army, soon drove a bulge in the American lines that gave the battle its name. The Battle of the Bulge was more a campaign of a series of smaller battles, however, each lasting a week or more, with the whole extending over a month. The German penetration eventually extended some 50 miles deep and 70 miles wide.

U.S. soldiers of the 289th Infantry Regiment moving up to cut off the St. Vith-Houffalize road in Belgium in January 1945. The Battle of the Bulge in the Ardennes forest of Belgium was Hitler's last major offensive and the largest land battle on the Western Front of the war. (National Archives)

On December 22, four German soldiers under a white flag walked toward an American outpost near Bastogne. They carried an ultimatum addressed to "the U.S.A. commander of the encircled town of Bastogne." This message called on the American commander (Brigadier General Anthony McAuliffe, in the absence of Major General Maxwell D. Taylor) to save his troops with an "honorable surrender." McAuliffe's response to the Germans was one of the most memorable statements of the war: "To the German Commander: Nuts. The American commander."

German forces flowed around Bastogne, heading northwest toward the Meuse. Field Marshal Walther Model, commander of Army Group B and charged with carrying out the offensive, sought to have the Fifth Panzer Army make the main effort. Hitler, ignorant of the situation on the ground, insisted that this be done by SS-Oberstgruppenführer Josef "Sepp" Dietrich's Sixth Panzer Army.

On the north shoulder of the bulge, the U.S. 1st Infantry Division dug in. The Americans massed 348 artillery pieces that shattered the German attack. In the center, units fighting mostly in isolated formations stood firm, impeding the German advance. Meanwhile, Patton's Third Army rushed to the rescue from the south. Patton had ordered his staff more than a week earlier to prepare for just such a contingency and assured an unbelieving Eisenhower that he could wheel his army 90 degrees and strike north into the bulge with three divisions in only three days. Patton accomplished this feat in one of the most memorable mass maneuvers of the war.

Other Allied resources were also diverted to the Ardennes fighting. Then on December 23, the weather changed along the front, clearing the sky, freezing the ground, and making the terrain passable for armor. Allied aircraft quickly filled the skies and transports parachuted supplies into Bastogne, where the defenders were down to only 10 rounds per gun. On Christmas Day the German tanks ground to a halt, out of fuel, while U.S. 2nd Armored Division gunners had a turkey shoot at Celles, almost at the German objective of the Meuse, in which they destroyed 82 German tanks. On December 26, the 4th Armored Division of Patton's Third Army lifted the siege of Bastogne.

Unfortunately, 21st Army Group commander British field marshal Bernard L. Montgomery had elected to remain on the defensive, overruling U.S. VII Corps commander Major General J. Lawton Collins's plan to cut off

the bulge by striking from each shoulder. Finally, the Allies attacked midway up the salient, although this obviated the chance to surround the Germans. Patton held that timidity on the part of Eisenhower and Montgomery allowed the bulk of the German attackers to escape.

On January 1, 1945, as part of the offensive, the Germans mounted an air attack on Allied air bases in Belgium. Operation BODENPLATTE (BASE PLATE) destroyed 500–800 Allied aircraft, most of them on the ground, but it also saw about 300 German aircraft shot down and 214 trained pilots lost to German as well as Allied antiaircraft fire.

On the ground, the Battle of the Bulge dragged on into the middle of January. Hitler had already ordered part of the participating panzer divisions transferred east, but before these resources could arrive, the Soviets began their last great offensive. By the end of January the American First and Third Armies had reached the German frontier and reestablished the line of six weeks before.

The Battle of the Bulge had been fought and won largely by American forces. Of the 600,000 U.S. troops involved, 19,000 were killed, about 47,000 were wounded, and 15,000 were taken prisoner. Of the 55,000 British engaged, casualties totaled 1,400, of whom 200 were killed. The Germans sustained nearly 100,000 killed, wounded, or captured. Both sides suffered heavy equipment losses, about 800 tanks on each side, and the Germans lost virtually all their aircraft committed. But the Western Allies could quickly make good their losses, while the Germans could not. Hitler had also seriously weakened German defenses in the east. In effect, all Hitler had accomplished was to hasten the end of the war. Germany surrendered four months later.

Arima Masafumi (1895–1944)

Japanese Navy vice admiral. Born in Kagoshima on September 25, 1895, Arima Masafumi joined the Japanese Navy in 1915. During the Sino-Japanese War beginning in 1937, he commanded the *Kamikawa-maru*, a transport that had been converted into a seaplane tender, and took part in the operations in southern China. Between 1938 and 1941, Arima had charge of various naval air units.

During October 26–27, 1942, in the Battle of the Santa Cruz Islands, Captain Arima commanded the fleet aircraft carrier *Shōkaku*, flagship of Vice Admiral Nagumo Chūichi's Third Fleet. Although the *Shōkaku* was heavily damaged by U.S. aircraft in that action, Japanese damage control and navigation skills saved the ship. Also in this battle, the *Shōkaku*'s aircraft fatally crippled the U.S. aircraft carrier *Hornet*, which was later abandoned and eventually sunk by Japanese destroyers. At the close of the battle, Arima called for continuing air attacks on the remaining U.S. ships, but Nagumo flatly rejected this suggestion. In this sense, Arima was in the same position Yamaguchi Tamon was at the Battle of Midway (June 3–6, 1942).

Following a short stint at the Navy Aviation Department as head of the training section, in 1943 Arima was promoted to rear admiral, and in the following year he took command of the 26th Air Flotilla based in the Philippines. During the air battle off Taiwan (Formosa) on October 15, 1944, Arima led an attack on U.S. warships. When his "Betty" bomber was hit, Arima ordered the pilot to dive the plane into the U.S. aircraft carrier

Franklin, but the aircraft was shot down by the U.S. combat air patrol and missed its intended target. To that date, Arima was the highest-ranking Japanese naval officer to carry out a suicide (kamikaze) air attack. His dramatic death preceded the first organized kamikaze operation, which took place off Leyte on October 25. Arima was posthumously promoted to vice admiral.

Armaments Production

Armaments production in each combatant nation, as with other economic aspects of the war effort, was intimately tied to decisions about grand strategy, the structure and ideology of the political economy, and the use of military force. Governments analyzed their economic resources and potential industrial mobilization, and they considered how noneconomic factors such as political tradition, cultural institutions, and the limits of state power would modify or restrict those plans. The resulting policies, which Allan Milward calls "strategic synthesis," allowed governments to distribute finite resources among the civilian economy, war production, and the armed forces in a more or less rational manner. Put another way, although munitions production was theoretically unlimited, competing demands on resources meant that armament creation was often constrained in ways that could not be overcome. The different national limitations on armament expansion help explain why the Allies dominated munitions production during the period 1939–1945.

Limits on armaments production in Nazi Germany were initially political, with the regime explicitly refusing to mobilize the economy too deeply. Given Germany's weaker economic position and fewer resources vis-à-vis its opponents, Adolf Hitler planned to avoid a long war of industrial attrition. Instead, he intended to wage short, intense campaigns with the limited military forces under development since 1936. Hitler's guiding strategic concept was to defeat his enemies quickly and avoid military stalemate. Italian and Japanese leaders took a similar approach, mainly due to their inability to compete with Britain and the United States in war production. The relatively small size of the Japanese and Italian economies and the drain on Japan of the Sino-Japanese War precluded major mobilization efforts in any case.

The initial Axis strategies called for a high investment in modern military equipment; a readiness to conduct short, opportunistic campaigns; and the careful avoidance of long-term economic mobilization. Unfortunately for the Axis powers, the course of the war quickly rendered these plans obsolete.

The Western Allies' strategic synthesis was also based on the wartime experience of 1914–1918, although different lessons were drawn from that Pyrrhic victory. Although the war itself was viewed as a political and economic disaster, the concept of mass industrial mobilization was taken for granted. By investing in technologically intensive and financially costly but manpower-saving armament programs, the Western democracies hoped to avoid the mass bloodletting of World War I. Future wars, their leaders believed, would be won by industrial might invested in such programs as the Maginot Line or four-engine bombers, not by running infantry against enemy trench lines. In contrast to the Axis strategy, the Allied strategy was slow to develop, as it took time to gather resources and mobilize industry for war.

Soviet strategy during 1921–1937 actually favored short wars, as military thinkers did not believe that the Soviet Union could compete with the Western industrial powers economically. Only during 1937–1942, after the purges, did the opposite come about, and then mostly by necessity. Despite the extreme social and economic disruption caused by industrial and agricultural five-year plans in the 1930s, the experienced and hardened Soviet bureaucracy was confident of a massive industrial response to any future conflict.

Viewed in these terms, there were four main centers of armaments

production during World War II: the Western democracies (after 1940, only the United States and British Commonwealth), the European Axis (Germany and Italy), the Soviet Union, and Japan. These economic spheres were in no way equal, however; the Axis powers were at a severe disadvantage. In 1938, for example, the Allied gross domestic product (GDP) was 2.4 times that of Axis nations. This ratio is meaningless if such economic power is not translated into combat-ready munitions though.

In 1939–1941, the Axis nations enjoyed a significant armaments advantage, as their rearmament programs had begun earlier and had concentrated on frontline aircraft, vehicles, and other equipment. The Western democracies and the Soviet Union were still heavily engaged in long-range rearmament programs at the outbreak of war. The British and the French were building aircraft factories and capital ships in 1940, for example, while the Russians were still focused on engineering, machine tools, and factory construction. Before the fall of France in June 1940, U.S. armament expenditure was quite low, and the munitions industry was backlogged with European orders for machine tools and aircraft.

This partly explains the military success of the German and Japanese offensives through 1941. Allied fortunes were then at a low point as entire countries and colonies fell under Axis control, and the Allied GDP ratio over the Axis fell to 2:1 at the end of the year.

From 1942 on, however, the ratio moved steadily against the Axis powers, particularly as the Allies began coordinating armaments production on a massive scale. During 1942, the United States, Britain, and Canada agreed to pool their resources and allocate the production of munitions on a combined basis. The governing idea was to take advantage of each nation's manufacturing potential and strengths, covering any shortfall in other areas through imports from other Allied countries. The British, for example, dedicated a higher proportion of national income to war production than they could normally support (more than 54 percent), covering the resulting gap in the civilian economy with imports from North America. It was the ability of the Western Allies to trade via the world's oceans, despite the challenge by German U-boats, that allowed the combined production process to work.

By 1944, an immense quantitative mobilization drive nearly doubled the 1938 GDP in the United States (with 42 percent of national income dedicated to the war), steadily increasing the Allied production ratio to 3.3:1 over Germany and Italy and to almost 10:1 over Japan. Combat armament production in the United States alone equaled 50 percent of total world munitions output, with the British adding another 15 percent. Although partly a function of mass-production methods, another key to Allied success was the advanced level of economic development in Britain and North America. Well-established transport networks and other advantages gave the Western Allied labor force a 1.4:1 productivity advantage over German workers. The combination led to Allied dominance in the output of a whole range of weapons.

The Soviet Union meanwhile struggled, owing to the civil war, the shattering effects of the purges, collectivization, and the abrupt shifts of its five-year economic plans. It also was forced to relocate half its industry east, behind the Urals during 1939–1942. Following a 25 percent drop in GDP after the German invasion in the summer of 1941, the Soviets labored under tremendous pressure to match Axis ground armament production. During a two-year period, almost half the Soviet economy was shifted from civilian to military efforts, with almost 60 percent of national income allocated to the

war in 1943. The ability of the Soviet government to mobilize resources and people proved astonishing, and as noted by Richard Overy, it was this "genius for industrial management" but also a great disregard for human life that allowed the Soviets to pull even with Germany by the end of that year. Despite the accompanying suffering and privation—what Overy called "an exceptional, brutal form of total war"—Soviet workers were helped tremendously by Lend-Lease aid from the United States and provided the Red Army with sufficient material to eventually destroy the German armies on the Eastern Front.

Sources: Mark Harrison, ed., *The Economics of World War II: Six Great Powers in International Comparison* (New York: Cambridge University Press, 1998); Richard Overy, *Why the Allies Won* (New York: Norton, 1996).

Although the German economy was increasingly mobilized for war after 1939, hopes for a quick end to the war were finally dashed that winter, and the German government embarked on a more systematic approach to economic mobilization. The ad hoc style of the past was more or less abandoned, although the mobilization program did not truly get under way until after the German defeat at Stalingrad in February 1943. German gains in war production, shown in Table 1, could simply not keep pace with the Allies. Germany was beset by enemy armies and heavily bombed from the air, and its economy collapsed in 1945.

In comparison with the larger powers, both the Japanese and the Italians fell woefully short in armaments production. Beginning with major disadvantages in resources, transportation, and population, neither country was able to mobilize for a long war of industrial attrition. The disruption of imports, the confusion in domestic resource allocations, and the loss of overseas supplies such as fuel, coal, and iron ore led to mobilization failures and declining armaments production. Indeed, labor and resource problems meant that Italy was never able to commit more than 23 percent of its GDP to the war effort. Japan fared a little better, dramatically raising the low 1941 ratio (27 percent of GDP) in a massive last-ditch mobilization effort (76 percent of GDP dedicated to military outlays in 1944) before economic collapse helped end the war a year later.

The core of Allied armaments production superiority was resource and industrial mobilization. Firmly rooted in prewar strategic thinking, the Allies refused to be derailed by Axis success during 1940–1941 and continued to plan for a long war of industrial attrition. Though their efforts were improvised and often wasteful, the Western Allies and the Soviet Union gathered resources from around the world, mobilized workers and industrial plants on a massive scale, and achieved a steady increase in armaments production. The Axis powers, smaller in size and resources even at the height of their conquests, could not match this effort, and this failure helped bring about their defeat.

Armored Cars

Four- to six-wheeled ground vehicles protected by a light to moderately thick steel armor skin and armed with weapons ranging from machine guns to a medium gun. Armored cars were employed primarily in reconnaissance. They were fast enough to maintain position in front of a body of tanks or mechanized infantry, armored well enough to stop most small-arms fire, and sufficiently armed to engage hostile infantry and armored cars with a significant chance of success. Virtually all powers in the war used armored cars, but differences can be seen in the designs of cars manufactured by the United States, Great Britain, and Germany.

The United States produced only three armored car designs in any great number: the M8 Scout Car, the M3A1 Scout Car, and the M20 Armored Utility Car. The M8 and M20 were built by Ford, and both used the same basic six-wheeled chassis, armored hull (20mm of armor, sufficient to stop even a .50-caliber machine gun), Hercules 6-cylinder gasoline engine, and four-man crew. The major difference lay in armament. The M8 had a 37mm cannon and two machine guns mounted on a turret. The M20 deleted the turret, replacing it with a single machine gun mounted on the turret ring.

The M3A1 Scout Car was a four-wheeled design manufactured by White. Slower and having a shorter range than the M8/M20, it was thinly armored (7mm, sufficient to stop most small arms). It boasted a pair of machine guns, one heavy and one medium.

The British Army produced an array of armored car designs. The predominant manufacturers were the Associated Equipment Company (AEC), Daimler, Humber, and Morris. These four companies built myriad armored cars of considerable variety, but those of Morris and AEC represent the range of British armored cars.

AEC produced a single design, the AEC Armoured Car, in three models: Marks I, II, and III. These had a common hull armored to early tank standards (57mm), a four-wheel drive system attached to a 6-cylinder diesel engine, a top speed of 40 mph, and a range of 250 miles. Their chief difference lay in armament. The Mark I carried turreted 2-pounder cannon with a coaxial machine gun, the Mark II a turreted 6-pounder with a coaxial machine gun, and the Mark III a 75mm gun with a coaxial machine gun.

The Morris company produced two designs, the Morris Armored Reconnaissance Car and the Morris Light Reconnaissance Car. The Morris Armored Reconnaissance Car went to war with a turreted Boys antitank rifle (.55-caliber bolt-action rifle) and a coaxial machine gun, a thin armored shell (7mm), a 6-cylinder gasoline engine, and the ability to maintain a speed of 45 mph for a range of 240 miles. This armored car had a four-wheel drive train, but unlike most four-wheeled cars, it was not four-wheel drive. The Morris Light Reconnaissance Car was slightly superior, possessing 7mm of additional armor plate and an armament of two machine guns.

Germany also produced a large number of armored car designs built by several firms, including Deutsche Werke, Daimler-Benz, Bussing-NAG, and Magirus. The 15 vehicles produced by these companies consisted of three basic models. The first, the SdKfz 234/2—at nearly 12 tons the largest of German armored cars—was capable of 50 mph on its eight-wheel suspension system and had a range of more than 500 miles. It was heavily armed with a 50mm tank gun and a coaxial machine gun, but its armor—although heavy for an armored car at 30mm—left it vulnerable to tanks.

The SdKfz 231 was of a smaller six-wheeled design and weighed under 6 tons. It was slower, shorter ranged, more lightly armored (15mm), and weaker armed than the 234/2, with a top speed of 38 mph, a range of 250 miles, and an armament of either an M42 machine gun or a 20mm cannon.

The SdKfz 233 was somewhere between the other two armored cars; weighing a bit more than 8 tons, it had a speed of 52 mph and a range of 185 miles. Its armor varied in thickness from 15mm to 30mm depending on the amount of supplemental armor welded on. Its most outstanding features, apart from its eight-wheel suspension, were the open-topped frame and a 75mm tank gun with a coaxial machine gun behind a thin steel shield.

Three things are clear about armored cars of World War II: there were only so many ways of building a light, fast, wheeled vehicle; most nations produced at least one armored car designed to resemble a wheeled tank; and no matter the manufacturing nation and the components of the particular hull, the objective of the vehicle was the same—to locate enemy forces rather than to engage them in battle.

Armored Personnel Carriers

German military exercises in 1934 showed that in order to keep up with the now faster tanks, infantry needed to be motorized. Trucks were sufficiently fast on roads, but they were not at all that mobile in open country. Also, troops being transported needed better protection. Consequently, armored half-tracks and fully tracked vehicles were developed to carry infantry; these came to be known as armored personnel carriers (APCs).

The Germans, with their tactics of rapid deployment of armored and mechanized forces (what came to be called later the blitzkrieg, or lightning war), were the first to develop these kinds of troop carriers in their SdKfz (Sonderkraft-fahr-zeug, or special motor vehicle) 250 and Hanomag 251 series. Preliminary trials had begun as early as 1926, and in 1939 the German Army issued a call for an armored vehicle that could carry half a platoon (four men). Demag built the D7 chassis based on the SdKfz 10, and Buessing-NAG developed an armored body. Production began in June 1941.

The SdKfz 250 weighed six tons; it could achieve a cross-country speed of up to 37 mph and a road speed of 42 mph. In 1943, the production process was simplified, reducing the main armor from 19 complex plates to 9 straight plates. The new version entered production in October 1943. The larger SdKfz 251/1 became the standard vehicle to equip German armored infantry (Panzergrenadier) units and could carry 12 men. It had a cross-country speed of up to 30 mph and a road speed of more than 35 mph; its road range was just under 200 miles.

Both the SdKfz 250 and the SdKfz 251 came in various subtypes. The SdKfz 250 had 12 main variants, the SdKfz 251 a total of 16. Usually the vehicles were equipped with one or two machine guns, but some also carried

guns or mortars and were employed as tank hunters or self-propelled artillery. These half-tracks were produced at least until 1944. In theory, all tank divisions operated together with armored infantry divisions in APCs from the summer of 1942 onward, but the reality was quite different. Despite having started the trend, the German Army was never as mechanized as the American or British forces.

The United States produced the well-known M-2 and M-3 half-tracks, which were used by all the Allies, including the Soviet Union. Although less sophisticated than their German counterparts, these vehicles were produced in much greater numbers. The engine was in the conventional truck position, the transmission being led forward toward the driven front wheels and backward to the track drive wheels through a transfer box. The track suspension had four road wheels, and the tracks had continuous steel bands with metal crosspieces driven by drive wheels that were elevated and to the front.

As staunch advocates of rapid movement in battle, the Germans were the first to develop armored personnel carriers for the transport of their infantry. This image shows German soldiers on a SdKfz 250 in the Soviet Union on August 5, 1941. (Heinrich Hoffmann/Ullstein Bild via Getty Images)

The M-2 design originated in the four-wheel-drive Scout Car M-3A1, with the rear wheels being substituted through tracks. This led to the Car, Half Track, M-2, which could carry 10 men. It had two machine guns and a 147-horsepower (hp) engine that provided a road speed of 40 mph and a cross-country speed of up to 33 mph. It had a 6.35mm armored hull with 12.72mm frontal protection. The M-3 was slightly elongated and had room for 13 men. It too came with various modifications, such as the antitank gun motor carriage M-3, a personnel carrier that also mounted a 75mm gun. To meet demand, the International Harvester Company was tasked with producing the M-5 and M-9 series, which were similar to the M-2 and M-3. But even the combined production of the various American factories could not keep up with orders.

During the last stages of the war, self-propelled guns such as the M-7 Priest howitzer motor carriage, the Canadian Ram Mk I (adopted from the U.S. M-3), and the U.S. M-4 Sherman medium tanks were converted to APCs by having their guns or turrets and top decking removed. This meant that the upper bodies of people in the vehicles were visible and vulnerable and that a grenade or shell landing in the open compartment could kill all inside.

The best-known Japanese APCs were the half-tracked Type 1 (known as the Ho-Ha) and the tracked Type 1 (Ho-Ki). The Ho-Ha was similar to the German SdKfz 251 but somewhat larger. Powered by a 134-hp 6-cylinder engine and weighing 7 tons, it provided room for 15 men protected by armor up to 8mm thick. The Ho-Ki weighed half a ton less and had 6mm all-around protection, but it also provided no overhead protection for the rear troop-carrying compartment. It had a top (road) speed of 25 mph.

During the war, APCs were used extensively in Europe and North Africa. The jungles of the Pacific theater were less favorable for mechanized combat, so APCs were little used there, although the U.S. Marine Corps did employ large numbers of armored amphibious vehicles (known as amphtracs) to deploy troops, equipment, and supplies in their Pacific amphibious operations.

Armored Warfare

A number of the belligerents in World War I employed both tanks and armored cars in combat, but it was in World War II that tanks and other armored fighting vehicles came into their own. In World War I, armored vehicles supported infantry; in World War II, the tank became the centerpiece of armored warfare.

As World War II began, the structure of armored forces depended much on the philosophy driving a country's mechanization efforts. Germany had been particularly active, in spite of treaty restrictions. Working secretly in the Soviet Union as early as 1922, Germany led the world in the development of an all-arms armored fighting force, with the role of other weapons subordinated to the requirements of tanks. An important part of emerging German armor doctrine was that offensive tanks should detour around the strongpoints of enemy defense.

Meanwhile, as late as the end of the 1930s, the British General Staff believed that breakthroughs would be accomplished by infantry supported by tanks, and tank units would be used only to exploit success. In France, although there was a move toward mechanization, most tanks were in separate tank battalions designed to support infantry. In the United States, progress was limited by both budgets and branch jealousy. Tanks were assigned to the infantry, and mechanization of the cavalry was slow. Having learned with the Germans the value of integrated mechanized arms, the Soviet Army, initially developing a combined-arms armored force along with Germany, took a giant step backward with Joseph Stalin's purge of most senior army officers and the breakup of armored formations. When war came in September 1939, Germany's success in Poland and later in France brought widespread realization of the effectiveness of all-arms armored warfare.

During World War II, armored forces played a role in every theater, but the impact of armored warfare was most evident in Poland in 1939, in France in 1940, on the Eastern Front, in North Africa, and in Western Europe during 1944 and 1945. Difficult terrain limited the importance of armored forces in other theaters.

The German invasion of Poland on September 1, 1939, and its blitzkrieg tactics opened the eyes of many to the potential of armored warfare. Germany attacked with a force of 54 divisions, 6 of them armored and 4 mechanized. With 3,195 tanks as well as a supporting fleet of 1,538 combat aircraft, in a matter of a few weeks the German Army overwhelmed Po-lish defenses. Learning from operations in Poland, the German Army assigned each armored (panzer) division its own air element. The Germans also learned that truck-mounted infantry could not accompany tanks cross-country or survive even infantry fire. Accompanying infantry required cross-country mobility and some armor protection.

In 1940, except for the Soviet Union, France had the strongest armored force in the world, but French leaders failed to learn from German experience. Most French tanks remained dispersed among infantry formations, and the French were slow to organize armored divisions. The British had created an armored division, but it was never deployed to France, where only one armored brigade joined the British Expeditionary Force (BEF). The Allied defensive strategy in the west assumed that Germany would attack through the Low Countries, and forces were deployed to meet that expectation. On May 10, 1940, however, Germany struck through the Ardennes toward the Meuse near Sedan, planning to then swing northwest in a wide arc toward the coast.

German Army tanks (Panzerkampfwagen II, PzKpfw II) in Warsaw, Poland, during fighting for the capital city in late September 1939. (Ullstein Bild via Getty Images)

In spite of the superior armor and firepower of many British and French tanks, the combined-arms attack of the German panzer divisions, accompanied by effective close air support, reached the English Channel by the end of May. By early June, following the evacuation of the BEF and some French forces from Dunkerque, the German Army turned its forces south. By the end of June, Germany had defeated France. German armored forces—employed in mass, using surprise, aiming at weak points, and well supported by aircraft—had enjoyed success.

Following the defeat of France, British leaders realized the necessity of building an armored force sufficient to counter German armor, especially as the war had extended into North Africa when Italy attacked Egypt. British prime minister Winston L. S. Churchill set a goal of 10 armored divisions by the end of 1941. The government quickly ordered 4,000 tanks from a variety of sources.

The focus of armored warfare next shifted to North Africa, where on September 13, 1940, Italian forces in Libya launched an offensive against British forces in Egypt. The weak British forces, including only one tank battalion and totaling 36,000 men, were pushed back, but the Italian force was exhausted after a 60-mile advance. By December the British, reequipped,

were able to launch a successful counterattack, using speed and surprise, with a force that included the 7th Armored Division (only the second to form) and the well-trained Indian 4th Infantry Division. The Italians were shattered. To save his ally from defeat in Libya, however, German chancellor Adolf Hitler organized and dispatched the Afrika Korps under Lieutenant General Erwin Rommel. Outmaneuvering the British, Rommel drove them back to Egypt. Through 1941 and most of 1942, the war in the African desert swung back and forth.

German tanks were superior to those of Britain, even when the British received tanks from the United States, but the British had more of them. Logistics for both sides were difficult but particularly so for Germany and Italy, given Britain's dominance in the Mediterranean. Armored combat in Africa was characterized by rapid movement over long distances and close-in violent fighting when forces met. Rommel employed antitank guns as an integral part of his operations, especially the powerful 88mm antiaircraft gun in a new role as a highly effective antitank gun.

Meanwhile, both the Soviet Union and the United States used the experiences of combat in France to rethink their armored forces. The Soviets stopped considering tanks useful solely for infantry support and began a rapid buildup of armored and mechanized units built on the German pattern. In the United States, the Armored Force was created in July 1940; it placed all armored units under one command. New tanks were designed, and production increased. Two all-arms armored divisions were formed, with three more soon to follow. Ambitious plans of the Armored Force, however, were greatly reduced by the commander of army ground forces, Lieutenant General Leslie J. McNair, who believed that infantry and artillery would be the key to success. The army planned for only about 10 percent of its divisions to be armored. Each corps would also have a group of tank battalions for infantry division support.

On June 22, 1941, Germany attacked the Soviet Union. The scale of armored warfare in this theater would dwarf other armored operations. The Germans invaded with 3,200 tanks; the Soviets defended with 20,000. But Germany planned to use the same blitzkrieg tactics of deep armored thrusts that had been successful in France and could select the points of attack. Although the attack was led by 25 panzer divisions, the invading army also included 750,000 horses.

Within weeks, the Soviets had been driven back 200–400 miles; they suffered massive losses as units ordered to stand firm were surrounded and captured. By mid-July, however, the Soviet defenders began to employ special tactics to repel the invaders. If a German armored spearhead broke through the lines, the Soviets, instead of retreating, closed in on both flanks to try to halt the flow, while other units took up defensive positions to the rear. Large reserve armored units would then attack the German flanks. In addition, the Soviets set up antitank guns and sowed large minefields along expected axes of German advance.

Nevertheless, it was August before the German advance slowed. On November 19, the Soviets were able to launch a counteroffensive. Inexperienced in the use of mass tank offensive operations, Soviet commanders often failed in their attacks, but by the end of 1941 the Germans were on the defensive. By mid-January 1942, tactical defeats suffered by the Germans threatened strategic disaster. Creating and holding a series of strongpoints, the Germans were able to stabilize the front by March. Several weeks of muddy conditions then held both armies in place. By then, the Soviets had realized that any continued offensive would require large massed armored formations, which they created in the form of armored and mechanized corps.

Germany was able to launch offensives in the summers of 1942 and 1943, but the relative strength of the two combatants was changing. On July 4, 1943, German forces, having concentrated most of their Eastern Front armor, attacked the 50-mile-deep Kursk salient, hoping to eliminate it and to cripple Soviet offensive capability. The Soviets were aware of the German plans and prepared a defense in depth marked by an intricate system of minefields and antitank defenses. In the Battle of Kursk, the greatest tank battle of all time, the Soviets yielded ground skillfully and launched strong counterattacks. By July 23, the Soviets had defeated the German offensive.

Each winter, the Soviets countered German attacks with offensives aided by their adaptability to winter and their massive armies. Germany was losing tanks and experienced tank crews at an alarming rate. Meanwhile, the Soviets were able to increase their armor strength substantially because of their own huge ordnance industry and through tanks shipped from the United States. From 1942 to 1945, the Soviets manufactured some 30,000 tanks and self-propelled guns, and the United States provided 7,056 tanks. The Soviet T-34

medium tank and the IS-2 heavy tank also proved to be more than a match for most German tanks.

Although the Soviets for the most part did not accomplish the breakthroughs typical of German offensives, they were able to conduct a successful war of attrition. Overall, the Soviet Union, with its unending miles of difficult terrain, its large population, its massive defense industry, and its terrible winters, proved too much for the German military machine. By the spring of 1945, the Soviet army had reached the Elbe River and joined hands with U.S. forces.

Meanwhile, U.S. forces were also conducting successful armored operations. Indeed, the U.S. Army was the most highly mechanized military force to that point in history. On November 8, 1942, the United States committed its new Armored Force to battle with successful landings in North Africa. Moving east rapidly, the inexperienced American force was bloodied at the first major contest with the Germans in the Battle of the Kasserine Pass (February 14–12, 1943). Recovering, the Americans soon combined with British forces to encircle the Axis forces in Tunis and defeat them there by May 13, 1943. U.S. armor units continued to gain experience in Sicily and Italy, but terrain there made impractical the employment of large armored forces. Besides, the Allies now placed their emphasis on building up a force to invade Northwestern Europe.

The June 6, 1944, landings on Normandy were accomplished by infantry, although a few tanks rigged as amphibians contributed to the effort. After a firm lodgment had been achieved, large armored forces could be committed. In late July, the highly mobile U.S. Third Army broke out of Normandy. Within a month, the Allies had advanced to the line of the Seine River and liberated Paris. Advancing on a broad front, by mid-September Allied forces had cleared Belgium and northern France. Although the Germans did not offer significant organized resistance, their Panther and Tiger tanks took a toll on the lighter and lesser-gunned—but more numerous—Allied tanks, especially the M-4 Sherman medium. Indeed, the United States did not have a heavy tank, the M-26 Pershing, in combat until early 1945.

In a winter offensive, the Allies attacked the German West Wall on a broad front with the aim of breaking through to the Ruhr industrial district. Gathering his armored forces for a counteroffensive, on December 16 Hitler surprised the Allies with a mobile attack through the weakly held Ardennes.

The Germans lacked the means to exploit their initial breakthrough, and within a month, they were stopped. By March 1945, Allied forces had encircled and defeated German forces west of the Rhine and crossed the river. Capitalizing on their highly mobile armored divisions and on weakening German defense, Allied forces then drove across Germany, which surrendered on May 8.

Clearly, in the 1930s, Germany had seized the initiative in the development of armored forces and the implementation of armored warfare. Its blitzkrieg tactics were highly successful until attrition and logistics problems began to play a part (particularly on the Eastern Front) and the Allies caught up in fielding effective armored forces. Whereas the Soviets defeated the German forces by overwhelming them, tactics played a greater part in the West. There the concepts of armored breakthroughs and exploitation were effective, especially in the American Third Army, led by Lieutenant General George S. Patton Jr.

Tanks and other armored vehicles were used effectively in other theaters of the war, but in those areas they usually served as infantry support rather than as highly mobile maneuver forces. Nevertheless, they played an important role in many Pacific campaigns. Among variants, flamethrower tanks proved effective.

From 1939 to 1945, Germany produced some 53,700 tanks, peaking at 22,100 in 1944. During the same period, Japan produced only 4,572, and Italy manufactured 3,054 through August 1943. Great Britain produced 28,296 tanks during the course of the war. The Soviet Union manufactured more tanks than any other power—105,232, more than 40,000 of which were T-34 tank variants. By December 1945, the United States had produced 88,479 tanks in 17 different plants. Production figures for supporting armored vehicle were similarly impressive. Clearly, armored warfare had come of age.

Arnauld de la Perière, Lothar von (1886–1942)

German Navy admiral. Born in Posen (today Poznan, Poland) on March 18, 1886, Lothar von Arnauld de la Perière entered the Imperial German Navy in 1903 and was commissioned in 1906. He became a torpedo specialist. Following sea duty, in 1913 Arnauld became adjutant to chief of the naval staff Admiral Hugo von Pohl. Arnauld then spent time in Britain acquiring language skills until the outbreak of World War I.

Returning to Germany, Arnauld volunteered for the Imperial Naval Air Service (Zeppelins), but he was recalled by Pohl. He then volunteered for U-boat service, and on completing submarine school, in October 1915 he took command of the *U-35* based at Pola on the Adriatic. From November 1915 to March 1918, Arnauld completed 14 cruises with the Pola Flotilla. During one cruise alone in 1916, he sank 54 ships totaling more than 90,150 tons. In March 1918, Arnauld took command of the *U-139* in the Atlantic. During his 16 wartime patrols, he sank 196 ships totaling 455,716 tons. This record stands unsurpassed.

Retained in the German Navy following World War I, Arnauld filled staff billets and commanded the light cruiser *Emden* from 1928 to 1930. He left

the navy in 1931 as a captain and subsequently taught at the Turkish Naval Academy from 1932 to 1938. Recalled to the German Navy at the start of World War II, Arnauld served as naval commander in Belgium, the Netherlands, Brittany, and western France. Promoted to vice admiral and named Admiral Southeast, he died in a plane crash at Le Bourget airport in Paris on February 24, 1942, en route to take up his new command.

Arnhem, Battle of

See MARKET-GARDEN, Operation

Arnim, Hans Jürgen Dieter von (1889–1962)

German Army general. Born at Ernsdorf on April 4, 1889, Hans von Arnim was commissioned in the German Army in October 1909. During World War I, he saw service on both the Western and Eastern Fronts and was promoted to captain in January 1917. Arnim continued in the Reichswehr after the war, and in 1935 he took command of the 69th Infantry Regiment. Promoted to major general in January 1938, Arnim had charge of an army service depot at Schweid-nitz in Silesia during 1938–1939.

Following the outbreak of World War II, on September 12, 1939, Arnim assumed command of the 52nd Infantry Division. He was promoted to lieutenant general in December 1939. In October 1940, he shifted to

command of the 17th Panzer Division and led it in Operation BARBAROSSA, the German invasion of the Soviet Union.

Assigned to General Heinz Guderian's Second Panzer Group, Arnim proved his mettle as a panzer commander. Seriously wounded near Schklov on June 27, 1941, Arnim did not return to action until September. He participated in the encirclement of Kiev later that month. His forces then took the important railway junction of Bryansk.

Shortly after the victory at Bryansk, Arnim was promoted to general of panzer troops effective in October 1941. He then commanded the XXXIX Motorized Corps, which became a panzer corps in July 1942, and saw action at Tikhvin and Cholm. Arnim was promoted to colonel general in December 1942 and assumed command of the Fifth Panzer Army in Tunisia.

Following meetings with Chancellor Adolf Hitler, Arnim assumed command of Axis forces in Tunisia on December 9, 1942. His performance in this role has drawn criticism from historians. Arnim and Field Marshal Erwin Rommel often worked at cross-purposes, and Arnim failed to take advantage of Rommel's victories at Kasserine and Tebersa. Arnim's own attack by the Fifth Panzer Army in February 1943 toward Medjez el Bat and Beja failed, even though he won a series of tactical victories. Following those events, Arnim received command of Army Group Africa on March 9, 1943.

British forces took Arnim prisoner on May 12, 1943. Incarcerated in an English country house at Hampshire until 1947, Arnim then took up residence in Bad Wildungen, Germany, where he died on September 1, 1962.

Arnold, Henry Harley “Hap” (1886–1950)

U.S. Army Air Forces (USAAF) general who led the USAAF and its predecessor, the Army Air Corps, throughout World War II. Born on June 25, 1886, in Gladwyne, Pennsylvania, Henry Harley “Hap” Arnold graduated from the U.S. Military Academy, West Point, in 1907 and was commissioned in the infantry. He transferred into the aeronautical division of the Signal Corps in 1911 and received his pilot’s certificate after training with Orville Wright. In 1912, Arnold set a world altitude record and won the first Mackay Trophy for aviation.

During World War I, Arnold served on the army staff in Washington, rising to the temporary rank of colonel and overseeing all aviation training. After the war, Arnold reverted to his permanent rank of captain. During the 1920s, he held a variety of assignments. Arnold supported Colonel William Mitchell at the latter’s court-martial, although this was not well received by his superiors. Arnold also wrote or cowrote five books on aviation, won a second Mackay Trophy, and continued to rise in the Army Air Corps. He became its assistant chief as a brigadier general in 1935. Three years later he became chief of the Army Air Corps as a major general following the death of Major General Oscar Westover in a plane crash.

General Henry Harley “Hap” Arnold seated at desk in his Munitions Building office. Arnold commanded the U.S. Army Air Forces during World War II. Arnold is the only U.S. airman to have achieved five-star rank. (Library of Congress)

Arnold proved particularly adept at improving the readiness of his service and expanding its resources, even with tight interwar budgets. Promoted to lieutenant general in December 1941, he was designated commanding general of the U.S. Army Air Forces in the March 1942 War Department reorganization, which raised the air arm to equal status with the Army Ground Forces and Army Service Forces. Because the British had a chief of air staff, Arnold was included on the U.S.-British Combined Chiefs of Staff as well as the U.S. Joint Chiefs of Staff. Although he was not a major player in their decisions, he was a loyal supporter of U.S. Army chief of staff George C. Marshall, who repaid Arnold after the war by supporting the establishment of an independent U.S. Air Force. Arnold was promoted to general in March 1943 and became one of four five-star generals of the army in December 1944.

During the war, Arnold built an organization that reached a peak of approximately 2.5 million personnel and more than 63,000 aircraft. He was a fine judge of people and selected the best men as his advisers, staff, and field

commanders. Arnold also established an emphasis on technological research and development. Although he was not really involved in day-to-day combat operations, his authority to relieve the field commanders who really did run the war gave him leverage to influence their actions. Poor health limited his effectiveness late in the war, especially after a fourth heart attack in January 1945.

Arnold was a proponent of precision bombing, but his pressure for more raids despite bad weather led to increased use of less accurate radar-directed bombardments in Europe, and his demand for increased efficiency in Japan inspired the fire raids there. His main goals were to make the largest possible contribution to winning the war and to ensure that the USAAF received credit through proper publicity.

Although Arnold retired in June 1946, his goal of an independent U.S. air service was realized the next year by his successor, General Carl Spaatz. In May 1949, Arnold was named the first general of the U.S. Air Force. Arnold truly deserves the title "Father of the United States Air Force." He died at Sonoma, California, on January 15, 1950.

Art and the War

Although World War II imagery is often thought of in terms of its haunting photographic legacy, thousands of other visual records were created by artists who depicted the war as it unfolded around them. Artists served as high-profile correspondents throughout much of the war, vividly documenting its conflicts in drawings, watercolors, and paintings executed on the spot and often under harrowing conditions.

An important precedent for European artists had been set by Pablo Picasso's mural-sized painting, *Guernica* (1937), named after the Basque town bombed by the German Kondor Legion during the Spanish Civil War. In *Guernica*, distended forms and disfigured characters were blown up large and linked to a vast panorama of brutality. The painting, which extended Picasso's fragmented Cubist pictorial language into the political arena, was all the more powerful for its ability to express an idyllic world shattered by the sweeping acts of anonymous warfare.

The warring powers linked art to propagandistic rhetoric. Perhaps the most unusual coupling of art and propaganda can be traced to Adolf Hitler's imagined lineage of the Germanic people from the Greek civilization of antiquity. The revival of severe forms of Greek classicism, along with a *Volkish* art and architecture (art and architecture "of the people"), would result in Germany in the most spectacular public rejection of modernism in the 20th century.

As early as 1933, the Nazi Party in Germany had stormed the legendary Bauhaus (an academy of applied arts founded in 1919) in Dessau and padlocked its doors. In 1937, the Nazis ordered museums purged of artwork they considered to have a corrosive effect on the morals of the German people. The targets of Nazi aggression were some of the greatest works of the avant-garde—the lyrical abstractions of Wassily Kandinsky, the raw energetic forms of Ernst Ludwig Kirchner and *Die Brücke*, and the antimilitarist sentiments and nihilist acts of George Grosz, Otto Dix, and Berlin Dadaists. Particularly scorned were the works of Jewish artists who expressed their spirituality in their work such as Marc Chagall, who had already lived through Russian pogroms in the century's first decade.

Many of the works of the artists in Nazi disfavor were simply destroyed (although some did find their way into the collections of the Nazi elite, such as Hermann Goering), but 650 were selected for a special exhibition, *Entartete Kunst* (Degenerate Art), which traveled to a dozen cities in

Germany and Austria. In the exhibition, paintings were poorly displayed, often at crooked angles, and sculptures were crowded together in piles. Instead of didactic labels, graffiti scrawled on the walls ridiculed the objects and their creators. More than 3 million people attended this exhibition and a companion to it, *Degenerate Music.* The success of the exhibit caused the Nazis to shut it down.

Generals Dwight Eisenhower (right), George Patton Jr. (center), and General Omar Bradley (far left) inspect art treasures stolen by the Germans and hidden in a salt mine in Germany, April 12, 1945. (National Archives)

During the war, a number of nations sent combat artists into the field. The United States was particularly active in this regard. The U.S. Army Corps of Engineers sent eight artists to document the experiences of American combat troops in Europe. In late 1942, a second War Art Unit was created. The War Art Advisory Committee led by muralist George Biddle and composed of

museum directors, curators, and including novelist John Steinbeck identified artists for the special unit. Of the 42 individuals selected by the committee, 23 were already on active military duty. Although the first artists were sent to the Pacific theater, shortly thereafter official artists were deployed to cover other theaters. By 1943, each branch of the military had assembled its own art unit to commemorate its contribution—by land, air, or sea.

Military artists were first and foremost soldiers who assumed the additional duties of documenting the war's events with the tools of the artist. The images they generated run the gamut from portraying soldiers' and sailors' everyday routines to stirring portrayals of troops in the heat of battle. Such artists participated in the events they recorded, and at times they had to take up weapons with their fellows. When the opportunity arose, they would take out their pads and drawing instruments to make sketches and jot down notations. Such sketches matured into full drawings or were translated into paint once the combat artists had the opportunity and resources.

Soldier-artists also served as illustrators for military publications such as the U.S. Army magazine *Yank*, which was created for the troops. Although civilian artists did not serve in combat, they accompanied the troops on dangerous missions and put themselves in harm's way.

When Congress's failure to appropriate funds threatened to eliminate the army's War Art Unit shortly after its inauguration, the contracts of 17 of the 19 civilian artists were taken over by publisher Henry R. Luce's *Life* magazine. The magazine profiled war artists such as Fletcher Martin, Floyd Davis, Tom Lea, Paul Sample, and Rubin Kadish, and photographs of the artists sketching in airplane cockpits or painting on aircraft carriers often appeared next to their works.

Life also ran several contests on the theme of art in the armed services and featured soldiers' work in subsequent multipage spreads. The magazine quickly became the vehicle by which the images moved beyond their original function as reportage to achieve acclaim as works of art in their own right. *Life* sponsored exhibitions of war art at populist venues such as state fairs and at venerable institutions such as the National Gallery in Washington, D.C., and the Metropolitan Museum of Art in New York. It was by examining the objects firsthand—hurried pencil sketches and pen-and-ink scrawls, watercolors and oils put down on wrapping paper and pasteboard from packing boxes—that the public could fully grasp their immediacy. They

could also ponder the obstacles the artists had to overcome to record each scene and be convinced of the soldiers' patriotic duty to make the art.

A second source of funding for the U.S. civilian art contracts came from Abbott Laboratories, a pharmaceutical company in Chicago that provided medical supplies to the troops. The company had an established record of patronage in the arts, and its director of advertising, Charles Downs, realized the power of images to rally public support. Working with the Associated American Artists group in New York, Abbott Laboratories recruited a dozen artists to be sent overseas and successfully lobbied the War Department to provide the artists with the same degree of support given to photographers and filmmakers in terms of housing, transportation, and security clearance.

Many of the artists, such as Thomas Hart Benton, Reginald Marsh, and John Stuart Curry, had worked on large-scale mural projects sponsored by the Works Projects Administration during the Great Depression years. Abbott Laboratories commissioned thematic sets of images, often showcasing their own products, although the stated mission of the project was to create permanent collections that were later donated to the military branches. Abbott also sponsored traveling exhibitions of these works to university galleries and museums across the country.

Although even the Museum of Modern Art in New York met the public's appetite for war pictures by sending art supplies to the front and mounting exhibitions from the battlefield, a small but vocal group of artists protested these images as sanitized portrayals of war—or worse, products of the American propaganda machine. Some were critical of the civilian component of the art units and those who traveled as artist-correspondents, charging that they played no direct role in the war effort. Artists who served in the war, however, designed camouflage patterns or condensed information into strategic charts and maps. Their skills directly contributed to the war effort.

Some artists objected to the lack of psychological or philosophical commentary in the images themselves, arguing that works of art should offer information beyond that of a photograph and should give a truer sense of the atrocities faced by the soldiers who were battling for freedom. The large community of European exiles gathered in New York City during the early 1940s created a more ambivalent body of images that speaks of the emotional and psychological complexities of a world at war. Paintings by Max Ernst and the Chilean artist Roberto Matta, often nightmarish plunges into

landscapes ruled by irrational forces, were executed in expressionist or surrealist styles.

After the war, U.S. soldiers who had worked in the art units or as artist-correspondents as well as those who had interest in but no actual background in the arts were offered the opportunity to pursue formal art training through the GI Bill. It created a generation of college-educated artists who sought to distance themselves from their experiences on the battlefield. Because of the association of conservative pictorial styles with Nazi propaganda and international outrage over Adolf Hitler's extreme forms of censorship, much postwar art in the Western world would attempt to break from the past altogether by experimenting with nonobjective styles that would be difficult for any party or platform to co-opt.

Artillery Doctrine

Artillery and fire-support tactics in World War II owed more to the lessons of World War I than to the theories of mechanized warfare that evolved between the wars. Between 1914 and 1918, artillery went through a series of radical changes, altering forever the face of modern warfare. Most of the artillery innovations of 1914–1918 are still around today, albeit in far more refined technological forms.

Major changes that occurred in World War I had an especially profound influence on the way World War II was fought. The most important was the perfection of indirect fire, as opposed to direct fire. Indirect fire techniques

had been developed before 1914, but during World War I they were standardized and became the norm rather than the exception for artillery combat. Firing an artillery piece by direct fire required the crew to be able to see the target and to aim at it directly, either through open iron or optical sights. Firing by this method limited the range at which guns could engage targets and required the guns to be far forward and exposed to enemy fire. Indirect fire is a system in which a gun can be fired at targets the gun crew cannot see. The gun crew instead aims the piece by sighting on a reference point.

Initially, indirect fire required a forward observer who could see the target and had some means of communication to transmit corrections back to the guns. After the first shot was fired, the observer would make successive corrections until the fall of shot was adjusted onto the target. Near the end of World War I, however, several armies had mastered the technique of firing without observer corrections. Using the correct current weather data and accurate ballistics data about the ammunition and the guns, the necessary adjustments could be mathematically predicted—hence the name “predicted fire” for the technique.

Indirect fire combined with predicted fire had several significant consequences for war fighting. First, it was no longer necessary to physically mass guns on the ground to produce massed fire effects on a target. Guns at diverse points on the battlefield could all fire simultaneously on the same target. The second major consequence was the introduction of depth to combat operations. The ability to engage targets beyond visual range transformed the conducting of warfare from a linear two-dimensional problem to a three-dimensional problem. The advent of combat aircraft also added significantly to three-dimensional warfare.

These changes came to dominate combat operations in the final years of World War I, but they were not fully developed by the time the war ended. Two major constraining factors were the relatively primitive mobility and communications technologies of the day, which limited the effectiveness of the new fire-support capabilities. Between the wars, the technologies of battlefield transportation and communications made great advances, which contributed significantly to the fact that the stagnation of the trench warfare of World War I was not repeated in World War II.

Germany

Germany led the world in the development of artillery tactics during World War I. Between 1916 and 1918, Colonel Georg Bruchmüller pioneered many of the most important artillery tactical methods: neutralization and suppressive fires, as opposed to simple destructive fires; performance of specific tactical missions by specially trained artillery groups, including infantry support, counterbattery, and deep attack; and fire preparations organized into phases to accomplish specific tactical objectives. In early 1918, Bruchmüller championed the work of Captain Eric Pulkowski, who developed a technique of meteorological corrections—still in use today, albeit computerized—that made accurate predicted fire both possible and practical.

Ironically, Germany in the interwar years all but abandoned most of the artillery lessons it had taught the rest of the world during World War I. German artillery had been so devastating that the Versailles Treaty only allowed the postwar German Army 284 artillery pieces, none larger than 105mm. As late as 1936, three years after Adolf Hitler came to power, the German army still had only 284 guns. An army not allowed any significant amount of artillery, then, focused on developing alternative tactics centered on the tank, which in theory was supposed to provide its own close fire support. This led the Germans to conclude that even if they had adequate artillery, the guns and especially their ammunition supply would not be able to keep pace with the tanks.

The Germans recognized that even a massive tank force would sometimes encounter stiff opposition that would slow its momentum. In such situations, the additional required fire support would come from the air, most notable the Junkers Ju-87 Stuka dive-bomber. By 1940, the Germans had developed an impressively sophisticated air-to-ground coordination system that was capable of concentrating as many as 2,700 aircraft over a critical sector. As successful as this system was in France, the Germans recognized that their panzer forces would still benefit from the addition of highly mobile, organic fire-support assets. At that point, they started to develop and field a limited number of self-propelled assault, antitank, and field guns.

The German system of relying primarily on airpower for fire support worked fairly well in France. As the war progressed, though, the Germans

realized that their approach was subject to flaws in three critical areas: mass, weather, and air superiority. When the German Army invaded the Soviet Union, the operational theater was so vast and Soviet ground forces spread so widely that the Luftwaffe could not be everywhere it was needed at one time. The weather in the Soviet Union also severely restricted Luftwaffe operations. But conventional field artillery is practically impervious to weather conditions, and the massively gunned Red Army almost always had adequate fire support. Finally, as the war progressed and attrition sharply affected the Luftwaffe, the Germans lost air superiority. The real importance of the Combined Bomber Offensive mounted by the Western Allies was not so much its effect on Germany's industrial base but rather the steady attrition of Luftwaffe fighters and pilots. By late 1944 and 1945, Germany no longer controlled the air over its own territory, let alone over the battlefields in France or the Eastern Front.

Again abandoning lessons it had taught the world in 1918, the German Army of World War II rarely emphasized the massing of artillery above the divisional level. It failed to provide artillery concentrations at the corps, army, or army group levels. The Soviets, though, considered artillery at those levels to be decisive. By 1944, the Germans had come to fully recognize their critical error with respect to artillery, and they desperately tried to re-create the fire-support structure and assets that had served them so well in 1918. By then, however, it was too little, too late.

Japan

The Japanese Army believed that the immediate close support of the infantry attack was the primary mission of field artillery. Secondary artillery missions included destroying the enemy's supporting infantry weapons, destroying obstacles in the way of the infantry advance, and interdicting enemy lines of communication. Counterbattery work had the lowest priority.

The Japanese stressed the importance of keeping their guns well forward, often placing firing positions within a few hundred yards of an enemy's forward positions. Command posts were sited right next to the guns so the battery could be controlled by voice command. The fire and observation conditions of Asian jungles, however, created special problems for close infantry support. The terrain often made it difficult or impossible to

accurately track the positions of the infantry units. The requirement to fire over trees almost always meant that the fall of shot would be too far forward of the infantry. The solution to that problem was to position the guns on the flanks of the attacking infantry.

Under Japanese doctrine, artillery was oriented primarily to the offense. Before an attack, standard Japanese artillery preparation lasted between one and two hours. The preparation was conducted in three phases of roughly equal duration: range adjustment, obstacle destruction, and fire on the enemy's forward positions. As the infantry began its attack, the mission of the artillery shifted to direct support. In defensive situations, the main weight of the Japanese guns would be echeloned 1 to 1.2 miles behind the main line of resistance. As the enemy massed for the attack, the defending artillery would fire a counterpreparation. Once the enemy attack started, the mission of the artillery was to break up the momentum of the assault with a series of standing barrages.

As with the Germans, the Japanese throughout World War II suffered from too little artillery and inadequate organization and control at the higher echelons. Artillery in small units was allocated directly to the tactical-level infantry units, which left almost no fire-support assets for centralized command and control at the divisional level and up. By 1944 the Japanese too had come to recognize the gravity of these shortcomings, and they moved to correct the problems. As with their German allies, it was too little and too late.

France

The French were slow to modernize their artillery following World War I. Throughout the interwar years, all French tactical thinking was either woefully outdated or too heavily influenced by a defensive orientation. The French believed that massive firepower was the key to victory. They took this idea to its extreme and also rejected mobility. They came to regard "weight of metal" as the decisive factor in any defense or attack. This, of course, led to the massive defensive system of the Maginot Line, which sought to replicate on a grand scale the fixed fortifications of Verdun, which had held out in 1916.

The French put most of their interwar artillery efforts into fortresses, largely ignoring mobile field artillery. In the early 1930s, the French did experiment with a mechanized division, but French field artillery was not even motorized until 1934. Throughout the 1920s and 1930s, French tactical doctrine emphasized that the mission of artillery was to destroy any obstacles in the path of the infantry, accompany the infantry by fire, and strike at the enemy artillery's capability to hit the friendly infantry. The emphasis on these missions, however, was always within a framework of counterpreparations and defensive fires.

Just prior to the start of World War II, a French artillery preparation had three primary targets: the enemy's infantry, the enemy's known antitank weapons, and the enemy's suspected antitank weapons. Counterbattery fire against the enemy's guns had almost completely fallen out of the French doctrine. The French believed that modern technology and mechanization made counterbattery fires impractical, if not impossible. Finally, the French failed to provide any real doctrine for coordinating artillery with air support and air defense. A result of this failure was that two French divisional artilleries were cut off and routed at Sedan in May 1940 before the German ground forces had even crossed the Meuse.

United States

As early as the mid-1920s, the U.S. Army started to abandon many of the hard-learned artillery lessons of World War I, and ground tactics shifted back to an infantry-centered world. Right up to the start of World War II, the U.S. Army neglected the requirements of artillery command and control above the divisional level and almost totally ignored corps-level artillery. What passed for corps-level artillery was little more than a holding pool for units and guns not otherwise assigned. According to the doctrine, corps artillery was responsible for counterbattery fire. As late as May 1943, though, the Field Artillery School at Fort Sill, Oklahoma, was still recommending that corps artillery units be parceled out to the divisions during operations.

The U.S. Army, however, did not go quite as far as the British, the French, or even the Germans in abandoning the artillery lessons of World War I. The American penchant for technical solutions prevailed, and Fort Sill experimented with various forms of fire-control techniques, including aerial

observation. By 1934, Fort Sill had developed the first battalion Fire Direction Center, which could simultaneously control and mass the guns of all three of an artillery battalion's batteries. In 1940, Fort Sill introduced the graphical firing table, a specialized artillery slide rule that greatly speeded the calculation of the firing solution. In April 1941, Fort Sill demonstrated for U.S. Army chief of staff General George C. Marshall a divisional shoot, controlling and massing against a single target the fires of four separate battalions, totaling 12 batteries.

In the late 1930s, Brigadier General Lesley J. McNair was the assistant school commandant at Fort Sill. McNair had commanded a field artillery brigade in France during World War I. Later, as commander of U.S. Army Ground Forces, he became the chief architect of the U.S. military buildup going into World War II. McNair was a strong believer in flexible massed fires. He championed the development of longer-range guns and supported all initiatives to centralize artillery command and control systems. Under his direction, the number of nondivisional medium and heavy artillery battalions in the U.S. Army nearly doubled between 1942 and 1944.

U.S. Army doctrine in World War II identified two primary field artillery missions: supporting the ground-gaining (infantry, cavalry, armored) units by either neutralizing or destruction fires and giving depth to combat by counterbattery fire, fire on enemy reserves, restricting movement in enemy rear areas, and disrupting enemy command and control systems.

As the war progressed, the U.S. Army's logistical advantage became increasingly decisive, and the American tactical experience mirrored that of the other Allies. At the corps level, the emphasis increased on command, joint operations, and airpower. Joint operations and airpower were especially important in the Far East, where amphibious operations and jungle terrain made it almost impossible to mass artillery on the ground.

Great Britain and British Commonwealth

The British Army had (and still has) a somewhat different approach to artillery command and control. In almost all other armies, the forward observers (FO), who accompanied the infantry and requested and, if necessary, adjusted the supporting fires were junior officers, usually lieutenants. The more senior artillery officers remained in command of the

guns or in the command posts of the artillery battalions or the divisional artillery headquarters. The British attached their more senior officers to the command post of the supported maneuver unit. Thus, a British infantry company would have a captain as an FO—or forward observation officer (FOO), as the British called them. The supported infantry battalion commander would have an artillery major as his artillery adviser.

The idea behind the British system is that the senior and more experienced officers would better understand the overall tactical situation. Whereas a lieutenant FO in most armies could only request fires, a British FOO had the authority to order the fires. The British believed that this system produced quicker and more responsive fire support. The system depended heavily on radio communication, which was widespread and effective in the British Army from 1940 forward.

As with the Germans, the British had rejected most of the artillery lessons of World War I. Great Britain entered World War II with a tactical doctrine that de-emphasized artillery, based on the theory that tanks could operate independently without much support from the other arms. Unlike the Germans, the British did not have an air force structured to provide air-to-ground support for emergencies. The Royal Air Force before World War II concentrated on building up its bomber forces. The lack of air support for their ground troops cost the British dearly in the campaign for France in 1940.

The British approach to mobile tactics worked well against the Italians at the start of the campaign in North Africa. Once the Germans entered that fight, though, the British were at a severe disadvantage against the German combined-arms tactics and organizations. Too often, the British tried to attack German positions without adequate artillery preparation and paid a high price. At the same time, the British had difficulty establishing an effective defense built on fire and maneuver.

What made the British situation even more difficult was that they were forced to use most of their field artillery in an antitank role, which left little for infantry support. By 1942, the British were pouring new antitank guns and more field artillery into North Africa, which allowed them to develop new tactical methods.

General Bernard Montgomery was the primary architect of the new British approach. Montgomery stressed the steady buildup of a superior

firepower ratio and the use of artillery to produce shock action in coordination with the other arms. The two main tactical techniques to achieve this were the creeping barrage and the timed concentration. These techniques had been developed in World War I, but in World War II they were far more sophisticated and effective because of better communications and predicted, rather than observed and adjusted, fire. At El Alamein, for example, 1,000 British guns produced a massive shock effect by firing more than 1.2 million shells at plotted German targets without having to telegraph the attack by first adjusting the fall of shot. The British also developed a standard fire mission they called the "72-gun battery," which concentrated all the guns of a division on a single target.

Soviet Union

Virtually alone among the world's major armies, the Red Army following World War I intensely studied the artillery lessons of that war and diligently applied them during the interwar years. In the 1920s, Soviet chief of artillery Lieutenant General Yuri Shedeyman personally translated from German into Russian the books written by Colonel Georg Bruchmüller about his artillery innovations during World War I. Reflecting their faith in massed firepower, the Soviets by the 1920s had built their army into a combined-arms force with artillery as a major component at all levels.

In 1941, the Soviets initiated a major reorganization of their artillery. The number of guns in a division was reduced by almost two-thirds, but the number of mortars increased by the same proportion. The objective was to make the divisions more mobile. The Soviets grouped their heavier artillery pieces into artillery reserve units, which then could be massed at the decisive point of any battle. Following these reorganizations, Soviet leader Joseph Stalin in 1942 directed that artillery should be concentrated to support a breakthrough in a designated sector and that more mobile artillery had to be developed to support the armored units that would exploit the breakthrough.

In late 1942, the Soviets organized their artillery reserve units into artillery divisions. With the exception of one artillery division with which the Germans experimented briefly, the Soviets were the only ones to field such organizations in World War II. By the end of the war, the Red Army had some 90 artillery divisions, about the same number of total divisions in the U.S. Army. In 1943, the Soviets began grouping their artillery divisions into breakthrough artillery corps of two or more artillery divisions and one rocket launcher division. The Soviets believed in holding artillery in reserve—the opposite of the American belief that artillery is never held in reserve. At the start of the war, some 8 percent of the Red Army's artillery was in the High Command Artillery Reserve. By the end of the war, this percentage had risen to 35 percent.

On the defensive for the first part of the war, the Soviets drew the following conclusions about fire support in defensive operations: artillery, not aircraft, was the superior form of fire support in the defense; the antitank plan should be the basis for determining the overall deployment of forces; all guns should be capable of direct fire; an artillery reserve was essential; armor

should counterattack only after a tank attack had been stopped by artillery; artillery must be sited in depth in prepared positions; and indirect fire was effective only when massed and centrally commanded.

Soviet Union attack doctrine grew out of Soviet experiences launching counterattacks from the defensive. By the time the Red Army went on the offensive in the final years of World War II, its artillery had three primary missions: preparation of the attack; support of the attack, principally through a creeping barrage or fixed concentrations; and accompaniment of the maneuver forces. Accompanying fire was the primary mission of the divisional artillery units, more often than not through close-range direct fire. As a result, divisional artillery units generally suffered 10 times the casualty rates of nondivisional units.

The Soviet system worked but had its drawbacks. Operations required a methodical buildup of overwhelming force, which in turn required periods of stability. This meant that operations on the Eastern Front went through cycles of long periods of buildup, followed by brief surges of steamroller-like momentum. The Soviets ultimately had the manpower and the resources to succeed with this approach on the operational level, but during the interim periods the Germans often were able to achieve stunning tactical successes because of their more flexible organization and doctrine. In the end, the Soviets succeeded; they proved that conventional artillery—the "god of war," as Stalin called it—was in fact a decisive element at the operational level of war.

Artillery Types

Firepower and maneuver are the two primary elements of land combat power. From the late Middle Ages to the early years of the 20th century, artillery was the only significant source of land-based firepower. Even after the appearance in World War I of machine guns, tanks, and ground-attack aircraft, artillery remained the major source of firepower on the battlefield. Throughout history, firepower and mobility technology have been in a constant tug-of-war. Rarely has one achieved a significant advantage, but whenever that has happened, the results have been devastating.

During World War I, firepower technology far outstripped mobility technology. In the years between the Franco-Prussian War (1870–1871) and the start of World War I (1914), there was vast technological improvement in artillery and infantry weapons, particularly the machine gun. The result was previously unimaginable levels of battlefield firepower. Battlefield mobility, however, was still primarily a matter of human and animal muscle, as it had been for thousands of years. Thus, firepower had become mechanized by 1914, mobility had not, and the result was trench warfare. By World War II, mobility technology had caught up, and the balance was restored.

Artillery pieces are broadly classified by the ballistic performance of the projectiles they shoot. The three basic categories of cannon, or tube, artillery have not changed in the past 300 years, although individual technologies have advanced considerably. Guns fire projectiles at a high velocity and on a relatively flat trajectory; they have the greatest range and tend to be the heaviest of artillery pieces. Mortars are generally light weapons that fire a relatively light projectile at low muzzle velocities and short ranges, but at angles of fire above 45 degrees. Howitzers are extremely versatile weapons, capable of firing at both high and low angles. The muzzle velocity and range of a howitzer are less than those of a gun of comparable size, but a howitzer is far more accurate. A howitzer also can fire a heavier shell than a gun of the same weight. Most armies in World War II had both guns and howitzers in their arsenals. Although technically artillery pieces, mortars were considered infantry weapons by almost all armies.

All forms of artillery through the start of the 19th century were the same smoothbore, muzzle-loading, black-powder mechanisms that had been in use for hundreds of years. They had poor mobility, and the gun crews engaged their targets by direct fire—that is, the gunner had to see and directly aim at the target, just as if he was firing a large rifle. In the last half of the 19th century, artillery made several technological leaps in areas such as improved metallurgical and manufacturing techniques, rifled bores, breech-loading mechanisms, fire-control instruments, and, most important, recoil mechanisms.

Modern recoil mechanisms, introduced at the end of the 19th century, allowed the artillery piece to hold its position on the ground as each round was fired. That, in turn, meant that the piece did not have to be reaimed after each round, which produced far more rapid rates of fire. The result was vastly improved accuracy and repeatability, which—combined with modern optics and fire-control techniques—made indirect fire possible.

Indirect fire is the technique of accurately firing at targets that the gun crew cannot see directly. That important advance extended the effective depth of artillery fire, which in turn led to the concept of deep battle. The first artillery piece with modern fire-control and recoil systems was the French Canon de 75 mle 1897 (75mm gun, model 1897), widely known as the "French 75."

Through World War I, all field artillery was horse-drawn. In the interwar years, the horse gave way to the truck as the artillery prime mover in the British Army and the U.S. Army. Many armies, however, including those of Germany, Japan, Italy, and the Soviet Union, relied heavily on horses until the end of World War II. Self-propelled (SP) artillery—guns mounted on a wheeled or tracked carriage—also appeared shortly after the end of World War I, when the British Birch Gun was introduced. By the end of World War II, almost all armies had SP guns and howitzers.

According to an old maxim of the British Royal Artillery, the real weapon of the artillery is the projectile—the gun is merely the means of sending a projectile to the target. During World War II the standard artillery projectile was high-explosive (HE), producing both blast and fragmentation effects. The blast was employed primarily against fortifications, and fragmentation was used against personnel. Smoke rounds were used to obscure enemy visibility on the battlefield, and illumination rounds were utilized to enhance

friendly visibility at night. In the early years of the war, most armies were forced to use their field artillery in an antitank role, which required the guns to fire special armor-piercing (AP) and high-explosive antitank (HEAT) rounds. During World War I, most armies developed and used a wide array of chemical rounds that produced various combinations of lethal and nonlethal, persistent and nonpersistent effects. Although all sides still had these chemical rounds in their arsenals during World War II, they were not employed.

The fuze is perhaps the most critical element of an artillery round. The point-detonating (PD) fuze triggers the round as soon as it touches the ground, producing a surface burst. Most PD fuzes could be set on "delay" to allow the round to penetrate into the ground and produce a subsurface burst. The concrete-piercing fuze is a variation of the delay fuze that allows an artillery projectile to burrow into the wall of a bunker or fortification before exploding. The mechanical time fuze was used to produce an airburst, which rained fragments on the target below. This was generally the most effective means of attacking troops in the open. The time fuze, however, required a high degree of skill on the part of the forward observer and the fire direction center personnel to get the time of flight and the height of burst just right.

Near the end of World War II, the U.S. Army introduced the proximity fuze, adapted from naval antiaircraft artillery for field artillery work. Also called the variable-time fuze, it contained a small radar transmitter and receiver that produced a perfect 66-foot height of burst every time. The "funny fuze," as Lieutenant General George S. Patton called it, was first used by U.S. artillerymen with devastating effect during the German Ardennes Offensive (December 16, 1944–January 25, 1945).

United States

The U.S. Army classified its field artillery guns and howitzers into three basic categories by weight: light, medium, and heavy. Light guns, used for direct support, were found only in divisional artillery. The airborne divisions and the 10th Mountain Division were armed with the 75mm M-1A1 pack howitzer. It was designed for easy disassembly, which allowed it to be dropped from the air or transported by six mules. The 75mm pack howitzer

was widely used in Italy and in the jungles of the Pacific, where its transportability was its most important feature.

The workhorse of most infantry divisional artillery was the 105mm M-2A1 howitzer, the most widely used artillery piece in history. It was accurate and reliable, and it could withstand a great deal of punishment and mishandling. It was first developed in the 1920s as a weapon capable of being towed by a team of six horses, and the design was approved in March 1940.

The M-2A1 was towed by a two-and-a-half-ton truck, which also carried the gun's crew and its basic load of ammunition. The armored divisions used the M-2A1's tube and gun carriage on one of several self-propelled mounts. The standard was the M-7B1, which was mounted on a Sherman tank chassis. In 1945, these guns began to be replaced by the M-37, which was mounted on a Chaffee tank chassis.

In 1943, the army introduced a lightened version of the M-2A1 with a shortened barrel to give airborne units more firepower than the 75mm pack howitzer delivered. The M-3 howitzer was not a successful design, however. After World War II, the M-2A1 was modified somewhat to become the M-101A1. That version remained in service with the U.S. Army through the Korean War and the Vietnam War. More than 10,200 M-2A1s or M-101A1s were built and supplied to some 45 different armies between 1940 and 1953.

The 155mm M-1A1 towed howitzer was the standard American medium artillery piece used by the general support battalions of almost all the infantry divisions. It was a successful and popular design although heavy and somewhat difficult to handle. The cannoneers on the gun crews called these weapons "pigs"—short for pig iron. A self-propelled version of the 155mm howitzer mounted on a Chaffee tank chassis was designated the M-41, but only about 100 were ever built.

The most widely used American heavy gun was the 155mm M-1 towed gun, which is not to be confused with the 155mm M-1A1 towed howitzer. The 155mm gun was two and a half times as heavy as the 155mm howitzer and could shoot a shell of the same weight (95 pounds) 60 percent farther. The 155mm gun had a 19-foot barrel and was nicknamed the “Long Tom” by all sides. One self-propelled version was the M-12, based on a modified Grant tank chassis. The M-40 version was based on a modified Sherman tank chassis.

The 8-inch M-2 towed howitzer used the same carriage as the 155mm M-1 towed gun. Where the bore sizes of all other U.S. Army artillery pieces were designated in millimeters, though, this one was designated in inches because it originally was adopted from a U.S. Navy design. Despite its relatively short barrel, the 8-inch had the reputation of being the most accurate artillery piece ever invented. It remained in service in the U.S. Army into the 1960s and in the British Army into the 1970s. After World War II, the U.S. Army also mounted the 8-inch on a self-propelled carriage, and that version remained in service until just after the 1991 Persian Gulf War.

The heaviest U.S. artillery piece was a 240mm M-1 towed howitzer called the “Black Dragon.” Towed by a 38-ton M-6 tractor, it had surprisingly good mobility for a gun weighing almost 21 tons. Once the gun arrived in a firing position, it took the crew about two hours to place the piece into action. The 240mm howitzer saw extensive service in the Italian Campaign.

France

At the start of the war the French Army still had large numbers of the World War I–era 75mm guns in service. One of these, the French 75, had been the world's first truly modern artillery piece, featuring a hydraulic recoil mechanism and a screw-type breechblock that allowed a high rate of fire. Between the wars, the French had tried to modernize the weapon, updating it with pneumatic tires and a split trail. The Germans captured thousands of these guns from the French in 1940 and incorporated them into lower-priority Wehrmacht units. The Germans also modified the French 75 as an antitank gun for service on the Eastern Front.

In 1939, the French still had more than 1,000 105mm and 3,000 155mm World War I–vintage artillery pieces in service. These obsolete weapons were a detriment in 1940. The standard French 105mm gun was the Canon de 105 mle 1913 Schneider. The French also still had in service 450 Canon de 155 Grand Puissance Filloux (Can 155 GPF). Despite the age of these weapons from an earlier war, the Germans placed many of the captured weapons into service with their own units—an indicator of Germany's overall weakness in field artillery.

The French did have some small numbers of modern light field guns, including the Canon de 105 mle 1934-S, the Canon de 105 court mle 1935-B, and the Canon de 105 L mle 1936 Schneider. Only 159 of the M-1936 guns were in service in 1940. The Germans used those captured pieces primarily for coastal defense. Of more value to the Germans was the Can 155 GPF (the updated version of the Can 155 GPF-T), which had a carriage designed for motor transport.

Soviet Union

The Soviets read the lessons of World War I as requiring more artillery rather than less. In 1937, the Red Army had an inventory of 9,200 field and heavy guns, more than twice that of the German Army and triple that of the French Army. When Germany attacked in June 1941, the Soviet artillery arsenal stood at 67,000 tubes. Throughout the war, Soviet artillery designs were more reliable, durable, and effective than those of virtually all other armies. Soviet Army guns generally had longer ranges. The Soviets also developed innovative mass-production techniques that produced large numbers of relatively inexpensive guns. Through their system of design evolution, they

repeatedly combined the successful features of various existing designs and could introduce improved models in a short period of time.

The Soviet Army did not put much effort into developing increasingly powerful antitank guns. Soviet field artillery pieces generally fired at a higher velocity than those of most other armies, and experience in the Spanish Civil War convinced the Soviets that if they were provided with the proper ammunition, field guns were the best weapons against tanks. With the Soviet Union's overwhelming tube superiority over Germany, Soviet field guns could be used effectively to mass indirect fires against distant targets and then quickly switch to a direct-fire point defense against tanks when the situation required. In 1941 and 1942, most German tank losses were to fire from towed field guns.

The Red Army suffered huge equipment losses in the early period following the German attack in 1941. In the first five months of the war, the Soviets lost upward of 20,000 guns. But this loss quickly led to a surge in mass production of modern, standardized weapons. The basic divisional support gun was the 76.2mm M1942 ZIS-3, a long-barreled gun with a split trail. By the end of the war, variants on the same design had been introduced in 85mm and 100mm types. With a range of nearly 13 miles, the latter outranged all comparable divisional support guns. The 100mm version also was mounted on the SU-100 SP assault gun. Soviet medium artillery included the excellent 122mm M-1931/37 A-19 and the 152mm M-1937 ML-20 and M-1943 D-1.

Massed artillery was the basis of the defense of Moscow in the winter of 1941. According to Soviet reports, artillery destroyed more than 1,400 German tanks between November 16 and December 10 alone. The Soviets relied on the same tactics in the Battle of Stalingrad (August 23, 1942–February 2, 1943). At Kursk on July 5, 1943, the Red Army fired a counterpreparation with 3,000 guns against the assembling German attack force. It was a dramatic demonstration of the power of massed artillery to disrupt an armored attack before it could be launched.

As the war wound into its final years and Soviet production continued to swell the Red Army's arsenal, artillery preparations became more and more massive. During the offensive to cross the Vistula and Oder Rivers in January 1945, the Soviets massed 7,600 guns and mortars along the 21-mile breakthrough sector alone, with 33,500 tubes deployed across the entire front.

The Germans were better armed with artillery than the Soviets in just one area. In 1944, a typical panzer division had some 70 SP guns with calibers up to 150mm. A Soviet tank corps of the same period had only 20 76mm SP guns. Despite their overwhelming number of tubes, only about 30 percent of the Soviet guns were larger than 100mm. The maximum effective range of most of the smaller guns was only about 3.1 miles. Much beyond that range, Soviet gunners had great difficulty supporting the advance of the maneuver units. Thus, the Soviets' large numbers of massed but relatively immobile guns were effective in creating the conditions for successful breakthroughs but ineffective in supporting and sustaining them.

Great Britain and British Commonwealth

In 1939, the British Army was the first fully motorized army in the world. All British field guns were towed by a four-wheel-drive truck that also carried the gun crew and the ammunition. The primary British close-support gun was the 25-pounder, which fired a 3.45-inch round. Initially designed in 1930, the 25-pounder had a box trail and an innovative central firing platform that allowed the crew to traverse the gun a full 360 degrees.

The earliest version, the MK-1, was based on the modified carriage of a World War I–vintage gun. The MK-1s saw service in France in 1940. The MK-2, with a carriage specifically designed for the 25-pounder, was introduced in 1940 and saw service in Norway. When firing special armor-piercing ammunition, the 25-pounder was pressed into service as an effective antitank gun during the early years of the war. In 1943, the Australian Army introduced a lightweight version of the 25-pounder for jungle operations. The British also mounted it on a Valentine tank chassis to produce a self-propelled version known as "The Bishop." A far more successful design called "The Sexton" mounted the 25-pounder on a Canadian Ram tank. The Royal Artillery also used the American 105mm M-7 SP howitzer, a system known as "The Priest."

At the start of the war, British medium artillery consisted of World War I–vintage guns, including the 6-inch gun, the 6-inch howitzer, and the 60-pounder. These were soon replaced by the 4.5-inch and 5.5-inch guns, which used the same chassis. The 5.5-inch gun was first developed in the 1930s, and its final version was approved in August 1939. It fired a 100-pound shell. The

4.5-inch gun first saw service in North Africa in 1942. Both guns were grouped together in medium field artillery regiments.

Early British heavy artillery also consisted mostly of World War I weapons, including the 8-inch, 9.2-inch, 12-inch, and 18-inch howitzers and 6-inch and 9.2-inch guns. All of these weapons were too heavy and cumbersome for modern mobile warfare, and the British lost most of them in France in 1940. Although the British started to design and develop more modern heavy artillery, they suspended those efforts when the United States entered the war. The British instead adopted the American towed 155mm gun and towed 8-inch howitzer.

Germany

The Germans had four categories of artillery: the *Kanone* (cannon), the *Haubitze* (field howitzer), the *Mörser* (a heavy howitzer firing at high angle only), and the *Werfer* (mortar). Generically, all artillery pieces were called *Geschütze* (guns). The three primary calibers of German field artillery were 75mm, 105mm, and 150mm. (The Germans used centimeters to designate their weapons—7.5cm, 10.5cm, and 15cm.) Almost from the start of the war, the Germans recognized that 75mm guns were ineffective for modern warfare. Those guns, including ones captured from the French, were issued only to low-priority units.

The towed 10.5cm leichte Feldhaubitze 18 (le FH 18) was the principal German close-support gun. Designed at the end of World War I, it remained a capable weapon throughout World War II. The main problems were that the Germans never had enough of them, and in almost all units right up until the end of the war they were drawn by horses. On the Eastern Front, the le FH 18 was an effective antitank weapon when armed with the proper ammunition. A self-propelled version for the panzer divisions called the *Wespe* (Wasp) was mounted on a PzKpfw-II tank chassis.

The heavier artillery at the divisional level included a gun (the 10cm s K 18) and a medium field howitzer (the 15cm schwere Feldhaubitze 18 [s FH 18]). The SP version of the s FH 18, called the Hummel (Bumblebee), was mounted on a PzKpfw-IV tank chassis. In the corps and field army echelons, the most common heavy support guns were the 17cm K 18 gun and the 21cm Mörser 18 (Mrs 18) heavy howitzer. Both weapons had a common carriage.

In most World War II armies, the organic fire support for infantry units came from mortars. The Germans did have effective mortars at both company and battalion levels, but on the basis of their experiences from World War I, they also fielded infantry guns right up until the end of the war. The two basic types were the 7.5cm leichtes Infantriegeschütz 18, designed late in World War I, and the heavier 15cm schweres Infantriegeschütz 33. The latter was actually too heavy for an infantry gun.

The Germans did produce several SP versions of their field and antitank guns, and they also produced a self-propelled weapon called an assault gun that was more like a turretless tank. Whereas the SP field and antitank guns consisted mostly of standard towed guns mounted on various tank chassis, many of the SP assault guns had no towed equivalent. The 7.5cm Sturmkanone 40 (Stu. K. 40) fired a 15-pound shell approximately 4 miles, the 10.5cm Sturm-haubitze 42 (Stu. H. 42) fired a 33-pound projectile 4.8 miles, and the 15cm Stu. H. 43 fired a 95-pound shell only 2.8 miles from a barrel that was about 6 feet long.

German artillerymen were tactically skilled, and their guns were generally technically advanced. Initially, though, the Luftwaffe provided the close fire support for the fast-moving panzer divisions on the Eastern Front. When the Germans found that the Luftwaffe could not be everywhere at once across the vast expanses of the east, though, especially in bad weather, they found themselves woefully outgunned by the Soviets.

Italy

The Italians entered World War II with many obsolescent artillery pieces in service. Italy had, however, undertaken a rearmament program in the 1920s, ahead of most other nations. The Italians entered the war with several modern artillery designs, but none produced in great numbers. As the war progressed, even the more modern Italian guns were outclassed by British and American guns whose development had started much later, in the 1930s.

The 75mm Cannone da 75/32 modello 37 was initially developed in the 1920s, but it never entered full production. The 75mm Obice da 75/18 modello 35 howitzer was another good design, but the Italians only had 68 in service by September 1942. The Italians started the war with more than 900 of the obsolete 149mm Cannone da 149/35 in service. Based on a turn-of-the-

century design and lacking a modern recoil system, the gun had to be relaid after every round. It was supposed to be replaced in 1940 by the 149mm Cannone da 149/40, but that weapon also never went into mass production. By 1942, in service were only 147 of the Obice da 149/19 howitzers and only 20 of the heavy 210mm Obice da 210/22 modello 35, which was an accurate and mobile piece for its heavy caliber.

Japan

The Japanese came late to artillery. Most Japanese had never seen a cannon before the arrival of Admiral Matthew Perry in 1853. Through World War II almost all Japanese artillery was based on European designs. Japanese guns, however, were lighter and had greater range than European designs of the same caliber. Japanese designers achieved the weight savings at the expense of the strength of the tubes, trails, and especially the recoil systems. As a result, these weapons suffered from a lack of ruggedness and also from high failure rates that proved costly in light of the heavy firing that was necessary during sustained combat.

Throughout the war, the Japanese had both horse-drawn and motorized artillery units. Whereas the U.S. Army and most European armies moved between the wars from 75mm to 105mm as the standard caliber for direct support of infantry, the Japanese stayed with 75mm throughout World War II. The standard divisional support gun was the 75mm type-90. It was introduced in 1930, but many units entered the war still equipped with the older type-38. The type-90 had a high muzzle velocity, which made it especially effective in an antitank role. The 75mm type-94 mountain gun was also widely used in the jungle as pack artillery. Weighing just 1,181 pounds, it could be carried by 18 men and assembled and laid for firing in about 10 minutes.

The Japanese also had an infantry gun. The 70mm type-92 battalion gun weighed only 450 pounds, but its range was only about one-third that of the type-94 mountain gun.

Japanese general support guns included the 105mm type-91 howitzer and the 105mm type-92 gun, introduced in 1931 and 1932, respectively. Both guns fired the same basic projectile, but the far heavier type-92 had almost twice the range. With a range of 11.3 miles, the type-92 could throw a 35-

pound shell farther than most other artillery pieces of World War II. The Japanese medium artillery battalions were armed with either the 149mm type-96 howitzer or the 149mm type-89 gun. Despite weighing almost three times as much as the 105mm type-92 gun, the 150mm type-89 gun had a range only 0.9 miles greater. The largest Japanese artillery piece of the war was the 240mm type-45 howitzer. An elderly pre–World War I design, it was most effective as a coastal defense gun.

With Japan's overwhelming emphasis on the infantry attack, the Japanese entered World War II without adequate industrial resources for large-scale artillery production and maintenance. Their production facilities were not tooled for standardized production and the mass production of interchangeable parts. Thus, the Japanese Army was always chronically short of artillery, and it had trouble keeping what it did have in service.

Aruga Kosaku (1897–1945)

Japanese Navy officer. Born on August 31, 1897, in Nagano Prefecture, Aruga Kosaku became a career naval officer. He specialized in surface warfare, especially in destroyers. In 1923, he graduated from the advanced course at the Torpedo School, and during the next decade he served in light cruisers. He was promoted to captain in November 1940.

By the beginning of World War II, Aruga was commanding Destroyer Division 4. Aruga's destroyers screened Vice Admiral Nagumo Chūichi's 1st Carrier Strike Force in the June 3–6, 1942, Battle of Midway. Two months later, Aruga's Destroyer Division 4 participated in the Battle of the Eastern Solomons, screening Admiral Abe Hiroaki's Vanguard Group.

In March 1943, Aruga took command of the cruiser *Chokai.* In July 1944, he was appointed head of the Torpedo School. On November 25, 1944, Aruga, now a rear admiral, assumed command of the battleship *Yamato.* That ship's war record had been undistinguished, and as flagship of the Combined Fleet it had often been kept far from the action. The *Yamato* had been damaged by a torpedo from the American submarine *Skate* on December 25, 1943, and its only surface action had been in the battle off Samar in October 1944 against American escort carriers.

On April 1, 1945, U.S. forces landed on Okinawa. Taunted by his army counterpart that the *Yamato* was a floating hotel for idle and inept admirals, commander of the Combined Fleet Admiral Toyoda Soemu drafted orders for Operation ICHI-TEN. The *Yamato* was provided sufficient fuel for a one-way trip to Okinawa. Escorted by a light cruiser and eight destroyers, the *Yamato* was to draw off American carrier planes, leaving the American fleet vulnerable to a mass attack by kamikazes. The *Yamato* would then destroy the American transports off Okinawa and beach itself to serve as an unsinkable fortress, with most of its crew joining the fighting on land.

When the task force commanders learned of the orders, they protested. Although they were willing to die for Japan, they did not believe that the plan would produce significant results. They wanted instead to attack U.S. lines of communication. When Second Fleet commander Vice Admiral Itō Seiichi, who took command of the operation aboard the *Yamato,* refused to change the orders, Aruga and the other commanders accepted their fate. Aruga was heard to state, "What a glorious way to die!"

The *Yamato* sortied on the afternoon of April 6. Naval cadets and ill sailors were landed before departure. U.S. forces located the *Yamato* early the

next morning and pounded it with waves of carrier planes. The ship was hit by at least 7 bombs and 11–15 torpedoes. When flooding caused a serious list to port, Aruga ordered counterflooding, although many men were trapped belowdecks. By 2:00 p.m., Aruga realized that the end was near. He ordered that Emperor Hirohito's portrait be saved and had himself tied to the compass mounting to avoid surviving the sinking of his ship. At 2:23 p.m., the *Yamato* rolled onto an even keel and exploded. Aruga and Itō were not among the 269 survivors of the *Yamato*'s 2,767-man crew. Aruga was posthumously promoted to vice admiral.

Asaka Yasuhiko (1887–1981)

Japanese Army general and prince. Born on October 2, 1887, in Kyoto, Japan, Asaka Yasuhiko was the uncle-in-law of Emperor Hirohito. Commissioned a sublieutenant in the army on graduation from the Military Academy in 1908, Asaka graduated from the Army Staff College in 1914. In the early 1920s, he spent time in France studying European military establishments.

Asaka was promoted to colonel in 1925 and to major general in 1930. He then taught at the Staff College. In 1933, he received a further promotion to lieutenant general and assumed command of the Imperial Guards Division.

Asaka became a member of the Supreme War Council in 1935, using his influence as a member of the imperial family to further the interests of the military faction in the Japanese government.

As the Sino-Japanese conflict in Manchuria escalated in November 1937, Asaka was assigned as deputy commander of the Center China Area Army Group, which was driving on the then Chinese Guomindang (GMD, Nationalist) capital of Nanjing (Nanking). The commander, General Matsui Iwane, became ill, and as a result Asaka led the final assault, ending in the capture of Nanjing on December 13, 1937. In the ensuing weeks, Japanese troops under Asaka's command committed atrocities against Chinese civilians and soldiers. This event, known as the "rape of Nanjing," was reported to the world by foreign correspondents. Asaka returned to Japan and was promoted to full general in 1939. He held no further field commands.

After the war Asaka was questioned by U.S. investigators, but as a relative of the emperor he was not charged with war crimes. In his later years, he was well-known in Japan for his interest in golf. Asaka died on April 13, 1981, at Atami.

Athenia, SS, Sinking of (September 3, 1939)

The passenger liner SS *Athenia* was the first British ship sunk by Germany in World War II. Launched at Govan, Scotland, in 1923 and owned after 1935 by the Donaldson Atlantic Line Ltd., the *Athenia* displaced 13,465 tons and was 536 feet 4 inches in overall length with a beam of 66 feet 5 inches. The ship was regularly employed in the transatlantic run between either Liverpool or Glasgow and Quebec and Montreal.

On September 1, 1939, the day that Germany invaded Poland, the *Athenia* sailed from Glasgow for Montreal. Commanded by Captain James Cook, it had a crew of 315 and was carrying 1,103 passengers, more than 300 of whom were Americans. Britain and France declared war on Germany on September 3. That same afternoon, the *Athenia* was steaming near the Hebrides Islands off Scotland's west coast when it was spotted and then tracked for three hours by the German submarine *U-30*, commanded by Senior Lieutenant Fritz-Julius Lemp. The attack occurred at 7:40 p.m. without warning, despite German chancellor Adolf Hitler's instructions that U-boat commanders follow the Hague Conventions. Lemp later claimed that because the ship was darkened and zigzagging, he assumed it was a troop transport or a disguised Q-ship or auxiliary cruiser.

Two torpedoes struck the *Athenia*, only one of which exploded. The ship soon began to settle by the stern, although it did not sink for 14 hours, until 10:40 a.m. on September 4. Seven ships, including three British destroyers, raced to the scene and rescued survivors. Of 117 people who perished (98 passengers and 19 crew members) in the torpedo explosion and the subsequent evacuation, 28 were Americans.

The sinking of the *Athenia* was reported in newspaper headlines throughout the English-speaking world. It certainly exacerbated anti-German sentiment in the neutral United States. Berlin claimed that the British had sunk the *Athenia* themselves to win U.S. sympathy.

Atlantic, Battle of the

The Battle of the Atlantic was the longest campaign of World War II. In it, the German Navy tried to sever the Allied sea lines of communication along

which supplies necessary to fight the war were sent to Great Britain. To carry out the battle, the Germans employed a few surface raiders and long-range aircraft, but principally they used U-boats.

At the beginning of the war, the German Navy possessed not the 300 U-boats deemed necessary by Commodore Karl Dönitz (he was promoted to rear admiral in October 1939) but 57 boats, of which only 27 could reach the Atlantic from their home bases. Although an extensive building program was immediately begun, only in the second half of 1941 did U-boat numbers begin to rise.

On the Allied side, Royal Navy leaders were at first confident that their asdic (acronym for Allied Submarine Detection Investigating Committee) location device would enable their escort vessels to defend the supply convoys against the submerged attackers so that shipping losses might be limited until new merchant ships built by Britain, Canada, and the United States could settle the balance. Dönitz planned to concentrate groups of U-boats (called wolf packs by the Allies) against the convoys to permit attacks by multiple submarines on the surface at night. It took time, however, before the battles of the convoys really began. The Battle of the Atlantic became a running match between numbers of German U-boats and the development of their weapons against the Allied merchant ships, their sea and air escorts (with improving detection equipment), and new weapons.

The Battle of the Atlantic can be subdivided into eight phases. During the first of these, from September 1939 to June 1940, a small number of U-boats, seldom more than 10 at a time, made individual cruises west of the British Isles and into the Bay of Biscay to intercept Allied merchant ships. Generally, these operated independently because the convoy system, which the British Admiralty had planned before the war, was slow to take shape. Thus, the U-boats found targets, attacking at first according to prize rules by identifying the ship and providing for the safety of its crew. When Britain armed its merchant ships, however, the German submarines increasingly struck without warning.

Dönitz’s plan to counter the convoy system with group or pack operations of U-boats—also developed and tested before the war—was put on trial in October and November 1939 and in February 1940. The results confirmed the possibility of vectoring a group of U-boats to a convoy by radio signals from whichever U-boat first sighted the convoy. At this time, though, the

insufficient numbers of U-boats available and frequent torpedo failures prevented real successes.

The German conquest of Norway and western France provided the U-boats with new bases much closer to the main operational area off the Western Approaches and brought about a second phase from July 1940 to May 1941. During this time the U-boats, operating in groups, were directed by radio signals from the shore against the convoys, in which were now concentrated most of the maritime traffic to and from Great Britain. Even if the number of U-boats in the operational area still did not rise to more than 10 at a time, peak efficiency was attained in terms of the relationship between tonnage sunk and U-boat days at sea.

This was made possible partly by the weakness of the convoy escort groups—because the Royal Navy held back destroyers to guard against an expected German invasion of Britain and maintained large forces in the Mediterranean to offset the loss of the French navy. In addition, British merchant shipping losses were increased during this phase by the operations of German surface warships in the North and Central Atlantic; by armed merchant raiders in the Atlantic, Pacific, and Indian Oceans; by the attacks of German long-range bombers against the Western Approaches; and by heavy German air attacks against British harbors. The Germans were also aided by Italian submarines based at Bordeaux and sent into the Atlantic, the numbers of which in early 1941 actually surpassed the number of German U-boats.

In late 1940 and the spring of 1941, when the danger of an invasion of the British Isles had receded, London released destroyers for antisubmarine operations and redeployed Coastal Command aircraft to support the convoys off the Western Approaches. Thus, in the third phase of the Battle of the Atlantic, from May to December 1941, the U-boats were forced to operate at greater distances from shore. Long lines of U-boats patrolled across the convoy routes to intercept supply ships. This forced the British, in June, to begin escorting their convoys along the whole route from Newfoundland to the Western Approaches and—when the U-boats began to cruise off West Africa—the route from Freetown to Gibraltar and the United Kingdom as well.

In March 1941, the Allies captured cipher materials from a German patrol vessel. Then on May 7, 1941, the Royal Navy succeeded in capturing the German Arctic meteorological vessel *München* and seizing its Enigma

machine intact. Settings secured from this encoding machine enabled the Royal Navy to read June U-boat radio traffic practically currently. On May 9 during a convoy battle, the British destroyer *Bulldog* captured the German submarine *U-110* and secured the settings for the high-grade officer-only German naval signals. The capture on June 28 of a second German weather ship, the *Lauenburg*, enabled British decryption operations at Bletchley Park to read July German home-waters radio traffic currently.

This led to interception of German supply ships in the Atlantic and cessation of German surface ship operations in the Atlantic. Beginning in August 1941, Bletchley Park operatives could decrypt signals between the commander of U-boats and his U-boats at sea. The Allies were thus able to reroute convoys and save perhaps 1.5 million gross tons of shipping. During this third phase, the U.S. Atlantic Fleet was first involved in the battle.

The entry of the United States into the war ushered in the fourth phase of the battle, presenting the U-boats with a second golden opportunity from January to July 1942. Attacking unescorted individual ships off the U.S. East Coast, in the Gulf of Mexico, and in the Caribbean, German U-boats sank greater tonnages than during any other period of the war.

Officers on the bridge of a U.S. destroyer, part of the escort element of a large convoy of ships, keep a sharp lookout for German submarines, ca. 1942. (Library of Congress)

Sightings and sinkings off the U.S. East Coast dropped off sharply after the introduction of the interlocking convoy system there though, and Dönitz found operations by individual U-boats in such distant waters uneconomical. Thus, in July 1942 he switched the U-boats back to the North Atlantic convoy route. This began the fifth phase, which lasted until May 1943, and proved to be the decisive period of the conflict between the U-boat groups and the convoys with their sea and air escorts. Increasingly, the battle was influenced by technical innovations. Most important in this regard were efforts on both sides in the field of signals intelligence.

On February 1, 1942, the Germans had introduced their new M4 cipher machine, leading to a blackout in decryption that lasted until the end of December 1942. This accomplishment was of limited influence during the fourth phase because the German U-boats operated individually, and there was no great signal traffic in the operational areas. When the convoy battles began again, the Germans could at first decrypt Allied convoy signals.

When Bletchley Park was able to decrypt German signals anew, rerouting convoys again became possible, although this was at first limited by rising numbers of German U-boats in patrol lines. In March 1943, the U-boats achieved their greatest successes against the convoys, and the entire convoy system—the backbone of the Allied strategy against “Fortress Europe”—seemed in jeopardy. But now Allied decryption allowed the dispatch of additional surface and air escorts to support threatened convoys. This development, in connection with the introduction of new weapons and high-frequency direction finding, led to the collapse of the U-boat offensive against the convoys only eight weeks later, in May 1943.

This collapse came as a surprise to Dönitz. Allied success could be attributed mainly to the provision of centimetric radar equipment for the sea and air escorts and the closing of the air gap in the North Atlantic. In a sixth (intermediate) phase from June to August 1943, the U-boats were sent to distant areas where the antisubmarine forces were weak, while the Allied air forces tried to block the U-boat transit routes across the Bay of Biscay.

The change to a new Allied convoy cipher in June, which the German decryption service could not break, made it more difficult for the U-boats to

locate the convoys in the seventh phase, from September 1943 to June 1944. During this time, the German U-boat command tried to deploy new weapons (acoustic torpedoes and increased antiaircraft armament) and new equipment (radar warning sets) to force again a decision with the convoys, first in the North Atlantic and then on the Gibraltar routes. After short-lived success, these operations failed and tapered off as the Germans tried to pin down Allied forces until new revolutionary U-boat types became available for operational deployment.

The eighth and final phase, from June 1944 to May 1945, began with the Allied invasion of Normandy. The U-boats, now equipped with snorkel breathing masts, endeavored to attack individual supply ships in the shallow waters of the English Channel and in British and Canadian coastal waters. The U-boats' mission was to pin down Allied supply traffic and antisubmarine forces to prevent the deployment of warships in offensive roles against German-occupied areas. Construction of the new U-boats (of which the Allies received information by decrypting reports sent to Tokyo by the Japanese embassy in Berlin) was delayed by the Allied bombing offensive, however, and the German land defenses collapsed before significant numbers of these boats were ready.

The Battle of the Atlantic lasted without interruption for 69 months, during which time German U-boats sank 2,850 Allied and neutral merchant ships, 2,520 of them in the Atlantic and Indian Oceans. The U-boats also sank many warships, from aircraft carriers to destroyers, frigates, corvettes, and other antisubmarine vessels. The Germans lost in turn the battleship *Bismarck*, the pocket battleship *Graf Spee*, some armed merchant raiders, and 650 U-boats, 522 of them in the Atlantic and Indian Oceans.

The Allied victory in the Battle of the Atlantic resulted from the vastly superior resources on the Allied side in shipbuilding and aircraft production (the ability to replace lost ships and aircraft) and from superior antisubmarine detection equipment and weapons. Allied signals intelligence was critical to the victory.

Atlantic Charter (August 14, 1941)

Declaration of Allied goals for the postwar world agreed upon between leaders of the United States and the United Kingdom that served as the basis for the United Nations Declaration. The conference that produced the Atlantic Charter was the first face-to-face meeting between U.S. president Franklin D. Roosevelt and British prime minister Winston L. S. Churchill. The meeting was critical because it marked the beginning of an extraordinarily close relationship between the two men, and it also demonstrated to the British that the United States would likely enter the war sooner rather than later. The conference occurred almost four months prior to the attack on Pearl Harbor that would bring the Americans into the war against the Axis powers.

Arranged by Roosevelt, the Atlantic Charter meeting took place in Placentia Bay, Newfoundland. Roosevelt had put out on the presidential yacht *Potomac* under cover of a vacation, and he then transferred secretly to the cruiser *Augusta.* Churchill traveled across the Atlantic in the battleship *Prince of Wales.* The two leaders and their staffs (including all service chiefs

of each side) met aboard these ships beginning on August 9 for four days. Topics of discussion included Lend-Lease aid, common defense issues, and a strong joint policy against Japanese expansion in the Far East. Almost as an afterthought, the meetings produced a press release on August 14, 1941, that came to be known as the Atlantic Charter.

The Atlantic Charter had eight main points: (1) the eschewing of any territorial aggrandizement for their countries, (2) opposition to territorial changes without the freely expressed consent of the peoples involved, (3) the right of all peoples to choose their own forms of government and determination to restore freedom to those peoples who had been deprived of it, (4) free access for all nations to the world's trade and raw materials, (5) international cooperation to improve living standards and to ensure economic prosperity and social security, (6) a lasting peace that would allow peoples everywhere to "live out their lives in freedom from fear and want," (7) freedom of the seas, and (8) disarmament of the aggressor states "pending the establishment of a wider and permanent system of general security."

Winston Churchill and Franklin Roosevelt aboard the British battleship *Prince of Wales*, August 14, 1941. The meeting aboard the British ship led to the Atlantic Charter. (National Archives)

Although there was no formally signed copy of the Atlantic Charter—only the press release containing the eight guiding principles—these principles had the same appeal as President Woodrow Wilson's Fourteen

Points of January 1918. Certainly the talks strengthened the bonds between the United States and Britain. Isolationists in the United States denounced the charter for the determination it expressed to bring about "the final destruction of the Nazi tyranny." The government of the Soviet Union later announced its support for the charter's principles, but even at this early stage in the war there were sharp differences between the Anglo-Saxon powers and the Soviet Union over what the postwar world should look like.

The Atlantic Charter subsequently formed the basis of the United Nations Declaration issued on January 1, 1942, one of the results of the December 22, 1941–January 14, 1943, Arcadia Conference.

Atlantic Wall

German defenses along the European coast, last of the great defensive lines to be built (1941–1944). As German plans to invade Britain faded late in 1940, it became clear to the German high command that thousands of miles of European coast had to be defended from possible Allied invasion. The German submarine bases in France, the occupied Channel Islands, and the Dover-Calais narrow point in the English Channel were heavily protected from the beginning. Following the June 1941 invasion of Russia and the U.S.

entry into the war in December 1941, Germany went on the defensive in the west. Formal work on the Atlantic Wall began in May 1942.

There never was a continuous wall per se. That would have been impossible to build or man. What was built was a series of defended zones—artillery and infantry positions overlooking likely invasion beaches and ports. Rivalries and different designs among army and navy units and civilian construction battalions often held up progress, as did strategic arguments about the comparative value of fixed defenses versus mobile reserves. So did Allied bombing of transport of construction materials. The three-year effort by Germany was massive nevertheless, involving huge quantities of men, money, and material.

Thousands of emplacements were built along the coast of France, with lesser facilities in the Low Countries, Denmark, and along the Norwegian coast. Where possible, existing fortifications and weapons were used. Highlights of the wall were the often extensive artillery batteries built into extensive steel-reinforced cement casemates designed to deflect air attacks. A typical position might include four separate 8-inch gun casemates (which, while protecting the gun and its crew, also limited the weapon's field of fire) plus one or more observation and combat-direction posts, all built close to the coastline. The largest positions might feature mobile 14-inch railway-mounted artillery or huge turret-mounted guns. Some of the latter, installed in massive emplacements built near the French coast, could actually shell England directly across the Channel.

Among German defenses were scores of smaller emplacements for machine guns, observation, personnel, command posts, and minefields. Some were camouflaged to look like houses or other structures, and most were at least partly built into the ground for further protection. A large number of so-called standard bunker designs were employed, although each service had its own set of standards. Extensive propaganda made the wall seem impregnable.

When placed in command of German beach defenses in October 1943, Field Marshal Erwin Rommel made the high-tide mark into the main line of defense, adding obstacles and intervening emplacements covering possible landing points. There were half a million beach obstacles along the English Channel alone, many armed with mines. In the end, the stupendous construction project was largely for naught. Although two-thirds of a planned

15,000 emplacements were completed, few of them fired in anger. D-day (June 6, 1944) was hardly hindered by the several emplacements in Normandy (some were shelled from the sea, and others were taken by paratroopers or special ranger attacks, as at Pointe du Hoc), and the rest of the coastal forts were generally captured from behind by advancing Allied forces. Extensive remains of the Atlantic Wall exist to this day.

Atlantis, KMS

The 7,862-ton *Atlantis* was the most successful of nine armed merchant cruisers deployed by the Germans in World War II. Launched as the freighter *Goldenfels* on December 16, 1937, the ship was refitted in the fall of 1939 and commissioned on December 19, 1939. Commanded by Captain Bernhard Rogge, the *Atlantis* sank or captured Allied 22 ships, for a total of 145,698 tons, during its 622 days at sea.

The *Goldenfels* was transformed into an armed merchant cruiser by the addition of six 150mm guns, one 75mm warning gun, two 37mm twin antiaircraft guns, and four 20mm automatic guns as well as torpedo tubes, mines, and two patrol aircraft. The ship sailed from Germany in March 1940, reaching its operating area in the South Atlantic, the Indian Ocean, and the South Pacific by the end of April. Designated as Ship 16 by the Germans and

Raider C by the British, the *Atlantis* preyed on British shipping under a variety of names, flags, and disguises between May 1940 and November 1941. In accordance with prize regulations, Rogge attempted to pick up the survivors of his attacks when possible, earning him a reputation as a fair opponent.

In the late summer of 1940, a British War Cabinet report suggested that no reinforcements would go to the Far East if a war developed there. Hong Kong, Malaya, Singapore, and the Dutch East Indies were all regarded as indefensible. Churchill decided not to tell the Australian and New Zealand governments, but he did send a copy to the British commander in the Far East, Air Chief Marshal Sir Robert Brooke-Popham. The report went out in a weighted bag at the end of September on the steamer *Automedon*, which was captured on November 11, 1940, by the *Atlantis.* The boarding party blew the master's safe and secured the document. Rogge then headed for Japan without delay, arriving there on December 4. The naval attaché, Vice Admiral Paul Wennecker, immediately telegraphed a four-page cipher summary to Berlin. German chancellor Adolf Hitler, calling it of the "utmost importance," ordered it turned over to the Japanese. One authority has said, "By any standard, it was one of the worst intelligence disasters in history."

On November 22, 1941, the British cruiser *Devonshire* located and destroyed the *Atlantis* while the ship was transferring supplies to the submarines *U-68* and *U-126* in the South Atlantic. Rogge and most of his crew were picked up by the U-boats and reached Saint-Nazaire after a series of mishaps. Rogge and his adjutant, Ulrich Mohr, both survived the war to write about their experiences.

Atomic Bomb, Decision to Employ

Although there were extensive consultations about the employment of the atomic bomb, discussions always focused on how to use the new weapon, not whether to use it. Its employment was a natural extension of bombing tactics already in use, including the firebombing of German and Japanese cities in which civilians were killed by the many thousands.

Intelligence reports had shown that Nazi Germany was working furiously to develop an atomic weapon, so during the first years of the top-secret Manhattan Project, military planners assumed that an American-made bomb would be used against the Germans. Germany surrendered, however, before the U.S. bomb could be successfully tested. In the spring and summer of 1945, the primary aim of Allied decision makers was to achieve the unconditional surrender of Japan as quickly as possible at the lowest cost in lives, and everyone of importance assumed that if the Manhattan Project could produce a workable weapon, that weapon would be expended against an enemy target.

It could be argued that the decision to use the atomic bomb was made on December 6, 1941, when the first funds were approved for its development. At the time, American leaders assumed that the new invention would be a legitimate weapon in the war, and they never questioned that assumption afterward.

Although President Franklin D. Roosevelt’s key advisers on the project concluded in May 1943 that the first operational bomb should be dropped on Japan, the choice of targets really did not receive systematic attention until two years later. A special Target Committee for the Manhattan Project began meeting in April 1945, and by the next month it had a shortlist of cities including Kyoto and Hiroshima. On May 31, a blue-ribbon Interim Committee appointed by Secretary of War Henry L. Stimson began meeting to discuss how best to use the new weapon. A suggestion made at lunch to try a warning and noncombat demonstration was quickly rejected. First, if a demonstration detonation failed, the United States and the Allies would be deeply embarrassed; it might also have served to stiffen Japanese resolve rather than forcing surrender. Second, at the time, there were only two or

three bombs under development; if one failed or did not impress the Japanese, that left only one or two bombs in the American arsenal. The committee thus recommended that the bomb be dropped without warning on a target that would make the largest possible psychological impression on as many inhabitants as possible.

On July 16, 1945, the United States successfully detonated the world's first atomic bomb in the desert near Alamogordo, New Mexico. Eventually, military planners came up with a target list of Hiroshima, Kokura, Kyoto, and Nigata. Stimson persuaded the planners to substitute Nagasaki for the shrine city of Kyoto and then presented the list to President Harry S. Truman in late July.

Truman approved the directive without consulting anyone and wrote in his diary that the bomb would be used between July 25 and August 10. The new weapon offered the possibility of ending the war sooner, and he had no compelling reason not to employ it. Despite some historians' claims to the contrary, there was no reliable evidence of any imminent Japanese collapse or surrender. Although some leaders did perceive a display of the atomic bomb's power as a potential tool to intimidate the Soviet Union in the future, this was a secondary benefit of its employment and not a factor in operational decisions.

No single government document shows Truman's decision to use the bomb, but there were two relevant military directives from the Joint Chiefs to the U.S. Army Air Forces. The first, to General Henry "Hap" Arnold on July 24, designated the four possible targets. The next day, a similar order to General Carl Spaatz, who was commanding strategic air forces in the Pacific, added a date: "after about August 3, 1945." That document also directed that other bombs were to be delivered against targets as soon as they were ready. On the basis of these orders, Spaatz selected Hiroshima and then Kokura to be the targets for the first and second atomic missions. Cloud cover on the day of the second raid caused the shift to the secondary target of Nagasaki.

Some critics have questioned why there was not more deliberation about whether to use the terrible new weapon. The main concern for decision makers was to win the war quickly while avoiding a costly invasion of the Japanese mainland or losing public support for unconditional surrender. Under the conditions in 1945, which had already produced fire raids that had killed far more Japanese civilians than did the attacks on Hiroshima and

Nagasaki, no U.S. president or general could have failed to employ the atomic bomb.

Attlee, Clement Richard (1883–1967)

British politician, leader of the Labour Party and deputy leader of the House of Commons, and prime minister (1945–1951). Born on January on 3, 1883, in the Putney part of London, Clement Attlee was educated at University College, Oxford. He initially practiced law, but after working with the poor in London's East Side, he joined the Labour Party in 1907, living in a settlement house until 1922 (except during World War I). He served as a lecturer at the London School of Economics. During World War I, Attlee rose to the rank of major and served at Gallipoli and in the Middle East and later on the Western Front.

Elected to Parliament in October 1922, Attlee held various minor posts in Labour and national governments. He became the head of the Labour Party in 1935 as a compromise candidate, a middle-of-the-road democratic socialist. Attlee and a growing proportion of his party agreed with Winston L. S.

Churchill’s call for faster rearmament in the face of the threat from Nazi Germany.

Refusing to serve under Neville Chamberlain, Attlee helped to bring about Winston Churchill’s government during the crisis of May 1940, when Chamberlain was forced to resign. On May 10, Churchill named Attlee lord privy seal (he served to 1942) and deputy leader of the House of Commons (effectively deputy prime minister), a position he held from 1942 to 1945. Attlee often chaired cabinet sessions during Churchill’s constant travels, and he remained loyal to Churchill throughout the war.

British Labor Party leader Clement Attlee. Prime minister during 1945–1951, he had to deal with a number of major challenges confronting his country. (Library of Congress)

Attlee worked closely with fellow Labourite Aneurin Bevin to develop the 1943 white paper on postwar social plans. He was renowned for his ability to remain calm in a crisis, outline major positions in few words, and

make hard decisions. Pressed by his party, however, he led Labour out of the national coalition in May 1945 after the defeat of Germany (there had not been a general election for a decade). This led to national elections in which Labour won a resounding victory, and Attlee became prime minister on July 26, 1945. He replaced Churchill as the British representative for the remainder of the July 17–August 2 Potsdam Conference.

Attlee presided until October 1951 over creation of the British welfare state with its nationalization of health services, steel, coal, railways, and civil aviation. He supervised the granting of independence to India and Pakistan on August 14, 1947, a key step in converting the British Empire to the Commonwealth of Nations. He also dispatched British troops to the 1950–1953 Korean War and was instrumental in the decision to permit the Federal Republic of Germany to rearm as the Cold War deepened in the early 1950s. On retiring as party leader, he was made an earl in 1955. He spoke often in the House of Lords against Britain becoming part of the Common Market. Attlee died in Westminster, London, on October 8, 1967.

Auboyneau, Philippe Marie Joseph Raymond (1899–1961)

French Navy admiral. Born in Constantinople (Istanbul) in the Ottoman Empire on November 9, 1899, Philippe Auboyneau graduated from the École

Navale in 1918. Between the wars, he attended the French War College and commanded a torpedo boat. He was promoted to commander in December 1939, and when World War II began, he was in the Far East serving as French liaison officer to British forces based at Colombo, Ceylon. After Germany invaded France in May 1940, Auboyneau was reassigned to the Mediterranean as liaison officer to British Mediterranean forces under Admiral Sir Andrew Browne Cunningham.

Three months later, Auboyneau chose to follow Brigadier General Charles de Gaulle and joined the Free French in London. There Auboyneau took charge of the 1st "Fighting French" Destroyer Division. Promoted to captain in November 1941, in March 1942 he became commander of all Free French naval forces, and he also headed naval representation on the Council of National Liberation.

In November 1942 shortly after the Allied landings in North Africa, Auboyneau moved to Algiers with most of the Free French leaders, becoming deputy chief of the French General Staff. In January 1943, he was promoted to rear admiral. In July 1944, Auboyneau directed the 3rd Cruiser Division in Operation DRAGOON, the Allied invasion of southern France.

Auboyneau was promoted to vice admiral in command of French naval forces in the Far East in September 1945, and he held the position for two years during the Indochina War. In August 1955, he became commander in chief of French naval forces in the Mediterranean based in Algiers. He received promotion to full admiral in December 1957 and directed French naval operations for five years during the Algerian War. Auboyneau retired in December 1960 and died in Paris on February 22, 1961.

Auchinleck, Sir Claude John Eyre (1884–1981)

British Army general. Born at Aldershot, England, on June 21, 1884, Claude Auchinleck, known as “the Auk,” graduated from the Royal Military Academy of Sandhurst in 1902. He saw extensive service in India and Tibet (1904–1912), in the Middle East (1914–1919), and in India again (1929–1940). In 1930, he was promoted to colonel; three years later he was appointed a temporary brigadier. He became a major general in November 1935.

Auchinleck returned to England in January 1940, expecting to prepare British units for action in France. Instead, he was sent on May 7, 1940, to command British forces in Narvik in the disastrous Norwegian Campaign, which suffered from lack of air cover and inadequate forces and equipment. Just after Britain’s evacuation of Norway, on June 14, 1940, Auchinleck took over the Southern Command to prepare for a possible German invasion. In this role, he worked effectively to improve the Home Guard.

As fears of invasion receded, Auchinleck was promoted to general and sent to India as commander in chief on November 21, 1940. British officials charged him with controlling pressures for independence while overseeing the training of Indian units for Allied use elsewhere.

Prime Minister Winston L. S. Churchill called on Auchin-leck to take the same role in the critical Middle East theater (June 21, 1941), replacing Archibald Wavell. While in Egypt, Auchinleck came under constant pressure from Churchill to undertake aggressive action against General of Panzer Troops Erwin Rommel’s Afrika Korps. Auchinleck countered that he first had to train his force and overcome the difficulties of having inadequate supplies and armaments. Auchinleck began his offensive, Operation CRUSADER, against Libya on November 18, 1941, but it suffered from the weakness of Eighth Army commander Lieutenant General Alan Cunningham. That effort would end on December 30. Auchinleck replaced Cunningham with Major General Neil Ritchie, and for a time the offensive went well. Rommel struck back, though, leading to the fall of Tobruk on June 21, 1942, when more than 30,000 men were taken prisoner.

Auchinleck then took direct control of the Eighth Army and stabilized his line at the First Battle of El Alamein (October 23–November 4) later that month, thus saving Egypt. Churchill, impatient for success from a more aggressive commander, nevertheless relieved him of command on August 5, 1942. Damning reports from Lieutenant General Bernard Montgomery about Auchinleck surely greased the skids.

Turning down a proffered command in Syria and Iraq, Auchinleck returned to India as commander in chief of the army there (June 18, 1943–14 August 1947). He was made a field marshal in June 1946, refusing a peerage a year later (he did not wish to be honored for helping to divide India and Pakistan, a result he abhorred). Auchinleck retired in 1967 to live in Marrakesh, Morocco, and died there on March 23, 1981.

Aung San, U (ca. 1915–1947)

Burmese Army general and nationalist leader. Born in Natmauk in the Magwe district of Myramir (Burma, today Myanmar), U Aung San's date of birth is obscure but was possibly February 13, 1915. As a young man, Aung was active in student politics, and in 1936 he and U Nu led a student strike. Aung graduated from Rangoon University (now the University of Yangon) in 1938 and became involved with the Dohbama Asiayone, a Burmese

nationalist organization that sought to obtain independence from Britain. His activities aroused the suspicion of British authorities, who sought to arrest him in 1940.

Aung fled first to China and then to Tokyo, where he arranged with the Japanese to create a military force known as the Burmese Independence Army (BIA) to aid the Japanese in their impending invasion of Burma. During the actual battle, which began with the invasion on December 14, 1941, and continued into the next summer, Aung's BIA provided the Japanese with intelligence and logistical support. Aung received the rank of major general in the Japanese Army.

Japanese forces overran Rangoon (now Yangon) in March 1942. In August 1943 Japan gave Burma nominal independence, and Aung served in the new government as minister of defense. He soon became disillusioned with the Japanese military government, and in August 1944 he formed the Anti-Fascist League of Burma and secretly worked against the Japanese. On March 27, 1945, as Allied forces advanced into Burma, his army switched sides and joined the British.

Allied forces captured Rangoon in June 1945. When the Japanese surrendered in August, Aung began negotiations with the British for Burmese independence, his true goal. This effort culminated in an agreement between British prime minister Clement Attlee and Aung on January 27, 1947, that promised an independent Burma in one year. Facing communist opposition, Aung's party won a large majority in the April 1947 elections.

On July 19, 1947, Aung was assassinated in Rangoon along with six other political leaders. U Saw, Aung's rival for power, was blamed for the assassination. Aung's daughter, Aung San Suu Kyi, is a major political figure and a member of the National League for Democracy in Burma. She was awarded the Nobel Peace Prize in 1991 and was elected a member of parliament on April 1, 2012.

Auphan, Paul Gabriel (1894–1982)

French Navy admiral. Born on November 4, 1894, at Alès, Gard, France, Paul Gabriel Auphan entered the French Naval Academy in 1911. He served in the World War I Dardanelles Campaign and in a submarine. Between the wars, he commanded submarines, destroyers, a cruiser, and a naval school ship.

Auphan was deputy commander of the Naval Academy at Brest and studied at the Naval War College. He was promoted to rear admiral in March 1931. As a vice admiral in 1936, he commanded the French Mediterranean Squadron (1936–1938) before becoming maritime prefect at Toulon. Known for administrative rather than seagoing skills, in September 1939 Auphan, a protégé of French Navy commander in chief Admiral Jean Darlan, became naval deputy chief of staff. The day before Franco-German armistice negotiations began in June 1940, Darlan and Auphan promised the British that they would never permit Adolf Hitler to control the French fleet, even if this meant scuttling it.

In July 1940 after the armistice, Auphan became director of the French merchant marine. In September 1941, he was named chief of the naval General Staff, a position to which in April 1942 he added that of secretary of the navy in the Vichy government. Auphan's defenders later claimed that he only accepted these posts to ensure the fleet's continued freedom from German control.

Both before and after the November 1942 Allied invasion of North Africa, Auphan and former French supreme commander General Maxime Weygand pressed Marshal Henri Pétain, head of the Vichy government, to support the Allies openly. After the Allied landings on November 8, 1942, Auphan and Weygand urged Pétain to accept the North African cease-fire with the Allies that Darlan, then in Algiers, had negotiated. At the insistence of collaborationist French premier Pierre Laval, Pétain initially condemned Darlan's negotiated cease-fire, but Auphan persuaded Pétain to reverse this stand. On November 10, 1942, Auphan sent a telegram legitimizing Darlan's

accord with U.S. Army lieutenant general Mark W. Clark. Auphan hoped to arrest Laval but could not obtain Pétain's authorization and was the only minister to advocate a cease-fire agreement for all North Africa.

On November 11, Auphan ordered Admiral Jean de Laborde at Toulon to destroy the French fleet should German forces threaten the port. With Pétain's approval, on November 13 Auphan cabled Resident General Charles Noguès of Morocco to transfer to Darlan command of all North Africa. On November 18, Auphan resigned to protest Laval's assumption of full governmental powers.

On August 18, 1944, Pétain empowered Auphan to negotiate the transfer of power to the Free French leader Charles de Gaulle, a development that de Gaulle completely ignored. In September 1944, the new French government revoked Auphan's pension, and in August 1946, the French High Court sentenced him to lifetime imprisonment and forced labor for treason, including for having commanded the Toulon fleet's destruction. Released in January 1955, Auphan was rehabilitated in November 1956. He subsequently published extensively in naval and political history. Auphan died at Versailles (Yvelines Department) on April 6, 1982.

Australia

Australia played an important role in Allied operations in all theaters of World War II. Although its population was only about 7 million people, Australia constituted 3 million square miles of territory strategically located in the Southwest Pacific. The war, however, caught Australians unprepared. As with the other Commonwealth nations, Australia followed Britain's lead, and Prime Minister Robert Menzies announced a declaration of war on Germany on September 3, 1939.

The exuberance that had marked the nation's entry into war in 1914 was lacking in 1939. Australians remembered the heavy losses sustained in World War I. Many had suffered in the Great Depression, and ties with Britain had grown weaker. Initially, the nation's war effort was directed at supporting Britain in the European theater of operations. After Japan's entry into the war, though, Australia became the principal Allied staging point in the Pacific, and during the conflict Australians served in virtually every theater of war.

With 10 percent of its population unemployed, Australia could easily raise men for the war effort, but weapons and equipment were in desperately short supply. In 1939, Australian defense spending was only 1 percent of its gross national product (GNP). Not until 1942 did the level of Australian defense spending approach that of the other warring powers. In 1943–1944, Australia was spending 37 percent of GNP on the war effort, in large part from higher taxes and the sale of low-interest government bonds.

During the course of the war the Australian economy shifted to military production, and real industrial expansion was achieved. For example, during the conflict Australia produced 3,486 aircraft. Although new defense spending was concentrated on production of equipment, including guns, ammunition, aircraft, and ships, measures were also put in place to increase the reserves. The government introduced conscription but only for home service, which included assignments to Papua and the mandate of New Guinea. As part of the mobilization for war, industrialist Essington Lewis was placed in charge of the production of munitions, and newspaper publisher Keith Murdoch headed propaganda.

In October 1941, the Labour Party took power; John Curtin served as prime minister until his death in July 1945. Labour would govern Australia for the remainder of the war. The generally ambivalent popular attitude toward the war changed when Japan joined the conflict in December 1941.

The early widespread, rapid Japanese victories raised the possibility of an invasion of Australia itself. This led to more government controls over the economy, including the right for the government to order men and women to work in any occupation. Wages and prices were controlled, and rationing was introduced. The government also increased efforts at civilian defense and the improvement of coastal defenses.

An even greater blow for Australians was the February 1942 fall of Singapore and the loss of two brigades of the Australian 8th Division there. The Japanese raid on Darwin later that month—the first time since the arrival of Europeans in Australia that Australians had been killed on their own soil by an invader—caused great anxiety.

Curtin then called for the return of Australian troops and naval assets from the Mediterranean theater. Gradually, most of these forces were released. British prime minister Winston L. S. Churchill was loath to see so many fine fighting men lost at once from the North African theater, however, and he called on Washington to take up the slack. The United States then became Australia's chief ally. Many thousands of U.S. servicemen arrived in Australia. (Eventually some 10,000 Australian women married U.S. military personnel.) This influx required the construction of bases and facilities, creating an acute labor shortage and necessitating the discharge of some personnel from the Australia armed forces. Italian prisoners of war were also pressed into labor service.

The labor shortage was also the result of the extensive Australian armaments program, which included an indigenous tank—the excellent medium cruiser Sentinel—that entered production in 1943 and a large shipbuilding program that produced three destroyers and 56 corvettes, in addition to some 30,000 small craft and amphibious vehicles. Australian shipyards also repaired or refitted thousands of Australian and Allied ships. To alleviate labor shortages, women's auxiliary units were created for each branch of the military, and large numbers of women went to work in industrial occupations.

In March 1942, the Australian government agreed to the formation of the Southwest Pacific Command, with American general Douglas MacArthur as commander in chief and General Sir Thomas Blamey as the commander of land forces. Australia became the principal logistics base for Allied military actions, particularly in the campaigns in New Guinea and the Solomon

Islands. The Australian conscripts proved to be an embarrassment for the government. Under pressure from MacArthur, who believed that Americans were doing an unfair share of the fighting, the Curtin government secured in February 1943 what became known as the Militia Bill. It permitted deployment of conscripts overseas, although this was to be limited to the Southwest Pacific Area. In August 1943, the Australian Labour Party scored a resounding election victory.

Tensions developed (largely behind the scenes) between MacArthur and the Australian government and armed forces, especially given MacArthur's tendency to take personal credit for any successes and blame others for anything that went wrong. His disparaging attitude toward Australians notwithstanding, Australians distinguished themselves in every theater of war, including North Africa and the Mediterranean and also with the Royal Australian Air Force in Bomber Command. Australian troops scored important successes on the ground in New Guinea and Papua, and they also helped garrison Allied island conquests. In 1945, Australian troops led the invasions of Borneo and Tarakan. They were also in garrison on New Britain Island. The July 1945 invasion of Balikpapan was the largest amphibious operation undertaken by Australian forces during the war.

By the end of the fighting, 993,000 Australian men and women had served in the army, air force, and navy, and more than half of them had been deployed overseas. In addition, the nation had suffered 27,073 military dead (including prisoners of war who died in captivity) and 23,467 wounded. World War II had a profound effect on the Australian nation. During the conflict Australia established formal diplomatic ties with many more nations, and after the conflict it took pride in its place as a principal Pacific power. The war enhanced Australian relations with the United States but at the expense of existing ties with Great Britain.

Australia, Air Force

The Royal Australian Air Force (RAAF) played an important role in the Allied war effort. At the beginning of the conflict, the RAAF was a small ill-equipped but well-trained force of 3,489 personnel and 146 mostly obsolete aircraft. These included Anson bombers, flying boats, and the Australian Wirraway, essentially a training aircraft that proved totally inadequate as a fighter.

When the war began in September 1939, one squadron was en route to Great Britain to secure new aircraft. The Australian government released this squadron to serve with the Royal Air Force (RAF), which it did for the remainder of the war under the auspices of RAF Coastal Command. In this role, the Australian squadron was responsible for sinking six enemy submarines. Other squadrons served under the RAF in the Middle East and in the Italian campaigns. Although there were 17 formal RAAF squadrons during the war, Australian pilots served in more than 200 individual Commonwealth squadrons.

To facilitate air training, representatives of the Commonwealth established the Empire Air Training Scheme. This brought potential pilots to Australia for initial training and then sent them to Canada for final flight

school and dispatch to Great Britain to serve in the RAF. The RAAF established several flight schools in Australia for a program that eventually trained some 37,000 pilots.

The initial deployment of RAAF assets was to support the war in Europe. The entry of Japan into World War II in December 1941 led to a redeployment of Australian squadrons to the Pacific. Japanese military advances and Japan's air raid on Darwin on February 19, 1942, increased pressure for better air defense over Australia. Beginning in 1942, U.S. air units were dispatched to Australia to bolster the RAAF. On April 17, 1942, all RAAF squadrons in the Pacific were placed under the auspices of Allied Air Forces Headquarters, part of U.S. general Douglas MacArthur's Southwestern Pacific theater command.

The RAAF participated in almost every major campaign of the Pacific theater. Four RAAF squadrons, two with Hudson bombers and two flying obsolete Brewster Buffalo fighters, fought in the 1941–1942 Malaya Campaign. Later, elements of these squadrons were withdrawn to the Netherlands East Indies and finally back to Australia. Two other RAAF squadrons fought in the Netherlands East Indies before being relocated to Australia. RAAF units distinguished themselves in the defense of Milne Bay in September 1942.

Early deficiencies in aircraft were overcome with the addition of P-40E Kittyhawk and Spitfire fighters. The RAAF played an important role in supporting ground operations and in attacking Japanese shipping, including during the Battle of the Bismarck Sea (March 2–5, 1943). It also assisted in long-range mine-laying operations throughout the war. The RAAF also provided wireless units to its troops who participated in the invasion of the Philippines (October 20, 1944–August 15, 1945). By the end of the war, the RAAF numbered 131,662 personnel and 3,187 aircraft.

Australia, Army

The Australian Army contributed to Allied successes in North Africa and the Middle East and in the Pacific theater. During the 1930s, the army had been drastically reduced in size as a consequence of financial pressures. The Australian government hoped that in an emergency, it could rely instead on reserve or territorial forces. By statute, these forces could not be deployed overseas. On the eve of World War II, the army did expand its reserve component and embark on a program of improving coastal defenses.

When Australia declared war on Germany on September 3, 1939, the army numbered 82,800 men, but this included 80,000 poorly trained volunteer militia. The regular army was basically a small cadre force of officers, noncommissioned officers, and support staff. After New Zealand offered to raise a division to serve with Commonwealth forces in the European theater, the Australian government announced its intention to do the same, and later it pledged to raise a corps. Given the high casualties sustained by Australian forces in World War I, the government extended conscription only for home defense. This meant that forces would have to be recruited for service abroad. The army grew to four divisions—the 6th, 7th, 8th, and 9th—formed into the Second Australian Imperial Force (the first being that of World War I).

The Imperial Staff decided to send this force to the Middle East for training prior to deployment in France. The first of the Second Australian Imperial Force, the 6th Division, departed Australia in January 1940. Some of the division, which became the nucleus of the 9th Division, went to Britain. In effect, Australia then fielded two separate armies: one in the Middle East and the other for the defense of Australia and its mandate of New Guinea.

With the fall of France in June 1940, the 6th, 7th, and 9th Divisions made up a corps in the Middle East under the command of Lieutenant General Sir Thomas A. Blamey. Recalled to Australia in March 1942, Blamey became both commander of the Australian Army and commander of land forces, Southwest Pacific Area.

In North Africa, Australian forces took part in the early victories against Italian forces. Part of the 6th Division was detached to join the British Expeditionary Force dispatched to Greece and was caught up in the defeats both in Greece and in Crete during the spring of 1941. The 7th Division fought in Syria, and the 9th Division helped defend Tobruk.

Amid increased anxieties about Japanese intentions, additional Australian troops were assigned to bolster Commonwealth garrisons throughout the Pacific. In August 1941, two brigades of the 8th Division and two squadrons of Royal Australian Air Force aircraft had been sent to reinforce Singapore, where the men were then taken prisoner. With the entry of Japan into the war in December 1941, the Australian government secured the release of two of its divisions from the Middle East. A third division remained there and played an important role in the Allied victory of El Alamein (October 23–November 4, 1942), after which it also returned to the Pacific.

In March 1942, much of the 7th Division was redeployed to Colombo. Part of the 7th was also sent to Java in the Netherlands East Indies, where it was captured by Japanese forces. Land forces in Australia itself consisted of an armored division with few tanks and seven militia divisions. Australia appealed to the United States for military aid and also passed legislation that allowed reserve units to be deployed anywhere in the Pacific south of the equator.

A member of an Australian tank crew awaits the signal to resume the attack during fighting at Buna in 1943. (Library of Congress)

In March 1942, the Southwest Pacific Command was formed under U.S. general Douglas MacArthur but with General Blamey as commander of land forces. The agreement gave MacArthur complete control of the Australian Army, which rankled many Australian officers and politicians—especially as the imperious MacArthur often excluded Australian officers from planning, gave the Australians little credit for their contributions, and generally viewed Australia as a base for American operations. Blamey and MacArthur often disagreed over strategy and over MacArthur's belief that the Australian general was too cautious. MacArthur's forces initially consisted of the seven militia divisions, the Australian 6th and 7th Divisions, and the U.S. 41st Infantry Division in April 1942, followed by the 32nd Infantry Division and other units.

The main thrust of the Australian land effort centered on the defense of Port Moresby and on a domestic buildup to counter a possible Japanese invasion. From July 1942 to January 1943, the Australians and Americans were locked in combat with the Japanese in Papua New Guinea. In late August 1942, Japanese forces landed at Milne Bay (August 25–September 6, 1942), at the eastern edge of Papua. Australian forces, not greatly superior to the Japanese, contained the landing and forced the Japanese to withdraw.

This event, a great psychological lift for the Allies and a humiliation for the Japanese, proved that the Allies could defeat the Japanese in jungle warfare.

Although Australia faced significant manpower shortages, its troops continued to support Allied operations in New Guinea, Papua, and Guadalcanal. The Australians were assigned the task of clearing the Japanese from New Guinea. Australian forces also took part in operations on New Britain and in Borneo in 1945. The Australian Army launched its largest amphibious invasion of the war on July 1, 1945, when troops landed at Balikpapan as part of the effort to recapture Brunei.

During the war, 691,400 men and 35,800 women served in the Australian Army, which suffered (including prisoners of war recovered) 19,351 casualties in the war in Europe and 42,224 in the war in the Pacific. For the two theaters combined, total casualties were 18,713 dead, 22,116 wounded, and 20,746 prisoners of war recovered.

Australia, Navy

The Royal Australian Navy (RAN) played an integral part in the Allied war effort in both the Mediterranean and Pacific theaters. At the beginning of World War II, in September 1939, the RAN had declined in strength to two heavy cruisers (the *Australia* and the *Canberra*) mounting 8-inch guns, four light cruisers (the *Adelaide*, the *Hobart*, the *Perth*, and the *Sydney*) mounting 6-inch guns, five old destroyers, and two sloops. Its primary missions were coastal defense and protection of trade.

When the war began, the Australian government immediately started work to build up the country's naval strength. In all, the RAN requisitioned 200 civilian vessels for military use, mainly coastal defense, transport, and search-and-rescue missions. Several small vessels were converted into minesweepers. The government also ordered construction of several warships, including 3 destroyers, 6 frigates, 56 corvettes, and 35 motor launches. By the end of the war, the RAN had 337 vessels in service (and an additional 600 in the naval auxiliary) with 39,650 personnel.

At the beginning of the war, the Australian government sent its five destroyers into the Mediterranean to assist the British there. The *Perth* went to the East Indian station, and the *Australia* and the *Canberra* helped escort Australian troop convoys to Egypt. The RAN also converted three liners into armed merchant cruisers for Royal Navy use, two of them manned by Australian personnel. Two others were commissioned in the RAN. All were sent to the China station. After Italy entered the war, the Australian government sent the *Sydney* to the Mediterranean, where it sank an Italian destroyer and helped to sink an Italian cruiser. In December 1940, the *Sydney* was replaced in the Mediterranean by the *Perth.* Other naval units were also sent, and Australian ships took part in many Mediterranean battles, including the Battle of Cape Matapan (March 28, 1941). Australian ships also participated in the hunt for the German battleship *Bismarck* and performed Atlantic convoy duty. Later in the war, eight RAN ships supported the Allied invasion of Sicily in July 1943.

The first real blow to the RAN came in November 1941, when the *Sydney* was sunk off Western Australia by the *Kormoran*, a German armed merchant cruiser. After Japan entered the war in December 1941, nearly all Australian ships were withdrawn to the Pacific theater either to Singapore or Australia. The cruiser *Perth* was sunk in the Battle of Sunda Strait during February 28–March 1, 1942. The Japanese air raid on Darwin (February 19) and the

midget submarine attack on Sydney Harbor (May 31) underscored the need for increased naval strength. By the end of 1942, the Japanese had sunk 30 ships in Australian waters through air, naval, or submarine attack.

For the remainder of the war, RAN ships in the Pacific undertook several duties. They engaged in antisubmarine and convoy protection missions and were credited with sinking six Axis submarines and escorting some 1,100 convoys. The RAN also laid some 10,000 defensive mines around Australia and New Zealand and engaged in minesweeping operations throughout the Pacific. RAN ships also fought in many of the major battles of the theater, including the Battle of the Coral Sea (May 7–8, 1942), the August 1942–February 1943 Solomon Islands Campaign (the cruiser *Canberra* was sunk in the Battle of Savo Island), and the Battle of Leyte Gulf (October 23–26, 1944). They also supported operations in Borneo and Burma and the Australian landings at Taraken, Brunei, and Balikpapan in 1945. In all, 45,800 men and 3,100 women served in the RAN during the war.

Austria

Landlocked nation located in Central Europe. In early 1938 prior to the German takeover, Austria was bordered by Germany to the north, Czechoslovakia and Hungary to the east, Yugoslavia and Italy to the south, and Switzerland to the west.

Austria emerged from World War I diminished and impoverished, a shadow of its former self. Once the anchor of the great multinational Hapsburg (Austro-Hungarian) Empire, the Federal Republic of Austria became a small (32,500-square-mile) state with an overwhelmingly German-speaking population of some 7 million people in 1939. Forbidden by the 1919 Treaty of Saint-Germain to unite with Germany, Austria was nonetheless drawn inexorably toward its aggressive northern neighbor. After years of political upheaval and economic hardship, Austrians could not shake the impossible urge to pursue contradictory courses: to foster self-determination and Austrian nationalism and to pursue Anschluss (union) with Germany (despite the treaty prohibition).

Adolf Hitler's accession to power as chancellor of Germany in 1933 put great pressure on Austria's social, political, and economic stability. Hitler was determined to bring the land of his birth into a greater German Reich. He undoubtedly realized that the annexation of Austria would have international repercussions, and thus he worked to achieve the annexation indirectly. Because the Austrian Nazis took their orders from Hitler, a political victory by that party in Austria would bring about the de facto union of the two states.

To achieve this end, Hitler's government began spending considerable sums on propaganda in Austria, including leaflets and radio broadcasts from stations in Bavaria. Berlin also applied major economic pressure, cutting off German tourism (an important source of revenue in Austria) by imposing severe limits on the amount of currency that might be taken out of Germany to that state. Meanwhile, the worldwide economic depression hit the Austrian economy hard.

With armed groups forming in Austria and the threat looming of civil war between the militias of the Christian Socialists and the Social Democrats, Chancellor Engelbert Dollfuss, himself a nominal Christian Socialist, on February 12, 1934, moved against the Social Democrats, outlawed the party, arrested its leaders, and proclaimed martial law. In March the Austrian parliament—without opportunity to debate and with more than half its

members, including Social Democrats, absent—approved a new constitution submitted by Dollfuss. It established an authoritarian corporate state and abolished both universal suffrage and political representation of the people.

On July 25, 1934, a small group of Austrian Nazis seized the government radio station and announced that the government had fallen. Another group seized the chancellery, mortally wounding Dollfuss, who had refused to flee, and holding other cabinet ministers captive. The plot was poorly organized, however, and soon collapsed. Within a few days, the Austrian government had put it down without outside assistance, and on July 29 a new cabinet was formed under Kurt von Schuschnigg, a Christian Socialist colleague of Dollfuss. A dozen leaders of the putsch were eventually executed, and hundreds more were sentenced to prison.

These events had repercussions abroad. Italian dictator Benito Mussolini, who considered Austria under his sway, ordered troops to the Brenner Pass. Hitler had initially expressed pleasure at the putsch, but when news arrived of its failure he washed his hands of it. There was in fact little he could have done, as Germany—still largely unarmed—was in no position to oppose Italy. Hitler expressed regret at the Dollfuss murder, recalled his ambassador (who had promised the putschists asylum), and assured the world that Germany had no role in the failed coup.

Schuschnigg attempted to continue the Dollfuss agenda, especially the cultivation of relationships with Italy and Hungary. He also endeavored to improve relations with Hitler, but at the same time he contemplated the restoration of the Austrian ruling house of Hapsburg, which Hitler vehemently opposed. By 1938 the international situation had dramatically changed for Austria, as Mussolini had become a confederate of Hitler in the Axis alliance.

In consequence Schuschnigg, while he pursued an alliance with Czechoslovakia, had little choice but to mend fences with Hitler. On February 12, 1938, he traveled to Berchtesgaden at Hitler’s insistence to meet with the German leader. Under heavy pressure, Schuschnigg agreed to appoint Austrian Nazi Arthur Seyss-Inquart as minister of the interior and other Austrian Nazis as ministers of justice and foreign affairs.

On March 9, however, in an attempt to maintain his nation’s independence, Schuschnigg announced a plebiscite on the issue of Anschluss to be held in only four days, hoping that the short interval would not allow

the Nazis to mobilize effectively. Hitler was determined that no plebiscite be held, and on March 11 Seyss-Inquart presented Schuschnigg with an ultimatum demanding his resignation and postponement of the vote under threat of invasion by German troops, which were already mobilized on the border.

A Nazi banner with swastika being hung in the plaza in front of the Schloss Esterházy in Eisenstadt, Austria. (Library of Congress)

Schuschnigg gave in, canceling the plebiscite and resigning. Seyss-Inquart then took power and invited in the German troops (which had actually already crossed the frontier) “to preserve order.”

Had it been ordered to fight, the small Austrian army might have given a good account of itself. Germany would have won, of course, but its military was hardly ready for war, and a battle might have dispelled some rampant myths about the invincibility of the German military. Hundreds of German

tanks and vehicles of the German Eighth Army broke down on the drive toward Vienna.

On March 12, Hitler returned to his boyhood home of Linz, Austria, and the next day Berlin declared Austria to be part of the Reich. On March 14, perhaps 1 million Austrians gave Hitler an enthusiastic welcome to Vienna. France and Britain lodged formal protests with Berlin, but that was the extent of their reaction.

The consummation of Anschluss greatly strengthened Germany's position in Central Europe. Germany was now in direct contact with Italy, Yugoslavia, and Hungary and controlled virtually all of the communications of Southeastern Europe. Czechoslovakia was almost isolated, and its trade outlets were at the mercy of Germany. Militarily, Germany outflanked the powerful western Czech defenses. It was thus not surprising that despite Hitler's pledges to respect the territorial integrity of Czechoslovakia, he should next seek to bring that state under his control.

The Austrian Army was absorbed into the Wehrmacht and the Waffen-Schutzstaffel (armed SS). Austria eventually contributed three army corps and additional military assets (a total of some 800,000 military personnel) to the Axis effort, and the country suffered roughly 400,000 military and civilian casualties during the war.

Certainly a great many Austrians enthusiastically supported the Nazi cause. Although Austrians comprised but 6 percent of the population of Hitler's Reich, they furnished 14 percent of SS members and 40 percent of those involved in the Nazi extermination efforts. Anti-Semitism was rife in Austria, and actions against the Jews (who had been prominent in the professions in Vienna in particular) were applauded by a significant sector of the population, unlike in Berlin.

Austrians who had welcomed the incorporation of their country into the Reich soon discovered to their dismay that German interests dominated much of Austria's economy and that the inhabitants of the Ostmark (as Austria was now known, its medieval name having been revived) were often treated more as a conquered people subject to intense scrutiny and discrimination. This says nothing of the experiences endured by minorities and Jews who came in for special, and horrific, treatment.

Resistance groups formed around the old political factions—socialists, monarchists, nationalists—and soon developed contact with the Allies. In-

country resistance and the work of Austrians abroad limited the extent to which Austria remained identified with Nazi Germany. In the 1943 Moscow Declaration, the Allies recognized Austria as the first victim of Hitler's aggression, a view that Austrian politicians did their utmost after the war to nurture.

Austria experienced air attacks beginning in 1943, and the attacks escalated as the Allies moved eastward in 1944. When Germany's military situation crumbled in the spring of 1945, Allied armies converged on Austria. The Red Army entered Austria at the end of March and liberated Vienna in mid-April. At the end of April, a provisional government headed by Social Democrat leader Karl Renner and established under Soviet direction nullified the Anschluss. As with Germany, Austria was divided into Soviet, U.S., British, and French occupation zones.

In October 1945, the Allies formally recognized Austria's provisional government. The Allied military occupation of Austria did not end until the Treaty of Belvedere in 1955.

Automedon, Sinking of (November 11, 1940)

The *Automedon* was a British Blue Funnel cargo ship of 7,528 tons. Steaming from Liverpool to Singapore with a cargo of crated aircraft, automobiles, spare parts, and other items, the ship was intercepted in the Indian Ocean on November 11, 1940, by the German commerce raider *Atlantis.* At less than 5,000 yards' range, the German ship ran up the German ensign and uncovered its guns. The *Automedon* got off only the start of a distress signal before its transmissions were jammed by the *Atlantis.* The German ship opened fire at only 2,000 yards, and its shells destroyed the British ship's bridge, killing everyone there including the captain. The shells also killed a crewman endeavoring to return fire from the British ship's stern gun.

With extensive damage to the ship, 6 crewmen killed, and 12 wounded, the British ship then surrendered. The Germans boarded and searched the ship and found 15 bags of top-secret mail for the British Far East Command. In the ship's safe the Germans discovered a copy of the British War Cabinet minutes for August 1940. This 87-paragraph document outlined British strategy in the Far East.

The most important part of the document, COS(40)592, was addressed to Air Marshal Robert Brooke-Popham, British commander in chief in the Far East. It indicated that Britain would not go to war against Japan, even if the Japanese were to invade French Indochina. The document also stated that the British chiefs of staff regarded both Thailand and Hong Kong as indefensible against Japanese attack.

Bernhard Rogge, captain of the *Atlantis*, recognized the significance of these papers. He ordered the members of the British crew transferred to his own ship, along with all the mail and food, and the *Automedon* scuttled. He then sent the papers via the vessel *Ole Jacob*, which had been captured earlier, to German authorities in Japan.

The *Ole Jacob* arrived at Kobe on December 4, and the papers were then delivered to the German naval attaché in Tokyo, Rear Admiral Paul Wenneker. He forwarded them to Berlin. Adolf Hitler ordered the information passed to the Japanese, and Japanese naval attaché Captain Yokoi Tadao sent a summary of the documents to the Navy Ministry in Tokyo.

On December 12, 1940, Wenneker handed the documents to Vice Admiral Kondō Nobutake, the Japanese Navy vice chief of staff. Wenneker

also stressed the weak British military posture in Asia and conveyed to Kondō Hitler's suggestion that the Japanese attack Singapore.

There is no doubt that these documents encouraged the Japanese leadership in its decision to advance into Southeast Asia in 1941. They convinced the Japanese naval minister, Admiral Oikawa Koshiro, that Britain would not wage war with Japan over French Indochina.

Auxiliary Vessels

The scope of World War II required huge numbers of auxiliary vessels for combat and support duties. In addition to the construction and conversion of specialist vessels, large numbers of civilian ships were requisitioned. The greatest demand was for coastal patrol, mine warfare, and antisubmarine vessels. Less frequently demanded, although no less important, were aviation ships, hospital ships, harbor craft, floating antiaircraft batteries, and the indispensable support vessel types of the fleet train.

Coastal Patrol Craft, Auxiliary Minesweepers, and Submarine Chasers

As in World War I, fishing fleets provided a cheap and reliable source of vessels and crews for the navies. Fishing vessels were versatile, and with modification they could usually perform patrol, minesweeping, and

antisubmarine escort tasks. So successful was the concept of using fishing fleets that the Royal Navy alone ordered the construction of 240 naval trawlers in addition to the nearly 1,000 that it requisitioned during the war.

As the sea frontier of its occupied territories increased throughout the war, Germany too compensated for the shortfall of purpose-built craft by converting hundreds of national and captured foreign fishing vessels, pilot boats, yachts, harbor craft, and even landing craft into patrol vessels, auxiliary minesweepers, dispatch vessels, escorts, submarine chasers, artillery support ships, and the like. The German Navy also built large numbers of commercial-type trawlers, which became known as KFKs (*Kriegsfischkutter*), specifically for military purposes.

Finally, the Germans revived the concept of the mine destruction vessel (*Sperrbrecher*) to counter the growing mine threat against its ships and bases. Sperrbrechers were medium-sized merchant ships employed for tactical underway mine protection of high-value units. The ships were equipped with bow protection gear and strong magnetic influence gear. Any mine not so swept, such as pressure mines, would ultimately be actuated by the ship itself. To absorb the blast, the ships' holds were lined with sandbags and filled with empty drums or timber to provide additional buoyancy.

Auxiliary Aviation Ships

The increasing demand for aircraft in naval warfare outpaced the capability of many belligerents to respond with new construction of adequate aircraft carriers. Many navies thus relied on seaplane tenders as ersatz carriers. The majority of those vessels in turn had been converted from civilian vessels or requisitioned from civilian aircraft operators. The Royal Navy in particular had to improvise because of the shortage of escort aircraft carriers (which it introduced in 1941). The Battle of the Atlantic thus witnessed the development of two new types of allied auxiliary aviation vessels: the catapult-assisted merchant ship and the merchant aircraft carrier.

A German Navy submarine tender. (Dirk Steffen)

The former represented a desperate stopgap measure designed to combat the German long-range patrol aircraft, which served as spotters for groups of U-boats and as attack aircraft. Catapult-assisted merchant ships (known as Catapult Aircraft Merchantmen, or CAM ships) were merchantmen fitted with a single catapult over their forecastle from which a fighter (usually a Hawker Hurricane) could be launched. At the end of the mission, the aircraft was ditched, and the pilot had to parachute into the water to be retrieved by a rescue vessel.

The concept was superseded by the merchant aircraft carriers (MACs). These too were regular merchantmen; however, their superstructure and masts had been razed to the weather deck to make way for a flight deck suitable for launching and receiving a small number of aircraft.

The Fleet Train

The vast and highly specialized navies of World War II required an extraordinary amount of support to function and maintain their operational readiness. The fleet train catered to those needs by providing an array of ship types ranging from replenishment ships (tankers and storeships), tenders, and repair and depot ships to crew-accommodation vessels. Lesser navies, including the German Navy, expanded their small prewar core of dedicated support ships by requisitioning merchantmen and converting them into the

required support roles. The Germans only used their tankers for underway replenishment of their surface raiders, if in a rather novel fashion as one-stop support ships. The repair and depot ships remained confined to a role of floating base facilities.

Only the U.S. Navy disposed a sophisticated purpose-built fleet train that could deploy to distant waters with the entire fleet. Lacking such, the Royal Navy in 1945 had to rely on the U.S. fleet train. The Japanese Navy, although it had a few fleet oilers, never developed a full fleet train team and advanced base force with floating docks, repair ships, and such. The U.S. Navy had designed its fleet train precisely for these operations to make up for the interwar limitations on base construction in the Western Pacific. The 13,000-ton Vulcan-class repair ships, for instance, could cope with most emergencies except heavy battle damage. For major repairs, the U.S. Navy commissioned no fewer than 30 forward-area floating docks, including 3 battleship docks. Since the tankers and storeships were expected to accompany the fleet even beyond the forward-area bases, underway replenishment capabilities became an integral part of U.S. support ship design. The demand for forward underway replenishment, often at high speeds, ultimately resulted in the development by the U.S. Navy of fast one-stop replenishment ships that could supply consumables, such as oil, aviation fuel, water, ammunition, and stores at once and under way.

Avranches, Battle of (August 7–12, 1944)

Land battle in France. A town of fewer than 9,000 inhabitants, Avranches is one of the oldest municipalities in Normandy. Situated on a 200-foot bluff at the southwestern base of the Cotentin Peninsula, Avranches overlooks the Bay of Mont Saint-Michel. The Saint-Michel abbey is some eight miles distant.

On July 31, 1944, following the breakout of the American First Army from its Normandy bridgehead, Major General John S. Wood's U.S. 4th Armored Division captured Avranches. This forced open a gateway for Lieutenant General George S. Patton's newly activated U.S. Third Army to push west into Brittany, or south and east toward the heart of France.

After Patton's advance beyond Avranches to the south revealed the Germans' inability to seal the breach in their line, Field Marshal Günther von Kluge would have done well to make a timely general withdrawal to a backup defensive line, possibly at the Seine River. Adolf Hitler, at his command post in distant East Prussia, adamantly refused to countenance such, though. Instead, he demanded a massive offensive west to Avranches. Hitler insisted that such an attack would enable the Germans to reverse the outcome of the entire Normandy Campaign.

Colonel general in the Waffen-SS Paul Hausser's Seventh Army, part of Kluge's Army Group B, mounted the counterattack. It began on August 7 and was intended to cut off Patton's army from Lieutenant General Courtney H. Hodges's U.S. First Army. Deciphered German radio traffic betrayed the German intentions, however, and Major General J. Lawton Collins's VII Corps of the First Army deployed to repel the counterattack. Collins noted Hill 317, a commanding elevation near Mortain, a crossroads town nearly 20

miles east of Avranches. Soon the 2nd Battalion of the 120th Infantry Regiment of Major General Leland S. Hobbs's 30th Division held this key position.

Hausser's Seventh Army launched its attack early on August 7, but the German forces had assembled hastily and did not deploy in the strength Hitler had desired. Even so, the Germans managed to achieve local surprises and make forward progress, including the isolation of Hill 317. The hill's defenders held on tenaciously but suffered some 300 casualties during the next few days.

Meanwhile, U.S. artillery forward observers there called down devastating fire, and Allied air forces dominated the battlefield from above. Heavy fighting engaged all or parts of six American divisions under Collins (north to south): the 9th, 4th, 30th, 1st, and 35th Infantry Divisions and the 2nd Armored Division. The battle lasted until August 12, but as early as August 8 it was clear that the German attack would fail.

A furious Hitler demanded a second and more powerful stroke, which required some days to organize. Kluge and his subordinates persuaded him to strike first at Major General Wade Hampton Haislip's XV Corps of Patton's army. Haislip was moving eastward around the Germans' left flank and then northward toward their rear. The Germans failed to stop Haislip, to launch another attack toward Avranches, and to impede the relentless advance of additional American forces through the Avranches corridor. Thus, the principal result of the unsuccessful German counterattack toward Avranches was to place their own forces in a pocket, risking envelopment and destruction.

"Axis Sally" (1900–1988)

American-born propaganda broadcaster for the Germans. Born on November 29, 1900, in Portland, Maine, Mildred Elizabeth Sisk later adopted her stepfather's name, Gillars. She studied drama at Ohio Wesleyan University but left in 1922 without graduating. She moved through a series of jobs, ending up in Germany by September 1934. There she taught and did translating for the Berlitz School in Berlin. She then began an affair with Max Otto Koischwitz, another former American, who was broadcasting propaganda for Germany as "Mr. O.K."

Gillars was apparently first heard on a German radio station on May 6, 1940, as an announcer on a service directed toward Britain. She soon became the host of entertainment programs. Persuaded by Koischwitz (she later testified) and joined by him, she began regular broadcasts titled *Home Sweet Home* for the German Rundfunk (Radio), aimed at U.S. soldiers in North Africa. She used the air names "Midge" and "Sally" (her American listeners called her "Axis Sally").

Gillars was soon among the highest-paid broadcasters in Germany. In *Midge's Medical Reports*, Gillars featured broadcasts from prisoner-of-war camps, attesting that the camps had high standards of treatment. *Midge at the Mike* offered music and talk for lonesome soldiers interspersed with considerable propaganda. In a particularly chilling broadcast before the June 6, 1944, Normandy landings, *Vision of Invasion*, she claimed that thousands would perish.

Koischwitz died in 1944, and Gillars spent the remainder of the war in Berlin. Arrested there by Allied authorities in 1946, she was released and gave an ill-advised press conference explaining her role. That forced Allied action, and she was rearrested and later tried in Washington, D.C. On March

10, 1949, she was found guilty of one of the eight treason counts and sentenced to between 10 and 30 years in prison. She was released on parole on July 10, 1961, from a federal reformatory after serving 12 years. She took up residence at a convent in Columbus, Ohio, and taught languages and music at a parochial school there. Gillars died on June 25, 1988, in Columbus.

B

Bab el Mandeb Strait

Narrow channel linking the Red Sea with the Gulf of Aden. The Bab el Mandeb (Gate of Tears) Strait is approximately 20 miles across and separates Yemen (on the Arabian Peninsula) to the east from Djibouti and Eritrea in the west. It is a vital passageway linking the Indian Ocean and the Mediterranean Sea (by way of the Suez Canal).

The strait is divided into two primary shipping channels by Perim, a volcanic island that for years was used as a coaling station for ships heading for the Suez Canal to the north. There is also a small cluster of islands located near Djibouti, known as the Seven Brothers. The eastern channel is about 2 miles wide, and the western channel is about 16 miles wide. Water depth ranges from 100 feet to about 1,000 feet. Currents are not strong, but there are two opposing ones: in the east channel, the flow is inward; in the western channel, the flow is outward.

Bab el Mandeb Strait has long been considered a choke point for shipping and remains so today. Control of the strait means ultimately control of the southern approaches to the Suez Canal. The Allies went to considerable measures to retain that control during World War II.

Babi Yar Massacre (September 29–30, 1941)

German mass shooting of Soviet Jews outside Kiev, Ukraine. Following the German Army's invasion of the Soviet Union on June 22, 1941, four Schutzstaffel Einsatzgruppen (SS deployment groups) entered Soviet territory, their task being the physical annihilation of Communist Party functionaries, Red Army commissars, the physically and mentally handicapped, partisans, and Jews.

As the Wehrmacht drove into the Soviet Union, the Einsatzgruppen followed, rounding up and slaughtering their victims. Consequently, by the time of their disbanding in 1943, when the war on the Eastern Front swung irreversibly in favor of the Red Army, the Einsatzgruppen—with the assistance of the German Army and a host of enthusiastic collaborators from the Latvian, Lithuanian, and Ukrainian populations—had committed a multitude of unspeakable atrocities and murdered an estimated 1.5 million Soviet Jews and others.

Among the numerous Einsatzgruppen crimes, the slaughter of Jews at Babi Yar in late September 1941—perpetrated by SS colonel Paul Blobel's Sonderkommando 4a, a subunit of Otto Rasch's Einsatzgruppe C—was arguably the most notorious. On September 19, 1941, units of German Army Group South occupied Kiev, the capital of Soviet Ukraine. In the days immediately following, a series of explosions rocked the city, destroying German field headquarters, burning more than one-third of a square mile of the Kiev city center, and leaving some 10,000 residents homeless. Although these explosions were likely the work of the Soviet political police, or NKVD, the Germans saw them as a convenient justification to massacre the city's Jews, a task that Blobel's Sonderkommando would have carried out regardless.

German SS troops preparing to execute Kiev Jews during the Babi Yar Massacre in Ukraine, September 29–30, 1941. (Hulton Archive/Getty Images)

Following discussions among Blobel, Rasch, and Major General Kurt Eberhard, the German field commander in Kiev, the latter ordered the city's Jews to assemble with their possessions—including money, valuables, and warm clothing—near the Jewish cemetery by 7:00 a.m. on Monday, September 29. The posted order indicated that the Jews were to be resettled and warned that failure to comply would be punishable by death.

Once assembled, Kiev's Jews were marched to Babi Yar, a partially wooded ravine just outside the city. There the Germans, following the procedure used by Einsatzgruppen since the mass shootings of Soviet Jews began in late June, forced the Jews to strip, dispossessed them of their belongings, and shot them to death in groups of 30 to 40 people. In the course of two gruesome days, Blobel's men—relying exclusively on automatic weapons—murdered 33,771 innocent men, women, and children. Subsequently, they reported that the Jews had offered no resistance and until the last minute had believed they were to be resettled.

During the months that followed the initial Babi Yar Massacre, the Germans periodically used the ravine as a murder site, killing several thousand more Jews there plus an untold number of Gypsies and Soviet prisoners of war. In July 1943, with Soviet forces having seized the military initiative and advancing rapidly, the Germans launched Operation

SONDERAKTION (SPECIAL ACTION) 1005 (or AKTION 1005) to eradicate evidence of their crimes in the Soviet Union.

Blobel, who had been released from his duties as commander of Sonderkommando 4a in early 1942 and transferred to Berlin, returned to Kiev. Throughout August and September, Blobel's men and conscripted concentration camp inmates reopened the mass grave, crushed bones, and cremated the remains of the dead. Despite the Germans' efforts to hide their crimes, significant evidence of the massacres remained and was discovered by Soviet forces following the liberation of Kiev in November 1943.

The Babi Yar Massacre of late September 1941 was not the largest German "special action" against the Jews. In October 1941, the Germans and their Romanian allies murdered an estimated 50,000 Jews at Odessa. Nevertheless, more than any other, Babi Yar has come to symbolize an aspect of the Holocaust that is invariably overshadowed by the horrors of Auschwitz and the other death camps.

Baby Blitz (January–May 1944)

German bombing raids against London in 1944. As 1943 drew to a close, the Allies had been achieving great military success against Germany. With British and U.S. bombing raids on German cities increasing in frequency and

destructiveness, German leaders were determined to carry out some action to boost German civilian morale.

German propagandists turned to *Vergeltung* (revenge). From January 1943, Minister of Propaganda Joseph Goebbels called on Germans to be patient, as a massive strike to drive Britain from the war was imminent. This blow was to be carried out with Germany's new V-1 buzz bombs and V-2 rockets, but production difficulties forced the Germans to rely on traditional bombers. The bombing plan was drawn up in November by Major General Dietrich Peltz. At Chancellor Adolf Hitler's direction and beginning in December 1943, the Luftwaffe stationed all available bombers at fields in northern France in preparation for the offensive.

On January 21, 1944, operations commenced when Peltz sent two waves totaling 447 bombers against London. Effective British antiaircraft measures and poor German navigation meant that only a minority of the bombers actually reached their targets. The Germans employed target markers from Pathfinder aircraft and dropped a mix of high-explosive and incendiary bombs, but only about 32 tons of bombs actually fell within Greater London. Of 268 tons dropped, most bomb loads were scattered over the English countryside, and 25 bombers were shot down.

On January 29, the Germans mounted a second attack on London with 285 bombers, mostly Junkers Ju-188s and a few Ju-88s. The bombing produced only minimal damage in the London area at a cost of 28 German aircraft shot down.

During February, the Germans sent 1,300 sorties (a sortie is one flight by one aircraft) against London. On February 18, they managed to drop 175 tons of bombs on the city, and thereafter 50 percent of the German bombs hit within London. The decreasing size of the German attacking force rendered the greater accuracy less significant, however. By the end of April, when the Germans had to break off the attacks because of prohibitive losses, they had launched a dozen attacks against London, Hull, Bristol, and Portsmouth and dropped some 2,000 tons of bombs at a cost of 329 bombers lost.

Although these attacks, dubbed by the British the "Baby Blitz," involved more aircraft than any other strikes on Britain since 1941, they caused relatively minor damage and few casualties. The raids were more costly for German military capabilities than for the British, draining the Luftwaffe of its experienced crews and aircraft and thus strength to oppose Operation

OVERLORD. From the end of December 1943 to May 1944, German bomber strength in northern France fell from 695 to 133 aircraft.

Bach-Zelewski, Erich von dem (1899–1973)

German Schutzstaffel (SS) general and commander of antipartisan units on the Eastern Front during World War II. Born to a Junker family in Lauenburg, Pomerania, on March 1, 1899, Erich von dem Bach-Zelewski volunteered in 1914 and served in the German Army during World War I. In the course of the war, he was awarded the Iron Cross and promoted to lieutenant. After the armistice, he served in a Freikorps unit and then as a Reichswehr officer until 1924.

In 1930, Bach-Zelewski joined the National Socialist Party and its elite SS paramilitary unit. After 1934, he commanded SS units in East Prussia and Pomerania. In 1939, he was promoted to SS general, and two years later, he was assigned to Army Group Center on the Eastern Front. Bach-Zelewski was largely responsible for masterminding and carrying out the massacre of ethnic and political enemies of the Reich. In July 1941, he took control of

11,000 SS troops, four times the number assigned to the special execution squads (Einsatzgruppen). Some 6,000 ordinary police were also under his authority. By the end of 1941, Bach-Zelewski commanded more than 50,000 men, whose job it was to kill "race enemies," such as Jews, Gypsies, the mentally and physically disabled, and homosexuals.

In June 1943 SS commander Heinrich Himmler appointed Bach-Zelewski as the antipartisan chief on the entire Eastern Front. In the late summer of 1944, Bach-Zelewski commanded the German units responsible for crushing the Warsaw Rising. Known for his brutality and improvisational skills, he ended the war as a corps commander.

The fact that Bach-Zelewski testified for the prosecution at the Nuremberg war crimes trials and denounced his fellow police chiefs spared him extradition to the Soviet Union. In March 1951, he was condemned by a Munich court to 10 years of special labor, which in practice meant being confined to his home in Franconia. The only individual among the mass murderers who personally took responsibility for his wartime actions, Bach-Zelewski was never prosecuted for his role in the anti-Jewish massacres. Instead, he was tried in 1961 for his participation in the 1934 Blood Purge and sentenced to four and a half years in prison. Indicted again in 1962 for the murder of six communists in 1933, he was tried at Nuremberg and received the unusually harsh sentence of life imprisonment. Neither indictment mentioned his wartime role. Bach-Zelewski died in a prison hospital in Munich on March 8, 1973.

Bader, Sir Douglas Robert Steuart (1910–1982)

Royal Air Force (RAF) officer and ace in World War II. Born in London on February 10, 1910, Douglas Robert Steuart Bader was commissioned in the RAF on graduation from the RAF Flying School in 1930. After losing both legs in an aircraft accident while performing low-level acrobatics in December 1931, Bader was medically retired with a disability pension on his recuperation in 1933. He then went to work for Shell Petroleum but taught himself how to use his artificial limbs well enough to fly again. After the beginning of World War II in September 1939, Bader argued his way back to active duty, flying Hawker Hurricanes. In early 1940, he became a flight commander in a Spitfire squadron.

During the July 10–September 30, 1940, Battle of Britain, Flight Lieutenant Bader became famous both for the fact that he was a double amputee and because he quickly became an ace. His aggressive flying style and inspired leadership while commander of 242 Squadron, flying Hurricanes in Number 12 Group during the height of the Battle of Britain, came to epitomize British pluck. Dissatisfied with the prescribed tight line-astern formations, Bader insisted, to the point of insubordination, that the RAF conduct attacks in looser formations utilizing all available aircraft. This approach came to be known as the Big Wing concept, identified with Number 12 Group's commander, Air Vice Marshal Sir Trafford L. Leigh-Mallory. By 1941, Bader was promoted to wing commander and took command of Number 11 Wing of three Spitfire squadrons in Sussex.

On August 9, 1941—at the time credited with 22.5 kills, making him one of the highest-scoring British aces—Bader was flying near Le Touquet, France, when he was shot down. Parachuting to safety, he badly damaged one of his artificial legs in the landing. Major General Adolf Galland, commander of the unit that had shot him down, interceded with Air Marshal Hermann Göring to allow the British to air-drop Bader a replacement leg.

Bader repeatedly attempted to escape imprisonment until he was finally sent to the German maximum-security prisoner-of-war camp of Colditz Castle, where he spent the remainder of the war. Bader led the Battle of Britain flyby in the postwar victory parade and retired from the RAF as a group captain in February 1946. His life was the subject of the book *Reach*

for the Sky and the movie of the same title. Bader died in London on September 5, 1982.

Badoglio, Pietro (1871–1956)

Italian Army marshal. Born in Grazzano Monferrato (later renamed Grazzano Badoglio), Italy, on September 28, 1871, Pietro Badoglio entered the Italian military in 1890 as an artillery officer. He participated in campaigns in Abyssinia during 1896–1897 and Tripolitania (Libya) during 1911–1912. A captain at the beginning of World War I, Badoglio rose to lieutenant general in August 1917 and commanded XXVII Corps in the October–November 1917 Battle of Caporetto. His deployment and poor handling of his corps opened a gap in the Italian lines and facilitated the Austro-German advance. Some information on this situation was suppressed, and Badoglio's career did not suffer. Indeed, Badoglio became deputy to chief of staff of the Italian Army General Armando Diaz.

From November 1919 to February 1921, Badoglio was army chief of staff. During 1924–1925, the antifascist Badoglio was ambassador to Brazil. In May 1925, however, he returned to Italy as chief of the General Staff and was promoted to field marshal in June 1926.

From 1928 to 1933, Badoglio served as governor of Italian North Africa, and during that period he oversaw suppression of the Senussi Rebellion. In November 1935, he assumed command of Italian forces in Ethiopia, completing the conquest of that country. Rewarded with the title "Duke of

Addis Ababa," he was named viceroy there in May 1936. In November 1939, Badoglio was again chief of staff of the Italian armed forces, a post he held until he was forced to resign on December 4, 1940, following the failure of Italian forces in Greece.

Italian marshal Pietro Badoglio helped engineer Italy's switch from Axis power to the Allied side as a cobelligerent. He then headed the Italian government until the liberation of Rome in June 1944. (Ullstein Bild via Getty Images)

After Italian dictator Benito Mussolini's arrest in July 1943, King Victor Emmanuel III selected Badoglio to head the Italian government and command the armed forces. Badoglio dissolved the Fascist Party and many of its institutions, released political prisoners, and did not enforce the anti-Semitic legislation. He also helped engineer Italy's change from the Axis to the Allied side as a cobelligerent, a move carried out secretly on September 3, 1943.

When the German Army took over much of Italy, Badoglio, the king, and other members of the government escaped Rome on the night of September 8–9 and made their way to Brindisi. There they set up a government in cooperation with the Allies. On September 29, 1943, Badoglio formally surrendered Italy, and on October 13, 1943, Italy declared war on Germany. Following the liberation of Rome, Badoglio stepped down on June 5, 1944. Badoglio died at his family home in Grazzano Badoglio on November 1, 1956.

Bagramyan, Ivan Khristoforovich (1897–1982)

Soviet Army general. Born to Armenian parents in Elizavetpol (now Ganca), in Azerbaijan, on December 2, 1897, Ivan Bagramyan (also widely spelled Bagramian) entered the Imperial Russian Army in 1915 and was a junior lieutenant by 1917. He joined the Red Army in 1920 and the Communist Party only in 1939.

Bagramyan attended both the Higher Cavalry School and the Frunze Military Academy. For four years, he was a lecturer at the General Staff Academy. He attained the rank of colonel by 1940, at which time he was posted to the Kiev Special Military District as deputy chief of staff to its commander, General Georgii Zhukov. Bagramyan assisted in preparing a paper for Zhukov titled "Conducting a Contemporary Offensive Operation,"

which the latter presented at the December meeting of the heads of military districts. The paper helped assure Bagramyan of Zhukov's future support.

At the beginning of the German invasion of the Soviet Union in June 1941, Bagramyan was operations officer for Marshal Semen Budenny's Southwestern Front. Bagramyan escaped the Kiev encirclement and was promoted to major general. In August 1941, he became chief of staff to Marshal Semen Timoshenko, commander of the Southwestern and Southern fronts. Bagramyan orchestrated two Soviet counteroffensives and in April 1942 was promoted to lieutenant general and made chief of staff of an operational group consisting of the Southern, Southwestern, and Bryansk fronts.

In late March 1942, Timoshenko had sent Bagramyan to Soviet dictator Joseph Stalin to discuss plans for the recapture of Kharkov. Bagramyan impressed Stalin, and in May he was made chief of staff of the Direction (Axis) as well. The Soviets recaptured Kharkov, but German forces then threatened to cut them off. Bagramyan sensed the danger and on May 18 urged that the plan be changed; however, Stalin refused to intervene, and three Soviet armies were lost. Stalin made Bagramyan the scapegoat for the disaster, removing him from his post.

In July, a rehabilitated Bagramyan took command of the Sixteenth Army, which he led in Operation RZHEV-SYCHEV to drive German forces from north of the Volga River and east of the Vazuza. In February, following the Battle of Stalingrad (August 23, 1942–February 2, 1943), the Sixteenth Army was increased to six divisions, two brigades, a tank corps, four tank brigades, and several artillery regiments. The Sixteenth Army performed well and was renamed the Eleventh Guards Army. It played a major role in the Battle of Kursk (July 5–13, 1943). For this success, Bagramyan was promoted to colonel general on July 28.

The Eleventh Guards Army was then redeployed as part of the 2nd Baltic Front in preparation for Operation BAGRATION, the Soviet offensive to destroy German Army Group Center. In November 1943, Stalin promoted Bagramyan to army general in command of the 1st Baltic Front. Bagramyan was the only front commander during the war of non-Slavic origins. On July 31, 1944, his forces reached the Baltic near Riga. In January 1945, his forces took Memel, cutting off 20 German divisions. In disfavor for not making as

much progress in East Prussia as Stalin expected, Bagramyan found his front downgraded to the Zemland Forces Group.

In April 1945, Bagramyan was appointed commander of the 3rd Belorussian Front, a post he held until its disbandment that August. He had command of the Baltic Military District from 1946 to 1954. In 1955 he was promoted to marshal of the Soviet Union and appointed inspector general of the Ministry of Defense, and from 1956 to 1958 he headed the General Staff Academy. Through the decade that followed, he was chief of home front services. Bagramyan died in Moscow on September 21, 1982.

BAGRATION, Operation (June 22–August 29, 1944)

Massive Soviet offensive in Belorussia in 1944, commencing exactly three years after the German invasion of the Soviet Union. The offensive was in part timed to meet Soviet leader Joseph Stalin's pledge at the November 28–December 1, 1943, Tehran Conference for an operation to prevent the transfer of German forces to the west to meet the Allied invasion of Normandy. The operation—named for Petr Ivanovich Bagration, a distinguished Russian general of the Napoleonic Wars—resulted in the most calamitous defeat of German forces in the war.

By the beginning of 1944, the Red Army clearly held the initiative on the Eastern Front. The campaign opened in January with offensives at Leningrad

and the Ukraine. The Leningrad offensive broke the German siege and ended with Soviet forces on the Estonian border. The Ukrainian offensive ended after nearly all of the Ukraine had been regained and after a southern salient had been created that nearly reached L'viv (Lvov), with the Red Army threatening the borders of Poland and Czechoslovakia. In the process, these offensives destroyed five German armies, causing more than 1 million German casualties and untold equipment losses and putting pressure on Finland and Romania, Germany's allies.

Because of these successes, particularly in the Ukraine, German leader Adolf Hitler believed that the Soviet summer offensive would continue from the Ukraine. The Soviets needed favorable terrain for mechanized operations, and two options seemed the most advantageous for them. First, they could push west from Ukraine and then south, removing Romania and its resources from German reach. Second, and most likely, they could push west and then north toward the Baltic to cut off both Army Group Center in the Belorussian bulge and Army Group North along the Baltic coast. A direct thrust in the north seemed possible but provided less strategic advantage, and an attack into Belorussia against Army Group Center seemed least likely because of the poor road network and the restrictive terrain in the forests and the Pripet Marshes.

The Soviets considered roughly the same options and chose the Belorussian thrust primarily because the others would leave large German forces on the Soviet flanks and because an assault straight into Belorussia would free the Soviet territory that remained occupied. In many respects, Operation BAGRATION was the reverse of Operation BARBAROSSA, fought over many of the same battlefields.

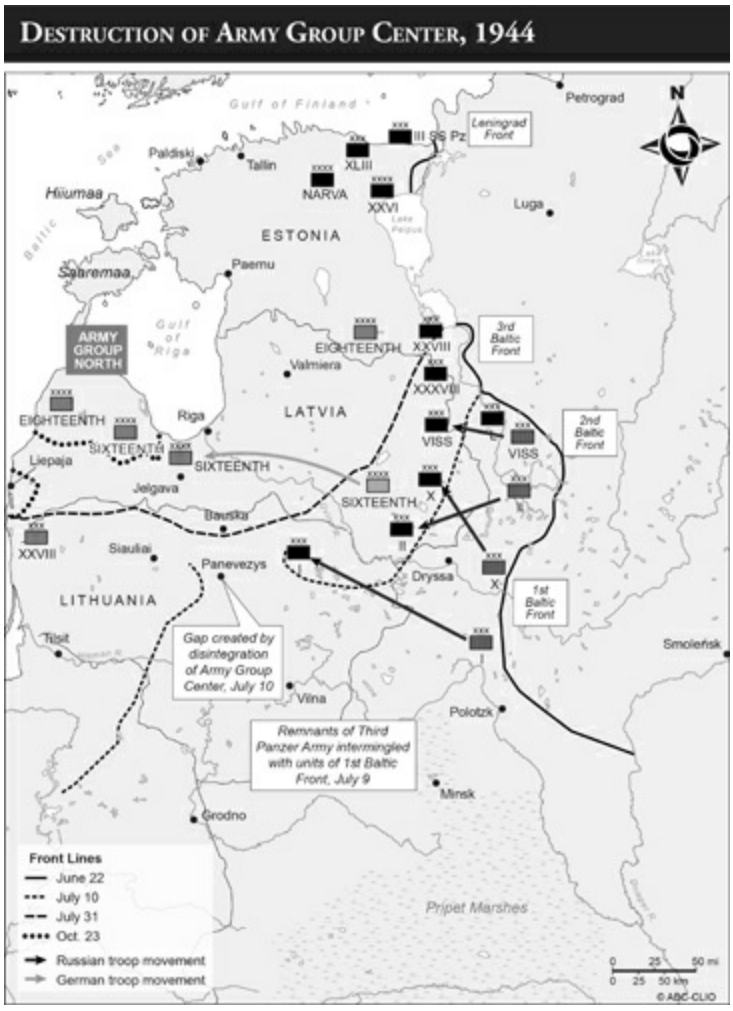
Arrayed against Field Marshal Ernst Busch's Army Group Center were four Soviet fronts (army group equivalents). From north to south were the 1st Baltic Front and the 3rd, 2nd, and 1st Belorussian Fronts, commanded by Generals Ivan Bagramyan, Ivan Chernyakhovsky, Georgii Zakharov, and Konstantin Rokossovsky, respectively. In addition, Soviet leader Joseph Stalin appointed two veteran commanders as Stavka (Soviet high command) special representatives—Marshal Georgii Zhukov overseeing the 1st and 2nd Belorussian Fronts and Marshal Aleksandr Vasilevsky coordinating operations of the 1st Baltic and 3rd Belorussian Fronts. The Soviet fronts

counted 168 divisions plus a large Belorussian partisan movement. German Army Group Center numbered only 54 divisions.

German intelligence keyed on identifying main thrusts by the location of Soviet tank armies, of which there were six in 1944. Soviet air supremacy and a shortage of assets denied the Germans long-range aerial reconnaissance. German military intelligence was forced to rely on signals intercepts, and Soviet deception focused on disguising heavy reinforcements moving into Belorussia and tank concentrations behind the front lines.

Operation BAGRATION began on June 22, with Soviet battalion- and company-sized infantry raids along the front probing for weaknesses while several divisions conducted major attacks to seize openings in the line. Between June 23 and 28, the Red Army broke through German lines in six places and encircled large German forces at Vitebsk and Bobruisk, taking 20,000 prisoners. On July 3 the Soviets, striking from two directions, entered Minsk, the Belorussian capital, capturing nearly 100,000 Germans east of the city.

After five weeks, the Red Army had advanced almost 360 miles while destroying Army Group Center. The operation ended inside Poland on the Vistula River. Between June 23 and August 29, 1944, along a more than 600-mile front, the Soviets defeated Army Group Center and advanced from 300 to 360 miles. The German Army high command’s official figure of losses was about 300,000 men, or 44 percent of those engaged, but this number may be low. Soviet losses were also heavy, with more than 178,000 dead and missing (8 percent of the total force involved) and more than 587,000 sick or wounded.



The success in Belorussia led to Soviet advances in other sectors of the front, the Ukraine, and Estonia and Latvia, where Army Group North's link to other German forces was temporarily cut. Operation BAGRATION was one of the greatest Soviet victories of the war and one from which German forces could never recover.

Bai Chongxi (1893–1966)

Nationalist Chinese general. Born in Guilin (Kweilin), Guangxi (Kwangsi) Province, on March 18, 1983, Bai Chongxi (Pai Ch’ung-his) graduated from the Baoding (Paoting) Military Academy in 1916, serving in his native provincial forces. In December 1924, in cooperation with another Guangxi officer, Li Zongren (Li Tsung-jen), Bai gained control of Guangxi.

Bai joined the Guomindang (GMD, Nationalists) in 1925, participating in the Northern Expedition of Jiang Jieshi (Chiang Kai-shek) between 1926 and 1928 while maintaining his power base in Guangxi. In 1929, Bai and Li, known as the Guangxi Clique, rebelled against Jiang for his concentration of power. The resulting struggle ended in stalemate, as national unity seemed more important after the September 1931 Mukden (Shenyang) Incident in Liaoning. In late 1931, Bai and Li rejoined the GMD, working to create a reformist provincial government and resolving their differences with Jiang. In mid-1936, their forces were reorganized as the Nationalist government’s Fifth Route Army, with Bai as deputy commander.

In the 1937–1945 Sino-Japanese War, Bai was both deputy chief of staff of the Military Affairs Commission and a member of the National Aeronautical Council, responsible for devising military strategy for the Nanjing (Nanking)-Shanghai area in Jiangsu (Kiangsu) Province. Given the heavy losses sustained by GMD forces during October and November 1937, Bai opposed the stand at Nanjing and argued for keeping Chinese forces intact. Jiang accepted Bai’s strategy, known as “trading space for time,” and

moved the Nationalist government to Chongqing (Chungking) in Sichuan (Szechwan) Province.

In Chongqing, Bai continued to participate in strategic planning that led to the first Chinese victory in the Tai'erzhuang (T'ai-erh-chuang) Campaign of March and April 1938 in Jiangsu. In July, Bai commanded the Fifth War Zone, covering Shandong (Shantung) and part of Jiangsu north of the Changjiang (Yangtze) River. In December, Bai personally commanded Chinese forces to halt the Japanese drive on Guangxi. Failing in that goal, he was recalled in January 1939.

Bai remained in Chongqing until the end of the war as deputy joint chief of staff, director of the Military Training Board, and chairman of the Military Inspection Commission. Despite his growing opposition to the Chinese Communists, he strongly supported the "protracted war" theory developed by Mao Zedong (Mao Tse-tung) in 1940 to fight the Japanese.

During the 1946–1949 Chinese Civil War, Bai, first as defense minister and then as director of the Strategic Advisory Commission, grew frustrated by Jiang's refusal to yield any authority and by his military policy related to the civil war, and he resigned in 1948. He returned later that year to command an army group in central China but again disagreed with Jiang's military policies that led to the disastrous defeat of the GMD. At the end of 1949, Bai fled to Taiwan (Formosa), where he became vice chairman of the Strategy Advisory Committee and a member of the Central Executive Committee of the GMD until his death in Taipei on December 2, 1966. Bai was one of the finest generals of the Chinese Civil War, but unfortunately his advice was often ignored.

Balbo, Italo (1896–1940)

Italian air marshal who argued against fighting the Allies in World War II. Born in Qartesana, Italy, on June 6, 1896, Italo Balbo joined the army in 1915 when Italy entered World War I and fought as a lieutenant in the Alpini. He joined the Fascist Party in 1921 and was a leader of the 1922 fascist March on Rome. One of the more brutal commanders of the antisocialist fascist militia, he became a top adviser to Benito Mussolini. After Mussolini became premier, Balbo held various cabinet posts before becoming minister of aviation in 1929, working to make Italy a major airpower. Balbo personally led a number of transatlantic flights to North and South America that captured public attention in Italy and abroad. But the Italian Air Force, despite setting numerous air records, was largely a paper tiger and had few modern aircraft.

Promoted to Italy's first air marshal in 1933, Balbo came to be seen as a political threat by Mussolini, who, in January 1934, appointed him governor and commander in chief of Italian forces in Libya. There, Balbo worked against the policy of Italian domination advocated by others. He instead favored a degree of assimilation for the Arab and Berber populations.

Balbo also criticized Italy's alliance with Germany. At a fascist Grand Council meeting on December 7, 1939, he raised the possibility of Italy fighting on the side of France and Britain. He continued to speak out, even to the British ambassador, against Italy going to war with the Allies.

After Italy declared war in June 1940, Balbo accepted command of Italian forces in North Africa. On June 28, his plane was shot down near Tobruk by Italian antiaircraft fire, and he was killed. A British air raid had just taken place, and Balbo's plane was downed while attempting to land after it failed to give the proper identification signal. Rumor had it that Mussolini had ordered his death. Il Duce later remarked that Balbo was "the only one capable of killing me."

Italian aviator and politician Count Italo Balbo, shown here on September 13, 1929. Minister of aviation in 1929 and made Italy's first air marshal in 1933, Balbo opposed the alliance with Germany and Benito Mussolini's decision to go to war against the Allies. (Library of Congress)

Balck, Hermann (1893–1982)

German general who commanded the Sixth Army at the end of World War II. Born in Danzig-Langfuhr, Prussia, on December 7, 1893, Hermann Balck was the son of William Balck, a World War I division commander and one of Germany's most noted writers on tactics. The younger Balck entered Hanover Military College in February 1914. During World War I, Balck served as a mountain infantry officer on the Western, Eastern, Italian, and Balkan fronts, rising to command a company. He was wounded seven times and was recommended for but did not receive the Pour le Mérite.

Balck remained in the postwar Reichswehr, transferring to the cavalry and becoming an early exponent of mechanization. He twice refused opportunities to be trained as a General Staff officer. Nonetheless, during the 1939 invasion of Poland, he served in Lieutenant General Heinz Guderian's Inspectorate of Mobile Troops, where he was responsible for managing the reconstitution of the German panzer divisions. In late 1939, Balck assumed command as a lieutenant colonel of the 1st Rifle Regiment in the 1st Panzer Division of Guderian's XIX Panzer Corps. On May 13, 1940, Balck's regiment crossed the Meuse River, spearheading Guderian's breakthrough at Sedan.

Largely on Balck's recommendation, after the fall of France German tanks and infantry were task-organized into combined-arms battle groups (Kampfgruppe). This change was a major development in the evolution of combined-arms warfare doctrine. Promoted to colonel, Balck served in the April 1941 Greek Campaign as commander of the 3rd Panzer Regiment. After the Germans broke through the Metaxis Line, he commanded the panzer battle group that outflanked the British at Mount Olympus. In November 1941, Balck became inspector of Mobile Troops, the position Guderian had held in 1938. During Operation TAIFUN, the abortive drive on Moscow, he was responsible for managing tank replacements for the panzer divisions.

In May 1942, Balck became the commander of the 11th Panzer Division in the Soviet Union. Promoted to major general that October, he often commanded from the front. His principal tactical axiom was "night marches are lifesavers." In December 1942, during the Soviet offensive along the Chir River north of Stalingrad, the 11th Panzer Division crushed a Soviet assault with a series of stunning counterattacks. With Balck issuing only verbal orders by radio, his division counterattacked in three different directions over

a period of four days, destroying a Soviet tank corps and defeating the Fifth Shock Army in the process. The Chir River may have been the most brilliantly fought divisional-level battle of the war.

Promoted to lieutenant general in January 1943, Balck briefly commanded the XIV Panzer Corps at Salerno in 1943, where he was injured in an airplane crash. He was made general of panzer troops in November 1943 and returned to duty as commander of the XLVIII Panzer Corps, heading it during the fierce fighting at Kiev, Radomyshl, and Tarnopol in 1944, when his corps destroyed three Soviet armies. Balck's chief of staff, Colonel Friedrich Wilhelm von Mellenthin, remained with him for most of the rest of the war. In August 1944, Balck and Mellenthin took over the Fourth Panzer Army. Counterattacking near Baranov, they halted the Soviet offensive in the great bend of the Vistula. For that action, Balck became the 19th recipient (out of only 27) of the Knight's Cross with Oak Leaves, Swords, and Diamonds.

In September 1944, Balck assumed command of Army Group G in the west. His mission was to stop Lieutenant General George S. Patton's Third Army to prevent it from interfering in the Ardennes Offensive (Battle of the Bulge, December 16, 1944–January 25, 1945). Late in December, however, Balck was relieved of his command, the victim of political intrigues by Schutzstaffel (SS) chief Heinrich Himmler and Adolf Hitler's periodic witch-hunts. Thanks to the intervention of Guderian, he was reassigned as commander of the reconstituted German Sixth Army, which also had operational control of two Hungarian armies. When the war ended, he kept his troops out of Soviet hands by surrendering them to the U.S. XX Corps in Austria.

Balck remained in captivity until 1947. Throughout that period, he declined to participate in the U.S. Army Historical Division's series of interviews and monographs. That decision may partially account for Balck's relative obscurity today—and the fact that the U.S. Army's official history tended to dismiss his role in the September 1–December 18, 1944, Lorraine Campaign. In his widely regarded 1956 book, *Panzer Battles*, Mellenthin rejected the standard portrayal of Balck in the Lorraine Campaign and called him Germany's finest field commander. Balck died in Erbenbach-Rockenau, Germany, on November 29, 1982.

Baldwin, Stanley (1867–1947)

British Conservative politician and three-time prime minister (1923–1924, 1924–1929, 1935–1937). Stanley Baldwin was born on August 3, 1867, in Bewdley, Worcestershire, England, to a wealthy and politically prominent family. His father served as a Conservative in Parliament beginning in 1892. Baldwin studied history at Trinity College, Cambridge. He then joined his father's iron and steel business, making a name for himself as a shrewd yet progressive industrialist. When his father Alfred died in 1908, the younger Baldwin took his seat in Parliament.

In 1917, Baldwin became financial secretary of the treasury and after World War I pushed hard to pay down Britain's war debt. Indeed, he donated one-fifth of his personal wealth to the treasury and appealed to other wealthy Britons to follow his example. Baldwin became president of the Board of Trade in 1921 and soon thereafter was chancellor of the exchequer. In May 1923, he became prime minister for the first time. In January 1924 after the defeat of his effort to pass trade protection legislation, Baldwin resigned his post. In November 1924, however, he was returned to power, this time for nearly five years. His second term saw the passage of progressive initiatives, including working-class pensions, increased modest-income housing, and the right of women over the age of 21 to vote. Baldwin also championed the

1925 Locarno Pacts, which attempted to normalize international relations after World War I. After his party lost the May 1929 election, Baldwin left office the following month.

In 1931 amid the domestic and international financial crisis precipitated by the global economic depression, Baldwin played a key role in the formation of the national coalition government under Labor leader Ramsay MacDonald. As lord president of the council, Baldwin also pushed for international disarmament and urged government leaders to seek accommodation with Germany and Italy.

Baldwin began his third stint as prime minister in June 1935. By now, he had come to doubt the wisdom of disarmament in the wake of menacing moves by the Italian, German, and Japanese governments. He did, however, reach a compromise with Italy after that nation invaded and occupied Abyssinia. At the same time, Baldwin attempted to co-opt both Benito Mussolini and Adolf Hitler into accepting a general European framework in which no nation sought to annex or attack another European country. By 1936, the Baldwin government had resolved to begin a general re-armament effort in the face of German and Italian recalcitrance. This effort, however, was compromised by political infighting and a lack of firm leadership and oversight on the part of Baldwin's cabinet. Further complicating the process was the Labour Party's firm opposition to general rearmament. Baldwin's critics, including Conservative Winston L. S. Churchill, engaged in a noisy campaign to discredit Baldwin's handling of the rearmament issue.

In May 1937 in the wake of the King Edward VII abdication crisis, which Baldwin handled quite deftly, the prime minister resigned and retired from politics, exhausted by his last tenure in office. The following year, he welcomed the ill-fated Munich Agreement. After World War II began in 1939, Baldwin tended to be reviled by many as an appeaser who too slowly grasped the peril posed by Hitler's Germany. This, however, is an unbalanced and unfair interpretation. There were, in fact, few statesmen who comprehended Hitler's true motives prior to 1938, and Baldwin did the best he could given the domestic limitations he faced during the 1930s. Baldwin died at Stourport-on-Severn, Worcestershire, on December 14, 1947.

Balikpapan, Battle of (January 24, 1942)

On January 21, 1942, after the Japanese capture of Tarakan in northern Borneo, a Japanese troop convoy sailed for Balikpapan, the port and important oil field two-thirds of the way down Borneo's east coast. The day before, following a premature Dutch report of the Japanese movement, Task Force 5, the U.S. Navy cruisers *Boise* and *Marblehead*, and six destroyers sailed to intercept. However, after the *Boise* tore its hull on an uncharted pinnacle, Rear Admiral William A. Glassford Jr., commander of Task Force 5, ordered Destroyer Division 59 under Commander Paul H. Talbot and consisting of the 1919-vintage destroyers *John D. Ford*, *Pope*, *Parrott*, and *Paul Jones* to patrol Makassar Strait's southern exit while the *Boise* and the *Marblehead*, which had burned out a turbine, retired, escorted by two destroyers. When further reports of the Japanese invasion convoy arrived, Division 59 proceeded north on the morning of January 23, intending to arrive off Balikpapan and deliver a surprise attack two hours before dawn.

The Japanese force under Rear Admiral Nishimura Shoji consisted of 15 transports escorted by the light cruiser *Naka* and 10 modern destroyers. There were also 3 large patrol boats (ex–World War I destroyers) and 4 minesweepers. Dutch aircraft attacked during the approach and damaged 2 transports, but the Japanese convoy arrived on schedule at 8:15 p.m. on January 23 and anchored off Balikpapan in two rows. The Dutch garrison had ignited the oil fields, and thick black smoke reduced visibility.

At 11:45 p.m., the Dutch submarine *K-XVIII* torpedoed a Japanese transport, and the Japanese destroyers deployed into the channel to hunt the submarine and prevent another attack. Meanwhile, assisted by a weather front, the U.S. destroyers approached undetected until 2:45 a.m. on January

24, when four Japanese destroyers crossed ahead. In the poor visibility, they misidentified the U.S. ships as friendly vessels.

Coming upon the anchored transports, the U.S. destroyers, using torpedoes only, missed with their initial salvos, but at 3:00 a.m., the American column came about and torpedoed an ammunition ship, which exploded with a tremendous blast. Admiral Nishimura did not believe that enemy destroyers could penetrate the anchorage, and the powerful Japanese force continued to operate in the channel. At 3:10 a.m., the destroyers torpedoed a second transport. As the Americans, shrouded in smoke from the burning oil installations, cut through the shallow anchorage at high speed, they accounted for a patrol boat at 3:19 a.m. and then, six minutes later, a third transport.

Circling this stricken vessel, the *John D. Ford* led the column north. The *Pope* and *Parrott,* out of torpedoes, engaged with gunfire. After penetrating the first line of Japanese transports again, at 3:40 a.m. the *John D. Ford* sheered out of line to starboard, believing that a minefield lay ahead. This disrupted the tight line, and the *Parrott* and *Paul Jones* circled south and out of the action, followed shortly after by the *Pope.*

The *John D. Ford* continued alone and torpedoed the same ship damaged by the Dutch submarine before gunfire from a transport slightly damaged the U.S. ship. As the *John D. Ford* circled this ship, its 4-inch guns inflicted 50 casualties. At 4:00 a.m., the *John D. Ford* turned south and withdrew. Nishimura was still querying his patrol boats whether they were mistaking friendly destroyers for enemy cruisers.

Destroyer Division 59 did not stop the Japanese invasion, but it won a tactical victory in the first surface engagement fought by the U.S. Navy since the Spanish-American War. The Americans eluded a vastly superior force, torpedoed a quarter of the enemy convoy, and escaped unharmed.

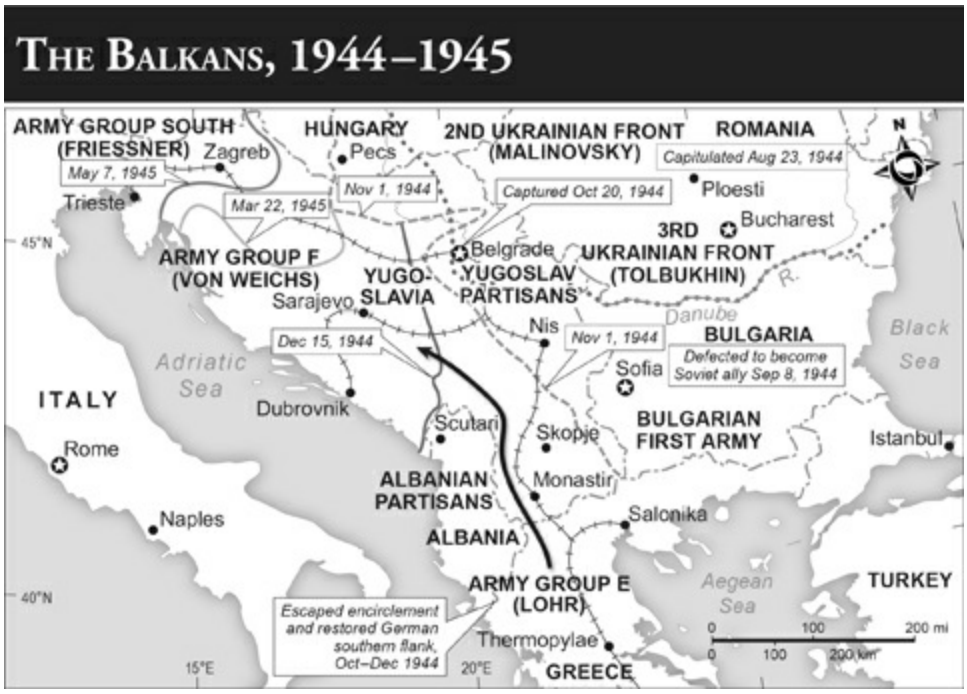
Balkans Theater

The Balkan Peninsula lies between the Black Sea and the Sea of Marmara to the east, the Mediterranean Sea to the south, the Ionian Sea to the southwest, and the Adriatic Sea to the west. The northern boundary of the Balkans is generally considered to be formed by the Sava and Danube Rivers. In 1939, there were six states south of that line: Albania, Greece, Bulgaria, European Turkey, most of Yugoslavia, and southeastern Romania.

The Axis powers of Germany and Italy gained the allegiance of some of the Balkan states and then in 1940–1941 invaded and conquered the remainder, with the exception of Turkey—which remained neutral. This ensured that the Axis powers had control over the eastern side of the Mediterranean and provided the security on the southern flank that was a prerequisite to a German invasion of the Soviet Union.

With the rapid collapse of France during May–June 1940, Soviet leader Joseph Stalin moved swiftly to secure gains promised him under the August 1939 Soviet-German pact. The Red Army occupied Lithuania, Latvia, and Estonia. This was expected, but Adolf Hitler professed himself surprised by the subsequent Soviet moves in the Balkans.



In late June 1940, Stalin ordered the annexation of the Romanian provinces of Bessarabia and northern Bukovina. Bessarabia had been assigned to the Soviet sphere under the August 23, 1939, Nazi-Soviet Non-Aggression Pact, but northern Bukovina had not. Also, unlike Bessarabia, Buko-vina had never been part of Imperial Russia, and it was the gateway to the Romanian oil fields at Ploieşti, vital to the German war machine.

Italy also sought to take advantage of the defeat of France as well as Britain’s weakness by opening new fronts in Africa and in Greece. In April 1939, Italian dictator Benito Mussolini had ordered Italian forces to seize Albania. Then on October 28, 1940, he sent his army into Greece from Albania, without informing Hitler in advance. Hitler knew of the Italian plans but neither restrained his ally nor reproached him.

Mussolini’s decision, taken on short notice and against the advice of his military leaders, had immense repercussions. Not only did the Greeks contain the Italians, but they drove them back and began their own counterinvasion of Albania. That winter the campaign deadlocked, which caused Hitler to consider sending German troops to rescue the Italians.

Meanwhile, Hitler acted aggressively in the Balkans to counter the Soviet moves and shore up his southern flank before the German invasion of the Soviet Union. In November 1940, he forced both Hungary and Romania to

join the Axis powers and accept German troops. Bulgaria followed suit at the beginning of March 1941. Hitler took advantage of irredentist sentiment but also used hardball tactics to secure the allegiance of these countries. He pressured Yugoslavia, and in late March, under German threats, Prince Regent Paul reluctantly agreed to join the Axis powers.

Meanwhile early in March 1941 and honoring the pledge to defend Greece, British prime minister Winston L. S. Churchill dispatched to that country two infantry divisions and an armored brigade. Churchill hoped thereby to forestall a German invasion, but this also forced the British Middle East commander, General Sir Archibald Wavell, to halt his offensive against the Italians in North Africa.

On March 27, elements in the Yugoslavian Army carried out a coup in Belgrade that overthrew Paul and repudiated the German alliance. This move was motivated, above all, by popular sentiment among the Serbs against the alliance. Furious at the turn of events, Hitler ordered German forces to invade Yugoslavia. Marshal Wilhelm List's Twelfth Army and Colonel General Ewald von Kleist's 1st Panzer Group, positioned in Hungary and Romania for the forthcoming invasion of the Soviet Union, now shifted to southwestern Romania and Bulgaria.

The German invasion of Yugoslavia began on April 6, 1941, with a Luftwaffe attack on Belgrade that claimed 17,000 lives. Eleven German infantry divisions and four tank divisions invaded from the north, east, and southeast. Other Axis troops, including the Third Hungarian Army, took part, but Hungarian premier Pál Teleki committed suicide rather than dishonor himself by participating. The invasion was so swift that the million-man Yugoslav army was never completely mobilized. Yugoslavia surrendered unconditionally on April 17.

Simultaneous with their move into Yugoslavia, the Germans came to the aid of the hard-pressed Italians by invading Greece. This move caught the Greeks with 15 divisions in Albania and only 3 divisions and border forces in Macedonia, where the Germans attacked. Also, the scratch British Expeditionary Force (BEF) in Greece was woefully unprepared to deal with German armor and the Luftwaffe, and between April 16 and 30, it precipitously evacuated Greece. Many of the roughly 50,000 troops taken off were then landed on Crete. During the evacuation of Greece, British naval

units were savaged by the Luftwaffe, with the Royal Navy losing more than two dozen ships to German air attack; many other ships were badly damaged.

In May 1941, the Germans continued their push south by occupying Crete in the first airborne invasion in history. The invasion turned out to be the graveyard of German paratroop forces. Hitler saw the action only as a cover for his planned invasion of the Soviet Union, securing the German southern flank against British air assault and helping protect the vital oil fields of Ploieşti.

The German invasion, conducted by parachutists and mountain troops carried to the island by transport aircraft, began on May 20 and was soon decided in favor of the attackers. Again, the Royal Navy suffered heavy losses, although it did turn back a German seaborne landing effort. Churchill's decision to try to hold Crete, unprepared and bereft of Royal Air Force (RAF) fighter support, ignored reality. But Hitler, by his aggressive Balkan moves, barred Soviet expansion there and secured protection against a possible British air attack from the south. These goals accomplished, he was ready to move against the Soviet Union.

From the beginning of the Axis occupation, the Balkans theater was ripe for guerrilla warfare until the Red Army invaded in August 1944. In both Greece and Yugoslavia, there were communist and noncommunist resistance groups, which often fought among themselves as well as against their Greek and Italian occupiers. In Greece, the lead was taken by the National People's Liberation Army (Ellinikós Laïkós Apeleftherotikós Stratós, ELAS), which came to be dominated by the communists, and the National Republican Greek League (Ethnikos Dimokratikos Ellinikos Syndesmos, EDES).

In Yugoslavia, the Chetniks were led by former army officers. Soon, a rival resistance group, known as the Partisans, came to the fore, dominated by the communists. As in Greece, these two groups would become bitter enemies, even fighting one another. Ultimately the British, who oversaw Allied aid to the Yugoslav resistance, decided to back only the Partisans, a decision that helped bring Josip Broz (Tito) to power in Yugoslavia after the war. The Yugoslav resistance largely freed the country from German control.

When Italy left the war in September 1943, Germany had to provide the occupying forces on its own, severely straining resources in men and material. The Allies also conducted a number of commando raids in the Balkans, including the German-occupied islands of the eastern Mediterranean.

In late August 1944, the Red Army's 2nd and 3rd Ukrainian Fronts launched an offensive in Romania against Army Group South Ukraine. Romania and Bulgaria soon capitulated and then switched sides, declaring war on Germany. In the case of Romania, these events occurred on August 23 and September 4, and for Bulgaria, they took place on August 25 and December 8, 1944.

In Greece, the communists made three attempts to seize power: the first came during the 1943–1944 Axis occupation in anticipation of an early end to the war, the second occurred in Athens in December 1944, and the third effort came in the form of a bloody and prolonged civil war from 1946 to 1949. The fighting in the Balkans was extremely costly in terms of human casualties, both directly—in actual military losses and civilian casualties resulting from warfare—and indirectly, stemming from shortages of food and other necessities.

In the immediate postwar period, the alignment of the Balkans actually worked out by and large along the lines of the agreement made between Churchill and Stalin at Moscow in October 1944. The Soviet Union dominated Romania and Bulgaria, whereas Greece ended up in the Western camp. Yugoslavia, which was to have been a 50-50 arrangement, freed itself from Moscow's grip in 1949, pursuing an independent, nonaligned foreign policy.

Balloon Bombs

In Operation FU-GO between November 1944 and July 1945, the Japanese Army launched balloon bombs carried by the jet stream across the Pacific Ocean from Japan to North America. The operation was planned by Colonel Kusaba Sueki of the 9th Research Division in reprisal for the Doolittle Raid on Tokyo of April 18, 1942. The original plan was to launch the bombs from submarines near the U.S. West Coast, but the Japanese Navy refused to provide the submarines, and in consequence plans were developed to launch the balloons from Japan.

The balloon bombs were made of paper and *konjak* (a Japanese food made from taro paste, used as glue). They were about 30 feet in diameter and filled with hydrogen. Each balloon carried one 33-pound antipersonnel bomb or two 13.2-pound incendiary bombs.

The balloons flew at a maximum speed of some 120 mph at an altitude of 24,000 to 30,000 feet. The flights, which began in Japan, took about 50 hours to reach North America. During the war, Japan produced 10,000 balloon bombs and launched 9,000 of them against North America. However, only about 285 incidents involving them were reported in the United States and Canada. The balloons had no sensor or guidance systems, and once they were released, their flight depended entirely on the jet stream air currents. Therefore, the bombs rarely hit their targets.

The bombs reached British Columbia in Canada and Alaska, Oregon, Montana, Washington, California, northern Texas, and even Michigan in the United States. The only reported fatalities from the balloon bombs were one woman and five children killed while on a picnic in Oregon on May 5, 1945. Some West Coast forest fires were attributed to the balloon bombs, but there is no direct evidence of this.

The U.S. government feared that Japan would use the balloons as biological weapons and prohibited press reports about them to prevent panic among its citizens. The Japanese made preparations for such an effort, although it was never carried out.

The U.S. military, meanwhile, endeavored to locate the balloon launch sites, which were finally identified by analyzing a balloon captured by the U.S. Navy. That the balloons had come across the Pacific from Japan was a considerable surprise.

The Japanese Army expended enormous resources in Operation FU-GO. Some 30,000 Japanese soldiers and almost 30,000 civilians were engaged in the operation during a two-year period, and 6 soldiers were killed in an accident while loading bombs for the balloons.

Baltic Sea, Naval Operations in

The Baltic Sea is a shallow enclosed body of water that separates Scandinavia from Northern Europe. In 1939, the major powers bordering its shores were Germany and the Soviet Union, while Poland, Sweden, and Finland also maintained moderate to small naval forces there.

The first naval actions in the Baltic were fought during a short campaign sparked by Germany's invasion of Poland on September 1, 1939. Anticipating this aggression and realizing that it could not contest German power, the Polish government dispatched three destroyers to Britain two days before the war began. The Kriegsmarine hunted the remainder of Poland's navy—which included another destroyer, a large minelayer, some smaller vessels, and five submarines—and even dispatched destroyers to shell the Polish naval base at Hel on September 3, 1939.

Nonetheless, Poland's submarines operated until September 19, laying mines that sank a German minesweeper before fleeing to Britain and to Sweden. Upon the conclusion of this campaign Germany controlled the Baltic, which provided a secure zone for training, particularly for the crews of submarines. This state of affairs lasted until June 22, 1941, when Germany invaded the Soviet Union.

The Soviet Union maintained a strong fleet in the Baltic based at Kronstadt near Leningrad, with secondary facilities at Ust-Dvinsk near Riga, Tallinn in Estonia, Hankö in Finland, and Libau in Latvia. The Soviet Baltic fleet included 2 battleships, 2 cruisers, 23 destroyers, 7 guard ships, and 69 submarines. Its mission was to defend the Gulf of Finland and the Gulf of Riga, interrupt German sea communications, and support the Red Army's maritime flank. The sudden eruption of war caught the Baltic Fleet unprepared, however, and it failed to carry out these missions.

The German naval command deployed light forces to the Baltic and focused on mine warfare. It did not develop plans to maximize the navy's resources in support of army operations. After the Germans captured Riga on July 3 and its protective minefield barrages were swept, however, convoys of barges and small merchant ships used this port to supply German land forces. Soviet destroyers and light forces attacked these convoys but failed to stop

the traffic, and they lost 3 destroyers in the process. The Baltic Fleet's major action in 1941 was the breakout from Tallinn to Kron-stadt on August 28, when 68 Soviet merchant ships and 128 warships from torpedo cutters to cruisers ran a gauntlet of German mines, aircraft, coastal batteries, and motor torpedo boats, losing in the process 5 destroyers, 3 guard ships, 5 other warships, and 34 civilian ships. The Soviets evacuated Hanko by December 3 but also had to cross an Axis minefield at great cost. As many as 20,000 soldiers and sailors died in these two operations; they would have been considered a fiasco by most standards, but the 30,000 men and considerable supplies they delivered to Leningrad represented an important contribution to that city's defenses.

In September 1941, German chancellor Adolf Hitler ordered the formation of a Baltic fleet centered on the battleship *Tirpitz* in case Soviets ships attempted to break out to Sweden, but this was never needed, and the season ended with the Soviet fleet bottled up in Kronstadt, with many units damaged and crews drafted to fight in ground units. Twenty-six submarines were also lost in the first summer of operations; they sank up to 13 Axis and neutral ships in return, all but 1 with mines. The guns of the large warships were instrumental in defending Leningrad. Weather heavily affected the operations that followed, because almost half of the sea, including the Gulf of Finland and the Gulf of Riga, freezes from December to April.

German and Finnish forces laid 10 major minefields in the Gulf of Finland before the winter freeze. In May 1942 the Soviets prepared submarines to break out into the Baltic, while the Germans refreshed their massive mine barrages to seal them in. Some submarines penetrated this barrage, but their cruises were largely unproductive, sinking or mining 25 Axis and neutral ships totaling 50,863 gross register tonnage at a cost of 12 submarines lost.

In April 1943, Finnish and German forces placed two rows of antisubmarine nets from Finland to Estonia. This barrage proved impenetrable, and there was no Soviet naval activity in the Baltic that year to disturb German training activities or commerce.

In 1944, ground advances finally allowed the Soviets to break the blockade of Kronstadt. Although the Germans strenuously sought to maintain their minefields in the Gulf of Finland, Soviet motor torpedo boats and aircraft forced the patrol craft maintaining these barrages to withdraw by July

1944. The Kriegsmarine's loss of three torpedo boats in August and two large destroyers in December to their own mines likewise demonstrated the dangerous impartiality of these weapons.

Finland was driven from the war and forced to sign an armistice with the Soviets in September 1944. The Soviets then mounted an amphibious invasion of the Estonian islands on September 29, 1944. These events finally unleashed the Baltic Fleet's submarines. Between October 1944 and April 1945, they enjoyed access to the open sea and during that period accounted for 37 ships sunk, totaling 102,856 gross register tonnage. However, 40 percent of the Axis tonnage lost occurred with the sinking of the *Wilhelm Gustloff* on January 30 and the *General Steuben* on February 10 during the evacuation of East Prussia. Some 10,000 soldiers and civilians died in these two sinkings alone.

The poor results achieved by Soviet submarines were not due to a lack of targets. Hitler assigned a high priority to maintaining German control of the Baltic because it was necessary for training the most important of his new war-winning weapons—high-speed submarines of the XXI type and the Walter turbine boats—all of which required extensive training and working up. For this reason, the 500,000-strong Army Group North maintained control of the Courland Peninsula rather than bolstering the homeland's defenses. In August 1944, 2.4 million tons of shipping plied the Baltic sea-lanes between Germany and the Courland bridgehead. Even as late as December 1944, traffic consisted of 575 vessels totaling 1.1 million tons.

In the war's final months, the Kriegsmarine undertook direct support of the German Army using *Panzerschiffe*, cruisers, and destroyers; naval gunfire was a key ingredient in the German Army's stubborn defense of littoral areas. The Kriegsmarine also evacuated 2 million troops and civilians in the face of the Soviet advance in what was certainly one of its greatest accomplishments of the war. Large Soviet warships remained inactive throughout this period. From the first day of the war to the last, Germany effectively controlled the Baltic Sea.

Ba Maw (1893–1977)

Burmese political figure and one of the leaders of Burma's movement to gain independence from Britain, which was achieved soon after World War II. Born in Maubin, Burma (today Myanmar), on February 8, 1893, into an aristocratic family, Ba Maw graduated from college in Rangoon in 1913. He also studied abroad at the universities of Calcutta in India, Cambridge in England, and Bordeaux in France, obtaining both certification as a lawyer in England and a doctorate.

Ba Maw returned to Burma, then a British crown colony, and began the practice of law. He made his mark by defending Saya San, a leader of the Thayawaddy peasant uprising in 1930. In 1933, Ba Maw organized a moderate political party known as Simyetta (People's Party). He became a member of the Legislative Council of Burma and then minister of education for Burma.

In April 1937, Ba Maw was appointed the first prime minister of the Burma Crown Colony government when Burma was officially separated from India. Facing radical labor and student unrest, he resigned in March 1939. He then formed a new political alignment, known as the Freedom Bloc, with the Thakin Party, and became its chairman. Protesting British policies toward Burma, he quit the legislature in 1940.

Ba Maw was arrested and imprisoned by the British in August 1940 on charges of maintaining contact with the Japanese and advocating noncollaboration with the British war effort. Escaping from prison in August 1942, Ba Maw came under the protection of Japanese forces advancing to Rangoon. He collaborated with them and was appointed chief of the Burma

Central Executive Council established by the Japanese authorities, adopting the title "Ahnashin" (Lord of Authority). When Japan recognized Burma as an independent state in August 1943, Ba Maw became the chief of state of the new Republic of Burma and took the title "Adipati" (Chief), leading an authoritarian, one-party state.

In November 1943, Ba Maw attended the Greater East Asia Conference in Tokyo with other Asian leaders collaborating with Japan. But the Burmese Army, led by Aung San, revolted in March 1945, and when Allied forces defeated the Japanese in Burma the next month, Ba Maw fled to Tokyo via Bangkok. In August 1945, when Japan surrendered, Ba Maw was arrested and interned in Sugamo Prison, Tokyo. Released in July 1946, he returned to Burma and resumed his political activities. He retired from politics in 1962 when the military, led by U Nu, carried out another coup d'état. Ba Maw published his autobiography in 1968. He died in Yangon (Rangoon) on May 29, 1977.

Bär, Heinrich (1913–1957)

German Air Force officer and World War II ace. Born in Sommerfeld, Germany, on March 25, 1913, Heinrich "Pritzel" Bär joined the Luftwaffe in 1937 and began World War II as an unteroffizier (corporal). Within a year, he had both attained the rank of sergeant and qualified as a noncommissioned fighter pilot. During this time, he was stationed with Jagdgeschwader (Fighter Group) 51.

On September 25, 1939, Bär scored his first confirmed victory (kill). During the May 10–July 11, 1940, Battle for France, he earned a battlefield

commission as a lieutenant. He then fought in the Battle of Britain (July 10–September 30, 1940), raising his kills total to 27.

Transferring to the Soviet Front in 1941 and now a first lieutenant, Bär continued to score victories in aerial combat. He obtained 96 kills in this campaign, including 6 against Soviet pilots in a single day. Once shot down behind Soviet lines, Bär made his way back to German-held territory. He was hospitalized with a spinal injury but rejoined his unit shortly thereafter.

In the spring of 1942, newly promoted Captain Bär was assigned as commander of JG-77 during the North African Campaign, flying from Sicily. In January 1945, Bär took command of JG-1, a jet fighter training unit. He was then transferred to JG-3, where he scored his 200th career victory. His final assignment of the war was with JV-44, Lieutenant General Adolf Galland's "Expert Squadron." Flying the Me-262 jet, Bär reached 220 career victories in more than 1,000 combat missions. His total of 16 victories in the Me-262 remains the record for a jet aircraft.

Bär completed his military service as a lieutenant colonel. He died in an airplane crash in Brunswick, Germany, while demonstrating the capabilities of a light plane on April 28, 1957.

BARBAROSSA, Operation (June 22, 1941)

German invasion of the Soviet Union that opened World War II on the Eastern Front. German chancellor Adolf Hitler's objective in Operation BARBAROSSA was simple: he sought to crush the Soviet Union in one swift blow. With the Soviet Union defeated and its vast resources at his disposal,

surely Britain would have to sue for peace. So confident was he of victory that he made no effort to coordinate the invasion with his Japanese ally. Hitler predicted a quick victory in a campaign of, at most, three months.

German success hinged on the speed of advance of 154 German and satellite divisions deployed in three army groups: Army Group North in East Prussia, under Field Marshal Wilhelm von Leeb; Army Group Center in northern Poland, commanded by Field Marshal Fedor von Bock; and Army Group South in southern Poland and Romania under Field Marshal Karl Gerd von Rundstedt. Army Group North consisted of 3 panzer, 3 motorized, and 24 infantry divisions supported by Luftflotte (Air Fleet) 1 and joined by Finnish forces. Farther north, German colonel general Nikolaus von Falkenhorst's Norway Army would carry out an offensive against Murmansk to sever its supply route to Leningrad. Within Army Group Center were 9 panzer, 7 motorized, and 34 infantry divisions, with Luftflotte 2 in support. Field Marshal von Rundstedt's Army Group South consisted of 5 panzer, 3 motorized, and 35 infantry divisions, along with 3 Italian divisions, 2 Romanian armies, and Hungarian and Slovak units. Luftflotte 4 provided air support.

To meet this onslaught were 170 Soviet divisions organized into three "strategic axes" (commanding multiple fronts, the equivalent of army groups)—Northern, Central, and Southern or Ukrainian—that would come to be commanded by Marshals Kliment E. Voroshilov, Semen K. Timoshenko, and Semen M. Budenny, respectively. Voroshilov's front was responsible for the defense of Leningrad, Karelia, and the recently acquired Baltic states. Timoshenko's front protected the approaches to Smolensk and Moscow, while Budenny's front guarded the Ukraine. For the most part, these forces were largely unmechanized and were arrayed in three linear defensive echelons, the first as far as 30 miles from the border and the last as much as 180 miles back.

The German plan called for three phases in which they hoped to achieve three broad objectives: the destruction of Soviet armed forces, the capture of political and industrial centers, and the occupation of coal, iron, and agricultural centers in the Ukraine and Caucasus. Phase one called for Nazi ground forces, supported by air, to drive deep into Soviet territory and encircle and destroy Soviet forces west of the Dvina-Dnieper Line while disrupting supply lines and creating maximum chaos. Phase two objectives

were the seizure of Leningrad, Moscow, and the Ukraine to prevent political-military direction and economic support to the Red Army. In phase three, the Wehrmacht was to advance to and hold the Volga-Arkhangelsk Line.

Initial Soviet defensive plans differed, but the primary defense in all was to position the bulk of forces along the perceived path of any German attack. The differences in the plans came from disagreements over the exact direction of the assumed main thrust. One concept held that the principal German attack would occur in the north, whereas another prepared for the main attack in the south, into the Ukraine. For whatever reasons, none considered the center of the front toward Moscow as primary. Soviet leader Joseph Stalin believed that the assault would be launched toward the Ukraine and Caucasus because of the agricultural and mineral resources there, and final General Staff plans were developed accordingly.

Whatever the direction of any German attack, Stalin counted on a repeat of the stalemate of the Western Front of 1914 to 1918 or at least a campaign lasting a year or more. Soviet planning estimated that any war between Germany and the Soviet Union would last a minimum of three years. Critical to ensuring the ability of the Soviet Union to fight a protracted war would be denial of the eastern Ukraine to the Germans, which is why so much Soviet armor was positioned forward in June 1941.

Stalin refused to believe Soviet intelligence reports that German forces were massing on the western approaches to the Soviet Union. He also rejected Western warnings with detailed information of the impending German attack. He received a reported 100 Western warnings but dismissed all as efforts by the Western powers to involve the Soviet Union in the war. The German ambassador to the Soviet Union, Count Friedrich von Schulenberg, who opposed war between Germany and the Soviet Union, even informed an astonished Vladimir Dekanozev, the Soviet ambassador to Berlin, that Germany would invade. Reportedly, Stalin informed the Politburo that “disinformation has now reached ambassadorial level.”

Although Stalin had utilized the respite of the Soviet-German Non-Aggression Pact period to improve war stocks and develop military industries, he ultimately resisted fully mobilizing the Red Army for fear that doing so would provoke Hitler. These factors, plus the self-inflicted decapitation of the Soviet armed forces in the 1937 purges that liquidated 60

to 75 percent of the senior officer corps, left the Red Army unable to prevent the Wehrmacht from achieving tremendous initial victories.

Hitler had ordered preparations for the invasion of the Soviet Union completed by May 15, but the assault did not actually occur until June 22, almost the very day that Napoleon Bonaparte had begun his ill-fated invasion of Russia in 1812. Heavy spring rains in Eastern Europe were the most important factor in the delay, as the panzers needed dry, hard ground for an advance across a country with few roads. Also, it took more time than anticipated to assemble the invasion force of more than 3 million men, the largest in history. Motor transport had to be allocated, and the Luftwaffe was also slow to build forward airfields. Moreover, units taking part in the campaign in the Balkans had to be relocated and refitted.

Despite all the German preparations, there was a great disparity in military hardware. The Luftwaffe, still waging operations against Britain and also supporting the Afrika Korps (Africa Corps) in North Africa, was forced to keep 1,150 combat aircraft in these theaters. Thus, only 2,770 combat aircraft were available against the Soviet Union. Arrayed against them were 18,570 Soviet aircraft, 8,154 of which were initially in the west and the bulk of them tactical aircraft of sturdy basic designs, including the excellent Ilyushin I1–2 Shturmovik ground-attack aircraft.

Soviet tanks moving to the battle front on June 22, 1941, the first day of the German invasion of the Soviet Union in Operation BARBAROSSA. (Hulton-Deutsch Collection/Corbis)

Germany deployed some 6,000 tanks, the Soviets 23,140 (10,394 in the west)—and even in 1941, the Soviets possessed some of the best tanks of the war. Their BT-series and T-26 were superior in armor, firepower, and maneuverability to the German light PzKpfw I and II and could destroy any German tank. Similarly, the Soviet T-34 medium tank and KV-1 heavy tank were superior to the PzKpfw III and IV and indeed any German tank in June 1941.

The German attack began at 3:00 a.m. on June 22, 1941, the longest day of the year, with only two hours of total darkness. Soviet forces were taken completely by surprise. German panzer and mechanized divisions easily broke through the defenses and were deep into Soviet territory by nightfall. Striking Soviet air forces within range, the Luftwaffe, in one day's operations, for all practical purposes, gained air supremacy over the operational area. Army Group North took Kaunas in one day and reached the Dvina River after four days, then rolled into Riga on June 29. Not until they reached new Soviet defensive positions south of Pskov on July 8 did the Germans encounter stiff resistance.

The progress of Army Group South was slowed by numerous natural obstacles, which allowed Soviet forces to withdraw in a more orderly manner and even to counterattack occasionally. The southern army group advanced along three lines: the Lublin-Kovel-Lutsk-Zhitomir-Kiev line, the Przemysl–L'viv (Lvov)–Vinnitsia–Dnieper River line, and a third line from Romania to Odessa and Dnepropetrovsk. Soviet forces avoided German encirclement attempts in this southern zone until Uman, where, in early August, over 100,000 men were encircled and surrendered, along with 300 tanks and 800 pieces of heavy artillery.

Army Group Center achieved the most spectacular results. It reached the Dnieper River by July 6, where it encountered increased Soviet resistance. Before arriving there, however, one column took Vilnius on June 24 and then headed for Minsk, where it joined the second column that had come from Brest-Litovsk. On June 27, the two columns met to surround a large number of Soviet troops around Grodno and Bialystok, provoking the surrender of 320,000 men, 3,000 tanks, and 2,000 pieces of heavy artillery. Even with stiffening resistance, Soviet forces could not prevent the Germans from crossing the Dnieper on July 9 and seizing Smolensk on July 16, where they captured another 300,000 prisoners.

Phase one of Operation BARBAROSSA seemed a success. Despite increased resistance, Wehrmacht forces appeared to have open roads to Leningrad, Moscow, and Kiev after capturing nearly 1 million Soviet troops and killing countless others. Phase two of the German plan, however, proved more difficult to achieve for several reasons. Soviet defenses were stiffening because the initial shock of invasion had worn off and an additional 5 million men in reserve forces had been mobilized and thrown into the breach. In addition, Hitler and his generals had been debating the best course of action for phase two, and the objectives continued to change. The generals believed that the army should concentrate on securing Moscow because it was the Soviet capital and a vital communication and industrial center. It offered, they believed, the best chance to destroy the Soviet armies. Hitler, however, at first thought that the priority should be the seizure of Leningrad and a linkup with the Finns; then, the Germans and Finns together should clear the Baltic and open a sea line of communications. But by mid-August, Hitler had changed his mind and directed the main effort to focus on the Ukraine and the Caucasus to gain the resources of those regions, relegating both Leningrad and Moscow to secondary priority. He even ordered the other two army groups to yield forces to reinforce Army Group South.

Phase two finally began with an assault on Kiev, which fell to the Germans on September 19 and netted 650,000 additional prisoners. Then, fall rains and mud slowed the German advance in the south. Movement toward Leningrad also slowed, partly because of increased Soviet resistance but also because Hitler conceived a new plan. This plan, known as Operation TAIFUN (TYPHOON), called for Leningrad to be encircled, put under siege, and starved into submission; the Crimea, the Donbass, and the Caucasus were to be taken for the coal and oil resources that would be gained for Germany’s use.

The new plan accorded the highest priority, however, to the encirclement and capture of Moscow. Previously transferred panzer forces were now to revert to Army Group Center, and operations were to commence on September 30. In the drive on Moscow, the Germans took Orel on October 3, and 17 days later, around Vyazma and Bryansk, they captured 665,000 Soviet prisoners. But again, fall rains and mud, increasing Soviet resistance as the Germans neared the capital, and an early drop in temperature to well below zero ground the German advance to a halt.

Some success was had elsewhere, however. Leningrad was nearly

surrounded, and the Crimea was taken along with Odessa, Kharkov, and Rostov-on-Don, but these achievements were short-lived when, along the entire front, the Soviets opened their first major counteroffensive in early December 1941.

Because the strategic objective did not change, it can be argued that Operation BARBAROSSA continued for the entire period of Germany's strategic advance, from the surprise attack on June 22, 1941, until the assault that stalled before Moscow in November. However, the commencement of Operation TAIFUN, with its change of operational focus and main objectives, technically ended Operation BARBAROSSA.

Barbey, Daniel Edward (1889–1969)

U.S. Navy admiral who established the navy's Amphibious Warfare Section and commanded the Amphibious Force, Seventh Fleet. Born on December 23, 1889, in Portland, Oregon, Daniel Edward Barbey graduated from the U.S. Naval Academy at Annapolis in 1912. He served on several ships during World War I and rose to the rank of lieutenant.

Following the war, Barbey was stationed in Wales and Turkey before returning to sea duty in 1922. Between 1928 and 1931, he served as an administrator at the U.S. Naval Academy. Promoted to commander in 1933, Barbey held various positions before being assigned to the War Plans Section of the Bureau of Navigation in 1937. There, he worked on developing mobilization strategies. He also became fascinated with amphibious warfare, a subject that had been little studied since World War I. In February 1940, Barbey was promoted to captain and assumed command of the battleship *New York.*

In January 1941, Barbey became the chief of staff to Rear Admiral Randall Jacobs of the Service Force and Amphibious Force, Atlantic Fleet. Barbey was promoted to rear admiral in June 1942 while on the staff of chief of naval operations Admiral Ernest King. In this capacity, Barbey founded the Amphibious Warfare Section of the U.S. Navy and worked to establish doctrine and tactics as well as to secure equipment better suited to amphibious operations. Under his leadership, the DUKW amphibious truck ("Duck") was developed, along with other new landing craft designs.

In January 1943, Barbey became commander of the Amphibious Force, Seventh Fleet, setting up his headquarters at Port Stevens, Australia. Working under General Douglas MacArthur from 1943 until the summer of 1945, Barbey commanded 56 amphibious landings in support of various invasions, including those in New Guinea, the Philippines, and Borneo.

Promoted to vice admiral in December 1944, Barbey was the ranking naval subordinate to MacArthur in the Southwest Pacific. After the war, Barbey held various positions, including commander of the Seventh Fleet, commander of the Atlantic Amphibious Forces, commander of the Fourth Fleet, and chairman of the Joint Military Board. From March 1947 until September 1950, he commanded U.S. naval forces in the Caribbean. Barbey

retired from the navy in June 1951. He died at Bremerton, Washington, on March 11, 1969.

Barkhorn, Gerhard (1919–1983)

German Air Force officer and fighter pilot, the second-highest-scoring ace of World War II, with 301 victories. Born in Königsberg, East Prussia, on March 20, 1919, Gerhard Barkhorn joined the Luftwaffe in March 1938. On completion of his pilot training, he was posted to Staffel (Squadron) 3, Jagdgeschwader (Fighter Wing) 2 (3.JG-2), in October 1939. In August 1940, he was transferred to JG-52 for the Battle of Britain (July 10–September 30, 1940). Barkhorn did not score his first victory until his 120th mission, on July 1, 1941. Within a year, his total stood at 60, and he was awarded the Knight's Cross and, six months later, in January 1943, the Oak Leaves. On January 23, 1944, Barkhorn became the first Luftwaffe fighter pilot to have flown 1,000 combat missions and the second to reach 250 victories. For the latter feat, he was awarded the Swords to his Knight's Cross.

During his career, Barkhorn entered combat more than 1,100 times. He was shot down nine times, bailed out once, and was wounded twice. On May 31, 1944, with 273 victories, he was well on his way to becoming the leading ace in the Luftwaffe when he was severely wounded in a dogfight. The four months he spent in the hospital allowed another JG-52 ace, Erich Hartmann,

to surpass his record. Barkhorn scored his 301st—and final—victory on January 5, 1945.

Barkhorn ended his wartime career as a major flying the Me-262 jet in JV-44, Major General Adolf Galland's "Squadron of Experts." Injuries from a crash landing took Barkhorn out of combat permanently on April 21, 1945. At the end of the war, he surrendered to the Americans and was held prisoner until September 1945.

Barkhorn's postwar career included service in the Federal Republic of Germany's (West Germany) air force from 1956 until his retirement as a major general in 1976. On January 6, 1983, he and his wife, Christl, were involved in a serious automobile accident near Köln (Cologne). Christl died at the scene, and Barkhorn died in the hospital in Köln on January 8, 1983.

Barrage Balloons

Balloons sent aloft to protect against low-level air attack. In 1938, the Royal Air Force (RAF) Balloon Command was established to arrange a system of barrage balloons at strategic sites in Great Britain as antiaircraft devices to guard communities, ports, and industries. Barrage balloons flown from boats prevented aircraft from mining estuaries. Within two years, approximately 6,400 barrage balloons protected Britain, 5,000 of which were in the London area. Air Marshal Sir E. Leslie Gossage directed 52 barrage balloon squadrons, involving 33,000 personnel.

Barrage balloons were designed to prevent low-altitude German air attacks against British factories and other strategic targets. Most of these

large hydrogen-filled, football-shaped balloons were connected to wagons by thick steel cables, which could damage any aircraft that hit them. Camouflage and clouds helped prevent enemy pilots from seeing the barrage balloons.

Mobility was crucial to form barriers of barrage balloons. Balloon crews, consisting of members of the Women's Auxiliary Air Force and the RAF Balloon Command, moved barrage balloons as needed and operated winches on the wagons to lower and raise the balloons to designated heights. Some barrage balloons actually reached an altitude of 5,000 feet. Not only did they help prevent German pilots from flying at low altitudes, they also increased the vulnerability of enemy aircraft to antiaircraft weapons, which could be concentrated to fire above their altitudes. During the Blitz (August 1940–May 1941), balloon crews devoted night duty to keeping barrage balloons at effective defensive heights and positions. Some 66 German aircraft were lost to collisions with barrage balloon cables.

Smaller barrage balloons were also used to protect shipping, and they floated above Allied ships approaching Normandy for the D-day landings on June 6, 1944. In addition to countering airplanes, barrage balloons were used to protect against attacks by V-1 buzz bombs. In 1944, operators placed a circle of 1,750 barrage balloons in south London, and the balloon cables stopped an estimated 231 V-1s.

The United States employed barrage balloons to help protect vulnerable sites on the U.S. West Coast and the Panama Canal. The Allies also used them in North Africa and in other locations in the Mediterranean. The Germans raised barrage balloons over strategic sites in the Reich. Italy and Japan also employed barrage balloons during the war.

U.S. Marine Corps barrage balloons at Parris Island, South Carolina, in May 1942. Barrage balloons trailing cables were one defense against low-flying enemy aircraft. (Library of Congress)

A number of the barrage balloons were destroyed by enemy fire or by lightning strikes, and wind and storms often caused balloon damage. Arthur Vestry, a Scottish physicist, devised ways to make the balloons lightning-proof, and the Germans sought to develop methods to cut barrage cables without ruining aircraft.

Barents Sea, Battle of (December 31, 1942)

Battle fought in the Barents Sea between German surface warships and British warships escorting convoy JW-51B to Kola Inlet in the Soviet Union. Following heavy losses sustained by convoys PQ-17 and PQ-18 during the summer of 1942, the British temporarily suspended the Arctic convoys to the Soviet Union. The convoys were resumed with the onset of winter and the long Arctic nights, which offered greater security.

In late 1942, German naval forces commanded by Vice Admiral Oskar Kummetz based in Alta Fjord near Norway's North Cape included the pocket battleship *Lützow*, the heavy cruiser *Admiral Hipper*, and 6 fleet destroyers: the *Theodor Riedel, Richard Beitzen, Friedrich Eckoldt, Z29, Z30*, and *Z31*. The Germans also had 23 U-boats operating in Arctic waters.

Convoy JW 51B consisted of 14 merchant ships, escorted by the British destroyers *Achates, Orwell, Oribi, Onslow, Obedient*, and *Obdurate;* the corvettes *Rhododendron* and *Hyderabad;* and the minesweeper *Bramble.* Captain Robert St. V. Sherbrooke commanded the escorts. In addition to the convoy escort, distant cover was provided by the Royal Navy's Force R, commanded by Rear Admiral Robert L. Burnett. It consisted of the British cruisers *Sheffield* and *Jamaica* and 2 destroyers.

Convoy JW 51B sailed from Scotland on December 22, 1942, and linked up with its escort on December 25. The day before, German aircraft had spotted the convoy and began tracking it. At noon on December 30 the *U-345* reported the convoy 50 miles south of Bear Island. Poor weather and low visibility, however, had caused the convoy to disperse.

Kummetz launched Operation REGENBOGEN (RAINBOW) shortly after noon on December 30. The German commander, however, was constrained by long-standing orders not to risk his ships by engaging superior enemy forces. As he put to sea with his flag in the *Admiral Hipper*, Kummetz received an ambiguous message: "Use caution even against enemy of equal strength; accepting undue risks for cruisers undesirable."

Proceeding cautiously, Kummetz divided his force into two sections at 2:40 a.m. on December 31. One half of the force proceeded north to intercept JW 51B's projected route, while the other half remained to the south ready to

intercept in the event of evasive action. At 7:18 a.m. that morning a German lookout spotted the convoy approximately eight miles to the northeast. Both of Kummetz's elements then began to close on it.

At 9:20 a.m. the *Friedrich Eckoldt*, *Richard Beitzen*, and *Z29* opened fire on the British destroyers. Force R, meanwhile, closed on the convoy from northward to provide additional support but initially mistook the stragglers for the main body. That error delayed the entry of the *Sheffield* and *Jamaica* into the fight.

About 10:00 a.m. the *Hipper* opened fire, scoring several hits on the *Onslow*. Sherbrooke was among the severely wounded. Shortly thereafter gunfire from the *Hipper* sank the *Bramble.*

Sometime before 11:00 a.m. the *Lützow* and the second arm of Kummetz's pincer passed within three miles to the front of JW 51B without sighting the convoy, and the double envelopment thus did not close. Burnett, meanwhile, realized his error in mistaking the convoy's stragglers for the main body and was now closing fast with his Force R. The *Sheffield* and *Jamaica* opened fire on the *Hipper* at 11:31 a.m., scoring several hits and reducing the *Hipper*'s speed. As other British warships also began to close in, Kummetz ordered his force to break contact and withdraw to the west. Before the Germans could disengage, however, the *Sheffield* sank the *Friedrich Eckoldt.* Although the fighting was at an end, the *Achates* had also been heavily damaged. It sank at 1:15 p.m.

Convoy JW 51B continued its voyage and successfully delivered 202 tanks, 2,046 other vehicles, 87 fighter aircraft, 33 bombers, 11,500 tons of fuel, and 12,650 tons of aviation fuel to Murmansk. The battle had been a tactical draw that cost the Germans one destroyer and 330 seamen killed. The British lost one destroyer, one minesweeper, and 250 men killed. Operation REGENBOGEN, however, was a major operational and strategic failure for the Germans. The supplies made it through to the Soviets, bolstering Allied confidence. The failure at the Barents Sea contributed directly to Grand Admiral Raeder's downfall three weeks later and his replacement as commander of the German Navy by Grand Admiral Karl Dönitz. Hitler also ordered that the German Navy now focus on U-boat operations at the expense of the surface warships.

Barré, Georges Edmund Lucien (1886–1970)

French Army general. Born at Saint-Augnan-sur-Cher on November 26, 1886, Georges Barré graduated from the French Military Academy of Saint-Cyr in 1912. He then became a colonial officer in Morocco. He distinguished himself in combat in World War I and in subsequent Moroccan pacification efforts. In December 1939, Barré was promoted to brigadier general, and when Germany invaded France in May 1940, he commanded the 7th North African Infantry Division, deployed on the French frontier. Barré's forces fought continuously, sustaining combat casualties of over 30 percent and winning high commendation.

After the June 1940 armistice, Barré was named to head the French delegation to the Italian demilitarization commission on the Libyan frontier. In January 1942, he was promoted to major general and appointed the senior military commander in Tunisia. When British and U.S. forces landed in Africa in November 1942, Barré initially hedged his bets and declared neutrality, prudent because German reinforcements under General of Panzer Troops Walter Nehring swiftly arrived in Tunisia, whereas the Allies had not yet landed the 5,000 men they had originally promised to send. Barré withdrew his forces into the hills, parleying with the Germans while waiting for Allied forces to arrive.

Early in the morning on November 19, 1942, Nehring delivered an ultimatum to Barré, demanding his withdrawal from his stronghold of Medjez-el-Bab within three hours, before dawn. Barré refused, holding the critical redoubt and communications center all day against heavy German air

attacks and assaults by the German 5th Parachute Regiment, while the 1st British Parachute Battalion and a U.S. artillery battalion hastily advanced to his support.

The French troops finally withdrew under cover of darkness to join with the Free French XIX Corps, fighting hard for the remainder of the Tunisia Campaign.

In 1943, Barré was promoted to lieutenant general. He retired after the war and died in Paris on January 22, 1970.

Baruch, Bernard Mannes (1870–1965)

Wall Street financier, U.S. governmental and presidential adviser, Democratic Party loyalist, and U.S. representative to the United Nations Atomic Energy Commission (1946). Born in Camden, South Carolina, on August 19, 1870, Bernard Mannes Baruch graduated from the City College of New York in 1889. His financial acumen had made him a millionaire by age 30.

Baruch served on a number of government advisory bodies and was chairman of the War Industries Board during World War I and a senior member of the U.S. delegation to the Paris peace talks in 1919. Baruch provided both official and unofficial advice to Presidents Warren Harding, Calvin Coolidge, Herbert Hoover, and Franklin Roosevelt between the wars.

Prior to America's entry into World War II, Baruch successfully counseled that existing U.S. neutralist legislation should be modified to

permit belligerent nations to purchase war supplies on a cash-and-carry basis—effectively aimed at Great Britain and its allies. During World War II, Baruch served as an adviser on economic and mobilization issues. By 1940, he had urged major increases in American naval and military strength and supported a comprehensive mobilization of the entire civilian population and U.S. resources. Baruch also advocated price and wage controls and pushed for the creation of a centralized government body to control all industrial production; the latter was accomplished with the establishment of the War Production Board (WPB) in January 1942. South Carolina senator James F. Byrnes, an old friend and associate of Baruch's, headed the WPB for a time. In February 1944, Baruch and John Hancock, an executive at Lehman Brothers, cowrote a lengthy report submitted to the government that detailed postwar demobilization policies and called for a rapid end to government controls over the economy. The Harry S. Truman administration and the U.S. Congress implemented many of the report's recommendations.

In early 1946, President Truman appointed Baruch to lead the U.S. delegation to the newly formed United Nations Atomic Energy Commission (UNAEC). Baruch began his work with a proposal developed by Dean Acheson at the State Department and David E. Lilienthal, head of the U.S. Atomic Energy Commission, that included a preliminary plan by atomic scientist Robert Oppenheimer arguing for international control of nuclear weapons by commanding, mining, and producing nuclear materials. Baruch modified this proposal, and the resulting concept for international control of atomic energy was commonly referred to as the Baruch Plan. The UNAEC approved the Baruch Plan in December 1946, but it was never ratified as a United Nations resolution or an international treaty. The Baruch Plan was perceived by the Soviets as an effort to limit their development of nuclear weapons while allowing the United States to retain its nuclear monopoly, and they vetoed it.

Until his death in New York City on June 20, 1965, Baruch continued to comment on public policy issues and was an active philanthropist and Democratic Party operative.

Bastico, Ettore (1876–1972)

Italian Army field marshal appointed governor of Libya in 1941. Born in Bologna on April 9, 1876, Ettore Bastico joined the army in 1896 and served in the elite Bersaglieri (light infantry). In 1912, he was posted to Libya, where he took part in pacification operations. Promoted to colonel during World War I, brigadier general in 1928, major general on May 29, 1932, and lieutenant general on February 10, 1936, Bastico commanded a division and then a corps during the invasion of Ethiopia.

A close friend of Italian dictator Benito Mussolini, Bastico was dispatched to Spain in April 1937 to head the Italian expeditionary force supporting the Nationalist side in the 1936–1939 Spanish Civil War. Although he scored one of the few Italian victories at Santander in August, he was relieved of his post in October because of conflicts with the Spanish Nationalist leader General Francisco Franco. Nevertheless, in 1938, Bastico received command of the Second Army, stationed on the border with Yugoslavia, and in December 1940, he was appointed governor of the Dodecanese Islands.

In July 1941, Bastico became governor of Libya. Although he was, in theory, the superior of Afrika Korps (Africa Corps) commander Erwin Rommel, he and Rommel immediately developed a contentious relationship. Rommel’s repeated rebuffs of Bastico’s attempts to rein him in as well as the

German general's increasingly ill-disguised contempt for the Italian Army led to a series of heated exchanges between the two, with Rommel referring to Bastico as "Bombastico." Nevertheless, the Axis forces were able to cooperate sufficiently to force the surrender of Tobruk in June 1942. As a result, Bastico was promoted to field marshal on August 12, 1942.

After the surrender of Tobruk in June 1942, Rommel as usual disregarded Bastico's cautious directives and invaded Egypt. Consequently, the Axis forces became overstretched, setting the stage for the decisive British counteroffensive at El Alamein (October 23–November 4, 1942). In the wake of the Axis defeat, Bastico was relieved of command in February 1943. He remained in the army, but without a field command, for the rest of the war.

Bastico retired from the army in 1947 and wrote a three-volume study of the evolution of warfare. He died in Rome on December 2, 1972.

Bastogne, Battle for (December 19, 1944–January 9, 1945)

Key battle within the December 16, 1944–January 25, 1945, German Ardennes Offensive (Battle of the Bulge). Bastogne, Belgium, was an important communications hub; seven main roads, a railroad line, and several minor roads met there. Elements of the U.S. First Army had liberated

Bastogne and the Ardennes area in September 1944. By December, following failed Allied attempts to invade Germany, lines in the west had solidified along the German West Wall (Siegfried Line). As the Allies prepared their next move, German chancellor Adolf Hitler put in motion a counteroffensive in the Ardennes with the goal of destroying Allied units and recapturing the port of Antwerp. At the least, Hitler expected to buy time to deal with the Soviets on the Eastern Front. German success in what was known to the Germans as Operation WACHT AM RHEIN (WATCH ON THE RHINE) depended on surprise and a rapid capture of Bastogne and the Allied fuel depots and communications routes between it and Saint Vith.

The German offensive, which opened early on December 16, caught the Americans completely by surprise. General of Panzer Troops Heinrich von Lüttwitz's XLVII Panzer Corps, the spearhead of the southern German thrust, made for Bastogne, some 20 miles from the German line of attack. The Germans expected to occupy Bastogne no later than December 18, but the poor state of the roads and misinformation provided by Belgians delayed their arrival. Meanwhile, supreme Allied commander General Dwight D. Eisenhower correctly concluded that this was a major German offensive rather than a spoiling attack and ordered up reinforcements, including the 101st Airborne Division. The 101st arrived at Bastogne near midnight on December 18. The first American units to reach the city, however, were elements of the 10th Armored Division, which had arrived there a few hours earlier.

Lieutenant General Fritz Bayerlein's Panzer Lehr Division reached Bastogne just after midnight on December 19. It attacked immediately, as Bayerlein was aware from radio intercepts that the 101st Airborne was on the way. The Americans beat back the German assault but were under constant German pressure from this point and were completely encircled in a six-mile-diameter pocket by the evening of December 21. The Germans then brought up supplies and reinforcements.

On December 22, four German soldiers, one carrying a white flag, walked toward an American outpost near Bastogne. They carried an ultimatum addressed to "the U.S.A. commander of the encircled city of Bastogne." The message urged the American commander to save his troops with an "honorable surrender." The response of Brigadier General Anthony McAuliffe, in command of the division in the absence of Major General

Maxwell D. Taylor, was memorable: “To the German Commander: Nuts. The American commander.”

Even though the Germans pressed their offensive all around Bastogne, they failed to take the city. The Allied forces did not break, and meanwhile Lieutenant General George S. Patton’s Third Army was rushing to relieve Bastogne from the south in one of the most memorable mass maneuvers of that or any war.

On December 23 the weather cleared, freezing the ground and making it passable for armor. Allied planes filled the skies, and transports dropped supplies to the Bastogne defenders, then extremely short of ammunition. On Christmas Day, 2nd Armored Division gunners had a “turkey shoot” near the Meuse, destroying 82 German tanks. Then on December 26, Lieutenant Colonel Creighton Abrams’s 37th Tank Battalion of the 4th Armored Division broke through the German lines, lifting the siege of Bastogne.

U.S. soldiers of the 4th Armored Division fire at German troops during the American advance to relieve the pressure on surrounded airborne troops at Bastogne, Belgium, December 27, 1944. (National Archives)

The battle now expanded as both sides poured in reinforcements. General of Panzer Troops Hasso Eccard von Manteuffel, commanding the Fifth Panzer Army, made Bastogne its principal effort, as the planned German drive on Antwerp turned into a struggle for Bastogne. Meanwhile, the Americans brought up significant amounts of artillery and armor. Allied

aircraft also attacked the German armor without letup, destroying large numbers of tanks. The last major German attack on the city occurred on January 4. Other smaller attacks took place until January 8, with the battle ending the next day. The fight for the city had claimed about 3,000 German and 2,700 American casualties; 782 Belgian civilians also died.

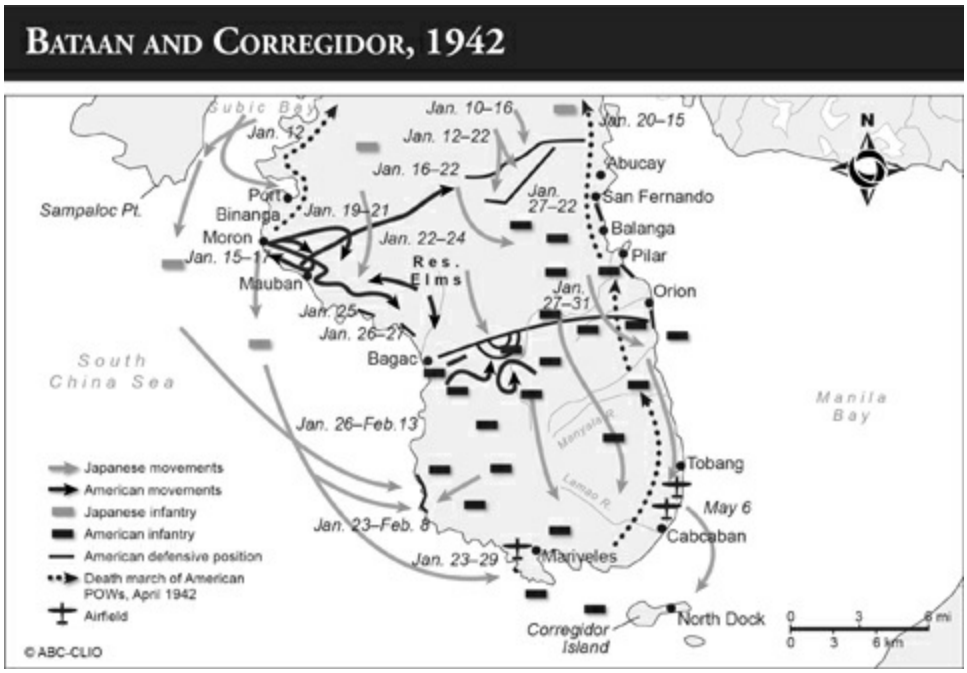
Bataan, Battle of (January 7–April 9, 1942)

Key battle of the failed American defense of the Philippine Islands between 1941 and 1942. Bataan is a peninsula on the big island of Luzon; it is some 25 miles long and roughly 20 miles wide and extends south into Manila Bay. The peninsula figured prominently in General Douglas MacArthur's plans for defending the Philippines against a Japanese invasion. The original plan called for U.S. and Philippine forces to withdraw onto the Bataan Peninsula and there fight an extended defensive battle until reinforcements arrived from the United States.



MacArthur changed this plan prior to the U.S. entry into the war following the December 7, 1941, attack on Pearl Harbor. He believed that even with his mobilizing Philippine army and promised reinforcements from the United States, he could defend the entire Philippine Islands against a Japanese invasion. But when elements of Lieutenant General Homma Masaharu's Fourteenth Army landed at Lingayen Gulf on December 22, 1941, it became apparent that MacArthur's new plan would not work. Japanese forces quickly broke through MacArthur's lines north and south of Manila, forcing him to fall back on the original plan but not in orderly fashion. Vast quantities of supplies were lost in the process.

By the end of December, more than 67,500 Filipino and 12,500 U.S. troops as well as 26,000 civilians, were on the Bataan Peninsula. The shortage of supplies put everyone on half rations. Malnutrition, dysentery, and malaria were soon commonplace, with many soldiers unable to fight.

Still, U.S. and Filipino troops put up a stout defense. They lost their main line of defense in late January 1942, but at their secondary line, they stopped Homma's forces by mid-February. The defenders bravely fought on, halting two battalion-sized Japanese landings in late January and early February.

Meanwhile, most of Homma's best troops were diverted to the Netherlands East Indies; with more than 2,700 dead, 4,000 wounded, and 13,000 sick, Homma was temporarily unable to mount additional attacks.

MacArthur used this pause to shore up his defensive positions, but the realization that no relief force was coming from the United States caused bitter disappointment. The Americans and Filipinos called themselves the "Battling Bastards of Bataan." In the wake of U.S. defeats at Pearl Harbor, Guam, and Wake Island as well as the British defeat at Singapore, the resistance mounted in Bataan boosted morale on the American home front.

President Franklin D. Roosevelt ordered MacArthur to leave the Philippines on March 11, and command of U.S.-Filipino forces fell to Major General Jonathan Wainwright, promoted to temporary lieutenant general. He inherited a hopeless cause. Homma received reinforcements, and his troops finally broke through the American-Filipino lines on April 3. MacArthur ordered Wainwright not to surrender, but the U.S. ground forces commander, Major General Edward P. King Jr., realizing that the cause was hopeless, decided to end the fight and capitulated on April 9.

A newspaper from April 9, 1942, displayed at a newsstand at a corner drugstore in Hayward, California, announcing the U.S. surrender of Bataan in the Philippines. (Library of Congress)

More than 20,000 Americans and Filipinos perished in the campaign, and roughly 2,000 escaped to the nearby island of Corregidor and fought on until they in turn were forced to surrender on May 6. The 76,000 prisoners of war of the battle for Bataan—some 64,000 Filipino soldiers and 12,000 Americans—then were forced to endure what came to be known as the Bataan Death March as they were moved into captivity. They had succeeded, however, in delaying the Japanese conquest of the Philippines for 148 days and briefly inspiring the Allied cause during the dark early days of U.S. participation in World War II.

Bataan and Corregidor, Recapture of (January 29–February 8, 1945)

Following the invasion of Luzon, the rapid advance of U.S. forces south on Manila imposed a major strain on supply lines back to the Lingayen Gulf. Securing Manila Bay was thus essential from a standpoint of supplying U.S. forces on Luzon. Although the Americans controlled the harbor, before it could be used for supply purposes they would have to secure the Bataan Peninsula and the island of Corregidor to the west.

Lieutenant General Walter Krueger's Sixth Army received the assignment of retaking Bataan and Corregidor. Major General Charles P. Hall's XI

Corps, consisting of the 38th Infantry Division and the 34th Regimental Combat Team (RCT) of the 24th Infantry Division, freed by the end of the Leyte Campaign, had been scheduled to land at Vigan on the northwest coast of Luzon but was now diverted to come ashore on the Zambales coast some 25 miles northwest of Bataan. It was to drive rapidly east across the base of the peninsula, cutting off Japanese forces, then push south with allied Filipino guerrillas to clear the peninsula. American intelligence grossly overestimated Japanese strength on Bataan at 13,000 men when there were in fact only some 2,800 troops on the peninsula, the principal unit being Colonel Sanonebu Nagayoshi's 39th Infantry Regiment.

On January 29, 1945, the 38th Division landed in the San Narciso area of Zambales Province. Surprise was complete, with the principal battle occurring in the rugged Zambales Mountains at the northern base of the peninsula, which the Americans named ZigZag Pass. The fighting was difficult, and the Americans took heavy casualties, despite substantial air support. Mopping-up operations were not completed until February 15.

The brutal fighting for ZigZag Pass claimed 338 Americans killed and 688 wounded. More than 2,400 Japanese perished, and 75 were wounded. Nagayoshi escaped with about 300 men and joined other Japanese farther south.

As other units of XI Corps swept south along the eastern coast of Bataan, on February 14 the 38th Division's 151st RCT went aboard ships of Task Group 78.3 at Olongapo in northwestern Bataan and proceeded to the southern tip of the peninsula. After the sweeping of mines—some of them of U.S. manufacture left from three years before—the next day the troops went ashore at Mariveles Harbor against little opposition. On February 21, Bataan was declared secure.

Corregidor was taken during February 16–22 following heavy U.S. naval bombardment and air strikes. Amphibious and airborne forces then assaulted the island. A reinforced battalion of the 34th Regiment of the 24th Division proceeded to the island by water from Mariveles, while the 503rd Parachute RCT arrived by air from Minanado. The subsequent fighting claimed U.S. casualties of 207 killed and 608 wounded; the Japanese sustained an estimated 6,600 killed and 19 prisoners. Several dozen Japanese stragglers survived in caves and tunnels, 20 of whom surfaced in January 1946. U.S.

Southwest Pacific theater commander General Douglas MacArthur returned to Corregidor on March 2, 1945, for an impressive flag-raising ceremony.

Bataan Death March (April 1942)

Forced march of 12,000 U.S. soldiers and 64,000 Filipino troops after the Japanese captured the Bataan Peninsula in the Philippines. On April 3, 1942, Japanese general Homma Masaharu launched a new offensive against the Bataan defenders. The U.S. Far Eastern commander, General Douglas MacArthur, had ordered the troops to continue to fight, but six days later, with his men worn down by the strain of constant combat, disease, and starvation, Major General Edward P. King, commander of the forces on Bataan, ordered them to surrender. The troops had been on half rations since January.

Homma had decided that he would hold the prisoners at Camp O'Donnell, 100 miles away. The Japanese forced the prisoners to march 52 miles from Mariveles to San Fernando, Pampanga, in order to be transported by rail to Capas, Tarlac. They would then walk another 8 miles to Camp O'Donnell. King expressed concern about his men being able to make this trip given their condition and asked that trucks transport them to their final location. Homma rejected the request.

The trek began on April 10, 1942, and lasted for over a week. Temperatures during the day were in the high 90s, compounded by smothering tropical humidity. The march is remembered for its sheer brutality, but before it even began, each prisoner was searched, and anyone

found to possess a Japanese souvenir was executed on the spot. Allied soldiers were, for the most part, denied food and water by their guards until the completion of their journey. The only food that some received was a bit of rancid rice. The prisoners of war were given only a few hours of rest each night in crowded conditions. One of the worst forms of punishment inflicted on the captives was known as the sun treatment, in which the prisoner, denied any water, was forced to sit in the scalding Philippine sun without the protection of a helmet. Prisoners were beaten, kicked, and killed for falling behind or violating the smallest rule.

Between 7,000 and 10,000 of the prisoners died before reaching Camp O'Donnell. The Japanese were indifferent to both the poor health of their captives and their large numbers. Although a few of the prisoners escaped into the jungle, most were physically unable even to make the attempt. A number were murdered at random by their guards.

The start of the brutal Bataan Death March of American soldiers taken prisoner by the Japanese in the Philippines. (Library of Congress)

Many who survived the march died in the overcrowded, suffocating boxcars on the rail trip to Capas. In the two months after reaching the camp,

1,600 Americans and 16,000 Filipinos died of starvation, disease, and maltreatment. The cruelty of the march became well known, and U.S. commanders used the story of the Bataan Death March to motivate their troops in subsequent fighting against the Japanese.

Batov, Pavel Ivanovich (1897–1985)

Soviet Army general who served with the Bryansk Front and in the Battle of Kursk, among many other engagements. Born on June 1, 1897, in the village of Filisovo in the Rybinsk region of Yaroslavl Province, Russia, Pavel Batov entered the army in 1915 during World War I and fought on the Russo-German front. He won two St. George crosses and was wounded in combat in 1917. On his recovery, he was assigned to the noncommissioned officer (NCO) school in Petrograd, where he became a convert to Bolshevism.

Batov joined the Red Army in August 1918 and fought in the Russian Civil War. Between 1926 and 1927, he attended the Vystrel Officers' School. On graduation, he took command of a battalion of the 1st Moscow Proletarian Rifle Division. He served with this division for nearly nine years, commanding its 3rd Rifle Regiment in 1933. In 1936 and 1937, he served as an adviser to the Republican side in the 1936–1939 Spanish Civil War and was twice wounded.

Promoted to brigade commander on his return to the Soviet Union in December 1937, Batov took command of the X Rifle Corps. In early 1938, he assumed command of the III Rifle Corps. At the same time, he served on a special commission to recommend the restructuring of Red Army mechanized and motorized forces. The commission's report, approved in November 1939, unwisely recommended abolishing the army's 4 tank corps and replacing them with 15 smaller motorized divisions.

Batov's III Corps of four divisions participated in the September 1939 Soviet invasion of Poland and in the February–March 1940 phase of the Soviet invasion of Finland. His service in Finland earned him promotion to lieutenant general in June 1940, and soon thereafter, he was named deputy commander of the Transcaucas Military District. In June 1941, Batov was summoned to Moscow and given command of the IX Separate Rifle Corps in the Crimea. No sooner had he taken up his post then the Germans invaded the Soviet Union.

In October 1941, Batov became deputy commander of the Fifty-First Special Army. From January to February 1942, he commanded the Third

Army of the Bryansk Front, and from February to October 1942, he was deputy front commander. He then headed the Fourth Tank Army, the redesignated Sixty-Fifth Army, in the Stalingrad area. Following the Soviet victory at Stalingrad in January 1943, Batov fought in the Battle of Kursk (July 5–13, 1943), the crossing of the Dnieper River, and the drive through Belorussia into East Pomerania and across the Oder River. Batov was popular with his men because he was one of the few senior officers who visited the front lines and conversed with the soldiers.

Promoted to colonel general in June 1944, Batov was in the Northern Group of Forces between 1944 and 1948 and was first deputy commanding general of Soviet forces in the occupation of East Germany. Promoted to army general in 1955, he commanded the Carpathian Military District from 1955 and 1958 and participated in suppressing the 1956 Hungarian Revolution. Batov commanded the Baltic Military District between 1958 and 1959 and the Southern Group of Forces in 1961 and 1962. He served as chief of staff of Warsaw Pact forces between 1962 and 1965. He then served as inspector general in the Soviet Ministry of Defense until his death in Moscow on April 19, 1985.

Battle Cruisers

Large armored cruisers that incorporated the speed and generally the armor of a cruiser but with the armament of a battleship. The original concept for this ship was developed by Italian naval constructor Colonel Vittorio Cuniberti in the early 20th century. The first power to fully endorse Cuniberti’s ideas was

Great Britain, through the work of First Sea Lord Admiral Sir John Fisher, who viewed this ship type as capable of performing the duties of cruisers and battleships.

Germany and Japan built these ships in tandem with the British in the years before and during World War I (the United States began six as a result of the 1916 naval building program but finished none). Each country pursued its own designs, the Germans placing more emphasis on armor than their British rivals. In the 1916 Battle of Jutland, poor armor protection contributed to the destruction of three British battle cruisers, whereas the Germans lost only one. The Washington Naval Treaty of 1922 discontinued construction of battle cruisers, and many of the surviving units were scrapped.

By the beginning of World War II, two nations retained some of their World War I–era battle cruisers. The British maintained the two ships of the Renown class. As built, the *Renown* and *Repulse* measured 794 feet in overall length and 90 feet in beam and displaced 30,835 tons at full load. They were protected by an armor belt with a maximum thickness of 6 inches. They mounted a primary armament of 6 15-inch guns as well as 17 4-inch guns (following a major refit, the *Renown* substituted 20 4.5-inch guns for its 4-inchers). Their engines produced a maximum speed of 30 knots. The British also operated the battle cruiser *Hood*, completed in 1920 to a World War I design, that displaced 45,200 tons fully loaded on a hull that measured 860 feet in length and 104 feet in beam and was protected by armor with a maximum thickness of 12 inches. It was armed with 8 15-inch guns and 12 5.5-inch weapons. Its engines could produce a speed of 31 knots.

The Japanese also retained their battle cruisers from World War I. These were the four ships of the Kongo class. They measured 704 feet in length and 92 feet in beam and originally displaced 32,200 tons fully loaded. The ships were rebuilt between the wars to be both faster and better protected. Their hulls were protected by belt armor with a maximum thickness of 8 inches. They were armed with 8 14-inch and 14 6-inch guns and could steam at a maximum speed of 27.5 knots. After reconstruction between 1927 and 1931, these four ships were reclassified as battleships.

France built two battle cruisers in the interwar period—the two ships of the Dunkerque class completed in 1937 and 1938. The *Dunkerque* and *Strasbourg* displaced 35,500 tons fully loaded, measured 703 feet 9 inches in length and 102 feet in beam, and were protected by belt armor of a maximum

thickness of 9.75 inches. They were armed with 8 13-inch and 16 5.1-inch guns. Their maximum speed was 29.5 knots.

The United States ordered six battle cruisers, of the Alaska class, during World War II but completed only two, both officially classified as large cruisers. Completed in 1944, the *Alaska* and *Guam* displaced 34,253 tons fully loaded on hulls that measured 808 feet 6 inches in length and 91 feet 1 inches in beam and were protected by armor 9 inches in thickness. Their armament consisted of 9 12-inch and 12 5-inch guns. These ships could steam at a maximum speed of 33 knots.

World War II battle cruisers were employed in a variety of duties that included surface action, shore bombardment, antiaircraft fire support to protect aircraft carriers, and occasional service as convoy escorts, in the case of the Allies in the Battle of the Atlantic. The majority of these ships were lost in the war. Surface action claimed the British battle cruiser *Hood* when design deficiencies in its armor resulted in a magazine explosion while the vessel was engaged with the German battleship *Bismarck.* The British battle cruiser *Repulse* succumbed to Japanese air attacks off Malaya. All four of the Japanese battle cruisers were sunk by air, surface, or submarine attacks. Finally, both of the French battle cruisers were scuttled to prevent their capture by the Germans.

Only the U.S. Alaska-class ships and the British *Renown* survived the war, but these ships were scrapped after the conflict—the *Renown* in 1948 and the *Alaska* and *Guam* in 1961.

Battleships

Large complex warships that had the primary mission of establishing control of the seas. Battleships were the toughest warships built. Despite yielding pride of place to the aircraft carrier as the principal sea-control and power-projection warship, battleships remained useful throughout World War II in carrying out a wide array of tasks.

The major naval powers continued to build battleships into World War II. The construction of these capital ships was only arrested under the pressure to construct submarines, antisubmarine warships, landing craft, and aircraft carriers. Italy and Germany launched new battleships as late as 1939 and 1940. Germany's *Bismarck* and *Tirpitz* were 41,700 tons, mounted eight 15-inch guns, and were capable of making a speed of 29 knots. Italy's *Vittorio Veneto, Italia, Roma,* and *Impero* (the latter never finished) displaced 40,700 tons, mounted nine 15-inch guns, and were capable of 30 knots.

The vulnerability of the battleship to aerial attack was finally demonstrated on November 11, 1940, when three Italian battleships were hit at anchor in Taranto Harbor by aging British Swordfish torpedo bombers from the carrier *Illustrious.*

It took only four days, December 7 to 10, 1941, for the Japanese Navy to emphasize that the battleship was no longer the capital ship of the world's navies. Building on the Taranto example, Japanese naval airpower crippled the U.S. Navy's Pacific battleship fleet during the attack at Pearl Harbor on December 7, 1941. Even after that destruction, there were still those who argued that a well-handled battleship, under way and with good antiaircraft protection, could beat off an aerial assault. They were proven incorrect on December 10, when the modern Royal Navy battleship *Prince of Wales* (36,700 tons, 10 14-inch guns, 29 knots) and the aging battle cruiser *Repulse* (17,300 tons, 6 15-inch guns, and 32 knots), under way and defended by an array of antiaircraft guns, were sunk in short order by Japanese naval warplanes. Yet those four days in December simply confirmed a trend that

was already in effect: by that time, no nation was laying down any new battleships.

In November 1941, the Royal Navy had begun the *Vanguard* (44,500 tons, eight 15-inch guns, and 30 knots), but this battleship was not completely new, having been constructed to put to use the 15-inch guns and turrets removed from two battle cruisers that had been converted to aircraft carriers following World War I. The *Vanguard*, leisurely constructed, was not commissioned until 1946, but the French battleship *Jean Bart*, finished in 1955, was the world's last battleship to be completed.

Nonetheless, battleships were still so valued during World War II that all of the capital ships from World War I and the immediate interwar era that had escaped the scrapping frenzy of the 1920s were pressed into combat service. For example, the Royal Navy's Queen Elizabeth–class ships, all but one of which—the *Queen Elizabeth* (27,500 tons, eight 15-inch guns, 23 knots)—had fought at Jutland, saw hard service in this new war. Only the Royal Navy, however, could boast of battleships that had fired their main batteries in battleship-to-battleship clashes in both world wars.

Most of the later World War I–era battleships that survived into World War II had been extensively modernized in the 1930s to protect them against air and submarine attacks, and in all cases they were converted to oil-fired propulsion. Although the main armament remained remarkably constant, virtually all World War I–era battleships were extensively rebuilt to afford much greater elevations for the main batteries. In terms of both dollars and time, the cost entailed in rebuilding these ships usually exceeded the original cost of construction.

Construction of the battleships that served in World War II, with the exception of the *Vanguard*, had been started before their nations had opened hostilities. (The last two units of the U.S. Navy's last battleships of the Iowa class were indeed started six months after Pearl Harbor, but the *Illinois* and *Kentucky* [48,000 tons, nine 16-inch guns, and design speed of 32.5 knots] were never completed.)

Battleship duties in World War II were not all that different from those in World War I: convoy escort and line-of-battle actions, although shore bombardment received far greater emphasis. There were only two line-of-battle fleet actions and but few battleship-to-battleship clashes. Among the latter category, the Royal Navy battle cruiser *Hood* (42,700 tons, 8 15-inch

guns, 31 knots) and battleships *Barham* (same statistics as the *Queen Elizabeth*) and *Resolution* (28,000 tons, 8 15-inch guns, 24 knots) attacked the stationary French *Bretagne* and *Provence* (both 22,200 tons, 10 13.4-inch guns, 20 knots) and *Dunkerque* and *Strasbourg* (both 26,500 tons, 8 13-inch guns, and 29.5 knots) at Mers-el-Kébir (Oran, Algeria) on July 8, 1940. The 15-inch shells from the British ships sank the *Bretagne* and heavily damaged the *Provence* and *Dunkerque.* Return fire lightly damaged the *Hood.*

At Dakar in West Africa, the *Resolution* and *Barham* engaged in a gunnery duel with the 95 percent completed *Richelieu* in September 1940, in the course of which a French submarine severely damaged the *Resolution.* The *Prince of Wales, King George V,* and *Rodney* (33,300 tons, nine 16-inch guns, 23 knots) participated in the sinking of the powerful German battleship *Bismarck* in May 1941; in November 1942, the U.S. Navy's *Washington* (37,500 tons, nine 16-inch guns, 28 knots) sank the Japanese battleship/battle cruiser *Kirishima* (32,100 tons, eight 14-inch guns, 30 knots, as rebuilt). The *South Dakota* suffered some moderate damage in the same action. Also in November 1942, the *Massachusetts* (38,000 tons, nine 16-inch guns, 27.5 knots) hit the uncompleted and stationary French *Jean Bart* (38,500 tons, eight 15-inch guns, 32 knots as designed but with only four 15-inchers in this action) with seven 16-inch shells at Casablanca, and in December 1943 the Royal Navy's new *Duke of York* (same characteristics as the *Prince of Wales*) sank the German *Scharnhorst* (31,900 tons, nine 11-inch guns, 32 knots) off North Cape, Norway.

The only battleship fleet actions of World War II took place on July 9, 1940, off Calabria, southern Italy, and on October 25, 1944, at Surigao Strait, near Leyte, Philippines. In the first action, the British battleships *Warspite* and *Malaya,* both Queen Elizabeth–class vessels, and the R-class *Royal Sovereign,* supported by an aircraft carrier, 5 cruisers, and 16 destroyers, encountered an Italian fleet with the rebuilt World War I–vintage battleships *Cavour* and *Cesare* (25,900 tons, 10 12.6-inch guns, 28 knots as rebuilt), 14 cruisers, and 16 destroyers. The Italian fleet disengaged after the *Warspite* moderately damaged the *Cavour* with an extreme range hit.

At Surigao Strait, a fleet consisting of the aging U.S. battleships *West Virginia* (31,800 tons, 8 16-inch guns, 21 knots), *California, Mississippi, Tennessee,* and *Pennsylvania* (all 32,000–32,300 tons, 12 14-inch guns, 21 knots), and *Maryland* (31,500 tons, 8 16-inch guns, 21 knots), with seven

U.S. and one Australian cruisers and four destroyer squadrons, sank the Japanese battleships *Fuso* (30,600 tons, 12 14-inch guns, 22.5 knots) by destroyer torpedoes and the *Yamashiro* by gunfire and destroyer torpedoes. The *West Virginia* inflicted the most damage, with its 16-inch guns directed by the Mk 8 gunfire control radar.

Not surprisingly, the Japanese Navy, with its fixation on the concept of the decisive battle, was also the most battleship-minded of any navy engaged in World War II. Although the Japanese built the largest battleships in history (the Yamato class), both completed units—the *Yamato* and *Musashi* (62,300 tons, 9 18.1-inch guns, 27 knots)—were sunk by U.S. naval airpower.

Perhaps the most impressive battleships from World War II are those of the U.S. Navy's Iowa class. These magnificent warships have an unmatched battle history, having fought in World War II, the Korean War, the Vietnam War (the *New Jersey* only [48,100 tons, 9 16-inch guns, 32.5 knots]), and the 1991 Persian Gulf War. All four units easily reached 30-plus knots during their reactivation in the 1980s.

Throughout World War II, the battleships performed magnificently in a shore-bombardment role. They also served effectively as antiaircraft platforms for the aircraft carriers and as fast oilers for the destroyers. Eight battleships of World War II remain in existence as museum pieces, and all are American: the *Texas* (27,000 tons, 10 14-inch guns, 21 knots), which also served in World War I, as well as the *Massachusetts*, *North Carolina*, *Alabama*, *Iowa*, *New Jersey*, *Missouri*, and *Wisconsin.*

Bay of Biscay, Battle of (December 28, 1943)

After the invasion of the Soviet Union severed German land access to strategic raw materials such as rubber and tin, blockade-runners became essential to the Axis war effort, and the Kriegsmarine maintained destroyers and fleet torpedo boats on the French Biscay coast to escort blockade-runners into port during the dangerous final leg of their voyage. On December 27, 1943, two German flotillas sortied to meet the blockade-runner *Alsterufer*, not realizing that Allied aircraft had surprised and sunk it the day before. The German units were the 8th Destroyer Flotilla (Captain Hans Erdmenger), with the *Z27*, *Z23*, *Z24*, *Z32*, and *Z37*, and the 4th Torpedo Boat Flotilla (Corvette Captain Franz Kohlauf), with the *T23*, *T22*, *T24*, *T25*, *T26*, and *T27*. Two British light cruisers, the *Glasgow* and *Enterprise*, which had been hunting the *Alsterufer*, were south of the Germans and, learning of their mission from signals intelligence, moved to intercept.

The German flotillas united just after noon on December 28 and swept eastwardly. The sea was rough with a strong easterly wind. Conditions were difficult aboard the German Type 36A destroyers, which were poor sea boats, and they were worse for the torpedo boats, which had green seas breaking over their bows and spray inundating their bridges.

At 1:32 p.m., the *Glasgow* spotted the Germans, and eight minutes later, the *Z23* saw the British cruisers bearing down. At this point, the Germans were steaming south by southeast in three columns. Almost immediately, Erdmenger ordered a torpedo attack, which was impractical due to the range and rough seas. Meanwhile, the British closed, and at 1:46 p.m., the *Glasgow* fired the first salvo from a range of 18,000 yards.

Initially, both forces ran south-southeast trading long-range broadsides. At 1:56 p.m., Erdmenger ordered another torpedo attack, and the *Z32*, *Z37*, and *Z34* took station to port and edged toward the cruisers. At 2:05 p.m., a

shell from the *Z32* struck the *Glasgow*, killing two men. At 2:15 p.m., the *Z37* fired four torpedoes from 14,000 yards.

Erdmenger then decided to divide his force, even though German shooting had been at least as good as that of the British. At 2:19 p.m., the *T26, T22, T25, Z27,* and *Z23* turned north as *Z32, Z37, Z24, T23, T24,* and *T27* continued southeast. The *Z27* turned toward the British rather than away, and the flagship became the first German vessel damaged when a 6-inch shell from the *Enterprise* penetrated a boiler room and ignited a huge fire.

As the Germans divided, the *Glasgow* joined the *Enterprise* and ranged its turrets on the three torpedo boats heading north. At 2:54 p.m., the *Glasgow* damaged the rear warship, the *T25.* Then the *Glasgow* shifted fire to the *T26* and hit its boiler room.

After temporarily disengaging to clear some gun defects, the *Enterprise* joined the *Glasgow,* and the two cruisers sank the *T26,* the most southerly of the three damaged ships, at 4:20 p.m. The *Enterprise* dispatched the *T25* at 4:37 p.m. with a single torpedo. Finally, the *Glasgow* located the *Z27* drifting with all guns silent. It closed and exploded the German destroyer's magazines at 4:41 p.m. The British cruisers then made for Plymouth. The *Glasgow* had been hit once, while the *Enterprise* received minor splinter damage from numerous near misses. The rest of the German force safely made port.

The Germans fired 34 torpedoes from impossibly long ranges in eight separate attacks, but in rough conditions with extended visibility, the better gun platform prevailed. The German commander's decision to divide his flotilla also proved ill-advised, as afterward ranges dropped. In the engagement, the Germans lost three ships.

Bay of Biscay Offensive (February–August 1943)

Major anti–U-boat operation conducted by the Royal Air Force and the U.S. Air Force. Beginning in January 1942, Allied maritime patrol aircraft carried out air antisubmarine transit patrols in the Bay of Biscay. The advent of the new 10cm radar in late 1942 and new methods of operations research encouraged a fresh approach to the flagging campaign there. The revised concept foresaw a continuous barrier patrol of the U-boat transit exit routes from the Bay of Biscay into the Atlantic by a total of 260 aircraft equipped with brand-new ASV Mk III 10cm-band radars. Operational command would lie with the Number 19 Group of the Royal Air Force's Coastal Command. Allied projections for success were vague and excessively optimistic, but the planners assumed correctly that it would take the Germans at least four months to respond effectively to the new 10cm radar.

The actual offensive was preceded by three trial phases: Operations GONDOLA (February 4–16, 1943), ENCLOSE I (March 20–28, 1943), and ENCLOSE II (April 5–13, 1943). Beset by difficulties, such as the withdrawal of the U.S. Army Air Force's Consolidated B-24 Liberator bombers, slow delivery of the ASV Mk III radar, and lack of aircraft, the operations were nonetheless a success in that they demonstrated an increased efficiency in aircraft allocation and in U-boat sightings.

British air marshal Sir John C. Slessor, head of Coastal Command, decided to launch the full-scale offensive (Operation DERANGE) on April 13 with 131 aircraft. The repeated, accurate night attacks by the Vickers Wellington medium bombers of Number 172 Squadron, then the only Coastal Command aircraft equipped with new ASV Mk III radars and Leigh lights, produced instant, although unforeseen, results. The failure of the German threat receivers to warn the U-boats of the incoming aircraft and the success of two U-boats in shooting down the attacking planes convinced the German U-boat command that the remedy was to give up the night surface transit and order the U-boats to fight it out with aircraft while on the surface during daylight hours.

Coastal Command aircraft wreaked havoc among the grossly overmatched U-boats during those daylight battles. In May alone, six U-boats were destroyed and seven were so severely damaged that they had to return to

their bases. In turn, the U-boats accounted for only 5 of 21 aircraft lost by the Coastal Command in the Bay of Biscay that month.

The German withdrawal from the North Atlantic convoy routes following the "Black May" of 1943 allowed Slessor to step up the operation with additional air assets. The Germans took to sending the U-boats in groups in order to provide better antiaircraft defense, yet in June four U-boats were lost and six others severely damaged. DERANGE peaked in July, when Allied aircraft claimed 16 U-boats—among them 3 valuable Type XIV U-tankers—compelling Grand Admiral Karl Dönitz to call off a planned operation in the Western Atlantic.

German losses in the Bay of Biscay dropped considerably thereafter, but the air patrols remained a formidable obstacle throughout the remainder of the war by forcing the U-boats to stay submerged for most of the time during transit. Although the Battle of the Atlantic was ultimately won around the convoys, the Bay of Biscay Offensive contributed to the success by preventing many U-boats from reaching their operational areas in time to saturate convoy defenses, as they had done in March 1943.

Bayerlein, Fritz (1899–1970)

German Army lieutenant general whose various commands included the Panzer Lehr Division. Born in Würzburg, Germany, on January 14, 1899, Fritz Bayerlein joined the German Army at age 16 and fought on the Western Front in World War I. He entered the Reichswehr in 1921 and was

commissioned a second lieutenant in January 1922. Bayerlein held a variety of positions in the interwar years and was a major at the beginning of World War II in September 1939.

During the invasion of Poland, Bayerlein served as chief of staff of the 10th Panzer Division, part of General of Panzer Troops Heinz Guderian's XIX Corps. Bayerlein was also operations officer for Panzer Group Guderian in the May 10–July 11, 1940, Battle for France and was promoted to lieutenant colonel that September. He continued to serve with Guderian as the operations officer of Guderian's Second Panzer Group in the first three months of the invasion of the Soviet Union.

In October 1941, Bayerlein was transferred to North Africa as chief of staff to General of Panzer Troops Erwin Rommel's Afrika Korps (Africa Corps). Bayerlein became chief of staff for Panzer Army Afrika in April 1942 and was promoted to colonel. On August 30 when General of Panzer Troops Walther Nehring was wounded at the start of the Battle of Alam Halfa (August 31–September 7, 1942), Bayerlein took command of the Afrika Korps. He again led a decimated Afrika Korps during its long retreat after the Battle of El Alamein (October 23–November 4, 1942). Wounded during the last days of the fighting in North Africa, he was evacuated prior to the Axis surrender on May 13, 1943.

Bayerlein was promoted to major general in July 1943. In October he took command of the 3rd Panzer Division, beginning his second tour on the Eastern Front. The division distinguished itself in the face of heavy odds, and his breakout of encirclement at Kirovgrad in January 1944 permitted the escape of his and four other German divisions.

Bayerlein then commanded the newly formed Panzer Lehr Division, which he led from its creation in early 1944 until February 1945. Under Bayerlein, who was promoted to lieutenant general in May 1944, the division fought in Normandy. The division helped slow the British advance on Caen but was decimated by the massive air attack on July 25 at Saint-Lô in Allied Operation COBRA (July 25–31, 1944). Later reconstituted, the division was a unit of the XLVII Panzer Corps of General of Panzer Troops Hasso Manteuffel's Fifth Panzer Army in the fighting at Bastogne during December 19, 1944–January 9, 1945. In February 1945 Bayerlein commanded LIII Corps, which included remnants of his old Panzer Lehr Division, and he defended the Ruhr Pocket until its surrender on April 15, 1945.

Bayerlein was held as a prisoner of war until 1947. Following his release, he wrote about his wartime impressions and experiences in North Africa, in the Soviet Union, and on the Western Front. He also contributed more than 20 studies to the postwar German Military History Program. His postwar reminiscences offer insightful historical analyses of Germany's leaders and military campaigns. Bayerlein died in Würzburg on January 30, 1970.

Bayonet

Thrusting weapon attached to the end of a rifle. Developed during the early to mid-17th century in Bayonne, France, the bayonet gave a musketeer a means by which to defend himself during close combat. It eventually rendered obsolete the foot soldiers with pole arms who were employed to protect the musketeers.

The first bayonets were simply inserted into the muzzle of the barrel. This action, however, rendered the firearm useless for its intended purpose. Such plug bayonets were later replaced with the socket style of bayonet that fit over the barrel itself, an invention sometimes attributed to Marquis Sébastien Le Prestre de Vauban. Such bayonets use a metal stud or the front sight to

stay aligned. A simple pressure fit or a locking ring keeps the bayonet attached. The blade is offset from the barrel, allowing the firearm to be loaded and fired with the bayonet mounted. By the 20th century most bayonets were attached, by means of a spring-loaded catch, to a separate lug mounted next to the barrel.

Most early bayonet blades had a triangular cross section. In the early 19th century, long sword bayonets with flat, knifelike cross sections made their appearance. By the 20th century, this style of bayonet was dominant, although numerous other shapes, including the cruciform and the spike, could also be found.

By World War II, the bayonet had lost prominence as a fighting weapon. Its length and weight, which had proven cumbersome in the trenches of World War I, also affected the accuracy of the firearm to which it was attached. Furthermore, many bayonets were expensive to produce, ill-suited as fighting knives, and of little use to the soldier requiring a utility knife capable of opening cans or hammering tent pegs. More important, however, the increased use of rapid-fire semiautomatic and fully automatic weapons had made close combat an increasingly rare occurrence.

Today's soldier still carries the bayonet, but incorporating the experiences of World War II and later conflicts, it is short, well balanced, and strong. It is also capable of performing numerous tasks, both as a weapon and as a tool.

Bazooka

U.S. antitank weapon developed during World War II. The bazooka was based on the hollow- or shaped-charge principle. By the spring of 1942 the U.S. Army had produced an excellent M-10 shaped-charge grenade capable of stopping German tanks, but it lacked an effective means of delivery. U.S. Army colonel Leslie Skinner charged Lieutenant Edward G. Uhl with developing a delivery system for the grenade. Uhl created a small rocket but needed a means of both aiming the weapon and protecting the person firing it from the rocket exhaust. Passing by a scrap pile, Uhl saw a piece of pipe about the same size as the grenade, and that became the solution. Uhl then developed the rocket launcher and is generally credited as the inventor of the bazooka. The prototype M1 was produced at George Washington University in Washington, D.C., with the help of Clarence Hickman, who had worked for rocket pioneer Robert H. Goddard, who had developed a tubed rocket for the army in 1918.

U.S. Army chief of staff General George C. Marshall learned of the experiments and immediately ordered production of 5,000 bazookas, now officially designated Launcher, Rocket, Anti-Tank, M1, to be ready in 30 days. General Electric accepted the contract on May 19, 1942. It is a considerable testimony to American manufacturing that this deadline was met, with 89 minutes to spare.

The M1 bazooka consisted of a sheet metal tube launcher with a wooden shoulder stock, hand grip, and sight (replaced by metal in production models), into which the 60.07mm-diameter (officially designated the “M6, 2.36-inch” to avoid confusion with rounds for the 60mm mortar) rocket grenades were inserted at the rear. The bazooka was operated by a two-man crew of gunner and loader.

The hand grip contained a trigger assembly that was an electric generator to send a current along a wire. Each rocket had two wires extending from the nozzle at its rear; when the rocket was packed, the wires were tucked along the body and grounded with a shorting cap. The loader pulled off the shorting cap before he placed the rocket in the rear of the launcher, then individually tied off the wires against electrical posts at the back of the launch tube that were connected to a two-cell dry battery. When the gunner squeezed the trigger, it generated an electric current through the wires to ignite the solid fuel in the rocket. The rocket had a diameter of 2.36 inches, and its tube launcher was 54 inches long. The rocket weighed 3.5 pounds, and tube and

rocket together were 18 pounds. The rocket's cast steel warhead contained 1.6 pounds of Pentolite high explosive. Skinner named the new weapon the "bazooka" after a long tubular custom-made musical instrument devised by then-popular radio comedian Bob Burns.

The 2.36-inch M1 rocket launcher was introduced in June 1942, and the improved M1A1 appeared in August 1943. The M9 bazooka, introduced in June 1943, was a major redesign and improvement of the original weapon. It was replaced in turn by the M9A1 in September 1944. The 2.36-inch rocket could penetrate about 80mm of armor and proved highly effective against German and Japanese tanks. The Germans used captured bazookas to produce their Raketenpanzerbüsche 54, also known as the *Panzerschreck* (tank terror), but firing a much more deadly 88mm rocket. That in turn spurred the Americans to upgrade from a 2.36-inch to a 3.5-inch rocket.

A U.S. soldier demonstrating the M1 2.36-inch bazooka in 1943. Developed in record time, this weapon was designed for use against enemy tanks. (Library of Congress)

During the Korean War, the 2.36-inch proved ineffective against the better-armored Russian T-34 tank. The 3.5-inch M20 superbazooka arrived in Korea by mid-July 1950. Putting more gas at greater temperature inside a

tank, it could knock out the T-34, the chief communist advantage in the early phase of that conflict.

Beaverbrook, First Baron/Lord

See Aitken, William Maxwell

Beck, Ludwig (1880–1944)

German Army general who was involved in attempts to overthrow German dictator Adolf Hitler. Born in Biebrich, Germany, on June 29, 1880, Ludwig Beck joined the army in 1898 and as a lieutenant attended the Kriegsakademie (War Academy) in Berlin from 1908 to 1911. Promoted to captain in 1913, he qualified as a General Staff officer the same year and served in a variety of staff and command positions during World War I on the Western Front.

Beck remained in the postwar Reichswehr, rising to command of the 1st Cavalry Division. Promoted to major general in February 1931 and to lieutenant general in December 1932, he was appointed, in October 1933, chief of the Truppenamt (Troop Office), the thinly disguised covert General Staff prohibited to the Germans under the 1919 Versailles Treaty. In 1933, Beck was the primary author of *Truppenführung* (Unit Command), which remained the principal war-fighting manual of the German Army until 1945.

The body of doctrine in that manual profoundly influenced the conduct of combined-arms warfare for the remainder of the 20th century.

In March 1935, the Truppenamt was redesignated the General Staff of the Army, and in May, Beck was promoted to General of Artillery. He presided over the expansion of the revived General Staff and the development of war plans based on a defensive strategy. His peers considered him a master military planner. He clearly understood that any future war would necessarily become a multifront conflict, which Germany could not win.

As late as 1935, however, Beck continued to believe that the officer corps of the German Army could keep the National Socialists under control. But as Chancellor Adolf Hitler continued the push to invade Czechoslovakia in 1938, Beck began to oppose him openly, writing a series of memoranda describing the inherent dangers in the policy of aggression. He attempted to mobilize other generals to oppose Hitler's policies but failed to gain the support of army commander in chief Colonel General Walther von Brauchitsch.

In August 1938, Beck retired from the army and was promoted to colonel general. He then organized a covert opposition group of active and retired officers and other conservatives, maintaining contact with other democratic opposition movements. Beck also contacted London in an attempt to secure British and French support for a coup against Hitler. British prime minister Neville Chamberlain declined to support such a move, however. Shortly before the 1940 invasion of Belgium and France, Beck's group tried to warn the Belgians of an impending attack.

By 1943, Beck had become convinced that the only way to save Germany was to assassinate Hitler. His group tried several times, culminating in Colonel Claus von Stauffenberg's bomb attempt on July 20, 1944. If Stauffenberg had succeeded, the conspirators planned to use the Replacement Army (Ersatzheer) to establish martial law, seize the radio stations, and arrest the key Nazi and Schutzstaffel (SS) leaders. As the head of the planned interim government pending free elections, however, Beck refused to agree to the systematic summary execution of party and SS leaders to secure success.

Colonel General Ludwig Beck was chief of staff of the German army before the war. Retiring in 1938, he deeply despised Adolf Hitler and his plans for war and sought unsuccessfully through secret emissaries to convince the British to stand up to the German leader. (Ullstein Bild via Getty Images)

When the conspirators learned that Stauffenberg had failed, Beck nonetheless insisted on continuing the putsch, called Operation VALKYRIE, saying that Germany deserved the attempt; it was unsuccessful. Arrested and confined in the Bendlerstrasse in Berlin, Beck was offered the privilege of shooting himself. When two tries only rendered him unconscious, a sergeant shot Beck in the neck, ending his life on the night of July 20–21, 1944.

Despite being unfairly and inaccurately painted by Heinz Guderian as a rigid and unimaginative opponent of armored warfare, Beck helped rebuild the German military into an efficient war-fighting machine.

Belgium

Belgium, situated in Northwestern Europe, is bordered by the North Sea and the Kingdom of the Netherlands to the north, Germany to the east, Luxembourg to the southeast, and France to the west and south. Belgium encompasses some 30,500 square miles. The nation also possessed the vast Belgian Congo, which completely dwarfed the mother country in size.

At the beginning of World War II in September 1939, Belgium was a constitutional monarchy of some 8.2 million people sharply divided along linguistic lines: the Dutch-speaking Flemish provinces in the north and the French-speaking Walloon area of the south and Flanders. The capital, Brussels, was a Walloon preserve, and French speakers dominated the political, economic, and intellectual life of the nation. In the decades before the war, the Flemish areas were beginning to assert themselves, and a Flemish nationalist party, the Vlammsch National Verbond (VNV), held 17 seats in parliament.

Belgium followed a neutralist foreign policy. The nation had secured its independence from the Kingdom of the Netherlands in 1830, and its neutrality and territorial integrity had been guaranteed by an international treaty signed by the major powers in 1839. The German government's decision to violate that neutrality in August 1914 at the beginning of World War I brought Britain into the war. Occupied by the German Army between

1914 and 1918, Belgium had then allied itself with France. With the increase in tensions in Europe, Belgium again sought refuge in neutrality in 1936. King Leopold III and the tripartite government of the Socialist, Catholic, and Liberal Parties renounced the French alliance. The government, however, proclaimed Belgium's right to maintain a military establishment to protect the nation from attack. This policy of armed neutrality found broad support among the Belgian people, who hoped that it might prevent another attack from the east.

In September 1939 when World War II began, Belgian premier Hubert Pierlot, leader of the Catholic Party, reiterated the government's resolve to remain neutral, and the government deployed the army along both the German and French borders. Belgians knew the true threat was from Germany, and the government reinforced the frontier with Germany following invasion alerts in November 1939 and January 1940. In the latter case, a German military aircraft had landed in Belgium by mistake, and its passenger was found to be carrying the entire German plan to invade the west, including Belgium.

Thus, the German invasion of May 10, 1940, did not catch the Belgian government by surprise. Indeed, some limited military plans had been made with Britain and France to prepare for that eventuality. Nonetheless, the Belgian military was quickly overwhelmed by German troops. Although there had been some coordination with the French and British, there were no prepared positions for the latter, and the military situation rapidly deteriorated. On May 25, King Leopold and his chief ministers met in Wynendaele and agreed on the need to end the military campaign in their country as quickly as possible. Leopold decided to remain in Belgium and share the fate of his subjects, whereas the ministers insisted that the government go to France, with whatever military forces could be withdrawn, to continue the fight against Germany. Both parties did what they believed to be appropriate.

King Leopold surrendered the Belgian Army unconditionally on May 28, without coordinating this decision with the allies who had come to the rescue of his country. This decision produced an immediate 30-mile gap between the British Expeditionary Force and the North Sea that rendered the British military position untenable and forced its evacuation from the French port of Dunkerque (Dunkirk), located only some 6 miles from the Franco-Belgian

border. Having taken this decision, Leopold then repaired to his palace at Laeken outside Brussels, where he remained under self-imposed isolation for the next four years before being removed to Germany in June 1944.

Leopold's ministers, meanwhile, fled to France, where they held a session of the Belgian parliament in Limoges on May 31 and criticized the king's actions. When France fell to the German Army in late June, the Belgian parliamentary representatives abandoned their effort to support the Allies and sought a rapprochement with the king, which he rejected. He—and most Belgians, for that matter—believed that the war was, in effect, over and that Germany had won. These parliamentarians then set up a Belgian government-in-exile in London. Belgian soldiers who escaped their country to Britain later formed the Independent Belgian Brigade, which operated under British command. Most of the 100 ships of the Belgian Merchant Marine evaded capture and, in accordance with a July 1940 agreement, operated under British control.

Following the surrender, German authorities promptly established an occupation government in Belgium. The German enclaves of Eupen, Malmédy, and Saint Vith, assigned to Belgium in the settlement following World War I, were promptly reintegrated into the Reich. A German Army administration nominally headed by General Ludwig von Falkenhausen ruled Belgium. Eggert Reeder, president of the military administration, was the real decision maker and also oversaw German authorities in Belgium, such as the Schutzstaffel (SS) and the Foreign Ministry. Reeder's priorities included advancing the position of the "Germanic" Flemish population at the expense of the francophone Walloons (in accordance with a July 1940 order from German leader Adolf Hitler), ensuring that Belgian industry was harnessed for the war machine of the Reich and administering Belgium with as little German manpower as possible.

On May 10, 1940, the Belgian parliament had passed a law allowing civil servants to administer the country in the absence of the political leaders, and the senior members of each department, the *secrétaries-généraux*, thus became the administrators of Belgium. Reeder worked through these officials in a system of indirect German rule, and although there were conflicts, the *secrétaries-généraux* agreed to maintain law and order and the nation's industrial and agricultural production.

Some Belgian elites were able to use this time of turmoil to enhance their

own positions. The Comité Galopin, a small group of influential bankers and industrialists, controlled the economy and ensured that Belgium provided Germany with the essential materials it required while maintaining their own interests. Many Belgians suffered terribly during the German occupation, however. The dislocation of the fighting and German requisitions led to a severe food shortage, and perhaps a fifth of the population was starving by the fall of 1940. King Leopold III was able to convince the Germans to scale back their requisitions of food, and he was also able to win some exemptions for women, war orphans, and children of war prisoners among those Belgians deported from the country to work in the Reich.

Resistance to the Germans, only sporadic at first, grew with the addition of the communists after the German invasion of the Soviet Union and as the overall German military situation deteriorated. Relations between these resistance groups and the government-in-exile in London were sometimes strained, however.

As in other countries occupied by the Germans, some people collaborated actively and were appointed to positions of influence as a result. The Germans also recruited an SS formation under Léon Degrelle for service on the Eastern Front. For most Belgians, however, the occupation produced a sense of solidarity against the occupier as they struggled to secure food, clothing, and shelter and as they lived with the ever-present risk of deportation to work in the Reich.

Belgium remained under German occupation until September 1944, when Allied troops arrived and rapidly liberated the country, with the Belgian parliament returning to Brussels. The sole feat of resistance by arms was the liberation of the port of Antwerp (September 4–October 2, 1944) and the prevention of its destruction by the German military, an important step. Some German forces remained on islands at the mouth of the Scheldt River until November 28, 1944, from which they were able to prevent the Allies from using the port.

On December 16, on Hitler’s orders, German forces launched what became the December 16, 1944–January 25, 1945, Ardennes Offensive (Battle of the Bulge), the goal of which was to take back Antwerp. During the course of the fighting, the Germans reoccupied part of Belgium, but in January 1945, Allied troops were again able to clear all Belgium of German control.

Belgium was fortunate in that the rapid German advance in 1940 and retreat in 1944 had left its cities and countryside relatively unscathed. Antwerp, the least bomb-damaged port in the Channel area, became a major Allied base in the closing campaigns of the war and was the target of a substantial number of German V-2 rockets in early 1945. The Belgian government took reprisals against collaborators, convicting some 53,000 men and women of assisting the enemy.

Shortly after V-E day (May 8, 1945), King Leopold III and members of the royal family were freed outside Strobl, Austria, by U.S. troops. The king became the center of political turmoil for having surrendered the army and for his refusal to go abroad with his ministers to support a government-in-exile. He was also suspected of having both German sympathies and authoritarian preferences. Then, too, he had compounded his unpopularity by his wartime marriage to a commoner. Leopold's brother, Prince Charles, the Count of Flanders, assumed the title of regent. A referendum in March 1950 gave Leopold a 58 percent favorable vote, but his return led to a major crisis, and he relinquished control of affairs to his son, Baudouin, who became king in 1951.

Belgium, Air Force

Formed in March 1920 as part of the Belgian Army, the Belgian Air Force had fewer than 250 aircraft in May 1940, including 90 fighters, 12 bombers, and 120 reconnaissance aircraft. Of this total, only 50 were relatively modern. Belgium produced some of its own planes, including the Renard R-31 reconnaissance aircraft, but most of its aircraft were acquired from Britain and the United States.

Belgian air bases lacked space to disperse the aircraft, and 53 planes were destroyed on the ground by the Luftwaffe at the beginning of the German invasion of Belgium on the morning of May 10, 1940. Two days later, the Belgians had only between 70 and 80 aircraft remaining. These planes, along with many Dutch aircraft, were incorporated into British and French units. In addition to providing ground support for Allied units, Belgian bombers also carried out one bombing mission in which two squadrons of nine bombers were sent to destroy bridges across the Albert Canal.

Although the strike was successful in hitting the targets, the light bombs the planes carried proved ineffective; moreover, six aircraft were lost. This action was the only independent mission carried out by Belgian aircraft during the campaign. Some Belgian Air Force units participated in the remainder of the Battle for France (May 10–July 11, 1940), in the Battle of Britain (July 10–September 30, 1940), and in the fighting on the Western Front between 1944 and 1945.

Belgium, Army

In 1936, Belgium renounced its 1919 treaty of alliance with France and reasserted its traditional neutrality. As a consequence, Belgian forces did not carry out any joint maneuvers with their potential French and British allies before the German invasion of May 1940.

Belgium mobilized its armed forces beginning on August 25, 1939. With the outbreak of the war, the government immediately reaffirmed the nation's neutrality, retaining the right to strengthen its military to prevent attack. Belgian king Leopold III acted as commander in chief of the armed forces, which consisted of an army of 18 infantry divisions, 2 partly motorized divisions, and 2 motorized cavalry divisions in May 1940. In all, the army numbered some 600,000 men. Although impressive on paper, the army suffered from serious weaknesses. Both its men and officers were poorly trained and equipped. Further, the army had virtually no antiaircraft artillery and only 54 tanks (42 British Carden-Loyd M1934s and 12 French Renault AMC-35s). The navy consisted of only a few small coastal defense vessels.

In hopes of remaining neutral, King Leopold had prevented significant military coordination with the French and British military staffs. Although British and French forces did come to the aid of Belgium when it was invaded by German forces on May 10, 1940, the Germans breached the initial Belgian defensive line along the Albert Canal that same day. King Leopold then withdrew the bulk of his forces to a line east of Brussels. British and French troops reinforced the new line, but the German strike through the Ardennes Forest flanked it. Soon, the Allies were forced to abandon Brussels and the surrounding area.

By May 24 the Belgian Army had regrouped in western Flanders, where it was again supported by both French and British forces. The only major battle of the campaign occurred there on May 24–25, with Belgian forces again unable to hold off the superior German forces. On May 28, King Leopold surrendered his army. In addressing the House of Commons on June 4 concerning the Belgian defeat, British prime minister Winston L. S. Churchill said that the surrender was given "suddenly, without prior consultation, with the least possible notice" and that this action had "exposed our whole flank and means of retreat." Although Leopold's decision was definitely not the cause of the German victory, it rendered the British military

position untenable and led to the evacuation of the British Expeditionary Force at Dunkerque (Dunkirk) during May 26–June 4, 1940.

In the 18 days of fighting during the campaign, the Belgian Army nonetheless fought bravely, with limited resources. Belgian casualties amounted to some 7,500 killed and 15,850 wounded. An additional 2,000 who had been taken as prisoners of war died in German captivity. Some Belgian soldiers and airmen managed to escape to Britain, where they formed the Independent Belgian Brigade and operated under the British for the remainder of the war.

Belgium Campaign (May 10–28, 1940)

A key element of the German invasion of Western Europe. Belgium had proclaimed its neutrality and sought to avoid involvement in World War II, but to invade and defeat France swiftly, the Germans needed to secure Belgium. When Germany invaded Poland in September 1939, thereby initiating World War II, Belgium declared a state of armed neutrality. Prime Minister Hubert Pierlot resolved to defend the country against all invaders and deployed forces along both the French and the German borders.

Still, Belgians knew that the real danger lay to the east, and they had begun mobilizing their armed forces on August 25, 1939. By May 1940, their country fielded an army of more than 600,000 men organized into 22 divisions: 18 infantry divisions, 2 partially motorized Chasseurs Ardannais divisions, and 2 motorized cavalry divisions. Unfortunately for Belgium, this sizable force was hardly equipped to defeat a German invasion. The Belgians

possessed few antiaircraft guns and had only 42 light and 12 medium tanks. What's more, their air service had only 184 operational aircraft. Thus, Belgium had no hope of winning a prolonged land campaign with Germany without outside assistance.

German colonel general Fedor von Bock's Army Group B operated against Belgium and the Netherlands. The Germans committed Colonel General Walther von Reichenau's Sixth Army, with 17 infantry and 2 tank divisions, to the initial invasion of Belgium. It was to drive southwest. General of Artillery Georg von Küchler's Eighteenth Army of 11 divisions (9 infantry and 1 each of cavalry and tanks) was expected to subdue the Netherlands quickly and then drive south to join the fighting in Belgium.

German soldiers raise the Nazi flag at the Royal Castle at Lacken following the German invasion of Belgium in May 1940. (Keystone/Getty Images)

Although Belgian intelligence accurately forecast the German attack that occurred on May 10, 1940, no one anticipated the audacious German attack on the fortress of Eben Emael in the first hours of the fighting. Eben Emael was a series of concrete and steel emplacements north of Liège that guarded bridges over the Albert Canal at Briedgen, Veldwezelt, and Vroenhoven. Garrisoned by more than 700 men, it was crucial to Belgian defensive plans because the only hope of slowing the German panzers lay in keeping them east of the canal. German Army planners took special notice of Eben Emael for that reason, and at 5:25 a.m. on May 10, 1940, they sent 78 specially trained men of Assault Detachment Kock in gliders to crash-land on top of the fortress. The attackers employed hollow charges to destroy the key gun turrets and bunkers. At the same time, German paratroopers captured the major bridges. Troops of the 223rd Infantry Division followed close behind and took the rest of the Belgian position the next day. In less than 24 hours,

the Germans had breached the key Belgian defensive line on the Albert Canal.

Fighting bravely, the Belgians fell back to the Dyle Line east of Brussels, with King Leopold III in personal command. The British and French had planned to send their own forces into Belgium in the event of a German invasion, but there had been little prior coordination between Britain, France, and neutral Belgium. On May 12, however, elements of the British Expeditionary Force (BEF) and General Georges Blanchard's French First Army began joining the Belgian defenders, and by May 15, the Allies had some 35 divisions in the Namur-Antwerp area.

As Reichenau's Sixth Army probed the Dyle Line, Küchler's Eighteenth Army turned south from the Netherlands after the surrender of that country to the Germans on May 15. This threatened the Allied left flank. At the same time and to the south, the hammer blow of Colonel General Karl Gerd von Rundstedt's Army Group A, heavy in tanks, was driving west and then north through the Ardennes Forest. The overall German plan, Operation SICHELSCHNITT (CUT OF THE SICKLE), worked to perfection.

On May 25, King Leopold III met with his ministers at the château of Wynendaele to discuss the possibility of surrender. His ministers wanted to flee to Great Britain and continue the war on the Allied side, but Leopold, despite a pledge to the British and French not to surrender unilaterally, believed that the campaign was lost and that he should end the fighting to save bloodshed and then remain to share the fate of his people. Leopold surrendered the Belgian armed forces on May 28. This exposed the left flank of the British-French line and ended any Allied hopes of holding part of Flanders. British prime minister Winston L. S. Churchill then ordered the Royal Navy to evacuate British forces at Dunkerque (Dunkirk).

The 18 days of the Belgian Campaign cost the nation some 7,500 troops killed in action and 15,850 wounded. At least 2,000 Belgian prisoners of war died in German captivity. The country remained under German occupation for the next four years.

Belov, Pavel Alekseyevich (1897–1963)

Soviet Army general. Born at Shuya, Russia, on February 18, 1897, Pavel Belov joined the Russian Army as a private in 1916 during World War I and rose to noncommissioned officer. In 1919, he joined both the Red Army and the Bolshevik Party. During the Russian Civil War, he commanded a cavalry squadron.

Between 1922 and 1929, Belov led a cavalry regiment. He graduated from the Frunze Military Academy in 1934 and then was deputy commander and later commander of a cavalry division. From 1935 to 1940, he was chief of staff of a cavalry corps.

In 1940, Belov took command of the II Cavalry Corps, later redesignated the I Guards Cavalry Corps, which played a major role in halting the German advance on Moscow in December 1941. Promoted to lieutenant general, Belov took command of the Sixty-First Army from General Markian Popov in June 1942 and participated in heavy fighting with the Germans in the Battle of Kursk (July 5–13, 1943) and also around Voronezh. Promoted to colonel general in July 1944, Belov fought with his army in the recovery of

Ukraine (November 1943–July 1944) and the Soviet invasion of Poland (July 1944–April 1945). He then participated in the Berlin Offensive (March 31–May 2, 1945).

Following the war, Belov commanded the Southern Ural Military District from 1945 to 1955, then chaired the Voluntary Association for Support of the Army, Air Force, and Navy. He retired in 1960 and died in Moscow on December 3, 1963.

Beneš, Edvard (1884–1948)

Czech statesman and president of Czechoslovakia. Born on May 28, 1884, at Kozlany, Bohemia, Edvard Beneš studied at Charles University in Prague, the Sorbonne in Paris, and the University of Dijon, where he earned a doctorate in law in 1908. In 1909, Beneš was appointed professor of economics at the Prague Academy of Commerce, and in 1912, he became a professor of sociology at the University of Prague. There, he met Czech nationalist leader Tomáš G. Masaryk and came to embrace his social and political philosophies. As one of the leaders of the Czech nationalist movement against Austria, Beneš went abroad during World War I, first to Paris, where he worked as a journalist to promote the cause of Czech independence. That same year, he joined the Czechoslovakian National Council, recognized by the Allies in 1918 as the provisional government of Czechoslovakia.

Edvard Beneš, Czech patriot and president of Czechoslovakia (1935–1938, 1945–1948). (Library of Congress)

On his return to Prague at the end of the war, Beneš became the first foreign minister of the new state. From 1918 to 1935, he worked to strengthen the security of Czechoslovakia, the cornerstone of which was a 1924 alliance with France. In addition, he worked to cooperate with Romania and Yugoslavia, with the three states signing collective security arrangements that led to the so-called Little Entente. Beneš was also a tireless advocate of the League of Nations, the predecessor to the United Nations, serving as League Council chairman five times. He secured a mutual security pact with the Soviet Union in 1935.

In December 1935, Beneš succeeded Masaryk on the latter’s resignation as president of Czechoslovakia. The one problem he could not solve was that of the minorities in his nation. The Czechs were not even a majority of the population of the state, and there were serious problems with the Ukrainians,

the Slovaks, and especially the Germans. German leader Adolf Hitler pushed the demands of the latter from relief of grievances into annexation by the Reich of those areas in which Germans were a majority. Beneš and his government went as far as they could without actually ceding territory, but at the September 1938 Munich Conference, the British and French agreed to Hitler's dismemberment of Czechoslovakia. A week later, Beneš resigned and went into exile in France.

Beneš became president of the Czechoslovakian government-in-exile in London in July 1940. He hoped to make his country a bridge between the East and the West, and he signed a 20-year treaty of alliance with the Soviet Union in 1943. He returned to Prague on May 16, 1945, stopping first in Moscow to confer with Soviet leader Joseph Stalin.

Beneš was reelected president in 1946, but his hopes of nonalignment ran afoul of the Cold War. The Soviets staged a coup d'état in Prague in February 1948, and Beneš was forced to accept communist control. Rather than agree to a new constitution that would legalize the communist seizure of power, he resigned on June 7, 1948. Beneš died in Sezimovo Üsti, Bohemia, on September 3, 1948.

Bennett, Donald Clifford Tyndall (1910–1986)

Royal Air Force (RAF) air vice marshal. Born in Toowoomba, Queensland, Australia, on September 14, 1910, Donald Bennett enlisted in the Australian Air Force as a young man, acquiring licenses as a pilot, navigator, wireless operator, and ground engineer. He resigned in 1935 to join British-based Imperial Airways, and in 1938 he set the world's long-distance air record for seaplanes in a flight from Dundee, Scotland, to South-West Africa.

In 1940, Bennett became flight superintendent of the Atlantic Ferry service, and that winter he piloted the first of thousands of American-built airplanes that would be flown to Britain. In 1941 he returned to the RAF, joining the Air Navigation School, where he began to develop pathfinding techniques for guiding bombers to their targets hundreds of miles distant. In 1942, he commanded Number 77 and Number 10 bomber squadrons at Leeming, Yorkshire. Shot down over Norway during an attack on the German battleship *Tirpitz*, Bennett escaped via Sweden and was awarded the Distinguished Service Order.

Shortly afterward, the British Air Ministry directed Bomber Command to establish the Pathfinder Force, and Bennett assumed command of Number 8 Group. The Pathfinder Force quickly developed great expertise in identifying and marking targets and effectively orientating bombers toward them. In 1943, Bennett was promoted to air vice marshal; his contributions to Bomber Command were a major factor in its success, but his relations with other bomber group commanders were often strained. In particular, his colleagues resented losing some of their best crewmen to Number 8 Group.

Bennett left the RAF at the end of the war to become a civil aviation executive. During the 1948–1949 Berlin Airlift, his private commercial aviation firm flew numerous flights to Berlin, 250 of them with Bennett himself piloting an aircraft. For some months in 1945, he had held a vacant seat in Parliament as a Liberal, but he lost it in the general elections that same year. He ran unsuccessfully as a Liberal in 1948 and 1950 and then ran again in 1967 as a decidedly reactionary National Party standard-bearer. Bennett died on September 15, 1986, at Wexham Hospital, Buckinghamshire, England.

Bennett, Henry Gordon "Cocky" (1887–1962)

Australian Army general. Born in Melbourne, Australia, on April 15, 1887, Henry Bennett was an insurance clerk and reserve officer in the early years of the 20th century. When World War I began, he served in the Australian infantry with distinction in the 1915 Gallipoli Campaign and on the Western Front, winning recognition as an outstanding frontline commander. He was also known for his frequent complaints, self-promotion, tactlessness, and poor interpersonal skills.

Between the wars, Bennett pursued a successful business career and rose from colonel to major general in the Australian citizen armed forces. He resented and publicly criticized both permanent regular army officers and British military representatives. Bennett particularly disliked Sir Thomas Blamey, who headed the World War II Australian Infantry Force, a position Bennett coveted.

Despite his seniority, Bennett received no command until September 1940, when he headed the Australian 8th Division. In September 1941, he accompanied his force to Singapore, where his relations with his juniors and with British military officers were predictably fractious. When the Japanese invaded in January 1942, Bennett commanded Westforce on the peninsula, enjoying some initial successes against the Japanese troops. Withdrawing to Singapore Island, he commanded the Western Area, which bore the brunt of the main Japanese assault on February 8. After five days of fierce fighting, Bennett and others advised British commander Lieutenant General Sir Arthur Ernest Percival to surrender. When negotiations began, Bennett handed over

command of his force to a subordinate and with other Australian officers fled by sampan from Singapore, reaching Melbourne on March 2.

Bennett received a mixed reception. He was promoted and became commander of III Corps in Perth, but Blamey ensured that he received no further field command, and in May 1944, Bennett gave up active duty. He published a highly apologist book seeking to explain his conduct, an effort undercut when General Percival was released by the Japanese at the end of the war in August 1945 and wrote to Blamey condemning Bennett's action as desertion. A military court of inquiry ruled against Bennett, although a civilian commission exonerated him, a decision that was generally considered politically motivated. In retirement, Bennett cultivated an orchard farm and wrote extensively on military topics. He died at Dural, New South Wales, on August 1, 1962.

Bergamini, Carlo (1888–1943)

Italian Navy admiral. Carlo Bergamini was born near Modena on October 24, 1888, and became a midshipman in 1908. Bergamini soon demonstrated a talent for technical matters and ballistics, publishing before 1915 studies of an improved fire-control computer. He was considered one of the four fathers of the Regia Marina's mechanical computer directors introduced after 1930.

In 1917, although still a lieutenant, Bergamini became fire-control officer of the armored cruiser *Pisa*, which on October 2, 1918, sank the Austro-Hungarian steamer *Stambul* at Durazzo. Bergamini was promoted to captain in 1932 and to rear admiral in 1937.

In August 1939, Bergamini was promoted to admiral and picked by Italian Navy chief of staff Admiral Domenico Cavagnari as chief of staff for fleet commander Admiral Inigo Campioni. During the spring of 1940, Bergamini was reassigned to fix problems associated with the 15-inch guns of Italy's new battleships *Littorio* and *Vittorio Veneto.* As a consequence, he missed the action off Calabria. Bergamini then supervised the salvage and recovery efforts of Italian ships damaged in the British air attack on Taranto of November 12, 1940. He was passed over for the position of commander of the Italian battle fleet in favor of Admiral Angelo Iachino when Campioni was removed from command, even though the navy's outgoing chief of staff, Cavagnari, considered him an aggressive leader and a first-class technician and had recommended him for the position.

In December 1941, Bergamini assumed command of the V Division of three modernized battleships: the *Doria*, *Duilio*, and *Cesare.* He left port immediately with the mission of escorting an important convoy to Libya at all costs. Interpreting his orders literally, he included his battleships inside the convoy as an antiaircraft screen.

On February 14, 1942, Bergamini sortied with the battleship *Duilio*, two light cruisers, and seven destroyers to intercept a British Malta convoy. The merchant ships in the convoy were disabled by air attacks and scuttled after the British learned of Bergamini's approach, and thus no action followed. In their return to base, the warships encountered a strong storm. Bergamini gave his commanders total freedom of maneuver, and damage was limited, with no ship losses, in stark contrast to the strict centralized control exercised by Admiral Iachino after the Second Battle of Sirte on March 22, 1942.

Bergamini assumed command of the battle force on April 5, 1943. He wanted to sortie on July 10 to attack British convoys off Sicily, although he recognized that with no air support and just two battleships against six (and two carriers) for the British, his chances would be slim. However, both Italian dictator Benito Mussolini and the navy chief of staff vetoed his request. On September 8, 1943, Bergamini was preparing to lead the fleet against the Allied forces off Salerno when news of the armistice arrived. Bergamini wanted to scuttle his ships, but Admiral Raffaele de Courten convinced him to sail them to the Sardinian base at La Maddalena instead. German bombers attacked the fleet at 3:50 p.m. on September 9 while en route, sinking the admiral's flagship *Roma* and taking his life and 1,252 of his men.

Bergamini was known as a humane commander who always demonstrated interest in the welfare of his men. He received the Medaglia d'Oro, Italy's highest military award, both from King Victor Emmanuel III and Mussolini's republic in 1944 and is today considered a key figure in the Italian Navy's history.

Bergeret, Jean Marie Joseph (1895–1956)

French Army general and air minister in the Vichy government. Born in Gray, Haute Saone, France, on August 23, 1895, Jean Marie Joseph Bergeret volunteered for military service at the start of World War I in 1914 and was selected for special officer training at the French Military Academy of Saint-Cyr. Immediately after graduation, he saw combat and distinguished himself, winning rapid promotion. After attending the French War College, he joined the Armée de l'Air, the French military air service, in 1928. He rose to air staff chief of operations and was promoted to brigadier general shortly before the beginning of World War II in 1939.

When Germany invaded France in May 1940, the marked French inferiority to Germany in the air caused Bergeret some humiliation. He remained loyal to the Vichy government, heading the commission that negotiated armistice terms with Italy in the summer of 1940. From September 1940 until April 1942, he served as air minister. The return to the government

of the collaborationist Pierre Laval, whom Bergeret despised, brought his resignation. Bergeret was then appointed inspector of air defenses.

In November 1942, just before the Allied invasion of North Africa, Bergeret joined General Henri Giraud in Algiers, where he became personal assistant and confidential adviser to Admiral Jean Darlan. Bergeret was in charge of the latter's headquarters security arrangements when Darlan was assassinated in his office in December 1942. From then until March 1943, Bergeret was deputy high commissioner for North Africa. In October 1943, a Gaullist purge of the National Resistance Council brought Bergeret's arrest and that of several other Vichy officials, and he was imprisoned until September 1945. Eventually, in November 1948, all charges against him were dropped, although his career was effectively over. Bergeret died in Neuilly, near Paris, on November 30, 1956.

Berlin, Air Battle of (November 1943–March 1944)

Between November 1943 and March 1944, the Royal Air Force (RAF) Bomber Command conducted 16 raids on the German capital in an attempt to defeat Germany by destroying Berlin. This effort was the third in a series of campaigns in 1943, with the first levied against German industrial production in the Ruhr Valley from April to July and the second launched against the city of Hamburg late in July.

The largest city in Germany, Berlin covered nearly 900 square miles. Attacking it not only would strike at the seat of power in the Third Reich but also would cripple a major industrial base for the German armed forces. Factories in Berlin contributed one-third of the Reich's electrical components as well as one-quarter of the army's tanks and half its field artillery.

Bolstered by the success of recent air raids, in particular the attack on Hamburg, British air chief marshal Sir Arthur "Bomber" Harris believed that he could do the same with Berlin and force a German surrender. If he could get the Americans to join in, he expected losses to be between 400 and 500 aircraft. Because of its own recent heavy losses over Germany, though, the U.S. Army Eighth Air Force could not participate.

Despite this setback, Harris received approval in early November 1943 from Prime Minister Winston L. S. Churchill to begin the bomber offensive. Harris employed the RAF's new Avro Lancaster heavy bomber, as this four-engine aircraft had the requisite range to strike targets deep in German territory. The first raid, the largest battle that Bomber Command had yet fought, occurred on the night of November 18–19.

Attacking heavily defended Berlin was not an easy task. The city was ringed with a flak belt 40 miles wide and a searchlight band over 60 miles across. The defenses centered on 24 128mm antiaircraft guns grouped in eight-gun batteries on flak towers. Additionally, the city's extensive subway system provided underground shelter for the civilians. Only the Ruhr region was more heavily defended.

The British employed strips of foil, known as "Window," that were dropped from aircraft to jam German radar. To counter this, the Germans organized groups of single-engine fighters to attack the bombers as they were caught in searchlights. The Germans called this new tactic *Wilde Sau* (wild boar), and the technique helped them until they could develop effective radar. By early 1944, German night-fighter aircraft—primarily Ju-88s, FW-190s, and Bf-109s—were successfully employing bomber-intercept tactics with the help of SN2, an aircraft-based, air-to-air radar that would cause Bomber Command's losses to approach 9 percent for a single raid. To make matters worse for the British, many bombs did not come close to their desired targets, as chronically poor weather over Berlin forced Pathfinders to mark targets blindly, relying exclusively on H2S radar; this problem was exacerbated by

the fact that the number of experienced Pathfinder radar operators dwindled as casualties mounted during the campaign.

The Battle of Berlin came to a close in March 1944 when the bombers passed under the operational control of the Supreme Allied Command to prepare for the Normandy Invasion. During the offensive, Bomber Command flew 9,111 sorties to Berlin and dropped 31,000 tons of bombs. Bomber Command lost 497 aircraft—5.5 percent of the force employed—and more than 3,500 British aircrew were killed or captured. On the German side, nearly 10,000 civilians were killed, and 27 percent of the built-up area of Berlin was destroyed. Harris's goal of defeating Germany was not, however, realized.

Berlin, Land Battle for (March 31–May 2, 1945)

Berlin, the capital of the Reich, was vital to the German war effort. German leader Adolf Hitler spent little time there during the war, but the city was the administrative center of the new German empire and a powerhouse of the war effort. Berlin was also a vital communications and transportation hub and a key production center, particularly for electrical products and armaments.

In August 1940 after the bombing of London, Bomber Command of the Royal Air Force (RAF) raided Berlin, but the city enjoyed a respite thereafter until March 1943. The battle for the city began in earnest in November 1943 with the first in a long series of punishing Allied air raids, with particularly severe attacks in March 1944. Berliners managed to carry on amid the ruins.

Hitler returned to Berlin from the Adlerhorst (Eagle's Nest), his retreat at Ziegenberg, by train on January 16, 1945, and as the war drew to a close, the city became the ultimate prize, at least for the Soviets. Soviet leader Joseph Stalin wanted it desperately. So did British prime minister Winston L. S. Churchill, but he was overruled by U.S. leaders, who showed little interest in capturing the city, particularly after agreements setting up the postwar occupation placed Berlin deep within the Soviet zone.

Soviet bomber aircraft supporting the Red Army troops on the ground in the Battle for Berlin, April 20, 1945. (Sovfoto/UIG via Getty Images)

Supreme commander of Allied forces in the west General Dwight D. Eisenhower, who was in any case distracted by a phantom Nazi Alpine "National Redoubt," said he had no interest in taking the city. High casualty estimates (Lieutenant General Omar Bradley posited a cost of 100,000 men)

also deterred Eisenhower. Thus, although U.S. forces, including the 82nd Airborne Division, were readied for such an assault, the task was left to the Soviets.

Stalin concealed the U.S. ambivalence concerning Berlin from his front commanders, Generals Ivan S. Konev and Georgii K. Zhukov. By early February, Zhukov's 1st Belorussian Front and Konev's 1st Ukrainian Front had completed the initial phase of their advance into Germany. Zhukov's troops were across the Oder River, 60 miles from Berlin. The Soviets had surrounded large German troop concentrations at Breslau and Posen. Soviet forces carried out a horrible revenge on eastern Germany, in which tens of thousands of civilians were murdered. Total German casualties ranged into the millions.

Zhukov might then have pushed on to the capital in another several weeks had not Stalin ordered a halt, necessary because of logistical problems resulting from the vast distances the Soviet forces had covered to that point. Meanwhile, Konev's forces threatened the German capital from the southeast. In defense of Berlin, Hitler had only the remnants of his Third Panzer and Ninth Armies, now constituting Army Group Vistula. In March, however, he ordered that the city be held "to the last man and the last shot."

On March 8, alarmed by the American crossing of the Rhine the day before, Stalin summoned Zhukov to Moscow to discuss an offensive against Berlin. The now rapid progress of the Western Allies eastward set off alarm bells in Moscow, and Stavka (the Soviet high command) rushed plans for an offensive to take the German capital. On March 31, Stalin ordered the offensive to begin.

Zhukov would make the principal drive on Berlin, while Konev supported him on the left flank and Marshal Konstantin Rokossovsky's 2nd Belorussian Front moved on Zhukov's right flank. Altogether, the three fronts had some 1.5 million troops, 6,250 armored vehicles, and 7,500 aircraft. Opposing them, the German Ninth Army and Third Panzer Army had only 24 understrength divisions, with 754 tanks and few aircraft.

Zhukov's frontal assaults on Berlin's defenses from the east failed. On April 18, Stalin ordered him to proceed around Berlin from the north, while Konev encircled the city from the south. Hitler, meanwhile, ordered his Ninth Army to stand fast on the Oder, thus facilitating Konev's move.

On April 20, Hitler's birthday, Konev's tanks reached Jüterbog, the

airfield and key ammunition depot south of Berlin. That same day, Hitler allowed those of his entourage who wished to do so to leave the city. He pledged to stay.

The Soviets completed the encirclement on April 25. Also on that day, Soviet and U.S. forces met on the Elbe River. Hitler attempted to organize the Ninth Army as a relief force for Berlin, but it too was surrounded and soon destroyed. Although Lieutenant General Walther Wenck's Twelfth Army tried to reach Berlin from the west, it was too weak to accomplish the task.

Meanwhile, the defense of Berlin itself fell to miscellaneous German troops unfortunate enough to be pushed back there and by old men and boys hastily pressed into service for the daunting task. On April 30, with the defenders' ammunition nearly depleted, the defenses fast crumbling, and Soviet troops in the Reichstag (parliament) building, Hitler committed suicide in his underground bunker. On May 2, Lieutenant General Hans Krebs, chief of the German General Staff, surrendered Berlin.

Given their country's suffering in the war, Soviet soldiers hardly needed encouragement to destroy the German capital, the symbol of Nazism, and they committed widespread atrocities in the city both during and after its fall.

Bradley's estimate of the cost of taking Berlin was, in fact, low. According to one source, the "Berlin Strategic Offensive" from April 16 to May 8, involving the 1st Belorussian, 2nd Belorussian, and 1st Ukrainian Fronts, produced a staggering total of 352,475 Soviet casualties (including 78,291 dead)—an average of 15,325 a day.

Bernadotte, Folke (1895–1948)

Swedish diplomat and Red Cross official who worked on behalf of prisoners of war. Folke Bernadotte was born in Stockholm, Sweden, on January 2, 1895; his father was a brother of King Gustav V. Although hemophilia limited his activities, Bernadotte served in the Swedish Army from 1918 to 1930. His skills were diplomatic rather than military, and he also worked closely with the Swedish Red Cross, of which he became a vice president, organizing prisoner-of-war exchanges.

Bernadotte was also a vice president of the Swedish Boy Scouts, and during World War II, he integrated that organization into neutral Sweden's defense network. He traveled extensively on behalf of the Swedish Red Cross, arranging exchanges of thousands of British and German prisoners in 1943 and 1944, and between 1944 and 1945, he concluded an agreement with Germany whereby Scandinavian prisoners would be transferred to the Neuengamme camp near Hamburg.

Count Folke Bernadotte of Sweden. As an intermediary between the Allies and Germany during World War II, he successfully negotiated the exchange of thousands of prisoners held by the Allies and Germans. (United States Holocaust Memorial Museum, courtesy National Archives)

Bernadotte visited Berlin in February 1945 to finalize the details of this arrangement with Heinrich Himmler, head of the Schutzstaffel (SS). At that time, Himmler expressed interest in negotiating surrender terms with the Western Allies, under which the Germans would spare those Jews still alive in concentration camps in exchange for Allied concessions. (Bernadotte has sometimes been criticized for a lack of concern about rescuing Jews, but this charge is based on a forged letter purportedly sent from him to Himmler.) In April 1945, Himmler met again with Bernadotte, suggesting that Germany would surrender in the west to Britain, France, and the United States, in exchange for their assistance against the Soviet Union in the east. Bernadotte relayed these suggestions to British prime minister Winston L. S. Churchill,

who passed them on to U.S. president Harry S. Truman, only to have them promptly rejected.

Bernadotte became president of the Swedish Red Cross in 1946. In May 1948, the United Nations appointed him to mediate peace in Palestine. Just four months later, however, on September 17, 1948, Jewish terrorists of the Lohamei Herut Israel (Lehi Group or Stern Gang) assassinated Bernadotte in Jerusalem.

Besson, Antoine Marie Benoit (1876–1969)

French Army general. Born on September 14, 1876, in Saint Symphonien near Lyons, France, Antoine Marie Benoit Besson graduated from the French Military Academy of Saint-Cyr in 1898. He then joined the 4th Regiment of Zouaves. During World War I, he distinguished himself in fighting on the Western Front, winning numerous decorations and eventually rising to command his regiment.

In July 1937, Besson was promoted to general of the army, commanding the Sixth Army, and he became a member of France's Supreme War Council. During the German invasion of France beginning on May 10, 1940, he commanded the 3rd Army Group (consisting of three armies totaling 36 divisions on the extreme right flank of the Allied line) on the Colmar-Mulhouse section of the front, protected by the Jura Mountains and Switzerland.

Following the German breakthrough, Besson followed orders and withdrew to the Seine River on June 8 to positions below the Aisne and Somme Rivers as far as Neufchâtel. Within a week as his men retreated in disorder to be isolated on the Loire River, he became a strong advocate for an

armistice, preferring that outcome to the continued senseless slaughter of his men. Besson spent the remainder of the war as a German prisoner of war. Subsequently, he became director of the French Prisoner of War Service. Besson died in Paris on July 25, 1969.

Beta Convoy Battle (November 9, 1941)

Royal Navy interception and destruction of a large Axis convoy carrying vital supplies to North Africa. Under pressure to more effectively interdict traffic to Africa, Vice Admiral Sir Andrew B. Cunningham, commander of the British Mediterranean Fleet, dispatched Force K under Captain W. G. Agnew, consisting of the light cruisers *Aurora* and *Penelope* and the destroyers *Lance* and *Lively*, to Malta on October 21, 1941.

In response, Italian naval headquarters temporarily suspended convoys, but a planned November 21 Axis offensive in North Africa forced the dispatch of an unusually large convoy, code-named Beta, of seven ships with ammunition, fuel, and vehicles. Beta received an unusually strong escort, consisting of the 10th Destroyer Squadron under Captain Ugo Bisciani, including the *Maestrale, Fulmine, Euro, Grecale*, *Libeccio,* and *Oriani*, and a distant escort of the III (heavy cruiser) Division under Rear Admiral Bruto Brivonesi with the *Trieste* and *Trento* and the 13th Destroyer Squadron of the *Granatiere, Fuciliere, Bersagliere*, and *Alpino.*

The Italian convoy's route to Tripoli circled east of Malta. Experience taught that aircraft were the principal danger during the day and that a surface interception at night was nearly impossible unless enemy forces knew the convoy's exact route and speed. If, however, a night encounter did occur,

improved training and the recent introduction of a primitive radar detection and jamming device gave the Italians some confidence that their escort could handle the situation. The Italians did not, however, understand the evolving capability of British radar or that signals intelligence had disclosed the convoy's itinerary.

Acting on Enigma decrypts, a British aircraft discovered Beta on the afternoon of November 8. Force K weighed anchor at 5:30 p.m., but the aircraft that was to vector Force K onto its target suffered equipment failures. Finally, at 12:39 a.m., the *Aurora*'s lookouts sighted the Italian ships. The transports were in two columns of three, with the odd ship bringing up the rear. The *Maestrale* sailed at the convoy's head, while the *Euro* and *Fulmine* guarded the starboard side, the *Oriani* and *Libeccio* the port side, and the *Grecale* the rear. The III Division and the 13th Squadron zigzagged five miles astern, the area believed most vulnerable to British attack.

The *Aurora* maneuvered to a down-moon position on the convoy's starboard quarter. Lookouts on the *Fulmine* sighted the British ships but assumed they were Brivonesi's cruisers. British lookouts likewise spotted the III Division looming in the darkness, but Captain Agnew assumed they were more merchant ships, and he decided to focus on the larger target dead ahead.

In the faint moonlight, the *Aurora* laid its guns with radar and opened fire at 12:57 a.m. at a range of 5,700 yards, followed seconds later by the *Penelope* and *Lance.* Their initial barrage severely damaged the *Grecale.* The convoy leader, the *Maestrale*, reacted to the outburst by turning away from the British. The escort commander assumed that Brivonesi's cruisers had the starboard quarter covered, and he was uncertain of the direction from which the sudden attack had come. The *Libeccio* and *Oriani* remained on the unengaged side. Brivonesi's lead destroyer broadcast an alert, and, in response, the admiral steered southwest and increased speed from 12 to 18 knots.

At 12:59 p.m., the *Aurora* turned to run down the convoy's starboard side, unknowingly pulling away from Brivonesi's approaching cruisers. The merchant ships filled the air with antiaircraft fire and made no attempt to scatter or turn away. At 1:03 a.m., the *Fulmine* tried to make a torpedo attack, but 6-inch gunfire from the *Penelope* exploded on the Italians' bridge and mortally wounded the captain. At the same time, the *Trieste* opened fire 7,000 yards off the *Lively*'s starboard quarter. No one in Force K realized that

a pair of heavy cruisers was even present. Several more broadsides struck the *Fulmine,* causing the destroyer to capsize and sink within minutes.

The *Euro* turned toward the British ships and closed to 2,000 yards. However, the escort commander on the *Maestrale* ordered the destroyers to concentrate around his flagship on the convoy's other side, which caused the *Euro*'s captain to think that the British must be there and that he was stalking the *Trieste.* Consequently, he turned away, realizing his mistake only when the *Aurora* and *Penelope* engaged. The cruisers hit *Euro* six times, but their shells passed through without causing crippling damage. As the *Maestrale, Libeccio, Oriani,* and *Euro* withdrew east to regroup, the convoy continued on course, engaging imaginary bombers. The British circled around the convoy's head, and at 1:25 a.m., they began passing up the convoy's other side, setting ablaze one ship after another.

The Italian III Division and 13th Squadron were still steaming south as the British column disappeared behind the smoke of the burning steamers, and the heavy cruisers ceased fire and turned north at 1:29 a.m., when Brivonesi attempted to intercept the British withdrawal. With every ship in sight burning, Force K headed home at 2:05 a.m. and, at 2:30 a.m., passed 20 miles astern of Brivonesi's cruisers, which were still steaming north. Force K had destroyed all seven transports, sunk the *Fulmine,* heavily damaged the *Euro* and *Grecale,* and escaped harm itself except for splinter damage to the *Lively.*

The Beta action was one of the most brilliant British naval surface victories of the war, demonstrating superior doctrine, technology, and leadership coupled with luck, surprise, and inept opposition. Italian Naval Headquarters relieved both commanders. The Germans were furious at the battle's outcome and tried to force their advisers upon the Italians.

Béthouart, Marie Émile Antoine (1889–1982)

French Army general. Born at Dôle, France, in the Jura Mountains, on December 17, 1889, Marie Émile Antoine Béthouart graduated from the French Military Academy at Saint-Cyr in 1912. During World War I, he served with Alpine troops and was wounded three times. As French military attaché, he was present when King Alexander of Yugoslavia and French foreign minister Louis Barthou were assassinated at Marseille, France, in October 1934.

Promoted to general of brigade in April 1940, Béthouart led the Franco-Polish expeditionary force that took part in the Norwegian Campaign of that spring. After France surrendered to Germany in June 1940, he initially remained with Vichy forces and took over the Casablanca Division in southern Morocco.

By late 1942, Béthouart was prepared to collaborate with U.S. forces invading North Africa, and he negotiated with American representatives, including U.S. civilian Robert Murphy. Béthouart promised that men under his command would occupy all key points and welcome the invaders. At the last moment in the confused meetings and negotiations, he also informed his superior, Governor-General Charles Noguès. Noguès had earlier warned the Americans that his forces would oppose them, and he ordered Béthouart and a subordinate arrested and tried for treason. Noguès then ordered their execution, a command that U.S. Army major general George S. Patton Jr. was able to countermand following the American landing.

From December 1942, Béthouart headed the French mission in Washington, negotiating military aid from the United States. Returning to Algiers, he became chief of the National Defense Staff, organizing the French Army of Africa in preparation for the invasion of France. In August 1944, Béthouart commanded I Corps of the French First Army in the invasion of southern France, through the Vosges Mountains into Alsace and across the Rhine as far as the southern bank of the Danube. His men saw particularly heavy action in the Colmar region.

Béthouart subsequently headed French occupation forces in Austria. In 1949, he became a general of army. After retiring in 1955, he entered politics and became a senator. Béthouart died in Fréjus in southern France, on October 17, 1982.

Bevin, Ernest (1881–1951)

British trade unionist, statesman, and member of the War Cabinet. Born at Winsford, Somerset, England, on March 7, 1881, the illegitimate son of a village midwife, Ernest Bevin became a drayman in Bristol. During a dock strike in 1910, he affiliated the local carters with the Dockers' Union. By 1914, Bevin was a national organizer for the Transport Workers' Federation.

Although noted for his pugnacious personality, Bevin preferred negotiation to confrontation with employers. He supported British participation in World War I and later made the massive Transport and General Workers' Union, which he organized in 1921, a restraining force on volatile occasions such as the General Strike of 1926. Bevin deplored the coalition with Conservatives and Liberals formed in 1931 by Labour prime minister Ramsay MacDonald, but his equally strong distaste for pacifism and appeasement of the fascist regimes alienated him from other Labour Party leaders who had also broken with MacDonald. Bevin was finally drawn

toward Conservative Winston L. S. Churchill's circle, which refused to countenance appeasers.

When Churchill became prime minister in May 1940, he appointed Bevin minister of labor, bringing him into the War Cabinet the following October. Bevin remained at his post until the Labour Party withdrew from Churchill's wartime coalition in May 1945. Many asserted that no one else could have mobilized the country's manpower and industrial resources as efficiently. With a mixture of coercion and rewards informed by humane common sense, Bevin reluctantly conscripted and deployed workers, including women, where they were most needed.

But Bevin also insisted on full rights of collective bargaining with employers and adequate provision for workplace safety and comfort. Work stoppages nearly disappeared. Ministers responsible for production and procurement often challenged him, but skillful use of his near dictatorial powers and the intense personal loyalty he evoked among millions of workers gave him the advantage in political and bureaucratic controversies.

When the British Labour Party took office after Churchill's electoral defeat in July 1945, Bevin became foreign secretary. Until ill health forced his retirement in 1951, he strove to prevent the spread of communism in Western Europe and successfully built an anti-Soviet alliance that included the United States. Bevin died in London on April 14, 1951.

Bey, Eric (1898–1943)

German Navy admiral. Born in Hamburg on March 23, 1898, Eric Bey joined the Imperial German Navy during World War I on June 13, 1916, and served

in destroyers. He continued in the German Navy (the Reichsmarine) after the war and, by the beginning of World War II, had risen to the rank of commander in the Kriegsmarine (the navy of the Third Reich). After engaging in mine laying off the English coast in December 1939, Bey commanded the 4th Destroyer Flotilla of three destroyers in Commodore Friedrich Bonte's naval force transporting troops of the 3rd Mountain Division to the port of Narvik during the German invasion of Norway on April 9, 1940.

In the naval battles at Narvik on April 10 and 13, 1940, Bey distinguished himself in leading his destroyers against superior Royal Navy resources, including the battleship *Warspite.* Despite the annihilation of his command, his performance earned him the Knights Cross of the Iron Cross. On May 10, 1940, Bey was promoted to captain and given command of the German destroyer force, succeeding Bonte, who had been killed at Narvik on April 10. Bey commanded the destroyer screen protecting the battle cruisers *Scharnhorst* and *Gneisenau* and the heavy cruiser *Prinz Eugen* in Operation CERBERUS (the so-called Channel Dash) in February 1942.

Promoted to rear admiral, Bey commanded the task force consisting of the battle cruiser *Scharnhorst* and the destroyers *Z29, Z30, Z33, Z34*, and *Z38* that sortied from Altafjord, Norway, on December 25, 1943, in Operation OSTFRONT, intending to intercept Allied Convoy JW-55B en route to Murmansk. Bey was freed of the restraints that Chancellor Adolf Hitler had imposed on German surface warships. Bey separated his destroyers to search for the convoy to the southwest while he proceeded north in the *Scharnhorst*, only to encounter a superior British force led by the battleship *Duke of York* that had located the German ship by radar. The ensuing Battle of the North Cape on December 26 was fought in conditions of poor visibility, with the British enjoying significant radar superiority. It was also the last classic single-ship duel between battleships.

The forward radar on the *Scharnhorst* was destroyed early in the battle by a lucky shot from the heavy cruiser *Norfolk* of the British screening force. In the ensuing running battle, the *Scharnhorst* was hit by both shells and torpedoes and went down. Of its crew of 1,968 men, only 36 were plucked alive from the icy waters, no officers among them. Reportedly, Bey and the *Scharnhorst*'s captain were spotted in the water badly wounded, but they

disappeared before they could be rescued. The sinking of the *Scharnhorst* ended German surface attacks on the Allied Murmansk convoys.

Bhamo, Siege of (November 14–December 15, 1944)

Key battle in north Burma (today Myanmar) in late 1944. In August 1944, Allied forces had taken Myitkyina on the China-Burma border. Chinese generalissimo Jiang Jieshi (Chiang Kai-shek) then demanded that Chinese divisions at Myitkyina be directed south against Bhamo to draw off the Japanese from Lungling. Lieutenant General Joseph W. Stilwell, commander of all U.S. Army forces in the China-Burma-India theater and chief of staff to Jiang, opposed this move on the basis that the troops needed rest, but he also believed the Japanese could hold Bhamo without withdrawing troops from Lungling. In mid-September, Jiang again demanded that Stilwell undertake an offensive against Bhamo to take pressure off Lungling; if that did not occur, he said, he would withdraw Y-Force back across the Salween River to protect Kunming. Jiang feared that a Japanese victory at Lungling would be followed by an attack on Kunming.

With the rainy season in north Burma coming to an end and as part of a campaign to take Rangoon, Stilwell ordered a renewal of the offensive. He had five Chinese divisions, the excellent British 36th Division, and the Mars Force of one Chinese and two U.S. regiments. Opposing him was Japanese lieutenant general Honda Masaki's Thirty-Third Army of three understrength

divisions. Stilwell planned an envelopment to trap the Japanese between his own force and Y-Force in Yunnan.

The offensive opened on October 15, 1944, with Chinese lieutenant general Sun Liren (Sun Li-jen) and his First Army, composed of the 30th and 38th Divisions, advancing toward the main elements of the Thirty-Third Army at Bhamo as the British 36th Division moved down the Railroad Corridor to protect the flank. At the same time, the bulk of Stilwell's troops were to proceed south from Mogaung, cross the Irrawaddy River near Shwegu, and gain the Burma Road near Lashio.

On October 18, three days after the offensive began, Stilwell was relieved of command. The charge that the American general had disobeyed orders in failing to advance on Bhamo was part of Jiang's litany of complaints in demanding Stilwell's relief. U.S. Army lieutenant general Dan I. Sultan, Stilwell's deputy, took over as commander of U.S. and Chinese forces in the South-East Asia Command.

On November 6, Chinese forces began crossing the Irrawaddy, and on November 14 the siege of Bhamo began. Stubborn Japanese defenses there held up the Chinese 30th and 38th Divisions for a month. With further resistance impossible, some 800 Japanese survivors managed to escape at night, rejoining the 56th Division in the mountains between Bhamo and Namkham. The siege officially ended on December 15. The Chinese divisions then began a slow pursuit.

The offensive was soon abandoned, the consequence of a Japanese offensive in China. Jiang decided to withdraw the Chinese 14th and 22nd Divisions from Burma. Both were flown out to stop Japanese drives in southern China. This action forced Sultan to abandon Stilwell's plan to encircle the Thirty-Third Army in favor of securing the road east from Bhamo to Namkham.

Biak, Battle for (May 27–August 17, 1944)

Battle during the Papua New Guinea Campaign. Biak (also spelled Wiak) is a small island some 45 miles long and 23 miles wide located at the entrance of Cenderawasih (Geelvink) Bay near the northwestern coast of Papua New Guinea, then part of Dutch New Guinea (from the 1960s, it has been part of Indonesia). Biak is the largest island in the small archipelago of the same name (formerly the Schouten Islands).

The Japanese took Biak Island in April 1942 and constructed a large air field complex there. U.S. Southwest Pacific theater commander General Douglas MacArthur was determined to secure Biak for subsequent operations against the Philippines, but he erred in his estimate that the Japanese had only some 3,000 troops on the island, code-breaking information to the contrary. In fact, Colonel Kuzume Naoyuki commanded some 11,000 defenders. During the subsequent fighting the Japanese also landed some 1,200 reinforcements but lost at least one destroyer in the effort. The Japanese had also constructed extensive fortifications on Biak, taking advantage of numerous caves in the hills and constructing pillboxes and bunkers.

Following naval bombardment and air attacks from the newly secured airfield on Wakde Island, on May 27 Major General Horace H. Fuller's U.S. 41st Infantry Division, less its regimental combat team at Wakde, landed on Biak near the principal town of Bosnek and moved inland for the airfields near Mokmer village. Only then did the Japanese emerge from their caves to mount a surprisingly effective resistance in some of the bitterest fighting of the Pacific war.

On May 29, Kuzume committed a number of light 9-ton tanks armed with 37mm guns to attack an isolated American battalion. In the first tank-on-tank battle in the Pacific theater, these were destroyed by the more powerful (75mm gun) U.S. M4 Sherman tanks. Having declared victory on Biak early

in the fighting, the stubborn MacArthur was loath to send in reinforcements, especially with Americans celebrating the triumph of his rival, General Dwight D. Eisenhower, at Normandy. MacArthur dispatched Lieutenant General Robert Lawrence Eichelberger to take command of operations on Biak. Despite some reinforcements, Japanese resistance continued until an amphibious landing at Wardo Bay on August 17.

U.S. losses in securing the island amounted to some 400 killed and 2,000 wounded. Nonbattle casualties, chiefly from typhus, were more than 7,000. Later, Biak's airfields were transferred to the Royal Australian Air Force.

During the fighting and concerned that an American success here would threaten Japanese land-based air supremacy over the waters south of the Palaus, Japanese admiral Toyoda Soemu ordered the giant battleships *Yamato* and *Musashi* to proceed at flank speed for Biak and shell the landing sites there. This mission was called off on June 13, however, with news of the American landings on Saipan.

Biak, Naval Battle of (June 8–9, 1944)

Pacific theater naval action during June 8–9, 1944, resulting from the U.S.-Australian interception of a Japanese destroyer force attempting to reinforce Biak Island.

On May 27, 1944, U.S. troops landed on the large island of Biak (also spelled Wiak), off western New Guinea, as part of General Douglas MacArthur's Southwest Pacific Campaign. Hoping that a long struggle for Biak would provoke a decisive battle, the Japanese Navy attempted to ferry reinforcements to the island in destroyers.

Six destroyers (three towing troop barges) and the cruisers *Aoba* and *Kinu* departed Sarong at midnight June 7 under the command of Rear Admiral Sakonju Naomaso. Allied aircraft spotted the Japanese, and at 12:45 p.m. on June 8, 10 U.S. Army Air Forces North American B-25 Mitchell twin-engine medium bombers sank one of the destroyers and three barges. The cruisers turned back, but Sakonju pressed on with the five surviving destroyers. These included the *Shikinami*, *Shigure*, and *Uranami* in the support role and the *Shiratsuyu* and *Samidare* in the transport role.

Task Force (TF) 74/75, commanded by Royal Navy rear admiral Victor Crutchley, guarded Biak against a Japanese landing. TF 74/75 included the heavy cruiser *Australia*, the light cruisers *Phoenix* and *Boise*, and 13 destroyers (Destroyer Division 42 under Commander Albert E. Jarrell with 4 ships, Destroyer Division 47 under Captain Kenmore M. McManes of 4 ships, Destroyer Division 48 under Commander John B. McLean with 3 ships, and an Australian destroyer division of 2 ships).

At 10:00 p.m. on June 8, a search plane warned Crutchley that the Japanese force was 60 miles to the northwest. Thinking that the nearly full moon made a surprise torpedo attack unlikely and that the destroyers would need gunfire support from the cruisers, Crutchley intended to assume battle formation after contact. At 11:20 p.m., the *Boise* reported a contact at 26,000 yards. Sakonju sighted Crutchley's force at the same time, and at 11:23 p.m., the Japanese reversed course, made smoke, and launched torpedoes while casting off the troop barges they had been towing.

After the sighting, Crutchley methodically formed his cruisers into column and ordered Destroyer Division 47 to the van, Division 48 to the rear, and Division 42 to take station on the cruiser column's port quarter. Commander Jarrell, however, noted that the range was opening. Disregarding Crutchley's instructions, he swung north in pursuit of the enemy. Crutchley released divisions 47 and 48 to join Division 42. It was 11 minutes after first contact and 8 minutes after the Japanese had reversed course. Meanwhile, the cruisers worked up to 25 knots while the two Australian destroyers trailed. At

11:40 p.m., a torpedo passed behind the *Boise*, causing the column to maneuver and lose more ground. Division 42 began seeing troop barges at the same time; the destroyer *Fletcher* passed one so rapidly that its machine guns could not track fast enough to fire.

At 12:17 a.m. on June 9, the *Fletcher* opened fire with its bow mounts, hoping for a lucky hit or at least to force the enemy to maneuver. The Japanese replied in kind, hoping for a similar result. At 12:45 a.m. the cruisers dropped out, and Crutchley recalled Division 48 to screen them while the Australian destroyers backtracked to hunt down the barges. Jarrell's Division 42 and McManes's Division 47 continued the chase.

At 1:26 a.m., when it had closed the distance to 14,000 yards, Division 42 turned to port, and all four ships fired broadsides hoping to drive the Japanese ships toward Division 47. This scheme provoked more torpedoes from the Japanese and brought Division 47 to within 15,000 yards, whereupon it likewise opened fire. At 2:11 a.m., lookouts reported an explosion. The Americans had hit the *Shigure* twice, but its speed was unaffected. Finally, at 2:27 a.m., facing a deadline imposed by Admiral Crutchley, the Americans broke off contact. Ironically, most of the Japanese barges delivered their troops to Biak.

"Big Week" Air Battle (February 20–25, 1944)

Name later given by the press to air combat over Germany during Operation ARGUMENT, a series of intensive Allied air strikes at the end of February 1944 against the German aircraft industry's final-assembly plants, ball-bearing factories, and facilities producing aircraft components. The Western Allies initiated the operation to reduce the numbers of Luftwaffe fighters contesting the presence of Allied bombers over Germany and to prepare for the invasion of Normandy. Although the Luftwaffe still maintained significant numbers of aircraft, it could not long survive both sustained losses in the air and attacks on its production facilities.

A period of clear weather allowed the Allies to begin the campaign. Bomber Command of the Royal Air Force (RAF) joined in for nighttime raids, but the bulk of the attacks were carried out by the U.S. Army Air Forces (USAAF) in daylight operations. Between February 20 and 25, 1944, some 1,000 bombers and 900 fighters of the U.S. Eighth Air Force carried out 13 major attacks against 15 centers of the German aviation industry, such as the Messerschmitt -Bf-109 factory at Leipzig. In the last four days of the offensive, the Fifteenth Air Force, headquartered at Foggia, Italy, joined in.

During February 20–25, the Eighth and Fifteenth Air Forces flew a combined total of 3,800 sorties (3,300 from England, 500 from Italy) and dropped almost 10,000 tons of bombs. German fighters contested the raids, and USAAF losses were heavy but acceptable, with 226 bombers shot down (137 from England and 89 from Italy) amounting to 6 percent of the force engaged. Fighters from other Allied countries also flew 3,673 sorties. A total of only 28 fighters were lost (for a rate of less than 1 percent). Total U.S. personnel losses in killed, wounded, and missing were 2,600. The USAAF claimed more than 600 German fighter aircraft shot down, although actual German losses were probably on the order of 355, with nearly 100 pilots killed in action.

The aircraft factory at Obertraubling, Germany, following a U.S. raid on February 22, 1944, by planes of the U.S. Fifteenth Air Force. Unfinished ME-109 jet fighters lie among the debris. (Corbis)

In “Big Week” the USAAF North American P-51 Mustang fighter played a notable role. Equipped with long-range fuel tanks, it could accompany the bombers all the way to Germany and return. The Mustang outclassed the German fighters in speed, ceiling, and climb rate. German fighters were simply no match for it, especially with many weighed down by the heavy armaments designed to destroy the Allied bombers. The Luftwaffe now removed from service in the west its twin-engine antibomber designs such as the Messerschmitt Me-410 Hornisse (Hornet) that had earlier proved highly effective against the Allied bombers but were extremely vulnerable to the more nimble Allied fighters. The defense of Germany in the skies passed primarily to the higher-performance single-engine designs.

Big Week also saw the USAAF register two firsts. The USAAF sent aloft 1,000 bombers, and the number of its aircraft exceeded those of Bomber Command. From this point forward the USAAF carried the majority of the bomber war against Germany. In the months following Big Week, the Allied bombers switched over to concentrate on German oil-production facilities.

Clearly, the days of the Luftwaffe were numbered. Big Week boosted morale among USAAF bomber crews and was a major defeat for the Luftwaffe. German aircraft production levels fell off in the weeks to come, and although they would rise again later in the spring, by that time Allied fighters were more than a match for anything the Germans could send aloft. Particularly grievous from the German standpoint was the number of trained fighter pilots lost. This reduction in German air strength was an essential prelude to the successful Normandy Invasion in June 1944.

Billotte, Gaston Henri Gustave (1875–1940)

French Army general. Born on February 10, 1875, in Sommeval (Aube), near Troyes, France, Gaston Henri Billotte graduated from the French Military Academy of Saint-Cyr in 1896. Commissioned in the naval infantry, he served in Indochina until 1915, and during World War I he held a variety of command and staff positions. While leading an infantry division, he was twice gassed.

Billotte returned to Indochina after the war, was promoted to general of division in 1927, and became commander of French forces there in 1930. He was promoted to general of the army in 1933, and served as inspector general of colonial troops in 1937. Billotte advocated the employment of tanks in the French military, and Charles de Gaulle credited him with the establishment of

the first two French tank divisions. Just before the outbreak of war in 1939, Billotte took command of the 1st Army Group and positioned this unit along the Belgian border around Malmédy. Among its five armies was the British Expeditionary Force.

Billotte's 1st Army Group played the major role in the Battle for France (May 10–June 25, 1940). On the German invasion, Billotte moved the bulk of his forces into Belgium in accordance with prearranged plans. The Germans then struck to the south, overrunning Billotte's southernmost army, the Ninth, in the area between Sedan and Givet. On May 14, realizing the threat this posed to his northern forces, Billotte ordered a withdrawal from the Dyle Line to the Escaute River.

On the night of May 21, Billotte was seriously injured in a car accident after meeting with the new French Army commander, General Maxime Weygand. His incapacitation increased confusion in the French Army command. Billotte died in Ypres of his injuries on May 23, 1940.

Bismarck, Sortie and Sinking of (May 1941)

The sinking of the *Bismarck* occurred at the height of German battleship operations in the Atlantic Ocean. Commander of the German Navy Grand Admiral Erich Raeder expected the new battleship *Bismarck* to be available in the spring of 1941 to provide an opportunity to test the navy's battle group strategy in support of a war on commerce. Repairs to the battleships *Gneisenau* and *Scharnhorst* forced delays, and the naval command decided to

send the *Bismarck* and the heavy cruiser *Prinz Eugen* to sea as soon as possible to attack shipping in the North Atlantic in Operation RHEINÜBUNG (RHINE EXERCISE). Raeder was determined to demonstrate the value of the battleships to the war effort, and the *Bismarck* was rushed into action with an incomplete antiaircraft control system and equipment scavenged from other ships.

Vice Admiral Günther Lütjens, the fleet commander and task force leader, opposed such a piecemeal approach. He advocated delaying the mission until the other battleships were available, including the *Tirpitz.* His pessimism would play a key role in his decisions during the course of the operation.

British intelligence, including Ultra, alerted the Royal Navy that a major German naval operation was under way, and aircraft spotted the two ships refueling at Bergen, Norway, on May 21, 1941. The British took countermeasures to patrol the Iceland-Faroes passage and the Denmark Strait to block a German breakout into the Atlantic. On May 23, the British cruisers *Norfolk* and *Suffolk* spotted the two German raiders in the Denmark Strait. The persistence of the British cruisers in shadowing the German ships led Lütjens to conclude that the British possessed new radar.

Off Iceland at about 5:55 a.m. on May 24 in the Iceland Battle, or Battle of the Denmark Strait, British rear admiral Lancelot E. Holland's battle cruiser *Hood* and battleship *Prince of Wales* engaged the *Bismarck.* The *Hood* was hit in its magazines by the *Bismarck*'s fourth salvo and blew up. Only 3 of its 1,419 crewmen survived. The *Prince of Wales* took seven hits (four from the *Bismarck*) and was damaged.

Although the *Bismarck* had received only three hits, the ship was leaking oil, and its speed was also reduced from flooding in the forward compartments. At about 4:00 p.m., Lütjens detached the *Prinz Eugen* in a vain effort to draw the British off while the *Bismarck* made for the French port of Saint-Nazaire to carry out repairs. On May 24, nine Swordfish torpedo bombers from the carrier *Victorious* attacked the German battleship under difficult conditions and scored one hit, but damage was superficial.

In the early morning of May 25, the *Bismarck* managed to elude its pursuers, but Lütjens was unaware of this despite reports from Naval Command Group West. When Lütjens broke radio silence, these messages were picked up by Allied high-frequency direction-finding receivers.

Increased German radio traffic along the French coast suggested that the destination of the *Bismarck* was a French port, which was later confirmed by a British intercept of a Luftwaffe signal. The principal British ships, which had been chasing the *Bismarck* in the wrong direction due to a plotting error, now altered course. In the meantime, Force H with the aircraft carrier *Ark Royal* had departed Gibraltar to provide air reconnaissance off the French west coast.

On May 26, Swordfish torpedo bombers from the *Ark Royal* and Coastal Command's patrol bomber aircraft regained contact with the *Bismarck.* Late in the day the Swordfish attacked, and a lucky torpedo hit jammed the German battleship's twin rudder system, rendering it unable to maneuver. With no air cover or help from the U-boats or other ships available, the fatalistic Lütjens, remembering the reaction to the scuttling of the *Graf Spee* and Raeder's orders to fight to the last shell, radioed the hopelessness of the situation.

Arriving on the scene at 8:45 a.m. on May 27, the British battleships *King George V* and *Rodney* opened fire. By 10:00 a.m., although hit by hundreds of shells, the *Bismarck* remained afloat. As the heavy cruiser *Dorsetshire* closed to fire torpedoes, the Germans scuttled their ship. Three torpedoes then struck, and the *Bismarck* went down. Reports of German submarines in the area halted British efforts to rescue German survivors. Only 110 of the crew of 2,300 survived. Lütjens was not among them.

A furious Adolf Hitler regarded the sinking of the *Bismarck* as a major loss of prestige and ordered that no more battleship operations be undertaken without his permission. The major German ships were now relegated to the defense of Norway, leaving the brunt of Germany's naval war to the U-boats.

Bismarck and *Tirpitz*, German Battleships

The two Bismarck-class battleships were the largest German warships of World War II. Although often regarded as the epitome of German battleship design, they actually represented something of a compromise, because German chancellor Adolf Hitler had concluded a naval agreement with Great Britain and did not want to provoke the British when the ships were laid down only a year later. Indeed, Hitler had hoped that the Anglo-German Naval Agreement of July 1935 would be the foundation for an Anglo-German alliance against France and the Soviet Union.

The two ships followed closely in design the *Baden*, the last German battleship built for the Imperial German Navy. Horizontal armor was somewhat thicker, vertical armor slightly thinner. Major compartments were larger to provide better working conditions for the crews. Armament was standard for the day. The ships were extremely broad in beam, making them excellent gunnery platforms even in heavy seas. So as not to alarm the British, the tonnage displacement figure was announced as 35,000. Not until after the war was it learned that the displacement was nearly 7,000 tons more than the Washington treaty limit.

The *Bismarck* was laid down on July 1, 1936, at the Blohm and Voss shipyards in Hamburg. It was launched on February 14, 1939, and commissioned on August 24, 1940. Named for Chancellor Otto von Bismarck (1815–1898), the ship was outfitted by January 1941 and underwent trials in March and April. Captain Ernst Lindemann was granted permission to refer to the ship with the pronoun "he" to honor Bismarck.

The *Tirpitz* was named for Grand Admiral Alfred von Tirpitz (1849–1930), father of the German High Seas Fleet. Built at Wilhelmshaven Navy Yard, it was laid down on October 20, 1936; launched on April 1, 1939; and commissioned on February 25, 1941.

The *Bismarck* displaced 41,700 tons standard and 50,900 tons deep load. The *Tirpitz* displaced 42,900 tons standard and 51,600 tons deep load. The ships were 813 feet 8 inches in overall length and 118 feet 1 inch in beam. Their hulls were protected by an armor belt ranging in thickness from 8.5 inches to 10.5 inches. The main turrets were protected by up to 14.25 inches, while deck armor was up to 4.75 inches in thickness. Their three geared turbine engines were capable of producing a top speed of 29 knots.

The Bismarck-class ships were armed with 8 15-inch guns in four double turrets and 12 5.9-inch secondary guns in six double turrets. They also mounted 16 105mm guns in eight double mounts, 16 37mm guns (eight double mounts), and 12 20mm guns. They could carry four to six aircraft. Normal crew complement was 2,092 officers and men for the *Bismarck* and 2,608 for the *Tirpitz.*

Both ships were sunk by the British. The *Bismarck* succumbed early, while on its first commerce raiding sortie. After sinking the British battle cruiser *Hood* and damaging the battleship *Prince of Wales* (the *Bismarck* was also damaged in the engagement and leaking oil), its rudder was jammed by torpedoes dropped by Swordfish aircraft flying from the carrier *Ark Royal.* This enabled the British battleships *King George V* and *Rodney* to close. Rendered largely hors de combat in the ensuing engagement, the *Bismarck* was struck by three torpedoes and then scuttled by its crew on May 27, 1941. Only 110 crew members of a complement of 2,300 survived. On June 9, 1989, undersea explorer Robert D. Ballard located the wreck of the *Bismarck* some 600 miles off the French coast. Ballard's investigations seemed to confirm the German view that the scuttling had sent it to the bottom.

The *Tirpitz* received additional armament in 1942 in the form of six 533mm torpedo tubes taken from the cruiser *Leipzig.* Its antiaircraft armament was also steadily increased, to 40 20mm guns in single and quadruple mounts. Stationed in Norway, the *Tirpitz* represented a great threat to the Allied Arctic convoys and was subjected to numerous Allied attacks, some of them by Royal Air Force Lancaster bombers, with special 12,000-pound "tallboy" bombs. It finally succumbed to one such attack on November 12, 1944, with 917 of its crew dying in the attack. After the war, much of the hulk was sold for scrap.

Bismarck Sea, Battle of (March 2–5, 1943)

Southwestern Pacific air-naval battle. As the troops of Southwest Pacific theater commander General Douglas MacArthur fought to expel the Japanese from New Guinea, it fell to the U.S. Fifth Air Force under Major General George C. Kenney to interdict Japanese resupply efforts. When Kenney assumed command of the Fifth Air Force in August 1942, he found many of his units operating obsolete aircraft and employing ineffective tactics.

Kenney quickly introduced two important new changes. The first was skip-bombing, in which medium bombers—the Douglas A-20 Havoc and North American B-25 Mitchell—attacked Japanese ships from low altitude and literally skipped bombs into the sides of their targets. The bombs used time-delayed fuzes so that the explosions would occur either within the ships, should they penetrate the hulls, or below their waterlines as the bombs sank after hitting the hulls. The second was the installation in the medium bombers of additional forward-firing .50-caliber machine guns, designed to sink small vessels and suppress antiaircraft fire. Kenney also had available several squadrons of the Royal Australian Air Force to supplement the Fifth Air Force.

In January 1943, Allied forces undertook a major offensive along the New Guinea coast. In response, the Japanese dispatched additional resources via convoys across the Bismarck Sea. On the night of February 28, 1943, Rear Admiral Kimura Masatomi departed Rabaul with eight transports and eight destroyers, transporting 6,900 troops of the 51st Division, bound for Lae, New Guinea.

The Japanese recognized the threat posed by Allied airpower, but Lae was thought too important to lose. Some 100 fighters (40 navy and 60 army) provided air cover for the convoy. Kenney knew of the Japanese activity through signals intelligence and reconnaissance flights. American Consolidated B-24s first sighted the Japanese formation on March 1, but eight Boeing B-17 Flying Fortresses sent to attack it failed to locate their quarry because of cloud cover. The following day, another B-24 reacquired the target, and eight B-17s attacked with 1,000-pound demolition bombs, sinking one transport and damaging another. Two of the Japanese destroyers rescued approximately 950 men and rushed ahead to Lae, returning to the convoy early the next morning.

On March 3, the largest Allied air effort yet seen in the theater assembled to attack the Japanese when the convoy came within range of the medium bombers. At 10:00 a.m., B-17s bombed the convoy to disrupt its formation. Shortly thereafter, Australian Beaufighters, followed by heavily armed B-25s and A-20s, attacked the convoy from an altitude of 500 feet or less, while Lockheed P-38 Lightnings engaged Japanese escort fighters. Out of 47 bombs dropped by the attackers, reportedly 28 found their targets. Allied aircraft repeated their assault that afternoon but with less success, as the weather began to interfere.

By the end of the day, all of the Japanese transports and three of the destroyers had been sunk. A fourth destroyer was heavily damaged and was sunk by Allied aircraft the next day. The remaining destroyers collected as many survivors as possible and returned to Rabaul. During the course of the next few days, aircraft and patrol-torpedo (PT) boats patrolled the area, machine-gunning and bombing any remaining Japanese to prevent enemy troops from reaching land. Allied pilots sought retribution against Japanese flyers who had reportedly machine-gunned an American crew parachuting from their stricken B-17.

In the battle, the Japanese lost some 60 aircraft, 12 ships, and 3,700 men.

The Allied cost was 3 fighters, 1 B-17, and 1 B-25. MacArthur described the victory as “the decisive aerial engagement” in the Southwest Pacific theater. Japanese transports never again approached within range of Allied airpower for the rest of the campaign. Without reinforcement, the Japanese lost Lae to Australian troops some seven months later.

BITING, Operation (February 27–28, 1942)

British combined-arms raid. The objective of Operation BITING (Bruneval Raid) was to bring back parts of a German Würzburg radar array determined to be located at a farmhouse on cliffs at Bruneval near Le Havre on the English Channel. The radar was providing the Germans warning of British aircraft and ships approaching the coast, and the British believed that it and similar radars were in large part responsible for recent heavy Royal Air Force (RAF) bomber losses. It was believed that a seaborne assault would provide the Germans too much warning, so an airborne operation was planned, with the men to be extracted by sea. The raid commander was Major John Frost, who led 120 men of C Company of the 2nd Battalion, the Parachute Regiment, 1st Airborne Division. Flight Sergeant C. W. H. Cox, an RAF expert radio mechanic, accompanied them. RAF 51 Squadron under Wing Commander P. Pickard had the task of delivering the raiders in its Armstrong

Whitworth Whitley bombers. Their extraction was to be by Royal Navy motorboats under Commander F. N. Cook of the Royal Australian Navy. As training proceeded, the French Resistance reported that the Bruneval position was being strengthened. While 30 German troops were at the farmhouse, some 100 others were in the immediate vicinity.

The attacking forces departed on the night of February 27–28. The airdrop was uneventful, and the attackers assembled at the designated point for the movement to the radar station location. The attack proceeded as planned; Cox dismantled vital parts of the radar, and Frost then led his men to the beach shortly after 2:00 a.m. on February 28. Managing to avoid detection by two German destroyers and 2 E-boats less than a mile from his own craft off shore, Cook sent in six landing craft to extract the men, who had come under heavy German machine-gun fire from the cliffs. The raiders and their precious cargo then transferred to the motor gunboats for the return to Portsmouth. Four Royal Navy destroyers and RAF Supermarine Spitfire fighters provided protection against possible German intervention.

The attackers suffered two killed, six wounded, and six captured. The Germans lost five killed, two wounded, two captured (including a radar technician), and three missing. The attack was judged a great success. Tests on the radar components helped the British in their development of countermeasures (code-named Window) to neutralize it.

Bittrich, Wilhelm (1894–1979)

German Waffen-SS general. Born in Wernigerode, Germany, on February 26, 1894, Wilhelm “Willi” Bittrich was a fighter pilot in the Imperial German Air Service during World War I. Following the war, he served in a Freikorps

unit, then spent several years as a civilian stockbroker. He joined the Schutzstaffel (SS) in 1932.

During the September 1939 Polish Campaign, Bittrich served as the adjutant on Oberführer Josef "Sepp" Dietrich's Leibstandarte Adolf Hitler, a Waffen-SS regiment. Bittrich then fought in the SS-Verfügungs Division (later the 2nd SS Division) in the campaign for France (May 10–June 25, 1940). Promoted to Oberführer, Bittrich took command of SS Regiment Deutschland in the 2nd SS Das Reich Division at the end of 1940. During the German invasion of the Soviet Union, he briefly led that division when its commander was wounded in December 1941. In January 1942, illness forced Bittrich to resign his command.

From May 1, 1942, to February 15, 1943, Bittrich, promoted to SS-gruppenführer and lieutenant general in the Waffen-SS, was head of the SS Cavalry Brigade, which grew into a full division during that time and saw continuous action on the Eastern Front. Bittrich was then tasked with organizing and commanding what eventually became the 9th SS Panzer Division (Hohenstaufen) and directed the division in its first combat in the breakout of the Soviet encirclement at Tarnopol in April 1944.

In July 1944, Bittrich was transferred to the Normandy front in France and appointed commander of the II SS Panzer Corps. Remnants of the corps that escaped destruction in the Falaise Pocket in August were in an ideal position to deal with the British 1st Airborne Division's attack on Arnhem on September 17, 1944, during Operation MARKET-GARDEN (September 17–26). Bittrich's reaction was decisive: he ordered the 9th SS Panzer Division to contain and attack the 1st British Airborne at Arnhem and the 10th SS Panzer Division to attack the U.S. 82nd Airborne Division at Nijmegen and stop the advancing British XXX Corps. This quick response resulted in the destruction of the British at Arnhem.

Bittrich's II SS Panzer Corps also participated in the December 16, 1944–January 25, 1945, Ardennes Offensive (Battle of the Bulge). In January 1945, the corps was transferred to the Eastern Front but fought its way back to the west before the end of the war. Surrendering to the Americans, Bittrich was turned over to the French, who convicted him of war crimes and imprisoned him until 1954. Bittrich died in Wolfratshausen, Germany, on April 19, 1979.

Black May (May 1943)

Defeat of German U-boats in the North Atlantic. The climactic convoy battles of March 1943 had given a first hint that Allied antisubmarine forces were finally gaining the upper hand in the battle for the North Atlantic. By early 1943, the fully mobilized American shipyards were producing vast numbers of escort vessels in addition to building more merchant ships than were being sunk by U-boats. Meanwhile, modern long-range naval patrol aircraft, such as the Consolidated B-24 Liberator, and escort carrier–based aircraft were closing the dreaded air gap, the wolf packs’ last refuge from Allied airpower in the North Atlantic. At the same time, Allied signals intelligence was reading the German U-boat cipher Triton almost continuously and with minimal delay.

On April 26, 1943, the Allies suffered a rare blackout in their ability to read the German cipher, just as 53 U-boats regrouped for an assault on the convoy routes. Miraculously, two eastbound convoys, SC.128 and HX.236, escaped destruction, but ONS.5, a weather-beaten westbound slow convoy of 30 merchant ships escorted by 7 warships, stumbled into the middle of the wolf packs on May 4. During the next 48 hours, the U-boats sank 12 ships but at an unacceptable cost. Escort vessels sank 6 U-boats, and long-range air patrols claimed 3 others. Radar in aircraft and escort vessels had played a decisive role in giving the numerically overmatched escorts a tactical edge in the battle.

The commander of the German U-boat arm, Admiral Karl Dönitz, was aware of the tilting balance, but he urged his U-boat commanders not to relent. Yet many of the vessels did not even reach their areas of operations.

The determined antisubmarine offensive in the Bay of Biscay (February–August 1943) by aircraft of the Royal Air Force Coastal Command destroyed six U-boats during May alone and forced seven others to return to base.

In the second week of May, the ragged survivors of the North Atlantic wolf packs regrouped and deployed against HX.237 and SC.129. Only three merchantmen were sunk, at the expense of the same number of U-boats. In addition to radar, the small escort carrier *Biter*, which had provided air cover for HX.237 as well as for SC.129, was vital in denying the German submarines tactical freedom on the surface near the convoys. When the U-boats renewed their attacks against Convoy SC.130 between May 12 and 20, escort vessels sank two U-boats, and shore-based aircraft claimed three others. SC.130 suffered no casualties. The U-boat offensive failed entirely against HX.239, a convoy with a rather generous organic air cover (aircraft attached to the convoy) provided by the escort carriers USS *Bogue* and HMS *Archer*. Not a single U-boat managed to close with the convoy, and on May 23, a U-boat fell victim to the rockets of one of the *Archer*'s aircraft. The following day, Dönitz recognized the futility of the enterprise and canceled all further operations in the North Atlantic.

During May 1943, to that point, more than 33 U-boats had been sunk and almost the same number had been damaged, nearly all of them in convoy battles in the North Atlantic or during transit through the Bay of Biscay. The month went down in German naval annals as "Black May," with the loss of 40 U-boats. At the end of May 1943, the British Naval Staff noted with satisfaction the cessation of U-boat activity. SC.130 was the last North Atlantic convoy to be seriously menaced during the war.

Black Sea, Area of Operations

The Black Sea is an oval-shaped inland sea stretching 600 miles west to east and ranging from 300 to 140 miles north to south. In 1941 the Soviet Union occupied a coastline along the northern shore of more than 2,200 miles (including the Sea of Azov), with the neutral state of Turkey to the south and the German allies Bulgaria and Romania to the west. The only maritime route into the Black Sea runs through the Turkish-controlled Bosporus Straits. The inability of the Soviets to construct major warships during the conflict and that of the Axis powers to send ships through the Bosporus forced both sides to fight with the large warships with which they had started the conflict. Another prominent geographic factor affecting naval operations was the Crimean Peninsula, which juts into the middle of the Black Sea. Possession of the Crimea and its great port, Sevastopol, ensured domination of the entire body of water.

In 1941 the Soviet Black Sea Fleet included 1 battleship, 3 heavy and 2 light cruisers, 17 destroyers, 2 guard ships, 44 submarines, and 120 other warships from gunboats to motor torpedo boats (MTBs). Sevastopol and Novorossiysk were the fleet's major bases. The fleet's mission was to control the Black Sea, prevent enemy naval forces from entering the region, destroy the Romanian Navy, and support the Red Army. Romania had bases at Sulina and Constanta, and its navy consisted of 4 destroyers, 3 small torpedo boats, 1 submarine, 11 smaller warships, and a flotilla of river monitors. Germany had no naval forces in the Black Sea, and Bulgaria prudently declined to fight the Soviet Union. Berlin believed that the capture of the coastline would eliminate the need for naval forces.

The first major operation of the Soviet Black Sea Fleet was an ineffective bombardment of Constanta, Romania, by two destroyers. One was mined and sunk and the other damaged. Two Romanian destroyers contested the attack in what was the only encounter between major warships in the Black Sea during the entire war.

Romania was a major supplier of oil to the Axis, and while most of Germany's allotment went up the Danube River, Italy's share was shipped through the Bosporus. Soviet submarines attacked this vital traffic, but beginning in October 1941, the Romanians fenced off the coastal route with a mine barrage. Thereafter, the Romanian Navy focused on the protection of the sea-lanes in the western Black Sea. Through December 1941, Soviet submarines (or submarine-laid mines) accounted for only 10 ships totaling 19,000 tons.

The rapid German advance into the Ukraine during the summer of 1941 cut off large Soviet forces in the major port of Odessa. The Black Sea Fleet effectively supported Odessa until the Soviet high command decided to evacuate. This highly successful operation, conducted from October 1 to 16, extracted 86,000 soldiers and 15,000 civilians, along with most of their weapons and supplies, without the Axis even being aware of the operation and just in time to meet Axis forces advancing into the Crimea.

German and Romanian forces besieged Sevastopol beginning on October 30, and for the balance of the year the Black Sea Fleet supported the fortress. The most important operation was the December 26–28 landing of 42,000 men on the Crimea's eastern finger, the Kerch Peninsula, and around Feodosiya in the largest and most complex Soviet amphibious operation of the war. This operation disrupted a German offensive to capture Sevastopol and helped the fortress hold out another six months.

Sevastopol's resistance convinced the German command that they needed naval assistance and led to the shipment of MTBs, *Marinefährprähme* (MFP) barges, and small submarines overland and down the Danube into the Black Sea. The captured shipyards at Nikolayev began fabricating MFPs as well. Italy contributed a flotilla of MTBs and miniature submarines.

During 1942, the Black Sea Fleet continued to support Sevastopol until its capture in July, bringing in supplies and reinforcements and conducting almost nightly shore bombardments. The months of May through July cost the fleet six destroyers and one light cruiser to mines and aircraft. Italian MTBs torpedoed the cruiser *Molotov* after a bombardment of Feodosiya on August 3, 1942.

The Germans crossed the Kerch Strait at the end of August using a flotilla of barges and small craft and captured Novorossiysk on September 6. This forced the fleet to retreat to the minor ports of Poti and Batumi near the

Turkish border. In 1942 Soviet submarines accounted for as many as 17 Axis and neutral ships of 12,660 gross register tonnage. The surface fleet remained active.

On December 1, a cruiser and a destroyer bombarded Fidonisi, Romania, at the cost of mine damage to the cruiser. In a subsequent raid by a destroyer and four large minesweepers, the Soviets struck a convoy escorted by a Romanian torpedo boat and four German R-boats (125-ton motor-minesweepers). In a two-hour action, the Soviets demonstrated heart but a lack of training and doctrine, failing to harm their vulnerable targets.

In 1943, the Soviet winter offensive forced a precipitous Axis retreat. Sea power, however, allowed the Germans to defend the Kuban bridgehead on the Tamen Peninsula. This required up to 2,500 tons of supplies per day, nearly all delivered by barges. The Black Sea Fleet retained 1 battleship, 4 cruisers, 8 destroyers, 29 submarines, and more than 100 smaller warships while the Germans had accumulated a mosquito fleet of 6 small submarines, 16 MTBs, 23 R-boats, 26 subchasers, and more than 100 MFPs. The Romanian Navy continued to escort shipping along the sea's western shores. During the year, Soviet submarines sank 20 ships of 34,000 gross register tonnage.

After the Soviet summer 1943 offensives threatened German land access to the Crimea, the Germans abandoned the Kuban bridgehead. Between September 15 and October 10, the Kriegsmarine pulled out 250,000 men with their supplies and equipment. The Soviet Navy failed to effectively contest this evacuation. In a costly defeat, German aircraft sank three Soviet destroyers after they had engaged in a melee with German MTBs. Following this episode, Moscow ordered that large surface warships could only operate with its authorization, a restriction that kept them in port for the remainder of the war.

Soviet armies cut off the Crimea by November 1943, but the German high command decided to retain the peninsula as a fortress to control the Black Sea and protect the Romanian oil fields. The Soviets tried to hustle the Germans out of the Crimea by landing at the tip of the Kerch Peninsula and at Eltigen south of Kerch on November 1, 1943. The Germans contained these landings and blockaded the more isolated beachhead at Eltigen with R-boats, MTBs, and MFPs. After an intense battle for maritime access, the Germans eradicated the Soviet position by December 11, 1943. Both sides had suffered

greatly, and a lull in operations ensued as the Germans concentrated on supplying and reinforcing their 200,000-man Crimean garrison.

The Soviets, with limited ability to repair their hard-used forces, regrouped; their ongoing westward advance ensured that the German tenure in the Crimea would be limited no matter what the naval situation was. Nikolayev fell on March 28, 1944, and Odessa was isolated shortly thereafter, necessitating the evacuation of this port by sea, an activity completed by April 9 and one that the Soviets permitted without interference.

Soviet forces then broke into the Crimea, and on May 9, German leader Adolf Hitler finally authorized a retreat from Sevastopol. Soviet submarines, MTBs, and aircraft contested this evacuation. The Black Sea Fleet continued to hold back its major warships, although their deployment could have turned a rushed and costly evacuation into a debacle. The Germans and Romanians brought off 130,000 men by sea (more than 30,000 in the last three days), but they lost 7 transports, 11 small warships and auxiliaries, and 11 barges, mainly to air attacks. More than 8,000 Axis troops drowned. This was the last major naval operation in the Black Sea. The campaign ended with the surrender of Romania on August 23, 1944.

Blackshirts

Fascist paramilitary units in Italy, officially established in 1923 by Italian premier and future dictator Benito Mussolini. Known as the Milizia Volontaria per la Sicurezza Nazionale (Volunteer Militia for National Security, MVSN) but informally called the Blackshirts for the distinctive

black shirts as part of their uniform, they were patterned after Giuseppe Garibaldi's Red Shirts during the Risorgimento in the last half of the 19th century.

Open to men between the ages of 17 and 50, the Blackshirts were formed largely from the fascist action squads that had battled the socialists and communists in the streets and helped bring Mussolini to power. Once Mussolini was firmly established in authority, the Blackshirts essentially functioned as Italy's fourth armed service. During the crisis following the murder of socialist leader Giacomo Matteotti in 1924, six legions of the MVSN were mobilized to defend the regime if need be. Blackshirt units were also deployed in the Italian Empire and later fought in both Africa and Europe during World War II.

The Blackshirts were organized into legions of 1,340 men. Each member wore a black cotton shirt underneath his uniform and carried a ceremonial dagger. Although Blackshirt units were under the command of the Italian Army, they also remained under Mussolini's direct orders. Theoretically, one Blackshirt battalion was attached to each infantry division, but a shortage of numbers meant that only about half the divisions actually received one. Blackshirts also manned coastal and antiaircraft batteries in Italy.

Before World War II Blackshirt units helped maintain order in Libya, and they fought in the 1935–1936 Italo-Ethiopian War and stayed on there afterward to participate in the low-level counterinsurgency operations. They also fought in the Spanish Civil War (1936–1939). At the end of 1940, the MVSN numbered some 312,000 men, of whom 112,000 were in 194 active battalions.

In June 1940 when Italy formally entered World War II, Blackshirt units were dispatched to East Africa, North Africa, and Greece. Two Blackshirt battalions comprised of Italian colonists from Ethiopia and Eritrea formed the Eleventh Blackshirt Legion and participated in the invasion of British Somaliland in August 1940. The Tenth Blackshirt Legion was raised from Italian colonists in Ethiopia and charged with the defense of Addis Ababa. Four Blackshirt battalions were recruited in Libya to police Tripoli, Misurata, Bengasi, and Derna. Four Blackshirt divisions from Italy joined Marshall Rodolfo Graziani's Tenth Army in the invasion of Egypt in September 1940. The First Blackshirt Division assisted in the capture of Fort Capuzzo and Sidi

Barrani. All four divisions were largely destroyed in the British winter offensive.

Seven Blackshirt battalions served with the Italian Eleventh Army during the invasion of Greece in November. In 1941, Blackshirts operated in Yugoslavia and the Soviet Union while continuing their activities in Greece and Africa. Additional Blackshirt battalions were sent to reinforce the Kelcyre Pass in Greece in January 1941. The Eleventh Blackshirt Legion defended the Dongolaas Gorge during the Battle of Keren from February until April, when Italy lost Eritrea to British forces.

Elite "M" (Mussolini) Battalions were also formed from experienced Blackshirt units that had distinguished themselves in combat. Six "M" Battalions were among the Blackshirts sent to engage in antipartisan warfare in Yugoslavia. "M" Battalions joined the Italian Eighth Army in the invasion of the Soviet Union in July 1941. The "M" Battalions were driven out of the Soviet Union along with the Italian Eighth Army in January 1943.

Blackshirts also played a role in the defense, collapse, and reestablishment of Mussolini's regime in 1943. An "M" division outfitted with 36 German Tiger Tanks was stationed outside Rome in May 1943 to defend the regime from insurrection. Cut off from its commander in Rome, General Enzo Galbiati, the armored "M" division was unable to act in time to prevent Mussolini's overthrow that July.

Native Blackshirts turned on their Italian officers in Albania, and many Blackshirts in Yugoslavia became anti-Axis partisans when Mussolini was deposed. A new fascist militia, the Republican National Guard commanded by General Renato Ricci, came into being when Mussolini was restored to power in September. It was comprised of 30,000 poorly trained and equipped teenagers who conducted antipartisan activity in Italy and acted as Mussolini's bodyguard.

By 1944, desertions had reduced the Republican National Guard to only 3,000 members. In July 1944, fascist Black Brigades commanded by Alessandro Pavolini were raised from men between the ages of 17 and 61. These undisciplined groups sought to crush partisan resistance through looting and torture. Mussolini took personal command of what remained of the Republican National Guard in August 1944.

Blamey, Sir Thomas Albert (1884–1951)

Australian Army general. Born on January 24, 1884, in Wagga-Wagga, Australia, Thomas Blamey secured an army commission through competitive examination in 1906. He made captain in 1910 and attended staff college in India during 1911–1913. During World War I, Blamey served as a staff officer in Egypt and fought at Gallipoli and on the Western Front. He rose to brigadier general in 1918. Following the war, he served on the Imperial General Staff. In 1925, Blamey retired from the regular army and became chief police commissioner in Victoria, Australia, while remaining a general in the militia.

Blamey resigned his police position in 1936 following a minor scandal in which he lied under oath to protect the reputations of two women who were victims of robbery. Shortly after the beginning of World War II, he rejoined the regular army, was promoted to lieutenant general, and was assigned command of I Corps. Serving in Egypt in 1940 under General Archibald P. Wavell, he oversaw the evacuation of Australian troops from Greece following the German invasion of that country in April 1941. Promoted to general in September 1941, Blamey became commander in chief of Australian forces in March 1942.

Under orders from U.S. general Douglas MacArthur, who was concerned about the Japanese occupation of Buna in Papua and a possible invasion of Australia, Blamey took personal command of the ground forces and led them

in the recapture of Buna in January 1943. He also held personal command in September 1943 in a campaign that took the city of Lae and liberated the eastern New Guinea coast. Following these actions, Blamey found himself relegated to a background role by MacArthur.

As the Allies island-hopped closer to Japan, Blamey undertook operations against isolated Japanese troops in islands bypassed by MacArthur. These actions, bereft of significant naval and air support, proved costly and were criticized by many as unnecessary, but Blamey believed that it was in Australia's interest that these occupied islands be freed. At the end of the war, he signed the Japanese surrender document as the Australian representative.

Retiring from active duty in January 1946, Blamey was promoted to field marshal in June 1950. Australia's first-ever field marshal, Blamey died at Melbourne on May 27, 1951.

Blanchard, Jean Georges Maurice (1877–1954)

French Army general. Born at Orléans on December 9, 1877, Jean Georges Maurice Blanchard graduated from the École Polytechnique in 1899 as an artillery specialist and was commissioned in the artillery. During World War I, he served at the front and on staff assignments, winning two citations for bravery and promotion to major. He was promoted to general of brigade in

1932 and to general of division in 1935. In 1938, Blanchard became director of French higher military instruction.

When World War II began, Blanchard took command of the First French Army near Cambrai, France, as part of General Gaston Billotte's 1st Army Group. When Germany invaded on May 10, 1940, Blanchard followed the prearranged French strategic plan, moving his army forward to the Dyle River in support of the Belgians. The British Expeditionary Force under Lord John Gort was on his north flank and General André Corap's Ninth French Army was to the south. After advancing approximately 25 miles, Blanchard encountered Colonel General Walther von Reichenau's German Sixth Army and was forced to withdraw and join those Allied troops cut off by the German drive down the Somme River to the English Channel.

Following Billotte's death in an automobile accident on May 25, 1940, a shattered Blanchard took over command of the 1st Army Group. British colleagues, such as Lieutenant General Alan Brooke, grimly noted that he was "merely existing and hardly aware of what was going on around him," completely bewildered and incapable of issuing orders. On May 29, Brooke even threatened to have Blanchard shot if his orders disrupted Brooke's evacuation plans. On June 1, 1940, Blanchard left Dunkerque for Britain on a French destroyer, and in late August, he was placed on the French Army's reserve list. Thereafter, he faded into obscurity, although he was later awarded the Grand Cross of the Legion of Honor. Blanchard died at Neuilly-sur-Seine on November 23, 1954.

Blandy, William Henry Purnell (1890–1954)

U.S. Navy admiral. Born in New York City on June 28, 1890, William Henry Purnell Blandy graduated at the head of his class from the U.S. Naval Academy at Annapolis in 1913 and began his career in the battleship *Florida.* He participated in the 1914 Veracruz landing and served in convoy duty during World War I.

During the interwar period, Blandy specialized in naval gunnery and ordnance. As head of the Bureau of Ordnance's Gun Section between 1927 and 1929, he contributed to innovations in gun design. In February 1941, he was selected over more than 100 more senior officers to become chief of the Bureau of Ordnance as a rear admiral. In this post, Blandy was instrumental in the production of new weapons systems, such as the 40mm Bofors and 20mm Oerlikon guns as well as the proximity fuze. He also had to resolve problems such as the malfunctioning Mark XIV torpedoes.

In December 1943, Blandy left administrative work to assume command of Amphibious Group 1 of the Pacific Fleet, from January 1944 to July 1945. His first combat operation was during the Battle for Kwajalein (January 19–February 6, 1944). Blandy then commanded Task Group (TG) 51.1, the Joint Expeditionary Force Reserve, at Saipan (June 15–July 9, 1944). For the attack on the Palau Islands in September 1944, he commanded TG 32.2, the Angaur Attack Group.

Blandy's expertise in gunnery and ordnance made him the choice to command Amphibious Support Task Force (TG 52), charged with all prelanding activities, including shore bombardment, minesweeping, and underwater demolition. Blandy commanded preassault operations at Iwo Jima in February 1945. His Amphibious Support Task Force played a key role in the Okinawa operation during March–June 1945, where it paved the way for the landings on Kerama Retto and Okinawa. Blandy ended the war as commander of Cruisers/Destroyers, Pacific Fleet, from July to November 1945. He was promoted to vice admiral in November 1945.

As the navy's ordnance expert, Blandy commanded the joint army-navy nuclear tests (Operation CROSSROADS) at Bikini Atoll in July 1946. From

February 1947 until his retirement three years later, he was commander in chief, Atlantic Fleet. Blandy died in Queens, New York, on January 12, 1954.

Blaskowitz, Johannes Albrecht von (1883–1948)

German Army general. Born on July 10, 1883, at Peterswalde, East Prussia, Johannes Albrecht von Blaskowitz saw action on both fronts during World War I, rose to the rank of captain, and was awarded the Iron Cross. He continued in the Reichs-wehr after the war and was promoted to general of infantry in December 1935. The following year, he took command of Military District II, and in January 1938 he became the commander of the Third Army, leading it into Prague as part of the German absorption of Czechoslovakia in March 1939.

Blaskowitz commanded the Eighth Army in the September 1939 German invasion of Poland, charged with protecting the Tenth Army's northern flank during the drive on Warsaw. Following initial German success, the Poles counterattacked on September 9 against the flank of the Eighth Army and managed to destroy one of Blaskowitz's five infantry divisions before they were defeated with the Tenth Army's assistance. The Battle of Kutno was the biggest Po-lish victory of the campaign.

On October 23, 1939, Blaskowitz assumed command of German forces occupying Poland. An officer of the old school who set high standards for his men, he was shocked by the brutal actions of the Schutzstaffel (SS) against

the local population. Blaskowitz went so far as to draw up a memorandum protesting these actions, which earned Adolf Hitler's displeasure.

Blaskowitz briefly commanded the Ninth Army in the invasion of France (May 10–June 25, 1940), then was military governor of northern France before being assigned to command the First Army in France in October 1940. He remained in this position until May 10, 1944, when he was assigned command of Army Task Group G, defending the Mediterranean and South Atlantic French coasts. In Operation DRAGOON (August 15, 1944), the Allies invaded the French Riviera and easily pushed aside Blaskowitz's thinly spread forces. Relieved of his command in September 1944, Blaskowitz returned to command Army Group H in Holland in January 1945, where he demonstrated compassion for the Dutch by permitting them medical supplies and food during the Allied advance.

Captured on May 8, 1945, by Canadian forces, Blasko-witz was charged with war crimes that involved passing along Hitler's order regarding the execution of enemy commandos. Rather than face trial, he committed suicide on February 5, 1948, in Nuremberg, Germany.

Bletchley Park

Secret British decryption center. Just prior to the beginning of World War II, the British Government Code and Cypher School purchased a Victorian mansion known as Bletchley Park (BP, also called Station X or War Station), located some 50 miles north of London in Bedfordshire. British code

breakers, some of them veterans of World War I, began moving to the BP in August 1939, just before the beginning of World War II. The staff, headed by Alistair Dennison, soon numbered 150 people.

Thereafter, the BP grew rapidly. By late 1942, BP personnel numbered around 3,500, a figure that would expand to 10,000 by 1945. The BP's overseas stations were the Combined Bureau, Middle East; the Wireless Experimental Centre at Delhi; and the Far East Combined Bureau. Each had its own outposts.

The personnel at Bletchley Park were a mix of mathematicians, cryptographers, engineers, and eccentrics. Among them was Alan Turing, regarded as the father of the modern computer. There were also members of the various British military services as well as foreign military personnel. At the BP, they continued the work begun by the Poles in reading German signals traffic and unlocking the secrets of the German Enigma encoding machine.

To house the growing staff, wooden huts were built on the garden grounds. These were numbered, and different types of analysis were conducted in each. Hut 3 decrypted German Army and Air Force codes, Hut 6 focused on German Army and Air Force Enigma cryptanalysis, Hut 4 worked on German naval translating and processing, and Hut 8 handled German Navy Enigma cryptanalysis. Others worked on Italian and Japanese codes. The intelligence produced by the BP was code-named Ultra.

By 1940, Bletchley Park had come up with additional devices that, given time, could sort through the possible variations of an encoded text. Careless German practices, mostly in the Luftwaffe, gave the electromechanical devices called "bombes" a head start and greatly shortened the delay between receiving and decoding messages. The changeable settings of the Enigma machine meant that most messages could not be read in real time, but the information was nonetheless invaluable.

The BP staff was ultimately able to provide an important advantage to the Allies in the war. The Axis powers never learned of the success of the Allied decrypting operations, and the activities at the BP remained unknown to the public until 1974, when Group Captain F. W. Winterbotham revealed them in his book, *The Ultra Secret.*

Blitz, The (August 1940–May 1941)

English term for Germany's sustained night air attacks on British cities, chiefly London, from August 1940 to mid-May 1941. The term "blitz" is taken from the German word *Blitzkrieg* (lightning war). Early in the war, the British government undertook preparations to deal with air attacks, especially in London.

The Blitz began as the daylight Battle of Britain (July 10–September 30, 1940) for control of the air over the island was reaching a climax. The Germans hoped at first to drive the Royal Air Force (RAF) from the skies, and then they sought to destroy the RAF by hitting factories and ground installations; finally, they turned to terrorizing the civilian population by bombing cities. This thrust was, in effect, triggered on the night of August 24–25 when German bombers that were supposed to target an oil depot at Thameshaven struck London instead.

The German bombers had hardly retired when British prime minister Winston L. S. Churchill ordered a retaliatory strike on Berlin. On September 5, German leader Adolf Hitler issued a directive calling for "disruptive attacks on the population and air defenses of major British cities, including London, by day and night." Such bombing could not have significant military value and was intended primarily to destroy civilian morale.

On September 7, 1940, the German Luftwaffe carried out a major raid that devastated London's East End. The bombers returned over the next two days, and more than 1,000 people were killed. From the beginning to the middle of November, London was the target. The intensity of raids varied,

but with good weather and a full moon, they were massive. On October 15, for instance, 538 tons of bombs fell on the city.

British authorities had rejected both the idea of building deep shelters and the concept of using the Underground (subway), for fear of creating a bunker mentality; some actually worried that people would refuse to return to the surface. Londoners forced the issue on September 8 when crowds pushed their way into the subway's Liverpool Street Station for refuge. The authorities capitulated, and by Christmas, 200,000 bunks were available in the Underground, with that many more ready for installation. A decision to build deep shelters was taken in October, but the Blitz was over before the first was completed. Nonetheless, by February 1941, some 92 percent of Londoners could be sheltered in a combination of public and private facilities.

A uniformed woman leads a group of boys through a bomb-damaged residential area of London during the "Blitz" in 1941. (Library of Congress)

Initially, the shelters were dismal places. Overcrowding was the rule, and sanitation was primitive at best. In mid-November 1940, the government instituted a food train to supply the hungry and thirsty citizens belowground,

and communities began developing. People returned to the same shelter night after night and slept in the same bunks. Sing-alongs were organized, and professional entertainment was often provided. The authenticity of this sort of camaraderie has been questioned, and some scholars have referred to the "myth of the Blitz." Certainly, the camaraderie has been exaggerated at times, but Londoners seem to have known that a brave front was expected of them, and they made real efforts to live up to the expectation.

The cheerful endurance and determination that was initially claimed and later rejected as myth was real. It was not universal or without cracks, but Londoners by and large kept daily routines in place with humor and mutual support. Predictions of disruptions proved mostly false. Initial class discontent because working-class areas in the East End were the first targets disappeared as the Germans pounded the rest of the city.

Life was not easy in London during that period. In the first six weeks of major raids, some 16,000 houses were destroyed and another 60,000 badly damaged, with the result that 300,000 people needed places to stay. By the end of the Blitz, one in six Londoners had been rendered homeless. Many historical sites were also damaged, including Buckingham Palace. Most sites, however, survived and proved to be symbols of defiance. The king and queen remained in London, and Big Ben, despite sustaining some damage, struck every hour. London also received some respite as raids were directed against other cities. There was a major attack on Birmingham on October 25, 1940, and on November 14, the city of Coventry was hit with a level of intensity beyond all previous efforts. Liverpool, Southampton, Birmingham (again), and Bristol were also struck.

London passed the Christmas of 1940 in comparative tranquility, and precautions were relaxed. Then, on December 29, the great fire raid came. It was not the biggest raid ever, but the Christmas complacency among Londoners resulted in a slowed response, and enormous damage ensued. After another respite, March and April 1941 saw the skies again filled with German raiders. The worst nights were April 16 and 19, which left 2,000 people dead and 148,000 homes damaged. Providers such as the Londoners' Meal Service, which was operating 170 canteens, were strained. Once again, however, there was a relative pause—and again, precautions waned.

On May 10, crowds flooded into London for a football championship match, only to be joined by German raiders. The attack was the worst raid of

the war, with more than 3,000 dead or seriously injured, 250,000 books burned at the British Museum, and pilots reporting the glow of fires visible as far away as 160 miles. It was also the last major raid of the Blitz. The British—and Londoners in particular—still had to face occasional raids and the V-1 and V-2 terror weapons at the end of the war, but for the Germans, strategic and tactical plans no longer included massive assaults from the air. Of course, as time passed, their ability to make them also waned.

One of the lessons of the Blitz was that contrary to German expectations and intent, bombing the civilian population often strengthened its morale and determination, a lesson the Allies failed to learn in their strikes against civilian targets in Germany. In the United States, extensive coverage of the Blitz provided by U.S. news correspondent Edward R. Murrow of CBS Radio was thought to have tipped U.S. public opinion toward aiding the British well before the nation entered World War II.

Blitzkrieg

The so-called blitzkrieg (lightning war) doctrine is one of the most enduring myths of World War II. In the early years of the war, however, the swift and stunning German successes in Poland in 1939 and France in 1940 came to be interpreted in the West as the result of some sort of revolutionary new

military doctrine that relied on combined-arms operations, with ground and air forces working together as a well-oiled military machine.

Military doctrine has been defined as the fundamental principles by which military forces guide their actions in support of national objectives. But what became known popularly as blitzkrieg was not a set of fundamental principles, nor was it written down as an authoritative document. Rather, the term "blitzkrieg" was created for public consumption. It did appear occasionally in the military literature between 1936 and 1940, but the German writers generally used it in reference to a short war, as opposed to the drawn-out trench warfare of World War I. The term became fixed in the public mind after articles appeared in *Time* magazine, one on September 25, 1939, about Germany's invasion of Poland and another on May 27, 1940, about the fall of France.

Immediately following World War I, the leaders of the much reduced German Army studied the causes of the defeat in 1918 and concluded that a lack of traditional mobile, maneuverable forces and tactics had resulted in the war of attrition that eventually doomed Imperial Germany on the battlefield. Unlike the French, who determined that better defenses would be the key to winning the next war and hence built the Maginot Line, the Germans concluded that the next war would be of short duration and would be won by maneuver warfare in the classical sense.

The German field service regulations of 1921, *Führung und Gefecht der verbundenen Waffen* (Command and Combat of Combined Arms), together with the updated version of 1934, *Truppenführung* (Unit Command), were infantry-oriented documents that cast tank and air assets strictly in an infantry-support role. Although *Truppenführung*, which remained the official doctrine for the German Army through 1945, emphasized traditional German thinking on mobility, it did allow for decentralization of control and provided considerable latitude for force structure changes. It was also not tied rigidly to specific operational concepts, to the exclusion of all others. Rather than an inflexible tactical cookbook, the manual was a philosophical treatment of the conduct of operations and leadership.

During the interwar years, the German mobility advocates enthusiastically read the works of the leading mobile warfare theorists of the time, J. F. C. Fuller, Charles de Gaulle, and Basil Liddell Hart. Younger German officers aggressively advanced the argument that a tank force could

alter the outcome of battles. Many of the older officers resisted the notion that the tank could be a decisive combat arm, remembering the grave difficulties that armored units experienced in World War I.

After Adolf Hitler came to power in Germany in 1933, he quickly made it clear that he intended to rearm the nation, and he was interested in the iconoclastic ideas of the younger officers. In June 1934, Colonel Heinz Guderian became chief of staff of the newly formed Motorized Troop Command. A little more than a year later, the Germans fielded an experimental panzer division. In October 1935 while still only a colonel, Guderian assumed command of one of the three new panzer divisions. He immediately set out to convince the traditionally infantry-oriented German General Staff to accept the concepts of armored warfare. Although Guderian received only limited support from some of his superiors, Hitler encouraged his aggressive concepts.

Meanwhile, the fledgling German Air Force also underwent important changes. Prior to German intervention in the Spanish Civil War (1936–1939), most Luftwaffe officers saw airpower in the same terms as their peers in most other air forces of the period. The two most essential missions were conducting long-range strategic bombing and achieving air superiority over the battlefield; the ground-support mission was largely ignored. But the successes of German air-ground operations during the Spanish Civil War convinced a number of high-ranking Luftwaffe officers to reconsider ground support.

General Ernst Udet, in charge of Luftwaffe development after 1936, pushed through the development of a dive-bomber, the Junkers Ju-87 Stuka. The aircraft was extremely accurate and mobile and was designed specifically to support ground forces. It became the plane that added the critical air dimension to mobile operations.

A German motorized detachment in the remains of a Polish town captured during the German Blitzkrieg of September 1939. (Library of Congress)

The Poland Campaign of 1939 was executed in short order and had all the outward appearances of a dazzling success of German arms. But the so-called blitzkrieg doctrine was never used in that campaign. Rather than being committed en masse, the panzer units were allocated to the various field armies. The Luftwaffe was primarily concerned with establishing air superiority and striking deep at Polish lines of communications. Tank maintenance was a severe problem, and too often the German system of resupply was unequal to the required tasks. But in the end, Germany crushed Poland quickly, and that success obscured the serious operational, tactical, and technical problems that the Wehrmacht experienced.

Between the end of the Polish Campaign and the start of the attack in the west against France and Britain in May 1940, the German Army made some significant changes. The panzer divisions were organized into corps. The

number of tanks in the German Army increased only slightly, but the number of tanks per division decreased, and thus the number of panzer divisions grew. Out of necessity rather than doctrinal design, the panzer divisions became combined-arms units, with a balance between tanks, infantry, artillery, engineers, and other arms. Tactical air, especially with the Stuka, became an important element in the combined-arms mix because Germany was woefully short of field artillery.

The Germans did not go into France planning for a rapid and overwhelming victory. But they achieved one because of a combination of luck, better leadership and training, superior concentration of forces, and correspondingly poor French leadership, training, and tactics. At first the Germans were stunned by their success, but they soon fell victim to their own propaganda and began to believe in the myth of blitzkrieg.

In June 1941, the Germans invaded the Soviet Union, this time anticipating a rapid campaign. They did not mobilize their economy for the invasion, nor did they accumulate the necessary stockpiles or provide adequately for the long lines of communications or winter conditions. Drawing the wrong lessons from the French Campaign, they believed that their use of tactical airpower had been so successful that it more than compensated for their severe shortage of artillery.

That approach may have worked against the poorly deployed French and British, but against the artillery-oriented Soviets, it was a recipe for disaster. The Germans learned quickly that the Luftwaffe could not be everywhere at the same time over the vast expanses of the eastern battlefields, especially with the onset of poor weather. The Soviets, with their abundant conventional field artillery, seldom lacked direct fire support.

The term “blitzkrieg” described a set of results, unique to a specific place and a specific time. The coordinated use of mobility, communications, and combined arms was not a revolution in military affairs, as it has often been portrayed, but rather a natural evolution of military doctrine that was clearly identifiable in the closing months of World War I. The myth of blitzkrieg, however, did obscure serious flaws in the German war machine, including supply, transport, maintenance, artillery, and intelligence. That circumstance proved progressively costly to the Germans as the war advanced and the Allies grew stronger and as the mechanized battlefield became increasingly lethal.

Bloch, Claude Charles (1878–1967)

U.S. Navy admiral. Born in Woodbury, Kentucky, on July 13, 1878, Claude Charles Bloch graduated from the U.S. Naval Academy at Annapolis in 1895 and was present at the Battle of Santiago Bay during the 1898 Spanish-American War. He later was a member of the international force sent to relieve the foreign legations in Beijing during the 1900 Boxer Uprising. He also participated in the U.S. occupation of Veracruz, Mexico, in 1914. During World War I, Bloch commanded the troop transport *Plattsburg* carrying members of the American Expeditionary Forces to France. He was promoted to captain in 1918.

Bloch was assistant chief of the Bureau of Ordnance during 1918–1921, then its chief as a rear admiral during 1923–1927. From 1927 to 1929, he commanded the battleship *California.* Graduating from the Naval War College in 1929, he commanded cruisers in the Battle Force during 1932–1934, then was judge advocate general of the navy in 1934–1936. He

commanded Battleship Division Two during June 1936–January 1937. A staunch advocate of preparedness and a member of the navy "Gun Club," which emphasized a blue-water navy based on battleships and cruisers rather than carrier aviation, Bloch supported the fortification of Guam. Promoted to full admiral in January 1937, Bloch became commander of the Battle Force in 1937. During 1938–1940, he commanded the West Coast–based U.S. Fleet.

In 1940, Bloch assumed command of the Fourteenth Naval District, Pearl Harbor, Hawaii, normally an enjoyable preretirement assignment. As a warning gesture to Japan in 1940, however, President Franklin D. Roosevelt transferred the Pacific Fleet from California to Hawaii.

Bloch sought to strengthen Hawaiian defenses, but he encountered much interference and obstruction from the fleet's new commander, Admiral Husband Edward Kimmel. Yet Bloch's own opposition to the installation of antitorpedo nets contributed to the disastrous Japanese attack on Pearl Harbor of December 7, 1941. Bloch was also largely responsible for placing the fleet on a rigid schedule so that its movements were entirely predictable. Although both Kimmel and General Walter C. Short, the army commander, were removed from their commands, Bloch served out his term until April 1942, when he retired. A congressional inquiry subsequently exonerated him of all responsibility for the Pearl Harbor debacle.

Recalled to Washington in April 1942 to serve on the navy's General Board, Bloch retired in August 1942. In retirement, he headed the Navy Board for Production Awards until the end of World War II. Bloch died in Washington, D.C., on October 4, 1967.

Blockade-Running

In the early stage of World War II, the main lines of communication between the Axis powers were either by land via the Trans-Siberian Railway or, when Japan entered the war in December 1941, across the sea by surface blockade-runners. Japan used German blockade-runners to send such goods as rubber, cooking oil, lead, tin, and tea to Germany. In return, the ships carried industrial products such as locomotives and machinery and various pieces of technical equipment, scientific instruments, and chemical and pharmaceutical products to Japan. In addition, ships carried supplies and spare parts for German warships in the Far East. Some blockade-runners also supplied German armed merchant cruisers operating in the South Atlantic, the Indian Ocean, and the Pacific.

After Germany invaded the Soviet Union in June 1941, the continental line was cut, and only sea routes remained. Blockade-running that began in April 1941 and ended in October 1943 involved a total of 36 ships traveling from Asia to Europe. Six of them were recalled or returned after sustaining damage, and of the 30 that remained, 11 were sunk by Allied forces or were scuttled by their own crews to prevent capture. Another 2 were accidentally sunk by German submarines, and 1 was seized by a U.S. cruiser. Thus, 16 ships actually completed their voyages and delivered their cargo to the port of Bordeaux in German-occupied France.

In the other direction, 23 ships, including 5 fleet supply ships, were sent from Europe to the Far East between September 1941 and April 1943. Of these, 16 reached Asian ports, 5 were sunk or scuttled, and 2 were recalled or returned to port.

Overall, 45.8 percent of the blockade-runners on the Far East route were lost; however, annual ship losses rose dramatically over the course of the war. Between April 1941 and October 1942, only 12.1 percent were lost, whereas in 1943 losses rose to 85.7 percent. Of 104,700 tons of materials loaded on the ships, only 26,600 tons reached their destinations. In addition to raw materials and equipment, these ships also transported passengers. Some 900 passengers embarked to travel from the Far East to Europe, but fewer than half of them arrived safely. A total of 136 died when their ships

were sunk, and the remainder became prisoners of war or remained in the Far East after their ships turned back.

From early 1944, submarines took over the blockade-runners' mission. Between then and early March 1945, 16 German U-boats sailed to the Far East as combat cargo transporters. But only 8 actually arrived in Far Eastern ports, carrying some 930 tons of cargo. The other 8 boats were lost, most of them to hostile action. Through the end of 1944, only 3 submarines reached Europe, but none got to Germany: the *U-843* arrived at Norway but was sunk in the Kattegat Straits, and the *U-510* and *U-861* reached French ports.

Under the code name AQUILA, five Italian submarines also participated in blockade-running. Departing France, they carried some 500 tons of supplies for German/Italian submarine bases in the Far East as well as personnel and cargo for Japan. None of them returned to Europe. The Japanese also sent five submarines to Europe to transport German military technology and to exchange personnel. Ultimately, four of them reached the continent, but only three returned: two to Singapore and one to Japan. All these submarines had Japanese and German technicians, liaison officers, and equipment and blueprints of Germany's newest weapons. Of 89 passengers aboard Axis submarines traveling from Japan, 74 arrived in France; the remainder died when their boats were sunk. A total of 96 passengers sailed in the opposite direction, 64 of them arriving safely; 22 were lost while under way, and 10 others fell into U.S. hands.

Blomberg, Werner von (1878–1946)

German field marshal and minister of war (1933–1938). Born in Stargard, Germany, on September 2, 1878, Werner von Blomberg entered the German Army in 1897 and graduated from the Prussian Kriegsakademie in 1907. In 1908 he qualified as a General Staff officer and then served with distinction on the Western Front during World War I. From 1927 to 1929 as a major general, he headed the Truppenamt, the clandestine version of the General Staff that had been outlawed under the Treaty of Versailles.

Blomberg traveled to the Soviet Union to further the secret military cooperation between it and Germany, and he was one of the first German generals to support Adolf Hitler. Blomberg participated in the Geneva disarmament talks but was recalled at the end of January 1933 to become defense minister (later, war minister) in Hitler's first cabinet. In April, he was made commander in chief of the German armed forces.

An enthusiastic Nazi, Blomberg was a key figure in Hitler's consolidation of power. He pressured the führer to remove the Sturmabteilungen (SA, or Storm Troops) as a possible threat and supported Hitler in the subsequent June 1934 purge of the SA (the Blood Purge), after which he issued an order congratulating Hitler, even though two army generals were among the victims. On the death of German president Paul von Hindenburg, Hitler called on Blomberg to swear an oath of allegiance to him personally, which Blomberg in turn imposed on his fellow officers, thereby helping confirm Hitler's control of the armed forces. (Blomberg was soon known by his fellow officers as the "Rubber Lion.") In gratitude for his support, the führer promoted Blomberg in April 1936, making him the first field marshal of the Third Reich.

The relationship between the two men soon changed, however. After Hitler revealed his expansionist plans in November 1937, Blomberg and army commander Colonel General Werner von Fritsch objected, and Hitler then decided to remove both men from their posts. The opportunity to get rid of Blomberg came in January 1938 after the field marshal remarried. Both Hitler and Luftwaffe chief Hermann Göring were at the marriage, with Göring as best man. It was soon revealed, however, that Blomberg's new wife had been a prostitute. There were immediate calls for Blomberg to resign, and he did so on January 27. In a meeting with the führer, Blomberg suggested that Hitler assume the post of war minister himself, which he did a week later.

Blomberg took no part in the war, but as a prominent German official, he was detained after the war and testified at the war crimes trials in Nuremberg. He died there while still in detention on March 14, 1946.

Blomberg-Fritsch Affair (1938)

The Blomberg-Fritsch Affair of 1938 resulted in the complete subordination of the Reichswehr (German Army) to the Nazi Party. In November 1937 during a secret meeting with German leaders at the chancellory, Adolf Hitler revealed his plans to acquire additional territory to the east. Believing that the army was not ready for the general European war that would surely follow, both minister of war Field Marshal Werner von Blomberg and commander of the Reichswehr Colonel General Werner von Fritsch expressed openly their serious doubts. Hitler was determined to get rid of both men and to purge the senior officer corps.

Hitler's opportunity came following Blomberg's marriage on January 12, 1938, to Margarethe Gruhn, a 26-year-old typist. Both Hitler and Luftwaffe commander Hermann Göring had attended the wedding, Göring having been Blomberg's best man and Hitler having served as a witness. The Nazi leadership was a nest of ambitious men eager to discredit their rivals, and a few days later reichsführer of the Schutzstaffel Heinrich Himmler, who sought to embarrass Göring and also discredit the senior army leadership, supplied evidence that Blomberg's new wife had a criminal record as a

prostitute and had posed for pornographic photographs. This revelation led to calls for Blomberg to resign, which he did on January 27.

Simultaneously, Himmler produced evidence that Fritsch was gay. This charge was completely false; the only truth in it was that a Captain Fritsch was indeed a homosexual, but he was no relation to the general. The much-respected Fritsch resigned his post, however, to demand a court-martial to clear his name. Although it subsequently cleared Fritsch, Hitler refused to reinstate him.

The Blomberg-Fritsch Affair allowed Hitler to abolish the Ministry of War and create a new high command, the Oberkommando der Wehrmacht (OKW). This new organization was in direct competition with the General Staff and served as Hitler's personal staff. An unabashed admirer of Hitler, Lieutenant General Wilhelm Keitel became OKW commander and took his orders directly from Hitler. Another enthusiastic Nazi, Colonel General Heinrich von Brauchitsch, became the new commander of the army. In the ensuing command shake-up 16 generals were relieved of their posts and another 44 transferred. Hitler now had complete control of the German armed forces.

Blue Division (1941–1943)

Spanish division that fought with the German Army against the Soviet Union in World War II. Lieutenant General Augustin Muñoz Grandes commanded

the Division Azul of 18,000 men. The initiative for a Spanish expeditionary force came from Spanish dictator Francisco Franco immediately after the German invasion of the Soviet Union in June 1941. The division was assembled in some haste, as Franco feared that the Soviet Union would be defeated before Spain could make a military contribution. Motivations behind its establishment were Franco's gratitude to Germany for critical assistance to the nationalist cause during the Spanish Civil War (1936–1939), his staunch anticommunism, and to provide a dumping ground for Spanish fascist (Falange) hotheads advocating social revolution in Spain.

Fearful of offending the Allied powers too greatly, Franco styled the division a "volunteer" force. The division's name came from the blue shirts worn by the soldiers, although its official designation in the German order of battle was the 250th Division.

Adolf Hitler saw the division as a means to bind Spain more closely to the Axis cause. He therefore ordered it to be issued German equipment and transports and even pension payments. The division reached the Eastern Front by early October 1941 and soon proved itself in the difficult fighting before Leningrad, especially in the winter of 1942. Of the 47,000 who fought with the division in its two years at the front, 22,000 were casualties, but estimated Red Army losses opposite the Blue Division totaled more than 49,000 men. Hitler called the Spanish soldiers "extraordinarily brave, tough against privations, but wildly undisciplined." Spanish improvisation was a constant irritant to the Germans.

With the Allied invasion of North Africa and the German reversals at Tunis and Stalingrad, Franco recalled the division in October 1943, replacing it with a legion of only 1,500 men. The division failed to achieve its goals of defeating communism, but it had another purpose as well. This was to demonstrate to Hitler that the Spanish would fight and take any casualties to forestall any German plans to occupy Spain and take Gibraltar. Undoubtedly the Blue Division did impress Hitler on this point and helped to keep Iberia free of fighting in World War II.

Blum, Léon (1872–1950)

French politician and premier (1936–1937, 1938, and 1946–1947). Born in Paris on April 9, 1872, Léon Blum attended the prestigious École Normale Supérieure. While studying law at the Sorbonne, he became a socialist. After graduating in 1894 with highest honors, Blum pursued a literary career as a critic. The Dreyfus Affair drew the Jewish Blum into politics, and he joined the French Socialist Party (SFIO) in 1904. Rejected for military service in World War I, he won election to the Chamber of Deputies in 1919.

The socialist-communist split in 1920 presented Blum with an enormous challenge as he worked to rebuild the SFIO. He came to be considered the leader of his party through his frequent articles in its chief newspaper, *Le Populaire.* Certainly, his moderate approach and his quiet, effective leadership were key factors in the party's revival.

The SFIO became the leading party in the Popular Front of the 1930s, which also included the Radicals and communists. After the Popular Front victory in the spring 1936 elections, Blum became France's first Jewish and first socialist premier on June 4, 1936. Under his leadership, the government enacted sweeping social legislation, including the nationalization of leading banks and industries and the establishment of a 40-hour workweek and other worker benefits. These changes came at precisely the time that Germany was cutting worker benefits and straining to rearm.

Blum failed to win centrist and rightist support for his programs, and the flight of capital abroad and foreign reverses, especially the failure to aid the Spanish Republic (under pressure from London) during the 1936–1939 Spanish Civil War, led to his undoing. Too late, he realized that France needed to rearm. After the Chamber of Deputies refused his request for

emergency fiscal powers, Blum resigned as premier in June 1937, although the SFIO continued in the Popular Front coalition. Blum was again premier briefly during March 13–April 10, 1938.

Arrested on the orders of the collaborationist Vichy government following Germany's defeat of France in July 1940, Blum was put on trial in Riom in February 1943, along with other leaders of the Third Republic, and charged with responsibility for the French defeat. His spirited defense embarrassed the Vichy government and helped lead to the suspension of the trial. Taken prisoner by the Gestapo later in 1943, he was held in the Buchenwald and Dachau concentration camps until the end of World War II.

Blum returned to France after the war as a respected elder statesman. He headed a caretaker government between 1946 and 1947 and secured aid from the United States to assist in the reconstruction of his nation. He then retired permanently to his estate at Jouy-en-Josas, although he continued to write for *Le Populaire.* Blum died there on March 30, 1950.

Blumentritt, Günther (1892–1967)

German Army general. Born in Munich on February 10, 1892, Günther Blumentritt entered the army in 1911, serving a year as a Fahnenjunker (officer cadet) in the Thüringen 71st Infantry Regiment before entering the Danzig Kriegs-akademie (War Academy) in early 1912. Commissioned in November 1912, Blumentritt served in various staff positions on the Eastern Front during World War I, ending the war as a senior lieutenant. He served

briefly in the Thüringen Freikorps in 1919. His performance was sufficient for his retention in the postwar Reichswehr, and in November 1919 he took command of a company in the 11th Jäger (light infantry) Regiment.

Blumentritt's postwar career followed a conventional path, with rotations between staff and low unit command positions in infantry, cavalry, and artillery units. His star began to rise in the early 1930s, assisted by his close friendship with future field marshals Erich von Manstein and Wilhelm von Leeb. In 1933, Blumentritt became an instructor in tactics at the Officers' Course, Germany's clandestine General Staff College (an institution forbidden under terms of the Versailles Treaty of 1919). In 1935 he left the War College as a lieutenant colonel and General Staff officer.

Most of Blumentritt's World War II assignments were in General Staff positions. He was Colonel General Karl Gerd von Rundstedt's operations chief for the invasion of Poland in September 1939 and then Colonel General Günther von Kluge's chief of staff for the invasions of France in May 1940 and the Soviet Union in June 1941. Blumentritt became chief of staff to Field Marshal von Rundstedt's Army Group D in France in September 1942 but was injured in a railway accident in January 1943 and did not return to service until June 10, 1944, after Allied troops had landed in Normandy.

Blumentritt's association with Kluge and others involved in efforts to overthrow Adolf Hitler led to his temporary suspension in early September 1944. Later that same month, he was promoted to general of infantry and assigned command of XII SS Corps on the Western Front. In January 1945 he assumed command of the Twenty-Fifth Army in Holland, and in March he assumed command of the First Parachute Army, ending the war in Schleswig-Holstein. He was held as a prisoner of war until January 1948.

Blumentritt enjoyed a brief postwar career as a commentator on Western Allied strategy, and he wrote extensively. In addition to his memoirs, he wrote a well-received book on Rundstedt and edited another on the German tactics and operations against the Allies in the fighting in Normandy. Blumentritt died in Munich on October 12, 1967.

Bock, Fedor von (1880–1945)

German Army field marshal. Born into an old noble Prussian family at Küstrin, Germany, on December 3, 1880, Fedor von Bock joined the army in 1898. During World War I, he was promoted to major and won the Pour le Mérite.

After the war, Bock remained in the Reichswehr and, despite his known monarchist leanings, was not purged when the Nazis came to power in 1933. Promoted to colonel general, Bock participated in the German invasions of Poland (September 1939) and France (May 10–June 25, 1940), commanding army groups North and B, respectively. Although shocked by the Schutzstaffel (SS) treatment of Jews in Poland, he declined to make an official protest. In July 1940, he was among 12 new field marshals created by Adolf Hitler.

During the invasion of the Soviet Union (Operation BARBAROSSA) on June 22, 1941, Bock's Army Group Center was assigned the task of capturing Moscow. In July 1941, his forces took Minsk and three weeks later reached Smolensk. When Bock was only 225 miles from Moscow, Hitler decided to divert some of his forces to Leningrad and Kiev. Bock was not able to resume his advance before October, and bad weather forced a halt in December 1941.

Hitler then dismissed Bock, but after only a month's rest he was again sent to the Eastern Front to command Army Group South. In the 1942 summer offensive, Hitler instructed Bock to destroy Soviet forces west of the Don River, reach the Volga, and secure the Caucasus oil fields. Bock enjoyed initial success at Voronezh, but after his progress slowed, Hitler replaced him with Colonel General Maximilian von Weichs on July 15, 1942. Bock never returned to command.

German field marshal Fedor von Bock. (Keystone/Getty Images)

In 1944 Bock's nephew, Henning von Tresckow, approached him about the possibility of joining the July bomb plot against Hitler. Bock refused as he had in 1941 after being confronted with SS atrocities in the Soviet Union. An old-style Prussian officer, he chose not to break his oath of office, but he did not pass his knowledge about the plot to overthrow the führer on to the Gestapo.

Bock continued to press for a return to military service, but his efforts were in vain. He and his wife were killed as the result of an Allied air raid in Schleswig-Holstein on May 3, 1945, during which a fighter pilot fired on their car. Bock died the following day.

BODENPLATTE, Operation (January 1, 1945)

Operation BODENPLATTE (BASE PLATE) was the last major effort by the Luftwaffe to check Allied airpower in the west. The commander of German fighter defenses, Major General Adolf Galland, attempted to hoard his fighter force for one concentrated blow against the Allied air forces. Each time he was able to gather such a force, however, it was dispersed to other fronts or used piecemeal against waves of attacking Allied bombers. In the fall of 1944, Galland had again assembled a sizable fighter force, only to have it decimated during the December 16, 1944–January 25, 1945, Ardennes Offensive (Battle of the Bulge). In desperation, the Luftwaffe high command directed Major General Dietrich Peltz, commander of II Jagdkorps (Fighter Corps), to execute a surprise attack on Allied bases in Belgium.

The intent of the plan was to buy time for the Luftwaffe to battle the Allied bombers. The Germans hoped to force the Allies to remove their fighters from the continent, allowing the Luftwaffe an opportunity to regain control of the skies over the front and achieve some advantage against the bombers. The plan envisioned hurling all available aircraft in an early-morning, low-level attack against 16 Allied fighter fields in Belgium. Planning began in strict secrecy in mid-December, with the operation set to take place in the next period of good weather. Weather analysts determined that the conditions would be right on January 1, 1945, and orders were issued accordingly on December 31.

To maintain operational security, group commanders were not briefed on the details of the plan, and for many the first news of the upcoming attack came late on December 31. By the time orders reached subordinate levels, there was not always sufficient time for proper briefings. In many cases, the briefing consisted of a simple "follow me" direction. Even in the best of circumstances, an operation of this complexity would have been hard to execute, but it was particularly difficult for the poorly trained Luftwaffe pilots at the end of 1944.

Some 800 aircraft took part in the attack. Early on January 1, the fighters lifted off from fields behind the front. Some experienced night-fighter pilots led the formations to the front lines and then turned back, leaving the other fighters to find their targets and return on their own. An unexpected ground mist delayed some takeoffs, and confused German antiaircraft gunners opened fire on late-arriving aircraft, shooting down a number of them. Some pilots became lost and attacked the wrong fields. Over some target areas the surprise was complete, but at others the Allies were beginning their own daily air operations and were able to react quickly.

In the final analysis, Operation BODENPLATTE achieved some tactical success but at an unacceptable cost. The Germans destroyed a total of 134 Allied aircraft and damaged an additional 62. The Allies could easily absorb these losses, however, and there was no thought of relocating air operations to Britain. The Luftwaffe lost some 300 aircraft to all causes. More important, 214 Luftwaffe pilots were killed, missing, or captured. This operation marked the end of the road for the German Air Force, which was largely ineffective for the remainder of the war.

Bodø, Norway Raid (October 4, 1943)

On October 4, 1943, the Americans and British undertook a raid against German shipping at Bodø, Norway, located some 100 miles north of the Arctic Circle. With the code name of Operation LEADER, it involved a U.S. Navy task group under the command of Rear Admiral Olaf M. Hustvedt as well as Royal Navy ships. The strike force was the U.S. aircraft carrier *Ranger*. The covering force consisted of the British battleships *Duke of York* and *Anson*, the U.S. heavy cruiser *Tuscaloosa*, the British light cruiser *Belfast*, and 12 American and British destroyers.

Surprise was complete, with the Allied ships arriving before dawn on October 4. Aircraft from the *Ranger* then attacked and sank six merchant ships and damaged eight others. Three of the attacking aircraft were shot down by German antiaircraft fire. That afternoon three German aircraft located the *Ranger*, but its combat air patrol shot down two and chased off the other.

Bogan, Gerald Francis (1894–1973)

U.S. Navy admiral. Born on July 27, 1894, at Mackinac Island, Michigan, Gerald Bogan graduated from the U.S. Naval Academy at Annapolis in 1916. Following U.S. entry into World War I in 1917, he served aboard the cruiser *Birmingham* on convoy duty. An instructor at Annapolis during 1923–1924,

Bogan became a naval aviator in 1925. As superintendent of aviation training at the Naval Air Station Pensacola, he impressed the commandant there, future Admiral William F. Halsey. In 1937 Halsey made Bogan his executive officer. When Halsey took command of Carrier Division 2, Bogan joined the carrier *Yorktown* as a navigator and was then its executive officer (1939–1940). He commanded the Miami Naval Air Station during 1940–1942.

Bogan took command of the carrier *Saratoga* in October 1942. Promoted to rear admiral that December, he participated in battles in the Eastern Solomons. Bogan was then commander, Naval Air, Tenth Fleet, during June–October 1943, and then of Fleet Air, Norfolk, until January 1944.

For the remainder of the war Bogan served as commander of carrier divisions in the Pacific theater. In July 1944 he took command of Task Group 58.4, which provided pre-invasion bombardment and close air support for the assaults on Guam and Tinian. Bogan's carriers struck the Palau Islands and Mindanao in August and September, setting the stage for the Battle of Leyte Gulf (October 23–26, 1944). On October 24 Bogan's carriers covered San Bernardino Strait and attacked the Japanese Center Force in the Sibuyan Sea. The next day Halsey ordered strong naval forces (including Bogan's carriers) north to chase the Japanese decoy carriers, but Halsey soon had to turn south to assist Vice Admiral Thomas Kinkaid's invasion force at Leyte. Bogan later stated that Halsey made a "great mistake" in the battle, but he failed to press his concerns at the time. Bogan's carriers supported the invasion of Luzon, suffering fierce kamikaze attacks. Bogan briefly went home on leave but returned to participate in the April 1945 invasion of Okinawa.

Bogan's postwar assignments included commander, Air Force, Atlantic Fleet (1946–1948). In 1949 he was embroiled in the so-called Revolt of the Admirals. His letters, deriding cuts in naval aviation at the expense of strategic bombers, were leaked to the press, and in February 1950 Bogan was forced into early retirement as a vice admiral. He died at La Jolla, California, on June 8, 1973.

Bohr, Niels Henrik David (1885–1962)

Nobel Prize–winning Danish atomic physicist. Born in Copenhagen on November 18, 1885, Niels Henrik David Bohr earned a doctorate in physics from Copenhagen University in 1911. He then studied in Britain, at Cambridge and Manchester, under leading physicists J. J. Thompson and Ernest Rutherford. By 1913, Bohr had received international acclaim for his work on the development of quantum theory. Returning to Copenhagen, he speedily made that university a leading international center of theoretical physics, attracting distinguished scientists from around the world. In 1922, a Nobel Prize recognized his work on quantum theory and atomic structure.

In 1938 and 1939, Bohr visited the United States, warning American scientists of his belief that German experiments had proved that the atom could be split and, by implication, that the opponents of Nazi Germany must develop atomic weapons before Germany did so. After Germany occupied Denmark in 1940, Bohr refused German requests for scientific collaboration and was active in the anti-Nazi resistance. In the late 1990s, Michael Frayn's acclaimed play *Copenhagen* provoked a well-publicized historical debate over Bohr's part in dissuading his former student, German scientist Werner Heisenberg, from pressing ahead with a German nuclear bomb project.

British Secret Service operatives helped Bohr escape to the United States in 1943, where he joined the Manhattan Project's laboratory at Los Alamos, New Mexico, working under its director and his old scientific associate, J. Robert Oppenheimer. There, Bohr contributed materially to the secret program developing atomic weapons. With the 1945 atomic explosions over Hiroshima and Nagasaki, Bohr hoped that the bomb's destructive potential might eventually force nations to abandon war as unacceptably devastating, a view that influenced Oppenheimer.

When the war ended, Bohr returned to Copenhagen to resume his scientific work. He campaigned for the open exchange of ideas and people among nations as a means of controlling nuclear weapons. One Soviet

general has alleged that Bohr deliberately assisted a Soviet physicist with vital atomic information. Bohr died in Copenhagen on November 18, 1962.

Boisson, Pierre François (1894–1948)

French colonial administrator and governor-general of French West Africa for the collaborationist Vichy regime. Born at Saint-Launeuch in Brittany, France, on June 19, 1894, Pierre Boisson entered the army at the beginning of World War I in August 1914. He lost a leg in the 1916 Battle of Verdun. After the war, Boisson joined the French Colonial Service, and in 1936, he was appointed governor-general of French Equatorial Africa. Based at Brazzaville, he was known as a harsh but honest and able administrator.

Following France's armistice with Germany in late June 1940, Boisson at first vehemently demanded that French forces continue fighting, but he was soon won over to the Vichy government when its head of state, Marshal Philippe Pétain, sent him to Dakar as governor-general of French West Africa and high commissioner for French Africa. Arriving in Dakar on July 23, 1940, he banned Germans from the city, but in September 1940, he also defeated an attempt by Free French leader General Charles de Gaulle to take over both Dakar and the French battleship *Richelieu*, which was sheltered there.

After the November 8, 1942, Allied landings in North Africa, Admiral Jean Darlan reached an accord with Lieutenant General Mark Clark, deputy U.S. commander, and ordered Boisson to bring French West Africa into the Allied camp, instructions Boisson took 10 days to obey. Nonetheless, U.S. president Franklin D. Roosevelt rather admired the straightforward Boisson's uncompromising and evenhanded style, which, although brutal on occasion, was direct, honest, and effective. Boisson's relations with the Allies were cold but correct, and Roosevelt initially insisted that de Gaulle leave him in his post; only on July 1, 1943, after de Gaulle became head of the Provisional French National Committee, was Boisson dismissed.

Ignoring Roosevelt's protests, de Gaulle ordered Boisson arrested on December 15, 1943. He was then incarcerated for two years without trial and released on grounds of ill health. In 1948, Boisson was summoned before the French High Court of Justice, but before proceedings began, he died suddenly, on July 20, at Châtou, Paris.

Bong, Richard Ira "Dick" (1920–1945)

U.S. Army Air Forces officer and ace of aces: the highest scoring U.S. ace ever. Richard Ira "Dick" Bong was born in Superior, Wisconsin, on September 24, 1920. The son of Swedish immigrants, he grew up one of nine

children on a farm in Poplar, Wisconsin. Bong entered Superior State Teachers College in 1938, enrolled in its Civilian Pilot Training Program, and took private flying lessons. In 1941 he enlisted in the Army Air Corps Aviation Cadet Program. Commissioned a second lieutenant on January 9, 1942, he was assigned as a gunnery instructor.

Bong's first operational assignment was to a fighter squadron at Hamilton Field, California, where he learned to fly the Lockheed P-38 Lightning. Temporarily grounded for having flown low over the house of a fellow pilot who had just gotten married, he missed deployment to England with his squadron in July 1942. Bong was assigned to another squadron and ordered to the Southwest Pacific theater.

In September 1942, Bong was stationed at Darwin, Australia, with the 9th Fighter Squadron of the 49th Fighter Group. While awaiting delivery of P-38s, Bong and the other pilots of his squadron flew with the 39th Fighter Squadron of the 35th Fighter Group at Port Moresby, New Guinea. Bong scored his first aerial victories on December 27, 1942, when he shot down both a Mitsubishi A6M Zero and a Nakajima Ki-43 Oscar over Buna, for which he was awarded the Silver Star.

Returning to the 49th Fighter Group in March 1943, Bong was stationed at Schwimmer Field near Port Moresby. On July 26, 1943, he shot down four Japanese fighters over Lae, for which he was awarded the Distinguished Service Cross. Following leave in the United States during November and December 1943, Bong returned to his unit. By April 1944 Bong, now a captain, had shot down 27 Japanese aircraft, surpassing the leading American ace of World War I, Captain Eddie Rickenbacker. Bong said that he did not trust his gunnery skills and so tried to get as close as possible to his opponent in his P-38 before opening fire, which meant that he often flew through debris fields and, on one occasion, actually collided with a Japanese aircraft.

Following another leave in the United States in May 1944, Major Bong returned to New Guinea in September. Although assigned to V Fighter Command staff and thus not required to fly combat missions, he continued flying from Leyte during the Philippine Islands campaign, increasing his aerial victory total to at least 40 by December. For Bong's accomplishments, including continuing to fly combat missions when not required, commander of Allied Air Forces, Southwest Pacific Area, Lieutenant General Richard C. Kenney recommended Bong for the Medal of Honor. General Douglas

MacArthur presented it in December 1944. Ordered to the United States in January 1945, Bong took part in numerous public relations activities, including the promotion of war bonds.

Assigned to Lockheed at Burbank, California, Bong was a test pilot for its P-80 Shooting Star jet fighter. On August 6, 1945, during takeoff, the primary fuel pump on Bong's P-80 malfunctioned. Although Bong was able to clear the aircraft, there was insufficient altitude for his parachute to deploy, and he was killed.

Bonhoeffer, Dietrich (1906–1945)

German theologian and Abwehr (German military intelligence service) counterspy. Born on February 4, 1906, in Breslau, Silesia, Dietrich Bonhoeffer was the son of the prominent neurologist and psychiatrist Karl Bonhoeffer and studied theology at Tübingen, Rome, and Berlin during 1923–1927. From 1930 to 1931, the younger Bonhoeffer attended classes taught by preeminent Protestant theologian Reinhold Niebuhr at Union Theological Seminary in New York City. In 1931, Bonhoeffer began teaching theology at Berlin and was ordained a Lutheran minister. From July 1933 until April 1935, he served two German parishes in London.

After Adolf Hitler came to power in 1933, Bonhoeffer rejected his government's efforts to create a united national Protestant church, the German Christians, that would synthesize National Socialism and Christianity. Instead, he urged evangelical Christians to join the Confessional

Church, which opposed Nazism. Bonhoeffer returned to Germany to lead a Confessional Church seminary at Finkenwalde, which was closed by the authorities in October 1937.

In 1938, Bonhoeffer's brother-in-law Hans von Dohnanyi introduced him to Major General Hans Oster, Colonel General Ludwig Beck, and Admiral Wilhelm Canaris of the Abwehr. Bonhoeffer then decided to join active resistance to the Nazi regime, and by 1939, he had become a double agent in Canaris's counterespionage service. As an Abwehr counterspy, he maintained links abroad and held to his pacifist principles.

In Stockholm in 1943, Bonhoeffer secretly met with Anglican Bishop George Bell of Chichester, England, for the Abwehr. This meeting failed to gain Allied support for the German resistance. Bonhoeffer also participated in Abwehr Operation SEVEN to spirit Jews out of Germany.

Arrested by the Gestapo on April 5, 1943, on charges of conspiring to overthrow the regime, Bonhoeffer was held at the Tegel, Buchenwald, and Flossenburg concentration camps. He was hanged at Flossenburg on April 9, 1945. Many Christians consider him a martyr.

Borghese, Junio Valerio (1906–1974)

Italian Navy officer and ardent fascist. Born on June 6, 1906, at the family estate near Rome, Junio Valerio Borghese spent three years as a student in Britain before entering the Italian Naval Academy. Graduating in 1928, he was commissioned an ensign. Lieutenant Borghese was commanding a

submarine off Spain during the 1936–1939 Spanish Civil War when, on August 31, 1937, believing it to be a warship of the Spanish Republican Navy, he mistakenly attacked the British destroyer *Havock* while it was on neutrality patrol. In trying to locate Borghese's submarine, the *Havock* employed sonar, the first time this had been done in a wartime situation. Neither the Italian submarine nor the British destroyer was damaged in the exchange.

During World War II Borghese was a proponent of special attack units, and his 620-ton submarine *Scire* transported three two-man guided slow (2–4 knots) torpedoes in the daring and successful attack on Alexandria on December 19, 1941. The raid sank the battleships *Queen Elizabeth* and *Valiant* and damaged a destroyer and an oiler. Although the battleships were refloated and repaired, it severely curtailed British naval operations in the Mediterranean in the first half of 1942.

Promoted to commander, Borghese assumed command of the 10th Light Flotilla, known as the "X MAS" (Decima Mas). Now known as the "Black Prince," Borghese conducted other operations up to the September 1943 armistice, resulting in total Allied losses of almost 200,000 tons of shipping, although many of the ships were sunk in harbors and subsequently returned to service.

A diehard fascist, Borghese struck an agreement between his X MAS unit and the Germans after the armistice to continue the war as an autonomous force. Borghese's unit ultimately numbered some 25,000 men and operated primarily on land in antipartisan activities, especially in the border areas with Yugoslavia, Austria, and Switzerland, in an attempt to retain those lands as Italian territory. In April 1945, Borghese and his wife, who worked in the office of the secretary of state of the Vatican, were taken prisoner by the Americans.

Held in prison for three years after the war, Borghese was put on trial in Rome in November 1948 on charges of having committed war crimes against the partisans. Acquitted, he was set free in February 1949. He then entered Italian politics on the far right wing. On December 7, 1970, he led an abortive coup against the Italian government. Fleeing to Spain, Borghese died in Cádiz on August 26, 1974.

Borie, USS, vs. *U-405* (November 1, 1943)

The U.S. Navy destroyer *Borie*, commanded by Commander Charles H. Hutchins, U.S. Naval Reserve, was part of hunter-killer Task Unit 21.14 centered on the escort carrier *Card* when it was detached to search for two German submarines spotted by aircraft. On the night of October 31, 1943, some 700 miles north of the Azores, it picked up a radar contact on a German submarine, which promptly submerged. The *Borie* carried out three depth charge attacks on the submarine, the *U-256.* After the third attack a large oil slick was spotted, and the *Borie* reported having sunk the submarine. Actually, the *U-256* was only damaged and managed to make it safely to its base.

At about 2:00 a.m. on November 1, the *Borie* picked up another radar contact, the *U-405*, which promptly submerged. The *Borie* then carried out a depth charge attack, and the *U-405* surfaced again in heavy 15-foot seas, apparently unable to submerge. During the next hour the two fought the most intense destroyer-submarine engagement of the war. The *Borie*'s 14-inch spotlight kept the submarine illuminated throughout the engagement except for periods when it was turned off for tactical reasons. The U-405's machine guns achieved hits on the destroyer as the deck gun crew traversed their 88mm gun to take aim on the *Borie*'s waterline, but 20mm gunfire from the *Borie* killed the exposed members of the sub's crew topside, and a salvo of three 4-inch shells blew off the sub's deck gun before it could fire a single shell. Finally the *Borie* was able to ram the *U-405*, but the two become

locked together for some 10 minutes, during which the crews exchanged small-arms fire from their decks. The Germans finally managed to free the submarine, but it suffered fatal damage in gunfire from the *Borie* and sank.

The *Borie*, however, had sustained heavy damage to its bow in the ramming, and despite a 16-hour effort to save the ship, Hutchins was forced to order abandon ship. Eight officers and 121 seamen were taken aboard two other destroyers, but 27 crewmen were lost. Surprisingly, the *Borie* remained afloat but was so badly damaged that the decision was made not to take it in tow. After torpedoes and naval gunfire failed to sink it, the *Borie* was sunk by bombs from the *Card*'s aircraft. As a consequence of this engagement, a number of Atlantic Fleet destroyers were modified with strengthened bows.

Boris III, Czar of Bulgaria (1894–1943)

King of Bulgaria whose country, although nominally an Axis power, remained autonomous throughout the war years. Boris III was born Boris Klemens Robert Maria Pius Ludwig Stanislaus Xaver, prince of Saxe-Coburg and Gotha, duke of Saxony, and prince of Tirnovo, at the royal palace in Sofia on January 30, 1894. His father was the bombastic and Machiavellian Czar Ferdinand, who had ruled since 1887. His mother, Princess Maria Luisa of Bourbon Parma, died while giving birth to his youngest sibling. Boris was educated by palace tutors and married Princess Giovanna of Savoy, daughter of King Victor Emmanuel III of Italy, in 1930. They had two children, Maria Luisa and Crown Prince Simeon.

Boris came to the throne following his father's abdication on October 3, 1918, at the end of World War I. Bulgaria was then in desperate straits. The 1919 Treaty of Neuilly involved loss of territory and the payment of

reparations. As a consequence of his country's many problems, Boris experienced an exceptionally stormy reign. The 1920s were filled with internal political strife, and economic problems forced Bulgaria to depend on Germany for supplies.

In the interwar years, Boris favored a neutral course for his country. He proved to be an adept diplomat and an intelligent yet cautious leader who was genuinely respected by his people for his skillful handling of the many problems besetting the kingdom. He was an unwilling junior partner in the Axis alliance during World War II. Pressured into joining the alliance by Germany, Boris regained the southern Dobruja region from Romania in 1940, which led to his being known as the "King Unifier" and the "Liberator Czar."

By 1941, Boris had little choice but to commit to the Axis powers and allow German troops to cross through his country en route to the Soviet Union. Unlike the other Balkan states, though, Bulgaria remained autonomous during the war. It did not invade Yugoslavia or Greece, but its troops did garrison parts of Macedonia and western Thrace. In December 1941, Bulgaria declared war on the United States and Britain, but Boris infuriated Adolf Hitler by withholding Bulgarian troops from the war effort and refusing to declare war on the Soviet Union or send Bulgarian Jews to the death camps. His actions helped save at least 50,000 Jews. Boris and Giovanna also arranged transit visas permitting thousands of other Jews to go to Palestine.

Boris's continuous obduracy regarding German policies led to a stormy meeting with Hitler at the latter's Wolfs-schanze headquarters near Rastenburg on August 14, 1943, in which Boris bluntly said that Bulgaria would follow its own path. He returned to Sofia depressed over the probable eventual fate of his country. Boris died at the royal palace in Sofia two weeks later, on August 28, 1943, most likely from an embolism. A regency then took power on behalf of the underage King Simeon II, who reigned until September 9, 1946.

Bór-Komorowski, Tadeusz (1895–1966)

Polish Army general and commander of the armed underground movement in Poland. Born in Chorobrów, a village in the Brze#lbany district of Austrian Poland, on June 1, 1895, Tadeusz Bór-Komorowski joined the Austro-Hungarian Army in 1913 and studied at the Military Academy in Vienna. Until 1918, he fought on the Russian and Italian fronts, attaining the rank of second lieutenant. After 1918, he served in the Polish Army, mostly commanding cavalry units, and was promoted to colonel in 1933.

Komorowski was supervising a cavalry training center in the Polish Corridor (the territory separating East Prussia from the rest of Germany) at the time of the September 1, 1939, German invasion. Although his unit was forced to surrender at the end of September, Komorowski avoided capture and joined the underground Związek Walki Zbrojnej (Union for Armed Struggle, ZWZ) in Kraków.

In May 1940, commander in chief of Polish armed forces in exile General Władysław Sikorski sent Komorowski to Warsaw as a brigadier general and deputy commander to General Stefan Rowecki, then leader of the ZWZ. When the German Gestapo arrested Rowecki in 1943, Komorowski replaced him, under the pseudonym Bór, as commander of the armed underground movement, which had become the Armia Krajowa (Home Army, AK) in 1942.

On Komorowski's orders, given with the approval of the government-in-exile's delegate in Poland and with the encouragement of the Soviets, who promised assistance, the Home Army rose against the German occupation in Warsaw on August 1, 1944. Although the Germans were hard-pressed to put down this Polish effort to retake Warsaw, after two months of heavy fighting the uprising ended in utter defeat for the Poles, who received no aid from the Soviets.

After his promotion to commander in chief of the Polish armed forces on September 30, Komorowski was captured by the Germans in October 1944. Liberated by the U.S. Army on May 5, 1945, he immigrated to London and resigned as commander in chief in 1946. As prime minister of the Po-lish government-in-exile from 1947 to 1949, Komorowski remained a prominent member of the Polish émigré community until his death in London on August 24, 1966.

Bormann, Martin Ludwig (1900–1945)

German official who was head of the Chancellery and Adolf Hitler's private secretary. Born in Halberstadt, Germany, on June 17, 1900, Martin Ludwig Bormann served in the German Army at the end of World War I. He then joined a Freikorps unit, but in 1924 he was sentenced to a year in prison for committing a vengeance murder.

Following his release, Bormann joined the National Socialist Party and was attached to the Sturmabteilungen (SA, Storm Troops) Supreme Command. From July 1933, he was the chief of staff in the office of Deputy Führer Rudolf Hess. Diligent and efficient, Bormann secured Hitler's trust by running his villa, the Berghof, at Berchtesgaden. He then began taking over Hess's duties and made himself indispensable to Hitler.

After Hess's flight to Scotland in May 1941, Hitler abolished the Office of Deputy Führer and renamed it the Party Chancellery, choosing Bormann as its head. In April 1943, Bormann was appointed secretary to the führer. He wrote down all of Hitler's oral commands, translating them into firm orders, and he controlled access to the führer. He also proved to be a master of

intrigue and manipulation. He was virtually Hitler's deputy and, some would argue, the second most powerful man in the Reich.

Skillfully steering Hitler into approving his own schemes, Bormann acquired the inside track for displacing dangerous rivals. Always a guardian of Nazi orthodoxy, he strengthened the Nazi Party and increased his grip on domestic policy. He advocated radical measures when it came to the treatment of Jews, the conquered peoples, and prisoners of war.

In October 1944, Bormann became executive head of the Volkssturm (militia). He signed Hitler's last will and testament and watched the führer commit suicide in the Chancellery bunker on April 30, 1945. Bormann then left the bunker. Most likely, he was killed trying to cross the Soviet lines. Doubts persisted, and numerous sightings of him were reported. He was sentenced to death in absentia at the Nuremberg war crimes trials. Bormann was pronounced dead in 1973 after his remains were found in Berlin and identified.

MARTIN MOLL

One of the most powerful figures in the Third Reich, Martin Bormann was Nazi Party secretary and private secretary to Adolf Hitler, thus controlling access to the führer. (Corbis)

Borneo Campaign (May 1–August 1, 1945)

The last major campaign of the war in the Southwest Pacific. Code-named Operation OBOE and begun on May 1, 1945, the Borneo Campaign was conducted by some 35,000 men of the Australian Army's I Corps, commanded by Lieutenant General Leslie "Ming the Merciless" Morshead. It was part of the larger Allied effort to secure the Netherlands East Indies (present-day Indonesia) and the southern Philippines. Borneo is the world's third-largest island and is important for its oil. Support was provided by the U.S. Navy Seventh Fleet, commanded by Admiral Thomas Kinkaid, and its Amphibious Force, joined by Australian warships. Elements of the U.S. Army Air Force's Thirteenth Air Force and the Australian First Tactical Air Force provided air support.

On May 1, the 26th Brigade of the 9th Division landed on Tarakan Island just off the coast of northeastern Borneo. They encountered strong resistance from the Japanese, but by the next day they secured the town of Tarakan and its airstrip. In all, the Japanese had in the defense of Borneo some 35,000 men of their Thirty-Seventh Army and Third Air Army under Lieutenant General Masao Baba and naval forces under Vice Admiral Kamada Michiaki. The Australians secured the island by June 22.

On June 10, meanwhile, elements of the 9th Division came ashore at Brunei Bay, a major harbor in British North Borneo, and rapidly pushed inland to establish airfields. During July 1–10 in the last major amphibious assault of the war, the Australian 7th Division landed at the oil center of Balikpapan on the southeast coast across Makassar Strait from Celebes. The Australians soon secured all of their major objectives.

Fighting on Borneo continued until the end of the war. Australian casualties in the campaign were light: fewer than 2,000 killed or wounded. The Japanese suffered perhaps 7,000 killed and another 1,000 captured. Most of the remainder surrendered at the end of the war, some not until October 1945. They surrendered their weapons and were told to march to Beaufort for transport back to Japan. Many were slain by Murut tribesmen on their march to that port.

Bose, Subhas Chandra(1897–1945)

Indian nationalist politician. Born at Cuttack, Orissa, in the Bengal Presidency on January 23, 1897, Subhas Chandra Bose attended college in India and then went to Cambridge University to prepare for a civil service career. Although he passed the exams in 1920, he instead embarked on a career in nationalist politics. He joined the Indian National Congress and took part in a number of acts of civil disobedience in the 1920s and 1930s, for which he was frequently jailed. In 1938, Bose became president of the congress. At that point, however, Bose broke with Mohandas Gandhi and other congress leaders because he advocated the use of violence to expel the British from India.

Bose was arrested by the British authorities in June 1940, but he managed to escape to Afghanistan and eventually made his way to Germany. Arriving in Berlin in January 1941, Bose, who had developed an admiration for totalitarian political systems, attempted to enlist German support for the creation of a pro-Axis Indian army recruited from among prisoners of war in North Africa. Because of Nazi racial biases, however, Bose was able to raise only a small token unit.

Hoping to have better luck with Germany’s Axis partner, Bose undertook a perilous long submarine journey to Japan. After arriving in Tokyo in June 1943, he became the leader of the Indian National Army, a Japanese-sponsored force of approximately 13,000 Indian former prisoners of war. In October 1943, Bose led the Provisional Government of Free India. In that capacity, he made propaganda broadcasts for the Japanese, and in November 1943 he participated in the Greater East Asia Conference, an attempt by

Japan to foster Asian solidarity under its leadership. Bose was killed in an airplane crash in Taiwan on August 18, 1945.

Bougainville Campaign (November 1, 1943–August 15, 1945)

One of the northern Solomon Islands, Bougainville is approximately 130 miles long and 48 miles across at its widest point. The Allies established and held a bridgehead there beginning in November 1943 to help neutralize the nearby Japanese base at Rabaul on New Britain Island.

On November 1, 1943, Allied forces, organized into the I Marine Amphibious Corps under Lieutenant General Alexander A. Vandergrift (after November 9, under Major General Roy S. Geiger), landed at Empress Augusta Bay about midway up the west coast of Bougainville. Japanese lieutenant general Hyakutake Haruyoshi's Seventeenth Army defended the island. The next day in the Battle of Empress Augusta Bay, U.S. Navy forces turned back an attempt by a Japanese task force to attack the landing force, while Allied air units secured aerial supremacy over Bougainville. On November 25, American destroyers intercepted a Japanese task force bringing reinforcements to nearby Buin Island in the Battle of Cape St. George, sinking two Japanese destroyers and a destroyer transport and halting further Japanese shipment of reinforcements to the Solomon Islands.

U.S. marines seen in front of a Japanese dugout on Cape Totkina on Bougainville in the Solomon Islands, which they helped to secure, January 1944. (National Archives)

Initially Hyakutake, who had 40,000 troops and 20,000 naval personnel, put up little resistance in the belief that the U.S. landing was a ruse. Moreover, he was hindered in organizing a counterattack by the island's rugged terrain. During the next weeks, the invading marines expanded their perimeter to the ridges overlooking the bay and established a strong defensive position while construction units built airfields to assist in the defense of the bridgehead and to attack Rabaul. In December 1943 the marines were withdrawn, and defense of the bridgehead was entrusted to the U.S. Army XIV Corps, commanded by Major General Oscar W. Griswold.

In March 1944, Hyakutake finally launched a major offensive to destroy the bridgehead, hurling 15,000 men against some 60,000 Americans defenders. Fierce battles took place at the Creeks area and Hill 700 in the middle of the perimeter and at Hill 260 on the east side. The American positions were too strong, however, and by the end of the month, the Japanese had been repelled, having lost 5,000 killed and another 5,000 wounded.

By this time, Rabaul had been effectively neutralized, and thereafter Bougainville, which had provided vital air bases for the victory, became a backwater. The Japanese, cut off from outside aid, were content to be contained, and Griswold saw no need to undertake an offensive against them as long as the bridgehead was secure. U.S. forces engaged only in aggressive patrolling to keep the Japanese off balance. At the end of 1944, the Australian I Corps, commanded by Lieutenant General Sir Stanley Savige, replaced the Americans in the bridgehead.

Unlike the Americans, the Australians were not content to be garrison troops, and in early 1945, Savige launched an offensive to wipe out the remaining Japanese. Although they were handicapped by disease, starvation, and supply shortages, the Japanese resisted in sustained fighting until the end of the war, losing 18,000 dead to all causes; the Australians suffered 516 killed and 1,572 wounded. Of the 60,000 Japanese on Bougainville when the Americans landed, only 21,000 remained to surrender in August 1945.

Bowhill, Sir Frederick William "Ginger" (1880–1960)

British air chief marshal. Born on September 1, 1880, in Gwalior, India, the son of an army officer, Frederick William Bowhill worked in the merchant marine for 16 years. In 1912, he learned to fly, and the following year he became a flying officer in the Royal Flying Corps, Naval Wing. During World War I, he saw combat attacking German submarine bases and zeppelins. He also served in Mesopotamia and in the Mediterranean, finishing the war as a wing commander. He remained in the Royal Air Force (RAF) after the war, serving in Britain, Egypt, and Iraq and at the Air Ministry in London.

In 1931, Bowhill was promoted to air vice marshal and appointed air officer commanding Fighting Area, Air Defence, of Great Britain. In August 1937, now knighted and an air marshal, Bowhill took over the Coastal Command, where he remained until June 1941. An innovative leader, he developed systems to control aircraft from the ground that proved invaluable during the Battle of Britain (July 1–September 30, 1940) and afterward. He also urged the use of barrage balloons to protect cities from low-level aerial bombardment, and he helped to develop the Women's Auxiliary Air Force. Bowhill's command participated in the rescue of captured British seamen from the German blockade-runner *Altmark* in February 1940 and in the destruction of the German battleship *Bismarck* in May 1941.

In June 1941, Bowhill moved to Canada to organize and take over from civilian control the RAF Ferry Command, initially set up in 1940 by a group of Montreal businessmen to fly desperately needed North American–built airplanes to Britain. The assignment demanded tact, charm, and diplomacy, all qualities that Bowhill and his wife exercised in abundance. In 1943, Bowhill became air officer commander in chief, Transport Command; he remained in this post until the end of the war, retiring four years after the normal retirement age. He spent two further years in Montreal as the British representative of the provisional International Civil Aviation Organization. Until 1957 he was also the Ministry of Civil Aviation's chief aeronautical adviser. Bowhill died in London on March 12, 1960.

Boyington, Gregory “Pappy” (1912–1988)

U.S. Marine Corps officer and aviator. Born on December 4, 1912, in Coeur d’Alene, Idaho, Gregory Boyington graduated from the University of Washington in 1934 with a degree in aeronautical engineering. Joining the Marine Corps in 1935, he became a naval aviator two years later. Excessive drinking, marital estrangement, financial difficulties, and disrespect for superior officers characterized his next four years of service; nevertheless, he was recognized as an excellent pilot and was promoted to first lieutenant in November 1940. In late 1941, Boyington volunteered for service with Colonel Claire Chennault’s American Volunteer Group (the Flying Tigers) in China.

Flying in defense of Burma and later in China during the spring of 1942, Boyington was credited with two aerial victories, although he maintained that he had downed six Japanese aircraft. Transferred to the South Pacific in early 1943, he was promoted to major and ordered to form a new squadron to take the place of the refitting VMF-214 unit. This new unit, also designated VMF-214 and operating in the Solomon Islands, became legendary as the Black Sheep Squadron.

Between September 1943 and January 1944, the Black Sheep Squadron claimed to have destroyed or damaged 197 Japanese aircraft. Boyington, nicknamed “Gramps” by his men and “Pappy” by the press because he was 30 years old, became something of a folk hero in the United States, immortalized in lavish news coverage. He downed 22 Japanese aircraft in this period. Combined with his earlier 6 in China and Burma, his 28 aerial victories made him the leading Marine Corps ace of all time.

Boyington was shot down on January 3, 1944, on a fighter sweep over Rabaul after being jumped by more than 20 Japanese aircraft. Picked up by a

Japanese submarine, he spent the remainder of the war in prisoner-of-war camps. On his return to the United States in 1945, he was promoted to colonel and awarded the Medal of Honor and the Navy Cross.

Boyington left the service in 1947. He then held a succession of jobs, constantly struggling with alcoholism and marital problems. In 1958, he wrote *Baa Baa, Black Sheep*, detailing his war experiences. In the 1970s, he produced the short-lived television series *Baa Baa Black Sheep*, based loosely on his book. Boyington died in Fresno, California, on January 11, 1988.

Bradley, Omar Nelson (1893–1981)

U.S. Army general. Born in Clark, Missouri, on February 12, 1893, Omar Nelson Bradley secured an appointment to the U.S. Military Academy at West Point in 1911. He graduated in 1915, a member of what would become known as the "class the stars fell on," and was commissioned a second lieutenant of infantry.

Assigned to the 14th Infantry Regiment in Spokane, Washington, Bradley saw service along the Mexican border during the 1916 crisis that followed Pancho Villa's raid on Columbus, New Mexico. Like his classmate Dwight D. Eisenhower, Bradley missed combat in World War I. During the interwar period, his career followed a familiar pattern, with a number of troop commands interspersed with assignments at various military schools,

including West Point. His most significant assignment was as chief of the Weapons Section during Colonel George C. Marshall's tenure as deputy commandant at the Infantry School at Fort Benning, Georgia.

Bradley graduated from the Army War College in 1934. Following service in General Marshall's secretariat of the General Staff between 1939 and 1941, he was promoted directly from lieutenant colonel to brigadier general on February 24, 1941, and assigned command of the Infantry School. Promotion to major general followed on February 18, 1942, and Bradley successively commanded the 82nd Infantry Division and the National Guard 28th Infantry Division. In February 1943, Marshall dispatched him to North Africa, where General Dwight D. Eisenhower assigned him as deputy commander of Lieutenant General George S. Patton's II Corps in the wake of the Kasserine Pass debacle (February 14–22, 1943). When Patton assumed command of the Seventh Army, Bradley took command of II Corps and led it with great distinction both in Tunisia and in Sicily. Bradley was promoted to lieutenant general on June 9, 1943.

U.S. Army general Omar Bradley, shown here in 1950. During World War II, Bradley commanded the 12th Army Group and was probably General Dwight Eisenhower's most trusted adviser. (Library of Congress)

In October 1943, Bradley assumed command of the First Army and transferred to Britain to prepare for the cross-Channel invasion. He commanded U.S. ground forces on D-day (June 6, 1944) in Operation OVERLORD and during the ensuing Normandy Campaign. On July 26, the First Army broke the German lines outside Saint-Lô in Operation COBRA (July 25–31), Bradley's operational masterpiece. On August 1, 1944, he assumed command of the 12th Army Group, which then encompassed General Courtney Hodges's First Army and General George Patton's Third Army.

During the subsequent drive across France, Bradley performed well but not spectacularly. His failure to close the Falaise-Argentan gap reflected poorly on his ability as a strategist and undoubtedly extended the war in the west. When the Germans launched the December 16, 1944–January 25, 1945,

Ardennes Offensive (Battle of the Bulge), Bradley was slow to react, but in the subsequent campaign, he renewed Marshall's and Eisenhower's confidence by carefully orchestrating the advance of the American armies on Field Marshal Bernard L. Montgomery's right flank. By war's end, Bradley had clearly emerged as Eisenhower's most trusted military adviser. As the 12th Army Group grew to include four separate armies, the largest purely American military force in history, Bradley was promoted to general on March 29, 1945, on the eve of Germany's capitulation.

Following the war, Bradley headed the Veterans' Administration, and in February 1948 he succeeded Eisenhower as army chief of staff. In this post, Bradley championed the continued unification of the nation's armed forces. One year later, he became the first chairman of the Joint Chiefs of Staff and was subsequently promoted to the five-star rank of general of the army on September 22, 1950. During the 1950–1953 Korean War, Bradley supported President Harry S. Truman's relief of General Douglas MacArthur in April 1951 and opposed expansion of the war. Bradley retired from active military service in August 1953 to become chairman of the board of Bulova Watch Corporation. During the Vietnam War, he served as an adviser to President Lyndon Johnson. Bradley died on April 8, 1981, in Washington, D.C.

Brandenberger, Erich (1892–1955)

German Army general. Born on July 15, 1892, in Augsburg, Germany, Erich Brandenberger became an officer candidate in July 1911 and was commissioned in the artillery in 1913. He fought in World War I and remained in the army thereafter, primarily in staff positions. He was promoted to lieutenant colonel in July 1934 and to colonel two years later.

Brandenberger was serving as chief of staff of XXIII Corps at the outbreak of war in September 1939. Promoted to major general in July 1940, he took command of the 8th Panzer Division in February 1941. His unit was part of Colonel General Erich Hoepner's Fourth Panzer Group of Army Group North at the June 22, 1941, commencement of Operation BARBAROSSA, the invasion of the Soviet Union. In the first few days of the offensive, Brandenberger's men seized a critical viaduct and then bridges over the Daugava River at Daugavpils.

Promoted to lieutenant general in August 1942, Brandenberger remained with the 8th Panzer Division until January 1943 and was engaged in the effort to relieve the pocket at Velikiye Luki. He was promoted to general of panzer troops in August 1943 and then led XVII and XXIX Corps on the Eastern Front. The latter was active in the southern Ukraine.

Brandenberger assumed command of the Seventh Army in August 1944 under Field Marshal Walter Model, commander of Army Group B. His delaying tactics in the Hürtgen Forest–Eifel Mountains area slowed the U.S. advance, inflicting heavy casualties on the Americans. His defense of this area ensured German control of the northern Eifel area, enabling Germany to launch the Ardennes Offensive (December 16, 1944–January 25, 1945) with a secure northern flank. Brandenberger's Seventh Army was the southernmost of the three German armies, and his objective was to secure the southern flank to protect the operations of the Fifth and Sixth Panzer Armies. He enjoyed some initial success, but in the end, he was forced back by the counterattacks of Lieutenant General George S. Patton's U.S. Third Army.

Making the most of the meager resources available to him, Brandenberger mounted effective actions against superior numbers of advancing Allied troops for the remainder of the war. Following the Ardennes campaign, he fought skillful delaying actions west of the Rhine River against the U.S. First and Third Armies, often recommending withdrawal in the face of

overwhelming odds. As a result of such actions, however, his relations with Model were strained, and the latter relieved him of command on February 20, 1945. Brandenberger returned to active duty to command the Nineteenth Army on March 25, 1945, against the French First Army in the Black Forest area. The Nineteenth Army was forced back through southern Germany until surrendering on May 5, 1945, near Innsbruck, Austria.

Brandenberger was interviewed by the Americans during his postwar internment and contributed 10 manuscripts for the German Military History Program. He died in Bonn on June 21, 1955.

Brauchitsch, Heinrich Alfred Hermann Walther von (1881–1948)

German Army field marshal. Born in Berlin on October 4, 1881, Heinrich Alfred Hermann Walther von Brauchitsch entered the 3rd Guards Field Artillery Regiment in 1901. He was promoted to captain in 1904, and between 1910 and 1912 he studied at the War Academy and served as a General Staff officer in Berlin. During World War I, he continued as a staff officer in several divisions and then a corps.

Brauchitsch remained in the Reichswehr after the war. In 1921 he commanded an artillery battery, and the next year he served as a staff officer in the Truppenamt (the secret General Staff), organizing maneuvers to test the employment of motorized troops supported by aircraft. In 1925 as a lieutenant colonel, he commanded a battalion of the 6th Artillery Regiment. Following additional staff work, he was promoted to colonel in 1928. Two years later, he was promoted to major general and became a department head in the Truppenamt. In 1932 he was inspector of artillery, and a year later he was promoted to lieutenant general and took command of both the Königsberg Military District and the 1st Division. In 1935 he commanded the I Army Corps at Königsberg, and in April 1936 he was promoted to general of artillery. Brauchitsch was instrumental in the development of the 88mm gun, one of the finest artillery pieces of World War II, as both an antitank and antiaircraft weapon.

In 1938 when General Werner von Fritsch resigned as chief of staff of the army, Adolf Hitler promoted Brauchitsch to colonel general and appointed him Fritsch's successor. Brauchitsch was an enthusiastic National Socialist, but he opposed Hitler's plans for territorial expansion, although not with the passion of his predecessor. Brauchitsch believed strongly that the military should maintain a neutral stance in politics, and he believed himself bound by his soldier's oath to obey Hitler as commander in chief.

Brauchitsch coordinated the early German victories in World War II in Poland, France, the Low Countries, and the Balkans. He opposed the stop order during the campaign for France (May 10–June 25, 1940) that allowed the British Expeditionary Force to escape at Dunkerque during May 26–June 4. Hitler raised Brauchitsch to field marshal in July 1940, but the June 22, 1941, German invasion of the Soviet Union, Operation BARBAROSSA, increased tensions between the two men. Brauchitsch believed that Moscow should be the primary target, whereas Hitler ordered a shift toward Leningrad in the north and the Donets Basin in the south. Brauchitsch also opposed Hitler's stand-fast order calling on the army to hold fast in the face of the Soviet counteroffensive, believing that the army should withdraw to more easily defended positions. Ultimately, Hitler went so far as to blame Brauchitsch for the failure of the 1941 offensive in the Soviet Union.

On December 9, 1941, Hitler dismissed Brauchitsch and assumed the post of commander of the army himself. Brauchitsch retired from the army 10

days later. Listed as a major war criminal and in poor health, he testified at the International War Crimes Tribunal at Nuremberg after the war. Brauchitsch died on October 18, 1948, in a British military hospital at Hamburg-Barmbeck while awaiting trial.

Braun, Eva Anna Paula (1912–1945)

Longtime companion of German Nazi leader Adolf Hitler and, for a brief time, his wife. Eva Anna Paula Braun was born on February 6, 1912, in Munich, Germany. She was educated at a Catholic lyceum and briefly at a convent before taking a job at age 17 as an assistant to Heinrich Hoffmann, official photographer of the Nazi Party. It was in this capacity that she met Hitler, who was 23 years her senior. Beginning in 1930, Hitler began to see Braun sporadically on a social basis. When Braun attempted suicide in 1932 in an apparent attempt to capture Hitler's romantic attention, Hitler and Braun became intimate, although Hitler was careful not to be seen in public with her.

After Hitler became German chancellor in 1933, he carefully cultivated his image as the purportedly chaste military warrior and political hero who was irresistible to women but married to the German nation. He had determined that remaining single enhanced his power and appeal, so only a few Germans close to Hitler knew of Braun and her relationship with the führer.

In 1935, Braun again attempted suicide in a bid for Hitler's attention. By the next year, she had become a fixture at Hitler's Berghof residence outside Berchtesgaden, although she still spent much of her time in a commodious Munich apartment that Hitler had provided for her and her sister.

Braun has been described by contemporaries as a somewhat vapid and vain woman who was far more interested in fashion and film than politics. Nevertheless, she remained undyingly faithful to Hitler, who likely saw in her a woman who could be easily manipulated and controlled. In June 1944, Braun's sister Gretl married Hermann Fegelein, a liaison officer on Hitler's staff and an aide to Reichsführer-SS Heinrich Himmler. This permitted Hitler to include Braun in official settings, although she was introduced merely as "Fegelein's sister-in-law." Even when Braun and Hitler were out of the public eye, few individuals reported any sort of display of affection between them.

As Soviet troops advanced into Berlin in April 1945, Braun expressed her desire to join Hitler at the Führerbunker beneath the Reich Chancellery. She traveled incognito from Munich to Berlin and refused to leave as Soviet forces fought their way toward the chancellery. Late in the evening of April 29, Hitler and Braun were married in a simple civilian ceremony in the bunker.

In the midafternoon of April 30, Hitler and Braun retreated to a private sitting room. There Braun bit into a cyanide capsule, which promptly killed her. Hitler then shot himself in the right temple with a pistol. Aides carried both corpses out of the bunker and into an adjacent garden, where they were burned beyond recognition. Only after their deaths did the public become aware of Hitler's relationship with Braun and their brief marriage.

Braun, Wernher von (1912–1977)

German physicist and rocket scientist. Born in Wirsitz, Posen, Germany (now Poland), on March 23, 1912, Wernher von Braun decided as a teenager to become a physicist and pioneer in space rocketry. After graduating from the Berlin Institute of Technology in 1932, he earned a doctorate in physics from the University of Berlin, concentrating on developing liquid-fueled rocket engines.

In 1932, the German military began funding Braun's work, and after heading a team of 80 engineers building rockets in Kummersdorf, he took over a new custom-designed facility at Peenemünde in the Baltic, the remoteness of which allowed long-range rocket testing. By 1943, Braun's team had successfully developed several rockets—the A-2, A-3, and A-4, the last capable of reaching Britain. Braun made no secret of his interest in sending rockets to explore space rather than using them as weapons, leading the German Schutzstaffel (SS) and Gestapo to arrest him for frivolous indulgence.

In 1943, as an Allied victory seemed increasingly likely, German leader Adolf Hitler ordered Braun's group to develop the A-4 as a "weapon of vengeance" to shower explosives on London. Braun's colleagues argued that without him, they could not accomplish this task, so he was freed. The first operational V-2 ("Vengeance") rocket was launched in September 1944.

In early 1945, fearing for his group members' personal safety and their program's future, Braun stole a train, forged travel documents, and led his production team to surrender to U.S. military representatives in western Germany. The Americans seized V-2s, spare parts, and scientific documents from the Peenemünde and Nordhausen facilities and gave Braun and 126 of his scientists visas for the United States. The group initially settled at Fort Bliss, Texas, but transferred to Huntsville, Alabama, in 1950, where they shared their knowledge with American scientists and laid the foundations of the U.S. rocketry and space-exploration programs.

German physicist and rocket scientist Wernher von Braun in a post-World War II photograph. (Library of Congress)

Braun's well-publicized suggestions that the United States build a space station and launch manned missions to the moon contributed to the establishment of the National Aeronautics and Space Administration (NASA) in 1958, the Apollo space program during the 1960s, and Slylab in the 1970s. Braun retired in 1972, and he died in Alexandria, Virginia, on June 16, 1977.

Brazil

Nation in South America with a 1939 population of approximately 40,289,000. The largest country in South America, Brazil encompasses 3,287,597 square miles. It is bordered by the Atlantic Ocean to the east; Venezuela, Guyana, and French Guinea to the north; Colombia to the northwest; Peru and Bolivia to the west; Argentina and Paraguay to the southwest; and Uruguay to the south. At the time of World War II, Brazil was ruled by a virtual dictatorship under President Getúlio Vargas, who was in power from 1930 until 1945.

The participation of Brazil on the side of the Allies in World War II marked a new chapter in the nation's history. The war severed Brazil's traditional relationships with West European sources of loans and investment capital. As a consequence, even before the United States joined the war in late 1941, President Vargas entered into an agreement with Washington to lease bases in northeastern Brazil along the air routes to Africa in return for Washington's support for Vargas's project of developing a national iron and steel mill at Volta Redonda. Such a step was unprecedented in Brazilian history and left Vargas open to charges that he had bargained away the national sovereignty.

Brazil did not follow the United States into the war in December 1941. Although the Brazilian government declared its solidarity with the United States, it also maintained diplomatic ties with the Axis states. The pretense of neutrality ended when Brazil severed these diplomatic relations, a step announced at the February 1942 Rio Conference. The fact that this consultative conference was held in Rio de Janeiro was indicative of the strategic importance that the U.S. government attached to Brazil. Following the conference, Brazil received a large quantity of U.S. military supplies, and it allowed the stationing of some U.S. troops on its soil.

Any Brazilian government efforts to avoid outright involvement in the war ended with the sinking of Brazilian merchant ships by German submarines. On August 22, 1942, Brazil declared war on Germany and Italy (it did not declare war on Japan until June 5, 1945), and in return, it received important military and technological aid from the United States.

Brazil proved to be an important addition to the Allied military effort. The country occupied a strategic position geographically, and bases there played a significant role in the war against German U-boats in the South Atlantic. Brazil was also a key link in the air route between Florida and the Middle East, and it furnished important raw materials, especially rubber, to the Allied war effort. Brazil was also the only Latin American state, apart from Mexico (with one air squadron), to furnish combat forces.

Under the order of Vargas, Major General João Baptista Mascarenhas de Moraes, commander of the Second Military Region of São Paulo, began organizing the Brazilian Expeditionary Force (Força Expedicionária Brasileira, FEB) in late 1943; it was to cooperate with Allied military operations in Europe. In 1944, Brazil shipped this expeditionary force to Italy. It also sent other military elements by air, including doctors and nurses.

The first part of the FEB departed Rio de Janeiro for Naples on July 2, 1944. Other elements followed over the next months, with the fifth and last component arriving in February 1945. The FEB troops were largely untrained and had no combat experience when they arrived in Italy to serve with Lieutenant General Mark Clark's U.S. Fifth Army, but they entered fighting that September and continued in the line until the end of the war. In all, 25,445 Brazilians fought in the Italian theater.

In addition to army personnel, 400 men of the Brazilian Air Force fought with the 350th Squadron of the U.S. Army Air Forces in Italy. Ships of the Brazilian Navy also worked with the U.S. Navy in patrolling the Brazilian coast.

Brazil's cooperation with the Allies in the war affected national development through the growth of important ties between the nation and the United States. The U.S. share in Brazilian trade jumped from 24 percent in 1938 to 55 percent in the early 1940s. Further, the war also had been fought in the name of democracy, and in 1945, the Brazilian Army overthrew Vargas and his dictatorship in a bloodless putsch.

Brecht, Bertolt (1898–1956)

Anti-Nazi critic, composer, poet, and playwright. Bertolt Brecht was born in Augsburg, Bavaria, Germany, on February 10, 1898. His most famous works completed during the pre-Nazi era include *The Threepenny Opera* (1928) and *The Rise and Fall of the City of Mahagonny* (1930).

The *Threepenny Opera*, one of the first musical comedies ever performed, had quite serious subject matter. Reflecting Brecht's Marxist leanings, the play was essentially a Marxist critique of capitalism and its excesses. The musical score, by Kurt Weill, was pathbreaking and heavily influenced by the new jazz form. One song from the musical went on to become a smash hit, the jazz/swing tune "Mack the Knife."

The Rise and Fall of the City of Mahagonny, a BITING political satire, caused an uproar among Nazis. This play was again set to music by Weill, essentially making it a modern opera. With these two works, Brecht became the star of Epic Theater, a form of theater that dealt with contemporary issues and relied on the audience itself to determine the efficacy of a play's conclusions.

A lifelong Marxist, Brecht fled Germany shortly after the Reichstag fire in Berlin in February 1933. During the next 14 years, he lived in exile in Denmark, Sweden, Finland, and finally in the United States from July 1941 to October 1947.

Although he was a resolute anti-Nazi, Brecht wrote on a variety of themes in wartime. His most notable contribution to the anti-Nazi effort was his collaboration with Fritz Lang on an important Hollywood film titled *Hangmen Also Die* (1943). The plot of the movie dealt with the assassination of Nazi official Reinhard Heydrich in Prague in May 1942 and the brutal German reprisals that followed. Neither Lang nor Brecht claimed to be happy with the finished product, but it is generally viewed as an excellent film of the war and one of the few that showed what life was like under German occupation.

About the same time, Brecht also wrote an anti-Nazi play titled *The Private Life of the Master Race* (1938). It was, however, performed only twice during the war. Perhaps Brecht's most blatant anti-Nazi works were a series of songs that were performed for broadcast on the British Broadcasting Corporation (BBC).

Brecht remained in the United States after the war but left for Zurich, Switzerland, in 1947 after being required to testify in front of the Congressional House Un-American Activities Committee. Outraged by the reinstatement of several former Nazis in the government of the Federal Republic of Germany (West Germany), Brecht went to live in communist-controlled East Berlin upon the invitation of East German officials.

While Brecht's creative output decreased in his later years, he did produce a series of moving poems while in East Berlin. He died there of a heart attack on August 14, 1956.

Brereton, Lewis Hyde (1890–1967)

U.S. Army Air Forces general. Born on July 21, 1890, in Pittsburgh, Pennsylvania, Lewis Hyde Brereton attended St. John's College in Annapolis, Maryland, for two years before entering the U.S. Naval Academy at Annapolis, where he graduated in 1911. He then gave up his ensign's commission to secure a commission as a second lieutenant in the U.S. Army coastal artillery.

In 1912, Brereton transferred to the Aviation Section of the Signal Corps and became a pilot the following year. When the United States entered World War I in April 1917, he was among the first aviators of the American Expeditionary Forces (AEF) in France. As commander of the 12th Aero Squadron between March and October 1918, he shot down four German planes and earned the Distinguished Service Cross.

Following occupation duty in Germany, Brereton served as air attaché in Paris from 1919 to 1922. He next was an instructor at Kelly Field, Texas, and Langley Field, Virginia, and commanded the 2nd Bombardment Group. Brereton graduated from the Command and General Staff School in 1927 and then held a succession of assignments. Promoted to temporary brigadier general on October 1, 1940, he commanded the 17th Bombardment Wing at Savannah, Georgia. On July 11, 1941, he was promoted to major general and commanded the Third Air Force at Tampa, Florida.

In November 1941, Brereton took command of the Far Eastern Air Force in the Philippines. General Douglas MacArthur refused him permission to launch an immediate strike on Formosa following the December 7, 1941, Japanese attack on Pearl Harbor, and as a result, nearly half of his planes were destroyed in the Japanese attack of December 8. Following the fall of the Philippines, Brereton took command of Tenth Air Force in India.

In June 1942, Brereton went to Cairo to command the Middle East Air Force, later designated the Ninth Air Force. He planned the air strikes against the oil refineries of Ploieşti, Romania, which began on August 1, 1943. Promoted to lieutenant general in April 1944, Brereton took command of the First Allied Airborne Army, which participated in the September 17–26 Operation MARKET-GARDEN, the unsuccessful Allied invasion of the Netherlands. In December 1944, during the December 16, 1944–January 25, 1945, Ardennes Offensive (Battle of the Bulge), Brereton's planes dropped supplies to the encircled 101st Airborne Division at Bastogne, Belgium, and

in March 1945, they dropped troops near Wesel, Germany, in Operation VARSITY to secure a bridgehead over the Rhine.

After the war, Brereton again commanded the Third Air Force at Tampa, Florida. He transferred to the newly established U.S. Air Force in 1947 and was a member of the Military Liaison Committee of the Atomic Energy Commission before retiring in 1948. Brereton published his memoirs in 1946. He died in Washington, D.C., on July 19, 1967.

Brett, George Howard (1886–1963)

U.S. Army Air Forces lieutenant general. Born in Cleveland, Ohio, on February 7, 1886, George Howard Brett graduated from the Virginia Military Institute in 1909 and a year later was commissioned a second lieutenant in the Philippine Scouts. In 1911, he received a regular army commission in the cavalry, and in 1916, he became a pursuit pilot in the Signal Corps. During World War I, Brett served in France and England in logistical assignments.

Between the world wars, Brett graduated from the Command and General Staff School in 1930 and the Army War College in 1936. Promoted to brigadier general in 1938, he served as chief of the Matériel Division at Wright Field, Ohio, from 1939 to 1940. In October 1940, promoted to major general, he was named acting chief of the army air corps.

Promoted to lieutenant general in January 1942, Brett took command of U.S. Army forces in Australia with responsibility for turning Australia into a

support base. For a brief time in early 1942, Brett was the deputy commander of the American-British-Dutch-Australian (ABDA) Command, headquartered on Java in the Netherlands East Indies. Following his return to Australia, Brett became commander of the Fifth Air Force and deputy supreme commander and head of all air forces in the Southwest Pacific Area.

From the outset, Brett's relations with General Douglas MacArthur, commander of Southwest Pacific Area (SWPA), were strained. MacArthur saw him as too close to Australian politicians, believed Brett had too many Australians in command and administrative positions, and saw him as responsible for the alleged poor performance of SWPA units in combat. In Brett's defense, it must be pointed out that the SWPA suffered from a lack of supplies and trained staff officers and from poor aircraft. But in the summer of 1942, MacArthur replaced Brett with Major General George Kenney.

In November 1942, Brett became head of the Caribbean Defense Command, a post he held until the end of the war. He retired in March 1946 and died in Winter Park, Florida, on December 2, 1963.

Bretton Woods Agreements (July 22, 1944)

International economic system intended to help rebuild Europe in the wake of World War II, provide aid to developing countries, and avoid the economic problems that arose after World War I. In July 1944, delegates from 45 countries met at the Mount Washington Hotel in Bretton Woods, New Hampshire, to discuss postwar reconstruction and economic development. Following three weeks of meetings, the delegates signed the Bretton Woods

Agreement on July 22, 1944. The agreement established the International Bank for Reconstruction and Development (IBRD, known today as the World Bank) and the International Monetary Fund (IMF).

The IBRD had five main goals: to assist in the reconstruction of member countries, either underdeveloped or devastated by war; to promote private foreign investments; to promote balanced international trade growth; to prioritize assistance so that countries with greater need would be dealt with first; and to enable a smooth transition from wartime economies to peacetime economies. Each member contributed a designated amount to the bank's initial capital formation of $10 billion. The United States provided the largest individual share ($3.2 billion), followed by Great Britain ($1.3 billion) and the Soviet Union ($1.2 billion).

The main purpose of the IMF was to establish and regulate monetary exchange rates among nations and lasted until the early 1970s. Under the IMF system, all member nations were required to maintain their currencies within a narrow range that varied by just 1 percent in either direction. The agreed-upon exchange rate was to be based on gold. That system was replaced by a system of floating exchange rates after 1971, when the Richard M. Nixon administration took the United States off the gold standard amid a period of increasing inflation and economic instability.

Bridgeford, Sir William (1894–1971)

Australian Army general. Born on July 28, 1894, at Ballarat, Australia, William Bridgeford studied at the Royal Military College, Duntroon. Service in France during World War I earned him a Military Cross. An excellent

administrator with a genial personality, Bridgeford served in assorted staff and training positions in the small Australian Army between the wars and also took further courses at the Staff College, Quetta, and the Imperial Defence College, London. By the late 1930s, Bridgeford seemed destined for success, but during World War II, he attained advancement and high command more slowly than expected, probably because of personal enmities he aroused during the Greece Campaign (October 28, 1940–March 1941).

When World War II began, Bridgeford was military liaison officer in the Australian High Commission in London. In June 1940, he was promoted to temporary brigadier and took command of the 25th Australian Infantry Brigade then being formed in Britain. From November 1940 through early 1942, he was deputy adjutant and quartermaster general at the headquarters of I Corps in the Middle East. He made valiant efforts to supply operational units during the Greece Campaign, for which he was awarded the Commander Order of the British Empire.

In the late winter of 1942, Bridgeford returned to Australia, assuming command of the 3rd Armoured Division in April, now with the rank of temporary major general. From August 1943 to April 1944, his forces participated in the campaign leading to the successful occupation of Madang, New Guinea. Bridgeford took command of the 3rd Infantry Division on July 1, 1944, leading it during the November 1, 1943–August 15, 1945, Bougainville Campaign and receiving four mentions in dispatches for bravery.

After the war, Bridgeford became quartermaster general of the Australian Military Forces; on October 1, 1948, he was made a permanent major general. In February 1951, Bridgeford was promoted to temporary lieutenant general, and from November 1951 to February 1953, he commanded British Commonwealth forces in the Korean War. Bridgeford retired from the army in 1953 as a lieutenant general. He was the chief executive officer of the 1956 Melbourne Olympic Games and remained strongly interested in sports activities until his death in Brisbane on September 21, 1971.

Britain, Battle of (July 10–September 30, 1940)

A series of individual engagements between the German Luftwaffe and the British Royal Air Force (RAF) between July 10 and September 30, 1940. The battle was first given its name by Prime Minister Winston L. S. Churchill during a speech before Parliament.

German chancellor Adolf Hitler assigned the Luftwaffe the task of eliminating the RAF and winning control of the skies over Britain, an essential precondition to the German invasion of England (Operation SEELÖWE [SEA LION]). There were additional reasons for the attack. Hitler did not particularly want a war with the British and had publicly appealed for an end to the conflict, only to be rebuffed. He nevertheless hoped that if the Luftwaffe were to inflict sufficient damage, the British would be forced to sue for peace. Thus, plans went forward, although Hitler expressly forbade Luftwaffe attacks on civilian targets and on London in particular.

The British frantically worked to prepare for a German invasion, although their army had been forced to abandon most of its equipment in France during the May 26–June 4, 1940, Dunkerque (Dunkirk) evacuation. The British did what they could, removing signposts and such, and a blackout had been observed from early in the war. The Germans were expected to attack in strength by parachute, and there was a certain amount of hysteria about fifth columnists (covert enemy sympathizers) and spies. The British also experimented with means of setting the sea on fire, and Bomber Command secretly trained crews in the use of poison gas.

German plans called for the Luftwaffe to establish air superiority over southern England between August 8 and September 15. To accomplish this, the Luftwaffe had to achieve a highly favorable kill ratio in the air or destroy RAF Fighter Command’s infrastructure on the ground while keeping a sufficiently large fighter force intact to protect the German invasion fleet.

Although Luftwaffe leaders were confident of defeating the RAF in the air, they were concerned about attrition among German aircraft.

Luftwaffe commander Reich Marshal Hermann Göring had three Luftflotten (Air Fleets) available to prosecute the battle (see Table 1). Luftflotte 2, based in Belgium and commanded by Field Marshal Albert Kesselring, was the largest with 1,206 aircraft, more than half of them fighters. Field Marshal Hugo Sperrle headed Luftflotte 3, with 1,042 aircraft, in France, and Colonel General Hans-Jürgen Stumpff commanded Luftflotte 5, based in Norway, with only 155 offensive aircraft.

Photograph taken of the London dock area during the first massive German air raid on the British capital city, September 7, 1940. Tower Bridge stands out against a background of smoke and fires. (National Archives)

RAF Fighter Command, headed by Air Chief Marshal Hugh Dowding, was organized into four fighter groups with 754 single-seat aircraft (see Table 2). Air Vice Marshal Sir Quintin Brand commanded 10 Group, covering the southwestern United Kingdom. It bordered 11 Group, headed by Air Vice Marshal Keith Park, which was in the southeast and thus likely to bear the brunt of the German attack. Air Vice Marshal Trafford L. Leigh-Mallory commanded 12 Group in the Midlands, and Air Vice Marshal Richard Saul headed 13 Group, covering northern England and Scotland. Of the four group commanders, Keith Park was probably the most capable.

Dowding had a significant aid in that his force boasted the world's only integrated air defense system. Based on the telephone and teleprinter network, it was resilient, merging inputs from radar stations and observer corps, filtering friendly or "doubtful" contacts, and devolving responsibility to group and sector levels. Group headquarters allocated raids to sectors, which then scrambled fighters and guided them by radio to intercept the attacking aircraft. The system was the product of years of careful thought,

and it enabled Dowding to make the most effective use of his inferior resources. The Luftwaffe was, of course, aware that some sort of fighter-direction system was in use but had no idea of its scope or capabilities.

In terms of aircraft, the German Messerschmitt Bf-109 and the British Supermarine Spitfire were quite evenly matched; the British Hurricane was of lower performance but more maneuverable. Both RAF fighters benefited from the introduction of constant-speed propellers and 100-octane fuel during the battle. The Bf-110 was shown to be inferior to single-engine fighters, and the German Junkers Ju-87 Stuka dive-bomber was so vulnerable that it was withdrawn partway through the Battle of Britain. The RAF, however, had much to learn about fighter tactics. The Luftwaffe was using flexible, open formations that had worked well in Spain and earlier in the war. Many RAF squadrons were still using close formations that allowed little tactical flexibility.

Table 2. RAF Fighter Command Frontline Day-Fighters and Night-Fighters in the Battle of Britain, as of July 1, 1940

Source: Data from Stephen Bungay, *The Most Dangerous Enemy: A History of the Battle of Britain* (London: Aurum, 2000).

About 80 percent of the RAF pilots were British, and roughly 10 percent were from Commonwealth countries, the bulk of them New Zealanders and

Canadians, with some Australians, South Africans, and Rhodesians. In June 1940, No. 1 Squadron of the Royal Canadian Air Force arrived with its own Hurricanes. Most of the remaining 10 percent were pilots who had escaped from occupied Europe (Poles, Czechs, Belgians, Free French); complete squadrons of Czechs (310 and 312) and Poles (302 and 303) were formed as the battle progressed. There were probably about 11 American pilots, but since some of the Americans pretended to be Canadian in order to circumvent U.S. neutrality, it is difficult to be certain of the exact number.

Beginning on July 4, 1940, a few isolated engagements occurred between British and German fighters, but on July 10, the Germans began the actual battle by mounting their first bombing raid against a convoy in the English Channel. The British had one ship sunk and one Hurricane lost; the Germans lost two Dornier Do-17s, two Bf-109s, and a Messerschmitt Bf-110. Over the next few weeks, the Luftwaffe mounted repeated raids on convoys and coastal targets and attempted to engage British fighters en masse with fighter sweeps, but RAF controllers carefully avoided fighter-versus-fighter combat. Early in the battle, German harbors and shipping became the RAF Bomber Command's priority targets; many mine-laying and antishipping sorties were made against the massing invasion barges.

On August 12, the Luftwaffe attacked and temporarily disabled radar stations at Dover, Pevensey, and Rye, and the Ventnor station was out of action for three days, although a dummy signal was sent out while repairs were made. The following day was designated Adlertag (Eagle Day) and marked the beginning of the German attack on Fighter Command. The Germans' plan for multiple raids was handicapped by bad weather and poor communications, however. Some of their bombers attacked without escorts, and they were lucky to escape with relatively few losses.

There was heavy fighting on August 15, with the Luftwaffe flying over 2,000 sorties against airfields and aircraft factories. Luftflotte 5 attacked from Norway for the first and last time and was badly mauled. The Luftwaffe lost a total of 75 aircraft in exchange for 34 RAF fighters.

Both sides inevitably overestimated the amount of damage they were inflicting on the enemy and overinflated claims for propaganda purposes. This caused the Germans to shift their targeting prematurely. The Germans believed that the RAF was down to 300 fighters, partly because they had badly underestimated the production rate of British aircraft. In fact, Dowding

still had about 600 fighters. The high sortie rate (RAF pilots sometimes flew five missions daily) was beginning to take its toll on the aircrews of both sides, however, and cases of combat fatigue were becoming more common.

Bad weather between August 16 and 19 offered some respite for the defenders. The Germans then heavily escorted subsequent bombing raids in a bid to wear down the last few British fighters. The RAF's No. 11 Group suffered determined attacks on several airfields, and a dispute broke out between Park, who used squadron-sized attacks, and Leigh-Mallory, who favored use of a "big wing" of five squadrons to deal a crushing blow to the enemy. However, the big wing took so long to assemble that it only contacted the Germans at full strength on three occasions, and the large number of fighters involved led to exaggerated claims that gave a misleading impression of its effectiveness.

Toward the end of August, Dowding was beginning to run out of pilots, in spite of transfers from other commands and the length of the pilot training course being cut. The Poles of No. 303 Squadron were declared operational and quickly became the squadron in Fighter Command with the highest kill-to-loss ratio, 14 to 1.

Following the inadvertent jettisoning of German bombs over London and subsequent night raids by the RAF on Berlin, the Luftwaffe shifted its focus to London on September 7. With hindsight, this decision can be seen as a mistake, but the prevailing view in the Luftwaffe was that the RAF had taken heavy damage and had few fighters left. On September 15, the Luftwaffe launched a large attack protected by many escorts that were progressively engaged by Park's fighters as the force approached London, where the bombers were confronted by Leigh-Mallory's big wing. Many aircraft were shot down on both sides; the RAF claimed 185 kills, but the Luftwaffe actually lost 56 aircraft against 28 RAF fighters.

On September 27, Germany's Operation SEA LION was postponed indefinitely. At Italian dictator Benito Mussolini's insistence, however, units of the Italian Regia Aeronautica (Italian Air Force) arrived in Belgium in mid-September and began training for attacks in England. They were, however, equipped with obsolete aircraft, and on their only daylight raid, on November 11, 1940, nearly half of the attacking force of two dozen aircraft were shot down, with no loss to the RAF. German daylight raids continued during October but tailed off through November as the emphasis gradually shifted to night attacks.

The Luftwaffe had effectively blunted itself on the most sophisticated air defense system in the world and was never again to be as strong relative to its opponents. In the Battle of Britain, the Luftwaffe reported 2,698 experienced aircrew killed or captured, resulting in a shortfall that the German training machine was poorly equipped to make up. The RAF lost 544 fighter pilots and more than 1,100 bomber aircrew, but it learned several important lessons and built up a cadre of experienced fighter units.

British Eastern Fleet

Established in 1904 with its headquarters at Singapore, the British Eastern Fleet (East Indies Fleet, Far East Fleet) was loosely organized into three separate commands: the East Indies Squadron, the China Squadron, and the Australian Squadron. During World War II, its primary duty was securing the safety of Allied convoys east of Suez. The fleet counted ships and personnel from other navies, including the Royal Australian Navy, the Royal New Zealand Navy, the Royal Netherlands Navy, and the United States Navy.

In September 1939 with the beginning of World War II, the chief threat faced by the British Eastern Fleet came from German commerce raiders and submarines. These included both the pocket battleship *Admiral Graf Spee* and auxiliary cruisers (converted merchant ships, the last of which was not sunk until October 1943) as well as submarines attacking British merchant shipping. When Italy joined the war in June 1940, its Red Sea Flotilla of destroyers and submarines operating from Italian East Africa posed a great threat to British shipping and especially the supply of oil from the Persian Gulf. This threat was neutralized through naval engagements in part but primarily by the capture of Italian bases from the land in the British East

Africa Campaign. The Eastern Fleet then supported British land operations in Iraq and Iran.

Japan posed a much greater threat. In September 1940, following the defeat of France by Germany, Tokyo secured bases in French Indochina that placed most of Southeast Asia within range of its bombers. This brought economic pressure from the United States, Britain, and the Dutch, leading the Japanese to declare war. On the commencement of hostilities with Japan on December 8, 1941, the Eastern Fleet amalgamated the East Indies Squadron and the China Squadron.

The Japanese ran riot. On December 10, their aircraft sank off Malaya the new British battleship *Prince of Wales* and the battle cruiser *Repulse.* They went on to conquer Malaya, Singapore, and the Netherlands East Indies. Then in the spring of 1942, Japanese carrier forces under Admirals Nagumo Chūichi and Ozawa Jisaburo operated freely in the Eastern Indian Ocean, attacked Colombo and Trincomalee in Ceylon (Sri Lanka), and sank a number of merchantmen and British warships, including the small carrier *Hermes* (April 9, 1942), and also disrupted sea traffic along the eastern coast of India. There was worry in London that the Japanese might force the Royal Navy from the Indian Ocean entirely, with dire implications for India. Fortunately for the Eastern Fleet, the Japanese soon withdrew without discovering and destroying its major assets.

With the death of Admiral Sir Tom Phillips in the sinking of the *Prince of Wales*, Admiral Sir Geoffrey Layton assumed command of the Eastern Fleet. Under Japanese pressure, Layton was forced to withdraw to Java and then to Trincomalee. In March 1942, Admiral Sir James Somerville assumed command. At this time, the Eastern Fleet had 2 modern and 1 small carrier (with fewer than 100 aircraft), 5 old battleships, 2 heavy and 5 light cruisers (1 Dutch), 16 destroyers, and 7 submarines (2 Dutch). Realizing the inadequacies and lack of security of Trincomalee and Colombo, Somerville established a new secret fleet anchorage at Addu Atoll in the Maldive Islands, but most of the fleet relocated to Kilindini near Mombasa, Kenya. The fleet was also severely strained by the siphoning off of its ships to meet other more pressing commitments, especially in the Mediterranean. The Eastern Fleet soon found itself little more than a glorified convoy escort force.

The Eastern Fleet supported the invasion of Madagascar (Operation IRONCLAD) in May 1942, brought on by British fears that Japan might secure

bases there. In this operation, the fleet was forced to deal with Vichy French navy ships as well as Japanese submarines.

Allied successes in 1943 and 1944 released British naval resources for the Indian Ocean. These included aircraft carriers; the battleships *Howe, Queen Elizabeth*, and *Valiant;* and the battle cruiser *Renown.* With the increase in forces and the liberation of British Pacific possessions in the offing, and with London determined to restore British prestige in the Pacific, agreement was reached with the United States, the Allied power in command of the Pacific Ocean area, regarding British participation in that theater. Following a training exercise in late March 1944, in April and May the Eastern Fleet, operating with U.S. Task Group 58.5, attacked Japanese installations and oil facilities in Sabang and Surabaya. On June 21 the Eastern Fleet mounted a carrier raid on the Andaman Islands, and on July 25 it struck Sabang with both air attack and naval gunfire.

On August 23, 1944, Admiral Sir Bruce Fraser replaced Somerville as commander of the Eastern Fleet. With the creation of the British Pacific Fleet in November 1944, the Eastern Fleet became the East Indies Fleet until the end of the war. Then it became the Far East Fleet, operating in all the Far East, including the Pacific Ocean.

In August and September 1944, the Eastern Fleet again struck oil installations in Sumatra, and in October it attacked the Nicobar Islands in an effort to divert Japanese attention from the U.S. landings on Leyte. Additional British ships arrived, including the carriers *Indomitable* and *Indefatigable* in January 1945 to carry out attacks against oil refineries in Sumatra and Java.

With the reestablishment of their control in the Bay of Benghal, British submarines based at Ceylon attacked Japanese merchant shipping and sank one Japanese and two German submarines. Subsequent operations for the East Indies Fleet included support for the recapture of Burma, to include landings near Rangoon (Yangon). Then on May 15–16, 1945, the 26th Destroyer Flotilla (HMS *Saumarez, Venus, Verulam, Vigilant*, and the *Virago*) used torpedoes to sink the Japanese heavy cruiser *Haguro* in the Malacca Straits. In late August it landed forces at Penang, and on September 2 it did the same at Singapore.

After the war, the fleet took part in putting down the Malayan Emergency. The Far East Fleet was disbanded in 1971.

British Naval Blockade of the European Axis Powers

With the beginning of World War II, the Royal Navy took the lead in the effort to prevent Germany, and later Italy, from securing raw materials and goods that would aid their war efforts. Given the success of the World War I Allied naval blockade of the Central Powers, British planning for possible war against Germany included as early as 1936 implementation of a naval blockade, supplemented by a bombing campaign to damage the German economy.

With its declaration of war against Germany on September 3, 1939, Britain therefore established a blockade that resembled closely that of World War I. Once again, it was a distant blockade, one that sought to intercept commerce at points away from the German coast rather than in German territorial waters. Two forces implemented the blockade of the North Sea. The primary one was the Northern Patrol, which policed a line running from Scotland to Iceland, later extended to run to the Denmark Straits.

Based at Kirkwall, this force was charged with interdicting ships bound for the North Sea and ultimately European ports to check for contraband of war and, if necessary, send these ships to a British port for examination of their cargoes. As in World War I, the force consisted primarily of aging fleet

cruisers at first, but over time these were replaced primarily with armed merchant cruisers and trawlers. At the outbreak of the war, the Admiralty had at its disposal 50 armed merchant cruisers, armed principally with 6-inch guns.

In addition to the Northern Patrol, until it could be replaced by a minefield, a force based at Ramsgate guarded the English Channel. A further element of the naval blockade was a patrol based at Gibraltar. It had the assignment of interdicting ships entering the Mediterranean Sea with cargoes that might be bound for Germany and then Italy when that country entered the war in June 1940.

Wedded to the naval effort of the blockade, and equally as important to its potential success, were diplomatic agreements crafted with neutral European nations and the United States. The agreements with European nations resembled those of World War I and centered on making certain that supplies bound for these countries were solely for domestic consumption rather than reexport to an Axis power. Agreements with the United States centered on ensuring that major U.S. industries did not ship contraband to the same neutrals for reexport to the Axis. A key element of the effort rested on the issuance of navicerts, documents that certified at the port of departure that the cargo of a ship was not contraband and consequently exempted those vessels from search by British blockaders.

Axis efforts at sea to undermine the British blockade were concentrated against forces in the North Sea and were consequently German operations. These resulted in losses for the Northern Patrol but not to such a degree as to upset operations. The best-known engagement between German naval units and the British blockaders occurred on November 23, 1939, when the German battleships *Scharnhorst* and *Gneisenau* sank the armed merchant cruiser *Rawalpindi,* southeast of Iceland. The majority of attacks on the Northern Patrol were carried out by German submarines, however. Nine armed merchant cruisers succumbed to these attacks, the majority of these also near Iceland.

While the efforts of the Kriegsmarine did not change the strategic situation, the naval blockade of Germany was undermined initially by the alliance between Germany and the Soviet Union. The German-Soviet Non-Aggression Pact of August 23, 1939, not only allowed the German invasion of Poland to proceed, but its secret provisions provided for the partition of

Poland and the Baltic states, and the Soviet Union agreed to supply Germany with essential raw materials from its own vast stocks and to act as a purchasing agent for other goods abroad. This was a tremendous boon to the Germans and a blow to any hopes that a British naval blockade might have ruinous effect on the German economy. In addition, the 1940 conquests of Norway, Denmark, and France provided both raw materials and food stocks.

Germany's access to the resources of much of Europe also undermined British efforts to deny strategic materials to Italy upon that country's declaration of war. The blockade did cause great disruption, as Italy had few natural resources and was consequently heavily dependent on imports of raw materials, particularly oil and coal. In September 1939, Italy had oil stockpiles equivalent to only nine months of peacetime consumption. The blockade was also responsible in part for the Italian implementation of rationing for foodstuffs. Even so, the Italians were able to mitigate these problems through reliance on Germany.

The greatest accomplishment of the blockade was in the reduction of German exports (by some 80 percent) and largely ending imports of such goods as copper, magnesium, nickel, and tungsten. Importation of other raw materials, most notably oil and rubber, was also greatly reduced. These achievements ultimately amounted to little, however, because Germany was able to make up the shortages from its continental conquests and alliances. The Germans did incur additional expense garnering goods by land transport, which was costlier than shipment by sea, and they also had to devote more manpower to the domestic production of these goods. Even so, the operation failed to achieve the strategic goal of the destruction or severe weakening of the civilian and government sectors of Axis economies to cripple those nations' capacity to wage war.

British Pacific Fleet

The British Pacific Fleet (BPF) was a British Commonwealth naval force that took part in operations against Japan in the last year of World War II. Formally established on November 22, 1944, it was also the most powerful conventional force in British naval history.

Following their withdrawal to the western side of the Indian Ocean in 1942, British naval units did not return to the Southwest Pacific until May 17, 1944, when they took part in an Anglo-American carrier task force raid on Surabaya, Java. British prime minister Winston L. S. Churchill was anxious that Britain's overseas possessions be recaptured by its forces and that British influence be restored. Although U.S. chief of naval operations Admiral Ernest J. King was opposed, U.S. president Franklin D. Roosevelt immediately accepted the offer of British naval assistance at the second Quebec Conference in September 1944. Although King had stipulated that the BPF be wholly self-sufficient, in practice the U.S. Navy provided substantial material assistance.

The British Eastern Fleet was reorganized into the BPF and the British East Indies Fleet, based in Ceylon (Sri Lanka). Admiral Sir Bruce Fraser, formerly commander of the Eastern Fleet, assumed command of the British Combined Fleet, flying his flag in the British battleship *Howe.* Although the Royal Navy provided the majority of the ships and all of its capital ships, the BPF included ships and personnel from the British Royal Navy, the British Royal Fleet Auxiliary, the Royal Australian Navy, the Royal Canadian Navy, and the Royal New Zealand Navy. The Royal Australian Navy's contribution was limited because its larger ships had been integrated with U.S. Navy formations since 1942. South African Navy personnel also contributed, while the U.S. Navy provided substantial fleet train support, an area in which the Royal Navy had scant resources. At peak strength the fleet numbered 4 battleships, 6 fleet carriers, 4 light carriers, 9 escort carriers, and 2 maintenance carriers, all with some 500 aircraft. There were also 11 cruisers, 35 destroyers, 14 frigates, 44 smaller warships, 31 submarines, 35 minesweepers, and numerous support vessels.

Although Fraser exercised formal command, actual command devolved to Vice Admiral Sir Bernard Rawlings, with Vice Admiral Sir Philip Vian in charge of air operations. The U.S. Navy, which had control of all Allied operations in the Pacific Ocean, designated the BPF as Task Force (TF) 57 when it operated with the Fifth Fleet beginning on March 15, 1945; it became TF-37 on May 27 when it passed under the U.S. Third Fleet. The fleet train element was designated TF-113.

Major actions in which the fleet was involved included air strikes in January 1945 against oil production facilities at Belawan Deli and Palembang in Sumatra, followed by support for Operation ICEBERG, the U.S. invasion of Okinawa, by neutralizing Japanese aviation operating from the Sakishima Islands, both through air strikes and naval gunfire against airfields. In April 1945 the British 4th Submarine Flotilla transferred to the Allied submarine base at Fremantle, Western Australia, as part of BPF. On June 8, the submarines *Trenchant* and *Stygian* sank the Japanese heavy cruiser *Ashigara* off Sumatra, and on June 31 the British midget submarine XE3 sank the Japanese Navy heavy cruiser *Takao* at Singapore.

Beginning on July 17, battleships and aircraft from the fleet attacked the Japanese home islands. The battleship *King George V* shelled naval installations near Tokyo, the last battle action by a British battleship. Carrier air strikes against land and sea targets disabled a Japanese escort carrier. Although the British had accepted that the BPF should become a component element of the U.S. Third Fleet, its commander, Admiral William F. Halsey, excluded it from a raid on the Japanese Navy base at Kure, noting after the war that he did not intend to give the British any basis for claiming that they had helped destroy the Japanese Navy. Regardless, the BPF would have played a major part in the proposed invasion of the Japanese home islands, Operation DOWNFALL, which was canceled after Japan surrendered.

With the end of the war, the fleet formed the naval arm of the British Commonwealth Occupation Force in Japan. The performance of the BPF at the end of the war did help repair to some extent British prestige and influence in the Pacific area.

Brittany, Battle of (June 9, 1944)

Battle fought in the English Channel between units of the German Navy and the Allied navies on June 9, 1944, three days after the initial Allied invasion of France in Operation OVERLORD. It was sparked by the German attempt to reinforce their naval forces on the western front of the Normandy Invasion zone with the last surviving large warships on the Atlantic coast, the 8th Destroyer Flotilla of destroyers *ZH1*, *Z32*, and *Z24*, under the command of Captain Theodor F. von Bechtolsheim, and the torpedo boat *T24*.

Signals intelligence alerted the Allies to this operation and allowed them to ambush the German force with the 10th Destroyer Flotilla, a veteran unit led by Royal Navy captain Basil Jones. It numbered eight destroyers: the British ships *Tartar* (flagship) and *Atshanti* and the Canadian ships *Haida* and *Huron* in one division, and the Polish *Blyskawica* and *Piorun* along with the British *Eskimo* and *Javelin* in another division.

At 1:16 a.m. Allied radar detected the Germans at 10 miles' range on an overcast and rainy night in which, despite a nearly full moon, visibility was no greater than 3 miles. The first division, let by the *Tartar*, charged the German formation in a staggered line-abreast formation heading straight for the Germans so that the forward guns of every ship could bear while presenting a minimal torpedo target. This anticipated the German tactic

employed successfully in several naval battles in 1943 of firing torpedoes and immediately turning away.

The first three German ships repeated the earlier tactic within a minute of the first star shells bursting overhead, but their torpedoes missed, while the marksmanship of the gunners on the British and Canadian ships was exceptionally good. The flagship, *Z32*, sheered away to the northwest lightly damaged; the *ZH1* was disabled; and the *Z24 was* moderately damaged as it and the *T24* fled southwest. German return fire was also slow and ineffective.

The battle then became a fragmented, confused melee. The *Z32* blundered into the northern division led by the *Blyskawica* and lightly damaged the *Eskimo* before breaking contact. The *Haida* and *Huron* pursued the *Z24* and *T24*, but they escaped the Canadian destroyers by successfully passing through a British minefield and eventually returned to Brest. The *Z32* returned to the original battle area trying to find its flotilla mates and had another encounter with the *Tartar* and *Ashanti*. The *Z32* severely damaged the *Tartar* before breaking contact. Shortly thereafter, the *Tartar* and *Ashanti* came upon the *ZH1* and sank it with torpedoes.

Meanwhile, the *Z32* ran into the *Haida* and *Huron* returning from their futile chase. The large German destroyer was able to disengage once, but when it set course to return to Brest, the Canadians again located it, and after a running gun battle and with damage mounting, the German captain ran his ship aground at 5:10 a.m. to save its crew.

With the Germans operating in three groups and the Allies in as many as four, the Battle of Brittany was confused, even for a night action. It demonstrated how the evolution of night combat tactics and technology had left the Kriegsmarine's first-line units behind, and it ended Germany's last hope of countering the Allied invasion with the largest warships it had left in the Atlantic.

Brody-Lwow, Battle of (July 13–27, 1944)

In early 1944, Soviet premier Joseph Stalin approved a plan to force German troops then occupying Ukraine. The objectives were the encirclement of German forces in Galicia, the seizure of Lwow in western Ukraine and the Lublin region of Poland, and the establishment of a new front along the Vistula and San Rivers. Collectively these were known as the Lwow-Sandomierz operation. This offensive was to occur in conjunction with Operation BAGRATION, the Belorussian Offensive.

Operation BAGRATION began on June 23. German Army Group Center, commanded by Field Marshal Ernst von Busch, waged a futile effort to hold against the 1st Baltic and 3rd Belorussian Fronts. Within two weeks Army Group Center had collapsed, with 25 German divisions destroyed. Field Marshal Walther Model now replaced Busch. Model now commanded what remained of Army Group Center in addition to Army Group North Ukraine.

Army Group North Ukraine covered the Borislav-Drohobych oil fields and the approaches to southern Poland, Czechoslovakia, and Silesia. Facing it was Marshal Ivan Konev’s 1st Ukrainian Front. The Germans here were outnumbered three to one in manpower, five to one in tanks, and six to one in aircraft. Model’s units consisted of the First Panzer Army, the Fourth Panzer Army, the Seventeenth Army, and the Hungarian First Army.

On July 13 Konev attacked Model’s forces. Following heavy artillery and air attacks, the Soviet Third Army moved forward but registered little progress against Colonel General Josef Harpe’s Fourth Panzer Army. The next day, the Soviet Thirteenth Army pushed deeper into the Fourth Panzer’s line at Brody. At the same time, the Soviet Thirty-Eighth and Sixtieth Armies hit the First Panzer Army, commanded by Colonel General Erhard Raus, east of Lviv (L’viv). By July 18, the Fourth Panzer Army had been pushed back along its entire front. Reportedly it had only 20 tanks still operational. The Soviet Third Guards Army encircled the German XIII Corps and destroyed it. Of its 35,000 soldiers, only 5,000 managed to break out. The Waffen-SS 14th Grenadier Division (Galicia) continued resistance for three days after being

surrounded, delaying the Red Army advance into Lviv and allowing several thousand civilians to flee westward. By the end of the battle this division had suffered two-thirds casualties; only some 3,000 soldiers managed to escape.

On July 20, the Soviet First Guards Tank Army drove a wedge between the First and Fourth Panzer Armies. Meanwhile, the Third Guards Tank Army approached Lviv from the north, and the Fourth Tank Army came up from the south. The next day the Fourth Tank Army cut the lines of communication at Przemysl, isolating the First Panzer Army in and around Lviv. The First Guards Tank and Third Guards Tank Armies pushed westward to the San River and would have continued to Krakow. Stavka (the Soviet supreme command), however, instead directed the First Ukrainian Front to drive the Germans from Lviv.

On July 27 the First Panzer Army abandoned Lwow and, together with the Hungarian First Army, withdrew toward the Carpathians to become part of Army Group A in Slovakia. The Fourth Panzer Army was pushed across the Vistula River, where it held static defensive positions in southern Poland until January 1945. With the liberation of Lviv, all Ukraine was under Soviet control.

The next phase of the Soviet operation was the crossing of the Vistula and the capture of Sandomierz in southeastern Poland. Konev met strong resistance from Harpe, but a German counterattack failed to push the Red Army back across the Vistula or prevent the capture of Sandomierz. Army Group North Ukraine was redesignated Army Group A in September 1944.

Brooke, Sir Alan Francis (1883–1963)

British Army general and chief of the Imperial General Staff from December 1941 to January 1946. Born on July 23, 1883, in Bagnères de Bigorre, France, Alan Francis Brooke graduated from the Royal Military Academy at Woolwich and was commissioned in the Royal Artillery in December 1902. He served in Ireland and India in the years before World War I. On World War I's Western Front, he rose from captain to lieutenant colonel. Between the wars, Brooke was an instructor at the Staff College (1923–1926), commandant of the School of Artillery (1929–1932), and inspector of artillery as a major general by 1935. In 1938, he was promoted to lieutenant general on assuming command of the Anti-Aircraft Corps. Early on, it was clear that his was one of the strongest intellects in the British Army.

On the eve of war (August 31, 1939), Brooke was assigned command of II Corps of the British Expeditionary Force (BEF) in France, a position that lasted until his evacuation with many of his troops at the end of May 1940. Brooke briefly returned to France from June 12 to 18, 1940, this time as nominal commander of the BEF. He became commander of the Home Forces on July 19, 1940, working to improve readiness for the expected German invasion.

Field Marshal Sir Alan Brooke, Chief of the British Imperial General Staff during World War II. (Getty Images)

Brooke was named chief of the Imperial General Staff on December 25, 1941, and held the post until January 25, 1946, serving concurrently (from March 1942) as chairman of the Chiefs of Staff Committee. In January 1944, he was promoted to field marshal. He attended all summit conferences from 1942 through 1945 concerned with the strategic direction of the war. Brooke held off the premature American desire for a cross-Channel invasion while supporting action in North Africa and Italy to spread and destroy German forces prior to an invasion of France.

Brooke's feelings toward Prime Minister Winston L. S. Churchill varied from admiration to exasperation. Churchill's penchant for late-night meetings, his impetuosity and interference in military affairs, and his focus on detail at the expense of broader strategic thinking constantly tried

Brooke's patience. Brooke's diaries, first published in highly edited fashion in the mid-1950s (and only made available in their full form in 2001), include some of the first postwar criticism of Churchill. Brooke grew to hate the meetings of the Combined Chiefs of Staff for the constant wrangling that arose—especially given his dim view of the strategic thinking of U.S. military leaders, particularly Generals George C. Marshall and Dwight D. Eisenhower. A firm supporter of General Bernard Montgomery, Brooke had little patience for those he believed to be of limited abilities.

Brooke was created a baron (becoming Lord Alanbrooke of Brookborough in September 1945) and a viscount (in January 1946). In 1946 he was made a Knight of the Order of the Garter. He died on June 17, 1963, at Ferney Close, England.

Brooke-Popham, Sir Henry Robert Moore (1878–1953)

Royal Air Force (RAF) air chief marshal. Born on September 18, 1878, at Mendlesham, Hartismere, in Suffolk, England, Henry Brooke-Popham entered the army upon graduation from Sandhurst in 1898. In 1911 he became a pilot, and he was a major in the Royal Flying Corps in 1914 at the beginning of World War I.

Considered too old to fly missions, Brooke-Popham served as a staff officer on the Western Front. Following the war, as a member of the RAF, he was posted to the Air Ministry and went on to command the RAF Staff College between 1921 and 1926. Promoted to air vice marshal in 1926, he served in various leadership positions in Britain and the Middle East until retiring in 1937 to become the governor of Kenya.

Brooke-Popham returned to active duty in September 1939 at the beginning of World War II. His first assignment was to help organize the British Empire Air Training Scheme in Canada and South Africa, a program that trained pilots from the British dominions. In October 1940, now an air chief marshal, he was appointed British commander in chief of the Far East, responsible for ground and air forces in the British possessions of Burma, Hong Kong, Malaya, and Singapore.

Plagued by organization difficulties, including the lack of a clear chain of command (area naval forces reported to a different commander), Brooke-Popham attempted to balance his military-diplomatic role and bolster British defenses against a possible Japanese attack. His ideas, including a proposed British invasion of Thailand, were mostly ignored. British and colonial troops under Brooke-Popham's command were ill-prepared for the Japanese invasion of Malaya in early December 1941 and the subsequent loss of Singapore (February 15, 1942), and he was relieved on December 27. Brooke-Popham died at Halton, Buckinghamshire, England, on October 20, 1953.

Brown, Wilson, Jr. (1882–1957)

U.S. Navy admiral. Born in Philadelphia, Pennsylvania, on April 27, 1882, Wilson Brown Jr. graduated from the U.S. Naval Academy at Annapolis in 1902. He returned to Annapolis as an instructor during 1907–1908. Staff assignments followed. During World War I, Brown served as an aide to Admiral William S. Sims and later commanded the destroyer *Parker*.

Brown next commanded the destroyer *Blakeley* during 1919–1920. He was naval aide to President Calvin Coolidge during 1926–1929. Promoted to captain, Brown commanded the battleship *California* during 1932–1933, then was chief of staff of the Naval War College, Newport, Rhode Island, during 1933–1934. He was then naval aide to President Franklin Roosevelt during 1934–1936. Promoted to rear admiral in July 1936, Brown commanded the Training Squadron, Scouting Force, during 1936–1938 and then was superintendent of the Naval Academy during 1938–1941.

Promoted to vice admiral in February 1941, Brown assumed command of Scouting Force, Pacific Fleet. He led the aborted carrier raid on Rabaul on February 20, 1942, and then commanded the largest task force put together by the United States in the war to date, consisting of the carriers *Lexington* and *Yorktown*, 8 heavy cruisers (7 U.S. and 1 Australian), and 14 destroyers, leading it in the highly successful March 10 attack against the Japanese landing force in the Salamaua-Lae area of northeastern Papua New Guinea. Because chief of naval operations Admiral Ernest J. King believed that Brown was not sufficiently aggressive, Pacific Fleet commander Admiral Chester W. Nimitz moved him to command of amphibious forces in April until July 1942.

Brown was commandant of the First Naval District during 1942–1943, then again naval aide to President Roosevelt during February 1943–December 1944, when he retired. Brown died at New Haven, Connecticut, on January 2, 1957.

Browning, Frederick (1896–1965)

British Army general and founder of British airborne forces. Born in London on December 20, 1896, Frederick Browning was educated at Eton and the Royal Military College, Sandhurst. He joined the British Army in France in 1915 and served with the Grenadier Guards. At age 20, he commanded a company, earning the nickname "Boy," which he kept for life. He also won the Distinguished Service Order and the French Croix de Guerre.

Continuing in the army after World War I, Browning served a tour as adjutant at Sandhurst between 1924 and 1928. From 1935, he commanded the Grenadier Guards battalion, mostly in ceremonial duties. On September 1, 1939, he was promoted to colonel. In 1940, he took command of a brigade as a brigadier. At the end of that year, Browning, a certified pilot, assumed command of the 1st Airborne Division, which he organized from scratch.

After his promotion to major general on November 3, 1941, Browning organized the Airborne Command, which eventually had 17 brigades. He set high standards for himself and his men in terms of training, fitness, and dress. Marked by strong esprit de corps, the British Airborne Command adopted the red beret and the name "Red Devils."

Elements of Browning's airborne forces participated in the Allied "race for Tunis" in November 1942. Browning then served as airborne adviser to U.S. general Dwight D. Eisenhower in planning the airborne assault on Sicily, although he personally saw no action. Promoted to lieutenant general on January 7, 1944, Browning took command of the I Airborne Corps, which included the 1st and 6th Airborne Divisions, a Special Air Service unit, and, later, the Polish 1st Separate Airborne Brigade. He led the I Airborne Corps in the Normandy Invasion that commenced on June 6, 1944.

In August 1944, on the establishment of the First Allied Airborne Army, Browning became its deputy commander under U.S. Army lieutenant general

Lewis H. Brereton, although Browning retained command of I Airborne Corps as well. He played a major role in Operation MARKET-GARDEN (September 17–26, 1944), landing at Nijmegen by glider with the U.S. 82nd Airborne Division. He later led the I Airborne Corps in the crossing of the Rhine (March 7–24, 1945) and the advance to the Baltic.

Following the end of fighting in Europe, Browning was appointed chief of staff of the South-East Asia Command under Lord Louis Mountbatten. Browning returned to Britain in late 1946 and served as secretary to the minister of war. He retired from the army in January 1948 but served as comptroller of Princess (later Queen) Elizabeth's household. Browning died at his estate, Menabilly, near Fowey in Cornway, Britain, on March 14, 1965.

B-29 Raids against Japan (June 1944–August 1945)

The attacks on Japan by the Boeing B-29 Superfortresses of the Twentieth Air Force, part of the U.S. Army Air Forces (USAAF), began in June 1944 and were key components in the series of shocks that produced the Japanese surrender in August 1945. The bombers burned down cities, mined waterways, destroyed major industrial targets, and eventually dropped two atomic bombs.

Planning for the use of the long-range B-29s against Japan began in early 1943. Operation MATTERHORN, launching these heavy bombers from China, was finally approved at the Cairo Conference in December 1943, and the Combined Chiefs of Staff there also supported basing in the Mariana Islands. In April 1944, General Henry "Hap" Arnold established the Twentieth Air Force, to be commanded out of Washington so he could keep the B-29s under his control. The first aircraft were rushed to the Far East that month.

Primary bases for the XX Bomber Command of the Twentieth Air Force were located in India, with forward operating fields in China. Results were disappointing, even after Arnold sent his best problem solver and combat commander, Major General Curtis LeMay, to take over the troubled unit. Facilities were austere, supply lines were long, crew training was inadequate, and the hastily fielded B-29s suffered from a host of technical problems, especially with their engines. In 10 months of operations, the XX Bomber Command delivered fewer than 1,000 tons of bombs to Japan, all against targets in Kyushu.

The USAAF had greater hopes for the XXI Bomber Command based in the Marianas, which launched its first attack on Japan in late November. This unit had better logistics and more secure airfields, and it was closer to Japan than the XX Bomber Command. Arnold expected Brigadier General Haywood Hansell, one of the architects of precision-bombing doctrine, to exert decisive airpower against Japan's homeland fortress and prove the worth of an independent air service. But Hansell was unable to put his theories into effective practice. In addition to the same problems faced in MATTERHORN, the XXI Bomber Command ran into a combination of cloud

cover and jet stream winds over targets that rendered high-altitude precision bombing almost impossible.

In January 1945, a frustrated Arnold decided to consolidate all B-29s in the Marianas under LeMay, who reorganized the staff, instituted new training, and improved maintenance. After a month of ineffective precision attacks, however, LeMay, on his own initiative, shifted tactics. He adopted low-level nighttime area incendiary attacks, designed to cripple key targets by burning down the cities around them and to destroy the Japanese ability and will to carry on the war. The first raid on Tokyo on the night of March 9–10 was a spectacular success militarily, killing more than 90,000 people and incinerating 16 square miles. By the end of the war, B-29s had burned out 178 square miles in some 66 cities and killed many hundreds of thousands of people.

The Superfortresses also performed other missions against the Japanese home islands. A psychological warfare campaign to drive panicked civilians out of targeted cities caused over 8 million Japanese to flee to the countryside. Mines dropped in waterways during the last five months of the war sank or damaged over 1 million tons of scarce shipping. And, of course, B-29s from the 509th Composite Bomb Group dropped two atomic bombs, one on August 6, 1945, and the other on August 9. On August 15, the Japanese agreed to surrender terms. Japanese leaders and postwar bombing evaluations acknowledged that the B-29s made a significant contribution to ending the war.

Buckner, Simon Bolivar, Jr. (1886–1945)

U.S. Army general. Born near Munfordville, Kentucky, on July 18, 1886, Simon Bolivar Buckner Jr. was the son of a Confederate Army general and governor of Kentucky. He graduated from the U.S. Military Academy at West Point in 1908 and was commissioned a second lieutenant of infantry. Assignment to the Aviation Section of the Signal Corps kept him in the United States during World War I but also made him one of the most air-minded of the army's ground officers.

Buckner was an instructor in tactics at West Point between 1919 and 1923. He then completed the Infantry Advanced Course. After graduating from the Command and General Staff School in 1925, he continued there as an instructor from 1925 to 1928. He graduated from the Army War College in 1927, where he would also be an instructor between 1929 and 1932. Buckner then returned to West Point as an instructor, and from 1933 to 1936 he was commandant of cadets.

Promoted to colonel in 1937, Buckner commanded the 66th Infantry Regiment in 1937 and 1938. He was then on duty with the Civilian Conservation Corps in Alabama between 1938 and 1939 before serving as chief of staff of the 6th Infantry Division in 1939 and 1940. Buckner was promoted to brigadier general in October 1940 and to major general in August 1941. Between 1940 and 1944, he headed the Alaska Defense Command. His primary responsibility was the construction of defense facilities, but units of his command cooperated with the navy in evicting the Japanese from two of the Aleutian Islands, Attu and Kiska.

U.S. Army lieutenant general Simon Bolivar Buckner, Jr., commanded American forces in the invasion of Okinawa, where he died from a shell explosion, becoming the highest ranking U.S. officer killed by enemy action in the war. (AP Photo)

A month after being promoted to lieutenant general in May 1943, Buckner went to Hawaii to organize the new Tenth Army. He then headed an army review panel that investigated the intraservice dispute over U.S. Marine Corps lieutenant general Holland M. Smith's relief of U.S. Army major general Ralph Smith on Saipan. Buckner commanded the main landings on Okinawa in April 1945. Citing logistical difficulties, he rejected navy pleas that he mount a subsidiary landing on the south end of the island.

On June 18, 1945, just three days before organized Japanese resistance ended, Buckner was killed on Okinawa by a coral fragment sent flying by the explosion of a Japanese shell. He was the highest-ranking American officer killed by enemy fire during the war. Buckner was posthumously promoted to general by a special act of Congress in 1954.

Budapest, Battle of (November 3, 1944–February 13, 1945)

A long siege that ended with the expulsion of German troops from Budapest by the Soviet Army. During this one battle, Soviet forces sustained half of all casualties suffered by them during the campaign in Hungary.

The city of Budapest stretches along both sides of the Danube River and consists of Pest on the east bank and Buda on the west bank. During the siege, there was heavy fighting for virtually every building. Hundreds of thousands of civilians were trapped in the city, unable to leave and caught in the cross fire without food and bereft of essential services, such as electricity. The siege lasted 108 days, and for 52 of those days, the defending Germans were completely surrounded.

In September 1944, Soviet troops invaded Hungary from Romania. The Hungarian government was then desperately trying to leave the war, and on September 28, representatives of Hungarian regent Miklós Horthy de Nagybánya were dispatched to Moscow. There, they signed a preliminary armistice agreement on October 11, which Horthy announced four days later. This step led to the German Army's occupation of Budapest. Using his son as a hostage, the Germans forced Horthy to appoint Ferenc Szálasi, head of the Hungarian Arrow-Cross (fascist) Party, as "Leader of the Nation."

SS-Obergruppenführer Karl Pfeffer-Wildenbruch commanded the German defense of Budapest. He had at his disposal the 8th and 22nd SS Cavalry Divisions and elements of the 13th Panzer Division, the 60th Panzergrenadier Division, and the 271st Volksgrenadier Division. Some units of the Hungarian Army under General Iván Hindy fought alongside the Germans. Altogether, the defenders numbered some 92,000 men. Adolf

Hitler ordered that Budapest and Hungary be held at all costs. He needed Hungary for its agriculture and industry but also as a location from which to mount a future counterattack in the Carpathian Basin.

Joseph Stalin's goal was to drive Hungary from the Axis alliance and introduce a Soviet-style political and social system as soon as possible. His plan to expand the Soviet sphere of interest was threatened by a British proposal to send forces to the Adriatic in the autumn of 1944 and from there perhaps move against the Carpathian Basin. Stalin was determined to forestall any British presence in the area, and on October 28, 1944, he ordered the capture of Budapest. He did not anticipate a lengthy battle for the city.

The Soviet 2nd Ukrainian Front (army group), commanded by Army General Rodion Y. Malinovsky, and the 3rd Ukrainian Front, commanded by Marshal of the Soviet Union Fedor I. Tolbukhin, now converged on the Hungarian capital. In all, the Soviets committed some 157,000 men, including a Romanian contingent, to the operation. Red Army troops first reached the east bank of the city (Pest) on November 3, 1944, but operations then halted.

Following several unsuccessful attempts, Soviet forces completed the encirclement of the city on December 25. On January 1, 1945, the Soviets took the first buildings in Pest proper, and by January 18, they had all of Pest under their control. Many civilians and defending army units escaped across the Danube to the Buda side, but before the evacuation was completed, all the bridges over the Danube connecting the two halves of the city were blown.

Meanwhile, on December 24, 1944, fighting had begun in Buda on the west bank. Pfeffer-Wildenbruch wanted to break out with his forces on December 28 when the Soviet encirclement was still loose, but Hitler strongly opposed this and ordered his troops to stand fast. Hitler did attempt to relieve the German garrison, however. The first effort was made in early January 1945 by SS-Obergruppenführer Herbert Gille's IV SS Panzer Corps from Komárno, about 30 miles west of Budapest but was unsuccessful. Gille then tried again from the vicinity of Lake Balaton to the southwest but got no closer than 15 miles from the city.

Intense fighting continued, meanwhile, between German and Soviet forces in a small area of Buda, only some three miles by four miles in size. On February 11, 1945, Pfeffer-Wildenbruch authorized his remaining men to

break out westward through the Buda Hills to join up with other German troops just outside the Soviet encirclement. Only some 800 men succeeded. The Soviets declared Buda secure on February 13. Pfeffer-Wildenbruch was among those captured and remained a prisoner in the Soviet Union until 1955.

The fighting is estimated to have claimed the lives of 60,000 German troops. The Soviets lost 72,000 confirmed dead, with another 80,000 missing. Some 105,000 Hungarians, mostly civilians, were also dead. Among survivors of the siege were some 100,000 Jews who had managed to escape Arrow-Cross roundups. The last German Army units did not leave Hungary until April 4, 1945.

Budenny, Semen Mikhailovich (1883–1973)

Marshal of the Soviet Union. Born on April 25, 1883, on a farm near Platoskaya, Russia, on the Don River, Semen (Semyon) Mikhailovich Budenny (Budyonny) entered the czarist army at age 20 and served as a dragoon in the 1904–1905 Russo-Japanese War. In 1907, he attended cavalry school, graduating as a sergeant. Returning to his regiment, he served as a platoon sergeant during World War I.

In the Russian Civil War beginning in 1918, Budenny fought on the Bolshevik side and served in a partisan cavalry regiment in the Don region

that grew to a brigade and then a division. Given brigade command, he showed great talent as a cavalry commander at the Battle of Tsaritsyn. Budenny distinguished himself against the best opposing White (counterrevolutionary forces) cavalry generals, and he ended the civil war in command of a cavalry army. During the Polish-Soviet War of 1919–1921 he was assigned to support the Western Front. He and Kliment Voroshilov—encouraged by political officer Joseph Stalin—refused to obey front commander General Mikhail Tukhachevsky's orders, which led to the defeat of the Red Army in Poland.

Marshal of the Soviet Union Semen Mikhailovich Budenny. (Hulton-Deutsch Collection/Corbis)

Budenny was appointed deputy commander of Cavalry Forces in 1923. When that post was abolished in 1924, Stalin secured Budenny's appointment as inspector of the cavalry. Despite this relatively modest post, he was one of five generals appointed marshal of the Soviet Union in 1935.

During the 1937 military purges, Budenny headed the Moscow Military District and served on the tribunal that condemned his colleagues to death. Poor troop performance during the First Finnish-Soviet War (1939–1940, Winter War) exposed Budenny's outdated training views, causing his removal from district command and appointment to the honorific post of deputy defense commissar. He held this post when the Germans invaded in June 1941.

Given command of the strategic Southern Axis, Budenny became responsible for Kiev, which Stalin ordered not to be surrendered. When it became apparent that the city would fall, Budenny recommended its abandonment, resulting in his relief and transfer to command the Reserve Front behind Moscow.

Unable to organize an effective defense when the German Army launched its advance on Moscow, Budenny was replaced by General Georgii Zhukov. In the spring of 1942, Budenny took command of the strategic North Caucasus Axis but was relieved after the Germans crushed the Crimean Front and raced into the Caucasus. In January 1943, Stalin appointed Budenny commander of the Red Army Cavalry. He held that post until 1953. Budenny died in Moscow on October 26, 1973.

Bulgaria

Country located in Southeastern Europe encompassing 42,823 square miles. Bulgaria borders Romania to the north, Serbia and Macedonia to the west, Greece and Turkey to the south, and the Black Sea to the west. In 1939, Bulgaria had a population of approximately 6,340,000 people. It had both a czar and a popularly elected parliament. Czar Boris III dominated the nation's foreign policy and was largely responsible for the nation's neutrality on the outbreak of World War II in September 1939. Boris hoped that peace might be quickly achieved in Europe, and he took note of the fact that although the Bulgarian people were largely pro-Soviet, the officers of the army were pro-German.

The weakness of Boris's policy, however, was the popular desire to attain additional territory in the Balkans. In World War I, Bulgaria had joined the Central Powers in an attempt to recoup territorial losses from the Second Balkan War. The country's defeat in 1918 led to a peace settlement that had further reduced Bulgarian territory. By 1940, the nation remained the only former Central Power that had not regained some of the land lost through the World War I peace treaties. Popular sentiment to redress this situation was high. Germany partially fulfilled these territorial ambitions on September 7, 1940, in the Treaty of Craiova, which granted the southern Dobruja region to Bulgaria.

German interest in Bulgaria was the product of the increased strategic importance of the country. By late 1940, German plans for the invasion of Greece and those for the conquest of the Soviet Union rendered Bulgaria much more significant to the Axis cause. On March 1, 1941, Sofia entered into an agreement whereby Bulgaria joined the Tripartite Powers and allowed German troops to move through Bulgarian territory. Unlike governments in other regions of Eastern Europe, however, the government of Bulgaria remained autonomous.

Sofia stayed uncommitted militarily until December 13, 1941, when it declared war on the United States and Great Britain; the country never declared war on the Soviet Union. Bulgaria's military participation in World War II was limited to the Balkans and centered on the acquisition of territory. Bulgarian troops did not take an active part in Germany's conquest of Yugoslavia or Greece, but the army did occupy both the Yugoslav and Greek portions of Macedonia and most of western Thrace.

Beyond this, Bulgaria contributed little to the Axis cause and often

opposed German requests in both the military and civilian sectors. Military operations were confined to garrison duties in Macedonia and Thrace, despite Berlin's attempts to persuade Sofia to commit troops against the Soviet Union. Boris and his government also compromised little on the issue of the Jews, who formed about 1 percent of the nation's population. By the end of the war, most of Bulgaria's Jews had escaped extermination, although to appease Berlin the government had confined them to labor camps.

Bulgarian fortunes declined after August 28, 1943, with the death of Czar Boris III. His successor, Simeon II, was a child, and the regency that governed in his stead was less effective than Boris. Political unrest was compounded by popular instability due to declining Axis fortunes and a weakening of the Bulgarian home front. On November 19, 1943, Sofia experienced its first heavy attack by Allied bombers, and by late 1943, food and consumer goods were in short supply.

Support for a coalition known as the Fatherland Front, which included the communists, rose as the Soviet Red Army marched toward Bulgaria's northern border in the spring of 1944. Efforts by Sofia to secure a peace settlement with the Americans or the British failed. Amid mounting Soviet pressure for a Bulgarian declaration of war against Germany, a new government acceded to Soviet demands on September 8; Moscow had declared war on Bulgaria three days earlier. Red Army troops subsequently occupied the country and appointed members of the Fatherland Front to the government.

The new government, eager to please Moscow, committed 450,000 Bulgarian troops to serve with the Red Army in operations in Yugoslavia and Hungary, at a cost of 32,000 killed or wounded. As operations unfolded, communist officials in Bulgaria began the process of firmly fixing the country in the Soviet sphere of influence.

Bulgaria, Air Force

As a defeated Central Power in World War I, Bulgaria was forbidden under the Treaty of Neuilly to maintain an air force. In 1936, however, it illegally reconstituted its air force with German biplanes, adding Polish fighters and German Messerschmitt Bf-109E fighters after 1938. Simultaneous domestic production at the Bulgarian national aircraft factory, Darjavna Aeroplanna Rabotilnitza (DAR), augmented the force. Following Bulgaria's declaration of war on Great Britain and the United States in December 1941, the Royal Bulgarian Air Force was further increased through Germany's contribution of a number of ex-Czechoslovakian aircraft. Bulgaria entered the war with 228 fighters, dive-bombers, and medium bombers of German, Polish, and Czechoslovakian design, together with DAR dive-bombers and reconnaissance aircraft.

The Bulgarian Air Force was largely inactive until August 1, 1943, when the U.S. Army Air Forces (USAAF) conducted their first major bombing raid on the Axis-held oil fields of Ploieşti, Romania. The Bulgarians' attempt to engage the U.S. Consolidated B-24 Liberator bombers clearly showed that their air arm was hopelessly obsolete. Most of the fighters could not catch the bombers, and Bulgarian aircraft shot down only two B-24s. The Ploieşti Raids lasted until August 18, 1944. The Germans then provided the Bulgarians with 120 French Dewoitine D.520 fighters and additional Messerschmitt aircraft.

These additional planes did little to improve the effectiveness of the Bulgarian Air Force. Between December 1943 and January 1944, Allied bombers sortied virtually unmolested over Bulgaria, and their defensive cover of Lockheed P-38 Lightning fighters shot down 39 Bulgarian fighters with negligible losses. Introduction of the superior North American P-51 Mustang fighter further reduced the effectiveness of Bulgarian air defenses.

After it was invaded by Soviet forces in September 1944, Bulgaria switched sides in the war. Royal Bulgarian Air Force units then provided ground support for the Red Army in Yugoslavia and Hungary.

Bulgaria, Navy

Bulgaria has never maintained a large navy, but the diminutive size of its naval force by the late 1930s was also the product of treaty restrictions stemming from the country's defeat in World War I and the difficult economic conditions Bulgaria faced during the interwar years. The core of the navy consisted of four obsolete Drski-class torpedo boats. Launched in 1907, they displaced 98 tons, were capable of 26 knots, and mounted three 17.7-inch torpedo tubes. The remaining naval unit, the torpedo gunboat *Nadiejda*, was built in 1898 and displaced 715 tons. It was armed with two 3.9-inch guns and two torpedo tubes and had a maximum speed of 17 knots.

This force was augmented after 1937, when Bulgaria entered into a military assistance agreement with Germany that eventually yielded five motor torpedo boats of the 1939 *Lurssen* design. They displaced 57.6 tons at full load, had a maximum speed of 37.1 knots, and were armed with two torpedo tubes and a 20mm antiaircraft gun. On Bulgaria's entry into World War II in March 1941, Germany also supplied three former Dutch motor torpedo boats.

The Bulgarian Navy saw little fighting in World War II. Its principal action came in October 1941, when it and the Romanian Navy mined Bulgarian coastal waters. Up until the time Bulgaria was invaded and then occupied by Soviet forces in September 1944, the navy's chief duties were escorting coastal vessels in the Black Sea and patrolling the Danube River.

Bulge, Battle of the

See Ardennes Offensive

Bull, Harold Roe (1893–1976)

U.S. Army lieutenant general. Born in Springfield, Massachusetts, on January 6, 1893, Harold Roe "Pink" Bull graduated from the U.S. Military Academy at West Point in 1914 and was commissioned into the infantry as a second lieutenant. Bull served in the American Expeditionary Forces (AEF) in France during World War I and was an instructor at West Point from 1921 to 1924.

Bull graduated from the Command and General Staff School in 1928 and was an instructor at the Infantry School, Fort Benning, Georgia, between 1928 and 1932. He graduated from the Army War College in 1933 and from the Naval War College in 1934. Bull was secretary of the War Department General Staff in 1938 and 1939. Promoted to brigadier general in July 1941, he was assistant divisional commander of the 4th Infantry Division. He then served as assistant chief of staff for operations of the War Department General Staff in 1942. Promoted to major general in March 1942, Bull headed the Replacement and School Command, Army Ground Forces, from 1942 to 1943. In 1943, U.S. Army chief of staff General George C. Marshall sent him to North Africa as a special observer. Bull returned to the United States in midyear to take command of III Corps but soon was assigned to Britain on the cross-Channel invasion planning staff.

In early 1944, General Dwight D. Eisenhower made Bull his deputy chief of staff for operations at AEF Supreme Headquarters, and he served in that position in 1944 and 1945. Eisenhower thought that Bull would be a fine corps commander if he were not so indispensable as a staff officer. In February 1945, he ranked Bull 14th among all U.S. officers in the European theater. Yet Bull was overshadowed by his British deputy, Major General John Whiteley, and in May 1944, the planning function of the operations section went to Whiteley, who was thus more influential in shaping strategy.

Bull's job involved preparing situation reports, conducting briefings, and handling relations with operational headquarters, the Allied governments, and the French Resistance. In January 1945, he accompanied Air Chief Marshal Sir Arthur Tedder on a mission to Moscow.

At times a difficult man, Bull found it hard to deviate from an original plan. He was present at General Omar Bradley's command post when news came of the capture of the Remagen Bridge over the Rhine, and he angered Bradley by insisting that the bridgehead had no place in the overall plan for the defeat of Germany.

After the war, Bull was commandant of the National War College. He retired from the army as a lieutenant general in July 1950. Bull died in Washington, D.C., on November 1, 1976.

Bullitt, William Christian, Jr. (1891–1967)

Journalist, writer, and U.S. diplomat. William Christian Bullitt Jr. was born into a patrician family in Philadelphia, Pennsylvania, on January 25, 1891. He graduated from Yale University in 1913 and attended Harvard Law School before dropping out in 1914. He then worked for several newspapers and magazines as a European correspondent before becoming an aide to President Woodrow Wilson during the 1919 Paris Peace Conference following World War I.

Bullitt proved to be a strong supporter of Wilsonian internationalism. While the negotiations were under way, Bullitt and several others made a clandestine trip to Russia in an attempt to open diplomatic ties with the Bolsheviks. Bullitt was unable to convince Wilson to establish relations with Russia, however, and he promptly resigned his post. He never forgave Wilson for spurning his work, and he later testified against the ratification of the Versailles Treaty in the U.S. Senate. Bullitt now turned his attention to writing and journalism, and in 1926 he published a critically acclaimed novel, *It's Not Done.*

Considered a liberal Democrat, Bullitt was selected by President Franklin D. Roosevelt to become America's first ambassador to the Soviet Union in 1933. Bullitt proved popular with the Soviet leadership, and he had high hopes of forging a meaningful relationship between the United States and the Soviet Union. By the time he relinquished his post in 1936, however, he had developed a jaded and hostile view of the Soviet regime. Bullitt would remain a committed anticommunist the rest of his life.

In October 1936 Roosevelt appointed Bullitt ambassador to France. As a francophile and francophone, he was ideally suited to the position, and he entertained lavishly at a château he rented in Chantilly. Bullitt also became quite close with France's senior leadership. He conversed almost daily with Roosevelt, particularly as the clouds of war gathered. The ambassador was sometimes influenced too heavily by favorites and too prone to gossip to send truly objective dispatches to the State Department.

In the fall of 1938, amid the crisis over Czechoslovakia, Bullitt publicly declared that the United States stood by France in both war and peace. Roosevelt quickly clarified that the United States would not commit to war if

it came over the future of Czechoslovakia. This incident began a rift between the two men that would never be resolved.

In June 1940, when German forces invaded France, Bullitt refused to vacate Paris and travel with the government-in-exile to Bordeaux. The mandate to leave was a direct presidential order that the ambassador ignored, much to Roosevelt's annoyance. This marked the end of Bullitt's diplomatic career. The rift between the president and Bullitt only deepened when Bullitt attempted to discredit Undersecretary of State Sumner Welles, who was a favorite of Roosevelt. Bullitt's attempts threatened to turn into a political scandal, and Roosevelt finally accepted Welles's resignation in 1943, although he was loath to do so.

Bullitt ran unsuccessfully for mayor of Philadelphia in 1943, and it was alleged that Roosevelt told fellow Democrats not to support his former ambassador. During the war years, Bullitt authored numerous commentaries and articles on the dangers of communism and fascism, and by the early 1950s he had become a strident opponent of communist China and the Soviet bloc. In a 1954 article in *Look* magazine, he famously advocated an immediate attack on China and suggested that the next crisis with Moscow be met with nuclear bombs. Bullitt continued to write and provide commentary on contemporary issues until his death on February 15, 1967, in Neuilly, France.

Buna, Battle of (November 16, 1942–January 22, 1943)

Key battle in New Guinea in the July 1942–January 1943 Kokoda Trail Campaign. In July 1942, Japanese major general Horii Tomitaro's South Seas Detachment landed at Buna on the northern coast of Papua New Guinea. During the next weeks, the Japanese moved south on the Kokoda Trail over the Owen Stanley Mountains toward Port Moresby on the southern coast of New Guinea, from which point they could reach Queensland, Australia, by air. Opposed by Australian and local Papuan forces, the Japanese offensive stalled some 30 miles short of Port Moresby, and during September and October, the remaining Japanese retreated back to Buna. There, the Japanese carved out a fortified zone approximately 16 miles long and 7 miles deep. It was manned by 8,000 men occupying well-camouflaged bunkers and trenches, most in strongpoints at Gona and Buna villages and Sanananda Point.

General Douglas MacArthur, commander of the Southwest Pacific Area, was determined to seize Buna as part of the Allied design to neutralize the Japanese base at Rabaul on New Britain Island. During the fall of 1942, troops from the Australian 7th Division and the U.S. 32nd Infantry Division moved by land and airlift to the Buna area. Because of the reluctance of Allied naval commanders to risk exposing their heavy ships to air attack or the treacherous reefs, MacArthur's divisions had no naval gun support and no transports to carry heavy artillery or tanks. For fire support, these troops had to depend on aircraft, which proved ineffective, and light guns and mortars, the shells of which failed to penetrate the thick log walls of the Japanese bunkers.

The Allied attack began on November 16. The Australians made some limited progress in their assaults on Gona and Sanananda. At Buna, however, the 32nd Infantry Division faced a tactical nightmare and was stopped in its tracks. Lacking sufficient men, forced to cross nearly impassable swamps and jungles, and encountering murderous machine-gun fire, the division made no headway during the next two weeks despite suffering heavy casualties. High humidity and temperatures as well as jungle diseases added to the hardship.

Convinced that the troubles at Buna were the result of poor leadership in the 32nd Infantry Division rather than a lack of proper weapons or the

strength of the Japanese positions, MacArthur relieved its commander, Major General Edwin F. Harding, and turned the battle over to the I Corps commander, Major General Robert L. Eichelberger. Many members of the 32nd believed that MacArthur had done little to support them and did not understand the situation at the front. A resourceful commander committed to the welfare of his men, Eichelberger led from the front and came to be regarded as one of the best Allied commanders in the Pacific. He restored Allied morale and improved the logistical situation.

In early December, U.S. engineers were able to open an airfield near Buna, significantly improving the Allied supply situation. The Australians received some artillery by air, and they also managed to transport light tanks by coastal barge. The tanks, although few in number, proved invaluable. The fighting was bitter, but on December 9 the Australians took Gona. The more heavily fortified Buna resisted U.S. pressure, but on December 14, the Americans took Buna Village. By January 2, 1943, all of the Japanese in the American sector had been eliminated, and on January 22, the Australians wiped out the last Japanese pocket at Sanananda.

The cost of the Buna operation was high. Some 7,000 Japanese defenders were killed, another 1,200 were injured and evacuated, and around 250 others were captured. The Australians and Americans lost 640 dead, 2,065 wounded (many more were hospitalized as a result of disease), and 132 missing. Yet for the Allies, Buna was a significant victory, for it provided airfields to support additional offenses in New Guinea and also taught valuable lessons about Japanese tactics and jungle fighting.

Burke, Arleigh Albert (1901–1996)

U.S. Navy admiral. Born on October 19, 1901, near Boulder, Colorado, Arleigh Albert Burke came from a family of modest means. He graduated from the U.S. Naval Academy at Annapolis in 1923, and he earned a master's degree in engineering from the University of Michigan in 1931. For the next eight years, Burke held a series of ship assignments and served in the Bureau of Ordnance in Washington.

At the time of the U.S. entry into World War II, Commander Burke was an inspector at the Naval Gun Factory. His attempts to secure a sea billet were not successful until May 1943, when he was promoted to captain and received command of the eight-ship 23rd Destroyer Squadron in the South Pacific. He then saw action in the Solomon Islands and the Marianas Campaign (June–August 1944).

Burke led the 23rd Squadron, known as the "Little Beavers," in the Battle of Empress Augusta Bay on November 2, 1943. In all, the 23rd Squadron fought in 22 engagements and helped to sink one Japanese cruiser, four destroyers, and one submarine. It also claimed more than 30 Japanese aircraft shot down. There are different versions of how Burke earned the nickname "31 Knot Burke," but the most likely is that it came from a radio message he made prior to the November 25, 1943, Battle of Cape St. George, stating he was making for the interception point at 31 knots. Because he had previously reported his best formation speed as 30 knots, Admiral Halsey addressed his next order to the captain with "Thirty-one knot Burke."

Known for his innovations as a commander, Burke became chief of staff of the 1st Fast Carrier Force, under Vice Admiral Marc Mitscher, in January 1945. Burke retained that post for the remainder of the war, coordinating carrier strike operations in the Battle of Iwo Jima (February 19–March 26, 1945) and the Battle of Okinawa (March–June 1945).

Between 1945 and 1947, Burke was chief of staff of the Atlantic Fleet before serving in the Office of the Chief of Naval Operations and as director of the navy's nuclear weapons program (1947–1949). His high profile in the so-called 1949 Admirals' Revolt, in which the navy protested the priority

given to the needs of the air force, led the administration of President Harry S. Truman to remove him temporarily from the list for promotion to admiral.

Nevertheless, Burke was promoted to rear admiral in July 1950. During the 1950–1953 Korean War, he commanded Cruiser Division 5 in Korean waters, and in July 1951 he was named a negotiator for the United Nations Command in armistice talks. In 1952, he became director of the Strategic Plans Division in Washington, D.C. Two years later, he took command of Cruiser Division 6, followed by command of the Destroyer Force, Atlantic Fleet (1954–1955).

In August 1955, Burke was appointed chief of naval operations, serving an unprecedented three terms. Refusing a fourth term, he retired as a full admiral in August 1961. While chief of naval operations, he oversaw the introduction of nuclear-powered ships in the navy as well as the implementation of the Polaris Ballistic Missile Program.

After his retirement, Burke was involved in various business enterprises. He died in Bethesda, Maryland, on January 1, 1996. The Arleigh Burke class of guided-missile destroyers is named for him.

See Mountbatten, Louis Francis Albert Victor Nicholas

Burma Air Campaign (1941–1942)

By the time the United States entered World War II at the end of 1941, China had been at war with Japan for four years. Virtually the only American force fighting the Axis powers anywhere in the world in December 1941 was the American Volunteer Group (AVG), popularly known as the Flying Tigers. Since August 1941, members of the AVG had been training at the British fighter base in Toungoo, Burma (Myanmar).

The Guomindang (GMD, Chinese Nationalist) government headed by Jiang Jieshi (Chiang Kai-shek) was not only at war with the Japanese but was also locked in an uneasy truce with Chinese Communist forces led by Mao Zedong (Mao Tse-tung). By late 1941, Jiang's troops had failed to block the Japanese move toward Burma, threatening the only land supply route into China that ran over the Himalayas, along the hairpin mountain curves of the Burma Road.

As the Japanese advance threatened Burma, the British requested one of the AVG's three squadrons to help defend Rangoon (Yangon). On December 12, 1941, the AVG 3rd Squadron, commanded by squadron leader Arvid Olson, moved south to Rangoon to join units of the Royal Air Force (RAF), while the other two squadrons flew to Kunming in China to cover the terminus of the Burma Road.

The AVG's first combat occurred over Yunnan Province in China on December 20. The 1st and 2nd Squadrons shot down 9 of 10 Japanese bombers, losing only 1 of their own P-40Bs. On December 23, the 3rd Squadron and RAF aircraft shot down 6 Japanese bombers and 4 fighters over Rangoon. The RAF lost 5 aircraft in the battle, and the AVG lost 4. On December 25, the Japanese sent 80 bombers over Rangoon in two waves, escorted by 48 fighters. The AVG knocked down 23 without suffering a single loss. The Japanese attacks continued through New Year's Eve. After 11 days of fighting, the AVG had shot down 75 Japanese aircraft, losing only 4 fighters and 2 pilots in the process.

In early January 1942, 8 aircraft from the AVG's 1st Squadron reinforced the 3rd in Rangoon. The rest of the 1st Squadron followed by midmonth. The AVG went on the offensive, attacking Japanese air bases in Thailand. During one raid alone, AVG pilots destroyed more than 60 Japanese aircraft on the ground. On January 23, the Japanese again hit Rangoon with 72 aircraft. The AVG shot down 21, suffering only a single loss.

The air battles over the Burmese capital continued until March 9, 1942, when the city finally fell to Japanese ground attack. The Japanese captured the remainder of Burma in May, effectively cutting China off from ground access. For most of the rest of the war, the United States supplied China by air from India in the massive airlift that became known as flying "the Hump."

During the 10 weeks of combat for the AVG over Rangoon and the Burma Road, it only had between 5 and 20 operational fighters in Burma at any given time. Yet in 31 separate air battles, they destroyed a confirmed total of 217 Japanese aircraft and probably had 43 more kills (victories). In the process, they lost 6 pilots and 16 P-40s. Fighting alongside the AVG, the RAF had 74 confirmed kills and 33 probable kills, losing 22 Buffaloes and Hurricanes.

Burma Road

Important route by which the Western Allies sent supplies to China. The Burma Road followed an ancient trail traveled by such legendary warriors and adventurers as Kublai Khan and Marco Polo as well as anonymous spice

and tea traders. In the early 20th century, Chinese laborers transformed the path into a road. The route was further improved between 1937 and 1938 during the Sino-Japanese War. The completed Burma Road stretched approximately 700 miles from Lashio in Burma, then a British colony (now Myanmar), to Kunming, capital of China's southwestern Yunnan Province. The Chinese shipped military supplies from the Irrawaddy River ports at Rangoon (Yangon) on the railroad to Lashio for transportation to China via the Burma Road.

When Japanese forces occupied Indochina and China's coastal areas, the interior route became more heavily traveled. The narrow, twisting Burma Road crossed through jungle, plateaus, mountainous terrain as high as 11,000 feet above sea level, gorges, rivers, and valleys. Steep grades, dangerous switchbacks, and plummeting drops challenged those who traveled it.

Allied transportation of military supplies from Burma via the road was disrupted when Japanese forces seized its southern end in April 1942. Hoping to delay a Japanese invasion, Chinese troops destroyed the Salween River Bridge and 25 miles of the adjacent Burma Road passing through the river's canyon. China was now isolated from Allied aid and faced perhaps its gravest crisis of the entire war. The United States responded by initiating cargo flights over the Himalayas. The cargo capacity of such flights over "the Hump" was severely limited, however, and the Western Allies feared that China might use its lack of military supplies as an excuse to conclude a separate peace with Japan. By September 1942, Allied forces gained control of some of the region, and Colonel Leo Dawson of the U.S. Army Corps of Engineers had command of road reconstruction. He directed a large group of Chinese engineers and approximately 30,000 local laborers.

A U.S. military convoy ascending the 21 curves of the Burma Road at Annan, China, on March 26, 1945. (National Archives)

In December 1942, U.S. combat engineers began building a road from Ledo in Assam, India, to Burma as an alternate route to bypass the Japanese-controlled sections. As of the autumn of 1943, Major General Lewis A. Pick directed work on the Ledo Road. By the next summer, builders had connected the Ledo and Burma Roads at Mongyu, Burma, and military transport expanded. The two roads, known collectively as the Stilwell Road, were 1,079 miles in length. The road was named after U.S. lieutenant general Joseph W. Stilwell, commander of all U.S. Army forces in the China-Burma-India theater.

Ultimately, some 28,000 U.S. and British engineers and 35,000 Burmese, Chinese, and other ethnic laborers surveyed, cleared, cut rock, widened, and repaired the Burma Road and built bridges. They also constructed a pipeline paralleling the road. Monsoon winds and the rainy season caused muddy

conditions, and workers were plagued by red ants and mosquitoes that transmitted malaria. The strenuous work resulted in more than 1,000 deaths.

The previously Japanese-held parts of the Burma Road were reopened by mid-January 1945, with Pick leading a convoy. By August 1945, 120,000 tons of material and 25,000 vehicles had been transported on the Burma Road.

Following World War II and the Chinese Civil War, parts of the Burma Road fell into disrepair. The road was also altered by the building of more direct routes, and in places, it was improved with easier grades. In some spots, it was widened to as many as six lanes.

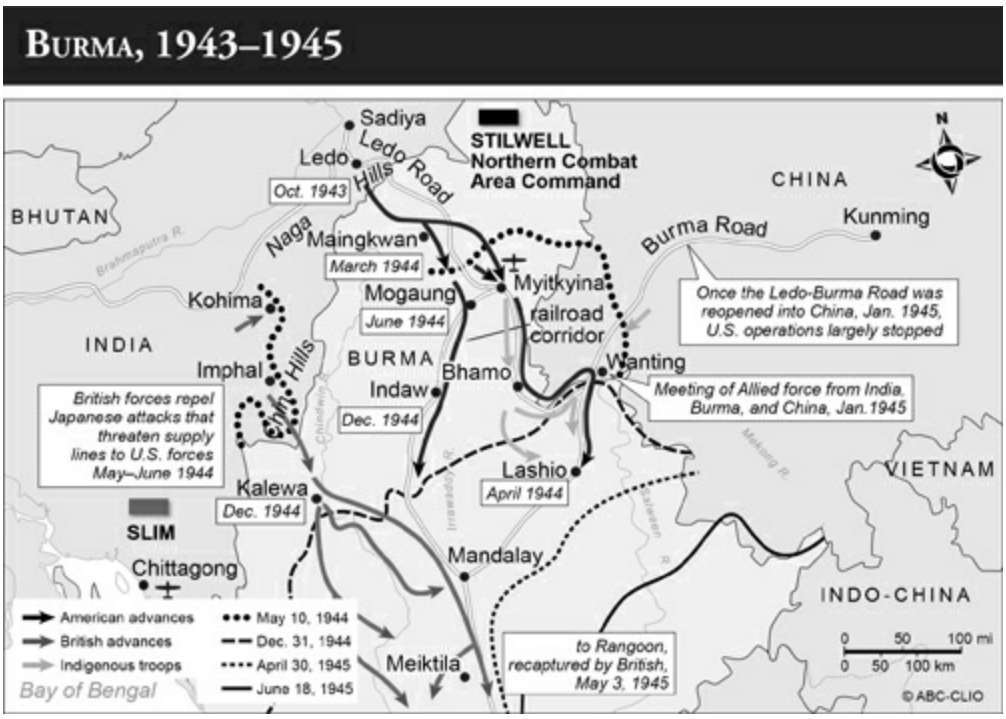
Burma Theater (1941–1945)

As part of Japan's southern offensive in the aftermath of its December 7, 1941, attack on Pearl Harbor, its forces landed on the Kra isthmus and moved down Malaysia to take the great British naval base of Singapore. Thereafter, Japan repositioned forces used in the attack on Malaysia and moved into Burma (Myanmar) to threaten the British in India. The location and topography of Burma helped determine that it would be a minor theater of action in World War II. As with much of Southeast Asia, the country features mountains and rivers running mostly north and south, and thus it presented

difficult topographical barriers for the Japanese forces advancing from east to west and for the British seeking to move from west to east. Terrain, climate, and disease remained formidable obstacles.

Despite these problems, the Japanese sought to secure Burma to cut the so-called Burma Road and further the isolation of China and to bring about an end to the Sino-Japanese War as well as to stir up nationalist opposition to the British in India. The British government, meanwhile, sought to keep China in the war and contain Japanese military forces sufficiently to the east to prevent them from encouraging Indian nationalist sentiment.



On December 8, 1941, Japanese lieutenant general Iida Shōjirō sent the 33rd and 55th Divisions that comprised his Fifteenth Army into Thailand. Then on January 20, 1942, Iida's reinforced divisions, with air support, crossed into Burma, driving west toward Moulmein and Tavoy. The Japanese had some success in mobilizing Burmese nationalists (notably Aung San) to their cause, promising them independence from British rule. Some uprisings occurred against the British.

The British defenders, initially commanded by Lieutenant General Thomas Hutton, believed that the difficult terrain would limit the Japanese to roads and cleared areas. The British suffered early and serious defeats

because of this mistaken preconception. On January 30–31, 1942, the Japanese drove Hutton's ill-equipped force—equivalent to two understrength divisions of British, Indian, and Burmese troops—from Moulmein, inflicting heavy casualties in the process. The faster-moving Japanese then forded the Salween River and outflanked the British left. In the February 18–23 Battle of the Sittang, they nearly surrounded Hutton's entire force, destroying 12 British battalions and virtually all heavy equipment.

On March 5, 1942, Lieutenant General Sir Harold Alexander arrived in Rangoon (Yangon) and took command from Hutton but without markedly different results. Reinforcements from India restored British strength to two small divisions, but Alexander knew that he could not hold back the Japanese, and on March 7 after hard fighting, he abandoned Rangoon and vast storehouses of supplies to the advancing Japanese; Alexander barely evaded capture. The Japanese occupied Rangoon the next day.

At that point, the understrength Nationalist Chinese Fifth and Sixth Armies, nominally commanded by U.S. lieutenant general Joseph Stilwell, entered northern Burma along the Burma Road to help the retreating British. The British held the right (southern) side of a rough defensive line across Burma; the two Chinese armies held the center and left. Major General William Slim, who arrived in Burma in mid-March, took command of the Burma Corps, as the British units were titled. Slim turned out to be one of the top field commanders of the war. The British continued to move along roads, however, and the Japanese continued to move along jungle trails and thus were able to outflank and defeat them.

A Chinese machine gun crew in their gun pit in the Burmese jungle, March 1942. (Library of Congress)

Iida made plans to attack first at Yenangyaung. He intended to occupy the Chinese Fifth Army, leave the Sixth Army to the east alone, and then mass against the Burma Corps at Yenangyaung to secure the oil fields there.

On March 21, 1942, the Japanese struck the Fifth Army at Toungoo, cutting off the entire Chinese 200th Division. Chinese counterattacks under Stilwell, supported by Slim's British troops, allowed the 200th Division to fight its way free. Allied forces were slowly driven back, however. Although both Chinese armies at times fought well, they and the British did not cooperate effectively. Both sides were then reinforced, leading to a temporary pause in the fighting. The addition of part of the Chinese Fifty-Sixth Army permitted Stilwell to strengthen his defense of the Rangoon-Mandalay Railroad. Slim and Stilwell now laid plans for a counteroffensive, but Iida had also been reinforced, in the form of two additional divisions freed up by the surrender of Singapore.

The Japanese struck first, attacking the Burma Corps, defending Yenangyaung, and holding elsewhere. In the ensuing Battle of Yenangyaung (April 10–19, 1942), the Japanese temporarily trapped the Burma 1st Division, but British counterattacks, supported by pressure from the Chinese

38th Division on the Japanese flank, allowed the 1st Division to escape. At this point, the Japanese 56th Division surprised the Chinese Sixth Army in the Loikaw-Taunggyi area and defeated it. On April 29, troops of the Japanese 56th Division entered Lashio and cut the Burma Road to China. Alexander now ordered his troops to withdraw across the Irrawaddy River.

General Slim continued to retreat under heavy Japanese pressure until he reached the Indian border and Imphal, with the Japanese pursuit halting at the Chindwin River. Meanwhile, the Chinese Sixth Army largely disintegrated under Japanese attacks, and other Chinese forces withdrew into Yunnan.

The rainy season beginning in May brought a welcome lull in operations for both sides. The Japanese now occupied four-fifths of Burma and needed time to organize their vast gains there and elsewhere, and the British wanted the respite to prepare a defense of eastern India. The cost of the fighting had been high, particularly for the British. A Japanese army of 50,000 men had beaten 40,000 British and Indian troops and inflicted on them some 30,000 casualties. The Japanese had also defeated 95,000 Nationalist Chinese troops, and only Major General Sun Liren's (Sun Li-jen) 38th Division withdrew as a fighting unit. At the same time, the Japanese had suffered only some 7,000 casualties themselves.

Allied air support had been largely ineffective. Colonel Claire Chennault's American Volunteer Group (AVG), known as the Flying Tigers, and Royal Air Force (RAF) fighters did what they could, claiming a high kill ratio against Japanese aircraft. But a surprise Japanese raid on Magwe on March 21, 1941, destroyed most British and American planes there and forced the RAF to withdraw to airfields in India. Although the RAF and the Flying Tigers continued to try to assist the withdrawing Allied troops, ground-air communications were poor, and the long distance from their airfields limited the time over target and thus rendered their efforts largely ineffective.

The arrival of long-range Spitfires for the RAF helped somewhat, and in June 1942, with land resupply to China through Burma no longer possible, Stilwell, now commanding the China-Burma-India theater, began aerial resupply by transport aircraft flying from airfields in northeastern India to Kunming. The planes were forced to fly over the eastern Himalayas, known to the American pilots as "the Hump."

British general Archibald Wavell, now commanding in India, worked to

prepare defenses against a possible Japanese invasion of that country from Burma. Wavell realized that it would be a year or more until he would have trained troops and sufficient matériel to assume the offensive, but at the same time, he worried about the effects of inaction on British, Indian, and Burmese morale. As a consequence, he decided to conduct a limited offensive action during the 1942–1943 dry season. Accordingly, in December 1942 the British launched a counterattack by the Indian 14th Division and British units against Arakan, the northwest coastal province of Burma and an area largely separated from the rest of the country by rugged mountains. Although the Japanese there were badly outnumbered, the 14th Division moved too slowly, allowing the Japanese to build up their strength and fortify.

Iida rushed in reinforcements, and in March 1943 troops of the Japanese 55th Division went on the offensive and worked their way over the mountains to hit the British in the flank and force their troops back to India by May. The British had again been proven wrong in their assumption that the Japanese would stick to existing roadways.

Meanwhile, Brigadier Orde Wingate secured Wavell's approval to try "long-range penetration attacks" with his Indian 77th Brigade, known later as the Chindits (their emblem was a *chinthe*, a mythical Burmese beast resembling a lion, and they operated beyond the Chindwin River). This move was a British effort to try to beat the Japanese at their own game in using infiltration tactics. The Chindits would operate deep behind enemy lines in an effort to damage Japanese communications, destroy supplies, and sow confusion. The force of 3,000 Chindits would rely entirely on aerial resupply for food, clothing, medicines, and arms.

The first Chindit raid began with a crossing of the Chindwin River in February 1943. The force managed to cut sections of the Mandalay-Myitkyina and Mandalay-Lashio railroads, and in mid-March they crossed the Irrawaddy River. This brought major Japanese reaction, forcing a Chindit withdrawal in April. Newspapers in the Allied countries claimed a great victory, but the raid had been a failure militarily. The damage to Japanese troops and positions was slight, and the raiders lost half of their force.

Although the British fared poorly on land, the Royal Navy continued to control the Indian Ocean, which was immensely important for the long supply lines to the Middle East and to the Soviet Union. Meanwhile, to secure the loyalty of Indian nationalists, the British held out the promise of

sovereignty after the war. The major Allied problems in the Burma theater remained the nearly complete lack of cooperation between the British and Chinese strategists, the inability to cope with Japanese tactics, and inadequate resources and supplies for a fighting front far down the Allied priority list.

Stilwell now mounted a drive into northern Burma. In February 1943, he committed the American-trained reconstituted Chinese 38th Division in upper Assam on the Burma-India border, where U.S., Chinese, and Indian engineers were building a road from Ledo. The 38th Division drove the few Japanese from the area. In late October, having secured the reluctant support of General Wavell and the agreement of Chinese Nationalist leader Jiang Jieshi (Chiang Kai-shek) to employ his forces to reopen a land route to China, Stilwell committed the 38th Division south into the Hukawng Valley, where it was resupplied entirely by air. At the same time, the Chinese 22nd Division moved up from Ramgarh to Ledo. Meanwhile, Stilwell pushed construction of the road from Ledo.

In late November, Japanese forces struck the 38th and subjected it to punishing attacks, completely cutting off some of its units. U.S. aerial resupply prevented the Japanese from overrunning the troops, however. At the end of December, Stilwell arrived, along with light artillery, and the Chinese then counterattacked, driving the Japanese from the Hukawng Valley.

During January and February 1944, there was stalemate in the Hukawng Valley. Japanese major general Tanaka Shinichi’s 18th Division halted the advance of the Chinese 38th and 22nd Divisions. The Chinese resumed their advance in late February.

Much of the rest of Burma had remained quiet throughout 1943. In a considerable engineering feat, the Japanese built a 250-mile railroad across Burma, in the process employing as slave labor British prisoners captured at Singapore and some American captives. The Japanese utilized the railroad to mass supplies for an attack on eastern India. On August 1, 1943, they also granted Burma its “independence,” although this step did not resonate sufficiently with the Japanese-installed Burmese government to enable Japan to fully exploit Burmese rice and petroleum resources.

The Japanese reorganized their forces in Burma, which were under the overall command of the Southern Resources Area commander, Field Marshal Count Terauchi Hisaichi, in Saigon. In March 1943, Lieutenant General

Kawabe Masakazu had assumed command from General Iida of the six Japanese divisions in Burma. Kawabe had direct supervision of the two divisions in southwest Burma; the other four Japanese divisions were in the north under Lieutenant General Mutaguchi Renya. Kawabe directed Mutaguchi to invade eastern India with three of his divisions, and toward that end the Japanese amassed some 100,000 troops. The Japanese intended to seize the Imphal-Kohima Plain of Manipur, the logical British staging area for an invasion of Burma from central India. Their second major goal was to take and hold the rail line into Assam that passed through Manipur. Along it flowed most of the supplies that were ferried into China as well as those destined for Stilwell's divisions in north Burma.

On the night of February 3, 1944, the Japanese attacked in the south, and once again they surprised the British with the size and speed of the assault. But the now experienced British and Indian troops held their positions even when surrounded and did not surrender their supply dumps, which the Japanese needed to support their advance. British and U.S. aircraft flew supplies to the defenders in Imphal, and other aircraft strafed the Japanese. General Slim also organized a relief column, drove it to Imphal, and broke the siege on June 22. After desperate fighting by both sides, the Japanese, short of supplies and facing the onset of the monsoon season, called off the attack, and the Fifteenth Army began to withdraw.

In October 1943, Vice Admiral Lord Louis Mountbatten had taken up his post as commander of the new South-East Asia Command, although command ambiguities remained. He and Slim agreed that British forces could not do much until the next dry season, although they were willing to organize some spoiling attacks to take pressure off a larger offensive sought by General Stilwell for his Chinese units. Wingate, now a major general and enjoying the full support of British prime minister Winston L. S. Churchill, planned a second and even more audacious raid for his Chindits that would include three brigades supported logistically by the U.S. Army Air Forces. The operation involved 25,000 men, of whom 3,000 were Americans. Led briefly by Brigadier General Frank Merrill, the 5307th Composite Unit (Provisional) was known popularly as Merrill's Marauders.

The March 1944 raid began with high promise, but the venture was doomed because its success rested on the active participation of Chinese divisions. These forces were being husbanded by Jiang Jieshi, who drove his

chief of staff, Stilwell (also commanding all U.S. forces in the China-Burma-India theater), to distraction. In secret instructions to his generals, Jiang sharply limited Chinese military involvement, which in any case proved ineffectual.

Another factor that contributed to the failure of the raid was the death of Wingate in a plane crash in India on March 24, whereupon Stilwell controlled operations. Wingate and Stilwell were much alike—both eccentric and dynamic—but they seldom disclosed their intentions, and as a result there were serious failures in planning and staff work. Stilwell, in fact, disliked the British and did not use the Chindits effectively. Nor did he understand the difficulties facing guerrilla forces while dependent on aerial resupply but operating as conventional units.

The Japanese, heavily outnumbered in the air and lacking other modern weapons, fought back with considerable tenacity. Finally, the monsoon rains that began in mid-May slowed the offensive and brought more malaria. By June, the chief Allied enemies were not the Japanese but exhaustion, malnutrition, and disease. Although the raid inflicted 50,000 Japanese casualties against only 17,000 for the British, Allied forces were obliged to withdraw from Burma in July. Since it was ultimately unsuccessful, the 1944 Burma Campaign has remained a controversial subject. Unfortunately for all involved, it had no practical effect on the outcome of the war.

The lack of Chinese support in this operation displeased U.S. leaders, who had hoped that Nationalist armies would tie down the Japanese forces. Jiang, however, seemed more preoccupied with building up his own strength so he could do battle with his domestic opposition, the Chinese Communists, after the war. Washington’s realization that it could not count on Jiang to fight the Japanese resulted in increased support for forces under Admiral Chester Nimitz in the Central Pacific and General Douglas MacArthur in the Southwest Pacific.

As the Japanese offensive ended, the Allies began their own offensive in October 1944, with the British largely in support of a Chinese attack. Stilwell employed five American-trained and -equipped Chinese divisions to take Myitkyana. Opposing them was the Japanese Thirty-Third Army, composed of three depleted divisions commanded by Lieutenant General Honda Masaki. Stilwell hoped to be able to trap the Thirty-Third Army between the five divisions in Burma and the Y-Force in Yunnan.

However, Stilwell's poor relationship with Jiang and the situation in China after the Japanese attacked to remove the threat of U.S. strategic bombers there led Jiang to demand that Washington replace Stilwell. This change occurred on October 18, with Stilwell succeeded by Lieutenant General Daniel Sultan. Jiang's recall of two of the Chinese divisions from Burma to help stop the Japanese offensive in southern China brought the Chinese offensive against the Japanese in Burma to a halt in December.

By the fall of 1944, the Allied position in Burma had improved considerably while the Japanese position had weakened, reflecting the relative fortunes of each side in the larger conflict. General Slim followed up his successful relief of Imphal, and in October the British crossed the Chindwin River. The new Japanese commander in Burma, Lieutenant General Kimura Heitaro, had 10 divisions. He wanted to let the British advance in the center and outrun their supplies; then, he would counterattack to cut off and surround the British. This approach set the stage for the climactic battles of 1945.

In December 1944, the Allies assumed the offensive in the south (assisted by landing craft no longer needed for the invasions of France), in the center, and from China in the north. The southern advance required crossing many rivers and canals, and the going was naturally rather slow, although the Anglo-Indian forces regained the port of Akyab and Ramree Island as Kimura withdrew. Meanwhile, two Chinese divisions advanced into northern Burma, reopened the Burma Road against negligible Japanese resistance, and seized Lashio in early March.

The chief battle took place in central Burma. Slim figured out Kimura's plan and, with great fanfare, dispatched forces to cross the Irrawaddy River while sending several divisions quietly to the south to outflank the Japanese, cut their line of communications and retreat, and possibly take the entire Japanese force defending central Burma. Advancing on a 140-mile front, the British captured Meiktila on March 4. They took Mandalay two weeks later while repulsing a simultaneous Japanese counterattack against Meiktila.

Slim sought to gain Rangoon while the roads and rice paddies were still sunbaked, dry, and hard. On May 3, a combined amphibious, land, and airborne attack recaptured the capital city, and the fighting largely came to an end. Most Japanese troops fled to neighboring Thailand.

Burns, Eedson Louis Millard (1897–1985)

Canadian Army lieutenant general. Born in Westmount, Quebec, on June 17, 1897, Eedson Louis Millard Burns attended the Royal Military College at Kingston, Ontario. During World War I, he served with the engineers and signalers and was wounded twice. He received the Military Cross, and ended the war as the youngest staff captain in the Canadian Expeditionary Force.

Burns remained in the army after the war and advanced steadily. He studied at the School of Military Engineering at Chatham in 1920, served as an instructor at the Royal Canadian Military College (1924–1926), was

assigned to the Geographic Section of the General Staff (1931–1936), and attended the Staff College at Quetta (1928–1929). He was promoted to brevet lieutenant colonel in 1935. Burns was a prolific writer, authoring numerous articles in the *Canadian Defence Quarterly* and H. L. Mencken's *American Mercury*.

When World War II began in Europe, Burns was studying at the Imperial Defence College. He was assigned from there to the General Staff under Brigadier Henry Crerar at Canadian Military Headquarters, London. When Crerar was posted as chief of the Canadian General Staff, Burns accompanied him as special assistant and then became assistant deputy chief of the General Staff. He was posted to the General Staff with the Canadian Corps in Britain in February 1941.

Burns was then promoted to brigadier and took command of a brigade in the Canadian 4th Armoured Division. He then commanded the Canadian 2nd Infantry Division and the Canadian 5th Armoured Division, being promoted to major general in January 1944. He took command of the Canadian I Corps in Italy in March 1944.

Burns's first task was to pierce the Hitler Line across the Liri Valley. The May 1944 attack started out well, but casualties soon began to mount, and movement was hampered both by inexperience at lower levels of command and by traffic jams. Burns received the blame and was rated poorly by Lieutenant General Sir Oliver Leese, commanding the British Eighth Army. Burns's leadership style made his subordinates uncomfortable. This included his dismissal of suggestions and use of sarcasm as well as his preoccupation with trivial matters of troop dress and discipline.

In August and September 1944, the Canadian I Corps played a major role in breaking the Gothic Line, for which Burns received much praise. This success did not save him, however, and when the advance stalled in the mud, the old complaints resurfaced. Lieutenant General Charles Foulkes replaced him in November 1944.

Burns served the rest of the war commanding all Canadian rear-area units of 21st Army Group. After the war, he worked with the Department of Veterans Affairs until 1954, when he took command of the United Nations Truce Supervisory Organization operating along the Israeli-Arab borders. Burns was promoted to lieutenant general in 1958 and retired the following year. He died at Manotick, Ontario, on September 13, 1985.

Burress, Withers Alexander "Pinky" (1894–1977)

U.S. Army lieutenant general. Born in Richmond, Virginia, on November 24, 1894, Withers Alexander Burress graduated from the Virginia Military Institute in 1914, where he received the nickname "Pinky," and was commissioned in the infantry two years later. During World War I, he served in the 2nd Division in the American Expeditionary Forces. Burress graduated from the Command and General Staff School in 1931 and the Army War College in 1935. An excellent instructor, he served in that capacity at the Infantry School for two years (1920–1922) and again at the Command and General Staff School from 1931 to 1933. In 1935, he returned to the Virginia Military Institute as a Reserve Officers' Training Corps instructor and subsequently as commandant, remaining there until 1940.

In 1940, Burress joined the G-3 (training) section of the General Staff, with special responsibility for raising and training troops as wartime pressures suddenly caused a huge expansion in the army. From October 1941 to early 1942, Colonel Burress was assistant commandant of the Infantry School, Fort Benning, Georgia. He was promoted to brigadier general in March 1942 and assigned to the Puerto Rican District on its activation in August 1942, at which time he was promoted to major general. He then commanded and trained the 100th Infantry Division. That division landed at Marseille, France, in October 1944 and fought in the difficult Vosges Mountains Campaign (including the sustained winter siege and assault on the

Maginot fortress at Bitche), winning a further spectacular victory at Heilbronn in early 1945 and pressing on to Stuttgart.

From September 1945 to 1946, Burress commanded VI Corps. He commanded the Infantry School at Fort Benning from 1948 to 1951, I Corps from 1951 to 1953, and the First Army from 1953 to 1954. He retired as a lieutenant general in 1954. Burress died in Arlington, Virginia, on June 13, 1977.

Busch, Ernst (1885–1945)

German Army field marshal. Born in Essen-Steele in the Ruhr July 6, 1885, Ernst Busch graduated from Gross-Lichterfelde Cadet Academy in 1904 and joined the Westphalian 13th Infantry Regiment as an officer candidate. Commissioned a second lieutenant in the 57th Infantry Regiment in 1908, he was promoted to first lieutenant and attended the War Academy in 1913. Busch spent most of World War I on the Western Front commanding infantry. Promoted to captain in 1915, he became a battalion commander in the 56th Infantry Regiment and fought in numerous battles, including Verdun, and was awarded the Pour le Mérite.

Retained in the German Army after the war, Busch held various staff billets. He was promoted to major in 1925 and to lieutenant colonel in 1930. After serving as a battalion commander in the 9th Infantry Regiment, he rose to colonel and assumed command of that regiment in 1932.

Busch became an enthusiastic follower of Adolf Hitler and Nazism. Promoted to major general, Busch took command of the 23rd Infantry Division in 1935; two years later, he was promoted to lieutenant general.

Busch was rewarded for his unflagging support of Hitler during the 1938 Blomberg-Fritsch crisis by being promoted to general of infantry and given command of VIII Corps.

In the September 1939 invasion of Poland, Busch's VIII Corps formed the left flank of Army Group South, taking Kraków, advancing along the Vistula River, and ending the campaign at L'viv (Lvov). Given command of Sixteenth Army for the May 1940 invasion of France and the Low Countries, Busch was assigned to cover the left flank of General of Panzer Troops Heinz Guderian's XIX Motorized Corps. In recognition of his service, Busch was promoted to colonel general.

During Operation BARBAROSSA, the German invasion of the Soviet Union in June 1941, Busch's Sixteenth Army covered the right flank of Army Group North on its drive to Leningrad. From 1942 to 1943, his army opposed numerous Soviet attacks and conducted the successful defense and relief of the Kholm and Demyansk pockets. Busch suffered no serious defeats, but after the initial push into the Soviet Union in 1941, he won no major victories.

Promoted to field marshal in February 1943, Busch assumed command of Army Group Center in October. Eight months later, in Operation BAGRATION, the Soviets destroyed his army group. Relieved of his command on June 28, Busch was retired but was brought back to command Army Group Northwest in March 1945 to oppose the Allied western advance into Germany. Busch died in British captivity at Aldershot, England, on July 17, 1945.

Bush, Vannevar (1890–1974)

U.S. scientist who was involved with the Manhattan Project to develop an atomic bomb. Born on March 11, 1890, in Everett, Massachusetts, Vannevar Bush earned both bachelor's and master's degrees in engineering at Tufts College before completing a joint doctorate at the Massachusetts Institute of Technology (MIT) and Harvard University. By 1932, he was dean of engineering at MIT.

During World War I, Bush designed a device utilizing magnetic fields to detect submarines. The navy deemed it worthless for combat, which affected Bush's attitudes regarding the relationship between science and government. He was interested in machinery that would automate thinking, and by 1931 he had built the first electronic analog computer to solve, at great speed, complex differential equations.

In 1938, Bush was selected as president of the Carnegie Institution in Washington, D.C.; his duties included advising the government on scientific research. He also was chairman of the National Advisory Committee for Aeronautics from 1939 to 1941. During World War II, he worked to establish relationships between scientists and government officials regarding research resources, especially those concerning defense work. He also emphasized the importance of technological innovation and proficiency to national security.

In June 1940, Bush presented President Franklin D. Roo-se-velt his ideas about the coordination of military research as a partnership of scientific, industrial, business, and government groups. This approach led to the establishment of the National Defense Research Committee (NDRC), with Bush as its director, in June 1941. In addition, Bush secured congressional funding to create the Office of Scientific Research and Development, which then oversaw the NDRC.

An adroit administrator, Bush became involved in significant technological developments, particularly in putting together a team for the Manhattan Project as well as improving radar and developing radio-guided bombs. He also recruited civilian scientists to work on military projects. His July 1945 report "Science: The Endless Frontier" advised President Harry S. Truman regarding governmental peacetime development of science and technology. The 1950 National Science Foundation incorporated many of

Bush's ideas for postwar science and government cooperation for basic research and education.

In 1945, Bush's *Atlantic Monthly* essay "As We May Think" discussed the hypothetical "memex," a machine capable of information storage and retrieval with associative linking. This automatic technology would enable humans to augment their memory technically. Computer engineers later stated that Bush's ideas influenced their digital development of hypertext and the Internet. Bush died at Belmont, Massachusetts, on June 28, 1974.

Bushido

Almost all accounts of World War II in the Pacific theater—both contemporary and those that have appeared since the war—note the tenacity of Japanese resistance, even after any hope of victory had vanished. The determination of individual Japanese soldiers to fight to the death was a hallmark of the bitter island battles of the Pacific theater. It perhaps found its most extreme expression in the kamikaze (divine wind) suicide aircraft attacks of Allied ships.

The explanation for the nature of this Japanese behavior lies partly in the intensely violent battlefield culture that developed in the Pacific and that deterred soldiers on both sides from surrendering, and partly in the extreme interpretation of the bushido warrior ethic that Japan's militarist rulers fostered within Japanese society.

Bushido was rooted in the value system of the samurai military caste that had dominated Japan from the 12th century to the middle of the 19th century.

It originated as a code that governed the conduct of the samurai. The term “bushido” translates as “the way of the warrior.” This warrior code was based on the concepts of Zen Buddhism, which combined warlike nature, and Confucianism, which instilled notions of the proper social hierarchy and correct social values. Bushido required loyalty above all else to the feudal lord, the daimyo. It placed bravery, honor, and personal loyalty above life itself. Ritual suicide (*seppoku*) was the respective alternative to dishonor or defeat.

Even though the political influence of the samurai declined following the Meiji Restoration in the late 19th and early 20th centuries, their cultural influence remained dominant. As the Japanese military and Japanese society modernized to keep Western political and economic influences at bay, the officers of the new military (many of whom were descended from samurais) gained positions from which they could dominate the value systems and culture of the new Japan.

They worked to indoctrinate rank-and-file servicemen and the wider society with the values of the ancient warrior caste. Loyalty to the divine figure of the emperor (only a figurehead in medieval Japan) took the place of loyalty to the daimyo. Their views found wide acceptance in the environment of cultural extremism that increasingly dominated Japan in the years after World War I.

The conscripted Japanese soldier of the 1930s and 1940s was raised in a society that emphasized worship of the divine figure of Japan’s emperor and glorified the way of the warrior. Training throughout the armed forces, but especially in the army, reinforced this cultural imperative. The training regimen was harsh and characterized by brutal treatment to enforce discipline throughout the command structure. Officers physically abused noncommissioned officers who, in turn, brutalized their enlisted men. Soldiers became hardened through a demanding program of rigorous physical training and long marches with heavy packs under the most adverse conditions.

Training stressed the offensive, with defensive tactics receiving limited attention. It emphasized the idea that in war, the soldier’s life belonged to the emperor, and thus, it was a great honor to die for him. A soldier shamed himself, his family, and the emperor if he did not fight to the death. Surrender or capture meant disgrace. Parallel to the glorification of death over surrender

was the castigation of American and Western culture as materialistic, impure, and soft.

This bushido-based training and indoctrination produced an army of tough, fatalistic soldiers who were fiercely determined on the attack and tenacious in defense. Although they were never the invincible jungle warriors that many Allied soldiers believed them to be early in the Pacific war, the Japanese proved adept at cover and concealment, infiltration, and the construction of strong defensive positions. At the same time, they lacked individual initiative and tended to choose death in a suicidal banzai charge or remain in an untenable defensive position when retreat would have saved their lives and enabled them to fight another day.

The brutal training and indoctrination, the glorification of death, and the vilification of Western culture also led to horrific treatment of Allied prisoners of war and civilian populations in Japanese-occupied territory that intensified hatred of Japan throughout Asia and in the Allied nations. The brutal Japanese treatment of Allied prisoners was a reflection of bushido. Because the Allied soldiers and occupied peoples had not fought to the death, they were deemed to be cowards and unworthy of honorable treatment.

The determination of Japanese soldiers to die fighting and their brutality and ruthlessness in battle translated into vicious no-quarter combat on dozens of Pacific islands and throughout East Asia. Patterns in Japanese resistance changed, however, as the war continued. Initially, Japanese responses to American landings on Pacific islands relied on the offensive. Their approach was to attack and destroy the beachhead before it could be consolidated. The result was frequent reckless and wasteful banzai charges that inevitably failed against overwhelming American firepower.

Following the disastrous loss of the Marianas islands of Guam, Saipan, and Tinian, Japanese strategists realized that victory was no longer possible. Their priorities then shifted to the defensive and the inflicting of unacceptable casualties on Allied forces, thereby forcing the United States and Britain into negotiations. On Peleliu, Iwo Jima, and Okinawa and in the Philippines, American soldiers and marines had to fight costly actions to root the Japanese out of stout fortifications. At sea, Allied ships faced suicide attacks from kamikazes, Japanese planes loaded with explosives that crashed into American and British vessels. This tactical shift notwithstanding, the

principles of the bushido code remained in place. Japanese soldiers were expected to die in place, killing as many Allied soldiers as possible.

As a result of this tactical shift, American casualty rates soared in the last year of the Pacific war. Japanese soldiers proved their willingness to endure unimaginable conditions and to choose death when there was no longer any chance for victory. Their suicidal resistance, however, did not have the desired effect. Instead, their adherence to the principles of bushido only served to reinforce the American decision to use the atomic bomb in August 1945 to force Japan's leaders to surrender.

Byrnes, James Francis (1879–1972)

U.S. politician, wartime "assistant president" to Franklin D. Roosevelt, and secretary of state from 1945 to 1947. Born on May 2, 1879, in Charleston, South Carolina, James Francis Byrnes studied law. After qualifying as a lawyer, he won election to Congress in 1910, and in 1931 he became a senator for South Carolina. A longtime friend of President Roosevelt, Byrnes used his considerable negotiating talents to steer New Deal legislation through Congress from 1933 onward. In 1941, Roosevelt appointed him to the U.S. Supreme Court.

Sixteen months later in 1942, Byrnes left the Supreme Court to head the new Office of Economic Stabilization. The following year, he became

director of the Office of War Mobilization (from 1944, the Office of War Mobilization and Reconversion). In domestic policy, Byrnes, often called the "assistant president," exercised powers second only to those of Roosevelt himself. Responsible for coordinating all domestic war agencies and federal government departments, Byrnes worked closely with both Congress and the bureaucracy to devise the most efficient arrangements to implement the war effort.

Passed over as Roosevelt's vice presidential running mate in 1944, Byrnes, already considered a hard-liner on the Soviet Union, attended the February 1945 Yalta Conference of the "Big Three" Allied leaders. Returning to Washington, he successfully lobbied Congress to support the outcome of Yalta, deliberately glossing over outstanding contentious issues dividing the Soviet Union and its allies. Still disappointed over the 1944 election, he resigned in March 1945.

On Roosevelt's death one month later, Vice President Harry S. Truman became president. Truman immediately appointed Byrnes as head of a top-secret committee on the employment of atomic weapons, then in their final stage of development, whose existence Byrnes recommended be kept secret even from U.S. allies until their first use in combat. He believed that U.S. possession of the bomb would make Soviet behavior more malleable.

In July 1945, Truman named Byrnes secretary of state. Attending the July 1945 Potsdam Conference, Byrnes hoped that the speedy employment of atomic weapons against Japan would prevent the Soviet Union from entering the Pacific war and enhancing its influence in Asia. He also helped to reach a compromise agreement on German reparations. Returning to Washington, he took part in drafting the Japanese surrender agreement in August, implicitly agreeing to retain the emperor.

As Soviet-U.S. relations became more strained after the war, Byrnes sought for several months to negotiate compromise solutions, traveling extensively to meet with other foreign ministers outside the United States. In early 1946, political complaints that he was too conciliatory led Byrnes to assume a harsher rhetorical stance toward the Soviet Union. Even so, in January 1947 Truman—increasingly irked by Byrnes's policies, his secretive diplomacy, and his condescending attitude—made George C. Marshall secretary of state in his stead.

Byrnes returned to South Carolina and wrote his memoirs. In 1948, he

broke with Truman over the issue of civil rights. Subsequently, Byrnes served two terms, from 1951 to 1955, as governor of South Carolina, defending segregationist policies. He died in Columbia, South Carolina, on April 9, 1972.

C

Cairo Conference (November 23–26 and December 3–7, 1943)

Code-named Sextant, this two-part conference was held in Cairo, Egypt, during November and December 1943 to discuss military strategy and postwar settlements. The primary participants were U.S. president Franklin D. Roosevelt and British prime minister Winston L. S. Churchill. The meetings in Cairo took place before and after a meeting that brought together Roosevelt, Churchill, and Soviet leader Joseph Stalin at Tehran. The Tehran Conference (code-named Eureka) proved necessary after Stalin refused to attend Sextant because a Chinese delegation, headed by Jiang Jieshi -(Chiang Kai-shek), was to participate. Because the Soviet Union was not then at war with Japan, Stalin did not want to attend or allow any other Soviet representative to take part in Sextant. Churchill had doubts about a meeting with Jiang, too, for he regarded China as a sideshow until the war in Europe was won. Roosevelt, however, envisioned China as a fourth great power after the war. In addition to large American, British, and Chinese delegations, Lord Louis Mountbatten, supreme commander of the Allied Southeast Asia Command, attended Sextant with his own delegation.

Roosevelt traveled across the Atlantic in the battleship *Iowa* and met with General Dwight D. Eisenhower in Algeria before flying on to Cairo, where he met with Jiang. At the Cairo Conference, Roosevelt, Churchill, and Jiang restated their determination to fight on until the war was won. Jiang pressed for an amphibious operation in the Bay of Bengal to coincide with Chinese participation in the fighting in Burma. Roosevelt initially agreed to this plan but was forced to withdraw his pledge following discussions at Tehran.

The Allied leaders announced at the Cairo Conference that after the war, Japan would be reduced to the territories it held before World War I. China would regain Manchuria, the Pescadores Islands, and Formosa, and Korea would, “in due course,” be restored to independence. In the meantime, a joint

U.S., Chinese, and Soviet trusteeship would hold sway in Korea, an arrangement that might last for 40 years. The mandated Japanese islands would, in all probability, pass to U.S. control, and it was implied that the Soviet Union would regain South Sakhalin Island (lost in the 1904–1905 Russo-Japanese War) and secure the Kuriles (which had never been Soviet territory). Stalin also wanted a warm-water port for the Soviet Union, probably at Dairen, Manchuria.

The second part of Sextant, which followed the Tehran Conference, included discussions with Turkish president Ismet Inönü in an effort to draw his country into the war on the Allied side. In addition, Roosevelt informed Churchill of his decision to appoint General Eisenhower to command the Normandy Invasion.

Calabria, Battle of (July 9, 1940)

Mediterranean air and naval battle fought between the British and Italians off the Calabrian coast of Italy on July 9, 1940. The engagement is known to the Italians and Germans as the Battle of Punta Stilo. Beginning on the evening of July 6, 1940, the Italians dispatched a large convoy from Naples to Benghazi (Libya). At the same time, the British commander in the Mediterranean, Vice Admiral Andrew B. Cunningham, sent two small convoys with numerous civilians on board being evacuated from Malta to Alexandria, Egypt.

On July 7, the Italians learned of the British ship movements and immediately sent naval units from several bases to sea. Vice Admiral Inigo Campioni had command, concentrating the ships in the Ionian Sea. Campioni had the modernized but small battleships *Cesare* and *Cavour*, with 12.6-inch guns; 6 heavy and 10 light cruisers; and 41 destroyers and torpedo boats. Also at sea but scattered throughout the Mediterranean were 25 Italian submarines.

Cunningham planned to cover the convoys with his naval force at Alexandria, consisting of the battleships *Warspite* and *Malaya* and the unmodernized *Royal Sovereign*, all armed with 15-inch guns; the aircraft carrier *Eagle;* 5 light cruisers; and 23 destroyers. Vice Admiral Sir James Somerville sortied from Gibraltar with Force H as a feint, which resulted in the loss of a destroyer to an Italian submarine and some minor splinter damage from high-altitude Italian bombing.

Following the safe arrival of the Italian convoy at Ben-ghazi, Campioni decided to try to intercept the British convoy and its escorts steaming from Alexandria, Egypt. He hoped that by the time of the naval encounter, the Italian Air Force would have been able to damage the British ships as they approached the Italian coast. Indeed, more than 100 Italian aircraft conducted attacks on the British ships, but the high-level bombing did little damage; all but one bomb missed. The bomb that hit its target damaged the light cruiser *Gloucester*, and a near-hit caused damage to the carrier *Eagle*, keeping it from participation in the air attack on Taranto four months later. The Italian planes also carried out several attacks in error on their own warships, again with no result.

Meanwhile, Cunningham was maneuvering to position his ships to block the Italian fleet from returning to Taranto. The *Eagle* launched several air attacks. Although not hitting any Italian ships, these attacks disrupted their movement, and British fighters did shoot down and chase off Italian reconnaissance aircraft. As a consequence, by the morning of July 9, the Italians were not cognizant of the exact location of the British force, whereas the British had fairly reliable information on the location of the Italian ships.

The battle opened on the afternoon of July 9 as the two fleets at last came into contact and lasted nearly two hours. The fight was initially a long-range cruiser gunnery duel, resulting in no damage to either side, although the British salvo spreads tended to be much tighter than those of the Italians.

As the Italian battleships came into action, they were opposed by Cunningham's flagship, the *Warspite*, fastest of the three British battleships. In the ensuing action, three British 6-inch shell hits on the Italian heavy cruiser *Bolzano* and one 15-inch shell hit on the *Cesare* slowed both and compelled the Italian main force to retire. The fact that three British battleships had outgunned the entire Italian fleet deeply affected Italian tactics.

As the Italian main force pulled back, both sides ordered their destroyers forward. At long range, the Italians fired torpedoes through their smoke screens but registered no hits. The ships in the Italian fleet then retired to their home ports. The Germans later criticized the Italians for not having launched night torpedo attacks with their numerous destroyers.

On July 10, the *Eagle* mounted an air strike on Augusta, Italy. An Italian destroyer was sunk (it was later raised and repaired), and an oiler was

damaged. Meanwhile, the British Malta convoys arrived safely at Alexandria.

The Battle of Calabria raised British morale, for the Royal Navy had successfully engaged a numerically superior enemy force close to its own coast. The Italians' failure could be traced to poor coordination between their air and naval assets. The Italians also came to realize the ineffectiveness of high-altitude bombing against warships maneuvering at high speed and firing back. The battle also demonstrated the fallacy of the decision made by Italian dictator Benito Mussolini and his navy to completely embrace land-based aviation at the expense of aircraft carriers. Thereafter, Italian naval leaders were reluctant to commit major naval units beyond the range of their land-based aircraft.

Callaghan, Daniel Judson (1890–1942)

U.S. Navy rear admiral. Born on July 26, 1890, in San Francisco, Daniel Judson Callaghan graduated from the U.S. Naval Academy at Annapolis in 1911. He served chiefly on destroyers, commanding one in 1916 before becoming the engineering officer of a cruiser during the last two years of World War I.

Following that war, Callaghan served on battleships and cruisers as a gunnery and operations officer. Known as an excellent staff officer, he became naval aide to President Franklin D. Roosevelt in July 1938, a post he feared would hamper his chances of becoming an admiral. Callaghan

returned to sea duty in the spring of 1941 as the captain of the cruiser *San Francisco,* which was at Pearl Harbor on December 7, 1941, but was undamaged in the Japanese attack.

In April 1942, Callaghan was promoted to rear admiral and in June became chief of staff to the commander of the Southwest Pacific Command, Admiral Robert Ghormley. Callaghan represented Ghormley at the planning conference leading up to the Operation WATCHTOWER, the landings on Guadalcanal in August 1942. On October 30, after Vice Admiral William F. Halsey had replaced Ghormley in the Southwest Pacific, Callaghan took over Task Group 67.4, a cruiser/destroyer force, raising his flag on his old ship, the cruiser *San Francisco.*

In early November, Callaghan's two cruisers and eight destroyers escorted a U.S. reinforcement convoy to Guadalcanal. When the transports departed to return to Noumea on November 12, Halsey ordered Callaghan, whose force was now joined by an antiaircraft cruiser and two destroyers under Rear Admiral Norman Scott, to intercept a much more powerful Japanese bombardment force under Vice Admiral Abe Hiroaki, which was also acting as cover for Japanese transports carrying a large troop reinforcement for Guadalcanal. Scott was junior to Callaghan, and the latter assumed command.

Just after midnight on November 13, Callaghan's ships intercepted Abe's force of 2 battleships, 1 light cruiser, and 14 destroyers off Lunga Point, Guadalcanal, on its way to shell Henderson Field. In a hard-fought, 38-minute action, the Americans sank 2 Japanese destroyers and crippled the battleship *Hiei* (which was later sunk by carrier aircraft), while losing 2 cruisers and 4 destroyers. Abe's squadron as well as the task force carrying 13,000 Japanese reinforcements to Guadalcanal that it was designed to mask both turned back.

Callaghan, dubbed "the Fighting Admiral," was killed by a shell that struck the bridge of the cruiser *San Francisco* during the action. He was awarded the Medal of Honor posthumously.

CAM Ships

British merchant vessel fitted with a catapult to launch fighters to provide defensive cover for North Atlantic convoys during World War II. CAM is an acronym for "catapult-assisted merchantman." This was an emergency response to the acquisition by Germany of bases in France from which their submarines and aircraft could attack Allied shipping beyond the range of British shore-based aircraft and in the absence of escort carriers for organic convoy defense. On completing their missions, CAM pilots would either seek the nearest land within range or abandon their aircraft close to the convoy and await rescue.

The Royal Navy fitted out five auxiliaries and a merchant ship in early 1941 to carry two fighters apiece. Between May and October, their fighters launched on 10 occasions, shooting down one Focke Wulf Fw 200 Condor and driving off several others, although three of the ships were lost to submarine attack.

The Royal Air Force's Merchant Ship Fighter Unit largely took over this task from the summer of 1941 until it disbanded in September 1943. It operated some 60 aircraft from 34 CAM ships, all modified merchant vessels with small air force contingents embarked to maintain and operate Hawker Hurricane fighters.

CAM-ship fighters destroyed six Condors and drove off several others during 170 round-trip voyages, but the arrival of the first escort carrier, the *Audacity*, in late 1941, followed by mass-produced units from U.S. shipyards

the following summer, rapidly rendered the concept obsolete. CAM ships were a valuable stopgap, but their inherent operational risks made deployment of carriers, to which aircraft could return, infinitely preferable.

Camm, Sir Sydney (1893–1966)

British aircraft designer who specialized in military planes. Born in Windsor, England, on August 5, 1893, Sydney Camm showed a keen interest in aviation at an early age. In 1912, he designed and flew a man-carrying glider. Shortly before the outbreak of World War I, he joined the Martinsyde Aircraft Company as a woodworker. He left Martinsyde in 1923 to be a senior draftsman with the Hawker Engineering Company, rising to chief designer within two years. He remained with Hawker for 43 years, where his work emphasized simplicity, symmetry, and lightness.

From 1925 onward, Camm concentrated on military designs, working closely with the Royal Air Force (RAF) and producing the Rolls-Royce aircraft engines that were closely integrated into the aircraft. His first big success was the Hawker Hart day-bomber biplane and its variants, of which 3,000 were eventually built. In 1933 Camm moved to monoplanes, and in 1934 he took on a British Air Ministry order for an eight-gun fighter named the Hurricane. The RAF's first monoplane fighter aircraft, the Hurricane was fast, maneuverable, and sturdy. A low-wing plane with retractable landing gear and an enclosed cockpit, it was built around the Rolls-Royce Merlin

engine. The Hurricane carried eight .303-caliber machine guns and reached a top speed of 315 mph at its first flight in late 1935.

During the Battle of Britain (July 10–September 20, 1940), the Hurricane made up the bulk of Fighter Command's aircraft and bore the brunt of the Luftwaffe onslaught. Though outclassed by the Messerschmitt Bf-109, the Hurricane could, in the right hands, hold its own against the German fighter. Later versions were used successfully as fighter-bombers in North Africa. By August 1940, more than 2,000 Hurricanes had been delivered to the RAF and were serving in 32 squadrons. During the war, a total of 14,500 Hurricanes were produced, many of which went to the Soviet Union. Camm designed two more fighters for the RAF during World War II, the Typhoon and the Tempest. Both were successful ground-attack aircraft.

Following the war, Camm began designing jet aircraft, including the Hunter and the first operational vertical takeoff and landing (VTOL) aircraft, the Harrier. He continued to serve on the board of Hawker Siddeley Aviation until his death in Surrey, England, on March 12, 1966.

Camouflage

The disguising of military personnel, equipment, or installations. With technical advances in long-range aviation and aerial photography as well as optical sights for weapons systems, camouflage became a regular feature of World War II. It was applied to individual soldiers, their equipment (such as tanks and warships), and industrial facilities and airfields.

Camouflage, also called protective concealment, attempts to disguise an object that is in plain sight and hide it from something or someone. If an object cannot be concealed—often something large, such as an airfield or a warship—camouflage may succeed merely by preventing an enemy from properly identifying the object. Camouflaging is normally accomplished by applying disruptive or blending paint or material to the object.

Modern camouflage techniques can be traced back to the French Army's Camouflage Division, established in 1915 when the army gave artists the responsibility for concealing airfields during World War I. The term "camouflage" comes from the French word *camoufler*, meaning "to blind or veil."

During World War II aircraft were often camouflaged, in direct contrast with the practice in World War I, attributed particularly to Germany, of painting some aircraft in bright colors to intimidate opposing aviators. World War II aircraft tended to be painted in graduated color schemes, with darker shades on top growing progressively lighter toward the plane's under section.

This technique served two purposes. The indistinct boundary between colors aided in obscuring the aircraft's silhouette and shape, leaving an opposing pilot unsure if a superior type of plane was about to be engaged. This scheme also allowed for a degree of camouflage both while the plane was in the air and when it was on the ground, particularly when a lightly painted aircraft belly was viewed against a light sky or when the green aspect of the same airplane parked on a grass field was seen from above.

Airfields were camouflaged to avoid enemy air strikes. An advanced airfield, for example, might be obscured by having camouflage netting extend a wheat field onto one of the runways and having another runway appear as a football field delineated by steel-wool "ditches." Troops might even play sports on the airfield to help deceive enemy reconnaissance.

Not one but two soldiers. The sniper on the left is wearing regular fatigues, while the one on the right is in camouflaged clothing so as to blend in with the terrain, 1942. (Library of Congress)

Although the aim was to avoid detection, obscuring clear identification often might suffice. For instance, the multiangular paint scheme in varying shades of gray that was applied to many naval vessels during the war served to confuse an enemy's determination of the vessels' speed and bearing rather than render them invisible. By diminishing torpedo or gunfire accuracy, a ship had a greater chance to avoid being hit.

Army vehicles, routinely painted green, brown, or gray to blend in with fields or urban areas, often had their camouflage augmented by their crews. Camouflage netting was used to break up the distinctive outlines of many vehicles, such that a parked tank might appear like a small tree. Netting, however, worked best with stationary vehicles, artillery pieces, and logistics sites. If used on other equipment or when a vehicle was moving, nets interfered with movement and vision, and they got in the way of effective tank fire.

Deception planners went to great lengths to create mock airfields and ports, complete with phony ships, planes, tanks, and personnel. Camouflage was incorporated into these plans; for example, simulated equipment was camouflaged to make it appear more authentic. Occasionally, such camouflage would intentionally be poorly applied: if it was too effective, the enemy might not have seen the phony equipment at all, negating the

deception effort. False sites drew many German air strikes during the July 10–-September 30, 1940, Battle of Britain.

A form of electronic camouflage was required as radar and radio interception expertise advanced. This type of camouflage normally took the form of maintaining radio silence to avoid detection. In the absence of stealth technology, however, it was easier to deceive radars through electronic camouflage than to conceal the target. In 1944, for example, German radars were tricked into believing that Calais was the target of Operation OVERLORD when small towed barges with electronic emitters gave off the radar reflection of approaching 20,000-ton amphibious ships.

British prime minister Winston L. S. Churchill, always interested in military gadgetry, was a great supporter of camouflage efforts, although his efforts in this field met with varying degrees of success. For instance, attempts to deny the Germans navigation landmarks by concealing inland lakes with coal dust failed: the dust blew to the edges and outlined the lakes, making them even more prominent. Churchill also insisted that factories be concealed with smoke, a technique that depended largely on wind conditions and adversely affected the workers involved. The Germans also frequently used smoke in an effort to obscure the targets of Allied air raids.

As the war progressed, increasingly technical reconnaissance and surveillance efforts and subsequent countermeasures forced intelligence staffs to confirm reports through more than one information source in their attempts to defeat complex camouflage problems.

Campioni, Inigo (1878–1944)

Italian admiral executed for treason by Italy's fascist regime. Born in Viareggio, Italy, on November 14, 1878, Inigo Campioni attended the naval academy at Livorno (Leghorn), graduating in 1896. He fought in the 1911–1912 war with the Ottoman Empire and served aboard a battleship during much of World War I. At the end of the latter conflict, he was a highly decorated destroyer commander.

In the interwar period, Campioni led naval design programs at the La Spezia weapons laboratory, served as naval attaché in Paris, and held various Naval Supreme Command staff posts. In 1936, he was promoted to full admiral, and two years later, he became vice chief of staff of the Italian Navy. In 1939, he was elected to the Italian senate.

Regarded as his country's most promising naval officer, Campioni was appointed to operational command of Italy's battle fleet at the beginning of World War II. He led the fleet in a number of engagements against the British in the Mediterranean, notably the Battle of Calabria (Punta Stilo) on July 9, 1940, and the Battle of Cape Teulada (Spartivento) on November 27, 1940. In the latter engagement, Campioni failed to intercept two converging British convoys. His superior naval force was hampered by poor Italian reconnaissance and by the failure of Italian air cover to materialize for well over an hour after the start of the battle. Campioni was subjected to intense criticism for his lack of aggressiveness, especially on those rare occasions when his fleet outgunned the opponent. On December 8, 1940, he was relieved of operational command and made deputy chief of staff of the Naval Supreme Command.

In July 1941, Campioni was assigned to command Axis forces in the Dodecanese Islands. After Italy's surrender to the Allies on September 8, 1943, he was contacted by the British and urged to resist German attempts to establish control over the Aegean region. Although Italian forces on Rhodes resisted the German takeover, they were compelled to surrender on September 11, 1943.

The Germans held Campioni prisoner at Schokken (Skoki) in Poland until January 1944, when he was turned over to Benito Mussolini's puppet Italian Social Republic in northern Italy and jailed in Verona. Tried at Parma for treason, Campioni was found guilty and executed there by fascist authorities

on May 24, 1944. In November 1947, the Italian government honored Campioni by posthumously awarding him the Gold Medal for Military Valor.

Canada

Located in northern North America, Canada encompasses 3,854,085 square miles. Its population on the eve of World War II was 11,267,000. The nation stretches from the Atlantic Ocean in the east to the Pacific Ocean in the west; it shares a long border with the United States to the south and the northwest; to the northeast lies Greenland, just across Baffin Bay and the Davis Strait. Canada is a parliamentary-style democracy; the British monarch serves as head of state although the country is entirely autonomous and a member of the British Commonwealth (Commonwealth of Nations). Arguably the greatest contributor, militarily and economically, of the "small" Allied powers in World War II, Canada put almost 10 percent of its population—slightly over 1 million men and women—into uniform and provided the fourth-largest output of war matériel.

Canada entered the war superficially united, but French Canadian support was lukewarm, and the specter of overseas conscription, which had been so divisive in World War I, loomed. Because Canada's military contribution could not be decisive, conscription remained a political issue, and its potential for wrecking national unity could not be overestimated.

Prewar isolationism had left Canada virtually disarmed, but when Canadian leaders declared war a week after Britain (a pointed display of their country's status as a completely self-governing dominion), they were confident that a military effort on the scale of World War I would be unnecessary. This time, Ottawa promised to match commitments to resources and make the economic sinews of war, not expeditionary forces, its priority. Predictably, this "limited liabilities" policy did not survive the defeat of France in 1940. Thereafter, for Canada, it would be total war.

On the economic front, after some faltering steps, the results were magnificent. Underutilized capacity, the country's bane during the depression, aided the government in its task of mobilizing the war economy. Coming up with the staggering sums to pay for it all proved to be an equal challenge. American neutrality—and Britain's precarious economic and financial position—greatly complicated Ottawa's task, a situation finally

resolved by the Hyde Park agreement signed with the United States in April 1941 that allowed American-produced war materials made in Canada for Britain to be included in the Lend-Lease agreement. By 1944, the gross national product (GNP) had more than doubled, with 50 percent of that figure being war production.

Although foodstuffs and vital raw materials such as nickel and aluminum dominated Canada's wartime exports to the United States and Britain, the production of armaments—including close to 1 million motor vehicles—was also significant. Sound management and the advantages of virtual economic integration with the United States ensured that Canada, alone among the Allies, avoided having to seek Lend-Lease assistance; it even launched its own generous Mutual Assistance Program, with Britain the chief beneficiary.

Given these important contributions to the common cause, Canadian officials aspired to play a role in Allied decision making. Canada more than earned its appointment to the Combined Food and Production and Resources Boards in 1943, but when it came to grand military strategy, vague hopes of "sitting at the table" went unfulfilled. Ottawa accepted its status as a junior partner gracefully, though, if somewhat reluctantly.

From the outset, Prime Minister Mackenzie King's focus had been to help Britain, an approach the great majority of Canadians embraced. Doing so necessitated close cooperation—especially economic cooperation—with the United States. The presumption that Canada could serve as a linchpin between Washington and London was a Canadian conceit, although certainly a neutral United States could materially assist Britain by helping Canada. Once the United States entered the war in late 1941, however, direct engagement with the British rendered Canada's erstwhile diplomatic role superfluous. Nonetheless, U.S.-Canadian ties deepened steadily for reasons of mutual benefit. With a war to win, few Canadians worried about the long-term implications of this shift in regard to their sovereignty.

In military terms, Canada boasted the fourth-largest air force and third-largest navy among the Allies by 1945 as well as an expeditionary force of nearly six divisions. In keeping with the country's Atlanticist orientation, Ottawa committed virtually the entire force to Europe. It is scarcely an exaggeration to say that the Pacific war, except for some panic after Pearl Harbor (December 7, 1941), hardly touched the Canadian consciousness.

Nationalism dictated that the government follow a Canadianization policy

whereby the armed forces would, as far as possible, fight in recognizable national units under national command. At the same time, the English Canadian majority's undiminished emotional attachment to Britain, not to mention practical considerations, guaranteed that these forces would operate under overall British command and fight in British campaigns—in other words, the military-political relationship formalized in 1917 and 1918 would continue.

Unfortunately, Canadianization proved to be a mixed blessing. On one hand, it satisfied (and encouraged) national pride and unquestionably aided the voluntary enlistment system. On the other, the limited availability of experienced Canadian commanders—and particularly in the Royal Canadian Navy (RCN) and Royal Canadian Air Force (RCAF) the inability of domestic industry to produce technically sophisticated armaments in a timely fashion—exacerbated the enormous growing pains experienced by the rapidly expanding armed forces. Finally, until mid-1943, nationalism also dictated that the army not be split up, a decision that denied the army necessary combat experience.

Canada's military role was that of willing subordinate. Building armed forces in wartime guarantees a steep learning curve, and Canada's experience bears this out. In 1939, the Canadian regular forces numbered 10,000. At peak strength in 1944, 780,000 Canadians were in uniform: 80,000 in the RCN, 210,000 in the RCAF, and the remainder in the army. The achievements of the army in Italy, Normandy, the Scheldt, and the liberation of Holland; of the RCAF's administration of the British Commonwealth Air Training Plan as well as participation in 6 Group and throughout RAF Bomber Command; and of the RCN in convoy operations in the Battle of the Atlantic all materially contributed to the Allied victory, at a cost of 42,000 Canadian dead.

Canada's role in the war, both militarily and economically, was far more significant than non-Canadians have credited over the years. That said, the major impact of Canadian participation was on Canada itself. The war rebuilt the Canadian economy, witnessed the implementation of overdue socioeconomic reforms, and greatly strengthened the sense of nationhood and national self-confidence. Isolationism gave way to internationalism, and the country emerged from the conflict well placed to do more than its share in the immediate postwar years to rebuild and defend Western Europe.

Canada, Air Force

Canada had virtually no air force before World War II but developed one quickly. When the war began in Europe in September 1939, the Canadian government agreed to help train Royal Air Force (RAF) pilots, leading to the development of the British Commonwealth Air Training Plan. Through it, some 130,000 pilots and aircrew from Canada, Britain, and other Allied nations were trained at Canadian airfields built or enlarged with British and, later, American assistance. The Royal Canadian Air Force (RCAF) itself grew to more than 250,000 personnel.

A Hawker Hurricane fighter aircraft and its Royal Canadian Air Force ground crew, 1943. (Corel)

Thousands of Canadian pilots and aircrew served in the RAF, often in fighter or bomber squadrons composed entirely of Canadians. Ultimately, the RCAF sent 48 squadrons and 94,000 personnel overseas. In the European theater, RCAF squadrons fought in the Battle of Britain, in Malta, in the campaigns of the Western Desert, and over Europe. In the Pacific theater, two Canadian transport squadrons served in Burma, and a squadron of Consolidated PBY Catalina patrol bombers was based at Ceylon. The RCAF also provided air defense for Canada and assisted in the defense of U.S. installations in Alaska.

In June 1941, the RCAF formed its first bomber squadron. Its Number 6 Group of eight squadrons was formed in Britain in January 1943, flying Wellington bombers from Yorkshire and then Lancaster and Halifax bombers. The group flew 41,000 sorties and dropped 126,000 tons of bombs, one-eighth of Bomber Command's total. It suffered 3,500 dead. In all, 17,101 Canadian aircrew died in the war, some 40 percent of Canada's total war dead.

RCAF pilots also played an important role in ferrying American-built aircraft to the British Isles. Air Commodore N. R. Anderson of the RCAF had lobbied for the ferrying of aircraft in April 1940, arguing that it would save valuable shipping space. The idea languished until the British minister of war production, Lord Beaverbrook, gave it his support and insisted on an

experimental flight. This flight took place in November 1940, when a group of Hudsons crossed the Atlantic from Newfoundland without loss.

Regular transfers continued, slowly at first because of a shortage of pilots and navigators but gaining momentum when increasing numbers of graduates of the Air Training Plan became available. Ultimately, the RCAF delivered more than 9,000 two- and four-engine aircraft to Britain in this manner. Subsequently, the RCAF also supplied Lend-Lease aircraft to the Soviet Union from airfields in northwest Canada. Many of the routes developed in this activity became the first routes of Trans-Canada Airlines after the war.

Canada, Army

Surmounting serious difficulties, Canada raised a substantial army that earned distinction in heavy fighting during World War II. In July 1939, the Permanent Active Militia, as it was then called, was a minuscule force of 4,261 soldiers. Reserves, most of them untrained, numbered 51,418 men. But by 1943, a prodigious effort produced six infantry divisions, two armored divisions, two armored brigades, two army artillery groups, an immense logistics organization, and the Canadian Women's Army Corps—a remarkable achievement for a nation of some 11.3 million people.

Initially, the Liberal government of Prime Minister Mackenzie King pursued a strategy that emphasized industrial and agricultural production, air and naval forces, and a small expeditionary ground force of two divisions. This strategy reflected the fundamental antagonism between English and Scottish Protestant Canadians and French Roman Catholic Canadians, with

the French minority constituting a quarter of the population. Efforts to impose conscription in 1917, during World War I, had sparked serious rioting, proved unenforceable in French communities, and pushed Canada to the brink of civil war. Understandably, the Canadian government in World War II was unwilling to risk such a crisis again. The conflict was sharpened by English and Scottish domination of the armed forces and officer corps.

This limited strategy was shattered by the German conquest of France in June 1940. All Canadian resources were mobilized for total war by the sweeping National Resources Mobilization Act of June 17, 1940. But compulsory military service was restricted to service in Canada; overseas service remained voluntary. Three infantry divisions were stationed on the coasts of Canada. Many French Canadians were willing to defend Canada, but few were willing to fight for Great Britain. Four French Canadian infantry regiments did have sufficient volunteers for overseas service, however.

In July 1940, Major General Henry Crerar assumed the post of chief of the General Staff. A capable administrator, he organized the framework within which the vastly expanded Canadian Army swiftly emerged. By December 1940, two Canadian infantry divisions formed the Canadian Corps in England. In June 1943, the Canadian Army in England numbered three infantry divisions, two armored divisions, and two armored brigades.

The Canadian Army was organized on the British model, and much of its equipment was also British. Rugged and accurate, the .303-caliber Lee Enfield No. 4 was the standard bolt-action rifle. Adapted by Enfield from a Czech design, the low-recoil and accurate Bren .303-caliber light machine gun proved effective. By 1942, 60 percent of all Bren guns were manufactured in Canada. The Mk-II 25-pounder (87.6mm) gun-howitzer—rugged, easily handled, and versatile—and the Mk-III 5.5-inch (140mm) medium gun, introduced in 1941, were the major artillery weapons. The Canadians did employ the U.S. M-4 Sherman as their tank.

The Canadian Army had to contend with serious difficulties. Undermanning was a constant problem, with Canadian units rarely at their established strength, a consequence of the voluntary system. Training suffered from the rapid pace of expansion and the lack of experience among senior officers. In addition, training in unit-level maneuvers was poor, and the army was slow to develop a common system of tactics.

An early tragedy of the war involved the Canadian garrison in Hong Kong. Caught up in the sweep of the opening Japanese offensive, 1,975 soldiers waged a forlorn defense in December 1941, suffering 800 casualties and the death of their commander. The Canadians also sustained heavy losses in the August 19, 1942, raid on the French seaport of Dieppe. A total of 4,963 Canadians from the 2nd Division took part and encountered well-planned German defenses. Only 2,110 of these men returned to England; 65 percent of the Canadian troops were killed, wounded, or taken prisoner.

A Canadian soldier receives attention from a medical orderly next to a burning overturned German tank amid heavy rubble, while Allied forces attempt to trap the German Seventh Army in nearby Falaise, France, August 1944. (Library of Congress)

On July 10, 1943, the Canadian 1st Infantry Division and 1st Army Tank Brigade were committed to the invasion of Sicily, operating as part of the British Eighth Army. On September 3, the Canadians crossed the Straits of Messina to Italy and fought their way up the Adriatic coast. In November, they were joined by the 5th Armoured Division and formed the Canadian I Corps. Initially the corps was led by Crerar, but he returned to England and assumed command of the First Army in March 1944. The Canadian First Army fought within the framework of 21st Army Group, commanded by

Field Marshal Bernard L. Montgomery. Lieutenant General Eedson L. M. Burns then took command of Canadian forces in Italy.

In the heavy and often frustrating fighting of the 1943–1945 Italian Campaign, the Canadians acquitted themselves well. In May 1944, Canadian forces in the Liri Valley participated in the Allied offensive that broke through the Gustav Line. In August 1944, a Canadian thrust near the Adriatic created an opportunity to move into the Po River Valley, but the British moved too slowly, and the chance was lost.

In the Normandy Invasion of June 6, 1944, the Canadian 3rd Infantry Division and 2nd Armoured Brigade landed on Juno beach as part of the British Second Army. Joined by the 2nd Infantry and 4th Armoured Divisions, they formed the Canadian II Corps on July 11, commanded by Lieutenant General Guy Simonds. He had led both infantry and armored divisions in Italy. On July 23, 1944, the Canadian First Army was activated, led by General Crerar. It also included British I Corps and the Free Polish 1st Armored Division.

The battle for Normandy was a crucible of fire for the Canadians. They and the British were deployed in the eastern sector of the beachhead, terrain reasonably favorable for German armored operations. To thwart offensives in this area, most German armor fought the British and Canadians. Canadian forces proved well trained and skilled in combat and played a key role in the defeat of a formidable German opponent. In Lieutenant General Guy Simonds, the Canadian Army found an outstanding leader who proved to be an innovative and exacting commander. Crerar and Simonds were good partners, with Crerar the manager and Simonds the battlefield leader.

After Normandy, the First Army proceeded along the French coast taking seaports. On September 4, 1944, the British 11th Armoured Division captured the vital port of Antwerp, with the Belgian Resistance saving all its port facilities and docks from German destruction. However, Antwerp could only be reached by the 45-mile-long Scheldt estuary, and swift action was imperative to prevent German deployment of defenses along the Scheldt. At this critical juncture, British field marshal Bernard L. Montgomery halted his forces, preferring to concentrate his troops for a thrust into northern Germany, Operation MARKET-GARDEN. This decision gave the Germans time to establish strong defenses along the Scheldt and at its mouth.

After the defeat at Arnhem in late September, the strategic focus returned

to ousting German forces from the Scheldt and opening Antwerp. This daunting task fell heavily on the Canadian First Army. On September 26, Crerar had departed to England for treatment of complications from dysentery, and Simonds assumed command.

The Scheldt battles (October–November 1944) were a nightmare, fought on sodden mud flatlands bereft of cover and intersected by canals and dikes ideally suited for defense. Montgomery assigned the Canadians the lowest priority for supplies, and only a direct and explicit order on October 9 from General Dwight D. Eisenhower to clear the Scheldt compelled Montgomery to furnish the Canadians (including their British corps) the supplies they needed.

Throughout October, bitter fighting raged as Canadian and British soldiers slowly overcame tenacious German resistance. Amphibious tanks and tracked amphibious landing vehicles proved useful. Equipped for amphibious operations, the 52nd Lowland Scottish Division joined the Canadians in this battle.

The assault on Walcheren Island was the climax of the campaign. Commanding the mouth of the Scheldt estuary, Walcheren's defenses included heavy coastal artillery. Royal marines and commandos joined Scots and Canadians to capture Walcheren on November 9. Minesweepers cleared the channel, and Antwerp was finally opened on November 28, 1944. The Scheldt fighting cost the Allies 12,873 casualties, half of them Canadian.

In December, a shortage of infantry replacements compelled the Canadian government to extend conscription for overseas service to troops already in home service. This move aroused a furor, but only 16,000 of 63,000 eligible soldiers were sent overseas. When Crerar returned to lead the First Army, he was entrusted with an Allied force of 475,000 men dedicated to winning control of the Rhineland. In a series of massive operations in February and March 1945, Crerar demonstrated his skill in logistics. German forces were eliminated between the Maas and Rhine Rivers, a loss of more than 90,000 men. In the closing months of the war, the Canadian I Corps was transferred from Italy to the Netherlands and completed the liberation of the latter.

The Canadian Army made a substantial contribution to the Allied victory. The men of this overwhelmingly volunteer force had fought with courage and tenacity in many hard battles. But they also paid a heavy price, for 22,917 Canadians were killed and 52,679 wounded.

Canada, Navy

At the outbreak of World War II, the Royal Canadian Navy (RCN) consisted of 6 destroyers, 5 minesweepers, and 2 small training ships. During the war, it underwent rapid expansion, astonishing for a nation of only 11.3 million people. By 1945, the Canadian Navy was the third-largest Allied navy in number of warships. Its core force consisted of 2 light carriers, 2 light cruisers, 15 destroyers, 60 frigates, and 118 corvettes. In all, it counted a total of 363 vessels, most of which were built in Canadian shipyards. Yards on the St. Lawrence River, the Great Lakes, and the Atlantic and Pacific coasts produced 70 frigates, 122 corvettes, 194 minesweepers, and numerous trawlers, motor torpedo boats, motor launches, and landing craft. From a permanent force of 1,774 men and 2,083 reserves on the outbreak of war in September 1939, the RCN expanded to some 100,000 personnel (6,700 of them women) by the end of the war in 1945.

Throughout the war, the RCN's primary function was convoy protection. In the gale-swept North Atlantic, RCN ships played a crucial role in the long struggle against German submarines. Having expanded so rapidly, however, the RCN suffered from poor training as well as a dearth of advanced equipment. Early in 1943, Canadian corvettes and frigates were sent to British bases, where they were fitted with new radar, sonar, and high-frequency direction-finding detection gear. In addition, the crews underwent intensive training in antisubmarine tactics and warfare. Of particular value was the Western Approaches Tactical Unit established in Liverpool in February 1942, which trained escort captains and commanders in a common doctrine of convoy defense. Practical training was provided by exercises against Royal Navy submarines. By mid-1943, the Canadians fought much more effectively in the Atlantic arena. As radio interception and the breaking of German codes assumed major roles in the war against the submarines, the RCN Operational Intelligence Centre proved to be a key Canadian capability.

The Canadians organized the massive convoys that set out from Nova Scotia and Newfoundland. In 1943 the ocean area off Canada and Newfoundland, which had been under British and then U.S. strategic control, became a strictly Canadian theater under Rear Admiral Leonard W. Murray, commander in chief, Canadian Northwest Atlantic. He now controlled all Allied ships and aircraft involved in protecting Allied convoys in the region.

In 1944 Rear Admiral (later vice admiral) George C. Johnes replaced Vice Admiral Percy Nelles as chief of the naval staff. By 1944 also, Canadian ships were providing a majority of close escort in the North Atlantic convoys. In all, the RCN provided eight mid-Atlantic support groups and escorted more than 25,000 merchant ship voyages with 180 million tons of cargo from North America to Great Britain.

Built to a British design stressing mass production, the Flower-class corvette was the mainstay of the escort fleet. Displacing 1,245 tons at full load, this ship was armed with a 4-inch gun and 40 (later 70) depth charges. The Flower-class ships proved to be miserable high seas vessels, however, taking on water and rolling furiously, and at 16.5 knots, they were too slow for offensive operations. A far more effective escort was the River-class frigate, weighing 1,920 tons at full load. The River-class ship could make 21 knots and mounted two 4-inch guns, a Hedgehog mortar, and 126 (later 150) depth charges.

While protecting the Allied convoys was the chief Canadian contribution to the war effort, the RCN made significant contributions in other areas. Canadian destroyers assisted in the May 26–June 4, 1940, Dunkerque (Dunkirk) evacuation of Allied soldiers from France and then protected Allied merchant ships in British waters. Three passenger liners were converted into auxiliary cruisers to help hunt down Axis commerce raiders in the North Atlantic, the Caribbean, and the North Pacific.

The acquisition of four large British Tribal-class destroyers (the *Athabaskan*, *Haida*, *Huron*, and *Iroquois*) gave the RCN additional capability for surface warfare operations. At full load, the Tribals displaced 2,519 tons (later 2,710 tons) and easily made 36 knots. Formidably armed for their size, they mounted six 4.7-inch guns, two 4-inch dual-purpose guns, and four 40mm antiaircraft weapons. They also carried four torpedo tubes. Two other Tribals (the *Micmac* and *Nootka*) were launched at Halifax in 1943 and 1944, respectively. The Canadian Tribal-class ships saw heavy action, especially in the spring of 1944 in the English Channel against German destroyers and heavy torpedo boats (900-plus tons). In the course of these battles, the *Athabaskan* was lost on April 29, 1944.

The RCN contributed 17 corvettes to Operation TORCH, the Allied invasion of Northwest Africa, which commenced on November 8, 1942. RCN ships also played a considerable part in the Normandy Invasion (June 6, 1944). Some 10,000 officers and seamen and 109 RCN warships participated in Operation NEPTUNE, landing 45,000 troops on the beaches. The Canadian contribution included 15 destroyers, 11 frigates, 19 corvettes, 16 minesweepers, and 30 landing craft.

In 1944, the Canadians acquired two British light aircraft carriers, the *Magnificent* and *Warrior* (displacing 14,000 and 13,350 tons, respectively). Both saw action overseas, with the RCN thereby acquiring valuable experience in naval aviation. Their 40 aircraft were wholly British, however. The RCN also secured two light cruisers from Britain, the *Uganda* (in August 1941) and the *Ontario* (in July 1943). The *Uganda* took part in the Okinawa invasion (March–June 1945).

In the course of the war, the RCN lost 24 ships sunk and 2,024 men killed. At the same time, the RCN played an important role in the Allied victory by destroying or capturing 42 Axis surface warships and helping sink 33 submarines.

Canaris, Wilhelm Franz (1887–1945)

German Navy admiral. Born in Aplerbeck, Westphalia, Germany, on January 1, 1887, Wilhelm Franz Canaris entered the German Navy in 1905. Serving aboard the cruiser *Dresden* off the South American coast at the beginning of World War I, he established an intelligence network to track Allied movements. From November 1915 until October 1916, he was in Spain on an intelligence mission. In April 1918, he took command of a U-boat in the Mediterranean.

Following the war, Canaris, an ardent conservative and nationalist, was active in covert operations to rebuild the German military, specifically working in Japan with German designers to build submarines. He then resumed his naval career, increasingly in intelligence activities. Promoted to captain in 1931, he took command of the battleship *Schlesien* the next year. He was named to head German military intelligence—the Abwehrabteilung (Abwehr)—in January 1935 and was promoted to rear admiral that April. One of his first successes was convincing German chancellor Adolf Hitler to intervene on the side of the Nationalists in the Spanish Civil War (1936–1939).

Canaris became disillusioned after the Fritsch Affair in 1938, when untruthful allegations of homosexual activities were brought against Colonel General Werner von Fritsch because of his opposition to Hitler's announced plans for war. Shortly thereafter, the Abwehr became tied to anti-Nazi elements in Germany. Canaris believed that Hitler's policies would lead to inevitable German defeat. Despite the admiral's reticence, Hitler personally liked him, and the Abwehr provided much useful information, all of which gave Canaris some protection as he aided a limited number of Jews and covertly undermined German attempts to involve Spain in the war. Canaris was promoted to full admiral in January 1940.

Canaris resisted efforts by Reinhard Heydrich, head of the Reichssicherheitshauptamt (Reich Main Security Office), to take over the Abwehr, but his position was threatened when Heydrich uncovered evidence that Canaris had committed treason. Heydrich's assassination in May 1942 provided a brief reprieve for the admiral, and it was not until February 1944 that Hitler removed him from his post. Shortly thereafter, Canaris was placed on the navy's inactive list. Canaris lived under a loose but comfortable house arrest at Burg Lauenstein until June, when Hitler recalled him to Berlin as head of mercantile warfare.

Admiral Wilhelm Canaris, head of German military intelligence (the Abwehr) during World War II. Canaris actively opposed German leader Adolf Hitler, believing he would lead Germany to defeat. Implicated in a plot against Hitler, he was executed in April 1945. (Ullstein Bild via Getty Images)

Implicated in the July 1944 bomb plot against Hitler (although he did not take an active role), Canaris was arrested afterward. Initially there was no evidence against him, but discovery of his secret diaries led to his trial and conviction. Canaris was hanged at Flossenburg Prison on April 9, 1945.

Cape Bon, Battle of (December 13, 1941)

Mediterranean Sea naval action between units of the Italian Navy and the Royal Navy. In November and early December 1941, British surface, air, and submarine forces operating from Malta enjoyed considerable success against Axis shipping to North Africa, sinking about two-thirds of the matériel dispatched and in the process sparking a supply crisis there. The Italian Navy responded by using destroyers and light cruisers to transport gasoline to Africa.

On December 12, 1941, Vice Admiral A. Toscano sailed from Palermo, Sicily, bound for Tripoli with the light cruisers *Alberico Da Barbiano* and *Alberto Di Giussano*, accompanied by the torpedo boat *Cigno.* Each of the cruisers carried 950 tons of aviation fuel in cans stacked on their decks and superstructures.

Signals intelligence provided the British advance notice of this important sailing, and Vice Admiral Wilbraham Ford commanding at Malta planned to attack the Italian cruisers at dawn with torpedo bombers. The 4th Destroyer Flotilla under Commander Graham Henry Stokes, comprising the *Sikh*, *Maori*, and *Legion* and the Dutch destroyer *Isaac Sweers*, happened to be en route from Gibraltar to reinforce the Mediterranean Fleet in Alexandria. When Stokes was informed of events, he increased speed in hopes of intercepting the Italian ships.

The British destroyers proceeded along the African coast, staying in French waters to avoid Axis minefields. At 3:02 a.m. on December 13 as they approached Cape Bon, lookouts spotted flashing lights that disappeared behind the promontory. The *Sikh*, followed by the *Legion*, *Maori*, and *Isaac Sweers*, rounded the cape in pursuit. Toscano, meanwhile, heard aircraft above his formation and assumed that the British had found him. The volatile nature of his cargo made him cautious, and he decided to abort his mission. The Italian warships executed a simultaneous turnabout, which positioned the *Cigno* to the formation's rear and put the Italians on a collision course with the Allied destroyers.

The British were inshore and hidden against the dark mass of the land, while the Italians were silhouetted against the horizon; thus, the British made the first sighting, and at 3:23 a.m. the *Sikh* fired four torpedoes at the *Da Barbiano* from 1,500 yards. Within a minute two torpedoes slammed into its hull, and the Italian flagship erupted in flames. By this time more torpedoes were streaming toward the Italians, and the Allied warships also opened fire with their guns.

As two more torpedoes hit the *Da Barbiano*, the *Di Giussano* fired three 6-inch salvos, but the rapidly converging destroyers were difficult targets, and the shells exploded ashore. At 3:27 a.m. a torpedo hit the *Di Giussano* amidships, along with two 4.7-inch shells and a stream of machine-gun fire. There was a massive explosion, and the cruiser swerved and lost way.

The *Cigno* launched a torpedo and opened fire as the Allied ships passed. The Italians incorrectly claimed several hits. The Dutch destroyer *Isaac Sweers* in turn targeted the torpedo boat, straddling it and launching four torpedoes, all of which missed. The Allied destroyers continued south at high speed, leaving the *Da Barbiano* sinking in a sea of flames and the *Di Giussano* waging a losing fight against uncontrollable fires. Toscano and more than 900 of his men died. The *Cigno* rescued survivors and returned to Sicily.

The Battle of Cape Bon was an embarrassing Italian defeat. Tactically, Toscano could not have picked a worse time to reverse course, and he should have kept the *Cigno* in the lead. But the real mistake was using cruisers as gasoline transports, which left them excessively vulnerable.

Cape Esperance, Battle of (October 11–12, 1942)

The second of five major surface actions fought off Guadalcanal. The battle occurred eight miles west-northwest of Savo Island as U.S. and Japanese forces maneuvered to protect their reinforcements moving toward Guadalcanal.

U.S. Navy rear admiral Norman Scott led Task Force 64, consisting of two heavy cruisers, two light cruisers, and five destroyers. Scott's mission was to protect transports carrying the U.S. Army's 164th Infantry Regiment to Guadalcanal by searching for and attacking Japanese ships. Scott's crews had just undergone three hard weeks of night training, and the admiral was fully prepared to engage in a night action, in which the Japanese had hitherto enjoyed superiority. Scott had developed simple tactics and rehearsed them, keeping his crews at station from dusk to dawn. His ships operated in a single column, with destroyers forward and aft of his cruisers.

Japanese rear admiral Goto Aritomo commanded a bombardment group, Cruiser Division 6, comprising three heavy cruisers and two destroyers. It protected Rear Admiral Joshima Takagi's two seaplane carriers and six destroyers transporting to Guadalcanal some 700 men and artillery of Lieutenant General Hyakutake Haruyashi's Seventeenth Army. Goto planned to shell Henderson Field to neutralize the U.S. air threat while Joshima landed the reinforcements off the northwestern cape of Guadalcanal.

U.S. aircraft tracked Goto's force as he approached, although communication miscues aboard the U.S. ships nearly rendered that advantage moot. Goto and Joshima did not expect opposition, and preoccupied with navigation and preparations for the Henderson Field bombardment, they ignored indications that U.S. vessels were nearby. Lacking radar, the Japanese blundered into the Americans. Their lookouts did spot the U.S. ships and identify them as enemy, but Goto believed they were friendly and flashed recognition signals.

At 11:25 p.m. on October 11, U.S. radar from the light cruiser *Helena* first picked up the Japanese, but Scott, on the flagship heavy cruiser *San Francisco,* did not learn of this before he ordered his ships to turn at 11:30 p.m. Eight minutes later, while his formation was still in some mild disorder from the turn, Scott received his first radar indication. Initially, he believed

that this came from his own destroyers out of formation. Fortunately for Scott and the Americans, the turn inadvertently allowed the U.S. ships to cross the T of Goto's approaching ships. The *Helena* opened fire at 11:46 p.m. at 3,600 yards, quickly followed by the other cruisers. Surprise was total, and Goto believed that Joshima's ships were shooting at him.

The U.S. guns pounded the Japanese ships. Among the casualties was Goto, mortally wounded. Before his death he ordered his force to withdraw, and a running gunfire duel followed. The Japanese heavy cruiser *Furutaka* and the destroyer *Fubuki* were sent to the bottom. The heavy cruiser *Aoba* was badly damaged and would require four months to repair. In an associated action on October 12, aircraft from Henderson Field sank the Japanese destroyers *Murakumo* and *Natsugumo*, which were searching for survivors.

On the U.S. side, the destroyer *Duncan* was sunk, the cruiser *Boise* was heavily damaged, the cruiser *Salt Lake City* was lightly damaged, and the destroyer *Farenholt* was damaged. Meanwhile, Henderson Field had been spared Japanese shelling, and U.S. morale soared, especially as Scott claimed that his force sank three cruisers, five destroyers, and a transport.

Despite their tactical defeat, the Japanese did land their troops and supplies safely, as did the Americans on October 13. Because the Japanese had not successfully employed their torpedoes in the Battle of Cape Esperance, the Americans discounted their effectiveness. U.S. Navy leaders also incorrectly concluded that using the single-column formation and gunfire was the way to fight at night. This approach slighted the destroyers' main battery, the torpedo, and effectively tied the destroyers to the cruisers.

Cape Matapan, Battle of (March 28, 1941)

Naval battle between British and Italian forces in the eastern Mediterranean. Despite crippling fuel shortages, on the urging of its German allies units of the Italian Navy set out on March 26, 1941, to attack British convoys around Crete. Commanded by Vice Admiral Angelo Iachino, the Italian force included the battleship *Vittorio Veneto;* the heavy cruisers *Trieste, Trento, Bolzano, Zara, Fiume*, and *Pola;* the light cruisers *Luigi di Savoia* and *Garibaldi;* and 17 destroyers. On March 27, Royal Navy forces under Vice Admiral Andrew B. Cunningham (Force A), alerted by key radio intercepts of the Italian movements, steamed from Alexandria to join Vice Admiral Henry D. Pridham-Wippell (Force B), already in the Aegean, in search of the Italian force, although the British were not certain of its exact composition or mission.

At 6:35 a.m. on March 28, Italian aircraft spotted Pridham-Wippell's force, which consisted of four light cruisers and four destroyers, and shortly before 8:00 a.m., Rear Admiral Luigi Sansonetti's 3rd Division, with three heavy cruisers, made contact south of Crete and proceeded to chase the British squadron until 8:55 a.m., firing more than 500 rounds at long ranges but failing to obtain any hits.

Fearing that Sansonetti was sailing into a trap, Iachino ordered the 3rd Division to reverse course and concentrate on his flagship. When the Italian division turned away, Pridham-Wippell likewise came about and followed. Iachino then maneuvered to trap the British between his battleship and his cruisers. At 10:55 a.m., the *Vittorio Veneto* came in range and opened fire from 25,000 yards. The British cruisers immediately made smoke and fled south.

All this time, Cunningham's battleships and the carrier *Formidable* were forging up from Alexandria. Cunningham had already launched a strike of six

Albacore aircraft to assist his cruisers. Iachino suspected that there were more British forces about but had no firm intelligence.

The Italians obtained several straddles and near hits on Pridham-Wippell's ships but no actual hits. At 11:15 a.m., the *Vittorio Veneto* gave up the chase just as the British air strike arrived. The planes attacked through an intense antiaircraft barrage, but all their torpedoes missed astern.

In steady pursuit 40 miles back, Cunningham's task force, joined by Pridham-Wippell's Force B, followed Iachino's ships. It consisted of the *Formidable* and the battleships *Warspite, Valiant,* and *Barham* with 4 cruisers and 13 destroyers, bolstered by British aircraft from nearby shore bases, which conducted six separate attacks.

The Italians received little useful air cover from their own air force or that of the Germans and suffered accordingly. Despite withering antiaircraft fire from the *Vittorio Veneto* and escorting ships, in their second attack British Albacores from the *Formidable* torpedoed the Italian battleship at 3:10 p.m. on March 28.

Cunningham judged that the progress of the Italian force, now drawn in around its wounded flagship, would likely be slow, and he plotted it at about 12 knots. But despite having shipped 4,000 tons of water and making way on only two of four propellers, the *Vittorio Veneto* worked up to a speed of 19 knots and thus moved its formation farther along than expected on the run toward home waters.

With night falling, however, Iachino received the unwelcome news that the heavy cruiser *Pola* was dead in the water from torpedoes in a third air strike from the *Formidable.* Believing that the British were still far astern, he instructed the cruisers *Zara* and *Fiume* (with four destroyers) to turn back and tend to their sister ship. In fact, from a distance of less than 50 miles, Cunningham was closing as fast as his flagship, the old battleship HMS *Warspite*, and its sister ships *Valiant* and *Barham* could make way.

By 8:30 p.m. radars on the vanguard cruisers *Ajax* and *Orion* had picked up the derelict *Pola* some six miles distant; it was presumed to be the *Vittorio Veneto.* As the main British force drew closer and prepared to attack the *Pola*, an in-line formation of six more unknown ships (the *Zara* and *Fiume* and their escorts) was detected at 10:25 p.m. at 4,000 yards, which shifted the British targeting and drew a wall of concentrated fire from the British battleships' main and secondary batteries at nearly point-blank range. The

Zara and *Fiume* were reduced to flaming wrecks within minutes; the *Fiume*, along with the destroyers *Alfieri* and *Carducci*, sank within an hour. The *Zara* and *Pola* remained afloat until early the following morning, finally dispatched by scuttling charges and torpedoes from British destroyers. Some 40 miles ahead, the main body of the Italian force pressed onward, arriving in Taranto on the afternoon of March 29 after evading the renewed chase given by Cunningham.

Cunningham claimed that in the Battle of Cape Matapan the Royal Navy established primacy in the Mediterranean. The loss of five valuable warships and 2,300 lives shocked the Italian leadership, and they ordered the battle force to stay within land fighter range and avoid night battles until the fleet had radar. Italian dictator Benito Mussolini also ordered the conversion of the liner *Roma* into an aircraft carrier.

Cape Passero, Action off (October 12, 1940)

Mediterranean naval engagement involving the Royal Navy and the Italian Navy. On October 8, 1940, a convoy of 4 British supply ships sailed from Alexandria for Malta escorted by 4 battleships, 2 aircraft carriers, a heavy cruiser, 5 light cruisers, and 16 destroyers. The commander of the British Mediterranean Fleet, Admiral Andrew Cunningham, ordered such a strong escort because 4 Italian battleships had sortied against the last Malta resupply operation.

Assisted by heavy weather, the convoy reached Malta undetected on October 11. That same day, however, an Italian aircraft reported the presence of the British warships. Italian naval headquarters responded by dispatching the 11th Destroyer Squadron of the *Geniere Aviere, Artigliere*, and *Camicia Nera* and the 1st Torpedo Boat Squadron of the *Alcione, Airone,* and *Ariel* to patrol east of Malta while the 7th Destroyer Squadron and a Motoscafo Armato Silurante (MAS or motor torpedo-boat unit) guarded the Sicilian Channel and two cruiser divisions raised steam.

The Mediterranean Fleet's main body remained south of Malta waiting to escort the empty transports back to Alexandria. The fleet's light cruisers scouted to the northeast, with the cruiser *Ajax* being the end ship on the line some 100 miles east of Malta. Meanwhile, the Italian 1st and 11th Squadrons swept west in an extended search line running north to south with 16,000 yards between the two squadrons.

At 1:35 a.m. on October 12, the *Alcione* detected the *Ajax* in bright moonlight 12 miles ahead and altered course southwest toward it. Within minutes the *Airone* and *Ariel* also spotted the enemy ship, and at 1:48 a.m. the squadron commander ordered a simultaneous torpedo attack.

At 1:55 a.m. lookouts on the *Ajax* spotted ships ahead and challenged the *Alcione,* which fired two torpedoes from under 2,000 yards. Almost at the same time the *Airone* off the British cruiser's port bow launched two torpedoes, while the *Ariel* off its starboard bow launched one. The *Ajax,* not having received the correct response to its challenge, had increased speed and altered course. This maneuver, along with Italian errors in calculating the British cruiser's speed and heading, resulted in all five torpedoes missing their target. The *Airone* closed rapidly and launched two more torpedoes from only 1,000 yards. That torpedo boat's 3.9-inch guns landed two shells on the *Ajax*'s bridge and another pieced the British ship's hull, but the torpedoes missed astern. The *Ariel* and *Alcione* opened fire as well but their aim was off, and the *Alcione* lost contact.

In response to the sudden Italian attack, the *Ajax* engaged the *Ariel* and the *Airone* with its main and secondary batteries. The first salvos crumpled the *Ariel*'s bridge and cracked its hull. The unarmored torpedo boat sank within minutes. The *Airone* tried to disengage, but a broadside of 112-pound British shells left the squadron flagship down at the stern and burning fiercely.

At 1:56 a.m. the 11th Destroyer Squadron began heading north. The *Aviere* sighted the *Ajax* at 2:10 a.m. and fired its guns, but the moon silhouetted the destroyer and made for effective shooting by the *Ajax*. Hit twice with major flooding, the *Aviere* staggered to starboard after only six minutes and lost contact. Crewmen in the *Geniere* spotted the *Ajax* at 2:18 a.m., engaged it briefly, and then withdrew. The *Artigliere* encountered the British cruiser at 2:29 a.m., and the *Ajax*, lurking unseen up-moon just a few thousand yards northeast, opened fire. The *Artigliere* launched one torpedo before an exchange of gunfire left the Italian destroyer adrift and on fire. The *Artigliere* retaliated with four shells that moderately damaged the cruiser.

The *Camicia Nera*, the southernmost Italian destroyer, came into action at 2:46 a.m., and the two opposing ships exchanged several ineffective salvos before the British cruiser reversed course and broke contact, ending the action. At 5:00 a.m. the *Camicia Nere* took the crippled *Artigliere* in tow, but at 8:40 a.m. the heavy cruiser *York* and the light cruisers *Gloucester* and *Liverpool* found and sank the *Artigliere.*

In the Battle of Cape Pessaro, the Italians lost the torpedo boats *Airone* and *Ariel* and the destroyer *Artigliere*, while the destroyer *Aviere* was severely damaged. The British cruiser *Ajax* suffered moderate damage that kept it out of action for two weeks. In the action the Italian torpedo boats had achieved surprise and attacked at point-blank range, but all their torpedoes had missed. This led Italian naval headquarters to conclude that its forces were technically inferior to the British in night actions. In fact, Italian weapons and tactics contributed to the defeat. The Italian torpedo boat commander conducted a brilliant approach, but his ships could only put five (of a maximum potential of six) torpedoes into the water. This feeble barrage was half that of one modern Allied destroyer. Then the 11th Destroyer Squadron, which possessed greater torpedo capability, never attempted to concentrate; instead its four ships presented themselves silhouetted in moonlight to the *Ajax*'s gunners one by one at close range. This proved ineffective as well as deadly.

Cape Spada, Battle of (July 19, 1940)

Naval engagement on July 19, 1940, between ships of the Italian Navy and the Royal Navy. When Italian naval headquarters received intelligence that some small British tankers were leaving Romania after that nation's change of alliance and passing through the Bosporus into Greek waters, it ordered Rear Admiral Ferdinando Casardi's II Division of the light cruisers *Bande Nere* and *Colleoni* into the Aegean Sea to attack them. Casardi departed Tripoli on July 17. By chance, British warships were operating along his route, sweeping for submarines in advance of a convoy from Port Said to Greece.

At 6:17 a.m. on July 19, the Italian cruisers entered the Aegean Sea northwest of Crete, where they encountered the British 2nd Destroyer Flotilla under Captain H. St. L. Nicholson with the *Hero*, *Ilex*, *Hasty*, and *Hyperion* headed in their direction from 10 miles away. The Australian light cruiser *Sydney*, commanded by Captain John Collins, and the British destroyer *Havock* were operating independently 40 miles to the north-northeast in the Gulf of Athens.

Sighting the enemy cruisers, Nicholson's flotilla immediately turned northeast. Casardi pursued through rough seas and strong winds at 30 knots on a slightly diverging course. He naturally suspected that the destroyers were the van of a larger force and that he had stumbled upon a dangerous situation. He opened fire at 6:27 a.m. from 19,000 yards. The destroyers replied, but their salvos fell well short.

Collins received Nicholson's report of enemy contact at 6:33 a.m. and immediately turned toward it, maintaining radio silence. Rolling swells limited the cruisers to 32 knots, while mist and the morning sun made long-range spotting difficult. At 7:30 a.m., the *Sydney* arrived 20,000 yards to the

north-northeast and opened fire out of a fogbank. The Italians came about and responded with their aft turrets. Firing rapidly, the *Sydney* hit the *Bande Nere* at 7:35 a.m.

The two forces settled into a stern chase trading fire from roughly 18,000 yards. Conditions made gun laying difficult, but on the *Sydney* the Italian gunfire seemed accurate, if slow. At 8:21 a.m., a 6-inch shell holed the *Sydney*'s forward funnel. The Italians passed Cape Spada, and at 8:25 a.m., a 6-inch shell hit the *Colleoni*, jamming its rudder in the central position. Then two more British shells struck, knocking out two boilers. Fires erupted, and with the other boilers starved for water, the Italian cruiser lost way.

At 8:40 a.m., the *Ilex* discharged a torpedo salvo, and one struck, blowing off the tip of the Italian's bow. Shortly thereafter, the *Hyperion* scored a hit amidships. The *Bande Nere* circled and then at 8:50 a.m. turned west as the *Sydney*, *Hero*, and *Hasty* pursued. At 8:59 a.m., the *Colleoni* capsized and sank six miles off Cape Spada. Meanwhile, the *Sydney* hit the *Bande Nere* again but did not slow it. Finally, at 9:37 a.m., with the range slowly opening and munition supply becoming a concern, the *Sydney* broke off. The *Bande Nere* made port at Benghazi (Libya).

In the engagement, the Italian cruisers fired 500 shells, scoring no hits on the British destroyers and only one on *Sydney* during a period of three hours. The *Sydney*, fighting its third surface engagement in a month, expended 1,300 shells and obtained five long-range hits in two hours.

Cape Spartivento, Battle of (November 27, 1940)

Mediterranean Sea battle between units of the British Royal Navy and the Italian Navy on November 27, 1940; the Italians know it as the Battle of Cape Teulada. After crippling three Italian battleships at Taranto on November 11, 1940, the British sought to exploit their victory by launching a major operation to reinforce Malta from both the west and east and to relocate a battleship and two cruisers from Egypt to the home islands. Elements of the British Mediterranean Fleet departed Alexandria on November 23, and Force H cleared Gibraltar two days later to escort three transports to Malta.

The Italian naval command learned that the British had major forces at sea, and Admiral Inigo Campioni sortied from Naples on November 26 with the battleships *Vittorio Veneto* and *Cesare;* the 1st Division of the heavy cruisers *Pola, Fiume,* and *Gorizia;* and the 11 destroyers of the 7th, 9th, and 13th Destroyer Squadrons. The 3rd Division of the heavy cruisers *Trieste, Trento,* and *Bolzano* and the 3 vessels of the 12th Destroyer Squadron under Rear Admiral Luigi Sansonetti left Messina the same day. Campioni and Sansonetti rendezvoused north of Sicily and headed west to challenge Force H.

Force H included the battle cruiser *Renown*, the carrier *Ark Royal*, two light cruisers, and nine destroyers. The convoy consisted of three transports escorted by two light cruisers, one destroyer, and four corvettes. Somerville planned to rendezvous with Force D of the battleship *Ramillies*, one heavy and two light cruisers, and five destroyers coming from Alexandria at noon on November 27 southeast of Sardinia. The combined force would then head toward the Sicilian narrows and return to Gibraltar, while the merchant ships, five destroyers, and the corvettes continued to Malta under the cover of darkness.

At dawn on November 26, Campioni’s fleet loitered off Sardinia with the cruiser divisions ahead of the battleships. Campioni’s orders were to remain under air cover from Sardinia, avoid action unless the enemy force was obviously inferior, and be highly aggressive while remembering the difficulty of replacing warship losses. When Campioni received a report that enemy ships had transited the Sicilian Channel heading west, he assumed that they

sought to join Force H, and hoping for an opportunity to fight within the constraints of his orders, he launched spotter aircraft.

As the Italians awaited news, Somerville sailed east, likewise scouting for the enemy. At 10:45 a.m. Campioni swung southeast, acting on an ambiguous report that led him to believe he could intercept the force previously reported in the Sicilian Channel. In fact, Force D had already slipped by. Somerville, meanwhile, had finally learned that there were Italian battleships astride his route.

Force H and Force D rendezvoused at 11:30 a.m., and as the *Ark Royal* and the convoy with their escorts cleared the area, Somerville turned north with the battleship *Ramillies* and the battle cruiser *Renown;* the heavy cruiser *Berwick;* the light cruisers *Manchester, Southampton, Sheffield,* and *Newcastle;* and 10 destroyers.

At 12:07 p.m., Campioni learned that the British force included a carrier. Considering that the odds were now tilted against him, he ordered his cruisers to discontinue their advance and concentrate on his flagship.

At 12:15 p.m., the British cruisers observed smoke on the northern horizon. On the Italian side, the cruiser divisions were heading east with Campioni to the east-northeast and closing. Despite orders to disengage, the *Fiume* fired a ranging salvo at the *Berwick* from 24,000 yards at 12:20 p.m. Within two minutes both Italian cruiser divisions were in action, having altered course away to maintain long range, which Italian doctrine favored. Almost immediately an 8-inch shell hit the *Berwick,* causing moderate damage. The British cruisers returned fire, and at 12:24 p.m. the *Renown* briefly engaged before losing its target in the smoke. The *Ramillies* discharged two ranging salvos that splashed far short, and the old battleship then slowly fell behind the rest of the fleet.

A brisk gunnery action ensued between 12:20 and 12:42 p.m. as the cruisers fought in a northeasterly direction at ranges up to 23,000 yards. Smoke rendered spotting difficult. Nonetheless, at 12:35 p.m. another 8-inch shell plunged into the *Berwick.*

The first British success came at 12:40 p.m., when a 6-inch round disabled the destroyer *Lanciere.* At the same time, 11 British Swordfish aircraft attacked the *Vittorio Veneto.* The battleship dodged every torpedo launched and then engaged the British cruisers from 32,000 yards. As giant

waterspouts erupted around the *Berwick* and the *Manchester*, the British squadron made smoke and fled southeast to close with the *Renown.*

As the Italians continued steaming northeast and disappeared over the horizon, Somerville quite correctly turned to close on the convoy before dark. During the remaining hours of daylight, both sides traded ineffective air attacks. After the battle, British prime minister Winston Churchill unfairly demanded Somerville's scalp, having questioned the admiral's offensive spirit ever since his reluctance to attack the French at Mers-el-Kébir (July 3, 1940). However, a board of inquiry exonerated Somerville. As for Campioni, although he had a mandate to be conservative, he had lost a splendid opportunity to defeat the British in a fleet action, and his days of command at sea were numbered. Nonetheless, the Italian Navy had demonstrated that despite the Taranto raid, it retained the battleships and the will to dispute the passage of even the most heavily escorted British convoys to Malta.

Cape St. George, Battle of (November 25, 1943)

Pacific theater naval battle. This final surface action in the Solomon Islands area was brought on by the Japanese attempt to reinforce their garrison at Buka in northern Bougainville on the night of November 24–25, 1943. The

Japanese transport group under Captain Kagawa Kiyoto was made up of three destroyer-transports—the *Amagiri*, *Uzuki*, and *Yugiri*—escorted by the destroyers *Onami* and *Makinami*.

The Allies had long been reading the Japanese naval code, however, and Captain Arleigh Burke and his 23rd Destroyer Squadron of five destroyers arrived just after midnight and took up station athwart the direct Buka-Rabaul route to intercept the Japanese on their return trip. The night was dark, with low-hanging clouds with occasional rainsqualls. The sea was calm.

Burke's plan was for his ships—the *Charles F. Ausburne* (flagship), *Claxton*, and *Dyson*—to launch a torpedo attack while Commander B. L. Austin's *Converse* and *Spence* covered with their guns; then the two formations would reverse roles. The action unfolded nearly as Burke had hoped.

At 1:40 a.m. on November 25, the two unsuspecting Japanese escorts appeared, and Burke, closing the range quickly, launched 15 torpedoes at 1:56 a.m. then turned hard right to avoid any Japanese torpedoes coming his way. None did. Both Japanese escorting destroyers were mortally stricken. The *Onami* went down quickly, and the *Makinami* somehow managed to stay afloat until the *Converse* and *Spence* sank it with gunfire.

Burke then set out in pursuit of the three transports that had turned north toward Rabaul. In the running fight, the Japanese ships separated. Burke went after the *Yugiri* and, at 3:28 a.m., sank it with gunfire.

Burke continued the chase until 4:04 a.m., and then, with only two hours of darkness remaining to shield him from Japanese aircraft from Rabaul, he turned for home. He had fought a near-perfect action, sinking three Japanese destroyers at no cost to his force. For the Japanese, the battle brought down the curtain on the costly war of attrition they had waged in the Solomons, though in mid-May, they lost the submarines *I-176* and *I-16* while attempting to supply the Buka garrison.

Capra, Frank Russell (1897–1991)

Hollywood filmmaker who produced a series of inspirational movies during the war years. Born Francesco Rosario Capra in Bisacquino, Sicily, a village near Palermo, on May 19, 1897, Frank Russell Capra immigrated to the United States with his family in 1903. After a stint in the army during World War I, he made a career as a film director, emphasizing stories of ordinary Americans who overcame corruption, greed, or cynicism. His films included *Mr. Deeds Goes to Town* (1936), *Mr. Smith Goes to Washington* (1939), and *Meet John Doe* (1941).

When the United States entered World War II, Capra was making *Arsenic and Old Lace*. Putting the project on hold until 1944, he rejoined the army as a major and was assigned to the Morale Branch in February 1942. U.S. Army chief of staff General George C. Marshall ordered Capra to "make a series of documented, factual-information films—the first in our history—that will explain to our boys in the Army why we are fighting, and the principles for which we are fighting."

After studying Leni Riefenstahl's *Triumph of the Will* and other German propaganda films, Capra produced a series of seven movies titled *Why We Fight.* The first of these documentaries was released in October 1942. The films were shown not only to the troops but also in war plants beginning in April 1943 and then to the general public by the end of May 1943. They were designed to be at once educational, inspirational, and recreational. Each examined what was seen as a totalitarian plan to take over the world.

After releasing the last of these movies, subtitled *War Comes to America*, in 1945. Capra returned to civilian life to establish Liberty Films. He continued to make important films until 1961, among them *It's a Wonderful Life* (1946). Capra won three Academy Awards. He died in La Quinta, California, on September 3, 1991.

Carlson, Evans Fordyce (1896–1947)

U.S. Marine Corps brigadier general. Born in Sidney, New York, on February 26, 1896, Evans Fordyce Carlson enlisted in the army at age 16 in 1912 and served in the Philippines and Hawaii from 1912 to 1915 before being discharged. He was recalled a year later for service on the Mexican border. During World War I, he was a captain on the staff of General John J. Pershing, commander of the American Expeditionary Forces, in France.

Dissatisfied with civilian life after the war, Carlson joined the marines as a private in 1922. The following year he was once again commissioned a second lieutenant. Intelligence duty with the 4th Marine Regiment in Shanghai from 1927 to 1929 sparked his deep fascination with China. After two years spent fighting Sandinista guerrillas in Nicaragua, Carlson returned to Beijing in 1933. In 1935, Carlson, now a captain, began a friendship with President Franklin D. Roosevelt while serving as second-in-command of the marine detachment at the president's Warm Springs, Georgia, retreat.

When the Sino-Japanese War commenced in July 1937, Carlson returned to China for a third time. He frequently wrote to Roosevelt regarding Chinese military and political affairs there. Carlson traveled extensively on officially sanctioned journeys with Chinese Communists, admiring the cooperation, simplicity, camaraderie, and fundamental democracy evident among officers and troops. He resigned in 1939 to write more freely about China's determined resistance in numerous articles and particularly in a book titled *Twin Stars of China* (1940). Despite being charged with naïveté, he extolled

the People's Army while optimistically foreseeing genuine cooperation between Guomindang (GMD, Nationalist) and Communist Chinese forces.

Joining the marine reserve as a major, Carlson was called to active duty in April 1941 and was soon promoted to lieutenant colonel. He commanded the experimental 2nd Marine Raider Battalion, known as Carlson's Raiders, and emulated People's Army principles of cooperation, self-reliance, and guerrilla tactics. (The unit's catchphrase, "gung ho," approximates a Chinese term meaning "work together.")

Carlson's Raiders slipped ashore from submarines at Makin Atoll, in the Gilberts, on August 17, 1942 (with the president's son, James Roosevelt, as executive officer), to destroy communications and gather intelligence. The raid was moderately successful and boosted home front morale, but 30 of 200 men perished, including 9 who were stranded during exfiltration and later beheaded by their Japanese captors. Subsequently, Carlson's Raiders repeatedly engaged the Japanese on Guadalcanal during long-range patrols, killing nearly 500 enemy troops while suffering only 16 deaths themselves.

Slowed by malaria, Carlson served as an adviser on Hollywood's popular 1943 account of the Makin raid, appropriately titled *Gung Ho.* He later returned to the Pacific—but as an observer rather than a unit commander. Serious wounds received at Saipan while rescuing a fallen enlisted man forced his retirement, with promotion to brigadier general.

Carlson vigorously and publicly opposed aiding the Nationalists in China's civil war. He succumbed to heart disease in Portland, Oregon, on May 27, 1947. Some portrayed Carlson as a romantic or a Christian Socialist. Senator Joseph McCarthy branded him "the Red General," but U.S. Marine Corps commandant David Shoup remarked, "He may have been Red, but he wasn't yellow."

Carol II, King of Romania (1893–1953)

Romanian monarch who reigned from 1930 to 1940. Born on October 15, 1893, at Sinaia, Romania, Carol was the eldest child of Ferdinand I of Romania and Princess Marie of Great Britain. Carol's upbringing was controlled by his great-uncle Carol I of Romania, who encouraged his fixation on German militarism, including service in a German Army regiment in Potsdam. Carol toured the front in the Second Balkan War but took little part in World War I except as a diplomatic envoy to Russia in January 1917. He provoked scandal by deserting and eloping with Joanna Marie Valentina (known as "Zizi") Lambrino in September 1918, although the marriage was later annulled by the Orthodox Church.

During the early 1920s, Carol appeared to have reformed, marrying Princess Helen of Greece and Denmark in March 1921 and fathering a son, Michael. However, Carol associated himself with a single political party, the National Peasants, and he played little role in running the country. Before long, he met a divorcée, Elena Lupescu, for whom he abandoned his marriage in August 1925 and went into exile in Paris, formally renouncing the throne in favor of his son. Carol's father, Ferdinand, died in 1927, and in May of the following year, Carol attempted a coup but was thwarted by British intelligence. On June 6, 1930, he successfully returned to Bucharest and disbanded the regency to seize the throne from his son.

Carol II, King of Romania, shown here in full regalia. He fled Romania in September 1940. (Library of Congress)

Carol’s reign was disastrous for Romania. He alienated the upper classes by persecuting the surviving members of his family, exiling his siblings Nicholas and Ilena and his ex-wife Helen, allowing his mistress to choose his advisers, and encouraging political gridlock by playing one political party against the other. Carol II also allowed Corneliu Zelea-Codreanu’s Iron Guard to promote fascism—at least until it began attacks on Lupescu, who was Jewish. Carol’s subsequent 1933 ban on the Iron Guard led to the assassination of two prime ministers.

After the national elections in February 1938 failed to establish a political majority for any party, Carol II declared himself dictator and named the Orthodox patriarch Miron Christea as his prime minister. Carol was unable to protect Romania from the effects of the German-Soviet Non-Aggression Pact of August 1939, however, and was forced to cede part of Transylvania to

Hungary, Bessarabia to the Soviet Union, and the southern Dobruja region to Bulgaria.

Carol II fled the country with Lupescu and the royal art collection in September 1940, leaving Michael as king again, under the control of General Ion Antonescu. Carol spent the rest of his life in exile in Brazil and Portugal. He married Lupescu in 1952 and died in Estoril, Portugal, on April 4, 1953.

Caroline Islands Campaign (February 15–November 25, 1944)

Part of the drive of U.S. forces across the Central Pacific. A widely scattered archipelago of some 680 coral islands, islets, and atolls stretching across the Pacific between the Mariana Islands and New Guinea, the Carolines were part of the German Empire prior to World War I. Japan occupied the Carolines in 1914 and, in 1920, received the islands as a League of Nations mandate. Japan also assumed control of the Marshall Islands and all of the Marianas except Guam, which was a U.S. territory.

These acquisitions dramatically increased Japanese power in the Pacific and created a potential major problem for the United States, as the Carolines straddled the sea-lanes between Hawaii and both the Philippines and China. Indeed, Japanese control of the islands spurred development of the U.S. Marine Corps amphibious warfare doctrine during the interwar period, a process that accelerated after Japan fortified the Caroline islands of Ponape, Truk, Yap, and Palau in the 1930s.

Following the Japanese attack on the United States in December 1941, U.S. forces were finally able to halt further Japanese expansion and then

assume the offensive in the Central Pacific. Japanese bases in the Solomons and Gilberts were either overrun or isolated by U.S. forces. Kwajalein Atoll, in the Marshall Islands, fell on February 3, 1944, and U.S. Fifth Fleet forces under Admiral Raymond A. Spruance accelerated preparations to capture Eniwetok (Enewetak) Atoll, also in the Marshalls, as part of a plan approved by the Combined Chiefs of Staff in December 1943. The plan called for the seizure of key islands in the Marianas as bases to support a strategic bombing campaign against Japan and for selected attacks to support the South Pacific forces of General Douglas MacArthur.

To cover the Eniwetok landings, however, U.S. planners believed that certain bases in the Carolines first had to be neutralized. Between February 15 and 26, 1944, Consolidated B-24 Liberator bombers from Major General Willis H. Hale's Seventh Army Air Force struck Ponape. The Eniwetok landings took place on February 17, and on that day and the next, aircraft carriers from Vice Admiral Marc A. Mitscher's Task Force 58 launched more than 30 raids on Truk, which served as the major forward Japanese fleet anchorage and base in the Central Pacific. Each of the raids included at least 150 planes, and together they destroyed more than 250 Japanese aircraft and some 200,000 tons of ships, including 2 light cruisers, 1 destroyer, 2 submarine tenders, 1 aircraft ferry, 6 tankers, and 17 merchant ships.

Eniwetok fell on February 22, and Mitscher's airmen carried out more attacks on Truk on April 29–30. Those attacks, combined with significant shore bombardment by Spruance's battleships, destroyed another 100 Japanese planes. The cumulative effect was so great that the Joint Chiefs of Staff chose to bypass Truk and move westward, isolating the substantial Japanese garrison there.

Between June and August, U.S. forces fought the July 19–21, 1944, Battle of the Philippine Sea and seized Saipan, Tinian, and Guam in the Marianas, then continued west to attack the Philippines. To cover the initial Philippine landings on Mindanao and Morotai, U.S. planners intended to capture both Peleliu and Yap in the Carolines for use as air bases and forward staging areas. Those plans changed, however, following the September 1944 raids on the Philippines by Mitscher's Task Force 38 of Admiral William F. Halsey's Third Fleet. Halsey found Japanese defenses so weak that he recommended bypassing Morotai, Mindanao, Yap, and Peleliu altogether and moving ahead with the attack on Leyte in October. The Joint Chiefs of Staff

agreed but decided to launch the landings on Peleliu in the Carolines and Morotai anyway, because the troops for those attacks were already embarked.

Morotai fell on September 15, the same day that U.S. troops of the 1st Marine Division landed on Peleliu and began one of the most grueling and perhaps unnecessary campaigns of the war. For the first time, the Japanese chose not to defend the beaches of an island under assault. Instead, the 5,300 defenders burrowed into the coral and prepared a main line of defense well inland. The Japanese counterattacked frequently; made use of underground tunnels, bunkers, and caves; and fought a battle of attrition in heat that sometimes reached more than 120 degrees Fahrenheit. By the time the Peleliu Campaign ended on November 25, more than 1,950 U.S. troops had been killed, and a regiment of the Army's 81st Infantry Division had been brought in as reinforcements. Whether the island needed to be taken and whether it materially aided the capture of the Philippines is extremely doubtful.

A Japanese Nakajima B6N Tenzan torpedo bomber flying through hail of antiaircraft fire to attack the aircraft carrier *Yorktown* during the U.S. raid on Truk in the Caroline Islands. (Library of Congress)

If Peleliu was a mistake, U.S. forces compensated by performing brilliantly throughout the rest of the Caroline Islands Campaign. A regimental combat team of the 81st Infantry Division took Ulithi Atoll on September 23, and in less than two weeks the U.S. Navy was utilizing its splendid large anchorage for attacks against Formosa. The rest of the 81st Infantry Division took Angaur (in Palau, near Peleliu) from 1,600 Japanese defenders on October 23, and with that the Caroline Islands Campaign came to a close.

Although no decisive battles were fought during the campaign, it was a vital stepping-stone toward victory in the Battle of the Philippine Sea and in the conquest of the Marianas and the Philippines. Ulithi became the major U.S. forward fleet anchorage for the duration of the war and played a critical role in the eventual defeat of Japan. Moreover, the strategy of island-hopping reached maturity in the Carolines, as did the evolution of the U.S. Navy's fast-attack carrier groups and the concept of refueling and replenishing at sea. In these and other subtle ways, the campaign played an integral if underappreciated role in the final outcome of the war. One measure of the success of the U.S. strategy may be found in the experience of the British naval squadron that returned to raid Truk in June 1945. By then, that island

had been so pummeled by U.S. attacks and its garrison so emaciated by isolation and lack of supplies that the British had no targets worthy of the name. Truk was little more than a prison for its defenders.

Carpenter, Arthur Schuyler (1884–1960)

U.S. Navy admiral. Born in New Brunswick, New Jersey, on October 14, 1884, Arthur Schuyler Carpenter graduated from the U.S. Naval Academy at Annapolis in 1908 and was commissioned in the navy in 1910. He served in the battleship *Minnesota* during the Great White Fleet's around-the-world cruise in 1908–1909. Carpenter also took part in the U.S. occupation of Veracruz, Mexico, in 1914.

In 1917 Lieutenant Carpenter commanded the destroyer *Fanning*, the first U.S. warship to sink a German submarine in World War I. Carpenter then commanded the destroyer *Maddox* during 1921–1922 and the *McDonough* in 1928. He was chief of staff to the Commander Destroyers in the Scouting Force during 1936–1937, commanded the cruiser *Northampton* during 1937–1939, and was then professor of naval science and tactics at Northwestern University until 1939.

Promoted to rear admiral in December 1941, Carpenter was Commander, Destroyers, Atlantic Fleet until June 1942. Promoted to vice admiral, from September 1942 to November 1943, he commanded the Southwest Pacific Force, known as "MacArthur's Navy," which, in February 1943, became the Seventh Fleet. Carpenter worked hard to alleviate supply problems and oversaw naval operations during the Battle of the Bismarck Sea (March 25, 1943) and Operation CARTWHEEL (1943–1944).

From January 1944 to March 1946, Carpenter commanded the Ninth Naval District. He then retired and was promoted to full admiral. Carpenter died in Washington, D.C., on January 10, 1960.

Carpet Bombing

The tactical application of strategic area bombing, originally used to direct a "carpet" of bombs to obliterate a target. Carpet bombing was first employed by the Germans during the 1936–1939 Spanish Civil War at Guernica in April 1937. They characterized it as "a controlled vivisectional experiment in modern bombing tactics."

By 1944, Allied carpet bombing involved heavy bombers dropping thousands of tons of relatively small bombs in an effective preparatory assault prior to a land attack. In this sense, the tactic was first utilized against Monte Cassino, Italy, on February 15, 1944. Waves of heavy and medium bombers dropped 435.5 tons of high explosives and reduced the ancient abbey to ruins. Ironically, the Germans, who had not previously garrisoned the abbey, now moved into the rubble and strengthened their defensive lines.

Following the June 6, 1944, Normandy Invasion, Allied planners envisioned using fleets of bombers to blow holes in the German defenses, through which Allied armor and mechanized forces could then pour. The British tried using heavy bombers in close air support during Operation CHARNWOOD in early July. The attempt failed largely because of poor target selection and the fact that the bombing ended hours before the British ground attack. That allowed the Germans to reorganize their defense. In Operation GOODWOOD in Normandy (July 18–20, 1944), British and American bombers tried again. After the carpet bombing, Allied ground forces met with initial success, but they foundered against a German antitank gun line that had not been a major target during the bombardment.

Operation COBRA (July 24–25, 1944) was another such bombing effort and the most significant example of carpet bombing. U.S. bombers dropped 4,169 tons of bombs on the Saint-Lô area as part of the effort to support the breakout from Normandy. The bombers struck a box that was 7,000 yards wide and 2,000 yards deep. During the first day, many of the bombs fell short, hitting U.S. frontline troops and inflicting hundreds of "friendly casualties." Among the dead was Lieutenant General Lesley J. McNair, chief of staff of Army Ground Forces. The second day's attacks were highly successful, helping Lieutenant General Omar N. Bradley's forces break out from the bocage, or hedgerow, country.

The use of strategic bombers for tactical missions such as carpet bombing met with strong resistance from leaders of the U.S. Army Air Forces (USAAF), who believed that army ground commanders were misusing airpower. They argued that the effects achieved at the tactical level were slight compared to those that could be achieved at the strategic level. The lack of priority afforded to tactical-strike support and interdiction finally forced the hand of the air commanders. Beginning in April 1944 and lasting until September, General Dwight D. Eisenhower was given control of the USAAF's strategic bombers.

Although the sight of an armada of bombers was awe inspiring and the simultaneous impact of hundreds of bombs was similar to an earthquake, the actual effect on tactical operations was mixed. The bombers lacked precision, and their bombs produced craters and rubble that impeded a rapid advance by attacking forces. The destruction of Caen in July 1944, for instance, was so complete that wheeled and tracked vehicles could not make it through the

bombed areas. Although carpet bombing in support of offensive operations raised the morale of attacking ground troops, it was a poor substitute for effective tactical air support.

Carton de Wiart, Sir Adrian (1880–1963)

British Army lieutenant general. Born on May 5, 1880, in Brussels, Belgium, Adrian Carton de Wiart briefly attended Oxford University before joining the British Army. With his reckless style of leadership, he was wounded in nearly every campaign in which he was a participant. He saw action in the 1899–1902 Boer War and in India. In November 1914 he lost an eye while fighting in Somaliland, and in May 1915 he lost a hand in the Second Battle of Ypres, though his actions in that conflict earned the Victoria Cross. One year later, he was promoted to brigadier general and became friends with Winston L. S. Churchill.

In February 1919, Carton de Wiart arrived in Poland as head of the British Military Mission and observed the Russo-Polish War (1919–1921). In 1924, he retired from the British Army and settled in Poland. Just prior to the beginning of World War II, he was recalled to British Army service and appointed head of the British Military Mission to Poland. After that country's collapse in the German invasion of September 1939, he escaped via Romania.

He stated in his memoirs that the campaign left him with an appreciation for the speed of mechanized warfare, the effect of airpower, and the peril posed by fifth columnists.

In November 1939 Carton de Wiart was assigned command of the 61st Division, and in April 1940 he took command of the Central Norwegian Expeditionary Force, tasked with securing Trondheim. Heavy air raids by the Luftwaffe prevented success, and Carton de Wiart and his troops were evacuated by the Royal Navy in early May. Afterward, he commanded the 61st Division while it trained and garrisoned Northern Ireland.

In April 1941, Carton de Wiart became head of the British Military Mission to Yugoslavia. On the way to his post, his aircraft was shot down, and he was captured by the Italians, spending the next two years as a prisoner of war. He and Lieutenant General Richard O'Connor broke out in March 1943 and enjoyed eight days of freedom before being recaptured. Carton de Wiart was repatriated to Britain in September 1943 on conclusion of the Italian armistice.

In October 1943, Prime Minister Churchill appointed Carton de Wiart as British representative to the Guomindang's (Kuomintang) Generalissimo Jiang Jieshi (Chiang Kai-shek) and as liaison between Jiang and Lord Louis Mountbatten. Carton de Wiart retired in 1946 and published his memoirs, *Happy Odyssey*, four years later. He died in County Cork, Ireland, on June 5, 1963.

Casablanca, Naval Battle of (November 8–11, 1942)

As a part of Operation TORCH, the Allied invasion of French North Africa, U.S. Navy forces commanded by Rear Admiral H. Kent Hewitt approached Casablanca, Morocco, to land army troops at Fédala and to suppress the area's strong land and naval defenses. Vichy French forces present at Casablanca included the battleship *Jean Bart* (immobile, four 15-inch guns) and the 2nd Light Squadron commanded by Rear Admiral Raymond Gervais de Lafond with the light cruiser *Primauguet,* the large destroyers *Milan* and *Albatros*, and the fleet destroyers *Fougueux, L'Alcyon, Frondeur, Brestois* and *Boulonnais.* The French also had the sloops *Commandant Delage, La Gracieuse*, and *La Grandière*, 4 patrol boats, 11 submarines, and, under repair, 3 more destroyers. A powerful coastal battery just south of Casablanca called El Hank and smaller batteries around Fédala and Casablanca aided the defense.

Hewitt's force included Task Group (TG) 34.1, under Rear Admiral Robert C. Giffen, with the battleship *Massachusetts* and two heavy cruisers, *Tuscaloosa* and *Wichita*, screened by Destroyer Squadron 8, the *Wainwright, Mayrant, Rhind*, and *Jenkins.* Their mission was to contain the French fleet in Casablanca, neutralize the *Jean Bart,* and guard against a sortie by the other modern French battleship, the *Richelieu,* that along with three light cruisers and three large destroyers was based at Dakar, 1,350 miles south. TG 34.9, directly under Hewitt's command, had the heavy cruiser *Augusta;* the light cruiser *Brooklyn;* Destroyer Squadron 26 with the *Wilkes*, *Swanson*, *Ludlow* and *Murphy;* and Destroyer Squadron 13 with the *Bristol, Woolsey, Edison, Tillman, Boyle* and *Rowan.* These ships were to provide fire support and protect the transports. TG 34.2 included the aircraft carrier *Ranger,* the escort carrier *Suwannee,* one light cruiser, and five destroyers.

The landings at Fédala commenced without a preliminary bombardment in the hope that the French would not resist. At 7:01 a.m., however, the El Hank battery opened fire, and Giffen's force replied while Douglas SBD Dauntless dive-bombers from the *Ranger* swooped down on the harbor. During a bombardment that lasted until 8:35 a.m., American warships and aircraft hit the *Jean Bart,* jamming its operational turret, and they sank three

submarines and eight commercial ships. They also damaged several other vessels. Fire from the shore batteries failed to hit the American ships.

The *Massachusetts* group had sailed beyond containment range when at 8:15 a.m. Admiral Gervais de Lafond's 2nd Light Squadron emerged from port and began to head northeast up the coast under the cover of smoke to attack the transports off Fédala. A Grumman F4F Wildcat aircraft spotted the French ships and alerted the *Augusta* and *Brooklyn*, which had been on the far side of the landing zone. While the American warships rushed to respond to this unexpected and dangerous thrust, fighters strafed the French ships, killing or wounding many topside personnel, including Gervais de Lafond, who was wounded.

At 8:25 a.m. the *Milan* engaged the American destroyers *Wilkes*, *Swanson*, and *Ludlow*, causing them to retreat and hitting the *Ludlow* hard enough to force it from the action. The French destroyers also targeted the American landing craft, sinking one and damaging another. This was the only occasion during World War II when American landing craft came under fire from enemy warships at sea.

At this point the *Augusta* and *Brooklyn* intervened, and the French, who were just 7,000 yards from the nearest transports, turned back toward Casablanca in hopes of drawing the American cruisers within range of El Hank's heavy guns. Meanwhile, the *Massachusetts* had returned and opened fire at 9:18 a.m., but smoke and equipment malfunctions made it difficult for the Americans to find targets, and neither side registered hits. Assuming that Giffen's ships had the situation in hand, the *Augusta* and *Brooklyn* returned to their screening duties. Finally, at 9:40 a.m. a 16-inch shell disabled the *Fougueux* and, six minutes later an 8-inch round from the *Tuscaloosa* slammed through the *Frondeur*'s bridge.

At 10:00 a.m. the guns at El Hank landed a 194mm shell on the *Massachusetts*, but it did little damage. Shortly thereafter the battleship narrowly dodged a spread of four torpedoes launched by the French submarine *Méduse.* Despite these distractions, the *Massachusetts* disabled the *Milan* before ceasing fire at 10:16 a.m. and heading west.

The French destroyers *Boulonnais* and *Brestois* noted the battleship's withdrawal and lunged toward the transports. This caused the *Augusta,* the *Brooklyn,* and three destroyers to return to the fight. At 10:12 a.m., after dodging more submarine torpedoes, the *Brooklyn*'s rapid-firing 6-inch guns

crippled the *Boulonnais,* forcing its crew to abandon ship. An 8-inch round from the *Augusta* penetrated the *Brestois,* and at 10:20 a.m. three rounds struck the *Primauguet.*

All this activity caused the *Massachusetts* to reverse course, and at 10:30 a.m. the battleship lofted a salvo at the French from 30,000 yards. Over the next half hour the two forces traded salvos through smoky skies. The *Albatros* hit the *Brooklyn* and the *Primauguet* hit the *Massachusetts,* but in each case little damage was done.

At 11:03 a.m. the *Massachusetts* ceased fire to conserve ammunition in case the *Richelieu* appeared. The *Tuscaloosa* and *Wichita,* however, continued to press the French. The *Boulonnais* sank at 11:10 a.m., and 15 minutes later an 8-in shell disabled the *Frondeur.* At 11:28 a.m. a round from El Hank punched through the *Wichita;* two minutes later, a shell damaged the *Primauguet*'s boiler room. U.S. aircraft, meanwhile, continued to harass the French ships. At 11:40 a.m. they bombed the *Primauguet* and *Albatros,* and F4Fs circled, taking turns strafing the gravely damaged warships. At 11:46 a.m. a bomb burst alongside the *Brestois* and caused serious flooding.

At 11:50 a.m. the *Tuscaloosa* and *Wichita* disappeared southwestward in pursuit of a rumored enemy cruiser. French sloops and a tug used the respite to rescue survivors. Their presence inspired another intervention by the *Augusta* and *Brooklyn* until 1:56 p.m., when aircraft reported that all the French ships were out of action. The *Primauguet, Milan,* and *Albatros* were heavily damaged; the *Fougueux* and *Boulonnais* sank offshore; and the *Frondeur* and *Brestois* limped back to port, where they capsized the next day. Only *L'Alcyon* remained operational.

In this battle American aircraft effectively supported their ships while French shore batteries and submarines failed in their role as potential equalizers. The battle lasted so long because the American admirals had too many jobs to perform any effectively, and they did not effectively coordinate their activities.

On November 10 the final events in the naval Battle for Casablanca occurred. At 10:10 a.m. three French sloops sortied to support troops defending the city, and the *Augusta,* with four destroyers, intervened. The *Jean Bart* had cleared the turret jammed two days before, and at 11:46 a.m. the battleship opened fire from 17,500 yards. As the *Augusta* fled, making smoke, the *Jean Bart* fired eight more two-gun salvos to a distance of 29,000

yards, narrowly missing the cruiser. Then the *Ranger*'s aircraft appeared and dropped nine 1,000-pound bombs; two struck and cratered the battleship's deck. This knocked the *Jean Bart* out of action for good. Casablanca surrendered the next day.

Casablanca Conference (January 14–24, 1943)

Important Anglo-American strategic planning conference held in Morocco. Following the successful Allied landings in North Africa and the breakout of the British Eighth Army at El Alamein, British prime minister Winston L. S. Churchill, U.S. president Franklin D. Roosevelt, and the Combined Chiefs of Staff met at Casablanca, Morocco, between January 14 and 24, 1943. Soviet leader Joseph Stalin was invited but declined to attend, citing the pressure of ongoing military operations.

The conference was code-named symbol and took place in a hotel complex in Anfa, a suburb of Casablanca. The principal topics of discussion were strategic military options once North Africa had been cleared of Axis troops. The British, who arrived at the meetings far better prepared than the Americans, made a strong case for invasions of Sicily and then the Italian Peninsula. The Americans, who preferred concentration on a cross-Channel invasion of France, reluctantly acceded. "We came, we listened, and we were conquered," remarked U.S. major general Albert Wedemeyer.

The Allied leaders at Casablanca also took another important step in deciding to launch a combined bomber offensive against Germany. On the

day the conference opened, the survivors of a special convoy from Trinidad arrived at Gibraltar. The convoy's devastating losses to German U-boats—77 percent—forced the two Allied leaders to assign priority to winning the Battle of the Atlantic. They agreed to divert to that struggle additional convoy escorts, escort carriers, and aircraft assets (including the VLR [very long range] Consolidated B-24 Liberator, which would, for the first time, be based at Newfoundland to close the Greenland "air gap").

U.S. president Franklin Roosevelt, with British prime minister Winston Churchill at his side, addressing assembled war correspondents at Casablanca, Morocco, and announcing that the Allies would insist on unconditional surrender, January 24, 1943. (Library of Congress)

But the Casablanca Conference is chiefly remembered for Roosevelt's surprise announcement that the Allies would insist on "unconditional surrender." Churchill, who had not been informed that the announcement would be made, nonetheless immediately supported it. Some have charged that this decision needlessly prolonged the war by preventing negotiations with factions in the German resistance to Adolf Hitler that might have led them to topple his regime. Certainly, the declaration was a windfall for the German propaganda machine. In making the announcement, though, Roosevelt had in mind World War I and the way the German Right had

utilized the November 1918 armistice to spread the myth that Germany had not been defeated militarily. That had been a powerful assist in Hitler's rise to power.

Another aspect of the Casablanca Conference concerned relations with the French. General Charles de Gaulle, leader of the Free French, was not informed of the meeting beforehand; Churchill simply ordered him to Morocco, which was then still a French protectorate. Roosevelt and Churchill pushed de Gaulle into a partnership with General Henri Giraud, who had been spirited out of France by submarine. De Gaulle, already upset because Britain had undermined the French position in Syria and Lebanon, was eventually able to elbow the politically inept and equally stubborn Giraud into the shadows. However, the whole affair negatively affected de Gaulle's attitude toward Britain and the United States.

Cash-and-Carry (November 1939)

U.S. program to allow nations that were victims of aggression to purchase American-made arms to fight the Axis powers. In July 1936, civil war broke out in Spain, and a year later, the Second Sino-Japanese War began. In May 1937, the U.S. Congress passed the Neutrality Act, which committed the nation to "permanent neutrality." The act revamped existing neutrality

legislation to include a prohibition on the sale of arms or munitions to either side in a civil war as well as a declared war between states. Travel by U.S. citizens on belligerent ships was made illegal, no longer just cautioned against as something undertaken at the passenger's risk. Well aware of the financial impact of trade, Congress provided that the president would draw up a list of certain strategic raw materials, such as oil, that were to be paid for on delivery and then transported on ships belonging to the belligerent power. Thus was born the phrase "cash-and-carry." These provisions were to last for two years.

On September 1, 1939, Germany invaded Poland, beginning World War II in Europe. Public sentiment in the United States demanded that the country stay out of the conflict but also generally favored assistance to the states fighting Germany, Italy, and Japan. In any case, the cash-and-carry provisions of the 1937 act had expired in May 1939, with the consequence that U.S. merchant vessels were free to sail into the war zones, albeit with the possibility that they would be sunk. The Western democracies, however, could not purchase arms in the United States.

On October 27, 1939, the U.S. Senate voted 63 to 31 to repeal the embargo on arms to belligerents, and a week later, the House of Representatives followed suit, with a majority of 61 votes. Under the November 1939 act, though, cash-and-carry remained in effect. The United States could now sell war materials to belligerents provided that they could pay cash for the goods and transport them in their own vessels. This act was, in fact, a compromise: the noninterventionists yielded on the arms embargo to secure the provision preventing U.S. ships from sailing into the war zones, and the interventionists accepted the latter to secure an end to the ban on arms sales.

The terms were intentionally crafted to favor the Atlantic sea powers that possessed merchant and naval forces to transport the material. To remain within the legal bounds of American neutrality, though, cash-and-carry was extended to all belligerents, both Axis and Allied, that could meet the specific requirements of the act. Japan was thus able to take advantage of its provisions—until the U.S. government embargoed war goods and froze Japanese assets in 1941, precipitating Tokyo's decision to launch an attack on the United States.

British prime minister Neville Chamberlain informed U.S. president

Franklin D. Roosevelt that he thought the November 1939 act would have a "devastating effect upon German morale," but that was hardly the case, as U.S. factories were only just beginning to produce quantities of weapons. The act also opened up the dilemma of how to allot the few weapons that were being produced. U.S. rearmament was barely under way at that point, and the armed services would have to compete with the Western democracies for American weapons. Many Americans also opposed the act because it provided assistance to the Soviet Union, and the legislation became an issue in the 1940 presidential campaign.

Cassino/Rapido River, Battles of (1944)

A series of engagements between the Allies and Germans for control of Monte Cassino, a mountain strategically located at the entrance of the Liri Valley in Italy. The site of a Benedictine abbey established in 529 CE, Monte Cassino formed an important part of the German Gustav Line, a set of defensive positions stretching across the Italian Peninsula and blocking the Allied approach to Rome.

Following up on the Allied success on Sicily in July and August 1943 (Operation HUSKY), the American Fifth Army landed at Salerno, a city on the western coast of Italy, on September 9, 1943 (Operation AVALANCHE), and began to push north. With rugged mountain ranges, heavy rains, and stiff German resistance barring the advance, Allied progress was slow. In late 1943, having broken through the Volturno Line (a German defensive line anchored on the Volturno River), the Allies found themselves up against the

Gustav Line. To force the German commander, Field Marshal Albert Kesselring, to fight in two directions (west and south), Fifth Army commander Lieutenant General Mark Clark planned Operation shingle, an amphibious landing at Anzio/Nettuno, north of and behind the Gustav Line. By landing at Anzio/Nettuno with a corps, Clark believed it would be possible to turn Colonel General Heinrich von Vietinghoff's Tenth Army out of the Gustav Line, thus opening the Liri Valley and the routes to Rome.

To prepare for the landing of Major General John Lucas's American VI Corps and its subsequent linkup with the Fifth Army, Clark ordered attacks by the British X Corps and the U.S. II Corps. To seize key heights to protect the southern flank of II Corps as it began its attack up the Liri Valley, Lieutenant General Richard McCreery's X Corps assaulted across the Garigliano River on January 17, 1944. Failing to cross the river, the British attacked once more two days later but did not achieve their objectives. As a result, Major General Geoffrey Keyes's II Corps would assault across the Rapido River with its left flank exposed.

Keyes's plan to attack into the Liri Valley was simple. The 36th Infantry Division would move forward, with two regiments abreast, roughly three miles downstream from the town of Cassino; the 34th Infantry Division would attack with three regiments abreast north of Cassino. Beginning their strike on January 20, the Americans immediately encountered stiff resistance from General of Panzer Troops Fridolin von Senger und Etterlin's German XIV Corps.

Throughout the night of January 20, the Americans struggled to find their way through minefields, cross the river in rubber rafts and canvas boats, and erect footbridges. Sunrise the next morning exposed the Americans to accurate German artillery and rocket fire. Concerned with his losses, the 36th Infantry Division commander, Major General Fred Walker, prevailed on Keyes to delay a renewed effort until after dark. Attacking again on the evening of January 21, the 36th Infantry Division suffered heavy losses without establishing a lodgment on the far side of the Rapido. Against Keyes's wishes, Clark authorized Walker to halt the attack on the morning of January 22.

With the 36th Infantry Division stalled, Clark now intended to envelop Cassino from the north. Attacking on January 25 with the 34th Infantry Division and units of General Alphonse Juin's French Expeditionary Corps,

the Allies soon ground to a halt. Once again, the soggy ground, a strong current, and determined German resistance frustrated Clark's efforts to capture Cassino. Over the next several days, the 34th Infantry Division, including the Nisei 100th Infantry Battalion, inched its way up and over the heights north of Cassino but was unable to capture the abbey or the town. By February 11, the II Corps attack was spent, and the task of opening the Liri Valley fell to Lieutenant General Bernard Freyberg's New Zealand II Corps.

Believing that the only way to capture Cassino was to eliminate the abbey from the commanding heights above the town, Freyberg received permission to bomb it, and on February 15, waves of bombers dropped 435.5 tons of high explosives, reducing the abbey to ruins. Although the Germans had not previously garrisoned the abbey, its destruction allowed them to position troops amid the rubble and to strengthen their lines. Launching Operation AVENGER on February 15, Freyberg's subordinates, facing the same problems the Americans had earlier, fought with little success to capture Monte Cassino. Frustrated by his lack of progress, Freyberg ordered a halt to AVENGER after three days.

Freyberg set the next attack for February 24. Called Operation DICKENS, the attack comprised two infantry divisions and a tank regiment. Believing that a direct approach would prove more effective, Freyberg planned to attack frontally into the town of Cassino, but heavy rains delayed the operation until March 15. Following the Italian Campaign's first massive carpet bombing, Freyberg's troops engaged in heavy fighting within the town and on the surrounding heights. For the next 10 days, the New Zealand II Corps fought in close combat amid the ruins of Cassino with little effect. Because Freyberg failed to commit his reserves in a decisive manner, his conduct of the operation resulted in the heavy casualties he had hoped to avoid. By March 24, the New Zealand II Corps attacks had halted, with the Germans still in possession of portions of Cassino and the abbey's ruins.

By mid-April, the Polish II Corps, commanded by Lieutenant General Władysław Anders, began to move into the line opposite Cassino. As part of an Allied deception plan, activity along the Gustav Line almost completely ceased. On May 11, the Allies attacked with the Fifth Army and the British Eighth Army; although the offensive caught the Germans by surprise, casualties among the Poles were still high. The Fifth Army's progress south of Cassino in the Liri Valley, however, rendered Monte Cassino unimportant

to the Germans' defense. On the evening of May 17, the defenders withdrew, and the next day, the Polish II Corps occupied Monte Cassino, completing a four-month battle for the heights. Allied casualties numbered some 120,000; the Germans sustained almost 130,000.

The Allied effort to crack the German Gustav Line saw some of the most bitter fighting of the war in extremely difficult conditions. Monte Cassino guarded the entrance to the Liri Valley and the decision to bomb the 6th century Benedictine monastery atop the mountain was one of the most controversial of the war. Casualties

World War II exacted a heavy toll on the combatant nations and the world community. Although figures vary widely based on the sources employed, perhaps 50 million servicemen and civilians were killed in the course of the conflict. World War II was thus the most destructive war in human history (see Table 1).

In terms of combat losses for the principal Allied powers, the Soviet Union officially had 8,668,400 military personnel killed. The majority of these were in the army, as the Soviets bore the brunt of the fighting on land against Germany. The United States, Great Britain, and France sustained far fewer losses, although in relative terms, given their smaller populations, the impact was still high. Of these powers, Great Britain's armed forces had 397,762 men killed. This figure includes losses incurred by imperial and Commonwealth forces: Canada sustained 37,476 deaths, India 24,338, Australia 23,365, New Zealand 10,033, and South Africa 6,840. The United States suffered 292,129 battle deaths, and the French lost 213,324 servicemen. The latter figure includes Free French forces.

China suffered 3–4 million military deaths, but civilian casualties may have raised the total figure to 20 million. Some sources suggest that total Chinese deaths as a result of the war may have reached 50 million.

Smaller Allied powers also lost heavily in comparison to their populations. Poland had 320,000 killed, and Greece lost 73,700. The Netherlands lost 6,238 servicemen. Belgium's armed forces lost 7,760 men. The dead of Norway totaled 4,780, and Denmark's losses were 4,339, a figure that includes merchant sailors in the service of other Allied navies.

The principal Axis powers had significantly fewer casualties than did the Soviet Union, but their populations were also much smaller. Germany, which waged a two-front war, suffered the most, with 2,049,872 dead. Japan

sustained 1,506,000 deaths, and Italy lost 259,732 men. This number includes some 17,500 men killed in battle after that nation declared itself a cobelligerent of the Allies.

The other Axis powers endured heavy losses as well. Romania suffered greatly with 300,000 men killed, most of these incurred while the country was an Axis power but a small number being deaths suffered after it joined the Allies late in the war. Hungary lost 147,435 men, and Finland's dead numbered 79,047 soldiers, sailors, and airmen. Bulgaria, initially an Axis power, suffered 10,000 deaths, with some of these individuals being in the service of the Allies late in the war.

Civilian deaths greatly increased the human toll, as the age of total warfare embraced the civilian sector, too. Total Soviet deaths in the war (including battle deaths) may have reached as high as 50 million, although some of these were self-inflicted. Allied bombing raids claimed the lives of some 410,000 German civilians. Air attacks on the home fronts of other nations also carried a heavy cost. In Japan, about 500,000 people lost their lives, whereas Great Britain suffered 92,673 deaths.

Wounded Americans being removed from Munda Point, New Georgia Island, in a landing craft, July 1944. (National Archives)

Adding to civilian figures were atrocities committed against civilians. Chief among these was the Holocaust, the German campaign to exterminate Europe's Jewish population. The Holocaust claimed an estimated 6 million Jews; half of this number were Polish citizens, and some 1.2 million came from the Soviet Union. Several million Romas (Gypsies), communists, religious and political dissidents, homosexuals, and disabled people were also systematically exterminated by the Nazis. Hungary's figure for Jewish deaths was 450,000, and Romania's total reached 300,000. The Baltic states lost 228,000 of their citizens. Germany sent 210,000 of its own people to their deaths. The Japanese also committed widespread atrocities in China and elsewhere in Asia. In all, World War II may have claimed 15 million deaths in battle, with 25 million wounded. Civilian deaths were in excess of 45 million.

Table 1. Casualty Figures for World War II

	Battle Deaths	*Wounded*	*Missing in Action*	*Civilian Dead*
Allied Powers				
Australia	23,365	39,803	32,393	—
Belgium	7,760	14,000	—	76,000
Canada	37,476	53,174	10,888	—
China	1,324,516	1,762,006	115,248	1,000,000
Denmark	4,339	—	—	1,800
France	213,324	400,000	—	350,000
Great Britain	397,762	348,403	90,188	92,673
Greece	73,700	47,000	—	325,000
India	24,338	64,354	91,243	—
Netherlands	6,238	2,860	—	200,000
New Zealand	10,033	19,314	10,582	—
Norway	4,780	—	—	7,000
Poland	320,000	530,000	420,760	3,000,000
South Africa	6,840	14,363	16,430	—
Soviet Union	8,668,400	14,685,593	4,559,000	14,012,000
United States	292,129	670,846	139,709	6,000
Axis Powers				
Bulgaria	10,000	21,878	—	10,000
Finland	79,047	50,000	—	11,000
Germany	2,049,872	4,879,875	1,902,704	410,000
Hungary	147,435	89,000	170,000	285,000
Italy	259,732	77,494	350,000	146,000
Japan	1,506,000	500,000	810,000	500,000
Romania	300,000	—	100,000	200,000

Note: Dashes indicate that figure is unknown.

Other Price of Hitler's War: German Military and Civilian Losses Resulting from World War II (New York: Greenwood, 1986).

The aftermath of World War II claimed additional victims. Some of these losses were the result of efforts by the Soviet Union and other Eastern and Central European governments to drive out their German minorities. Perhaps 2 million of the 14 million ethnic Germans who had been living in Eastern Europe died in the course of this expulsion. The final legacy of the war was an estimated 20 million people displaced by the conflict, some of whom perished from simple lack of food or shelter.

In addition to the death totals, large numbers of people were wounded, many of them seriously. These casualties, too, imposed a heavy financial toll on all combatant states after the war. Finally, it should be noted that death tolls in the war would have been much higher except for new miracle drugs and blood plasma.

CATAPULT, Operation (July 1940)

British Royal Navy operation, beginning on July 3, 1940, to neutralize, seize, or, if necessary, destroy French Navy warships, which British leaders feared would fall into German hands. In 1940, the French Navy was the second most powerful in Europe and had many modern warships. With the defeat of

France and the German capture of its Atlantic ports, a number of French warships ended up in British harbors; by July 3, these included the old battleships *Courbet* and *Paris,* one superdestroyer leader, two destroyers, six torpedo boats (called light destroyers by the French), and numerous other small warships. Many more ships remained in French ports, however.

When the French entered into armistice talks with the Germans, British prime minister Winston L. S. Churchill and the War Cabinet became concerned over the final disposition of the French fleet. Although the commander of the French Navy, Admiral Jean Darlan, had promised that France would scuttle the fleet rather than see it fall into German hands, Britain's leaders were not certain that would be the case. With a German invasion of Britain looming, Churchill was determined to neutralize the French fleet. Such a dramatic action would also demonstrate to the Americans the British determination to continue in the war.

The armistice terms allowed the French government to retain control of the fleet, but it was to be disarmed, mostly at the French naval base of Toulon and also at colonial French ports. At that time a majority of the French ships were in North Africa, at the ports of Mers-el-Kébir, Oran, Algiers, Bizerte, Alexandria, or elsewhere overseas. The almost completed and powerful battleships *Richelieu* and *Jean Bart* had escaped France and were at Dakar and Casablanca, respectively. At Mers-el-Kébir, there were the two fast battleships, the *Dunkerque* and *Strasbourg;* the two older modernized battleships *Provence* and *Bretagne;* the seaplane tender *Commandant Teste;* and some large destroyers and miscellaneous warships. Oran served as base to seven destroyers, and Algiers had six modern light cruisers.

Despite some opposition, the War Cabinet approved Operation CATAPULT to carry out the "simultaneous seizure, control or effective disablement or destruction of all the accessible French Fleet." French naval commanders were offered a series of options: they could join Britain and continue the fight, they could sail their ships to a neutral port and be disarmed there, or they could scuttle their ships. If French commanders rejected these options, the British naval commanders were under orders to open fire and sink the French ships.

The plan, which unfolded on July 3, met with considerable success in those areas under British control. At Portsmouth, the British seized the old French battleship *Courbet,* along with other small vessels. At Plymouth, they

secured the battleship *Paris*, 2 destroyers, 1 torpedo boat, and 3 sloops. There they also took the *Surcouf*, the world's largest submarine. Three submarines and other craft were secured from the ports of Falmouth and Dundee. In their home ports, the British secured almost 200 small warships, including minesweepers, tugs, submarine chasers, and trawlers. The vessels were taken at a cost of 3 sailors killed (2 British and 1 French). Later, 3,000 of the ships' 12,000 officers and sailors joined the Free French. Also seized were French merchant ships and their crews.

CATAPULT was also successful in the West Indies. Prolonged talks involving the British, French, and Americans led to the internment of the aircraft carrier *Béarn* and two light cruisers at Martinique.

At Alexandria, Vice Admiral Sir Andrew Cunningham negotiated with Vice Admiral René Émile Godfroy, who commanded a French squadron consisting of the rebuilt World War I–era battleship *Lorraine;* the heavy cruisers *Duquesne, Tourville*, and *Suffren;* the light cruiser *Duguay-Trouin;* three destroyers; and one submarine. In deft negotiations, Cunningham managed to secure an agreement that the French ships would be disarmed and their fuel emptied. Some of the sailors were also repatriated to France.

The operation was not so effective farther west in the Mediterranean. At Mers-el-Kébir, the French refused to yield and fought a battle with Vice Admiral James Somerville's newly formed Force H from Gibraltar. In the action, the French battleship *Bretagne* blew up and sank. The *Provence* was also badly damaged and beached itself; the battleship *Dunkerque* ran aground. In this battle, 1,297 French seamen died; another 351 were wounded. During the battle, however, the *Strasbourg* and four of the large destroyers broke free and escaped. There was also fighting at Dakar, where a small British squadron built around the tiny aircraft carrier *Hermes* damaged the battleship *Richelieu* on July 8.

Because of CATAPULT, the collaborationist Vichy French government severed diplomatic relations with Britain. The German government also lifted demobilization requirements for the French fleet and elements of its air force, and the French then mounted several largely ineffectual air strikes against Gibraltar. On July 26, London declared a blockade of metropolitan France and French North Africa, although it was never heavily enforced.

Those who had opposed CATAPULT believed that it would drive a wedge between the two former allies; they also expected France to honor its pledge

to Britain to scuttle the fleet if necessary. In these beliefs, they were quite correct. Yet despite their sharp animosity toward Britain for launching CATAPULT—which lingers to this day—the French honored their pledge. In November 1942 following the Allied landings in North Africa (Operation TORCH), the French scuttled their ships when the Germans tried to secure them at Toulon. Operation CATAPULT was one of the most tragic aspects of the war.

Catholic Church and the War

The Catholic Church's record in World War II, particularly its assistance to Jews and resistance to the Holocaust, or lack thereof, has generated intense controversy. Individual Catholics certainly acted with considerable bravery in opposing Nazi agendas. Archbishop Clemens August Graf von Galen of Münster, Germany, condemned Germany's euthanasia program from the pulpit in 1941, which led Adolf Hitler to suspend mass killings. So-called mercy killings continued on a smaller hidden scale, however. Other Catholics hid Jews and served bravely in the Resistance in France or as chaplains at the front (more than 3,000 in the U.S. Army alone). Yet the Vatican refused to issue official statements condemning the Holocaust, fearing retaliation against Catholic laypeople and clergy within Germany. In an exercise in poor timing, moreover, the Vatican extended diplomatic relations to Japan early in 1942, at the high tide of Japanese aggression in Asia and the Pacific.

In part, nationalist loyalties constrained the Vatican and proved more powerful, if not more resilient, than supranational Catholicism. In the Nazi puppet state of Croatia, headed by Roman Catholic priest Jozef Tiso, Franciscan monks and ultranationalist priests lent their moral authority to the murder of tens of thousands of Jews and Orthodox Serbians in 1941. A few priests even joined in the killing. Meanwhile, anti-Bolshevism drove many European priests to support the Nazi "crusade" against the Soviet Union. Traditional expressions of biblical anti-Semitism and consistent opposition to Zionism tended to inhibit sympathy for Jews.

Ultimately, Pope Pius XII was responsible for exercising and enforcing the church's moral authority, and evidence indicates that he was a Germanophile. As a cardinal, he had negotiated the 1933 concordat between the Vatican and Nazi Germany that gave the Holy See tighter control over independent-minded German Catholics. It also gave Hitler important international recognition and a freer hand in Germany, as it led to the dissolution of Germany's Catholic Center Party.

In the invasion of Poland in September 1939, the Nazis revealed their murderous nature. Polish priests were either murdered or deported to concentration camps. In the Warthegau region alone, the Nazis killed more than 300 priests. Apparently concluding that official condemnations would goad the Nazis to further excesses, Pius XII remained silent. After failing to protest the mass murders of priests, it was not surprising that the pope, who knew of the mass murders of the Jews by mid-1942, nevertheless refused to condemn these crimes officially.

Pius XII was too cautious, and his well-intentioned attempts at behind-the-scenes diplomacy proved ineffectual. Critics have cited his reluctance to identify the Jews as victims (he preferred the pusillanimous term "unfortunate people") to suggest that he was an uncaring anti-Semite. Such accusations are unjust, however. Guided more by concerns about the preservation of the church hierarchy and the physical survival of Rome, Pius XII failed to lead morally and speak authoritatively. Exaggerated caution and the belief that communism was an even greater threat to the Catholic Church than Nazism, rather than anti-Semitism, accounted for his reluctance to remonstrate against Nazi war crimes.

In March 1998, Pope John Paul II issued a document titled "We Remember: A Reflection on the Shoah." Although it called for Catholics to

repent if they had known about the Holocaust yet failed to act, this document absolved Pius XII of blame and praised him for resolute diplomacy that reputedly led to the salvation of hundreds of thousands of Jews. Controversy nevertheless continues today on whether Pius XII should be beatified and made a saint or vilified as "Hitler's pope." A middle ground does exist between hagiographers, on the one hand, and scandalous and carping caricaturists, on the other.

Catroux, Georges Albert Julien (1877–1969)

Free French general and colonial administrator. Born on January 29, 1877, at Limoges, France, Georges Albert Julien Catroux was the son of a general and spent much of his youth in the Middle East. He graduated from the French Military Academy at Saint-Cyr in 1898, was assigned to the French Foreign Legion, and served in North Africa. During World War I, Catroux was wounded and captured on the Western Front while commanding a company of Algerian *tirailleurs* (riflemen). Between the wars, he returned to colonial service, becoming a general of army and commanding XIX Corps in Algeria in 1938. In 1939, Catroux's advocacy of sweeping military reforms led chief of staff General Maurice Gamelin to place him on the reserve list.

In August 1939, Catroux, known for his relatively liberal views regarding colonialism, was sent to Indochina as governor-general. He was one of only

two overseas commanders who rejected the June 1940 armistice with Germany. Following the French military defeat, Catroux came under intense Japanese pressure for base rights in northern Indochina, which the Vichy government conceded in late August 1940 in exchange for Japanese recognition of French sovereignty over the colony. Ordered back to France on July 26, 1940, he led an unsuccessful colonial anti-Vichy revolt before joining Charles de Gaulle's Free French forces in London in September, the most senior French officer to transfer allegiance.

When British forces took Vichy-held Syria in June 1941, Catroux became the Free French delegate general for the mandates of Syria and Lebanon and promised the area's postwar independence, pledges that de Gaulle declined to endorse. Deeply involved in the complicated maneuverings between Vichy and Free French representatives in Algiers after the November 1942 Allied landings, in which the Free French eventually prevailed, Catroux was designated to establish control over all French colonial forces. Although he stalwartly supported de Gaulle, he lamented his leader's ferocious quarrels with the British.

In June 1943, Catroux became commissioner for Muslim affairs throughout the French colonies. Appointed governor of Algeria in June 1944, he began extending French citizenship to Algerian Muslims. In September, he was named French minister for North Africa.

After the war, Catroux spent the years between 1945 and 1948 as the French ambassador to Moscow. In 1954, he presided over France's inquiry into the loss of Indochina. In 1956, he became governor-general of Algeria but resigned after four days when reactionary European colonists objected to his proindependence views. A de Gaulle confidant during the general's 1953–1958 exile, Catroux chaired the court-martial in 1961 that condemned those French generals who rebelled against de Gaulle's instructions to cease hostilities in Algeria. Catroux died in Paris on December 21, 1969.

Caucasus Campaign (July 22, 1942–February 1943)

German military campaign, dubbed Operation EDELWEISS, to capture the rich Caspian oil fields. Although the offensive was unsuccessful, the territory taken in this operation represented the farthest points to the east and south reached by the German Army during the war.

The great German summer offensive, Operation BLAU (BLUE), opened on June 28. General Erich von Manstein had argued for a concentration in the center of the front. He believed that Soviet leader Joseph Stalin would commit all available resources to save Moscow and that this approach offered the best chance of destroying the Red Army; it would also result in a more compact front. German leader Adolf Hitler rejected this sound approach and instead divided his resources. In the north, he would push to take Leningrad, still under siege, and link up with the Finns. But the main effort would be Operation BLAU to the south, with the ultimate prize the Caucasus oil fields located near Baku, Maikop, and Grozny. Securing these would severely cripple Soviet military operations while aiding those of Germany.

Hitler ordered Field Marshal Fedor von Bock's Army Group South to move east from around Kursk and take Voronezh, which fell to the Germans on July 6. Hitler then reorganized his southern forces into Army Groups A and B. Field Marshal Siegmund Wilhelm List commanded Army Group A, the southern formation; Colonel General Maximilian von Weichs had charge of the northern formation, Army Group B.

Hitler's original plan was for Army Groups A and B to cooperate in a great effort to secure the Don and Donets Valleys and capture the cities of Rostov and Stalingrad. The two could then move southeast to take the oil fields. The Germans expected to be aided by the fact that most of the region was inhabited by non-Russian nationalities, such as the Chechens, whose loyalty to the Soviet government was suspect.

On July 13 Hitler ordered a change of plans, now demanding that Stalingrad, a major industrial center and key crossing point on the Volga River, and the Caucasus be captured simultaneously. This placed further strains on already inadequate German resources, especially logistical support. The twin objectives also meant that a gap would inevitably appear between the two German army groups, enabling most Soviet troops caught in the Don River bend to escape eastward.

On July 22, Army Group A's First Panzer and Seventeenth Armies assaulted Rostov. Within two days, they had captured the city. A few days later, the Germans established a bridgehead across the Don River at Bataysk, and Hitler then issued Führer Directive 45, initiating EDELWEISS. He believed that the Red Army was close to defeat and that the advance into the Caucasus should proceed without waiting until the Don was cleared and Stalingrad had fallen. The operation was a classic case of strategic overreach.

Securing the mountain passes of the Caucasus region between the Black and Caspian Seas was crucial in any operation to take the oil fields. To accomplish this task, Army Group A had special troops trained for Alpine operations, including the Seventeenth Army's XLIX Mountain Corps. Supporting Army Group A's eastern flank was Army Group B's Fourth Panzer Army.

At the end of July, List had at his disposal 10 infantry divisions as well as 3 panzer and 2 motorized divisions, along with a half dozen Romanian and Slovak divisions. Hitler expected List to conquer an area the size of France with this force. Despite these scant German and allied forces, the Soviets had only scattered units available to oppose the German advance. On July 28, the Soviets established the North Caucasus Front, commanded by Marshal Semen Budenny, and Stalin ordered his forces to stand in place and not retreat. But even reprisals failed to stem the Soviet withdrawal before Army Group A's rapid advance, which had all the characteristics of a blitzkrieg. Indeed, the chief obstacles to the German advance were logistical, created by the vast distances involved and terrain problems. The Germans used aerial resupply where possible and also horses and camels to press their advance.

By August 9, the 5th SS Panzer Division had taken the first of the Caucasus oil fields at Maikop. To the west, infantry and mountain formations of the Seventeenth Army had made slower progress, but also on August 9, they took Krasnodar, capital of the rich agricultural Kuban region. They then

moved in a broad advance into the Caucasus Mountains, with the goal of taking the Black Sea ports of Novorossiysk, Tuapse, and Sukhumi. Soviet forces meanwhile continued to fall back into the Caucasus. As Budenny's North Caucasus Front prepared to defend the Black Sea ports, the Soviets sabotaged the oil fields, removing much of the equipment and destroying the wellheads. So successful was this effort that there would be no significant oil production from the region until after the war.

By the end of August, the German advance had slowed to a crawl. For the Seventeenth Army, the problems were terrain and stiffening Soviet resistance. Bitter fighting occurred in Novorossiysk beginning on August 18, when the Germans threw six divisions against the city. It fell on September 6, although the Soviets managed to evacuate their defending marine infantry by sea.

To the east, the advance of the First Panzer Army, pushing toward the oil fields at Grozny, also slowed. Problems there were largely logistical, with a serious shortage of fuel impeding forward movement. In addition, Hitler was gradually siphoning off the First Army's strength, including two divisions, some of its artillery, and most of its air support, to the cauldron of Stalingrad. Weather now became a factor, with the first snowfall in the mountains on September 12. Displeased with the progress of his forces in the Caucasus and despite List's objections, Hitler assumed personal control of Army Group A on September 10 and sacked List.

Hitler's plan proved far too ambitious for the assets committed. The weather had become a critical concern, as did continuing German logistical problems. The Soviets meanwhile were able to feed additional resources into the fight. On October 14, the Germans suspended offensive operations in the Caucasus except for the Seventeenth Army efforts on the Terek River and around Tuapse. The Germans took Tuapse several days later but then called a halt to offensive operations on November 4.

Events at Stalingrad now took precedence. By the end of November, Soviet forces had encircled the German Sixth Army at Stalingrad, and Soviet successes there placed the Axis forces in the Caucasus in an untenable situation. Then on November 29, the Soviet Transcaucasus Front launched an offensive of its own along the Terek. The Germans repulsed this attack, but on December 22, German forces began a withdrawal from positions along the Terek River. At the end of December, with the situation to the north growing more precarious daily, Hitler reluctantly ordered Army Group A to withdraw. This movement began in early January, with Soviet forces unable seriously to disrupt it. By early February, German forces had withdrawn to the Taman Peninsula, from which Hitler hoped to renew his Caucasus offensive in the spring. In October 1943, however, German forces there were withdrawn across Kerch Strait into the Crimea.

Germany's Caucasus Campaign turned out to be a costly and unsuccessful gamble. Ultimately, by splitting his resources between Stalingrad and the Caucasus, Hitler got neither.

Cavagnari, Domenico (1876–1966)

Italian Navy admiral. Born on July 20, 1876, at Genoa, Italy, Domenico Cavagnari graduated from the Italian Naval Academy in 1895 and served as a destroyer captain in World War I. In 1933, Italian dictator Benito Mussolini named him both undersecretary of the navy and naval chief of staff, offices that over time Cavagnari would use to position the navy more favorably within the fascist regime, forestall developments in naval aviation, and assert the peculiar ethos of the harbor-bound "fleet in being" as a passive naval deterrent and preservative.

France had long been the Italian Navy's presumptive regional rival, but from March 1935 Cavagnari began to focus on Great Britain as a more likely Mediterranean threat. He proposed developing a large Italian counterfleet to deal with that threat, although Mussolini refused to consider the concept. The Italian Navy embarked on more modest building and rebuilding projects focused on capital ships, but as late as 1938 it had no plans for an aircraft carrier, which was manifest in the lack of cooperation between the navy and the air force. Also, the May 1939 Friedrichshafen summit confirming the Pact of Steel left Cavagnari skeptical of the practical benefits of a naval alliance with Germany.

The coming of war in June 1940 nonetheless found Italy with a navy that was well positioned to disrupt British movements in the Mediterranean. Cavagnari, however, did not deploy his forces decisively, which effectively

gave the initially weaker Royal Navy opportunities to regroup and build to strength.

The November 11, 1940, torpedo attack on the Italian fleet at Taranto by Royal Navy carrier aircraft clearly demonstrated the power of naval aviation and crippled not only the Italian Navy but also the credibility of the "fleet in being" imperative. Mussolini relieved Cavagnari of his dual command in December 1940, and the admiral soon went into retirement. Cavagnari died in Rome on November 2, 1966.

Cavallero, Ugo, Conte (1880–1943)

Italian Army marshal, industrialist, and government figure. Born at Castello Monferrato, Italy, on September 20, 1880, Ugo Cavallero was commissioned an infantry lieutenant in 1900. He became a gunnery instructor in 1906 and graduated from the War College at Turin in 1911. As a captain, he fought in Libya during the 1912–1913 Italo-Turkish War. He served largely at the staff level during World War I, reaching the rank of brigadier general in 1918.

Cavallero also sought advancement in industry, assuming the directorship of the Pirelli Works in 1920. Five years later, Italian Premier Benito Mussolini appointed him undersecretary of war. In that capacity, Cavallero appointed Pietro Badoglio to the highest posts in the Italian Army before souring on him and stripping him of his powers in 1927 and then publicly snubbing him in 1928—a scandal that cost Cavallero his own position. Again finding a lucrative refuge in industry, he assumed the presidency of the Ansaldo arms and shipbuilding conglomerate, devoting himself to updating and improving its output. Ironically, the Italian Navy's 1933 protests that a

new cruiser was receiving substandard armor plate and machinery obliged Cavallero to resign in disgrace, although his complicity in the scandal was never established.

Cavallero was a member of the Italian delegation to the 1932–1934 Geneva arms conference. He commanded Italian forces in East Africa in 1937 but resigned in the spring of 1939 after a dispute with his superior, the Duke of Aosta. That June, Cavallero began shaping the Pact of Steel with Germany, conveying to Berlin Mussolini's wish to delay war until 1943, when Italy might be fully armed. In December 1940, he succeeded Badoglio as chief of staff, and he struggled to maintain the tenuous Italian Balkan Front even as Mussolini demanded a (doomed) March 1941 offensive.

Cavallero cleaned house at the War Ministry beginning in May 1941; his reforms of the three military branches came amid increased German strategic control of the Italian war effort and were hampered by Il Duce's habitual interference. Elevated to marshal in July 1942, Cavallero was thwarted in his plans for an assault on Malta by German demands for Italian forces on the Soviet Front. Until January 1943, he attempted to evacuate Libya while deflecting the criticism of, among others, Mussolini, who dismissed him from office on February 6, 1943.

Arrested and imprisoned by Badoglio after Mussolini was removed on July 25, 1943, Cavallero tried to link himself with anti-Duce conspirators. After the September 8 armistice, Field Marshal Albert Kesselring, the German commander in Italy and a personal friend of Cavallero, released him and offered him military command of the new fascist Italian Social Republic. Cavallero was discovered dead of an apparently self-inflicted pistol wound at Kesselring's headquarters in Frascati, outside Rome, on September 14, 1943.

Cavalry, Horse

After their domestication, horses served as mounts for countless soldiers over the centuries. Associated with gallantry and courage, they were valued as cavalry mounts for their speed and ability to cover rough ground inaccessible to vehicles. Cavalry troops rode into battle; dragoons were mounted infantrymen who used the horses for transportation to battle and then fought dismounted. Not until the 1911–1912 Italo-Turkish War did mechanized vehicles began to replace horses. Although limited in number in comparison with previous conflicts, cavalry troops fought during World War II on both the Allied and Axis sides.

Britain and the United States did not utilize cavalry to any appreciable extent, but other Allied countries deployed horse cavalry because they could not afford sufficient mechanized equipment. Especially on the Eastern Front, horses proved to be capable transportation and combat mounts that could overcome difficult conditions and the lack of paved roads. Poland, the Soviet Union, Germany, Italy, China, Japan, and Hungary all employed horse cavalry units in the war.

Cavalry charges sometimes enabled soldiers to take enemy troops by surprise and also provided shock value. Mounted raids permitted soldiers to seize property and destroy military supplies and encampments. Mounted soldiers also performed reconnaissance duties. But modern weapons with high-volume firepower were serious obstacles for the vulnerable, unarmored cavalry; also, procuring forage and veterinary care for their horses presented problems.

Poland maintained cavalry reconnaissance units and brigades. In September 1939, it had 41 cavalry regiments, of which only 3 were mechanized. Armed with guns and antitank rifles, the Polish cavalry confronted German tanks. At Morka, for example, the Wolynska Cavalry Brigade engaged the 4th Panzer Division for three days and disabled 80 German tanks and armored vehicles before retiring. World War II myths include tales that Polish cavalry armed with lances charged German tanks, and Italian newspapers printed stories about a Polish cavalry attack that did not occur and was actually German propaganda. Some notable authentic

cavalry charges of the war, however, included the September 1, 1939, engagement between German lancers and Po-lish troops at the Ulatkowka River and the August 12, 1942, Italian charge at Chebotarevsky in the Soviet Union. Most World War II cavalrymen, however, were really dragoons who fought dismounted.

Germany fielded five cavalry divisions in 1940. In addition, the Germans assigned reconnaissance cavalry squadrons to infantry divisions and stationed a cavalry brigade in East Prussia. The German 1st Cavalry Division covered some 1,200 miles in the Battle for France (May 10–June 25, 1940), when France also employed horse cavalry.

The German Army expanded its cavalry strength and capabilities for Operation BARBAROSSA, the invasion of the Soviet Union that commenced on June 22, 1941. On the Eastern Front, the Red Army employed some 1.2 million horses to support its cavalry, artillery, and supply needs. At the time of the June 1941 German invasion, the Soviets had reduced their 7 cavalry corps and 32 cavalry divisions of 1937 to 4 corps and 12 divisions, of which 4 were mountain cavalry.

One of the last significant cavalry charges on the Eastern Front occurred in November 1941 outside Musino, near Moscow, when the 44th Mongolian Cavalry Division attacked the Germans. The defenders used machine-gun fire to kill many of the attacking troops and an estimated 2,000 horses in only 10 minutes. No Germans died in the battle.

The Soviets supplemented their mounted forces with artillery. Given the primitive Soviet transportation system and the weather that turned tracks into seas of mud, horses were often more effective at transport than were vehicles. Guerrillas in Ukraine also utilized horses to raid the Germans, and a number of these fighters, including Cossacks and Kalmucks who were highly skilled horsemen well familiar with local conditions, actually fought the Soviets, even after the end of World War II. When the Waffen-SS XV Cossack Cavalry Corps surrendered to the British and its members were turned over to the Soviets in 1945, the troops were either executed outright or sent to labor camps in Siberia.

The British Army deployed the 1st Cavalry Division as well as the Royal Dragoons and Royal Scots Greys, both of which were mechanized in 1941. The Cheshire Yeomanry and the Queen’s Own Yorkshire Dragoons fought Vichy French troops in Syria in 1941 before becoming mechanized. The final

horse cavalry charge in British history occurred on March 21, 1942, at Toungoo, Burma. Captain Arthur Sandeman commanded the Central India Horse of the Burma Frontier Force. Mounted on mostly Burmese ponies, his column of primarily Sikh horsemen spotted Japanese troops constructing trenches and defenses. Sandeman and his men mistook the Japanese for Chinese soldiers and approached them. Too late they realized their mistake, and Sandeman then led a charge but was killed.

The U.S. Army also had horse cavalry units at the start of the war, although half of its 17 cavalry regiments were dismounted by 1941. Most were mechanized, although some fought as infantry. On April 1, 1941, the army activated the 2nd Cavalry Division at Fort Riley, Kansas. Almost 6,000 cavalry horses were stationed at Fort Riley early in the war, but by the end of 1942, all U.S. cavalry regiments had been mechanized. They nonetheless retained emblems and traditions of the horse cavalry.

The U.S. 26th Cavalry Regiment served in the Philippines, arriving there in December 1941 as part of the effort to counter the invading Japanese. The cavalrymen played an important role in delaying the Japanese advance and allowing U.S. and Filipino troops to withdraw into the Bataan Peninsula. Because the Allied forces were short of food, the cavalry horses were subsequently killed for meat. The 26th Cavalry was then mechanized and fought until the April 9, 1942, surrender to the Japanese.

Major General Lucian K. Truscott Jr. formed the 3rd Provisional Reconnaissance Troop (Mounted) in Italy in 1943. The horses of this unit proved useful for travel in the mountains during the fighting there. Lieutenant General George S. Patton Jr. asserted that “If we’d had a brigade or a division of horse cavalry in Sicily and Italy the bag of Germans would certainly have been bigger.”

The National Defense Act of 1947 officially ended mounted units in the U.S. military. In post–World War II military actions, cavalry horses seemed obsolete except in parts of the Third World where deep snow and mountainous conditions hindered movement by vehicle. Modern cavalry is primarily known as mechanized, armored, or air cavalry.

Celles, Battle of (December 24–27, 1944)

The Battle of Celles was the point of maximum penetration for German forces during their Ardennes Offensive (Battle of the Bulge). As a key part of the German main effort, the 2nd Panzer Division and 26th Volksgrenadier Division of XLVII Panzer Corps attacked on December 16, 1944. Their assignment was to seize within two days the crossings over the Meuse River at Dinant.

American forces, however, put up a far stiffer resistance than the German commanders had anticipated, and the German operational timetable quickly broke down. Although the XLVII Panzer Corps, commanded by General of Panzer Troops Heinrich von Lüttwitz, was supposed to bypass Bastogne, the 26th Volksgrenadier Division was drawn into the fight for Bastogne, which stripped the 2nd Panzer Division of its infantry support.

Nonetheless, Colonel Meinrad von Lauchert's 2nd Panzer Division broke through Allied blocking positions between Marche and Rochefort and advanced toward the Meuse. Supported by the 116th Panzer Division on its northern flank and the Panzer-Lehr Division on its southern flank, the 2nd Panzer Division was the main German spearhead. By the night of December

22–23, the 2nd Panzer found itself virtually alone as Allied resistance grew to their front and especially on their northern flank.

On December 23 after a short fight, the 2nd Panzer Division's reconnaissance battalion took the town of Foy-Notre Dame. Continuing its drive westward, by nightfall the reconnaissance battalion reached the town of Celles, about five miles from Dinant and the Meuse. Wary of Allied minefields to their front, the Germans established a defensive perimeter in Celles and waited for the main body of the division to close. Major General Ernest N. Harmon's U.S. 2nd Armored Division, meanwhile, was advancing on Celles from the north.

On December 25, the 2nd Armored Division cut off the German reconnaissance battalion and started to systematically destroy it. The main body of the 2nd Panzer Division tried to reach their forward elements but became bogged down southwest of Conneux and went into a defensive perimeter. The Panzer-Lehr Division was ordered to move to support the 2nd Panzer Division, but with clearing weather on December 25, Allied tactical air forces began attacking the fuel and supply routes of the forward-most German units. That same day, one battalion of the 2nd Panzer Division's artillery regiment was caught by Allied aircraft while refueling alongside the road and was destroyed. The last elements of the reconnaissance battalion in Celles were also destroyed on the 25th.

Continually pounded from the air, out of fuel, and under pressure from the 2nd Armored Division, the remainder of the 2nd Panzer Division in Marche was ordered on December 26 to destroy their equipment and then try to escape and evade individually. By December 27 some 600 survivors of the division managed to cross a bridgehead held by the Panzer-Lehr Division near Rochefort. The 2nd Panzer Division had been completely destroyed. German casualties totaled 2,500 killed or wounded and 1,200 taken prisoner. The division's 82 tanks, 83 assault guns, all of its artillery, and hundreds of motor vehicles were destroyed. The U.S. 2nd Armored Division lost 17 killed and 227 wounded and 26 tanks knocked out. Most of these tanks were back in service in a matter of days, however.

Censorship

The practice of suppressing and/or manipulating information and news, usually by a government agency. Every nation involved in World War II applied censorship to some degree, but exactly what was censored and how it was censored varied widely. Totalitarian Germany and the Soviet Union generally manipulated the news by completely controlling the newspapers and radio stations: citizens normally knew only what their governments decided they should know. German minister of propaganda Joseph Goebbels, for example, rigidly controlled the flow of news to the German people.

The governments of Italy and Japan held similar powers and used them frequently, but there were also surprising instances when newspapers were generally able to criticize those governments without severe repercussions. Still, the Japanese people at large knew nothing about their navy's great defeat in the June 3–6, 1942, Battle of Midway.

In Great Britain, the wartime government preferred to enforce censorship through prior restraint by creating a detailed censorship code and having government employees enforce it by carefully reviewing the contents of all news before it could be published or broadcast. Most of the Commonwealth nations followed suit, creating censorship codes and enforcing them as Britain did.

The U.S. system of wartime censorship also employed written censorship codes, but the government enforced these codes in a less intrusive way. This unique system of "voluntary self-censorship" was created just after Pearl Harbor. President Franklin D. Roosevelt decided that American censorship should begin with separate spheres for military information and domestic news. Thus, the army and navy kept control of their information by such

traditional expedients as editing the mail of military personnel (the extent varied widely from unit to unit) and issuing very general press releases. In the field, the army and navy required American correspondents to agree to specific rules or be banned from combat theaters. Military censors also reviewed the copy written by correspondents, which had to be approved before it could be transmitted to their home offices.

For the most part, correspondents accepted military censorship without protest. At one point, virtually the entire press corps in Sicily voluntarily suppressed the story about Lieutenant General George S. Patton slapping two soldiers. Writer John Steinbeck, who spent about five months in Europe as a war correspondent, remembered that he and his colleagues censored themselves more vigorously than did the military censors.

For domestic news, Roosevelt created the Office of Censorship. This body was similar to the Creel Committee of World War I, which had developed a general censorship code that the media then pledged to follow. Knowing how American reporters and editors had resented George Creel's heavy-handed approach, however, Roosevelt shrewdly selected Byron Price, lead editor of the Associated Press, to head his new office. Price, in consultation with a censorship operating board composed of representatives of several federal agencies, handled the press fairly by applying the new censorship codes for the press and for radio news in a consistent manner.

Neither of the codes was long, and the details were deliberately vague. Price preferred to ask editors to guide their own actions by asking themselves "Is this information I would like to have if I were the enemy?" This appeal to patriotism worked well, for throughout the war editors tended to censor their agencies' stories so heavily that Price's staff and the volunteer monitors who reviewed local newspaper stories for the office often suggested that deleted information could be returned to the text.

The most serious challenge to censorship came in June 1942, when Stanley Johnston, a reporter for the *Chicago Tribune*, gained access to a confidential navy communiqué based on the navy's ability to read Japan's naval codes. From this information, Johnston wrote a story revealing that the U.S. Navy had advance information about the Japanese attack on Midway. This scoop, which the *Chicago Tribune* published without submitting it to Price's censors, threatened to expose U.S. code-breaking operations.

A page from the notebook of United Press correspondent Robert C. Miller, which has parts blacked out by naval censorship, 1942. (Library of Congress)

Outraged at the harm this could have done to the war in the Pacific, the Department of Justice prepared a case against the newspaper for violating the Espionage Act. In the end, however, the government dropped the matter, partly because the story had not contravened the existing censorship code but largely because a public trial would only further jeopardize the code-breaking secret. Fortunately for the Allies, the Japanese apparently were not aware of the story.

The censorship code was then revised and reissued with greater restrictions. The main impact of the incident seems to have made most editors even more cooperative in censoring their own stories. By 1944, a few reporters had picked up gleanings about the purpose of the top-secret Manhattan Project, yet all of them kept quiet about the knowledge that

America was building an atomic bomb. The fact that one of these reporters was the notorious whistle-blower Drew Pearson only underscores how readily the media accepted the need for wartime censorship.

Throughout the war, most of the Office of Censorship's 15,000 employees were not battling with the press but instead were monitoring the vast amount of mail, cables, and telephone calls that went overseas, seeking to keep information from falling into the wrong hands.

American citizens accepted this censorship without great protest. Few Americans complained about censorship at all, which was very different from the way they groused about rationing, taxes, shortages, or many of the other restrictions that the war had placed on their freedoms.

Even after 1945 there was remarkably little criticism of wartime censorship, in marked contrast to the complaints that followed the war in Britain and elsewhere. These attitudes shed light on popular American views of the emergency in the early months after Pearl Harbor. They also suggest that Byron Price had been right when he told President Roosevelt that he would get more cooperation from Americans by asking them to help him rather than telling them what to do.

Central Pacific Campaign

The U.S. Navy's overarching strategy for defeating the Japanese by pushing through the Central Pacific had its roots in a long-standing concept for a maritime war with Japan. The U.S. plan for war with Japan, War Plan

Orange, dated to 1898, and although modified many times, its basic scheme remained consistent. It called for marshaling the main battle fleet in the Eastern Pacific, then steaming to the Philippines, where a decisive battle fleet engagement in the style predicted by 19th-century geostrategist and rear admiral Alfred Thayer Mahan would occur. Simultaneously, the navy would relieve the beleaguered Philippine Army garrison. Faced with catastrophic defeat and total American command of the sea, Japan would surrender.

The successful Japanese strike on Pearl Harbor on December 7, 1941, completely disrupted Plan Orange and the Central Pacific thrust. With all Pacific Fleet battleships sunk or damaged and only five aircraft carriers available in the Pacific, the navy was in no condition to execute Plan Orange, defeat the Imperial Japanese Navy in a decisive battle for command of the sea, or even reinforce or evacuate the Philippine defenders. Consequently, for almost two years, the navy engaged in peripheral operations against the Japanese defensive perimeter, supporting the marines and the army in the Solomon Islands and New Guinea and repelling Japanese main strike forces in the Battle of the Coral Sea (May 7–8, 1942) and the Battle of Midway (June 3–6, 1942).

By mid-1943, with Essex-class fleet carriers coming on line from the "two ocean" Naval Expansion Act of 1940 and fast battleships of the North Carolina and South Dakota classes for antiaircraft support and shore bombardment, commander in chief of the Pacific Fleet Admiral Chester Nimitz was ready to launch the Central Pacific assault against the Japanese Empire.

The dual-pronged Pacific strategy that emerged in 1943 represented a compromise between the services. The ABC Conference of Britain, Canada, and the United States in March 1941 established Pacific operational areas, which the Joint Chiefs of Staff confirmed in March 1942. The agreement gave the U.S. Navy operational control over the Central and South Pacific areas; the U.S. Army had responsibility for the Southwest Pacific. The army area commander, General Douglas MacArthur, advocated an advance up the New Guinea coast along the New Guinea–Mindanao axis to isolate the Japanese base at Rabaul and drive to the Philippines. The navy, meanwhile, pressed for a Central Pacific thrust. In March 1943, the Joint Chiefs agreed on a compromise whereby both services would advance along their preferred routes while simultaneously supporting each other. The results of this dual-

pronged strategy formed from compromise were devastating for Imperial Japan.

To face two simultaneous threats, the Japanese, unable to concentrate against a single-threat axis, had to stretch their air, naval, and ground forces perilously thin. Adopting a leapfrogging operational mode in both the Central and Southwest Pacific, U.S. forces attacked strategic points, such as islands with airfields, while simply bypassing and isolating large Japanese garrisons, such as Truk and Rabaul. These latter points then withered on the vine.

Another component of the Central Pacific strategy was the submarine offensive against Japanese shipping. This further reduced Japan's capability to reinforce and sustain isolated garrisons, as U.S. forces advanced key island by key island, beginning with Operation GALVANIC against the Gilbert Islands in November 1943. In the interwar years, the U.S. Marine Corps had made great strides in amphibious operations, and Guadalcanal had been a useful test of amphibious doctrine. Nimitz and his chief of staff, Vice Admiral Raymond Spruance, had originally conceived of the first thrust going against the Marshall Islands; however, the Gilberts were closer to Hawaii and within range of land-based air cover.

The Central Pacific thrust offered a number of advantages. Its many islands and atolls provided a target-rich environment that prevented the Japanese from determining the precise route of advance and forced them to defend all points. The size of the islands and atolls discouraged the establishment of large garrisons. The long distances between islands mitigated mutual support, and American carrier airpower inhibited Japanese supply and reinforcement. Further, the lines of communications from Pearl Harbor and the mainland United States would be shorter than those to the Southwest Pacific. The Central Pacific also offered a more healthful climate than the jungles of New Guinea. And an advance through the Central Pacific would cut off and isolate Japanese forces in the South Pacific.

There were, of course, some disadvantages to a Central Pacific thrust. These included the requirement for overwhelming naval and air superiority, which could not be achieved until late 1943 and necessitated the defeat of the main Japanese battle fleet (which occurred in the Battle of Midway). The U.S. plan also relied on successful amphibious operations, which had not been totally proven.

Operation GALVANIC commenced in late autumn 1943 with landings on

Tarawa Atoll (the primary objective being Betio, with its airfield) and Makin Atoll. The joint army, navy, and marine force employed overpowering numbers, with more than 200 ships and 35,000 troops under Rear Admiral Richmond Kelly Turner, commander of V Amphibious Force. Task Forces 52 and 53 assaulted the atolls on November 20, 1943. Six fleet carriers and five light carriers, escorted by six battleships, provided overwhelming firepower, naval gunfire support, and air cover. Additionally, several hundred army, navy, and marine aircraft participated from the base at Ellice Island. Despite Japanese air attacks from the Marshalls, the air threat proved negligible.

On Tarawa, strong fortifications, bunkers, hidden obstacles, and barbed wire slowed the advance—a prelude to future Japanese defensive schemes—and with orders to fight to the last man, the garrison staunchly resisted. Very few Japanese survived, another indicator of the bitter struggle unfolding in the Central Pacific Campaign. U.S. forces suffered a 17 percent casualty rate and encountered other problems as well, including faulty beach and surf intelligence, the inability of landing craft to negotiate shallow atoll waters, inadequate landing craft, too little advance shore bombardment, and poor communications. The Gilberts experience of November 1943 provided many valuable lessons for the U.S. Navy and the U.S. Marine Corps on how to conduct future operations.

U.S. marines storm Tarawa in the Gilbert Islands, November 1943. (National Archives)

The Marshall Islands were next. Despite a dearth of transports, Operation FLINTLOCK finally commenced on January 31, 1944. Kwajalein (January 19–February 6, 1944) and Eniwetok (February 17–22, 1944) succumbed to overwhelming force and the pounding from Vice Admiral Marc Mitscher's Fast Carrier Task Force 58. The Americans had learned from the Gilberts experience, and casualties among the assaulting forces were much lighter. With the capture of the Marshalls by March, 10 weeks ahead of the established timetable, the navy bypassed several heavily fortified Japanese-held islands and turned its attention to the Mariana Archipelago.

The June–August 1944 assault on the Marianas, Operation FORAGER, aimed at taking Guam, Saipan, and Tinian islands. From these bases, the Japanese home islands would be within striking distance of the B-29 Superfortress heavy bombers. The assault on Saipan commenced on June 13, 1944, with landings on June 16. Determined to halt the advance by interdicting the supporting naval forces, Vice Admiral Ozawa Jisaburo mounted an assault on the Americans in the Battle of the Philippine Sea. The assault, which commenced on June 19, turned into disaster as the better-trained and better-equipped U.S. Navy pilots decimated the inexperienced Japanese airmen in what came to be called the "Great Marianas Turkey Shoot." Ozawa lost 325 of 375 attacking aircraft; Japanese naval airpower disappeared in a day, never to play any significant role in the war thereafter except in desperate suicide attacks in the last months.

Saipan was taken by July 13. The marines landed on Tinian on July 24 and secured it on August 2. Guam, the last of the major islands, was struck on July 21 and declared secured on August 10.

With the loss of the Marianas, the Japanese defensive perimeter had been decisively breached. U.S. strategic bombing of the Japanese home islands now began in earnest and ended in the atomic bomb attacks launched from Tinian a year later. From the Marianas, the two prongs of the Pacific strategy came together again with the invasion of the Philippines in October 1944.

Tenacious Japanese defenders and their fortifications did cause heavy American casualties, and the difficulties inherent in staging such massive invasion efforts presented formidable challenges to U.S. operations. Nonetheless, the Central Pacific Campaign succeeded decisively. The

Imperial Japanese Navy's hitherto deadly air arm had been utterly destroyed, and the stage was set for the final Allied thrust through the Philippines, Iwo Jima, and Okinawa and on toward the Japanese home islands.

Cephalonia Island Massacre (September 1943)

Scene of a German atrocity in 1943. Cephalonia Island (variously spelled as Cephallonia, Cefallonia, Kefalonia, Kefallonia, and Kefallinia) lies about 200 miles from Italy and is the largest of the Ionian Islands west of Greece. Located at the mouth of the Gulf of Corinth, it is across a strait from the island of Ithaca. Beginning in April 1941, the Italians occupied the island and informed the Greek inhabitants that they were now Italian citizens.

In May 1943, the Italian Acqui 33rd Infantry Division arrived on Cephalonia. Its commander, Division General Antonio Gandin, was fluent in German, a veteran of the Soviet Front (1941–1942), known to a number of German generals, and a recipient of the Iron Cross. The 33rd Division was composed of about 11,500 enlisted men and officers and was centered on two infantry regiments (the 17th and 317th), an artillery regiment (the 33rd), the 27th Blackshirt Legion, the 19th Blackshirt Battalion, and various support units. In addition, the Italians had some naval coastal batteries, a few torpedo boats, and two aircraft.

Allied gains in 1943 led the Germans to consider the possibility that the Italians would opt out of the war, whereon the Germans decided to reinforce their token garrison on Cephalonia. Between July 5 and 6, Lieutenant Colonel Hans Barge's 966th Grenadier Regiment arrived, along with a battery of self-propelled guns and nine tanks. This addition brought the German strength to a total of 1,800 men. Shortly thereafter, on July 25, Mussolini's government collapsed. The Italians on Cephalonia, however, were ignorant of the plans of the Italian War Office and of the possibility of conflict with the Germans.

On the evening of September 8, 1943, Marshal Pietro Badoglio, with the agreement of Italian king Victor Emmanuel, ordered Italian troops to cease all hostilities against Anglo-American forces. Badoglio also ordered that Italian forces should respond with "maximum decision" to any offensive action from "[any] direction whatsoever." The Germans, meanwhile, chose to treat Italians who resisted their authority as mutineers.

On September 11, the Germans on Cephalonia gave Gandin an ultimatum to surrender his weapons. While he was attempting to delay a decision, word came that Italian forces on Corfu were fighting the Germans and that elsewhere the Germans were sending the Italians who surrendered to internment camps, despite promises they would be repatriated. On September 13, the Germans attempted to reinforce their garrison on Cephalonia, but the Italians opened fire on the two barges carrying troops and supplies and sank

both. The next day, Gandin was hand-delivered an order demanding that the Italians turn over their weapons, issued by Lieutenant General of Mountain Troops Hubert Lanz, commanding the German XXII Mountain Corps. That same day, elements of the 1st Alpine Division under the command of Colonel Harald von Hirschfeld landed on the island.

Meanwhile, the Italian War Office, now located at Brindisi, ordered the 33rd Division to fight the Germans. Gandin then issued orders to attack the German positions on the island on September 15 if they did not surrender. On that day, German aircraft attacked the Italian positions, and the Italians in turn captured 400 German troops. Intense fighting continued until September 22. During that time, the British and Americans, whether from ignorance or from distrust of the Italians, had forbidden Italy's navy or air force to aid Italian troops fighting in Greece. With their ammunition exhausted and having sustained some 1,300 casualties, the Italians surrendered. Almost simultaneously, the Italian War Office announced that help was on the way.

Men of the German XXII Mountain Corps had received a special Führer Order to execute all the Italian soldiers who had fought on Cephalonia. Many Italians who surrendered were shot in their positions, and a group of Bavarian soldiers who protested this action were threatened with summary execution. Large numbers of Italian troops were slain where they were taken; the remainder were transported to the town of San Teodoro and held in the town hall. Gandin was shot first, but before the bullets hit his body, he threw his Iron Cross into the dirt. His staff and then all the officers were executed, followed by the noncommissioned officers, the enlisted men, and even the medical personnel. The officers' bodies were then weighted and dumped into the sea by Italian Navy personnel who were, in turn, shot. In all, about 4,750 Italians were summarily executed. The only ones spared were the military chaplains, who would later provide many of the details of the massacre. About 1,200 Italians, led by Captain Renzo Appollonio, joined with some Greek partisans and escaped to the mainland.

A group of about 4,000 who had surrendered their arms without fighting were imprisoned in barracks on the island. In October, they were put onto three ships sailing for Greece, but these hit mines shortly out of port. Those who did not drown were machine-gunned by the Germans. In all, 390 Italian officers and 9,640 enlisted men perished at the hands of the Germans. In

1948, the Military Tribunal at Nuremberg sentenced Lanz to 12 years' imprisonment. He was released in 1954.

In 2000, Universal Studios released *Captain Corelli's Mandolin*, a romantic story of the Italian occupation and the 33rd Division's destruction that was based on Louis de Bernières's novel of the same name.

CERBERUS, Operation (February 11–13, 1942)

Passage of the German battleships *Scharnhorst* and *Gneisenau* and the heavy cruiser *Prinz Eugen* through the English Channel from Brest, France, to Wilhelmshaven, Germany, in February 1942. In March 1941, the *Scharnhorst* and *Gneisenau* had arrived at Brest on the French Atlantic coast after a commerce-raiding voyage; they were joined there by the *Prinz Eugen* in June 1941. Although vulnerable to British bombing, the ships constituted a standing threat to Allied convoys in the Atlantic. By late 1941, however, Adolf Hitler was convinced that the British were planning to invade Norway, and, against the advice of his naval commanders, he demanded that the three ships return to Germany for deployment in Norwegian waters.

In early 1942, when British intelligence strongly suggested a possible German breakout and passage through the Straits of Dover, preparations for aerial and naval attacks, already under way for nearly a year, were accelerated. The British assumed that any transit by the German ships through the narrowest part of the channel would be at night, but the Germans planned Operation CERBERUS (also known as the Channel Dash) to conceal

the ships' departure from Brest and to run the straits in daylight, counting on surprise to prevent a timely British concentration of adequate resistance.

Exceptional cooperation between German naval and air commands combined with failures in British technology and communications brought the Germans almost complete success. At 10:45 p.m. on February 11, the three big ships and an escort of six destroyers, with Vice Admiral Otto Ciliax commanding, cleared Brest Harbor. Not until 11:09 a.m. on February 12, when the Germans were less than an hour from the straits and had been reinforced by torpedo boat squadrons from French ports, did the British identify the ships. By noon, the German ships were in the Dover narrows, and although attacked by British coastal artillery, torpedo boats, and the Fleet Air Arm, they passed through unscathed. Later attacks along the Belgian and Dutch coasts by destroyers and by Royal Air Force fighters and bombers were no more successful. Although the *Gneisenau* struck one mine and the *Scharnhorst* hit two (the second one seriously slowing it and separating it from the rest of the flotilla), all the German ships were safely in the Elbe estuary by 10:30 a.m. on February 13.

Amid German euphoria and British humiliation, thoughtful minds on both sides realized that this German tactical success in the Channel represented a self-inflicted strategic defeat in the Atlantic. Even the sense of victory was short-lived, for the mine damage to the *Scharnhorst* took six months to repair, the *Prinz Eugen* was torpedoed on February 23 by a British submarine in the North Sea, and the *Gneisenau* was irreparably damaged during air raids on Kiel on February 26–27.

Chaffee, Adna Romanza, Jr. (1884–1941)

U.S. Army major general. Born in Junction City, Kansas, on September 23, 1884, the son of the second chief of staff of the U.S. Army, Adna Romanza Chaffee Jr. graduated from the U.S. Military Academy at West Point in 1906. He was commissioned in the cavalry and served with the 15th Cavalry Regiment in Cuba until 1907. Between 1907 and 1911, he was assigned to the Mounted Services School at Fort Riley, Kansas, commanding the mounted detachment supporting students and staff at the school. After attending the French Cavalry School at Saumur (1911–1912), Chaffee returned to teaching at Fort Riley. In 1914 and 1915, he served with the 7th Cavalry Regiment in the Philippines. Chaffee was then assigned to West Point, where he was senior cavalry instructor for the Tactical Department until 1917.

Following the U.S. entry into World War I, Chaffee attended the staff school at Langres, France, then was an instructor there. Thereafter, he was assigned as a staff officer with the 81st Division and fought with it in the Saint-Mihiel and Meuse-Argonne offensives. He ended the war as a temporary colonel.

Following occupation duty in Germany as a staff officer of III Corps, Chaffee reverted to his permanent rank of captain in 1919. He was then an instructor at the Command and General Staff School at Fort Leavenworth, Kansas. Promoted to major in 1920, after various assignments he served as the G-3 of the 1st Cavalry Division at Fort Bliss, Texas, between 1921 and 1924. Chaffee graduated from the Army War College in 1925, and from then until 1927, he commanded a squadron of the 3rd Cavalry Regiment. He next served on the War Department General Staff. Promoted to lieutenant colonel in 1929, he was charged with developing mechanized and armored forces for the army.

A staunch supporter of mechanized warfare, Chaffee was a leading proponent of a separate armored force. In 1931, he joined the new 1st Cavalry Regiment (Mechanized) at Fort Knox, Kentucky, as its executive

officer. Between 1934 and 1938, Chaffee was chief of the Budget and Legislative Planning Branch of the War Department. He then returned to Fort Knox to command the 1st Cavalry Regiment. In November 1938, he was promoted to brigadier general and assumed command of the 7th Mechanized Brigade, which he led during the maneuvers at Plattsburgh, New York, in 1939 and in Louisiana in 1940, both of which had significant impact on U.S. Army mechanized doctrine.

Chaffee assumed command of the new Armored Force in June 1940 and thus was responsible for the development of the 1st and 2nd Armored Divisions. In October 1940, he took command of the I Armored Corps as a major general, but by that point, he was already ill from cancer. The disease took his life in Boston, Massachusetts, on August 22, 1941. In 1945, the army named its new light tank, the M-24, in his honor. Chaffee is regarded as the father of the U.S. Army's armored branch.

Chamberlain, Arthur Neville (1869–1940)

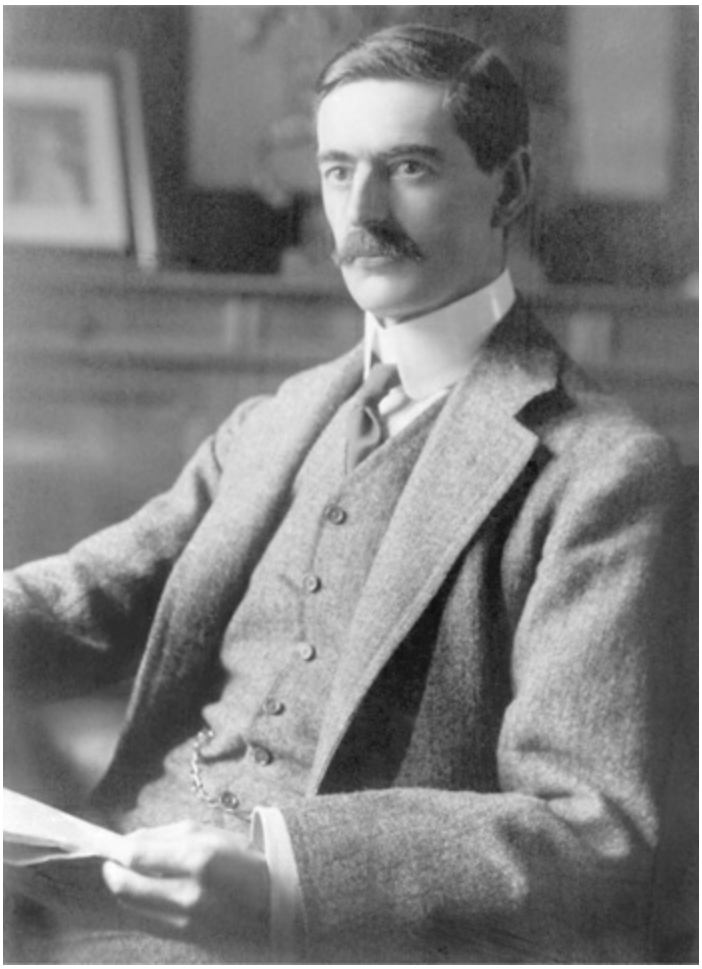
British Conservative politician and prime minister (1937 to 1940). The son of a distinguished political family, Arthur Neville Chamberlain was born on March 18, 1869, in Birmingham, England. He graduated from Mason College, Birmingham; administered a family plantation in the Bahamas; and later ran a metals business, becoming lord mayor of Birmingham in 1915. Chamberlain was elected to Parliament in December 1918 and achieved cabinet rank quickly, serving as minister of health (1923, 1924–1929, and 1931) and becoming an important reformer in that post. After serving as chancellor of the exchequer (1923–1924, 1931–1937), he was clearly in line

to be prime minister and assumed that post on the retirement of Stanley Baldwin on May 28, 1937.

Intellectually arrogant and convinced that his opinions were correct in all things, Chamberlain rarely sought advice from a generally weak cabinet, listening only to his confidant, Sir Horace Wilson. Chamberlain was woefully ignorant of foreign affairs, and his policy through most of the 1930s was to cut defense spending while appeasing those who appeared to pose threats. In April 1938, he abandoned Royal Navy bases in Ireland. Until his final weeks in office, however, he enjoyed strong support in Parliament and from the establishment British press.

Chamberlain is remembered most for his dogged efforts to appease Adolf Hitler in order to avoid war, culminating in the shameful Munich Agreement of September 30, 1938, which gave the Sudeten portion of Czechoslovakia to Germany (without any Czech participation in the decision) to avert a threatened German invasion. At home, Chamberlain was widely praised for bringing, in his words, “peace in our time.” He ignored the tiny parliamentary minority led by Winston L. S. Churchill, who argued that Britain had to rearm, and virtually forced Anthony Eden to resign as foreign secretary on February 19, 1938, when the two men disagreed about discussions with the Italian government. Chamberlain only reluctantly repudiated appeasement when Germany occupied the remainder of Czechoslovakia on March 10, 1939.

Finally pushed hard by members of his own cabinet, Chamberlain issued an ultimatum to Hitler after Germany’s invasion of Poland on September 1, 1939. Receiving no answer, Chamberlain took his nation to war two days later and directed Britain’s effort for the first eight months of the conflict. His war cabinet now included Churchill, back as first lord of the admiralty. Although much of the period passed as the so-called Phony War, the spring of 1940 saw Germany’s invasion and occupation of Norway and Denmark and its invasion of the Low Countries and France.



Neville Chamberlain served as prime minister of Great Britain during 1937–1940. He believed that he could avoid a new world war by making concessions to German leader Adolf Hitler (what became known as appeasement). (Library of Congress)

By then, Chamberlain had lost his support in the House of Commons, and after several days of emotional debate, he was replaced by Churchill on May 10, 1940, with a multiparty national government. Chamberlain became lord president of the council (he remained head of the party) and a member of the War Cabinet until September 30, 1940, when he resigned due to ill health. He died of cancer on November 9, 1940, in Heckfield, England.

Channel Islands Campaign (June 1944–May 1945)

The Channel Islands, situated in the south-central portion of the English Channel and closer to France than mainland Britain, were the only British territory occupied by Germany in World War II. Germany fortified and equipped them with powerful coastal artillery emplacements as part of the Atlantic Wall. After the Allies invaded Normandy on June 6, 1944, the 26,100-man German garrison—which included the 319th Infantry Division and assorted coastal artillery, air force, navy, construction and supply personnel—remained in place. The decision to hold the islands rather than evacuate them led to a miniature naval war far behind the front lines that lasted nearly a year until the defeat of the Nazi regime in May 1945.

In the Gulf of Saint-Malo, the German Navy deployed the 24th Minesweeper Flotilla, with seven 775-ton M-class minesweepers; the 46th Minesweeper Flotilla of converted trawlers, numbered sequentially *M4600* through *M4628;* and the 2nd Patrol Boat Flotilla of converted trawlers, numbered *V201* through *V216.* Following the Normandy landings, German convoys sailed nearly every night throughout June, rushing supplies into the islands and evacuating construction workers and concentration camp inmates.

Allied forces patrolled across the English Channel to suppress this German traffic. On the night of June 13, the Polish destroyer *Piorun* and the British destroyer *Ashanti* attacked six German minesweepers of the 24th Flotilla along with assorted V-boats escorting a convoy from Saint-Malo. They sank the *M343* and damaged the *M412*, *M422*, *M432*, *M442*, and *M452.* On June 15, the Canadian 65th Motor Torpedo Boat (MTB) Flotilla intercepted a convoy of two M-class minesweepers, three trawlers, and two merchantmen and torpedoed the *M133.*

On June 22, four boats of the Canadian 65th Flotilla, along with four MTBs of the Royal Navy's 52nd Flotilla, conducted a sweep off Jersey. The 65th's boats came upon a German convoy consisting of a minesweeper, a pair of armed trawlers, and the merchant ship *Hydra.* They sank the *Hydra*, but the *MTB-745* was severely damaged in the exchange. On the night of June 26, the 52nd Flotilla had better luck off Jersey, sinking the *M4620.* The Germans won a rare victory the next night when the large Tribal-class destroyers *Eskimo* and *Huron* intercepted the *M4611* and two patrol boats. The destroyers set the *M4611* ablaze, but the *V213*, a 282-ton ex-fishing boat, put an 88mm shell into the *Eskimo*'s number one boiler room, and a 37mm

round pierced the main steam line. The *Eskimo* was reduced to steaming in circles at six knots before eventually making it back to Plymouth.

On the night of July 3, the 65th Flotilla ambushed a convoy sailing from Jersey to Saint-Malo and torpedoed the *V210* and *V208* and the tug *Minotaure*. The *MTB748* was damaged. On the night of July 7, the destroyers *Huron* and *Tartar* sank the *M4605* and *M4601*.

On July 25, the Americans broke the German lines in Normandy around Saint-Lô and raced into Brittany. On the night of August 6, the surviving units of the 24th Minesweeper Flotilla, the *M-412*, *M-432*, *M-442*, and *M-452*, evacuated Saint-Malo. An Allied force of two destroyers and MTBs intercepted the Germans off Jersey but could not prevent the 24th from fighting its way through to Saint-Hélier, Jersey.

The Allies proceeded to quarantine the Channel Islands, and after August 2, this became the responsibility of the U.S. Navy. The Americans teamed destroyer escorts with PT squadrons 30 and 34 operating out of Cherbourg and began to patrol around the islands every night.

On August 9, the U.S. destroyer escort *Maloy*, with five PT boats, encountered six trawlers of the 46th Flotilla. The Germans emerged from this scrap intact, while *PT-509* was sunk. On August 11, the destroyer escort *Borum* supporting two PT boats attacked two ships of the 24th Minesweeper Flotilla off Jersey without result. On the night of August 13, the British destroyers *Onslaught* and *Saumarez*, with the *Borum* and two U.S. and two British MTBs, engaged four ships of the 24th Flotilla and a merchant vessel off St. Peter Port, Guernsey. The minesweepers inflicted slight damage and some casualties on the destroyers and suffered light damage in return. On August 19, Allied forces intercepted an interisland convoy escorted by the 24th Flotilla and heavily damaged a minesweeper.

After this action, as the U.S. Army liberated Brittany, the 24th and 46th Flotillas kept largely to port, while the U.S. Navy discontinued offensive patrols. As autumn passed into winter, supplies began to run low in the Channel Islands, and the civilian population faced starvation. The German naval commander decided to raid the mainland to obtain food and coal. By coincidence, the Allies were shipping coal to the nearby port of Granville on the Cotentin Peninsula, which had good rail connections to Paris.

On the night of March 8, 1945, the *M-412, M-432, M-442*, and *M-452* as well as a tug, three artillery lighters, three fast launches, and two armed

trawlers sailed from Saint-Hélier. They encountered and badly damaged the U.S. submarine chaser *PC-564* outside of Granville. The Germans then stormed ashore. Everything went as planned except that the *M-412* grounded on a mud bank in the outer harbor. At 3:00 a.m., the Germans retired with one collier loaded with coal. There was no time to salvage the *M-412*, however, and the crew blew it up. The Germans then returned to Saint-Hélier.

On May 8, 1945, following the collapse of the Nazi regime, the British destroyer *Bulldog* approached Guernsey to demand the island's immediate surrender. An emissary sailed out on a rusty and battered minesweeper and instructed the destroyer to depart. Facing 12-inch coastal guns, the British destroyer commander complied and did not receive the surrender until the next day. It was clear that the German defenders of the Channel Islands believed they had never been defeated.

Chaplains

Throughout the long history of warfare, nations have relied on the spiritual and emotional support of military chaplains of various denominations and spiritual traditions to attend to the needs of their fighting men and women. In some cases, military chaplains are commissioned officers in a branch of the military; in others, they are appointed by the leaders of their respective religious denominations and serve in a civilian capacity.

All of the major nations relied on chaplains. Great Britain and the Commonwealth nations commissioned chaplains from all denominations and gave them wide latitude in their responsibilities to meet the spiritual and emotional needs of their soldiers. The Church of England and Roman

Catholic dioceses provided the largest number of chaplains to the British military. During the “Great Patriotic War,” the Soviet government put aside its opposition to the Russian Orthodox Church, reopening churches and releasing priests and bishops from prison to bolster the morale of the Soviet people. Russian Orthodox priests also accompanied the Red Army in the field. Military chaplains in Germany and Italy were unique because of their close connection with the state. For example, German chaplains were required to pray for the Fatherland and the führer at their religious services. The Italian Army enjoyed the spiritual support of a wide range of Catholic chaplains as well as local Catholic clergy.

In the United States, chaplains of all of the major religious groups served the 12 million men and women of the armed services without regard to the religious affiliation of the supplicant. A total of 8,100 U.S. chaplains served during the war overseas as well as on the home front. The requirements for the chaplaincy were straightforward. Individuals needed a certificate of ordination, two years of successful ministerial experience, and endorsement from the individual’s denomination.

U.S. military chaplain candidates temporarily vacated their obedience to their religious bodies and were subject to the discipline and orders of their military superiors. In place of boot camp, the candidates were enrolled in Chaplain School (two weeks for the navy and four weeks for the army), where they were indoctrinated in armed forces law, drills, customs, and interdenominational cooperation. Those chaplains assigned to specialized units (such as paratroopers) were required to undergo the same training as the men they were serving, and many volunteered for these rigorous assignments. The Geneva Convention defined chaplains as noncombatants, and close attention was paid to ensuring that their roles were not compromised in combat situations.

Although the official functions of U.S. military chaplains included conducting religious services, preaching, encouraging those who were experiencing difficulties, and writing families of those lost in battle, many received medals and distinctions for valor. Two chaplains (a Protestant and a Catholic) on the battleship *Oklahoma* at Pearl Harbor were among the first to die in battle, on December 7, 1941. A total of 77 U.S. chaplains died during World War II, and chaplains received 2,453 medals for valor. One of the most highly decorated military chaplains was Catholic chaplain Albert

Hoffman, who received the Distinguished Service Cross and the Silver Star and lost a leg while serving with the 133rd Infantry Regiment in Italy. Perhaps the most famous act of courage occurred on the deck of the U.S. Army transport *Dorchester* on February 3, 1943, when four chaplains (Methodist reverend George L. Fox, Rabbi Alexander D. Goode, Roman Catholic reverend John P. Washington, and Reformed Church in America reverend Clark V. Poling) gave their life vests to others and went down with the ship.

In carrying out their duties, military chaplains of the belligerent nations demonstrated both compassion and personal bravery. Their services were much appreciated by the men and woman to whom they ministered, frequently in difficult circumstances. The chaplains often referred to their years in the military during World War II as the most rewarding of their ministries.

Charities

Private or quasi-private organizations created to provide aid to both civilians and military personnel during the war. At the beginning of World War II, the British and French instituted a naval blockade of Germany, halting the shipment of food, among other items. This policy often hurt innocents, as it contributed to hunger and even starvation in some places. A number of people in Britain opposed this policy and formed the national Famine Relief Committee at Oxford, which eventually became Oxfam.

At the beginning of World War II, Canadian charities mobilized to lobby the government regarding the Canadian Patriotic Fund Bill and the War Charities Bill, which were essentially improved versions of World War I legislation. To coordinate voluntary assistance, the Canadians created the Department of National War Services.

As American charities mobilized, President Franklin D. Roosevelt, aware that multiple war-relief appeals might discourage donations, issued an order in mid-September 1939 that required all war-relief organizations to secure certificates of registration from the Department of State. Among American charities, the Community Chests (successors of the Community War Chests of World War I and predecessors of today's United Way) joined with many relief agencies—including the United States Committee for the Care of European Children, the Volunteer Bureaus, and the Junior League—to meet wartime needs. U.S. charities often helped European refugees survive while they waited for visas and steamship tickets to the United States or elsewhere.

On September 16, 1940, the United States instituted its first peacetime conscription. To aid military personnel, the Navy Relief Society and the Army Relief Society were formed by the military itself. On March 11, 1941, Congress passed Lend-Lease legislation: as well as weapons, this aid included billions of dollars in food and nonmilitary assistance to nations fighting the Axis powers. That same year, the Young Men's Christian Association (YMCA), Young Women's Christian Association (YWCA), National Catholic Community Service, Salvation Army, Jewish Welfare Board, and National Traveler's Aid Association formed the United Service Organizations (USO). At President Roosevelt's request, the USO operated the military services' huts and canteens.

In 1942 there was widespread starvation in Greece caused in large part by the German seizure of Greek food supplies. An estimated 500,000 Greeks starved to death in the war years. The Oxford Famine Relief Committee, well connected to the exiled Greek government, promoted international aid. Wheat from Canada, purchased by relief agencies, was allowed through the British blockade to Turkey in Swedish ships flying the Red Cross flag. The Germans allowed the wheat into Greece in ships flying Turkey's Red Crescent insignia. Spain also received food shipments from charities.

In 1943, Russian War Relief was organized as an agency of the National War Fund, with much of the aid coming from the United States. Also in

1943, many American agencies formed the United Relief organization, with the Red Feather as its symbol.

In Germany, the Nazis ran their own annual charity once a year. Known as Winterhilfe (Winter Help), it was the official private charitable organization of the Nazis, which nonetheless accomplished much. In China, many organizations were involved in relief work, including members of the Friends Society (Quakers), Mennonites, and the Brethren. The Red Cross was also active in relief work in Portugal, aiding refugees and handling tons of packages for prisoners of war; however, the relief work was hampered by the lack of provisions in the Geneva Convention to cover civilian relief.

In February 1944, Washington took the lead in moving from a policy of blockade to controlled relief. Dislocations at the end of the war increased the need for relief. By November 27, 1945, a consortium of 22 American charities came together to establish the Cooperative for American Remittances to Europe (CARE) to handle postwar charity. The new United Nations organization was also actively involved in this effort through the United Nations Educational, Scientific and Cultural Organization (UNESCO), created in late 1945.

Chemical Weapons and Warfare

Poison gas had been utilized with considerable effect by the major belligerents in World War I. In the course of the conflict, the combatants had deployed about 113,000 tons of chemicals, and some estimates have more than 1 million soldiers injured by poison gas during the war, 10 percent of them fatally.

In the interwar period, the major powers discussed outlawing the use of poison gas, but they also continued to produce it. Prior to World War II, more than 40 nations signed the Geneva Protocol of 1925 banning the offensive use of chemical weapons in warfare. All of the main combatants in World War II except the United States and Japan ratified the protocol, which went into force in August 1928. Although the United States had first proposed the treaty, isolationist sentiment blocked its ratification in the Senate. Japan feared giving away any advantage in case of a conflict with the far more populous China. The signatory powers, however, reserved the right to utilize chemical weapons in a retaliatory attack and to employ them against a country that had not signed the protocol.

Chemical weapons are categorized by their effects on human beings, animals, and plants. Lung irritants, such as phosgene, make victims choke or suffocate, with symptoms usually delayed for several hours after contact. Vesicants, such as mustard gas, cause the skin to blister and the eyes to swell, sometimes with loss of sight. The symptoms of vesicants can be delayed up to 48 hours. Lacrimators are tear gases, such as chloracetophenone and brombenzylcyanide, that irritate the eyes and cause difficulty with breathing.

The warring powers also produced irritant smoke (such as sneezing gases or adamsite), screening smokes, and incendiaries. A new and deadly chemical agent, nerve gas, was developed during the war. Nerve gases take effect quickly, producing symptoms in 10 to 30 minutes depending on whether they are inhaled or absorbed through the skin.

Chemical weapons can be launched in a variety of forms: through shells and bombs that explode and disperse the chemicals into the air in drops or small particles, from containers with vaporized solids that infiltrate the air as a smoke, and through liquids released from airplanes as drops or mist. Chemical weapons can be more useful than conventional weapons because their effects are longer lasting, sometimes persisting for days or weeks. The most desirable chemical agents have many of the same characteristics in common. They are effective in small concentrations, difficult to protect

against, quickly and cheaply manufactured, made from easily obtainable raw materials, heavier than air, easily and safely transportable, effective against multiple parts of the body, and not easily detectable.

Three of the most common means used to deploy chemical agents by the end of World War I were the portable gas cylinder, the Livens Projector, and the chemical mortar. But these delivery systems were obsolete by the time of World War II, given the greater mobility of infantry troops. Accordingly, the size of chemical mortars was increased, as was their range (to 1,400 yards), and the Livens Projector was replaced by 100mm-caliber mobile rocket launchers. During the interwar years, governments also experimented with using airplanes to deliver chemical weapons, through cluster bombs and spraying. By the time World War II began, aerial bombardment with chemical weapons was the most common deployment mechanism. It is also possible to deploy chemical weapons, particularly mustard gas, in land mines and grenades. German leaders debated the feasibility of combining missiles and chemical weapons, but production of such mechanisms did not occur.

A supervisor inspects mustard gas warheads at an unidentified U.S. arsenal. President Franklin Roosevelt made it clear that the United States would only employ the gas if the Axis powers did so first. (Bettmann/Corbis)

In stark contrast to the situation in World War I, chemical weapons were used only sparingly in World War II. The major powers were reluctant to employ them. This was in part because they were convinced that their opponents had extensive stockpiles of poison gases and because their own populations were not prepared to withstand a retaliatory attack. They also did not wish to be the first to violate the Geneva Protocol.

Several key leaders were hesitant to authorize the use of chemical weapons. German leader Adolf Hitler, who had been gassed at Ypres in 1918, had a strong aversion to the use of gas as an offensive weapon, and President Franklin D. Roosevelt also opposed the use of chemical weapons. For the European powers in particular, the threat of retribution against cities and large-scale civilian suffering was a major deterrent. Fighting in World War II,

marked as it was by rapid movement, also was dramatically different from the stalemated trench warfare of the previous conflict. Early in the war, the Axis powers scored a succession of quick victories and did not need to resort to poison gas. Finally, the shipping of chemical weapons and equipping friendly troops for chemical attacks also presented logistical difficulties.

The fate of SS *John Harvey* illustrated the difficulty of shipping poison gas. The ship sailed from the United States to Italy in 1943, carrying 2,000 bombs loaded with mustard gas. Each bomb held 60 to 70 pounds of the gas. The ship docked at Bari on November 28, 1943. Four days later, German aircraft attacked the port. Their 20-minute assault sank 17 ships and badly damaged 8 others. Racked by explosions, the *John Harvey* sank, and some of the mustard gas in the bombs in the hold was released. It mixed with the oil and smoke and rolled across the water. More than 1,000 Allied soldiers and Italian civilians died as a result, and hundreds were blinded, some permanently. The death rate was particularly high because no one knew of the cargo until several weeks had passed.

Yet such difficulties did not preclude the use of poison gas in the war. The Italians, for example, utilized mustard gas and tear gas grenades in their 1935–1936 conquest of Ethiopia. They employed it to protect their flanks by saturating the ground on either side of the advancing columns. They also targeted Ethiopian communications centers and employed mustard gas against Ethiopian military personnel. In fact, the Italians deployed more than 700 tons of gas against the local population, either as bombs (each container contained about 44 pounds) or sprayed from aircraft. Their use of chemical weapons was indiscriminate, targeting both military and civilian areas. One-third of all Ethiopian military casualties in this conflict resulted from exposure to chemical agents.

The Italian decision to employ chemical weapons on a large scale in Ethiopia prompted other nations to renew their production of such weapons and to plan for protecting their armed forces and civilian populations. France began production at a phosgene facility at Clamency in 1936. The U.S. government reopened mustard gas and phosgene plants in New Jersey the following year. The Soviet Union opened three new chemical weapons production plants. And in November 1938, after the Munich Conference, the British government issued tens of thousands of gas masks to civilians and

mandated a minimum level of production of 300 tons of mustard gas per week, with 2,000 tons held in reserve.

At the beginning of World War II, Germany held a commanding lead in the stockpiling of chemical weapons, but its government officials did not know this. German stockpiles in 1939 are estimated at 10,000 tons, as compared with 500 tons in Great Britain, 1,000 tons in the United States, and 2,000 tons in Japan.

During World War II in the European theater, chemical weapons were never deliberately employed on a large scale. In June 1940, British prime minister Winston L. S. Churchill discussed with his cabinet the idea of using poison gas to repel a German invasion of either Great Britain or Ireland. Although many of the senior military staff opposed this notion, the cabinet approved it. The British government also considered the use of poison gas to combat the German V-1 and V-2 rockets later in the war. By 1944, Germany's production capacity was 10,000 tons of poison gas per month; in addition, myriad delivery systems were available, including grenades filled with hydrogen cyanide. The Luftwaffe had more than 480,000 gas bombs, ranging in size from 33 to 1,650 pounds.

In the Pacific theater, the Japanese had been involved in massive production of poison gas since the later portion of World War I. By 1937, Japan was daily producing up to 2 tons of Lewisite, a virulent form of mustard gas. In their invasion and occupation of China from 1937 to 1945, the Japanese employed a wide variety of poison gases, including phosgene, hydrogen cyanide, mustard gas, and Lewisite. Since the Chinese population, both military and civilian, was completely unprotected against chemical warfare, the effects were devastating.

The Japanese deployed the chemical weapons by aerial bombardment and artillery shells. They also designed rockets capable of holding 10.5 quarts of a chemical agent and traveling up to two miles, flamethrowers that propelled hydrogen cyanide, and a handheld antitank weapon that employed hydrogen cyanide. The Japanese also utilized gas grenades during the Imphal and Kohima sieges (March–July 1944). The United States considered using poison gas during the invasion of Iwo Jima and the proposed invasion of the Japanese home islands, but the former was never ordered, and the latter proved unnecessary.

The deadliest form of chemical warfare at that time, nerve gas, was never

used in battle. A German scientist, Gerhard Schrader, employed by I. G. Farben in 1936, discovered tabun while he was trying to create a more powerful insecticide. Tabun can be absorbed directly into the body and is colorless and odorless. It stops the nervous system from producing a key enzyme, acetylcholinesterase, which allows contracting muscles to relax. If this enzyme is not active, important muscles, such as the heart, contract and begin to spasm. As all the body's muscles contract, the person suffocates.

Tabun is 100 to 1,000 times more deadly than chlorine gas and 10 to 100 times more deadly than mustard or phosgene gas. Later, Schrader discovered a second and even more toxic nerve gas, which he named sarin. It is almost 10 times more lethal than tabun. In 1944, a still more deadly nerve gas, soman, was discovered, but it was never mass-produced during the war. Great Britain also manufactured sarin and soman.

Germany's leaders chose not to deploy tabun, because they lacked the ability to protect their own population against this nerve gas and no known antidote existed. The Germans did test their nerve gases on unwilling inmates of concentration and prisoner-of-war camps. At the Natzweiler concentration camp, tests with both mustard and phosgene gases were also conducted on unwilling prisoners. Germany moved its storage of nerve gas in 1944 in anticipation of Allied advances in the west, but their production facility in Silesia fell into Soviet hands.

The German government used a poison gas, namely Zyklon B, against prisoners in concentration camps, notably the Jews, and in its killing centers in Poland. Zyklon B was developed in the 1930s by Deesch, a subsidiary of I. G. Farben that was experimenting with more powerful insecticides. Zyklon B, also known as Prussic acid, is hydrogen cyanide—a powerful toxic, volatile, and colorless liquid. In order to transport the gas, it was absorbed by wood circles or small cubes because of its great volatility.

Zyklon B was dropped into gas chambers and caused suffocation as well as vomiting and feelings of fear and dizziness. The Germans constructed gas chambers to use Zykl-on B in their camps at Auschwitz, Buchenwald, Sachsenhausen, Neuengamme, Majdanek, Mauthausen, Stutthof, Lüblin, Gross-Rosen, Ravensbrück, and Treblinka. In Auschwitz alone, more than 2.5 million people were murdered through the use of Zyklon B between May 1940 and December 1943. At other concentration camps and killing centers, prisoners were usually killed by carbon monoxide poisoning.

By 1945, the major combatants as a group had stockpiled more than 500,000 tons of chemical weapons, led by the United States with 110,000 tons. This amount was five times the total amount of gas employed in World War I. Although poison gases were never used in large-scale attacks during World War II, the threat was present throughout the conflict. Given their deadly nature, the updated deployment systems, and the large stockpiles, chemical weapons could have played an enormous role in World War II.

Chen Cheng (1898–1965)

Chinese Nationalist general who commanded the Chinese Expeditionary Army and served as war minister. Born in Qingtian (Ch'ingt'ien), Zhejiang (Chekiang) Province, on January 4, 1898, Chen Cheng (Ch'en Ch'eng) enrolled at the Baoding (Paoting) Military Academy in 1919 and graduated in 1922. He then served both in his native province and in Guangdong (Kwangtung) Province.

In 1924, Chen became an artillery instructor in the Huangpu (Whampoa) Military Academy, where he joined the Guomindang (GMD, Nationalists) and developed a close relationship with Jiang Jieshi (Chiang Kai-shek). Chen held a number of command posts in the Eastern and Northern Expeditions between 1925 and 1928 as well as in the antiwarlord and anti–Chinese Communist "extermination campaigns" of the early 1930s. Chen became

commander in chief of the Fourth Group Army, a position second only to that of Jiang, in early 1937.

After the start of the Sino-Japanese War in July 1937, Chen took command of the Fifteenth Group Army and became deputy commander of the Fourth Reserve Army; that November, he was also made commander in chief of the Third War Area of Zhejiang and southern Jiangsu (Kiangsu), defending both Shanghai and Nanjing (Nanking). When both cities fell at year's end, Chen went to Wuhan, Hubei (Hupeh), assuming the post of defense commander in chief in January 1938. He was concurrently commander of the newly created Ninth War Area of southern Hubei, northern Jiangsu, and Hunan in June and governor of Hunan in July. After Wuhan's fall in late October 1938 in the First Battle of Changsha in Hunan, Chen moved to Chongqing (Chung-king) in Sichuan (Szechwan), where he was responsible for guerrilla and corps training. In October 1939, he became commander of the Sixth War Area, comprising the areas west of Hunan including eastern and southern Hubei and eastern Sichuan. From May 1940, he held back the Japanese advance to Chongqing at Yichang (Ichang), Hubei.

In February 1943, Chen was also commander of the Chinese Expeditionary Army, responsible for preparing the joint Anglo-American–Chinese Burma Campaign launched the next year (he was succeeded in this post by Wei Lihuang [Wei Li-huang] in October). After the Japanese launched Operation ICHI-GO (April–December 1944) against Henan (Honan), Chen became commander of the enlarged First War Area of Hebei, northern Shandong (Shantung), Henan, Anhui (Anhwei), and Shaanxi (Shensi). When the Japanese advanced into Guangxi (Kwangsi), Guizhou (Kewichow), and Yunnan at the end of the year, Chen left the battlefield and, as war minister, concentrated on modernizing GMD forces, employing U.S. technical and material assistance.

After the beginning of the Chinese Civil War, Chen became director of the Northeastern Headquarters in August 1947. He resigned in January 1948 because of illness, and his position was taken by Wei. In October, Chen fled to Taiwan, where he assumed the governorship, preparing the GMD retreat from the mainland. In 1954, he was elected vice president of the Republic of China. Chen died in Taipei on March 5, 1965.

Chennault, Claire Lee (1893–1958)

U.S. Army Air Forces lieutenant general. Born in Commerce, Texas, on September 6, 1893, Claire Lee Chennault was raised in rural Louisiana. He taught English and business at a number of southern colleges until August 1917, when he became a second lieutenant in the army reserve. He remained in the United States during World War I, transferring to the Signal Corps and completing pilot training in 1920.

An accomplished flier, Chennault then held a number of assignments, among them command of the 19th Pursuit Squadron in Hawaii between 1923 and 1926. He became an outspoken advocate of fighter aircraft in a period when prevailing military thought subscribed to the doctrines espoused by Italian airpower theorist Giulio Douhet and the underlying assumption that "the bomber will always get through." While serving as an instructor at the Air Corps Tactical School in 1935, Chennault wrote *The Role of Defensive Pursuit*, an important but controversial book at the time because it stressed the need for fighter aircraft. Removed from flying status in 1937 because of a serious hearing loss, Chennault was forced into medical retirement as a captain.

In May 1937, Chennault went to China as aviation adviser to the Nationalist government of Jiang Jieshi (Chiang Kai-shek). When the Japanese attacked China that September, he became a colonel in the Chinese air force and began testing his tactical theories. In late 1940, Chennault was

allowed to recruit American military pilots for service in China, despite the strong opposition of the State, War, and Navy Departments. His American Volunteer Group (AVG), popularly known as the Flying Tigers, consisted of some 200 ground crew and 100 pilots flying semiobsolete Curtiss P-40B fighters. The AVG entered combat for the first time on December 20, 1941. By the time the unit disbanded in July 1942, it claimed 296 Japanese aircraft shot down, with only 12 planes and 4 pilots lost.

In April 1942, Chennault was recalled to active duty with the U.S. Army as a colonel. A few months later, he was promoted to brigadier general and put in command of the newly formed China Air Task Force (CATF), a subordinate command of the U.S. Tenth Air Force in India. In March 1943, the CATF became the Fourteenth Air Force, with Chennault promoted to major general.

U.S. Army Air Forces major general Claire Chennault established and commanded the American Volunteer Group (AVG), known as the Flying Tigers, in China early in World War II. He then

commanded the Fourteenth Air Force. After the war Chennault founded Civil Air Transport (CAT), which later became Air America. (National Archives)

The CATF and the Fourteenth Air Force were economy-of-force organizations in a tertiary theater and therefore always operated on a shoestring. Operating under Chennault's theories, however, both organizations achieved combat effectiveness out of proportion to their size and resources. By 1945, the Fourteenth Air Force had destroyed some 2,600 Japanese aircraft and thousands of tons of supplies.

During his time in China, Chennault conducted a long-running and public feud with U.S. Army lieutenant general Joseph Stilwell, the equally stubborn and irascible U.S. commander of the China-Burma-India theater. Chennault engineered Jiang's demand for Stilwell's recall, but Chennault was removed from command and forced into retirement for a second time on August 1, 1945.

After the war, Chennault remained in China. He established and operated the Civil Air Transport (CAT) airline, which supported Jiang's Nationalist government in its civil war with Mao Zedong (Mao Tse-tung) and his Communist forces. In 1950, Chennault sold his interest in CAT to the Central Intelligence Agency, but he remained the chairman of the airline's board until 1955. He died at Walter Reed Army Hospital in Washington, D.C., on July 27, 1958. Only days before his death, Chennault was promoted to lieutenant general.

Chen Yi (1901–1972)

Chinese military leader and marshal of the People's Republic of China. Born in Lezhi (Lochih), Sichuan (Szechuan) Province, to a well-to-do family on August 16, 1901, Chen Yi (Ch'en Yi/Ch'en I) studied at both Shanghai University and the Beijing (Peking) College of Law and Commerce before traveling to France in 1919 on a work-study program. During his stay in France, he met Zhou Enlai (Chou En-lai) and became politically active. In 1921, Chen was deported from France for involvement in protests by Chinese exchange students.

On his return to China, Chen joined the Guomindang (GMD, Nationalist Party) in 1921 and the Communist Party in 1923; they were then loosely allied in the struggle to reunify China. Following study at the Sino-French University of Beijing between 1923 and 1925, Chen became a political instructor at the Huangpu (Whampoa) Military Academy in 1925. He then served on the staff of General Ye Ting's (Yeh T'ing) 24th Division at the beginning of the Northern Expedition, the Nationalist-led reunification campaign launched in the summer of 1926.

In 1927 the alliance between the Communists and Nationalists collapsed, and civil war ensued. Chen participated in the abortive Communist Nanchang Uprising of Jiangxi (Kiangsi) Province in August 1927. In January 1929, he joined Zhu De (Chu Teh) in the Communist enclave of Jiangxi and commanded the 12th Division of the Red IV Corps fighting Nationalist forces under Jiang Jieshi (Chiang Kai-shek). Chen did not join Mao Zedong (Mao Tse-tung) in the epic Long March of 1934–1935. Instead, Chen stayed behind to organize guerrilla forces in south-central China, which eventually became part of the New Fourth Army. Following the beginning of war with Japan in 1937, he fought with the New Fourth Army against the Japanese along the Changjiang (Yangtze) River.

After the Japanese inflicted a sharp defeat on the New Fourth Army in January 1941, Chen, who had been a sector commander, took command of the entire army. From that point until 1945, his New Fourth Army greatly expanded the area of Communist control in central China by conducting a highly effective guerrilla campaign characterized by rapid maneuver.

Following Japan's surrender, Chen was formally assigned command of the New Fourth Army. In the 1946–1949 Chinese Civil War, he encircled the

Nationalist 2nd and 7th army groups, destroying them in the Huai-Hai Campaign between November 1948 and January 1949. After that, he advanced to take Nanjing (Nanking) in Jiangsu (Kiangsu) Province in April and both Wuhan in Hubei (Hupeh) Province and Shanghai in Jiangsu Province in May. Chen served as mayor of Shanghai and commander of the East China Military Region (1949–1956) and vice premier (1956). He was promoted to marshal of the People's Liberation Army in 1955 and served as China's foreign minister from 1956 to 1968. Attacked by Red Guards during the Cultural Revolution, Chen died in Beijing on January 6, 1972.

Cherbourg, Capture of (June 1944)

The capture of the French port city of Cherbourg, on the northern shore of Cotentin Peninsula, was vital to the Allied buildup for the Normandy breakout. On June 7, 1944, the day after the Allied landings at Normandy, Major General J. Lawton Collins's VII Corps attacked westward from the Utah Beach lodgment across the Cotentin Peninsula to isolate the port of Cherbourg. On June 18, VII Corps succeeded in cutting completely across the peninsula and isolating parts of four German divisions in the Cherbourg Pocket commanded by Lieutenant General Karl Wilhelm von Schlieben.

With VIII Corps holding the southern shoulder of the Allied success, VII Corps advanced northward on Cherbourg starting on June 19. That same day, a strong storm hit Normandy. Three days later when the storm lifted, the artificial harbor (Mulberry A) at Omaha Beach had been destroyed, rendering the capture of Cherbourg even more urgent. When Collins launched VII Corps with three divisions abreast, the German defenses along the eastern

shore of the peninsula were outflanked, and Schlieben had no choice but to fall back into the defenses that circled Cherbourg along high ground. By June 21, VII Corps invested the defenses, and the fall of the city was imminent.

On June 22, the Allies launched heavy air attacks to open the final phase of the battle. Collins ordered the main attacks in the center and left, conducted by the 79th and 9th Infantry Divisions, while the 4th Infantry Division supported in the east. On June 22, German leader Adolf Hitler ordered Schlieben to fight to the last and leave nothing but ruins for the Allies. VII Corps advanced steadily on June 22–23 and reached Cherbourg's outer suburbs of Octeville and Tourlaville, which were taken on June 24. The air attacks dampened German morale, and on June 25 a naval task force headed by three battleships supported the final attack on Cherbourg proper with naval gunfire.

The 4th and 9th Infantry Divisions seized their objectives inside the city by nightfall on June 25. The 79th Infantry Division had a more difficult fight around Fort du Roule, which finally fell on June 26. Schlieben made his final radio message that afternoon and was captured shortly thereafter; he refused to order a general surrender of forces.

Organized German resistance ended on June 27, but fighting continued as VII Corps reduced several strongpoints that had been previously bypassed, including Cap de la Hague at the northwest corner of the peninsula, the port facilities, and other resistance pockets on the Cotentin Peninsula. The harbor strongpoints, under heavy dive-bomber attack, held out until June 29, and when the 9th Division seized Cap de la Hague on June 30, the campaign was concluded.

Bomb damage in the French port city of Cherbourg, on its liberation in late June 1944. (National Archives)

The heavy fighting to take Cherbourg severely damaged the port facilities. VII Corps found landing berths blocked by sunken ships, the harbor mined, the breakwater ripped open, and dock facilities demolished. Three weeks passed before the docks were able to receive cargo, and it was several months before shipments could be received in quantity—a serious blow to Allied logistical planning.

Chernyakhovsky, Ivan Danilovich (1906–1945)

Soviet Army general. Born in Uman in Ukraine on June 29, 1906, Ivan Chernyakhovsky joined the Red Army in 1924 and the Communist Party in 1928, when he was commissioned. He then held a variety of assignments. He graduated from the Kiev Artillery School in 1928 and the Mechanization and Motorization Academy in the late 1930s. By 1940, he was a colonel commanding the 28th Tank Division in the Baltic Special Military District.

Following the June 1941 German invasion of the Soviet Union, Chernyakhovsky fought with his division as a part of the XVIII Tank Corps on the Leningrad front until July 1942. He then commanded the Sixtieth Army and took part in the Kursk Offensive of July 5–13, 1943. The youngest Soviet front commander of World War II, he was promoted to colonel general in March 1944. Marshal Georgii Zhukov recommended him to command the Western Front, which he took over in April 1944 just before it was renamed the 3rd Belorussian Front.

In the Belorussian Offensive, Chernyakhovsky's command participated in the taking of Minsk and then moved through Latvia and took Vilna (Vilnius). It then drove into East Prussia, eventually taking Königsberg (Kaliningrad). Promoted to army general in June 1944 just days before his 38th birthday, Chernyakhovsky was one of the finest Soviet front commanders. Unusual for senior Soviet commanders of the war, he was a Jew, had joined the army after the civil war, and never attended the Frunze Military Academy. Chernyakhovsky did not live to see the capture of Königsberg. He was mortally wounded by artillery fire at Melzak, Poland, and died on February 18, 1945.

Cherwell, Lord

See Lindemann, Frederick Alexander

Cheshire, Geoffrey Leonard (1917–1992)

Royal Air Force (RAF) group captain. Born at Chester, England, on September 7, 1917, Geoffrey Leonard Cheshire was educated at Oxford University and joined the Air Squadron there in 1936. He was commissioned in the RAF Volunteer Reserve in 1937, and when war became imminent he accepted a regular commission and was assigned to bombers.

Cheshire began his first combat tour in June 1940, with Number 102 Squadron. Completing his first tour, he immediately accepted a second, with Number 35 Squadron. After a short stint as an instructor pilot, during which he wrote *Bomber Pilot*, Cheshire returned for a third operational tour, as wing commander of Number 76 Squadron. His bombing missions took him over the heavily defended Ruhr region, Berlin, and Bremen. Finishing his third tour, Group Captain Cheshire became a deputy base commander in March 1943.

Cheshire was unhappy when not flying and relinquished his rank to return to flying duties for a fourth time, in October 1943, as a wing commander in Guy Gibson's Number 617 Squadron, the "Dam Busters." There, Cheshire pioneered the master bomber technique, in which a low-flying Mosquito bomber flew ahead of and below the main attack force to mark targets with incendiaries. This placed the marking aircraft, which Cheshire regularly flew, in the teeth of the fiercest enemy fire, at altitudes as low as 200 feet. While commanding the 617 Squadron, he led every raid using the master bomber procedure, including the April 24–25, 1944, raid against Munich. In this action, his Mosquito was pushed perilously close to its maximum fuel range at an altitude of 700 feet over the city's heavy air defenses, and it was exposed to 12 straight minutes of enemy fire during the withdrawal. Cheshire also flew important missions in support of the Normandy bombing campaign and against the Le Havre E-boat (German fast attack craft) pens.

Cheshire won a Victoria Cross, awarded September 8, 1944, for flying an incredible 100 missions over German-held territory between 1940 and 1944.

His citation prominently mentions the Munich raid. Retiring from the RAF in December 1945, he founded Cheshire Foundation Homes in 1948, a worldwide organization that provides housing and services to disabled persons. Created Baron Cheshire of Woodall in 1991, he died in Cavendish, Suffolk, England, on July 31, 1992.

Chevallerie, Kurt von der (1891–1945)

German Army general. Born on December 23, 1891, in Berlin to a family of Huguenot origin, Kurt von der Chevallerie was commissioned in the army as a lieutenant in August 1911. His first assignment was with the 5th Guards Grenadier Regiment in Berlin-Spandau. Decorated for valor in World War I, he remained on duty with the 4th Infantry Regiment after the war.

During the interwar period, Chevallerie held a variety of infantry commands and staff posts. He commanded the 83rd Infantry Division as a major general at the outbreak of World War II in 1939. Promoted to lieutenant general, he commanded the 99th Light Division in Operation BARBAROSSA, the invasion of the Soviet Union that began June 22, 1941. He took command of the LIX Army Corps in December 1941 and was promoted to general of infantry. In January 1942, Chevallerie's forces sealed a dangerous gap between Velikiye Luki and Rzhev, preventing a Soviet

breakthrough. He was also involved in the effort to rescue the surrounded garrison at Velikiye Luki in January 1943.

At the time of the June 1944 Normandy Invasion, Chevallerie commanded the First Army, part of Army Task Group G under Colonel General Johannes von Blaskowitz. Chevallerie's duties were to defend southwest France and the Bay of Biscay area. He had about 100,000 men but few first-rate combat soldiers. Most of his men were garrison or coastal defense troops fit mainly for occupation duties or limited defensive missions. Eventually Chevallerie defended the Paris-Orléans gap area south of Paris. He was unable to halt the Allied advance, however, so Adolf Hitler removed him from command and placed him on the command reserve list, where he remained for the rest of the war.

Chevallerie disappeared during the Soviet assault on and capture of Kolberg on March 18, 1945. He may have died in the city or in Soviet captivity shortly thereafter. His younger brother was Lieutenant General Helmut von der Chevallerie, who commanded the 11th Panzer Division and then the 273rd Reserve Panzer Division.

Children and the War

During World War II, millions of men and women around the world served in the armed forces of their respective nations. Millions of others contributed to the war effort by maintaining vital services and laboring in war-related industries. Children went to war as well. Even those far removed from the fighting were affected by the war. They collected scrap metal and other materials that would be vital to the war effort, participated in austerity programs, left school to work on farms, grew vegetables in urban plots, and suffered from the same shortages and wartime prohibitions as their parents.

In many lands, children experienced the horrors of war firsthand, both as combatants and victims. Children were the most vulnerable part of the population, and many perished from starvation, malnutrition, or disease. Others fell victim to Nazi Germany's euthanasia programs. Some 1.2 million Jewish children throughout Europe died in the Holocaust.

Many children perished as a direct result of Soviet policies as well. Polish authorities estimated that about 140,000 Polish children were uprooted from their homes in the Soviet-occupied portion of Poland. Of these, perhaps 40,000 simply disappeared. In the Far East, Chinese children suffered in the Japanese reprisal campaigns. Children were also innocent victims of the indiscriminate bombing of cities conducted by both sides, beginning with German air attacks on Warsaw and ending with the atomic bombs dropped by the United States on Hiroshima and Nagasaki.

Many children in nations under air attack were sent into the countryside to live with relatives or even with strangers. A number were also sent abroad, separated from their parents for years and, in many cases, forever; examples include British children sent to North America and Finnish children sent to Sweden.

In the Soviet Union, children helped patrol their neighborhoods at night to make certain that blackouts were being enforced. They filled sandbags and water buckets to prepare against incendiary bomb attacks and were enlisted to help in constructing antitank defenses before Moscow in the summer of 1941. Children were also actual combatants. They fought with partisan units in the Soviet Union and in Yugoslavia, among other nations. They also helped

collect intelligence on Axis occupying forces. And in the last desperate fighting of World War II in Europe, Adolf Hitler pressed many German boys into the army.

After the war, conditions were desperate in many parts of the world. In Indochina, perhaps 1 million people, including children, perished due to famine. Conditions were equally desperate in other nations. Large numbers of people were displaced by the war, left homeless and hungry. There were perhaps 13 million abandoned European children at the end of World War II. Poland claimed 1 million orphans, and France claimed 250,000. This became a problem of major proportion in many nations, especially in the Soviet Union with an entire generation of orphans.

A 10-year old Chinese soldier, with a heavy pack, and a member of a Chinese division, boarding planes at the North Airstrip, Myitkyina, Burma, bound for China, December 5, 1944. (National Archives)

Adults were changed by the war, but so were the children who survived it. As they aged, their childhood experiences remained a reference point for their adult lives and served as a benchmark with which to measure future generations.

China

Large Asian nation with a 1939 population of approximately 517,568,000 people, making it the most populous country in the world. Encompassing 3,704,427 square miles, China stretches from Korea and the Yellow Sea in the east to Afghanistan in the west and from Mongolia and Russia in the north to India and Vietnam in the south. In the decades before World War II, the Republic of China was politically fragmented; it was rather weakly governed by the Nationalist Party—the Guomindang (Kuomintang, GMD)—of President Jiang Jieshi (Chiang Kai-shek), but the Chinese Communists had been waging a mounting insurgency to oust the GMD and establish a communist regime over all China. Several regions were under the actual control of local warlords, often but not always affiliated with the Nationalists. At the same time, China came under increasing pressure and repression from the Japanese, who hoped to turn China into a vassal state.

China was one of the four major Allied powers of World War II. It fought Japan alone for four years and throughout the war tied down more than 1 million Japanese troops. The war strengthened the position of the Chinese Communists, however, and helped to precipitate the eventual downfall of the GMD, which occurred in 1949.

For China, war began in July 1937, when long-standing hostilities with Japan, provoked by the latter country's effective annexation of Manchuria in 1931 and a continuing series of territorial, economic, and political incursions in other areas, caused a small skirmish near the Lugouqiao (Lukouch'iao) Marco Polo Bridge, close to Beijing (Peking) in Hebei (Hopeh) Province. The incident quickly escalated into full-scale warfare. The Chinese invariably called the conflict "the War of Resistance against Japanese Aggression." Until December 1941, when China formally declared war on Japan and thereby aligned itself with the Western Allies after the Japanese attack on Pearl Harbor, Japan dismissively referred to the Chinese conflict as the

“China Incident.” After that date, it became part of the “Greater East Asia War.”

For much of the 1930s, the Chinese Nationalist government effectively acquiesced to Japanese demands. Although Jiang believed that war with Japan was inevitable, he sought to defer this until, with the help of German military advisers, he had successfully modernized China’s armed forces. In the early 1930s, his first priority was to eliminate the GMD’s major political rival—the Chinese Communist Party (CCP), led by the charismatic and innovative Mao Zedong (Mao Tse-tung), against whose forces Jiang mounted annual campaigns from 1930 to 1935. Only after December 1936—when another leading Chinese politician, the Manchurian warlord Zhang Xueliang (Chang Hsüeh-liang), captured Jiang and made his release conditional on the formation of a united Nationalist-Communist anti-Japanese front—did Jiang reluctantly and temporarily renounce his deeply rooted anticommunist hostility.

The two camps never trusted each other, and political factionalism within the GMD also continued throughout the war, hampering Jiang’s freedom of action and his ability to wage effective warfare against Japanese forces. Communist and GMD forces remained essentially separate, mounting independent operations. From late 1938 onward, the GMD government, headed by Jiang and based in Chongqing (Chungking) in Sichuan (Szechwan) Province, controlled southwest China. The Communists held sway over northwest China from their base in Yan’an (Yenan) in Shaanxi (Shensi) Province.

In its early stages, China’s war with Japan was one of rapid movement and military disaster. In late July 1937, Japanese troops took over the entire Beijing-Tianjin (Tientsin) area of northern China. They inflicted a series of major defeats on Jiang’s military, wiping out most of his modernized units and, over the following 18 months, successively taking Shanghai and Nanjing (Nanking), Guangzhou (Canton), and Wuhan, China’s provisional capital after Nanjing fell. Chinese troops had occasional triumphs. Notable was the April 1938 Battle of Taierzhuang (Hsieh Chan T’ai-Erh-Chuang). Yet these were rarely followed up. Japanese leaders assumed that Jiang would sue for peace before the end of 1938, but to their frustration, he refused to do so.

Jiang adopted a strategy of trading space for time, assuming that the Chinese could force the Japanese to overextend themselves, making them

vulnerable to a lengthy war of attrition. This proved substantially correct. By 1940, Japanese forces were bogged down in an inconclusive war in mainland China, occupying vast tracts of territory without fully controlling them. Even so, and despite the scorched-earth policy Jiang followed, the regions he ceded to Japanese rule—from March 1940 exercised through the puppet regime of renegade Chinese politician Wang Jingwei (Wang Ching-wei)—included most of China's leading cities, its major industrial areas, and its most fertile and densely populated agricultural regions. Jiang's early dogged resistance to Japanese invasion won him great national prestige. His subsequent protracted abandonment of most of northern and eastern China to Japanese occupation, however, eventually damaged his standing and weakened his authority.

From 1931 onward, Jiang sought assistance against Japan from Western powers and the League of Nations. But effectual aid was rarely forthcoming. The league restricted itself to nonrecognition of Manzhouguo (Manchukuo) and moral condemnation of Japan's policies, together with the imposition of limited economic sanctions on Japan. They were, however, restrictions that only some of its member states observed. In 1938, the U.S. government extended limited economic assistance to China, making a loan against its tung oil supplies.

By the late 1930s, the growing demands of Germany and Italy in Europe preoccupied most Western nations. Thus, the Sino-Japanese War remained a distant sideshow, albeit one with implications for the European powers' colonial positions in Asia. In the summer of 1940, the German conquest of most of Western Europe brought Japanese demands that Britain, France, and the Netherlands forbid the sale or transit of war supplies to China through their Asian colonies. France's Vichy government was also forced to open air bases in Indochina to Japanese warplanes. In the autumn of 1940, Japan formally joined Germany and Italy in the Tripartite Alliance of the Axis powers. These actions brought additional U.S. economic and military assistance for China, including the dispatch of American warplanes. In 1941, President Franklin D. Roosevelt drastically tightened economic sanctions on Japan and repeatedly demanded the withdrawal of Japanese troops from China.

When Japan attacked American forces at Pearl Harbor on December 7, 1941, simultaneously declaring war on Great Britain and swiftly annexing British, Dutch, and American territories in East and Southeast Asia, China

finally formally declared war on Japan. Jiang was named supreme commander of the Allied China theater, receiving substantial amounts of military aid under the American Lend-Lease program. Even so—and despite his Western-educated wife's skillful dissemination in the United States of an image of China as a heroic, democratic, and modernizing state—Jiang's relations with other Allied leaders were poor.

Jiang's single-minded focus on Chinese interests, regardless of the impact on the broader Allied coalition, annoyed Roosevelt and British prime minister Winston L. S. Churchill. Nonetheless, it sometimes paid dividends. At the 1943 Cairo Conference, Allied leaders agreed that China should regain all territories annexed by Japan since 1895. Jiang also sought to end foreign extraterritorial privileges and concessions in China and, less successfully, to regain the British colony of Hong Kong. At the autumn 1944 Dumbarton Oaks meeting, China was one of the five great powers awarded permanent Security Council seats in the new United Nations. At the February 1945 Yalta Conference, however, Roosevelt, Churchill, and Soviet leader Joseph Stalin agreed (in Jiang's absence) that in return for joining the war against Japan from which it had remained aloof, the Soviet Union should regain the special rights the czarist Russia had exercised in Manchuria before 1905.

The continuing Chinese inability or reluctance to mount an aggressive campaign against the Japanese occupiers irritated British and American officials. This was especially the case with U.S. lieutenant general Joseph W. Stilwell, American commander of the China-Burma-India theater and Jiang's chief of staff. Stilwell hoped to modernize the Chinese Army and lead it in such a venture—an undertaking that Jiang opposed as impractical, probably motivated in part by fears that this would weaken his own control of the Chinese military and his postwar position vis-à-vis the Chinese Communists. Over Jiang's opposition, Stilwell also sought to supply weapons to all anti-Japanese forces in China, including the Communists. Ultimately, at Jiang's insistence, Roosevelt withdrew Stilwell in 1944. Many Allied officials and journalists also deplored the pervasive corruption of the Nationalist regime that Jiang, though personally honest, tolerated.

Such shortcomings among the Nationalists enhanced the image of the Chinese Communists. Since 1937, they had supposedly been Jiang's partners against Japan, though both the Nationalists and the Communists believed that civil war was inevitable and sought to strengthen themselves for the

anticipated confrontation. The Communists' Eighth Route Army, created in 1937, and the New Fourth Army built up by Lin Biao (Lin Piao) fought largely behind Japanese lines in central China and the northern Hebei and Shanxi (Shensi) Provinces. They worked closely with local guerrilla and partisan forces and built up bases that would potentially enhance the postwar Communist position. Communist forces adopted this strategy after their defeat in the "Hundred Regiments" Campaign of August to November 1940, in which Japanese rail and road networks in northern China were attacked. CCP-GMD cooperation largely ceased after the 1941 New Fourth Army Incident, when Nationalist troops attacked and defeated that unit in the lower Chanjiang (Yangtze) Valley.

Despite the Chinese Communists' undoubted ruthlessness, their reputation far surpassed that of the GMD government. Idealistic young students and intellectuals flocked to join the Communists. Their selfless dedication and austere lifestyle and the charm and ability of their top leaders, especially Zhou Enlai (Chou En-lai), later China's premier, impressed Western journalists and officials who visited the Communist Yan'an base. That included the young diplomats of the 1944 U.S. "Dixie Mission." Nonetheless, despite their disillusionment with GMD leaders, senior American officials never endorsed the Chinese Communists.

When the war ended in August 1945, Japanese troops were still in occupation throughout China. In Manchuria, despite objections from Jiang, Soviet forces turned over to Communist Chinese units arms and equipment captured from the Japanese. American leaders, especially Ambassador Patrick J. Hurley in late 1945, were concerned about communist inroads in China and sought to strengthen Jiang's regime. They also strove to promote reform and encourage GMD-CCP reconciliation and the formation of a coalition government in which communists would have limited influence. Between December 1945 and January 1947, former U.S. Army chief of staff General George C. Marshall was in China endeavoring to secure an accommodation between the two sides. In January 1946 he arranged a temporary cease-fire, but it was broken later that spring when, as Soviet forces withdrew, GMD forces attacked Chinese Communist troops in Manchuria. No further agreement acceptable to both sides could be brokered.

Civil war then continued until the Communists secured military victory. The GMD government retreated to the island of Taiwan, and on October 1,

1949, Mao proclaimed the new People's Republic of China. From then on, China would play a major role in the Cold War that succeeded and grew out of World War II.

China, Air Force

In December 1941 at the beginning of the Pacific war, the Nationalist China Air Force (CAF) had already been at war with Japan for almost four years. Beginning in 1932, trainers, pilots, and aircraft from the United States, Italy, Germany, and the Soviet Union had all played a part in building the

Nationalist Chinese air element and the small air arms of several Chinese warlords. In July 1937, the CAF had three air groups, with a mix of U.S. and Italian fighters and bombers. Fewer than 100 of the more than 600 aircraft in the Chinese inventory were combat ready, however, and there were few experienced or adequately trained pilots. With the beginning of the war, available forces immediately went into action to support Nationalist army units in their defense of Shanghai, Jiangsu (Kiangsu) Province, in early August and to assist in the fighting withdrawal of Chinese forces into central China. The CAF was decimated in the late 1930s by the well-trained and well-equipped Japanese forces.

From 1937 until the German invasion of the Soviet Union in June 1941, the Soviets were the major supplier of aircraft, pilots, and trainers to China. In April 1937, though, retired U.S. Army Air Corps officer Claire Chennault arrived in China to serve as an aviation adviser to the Nationalist government of Jiang Jieshi (Chiang Kai-shek). Chennault organized and led the American Volunteer Group (AVG) of the CAF, known as the Flying Tigers. In September 1941, Washington dispatched the American Military Mission to China (AMMISCA) to "advise and assist" in rebuilding the Nationalist forces. Providing aircraft to the CAF and its AVG was a high priority, and the creation of a Chinese military capable of taking the war to the Japanese was the mission of Lieutenant General Joseph Stilwell.

Prior to Stilwell's arrival in Asia in March 1942, Washington had decided to try to build up and maintain a CAF of 500 operational aircraft, including the Lockheed P-38 Lightning, the Curtiss P-40E Kittyhawk, the Republic P-43 Lancer, the Vultee P-66 Vanguard, and later North American P-51 Mustang fighters and North American B-25 Mitchell and Consolidated B-24 Liberator bombers. With the closing of the landline of communication through Burma, the United States also promised the Chinese Curtiss C-46 Commando and C-47 Skytrain transport aircraft. From 1941 to V-J Day in 1945, Washington allocated 1,568 U.S. aircraft for China.

When the line of communication with Burma closed, everything had to be flown over "the Hump" (the Himalayas) to bases in southwestern China. Chennault, who rose to major general commanding the U.S. Fourteenth Air Force in March 1943, wanted to concentrate air assets on the destruction of Japanese air forces in China and build a bomber force capable of striking targets in eastern China and the Japanese home islands. The United States

also continued training the CAF and supplying equipment and aircraft to it and to its logistic arm, the China National Aviation Corporation. The U.S. Tenth and Fourteenth Air Forces, however, required most aircraft delivered to the China-Burma-India theater simply to keep the air bridge open and to support Allied offensives in Burma.

At the end of the war, U.S. aircraft were transferred to the CAF. When the Chinese Civil War began in 1946, Jiang's Nationalist forces had a competent air arm of nearly 500 aircraft and more than 5,000 trained pilots, aircrew, and maintenance personnel.

China, Army

The armed forces of China before and during World War II reflected the deep political divisions of that nation. Each major faction maintained its own military organization. In addition to conventional forces controlled by the principal political factions in the country, various warlords had their own regional forces, the loyalties of which shifted according to the circumstances of the moment. Alongside these, at the local level, village defense forces struggled to protect their inhabitants against bandit gangs that roamed large stretches of the countryside.

Civil war between the Nationalists, the Communists, and various regional warlords had been raging intermittently in China since 1911. Following the

Japanese takeover of Manchuria and incursions into northern China in 1931, the Communists and Nationalists arranged an uneasy truce, but the Chinese military effort during the war was undercut consistently by politics. By the end of 1942 Nationalist leader Jiang Jieshi (Chiang Kai-shek) and Communist leader Mao Zedong (Mao Tse-tung) believed that the United States and its allies would defeat Japan. Given their ardent conviction that a powerful military establishment would be essential in winning the postwar political struggle that was bound to follow, they planned (or rather, did not plan) their military moves accordingly. This meant, for the most part, avoiding contact with powerful Japanese forces, much to the exasperation of such individuals as Jiang's army commander, U.S. Army lieutenant general Joseph W. Stilwell.

The Nationalist Army

The army had always been central to the power of the Nationalist Party—the Guomindang (Kuomintang, GMD). The National Military Council (NMC) controlled the military establishment. Jiang was its chairman, with complete power over the NMC, and as such he directed all Nationalist military forces. At the beginning of the war, these numbered about 1.5 million men.

In the 1930s, the German government had sent military advisers to China to help train the Nationalist Army. In consequence, the Nationalist Central Armies were patterned more or less along German lines. Throughout the period these were the best trained of the Nationalist forces, although still inferior to Japanese or Western forces. At the beginning of the Second Sino-Japanese War in 1937, the Central Armies numbered about 300,000 men. Included in this body was the Generalissimo's Own, a force of some 80,000 men. Armed with German weapons, it was the elite force of Jiang's military establishment. There were some 1.2 million men in other units of indifferent training and capability. Although Nationalist senior leaders were often corrupt and not well educated, the middle ranks—trained at the Huangpu (Whampoa) Military Academy in Guangzhou (Canton), Guangdong (Kwangtung) Province—were capable. Most Nationalist soldiers, however, were conscripts, dragooned into service and often of low quality.

In the summer of 1941, the United States extended Lend-Lease aid to the Nationalist government, although the bulk of the early assistance went toward

improving transport to China over the Burma Road from India. This route was cut off when the Japanese invaded Burma in force in early 1942, and it was not reopened until 1945. In the meantime, much of the U.S. military aid to China was flown in over the Himalayas (“the Hump”). Tonnages by air gradually increased, but heated arguments occurred over the allocation of these still inadequate resources.

By the end of the war, the Nationalist Army numbered some 300 divisions. Although each supposedly had 10,000 men, some were seriously undermanned. Much military assistance continued to flow into China after the war, and the bulk of this ended up in Nationalist hands. The result was an army that was large in size and relatively well equipped but of limited capability and with indifferent leadership and inadequate training.

Chinese Communist Army

According to the 1936 Xian Agreement whereby the Nationalists and Communists would make common cause against the Japanese, Chinese Communist forces in northern China came to be designated the Eighth Route Army, authorized to a strength of three divisions. In 1938, the Nationalists also authorized formation of the smaller New Fourth Army in the lower Changjiang (Yangtze) River region.

The Chinese Communists refused to allow any Nationalist political authority in areas they controlled and denied the Nationalist side their military resources. Communist military forces were controlled by the Military Affairs Committee, which was responsible to the Communist Party Central Committee, chaired by Mao.

Camouflaged Chinese soldiers repel a charge by Japanese troops along the Salween River near Burma, ca. June 1943. (National Archives)

Although the Communists' equipment was not on a par with that available to the Nationalists, their military leadership and training were both superior, and their morale was significantly higher. Unlike the Nationalist forces, in which many of the men taken into the service were removed to other areas and forcibly kept there, Communist forces remained in their own areas and were seen by the people as a positive force, even helping them with crops and looking after their welfare.

Meanwhile, Communist forces grew far beyond the numbers authorized by the Nationalists, although little expansion occurred after midwar, because the Communists endeavored to improve the quality of their forces and because of Japanese "pacification" campaigns and Nationalist military actions. Nonetheless, at the end of the war, Mao could claim an army of about 1 million men, with reserves and local-level militia forces numbering an additional 2 million.

Collaborationist Armed Forces

The Japanese organized collaborationist armed forces in the areas of China occupied by their troops. These highly unreliable forces were drawn from a

variety of sources under a wide range of motivations. Some local commanders obeyed whichever side seemed ascendant at the moment. Nominally at least, many of these forces belonged to the Nationalist side. In the early 1940s, collaborationist forces might have numbered some 900,000 men.

Nationalist forces suffered most heavily in the first year of fighting the Japanese, especially in three months of struggle for Shanghai and the subsequent effort to defend Nanjing (Nanking) in Jiangsu (Kiangsu) Province. The Chinese lost perhaps 1 million dead, wounded, or missing in the first year of the war alone. The Nationalists then withdrew into the interior, relocating the capital to Chongqing (Chung-king) in Sichuan (Szechwan). The Chinese then transformed the war into a struggle of attrition, which Japanese forces, despite their superior mobility, could not win.

Although the Communist forces conducted operations against the Japanese rear areas and some large-scale conventional offensives, the brunt of the fighting that then occurred was borne by the Nationalist Army and warlord forces loyal to Jiang. In the eight years of fighting through 1945, the Nationalists suffered more than 3 million casualties while inflicting up to 2 million casualties on the Japanese. They were never able to gain a decisive victory over their antagonist, but the Chinese tied down significant numbers of Japanese forces until the end of the war.

In January 1941, the Chinese united front was severely damaged when the Nationalists attacked the Communist New Fourth Army. Open war now broke out between the Nationalists and the Communists. The fighting in China was henceforth a three-way contest. The Nationalists were no longer able to launch major offensives against the Japanese, but they were in a relatively secure position in central China. The Communists had also been weakened in fighting against the Nationalists and the Japanese but maintained control of large areas in north-central China. The Japanese, with a great expenditure of troops and material, were only in control of the line of communications and were dangerously overextended in China even as they widened the war by attacking the United States.

Aside from grudgingly providing a small portion of their troops to Stilwell to assist in the Allied recapture of Burma, Nationalist forces did not conduct any major actions from 1942 until forced to defend against Japan’s

April–December 1944 ICHI-GO Offensive. That offensive was precipitated by the establishment of U.S. air bases from which the United States could conduct strategic bombing raids on the Japanese home islands. The real battles for the Nationalist and Communist forces came in 1945 over Manchuria and marked the beginning of the Chinese Civil War.

See ICHI-GO, Operation

China, Navy

In the 1920s, Germany assisted the Nationalist government of China in establishing a naval academy at Mamei in Fujian (Fukien) Province, and in 1927 the Nationalist leaders also set up the Chinese Naval General Headquarters. The vast bulk of available resources, however, went into the army and air forces. When war with Japan began in July 1937, the Nationalist navy counted only a few old gunboats, some small coastal vessels, and assorted river craft. The navy also maintained a few naval stations inland on the major rivers and a facility that manufactured mines and naval explosives.

The Japanese quickly destroyed the larger Chinese naval craft during and after the August 1937 Battle of Shanghai in Jiangsu (Kiangsu) Province. Throughout the war, elements of the Chinese Navy nonetheless conducted sabotage attacks against Japanese ships and shore bases in China.

In early 1942, the U.S. Navy sent to China a small detachment known as the Sino-American Cooperative Organization, or the "Rice Paddy Navy," under the joint command of Nationalist general Dai Li (Tai Li) and U.S. Navy captain Milton E. "Mary" Miles. Its mission was to establish and man weather stations and communications facilities, gather intelligence, and conduct sabotage and guerrilla operations in the coastal areas and along the inland rivers of China. In 1943, Miles was promoted to commodore and assigned as commander, Naval Group China.

At the end of the war, there was a significant interservice battle over the type of navy China should maintain, who would control it, and how it would be equipped. Disputes thus slowed the effort to build a postwar Nationalist navy. Nationalist leaders, in any case, did not see maritime forces as critical in the coming battle with the Communists.

China-Burma-India Theater

General geographic reference for the immersion of East Asia, Southeast Asia, and South Asia in the war against Japan. China-Burma-India (CBI) also refers to an Allied military command structure in the Pacific theater that was established early in the war. At the December 22, 1941–January 14, 1942,

Arcadia Conference in Quebec, British prime minister Winston L. S. Churchill and U.S. president Franklin D. Roosevelt agreed to set up the American-British-Dutch-Australian (ABDA) Command under General Sir Archibald Wavell in India. Separate from but nominally equal to the ABDA was the China theater under Generalissimo Jiang Jieshi (Chiang Kai-shek) as supreme commander, in recognition of China's role in fighting Japan since at least the start of the Sino-Japanese War in 1937.

Lieutenant General Joseph Stilwell, who had more experience in China than any senior U.S. Army officer and spoke Chinese fluently, became the senior Allied officer in the region. His two titles were "Commanding General of the United States Army Forces in the Chinese Theater of Operations, Burma, and India" and "Chief of Staff to the Supreme Commander of the Chinese Theater." The chain of command was confusing, because American forces in China came under the authority of Wavell's ABDA Command. Wavell also commanded forces in Burma, whereas Stilwell was to have direct command of Chinese forces committed to Burma (initially, three armies of up to 100,000 men). From the beginning, Stilwell and Jiang did not get along, and Stilwell was repeatedly handicapped by Jiang's interference in military matters.

In February 1942 following the loss of most of the Netherlands East Indies, the ABDA Command was abolished. From that point forward, the Pacific became an American responsibility, with the British assuming authority from Singapore to Suez. Jiang continued to control the China theater, and Wavell, headquartered in India, had authority over India and Burma. At the same time, Stilwell formed a new headquarters, the American Armed Forces: China, Burma, and India. The command included the small prewar U.S. military advisory group and Colonel (later major general) Claire Chennault's American Volunteer Group (AVG), known as the Flying Tigers, later a part of the Tenth Army Air Force.

This command structure continued until the August 12–24, 1943, Quebec Conference, when Churchill and Roosevelt agreed on the establishment of the more integrated South-East Asia Command (SEAC), with British admiral Lord Louis Mountbatten as commander and Stilwell as his deputy. Operations in Burma were separated from those in India, now under the command of General Claude Auchinleck, commander in chief there since June 1943.

Designed to improve Allied military operations in the region, the new command structure did not achieve that end. Conflicts and different goals remained, with Jiang being the chief problem in Allied cooperation. But the British and Americans also had different priorities. The British were mainly concerned with the defense of India and preventing the Japanese military from exerting an influence on growing Indian nationalism. London saw defeating the Japanese in Burma as the chief means to bring about that end rather than as a means to channel supplies to China. British military efforts in Burma would thus ebb and flow.

The United States was primarily interested in building up China's military strength, and Burma would be a chief route for these supplies to reach China; President Roosevelt saw China taking its rightful place as a major world power at war's end. U.S. military planners also saw China as a potential location for heavy bombers to be used in the strategic bombing of Japan. These conflicting views were exacerbated by the personalities involved. Stilwell continued to feud with Jiang and also held that the British were more interested in defending their Asian empire than in fighting Japan. Stilwell wanted to recover Burma, and he worked hard to improve the fighting ability of those Chinese Army units he could influence.

The only way to get substantial military heavy equipment to China—which was essential if its fighting ability was to improve dramatically—was by way of Burma, and so construction of the so-called Ledo Road there became imperative. In the meantime, the United States undertook a massive logistical air supply operation to China from bases in India over "the Hump" of the Himalaya Mountains, the highest in the world. The ubiquitous C-47 (DC-3) aircraft was the workhorse for much of this campaign.

Construction of the 478-mile Ledo Road to connect the old Burma Road from Ledo, India, to Bhama, Burma, took 25 months. The new road ran through jungles, over mountains, and across 10 rivers. U.S. Army brigadier general Lewis A. Pick commanded this vast project, one of the major engineering accomplishments of the war.

Meanwhile, Jiang refused to yield operational command of the growing Chinese military establishment to Stilwell. Jiang saw the Chinese forces as a means to defeat the Communists in China after the war as much as to destroy the Japanese forces in the current conflict. Stilwell fervently believed that properly trained and equipped, Chinese soldiers could be the equal of any in

the world, but all of his efforts to eradicate corruption, weed out ineffective leaders, and end political interference in the Chinese military were rebuffed by Jiang. The Chinese Nationalist leader repeatedly promised reforms but delivered only sufficient compliance to keep up the flow of U.S. military aid.

General Chennault and airpower advocates believed that Japan might be bombed into submission from bases in eastern China. Stilwell dismissed such views and pointed out that the Japanese could simply carry out an offensive to wipe out the bases. Nonetheless, the first production Boeing B-29 Superfortresses were sent to China from India, and an ambitious base-construction program was undertaken. Although a few air bombing missions were carried out, the Japanese responded by mounting a great ground offensive, the ICHI-GO campaign, during April–December 1944, during which all the bases were captured without significant Chinese ground resistance. The B-29s were shifted from the CBI to the Marianas in the Central Pacific.

Roosevelt now applied heavy pressure on Jiang to carry out the reforms advocated by Stilwell and place an American general, preferably Stilwell, in command of the Chinese Army. Frustrated by its inability to turn China into a major theater of war, the United States increasingly used its massive naval strength to invest in the highly productive leapfrogging strategy of securing important islands as stepping-stones toward Japan across the Central Pacific. As a result, China was more and more marginalized and downgraded to a minor theater of war, chiefly important for its role in tying down 1 million Japanese troops.

Stilwell, now at wit's end, reached an impasse with Jiang and was recalled to Washington in October 1944. Stilwell was replaced by U.S. Army major general Albert Wedemeyer, a far more tractable individual bent on getting along with Jiang. The demands for reforms in the Chinese military came to an end. In effect, the CBI ended in October 1944 when it was divided into two spheres of command, India-Burma and China. Stilwell's deputy, General Daniel L. Sultan, became the commander of U.S. forces in India-Burma and directed the Allied military effort in northern Burma.

The CBI saw unique air, guerrilla, and logistical operations. Among innovative military and air tactics originating in the CBI was the establishment of Long-Range Penetration Groups, more popularly known as Wingate's Chindits and Merrill's Marauders. Utilizing air assets, British and U.S. commanders projected ground troops far behind Japanese lines, their

communication and supply provided by air. Here and elsewhere, guerrilla operations were developed and intelligence and insurgency operations were carried out. William Donovan and the Office of Strategic Services were also active in the theater.

Finally, the CBI was a major scene of postwar confrontation. Early in the war, Japan had conquered and overrun much of China and most of the European and U.S. colonies in the Pacific. The arrival of Japanese forces in Indochina was a great blow to French influence, and the defeat of the British at Singapore had an even more powerful impact on British prestige.

President Roosevelt envisioned the end of colonization after the war, but with the arrival of the Soviet threat, new U.S. president Harry S. Truman was less sympathetic. Although the Philippines, India, Burma, and some other states gained independence just after the war, the process of decolonization was actually delayed in some areas, resulting in costly wars in the Netherlands East Indies and French Indochina. American efforts by Roosevelt's ambassador to China, Patrick J. Hurley, to mediate between the Chinese Nationalists and Communists came to naught; that vast country soon disintegrated into civil war. The United States, which had already committed to Jiang, was unwilling and unable to adopt a neutral stance and paid the price in influence when the civil war ended in a Communist victory in 1949.

Chindits

Name applied to irregular forces raised by British brigadier Orde Wingate for special operations in Burma in 1943 and 1944. The name "Chindits," selected by Wingate, derived from the Burmese word "Chinthé," the name of a mythical griffin-like creature, stone effigies of which guard the entrance to Burmese temples.

In early 1942, Wingate was transferred to India at the request of General Archibald Wavell, who commanded Allied forces in the Far East. Wavell had known Win-gate since service in Palestine and respected his innovative thinking, especially in the use of irregular forces. Wingate was charged with applying this ability against the Japanese in Burma, who had seemed invincible up to that time. He developed the concept of long-range penetration operations, which consisted of semi-independent guerrilla forces operating deep in the rear of Japanese forces. These forces would be resupplied by air.

Under cover as the 77th Brigade, Wingate formed the Chindits out of disparate elements of Gurkhas, the Burma Rifles, and British units, and he conducted strenuous training in central India through 1942. On February 16, 1943, this force of about 3,000 men with 1,000 pack animals crossed the Chindwin River into northern Burma, thereby launching the first Chindit operation (Operation LONGCLOTH). The force was organized into six columns, the nucleus of each being an infantry company, and given the objectives of disrupting communications (notably, by cutting the Myitkyina-Mandalay

railway line) and creating general havoc through ambushes and other small-unit operations. LONGCLOTH, which ended in late April, achieved mixed success and took heavy casualties. Only 70 percent of those who had crossed the Chindwin in February returned, and of these, only about 28 percent would be fit for future active service.

Nevertheless, in a theater where all had been doom and gloom, the campaign's limited achievements were widely heralded. British prime minister Winston L. S. Churchill, in particular, seized on the publicity and promised Wingate his personal support for future operations, even taking him along to the August 14–24, 1943, Quebec (Quadrant) Conference. Plans now commenced for a larger, more ambitious campaign. Using the cover of the 3rd Indian Division, six brigades and a U.S. air contingent were trained for an operation that was to be coordinated with a push south from northern Assam by a joint Sino-American force under Lieutenant General Joseph Stilwell. Wingate expanded his concept to include strongholds, semipermanent bases from which operations could be conducted. Each was to be built around an airstrip and include other support facilities.

Members of Major General Orde Wingate's British India Special Force, known as Chindits, moving through the jungle in Burma. (Hulton Archive/Getty Images)

On March 5, 1944, the second Chindit operation (Operation THURSDAY) began. One brigade had begun to move by foot into the area of operations the previous month; two additional brigades, preceded by glider-borne pathfinder teams, were flown into strongholds deep inside Burma. The remaining brigades were held in reserve. Again, there were some successes. The railway line was again interrupted, the town of Mogaung was briefly captured, and the Japanese response appeared generally confused. Unfortunately, Wingate was killed in a plane crash on March 24. Without his inspired, if unorthodox, leadership, the operation slowly began to lose momentum. Eventually, it collapsed from both exhaustion and outside intervention.

In early April, the Chindits were placed under Stilwell's operational control. Stilwell distrusted the Chindit concept (and the British), and despite their specialized training, the Chindits were turned into regular infantry formations. In August, they were withdrawn from combat and at the beginning of 1945 disbanded.

In concrete terms, the achievements of the Chindits seemed small and their cost-effectiveness questionable. Yet Japanese Fifteenth Army commander General Mutaguchi Renya wrote after the war that Chindit operations, especially Operation THURSDAY, were an important factor in the inability of his forces to invade India. In any case, the Chindits served as a morale booster at a critical time and were a pioneering concept for special operations brought to fruition by a determined and imaginative Wingate in the face of significant opposition.

Chir River, Battles of the (December 7–22, 1942)

A series of battles fought in the Soviet Union during December 7–22, 1942, along the Chir River north of Stalingrad, where the German Sixth Army was besieged. The commander of German Army Group Don, Field Marshal Eric von Manstein, hoped to relieve the Sixth Army with Colonel General Hermann Hoth's Fourth Panzer Army, attacking from the north of Stalingrad, supported by the XLVIII Panzer Corps. On December 7, however, before the XLVIII Panzer Corps could link up with the Fourth Panzer Army, elements of the Soviet Fifth Tank Army launched heavy attacks at various points along the Chir River. Two divisions of the XLVII Panzer Corps were deployed along the west bank of the river, with the 7th Luftwaffe Field Division on the left and the 336th Infantry Division on the right. To their rear, the 11th Panzer Division, commanded by Major General Hermann Balck, was the corps reserve.

By the end of December 7, the Soviet I Tank Corps had penetrated 10 miles to the south, reaching State Farm 79. Balck attacked at dawn on December 8, with one Panzergrenadier regiment conducting a holding attack against the Soviet front and the 15th Panzer Regiment supported by another Panzergrenadier regiment delivering the decisive blow against the Soviet rear. By the end of the day, the I Tank Corps had been thrown back across the Chir with the loss of 53 of its tanks. For the next three days, the 11th Panzer Division fought a series of running battles, clearing out Soviet bridgeheads across the Chir.

Late on December 11, the Soviets made two more major penetrations into the XLVIII Panzer Corps sector. After another night march, the 11th Panzer Division attacked one of the Soviet penetrations at Lissinski from the flank and defeated it. Balck then moved his division 15 miles to the northwest and attacked the Soviet bridgehead at Nizhna Kalinovski. At dawn on December 13, the 11th Panzer Division was preparing to make its final attack when it

was hit on the right flank by another strong Soviet assault. One of the German battalions was temporarily surrounded, but Balck continued his assault on the bridgehead while methodically extracting the battalion. By the end of the day the Soviets had been fought to a standstill, although the Nizhna Kalinovski bridgehead was not completely eliminated. The 11th Panzer Division had been marching by night and fighting by day for almost eight continuous days.

On December 10, the Fourth Panzer Army began its attack to relieve the Sixth Army at Stalingrad. Despite being heavily engaged along the Chir, the XLVIII Panzer Corps was ordered to link up with and support the Fourth Panzer Army. In order to do so, the XLVIII Panzer Corps had to cross the Don. On December 15, the 11th Panzer Division started moving toward Nizhna Chirskaya, just below the confluence of the Chir and the Don. Balck's division was prepared to force a crossing of the Don on December 17, but the Soviets struck first.

Ignoring the Fourth Panzer Army's attack, the Soviets struck a massive blow against the Italian Eighth Army farther north along the Don. This Soviet push threatened to take Rostov, at the mouth of the Don on the Azov Sea. Such a move would have cut off Field Marshal Ewald von Kleist's Army Group A in the Caucasus. Manstein was thus forced to draw heavily from the Fourth Panzer Army to defend Rostov. This sealed the fate of the Sixth Army at Stalingrad.

The new Soviet drive overlapped into the sector of the XLVIII Panzer Corps, overrunning units of the 336th Infantry Division. The assault crossing by the 11th Panzer Division was canceled, and once again Balck's troops were thrown into the breach. The 11th Panzer Division attacked on December 18 at Nizhna Chirskaya. It then conducted another night march and attacked at dawn on December 19 at Nizhna Kalinovski. Balck's 15th Panzer Regiment, which was now down to about only 25 tanks, attacked two Soviet columns, destroying 65 Soviet tanks and suffering no losses of its own.

Bitter back-and-forth fighting continued along the Chir for the next two days. By December 22 the series of defensive battles along the Chir had ended, with the Germans the clear tactical victors. That same day, however, the XLVIII Panzer Corps received orders to move immediately 90 miles to the west and establish blocking positions before Rostov. Despite their tactical success, the Germans had been outmaneuvered by the Soviets at the

operational level. Nonetheless, the battles involving the 11th Panzer Division along the Chir River are some of the most outstanding examples of maneuver warfare and mobile defense. Throughout, the XLVIII Panzer Corps' two infantry divisions served as a shield and pivot, behind which the 11th Panzer Division was the mobile counterattack force. During the 1980s and 1990s this series of battles was still studied by students at the U.S. Army's Command and General Staff College as a classic example of the principles of what would be AirLand Battle.

Cho Isamu (1895–1945)

Japanese Army general. Born in Fukuoka, Japan, on January 19, 1895, Cho Isamu graduated from the Japanese Military Academy in 1916. Promoted to captain in 1925, he graduated from the Army War College three years later. He was appointed a member of the Chinese Section of the army General Staff in 1929 and was promoted to major in 1931. Cho planned a coup d'état with his superior, Lieutenant Colonel Hashimoto Kingoro, in March 1932. The attempt failed, but Cho was not punished.

In August 1937, Cho joined the Army Expeditionary Force in Shanghai as chief of the intelligence staff. He participated in the fighting for Nanjing (Nanking) and was one of the instigators of the atrocities in December 1937 there, known as the Nanjing Massacre. Cho was appointed commander of the 74th Infantry Regiment in March 1938 and fought against the Soviet forces at Changkufeng in July 1938. As chief of staff of the 26th Division, he

persuaded the governor-general of French Indochina, General Georges Catroux, to admit Japanese occupation troops in September 1940.

Cho was promoted to lieutenant general in October 1944 and appointed chief of staff of Lieutenant General Ushijima Mitsuru's Thirty-Second Army on Okinawa. After invading U.S. forces smashed the Japanese defensive line, Cho and Ushijima committed suicide on June 23, 1945.

Choltitz, Dietrich von (1894–1966)

German Army general and military governor of Paris. Born on November 9, 1894, in Wiesegräflich, Upper Silesia, Germany, Dietrich von Choltitz was a fourth-generation professional soldier. A page in the Saxon court, he was educated at various cadet schools and began his military career as an officer candidate in the 107th Infantry Regiment in 1914; he fought in that unit during World War I as a company commander and adjutant. Choltitz served in the cavalry in the 1920s and early 1930s and then transferred to the air-transportable 16th Infantry Regiment of the 22nd Infantry (later, Air-Landing) Division. He was promoted to major in 1937 and to lieutenant colonel in April 1938. He took command of the 3rd Battalion of the 16th Infantry Regiment on September 1, 1939, and the entire regiment 10 days later.

Choltitz's regiment fought in Poland in September 1939, and he was with the element that attacked Rotterdam on May 14, 1940. He was promoted to colonel in April 1941. His regiment was part of the Eleventh Army of Army

Group South in Operation BARBAROSSA, the invasion of the Soviet Union that commenced on June 22, 1941, in actions along the Prut, Dniester, and Bug Rivers and in the assault on the fortress of Sevastopol that began on October 30, 1941, where the unit suffered heavy losses. Choltitz was also involved in the summer 1942 assault on Sevastopol, and on June 28, 1942, his men crossed North Bay in rubber boats in the surprise attack in the rear of the fortress city, which surrendered on July 2.

German general Dietrich von Choltitz surrenders the city of Paris to Allied forces in August 1944. Choltitz disobeyed Adolf Hitler's express order to destroy the city rather than hand it over to the Allies. (Corbis)

Promoted to major general, Choltitz took command of the 260th Infantry Division in August 1942. He remained engaged in southern Russia and held a variety of positions, some of them only briefly. He was deputy commander of the crack XLVIII Panzer Corps in November 1942, acting commander of XVII Corps (December 1942–March 1943), commander of the 11th Panzer Division (March–May 1943), and acting commander of the XLVIII Panzer Corps (May–August 1943). He was promoted to lieutenant general in 1943.

On June 12, 1944, General of Artillery Erich Marcks, commanding LXXXIV Corps of Colonel General Friedrich Dollman's Seventh Army in

the Cotentin Peninsula of Normandy, was mortally wounded in an attack by an Allied fighter bomber, and on June 15 Choltitz replaced him. Units of the command were hard-hit by the Saint-Lô carpet bombing of July 25, 1944, and much of the command was destroyed. Choltitz made maximum use of the limited resources at hand to slow the American advance. Field Marshal Günther von Kluge, however, unjustly sacked him on July 28, 1944, for the Normandy debacle.

Adolf Hitler promptly reassigned Choltitz, promoting him to General of Infantry and appointing him commander of the greater Paris area on August 7, 1944. Choltitz had few available resources to stop the advance of the Western Allies, however, and he resolutely refused to allow aircraft and artillery attacks in defense of Paris. Receiving orders from Hitler on August 23 to begin demolishing parts of the city, he refused and ensured a relatively orderly turnover of the city, with little damage to its public buildings and monuments, via negotiations with the French Resistance. Swedish consul general Raoul Nordling served as one intermediary.

Choltitz formally surrendered on August 25, 1944, and became a prisoner of war. Three days later, Field Marshal Walther Model asked the president of the Reich Military Tribunal to open criminal charges against Choltitz. Recent scholarship indicates that Model initiated the action to keep it in military rather than Nazi political channels and thus screen Choltitz's family in Germany.

While in captivity, Choltitz contributed two monographs to the German Military History Program. Following his release in April 1947, he retired in Baden-Baden. Choltitz wrote a short monograph titled *Brennt Paris?* (Is Paris Burning?), published in 1950. He also published his memoirs, *Soldat unter Soldaten* (Soldier among Soldiers), in 1951. Choltitz died in Baden-Baden on November 5, 1966, probably better remembered in France than in Germany.

Christian X, King of Denmark (1870–1947)

King of Denmark. Born on September 26, 1870, near Copenhagen, Christian X was the son of King Frederick VIII of Denmark and Princess Louise of Sweden. Christian was tutored within the palace and received military training. He married Alexandrine of Mecklenburg-Schwerin in 1898. On the death of his father, he inherited the throne on May 13, 1912.

King Christian X enforced Denmark's neutrality throughout World War I. He took in numerous Romanov relatives fleeing the Russian revolutions, including his aunt, the Dowager Czarina Maria Feodorovna. During the 1930s, the king promoted national unity and became the first European ruler to visit a Jewish synagogue. Denmark's nonaggression pact with Germany seemed to ensure peace, so Christian X was taken by surprise when the Germans invaded his country on April 9, 1940.

Christian X, King of Denmark. (Library of Congress)

Christian X instructed his forces to surrender and appealed to his subjects to behave correctly and give the Germans no pretext for further violence. Under house arrest, he became a rallying symbol for the Danes, noted for the daily horseback rides he took alone. His position was a difficult one, as he refused to allow Danish Nazis into the government but did allow Schutzstaffel (SS) recruitment and agreed to have a pro-German prime minister.

In 1941, Adolf Hitler interpreted Christian X's cool response to birthday greetings as a pretext for forcing Denmark to sign the Anti-Comintern Pact on November 23. The king became even more important as a resistance symbol in 1943, when the Germans assumed control of the government over royal and cabinet protest. Guarded only by the Copenhagen police and confined to a wheelchair after a riding accident, the elderly king was beloved by his people, and his popularity gave rise to two apocryphal legends: that he

offered to wear a yellow star if Danish Jews had to do so and that he challenged German soldiers to shoot him for taking down a Nazi flag flying over Copenhagen.

After the liberation of Denmark in May 1945, the king asked for dispensation to avoid signing death sentences for collaborators but retained the ability to pardon them. He also exiled members of his family who had shown marked sympathy to the Germans during the occupation. Christian X died in Copenhagen on April 20, 1947.

Christie, John Walter (1865–1944)

U.S. inventor and tank designer. Born in River Edge, New Jersey, on May 6, 1865, John Walter Christie went to work at the Delamater Iron Works in New York City at age 16. After attending evening classes at Cooper Union, he became a consulting engineer for several steamship lines. Around 1900, he developed a ring-turning lathe that resulted in a stronger turret track for naval guns.

Christie then entered the automobile industry, building his own cars and testing them in speedway races. Among these was a front-wheel-drive car, which was then considered a pioneering design. He also invented a steam-engine, piston-packing ring that was used in ferryboat engines. In 1912, Christie began manufacturing wheeled tractors to pull firefighting equipment, selling several hundred to New York City alone.

In 1916, Christie designed a four-wheel-drive truck for use by the military in the rugged terrain of the southwestern United States in the event of trouble with Mexico. That same year, the army contracted with his Front

Drive Motor Company for a motor carriage for a self-propelled, 3-inch gun. During World War I, Christie became interested in tank design. The first of some 15 designs for the army was for a “convertible,” self-propelled, 8-inch gun that could operate either on tracks (for cross-country mobility) or at a higher speed on its own road wheels. It was produced as a single prototype in 1921 but failed to meet army design specifications, beginning what would be an acrimonious relationship between Christie and the Ordnance Department.

This experience led Christie to design the first American postwar tank, the three-man, 13.5-ton Medium Tank M1919, with a removable track that could be stored around the tank hull during road operations. The M1928 was powered by a Liberty aircraft engine and had both great speed and a revolutionary suspension system of large weight-bearing wheels on torsion bars. The army ordered five M1928s. This vehicle was highly influential in tank design abroad, first in the Soviet Union and then in Britain. The Soviets acquired two copies and used the M1928 as the basis for their BT series. Their T-34 tank, which employed the Christie suspension system, may have been the best tank of World War II.

The U.S. Army purchased three M1931 (U.S. designation, T-3) Christie tanks, and the Soviets bought two. The vehicle was armed with both a 37mm gun and a machine gun. Christie’s M1932 employed lightweight materials and had a forward-facing propeller so that it could be dropped from a low-flying aircraft, fly, and hit the ground running. It was capable of road speeds of 36 mph on tracks or 65 mph on wheels, enabling it to leap a 20-foot gap from a 45-degree ramp. It was also sold to the Soviets. Christie’s M1936, a 6-ton, 2-man tank, was capable of cross-country speeds of up to 60 mph. In Britain, it evolved into the first Cruiser tank.

For the United States, Christie also designed turret tracks for battleships as well as gun mounts and carriages. His amphibious platform for a 75mm gun, begun in 1921, led to the first amphibious tank. Never fully appreciated in his own country, in part because of his acerbic and combative personality, Christie died penniless and embittered in Falls Church, Virginia, on January 11, 1944.

Christie, Ralph Waldo (1893–1987)

U.S. Navy vice admiral and commander of submarines in the South Pacific. Born in Somerville, Massachusetts, on August 30, 1893, Ralph Waldo Christie graduated from the U.S. Naval Academy at Annapolis in 1915. Eight years later, he earned an MS degree from the Massachusetts Institute of Technology (MIT). On entering the navy, Christie specialized in the submarine service and torpedoes, commanding individual submarines in 1919, 1920, 1923, and 1924 and pursuing research at MIT that contributed to the development of the trouble-prone magnetic torpedo exploder.

From 1939 to 1940, Christie commanded Submarine Division 15 before moving to Brisbane, Australia, to take command of Submarine Squadron 20, which he led from late 1940 to 1942. In November 1942 Christie was promoted to rear admiral, and in April 1943 he became commander of submarines in the South Pacific, operating out of Perth and Fremantle in Western Australia. Christie’s forces made extensive use of Magic code-breaking intelligence material, gathered from code-breaking and radio direction–finding technology used against Japanese vessels, and succeeded in interdicting Japan’s capacity to control its conquered Pacific territories and maintain an operational seagoing navy.

Despite Christie’s obvious talents and achievements as a submarine commander, he clashed repeatedly with Seventh Fleet commander Admiral Thomas Kinkaid concerning management of his force and the number of casualties resulting from his aggressive tactics. These led Kinkaid to replace him in February 1945.

Christie’s subsequent commands included the Puget Sound Navy Yard between 1945 and 1948 and the U.S. naval forces based in the Philippines. He retired in August 1949 as a vice admiral. Christie died in Honolulu, Hawaii, on December 19, 1987.

Chuikov, Vasily Ivanovich (1900–1982)

Marshal of the Soviet Union. Born in the village of Serebryanye Prudy in the Moscow region on February 12, 1900, Vasily Ivanovich Chuikov left home and became a mechanic at age 14. He joined the Red Army four years later. By 1919 he had risen to command a regiment, and during the Russian Civil War he fought in Siberia and in the western Ukraine. He also fought in the 1919–1921 Russo-Polish War.

Chuikov graduated from the Frunze Military Academy in 1925. Assigned to China two years later, he fought in the battle for the Chinese Eastern Railroad in 1929. He served in the Special Red Banner Far Eastern Army until 1932 and managed to survive the purge of the officers in the Far East in the late 1930s.

Chuikov served in the Soviet invasions of Poland (1939) and Finland (1939–1940), commanding the Fourth and Ninth Armies, respectively. He was promoted to lieutenant general in June 1940 and returned to China for a third tour, serving as a military attaché beginning in December 1940. He was recalled in March 1942 to become deputy commander and then commander of the newly formed Sixty-Fourth Army (July 22, 1942). A protégé of Georgii Zhukov, Chuikov assumed command of the Sixty-Second Army on the west bank of the Volga at Stalingrad, which he defended at tremendous cost. His determination was a major factor in enabling the Soviets to hold until they could mount a counteroffensive.

Marshal of the Soviet Union Vasily Chuikov. (AP Photo)

Assigned to the Southwestern Front in March 1943, the Sixty-Second Army was redesignated the Eighth Guards Army. Chuikov then led his troops in spearheading the liberation of Ukraine and Belorussia from German forces and was promoted to colonel general in October 1943. In mid-1944, the Eighth Guards Army was transferred to Konstantin Rokossovsky's 1st Belorussian Front. The unit then distinguished itself in operations in eastern Poland, taking Lublin and Lodz. The Vistula-Oder operation between January and February 1945 opened the way to Berlin, and Chuikov's tanks spearheaded the final assault on Berlin in a front-wide night attack; on May 2, 1945, Chuikov's headquarters took the surrender of the German Berlin garrison on behalf of the Red Army high command.

Chuikov was promoted to army general after V-E day and served as deputy commander and then commander of Soviet occupation forces in eastern Germany (1946–1953). Promoted to marshal of the Soviet Union in

1955, he commanded the Kiev Military District (1953–1960) and then Soviet Ground Forces (1960–1964). He was chief of civil defense from 1961 to 1972, after which he served in the general inspectorate of the Ministry of Defense. Chuikov died in Moscow on March 18, 1982.

Churchill, Sir Winston L. S. (1874–1965)

British political leader, cabinet minister, and prime minister (1940–1945, 1951–1955). Born at Blenheim Palace, Oxfordshire, on November 30, 1874, Winston Leonard Spencer Churchill was the eldest son of Lord Randolph Churchill, third son of the Duke of Marlborough and a rising Conservative politician, and his wife, Jennie Jerome, an American heiress. Educated at Harrow and the Royal Military College, Sandhurst, from 1895 to 1899, Churchill held a commission in the British Army. He visited Cuba on leave and saw active service on the Afghan frontier and in the Sudan, where he took part in the Battle of Omdurman. Captured by South African forces in 1899 while reporting on the Boer War as a journalist, he made a dramatic escape from Pretoria and went to Durban, winning early popular fame.

Churchill emulated his father—who attained the position of chancellor of the exchequer before a premature death ended his political career—by entering politics in 1900 as a Unionist member of Parliament. In 1904, his

party's partial conversion to protectionism caused him to join the Liberals, who made him president of the Board of Trade (1908–1910) and home secretary (1910–1911) after they returned to power.

As first lord of the admiralty (1911–1915), Churchill enthusiastically backed the campaign of first sea lord Admiral Sir John "Jackie" Fisher to modernize the Royal Navy with faster battleships and more efficient administration. One of the few initial cabinet supporters of British intervention in World War I, Churchill was blamed for the disastrous 1915 Dardanelles expedition against the Ottoman Empire, prompting his resignation. He spent the six months up to May 1916 in active service on the Western Front but regained high political office in July 1917, when Prime Minister David Lloyd George made him minister of munitions in his coalition government.

In December 1918, Churchill moved to the War Office, where he unsuccessfully advocated forceful Allied action against Russia, in the hope of eliminating that country's new Bolshevik government. In late 1920, he became colonial secretary. Two years after Lloyd George's 1922 defeat, Churchill returned to the Conservatives, who made him chancellor of the exchequer in November 1924, a post he held for five years. He reluctantly acquiesced in Britain's return to the gold standard, and his determination to suppress the 1926 general strike won him the lasting enmity of much of the labor movement.

By 1928, Churchill believed that the postwar peace settlement represented only a truce between wars, a view forcefully set forth in his book *The Aftermath* (1928). When Labour won the 1929 election, Churchill lost office, but he soon began campaigning eloquently for major British rearmament, especially the massive enhancement of British airpower, to enable the country to face a revived Italian or German military threat. From 1932 onward, he sounded this theme eloquently in Parliament, but Conservative leaders remained unsympathetic. Churchill also became perhaps the most visible and vocal critic of the appeasement policies of the successive governments of Prime Ministers Stanley Baldwin and Neville Chamberlain, who effectively tolerated German rearmament; Chancellor Adolf Hitler's deliberate contravention of the provisions of the Treaty of Versailles; and Germany's and Italy's territorial demands on their neighbors.

When Britain declared war on Germany in September 1939, Churchill

resumed his old position as first lord of the admiralty. Despite the German attacks on the British aircraft carrier *Courageous* and the battleship *Royal Oak* as well as the responsibility he bore for the Allied disaster in Norway during April and May 1940, he succeeded Chamberlain as prime minister on May 10, 1940, the day Germany invaded France and the Low Countries. During the next three months, Britain sustained repeated disasters as German troops rapidly overran the Low Countries and France, forcing the British Expeditionary Force to withdraw in disarray from northern France at Dunkerque during May 26–June 4, 1940, abandoning most of its equipment. During the Battle of Britain (July 10–September 30, 1940), German airplanes fiercely attacked Britain in an apparent prelude to a full-scale cross-Channel invasion.

Churchill responded vigorously. Although he was 65 years old, he still possessed abundant and unflagging energy; his vitality was fueled by his habit of an afternoon siesta, after which he normally worked until 2:00 or 3:00 the next morning. His fondness for sometimes fanciful and questionable strategic plans often exasperated his closest advisers, as did his attachment to romantic individual ventures—such as those launched by the Special Operations Executive covert action agency, whose establishment he backed enthusiastically. Although he acted forcefully, he did not always make the best decisions.

Even so, Churchill was an outstanding war leader. On taking office, he delivered a series of rousing and eloquent speeches, affirming Britain’s determination to continue fighting even without allies and voicing his conviction of ultimate triumph. Churchill also followed a demanding schedule of morale-boosting personal visits to British cities, factories, bomb targets, and military installations, a practice he continued throughout the war.

Besides rallying the British people to endure military defeat in France and the bombing campaign Germany soon launched against Britain’s industrial cities, Churchill’s speeches, which caught the international imagination, were designed to convince the political leaders and people of the United States—the only quarter from which Britain might anticipate effective assistance—of his country’s commitment to the war. U.S. president Franklin D. Roosevelt responded by negotiating the Destroyers-for-Bases Agreement of August 1940, whereby the United States transferred 50 World War I–vintage

destroyers to Britain in exchange for naval basing rights in British Caribbean Islands and North America.

British prime minister Winston Churchill giving the victory sign. Churchill made a point of visiting bombed-out areas in an effort to keep civilian morale high. (The Illustrated London News Picture Library)

Since the war began, Britain had purchased war supplies in the United States on a “cash-and-carry” basis. By December 1940, British resources were running low, and Churchill wrote to Roosevelt to request more extensive U.S. aid. Roosevelt responded by devising the Lease-Lend Act that was passed by Congress the following spring.

In August 1941, Churchill and Roosevelt met for the first time, in Placentia Bay off the Newfoundland coast, and agreed to endorse a common set of liberal war aims—the Atlantic Charter—and to coordinate their two countries’ military strategies. Churchill also agreed to allow British scientists

to pool their expertise in nuclear physics with their American counterparts in the Manhattan Project, a largely U.S.-financed effort to build an atomic bomb; the project reached fruition in the summer of 1945.

Churchill was relieved by Japan's December 7, 1941, attack on Pearl Harbor, Hawaii, and the subsequent German and Italian declarations of war on the United States, as they brought the United States fully into the war and, from his perspective, guaranteed an ultimate Allied victory. In the interim, Churchill needed all his talents to sustain British resolution through various disasters, including Japan's conquest of Hong Kong, Malaya, Singapore, and Burma and British defeats in North Africa.

After Germany invaded the Soviet Union in June 1941, Churchill also welcomed the Soviet Union as an ally, although his relations with Soviet leader Joseph Stalin were never close. Churchill made repeated visits to the United States and met Roosevelt at other venues. In addition, all three leaders gathered at major international summit conferences at Tehran in November 1943 and Yalta in February 1945, and Churchill also met Stalin separately on several occasions. Churchill traveled abroad more than any of the other Allied leaders, often at substantial personal risk.

Stalin resented the Anglo-American failure to open a second front in Europe until June 1944, a decision due in considerable part to Churchill's fear that if Britain and the United States launched an invasion of Western Europe too soon, the campaign would degenerate into bloody trench warfare resembling that between 1914 and 1918. Meeting Roosevelt in May 1943 in Washington, he finally succumbed to American pressure to open the second front the following summer. Churchill resented intensifying U.S. pressure for phasing out British colonial rule, a prospect made increasingly probable by Britain's growing international weakness.

As the war proceeded and Soviet forces began to push back German troops, Churchill feared that the Soviet Union would dominate postwar Eastern Europe. Soviet support for communist guerrillas in occupied countries and for the so-called Lublin government in Poland reinforced his apprehensions. In October 1944, he negotiated an informal agreement with Stalin whereby the two leaders delineated their countries' respective spheres of influence in Eastern Europe. At the February 1945 Yalta Conference, Churchill and Roosevelt both acquiesced in effective Soviet domination of most of that region. The three leaders also agreed to divide Germany into

three separate occupation zones, to be administered by their occupying military forces but ultimately to be reunited as one state. In April 1945, Churchill unsuccessfully urged the United States to disregard existing understandings with Soviet forces and take Berlin. Despite the creation of the United Nations in 1945, Churchill hoped that close Anglo-American understanding would be the bedrock of the international world order, a perspective intensified by his continuing fears of Germany.

In July 1945, the British electorate voted Churchill out of office while he was attending a meeting at Potsdam, replacing his administration with a reformist Labour government. Churchill was still, however, honored as "the greatest living Englishman" and the war's most towering figure. He used his prestige to rally American elite and public opinion in favor of taking a stronger line against Soviet expansionism in Europe and elsewhere, a position he advanced to enormous publicity in his famous March 1946 "Iron Curtain" speech at Fulton, Missouri. Churchill's six best-selling volumes of memoirs, *The Second World War*, presented a somewhat roseate view of Anglo-American wartime cooperation, and they were carefully designed to promote the continuing alliance between the two countries, which had become his most cherished objective.

From 1951 to 1955, Churchill served again as Conservative prime minister. Declining health eventually forced him to resign from office. A House of Commons man to the core, he consistently refused the peerage to which his services entitled him. In 1953, however, he did accept a knighthood in the Order of the Garter, the most prestigious and exclusive of all British orders.

Among Churchill's many honors was the Nobel Prize in Literature in 1953 for his many published works. He also was the first person to be made an honorary citizen of the United States, by a special act of Congress. And in 1995 the United States named the guided missile destroyer *Winston S. Churchill* (DDG-81) in his honor.

Churchill died in London on January 24, 1965. For many, his death marked the symbolic final passing of Great Britain's imperial age. Churchill received the first state funeral for any British commoner since the death of the Duke of Wellington over a century before. An idiosyncratic political maverick whose pre-1939 record was, at best, mixed, Churchill rose to the

occasion to become the greatest British war leader since the 1st Earl of Chatham in the 18th century.

Churchill-Stalin Meeting (October 9–10, 1944)

Conference in Moscow that determined postwar spheres of influence in Eastern Europe. Concerned particularly about issues involving postwar Poland, Greece, and the Balkans, British prime minister Winston L. S. Churchill suggested the meeting, code-named TOLSTOY. Soviet leader Joseph Stalin would not travel from the Soviet Union, so on September 27, 1944, Churchill asked him to receive a small British delegation to discuss these and

related issues, including the entry of the Soviet Union into the war against Japan.

Facing imminent national elections, U.S. president Franklin D. Roosevelt could not attend. (Churchill had just seen him in Quebec but informed him about this proposal only two days *after* sending his note to Stalin.) Roosevelt saw the meeting as a preliminary for the forthcoming summit at Yalta (to be held February 4–11, 1945) and asked that U.S. ambassador W. Averell Harriman observe, although in the end, Harriman was not present for some crucial two-man talks.

Stalin agreed to the meeting, and Churchill, Foreign Minister Anthony Eden, and chief of the Imperial General Staff General Alan Brooke flew to Moscow, where they stayed from October 9 to 18, 1944. British ambassador Clark Kerr also joined the delegation.

Churchill's primary concern was to gain freedom of action in the difficult Greek political situation, which teetered on civil war. This he secured. During dinner conversation with Stalin, Churchill produced a half sheet of paper (terming it a "naughty document") and wrote out proposed spheres of postwar influence: Romania, 90 percent Soviet; Greece, 90 percent British; Yugoslavia and Hungary, both to be evenly divided between the Soviet Union and the Western Allies; and Bulgaria, 75 percent Soviet. Stalin checked and approved the page and returned it to Churchill. Although the numbers may seem somewhat arbitrary at first glance (with the exception of those for Greece, where the issue was very much in doubt), they merely reflected the reality of a surging Red Army and understated it in regard to both Yugoslavia and Hungary. Although Soviet foreign minister Vyacheslav Molotov and Eden dickered about some of the percentages the next day, nothing was changed. All parties present concurred that they were guidelines for discussion and nothing more.

Churchill and Stalin agreed to put off decisions about Poland until Roosevelt could be present. Still, there was considerable argument over the London Poles versus Lublin Poles and how they might share power after the war. The head of the London Poles, Stanisław Mikołajczyk, joined the conference briefly but disagreed with Lublin's representatives and with most of what was proposed as to border adjustments and governance.

Extensive discussions of military plans also took place, and regular reports were sent to Roosevelt in Washington by Churchill and Harriman and

to the War Cabinet in London by Churchill. The meeting laid some of the groundwork for the subsequent Yalta Conference, but it also cleared the way for firm British action in Athens in December 1944, designed to put down Greek communist guerrillas. The Soviets, true to the TOLSTOY discussions, did not intervene.

Chynoweth, Bradford Grethen (1890–1985)

U.S. Army brigadier general. Born in Fort Warren, Wyoming, on July 20, 1890, Bradford Grethen Chynoweth graduated from the U.S. Military Academy at West Point in 1912 and was commissioned a second lieutenant in the Corps of Engineers. He served through World War I, rising to temporary lieutenant colonel. Reverting to his permanent rank of captain after the war and despairing of his chances at promotion in the postwar military, he left the army in 1919.

Bored by civilian life, Chynoweth rejoined the army in November 1920 as a major of infantry. He was a close friend of Captain Dwight D. Eisenhower and Major George S. Patton Jr. Chynoweth contributed steadily to the professional discourse of the era, writing articles for a number of professional journals. In the *Cavalry Journal*, he argued strongly for tanks as a new combat arm.

Chynoweth served on the Infantry Board at Fort Benning, Georgia, when Lieutenant Colonel George C. Marshall was assistant commandant of the Infantry School there. Chynoweth's strongest supporter was his brother-in-law, Major George A. Lynch, author of the army's capstone doctrinal publication, *Field Service Regulations* (1923). Chynoweth attended both the Command and General Staff School (1927–1928) and the Army War College (1931–1932). Following an assignment with the army's G-3 (training) section, he served three years as a senior instructor with the 44th Infantry Division of the New Jersey National Guard.

Appointed military attaché in London in the spring of 1939, Chynoweth soon fell out with U.S. ambassador Joseph P. Kennedy Sr. over his own prediction that Germany would attack France and that, subsequently, the Germans would bomb London from the air. Kennedy did not trust Chynoweth and demanded and secured his recall. Given his choice of postings by his brother-in-law (now a major general and chief of infantry), Chynoweth took command of a tank battalion with the 66th Infantry Regiment. He served with the 66th between October 1939 and July 1940 and with the 53rd Infantry Regiment between July 1940 and November 1941.

During the 1941 maneuvers, Chynoweth finally was able to demonstrate his theories of mobile warfare, which he did with considerable success, despite considerable opposition. Colonel Chynoweth continued to argue for the independent employment of tanks. Assigned to the Philippines in the fall of 1941, he took command of the defenses of Cebu and the Visayan Islands. From there, he waged a masterful defense throughout the winter of 1941–1942, and he was prepared to retire to the interior of the islands, where he had stockpiled materials, when he was ordered by his superiors to surrender.

Chynoweth spent the remainder of the war as a prisoner of the Japanese. Only on his repatriation in 1945 did he learn that just prior to his capture, he had been promoted to brigadier general. He retired in October 1947; pursued graduate studies at the University of California, Berkeley; and wrote his

memoirs, *Bellamy Park.* Chynoweth died at the Presidio in San Francisco on February 8, 1985.

Ciano, Galeazzo, Conte di Cortellazo (1903–1944)

Italian diplomat and foreign minister under Benito Mussolini. Born at Livorno (Leghorn), Italy, on March 18, 1903, Galeazzo Ciano was the son of World War I naval hero Admiral Costanzo Ciano. Dabbling in theatrical criticism and journalism and earning a law degree by 1925, the younger Caino was propelled by his father (by then a prominent fascist) into the foreign service of Italy's new regime. Posted to South America and then Asia, Ciano found diplomatic life and its connections most agreeable, particularly when his 1929 posting to the Holy See returned him to Rome, where he met and married (in April 1930) Edda Mussolini, Il Duce's daughter.

Galeazzo Ciano, son-in-law of Benito Mussolini. His diary is an important source of information regarding Italian government decisions during World War II. (Heinrich Hoffmann/Ullstein Bild via Getty Images)

In June 1933, Ciano was the delegate to the World Monetary and Economic Conference in London, and by June 1935, he was minister for press and propaganda, a position he left two months later to lead a bomber squadron in the Ethiopian War (1935–1936). Less than a month after Ciano's return to Italy, on June 9, 1936, Mussolini appointed him foreign minister, a move that attracted much criticism.

Ciano's foreign ministry undertook a mix of standard fascist foreign policy initiatives (such as Italy's withdrawal from the League of Nations, Balkan incursions, and military intervention in the 1936–1939 Spanish Civil War) with proposals for regional alliances that sought to curb Germany's hegemony by linking Italy with, variously, Austria, Czechoslovakia,

Hungary, and Yugoslavia. Ciano's diaries reveal his antipathy toward Germany and detail his September 1939 forging of a "nonbelligerency" policy designed to forestall Italian entry into World War II.

With the Italian declaration of war on June 10, 1940, Ciano resumed bomber pilot duty over Greece, repatriating in April 1941 to find his minister's portfolio reduced to mere courier status. Eventually, he was fired in a February 1943 cabinet shift, and after participating in the fascist Grand Council's no-confidence vote on Mussolini's rule on July 25, 1943, he unsuccessfully sought asylum in Spain. Cynically (or guilelessly) arranging his family's passage to Germany instead that August, Ciano, not surprisingly, was made a prisoner of Il Duce's new Italian Social Republic after the September 1943 armistice. Receiving no mercy from Mussolini despite Edda Ciano's pleas, Galeazzo Ciano was tried and condemned on a charge of treason and executed by a firing squad at Verona on January 11, 1944.

Ciliax, Otto (1891–1964)

German Navy admiral. Otto Ciliax was born in Gotha-Neudietendorf, Germany, on October 30, 1891. He entered the German Navy in 1910 and served in submarines during World War I. After the war, Ciliax continued in the navy and held various posts. During the 1936–1939 Spanish Civil War, he commanded the pocket battleship *Admiral Scheer* and in 1938 also briefly filled the post of senior officer of the naval forces in Spain.

At the outbreak of World War II, Captain Ciliax commanded the battleship *Scharnhorst.* Promoted to rear admiral on November 1, 1939, he was appointed chief of staff of Navy Group West at Wilhelmshaven. He then

commanded the German battleships between June 1941 and June 1942 until this post was disbanded. In the high point of his World War II service, in February 1942 then Vice Admiral Ciliax, flying his flag in the *Scharnhorst*, had charge of Operation CERBERUS, more widely known as the Channel Dash. Against the advice of German Navy commander Grand Admiral Erich Raeder, German chancellor Adolf Hitler ordered that the battleship *Scharnhorst* and its sister *Gneisenau* be returned to Germany along with the heavy cruiser *Prinz Eugen.* The three capital ships departed Brest, France, on the night of February 11 and, escorted by 6 destroyers and 14 torpedo boats, made it safely through the English Channel to Wilhelmshaven and the Elbe River estuary on February 13 in what proved to be a great embarrassment to the British.

From March 1943 to April 1945, Ciliax commanded German naval forces in Norway. Ciliax died at Lübeck-Travemünde on December 12, 1964.

Clark, Mark Wayne (1896–1984)

U.S. Army general. Born at Madison Barracks, New York, on May 1, 1896, Mark Wayne Clark graduated from the U.S. Military Academy at West Point in 1917 and was wounded in action in France in 1918. He graduated from the Infantry School in 1925, the Command and General Staff School in 1935, and the Army War College in 1937.

Promoted to brigadier general in August 1941, Clark was working on army expansion when the war began. He was promoted to major general as chief of staff of Army Ground Forces the following April. He rose to

lieutenant general in November 1942 and was named deputy supreme commander for the Allied invasion of North Africa, Operation TORCH, under Lieutenant General Dwight D. Eisenhower. Clark met secretly with Vichy French officials in October 1942 prior to the invasion to seek their cooperation, and he negotiated a cease-fire with the French authorities two days after the landings.

Given command of the Fifth Army, Clark led the invading U.S. troops at Salerno, Italy, in September 1943. The Fifth Army's slow advance up the western side of the Italian Peninsula led to harsh criticism of Clark. His troops suffered heavy casualties in the attempt to penetrate the Gustav Line, and the bombing of the monastery on Monte Cassino tarnished his reputation, while heavy casualties at the Rapido River prompted a Senate investigation. The Anzio landings in January 1944 did little to speed up the Fifth Army's advance, and the assault failed to lead to a quick capture of Rome. The Fifth Army finally liberated Rome on June 4, 1944, but Clark was roundly criticized for his determination that U.S. troops be the first to enter the Eternal City, which allowed the German Tenth Army to escape encirclement and reach the Gothic Line to the north.

Lieutenant General Mark Clark, commander of the U.S. Fifth Army in Italy. Clark's decisions while commanding in Italy remain controversial. (Library of Congress)

As the cross-Channel invasion of France became the chief focus of Allied efforts in Europe, the Italian theater gradually became secondary. In December 1944, Clark succeeded Sir Harold Alexander as commander of the multinational 15th Army Group, and in March 1945, he became the U.S. Army's youngest full general. He led the Allied offensive that breached the Gothic Line, crossed the Po River, and entered Austria just as the war in Europe ended. On May 4, 1945, Clark personally received the surrender of all German forces in Italy.

After the war, Clark commanded U.S. occupation forces in Austria (1945–1947), the Sixth Army (1947–1949), and Army Field Forces (1949–1952). He succeeded General Matthew Ridgway as commander of U.S. forces in the Far East and of United Nations Forces in Korea (May 1952–October 1953) but chafed at restrictions placed on his command. Clark wrote

two memoirs, *Calculated Risk* (1950) and *From the Danube to the Yalu* (1954). On his retirement from the army in 1954, he served as president of The Citadel, the military college in South Carolina (1954–1960). Clarke died in Charleston, South Carolina, on April 17, 1984.

Clark Field, Japanese Raid on (December 8, 1941)

Devastating Japanese air attack in the Philippines. To secure the lines of communication between the oil-rich Netherlands East Indies and the home islands, the Japanese planned to seize the Philippine Islands. The first step in that process was the elimination of U.S. airpower.

American planners had long recognized the vulnerability of the Philippines to Japanese attack. In July 1941, President Franklin F. Roosevelt named General Douglas MacArthur commander of United States Army Forces in the Far East (USAFFE). His air commander was Major General Lewis Brereton. By the fall of 1941, Brereton had priority in aircraft deliveries, and in early December, the Far East Air Force (FEAF) possessed 35 Boeing B-17 Flying Fortresses, more than 100 modern Curtiss P-40 Warhawk fighters, and some 135 older aircraft.

At 2:40 a.m. on December 8, 1941 (December 7 Hawaii time), the U.S. Navy’s Asiatic Fleet Headquarters in Manila learned of the attack on Pearl

Harbor but then had trouble informing MacArthur. An hour later, MacArthur's chief of staff, Brigadier General Richard Sutherland, heard a commercial broadcast reporting the attack and woke the general. Official word from the War Department did not arrive until 5:30 a.m. Brereton placed his aircraft on standby and requested permission from MacArthur to strike Takao Harbor, Formosa, to destroy Japanese warships and shipping gathering there for the invasion of the Philippines. MacArthur refused, and Sutherland denied Brereton access to MacArthur.

At 9:20 a.m., Japanese Army aircraft bombed Baguio, the Philippine summer capital north of Clark Field. Fog on Formosa, however, delayed the Japanese Navy raid on the Clark and Iba airfields. At 11:30 a.m., reports of incoming aircraft reached FEAF headquarters. Clark Field received a warning, but it was not passed to the V Bomber Command. Although the Americans had one radar station operating and nearly 10 hours had elapsed since the attack on Pearl Harbor, the Japanese caught most of Clark's aircraft on the ground, launching 53 bombers and 44 Zero fighters against the airfield. All the attacks on Luzon cost the Japanese only 7 fighters lost. The Americans lost 18 B-17s, 35 P-35s and P-40s, and another 25 to 30 B-10s, B-18s, and observation aircraft. The FEAF thus ceased to exist as a meaningful force on the first day of the war.

Blame for the American disaster has never been suitably determined. Complacency played a role, as American strategists discounted the technical achievements and fighting ability of the Japanese. Brereton wrote that had permission been granted to attack Formosa, his Clark Field bombers would not have been caught on the ground. Sutherland blamed Brereton for not dispersing all his B-17s to the south (only half had been sent there) as ordered prior to December 8, whereas MacArthur held the War Department responsible for not strengthening the defense of the Philippines soon enough. Nevertheless, although army and navy commanders at Pearl Harbor were removed following the Japanese attack there, MacArthur retained his post in the Philippines.

Clay, Lucius DuBignon (1897–1978)

U.S. Army general. Born on April 23, 1897, in Marietta, Georgia, Lucius DuBignon Clay graduated from the U.S. Military Academy at West Point in 1918 and was commissioned in the engineers. He returned to West Point as an instructor during 1924–1928. Clay served on General Douglas MacArthur's staff (1937); was in charge of the construction of the Red River Dam near Denison, Texas from 1938 to 1940; and headed the Civil Aeronautics Authority Defense Airport Program from 1940 to 1941. In the latter position, he oversaw the expansion and improvement of 277 airports and the construction of 197 new ones.

In March 1942, Clay was promoted to brigadier general—the youngest in the army at the time—and appointed assistant chief of staff for matériel. Rising to major general that December, he oversaw both military procurement and production. In November 1944, General Dwight D. Eisenhower called Clay to Europe to take on the Herculean task of rejuvenating for Allied supply the French port of Cherbourg, which the Germans had destroyed. He was next deputy chief of the Office of War Mobilization and Reconversion in Washington (December 1944 to April 1945).

Clay returned to Europe at the end of the war as a lieutenant general and Eisenhower's civilian affairs deputy. In March 1947, Clay became U.S.

military governor in Germany. In that position, he played a key role in rebuilding western Germany. When the Soviet Union imposed a blockade of Berlin in 1948, Clay recommended that the Western Allies attempt an airlift, which President Harry S. Truman approved.

Days after the successful blockade ended in May 1949, Clay retired. One of the few occupying generals to have a street named after him (Clayallee in Berlin), Clay subsequently served as chairman of the board of the Continental Can Corporation, although he carried out several special governmental assignments as well. Clay died in Chatham, Massachusetts, on April 16, 1978.

CLAYMORE, Operation (March 4, 1941)

Allied raid against the Norwegian Lofoten Islands some 100 miles north of the Arctic Circle. Operation CLAYMORE, also known as the Lofoten Islands Raid, involved the Royal Navy troopships *Queen Emma* and *Princess Beatrix* transporting some 1,000 men of No. 3 Commando and No. 4 Commando, with a naval escort of five destroyers. The ships departed Scapa Flow on February 21, 1941, and then proceeded to the Faroe Islands for training and left there on March 1.

The primary target of the raid was the Norwegian fish oil factories, the destruction of which would adversely affect German glycerine production for munitions. Despite the ships having been spotted by a German aircraft in their approach, surprise was complete. During the March 4 raid, 11 factories, 800,000 gallons of oil, and five ships in harbor were destroyed. A total of 225 Germans and 60 Norwegian collaborators were taken prisoner, and 314 Norwegians volunteering to join their government's forces in exile were taken to Britain. In addition, the raiders secured from a German trawler a set of spare rotors for an Enigma coding machine, which was sent to Bletchley Park to assist British code breakers.

There were no British casualties. The success of the raid was a fillip to British morale, which had been badly shaken by a series of military reverses.

Coastal Defense

The defense of important harbors to protect against attack from the sea. During World War II, most fighting nations developed new harbor fortifications or manned ones developed before the war, although few of these locations saw action. Most major American port cities (including those in Panama and the Philippines) were protected by coastal forts, many of which originally dated from the turn of the century and were thus on caretaker status as obsolete when the war began. In the continental United States, more than 30 new batteries designed to a common standard and with greater ranges were constructed before and during the war. These installations were chiefly shielded twin batteries of 6-inch guns as well as a few heavily casemated 16-inch batteries, the largest coastal defenses ever installed. A number of existing batteries were also casemated to protect against possible air attack. Older weapons from other batteries were often sent to other nations, such as Brazil and Canada, to bolster their coastal defenses. Fully manned in the opening months of the war, batteries were increasingly placed on caretaker status, and new construction (of more than 100 batteries) was halted by 1944.

Only the American-built harbor forts at Manila—most constructed early in the century—actually saw action, as Japanese forces advanced down the Bataan Peninsula between December 1941 and May 1942. U.S. mortar and gun batteries on Corregidor and other harbor islands and the twin turrets of Fort Drum, the famous "Concrete Battleship," in Manila Bay dueled with Japanese artillery, ships, and aircraft until the final American surrender in April and May. The forces at Drum prevented Japan's use of Manila Bay and also kept the Japanese from flanking the Bataan defenses by sea. Hawaii (Oahu), already extensively armed, was further fortified with naval turrets,

including two removed from the sunken battleship USS *Arizona*, but none of its batteries saw action in the war.

In Canada, the key ports on the Atlantic (Halifax and Sydney, Nova Scotia) and the Pacific (Vancouver and Victoria) had been fortified earlier, usually with British 9.2-inch and smaller artillery in open emplacements. Several were upgraded with new guns and communications links. Although all of the Canadian forts were manned in support of convoy and military shipping, none saw action.

Major British harbors had been fortified at least since the mid-19th century. Although some new emplacements were constructed, chiefly along the coast facing the mainland, British batteries were largely holdovers from the turn of the century and World War I. With Britain facing invasion in 1940, a host of emergency batteries were hastily built using cast-off 4-inch and 6-inch naval weapons. Pillboxes and other armored positions festooned coast and countryside. Sizable antiaircraft "sea forts" were built in the Thames and Mersey estuaries in 1942 and 1943 and were quite effective. Huge 14-inch and 15-inch guns emplaced near Dover controlled the English Channel and could bombard Atlantic Wall defenses along the French coast. Unfortunately, British coastal batteries at Hong Kong (in 1941) and Singapore (in 1942) did little to slow the Japanese advances there.

Coastal defense was extensively developed by the Axis powers, most specifically by the massive German Atlantic Wall. The Italian ports of Genoa and Venice were heavily defended with batteries, and the Germans added more after 1943. Few of these saw action, as Allied forces typically went around them or took them from behind. Japan rapidly fortified Pacific islands taken over in 1941 and 1942, and most of these facilities saw active combat, as did some of the extensive facilities protecting the Japanese home islands.

COBRA, Operation (July 25–31, 1944)

U.S. Army breakout from the Normandy peninsula in July 1944. The success of the Allied invasion of June 6, 1944, turned to frustration when the tenacious German defense of the Cotentin Peninsula stifled efforts to expand beyond the initial beachheads. Supreme commander of the Allied Expeditionary Force General Dwight D. Eisenhower had grown impatient with the disrupted timetable as General Sir Bernard L. Montgomery failed to take Caen and Lieutenant General Omar N. Bradley's U.S. First Army remained stalled in the bocage, or hedgerow, country.

To break the deadlock, two offensive plans were developed. Operation GOODWOOD, led by British lieutenant general Miles C. Dempsey, would fix the German attention on British forces as they moved to capture Caen. Meanwhile, Bradley planned Operation COBRA, a mobile ground attack to break out of the Cotentin Peninsula and drive west into Brittany. That would culminate in a wide sweep to the southeast to stretch German defenses to the breaking point.

Tactical command for COBRA fell to aggressive VII Corps commander Major General J. Lawton Collins. Collins would have six divisions and almost 100,000 men for the attack. The plan hinged on a concentrated strike by heavy bombers to destroy a significant portion of the German lines. After the bombardment, an overwhelming ground attack by the U.S. 9th, 4th, and 30th Infantry Divisions would penetrate the disrupted German defenses and hold open a corridor for the exploiting mobile divisions. Opposing Collins

was German lieutenant general Dietrich Choltitz's LXXXIV Corps, which had experienced heavy fighting and had many understrength units, such as the Panzer Lehr Division, which could muster only 3,200 troops along a three-mile front.

A key element in the COBRA plan was to locate a point of penetration where there were sufficient parallel roads in the direction of the attack to allow follow-on forces into the breach. The most controversial aspect of the operation was the carpet bombing by strategic bombers. Bradley designated a rectangular target box 2,500 yards wide and over 7,000 yards long, and his IX Tactical Air Command commander, Major General Elwood "Pete" Quesada, met with Air Chief Marshal Sir Trafford Leigh-Mallory to coordinate the air attack. However, the competing needs for dropping maximum bomb tonnage, maintaining tactical positions for the infantry, and placing 1,500 bombers in the mile-wide corridor in a single hour could not be entirely reconciled.

COBRA was scheduled for July 24, but overcast skies led Leigh-Mallory to call off the carpet bombing. Unfortunately, U.S. Eighth Air Force bombers were already in flight, and they approached the target from a perpendicular direction, causing bombs to fall short of the target and into the 30th Infantry Division, killing 25 and wounding 131. The attack postponed and the surprise lost, an infuriated Bradley was told that another attack would follow the next day.

On July 25, bombers dropped 4,400 tons of bombs. The Germans, alerted from the previous attack, had dug in. Despite this, the Panzer Lehr Division was left in shambles, with 70 percent of its soldiers suffering shock and several battalion command posts destroyed. The Americans, in exposed positions and ready to move, suffered in "shorts" (bombs that fell short of their targets, landing on friendly forces) another 111 men killed, almost 500 wounded, and psychological trauma for 200 more. Among the U.S. dead was Lieutenant General Lesley J. McNair, commander of Army Ground Forces, who was visiting the front to observe the attack.

In spite of this tragedy, VII Corps immediately attacked, although strong pockets of German resistance limited the advance to only a mile or two. The next day, Collins made a bold decision to commit his armored and motorized forces, even though no U.S. unit had reached its planned objectives. The disrupted German command-and-control network failed to react when U.S.

armored divisions sliced through the lines on July 26. The next day, Collins's mobile units exploited their success deeper into the German rear areas, which led Bradley to order VIII Corps through the breach to seize Avranches.

According to the plan, once forces moved toward Brittany, the U.S. Third Army, commanded by Lieutenant General George S. Patton Jr., would be activated. To facilitate this transition, Bradley gave Patton immediate command of VIII Corps, which he drove hard to capture Avranches on July 31 and mark the end of COBRA. In just six days, the entire German front collapsed, enabling the Allies to carry out their own operational blitzkrieg deep into France.

Cochran, Jacqueline (1906–1980)

American aviator. Abandoned at birth, Jackie Cochran was born on May 11, 1906, near Muscogee, Florida. Growing up with a foster family in extreme poverty in Florida and Georgia, she received only two years of formal education. She worked at a variety of jobs in various settings, from cotton mills to beauty parlors. In 1932, Cochran earned her pilot's license, and in 1934, she won her first air race. She married Floyd Odlum, a wealthy businessman, in 1936. Two years later, Cochran was the first woman to win the Bendix Trophy for aeronautical racing and was recognized as the leading female pilot in the world.

When the United States entered World War II, Cochran attempted to change the U.S. Army Air Corps policy of not allowing women pilots to fly its planes. Seeing that the matter was hopeless, she took a group of women pilots to Britain to fly with the Royal Air Force's Air Transport Auxiliary. During her absence, the Air Transport Command organized the Women's Auxiliary Ferrying Squadron (WAFS), a civilian command for women to ferry aircraft throughout the contiguous United States. Nancy Harkness Love took command of the unit.

Cochran returned to the United States, angry that the WAFS had been formed without her. As a peace offering, the chief of staff of the U.S. Army Air Forces (USAAF), General Henry H. Arnold, authorized Cochran to organize, in November 1942, the Women's Flying Training Detachment (WFTD) to train future ferry pilots. In August 1943, the two women's groups were merged under Cochran's command and renamed the Women's Airforce Service Pilots (WASPs). Seeing this as a chance for women to prove themselves as military pilots, Cochran pushed for missions beyond simple ferrying. In addition to ferrying every type of military aircraft in the U.S. inventory, the WASPs performed flight checks, towed antiaircraft targets, trained male pilots, and worked as test pilots.

Despite Cochran's efforts to secure military status for the unit—and Arnold's support for that designation—Congress failed to approve it, and the women remained civilians throughout the war and did not secure veteran's status until 1978. In 1945, Cochran was awarded the Distinguished Service Medal.

Following the war, Cochran continued to fly. In 1953, she became the first woman to break the sound barrier, and she also campaigned for female astronauts. In 1960, she was the first woman to launch from and land on an aircraft carrier. Awarded the Legion of Merit by the U.S. Air Force in 1970, she was the first woman enshrined in the Aviation Hall of Fame, in 1971. By the time of her death in Indio, California, on August 9, 1980, Cochran held more aviation records and firsts than any other aviator.

COCKLESHELL, Operation (December 6–12, 1942)

A small unit of British marines, known as the Royal Marines Boom Patrol Detachment (RMBPD), part of Combined Operations, on December 11–12, 1942, attacked German ships in the Gironde River at Bordeaux, France. The men had been organized under the RMBPD cover. Following intensive training, they set sail to execute Operation FRANKTON (popularly known as Operation COCKLESHELL). The plan had been developed at the headquarters of Rear Admiral Lord Louis Mountbatten, chief of Combined Operations. It called for the launching of six two-man collapsible canoes on a moonless night off the Gironde estuary in an effort to destroy up to 12 German merchant ships. December had been chosen because the longer nights of winter would give greater cover to the raiders.

On the night of December 6, the party of 12 Royal Marines under Major Herbert G. "Blondie" Hasler arrived in the Bay of Biscay off the Gironde on board the British submarine *Tuna.* Their mission was to paddle the canoes, known as Cockle Mark IIs, nearly 100 miles from their launch point up the Gironde to Bordeaux and there destroy the German merchant ships with mines. The men were then to make their way home via Spain on foot.

Bad weather delayed the launch until the night of December 7, and an even more serious setback occurred when one canoe was damaged in launching and had to be scrubbed. The remaining five successfully launched and then set out for the mouth of the Gironde. Then one of the boats capsized, and its two men were drowned: just four canoes and eight men remained. The Gironde's tidal races caused another canoe to become separated. It was spotted by Germans ashore, and its crewmen were captured. Although the two men were in uniform, they were brutally interrogated (they revealed

nothing) and were executed at Bordeaux early on December 13 by a firing squad acting under Adolf Hitler's infamous Commando Order.

Another canoe sank after hitting an underwater obstacle as it neared Bordeaux. While making their way to Spain, the two men from this boat were betrayed to the Gestapo at La Reole. Taken to Paris, they were executed on or about March 23, 1943.

The men in last two canoes—the first containing Hasler and marine William Sparks and the second with Corporal A. F. Laver and marine W. H. Mills—paddled the 91 miles to Bordeaux at night (going ashore and sleeping in the day) in cold and wet conditions. Finally reaching their target, they set time-delay limpet mines on four cargo ships and a small tanker during the night of December 11–12. When the mines exploded the next morning, the ships flooded and sank; a minesweeping vessel was also badly damaged. None of the ships again saw service in the war.

After setting the mines, Hasler, Sparks, Laver, and Mills paddled to the riverbank, scuttled their canoes, and split up to attempt the trip to Spain and safety. Laver and Mills made for Ruffec but were betrayed to the Germans by French police at Montieu. They were shot in Paris on or about March 23, 1943.

Hasler and Sparks walked 100 miles northeast to make contact with the French Resistance at Ruffec. From there, Resistance members led them across France to the Spanish border, and they then made their way to Gibraltar. The only survivors of the operation, they arrived in Britain in April 1943. Hasler was awarded the Distinguished Service Order, and Sparks was awarded the Distinguished Service Medal. The story was commemorated in a 1955 film titled *The Cockleshell Heroes.*

Code Breaking

See Signals Intelligence

Code Talkers

Native Americans specifically recruited to relay battlefield information in their native language in the clear (that is, without employing a cipher). During World War II, nearly all code talkers were Navajos operating with the U.S. Marine Corps in the Pacific theater. The U.S. Army employed a handful of Comanches in the European theater, but they numbered fewer than 20. In the Pacific theater, nearly 400 Navajos provided their services to the Marine Corps. The idea was that the enemy—especially the Japanese—would have no knowledge of Native American languages and thus be unable to figure out what was being said. There was precedence for such activity, as the U.S. Army had employed a small number of Choctaws as signalmen on the Western Front during World War I.

In early 1942, U.S. Marine Corps recruiters visited a Navajo reservation in the American Southwest with the express purpose of recruiting and grooming code talkers to be used on the battlefield to relay fire-control and combat intelligence. Many of the Navajos recruited had never been off their reservation, but the marines persevered, as did the Navajos they recruited. The men received basic military training and developed a simple code for some words that did not exist in Navajo. Thus “machine gun” was translated into Navajo as “rapid-fire gun,” while “battleship” became “whale.”

The code talkers first saw service during the Guadalcanal Campaign (August 1942–February 1943). They performed in stellar fashion, and the Japanese were entirely unable to decipher their language. At first, the code included Navajo translations of 211 English words used mostly by the military. This was expanded until there were 411 terms in Navajo code. The

code talkers took great care to ensure that no codes or messages were ever written down; all communications were spoken in the Navajo code.

After their initial deployment at Guadalcanal, the Navajo code talkers saw extensive service at Tarawa (November 20–24, 1943), Peliliu (September 15–November 27, 1944), and Iwo Jima (February 19–March 26, 1945), among other battles and campaigns. Some Navajos experienced discrimination while in the service, while others were mistaken for the enemy because of the language and physical appearance. Nevertheless, the code talkers played an important role in the Pacific war, but none received public recognition of their contributions until the 1980s. In fact, their employment during the war had remained a government secret until 1968, at which time the operation was declassified.

PAUL G. PIERPAOLI JR.

Henry Bake and George Kirk, Navajo Code Talkers in a U.S. Marine Corps artillery regiment, relay orders over a field radio in December 1943. The Navajo Code Talkers developed and implemented a

code based on their native language for use in military telephone and radio communications during World War II. (National Archives)

Collaboration

Literally “cooperation” or “unity of effort” but interpreted during World War II to mean working actively with the enemy, implying treasonable activity. The issue is a complex one, for collaboration could run from selling the occupier agricultural produce to rounding up Jews and actively assisting in the prosecution of military activities. Collaboration could be military, political, economic, social, or cultural. In any case, such activities implied treason (in varying degrees) on the part of the collaborator. One point that must be made, however, is that one side’s “collaborator” was the other side’s “ally,” “loyalist,” or “assistant.” Collaboration with enemy or occupying forces occurred on both sides during the war.

Western and Northern Europe

France presents a complicated picture. Following the defeat of France in 1940, the Germans dictated armistice terms that saw them occupy about two-thirds of the country in the north and west. The French were allowed to establish an “independent” government in the remainder of the country, with its capital at Vichy. The term “collaboration” was actually first used in the course of a meeting between Vichy head of state Marshal Henri Philippe Pétain and German leader Adolf Hitler at Montoire-sur-Loire on October 24, 1940. Pétain and his supporters concluded that Germany had won the war and that, for the foreseeable future, that nation would dominate the continent. The

marshal therefore informed the French people that he accepted “in principle” the idea of “collaboration” with Germany.

Despite Pétain’s pronouncement, the French population was bitterly divided. A small minority at first rallied to the Resistance led in London by young General of Brigade General Charles de Gaulle (condemned to death in absentia by the Vichy government as a traitor). Germany had direct sources of pressure on Vichy, including heavy “administration costs” that amounted to more than 60 percent of French national income, control over traffic across the armistice demarcation line, possession of 1 million French prisoners of war (POWs), and exploitation of the press.

Following the Allied invasion of French North Africa, the Germans occupied the remainder of France. While de Gaulle established his position in North Africa and the French Empire in general, Vichy premier Pierre Laval became increasingly open about collaborating with Germany within continental France, including active participation in the rounding up and deportation of Jews and the hunting down of partisans by the Milice, the 30,000-man-strong Vichy militia force. Meanwhile, as the fortunes of war shifted, de Gaulle’s influence in France grew.

Certainly, a large number of French men and women collaborated with the Nazi regime, and many made sizable fortunes in the process. In addition, little was done after the war to punish such war profiteers. The carefully nurtured myth in postwar France of a nation of resisters was totally false, although thousands of French men and women did risk their all for the Allied cause.

Occupation arrangements varied in other West European countries. Belgium experienced a rather harsh German military rule, whereas the Netherlands and Norway had civil administrations, and Denmark was able to retain sovereignty until August 1943. After the war, the Belgian government punished, in varying degrees, some 53,000 men and women adjudged to have collaborated with the German occupiers.

Vidkun Quisling of Norway was one of the most notorious collaborators, his name becoming synonymous with the term. In February 1942, Quisling became minister-president of Norway, but his effort to Nazify his country was ardently resisted by most of the population. Anton Mussert was his Dutch counterpart and founder of the Netherlands Nazi Party. The party

membership was 30,000 at the start of the war, increasing to a peak of 50,000.

Eastern Europe

Although Poles prided themselves after the war on offering little collaboration with the hated German and Soviet occupiers, collaboration did take place. In the General Government set up by the Germans, units of Polish police operated under German command, as did Jewish police in the ghettos established by the Germans. There were also Poles who collaborated with the Soviets in 1939 as well as in 1943–1944. The Lublin government set up by the Soviet Union is a prime example. Even during the Nazi-inspired Holocaust, the Germans discovered those individuals who would collaborate in the concentration camps—the Kapos, or trustees, who worked for the German guards in the Sonderkommando. When Soviet forces invaded eastern Poland, they mobilized large numbers of Poles to fight for them against Germany; many Poles regarded these soldiers as collaborators.

In the rest of Central and Eastern Europe, experiences varied. Bulgaria, nominally an Axis power, hardly participated in the war. Its government did send troops to occupy Thrace and Macedonia in Greece, but it steadfastly rejected Hitler's demands that it dispatch troops to the Eastern Front. Hungary and Romania both supplied troops for the German invasion of the Soviet Union, suffering heavy losses in the process. They also actively participated in rounding up Jews to be sent to the extermination camps. In both Greece and Yugoslavia, there was active resistance to the Germans, although the government of newly independent Croatia, carved from Yugoslavia, was highly supportive of Berlin and its policies.

Many inhabitants of the eastern portions of the Soviet Union, such as the Baltic states and Ukraine, openly welcomed the German Army as their liberator and collaborated fully with it, until they discovered that German occupation policies were even more repressive than Soviet rule. In 1943 alone, as Soviet troops moved westward, the Soviet Narodnyy Komissariat Vnutrennikh Del (NKVD, or secret police) arrested more than 931,000 people for questioning. Hundreds of thousands of Soviet minorities—most notably the Crimean Tartars but also Turks and Chechens, among others—were simply deported en masse to the eastern Soviet Union as a consequence

of their wartime collaboration with the Germans. General Andrei Vlasov, a Hero of the Soviet Union, agreed to head the German-sponsored Russian Liberation Army, although Hitler refused to allow it any real function. Hundreds of thousands of Soviet prisoners worked in the German Army in nonmilitary roles, as cooks, drivers, and the like. Much of their motivation came from the simple desire to stay alive, as millions of Soviet soldiers perished from starvation in German POW camps. Stalin, however, deemed them collaborators—along with all other Soviet POWs—and condemned them to the gulags after the war.

One tragic episode following the war resulted from the decision by the Western powers to hand over to the Soviet Union millions of Soviet citizens, many of whom had lived in the West for decades and had played no wartime collaborative role. Nonetheless, they were shipped off to work at hard labor in the gulags.

Far East

In the Far East, Japan's occupation of its conquered territories was generally quite harsh. Paradoxically, as the war dragged on, Japan encouraged independence from colonial rule in some areas, especially in those lands that had been European or U.S. colonies. A notable example of the latter was the Netherlands East Indies, where indigenous peoples were treated comparatively well, in contrast to Europeans, and where the postwar independence movement was effectively encouraged. There as elsewhere, there was considerable popular support for Tokyo's efforts to eliminate the influence of the European colonial masters. One component of the Japanese theme of a "Greater East Asia Co-Prosperity Sphere" was to grant independence to Asian states. But the phrase "Asia for the Asians" actually meant that Asian peoples were to be subordinate to Japan.

In French Indochina, the Japanese allowed the French colonial administration to remain in place for purposes of expediency, for it could thus be held with fewer Japanese troops. In March 1945, however, with the war almost certainly lost for Japan, the French plotted to liberate Indochina themselves. The Japanese then took control and granted Vietnam its "independence." The Viet Minh, die-hard Vietnamese nationalists led by Ho

Chi Minh, rejected collaboration, fought both the French and the Japanese, and appealed to Washington for support.

Much to the surprise of the Japanese, most Filipinos remained loyal to the United States. But under heavy Japanese pressure, the Philippine government did accept the principle of collaboration and even declared war on the United States. Following the liberation of the islands, however, few Filipino collaborators were punished, and the Philippines received independence. Burma had its share of collaborators. A number of Burmese regarded the Japanese as liberators, and the Burmese Independence Army actively fought on their side.

Throughout its long occupation of much of China, Japan sought collaborators. Wang Jingwei (Ching-wei), a founding father of the Nationalist Party, grew disillusioned with Nationalist leader Jiang Jieshi (Chiang Kai-shek) and his failure to make peace with the Japanese. In March 1940, the Japanese installed Wang as head of the puppet Reorganized Nationalist Government of China in Nanjing (Nanking). However, Wang's hopes of presenting himself as a credible alternative to Jiang were dashed on the rocks of Japanese military domination. Wang died in Japan in November 1944 while undergoing medical treatment.

After the Allied victories in Europe and the Pacific in the spring of 1945, collaborators were variously punished. Many individuals were simply executed on the spot by soldiers and civilians. In France, women who had fraternized with the Germans had their heads shaved, among other indignities. Some key political leaders, such as Quisling, were tried and executed. In France, the aged Marshal Pétain was tried and sentenced to death, but de Gaulle remitted that sentence in recognition of his World War I services, and the marshal spent the remainder of his life in prison.

Collins, Joseph Lawton "Lightning Joe" (1896–1987)

U.S. Army general. Born on May 1, 1896, in New Orleans, Louisiana, Joseph Lawton Collins was the brother of James Lawton Collins, another future U.S. Army general. Joseph Collins attended Louisiana State University during 1912–1913, then went on to the United States Military Academy at West Point, where he graduated in 1917, was commissioned a second lieutenant, and assigned to the 22nd Infantry. Although he did not take part in combat in World War I, he was promoted to captain in 1919 and served with U.S. occupation forces in Germany (1919–1921).

Collins was an instructor at West Point (1921–1925). He graduated from the Infantry School at Fort Benning, Georgia, in 1925 and then was an instructor there (1925–1931). Promoted to major in 1932, he was a student at the Command and General Staff School, Fort Leavenworth, Kansas (1932–1933), then served in the Philippines (1933–1935). He attended the Army Industrial College (1936–1937) and the Army War College (1937–1938) before serving as an instructor at the latter (1938–1941). He was then chief of staff of VI Corps in Alabama (1941). Shortly after the Japanese attack on Pearl Harbor (December 7, 1941), Colonel Collins was named chief of staff
