These efforts ran concurrently with defeats at Soviet hands. Japanese commitments in China dictated a cautious policy in Manchuria and Inner Mongolia, but in 1938 and 1939 several small and two major clashes occurred between Japanese and Soviet forces. The first major clash took place between July 11 and August 10, 1938, in the area around Zhanggufeng (Chang-ku-feng) where Manchuria, Korea, and the Maritime Provinces met; the second occurred between May and September 1939 in the area between the River Halha and Nomonhan.

In both cases, single Japanese divisions attempted to clear Soviet forces from their territorial holdings, but in the first action the Japanese were

checked, and in the second they were subjected to attack by an enemy possessing overwhelming numerical superiority in aircraft, tanks, and artillery. Beginning on August 20, the Soviets undertook an offensive that shredded the Komatsubara Force and then destroyed one infantry regiment on the banks of the Halha. By mid-September, the Japanese had brought three fresh divisions to Nomonhan, but by this stage, both sides had little interest in continuing, and a local truce was arranged. the Zhanggufeng and Nomonhan disputes were resolved in June 1940.

The defeat at Nomonhan coincided with the 1939 German-Soviet Non-Aggression Pact, and this, together with the Anglo-French declaration of war on Germany, caused Japan to adopt a cautious policy. The German victory in Northwestern Europe in the spring of 1940 was immediately followed by a change of government. On July 21, Prince Konoe Fumimaro replaced the more circumspect Yonai Mitsumasa as prime minister. The two services' precondition for allowing Konoe to form a government was his prior acceptance of their demands for a treaty with Germany and Italy, additional credits for the army, a nonaggression treaty with the Soviet Union, and the adoption of a forward strategy in southeast Asia.

In the China theater, however, the international situation offered the army the means to isolate the Chinese Nationalist regime by intimidating the British and French colonial authorities in Southeast Asia. The German attack on the Soviet Union in June 1941 and the U.S. embargo of various goods, which was drastically extended that July, placed Japan in a situation where a choice had to be made. At the navy's insistence, Japan's leaders decided to move into Southeast Asia to ensure access to raw materials. Without these assets, Japanese leaders believed that their nation could not survive as a great power, even if this move meant war with the United States.

The army's role would be to provide garrisons in the islands marking the defensive perimeter where the Americans would be fought to a standstill. The navy's belief was that the fleet and land-based aircraft would meet the Americans more or less on the basis of equality and fight them to exhaustion, forcing the United States to reach a negotiated settlement.

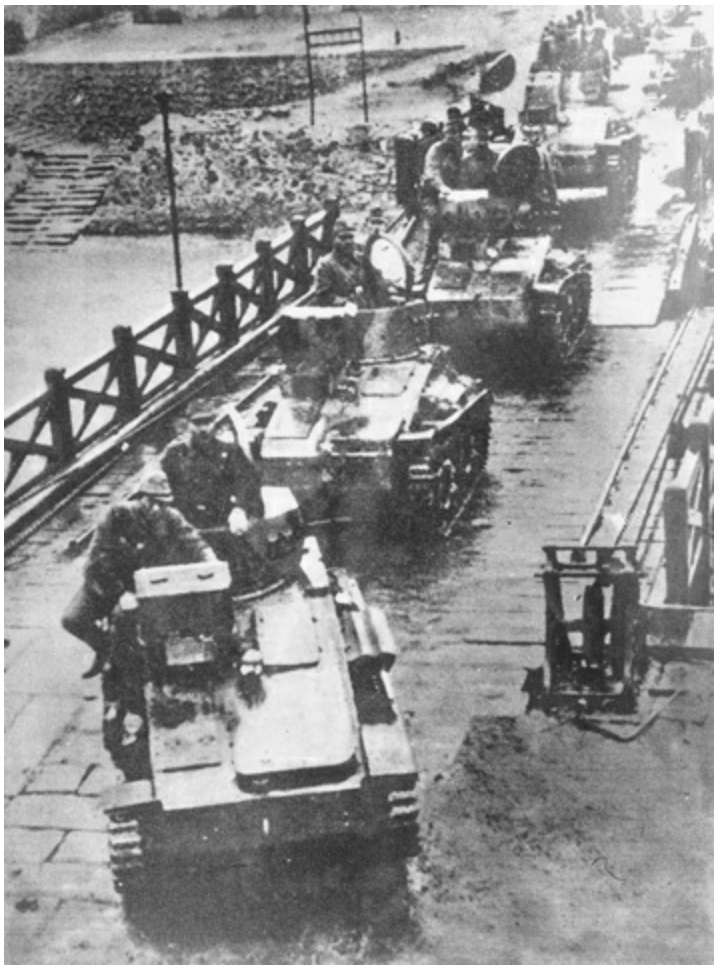
Although this has been overlooked, the role of the army in the Pacific war was therefore limited; even in the initial phase when Southeast Asia was overrun, the commitment of the Imperial Japanese Army remained modest. The campaigns in Burma, Malaya, the Netherlands East Indies, and the

Philippines involved only 11 Japanese divisions, the equivalent of a single army, and after these conquests were completed, no single campaign, whether in the Southwest, Central, or North Pacific, involved a corps equivalent or more in the field until that in the Philippines in 1944 and 1945.

Admittedly, the defeats that Japan incurred in eastern New Guinea (March 1942 to December 1943) and thereafter along the northern coast of the island (December 1943 to May 1944) and in the central and upper Solomons (February to November 1943) did involve more than a corps equivalent, but these were local defeats largely separated from one another. Probably no single reverse, even Guadalcanal (August 1942 to February 1943) at the beginning of second-phase operations, involved more than two divisions.

The only defeat of corps-sized proportions incurred prior to the Philippines Campaign in Burma at Imphal and Kohima during the 1943–1944 campaigning season was the so-called March on Delhi that went disastrously wrong. The origins of this defeat lay in the ease with which the Japanese, with just one division, had frustrated a corps-sized British offensive in the Arakan in 1943.

In these 1941–1942 campaigns, the Japanese had no military margin of superiority, but they outfought individual enemies who were defensively dispersed and subjected to amphibious assaults by Japanese forces enjoying local air and naval superiority. The campaigns, conducted across a frontage of more than 3,000 miles, were characterized by economy of effort and an almost aesthetic quality as successive landings penetrated to the depth of Allied defenses.



Japanese army tanks approaching the Singapore Causeway during the Japanese drive on the city in February 1942. (Keystone/Getty Images)

Thereafter, the problem for Japan and the Imperial Japanese Army was threefold. First, once they were no longer taking the initiative in the Pacific, Japanese garrisons were subjected to attack by massively superior Allied assets. No force could sustain itself against such an attack, and no resistance, however protracted and effective in terms of tying down U.S. military assets, could alter a pattern of defeat that brought American forces astride Japanese lines of communication to the south and took the war to the home islands.

Second, the Imperial Japanese Army deployed formations to the Pacific at the expense of garrison forces in Manchuria and China, where these formations were not easily replaced. By 1944, ammunition shortages precluded live-fire training. By August 1945, the class of 1945 was basically untrained, and the 1944 class was little better. The army, which had numbered some 24 divisions in the mid-1920s and 51 divisions in December

1941, raised 3 armored and 107 infantry divisions for service overseas; 1 tank division and 55 infantry divisions remained in the home islands.

Despite these numbers, the quality of the army was declining because Japan lacked adequate industrial capacity to meet the requirements of total war. Japanese output in 1944 was equivalent to 4 percent of the American production of mortars, 4.7 percent of tanks, 8 percent of antiaircraft ammunition, perhaps 10 percent of all ordnance, and 6.5 percent of small-arms ammunition. With minimum capability, the divisions in the home islands in 1945 were singularly ill-prepared to resist assault landings.

The Japanese Army never experienced defeat in the home islands, but it faced defeat repeatedly on the continental mainland. Japanese forces were defeated throughout Burma (with the exception of Tenasserim) in 1945 and also in August throughout Manchuria, northern China, and Korea, on Sakhalin and in the Kuriles, when Soviet forces put together a masterly short campaign. The Japanese forces numbered some 750,000 troops, but of these, some 300,000 were Manchurians suited only to garrison duties.

Japanese troops were mustered in 17 infantry divisions, equipped with 1,155 tanks, 5,360 artillery pieces, and 1,800 aircraft, but these were utterly routed by an enemy force consisting of 1 tank army and 11 infantry armies. Seeking to consolidate and allow removal of formations to more important theaters, the Japanese had begun major withdrawals within China, ending the period of Japanese successes that had begun in the spring of 1944. The conduct of these operations resembled previous Japanese efforts in brutality.

In July 1945, the Japanese Army had 26 infantry divisions in China and another seven in Korea, but even so, its position was hopeless. The extent of failure can be gauged by the fact that Japan managed to conjure into existence an alliance that included the world’s most populous country; the greatest empire; the greatest industrial power, naval power, and airpower; and the greatest military power. However unintentional, this was a formidable achievement, but it was combined with fundamental failure by the army leadership to comprehend the nature of the war in which it was involved.

Drawing on its highly selective interpretation of Japanese history and hobbled by the fact that never having been defeated it could not understand defeat, the army was dominated by an ethos that stressed reverence for rank. A formal organization, it had no real capacity for flexibility and initiative at the lower levels. Its broad distaste for political and economic liberalism

coexisted with its belief in what it deemed traditional Japanese martial values—specifically, its willingness to die "honorably." The war proved, however, that sacrifice could not confound superior enemy industrial output and matériel.

Japan, Navy

By the 1920s, the Dai-Nippon Teikoku Kaigun (Imperial Japanese Navy, IJN), which dated only from the late 1860s, ranked as the third-largest navy in the world. By then, it had fought three wars, and at the Battle of Tsushima in May 1905, it won one of the most comprehensive victories in the long history of naval warfare. The IJN was to fight two more wars, one in the Western Pacific, directed against China, and the other throughout the Pacific,

Eastern and Southeast Asia, and the Indian Ocean. The latter resulted in utter and total national defeat and the destruction of the Kaigun as a service.

From 1907 onward, IJN leaders identified the United States as the enemy against which preparations had to be made. Yet the Kaigun faced a basic and insoluble problem, namely Japan's acceptance of the limitation of its navy to three-fifths those of the United States and Great Britain, as agreed at the 1921–1922 Washington Naval Conference. This resulted from the conviction of minister of the navy Admiral Kato Tomosaburo that the only thing worse for Japan than an unrestricted naval construction race would be war against the United States. Kato believed that Japan therefore had to seek security through peaceful cooperation and diplomatic arrangements. Kato and others viewed the navy as a deterrent and, in the event of war, a defense; however, they also believed that Japan's best interests would be served by arrangements that limited U.S. naval construction relative to Japan and so provided the basis of U.S. recognition and acceptance of Japan's regional position. The problem was that events unfolded in a manner that forced the IJN into planning for a war that, by its own calculations, it was certain to lose.

The basis of this position was twofold. First, the Kaigun found itself obliged to fight not one but two wars. It would have to confront a U.S. enemy that would seek battle and carry out major amphibious undertakings across the Western Pacific to bring the war to Japanese home waters. The Kaigun would also be obliged to fight a maritime war to defend Japanese shipping and seaborne trade. Losing either would result in Japan's defeat. In the event, the Kaigun suffered both naval and mercantile defeats.

The maritime defeat could have been predicted. Four Shimushu- or Type A–class escort warships were ordered under the 1937 naval estimates, but none was begun before November 1938, to be completed between June 1940 and March 1941. In December 1941, these four ships were the only purpose-built escorts in service with the IJN, and all lacked underwater detection gear (sonar).

Quite simply, Japanese industry did not have the capacity to build and service both warships and merchantmen or to build both fleet units and escorts (see Table 1). Japan's limited industrial capacity forced it to choose between warships and merchantmen, between building and refitting. Moreover, the Kaigun had no real understanding of trade defense and the

principles of convoy. Not until November 1943 did the navy institute general convoy, and lacking sufficient escorts and integrated air defense, this merely concentrated targets rather than protecting shipping.

Here too lay the basis of Japan's naval defeat in the Pacific. In order to fight and defeat the U.S. attempt to carry the war across the Pacific, the Kaigun developed the *zengen sakusen* (all-out battle strategy), which envisaged the decisive battle in five phases. Submarines gathered off the Hawaiian Islands would provide timely reports of U.S. fleet movements and, with top surface speeds of 24 knots, carry out a series of night attacks on U.S. formations. It anticipated that the United States would suffer losses of one-tenth of strength in this phase and the same in the next, when Japanese shore-based aircraft, specially built for superior range and strike capability, would engage the U.S. formations. The U.S. ships would then be subjected to night attack by massed destroyer formations, Japanese battle cruisers, and cruisers being used to blast aside escorts. The Japanese anticipated massed scissors attacks using as many as 120 Long Lance torpedoes in a single effort.

Thereafter, with U.S. formations losing cohesion and organization, Japanese carriers would join the battle—employed in separate divisions rather than concentrated—to neutralize their opposite numbers. Finally, Japanese battleships would engage the U.S. battle line in what Japanese planners expected to be the decisive battle. In the 1930s, when these ideas were formulated, the Japanese expected that the main battle would take place around the Marianas.

The Kaigun organized its formations and building and refitting programs accordingly. Destroyers featured torpedo armaments, and battleships and cruisers emphasized armament, speed, and armor rather than range. The Yamato-class battleships, at their full displacement of 71,659 tons, carried a main armament of nine 18.1-inch guns. They had a top speed of 27.7 knots and a range of 8,600 nautical miles at 19 knots or 4,100 nautical miles at 27 knots. These ships were deliberately conceived as bigger and more formidably armed and protected than any U.S. battleship able to use the Panama Canal. The Japanese quest for qualitative superiority extended through the other classes of warships.

As part of this process, the Kaigun developed the famous Long Lance torpedo, land-based and carrier-based aircraft such as the A6M Zero-sen and the long-range Mitsubishi G4M "Betty" bomber, and long-range submarines,

one type equipped with seaplanes to extend scouting range. Individually and collectively, these were unequaled in 1941 and 1942, and in terms of night-fighting capability in 1941, the Kaigun had no peer.

Despite these advantages, the Japanese naval battle plan represented an inversion of what was required. By December 1941, the Kaigun had basically secured parity in the Pacific with the United States, with warships, carrier air groups and aircraft, and a pool of trained manpower that was probably the best in the world. The problem was that the perimeter along which the Japanese planned to fight the Americans to a standstill largely consisted of gaps. Japan had neither the shipping nor the base organizations to transform the island groups into the air bases essential to the fleet. The latter, moreover, could not be permanently ready to meet any U.S. move, which would, by definition, be made in a strength and at a time that all but ensured U.S. victory.

Table 1. Wartime Commissioning and Completion of Major Units by the Japanese and U.S. Navies

U.S. Navy	18	9	77	8	2	13	33	349	420	73	203

Note: The drawing of direct comparisons between different types of warships, specifically escorts, is somewhat difficult. Counted under the heading Esc in the Japanese listings are named escorts and patrol boats; under the heading CD are the *kaiboken*, or coastal defense ships. These types were not the direct equivalents of U.S. destroyer escorts and frigates, respectively, but diversity precludes these types of U.S. and Japanese ships being compared with anything but one another. U.S. figures exclude Lend-Lease vessels.

Note: Dashes = zero; CL = light cruiser; CV = fleet carrier; DD = destroyer; CVL = light carrier; Esc = escort; CVE = escort carrier; DE = destroyer escort; BB = battleship; CD = coastal defense ship; CB = battle cruiser; PF = frigate; CA = heavy cruiser; and SS = submarine.

Individual Japanese bases, or even several bases within a group or neighboring groups, could be overwhelmed by an enemy free to choose when and where to mount offensive operations, a second flaw within the *zengen sakusen* concept. By 1942, the Kaigun was only prepared to win the battle it intended to fight; of course, the battle it was called on to fight was not the one for which it had prepared.

The IJN, moreover, faced not one enemy but two. It opened hostilities with a total strength of 10 battleships, 6 fleet and 3 light fleet carriers and 1 escort carrier, 18 heavy and 20 light cruisers, 111 destroyers, and 71 submarines. A token of its future problems lay in the fact that only 1 fleet unit, a destroyer, was not in service on December 6, 1941. Even when it went to war, the Kaigun faced a U.S. Navy that, between May 1942 and November 1943, fought it to a standstill. After that date, the Kaigun faced a wartime U.S. Navy, virtually every ship of which had entered service after Pearl Harbor.

Table 2. The State of Japanese Shipping, 1941–1945 (in Tons)

Year	*Built*	*Captured and Salvaged*	*Total Acquisitions*	*Lost*	*Net Lossin Year*	*Shipping Available on*		*Tonnage*		*Percent Laid Up*

						March 31, 1942	6,150,000	5,375,000	775,000	12.61

1942	266,000	566,000	832,000	1,065,000	–233,000	December 31, 1942	5,942,000			
						March 31, 1943	5,733,000	4,833,000	900,000	15.70
1943	769,000	109,000	878,000	1,821,000	–943,000	December 31, 1943	4,999,000			
						March 31, 1944	4,352,000	3,527,000	825,000	18.96
1944	1,699,000	36,000	1,735,000	3,892,000	–2,157,000	December 31, 1944	2,842,000			
						March 31, 1945	2,465,000	1,659,000	806,000	32.70
1945	559,000	6,000	565,000	1,782,000	–1,217,000	August 15, 1945	1,625,000	948,000	677,000	41.66

Note: The figures presented in this table are based on my own calculations. These, however, are not complete and differ in virtually every detail from figures generally given in Western histories, the sources of which are normally U.S. and date from the period immediately after the end of the war. The figures here have been taken from such a source. I would advise that a certain caution be exercised with respect to the detail of these figures and calculations and would note that Japanese merchant shipping losses in this table include ships of unknown ownership and one Thai ship but not foreign ships under charter. These caveats noted, I vouch for the general accuracy of the figures and the conclusions that have been drawn from them.

The Japanese shipbuilding effort from 1942 to 1944, though substantial, was simply overwhelmed by a truly remarkable U.S. industrial achievement: 18 U.S. fleet carriers to 7 for Japan, 9 light fleet carriers to 4, 77 escort carriers to 4, 8 battleships to 2, 13 heavy and 33 light cruisers to 4 light cruisers, 349 destroyers and 420 destroyer escorts to 90, and 203 submarines to 116. U.S. superiority was not simply numerical; radio, radar, and diversity of weaponry were all areas in which the Kaigun could not match its U.S. enemy but was systematically outclassed as the war progressed.

During 1943 and 1944, the United States acquired such overwhelming numerical superiority that the Kaigun was denied not merely any chance of victory but even any means of effective response. Between December 26, 1943, and October 24, 1944, Japanese warships and aircraft destroyed no U.S. fleet units, if submarines are excluded. Events in 1945 conspired to demonstrate the singular ineffectiveness of such a course of action, as Japanese losses between July 1944 and August 1945 reflected both this dilemma and the wider national defeat. Overall, the Kaigun lost 1,028 warships of 2,310,704 tons, of which 631 warships of 1,348,492 tons were destroyed in the last 13 months of the war (see Table 2). The wartime losses

incurred by the merchant fleet—not the service auxiliaries—told the same story, totaling 1,181.5 merchantmen (there were navy, army, and civilian ships and, occasionally, shared ships, which are here calculated as half a ship) of 3,389,202 tons, of which 811 vessels of 2,077,249 tons were lost in the period after the Battle of the Philippine Sea (June 19–21, 1944). Losses of this order reduced the Kaigun to no more than an ever less effective coastal defense force.

By August 1945, Japan had been pushed to the edge of comprehensive defeat, losing all semblance of strategic mobility. Its industry was in end-run production; its people would have died by the millions from disease and starvation had the war lasted into the spring of 1946. For all intents and purposes, the Kaigun had by then ceased to exist, as U.S. carrier air groups flew combat air patrols over Japanese airfields. A remarkable U.S. achievement had reduced the Kaigun to irrelevance. States, especially great powers, are rarely defeated by naval power, but in this case, the Kaigun had been powerless to prevent such an outcome.

Japan, Occupation of

On August 14, 1945, the Japanese government formally accepted the terms of the Potsdam Declaration for the surrender of Japan. The next day, Emperor Hirohito broadcast the news to the Japanese people. From then to April 28, 1952, when the San Francisco Peace Treaty went into effect and Japan recovered its full sovereignty, the country was under Allied control.

The occupation can be divided into two periods. The first began with the Japanese surrender in August 1945 and lasted until the Cold War spread into East Asia around 1948. It was characterized by faithful implementation of the Potsdam Declaration, which emphasized the complete democratization and demilitarization of Japan. The second period, which lasted until the restoration of Japanese sovereignty in 1952, was marked by economic renovation and rearmament.

Occupation policies stipulated by the Potsdam Declaration called for the loss of territory, the elimination of militarism, the disbandment of the Japanese armed forces, the punishment of war criminals, and the creation of democracy. Japan was to be placed under military occupation until these goals were achieved.

On August 30, U.S. general of the Army Douglas MacArthur arrived in Japan to assume his duties as supreme commander of the Allied occupation forces, and soon the General Headquarters of the Supreme Commander Allied Powers was established in Tokyo. The official Japanese surrender occurred on board the U.S. battleship *Missouri* in Tokyo Bay on September 2, 1945. By the end of September, the U.S. military had occupied all of Japan.

The Far Eastern Commission, representing 11 nations, was vested with control over the occupation, and the U.S. government was supposed to implement its decisions. Given sharp disagreements between the United States and the Soviet Union, however, Washington was determined to conduct the occupation with as little interference as possible by the commission.

Consequently, the Harry S. Truman administration set out to establish the occupation regime and implement basic reforms before the Far Eastern

Commission officially began its work. Not until February 26, 1946, was the commission officially established in Washington, D.C., and by that time, most basic reforms in Japan were in place. The Allied Council for Japan was an advisory body to the supreme Allied commander, established in Tokyo; the United States, Britain, China, and the Soviet Union were members. Because of the Soviet presence, MacArthur was determined to minimize the council's involvement.

The drastic reforms of Japan ordered by General Headquarters (GHQ) were implemented by the cabinet of Prime Minister Shidehara Kijuro, established on October 9, 1945. When Shidehara visited MacArthur on October 11, the general informed him of the main points of reform he was to carry out. These measures included the emancipation of women, protection of workers, reform of the educational system, abolition of the feudal system, and democratization of the economy. MacArthur pushed for immediate reform before the Far Eastern Commission could begin functioning.

Meanwhile, intense debate took place in the United States on the continuation of the emperor system. MacArthur strongly favored retaining the emperor, since he believed that this would ease the occupation and reform process. Were the emperor system to be abolished, he feared Japanese anger might cause acts of terrorism against the numerous U.S. soldiers in Japan. MacArthur, however, viewed the emperor only as a figurehead, symbolizing the unity of the Japanese nation.

By the end of 1945, Japanese charged with war crimes had been arrested and detained in Sugamo Prison in Tokyo. The International Military Tribunal for the Far East (the Tokyo War Crimes Trials) opened at Ichigaya, Tokyo, on May 3, 1946. On November 12, 1948, 25 of 28 Japanese classified as Class A war criminals were found guilty. Seven who received death sentences were executed on December 23, 1948.

The GHQ took particular interest in democratization and demilitarization provisions in the new constitution, promulgated on November 3, 1946. Article 9 renounced war as an instrument of state policy and denied the government the right to declare war. Japan was also completely disarmed, with no military establishment. The new constitution formally went into effect on May 3, 1947.

During 1946 and 1947, meanwhile, the Cold War began in Europe, precipitated by the Soviet occupation of Eastern Europe and disagreements

over the future of Germany. In Asia, the Chinese Civil War between the Nationalists and Communists resumed in January 1946, with the Communists eventually gaining the upper hand. In these circumstances, by 1948 the Truman administration moved to review its policies toward Japan. Increasingly, Washington saw Japan as the chief bastion of anticommunism in East Asia. The administration began to strengthen the Japanese economy, which would reduce the cost of the occupation.

In October 1949, the Communists won the Chinese Civil War. On June 25, 1950, the Democratic People's Republic of Korea (North Korea) invaded the U.S.-supported Republic of Korea (South Korea). A major part of the U.S. occupation forces in Japan were immediately sent to Korea, leaving Japan suddenly vulnerable to attack. The Korean War thus brought the militarization of the U.S. strategic doctrine of containing communism and also a decision to rearm and rehabilitate Japan.

Article 9 represented a real stumbling block to Japan's rearmament, but the GHQ found a loophole in the formation of the Japanese National Police Reserve Forces. On July 8, 1950, MacArthur sent Prime Minister Yoshida Shigeru a note requesting him to form such a force. The National Police Reserve Forces came into existence on August 10. The Korean War marked a key turning point in postwar Japanese history, as the Americans and their allies utilized Japanese industry to produce numerous military end items between 1950 and 1953; by the end of the conflict, Japanese economic growth was robust and would continue to expand exponentially over the succeeding decades.

On September 8, 1951, Yoshida and a Japanese government delegation concluded the San Francisco Peace Treaty with 48 nations, not including the Soviet Union. Japan formally renounced all claims to territories formerly under its rule, including Korea, Taiwan, south Sakhalin Island, and the Kurile Islands. When the treaty went into effect on April 28, 1952, Japan recovered its full sovereignty, and the U.S. occupation formally came to an end.

A U.S.-Japan security treaty was also signed on September 8, 1951. Under its provisions, the United States undertook to defend Japan, and Japan agreed to the stationing of U.S. forces on Japanese land.

Japan, Surrender of (August 15, 1945)

By early 1945, it was clear to most observers that Japan could not hope to win the war. U.S. forces captured Iwo Jima in February, and Okinawa, secured in June, could be used as a staging area for an invasion of the Japanese home islands. Germany, Japan's only remaining ally, had been defeated in May. Meanwhile, Boeing B-29 Superfortresses flying from the Marianas were destroying Japan's cities, while submarines cut off Japanese seaborne trade and B-29 aerial mining eliminated much of the important coastal trade, raising the specter of starvation for the Japanese people. Still, Japan fought on.

Revisionist historians have held that since the Japanese government was by this time seeking desperately to leave the war, employing the atomic bomb against Japan was unnecessary. Intercepts of diplomatic messages, however, indicate that Japan had not reached the decision to surrender when the first bomb was dropped. Although Emperor Hirohito and his principal advisers had concluded that Japan could not win the war, they hoped for a last "decisive battle" that would force the Allies to grant more favorable peace

terms. On July 28, the Japanese government formally refused to accept the Potsdam Declaration, as demanded by U.S. president Harry S. Truman two days before—a refusal that led Truman to decide to employ the atomic bomb.

On August 6, 1945, the United States dropped an atomic bomb on the Japanese city of Hiroshima. About 100,000 people perished outright or died later from radiation effects; another 40,000 were injured, and most of the remaining population suffered some long-term radiation damage. Even so, this carnage was less than that inflicted in the firebombing of Tokyo in March 1945. Meeting with the emperor, the army leadership still strongly opposed accepting the Potsdam Declaration.

On August 8 the Soviet Union declared war on Japan, with Joseph Stalin honoring his pledge at Yalta to enter the war against Japan "two or three months after the defeat of Germany." One day later, Soviet troops invaded Manchuria in force. That same day, a B-29 dropped a second atomic bomb, this one on Nagasaki. The blast claimed about 70,000 dead, either killed outright or dying later from radiation, and injured as many more.

Following prolonged meetings with his top advisers, Emperor Hirohito made the decision for peace on August 14. He stated that as onerous as it would be to order the surrender, have the Japanese homeland occupied, and see loyal servants face possible trial as war criminals, these considerations had to be weighed against the devastation facing the Japanese people in a continuation of fighting.

Braving possible assassination by fanatics determined to stage a coup d'état and fight to the end, Hirohito communicated this decision over the radio on August 15 at noon Tokyo time, the first occasion on which the Japanese people had heard his voice. In the course of his remarks, Hirohito said, "We have resolved to pave the way for a general peace for all generations to come by enduring the unendurable and suffering what is unsufferable." He referred specifically to the atomic bombs when he said, "Moreover, the enemy has begun to employ a new and more cruel bomb, the power of which to do damage is indeed incalculable, taking the toll of many innocent lives."

On September 2, the final terms of surrender were signed aboard the battleship *Missouri* in Tokyo Bay, and the Japanese islands came under the rule of a U.S. army of occupation.

Japan, U.S. Navy Carrier Raid against

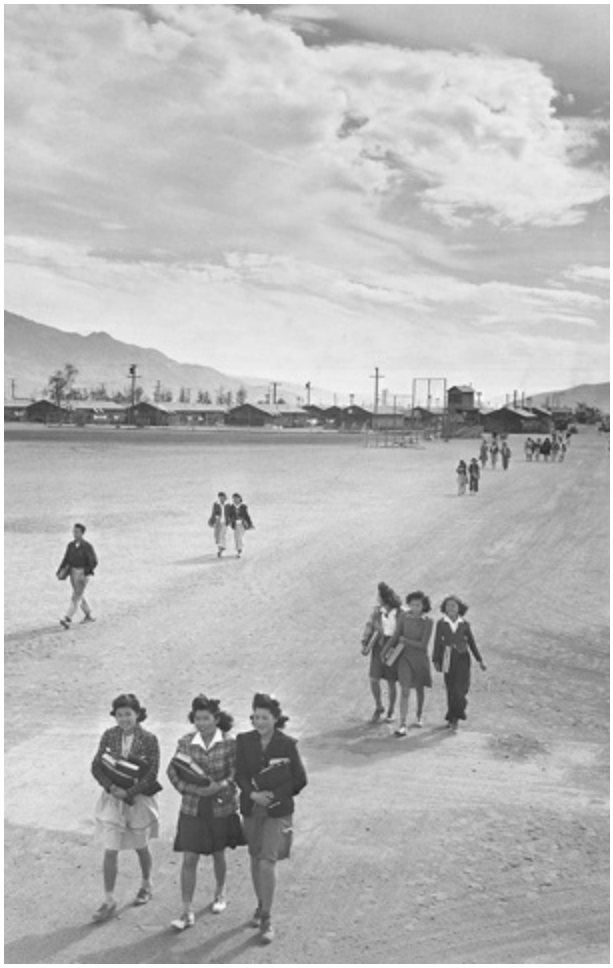
See United States Navy Carrier Raid against Japan

Japanese Americans

After the December 7, 1941, Japanese attack on Pearl Harbor, there was tremendous paranoia in the United States regarding Japanese Americans and a general belief among the U.S. counterintelligence community, including the Federal Bureau of Investigation (FBI), that Japanese Americans were engaged in widespread spying for Japan. Certainly racism played a role. During the conflict, the U.S. government treated Japanese Americans very differently from German Americans and Italian Americans.

On December 11, 1941, the FBI ordered the detention of 1,370 Japanese classified as "dangerous enemy aliens." By early January 1942, many notable American politicians were calling for the complete removal of Japanese immigrants and many Japanese American citizens from the entire West Coast. Later that year, the California State Personnel Board voted to remove all "descendants of natives with whom the United States is at war" from civil service positions. Although this act clearly included German Americans and

Italian Americans, it was only enforced en masse against Japanese. Almost simultaneously, the U.S. Army created 12 West Coast “restricted zones,” in which enemy aliens were confined to a five-mile radius around their homes and subjected to a curfew; again, this measure pertained almost exclusively to the Japanese.



Japanese American school children at the Manzanar Relocation Center in California during World War II. The internment of Japanese Americans during the war was both unnecessary and a major wrong. (Library of Congress)

Then, on February 19, 1942, President Franklin D. Roosevelt signed Executive Order (EO) 9066, authorizing the secretary of war to define military areas “from which any or all persons may be excluded as deemed necessary or desirable.” Secretary of War Henry Stimson ordered Lieutenant General John DeWitt, commander of the Fourth Army and the Western Defense Command, to enforce EO 9066. On March 2, DeWitt issued Public Proclamation No. 1, creating military areas in Washington, Oregon, California, and parts of Arizona and declaring the right to remove German, Italian, and Japanese aliens and anyone of “Japanese ancestry” living in specified military areas should the need arise.

In March, the government opened its first concentration camp, Manzanar, in Owens Valley, California. That same month, the government began the forced removal of Japanese Americans from the military zones. By August 7, eight months after Pearl Harbor, General DeWitt announced the complete evacuation of 111,000 Japanese (64 percent of whom were U.S. citizens) from two of the major military zones to army concentration camps. Included in the removal were West Coast Japanese and those having at least one grandparent who had emigrated from Japan. Forced to settle their personal affairs immediately, the Japanese were removed to 10 camps located in California, Arizona, Colorado, Idaho, and Utah.

Ultimately, the government did allow 35,000 Japanese to leave the camps in return for loyalty oaths and pledges not to settle on the West Coast. Japanese living in the Hawaiian Islands were untouched. That U.S. territory contained the nation's largest concentration of Japanese Americans: 150,000 people, representing 37 percent of the islands' population, but deporting them would have destroyed the islands' economy.

Despite its actions in forcibly relocating Japanese Americans, the U.S. government began recruiting American-born Nisei (second-generation) Japanese for the armed forces in 1943. The Nisei 442nd Regimental Combat Team (RCT), recruited from Japanese American volunteers from the mainland concentration camps and from Hawaii, fought with distinction in the European theater of operations and became the most highly decorated unit in U.S. military history. Twenty-one Medals of Honor were bestowed on members of the 442nd, one of whom was the late Senator Daniel Inouye from Hawaii. Additionally, an unprecedented eight Presidential Unit Citations were awarded to the 442nd RCT. Nisei also proved to be an invaluable asset in the Pacific theater, decoding communications, interrogating prisoners, and broadcasting propaganda. In June 1943 while the Nisei were fighting and dying in the Pacific and European theaters, California governor Earl Warren signed a proclamation forbidding Japanese Americans from filing for fishing licenses.

By 1945, the U.S. government began authorizing the return of Japanese Americans to their homes. Racism continued, however; in that same year, Hood River, Oregon, removed the names of 17 Nisei soldiers from its community roll of honor because they were Japanese. During the four years the United States was at war, even as thousands of Japanese were detained in

military camps, only 10 people were convicted of spying for Japan; all were Caucasian. Not until a half century later did the U.S. government admit its mistake and make partial restitution.

Japanese-Soviet Neutrality Act (April 13, 1941)

Important treaty between the Soviet Union and Japan signed on April 13, 1941. The failure to coordinate policy and exchange information was typical of the Axis powers in World War II. When the Soviet Union and Germany concluded their nonaggression pact on August 23, 1939, the Japanese were caught by surprise, and when Japanese foreign minister Matsuoka Yōsuke visited Berlin in March 1941, German chancellor Adolf Hitler ordered that he not be informed about Operation BARBAROSSA, Germany's plan to invade the Soviet Union, that would begin on June 22, 1941.

On his way back to Tokyo, Matsuoka stopped in Moscow, where he concluded the Japanese-Soviet Neutrality Pact on April 13, 1941. This agreement guaranteed territorial inviolability as well as neutrality in case either power became involved in hostilities with a third nation. The agreement had far-reaching consequences, as it provided for Japanese neutrality when Germany invaded the Soviet Union in June 1941. The treaty was to be valid for five years, with an automatic extension for an additional five years.

Since 1939, Tokyo had sought an agreement with the Soviet Union to remove a threat from the north as it attempted to conquer China. The Japanese first raised the idea of a nonaggression pact in May and June 1940 when the fall of France allowed Tokyo to contemplate a move against the European colonies in Southeast Asia, in which Soviet neutrality would be essential.

Negotiations between Tokyo and Moscow began in August 1940. During the ensuing negotiations, the Soviets pursued a cautious approach, suggesting a neutrality agreement instead of a nonaggression pact to avoid straining relations with the Western powers. The Japanese urged a more binding treaty modeled after the German-Soviet pact of 1939, with the undisguised goal of Japanese expansion southward. The Japanese memorandum resembled the content of the secret protocol of the German-Soviet pact, calling on the Soviet Union to recognize the traditional interests of Japan in Outer Mongolia and the three provinces of northern China (Manchuria) and to agree that French Indochina and the Netherlands East Indies lay within the Japanese sphere of influence. In return, Japan agreed to look favorably on a Soviet advance into Afghanistan and Persia (Iran).

The Japanese-Soviet Neutrality Pact greatly facilitated Japanese expansion in the Southeast Pacific and its attack on the United States. Soviet leader Joseph Stalin’s policy toward Japan in the summer and fall of 1941 resembled his attitude toward Germany before June 1941. He ordered his generals in the Soviet Far East to avoid any hostilities with Japan along their common border in Manchuria and Mongolia.

Despite this treaty, Japan contemplated attacking the Soviet Union in the fall of 1941. Leaders of the Guandong (Kwantung) Army in Manchuria especially supported such a move, but Tokyo decided in favor of a move south into the vacuum created by the temporary weakness of the European powers in Southeast Asia. Tokyo reached its decision on the basis of the outcome of earlier fighting with the Soviets, the difficult weather in Siberia, and the absence from that region of oil and rubber, the two natural resources Japan needed most critically.

The Soviet-Japanese Neutrality Pact of 1941 was of immense assistance to the Soviet Union in its war with Germany. Thanks to Japan’s neutrality, the Soviet Far East provided the Soviet Western Front with 250,000 men

between 1941 and 1944. The pact also allowed the Soviet Union to benefit from substantial and vital U.S. Lend-Lease aid.

Japan gained immensely from the pact as well. During its war with the United States, Japan received from the Soviet Union 40 million tons of coal, 140 million tons of wood, 50 million tons of iron, 10 million tons of fish, and substantial quantities of gold from Siberia and the Soviet Far East. Soviet trade helped make possible Japan's war with the United States.

The Soviet Union ultimately broke the nonaggression pact with Japan in 1945. At the February 1945 Yalta Conference, the Soviets promised that the Soviet Union would enter the war against Japan "two or three months" after the end of the war in Europe in return for territorial concessions in the Far East. Three months to the day, on August 8, 1945, the Soviet Union declared war on Japan.

Japanese Surrendered Personnel

Term used to describe Japanese forces surrendered to the British at the end of World War II. Japanese surrendered personnel (JSP) comprised some 633,000 Japanese officers and men surrendered to the largely British South-East Asia Command (SEAC). The British treated these servicemen as JSP rather than prisoners of war (POWs) under international law, an unprecedented and special status that differed in terms of the protection of conventional international law.

According to the SEAC order of August 28, 1945, those POW officers under full British control would be isolated from their men and interned. They would, however, be treated in accordance with the Geneva Convention in every respect, including the provision of subsistence based on the high British levels of supplies allocated for POWs. The JSP, in contrast, remained under the authority of their own officers and in their original units. Japanese commanders were held responsible for maintaining discipline and proper conduct among their subordinates.

Because of these differences, the British did not treat the JSP according to the Hague Convention regulations relative to the laws and customs of land warfare and the Geneva POW Convention. Furthermore, British forces failed to fulfill Article 9 of the Potsdam Declaration, which stated that Japanese military forces, after being completely disarmed, should be permitted to return to their homes. After July 1946, when most of the Allied powers (with the notable exception of the Soviet Union) had returned Japanese military personnel to Japan, British forces continued to detain about 106,000 JSP throughout Southeast Asia, demanding various services of them to facilitate the postwar recovery and to increase food production. Only at the end of October 1947 were the last JSP repatriated from Singapore.

Compulsory labor for JSP included much dangerous and unhealthy work, including disposing of ammunition stocks, quarrying, cutting trees, doing sewage work, and guarding British quarters from bandits. Moreover, rations for JSP were limited, and the diet was monotonous. JSP received only about half of the standard ration for British military personnel.

The British paid no wages for the work done by JSP. Indeed, from the beginning the British announced that they would not pay wages because JSP were not POWs. Poor sanitary conditions, malnutrition, and forced labor in difficult conditions led to outbreaks of tuberculosis, beriberi, and other diseases. By October 1947, 8,971 JSP had died and 20,084 had been injured or fallen ill. In French Indochina and Netherlands Java and Sumatra, the SEAC rearmed the JSP and commanded them to maintain order and forcibly suppress nationalist uprisings. As a result, nearly 1,000 JSP were killed in action in these operations. Such SEAC treatment of Japanese servicemen violated international law.

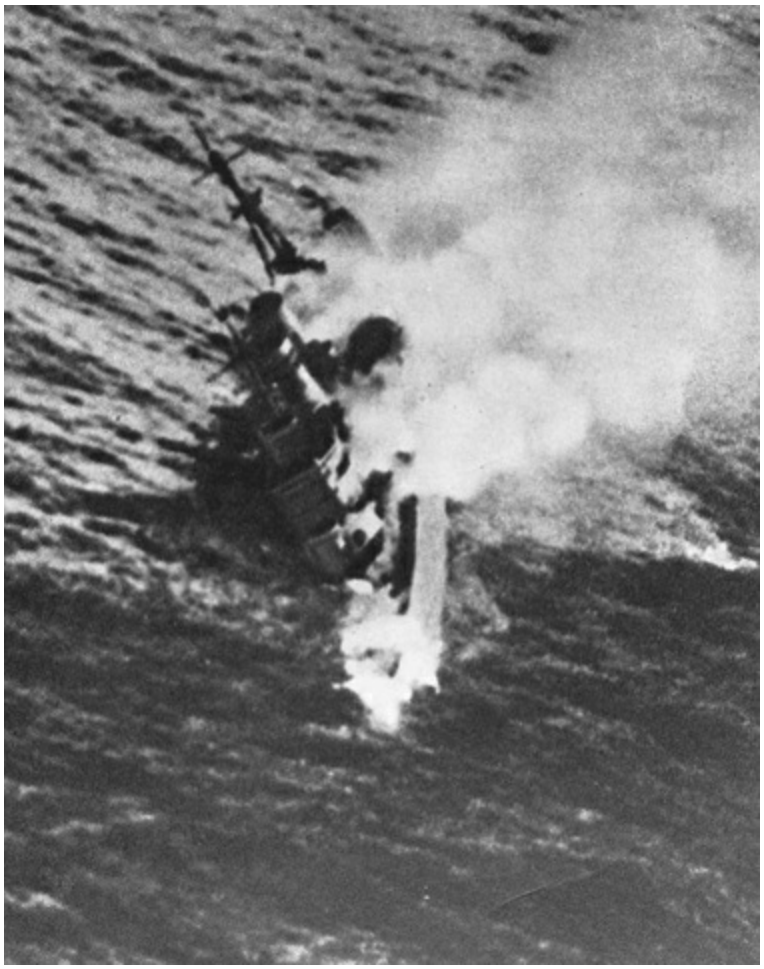
Java Sea, Battle of (February 27, 1942)

Naval battle marking the end of organized Allied resistance at sea in the Netherlands East Indies. By January 1942, the Allied defense of the Southwest Pacific was collectively organized in the American-British-Dutch-Australian (ABDA) Command.

On February 24, two Japanese invasion forces set sail for Java. A Dutch patrol plane discovered the eastern force some 50 miles north of Surabaya on February 27. Rear Admiral Takagi Takeo commanded a force of 2 heavy cruisers, 2 light cruisers, and 14 destroyers covering 41 transports. Dutch rear admiral Karel Doorman commanded the ABDA striking force of 2 heavy cruisers, 3 light cruisers, and 8 destroyers, representing all four ABDA nations.

In the ensuing engagement, the lack of coordination limited Allied effectiveness. There was no plan of attack, and each nationality used different radio frequencies, signals, and tactics. Furthermore, the Allied crews were exhausted, and many ships were in need of either maintenance or repair.



The British heavy cruiser *Exeter* sinking during the Battle of the Java Sea on February 27, 1942. (Corbis)

At 4:16 p.m., the Japanese opened the battle. Soon thereafter, the heavy cruisers USS *Houston*—its aft turret inoperable from earlier battle damage—and HMS *Exeter* returned fire. The Japanese scored the first hit when a dud shell struck Doorman's flagship, the Dutch cruiser *De Ruyter*. At 4:35 p.m., the Japanese launched a mass torpedo attack, without success. Shortly after 5:00 p.m., Japanese ships made another torpedo attack, this time sinking the Netherlands destroyer *Kortenaer*. Concurrently, a Japanese shell knocked out most of the *Exeter*'s boilers, which disrupted Doorman's formation. Further adding to the disarray, HMAS *Perth* made smoke to protect the disabled British cruiser.

The Allied force was now in confusion. Two British destroyers covering the *Exeter*'s withdrawal engaged the Japanese ships, and during this engagement, shells from HMS *Electra* hit the Japanese light cruiser *Jintsu*,

flagship of Rear Admiral Tanaka Raizo's destroyer squadron. Several Japanese destroyers pounded the *Electra* in return until it sank at 6:00 p.m. U.S. destroyers made a torpedo and gun attack shortly thereafter, holing but not sinking the Japanese destroyer *Asagumo.*

Under cover of darkness, Doorman futilely attempted to reach the Japanese transports. He tried a run along the Java coast, during which HMS *Jupiter* struck a Dutch mine and eventually sank. HMS *Encounter* lingered to pick up survivors. Being low on fuel and having no remaining torpedoes, the U.S. destroyers also withdrew. That left Doorman with only four cruisers, which the Japanese detected just after 11:00 p.m. A Japanese torpedo struck the *De Ruyter* aft, and the ship sank. Doorman perished with his flagship. A torpedo hit also doomed the *Java.* Before losing contact, Doorman had ordered the *Houston* and *Perth* to withdraw to Batavia.

In the engagement, the Allies lost two light cruisers and three destroyers. Three cruisers and six destroyers (four U.S.) survived. The Japanese lost no ships, although one destroyer suffered moderate damage and other units light damage. The battle was the last major naval engagement preceding the Japanese conquest of the Netherlands East Indies.

Jeep

U.S. World War II military vehicle. The jeep was developed in answer to the army's need for a rugged, fast, and small motorized vehicle designed for reconnaissance and utility uses and capable of operating cross-country. At Fort Benning, Georgia, in the late 1930s, Captain Robert G. Howie and Master Sergeant Melvin C. Wiley built a machine-gun carrier made of parts from junked automobiles. It was not sufficiently rugged to be used as a multiterrain military vehicle. In 1940, however, Howie was detailed to the American Bantam Car Company in Baltimore, Maryland, to help produce a more robust design. The president of Bantam, Harry Payne, had previously developed a small truck for logging camps and construction sites. He set about, with Howie's assistance, modifying this vehicle for sale to the army.

Four Japanese American U.S. Army servicemen in a jeep towing a supply trailer on a rural road in France during World War II. (Hulton Archive/Getty Images)

Shortly thereafter, the U.S. Army Ordnance Department sent invitations to 135 companies to bid on a quarter-ton 4-by-4 truck. Only Bantam and Willys Overland submitted bids. In short order, Bantam produced 70 small trucks. Although enthusiastically received, the vehicles suffered from numerous mechanical problems. Willys meanwhile developed two prototype test vehicles at its own expense and independent of the contract. The

company ignored some of the army specifications, which had stressed lightness, and concentrated instead on performance and ruggedness.

Meanwhile, the secretary of the General Staff, Major General Walter Bedell Smith, interceded, touting the Bantam version to the army chief of staff, General George C. Marshall. In November 1940, Bantam received a contract for 1,500 trucks. Doubts persisted that the company could fulfill its contract, so the government also ordered 1,500 of the Willys version. Also, the Ford Motor Company was talked into building 1,500 of its own design. The vehicle weight specification was also increased to 2,160 pounds. Tests of the three vehicles were then conducted. Both the Ford and Bantam versions contained smaller engines, and the Bantam proved unreliable mechanically. The Willys was over the weight limit, but engineers managed to pare it down to meet the requirement.

The new vehicle had a 60-horsepower engine and was capable of a top speed of 55 mph. It could climb steep grades and ford streams up to 18 inches deep. Willys engineers called it the "jeep" after a popular cartoon character, although almost until the end of the war, soldiers generally referred to it as a "peep." "Jeep" was the term used by Willys, civilians, and the newspapers, and it stuck.

The jeep was remarkably successful. It could easily transport four men and 800 pounds of equipment and even trail a 37mm antitank gun. Wartime production amounted to some 650,000 units. The jeep, with some modifications, remained in the army inventory until the mid-1980s. In the meantime, civilian versions of the jeep gained in popularity so that by the 1980s they had become the prototype of the immensely popular sport utility vehicle (SUV).

Jeschonnek, Hans (1899–1943)

German Air Force general. Born in Hohensala, Prussia, on April 9, 1899, Hans Jeschonnek volunteered for military service during World War I. Accepted as a cadet to the military school at Berlin-Lichterfeld, he was commissioned a second lieutenant in 1915. Two years later, he completed flight training and was posted to the Western Front. By the end of the war, he had two victories, or kills, to his credit.

Jeschonnek continued in the Reichswehr after the war, serving in the Ordnance Department from 1923 to 1928. He graduated at the top of his class from the General Staff College in 1928. In September 1933, he became adjunct to Aviation Minister Erhard Milch and played an important role in the secret building of the Luftwaffe. Jeschonnek was next assigned as Luftwaffe chief of operations in 1937, and a year later, he was promoted to colonel. Appointed chief of staff of the Luftwaffe in February 1939, he was promoted to major general that August and to colonel general in 1942.

An ambitious and hardworking officer, Jeschonnek was totally dedicated to Adolf Hitler and National Socialism. Jeschonnek never questioned policies and took Hitler at his word. Informed by the führer that he intended to wage a short war, Jeschonnek never prepared the Luftwaffe for a protracted struggle, nor did he mobilize the production assets to ensure an adequate number of replacement aircraft. Devoted to tactical aviation, he insisted that all bombers be able to dive-bomb, which increased the weight of aircraft and reduced bomb loads.

As the war progressed and Germany's fortunes turned, the head of the Luftwaffe, Reichsmarshal Hermann Göring, shifted more and more blame on his young chief of staff. Eventually, the burdens of the war and the bickering and backstabbing at the higher levels of command overcame Jeschonnek. Made a scapegoat by Göring for the Luftwaffe's failure to stop the Allied bombing of Germany and to supply the Sixth Army at Stalingrad, Jeschonnek committed suicide at Rastenburg, Germany, on August 18, 1943.

Jewish Resistance

The Nazis exterminated some 6 million Jews during World War II. Those who claim that Jews went as sheep to the slaughter ignore the many instances of remarkable courage in the face of this crime against humanity. Jewish resistance took many forms. That it often proved futile reflects the poignant vulnerability of Jews rather than any lack of bravery or courage.

Resistance can be divided into the general categories of passive and active. Passive resistance took the form of cultural and spiritual endurance and assertiveness. Jews confined to ghettos such as Warsaw continued to practice their culture and religion despite prohibitions. They organized symphonies, drama clubs, schools, and other voluntary and educational associations. They risked their lives by trading across ghetto walls, despite threats of torture and execution.

Passive resistance drew on a long and esteemed Jewish tradition of outlasting the persecutor. Initially believing that the Nazis and their various European sympathizers wanted to put Jews in their place, not in their graves, Jewish leaders sought to endure discriminatory laws, pogroms, and deportations, hoping for an eventual relaxation of anti-Semitic policies or perhaps even a defeat on the battlefield.

Thus, Jewish resistance remained largely nonviolent until 1943, in part because the Germans succeeded in deceiving the Jews. They were helped by the fact that the German soldiers of World War I had generally behaved decently, treating Jewish noncombatants humanely. Jews in Poland and the east initially expected similar behavior from the Nazi invaders. Even after it became apparent that Nazi soldiers and especially police were intent on human butchery on a scale previously unimaginable, Jewish cultures that

embraced the sanctity and sheer joy of life found it difficult to comprehend a culture built on hate and murderous brutality, especially one that continued to worship civilized icons such as Johann Wolfgang Goethe and Ludwig van Beethoven. Many Jews put their faith in God—hoping for the best, preparing for the worst, yet not daring to think the unthinkable.

When Jewish communities and individuals recognized that the Nazis and their European allies wanted to systematically exterminate all Jews in Europe, active and armed resistance increased. Active resistance included acts of industrial sabotage in munitions factories and isolated bombings of known Nazi gathering spots. One must recognize, however, the near utter futility of such efforts, given the impossibility of Jews winning pitched battles against their killers. The Nazis had machine guns, dogs, and usually superior numbers, and they could call on tanks, artillery, and aircraft. The Jewish resisters were often unarmed. At best, some might have had pistols or rifles with limited ammunition, perhaps supplemented by a few hand grenades. Such unequal odds often made the final result tragically predictable, yet many Jews decided that it was better to die fighting than face extermination in a death camp.

When it became apparent that they were being deported to Treblinka to be gassed, the Jews of Warsaw at first refused to assemble and then led a ghetto uprising in April 1943, the ferocity of which surprised the Germans. More than 2,000 German soldiers, supported by armored cars, machine guns, flamethrowers, and unlimited ammunition, faced approximately 750 Jews with little or no military training. Schutzstaffel (SS) Brigadeführer Jürgen Stroop estimated that he would need two days to suppress the uprising. In fact, he needed a full month, as Jews, armed mainly with pistols, homemade grenades, and Molotov cocktails, fought frantically and ferociously from street to street and bunker to bunker. The Warsaw Uprising was only the most famous example of nearly 60 other armed uprisings in Jewish ghettos.

Resistance was less common in death camps such as Chelmno, Sobibor, and Treblinka, mainly because there was not sufficient time for resistance networks to form. Resistance requires leaders, organization, and weapons. These elements cannot be improvised and employed in a few hours or even days; months of planning and training are required. Despite nearly insurmountable difficulties, however, Jews did revolt at all 3 of these death camps as well as at Auschwitz-Birkenau and 18 forced-labor camps.

One of the most extraordinary acts of Jewish resistance took place at Treblinka. On August 2, 1943, a group of Jewish prisoners rose up, killed their guards, burned the camp, and escaped. Of 600 prisoners who got away, only about 40 survived the war.

Jews also participated actively in resistance networks in Poland, the Soviet Union, France, and other countries. Their plight was difficult in the extreme, because anti-Semitism within these networks often required Jews to hide their ethnicity. In some cells of the Polish resistance, Jews were killed outright. Many Soviet partisans distrusted and exploited Jews; nevertheless, between 20,000 and 30,000 Jews fought as partisans in the Soviet Union against Nazi invaders. In France, Jews made up less than 1 percent of the population but 15 to 20 percent of the French underground. In 1944, nearly 2,000 Jewish resisters in France united to form the l'Organisation Juive de Combat (Jewish Fighting Organization), which supported Allied military operations by attacking railway lines and German military installations and ordnance factories.

Impressive as it was, Jewish resistance was always hamstrung for several reasons. In general, Jews lacked combat experience, as many countries forbade Jewish citizens from serving in the military. As with Soviet prisoners of war taken by the Germans, many Jews, especially those confined in ghettos, were weakened by disease and deliberate starvation. Under these conditions, trained Soviet soldiers died with hardly a murmur of protest, so it is not surprising that Jewish families who had never been exposed to the hardships of war would likewise succumb.

The Nazis succeeded in creating a Hobbesian state of nature in which people were so focused on surviving from hour to hour that their struggles consumed virtually all their energy and attention. Dissension within Jewish communities also inhibited resistance, with older Jews and members of the Judenrat (Jewish Council) tending to support a policy of limited cooperation with the Nazis, hoping that by contributing to the German war effort, they might thereby preserve the so-called productive elements of Jewish communities.

More controversially, Jewish resistance was hampered by weak and irresolute international support. Although Western leaders often condemned Nazi actions, they took little action. Official Catholic and Protestant statements were equally tentative. Irresolute and sporadic support

unintentionally played into the hands of the Nazis as they planned for Jewish extermination.

Observant Jews were people of God's law, the Torah, who put their faith in God, with Jewish culture in general tending to disavow militant actions. Confronted by murderous killing squads possessing all the tools of industrialized mass warfare, some Jews nevertheless resisted courageously, both passively and actively. That their resistance often ended tragically does not mean that it failed. Indeed, Jewish resistance was the genesis of the Israel Defense Forces.

Jiang Jieshi (1887–1975)

Chinese general and Guomindang (Nationalist, GMD) politician and president of China from 1928 to 1949 and of the Republic of China on Taiwan from 1949 to 1975. Born on October 30, 1887, in Zhejiang Province, China, Jiang Jieshi (Chiang Kai-shek) entered the Chinese military as a career officer in 1908. After joining a revolutionary organization that sought to overthrow the Qing government, Jiang welcomed the successful 1911–1912 Chinese Revolution. In 1920, he allied himself with Sun Yixian (Sun Yat-

sen), the head of the GMD and president of China from 1920 until his death in 1925. In Guangzhou (Canton), where he became commandant of the Guomindang Huangpu (Whampoa) Military Academy in 1924, Jiang rapidly developed his power base.

After Sun's death, Jiang undertook the 1926–1927 Northern Expedition, suppressing the Communist movement and subjugating warlords to Nationalist rule. In December 1927, he consolidated his power by marrying Song Meiling (Soong May-ling), daughter of an influential Shanghai Christian family.

In 1928, Jiang became head of the Nanjing-based Guomindang government, continuing his ferocious anti-Communist campaigns. Antiforeign and authoritarian in outlook, he promoted a revival of Confucian social and political values. When Japanese forces seized China's northeastern province of Manchuria in 1931 and established the puppet state of Manzhouguo (Manchukuo), he protested to the League of Nations but received little concrete assistance. In 1933 and 1935, Jiang signed agreements with Japan whereby he acquiesced, at least temporarily, to Japan's domination of northern China.

Although Jiang began building up and modernizing Chinese military forces, his drive to eliminate the Chinese Communist Party aroused serious discontent. In 1935, his northern warlord ally Zhang Xueliang and his troops broke off an anti-Communist military campaign. In the December 1936 Xi'an Incident, Zhang kidnapped Jiang and forced him to agree to join an anti-Japanese united front with the Communists.

On July 7, 1937, Japanese and Chinese forces clashed at the Marco Polo railway bridge near Beijing, an incident that quickly escalated into full-scale war between Japan and China. From August to November, Jiang staunchly resisted Japanese assaults on Shanghai, but he eventually abandoned that city and in quick succession also lost Nanjing (Nanking), his capital, and Wuhan (Hangzhou or Hankow). Fighting at Changsha and other cities, Jiang nonetheless gradually fell back westward. In late 1938, he established his capital in Chongqing (Chungking) in the southwestern province of Sichuan. Jiang's overall strategy was to wage a war of attrition, forcing Japanese troops to overextend their lines and occupy territory they could never fully control.

Jiang repeatedly sought assistance from Western powers (especially the

United States and Britain), but until 1940 he only received modest American financial and military aid and the imposition of limited economic sanctions on Japan. Japan's formal alignment with Germany and Italy in the Axis Tripartite Alliance (September 1940) brought increased aid from the United States, including some airplanes. In response to Japanese demands on the Vichy government for air bases in Indochina and other concessions, American policy toward Japan hardened, and sanctions were tightened beginning in the summer of 1940. In the autumn of 1941, U.S. president Franklin D. Roosevelt repeatedly demanded that Japanese forces withdraw from Chinese territory. He also permitted volunteer American aviators to fight under Colonel Claire Lee Chennault, Jiang's American air adviser.

After the sudden Japanese attack on the United States at Pearl Harbor (December 7, 1941), China formally declared war on Japan, and the Allies appointed Jiang supreme commander in the China theater. When dealing with his Allied partners, he uncompromisingly defended China's interests, demanding, for instance, the end of Western colonialism and special privileges in China, together with additional wartime assistance to China. At the 1943 Cairo Conference, the Allies also accepted Jiang's demand that China regain all territories ceded to Japan since the 1890s.

Generalissimo Jiang Jieshi (Chiang Kai-shek) inspecting high-ranking officers of Officers Training Corps at Lushan, Kinkiang, Jiangxi Sheng Province, China. (Library of Congress)

Chennault and Jiang enjoyed good relations, sharing the ill-founded faith that airpower alone could win the war against Japan. Jiang sought to conserve his best forces for the postwar struggle he anticipated with the Communists, who consolidated their power at their wartime base at Yan'an (Yenan) in Shaanxi (Shensi) Province. His attitude provoked acerbic disputes with General Joseph W. Stilwell, the American commander of the China-Burma-India theater, who sought to build up a strong Chinese Army, preferably under his own command, to mount a large anti-Japanese ground campaign. Stilwell's plans implied major reforms to upgrade the Chinese Army.

Although Jiang was not personally corrupt, many of his military and civilian associates were. Measures to end corruption would have jeopardized his tenuous hold on the loyalties of a large number of his semi-independent military field commanders, at least some of whom deliberately embezzled part of the funding intended to support their troops and thereby fielded poorly equipped and understrength units. On Jiang's insistence, in 1944 Roosevelt withdrew Stilwell from China.

Jiang enjoyed better relations with Stilwell's successor, General Albert Wedemeyer. The China theater stalemated, and neither Jiang nor the Japanese ever won a decisive victory over the other.

As the war ended, Jiang faced renewed threats from the Communists who, with Soviet assistance, quickly took control of much of northern China. In late 1945 and 1946, lengthy American mediation efforts headed by the wartime chief of staff, General George C. Marshall, failed to avert civil war between Guomindang and Communist forces. In 1949, Jiang fled to the island of Taiwan; he served as president of the Republic of China until his death in Taibei (Taipei) on April 5, 1975. On numerous occasions, he fruitlessly attempted to persuade the United States to restore his rule over the Chinese mainland, whose legitimate government he still claimed to head.

Jodl, Alfred (1890–1946)

German Army general and chief of the armed forces operations staff during World War II. Born on May 10, 1890, in Würzburg, Germany, Alfred Jodl joined a Bavarian field artillery regiment in 1910 and served in World War I, finishing the war as a General Staff officer. His superior performance secured him a position in the postwar Reichswehr.

Serving primarily in staff positions during the interwar years, Jodl was assigned in 1939 as a major general to the Oberkommando der Wehrmacht (OKW, or Armed Forces Supreme Command) as chief of the Wehrmachtführungsamt (Armed Forces Operations Office, renamed in 1940 Wehrmachtführungsstab, or Armed Forces Operations Staff). Promoted to general of artillery in 1940, he held his OKW position until the German surrender in May 1945.

Despite his position as chief of operations, Jodl had little direct influence on the planning and execution of Germany's military campaigns. This was primarily a result of German chancellor Adolf Hitler's unwillingness to delegate authority. He was an admirer of the führer's successes in 1939 and 1940, but Jodl was not slavish in his devotion to Hitler. After investigating Army Group A's lack of progress during the Caucasus Campaign of 1942, Jodl returned to endorse the commander's actions, thus contradicting Hitler. In the inevitable tirade that followed, Jodl stood his ground, reportedly giving as good as he got. Even though he was disillusioned with his commander in chief and with the conduct of the war, he held true to his belief in obedience

and duty and remained at his post for the rest of the war. He was promoted to colonel general in January 1944.

Brought before the International Military Tribunal at Nuremberg after the war, Jodl was tried as a war criminal. Found guilty, he was condemned to death and hanged in Nuremberg on October 16, 1946.

Joint Chiefs of Staff

Ad hoc organization composed of the chiefs of the U.S. military services, formed to coordinate strategic planning with the British chiefs of staff during World War II. The Joint Chiefs of Staff was originally formed in January 1942, soon after the United States entered World War II, when the British chiefs went to Washington to reaffirm earlier informal agreements. One proposal upon which the Anglo-American chiefs agreed was the establishment of a permanent organization for collaboration—the Combined Chiefs of Staff, defined as the British chiefs of staff and their opposite numbers from the United States. It was primarily to provide these opposite numbers to the British membership in the Combined Chiefs that the U.S. Joint Chiefs of Staff was established.

Initially, the Joint Chiefs of Staff consisted of the army chief of staff, General George C. Marshall; the commanding general of the army air forces and deputy chief of staff for air, Lieutenant General Henry H. Arnold; the chief of naval operations, Admiral Harold R. Stark; and the commander in chief of the U.S. Fleet, Admiral Ernest J. King. In March 1942, the positions held by Stark and King were combined under King, and Stark was sent to London to command U.S. naval forces in Europe. In July, U.S. president

Franklin D. Roosevelt brought the former chief of naval operations, Admiral William D. Leahy, out of retirement and appointed him chief of staff to the president. This position was the forerunner of today's chairman of the Joint Chiefs of Staff.

Throughout the war, the U.S. joint chiefs followed the British lead and established their primary subordinate organization, the Joint Planning Staff, along the British pattern. In early 1942 most U.S. planning was done by the War and Navy Departments, which focused primarily on Europe and the Pacific, respectively. By 1943, however, the practice of joint and combined planning was carried out by joint committees and coordinated by the Joint Planning Staff and then submitted to the joint chiefs for approval. The National Security Act of 1947 finally codified the permanent establishment of the Joint Chiefs of Staff.

Journalism and the War

Recognizing that mass popular support was fundamental to the prosecution of a total war by their entire societies, Western democracies and totalitarian regimes in the war co-opted their various media resources to support their war efforts. Manipulation of the press for wartime state propaganda first became prevalent during World War I, when the major combatants employed a combination of comprehensive censorship, coercion, and legislation to ensure that the mass media printed only officially sanctioned versions of events relating to the war. During the interwar period, however, these tactics

produced a severe backlash, which was particularly pronounced in the United States.

In the totalitarian states, including all three Axis nations and also the Soviet Union and China, state control of the media was already well established when the war began. These countries had no long-standing tradition of a free press as a voice against government encroachments on the rights of the people, and throughout the war their mass media functioned primarily as outlets through which governments could present their preferred version of reality. Until August 1945, for example, the press and radio told the Japanese people that their armies were still winning glorious victories overseas. In those territories occupied by Axis armies, the press was quickly reduced to a similar condition. In both Axis and occupied states, however, some clandestine publications circulated—at great danger to their authors and distributors, who ran the risk of arrest and imprisonment or execution, fates that frequently befell them.

The United Kingdom and the United States each had a strong free press tradition, and in these states, government control over the press in wartime was more restrained. With the onset of World War II, Great Britain and France again placed restrictions on their media, which applied to both radio and print journalism. Some of these constraints affected not only their citizens but also foreign journalists reporting from Allied countries, who could be denied access to sensitive areas and to the facilities they needed to transmit their stories. In practice, many leading American correspondents were staunchly pro-Allies, and the Allied censors therefore granted them considerable latitude. Edward R. Murrow of the Columbia Broadcasting Service (CBS), for example, transmitted radio broadcasts from the London Blitz that gave the American people a sense of the war’s immediacy and helped to generate popular support for Britain.

The United States, a neutral during the first two years of the war, retained its tradition of independent journalism based on the foundation of the First Amendment to the U.S. Constitution. This ended, however, when that country entered the war after Japan’s surprise attack on Pearl Harbor on December 7, 1941. In part because the nature of the Japanese attack struck almost all Americans as the epitome of duplicitous and dishonorable behavior, U.S. media representatives immediately acceded to their government’s requests that they submit to censorship, engage in self-

censorship, and submit any questionable materials to the government and the military for vetting prior to their release.

Even movies were expected to showcase the official view of the war—that all American soldiers were patriotic and honorable and that their enemies were evil, untrustworthy, and despicable. The media also presented a sanitized, even glamorized view of war, playing down its horrific aspects and ensuring that only enemy soldiers were seen to suffer gruesome deaths.

Before the advent of television, straight battlefield reporting was highly restrained, emphasizing the heroism of commanders and troops on one's own side and omitting the filth, foul language, and other unsavory aspects that formed part of the combat experience. As in other nations at war, censorship in the United States created a public perception that all its fighting men and women were brave and patriotic, that the home front was united behind the war effort, and that government decisions were wise and just.

Press censors at work in the British Ministry of Information, 1940. (Hulton-Deutsch Collection/Corbis)

If reported at all, military disasters were presented as minor reverses. One exception was that the press was encouraged to pillory fraudulent activities or overly opportunistic "war profiteering." In both Britain and the United States, criticism of governmental incompetence, especially instances where officials had allegedly been inefficient in prosecuting the war, continued to appear, often as part of the normal political process, which was by no means suspended during the war.

Military commanders expected war correspondents accredited to their forces to function primarily as adjuncts to their own efforts, disseminating only those messages and images acceptable to the government. Only occasionally, as when Lieutenant General George S. Patton Jr. slapped a hospitalized soldier who had suffered a nervous breakdown, did correspondents report news that was unflattering or discreditable to the military. These policies brought a near-total suspension of in-depth investigative journalism over a wide range of topics. The complete censorship of communications coming from military units (extending even to the personal correspondence of soldiers) made reporters doubly dependent on the goodwill of the armed forces. One by-product was to preclude the publication of critiques of military operations or strategy.

As a result, in almost all combatant nations the bulk of World War II military journalism consisted of variations on the personal interest or feature story. Generally, these stories eschewed hard facts (who, what, when, where). In the United States, the recognized master of this format was the military journalist Ernie Pyle, whose affinity for the common infantryman won him the label “friend of the dogface.” Pyle produced classic pieces that became more realistic over time and, as he moved to the Pacific theater, grew increasingly honest and made less effort to minimize the misery and deprivation the fighting troops experienced. Even today, his famed dispatch titled “The Death of Captain Wasko” remains a staple for American soldiers. Like a number of other war correspondents, Pyle paid the ultimate price for his efforts to accompany soldiers to the front when a Japanese sniper killed him on the island of Ie Shima off Okinawa in the closing days of the war.

Together with many other well-known American journalists, among them the young Walter Cronkite, Pyle often wrote for the *Stars and Stripes,* a four-page (later eight-page) daily newspaper produced by the armed forces and widely circulated among the troops. This journal first appeared during the American Civil War and reappeared in World War I; in 1942, the U.S. military resumed its publication in London, with the first issue carrying an article by army chief of staff General George C. Marshall lauding its contributions to morale in World War I. The paper’s editors and correspondents accompanied U.S. forces through their various campaigns and had to locate suitable publication facilities as they moved.

In 1945 *Stars and Stripes* also began to issue a Pacific edition, and from

World War II onward it appeared without a break. Unlike publications designed for a civilian audience, *Stars and Stripes* could afford to be more frank about the rigors and dangers of combat. Both Marshall and General Dwight D. Eisenhower, supreme commander of the Allied Expeditionary Force, took pride in the fact that this newspaper belonged to the "free press" and instituted a hands-off policy forbidding military censorship of its contents.

Although its articles were far more honest than those in similar Axis publications designed for the troops, contributors to *Stars and Stripes* were usually, in practice, military employees who firmly supported the overriding wartime objective of victory. On those occasions when the newspaper criticized military practices it considered unfair or inefficient, it did so from the perspective of the insider who sought to improve an institution he fundamentally supported.

Throughout World War II, the media in all belligerent countries were expected to support their own nation's war effort. Although press controls were far more stringent in totalitarian countries, even democracies with a traditionally strong free press exercised a substantial degree of censorship and demanded that print and broadcast outlets alike publish nothing potentially detrimental to the war effort. Bulky equipment often made live newsreel coverage from the front impracticable, and except when the intention was to stir up popular feeling against the enemy, newspapers were forbidden to disturb the public by featuring overly graphic photographs of bodies of soldiers or civilians who had suffered particularly horrific deaths. Even where censorship was relatively restrained, the home front media usually presented a simplistic and sanitized view of the experience of combat troops in fighting that deliberately minimized brutality, dirt, and bodily discomforts; omitted the mention of savage fighting tactics or atrocities unless these were committed by the enemy; and tended to present all soldiers from their own country as invariably brave, heroic, steadfast, and patriotic. Although there were other reasons for such sentiments, practices of this type undoubtedly contributed to the continuing popular view of World War II as a "good war."

Juin, Alphonse Pierre (1888–1967)

French Army marshal. Born at Cape Rosa near Bône, Algeria, on December 16, 1888, Alphonse Juin joined the French Army and completed two years of obligatory enlisted service. He then entered the French Military Academy at Saint-Cyr in 1910 and was commissioned two years later. His classmate Charles de Gaulle became a close friend. Juin first served in Morocco with the 1st Regiment of Algerian Tirailleurs, undertaking large-scale pacification operations under General of Division Louis Hubert Lyautey, who would

become his long-term patron. During World War I and in North Africa, where he served both before and after the war, the highly decorated Juin demonstrated almost foolhardy courage, together with unconventional tactical military brilliance.

Juin studied and taught at the École Supérieure de la Guerre (1919–1921, 1933–1935). He also attended the Higher Command Course in Paris (1938–1939), but he spent most of the interwar period with the French North African Army in staff assignments, participating in pacification campaigns. By 1935, he was a colonel commanding a regiment in Algeria.

In December 1939, Juin took command of the 15th Motorized Infantry Division in France. From May 10 to 29, 1940, during the Battle for France, he and his troops performed well in Belgium and northern France, covering the Allied retreat to Dunkerque and helping to make possible the evacuation there (May 26–June 4). On May 30, German troops captured Juin; at the insistence of General Maxime Weygand, he was repatriated in June 1941. Sent by the French Vichy government as a major general to North Africa, Juin commanded French troops in Morocco and, from November as lieutenant general and then general, French troops in Algeria and Tunisia as well.

Juin worked to build up his forces so they could defend North Africa against any invader. He had no advance knowledge of the Anglo-American North African landings (Operation TORCH) on November 8, 1942, but later that month, he was instrumental in persuading Admiral Jean Darlan to order a cease-fire.

Briefly heading the French Army detachment on the Tunisia front (1942–1943), Juin was soon occupied with the preparation of the French Expeditionary Corps (Corps Expéditionaire Français, CEF), which deployed to Italy in November 1943. To command this corps, he accepted a voluntary reduction in rank to lieutenant general. In Italy, he established a good working relationship with the U.S. Fifth Army's temperamentally difficult commander, Lieutenant General Mark W. Clark. Juin convinced Clark and his superior, British general Sir Harold Alexander, to take advantage of his colonial North African troops' expertise in mountain warfare. The CEF displayed its mettle from January 1944 and played a decisive role in the Allied breakthrough of the German Gustav Line to Rome in May. Outflanking the Germans in the Apennines, the CEF enabled the Allied

capture of Monte Cassino in May 1944 and Siena and Florence that July. Juin was arguably the ablest Allied commander in the 1943–1945 Italian Campaign.

In 1944, Juin favored reinforcing Allied troops in Italy, but General de Gaulle, head of the Fighting French government-in-exile, insisted on French participation in the scheduled Allied landings in southern France and ordered Juin to relinquish his troops to General Jean de Lattre de Tassigny for that purpose. De Gaulle later wrote that de Lattre was better suited than the colonial Juin to lead soldiers in metropolitan France, but there has been speculation that he preferred that no single general save himself emerge from the war as France's principal military hero.

General Alphonse Juin, chief of staff of the French Committee of National Defense, in England to meet the chiefs of staff of the three British services. (Keystone/Getty Images)

Juin served as chief of the French defense staff (1944–1947), resident general in Morocco (1947–1951), inspector general of the armed forces (1951), and commander of the North Atlantic Treaty Organization (NATO) land forces in Central Europe (1951–1956). Made a marshal of France in 1952, he outspokenly opposed Algerian nationalism and was embittered by de Gaulle's decision to grant Algerian independence in 1962. Juin died in Paris on January 27, 1967.

July Bomb Plot (July 20, 1944)

Assassination attempt on Adolf Hitler's life. The effort to kill Hitler on July 20, 1944, was, however, only the most visible sign of resistance to the führer and the last in a string of assassination plots. Many prominent Germans were involved in this activity. The plot included Foreign Ministry officials Adam von Trott zu Solt, Ulrich von Hassell, and Count Friedrich von Schulenberg. Carl Goerdeler, the former mayor of Leipzig, was perhaps the most prominent civilian involved. Military leaders included Field Marshal Erwin von Witzleben, Generals Ludwig Beck and Friedrich Olbricht, and Admiral Wilhelm Canaris, head of the Abwehr. Opposition to Hitler within the military crystallized after Operation BARBAROSSA, the German invasion of the Soviet Union on June 22, 1941.

Disillusioned by the brutal actions carried out by Germany in the Soviet Union, a group of young officers made several attempts to kill Hitler. They planted bombs on his airplane and in the pockets of his overcoat and carried them into meetings with the führer. Incredibly, fate foiled each attempt.

Killing Hitler would exempt members of the Wehrmacht from their oath of allegiance and make a coup d'état possible. Even if this would not secure better terms from the Allies, at least there would be a moral victory. In early 1944, a new leader instilled the movement with renewed hope. Count Claus Schenk von Stauffenberg became disillusioned with Nazi occupation policies on the Eastern Front. He had been badly wounded in Tunisia that year, losing his left eye, right hand, and two fingers on his left hand. While recovering in Germany, he dedicated himself to the task of killing Hitler. Appointed chief of staff of the Replacement Army in July, Stauffenberg developed a daring scheme to assassinate the führer.

Stauffenberg openly developed a plan, under the code name VALKYRIE, for the Berlin garrison to impose military control on the city in case of a rebellion by the millions of foreign workers employed there. This provided cover for the plot to suppress the Schutzstaffel (SS) after Hitler had been removed. The police chief and commandant of Berlin supported the plan, and Stauffenberg carefully coordinated with sympathetic military officials in Paris and Vienna. He hoped to carry off the coup before any Allied invasion could occur and then negotiate an end to the war.

D-day, the June 6, 1944, Allied invasion of Normandy, occurred before an attempt could be made, however, and many conspirators argued that the invasion rendered the question of assassination moot. Stauffenberg remained determined. Twice he carried explosives to meetings where Hitler was to appear; twice circumstances stayed the event. Then on July 20, 1944, at a meeting of Hitler and the General Staff near Rastenburg, East Prussia (Ketrzyn, Poland), Stauffenberg armed the bomb concealed in his briefcase, set it down six feet from the führer, and slipped from the meeting to signal the start of the coup d'état.

Through an accident, the bomb-laden briefcase was moved behind a heavy wooden table leg, and it only wounded Hitler when it went off. Meanwhile, waiting for confirmation that the führer was dead, Stauffenberg's coconspirators hesitated and then divided. When news came that Hitler was still alive, the plot collapsed as SS leader Heinrich Himmler and the head of

the Armed Forces Supreme Command (Oberkommando der Wehrmacht, OKW), Field Marshal Wilhelm Keitel, moved quickly to crush it.

Troops loyal to Hitler arrested the leading conspirators. Beck was permitted to commit suicide, whereas Stauffenberg and Olbricht were shot out of hand. Further investigation by the Gestapo revealed the breadth of the activity, which came as a surprise to the regime. Ultimately, some 7,000 people were arrested. The leaders were tortured and subjected to farcical "trials" before the People's Court and then executed in the most hideous fashion, with the event filmed for the amusement of Hitler and other Nazi leaders. In all, perhaps 5,000 opponents of the regime, no matter what the level of their involvement in the plot, were executed.

As the best-known act of resistance in Nazi Germany, the unsuccessful attempt of military leaders to kill Hitler remains controversial. Some scholars hail it as an act of conscience that laid the foundations for a new Germany, but others note that the attempt did not come until Germany was on the brink of defeat. They interpret it, moreover, simply as repudiation of Hitler himself and not of Nazi principles in general.

K

Kaiser, Henry John (1882–1967)

American industrialist whose shipbuilding activities were vital to the U.S. war effort. Born in Sprout Brook, New York, on May 9, 1882, Henry John Kaiser left school at age 13 and worked at various odd jobs. He then turned to wholesale hardware and construction. He established his own construction company in 1914 and built roads in the United States and abroad. Kaiser was also involved in the construction of the Hoover, Shasta, Bonneville, and Grand Coulee Dams as well as levees on the Mississippi River. His factories produced steel, cement, and aluminum.

With the great demand for merchant ships in World War II, Kaiser turned to shipbuilding, beginning with a British contract for 30 merchant vessels. During the war, he came to own seven shipyards in California and Oregon that constructed both cargo vessels and warships. He helped revolutionize shipbuilding by introducing assembly-line practices that drastically cut construction time; his Richmond, California, shipyard set a record by launching the 441.5-foot-long Liberty ship *Robert E. Peary* in only 111.5 hours. In World War II, Kaiser's shipyards produced 1,490 vessels, including 50 small escort aircraft carriers, and they also turned out almost one-third of all the merchant ships built in the United States through the war years. His other wartime construction projects included aircraft, vehicle, and munitions manufacture.

Kaiser also established the Kaiser Permanente Foundation, which provided hospital and health facilities to all workers in his industrial empire, a development that was several decades ahead of its time. By 1967, the Kaiser Permanente Health Plan was the largest health-maintenance organization in the United States.

Following the war, Kaiser remained in shipbuilding and repair but also expanded into housing and automobiles. He died on August 24, 1967, in

Honolulu, Hawaii. Many of his companies and business practices survive today.

Kaitens

Japanese suicide submarines. By late 1944, the situation for Japan in the Pacific had deteriorated to the point that its leaders turned to extraordinary measures in an attempt to stem the tide of Allied victories. Already employing kamikaze suicide pilots, the Japanese also focused on developing the Kaiten (meaning "turning the heavens") suicide submarine, which was really nothing more than a Type 93 Japanese torpedo with a small compartment for a pilot.

The individual Kaiten torpedo was lashed to the deck of a submarine and transported underwater to the approximate location of a U.S. ship or naval anchorage. Following the appropriate ceremony, the pilot would leave the submarine and enter the Kaiten while it was submerged. The Kaiten would then be released and propelled at high speed by its oxygen-fueled engine to smash into the enemy ship. Capable of sustaining a speed of 40 knots for one hour, the Kaiten could outrun any U.S. warship.

There was no provision for the Kaiten to be recovered by the launching submarine. Although the Japanese Naval General Staff had insisted that a means be provided for the pilot to be ejected from the Kaiten about 150 feet from impact, no pilot is known to have attempted to escape from his speeding torpedo as it approached the target. The first group of Kaiten pilots began training in August 1944, and several submarines were modified to carry the submersibles. All Kaiten pilots were volunteers.

The first Kaiten mission occurred in November 1944, when three submarines, each carrying four Kaitens, departed Japan to attack U.S. fleet anchorages in the Caroline Islands. The Kaitens were launched on the morning of November 20. Although three Kaitens could not get under way because of mechanical difficulties, five others set off for anchored U.S. warships in Ulithi Lagoon. Explosions followed, with the Japanese later claiming three aircraft carriers and two battleships sunk. In reality, one U.S. tanker, the *Mississinewa*, was sunk. One submarine, still carrying its four Kaitens, was detected by U.S. warships and sunk in turn.

More Kaiten missions followed. A Kaiten unit composed of three submarines sailed for Iwo Jima on February 22, 1945. One was sunk by the U.S. destroyer escort *Finnegan,* which was escorting a convoy from Iwo Jima to Saipan when it happened on the submarine. The surviving submarines inflicted no damage on the U.S. anchorage at Iwo Jima.

The last Kaiten operation saw six submarines sortie between July 14 and August 8, 1945, each carrying five or six Kaitens. Again, mechanical problems plagued the operation, and three submarines had to turn back to Japan. The Kaitens from the others attacked U.S. ships off Okinawa in the most successful of the suicide missions. On July 24, a Kaiten from *I-53* sank the destroyer escort *Underhill*, with a loss of 114 officers and men.

The Kaiten effort had failed. Only two U.S. ships had been sunk, one each on the first and the last Kaiten mission, but eight of the carrying submarines were sunk, with almost 900 crewmen lost. The Kaitens, as with the kamikaze pilots, were an indication that the Japanese had run out of alternatives to counter the rapidly advancing Allied forces on their march toward Japan.

Kalinin, Recapture of (December 15, 1941)

Major battle during the Soviet counteroffensive to reverse the German Army's drive to Moscow. Kalinin (now Tver), situated some 100 miles northwest of Moscow, served as the northern linchpin in the defense of the Soviet capital. Retreating to within 40 miles of Moscow, the Soviets brought up 100 fresh divisions, including 34 from Siberia specially trained for winter warfare. From mid-November to December 4, German casualties reached some 85,000 in the Moscow area alone. The unusually early and harsh winter, with temperatures as low as –31°F, had brought most motorized transport to a halt. The German Army, unlike its Soviet counterpart, was ill-prepared to fight in such conditions.

Complicating the situation, German leader Adolf Hitler had issued orders on December 1 that threw the German high command into disarray. On that date, Hitler relieved Field Marshal Karl Gerd von Rundstedt as commander of the Fifth Panzer Army and personally took command of this crucial sector of the front before Moscow. That same day, Field Marshal Fedor von Bock, commanding Army Group Center (Heeresgruppe Mitte), relayed the message that German troops were completely exhausted. The German drive against Moscow had ground to a halt.

On November 30, Soviet leader Joseph Stalin had agreed to plans drawn up by the chief of the Soviet General Staff, Marshal Boris M. Shaposhnikov, and the next day the General Staff made final preparations for the offensive. On December 5, Soviet commander on the Moscow front General GeorgiiK. Zhukov began the first great Soviet counteroffensive in the Kalinin sector. Siberian troops, who were extremely effective in cold-weather operations, were used for these actions. The next day, Zhukov ordered a general offensive against German forces west of Moscow—Army Group Center. Some 88 Soviet divisions with 1,700 tanks and 1,500 aircraft attacked 67 German divisions (many of them understrength) on a 500-mile front between Kalinin and Jelez. They pushed back the completely exhausted Germans, encircling them where possible and forcing a general retreat.

Hitler, however, forbade anything but the shortest withdrawals. On December 8, with the Red Army achieving many breakthroughs, he ordered

his troops to go over to purely defensive operations and hold their positions at all costs. This decision, though helping to ensure that the retreat did not turn into a general rout, condemned thousands of Germans to death. On December 13, Soviet forces moved to relieve Leningrad, extending the counteroffensive to the northwest. On December 14, German troops departed Kalinin, which the Soviets entered the next day. Hitler assumed command of the German Army on December 19, and German forces managed to establish a stable front line some 55 miles west of Moscow one day later. The Red Army's winter counteroffensive continued into February 1942, although its greatest gains were registered at its beginning.

Kaltenbrunner, Ernst (1903–1946)

Leader of the Austrian Schutzstaffel (SS) and later chief of the Reichssicherhauptamt (RSHA). Born in Ried/Innkreis, Austria, on October 4, 1903, Ernst Kaltenbrunner earned a doctorate in law at the University of Graz in 1926 and entered practice in Linz. Joining the Austrian Nazi Party in 1930, he worked to destabilize the Austrian Republic. He became head of the SS at Linz in 1934 but was arrested and accused of being involved in the assassination of Austrian chancellor Engelbert Dollfuss on July 25, 1934.

Following the Anschluss (the union between Germany and Austria) in March 1938, Kaltenbrunner became minister for state security as well as police chief in Vienna. During the next three years, he served as commander of the SS in the Ostmark (former Austria).

Kaltenbrunner impressed SS chief Heinrich Himmler, who on January 30, 1943, appointed him to succeed Reinhard Heydrich as head of the RSHA (Reich Main Security Office) and SS intelligence. Kaltenbrunner not only controlled the Geheime Staatspolizei (Gestapo, the secret police) but was also responsible for carrying out the "Final Solution" (the Holocaust).

Kaltenbrunner held his position until the end of the war and was promoted to SS-Obergruppenführer and general of police on June 21, 1943. He took personal interest in the different methods used to kill the inmates in the extermination camps. Besides supervising the hunting down of Jews, he was also responsible for the murder of some Allied prisoners of war.

Kaltenbrunner's power increased greatly after the July 20, 1944, attempt on Hitler's life. Kaltenbrunner directed the Gestapo's investigation into the plot and was in charge of administering Hitler's policy of retribution against the conspirators. When the Allies were closing in on Germany, Kaltenbrunner gave orders for all prisoners to be killed. Then he fled south. He was captured in the Austrian mountains on May 15, 1945. Charged with conspiracy to commit crimes against peace, war crimes, and crimes against humanity at the International Military Tribunal at Nuremberg, Kaltenbrunner was found guilty and was hanged on October 16, 1946, in Nuremberg.

Kaluga, Battle of (December 26–30, 1941)

Culmination of the Soviet winter offensive in December 1941 that halted the German drive on Moscow. Kaluga is situated some 90 miles southwest of

Moscow; the Germans had taken it on October 12, 1941.

Reinforced by 100 fresh divisions, the Soviets launched a massive counteroffensive to save Moscow on December 5–6, 1941. The action took place in subzero temperatures and with German forces exhausted and strung out along a front of 560 miles, from Kalinin in the north to Yelets in the south. During the first days of their offensive, the Soviets registered significant progress. Where possible, Red Army troops avoided frontal assaults, endeavoring to flank and get behind the German positions and cut them off. Partisans also struck the overextended German communication and supply lines.

Fearful of encirclement, the Germans destroyed what they could and withdrew. On December 13, the Soviet government issued a communiqué announcing that the German effort to take Moscow had failed. On December 14, Soviet general Ivan Zakharin's Forty-Ninth Army went on the offensive north of Tula against Army Group Center. Despite Adolf Hitler's order of December 16 calling for "fanatical resistance," the right wing of the German Fourth Army on the east bank of the Oka collapsed, and on December 17, Aleksin fell. The offensive continued in the direction of Tarusa, which was taken the next day.

A special mobile group under Lieutenant General V. S. Popov, including cavalry, infantry, and tank units, then moved in deep snow on the southern bank of the Oka. The offensive to recapture Kaluga began on December 17. In three days, Popov's troops covered nearly 60 miles, and by the evening of December 20, they had Kaluga in sight. The Germans there were taken completely by surprise. During the morning of the next day, the 154th Rifle Division, supported by the 31st Cavalry Division and tanks, attacked the railway station.

On December 26, German resistance in the Nara-Fominsk area broke, and the city was retaken. Borovsk and Maloyaroslavets soon fell. On December 28, Hitler issued a new order calling for every hamlet and farm to be turned into a defensive position and held at all costs. Counterattacks could not be realized, however. German tanks were no longer capable of offensive operations but could only cover retreating infantry units.

Much more adept at fighting in winter conditions, the Soviets threw back every German attempt to stop their advance. Unable to cover and plug the ever-increasing number of holes appearing in their front line, the Germans

had to withdraw even farther west. On December 30, Soviet forces completely secured Kaluga. The Soviet offensive ended on January 5, 1942. The Soviet Army had established a line between Uhnov, Kirov, and Ludinovo and completed the encirclement of Army Group Center. The German Army had lost 25 percent of its original strength and been handed its first strategic defeat.

Kamikaze

Japanese suicide pilot. The special corps of suicide aviators was organized by Rear Admiral Arima Masafumi in 1944 to compensate for the critical shortage of skilled Japanese pilots and the increasingly desperate situation of the Japanese forces after the June 19–21, 1944, Battle of the Philippine Sea. The term "kamikaze" means "divine wind" and derives from two legendary Japanese victories over invading Mongol forces in the 13th century when a typhoon—or kamikaze—destroyed the Mongol fleet as it lay off Japan in preparation for invasion. The Japanese had long believed that this kamikaze was a divine intervention, and over many centuries they had come to accept the proposition that Japan was shielded from calamity by a supernatural force. Japanese leaders hoped that the kamikaze pilots, like the wind that had saved their land seven centuries earlier, would spare Japan an Allied victory in the 20th century.

Arima had little trouble in recruiting pilots for his suicide missions. Thousands of young Japanese volunteered. A last-ditch defensive measure, the kamikaze missions succeeded in wreaking havoc on Allied warships

without sapping Japan's other resources. The first kamikaze missions were flown during the Battle of Leyte Gulf on October 23–26, 1944, when 24 volunteer pilots of the Japanese Navy's 201st Air Group on Leyte attacked a force of U.S. escort carriers. During this action, one escort carrier, the *St. Lô*, was sunk, and two others were heavily damaged.

The kamikaze plane operated as a kind of guided missile with human control, as the pilots tried to crash them into enemy ships. Most kamikaze aircraft were ordinary fighters or light bombers, often loaded with bombs and extra gasoline tanks. Many of the aircraft were old (some were biplanes with nonretractable gear), but later, the Japanese also used a new aircraft, which was a piloted rocket. Specifically developed for suicide missions, this aircraft, called "Baka" (the Japanese word for "fool") by the Allies, was carried to the target area by a medium bomber. Dropped from an altitude of more than 25,000 feet, the rocket would glide to about three miles from its target before the pilot turned on the three rocket engines, accelerating the craft to more than 600 mph in its final dive.

Determination and pride show in the faces of these young Japanese kamikaze pilots in 1945. They will attempt to crash their aircraft into Allied ships. Kamikaze, meaning "divine wind," refers to two massive typhoons in 1274 and 1281 that wrecked Mongol invasion fleets and forced the Mongols to quit Japan. (Hulton-Deutsch Collection/Corbis)

After nearly securing Leyte, the Allies prepared to land on Luzon in the Philippines. With the loss of Leyte, there was little the Japanese could do to stop the U.S. advance, but they were determined to make the October 20, 1944–August 15, 1945, Luzon Campaign a costly one for their adversaries. Having suffered the loss of the bulk of their fleet in the Battle of Leyte Gulf, the Japanese turned to kamikazes. One estimate holds that 1 out of every 4 kamikazes hit its target and that 1 out of every 33 sank a ship.

During the February 19–March 26, 1945, Battle of Iwo Jima, the kamikaze threat was lessened because of the distance between the island and the nearest Japanese air bases. However, there were still kamikaze attacks. On February 21, 1945, kamikazes sank the escort carrier *Bismarck Sea* and damaged the fleet carrier *Saratoga* (with the loss of some four dozen of its aircraft) as well as the escort carrier *Lunga Point*, a cargo ship, and two LSTs (landing ships, tank).

The kamikaze effort reached its zenith during the battle for Okinawa (March–June 1945), when the Allied task force was repeatedly attacked by waves of suicide planes. Their tactics were new. Previously, kamikazes had operated in separate and individual attacks. During this operation, however, the fleet was subjected to massed kamikaze raids. These *kikusui* (floating chrysanthemum) attacks, as the Japanese called them, were far more devastating than single kamikazes and took a heavy toll of Allied ships. In several of the raids, more than 350 planes were sent against the ships. Often, these suicide missions occurred simultaneously with conventional air attacks.

By the end of the Okinawa campaign, at least 1,450 kamikaze pilots had lost their lives, sinking or damaging 263 Allied ships, resulting in the deaths of 5,000 men. These were the greatest losses ever suffered by the U.S. Navy in a single battle.

The effect of the kamikaze attacks, particularly during the Okinawa operation, had a major impact on Allied strategic planners as they contemplated an invasion of the Japanese home islands and played a role in the decision to employ the atomic bomb in August 1945.

Kammhuber, Josef (1896–1986)

German Air Force general. Born in Burgkirchen, Upper Bavaria, Germany, on August 19, 1896, Josef Kammhuber enlisted as a private in the army at the beginning of World War I. Ending the war as a second lieutenant, he continued in the Reichswehr thereafter. Between 1926 and 1928, he qualified as a General Staff officer in the Reichwehr's clandestine training program, and from 1929 to 1930 he took pilot training at the secret Luftwaffe training facility at Lipetsk.

Kammhuber joined the Luftwaffe in 1933 and then held a variety of staff and command positions, including chief of staff of Luftflotte 2 (Second Air Fleet). During the May 10–June 25, 1940, Battle for France, he commanded 51st Kampfgeschwader (Bomber Wing) and was shot down and taken prisoner.

Following his release, Kammhuber was ordered to organize the primitive German night defenses, developing them into a highly efficient system that came to be known as the "Kammhuber Line," an interlocking system of radar, aircraft, and ground controllers stretching from the North Sea to southern France. With advances in radar technology, the line was effective, but it was a defense in width rather than depth. The Royal Air Force Bomber Command eventually exploited this weakness by blinding the German radars with strips of foil called "Window" (known as "chaff" by the Americans). Following several devastating British raids, Kammhuber was relieved as general of night fighters in the autumn of 1943 and posted to Norway.

Following the war, Kammhuber passed on his night-fighting experiences to the U.S. Air Force. In 1956, he was named the inspector (chief of staff) of the air force of the new Federal Republic of Germany, a post he held until his

retirement as a full general in 1962. Kammhuber died in Munich, Germany, on January 25, 1986.

Kan'in Kotohito, Prince (1864–1945)

Japanese field marshal and member of the imperial family. Born on September 22, 1864, in Kyoto, Japan, Prince Kan'in Kotohito received the title of Imperial Prince Kan'in in 1872. Educated at the Japanese Army Cadet School, he studied in the French Army Cadet School and the French Cavalry School from 1878 to 1882. Following his return to Japan, he served in almost all major cavalry army posts.

During the 1904–1905 Russo-Japanese War, Major General Prince Kan'in served in the headquarters of the Manchuria Expeditionary Army. Promoted to lieutenant general, he commanded both the 1st Division and the Imperial Guards Division. Kan'in was promoted to field marshal in 1919.

As a "grand old man" of the Imperial Army, Kan'in occupied the post of chief of staff of the army between December 1931 and October 1940. His age made him a mere figurehead, allowing radical midrank officers to increase their influence in army decision making. Prince Kan'in died in Tokyo on May 20, 1945.

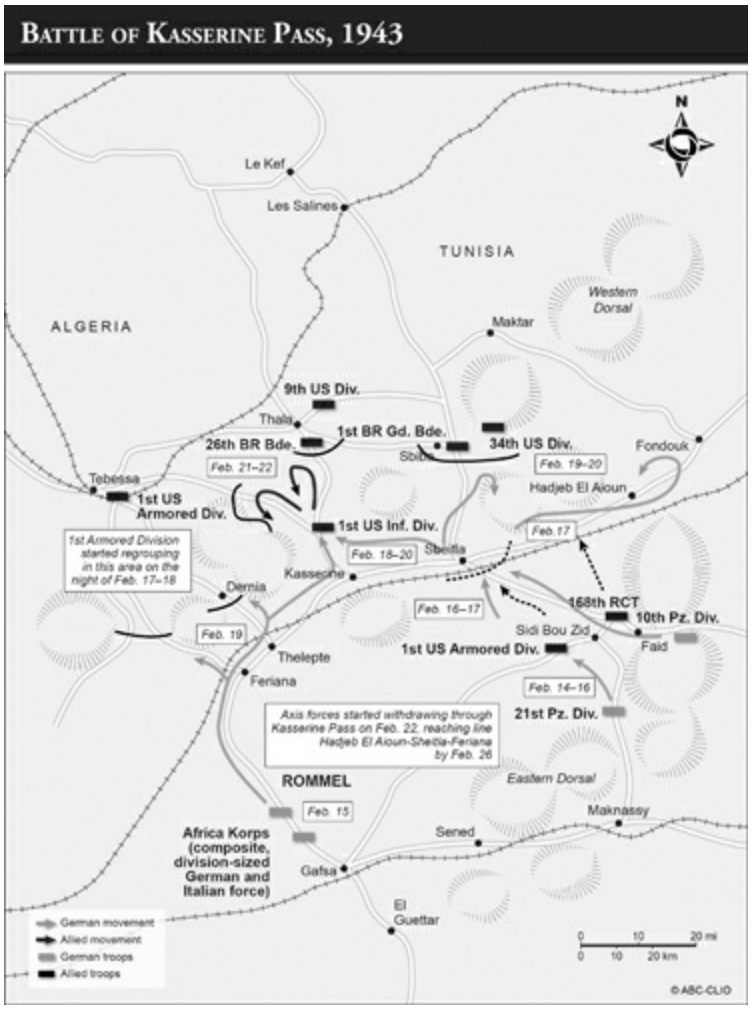
Kasserine Pass, Battle of (February 14–22, 1943)

Axis counteroffensive in Tunisia and an operational defeat for the Allies. On November 8, 1942, U.S. and British forces invaded Vichy-held French North Africa (Operation TORCH) while the British Eighth Army pushed Italian and German forces from Egypt into Libya. Italy and Germany then rushed reinforcements to Tunisia, but Axis forces there soon found themselves sandwiched between two Allied armies. Victory for the Allies seemed only a matter of time, but the friction of logistics, poor weather, and overconfidence provided the Axis an opportunity to seize the initiative and launch a counterstroke.

Hindering any Axis operation was the issue of who controlled the two armies in Tunisia. German field marshal Albert Kesselring in Italy was the theater commander of German forces in the Mediterranean. Under him, Field Marshal Erwin Rommel commanded Panzerarmee Afrika in southern Tunisia, and Colonel General Hans Dieter Jürgen von Arnim commanded the Fifth Panzerarmee in the north. The Axis plan called for Arnim's 10th and 21st Panzer Divisions to move through the Faid Pass and destroy American forces at Sidi Bou Zid. Rommel was to seize Gafsa on the Allied right flank and then move north to link up with Arnim. Although the Axis forces had combat experience, effective air support, and better equipment, the murky command arrangement mitigated against decisive success on the battlefield.

Men of the U.S. Army 33rd Field Artillery Battalion and their artillery pieces set in an Arabic mud-block abode for firing in defense of Kasserine Pass during the Tunisian Campaign in February 1943. The battle here was a major defeat for the inexperienced Americans. (Library of Congress)



For the Allies in Tunisia, the embryonic nature of coalition operations manifested itself at all levels, to include integrating French forces into the operational structure. The major U.S. element was Lieutenant General Lloyd Fredendall's II Corps, which held the southern flank between Faid and Meknassy passes.

Fredendall, overconfident yet overly cautious, deployed his inexperienced troops in unsupportable positions and unnecessarily complicated the command-and-control structure. His main battle element, the 1st Armored Division, was scattered into small detachments and could not fight as a complete unit. Fredendall directed operations from an elaborate underground command post some 70 miles from the front in Tebessa, which caused both superiors and subordinates to question his competence.

During a raging sandstorm on February 14, 1943, more than 200 of Arnim's tanks, supported by aircraft, began an attack reminiscent of the early

blitzkriegs. The Americans' inexperience and poor leadership proved no match for the veteran panzer divisions, which quickly bypassed and cut off more than 2,500 Americans near Sidi Bou Zid. In two days, the Allies lost six battalions of infantry, armor, and artillery, leaving the 1st Armored Division in shambles. As Axis forces attacked toward Sbeitla, the demoralized Americans began a general retreat, during which they destroyed supplies to prevent their capture.

As the Allies rushed reinforcements forward to stabilize their defense, the German command debated the objective. Rommel wanted complete operational control in order to cut Allied lines of communications and capture the logistics base at Tebessa. Kesselring refused to grant Rommel's request and subsequently ordered an attack toward the Le Kef and Allied reserves. This command disagreement diluted the Axis attack and provided the Allies valuable time to recover and rest their disorganized forces.

On February 19 Rommel struck at Kasserine Pass, a constricted defile 800 yards wide between 4,000-foot hill masses. The pass was guarded by a mixed force of more than 2,000 U.S. infantrymen and engineers as well as French artillery, including a battalion of tank destroyers, all commanded by Colonel Robert Stark. Fredendall ordered Stark to "pull a Stonewall Jackson." Stark's command held until the next day, when an Axis attack broke through his defense. Deterred from gaining Tebessa by a strong Allied defense, Rommel ordered his forces toward Thala, where they swept through a British armor rear guard. An apparent Axis victory was blunted by a dramatic reinforcement of U.S. artillery on February 21. Frustrated by stiffening Allied resistance and an inability to gain firm control of all the Axis forces, Rommel withdrew on February 22 to face General Bernard Montgomery's Eighth Army along the Mareth Line to the east.

Aided by Axis indecision, the Allies had held just long enough, but the cost was high. Records on both sides are fragmentary, but the Allies sustained nearly 4,000 casualties, with 60 artillery pieces and 64 armored vehicles captured; II Corps probably lost 20 percent of its engaged forces as well as up to 400 armored vehicles and more than 200 artillery pieces. Kasserine Pass was a serious defeat for the inexperienced Americans. U.S. commander in North Africa General Dwight D. Eisenhower quickly took steps to shuffle his command, including the replacement of Fredendall by Major General George S. Patton Jr.

Kato Takeo (1903–1942)

Japanese Army major general and fighter ace. Born in Hokkaido, Japan, on September 28, 1903, Kato Takeo graduated from the Japanese Military Academy in 1925. Promoted to captain in 1933, he took command of the 2nd Air Squadron in 1937. The next year, he fought in northern China during the Sino-Japanese War.

During the Pacific war, Kato commanded the 64th Air Squadron, flying the Nakajima Ki-43 Hayabusa ("Oscar" in the Allied identification system) and smashing British air units in the Battle of Palembang in Sumatra on February 14–16, 1942. Promoted to lieutenant colonel, Kato shot down British lieutenant Martin Huggard's Blenheim bomber off Akyab, Burma, on May 22, 1943. Kato's own aircraft was damaged in the exchange of fire, however, and shortly thereafter he ditched his plane into the sea. At the time of his death, Kato was a multiple ace, credited with shooting down 26 enemy aircraft. Promoted posthumously to major general, he became a legend in the Japanese Army.

Katyn Forest Massacre (1940)

World War II Soviet atrocity in Poland. On April 13, 1990, the Soviet news agency TASS announced that a joint commission of Polish and Soviet historians had found documents proving the involvement of personnel from the Narodnyy Komissariat Vnutrennikh Del (People's Commissariat for Internal Affairs, NKVD) in the deaths of some 15,000 Polish officers in the Katyn Forest of eastern Poland in 1940. The secretary-general of the Communist Party of the Soviet Union and president of the Soviet Union, Mikhail Gorbachev, handed over a list of the victims to Polish president Wojciech Jaruzelski. In October 1992, Russian president Boris Yeltsin produced more archival documents, helping to determine the burial sites of missing officers not found near Katyn.

Until 1990, the Soviet Union had consistently denied murdering captured Polish Army officers after its occupation of eastern Poland ever since Radio Berlin announced on April 13, 1943, that German troops, tipped off by local inhabitants, had discovered mass graves near Smolensk. That June, the German Field Police reported that 4,143 bodies had been found in the Katyn Forest, all clothed in Polish Army uniforms. Some 2,815 corpses were later identified by personal documents in their pockets. Without exception, all the officers, ranking from general to noncommissioned, had been killed by shots in the back of the head. Medical examination later showed that a few bodies had jaws smashed by blows or bayonet wounds in their backs or stomachs, probably sustained when the individuals resisted.

A German doctor performing an autopsy on the body of a Polish soldier selected at random from a mass grave in the Katyn Forest, Poland. This photo, subsequently shown at congressional hearings probing the massacre by the Soviets of Polish officers in 1940, was taken in 1943 when American and British POWs held by the Germans were taken to view the massacre site. (Corbis)

The Germans predictably tried to exploit the Katyn murders for propaganda purposes, pointing out to their wartime enemies that any alliance with the perpetrators of this atrocity was too dangerous to continue. By then, General Władysław Sikorski's London-based Polish government-in-exile and General Władysław Anders, commander of the Polish forces in the Soviet Union and the Middle East, had been worrying for a considerable time over the fate of the missing officers. Following the Soviet-Polish agreement in the summer of 1941, a small but steady trickle of Poles arrived at the reopened Polish embassy in Kuibyshev. These individuals, from prison camps scattered over the western parts of the Soviet Union, agreed that their fellow servicemen had been transferred to unknown destinations when the NKVD liquidated the camps in April 1940. The arrivals at Kuibyshev turned out to be the few survivors of the Katyn Forest Massacre. The massacre was apparently a Soviet effort to deprive the Poles of their natural leaders, who would undoubtedly oppose a Soviet takeover.

After numerous fruitless discussions on the subject with Soviet authorities, the Polish government-in-exile came to believe the German

announcement of April 1943 and demanded an independent investigation by the International Committee of the Red Cross (ICRC). This caused the Kremlin to accuse the Polish government-in-exile of siding with the "fascist aggressors" and break off diplomatic relations. The ICRC, pursuant to its policy of neutrality, could take no action without Soviet consent. London, although embarrassed by this development, made it plain that it was unwilling to risk an end to the alliance with the Soviet Union over such an investigation. The United States took a similar stance.

When the Red Army finally drove the German armies westward, Moscow determined that it needed to present its own investigation results in 1944. A Soviet special commission pointed out that the bullets found on the crime scene were manufactured in Germany and concluded that the Germans had killed the Polish officers in 1941. British and American protests notwithstanding, the Soviet prosecution raised the Katyn affair at the International Military Tribunal in Nuremberg, but because the Soviets were unable to prove German guilt, the tribunal simply dropped the case. Throughout the Cold War, the issue of the Katyn Forest Massacre resurfaced time and again, partly because of the efforts of the Polish émigré community. However, it remained unresolved until the dissolution of the Soviet Union.

Kawabe Masakazu (1886–1965)

Japanese Army general and older brother of General Kawabe Torashirō. Born in Tokyo on December 5, 1886, Kawabe Masakazu was commissioned in the 35th Infantry Regiment in December 1907. His assignments included postings to Switzerland and Germany, and staff duties. In the 1930s, he spent

most of his time in the Infantry Training Inspectorate. In July 1937, Kawabe was assistant chief of staff of the Guandong (Kwantung) Army in Manchuria, and he supported Japanese attacks on Chinese troops following the July 7 Marco Polo Bridge Incident. In February 1938, as a major general, Kawabe was appointed chief of staff of the Central China Expeditionary Army and saw action in China over the next five years. Promoted to lieutenant general in March 1939, he commanded the 12th Division from March 1940 to March 1941, after which he took command of the Third Army.

In March 1943, Kawabe assumed command of the Burma Area Army from Iida Shōjirō. Impressed by Major General Orde Wingate's success in using large formations in the jungle, he reviewed and endorsed Lieutenant General Mutaguchi Renya's plan for a large-scale offensive against the British in northeastern India. Kawabe believed that Japanese success would provoke a widespread uprising against the British.

A diversionary attack in Arakan in February 1944 drew off British reserves, and in early March Japanese soldiers from the 33rd and 15th Divisions crossed the Chindwin River and surrounded the British base of Imphal. They were accompanied by 7,000 men of the Indian National Army.

The 31st Division attacked Kohima, the gateway to Imphal. Kawabe refused to let Mutaguchi advance against Dimapur, an important supply base on the railroad to Ledo. Had Dimapur been captured, the Allies would not have been able to fly supplies from Ledo to China.

British and Indian reinforcements broke the siege of Kohima by April 18, but they could not drive off the 31st Division until June. Imphal was relieved on June 22, and the Japanese finally withdrew to Burma. In this campaign, Mutaguchi lost nearly 100,000 men, making it one of the worst defeats in Japanese history. Both Kawabe and Mutaguchi were removed from their posts in August 1944.

Kawabe returned to Japan, where he headed the Central District Army Command, and in March 1945, he was promoted to full general. A month later, he assumed command of the Air General Army, with responsibility for the air defense of the Japanese homeland. After the Japanese surrender, he succeeded Marshal Sugiyama Hajime in command of the First General Army. Kawabe died in Tokyo on March 2, 1965.

Kawabe Torashirō (1890–1960)

Japanese Army general and younger brother of General Kawabe Masakazu. Born in Tokyo on June 25, 1890, Kawabe Torashirō served in the Operations Division of the army General Staff as a young officer. From 1926 to 1928 he was in Riga as resident officer, studying Soviet military plans and capabilities. He was military attaché in Moscow between 1932 and 1934. As chief of the intelligence section of the Guandong (Kwantung) Army, Kawabe was involved in efforts to gain control over Chahar Province in Inner Mongolia. Because of his concern with Soviet intentions, he was one of the few senior Japanese officers hoping to limit Japan's involvement in China after the Marco Polo Bridge Incident in July 1937.

Kawabe spent October 1938 to February 1940 as military attaché to Germany, and from August 1939, he was concurrently attaché in Hungary. In September 1940, he assumed command of the 7th Air Brigade in Manchuria. His unit relocated to Guangzhou (Canton) in February 1941.

Just before war with the United States began, Kawabe was promoted to chief of the General Affairs Department of the Japanese Army Air Force Inspectorate General. In May 1943, he commanded the Second Air Army in Manchuria. He returned to Japan in August 1944 and was promoted to deputy chief of the army General Staff in April 1945.

Following the Japanese government's decision to surrender, Kawabe was selected to head the team that would work out the details of the capitulation. On August 19, 1945, he and his 16-man team flew to Ie Shima, near Okinawa. An American transport plane then carried them to General Douglas

MacArthur's headquarters in Manila. There, Kawabe received the American demands for the surrender arrangements and the initial occupation of Japan. The firm but fair attitude of the Americans greatly impressed him. He secured agreement that the Japanese would disarm their own troops prior to the arrival of the U.S. forces.

The Japanese government accepted the terms negotiated by Kawabe, which provided for the peaceful U.S. military occupation of Japan. Following the war, Kawabe served on an advisory commission to the Japanese government on armaments. He died in Tokyo on June 25, 1960.

Kawaguchi Kiyotake (1892–1961)

Japanese Army major general. Born in Kōōchi Prefecture, Japan, on December 3, 1892, Kawaguchi Kiyotake graduated from the Japanese Military Academy in 1914 and was commissioned in the infantry. He also graduated from the Military Staff College in 1922. Kawaguchi then served on the General Staff from 1923 to 1925, as a staff officer with the 4th Division from 1925 to 1928, in the Military Affairs Bureau of the War Ministry, and as an aide to the minister of the army from 1930 to 1933. Between 1933 and 1939, he served with the China Garrison Army and North China Area Army as a staff officer, then as director of the Public Liaison Office.

In December 1940, Kawaguchi was promoted to major general and took command of the 35th Infantry Brigade. On the outbreak of the Pacific war, his unit took part in amphibious operations resulting in the capture of Borneo (December 1941), Cebu (March 1942), and Mindanao (April 1942). In late August 1942, he landed on Guadalcanal from Rabaul, in charge of some

3,500 reinforcements. He then commanded some 6,000 troops in their efforts to retake Henderson Field. His men participated in the September 13–14 Battle of Bloody Ridge, taking heavy casualties during their attempt to penetrate the U.S. defensive perimeter.

Prior to another major Japanese attack on October 24–25, 1942, Kawaguchi opposed Seventeenth Army commander Lieutenant General Hyakutake Haruyoshi's plan for a frontal assault, arguing for a flanking movement instead. On the day of the assault, Hyakutake removed Kawaguchi from his command and dismissed him.

Kawaguchi returned to Japan and was attached to the headquarters of the Eastern District Army. In March 1943, he was relegated to the unassigned list and, the next month, the reserve list. Kawaguchi remained there until March 1945, when he was reactivated as commander of the Tsushima Island Fortress Zone. In February 1946, he was arrested on war crimes charges for the execution of the Philippines' minister of justice. Tried and convicted, Kawaguchi was sentenced to imprisonment at hard labor from 1946 to 1953. He died in Tokyo on May 16, 1961.

Kearny, USS, Torpedoing of (October 17, 1941)

The destroyer *Kearny* was the first U.S. warship to be torpedoed in World War II, bringing the United States, which was not a belligerent at the time, one step closer to joining the conflict. Under its captain, Commander Anthony Leo Danis, the *Kearny* was one of a number of destroyers on Atlantic convoy duty as part of the Northeastern Escort Force assigned to

escort convoys as far east as Iceland and as far west as the United States. A new Benson-class destroyer, the *Kearny* had been completed only in 1940; with a displacement of 1,630 tons and a main armament of four 5-inch guns, along with four 40mm Bofors and seven 20mm Oerlikon antiaircraft guns, it was capable of 36.5 knots.

The *Kearny* was at Reykjavik, Iceland, with a destroyer division that had just made the run from the United States when news arrived of attacks by German U-boats on convoy SC.48 of 50 merchantmen, about 400 miles west of Iceland. On October 15, a German wolf pack had sunk three of the merchantmen. The *Kearny* was one of a half dozen escorts dispatched to SC.48's assistance. The *Kearny* and four other destroyers from Iceland joined up with the convoy about 350 miles southwest of Iceland early on October 16 and immediately took up station screening it. With the destroyers only 1,000 to 1,500 yards from the convoy, the German submarines were able to take up longer-range firing positions undetected.

That night in three separate waves of attacks, the German wolf pack struck again, sinking seven more merchant ships. In the last of these attacks, around 2:00 a.m. on October 17, the *Kearny* was searching for U-boats on the surface when it came under attack by *U-569*, which fired three torpedoes against it. One of these struck home, hitting the *Kearny* on its starboard side amidships.

Through valiant effort, the crew managed to save their ship, although 11 sailors were killed and 24 wounded. Miraculously, given the extensive damage and the hole in its side, the *Kearny* made it to Iceland under its own power, escorted by the destroyer *Greer*. Eventually, the *Kearny* rejoined the fleet.

The attack on the *Kearny* came in the middle of debate over the repeal of the Neutrality Acts in the United States. President Franklin D. Roosevelt took to the airwaves, telling the American people, "We have wished to avoid shooting. But the shooting has started. And history will record who fired the first shot." A few days later, a German submarine torpedoed and sank the destroyer USS *Reuben James*, also on convoy duty in the Atlantic. By then, it seemed as if U.S. entry into the war had become only a matter of time, although Americans were shocked to see the final provocation come from another quarter—the Japanese attack on Pearl Harbor, halfway around the globe.

Keitel, Wilhelm (1882–1946)

German Army field marshal and chief of the Oberkommando der Wehrmacht (OKW). Born on September 22, 1882, in Helmscherode, Germany, Wilhelm Keitel joined a Prussian field artillery regiment in 1901 and served as its staff captain during the early months of World War I. He was then posted to the German General Staff. His demonstrated abilities there secured him a position in the postwar Reichswehr.

Chosen to head the Wehrmachtamt (Armed Forces Office) in 1935, Keitel became chief of staff to the commander in chief of the Wehrmacht. When Adolf Hitler assumed command of the Wehrmacht in 1938, Keitel remained as chief of staff, although with the new title of OKW chief, and he maintained that position until Germany's surrender in 1945. Keitel was promoted to major general in April 1934, to lieutenant general in January 1936, to general of artillery in August 1937, and to colonel general in November 1938. He became a field marshal in 1940.

Although competent as a staff officer, Keitel maintained his position as a direct result of his personal loyalty to Hitler. With his headquarters responsible for only one operation during World War II (the 1940 Denmark-Norway Campaign), German commanders and staffs consistently bypassed him and the OKW and went directly to Hitler. Privately, they referred to Keitel as "Lakeitel" (a play on the German word for lackey, *Lakai*), a

reference to his relationship to Hitler and his limited influence on Germany's military operations. More than any other act, his work in the promulgation of the Commissar Order of 1941, a decree mandating the immediate execution of all captured political officers on the Eastern Front, led to his classification as a war criminal. Brought before the International Military Tribunal at Nuremberg after the war, he pleaded not guilty to all charges, citing his responsibility to carry out superiors' orders as his defense. Convicted and condemned to death, Keitel was hanged in Nuremberg on October 16, 1946.

Field Marshal Wilhelm Keitel signing, for the Germans, the ratified surrender terms at Soviet Army headquarters in Berlin, May 7, 1945. (National Archives)

Kellogg-Briand Pact (August 27, 1928)

International agreement signed in Paris on August 27, 1928. The Kellogg-Briand Pact sought to outlaw wars of aggression. It was named for its two principal negotiators—U.S. secretary of state Frank B. Kellogg and French foreign minister Aristide Briand. The pact grew out of the French desire for a mutual security arrangement with the United States. American leaders opposed this, and the subsequent negotiations led to an innocuous treaty outlawing war as an instrument of national policy. Ultimately signed by most nations, it won Kellogg and Briand the Nobel Prize for Peace.

The Kellogg-Briand Pact forbade the use of force to resolve disputes among the signatory nations. It also forbade its signatories from waging war against another nation for the purpose of acquiring or annexing new territory. The original signatories included France, the United States, Germany, the United Kingdom, Italy, Japan, Canada, Belgium, Czechoslovakia, Poland, British India, New Zealand, Australia, South Africa, and the Irish Free State. The Kellogg-Briand Pact went into effect on July 24, 1929. In all, 62 nations became signatories to the agreement.

There are a number of notable points to be made in relation to the Kellogg-Briand Pact. First, it was negotiated and concluded entirely outside the context of the League of Nations, to which several signatories—most notably the United States—did not belong. Second, the agreement lacked any monitoring program and, more critically, had no enforcement power whatsoever. Third, the pact did not include any collective security arrangements and did not oblige any signatories to come to the aid of another in the event of a war of aggression. Kellogg-Briand may be viewed as a multilateral effort in the aftermath of World War I to avoid a similar conflagration in the future by co-opting nations into an international agreement prohibiting the use of war as a means of national policy. For the French, the pact helped solidify the ongoing Franco-German rapprochement that had been a goal of Briand’s since the mid-1920s.

In the end, the lack of monitoring and enforcement mechanisms rendered the pact virtually useless as a tool for international diplomacy. It did nothing to stop the Japanese invasion of Manchuria in 1931, the Italian invasion of

Abyssinia (Ethiopia) in 1935, the Soviet invasion of Finland in 1939, the German invasion of Poland that same year, or even U.S. armed intervention in Central America. Nevertheless, at the time it was promulgated, many nations were buoyed by the illusion that states would not wage war to advance their interests.

Although the Kellogg-Briand Pact proved unsatisfactory at preventing war, it did serve as the legal foundation for the idea of "crimes against peace," and the International Military Tribunal at Nuremberg convened after World War II was premised partly on the precedent set by Kellogg-Briand. Also, the prohibition of wars of aggression became the basis for part of the United Nations (UN) Charter in 1945, although this time the UN put in place specific enforcement mechanisms. Although rarely invoked in modern times, the Kellogg-Briand Pact continues to be a binding international treaty.

Kennedy, Joseph Patrick, Sr. (1888–1969)

Investor, businessman, influential U.S. government official, and ambassador to the United Kingdom. Joseph "Joe" Patrick Kennedy Sr. was born on September 6, 1888, in Boston, Massachusetts, the son of a successful Boston businessman and Irish American leader. Kennedy graduated from Harvard University in 1912 and entered the banking industry. In 1914, he married Rose Fitzgerald, daughter of Boston mayor John F. "Honey Fitz" Fitzgerald. There is little doubt that the marriage was a significant boost to Kennedy's financial and political aspirations.

Kennedy soon began to make substantial sums of money investing in commodities, real estate, and stocks. In 1917, in a move designed chiefly to increase his visibility, he took a position as assistant general manager of a shipyard in Quincy, Massachusetts. Notably, Kennedy dealt extensively with a young Franklin D. Roosevelt, then assistant secretary of the navy. The two men thereafter became political allies.

Kennedy managed to avert major losses in the stock market crash of 1929, chiefly through insider trading. He also made a considerable fortune in the illicit alcohol business after Prohibition was instituted in 1920, and he invested considerable sums in the burgeoning film industry in Hollywood. An uncannily shrewd man, Kennedy's many business ventures seemed calculated as much to increase his personal visibility and social standing as to make money. For many years he harbored presidential aspirations, and when those did not bear fruit, he groomed his sons for the presidency.

In 1934, as the Franklin D. Roosevelt administration tackled the economic crisis of the Great Depression, the president tapped Kennedy to head the new Securities and Exchange Commission (SEC), designed to impose order and discipline in securities trading and eliminate corruption and fraud. This appointment was largely payback to Kennedy, who had raised funds for Roosevelt's 1932 presidential bid. Kennedy had hoped for a cabinet-level position, but he eagerly accepted the SEC challenge and did a fine job organizing and staffing it. From 1936 to 1938, he headed the U.S. Maritime Commission.

In 1938 Kennedy was named ambassador to Britain. He relished the role, although his tenure would be rife with controversy. On several occasions, both before and after the start of World War II, Kennedy attempted unsuccessfully to arrange a meeting between himself and Adolf Hitler in an attempt to broker an understanding between the United States and Germany. This he did without State Department or presidential approval. Kennedy also went on record as opposing military and financial aid to the British, which alarmed the Roosevelt administration and outraged many Britons. As time went on, Kennedy became ever more isolationist and defeatist in his sentiments, admitting privately to many that the United States should avoid the conflict at virtually all costs.

Kennedy's biggest blunders came after the beginning of the German bombing of London in September 1940. At a time in which most British

officials—including the royal family—stayed in London despite the air raids and bombings, Kennedy vacated the London embassy and took refuge in a country estate. In early November 1940, Kennedy publicly asserted that democracy was not driving the British war effort; instead, he argued, it was simply self-preservation. He also stated that the United States should aid Britain, but only because it would give the Americans more time to prepare for a potential Axis move against them. This not only shocked and outraged the Roosevelt administration but led many Englishmen to demand Kennedy's recall. Under heavy pressure from the State Department and the British government, Kennedy tendered his resignation in late November 1940 and returned home. This marked the effective end to Kennedy's political aspirations.

Kennedy strongly opposed Roosevelt's bid for a third term in 1940, believing that it would ultimately lead to war. Kennedy now focused on grooming his four sons—Joseph Jr., John, Robert, and Edward—for high political office. Unfortunately, Joseph Jr. was killed in action in August 1944. John was elected president in 1961 but assassinated in November 1963; Robert, a sitting senator from New York, was assassinated in June 1968 as he ran for president; Edward, a longtime senator from Massachusetts, died in 2009 of cancer.

Kennedy continued to work behind the scenes to help his sons' political careers after leaving his ambassadorship, sometimes forging odd alliances, as with Republican senator Joseph R. McCarthy, the perpetrator of McCarthyism, in the early 1950s. Kennedy suffered a debilitating stroke in 1961 and died at Hyannis Port, Massachusetts, on November 18, 1969.

Kenney, George Churchill (1889–1977)

U.S. Army general. Born on August 6, 1889, in Yarmouth, Nova Scotia, George Churchill Kenney studied at the Massachusetts Institute of Technology and worked as an engineer for several years. Following the U.S. entry into World War I, he joined the Aviation Section of the Army Signal Corps, becoming a fighter pilot in the World War I American Expeditionary Forces Air Service. After the war, Kenney continued in what became the Army Air Corps in 1926. In 1938, Major General Henry Harley Arnold, the new Air Corps chief, appointed Kenney as chief of the Production Engineering Sections of the Matériel Division. In January 1941, Kenney, promoted to brigadier general, became head of the Air Corps Experimental Depot. He then briefly commanded the West Coast Fourth Air Force.

From July 1942, Kenney commanded Allied Air Forces, Southwest Pacific Area; later that year, he was promoted to lieutenant general. In June 1944, he also took command of the new U.S. Far East Air Force, and he became a full general in March 1945. Kenney's boldness and his efficiency and drive in introducing innovative aircraft, equipment, and tactics and inspiring his subordinates helped transform U.S. airpower in the Pacific.

Kenney oversaw the transformation of the U.S. air service from a primarily defensive arm of the military to a powerful offensive force that wrested control of the skies from the Japanese. Between 1942 and 1945, his U.S. Fifth Air Force provided invaluable strategic and tactical air support to Southwest Pacific theater commander General Douglas MacArthur's operations, transporting troops and supplies, destroying enemy shipping, and supporting 56 amphibious operations by Australian and U.S. ground forces. Kenney was the Pacific theater's most distinguished air commander.

After the war, Kenney headed, in succession, the Pacific Air Command, the Strategic Air Command, and the Air University before retiring in 1951. Kenney died in Bay Harbor Islands, Florida, on August 9, 1977.

Kerr, Philip Henry (1882–1940)

British ambassador to the United States (1939–1940). Born in London on April 18, 1882, Philip Henry Kerr graduated from New College, Oxford, in 1904. Immediately afterward he went to South Africa, where he worked on its post–Boer War reconstruction. Returning to Britain in 1910, Kerr became editor of the *Round Table*, a quarterly established to encourage closer union among the British Dominions.

In late 1916, Kerr joined British prime minister David Lloyd George's personal secretariat. As the prime minister's private secretary from late 1918 to 1921, Kerr attended the 1919 Paris Peace Conference, drafting the Allied letter of response to German protests over the peace terms. A dedicated advocate of closer Anglo-American relations, Kerr was secretary of the Rhodes Trust from 1925 to 1939.

In 1930, Kerr inherited the title Lord Lothian. In the early 1930s, he served briefly as chancellor of the Duchy of Lancaster and as undersecretary of state for India. Although Kerr publicly advocated the appeasement of Germany in the 1930s, Adolf Hitler's annexation of Czechoslovakia convinced him that his pro-German sympathies had been mistaken. Kerr thereafter publicly advocated the pooling of national sovereignty among the Western democracies, including the British Empire and the United States.

In the late summer of 1939 shortly before Britain declared war on Germany, Kerr became British ambassador to the United States. He soon delivered a series of widely reported public speeches that were highly effective in expounding Britain's perspective on the war. Kerr argued that U.S. security had always depended on the protection of the British fleet and that any German victory over Britain would therefore jeopardize vital American national interests. His numerous contacts among the northeastern

American elite proved particularly useful, as he maintained unofficial contacts with such staunchly pro-Allied organizations as the Century Group and the Committee to Defend America by Aiding the Allies.

One of Kerr's major accomplishments was the negotiation of the Destroyers-for-Bases Agreement in the summer of 1940. The following December as British supplies of dollar exchange diminished, he also laid the groundwork for what would become the Lend-Lease program. In addition, he supervised what was a highly effective, although low-key, British propaganda effort in the United States. Kerr died suddenly in Washington, D.C., on December 12, 1940.

Kesselring, Albert (1885–1960)

German Air Force field marshal. Born in Marksheft, Bavaria, on November 20, 1885, Albert Kesselring joined the Bavarian Army as an officer candidate in the 2nd Regiment of Foot Artillery in 1904 and was commissioned in 1906. A trained balloon observer, he served with his battery on the Western Front during World War I. Soon, he was on the staff of a regiment and then a division and finally with the II Bavarian Army Corps until the armistice.

Kesselring continued in the postwar Reichswehr and secured his reputation as a superb administrator. Colonel Kesselring transferred to the still-secret air force in 1933 as chief of administration and military assistant to Luftwaffe state secretary Erhard Milch. There, he helped direct the secret expansion of the air force, for which he deserves considerable credit. In June 1936, he became the Luftwaffe chief of staff as a lieutenant general.

Unable to work with Milch, Kesselring applied for retirement. Instead Luftwaffe chief Reichsmarshal Hermann Göring gave him command of the Third Air Region and promotion to general of aviation. Later, he commanded the 1st Air Group, which was upgraded to Luftflotte 2 (Second Air Fleet), composed of 20 bomber and fighter groups. Kesselring led this fleet in the invasion of Poland in September 1939.

He also commanded Luftflotte 2 in the invasion of France and the Low Countries in May 1940, his aircraft striking both Rotterdam and Dunkerque. Promoted to field marshal in July 1940, Kesselring continued to command Luftflotte 2 in the Battle of Britain (July 10–September 30, 1940), when he advised Adolf Hitler to concentrate on London to bring up the Royal Air Force (RAF) so that it might be destroyed. Kesselring also commanded Luftflotte 2 in the invasion of the Soviet Union in June 1941. With some 1,000 aircraft, this force was the largest German air fleet in the invasion.

In December 1941, Kesselring went to Italy as commander in chief, south, a post he held until March 1945. His command encompassed the Mediterranean Basin, and there, he won the nickname “Smiling Albert” for his ability to get along with Italian leaders. Kesselring believed that the key to the supply situation in North Africa was control of Malta, and he urged Hitler to take the island by airborne assault. Hitler pledged to do so but never acted.

Field Marshal Albert Kesselring, one of the most capable German military commanders of the war. (Library of Congress)

Kesselring won admiration for the skillful Axis evacuations of Tunis in May 1943 and Sicily in August 1943 as well as the defense of Italy. Badly injured in a car accident in October 1944, he underwent successful brain surgery and returned to his command the following January. On March 8, 1945, he succeeded Field Marshal Karl R. Gerd von Rundstedt as Oberbefehlshaber West (commander in chief, west).

On April 15, Hitler divided the remaining Reich into two defensive zones. Grand Admiral Karl Dönitz took command of the north, and Kesselring received command of the south. Kesselring surrendered his forces to the Western Allies on May 7, 1945.

Tried after the war for his role in the March 24, 1944, Ardeatine Massacre, Kesselring was sentenced to death in 1947, but his sentence was reduced to life in prison. He was released in October 1952 as “an act of

clemency" when he developed cancer. Kesselring then wrote his memoirs (published in English as *A Soldier's Record*), which criticized Hitler only for certain military decisions. Kesselring also headed the Stahlhelm, a right-wing German veterans' organization. He died in Bad Nauheim on July 20, 1960.

Keyes, Geoffrey (1888–1967)

U.S. Army lieutenant general. Born in Bayard, New Mexico, on October 30, 1888, Geoffrey Keyes graduated from the U.S. Military Academy at West Point in 1913 and was commissioned in the cavalry. He graduated from the Command and General Staff School (1926) and taught tactics at the Cavalry School, Fort Riley, Kansas (1933–1936). He then graduated from the Army War College (1937) and headed the Supply and Transportation Branch, Supply Division, War Department General Staff (1939–1940), as a colonel.

Assigned in 1940 as chief of staff of the new 2nd Armored Division, Keyes became a close personal friend and protégé of Major General George S. Patton Jr. Promoted to brigadier general in January 1942 and to major general that June, Keyes was Patton's deputy in the Western Task Force

invading North Africa on November 8, 1942. Between 1943 and 1945, Keyes commanded II Corps. In Sicily with Patton's Seventh Army, he directed the provisional corps that captured Palermo in late July 1943.

With II Corps in Lieutenant General Mark Clark's Fifth Army in Italy, Keyes's first major action was a failure—the poorly planned and badly executed attack across the Rapido River in January 1944. Fortunately for Keyes, most of the blame for the debacle was assigned to Major General Fred L. Walker, commander of the 36th Infantry Division. Although not assigned a prominent role in either the May 1944 drive on Rome or the April 1945 final offensive into the Po Valley, II Corps usually performed competently under conditions that were anything but conducive to maneuver and rapid movement.

Throughout the 1943–1945 Italy Campaign, Keyes got along reasonably well with the often difficult Clark. Keyes made numerous tactical suggestions, most of which Clark ignored. Keyes might have taken over the Fifth Army in December 1944 when Clark moved up to 15th Army Group had not Lucian Truscott, already a lieutenant general, been available. Keyes was promoted to lieutenant general in April 1945.

Keyes took command of the Seventh Army in 1945 and the Third Army in 1946 in Germany. The following year, he succeeded Clark as U.S. high commissioner on the Allied Council for Austria. Retiring from the army in 1950, Keyes died in Washington, D.C., on September 17, 1967.

Keyes, Roger John Brownlow (1872–1945)

British Royal Navy admiral. Born in Tundiani, India, on October 4, 1872, Roger John Brownlow Keyes joined the Royal Navy in 1887. He took part in anti–slave trade campaigns and distinguished himself during the 1900 Boxer Uprising in China. By 1905, he was a captain and was regarded as one of the most promising Royal Navy officers. In 1912, Keyes was appointed as commodore in charge of the submarine service. In 1917 he became chief of staff to Admiral Sackville Carden, commander of the Dardanelles Campaign. In October 1917, Keyes became director of plans for the Admiralty. Promoted to vice admiral, he was made commander of the Dover Patrol in January 1918. Rewarded with a baronetcy and promotion to admiral of the fleet, he became the Conservative member of Parliament for North Portsmouth in 1934 and retired from the navy in 1935.

When World War II began, Keyes staunchly supported First Lord of the Admiralty Winston L. S. Churchill's ill-considered efforts in Norway in 1940, and his parliamentary speech of May 7, 1940, criticizing the government's record, helped cause the fall of Prime Minister Neville Chamberlain and his replacement by Churchill. Three days later, Keyes became British liaison officer to King Leopold III of Belgium until the latter signed an armistice with Germany on May 27, 1940.

In July 1940, Churchill appointed Keyes director of combined operations. As such, he was responsible for the early planning of British efforts to return to continental Europe, including organizing a special force of commandos intended to mount unconventional secret raids against enemy targets. He expanded this organization substantially and won it considerable independence from supervision by the army, navy, marines, and air force. In the autumn of 1941, however, Churchill's decree that Keyes should not direct commando operations but simply organize and train the units and advise on their use led the admiral to resign. Lord Louis Mountbatten replaced him. In late November, Keyes's son Geoffrey died in an unsuccessful commando raid intended to assassinate German general Erwin Rommel, for which he won the Victoria Cross.

Although Keyes criticized in Parliament the government's handling of the war, he was made a peer, Baron Keyes of Zeebrugge and Dover, in January 1943. He undertook minor government assignments thereafter and lectured

widely in the summer of 1944. Keyes died in Buckingham, England, on December 26, 1945.

Khalkhin Gol, Battle of (May–September 1939)

A large-scale border clash from May to September 1939 between Japanese (including Manchurian) and Soviet (including Mongolian) forces around Khalkhin Gol (Nomonhan) on the Mongolian-Manchurian border. Small skirmishes between Manchurian and Mongolian border guards escalated in May 1939 into a clash between Japanese and Soviet forces supporting their respective satellite states of Manzhoudiguo (Manchuko) and the Mongolian People's Republic. In late May, a Japanese reconnaissance unit of the 23rd Division that had crossed the Khalkha River was encircled and annihilated by a Soviet mechanized battalion and Mongolian cavalry.

Japanese Guandong (Kwantung) Army leaders were determined to repel the Soviets and settle the border dispute in Japan's favor. They ordered in Lieutenant General Komatsubara Michitarō's 23rd Division, committing its infant tank corps of approximately 100 tanks and armored vehicles. In the resulting fighting, Japan lost more than 40 tanks within a week, and the remainder were withdrawn. Thereafter, the only antitank weapons available to the Japanese infantry were 37mm antitank guns and improvised gasoline bombs—what would become known as Molotov cocktails.

Meanwhile, in June, General Georgii K. Zhukov was appointed commander in chief of the Soviet LVII Special Army Corps in the battle. He

held the front line until the Japanese offensive lost its steam by mid-July. Both sides then began preparations for the next phase. As the Japanese contemplated a prolonged winter operation, the Soviets secretly assembled a massive force of two infantry divisions, tank and armored brigades, and more than 550 aircraft for a general offensive. Zhukov mobilized several thousand trucks to maintain the 390-mile supply line between the railway terminal depot and the front line.

The Soviets launched their counterattack on August 20, and within a week all of the Japanese front line had been cut off, encircled, and destroyed. The battle was virtually a fight between tanks and artillery on the Soviet side and small arms and bayonets on the part of the Japanese.

Although the Japanese achieved a minor tactical success in the final stage of the conflict (a night attack by Colonel Miyazaki Shigesaburo's regiment that pushed back a portion of the Soviet line), overall the battle was a shattering defeat for the Imperial Army. Its 23rd Division sustained a casualty rate of more than 70 percent. Total Japanese casualties came to 19,904 killed or wounded. Soviet and Mongolian casualties were even higher: 7,974 killed or missing and 15,925 wounded, for a total of 23,899. The Soviets lost some 350 aircraft and more than 300 tanks and armored vehicles during the fighting. However, the border dispute was settled in favor of the Soviets and Mongolians in an armistice arranged in Moscow in September 1939 between Soviet commissar of foreign affairs Vyacheslav Molotov and Japanese foreign minister Tōgō Shigenori.

This battle demonstrated Japanese backwardness in artillery doctrine, armored warfare, and logistics. The Japanese Army, hampered by the continuing fighting in China, lacked the will, time, and resources to correct these defects before the start of the Pacific war in December 1941. In contrast, the fighting increased Soviet confidence in their integration of armor, artillery, and infantry, supported by in-depth logistical systems.

Politically, the Japanese Army lost its confidence in a "northern advance" strategy into the Soviet Union and began seeking an alternative in expansion to the south, which inevitably led to increased friction with Britain and the United States. The Japanese military reversal at Khalkhin Gol also induced Tokyo to sign a neutrality pact with the Soviet Union in April 1941. The Soviet Union, which concluded its own nonaggression pact with Germany on August 23, 1939, in the final stage of the Battle of Khalkhin Gol, was now

able to concentrate its attention on the partition of Poland between itself and Germany.

Kharkov, Battles of (1941–1943)

Three separate battles were fought for control of the key Ukrainian city of Kharkov, an important rail and manufacturing center producing aircraft, tanks, and small arms. During Operation BARBAROSSA, the initial German invasion of the Soviet Union, Kharkov lay in the path of Army Group South's Sixth Army, commanded by Field Marshal Walther von Reichenau. During October 20–24, 1941, Kharkov was taken by Major General Anton Dostler's 57th Infantry Division attacking from the south and Lieutenant General Josef von Haydringen's 101st Light Division moving from the north. The city was defended by the Red Army's 216th Rifle Division, part of Major General Aleksei Maslov's Thirty-Eighth Army.

During the Red Army's Winter Offensive from December 6, 1941, to May 7, 1942, the Ninth and Fifty-Seventh Armies pushed across the Izium River and drove a salient deep into the sector of Colonel General Hermann Hoth's Seventeenth Army, threatening to envelop Kharkov from the south. The Second Battle of Kharkov began on May 12, when units of Marshal Semyon Timoshenko's Southwest Front tried to break out of the Izium bridgehead and continue the offensive against the German Sixth Army, now commanded by Colonel General Friedrich Paulus. Timoshenko intended to

recapture Kharkov, and initially his forces made good progress, penetrating up to 60 miles west of the Izium.

On May 17, Field Marshal Ewald von Kleist's First Panzer Army and the Seventeenth Army, now commanded by Colonel General Hans von Salmuth, broke into the Soviet southern flank. At that point the Germans had a local superiority of 4.4 to 1 in tanks, 1.3 to 1 in infantry, and 1.7 to 1 in artillery. Timoshinko requested permission to withdraw, but by the time Soviet premier Joseph Stalin had responded, the Sixth Army penetrated the salient from the north and sealed the pocket. By the time the battle ended on May 22, German forces had suffered some 20,000 casualties and lost 38 aircraft. The Red Army sustained 277,000 casualties and lost 1,250 tanks, 2,080 artillery pieces, and 540 aircraft.

The Third Battle of Kharkov was fought between February 19 and March 15, 1943. Following their victory at Stalingrad in early February 1943, the Soviet Voronezh and Southwestern Fronts under Generals Filipp Golikov and Nikolai Vatutin drove to the Donets River and recaptured Kursk, Rostov, and Kharkov. During a visit to the front on February 17–19, 1943, Hitler ordered a counterattack. In the resulting offensive action, Field Marshal Eric von Manstein's Army Group South struck the Soviet flank with an attack from the south by Hoth's Fourth Panzer Army and Colonel General Eberhard von Mackensen's First Panzer Army. Army Group South had only 350 operational tanks at that point, but the Germans managed to achieve a seven-to-one superiority over the Soviets at the point of the main effort.

German soldiers, dislodged from a house on the outskirts of Kharkov, taking cover outside a building that has been set on fire, February 23, 1943. (Keystone/Getty Images)

During a running battle from Krasnoarmeiskaia to the northern Donets River, the Fourth Panzer Army's XL Panzer Corps encircled and destroyed what was left of Mobile Group Popov. On February 22, the Fourth Panzer Army's SS Panzer Corps and LVIII Panzer Corps attacked Vatutin's Southwest Front, the leading XXV Tank Corps of which was within 12 miles of Zaporozhye. Having run out of fuel, the men of the XXV Tank Corps abandoned their equipment and attempted to escape to the north. For the most part this was successful, as the Germans took only 9,000 prisoners.

On March 1, Manstein began an advance on Kharkov, attempting to get behind the Red Army forces west of that city. The Soviets were then driving against Army Detachment Kempf, commanded by General of Panzer Troops Werner Kempf. A five-day battle for the city raged, with the Fourth Panzer Army getting the better of Lieutenant General Pavel S. Rybalko's Third Tank

Army, which had been sent to reinforce the hard-pressed Southwestern Front but had gone on to Kharkov only to be cut off there with the start of the rainy season. By March 5, the Germans had mauled the units of the Third Tank Army on the Berestovaya River southwest of the city, capturing 61 tanks, 225 guns, and 600 motor vehicles in a small pocket at Krasnograd.

Manstein wanted to proceed west to attack the rear of the Soviet Voronezh Front, forcing it to fight simultaneously in two directions near Poltava, but rain and mud forced the Germans to resort to a strike on the Soviet flank from the south on March 7. This had some success and resulted in a wedge between the Soviet Third Tank and Sixty-Ninth Armies, with pressure from the west as Army Detachment Kempf was freed for action. Meanwhile, the Soviets brought up the II Guards Tank Corps from the east. The SS Panzer Corps, apparently intending to present the trophy city of Kharkov to Hitler, had to be restrained to prevent it from launching a frontal assault on the city, which Manstein feared could produce another Stalingrad.

Hitler's visit to Manstein's headquarters on March 10 probably inspired SS Panzer Corps commander SS-Obergruppenführer Paul Hauser to disobey orders and commit the 2nd SS Panzer Division ("Das Reich") and the 1st SS Panzer Division ("Leibstandarte Adolf Hitler") to three days of house-to-house battles, bringing a German recovery of Kharkov on March 14, 1943. At the same time, to the north of Army Detachment Kempf the Gross Deutschland Division moved rapidly on Belgorod. At Gaivoron, the Germans wiped out Soviet armored forces that tried to defend Belgorod.

The captures of Kharkov and Belgorod marked the end of the German counteroffensive that reestablished the Donets-Mius Line. The German suffered some 11,500 casualties. The two Soviet fronts sustained together 86,000 casualties and lost more than 1,200 tanks and 900 artillery pieces. The Soviets finally retook Kharkov for good on August 23, 1943, following their victory at the Battle of Kursk.

Kholm Pocket (January 23–May 5, 1942)

With the German failure to capture Moscow in December 1941, Chancellor Adolf Hitler ordered the Wehrmacht to hold in place along the entire Eastern Front. Before the Germans could stabilize these, Soviet Army general Georgi Zhukov launched an offensive against German field marshal Fedor von Bock's Army Group Center. Although many German military leaders favored a withdrawal, Hitler ordered the army to stand in place regardless of the cost, and the Germans held.

On January 7, 1942, the Red Army launched a pincer drive south of Lake Ilmen that resulted in the Demyansk Pocket on February 8 containing almost 100,000 Germans. On January 9, the Soviets began their Toropets-Kholm Offensive of a southern pincer. The Red Army's objective was to penetrate deeply into Army Group Center. On January 16, their Third Shock Army captured Andreapol, some 18 miles north of Kholm, destroying the German 189th Infantry Regiment of the 81st Infantry Division. On January 19, the Soviet Third and Fourth Shock Armies pushed toward Kholm, catching the Germans by surprise. Though they were only lightly equipped, Soviet forces managed to overrun the 123rd Infantry Division. On January 20 the Fourth Shock Army captured the large German supply dump at Toropets, providing needed fuel and ammunition. Then on January 22, the Third Shock Army engaged the 218th Infantry Division at Kholm.

The next day, January 23, the Soviets succeeded in surrounding 5,500 German soldiers, most of them from the 218th Infantry Division of II Corps, which itself would soon be entrapped at Demyansk. This created what

became known as the Kholm Pocket. In addition to the 218th Infantry Division, those caught in the pocket included elements of the 123rd Infantry Division; the 553rd Infantry Regiment of the 329th Infantry Division; the 3rd Battalion, 1st Luftwaffe Field Regiment; and the 65th Police Battalion.

On February 2, the Third Shock Army attacked the pocket, but the German defenses held. The attack was not sustained, as the Soviets were more interested in destroying the German forces now encircled at Demyansk. All the Red Army had to do was keep the pocket intact. As in the case of the Demyansk Pocket, the Germans at Kholm were resupplied by air. However, as the pocket was relatively small and aircraft landing was difficult, much of the airborne resupply was through airdrops, many of which fell outside the pocket. Also, as at Demyansk, the airdrop supplies could not keep up with consumption. By the middle of March German forces were dangerously low on rations and ammunition.

German major general Theodor Scherer commanded at Kholm. With virtually no heavy weapons and German artillery support some 10 miles distant, Kampfgruppe Scherer held off more than 100 Soviet infantry attacks, many with tank support, during a span of 105 days. Understanding Soviet tactics, Scherer was able to determine when and where the assaults were likely to occur and employed mortar and machine-gun fire to defeat the infantry assaults, resulting in heavy Soviet losses.

One particularly significant Soviet attack began on February 13, when 23,000 troops in two assault groups attacked the southwest and east sectors of the German defenses at Kholm. One body supported by T-34 and T-60 tanks and artillery and rocket launchers struck Kholm’s southwest sector. Farther to the east, a second Soviet infantry assault group supported by British-made Matilda II tanks hit the 218th Infantry Division’s 386th Infantry Regiment. The Soviets made deep advances into the pocket and actually attacked Scherer’s headquarters. Scherer’s troops were able to close the breech after five days of hard fighting but suffered 550 casualties in the process. Severe cold and frostbite also exacted a toll of the German defenders, while poor weather conditions severely limited Luftwaffe support.

The Germans made three attempts to relieve the pocket. The first came in late January, immediately after its formation. The second began on March 6 but was broken off on the 31st. The third attempt on May 5 by the 411th Grenadier Regiment of the 122nd Infantry Division finally breached the

pocket. Only 1,200 of the original 5,500 German defenders remained. Hitler awarded Scherer the Oak Leaves to the Knight's Cross of the Iron Cross. Upon Scherer's recommendation, the Kholm Shield was awarded to all those German soldiers who had been trapped in the Kholm Pocket. Kholm was held by German forces until February 21, 1944.

Khozin, Mikhail Semenovich (1896–1979)

Soviet Army general. Born in the village of Skachikha, Russia, on October 22, 1896, Mikhail Khozin served as a junior officer in the Russian Army during World War I before joining the Red Army and the Communist Party in 1918. He held a variety of assignments, and by the time of the German invasion of the Soviet Union in June 1941, Khozin was a lieutenant general heading the Frunze Military Academy.

In October 1941, Khozin took command of the Leningrad Front. Soviet dictator Joseph Stalin demoted him after he promised but failed to save General Andrei Vlasov's Second Shock Army. Between June and October 1942, Khozin commanded the Thirty-Third Army. He briefly commanded the Twentieth Army (from December 1942 to January 1943). Khozin died in Moscow on February 27, 1979.

Kiev Pocket, Battle of the (August 21–September 26, 1941)

Significant German encirclement of Soviet forces on the Eastern Front in 1941. Operation BARBAROSSA, the German invasion of the Soviet Union, began on June 22. A month later, sharp disagreements developed between German chancellor Adolf Hitler and his senior generals concerning strategy. The generals—led by the army chief of staff, Colonel General Franz Halder, and the army commander, Colonel General Walther von Brauchitsch—pointed out that not all German Army groups would be able to accomplish their assigned tasks. Field Marshal Fedor von Bock's Army Group Center was advancing faster than the weaker Army Groups North and South. At the same time, Hitler was preoccupied with securing the industrial and agricultural heartland of Ukraine and the Crimea and linking up with the Finns at Leningrad.

As a result, Hitler decided on July 19, in Führer Directive 33, to divert substantial panzer units from Army Group Center, thereby postponing the drive on Moscow. He sent Colonel General Hermann Hoth's 3rd Panzer Group north to assist in the drive to Leningrad and Colonel General Heinz Guderian's 2nd Panzer Group south to deal with the bulge created by Soviet colonel general Mikhail Petrovich Kirponos's Southwestern Front, with its mechanized corps. The German generals argued against this decision, pointing out that Moscow was the more important objective. Not only was Moscow the political capital of the Soviet Union, but it was also a major industrial area and transportation nexus. Attempts to convince Hitler that the advance on Moscow was more important failed, and he issued a final directive on August 21 for a major encirclement operation, with the goal of destroying Soviet forces in northern Ukraine.

On July 10, Soviet leader Joseph Stalin had appointed Marshal of the Soviet Union Semyon Mikhailovich Budenny to command the Southern and Southwestern Groups. German forces advanced under the capable leadership of Field Marshal Karl Gerd von Rundstedt, commander of Army Group South. Stalin poured troops into the new command, amounting ultimately to almost 1 million men, insisting that the Dnieper River Line be held at all costs.

In Uman, the Germans encircled Budenny's forces of the Sixth, Twelfth, and Eighteenth Armies. He remained stationary as Colonel General Ewald von Kleist's 1st Panzer Group drove around his flank to the southeast. Kleist's panzers advanced north even as Guderian's 2nd Panzer Group attacked south through the weakly held northern flank of the Southwestern Front, aiming for a linkup east of Kiev. When Soviet Army chief of staff General Georgii Zhukov tried to point out the dangers of encirclement to Stalin on August 5, the latter sent him to Leningrad's defense and appointed Marshal of the Soviet Union Boris Mikhailovich Shaposhnikov in his stead.

By early September, Kiev was a salient endangered by advancing German troops to the north and the south. An attempt by Lieutenant General Andrei Ivanovich Yeremenko's newly formed Bryansk Front to halt Guderian's push south failed on September 2, and by September 11 the German pincers were closing on Kiev. Budenny requested authority to retreat, but Stalin preferred to replace him with Marshal Semen Konstantinovich Timoshenko. On September 12, Kleist's panzers broke through the Soviet Thirty-Eighth Army, attacking north from bridgeheads at Cherkassy and Kremenchug.

Despite the onset of the rainy season, the 1st and 2nd Panzer Groups linked up at Lokhvitsa, 125 miles east of Kiev, on September 16. Timoshenko and Nikita Khrushchev, representing the War Council of the Southwestern Direction, authorized a Soviet withdrawal, but Kirponos feared Stalin's reaction and refused to move until Moscow confirmed the orders near midnight the next day.

The encirclement was still sufficiently porous to allow some Soviet forces to escape, including Timoshenko, Khrushchev, and Thirty-Seventh Army commander Andrei Vlasov (whose forces had defended Kiev skillfully), but Kirponos was among the dead. The Soviet Fifth and Twenty-First Armies were destroyed, along with major portions of the Thirty-Seventh and Fortieth Armies. Army Group South also claimed 665,000 Soviet prisoners taken,

along with 3,500 guns and 900 tanks. For all practical purposes, the Soviet Southwestern Front ceased to exist. It had to be entirely reconstructed from the nucleus of 15,000 men who escaped the disaster.

This was one of the greatest German tactical victories of the war. Yet despite opening a 200-mile gap in Soviet defenses and permitting the investment of the eastern Ukraine, it had negative strategic consequences for Germany. Senior German commanders, including Halder and Guderian, concluded that it had been a major blunder, ultimately dooming the German attempt to take the Soviet capital in 1941.

Kikkawa Kiyoshi (1900–1943)

Japanese Navy vice admiral. Born on November 3, 1900, in Hiroshima Prefecture on Honshu, Kikkawa Kiyoshi graduated from the Japanese Naval Academy in 1922 and from gunnery school in 1924. From that time to 1939, he captained a succession of destroyers. In 1940, he was promoted to commander and assigned as captain of the destroyer *Oshio* in the 8th Destroyer Flotilla of the Second Torpedo Fleet.

During the Japanese invasion of the Netherlands East Indies, Kikkawa particularly distinguished himself in the Battle of Lombok (Badeong Strait) on the night of February 19–20, 1942, when his ship sank the Dutch destroyer *Piet Hein* by gunfire and torpedoes. Assigned to command the destroyer *Yudachi* in May, on the night of September 4–5 he successfully carried out a resupply mission to Guadalcanal in the Solomon Islands, also shelling Henderson Field and sinking the U.S. destroyer-transports *Little* and *Gregory*.

Kikkawa was active through the August 1942–February 1943 Guadalcanal Campaign and especially in the fighting on November 12–15, during which the *Yudachi* was sunk. Wounded but rescued, Kikkawa returned to Yokosuka to recover.

Offered the position of instructor at the Japanese Naval Academy, he refused the assignment, insisting that he return to battle as a destroyer captain. In 1943 he took command of the newly constructed destroyer *Onami*.

Kikkawa was eager for battle, and his destroyer was one of five returning from a supply run to Buka Island north of Bougainville when the Japanese force was intercepted by five U.S. destroyers commanded by Captain Arleigh Burke on the night of November 24, 1943. In the Battle of Cape St. George the next day, the *Onami* was hit by U.S. torpedoes, the first of three of the Japanese destroyers sunk in the battle for no U.S. losses. Kikkawa was among the more than 640 Japanese to die in the battle. His superiors were unstinting in their praise, and he was posthumously promoted two grades, to vice admiral.

Kimmel, Husband Edward (1882–1968)

U.S. Navy admiral. Born in Henderson, Kentucky, on February 26, 1882, Husband Edward Kimmel graduated from the U.S. Naval Academy at Annapolis in 1904 and was commissioned an ensign in 1906. During the next years, Kimmel served on battleships; participated in the 1914 intervention at Veracruz, Mexico; served as a naval aide to Assistant Secretary of the Navy Franklin D. Roosevelt; and was staff gunnery officer for the U.S. battleship squadron, attached to the Royal Navy's Grand Fleet during World War I.

Admiral Husband E. Kimmel, commander of the U.S. Navy Pacific Fleet at the time of the Japanese attack on Pearl Harbor. (Ullstein Bild via Getty Images)

Kimmel, a highly regarded gunnery expert, rose to the rank of rear admiral in 1937 and served at the Naval Gun Factory; he also commanded a destroyer squadron, attended the Naval War College, commanded the battleship *New York*, and served as chief of staff of the battleships in the

Battle Force. From 1937 to 1939, he was budget officer of the navy, and following command of a cruiser division and of cruisers in the Battle Force, Pacific Fleet, he was named commander of the U.S. Pacific Fleet in February 1941 as a full admiral.

During the next months, Kimmel put the Pacific Fleet through a vigorous training program in preparation for a possible war with Japan and refined plans for offensive operations in the Western Pacific. Following the Japanese attack against Pearl Harbor on December 7, 1941, which put all of the Pacific Fleet's battleships out of commission, he was relieved of his command.

Kimmel has been the subject of considerable controversy for his actions preceding the Japanese attack. Several investigations and historians determined that he was too lax in his command and not sufficiently prepared for the possibility of war. His defenders—and Kimmel himself—believed that he was made a scapegoat for the failures of Washington officials, arguing that he was denied both crucial intelligence about deteriorating Japanese-U.S. relations and adequate numbers of long-range reconnaissance aircraft. Pearl Harbor had a narrow mouth, and Kimmel's decision not to deploy torpedo nets so the ships could exit more quickly added to the destruction of the Japanese attack.

On March 1, 1942, Kimmel retired in disgrace. Thereafter, he was employed by an engineering consulting firm until 1947. He died in Groton, Connecticut, on May 14, 1968.

Kimura Heitaro (1888–1948)

Japanese Army general. Born in Tokyo on September 28, 1888, Kimura Heitaro joined the army in December 1908. Although trained in the artillery, he held a number of unusual positions, including that of resident officer in Germany during 1922–1925. By 1938, Kimura was a lieutenant general. After commanding the 32nd Division, he served as chief of staff of the Guandong (Kwantung) Army in Manchuria.

Kimura sided with those who favored Japanese expansion, and from April 1941, he was vice minister of war and a close adviser to General Tōjō Hideki, helping develop the Japanese military strategy for war with the United States. When Japanese efforts to secure Guadalcanal failed, Kimura became the scapegoat, and he was removed from his post in March 1943.

Kimura returned to active military duty in August 1944, succeeding Kawabe Masakazu as commanding general of the Burma Area Army; Kawabe had been sacked as a result of the disastrous Imphal Campaign (March–July 1944). Kimura commanded three armies of 250,000 men in 10 divisions. Expecting an attack by the British Fourteenth Army during the dry season, along the lines of earlier attacks, he planned to withdraw behind the Irrawaddy River and counterattack when British supply lines were overextended. But British commander Lieutenant General William Slim learned of Kimura's intention and revised his own plan. Employing aerial resupply, Slim was able to move forces through difficult terrain to Meiktila and Mandalay.

Kimura was surprised and outmaneuvered. In fighting between February 21 and March 31, 1945, the British effectively destroyed the Fifteenth Army. Kimura then precipitously abandoned Rangoon, leaving behind much equipment and many troops. Occupying the city on May 2, the British improved their supply lines and were in a position to continue their advance when weather permitted.

Kimura was promoted to full general in May 1945. Following the war, he was arrested and tried for war crimes. Convicted of mistreating prisoners of war during the construction of the Burma-Thailand Railroad, he was executed in Tokyo on December 23, 1948.

Kimura Masatomi (1891–1960)

Japanese Navy vice admiral. Born in Shizuoka Prefecture, Japan, on December 6, 1891, Kimura Masatomi graduated from the Japanese Naval Academy in 1913. He spent virtually his entire naval career in smaller surface vessels. He specialized in mine warfare between 1923 and 1925 and then commanded destroyers. Kimura commanded several cruisers in the late 1930s and was promoted to rear admiral in November 1942.

The navy recognized Kimura's outstanding leadership qualities when he received command of the 3rd Destroyer Squadron in the South Pacific on February 14, 1943. At the end of that month, his eight destroyers escorted eight Japanese transports carrying reinforcements to Lae, New Guinea. Allied aircraft discovered the convoy soon after it left Rabaul on February 28, and on March 3 Allied bombers attacked and sank two of the transports. Kimura then detached two destroyers to pick up survivors and rush them to Lae. He and the remaining six destroyers continued doggedly on course at the best speed the transports could make.

On March 4, U.S. and Australian aircraft again attacked, this time at low level, strafing and skip-bombing and sinking the six remaining transports and four of the destroyers. More than 3,000 Japanese died in what became known as the Battle of the Bismarck Sea (March 2–5). Kimura was among the many wounded.

The outcome of the battle was not held against Kimura. When he recovered from his injuries, he assumed command of the 1st Destroyer Squadron, part of the Japanese Fifth Fleet in the North Pacific. His major task was to evacuate Kiska Island in the Aleutians. Skillfully utilizing a bad-weather advantage, he took two cruisers and six destroyers into Kiska Harbor

on July 28 at 5:40 p.m. In only 55 minutes, they embarked 5,183 troops and departed. He did not lose a man or a ship in the operation.

Kimura's last surface action came in December 1944. The Battle of Leyte Gulf on October 23–26 had destroyed the Japanese fleet as a fighting force, and Kimura led two cruisers and six destroyers from Camranh Bay in Indochina against the U.S. beachhead at San Jose on Mindoro. The ships sortied on December 24 and were not discovered until they were within 200 miles of their destination. Despite Allied air attacks against his ships, Kimura shelled the U.S. positions ashore for a half hour. In the operation he lost one destroyer, but the other ships returned to Camranh Bay.

In the final months of the war, Kimura held several senior staff positions. He was promoted to vice admiral in November 1945 and retired that month. He died in Tokyo on February 14, 1960.

King, Edward Postell, Jr. (1884–1958)

U.S. Army major general. Born in Atlanta, Georgia, on July 4, 1884, Edward Postell King Jr. received a law degree from the University of Georgia in 1903. He began his military career with the Georgia National Guard. In 1908, he was commissioned a second lieutenant in the U.S. Army and assigned to the 6th Field Artillery Regiment. In the following years, King served in the Philippines, did three tours in the Office of the Chief of Field Artillery, and was both a student and an instructor at the Command and General Staff

School and the Army War College. He also graduated from the Naval War College.

In September 1940, Brigadier General King returned to the Philippines to command Fort Stotsenburg. Later, he supervised artillery training for the Philippine Army. During the first months of World War II, King, now a major general, was artillery officer for General Douglas MacArthur, commander of U.S. forces in the Far East. On March 21, 1942, Lieutenant General Jonathan Wainwright, commander of all U.S. forces in the Philippines, appointed King to head the Luzon Force, which was responsible for defending the Bataan Peninsula, the last major piece of territory on Luzon still in American hands.

King had more than 80,000 men under his command, but their situation was hopeless. Short of food, wracked by disease, exhausted from months of fighting, and cut off from any reinforcement, they were unable to stop the Japanese offensive launched on April 5 to complete the conquest of the peninsula. King had orders from Wainwright and MacArthur to counterattack; however, he was fearful that his men would be massacred by the advancing Japanese and, on his own initiative, surrendered his force on April 9, the greatest capitulation in U.S. military history.

King spent the remainder of the war in Japanese prison camps in the Philippines, Formosa, and Manchuria. After the war, he served on the secretary of war's personnel board until his retirement in November 1946. King died in Brunswick, Georgia, on August 31, 1958.

King, Ernest Joseph (1878–1956)

U.S. Navy fleet admiral and chief of naval operations. Born in Lorain, Ohio, on November 23, 1878, Ernest Joseph King graduated from the U.S. Naval Academy at Annapolis in 1901. He subsequently served in a variety of assignments on cruisers and battleships and at the Naval Academy, where he was an instructor of ordnance and gunnery from 1906 to 1908. King commanded a destroyer in 1914. Between 1916 and 1919, he served on the staff of the commander of the Atlantic Fleet.

In 1919 King, now a captain, headed the naval academy's postgraduate school. During the next seven years, the ambitious, hard-driving King specialized in submarines. In 1926, he took command of an aircraft tender and was senior aide to the commander of Air Squadrons, Atlantic Fleet. In 1927 King underwent flight training, and the next year he became assistant chief of the Bureau of Aeronautics. In 1929 he commanded the Norfolk Naval Air Station, and from 1930 to 1932 he commanded the aircraft carrier *Lexington.*

After graduating from the Naval War College and being promoted to rear admiral, King served as chief of the Bureau of Aeronautics from 1933 to 1936. He spent the next five years in senior naval aviation assignments, including a tour as commander of the Aircraft Base Force. In 1938, he was promoted to vice admiral. Appointed to the Navy General Board in 1939, King criticized the lack of war preparations, recommending that should the United States go to war with Japan, it had to follow an offensive Pacific naval strategy. He also proposed measures for the better integration of aircraft, submarines, and small fast ships with battleships and aircraft carriers.

U.S. admiral of the fleet and chief of naval operations Ernest Joseph King. (Library of Congress)

In February 1941, King was promoted to admiral and appointed commander of the Atlantic Fleet. On December 30, 1941, following the Japanese attack on Pearl Harbor, he became commander in chief of the U.S. Fleet. The following March, President Franklin D. Roosevelt appointed King as chief of naval operations, making him the only U.S. Navy officer ever to hold both positions concurrently.

As a member of the Joint Chiefs of Staff, King was a major architect of wartime strategy. He vigorously prosecuted a two-front war in both the Atlantic and the Pacific but consistently gave higher priority to operations utilizing naval forces. He was committed more to extensive Pacific operations, which relied heavily on naval power, than his colleague General George C. Marshall, the army chief of staff, who generally followed a Europe-first strategy.

King forcefully directed a strategy of aggressive advance against Japan through the Central Pacific, later modified to include a second, southwestern, offensive by way of the Philippines and Taiwan. Despite feuds over authority with Secretary of the Navy Frank Knox and his successor, James Vincent Forrestal, King successfully built up U.S. naval forces, introduced tactical and technological innovations, and contributed heavily to the Allied victory in the Pacific.

In October 1945 King abolished the position of commander in chief of naval forces, and in December he retired, succeeded as chief of naval operations by Fleet Admiral Chester W. Nimitz. Over the next decade, King served as a special adviser to the secretary of the navy and also headed the Naval Historical Foundation. He was one of the few naval officers in history fully qualified in all three of the modern U.S. Navy's combatant communities —surface warfare, submarines, and aviation. King died in Portsmouth, New Hampshire, on June 25, 1956.

King, William Lyon Mackenzie (1874–1950)

Wartime prime minister of Canada. Born on December 17, 1874, at Berlin (now Kitchener), Ontario, Canada, Mackenzie King graduated from the University of Toronto and did graduate work at the University of Chicago. He was appointed Canada's first deputy minister of labor and then served as minister of labor (1908–1911). King spent the war years in the United States as the chief labor mediator for the Rockefellers, but in 1919 he returned to Canada to seek the leadership of the Liberal Party, which had been shattered by the 1917 conscription crisis. King revived the Liberals, becoming the Canadian prime minister in 1921 and winning subsequent elections in 1925, 1926, and 1935. During the 1920s, he played the central role in Canada's transition to an autonomous dominion.

A skillful administrator and consensus builder and an astute politician, King deserves much of the credit for Canada's remarkable economic and military mobilization during World War II. In September 1939, French Canadian support for the war was lukewarm at best, and a great many among the English Canadian majority questioned their fellow citizens' loyalty. King forged a precarious unity by promising his Liberal government would emphasize war production rather than expeditionary forces. This policy of "limited liabilities" did not, however, survive the defeat of France in June 1940. King also promised not to impose conscription for overseas service. Luck—the Canadian army saw little combat until mid-1943—combined with a sincere political effort not to isolate the people of Quebec and simultaneously to reach out to moderate English Canadians almost got the country through unscathed. With the Allies facing a desperate shortage of infantry reinforcements in the autumn of 1944 and with his own leadership at stake, King reluctantly implemented limited overseas conscription that November. In retrospect, his deft handling of the explosive conscription issue was a singular political achievement.

Although Canada's international stature and national pride grew dramatically during the war years, the ever-cautious King was content for the country to continue playing the role of a loyal subordinate. His relationship with British prime minister Winston L. S. Churchill was often strained, but his government still provided enormous military, economic, and financial assistance to the mother country, most of it ultimately at no cost. In contrast, King's relationship with U.S. president Franklin D. Roosevelt was warm.

Common sense dictated that King encourage closer ties with the United States. The wartime advantages of this policy were immeasurable for Canada.

Canadian prime minister Mackenzie King during the Quebec Conference, August 19, 1943. (National Archives)

In the June 1945 election, running on a platform of progressive social and economic measures for the postwar era, King's government won a slender majority. Worn out by his wartime exertions, King retired in October 1948. He died in Ottawa on July 22, 1950.

Kinkaid, Thomas Cassin (1888–1972)

U.S. Navy admiral. Born in Hanover, New Hampshire, on April 3, 1888, the son of U.S. Navy rear admiral Thomas W. Kinkaid, Thomas Cassin Kinkaid graduated from the U.S. Naval Academy at Annapolis in 1908, then served in the Great White Fleet during its circumnavigation of the globe. Kinkaid first served in ordnance capacities and aboard battleships. During World War I, he was assigned as a naval envoy at the British Admiralty. From 1929 to 1930, he attended the Naval War College. Promoted to captain in 1937, he commanded a cruiser, and two years later, he was assigned as naval attaché to Italy and Yugoslavia.

Promoted to rear admiral in late 1941, Kinkaid took command of Cruiser Division 6. In March 1942, he led his ships in raids on Rabaul and New Guinea, then participated in the May 7–8, 1942, Battle of the Coral Sea and the June 3–6 Battle of Midway. In August 1942, Kinkaid assumed command of Task Force 16, centered on the carrier *Enterprise*, and took part in the invasion of Guadalcanal and the battles of the Eastern Solomons (August 22–25) and the Santa Cruz Islands (October 26–27). In January 1943, Kinkaid assumed command of the North Pacific Force in Alaskan waters, his ships participating in the recapture from the Japanese of the Aleutian islands of Attu and Kiska.

Promoted to vice admiral, Kinkaid assumed command of the Seventh Fleet, "MacArthur's Navy," in November 1943, with the mission of providing amphibious lift and protection to General Douglas MacArthur's Southwest Pacific Area forces on their approach to the Philippines. The Seventh Fleet then participated in the defense of landings at Leyte by destroying attacking Japanese forces in Surigao Strait. In January 1945, Kinkaid led the Seventh Fleet in the invasion of Luzon at Lingayen Gulf. Promoted to admiral in April, he took the surrender of Japanese forces in Korea in September 1945.

Following World War II, Kinkaid briefly commanded the Eastern Sea Frontier and then the Sixteenth (Reserve) Fleet. He retired in May 1950 and died in Bethesda, Maryland, on November 17, 1972.

Kirk, Alan Goodrich (1888–1963)

U.S. Navy admiral. Born in Philadelphia, Pennsylvania, on October 30, 1888, Alan Goodrich Kirk graduated from the U.S. Naval Academy at Annapolis in 1909 and then specialized in gunnery and served in the Asiatic Fleet. During the period of U.S. involvement in World War I, Kirk was stationed at the Naval Proving Ground, Dahlgren, Virginia.

In the 1920s Kirk was executive officer of the presidential yacht and served as presidential naval aide. He was then gunnery officer for the battleship *Maryland.* He graduated from the Naval War College in 1929 and then was an instructor there for two years. In 1931 Kirk assumed his first command, a destroyer, and during 1933–1936 he served in the Office of the Chief of Naval Operations. He was then executive officer of the battleship *West Virginia* before taking command of the light cruiser *Milwaukee* and serving as operations officer to the commander of the U.S. Fleet.

In 1939 Kirk became American naval attaché in London, where he familiarized himself thoroughly with Royal Navy procedures, which he strongly admired even though British condescension occasionally irked him. Kirk's forceful advocacy of greater Anglo-American cooperation and urgent warnings in 1940 of Britain's extreme danger helped persuade President Franklin D. Roosevelt and his administration to assist Britain with measures potentially liable to precipitate conflict with Germany.

In March 1941 Kirk became director of naval intelligence, but fierce bureaucratic infighting with the War Plans Division was one reason why, despite clues that Japan planned to attack American forces, his office failed to produce any specific warnings of Japanese intentions. In October 1941 Kirk returned to sea duty as commander of a division of destroyer escorts in the Atlantic Fleet, fortuitously escaping responsibility for the failure to predict the Pearl Harbor raid.

Promoted to rear admiral in November 1941, in March 1942 Kirk became chief of staff to Admiral Harold Stark, commander of American naval forces in Europe. In London, Kirk contributed substantially to Allied strategic planning. In February 1943 he took command of the Amphibious Force, Atlantic Fleet, and that July he led an amphibious naval task force in the Sicily landings (July 9, 1943). Kirk's outstanding success in the face of unexpectedly difficult conditions brought him command of all U.S. naval forces for the June 6, 1944, Normandy landings. Later that year he commanded all U.S. naval forces in France. Kirk was promoted to vice admiral in May 1945.

Kirk retired with the rank of admiral in March 1946. He then served as ambassador to Belgium and minister to Luxembourg until 1949 and spent a further two years as ambassador to the Soviet Union (April 1949–October 1951) and the Republic of China (May 1962–April 1963). Kirk died in New York City on October 15, 1963.

Kirtleside, First Baron Douglas of

See Douglas, William Sholto

Kleist, Paul Ludwig Ewald von (1881–1954)

German field marshal. Born in Braunfels an der Lahn, Germany, on August 8, 1881, Paul Ludwig Ewald von Kleist entered the army in 1900 and rose to the rank of captain by 1914. During World War I, he fought on both the Eastern and Western Fronts. Following the war, he served in artillery and cavalry assignments. Although he was promoted to lieutenant general in August 1936, he retired in February 1938 during German chancellor Adolf Hitler's purge of the army.

Recalled to active duty in August 1939, Kleist commanded the XXII Panzer Corps in the Fourteenth Army during the invasion of Poland. He then assumed command of the army-sized Panzer Group Kleist in the May 1940 invasion of France and the Low Countries, spearheading Army Group A's advance. Promoted to colonel general in July 1940, Kleist commanded the First Panzer Group in the April 1941 invasion of Yugoslavia, then the First Panzer Army in Army Group South in Operation BARBAROSSA, the June 22 invasion of the Soviet Union. His forces pushed into Ukraine and devastated nearly 20 Soviet divisions, assisting in the encirclement of Kiev (August 21–September 2) and establishing a bridgehead west of Rostov (November 17–30) before being forced to retreat that winter.

German field marshal Paul Ludwig von Kleist. (Hulton Archive/ Getty Images)

Kleist's First Panzer Army carried out a decisive counterstroke in the Second Battle of Kharkov (May 1942). Ordered to take the Caucasus oil fields, Kleist saw his forces drained away for the cauldron of Stalingrad (August 23, 1942–February 2, 1943). He commanded Army Group A in November 1942 and proved adept at defensive operations.

Promoted to field marshal in February 1943, Kleist carried out an orderly withdrawal of German forces from the Crimea that October. He then withdrew his force, now designated Army Group South Ukraine, into Romania. Having lost confidence in Kleist, Hitler relieved him of command in March 1944, whereon Kleist was assigned to the Führer Reserve.

Kleist was taken prisoner by the U.S. 26th Infantry Division on April 25, 1945. He was then turned over to Yugoslavia, where he was tried for war crimes, found guilty, and sentenced in 1948 to 15 years in prison. Extradited to the Soviet Union, he was sentenced there to an additional term of

imprisonment. Kleist died at Vladimir Prison Camp in the Soviet Union on October 15, 1954.

Kluge, Günther Adolf Ferdinand von (1882–1944)

German Army field marshal. Born in Posen, Prussia (now Poznan, Poland), into an old aristocratic family on October 30, 1882, Günther Adolf Ferdinand von Kluge joined the army as an artillery officer in 1901. During World War I he served on the General Staff (1916–1918) and was wounded in fighting at Verdun in 1918.

Selected to continue in the Reichswehr after the war, Kluge was promoted to major general in February 1933 and named inspector of Signal Troops. He became a lieutenant general in April 1934 and commanded the 6th Division in Münster. With German chancellor Adolf Hitler's expansion of the army, Kluge commanded VI Corps in 1936. In 1938 Hitler purged Kluge, along with other German generals, for supporting General Werner von Fritsch, who had opposed Hitler's plans for war.

With war looming, Hitler recalled Kluge from retirement in October 1938 and gave him command of the newly established 6th Army Group. Later, the unit was redesignated the Fourth Army. Kluge led it during the invasion of Poland in September 1939. An innovative commander, he won Hitler's admiration and promotion to colonel general.

Kluge led the Fourth Army against France and the Low Countries in May 1940. Promoted to field marshal in July, he went on to command the Fourth Army in the invasion of the Soviet Union on June 22, 1941, and Army Group Center from December 1941 to October 1943, again proving to be an effective field commander.

Injured in a car accident in October 1943, Kluge went on prolonged medical leave. In July 1944, he replaced Field Marshal Karl Gerd von Rundstedt as commander in chief, west, and commander of Army Group B in Normandy. Kluge was aware of the plot to assassinate Hitler but wavered in his support and finally declined to participate. He also failed to report it. Following the bomb attempt on Hitler's life on July 20, 1944, Kluge came under increased suspicion.

Kluge led the German counterattack at Avranches in August but, on its failure, was relieved of command on August 17, 1944, by Field Marshal Walther Model. Kluge wrote to Hitler, urging him to make peace and end the suffering for the German people. Aware that he would be implicated in the conspiracy against Hitler and depressed by the military situation, Kluge committed suicide in Valmy, France, on August 19, 1944.

Knox, William Franklin "Frank" (1874–1944)

U.S. secretary of the navy during much of World War II. Born on January 1, 1874, in Boston, Massachusetts, William Franklin (Frank) Knox followed his political idol and role model, Theodore Roosevelt, and joined the 1st Volunteer U.S. Cavalry (the Rough Riders) in 1898 to fight in Cuba during

the Spanish-American War. After mustering out, Knox became a highly successful newspaper editor and publisher, acquiring papers in Michigan and New Hampshire.

A strong supporter of U.S. intervention in World War I, Knox served in the artillery in France in 1917 and 1918, rising from private to major. After the war, he returned to the newspaper business and was active in Republican politics, running unsuccessfully as the Republican vice presidential candidate in 1936.

Knox firmly believed in the late 1930s that the United States could not remain aloof from the increasingly critical situation in Europe. Thus, although unsympathetic toward President Franklin D. Roosevelt's domestic policies, he strongly endorsed the president's interventionist and pro-Allied international outlook. In 1940, Roosevelt persuaded Knox, together with former Republican secretary of state Henry L. Stimson, to join his cabinet, with Knox serving as secretary of the navy—a step clearly designed to win support from nonisolationist Republicans.

Knox quickly recruited as assistants various able young businessmen and lawyers, such as James V. Forrestal (whom he appointed undersecretary), Ferdinand Eberstadt, and Adlai E. Stevenson. Knox utilized their industrial and organizational skills to carry out a massive naval expansion as the U.S. Navy prepared for war. He also introduced modern business and management methods to the Navy Department's administration.

Knox helped to devise and lobby for the Destroyers-for-Bases Agreement of 1940, whereby Britain acquired American warships in exchange for leases to Caribbean naval bases, and the 1941 Lend-Lease program to aid the Allies. Like other Roosevelt administration officials, Knox did not predict the surprise Japanese attack on Pearl Harbor of December 7, 1941, and he rather ascribed responsibility for the U.S. defeat almost solely to the unpreparedness of the base's naval and military commanders.

Knox welcomed the American entrance into World War II. During its course, he traveled extensively to the various theaters of war. As a former newspaperman, he emphasized the importance of good public relations, holding frequent press conferences. He stalwartly supported the abortive National Service Act of 1944, which would have imposed the obligation of national service on all Americans, military and civilian.

Knox died suddenly of heart failure in Washington, D.C., on April 28,

1944.

Knudsen, William S. (1879–1948)

American industrialist and war production manager. Born in Copenhagen, Denmark, on March 25, 1879, Signius Wilhelm Poul Knudsen was educated in Denmark and worked as a merchant's clerk and bicycle assembler. At age 21, he immigrated to the United States, Anglicized his name, and found work in a succession of manufacturing industries, thereby acquainting himself with modern production techniques.

While working at the John R. Keim Mills in Buffalo, New York, Knudsen introduced many innovations in the manufacture of bicycle and automobile parts. The Keim firm was bought out by Henry Ford in 1913, and Knudsen then ran assembly lines for the Ford Motor Company from 1913 to 1921. Following a dispute with Ford, Knudsen was hired by the Chevrolet division of General Motors in 1922, and by 1927 Chevrolet had outpaced Ford in sales. Knudson became president of General Motors in 1937 and achieved international renown as a mass-production manager.

In May 1940, Knudsen resigned his position to serve on the National Defense Advisory Commission appointed by President Franklin D. Roosevelt. Knudson was instrumental in convincing American automobile manufacturers to take up the wartime manufacture of military aircraft. On January 7, 1941, he became director-general for production in the newly

created Office of Production Management (OPM) and was involved in expediting U.S. war manufacturing efforts.

By a presidential executive order of January 16, 1942, the War Production Board headed by Donald M. Nelson superseded the OPM, and on January 28, 1942, Knudsen accepted a wartime commission as a lieutenant general in the U.S. Army; he served as director of production for the War Department until June 1945. He settled labor disputes and expedited the manufacture of war matériel, especially aircraft, becoming known as a master troubleshooter. Knudsen was twice awarded the Distinguished Service Medal for his contributions to the war effort.

After the war, Knudsen served for a time on the General Motors board of directors and also worked for the Hupp Corporation. He died in Detroit, Michigan, on April 27, 1948.

Koenig, Marie Pierre Joseph François (1898–1970)

French Army general. Born in Caen, Normandy, France, on October 10, 1898, Marie Pierre Joseph François Koenig volunteered for service in the army during World War I after obtaining his baccalaureate in 1917. He ended the war as a temporary second lieutenant.

After the war, Koenig served with the French army of occupation in Germany. Promoted to lieutenant in 1920, he participated in the French occupation of the Ruhr in 1923 and then served with occupation forces in the Rhineland between 1923 and 1929. From 1931, Koenig was assigned to the

French Foreign Legion in Morocco. Promoted to captain in 1932, he participated in pacification campaigns.

With the start of World War II, Koenig departed Morocco in February 1940 and, as a major in the legion's 13th Demi-Brigade, fought in the Norway Campaign at Narvik (April 24–June 7, 1940). In June 1940, he joined the Free French forces of General Charles de Gaulle and commanded a battalion, fighting Vichy French forces in Africa and the Middle East in 1940 and 1941.

Koenig's advance was rapid. He made colonel in June 1941 and became chief of staff of the 1st Free French Division in the Sudan, taking part in the Syria and Lebanon Campaign. Promoted to temporary general of brigade that August, he commanded the 1st Free French Brigade in Egypt.

Koenig won renown for leading his brigade in the Battle of Bir Hacheim, a critical point in the British Eighth Army's defensive line against the Afrika Korps. Koenig's men held Bir Hacheim from May 27, 1942, refusing to withdraw until ordered to do so on the night of June 10–11. Their epic stand restored French military honor after the Battle for France debacle of May–June 1940 and established the Free French as an effective fighting force.

Koenig was promoted to general of corps in May 1943, and that July he became deputy chief of staff of the French Army. In April 1944, he was named commander of Free French forces in Britain. On June 25, he was promoted to general of the army, and as a member of General Dwight D. Eisenhower's staff, he commanded Free French Forces of the Interior (FFI) following the June 6 Normandy Invasion. The FFI made a substantial contribution to Allied success by disrupting German lines of communication and tying down German military assets in Brittany and elsewhere. In August 1944, Koenig became military governor of Paris.

French general Marie Pierre Koenig, commander in chief of French forces of the interior from June 1944 and military governor of Paris following the Allied liberation that August. (Hulton Archive/Getty Images)

Between 1945 and 1949, Koenig commanded the French zone of occupation in Germany. Promoted to general of the army in 1946, he retired in 1951 and was elected as a Gaullist deputy to the National Assembly. Koenig served as minister of defense in 1954 and 1955 but resigned in opposition to the government's Moroccan policies. Retiring from politics in 1958, Koenig died in Neuilly, a suburb of Paris, on September 2, 1970. He was posthumously promoted to marshal of France in 1984.

Koga Mineichi (1885–1944)

Japanese Navy fleet admiral. Born in Saga Prefecture, Kyushu, Japan, on April 25, 1885, Koga Mineichi graduated from the Japanese naval academy in 1906. A specialist in naval gunnery, he also graduated from the naval war college four years later. He served on the staff of the Second Fleet and took part in the Japanese capture of Qingdao (Tsingtao) at the beginning of World War I.

From 1916 to 1922, Koga held a number of administrative assignments ashore, including that of resident officer in France. Promoted to commander in 1922 and to captain in 1926, he was naval attaché to France between 1926 and 1928 and attended the 1927 Geneva Arms Limitation Conference. Returning to Japan in 1928, he was then secretary to the minister of the navy and a member of the Japanese delegation to the London Naval Conference of 1930. From 1930 to 1932, he commanded first the heavy cruiser *Aoba* and then the battleship *Ise.* Promoted to rear admiral in 1932, Koga next held a number of staff positions, including head of the Intelligence Division (1933) and vice chief of the Naval General Staff (1937). He was promoted to vice admiral in 1936.

Koga commanded the Second Fleet from 1939 to 1941. He strongly opposed the conclusion of the Tripartite Pact with Germany and Italy in September 1940. In 1941, he assumed command of the China Area Fleet, supporting naval operations against Hong Kong at the beginning of the Pacific war. Promoted to full admiral in May 1942, Koga then commanded the Yokosuka Naval Station (1942–1943).

In May 1943, Koga succeeded Yamamoto Isoroku as commander in chief of the Combined Fleet following the latter’s death on April 18, 1943. By mid-1943, Japan had lost Guadalcanal as well as Attu and Kiska in the Aleutians

to Allied counteroffensives. Koga worked to rebuild Japanese naval air strength and sought to retrieve the situation before it became irreversible by a decisive naval action employing the Combined Fleet. In October 1943, Koga ordered Vice Admiral Ozawa Jisaburo to launch Operation RO-GO to attack U.S. naval forces in the Solomons, but Ozawa suffered a major reversal in the operation, losing 120 of 170 aircraft in November.

Koga then planned Operation O-GO to smash U.S. naval forces in the Marshall Islands in February 1944. In the process of relocating his headquarters from Palau to Davao in the southern Philippines for this operation, Koga's plane was lost in a severe storm on March 31, 1944. He was posthumously promoted to admiral of the fleet. Admiral Toyoda Soemu succeeded him as commander of the Combined Fleet.

Kohima and Imphal, Sieges of

See Imphal and Kohima, Sieges of

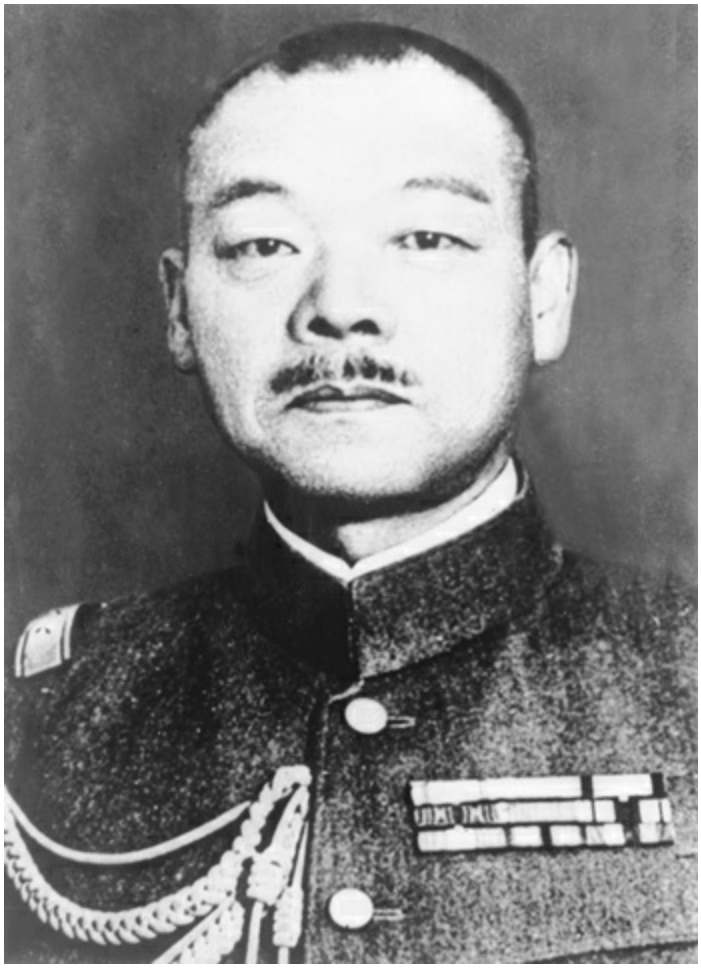
Koiso Kuniaki (1880–1950)

Japanese Army general and prime minister (1944–1945). Born in Yamagata Prefecture, Japan, on March 22, 1880, Koiso Kuniaki graduated from the Japanese Military Academy in 1900 and saw combat during the 1904–1905 Russo-Japanese War. Graduating from the General Staff College in 1910, he was posted to the General Staff in 1913. While still a junior officer, Koiso associated himself with elements in the Japanese military seeking to pursue expansion on the Asian continent. In 1916, he played a role in the Japanese Army's unsuccessful attempt to foster an independence movement in Manchuria and Mongolia and detach those areas from China.

As he advanced in rank, Koiso continued to support not only the expansionist aims of the Japanese military but also its attempts to dominate the government. He joined the Kokuhonsha (National Foundation Society), a right-wing political organization formed in 1924, and in March 1931, he lent his support to an unsuccessful military coup attempt staged by a group of junior officers. Despite his involvement in the affair, Koiso continued to advance. In 1937, he was appointed governor-general of Korea and promoted

to full general. Koiso returned to Japan in 1939 to serve as minister of colonies.

From 1942 to 1944, Koiso again served as governor-general of Korea, where his second term was characterized by a brutal attempt to eradicate the cultural identity of the Korean people. He was recalled to Japan in July 1944 to succeed Prime Minister Tōjō Hideki, who had been forced to resign. Although Koiso believed that the war was lost, he attempted to bolster Japan’s deteriorating war effort. He lowered the draft age, established the Supreme War Leadership Council as a liaison between the military and the cabinet, and attempted to coordinate munitions production. He could not, however, produce any victories, and he was forced to resign in April 1945.



Japanese Army general Kuniaki Koiso. (Keystone/Getty Images)

Following the war, Koiso was tried and convicted of war crimes by the International Military Tribunal for the Far East. Sentenced to life

imprisonment, he died in Sugamo Prison in Tokyo on November 3, 1950.

Kokoda Trail Campaign (July 1942–January 1943)

Land battle fought on New Guinea. The naval battles of the Coral Sea in May 7–8, 1942, and Midway on June 3–6 placed the Japanese Navy on the defensive in the Central and South Pacific and altered Japanese plans to take the key Allied base at Port Moresby, from which they could strike Queensland, Australia, by air. The upcoming battles for Guadalcanal in the Solomon Islands and Port Moresby in New Guinea were critical to the Allies in gaining and maintaining the offensive in the Pacific theater. The Americans struck first in the Solomons (August 1942–February 1943), but the Japanese took the initiative in New Guinea (March 9, 1942).

While U.S. Navy and Marine Corps elements prepared for operations in the Solomons, supreme Allied commander in the South Pacific General Douglas MacArthur and his Allied Land Force commander, Australian general Sir Thomas Blamey, began a series of actions to strengthen Allied defensive positions in New Guinea, including the August 1942 deployment of two brigades of the Australian 7th Division to Port Moresby and one to Milne Bay. These moves were the prelude for a bloody six-month campaign in some of the world's most difficult terrain, with far-reaching strategic consequences.

In early July 1942, the 39th Infantry Battalion of the Australian militia was sent to reinforce local Papuan infantry at Kokoda Pass in the Owen Stanley Mountains. The area was a critical terrain feature that the Japanese

would have to secure before assaulting Port Moresby from the north. Denied an invasion of Port Moresby by sea as a consequence of the Battle of the Coral Sea, the Japanese endeavored to take it by land, working southwest along the treacherous Kokoda Trail that crossed the east-west Owen Stanley Mountains. The trail was as high as 8,000 feet in places and as low as 1,000 feet, with slopes as great as 60 degrees.

On July 21, the Japanese Yokohama Force of engineer, infantry, and marine units landed at Buna on the north side of New Guinea to prepare the way for the follow-on South Sea Detachment commanded by Major General Horii Tomitaro, who arrived himself in mid-August. Horii pushed a force inland from Gona, drove back local Allied troops, and moved up the rugged and treacherous track of the Kokoda Trail that ran south to Port Moresby. By mid-August, the Japanese had seized the passes over the Owen Stanley Mountains that ran across the island.

During the march, Japanese forces quickly fixed and bypassed the detachments of Australian and Papuan forces guarding several key areas, including Kokoda. The 21st Brigade of the Australian 7th Division was then sent to relieve the elements that had borne the brunt of the fighting. The Japanese, however, outflanked the 21st Brigade and forced it to withdraw, a maneuver repeated several times over the next few weeks.

In early September, the 25th Brigade arrived to reinforce the 21st, and in mid-September, it joined in the unsuccessful defense at Ioribaiwa, some 30 miles from Port Moresby. The Japanese entered that village on September 16 in what was their last land victory of the Pacific war. There, Australian and U.S. forces under Major General Edmond F. Herring, benefiting from Allied air superiority, helped contain the Japanese advance.

On August 25, the Japanese landed 1,900 men at Milne Bay, at the eastern tip of Papua. This force planned to make its way west and support Horii's drive on Port Moresby. Australian forces, not greatly superior to the Japanese in size but with the advantage of air support, contained the landing and then mounted a counterattack. On the nights of September 5 and 6, the Japanese evacuated 1,300 survivors, half of them wounded.

The Australian victory in the Battle of Milne Bay was extremely important. Both a humiliation for the Japanese and a lift for the Allies, it proved that the Allies could defeat the Japanese in jungle warfare. And its outcome isolated the Japanese coming off the Kokoda Trail.

The Japanese engineers at Buna had hoped to construct a small road along the Kokoda Trail. When this proved impossible, the engineers fortified an area about 10 miles long and several miles deep between Gona and Buna on the Solomon Sea. There 7,000 Japanese, half of them survivors of the Kokoda Trail march, awaited an Allied attack.

Fighting on Guadalcanal deprived the Japanese of resources for Papua, and during October, Allied pressure and orders from General Imamura Hitoshi on Rabaul to withdraw caused Horii to fall back over the Owen Stanley Mountains. The Australian 7th Division followed. But instead of withdrawing to the coast at Buna, Horii decided to make a stand near the Kokoda Trail between the settlements of Oivi and Gorari, a few miles east of Kokoda.

He was confident of victory, but by early November, the Allies had learned much about jungle warfare, and in the Battle of Oivi-Gorari, the Australians flanked the Japanese position, driving Horii's men off the trail and into a river. Taking advantage of the dense jungle, many Japanese managed to reach the coast. Horii was not among them; he drowned a week later while crossing the Kumusi River.

In late November 1942, the Australians approached Buna from the Kokoda Trail. Meanwhile, the U.S. 32nd Division advanced up the Papuan coast in a strange collection of fishing boats and coastal vessels. Because the coast was poorly charted and there were numerous reefs as well as concerns about Japanese aircraft, the U.S. Navy did not support the operation with transports or warships, which adversely affected its progress.

The Kokoda Trail was far too rugged to move artillery and significant quantities of supplies by that route, nor could artillery be brought in on the small U.S. Army vessels. Thus, the 32nd Division, unprepared for the jungle conditions in any case, had to go into battle without artillery support against Japanese machine-gun nests that were well dug in and concealed in the dense jungle.

The Australian-U.S. advance against the Buna-Gona fortified zone began on November 18. Progress in the jungle and swamps was slow, and many of the troops were incapacitated by disease. Fortunately for the Allies, fighting on Guadalcanal meant that the Japanese on Papua received few supplies. The Japanese had to deal not only with disease but also with malnutrition.

Displeased, MacArthur brought in U.S. Army lieutenant general Robert

L. Eichelberger to command I Corps, ordering him to take Buna or not come back alive. Eichelberger flew to Dobodura on December 1, 1942, to take command of the American sector. An effective commander, he soon restored Allied morale. In early December, U.S. engineers were able to open an airfield near Buna, significantly improving the Allied supply situation. On December 9, the Australians took Gona. The more heavily fortified Buna resisted U.S. pressure, but on January 23, 1943, a concerted attack by Australian and U.S. forces secured it as well.

Köln, Raid on (May 30–31, 1942)

City targeted for the first thousand-plane air raid in World War II. Although the British had first bombed German industry in 1940, their successes until 1942 had been minimal. The British strategic bombing campaign suffered from a lack of bombers (prior to 1942, the Royal Air Force [RAF] Bomber Command never possessed more than 400 bombers) and an inability to hit targets with any accuracy at night. In the spring of 1942, the war was going badly for the Allies, and the Soviet Union was pressing for a second front. As the only alternative for direct offensive action against Germany, the British changed their policies on strategic bombing.

With the accession of Air Chief Marshal Sir Arthur Harris as commander of Bomber Command in February 1942, the British began a deliberate program of targeting built-up areas instead of industries. In desperate need of

a boost to morale at home and to demonstrate the increasing capabilities of Bomber Command, Harris proposed to Prime Minister Winston L. S. Churchill the idea of a thousand-plane raid. The plan immediately received Churchill's approval. By temporarily stripping Training Command of aircraft and securing other planes from Coastal Command, Harris assembled 1,086 aircraft, more than enough to cover any aborted takeoffs. The Admiralty then withdrew the 250 Coastal Command aircraft, but Harris was determined to reach the thousand-plane figure, even though it meant sending some crews who were not yet fully trained.

Köln (Cologne) and Hamburg were the two possible targets. They were selected over the more valuable Essen because each was located on a large body of water and could be readily identified by Gee (for "G," or grid), a new navigational aid. On the day of the raid, bad weather ruled out Hamburg, but Köln was clear. Known as Operation MILLENNIUM, the raid occurred on the night of May 30–31, 1942. As it worked out, Harris got 1,046 bombers aloft, 600 of them Wellingtons. His goal was to pass all aircraft over Köln in only 90 minutes.

The air raid on Köln, Germany's fifth-largest city, lasted approximately 100 minutes, with the British bombers passing over the city at an average of 11 per minute. A total of 890 bombers reached Köln and dropped more than 1,455 tons of bombs on the city, two-thirds of them incendiaries. The bombing resulted in the destruction of an estimated 13,000 homes and the razing of almost 600 acres of the city. Casualties amounted to 469 dead and over 5,000 wounded on the German side, with another 45,000 left homeless. The British lost more than 300 crewmen in the 41 bombers that failed to return, a rate of just 3.8 percent. The large number of bombers overwhelmed the German fighter defenses. The considerable destruction of this raid captured the imagination of the British public amid a series of Allied defeats in North Africa and East Asia.

Following the Köln raid, the British also launched thousand-plane raids against Essen and Bremen in June 1942. The Köln raid confirmed to Harris and Bomber Command the viability and effectiveness of night area bombing. The raid also shattered German illusions about who was winning the war and caused Chancellor Adolf Hitler to lose confidence in the Luftwaffe. But instead of accepting the need to strengthen Germany's air defenses, Hitler ordered retaliatory German air attacks.

Kolombongara, Battle of (July 13, 1943)

Naval engagement between Allied and Japanese forces off the coast of Kolombongara, a small island north of New Georgia in the Solomon Islands. U.S. Navy rear admiral Walden Ainsworth commanded a force of three cruisers, reinforced by five destroyers under Captain Francis McInerney and another five under Captain Thomas Ryan. Rear Admiral Izaki Shunji led the Japanese squadron of one cruiser and five destroyers. Izaki's squadron was protecting transports carrying 1,200 Japanese soldiers to Vila.

At 12:35 a.m. on July 13, a "Black Cat" PBY reconnaissance aircraft spotted Izaki's ships heading southeast toward Kolombongara. Ainsworth ordered his squadron into a single column and headed west on a closing course with McInerney's squadron pushed out ahead. At 1:01 a.m., the U.S. destroyer *Nicholas* made radar contact, followed by visual contact two minutes later. Ainsworth assumed that he would achieve complete surprise because the Japanese ships lacked radar. However, the Japanese had received some minutes earlier a radio warning from one of their seaplanes of an enemy force and were expecting contact.

At 1:08 a.m., Izaki's squadron came within 10,000 yards of Ainsworth's forces and launched torpedoes. The U.S. destroyer vans launched their own torpedoes two minutes later. Izaki then turned his column directly north, and the Japanese cruiser *Jintsu* turned its searchlights on the destroyer *Nicholas.*

While the *Jintsu* fired both guns and torpedoes, Ainsworth waited until all three of his cruisers had closed the range before opening fire.

By 1:17 a.m., the *Jintsu* was dead in the water. Ainsworth then ordered his whole squadron to turn away, but some ships did not receive the order, and the formation became disordered. Then the New Zealand cruiser *Leander* was struck by a torpedo. Severely damaged, it was nonetheless able to retire.

Black Cat aircraft then reported that two Japanese ships were escaping to the north, leaving the impression that four ships had been crippled. In reality, only the *Jintsu* had been damaged; the rest of Izaki's squadron had retired north to reload their torpedo tubes. In just 18 minutes, they reversed course again to reengage.

Meanwhile, Ainsworth headed northeast to chase what he thought were fleeing Japanese ships. As he pursued, he was unable to locate his destroyers by radio and ordered his two cruisers to illuminate unidentified targets on radar with star shells to see if they were McInerney's destroyers. Rather than U.S. destroyers, the unidentified ships turned out to be Japanese warships that had just fired 31 reloaded torpedoes. At 2:08 a.m. Ainsworth ordered fire opened, but before this order could be followed, the cruisers *St. Louis* and *Honolulu* took torpedoes in their bows and the destroyer *Gwin* was hit amidships.

The *Gwin* was scuttled the next morning. The Allies thus had three cruisers badly damaged in exchange for the *Jintsu,* which went down with its entire crew. Personnel losses numbered 482 Japanese, 61 Americans, and 28 New Zealanders. Because the Japanese were able to land all 1,200 reinforcements at Vila, Kolombongara was a strategic Japanese victory.

Komandorski Islands, Battle of the (March 26, 1943)

Concluding naval battle of the 1942–1943 Aleutian Islands Campaign in the North Pacific and the last major daylight naval action in which aircraft played no role. The Aleutian Campaign began in June 1942 with the Japanese occupation of the islands of Attu and Kiska. To protect their northern flank, the Japanese held these islands into 1943, while U.S. bombers and submarines from Dutch Harbor, enduring terrible weather conditions, slowly cut off Japanese supplies.

To break this tightening noose and reinforce Attu, Japanese vice admiral Hosogaya Boshiro led a task force of the heavy cruisers *Nachi* and *Maya*, the light cruisers *Tama* and *Abukuma*, and four destroyers escorting the armed 7,000-ton converted merchant cruisers *Asaka Maru* and *Sakito Maru*, which were acting as transports. Acting upon intelligence that the Japanese might be sending a convoy, the theater commander dispatched Rear Admiral Charles McMorris to intercept them. The Americans underestimated the size of the Japanese fleet, and McMorris had a much smaller force consisting of the heavy cruiser *Salt Lake City*, the light cruiser *Richmond* (flagship), and four destroyers. The Americans encountered the Japanese force near the Komandorski Islands.

Before dawn on March 26, 1943, U.S. radar picked up the approaching Japanese ships. McMorris, expecting only lightly escorted supply ships, made for the Japanese and closed to gun range, only to discover that he was both outnumbered and outgunned. He then attempted to maneuver, hoping to draw the Japanese eastward toward U.S. air support and perhaps slip past their warships to attack the supply vessels.

The two task forces engaged in a running duel for four hours. With more ships, more guns, and superior torpedoes, Hosogaya could have closed on the Americans and won a decisive victory. But his ships lacked effective radar, and he hesitated to press his advantage. Late in the battle, the *Salt Lake City* was struck by shells fired by either the *Maya* or the *Nachi* and lost steam. McMorris then ordered his destroyers to carry out a torpedo attack while he moved the *Richmond* in to cover the stricken *Salt Lake City*.

Although the U.S. destroyers scored no hits and the destroyer *Bailey* was damaged by Japanese fire, the attack gave the *Salt Lake City* time to again get under way. At that point, Hosogaya broke off the action and withdrew without delivering the vital supplies to Attu. Hosogaya explained his decision on the grounds that he was low on ammunition and fuel and worried about U.S. air attacks; he was subsequently relieved of his command.

Although several of his ships had sustained damage, McMorris had lost none, and he had won a strategic victory. The U.S. 7th Infantry Division landed on Attu in May, securing that island after a hard fight against the isolated Japanese defenders. The Japanese evacuated Kiska a month later, ending the Aleutian Campaign.

Komatsubara Michitarō (1886–1940)

Japanese Army lieutenant general. Born in Kanagawa, Japan, on July 20, 1886, Komatsubara Michitarō graduated from the Japanese Military Academy in 1905 and from the Army War College in 1915. He was a resident officer in Russia in 1909 and 1910 and took part in the capture of Quindgao (Tsingtao), China, in 1914.

Komatsubara was an assistant military attaché in Russia between 1919 and 1925, then military attaché there from 1927 to 1929. Promoted to colonel in 1929, he commanded a regiment. In April 1932, he became director of the Harbin Special Service Agency in northern Manchuria, charged with gathering intelligence concerning Soviet activities. Promoted to major general in 1934, he commanded infantry brigades. In March 1937, he was promoted to lieutenant general and given command of the Second Independent Garrison in Manchuria, and in July 1938, he took command of the 23rd Division in Manchuria.

While Komatsubara was commanding the 23rd Division, a clash occurred between Japanese and Soviet forces in the border area between Manzhoudiguo (Manchoutikuo) and Mongolia. In initiating the fighting, the Japanese Guandong (Kwantung) Army underestimated Soviet strength and disregarded instructions from Tokyo. Komatsubara did not accurately estimate the Soviet forces led by Soviet lieutenant general Georgii Zhukov; his division was newly organized, and although mobile, it was only lightly armed.

Komatsubara began the May–September 1939 Battle of Khalkhin Gol (Nomonhan Incident), and his division was annihilated by Soviet tanks and artillery: of some 15,975 men in the 23rd Division, 11,230 were casualties. Made the scapegoat for the Japanese defeat, Komatsubara was removed from command. He retired from the service and died of stomach cancer on October 6, 1940.

Komura Keizo (1896–1978)

Japanese Navy vice admiral who took part in numerous key battles in the Pacific theater. Born in Nagano, Japan, on July 20, 1896, Komura Keizo graduated from the Japanese Naval Academy in 1917. Promoted to lieutenant in 1923, he graduated from the Naval College in 1929. Promoted to lieutenant commander, he commanded the destroyer *Kuretake* that year and was appointed assistant naval attaché to Britain in 1933.

Promoted to captain in 1936, Komura participated in the December 7, 1941, attack on Pearl Harbor and the June 3–6, 1942, Battle of Midway as the captain of the seaplane heavy cruiser *Chikuma.* In June 1942, he took command of the new battleship *Musashi.* Promoted to rear admiral and appointed chief of staff of the Third Fleet in December 1943, Komura assisted Vice Admiral Ozawa Jisaburo in the Battle of the Philippine Sea on June 19–21, 1944, and the Battle of Leyte Gulf (October 23–26). In the latter engagement, Ozawa and Komura drew Admiral William Halsey's U.S. Third Fleet away from Leyte and completed their mission as a decoy, although at considerable cost in Japanese ship losses.

On April 5, 1945, Admiral Toyoda Soemu ordered Operation TEN-ICHI (HEAVEN NUMBER ONE) in which the Second Fleet—consisting of the flagship *Yamato,* the light cruiser *Yahagi,* and eight destroyers—was to steam to Okinawa in an attempt to destroy U.S. support ships off the landing sites. The ships only had fuel for a one-way voyage, for the plan called for *Yamato* to inflict as much damage as possible and then be beached as a stationary battery. The operation was a suicide mission, but Komura joined it aboard the *Yahagi.*

In the East China Sea on the early morning of April 7, the *Yahagi* was attacked and sunk by planes of U.S. vice admiral Marc A. Mitscher's fast carrier Task Force 58, but Komura survived. The *Yamato* was sunk the same day. That evening, Admiral Toyoda ordered the remaining destroyers of the task force to return to Japan.

In May 1945, Komura was appointed commander of the Yokosuka Naval Station. After the war, in 1948 Komura was hired by the U.S. occupation forces at Yokosuka to manage 27 patrol vessels at the naval station. He also helped establish the Japanese Naval Self-Defense Force on the outbreak of the Korean War in June 1950. He did not join that force but worked with the U.S. Navy for 11 years. Komura died in Tokyo on February 7, 1978.

Kondō Nobutake (1886–1953)

Japanese Navy admiral who commanded the China Sea Fleet. Born in Osaka Prefecture, Japan, on September 25, 1886, Kondō Nobutake graduated from the Japanese Naval Academy in 1907 and became a gunnery officer. Graduating from the Naval War College in 1919, he was promoted to lieutenant commander. He was a resident officer in Russia in 1919 and 1920 and in Germany from 1921 to 1923 and was appointed aide to the imperial prince in 1924. Kondō was then assigned as a staff officer in the Grand Fleet. Promoted to captain in 1927, he was an instructor at the Naval War College. He then commanded the cruiser *Kako* and the battle cruiser *Kongo.*

Promoted to rear admiral in 1933, Kondō became vice president of the Naval War College, and in 1935 he was chief of staff of the Grand Fleet. One year after being promoted to vice admiral in 1937, he took command of the Fifth Fleet. In 1939, he became vice chief of the Naval General Staff.

In September 1941, Kondō took command of the Second Fleet, and at the outbreak of the Pacific war, he provided support for the Japanese force invading Malaya. On December 10, 1941, Kondō's aircraft sank the British battleship *Prince of Wales* and the battle cruiser *Repulse.* His fleet then provided cover for Japanese forces occupying the Philippines and Java in the Netherlands East Indies.

At the June 3–6, 1942, Battle of Midway, Kondō commanded the Midway Invasion Force comprised of 12 transports carrying 5,000 troops with four cruisers in support. His force did not see action, however. He then took a leading role in the long-running naval struggle for control of Guadalcanal.

Kondō was unsuccessful in luring the U.S. naval forces into a trap in the Eastern Solomons during August 22–25, 1942, and in the Battle of the Santa Cruz Islands on October 16–27, his units provided gunfire support for the Japanese land effort to retake Henderson Field. This action also led to the crippling and eventual loss of the U.S. carrier *Hornet.* In naval actions off Guadalcanal from November 12 to 15, Kondō's forces were defeated, losing the battleship *Kirishima.* Their withdrawal sealed the fate of Guadalcanal. Kondō then supervised the successful evacuation from the island of Japanese ground-force survivors.

In April 1943, Kondō was promoted to admiral, and he was appointed commander in chief of the China Sea Fleet the following December. In May 1945, he became military adviser to Emperor Hirohito. Kondō died in Tokyo on February 19, 1953.

Kondor Legion

German Luftwaffe unit that fought on the Nationalist side in the Spanish Civil War (1936–1939). The Kondor (Condor) Legion was instrumental in the eventual Nationalist victory over the Republicans. At the same time, it provided a laboratory for the tactics, technology, and organization that the Luftwaffe would employ in World War II.

The beginning of the Spanish Civil War in July 1936 found the Nationalist side with many of its troops stationed in Spanish Morocco and the Republican side controlling the sea via the Spanish Navy. The Nationalists sought German dictator Adolf Hitler's support, and on July 26, 1936, he ordered clandestine military aid to them by airlifting troops to Spain from North Africa. Initial support included 10 Junkers Ju-52 transports, a handful of obsolete biplane fighter aircraft, some 88mm antiaircraft artillery, and crews.

The Ju-52s soon began the first major military airlift in history, and together with Italian aircraft, they transported more than 13,000 troops of General Francisco Franco's Army of Africa from Spanish Morocco to Spain between July and October 1936. The German biplane fighters, however, proved no match for the Republican side's Soviet fighter aircraft. In October, Hitler decided to increase the Luftwaffe presence in Spain, resulting in the official formation of the Kondor Legion in October 1936. Eventually the legion numbered more than 5,000 "volunteers" and fielded more than 100 aircraft of various types. A total of 19,000 men and 300 to 400 planes served in the Legion during the course of the war, and the Kondor Legion was made up of regular German military units, not volunteers.

The relatively poor performance of the legion's biplanes against the Republican fighters led the Germans to employ them in a ground-support role, essentially as flying artillery. This move was instrumental in the development of Luftwaffe doctrines of close air support for ground

operations. Kondor Legion aircraft hammered Republican troop lines just before Nationalist troops assaulted; the Germans then struck enemy rear areas to prevent reinforcement. These tactics proved key to a number of Nationalist ground victories.

Men of the German Kondor (Condor) Legion arriving in Gijo Harbor, Spain, 1939. (Bettmann/Corbis)

The Kondor Legion used the most advanced German aircraft as they became available, including the Heinkel He-111 bomber and the Messerschmitt Bf-109 fighter. The legion also field-tested new aircraft, such as the first Junkers Ju-87 Stuka dive-bomber, and it experimented with new combat techniques. The legion became notorious on April 26, 1937, for its terror bombing of the Basque city of Guernica.

By 1938, the Nationalists secured air superiority. The Kondor Legion quickly appeared on any front required, with its support relocated via train and air transport. Its 88mm flak guns, originally sent to provide air defense, eventually became the backbone of Nationalist artillery batteries, serving as highly mobile field artillery. Certainly, the Kondor Legion was an important factor in the Nationalist victory. Success, however, did not come without cost. Some 330 members of the legion died in Spain, and approximately 1,000 were wounded.

Some of the Luftwaffe's leading fighter aces, such as Adolf Galland, received their baptism of fire with the Kondor Legion. The Luftwaffe adopted much of the legion's organization and tactics for World War II, particularly in ground-support and psychological operations.

Konev, Ivan Stepanovich (1897–1973)

Marshal of the Soviet Union. Born near Kirov, Russia, on December 28, 1897, and schooled to age 12, Ivan Konev initially became a lumberjack. Conscripted into the Russian Army in 1916, he served in the artillery on the Galician front, achieved officer rank, and was demobilized in November 1917. Konev joined the Red Army and the Bolshevik Party in 1918, rising to divisional commissar by 1920.

Konev played a notable role in crushing the Kronstadt Rebellion of March 1921. He graduated from the Frunze Military Academy six years later and switched to the command side. He was given divisional command and attended special courses at the Frunze during 1934–1935. He went on to serve as commander of the Special Red Banner Army in the Far East and then as head of the Transbaikal Military District (1938–1941). His presence in the Far East and his political acumen helped him survive the 1936–1938 purge of the Soviet Army officer corps. In the course of fighting against the Japanese in 1939, he developed a bitter rivalry with Georgii Zhukov.

Promoted to lieutenant general, Konev assumed command of the North Caucasus Military District in January 1941. On June 22, 1941, when the Germans invaded the Soviet Union, he received command of the Nineteenth Army. That September, he was promoted to colonel general and succeeded Semen Timoshenko as commander of the Western Front.

Terrible Soviet defeats followed, with five Soviet armies encircled and half a million men taken prisoner. Responsibility for the defeat lay with Konev and Joseph Stalin, as the large encirclement could have been prevented. Zhukov then replaced Konev. In an appeal to Stalin, however, Zhukov saved Konev and made him his deputy—a favor that Konev would not repay.

Marshal of the Soviet Union Ivan Konev. (Hulton Archive/Getty Images)

When the Kalinin Front was formed in October, it was commanded by Konev as colonel general. In that post, he successfully defended the northern

approaches to Moscow, and in mid-December he drove the German Army from Kalinin.

In August 1942, Konev again secured command of the Western Front when Zhukov returned to duty with Stavka. He halted the last German drive toward Moscow and was shifted to command the Northwestern Front (February–June 1943). During the critical July 5–13, 1943, Battle of Kursk, Konev commanded the strategic reserve Steppe Front, the powerful armor forces of which blunted the German panzers at Prokhorovka.

Konev secured promotion to general of the army in August 1943. In October, his front, now known as the 2nd Ukrainian Front, played a key role in the encirclement of German forces at Korsun-Shevchenko (January 25–February 17, 1944), earning him promotion to marshal of the Soviet Union in February 1944. Taking command of the 1st Ukrainian Front that May, Konev swept through southern Poland and captured the Silesian industrial region. Zhukov was initially assigned the honor of taking Berlin, while Konev moved south of the German capital to the Elbe. But heavy German resistance allowed Konev to propose that his armor be diverted north to the city, and Stalin agreed. Thus, on April 25, 1945, Konev's tanks linked up with those of Zhukov, isolating Berlin. That same day, Konev's patrols made contact with the U.S. First Army on the Elbe at Torgau, in effect splitting Germany. Konev then commanded Soviet occupation forces in Austria.

By July 1946, Konev had succeeded Zhukov as commander of occupation and ground forces in Germany, having provided "evidence" against Zhukov during Stalin's inquiry of the latter's "improper behavior." He would go on to serve as chief inspector of Soviet Forces (1950–1952), commander of the Transcarpathian Military District (1952–1955), and commander in chief of Soviet Ground Forces (1955–1956).

On the formation of the Warsaw Pact, Soviet leader Nikita Khrushchev named Konev commander of its forces (1956–1960) in time to crush the 1956 Hungarian Revolution. Konev again turned on Zhukov when Khrushchev removed him in 1957. Ironically, Konev's Zhukov-like objections to the move from conventional forces to missiles resulted in his "voluntary" retirement to the Inspectorate. During the Berlin crisis of 1961, he was called on to head Soviet forces in Germany again, through April 1962. Konev went into active retirement in 1963 as a Ministry of Defense inspector. He died in Moscow on May 21, 1973.

Konoe Fumimaro, Prince of Japan (1891–1946)

Japanese politician and prime minister (1937–1939, 1940–1941). Born in Tokyo on October 12, 1891, Konoe Fumimaro was a member of one of the five highest-ranked aristocratic families in Imperial Japan. His father, Prince Atsumaro, was a renowned Pan-Asia movement leader. A graduate of the Department of Law of Kyoto Imperial University, Konoe pursued a career in diplomacy and attended the Paris Peace Conference in 1919. There he observed the reality of international power politics, in which the defeated became prey to the victors. Japan's failure to secure a statement on racial equality in the League of Nations Covenant disillusioned the young diplomat. Highly critical of the Anglo-American domination of the peace conference, Konoe published an article in 1920 attacking the hypocrisy of the postwar settlement.

Having served some years as a member of the House of Peers in the Japanese government, Konoe was appointed prime minister in 1937. Konoe's popularity was immense, and he enjoyed widespread support from both the military and the general public. Following the Marco Polo Bridge Incident of July 7, 1937, Konoe permitted the hard-liners in his cabinet to pursue an all-out war against China, thus making a fateful choice for Japan. In January 1938, he vowed that he would not negotiate with Jiang Jieshi (Chiang Kai-

shek). With the military stalemated in China, though, Konoe resigned in January 1939.

Konoe was once again called to the premiership in July 1940. In his second cabinet, a drastic political restructuring was carried out in the dissolution of existing political parties and the establishment of the Taisei Yokusankai (Imperial Rule Assistance Association). Konoe became the first president of this organization, which was modeled on the one-party systems of Nazi Germany and the Soviet Union. While preparing for a total war at home, he agreed to the army's strategy of sending troops into French Indochina in September 1940. That same month on the initiative of Foreign Minister Matsuoka Yōsuke, Japan concluded the Tripartite Pact with Germany and Italy. These actions further worsened already declining U.S.-Japanese relations. Faced with a diplomatic stalemate with the United States, Konoe resigned in July 1941 and was succeeded by General Tōjō Hideki.

After the tides of war turned, Konoe maneuvered carefully to rally anti-Tōjō elements in Japan and secure a negotiated peace with the Allies. In early 1945, he was designated as a special envoy to the Soviet Union to seek peace through a Soviet intermediary, which did not materialize. These actions did not, however, save Konoe from prosecution by the International War Crimes Tribunal in Tokyo after the war. Rather than face trial, he committed suicide on December 16, 1946, in Tokyo.

Korea

East Asian nation encompassing 84,610 square miles with a 1939 population of approximately 23.8 million. Korea is a large peninsula that borders China to the north and Russia (then the Soviet Union) to the northeast. To the west lies the Yellow Sea; to the east lies the Sea of Japan. Japan is located to the east.

Caught between three powerful neighbors—China, Russia, and Japan—Korea experienced a stormy history. The nation was long dominated or controlled by China, but Japanese leaders saw Korea as a "dagger" pointed at their country and believed that control of the peninsula was a necessary step to dominating Manchuria and China. After defeating China during 1894–1895, Japan went to war against Russia in 1904. In the resulting Treaty of Portsmouth of 1905, Japan gained control of Korea. Five years later, Japan forced the Korean king to abdicate and then formally annexed Korea.

Korean nationalists were buoyed by U.S. president Woodrow Wilson's World War I call for the "self-determination of peoples," but demonstrations in March 1919 were met with severe Japanese repression. Some Korean nationalist leaders fled abroad and established a Korean provisional government at Shanghai. In 1925, a communist movement was formally organized within Korea. It had ties to the Communist International (Comintern).

Japanese rule in Korea was both oppressive and exploitive, a poor advertisement for the Greater East Asia Co-Prosperity Sphere the Japanese government proclaimed in the late 1930s in the hope of winning support from Asian nationalist movements. Japan built highways and railroads, but they were designed for military use and to consolidate the Japanese position. It also industrialized Korea, but the economy was completely integrated with that of Japan. In 1937 Governor-General Koiso Kuniaki, a Japanese Army general, began a process of cultural assimilation for the 24 million Koreans, banning the Korean language and literature and insisting that all education (fewer than 20 percent of Koreans were literate) be conducted in Japanese. In 1939 the Japanese began employing Korean labor in other parts of their empire, and in 1942 they introduced conscription in Korea for the Japanese army.

Meanwhile, Korean nationalists and communists organized military formations in China to fight the Japanese. In 1941, these were integrated into a single military force under Yi Pom-sok, and troops of this force fought the

Japanese in Burma. Communist units also formed in Siberia under the young communist leader Kim Il-sung.

During World War II, the Koreans suffered extensively. Japan ruined many of the country's industrial plants by overworking the machinery without providing adequate maintenance. It expropriated most chemical products, especially nitrogen, causing near total soil depletion in Korea. Japan also stripped the country of much of its rice production and cattle. Unrest in Korea increased, forcing Japan to increase its military presence; by 1945, 300,000 Japanese troops were in Korea. By the end of the war, Japan had also sent 723,000 Koreans as laborers to other parts of its empire, including Japan itself. Tens of thousands of Korean women were forced into prostitution as "comfort women" for Japanese troops.

Korea became a focus of Allied attention only as World War II was ending in Europe. The December 1943 Cairo Conference resulted in a joint statement, involving leaders of the United States, Great Britain, and China, that called for a "free and independent" Korea in "due course." But as one of many countries being freed from German or Japanese control, Korea became a focal point for clashing U.S.-Soviet interests.

At the February 1945 Yalta Conference, President Franklin D. Roosevelt and Premier Joseph Stalin touched on the postwar status of Korea. Roosevelt advocated a 20- to 30-year trusteeship to be administered by the United States, the Soviet Union, and China. Stalin suggested that Great Britain should also be a trustee. Following Roosevelt's death in April 1945, Stalin informed President Harry S. Truman's special envoy, Harry Hopkins, that the Soviet Union was committed to a four-power trusteeship for Korea.

Agreement regarding the extent of advance into Korea of Soviet and American military forces was not reached until the July 1945 Potsdam Conference of the great powers, following the end of fighting in Europe and before the August declaration of war against Japan by the Soviets. There, the United States proposed—and the Soviets accepted—a demarcation line along the 38th parallel to separate the different Allied forces. Soviet troops were to occupy the northern part of the country and U.S. forces the southern part. The Soviet Twenty-First Army invaded Korea at the end of the war, and U.S. lieutenant general John Hodge's XXIV Corps occupied southern Korea beginning in early September 1945.

This occupation was supposed to be temporary, but as in the case of

Germany, efforts to create a unified country foundered. Occupation lines became permanent, and two states appeared, the northern one under communist control and bound to the Soviet Union and the southern state supported by the United States. In 1950 North Korean leader Kim Il-sung, with the support of the Soviet Union and China, invaded South Korea in an effort to unify Korea under communist rule. The 1950–1953 Korean War prevented him from realizing this goal, but unlike Germany, which reunified at the end of the Cold War, Korea remains divided and is a world flash point today.

Korsun Pocket, Battle of the (January 25–February 17, 1944)

Important Eastern Front battle. The Battle of the Korsun Pocket, known to the Soviets as the Korsun Shevchenkovsky Operation and to the Germans as the Cherkassy Pocket Engagement, pitted Russian marshal Georgii K. Zhukov against German field marshal Fritz Eric von Manstein. Zhukov was supervising elements of General of the Army Nikolai F. Vatutin's 1st

Ukrainian Front and General of the Army Ivan S. Konev's 2nd Ukrainian Front; Manstein was leading Army Group South. The Battle of the Korsun Pocket, the first successful large-scale Soviet encirclement combat since Operation URANUS in the Battle of Stalingrad (August 23, 1942–February 2, 1943), became known as "little Stalingrad on the Dnieper."

Unlike previous major Soviet offensives, Korsun Shevchenkovsky did not result from weeks or months of careful planning and force buildup. Rather, Stavka and the two Ukrainian fronts organized it opportunistically. The battle demonstrated a Soviet operational adaptability comparable to that shown by the Germans between 1941 and 1943.

On January 28, 1944, converging attacks by the Fifth Guards Tank Army and the Sixth Tank Army cut off and isolated the bulge in the Germans' line that was their last toehold on the Dnieper River. The Soviets trapped at least 60,000 German soldiers, including the XI and XLII Army Corps, and the 5th SS Panzer Division, known as "Viking." In response, employing the Eighth Army's XLVII Panzer Corps and the III Panzer Corps of First Panzer Army, Manstein sought to punch through the Soviet siege ring, relieve the trapped German troops, and in turn encircle the surrounding Soviet armies.

On the Soviet side, the Battle of the Korsun Pocket included six tank corps, a mechanized corps equipped with Sherman tanks, and a cavalry corps. They opposed eight German panzer divisions, a heavy tank regiment equipped with Tiger and Panther tanks, and a reinforced Schutzstaffel (SS) Panzergrenadier division. Substantial amounts of infantry, artillery, and air units on both sides were also involved. The Soviets halted two German armored relief attempts and simultaneously endeavored to crush the German pocket.

When it became obvious that the German counterattacks had failed, troops in the pocket were told that they would have to save themselves. An initially successful breakout on the night of February 16–17, obscured by a blizzard, turned into a massacre as day broke. The desperate German columns were beset by everything from air attacks to saber-swinging Soviet cavalrymen. The battle ended on February 17.

Soviet and German claims about the number of troops lost in the pocket are contradictory, but at least half of the German forces trapped there were killed, wounded, or captured, and even the survivors were in no shape to fight again for weeks or months. Six German divisions were destroyed. When the

battle ended, Soviet forces were poised to complete the liberation of the western Ukraine.

Kozhedub, Ivan Nikitovich (1920–1991)

Soviet Air Force marshal of aviation and leading Soviet ace of the war. Born in Obrzheyevka, Russia, on June 8, 1920, Ivan Kozhedub completed chemical engineering school in 1940 and immediately joined the air force. After graduating from the Aviation School for Pilots in 1941, he was a pilot instructor until the end of 1942.

Kozhedub saw combat on the Eastern Front during World War II, assigned to the Voronezh, Steppe, 2nd Ukrainian, and 1st Belorussian Fronts between March 1943 and May 1945. During this period, piloting LA-5s and LA-7s, Kozhedub flew 330 combat missions and was credited with 62 air-to-air kills in 120 dogfights, making him the leading Soviet ace of the war. He was awarded Hero of the Soviet Union three times. He commanded a squadron and then was deputy commander of a fighter wing.

Kozhedub remained in the service, and he led the 324th Fighter Air Division during the 1950–1953 Korean War and graduated from the Military Academy of the General Staff in 1956. He was then inspector of flight

training between 1956 and 1966. As a colonel general, he was first deputy commander of aviation for the Moscow Military District in 1964. Promoted to marshal of aviation, he was a member of the Group of Military Inspectors from 1978 to 1985. Kozhedub died at his dacha in Mnino, outside Moscow, on August 8, 1991.

Krebs, Hans (1898–1945)

German Army general of infantry. Born in Helmstedt, Germany, on March 4, 1898, Hans Krebs entered the German Army in August 1914 as an officer candidate and was commissioned a lieutenant in June 1915. By the end of the war, he was a regimental adjutant. Krebs continued in the army during the interwar period. Given his intelligence and gift for staff work, the remainder of his career was spent in General Staff assignments. He was assistant military attaché in Moscow in 1933 and 1934. Promoted to lieutenant colonel in February 1938, Krebs was sent to Moscow in September 1939 to assist the German embassy in negotiations with the Kremlin concerning the partitioning of Poland. He was appointed chief of staff of the VII Army Corps in December 1939.

Promoted to colonel in October 1940, Krebs returned briefly to Moscow in March 1941 as deputy military attaché to General of Cavalry Ernst August Kostring. Because of Kostring's illness, Krebs was acting attaché until the German invasion of the Soviet Union on June 22. In January 1942, he became chief of staff of the Ninth Army. He held the same post in Army Group Center (under Field Marshal Günther von Kluge) beginning in March

1943 and Army Group B (under Field Marshal Walther Model) in September 1944.

Krebs was promoted to major general in February 1942, lieutenant general in April 1943, and general of infantry in August 1944. In February 1945, German chancellor Adolf Hitler ordered Krebs assigned to Berlin, where he succeeded Colonel General Heinz Guderian as acting German Army chief of staff following the latter's dismissal on March 27. With Hitler's suicide on April 30, 1945, Krebs's final duty was to act as the liaison with the Soviets regarding the surrender of the Berlin garrison. Krebs crossed their lines on May 1 to inform the Soviets of Hitler's death and to attempt to negotiate an armistice. His hopes were quickly dashed by commander of the Eighth Guards Army General Vasily Chuikov, who insisted on unconditional surrender. Krebs returned to Hitler's bunker and then committed suicide on May 1 or 2, 1945. His body was never found.

Kretschmer, Otto August Wilhelm (1912–1998)

German frigate captain and submarine commander. Born at Heidau, Liegnitz, Silesia (now Hajduki Nyskie, Poland), on May 1, 1912, Otto August Wilhelm Kretschmer joined the German Navy in April 1930 and entered the officer training program. He subsequently served in the light cruisers *Emden* and *Köln.* In January 1936, he volunteered for submarine service and took up his

first command, the *U-35,* in July 1937, in which he conducted a patrol in Spanish waters during the 1936–1939 Spanish Civil War. In September 1937, Kretschmer assumed command of the *U-23,* a Type II coastal U-boat.

Otto Kretschmer was the most successful German U-boat commander of World War II. He was later an admiral in the Bundesmarine, the Federal Republic of Germany navy. (Heinrich Hoffmann/Ullstein Bild via Getty Images)

During the first eight months of World War II, Kretschmer conducted eight patrols in *U-23* in the North Sea near the coast of Great Britain but achieved little success due to the limited capabilities of the submarine. His most notable achievements were sinking a tanker in January 1940 and the destroyer HMS *Daring* in February 1940. In April 1940, Kretschmer took command of *U-99,* a much larger and more capable Type VII submarine. After two months of intensive training with his crew, he began the first of eight patrols into the Atlantic in June 1940.

During these patrols, Kretschmer refined his tactics of slipping into the middle of convoys at night and torpedoing ships from the surface, often at close range. The success of these attacks spawned his motto: “one torpedo, one ship.” He also earned recognition for sinking three British armed merchant cruisers in November 1940, including two on the night of November 3–4 in a running surface engagement in which he utilized his 88mm deck gun. This action helped to convince the British Admiralty to discontinue the use of such ships. Kretschmer was the first German submarine commander to sink 250,000 tons of Allied shipping.

The most successful U-boat commander of the war, Kretschmer was known as “the tonnage king” because of his exploits. From September 1939 to March 1941, he sank 47 merchant ships totaling 273,503 tons and earned the Knights Cross with Oak Leaves and Swords to the Iron Cross. Kretschmer, however, eschewed efforts to propagandize his accomplishments, earning another nickname, “Silent Otto.”

On March 17, 1941, Kretschmer successfully attacked the 10-ship HX.112 convoy south of Iceland. After expending his torpedoes, he was returning to base in France when two British destroyers attacked and sank his boat. He and 40 of his 43-man crew were rescued and taken prisoner.

Kretschmer spent the remainder of the war as a prisoner of war in Canada, returning to Germany in December 1947. In 1955, he joined the navy of the Federal Republic of Germany, the Bundesmarine, and in 1965 he became chief of staff of the North Atlantic Treaty Organization Baltic Command, a position he held for four years. He retired in 1970 with the rank of flotilla admiral. Kretschmer died at Straubing, Germany, on August 5, 1998.

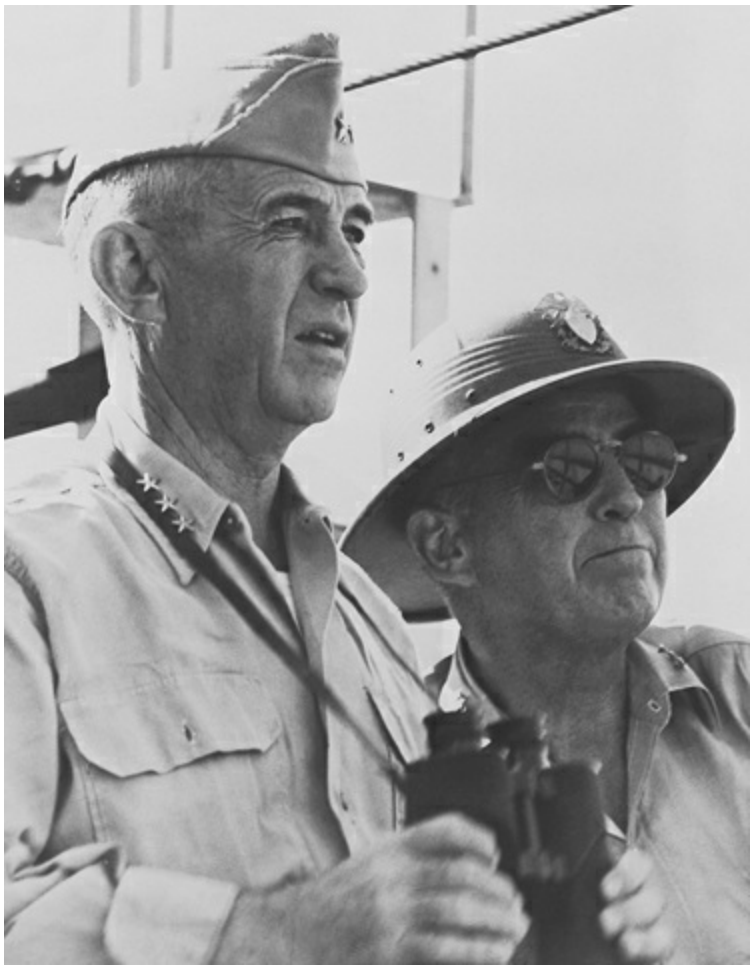
Krueger, Walter (1881–1967)

U.S. Army general who commanded the Sixth Army in the Pacific theater. Born in Flatow, West Prussia, on January 26, 1881, Walter Krueger immigrated to the United States in 1889. He enlisted in the army during the 1898 Spanish-American War, earning a commission in 1901. He graduated from the Infantry and Cavalry School in 1906 and the School of the Line in 1907. He was a faculty member at the army's School of the Line between 1909 and 1912. Captain Krueger participated in the 1916–1917 Punitive Expedition into Mexico. Sent to France during World War I, he rose to be chief of staff of the Tank Corps of the American Expeditionary Forces as a temporary colonel. He was then chief of staff for VI Corps in France and IV Corps in Germany.

Krueger graduated from the Army War College in 1921 and the Naval War College in 1926 and later taught at both schools before serving with the Army War Plans Division for three years. He was promoted to colonel in 1932 and brigadier general in 1936 and then headed the Army War Plans Division from 1936 to 1938. He next commanded a brigade and was promoted to major general in February 1939, thereafter taking command of the 2nd Division at Fort Sam Houston, Texas. He went on to command VIII Corps, and in May 1941, he took command of the Third Army as a temporary lieutenant general.

When the United States entered World War II, there seemed little chance that Krueger would receive a battlefield command because of his advanced age and his skill as a trainer of soldiers. In January 1943, however, General Douglas MacArthur personally requested Krueger and the Third Army for deployment to the Southwest Pacific. Instead, the War Department transferred Krueger and some of his staff to Australia to activate the Sixth Army.



U.S. Army lieutenant general Walter Krueger (left) and Navy vice admiral Thomas Kinkaid observing the U.S. landing on Leyte in the Philippines, October, 1944. (Corbis)

Krueger commanded the Sixth Army in a series of widespread combat operations across the Southwest Pacific until the end of the war, beginning with the occupation of Kiriwina and Woodlark Islands in June 1943. He headed operations against New Britain, the Admiralty Islands, New Guinea, Biak, and Morotai. By the midsummer of 1944, New Guinea was in Allied hands, and MacArthur was ready to return to the Philippines. Krueger led the landings at Leyte (October 20, 1944) and the Lingayen Gulf. In the ensuing campaign, the Sixth Army captured Manila and cleared most of Luzon Island. Promoted to full general in March 1945, Krueger was scheduled to lead the invasion of Kyushu Island when Japan surrendered.

Critics thought Krueger too slow and methodical, but few have complained about his low casualty rates relative to his successes. Although MacArthur may have been displeased at Krueger’s slowness on Luzon, he

still selected him to lead the planned invasion of Japan. Rarely seeking the limelight, Krueger enjoyed MacArthur's full confidence. After the war, Krueger remained with the Sixth Army during the occupation of Japan. He retired in July 1946 and died on August 20, 1967, in Valley Forge, Pennsylvania.

Krug, Julius Albert (1907–1970)

Engineer, chairman of the War Production Board (WPB) from 1944 until 1945, and secretary of the interior during 1946–1949. Julius Albert Krug was born on November 23, 1907, in Madison, Wisconsin. He graduated from the University of Wisconsin–Madison with an undergraduate degree in 1929 and a master's degree in 1930. He thereafter worked for several Wisconsin utility companies, the Federal Communications Commission, and the Kentucky Public Service Commission before securing a job with the Tennessee Valley Authority, where he served as chief power engineer.

In 1941, Krug was named director of the power division at the Office of Production Management, which became part of the WPB in January 1942. The following year, he was appointed director of the Office of War Utilities. In April 1944, Krug enlisted in the U.S. Navy, but in August he was named chairman of the WPB; he succeeded Donald M. Nelson.

Krug's tenure at the helm of the WPB was an unremarkable one, chiefly because most of the problems associated with mobilization and military

procurement had already been resolved. Krug remained with the WPB until that body was disbanded by executive order on October 4, 1945.

Named secretary of the interior by President Harry S. Truman, Krug served in the position from March 18, 1946, until December 1, 1949. Krug proved to be an activist secretary, opposing lumber companies' attempts to log the vast forests of the state of Washington and the construction of unnecessary and unsightly dams. In 1946, he unsuccessfully tried to avert a strike by the United Mine Workers. In the summer of 1949, Krug presided over a United Nations conference on conservation and resource-management issues at Lake Success, New York. Krug resigned his post effective December 1, 1949.

Krug thereafter worked as a utilities consultant, served as chairman of the board of Brookside Mills (Tennessee), and later cofounded the Volunteer Asphalt Company in Knoxville, Tennessee. Krug died on March 26, 1970, in Knoxville.

Küchler, Georg von (1881–1968)

Germany Army field marshal who took command of Army Group North in 1942. Born near Hanau, Germany, on May 30, 1881, Georg von Küchler entered the German Army in 1900 and was commissioned a lieutenant the next year. Promoted to captain, he took command of an artillery battery on the outbreak of World War I, distinguishing himself in combat on the Western Front and in General Staff service.

Küchler continued in the German Army after the war, advancing steadily in rank. He was promoted to major in 1924, to lieutenant colonel in 1929, and

to colonel in 1932. By 1934, he was a major general commanding the 1st Infantry Division in East Prussia. Promoted to lieutenant general in 1935, Küchler was appointed inspector general of the service academies.

In April 1937, Küchler was promoted to general of artillery, commanding the I Army Corps at Königsberg. In March 1939, his forces participated in the incorporation of Memel into the Reich. In the German invasion of Poland (September 1, 1939), Küchler commanded the Third Army, which struck south from East Prussia as part of Colonel General Fedor von Bock's Army Group North. During the Polish Campaign, Küchler directed the northern portion of the envelopment of Warsaw. Seen as a favorite of Adolf Hitler, Küchler defied Schutzstaffel (SS) leader Heinrich Himmler and ordered the courts-martial of German soldiers guilty of committing atrocities against Poles.

During the invasion of France and the Low Countries in May 1940, Küchler commanded the Eighteenth Army, consisting of 11 divisions in Bock's Army Group B. He had responsibility for the invasion of the Netherlands and the linkup with highly vulnerable German airborne forces holding key bridges, cities, and installations. Following the surrender of the Netherlands on May 15, Küchler's forces occupied Antwerp, then forced the Scheldt and drove on Ghent in Belgium. His forces mopped up the remaining resistance following the British evacuation at Dunkerque (May 26–June 4) before driving south toward Amiens and taking Paris on June 14.

Promoted to colonel general in July 1940, Küchler then led his Eighteenth Army as part of Field Marshal Wilhelm von Leeb's Army Group North in Operation BARBAROSSA, the June 21, 1941, invasion of the Soviet Union. The Eighteenth Army held the north flank in the advance toward Leningrad. In addition to forcing prisoners of war to clear mines, Küchler also enforced Hitler's Commissar Order, and he ordered the execution of both partisans and Gypsies.

In January 1942, Küchler took command of Army Group North from Leeb. He was promoted to field marshal in June 1942. When the Soviets launched their great counteroffensive at Leningrad on January 28, 1944, Küchler was forced to withdraw to the Luga River. Hitler made him the scapegoat for the reversal and, on January 29, temporarily replaced him with Field Marshal Walther Model. On January 31, Hitler assigned Kuchler to the Führer Reserve.

Arrested after the war, Küchler was tried and convicted of war crimes at the American Military Tribunals in Nuremberg in October 1948 and sentenced to 20 years of imprisonment. Freed in February 1955, he died in Garmisch-Partenkirchen, Germany, on May 25, 1968.

Kula Gulf, Battle of (July 6, 1943)

Pacific theater naval battle, the first of two night surface actions fought for control of the major deepwater entrance to New Georgia Island. Rear Admiral Walden L. Ainsworth, with a light cruiser task group, had been in the gulf on the night of July 5, 1943, on a bombardment mission and was southeast of Guadalcanal when he received orders to return and intercept a Japanese transport group believed to be making for Vila.

Joined by two destroyers from Tulagi, Ainsworth arrived off the gulf entrance an hour after midnight. The sky was overcast, with passing showers and visibility 2,000 yards or less. Radar contact was made at 1:36 a.m. on July 6 with three warships some 22,000 yards distant, standing out of the gulf 5,000 yards off the Kolombongara shore. Ainsworth immediately assumed battle formation: two destroyers in column ahead; the light cruisers *Honolulu*, *Helena*, and *St. Louis* behind them; and two destroyers astern. At the same time, Ainsworth turned to port to close with the Japanese, and then, at 1:49 a.m., he came back right to unmask all guns. Radar then picked up a second

Japanese group astern the first, and Ainsworth delayed opening fire as he pondered this new situation.

The Japanese were, in fact, in three groups. The first, with which Ainsworth had made contact, was Rear Admiral Akiyama Teruo's covering force of the destroyers *Niizuki* (flagship), *Suzukaze,* and *Tanikaze.* The second group was made up of four destroyer-transports that Akiyama had first ordered to make for Vila; when contact was made with Ainsworth, Akiyama directed them to reverse course and join in the battle. The third group of three destroyer-transports was already unloading at Vila.

Ainsworth opened fire on Akiyama's group at 1:57 a.m., and the rapid-firing, radar-directed 6-inch guns in which the Americans put their faith quickly hammered the *Niizuki* into a wreck. But the gunfire lit up the U.S. battle line, and almost immediately, the *Suzukaze* and *Tanikaze* launched 16 torpedoes and escaped to the northwest. Believing he had accounted for all three ships of Akiyama's group, Ainsworth countermarched at 2:03 a.m. to deal with the transport group. Seconds later, three Japanese Long Lance torpedoes struck the *Helena.* It sank at about 2:25 a.m. At 2:18 a.m. Ainsworth had taken the transport group under fire, scoring some hits, but the four destroyers scattered and headed for Vila, the only casualty resulting when the *Nagatsuki* ran hard aground on Kolombongara.

Finding no targets to the west and convinced that he had accounted for many more Japanese ships than the *Niizuki,* Ainsworth, whose own ships were low on both fuel and ammunition, ordered his force to head for Tulagi, leaving the *Nicholas* and *Radford* to pick up the *Helena*'s survivors. Three times during the early morning hours, the two destroyers interrupted their work to engage Japanese ships. Although gunfire and torpedoes were exchanged, there was no major damage to either side, and by daylight Kula Gulf was clear of the Japanese.

Kuribayashi Tadamichi (1891–1945)

Japanese Army general. Born in Nagasaki Prefecture, Japan, on July 7, 1891, to a family of samurai descent, Kuribayashi Tadamichi graduated from the Japanese Military Academy in 1914. After serving in the cavalry, he was admitted to the General Staff Academy, from which he graduated in 1923, second in his class. In 1928, he was posted to the United States as a deputy military attaché, and between 1931 and 1933, he served as military attaché to Canada. Promoted to lieutenant colonel in 1933, Kuribayashi commanded a cavalry regiment in 1936 and 1937, followed by promotion to major general in 1940, and a series of brigade commands and promotion to chief of staff of the Twenty-First Army in China in 1941. In 1943, he returned to Japan, where he commanded the 1st Imperial Guards Division until 1944.

In May 1944, Kuribayashi took command of the 109th Infantry Division and was assigned the defense of Iwo Jima, part of the Volcano Island chain located approximately 700 miles from Tokyo. Kuribayashi arrived on Iwo Jima in June and began preparing the island to meet an anticipated U.S. amphibious assault. Disregarding the advice of his subordinates and ignoring the protests of the commander of Iwo Jima's contingent of naval troops, he decided not to attempt to hold the island's beaches. Instead, he ordered his troops to construct deep and heavily fortified positions inland, centered on the 556-foot Mount Suribachi. Kuribayashi's aim was to exact as heavy a toll as possible on the invaders after they landed.

Iwo Jima's defenders dug in accordingly, which allowed them to withstand over two months of U.S. air strikes and naval bombardment before the American landing on February 19, 1945. Although Kuribayashi's plan succeeded in inflicting heavy casualties on the attacking Americans, he and his men were inexorably ground down. On March 17, Kuribayashi, who had been promoted to full general, made a farewell radio broadcast to Japan. He

died in action during the last few days of organized resistance, sometime between March 21 and 24. His body was never recovered.

Kurita Takeo (1889–1977)

Japanese Navy admiral. Born in Ibaragi, Japan, on April 28, 1889, Kurita Takeo graduated from the Japanese Naval Academy in 1910. In the 1920s, he held a number of destroyer commands. Promoted to commander, Kurita was an instructor at the Torpedo School between 1928 and 1934 and again between 1935 and 1937. He was promoted to captain in 1932. Kurita commanded the cruiser *Abukuma* in 1934–1935 and then the battleship *Kongo* during 1937–1938. Promoted to rear admiral in 1938, he commanded destroyer squadrons over the next two years.

Promoted to vice admiral in May 1942, Kurita commanded the Close Support Group in the June 3–6 Battle of Midway. In August 1943, he took command of Second Fleet. In the October 23–26, 1944, Battle of Leyte Gulf, Kurita commanded the 1st Strike Force (the central force) in executing Operation SHō-GO (VICTORY ONE). Kurita's force was the most powerful of those that were to converge on the U.S. landing site on Leyte Gulf; it was to proceed through San Bernardino Strait and then join up with the 3rd Force under Vice Admiral Nishimura Shoji, which would pass through Surigao Strait to the south. Kurita's force had five battleships, including the *Yamato* and *Musashi*. The two forces were to come together at the U.S. landing site

and destroy the support ships there, while the U.S. covering force was drawn off by a decoy Japanese carrier force under Vice Admiral Ozawa Jisaburo.

As it turned out, Nishimura's force was destroyed, Kurita's ships were discovered and attacked by U.S. aircraft, and the *Musashi* was sunk. Kurita then reversed course, but, unknown to the Americans, he turned around again. Meanwhile, U.S. admiral William F. Halsey took his entire covering Third Fleet to engage Ozawa's decoy force, as Kurita's force issued from San Bernardino Strait to engage U.S. vice admiral Thomas C. Kinkaid's Seventh Fleet in Leyte Gulf.

In the early morning of October 25, Kurita's ships approached the unprotected U.S. transports and their weak support force off Leyte. Kurita was on the verge of being able to annihilate them when he decided to withdraw. He never explained his decision publicly, but apparently, he mistakenly believed that the aircraft attacking his ships were from Halsey's force. Several days of near-incessant air attacks on his ships may also have affected the exhausted Kurita, but the reasons for his decision are still debated. Not censured for the "mysterious U-turn," as his action is known in Japan, Kurita subsequently returned to Japan. He commanded the Japanese Naval Academy from January 1945 until the end of the war. Kurita died in Hyogo, Japan, on December 19, 1977.

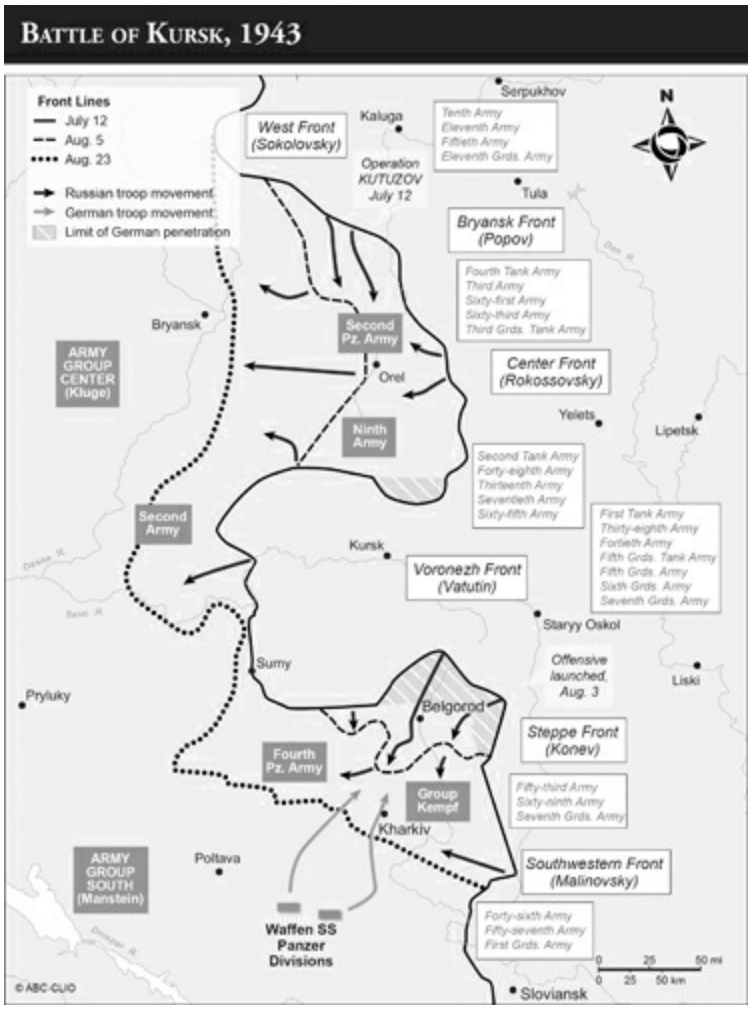
Kursk, Battle of (July 5–16, 1943)

Major Eastern Front battle and the largest tank engagement in history. The Battle of Kursk demonstrated the end of German dominance on the Eastern Front. The 1942–1943 winter campaign had left a 120-mile-wide bulge around Kursk, an important rail junction north of Belgorod and Kharkov protruding 75 miles deep into German-held territory. German dictator Adolf Hitler saw the salient as an opportunity. By reducing it, his army could regain prestige lost by previous setbacks.

By April, plans to blast the Soviets from Kursk were under discussion, and they were solidified into Operation ZITADELLE (CITADEL) by early May. The plan was to reduce the salient with two armor-led pincer attacks at the northern and southern shoulders that would meet in the middle, surrounding all of the forces in the pocket. From the north near Orel, Field Marshal Günther von Kluge's Army Group Center would launch General Walther Model's Ninth Army, led by two panzer corps. The main thrust, however, would come in the south from Field Marshal Erich von Manstein's Army Group South, with Colonel General Hermann Hoth's Fourth Panzer Army moving north from near Belgorod.

Hitler left the start date for the operation open to sometime after May 1. He then delayed it to June and again to July in order to build up the panzer forces with newly developed heavy Tiger and Panther tanks and Ferdinand 88mm self-propelled assault guns, although they had been rushed into production and suffered from design flaws.

The Soviets knew of the plans for the impending German offensive through reconnaissance and intelligence agents. Soviet leader Joseph Stalin wanted a preemptive spoiling attack, but Stavka representative Marshal Georgii Zhukov convinced him that within the Kursk salient, the Central Front, under General Konstantin Rokossovsky, and General Nikolai Vatutin's Voronezh Front would be able to absorb the initial German blows with the defenses they had established, and to the rear, General Ivan Konev's Steppe Front could then counterattack.



Katyusha multiple rocket launchers during the battle of Kursk in July 1943. (Slava Katamidze Collection/Getty Images)

Both sides built up armor and troop concentrations for the coming battle. The Germans amassed 900,000 men in 50 divisions, of which 19 were panzer and motorized, with 2,700 tanks and assault guns, 10,000 artillery pieces, and 2,000 aircraft. The delay, however, allowed the Soviets to assemble 1.3 million men, 3,600 tanks, 20,000 artillery pieces, and 2,400 aircraft. Some 300,000 local civilians joined the Red Army in laying a massive array of tank traps, minefields, and dug-in antitank guns designed to channel the German armor into kill zones for Soviet artillery.

The German attack commenced on July 5. In the north, the Ninth Army assaulted on a narrow 30-mile front but managed to penetrate only 6 or 7 miles in seven days of fierce fighting. The fighting resembled some of the fierce attrition battles of World War I. The Fourth Panzer Army in the south did slightly better, pushing to the third Soviet defensive belt about 20 miles deep. The critical stage of the battle came between July 11 and 12, when Hoth turned his panzer spearhead northwest to envelop the Soviet 1st Tank Army, and with about 400 tanks, his forces reached Prokhorovka Station. Zhukov responded with a counterattack of five tank armies, two coming from the Steppe Front.

This engagement was a cauldron embroiling more than 1,200 tanks from both sides (three-quarters of them Soviet) in the largest tank battle of the war. By the end of July 12, Prokhorovka lay littered with the burned-out hulks of German and Soviet tanks.

At that point, on July 13, Hitler called off the offensive in order to withdraw panzer forces to reinforce units in Sicily, where the Allies had landed three days earlier. The German commanders had no choice but to conduct a fighting retreat in the face of a Soviet counteroffensive that began on July 12. By August 5 the Soviets had retaken Orel and Belgorod, and they retook Kharkov by August 23, an action that the Soviets consider to be part of the Battle of Kursk. By that reckoning, Kursk involved 4 million men, 13,000 armored vehicles, and 12,000 aircraft, making it one of the largest battles of the war.

In the Battle of Kursk, the Germans lost an estimated 70,000 men killed, 2,900 tanks, 195 self-propelled guns, 844 artillery pieces, and 1,392 planes. More important, the battle cost the German Army the strategic initiative. The Germans were now forced over to the defensive, leading to an almost continuous retreat that ended in Berlin.

Kusaka Ryūnosuke (1892–1971)

Japanese Navy vice admiral. Born in Tokyo on September 25, 1892, Kusaka Ryūnosuke graduated from the Japanese Naval Academy in 1913. He was one of the early specialists in naval aviation in the Japanese Navy and served as an instructor at the Kasumigaura Naval Air Station and the Naval War College in 1924. He served on the Navy General Staff in 1929 and was promoted to commander in 1930. Promoted to captain in 1934, he commanded the aircraft carriers *Hosho* in 1936 and *Akagi* in 1939.

Promoted to rear admiral in 1940, Kusaka served as chief of staff of the First Air Fleet and helped to plan the December 7, 1941, attack on Pearl Harbor. He also assisted the commander of the Combined Fleet, Admiral Yamamoto Isoroku, in planning the attack on Midway (June 3–6, 1942). Kusaka participated in this operation as chief of staff of the First Air Fleet.

Kusaka fought in the October 26–27, 1942, Battle of the Santa Cruz Islands as chief of staff of the Third Fleet. In 1944, he was promoted to vice admiral and appointed chief of staff of the Combined Fleet under Admiral Toyoda Soemu, participating in the Battle of the Philippine Sea (June 19–21)

and the Battle of Leyte Gulf (October 23–26). At the very end of the war, in August 1945, he was appointed commander of the Fifth Air Fleet. Kusaka died at Hyogo, Japan, on November 23, 1971.

Kuznetsov, Nikolai Gerasimovich (1904–1974)

Soviet Navy admiral of the fleet, minister of the navy, deputy minister of Soviet armed forces, and commander of Soviet naval forces. Born in the Arkhangelsk Oblast of northern Russia on July 24, 1904, Nikolai Kuznetsov joined the Red Navy in 1919. After service in the Russian Civil War, he graduated from Leningrad Naval College in 1926 and from the Voroshilov Naval Academy in 1932. During 1936–1937, he served as the Soviet adviser to the Republican navy during the 1936–1939 Spanish Civil War. The Great Purges orchestrated by Soviet leader Joseph Stalin exacted a frightful toll on the Soviet Navy leadership, and as a consequence, Kuznetsov was named people's commissar of the navy (minister of the navy) in 1939 at age 37.

In August 1939, Kuznetsov submitted an ambitious naval construction plan designed to produce 2 aircraft carriers, 18 battleships, 48 cruisers, 198 flotilla leaders and destroyers, and 433 submarines. However, the demands and costs of overseeing widely dispersed Soviet naval actions during World War II prevented any meaningful result.

Promoted to admiral in 1940 and to admiral of the fleet in May 1944, Kuznetsov commanded the Soviet Pacific Fleet that supported the Red Army's operations against the Japanese at the end of the war. Kuznetsov's

postwar shipbuilding plan was far beyond the means of the Soviet Union's war-ravaged industries and did not reflect Stalin's expectations.

Kuznetsov was named deputy minister of the Soviet Union's armed forces and commander in chief of naval forces in 1946, minister of the navy in 1951, and first deputy minister of defense of the Soviet Union and commander in chief of naval forces in 1953. Stripped of these titles in December 1955, Kuznetsov was demoted to vice admiral in February 1956 and forcibly retired, apparently because of the October 1955 explosion and sinking of the battleship *Novorossiysk* (formerly the Italian *Giulio Cesare*) while it was moored at Sevastopol. His immediate subordinate, the more progressive Admiral Sergei Georgievich Gorshkov, assumed Kuznetsov's post and led the Soviet Navy to unprecedented prominence over the next three decades. Kuznetsov was posthumously restored to his rank of admiral of the fleet by the Supreme Soviet in 1988, nearly 14 years after his death in Moscow on December 6, 1974.

Kwajalein, Battle for (January 9–February 6, 1944)

Battle for a strategic Japanese logistics base in the Marshall Islands. Kwajalein, the world's largest atoll and among 32 separate atolls that comprise the Marshall Islands, was a primary target of the U.S. Navy's Central Pacific Campaign. As a consequence of its participation in World War I, Japan had secured the Marshalls, located approximately halfway

between Pearl Harbor and the Mariana Islands. Control of the Marshalls allowed the Japanese to extend their power southeast to the Gilbert Islands. These island bases also protected their fleet anchorage to the west at Truk and the airfields to the northwest on the Marianas, which lay close enough to Japan to be within the range of U.S. strategic bombers.

Following their bloody initiation in the opposed amphibious landing on Tarawa, American military planners devised Operation FLINTLOCK to bypass the heavily defended eastern atolls and strike directly at the administrative and communication complexes centrally located on Kwajalein. A secondary assault on Eniwetok (Operation CATCHPOLE) to the west would follow. FLINTLOCK incorporated lessons learned from the Tarawa experience. The Marshalls landings benefited from a sharp increase in the quality and quantity of naval gunfire support, large-scale air bombardments of the target prior to D-day, and land-based artillery prepositioned on adjacent atolls to provide additional fire support. Frogmen of the newly created navy underwater demolition teams scouted the beaches for potential obstacles and marked the lanes for the landing craft. Requirements and procedures for landing assault troops were revamped to increase speed and efficiency in getting ashore, and the assaulting troops would have greatly increased firepower, including more automatic weapons, flamethrowers, and demolition charges.

An unprecedented two-day aerial and naval barrage preceded troop landings by the 4th Marine Division and the army's 7th Infantry Division on February 1, 1944. The marines stormed Roi-Namur, two islands linked by a causeway on the atoll's northern tip, while the army took responsibility for seizing the main island of Kwajalein at the southern end. Although confusion plagued the marines' initial ship-to-shore movement, the assault on Roi met with light resistance and secured the island's airfield in a single day.

The attack on Namur's supply facilities encountered heavier opposition, and only a portion of the island had been taken by nightfall. At least 120 American casualties occurred on Namur when engineers unknowingly detonated a bunker containing torpedo warheads. Just before daybreak on February 2, the marines repelled a counterattack by the remaining Japanese defenders and secured the island.

The more orderly landings on Kwajalein met with substantial opposition, and it required four days of intense fighting to clear the island. Nearly the entire garrison of 8,675 Japanese soldiers on Roi-Namur and Kwajalein

perished in these battles, with half of these casualties resulting from the preliminary bombardment. U.S. forces took only 265 prisoners, including 165 Korean laborers. U.S. losses were 372 dead and 1,582 wounded.

Operations FLINTLOCK and CATCHPOLE validated the American revised doctrine of amphibious warfare employing massive fire support and speed to achieve victory with minimum casualties. The success in the Marshall Islands actions also confirmed the wisdom of the Central Pacific island-hopping campaign, which called for bypassing and isolating Japanese strongpoints to move within striking distance of the Japanese home islands.

L

Laborde, Jean Joseph de (1878–1977)

French Navy vice admiral. Born on November 29, 1878, at Chantilly, Oise, France, Jean Joseph de Laborde graduated from the École Navale in 1895. He first served on a cruiser in the Mediterranean before beginning a long period aboard cruisers in the Far East until 1901. He then served in torpedo boats and cruisers in the North Atlantic and in the Mediterranean. Assigned to the Far East again, he became interested in aviation and learned to fly while in Saigon. He served on a cruiser in the Atlantic in 1912 and earned his pilot's license in April 1914. During World War I, he commanded bomber squadrons and was charged with creating the French naval aviation center at Dunkerque. He was promoted to commander in January 1917.

Following the war, Laborde commanded the naval aviation center at Saint-Raphaël in 1919 and presided over a commission charged with developing French carrier aviation. In 1922, he took charge of the aerial defense of southern France. He was promoted to captain in January 1923. Named head of French naval aviation in November 1924, Laborde oversaw construction of France's first aircraft carrier, the *Béarn*, completed in 1926, which he then commanded. He went on to develop French Navy air doctrine and strategy.

Although Laborde lacked a certain political suppleness, he was clearly destined for high rank. He was promoted to rear admiral in August 1928 and commanded the 2nd Squadron in 1930. He became a vice admiral in October 1932 and was appointed maritime prefect of Bizerte. Promoted to full admiral in 1938, he took command of the French fleet in the Atlantic in April 1939. An admitted Anglophile, he conducted joint maneuvers with the Royal Navy and was well respected by British naval officers.

At the beginning of World War II, Laborde oversaw the French Navy's antisubmarine efforts against German U-boats and planned French naval efforts in the Norwegian Campaign. When France and Germany signed an

armistice in June 1940, he initially ordered his ships to take refuge in British ports, until French premier Henri Philippe Pétain and navy commander Admiral Jean Darlan prevailed on him to honor the naval paragraphs of the armistice agreement. In September, Laborde was named commander of the Vichy French high seas fleet at Toulon.

After U.S. and British forces invaded French North Africa in November 1942 (reaching an accommodation with the Vichyite Darlan) and after the Germans occupied southern France, both sides sought to secure the Toulon fleet. Darlan invited Laborde to bring the ships to North Africa to join the Allies, but Laborde detested Darlan and flatly refused, stating that he would defend his Toulon base against all threats. Incredibly naive, he believed that Adolf Hitler would honor his pledge not to take the French fleet; thus, he did nothing to prepare Toulon's land defenses, which enabled the Germans to launch a successful surprise attack on the morning of November 27, 1942.

Laborde had, however, made plans for scuttling the fleet, and he now ordered them carried out. The operation was abetted by German incompetence, and the French successfully sent to the bottom 77 ships, including 3 battleships, 8 cruisers, and 32 destroyers. Although Laborde's critics argued that he should have braved German retribution and fought his way out, German air assaults would have wreaked havoc on his ships.

When the war ended, Laborde was first denied his pension and then, in 1947, condemned to death, a sentence later reduced to 15 years of imprisonment. Freed in 1951, he was pardoned 8 years later. He died in Castillon-la-Bataille, Gironde, France, on July 30, 1977.

Laconia Incident (September 12–16, 1942)

Incident in the Atlantic Ocean involving RMS *Laconia* that brought unrestricted submarine warfare in World War II. Early in 1942, the Cunard luxury liner *Laconia* underwent conversion into a troopship. On September 12, 1941, the 18,700-ton *Laconia* was steaming alone off the coast off West Africa between Ascension Island and Liberia. With a crew of 463 officers and men, it was transporting 1,800 Italian prisoners of war from the fighting in Egypt, along with 103 Polish soldier guards, 286 mostly severely wounded British military personnel, and 80 civilians. At 10:00 p.m., the ship was struck by two torpedoes from the German submarine *U-156.* The *Laconia*'s captain ordered the ship abandoned, and it sank an hour and a half later. Far from the West African coast, there appeared to be little chance of rescue.

The *U-156*'s captain, Captain Lieutenant Werner Hartenstein, ordered his submarine to surface, hoping to take the senior officers of the *Laconia* prisoner. Discovering the many Italian soldiers struggling in the water, he immediately commenced rescue operations and sent a signal to German submarine command that caused commander of submarines Admiral Karl Dönitz to order other German U-boats to the area.

Soon *U-156* had some 200 survivors, including 5 women, aboard and was towing another 200 in four lifeboats. Realizing that the deaths of so many Italian soldiers could be a major blow to German-Italian relations, at dawn on September 13 Hartenstein broadcast a cease-fire message in the clear in English and radioed Berlin for approval for his actions. The German naval command rejected the cease-fire order but requested that the Vichy France government order warships from its West African bases to the scene.

The British intercepted Hartenstein's message. Assuming that it could be a ruse, they nonetheless passed it on to the Americans. The Allies had secretly established an airfield on Ascension Island in the South Atlantic to protect the important air route to West Africa.

The *U-156* remained surfaced for the next two and a half days. It was joined by *U-507* on the morning of September 15 and that afternoon by *U-*

506 and the Italian submarine *Cappellini*. All four submarines, surfaced, headed for the African coast to rendezvous with the French cruiser *Gloire* from Dakar and two sloops from French Guinea and Dahomey.

On the morning of September 16, a U.S. Army Air Forces Consolidated B-24 Liberator flying from Ascension came on the scene. U.S. Army captain Robert C. Richardson III, the senior officer then on duty at the Ascension base, ordered the B-24 to attack, despite the report from the pilot of Red Cross flags draped on the Axis vessels. Hartenstein ordered the lifeboats cast adrift and those who had been rescued and standing on the deck of the submarines into the water and ordered the submarines to submerge. Although the B-24 dropped bombs and depth charges, the four submarines escaped without damage. The French ships arrived on the scene later and rescued many of the survivors. In all about 1,600 people from the *Laconia* perished, among them about 1,000 Italians.

The incident led Dönitz to issue his "Laconia Order," which ordered U-boat crews to end the practice of attempting to rescue civilian survivors of submarine attacks at sea. Following the war, at Nuremberg Dönitz was brought to trial on war crimes charges, including that he had ordered his crews to fire on survivors of U-boat attacks. He was acquitted on this charge but was found guilty on other charges.

Landing Craft

Both the Axis and Allied powers utilized amphibious warfare during World War II, but especially the Allies (Table 1). Landing craft were widely employed in the Mediterranean, European, and Pacific theaters. The Italians

employed amphibious warfare in the Adriatic and the Aegean and in Africa, and the Germans used it in Norway and Denmark and in the Greek islands and the Adriatic.

Early landing craft were usually improvised from conventional vessels such as barges and ferries, but World War II saw the development of purpose-built craft to land troops and equipment on a hostile shore. Such specialized craft allowed an attacker to land a larger number of men and their equipment and to do so faster and in a smaller area than would otherwise be possible. Modified craft continued to be used during the war, however; for example, in 1940, the Germans assembled such vessels for Operation SEA LION, their planned cross-Channel invasion of Britain, and between 1942 and 1944, General Douglas MacArthur's forces used modified craft in the Southwestern Pacific.

During the years before the war, the U.S. Marine Corps embraced amphibious warfare as its raison d'être. This doctrine was spelled out in its *Tentative Landing Operation Manual* (1935). The marines also developed a prototype for the landing vehicle, tracked (LVT). However, it took the practical demands of World War II to force mass production of landing craft and amphibious tractors. Only the United States built large numbers of amphibious wheeled and tracked vehicles that allowed the transport of men and equipment from ship to shore and then inland.

Landing craft came in a wide variety of forms. They were armored and unarmored and were designed to transport both personnel and vehicles. Some had bow ramps, and others had a fixed-bow configuration. Most landing craft, however, had a blunt bow, were powered by diesel engines acting on twin screws, were anchored at the stern, and had a shallow draft forward, a flat bottom, and a bow ramp. This ramp allowed the rapid unloading of men or cargo.

U.S. Navy LSTs landing much needed supplies and equipment on Leyte Island in the Philippines, 1944. (National Archives)

German *Wasser-Pionieren* (water engineers) developed small landing craft before the war, but the senior German leadership had little interest in these. Landing craft became a priority only in 1940, with the planning for Operation SEA LION. During the war, the Germans built slightly more than 1,000 landing craft of all types; the largest of these had a displacement of 280 tons. The Germans utilized their landing craft chiefly to resupply their Mediterranean island garrisons and for operations in the Aegean, Adriatic, Black, and Baltic Seas. At the end of the war, these vessels were utilized to evacuate forces pressed by the Soviet advance.

Italy built approximately 100 landing craft based on German models. The first 65 of these were roughly 154 feet long and could carry up to 65 tons of cargo at a speed of 11 knots for some 800 miles. Known as the *mule de mare* (mule of the sea), this landing craft was armed with a 76mm antiaircraft gun and two machine guns and had a crew of 13.

The standard Japanese landing craft was known to the navy as the Daihatsu (the army designation was LB-D). It had a length of 47 feet 11 inches, a beam of 11 feet, and a draft of 2 feet 6 inches. Displacing in excess of 20 tons and capable of carrying 10 tons of cargo, it had a crew of 12 men and was armed with two 7.7mm machine guns (two or three 25mm antiaircraft guns in later versions). It had a speed of 7.5 to 8.5 knots. The Japanese built 3,229 of them between 1935 and 1945. In addition, they built small numbers of landing craft that were roughly 33 feet, 43 feet, and 56 feet long. Beginning in 1944, they also built 1,140 49-foot Moku Daihatsu landing craft of wood. Japanese amphibious doctrine developed during the war with China that began in 1937.

The Western Allies and especially the United States built by far the largest number of landing craft during the war to meet needs in both the European and Pacific theaters. Allied troops had to invade and secure areas in the Mediterranean and then invade Northwestern Europe, and in the Pacific, they had to recapture the various islands held by the Japanese. Many Allied landing craft were quite large and carried smaller landing craft on their decks. The craft were identified not by name but by numbers appended to the

general designation. The most common types of landing craft are listed in Table 1.

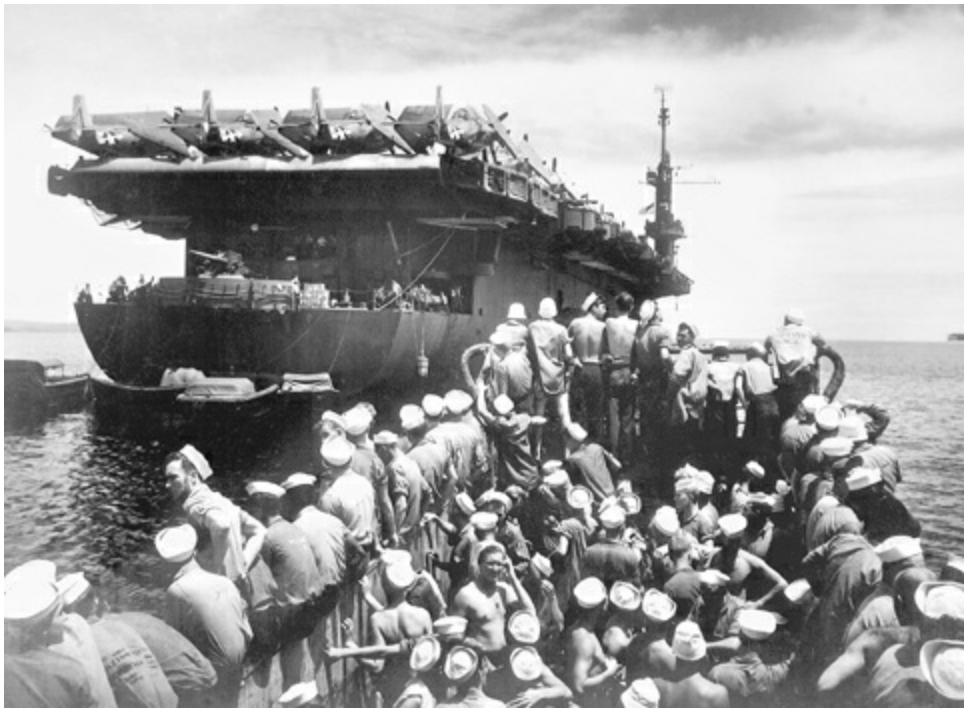
In 1941, the British pioneered development of the LST (landing ship, tank) and the LCT (landing craft, tank). Both were intended to be seagoing craft to deliver vehicles and bulk supplies directly to the shore. The United States altered the original British design and produced them for both nations. The British later modified some of the designs for their own use.

The LST was undoubtedly the most widely known larger landing vessel of the war, a staple of later landings in the Pacific theater. The most common version of the LST was 328 feet in overall length with a beam of 50 feet and displacement of 4,080 tons, fully loaded. LSTs were unarmored or only lightly armed (with 8 40mm and 12 20mm antiaircraft guns). The bow of the ship opened, allowing the front ramp to drop and the crew to land cargo directly on a shore. The LST could carry smaller LCTs and was configured with davits to lower personnel landing craft (LCVPs) over the sides. Some LSTs carried only two LCVPs in this fashion; others carried six. The LST crew complement was 111 officers and men.

The LCS(L) (landing craft, support [large]) was developed to provide support to amphibious landings. With a crew of 71, it was armed with one 3-inch .50-caliber gun, four 40mm guns (two by two), four 20mm guns, and 10 rocket launchers.

The smaller LCT carried trucks, tanks, or cargo directly to an invasion beach. The LCVP, developed by New Orleans entrepreneur Andrew J. Higgins and popularly known as the Higgins boat, was made of wood. With a crew of three men, it was designed to land 36 troops (or one 6,000-pound vehicle or 8,100 pounds of cargo) directly on the beach. The vessel was developed for ease of mass production, and more than 23,000 had been manufactured by the end of the war.

The Allies also developed true amphibians capable of transporting men and equipment from ship to shore and then inland. Of these, the best known is undoubtedly the DUKW (an administrative code for a 1942 model amphibious four-wheel-drive truck). The DUKW had both a propeller and wheels that moved it at 5.5 knots in the water and up to 50 mph on land. It carried 25 troops or 5,000 pounds of cargo and was particularly useful for transporting litters of wounded. A number of the popular DUKWs remain in service today as tourist attractions.



Sailors aboard an LCM (landing craft, mechanized) returning from liberty to the USS *Casablanca* from Rara Island, off Pitylieu Island, Manus, Admiralty Islands, April 19, 1945. (National Archives)

Landing craft were immensely important to the Allies in the war, so much so that U.S. Army chief of staff George C. Marshall stated in 1943, “Prior to the present war I never heard of landing craft except as a rubber boat. Now I think of nothing else.” The availability of landing craft dictated timetables for Allied amphibious actions, and the shortage of them precluded simultaneous landings in northern France (in the June 6, 1944, Operation OVERLORD) and southern France (in the August 15, 1944, Operation ANVIL-DRAGOON).

Some historians have argued that the U.S. chief of naval operations, Admiral Ernest J. King, placed too many landing craft in the Pacific, thus hindering Allied efforts in Europe. Current scholarship has concluded that the major problem was over commitment within the European theater itself. Far less glamorous than combatant vessels, landing craft were nonetheless an essential element in the Allied victory in World War II, just as they continue to be an integral part of naval operations today.

Langsdorff, Hans Wilhelm (1890–1939)

German Navy captain. Born on March 20, 1890, in Bergen, Germany, Hans Wilhelm Langsdorff joined the Imperial Navy in 1912 and experienced his first action in the 1916 Battle of Jutland. Through the remainder of World War I, he commanded minesweepers.

Langsdorff remained in the navy after the war and commanded a half flotilla (four vessels) of torpedo boats. From 1931 to 1935, he was an adjutant in the Ministry of Defense, and he then served as a staff officer. Promoted to captain in January 1937, Langsdorff assumed command of the pocket battleship *Admiral Graf Spee* in November 1938.

With German leader Adolf Hitler having decided on an invasion of Poland for September 1, 1939, the *Graf Spee* and its sister ship, the *Deutschland,* were ordered to sea in advance of hostilities. The *Graf Spee* departed German waters on August 21.

Langsdorff's orders were to operate against Allied commerce in the southern Atlantic and Indian Oceans, and his ship sank 10 merchant vessels for a total of 50,000 tons by December. The British dispatched a number of ships to intercept the *Admiral Graf Spee* off South America, including Commander Henry Harwood's Force G of four cruisers. The Battle of Río de la Plata on December 13, 1939, between the *Admiral Graf Spee* and the

heavy cruiser HMS *Exeter* and the light cruisers HMS *Ajax* and HMNZS *Achilles* resulted in damage to all but the last of these vessels. Langsdorff took refuge in the port city of Montevideo, Uruguay, going ashore there to bury crewmen killed in the battle.

Because Uruguay was a neutral country, combatant ships from belligerent nations could remain in port only for 72 hours. The British bluffed Langsdorff into believing they had gathered a superior force off Montevideo, centered on the battle cruiser *Renown*, and on December 17 he ordered his ship out of port and scuttled it at the mouth of the Río de la Plata. Langsdorff then took a hotel room ashore. On December 20, 1939, he wrote a letter explaining his actions, wrapped himself in his ship's ensign, and shot himself.

Laon, Battle of (May 17–19, 1940)

Engagement during the May 10–June 25, 1940, Battle for France. On May 15, French commander in chief on the Northeast Front General Alphonse Georges ordered Colonel Charles de Gaulle to buy time while the Sixth Army established a defensive line on the Aisne and Ailette Rivers. De Gaulle was to employ the 4th Armored Division, a newly created force gathering some 120 miles northeast of Paris at Laon on the southern flank of the invading German armies.

Since 1933, de Gaulle had argued that France needed a modern mechanized force, but this would be his initial experience commanding tanks

in battle. He met most of his troops for the first time on the day of the battle. After reconnoitering, de Gaulle chose as his objective the crossroads at Montcornet on the Serre River, 20 miles northeast of Laon. Units dribbled in on May 17. The tank crews had fired guns of the most modern tanks only once, if at all. The drivers were equally inexperienced.

Almost immediately, de Gaulle dispatched the 46th Battalion to Montcornet. The battalion operated the Char Bs, France's most modern heavy tank. The 46th was joined by a company of SOMUA D-2 tanks from the 6th Demibrigade. Both tank models had firepower and frontal armor superior to those of the German tanks. The 2nd and 24th Battalions operated R-35s, obsolete tanks but comparable to Germany's older models. However, the Germans had the advantage in training, experience, communications ability (by radio), tactical doctrine, and integration of combined arms.

The French force shot up two columns of soft-skinned vehicles from General of Panzer Troops Heinz Guderian's XIX Panzer Corps and knocked out a few light panzers before fighting its way into Montcornet around 3:00 p.m. Meanwhile, the French 4th Battalion of Chasseurs eliminated a threat to the French rear from German infantry concealed near Chivres. For three hours, the 4th Armored Division endured German artillery and air strikes with no means of responding. Finally, it fell back to Laon, harassed by Ju-87 Stuka dive-bombers. At least two Char Bs and about 200 infantrymen were lost in combat.

On May 19, de Gaulle attacked again, this time northwest of Laon toward bridges at Crécy, Mortiers, and Pouilly. Although his troops were reinforced to about 30 Char Bs, 40 SOMUAs, and 80 R-35s, plus 75mm guns from the 332nd Artillery Regiment and additional infantry, de Gaulle still lacked adequate artillery and air support. His troops were unable to fight their way across the Serre. The Sixth Army had completed its defensive deployment on the Aisne by this time. Ordered to add his tanks to those defenses, de Gaulle lingered another day and then withdrew his troops in good order, fending off attacks by German armored cars along the way.

Although ballyhooed at the time, de Gaulle's counterstrikes had no effect. Guderian had been ordered to halt before de Gaulle attacked, a pause that lasted only 24 hours, and he did not even report the impotent French counterattacks to army headquarters until the following day. Regardless, the actions around Laon became one of the pillars of the de Gaulle pantheon. The

others were his prewar advocacy of a mechanized army, his leadership of the Free French during the war, and his postwar political career.

Latin America and the War

After World War II began in Europe, representatives of the United States and Latin American nations convened in Panama in September 1939 and issued a "general declaration of neutrality," indicating that it was the intention of all the American republics to remain neutral in the European conflict. In the event that the United States and Latin America were drawn into the war, U.S. strategic planners did not envision an important military role for Latin American armed forces beyond defense of their own countries. However, the United States did want the Latin American nations to furnish bases for U.S. operations, increase the flow of strategic materials, and take action to curb Axis subversive and intelligence activities.

The United States engaged in negotiations with the Latin American nations concerning closer military cooperation and the acquisition of bases. Washington signed a series of bilateral "staff agreements" promising military aid in return for the Latin American nations' promise to call for assistance if attacked, combat subversive activities, exchange intelligence, and permit the transit of U.S. forces going to the aid of another Latin American country.

In response to the request for bases, Latin American leaders expressed concerns about jurisdiction and access. The United States responded by offering to provide financing and technical assistance for bases, with the host country retaining jurisdiction and administration. Moreover, the bases would be open not only to the United States but also to all other Latin American nations. The United States signed staff agreements with every Latin American nation except Argentina and signed base agreements with 16 countries.

The U.S. Lend-Lease Act, which went into effect in March 1941, authorized the president to lend, lease, or sell military items to any country whose defense was deemed vital to the defense of the United States. In April, Roosevelt certified that Latin America came under the provisions of the act, and in October 1941, the U.S. Congress approved funding for Latin America. Washington eventually provided $475 million in Lend-Lease aid to Latin America, with some $348 million of that amount going to Brazil.

When the United States officially entered the war in December 1941, all of the Latin American nations made some positive response. Nine countries declared war on the Axis powers in December 1941: Costa Rica, Cuba, the Dominican Republic, El Salvador, Guatemala, Haiti, Honduras, Nicaragua, and Panama. Colombia and Mexico broke diplomatic relations with the Axis powers. Brazil, Ecuador, Paraguay, and Peru declared their solidarity with the United States, and the remaining countries granted the United States nonbelligerent status, giving it greater freedom of action within their national territories.

A meeting of the American republics called by the United States and Chile convened in Rio de Janeiro on January 15, 1942. Washington was not seeking a joint declaration of war because of the military demands that would result. Instead, it supported a joint declaration calling for a break in relations with the Axis powers. The conference approved a resolution that “recommended” a break in diplomatic relations as well as in commercial and financial connections. Those countries that had not already broken diplomatic relations quickly did so, except for Argentina and Chile. The conference also established the Inter-American Defense Board, made up of military and naval representatives from each country to coordinate hemispheric defense.

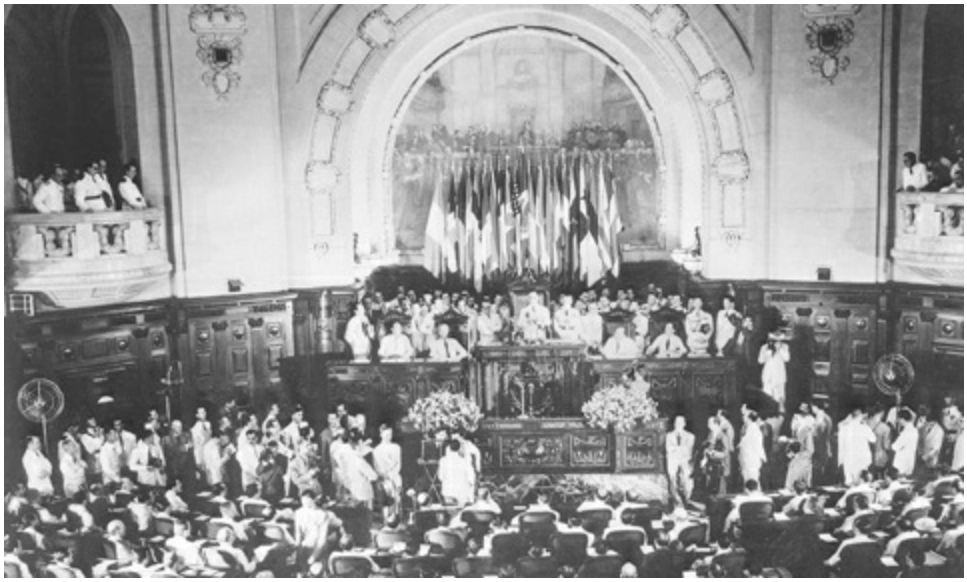
The fact that the consultative conference was held in Rio de Janeiro indicated the special role that the United States assigned to Brazil. U.S.

planners believed that the most likely scenario for an Axis attack on the Western Hemisphere was a German assault launched from Africa against Brazil's northeastern "bulge." The United States wanted to send U.S. troops to defend the bulge, but the Brazilians were unwilling to accept U.S. ground forces and wanted U.S. arms instead. Both sides eventually accepted a trade-off between U.S. troops and arms for the Brazilians. Brazil received a large increase in military aid in return for permitting unrestricted U.S. air operations in the Brazilian northeast and even the stationing of U.S. troops. In August 1942, Brazil declared war on the Axis after German submarines attacked Brazilian shipping. Brazil also became the only Latin American country to provide a major military force for combat. (Mexico provided one fighter squadron.) With the United States furnishing training, supplies, and transport, the Brazilian Expeditionary Corps of approximately 25,000 men participated in the 1943–1945 Italian Campaign.

The United States recognized early on that it had to address the economic as well as military consequences of war. Even in the summer of 1940, Washington planners were already thinking in terms of a "hemispheric economic policy" that called for much closer economic relations with Latin America. Strategic metals were of particular interest to the United States; in November 1940, the U.S. government contracted to purchase virtually the entire Latin American production of copper and tin. The United States also developed a blacklist of firms and individuals operating in Latin America who were considered pro-Axis or anti–United States. U.S. firms were prohibited from dealing with anyone or any firm on this "Proclaimed List of Certain Blocked Nationals," and Franklin D. Roosevelt's administration attempted, with considerable success, to get Latin American governments to enforce this blacklist. The United States also dramatically increased its lending to Latin America, mainly to finance the purchase of U.S. products.

U.S. entry into the war led to even greater efforts at economic cooperation between the United States and Latin America. As mentioned, the Rio Conference in January 1942 approved a resolution recommending a break in commercial and financial relations with the Axis powers. The conference also called for a complete economic mobilization of the American republics to provide an adequate supply of both military and civilian goods. U.S. purchases of Latin American commodities continued to be at the center of U.S.–Latin American economic relations.

Washington stepped up its purchases of strategic metals, reaching agreements with 12 Latin American nations to buy metals. Cut off from its principal source of natural rubber in Asia, the United States also entered into contracts with 16 Latin American nations to promote the production of rubber. In addition, actions were taken to improve transportation within the hemisphere. An inter-American technical commission was established to improve maritime transportation, and the United States tried to improve land transportation by reviving construction on the Inter-American Highway, concentrating on the Central American section of the road.



Brazilian president Getulio Vargas addresses delegates at the Conference of American Foreign Ministers in historic Tiradentes Palace, Rio de Janeiro, January 20, 1942. (Corbis)

Axis-connected firms operating airlines in Bolivia, Brazil, Colombia, Ecuador, and Peru were forced out of business and replaced by U.S. firms or locally controlled operations. The United States even provided aircraft for local airlines in Brazil and Chile. The net effect of all of these actions was to create an even greater economic interdependence between the United States and Latin America. From 1941 to 1945, the United States purchased more than 50 percent of Latin America's exports and provided more than 60 percent of its imports.

Wartime themes and postwar plans came together at the Chapultepec Conference in Mexico City in February and March 1945. The Latin American nations were concerned that the United States might relegate the

inter-American system to a lesser role once it had served its wartime purposes. They also hoped that the United States would facilitate the transition to a peacetime economy and would aid in Latin America's postwar development. When the United States finally agreed to the Chapultepec Conference, it sent an impressive delegation, including the new secretary of state, Edward Stettinius, who was returning from the Yalta Conference.

The Latin American nations wanted to put the inter-American system on a more formal basis, but the United States delayed action until the next regular inter-American conference. Latin American demands for a strengthening of the inter-American security system led to the Act of Chapultepec, which classified an attack against any American state as an attack against all American states and required consultation on the measures to be taken in response, including the use of force. Although the act applied only for the duration of the war, it was to be incorporated in a permanent treaty once the war concluded.

On the question of economic relations, the United States agreed to aid in the transition to a peacetime economy by gradually reducing its purchases of strategic raw materials; it also indicated, in general terms, its support for economic development in Latin America but did not commit itself to any specific programs of assistance.

The warm glow of the Chapultepec Conference soon faded. The meeting scheduled for Rio in October 1945 to place the Act of Chapultepec into treaty form was postponed, and there were repeated delays in holding the technical conference to deal with inter-American economic problems. The war had put the Latin American nations in the role of principal supporters of the inter-American system at the very time that the United States was shifting its emphasis to global organization. Latin America wanted to enlist U.S. support in dealing with its growing social and economic problems; the United States, however, was preparing for another struggle: the Cold War with the Soviet Union.

Latvia

Baltic nation with an estimated 1939 population of 1.994 million. Encompassing 24,938 square miles, Latvia is located in Northeastern Europe. It borders the Baltic Sea to the west, Estonia to the north, Lithuania to the south, Russia (the Soviet Union in 1939) to the east, and Belarus to the southeast. Between 1918 and 1934, Latvia was a constitutional republic. In 1934, Karlis Ulmanis seized power and established a nationalist, quasi-fascist regime there, which endured until 1940.

Along with the other Baltic states of Estonia and Lithuania, Latvia had the unfortunate fate to be occupied by both the Soviet Union and Germany during World War II. The initial Soviet occupation was presaged by the German-Soviet Non-Aggression Pact of August 23, 1939, which had a secret additional protocol stipulating that Latvia and Estonia would be under Soviet control and Lithuania would be under German control. In October 1939, Latvia was forced to agree to the Treaty of Friendship and Cooperation with Moscow, which permitted the stationing of Soviet troops.

Latvian representative in Great Britain Karlis Zarins was given authority to handle national affairs overseas should contact with the home country be broken. In June 1940, following the German invasion of France, the Soviet Union activated the pact, and its troops invaded Latvia. Threats by Moscow to bomb Latvian cities ended preparations for armed resistance, and Moscow established a puppet “people’s government” in the country. On August 5, 1940, the Latvian Soviet Socialist Republic was formally admitted into the Soviet Union.

In June 1941 Germany invaded the Soviet Union, and the German Army occupied the Baltics. The German blitzkrieg moved with great speed, and some 15,000 men in Latvian defense battalions surrendered to German

forces. Certainly, an element of the population strongly favored the Nazi cause.

German plans called for annexing the Baltic states, expelling approximately two-thirds of their populations, and integrating the remainder with German immigrants. Nazi leader Alfred Rosenberg, a Baltic German, proposed a substantial expansion of Latvia and the other republics with land from Belorussia and the Soviet Union. The harshness of the occupation was reflected in the confiscatory devaluation of the Latvian currency, the seizure of private property, and the forced conscription of citizens into labor and military units, including deportations. Property that had been expropriated by the Soviets was not returned but instead was turned over to specially created German companies.

Censorship and a strict regulation of formal education were also features of the occupation. Riga University and Tartu University were closed and then reluctantly reopened in early 1942. Kaunas University and Vilnius University were opened in the fall of 1941 following Soviet closure, then closed again early in 1943. Nazi principles were integrated into school textbooks on biology and history. The burden of censorship, combined with paper shortages, forced newspapers out of print. Certain books were also banned.

Administrative directorates implemented German instructions but provided for some informal independence and resistance to the occupation as well. The directorate of Latvia successfully opposed a conscription of 13,000 women from Estonia and Latvia that was announced in the spring of 1943. Bribery and promises of a smooth administration of the economy were useful tools in persuading the occupiers to be more flexible in their policies.

Nonetheless, the German occupation steadily grew harsher, with the directorates bypassed in the drive for laborers and other assets. The total number of Latvian people killed or deported by the Nazis has been estimated at 120,000, approximately half of them Jews. At the end of the war, the Soviet Union reestablished its control and replenished the loss with Soviet immigrants, who soon threatened to become an absolute majority. Latvia remained under the Soviet yoke until it declared its independence in 1991, a prelude to the end of the Cold War.

Laval, Pierre (1883–1945)

French politician and premier. Born in Châteldon, Puy-de-Dôme, France, on June 28, 1883, Pierre Laval was trained as a lawyer. In 1914, he won election to the Chamber of Deputies of the French National Assembly as a socialist and a pacifist. Despite frequent policy shifts in other matters, he consistently promoted his policy of peace at any price—a policy that led directly to his collaborationist platform during World War II.

Laval served in the National Assembly from 1914 to 1919 and again from 1924 to 1927. Following the split in the Socialist Party at Tours in 1920, he became a political moderate, eschewing party affiliation. He gradually moved to the Right politically, in the process acquiring a reputation as an unprincipled political manipulator.

Laval held important positions from 1925 to 1936, including that of premier in three successive governments between January 1931 and February 1932 and then again from November 1934 to January 1936 (when he was also minister of foreign affairs). As foreign minister, he played an important part in developing the Rome Accords of January 1935 with Benito Mussolini’s Italy. Evidence suggests that Laval offered Italy a free hand in Ethiopia. Certainly, he and British foreign minister Sir Samuel Hoare sought to arrange an economic protectorate for Italy in Ethiopia, even after the Italian invasion of that country. Public outcry over this situation led to the resignation of both men. Laval then remained something of a political outcast until World War II.

Laval’s strong opposition to the war in September 1939 helped his political career the following June when he actively supported an armistice

with Germany, along with Marshal Henri Philippe Pétain and General Maxime Weygand. On June 21, Laval helped lead the opposition to removing the government to North Africa, and two days later he joined the Vichy government as minister of state. On July 1, he played the key role in removing the government to the resort town of Vichy in central France.

Vichy France political leader Pierre Laval, shown here in 1942. Tried after the war and found guilty of collaboration with the Germans, he was executed in 1945. (Popperfoto/Getty Images)

Laval's intervention helped convince leaders in the National Assembly to accept constitutional changes on July 10, 1940, that gave Pétain sweeping powers as the head of state. As vice president of the Council of State and Pétain's designated successor, Laval encouraged active collaboration with the Germans. After meeting with the German ambassador, Otto Abetz, in July, Laval visited with Adolf Hitler at Montoire-sur-le-Loir on October 22 to prepare an encounter between Pétain and the German leader two days later.

His role of matchmaker was, however, less appreciated by Pétain and the Vichy ministers. Following considerable intrigues by the latter, Pétain dismissed Laval from his posts and had him arrested on December 13, 1940, on suspicion of planning a coup d'état. The Germans secured his release.

During the next year and a half, Laval remained near German-occupied Paris, barely surviving an assassination attempt on August 27, 1941, at Versailles. He continued criticizing Pétain for not collaborating sufficiently with the Germans before he returned on April 18, 1942, to play the leading role in the Vichy government as minister of foreign affairs, information, and the interior, largely on German insistence. He purged the government of his enemies and continued collaborating with the Germans, as evidenced in his declaration of June 22, 1942, expressing hopes for a German victory to prevent the spread of communism.

Laval sought to win concessions from the Germans in return for supplying them with French workers; his La Relève (Relief) system involved the exchange of French workers for prisoners of war. This system was soon replaced by Le Service de Travail Obligatoire (Obligatory Labor Service). Laval agreed to having French Jews in both zones of France rounded up and shipped to Germany, and he created the French Milice (Militia) to secure internal order and repress the French Resistance.

As the tide of war turned, however, Laval sought to play a double game, trying to hold off on some of Hitler's demands for increased French assistance. In the fall of 1943, Germany again intervened to prevent the firing of Laval, who had been joined by even more extreme collaborators in the government. In August 1944 following the Allied landing in Normandy on June 6, Laval moved the government to Belfort; one month later, he moved with Pétain and the Vichy government to Sigmaringen in Germany. At the end of the war, Laval sought asylum in Spain, which refused to accept him.

Laval was returned to France for a controversial and particularly rapid trial before the High Court of Justice in Paris. Found guilty of collaboration on October 9, he was sentenced to death. After a failed attempt to kill himself with poison, Laval was shot by a firing squad at the prison of Fresnes on October 15, 1945.

League of Nations

Supranational peacekeeping organization formally established in January 1920, the structure of which was drawn up at the 1919 Paris Peace Conference. The League of Nations was perhaps most ardently championed by U.S. president Woodrow Wilson, who played a significant role in shaping its ideology and organization. The League of Nations was the first international organization in world history dedicated to promoting peace among all nations, and Wilson had made it a priority since at least 1916, when he ran for reelection promising American participation in an international league of nations dedicated to the pursuit of world peace, disarmament, and international arbitration of member disputes.

The covenant (i.e., constitution) of the League of Nations was drafted during the Paris Peace Conference. Produced in less than two weeks and presented to a plenary session of the Paris Peace Conference on February 14, 1919, it closely reflected Wilson's desires. Containing 26 articles, it provided for an organizational framework that included a Secretariat (the executive), a Council (France, Britain, Italy, Japan, and the United States as permanent members, with four nonpermanent members selected by the League of Nations Assembly); and an assembly representing all member states. A novel creation was a Mandates Commission, which would supervise treatment of the inhabitants of the former German and Ottoman/Turkish colonies, which were to be parceled out to the victorious powers.

The League of Nations Covenant became Article I of the Treaty of Versailles, formalized in April 1919. It had been Wilson's insistence that the covenant be a part of the treaty, meaning that any nation that agreed to and

signed the treaty also gave de facto support to the establishment of the League of Nations. The covenant was concerned with three basic ideas. First, the League of Nations would require members to demur from hostilities and submit disputes for league arbitration. Second, the League of Nations was to draw up plans for—and supervise—a general arms reduction program so that no nation possessed significant military advances over another. Third, the covenant embraced the concept of collective security, binding all members to eschew all relations—including commercial—with an aggressor nation and to unite in military opposition against any aggressor nation, using any force necessary. This last point, which was encapsulated in Article 10 of the covenant, became highly controversial in the United States, as many senators —mainly Republicans—saw in it an unnecessary giveaway of America's prerogative to decide on or wage war. Wilson's refusal to compromise on this point doomed the treaty to failure in the United States.

The covenant took effect in January 1920 but with no U.S. participation. The League of Nations was seriously weakened at the onset by the refusal of the United States to join, and the covenant's strongest enforcement weapon was the threat of sanctions. The League of Nations proved ineffectual during the crises of the 1930s precipitated by Italy, Germany, and Japan, who essentially ignored the organization and pursued their own plans for conquest.

Although the League of Nations had serious shortcomings, it was a novel creation and sparked great interest and enthusiasm. One problem with this, as French premier Georges Clemenceau was quick to point out, was that many people would place their confidence in the new League of Nations, assuming that it would solve all of the world's security problems. The League of Nations ultimately proved entirely incapable of doing so, to which the outbreak of World War II in 1939 grimly attested. The United Nations, created in the immediate aftermath of World War II, was modeled directly on the League of Nations but without some of its ineffectual mechanisms. The United States also took a central role in the creation and organization of the United Nations.

Leahy, William Daniel (1875–1959)

U.S. Navy admiral of the fleet. Born in Hampton, Iowa, May 6, 1875, William Daniel Leahy graduated from the U.S. Naval Academy at Annapolis in 1897. He first served aboard the battleship *Oregon,* taking part in the 1898 Spanish-American War. From 1899 to 1907, Ensign Leahy saw service in the Pacific, including during the Boxer Uprising in China and in the Philippines. He also served in Panama. During World War I, he formed a friendship with Assistant Secretary of the Navy Franklin D. Roosevelt, and in 1918 he was promoted to captain.

Leahy then served at sea and held important posts ashore. Promoted to rear admiral in 1927, he headed the Bureau of Ordnance (1927–1931) and then the Bureau of Navigation (1933–1935). He was promoted to vice admiral in 1935. In January 1937, Leahy was promoted to admiral and appointed by President Roosevelt as chief of naval operations (CNO). As CNO, he argued for naval expansion. After retiring from the navy in August 1939, he served as governor of Puerto Rico (September 1939–November 1940). Roosevelt next named him U.S. ambassador to Vichy France.

In May 1942, Roosevelt recalled Leahy to active duty and made him presidential chief of staff and de facto chairman of the Joint Chiefs of Staff. Leahy also presided over the Combined Chiefs of Staff meetings when the United States was the host. Throughout the war years, he was an adviser and confidant to Roosevelt, especially during meetings with Allied heads of state at places such as Casablanca, Cairo, Tehran, and Yalta. A strong nationalist,

Leahy did not put much credence in Roosevelt's cherished United Nations. On December 15, 1944, Leahy was promoted to fleet admiral, becoming the first American military officer to hold five-star rank.

U.S. Navy admiral of the fleet and Chairman of the Joint Chiefs of Staff William D. Leahy. (Library of Congress)

When Roosevelt died on April 12, 1945, Leahy became one of President Harry S. Truman's closest advisers, playing an important role at the Potsdam Conference of July and August 1945. He opposed dropping the atomic bomb on Japan, urging Truman to continue conventional bombing and to tighten the naval blockade in the belief that Japan was ready to sue for peace. He also feared that the atomic bomb might not work.

After the war, Leahy played a major part in the formation of the National Security Act of 1947. His advice helped lead to the subsequent establishment of the National Military Establishment, later known as the Department of

Defense, and the Central Intelligence Group, later known as the Central Intelligence Agency. He continued to play vital roles in the formation and expansion of the National Security Council, the Joint Chiefs of Staff, and the North Atlantic Treaty Organization.

Leahy was an ardent anticommunist who shared Truman's abiding distrust of the Soviet Union. He retired from government service in March 1949 but continued to act as a key adviser to the secretary of the navy. He also helped establish the Naval Historical Foundation and served as its first president. Leahy died on July 20, 1959, in Bethesda, Maryland.

Leclerc, Jacques Philippe (1902–1947)

French Army marshal. Born on November 28, 1902, into a distinguished and ennobled military family near Amiens, France, Count Philippe de Hauteclocque would take the nom de guerre of Leclerc during World War II to avoid reprisals against his family in France. Too young to have fought in World War I, he graduated from the French Military Academy of Saint-Cyr

in 1924 and distinguished himself in combat against insurgents in Morocco. He then taught at Saint-Cyr.

While fighting as a captain during the Battle for France (May 10–June 25, 1940), Leclerc was wounded and captured by the Germans. They thought he was too weak to move and placed him at a château belonging to some of his friends, from which he managed to escape. After a perilous journey through Spain and Portugal, he arrived in London in July to join General Charles de Gaulle's Free French forces. Following Leclerc's recuperation and promotion to major, de Gaulle sent him to French Equatorial Africa to organize Free French forces.

Starting with only about 20 men, Leclerc defeated Vichy French forces and won control of Gabon and the Cameroons during October and November 1940. By 1942, Free French forces controlled all of French Equatorial Africa. Leclerc, now a colonel, commanded the Desert Army and conducted raids against Italian outposts in the Sahara. In December 1942, he led a march from Lake Chad to Tripoli, covering 2,000 miles in 39 days. Leclerc's actions guaranteed the safety of the Takoradi air route used to ferry supplies from the United States to the Soviet Union. In January 1943, his forces linked up with the British Eighth Army outside Tripoli.

In June 1944, Leclerc assumed command of the French 2nd Armored Division as a general of division. He and his unit fought in the Normandy Campaign and in the drive across France. On August 23, on General Dwight D. Eisenhower's approval, his unit was the first Allied formation to enter Paris. Promoted to general of corps, he then helped liberate both Strasbourg and Bordeaux.

After the Allied victory in Europe, de Gaulle appointed Leclerc to command the French Expeditionary Force sent to restore French control in Indochina; on the way there, Leclerc represented France in the formal Japanese surrender.

Despite having only 40,000 men, Leclerc speedily restored French authority in Vietnam and Cambodia. Aware of the great difficulties of engaging in jungle warfare against nationalist guerrillas, he was not optimistic about his country's long-term prospects in the area, and he informed the government in a secret report that there would be no victory through force in Indochina. Undercut by French nationalists, Leclerc asked for and received a transfer. In July 1946, he was promoted to general of the

army and appointed to command French forces in North Africa. Leclerc died in a plane crash in Algeria on November 28, 1947. He was posthumously promoted to marshal of France.

Lee, John Clifford Hodges (1887–1958)

U.S. Army lieutenant general. Born in Junction City, Kansas, on August 1, 1887, John Clifford Hodges Lee graduated from the U.S. Military Academy at West Point in 1909 and was commissioned in the Corps of Engineers. During World War I, he served as aide to Major General Leonard Wood, commanding general of the 89th Division and then chief of staff of the 89th Division. Lee graduated from the army General Staff training course at Langres in 1918 and was actively involved with the planning of the Saint-Mihiel and Meuse-Argonne offensives. He ended the war as a temporary colonel.

During the interwar years, Lee graduated from the Army War College (1932) and the Army Industrial College (1933). He oversaw numerous harbor and river projects and commanded the San Francisco Port of Embarkation (1940). Promoted to brigadier general in October 1940, the arrogant Lee, whose initials were J. C. H., came to be known as "Jesus Christ Himself." In November 1941, he assumed command of the 2nd Infantry Division, and in February 1942, he was promoted to major general.

That May, Lee took command of the Services of Supply (SOS) in the United Kingdom to oversee the greatest engineering project of the war: the massive buildup of men and supplies for the invasion of occupied Europe, code-named bolero. In addition to commanding the SOS (designated the Communications Zone [COMMZ] on June 7, 1944) and acting as the G-4 (assistant chief of staff for logistics) for the European theater of operations, U.S. Army Headquarters, Lee served as deputy theater commander, with special responsibility for administration and supply, from January to July 1944. He was promoted to lieutenant general in February 1944.

With the dissolution of the COMMZ at the end of the war, Lee took charge of the successor command, Theater Service Forces, European theater. In January 1946, he was assigned as commanding general of the Mediterranean theater and deputy supreme commander of Allied Forces, Mediterranean. Lee retired from the army in December 1947 and died in York, Pennsylvania, on August 30, 1958.

Lee, William Carey (1895–1948)

U.S. Army major general, considered the father of U.S. airborne forces. Born in Dunn, North Carolina, on March 12, 1895, William Carey Lee graduated from North Carolina State University and was commissioned a second lieutenant in August 1917. He served with the American Expeditionary Forces (AEF) in France during World War I, where he commanded an infantry platoon. He then served on occupation duty in Germany through most of 1919.

Lee taught military science with the Reserve Officers' Training Corps program at North Carolina State University from 1922 to 1925. Between 1926 and 1929, he served in Panama. He then attended the Tank School at Fort Meade, Maryland, and later became an instructor. Major Lee graduated from the Command and General Staff School in 1938. Assigned to the army's Airborne Project in June 1940, he became the foremost proponent of U.S. parachute and glider-borne infantry formations.

In July 1940 Lee formed the Parachute Test Platoon, and within three months this organization had grown into a parachute infantry battalion. Following Germany's successful, albeit pyrrhic seizure of Crete with airborne forces in May 1941, the British and Americans developed large airborne formations. Lee, promoted to lieutenant colonel in February 1941 and colonel that December, had a major role in that effort.

In March 1942, the army established the Airborne Command headed by Lee, who was promoted to brigadier general that April. The Airborne Command consisted of two airborne divisions: the 82nd and 101st. Lee was promoted to major general in August 1942, and he took command of the "Screaming Eagles," the 101st Airborne Division, and accompanied it to Britain for the June 6, 1944, Normandy Invasion. Lee—the oldest parachute-qualified officer among U.S. forces—did not accompany the 101st into battle.

He suffered heart attacks in February and March 1944. Medically retired in December 1944, he died in Dunn, North Carolina, on June 25, 1948.

Lee, Willis Augustus "Ching" (1888–1945)

U.S. Navy vice admiral. Born on May 11, 1888, in Natlee, Kentucky, Willis Augustus Lee graduated from the U.S. Naval Academy at Annapolis in 1908. An early gunboat billet with the Asiatic Fleet and a fondness for China earned him the sobriquet "Ching." Lee advanced steadily through the various ranks before World War II and served in numerous capacities, both at sea and ashore, including four tours with the Division of Fleet Training. He returned to that organization as its director during 1941–1942.

Promoted to rear admiral in January 1942, Lee subsequently took command of the Pacific Fleet's Battleship Division 6, composed of the recently commissioned fast battleships *Washington* and *South Dakota.* At Guadalcanal, he repulsed a superior Japanese force on the night of November 14–15, 1942. Despite losing his destroyer screen, Lee engaged the Japanese. Through the judicious use of radar, he identified and targeted the battleship *Kirishima,* which fell victim to devastatingly accurate gunfire from the *Washington*'s 16-inch main batteries. With *Kirishima* mortally damaged, the Japanese ships withdrew. Lee's victory effectively ended Japan's efforts to dislodge U.S. forces from Guadalcanal and was thus a turning point in the Pacific theater fighting.

Although promoted to commander of the Pacific Fleet's battleships in 1943, Lee never again engaged the Japanese in a decisive surface battle. Eclipsed by naval airpower, his battlewagons were reduced to providing

antiaircraft screens for the fast carrier task forces, for which he nevertheless earned recognition. Selected to develop kamikaze countermeasures in July 1945, Lee, who had been vice admiral in March, had just formed his task group when the war ended. He died shortly thereafter, on August 25, 1945, of a sudden heart attack, off the coast of Maine.

Although Lee was a hero of the fighting at sea, his efforts at the Division of Fleet Training remain his greatest contribution to victory. Improving the equipment of combat ships and spearheading the drive to outfit vessels with radar, Lee prepared the U.S. Navy for a two-ocean war.

Leeb, Wilhelm Franz Josef Ritter von (1876–1956)

German Army field marshal. Born on the family estate in Landsberg-am-Lech, Bavaria, on September 5, 1876, Wilhelm von Leeb began his military career as an officer candidate in the Bavarian Army in 1895. Commissioned a lieutenant in 1897, he saw action in the 1900 Boxer Uprising in China. He attended the Bavarian Kriegsakademie (War College) in Munich, then served on the Bavarian General Staff (1907–1909) and on the Great General Staff in Berlin (1909–1911).

Promoted to captain in 1912, Leeb was serving on the General Staff of the I Bavarian Army Corps in Munich when World War I began. During the war, he was a staff officer with the 11th Bavarian Infantry Division on the Western, Galician, and Serbian fronts. He was awarded the Bavarian Military Order of Max Joseph for exceptional bravery and, as a member of the

knighthood, could add the title “Ritter” to his name. He ended the war as a major.

Selected for retention in the postwar Reichswehr (German Army), Leeb was promoted to lieutenant colonel in 1920. Six years later, he took command of the 7th Artillery Regiment, and in 1928, he was one of two deputy commanders of the 5th Infantry Division at Stuttgart. In 1929, he was deputy commander of the 7th Infantry Division in Munich, and in February of that year, he was promoted to general. In 1930, he commanded the VII Military District in southern Germany.

Considered an expert on defensive warfare, Leeb wrote extensively on that subject. The Soviets incorporated many of the principles espoused in his prewar publications into their 1936 field regulations. In that regard, Leeb helped shape the Soviet Army tactics and operational art that cost the Germans so heavily in World War II. Leeb stressed that in a new war, Germany should initially maintain a strategic defense, force the numerically superior enemy to attack, and reduce its forces through attrition warfare, only then going over to offensive operations centered on armor.

Leeb was not fooled by Adolf Hitler, who branded him an “incorrigible anti-Nazi.” A thinker rather than a man of action, Leeb was never active in the anti-Hitler opposition. Promoted to general of artillery in 1934, he assumed command of the 2nd Army Group at Kassel. Leeb headed the list of senior officers retired on Hitler’s insistence after the 1938 Fritsch-Blomberg Affair, being promoted to temporary colonel general.

Recalled to active duty in August 1938 during the crisis over Czechoslovakia, Leeb commanded the newly established Twelfth Army. When Germany secured the Sudetenland without war, Leeb’s forces occupied it peacefully, and he then returned to Bavaria and retirement.

In 1939 as Hitler prepared to attack Poland, Leeb was again called to active duty, taking command of Army Group C to defend against a possible Allied attack in the west while the German army invaded (September 1) and absorbed Poland. Leeb contained the weak French advance into the Saar region and launched a counteroffensive there in mid-October.

Leeb opposed Hitler’s plans to invade Western Europe and especially neutral Belgium, which he objected to on moral grounds. He circulated a memorandum among other generals, but many of them, intoxicated by the success of the invasion of Poland, regarded him as too cautious and behind

the times. Army Group C played a supporting role in the May 10–June 25, 1940, Battle for France, but Leeb's feints against the French Maginot Line were so successful that the French held many units there until it was too late to commit them to meet the main German thrust to the north. In the subsequent fighting during the British evacuation at Dunkerque (May 26–June 4), Leeb's forces took 250,000 French prisoners. In July 1940, Leeb was among the generals rewarded by Hitler with promotion to field marshal.

Leeb commanded Army Group North in the invasion of the Soviet Union (June 22, 1941) for the first time directing a large number of panzer formations, with which he had no experience. In less than 90 days, his force drove to within 20 miles of Leningrad. The Soviets successfully rallied and held the city, though, resulting in a siege that would last for three years. Leeb was one of the senior German officers who recommended withdrawing to more defensible positions and resuming the offensive later, and his comments about whether Hitler was actually allied with Soviet leader Joseph Stalin against the German Army were known to the führer.

Frustrated with Hitler's micromanagement of his forces, Leeb asked to be relieved of his command on January 16, 1942. He retired to Bavaria for a third and final time, never again serving in an active capacity. Arrested by the Allies at the end of the war, he was tried and sentenced to three years of imprisonment as a minor war criminal, a severe sentence given his military record. On his release, he lived quietly in retirement. Leeb died in Hohenschwangau, Bavaria, on April 29, 1956.

Leese, Sir Oliver William Hargreaves (1894–1978)

British Army lieutenant general. Born in London on October 27, 1894, Oliver Leese was educated at Eton. In 1914, after the start of World War I, he joined the Coldstream Guards and served with the regiment in France. Wounded three times during the war, he won the Distinguished Service Order as a platoon commander in the 1916 Battle of the Somme.

In 1940, Leese was appointed deputy chief of the General Staff of the British Expeditionary Force in France. Following the evacuation from Dunkerque (May 26–June 4), he took command of an infantry brigade in England.

Promoted to major general in 1941, Leese was later appointed to form and train the Guards Armoured Division. In September 1942, he was sent to Egypt to command XXX Corps in General Bernard Montgomery's Eighth Army. Montgomery held a high opinion of Leese, assigning him to achieve the breakthrough in the Battle of El Alamein (October 23–November 4, 1942). Leese subsequently served in the advance across Libya to Tripoli, the 1943 Tunisia Campaign, and the invasion of Sicily (July 9–August 22, 1943).

In December 1943, Leese succeeded Montgomery as commander of the Eighth Army. In that post, he participated in two major offensives: the Fourth Battle of Cassino in May 1944 and Operation OLIVE in August 1944. OLIVE, planned by Leese, achieved considerable success, as it forced the Gothic Line and brought an Allied breakout into the Po Valley. He was promoted to lieutenant general in 1944.

In November 1944, Leese was appointed Eleventh Army Group commander in Southeast Asia under supreme commander South East Asia, Lord Louis Mountbatten. In this position, Leese provided direction to Lieutenant General William Slim's Fourteenth Army in Burma. Following the fall of Rangoon in May 1945, Leese attempted to dismiss Slim, believing him both worn out after several years of service in Burma and inexperienced in the amphibious warfare required in the proposed campaign in Malaya. Leese attempted to assign Slim to a less important command but did not have the authority to do so. As a result of this blunder, Leese was himself dismissed in July 1945. He took the sacking with aplomb and returned to

England to briefly lead the Eastern Command before retiring in 1946. Leese died in Cefn Coch, Wales, on January 22, 1978.

Legentilhomme, Paul Louis (1884–1975)

French Army general and colonial administrator who served with the Free French forces. Born at Valognes, near Cherbourg, France, on March 26, 1884, Paul Legentilhomme graduated from the French Military Academy of Saint-Cyr in 1907. Following his commissioning, he served in Tonkin in French Indochina until 1912.

During World War I, Legentilhomme fought on the Western Front and rose to captain. After the war, he served in the Far East and then in Madagascar between 1922 and 1931. Promoted to general of brigade in 1938, he commanded French forces in French Somaliland and then French and British forces in Somaliland (1939–1940). Following Italy's entry into the war in June 1940, Legentilhomme led forces into Ethiopia along the Djibouti–Addis Ababa Railroad. He continued the advance even after France signed the armistice with Italy.

Legentilhomme and Georges Catroux were the only French generals initially rallying to General of Brigade Charles de Gaulle. Uncertain of support from his subordinates, Legentilhomme departed Djibouti secretly on the night of August 1–2, 1940, and made his way to London. Promoted to general of division in the Free French forces in January 1942, he joined British units in the Sudan. In April, he assumed command of the French

forces in the Middle East being formed into the 1st Free French Division. Legentilhomme's division participated in the invasion of Syria (June 8–July 14, 1941), entering Damascus on June 22. Although seriously wounded in the fighting, he kept his command.

Court-martialed by the collaborationist Vichy French government, Legentilhomme was sentenced to death in absentia in September, the same month he was appointed commander in chief in Free French Africa. In December 1942, he was named commissioner of French possessions in the Indian Ocean area. In November 1942, Legentilhomme took administrative control of Madagascar following the British capture of that island.

Promoted to general of corps on March 1943, Legentilhomme was assistant commissioner and then commissioner of national defense. At the end of June 1944, he took command of the 3rd Military Region of France, which included Normandy. Following its liberation, he became the military governor of Paris. Legentilhomme retired after being promoted to general of army in January 1947. He died in Nice on May 23, 1975.

Leigh Light

Powerful airborne searchlight installed on Britain's Royal Air Force (RAF) Coastal Command aircraft to illuminate German U-boats at night. Employed in conjunction with the aircraft's air-to-surface search radar, which actually located the target, the Leigh Light illuminated the submarine only immediately prior to an attack, thus preserving surprise and maximizing the chances of success.

The minimum range of early airborne search radars would not allow their use to guide a night attack; the ASV (air-to-surface vessel) Mk II set was only effective between 1 and 36 miles. Dropping flares gave a submarine sufficient warning to escape before the aircraft could attack.

Squadron Leader Humphrey de Verde Leigh, together with the firm of Savage & Parsons, developed a 24-inch, 22-million-candlepower searchlight that could be switched on just before losing the target on radar, giving the submarine only 15 to 20 seconds to evade attack. Initial testing began in March 1941, but operational aircraft equipped with Leigh Lights did not enter service until mid-1942 because the Air Ministry initially preferred the Turbinlite, an existing but less powerful (and less effective) airborne searchlight.

Leigh Light–equipped aircraft over the Bay of Biscay greatly increased their contact rate but sank only two submarines during 1942, largely because the U-boats began carrying radar-warning receptors. Nevertheless, the ease with which the Leigh Light–equipped aircraft intercepted submarines led Admiral Karl Dönitz to order U-boats in transit to remain submerged even at night, greatly reducing their operational effectiveness. Moreover, the combination of Leigh Lights and centimetric radars, which entered service in 1943, subsequently proved deadly to Germany's U-boats, most notably during the Biscay Offensive that summer.

Leigh-Mallory, Sir Trafford (1892–1944)

British air chief marshal. Born in Mobberley, Cheshire, England, on July 11, 1892, Trafford Leigh-Mallory graduated with honors from Cambridge

University. He served in the British Army in the infantry during World War I but transferred to the Royal Flying Corps in 1916. By war's end, he commanded a fighter squadron.

Leigh-Mallory remained with the Royal Air Force (RAF) after the war and graduated from both the RAF Staff College and the Imperial Defence College. He also taught at the Army Staff College. He was promoted to air commodore in 1936 and to air vice marshal in 1938.

In 1937, Leigh-Mallory assumed command of Number 12 Fighter Group, a post he held when the war started. During the July 10–September 30, 1940, Battle of Britain, his primary responsibility was defense of the Midlands industrial area and reinforcing Number 11 Fighter Group over southeastern England. He disagreed with his counterpart at Number 11, Air Vice Marshal Keith Park, and the head of Fighter Command, Air Chief Marshal Hugh Dowding, concerning which fighter tactics best opposed the Luftwaffe.

British air chief marshal Sir Trafford Leigh-Mallory, August 1941. (Davis/Topical Press

Agency/Hulton Archive/Getty Images)

Leigh-Mallory favored the so-called Big Wing tactic involving multiple squadrons striking the attacking Luftwaffe with all available air assets at once, which, because of the assembly required, meant that the defenders were sometimes slow to respond. Park and Dowding supported repeated single-squadron attacks with quicker response times. In actions that bordered on insubordination, Leigh-Mallory boasted that he would secure Dowding's removal. That prediction became reality when Air Chief Marshal Sir Charles Portal backed Leigh-Mallory, which led to Dowding's dismissal in November 1940 and Park's transfer the next month. Air Marshal William Sholto Douglas, the new Fighter Command chief, named Leigh-Mallory to command Number 11 Fighter Group.

Under his command, Number 11 Group instituted his Big Wing tactics, but with only marginally greater success than previously experienced. Leigh-Mallory began offensive air operations against Luftwaffe airfields in France, and he commanded the air support for the ill-fated August 19, 1942, Dieppe Raid. In November 1942, he assumed leadership of RAF Fighter Command. He emphasized operations known as "rhubarbs," "circuses," and "beehives"—hunter-killer flights of hundreds of fighter aircraft, often combined with bombers, that flew at low level over France in search of Luftwaffe targets of opportunity. Such operations were considered ineffective by many, and they incurred grievous losses.

In November 1943, the Combined Chiefs of Staff named Leigh-Mallory commander of the Allied Expeditionary Air Forces for Operation OVERLORD, the invasion of Normandy that began on June 6, 1944. Promoted to air chief marshal in December 1943, Leigh-Mallory directed Allied fighter attacks in his "Transportation Plan" against railroad marshaling yards in an effort to disrupt German reinforcement efforts against the Normandy beachhead. On D-day, he commanded 9,000 aircraft, and his pilots swept the skies over the beaches to clear them of German fighters.

Leigh-Mallory's job of coordinating Allied tactical air forces was largely completed by October 1944, when he was named to command all Allied air forces in the Far East. En route to his new post, he and his wife were both killed when the airplane in which they were passengers crashed near Grenoble, France, on November 14, 1944.

LeMay, Curtis Emerson (1906–1990)

U.S. Army Air Forces (later U.S. Air Force) general. Born on November 15, 1906, in Columbus, Ohio, Curtis Emerson LeMay graduated from Ohio State University in 1928 with an engineering degree. Completing pilot training at Kelly Field, Texas, he secured a commission in October 1929 as a second lieutenant in the U.S. Army Air Corps Reserve and a regular commission in January 1930.

U.S. Army Air Forces major general Curtis Emerson LeMay. (Library of Congress)

LeMay spent four years with the 27th Pursuit Squadron and then served with other fighter squadrons before being assigned to the 49th Bomb Squadron in 1937. In June 1942, he assumed command of the 305th Bomb Group, flying the Boeing B-17 Flying Fortress. That unit's fourth commanding officer within four months, LeMay became known as "Iron Ass" for the relentless pressure he placed on his men. In May 1943, he took command of the 3rd Bombardment Division, and he was promoted to temporary brigadier general that September. On August 17, 1943, LeMay piloted the lead bomber in the 3rd Air Division's bombing raid on Regensburg, Germany. That day, the 3rd lost 24 of 127 planes, but the raid inflicted heavy damage on the aircraft factory that produced nearly 30 percent of Germany's Messerschmitt Bf-109 fighter aircraft.

Promoted to temporary major general in March 1944, LeMay became head of the XX Bomber Command in China. In January 1945, he took over

the XXI Bomber Group in Guam in the Mariana Islands. LeMay stressed extensive training and instituted new tactics that included low-level night attacks in the firebombing of Japanese cities. On the night of March 9–10, his Boeing B-29 Superfortresses struck Tokyo in what was the single most destructive bombing raid in history. That July, LeMay assumed command of the Twentieth Air Force, composed of the XX and XXI Bomber Commands.

From 1945 to 1947, LeMay was deputy chief of the Air Force Staff for Research and Development. In September 1947 when the air force became a separate military branch, LeMay, a temporary lieutenant general, took command of U.S. Air Forces in Europe (USAFE) and helped organize the 1948–1949 Berlin Airlift.

In October 1948, LeMay became head of the Strategic Air Command (SAC). He was promoted to general in October 1951, America's youngest four-star general since Ulysses S. Grant. LeMay commanded SAC until July 1957, when he was appointed air force vice chief of staff. In May 1961, he became chief of staff of the air force, remaining in that post until his retirement in February 1965.

LeMay published his autobiography in 1965 and was chairman of the board of Network Electronics from 1965 to 1968. In October 1968, he entered politics as George Wallace's vice presidential running mate on the American Independent Party ticket. LeMay was an outspoken proponent of the bombing of North Vietnam, and his campaign generated a firestorm of controversy. He died on October 1, 1990, at March Air Force Base, California.

Lend-Lease

U.S. military aid program begun during World War II. Designed originally as a means for the United States to assist Great Britain without becoming a belligerent itself, the Lend-Lease program provided more than $50 billion in aid to 38 nations between March 1941 and June 1947. The British Empire received the most aid under the program ($31.4 billion), followed by the Soviet Union ($11 billion).

The immediate impetus for Lend-Lease was the fall of France in June 1940, which left Great Britain fighting Germany and Italy alone. Strapped for cash, Britain could no longer afford to purchase supplies from the United States. Britain's economic crisis notwithstanding, President Franklin D. Roosevelt believed that the United States had to find ways to maintain the resolve of the British, thereby allowing them to continue in the war.

British fiscal problems were not the only barrier to be overcome. U.S. firms were hampered from trading with Britain because of restrictions included in the Neutrality Acts that were passed in the late 1930s. These measures required that trade be conducted on a cash-and-carry basis, meaning that American firms could neither extend credit nor transport materials across the U-boat–infested Atlantic Ocean. With Britain nearly out of hard currency, trade under the cash-and-carry provisions was virtually impossible. The original Lend-Lease authorizations specified that the funds were to be given only to democracies that agreed to pay the loans back in full at the earliest possible opportunity.

From the start, however, Roosevelt envisioned that Lend-Lease would operate much as his domestic New Deal did. It would be a practical and flexible program that was able to meet changing demands. It would also be centrally controlled from the executive branch, leaving Roosevelt the options of deciding which nations would receive aid and what forms that aid would take. Rhetoric notwithstanding, the program was more realistic than ideological.

Roosevelt also promoted Lend-Lease as being in the direct strategic interests not only of Great Britain but also of the United States. He compared Lend-Lease to lending a neighbor a fire hose when his house was in flames. This act would help save the lender's house from destruction as well, and once the fire was out, the hose would be returned.

To answer the charge of critics who believed that the impoverished British government would never repay Lend-Lease obligations, Roosevelt said that he expected Britain to honor a gentleman's agreement to eventually repay the United States in kind. He linked Great Britain's war to the United States in compelling rhetoric that helped to overcome abiding strains of American isolationism. Roosevelt reinforced these points in a series of fireside chats that led to widespread public acceptance of the program.

On January 6, 1941, supporters introduced the Lend-Lease bill, which they patriotically numbered H.R. 1776, in Congress. In a speech delivered soon afterward, Roosevelt connected Lend-Lease to the famous Four Freedoms that defined America's global goals: freedom of speech, freedom of religion, freedom from want, and freedom from fear. Lend-Lease, Roosevelt argued, promised to further those aims without putting American lives at risk. After an amendment stipulating that the U.S. Navy would not convoy supplies to Britain directly, the bill passed both houses of Congress by large majorities on March 8, 1941. It authorized the president to "sell, transfer to, exchange, lease, lend, or otherwise dispose of" property to any nation whose defense the president deemed "vital to the defense of the United States." As the program's success became more manifest, public opposition to Lend-Lease, always in the minority, became even less vocal.

American-made .38 caliber revolvers shipped to Britain from the United States under Lend-Lease are unpacked at an English ordnance depot. (Library of Congress)

The emergency faced by the Soviet Union after the German invasion of June 22, 1941, required a reconsideration of the specific provision that Lend-Lease applied only to democracies. In August, Roosevelt had declared that Lend-Lease did not apply to the Soviets, but he was even then accepting a 29-page list of Soviet requests. Despite serious misgivings from anticommunist members of Congress, where the extension was debated over a four-month span, the United States finally added the Soviet Union to the program in November 1941. Roosevelt agreed with British prime minister Winston L. S. Churchill that whatever the ideological conflict, the Soviets had to be supplied if they were to remain in the war against Germany. Sensitive to the tensions involved in extending Lend-Lease aid to a communist nation, Roosevelt sent Harry Hopkins, his most trusted adviser, to Moscow to coordinate Lend-Lease assistance there.

The U.S. Office of Lend-Lease Administration worked to overcome myriad complex problems of logistics. Until the Allies gained the upper hand in the Battle of the Atlantic, supplying Britain proved difficult, and supplying the Soviet Union necessitated air routes over Africa, sea routes along the Arctic Ocean, and land routes across Persia. Complications with flying supplies over "the Hump"—as the Himalaya Mountains were known—limited U.S. aid to China, although that country still received almost $2 billion in assistance. Because of the immense logistical difficulties, the vast majority of Lend-Lease aid to China comprised light weapons systems that could be flown in.

Lend-Lease worked in reverse as well. Thus, Britain shared with the United States radar technology, in which it then led the world. The British also provided technology on jet engines and rocketry. Reverse Lend-Lease of all types amounted to some $7.8 billion during the war.

Lend-Lease provided a wide range of arms, equipment, food, and raw materials to nations fighting the Axis powers. In the end, munitions formed almost half of the total aid package. Although the British Empire received more than 60 percent of the aid distributed under the program, Lend-Lease assistance proved to be critical to the Soviet Union. The Americans provided the Soviet Union with 34 million sets of uniforms, 15 million pairs of boots, 350,000 tons of explosives, 3 million tons of gasoline, 1.75 million tons of food, 12,000 railroad cars, 375,000 trucks, and 50,000 jeeps. American vehicles and petroleum supplies allowed the Red Army to develop a deep-offensive doctrine in 1943 that enabled Soviet units to go greater distances. The Soviet Union could also concentrate on the production of tanks and artillery because of the steady supply of trucks and jeeps arriving from the United States. In all, some 17.5 million tons of Lend-Lease aid was shipped from the Western Hemisphere to the Soviet Union, with 94 percent of this from the United States. One estimate holds that American deliveries to the Soviet Union through Persia alone were sufficient, by U.S. Army standards, to maintain 60 divisions in the field.

Roosevelt and his closest advisers sought to employ Lend-Lease to open the Soviet system to American ideas. In a similar vein, they insisted that any nation receiving Lend-Lease assistance had to agree to open its markets to U.S. products. Thus, Washington finally forced Great Britain to abandon the

Imperial Preference System that had provided more favorable trade terms to members of the British Empire.

Lend-Lease paid important dividends on the strategic level as well. U.S. aid helped to fend off Soviet demands for a second front in Western Europe. It also helped the Americans convince Chinese generalissimo Jiang Jieshi (Chiang Kai-shek) that he must at least appear to accept the counsel of his American advisers—most notably, the reform-minded Lieutenant General Joseph W. Stilwell. The United States later extended Lend-Lease aid to many Latin American nations, prominently Mexico and Brazil. The program brought these nations closer to the Allies and ensured that the Axis powers would not be able to establish important connections there.

Lend-Lease thus served many key roles during the war. Most critically, it unquestionably shortened the conflict and relieved the suffering of millions. As Allied armies advanced across Western Europe, Lend-Lease funds paid for food and livestock shipments to France, the Netherlands, and Belgium. Churchill called Lend-Lease the most unsordid act in history. Although Soviet historians later discounted its value, Joseph Stalin himself said that the Soviet Union could not have won the war without Lend-Lease.

Leningrad, Siege of (July 10, 1941–January 27, 1944)

The longest and most devastating siege of a major urban center in the history of modern warfare. The nightmare that engulfed the population of the Soviet Union's second-largest city lasted from July 10, 1941, until January 27, 1944. The once vibrant city had been built by Peter the Great and was considered Russia's window to the West, but by March 1943 Leningrad and its 3.2 million people had been reduced to a militarized fortress of some 700,000 inhabitants.

Inhabitants of the city of Leningrad (today Saint Petersburg), including women of all ages, use shovels and picks to help construct antitank ditches during the lengthy German siege of that city. (Library of Congress)

The Germans invaded the Soviet Union on June 22, 1941. The capture of Leningrad—a city described by Adolf Hitler as the "hotbed of Communism"—was one of the major strategic goals of Operation BARBAROSSA. Field Marshal Wilhelm von Leeb commanded Army Group North, charged with taking Leningrad. He believed that his troops would soon take the city in cooperation with the Finns, who had now reentered the war. As Leeb's forces moved northeast, Finnish forces drove south, both to the east and the west of Lake Ladoga, toward the Svir River and Leningrad.

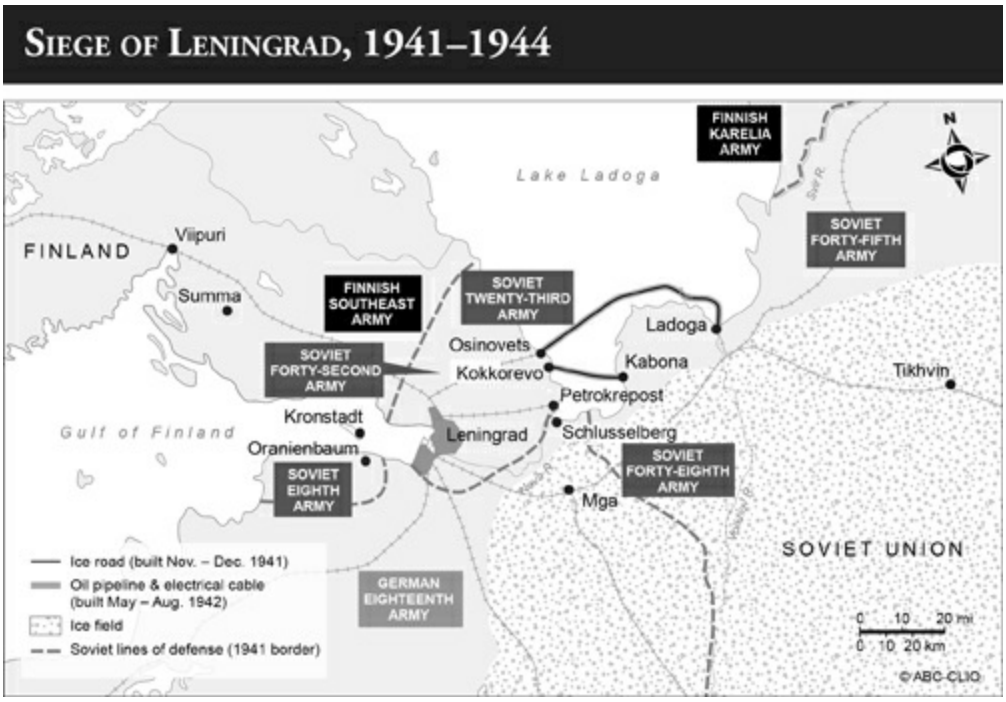
On July 8, the German Fourth Panzer Army reached the old fortress of Shlisselburg east of Leningrad, guarding the point at which the Neva River flows out of nearby Lake Ladoga. This cut off Leningrad from the Soviet

interior. The siege, which was actually a blockade, officially began on July 10. Leeb's hopes for a quick victory were dashed, however, when the Finns merely reoccupied the territory taken by the Soviets in consequence of the 1939–1940 First Finnish-Soviet War (also known as the Winter War), thus halting some 26 miles north of Leningrad. The refusal of the Finns to push beyond the Svir or their pre-1940 borders was a major factor in Leningrad's survival. Leeb also lost much of his Fourth Panzer Army, which Hitler diverted to the drive on Moscow.

Hitler ordered Leningrad obliterated through artillery fire, air attack, and blockade; moreover, he prohibited any acceptance of a surrender were one to be offered. In mid-October, he ordered Leeb to make a wide sweep of some 150 miles around Lake Ladoga to link up with the Finns on the Svir River. On November 8, the Germans took the vital rail center of Tikhvin, about halfway to the Svir. Joseph Stalin then shifted major reinforcements north, and in mid-December Hitler authorized Leeb to withdraw. Soviet troops reoccupied Tikhvin on December 18.

Authorities in Leningrad had done little to prepare the city for a blockade. Although the city was believed to be a major German military objective, efforts to evacuate part of the population suffered from bureaucratic delays. The party boss in Leningrad, Andrei Zhdanov, second only to Stalin in the party hierarchy, and Marshal Kliment E. Voroshilov, appointed by Stalin to defend the city, were reluctant to order any measures that might be branded defeatist.

On July 11, the Leningrad Party Committee ordered the civilian population to take part in the construction of tank traps and other defensive positions in front of the city. Between July and August, nearly half of the population between the ages of 16 and 55 engaged in this effort, which proceeded under constant German artillery and air attack. The city government also ordered the establishment of some civilian combat units made up of workers, men and women alike, but they were poorly trained and had virtually no weapons.



In normal circumstances, Leningrad was entirely dependent on outside sources for its food and fuel and for the raw materials used in its factories. Now it had to find food for some 2.5 million civilians as well as the forces of the Leningrad Front and the Red Banner Fleet in the Baltic. By November, rations had been cut to the starvation level. The soldiers and sailors received priority in the allocation of food, and rationing authorities held the power of life and death.

Rations were cut again and again, beyond the starvation level. People tried to survive any way they could, whether on stray animals or on glue from wallpaper. Hunger even led to instances of cannibalism. The hardships were not, however, evenly shared, for communist officials ate well throughout the siege.

Lake Ladoga was the only means of accessing the rest of the Soviet Union. In winter, trucks were able to travel across the ice, and in summer, some boats got through. But this route was insufficient to overcome the fuel shortage. The Soviets rebuilt the rail line from Tikhvin, but the Germans bombed and shelled it as well as the Lake Ladoga route.

In January 1942, Stalin ordered General Kirill A. Meretskov’s Volkhov Front to strike the German lines from Lake Ladoga to Lake Ilmen, but after punching a narrow gap in them, the Soviet offensive faltered. When Stalin

refused to allow a withdrawal, the Germans cut off the Soviet forces in June and restored their own lines. Between January and July 1942, Soviet authorities meanwhile managed to evacuate 850,000 people from Leningrad, including a large number of children.

Hitler's plans for the summer 1942 campaign called for the destruction of Leningrad and the occupation of the area between Lake Ladoga and the Baltic to free up the Finns for operations against Murmansk. In August, Meretskov carried out another attack against the eastern part of the German lines. Field Marshal Fritz Eric von Manstein, sent to Leningrad by Hitler, replied with a counterattack in September.

That summer, the Soviets managed to lay both pipelines and electric cables under Lake Ladoga. The Germans brought in E-boats, and the Italians also operated some midget submarines in the lake. In January 1943, in Operation SPARK, Red Army troops in Leningrad (which the Soviets had managed to reinforce and were now commanded by General Leonid A. Govorov) and Meretskov's forces to the east struck the Germans from the north and east. The offensive was successful, with the two Soviet armies meeting at Shlisselburg on January 19, thus breaking the siege and opening a 10-mile corridor. On February 7, a Soviet train reached Leningrad through the corridor and across the Neva River on tracks over the ice. Although this line came under constant German attack and had to be repaired daily, it operated continuously thereafter.

On January 14, 1944, Govorov and Meretskov struck German positions, with their forces outnumbering the Germans by a ratio of 2:1 in men and 4:1 in tanks and aircraft. Yet Hitler refused to authorize a withdrawal, and bitter fighting ensued. Ultimately the Soviets were successful, driving the Germans back. On January 27, 1944, with the Leningrad-to-Moscow railroad line reopened, Stalin declared the "900-day" siege at an end.

During the blockade, perhaps 1 million people in Leningrad—40 percent of the prewar population—died of hunger, the majority of them in the winter of 1941–1942. The entire city was within range of German artillery fire, and the bombing and shelling claimed many of the city's buildings and architectural and art treasures, including works from the Hermitage Museum. The travails of Leningrad became the chief subject of Soviet war literature. Similar to the bombings of Dresden and Hiroshima, the siege of Leningrad became a national and even worldwide symbol of the horror of war.

Lent, Helmut (1918–1944)

German Air Force colonel. Born in Pyrehne, Germany, on June 13, 1918, Helmut Lent was introduced to military aviation through a glider club. He joined the Luftwaffe, trained to fly single-engine fighters, and was selected to join the more prestigious heavy fighter squadrons flying the twin-engine Bf-110. He was posted to 76th Zerstorer Geschwader (destroyer wing) (ZG-76) in 1939.

Lent scored his first victory a day after the German invasion of Poland on September 2, 1939, followed by two more in December. Before transferring to night fighters in 1940, his total score stood at eight, an exceptional feat given the limitations of the Bf-110 as a fighter.

Joining Nacht Jagdgeschwader 1 (night-fighter wing) (NJG-1) as a squadron commander in 1941, Lent found scoring at night to be an even tougher proposition, and in frustration, he requested reassignment to day fighters. His request was postponed for one month, and he scored his first

night victory in May 1941. By August, he had downed 14 British bombers and was awarded the Knight's Cross to the Iron Cross. Lent was the first night-fighter pilot to achieve 100 kills and the first awarded the Knight's Cross with Oak Leaves, Swords, and Diamonds. He received the award personally from Adolf Hitler in July 1944.

On October 5, 1944, at Paderborn, Germany, Lent crashed his Ju-88 while landing. He and three others on the aircraft died of their injuries. Lent's final tally was 102 night and 8 day victories.

Léopold III, King of the Belgians (1901–1983)

King of the Belgians (1934–1951). Born on November 3, 1901, in Brussels, the son of King Albert and Queen Elisabeth of Belgium, Léopold was educated at Eton in Britain and served in the Belgian Army. He succeeded his father to the throne in 1934 after marrying Princess Astrid of Sweden in 1926. They had three children, but a car accident, with Léopold driving, claimed Astrid's life in 1935. Many Belgians never forgave him for this.

Léopold was heavily influenced by the German invasion of his country in 1914 and sought to avoid its repetition by taking refuge in neutrality. After the German remilitarization of the Rhineland in March 1936, he withdrew Belgium from its military alliance with France and pursued a neutral stance. When war began in September 1939, Léopold rejected appeals from Britain and France for discussions of war plans, fearful of giving Adolf Hitler a pretext to invade his country.

Léopold's policy did not spare Belgium from German invasion, which occurred in May 1940. British and French forces then moved into Belgium to

support that country. However justified in terminating hopeless resistance, Léopold's surrender of the Belgian Army on May 28, 1940, after only a brief stand was a violation of pledges given to Britain and France, and it made inevitable the Dunkerque evacuation (May 26–June 4). Even more dubious was the king's failure to go abroad with his ministers to support a government-in-exile in London. Many Belgians suspected him of both German sympathies and authoritarian preferences. He then compounded his unpopularity by marrying a commoner—his children's governess, Liliane Baels—in 1941.

Removed from Belgium by the Germans in 1944, Léopold was freed by U.S. troops in Austria at the end of the war. Because he was being held in Germany when Belgium was liberated in the fall of 1944, his brother, Prince Charles, the count of Flanders, assumed the title of regent. Léopold, meanwhile, resided in Switzerland.

After the war, the question of the monarchy remained in abeyance for several years. There was strong socialist opposition to the monarchy, and so it was not until a referendum in March 1950 gave him a 58 percent favorable vote that Léopold attempted to regain his throne. His return precipitated such a major crisis that he then relinquished control of affairs to his son Baudouin. When Baudouin reached majority age, Léopold abdicated in his favor, in 1951. Léopold died in Brussels on September 25, 1983.

Les Sept Iles, Action off (October 23, 1943)

Engagement between the British and Germans in the English Channel on October 22, 1943. The importance of the Channel as a transit route for British

and German shipping made it one of the war's most bitterly contested bodies of water. When the German blockade-runner *Münsterland* and its escort of six minesweepers and two patrol boats departed Brest on October 22, 1943, the Royal Navy's Plymouth Command ordered the antiaircraft light cruiser *Charybdis* (senior officer, Captain George Arthur Wallis Voelcker), the fleet destroyers *Grenville* and *Rocket,* and the escort destroyers *Limbourne, Wensleydale, Talybont,* and *Stevenstone* to intercept. Because Plymouth was a transit point, it often tried to maximize resources by using ships that were passing through, such as the *Charybdis,* but this practice had its dangers, as became clear in execution.

The British warships arrived off the Breton coast shortly after midnight on October 23 and, with the cruiser in the lead, began sweeping west. Meanwhile, the German 4th Torpedo Boat Flotilla, *T23* (commanded by Corvette Captain Franz Kohlauf), *T26, T27, T22,* and *T25,* reinforced the escort. Based on past operations, the Germans had a good idea when and how the British would come. When *T25*'s hydrophone detected ships to the northeast, the 4th Flotilla turned toward the contact.

At 1:30 a.m., the *Charybdis*'s radar detected the Germans 14,000 yards ahead. As the columns rapidly converged, Voelcker ordered his column to come to starboard and increase speed, but there was confusion, and only the rear ship received his signal. A minute later at 1:43 a.m., the German commander saw the cruiser's large silhouette illuminated against the lighter northern horizon only 2,200 yards distant, and he ordered an emergency turn to starboard. As they came about, the *T23* and then the *T26* emptied their torpedo tubes toward the enemy.

The *Charybdis* fired star shell, but the rockets burst above the clouds and only brightened the overcast sky. The *Limbourne,* which had lost touch with the flagship, plotted a contact off its port bow and, unsure whether it was hostile, likewise fired rockets. The fleet destroyers came to port and crossed ahead of *Limbourne,* then lookouts aboard the *Charybdis* reported the tracks of torpedoes.

The *Charybdis* came hard to port, but at 1:47 a.m. a torpedo struck it on the port side. As this happened the German column was still turning, and both the *T27* and *T22* fired full torpedo salvos as they came about. Only the *T25* failed to launch. At 1:51 a.m., the German column withdrew on an easterly heading.

Another torpedo struck the *Charybdis,* and within five minutes its deck was underwater. A minute later, a torpedo slammed into the *Limbourne* and detonated its forward magazine. The *Grenville* and *Wensleydale* barely avoided the massive explosion. The *Charybdis* sank at 2:30 a.m. Attempts to tow the *Limbourne* failed, and it was scuttled.

An improvised British force following a scripted plan had blundered into a massed close-range torpedo salvo. Indeed, the British were fortunate in only losing two ships. It was the last clear victory that German surface forces would win during the war.

Leyte Gulf, Battle of (October 23–26, 1944)

Pacific war naval battle and history's largest naval engagement in terms of the amount of ships, personnel, and area involved. The battle engaged 284 ships (216 U.S., 4 Australian, and 64 Japanese) and nearly 200,000 men and took place over an area of more than 100,000 square miles. It saw all aspects of naval warfare—air, surface, submarine, and amphibious—as well as the employment of the largest guns ever at sea, the last clash of battleships, and the introduction by the Japanese of kamikaze aircraft. The engagement also involved excellent planning and leadership, deception, failed intelligence, and great controversies.

The battle resulted from U.S. president Franklin D. Roosevelt's decision to follow the conquest of the Mariana Islands with the recapture of the Philippines. This idea was proposed by the commander of Southwest Pacific Forces, General Douglas MacArthur; the chief of naval operations, Ernest J.

King, wanted to land on Formosa instead. The latter move made sound military sense, the former political sense.

On October 20, the U.S. Sixth Army began an invasion of Leyte, with more than 132,000 men going ashore the first day. Alerted by the preliminary bombardment, the Japanese put into effect their overly complicated contingency plan. As early as July 21, 1944, the Naval General Staff in Tokyo had issued a directive for an operation in which the Combined Fleet would seize the initiative "to crush the enemy fleet and attacking forces."

On July 26, the General Staff informed the Combined Fleet commander, Admiral Toyoda Soemu, that the "urgent operations" would be known by the code name shō (victory). The Japanese had four of these operations to combat the next U.S. offensive; SHŌ ICHI-GO (VICTORY NUMBER ONE) covered defense of the Philippine archipelago, to which the Japanese decided to commit the entire Combined Fleet. Toyoda knew it was a gamble but believed that the chance had to be taken. Should the United States retake the Philippines, it would be in a position to cut Japanese access to oil from the Netherlands East Indies.

Prior to the battle, Japanese naval air strength had been severely reduced in the June 19–21, 1944, Battle of the Philippine Sea (the "Great Marianas Turkey Shoot"), and between October 12 and 14, U.S. carrier planes and army B-29 bombers struck Japanese airfields on Formosa, Okinawa, and the Philippines. These strikes denied the Japanese Navy badly needed land-based air support and alone doomed the Japanese plan. The Japanese did add extra antiaircraft guns to their ships in an attempt to offset the lack of aircraft, but offensively they had to rely on naval gunnery and some 335 land-based planes in the Luzon area.

The Japanese plan was to destroy sufficient U.S. shipping to break up the Leyte amphibious landing. There were four prongs in the Japanese attack. A decoy force would draw U.S. naval covering forces north, while two elements struck from the west on either side of Leyte to converge simultaneously on the landing area in Leyte Gulf and destroy Allied shipping there. At the same time, shore-based aircraft were to attack U.S. naval forces offshore.

On October 17 upon receiving information that U.S. warships were off Suhuan Island, Toyoda alerted his forces. The next day, he initiated SHŌ ICHI-GO. The original target date for the fleet engagement was October 22, but

logistical difficulties delayed it to October 25. Vice Admiral Ozawa Jisaburo's decoy Northern Force (Third Fleet) consisted of the heavy carrier *Zuikaku*, three light carriers, two hybrid battleship-carriers, three cruisers, and eight destroyers. Ozawa had only 116 aircraft, flown by poorly trained pilots. His force sortied from Japan on October 20, and on the evening of October 22 it turned south toward Luzon. At the same time, Japanese submarines off Formosa were ordered south toward the eastern approaches to the Philippine archipelago, and shortly before October 23 what remained of the Japanese Second Air Fleet began to arrive on the island of Luzon.

The strongest element of the Japanese attack was the 1st Diversion Attack Force, which reached Brunei Bay in northwest Borneo on October 20, refueled, split into two parts, and resumed its movement two days later. The Center Force under Admiral Kurita Takeo had the bulk of the Japanese attack strength, including the giant battleships *Musashi* and *Yamato* with their 18.1-inch guns; Kurita also had 3 older battleships, 12 cruisers, and 15 destroyers. Center Force sailed northeastward, up the west coast of Palawan Island, and then turned eastward through the waters of the central Philippines to San Bernardino Strait.

Meanwhile, the Southern Force (C Force) of two battleships, one heavy cruiser, and four destroyers, commanded by Vice Admiral Nishimura Shoji, struck eastward through the Sulu Sea in an effort to force its way through Surigao Strait between the islands of Mindanao and Leyte. The Southern Force was trailed by Vice Admiral Shima Kiyohide's 2nd Diversion Attack Force. Shima had two heavy cruisers, one light cruiser, and four destroyers. Shima's warships left the Pescadores on October 21, steamed south past western Luzon, and refueled in the Calamian Islands. Late in joining Nishimura's ships, Shima's force followed them into Surigao Strait.

Opposing the Japanese were two U.S. Navy fleets: Vice Admiral Thomas C. Kinkaid's Seventh Fleet, operating under General MacArthur's Southwest Pacific Command, and Admiral William F. Halsey's Third Fleet, under the Pacific Fleet commander, Admiral Chester W. Nimitz, at Pearl Harbor. Leyte was the first landing to involve two entire U.S. fleets and also the first without a unified command, which would have unfortunate consequences.

The Seventh Fleet was divided into three task groups. The first consisted of Rear Admiral Jesse B. Oldendorf's 6 old battleships, 16 escort carriers, 4 heavy cruisers, 4 light cruisers, 30 destroyers, and 10 destroyer escorts. The

other two elements were amphibious task groups carrying out the actual invasion. The Seventh Fleet had escorted the invasion force to Leyte and now provided broad protection for the entire landing area. Because most of Halsey's amphibious assets had been loaned to Kinkaid, the Third Fleet consisted almost entirely of Vice Admiral Marc Mitscher's Task Force (TF) 38 of 14 fast carriers, with more than 1,000 aircraft, organized into four task groups containing 6 battleships, 8 heavy cruisers, 13 light cruisers, and 57 destroyers. The Third Fleet had the job of securing air superiority over the Philippines and protecting the landings. If the opportunity to destroy a major part of the Japanese fleet presented itself or could be created, that was to be Third Fleet's primary task.

The Battle of Leyte Gulf was actually a series of battles, the first of which was the October 23–24 Battle of the Sibuyan Sea. Early on October 23, the U.S. submarines *Darter* and *Dace* discovered Kurita's Center Force entering Palawan Passage from the South China Sea, and they alerted Halsey, whose Third Fleet guarded San Bernardino Strait. The submarines sank two Japanese heavy cruisers, the *Atago* (Kurita's flagship) and the *Maya*, and damaged a third. Kurita transferred his flag to the *Yamato*, and his force continued east into the Sibuyan Sea where, beginning in the morning of October 24, TF 38 launched five air strikes against it. The first wave of carrier planes concentrated on the *Musashi*, which absorbed 19 torpedoes and nearly as many bombs before sinking, taking down half of its 2,200-man crew. Several other Japanese ships were also damaged.

In midafternoon on October 25, U.S. pilots reported that Kurita had reversed course and was heading west; Halsey incorrectly assumed that this part of the battle was over. He did issue a preliminary order detailing a battle line of battleships known as TF 34 to be commanded by Vice Admiral Willis A. Lee. Kinkaid was aware of that signal and assumed that TF 34 had been established.

Meanwhile, Japanese land-based planes from the Second Air Fleet attacked a portion of TF 38. Most were shot down, but they did sink the light carrier *Princeton* and badly damaged the cruiser *Birmingham*. Also, unknown to Halsey, Kurita's force changed course after nightfall and resumed heading for San Bernardino Strait.

The Casablanca-class escort carrier *St. Lô* suffers a major explosion on October 25, 1944; during the Battle of Leyte Gulf. The *St. Lô* was the first major ship to be sunk by a Japanese kamikaze aircraft during the war. (US Navy/National Archives/The LIFE Picture Collection/Getty Images)

Warned of the approach of the Japanese Combined Fleet, Kinkaid placed Oldendorf's 6 old Seventh Fleet fire-support battleships (all but 1 a veteran of Pearl Harbor), flanked by eight cruisers, across the mouth of Surigao Strait to intercept it. He also lined the strait with 39 patrol-torpedo (PT) boats and 28 destroyers. In terms of naval warfare, the October 24–25 Battle of Surigao Strait was a classic case of crossing the T. The PT boats discovered the Japanese moving in line-ahead formation, but Nishimura's force easily beat them back.

Although the battleships often get the credit for the Surigao Strait victory, it was U.S. destroyers that inflicted most of the damage. Their converging torpedo attacks sank the battleship *Fuso* and three destroyers. The Japanese then ran into the line of Oldendorf's battleships, which sank all the Japanese warships except the destroyer *Shigure.* Nishimura went down with his flagship, the battleship *Yamashiro.*

Shima's force, bringing up the rear, then came under attack by the PT boats, which crippled a light cruiser. Shima's flagship collided with one of Nishimura's damaged vessels. Oldendorf's ships pursued the retreating Japanese. Another Japanese cruiser succumbed to attacks by land-based planes and those of Admiral Thomas L. Sprague's escort carriers. The rest of

Shima's force escaped when Oldendorf, knowing that his ships might be needed later, turned back. The battle was over by 4:30 a.m. on October 25.

Meanwhile, during the night of October 24–25, Kurita's force moved through San Bernardino Strait, issued from it unopposed, and turned south. In the most controversial aspect of the battle, Halsey left San Bernardino Strait unprotected near midnight to rush with all available units of the Third Fleet after Ozawa's decoy fleet, which had been sighted far to the north. Several of Halsey's subordinates registered reservations about his decision, but he would not be deterred. Compounding the error, Halsey failed to inform Kinkaid, who in any case assumed that TF 34 was protecting the strait.

Halsey's decision left the landing beaches guarded only by the Seventh Fleet's Taffy 3 escort carrier group, commanded by Rear Admiral Clifton A. F. Sprague. It was one of three such support groups operating off Samar. Sprague had six small escort carriers, three destroyers, and four destroyer escorts.

Fighting off Samar erupted at about 6:30 a.m. on October 24, as Taffy 3 found itself opposing Kurita's 4 battleships (including the *Yamato*), 6 heavy cruisers, and 10 destroyers. The aircraft from all three of the Taffy groups now attacked the Japanese. The planes carried only fragmentation bombs for use against land targets, but they put up a strong fight, harassing the powerful Japanese warships. Sprague's destroyers and destroyer escorts also joined the fight. Their crews courageously attacked the much more powerful Japanese warships, launching torpedoes and laying smoke to try to obscure the escort carriers. These combined attacks forced several Japanese cruisers to drop out of the battle.

Kurita now made a poor decision. By 9:10 a.m. his warships sank the *Gambier Bay*, the only U.S. carrier ever lost to gunfire, as well as the destroyers *Hoel* and *Johnston* and the destroyer escort *Samuel B. Roberts.* But Kurita believed that he was under attack by aircraft from TF 38 and that he had inflicted more damage than was the case. At 9:11 a.m. just at the point when he might have won a crushing victory, he ordered his forces to break off the attack, his decision strengthened by news that the southern attacking force had been destroyed. Kurita then exited through San Bernardino Strait. The four ships lost by Taffy 3 were the only U.S. warships sunk by Japanese surface ships in the entire battle.

At 9:40 p.m., Kurita's ships reentered San Bernardino Strait. As the

Japanese withdrew, they came under attack by aircraft from Vice Admiral John S. McCain's task force from Halsey's fleet, losing a destroyer. Meanwhile, Sprague's escort carriers and Oldendorf's force returning from the Battle of Surigao Strait came under attack from land-based kamikaze aircraft, the first such attacks of the war. These attacks sank the escort carrier *St. Lô* and damaged several other ships.

At about 2:20 a.m. on October 25, Mitscher's search planes, from Halsey's force, located Ozawa's northern decoy force. At dawn, the first of three strikes was launched in what became known as the Battle of Cape Engaño. Ozawa had sent most of his planes ashore to operate from bases there and thus had only antiaircraft fire with which to oppose the attack. While engaged against Ozawa, Halsey learned of the action off Samar when a signal came in from Kinkaid at 8:22 a.m., followed by an urgent request eight minutes later for fast battleships. Finally, at 8:48 a.m. Halsey ordered McCain's Task Group (TG) 38.1 to make "best possible speed" to engage Kurita's Center Force.

The task group was en route from the Ulithi to rejoin the other elements of TF 38. Because it had more carriers and planes than any of the three other task groups in Halsey's force, it made good sense to detach this unit. Several minutes later, Halsey was infuriated by a query from Nimitz at Pearl Harbor: "WHERE IS RPT WHERE IS TASK FORCE THIRTY-FOUR RR THE WORLD WONDERS." (The last three words were simply what was known as "padding," drawn from the poet Alfred Lord Tennyson's "Charge of the Light Brigade," but Halsey took them to be an integral part of the message and believed that they were a reproach delivered in an insulting manner.)

At 10:55 a.m., Halsey ordered all six fast battleships and TG 38.2 to turn south and steam at flank speed, but they missed the battle. After the war, Kurita admitted his error in judgment; Halsey never did. In fact, Halsey said that his decision to send the battleships south to Samar was "the greatest error I committed during the Battle of Leyte Gulf."

By nightfall, U.S. aircraft, a submarine, and surface ships had sunk all four Japanese carriers of Ozawa's force as well as five other ships. In effect, this blow ended Japanese carrier aviation. But the battle of annihilation that would have been possible with the fast battleships had eluded Halsey. Still, of Ozawa's force, only two battleships, two light cruisers, and a destroyer escaped.

Including retiring vessels sunk on October 26 and 27, Japanese losses in the Battle of Leyte Gulf came to 29 warships (4 carriers, 3 battleships, 6 heavy and 4 light cruisers, 11 destroyers, and 1 submarine) and more than 500 aircraft; in addition, some 10,500 seamen and aviators were killed. The U.S. Navy lost only 6 ships (1 light carrier, 2 escort carriers, 2 destroyers, and 1 destroyer escort) and more than 200 aircraft. About 2,800 Americans were killed and another 1,000 were wounded. The Battle of Leyte Gulf ended the Japanese fleet as an organized fighting force.

Leyte Landings (October 20, 1944)

In July 1944, U.S. president Franklin D. Roosevelt met with his Pacific theater commanders General Douglas MacArthur and Admiral Chester Nimitz to determine the next U.S. military objective. MacArthur argued for a return to the Philippines, whereas Nimitz and the navy wanted to bypass those islands entirely in favor of securing Formosa. Ultimately, because

sufficient resources were available, Roosevelt decided on both the Philippines and Okinawa in the Ryukyus.

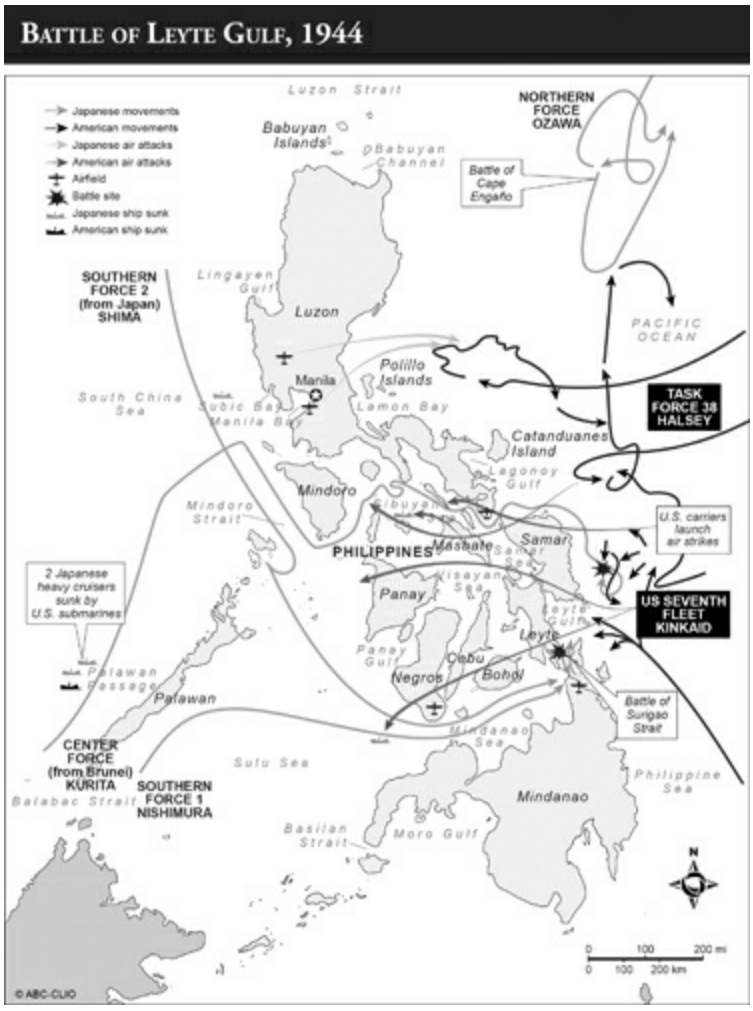
The U.S. Philippine invasion had three main phases: first, the capture of Leyte Island, between the big island of Luzon to the north and Mindanao to the south; then, the capture of Luzon; and finally, the clearing of other Japanese-held islands to the south. A precondition to such an undertaking was the neutralization of Japanese airpower. In wide-ranging preinvasion operations between October 7 and 16, Admiral William Halsey's Third Fleet and Lieutenant General George C. Kenney's Far East Air Force struck all Japanese bases within range, while XX Bomber Command Boeing B-29 Superfortress bombers attacked Formosa from bases in China, decimating the rebuilt Japanese naval air arm and destroying some 700 Japanese planes and 40 ships.

Japanese leaders knew that they would have to hold the Philippines to prevent the severing of the supply route between Japan and the vital oil and other resources of the Netherlands East Indies. Tokyo was thus prepared, once U.S. forces committed themselves, to gamble what remained of the Japanese fleet on a vast and complex naval operation. This action would culminate in the Battle of Leyte Gulf (October 23–26).

Japanese commander in the Philippines General Yamashita Tomoyuki had some 350,000 troops to defend the islands. But Yamashita believed that the U.S. effort would be against the big island of Luzon, where he placed his Fourteenth Area Army and prepared defensive positions. Meanwhile, U.S. invasion forces headed for Leyte.

U.S. planners assembled a vast amphibious force. The 700 vessels of Vice Admiral Thomas Kinkaid's Seventh Fleet transported Lieutenant General Walter Krueger's 194,000-man U.S. Sixth Army, consisting of Major General Franklin C. Sibert's X Corps and Major General John Hodge's XXIV Corps. Rear Admiral Thomas L. Sprague's air-support escort carrier group consisted of 16 escort carriers, 9 destroyers, and 11 destroyer escorts. Rear Admiral Russell Stanley Berkey commanded a close covering group of 4 cruisers (2 of them Australian) and 7 destroyers (2 Australian). Admiral William Halsey's Third Fleet was to provide covering protection and engage the Japanese fleet should it decide to do battle.

Landing craft loaded with U.S. soldiers sweep toward the Leyte invasion beaches. The men watch American and Japanese planes duel overhead as the landing craft approach the shore, October 1, 1944. (National Archives)



On October 20 following a heavy naval bombardment, four divisions assaulted Leyte's east coast on a 10-mile front. By nightfall, some 132,400 men were ashore, along with 200,000 tons of supplies and equipment.

Immediately on learning of the landings, the Japanese Navy initiated the SHŌ ICHI-GO (VICTORY ONE) plan, and during October 23–26, the U.S. Navy won a decisive victory, defeating the Japanese effort to attack the landing site from the sea. The naval Battle of Leyte Gulf ended the days of the Japanese Navy as a major fighting force. U.S. land forces continued their advance as Kenney's and Halsey's aircraft choked off the stream of Japanese reinforcements. On November 11, attacks by Third Fleet aircraft decimated a Japanese convoy with 10,000 troop reinforcements.

Although the unexpected Japanese reinforcements and heavy rains had delayed the conquest of Leyte, the outcome was never in doubt. In the battle for the island, the Japanese lost some 70,000 men, most of them dead. U.S.

losses were about 3,500 killed and 12,000 wounded. In late October, U.S. forces landed on the adjoining Samar Island, and in mid-December, they seized Mindoro in the northern Visayas, just south of Luzon, as an air base for the coming assault on Luzon.

Liberty Ships

The U.S. Maritime Commission's mass-produced emergency cargo vessels, whose construction comprised the largest single shipbuilding program of World War II. Eighteen shipyards, using assembly-line methods, completed 2,710 Liberty ships, beginning with the *Patrick Henry*, launched on September 27, 1941 (only eight months after the groundbreaking at the new Bethlehem-Fairfield yard), and ending with the *Albert M. Boe*, which was launched in October 1945 by New England Shipbuilding.

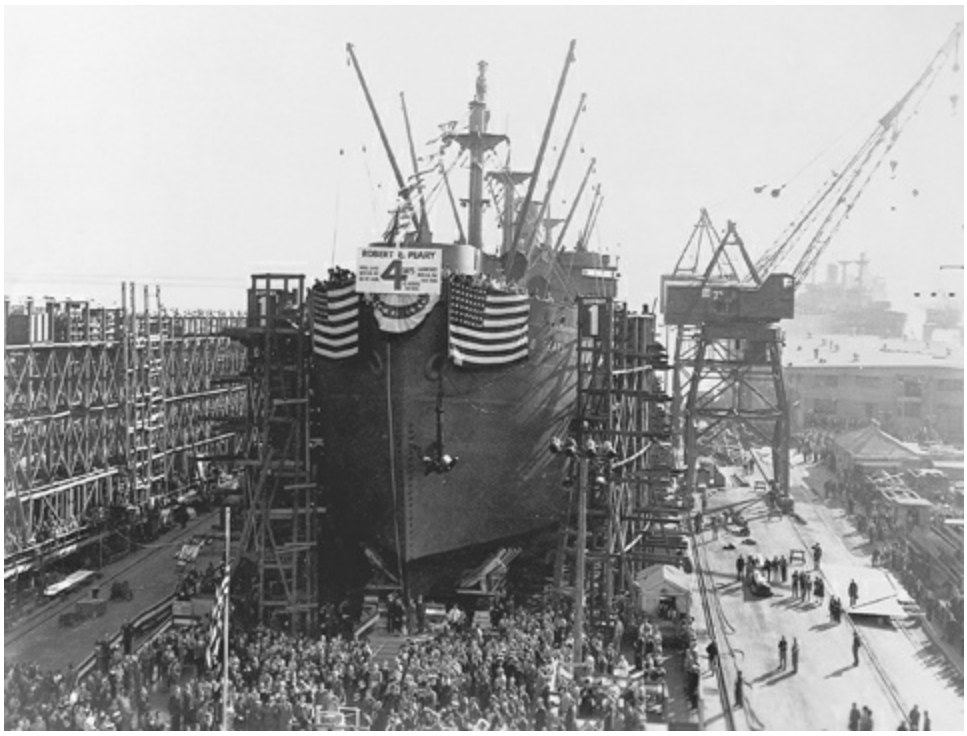
The British ship *Dorington Court* of 1939 was the basis for the Liberty ship design, adapted for welded construction and with improved crew accommodation. Liberties were 441 feet 6 inches in overall length and 57 feet in beam, and they registered 7,176 tons gross and 10,865 tons deadweight. Two oil-fired boilers provided steam for a three-cylinder, triple-expansion engine of 2,500 indicated horsepower that propelled the ship at 11 knots. The commission was criticized for specifying such old-fashioned machinery. As it worked out, however, there was a critical shortage of more modern turbine

machinery because of the demands of other wartime expansion programs; moreover, the engines were thoroughly reliable, and there was a substantial force of engine-room crewmen who were familiar with this type of plant.

Speedy construction and delivery was central to the Liberties' contribution to the war effort. An overwhelming majority of the yards in which they were constructed were newly created facilities purpose-built by either the Maritime Commission or the contractors. Initially, the vessels required around 250 days for completion, but within a year, this was reduced to fewer than 50 days. The Richmond Shipbuilding Corporation, a subsidiary of Henry J. Kaiser's Permanente Metals Corporation located in Richmond, California, broke all records by assembling the *Robert E. Peary* in just over 4 days between November 8 and 12, 1942, and delivering the ship 3 days later. More important, U.S. shipyards delivered 93 new ships in September 1942, totaling more than 1 million deadweight tons, of which 67 were Liberties.

Liberty ships proved to be very adaptable. Although intended to operate as freighters, they were modified for service as troop transports, tankers, aircraft transports, depot ships, and an array of naval auxiliaries. Liberty ships were tough, even though they were classified as expendable war materials. Some problems were encountered with unexpected stress fatigue, but the ships often survived considerable combat damage and served successfully throughout the world in all types of weather. Many continued in postwar commercial service for 25 years or more. Two are preserved as tributes to the type's crucial contribution to the Allied victory: the *John W. Brown* in Baltimore, Maryland, and the *Jeremiah O'Brien* in San Francisco.

PAUL E. FONTENOY



The launch of the Liberty Ship *Robert E. Peary*, which was fitted and delivered in a record four days (the hull and keel took seven days), in the Richmond Shipyards in California, November 12, 1942. (Corbis)

Liddell Hart, Sir Basil Henry (1895–1970)

British military journalist, strategist, and historian. Born on October 31, 1895, in Paris, Basil Henry Liddell Hart studied at Cambridge University before serving in the British Army on the Western Front in World War I, where he saw action and was twice wounded. By 1918, he was a company commander.

After retiring on half pay in 1924, he was invalided out of the service as a captain in 1927.

Liddell Hart served as the military correspondent for the *Daily Telegraph* (1925–1935), the (London) *Times* (1935–1939), and, during World War II, for the *Daily Mail* (1939–1945). His columns were highly influential in both military and political circles. He served briefly (1937–1938) as an adviser to War Minister Leslie Hore-Belisha but so angered top generals with his ideas (which they considered radical) and his personal attacks that he had to resign.

In his many articles and eventually more than 30 books, Liddell Hart continually advocated the benefits of military surprise, mobility, mechanization (he became the leading exponent of using tanks to strike deep into enemy territory), indirect approach, and the effective use of airpower to cut enemy troops off from their supplies and commanders. German generals such as Erwin Rommel and Heinz Guderian would make good use of his ideas, but to his extreme frustration, Liddell Hart was largely ignored in Britain and France.

In the postwar years Liddell Hart wrote extensively, including histories of both world wars, a historical analysis of changing thoughts on military strategy (*Strategy*, first published in 1957, is perhaps his best-known work), and a review of German strategic planning during the war. He also argued strongly for reliance on conventional forces in a nuclear age. Liddell Hart was knighted in 1966 and died on January 29, 1970, in Marlow, England.

Lidice Massacre (June 9–10, 1942)

Atrocity in Czechoslovakia on June 9–10, 1942. On June 4, 1942, SS-Obergruppenführer Reinhard Heydrich, chief of the German Sicherheitsdienst (Security Service, sd) and acting Reichsprotektor (administrator) of Bohemia and Moravia, died of wounds suffered when his car was attacked with grenades in Prague, Czechoslovakia, on May 27, 1942. The attack was carried out by two agents of the London-based Czech government-in-exile, Jan Kubis and Jozef Gabcik.

German reprisals were swift and deadly. Ultimately, the Germans raided 5,000 towns and villages. In the process, some 3,180 persons were arrested, and 1,344 were sentenced to death. German dictator Adolf Hitler ordered additional severe reprisals against the Czechs, threatening to kill 30,000 of them. Although this threat was not carried out, the mining community of Lidice near Kladno, 11 miles northwest of Prague, was chosen for a conspicuous reprisal, presumably because some villagers there had sheltered Heydrich’s assassins and had been otherwise identified with the Czech Resistance.

Ruins of Lidice, Czechoslovakia, following destruction of the village and the killing of most of its inhabitants, part of the German reprisal for the assassination by the Czech resistance of Reinhard Heydrich. (Library of Congress)

The German operation against Lidice was carried out during two days, June 9 and 10, by German police and SD personnel led by SS-Hauptsturmführer Max Rostock. They surrounded the village on the evening of June 9, and the action began the following morning. First, the police and SD men rounded up and took away the town's children and most of the women. Then, an execution squad of 3 officers and 20 men methodically killed 172 males over the age of 16. Later that day, another 11 workers from the late shift at the Lidice mine were also executed, as were 15 relatives of Czech soldiers serving in Britain who were already in custody, bringing the total number of men murdered to 198.

The Germans also executed 71 women in Lidice, and another 7 were taken to Prague, where they too were shot. Of the 184 Lidice women transported to Ravensbrück concentration camp and the 11 already in prison, 143 eventually survived. The 98 children in the village were transported to a camp at Gneisenau. Eighty-two of the children were gassed at Chelmno, and 8 are known to have been given to Schutzstaffel (SS) families to raise. In any event, only 16 surviving Lidice children could be identified in 1945. The village of Lidice itself was burned to the ground. The site was then dynamited and bulldozed, and the ground was sowed with grain.

A similar reprisal was carried out on the village of Lezaky, east of Prague, where the radio transmitter used by the Czech agents was discovered. All of the village's adult inhabitants were killed, and only 2 Lezaky children survived the war. On the direct orders of SS-Reichsführer Heinrich Himmler, 252 friends and relatives of the Lidice inhabitants were gassed at the Mauthausen concentration camp on October 24, 1942. So severe were these reprisals that the British suspended any further targeting of high Nazi officials.

No link between Lidice and the Heydrich assassination was ever proven. The village was rebuilt nearby after the war and renamed Nove Lidice. Rostock was executed in 1951 for his part in the Lidice Massacre, which came to symbolize the Nazi oppression of Czechoslovakia.

Ligurian Sea, Battle of the (March 18, 1945)

Destroyer action between British and German forces and the last naval surface battle fought in the Mediterranean Sea. Even after the Allies landed in southern France in Operation DRAGOON on August 15, 1944, Germany retained a portion of the Mediterranean coast stretching from the Franco-Italian border to a point south of La Spezia. Captured Italian and French warships that Germany had refurbished or finished constructing formed the backbone of a small but active fleet that fought small craft, special forces, and surface actions against the vastly superior Allied navies. By the beginning of 1945, the Kriegsmarine still possessed 3 torpedo boats, 2 minelayers, 9 submarine chasers, 10 motor minesweepers, and 35 armed barges in the Ligurian Sea. They were supported by 6 Motoscafo Armato Silurante (MAS) motor torpedo boats of the fascist Italian Republic Navy.

On the night of March 17, 1945, the last three operational ships of the German 10th Torpedo Boat Flotilla, the destroyer *TA32* and the torpedo boats *TA24* and *TA29,* conducted an offensive mining operation northwest of Corsica. After dropping 132 mines, the flotilla united for the return to Genoa, with the *TA24* and *TA29* preceding the *TA32.* They were 20 miles north of Cape Corse when Allied shore radar at Livorno detected their presence. Four Allied destroyers were patrolling in the vicinity: the French *Basque* and *Tempete* and the British *Meteor* and *Lookout.* Captain A. Morazzani, the *Tempete*'s captain and the senior officer, ordered the British ships to intercept the intruders while he led the slower French ships southeast to cover a convoy nearing Cape Corse.

The *Lookout* made radar contact at 3:01 a.m. The German column was steaming north at 20 knots. The British destroyer approached at high speed and surprised the enemy force, opening fire at 3:10 a.m. from 5,000 yards.

Two minutes later, it swung around and launched torpedoes. The *Lookout*'s radar-directed gunfire slammed into the *TA24* and *TA29.* The *TA29* dropped out of the line while the other two ships fled north. The *Lookout* let them go and circled the *TA29,* firing continuously from 2,000 yards. The *TA29* fought back, but the only damage the German warship inflicted occurred when a burst of 20mm shells hit some smoke floats and ignited a small fire on the British ship. The *TA29* sank at 4:20 a.m., riddled by more than 40 shells.

The *Meteor,* meanwhile, found the other German ships at 3:52 a.m. and engaged at 8,000 yards, hitting the *TA24* almost immediately—highly effective shooting for such a long range, especially at night. The *Meteor* followed up its gunnery attack with a torpedo salvo that scored one hit on the *TA24.* The German torpedo boat exploded and sank at 4:05 a.m. The *TA32,* although damaged, escaped after firing a few broadsides and an ineffective torpedo barrage.

The British destroyers achieved decisive results against a German unit that had effectively harassed the Allies for more than a year, and their victory ended the Kriegsmarine's ability to undertake deepwater offensive operations in the Ligurian Sea.

Li Kenong (1899–1962)

Chinese Communist intelligence and security chief. Born in Chaoxian (Ch'ao-hsien) in Anhui (Anhwei), China, on September 15, 1899, Li Kenong (Li K'o-nung) spent his youth spreading revolutionary ideas in his native province. He joined the Chinese Communist Party (CCP) in late 1926. In

1928, Li went to Shanghai in Jiangsui (Kiangsu), where he received intelligence training, developed a close relationship with Zhou Enlai (Chou En-lai), and infiltrated the organs for intelligence collection and subversive activities of the Nationalist Party—the Guomindang (Kuomintang, GMD).

In late 1931, Li arrived at the central Soviet base in Ruijin (Juichin), Jiangxi, continuing his intelligence and security work, first as director of the Administrative Department of the National Political Security Bureau; then, in late 1933, as chief of the Political Security Bureau under the First Front Army; and finally as the overall security chief during the 1934–1935 Long March. After reaching Yan'an (Yenan), Shaanxi (Shensi), in October 1935, Li became head of the CCP Central Committee's Liaison Bureau, also known as the Northwestern Liaison Bureau, which was responsible for united front external communications. He also assisted Zhou's Northeastern Work Committee. As a result of Li's efforts throughout 1936, Zhou successfully secured an agreement from Zhang Xueliang (Chang Hsüeh-liang), commander of the Nationalist Northeastern Army, on a GMD-CCP united front against the Japanese, which became official after the Xi'an (Sian) Incident at the year's end.

While continuing his GMD-CCP liaison responsibilities during the 1937–1945 Sino-Japanese War, Li also served as director of the Eighth Route Army's offices in various places, first in Shanghai and Nanjing (Nanking) in Jiangsu (Kiangsu); there, he conducted intelligence collection and helped secure the Nationalists' release of the Chinese Communist political prisoners. After Nanjing's fall in late 1937, Li went to Wuhan in Hubei (Hupeh) and then, in October 1938, to Guilin (Kweilin) in Guangxi (Kwangsi). The Guilin office was of more significance, as it was the CCP's communication center with eastern and southern China and with overseas Chinese as well as the command post for directing cultural and united fronts in China. When it was closed after the January 1941 New Fourth Army Incident, Li returned to Yan'an, serving as deputy director of both the Social Affairs Department and the Central Committee Intelligence Bureau throughout the remainder of the war.

During the Chinese Civil War, Li worked in the northwest. After the birth of the People's Republic of China in October 1949, he became the vice minister of foreign affairs until 1954. The next year, Li was made deputy

chief of staff and colonel general of the People's Liberation Army. Li died in Beijing (Peking) on February 9, 1962.

Lin Biao (1907–1971)

Chinese Communist marshal. Born in Hubei Province, China, on December 5, 1907, Lin Biao (Lin Piao) was the son of a factory owner. In 1925, he moved to Shanghai in Jiangsu Province, where he joined the Socialist Youth League and the Nationalist Party—the Guomindang (Kuomintang, GMD). At the Huangpu Military Academy in Guangzhou (Canton), Kwangdong (Kwangtung) Province, where he graduated in 1926, Lin met Communist leader Zhou Enlai (Chou En-lai), deputy director of the school's Political Department. Lin served with GMD forces in the 1926–1927 Northern Expedition, rising to the rank of major, but in the summer of 1927, he defected with his troops to assist the unsuccessful Jiangxi (Kwangsi) Communist uprising.

Lin then joined communist leaders Zhu De (Chu Teh) and Mao Zedong (Mao Tse-tung) in the 1927–1928 Jiangxi Soviet, commanding Communist troops. In 1934 and 1935, Lin led the Communist I Corps in its breakout from GMD encirclement in Jiangxi on the Long March to Yan'an (Yenan), in Shaanxi (Shensi) Province.

Appointed commander of the Eighth Route Army's 115th Division in 1937, Lin gradually expanded his forces into what became the Fourth Field

Army after the Communist-Nationalist anti-Japanese rapprochement. In September 1937, his troops ambushed a Japanese regiment, and Lin figured prominently in the unsuccessful autumn 1940 "Hundred Regiments" offensive. From then until Japan surrendered in August 1945, Lin concentrated on building up Communist bases and forces behind Japanese lines in northern China, facilitating the communist position in that region during the postwar conflict between GMD and Communist forces.

From November 1950 to April 1951, after the Communists had prevailed in the civil war, Lin's Fourth Army spearheaded the Chinese forces that entered the Korean War. In 1955, he became one of the 10 marshals of the Chinese People's Liberation Army and in 1959 minister of defense. In 1969, Communist Party chairman Mao named Lin—his supporter from 1966 to 1969 during the Cultural Revolution—as his heir. But for reasons that remain obscure, Mao apparently broke with him in 1971. Subsequently, Lin was alleged to have mounted an unsuccessful coup or assassination attempt against Mao, and on September 13, 1971, he died with his family in an airplane crash near the Mongolian frontier while fleeing for asylum to the Soviet Union.

Lindbergh, Charles Augustus (1902–1974)

U.S. aviation pioneer and isolationist leader. Born on February 4, 1902, in Detroit, Michigan, Charles Augustus Lindbergh attended the University of Wisconsin but left school to study flying in Minnesota in 1922. He was commissioned in the Army Air Service Reserve Corps in 1924, and two years later, he became an airmail pilot. On May 20, 1927, Lindbergh took off in the *Spirit of St. Louis* from Long Island, New York, on the first successful solo transatlantic flight, landing in Paris 33.5 hours later.

Charles A. Lindbergh beside his plane, *The Spirit of St. Louis*. Lindbergh was a staunch advocate of isolationism early in World War II and openly critical of President Franklin D. Roosevelt's policy of aiding the Allies. (Library of Congress)

Lindbergh returned to the United States a national hero. Awarded the Medal of Honor, he carried out a goodwill tour of North and South America. He and his wife, Anne Morrow Lindbergh, then pioneered air routes that would later be used by commercial airliners.

Four years after the kidnapping and death of his infant son (1932), Lindbergh moved his family to Europe to escape the press. The "Lone Eagle," as Lindbergh was known, was invited to inspect the German Luftwaffe, and he came away convinced of the Germans' air superiority.

Returning to the United States in 1939, Lindbergh became one of the chief advocates of U.S. neutrality after Germany invaded Poland on September 1, and he was openly critical of President Franklin D. Roosevelt's efforts to support the Allies. In a series of speeches, Lindbergh became the leading spokesperson for the Committee to Defend America First. The animosity between Roosevelt and Lindbergh was acute, and Lindbergh resigned his Air Corps reserve commission. A Madison Square Garden speech he gave on May 23, 1941, produced a popular backlash; however, threats were made against his life, and his books were removed from library shelves. In a speech in Des Moines, Iowa, Lindbergh claimed that the Roosevelt administration, the British, and the Jews were drawing the United States into the war.

After the Japanese attack on Pearl Harbor (December 7, 1941), Lindbergh urged support for the war effort, and in late December 1941, he offered his services to the military but was rejected because of his prewar position. Seeking to become part of the war effort, he joined the Ford Company to assist in production of the Consolidated B-24 Liberator bomber. Lindbergh then joined United Aircraft, and in 1944, he helped to test fighter aircraft in the Pacific and teach fuel economy techniques. He also flew some 50 combat missions and shot down at least one Japanese plane. Returning to the United States, he spent the remaining years of his life championing conservationist causes. He won the 1953 Pulitzer Prize for his autobiography, *The Spirit of St. Louis*, and in 1954 his Air Force Reserve commission was restored at the rank of brigadier general. Lindbergh died on August 26, 1974, in Hana, Maui, Hawaii.

Lindemann, Frederick Alexander (1886–1957)

British physicist. Born on April 5, 1886, in Baden-Baden, Germany, Frederick Alexander Lindemann earned a doctorate in physics from the Sorbonne (1910). During World War I, he served as a civilian expert at the Royal Aircraft Establishment in Farnborough, England, studying means of overcoming otherwise fatal aircraft spins. He obtained a pilot's license in 1916.

Lindemann became a professor of experimental philosophy (physics) at Oxford University in April 1919 and first met Winston L. S. Churchill in August 1921, becoming friends with the whole Churchill family, thanks in part to his ability to explain abstruse scientific facts or theories in language that could be understood by a layperson.

Lindemann entered government as Churchill's adviser at the Admiralty in September 1939. A month later, Lindemann established a statistical section. In 1942, he was named paymaster general, a cabinet position that he held until 1945. But his primary focus was on advising Churchill (in the course of the war, he sent the prime minister some 2,000 memos, about a third of them concerned with weapons or the armed forces) and heading the Statistical Branch, which reduced as many aspects of the conflict as possible to quantitative terms to allow easier assessment of what was working and what was not.

Arguing from the data developed by his statisticians, Lindemann strongly supported strategic bombing (although he deliberately overestimated its likely impact), and he backed development of the proximity fuze. Unfortunately, he retained grudges, had an acidic personality, appeared aloof, offered opinions on subjects about which he was not an authority, and was all too easily critical of others.

Lindemann was named a peer in 1941, becoming Lord Cherwell, and was made a viscount in 1956. He taught at Oxford after the war and then briefly joined Churchill's second government, until he resigned due to ill health (in October 1953) and returned to Oxford. Lindemann died there on July 3, 1957.

List, Siegmund Wilhelm Walter (1880–1971)

German Army general. Born on May 14, 1880, in Oberkirch, Germany, Siegmund Wilhelm Walter List joined the army in 1898. During World War I, he was a General Staff officer and became an expert on the Balkans. After the war, List served in a Freikorps unit and then joined the Reichswehr, eventually becoming a tank specialist.

List was made chief of the Army Organization Department in 1930 and was promoted to major general. In 1932, he was promoted to lieutenant general, and in 1934 he took command of the 4th Infantry Division at Dresden. In 1935, he commanded the IV Army Corps. Although he was anti-Nazi, List failed to speak out against Adolf Hitler's dishonorable treatment of Generals Werner von Blomberg and Werner von Fritsch. Escaping the generals' purge of 1938, List assumed command of the 5th Infantry Division in Vienna.

In the September 1, 1939, attack against Poland, List, now a colonel general, commanded the Fourteenth Army in General Karl Gerd von Rundstedt's Army Group South and captured Kraków. In the May 10–June 25, 1940, Battle for France, List again served under Rundstedt, commanding the Twelfth Army, primarily an infantry force. He impressed his peers by the speed with which he maneuvered his troops and in penetrating the Maginot Line. Hitler promoted him to field marshal in July 1940.

List then returned to the Balkans, concluding a secret agreement with Bulgarian minister of war General Teodossi Dascaloff to allow German troops safe passage through that country to Greece. List and his forces helped conquer Greece by April 23, 1941, and he then commanded all German

forces in the Balkans. Directly subordinate to Hitler, List was responsible for the German-occupied areas of the Balkans as well as liaison with Italian and Bulgarian forces there.

In July 1942, List took command of Army Group A in the Soviet Union, with the task of securing the Black Sea ports of Novorossiysk, Tuapse, Sochi, Sukhumi, and Batumi to take the Soviet naval bases and oil fields there. His forces were insufficient for the task and were halted at the Terek River at the end of August. List wanted to fall back and regroup, but Hitler insisted that he continue offensive operations and secure the oil fields of Baku, Tiflis, and Batumi, but he was unable to do so. List fell ill and was removed from command on September 9, 1942, and Hitler then took personal command of Army Group A.

In February 1948, List was tried at Nuremberg on war crimes charges, found guilty, and sentenced to life in prison. He was released in December 1952. List died in Garmisch-Partenkirchen, Germany, on August 17, 1971.

Literature and the War

While military action involving a given war has a relatively restricted timeline, the literature of a war has no such limits. Wars are routinely reanalyzed and refought in the context of literary works, and World War II continues to loom over the global consciousness well into the 21st century and particularly in the wake of later conflicts such as the Cold War, the Korean War, the Vietnam War, and a host of other military confrontations that demonstrate that World War II has never truly ended. A survey of World War II literature can hardly hope to do justice to this complex area, but it can

highlight major works from three areas: first, literary works immediately before and during the conflict; second, literature from the end of the war to the present; and third, the literature of the Holocaust, an event that preceded armed conflict but has left perhaps the most indelible mark on the modern consciousness.

Concurrently, since World War II was indeed a global war, this overview will focus on national literatures that demonstrate how their respective publics tried—and continue to try—to deal with the developments of the era.

Literature Written on the Eve of World War II and during the Conflict

The 1936–1939 Spanish Civil War

This conflict served in many ways as a preliminary staging ground for World War II, and a number of writers dealing with it reflect an awareness that Bolshevism and fascism were counterpoised, in spite of the apathy of Western governments. Foremost among French left-wing writers is André Malraux, who published his *L'Espoir* (Man's Hope, 1938), a novel influenced by his Spanish war experiences. In contrast, Robert Brasillach, later executed as a collaborationist at the end of World War II, voiced fascist sentiments in his fictional works and his writings in the journal *Je suis partout* (I Am Everywhere) from 1937 to 1943. Among the members of the American "Abraham Lincoln Brigade," writers such as Ernest Hemingway, Herbert Matthews, Martha Gellhorn, and Lillian Hellman strengthened antifascist opinion in the United States; in this context, Hemingway's *For Whom the Bell Tolls* (1940) has become a classic. In a British context, George Orwell's *Homage to Catalonia* (1938) is based on his experiences during the Spanish Civil War.

Germany and Italy

Not surprisingly, Nazi propaganda dominated German literary output before and during the war. Most notably, Adolf Hitler's *Mein Kampf* (My Struggle, 1925–1926) expanded upon earlier racist theories and anti-Semitism. Moreover, it clearly identified what Hitler viewed as the twin evils of Judaism and communism and, prefiguring the Reich's later military moves,

called upon Germany to fulfill its destiny of moving eastward to achieve *Lebensraum* (living space). In addition, Nazi propaganda relied heavily on the press, censored from 1933 onward. Party mouthpieces included the *Völkischer Beobachter* (People's Observer) and the even more virulent *Der Stürmer* (Storm Trooper), controlled by Julius Streicher, who later founded a publishing house under the same name. This prolific writer produced a host of overtly anti-Semitic works, including books for children. Other pro-Nazi writers invoked the fearless, pure-blooded Germanic archetype: for example, Hanns Johst in his novel *Undying Mother* (1933) and a host of short stories and poems.

A prominent group of German writers (many in internal and external exile), however, voiced resistance to the Nazi regime. In *The World of Yesterday* (1942), published in the year of the writer's suicide, Stefan Zweig views World War I and the rise of Hitler as "the fist shattering the continent." Other prominent writers in exile included Thomas Mann (whose *Lotte in Weimar*, published in 1939, offers a subtle critique of German militarism) and his brother, Heinrich Mann. Klaus Mann, son of Thomas, published his *Mephisto,* a portrayal of a famous actor who, as a modern-day Faust, sells his soul to fascism, only to be destroyed by it. Other writers such as Bertolt Brecht and Anna Seghers offered a socialist alternative to fascism, including Brecht's drama *Fear and Misery of the Third Reich* (1938) and Seghers's *Seventh Cross* (1942), a novel about a successful escape from a concentration camp.

Among other Axis allies, little of import evolved from fascist Italy before or during the war years. A notable exception is Giuseppe Antonio Borghese's *Goliath: The March of Fascism* (published in English in 1937 but not translated into Italian until 1947). Another exile writer, novelist Ignazio Silone, published *Fontamara* in 1933 and *Bread and Wine* in 1936. Curzio Malaparte's *Kaputt* (1944), a novel by a war correspondent, a onetime fascist who was later to become a Marxist, spans Axis Europe and darkly portrays the Jewish genocide. In Japan as in the Third Reich, propaganda served as literature, as reflected in newspapers and magazines. Pamphlets abounded, including *Read This and the War Is Won* (1937?).

France

As in Germany, the literary world in France was divided between collaborators and resistors—many of whom emigrated. Among collaborators, Louis-Ferdinand Céline published anti-Semitic material such as *Trifles for a Massacre* (1937) and *School for Corpses* (1938); others, such as Pierre Drieu La Rochelle, Robert Brasillach (*Our Prewar,* 1941), and Lucien Rebatet also made no secret of their fascist persuasions. In contrast, the poetry of two Marxists, Paul Éluard and Louis Aragon, had extensive clandestine circulation, as did Jean-Marcel Bruller's (aka Vercors) *The Silence of the Sea* (1941). Albert Camus's significant novel *The Plague* (1947) uses the metaphor of a plague epidemic to probe the issues of resistance and collaboration. Romanian French writer Eugène Ionesco was to return to this motif of political "infection" as an epidemic in his powerful drama *Rhinoceros* in 1959. To a lesser extent, Jean-Paul Sartre's wartime writings such as *The Flies* (1943) and *No Exit* (1944) also probed the conflicts of individual and collective responsibility. In addition, Antoine de Saint-Exupéry's poetic *Wartime Pilot* (1942) was based on the author's wartime mission as a pioneer aviator.

Soviet Union

Soviet writers were directed to promote public readiness for an eventual conflict with Nazi Germany, although this changed to some extent after the Nazi-Soviet Pact of August 1939. For instance, Ilya Ehrenburg, a veteran of the Spanish Civil War, found that *Izvestia* no longer published his articles when he returned to the Soviet Union from France in 1940, even though Joseph Stalin grudgingly approved his novel *The Fall of Paris* after the first part appeared in 1941.

After the German invasion of the Soviet Union on June 22, 1941, however, Ehrenburg became a weapon of war, publishing more than 2,000 articles, many of them ferociously anti-German, chiefly in the paper *Red Star.* In 1943, in conjunction with fellow journalist Vasily Grossman, Ehrenburg began editing *The Black Book,* a record of depredations against Soviet Jewry on the basis of firsthand testimony from newly liberated areas; Stalin, however, was to prevent its postwar publication. Even more than Ehrenburg, Grossman's *Red Star* reporting led him to the front lines, where he based his

stories on extensive interviews with men of all ranks and even accompanied Stalingrad sniper Anatoly Chekhov to his post.

Among writers in other genres, poets such as Aleksey Surkov, Konstantin Simonov, and Semyon Gudzenko reflected the pain of separation and the harrowing experiences of combat. In particular, Olga Berggolts's voice was familiar to radio listeners during the Siege of Leningrad (July 10, 1941–January 22, 1944), especially with her poem "February Diary" (winter of 1941–1942), written while her husband was dying of starvation. In addition, Aleksandr Tvardovsky's long narrative poem, *Vasily Tyorkin: A Book about a Soldier* (1942–1945), follows its hero through battles, convalescence from wounds, and the advance on Berlin. Novelists were less prolific during the war years; the one work that stands out is Victor Nekrasov's *In the Trenches of Stalingrad* (1945).

Great Britain

During World War II, prose in Great Britain was the predominant genre. Representations of the Blitz are vivid in James Hanley's novel *No Directions* (1943), William Sansom's firefighting stories, and Henry Green's novel *Caught* (1943). Similarly, Elizabeth Bowen's collection of short stories, *The Demon Lover and Other Stories* (1945), reflects the psychological disorientation that results from war. In Patrick Hamilton's novel *Hangover* (1941), the heroine is traumatized by her lover, who turns out to be a fascist. In contrast, Evelyn Waugh's *Put Out More Flags* (1942) is a satirical representation of the inability of upper-class Britons and other groups to deal seriously with the fascist threat during the onset of the war. Among poets, Alun Lewis, Sidney Keyes, and Keith Douglas died in service; the most eloquent poetic voice of the generation, however, may well have been T.S. Eliot in *The Four Quartets* (1935–1942), which represents a search for significance in the midst of destruction and strident nationalism.

United States

The number of American literary works written during World War II is fairly limited. Among poets, John Gillespie Magee wrote his poem "High Flight" (1941) as a pilot in the Royal Canadian Air Force shortly before the United

States officially entered the war. Other major poets included Randall Jarrell, whose experience in the air forces inspired a series of bitter poems, *Little Friend, Little Friend,* in 1945, and Archibald MacLeish, whose poetic drama *The Fall of the City* (1937) is a parable of Adolf Hitler's rise. Another major American poet, Ezra Pound, was notorious for his support of Benito Mussolini and his propaganda broadcasts from Italy; tried for treason after the war, Pound was declared insane and confined to a mental hospital.

Other American works during the war include Lillian Hellman's play *Winged Victory* (1941), reprised as a film in 1943. Gertrude Stein's journals of her war years in France appeared as *Wars I Have Seen* (1945). John Steinbeck, who worked as a correspondent, brought forth his propagandistic side in *The Moon Is Down* (1942), a novel about Norwegians under the Nazis. As in the Soviet Union, however, the United States produced a constellation of war correspondents, among whom Pulitzer Prize–winner Ernie Pyle is perhaps the best known for his vivid reports from Europe, North Africa, and the Pacific; he died in sniper fire on a small island near Okinawa in 1945. A number of collections of his reports appeared during the war: *Ernie Pyle in England* (1941), *Here Is Your War* (1943), and *Brave Men* (1944). Other prominent war correspondents include William L. Shirer, Edward Murrow, Bill Mauldin, and John Hersey.

Literature Written from 1945 to the Present

United States

Shortly after war's end, a number of major American novels emerged, including Norman Mailer's *The Naked and the Dead* (1948), Irwin Shaw's *The Young Lions* (1948), and James Jones's *From Here to Eternity* (1951), followed by *The Thin Red Line* (1962). Herman Wouk gained extensive popularity with his *Caine Mutiny* (1951), *Winds of War* (1971), and *War and Remembrance* (1978), all of which inspired successful movies.

Thomas Heggen's *Mister Roberts* (1946), based on the writer's memories as a sailor aboard a navy cargo ship in the Pacific, probes the daily boredom and hijinks of a crew that sees no combat. Eventually Roberts transfers to a destroyer, where he is killed. Originally a novel, the work later became a successful Broadway production and, later still, a movie starring Henry Fonda. James Michener's *Tales of the South Pacific* (1948) is a series of

loosely connected stories based on the writer's experiences with the U.S. Navy; this later became famous in its musical adaptation by Rogers and Hammerstein (*South Pacific*).

Among ground-breaking works using postmodernist techniques, Joseph Heller's *Catch-22* (1961) follows a fictional American squadron on the Mediterranean front in a chronologically truncated series of episodes that reflect the group's often futile attempts to maintain their sanity amid chaos and existential uncertainty. Another significant novel is Kurt Vonnegut's *Slaughterhouse Five* (1969), which takes its title from the writer's experiences as a prisoner of war in a German slaughterhouse. Billy Pilgrim and his fellow prisoners of war undergo an apocalyptic experience during the Allied firebombing of Dresden (February 13–15, 1945) and are forced to excavate corpses from the rubble of the ruined city. An even more complex work, Thomas Pynchon's *Gravity's Rainbow* (1973), is set in Europe during the final days of the war; highlighting a quest to decipher the secret of a mysterious "black device" for a rocket, the novel, hailed as an American masterpiece, weaves together nonsense, history, science, and philosophy.

Fictional and nonfictional treatment of World War II has remained a constant in American literature up to the present. In a gripping plot, Richard Wiley's novel *Soldiers in Hiding* (1986) is about a group of Japanese American jazz musicians stranded in Japan after the December 7, 1941, attack on Pearl Harbor. Feminist writer Marge Piercy published her acclaimed *Gone to Soldiers,* a novel intertwining the stories of six women and four men, in 1988, and in 1992 well-known historian Stephen Ambrose published *Band of Brothers: E Company, 506th Regiment, 101st Airborne from Normandy to Hitler's Eagle's Nest.* More recently, Joseph Bruchac's *Code Talker: A Novel about the Navajo Marines of World War Two* (2006) features Native Americans, while David Robbins's *Liberation Road: A Novel of World War II and the Red Ball Express* (2004) deals with the 23,000 men —mostly African Americans—who supplied American forces during the liberation of France.

Great Britain

In a time of postwar exhaustion, economic problems, and the dissolution of its colonial empire, it is not surprising that few significant works about World

War II emerged in the United Kingdom during the first decades after the war. After focusing on the war-ravaged city of Vienna in *The Third Man* (1950), Graham Greene's *The End of the Affair* (1951) uses the London Blitz as a backdrop for the story of an adulterous affair, infused with fervent Catholicism. Evelyn Waugh, another convert to Catholicism, wrote *Men at Arms* (1952), the first novel in his *Sword of Honor* trilogy; the hero, Guy Crouchback, hails from a decadent British family and, during his involvement with the army, experiences recurrent chaos before he is sent home. Mary Renault's *The Charioteer* (1953) takes up a daring topic for its time when a young soldier, recuperating from an injury, falls in love with a ward mate. Another controversial novel, Muriel Spark's *The Prime of Miss Jean Brody* (1961), deals with a jealous student who accuses her teacher of fascism.

More directly related with combat, Peter Towry's *Trial by Battle* (1959), which concerns a young British officer in Malaya during the Japanese advance there, is possibly the best British novel that emerged from the war, alongside J. G. Ballard's *Empire of the Sun* (1984), set in occupied China. In the popular press, Ken Follett's spy thriller *Eye of the Needle* (1978) and his more recent *Jackdaws* (1996), about female saboteurs behind enemy lines in France, have been best sellers. Also, Alastair Maclean deserves mention for his books, including *HMS Ulysses* (1955), *The Guns of Navarone* (1955), *Force 10 from Navarone* (1968), and *Partisans* (1982).

The onset of the 21st century demonstrates that World War II is still very much a presence in the British imagination, and here the focus has been on the female experience. Sebastian Faulks's *Charlotte Gray* (1998) is the romantic tale of a Scottish woman parachuted into France. In contrast, *Nella Last's War: A Mother's Diary, 1939–45* (2006) takes the war to the home front, as does Angela Huth's *Land Girls* (1994), a novel about three women who form a strong friendship during a summer of land service. Also set on the home front, Robert Radcliffe's *Under an English Heaven* (2002) deals with the apprehensions of villagers in East Anglia as American airmen take off on daytime assaults on industrial targets in Germany.

Germany

In the rubble of its defeat, Germany faced a particular conundrum. Not only was the country divided into east and west zones, but Germans had to come to terms with the atrocities of the past, a huge influx of ethnic German deportees, and their own substantial losses. Not surprisingly, major works on the war emerged relatively late. In the Soviet Zone, little was done to raise the public consciousness of the past, for the conversion to a Marxist regime had ostensibly obliterated all remnants of capitalist Nazism. In the Western Zone, nevertheless, memoirs and pseudobiographical works abounded, often published by private presses.

In addition, the 1950s saw an influx of novels probing the trauma of conflict, such as Gert Ledig's *Stalin Organ* (1958), which portrays unexceptional men thrust into the vicious futility of the Siege of Leningrad. Also, Willi Heinrich achieved considerable popularity with his racy, candid war novels, of which *Cross of Iron* (1955), originally published in English as *The Willing Flesh*, is the best known. On a more serious level, Heinrich Böll probed World War II in such works as *The Train Was on Time* (1949), about a German soldier traveling by train from Paris, and *Billiars at Half-past Nine* (1959), which traces a family history and shows Böll's opposition to Nazism and to war in general. More confrontationally, Günther Grass offers a biting allegory of the rise of Nazism in *The Tin Drum* (1959) in the person of the dwarf Oskar Matzerath, who decides that his "spiritual development is complete at birth and only needs to affirm itself," so long as he can use noise as a weapon. Grass demonstrated, however, a different view of the war in his later work, *Crabwalk* (2002), focusing on thousands of ethnic German refugees on the *Wilhelm Gustloff*, sunk by a Russian submarine in January 1945. Similarly, Siegfried Lenz's *Heritage* (1978) tells the story of the flight of a peaceful group of Mazurian Prussians in the face of the Red Army.

More controversially, Martin Walser, whose drama *Black Swan* (1964) has been hailed for dealing with the guilt of the past, later created a public outcry in 1998 when, accepting the Frankfurt Book Fair Peace Prize, he stated that while no reasoning person can deny the Holocaust, it is currently being used as a "routine threat" or "moral cudgel."

Former Luftwaffe lieutenant Hans Helmut Kirst was a post–World War II German novelist who wrote 46 books, many of them dealing with military and political themes. During the 1960s he was the most widely published modern German author in English. One of his most successful books was the

1962 *Die Nacht der Generale.* In 1967 the book was turned into a successful film starring Peter O'Toole and Omar Sharif. Kirst's 1962 book, *Fabrik der Offiziere* (*Officer Factory*) is a gripping murder mystery set in a German officer candidate school in 1944. It is also a penetrating analysis of the moral rot and political corruption of the Wehrmacht during the Third Reich.

Kirst's most famous books are the *Gunner Asch Trilogy,* originally published in German as the *Null-Acht-Fünfzehn* series. The main character, clearly based on Kirst, starts as an enlisted soldier in the prewar German military, serves throughout World War II, reaches the rank of lieutenant, and returns to a shattered Germany in 1945. Increasingly, German literature marks a determination to come to terms with the past, a move that also includes, as W. G. Sebald states in his controversial *On the Natural History of Destruction* (1999), overcoming the "self-imposed silence" on the destruction that Germans experienced during the final months of the war.

Italy

Italian literature reveals a spectrum of trauma and loss. In a memoir of 1953, *The Sergeant in the Snow,* Mario Rigoni Stern tells the harrowing story of 200,000 Italian troops involved in the advance on and retreat from the Soviet Union between mid-1941 and early 1943, while Alberto Moravia's *Two Women* (1958) details the abuse of a mother and daughter during the final year of the war from their Italian compatriots, occupying Germans, and then the Allied liberators. In a similar vein, Elsa Morante's *History: A Novel* (1974) deals with a part-Jewish mother trying to protect her family in the Roman slums during the German occupation. Also with a civilian focus, Cesare Pavese's *House on the Hill* (1948) describes an Allied bombing raid on Turin. Deflating the myth of the Resistance, Italo Calvino's *The Path to the Nest of Spiders* (1947) centers on a boy and his prostitute sister in a partisan group composed of criminals; similarly, Luigi Meneghello's *Outlaws* (1964) and Beppe Fenoglio's *Johnny the Partisan* (1968) tend to debunk the myth of the partisan. More recently, Alessandro Portelli's *The Order Has Been Carried Out* (1999) concerns the Nazi massacre of 335 Roman hostages in the Fosse Ardeatine on March 24, 1944, in reprisal for a Resistance attack that killed 33 German soldiers.

Soviet Union and Post-Soviet Russia

Stalinist propaganda at the beginning of the Cold War hampered Russian literature dealing with World War II. Grossman's *For a Just Cause* (1952) incited criticism for failing to acknowledge the Communist Party's role in the Great Patriotic War; similarly, Aleksandr Fadeyev's *Young Guard* (originally written in 1945 but published with extensive revision in 1951), based on the activities of an underground resistance group, was heavily censored. Vasily Grossman's *Life and Fate,* an epic novel that sweeps from Stalingrad to Soviet prisoners to Jewish ghettos, had to be published in Switzerland in 1980; it did not appear in the Soviet Union until 1988, during the perestroika era of Mikhail Gorbachev. Boris Vasilyev, another writer who capitalized on his wartime experiences, produced *The Dawns Here Are Quiet* (1969), a tale of female heroism, followed by major stories: "Not on the Active List" (1974) and "Tomorrow There Came War" (1984). Other works by soldiers turned writers include Boris Nikolaevich Polevoy's *Story of a Real Man* (1952) about fighter pilot Alexei Petrovich Maresiev; Victor Astafyev's *Jolly Soldier* (1999); and the novellas of Vasil Bykaŭ, "The Dead Feel No Pain" (1965), "The Ordeal" (1970), and "Wolf Pack" (1975).

Japan

The best-known World War II novel from the Japanese point of view remains Sholei Ooka's *Fires on the Plain* (1957), which describes a warrior devastated by the collapse of his country; as a prisoner of the Americans, he acknowledges the futility of all sacrifices in war. Akira Yoshimura's powerful novel *One Man's Justice,* although originally published in 1978, did not become available in English translation until early in the 21st century. It contained no mention of Pearl Harbor or the atrocities committed by the Japanese against the Chinese and other peoples who fell under their control, but it did movingly capture the thoughts and emotions of its hero, a Japanese soldier.

On the run from a U.S. military tribunal, the soldier feels no guilt for having beheaded an American prisoner of war after the end of hostilities. He has witnessed the sufferings of Hiroshima and does not believe that Americans have the moral authority to judge him. They have exterminated

his countrymen “as if they were vermin” and, he learns, listened to jazz while returning from their murderous bombing raids.

Considering the magnitude of the event, there are relatively few fictional treatments of the beginning of the atomic age and the destruction of Hiroshima and Nagasaki. One well-known novel is, however, based on diaries and interviews with survivors of Hiroshima, Masuji Ibuse’s *Black Rain* (1985).

France

After the liberation of France, there was freedom to reflect on the national humiliation. Simone de Beauvoir’s *The Blood of Others* (1948) placed ill-fated lovers adrift in wartime France. Henri Troyat’s 1958 novel, *The Encounter,* examined the German occupation through the eyes of a woman who kept a music shop and loved American jazz. Jean Paul Sartre’s *Troubled Sleep* (1959) tried to suggest reasons for the ignoble capitulation of France. The short stories, novels, and plays of both Sartre and Albert Camus—and the existentialist philosophy they expressed—were likewise products of occupation and experiences of the Resistance. The most curiously disturbing French writer during the period was Louis-Ferdinand Céline, who vacillated between admiration for and abhorrence of Hitler, between French patriotism and denunciation of his countrymen. His last important works, *Castle to Castle* (1957) and *North* (1960), described the Nazi nightmare world that France became in the war.

Perhaps the best-loved World War II novel from a French writer was Pierre Boulle’s *The Bridge over the River Kwai* (1954), with its generally admiring view of the professionalism of British servicemen, its exploration of the moral ambiguities of wartime, and the humor and irony with which it examined relationships between Japanese officers and British prisoners of war. Another popular work is Guy Sajer’s *The Forgotten Soldier* (1965), originally published in French, an account of an Alsatian soldier’s vicissitudes on the Eastern Front as a member of the Grossdeutschland Division.

Other Nations

Of the many war novels written in the less widely known languages of other participants, several have been translated and merit mention. Tage Skou-Hansen's *The Naked Trees,* translated from Danish and first published in 1959, was a love story from occupied Denmark. The best-known Finnish novel from the war was Paavo Rintala's *The Long Distance Patrol* (1967), detailing the experiences of Finnish soldiers caught between two oppressors, the Soviets and the Germans. A powerful Dutch novel was Hugo Claus's *The Sorrows of Belgium* (1990), which viewed the trauma of a complex society in wartime and the collaboration of certain Flemish nationalists with invading Nazis.

Two Czech novels that have received international acclaim are Josef Bor's *The Therezin Requiem* (1963) and Bohumil Hrabal's *Closely Watched Trains* (1968). Bor fictionalized an actual event, performances of Verdi's *Requiem* for an audience of Nazi officials, including the notorious Adolf Eichmann. The musicians, all prisoners of the Theresienstadt camp, were exterminated after their last concert. Hrabal's novel pictured life in a small depleted Czech village in the last days of the occupation.

Other East European writers have left unique records. Constantin V. Gheorghiu's *Twenty-Fifth Hour* (1950) is a picaresque tale of the misadventures of a Romanian peasant held for 13 years in different work camps, caught up in the various bureaucracies, and perplexed in turn by fascists, communists, and democratic governments. Another Romanian novel of note is Zaharia Stancu's *The Gypsy Tribe* (1971) about the Nazi persecution of Romany peoples.

The Polish writer Monika Kotowska, in *The Bridge to the Other Side* (1963), provided a sensitive rendering of the sufferings of children during the war and its aftermath. The better-known Polish novelist Stanislaw Lem employed the image of a mental hospital to convey the insanity of the Nazi subjugation of Poland in *Hospital of the Transfiguration* (1975).

Istvan Orkeng, a Hungarian, wrote *The Toth Family* (1966), a black comedy indicting the general compliance of his countrymen with Nazism. Danilo Kis's *Hourglass* (1984) displayed a Kafkaesque world on the multiethnic borders of Hungary and Yugoslavia, where suicide, murder, and instant disappearance became mundane events. The most acclaimed Serbo-Croatian novel was Miodrag Bulatovic's *A Hero on a Donkey* (1965), set in Montenegro under the Italian fascist military presence. With a lighter touch,

Bulatovic reinforced the common perception that an Italian occupation was the least of many possible misfortunes. Statis Tsirkas's *Drifting Cities* (1974) was the most notable Greek novel of the war, with its mysterious locales of Cairo, Jerusalem, and Alexandria and its celebration of the Greek struggle against both fascism and communism.

Two books with special exotic appeal came from Indonesia and Iran, respectively. Ismail Marahimin's *And the War Is Over* (1977) was set in fabled Sumatra, among Dutch prisoners of the Japanese. The book won the highest literary prize offered by Indonesia. *Savushun: A Novel of Modern Iran* (1969) by Simin Daneshvar described Iran during the British and Soviet occupations. Although protection of the oil fields is the official concern, one simple family struggles to maintain honor and dignity, despite disease, famine, and the assassination of their patriarch. The book was also notable for its feminine point of view; it was the work of an accomplished Iranian woman novelist.

Holocaust Literature

Of all the many atrocities of the 20th century, the Holocaust stands out most vividly in the Western collective memory, and an abbreviated overview cannot do more than scratch the surface. Most famous is, of course, *The Diary of Anne Frank*, a coming-of-age memoir of years in hiding from the Nazis. This focus on adolescence continues in a host of biographies and memoirs written for a juvenile audience: for example, Judith Kerr's *When Hitler Stole Pink Rabbit* (1987), Uri Orlev's *The Island on Bird Street* (1984), and Ida Fink's *A Scrap of Time* (1989).

Foreign editions of *The Diary of Anne Frank*. (Todd A. Gipstein/Corbis)

On an adult level, Tadeusz Borowski's *This Way for the Gas, Ladies and Gentlemen: And Other Stories* (1948), written by a non-Jewish member of a work commando unit, probes the minds and behaviors of both victims and perpetrators. Elie Wiesel's *Night* (1982), a memoir of Auschwitz, remains one of the most compelling works in the area, as does Charlotte Delbo's *None of Us Will Return* (1968), written by a member of the French Resistance arrested alongside her husband in 1942. Although plagued with personal controversy, Bruno Bettelheim offers considerable insight into the psychology of victim and perpetrator in his *Surviving and Other Essays* (1980). With a similar aim, Victor Frankl's renowned *Man's Search for Meaning* (1984) uses personal experience to arrive at a philosophy of survival.

Another biographical novel that has achieved prominence through the Nobel Peace Prize, *Fateless* (1992), by the Hungarian writer Imre Kertesz, describes the experiences of a 15-year-old sent to Auschwitz and Buchenwald among other Hungarian Jews. The poetry of another Hungarian writer, poet Miklos Radnóti, underlies one of the most striking stories of the Holocaust. Evacuated from a Serbian labor camp, Radnóti collapsed on the forced march near the Austrian border, whereupon he was shot and interred in a trench. When his body was exhumed in 1946, his final poems were found

sewn into the coat in which he was buried. Similarly, French writer Irène Némirovsky's *Suite Française* (2004) appeared posthumously. Italian Primo Michele Levi's *If This Is a Man* (1947, published in the United States as *Survival in Auschwitz*) treats the year he spent in Auschwitz. In Art Spiegelman's *Maus* (1991), cartoon characters represent people, portraying the Jews as mice and the Nazis as cats.

Other notable Holocaust writings were not by survivors but rather by novelists who had lived among survivors: for example, *The Shawl and Rosa* (1989) and William Styron's *Sophie's Choice.* Leon Uris's *Mila 18* (1961) and John Hersey's *The Wall* (1950) are novels about the Warsaw ghetto.

Lithuania

The largest and most southerly of the Baltic states. Occupied by both the Germans and the Soviets during World War II, Lithuania had a 1939 population of approximately 3 million. Located on the southeast coast of the

Baltic Sea, Lithuania borders Latvia to the north, Poland to the south, and Kaliningrad Oblast, an ethnically Russia exclave, to the southwest. Encompassing 25,212 square miles, Lithuania had secured independence from Russia on February 16, 1918, as a consequence of World War I and Russian revolutions. The Russian Soviet Federated Socialist Republic recognized this independence in a bilateral treaty in July 1920, and this was confirmed in a nonaggression pact with a term of 5 years between Lithuania and the Soviet Union on September 18, 1926, extended to a 10-year period in 1934.

In 1939, Antanas Smetona ruled Lithuania as dictator from the capital of Kaunas. Unlike the other Baltic states, Lithuania enjoyed satisfactory relations with the Soviet Union. The nation's vulnerability to its more powerful neighbors was shown in the 1920 Polish seizure of Wilno (Vilnius, Vilna), the old medieval capital of Lithuania. Then in March 1939, Germany seized Memel (Kaunus).

Lithuania remained independent until implementation of the terms of the nonaggression pact between Germany and the Soviet Union of August 23, 1939. Under the terms of this agreement, Lithuania was originally assigned to Germany, but in return for additional territory in Poland, Germany ceded Lithuania to the Soviet Union's sphere of influence on September 28.

German forces landing with their equipment at Memel in Lithuania, May 1939. (Central Press/Getty Images)

After the German invasion of Poland on September 1, 1939, Lithuania declared its neutrality. On October 10, its leaders signed a mutual assistance treaty with the Soviet Union. The Soviets then returned Wilno to Lithuania from Poland in exchange for permission to station Soviet troops on Lithuanian soil. The Soviet Union also promised not to interfere in Lithuanian internal affairs.

On activation of this treaty in June 1940, Soviet troops entered Lithuania, and pledges to the contrary notwithstanding, the Soviet government carried out subversive activities, arrested several thousand Lithuanians, and subverted the election process, which brought the communists to power and resulted in the proclamation of the Lithuanian Soviet Socialist Republic. The new government then voted to join the Soviet Union, as announced by Moscow, on August 5, 1940.

The process of the sovietization of Lithuania then commenced. Lithuanian institutions were done away with, and Soviet laws replaced Lithuanian ones. Soviet authorities abolished religious teaching in the schools, seized private lands, and nationalized industries. At least 40,000 Lithuanians believed to be in opposition to these policies were deported to remote portions of the Soviet Union in early June 1941, just before the German invasion of the Soviet Union in Operation BARBAROSSA (June 22, 1941).

The German Army soon occupied Lithuania and subjected the country to its own control. Industries nationalized by the Soviets now came under Third Reich control, and food and basic goods were rationed. The Germans also attempted to recruit a Lithuanian Schutzstaffel (SS) division, but few responded, and the effort failed. Tens of thousands of Lithuanians were deported to Germany to serve there as slave laborers. The Germans also encouraged the settlement of native Germans in Lithuania, and efforts to secure “racial purity” led to the killing of some 170,000 Lithuanian Jews, chiefly from the ghettos of Wilno and Kaunas.

The reoccupation of Lithuania by the Soviets, beginning in April 1944, brought the flight of tens of thousands of Germans and Lithuanians westward and a new wave of terror. Once the Soviets had control, they reintroduced the

communist leaders from 1940 and Sovietization, including collectivization in land, deportation of remaining Poles, and persecution of the Catholic Church.

The war claimed at least 25 percent of the population of the country through deportations and the loss of virtually all its minorities, including at least 135,000 Jews as well as the Germans and Poles. Between 1947 and 1950, Soviet authorities ordered the deportation of some 350,000 additional Lithuanians. The country did not regain its independence until 1991.

Li Tsung-jen

See Li Zongren

Litviak, Lidiia Vladimirovna (1921–1943)

Soviet Air Force officer and first woman fighter pilot to shoot down an enemy aircraft in daytime. Born in Moscow on August 18, 1921, Lidiia (Lilia or Liliia) Vladimirovna Litviak became a flying instructor after graduating from the Kherson Flying School. By mid-1941, she had trained 45 pilots. That fall, she joined Major Marina Raskova's 122th Group. Litviak's 586th Fighter Regiment, which flew Yak-1 fighters, became operational in April 1942 and was assigned the defense of military and civilian installations in Saratov.

In September 1942, Litviak was sent with her squadron to Stalingrad. With fighter pilots Raisa Beliaeva, Ekaterina Budanova, and Mariia

Kuznetsova, Litviak joined the 437th Fighter Regiment, scoring her first two victories on September 13, 1942. As her new wing did not fly Yaks, she soon transferred with Budanova to the 9th Guards Fighter Regiment.

In January 1943 when this wing began acquiring American Bell P-39 Cobras, Litviak and Budanova transferred to the 296th Fighter Regiment (renamed the 73rd Stalingrad-Vienna Guards Fighter Regiment) of 6th Fighter Division, Eighth Air Army, to continue flying Yaks. Both women were commissioned as junior lieutenants on February 23, 1943. Litviak and Budanova both became "free hunters," searching for targets of opportunity. Litviak's final score stood at 12 autonomous and 3 group victories.

Outnumbered in a dogfight, Guards Senior Lieutenant Litviak was killed on August 1, 1943. Because her Yak was missing, rumors persisted that she had gone over to the Germans. Her loyalty to the Soviet regime was suspect, as her father, the former deputy minister of transportation, had been executed in 1937 in the Great Purges. After her remains were found in 1979, Litviak was rehabilitated in March 1986. She was posthumously awarded the Hero of the Soviet Union award by Mikhail Gorbachev on May 5, 1990.

Litvinov, Maxim Maksimovich (1876–1951)

Soviet foreign minister and diplomat. Maxim Maksimovich Litvinov was born Meir Henoch Mojszewicz Wallach-Finkelstein July 17, 1876, in Bialystok, in the Jewish "Pale of Settlement" in what is now Poland. Litvinov

joined the Russian Army in 1893 and was there exposed to Marxism. In 1898, he refused to fire on strikers at a factory in Baku, and while this insubordination was covered up, he was soon dismissed for other violations of army regulations. That same year, Litvinov joined the Russian Social Democratic Party.

Litvinov eventually settled in Kiev, where he managed a sugar factory by day and worked for the underground Social Democratic Party at night. Arrested in 1901, he was sentenced to two years in prison but escaped and fled to Berlin and then to Britain. In 1903, when the Social Democratic Party split into the Mensheviks and Bolsheviks, Litvinov sided with the Bolsheviks and worked to promote revolution in Russia.

In November 1917 the Bolsheviks seized power in Russia, and Litvinov, who had been living in Britain for a decade, became the Russian diplomatic representative in London. Expelled from Britain in 1919, he returned to Russia and began working in the Commissariat for Foreign Affairs. During the Russian Civil War, Litvinov was the Russian government's only official diplomat. He became commissar for foreign affairs in July 1930, and in February 1932 he led the Russian delegation to the World Disarmament Conference in Geneva, where he proposed general and complete disarmament.

When Adolf Hitler came to power in Germany in 1933, Litvinov championed ties with Western Europe and collective security. Diplomatic relations were also established with the United States in November 1933. In 1935, Litvinov signed mutual assistance pacts with both France and Czechoslovakia directed against Germany.

Following the appeasement of Germany over Czechoslovakia by Britain and France at the September 1938 Munich Conference, Joseph Stalin began to reverse Russian foreign policy to secure time to rearm. Litvinov was dropped as foreign minister in May 1939, replaced by hard-liner Vyacheslav Molotov. Hitler said that this step of dropping an internationalist and a Jew helped convince him that Stalin was serious about a rapprochement. On August 23 in Moscow, the Soviet Union and Germany concluded a nonaggression pact that also secretly partitioned much of Eastern Europe between them.

Following the German invasion of the Soviet Union in Operation BARBAROSSA on June 22, 1941, Stalin appointed Litvinov as Soviet

ambassador to the United States. He held this post from November 1941 to August 1943 and greatly assisted in the inclusion of the Soviet Union in Lend-Lease assistance.

Litvinov then returned to the Soviet Union to serve as deputy commissar for foreign affairs until he retired in August 1946. He died in Moscow on December 31, 1951.

Li Zongren (1891–1969)

Chinese Nationalist general. Born in Lingui (Linkwei), Guangxi (Kwangsi) Province, China, on August 13, 1891, Li Zongren (Li Tsung-jen) graduated from the Guangxi Short-Course Military Academy in 1913. For the next 10 years, in cooperation with another Guangxi officer, Bai Chongxi (Pai Ch'ung-hsi), Li fought against the warlords for control of his native province, which came under his control in December 1924. Around this time, Li joined the Nationalist Party—the Guomindang (Kuomintang, GMD)—of Jiang Jieshi (Chiang Kai-shek) and was appointed pacification commissioner of Guangxi and commander of the First Guangxi Army.

In 1926, Li participated in the 1926–1928 Northern Expedition, with his forces reorganized as the GMD National Revolutionary Army's Seventh Army and himself as commander. In 1929, Li and Bai, known as the Guangxi Clique, rebelled against Jiang to protest his concentration of power, receiving

support from Feng Yuxiang (Feng Yü-hsiang), Yan Xishan (Yen Hsi-shan), and Wang Jingwei (Wang Ching-wei). The resulting struggle ended in a stalemate, as national unity against the Japanese seemed more important after the September 18, 1931, Mukden (Shenyang) Incident in Liaoning Province. In late 1931, Li rejoined the GMD and resumed the post of Guangxi's pacification commissioner, preparing for the forthcoming anti-Japanese war. In mid-1936, he resolved his differences with Jiang and had his forces reorganized as the Fifth Route Army, with himself as commander in chief.

After the Sino-Japanese War began in July 1937, Li became commander in chief of the Fifth War Zone, comprising northern Jiangsu (Kiangsu), northern Anhui (Anhwei), and southern Shandong (Shantung); he was concurrently governor of Anhui. Li established his headquarters in Xuzhou (Hsuchow) in Jiangsu Province, engaging the Japanese in the Battle of Xuzhou at Taierzhuang (T'ai-Erh-Chuang) in March 1938. In May, he moved to Hubei (Hupeh) to defend Wuhan, which fell to the Japanese at year's end. In early 1939, Li confronted the Japanese at another Hubei city, Hankou (Hankow), successfully holding them there and preventing them from advancing westward until early 1945, when he was sent to Shaanxi (Shensi) to head the GMD's Military Affairs Commission.

After the war, Li became director of the presidential headquarters at Beijing (Peking), Hebei (Hopeh), until April 1948, when he was elected vice president. On January 21, 1949, he became acting president. In that capacity, he made a last attempt to negotiate with the Chinese Communists to settle the Chinese Civil War. Because Jiang continued to rule behind the scenes while preparing his way to Taiwan, Li failed to prevent the GMD's defeat. In November 1949, he went to the United States for medical treatment, where he stayed until July 1965. Li then returned to Beijing, receiving a warm reception from the Chinese Communist leaders. He died in Beijing on January 30, 1969.

Lockwood, Charles Andrew, Jr. (1890–1967)

U.S. Navy vice admiral. Born on May 6, 1890, in Midland, Virginia, Charles Andrew Lockwood Jr. graduated from the U.S. Naval Academy at Annapolis in 1912. He commanded submarines during World War I and after the war evaluated captured German U-boats. Lockwood spent most of the interwar years in the submarine service. He taught at the Naval Academy from 1933 to 1935 and was chief of staff to the U.S. Fleet submarine commander between 1939 and 1941.

When the United States entered World War II, Lockwood was serving as U.S. naval attaché to Great Britain, a post he retained until March 1942, when he was promoted to rear admiral and became commander of U.S. submarines in the Southwest Pacific. Lockwood assumed command during a difficult time. The navy had recently reorganized his command and relocated it to Australia. In addition, U.S. submarine commanders were experiencing serious problems with unreliable torpedoes. Lockwood led the way in ordering tests to determine the cause of torpedo failure. These experiments eventually resulted in securing properly functioning weaponry for the submarines.

In February 1943, Lockwood became commander of submarines in the Pacific Fleet, and that October he was promoted to vice admiral. Under his direction, the U.S. Pacific submarines became the most effective submarine force in history, utilizing radar, signals intelligence, improved torpedoes, and more aggressive tactics to sink two-thirds (5.3 million tons) of Japanese merchant ships and a third of Japanese warships, at a cost of 52 U.S. submarines sunk.

Lockwood also played an important role in developing procedures to rescue aircraft personnel. In 1943, he adopted a plan that posted submarines in various locations to retrieve downed pilots. This program, dubbed the Lifeguard League, led to the safe return of more than 500 Americans shot down over the Pacific.

After the war, Lockwood went on to serve as navy inspector general in the Office of the Chief of Naval Operations. He served in that assignment until his retirement in September 1947. He then wrote several books about his experiences. Lockwood died in Monte Serena, California, on June 6, 1967.

Lofoten Islands Raid

See CLAYMORE, Operation

Logistics, Allied

Logistics—the ability to procure, maintain, and transport military matériel, facilities, and personnel—was one key to the Allied victory in World War II. The war required the procurement and transportation of vast quantities of materials to locations thousands of miles distant, with climates as varied as the frozen Aleutian Islands, the tropical jungles of New Guinea and Burma, and the deserts of North Africa. The service troops not only had to deliver the goods but also usually had to develop the transportation infrastructure to enable large quantities of materials to flow efficiently. The Allied powers of Great Britain, the Soviet Union, and the United States proved adept at solving most logistical challenges and getting the required materials to the locations where they were most needed.

The production of war matériels is ultimately dependent on resources. Although the Axis powers were short of many strategic materials from the beginning of the war, the Allies were fortunate to have adequate supplies of the most vital war resources. The United States and the Soviet Union were especially well placed as far as natural resources were concerned, with sufficient supplies of such resources as coal, oil, iron, copper, lead, and zinc. Shortages of tin, nickel, manganese, tungsten, and magnesite were made up from other Allied powers or neutral states.

These resources were available as long as the Allies controlled the seas and had sufficient merchant shipping to move them where needed. Latin America produced tin, Canada supplied nickel, and India, South Africa, and Latin America had supplies of manganese. Latin America had tungsten, and the Soviet Union and Australia had magnesite. What one country lacked, another often had in surplus.

No single resource proved more important than oil, and the Allies had adequate supplies of that vital commodity. In 1937 the United States produced 60 percent of the world's oil, and Latin America produced 15 percent. Germany, by contrast, produced just 0.2 percent and depended on Romanian oil, which accounted for 2.4 percent of the world's production in 1937. The Allies drew on American domestic production along with oil from Latin America, the Caribbean, and the Middle East.

The only petroleum problems experienced by the Allies involved the production of sufficient high-octane aviation fuel and the general distribution of petroleum products. The United States eliminated the shortage of high-octane fuel by implementing a major construction program to build additional refineries. The construction of oil tankers, the defeat of the U-boat menace, and the development of pipelines to move fuel—such as the "Pipeline under the Ocean" (PLUTO) for the Normandy Invasion and the petroleum, oil, lubricants (POL) pipeline system across France—all were key to solving the transportation problems. Some campaigns were affected by fuel shortages, such as Lieutenant General George Patton's drive across France in the summer of 1944, but the Allies usually had ample supplies of fuel with only occasional spot shortages, whereas major fuel shortages hindered the Axis powers throughout most of the war.

The four major Allied powers each had special logistical requirements and problems during the war, which they confronted with varying degrees of

success. In the end, the combined logistical effort enabled the Allies to defeat the Axis powers.

In the Far East, the Chinese—both the Nationalists led by Jiang Jieshi (Chiang Kai-shek) and the Communists led by Mao Zedong (Mao Tse-tung)—had large numbers of ground forces in the field and millions of troops during the war but limited industrial capability to support them. By 1941, most of China's industrial areas had been overrun by the Japanese following their invasion of Manchuria in 1931 and China proper in 1937. The Chinese needed whatever aid the other Allies could spare, but geography imposed serious limitations on transporting that aid into the country.

Prior to December 1941 and the U.S. entry into the war, Western aid to China was limited to a trickle of supplies arriving through Burma or was primarily symbolic, such as that provided by the famed Flying Tigers (the American Volunteer Group) commanded by Claire Chennault.

Construction of the Burma Road and later the Ledo Road and the establishment of an air bridge over the Himalaya Mountains enabled greater quantities of aid to reach China, but these provisions were limited in comparison to materials going to Great Britain and the Soviet Union. Japan's invasion of Burma and its subsequent drive toward India imposed further difficulties on providing aid to China. Indeed, getting military assistance there remained a daunting task throughout the war. The success of the air bridge and the Burma and Ledo Roads helped keep the Chinese in the war, thereby tying down the majority of the Japanese Army.

The British mobilized when war broke out in September 1939, but they were dependent on their overseas empire and trade for foodstuffs and war materials. The timely arrival of merchant ships loaded with fuel and raw materials was crucial to the long-term survival of the British Isles in the war. If resources could not reach the homeland and British troops overseas expeditiously, then the war would be lost. Thus, the Battle of the Atlantic proved to be the most important campaign of the war for Britain. Maintaining the sea-lanes to its overseas empire, along with securing massive amounts of aid from the United States in the form of Lend-Lease assistance, enabled Britain to remain in the war.

The Soviet Union, which joined the Allied camp in June 1941 after it was invaded by Germany, faced some of the most difficult logistical challenges. With millions of military and civilian casualties and much of its European

territory occupied by the German Army, the Soviet Union had to fully mobilize its remaining population and endure sacrifices at levels not known in the West. The Soviet logistical effort relied on the complete mobilization of the Soviet citizenry and the use of Siberian resources, supplemented by Lend-Lease materials from the Western Allies.

During the initial campaign of the summer of 1941, the Soviet Union evacuated entire industries, moving factory machinery from the path of the advancing Germans to safety behind the Urals. Workers were also relocated in large numbers so they could put the machinery back into production, often in the dead of winter. The sacrifices of the Soviet people were extraordinary, but by the end of 1942, the Soviet economy was outproducing that of Germany in nearly all key areas of armaments production, such as tanks, aircraft, and artillery.

Recognizing that it was vital to keep the Soviet Union in the war, the United States extended Lend-Lease to that country in November 1941, sending large quantities of weapons, trucks, and equipment to the Red Army and also sending food. Aid to the Soviet Union was sent by one of three routes: by ship to Murmansk, by ship to the Persian Gulf and then by rail to the Soviet Union, or by ship across the Pacific to Vladivostok in Soviet hulls. U.S. shipments of tanks and aircraft equaled less than 10 percent of the total produced by the Soviets, but additional items such as trucks (over 400,000), boots, sugar, foodstuffs, and communications equipment played important roles in helping Soviet forces survive and then take the offensive against the Germans.

In the United States, the Two-Ocean Navy Act of 1940, the expansion of the army and its burgeoning need for weapons, and armaments orders from France and Great Britain all promoted the growth of military industries. The Lend-Lease Act, passed by Congress in March 1941, provided for the shipment of goods and war materials to nations fighting the Axis powers and helped make the United States the “arsenal of democracy.”

During the war, the United States produced vast quantities of goods for the war effort, including aircraft, tanks, trucks, warships, merchant ships, oil, and agricultural products. Henry J. Kaiser mastered the art of mass-producing merchant ships, and in 43 months of operation, Henry Ford’s Willow Run, Michigan, factory turned out 8,685 B-24 bombers, 1 every 102 minutes. Its

industrial might enabled the United States not only to arm its allies but also to field the best-supplied and most mobile force to that point in military history.

In March 1942, President Franklin D. Roosevelt approved U.S. Army chief of staff General George C. Marshall's reorganization of the army into the Army Ground Forces, the Army Air Forces, and the Army Service Forces (ASF). Headed by Lieutenant General Brehon Somervell, the ASF was responsible for supplying, quartering, and transporting the ground and air forces. It provided the myriad services required by an army in the field. Meeting the logistical requirements for an expanding military within the continental United States was, in itself, a daunting task, not to mention the job of supporting forces in the European and Pacific theaters.

Although the Allied invasion of France did not take place until June 6, 1944, the buildup for the invasion began in May 1942. Then on November 8, 1942, Allied forces invaded North Africa in Operation TORCH. In the Mediterranean theater of operations, Services of Supply Command oversaw the American logistical effort in the Mediterranean.

To ensure the safe buildup of supplies in Britain and the continued support of Allied forces in the Mediterranean, winning the Battle of the Atlantic was critical. British prime minister Winston L. S. Churchill and Roosevelt met at Casablanca in January 1943 and decided that battle and the bombing of Germany would have the highest priority. The accomplishment of both goals reflected the importance of logistics: the first ensured the safe and timely arrival of war matériels from North America, and the second hindered the German and Italian logistical efforts by round-the-clock bombing of Axis industry.

The Normandy Invasion required an immense logistical effort, ultimately involving the transportation of hundreds of thousands of troops and millions of tons of cargo. Allied planners knew that they could not count on using French ports, so to ensure that matériels could be gotten ashore, the Allies constructed two artificial harbors known as Mulberries and then moved them to the invasion area. The Mulberries were truly an engineering marvel, but they failed to meet expectations because one was destroyed and the other was severely damaged by an English Channel storm in late June 1944. To ensure the rapid delivery of gasoline, the Allies laid a pipeline under the English Channel that allowed fuel to be pumped from England to Normandy, where it

was decanted into five-gallon cans or pumped into large storage tanks until the pipeline could be extended across France.

Once Allied forces were ashore in France, the European theater Services of Supply Command—known after June 1944 as the Communications Zone (COMMZ)—oversaw the supply and administration needs of the U.S. Army in France. Commanded by Lieutenant General John C. H. Lee, COMMZ played a vital role in keeping the army moving forward. When the Allies broke out of Normandy in Operation COBRA in late July 1944, the First and Third U.S. Armies moved so quickly across northern France that they outran their supply lines.

As an emergency measure, the Red Ball Express was activated—a circular truck route on which vehicles moved around the clock to transport fuel, ammunition, and food to the forward units. The route helped fill the gap until French rail lines could be restored. Toward that end, the Allies transported locomotives and rolling stock to France aboard ships. In sum, the Allied logistical effort in the Mediterranean and in Western Europe made the defeat of Germany in May 1945 possible. Without adequate logistics support, Allied forces would have been unable to pressure the Germans on multiple fronts and destroy the ability of the Axis states to wage war.

A key to victory in the Pacific theater was the transportation of men and matériel across the ocean to newly created bases. Units such as the Seabees carved air and naval bases out of tropical islands in record time. Marines and army units secured suitable islands, and fleet anchorages and depots ashore were established. Before the war, naval leaders assumed that the U.S. Navy would have to fight at vast distances in the Pacific, and they developed the fleet train concept, one of the most important factors in the Allied victory in the Pacific.

A great fleet of merchant ships, fleet oilers, tenders, and support vessels of all kinds kept the supply lines open and the fleet functioning for long periods at considerable distances from the nearest bases. The U.S. Navy mastered the art of midocean refueling and provisioning. U.S. ships were thus able to remain at sea for extended periods, only calling at a fleet anchorage for major repairs or crew rest and relaxation. The ability of the navy to bring everything it needed to establish a fleet anchorage turned peaceful lagoons such as Ulithi into bustling major port facilities.

Logistics proved essential in the China-Burma-India theater as well.

Although low on the overall priority list, the movement of supplies over the Burma Road and the aerial resupply of China over the Himalaya Mountains from bases in northern India helped keep China in the war and tie down the bulk of the Japanese Army.

Throughout the war, the use of aircraft to haul supplies to advancing armies or forces cut off from the more conventional forms of resupply became increasingly important. Whether bearing supplies or paratroopers, the cargo planes—the Curtiss C-46 Commando and the Douglas C-47 Skytrain—were vital additions to the overall logistical effort. During the war, both sides learned the limitations in the use of aircraft for resupply, but the Allies had far more transport aircraft than the Axis powers and were able to use them more effectively. Allied aircraft supported airborne operations, supplied troops, evacuated the wounded, and transported high-priority supplies to advancing units of Patton's Third Army during its drive across France. Transport aircraft were valuable assets, provided their limitations were understood.

In all theaters of the conflict, logistics proved critical to Allied successes in World War II. When the Axis powers failed to achieve a quick victory in the war, the initiative passed to the Allies, with their far greater collective economic strength. This, together with their ability to get these resources to the fighting fronts, helped ensure the Allies' victory.

Logistics, Axis

World War II required the procurement and transportation of vast quantities of materials over considerable distances and in climates as diverse as the Arctic, jungles, and deserts. The inability of the Axis powers of Germany, Italy, and Japan to procure, maintain, and transport military matériel, facilities, and personnel in sufficient quantities played a key role in their eventual defeat. The Axis logistical effort was handicapped from the beginning by a combination of factors, including limited resources and production capacity, mismanagement, and transportation difficulties.

As long as they could successfully conduct short or decisive campaigns and avoid protracted conflicts, the Axis powers could compensate for most logistical shortfalls. But when forced to conduct a lengthy war of attrition against the economic giants—the United States and the Soviet Union—the Axis powers discovered that their logistical shortcomings continually limited their military options and led directly to their eventual defeat.

Germany began the war with an economy mobilized unlike any other in Europe. Fortunately for the Allies, however, Germany had neither the centrally planned and centrally commanded economy of the Soviet Union nor the free enterprise, capitalist-driven economy of the Western Allies. In the

end, the German economy, along with the economies of Italy and Japan, suffered from poor management, which resulted in inefficient production and the misuse of valuable resources. For example, whereas the Allies standardized weapons to speed up mass production, the Luftwaffe at one point was producing 425 different aircraft models and variants. Such diversity made it difficult to mass-produce war matériels.

Germany began the war with serious shortages of strategic resources. It imported oil, iron ore, copper, tin, nickel, bauxite, manganese, tungsten, chromium, molybdenum, sulphur and pyrites, phosphates, rubber, rice, maize, wheat, and meat. Some of the shortages could be made up by prioritizing the use of resources and by acquiring new supplies through conquest.

The vital resource in shortest supply in Europe was oil. Germany produced only 0.2 percent of the world's oil in 1937. Romania, its chief supplier of oil, produced just 2.4 percent. The Allies, by contrast, had access to nearly all the world's oil production; the Soviet Union had 10.6 percent, the United States had 60.4 percent, and Latin America had 15.3 percent. Germany had experimented with synthetic fuel production in the interwar years and had some success, but without imports of oil from Romania throughout the war and from the Soviet Union prior to the German invasion of that country in 1941, the German war machine would have ground to a halt.

Italy and Japan were in even worse shape with regard to oil. The Axis powers were desperately short of oil throughout the war, which severely limited their mobility, the training of their armed forces, and the overall production of war matériels.

Logistical support for the German military improved greatly with the appointment of Albert Speer as the minister of armaments in 1942. Speer led an effort to centralize the German economy, reduce the number of weapon types, and maximize production. Weapons production trebled in three years. Just when the efforts to centralize production in large assembly plants began to result in increased output, however, the Allied bombing campaign began in earnest, and the large production facilities were bombed repeatedly by Allied aircraft.

Speer's efforts to boost production could have been even more successful had Adolf Hitler approved the large-scale use of German women in the war

economy. Unlike the situation in the United States, Great Britain, and the Soviet Union, only a small percentage of German women were engaged in manufacturing work at the beginning of the war. Instead of mobilizing women for the factories, Germany relied on the use of millions of slave laborers to meet the ever-increasing demand for workers. Speer's efforts most certainly prolonged the war, but they came too late to bring Germany victory.

The lack of resources affected German strategy during the war. Supplies of iron ore from Sweden were secure when the Baltic Sea was open, but during the winter, the ore had to be shipped through Narvik in Norway. Keeping that supply route open was a prominent factor in the German decision to invade Norway in April 1940. Similarly, the invasion of the Soviet Union, which ultimately proved to be a logistical disaster, was partially prompted by logistics. The wealth of resources there, both agricultural and mineral, would have gone a long way toward making Germany self-reliant in most areas.

Hitler's decision to turn the armored forces south to envelop Kiev in August 1941 not only resulted in the surrender of a large Soviet force but also secured the Ukraine, the breadbasket of the Soviet Union. The German 1942 campaign that culminated at Stalingrad was the result of Hitler's attempt to capture the Caucasus oil fields. In 1944, the German Army used all available resources in its attempt to keep the Red Army from seizing the Ploieşti oil fields in Romania. The loss of Romanian oil, along with the Allied bombing of the German synthetic fuel plants, helped bring about the ultimate defeat of Germany in many ways; for example, it sharply reduced training time for pilots.

Once matériels were produced, the sinews of war had to reach the armed forces at the front. Despite the popular image of panzer divisions slicing their way across Europe, the German Army was basically a force of foot soldiers supported by horses, wagons, and railroads. Throughout the war, 80 to 85 percent of the army moved on foot and received supplies by wagon from the nearest railhead, and Germany actually used more horses in World War II than it did in World War I. Indeed, the German logistical system for supplying the armed forces had advanced little since World War I, except for the use of trucks by some units.

To motorize only 15 percent of its forces, Germany confiscated trucks from the occupied countries whenever possible. As a result, the German

military eventually had 151 different types of trucks in service, and it proved virtually impossible to get the right spare parts to the right trucks expeditiously. The Americans, by contrast, had one primary truck—the rugged 2.5-ton “deuce-and-a-half,” of which over 2 million were produced.

The most important element of the German supply system was the railroads. When the Luftwaffe had air superiority early in the war, the railroads were secure. But by 1943 the Allies were gaining control of the air, and the resulting fighter-bomber and bomber strikes on the German transportation system began crippling the German logistical effort. By the end of the war, German production, even though maximized by Speer’s reforms, was rendered nearly useless when the matériels that were produced could not be transported to the front for use by the troops.

The Italian logistical situation was even worse. Italy entered the war unable to support its armed forces in a long conflict. In fact, the nation lacked all the vital resources necessary to fight a major war, regardless of duration. Oil was in short supply, as were most strategic metals. Benito Mussolini’s drive for empire—the invasion of Ethiopia in 1935 as well as the invasions of France, Greece, and Egypt in 1940—failed to improve Italy’s logistical situation. These campaigns actually did more harm than good because they taxed Italy’s limited resources, and the resulting supply lines to its far-flung empire were virtually insupportable. Long and tenuous supply lines to Italian forces in Ethiopia, for example, could not be sustained, and the Italians there fell victim to a British offensive in 1941. Support of Italian forces in Libya required control of the central Mediterranean Sea. Yet by late 1942, the Allies, operating from Malta and bases at Gibraltar and Alexandria, had gained effective control of the Mediterranean Sea.

Italy had too little fuel to produce additional war matériels or even to support the tanks and aircraft it already possessed. The navy lacked the fuel to sortie, so it remained largely in port. The army, as with the German military, was dependent on horses, mules, and wagons as well as the railroads and a few trucks.

Japan, an island nation, suffered from the same logistical problems. Largely bereft of natural resources, it had to import nearly all its strategic materials in merchant ships. The quest for resources was an important factor in the Japanese moves into Korea in 1904, into Manchuria in 1931, and into China in 1937. The main goal of the Greater East Asia Co-Prosperity Sphere

was the economic independence of Japan. When the United States embargoed scrap metal and then oil following Japan's move into French Indochina between 1940 and 1941, Japan found itself in the awkward situation of having to back down and withdraw from the occupied territory or go to war to solidify its hold on the needed resources. The attack on Pearl Harbor on December 7, 1941, covered the Japanese drive to seize Southeast Asia to acquire the oil fields of the Netherlands East Indies and the rubber and tin of Malaya as well as other strategic resources.

Unfortunately for Japan, the country did not have enough time to develop its newly acquired resources, nor did it have the sealift capacity to transport the materials that were produced. In December 1941, Japan had only 49 tankers totaling 587,000 tons. By contrast, Britain, which was also dependent on foreign oil, had 425 tankers of 2,997,000 tons in 1939, and the United States had 389 tankers of 2,836,000 tons.

The marginal Japanese sealift was steadily reduced during the course of the war by U.S. submarines and airpower. By late 1944 and into 1945, Japan was almost completely cut off from imports, and the overall lack of petroleum products crippled the Japanese war effort even more severely than was the case for Germany. Aerial mining by Boeing B-29s Superfortresses also disrupted or destroyed much of the Japanese coastal trade.

Growing Allied air superiority, increasing shortages of merchant ships, the failure to convoy (there were scarcely any escorts available) or implement an effective antisubmarine effort until late in the war, limited resources within Japan itself, and the U.S. strategic-bombing campaign against Japan all but doomed the Japanese supply system to failure. By the last years of the war, bypassed Japanese forces in the Pacific were starving for lack of logistical support. All that the Japanese could do was convert some of their submarines to transports and deliver small quantities of supplies to isolated garrisons. Such stopgap measures only briefly prolonged the war.

For the Axis powers, logistical factors were always a major concern. German mechanized warfare was ultimately limited by the lack of motor transport available to the German military. But even if Germany had been able to produce more vehicles, the limited availability of fuel would have sharply restricted their use. By 1944, when German single-engine fighter production peaked, the lack of high-octane aviation fuel so limited training that the pilots quickly fell victim to the better-trained and more experienced

Allied pilots. The Italians also suffered from a lack of oil from the beginning of the war, and their inability to transport gasoline and replacement weapons and personnel across the Mediterranean in sufficient numbers proved to be a major factor in the Axis defeat in North Africa. Japan's inability to protect its merchant fleet and ensure delivery of fuel and other resources from Southeast Asia ultimately destroyed the Japanese economy in 1945 and left the nation on a starvation diet. Axis victories on the battlefield became fewer and farther between as the logistical situation of the Axis powers deteriorated during the course of the war.

Löhr, Alexander (1885–1947)

German Air Force general. Born in Turnu-Severin (in today's Romania) on May 20, 1885, Alexander Löhr joined the Austro-Hungarian Army and became a lieutenant in 1906. He contributed greatly to the buildup of the Dual Monarchy's air service during World War I. In the interwar period, he

served in the Austrian War Ministry and commanded the aviation branch as a major general in 1934.

After Germany's annexation of Austria in March 1938, Löhr joined the German Luftwaffe, and in 1939, he commanded its Luftflotte 4 (Fourth Air Fleet). During the invasion of Poland in September 1939, his aircraft destroyed Polish communications and traffic lines. In early April 1941, Löhr was assigned a similar task against Yugoslavia, with the additional charge of paving the way for advancing army units. On the morning of April 6, 1941, without a declaration of war, Löhr's bombers attacked Belgrade. They destroyed the Yugoslav command structure but also killed 1,500 civilians.

Promoted to colonel general on May 9, 1941, Löhr was the overall commander of the bloody German airborne assault of Crete, beginning on May 20, 1941. After the invasion of the Soviet Union on June 22, 1941, he commanded 4th Air Force Group in the southern part of the front. In July 1942, Adolf Hitler appointed him to command the Twelfth Army in the Balkans (renamed Army Group E in January 1943). From 1943, Löhr additionally acted, with several interruptions, as commander in chief, southeast. His task was to suppress the resistance movements and defend Greece against Allied landings.

In the summer of 1944, Soviet forces advanced toward Bulgaria and Hungary and threatened to cut off German units in the Balkans. Therefore, Hitler authorized a withdrawal through Yugoslavia to Hungary. Under constant partisan attacks, Löhr's army nonetheless slowed the Soviet advance until the end of the war. A prisoner of war of the Yugoslavian government from May 11, 1945, Löhr was tried for war crimes by a Yugoslav military court. Convicted and sentenced to death, he was executed in Belgrade on February 26, 1947.

Lombok, Battle of (February 19–20, 1942)

Pacific naval battle, also known as the Battle of Badeong Strait, fought between Japanese and Allied forces on the night of February 19–20, 1942. It followed the Japanese effort to isolate the important Netherlands East Indies island of Java by an amphibious assault on Bali on the morning of February 19.

As soon as he received word of the Japanese landing on Bali, Dutch rear admiral Karel Doorman, commander of the American-British-Dutch-Australia (ABDA) surface force, ordered a naval attack into Lombok Strait in hopes of destroying the Japanese invasion force. U.S. submarine attacks had earlier failed, largely because of faulty torpedoes, although Allied air strikes had damaged one Japanese transport that was escorted by two Japanese destroyers of Captain Abe Toshio's Destroyer Division 8.

Three waves of Allied warships attacked the two Japanese destroyers. Doorman led the first, consisting of the Dutch light cruisers *De Ruyter* and *Java,* and three destroyers (one Dutch and two U.S.) in a lengthy line-ahead formation at approximately 11:00 p.m. on February 19. The two Japanese destroyers returned fire, disabling by gunfire the Dutch destroyer *Piet Hein* and then sinking it with torpedoes. After the first Allied attack had passed through the strait, the Japanese destroyers exchanged fire with one another, although without damage.

The second Allied attack wave arrived at about 1:30 a.m. on February 20. It consisted of four U.S. destroyers followed by the small Dutch light cruiser *Tromp.* An exchange of gunfire and torpedoes at ranges as close as 2,000 yards resulted in damage to several Allied ships, including the *Tromp* and both Japanese destroyers. The remaining two destroyers of Abe's Division 8 now arrived in Lombok Strait to reinforce.

Abe steamed in the opposite direction among three of the Allied destroyers and the *Tromp.* The Japanese destroyer *Michishio* was heavily damaged in the exchange of fire, with 96 killed or wounded. Both sides then disengaged. The third attacking Allied wave arrived in the strait about 5:30

a.m. It consisted of seven Dutch motor torpedo boats, but these failed to locate the Japanese.

The Battle of Lombok forced the *Tromp* to steam for Australia and repairs, and the two Japanese destroyers returned to Japan for the same purpose. The damaged U.S. destroyer *Stewart* would enter dry dock at Surabaya in the Netherlands East Indies, where it was captured by the Japanese and recommissioned in their navy as a patrol ship.

The mix of Allied ships manned by exhausted crews was insufficient to deter the Japanese from their advance on Java. Insufficient Allied training, faulty tactics that did not allow for a coordinated attack, and poor luck accounted for this Allied defeat.

"Lord Haw Haw" (1906–1946)

Supposed British citizen who broadcast propaganda for Germany during the war. Born on April 24, 1906, in Brooklyn, New York, William Brooke Joyce was the son of a naturalized U.S. citizen. He grew up in Ireland (from 1909) and then England (from 1921) and obtained a British passport in 1938 and claimed British citizenship. He earned a first-class degree in English literature at Birkbeck College, London University (1927), and began work on a PhD.

By the late 1920s, Joyce was active in fascist organizations. He joined Oswald Mosley's British Union of Fascists in 1933 and rose in the hierarchy. Four years later, the two men fell out, and Joyce founded a parallel

organization. Fearing arrest as war neared, he left England for Germany in August 1939.

On September 6, 1939, Joyce first appeared on a German broadcast that became known as *Germany Calling*. His British listeners dubbed the unknown voice "Lord Haw Haw" for its affected, sneering tone and laugh. On September 26, 1940, Joyce became a naturalized German citizen. By April 1941, he was using his own name as well as the common appellation.

Praise for his work showed up regularly in Josef Goebbels's diaries, which were published after the war. Joyce's broadcasts became more extreme (and his English audiences smaller) as the war continued. Some were from so-called secret stations that supposedly broadcast from within Britain but were, in fact, based in Berlin. He broadcast his anticommunist and anti-Semitic rants on *Germany Calling* largely from Berlin but from a rural area in the last few weeks of the war.

At the end of the war, Joyce attempted to escape to Sweden but was captured on May 28, 1945, by British forces, and in June he was sent to Britain. He was charged with treason on September 17, 1945. After considerable discussion about his citizenship status, he was found guilty just three days later in a trial heavily covered by the press. Several failed appeals followed before Joyce was executed by hanging on January 3, 1946, in London, still an ardent believer in the Nazi cause.

Lorraine Campaign (September 1–December 18, 1944)

Fall 1944 offensive by the U.S. Third Army in the European theater. The Lorraine Campaign of September 1–December 18, 1944, followed the successful Allied breakout from the Normandy beachhead and the rapid pursuit of the retreating German forces across France to the Meuse River between July and September 1944.

After a brief pause at the Meuse to allow their supply lines to catch up, the Allies resumed their advance to the Rhine River in early September. The main effort was an attack through Belgium and Holland toward the Rhine and the Ruhr industrial area by Field Marshal Sir Bernard Law Montgomery's British and Canadian 21st Army Group, supported by the U.S. First Army of Lieutenant General Omar Bradley's U.S. 12th Army Group. Lieutenant General George S. Patton Jr.'s U.S. Third Army, also a part of the 12th Army Group, was assigned the mission of conducting a secondary offensive through Lorraine and across the Moselle River to occupy the Siegfried Line sector covering the Saar and then to seize Frankfurt.

The initial plans for the Third Army's operations envisioned a rapid, continuous action spearheaded by armored units to occupy Lorraine, penetrate the West Wall, and cross the Rhine. However, difficult terrain, bad weather, logistical shortages, and a tenacious German defense delayed the Third Army's arrival at the West Wall until December 16, 1944, at which time several of its key units had to be diverted to block an unexpected German counteroffensive in the Ardennes.

Lorraine sits astride the traditional invasion route between France and Germany. A plateau ranging from 600 to 1,300 feet in elevation, it has many rivers and ridges that provide natural lines of defense. Its rolling farmlands are frequently broken by dense woods or towns that limit observation and fields of fire in combat situations. Moreover, Lorraine was heavily fortified. The French Maginot Line ran through the province, and the city of Metz had been strongly fortified since Roman times. In 1944, two high-speed highways led from Lorraine into Germany: the first from Metz via Saarbrücken to Mannheim and the second from Nancy through the Vosges Mountains to Strasbourg.

The fall climate of Lorraine is foggy and rainy. Rainfall in the autumn of 1944 was two to three times above average, with seven inches of rain falling in November alone. Flooded streams and oceans of mud hampered the mobility of the heavily mechanized American forces, and poor flying weather

limited Allied air support. At the start of the campaign, Patton's Third Army had only two available corps: the XII Corps under Major General Manton S. Eddy and the XX Corps under Major General Walton H. Walker. Patton's VIII Corps, under Major General Troy H. Middleton, remained tied down clearing German units from the Brittany ports. For the first phase of the campaign, however, Major General Wade Haislip's XV Corps was available, thus giving the Third Army a force of three armored and six infantry divisions, supported by the usual array of nondivisional combat and logistical units.

Patton's combat power was limited by the fact that his forces were at the far end of a fragile logistical line. Priority for logistical support had been assigned to Montgomery's 21st Army Group, and the French ports had not yet been fully cleared. Moreover, the U.S. Army was already beginning to run short of infantry replacements.

German forces were in even worse shape, having been badly battered on the Eastern Front and in Normandy. The principal German units facing the Third Army were the LXXXII Corps and the XLVII Panzer Corps of the German First Army under General of Infantry Kurt von der Chevallerie, which on September 8 was joined with the German Nineteenth Army in Army Group G, commanded by Colonel General Johannes von Blaskowitz. Many of the German combat units were seriously understrength in both men and horses, their primary means of mobility. Elite units, such as the Waffen-SS and Luftwaffe parachute divisions, were in better shape, but many of the German defenders were in newly formed Volksgrenadier divisions manned by poorly equipped troops of low quality. Although German lines of communications were shorter, Allied air interdiction made it difficult to move men and supplies to the front.

The U.S. campaign opened in early September with only limited success. In the north, the 90th Infantry Division of XX Corps suffered heavy casualties in unsuccessful efforts to cross the Moselle near Metz, but south of Metz, the 5th Infantry Division gained a limited bridgehead over the river. Farther south, XII Corps had better luck after a few setbacks. On September 13, the 4th Armored Division conducted a double envelopment around Arracourt, 20 miles beyond the Moselle, and forced the German First Army to evacuate the city of Nancy on September 14.

A German counterattack from the south designed to destroy the Third

Army before it could link up with the 6th U.S. Army Group advancing from southern France failed when Haislip's newly assigned XV Corps hit and shattered the German left flank. In the center, a German attempt between September 19 and 29 to squeeze out the U.S. 4th Armored Division's Arracourt salient also failed. As a result, Blaskowitz was replaced as commander of Army Group G by General of Panzer Troops Hermann Balck. On the northern side of XII Corps' salient in the forest east of Nancy, a weak German force almost broke through the 35th Infantry Division in confused forest fighting between September 27 and October 1, but the front was restored when Patton committed his army-level reserve, the 6th Armored Division.

On September 22, supreme Allied commander General Dwight D. Eisenhower reaffirmed the logistical priority of Montgomery's 21st Army Group and ordered Patton to restrict his offensive operations. In addition, Patton had to relinquish the 7th Armored Division and eventually the entire XV Corps. Despite serious shortages of gasoline and other supplies, the always-aggressive Patton continued local attacks during October, the most important of which was a vain effort to capture Fort Driant on the west bank of the Moselle facing Metz, an attempt that cost the U.S. 5th Infantry Division some 500 casualties.

The October pause was also costly for the Germans. Balck had to transfer two divisions, and several of his higher headquarters, including that of the Fifth Panzer Army, were moved north for the planned Ardennes Offensive. This situation left the German First Army with approximately 87,000 men and 130 tanks to oppose the 250,000 men and 700 tanks of the Third Army.

The Allied logistical situation improved at the end of October as the port of Antwerp was put back in operation. Commander of the 12th Army Group General Bradley planned a new offensive, but the First Army on Patton's left was unable to meet the schedule, and the Third Army attacked alone on November 8. Using skillful deception techniques, XX Corps on the left took Metz in a double envelopment between November 8 and 19. Some of the Metz forts were captured by surprise; others were neutralized and bypassed. North of Metz, in only five days the Americans constructed the longest Bailey bridge in Europe, allowing the commitment of the new 10th Armored Division to pursue the Germans back to the Saar River.

The XII Corps attacks east of Nancy did not go as smoothly. The 26th

Infantry Division suffered more than 6,000 casualties in heavy fighting between November 18 and 28. The 4th Armored Division passed through the 26th Division on November 22 and seized a crossing over the Saar the next day. By accident, the 4th Armored ran into and halted the German Panzer Lehr Division, which was moving to attack XV Corps, then part of the Seventh Army to the south. On the left of XII Corps, both the 35th and 80th Infantry Divisions used artillery and close air support to reduce German outposts in the old Maginot Line. The 6th Armored Division passed through the 35th Infantry Division on November 25, but its advance was limited by mud and German fortifications.

The slow advance of the Third Army in November was mainly the result of poor weather and a lack of mass, for its nine understrength divisions were spread along a 62-mile front. Nevertheless, by December 2 the Third Army had reached the West Wall along the Upper Saar. Under cover of fog, a battalion of the 95th Infantry Division crossed the river on the morning of December 3 and seized the bridge at Saarlautern (modern-day Saarlouis) intact. Intense fighting followed as the American troops inched their way through a maze of houses and pillboxes. Heavy battle and nonbattle casualties, plus the declining availability of infantry replacements, limited the American advance. Just as Patton's infantry began to make progress, the Germans launched their Ardennes counteroffensive.

Between December 16 and 18, Patton halted his advance, spread his divisions to cover wider frontages, and turned the 4th Armored and 80th Infantry Divisions 90 degrees to the left and rushed to attack the left flank of the German advance in the Ardennes, thereby ending the Lorraine Campaign after three and a half months of heavy fighting under trying logistical and climatic conditions.

Louisiana Maneuvers

U.S. Army training exercises conducted in the state of Louisiana during September 1941. Lieutenant General Lesley J. McNair, chief of the newly organized General Headquarters, was tasked with preparing a large and inexperienced force for war. In 1939 the U.S. Army numbered only 190,000 men, but in less than two years it had expanded to nearly 1.6 million men through the activation of reserve components and a peacetime draft. Also, the army had added tanks and tactical aircraft, requiring extensive training to overcome two decades of stagnation.

McNair was a master organizer who greatly influenced how the U.S. Army would fight during World War II. Faced with a cadre of leaders previously experienced with leading small units but now leading divisions and corps, McNair organized a series of large-scale maneuvers as a laboratory to test the commanders as well as new doctrines, procedures, and equipment. These maneuvers were the largest training exercises in U.S. Army history and would pit field armies against each other in mock battle.

A 30,000-square-mile area of northwest Louisiana was chosen for the exercise, to be followed by further maneuvers in North and South Carolina. The Second Army, commanded by Lieutenant General Ben Lear, fought against the Third Army, commanded by Lieutenant General Walter Krueger. McNair served as the exercise's director to give each army its objectives for the two-week war. With journalists recording the event, more than 400,000 soldiers engaged in mock warfare, overseen by umpires who adjudicated the outcome of each action. More than 300 aircraft conducted mock bombardments of ground units and fought other air units in simulated dogfights high above the battlefield. Supporting arms such as engineer, signal, and medical corps attended to simulated and real tasks, which provided valuable knowledge about what equipment or procedures worked or failed.

In the first engagement, the Third Army was judged the winner after forcing the Second Army to retreat or face envelopment from the flanks. A few days later, the Second Army defended Shreveport against the Third Army. As the Second Army skillfully avoided contact, a frustrated Krueger ordered the 2nd Armored Division, commanded by Major General George S. Patton Jr., to attack through east Texas and cut off the Second Army from Shreveport. This successful attack ended the Louisiana Maneuvers, and the exercise shifted to the Carolinas. Only nine days after completion of that exercise, Japan attacked Pearl Harbor.

During the course of both maneuvers, more than 740,000 men underwent training. The largest U.S. Army training maneuvers ever conducted, the Louisiana Maneuvers cost more than $20 million and 61 men killed in accidents. Although only 11 of its 42 commanders would go on to command in combat, the Louisiana Maneuvers provided a new generation of soldiers some experience in moving, sustaining, and fighting large units, with real tanks and aircraft. The maneuvers also helped prepare the American public psychologically for the coming demands of World War II.

Love, Nancy Harkness (1914–1976)

Squadron commander of the U.S. Women's Auxiliary Ferrying Squadron (WAFS). Born on February 14, 1914, in Houghton, Michigan, Nancy Harkness developed an interest in aviation early in life. At age 16, she earned her pilot's license, and while a student at Vassar College, she began a flying school. Harkness earned an air transport rating in 1933. In 1936, she married Robert McClure Love, who owned Inter-City Aviation, an aircraft sales and service company in Boston.

On September 10, 1942, Nancy Love, with the support of Colonel William H. Tunner, head of the Ferrying Division's Domestic Wing of the U.S. Air Transport Command, organized 25 women pilots into the WAFS. Headquartered at New Castle Army Air Base in Delaware, the WAFS was formed to deliver planes from factories to military bases.

On August 5, 1943, the WAFS and the Women's Flying Training Detachment (WFTD) merged to form the Women Air Force Service Pilots (WASP), with Jacqueline Cochran as director of the WASP and its Training Division and Love as director of the Ferrying Division. Love's duties included the administration of six WASP ferrying squadrons and the planning of operational and training procedures.

Love was the first woman to be qualified to fly the North American P-51 Mustang fighter, and by March 1943, she was also proficient in the North American A-36 Apache dive-bomber and 14 other types of military aircraft. She was also the first woman to fly the North American B-25 Mitchell bomber, piloting it coast to coast in record time. Accompanied by Betty Gillies, Love was one of the first two women qualified to fly the Boeing B-17 Flying Fortress bomber. She was also the first woman to deliver a Douglas C-47 Skytrain and to qualify in the Douglas C-54 Skymaster transport.

Nancy Harkness Love, director of the U.S. Women's Auxiliary Ferry Squadron, in the cockpit of her plane before taking off from an eastern U.S. base. The women under her command ferried aircraft from factories to coastal airports, from which they were flown to overseas battle fronts during 1942–1945. (National Archives)

At the end of the war, Love and her husband, a major in the Army Air Forces, were each awarded the Air Medal for their leadership and service in World War II. After the war, Love continued as an aviation industry luminary and became a champion in the fight to have the women who served in the WASP recognized as military veterans, a status they received in 1977 shortly after Love's death in Sarasota, Florida, on October 22, 1976.

Lovett, Robert Abercrombie (1895–1986)

U.S. assistant secretary of war for air. Born on September 14, 1895, in Huntsville, Texas, Robert Abercrombie Lovett attended Yale University. He served as a naval aviator during World War I, and in the early 1920s he joined the investment bank Brown Brothers, where he soon became a partner.

In 1940 his continuing interest in aviation led Lovett, who had traveled extensively in Europe, to tour American aircraft factories and to submit to new secretary of the army Robert P. Patterson a report highlighting their inability to produce aircraft in the vast quantities modern warfare demanded. After reading this report, Patterson promptly made Lovett his assistant, and four months later Secretary of War Henry L. Stimson made Lovett assistant secretary of war for air. Lovett then supervised the immense World War II buildup of U.S. airpower. He also helped the Army Air Forces retain some autonomy, facilitating its subsequent evolution into an independent service after the war.

Following World War II, Lovett served as undersecretary of state under George C. Marshall from 1947 to late 1948, supervising the evolving Marshall Plan and North Atlantic Treaty Organization (NATO). In September 1950 during the Korean War, Lovett became undersecretary of defense, succeeding Marshall (who was defense secretary in September 1950) as secretary in September 1951. Lovett left office in 1953, but successive presidents repeatedly consulted him on assorted foreign policy issues, regarding him as one of the key "Wise Men," the establishment figures who presided over the mid-20th-century expansion of American international power. Lovett died in Locust Valley, Long Island, New York, on May 7, 1986.

Lucas, John Porter (1890–1949)

U.S. Army major general. Born in Kearneysville, West Virginia, on January 14, 1890, John Porter Lucas graduated from the U.S. Military Academy at West Point and was commissioned a second lieutenant of cavalry. He served in the Philippines and in the Punitive Expedition into Mexico in 1916. Promoted to temporary lieutenant colonel, he served in France during World War I with the 33rd Infantry Division and was wounded.

Reverting to his permanent rank of captain after the war, Lucas taught military science at the University of Michigan. He transferred to the field artillery and was promoted to major on graduation from the Field Artillery School (1921), where he then taught for two years. He graduated from the Command and General Staff School and then taught military science at Colorado Agricultural College (1924–1929). Following a command assignment at Fort Bliss, he graduated from the Army War College (1932). Lucas then served on the War Department General Staff. Promoted to lieutenant colonel (1935), he commanded the 1st Field Artillery Regiment at Fort Bragg, North Carolina (1936–1937). He next served on the Field Artillery Board (1937–1940) and was promoted to brigadier general (1940).

After briefly commanding the 2nd Infantry Division, Lucas assumed command of the 3rd Infantry Division (July 1941) and was promoted to major general (August 1941). He then commanded III Corps in Georgia (1942–1943).

Sent to the Mediterranean in mid-1943, Lucas served as observer and deputy for General Dwight D. Eisenhower. Following the Allied conquest of Sicily, Eisenhower selected Lucas to command VI Corps in Lieutenant General Mark Clark’s Fifth Army, although Lucas was not Clark’s choice. Lucas’s corps was the Fifth Army’s principal U.S. Army formation during its slow northward advance from Naples to the German Gustav Line at Cassino.

On January 22, 1944, Lucas commanded an uncontested amphibious landing at Anzio behind the German lines. Mounted with insufficient manpower and logistical support, the effort was undertaken in response to insistent pressure from Prime Minister Winston L. S. Churchill and theater land forces commander General Sir Harold Alexander, who anticipated that it would compel a precipitous German retreat from the formidable Gustav Line and open the way to Rome. Instead of striking immediately to the interior and securing the Alban Hills, Lucas consolidated the beachhead. Field Marshal Albert Kesselring rushed reserves there, and the Germans staged a powerful counterattack. Alexander blamed Lucas for the resultant stalemate, describing the cautious, pessimistic American general as "an old woman." Lucas was relieved on February 22, 1944, replaced by Major General Lucian K. Truscott.

Lucas commanded the Fourth Army in Texas (1944–1946) and the Army Advisory Group in China (June 1946–January 1948) and was then deputy commander of the Fifth Army in Chicago, where he died on December 24, 1949.

Lütjens, Günther (1889–1941)

German Navy admiral. Born in Wiesbaden, Germany, on May 25, 1889, Günther Lütjens joined the navy in 1907 and served on torpedo boats during World War I. In 1937, he commanded the torpedo boat arm of the Kriegsmarine.

With the beginning of World War II, in October 1939 Lütjens was appointed commander of Scouting Forces. In June 1940, he was named fleet commander after Grand Admiral Erich Raeder had sacked the first two fleet commanders for not taking aggressive action. On June 20, Raeder ordered Lütjens to take out the battleship *Gneisenau* and the heavy cruiser *Admiral Hipper* in a foray, but a British submarine torpedoed and badly damaged the *Gneisenau,* forcing a postponement in battleship operations. Raeder was determined to send the battleships into the North Atlantic to demonstrate their value before Germany had won the war, which led him to take the gamble of deploying the new battleship *Bismarck* in May 1941 when only the new heavy cruiser *Prinz Eugen* was available as a consort. Lütjens commanded the force.

Lütjens disagreed with Raeder's piecemeal approach to battleship operations and urged postponing Operation RHEINüBUNG (RHINE EXERCISE) until the other battleships were ready for action. He loyally supported Raeder's decision, however, and defended the mission when questioned by Adolf Hitler. Both Raeder and Lütjens were aware that the *Bismarck* departed Bergen, Norway, after refueling, on May 22, 1941, with weapons and equipment cannibalized from other ships and an incomplete antiaircraft fire-control system.

Lütjens's ineffective leadership and pessimism, along with his rigid adherence to his orders to avoid risks, hindered his ability to objectively analyze either his options or his opportunities. He declined to exploit his victory over the British battle cruiser *Hood* and finish off the battleship *Prince of Wales.* Influenced by his belief that the British were employing new radar, he gave his position away by radioing for instructions from Berlin and failed to recognize that he had actually eluded his pursuers. His decision to steam directly for Saint-Nazaire, instead of withdrawing to a more remote area or even returning to Norway, exposed the *Bismarck* to the British Force H from Gibraltar and the carrier *Ark Royal.* Following damage by a lucky torpedo that jammed the *Bismarck*'s twin rudders, Lütjens resigned himself to carrying out Raeder's instructions to fight "to the last shell" and was lost when the *Bismarck* went down on May 27, 1941.

Luxembourg

Diminutive constitutional grand duchy located in West-Central Europe with a 1939 population of just 293,000 people. Encompassing only 998 square miles, Luxembourg is surrounded by France to the south, Belgium to the north and west, and Germany to the east. Luxembourg enjoyed a high standard of living, the consequence of its rich deposits of iron ore. Although Luxembourg declared its neutrality, the German Army invaded the country on May 10, 1940, in its campaign against the Low Countries and France. Grand Duchess Charlotte and her government escaped to London, where they established a government-in-exile.

On July 29, 1940, the Germans replaced the military occupation with a civil administration, and on August 14, Berlin decreed an end to Luxembourg's independence, abolishing its constitution, laws, and governmental institutions. Although the vast majority of Luxembourgers were hostile to the German occupation, some chose to join the German People's Movement. In an effort to Germanize the country, the authorities forbade Luxembourgers from speaking French, using French names, and even wearing berets.

Beginning in April 1941, the Germans deported some 12 percent of Luxembourg's population to Germany. A number of citizens joined one of the five separate resistance movements that sprang up in response to the German occupation.

The Belgian Resistance played an important role in rescuing downed Allied airmen. The Germans executed those who offered direct resistance and also suppressed a general strike in 1942 protesting conscription into the German military. More than 25 percent of Luxembourg's men who were

drafted refused to report for duty, but a total of 2,848 Luxembourgers died in German uniform, including some shot for desertion. A number also served on the Allied side, both in the Belgian Brigade and with British military formations.

Allied troops entered Luxembourg on September 10, 1944, driving the Germans eastward. Extremely heavy fighting took place in Luxembourg during the German Ardennes Offensive (Battle of the Bulge) of December 16, 1944–January 25, 1945, and Luxembourg was not finally liberated until February 1945. It then became an important Allied staging and supply area until the end of the war.

Houses in Mondorf, Luxembourg, destroyed during the first day of the German invasion, May 10, 1940. (Library of Congress)

Luxembourg was hard-hit by the war. The country had been stripped of important resources of food, raw materials, and finished goods, and the fighting destroyed or seriously damaged a third of the country's dwellings. During the war, 5,159 civilian Luxembourgers were killed. Afterward, the government punished some 10,000 people for collaboration with the Germans.

Lyme Bay, Battle of (April 28, 1944)

In preparation for their invasion of Normandy, some 30,000 U.S. troops were to participate in Exercise TIGER, consisting of practice landings at Slapton Beach on the coast of Devon in southeastern England. The area had been selected for its resemblance to the designated invasion site of Utah Beach on France's Normandy coast. Exercise tiger was to last from April 22 to 30.

The first practice assault, on April 27, 1944, proceeded smoothly, but the next, on the morning of April 28, became a nightmare for those involved. The troops were embarked on nine tank landing ships (LSTs), which were to have been protected by a Royal Navy force of the destroyer the *Scimitar*, the Flower-class corvette the *Azalea*, three motor torpedo boats, and two motor gunboats patrolling the entrance to Lyme Bay where the exercise was to occur. In addition, other motor torpedo boats were to have under surveillance the French port of Cherbourg, where German motor torpedo boats (S-boats) were based. However, the *Scimitar* had been rammed the previous day and was at Portsmouth for repairs, while its replacement did not sail because of a mix-up in the shore command. The U.S. commander learned of this only after the operation was under way.

On the morning of April 28, nine German S-boats of the 9th Flotilla (*S-100, 130, 136, 138, 140, 142, 143, 145,* and *150*) that had departed on patrol from Cherbourg crossed the channel. They were engaged by British destroyers and *Azalea*'s commander received an enemy alert shortly after midnight. He continued to lead the LSTs in a straight line formation, however, making them an easy target, and did not attempt to warn the American vessels.

The German S-boats spotted the convoy of LSTs in Lyme Bay and, after tracking it for a half hour, attacked it with torpedoes, hitting *LST-507* at 2:03

a.m. A large fire broke out and quickly spread amid the stored vehicles and ammunition, forcing the embarked soldiers and crew to abandon ship. Many soldiers panicked and put on their life belts incorrectly and were drowned in the frigid 42-degree water. More than 260 of the vessel's crew and passengers perished.

At 2:17 a.m. *LST-531,* in the middle of the American column, exploded under the impact of two torpedoes. It sank within six minutes with the loss of 467 men. A torpedo also hit *LST-289,* but it remained afloat and lost only 13 men in the explosion. Friendly fire damaged *LST 511.*

The escort HMS *Azalea* returned up the column after the first explosion, but its crew could not determine the source of the attack. The corvette's crew was unable to seek information because, due to a typographical error in their orders, the Americans and British were using different radio frequencies and could not communicate.

After the Germans had expended their torpedoes, several LSTs returned and rescued survivors. They were joined by HMS *Saladin,* the relief escort for the *Scimitar.* Eyewitnesses reported that sections of the sea were covered with corpses. Although figures vary, deaths caused by the German attack probably totaled 198 sailors and 551 soldiers. Another 200 personnel were wounded. The German S-boats returned to Cherbourg unscathed.

Official embarrassment and concern that disclosure might compromise the Normandy landings led to the order that the events of April 28 be kept secret. Indeed, 10 officers killed in the action had detailed knowledge of the forthcoming invasion that they could have revealed had they been captured, and the invasion was on hold until their bodies were located and identified. Exercise TIGER did not become public until after the end of the war. Even today, there is little documentation available about events on April 28. The events of that day did lead to better coordination of more extensive training in life belt use and the inclusion of more small craft in the actual Normandy landings to pick up men in the water.

M

MacArthur, Douglas (1880–1964)

U.S. general of the army and, during World War II, supreme commander of Allied forces in the Southwest Pacific. Born on January 26, 1880, in Little Rock, Arkansas, the son of Major General Arthur MacArthur, Douglas MacArthur graduated from the U.S. Military Academy at West Point in 1903 as first captain. Following service in the Philippines and Japan, he became an aide to President Theodore Roosevelt (1906–1907). MacArthur took part in the 1914 occupation of Veracruz, Mexico, where he was nominated for the Medal of Honor, and served on the General Staff (1913–1917).

After the United States entered World War I in April 1917, MacArthur went to France as chief of staff of the 42nd Division. Promoted to temporary brigadier general, he fought with the division in the Second Battle of the Marne. MacArthur then led the 8th Infantry Brigade in the Saint-Mihiel and Meuse-Argonne offensives. He commanded the 42nd Division at the end of the war.

Following occupation duty in Germany, MacArthur returned to the United States as superintendent of the U.S. Military Academy (1919–1922), carrying out much-needed reforms. He again served in the Philippines and claimed that his extensive service there gave him special insight into the "Oriental mind."

MacArthur was then chief of staff of the army (1930–1935), but his reputation suffered in the 1932 Bonus Army Incident when he employed force to oust a protest by World War I veterans in Washington, D.C. In 1935, MacArthur returned to the Philippines as adviser to the Philippine government in establishing an army capable of resisting a Japanese invasion. He retired from the U.S. Army in 1937 and became field marshal of Philippine forces.

Recalled to active duty with the U.S. Army in July 1941 as a lieutenant general (he was promoted to full general on December 22), MacArthur

assumed command of all U.S. forces in the Far East. Believing that his forces could defend the islands, he scrapped the original, sound plan to withdraw into the Bataan Peninsula. His refusal to allow Major General Lewis Brereton to launch an immediate retaliatory strike against the Japanese on Formosa following the December 7, 1941, attack on Pearl Harbor meant that most of his air force was caught and destroyed on the ground.

Although the Japanese force invading the Philippines numbered only 57,000 men, half that of MacArthur's own force, many of the general's men were poorly trained (some were recent inductees), and they were thinly spread. The Japanese had little difficulty taking Manila and much of the island of Luzon. MacArthur then ordered his forces to follow the original plan for withdrawing into the Bataan Peninsula. Unfortunately, the bases there were not ready, and the retreating troops had to abandon precious stocks of supplies and ammunition in the process. Over the next months, MacArthur spent most of his time on Corregidor.

Rather than see him become a prisoner of the Japanese, President Franklin D. Roosevelt ordered MacArthur to Australia on February 22, 1942, where he became supreme commander of Allied forces in the Southwest Pacific. MacArthur also was awarded the Medal of Honor, which many defenders of Bataan and Corregidor believed was undeserved. Officials in Washington were also miffed by MacArthur's acceptance of a $500,000 payment from his friend Manuel Quezon, the Philippine president.

U.S. Army general Douglas MacArthur, one of the most controversial figures in U.S. military history, commanded the South West Pacific Theater during World War II. (National Archives)

From Australia, MacArthur initially developed a deliberate strategy to return to the Philippines. The slow pace of the Allied advance led Washington to insist on a leapfrogging approach that would bypass strongly held Japanese islands and positions, such as Rabaul on New Britain Island and Truk. In the spring of 1944, MacArthur's troops invaded New Guinea and isolated Rabaul. By September, they had taken Morotai and the rest of New Guinea.

In a meeting with Roosevelt in Hawaii in July 1944, Admiral Chester Nimitz, who commanded forces in the Central Pacific, proposed moving against Formosa, whereas MacArthur sought to retake the Philippines. The goal of both approaches was to deny Japanese forces access to supplies in the south. The upshot was that Roosevelt agreed MacArthur would be allowed to retake the Philippines, and Nimitz shifted his resources against Okinawa.

MacArthur commanded the ground forces in the liberation of the Philippines (October 20, 1944–August 15, 1945). In October, U.S. troops landed on Leyte. They then secured Luzon between January and March 1945, followed by the southern Philippines. An invasion of Japan proved unnecessary, and MacArthur, one of those promoted to the new rank of general of the army, presided over the formal Japanese surrender ceremony on the battleship *Missouri* in Tokyo Bay on September 2 in his capacity as supreme commander of the Allied powers in Asia.

President Harry S. Truman then named MacArthur commander of Allied occupation forces in Japan. In this position, the general in effect governed Japan as a benevolent despot, presiding over the institution of a new democratic constitution and domestic reforms. On the beginning of the Korean War in June 1950, Truman appointed MacArthur commander of the United Nations (UN) forces sent to prevent a North Korean victory. During the perilous UN withdrawal into the Pusan Perimeter, MacArthur husbanded his resources, and on September 15, 1950, he launched a brilliant (but also lucky) invasion at Inchon that cut North Korean supply lines to the south.

He then oversaw the United Nations Command invasion of North Korea, but his faulty troop dispositions and his disdain for possible Chinese intervention nearly led to disaster. His increasingly public disagreement with Truman over the course of the war—which the administration in Washington sought to limit and MacArthur wanted to widen by attacking China proper—led to his removal from command in April 1951.

MacArthur returned to the United States a national hero. He then retired from the military, accepting the position of chairman of the board of Remington Rand Corporation. His attempt to run for the presidency as a Republican in 1952 quickly collapsed, and the nomination and office went to another general, whom MacArthur held in great disdain—Dwight D. Eisenhower. MacArthur died in Washington, D.C., on April 5, 1964.

Machine Guns

Relatively small-caliber, automatic-fire, crew-served weapons. The machine gun of World War II was a weapon class in itself. In World War I, machine guns were mainly heavy water-cooled, belt-fed weapons mounted on heavy tripods and used for trench defense or for long-range suppressive fire. The need for machine guns in aircraft and the invention of the British Lewis gun during World War I, however, created a new form of machine gun.

Germany and the United States were the first nations to develop the light machine gun (LMG) for infantry assault use. The Germans stripped down their Machinengewehr 08/15 (MG-08/15), fitted it with a bipod and a rudimentary stock, and reduced the operational weight to 28 pounds. The resulting MG-34 with its 75-round drum magazine could be carried by a man on the battlefield. It was produced in large numbers throughout the war. In 1942, the Germans introduced the MG-42.

The French World War I M-1914 Chauchat machine gun remained in service. It came in 7.65mm, 7.92mm, and 8mm models but was of questionable tactical value.

Machine guns of the period operated either by recoil or by gas. Recoil-operated machine guns, such as the German MG-34 and MG-42, often had high rates of fire. When the cartridge was fired, the recoil was used to eject the spent cartridge by pushing the breechblock rearward against a spring,

after a safety delay. The spring then forced the breechblock forward again and in so doing reloaded the weapon, which fired as soon as the breech was locked. Gas-operated weapons used gas from the cartridge discharge, which was bled off from a gas port in the barrel. This operated a gas piston, which interacted with the breechblock to extract and reload the weapon.

Machine guns were classified in the period after World War I as heavy or light. The heavy versions were still mounted on tripods, equipped with both direct and indirect sighting methods and used for direct shooting and long-range interdictory fire. The LMGs, however, were the weapons used prolifically by the infantry. These weapons were often but not always fed by magazines or cartridge strips. They were fitted with bipod legs and could be carried in battle by one man. Normally, because of the high rate of ammunition expenditure, one or two other men accompanied the light machine gunner, carrying spare ammunition and sometimes spare barrels.

Ammunition for the machine gun was supplied in various ways. One method was the strip, in which a number of rounds were held on a metal base that was fed through the gun and then reloaded when empty. This method was employed in the French Hotchkiss, the Italian Breda, and the Japanese heavy machine gun. Another method was the magazine, which was a spring-loaded box or drum fitted to the gun that could be replaced when empty. Magazines held about 30 rounds of ammunition, and weapons so fitted included the British Bren, the French M-1931A, the Soviet DP (Degtyarev Pekhotniya [Obratsa] or Degtyarev Infantry [Pattern]) (as a drum), and the Japanese type-96 and similar weapons.

Belt feeds, which allowed sustained long-range fire, were found, for example, on the Browning M-1917AI and M-1919A4 .30-caliber machine guns, the German MG-34 and MG-42, the British Besa 7.92mm gun (mainly used as coaxial tank armament), and the Italian 8mm Fiat Model 35 machine gun.

One other method was used—the clip box. This box, which held ammunition in rifle clips that were fed automatically into the gun, was a rarity. It was seen on the Japanese Nambu 6.5mm and the Italian Revelli 6.5mm Feed; supply problems rendered these weapons inefficient, however, and they were soon phased out.

The LMG was issued on the basis of one weapon to every 7 to 10 men, meaning that every infantry platoon had three or four of them, though this

varied from army to army; U.S. infantry platoons, for instance, were armed only with the Browning Automatic Rifle (BAR) and not light machine guns. Infantry usually could also call on support from the heavy machine guns if needed. World War II infantry tactics were based on fire and movement, with the LMG firing and the riflemen of a section moving or vice versa. In the British Army during the war, the LMG was considered a support weapon, allowing the riflemen to close on the enemy and to attack with the bayonet. The Germans saw the LMG as the main weapon with which to win a firefight with the enemy, who was then to be rolled up by the infantrymen in the section.

U.S. Army Air Forces gunner Sergeant William Watts firing his machine gun at a German aircraft during a bombing mission in 1942. (National Archives)

U.S. Army infantry companies were equipped with LMGs. The M-1917 series water-cooled, .30-caliber Browning LMG was used by U.S. units throughout the war. It was belt-fed and could be carried in the company as well as fitted to just about every vehicle in or near the front line. It led to the M-1919 series of .30-caliber, air-cooled machine guns that were the principal U.S. machine guns of the war. They were only moderately accurate, as they

had no butt stock to allow effective fire control but instead were fired with a pistol grip at the rear of the gun body. The M-1919A6, based on the same receiver, did have a butt stock and was fired from a bipod.

Backing up these weapons was the .50-caliber Browning. The M-1921 series was originally a water-cooled weapon developed to attack aircraft and observation balloons. Its air-cooled offspring, the M-2 series ("Ma Deuce"), was used by every U.S. branch in every environment and theater of the war. It could be fired from a tripod mount or fixed on vehicles and could be set for single-shot fire, although it was not intended for use against personnel. The M-2 .50-caliber was also fitted in a number of aircraft, equipped with a lighter barrel and often with a solenoid firing mechanism. It is still in service in many armies today, including the U.S. Army.

British infantry used the Lewis gun initially, but this weapon was rapidly replaced by the Enfield version of an LMG produced on license from the Brno arms firm of Czechoslovakia. Known as the Bren gun, it was regarded by many as the finest LMG ever made. The Bren was a .303-caliber, detachable-box, magazine-fed, gas-operated weapon with a rate of fire of 450 to 540 rounds per minute. It was accurate and had a quick barrel-change system that coped with rapid firing. The Bren gun served throughout World War II and was well respected, although its rate of fire and the tactical restrictions placed on it meant that it was no match in a firefight with its German equivalent. The British also used the famous Vickers .303 machine gun in a support role.

The Soviets began the war with heavy wheel-mounted and shield-protected Maxim M-1910 machine guns, but experience with the Germans led to the rapid development of the DP, a section automatic weapon, fed with 7.62mm rounds from a top-mounted round drum with a capacity of 47 rounds. This weapon was increasingly backed up by the submachine gun, which meant that the firepower of a Soviet section began to approximate that of a German infantry section, although weight and rate of fire figures were still lower.

Machine guns were not only used by the infantry, however. They were also mounted in tanks for protection against infantry and for air defense, although the Germans' self-propelled Ferdinand gun was not so fitted; as a consequence, German troops suffered greatly from Soviet infantry attacks during the Battle of Kursk (July 5–13, 1943). Most tanks had a coaxial rifle-

caliber machine gun fitted in the turret and another in the hull, the latter operated by the driver, codriver, or radio operator. These machine guns were of great value in suppressing enemy machine guns and artillery when use of the main armament was ineffective or impossible.

The Americans and Germans also linked two or more machine guns for antiaircraft use. Early in the war, the Germans had a small infantry cart fitted with two MG-34 machine guns and the appropriate sights for antiaircraft defense; it was soon found, however, that the cart was too easy a target for the aircraft, and the idea was discontinued. U.S. tanks were equipped with .50-caliber machine guns for antiaircraft defense, the gun being fitted above the commander's cupola on the tank and capable of a 360-degree traverse and a 90-degree elevation. Although the .50-caliber machine gun was a formidable weapon, it had few antiaircraft successes and was often used in a ground role for attacking soft-skinned vehicles and buildings.

Aircraft were also fitted with machine guns. The British Spitfire, for example, carried eight .303-caliber machine guns, but these were short-ranged and relatively ineffective against German aircraft. The British also employed the .303-caliber machine gun for bomber defense. The Americans entered the war with the .50-caliber weapon in their aircraft, which could inflict great damage on German and Japanese fighter aircraft. The Germans, however, were using 20mm and 30mm cannon from the start, and they soon learned that one hit from such a weapon was worth more than any number of .303 rounds and better than a burst of .50-caliber ammunition (which is roughly 12.7mm).

The British turned to the 20mm cannon for later versions of their fighter aircraft, and the weapon proved singularly effective. The smaller caliber also meant that more ammunition could be carried per gun as compared with the German 30mm cannon, but the Germans turned to another air weapon—the antiaircraft rocket. American fighter aircraft, however, continued to utilize the .50-caliber gun.

Naval use of machine guns was limited, although early World War II warships carried some machine guns for local protection. It was soon found, however, that much heavier weapons were needed for antiaircraft protection, and in most cases, the light and heavy machine guns went into lockers. Naval aircraft reflected their ground-based counterparts in terms of the weapons fitted on them.

Mackensen, Eberhard von (1889–1969)

German Army general. Born in Bromberg (today Bydgoszcz, Poland) on September 24, 1889, Eberhard von Mackensen was part of a distinguished military family. His father was General (later Field Marshal) August von Mackensen. The younger Mackensen entered the army in October 1908 as an officer candidate. He was commissioned as a lieutenant two years later. During World War I, he earned the Iron Cross First and Second Classes and other awards for valor.

Mackensen remained with the army after the war and was promoted to lieutenant colonel in 1932. The next year, he became chief of staff of the cavalry inspectorate. He was promoted to colonel in September 1934, major general in January 1939, and lieutenant general in January 1940. He briefly served as chief of staff of the Fourteenth Army (from September to November 1939) and then as chief of staff of Colonel General Siegmund Wilhelm List's Twelfth Army (from November 1939 to January 1941). Mackensen participated in the invasion of France (May 10–June 25, 1940) and was promoted to general of cavalry in August 1940.

In January 1941, Mackensen took command of the III Corps (Motorized). His seizure of bridgeheads at Dnepropetrovsk during the invasion of the Soviet Union, which began on June 22, 1941, assisted Colonel General Ewald von Kleist's breakthrough. Mackensen's troops captured and briefly held Rostov (November 17–30, 1941). In January 1942, the III Corps was redesignated the III Panzer Corps. It remained engaged in the Ukraine and

Caucasus areas. Mackensen's forces crossed the Terek River in late 1942 before having to withdraw in consequence of the Soviet offensive at Stalingrad.

Mackensen assumed command of the First Panzer Army in November 1942 and was promoted to colonel general in July 1943. His army took part in Field Marshal Erich von Manstein's counteroffensive and recapture of Kharkov (March 1–14, 1943) and pushed to the Donets River in the area east of Petrovskoye. During the summer, the First Panzer Army was gradually forced from the Donets Basin and back toward the Dnieper River at Zaporozhye and Dnepropetrovsk. Mackensen was compelled to give up the German bridgehead on the Dnieper at Zaporozhye by mid-October 1943.

That November, Mackensen assumed command of the reconstituted Fourteenth Army in Italy. His forces engaged the Allied landing at Anzio on January 22, 1944, and contained the Allies there for several months. Mackensen did not get along well with Field Marshal Albert Kesselring, though, and Hitler blamed Mackensen for the loss of Rome, relieving him of command in June 1944. Makemsen did not again hold a command in the war.

Following the war, Mackensen was tried for the March 24, 1944, Ardeatine Caves Massacre and sentenced to death on November 30, 1945; the sentence was then commuted to life imprisonment. He was released from Werl Prison in October 1952. He later published a book on the 1941–1942 Eastern Front campaign of the III Panzer Corps. Mackensen died in Altmühlendorf, Schleswig-Holstein, Germany, on May 19, 1969.

Maczek, Stanisław (1892–1994)

Polish Army lieutenant general. Born on March 31, 1892, in Szczerzec near Lviv (Lvov) in Ukraine, Stanisław Maczek served during World War I as an infantry officer of the Austrian-Hungarian Army. In November 1918, he joined the armed forces of the newly formed Polish Republic. He first served as commander of the Special Storm Battalion on the Volhynian Front.

Following the 1919–1920 Russo-Polish War, Maczek commanded a battalion of the 26th Infantry Regiment stationed in Lviv. After studies at the Staff College in Warsaw in 1923, he served as intelligence officer of the Lviv Military District. Between 1927 and 1938, he commanded various infantry units.

In 1938 when Marshal Edward Rydz-Śmigły began to modernize the Polish Army, Maczek was put in charge of the first of the two armored brigades. The training of his brigade was barely finished when Germany invaded Poland on September 1, 1939. Maczek's units did what they could against overwhelming German armored strength on the southern sector of the front. When the Soviet Union also invaded Poland from the rear on September 17 and the struggle on two fronts became hopeless, Maczek crossed with his brigade into Hungary; there, he and the bulk of his brigade were interned. Thanks to the friendly attitude of the Hungarian authorities, most of the personnel of the brigade managed to reach France by 1940, where General Władysław Sikorski was forming a new Polish army. Maczek's brigade was ready just in time to take part in the May 10–June 25, 1940, Battle for France.

After the French capitulation, most of Maczek's officers and men escaped to Britain, where Maczek was put in charge of reestablishing his unit; by 1942, it became the Polish 1st Armored Division. Maczek commanded the division in the campaign across Western Europe in 1944 and 1945. His division was instrumental in closing the Falaise-Argentan gap (August 1944). After that, as a part of 21st Army Group, commanded by Field Marshal Bernard L. Montgomery, it continued its victorious march through northern France, Belgium, Holland, and northwestern Germany until the end of the war in May 1945.

After the demobilization, Maczek settled in Edinburgh, Scotland. He published his memoirs in 1961 and died in Edinburgh on December 11, 1994.

Madagascar

A French colony since 1896, Madagascar is located off the East African coast in the Indian Ocean. A thousand miles in length, Madagascar is the world's fourth-largest island. In 1939 its population numbered 4,000,000 people, and 34,000 Malagasy troops participated in fighting preceding the defeat of France.

In 1940, the Nazi regime in Germany tried to create a settlement colony there for European Jews. Plans to resettle Jews there had been advanced in the late 1930s by the Polish and German governments, but after the defeat of France in June 1940 the plan gained wider support from Nazi leaders. The so-called Madagascar Plan involved the relocation of 4 million Jews to the island, which France would transfer to German control. Nothing came of the plan, which was soon superseded.

Following the Royal Navy's attack on the French fleet at Mers-el-Kébir, Madagascar's administration proclaimed its allegiance to the Vichy government, headed by Marshal Henri Philippe Pétain. Meanwhile, with Japanese submarines operating freely in the Indian Ocean and Japanese carriers raiding there, the British Eastern Fleet was driven from the northeastern Indian Ocean. Royal Navy units were forced to relocate to a new base at Kilindini (Mombasa), Kenya. The Japanese carrier foray into the Indian Ocean in March–April 1942 raised alarm bells in London that Tokyo

might mount an operation to seize Madagascar and use bases there for attacks against the British Eighth Army's vital supply route from the Cape of Good Hope to Egypt. In any case, if the British could control Madagascar, this would enable them to base ships there and provide better protection for their convoys.

Major General Robert Sturges of the Royal Marines commanded the expeditionary force of British, British East African, and South African troops. Rear Admiral Edward Neville Syfret had charge of the naval forces. Some 8,000 Vichy troops, 2 armed merchant cruisers, 2 sloops, 5 submarines, 8 coastal batteries, and 27 aircraft defended the island

The Allied invasion force departed England in March for Durban, South Africa. Covering warships were drawn largely from Force H at Gibraltar, along with some ships from England and others from the Eastern Fleet. Syfret was appointed combined commander of all naval forces. These consisted of the battleship *Ramillies,* the aircraft carriers *Illustrious* and *Indomitable,* the cruisers *Hermione* and *Devonshire,* and 13 destroyers (2 of them Australian) along with frigates, corvettes, and transports. Everything was in place at the end of April, but the British cabinet did not give final approval for the assault until May 1, when the expeditionary forces had already sailed from Durban for their objective.

The chief British objective was the northern port city and naval base of Diégo-Suarez (now Antsiranana). The British decided to approach it from the rear by landing on the west coast of the island. The invasion, the first major British amphibious assault of the war, began before dawn on May 5, 1942.

Although the invasion achieved surprise, the French resisted. Fleet Air Arm aircraft flying from the carriers *Indomitable* and *Illustrious* attacked and neutralized French airfields and warships, and the expeditionary forces went ashore. Diégo-Suarez was taken on May 7, but fighting to secure the entire island continued for some months.

On May 30, a Japanese midget submarine attack sank a tanker and badly damaged the battleship *Ramillies,* putting it out of action for nearly a year. On September 10, another British landing took place at Majunga. An armistice was arranged with Vichy French authorities on November 5. The fighting had claimed some 1,200 casualties, including 600 Malgache. In January 1943 the British handed over Madagascar to the Free French.

In 1947–1948 there was a major uprising on the island against French

rule, resulting in the deaths of between 11,000 and 80,000 people. Madagascar became independent in June 1960.

Madagascar, Allied Invasion of

See IRONCLAD, Operation

Madoera Strait, Battle of (February 4, 1942)

Naval battle between Japanese and Allied forces in the Netherlands East Indies. On January 10, 1942, responding to the deteriorating situation in the Far East, the Allies established the joint American-British-Dutch-Australian (ABDA) Command. The next day, the Japanese began their conquest of the Netherlands East Indies by invading Tarakan in Borneo and Menado in Celebes. This move was followed by the Japanese capture of Balikpapan in Borneo and Kendari in Celebes (January 24) and Ambon in the Moluccas (January 27). The ABDA Command retaliated with its aircraft and an inconclusive naval strike against Balikpapan (January 24).

On February 2, ABDA naval commander U.S. admiral Thomas Hart formed the Combined Striking Force to concentrate his naval resources to meet the next Japanese move. When a Japanese convoy was spotted assembling at Balikpapan, he ordered a sortie. Hart wanted his warships to strike the Japanese as the convoy approached either Makassar in Celebes or

Bandjermasin in Borneo. Already assembled at Madoera Island, near Java's naval base of Soerabaja, were the ABDA cruisers USS *Houston* and *Marblehead* and HMNS *Tromp,* supported by seven destroyers: USS *Barker, Bulmer, John D. Edwards,* and *Stewart* and HMNS *Banckert, Piet Hein,* and *Van Ghent.* When their air reconnaissance sighted these vessels on February 3, the Japanese gathered 36 Mitsubishi G4M (known as "Betty" in the Allied recognition system) and 24 Mitsubishi G3M ("Nell") bombers, along with 7 Mitsubishi CSM2 ("Babs") reconnaissance aircraft to seek out and destroy this threat.

On the morning of February 4, Dutch rear admiral Karel Doorman led the Combined Striking Force north. No ABDA air cover was available except for the *Houston*'s three floatplanes. Doorman's concern that his force would be spotted by Japanese aircraft was confirmed at 9:49 a.m., when nine Japanese bombers found his ships passing through the Madoera Strait. For the next two hours, the Japanese concentrated their air attacks on the U.S. cruisers. The Japanese had only one plane shot down and two damaged.

Although the Japanese failed to sink any of the ABDA ships, they did inflict serious damage. The *Houston*'s after-turret was knocked out, and the *Marblehead* was so badly damaged that it was forced to steam to the United States for repairs. Doorman was obliged to withdraw his force to Tjilatjap on Java's southern coast. U.S. casualties in the battle totaled 63 dead and 84 wounded. Hollywood treated the story of the wounded sailors in the 1944 propaganda film *The Story of Dr. Wassell,* starring Gary Cooper.

Maginot Line

Massive French defensive fortifications built between 1929 and 1938 along both the German and Italian frontiers. Bled white by huge losses in World War I, France resolved in the 1920s to defend its borders with an efficient fortified wall to make up for its lack of manpower. The maxim of French defense became “Stingy with manpower, extravagant with steel.” In part based on the effective resistance of Verdun’s ferro-concrete forts in 1916, the building of the line became the driving passion of Defense Minister André Maginot, who had fought at Verdun as an enlisted soldier and was seriously wounded.

The Maginot Line was conceived as a self-contained system, eventually consisting of two distinct geographic regions. The main part of the line protected Alsace-Lorraine along the Rhine frontier. The Thionville-Metz region was the most heavily fortified and included the huge Hackenberg fortress, with more than six miles of underground galleries separated into sectors by heavy antiblast doors, connecting 17 combat blocks.

Less known even today was what some sources call the Little Maginot Line. This protected the French Alpine provinces facing Italy, including important mountain passes, with about 25 miles of continuing fortification down to the Mediterranean at Menton. One of these forts, Rimplas was the first of the entire system to be built, beginning in 1928.

In each region, the Maginot Line was made up of advance posts, major forts, support facilities, and lines of communication—all built to a standard plan and widely dispersed to withstand modern artillery attack. Located three to six miles behind the frontier, major (*gros*) and smaller (*petit*) infantry or artillery forts (*ouvrages*) were built to make effective use of terrain to control transportation routes. Artillery pieces—mortars and howitzers—were especially designed for Maginot Line use and were housed in huge casemates, some with retractable turrets. The largest howitzers were 135mm weapons. Each fort had its own diesel power supply and storage deep underground. The largest forts were served by up to 1,000 men moved from one part of a fort to another by underground electric trains (*métro*) and were capable of operating without resupply for a month.

Forts were positioned so that troops had the ability to fire on their neighbors to fend off surface enemy attacks (which did not happen at Eben Emael) without harming the occupants (casemate reinforced concrete was more than 10 feet thick and then further protected with many feet of earth). Command-and-control facilities were often buried 60 or more feet deep, relying on input from fortified observation cupolas, an extensive buried telephone network, and radio links. All entrances (usually one for provisions and another for men) were heavily fortified, featured retractable drawbridges (or lifting bridges), and were made airtight against gas attack. There were also emergency entrances for all forts.

The Germans knew quite a bit about the Maginot Line before the war, much of it learned from the captured Czech border forts that were closely modeled on Maginot examples. Aerial surveys just before the war, intelligence agents, and interviews with many who had helped to construct the forts (some of them German) gave the German military a good sense of where the Maginot Line forts were and what they could offer in resistance. The Germans began work on the Gustav gun in 1937 with the intention of using it to crack the Maginot Line.

The Germans were also well aware of the fatal flaw in the Maginot Line’s geographic conception. Persuaded that no sizable military force could penetrate the dense Ardennes Forest region of southern Belgium, the line of forts stopped at that point, and only light fortifications (dubbed the Maginot Extension) were built along the Belgian frontier to the English Channel. The French plan was to advance into Belgium and assist their allies at the Belgian border fortresses. The plan depended on having enough time to move the requisite armies.

American soldiers inspecting the Maginot Line in eastern France, 1944. (National Archives)

When the German attack finally came on May 10, 1940, of course, blitzkrieg tactics did not prevail that time. The German panzers and infantry broke through the Ardennes and turned the flank of the Maginot Line while other forces drove toward the Channel, cutting off British forces. The French, who could barely advance, were rapidly overwhelmed. German attacks never breached the structures of any of the *gros ouvrages,* although some of the smaller outlying facilities were taken in fierce fighting because the interval troops supporting them had been withdrawn.

Despite the German use of huge siege mortars and cannon, no major fort fell. The Germans took only a few *petits ouvrages* on the far western end and directly along the Rhine, even though they expended considerable effort and usually greatly outnumbered the defenders. To the south, the Italians never broke through the Alpine defenses, although they did directly assault the *gros*

ouvrage of Cap Martin overlooking the sea in a failed attempt to gain control of the coast road.

In the end, the Maginot Line accomplished exactly what it was designed to do—protect Alsace-Lorraine and the French provinces facing Italy. It did not fail, despite the fact that some of its forts had not yet been fully armed. The existence of the line, originally designed to give the army time to mobilize and attack, had lulled France into complacency in the face of a rearming Germany and Italy. The French Army succumbed to a defensive stance and ignored mobile warfare, as the high command was convinced that the line could contain any enemy attack. Only after the Germans occupied two-thirds of the nation did Maginot Line forces surrender with the rest of France.

Forces stationed at many of the forts (e.g., Hackenberg and Simershoff) fought again in 1944 as the Allies neared the German frontier, and some of the fortifications were heavily damaged as they had not been in 1940. After the war, the French reoccupied and partially rearmed the Maginot Line, maintaining some forts into the 1960s; then, they were finally abandoned for good. A few facilities, such as a part of Hochwald, are still used by the French Army or the French Air Force, generally for storage or communications. A number of *ouvrages* have been opened as museums. Others are used to grow mushrooms or store wine.

Magwe, Battle for (March 8–22, 1942)

Air battle in Burma pitting Japanese aircraft against American and British aircraft. On February 28, 1942, remaining American Volunteer Group (AVG) Curtiss P-40B Tomahawks of the "Adam and Eve" Squadron were forced to abandon Mingaladon Airfield near Rangoon and evacuate to Magwe. Between March 8 and 13, they were reinforced by 10 Boeing B-17 Flying Fortresses from the U.S. Army Air Forces (USAAF) Tenth Air Force that flew in 474 men of the British Innishilling Fusiliers and 29 tons of supplies from New Delhi, India. On the return flights, these aircraft evacuated 423 civilians. On March 15, Royal Air Force (RAF) Blenheims of Number 113 Squadron from Calcutta flew to Magwe to use it as an advanced base for raids on Japanese Fifteenth Army troop concentrations and supply areas in the Irrawaddy Valley.

On March 19, 2 AVG P-40s armed with fragmentation bombs flew from Magwe to sweep the Japanese Air Force's 5th Air Division airfield at Moulheim. The airfield was 250 miles by air from Magwe, and the Japanese believed that they were beyond the range of P-40s and had made no effort to either camouflage or disperse the 20 fighters on the ground there. The 2 P-40s destroyed 15 of the 20 Japanese aircraft on the ground without a shot fired in return. On March 20, 9 Bristol Blenheim bombers of Number 113 Squadron, escorted by 10 Hawker Hurricanes of Number 67 Squadron, mounted an attack on Mingaladon and destroyed 16 Japanese aircraft on the ground and 11 others that took off, of the 50 Japanese aircraft based there. Although some of the British aircraft were damaged, all returned safely to base.

In turn, the Japanese attacked Magwe Airfield. The 98th Sentai (attack group) sent 27 Mitsubishi Ki-21 ("Sally") bombers, escorted by 20 Nakajima Ki-27 "Nates" from 1st Sentai, destroying 6 AVG P-40s and 2 Hurricanes of Number 67 Squadron and 3 Blenheims of Number 113 Squadron. However, 5 AVG P-40s and 2 RAF Hurricanes of Number 67 Squadron shot down 5 of the Japanese bombers.

On March 22, Ki-27 "Nates" of the 1st Sentai, escorting Kawasaki Ki-32 "Mary" light bombers of the 31st Sentai, attacked Magwe Airfield. Only three AVG P-40s and four RAF Hurricanes of Number 67 Squadron remained operational. With Magwe's position compromised and the airfield in poor condition, the four flyable RAF Hurricanes were shifted to Akyab Airfield near the India-Burma border and the three AVG P-40s were moved

to Laiwing on the Burma-China border, where five damaged aircraft were also transported by truck. The evacuation of Magwe left the British Imperial and Chinese troops in Burma devoid of air cover.

Makin Island, Battle of (November 20–23, 1943)

Makin Atoll is part of the Gilbert Island chain in the Central Pacific. It was the site of two World War II battles, both of which occurred on Butaritari, the largest island. Makin is shaped like a long, crooked hammer; the head is 3.5 miles long, and the handle about 11 miles long. In the first battle on August 17 and 18, 1942, the 2nd Marine Raider Battalion destroyed the Japanese seaplane base there and decimated the garrison. This outcome had an unfortunate effect for the Americans, because it caused the Japanese to strengthen their defenses in the Gilberts.

On Butaritari, they constructed bunkers, trenches, machine-gun nests, gun emplacements, and two deep tank traps; the traps each ran shore to shore across the central part of the handle of the island to defend a 3,000-yard-long area known as the Citadel, where the Americans had landed in 1942. Japanese Navy junior grade lieutenant Seizo Ishikawa commanded some 500

Japanese military personnel, and there were 79 Japanese and 200 Korean construction workers.

The invasion of Makin was part of the U.S. campaign against the Gilberts, which included the bloody struggle for Tarawa (November 20–24, 1943). The Makin assault force numbered 6,471 men: the 165th Regimental Combat Team and a battalion of the 105th Infantry Regiment of Major General Ralph C. Smith's 27th Infantry Division, originally a National Guard unit. Rear Admiral Richmond Kelly Turner directed operations from the battleship *Pennsylvania*. The navy supported the landing with 3 battleships, 5 cruisers, 13 destroyers, and planes from 5 aircraft carriers.

Beginning at 5:40 a.m. on November 19, 1943, naval gunfire, including 14-inch shells from the battleships *Pennsylvania, New Mexico,* and *Mississippi,* pounded Makin. Carrier planes followed a half hour later. The Japanese had no effective means of response.

On November 20, beginning at 8:30 a.m., the navy's Northern Attack Force put the troops ashore on two beaches on the western part of the island. Later, another force went ashore on the lagoon side. The attackers met little opposition, pushing east toward the Citadel and taking the western Japanese tank barrier by the end of the day.

Here the attack bogged down, as the troops were pinned down by Japanese snipers. On the night of the third day, the Japanese mounted a counterattack, during which they lost more than 50 men. But at 10:30 a.m. on November 23, the army declared Makin secured. The attackers had suffered 64 men killed in action and another 150 wounded. V Amphibious Corps commander U.S. Marine Corps major general Holland Smith regarded the four days it had taken to secure the island, despite the army's overwhelming superiority in manpower, as "infuriating slow." During the invasion of Saipan the next year, he removed General Ralph Smith from command. Following Makin's capture, army engineers built an airstrip to allow further attacks on nearby Japanese forces.

The capture of the island proved far more costly for the U.S. Navy. During the preliminary bombardment, a turret explosion on the *Mississippi* killed 43 men and wounded 19. Also, the delay in taking Makin caused the supporting warships to remain close by, where they were vulnerable to attack by Japanese submarines sent there from Truk. On November 24, *I-175*

torpedoed the escort carrier *Liscombe Bay*. A terrific explosion tore apart the entire aft third of the carrier, and 640 sailors died.

Makin Island Raid (August 17–18, 1942)

U.S. Marine assault on Makin Atoll in the Gilbert Islands group in the Central Pacific. This operation by the 2nd Marine Raider Battalion was designed to divert Japanese attention from the Solomons Campaign and to boost American morale. U.S. Pacific Fleet commander Admiral Chester Nimitz decided to employ Lieutenant Colonel Evans F. Carlson's 2nd Raider Battalion. Specific plans called for the two large 2,700-ton mine-laying submarines *Nautilus* and *Argonaut* to land two companies of 221 raiders on Butaritari Island of Makin Atoll just before dawn on August 17 to wipe out the Japanese garrison there. Withdrawing that evening, they were to land the next day on Little Makin Island and destroy its installations. The stated goals were to gather intelligence and take prisoners, destroy Japanese supplies and installations, and distract Japanese attention from the U.S. reinforcement of Guadalcanal and Tulagi.

U.S. soldiers on Makin Atoll in the Gilbert Islands. (Library of Congress)

The submarines arrived off Makin early on August 16 and put the raiders ashore early the next morning. Unfortunately for the Americans, the premature discharge of a rifle by one of the marines destroyed the element of surprise. Carlson's raiders then moved inland and engaged the Japanese troops on Makin Island, virtually wiping them out. Following Japanese air strikes, Carlson decided to withdraw, but rough seas and the failure of outboard engines capsized a number of the boats and stranded Carlson and some 120 raiders ashore, most of them without their weapons. Fearing that he was surrounded, Carlson considered surrender and even sent out a patrol with a surrender note.

On the morning of August 18, Carlson led a patrol inland and discovered 83 Japanese bodies. Utilizing rubber boats and dugouts made by local peoples, most of the remaining raiders had returned to the submarines by 11:00 that night. In the raid, the Japanese lost perhaps 160 dead; the marines had 19 killed and 9 missing. The 9 marines evaded capture with help from locals until their food ran out. They surrendered on August 30. The Japanese took these men to Kwajalein and beheaded them as war criminals. The raiders had fought well, and Sergeant Clyde Thomason, who sacrificed his life to save several comrades, became the first enlisted marine in World War II to earn the Medal of Honor.

Although the raid did divert attention from Guadalcanal, it also taught the Japanese that they needed to strengthen their defenses. As a result, they heavily fortified Tarawa, which witnessed one of the bloodiest marine landings of the Pacific war 16 months later.

In 2000 and 2001, the remains of the 19 dead raiders were returned to the United States.

Malaya Campaign (1941–1942)

Malaya comprises the 700-mile-long Malay Peninsula and Singapore. The British took Malaya from the Dutch in 1810 and established political and administrative control over four of the sultanates. Protectorate status was extended to the remaining five sultanates by 1914. During the mid-19th century, Malaya's economic value grew following the discovery of significant tin deposits there, and after the turn of the century the rubber industry underwent considerable development. These two resources made Malaya strategically important to the British.

Following World War I, the British government decided to develop Singapore into a large naval base, intended to defend against Japanese expansionism, although construction was never completed. During the 1930s, the British built a series of airfields on the peninsula in the belief that Singapore and Malaya could best be defended from the air.

In October 1940, Air Chief Marshal Sir Henry Robert Brooke-Popham was appointed commander in chief, Far East, with his headquarters in Singapore. Brooke-Popham had never served east of Suez and was unfamiliar with the political and military forces girding for war in Southeast Asia.

Below him were Sir Shenton Thomas, governor of the Straits Settlements and high commissioner of the Malay States, and the individual service commanders. The senior of these—the general officer commanding, Malaya, Lieutenant General Arthur Ernest Percival—arrived in May 1941. London rejected Brooke-Popham's requests for more resources and a preemptive strike in southern Thailand against the mounting Japanese threat.

When the Japanese finally began their invasion of Malaya with landings along the northeastern coast on the night of December 7–8, 1941, the British thus were caught unprepared. With insufficient ships and aircraft to create a simultaneous presence in all theaters, Britain had been forced to establish priorities, and the theaters receiving most of the naval and air assets were the Atlantic and North Africa. Consequently, the defense of the peninsula was left to the army, which numbered some 88,600 Australian, British, Indian, and Malay troops. The principal ground units were the understrength Indian 9th and 11th Divisions and two brigades of the Australian 8th Division as well as the 1st and 2nd Malaya Brigades at Singapore. The British had only 158 aircraft, mostly obsolete types, and no tanks. They also suffered a severe blow when Japanese aircraft sank Admiral Sir Tom Phillips's new battleship, the *Prince of Wales,* and the battle cruiser *Repulse* on December 10 when they attempted to oppose the Japanese landings.

The Japanese had devoted extensive planning to the Malayan operation, and the occupation of southern Indochina earlier in 1941 had formed part of their preparation. Malaya would provide them with tin and rubber resources, a strategic naval base at Singapore, and a jumping-off point for further expansion into the oil-rich Netherlands East Indies and the Indian Ocean.

The invading Japanese forces, commanded by General Yamashita Tomoyuki, went ashore beginning on the night of December 7–8. Some 60,000 men were centered in three divisions, supported by Vice Admiral Ozawa Jisaburo's Malay Force, 158 naval aircraft, and 459 aircraft of the 3rd Air Division as well as 80 tanks, 40 armored cars, and several artillery regiments. The Japanese quickly gained air superiority and began a rapid move southward. On December 15 in a desperate move, Governor Thomas accepted an offer of cooperation from the Malayan Communist Party (MCP) and lifted the official proscription on both it and the Nationalist Party—the Guomindang (Kuomintang, GMD). Many members of these two parties

would now be trained in guerrilla warfare and sabotage at the 101st Special Training School, which had been hastily created at Singapore.

In late December, Brooke-Popham was recalled and blamed, unjustly, for the Japanese successes. Kuala Lumpur fell on January 11. British, Australian, and Indian reinforcements, most of them poorly trained, were sent in through Singapore Harbor to the retreating front but could do little to stem the Japanese advance. In a series of short battles in mid-January, the remaining British defenses in southern Malaya were broken, and on January 31 the defenders blew the causeway linking Singapore with the mainland.

Soon after the invasion had begun in December, General Sir Archibald Wavell, commander of Allied forces in the Far East, had visited Singapore and warned that the island's defenses had to be prepared should mainland units eventually be compelled to withdraw to it. Unfortunately, little serious effort was made in this regard. On February 9, the Japanese landed on the island's northwest coast. Singapore was now crowded with refugees, its inhabitants demoralized and its facilities stressed.

On February 15 the British commander, Lieutenant General Percival, surrendered his remaining 70,000 troops. Most of the surviving graduates of the 101st Special Training School took to the jungles to carry on the fight, forming the Malayan People's Anti-Japanese Army (MPAJA) in March 1942.

British prime minister Winston L. S. Churchill described the loss of Malaya as the greatest disaster in British military history. The loss clearly demonstrated that the British had grossly underestimated Japanese capabilities. Furthermore, their commanders had done a poor job in handling the ill-trained and inadequately equipped force they had sent to meet the invasion. The larger lesson of Malaya was that for commitments to be realistic, they had to be supported with sufficient resources.

Malinovsky, Rodion Yakovlevich (1898–1967)

Marshal of the Soviet Union. Born near Odessa, Russia, on November 23, 1898, Rodion Malinovsky enlisted in the Russian army at the outbreak of World War I. Badly wounded in 1915, he spent several months recuperating before being reassigned as a machine gunner in April 1916. Malinovsky was decorated for bravery and again wounded. His unit mutinied in the spring of 1917, however, and he was transported to North Africa.

Malinovsky returned to Russia in August 1919, joining the Red Army at Omsk and fighting against the White forces. He then served as chief of staff of the III Cavalry Corps. In 1926, Malinovsky joined the Communist Party, and a year later, he entered the Frunze Military Academy. He then went to Spain as a military adviser to the Republican forces in the Spanish Civil War between 1937 and 1938. Returning to the Soviet Union, he served on the faculty of the Frunze Military Academy.

In March 1941, Major General Malinovsky assumed command of the new XLVIII Rifle Corps on the Romanian border. In August, following the German invasion of the Soviet Union, he commanded the Sixth Army in Ukraine, where he had no choice but to withdraw before the advancing Germans. Promoted to lieutenant general that November, Malinovsky assumed command of the Southern Front one month later. Following the ill-fated Kharkov Offensive in June 1942, for which he shared blame, he was reassigned to rear-echelon duty.

During July and August 1942, Malinovsky headed the Don Operational Forces Group before being named to command the Sixty-Sixth Army in August. Malinovsky next commanded the Voronezh Front in October and the Second Guards Army in November. In the latter capacity, he played a key role in the Battle of Stalingrad (August 23, 1942–February 2, 1943),

defeating Army Group Don, the German relief force under Field Marshal Erich von Manstein, in December.

Malinovsky was promoted to colonel general in February 1943, commanding the Southern Front that month and the Southwest Front in March. In April, he was promoted to army general. He played a major role in the Battle of Kursk (July 5–13, 1943) and then spearheaded the drive across Ukraine, taking Odessa in April 1944. His command was redesignated the 3rd Ukrainian Front in October 1943 and the 2nd Ukrainian Front in May 1944. From Ukraine, Malinovsky led Soviet forces into Romania, Hungary, Austria, and Czechoslovakia. In September 1944, he was promoted to marshal of the Soviet Union.

When the war in Europe ended, Malinovsky commanded the Trans-Baikal Front in the Far East, pushing into Japanese-held Manchuria. A prominent member of the Soviet military hierarchy after the war, he headed the Far East Command between 1947 and 1953 and the Far East Military District from 1953 to 1956. He was then deputy minister of defense from 1956 to 1957, when he succeeded Marshal Georgii Zhukov as minister of defense. In this post, Malinovsky introduced strategic missiles into the Soviet arsenal and oversaw Soviet military modernization. Malinovsky died in Moscow on March 31, 1967.

Malmédy Massacre (December 17, 1944)

Notorious incident involving the murder of unarmed American prisoners of war during the German Ardennes Offensive (Battle of the Bulge, December

16, 1944–January 25, 1945). In the offensive, I Panzer Corps had the task of breaking through Allied lines in the Monschau-Losheim sector and advancing to the Meuse. The 1st SS Panzer Division was on the left wing of the corps, and SS-Obersturmbannführer Joachim Peiper commanded the division's spearhead, known as Kampfgruppe Peiper.

On December 17, the second day of the offensive, the 1st SS Panzer Division broke through the Allied lines between the Belgian towns of Malmédy and Saint Vith. At the village of Baugnez, Peiper's unit encountered a small group of trucks and jeeps belonging to Battery B of the U.S. 285th Field Artillery Observation Battalion. In the ensuing fight some 20 U.S. soldiers were killed, and Peiper's force took 125 prisoners. Peiper left behind some men to guard the prisoners before moving on to his next objective. A few hours later, another 1st SS Panzer Division column arrived at Baugnez, adding some additional prisoners.

The Germans herded the Americans into a snowy field, where they were held under guard. Meanwhile, another group of separated Americans who had previously escaped from the Germans moved toward the crossroads, and a firefight broke out in which more Americans were killed. This engagement led the guards in the field to fire on their prisoners, perhaps believing that they would try to escape. The Germans then moved among the wounded, executing them with bullets to their heads. Most of those shot were unarmed. At least 72 men were killed, although some 30 others feigned death and later escaped to American lines.

The incident was the worst atrocity against Americans in the European theater during the war. News of the event, which became known as the Malmédy Massacre, quickly circulated among Allied troops, and the U.S. Army made the most of it for propaganda purposes, even including civilians who had died in the fighting in the total of persons killed, although many were actually victims of U.S. bombing.

Bodies of U.S. Army personnel slain by the Germans after they were taken prisoner near Malmédy, Belgium, December 17, 1944. (National Archives)

In May 1946, Peiper and 73 members of the 1st SS Panzer Division, a number of them selected randomly, were brought to trial by a U.S. military court for the Malmédy killings and the murder of soldiers and civilians elsewhere during the offensive. Army prosecutors presented testimony from massacre survivors and civilian witnesses, captured German documents indicating that German troops had been urged to be “ruthless” with prisoners during the offensive, and confessions from some of the accused. In response, the defense argued that pretrial investigations had not been thorough and that confessions had been extorted by mock trials and threats of summary execution. The court dismissed these complaints and convicted all of the defendants. Peiper and 42 others were sentenced to death, and the rest were given lengthy prison sentences.

Questions about the trial results were raised almost immediately, and review boards cited errors in the court's procedural rulings. Several defendants claimed that their confessions had been extracted by physical force, charges that the original prosecutors angrily denied. The army reduced the death sentences to long prison terms, but ultimately all the defendants, including Peiper, were released from prison within a few years.

Malta

British island in the central Mediterranean some 60 miles from Sicily. This archipelago of 122 square miles, with a 1939 population of 270,000 people, played a crucial role in the struggle to control the Mediterranean. Just as Malta had been a key location for forces traveling to the Near East in support of the Crusades and during the French Revolution and the Napoleonic Wars, it proved to be a vital link in the defeat of Axis forces in North Africa. Formally a British possession since 1814, Malta had the only British port facilities between Alexandria, Egypt, and Gibraltar. Because Malta was 1,000 miles from the nearest British base, it was difficult both to defend and to resupply.

The governor of the island—Lieutenant General William Dobbie and then, from May 1942, General Lord John Gort—also acted as its military commander. The British used Malta as an air and naval base to interdict Axis supply lines between Italy and Libya. In October 1941, British ships and

planes operating from Malta sank two-thirds of the Axis supplies sent to Libya.

Both sides recognized the importance of Malta to operations in the Mediterranean theater. When Italy declared war on the Allies in June 1940, it immediately began air attacks on Malta, and initially the British had only a handful of Sea Gladiator biplanes to meet these attacks. The Germans increased the pressure on the island by sending the Fliegerkorps X to Sicily to neutralize Malta so that Axis supplies and men might reach North Africa. Beginning in January 1941, Fliegerkorps X struck both the island and the British supply convoys in what became a furious two-year aerial campaign.

Sustaining Malta became a top priority for the Allies in the Mediterranean theater. From August 1940 until January 1943, the British pushed 13 convoys through to Malta, all of which sustained losses to Axis naval and air attacks. Critical to Malta's survival was the resupply of fighter aircraft, sent to the island via aircraft carrier. The situation became so desperate and British naval forces were stretched so thin that the United States employed the fleet carrier *Wasp* to fly in Spitfire aircraft during April and May 1942. This was at a time when the U.S. Pacific Fleet desperately needed every available carrier in the Pacific to stem the Japanese advance there.

Despite Allied efforts, the situation in Malta remained precarious for much of 1942. The largest effort to resupply the island came in Operation PEDESTAL (August 3–15, 1942), when the British sent 4 aircraft carriers, 2 battleships, 7 cruisers, and 24 destroyers to escort a convoy of 14 merchantmen to the island. After numerous air and U-boat attacks, the convoy limped into Malta's harbor on August 12 with just 5 merchant ships, 3 of them damaged. The Royal Navy lost 1 aircraft carrier, 2 cruisers, and 1 destroyer, with another carrier and 2 cruisers damaged. However, Operation PEDESTAL was sufficient to allow operations from Malta to continue.

In the spring of 1942, Axis leaders discussed employing Italian and German paratroopers, supported by a sea invasion, to seize the island, but the Italians' lack of preparation, the desire to move German air units to the Eastern Front, General Erwin Rommel's recent success in Libya, and the memory of the costly Crete operation all led Adolf Hitler to cancel the operation. By the time the siege of Malta had been lifted in December 1942, more than 1,500 Maltese had died from Axis air attacks. In recognition of their stoutness and to improve their morale during the bleakest of times,

Britain's King George VI bestowed on the entire nation of Malta the George Cross for valor.

Malta, Air Battles of (1940–1942)

The island of Malta in the central Mediterranean was critically located to interdict Axis lines of communication to Libya and was an important way station for Allied aircraft in transit to North Africa. The air attacks on Malta by the Axis powers were initially intended to reduce the disruption of Axis lines of communications to North Africa by Malta-based bombers and submarines. However, they were also to be the precursor to a planned Axis invasion of the island, code-named Operation HERKULES (the Italian name was C-3).

At the start of World War II, Air Commodore Forster Herbert Martin "Sammy" Maynard was the air officer commanding (AOC) Malta. He developed a reputation for hanging on to any useful aircraft that happened to land on the island. Initially, Malta's fighter defense consisted of four antiquated Gloster Sea Gladiator biplanes. Three of them were popularly known as "Faith," "Hope," and "Charity."

The first Italian bombing attack on Malta occurred on June 11, 1940. Bombing continued throughout the summer and autumn, but reinforcements continued to arrive on the island, including a few Hawker Hurricane fighters. From mid-February 1941, the Luftwaffe deployed large numbers of fighters to the battle, and the Royal Air Force (RAF) began to take heavier losses among its Hurricanes.

Bombing attacks eased off during May 1941 as the Luftwaffe concentrated on Crete. Then on June 22, 1941, Germany invaded the Soviet Union in Operation BARBAROSSA, and many of the Luftwaffe units were diverted to the Soviet front. As a result, defense and interdiction forces on Malta could be strengthened. Supply convoys arrived, and attacks on Axis shipping intensified. Also in June, Air Vice Marshal Hugh Lloyd replaced Maynard as AOC Malta.

Inhabitants of Valletta, Malta, salvage their belongings from a bombed building. The island of Malta sustained extensive Axis air raids during World War II. (Corbis)

Malta had become the most important British overseas base in the world, and from the Axis point of view, corrective action was required. In December 1941, Oberbefehlshaber Süd (OB-Süd), Field Marshal Albert Kesselring's Luftflotte 2 of more than 600 aircraft was transferred to Sicily with orders to neutralize Malta. Between December 1941 and April 1942, Kesselring mounted sustained heavy attacks on the island, and as a result, the activities of its bomber force were drastically curtailed. In January 1942, no Axis ship supplying North Africa was sunk, and the February Allied supply convoy to

Malta was forced to turn back. The total tonnage of bombs dropped on Malta in March and April 1942 was more than that expended on London during the whole of 1940.

After February 1942, the British adopted more effective fighter tactics, and 31 Supermarine Spitfires were delivered from the aircraft carrier HMS *Eagle* during March 1942. Hurricanes were good dogfighters, but given the short distance from Italian airfields (60 miles), they lacked the climb performance to gain an altitude advantage before attacking. With the advent of Spitfires, the defending fighters were able to gain sufficient altitude to attack from above. Malta pilots became adept at high-speed dive and zoom attacks.

The March 1942 Allied supply convoy to Malta nonetheless suffered heavy losses, and many ships were sunk; only 5,000 tons of supplies got through. By April, food, fuel, spare parts, and ammunition were all in short supply. Rationing was severe and disease rife; the situation was becoming critical. On April 15, 1942, King George VI took the highly unusual step of awarding the George Cross to the entire island. During April and May 1942, the aircraft carriers USS *Wasp* and HMS *Eagle* delivered a total of 132 Spitfires to Malta. On May 10, 1942, Kesselring, following a particularly poor intelligence assessment, reported to the German high command that the neutralization of Malta was complete.

Renewed Axis attacks against the island in June were timed to coincide with the advance of the Afrika Korps to Egypt. Italian warships forced back an Allied supply convoy from Alexandria, and another convoy from Gibraltar was heavily attacked. But two merchantmen reached Grand Harbor, preventing starvation on the island for another two or three months.

Air Vice Marshal Keith Park was appointed AOC Malta in July 1942, and he instituted an aggressive forward-interception policy to attack Axis raiders as they were forming up. Within a few weeks, this policy had dramatically reduced the effectiveness of the bombing and inflicted increasingly severe losses on the Luftwaffe. During July and August, bombers from Malta again inflicted heavy damage on Axis convoys, greatly assisting the British Eighth Army during the Battle of Alam Halfa (August 31–September 7, 1942) and the Battle of El Alamein (October 24–November 4). During August, Operation PEDESTAL (August 3–15) delivered 53,000 tons of supplies to Malta.

Axis forces made one last series of heavy attacks between October 10 and 20. After that, most transferred to North Africa. Raids on the island were gradually reduced. The siege was lifted altogether on November 20 when Operation STONEAGE delivered another 35,000 tons of supplies, and a further 55,000 tons were delivered in December. The battle officially ended on December 31, 1942.

Malta, Convoy Battles (June 12–16, 1942)

A series of aero-naval actions fought in the Mediterranean in June 1942 resulting from a British effort to run convoys to Malta from both Egypt and Gibraltar.

During the spring of 1942, British warships withdrew from Malta because of the pressure of Axis air attacks and the failure of a convoy in March 1942 to deliver a meaningful amount of supplies and fuel. By June, Malta's civilians were reduced to a daily diet of 1,500 calories, and Governor-General Lord John Gort warned that starvation could force the island's surrender by August.

In response, the British Admiralty planned a massive double convoy operation to relieve Malta and restore its ability to function as a base. The convoy from the east, code-named Operation VIGOROUS, was commanded by Rear Admiral Philip Vian and included 11 transports escorted by 8 light

cruisers, 26 destroyers, 4 corvettes, 2 minesweepers, and an old dreadnought disguised as a modern battleship.

The western convoy, code-named Operation HARPOON, consisted of five transports and one tanker. Force X, commanded by Captain Cecil Campbell Hardy, provided the close escort, with an antiaircraft cruiser, five fleet destroyers, four Hunt-class destroyer escorts, and four fleet minesweepers. The distant escort, Force W, commanded by Vice Admiral Sir Alban T. B. Curteis, consisted of a battleship, two aircraft carriers, three light cruisers, and eight destroyers.

Both convoys got under way on June 12, 1942. VIGOROUS lost two transports in the first two days, one to bomb damage and the other to straggling. On June 14, Italo-German air strikes sank another transport; then at 2:30 p.m. that day, Italian admiral Angelo Iachino sailed from Taranto with 2 modern battleships, 2 heavy and 2 light cruisers, and 12 destroyers, planning to intercept the convoy the next morning.

The Mediterranean Fleet's new commander, Admiral Henry Harwood, ordered Vian to reverse course at 2:00 a.m. on April 15, and during this revolution German motor torpedo boats attacked, sinking one destroyer and damaging a cruiser. At 5:25 a.m., Harwood ordered Vian to return to his original course, hoping that air attacks and a submarine picket line would take care of the Italian fleet. British and U.S. pilots delivered four separate attacks and claimed more than a dozen hits on the Italian battleships. In fact, they torpedoed the heavy cruiser *Trento,* while a bomb bounced off one of the *Littorio*'s turrets.

Harwood instructed Vian to reverse course again from west to east at 8:28 a.m., and then, based on the overly optimistic reports from the airmen, from east to west at 11:51 a.m. Vian knew that the Italian battleships were pressing forward, however, and he held steady for Alexandria despite his orders. Meanwhile, further Axis air strikes sank two destroyers and damaged a cruiser, and a German submarine accounted for another cruiser. In the return to base, a British submarine finished off the *Trento,* and a torpedo bomber hit the *Littorio,* putting it into dock for repairs for three months. Nonetheless, Operation VIGOROUS was a major Italian victory because no British ships made it to Malta.

Operation HARPOON, which also got under way on June 12, was spotted by Axis aircraft the next day. It suffered its first air attack on June 14, when

Italian bombers sank one freighter and severely damaged a light cruiser. Subsequent air strikes failed to score, and at 8:15 p.m. the distant escort, Force W, turned back, while the convoy, four freighters and a tanker, and Captain Hardy's close escort of an antiaircraft cruiser, five destroyers, four destroyer escorts (one Polish), and four fleet minesweepers began the dash through the Sicilian narrows.

That same evening, the Italian Navy's 7th Division, commanded by Rear Admiral Alberto Da Zara and consisting of two light cruisers, set sail from Palermo intending to intercept the British force at dawn. Da Zara was accompanied by five destroyers.

The Italians intercepted the British convoy on June 15 at 5:30 a.m., 25 miles southwest of the island of Pantelleria. The 12th Flotilla made smoke, while the 11th Flotilla interposed itself between the Italian cruisers and the convoy. A British destroyer and a destroyer escort sustained heavy damage from Italian cruiser gunfire. Two of the Italian destroyers attacked independently and engaged the British destroyer escorts, one of which received a disabling hit.

While the British ships kept the enemy cruisers away from the convoy, German Junkers Ju-88 bombers struck at 6:15 a.m., taking the opportunity presented by the lack of opposition to sink one freighter and damage the tanker. The warships continued to spar from long ranges for two and a half hours until the presence of a minefield caused the Italian admiral to break off action and seek a better location to renew the battle. During this time, the Italian cruisers were each hit by shells, while the British cruiser was moderately damaged and a destroyer lightly damaged.

At 10:20 a.m. another Axis air attack damaged a transport. The British force already had two ships under tow, and Captain Hardy decided to cut his losses and make a run for Malta with his undamaged ships. He ordered the damaged transport and tanker scuttled, but the 4-inch guns of the two warships assigned to accomplish this task proved insufficient and only ignited fires that cast huge plumes of smoke. These unintentional beacons attracted Admiral Da Zara, who had lost the British location. By 12:15 p.m. the Italian squadron was back in action, damaging a minesweeper that had stayed behind to sink the stragglers. They also finished off the cripples and chased off a destroyer that had been towing its damaged sister, which was torpedoed and sunk by an Italian bomber at 1:25 p.m.

At 2:40 p.m. Admiral Da Zara broke off the chase and headed for home after an effective intervention that saw, in cooperation with aerial units, a destroyer, two transports, and a tanker sunk and two destroyers, a cruiser, and a minesweeper damaged. The Italians suffered one destroyer heavily damaged and two cruisers lightly damaged. As the British convoy approached Malta, it ran into a minefield laid the month before by Italian destroyers. The Polish destroyer was sunk, while one of the transports, two destroyers, and a minesweeper were heavily damaged.

Of the 17 transports and tankers involved in the twin operations, only 2 arrived. Overall British losses consisted of 6 transports, a tanker, a light cruiser, and 5 destroyers; also, 4 cruisers, 4 destroyers, and a minesweeper had been significantly damaged. The Italians lost 1 heavy cruiser and had significant damage to 1 battleship and 1 destroyer. Rome rightfully celebrated the mid-June convoy operations as a major victory, while the British immediately began planning another operation to relieve Malta.

Manado, Battle of (January 11–12, 1942)

Initial Japanese attack on the Netherlands East Indies that featured the first Japanese use of paratroopers. The ultimate prize for the Japanese in the South Pacific was Java, the most developed island of the Netherlands Indies. To reach Java, the Japanese seized several intermediate locations so that their

subsequent advances would be covered by land-based aircraft. Manado (or Menado), located on the northernmost peninsula of the island of Celebes, met Japanese needs because it had both a good harbor and a nearby airfield.

On January 9, 1942, the First Eastern Invasion Force departed Davao in the southern Philippines for Manado. Ten transports carried 2,500 marines of the 1st Sasebo Special Landing Force. This naval force consisted of two reinforced battalions. Among the supporting units was a tank company equipped with Model 95 light tanks. Five minesweepers and two submarine chasers provided close support. Rear Admiral Tanaka Raizo commanded a covering force of one light cruiser and eight destroyers, and stronger Japanese naval forces provided distant cover.

The Dutch defenders on Celebes were heavily outnumbered. The garrison numbered 1,500 men, but fewer than 400 were regular soldiers; the remainder were local militia troops and retired soldiers. Heavy weapons were limited, along with communications equipment.

The Dutch were surprised when the Japanese came ashore at Manado beginning at 4:00 a.m. on January 11. The defenders fell back toward the city but were hampered by poor communications. The Japanese quickly took the key road centers, and Dutch forces near the beach were overwhelmed, unable to oppose the light Japanese tanks. Soon, the Japanese controlled both the harbor area and the town.

Shortly after 9:00 a.m., the Japanese inserted into the battle the 1st Yokosuka Special Landing Force, a battalion-sized naval parachute unit under Commander Toyoaki Horiuchi, to seize the nearby airfield at Langoan. Twenty-seven Mitsubishi G3M1-L transports (“Nell” in the Allied code system) flying from Davao dropped 334 men onto the field. The Japanese made many mistakes in their first combat airdrop. The altitude was too high and the winds too strong, scattering men and equipment over a wide area and allowing the Dutch defenders to inflict heavy casualties. The Japanese commander and 34 of his men were killed, and 90 others were wounded. The paratroopers were largely ineffectual.

On January 12, an additional 185 paratroopers were dropped at Langoan in reinforcement. The airfield fell the same day, although the Dutch were able to sabotage it somewhat during the fighting. The field was not restored to service until January 24.

Following the surrender, the Japanese executed a number of the

surrendered Dutch defenders by beheading or bayoneting. After the war, Captain Toyoaki was tried for this war crime and executed in September 1948.

Many of the Dutch defenders of Manado attempted to escape into the jungle to wage guerrilla war against the Japanese invaders, but most were caught and executed. By January 12, the Japanese had secured both the harbor and the airfield, which were then used as staging areas for subsequent Japanese moves farther south.

Manchuria Campaign (August 9–September 5, 1945)

Soviet conquest of Manchuria. At the Yalta Conference (February 11–14, 1945), Soviet leader Joseph Stalin promised that the Soviet Union would enter the war against Japan "two to three months" after the conclusion of fighting in Europe. The Soviets began serious preparations for this eventuality in April 1945, when they initiated the transfer of the equivalent of 12 army corps and tremendous amounts of supplies from Eastern Europe via the Trans-Siberian Railway, headed east to three commands fronting Manchuria: the Trans-Baikal Front to the northwest, the 2nd Far Eastern Front to the northeast, and the 1st Far Eastern Front on the east.

For this campaign, Stavka (the Soviet high command) established the first Soviet theater-level command, under Marshal Aleksandr Vasilevsky. Against the Japanese, the Soviets amassed 1.5 million men, 28,000 guns and mortars, 5,500 tanks, and 4,370 aircraft; they faced the defending Japanese Guandong (Kwantung) Army, which (although it contained 1.2 million men, including

forces in Korea, southern Sakhalin, and the Kuriles) was a shell of its former self. Many of its units had been transferred to Japan for the defense of the home islands. The Guandong Army commander, General Yamada Otozō, called up 250,000 reservists for new units, pulled back his border forces, and planned a defense of central Manchuria, where the bulk of the population was located.

Japanese military intelligence, however, failed to ascertain the extent of the Soviet buildup and believed that the terrain in the Trans-Baikal, where the Soviets planned their main attack, would be impenetrable to armor. Fearing Japan's use of biological agents, the Soviets vaccinated their troops against plague and other diseases and issued masks to them.

The Soviets presented their declaration of war to Japanese ambassador Satō Naotake in Moscow only minutes before they attacked. Soviet plans called for nearly simultaneous night attacks from the three fronts beginning after midnight on August 9, 1945, all to converge on the central plain of Manchuria. Vasilevsky later acknowledged that U.S.-supplied trucks and fuel landed at Vladivostok were vital in the Soviets' ability to launch this campaign as rapidly as they did.

The main attack was delivered by the Trans-Baikal Front of Marshal Rodion Malinovsky, operating from Mongolia. The Sixth Guards Tank Army, with 1,019 tanks and self-propelled guns, acted, in effect, as a forward detachment. The intent was to bypass Japanese strongpoints where possible to preempt the defenses of the Japanese Third Area Army. The Soviets raced for the 6,600-feet-high passes of the Greater Khingan Mountains and managed to cover 300 miles in only three days, encountering more problems from the terrain and fuel shortages than from the Japanese. The Japanese forces held on to Haliar until August 18. Changchun and Mukden (Shenyang) fell on August 21. Meanwhile, air-landed troops entered Darien and Port Arthur on August 19, followed by forces sent via rail.

Driving from the Soviet Maritime Provinces, Marshal Kirill Meretskov's 1st Far Eastern Front had to overrun or bypass seven fortified districts held by the Japanese First Area Army. Attacking in a torrential thunderstorm, the Soviets skirted around most fortified areas, leaving their reduction to follow-on forces. Mutanchiang was held by Japanese forces until August 16. Soviet aircraft dominated the skies, with the few Japanese planes seeking refuge in Korea or Japan.

Although considered of secondary importance to the deeper pincerlike thrusts of the other fronts, the efforts of the 2nd Far Eastern Front in northern Manchuria, supported by the Amur River Flotilla, tied down some of the best-prepared Japanese forces by crossing the Amur and moving up the Sungari River toward Harbin. Although the Japanese emperor had signed the Imperial Rescript of Surrender on August 14 and the Guandong Army's commander, General Yamada, had accepted it on August 18, the Soviets were determined to regain the territories lost in the 1904–1905 Russo-Japanese War. Thus, Soviet forces continued combat operations in Korea until the armistice on September 2, by which time they had reached the 38th parallel, and in the Kuriles until September 5. The Soviets subsequently turned over a huge cache of Japanese weapons to the People's Liberation Army of Mao Zedong (Mao Tse-tung), including 3,700 guns, 600 tanks, and 861 aircraft.

During the campaign, the bulk of the Guandong Army was not committed to battle, but the Soviets estimated that 83,737 Japanese were killed compared with Soviet casualties of more than 12,000 dead and nearly 25,000 wounded. More than 100,000 Japanese in Manchuria died after the cease-fire, and an estimated 594,000 Japanese prisoners were taken back to forced-labor camps in the Soviet Union.

Manhattan Project

Crash program led by the United States to develop an atomic bomb. The discovery of fission in uranium by Otto Hahn and Fritz Strassman in 1938 led physicists such as Enrico Fermi and Leo Szilard to suggest the feasibility of sustained nuclear chain reactions, promising a quantum leap in destructive

power if harnessed in “atomic” bombs. Szilard approached Albert Einstein in 1939 with the idea of writing a letter to President Franklin D. Roosevelt warning of this possibility and of German research into nuclear fission. Szilard and Einstein’s letter prompted Roosevelt to appoint the Uranium Committee to explore the feasibility of developing an atomic bomb. In the spring of 1940, a British memorandum by Rudolf Peierls and Otto Frisch, titled “On the Construction of a ‘Super-bomb’; Based on a Nuclear Chain Reaction in Uranium,” concluded that “a moderate amount of Uranium 235 would indeed constitute an extremely efficient explosive.” On the U.S. entry into the war in December 1941, British and American cooperation increased.

Recognizing that a project to build atomic bombs would require immense industrial resources, the Americans took the lead. They organized the Manhattan Engineer District of the Army Corps of Engineers in 1942. Vannevar Bush, head of the Office of Scientific Research and Development (OSRD), appointed Brigadier General Leslie Richard Groves, who had overseen construction of the Pentagon, to direct the Manhattan Project.

Sustaining and controlling a nuclear chain reaction was the first crucial technical step. Fermi’s team accomplished this at the Metallurgical Laboratory at the University of Chicago on December 2, 1942. Fermi thus proved that a larger reactor could produce enough of a highly fissionable isotope of plutonium (^{239}Pu) to make a bomb. Work began on a reactor complex at Hanford, Washington, to produce the required plutonium.

The uranium 235 (U-235) isotope mentioned in the Frisch-Peierls memorandum also held considerable promise as bomb material and was pursued simultaneously. Separation of U-235 from U-238 was accomplished at Oak Ridge, Tennessee, by gaseous diffusion and electromagnetic separation in an immense plant that covered 43 acres and employed 31,000 people. As work progressed, Groves recognized that a central laboratory was needed to design, develop, and assemble the bombs. He chose Julius Robert Oppenheimer to direct what became known as Los Alamos (New Mexico) Laboratory. Work began there in the spring of 1943.

Intense secrecy and compartmentalization characterized the Manhattan Project, but at Los Alamos, Oppenheimer fostered a spirit of collaboration, camaraderie, and open communication. Design and assembly of the ^{235}U bomb was straightforward in that a gun-type method could be used to initiate

the explosion. The time-consuming process of separating U-235 was the chief difficulty, but Oak Ridge eventually succeeded in isolating enough U-235 for Oppenheimer's team to assemble "Little Boy," the bomb used on Hiroshima on August 6, 1945.

By mid-1945, Hanford had produced enough ^{239}Pu for three bombs, but they required a complex implosion device with multiple detonators firing simultaneously to create compression waves that would initiate a core explosion. In 1944, to tackle the implosion design challenge, Oppenheimer called on George Kistiakowsky to head the effort to produce the necessary shaped charges. His design was successfully tested at Alamogordo, New Mexico, on July 16, 1945, and used in "Fat Man," the plutonium bomb that devastated Nagasaki on August 9, 1945. At a cost of $2 billion, Manhattan Project scientists and engineers had achieved the seemingly impossible—producing three atomic devices by August 1945 that fundamentally changed the nature of warfare, vastly enlarging humanity's capacity for mass destruction.

Debate about whether the atomic bomb attacks were justified or needed to end the war continues. Certainly, even after it became apparent by 1944 that Germany had abandoned its effort to produce atomic bombs, nearly all members of the Manhattan Project team continued to press ahead. The ultimate decision to use the bombs rested with President Harry S. Truman, who never doubted that they were a major factor in Japan's decision to surrender, thereby saving tens of thousands of Allied lives.

The project's technical success strengthened an emerging military-industrial complex in the United States and led to the formation of the Atomic Energy Commission in 1946. Further research into nuclear weapons production led to the successful test of a hydrogen bomb in 1952, ushering in a new and frightening thermonuclear age.

Manila, Battle for (February 3–March 3, 1945)

Battle for the capital of the Philippines. Located on the island of Luzon, Manila was one of the largest cities of Southeast Asia, with a population of more than 800,000 people. The Japanese commander in the Philippines, General Yamashita Tomoyuki, had 250,000 men on Luzon, a figure that General Douglas MacArthur's intelligence chief, Major General Charles A. Willoughby, had grossly underestimated.

Beginning on January 9, 1945, General Walter Krueger's Sixth Army assaulted the western coast in the Lingayen Gulf. The Japanese made no effort to contest the landing, and that first day 68,000 men went ashore. They then drove southward toward Manila. Major General Oscar W. Griswold's XIV Corps had the right flank, and Major General Innis P. Swift's I Corps was on the left. I Corps had the more difficult going.

Beginning on January 30, units of Lieutenant General Robert L. Eichelberger's Eighth Army began landing north and south of Manila. Major General Charles P. Hall's XI Corps landed in the Subic Bay area, helping to seal off the Bataan Peninsula and preventing the Japanese from repeating the American defense of 1942. Meanwhile, on January 31 two regiments of Major General Joseph M. Swing's 11th Airborne Division went ashore at Nasugbu, about 45 miles southwest of Manila. On February 3, the division's remaining regiment was air-dropped on Tagaytay Ridge, 30 miles south of the city. The next day, elements of the 11th Airborne Division reached Paranaque, just south of Manila.

MacArthur urged a rapid advance. While the 37th Infantry Division of Griswold's corps pushed toward Manila from the north, the lighter and more mobile 1st Cavalry Division also drove on the city. It had just landed to reinforce Griswold's corps, and MacArthur ordered the cavalry division to

advance as fast as possible. Elements of the 1st Cavalry reached the northeastern outskirts of Manila on February 3, the first U.S. unit to do so. As darkness fell, one of its tanks smashed through the gates of Santo Tomas University, releasing 4,000 American prisoners held there.

Rear Admiral Iwabuchi Sanji now defied Yamashita's orders to withdraw from the city and utilized his 18,000 men, mostly naval personnel, to stage a fanatical monthlong block-by-block and house-by-house defense of the city. As units of the 1st Cavalry and 37th Divisions closed on Manila, Iwabuchi's forces withdrew across the Pasig River, destroying its bridges and setting fire to the highly flammable residential areas. For the next several days, American forces battled these flames.

General MacArthur had hoped that Manila would fall without significant damage to the city. On February 6, he announced in a communiqué that the complete destruction of the Japanese in Manila was "imminent." To save civilian lives, he ordered that no air strikes be utilized. This order did not pertain to artillery fire, however, and its heavy use by both sides produced many civilian casualties. The doomed Japanese defenders also went on an orgy of murder and rape, killing thousands of innocent Filipinos.

Smoke and flames pour from the old walled city section of Manila as American forces shell the Japanese garrison holding out in that part of the city. (Keystone/Getty Images)

By February 22, the 37th Division had driven the Japanese defenders into the old walled portion of the city (Intramuros) and the modern business district. In the Intramuros, U.S. troops had to fight the Japanese, who were well dug in, one building at a time. Many buildings were simply turned into rubble by the unrestricted support fire, as breaching the buildings with infantry was virtually impossible.

By February 26, 1945, the remaining Japanese resistance was compressed into the three Philippine Commonwealth government buildings off the southeast corner of the walled city. The last organized Japanese resistance was in the Finance Building. Late on March 3, 1945, General Griswold reported that all organized resistance in the Manila area had ended.

The Battle for Manila cost the Americans 1,010 killed and 5,561 wounded. The Japanese lost perhaps 16,000 men in and around the city. In addition, more than 100,000 Filipino civilians were killed in the battle, and perhaps 70 percent of Manila was leveled. Thirty-nine bridges, including the six major bridges over the Pasig River, were destroyed, and port facilities were badly damaged.

Mannerheim, Carl Gustav Emil von (1867–1951)

Finnish field marshal and president of Finland (1944–1946). Born in Louhisaari, Finland, then part of the Russian Empire, on June 4, 1867, Carl

Gustav Emil von Mannerheim graduated from the prestigious Nikolaevsky Cavalry School in Saint Petersburg in 1889. Initially commissioned into a dragoon regiment based in Poland, he transferred to the Chevalier Guards Regiment in Saint Petersburg in 1890. Following a posting to the Cavalry School, Lieutenant Colonel Mannerheim saw combat in the 1904–1905 Russo-Japanese War and was promoted to colonel.

Between 1906 and 1908, Mannerheim led a special mission for the Russian government, collecting intelligence along Russia's border areas in the Far East. Mannerheim's excellent reports made a favorable impression on Czar Nicholas II, whom he met in 1908. Mannerheim then commanded cavalry units in Poland and was promoted to major general. He saw considerable combat during World War I, was promoted to lieutenant general in June 1917, and then commanded VI Cavalry Corps.

Mannerheim opposed the March 1917 revolution that deposed the czar and, following the Bolshevik Revolution of November 1917, retired from the Russian Army and returned to Finland. He then commanded the White Army in Finland, defeating the Red Guards and freeing Finland of Russian troops. Thereafter, he resigned his command and traveled in Western Europe. Appointed regent in December, he returned to Finland. After being defeated in the presidential election of July 1919, he retired from public life and traveled widely.

Field Marshal Carl Gustav Emil von Mannerheim commanded Finnish forces during World War II and was president of Finland from 1944 to 1946. (Library of Congress)

Mannerheim returned to public service as minister of defense in 1931. As part of a program of bolstering Finland's defenses, he oversaw construction of what became known as the Mannerheim Line, which held invading Soviet troops at the beginning of the 1939–1940 First Finnish-Soviet War (Winter War). He commanded Finnish forces in the Winter War and in the renewal of fighting with the Soviet Union between 1941 and 1944 (the Continuation War). Promoted to field marshal in 1942, Mannerheim became president of Finland in 1944 and negotiated the armistice with the Soviet Union. He retired because of ill health in 1946 and moved to Switzerland to write his memoirs. Mannerheim died in Lausanne, Switzerland, on January 28, 1951.

Manstein, Erich von (1887–1973)

German Army field marshal. Born in Berlin on November 24, 1887, of military stock, Fritz Erich Georg Eduard von Lewinski took the name Manstein from his uncle, who adopted him after his father's death in 1896 (he also dropped the name Fritz at this time). Manstein received a commission in 1906, serving in his uncle Paul von Hindenburg's regiment. World War I interrupted his studies at the War Academy. Manstein participated in the capture of Namur in Belgium and then served on the Eastern Front, where he was wounded in November 1914. Thereafter, he held staff assignments.

Manstein continued in the army after the war, and in 1919, he was chief of staff of the Berlin Military District, helping to draw up plans for the new 100,000-man army. In October 1920, he commanded a company of the 5th Infantry Regiment in Pomerania.

German field marshal Erich von Manstein, a masterful tactician and one of the leading German generals of World War II. (Ullstein Bild via Getty Images)

Promoted to major in 1927, he held staff positions; in September 1929, he was in the Operations Branch of the Truppenamt (the clandestine General Staff). Promoted to lieutenant colonel, he commanded a battalion of the 4th Infantry Regiment in October 1932. In December of the next year, he was promoted to colonel. In July 1935, he was assigned as chief of the Operations Branch of the General Staff, and in October 1936, he was promoted to major general. In February 1938, Manstein became deputy to the chief of staff of the army, General Ludwig Beck, but his opposition to Adolf Hitler's rearmament program led to his reassignment as commander of the 18th Division in Silesia. That August, he was reassigned as chief of staff in General Wilhelm von Leeb's Army Group South. Promoted to lieutenant general in April 1939, Manstein was named chief of staff of Arbeitsstab Rundstedt (Working Staff Rundstedt) and helped plan the invasion of

southern Poland and the capture of Warsaw. In August, he was named chief of staff to General Karl Gerd von Rundstedt's Army Group South, a post he held through the Polish Campaign. In October 1939, Manstein was appointed chief of staff of Army Group A under Rundstedt in the west and helped develop an alternative to the plan for the invasion of France (the Sickle Cut, Sichelschnitt), which Hitler adopted.

In February 1940, Manstein took command of XXXVIII Corps, which he led during the Battle for France (May 10–June 25, 1940). Promoted to general of infantry in June 1940, he assumed command of the LVI Panzer Corps in East Prussia assigned to Colonel General Erich Hoepner's Panzer Group, Army Group North, in May 1941. Manstein advanced over 100 miles in the first two days of Operation BARBAROSSA, the June 22 invasion of the Soviet Union, and seized the key bridges at Dvinsk. When the commander of the Eleventh Army, Colonel General Eugen Ritter von Schobert, was killed, Manstein was transferred to Army Group South in September to take command and began the conquest of the Crimea. After hard fighting, Manstein's forces managed to secure Sevastopol on July 2, 1942, the day after his promotion to field marshal.

In August 1942, Manstein was ordered to take a stripped-down Eleventh Army to relieve the Eighteenth Army south of Leningrad. He fought a series of costly battles with some success, suffering 60,000 casualties in the process. He urged Hitler to concentrate in the center part of the Eastern Front, without success. Briefly moved into Army Group Center's sector, Manstein was ordered by Hitler, in November 1942, to assume command of the newly formed Army Group Don on both sides of Stalingrad, between Army Group A in the Caucasus and Army Group B. Assigned the mission of rescuing the Sixth Army in Stalingrad and working with only three panzer divisions, Manstein's Operation WINTER STORM fought his way to within 35 miles of the German perimeter before being halted. He did succeed in preventing the Soviets from taking Rostov and trapping German Army Group A.

In February 1943, the Soviets drove to the Donets River and recaptured Kursk, Rostov, and Kharkov to the west, leading Hitler to approve a counterattack. Manstein exploited Soviet fuel shortages with a panzer attack from the south that resulted in the recapture of Kharkov and Belgorod in March 1943. He attempted to entice the Soviet Army's South and Southwest Fronts into a similar indiscretion near Odessa, but Hitler insisted instead on

Operation CITADEL to reduce the Kursk Salient. Although the Germans made some headway in the Battle of Kursk (July 5–13), their offensive soon ground to a halt in what was the largest tank battle of the war.

Hitler's policy of refusing to allow withdrawals frustrated Manstein's approach based on an elastic defense, and Manstein's frankness did not ingratiate him with the German dictator. Manstein fought to prevent a Soviet encirclement after being forced to cross the Dnieper. The Soviets finally succeeded in encircling Manstein's forces in the Cherkassy pocket, but he managed to extract the bulk of two corps.

Manstein never could convince Hitler to allow the appointment of a chief of staff for the Eastern Front. A March 1944 conference with the führer at Berchtesgaden led to a heated exchange and Manstein's relief as commander of Army Group South in April. Manstein declined to participate in the July 1944 putsch against Hitler.

Manstein was arrested in May 1945 at the end of the war and held in Great Britain. Tried and convicted in 1949 for war crimes involving the executions of Jews, Romas (Gypsies), and Crimean Tartars in his rear areas and enforcement of the Commissar Order, he was sentenced to 18 years of imprisonment in February 1950. He was freed in May 1953 for medical reasons. Between 1955 and 1956, Manstein headed a committee to advise the government on the creation of a new German Army. Manstein died in Irschenhausen, Bavaria, on June 11, 1973. British military historian Basil Liddell Hart called Manstein the ablest German general of the war.

Manteuffel, Hasso Eccard von (1897–1978)

German Army general. Born on January 14, 1897, in Potsdam, Germany, into an old aristocratic Prussian military family, Hasso Eccard von Manteuffel saw action as a cavalry officer on the Western Front during World War I. He remained in the regular army after the war.

Manteuffel transferred to the armored forces in 1934 and then taught at the Panzer Training School at Wünsdorff; thereafter, he served in the Inspectorate of Panzer Troops, helping to carry out the motorization of four infantry divisions. In February 1939, Manteuffel became head of the staff of the Panzer Troops Training School II in Berlin-Kramprintz. He was a regimental commander in the 7th Panzer Division during the Battle for France (May 10–June 25, 1940) under major general Erwin Rommel and during Operation BARBAROSSA, the June 22, 1941, invasion of the Soviet Union. On November 27, 1941, Manteuffel's unit captured a key bridge across the Volga-Moscow Canal north of Moscow, about 20 miles from the capital. He was awarded the Knight's Cross of the Iron Cross for this exploit.

Ordered to North Africa in July 1942, Manteuffel commanded a collection of units known as Division Manteuffel. In the final days of the 1940–1943 North African Campaign, he collapsed from exhaustion and was evacuated. Promoted to major general in May 1943, Manteuffel assumed command of his old unit, the 7th Panzer Division, in August 1943.

Manteuffel's division distinguished itself in the recapture of Zhitomir that November, an action for which he became known as the "Lion of Zhitomir"; he was promoted to lieutenant general in February 1944. That same month, he took command of the elite Panzergrenadier Grossdeutschland Division. At one point Soviet forces surrounded the division, but Manteuffel extricated his entire force and later inflicted heavy losses on the Soviets near Jassy, Romania. The Grossdeutschland Division was transferred to East Prussia in August 1944.

Adolf Hitler promoted Manteuffel to general of panzer troops in September 1944 and placed him in command of the Fifth Panzer Army,

which was engaged against U.S. forces in eastern France and Lorraine. Manteuffel was one of the few general officers who went directly from divisional to army command and completely bypassed corps command.

Manteuffel's army was assigned to support Josef "Sepp" Dietrich's Sixth Panzer Army in the Ardennes Offensive (December 16, 1944–January 25, 1945). Manteuffel agreed with Field Marshal Walther Model that Hitler's plan was too ambitious for the forces available and instead advocated Model's proposed "small solution." Hitler refused to accept Model's plan, however. During the offensive, Manteuffel's forces were active at Saint Vith, Clervaux, and Bastogne.

Despite the failure of the offensive, Manteuffel retained Hitler's confidence and was awarded the Diamonds to the Knight's Cross of the Iron Cross. In March 1945, Manteuffel took command of the battered Third Panzer Army, defending the Oder River below Stettin. Although continually pushed back by superior Soviet forces, Manteuffel maintained unit cohesion and was able to retreat and surrender to the Western Allies on May 3.

After the war, Manteuffel spent two years as a prisoner of war. Released in December 1947, he engaged in business and joined the Free Democratic Party (FDP) in 1949. From 1953 to 1957, he was an FDP deputy in the Bundestag. Manteuffel was a popular guest lecturer for American and North Atlantic Treaty Organization (NATO) groups and at Battle of the Bulge commemorations. He also wrote about the war. Manteuffel retired in Diessen am Ammersee, Germany, where he died on September 28, 1978.

Manzhouguo

Name meaning “state of the Manzhus (Manchus),” given by the Japanese to Manchuria (Manchukuo) after their occupation of that Chinese territory in 1931. The Japanese began establishing a significant military presence on mainland Asia with the Sino-Japanese War of 1894. In 1900, Japanese forces took part in suppressing the Boxer Uprising and remained in China as one of the occupying powers thereafter. At the end of the 1904–1905 Russo-Japanese War, Japan controlled Korea and had large numbers of troops in Manchurian China. Its Guandong (Kwantung) Army was formed from these occupying forces, with the mission of supporting Japanese interests in China and Manchuria. In 1928, Manchurian warlord Zhang Zuolin (Chang Tso-lin) was assassinated in a Guandong Army plot to gain greater control of the region. Zhang Xueliang (Chang Hsueh-liang) replaced his father and quickly became an ally of the Nationalist government of Jiang Jieshi (Chiang Kai-shek).

Amid tensions between the military and political leadership of Japan, the increasingly independent Guandong Army began a military campaign to regain control of Manchuria. On September 18, 1931, its staff officers in southern Manchuria set off an explosion close to the main line of the South Manchuria Railway near Mukden (Fengtien after 1932 and Shenyang today), blaming the act on nearby Chinese soldiers. Guandong Army leaders used the Mukden Incident (or Manchurian Incident) as the excuse to take control of Mukden and mount a campaign to conquer all Manchuria. Presented with a fait accompli by its own military, Tokyo nonetheless supported the action.

By October 1931, Japanese forces controlled all of Manchuria. The Japanese falsely claimed that they had acted only in self-defense and insisted that the crisis be resolved through direct negotiations with China. The Chinese government, however, appealed to the League of Nations; this was the first major test involving aggression for that organization. The League Council was reluctant to initiate tough action against Japan without the assurance of support from the United States, which was not forthcoming. The British also opposed strong action.

In February 1933, the League Assembly voted to approve the report of its investigating committee, which blamed Japan. It also approved a resolution that called on League of Nations states to adopt a doctrine of nonrecognition of Manchukuo. Japan alone among the 42 member states voted no. The Japanese delegation then walked out, and Tokyo gave formal notice of its intention to withdraw from league membership.

In March 1932, meanwhile, the Japanese established Manchukuo. Larger than France and Germany combined, this puppet state of Japan had a population of some 34 million people. In March 1933 Japan added to it the Chinese province of Jehol, and in 1935 it added eastern Chahar.

The Chinese people deeply felt the loss of their five “eastern provinces,” and this led to strong anti-Japanese nationalism in China, especially among the educated classes and students. In 1936 in the aftermath of the Xi’an (Sian) Incident, a united front of Nationalists under Jiang Jieshi and Communists under Mao Zedong (Mao Tse-tung) was formed to oppose Japanese imperialism in China. Tensions continued to mount, and in July 1937 an incident at the Marco Polo Bridge near Beijing (Peking) between Japanese and Nationalist forces precipitated the Second Sino-Japanese War, marking the effective beginning of World War II in Asia.

Nominally independent, Manchukuo had a Chinese dynastic figurehead in the last Qing (Ch’ing) emperor, Aixinjueluo Puyi (Aisingioro P’u-i, known to Westerners as Henry Puyi), after which the state became known as Manzhoudiguo (Manchoutikuo), but Japanese officials controlled its affairs and instituted an immigration policy that brought in thousands of Korean and Japanese settlers. Some 240,000 Japanese in Manchuria increased to 837,000 by the end of the war. Japan maintained its control of Manchuria until the last weeks of World War II.

On August 9, 1945, the Soviets launched a three-pronged offensive designed to capture Manchuria and destroy the vaunted Guandong Army. The Soviet’s bold operation ended by August 16. The experienced Soviet commanders and their battle-tested formations quickly defeated the defending Japanese forces and gained control of Manchuria.

Soon after the end of the war, U.S. forces acted to support the large-scale redeployment of Nationalist troops to accept the surrender of Japanese forces and regain control of the lost territory. Jiang utilized some of the surrendered

Japanese forces in northeast China to fight the Communists in the opening rounds of the Chinese Civil War.

Mao Tse-tung

See Mao Zedong

Mao Zedong (1893–1976)

Chinese political and military leader. Born on December 26, 1893, into a prosperous peasant family in Shaoshan (Shao-shan), Hunan Province, in central China, Mao Zedong (Mao Tse-tung) graduated from the Fourth Teacher's Training School in Changsha, Hunan, and also read extensively in both Chinese and Western literature, philosophy, politics, and economics, including Marxist theory. Like many other young Chinese intellectuals of his time, Mao embraced revolutionary thinking, and in July 1921, he attended a meeting in Shanghai in Jiangsu (Kiangsu) Province, where the Chinese Communist Party (CCP) was founded.

Mao became a labor organizer. In the mid-1920s, following Soviet instructions, he and other Chinese Communists cooperated with the Nationalist Party—the Guomindang (Kuomintang, GMD)—of President Sun Yixian's (Sun Yatsen). Mao held several posts in the Guomindang, and in

1925, he was appointed secretary of its propaganda department. After Sun's death that year, Jiang Jieshi (Chiang Kai-shek)—head of the Huangpu (Whampoa) Military Academy in Guangzhou (Canton), Guangdong (Kwangtung) Province, which had been cofounded by Communists and Nationalists two years earlier—won control of the GMD.

In 1926, Jiang began to eliminate rival political groupings, purging Communists from GMD positions and launching the 1926–1927 Northern Expedition against assorted warlords. In 1927, he turned against Communists who had escaped his purge and proceeded to establish a base in Jiangxi (Kiangsi) Province, suppressing several Communist insurrections that year, including the Autumn Harvest Uprising of peasants and guerrillas led by Mao.

Joined by renegade GMD army officers Zhu De (Chu Teh) and Lin Biao (Lin Piao), who took their troops to join him, Mao founded the Jiangxi Soviet Republic, a communist redoubt in the province's southeast area. Mao became chairman of the organization in October 1931. At that time, Mao and Zhu elaborated theories of relying on peasant warfare and guerrilla tactics to win control of China, rejecting orthodox Marxist teachings that the urban proletariat had to be the driving force of revolution. By 1933, their base harbored an army numbering 200,000.

The Communists launched several uprisings in major Chinese cities, posing a threat to the authority of Jiang, who took Beijing (Peking) in Hebei (Hopeh) Province in 1928, unifying all China south of the Great Wall, and headed a new GMD government beginning in October. From 1930 onward, Jiang mounted annual campaigns against the Soviet republic, and eradicating it apparently ranked higher in his priorities than opposing Japan's 1932 establishment of a puppet government in China's northeastern region of Manchuria.

In 1934, GMD forces encircled the Jiangxi Soviet. Mao and Zhu broke out, leading over 100,000 followers on the epic 6,000-mile Long March to Yan'an (Yenan) in northern Shaanxi (Shensi); during this march, heavy fighting and harsh conditions reduced their numbers to 7,000, and Mao was forced to abandon two of his own children. In 1935, he was elected CCP chairman. That same year, Jiang ordered troops under Zhang Xueliang (Chang Hsüeh-liang), a prominent northern Manchurian warlord who had pledged allegiance to him, to attack the Communists—orders they rejected,

urging all Chinese to join forces against the Japanese. In the December 1936 Xi’an (Sian) Incident in Shaanxi, Zhang kidnapped Jiang and forced him to form a united anti-Japanese front with the Communists.

Mao Zedong (old spelling Mao Tse-tung) led the communist side in the civil war against the Nationalists in China and was the leader of the People's Republic of China from 1949 to 1976. Although remembered as a key figure in making China a major player on the world stage, he was also responsible for the disastrous Great Leap Forward and the Cultural Revolution that brought the deaths of tens of millions of Chinese. (The Illustrated London News Picture Library)

In July 1937, the Battle of Marco Polo Bridge in Lugou-qiao (Lukouch'iao) sparked full-scale war between Chinese and Japanese troops, and in 1938, GMD forces retreated to Chongqing (Chungking) in the southwestern Province of Sichuan (Szechwan). From their Yan'an base, the Communists effectively controlled northwestern China, and the GMD controlled the southwest. Mao's Red Army, rechristened the Eighth Route Army, participated in fighting against Japanese troops, and Communist guerrilla forces operated in Henan (Honan), Zhejiang (Chekiang), and Shandong (Shantung) Provinces. Mao still anticipated that the communists would eventually gain control of China; meanwhile, he consolidated his

authority within his own party, which adopted a constitution accepting his teachings as its official ideology in 1945.

By early 1941, the Communist-Nationalist front had largely broken down after Nationalist units defeated the Communist New Fourth Army near the Changjiang (Yangtze) Valley. From then until 1945, Communists concentrated their energies on establishing guerrilla bases and securing peasant support behind Japanese lines, efforts that harassed the enemy and also helped to assure them ultimate postwar control of these areas. When the war ended in August 1945, incoming Soviet troops facilitated Chinese Communist moves to take control of much of Manchuria. In early 1946, GMD and Communist forces resumed fighting each other, and U.S. attempts in late 1945 and all of 1946 to negotiate a truce foundered due to both sides' deeply rooted antagonism.

Civil war continued until January 1949, and the following October, Mao proclaimed the new People's Republic of China, which the United States only recognized in January 1979. Until his death, Mao remained China's supreme leader, dominating the country's politics. He was responsible for several controversial policies, including the November 1950 decision to attack U.S.-led United Nations forces during the Korean War, the economically disastrous Great Leap Forward between 1958 and 1962, and the Great Proletarian Cultural Revolution of 1966, a socially divisive campaign designed to induce a state of permanent revolution in China. Mao died in Beijing on September 9, 1976.

Maquis

Term describing French guerrilla units that fought as part of the French Resistance. The word “maquis,” which means “scrub” or wild brushy land, originated with 18th-century guerrilla fighters on Corsica. In World War II, the term identified French men and women who fled to the brush or hills instead of reaching accommodation with the occupying Germans. These resisters formed armed camps to fight the Germans. As the Maquis grew, arms, food, leadership, and training were required. Ultimately, the Maquis became affiliated with the Mouvements Unis de la Résistance, under its military chief, Henri Frenay. Frenay appointed Michel Brault, who is said to have originated the term “maquis,” as head of the Service Maquis.

Maquis membership was diverse and included those determined to fight the Germans and those escaping the Service de Travail Obligatoire (STO), the German compulsory labor service. Its members came from all walks of life; students, workers, and farmers were included. Although these Resistance groups were scattered and disconnected, the Western Allies provided some assistance through the U.S. Office of Strategic Services (OSS) and especially the British Special Operations Executive.

The Allies provided some arms, money, supplies, and training for specialists to the many Resistance groups, including the Maquis. Such U.S. and British assistance was limited, however, in part from the fear that the Maquis might complicate or even compromise the well-organized invasion plans of the United States and Britain.

Initially, the Maquis was based in Vichy France, but after the Germans occupied that area in November 1942, Maquis units appeared throughout France. Even some Spanish Republicans formed Maquis units. The Maquis assisted in rescuing downed Allied airmen and smuggling them out of France so they might return to Britain. These units also conducted limited sabotage attacks against German forces from 1940 to 1943; they stockpiled weapons, explosives, and supplies dropped by the Allies in order to play a role in the liberation of France. In 1944, all French Resistance groups, including the Maquis, were merged to form the Forces Françaises de l’Intérieur (French Forces of the Interior, FFI).

Prior to the June 6, 1944, Normandy landings, Resistance units throughout France, including the Maquis, gathered intelligence on German

dispositions. During Operation OVERLORD, the Allied invasion of Normandy, Maquis units in northwestern France conducted sabotage operations and destroyed key bridges, rail lines, and communication centers to isolate the Allied landing sites from German reinforcement. Supreme commander of the Allied Expeditionary Force General Dwight D. Eisenhower believed that this support was invaluable and worth an estimated 15 extra divisions to the operation. No doubt, this assessment was exaggerated, but the French Resistance contribution was important.

German reprisals against Maquis units were swift and often bloody, and many Maquis groups operating far from Normandy were hunted down. Between July 18 and 23, 1944, German forces encircled and wiped out nearly 3,000 Maquisards on the natural defensive position of the Vercors Plateau in southern France. The Germans also carried out reprisals against French civilians in the area. During the 1944 campaign for France, Germans retreating from the Allied advance or trapped behind enemy lines willingly surrendered to British and American forces to avoid the ferocity of the Maquis. Regardless of their exact contribution to the Allied victory, members of the Maquis helped to restore French national pride, especially after the debacle of the defeat of the French Army in June 1940.

Marco Polo Bridge, Battle of (July 7, 1937)

Armed clash between Japanese and Chinese troops in northern China at Lugouqiao (Lukouch'iao) in July 1937 that sparked full-scale warfare between the two countries. From at least 1894–1895 and the First Sino-Japanese War, Japan and China had poor diplomatic relations. Japan sought to increase its influence in northern China, holding Hebei (Hopeh) Province, administering much of the Shandong (Shantung) Peninsula as a virtual protectorate, and claiming special rights over various strategic railway lines.

During the mid-1930s, Chinese resentment of Japanese incursions grew dramatically. In 1935, troops commanded by Marshal Zhang Xueliang (Chang Hsüeh-liang), a leading Manchurian warlord who had sworn allegiance to Guomindang (GMD) leader Jiang Jieshi (Chiang Kai-shek), the president of China, defied the latter's orders to launch another campaign against the Chinese Communists. Marshal Zhang contended that all Chinese political factions should unite against the Japanese invaders, not fight each other. In December 1936, Zhang kidnapped Jiang at a spa in Xi'an (Sian) in China's far west Shaanxi (Shensi) Province, not releasing him until he agreed to an anti-Japanese rapprochement with Communist leaders. Jiang also probably agreed to take a harsher line toward future Japanese incursions.

On July 7, 1937, a skirmish occurred between Chinese and Japanese troops stationed near the historic Lugouqiao (Lukouch'iao) Marco Polo Bridge in the vicinity of Peking (Beijing). Japanese forces on night

maneuvers fired blank cartridges, prompting nearby Chinese soldiers to retaliate with live fire, although without injuring anyone. At the next day's roll call one Japanese soldier was missing, and his commander assumed that he had been taken captive by Chinese units based in nearby Wangping (Wangp'ing). On July 8, the Chinese commander refused entry to Japanese forces seeking the missing soldier, whereupon the Japanese unsuccessfully attacked the town. The missing soldier, who apparently had never been in Chinese custody, reappeared the following day, and both sides began negotiations intended to resolve the dispute, which initially involved only 135 Japanese troops.

Although Japanese officials undoubtedly sought to increase their influence in Wangping and the neighboring Lugouqiao area, the initial incident was, in all probability, a spontaneous accident, not a premeditated effort to provoke a broader crisis. Such minor incidents were not uncommon. In this case, however, officials in both governments seized on the event as a pretext to demand a broader comprehensive settlement of outstanding issues dividing Japan and China. Japanese military commanders in Manzhouguo and northern China sought extensive concessions from China, whereas Jiang feared that further acquiescence in Japanese demands would irretrievably damage his political standing.

On July 20 Jiang sent several Chinese divisions to reinforce northern China, and Japanese forces quickly seized control of the entire Beijing-Tianjin (Tientsin) area, transferring 15 additional divisions there and killing several thousand Chinese. Japan sought outright control of northern China, whereas Jiang insisted on maintaining full Chinese sovereignty there. Both Chinese and Japanese policies hardened until no compromise was possible, although neither side formally declared war. On August 7, however, Jiang and his advisers decided to wage a full-scale war of resistance against Japan, beginning eight years of bitter and brutal warfare between the two countries that ended only when Japan surrendered unconditionally to the Allies in August 1945.

Mareth, Battle of (March 20–26, 1943)

North African battle that sealed the fate of Axis forces in Tunisia. Following the February 14–22, 1943, Battle of Kasserine Pass, units of Field Marshal Erwin Rommel's Panzerarmee Afrika turned to face General Bernard Montgomery's British Eighth Army, then preparing to attack the German Mareth Line. The latter, built on a French defensive belt that stretched more than 20 miles from the Mediterranean to the Matmata Hills, anchored Axis defenses in southern Tunisia.

Rommel ordered his panzer divisions south to force the Eighth Army to retreat. Montgomery, warned of the impending attack by Ultra intercepts, reinforced around Medenine and defended in depth. On March 6, Rommel attacked on a wide front, his advance spearheaded by the 10th, 15th, and 21st Panzer Divisions, but Montgomery's defense forced Rommel against the strengthened center of the Eighth Army.

His offensive halted by antitank fire, Rommel renewed his attacks, which were repulsed with costly panzer losses. Because of his own deteriorating physical and mental condition, Rommel departed for Germany on March 9, leaving command to Colonel General Hans Jürgen Dieter von Arnim.

Montgomery now went on the offensive, ordering XXX Corps to advance directly against the Mareth Line. Its task was to create a gap that would allow the armor of X Corps to advance through the Gabès Gap along the coast toward Sfax and eventually Tunis. Montgomery also ordered the New Zealand Corps wide around the west flank of the Mareth Line. This column swung west and then north in an attempt to break through at the Tebaga Gap and reach the El Hamma Plain and envelop Army Group Afrika.

On the night of March 20, the 50th Division launched the main frontal assault on the Mareth Line. A foothold established on the morning of March

21 was lost the next day to counterattacks by the 15th Panzer Division. Meanwhile, on the evening of March 20, the New Zealand Corps reached Tebaga Gap, which forced Arnim to shift the 164th Light Division and eventually the 21st Panzer Division to meet this threat to his flank.

A formation of British Supermarine Spitfire fighters on patrol over De Djerba Island, off Gabès, Tunisia, in 1943. (Library of Congress)

Montgomery now altered his plan and ordered the 1st Armoured Division to follow the path of the New Zealand Corps to the Tebaga Gap, while the 4th Indian Division took a shorter swing left around the Mareth Line. On March 26, Montgomery's forces breached the Tebaga Gap and threatened the continuity of the German defenses. Arnim temporarily saved his deteriorating situation by creating a defensive line at El Hamma. When the 4th Indian Division turned the Mareth Line, though, Arnim disengaged the bulk of his forces on March 27, escaping the envelopment.

In the battle, Montgomery demonstrated his ability to improvise, although Army Group Afrika managed to escape his trap. Combined with the successful Operation TORCH landings (November 8, 1942), these developments meant that the die was now cast for the Axis powers in North Africa. Rommel had predicted that a failure to seize Medenine would be fatal; the collapse of the Mareth Line signaled the beginning of the final chapter in North Africa, which ended with the Allied capture of Tunis on May 7, 1943.

Mariana Islands Campaign (June–August 1944)

Military campaign in the Central Pacific. After securing the Marshall Islands in early 1944, U.S. military planners decided that the next step would be to bypass the Japanese-held Caroline Islands (including the stronghold of Truk) and seize the Mariana Islands. Equidistant from the Marshalls and the Japanese home islands, the 15 islands of the Marianas are spread over 400 miles, with the largest, Guam, located at the southern end of the chain. Two other large islands, Tinian and Saipan, are 100 miles north. In U.S. hands, the Marianas would offer a base for a subsequent assault on the Philippine Islands to the west and a strike at the Bonin Islands to the north (only 700 miles from the Japanese home islands) as well as a location for air bases from which B-29 strategic bombers might raid the Japanese home islands.

Japanese military leaders knew that holding on to these islands was essential to their control of the shipping routes to Southeast Asia, retention of the Philippines, and the defense of Japan itself. In consequence, the Marianas would prove much more difficult to seize than were the Gilberts and Marshalls.

For the U.S. commander of Central Pacific forces, Admiral Chester W. Nimitz, the primary objectives in Operation FORAGER were to secure Guam,

Saipan, and Tinian. Vice Admiral Raymond Spruance's Fifth Fleet would conduct FORAGER. The main naval component was Vice Admiral Marc Mitscher's Task Force 58 of four fast carrier battle groups. Also under Spruance was Vice Admiral Richmond Kelly Turner's V Amphibious Force. Its task was to put ashore the ground force of nearly six marine and army divisions under Lieutenant General Holland Smith. The forces involved in FORAGER deployed from as far away as Hawaii, 5,000 miles from the Marianas.

Beginning on February 23, 1944, Mitscher's carrier aircraft repeatedly attacked Japanese air bases in the Marianas, virtually wiping out Japanese airpower. On June 15, the 2nd and 4th Marine Divisions went ashore on Saipan. Despite intense naval bombardment that pounded the island for two days in advance of the invasion, the Japanese defenders held fast. The marines did not consolidate their beachhead until late that night, and with army reinforcements, they pushed inland over the next two weeks.

A Japanese aircraft is shot down while attempting to attack the U.S. Navy escort carrier *Kitkun Bay*, off the Mariana Islands in June 1944. (National Archives)

The Japanese had anticipated the U.S. invasion, and on its execution, Admiral Toyoda Soemu, commander of the Japanese Combined Fleet,

ordered the 1st Mobile Fleet to launch Operation A-GO, an effort to destroy the Fifth Fleet. The heavily outnumbered Japanese naval forces were supported by land-based aircraft from the Marianas and nearby islands. To meet this Japanese attack, Spruance delayed the amphibious assault on Guam scheduled for June 18.

From June 19 to 21, U.S. and Japanese naval forces met in the Battle of the Philippine Sea, essentially a contest of naval airpower and one of the largest and most decisive battles of the war. Superior numbers and pilot proficiency as well as radar carried the day for the Americans. The three-day engagement cost the Japanese three large carriers and more than 480 aircraft, in what came to be known as the "Great Marianas Turkey Shoot." U.S. losses came to 130 aircraft, with light damage to the battleship *South Dakota*. Spruance then ordered Task Force 58 to fall back on the Marianas to protect the U.S. shipping there. Spruance was criticized at the time and has been since for his failure to pursue the Japanese fully, but his primary mission was to cover the assault in the Marianas.

Meanwhile, the struggle for Saipan raged. The Japanese commanders on the island, Lieutenant General Saitō Yoshitsugu and Vice Admiral Nagumo Chūichi, both committed suicide on July 6 as the remaining Japanese defenders launched wave after wave of suicide charges, the largest of the war; this accelerated the U.S. victory. Because of Japan's effective anti-American propaganda, more than 8,000 civilians committed suicide, many by throwing themselves off cliffs on the northernmost end of the island.

Bombardment of Tinian commenced before Saipan fell on July 13. The landings on Tinian occurred on July 24. Marines stormed Tinian's northern coast and encountered little opposition. The situation soon changed, however, when the Japanese defenders regrouped and attacked the marines in fanatical but futile suicide charges. Tinian was secured by August 2.

Guam, the most important of the Marianas, had been a U.S. possession for 40 years prior to the war. Actual fighting for Guam began on July 21, when three U.S. divisions executed near perfect amphibious landings following two weeks of preinvasion bombardment. The ground troops, commanded by U.S. Marine Corps major general Roy Geiger, faced difficult terrain that favored the fanatical Japanese resistance. The Americans secured Guam by August 10, although mopping-up operations continued in some areas until the end of the war.

The capture of the Marianas accomplished five key objectives of the Pacific Campaign. The Great Marianas Turkey Shoot ended the threat from Japanese carrier-based aviation. Additionally, Guam became one of three major western bases for the Pacific Fleet, and the United States established several air bases on these islands from which to launch massive raids against Japan. U.S. forces were now in position to strike at the Philippines and cut off Japan's oil supply from the East Indies. The U.S. victory in the Marianas also prevented any further Japanese resistance to Allied operations in New Guinea. Finally, the loss of Saipan led to the collapse of Tōjō Hideki's government and his replacement as premier by Koiso Kuniaki.

MARKET-GARDEN, Operation (September 17–26, 1944)

Anglo-American offensive that included history's largest airborne operation. The brainchild of British field marshal Bernard L. Montgomery, Operation MARKET-GARDEN was designed to catapult the 21st Army Group across the Rhine River into the Ruhr, Germany's industrial heartland, and win the war in 1944. The plan called for three airborne divisions to establish a 64-mile-

long corridor through which an armored spearhead would pass, ending with Montgomery's forces vaulting the lower Rhine at Arnhem, Holland.

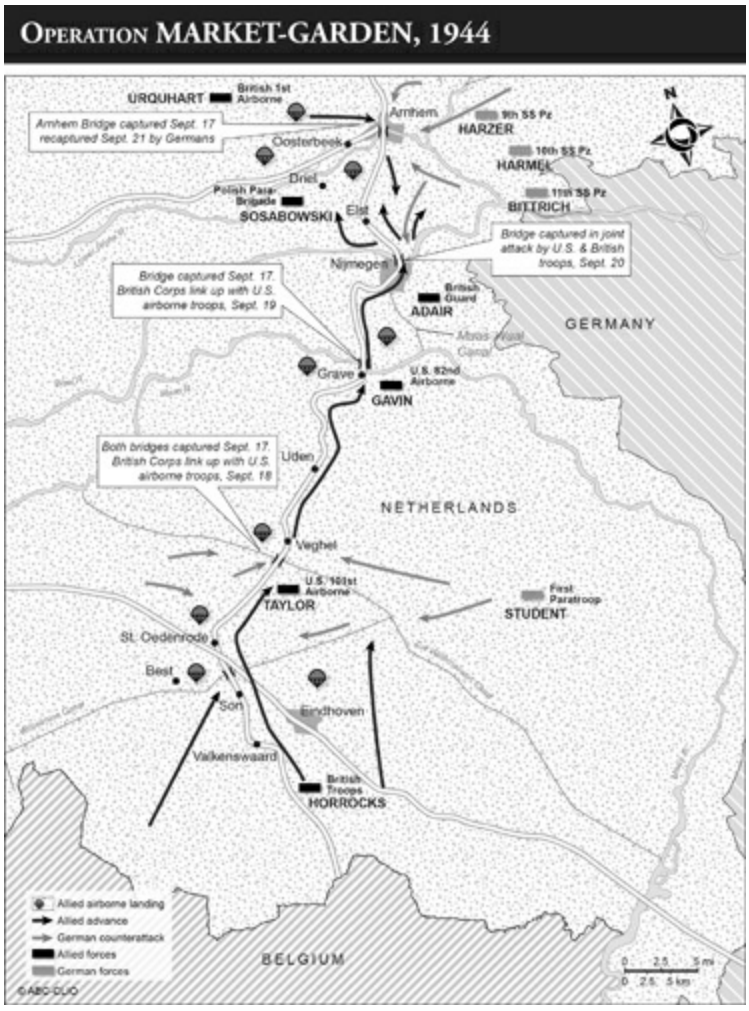
Montgomery conceived this daring plan in the full flush of victory. During the first week of September 1944, Allied intelligence reports painted a picture of a German Army that had lost all semblance of cohesion. In light of these reports and having been granted operational control of the newly formed First Allied Airborne Army as well as the U.S. First Army, Montgomery broke with his usual cautious battlefield demeanor and hastily devised MARKET-GARDEN.

Paratroopers, planes, and gliders fill the skies during Operation MARKET-GARDEN in September 1944, during which the Allies dropped more than 20,000 paratroopers and landed more than 13,500 glidermen behind German lines in the Netherlands. (Corbis)

The plan called for the establishment of an airborne corridor (MARKET) that would run in a northeasterly direction and comprise, from south to north, Major General Maxwell D. Taylor's U.S. 101st Airborne Division, dropping

near Eindhoven, Holland; Brigadier General James Gavin's U.S. 82nd Airborne Division, dropping near Nijmegen, Holland; and Major General Robert "Roy" Urquhart's British 1st Airborne Division, reinforced by Major General Stanisław Sosabowski's Polish 1st Separate Parachute Brigade, dropping outside Arnhem. All airborne forces were to be under the command of British I Airborne Corps commander Lieutenant General Frederick "Boy" Browning.

Lieutenant General Brian G. Horrocks, British XXX Corps commander, led the ground (GARDEN) component and was expected to pass approximately 20,000 vehicles over bridges seized by the 101st and 82nd Divisions and get to Arnhem within 60 hours. Prior to the operation, Montgomery's army group had taken Antwerp but had failed to secure the islands commanding the Scheldt Estuary to the west. This oversight not only negated use of the port at Antwerp but also allowed the Germans to evacuate elements of nine divisions, totaling over 65,000 men, before they could be cut off and destroyed.



Meanwhile, Hitler had appointed Colonel General Kurt Student to form the First Parachute Army from these withdrawing German forces, with the mission of stopping any further Allied advance. Student's force was subordinated to Field Marshal Walther Model's Army Group B. Model, meanwhile, also had at his disposal SS-Gruppenführer Wilhelm Bittrich's II SS Panzer Corps, comprising the 9th SS and 10th SS Panzer Divisions. These panzer divisions were refitting in the vicinity of Arnhem. The Dutch resistance warned of the presence of the German armor, but this was discounted.

Operation MARKET-GARDEN began with the simultaneous drop of elements of the 101st, 82nd, and British 1st Airborne Divisions in their respective areas during daylight on September 17. Shortly thereafter, Horrocks's XXX Corps jumped off from its line of departure, the Albert Canal, driving northward toward Arnhem.

Although taken by complete surprise, the Germans reacted quickly. They used the restrictive terrain to their advantage, slowing the Allied armor thrust while denying to the airborne elements the swift capture of their respective assault objectives. The Germans were aided by having secured the entire Allied operational plan, carried in defiance of orders by an officer who was killed in the crash of his glider during the initial assaults.

Although both the 101st and 82nd Airborne Divisions encountered unexpected resistance, they were able to secure the bridges in their areas by September 18, with the exception of two: the railroad and highway bridges over the Waal at Nijmegen. Meanwhile, XXX Corps had fought through tough German resistance to link up with the 82nd by the morning of September 19. On the next day, however, the 3rd Battalion of the 504th Parachute Infantry Regiment conducted a daylight river crossing and secured the two Waal bridges, opening the way for XXX Corps to continue its advance to Arnhem. However, elements of Bittrich's II SS Panzer Corps had taken up defensive positions between Nijmegen and Arnhem and blocked any further advance by XXX Corps. German strength continued to increase throughout the battle.

At Arnhem, Urquhart's paratroopers and glidermen landed more than eight miles from their primary objective, a highway bridge over the lower Rhine in the heart of the city. They succeeded in getting only one battalion, Lieutenant Colonel John D. Frost's 2nd Parachute Battalion, to the northern terminus of the bridge. The two SS panzer divisions in the city, reinforced by hundreds of German soldiers garrisoned throughout the area, were able to cut off Frost's battalion from the rest of the lightly armed parachute division to the west as well as from relief from the south. Holding out for three days and four nights, Frost's men were finally overrun by an all-out armor-infantry assault on their positions. The remainder of Urquhart's division, surrounded in the suburb of Oosterbeek to the west, was finally withdrawn to the south of the lower Rhine on September 26, bringing the operation to a close.

During MARKET-GARDEN, the Allies dropped more than 20,000 paratroopers, landed more than 13,500 glidermen, and air-delivered some 5,200 tons of equipment, 1,900 vehicles, and 560 guns. They were hampered for several days by cloud cover in England, which forced the delay of follow-on drops, including Sosabowski's Polish paratroopers, leaving the British paratroopers at Arnhem especially short of water, ammunition, and needed

reinforcements. British airborne casualties numbered more than 7,200 men, and the 82nd and 101st lost some 1,400 and 2,100, respectively. Horrocks's XXX Corps sustained 1,400 casualties. There is no listing of German casualties throughout the battle area, although they suffered more than 3,000 in Arnhem alone.

Marschall, Wilhelm (1886–1976)

German admiral. Born in Augsburg, Germany, on September 30, 1886, Wilhelm Marschall entered the Imperial German Navy as a naval cadet in 1906. He was a submarine commander during World War I. Continuing in the German Navy after the war, in 1934 Marschall took command of the pocket battleship *Admiral Scheer*. Promoted to rear admiral in 1936, he headed the operations division of the Oberkommando der Kriegsmarine (Supreme Command of the Navy). Between 1937 and 1938, Marschall commanded German naval forces off Spain during the Spanish Civil War. He then was chief of the navy's operations staff just before the start of World War II, with responsibility for wartime planning.

Appointed fleet commander in October 1939, Vice Admiral Marschall sortied with the battle cruisers *Scharnhorst* and *Gneisenau* that November. On June 8, 1940, Marschall and the two battle cruisers encountered the British aircraft carrier *Glorious* and destroyers *Acasta* and *Ardent* some 280

miles west of Harstad, Norway. The three British ships were evacuating Allied forces from Norway and headed for Scapa Flow. In the ensuing two-hour engagement, all three British ships were sunk, but a torpedo from the *Acasta* badly damaged the *Scharnhorst*, and both German ships received a number of hits from 4.7-inch shells fired by the destroyers. The damage was sufficient to cause the Germans to retire to Trondheim, which allowed the safe passage of the evacuation convoy through the area later that same day. While escorting the damaged *Scharnhorst*, the *Gneisenau* was in turn badly damaged by a torpedo from the British submarine *Clyde*. Both German capital ships required extensive repair.

Commander of the navy Grand Admiral Erich Raeder relieved Marschall from his post for not strictly following the operational plan, which had called on him to avoid such action. Marschall believed that a commander at sea had to have freedom of action. Admiral Günther Lütjens replaced Marschall as fleet commander.

Given command of Navy Group West in the summer of 1942, which he considered vindication of his earlier ideas, Marschall was promoted to general admiral in February 1943. Raeder's successor, Admiral Karl Dönitz, preferred others in command positions, and Marschall then held posts ashore. He was held as a prisoner of war during 1945–1947. Marschall died in Mölln, Schleswig-Holstein, on March 20, 1976.

Marseille, Hans-Joachim (1919–1942)

Luftwaffe captain and leading German ace on the Western Front. Born in Berlin on December 13, 1919, Hans-Joachim Marseille joined the Luftwaffe

in 1938. Although he was a gifted flyer, he chafed at military discipline. This fact, coupled with his "playboy" attitude, landed him in trouble numerous times. Following the Battle of Britain (July 10–September 30, 1940), Marseille was transferred to Jagdgeschwader (fighter wing) 27 in North Africa.

Sometimes called the "Star of North Africa," Marseille was noted for his uncanny ability at deflection shooting and achieving multiple victories, or kills, in a single day. His best day was September 1, 1942, when he was credited with shooting down 17 British aircraft during three sorties. He died shortly thereafter, in a flying accident over Alam Halfa on September 30. His final tally was 158 victories. Just before his death, he was promoted to captain and awarded the Diamonds to the Knight's Cross of the Iron Cross.

Marshall, George Catlett (1880–1959)

U.S. Army general, chief of staff of the army, secretary of state (1947–1949), and secretary of defense (1950–1951). Born in Uniontown, Pennsylvania, on December 31, 1880, George Catlett Marshall graduated from the Virginia Military Institute in 1901. Commissioned in the infantry in 1902, he then held a variety of assignments, including in the Philippines. He attended the Infantry and Cavalry School, Fort Leavenworth, in 1907 and was an instructor at the Staff College between 1907 and 1908.

After the United States entered World War I, Marshall went to France with the American Expeditionary Forces as training officer to the 1st Division in June 1917. Promoted to lieutenant colonel in 1918, he became chief of operations of the U.S. First Army, winning admiration for his

logistical skills in directing the repositioning of hundreds of thousands of men quickly across the battlefront for the Meuse-Argonne Offensive. After working on occupation plans for Germany, Marshall became aide to General John J. Pershing, who was named chief of staff of the army in 1921.

Beginning in 1924, Marshall spent three years in Tianjin (Tientsin), China, with the 15th Infantry Regiment and then five years as assistant commandant in charge of instruction at the Infantry School, Fort Benning, Georgia, where he helped to train numerous future U.S. generals. He was promoted to colonel in 1932, holding assorted command posts in the continental United States. He was promoted to brigadier general in 1936.

In 1938 Marshall became head of the War Plans Division in Washington and then deputy chief of staff with promotion to major general that July. President Franklin D. Roosevelt promoted Marshall over many more senior officers to appoint him chief of staff of the army as a temporary general on September 1, 1939, the day that German armies invaded Poland. As war began in Europe, Marshall worked to revitalize the American defense establishment. Supported by pro-Allied civilians such as Secretary of War Henry L. Stimson, Marshall instituted and lobbied for programs to recruit and train new troops; expedite munitions production; assist Great Britain, China, and the Soviet Union in resisting the Axis powers; and coordinate British and American strategy. After the United States entered the war in December 1941, Marshall presided over an increase in the U.S. Army from a mere 200,000 troops to a wartime maximum of 8 million men and women. For this he became known as the “Organizer of Victory.”

Marshall was a strong supporter of opening a second front in Europe, a campaign ultimately deferred until June 1944. Between 1941 and 1945, he attended all the major wartime strategic conferences, including those at Placentia Bay, Quebec, Cairo, Tehran, Malta, Yalta, Potsdam, and Washington, D.C. Marshall was the first to be promoted to the newly authorized five-star rank of general of the army in December 1944. Perhaps his greatest disappointment was that he did not exercise field command, especially command of the European invasion forces. Roosevelt and the other wartime chiefs wanted him to remain in Washington, and Marshall bowed to their wishes. He was a major supporter of the U.S. Army Air Forces, and in 1945 he advocated use of the atomic bomb against Japan.

On the urging of President Harry S. Truman, Marshall agreed to serve as

special envoy to China (1945–1947). As secretary of state, he advanced the Marshall Plan to rebuild Europe, and he then served as president of the American Red Cross (1949–1950). Truman persuaded him to return to government service as secretary of defense in September 1950. In that capacity, Marshall worked to repair relations with the other agencies of government that had become frayed under his predecessor and to build up the U.S. military to meet the needs of the Korean War and commitments in Europe while at the same time maintaining an adequate reserve. Marshall opposed General Douglas MacArthur's efforts for a widened war with China and supported Truman in his decisions to fight a "limited war" and to remove MacArthur as commander of United Nations forces.

General George C. Marshall, U.S. Army chief of staff, known for his important role in World War II as "the Organizer of Victory." (Library of Congress)

Marshall resigned in September 1951, ending 50 years of dedicated government service. Awarded the Nobel Peace Prize in 1953 for the Marshall Plan, he was the first soldier so honored. He was certainly one of the nation's greatest military leaders and one of the most influential figures of the 20th century. Marshall died in Washington, D.C., on October 16, 1959.

Marshall, Samuel Lyman Atwood (1900–1977)

U.S. Army Reserve brigadier general and noted military historian for World War II theaters. Born on July 18, 1900, in Catskill, New York, Samuel Lyman Atwood Marshall (known as "Slam") enlisted in the army in 1917. He then saw extensive combat in France, where he was promoted to second lieutenant, the youngest U.S. Army officer in the conflict. Leaving active duty at the end of the war, Marshall pursued parallel careers as a journalist and a reserve army officer. In 1943, he became chief combat historian in the Pacific theater, and just before the June 6, 1944, Allied invasion of Normandy, he became chief historian for the European theater of operations.

As the chief combat historian of the U.S. Army in World War II, Marshall recruited many of the other combat historians and initiated work on the *U.S. Army in World War II* series of combat histories. In his long career, he wrote nearly 30 books and hundreds of articles and reviews. His volumes about World War II included *Island Victory, Men against Fire,* and *Bastogne*. He emphasized personal interviews with participants as soon after battle as possible.

Marshall wrote *Men against Fire,* which analyzed small-unit combat and effectiveness, in 1947; the work pointed out many problems, which the army then sought to correct. During the Vietnam War, as a retired brigadier general, he coauthored with the controversial Colonel David Hackworth *Vietnam Primer,* and the army published it as a training manual. Marshall died at Fort Bliss, Texas, on December 17, 1977.

Marshall Islands, Naval Campaign (January 29–February 22, 1944)

U.S. amphibious assault on Japanese-held territory in the Central Pacific in the drive toward the Japanese home islands. This campaign came after the U.S. seizure of Tarawa (November 20–24, 1943) and Makin (November 20–23, 1943) in the Gilberts.

The Marshall Islands are two parallel coral atoll chains, located within a 400,000-square-mile area. They are about 4 degrees above the equator and 2,000 miles southwest of Pearl Harbor, Hawaii. At the beginning of 1944, the Marshall Islands formed the outermost Japanese defensive barrier in the

Central Pacific. The Japanese had received the islands from Germany as a consequence of World War I and thus had ample opportunity to fortify them.

Initially, U.S. planners intended to capture the Marshalls and bypass the Gilbert Islands immediately to the south, but in mid-1943 the Joint Chiefs of Staff decided to secure the Gilberts first and then use them as a base to attack the Marshalls. In developing the attack plan, which was completed in early December 1943, the Pacific Fleet commander, Admiral Chester W. Nimitz, overrode his own staff by insisting on bypassing the more heavily fortified outer islands of the atoll.

Aerial photography revealed an airstrip under construction on Kwajalein Island, the hub of Japanese operations in the Marshalls; because that airstrip would be capable of handling bombers, it became the priority. The adjacent islands of Roi and Namur were also to be taken. The final objective was Eniwetok Atoll. Kwajalein is in the center of the Marshalls, just south of Roi and Namur, whereas Eniwetok is located at the northwestern end of the islands and 300 miles closer to Tokyo. The first step, however, would be to secure Majuro, an undefended atoll. Its lagoon would provide anchorage for support vessels.

Vice Admiral Raymond A. Spruance, commander of the Fifth Fleet (and Central Pacific Force), was in overall command of the operation. Rear Admiral Richmond Kelly Turner commanded the Joint Expeditionary Force (Task Force 51) of transports and landing craft, and U.S. Marine Corps major general Holland M. Smith would command the assault once troops were ashore. The attacking forces were arranged in three groups: Rear Admiral Richard L. Conolly commanded the Northern Attack Force, charged with taking Roi and Namur in Kwajalein Atoll; Turner retained command of the Southern Task Force, with the objective of Kwajalein Island; and Captain Donald Wood Loomis commanded a reserve force that would stand by during the capture of Kwajalein. Later, this force secured Eniwetok. The assault force, not counting the fast carrier task groups of submarines, numbered 197 ships, lifting a total of 54,000 assault troops, double the number in the Gilberts operation; on Kwajalein, there would be 41,000 U.S. troops versus 8,000 Japanese.

U.S. pilots, pleased with their success, along the tail section of a Grumman F6F Hellcat on the carrier *Lexington*, after they had shot down 17 out of 20 Japanese planes headed for Tarawa, November 1943. (National Archives)

Learning from the experience at Tarawa, U.S. planners provided for a much heavier air and naval bombardment. On January 29, U.S. carrier aircraft began hitting Japanese positions. Roi was the center of Japanese airpower in the Marshalls, with almost 100 aircraft based there. Its aircraft were obliterated in the sky and on the ground, ending any Japanese air threat that same day. U.S. aircraft and ships pounded Mili, Kwajalein, Roi, Maloelap, Taroa, Jaluit, and Wotje simultaneously with bombs and naval gunfire. Majuro Atoll, composed of 56 islands, was secured between January 31 and February 8 and perfectly served the needs of the mobile supply system.

The primary target was Kwajalein Atoll (Operation FLINTLOCK). On January 31, troops of the 4th Marine Division landed on Roi and Namur. Unlike operations in the Gilberts, FLINTLOCK had a sufficient number of tracked amphibious landing vehicles (amtracs, or LVTs) available for the forces, and it also saw the first large-scale use of DUKW amphibian trucks. The prolonged preinvasion bombardment was also effective. Once ashore, the marines progressed rapidly across the small islands. Japanese resistance ceased by the end of February 2.

Meanwhile, the U.S. Army's 7th Infantry Division landed on Kwajalein Island. Turner decided first to subject the island to an extensive bombardment from battleships, cruisers, destroyers, and carrier aviation. The preliminary bombardment lasted from January 30 to February 1. The troops went ashore early on February 1 in textbook fashion, and Kwajalein was taken on February 5. After seizing a few smaller islands, Kwajalein Atoll was declared secure two days later, at a cost of 372 Americans killed and 1,582 wounded. The Japanese suffered 7,870 killed and 265 taken prisoner.

At the far northwestern edge of the Marshalls lay Eniwetok Atoll, only 1,000 miles from the Marianas. Eniwetok, whose name translates as "Land between West and East," came to serve as the staging point for U.S. military operations against the Mariana Islands. Nimitz had not planned to take it until May, but the surprisingly easy victory at Kwajalein emboldened his commanders to move the attack up to February, fearful that a delay would allow the Japanese time to reinforce.

However, Eniwetok lay within striking distance of the massive Japanese base at Truk in the Caroline Islands. This bastion had to be eliminated before operations against Eniwetok could commence. Rear Admiral Marc Mitscher led Task Force 58 to neutralize Truk. His carrier aircraft destroyed more than 200 Japanese aircraft, sank 8 warships and 24 merchant vessels, and damaged an aircraft carrier. Mitscher's raids effectively ended Truk's value as a major Japanese base.

Code-named CATCHPOLE, the operation against Eniwetok was carried out by the 22nd Marine Regimental Combat Team (RCT) and the 106th Infantry Regiment. The invasion of Eniwetok Atoll began on February 17 with an assault on Engebi Island at the northern end of the atoll. This tiny island was secured by early the next day, but the Japanese defenders who were well dug in on the southern islands of Parry and Eniwetok offered stiffer opposition. Eniwetok Island was secured on February 21, and Parry Island was declared secure on February 22. Operations against Eniwetok Atoll claimed 195 American dead and nearly 2,700 Japanese. Only 64 Japanese were taken prisoner.

The fighting ashore had not been easy, but no U.S. ships were sunk and only a few were damaged, although several grounded in the channels between islands. Imperial Japanese Navy surface ships did not contest the landings, but submarines were present, four of which were sunk. A number of

Japanese supply ships, auxiliaries, and patrol ships were also sunk by U.S. forces during the operation.

The U.S. success here neutralized Japanese bases on other islands in the Marshalls group, which remained isolated for the rest of the war. The Marshalls operation saw the U.S. Navy and Marine Corps perfect their amphibious assault techniques. More important, the operation enabled U.S. forces to bypass Truk and the other Caroline Islands and leap 1,000 miles forward to the Mariana Islands, from which U.S. bombers would be able to strike Japan.

Martel, Sir Giffard Le Quesne (1889–1958)

British Army lieutenant general. Born in Millbrook, Southampton, on October 10, 1889, Giffard Le Quesne Martel graduated from the Royal Military Academy at Woolwich in 1909 and was commissioned in the Royal Engineers. During World War I, he pioneered the training of tank crews, serving on the staff of the new Tank Corps from 1916 to November 1918.

Between the wars Martel remained with the Royal Engineers, but believing that future wars would depend heavily on massive armor forces, he

pursued his interest in tank warfare and doctrine, developing—often at his own expense—prototypes of light tanks and machine-gun carriers and writing prolifically on the subject. After several years in India, Martel became assistant (and later deputy) director of mechanization in 1936, attempting to prepare the British Army for a potential war with Germany.

In September 1939, Major General Martel took command of the 50th Northumbrian Motorized Division of the Territorial Army, which fought fiercely on the Meuse against German major general Erwin Rommel's 7th Panzer Division; Martel's forces temporarily checked the panzer advance to the English Channel until limited numbers compelled Martel to withdraw.

In December 1940 after returning to Britain, Martel became commander of the Royal Armoured Corps, which initially controlled all British armored forces, and in 1942 he was promoted to lieutenant general. He resented the establishment of the British Tank Parliament in 1942, a grouping of divisional commanders and tank experts that he felt weakened his authority. In autumn of that year during his absence in Burma and India, the position of commander, Royal Armoured Corps, was abolished.

Martel subsequently spent a frustrating year heading the British military mission in Moscow. In 1944, he lost an eye during a bombing raid on London, and he was invalided out of the army in 1945. In retirement, Martel wrote his memoirs and several controversial books on armored warfare and on relations with the Soviet Union, including *Our Armoured Forces* (1945), *The Russian Outlook* (1949), and *East versus West* (1952). He died in Camberley on September 3, 1958.

Martinengo, Federico Carlo (1897–1943)

Italian Navy rear admiral. Born in Rome on July 18, 1897, Federico Carlo Martinengo followed a family tradition in joining the navy in 1911. In 1915 as a midshipman he volunteered for the naval air service and achieved his first aerial victory as a gunner on an FBA flying boat in October 1916. In November he was promoted to sublieutenant and given command of the 1st Squadriglia Idrovolanti (Seaplane Squadron) in the newly created Italian naval air service. By June 1918 he had earned five confirmed victories in 172 combat missions.

In 1923 Martinengo refused the opportunity to join the new Regia Aeronautica. By 1939 he was captain of the cruiser *Attendolo* and in October of that year became chief of staff of the Ionian Naval Department. He remained in that role until April 1943, when he was appointed rear admiral and general inspector of the Regia Marina's coastal antisubmarine flotillas at Spezia. On September 9, 1943, after the conclusion of the armistice between Italy and the Allies, Martinengo died in a surface engagement off Gorgona Island. Martinengo was posthumously awarded the Medaglia d'Oro al Valor Militare, Italy's highest medal for gallantry.

Matsui Iwane (1878–1948)

Japanese Army general and commander of forces involved in the Second Sino-Japanese War. Born in Aichi Prefecture, Japan, on July 27, 1878, Matsui Iwane graduated from the Military Academy in 1898. He fought in the 1904–1905 Russo-Japanese War as a captain and was awarded the Military Cross. He was a resident officer in China (1907–1912, 1915–1919) and in France and Indochina between 1914 and 1915. Promoted to colonel in

1918, he commanded the 29th Infantry Regiment in Japan from 1919 to 1921, then served as a staff officer in the Siberian Expeditionary Force at Vladivostok between 1921 and 1922.

Matsui served as a staff officer in the Guandong (Kwantung) Army from 1922 to 1924 and was promoted to major general in 1923. Between 1924 and 1925, he commanded a brigade, and he was then chief of the Intelligence Division of the army General Staff (1925–1928).

Promoted to lieutenant general in 1927, Matsui commanded the 1st Division (1929–1931) and served as a delegate to the 1931–1933 Geneva Disarmament Conference, after which he was promoted to full general in 1933. In semiretirement, he served on the Supreme War Council between 1934 and 1935. Matsui then retired from the army.

Matsui thereafter traveled widely in China and met with Jiang Jieshi (Chiang Kai-shek), head of the Nationalist Party—the Guomindong (Kuomintang, GMD); he hoped to reconcile Japan and China.

Ordered back to duty with the Japanese Army in 1937 following the start of the Sino-Japanese War, he commanded the Japanese forces sent to capture Shanghai in Jiangsu (Kiangsu). Following heavy fighting, his forces took the city. In October 1937, Matsui was appointed to command the Central China Area Army.

Japanese general Matsui Iwane salutes his victorious troops upon entering Nanjing (Nanking), China. The Japanese captured the city on December 13, 1937. (Paul Popper/Popperfoto/Getty Images)

In November 1937, Matsui's forces began their advance on Nanjing (Nanking), in Jiangsu. On December 1, Matsui demanded that the Chinese commander, General Tang Shengzhi (T'ang Sheng-chih), surrender the city to the Japanese, but Tang refused. On December 10, Matsui ordered an attack on Nanjing, which fell three days later. During this period and afterward, Japanese troops killed thousands of prisoners of war and civilians in what became widely known as the Rape of Nanjing. Although Matsui did not issue an order for his troops to kill civilians, he was held responsible as the overall Japanese commander at Nanjing.

Matsui returned to Japan in 1938 and was a cabinet adviser from 1938 to 1940, when he retired for a second and final time. Following the war, he was brought before the International Military Tribunal for the Far East on war

crimes charges stemming from the atrocities at Nanjing. Found guilty, Matsui was sentenced to death and hanged on December 23, 1948, in Tokyo.

Matsuoka Yōsuke (1880–1946)

Japanese diplomat and foreign minister (1940–1941). Born in the village of Morozumi in Yamaguchi Prefecture, Japan, on March 4, 1880, Matsuoka Yōsuke went to the United States at age 13, working his way through and graduating from the University of Oregon in 1900. Returning to Japan, he became a diplomat in 1904, and between 1904 and 1921 he developed close ties with the Japanese business community and military.

Matsuoka left the diplomatic service in 1921 to become a director of the South Manchurian Railroad and was its vice president from 1927 to 1929. The following year, he entered the Japanese Diet (parliament) as a representative of the conservative Seiyūkai Party. In July 1932, he became Japan's representative to the League of Nations, where he led the Japanese delegation in walking out following the league's acceptance of the Lytton Commission report on February 24, 1933.

A staunch conservative, Matsuoka left the Seiyūkai Party in December 1933, advocating the abolition of political parties. In 1935, he rejoined the South Manchurian Railroad Company, serving as its president until 1939. He was also an adviser to the Japanese cabinet between 1937 and 1940.

From July 1940 to July 1941, Matsuoka was the Japanese foreign minister, taking a strongly pro-Axis position. Outspoken and garrulous, he was known to his friends as “Mr. 50,000 Words.” During his time as foreign minister, Japan joined Italy and Germany in the Tripartite Pact of September 1940. In March 1941, Matsuoka traveled to Berlin, where he held talks with Chancellor Adolf Hitler and Foreign Minister Joachim Ribbentrop. Hitler tried to turn the Tripartite Pact into an offensive alliance by convincing Matsuoka that Japan should join Germany in war against Britain, whereas Ribbentrop advocated a Japanese attack on Singapore. Matsuoka was noncommittal.

Matsuoka then traveled on to Moscow to meet with Soviet leaders. There, on April 13, he signed a five-year nonaggression pact with the Soviet Union. Following the June 22, 1941, German invasion of the Soviet Union, Matsuoka advocated that Japan join Germany in war against the Soviets, in violation of its neutrality pact with the Soviet Union. He also urged an end to negotiations with the United States. In speeches in Japan, Matsuoka argued for Japanese control of the entire Western Pacific.

Matsuoka alienated other members of Japan’s cabinet not by his anti-American stance but by his ambition, his obnoxious behavior, and his flouting of the prime minister’s position by holding unauthorized talks with the Germans. Indeed, Prime Minister Konoe Fumimaro and the entire cabinet resigned on July 16, 1941, so that the government could be reorganized without Matsuoka. The next day, Konoe again became prime minister—but with Vice Admiral Teijiro Toyoda as foreign minister.

Tuberculosis forced Matsuoka to retire from the political scene. At the end of the war, he flirted with the possibility of heading a military government, installed by a coup d’état and committed to a last-ditch resistance to any Allied invasion. He was arrested after the war and brought to trial before the International Military Tribunal for the Far East at Tokyo as a Class A war criminal. Matsuoka died in Tokyo on June 27, 1946, before a verdict could be rendered on his guilt or innocence.

McAuliffe, Anthony Clement (1898–1975)

U.S. Army general. Born on July 2, 1898, in Washington, D.C., Anthony Clement McAuliffe attended West Virginia University for one year before entering the U.S. Military Academy at West Point, where he graduated and was commissioned a second lieutenant of field artillery in 1919. Following a variety of routine assignments, McAuliffe graduated from the Command and General Staff School in 1937 and from the Army War College in 1940. Promoted to major in 1940, he served on the General Staff. He was promoted to lieutenant colonel in 1941 and to colonel the following year.

On August 8, 1942, McAuliffe was promoted to brigadier general and assigned as divisional artillery commander of the 101st Airborne Division. He parachuted into Normandy with the division in June 1944 and took part in Operation MARKET-GARDEN during September 17–26. McAuliffe was serving as acting commander of the 101st Airborne Division when the German Ardennes Offensive began on December 16, 1944. His division's defense of the strategic town of Bastogne (December 20–26) was important in disrupting the German attack. The unit was surrounded by advancing German troops, but McAuliffe replied to the German demand of surrender with the classic message: "To the German Commander. Nuts! The American Commander." His men held out until relieved by elements of the Third Army. Promoted to major general in March 1945, McAuliffe commanded first the 103rd Infantry Division and then briefly the 79th Infantry Division, which he led into Austria by the end of the war.

Following the war, McAuliffe commanded the Airborne Center at Fort Bragg, North Carolina (1945–1946). He then held staff positions in Washington; in 1951, he was promoted to lieutenant general. Two years later,

McAuliffe took command of the Seventh Army in Germany, and between 1955 and 1956, he commanded the U.S. Army in Europe. He retired from the army in 1956 as a full general and became a senior executive at American Cyanamid Company in New York City (1956–1963). McAuliffe died in Washington, D.C., on August 11, 1975.

McCain, John Sidney, Sr. (1884–1945)

U.S. Navy admiral. Born in Teoc in Carroll County, Mississippi, on August 19, 1884, John Sidney "Slew" McCain attended the University of Mississippi and the U.S. Naval Academy at Annapolis, where he graduated in 1906. Commissioned an ensign, McCain embarked on a career as a surface warfare officer, during which he commanded two ships and rose to the rank of captain. In 1936, McCain qualified as a naval aviator. His audacious decision to become a pilot led to his command of two naval air stations (Coco Solo and San Diego) and the aircraft carrier *Ranger* (May 1937 to July 1939).

Promoted to rear admiral in February 1941, McCain commanded the Aircraft Scouting Force, Atlantic. In May 1942, he took command of all land-based naval aircraft in the South Pacific in the Guadalcanal Campaign (August 1942–February 1943). That October, he was assigned to Washington as chief of the Bureau of Aeronautics. He was promoted to vice admiral and assigned as deputy chief of naval operation for air in August 1943.

In August 1944, McCain returned to the Pacific theater to command a carrier task group under Vice Admiral Marc Mitscher and participated in the Battle of the Philippine Sea (June 19–21, 1944) and the Battle of Leyte Gulf

(October 23–26). In October, he took command of Carrier Task Force 38 from Mitscher, who in turn relieved him in January 1945. McCain returned to the same command in May 1945. He coordinated the highly effective air campaigns at Peleliu (September 15–November 27, 1944) and Okinawa (March–June 1945) and several carrier raids into Japanese home waters, and he also developed tactics to deal with Japanese kamikaze attacks. In only one month, his planes sank 49 Japanese ships and destroyed more than 3,000 aircraft on the ground. Although in failing health and hurt by the finding of a court of inquiry into his actions during a typhoon in December 1944, McCain remained aboard the battleship *Missouri* to witness the formal Japanese surrender on September 2, 1945, before returning home to Coronado, California.

McCain died on September 6, 1945, of a heart attack. Congress promoted him to full admiral posthumously. McCain was the father of four-star admiral John S. McCain Jr. and the grandfather of John S. McCain III, a navy pilot who spent six years as a prisoner of war during the Vietnam War and later became a U.S. senator and Republican presidential nominee (2008).

McCloy, John Jay (1895–1989)

U.S. Assistant Secretary of War. Born in Philadelphia on March 31, 1895, John Jay McCloy attended Amherst College and Harvard Law School. During World War I, he interrupted his studies to serve in the U.S. Army and

acquired an internationalist outlook. In 1924, McCloy joined a prestigious New York corporate law firm, rising to partner within five years.

In the 1930s, McCloy headed the Paris office and spent several years representing Bethlehem Steel in the “Black Tom” case, in which the company sought and eventually obtained $20 million in damages from the German government for sabotaging an American munitions plant during World War I. The case enhanced McCloy’s interest in international politics.

In 1940, McCloy became a consultant to U.S. secretary of war Henry L. Stimson, and in 1941 he became assistant secretary of war. Immensely energetic and personable, McCloy was involved in virtually every major political and military wartime decision. In 1941, he and his French friend Jean Monnet devised the phraseology used by President Franklin D. Roosevelt in announcing that the United States would serve as the “arsenal of democracy,” furnishing Lend-Lease aid to its Allies.

McCloy staunchly advocated the wartime internment of Japanese Americans, citing national security reasons, and for the rest of his life would claim that adequate justification existed for the consequent infractions of civil liberties. In 1944, on the advice of various Jewish associates who believed that reports of concentration camp atrocities must have been exaggerated, McCloy advised against aerial bombing of the railway lines leading to the Auschwitz camp on the grounds that this would divert scarce resources from the main war effort. He supported War Department proposals envisaging Germany’s economic reintegration into Europe, in opposition to Treasury Department plans to break that country into smaller states and destroy its industry. In 1945, McCloy attempted to persuade other American officials to seek a peace settlement with Japan rather than using atomic weapons against Japanese cities—a move he always believed was unnecessary.

McCloy left the War Department in 1945, but from 1949 to 1952, he served as the U.S. high commissioner in the Federal Republic of Germany, responsible for gradually implementing its return to independence. Controversially, he decided to pardon various German industrialists convicted of wartime crimes.

McCloy staunchly backed Monnet’s efforts for West European political and economic integration. From 1961 to 1974, he was a presidential adviser on arms control. Until the 1980s, he remained one of the “wise men”—the recognized foreign policy experts with whom successive presidents consulted

on a wide range of international issues. McCloy died in Stamford, Connecticut, on March 11, 1989.

McConnell, John Paul (1908–1986)

U.S. Army Air Forces general. Born in Booneville, Arkansas, on February 7, 1908, John Paul McConnell graduated from Henderson Brown College in 1927. He then graduated from the U.S. Military Academy at West Point with a commission as a second lieutenant in 1932. The next year, he underwent flight training at Randolph and Kelly fields in Texas.

Following a variety of routine assignments, McConnell was promoted to major in July 1941 and to lieutenant colonel in January 1942, when he was assigned to the office of the chief of the Army Air Forces (AAF). He was promoted to colonel that December and became deputy chief of staff of the AAF Training Command at Fort Worth, Texas. In November 1943, McConnell was named chief of staff of the China-Burma-India Air Force Training Command, located at Karachi, India (now Pakistan). In August 1944, he was promoted to brigadier general and served as senior air staff officer, Air Command Southeast Asia, and also deputy commander of the Third Tactical Air Force in India and then the Southeast Asia Air Command in Ceylon (Sri Lanka) during 1944–1945.

After the war McConnell was senior air adviser to the Nationalist government of China, and in 1947 he headed the Reserve and National Guard Division at air force headquarters, Washington, D.C. He was promoted to major general in December 1950. Other postwar assignments included

commanding general of the Second Air Force, Barksdale Air Force Base, Louisiana (1957–1961), as a lieutenant general; vice commander of the Strategic Air Command (1961–1962); and, as a full general, deputy commander in chief of the U.S. European Command (1962–1964). He became vice chief of staff of the air force in August 1964, and in February 1965 he became chief of staff, holding that post until his retirement in July 1969. McConnell died in Bethesda, Maryland, on November 21, 1986.

McCreery, Sir Richard Loudon (1898–1967)

British Army general. Born on February 1, 1898, at Harcourt in Leicestershire, England, Richard McCreery was educated at Eton and the Royal Military College, Sandhurst. He was commissioned to the 12th Lancers in 1915 and served in France during World War I.

In 1935, McCreery took command of the 12th Lancers, and in 1938, he was appointed as staff officer 1 (GSO1) of the 1st Infantry Division. He served with this division in the British Expeditionary Force (BEF) in France during the so-called Phony War from September 1939 to May 1940. He commanded with distinction an armored brigade in the subsequent fighting around Dunkerque in May 1940.

Evacuated to Britain with the BEF, McCreery then commanded the 8th Armoured Division in England. In 1942, McCreery was posted to Cairo to act as an armored adviser to theater commander General Claude Auchinleck. McCreery's advice was unappreciated, and he was dismissed in July 1942. His career quickly revived, however. The next month, he was appointed chief

of staff to Lieutenant General Sir Harold Alexander, who had arrived in Egypt to take over from Auchinleck.

Promoted to major general in mid-1943, McCreery took command of X Corps, leading it in the September 9, 1943, Salerno landing; the crossing of the Garigliano River; the 1944 Cassino battles; and the attacks on the Gothic Line. He achieved success during the Italian Campaign, despite serving under U.S. lieutenant general Mark Clark, an Anglophobe who disliked him.

In September 1944, McCreery was appointed commander of the British Eighth Army. Promoted to lieutenant general in December 1944, he commanded the army through the 1944–1945 winter stalemate in Italy and in the successful spring offensive of April 1945 that ended the war in Italy.

McCreery held several noteworthy postwar appointments, including commander of British occupation forces in Austria and commander in chief of the British Army of the Rhine. Promoted to general in 1948, he retired in December 1949. In 1959, he created a great deal of controversy by writing an article for his regimental journal that was highly critical of Field Marshal Bernard Montgomery's tactics in Egypt. McCreery died in London on October 18, 1967.

McGrigor, Sir Rhoderick Robert (1893–1959)

British Royal Navy admiral. Born in York, England, on April 12, 1893, Rhoderick Robert McGrigor graduated from the Royal Naval College, Dartmouth, in 1909 and was assigned to a cruiser. Between the wars, he

became a torpedo specialist. Following a number of routine assignments, McGrigor was promoted to captain in December 1933.

When World War II began, McGrigor was chief of staff to Sir Percy Noble on the China station, but he returned to Britain in late 1940 to command the battle cruiser *Renown*, part of Force H, protecting convoys to Malta and joining in the bombardment of Genoa and the 1941 pursuit of the German battleship *Bismarck*.

Promoted to rear admiral in July 1941, McGrigor was assistant chief of naval staff for weapons for 18 months, a position in which he brought into service many naval innovations, such as radar. In 1943, he became a force commander in the Mediterranean, training crews in the new landing craft and taking part in assaults on Pantelleria and Sicily. After some months as naval commander in southern Italy, McGrigor returned to Britain, leading the Home Fleet's 1st Cruiser Squadron in numerous successful attacks on German vessels in the North Sea and in escorting Allied convoys to the northern Soviet Union.

Promoted to vice admiral in April 1945, McGrigor was vice chief of the naval staff from 1945 to 1948. Promoted to full admiral in September 1948, he served as commander in chief of the Home Fleet from 1948 to 1951. As first sea lord from 1951 to 1955, McGrigor tried to mitigate the worst of the postwar budgetary defense cuts. He insisted on maintaining high training standards, and in the 1950s he fought hard and successfully to retain aircraft carriers. Promoted to admiral of the fleet in April 1953, McGrigor retired in April 1955. He died in Aberdeen, Scotland on December 3, 1959.

McIndoe, Sir Archibald Hector (1900–1960)

New Zealand–born plastic surgeon who pioneered burn treatments. Born on May 4, 1900, in Dunedin, New Zealand, Archibald Hector McIndoe was educated at Otago University, and in 1924, he pursued postgraduate training in surgery at the Mayo Clinic in the United States. Arriving in Britain in 1930, he specialized in plastic surgery, a field developed by his cousin, Sir Harold Gillies. McIndoe simultaneously worked as a general surgeon at the London Hospital for Tropical Diseases.

In 1939, McIndoe, one of only three experienced plastic surgeons in Britain, became consultant in plastic surgery to the Royal Air Force and established a treatment center at Queen Victoria Hospital, East Grinstead, to handle facial injuries and burns inflicted in air raids. Under McIndoe's forceful leadership, this facility became a model for burn treatment for the entire country. McIndoe treated several hundred badly burned fliers, battling with the government to win them better pay, conditions, and rehabilitation facilities, and he succeeded in abolishing the rule that after 90 days, such patients would be invalided from the military. He also paid great attention to the psychological well-being of his patients, who formed a club that continued to meet after the war. Skillful publicity enhanced the reputations of both McIndoe and his center, which improved his success in confrontations with civil servants, as did his refusal to compromise his independence and subject himself to military authority by entering the armed services.

After the war, McIndoe served on the council of the Royal College of Surgeons and developed the training of plastic surgeons. He also traveled and wrote extensively in his field. McIndoe died in London on April 12, 1960.

McLain, Raymond Stallings (1890–1954)

U.S. Army lieutenant general. Born in Washington County, Kentucky, on April 4, 1890, Raymond Stallings McLain grew up in Oklahoma, attended Hills Business College in 1909, and achieved success in banking. He joined the National Guard in 1912 and was commissioned a lieutenant of infantry in 1916. McLain served with the National Guard along the Mexican border that year and was called up again during World War I, when he commanded a machine-gun company in France.

Following the war, McLain returned to his banking career but remained in the National Guard, and in June 1937, he was promoted to brigadier general. The next year, he completed an abbreviated course at the Command and General Staff School. He was mobilized with the National Guard 45th Infantry Division in September 1940 and commanded its artillery. During the July 9–August 22, 1943, invasion of Sicily, he attracted the attention of Lieutenant General Omar Bradley and Major General George S. Patton Jr. McLain then fought with the 45th in Italy, including at the Anzio landing (January 22, 1944). He was assigned to command the 30th Division Artillery in England in April 1944. In late July, McLain assumed command of the 90th Infantry Division, rated a "problem" division. He was promoted to major general the next month.

McLain was the 90th Infantry Division's third commander in three months. Both of his predecessors had been inadequate leaders, and battlefield challenges in Normandy were extraordinarily severe. Leading by example, McLain and his assistant, Brigadier General William G. Weaver, transformed the 90th into one of the best divisions in Lieutenant General Patton's Third Army. In October, McLain took command of XIX Corps, partly because he had earned the assignment and partly because the army found it politically expedient to recognize an outstanding National Guardsman. He was the first citizen-soldier to command a corps since the American Civil War and the only National Guardsman ever to command a corps in combat.

Despite his civilian background, McLain earned the respect of his regular army subordinates. His corps spent the remainder of the war in Lieutenant General William H. Simpson's Ninth Army. In March 1945, XIX Corps spearheaded the northern pincer in the encirclement of the Ruhr, and in April,

it led the Ninth Army's push to the Elbe. McLain was promoted to lieutenant general in June 1945, the first National Guardsman to achieve that rank.

McLain remained in the army after the war, serving as its chief of information (1946–1949) and as comptroller of the army (1949–1952). He retired in March 1952. McLain died in Washington, D.C., on December 14, 1954.

McMorris, Charles Horatio "Soc" (1890–1954)

U.S. Navy vice admiral. Born on August 31, 1890, in Wetumpka, Alabama, Charles Horatio McMorris graduated from the U.S. Naval Academy at Annapolis in 1912. Nicknamed "Soc" or "Socrates" for his intelligence, he took part in the 1914 U.S. Navy landing at Veracruz, Mexico, and served on destroyers in the North Atlantic during World War I.

McMorris then held a variety of assignments, including instructor in seamanship and history at the Naval Academy (1925–1927, 1930–1933). In the interval, he commanded destroyers. From 1933 to 1935, he was a navigator on the battleship *California*. McMorris graduated from the Naval War College in 1938, served as operations officer for the Scouting Force (1938–1939), and then served in the same capacity with the Hawaiian Department (1939–1941).

In January 1941, promoted to captain, McMorris became war plans officer on the staff of Admiral Husband Edward Kimmel, commander in chief of the Pacific Fleet. In April 1942, he took command of the heavy cruiser *San Francisco*. Promoted to rear admiral, he assumed command of Task Force 8 that December and provided gunfire support for the 7th Infantry

Division as it retook Attu Island in the Aleutians. On March 26, 1943, some 200 miles west of Attu and without air support, he fought the Battle of the Komandorski Islands, repelling a stronger Japanese naval force under Vice Admiral Hosogaya Boshiro.

In June 1943, McMorris became chief of staff to Admiral Chester W. Nimitz, commander in chief of the Pacific Fleet and Pacific Ocean Area. McMorris helped plan the Central Pacific offensives of the war's final two years and remained in his post until February 1946. Promoted to temporary vice admiral in September 1944, he took command of the Fourth Fleet in 1946. He served on the General Board from 1947 to 1948. In June 1948, he became a permanent vice admiral, commanding the 14th Naval District and Hawaiian Sea Frontier until he retired in September 1952. McMorris died in Honolulu, Hawaii, on February 11, 1954.

McNair, Lesley James (1883–1944)

U.S. Army general. Born in Verndale, Minnesota, on May 25, 1883, Lesley James McNair graduated from the U.S. Military Academy at West Point in 1904 and was commissioned in the artillery. He served in the Mexican Punitive Expedition in 1916 and then deployed to France with the 1st Division as a lieutenant colonel in June 1917, where he served with George C. Marshall as an assistant chief of staff. That August, McNair transferred to the training section of the American Expeditionary Forces (AEF) General Staff, where he was promoted to colonel (June 1918) and to brigadier general (October), the youngest in the U.S. Army.

Reverting to his permanent rank of major after the war, McNair held a succession of routine assignments and graduated from the Army War College in 1929. He was again promoted to colonel in May 1935 and to brigadier general in March 1937, commanding an artillery brigade. McNair had already come to the notice of his friend Marshall as a talented organizer and trainer of soldiers. In 1939, McNair became commandant of the Command and General Staff School at Fort Leavenworth, Kansas.

Marshall then placed McNair in charge of organizing and training all of the army's ground forces in World War II. McNair was promoted to major general in September 1940 and to lieutenant general in June 1941. He became chief of army ground forces in March 1942.

The training assignment was a task for which McNair was perfectly suited and one that he performed brilliantly. He insisted on rigorous and realistic training, and he set high standards for officers. He often went into the field to gauge the results of his training programs. During one inspection trip to see the 1st Infantry Division in Tunisia in the spring of 1943, he was wounded. While substituting for General George C. Patton Jr. as commander of the fictitious First U.S. Army Group in the United Kingdom, McNair visited Normandy, France. He was killed there on July 25, 1944, by U.S. bombs that fell short near Saint-Lô. McNair was promoted to full general posthumously in July 1954.

McNaughton, Andrew George Latta (1887–1966)

Canadian Army general. Born on February 25, 1887, at Moosomin, Saskatchewan, Andrew George Latta McNaughton served with distinction in World War I. In October 1918, McNaughton was promoted to brigadier general and given command of the Canadian Corps heavy artillery. After the armistice, McNaughton remained in the Permanent Force (Canadian Army). While serving as chief of staff from 1929 through 1935, he pioneered many modernizing innovations.

Major General McNaughton was chosen to command the Canadian 1st Division in September 1939. Thereafter, his rise was rapid: Canadian Corps commander and lieutenant general in July 1940, and Canadian First Army commander in April 1942. During the early war years, McNaughton's public reputation was unchallenged.

In reality, McNaughton's prickly temperament, poor judgment in selecting subordinates, administrative deficiencies, and obsession with technology made it clear to most insiders that he was unfit to command a large force in the field. A consensus that his performance during Exercise SPARTAN in England in 1943 was a disaster proved to be the final straw for his many British critics, especially Field Marshal Sir Alan Brooke. The Canadian government agreed, and McNaughton was relieved in December 1943 and replaced by Lieutenant General Kenneth Stuart.

An embittered McNaughton returned to Canada. When a conscription crisis erupted in the autumn of 1944 and Prime Minister Mackenzie King sacked Minister of National Defence James Layton Ralston, McNaughton—the only senior general still favoring voluntary enlistment—entered the cabinet as Ralston's replacement. Within a month, however, the government enacted limited overseas conscription, and McNaughton's political career fizzled.

In contrast to the turmoil of his World War II service, McNaughton enjoyed a highly successful postwar career as a diplomat, serving as Canada's representative on the United Nations Atomic Energy Commission (1946–1948), the International Joint Commission (1950–1962), and the Permanent Joint Board on Defence (1950–1958). McNaughton died in Montebello, Quebec, on July 11, 1966.

Medical Experimentation

During World War II, a number of heinous crimes were committed in the guise of medical experimentation. Such experimentation usually involved the use of concentration camp prisoners as subjects. While the Germans committed the majority of the most infamous medical experiments, the Japanese also conducted highly destructive and unethical medical experiments on prisoners of war. Other countries also engaged in unethical medical experiments. Even the U.S. government conducted unethical experimentation, such as the Tuskegee Syphilis Study of 1932–1972, which was conducted without the subjects' knowledge or consent. However, these studies did not involve the acute brutality and massive loss of life that characterized both German and Japanese medical experimentation.

Approximately 200 German doctors coordinated at least 70 medical experimentation projects during the Nazi era. However, the number of medical and academic professionals actually involved in such projects was probably much higher. The exact number of individuals involved remains unknown, because the Germans destroyed most of the records toward the end of the war.

Medical experimentation by the Germans during the war was conducted primarily for military, biomedical, and ideological reasons. National Socialist Party leaders such as Heinrich Himmler ordered the military application experiments. The Nazis conducted the most infamous of these studies at the Dachau concentration camp just north of Munich. These included hypothermia, high-altitude, and seawater projects. Dr. Sigmund Rascher, an SS-Untersturmführer who also played a major role in perfecting the gas chambers utilizing Zyklon-B gas, was the primary physician responsible for these studies.

The hypothermia studies simulated conditions experienced by aviators who ejected from their planes into freezing seawater. The aim was to find the best means possible for resuscitating and rewarming pilots following exposure to intense and prolonged cold. For the experiment, prisoners were submerged under varying conditions (e.g., amount and type of clothing, fully submerged vs. partially submerged, length of exposure) in water with temperatures ranging from 37 to 54 degrees. Varying methods of rewarming and resuscitation (e.g., slow vs. rapid rewarming, type of rewarming) were tried after the prisoner's body temperature reached 80 degrees. These studies resulted in extreme pain, serious injury, or death to the prisoners used as subjects.

The high-altitude studies examined the effects of altitudes on pilots in relation to new jet technology and the impact of ejection at high altitudes on aviators. Those conducting the experiments placed prisoners in specially designed and sealed sub–atmospheric pressure chambers. Pressure levels were slowly lowered to simulate a gradual rise in atmosphere, and the impact of varying levels of oxygen was studied. All the subjects died in these experiments, and the doctors involved then performed autopsies to document the degree of air embolism damage caused within the arteries and brains of the subjects.

Between July and September 1944, the Germans conducted additional military/medical tests involving seawater. These tests were designed to benefit both the Luftwaffe and the German Navy. They were part of an effort to make seawater potable for military personnel lost at sea. Prisoners were starved and then forced to drink seawater treated with various chemicals. The result was acute illness, permanent injury, or death.

Biomedical research was the second rationale for research, and the Nazis conducted experiments in concentration camps such as Auschwitz, Buchenwald, Mauthausen, Sachsenhausen, and Ravensbrück. These studies included infectious disease studies, pharmacological studies, surgical experiments, and traumatic injury studies. In relation to infectious disease studies, those conducting the experiments injected prisoners with various diseases (e.g., typhus, tuberculosis) and observed the course of the disease. The prisoners were then killed, and autopsies were performed to examine the impact of the disease on specific body organs. For the traumatic injury studies, German doctors inflicted wounds on prisoners and rubbed foreign

substances such as dirt, glass, wood, or rusty nails into them. The course of infection and possible treatments were then studied. Other biomedical research did not involve direct experimentation but rather the removal of specimens such as brains or other organs for university and institute collections.

The final explanation for German medical experimentation was ideological, specifically the pursuit of "racial purity" or "racial hygiene." The Holocaust and many of the activities of the Nazis such as the T-4 or Euthanasia Project were eugenic in nature. The goal was to purify the so-called Aryan race through the elimination of individuals with genetic abnormalities as well as the destruction of "inferior" races. While most individuals considered inferior (e.g., Jews, the mentally ill) were simply killed, experimentation was undertaken to find a means of cheap, efficient, and effective mass sterilization that could be completed without an individual's knowledge. Prisoners at Sachsenhausen, Ravensbrück, Auschwitz, and other sites were exposed to radiation, underwent surgery, or had caustic substances injected internally. The notorious Block 10 at Auschwitz was the site of much of this research at the hands of Dr. Carl Clauberg, aka "The Beast."

Under the guise of genetic research, Dr. Josef Mengele (aka "Angel of Death") conducted his infamous twin studies. Mengele's capricious and extremely cruel experiments with children ranged from attempts to change eye color by injecting dye chemicals into the eye to experiments with blood transfusions. Mengele regularly conducted ghastly experiments and infectious disease studies by injecting one twin with a disease such as typhus and then killing both twins to examine the differences upon autopsy.

All of the research conducted in the concentration camps violated the rights of participants in experiments and fundamental human rights standards. Sixteen doctors were brought to trial and found guilty of war crimes and crimes against humanity in 1947 in the Nuremberg Trials. The resulting Nuremberg Laws, some of which outlined 10 directives related to experimentation with humans, were written because of the abuses committed by the Nazis in the name of medical research.

The Japanese also engaged in extensive biological warfare research on humans during World War II in China. Unit 731 of the Japanese Army, under the leadership of Lieutenant General and microbiologist Shiro Ishii, was the

primary research group located out of Harbin, China. The Japanese experimented on prisoners at a disguised "water purification" plant. After the experiments, there were no survivors. The Japanese also conducted field trials across the Chinese countryside to test various disease (e.g., anthrax, small-pox, cholera) delivery systems. These experiments killed or made seriously ill tens of thousands of Chinese villagers. The individuals involved with Unit 731 and the other biological warfare units were never brought to trial following the war. Instead, the United States granted them immunity in exchange for access to their biological warfare data.

Medicine and the War

Medicine during World War II was marked by advances in triage and transport, management of shock, and treatment of infectious diseases. The war also witnessed the emergence of aviation and submarine medicine and the misuse of human experimentation, resulting in new standards for medical research.

Better transportation and triage were made possible by improved triage systems dating to World War I. By 1939, military surgeons recognized the importance of early management of battlefield trauma. Medics trained and equipped to control blood loss and administer analgesics at the initial site of

injury were attached to individual combat units. Injectable morphine dispensed on the battlefield lessened both pain and shock during evacuation. Taking the model developed by the Royal Army Medical Corps, transport from the field was organized in stages, with each step assigned a specific range of duties.

The first stop after field stabilization was the regimental collecting station, where hemostatic bandages and splints could be applied. The collecting stations also had plasma or blood available to manage shock, and staff there could secure adequate ventilation, including tracheotomies if needed. From the collecting station, men could be moved to semimobile field hospitals equipped to perform emergency surgery. The field hospitals were the first stage fully staffed with physicians. From the field hospital, men could be moved to fixed-station or general hospitals, where more complex procedures (neurosurgery, chest surgery, orthopedic reconstructions, and the like) could be performed and where men expected to return to duty could convalesce. General and rehabilitation hospitals in the zone of the interior could provide major reconstruction (predominantly orthopedic and plastic surgical procedures) and long-term rehabilitation if necessary. Depending on the severity of the injury, a wounded man could exit the system and return to duty at any point in the chain.

Semimobile medical units were linear descendants of the French *auto-chir*, a World War I attempt to create motorized field hospitals. A high level of mobility was less important in that relatively stationary war, and development of the freely movable hospital only blossomed in World War II. These auxiliary surgical teams remained somewhat difficult to transport and were limited in the services they could provide, but they were an important interim step toward the mobile army surgical hospitals (MASH units) of the Korean War and the Vietnam War.

Aeromedical evacuation, although tried in a crude way in World War I, came into its own in World War II. The process largely involved the use of fixed-wing aircraft (for U.S. forces, mostly C-47s, C-54s, and C-54As) to move men from field or general hospitals to facilities in the zone of the interior. Medical air transport became especially sophisticated in the long distances of the Pacific war, where the U.S. Army Nurse Corps developed the expertise in managing patients during prolonged transit that engendered current civilian and military flight nurses.

The island war in the Pacific presented unique problems in medical evacuation: the distances were inordinately long, and there was almost never an accessible general hospital to augment basic field hospital care. Although hospital ships had been used since the mid-1800s and had reached a high degree of sophistication under the Japanese in their 1904–1905 war with Russia, the U.S. Navy employed them to unprecedented advantage in World War II.

At the beginning of the war, the navy had only two hospital ships (the *Relief* and the *Solace*), and only one of these was in the Pacific. During the war, the United States commissioned an additional eight hospital ships and developed an entire class of troop transports equipped to provide limited hospital services. The navy also deployed a series of adapted landing craft—LST(H)s (landing ships, tank [hospital])—manned with 4 surgeons and 27 corpsmen and capable of serving as a field hospital for up to 350 wounded. Hospital ships, required by the navy to be held well back from areas of direct combat, served essentially the same role as land-based general hospitals.

Although some new surgical techniques, particularly in vascular surgery, were developed during the war, the primary advances were in the early management and treatment of physiologic effects of trauma. As noted, medics made almost immediate hemostasis and pain management a standard. Understanding of the mechanisms and treatment of shock came early in the war. Shock is clinically characterized by a fall in blood pressure, a rise in the pulse, coolness and discoloration of poorly perfused extremities, and mental changes ranging from anxiety through confusion to coma. The syndrome’s common denominator is failure of the heart and the circulatory system to supply adequate blood to the body’s organs.

In the early years of the war, clinicians first realized that poor perfusion was the common factor in various types of shock. Blood loss, loss of body fluid such as that caused by weeping burn wounds, sepsis with its toxic bacteriologic by-products, and extreme cold can all cause the circulatory system to fail. The physiologic effects of that failure can (at least temporarily) be ameliorated by increasing the amount of fluid in the system.

Soviet scientists in the 1930s had shown that plasma—blood with the red cells removed—could be effectively used to treat shock. Plasma had two signal advantages: unlike whole blood, it was not type-specific, and it could

be readily stored for long periods. Plasma could be started by medics at the front, and it was widely administered from the early days of the war.

Recognizing the need for blood and plasma, the British started a national blood-banking program early in the war, a collection and storage system the Americans later adopted, enlarged, and improved. As the war progressed, plasma's limitations as a replacement for lost blood became evident, and the use of whole blood to treat shock became more prevalent. Although civilian donors played a major role in supplying the blood banks, most donations came from combatants themselves, with medics providing a disproportionate share. In addition to whole blood, military surgeons had cardiac stimulants and vasoconstrictors, such as adrenaline and ephedrine, to augment perfusion.

Military medicine also saw significant advances in the management of infectious diseases during World War II. These improvements primarily involved the treatment and control of tropical diseases, control of diseases resulting from poor sanitation aggravated by dietary deficiency, and chemical treatment of infections.

The Pacific war forced Japanese and Allied soldiers to fight in areas where tropical infections, especially malaria, were endemic. In the latter part of 1942 and in early 1943, American soldiers in the Solomons were hospitalized for malaria at a rate of 970 per 1,000 per year, with 100,000 men ultimately contracting the disease. The unacceptable loss of fighting men led General Douglas MacArthur to form the Combined Advisory Committee on Tropical Medicine, Hygiene, and Sanitation. The committee used preventive measures to bring an 85 percent decrease in the hospitalization rate within six months.

When World War II began, quinine was the agent of choice in treating malaria, but the Japanese captured the drug's major sources of supply. The antimalarial Atabrine was developed as a synthetic substitute, and although soldiers had to be forced to take it because of its bitter taste and tendency to turn the skin yellow, 2.5 billion doses had been dispensed by war's end.

Vigorous efforts were used to control the anopheles mosquito that carried the disease, including oil coating of breeding ponds and spraying with the newly developed chemical insecticide, DDT. As a result of these preventive measures, less than 1 percent of hospitalized American personnel had malaria by the end of 1943. The Japanese did not do as well. They had access to quinine but were ineffective in distributing it. In addition, their soldiers were

often underfed, and their rice-based diet resulted in vitamin deficiencies—particularly B1 deficiency or beriberi—that increased susceptibility to infectious disease.

Besides malaria, soldiers in the Pacific theater suffered from dengue fever (an untreatable, incapacitating, but usually self-limited viral disease), various forms of infectious diarrhea, and fungal skin diseases (collectively termed "jungle rot").

Typhus, a louse-borne *rickettsia* disease, was the most threatening infectious disease in the European theater. When the Western Allies landed in French North Africa in November 1942, the area was in the midst of a typhus epidemic that ultimately infected over 500,000 civilians. The U.S. Army received a vaccine mass-produced by a process developed in the U.S. Department of Agriculture, and only 11 men from a force of nearly half a million contracted typhus. Allied troops arrived in Europe vaccinated against typhus, typhoid, paratyphoid, and smallpox, but malaria remained a significant problem, especially in Italy, because Allied soldiers resisted taking Atabrine.

An American soldier wounded by shrapnel being given a blood plasma transfusion during the Sicily Campaign, July 1943. (Wever/US Navy/National Archives/The LIFE Picture Collection/Getty Images)

In addition to preventative vaccination, DDT was used to kill body lice that carried the infection. The new chemical agent stayed in clothes, so people could be dusted without removing their garments (an important factor in the North African Muslim culture), and the clothing no longer had to be sterilized or destroyed. Effective delousing was also important in limiting typhus outbreaks in the Soviet Union, Eastern Europe, and Germany as the war ended; it was especially useful in controlling epidemics among concentration camp survivors when those facilities were liberated.

One of the most important advances in the treatment of wartime trauma was the use of antibiotics. German scientist Gerhard Domagk, working at I. G. Farbenindustrie, had synthesized Prontosil in 1935, and scientists at the Pasteur Institute in Paris had adapted that chemical to the more effective sulfanilamide, an antimicrobial that could be applied directly to a wound or taken orally. Sulfa drugs were used prophylactically and therapeutically from the first months of the war. Sir Alexander Fleming had accidentally discovered the antibacterial properties of penicillin in 1929, but the drug was difficult and expensive to make and was not widely used until 1940, when scientists at Oxford produced a concentrated form suitable for clinical application. The drug remained so expensive that it was routinely recovered from patients' urine, purified, and reused.

Improvements in aviation and submarine technology outstripped the ability of humans to adapt to newly accessible environments. Frenchman Paul Bert had described the physiologic effects of extreme altitude on balloonists in the previous century, but the extremes of temperature, pressure, and oxygen tension became acute concerns as great depths and nearly stratospheric altitudes were reached. Warplanes had service ceilings well beyond the survival capabilities of humans without artificial pressurization. Supplemental oxygen was required above 10,000 feet, and daytime bombing missions at altitudes in excess of 25,000 feet were often the rule. At these altitudes, temperatures ranged as low as 50 degrees below zero, posing significant risk of frostbite or even hypothermic shock. A dive-bomber could descend at 30,000 feet per minute (compared with a commercial airliner's usual rate of 400 feet per minute), a rate that introduced serious risk of barotrauma to the middle ear, sinuses, or intestines. Pooling of blood in the extremities due to extreme gravitational forces from rapid acceleration caused loss of vision and unconsciousness. Allied pilots taped their legs and

abdomens to protect against blackouts, and the Germans manufactured the first pressurized body suit with the same goal. Rapid ascent either from the ocean to the surface or the surface to high altitudes produces intravascular nitrogen bubbles, leading to the syndrome of joint pain and stroke collectively referred to as the bends.

Human experimentation carried out by the German and Japanese military medical establishments led to permanent changes in standards for scientific research. The Japanese used Soviet and Chinese prisoners of war and civilians in biowarfare experiments in Manchuria and performed anatomy experiments on living American prisoners in Japan. The Germans used concentration camp inmates to perform experiments on pressure and cold tolerance that, although undeniably inhumane, provided information that remains unique. Allied military surgeons were called on to help assess the Axis physicians' behavior after the war, and the resulting Nuremberg Code still sets the standards for ethically appropriate human experimentation.

Mediterranean Theater, Naval Operations in

The Mediterranean Sea extends 2,000 nautical miles from the Levant to Gibraltar and varies in width from 700 miles to 80 miles. A great many nations depended on maritime traffic through the Mediterranean to sustain

their economies. Italy, for example, received 86 percent of its prewar imports by sea, and 75 of that total came through Gibraltar or Suez. For Great Britain, the Suez Canal cut 4,500 nautical miles from the journey between Bombay and London, and before the war, nearly 200 British merchant ships sailed the Mediterranean on any given day. France's economy and its imperial connections likewise depended on the Mediterranean.

Upon Italy's declaration of war in June 1940, the following forces were in the Mediterranean: Italy had 2 battleships, 7 heavy and 14 light cruisers, 52 destroyers, 69 torpedo boats, and 105 submarines; France had 5 battleships, 7 heavy and 7 light cruisers, 38 destroyers, 6 torpedo boats, and 40 submarines; Great Britain had 4 battleships, 1 battle cruiser, 2 aircraft carriers, 13 light cruisers, 36 destroyers, and 12 submarines; Spain had 6 cruisers, 20 destroyers, 6 torpedo boats, and 5 submarines; Greece had 2 cruisers, 10 destroyers, 13 small torpedo boats, and 6 submarines; Turkey had 1 old battle cruiser, 2 cruisers, 4 destroyers, 4 small torpedo boats, and 8 submarines; Yugoslavia had 1 old cruiser, 4 destroyers, 6 small torpedo boats, and 4 submarines.

In the war's first two weeks, the major operation was an ineffectual bombardment near Genoa by French naval forces. After France signed an armistice with the Axis powers, the disposition of its fleet became a critical concern for the British—one the Royal Navy attempted to resolve by attacking the French squadron demobilizing at Mers-el-Kébir. This sparked a semiwar between the French—who maintained a credible fleet in being—and British forces that complicated operations in the western Mediterranean.

Contrary to prewar plans, Italian leader Benito Mussolini decided to reinforce Africa shortly before war started, which presented the Regia Marina with the unanticipated mission of escorting convoys. For offensive operations, Italy planned to use light forces and bombers to wage a low-risk, high-return campaign. However, poor tactics, unsuitable submarines, and the air forces' reliance on inefficient high-altitude bombing led to low returns and the rapid loss of 10 submarines.

Great Britain, meanwhile, decided to hold Malta as an outpost, and most of the early operations revolved around British convoys to Malta or Italian convoys to Africa. London also expected to win its first significant victories of the war against Italy. The opportunity for such a victory coincided with

Italy's first large convoy to Africa. The result was an inconclusive engagement off Calabria on July 9, 1940.

The Battle of Calabria set the naval status quo, which consisted of an Italian blockade of the Sicilian narrows by mines and light forces backed up by the battle fleet. With the Mediterranean's central basin closed to all but occasional and heavily protected convoys, Britain was forced to maintain its Middle Eastern position from around Africa and up the Red Sea, a four-month voyage for a slow convoy. This required the withdrawal of shipping from the North Atlantic and contributed to a 35 percent decline in British imports between June and December 1940.

In August 1940, Italy commissioned two modern battleships, the *Littorio* and *Vittorio Veneto,* giving its battle line superiority to that of Great Britain. In September, Italian forces invaded Egypt from Italy. Italy also invaded Greece on October 28 over the objections of the naval leaders, who were rightfully concerned that this action would complicate the naval war and provide the British with strategic bases.

In November during the course of a Malta supply operation, the Royal Navy launched an air strike on the Italian Navy's base at Taranto and there damaged three battleships—the *Littorio*, *Duilio,* and *Conte di Cavour,* the latter being knocked out of the war permanently. As a result, the Regia Marina temporarily pulled back from Taranto and the Ionian Sea, but the Taranto attack did not eliminate Italy's ability to dispute the through passage of the Mediterranean, as indicated by the Battle of Cape Spartivento (November 27, 1940), an indecisive battleship action fought two weeks later.

In December 1940, British and British Empire forces routed Italy's North African army and, by the beginning of February 1941, had advanced all the way to the borders of Tripolitania. This, along with the occupation of Crete, improved the Allied position in the eastern Mediterranean. During the war's first seven months, the Italians ran 331 transports to Africa, losing 0.6 percent of the men and 2.2 percent of the matériel en route. The British brought 7 convoys with 27 merchant ships into Malta, yet only 1 British merchant ship successfully made the passage from Gibraltar to Egypt.

Germany deployed air units in Sicily in December 1940. This was done in accordance with plans developed as early as July 1940 and to advance the Reich's own war aims rather than to prop up Italy. German dive-bombers proved more effective than Italian high-level bombers in action against

British ships off Pantelleria on January 10 and 11, when they sank a light cruiser and severely damaged the carrier *Illustrious* during a Malta operation.

In early 1941, Britain decided to dispatch an expeditionary force to Greece in accordance with its treaty with that nation. This led to London's questionable decision to strip North Africa of its best forces. The Regia Marina, under heavy German pressure, attempted to raid convoys bringing troops to Greece with surface forces, but the British, who received hints of an operation from decrypts of German Enigma air force communications, dispatched the Mediterranean Fleet to intercept the sortie. The result was a night ambush by the fleet's battleship division and the loss of an Italian cruiser division in the Battle of Cape Matapan (March 28, 1941).

Events on land rather than the sea shaped the course of naval operations during the next several months. In Africa, Axis forces rolled the British back to Egypt and invaded Greece, expelling the Allies from the mainland and forcing a massive naval evacuation. The decision to hold Crete proved costly for the Royal Navy. Convinced that the island could only be taken by sea, it sent cruiser/destroyer task forces north, and although one convoy was turned back and another largely destroyed, German paratroopers took the island anyway. Another evacuation followed, and the Royal Navy suffered grievous losses in the process. Combined with an Axis advance into Egypt, the pendulum in the eastern Mediterranean now swung against Great Britain, and its convoys had to face a longer passage through waters dominated by Axis air forces.

In the spring of 1941, Malta also experienced intensified air attacks, and the British squadron based at Gibraltar focused on bringing aircraft to reinforce the island. During May and June 1941, 60 Axis transports and freighters arrived in Africa, and just 1 was lost en route. However, the Regia Marina had depleted much of its fuel reserves by this point, and the naval command had to be selective in its use of large warships.

In the eastern Mediterranean, the Royal Navy devoted a destroyer squadron to keeping the besieged port of Tobruk supplied, and after British and other Allied forces invaded Syria in June, the Royal Navy committed cruisers and destroyers to counter a pesky Vichy French flotilla that inflicted a sharp defeat on British destroyers off the Lebanese coast on June 9.

During the second half of 1941, the convoy war intensified. The Germans transferred their air corps from Sicily, and on June 23 the British broke the

cypher used by the Italian Navy for administrative purposes. This intelligence coup gave the British advance notice of most convoys to Africa.

As Malta-based submarines and bombers inflicted greater losses on Axis convoys, the British successfully brought a large convoy to Malta from the west in July. Italy's special forces attempted to attack the convoy after it had docked but suffered a stinging defeat. On the occasion of another major convoy from the west in September, Italy decided to spend much of its remaining oil reserves to seek a strategic victory employing its fleet in conjunction with strong air attacks. The plan failed due in large part to Italian commander Angelo Iachino's mistaken belief that the British had stronger forces and were trying to lure him into a trap.

German submarines entered the Mediterranean in September, following complaints by German commander in North Africa General of Panzer Troops Erwin Rommel that the Italians were not doing enough to protect convoys. The U-boats sank the British aircraft carrier *Ark Royal* and the battleship *Barham* before the end of the year.

With Malta's supply position improving, the Royal Navy based a cruiser/destroyer force there, and this, along with submarines, aircraft and the advantage of Ultra intelligence, allowed several impressive sea denial victories, the most notable being against the seven-ship Beta convoy on November 9. This was followed by other British victories against small Italian one- and two-ship convoys and against two light cruisers in the Battle of Cape Bon on December 13. In November, only 38 percent of the Axis supplies shipped by sea reached Africa (for the six months ending in December, only 73 percent arrived). Just two days after the Battle of Cape Bon, the Italo-German armies in North Africa were in retreat and facing a supply crisis.

The Italian Navy made strenuous efforts to restore the situation, and it won three important victories in mid-December. The First Battle of Sirte on December 17 allowed a major convoy to reach North Africa. On December 19, a British cruiser/destroyer force blundered into a minefield off Tripoli and lost one cruiser and one destroyer sunk and had two cruisers damaged. The same day, Italian commandos attacked the Mediterranean fleet's main base at Alexandria and disabled two battleships, the *Queen Elizabeth* and the *Valiant*. Meanwhile, the Germans redeployed air units to Sicily and began, once again, to hammer Malta.

In the first half of 1942, the Allied position steadily deteriorated. In the short term, Japan's entry into the war offset the advantages Britain gained by U.S. participation. Small convoys from the east proved insufficient to maintain Malta's position, and as food stocks there fell, the Mediterranean Fleet mounted a major operation to succor the island. This led to the Second Battle of Sirte on March 22, 1942. The convoy did not deliver sufficient supplies to relieve the situation, however, and following the intensification of the Axis air campaign against Malta, the British attempted a larger resupply operation from both the east and the west. This led to the convoy battles of mid-June and a defeat for the Royal Navy as only 2 of 17 merchant ships got through at great cost. The Axis leaders canceled plans to conquer Malta using paratroopers and an amphibious landing in the belief that their siege of the island had neutralized it.

On June 21, the Axis armies took Tobruk and drove into Egypt before being halted 60 miles short of Alexandria. This caused the Mediterranean Fleet to withdraw into the Red Sea and Palestine. Two months later, the Royal Navy mounted another Malta operation, this time only from the west, sending 14 freighters and tankers supported by 4 carriers, 2 battleships, 7 cruisers, and 32 destroyers. Five ships from the convoy eventually reached their destination. In contrast, 94 percent of the matériel shipped by Italy to North Africa from January through June arrived safely.

In the latter half of 1942, the British reverted to a blockade-running strategy to keep Malta alive. They made great efforts to chip away at the Axis North African sea-borne traffic with some success, as only 74 percent of Axis shipments arrived. The major naval event was Operation TORCH on November 8. The Allied invasion and subsequent conquest of Morocco and Algeria and the partial occupation of Tunisia finally relieved the siege of Malta and also saw the end of French naval power with the scuttling of the French fleet at Toulon, which greatly simplified matters for the Allies. Operation TORCH also introduced massive U.S. strength into the Mediterranean, and this—not the British victory at El Alamein (October 23–November 4)—marked the beginning of the end of Axis power in the region.

The Axis fought to maintain a bridgehead in Africa centered on Tunis, and the focus of the naval war now shifted to the Sicilian Channel. Once again, small Italian convoys ran through heavily mined waters in the face of Allied air, submarine, and surface naval power, and losses were heavy.

Tunis finally fell on May 8, 1943, and in the face of Allied naval strength, the Axis made no effort to evacuate their African army by sea. Another consequence of this victory was the arrival in Egypt that month of the first convoy from Gibraltar since early 1941. The breaking of the Italian blockage of the Sicilian narrows freed an estimated 1 million tons of shipping.

The Anglo-American invasion of Sicily (July 9) in Operation HUSKY—which followed on July 10—faced minimal and ineffective interference from Axis submarines and motor torpedo boats. On July 25, Italy had a change in government. Mussolini was arrested, and on September 8 the new government signed an armistice with the Allies. This armistice caught the Italian Navy by surprise—in fact, the fleet was sortieing to attack the Allied beachheads at Salerno—and it was swept up in a campaign against the Germans that cost it a battleship and several destroyers while en route to the port of La Maddalena in Sardinia. After German forces captured La Maddalena and threatened Taranto, the naval command ordered the battle fleet to concentrate at Malta but to not lower their flag or surrender control to the Allies. At the time of the armistice, the Regia Marina had operational 6 battleships, 9 cruisers, 18 destroyers, 33 torpedo boats, 17 corvettes, and 42 submarines. The navy had 1 battleship, 4 cruisers, 9 destroyers, 10 torpedo boats, 6 corvettes, and 17 submarines under repair.

Following the Italian armistice, Germany proceeded to collect a surface fleet that deployed at one time or another 63 warships displacing more than 500 tons, mostly from captured Italian or French ships that were repaired or completed by the Germans. Germany fought several distinct naval campaigns. The Reich held the Aegean to keep Turkey neutral and deny the Allies access to the Black Sea. Germany had to protect the Balkans, and it needed the Adriatic Sea as a supply corridor to import raw materials and support its Balkan and Italian armies. In the western Mediterranean, German flotillas of torpedo boats and motor torpedo boats, supported by a new Italian fascist navy, fought in the Tyrrhenian Sea to protect the seaward flanks of their armies, transport supplies, and maintain imports from Spain. The Allies tried to break the stalemated land campaign on the Italian Peninsula with Operation SHINGLE, an amphibious assault at Anzio on January 22, 1944. This operation, however, only resulted in an isolated beachhead that required support from the sea.

Giant U.S. convoys now traversed the Mediterranean. Between the Italian

armistice and December 1944, 50 Allied convoys averaging 69 ships each entered the Middle Sea. German submarines were foiled by the strength of their escorts, and their last submarine success occurred on May 18, 1944.

In Operation DRAGOON on August 15, 1944, the Americans and French landed in the south of France. An Allied armada of 9 escort carriers, 5 battleships, 24 cruisers, and 111 destroyers supported this massive operation. However, even the conquest of southern France did not end naval operations in the Mediterranean, as fighting continued in the Adriatic and Ligurian Seas up to the end of the war. The last surface action fought in European waters pitted British destroyers against German torpedo boats in the Ligurian Sea on March 18, 1945.

Overall, operations in the Mediterranean proved long and bitter. More surface actions were fought there than anywhere else in the war. Submarine operations were costly for both sides. There were five Allied major multidivisional landings and dozens of smaller ones by the Allies and Axis both. For the first three years Italy largely realized its naval objectives, and not until the capture of Tunisia did the Allies gain control of the Mediterranean. Germany's final campaigns in the Adriatic, Tyrrhenian, and Ligurian Seas were instrumental in preventing the Reich from ever being threatened from the south.

Meiktila, Battle of (February 28–March 28, 1945)

Important and hard-fought battle in Burma (Myanmar). By mid-1944, the tide in Burma had turned, and it was the Japanese who were on the defensive. In the first half of that year, British lieutenant general William Slim, commander of the Fourteenth Army, blunted Japanese general Mutaguchi Renya's U-GO Offensive before Kohima and Imphal, then liberated northern Burma by the end of the year. Early in 1945, Slim's forces went on the offensive in central Burma. Utilizing new techniques of aerial resupply, Slim directed a drive against the Japanese geographic defense line of the Irrawaddy River.

Meiktila, the center of Japanese logistical infrastructure in the area, was also a gateway to the cities of Rangoon (Yangon) and Mandalay and an equally important center of communication for the entire Burma theater. Meiktila's airfields were key. Capture of these would allow aerial resupply of Allied ground operations throughout the entire theater of operations.

In an effort to trap and destroy Japanese lieutenant general Katamura Shihachi's Fifteenth Army at Meiktila, Slim resorted to an elaborate deception plan. Code-named CLOAK, it involved sending radio signals from a nonexistent headquarters at Shwebo on his left flank to convince Katamura that Slim's IV Corps was about to drive on Mandalay from that direction. At the same time, Slim secretly moved IV Corps, made up of the Indian 17th Division and the 225th Tank Brigade, south down the Myittha Valley and then across the Irrawaddy River near Pakokku, 100 miles south of Mandalay.

On February 13, IV Corps made a surprisingly easy crossing of the Irrawaddy. The tanks then dashed to cut off Meiktila, easily sweeping aside Japanese-puppet Indian National Army forces.

The Battle of Meiktila opened on February 28. Major General David Tennant Cowan, commander of the 17th Division, had charge of the attack. Meiktila was basically a logistics and medical center, and the Japanese had few fighting units there other than battalions for airfield defense. In all, there were only 4,000 men. Organized Japanese resistance soon collapsed, but the defenders then broke into small bands, forcing the British to clear the town street by street and house by house. This bloody task was carried out by ruthlessly efficient Gurkha troops.

Meiktila was secured on March 3, with more than 2,000 Japanese dead and 48 taken prisoner, along with 48 guns. Slim called the capture of Meiktila in only four days "a magnificent feat of arms" and immediately rushed in supplies by air from India to prepare for the inevitable Japanese counterattack.

The Japanese response was not long in coming. Burma area commander Lieutenant General Kimura Heitaro had already ordered Lieutenant General Takehara Saburō's 49th Division to Meiktila. Other Japanese units also were committed, including regiments from the 2nd, 18th, and 33rd Divisions. The battle was renewed on March 6. Although the Japanese managed to cut off the Indian 17th Division at Meiktila and for a time threatened the airfields, Slim was able to bring in a brigade by air.

On March 16, Thirty-Third Army commander Lieutenant General Honda Masaki took command of the 18th and 49th Divisions, with orders to retake Meiktila. But with XXXIII Corps and the remainder of IV Corps coming up, Honda halted the Japanese counterattack, and on March 28 he ordered Japanese forces to withdraw.

Slim's plan had succeeded brilliantly. The capture of Meiktila opened the way for the British to take Rangoon. Mandalay fell in March and Rangoon fell in May, but Meiktila was the key to the campaign.

Mellenthin, Friedrich-Wilhelm von (1904–1997)

German Army general. Born in Breslau, Germany, on August 30, 1904, Friedrich-Wilhelm von Mellenthin grew up in a military family. Mellenthin joined the Reichswehr in 1924, received his commission in the cavalry, and was a master horseman. Between 1935 and 1937, he attended the War Academy and qualified as a General Staff officer. Virtually all of his subsequent assignments were in General Staff positions, where he specialized first in intelligence and then in operations.

Mellenthin served for 15 months on General Erwin Rommel's staff in North Africa. After Mellenthin was medically evacuated back to Germany for amoebic dysentery, he was posted to the Eastern Front. As the chief of staff of XLVIII Panzer Corps, he worked for the first time with Major General Hermann Balck, who was the commander of the subordinate 11th Panzer Division. Balck later assumed command of the corps, and the Balck-Mellenthin partnership lasted for almost the rest of the war. In August 1944, Balck and Mellenthin moved to the Fourth Panzer Army, which halted the Soviet offensive at the great bend in the Vistula. Just four weeks later, Mellenthin and Balck transferred to the Western Front to take charge of Army Group G in Lorraine.

In November 1944, Mellenthin had a run-in with the German Army's high command, which led to his recall and eventual assignment to the front as a regimental commander. Nonetheless, by March 1945, Mellenthin was a major general and was once again given a chief of staff posting, this time with the Fifth Panzer Army. Following the German defeat in the Ruhr Pocket, he and other staff officers tried to escape but were captured on May 3.

Released from U.S. captivity in 1947, Mellenthin became a businessman in the airline industry and immigrated to South Africa in 1950. Mellenthin wrote two significant books after the war, including the highly regarded

Panzer Battles. In the early 1980s he and Balck participated in a series of symposiums at the U.S. Army War College with senior U.S. Army officers. The symposiums contributed significantly to the development of America's AirLand Battle doctrine. Mellenthin died in Johannesburg, South Africa, on June 28, 1997.

MENACE, Operation

See Dakar, Attack on

Mengele, Josef (1911–1979)

Nazi physician who became infamous for his nonchalant cruelty and human experimentation during 1943–1945 at the Auschwitz and Birkenau concentration camps. Josef Mengele was born on March 16, 1911, in Günzburg, Bavaria. He received a PhD in anthropology from the University of Munich in 1935; he then became interested in genetics, taking a special interest in human twins. Three years later, he received a medical degree from Frankfurt University. Meanwhile, in 1937 he joined the Nazi Party.

In 1940, Mengele was conscripted into the German Army Medical Corps, and saw service on the Eastern Front where, in 1942, he was credited with saving two German soldiers from certain death. Wounded during operations there, he received a medical furlough and in early 1943 became a member of a human genetics and eugenics center in Berlin. In April 1943, Mengele was promoted to captain in the Schutzstaffel (SS); a month later, he was named chief medical officer at the notorious Auschwitz death camp.

Mengele remained at the Auschwitz facility until early 1945. Once there, he was nicknamed the “Angel of Death” and the “White Angel” because he always wore a pristine white lab coat as he greeted new internees and conducted various—and horrific—experiments. Mengele decided which arriving prisoners were to become laborers and which were to be sent promptly to the gas chambers. Mengele’s cruelty seemingly knew no bounds. When a women’s cell block became infested with lice, no doubt because of the appalling living conditions mandated by Mengele, he ordered all prisoners—some 750 women—exterminated by gassing.

Perhaps nothing surpassed Mengele’s treatment of children and his “experiments” on living human beings, scores of whom perished because of mistreatment. Mengele took a special interest in young twins and those who exhibited some sort of physical abnormality. He would often ingratiate himself to children by offering them sweets and then perform inhuman experiments on them. One experiment witnessed the injection of different chemicals into children’s eyes to see if their eye color could be altered. Other children underwent bizarre amputations and other “experimental” surgeries, often without proper anesthesia.

One particularly grotesque experiment involved sewing together two Roma twins to create conjoined twins. They eventually died of gangrene and massive infections. Young girls were routinely sterilized and given shock treatments to gauge their reactions to such stimuli. One night saw the rounding up of 14 pairs of Roma twins; they were taken to a lab, killed by the injection of chloroform into their hearts, and meticulously dissected by Mengele.

There is no accurate tally as to the number of people Mengele killed or tortured, but it is assumed that he was directly or indirectly responsible for the murder of perhaps several thousand people during his 21 months at Auschwitz. Mengele fled in January 1945 when the Germans closed

Auschwitz. He then served as a physician in several other camps. After the war, he remained in Germany after assuming an alias and worked as a farmhand until 1949, when he fled to Argentina. He remained there for some time, leading a privileged life until he learned that Israeli agents were in pursuit of him.

Sometime in 1962, he fled to Paraguay. In the meantime, he steadfastly denied his heinous crimes, even in the face of eyewitness testimony from dozens of individuals. Mengele then moved to Brazil, once again to escape capture. He died in Bertioga, Brazil, on February 7, 1979. In 1985, Mengele's presumed remains were located in Brazil and exhumed; in 1992, DNA testing proved that the bones were indeed those of the "Angel of Death." Mengele was thus never brought to justice for his horrific crimes.

Menzies, Robert (1894–1978)

Australian politician and prime minister (1939–1941, 1949–1966). Born on December 20, 1894, at Jeparit, Victoria, Australia, Robert Menzies attended Wesley College in Melbourne and the University of Melbourne, where he graduated in 1916. Admitted to the bar two years later, he became a successful lawyer and entered Victoria's state legislature in 1928. He became deputy premier of Victoria in 1932, resigning to enter the federal Parliament in Canberra in 1934; there, he served as attorney general and became the leader of the United Australia Party (UAP). Because of his activity in battling dockworkers, who refused to load scrap metal for Japan in 1938, he acquired the nickname "Pig-iron Bob." He was also known as "Ming the Merciless."

Following the death of Prime Minister Joseph Lyons, Menzies assumed that office on April 26, 1939, at the head of a minority government. He supported British prime minister Neville Chamberlain's policy of appeasing Germany but immediately led Australia into World War II after the British declaration of war. Menzies introduced compulsory military service and then sent three Australian divisions to the Middle East. He barely survived the national election of September 1940.

In early 1941, Menzies went to London to alert the British government to the threat posed by Japan, but his efforts had no effect. He did, however, develop a close relationship with British prime minister Winston L. S. Churchill and attended a number of cabinet meetings, including those where it was decided to dispatch troops to Greece—a decision for which he was roundly criticized in Australia. Menzies also toured the war zone of the Middle East before returning to Australia in May 1941. He had sought an imperial war cabinet that would include the Dominion prime ministers, but Churchill strongly opposed this concept.

Australian military defeats under British leadership sharply divided the UAP, and pressure from various quarters forced Menzies to resign in August 1941. He was replaced by his deputy, Arthur Fadden, but continued as minister of defense. In October 1941, however, the Labour Party, headed by John Curtin, was voted into power. Menzies's wide unpopularity led him to resign the UAP leadership.

Menzies showed a remarkable ability to learn from his mistakes, and from the remnants of the UAP he put together a new party, the Liberals, which he led to a landslide victory in 1949. He courted the middle class and, under the slogan "Populate or perish," encouraged European emigration to Australia. Knighted in 1963, he was known as the "Queen's man" because of his loyalty to the British royal family. Menzies retired in 1966, having led the Liberals to seven electoral victories. He died on May 15, 1978, in Melbourne.

Merchant Aircraft Carrier Ships

British ships that superseded the earlier CAM (catapult-assisted merchant ships) ships in providing emergency air cover for World War II convoys in the North Atlantic Gap, the area then beyond the range of shore-based aircraft. Unlike escort carriers, the merchant aircraft carrier (MAC) ships retained most of their cargo-carrying capacity and operated as normal merchant vessels with merchant service commanders and crews. Only the aircrews and necessary aviation maintenance staff were naval personnel.

The initial MAC ship design added a flight deck above a grain carrier hull because its cargo handling gear was unaffected by the change. There was a small hangar aft with an elevator. Each ship carried three to four obsolescent Fairey Swordfish biplanes, the performance of which allowed safe operation from a deck just more than 400 feet long. Tankers also were suitable for conversion but could not incorporate a hangar without interfering with cargo discharge pipework, so these ships parked their aircraft on a flight deck extended by 100 feet.

The Burntisland Shipbuilding Company received two contracts in June 1942, and the first MAC ship entered service in April 1943. By May 1944, 19 ships (6 grain ships and 13 tankers) were operational out of some 30 originally envisioned, but by then the ready availability of far superior escort carriers terminated the program.

MAC ships used their aircraft primarily to prevent U-boat attacks on convoys. Their Swordfish carried out 12 direct attacks in all but sank no enemy submarines. The true measure of their effectiveness is that no U-boat successfully attacked a convoy that included a MAC ship.

Meretskov, Kirill Afanasievich (1897–1968)

Marshal of the Soviet Union. Born in Nazaryevo, near Moscow, on June 7, 1897, Kirill Meretskov was a factory worker and joined the Bolshevik Party in 1917, entering the Red Guard. Wounded twice during the Russian Civil War, he decided to make the army a career and was among the first class of Red Army officers produced by the newly established General Staff Academy (later the Frunze Military Academy).

Meretskov rose rapidly through the ranks, serving mostly in staff positions. By 1922, he was a major general and chief of staff of a cavalry corps in the Belorussian Military District. During the next decade, he held a variety of posts in the Chief Personnel Directorate and the North Caucasus and Moscow military districts.

Meretskov was selected for secret training in Germany in 1931. After a tour in the Special Red Banner Far Eastern Army (1935–1936), he went abroad, first as an observer of Czechoslovakian military maneuvers and then as a military adviser to the Republican side in the 1936–1939 Spanish Civil War. Returning to the Soviet Union, he was assigned as deputy commander of the General Staff.

In 1938, Meretskov commanded the Leningrad Military District. When Joseph Stalin decided on war with Finland, Meretskov was given only three days to prepare an attack by four armies. The attack was a disaster, and he lost his command. Meretskov nonetheless participated in the successful phase of the Finnish (Winter) War and was promoted to general of the army in June 1940. He became chief of the General Staff in August 1940, but his tenure was again short-lived. General Georgii Zhukov succeeded him in January 1941.

Meretskov was subsequently arrested on false charges but was released in September 1941 and assigned as the Stavka (Soviet high command) representative in Leningrad. He then commanded the Volkhov Front between the Leningrad and Northwest Fronts until April 1942, when he was transferred to the Western Front as Zhukov's deputy commander. Stalin restored Meretskov to command of the Volkhov Front, which helped break the siege of Leningrad in early 1944.

Meretskov assumed command of the Karelian Front in February 1944 and forced Finland from the war that October. Promoted to marshal of the Soviet Union that same month, he received command of the 1st Far Eastern Front in Manchuria, which carried out a supporting attack in the most heavily fortified Japanese-held area and helped crush the Japanese Guandong (Kwantung) Army in a nine-day campaign in August.

Given assignments to keep him out of the limelight, Meretskov finally served as an assistant minister of defense from 1955 until his retirement in 1964. He died in Moscow on December 30, 1968.

Merrill, Frank Dow (1903–1955)

U.S. Army general and leader of the famed Merrill's Marauders. Born in Hopkinton, Massachusetts, on December 4, 1903, Frank Dow Merrill enlisted in the army in 1922. In 1925, he received an appointment to the U.S. Military Academy at West Point, graduating in 1929. Merrill also earned a BS degree in military engineering from the Massachusetts Institute of Technology.

In 1938, Captain Merrill was assigned as assistant military attaché at the U.S. embassy in Tokyo. Fascinated by East Asian culture, he studied both the history and languages of Japan and China. In early 1941, Major Merrill was transferred to Manila as an intelligence officer on the staff of General Douglas MacArthur. Merrill was in Burma on a mission that December when the Japanese attacked the Philippines and was then reassigned to the China-Burma-India theater.

In the spring of 1942, Merrill was promoted to lieutenant colonel, but he was wounded in action in May when the Japanese pushed Allied forces out of Burma. In October 1943, Merrill became operations chief for Lieutenant General Joseph Stilwell and in India organized the 5307th Composite Unit (Provisional), modeled after British brigadier Orde C. Wingate's Chindits. This regimental-size infantry formation of nearly 3,000 men was designed for long-range penetration operations and relied entirely on airdrops for supplies; it was the first U.S. ground unit to fight on the Asian mainland since the Boxer Uprising of 1900. Merrill assumed command of the 5307th in January 1944 and led Merrill's Marauders, as the outfit became known.

Named Task Force Galahad, the 5307th took part in operations in north Burma during late February 1944, first in conjunction with two Chinese divisions and later with British Chindits. Over the next four months, the Marauders marched more than 1,000 miles through some of the densest jungles and over some of the highest peaks in Asia.

U.S. Army brigadier general Frank D. Merrill, at his headquarters behind Japanese lines in Burma. (Bettmann/Corbis)

Although consistently outnumbered, they participated in 5 major battles and 30 minor engagements against the veteran Japanese 18th Division. The 5307th sustained significant losses due both to the fighting and to disease. By August, the unit was at one-third strength, and Stilwell decided to disband it.

Merrill suffered a heart attack in the middle of Galahad's actions and was replaced. Promoted to major general in September 1944, Merrill became chief of staff of the Tenth Army and fought in the conquest of Okinawa in 1945. In March 1947, Merrill was part of the U.S. military advisory group sent to the Philippines as it gained full independence. He retired from the army in 1948 and then became highway commissioner for the State of New Hampshire. Merrill died on December 12, 1955, at Fernandina Beach, Florida.

Mersa Matrûh, First Battle of (June 28, 1942)

Ground battle in which an Egyptian fortress was seized by Field Marshal Erwin Rommel's Afrika Korps. Mersa Matrûh is located approximately 60 miles from Egypt's border with Libya. With Tobruk captured on June 21, 1942, Rommel decided on an immediate advance into Egypt. This approach abandoned the original Axis plan calling for a halt at the border to await the reduction of Malta, which would have ensured Axis supply lines on the drive toward the Suez Canal.

In spite of severe fuel shortages and mechanical breakdowns, Rommel's forces pushed eastward in hopes of enveloping and destroying the British Eighth Army. The Afrika Korps spearhead entered Egypt with fewer than 50 operational tanks, and its speedy advance outstripped fighter coverage, which brought vicious attacks by the Allied Desert Air Force. Nonetheless, on June 25, advanced elements of the Afrika Korps reached the outskirts of Mersa Matrûh.

The Eighth Army's commander, Lieutenant General Neil N. Ritchie, hoped to make a stand at Mersa Matrûh rather than withdraw to Alamein. On June 25, General Sir Claude Auchinleck relieved Ritchie and assumed command of the Eighth Army. He decided to fight using Ritchie's plan, with two strong wing elements of X and XIII Corps and a weakened center. He also instructed his corps commanders to withdraw rather than risk envelopment.

Rommel resumed his advance on June 26 by ordering his Italian infantry to fix X Corps inside Mersa Matrûh's defenses while his armor swung east on

the escarpments south of the city, hoping to envelop all British forces to his front. The Afrika Korps now found itself heavily engaged with the New Zealand 2nd and 1st Armoured Divisions of XIII Corps and unable to advance. Rommel's 90th Light Division overran Auchinleck's weakened center and, by the afternoon of June 27, was in striking distance of the coast behind Mersa Matrûh.

Following Auchinleck's orders not to become decisively engaged, XIII Corps commander Lieutenant General William H. Gott broke off the battle and withdrew toward Alamein, not realizing that he had the Afrika Korps in a precarious situation. The withdrawal enabled the 90th Light Division to reach the coast at 7:00 p.m. on June 27. This move cut off X Corps, which was unaware that XIII Corps had retired.

Rommel besieged Mersa Matrûh on June 28. X Corps commander Lieutenant General William George Holmes ordered his units to break out of the city that night and escape to Alamein. In spite of bitter fighting, much of the corps reached friendly lines because of the weakened condition of Rommel's forces. Axis troops entered Mersa Matrûh on June 29, capturing 8,000 British personnel and quantities of weapons and supplies. The Afrika Korps then continued its pursuit, reaching Alamein on June 30.

Mersa Matrûh was Rommel's last victory in the Libyan-Egyptian theater. The battle exhausted much of what little strength was left in Rommel's dash into Egypt after the seizure of Tobruk. On the British side, the defeat at Mersa Matrûh sent the Eighth Army to its final defensive barrier at El Alamein, but Auchinleck had preserved most of his command.

Mersa Matrûh, Second Battle of (November 7, 1942)

Battle in Egypt in which Field Marshal Erwin Rommel's Panzerarmee Afrika eluded capture by Lieutenant General Bernard Montgomery's pursuing Eighth Army. The battle followed shortly the October 23–November 4, 1942, Battle of El Alamein. Mersa Matrûh is located about 60 miles from the border with Libya. Montgomery planned to pursue the beaten Rommel and envelop Axis forces before they could escape westward, but he had not allocated any particular forces for this effort prior to the Battle of El Alamein. Rommel's temporary halt at Mersa Matrûh offered the Eighth Army a chance to surround and destroy Panzerarmee Afrika.

Rommel, who hoped to delay his retreat long enough to allow his infantry an opportunity to avoid capture, ordered his armored forces to fall back to Matrûh on November 5. Montgomery sent the 1st Armoured Division on a wide sweep to the southwest to try to reach Matrûh from the rear. Heavy rains affected the movement of both armies. Despite poor road conditions and resupply problems, much of Rommel's remaining mechanized forces made it to Matrûh. Both the 15th Panzer Division and the 90th Light Division reached Matrûh safely, but the 21st Panzer Division, short on fuel, was surrounded by the 22nd Armoured Brigade. The 21st Panzer Division then took up a hedgehog (circular) defense, eventually abandoning most of its remaining tanks.

Heavy rains, minefields, and undelivered fuel supplies prevented Montgomery's armor from advancing farther, saving Panzerarmee Afrika from encirclement. Certainly the poor weather hampered air strikes by the Desert Air Force, which had been virtually unchallenged by the Luftwaffe. On November 7, with three pursuing divisions halted, the 1st Armoured Division slowly moved forward along the coast road. But not until the evening of November 8 did the division's patrols enter Matrûh, well after Rommel's departure.

Rommel believed that Montgomery's caution allowed him to escape at Mersa Matrûh, whereas Montgomery blamed it on the heavy rains. Because the weather affected both sides equally, it was not the sole determinant.

Montgomery had not prepared for a pursuit, and he failed to press his advantage by striking deeper into the desert behind Rommel. Further, the El Alamein victory may have so exhausted the Eighth Army that an effective pursuit was impossible.

Mers-el-Kébir, Attack on (July 3, 1940)

Naval engagement between British and Vichy French warships. This battle, which took place on July 3, 1940, at the naval harbor outside Oran in French Algeria, was the most dramatic part of Operation CATAPULT, the British effort to secure the French Navy or at least keep it from falling into German hands during July 1940. British prime minister Winston L. S. Churchill ordered Vice Admiral James Somerville's newly formed Force H to steam to Oran and deliver an ultimatum to Vice Admiral Marcel-Bruno Gensoul. The French commander was offered the choice of joining his ships with the British and continuing the fight against the Germans and Italians; sailing them with reduced crews to a British port, with the crews to be promptly repatriated; sailing them with reduced crews to a French port in the West Indies; or scuttling them. If Gensoul refused all these options, Somerville would open fire and sink the French ships.

Somerville had the battle cruiser *Hood* and the battleships *Resolution* and *Valiant* (all 3 with a main armament of eight 15-inch guns), the aircraft

carrier *Ark Royal,* 2 light cruisers, and 11 destroyers. Gensoul commanded the modern fast battle cruisers *Strasbourg* and *Dunkerque,* 2 older modernized battleships, 6 superdestroyers, and a seaplane tender, along with some small craft. Additional French warships were at nearby Oran.

Somerville arrived at Mers-el-Kébir early on July 3. Gensoul tried to stall negotiations as he signaled for help from nearby French naval forces, while the *Ark Royal*'s aircraft dropped five magnetic mines in the harbor entrance. The mining occurred at about 1:30 p.m. After the French signal was intercepted by the British and decoded, London insisted that Somerville act quickly. At 5:54 p.m., the *Hood* led the *Resolution* and then the *Valiant* in a battle line and opened fire, utilizing spotting aircraft. The French ships were covered in smoke as they attempted to raise steam and leave the harbor. The range fell to about 15,300 yards.

As both sides had been observing each other for hours and taking the range, and with the French ships initially stationary, British fire was quite accurate. The confined waters, the process of getting under way, and the location of the Mers-el-Kébir fort on a ridge overlooking the harbor between the opposing ships all conspired to make it difficult for the French ships to return fire accurately. The French managed to straddle the *Hood* with shells once or twice, and some shell fragments hit it and wounded two men, but no other damage was inflicted on the British ships.

The British fired 36 salvos of 15-inch shells. The *Dunkerque,* hit four times and forced to beach, nonetheless managed to fire 40 13-inch rounds. These rounds and the increasing accuracy of the 9.4-inch and 7.6-inch guns of the French coastal batteries forced the British battle line to the west, away from the harbor entrance. On July 6, British torpedo planes attacked the *Dunkerque,* further damaging it and taking it out of the war for two years.

The French battleship *Bretagne* on fire and sinking following the British shelling of French Navy ships at Mers-el-Kébir, Algeria, July 3, 1940. (Bettmann/Corbis)

The *Bretagne* sustained the worst damage. The second British salvo of several shells hit and penetrated its thin deck armor, causing a massive magazine explosion and capsizing it, resulting in the death of its captain and 976 men out of a crew of 1,012. The battleship *Provence* was hit several times and damaged. The vessel later steamed to Toulon for extensive repairs. The French destroyers, meanwhile, proceeded independently to sea; all escaped except the *Mogador*. That ship was hit on the stern and disabled. The others joined the *Strasbourg*, which fled the harbor and, although chased by the *Hood*, made it to Toulon.

The *Ark Royal* lost three planes during the battle, and 2 of its men were dead. The French had 1,297 men killed and another 351 wounded. Cheering French sailors met the *Strasbourg* at Toulon, although it had lost 5 men because of an engineering accident during its voyage. Two light destroyers from Oran also steamed to Toulon, and the seaplane tender *Commandant Teste* (undamaged in the action) and six Gloire-class light cruisers from Algiers made Toulon on July 5. The light destroyers and small craft from Mers-el-Kébir had withdrawn to Algiers, and one sloop, the *Rigault de Genouilly*, was sunk by a British submarine. The battle was so one-sided because the French were surprised and their ships were at anchor without having steamed up.

The fight at Mers-el-Kébir ruptured Anglo–Vichy French relations and almost brought a Vichy declaration of war against Britain. Despite this episode, which still rankles the French, the French Navy honored its pledge not to surrender its ships to the Germans. In November 1942, it scuttled its ships at Toulon rather than see them fall into German hands.

Messe, Giovanni (1883–1968)

Italian Army general. Born at Mesagne (Apulia), Italy, on December 10, 1883, Giovanni Messe volunteered for the Italian Army in 1902 as a private. In 1910, he entered the Modena Military School and was commissioned on graduation, thereafter taking part as a lieutenant in the 1911–1912 Italo-Turkish War. During that conflict, he was promoted to captain.

In World War I, Messe was a battalion and Arditi (shock troops) unit commander. In 1920 he fought in Albania as an assault unit commander. Promoted to colonel, he was assigned to the War Ministry, and from 1935, he commanded the Celere Brigade. He took part in the 1935–1936 Ethiopian War as a brigadier general and deputy commander of the Cosseria Division, and on his return to Italy he was named deputy commander of mobile troops. In April 1938, Messe took command of the 3rd Celere Division. He was then sent to Albania as deputy commander of occupation troops. On December 21, 1940, following Italy's invasion of Greece, Messe was assigned command of the Special Army Corps.

In July 1941, Messe was promoted to temporary lieutenant general and assigned as commander of the Corpo di Spedizione in Russia (CSIR,

Expeditionary Corps in Russia). In July 1942, Messe's unit was renamed XXXV Corps, and he continued as its commander. Promoted to full general on January 31, 1943, he was assigned to Tunisia as commander of the First Italian Army, which included the Italian units formerly under Field Marshal Erwin Rommel's command. On May 8, 1943, following a number of defensive battles, the First Army surrendered to the Allies. Messe had been promoted to marshal a few days earlier.

Repatriated on his demand in November 1943 following Italy's armistice, he was appointed chief of staff of the new Italian Army on the Allied side. He held this post until 1945. Probably the best Italian Army senior commander of the war, Messe was widely respected by his own troops and his German allies.

In 1953, Messe entered the Italian parliament as a senator in the Christian Democratic Party. Two years later, he founded and became the head of the Unione Combattenti d'Italia (UCI, Italian Veterans Association), which had a strong monarchist bent. In 1957, he was elected to parliament as a member of the Monarchical Party, and in 1963, he was elected to the same body as a representative of the Liberal Party. Messe died in Rome on December 18, 1968.

Messerschmitt, Wilhelm Emil (1898–1978)

German aircraft designer and developer of the most widely produced World War II aircraft. Born in Frankfurt-am-Main, Germany, on June 26, 1898, Wilhelm (Willy) Messerschmitt developed a relationship with early German glider pioneer Friedrich Harth. Together, they designed and built numerous

gliders before Harth was mobilized for World War I. In 1916, Messerschmitt was drafted for military service but was discharged for medical reasons a year later. Following the war, he continued his engineering studies and graduated from the Technische Hochschule in Munich.

German aviation designer and production chief Wilhelm Messerschmitt, ca. 1940. (Keystone/Hulton Archive/Getty Images)

Endeavoring to capitalize on the growing glider craze in Germany, Messerschmitt founded his own company, Flugzeugbau (aircraft construction) Messerschmitt. After some success with powered designs, he entered into a partnership with Bayerische Flugzeugwerke (BFW) in 1927. BFW's big opportunity came in 1934 after Nazi leader Adolf Hitler rose to power and began to rearm Germany. Messerschmitt's low-wing monoplane, the Bf-109, won a competition that also involved German aviation giants Heinkel, Arado, and Focke-Wulf. The Bf-109 became the most widely

produced fighter of World War II. Between 1939 and 1945, more than 33,000 were built.

Messerschmitt's company also pioneered developments in jet- and rocket-propelled aircraft. The Me-163 Komet rocket-powered fighter was the first of its type in the war. On July 28, 1944, it attacked U.S. Army Air Forces Boeing B-17 Flying Fortresses over Merseburg, beginning a new phase of air warfare. Much more successful was the Me-262. Entering service in the autumn of 1944, it was the world's first operational jet fighter. However, this plane appeared too late in the war and in insufficient quantity to have had a major impact.

After the war, Messerschmitt was arrested and imprisoned for employing slave labor. Released after two years in prison, he began to rebuild his business, beginning with sewing machines, housing, and a compact car. In 1968, he resumed work in aviation, combining with two other manufacturers to form Messerschmitt-Bölkow-Blohm. Messerschmitt was honorary chairman of this company until his death in Munich, Germany, on September 15, 1978.

Metaxas, Ioannis (1871–1941)

Greek Army general and dictator of Greece (1936–1941). Born on the island of Ithaca on April 12, 1871, Ioannis Metaxas was commissioned in the army on graduation from the Greek Military Academy in 1890. Following service in the 1897 Greco-Turkish War, he studied in Berlin. Metaxas served on the Greek General Staff during the 1912–1913 Balkan Wars. He became army chief of staff in 1913.

Ioannis Metaxas was a Greek general and also premier of his country from 1936 until his death in 1941. (Hulton Archive/Getty Images)

At the beginning of World War I, Metaxas favored an alliance with the Central Powers. A staunch monarchist, he left Greece following the forced abdication of King Constantine in 1917 and returned with the king three years later. Metaxas entered the Greek parliament in 1926, and in 1936 he seized power and became dictator, with the justification of preventing a communist takeover. During his rule, the Greeks successfully repelled the Italian invasion that began in October 1940 and indeed went on the offensive the next month, occupying much of Albania. Metaxas died on January 29, 1941, before the German military intervened in Greece.

Metz, Battle of (September 19–November 22, 1944)

One of the few siege-warfare battles of the Western Front in Europe during World War II and the most costly single battle of the war for the U.S. Third Army. Lying in the Moselle River Valley in Lorraine, Metz was in the path of Lieutenant General George S. Patton’s U.S. Third Army in its quest to reach the Rhine. Bypassing Metz would lengthen the Third Army supply lines by some 100 miles. Furthermore, Metz lay astride one of the principal invasion routes between Germany and France and would be an important staging point for an Allied drive into Germany through Trier, the Kaiserslautern corridor, and the Saverne Gap.

Metz had long been a key fortress, and its defenses faced in both directions. The strongest defenses actually faced west, because that had been built prior to World War I, when Metz was German territory. As part of the prewar French Maginot Line fortress system, Metz had an inner circle of 15 forts and a perimeter defense of 28 steel and cement bastions. The Germans had added a number of 210mm and 105mm guns in revolving steel turrets, which could withstand direct fire. Defense of Metz was entrusted to Major General Heinrich Kittel’s 14,000-man 462nd Volksgrenadier Division.

On September 10, 12th Army Group’s commander, Lieutenant General Omar N. Bradley, ordered Patton’s Third Army to advance toward Mainz and Mannheim, Germany. With little knowledge of the fortifications in his path, Patton assigned the capture of Metz to Major General Walton Walker’s XX Corps. Walker ordered the 5th and 90th Infantry Divisions, supported by the 81st Chemical Mortar Battalion, to take the fortress. The American attack on the outer ring of the German defenses began on September 27, with 5th Infantry Division carrying the brunt of the attack.

Without major preparations, the Americans mounted a frontal assault into the area of greatest German strength and were repulsed. Even the addition of a combat command of the 7th Armored Division failed to dislodge the defenders. The battle then disintegrated into a protracted siege, similar to the static warfare of World War I. Fall rains worsened conditions, turning the ground to mud. Although air support was called in, 500-pound bombs had little effect on the German fortifications. The Americans utilized smoke screens as they moved to take the villages around the forts, but all attempts in September and early October to take the fortress failed, and the rains continued amid mounting American casualties. Patton's efforts were also handicapped by the shift in logistics support to the north for Operation MARKET-GARDEN, the September 17–26 failed effort to secure a crossing over the Rhine at Arnhem.

Between October 3 and 15, the 5th Infantry Division again tried to take the forts through direct assault but failed. The centerpiece of that effort was Fort Driant, the newest and most powerful of the Metz forts. In addition to infantry and tank destroyers, Walker committed 23 battalions of artillery. The assaulting infantry battalion took 50 percent casualties before the attack was canceled.

The Third Army was reequipped and resupplied for the November general offensive, and XX Corps was reinforced by the addition of the 95th Infantry and 10th Armored Divisions. The offensive opened on November 9 with a diversionary attack by the 95th Infantry Division on Maizières-lès-Metz, distracting the German defenders. Walker then slipped his 90th Infantry and 10th Armored Divisions farther north and crossed the Moselle River, taking Fort Königsmacker. The forces then captured forts at Volstroff and Distroff. The 90th Infantry Division now closed on Metz from the north, the 95th Infantry Division from the west and northwest, and the 5th Infantry Division from the south and southwest. This time, the Americans abandoned costly frontal assaults in favor of bypassing strongpoints and then reducing them with demolition charges.

The first American troops entered Metz on November 17. Defying Adolf Hitler's orders that the city be held to the last, the Germans managed to withdraw some of their defenders until the escape hatch was closed by the linkup of the 5th and 90th Infantry Divisions east of Metz on November 19. Although Metz surrendered two days later, some Germans chose to obey

Hitler and fight on. The last Metz fort, Jeanne d'Arc, did not surrender until December 13.

Mexico

Latin American nation covering 769,000 square miles. Mexico, which had a 1914 population of 19.3 million people, is bordered by the United States to the north and Guatemala and Belize to the south. Its east coast is on the Gulf of Mexico; its west coast is on the Pacific Ocean.

When World War II began in Europe, the controversial administration of Mexican president Lázaro Cárdenas (1934–1940) was coming to an end, and there was considerable uneasiness over the approaching presidential elections. Mexico's new president following the 1940 elections was moderate General Manuel Avila Camacho, who had served as Cárdenas's minister of war. Avila Camacho's presidency (1940–1946) encompassed the entire wartime period.

Although the Mexican people were initially divided over which side to support, Avila Camacho followed a strongly pro-Allied course from the

beginning of his administration. After the U.S. entry into the war in December 1941, Mexico quickly broke diplomatic relations with Germany, Japan, and Italy. The Mexican government also froze Japanese assets and ordered all Axis nationals out of coastal and defense areas. There was, however, little domestic support for a declaration of war. It was not until German submarines sank two Mexican oil tankers that Mexico declared war in May 1942.

Mexico's involvement in the war meant closer relations with the United States. Washington wanted bases for U.S. troops in Mexico, whereas Mexico sought economic and military aid. The United States never attained the type of base agreement it sought, but there was close cooperation between the two countries in military matters. Mexico received military aid under the U.S. Lend-Lease program, and the two nations established a joint defense committee to coordinate military activities. Mexico also established an obligatory military service law, affecting men between the ages of 18 and 45.

Mexico was one of only two Latin American countries (Brazil being the other) to furnish combat forces during the war; Mexico provided the 201st Fighter Squadron, which was equipped with U.S. aircraft and trained in Texas. The 201st served in the Philippines and had 2 men killed in training and 5 killed in combat. A more important form of military cooperation was the U.S.-Mexico agreement permitting the United States to draft Mexican citizens residing in the United States and even to recruit in Mexico. As a result, some 250,000 Mexicans served in the U.S. armed forces during the war, with 14,000 seeing combat. Mexican combat veterans received some 1,000 Purple Hearts and 1 Medal of Honor.

Mexico's wartime response also involved internal security measures. Mexico adopted a program of surveillance, relocation, and deportation aimed at Axis nationals. The Mexican government forcibly relocated Japanese and Japanese Mexicans living in coastal areas and along the U.S. border. Several German agents were detained, and Axis nationals who could not prove Mexican citizenship were deported.

Mexico's greatest contribution to the war came in the economic sphere. The country provided a variety of strategic materials needed for the war effort: copper, oil, lead, mercury, and zinc. Agricultural products also figured prominently in exports, even though Mexico experienced problems feeding its own people during the war. Mexico helped to relieve labor shortages in

the United States by agreeing to the bracero (day laborer) program, a government-regulated system of contract labor under which Mexican workers found employment in the United States.

Originally intended to meet the need for agricultural laborers in the U.S. Southwest, the program was expanded in 1943 to include nonagricultural workers as well. Some 300,000 Mexicans worked under the program during the war years. The war had negative economic consequences for Mexico as well; austerity measures, inflation, and rationing affected the daily lives of its citizens. In June 1944, the Avila Camacho administration even suspended the traditional siesta, the afternoon closing of offices and businesses.

World War II had a profound and long-term impact on Mexico's domestic and foreign policies. The war was particularly important in promoting the government's new development approach, with its emphasis on rapid industrialization based on import substitution. The close military ties between Mexico and the United States did not continue after the war, but the already intimate economic connection became even more pronounced. The bracero program—conceived to meet a wartime need—continued until 1964. World War II confirmed and increased the dominant role played by the United States in the Mexican economy.

Mexican laborers harvesting carrots in the state of Arizona in 1942 as part of the Bracero guest worker program. (National Archives/Corbis)

Meyer, Kurt (1910–1961)

German Waffen-SS general. Born in Jarxhelm, Brunswick, Germany, on December 23, 1910, Kurt Meyer became a policeman. He joined the Schutzstaffel (SS) in 1932 and the Leibstandarte Adolf Hitler (LAH) in 1934. During World War II, Meyer fought with distinction in the September 1939 invasion of Poland and received command of the LAH Motorcycle Reconnaissance Battalion. Known for his aggressive and resolute command style, he participated in the invasions of France and the Low Countries (May 1940) and Greece (April 1941). He then fought in the Soviet Union for three years as a regimental commander.

Meyer commanded the 25th Panzergrenadier Regiment of the 12th SS Panzer Division (Hitlerjugend) when the Allies invaded Normandy on June 6, 1944. He took over the division on June 17 following the death of its commander. During the campaign, the 12th SS Panzer Division fought hard along the British-Canadian front, particularly frustrating the Canadians.

An effective commander, Meyer excelled in relentless, close-quarters combat, and his division was known for its refusal to surrender. It played a key role in holding the northern shoulder of the Falaise Pocket (August) long enough to allow much of the German Seventh Army to escape to the east. By the time the division broke free of the pocket, it had been reduced from 20,000 men with 150 tanks on D-day to fewer than 300 men and 10 tanks.

Belgian partisans captured Meyer and turned him over to American forces in September.

In December 1945, Meyer was tried and convicted for the mid-June 1944 execution of 40 Canadian prisoners of war at Château Audrieu in Normandy. Although no direct evidence linked him to the crime, there was strong circumstantial evidence. A sentence of death was commuted to life in prison in New Brunswick, Canada. In October 1951, Meyer was transferred to a prison in Werl, Germany, from which he was released because of poor health in September 1954. He died at Hagen, Germany, on December 23, 1961.

Middleton, Troy Houston (1889–1976)

U.S. Army lieutenant general. Born near Georgetown, Mississippi, on October 12, 1889, Troy Middleton graduated from Mississippi A&M College (now Mississippi State University) in 1909 and enlisted in the U.S. Army in 1910. He received a commission in 1912. Middleton served on the Mexican border in 1916, and during World War I, he became the youngest colonel in the American Expeditionary Forces (AEF).

Following the war, Middleton served in the U.S. occupation forces in Germany. Reverting to his permanent rank of captain on his return to the United States, he taught at the Infantry School at Fort Benning. He graduated from the Infantry Advanced Course in 1922, the Command and General Staff School in 1924, and the Army War College in 1929. Forced to retire from the army in 1937 because of an irregular heartbeat, Middleton became the dean of administration at Louisiana State University (LSU).

Because of physical problems, including an arthritic knee, Middleton was not recalled to active duty with the army as a lieutenant colonel until January 1942. In June, he was promoted to brigadier general and became assistant commander of the 45th Infantry Division. In October 1942, he took command of the division, leading it in the invasions of Sicily (July 9–August 22, 1943) and Salerno (September 9).

Middleton was then appointed to command VIII Corps of General Omar N. Bradley's First Army in March 1944 and led it until the end of the war. His corps played a significant role in the Ardennes Offensive (Battle of the Bulge, December 16, 1944–January 25, 1945). Later, suspecting that the Germans had few men in Koblenz, he mounted a successful surprise attack on the city. His corps crossed the Rhine near the massive Lorelei rock structure—something no other invader had ever attempted because of the unfavorable terrain.

Despite being one of the best U.S. corps commanders in the European theater, Middleton was not promoted to lieutenant general until June 1945. Retiring from the army that August, he returned to LSU as comptroller, then served as the university's president from 1951 to 1962. Middleton died in Baton Rouge, Louisiana, on October 9, 1976.

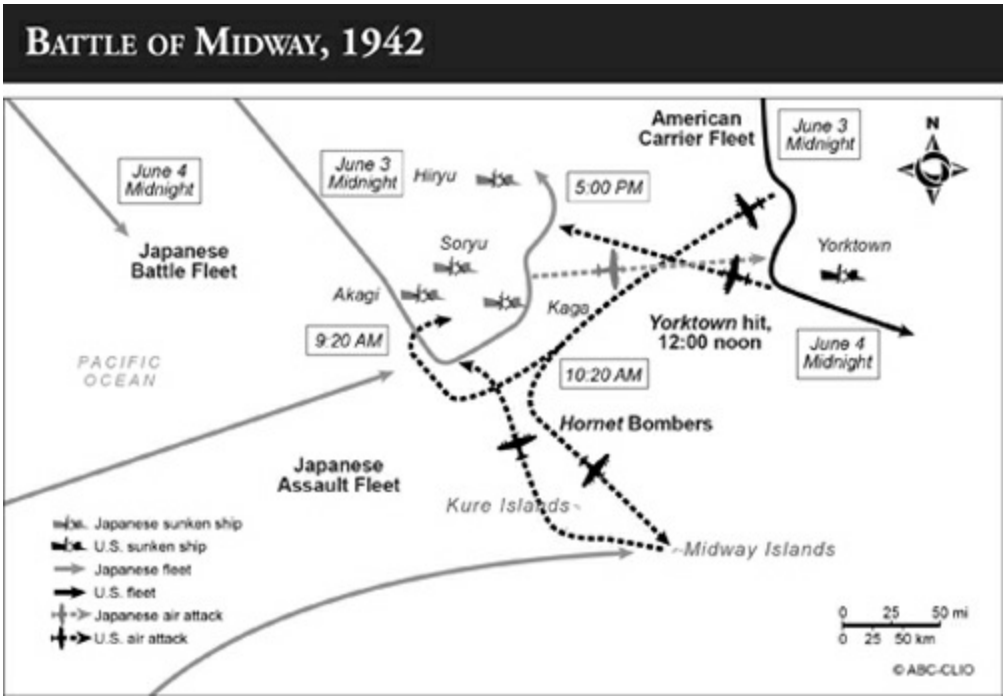
Midway, Battle of (June 3–6, 1942)

The Battle of Midway was the decisive naval engagement during the war between the United States and Japan. With their amazing run of successes in the first months of the Pacific war, the Japanese were understandably reluctant to go on the defensive. Admiral Yamamoto Isoroku, commanding the Combined Fleet, and his staff wanted to secure Midway Island, 1,100 miles west of Pearl Harbor.



The half dozen U.S. carrier raids from February to May 1942—especially the April 18 raid on Tokyo—helped silence Yamamoto's critics and produce approval for his Midway plan. Under the revised plan, the Japanese first move would be to advance deeper into the Solomons and take Port Moresby, on the south coast of New Guinea. Yamamoto's Combined Fleet would then occupy Midway Island, which Yamamoto saw as a stepping-stone toward a possible Japanese invasion of Hawaii. In any case, Midway could be used for surveillance purposes. After the Midway operation and the anticipated destruction of the U.S. fleet, the Japanese would resume their southeastern advance to cut off Australia.

In the May 8, 1942, Battle of the Coral Sea, however, U.S. carriers caused the Japanese to call off the invasion of Port Moresby. In that battle, the

Japanese lost the light carrier *Shōhō,* and the fleet carriers *Shōkaku* and *Zuikaku* were damaged. The Americans lost the fleet carrier *Lexington,* and the *Yorktown* was damaged. It was a plus for the United States strategically, however. Both Japanese carriers in the battle failed to participate in the subsequent fight at Midway (one from damage and the other for lack of aircraft), while superior repair facilities and superhuman efforts made it possible for the heavily damaged *Yorktown* to join that fight.

Meanwhile, planning for the Midway attack went forward. Yamamoto's plan was both comprehensive and complex. For the Midway invasion, Yamamoto deployed an advanced submarine force to savage U.S. ships on their way to Midway; an invasion force under Vice Admiral Kondo Nobutake of 12 transports with 5,000 troops supported by 4 heavy cruisers and a more distant covering force of 2 battleships, 1 light carrier, and 4 heavy cruisers; Vice Admiral Nagumo Chūichi's First Carrier Force of the fleet carriers *Hiryū, Sōryū, Kaga,* and *Akagi,* with 2 battleships, 2 heavy cruisers, and a destroyer screen; and the main battle fleet under Yamamoto of 3 battleships (including the giant *Yamato,* his flagship), a destroyer screen, and a light carrier. The total was 8 carriers, 11 battleships, 22 cruisers, 65 destroyers, 21 submarines, and more than 600 aircraft—some 200 ships, constituting almost the entire Japanese Navy.

For the Aleutians, Yamamoto allotted an invasion force of three escorted transports carrying 2,400 troops, with a support group of two heavy cruisers, two light carriers, and a covering force of four older battleships. Apart from its tie-in with Midway, this force was to enable the Japanese to occupy Attu and Kiska, thus blocking a supposed U.S. invasion route to Japan.

The battle was to begin in the Aleutians, with air strikes on June 3, followed by landings on June 6. On June 4, Nagumo's carrier planes would attack the airfield at Midway. On June 6, the cruisers would bombard Midway and troops would be landed, covered by the battleships. The Japanese expected there would be no U.S. ships in the Midway area until after the landings, and their hope was that the U.S. Pacific Fleet would hurry north to the Aleutians, enabling the Japanese to trap it between their two carrier forces.

Commander of U.S. forces in the Pacific Admiral Chester W. Nimitz could only deploy 76 ships; he had no battleships and only 2 carriers, the *Enterprise* and *Hornet,* fit for action. By an astonishing effort, the *Yorktown,*

heavily damaged in the Battle of the Coral Sea, was readied in 2 days instead of the estimated 90 and was sent to join the other 2 carriers. Nimitz did have the advantage of an accurate picture of the Japanese order of battle, and thanks to code-breaking, he was reasonably certain that Midway was the Japanese objective. By contrast, the Japanese had virtually no information on the Americans, but at this point in the war the Japanese tended to dismiss the Americans and exaggerate their own abilities.

Nimitz packed Midway with B-26 and B-17 bombers. He positioned the three U.S. carriers, with 233 planes, some 300 miles to the northeast. He hoped that the carriers would remain hidden from Japanese reconnaissance planes while counting on information on Japanese movements from Consolidated PBY Catalina aircraft based on Midway. He hoped to catch the Japanese by surprise, their carriers with planes on their decks.

Rear Admiral Raymond Spruance had tactical command of U.S. naval forces in the battle. The Japanese deployed 86 ships against 27 U.S. ships and had 325 planes against 348 (including 115 land-based aircraft) for the United States. Carrier strength was 5 for Japan and 3 for the United States.

On June 3, the day after the U.S. carriers were in position, U.S. air reconnaissance detected the Japanese transports some 600 miles west of Midway. A gap in the search pattern flown by Japanese aircraft allowed the U.S. carriers to remain undetected. In any case, the Japanese did not expect the U.S. Pacific Fleet to be at sea yet.

Early on June 4, Nagumo launched 108 aircraft against Midway, while a second wave of similar size was prepared to attack any warships sighted. The first wave did severe damage to Midway at little cost to itself, but the pilots reported the need for a second attack. Because his own carriers were being bombed by planes from Midway, Nagumo ordered the second wave of planes to change from torpedoes to bombs and to focus on the airfields.

Shortly thereafter, a group of U.S. ships was spotted about 200 miles away, but the Japanese at first thought it was only cruisers and destroyers. Then at 8:20 a.m. came a report identifying a carrier. Most of the Japanese torpedo bombers were now equipped with bombs, and most fighters were on patrol. Nagumo also had to recover the first wave of aircraft from the strike at Midway.

Nagumo accordingly ordered a change of course to the northeast. This helped him avoid the first wave of U.S. dive-bombers. When three waves of

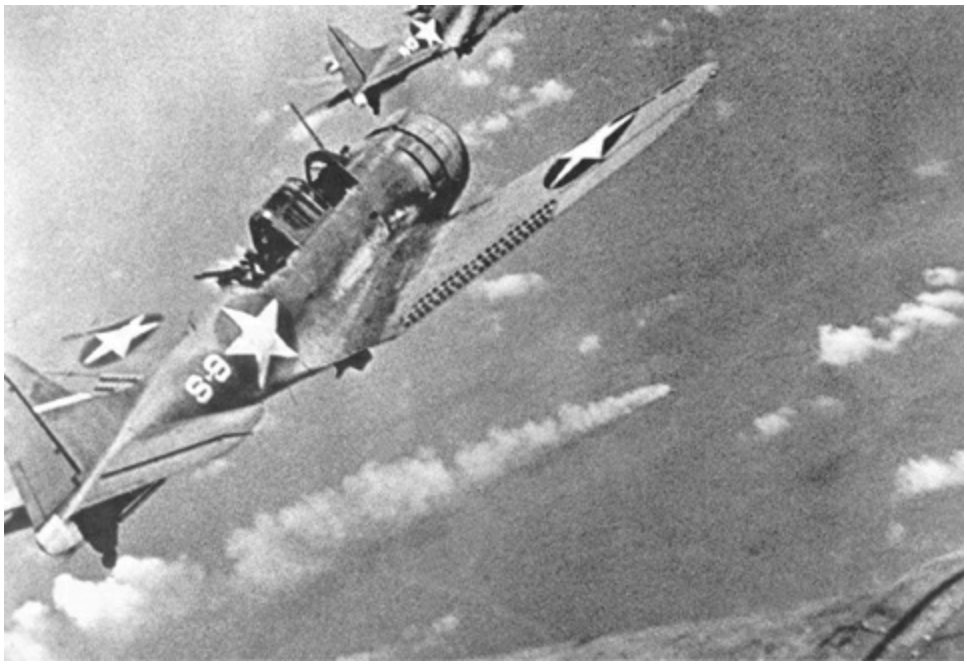
U.S. torpedo bombers attacked the Japanese carriers between 9:00 and 10:24 a.m., 47 of 51 were shot down by Japanese fighters or antiaircraft guns. The Japanese now believed they had won the battle.

Two minutes later, however, 37 U.S. dive-bombers from the *Enterprise* swept down to attack the Japanese carriers, while the Japanese fighters that had been dealing with the torpedo bombers were close to sea level. Soon the *Akagi* and *Kaga* were flaming wrecks, with the torpedoes and fuel on their decks feeding the fires. The *Sōryū* took three hits from the *Yorktown*'s dive-bombers that had arrived on the scene, and soon it too was abandoned.

The *Hiryū*, the only Japanese fleet carrier still intact, then sent its planes against the limping *Yorktown*, forcing the Americans to abandon it. Then 24 U.S. dive-bombers, including 10 from the *Yorktown*, caught the *Hiryū*. It went down the next day. Yamamoto now suspended the attack on Midway, hoping to trap the Americans by drawing them westward. Spruance, however, refused to take the bait.

The Battle of Midway was a crushing defeat for Japan. The Americans lost the carrier *Yorktown* and about 150 aircraft, while the Japanese Navy lost four fleet carriers and some 330 aircraft, most of which went down with the carriers, and a heavy cruiser. The loss of the carriers and their well-trained aircrews and support personnel was particularly devastating. The subsequent Japanese defeat in the important land battle of Guadalcanal was principally due to a lack of naval airpower.

The Battle of Midway also provided the Americans a respite until, at the end of 1942, the new Essex-class fleet carriers began to come on line. In Nimitz's words, "Midway was the most crucial battle of the Pacific War, the engagement that made everything else possible."



U.S. Navy Douglas SBD Dauntless dive bombers shown during the attack on the Japanese fleet off Midway, June 4–6, 1942. Visible in the center of the photograph is a burning Japanese ship. (National Archives)

Mihailović, Dragoljub "Draža" (1893–1946)

Yugoslavian Army general and guerrilla leader. Born at Ivanjica, Serbia, on April 27, 1893, Dragoljub Mihailović, nicknamed "Draža," entered the military academy in Belgrade in 1908 but interrupted his studies to serve with distinction in the 1912–1913 Balkan Wars and World War I. Mihailović rose to the rank of colonel and was, for a time, inspector general of fortifications. When the Germans invaded Yugoslavia in April 1941, he organized resistance to the Axis occupation forces in the mountains of western Serbia.

Mihailović's Četniks (Chetniks), named after the Serbian guerrillas who had fought the Turks, were mostly promonarchist Serbs. Mihailović was promoted to general in December 1941, and in June 1942, he became minister of war in King Peter II's Yugoslav government-in-exile.

Already reluctant to pursue a vigorous campaign against the Axis occupation forces lest he provoke reprisals against Yugoslav civilians, Mihailović believed that a rival resistance group, the procommunist Partisans led by Josip Broz (Tito), posed a greater threat to the restoration of a Serb-dominated monarchy than did the Axis powers, especially as Tito and most of his followers were Croats, the Serbs' traditional rivals for power. Accordingly, Mihailović and Tito focused on fighting each other rather than the Germans and Italians, with whom they both also collaborated when it suited their purposes.

At first, the četniks enjoyed Allied support, but Mihailović was systematically discredited by communist sympathizers among the British. Pressured by Soviet leader Joseph Stalin at Tehran, the Allies agreed to shift their support to Tito. In December 1943, the British halted all aid to the Četniks, and in May 1944, King Peter formed a new government and named Tito as minister of war.

Abandoned by the Allies, the Četniks were soon overpowered, and Mihailović went into hiding. He was captured by the communists on March

13, 1946; tried for collaboration with the Axis powers; and, despite protests by Western governments, executed in Belgrade on July 17, 1946. In March 1948, U.S. president Harry S. Truman secretly awarded Mihailović the Legion of Merit for rescuing some 500 Allied airmen and for his role in helping to defeat the Axis powers.

Mikawa Gunichi (1888–1981)

Japanese Navy vice admiral. Born in Hiroshima Prefecture, Japan, on August 29, 1888, Mikawa Gunichi graduated from the Japanese Naval Academy in 1910 and the Naval War College in 1924. A specialist in navigation, he served on several ships as a navigation officer. Promoted to commander, Mikawa also served as a member of diplomatic missions to Paris and Geneva between 1928 and 1930. Promoted to captain in 1930, he was then naval attaché in France (1930–1931).

Returning to Japan in 1931, Mikawa taught briefly at the Naval Academy before he took command from 1931 to 1936 of the cruiser *Aoba*, then the cruiser *Chōka*, and finally the battleship *Kirishima*. Promoted to rear admiral in 1936, Mikawa was appointed chief of staff of the Second Fleet. In 1937, he became chief of the Intelligence Department of the Naval General Staff, and in 1940, he took command of the 5th Cruiser Squadron. Promoted to vice admiral in November 1940, Mikawa assumed command of Battleship Division 3 in September 1941 and had charge of the Support Force of

Battleship Division 3 and Cruiser Division 8 for the Japanese attack against Pearl Harbor on December 7, 1941.

In July 1942, Mikawa received command of the newly formed Eighth Fleet and Outer South Seas Force at Rabaul. He thus was in charge of Japanese naval forces during the prolonged naval struggle off Guadalcanal, and in the course of this campaign, he administered the worst defeat ever suffered by the U.S. Navy in a stand-up fight in the August 9, 1942, Battle of Savo Island. Mikawa sank four Allied heavy cruisers and one destroyer, with no ships of his own lost in the battle (a U.S. submarine torpedoed and sank the heavy cruiser *Kako* on the return to Rabaul), but he also withdrew without attacking the vulnerable Allied transports in the sound, for which he was later criticized by naval historians.

Mikawa commanded the covering force for Japanese carriers in the Battle of the Eastern Solomons on August 22–25, 1942. In June 1944, he took command of the Southwest Area Fleet and the Thirteenth Air Fleet at Manila. Concurrently commander of the Southern Expeditionary Fleet (from August to November 1944), he was attached to the Naval General Staff before he was transferred to the reserves in May 1945. Mikawa died in Kamagawa Prefecture, Japan, on February 25, 1981.

Mikołajczyk, Stanisław (1901–1966)

Polish politician and premier of the Polish government-in-exile in London. Born on July 18, 1901, at Holsterhausen in Westphalia, Germany, Stanisław Mikołajczyk was an active member of the insurrectionist Sokoly movement during the 1918–1919 uprising against the Germans in Wielkopolska (Greater Poland). In 1920, he graduated from agricultural secondary school and became a private in the Polish Army, participating in the Russo-Polish War (1919–1921). In 1922, he joined the large moderate-rightist Polish Peasants' Party (PSL), and in 1927 he helped found the Wielkopolska Union of Rural Youth in Poznan.

Mikołajczyk emerged as a major figure in Polish politics as he rose through the ranks of the PSL, serving as a parliament member from 1930 to 1937 and leading peasant strikes in 1937. He fought as a private in the Poland Campaign of September 1939, after which he was interned in Hungary before escaping to France. From December 1939, he was vice president of the Polish National Council in Paris (the parliament-in-exile) until his evacuation to London on Germany's occupation of France.

In 1941, Mikołajczyk was appointed deputy premier and minister of the interior in General Władysław Sikorski's Polish government-in-exile in London (the London Poles). One of Mikołajczyk's principal tasks was to maintain ties with the resistance in Poland. On Sikorski's death in July 1943, Mikołajczyk replaced him as premier. Mikołajczyk lacked the national prestige of his predecessor but also inherited an impossible political situation, with the Soviet Union demanding that the Curzon Line set by the Allied powers after World War I be made the new eastern border of Poland.

In October 1944, British prime minister Winston L. S. Churchill traveled to Moscow and met with Soviet leader Joseph Stalin. They invited a delegation from the London Poles, including Mikołajczyk, to join them for discussions with Soviet leaders and members of the rival Soviet-sponsored Lublin Polish Committee (the Lublin Poles) in what was to be a final opportunity for reconciliation. Mikołajczyk was open to some compromise, but his colleagues among the London Poles were not. Frustrated by his own increasingly fractious government and the lack of Allied support for the Warsaw Rising, Mikołajczyk resigned on November 24, 1944. Moscow then broke off relations with the London-based government-in-exile.

Stanisław Mikołajczyk, leader of the Polish government-in-exile in London, shown here in 1948. (Time Life Pictures/Getty Images)

Probably no genuinely representative Polish government would have been prepared to yield the concessions or exhibit the spirit requisite for Soviet security. Strong British and U.S. pressure, especially at the February 1945 Yalta Conference, induced the communists to admit Mikołajczyk (as deputy premier) and three other representatives to the government, and the West then reluctantly recognized the Lublin Poles as the legal government.

Not until January 1947 was the Polish regime confident enough to call elections. The old Polish Peasants' Party had been so completely infiltrated that on his return to Poland, Mikołajczyk established a new peasant organization, known as the Polish People's Party. The government directed its full attention against it and Mikołajczyk, branding him a British agent. Given the circumstances, no one was surprised when the government bloc,

which included the nominal participation of several captive parties, won 394 out of 444 seats in the parliament.

In October 1947 Mikołajczyk fled Poland, which was by then completely dominated by the communists. Mikołajczyk settled in the United States in late 1947, continuing to champion the Polish cause in exile. He died in Chevy Chase, Maryland, on December 13, 1966.

Milch, Erhard (1892–1972)

German Air Force field marshal. Born on March 30, 1892, in Wilhelmshaven, Germany, Erhard Milch enlisted in the German Army in 1910, rising to the rank of lieutenant in the artillery. He became an aerial observer in 1915, and although not a pilot, he assumed command of a fighter squadron as a captain in October 1918.

Milch resigned from the army in 1921 to pursue a career in civil aviation and rose to be the chief executive of Lufthansa, the German national airline. He became close friends with Hermann Göring in the process, and when the latter was appointed Reich commissar for air, Milch followed as his secretary of state. Milch is widely credited for laying the organizational groundwork for the Luftwaffe during this period. In many ways, he was the man who built the Luftwaffe into the world's most powerful air force by 1939, but he also shared responsibilities for its shortcomings during the war. Although not technically a member of the armed forces from 1921, Milch was made a

major general in 1934, a lieutenant general in 1935, and a colonel general in 1938.

Milch became inspector general of the Luftwaffe in 1939. His lone field command of the war was in 1940 when he commanded the Fifth Air Fleet in Norway. For this service, he earned the Knight's Cross of the Iron Cross and was promoted to field marshal in July 1940. Milch recommended an immediate descent on Britain following the evacuation of the British Expeditionary Force at Dunkerque (May 26–June 4, 1940), but the idea was rejected by Adolf Hitler. Milch also expressed grave reservations about attacking the Soviet Union but was again ignored.

Following the suicide of Ernst Udet in 1941, Milch took over his position as director of air armament. He then tripled aircraft production and improved aircraft maintenance procedures. Milch found himself increasingly estranged from both Göring and Hitler, who disliked his realistic assessments. They also rejected his belief that Germany's survival lay in having large numbers of fighters to protect industrial production.

Milch pushed development of new aircraft, but Göring removed him from his posts in July 1944. Taken prisoner by the British in May 1945, Milch was sentenced to life imprisonment for war crimes, chiefly the use of forced labor in production. He was released from prison in 1954 and died on January 25, 1972, in Wuppertal-Barmen, Germany.

Miles, Milton Edward (1900–1961)

U.S. Navy vice admiral. Born in Jerome, Oklahoma, on April 6, 1900, Milton Edward Miles joined the U.S. Navy as an apprentice seaman in 1917. Commissioned an ensign on his graduation from the U.S. Naval Academy at Annapolis in 1922, Miles was promoted to lieutenant (junior grade) in 1927. Assigned to the U.S. Naval Academy, in 1928 he was promoted to lieutenant. In 1929 he earned a master of science degree at Columbia University.

During 1929–1932, Miles was assigned to the carrier *Saratoga* and in 1932–1934 was a member of the Navy Department's Bureau of Engineering. From 1934 to 1939, he served on destroyers with the U.S. Pacific and Asiatic fleets, and in 1937, he was promoted to lieutenant commander. From 1939 to 1942, Miles was a member of the Interior Control Board of the Navy Department. In 1942, he received promotion to commander and to captain.

In 1942, Miles was assigned as a U.S. naval observer at Chungking (now Chongqing), China, and as chief of the Office of Strategic Services for the Far East. Promoted to commodore in 1943, he was deputy director, Sino-American Cooperative Organization (SACO) from 1943 to 1945, and in 1944–1945, he commanded the U.S. Navy Group, China. He was promoted to brevet rear admiral in 1945. SACO consisted of 3,000 U.S. Navy personnel and some 100,000 Chinese guerrillas operating behind Japanese lands from the Gobi Desert to Indochina to relay vital weather data and other intelligence to U.S. Navy and Chinese forces. They also conducted sabotage operations against Japanese forces in the coastal areas and along the rivers of China.

In 1946, Miles took command of the heavy cruiser *Columbus*, and the next year he was a staff officer with the Atlantic Fleet. Promoted to permanent rear admiral in 1948, he commanded in succession Cruiser Division 1, Cruiser Division 6, and Cruiser Division 4. During 1950–1954, Miles was director for American affairs and U.S. naval missions in the Office of the Chief of Naval Operation and the senior naval delegate to the Inter-American Defense Board. During 1954–1955, he commanded the Fifteenth Naval District in the Panama Canal Zone and in the latter year commanded Operation FRIENDSHIP, a flood relief effort in Tampico, Mexico. During 1956–1958, he commanded the Third Naval District in New York, and in 1956 he was the senior officer of the board that investigated the grounding of the battleship *Missouri* in Chesapeake Bay.

Miles was promoted to vice admiral on his retirement from the navy in

1958. He died in Bethesda, Maryland, on March 25, 1961.

Milne Bay, Battle of (August 25–September 6, 1942)

Important Pacific theater battle on New Guinea involving Australian, U.S., and Japanese troops. In late August 1942, the Japanese continued their advance southeastward down New Guinea's northern coast. Their destination was Port Moresby, initially denied to them by the Battle of the Coral Sea (May 7–8, 1942). Milne Bay, on New Guinea's southeast tip, offered a harbor and good sites for airfields. The Australians and Americans had already built there one airfield, and two more were under construction, all part of the Allied defense of Port Moresby.

On August 24, 1942, the Japanese light cruisers *Tenryu* and *Tatsuta*, three destroyers, two submarine chasers, and two transports departed Rabaul transporting 612 naval troops of the Kure 5th Special Naval Landing Force and 197 men of the Sasebo 5th Special Naval Landing Force. Another 362 navy cadre and civilians of the 16th Naval Construction Unit were also aboard. These troops were to take the Allied airfields.

The Japanese landed at Milne Bay on the night of August 25 and ran into trouble in the form of torrential rains, swamps, mud, and flooded streams. They also encountered many more Allied troops than anticipated. The Japanese Navy had estimated Australian forces at Milne Bay at about a battalion, but the Australians had recently reinforced their garrison and had six battalions present from the 7th and 18th Australian Infantry Brigades

under Major General Cyril A. Clowes. In and around the airfields were 9,458 Australians and Americans. The Australians also had 34 Curtiss P-40 Warhawk fighter aircraft.

The Japanese landed five miles from the beaches where they had planned to land and eight miles from their objective. They had no useful maps, nor did they have mechanized equipment to haul supplies inland. The Australian P-40s bombed and strafed beached supplies, oil drums, and barges and thereby destroyed most of the Japanese food stocks. Bombs from a Boeing B-17 Flying Fortress bomber also damaged a Japanese transport unloading supplies.

Another Japanese landing unit, actually part of the initial effort, never made it to shore. Some 350 Kure 5th Special Naval Landing Force troops aboard seven powered barges stopped at Goodenough Island for a break. Nine P-40s attacked and sank all seven barges, stranding the men. Japanese reinforcements (568 men of the Kure 3rd and 200 men of the Yokosuka 5th Special Naval Landing Forces) arrived on August 29 aboard three destroyers and three patrol boats.

Despite an early setback, the Australians fought the Japanese to a standstill at the edge of the easternmost airfield. By August 30, the Japanese at Milne Bay were short of supplies. Rain, mud, malaria, air attacks, and infantry combat wore them down. A final Japanese assault on the airfields during the night of August 30 failed. The Australians then counterattacked and drove the Japanese back toward their landing sites.

The Japanese then decided to cut their losses and evacuate the survivors. As a consequence of the Allied air threat and because the Japanese needed only to evacuate men and not equipment or supplies, they employed two light cruisers and destroyers in the evacuation effort. They removed their wounded on the night of September 4–5; the main body of the force departed the next night. One Japanese destroyer was lost during the withdrawal, sunk by U.S. aircraft.

The Battle of Milne Bay was a tremendous psychological boost for the Allies. Until then, the Japanese had repeatedly defeated Allied ground forces. Japanese aggressiveness and spirit had previously triumphed over Allied soldiers and matériel—but not at Milne Bay. The Allied repulse administered to crack special naval landing forces helped convinced Allied soldiers that they could defeat the Japanese.

Minakami Genzō (1888–1944)

Japanese Army lieutenant general. Born in Yamanashi, Japan, on September 26, 1888, Minakami Genzō joined the army and was trained as an infantry officer. As a young lieutenant between 1919 and 1920, he took part in the Japanese intervention in Siberia during the Russian Civil War.

After combat and garrison duties in China in the 1930s, Minakami was promoted to major general in October 1941. He then served on the staff of the 54th Division headquarters. In June 1943, he was assigned to command the 56th Infantry Brigade Group, the core of the 56th Division that fought in northern Burma near China's Yunnan Province.

In the summer of 1944, Minakami was sent to Myitkyina in northern Burma to inspect the garrison there. At that time, overwhelmingly superior U.S. and U.S.-trained Chinese forces were driving south from Yunnan in an attempt to reopen the Burma Road. After a fierce resistance in the encircled Myitkyina, Minakami allowed the remaining garrison troops to break out of the siege. He then committed suicide on August 4, 1944.

Twenty-Eighth Army headquarters had ordered Minakami to defend Myitkyina to the last man, but the order was given to him personally and not in formal fashion to his unit. This loophole allowed the remaining garrison forces to attempt an escape from Myitkyina when, in such circumstances, the battle code of the Imperial Army was to fight to the last. In that sense, Minakami sacrificed his life to save his men.

MINCEMEAT, Operation (1943)

Major British deception preceding Operation HUSKY, the Allied assault on Sicily during July 9–22, 1943. Even as Allied forces cleared Tunisia of Axis troops, their leaders were debating their next target in the Mediterranean. Although British prime minister Winston L. S. Churchill wanted a thrust into the Balkans, the Allies settled on Sicily, to be followed by an assault on southern Italy. Operation MINCEMEAT was a British deception to convince the Germans and Italians that the invasion would instead occur in the Greek Isles and Sardinia.

Intelligence officer Lieutenant Commander Ewen Montagu of the Royal Navy conceived the idea of using the corpse of a man who had died of pneumonia, a disease that has all the physical characteristics of a drowning. He would be given a false military identity to convey papers that would reach the Germans. On April 18, 1943, at Greenock, Scotland, the British submarine *Seraph* took on board a specially constructed steel container weighing about 400 pounds and marked "Handle with Care—Optical Instruments."

Eleven days later, early on April 30, the *Seraph* surfaced off the southern coast of Andalucia, Spain. Officers sworn to secrecy then opened the container and removed a soggy corpse dressed in the uniform of an officer of the Royal Marines. The body, which had been preserved in ice, had a briefcase affixed with the royal seal chained to one wrist. The officers then inflated the "Mae West" life jacket worn by the corpse, offered a few prayers, and pushed "Major Martin" overboard to drift inland with the tide. Later, a half mile to the south, the same officers turned an inflated rubber life raft upside down and pushed it and a paddle off the submarine.

A Spanish fisherman recovered the body off Huelva and turned it over to the authorities. The British had chosen this location because a German intelligence officer was known to be in the area. The Spanish identified the corpse from its papers as that of Major William Martin of the Royal Marines. It appeared from the condition of the body that it had been in the water for several days, and the Spanish concluded that the death resulted from an airplane crash at sea. They then allowed German intelligence to examine the body and the attaché case. To keep up the ruse, the British demanded that the case be returned without delay. The Spanish finally turned it over on May 13, and subsequent tests in London revealed that it had indeed been tampered with, its contents in all probability passed on to the Germans.

The briefcase contained presumably sensitive papers and private letters from British leaders in London to theater commanders in North Africa. The Germans could only conclude from the contents that operations against Sicily were only a feint and that the Allies would next invade the Greek islands (Operation BARCLAY) with 11 British divisions. A few days later, a large U.S. force was to invade Sardinia, Corsica, and southern France.

The deception confirmed what the Germans already believed, but there is no evidence that the Italians were deceived. Adolf Hitler, however, sent reinforcements, including the 1st Panzer Division from southern France, to Greece. This unit might have been decisive had it been dispatched to Sicily. Clearly, the invading forces of Operation HUSKY benefited immensely from the MINCEMEAT deception.

Mindanao, Campaign for (April 17–June 30, 1945)

Major campaign in the recapture of the Philippines in the closing months of World War II. The battle was code-named Operation VICTOR V. The island of Mindanao in the southern Philippines is the second-largest and most easterly Philippine island. It is also the only island in the Philippines with a significant Muslim presence. Since early March 1945, some 24,000 Moro guerrillas under Colonel Wendell W. Fertig, an American mining engineer before the war, had been actively engaging Japanese forces on the island and receiving some support from U.S. Army Air Forces Thirteen Air Force aircraft.

The 43,000 Japanese troops in Mindanao were concentrated in the eastern part of the island. There were also some 13,000 noncombatant Japanese civilians. Lieutenant General Morozumi Gyosaku, commander of the 30th Division, had nominal command, but with communications a problem, he elected to remain with his own division and let Lieutenant General Harada Jiro, commander of the 100th Division, and Rear Admiral Doi Naoji, commander of the 32nd Naval Special Base Force, exercise independent command. The strongest Japanese defenses were around the Davao Gulf area in eastern Mindanao, which was heavily mined to counter an anticipated American amphibious landing, and in Davao, the island's largest city.

Believing that the Americans would attack from Davao Gulf and eventually drive them from Davao City, the Japanese prepared defensive bunkers inland, where they planned to regroup. They had no offensive plans but simply operated in accordance with Japanese commander in the Philippines General Yamashita Tomoyuki's directive that they delay and tie down as many U.S. troops as possible. Morozumi hoped to take advantage of the island's inhospitable terrain to hold their organized defensive positions for two months. Once these were overrun, he planned to withdraw and fight to the end in the rugged interior mountain region.

Japanese forces were, however, isolated from resupply and short of almost everything, including ammunition. Also, a significant number of them were Koreans, with little desire to fight to the death for the Japanese cause. The Filipino guerrillas further inhibited the defenders, destroying supply dumps and attacking the few Japanese truck convoys.

On February 28, 1945, elements of Major General Jens A. Doe's 41st Infantry Division landed on Palawan Island to the west of Mindanao and immediately commenced construction there of airfields to support the planned landing on Mindanao. At the same time, Filipino guerrillas seized a makeshift airfield at Dipolog, on the long, narrow Zamboanga Peninsula of Mindanao that reaches to the southwest. On March 8 the Americans airlifted to Dipolog two reinforced companies of the 21st Infantry Regiment and the 24th Infantry Division, and shortly thereafter U.S. Marine Corps aircraft were flying sorties from that place to cover naval bombardment and landing preparations off Zamboanga City, situated at the end of the peninsula.

Following a naval bombardment, on March 10 Rear Admiral Forest B. Royal's Task Group 78.1 landed elements of the 41st Infantry Division at Zamboanga City, which was quickly taken. During the next two weeks the 41st Infantry Division, supported by marine aviation and naval gunfire, experienced heavy fighting in difficult terrain inland against some 8,900 men of the Japanese 54th Independent Mixed Brigade. On March 23, however, the Japanese defenders here began to withdraw up the peninsula. Operations here claimed 220 Americans killed compared with 6,400 Japanese dead.

Meanwhile, Filipino guerrillas enjoyed success in Malabang Province in western Mindanao. By late March the guerrillas had taken the Malabang airstrip, and by April 5 U.S. Marine Corps aircraft were operating from there. This being the case, American planners now decided not to assault the Japanese strength in eastern Mindanao over the beaches but instead to land at Illana Bay in Malabang, then push eastward more than 100 miles across difficult terrain to take the principal Japanese defenses from the rear. American planners assumed that the campaign would take four months.

The task of securing Mindanao was assigned to the 35,000 men of Major General Franklin C. Sibert's X Corps of two reinforced infantry divisions—the 24th under Major General Roscoe B. Woodruff and the 31st under Major General Clarence A. Martin. Rear Admiral Albert G. Noble, commander of Amphibious Task Group 78.2, had charge of transporting the initial landing force of the 24th Division and X Corps headquarters to Malabang. The first troops in Operation VICTOR V came ashore on schedule on the morning of April 17 in Illana Bay and quickly proceeded inland. Their assignment was to advance up Highway 1 (little more than a trail) to Digos and then seize Davao.

Meanwhile, a small flotilla of gunboats proceeded up the Mindanao River. Roughly paralleling Route 1, it was navigable for some 35 miles and became the main supply line for the advancing U.S. forces. On April 22 Noble's ships returned with the 31st Division, which came ashore at Parang, also in Illana Bay. It was to proceed to Kabacan and then attack north toward Macajalar Bay.

The Americans moved so rapidly that they were almost on top of the Japanese around Davao before General Morozumi realized that the western landing was not a diversion. The Americans secured Digos on April 27, overwhelming the Japanese there who were defending against an attack from the other direction. The 24th Infantry Division then turned north toward Davao. The last major Philippine city under Japanese control, it was taken on May 3 after the Japanese withdrew, having destroyed much of it.

The fighting now entered its most difficult phase as the Japanese mounted a tenacious defense in fields of thick-stemmed abaca plants. Mandong fell to the 24th Infantry Division on May 29. The 31st Infantry Division proceeded to Kibawe. On May 6, the most difficult combat of the campaign began when General Morozumi ordered a Japanese battalion to delay the Americans at Maramag so that he might reorganize the shattered 30th Division. A six-day fight here ended in a Japanese banzai charge on May 14 that killed 73 Japanese.

Morozumi and the remnants of his 30th Division continued their retreat up the Agusan Valley, and after a vicious encounter with the pursuing 31st Division on June 5, they dispersed into the jungles. To the south, meanwhile, smaller X Corps units seized Sarangani and Balut islands off the southern tip of Mindanao, and on July 12 U.S. troops came ashore in Sarangani Bay.

Although Eighth Army commander Lieutenant General Robert L. Eichelberger declared on June 30 that organized resistance on Mindanao was at an end, mopping-up operations continued in its jungles until the end of the war, when some 22,000 Japanese surrendered. The fight for Mindanao cost some 10,000 Japanese killed in combat; another 7,000 were lost to starvation and disease, and 7,000 were wounded. American losses were 820 men killed and 2,880 wounded. The American success in Mindanao and relatively light casualties for the U.S. forces involved owed much to the support of Filipino guerrillas, who had supplied critical intelligence and fought alongside American forces.

Mindoro, Invasion and Battle of (December 13–16, 1944)

The first step toward the U.S. invasion of the big Philippine island of Luzon was securing the island of Mindoro. Some 58 by 110 miles in area, Mindoro is located in the northern Visayas immediately to the south of Luzon. American planners wanted to secure the island as an advanced air base for the upcoming invasion of Luzon. The Japanese garrison here numbered about 1,000 men, including some 200 survivors of Japanese ships sunk off the island.

Rear Admiral Arthur D. Struble commanded the Mindoro Attack Group consisting of the light cruiser *Nashville* (flagship), 8 destroyer transports, 30 LSTs (landing ship, tank), 12 LSMs (landing ship, medium), 31 LCI (landing craft, infantry), 20 large and 7 small minesweepers, and 14 other small craft, all escorted by 14 destroyers. Rear Admiral Russell S. Berkey commanded the Close Covering Group of 1 heavy cruiser, 2 light cruisers, and 7 destroyers. There was also a motor torpedo boat group of 23 PT boats under Lieutenant Commander N. Burt Davis.

Brigadier General William C. Dunckel commanded the Western Visayan Task Force. Its principal components were the 503rd Parachute Regimental Combat Team (RCT) and the 19th RCT of the 24th Infantry Division. The 503rd was to have made an airborne assault, but this was called off because of insufficient space on the airfields at Leyte for the troop-carrying aircraft required. Instead, the 503rd RCT joined the 19th RCT in the amphibious

landing. Air support both for the invasion and to neutralize Japanese aircraft on Luzon was provided by the Fifth and Seventh Air Forces and Third Fleet carrier aircraft.

The invasion force staged off Leyte on December 12 and then proceeded to Mindoro. On the afternoon of December 13, a single kamikaze aircraft, flying low across the Mindanao Sea, crashed into the superstructure of the cruiser *Nashville*. Losses were heavy, with 131 killed and 158 wounded. Dunckel was slightly wounded. The *Nashville* was forced to return to Leyte, and Dunckel and members of his staff transferred to the destroyer *Dashiell*. Later that afternoon another kamikaze crashed into the destroyer *Harden*, killing 15 and wounding 25. The *Harden* too was forced to return to Leyte.

The invasion occurred on schedule on the morning of December 15 in Mangarin Bay. Destroyers provided fire support for the troop landings and antiaircraft protection for the landing ships. The chief threat remained kamikaze aircraft. Although Lockheed P-38 Lightnings and carrier aircraft shot down 8 of 15 kamikazes, two LSTs were struck by the Japanese suicide aircraft and badly damaged. Later they had to be scuttled. The destroyer *Moale* was damaged by exploding ammunition in an attempt to rescue crew members of one of the LSTs. One LSM, the destroyer *Howerth*, and the escort carrier *Marcus Island* all received light damage from kamikazes but were able to continue operations. Casualties totaled 7 killed and 20 wounded.

There was little initial resistance by the vastly outnumbered and outgunned Japanese defenders on Mindoro. No Americans were killed in the initial landing, and the town of San Jose and its airfield, about five miles inland, were secured that afternoon. Some 300 Japanese at an air raid warning station at the northern tip of the island put up a stiff fight against a company of the 503rd, but except for mopping up, the island was secured within 48 hours.

In the fighting for Mindoro the Japanese suffered some 200 killed and 375 wounded. American losses were 18 killed and 81 wounded. By the end of the first day, army engineers were at work preparing airfields for the invasion of Luzon, two of which were completed in 13 days.

Mines, Land

Two basic forms of land mines existed in World War II: antipersonnel and antitank mines. Antipersonnel mines are primarily based on static omnidirectional (360-degree), static directional (180-degree), and bounding omnidirectional (360-degree) models. Often injury rather than death was viewed as a more desirable outcome from the use of land mines because of the logistical strain it could impose on an opposing force. For this reason, many mines were developed and placed to maim rather than kill.

Antitank mines were used either in an antimobility or a catastrophic-kill function. Beyond their destructive effects, land mines were also useful to channel enemy forces into kill zones, create barriers to maneuver, engage in the area denial of key points, deny matériel resources via booby-trapping, and psychologically affect opposing troops. Almost all land mines of World War II had igniters based on one of four principles: pressure, pressure-release, pull, and pull-release.

U.S. land mines were based on both antipersonnel and antitank requirements. The two standard U.S. antipersonnel mines were the M-2 and the M-3. The M-2 was a 6.5-pound bounding mine based on a modified 60mm mortar shell. When the mine was triggered, a small secondary charge propelled the main charge into the air, where it then exploded. The resulting fragmentation pattern caused more casualties than a ground burst. It had a 30-foot casualty radius. The M-3 was a larger 10-pound mine made out of cast iron and filled with TNT. It could be buried or used in an aboveground booby-trap mode. It also had a 30-foot casualty radius.

At the start of World War II, the standard U.S. antitank mine was the M-1. This simple mine used a cross-shaped metal pressure detonator, known as a “spider,” that fit over the mine. The M-1 was later replaced by the heavier M-5, which weighed 14.5 pounds. The additional weight allowed for a greater explosive charge to be packed in the mine, which then could better disable a tank tread or destroy a lighter vehicle. The even more effective M-6 was developed next. It weighed 20 pounds. A lighter M-7, weighing 4.5 pounds, was also fielded against lighter vehicular threats.

British forces used both antipersonnel and antitank mines. The British No. 75 “Hawkins,” an antipersonnel mine shaped like a rectangular food tin, was carried by paratroopers and U.S. forces. British forces also utilized U.S. land mines as part of the American aid effort. British minefields were used extensively in North Africa.

French mines were based on World War I and interwar designs. One example was the 14.5-pound light antitank mine. This pressure-sensitive mine had a rectangular steel body and was filled with 5.12 pounds of high explosives. It was employed in defensive mine belts to help protect the Maginot Line.

Soviet and German military forces were the principal innovators in land mines during the war. Soviet mine advances were primarily antitank in nature because of the continued operational encirclement threat posed by German panzer divisions. The 1941 AKS was likely the first full-width–attack, tilt-rod–actuated mine. The Red Army employed fuzing based on both seismic (VZ-1) and magnetic devices and deployed the first radio-controlled mines in 1942. At Kursk (July 5–19, 1943), the first use of a flame mine took place. Calling on their harsh experiences in the Russo-Finnish War of 1939, Soviet forces also utilized stake mines (based on improvised grenade booby traps), mine daisy chaining, low metal mines, and well-defined countermine assault techniques. The Soviets also employed antitank dog mines during the war. Specially trained dogs carrying explosive mine packs were taught to run under German tanks. The mines were then detonated on the command of the dog handler or set off by a timing mechanism. The technique was not very effective.

German innovations in land mines included the bounding antipersonnel mine of the 1930s. This was known as the “S” mine or the “Bouncing Betty” mine. Scatterable antipersonnel mines, such as the SD-2B Schmetterling (butterfly), were first used in Poland in 1939 and dropped by fixed-wing aircraft. Side-attack mines based on the Panzerfaust (armored fist) antitank rocket grenade were employed on the Eastern Front in 1943. Booby-trapped antihandling devices, attached to land mines, were also developed by German forces in the war. A chemical mine, known as the “Bounding Gas Mine 37” and based on the mustard gas agent, was developed, but it was never fielded.

About 40 types of German antitank mines existed, with the Tellermine 42, Tellermine 43, and Tellermine 35 (two variants) being the most common.

The name derived from the fact that the circular mine was about the same diameter as a dinner plate (*Teller*).

The Japanese were not known as innovators in land mines, but they fielded both land mine types and were adept at booby traps. The Model 93 (1933) "tape-measure mine" was an antipersonnel device that weighed 3 pounds. The mine had four metal rings on the side for carrying it and for emplacement and a brass dome fuze. The Model 99 (1939) armor-piercing mine was developed for use against tanks and the iron doors of pillboxes. This 2.11-pound mine was carried in a stiff canvas pouch and had four permanent magnets attached via khaki webbing to the outer edge of the mine body. It was carried by individual soldiers and was usually coupled with another for greater armor penetration by placing the opposite magnetic poles of the four outer-edge magnets together.

The fielding of a Japanese antitank "satchel charge–like" mine, rather than a traditional antitank mine, represents a tactical limitation. This limitation was somewhat made up for by the existence of the Model 96 (1936) dual-use land and water mine and the Bangalore torpedo. The Model 96 carried a 46-pound explosive charge, and the Bangalore torpedo had sections weighing 10 pounds each (most of that a TNT-cyclonite explosive mixture).

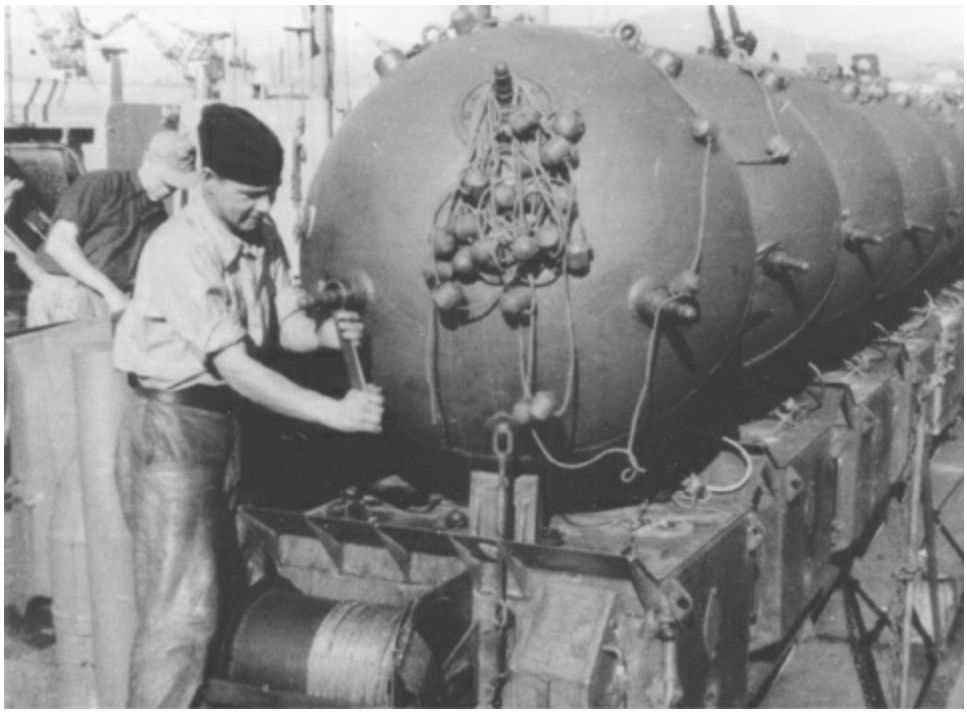
Mines, Sea

As a result of the experiences of World War I, combatants were much better prepared for mine warfare in 1939 than they had been in 1914. All belligerents expected to be committed to a mining campaign. Major advances in mine warfare before and during World War II included the widespread use of influence (i.e., acoustic, magnetic, and pressure-actuated) mines and large-scale aerial mining and the broad application of antisweeping devices. In moored mines, the trend, except in Germany, was to replace the acid-filled Hertz horns with electric switch horns.

Despite prewar financial limitations and errors in judgment, Great Britain entered the war with an adequate stock of mines—both technically and quantitatively. These included some 1917 H.II Hertz horn-type moored contact mines, but the standard moored contact mine was the switch-horn-type Mark XVII. It could be configured to take a charge of 320 or 500 pounds and could be laid with a depth setting of up to 303 feet. In 1939, Great Britain had both moored (M Mark I) and air-laid ground magnetic mines (A Mark I) available for deployment. Both were based on the magnetic induction principle (the horizontal magnetic field of a ship induced an electric current in a coiled rod) and proved so satisfactory that they remained in service throughout the war. The airborne ground mine was subsequently modified to conserve scarce materials (A Mark II, III, and IV), to improve compatibility with bomb gears (A Mark V, 1940), and to include acoustic actuation (A Mark VI, 1944).



Arming German UMB-mines. Snaglines with cork floats are attached to the mines' Herz horns (1941). (Naval Historical Center)

The majority of the mines laid by Great Britain were dropped by aircraft; hence, the British effort for a ship-laid ground mine was confined to the magnetic M Mark III, a cylindrical device that was introduced in April 1941. The charge weight was increased from 1,500 pounds to 1,600 pounds of amatol (or 1,750 pounds of minol) in 1942, and in 1943 acoustic mechanisms were added. An upgraded model with improved sensitivity and a pressure firing unit was canceled in 1944. Owing to the wartime shortages of TNT and RD (cyclonite), most British mines had 50/50 ammonium nitrate/TNT (amatol) explosive charges. This low-quality explosive was later improved by the addition of around 20 percent aluminum powder (minol).

Germany displayed the greatest creativity and activity in the field of mine technology. It developed a large number of sophisticated mines before and during World War II, with a focus on influence mines. The intense rivalry between Germany's navy and air force severely hampered the development of airborne mines, although ultimately the project was successful. For moored contact mines, the German Navy relied on the successful EM designs of World War I, the most common being the EMA (331-pound charge), the EMB (497-pound charge), and the EMC (661-pound charge). The Germans

also perfected the art of sweep obstruction. Many of the EM-type mines were fitted with chains (to resist wire cutters) and *Kontaktauslösung* (KA, contact deflection) gear, comprising a 98-foot Tombac tube over the upper part of the mooring wire that, when subjected to the upward drag in sweeping, closed a switch and fired the mine.

The best-known German influence mine was probably the LMA airborne parachute magnetic ground mine; when one was retrieved on November 22, 1939, the British were alerted to the fact that the Germans too had a capability in noncontact mines. Unlike the British magnetic mines, the German mines were actuated by a change in the vertical component of the magnetic field (the dip-needle principle). The LMA had a 661-pound charge and a practical depth limit of 130 feet. It was superseded by the larger (1,554-pound charge) LMB with magnetic (1939), acoustic (1940), and combined magnetic/acoustic and magnetic/pressure (1944) firing.

The development of the BM 1000 (1,500-pound charge) greatly improved the efficacy of German aerial mining. That mine was dropped without parachute from altitudes of up to 19,700 feet in water depths up to 115 feet, and it was regularly equipped with a variety of antisweeping and antilifting devices. For mine laying from torpedo tubes of submarines and E-boats, the Germans produced the TMA (moored magnetic) and TMB (ground magnetic and acoustic) mines. Both weapons suffered from serious construction defects that limited their endurance on the seabed to 6 to 12 months.

The construction of the Atlantic Wall, Germany’s seaward defense against the Allied invasion, inspired the KMA anti-invasion mine. This was a shallow-water ground mine with a 165-pound charge set in a rectangular concrete block anchor and surmounted by a steel tripod frame with a single Hertz horn on top. The total height of the mine was 8 feet 10 inches, and it could be fitted with a snag line for depths of 16 to 33 feet. German charge weights in general were conspicuously heavy by international standards to compensate for the generally poor quality of the explosive fillings, usually made up of a mixture of ammonium nitrate, sodium nitrate, potassium nitrate, cyclonite, ethylinediamine dinitrate, and aluminum—TNT being an exception.

Many of the mines employed by Italy during the war were left over from World War I, some of them from the Austro-Hungarian Empire service. Some Italian mines were specifically built for deployment in warm-water

conditions, such as off Libya. The P200 appeared in 1936. It weighed about 2,244 pounds and had an explosive charge of 441 pounds.

The Soviet Navy relied mainly on material developed before 1917, such as the M06, M08, and M12. Conditions in the Soviet Union between 1917 and 1941 had stifled mine development, yet the Soviet Navy put to use a handful of mines developed in the interwar period.

Notably, Italy and the United States distinguished themselves as substantial mine producers, the latter with an emphasis on submarine and air-laid mines such as the Mk 12/3 and the Mk 12/4 (1,200-pound Torpex charges). Japan, as during World War I, neglected mine development and relied solely on a handful of obsolescent moored contact mines.

Minesweeping and Mine Laying, Sea

The mine war at sea between 1939 and 1945 was a vast enterprise in terms of men and matériel that dwarfed the already quite considerable efforts made during World War I. The aim of mining was either tactical, by sinking specific enemy ships, or strategic, by assisting in dislocating enemy war efforts in general and contributing to the security of friendly sea lines of communications through the destruction or threat of destruction of enemy forces. The aim of mine countermeasures, in turn, was to permit warships and merchant vessels to use the seas and enter and leave ports as necessary for the

furtherance of the war effort and the support of the population, without unacceptable damage or losses from mines.

A grand total of 636,000 mines and sweep obstructers were laid in European waters between 1939 and 1945. Some 95,400 more were laid in the Western Pacific between 1941 and 1945. On balance, both sides laid roughly the same number of mines. The Allies lost a total of 1,406,037 tons of merchant shipping to mines—almost exclusively in European waters—representing 6.5 percent of their entire merchant ship losses. The Axis powers lost 660,533 tons of merchant shipping in the European theater and 397,412 tons in the Pacific.

Strategically, the Allies were more effective than the Axis powers in disrupting and obstructing the enemy's seaborne traffic. This was particularly true in the Pacific theater of operations, where Japanese mine-laying operations had virtually no impact on Allied naval operations. By contrast, a well-conceived U.S. aerial mining operation, in which 15,800 mines were laid in Japanese and Korean waters between December 1944 and July 1945, all but paralyzed Japanese coastal traffic and hastened the collapse of the Japanese Empire's tottering economy.

Several factors affected mine laying and minesweeping in World War II. First, mines were increasingly of the influence type; second, aircraft emerged as an effective means of delivery; and, third, the use of sweep obstructers and evaders and antilifting devices became commonplace, to the point where mine forces deliberately targeted enemy countermeasure forces and aimed to tie down valuable resources. Again, the Allies had comparatively better success in this respect: throughout the war, the German Navy employed about twice as many minesweepers and about 1.5 times as many personnel in the war against sea mines in European waters as its adversaries.

Mine laying distinguished between the two fundamental principles of offensive and defensive mining. Both sides expended a considerable part of their stock for the latter purpose. Great Britain alone laid 185,000 mines in defensive minefields in all theaters of war. Defensive minefields were usually laid by surface craft. Their purpose was to augment coastal defenses by providing operational depth seaward against maritime incursions and invasions. Frequently, a channel between the coast and the minefields was kept open for coastal traffic, thus offering a certain degree of protection to

shipping while freeing flotilla craft from tedious coastal escort and patrol duties.

Offensive minefields were ideally laid covertly, inviting the use of aircraft and submarines. The former offered an additional advantage because they could penetrate deep into enemy-controlled sea spaces in great numbers and even attack inland waterways. Famous aerial mining operations included those by the Royal Air Force (RAF) against the Kiel Canal on May 12–13, 1944 (11 mines), and against the German oil shipments on the Danube between May and October 1944 (1,200 mines). Both operations caused significant economic disruptions of the German war machine. Of the 76,000 mines laid offensively by Great Britain in European waters, 55,000 were laid by aircraft, mostly by the RAF's Bomber Command.

A variant of both the defensive and the offensive minefield was the tactical minefield. This minefield was usually laid on the basis of tactical intelligence reports or educated guessing in what was assumed would be the probable path of a specific target. During their advance through the Baltic states in August 1941, for instance, the Germans laid a tactical minefield off Juminda, Estonia, knowing that a heavily escorted Soviet troop convoy from Tallinn had to take that route. On August 28–29, 25 Soviet troop transports out of 29 within the targeted convoy foundered on the minefield. Additionally, because the Germans had deliberately also targeted escorts and minesweepers with shallow-depth mines, the Soviets lost two destroyers, nine minesweepers, and several small patrol craft. This was the largest single tactical success in the history of mine warfare.

The minesweeping effort on all sides necessarily rose to the enormous challenge posed by the extensive mine-laying campaigns—both quantitatively and qualitatively. Great Britain had built only 21 fleet minesweepers between 1933 and 1939. During the war years, these were augmented by a further 283 minesweepers. To this substantial minesweeping fleet came hundreds of motor minesweepers and auxiliary minesweepers. By May 1944, the Royal Navy had more than 650 trawlers on sweeping duties alone. The Germans entered the war with a number of World War I–vintage sweepers as well as a dozen sophisticated 784-ton M-35–type minesweepers under construction and dozens of cheap but capable *Räumboote* (motor minesweepers), the numbers of which would total 300 at the end of the war. Despite the eventual mass production of over 400 simplified M-type

sweepers, the German Navy too had to expand its capabilities further, and it requisitioned hundreds of civilian ships for minesweeping duties. As with Great Britain, Germany also built commercial trawlers for minesweeping duties.

In 1939, most minesweeping forces were geared for operations against moored contact mines. To that end, the minesweepers carried an Oropesa gear, or A-sweep, consisting of a steel wire (up to .5 inches in diameter and 1,500 feet long), which was streamed behind the minesweeper. The end of the sweep wire was fitted with wire cutters and supported by a float known as an Otter. The sweep was held at a predetermined depth by a horizontal kite near the stern of the towing vessels, and the angle to the ship's course was maintained by a vertical kite beneath the Otter. The A-sweep could be streamed on one or both sides of the ship. Minesweepers so equipped steamed in a diagonal formation on overlapping tracks. Small A-sweeps streamed from the stem post provided bow protection. Mine cases that rose to the surface after the mooring wires had been cut were usually destroyed by gunfire.

To protect fields of moored mines from sweepers, minefield planners frequently resorted to sweep obstructers such as chains on mooring wires, fuze settings that exploded the mines when swept, and other gear that would destroy or foul the sweeps or endanger the minesweepers. The Germans earned a particular reputation for indulging in this type of warfare, and they deployed minefields that contained up to 30 percent sweep obstructers. Sweep evaders, such as sprocket wheels that would let the sweep wire pass through the mine's mooring wire, and delayed-rise or multiple-rise mines additionally thwarted sweeping efforts.

The advent of ground-influence mines required different sweeping techniques. For sweeping magnetic mines, navies developed a towed current-bearing cable, called the L-sweep. This equipment consisted of two cables streamed behind the minesweeper that generated a pulsating electric current, which, when passed through the cables and the seawater, produced a magnetic tow. To overcome dependence on the seawater's conductivity and improve the individual ship's sweep efficiency, the Royal Navy and later the German Navy introduced the closed-loop system. The loop shape of the current-bearing cable was maintained by attaching it to A-sweep wires. Acoustic influence mines required the use of noisemakers. The Allied Pipe

Noise Maker ("Foxer"), originally developed as a decoy for the German T-5 homing torpedo, was well suited to that task. Noisemakers were usually streamed in conjunction with the magnetic sweep.

The improvement in sweeping techniques quite naturally called for responses by minefield planners and mine designers. An easy way to delay any sweeping attempt was to increase the sweep effort necessary to clear a given sea space by laying combined fields of moored contact and ground-influence mines. Ship counters that ignored a certain amount of passes were an even better way to achieve the same effect. This concept was perfected by the British MX organization, which specialized in the modification of standard mines. The MX-modified mine was only actuated when first influenced by a strong magnetic field (i.e., a sweeper) and then by a weaker one within a certain time span. The Germans countered by preceding their U-boats with two minesweepers or *Sperrbrechers* (barrage breakers), to which the MX organization in turn responded by setting the counters to allow the passage of two strong minefields before it detonated the mine under a third, weaker, magnetic field. The Germans then adopted the rather wasteful measure of employing three mine-countermeasures vessels.

The ultimate hurdle for mine countermeasures during the war, the pressure mine, was never mastered satisfactorily. For this reason, both sides hesitated to employ it for fear that it would be captured and used by the enemy. The Germans waited until June 1944 before desperation drove them to lay that type of mine. When the Allies responded with like devices, the Germans used their *Sperrbrechers* as expendable decoy ships against the pressure mines. Short of crawling through a minefield at speeds of less than four knots, this was the only viable method of countering pressure mines.

Mine Warfare Vessels

At the start of World War II in 1939, mine warfare vessels were not substantially different in design from those of 1918. Indeed, many countries, such as Germany and the United States, still operated large numbers of World War I minesweepers. New commissions of minesweepers were few and unspectacular. The most significant prewar designs were the German *Minensuchboote* (minesweepers) laid down in 1936 and 1937 and the French Elan class. The German ships displaced about 600 tons, were armed with two 10.5cm (4.1-inch) and two 37mm guns, and could be driven by their powerful turbines at 17 knots. The Elan-class ships were similar in performance, if slightly larger. They were armed with two 3.5-inch, one 40mm, and six 20mm antiaircraft guns. As with other Allied designs, they doubled as escorts. The Soviets, well versed in mine warfare, opted for a somewhat smaller design with a shallow draft. The 490-ton Tral class was optimized for the confined waters of the eastern Baltic. Italian minesweepers were built before the war and displaced between 240 and 255 tons. They were armed with two 20mm antiaircraft guns.

Before the war, neither Great Britain nor the United States had devoted significant resources to mine warfare. The Royal Navy had adhered to the fleet sweeper design and hastily commissioned the somewhat inadequate Bangor-class minesweepers in 1940 to replace the unsuitable Halcyon-class fleet sweepers. The new challenges posed by mine warfare soon required design changes. The German prewar designs proved inadequate and too complicated for mass production. Like the Bangor-class ships, they soon turned out to be too cramped to accommodate the extra sweep gear for use against influence mines. New minesweeper designs also required more powerful auxiliary engines that could produce the necessary current for the magnetic-influence sweeping gear.

The Germans responded by building the 1940- and 1943-type minesweepers. Although similar in appearance to the 1935-type, those vessels were simplified to the point where their sections could be largely prefabricated by specialized yards and assembled by others. The turbines were substituted by coal-fired, triple-expansion engines for cost reasons and

to conserve the navy's oil fuel stocks. Otherwise, except for the improved sweeping facilities, added antiaircraft armament, and minor details, the layout of the German minesweepers remained unchanged.

The British substituted for their Bangor-class ships the larger 1,200-ton Algerine-class vessels, of which nearly 100 were built. The concept was a return to the fleet sweeper, and with their armament of one 4-inch gun, four 40mm guns, and 92 depth charges, the Algerines easily outclassed the smaller Flower-class corvettes in their escort role.

The United States responded late to the Japanese mine threat, which turned out to be a minor irritant at most. Many U.S. minesweepers subsequently saw heavy action in the Normandy landings and in the preparation for them. Apart from the 1918-vintage Bird-class minesweeper, the U.S. Navy commissioned nearly 200 minesweepers. Most were of three main types: the big Raven and Auk classes; two-funneled diesel vessels of 810 and 890 tons, respectively, with a speed of 18 knots and one or two 3-inch guns; and the diesel-powered Admirable-class of 650 tons and 15 knots.

For economic reasons and for inshore sweeping, all navies took to building motor minesweepers as a cheap alternative to the fully fledged minesweepers. These boats, produced by the hundreds, ranged from the British 80-foot motor launches and the German 120-foot *Räumboote* (motor minesweepers) to the somewhat understated U.S. yard minesweepers that, at 136 feet in length, displaced 215 tons. Nearly all of the motor minesweepers, except the smallest, eventually assumed duties beyond inshore or harbor sweeping.

The explosive growth of the minesweeping forces in World War II contrasted with that of the dedicated mine-laying forces. As in the years from 1914 to 1918, most navies were content to rely on converted civilian vessels or regular combatants, such as destroyers, submarines, and patrol boats, for the bulk of their mine-laying activities. Few purpose-designed minelayers, such as the British Abdiel class, were built before and during the war. At 37 knots, these 4,000-ton vessels were exceptionally fast. The advent of large-scale aerial offensive mining, however, rendered them largely obsolete. The Abdiels eventually ended up as fast blockade-runners to Malta and elsewhere.

Minsk, Battle for (June 27–July 9, 1941)

Large German encirclement operation on the Eastern Front. Under Adolf Hitler's Führer Directive 21 for the June 22, 1941, invasion of the Soviet Union (Operation BARBAROSSA), Army Group Center had responsibility for the destruction of Soviet forces in Belorussia. The Germans considered this an essential prerequisite to subsequent drives on Leningrad and Moscow. Toward that end, when the Germans invaded the Soviet Union, Field Marshal Fedor von Bock's Army Group Center was the most powerful of the three German army groups.

Bock commanded three field armies, along with two of the four available panzer groups. His southern wing, charged with advancing just north of the Pripet Marshes, consisted of Field Marshal Günther von Kluge's Fourth Army of 21 infantry divisions and Colonel General Heinz Guderian's Second Panzer Group of 1 cavalry, 5 panzer, and 3 Panzergrenadier divisions. In the north, attacking from East Prussia, Colonel General Adolf Strauss's Ninth Army had 12 infantry divisions and Colonel General Hermann Hoth's Third Panzer Group had 4 panzer and 4 Panzergrenadier divisions. In reserve, Bock had Colonel General Maximilian von Weichs's Second Army. To support his ground effort, Bock could rely on the largest German air fleet on the Eastern Front at the time, Field Marshal Albert Kesselring's 1,000-aircraft Second Luftflotte.

Bock's invading German forces were actually matched in terms of numbers and matériel by the Soviet Western Front, consisting of four armies commanded by Colonel General Dmitry G. Pavlov. Unfortunately for the

Soviets, three of these armies—the Third, Fourth, and Tenth—were positioned in the westward-protruding Bialystok salient, which turned into a trap. The Soviet Thirteenth Army was more to the east, near Minsk.

Pavlov, however, was handicapped not only by manpower dispositions that had been forced on him but also by defense commissar Marshal Semen Timoshenko's Directive No. 3 that required all fronts, regardless of circumstance, to take the offensive. In the event of a German invasion, the Northwestern and Western Fronts were to launch coordinated attacks from Kaunas and Grodno, respectively. But the front commanders, despite having two mechanized corps each, were unable to mount a coordinated offensive. Still, Pavlov appointed Lieutenant General Ivan Boldin to form a "shock group" and attack south of Grodno, near Brest. But Boldin soon found promised support unavailable and a German encirclement of his forces a distinct possibility.

Disgusted with Pavlov, Timoshenko sent Lieutenant General Andrei I. Yeremenko to replace him. In the meantime, Timoshenko ordered Pavlov to hold Minsk and the Slutsk Fortified District with the Thirteenth Army and his second-echelon mechanized corps.

Pavlov was then ordered to withdraw his armies from the Bialystok salient, where they were now threatened by Hoth's Third Panzer Group sweeping around Minsk from the north through Vilnius-Molodechno, while Guderian's Second 2nd Panzer Group drove around the city from the southwest through Baranovichi. On the night of June 25–26, Pavlov ordered his four armies to withdraw east, but this plan succeeded no better than his earlier offensive. Hoth had torn a 60-mile gap between the retreating Eleventh Army of the Soviet Northwest Front moving to the northeast and the Third Army of the Western Front retreating southeast by attacking along the frontal boundary.

Boldin's force, aiding Major General Konstantin Dmi-trievich Golubev's Tenth Army, pleaded for an airdrop of fuel and ammunition. By June 26, it had withdrawn into thick forest south of Minsk. Pavlov had assigned the Fourth Army the task of holding at the Shchara River and defending the Slutsk Fortified District in the southwest, only to discover that Slutsk had sent all its weapons to Brest.

The Battle for Minsk was joined by June 26 as Pavlov withdrew with his staff to Mogilev, leaving the weak Thirteenth Army to defend Minsk, even as

the inner encirclement progressed as part of the "double battle of Bialystok-Minsk." Slutsk fell to the Germans the next day as the German spearheads raced toward the Berezina River. Pavlov's Third and Tenth Armies were withdrawing toward Minsk, hoping to break the inner encirclement despite having little ammunition, but both were cut off by June 28, along with Thirteenth Army. Pavlov's pride, the VI Mechanized Corps—a unit that began the campaign with more than 1,000 tanks—was shattered and its commander killed.

On June 29, Yeremenko took command from Pavlov, who was sent to Moscow. Meanwhile, Yeremenko lost the race to the Berezina to the German panzers. The savaged Soviet Western Front was scattered over a 200-mile area, as Minsk had fallen on June 29. By July 9, German mopping-up operations ended. In the operation, the Germans claimed to have destroyed five Soviet armies and taken nearly 324,000 prisoners, 1,809 guns, and 3,332 tanks.

The Soviets, led by surviving commanders such as Boldin, took advantage of the spring rains and managed to break out about 300,000 men. Although Joseph Stalin's inept decisions had contributed greatly to the Soviet military failures to that point, Pavlov was made the scapegoat for the Minsk disaster and shot, along with Fourth Army commander General Aleksandr Korobkov and XLI Rifle Corps commander General I. S. Kosobutsky, both of whom had managed to escape the German trap. Smolensk was the next German objective.

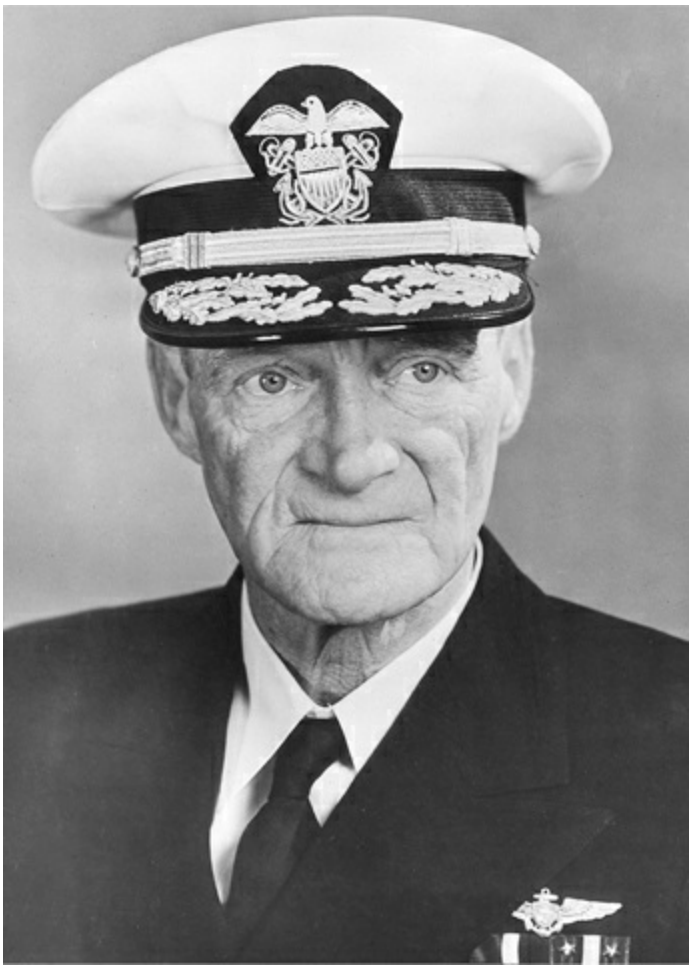
Mitscher, Marc Andrew (1887–1947)

U.S. Navy admiral. Born on January 26, 1887, in Hillsboro, Wisconsin, Marc Andrew Mitscher grew up in Washington, D.C., and graduated from the U.S. Naval Academy at Annapolis in 1910. He then served with the fleet until 1915, when he seized an opportunity to enter naval aviation, becoming naval aviator number 33.



U.S. Navy vice admiral Marc A. Mitscher, a leading advocate and practitioner of naval aviation during World War II. (PhotoQuest/Getty Images)

In 1919, he participated in the U.S. Navy's first attempted transatlantic flight, although his own aircraft only reached the Azores. Between the wars, Mitscher remained in aviation through a variety of administrative and operational postings, including assignments aboard the carriers *Langley* (1929–1930) and *Saratoga* (1934–1935) as well as with the Bureau of Aeronautics (1930–1933 and 1935–1937).

In 1938, Mitscher was promoted to captain. Three years later, he was the first commanding officer of the carrier *Hornet*. His ship launched Lieutenant Colonel James H. Doolittle's raid on Tokyo on April 18, 1942. Promoted to rear admiral, Mitscher commanded all air operations in the Solomon Islands in 1943. In 1944, he assumed command of Fast Carrier Task Force 58/38 (38 if William Halsey commanded the Third Fleet, 58 for Raymond Spruance when it was designated the Fifth Fleet). In March 1944, Mitscher was

promoted to vice admiral. Excluding a brief period from October 1944 to January 1945, he remained with Task Force 58/38 for many of the great Pacific battles.

In July 1945, Mitscher became deputy chief of naval operations for air. In March 1946, he commanded the Eighth Fleet, then assumed the post of commander in chief, Atlantic Fleet, in September. Mitscher died in Norfolk, Virginia, on February 3, 1947.

Miyazaki Shigesaburō (1892–1965)

Japanese Army lieutenant general. Born in Gifu Prefecture, Japan, on January 4, 1892, Miyazaki Shigesaburō graduated from the Japanese Military Academy in 1914 and the Army War College in 1929. He was a member of the army General Staff from 1925 to 1929. In 1938, he was promoted to colonel and became a staff officer in the Taiwan Army.

In August 1939, Colonel Miyazaki commanded the 16th Infantry Regiment in the May–September Battle of Khalkhin Gol (Nomonhan Incident) against Soviet forces in Mongolia, executing the final successful night attack against Hill 997 on September 8. Promoted to major general in 1943, Miyazaki assumed command of the 26th Brigade fighting in China. In early 1944, he had charge of the 31st Division in the struggle for Imphal in Burma (Myanmar), the climax of his military career. Miyazaki's forces occupied Kohima, north of Imphal, on April 6, 1944. He then defended it against British attack for two months without resupply. Finally, his division

was surrounded by British troops, but Miyazaki was able to extract his men, including the wounded.

Promoted to lieutenant general in June 1944, Miyazaki took command of the 54th Division of the Twenty-Eighth Army in Burma, where he enjoyed several tactical successes. He was able to escape entrapment by British forces, but by early August, only about 4,000 of his 9,000-man division remained. Nonetheless, many regarded the five-foot-tall Miyazaki as one of the most skillful and tenacious Japanese generals of the war. He died in Tokyo on August 30, 1965.

Model, Walther (1891–1945)

German field marshal. Born in Genthin, Germany, on January 24, 1891, Walther Model joined the army in 1909 and served during World War I, rising to captain. He remained in the Reichswehr after the war, and in 1935 he was appointed head of its Technical Warfare Section.

Promoted to major general in March 1938, Model served as chief of staff of the IV Army Corps in the September 1939 invasion of Poland. He was promoted to lieutenant general in April 1940 and led the 3rd Panzer Division in the invasion of France and the Low Countries in May 1940. He next participated in the June 22, 1941, invasion of the Soviet Union (Operation BARBAROSSA) and was promoted to general of panzer troops in October 1941 and given command of the XLI Panzer Corps. In January 1942, Model took over the Ninth Army; the next month, he was promoted to colonel general. An aggressive, capable commander, Model helped convince Hitler to delay plans for Operation CITADEL, leading to the German defeat in the July 5–13, 1943, Battle of Kursk.

Model became commander of Army Group North in January 1944 and was promoted to field marshal that March. The same month, he took over an army group in the southern Soviet Union. Again and again, he proved his talent in defensive warfare, hampering the Soviet advance. Hitler sent his expert in defensive warfare to various places where an Allied breakthrough was imminent. Model became known as “Hitler’s Fireman.”

Transferred to the Western Front in August 1944 as supreme commander (Oberbefehlshaber West) and simultaneously commander of Army Group B, Model initially believed that he could replicate his successful defensive tactics developed in the east. Enormous Allied superiority, however, disabused him of this notion. After only 18 days, he reverted to command of Army Group B only. During September 17–26, Model blunted the Allied drive in Operation MARKET-GARDEN. In December 1944, he was increasingly drawn into planning the December 16, 1944–January 25, 1945, Ardennes Offensive.

German field marshal Walther Model proved himself a master at defensive warfare on the Eastern Front. (Keystone/Getty Images)

In 1945, Model was charged with defending the Ruhr, clashing with Hitler when the latter refused to allow him to retreat. On the destruction of his encircled army group, Model issued official discharge orders to all of his troops to facilitate their reintegration into postwar Germany. He then committed suicide on April 21, 1945, in Lintorf near Duisburg, Germany.

Mölders, Werner (1913–1941)

German Air Force colonel. Born on March 18, 1913, in Gelsenkirchen, Germany, Werner Mölders was commissioned in the army in 1934 after two years at the Dresden Military Academy. He applied for flight training but failed the centrifugal chair test. Through sheer force of will, Mölders overcame his motion sickness and earned his pilot's badge in 1936. Two years later, he replaced Adolf Galland as the leader of the fighter squadron of the Kondor Legion during the Spanish Civil War (1936–1939).

Mölders's greatest contribution to aerial combat occurred during his service in Spain. He realized that the tactics of World War I were obsolete and ineffective with high-speed modern aircraft. Rather than keeping his planes in a tight three-plane "V" formation, he experimented with flying them widely spaced and paired in four-plane flights. This formation has been called the "Finger Four" and is still used by air forces to this day. The formation allowed the wingman to cover the lead pilot as he made his attack, without trying to maintain formation. This tactical innovation would eventually be adopted by every air force. Such tactics enabled Mölders to emerge from the Spanish Civil War as its leading ace, with 14 victories.

After the start of World War II, Mölders rose rapidly through the Luftwaffe ranks, culminating in September 1941 with his appointment as general of fighters. Along the way, he had been awarded the Oak Leaves, Swords, and Diamonds to the Knight's Cross of the Iron Cross and had scored 115 victories. Summoned back to Berlin from the Eastern Front to attend the funeral of Ernst Udet, Mölders was killed in a plane crash at Breslau-Hundsfeld Airfield (Germany) on November 22, 1941.

Molotov, Vyacheslav Mikhailovich (1890–1986)

Soviet foreign minister (1939–1949). Born Vyacheslav Skriabin in the village of Kukarka, Viatsk Province, Russia, on March 9, 1890, Molotov became involved in underground revolutionary activities, and in 1906, he joined Vladimir Lenin's Bolshevik faction of the Social Democratic Party. In 1909, Molotov was arrested and exiled. On completion of his sentence in 1911, he moved to Saint Petersburg, where he joined the staff of the Bolshevik newspaper *Pravda*. While there, he met Joseph Stalin, who was one of the editors. By the time of the Bolshevik Revolution in November 1917, Molotov had become one of Stalin's most loyal followers, and as Stalin's star ascended in the 1920s, so did that of Molotov.

In 1926, Molotov became a full member of the Politburo, where he led attacks on Stalin's political adversaries. During the 1930s, he faithfully assisted Stalin in carrying out agricultural collectivization and the massive purges of the party and armed forces, for which Stalin rewarded his diligent henchman with a succession of increasingly important positions.

Soviet foreign minister Vyacheslav Molotov signing the German-Soviet Non-Aggression Pact in Moscow, August 23, 1939. German Foreign Minister Joachim von Ribbentrop and Soviet leader Josef Stalin look on. (National Archives)

In May 1939, Molotov replaced the internationalist Maxim Litvinov as foreign minister. Although Molotov had no diplomatic experience, his appointment served as a signal that Stalin was seeking to reach accommodation with Germany. Accordingly, on August 23, 1939, Molotov and German foreign minister Joachim von Ribbentrop signed the German-Soviet Non-Aggression Pact in Moscow. In November 1940, Molotov went to Berlin to confer with Adolf Hitler about further defining German and Soviet spheres of influence, but the negotiations failed, and Hitler decided to attack the Soviet Union.

When the German invasion commenced on June 22, 1941, it was Molotov, not Stalin, who informed the nation in a radio broadcast; Stalin apparently was incapacitated by shock. During the war, Molotov dealt

extensively with the Soviets' Western allies, but by the end of the war, his stubborn pursuit of Soviet goals and disagreeable demeanor made him one of the symbols of the emerging Cold War. His diplomatic counterparts nicknamed him "Iron Bottom" for his obstinacy.

After World War II, Molotov went into political eclipse. He stepped down as foreign minister in 1949, and he was expelled from the Communist Party in 1962 following a dispute with Nikita Khrushchev. Rehabilitated in 1984 after spending two decades in political obscurity, Molotov died in Moscow on November 8, 1986.

Monitors

Monitors were specialized shore bombardment warships. Heavily armed for their size and armored, the ship type evolved from John Ericsson's iron turreted *Monitor* of the American Civil War. Monitors generally mounted their main guns in a turret amidships and, because of their large guns and armor, were quite slow. Of broad beam and shallow draft, they were designed to operate in coastal waters and rivers and were not intended for sea service. The U.S. Navy especially but also the Royal Navy built a number of these ships.

Monitors saw service in World War I in a shore bombardment role. The British had 35 monitors in service by 1916, mounting main batteries of 12-, 14-, or 15-inch guns. Three of them mounted single 18-inch guns. The monitors saw action in the North Sea, the Mediterranean, the Aegean, and the English Channel and were used to destroy enemy forts and provide support for troops ashore.

A few monitors remained to see service in World War II. The British monitor *Terror* defended Malta against possible attack by the Italian Navy and also provided shore bombardment to support operations in North Africa. HMS *Erebus* and *Terror* (both launched in 1916) mounted a main armament of two 15-inch guns and displaced 8,450 tons at deep load.

Both ships received additional armor and antiaircraft gun protection during World War II, increasing their deep load displacement to some 9,400 tons in the *Terror* and 9,800 tons in the *Erebus*, although they were capable of a speed of 12 knots. Based at Singapore when the war began, the *Terror* was dispatched to the Mediterranean, where it played an important role in Operation COMPASS (December 7, 1940–February 7, 1941), conducting numerous fire missions in support of British and British Empire troops ashore. The *Terror* was slightly damaged by a mine on February 22, 1941, and heavily damaged by near misses from German bombs in an air attack on February 23. It went down off Derna, Libya, on February 24. The entire crew got off without loss.

The *Erebus* helped protect Britain from German invasion in 1940 and then was moved north to defend the base at Scapa Flow. In 1942 it acted as a guard ship for the port of Trincomalee, Ceylon (Sri Lanka), where it was damaged in a Japanese air attack that April. Repaired in India, it took part in the invasion of Madagascar and then in the invasions of Sicily (July 9–August 22, 1943) and Normandy (June 6, 1944). It survived the war and was broken up in 1947.

The last of the British monitors were the *Roberts* (commissioned in 1941) and *Abercrombie* (commissioned in 1943). Mounting two 15-inch guns, they had a deep load displacement of 9,500 to 9,900 tons. The *Roberts* was badly damaged when it was hit by two 1,100-pound German bombs, while the *Abercrombie* was badly damaged by a mine on September 9, 1943, during the Allied invasion of Italy and spent considerable time in dry dock at Taranto.

Significant repair did not begin until January 1944, so the *Abercrombie* missed the Normandy Invasion. The *Abercrombie* was again damaged, this time by two mines, off Malta on August 24, 1944. The *Roberts* took part in the Normandy Invasion. The *Abercrombie* was broken up in 1954, the *Roberts* in 1965.

The Romanian Navy also operated seven old river monitors during the war, all of which had served in World War I. Four were built for the

Romanian Navy in 1907–1908, and three had seen service with the Austro-Hungarian Navy during World War I and had been acquired with the defeat of the Central Powers. The monitors operated on the Danube, were heavily armored and yet of light draft, and were designed to provide fire support to troops ashore. The four original Romanian monitors were the *Ion Bratineau*, *Alexandru Lahovary*, *Lascar Catargia*, and *Mihail Kogalniceanu*. Displacing 670 tons and 208 feet 3 inches in length, they drew only 5.5 feet of water. During World War II, they were each armed with three 4.7-inch (120mm) guns and one 3-inch and two 47mm antiaircraft guns. The three ex–Austro-Hungarian monitors were smaller; they displaced 443 to 541 tons and were 183 feet 6 inches to 203 feet 3 inches in length and were each armed with two or three 4.7-inch (120mm guns). All three also mounted 37mm and 20mm antiaircraft guns.

Monnet, Jean Omer Marie Gabriel (1888–1979)

French diplomat. Born in Cognac, France, on November 9, 1888, Jean Omer Marie Gabriel Monnet was the son of a prosperous vintner. At age 16 he joined the family firm, traveling extensively on its business affairs in Great Britain, Europe, North America, and the Middle East. In the autumn of 1914, Monnet used his business connections to assist French government officials in establishing a unified purchasing system for war supplies in Canada, and he later represented France in the inter-Allied economic bureaucracy established in 1917 to rationalize Allied purchasing and shipping.

From 1919 to 1922, Monnet was deputy secretary-general to the new League of Nations and was instrumental in raising an international loan that facilitated Austrian postwar economic reconstruction. From 1923 until the late 1930s, he was a partner in various American financial firms, raising further international European reconstruction loans in the 1920s and attempting to do the same in China for much of the 1930s.

Monnet was an early opponent of Adolf Hitler, and after the 1938 Munich Agreement, he believed that massive French rearmament and the rapid expansion of his country's air capacity were essential. Monnet represented France in the United States, attempting to facilitate major French purchases of American warplanes. After Britain and France declared war on Germany in September 1939, Monnet was the French member on the joint Allied purchasing commission that sought to unify Allied overseas war purchases and finance. Before France signed an armistice with Germany in June 1940, Monnet and General of Brigade Charles de Gaulle were instrumental in persuading British prime minister Winston L. S. Churchill to offer the French, albeit unavailingly, an indissoluble Anglo-French union should they continue the fight.

After the fall of France, Monnet unobtrusively became a key member of the British Supply Commission based in Washington. There, his prewar links with numerous influential Americans, many in crucial positions within the wartime bureaucracy, proved invaluable. Monnet relentlessly lobbied the Franklin D. Roosevelt administration for exponential increases in industrial war production and for enormously expanded aid to Great Britain, playing significant roles in devising the details both of Lend-Lease aid to Britain and of the January 1942 Victory Program, which vastly expanded American wartime industrial output.

Monnet spent most of 1943 in Algiers, helping effect a united front for France's liberation between Vichy and Gaullist Free French forces in Algiers, an organization that General de Gaulle soon dominated. Monnet returned to the United States in October 1943 as France's commissioner-at-large to negotiate presidential recognition of de Gaulle's position, a formal Lend-Lease agreement, and relief and reconstruction aid for liberated France.

Monnet returned to France in November 1945, where, as commissioner general for planning, he speedily devised the Monnet Plan for French economic revival and modernization—a scheme driven by a mixture of

democratic planning and foreign economic assistance. A brilliant success, the Monnet Plan became a model for economic planning through the democratic process.

The major architect of the European Coal and Steel Community of 1950, Monnet became the president of its High Authority. He remained a passionate advocate for and driving force behind greater European unity and is widely considered the father of the European Common Market of 1957. Monnet died at Montfort-l'Amaury, France, on March 16, 1979.

Montélimar, Battle of (August 21–28, 1944)

Key battle following Operation DRAGOON, the Allied invasion of southern France. The battle around Montélimar saw the heaviest fighting of the northerly advance. DRAGOON, delayed by a shortage of landing craft, began on August 15, 1944. Lieutenant General Jacob Devers commanded the 6th Army Group, composed of U.S., French, Canadian, and British troops. Landing initially at Saint-Tropez, the Allies quickly secured the ports of Marseille and Toulon.

Having failed to stop the Allies, the Germans made the logical decision to withdraw. On the night of August 17, the German Armed Forces Supreme Command ordered Colonel General Johannes Blaskowitz's Army Task Group G to evacuate southern France. German forces then began to move to the northeast.

To cut off the Germans and capture as many as possible, VI Corps commander Major General Lucian K. Truscott organized a mobile task force under his chief of staff, Brigadier General Frederick B. Butler, on August 17.

Its job was to drive north, link up with the French Resistance, and cut off General Friedrich Paul Wiese's retreating German Nineteenth Army. It set out on August 18.

Task Force Butler advanced north along the Rhône River, and on the night of August 20, Truscott ordered it to move the next morning to the town of Montélimar east of the Rhône, through which Highway 7 and a railroad line ran north. It was to set up blocking positions up the Rhône River Valley in that vicinity.

Truscott guessed correctly that the Germans intended to use the valley as their major escape route north. Major General John E. Dahlquist's 36th Infantry Division would then come up in support. Task Force Butler began arriving in the area on August 21. As most bridges across the Rhône had been destroyed, the Americans hoped to trap Lieutenant General Wend von Wietersheim's 11th Panzer Division at Montélimar.

The eight-day battle there took place beginning on August 21 in a rough quadrilateral area about 15 miles north and 10 miles east of Montélimar. Despite Truscott's repeated orders to move as quickly as possible, the 36th Infantry Division was handicapped by an acute shortage of gasoline. The 141st Infantry Regiment of the 36th Infantry Division did not begin arriving at Montélimar on August 23. Repulsed by German artillery, it had to settle for securing positions north of the town and east of Highway 7. Dahlquist, meanwhile, believed that his men held the town itself and the highway.

Most German units were still south of Montélimar, and by August 24, the American units had set up blocking positions. The Germans were now forced to find other escape routes east of Montélimar. Three German divisions, the 198th Infantry, 337th Infantry, and 11th Panzer, were ordered to hold off the 36th Infantry Division to the south while opening escape routes north. The Germans captured an American operations order, and on August 25, they struck at the hinge between the 141st and 142nd Infantry Regiments at Bonlieu. After two assaults, they breached the American line there. A substantial number of Germans troops and tanks escaped north through this opening toward the Drôme River before it was closed on August 27.

Other German troops managed to push up Highway 7, although they were subject to heavy artillery fire. Still others made their way west across the Rhône bridges, usually at night to avoid American artillery and aircraft strafing attacks. Not until August 28 did the 141st Infantry Regiment finally

gain full control of the heights north of Montélimar, allowing the remainder of the 36th Infantry Division to enter the town and conduct mopping-up operations.

Although the Americans failed to trap the Germans, they did inflict losses of 2,000 motor vehicles, 1,000 horses, 5 railroad guns, and 40 other artillery pieces. They also took more than 3,000 prisoners. Unfortunately for the Allies, most of the Germans had escaped north to continue the fight.

Montgomery, Alfred Eugene (1891–1961)

U.S. Navy vice admiral. Born in Omaha, Nebraska, on June 12, 1891, Alfred Eugene Montgomery graduated from the U.S. Naval Academy at Annapolis in 1912. He briefly served aboard cruisers before transferring to submarines and commanded the *F-1*, which was lost in a collision in December 1917. As a lieutenant commander, Montgomery commissioned and commanded the submarine *R-20* between 1918 and 1920.

Montgomery earned his pilot's wings in 1922 and was closely identified thereafter with naval aviation. In the late 1920s, he was the air officer of the aircraft carrier *Langley*. Montgomery commanded the Seattle Naval Air

Station during 1930–1932. He was executive officer of the carrier *Ranger* in the Pacific from 1934 to 1936 and its captain in the Atlantic from 1940 to 1941. Montgomery remained on board as chief of staff and aide to the commander of aircraft in the Atlantic Fleet in 1941 and 1942. In June 1942 as a rear admiral, he took command of the Naval Air Station, Corpus Christi, Texas.

From August 1943, Montgomery commanded Carrier Division 12 and later Carrier Division 3 in the Pacific theater. He was almost continually engaged in operations until December 1944, commanding task groups that were usually composed of four fast carriers with escorting vessels. He participated in nearly all of the major Pacific engagements of that period, including the major fleet actions in the Battle of the Philippine Sea (June 19–21, 1944) and the Battle of Leyte Gulf (October 23–26, 1944), gaining a reputation as an aggressive, forceful leader.

Rotated back to the United States, Montgomery commanded the air component of the West Coast Fleet (1945) and, as a vice admiral, the Pacific Fleet Air Forces (1945–1946), rising by 1947 to command of the Fifth Fleet and then the First Task Fleet. Reverting to his permanent rank of rear admiral, he held commands in Alaska and Bermuda before retiring in June 1951 as a vice admiral, leaving his final assignment as commander of fleet air at Jacksonville, Florida. Montgomery died in Bremerton, Washington, on December 15, 1961.

Montgomery, Sir Bernard Law (1887–1976)

British Army field marshal. Whether considered a latter-day Marlborough or Wellington or “the most overrated general of World War II,” Bernard Law

Montgomery remains the most controversial senior Allied commander of World War II. Montgomery was born in Kennington, London, on November 17, 1887. He entered the Royal Military College, Sandhurst, in 1907 and the next year was commissioned into the Royal Warwickshire Regiment. Montgomery served in India, and in World War I he fought on the Western Front, where he was wounded. Montgomery ended the war as a division staff officer.

Following occupation duty in Germany after the war, Montgomery graduated from the Staff College at Camberley in 1921 and returned there as an instructor five years later. In 1929, he rewrote the infantry training manual. He then served in the Middle East, commanded a regiment, and was chief instructor at the Quetta Staff College from 1934 to 1937. Between 1937 and 1938, he commanded the 1st Brigade.

Montgomery then took command of the 3rd Infantry Division, which he led in France as part of the British Expeditionary Force (BEF) after the start of World War II. He distinguished himself in the British retreat to Dunkerque (May 26–June 4, 1940), and in July he took command of V Corps in Britain, protecting the English southern coast.

In April 1941 Montgomery assumed command of XII Corps, which held the crucial Kent area in England. He established himself as a thoroughly professional soldier; he was also very much the maverick. Montgomery helped plan the disastrous Dieppe Raid (August 19, 1942) but left to command the First Army in the planned Allied invasion of North Africa. On August 13 following the death of General William Henry Ewart Gott, Montgomery took command of the Eighth Army in Egypt, repulsing Field Marshal Erwin Rommel’s attack at Alam Halfa (August 13–September 7, 1942).

General Bernard L. Montgomery, commander of the British Eighth Army in Egypt, observes his tanks moving forward, November 1942. (National Archives)

Montgomery rebuilt the Eighth Army's morale. Known for his concern for his men's welfare, he was also deliberate as a commander. In the Battle of El Alamein (October 23–November 4, 1942), his superior forces defeated and drove westward German and Italian forces under Rommel. Montgomery's less than rapid advance, however, allowed the bulk of the Axis forces to escape. Montgomery was promoted to full general that November.

Following the Axis surrender in the May 3–13, 1943, Battle of Tunis, Montgomery played an active role in the July 9–August 22 invasion of Sicily, and he led the Eighth Army in Italy in September, where his forces again carried out a leisurely advance, this time north to Naples. He returned to Britain to assist in planning for the June 6, 1944, Allied invasion of Normandy, then temporarily commanded its ground forces in the landing until General Dwight Eisenhower moved his headquarters to France in September.

Promoted to field marshal in September 1944, Montgomery commanded the British 21st Army Group. He sought to finish the war by the end of the year with a daring invasion of Germany across the Rhine at Arnhem in Operation MARKET-GARDEN (September 17–26), a surprise from the conservative Montgomery. The plan, however, failed. Montgomery's forces

defended the north shoulder in the German Ardennes Offensive (December 16, 1944–January 25, 1945). His claim in a press conference that British troops had in effect rescued the Americans caused considerable acrimony. Montgomery then directed the drive into northern Germany.

Following the war, Montgomery commanded British occupation troops in Germany between May 1945 and June 1946. From 1946 to 1948, he was chief of the Imperial General Staff. He next served as chairman of the West European commanders in chief from 1948 to 1951 and as commander of North Atlantic Treaty Organization (NATO) forces in Europe and deputy supreme commander between 1951 and 1958. He retired in September 1958. A prolific writer, he drafted his memoirs that same year. Montgomery died at Isington Mill, Hampshire, England, on March 24, 1976.

Moreell, Ben (1892–1978)

U.S. Navy admiral. Born on September 14, 1892, in Salt Lake City, Utah, Ben Moreell was raised in St. Louis, Missouri. After graduating from Washington University with a degree in civil engineering and spending four years with the Engineering Department of the city of St. Louis, Moreell was commissioned a lieutenant (junior grade) in the Civil Engineer Corps of the U.S. Navy in 1917. He spent World War I in the Azores.

After the war, Moreell remained with the navy. He then served in the United States and in Haiti. From 1926 to 1930, he was with the Bureau of Yards and Docks. After a period in France studying European engineering techniques, Moreell returned to the bureau. In 1937, President Franklin D. Roosevelt appointed him chief of the Bureau of Yards and Docks and chief of the Civil Engineers of the U.S. Navy, as a rear admiral.

In his new position, Moreell oversaw the construction of U.S. bases around the world. To build the infrastructure required by the navy during the war, he spent $9.25 billion. By the time the United States entered the war in 1941, Moreell had 70,000 men engaged in construction projects worldwide. All bases were built by private firms employing civilian laborers, and wherever possible, Moreell worked on a cost-plus-fixed-fee contract basis rather than cost-plus-percentage contract basis. Worried that construction would stop in the event of war because civilians were prohibited by international law from carrying weapons, Moreell recommended the creation of a militarized construction battalion.

Following the capture of U.S. construction workers by the Japanese, Moreell received authorization from the Bureau of Navigation on January 5, 1942, to recruit a naval construction regiment composed of three battalions. Taking their name from “c” and “b,” the initials for “construction battalions,” the Seabees greatly aided the naval war effort by building many naval facilities around the world. During the war, the Seabees constructed 40 domestic bases and 600 advanced bases in the Pacific and Atlantic. In 1945, Moreell received the Distinguished Service Medal for his work.

Moreell was promoted to vice admiral in February 1944, the first Civil Engineer Corps officer to hold that rank, and then to admiral in June 1946. He retired from active duty that September and then headed a number of construction and steel businesses. Moreell died in Pittsburgh, Pennsylvania, on July 30, 1978.

Morgan, Frederick Edgeworth (1894–1967)

British Army general. Born on February 5, 1894, in Paddockwood, Kent, in England, Frederick Morgan graduated from the Royal Military Academy, Woolwich, in 1913 with a commission in the artillery. He served with the Canadian Corps in World War I, in India from 1919 to 1935, and later in the War Office. A logistician, Morgan commanded support forces for the 1st Armoured Division beginning in 1938, and he fought with that division in the Battle for France (May 10–June 25, 1940). He then commanded the 55th Division and I Corps.

Morgan next held various staff positions, including that of assistant to U.S. Army lieutenant general Dwight D. Eisenhower in planning the November 8, 1942, invasion of North Africa (Operation TORCH). Promoted to temporary lieutenant general in 1942, Morgan was named chief of staff to the supreme Allied commander (COSSAC) in March 1943 and charged with developing the plans for the cross-channel invasion of Normandy (June 6, 1944).

The most significant aspect of Morgan's assignment was that the supreme Allied commander would not be appointed for another nine months. Working without standard command guidance, Morgan and his staff planned a three-division initial landing and the use of artificial harbors (Mulberries). In 1944 when U.S. general Dwight D. Eisenhower was designated supreme Allied commander and British general Bernard Montgomery was designated land forces commander, Montgomery criticized the landing plan as too narrow, and Eisenhower agreed. The plan was then expanded to a five-division front. It was possible to do so in a relatively short period because Morgan and his staff had done most of the detailed staff work on the potential lateral landing beaches. It was one of the most brilliant pieces of operational staff work in all military history.

Eisenhower nonetheless insisted on bringing along his existing chief of staff, Major General Walter Bedell Smith. Morgan agreed to step down and serve as Bedell Smith's deputy chief of staff, a post he filled effectively until the end of the war. His unselfish action made it possible for the COSSAC staff to accept the changes and then complete the necessary staff work on time.

Morgan retired in 1946 and served briefly as head of the United Nations Relief and Recovery Administration (UNRRA) in Germany. Between 1951 and 1956, he played an important role in the development of British atomic energy. He died in Northwood, Middlesex, England, on March 19, 1967.

Morgenthau, Henry, Jr. (1891–1967)

U.S. secretary of the treasury (1934–1945) and friend and adviser to President Franklin D. Roosevelt. Born in New York City on May 11, 1891, the son of a prominent and politically active Jewish real estate speculator, Henry Morgenthau Jr. chose to become a gentleman farmer on an estate in Dutchess Country, New York. There, a neighbor, the rising young Democratic politician Franklin Roosevelt, soon became his close friend.

From 1929 to 1932, when Roosevelt was governor of the State of New York, Morgenthau was his commissioner of conservation.

In 1933, Roosevelt became president of the United States and appointed Morgenthau to head the Farm Credit Association. A year later, Morgenthau became secretary of the treasury, serving as one of the president's most trusted advisers on both domestic and international affairs.

An early opponent of National Socialism and militarism, Morgenthau argued from the mid-1930s that the United States could not remain aloof from international affairs, and he urged forceful U.S. action in both Europe and Asia. He supported economic sanctions against aggressor nations, and in 1937, he prevailed on Roosevelt to assist China financially against Japan. In 1941, when Japan occupied bases in southern French Indochina, Morgenthau advocated a complete American economic embargo of Japan. He likewise urged the imposition of economic sanctions on Germany. Understandably, Morgenthau was also a leading advocate of massive increases in U.S. defense spending.

Almost a year before Pearl Harbor (December 7, 1941), the Treasury Department was heavily involved in developing the Lend-Lease program to assist Great Britain and other nations, which had been passed by Congress in the spring of 1941. Morgenthau successfully financed the extremely costly U.S. war effort while keeping inflation and interest rates low. Under his direction, well-organized campaigns persuaded the American public to purchase over $12.9 billion in war bonds.

Morgenthau headed the U.S. delegation to the 1944 Bretton Woods Conference, where proposals were drafted for two financial institutions to fund postwar reconstruction—the International Monetary Fund and the International Bank for Reconstruction and Development. He also strongly supported the creation of the United Nations.

In early 1944, Morgenthau complained to Roosevelt of the State Department's disinterest in assisting Jewish Holocaust survivors in Europe, impelling Roosevelt to create the War Refugee Board. Later that year, hoping to destroy defeated Germany's future war-making potential, Morgenthau drafted a harsh proposal to divide that country into separate states and dismantle its industrial capacity. This plan was ultimately reversed by the State and War Departments.

After Roosevelt's death in April 1945, Morgenthau's influence declined.

Three months later, he resigned. For the next decade, he chaired Jewish philanthropic organizations, raising funds for Israel. Morgenthau died at Poughkeepsie, New York, on February 6, 1967.

Morgenthau Plan (1944)

Abortive plan first conceptualized by U.S. secretary of the treasury Henry Morgenthau Jr. in 1944 that called for the de-industrialization, pastoralization, and partitioning of Germany after World War II. At the time Morgenthau presented his plan to President Franklin D. Roosevelt, he was perhaps the president's closest and most influential adviser. By the spring of 1944, Morgenthau had virtually all of his plan in place; its goal, quite simply, was to penalize the Germans for their behavior prior to and during the war and to ensure that the nation would never again be able to menace any other state in the international community by force of arms. Roosevelt was initially supportive of the plan, which also would play well with Soviet leader Joseph Stalin.

In a nutshell, the Morgenthau Plan called for the division of Germany into two states—north and south. An "international" zone would be established in the west (chiefly the Ruhr Valley), where occupying nations could control the region's raw materials and remaining factories. The Saar would be handed over to France, while East Prussia and Upper Silesia would be given to Poland. All heavy industry would either be dismantled and divided among the victors or destroyed. Reparations would not be demanded of the Germans,

who would essentially have to adjust to farming and shop-keeping. Losses incurred before and during the war by Germany's neighbors would be partially covered by the sale or transfer of German industry and heavy equipment.

In September 1944, Morgenthau traveled with Roosevelt to the Second Quebec Conference, where Morgenthau presented his plan to British prime minister Winston Churchill, who was less than enamored of it. Churchill, however, was seeking a large American loan and so ultimately signed off on it. Churchill did demand one major change: although he backed the pastoralization of Germany, he did not agree that partitioning Germany was a wise idea. Clearly, he was already concerned that the Soviets might take advantage of this and annex what they could before the war was over.

Later that autumn, news of the plan was leaked to the American press. Roosevelt denied its existence, but the damage was done. The U.S. State Department strongly objected to Morgenthau's plan, and the German government used the scheme for propaganda purposes, urging the German people to fight on lest they be eviscerated by the Allies. Nevertheless, parts of the plan remained part of Allied policy toward Germany until early 1946.

The problems with enforcing such a harsh postwar settlement on Germany were multifold. First, the considerable suffering of a sizable number of Germans between 1945 and 1947 greatly destabilized the country, making communism seem palatable. The Soviets appealed to the German people with offers of a higher standard of living. Their ulterior motive, however, was to control all of Germany. Also, a prostrate Germany, which had historically been the engine of economic growth in Europe, made the reconstruction of all of Europe far slower and more problematic.

By early 1947, the Harry S. Truman administration had virtually abandoned the Morgenthau Plan amid widespread hardship and criticism throughout Europe. The Marshall Plan, a massive economic scheme to stabilize and rebuild Europe that was announced in June 1947, specifically included the western zones of Germany as a potential recipient nation. The growing Cold War convinced policy makers that a stable, prosperous Germany was essential to the reconstruction of Western Europe and would thus provide a bulwark against Soviet adventurism from the east. The western zones of Germany, which became the Federal Republic of Germany in 1949, became an integral part of Marshall Plan funding, and by the early 1950s it

had become fully reintegrated into the Western orbit. This included membership in the North Atlantic Treaty Organization (NATO) and the rearming of the country.

Morison, Samuel Eliot (1887–1976)

Noted U.S. naval historian and reserve rear admiral who chronicled the naval events of World War II. Born on July 9, 1887, in Boston, Massachusetts, Samuel Eliot Morison attended Harvard University from 1904 to 1908. After one year spent studying at the École des Sciences Politiques in Paris, he returned to Harvard, where he completed his doctorate in 1913. He taught briefly at the University of California, Berkeley, and then joined the history faculty at Harvard in 1915, where he remained until his retirement 50 years later.

Morison spent three years at Oxford (1922–1925) as the first Harmsworth Professor of American History, and he retraced Columbus's voyages (1937–1940) in preparation for his biography of the Italian explorer, *Admiral of the Ocean Sea* (1942), for which he received the Pulitzer Prize. Morison's love of the sea, so evident in his early work *The Maritime History of Massachusetts, 1783–1860* (1921), and his belief in Francis Parkman's participatory style of history led him to undertake his most difficult project after the United States entered World War II.

Too old to receive a commission, Morison lobbied President Franklin D. Roosevelt, who appointed him the navy's official historian in 1942.

Commissioned a lieutenant commander in the naval reserve and authorized to travel at will, Morison obtained berths on combat vessels ranging from patrol boats to heavy cruisers, and he witnessed several pivotal battles. Given complete access to files, Morison also attended planning sessions for crucial operations such as TORCH, the November 8, 1942, Allied invasion of North Africa, and conducted after-action interviews with commanders. The resulting *History of United States Naval Operations in World War II* appeared in 15 volumes between 1947 and 1962.

Promoted to rear admiral in 1951, Morison also received the Medal of Freedom in 1964, the highest civilian decoration that the president of the United States can bestow. Although *John Paul Jones: A Sailor's Biography* (1957) won Morison a second Pulitzer, biographer Gregory Pfitzer identified *The Oxford History of the American People* as Morison's crowning glory. Morison died in Boston on May 15, 1976.

Morshead, Sir Leslie James (1889–1959)

Australian Army lieutenant general. Born in Ballarat, Victoria, Australia, on September 18, 1889, Leslie James Morshead was educated at the Teachers' Training College, Melbourne. His military career began when, as a schoolteacher, he had responsibility for a school cadet unit; this led to service in the militia and the army during two world wars.

Following Britain's declaration of war against Germany in 1914, Morshead enlisted as an officer in the newly raised Australian Imperial Force

(AIF) and served at Gallipoli and on the Western Front. He ended the war as a lieutenant colonel. Following the war, Morshead entered business as the Sydney manager for the Orient Steam Navigation Company but also served in the reserves. In October 1939, Morshead returned to active duty as a brigadier in command of the 18th Brigade of the 2nd AIF.

Posted with his brigade to the Middle East, Morshead was promoted to major general in January 1941 and took command of the newly formed 9th Division. Soon afterward, he was confronted in Libya by the advance of Axis forces under German lieutenant general Erwin Rommel. He withdrew his force into the former Italian fortress at Tobruk and was appointed fortress commander on April 9. Surviving a 242-day German siege, Tobruk's tenacious defense presented a threat to Rommel's flank and prevented an Axis advance into Egypt. Promoted to lieutenant general in February 1942 and knighted that same year, Morshead commanded all Australian forces in the Middle East and played an important role in the Battle of El Alamein (October 23-November 4, 1942).

In early 1943, Morshead returned to Australia with his 9th Division, leading it to New Guinea in September 1943 for the Huon Peninsula Campaign. In November 1943, Mors-head became general officer commanding (GOC) of the Second Australian Army and GOC of the New Guinea Force. In July 1944, he assumed command of I Australian Corps, which eventually liberated Borneo.

Morshead retired from the army in January 1946 and returned to the Orient Steam Navigation Company, becoming its Australian general manager in 1948. He is considered Australia's greatest field commander of the war. Morshead died at Sydney on September 26, 1959.

Mortars

The mortar began as a short high-angle-fire weapon used in siege warfare. During World War I it was well adapted to static trench warfare, and all participants employed some version of it. Mortars were an excellent infantry weapon, and their plunging fire rendered them most effective in trench warfare. Proper trench mortars, for which the two chief criteria were ease of use and portability, appeared in 1915. Most mortar crews were infantrymen trained to use the weapon. This meant that each unit could call for fire support when it was needed.

The mortar evolved from the heavy trench mortar of World War I into the Brandt- and Stokes-type mortars of the 1930s. The latter were battlefield weapons served by a team that delivered an effective shell when conventional artillery was unavailable. Setup and firing was a quick process, and in view of the short range of mortars, fire control and correction were relatively easy for trained crews.

The mortar, in comparison with artillery, has the benefit of simplicity, and it is cheaper to manufacture than a gun or howitzer. As with the howitzer, it has a high angle of fire. Its shell has excellent antipersonnel characteristics. As it descends from the near vertical, the shell, when detonated, produces a 360-degree blast and shrapnel effect, unlike the less effective low-angle gun shell. The mortar also can be used to overcome obstacles to direct fire, such as buildings, trenches, and hills. Lighter mortars are mobile, especially in terrain into which guns have difficulty penetrating, such as mountainous and wooded ground.

Unlike the gun, the mortar has a low chamber pressure and a smooth barrel, factors that reduce wear on the barrel and thus prolong the effective accuracy and life of the weapon. As a tactical weapon, it is easy to conceal, and it can be fired from a trench, making it possible, although not desirable, to have mortars in the front line.

In World War II, participants used light and medium mortars at the beginning, with much heavier mortars appearing later, particularly on the Eastern Front in the Soviet Union (see Table 1). Light mortars, of approximately 5cm or 2-inch caliber, were used by, among others, the

Germans, British, Japanese, and Americans. They were issued at the platoon level, the idea being to provide every platoon with a short-range weapon for immediate support. The mortar proved of some value for laying a smoke screen, but the high-explosive content of the shell was effective only for suppressive fire. The illumination shell, however, proved to be of great value at night, enabling a platoon to light up its front in an instant.

Table 1. Mortar Statistics

	United Kingdom	*Germany*	*United States*	*USSR*	*Japan*	*Italy*
Light mortars						
Caliber	2-inch	5cm	60mm	50mm	50mm	45mm
Shell weight (in pounds)	2.25	1.98	3–4	1.9	1.75	1.025
Range, maximum (in yards)	500	550	2,000	800	700	585
Medium mortars						
Caliber	3-inch	8cm	81mm	82mm	80mm	81mm
Shell weight (in pounds)	10	7.72	7–15	6.72	7.4	6.9
Range, maximum (in yards)	2,800	2,625	3,290	3,400	3,100	4,430

The Germans developed their World War I mortars along both the Brandt and the Stokes patterns to produce the 8cm Granatwerfer 34, which was issued to all German Army battalions in the support or heavy weapon companies that also controlled the heavy machine guns. The German employment of mortars in World War II was closely linked to their use of machine guns in both attack and defense, and their medium mortar teams gained a solid reputation for their work in supporting their infantry.

The Germans, however, regarded the Soviets as the masters of the mortar. The Soviets issued a series of 5cm mortars, but these were overshadowed by their larger-caliber weapons. The 82mm mortar Type M36 (and later, its successors) was the main infantry mortar, and although it fired only a 6.7-pound projectile, the number of mortars available in the Soviet battalion was so high that the effect on German forces was often catastrophic.

The Soviets had an affinity for the mortar, and they began to bring in heavy mortars, increasing in caliber to 160mm. These large-caliber weapons did not so much outrange their smaller brethren as outweigh them in the amount of explosive they could drop onto a target. Whereas the 82mm shell weighed less than 6.71 pounds, the 160mm shell weighed 89.7 pounds. Explosive fillers were 4.5 and 62 pounds, respectively, which meant that the explosive content of the latter was 14 times that of the former.

Development of the mortar in World War II followed two diverse paths. The first was the Allied weapons, whereby range, bomb, and accuracy improvements were seen as most important. These developments led to rifled-barrel mortars, proximity-fuzed and rod-detonated shells, and sighting systems nearly as complex as artillery. The conflict on the Eastern Front, however, led to greatly increased calibers and multibarreled mortars, essential against large masses of attacking infantry.

Moscow, Battle of (September 30, 1941–April 1942)

Second major German offensive to seize the Soviet capital following the initial efforts of Operation BARBAROSSA, which began on June 22, 1941. After initial successes in Operation BARBAROSSA, the Wehrmacht appeared to have unimpeded routes to Leningrad, Moscow, and Kiev. However, the second phase proved to be more difficult for several reasons. Soviet defenses were stiffening after the initial shock of the invasion, and an additional 5 million men in the reserve forces were mobilized and thrown into battle. Also, German leader Adolf Hitler and his generals debated over the next objectives.

The generals considered Moscow the main goal, because it was a vital communication and industrial center and the Soviet capital and because a battle for it offered the best chance of destroying the Red Army and ending the campaign. Hitler, however, initially thought that taking Leningrad and linking up with the Finns should have priority in order to secure the Baltic completely. By mid-August, though, Hitler had changed his mind and focused the main effort on gaining the resources of the Ukraine and the Caucasus, relegating both Leningrad and Moscow to secondary status. He even reinforced his Army Group South, stripping panzer forces from the other two army groups.

Phase two finally began with an assault on Kiev, which fell to the Germans on September 19 and netted 650,000 prisoners. Then, fall rain and mud slowed the German advance in the south. Progress toward Leningrad also ground to a halt, partly because of increased resistance but also because Hitler conceived a new plan. On September 6, he directed that Leningrad was to be encircled, put under siege, and starved into submission, and the Crimea, the Donets Basin, and the Caucasus were to be taken for their coal and oil resources. The encirclement and capture of Moscow received highest priority, with panzer forces previously transferred to the other army groups now returned to Army Group Center; operations began on September 30. Commencement of the new plan, Operation TAIFUN (TYPHOON) effectively brought to an end Operation BARBAROSSA.

The Battle for Moscow breaks generally into three phases: the first German offensive encompassed the period from September 30 to nearly the end of October, the second German offensive took place between November 17 and December 5, and the Soviet counteroffensive lasted from December 6 to the spring of 1942.

General Heinz Guderian’s Second Panzer Group of Army Group Center spearheaded the first German offensive. It took Orel on October 3 and then 17 days later captured 665,000 Soviet prisoners around Vyazma and Bryansk. On October 6, the Germans broke through the Rzhev-Vyazma Line and advanced toward the Mozhaisk Line, an improvised system of fortifications thrown up by the Soviets 50 miles west of Moscow during the summer of 1941. The Germans bypassed the Mozhaisk Line on the south and captured Kaluga on October 12 and Kalinin two days later. On October 18, the Soviets abandoned Mozhaisk after heavy fighting.

Also on October 6, the *rasputitsa* (literally “time without roads,” caused by the fall and spring rain and mud in the Soviet Union) began with the first wet snow, and alternating rain and snow fell almost continuously. At the same time, reinforcements from the Far East Command were on their way to the Moscow Front. These troops had been freed when the Japan-based Soviet spy Richard Sorge assured Joseph Stalin that the Japanese were going to strike south and not attack the Soviet Union, thus honoring their nonaggression pact.

On October 10, Marshal Georgii Zhukov, pulled from commanding the defense of Leningrad, where he had been sent only weeks before, assumed command of Moscow’s defense. With the help of the weather and with the defenders’ backs pressed against the capital, Soviet resistance solidified as the Germans advanced. For the first time in the war, the Soviets were able to confront the Germans head-on and force them to fight for every mile.

On October 15, with the Germans having reached within 50 miles of the capital, the Soviet government and diplomatic community were evacuated from Moscow to Kuibyshev on the Volga. This caused a panic among the Muscovites the next day, who believed they had been abandoned. The announcement on October 17 that Stalin was in the Kremlin, where he remained throughout the war, returned the city to relative calm. On October 20, the State Defense Council declared the capital under a state of siege in order to deal swiftly with any acts of civil disorder.

By October 18, local Soviet counterattacks and the weather slowed the German advance, and between then and the beginning of November, the Germans made little progress. It was in this context that on November 7, ceremonies commemorating the 24th anniversary of the Bolshevik Revolution were held in Red Square and Stalin made his “Holy Russia” speech, seeking to mobilize resistance to the invaders.

The German failure to capture Moscow with the October offensive raised Soviet civilian and military morale and gave the Soviet high command time to assemble large strategic reserves to the east. At the beginning of November, however, everything pointed to the Germans’ preparation for another all-out attack.

That blow fell on November 16 in the Kalinin-Volokolamsk sector, and in two days the Germans entered Klin, north of Moscow, and Istra, only 15 miles west—the closest the Germans were able to get to Moscow in force. To

the south, Tula, which had been connected to Moscow by a narrow bottleneck, was encircled on December 3 for a short time, but the Soviets counterattacked and quickly reopened the Moscow highway. On December 4, temperatures fell to well below freezing and remained there, stalling the German offensive.

On December 6, the Soviets launched their winter counteroffensive along the Moscow front from Kalinin in the north to Yelets in the south. By December 1, 70 Soviet Far East divisions and another 27 from Central Asia had been transferred to the west. Approximately 20 of these entered the fight around Moscow in December. Although the German offensive, after heavy fighting in December and the first half of January, made fairly good progress on the northern and southern flanks of the front, the advance due west of Moscow was much less successful.

The Soviets' plan had been to encircle the Germans west of the capital, but Hitler had purged some of his generals in Army Group Center and taken supreme command; he ordered a stiffening of the defense east of the Rzhev-Vyazma-Gzhatsk-Yukhnovo Line. By the end of January 1942, the Red Army's counteroffensive came to a virtual standstill. Fierce combat in the Moscow area continued from January until the end of April 1942, by which point the German army had been driven back up to 160 miles from the Soviet capital.

The German failure to take Moscow within six months of its invasion of the Soviet Union was as important symbolically as militarily. It demonstrated both the Soviet determination and ability to defend the capital city and the inability of Hitler to conquer the Soviet Union as he had Western Europe. Apart from being a substantial propaganda blow to Germany, the Battle of Moscow proved that there were definite limits to German military power and marked the end of the German blitzkrieg on the Eastern Front.

Moscow Conference (October 19–30, 1943)

First meeting of the Big Three Allied foreign ministers, yielding the Four-Power Declaration. U.S. president Franklin D. Roosevelt prodded Soviet leader Joseph Stalin in 1943 for a meeting of the Allied heads of state, and the Soviet leader reluctantly agreed but suggested that their foreign ministers get together in advance. Hoping to enlist the Soviets in the general American plans for postwar cooperation, U.S. secretary of state Cordell Hull flew to Moscow. Hull understood that Roosevelt intended to resolve the thorniest questions with Stalin at their subsequent meeting. British foreign minister Anthony Eden generally favored broad American internationalist ideas but also hoped to forestall Soviet expansionism and protect the interests of the exiled Polish government in London, recently infuriated by stories of mass Soviet executions of Polish military officers in the Katyn Forest.

Soviet foreign minister Vyacheslav Molotov chaired the 12-day meeting in the old Spiridonovka Palace, intent on burnishing the image of Allied cooperation, securing firmer assurances regarding the timing of Operation OVERLORD, and asserting the Soviet Union's right to play some role in Italy. (Moscow had loudly complained that the Anglo-Americans had made a separate peace after Benito Mussolini's collapse.) Hull and Eden affirmed that OVERLORD, the invasion of northern France, would commence in the spring of 1944, although Eden shared British prime minister Winston L. S. Churchill's hints of possible modest delays.

Hull's crowning achievement was the acceptance of the statement of general principles regarding postwar cooperation and creation of the United Nations. For Hull, it was particularly important that the Soviets and the British accept the Chinese among the signatories, thereby acknowledging China's status as a major power—one of the "Four Policemen," in Roosevelt's view. The Soviets agreed to the declaration but only after

revising it so as to retain greater freedom in how they might use military or political forces in Eastern Europe after the war. Perhaps naively, Hull and Roosevelt thought that Moscow's commitment to the general principles of cooperation, embodied in the United Nations, outweighed resolving any specific problems at that stage.

Conversely, Eden sought a self-denying pledge from the Soviets regarding future conduct along their western borders and suggested a statement affirming nations' rights to self-determination, similar to the Declaration for Liberated Europe that emerged from the Yalta Conference some 15 months later. But Eden, receiving little support from Hull, failed to budge the Soviets, who would go no further than stating their desire to see an independent Poland—but one favorably disposed toward Moscow.

The conferees set up two joint commissions to address postsurrender issues in Italy and the rest of Europe and proclaimed their intent to punish Nazi war criminals. After agreeing on some general principles and setting the stage for later more substantive discussions, the diplomats concluded their work on October 30. At the closing banquet, Stalin unambiguously volunteered to join the war against Japan after Hitler was defeated. Hull left feeling tremendously pleased by this and by Soviet support for the United Nations. Roosevelt pronounced the spirit of the conference to have been "amazingly good," but Eden and new U.S. ambassador to the Soviet Union Averell Harriman, among others, were already worried about Soviet intentions in Eastern Europe.

Moskalenko, Kirill Semenovich (1902–1985)

Soviet Army marshal of the Soviet Union. Born in Grishino in the Donets region of Russia on May 11, 1902, Kirill Semenovich Moskalenko joined the Red Army as a cadet in 1920 and became a battery commander that same year. He joined the Communist Party in 1926 and, following routine military assignments, commanded a mechanized brigade in the Far East in 1935. Moskalenko fought in the 1939–1940 Finnish-Soviet War (Winter War) as an artillery commander in a rifle division.

Promoted to major general in June 1940, Moskalenko commanded the 1st Artillery Anti-Tank Brigade at Kiev at the time of the German invasion of the Soviet Union in June 1941. As commander of the XV Rifle Corps, he managed to escape the Kiev encirclement that September and fought in the counteroffensive that saved Moscow in December. From March to July 1942, Moskalenko commanded the Thirty-Eighth Army of the Northern Attack Group on the north Donets River. During July and August, he commanded the First Tank Army and was engaged in heavy fighting along the lower Don River.

During August and September, Moskalenko led the First Guards Army in counterattacks in the August 23, 1942–February 2, 1943, Battle for Stalingrad, then took over the Fortieth Army of the Voronezh Front in October. Promoted to lieutenant general in January 1943 and colonel general that September, he assumed command of the reconstituted Thirty-Eighth Army in Ukraine in October 1943. His forces liberated Kiev and then helped smash German Army Group South, driving the Germans back through the Carpathian Mountains.

After the war, Moskalenko commanded the Moscow Air Defense District. A protégé of Soviet leader Nikita Khru-shchev, he was promoted to marshal of the Soviet Union in 1955. Moskalenko then wrote his memoirs. He died in Moscow on June 17, 1985.

Mosley, Sir Oswald Ernald (1896–1980)

British fascist political leader. Born in Mayfair, London, on November 16, 1896, and heir to a wealthy baronetcy, Oswald Ernald Mosley attended the Royal Military College, Sandhurst. He served with distinction during World War I until he was invalided in 1916.

After the war, Mosley entered politics, winning a Conservative seat in December 1918 and marrying a wealthy heiress. Mosley became a prominent supporter of the League of Nations but broke with the British government on military expenditure, foreign involvements, and its policy toward Ireland. Arguing that domestic affairs deserved a higher priority, he became an Independent in 1922, winning reelection. Two years later, Mosley stood unsuccessfully for the Labour Party, but he returned to Parliament in 1926. When Labour formed a government in 1929, Mosley became chancellor of the Duchy of Lancaster. In May 1930, however, the cabinet rejected his radical proposals for economic recovery, and he resigned to establish the New Party.

In the 1931 general election, all 24 New Party candidates were defeated, and Mosley turned to extraparliamentary opposition. After visiting Italy in 1932, he began to establish a British fascist movement, arguing that the future lay with politicians who rejected democracy in favor of efficient economic management and mass political participation. A charismatic and inspiring orator who emphasized patriotic themes, Mosley initially attracted substantial support to the British Union of Fascists, much of it from respectable center-rightists. Mass violence at a huge meeting at Olympia on June 7, 1934, however, repelled many of its early middle-class adherents. So,

too, did the movement's growing anti-Semitism and rough tactics and Mosley's increasing identification with the totalitarian governments in Italy and Germany, which assisted him financially, even though he publicly denied receiving any such subsidies.

With World War II, the British government interned Mosley and his wife in May 1940 for more than three years. Mosley vociferously opposed war with the European dictatorships, the possibility of which he claimed arose only from a conspiracy orchestrated by influential international Jews. After his release for reasons of health in November 1943, he wrote extensively, justifying his prewar policies and advocating a politically and racially united Europe as a means of preserving Western supremacy. Late-20th-century historians admired the innovative economic policies he advocated during the 1920s and early 1930s but condemned his poor political judgment. After the war, Mosley lived primarily in France. He died in Orsay, France, on December 3, 1980.

Moulin, Jean (1899–1943)

French Resistance leader. Born in Béziers (Hérault), France, on June 20, 1899, Jean Moulin was educated as a lawyer. A promising politician, Moulin was France's youngest prefect in 1940, in charge of the Department of Eure-et-Loire. After the armistice, he refused a German order to sign a document falsely accusing Senegalese troops of atrocities. Imprisoned and tortured, Moulin tried to commit suicide.

Ordered by the Germans to remove several leftist mayors in his department, Moulin instead fled France and arrived in London in October

1941. There he became connected with several key resistance groups, most notably those with leftist inclinations. The leader of the Free French, General Charles de Gaulle, soon recognized Moulin's value. At de Gaulle's urging, Moulin parachuted with two assistants into southern France in January 1942 with instructions to unite the fractured Resistance groups.

Jean Moulin united the Resistance groups opposing the Germans in France. Betrayed to the Germans by an informant, he died after undergoing torture and while being transported to Germany. The charismatic Moulin is regarded as a hero of the French Resistance. (Keystone/Getty Images)

In early 1943, Moulin established the Mouvements Unis de la Résistance, an umbrella organization for Resistance groups in the south. Moulin returned briefly to Britain to arrange with the Special Operations Executive for airdrops of arms, radios, and propaganda material.

Back in France in May, Moulin presided over the first meeting of the Conseil National de la Résistance (CNR) in Paris on May 27. The meeting

brought together Resistance groups from all regions and ideological perspectives, including the anti-Gaullist communists.

Shortly after the founding of the CNR, Moulin was betrayed by an informer and arrested by the Gestapo near Lyon on June 21. Aware that he had vast knowledge of the French resistance, the Gestapo chief in Lyon, Klaus Barbie, personally oversaw the torture of Moulin during five days, but Moulin revealed nothing. He died on a train on July 8, 1943, probably at Metz, while being transported to Germany. The charismatic Moulin is regarded as the greatest hero and martyr of the French Resistance and one who prevented the various groups from engaging in internecine warfare. Today, the Gestapo headquarters in Lyon where he was tortured is a museum of the French Resistance. In 1964, his remains were reinterred in the Pantheon in Paris.

Mountbatten, Louis Francis Albert Victor Nicholas (1900–1979)

British admiral of the fleet. Born at Frogmore House on the grounds of Windsor Castle, Berkshire, England on June 25, 1900, Louis Francis Albert Victor Nicholas (“Dicky”) Mountbatten was the second son of Admiral of the Fleet Prince Louis of Battenberg (the family adopted the less Germanic name of Mountbatten in 1917, during World War I). Educated at the Royal Naval College, Dartmouth, and Cambridge University, Mountbatten then accompanied his cousin Edward, the Prince of Wales and future King Edward VIII, on a tour of the Far East.

Mountbatten entered the Royal Navy in 1916 during World War I and served in the Grand Fleet. He rose rapidly in rank, gaining expertise in communications. His first command was the destroyer *Daring* in 1934, and he was promoted to captain in 1937. In June 1939, he took command of the destroyer *Kelly,* and in September he was appointed captain of 5th Destroyer Flotilla. The *Kelly* was mined once, torpedoed twice, and finally sunk off Crete on May 23, 1941.

Mountbatten's exploits, dash, and popularity brought him to the attention of Prime Minister Winston L. S. Churchill, who selected him to be director of Combined Operations, with the rank of vice admiral. While he was director, several important raids were conducted, most notably against the French seaport of Dieppe on August 19, 1942. This operation was a costly failure, and Mountbatten bears much responsibility for this. The reverse did not affect his popularity, however, and it did provide lessons for future amphibious operations, particularly the Normandy Invasion of June 6, 1944 (Operation OVERLORD).

British admiral Lord Louis Mountbatten, commander of the South-East Asia Command, reads a dispatch at Gatow Airport in Berlin, Germany, before the Potsdam Conference, July 24, 1945. (National Archives)

In August 1943, Churchill convinced U.S. president Franklin D. Roosevelt to make Mountbatten supreme commander of the South-East Asia Command (SEAC). He took up his post in October, first at Delhi in India and later at Kandy in Ceylon (Sri Lanka). As SEAC commander, he made a number of important decisions, including that to continue fighting during the monsoon season, which resulted in the defeat of the Japanese Fifteenth Army. He took steps to reduce the impact of malaria, and he restored Allied morale. He also played a key role in the defense of Imphal by diverting air assets there. Mountbatten personally took the Japanese surrender at Singapore on September 12, 1945.

The British government did not wish to inflame nationalist sentiment in Burma (Myanmar). As the war ended, Mountbatten therefore ordered that Burmese who had previously collaborated with the Japanese occupation should not suffer reprisals unless they had been personally involved in atrocities. Mountbatten remained at his post until May 1946.

Appointed the last viceroy and first governor-general of India, Mountbatten presided over the independence and division of India into the two states of India and Pakistan. He received an earldom in 1947. Mountbatten was first sea lord between 1955 and 1959, helping to carry out a restructuring of the British armed forces. He then became chief of the Defence Staff in 1960, retiring as an admiral of the fleet five years later. On August 27, 1979, Mountbatten and several other members of his party were assassinated by the Irish Republican Army by means of a radio-controlled bomb set off on his boat, which was en route to Donegal Bay (Republic of Ireland).

Mulberries

Artificial harbors constructed to support the Allied invasion of France in June 1944. Early invasion planning for the Allied assault on occupied Europe quickly revealed the need for securing a major port to support the invasion forces and ensure the operation's success. The Dieppe Raid of August 19, 1942, by British and Canadian forces demonstrated to the Allied planners that ports were too difficult to assault directly. It also validated fears that German defenders would be able to destroy vital facilities before a port could be captured.

If the Allies could not capture a major port, they would have to bring their own with them. The British War Office began the planning and construction of two artificial anchorages and ports to support the upcoming Allied invasion of France. The Combined Chiefs of Staff officially approved the artificial port concept at Quebec in August 1943. The project was code-named Mulberry. The Allies would fabricate the two artificial ports in England, tow them across the English Channel, and establish them off the French coast. Mulberry A would support the U.S. invasion beaches, and Mulberry B would support the British beaches.

The prefabricated ports incorporated numerous components that had code names of their own. The first step in the process involved the creation of artificial anchorages known as Gooseberries. Engineers accomplished this feat by positioning and sinking a number of blockships on D-day, June 6, 1944, to create Gooseberries. Five such anchorages were created, two off Omaha Beach for the Americans and three off the British and Canadian beaches. The ships utilized were obsolete U.S., British, Dutch, and French warships and merchant vessels.

Two of the anchorages served as the foundation for the two Mulberries. The outermost breakwater consisted of Bombardons, large floating constructions that were 200 feet in length and 25 feet across and weighed 1,500 tons. These were located approximately 5,000 feet out from the high-water line. They enclosed an outer harbor, and 1,000 to 1,500 yards closer to shore, a row of sunken ships known as Corncobs and large concrete caissons known as Phoenixes created another breakwater to shelter the inner harbor.

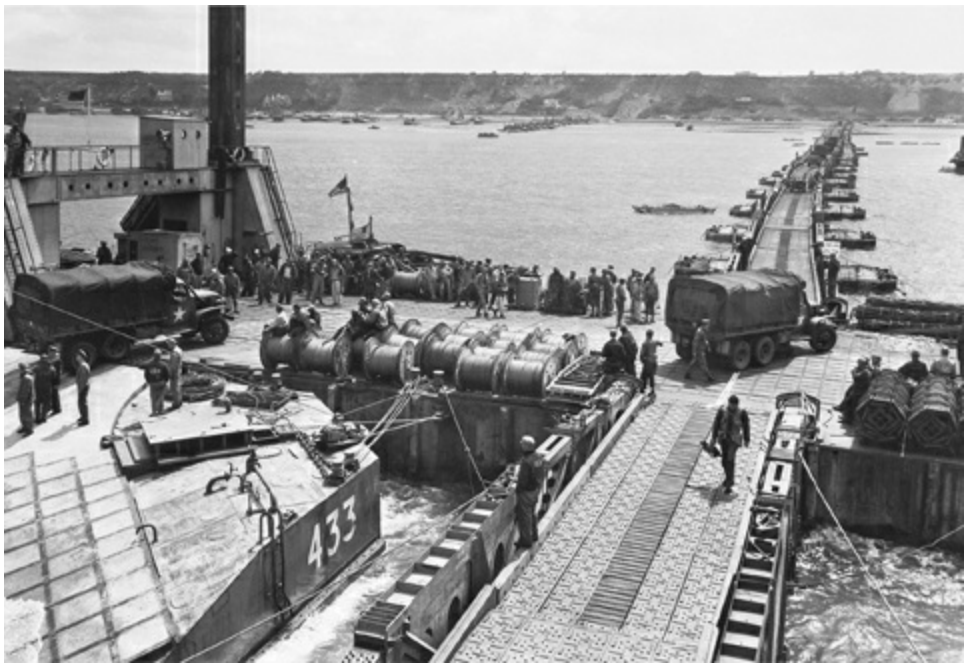
The floating and sunken breakwaters protected a series of piers, pier heads, and moorings for large vessels, such as Liberty ships, and smaller landing craft.

Plans called for Mulberry A to have three pier heads, two pontoon causeways, and moorings for seven Liberty ships and five large and seven medium coasters. It was to have a capacity of 5,000 tons of cargo and 1,400 vehicles per day. Construction began on June 7, 1944, with a planned completion date of June 24. On June 10, the engineers completed the Omaha Beach Gooseberry, followed on June 13 by the Utah Beach Gooseberry.

On June 16, the first LST (landing ship, tank) pier went into operation at Omaha Beach, with one vehicle landing every 1.6 minutes. By midnight on June 17, U.S. Navy engineers working on Mulberry A had placed all 24 Bombardons and 32 of 52 Phoenixes, along with mooring facilities for two Liberty ships. They also had completed the western LST pier, with work on the eastern pier under way.

As that work progressed, construction on pontoon causeways at both beaches continued. The first and second pontoon causeway at Omaha entered service on June 10 and 20, respectively. At Utah, the first opened on June 13 and a second on June 16. The initial concept of the artificial port appeared to be proving its worth. Work on the British Mulberry B proceeded at a similar pace.

Unfortunately for the Allies, the worst storm in the English Channel in half a century hit the Normandy coast on June 18, halting all landing operations for three days and, more important, destroying Mulberry A and forcing the Americans to abandon the artificial port. This made capture of the port of Cherbourg all the more important. As feared, however, the German defenders put up a stiff resistance, and the port did not fall until June 27, and only after it had been effectively destroyed. The first Allied cargo did not arrive through Cherbourg until July 16 and even then only in small amounts. By the end of July, cargo arriving in Cherbourg constituted only 25 percent of the total arriving over the beaches at Omaha and Utah.



Supplies being unloaded at the U.S. Mulberry at Omaha Beach off Celleville, France. (Bettmann/Corbis)

The great storm also seriously damaged Mulberry B off the British beaches, but it could be repaired. General Dwight D. Eisenhower, commander of the Supreme Headquarters Allied Expeditionary Force, ordered that Mulberry A not be rebuilt and that parts from it be used to complete Mulberry B to the original specifications. When completed, Mulberry B became known as the Harbor at Arromanches. By October, the port enclosed two square miles of water and could berth 7 Liberty ships and 23 coasters at the same time. Intended for use only until French ports were repaired and put back into operation, the artificial harbor remained in service until November 19. By the end of December, disassembly had begun.

While the contribution of the Mulberries did not meet preinvasion expectations because of the storm destruction, the artificial harbors proved invaluable in the Allied supply effort. Fortunately for the Allies, DUKW amphibious trucks and LSTs proved more effective in moving supplies over the beaches than expected and were able to compensate for the shortfalls from the Mulberries. The combination of tonnage delivered over the beaches, through the Mulberries, and through captured French ports enabled Operation OVERLORD to succeed, leading to the victory in France.

Munich Conference and Preliminaries (1938)

International conference at which the major powers agreed to the territorial dismemberment of Czechoslovakia, yielding the Sudetenland to Adolf Hitler. Hitler's expansion of power both domestically and internationally in the late 1930s was predicated on a mixture of belligerence, bluff, bullying, and inspired political insight. His theme of incorporating all Germans into a greater Germany allowed him to move east, where he believed the Western democracies would not make a stand. In March 1938, he assimilated Austria (the Anschluss), but he claimed to have no interest in Czechoslovakia.

The Czech government in Prague was not particularly concerned. Unlike Austria, the Czechs had strong military and defensive alliances with France and the Soviet Union. The Sudetenland was an industrial area and was hurt by the world economic depression, which only worsened discontent created by the sense that the Czech government discriminated against its German citizens. Encouraged by Berlin, a Nazi movement emerged in the largely German Sudetenland of western Bohemia, and its leader, Konrad Henlein, met with Hitler in late March 1938 and called for immediate justice for his people. The führer, well aware of Czech advantages, preferred what he called a more "evolutionary" arrangement.

Nonetheless, only a month later, Henlein made a speech at Karlsbad demanding autonomy and other concessions for the Sudetenland. Disturbances and clashes between German Czechs and the police followed. The French government openly said that France would fight if Germany

intervened. British prime minister Neville Chamberlain had previously warned that such a conflict would draw in other nations.

Chamberlain did not, however, believe that the Czech situation justified war. He questioned the viability of an artificial multinational state created only as a consequence of World War I. He convinced French premier Édouard Daladier to join in pressing Prague to make a deal, while at the same time hinting to Berlin that intervention could lead to war.

Czech president Eduard Beneš offered a conciliatory approach to meeting the Sudeten German demands, and on May 18, there were talks between representatives of the Sudeten Germans and the Czech government. The next day, however, reports of German troop movements caused widespread confusion. During the next few days, Prague ordered partial mobilization, Sudeten Germans clashed with police, and France and Britain warned Germany about intervention. Hitler, outraged by press implications that he had been forced to back down, told German military leaders on May 28 that he would finish with the Czechs by 1 October.

With tensions growing, French foreign minister Georges Bonnet told Chamberlain that he was prepared to force concessions from Prague, although officially, France stood by its commitments to defend Czechoslovakia. Chamberlain was determined to avoid war, although he remained committed to supporting France.

Chamberlain then received Czech permission to send Lord Walter Runciman as mediator while continuing to warn Hitler of the threat of war. Runciman had about six weeks until Nazi Party meetings in the second week of September, where Hitler was expected to publicly demand concessions. Bonnet assured Chamberlain that if Runciman’s efforts led to a British proposal, Paris would support it, and Prague could go along or stand alone. On September 4, Runciman informed Beneš that the Czechs would have to accept Henlein’s Karlsbad points, and two days later, Beneš yielded. Then talks broke down, however, after reports that Czech police had abused a Sudeten official.

On September 12, Hitler spoke at the annual Nazi Party rally in Nuremberg, demanding redress for the Sudetenland but suggesting no specific remedy. Riots followed immediately thereafter in the Sudetenland, raising the specter of insurrection, which the Germans had long said would provoke their intervention.

On September 13, Chamberlain requested a meeting with Hitler, which took place three days later at Berchtesgaden; Hitler posed as a moderate, calling only for self-determination for the Sudeten Germans. Although he could secure no specifics, Chamberlain decided that annexation of areas with populations that were 50 percent or more German would satisfy the führer. Hitler then agreed not to act unless there was a major incident, and Chamberlain returned to London to consult colleagues and allies. Once the French agreed to the 50 percent plan, Beneš was told to accept it or face German invasion.

On September 22, Chamberlain again met Hitler, this time at Godesberg, only to find that the führer now had upped the ante. He had a map showing areas Germany would occupy by October 1, and he demanded that all Czech officials be withdrawn from them by that date and that all military, economic, or traffic establishments be removed. The Sudeten Free Corps was already occupying towns. Chamberlain then balked, asserting that this was neither self-determination nor what had been agreed on. London and Paris reluctantly decided to withdraw their advice to Prague not to mobilize, and the Godesberg Conference ended on September 24. War seemed inevitable.

During the next few days, the British and French looked for a solution. Although they continued to warn Hitler in rather vague terms, they also made clear to Beneš that the only way to avoid a German attack was to accept the German demands. Hitler continued to insist on concessions. It thus appeared that he might carry out his threat to use force and that a general European war might result.

U.S. president Franklin D. Roosevelt then made a direct appeal to Hitler, urging an international conference. On September 28, Italian dictator Benito Mussolini talked to Hitler and secured his agreement for such a meeting. Perhaps Hitler’s acceptance was prompted, in part, by the unenthusiastic reception Berliners accorded a German motorized division moving through Berlin on September 27, which left the German leader in a rage.

Chamberlain, Daladier, and Mussolini met with Hitler in Munich on September 29. The Soviet Union was not invited, and Czechoslovakia was not officially represented; the object was to give Hitler the Sudetenland and avoid war. At Munich, Hitler was on his worst behavior, treating Chamberlain in the most brusque and disdainful fashion. After the conference, Hitler vowed to his confidants he would never again be cheated

out of a military victory and that he would attack and destroy the British and the French. This astonishing reaction to his diplomatic triumph showed clearly that Hitler sought war.

The Munich Agreement, dated September 30 but actually signed just after midnight on October 1, gave Hitler everything he demanded: evacuation would take place between October 1 and 10 under conditions arranged by an international commission, which would also determine plebiscite areas. Early on the morning of October 1, 1938, German troops marched across the frontier, and two days later, Hitler made a triumphal entry into Eger, the unofficial capital of the Sudeten Germans.

Other nations of Central Europe also joined in the division of Czechoslovakia. Poland demanded and received some 400 square miles around Teschen with roughly 240,000 people, only 100,000 of whom were Poles. Then in November, Hungary annexed some 4,800 square miles of Czechoslovakia with a population of about 1 million people.

Seen in retrospect—and psychological and morale factors notwithstanding—the West, unprepared as it was, would have been better off fighting in September 1938 than capitulating at Munich. Britain and France might have secured as allies the Soviet Union and Poland, but even discounting them, the German Army would have been forced to fight on two fronts: against both France and Britain and also against Czechoslovakia. Despite Hitler’s boasts, Germany was unprepared for war in September 1938, as both air and land forces were deficient.

Italian dictator Benito Mussolini (left) and German deputy führer Rudolf Hess (right) arrive at the Führerhaus for the Munich Conference, September 1938. (Library of Congress)

Of course, the Western democracies were also weak militarily. Britain's rearmament program had begun only in 1937. France had many more artillery pieces than Germany, but it was deficient in aircraft. If the Allies had fought Germany in 1938, however, they could have counted on 35 well-armed and well-equipped Czech divisions, supported by substantial numbers of artillery pieces and tanks and perhaps 1,600 mixed-vintage aircraft.

Those responsible for the Munich debacle later claimed that it bought time for the Western democracies to rearm. Winston Churchill noted in his memoirs that British fighter squadrons equipped with modern aircraft rose from only 5 in September 1938 to 26 by July 1939 (and 47 by July 1940), but he also observed that "The year's breathing space said to be 'gained' by Munich left Britain and France in a much worse position compared to Hitler's Germany than they had been at the Munich crisis."

The Munich Conference had far-reaching international influence. Chamberlain and Daladier were warmly received by welcoming crowds when they returned home, especially the British prime minister when he reported that he believed he had achieved "peace in our time." The Munich Agreement, however, effectively ended the French security system. Poland, Romania, and Yugoslavia now all doubted French commitments to defend them, and Stalin was further alienated from the West. He told associates that Chamberlain and Daladier had given in to Hitler in order to facilitate Germany's *Drang nach Osten* (drive to the east) and bring about a war between Germany and the Soviet Union. For the German opposition, Munich was also a disaster. Even the most diehard of plotters realized that the opportunity to eliminate Hitler had vanished.

Despite Hitler's pledges that the Sudetenland was his last territorial demand in Europe, events soon proved the opposite. The day after Munich, Hitler told his aides that he would annex what remained of Czechoslovakia at the first opportunity. Within a few months, he took advantage of the internal situation in that country. In March 1939, he supported the leader of the Slovak Popular Party, Jozef Tiso, who sought complete independence for Slovakia. On March 14, Slovakia and Ruthenia declared their independence from the rest of Czechoslovakia.

Hitler summoned Czech president Emil Hácha to Berlin that very day. One day later, Luftwaffe commander Hermann Göring threatened the immediate destruction of Prague unless Moravia and Bohemia were made Reich protectorates. Hácha fainted. When he was revived, he signed a communiqué placing "the fate of the Czech people and country in the hands of the Führer of the German Reich." On March 15, Nazi troops occupied what remained of Czechoslovakia.

Murphy, Audie Leon (1924–1971)

U.S. Army soldier and officer who was awarded the Medal of Honor. Audie Leon Murphy was born near Kingston, Texas, on June 20, 1924, the 7th of 12 children in a poor sharecropper family. Murphy attempted to enlist in the U.S. Marine Corps following the December 7, 1941, Japanese attack on Pearl Harbor, but he was turned down because he was both too small and too young. He enlisted in the army on his 18th birthday and was assigned to the 15th Infantry Regiment of the 3rd Infantry Division.

U.S. Army lieutenant Audie Murphy, ca. 1945. (Library of Congress)

Murphy first came under enemy fire in Sicily in July 1943. He then fought in Italy, France, and Germany. Murphy became one of the most decorated U.S. soldiers of the war, earning 33 medals and being wounded three times. As a staff sergeant, he received a battlefield commission to second lieutenant in October 1944. He was awarded the Medal of Honor for his actions at the Colmar Pocket on January 26, 1945, during a German attack on his position. He called down artillery fire on his own location, jumped onto a burning tank destroyer, and manned its .50-caliber machine gun. Despite being wounded, he then led a counterattack.

Murphy left the service in September 1945 as a first lieutenant. Thereafter, he parlayed his fame and youthful good looks into a movie career. He played himself in the 1955 movie based on his 1949 autobiography, *To Hell and Back*. He starred or appeared in some 40 other films.

Murphy suffered from what is now called post-traumatic stress disorder (PTSD)—then called battle fatigue or shell shock. He was plagued with bouts of depression, insomnia, and nightmares. He was addicted to sleeping pills until the mid-1960s, and after freeing himself from addiction, he broke the veterans' taboo of publicly discussing his war-related mental conditions. Nearly bankrupt, Murphy died in an airplane crash near Roanoke, Virginia, on May 28, 1971. He was a major in the Texas Army National Guard at the time of his death.

Murrow, Edward Roscoe (1908–1965)

Pioneering broadcast journalist whose reports during World War II made him a household name in the United States. Edward Roscoe Murrow was born

Egbert Murrow on a small farm outside Greensboro, North Carolina, on April 25, 1908. He later changed his first name for professional reasons. When he was six years old, Murrow moved with his family to Washington State. In 1930, he earned a bachelor's degree in speech from Washington State College (now Washington State University). He worked for the Institute of International Education before joining CBS Radio in 1935; he would remain at CBS nearly his entire career. In 1937, Murrow became director of CBS Europe, headquartered in London.

The following year, Murrow and a colleague, William L. Shirer, began broadcasting European events from London that were aired in the United States. The first significant event covered was Germany's annexation of Austria (the Anschluss) in the early spring of 1938. Shirer's reports were frank and uncensored, capturing an ever-increasing audience. Meanwhile, Murrow began broadcasting from Vienna, offering firsthand accounts of the Anschluss. Both Murrow and Shirer pioneered the live radio broadcast, which was considered revolutionary at the time.

During the bombing of London, known as the Blitz (August 1940–May 1941), Murrow broadcast hundreds of reports—many of them live—as German aircraft attacked the British capital and other cities. Opening his reports with "This is London calling …," Murrow became the most celebrated and well-known journalist in the United States. His dramatic, detailed, yet calmly dispassionate reports of the bombings garnered atmospheric ratings, and many have since asserted that Murrow's reporting likely tipped U.S. public opinion toward aiding the British well before the nation entered World War II. When Murrow returned to the United States in 1941, President Franklin D. Roosevelt sent him a telegram lauding his service.

Murrow continued his wartime reporting in Europe, and his April 1945 report on the liberation of the Buchen-wald concentration camp is considered among the best work ever by a broadcast journalist. He remained at CBS, alternately holding both management and journalism positions, although his first love was always reporting. He had a popular radio show, which in 1951 was converted to the new medium of television. In March 1954, Murrow's *See It Now* show covered Senator Joseph McCarthy, in the process laying bare much of that senator's bombast and pointless and inaccurate accusations. Murrow allowed McCarthy a rebuttal on national TV, but the senator only

dug a deeper hole for himself. Many laud Murrow's coverage for paving the way for the eventual censure of McCarthy, which came in December 1954.

Murrow left CBS in late 1960 over an increasingly acrimonious relationship with William Paley, head of the CBS network. From 1961 until 1964, Murrow headed the U.S. Information Agency. In failing health with lung cancer, Murrow died on April 27, 1965, in Pawling, New York.

Muselier, Émile Henri Désiré (1882–1965)

French Navy admiral. Born at Marseille (Bouchres-du-Rhône Department) on April 17, 1882, Émile Henri Désiré Muselier graduated from the French Naval Academy in 1902 and served in the Far East between 1903 and 1905. He then held ship assignments in the Mediterranean and attended the Gunnery School at Toulon before serving aboard cruisers in the Mediterranean. In 1911, he became a gunnery instructor at Toulon.

Muselier served as the gunnery officer on the armored cruiser *Edgar Quinet* in the Mediterranean, where he took part in the first actions in the Adriatic during World War I. He commanded a battalion of marines ashore, distinguishing himself in fighting at Nieuport. He next commanded a battalion of naval artillery on the Western Front before service with the government agency overseeing naval inventions. In April 1918, Muselier assumed command of the dispatch boat *Scarpe*. Promoted to lieutenant commander in July, he participated in operations first in the Atlantic and then in the Black Sea, aiding anti-Bolshevik forces during the Russian Civil War.

In 1920, Muselier joined the French delegation to the Allied Control Commission in Germany. Promoted to commander in July 1922, he served briefly in the military cabinet of the government, then commanded the

torpedo boat *Ouragan*. He was promoted to captain in July 1926 and assumed command of the armored cruiser *Ernest Renan* in 1927. Following service ashore at Cherbourg, Muselier commanded the old semidreadnought *Voltaire* in 1930. He then served ashore at Toulon before taking command of the battleship *Bretagne* in September 1931.

Promoted to rear admiral in July 1933, Muselier commanded at Cherbourg and then the arsenal at Sidi-Abdallah and, in 1934, French Navy units in Tunisia. Muselier had charge of the 2nd Cruiser Squadron during 1937 and 1938, with his flag in the *Suffren*. In September 1938 he headed the Marseille Defense Zone, and in October 1939 he joined the 2nd Section and was promoted to vice admiral.

Muselier rallied to General Charles de Gaulle in July 1940 and created the Free French Navy, of which Muselier was named commander in chief that October. His principal assistant in London was Captain Thierry d'Argenlieu. Muselier commanded Free French naval units in the December 1941 seizure of the Vichy-controlled islands of Saint-Pierre and Miquelon off Newfoundland. Muselier's relations with de Gaulle were stormy, however.

Muselier collaborated with the British in an attempt to oust de Gaulle as head of the Free French, and in March 1942 Muselier was replaced by Captain Philippe Auboyneau. In May, Muselier became inspector general of the Free French Navy, and in 1943, he transferred to Algiers and that June was named deputy commander in chief of French Maritime Forces. Suspended from his duties the following August, he then served as chief of the naval section of the French military commission dealing with German affairs.

Muselier retired in June 1946. He wrote two books, *Marine et Résistance* and *De Gaulle contre le Gaullisme* (1946), in which he discussed the history of Free French naval forces as well as infighting among the Free French and his differences with de Gaulle. Muselier died in Toulon on September 2, 1965.

Music and the War

Several musical trends defined themselves in the years between the world wars. Some composers emphasized the sounds of their respective ethnic cultures through the use of folk music and folklore. Others, concerned by the widening rift between composer and audience, created what was called in Germany *Gebrauchsmusik* (utility music), music intended for students and amateurs as opposed to music for its own sake. Neoclassicism remained an influential style (particularly in the United States), the composers of which retained aspects of past musical forms while incorporating new and unfamiliar elements. There were also more and more composers who espoused a radical aesthetic that broke with European tradition. This radicalism led to the evolution from about 1908 of atonality (a free chromaticism that avoided the traditional tonal hierarchy used throughout the 18th and 19th centuries) and serialism (music written using a systematic ordering of the 12 pitches, also without regard to a tonal center).

In many respects, a great deal of the music that predated the war was written in reaction to World War I, although the responses could be quite subtle. (The moving *Cello Concerto* of Sir Edward Elgar [1857–1934] is essentially a war memorial, for instance.) Nationalism took on a political aspect during the years between the wars and was seen as a means of establishing an ethnic identity in an increasingly intolerant world. Composers such as the Hungarians Béla Bartók (1881–1945) and Zoltán Kodály (1882–1967) used folk songs and folk instruments in their music. Kodály's *Háry János Suite* (1926) and Bartók's *Music for Strings, Percussion and Celesta*

(1936) showed the influence of regional music that they collected in the early years of the century.

Nationalism surfaced in the United States as well, perhaps best exemplified by Aaron Copland (1900–1990), whose ballets *Billy the Kid* (1938) and *Appalachian Spring* (1944) drew on uniquely American themes. Two of his works directly connected with the war were the *Fanfare for the Common Man* (1942), the result of a commissioning project in which composers wrote fanfares for brass and percussion on patriotic themes, and *Lincoln Portrait* (1942), for narrator and orchestra. Both received numerous performances during the war years.

Soviet composer Dmitri Shostakovich (1905–1975) composed his *Symphony No. 7* (1941) as a musical response to the heroic defense of Leningrad. Shostakovich had served briefly in the Leningrad Volunteer Home Guard before being evacuated. This work had no fewer than three major conductors (Leopold Stokowski, Artur Rodzinski, and Serge Koussevitsky) fighting over American premier rights. The numerous performances the symphony received were a propaganda boon for both Soviet and American audiences.

Austrian composer Arnold Schoenberg (1874–1951) was forced into exile during the war years. After immigrating to the United States, he took a teaching position at the University of California, Los Angeles. Schoenberg composed two important responses to the war: *Ode to Napoleon Buonaparte* (1942), a setting of the poem by Lord Byron that in Schoenberg's hands became a not-so-veiled reference to Hitler, and the terrifying *Survivor from Warsaw* (1947), ostensibly based on events that took place in the Warsaw ghetto.

There were also composers who responded to the war from the concentration camps: *Quartet for the End of Time* (1941) by Olivier Messiaen was premiered on January 15, 1941, in Stalag VIIIA at Görlitz before an audience of fellow prisoners of war. Composers Pavel Haas (1899–1944), Hans Krása (1899–1944), and Viktor Ullmann (1898–1944) were among many who were incarcerated at Terezín (Theresienstadt) and who ultimately would die in the gas chambers. Ullmann's opera *Der Kaiser von Atlantis* (1944) was composed at Terezín and was in rehearsal before the Nazis shut the performance down shortly before deporting the composer to Auschwitz.

The end of the war saw a complete break from 19th-century romanticism.

Although the newer musical languages were often not conducive to conventional memorials, there were some significant responses. The *War Requiem* by English composer Benjamin Britten (1913–1976), using the text of the requiem mass and the poetry of World War I poet Wilfred Owen, was written for the reconsecration of Coventry Cathedral in 1962 and is one of the most powerful antiwar statements in the history of music. There was also the brilliant *Threnody for the Victims of Hiroshima* (1960) by Polish composer Krzysztof Penderecki. The war marked the end of an era for art music, and the postwar world would ultimately demand a different kind of music.

The war years were a time when jazz and popular music were essentially identical (compare this with the Vietnam War years, when there was a clear distinction between jazz and popular music, that is, rock and roll). Jazz had begun to surface as a major musical force in the United States in the years immediately following World War I, and by the late 1920s, it had evolved beyond its Dixieland roots into something new and original. This new form at first came mainly in the form of the big bands, which proliferated during the 1930s and 1940s. Throughout the 1930s, a wide range of these bands worked to solve the problems of getting a large ensemble to "swing," and by 1938, they were appearing at such august venues as Carnegie Hall. The new swing music was performed by popular bands led by Glenn Miller, Tommy Dorsey, Harry James, Count Basie, Duke Ellington, Benny Goodman, and countless others. Big band music was melodic and often upbeat in tempo.

The popular songs of the time were closely associated with these bands. Important vocalists, including Bing Crosby, Dinah Shore, Frank Sinatra, Ella Fitzgerald, and the Andrews Sisters, recorded many of these songs. The influence of this music was enormous. In a very real sense, American popular music was *the* popular music of World War II.

The U.S. Army, recognizing the importance of this music, entered the business of providing music for the troops in both European and Pacific theaters through the Special Services Division of the Army Service Forces. Many of the bands ultimately ended up in uniform performing overseas, sometimes in circumstances of great danger. Band leader Glenn Miller was killed in 1944 when his plane went down in the English Channel en route to a performance in France.

Jazz was almost exclusively an American phenomenon. In Nazi dictator Adolf Hitler's Germany, jazz was prohibited and actively disparaged. In a

now notorious exhibition in 1938, jazz was labeled *Entartete Musik* (degenerate music). Jazz was "degenerate" because it was associated with Negroes and miscegenation. As a result, "popular" music in Germany consisted largely of official patriotic songs associated with the Reich, folk songs, and some sentimental ballads.

Strangely enough, one of these sentimental ballads had the unusual distinction of being popular on virtually every front in Europe. "Lili Marlene," originally written by German soldier Hans Leip in 1915 and set to music by Norbert Schultze in 1938, was as popular with Allied troops as it was with the Germans. An English version was devised shortly after the song became popular in Germany and was made famous by Marlene Dietrich in 1943. There was even a version in French.

Because the musical cultures in Europe all stemmed from the same musical roots, this "sharing" of songs is perhaps not surprising. Of course, no such sharing was possible in the Pacific, although Allied troops were kept current with the latest popular songs by broadcasters such as "Tokyo Rose."

The range of popular songs was enormous. There were patriotic songs, designed to inspire support for the war effort as well as for the realities of day-to-day life during the war ("Cowards over Pearl Harbor," "America Calling," "There'll Always Be an England," and "Rosie the Riveter"). There were songs directly related to military service, some with specific references to the commanding officers ("Keep Your Powder Dry," "Nimitz, Halsey and Me," "Here's to You, MacArthur"). Sentimental songs of love and separation were particularly popular ("We'll Meet Again"; "White Cliffs of Dover"; "In the Mood," made popular by the Glenn Miller Band; "Cleanin' My Rifle [And Dreamin' of You]") as well as novelty songs ("Lalapaluza Lu," "Little Bo Peep Has Lost Her Jeep," and "Boogie-Woogie Bugle Boy").

Some songs made unmistakably violent and disparaging references to the enemy (which read somewhat awkwardly in light of modern sensibilities). They included "Mow the Japs Down!"; "Der Fuehrer's Face," popularized by Spike Lee; "Hey, Tojo! Count Yo' Men!"; and "You're a Sap, Mister Jap." World War II also witnessed the spread in the United States of country and western music, taking it well beyond its Appalachian and western roots. Young soldiers took this largely rural music into the military camps and urban defense plants, which contributed to its growing popularity not only in the more urban northern United States but ultimately overseas as well.

Dinah Shore and Bing Crosby entertaining U.S. troops at a USO show in France, October 1944. (Bettmann/Corbis)

The end of the war essentially spelled the beginning of the end of the big band and swing eras. Jazz moved on to a grittier, more improvisational style known as bebop, which eschewed large bands and orchestras for trios, quartets, and quintets, and in the mid-1950s popular audiences would turn to another form of music that began to rise from its roots in rhythm and blues: rock and roll. This would become the music of future wars.

Mussolini, Benito (1883–1945)

Italian fascist dictator (1922–1943). Born in Predappio, near Forli in Romagna, Italy, on July 29, 1883, Benito Amilcare Andrea Mussolini was named after the Mexican revolutionary and president Benito Juárez. Mussolini earned a teaching diploma in 1901. His mother wanted him to be a schoolteacher, but Mussolini found the profession too boring.

As an adolescent, Mussolini had joined the syndicalist branch of the Italian Socialist Party. He soon found that he enjoyed the role of agitator, fomenting strikes and establishing unions. At age 19, he fled to Switzerland to avoid compulsory military service. He stayed there for three years, doing odd jobs and living on money sent by his mother. He intermittently attended some university classes and served time in jail. An amnesty caused Mussolini to return to Italy and perform his military service. He then edited a socialist newspaper, *La Lotta di Classe* (The Class Struggle), at Forli and was secretary of the local Socialist Party there. His opposition to war with the Ottoman Empire in 1911 and 1912 earned him national prominence, and he was now one of the leaders of the left wing of the Italian Socialist Party. In 1913, he became editor of the socialist daily *Avanti,* published in Milan.

On the outbreak of World War I, however, Mussolini abruptly modified his socialism by embracing Italian nationalism and urging intervention on the Allied side. This interventionist position caused his expulsion from the Socialist Party. Mussolini then founded a French-financed daily, *Il Popolo d'Italia* (The People of Italy). In October 1914, he also founded the prowar group Fasci Rivoluzionario d'Azione Internazionalista (Revolutionary Fasci for International Action) to bring about intervention in the war. In December

of that year, the group became the Fasci di Azione Rivoluzionaria (Fasci for Revolutionary Action).

The word *fascio* recalled the bundle of sticks carried by the lictors of ancient Rome, representing state power; one stick might be broken, but fastened together, the sticks were unbreakable. Mussolini liked to call up ancient Italian glories, and this bundle of sticks later became the emblem of fascist Italy. His belief that the proletariat should unite and create a formidable organization before seizing power was the germ of the Italian fascist movement. Following Italy's entry into the war on the Allied side in May 1915, Mussolini was called up for the army and served until 1917 on the Austrian front, reaching the rank of corporal. He was wounded slightly and discharged.

On the return of peace, the Socialist Party resumed its agitation. Mussolini's reaction to this was to organize ex-soldiers in the Fascio di Combattimento (Combat Bands) in March 1919. Mussolini carefully built the fascist organization, paying special attention to the Blackshirt squads, militia supported with financial contributions (not always voluntary) from businessmen and landlords. Distinguished by their black shirts and Roman salute, the Blackshirts were clashing with socialists and communist groups by the summer of 1919. Mussolini's policy was to meet every act of violence with greater violence, and between 1921 and 1922, a veritable civil war with the socialists raged the length of Italy.

The fascist political program was little more than devotion to their leader ("Il Duce"), Italian nationalism, "law and order," and opposition to communism. After they came to power, the fascists claimed they had saved Italy from communism. There is, however, little support for that in fact. Certainly, Mussolini did exploit middle- and upper-class fears of socialism and communism, though.

In the 1921 elections, the fascists gained less than 10 percent of the vote, but the size of the organization (300,000 members by the end of September 1922) made force—or the threat of it—a possible route to power. By September 1922, Mussolini was openly demanding that he be named premier. In late October, some 10,000 of his followers converged on Rome. During this "March on Rome," Mussolini remained safe in Milan until he was informed that it had succeeded, a fact carefully concealed by fascist historians.

When King Victor Emmanuel III refused to authorize martial law, Premier Luigi Facta resigned, and on October 29, 1922, the king called Mussolini as premier. It was all quite legal—or almost so. On November 25, threatened with new elections held under fascist supervision, Parliament conceded Mussolini full powers for 1 year; he held them for 20.

A new election law and the trampling of the rights of the opposition in 1924 gave the fascists 374 of 535 seats. Mussolini then proceeded to disband the opposition parties and secure complete power as Il Duce. He alone made the decisions, and he was not only head of state but also foreign minister, chief of the armed service branches, minister of the interior, and minister of the colonies. This concentration of authority produced chaos rather than efficiency, however. Restoring the economy also proved elusive. The only real domestic achievements of his regime were advances in literacy (fascist education was more formative than informative) and the 1929 accord with the Vatican (the Lateran Treaty).

Mussolini's dominant motivations were his personal vanity and desire for adulation; not surprisingly, flattery was a key factor in his undoing. He became captivated by his own myth of the invincible, irreplaceable leader and came to believe his own propaganda that only he could make the right decisions and that his intuition was always correct. Serious study and discussion were not Mussolini's style. He rushed to decisions, often with unfortunate results. He also changed his mind frequently and precipitously, and he was totally inept as a war leader. He ordered military campaigns begun on short notice, with no thought of the need for detailed planning.

The hallmarks of the Italian state and military under Mussolini were administrative confusion and incompetence.

Mussolini pursued an aggressive foreign policy, beginning with the Italian bombardment of the Greek island of Corfu in 1923. Alienation from the West over Italy's 1935 invasion of Abyssinia (Ethiopia) and support of the Nationalist side in the 1936–1939 Spanish Civil War led to a rapprochement with Adolf Hitler's Germany.

This Rome-Berlin Axis became a formal alliance in 1939. The year before, Mussolini had allowed Hitler to annex Austria; four years previously, he had helped uphold Austrian independence against an attempted Nazi coup. He also was a prime mover behind the agreement at Munich in September

1938 that led to the dismemberment of Czechoslovakia. In April 1939, Mussolini ordered the invasion of Albania.

When the general European war began in September 1939, Mussolini, fearful that Germany would not win, declared Italy's nonbelligerency. With Germany about to defeat France and being anxious to join in the spoils, he declared war on France on June 10, 1940, and sent Italian divisions into southeastern France and into Egypt from Libya, with little military success. He also insisted on sending obsolete Italian aircraft to participate in the July 10–September 30, 1940, Battle of Britain. In October 1940, without consulting Hitler, he ordered Italian forces to invade Greece from Albania. The Greeks promptly drove the Italian forces out, leading Hitler to come to the rescue of his hard-pressed ally in the spring of 1941. Mussolini also sent Italian forces to assist the Germans in their invasion of the Soviet Union, a step that was particularly unpopular in Italy.

Italian dictator Benito Mussolini, photographed on April 8, 1938. (AP Photo)

Following Allied victory in North Africa and the successful Allied invasion of Sicily, the fascist Grand Council voted to depose Mussolini on July 25, 1943. Hitler ordered him rescued by German commandos, and Mussolini was then installed as nominal leader of a puppet state in northern Italy, under complete German control. In September 1943, however, Italy switched sides in the war. As the end of the war approached, Mussolini and his mistress, Clara Petacci, attempted to flee northern Italy with a German convoy in April 1945. Partisans captured them on April 28 and shot both that same day. Their bodies and those of other members of Mussolini's government were taken to Milan and strung up there, upside down, in the great square, the Piazzale Loreto. Mussolini's body was later rescued and buried in the family mausoleum.

Mussolini never accepted responsibility for his failures but blamed others, when he alone was responsible. He claimed that the Italian people were not worthy of him. He may have been the least brutal of the major dictators of World War II, but he was bad enough. To the end, his chief motivation was personal power rather than the good of the Italian people.

Mutaguchi Renya (1888–1966)

Japanese Army lieutenant general. Born in Saga, Japan, on October 7, 1888, Mutaguchi Renya graduated from the Japanese Military Academy in 1910 and the Army War College in 1917. An infantry officer, he served on the staff of the Siberian Expeditionary Force sent to Vladivostok between 1920 and 1921. Promoted to major in 1926 and to colonel in 1930, Mutaguchi headed the Military Affairs Section of the army General Staff from 1933 to 1936.

As commander of the 1st Infantry Regiment of the China Garrison Army in Beijing from 1936, Mutaguchi helped provoke the Marco Polo Bridge (Lukouch'iao) Incident of July 1937, which caused the outbreak of the Second Sino-Japanese War. He was promoted to major general in 1938 and assigned to the headquarters of the Guandong (Kwantung) Army in Manchuria. Promoted to lieutenant general in 1940, Mutaguchi commanded the 18th Division in the Malaya Campaign of December 1941 to February 1942 under the overall direction of Lieutenant General Yamashita Tomoyuki.

In March 1943, Mutaguchi assumed command of the Fifteenth Army in northern Burma. On his urging, commander of the Burma Area Army General Kawabe Masakazu authorized him to carry out Operation U-GO, a reckless offensive against Imphal and Kohima. Although Mutaguchi achieved initial success in March and April 1944 and besieged both places, superior Allied firepower and air assets forced him into retreat in July. Some 50,000 of Mutaguchi's 65,000-man force died, most of them of starvation or disease. Relieved of command that August, Mutaguchi was assigned to staff duties until the end of the war.

After the end of the war, Mutaguchi was arrested and transported to Singapore, where he stood trial for war crimes and was convicted. Released from prison in March 1948, he returned to Japan. Mutaguchi died in Tokyo on August 2, 1966.

Mutō Akira (1892–1948)

Japanese Army lieutenant general. Born in Kumamoto, Japan, on December 15, 1892, Mutō Akira graduated from the Japanese Military Academy in 1913. He studied in Germany in 1923 and was promoted to major in 1929. Mutō was appointed a member of the army General Staff in 1935 and became chief of staff of the Guandong (Kwantung) Army in Manchuria in 1936.

As vice chief of the army General Staff and a major general, Mutō insisted in 1937 on an escalation of the Sino-Japanese War, whereas chief of the General Staff General Ishiwara Kanji sought to calm the situation. Mutō secured majority support in the General Staff, leading to a wider conflict with China. In 1938, Mutō was transferred to Beijing as deputy chief of staff of the China Army. Many hold Mutō responsible for the atrocities committed by Japanese troops under his overall command at Nanjing (Nanking) in December 1937.

Mutō was appointed head of the Military Affairs Bureau of the Ministry of War and adviser to Minister of War Lieutenant General Tōjō Hideki. He also supported Foreign Minister Matsuoka Yosuke's policy of concluding the Tripartite Pact with Germany and Italy on September 27, 1940, although he was eager to avoid war against the United States. In October 1941, Tōjō became prime minister, and Mutō was promoted to lieutenant general. As one of the most influential officers of the Japanese Army, Mutō tried to resolve the Sino-Japanese dispute and improve relations with the United States, but he failed in both endeavors.

In April 1942, Mutō was appointed commander of the 2nd Imperial Guards Division, fighting with it in Malaya and then, in October 1944, in the Philippines, where, as a lieutenant general, he was chief of staff of the Fourteenth Area Army under General Yamashita Tomoyuki. On September 3, 1945, Yamashita and Mutō signed the unconditional surrender of Japanese forces in the Philippines.

After the Japanese surrender, Mutō was arrested and charged by the International Military Tribunal for the Far East with war crimes in China and the Philippines. Tried and convicted, Mutō was sentenced to death and executed in Tokyo on December 23, 1948.

Myitkyina, Siege of (May–August 1944)

The key military objective of the 1944 Allied Northern Burma (present-day Myanmar) Campaign in the China-Burma-India (CBI) theater of operations. U.S. lieutenant general Joseph "Vinegar Joe" Stilwell had command of Allied forces in the battle and subsequent "siege." The action began in late April 1944 with attacks in the Mogaung Valley by predominantly Chinese troops, followed by a general Allied effort against the airfield and railroad center of Myitkyina. The aim of the campaign was to reduce Japanese pressure on the air resupply route from India to China over the Himalayas ("the Hump") and to clear a vital road link along the ground line of communications under construction along the Ledo Road, later known as the Stilwell Road. British, Chinese, Burmese, and U.S. troops (Merrill's Marauders, the 5307th Composite Unit [Provisional]) captured the airfield on May 17, but they could not eliminate stubborn resistance by elements of the Japanese 18th and 56th Divisions in the Myitkyina area until August 3.

The Allied operation, code-named END-RUN, was conducted by three separate combat brigade–sized elements organized around the battalions of Merrill's Marauders (code-named GALAHAD). H Force, consisting of the 1st Battalion, the 150th Regiment of the 50th Chinese Division, and a battery of

the 22nd Chinese Division artillery, moved south on April 30. M Force, the 2nd Battalion with attached Burmese Kachins, began its operations on the southernmost axis on May 7. K Force, consisting of the 3rd Battalion of GALAHAD and the 88th Regiment of the 30th Chinese Division, began the advance to Myitkyina on April 28. These three formations were accompanied by U.S. and Chinese support troops, including mobile hospitals, engineers, and animal transport units.

U.S. Army colonel Charles N. Hunter (center), commanding Merrill's Marauders, at Myitkyina airfield in Burma, with Lieutenant General Joseph Stilwell (left). (Time Life Pictures/Getty Images)

The May 17 attack completely surprised the 700 to 800 Japanese troops defending Myitkyina Airfield. Spearheading the attack, Colonel Charles Hunter's H Force secured the field and supporting facilities. A U.S. engineer unit, a Chinese infantry battalion, and a British antiaircraft unit were quickly airlifted into the field. Allied reinforcements also arrived in preparation for

the difficult task of taking the town and supporting defensive positions. Initial attempts by Chinese forces to take the town were unsuccessful, and a stalemate ensued. Both sides sent in reinforcements and built strongpoints that were difficult to overrun.

British forces under General Sir William Slim, fully engaged against the Japanese in the west around the Imphal and Kohima area near the Burma-India border, were unable to provide major combat formations for the Northern Burma Campaign. Major General Orde C. Wingate died in a plane crash on March 25; his special forces, or "Chindits," were placed under the command of Major General Walter David Alexander Lentaigne. Elements of this force were put under Stilwell's direct command and fought their way north to support the effort around Myitkyina. Unable to quickly consolidate initial gains against stubborn Japanese resistance, Stilwell ordered the exhausted Marauders to continue the fight. He also brought in U.S. combat engineers working on the Ledo Road to serve as infantry, and he called for additional Chinese reinforcements.

During the next two months, both sides conducted small-scale attacks, with no significant change in the military situation on the ground. By late July, however, continued Allied efforts, supported by increased air sorties and added artillery, began to take their toll on the Japanese defenders. Determined and often bitter small-unit actions wore down the Japanese, and during the last three days of July, Allied forces made significant advances. On August 3, Myitkyina was declared secure.

The key U.S. formation, Merrill's Marauders, fought on doggedly and remained in the field until victory, despite being decimated by combat casualties and losses from sickness and disease. The unit ceased to exist as a viable combat formation and was eventually replaced by the Mars Force under the command of Lieutenant General Daniel Sultan. However, it was the Chinese units, which had shown that they could stand with veteran Japanese formations, that were the key to the eventual Allied victory in northern Burma.

Although delayed by stubborn Japanese resistance, the difficult terrain, and the challenges of coordinating Allied forces, Stilwell's Northern Burma Campaign was a success. With the fall of Myitkyina, the Allies were one step closer to opening a secure ground supply line to China and to setting the stage for a major offensive to drive the Japanese from Burma. Stilwell,

principal architect of the campaign, was relieved of his duties in the CBI in mid-October and replaced as commander of U.S. combat forces in Burma by Sultan.

N

Nagano Osami (1880–1947)

Japanese Navy fleet admiral. Born in Kōchi, Kōchi Prefecture, Japan, on June 15, 1880, Nagano Osami graduated from the Japanese Naval Academy in 1900. Nagano participated in the siege of Port Arthur during the 1904–1905 Russo-Japanese War. Promoted to lieutenant in 1905, he was an instructor at the Naval Academy in 1906, then served as chief gunnery officer in the cruiser *Itsukushima* during 1906–1908. He graduated from the Naval War College in 1909. Promoted to lieutenant commander in 1910, he was then chief gunnery officer in the battleship *Katori*. He studied in the United States at Harvard University from 1913 to 1915.

During World War I, Nagano served as executive officer of two cruisers. Promoted to captain in 1918, he commanded the cruiser *Hirado* during 1919–1920, his first (and only) ship command. Nagano was the naval attaché to the United States from 1920 to 1923.

Promoted to rear admiral in December 1923, Nagano was chief of Japanese naval intelligence in 1924. At the end of that year, he assumed command of the 3rd Battleship Division, and in 1925 he took command of the 1st China Expeditionary Force. Promoted to vice admiral in December 1927, Nagano commanded the Naval Academy from 1928 to 1930. He headed the Japanese delegation at the London Naval Conference of 1935–1936, where he presented the Japanese plan for parity in naval tonnage with the Royal Navy and the U.S. Navy, which the Western powers rejected.

In 1936, Nagano became minister of the navy in the Hirota Kōki cabinet. In 1937, he was appointed commander in chief of the Combined Fleet. From April 1941 to February 1944, Nagano served as chief of the Navy General Staff.

Nagano, a generally weak leader, believed that war with the United States was inevitable, and he therefore had little interest in negotiations. At the same time, although Nagano believed that the Japanese Navy could not defeat the

U.S. Navy in war, he did not oppose the plans of Admiral Yamamoto Isoroku, commander of the Combined Fleet, to attack Pearl Harbor.

In April 1943, Nagano was promoted to admiral of the fleet. By 1944, however, with Japan having suffered major military reversals, Nagano was removed from his post. After the Japanese surrender in August 1945, Nagano was arrested and jailed in Sugamo Prison in Tokyo. He was charged as a war criminal before the International Military Tribunal for the Far East. Nagano died on January 5, 1947, before the conclusion of the trial.

Nagasaki, Bombing of (August 9, 1945)

Second U.S. atomic bombing of a Japanese city. Following the Japanese refusal to surrender following the atomic bombing of Hiroshima on August 6, 1945, Twentieth Air Force headquarters on Guam issued Field Order 17 on August 8, directing that on the following day the second atomic bomb on Tinian Island be dropped on another Japanese city. Kokura was designated as the primary target, with Nagasaki, a city of some 230,000 persons, the alternate.

At 3:49 a.m. on August 9, the Boeing B-29 Superfortress bomber *Bockscar* (sometimes written as *Bock's Car*), commanded by Major Charles Sweeney, departed Tinian. It was followed by two other B-29s as scientific observer and photographic observer aircraft. *Bockscar* carried a plutonium nuclear-fission bomb nicknamed "Fat Man" that was 10 feet 8 inches long and 5 feet in diameter, with a payload greater than that of the Hiroshima bomb. The plutonium 238 isotope core consisted of two melon-shaped hemispheres surrounded by a ring of explosive charges designed to drive the

sections together, achieving critical mass and a chain reaction releasing 22 kilotons of energy in one-millionth of a second.

Sweeney flew to Kokura but found it overcast and circled for 10 minutes. Despite the clouds, bombardier Kermit Beahan believed that they could bomb visually. Sweeney, concerned about a faulty valve that limited fuel, decided to divert to Nagasaki, which was also partly obscured by clouds. Beahan believed that he could bomb by radar, but a break in the clouds allowed him to bomb visually, using the Mitsubishi shipyards as his aiming point.

Nagasaki, Japan, showing damage from the atomic bomb dropped on that city, August 1945. (Andrew J. Waskey)

Bockscar released the bomb from 31,000 feet at 11:02 a.m. local time. The bomb detonated 53 seconds later, approximately 1,500 feet over the city, destroying everything within a 1,000-yard radius. An intense blue-white explosion pushed up a pillar of fire 10,000 feet, followed by a mushroom cloud to 60,000 feet.

Although the bomb missed its intended aiming point by 8,500 feet, it leveled one-third of the city. Called the “Red Circle of Death,” the fire and blast area within the Urakami Valley section destroyed more than 18,000 homes and killed 74,000 people. Another 75,000 were injured, with many of these dying from wounds or complications. Blast forces traveling in excess of 9,000 mph damaged buildings three miles away, and the concussion was felt

40 miles from the epicenter. “Ashes of Death” from the mushroom cloud spread radiation poisoning, killing all who were not killed outright within 1,000 yards of the epicenter. The bomb might have killed thousands more, but it detonated away from the city center in a heavy industrial area, vaporizing three of Nagasaki’s largest war factories but “minimizing” deaths.

Sweeney made one complete circle of the city to determine damage and then left after fuel concerns and heavy smoke made other circuits futile. Critically low on fuel, he flew to Okinawa, landing at Yontan Field at about 12:30 p.m., his gas tanks virtually empty. After refueling, he flew *Bockscar* on to Tinian, arriving there at 10:30 p.m. local time after a 20-hour flight.

Included in the instrument bundle dropped from the observation plane was a letter addressed to Japanese physicist Professor F. Sagane that urged immediate surrender and threatened continued atomic destruction of Japanese cities. Written by three American physicists, the letter was a bluff, as no other atomic bombs were then ready. Nonetheless, the second atomic attack, coupled with the August 8 declaration of war by the Soviet Union, provided Japanese emperor Hirohito with the excuse to end the war.

Nagumo Chūichi (1886–1944)

Japanese Navy admiral. Born in Yamagata Prefecture on March 25, 1886, Nagumo Chūichi graduated from the Japanese Naval Academy in 1908 and from the Naval Staff College in 1920. Promoted to commander in 1924 and known as a torpedo expert, Nagumo commanded several cruisers before

taking command of a destroyer squadron in 1930. He also became a strong advocate of naval airpower.

Promoted to vice admiral in 1939, Nagumo took command in April 1941 of the First Air Fleet, which concentrated Japan's six most powerful aircraft carriers into a single force. Although he opposed the Pearl Harbor operation, his carriers carried out the attack on December 7, 1941, crippling the U.S. Navy's Pacific battle fleet. Nagumo was, however, criticized in some quarters for his unwillingness to carry out additional air strikes against port facilities or attempt to locate and destroy U.S. aircraft carriers then at sea.

Vice Admiral Nagumo Chūichi, Commander of the Japanese task force that attacked Pearl Harbor on December 7, 1941. (U.S. Naval Historical Center)

Nagumo's First Air Fleet next undertook strikes on Rabaul and Port Darwin (February 19, 1942) before beginning operations in the eastern Indian Ocean that devastated Allied naval power in the region. The carriers *Shōkaku*

and *Zuikaku* were later detached to support the Port Moresby operation that ended with withdrawal after the Battle of the Coral Sea (May 7–8, 1942). Following their refit, the other four carriers sortied as the principal striking force for the Midway operation (June 3–6), which ended in their loss.

The defeat at Midway ruined Nagumo's reputation. Afterward, he commanded carriers during the Guadalcanal Campaign (August 1942–February 1943), and in August and October 1942 he inflicted losses on U.S. forces in the Solomon Islands, but his own air groups also sustained heavy damage. Regarded as excessively cautious, Nagumo was relegated to a series of second-line shore commands until recalled to frontline service in late 1943 as commander of the 6,000-member force assigned to defend Saipan against an impending U.S. assault. The invasion began on June 13, 1944, and Nagumo committed suicide there on July 6, 1944. He was posthumously promoted to admiral on July 8.

Nakagawa Kunio (1898–1944)

Japanese Army lieutenant general. Born in Kumamoto Prefecture on January 23, 1898, Nakagawa Kunio graduated from the Japanese Military Academy in 1918 and was commissioned in the 48th Infantry Regiment. He graduated from the Military Staff College in 1939.

In March 1943, Nakagawa was promoted to colonel and assigned as commander of the 2nd Infantry Regiment of the Guandong (Kwantung) Army. In April 1944, his regiment was deployed to Peleliu Island in the Southwest Pacific, where he commanded some 6,000 defending troops. Nakagawa adopted new tactics for the island. With scant resources and lacking the firepower to prevent a U.S. landing, Nakagawa ordered construction of the main defenses in the island's interior to extract the highest possible cost in American lives. He also prohibited suicidal attacks as wasteful of manpower and unlikely to achieve satisfactory results.

Following the landing by U.S. marines on September 15, 1944, Nakagawa directed a protracted three-month defense of the island that cost U.S. forces some 9,600 casualties. Of the Japanese defenders, only 33 surrendered or were captured. Nakagawa committed *seppuku* (ritual suicide) on November 24, 1944, the same day he was promoted to brevet major general; he was posthumously promoted to lieutenant general for valor. The marines secured Peleliu three days later.

Nanjing Massacre (December 13, 1937–January 22, 1938)

Six-week period of atrocities and terrorism after Japanese troops captured the Chinese capital of Nanjing (Nanking) in Jiangsu (Kiangsu) Province. In July 1937, outright war began between Japan and China after the Marco Polo Bridge/Lugouqiao (Lukouch'iao) Incident. Chinese Nationalist forces under Guomindang (Kuomintang, Nationalist, GMD) president Jiang Jieshi (Chiang Kai-shek) initially offered strong resistance to the Japanese invasion, holding

out at Shanghai—the country's greatest port city and the site of a major international settlement—from August 13 to November 9, 1937.

Nationalist troops then fell back, moving inland in a near rout to the Nationalist capital of Nanjing, a symbolic location home to more than 1 million Chinese. Jiang was not prepared to abandon it without a fight, but no defense or evacuation plans had been made. Another of Jiang's objectives in defending both Shanghai and Nanjing, home to numerous foreign embassies, was to attract worldwide attention and win foreign support for China's anti-Japanese war.

In early December, Japanese troops converged on Nanjing. After Chinese troops rejected Japanese demands to surrender, on December 9 the Japanese opened a massive assault. Three days later the Chinese defenders fell back across the Changjiang (Yangtze) River, and the following day the 6th, 9th, and 116th Divisions of the Japanese Army entered the city as two Japanese Navy flotillas arrived up the Changjiang River. During the ensuing six weeks the Japanese occupiers deliberately instituted a reign of terror, apparently designed to cow China's population into ready submission to Japanese invasion. Frustration over Jiang's refusal to surrender, which Japanese leaders had expected him to do before the end of 1937, might have been another factor.

Entering the city on December 13, Japanese forces fired on streets crowded with refugees, wounded soldiers, and civilians. They also fired on many thousands of refugees who were attempting to escape by swimming the river. The occupying forces used machine guns, swords, bayonets, fire, live burial, and poison gas to massacre captured Chinese soldiers and any young men suspected of being such. Scattered atrocities and murders, often marked by great brutality, continued throughout the city for six weeks, as did heavy looting. Counts of how many soldiers and civilians died in the Nanjing Massacre vary widely, ranging from 42,000 to 300,000. During this period Japanese soldiers raped an estimated 20,000 women, most of whom were then killed.

Chinese prisoners being buried alive by their Japanese captors outside the city of Nanjing, during the infamous rape of Nanjing, 1938. (Keystone/Getty Images)

The Nanjing Massacre shocked the West and generated extensive international sympathy for China, although this did not necessarily translate into tangible support and assistance. It was an early example of the use of organized brutality to cow and terrorize civilian populations characteristic of many World War II military occupations. As the 21st century began, memories of the Nanjing Massacre remained bitter in China; a major museum commemorating the event exists in Nanjing. In contrast, Japanese officials for many decades denied that the episode ever took place or at least minimized its scale, and it was omitted from official Japanese accounts of the war. In the late 1990s, however, several Japanese journalists and academics mounted dedicated efforts to bring the event to the attention of the Japanese people.

Napalm

Incendiary material made from thickened gasoline. Napalm was developed by American scientists at Harvard University early in the war to improve the performance of petroleum-based incendiary weapons. It was available in late 1942. Napalm powder, an aluminum/soap mix, draws its name from the acidic components naphthene and palmitate combined and mixed with gasoline to create a gel that was then used in bombs or as an improved fuel for flamethrowers. Other nations developed similar materials; the British mix was named Perspex. Liquid napalm was a sticky compound with improved burning characteristics and good stability for safe handling.

Napalm was originally delivered in a 100-pound chemical-weapons bomb, the M47. In the strategic bombing campaign against Japan, napalm incendiaries were responsible for the significant destruction of Japanese cities by fire. Boeing B-29 Superfortress pathfinder aircraft dropped the M47, and the bulk of the following bombers dropped clusters of 6.2-pound M69 bombs. The M69 ignited and ejected the napalm fill from its tail after a delayed fuze allowed the bomb to penetrate the building it hit.

After mid-1944, the U.S. tactical air forces employed a wide variety of sizes of firebombs or napalm bombs against Japanese forces and defensive positions. These bombs were often auxiliary fuel tanks that were simply filled with the napalm mix and equipped with an igniter. Napalm attacks were often cited for their psychological value as well as for their physical destruction. After World War II, napalm continued to be used as a generic term for fire-producing weapons, even though the original components that provided the name were no longer used.

Narvik, Allied Evacuation of (June 5–8, 1940)

Although the Allies had retaken Narvik on May 28, overall the Norwegian Campaign was proceeding poorly for them, and, more important, the Germans had invaded the Low Countries and France on May 10 and were overrunning both. This prompted the Allied decision on May 24 for Operation ALPHABET, the evacuation of the 25,000 men remaining in northern Norway. The evacuation force included the British aircraft carriers *Ark Royal* and *Glorious*, the British cruisers *Southampton* and *Coventry*, 16 destroyers, and numerous other smaller warships, transports, and cargo vessels. The evacuation began on June 5 and was completed by June 8. Another British cruiser, the *Devonshire*, evacuated the Norwegian royal family and government and sailed under radio silence independently for Scapa Flow.

The *Glorious* had taken on board 20 Royal Air Force fighters for transport to Britain and also had on board 10 fighters and 5 torpedo bombers of the Fleet Air Arm. Captain Guy D'Oyly-Hughes of the *Glorious* requested and received permission to proceed independently at greater speed, with the justification that his ship was short of fuel. Unknown to the British, however, the Germans had powerful forces at sea. Escorted by the destroyers *Acasta* and *Ardent*, the *Glorious* was intercepted by the German battleships *Scharnhorst* and *Gneisenau* some 280 miles west of Harstad, Norway. The carrier had 6 Swordfish aircraft available for operations, but for reasons that will never be known, D'Oyly-Hughes did not have any on patrol and was thus caught by surprise.

Homing on smoke from its stack, the two German capital ships opened fire on the *Glorious* at a range of some 27,000 yards. Before any aircraft could be launched, a German shell hit the forward hangar, destroying the aircraft there. The *Glorious* was soon listing and went down within 20 minutes. Although the two British destroyers were also sunk, the *Acasta* heavily damaged the *Scharnhorst* with a torpedo and scored with one 4.7-inch shell. This damage caused the German commander, Vice Admiral Wilhelm Marschall, to order the two German battleships to steam for Trondheim, which allowed the safe passage of the *Ark Royal* and the remainder of the British evacuation transport and store convoys later that same day, sailing without battleship protection.

The eventual loss in lives from the three British warships was 1,519 men (1,207 in the *Glorious*, 160 in the *Acosta*, and 152 in the *Ardent*). Only 40 men survived, including 1 each from the *Acosta* and the *Ardent*. The remaining British forces made it safely to Scapa Flow.

One consequence of the evacuation was increased German pressure on both Sweden and Finland, leading to an agreement in June whereby the government in Stockholm permitted unarmed German troops to transit Sweden on its railroads, that country's major departure from neutrality during the war.

Narvik, Naval Battles of (April 10 and 13, 1940)

Anglo-German naval battles during the Norwegian Campaign of 1940. The Battle of Narvik comprises two separate engagements in the area of that Norwegian port, the first on April 10 and the other on April 13.

On April 9, 1940, the Germans launched Operation WESERÜBUNG, their invasion of Norway. The operation involved six main invasion groups to take and hold the principal Norwegian ports. As part of WESERÜBUNG, they dispatched to the northern Norwegian port of Narvik under Commodore Friedrich Bonte a force of 10 large destroyers (*Wilhelm Heidkamp* [flagship], *George Thiele, Wolfgang Zenker*, *Baron von Arnim, Erich Giese*, *Erich Koellner*, *Diether von Roeder, Hans Lüdemann*, *Hermann Künne,* and *Anton Schmitt*) transporting some 1,900 ground troops. At Ofotfjord they captured three Norwegian patrol boats. The destroyers then landed their troops. Norwegian ships detected the German destroyers as they approached Narvik, and early on April 9, the Germans were intercepted by the old (1905) Norwegian coastal battleship *Eidsvold*, with a main armament of two 210mm (8.26-inch) guns and commanded by Captain Off Isaachsen Willoch. Willoch ordered the Germans to turn back.

The Germans refused, demanding in turn that the *Eidsvold* surrender. When Willoch rejected the German demands and prepared to ram the lead German destroyer, the Germans opened fire with torpedoes, sinking the *Eidsvold*, which lost all but 8 of its crew of 193. Willoch was among the dead. The Germans then torpedoed and sank the *Norge,* the sister ship of the *Eidsvold*, commanded by Captain Per Askim. It went down with 101 of its crew; another 90 men survived. No Germans were casualties in this battle.

That same day, British captain Bernard A. W. Warburton-Lee, commanding the 2nd Destroyer Flotilla of five destroyers, was ordered to sink or capture German ships and transports near Narvik and recapture the town at his discretion. His flotilla consisted of the *Hardy* (flagship), *Havoc, Hotspur, Hostile,* and *Hunter*. The British ships were smaller and with less armament than the German destroyers they were seeking (1,340 tons versus 1,625 tons each and four 4.7-inch guns versus five 5-inch guns each), but they arrived undetected off Narvik early on the morning of April 10, their approach concealed by a snowstorm.

Warburton-Lee ordered his flotilla to attack German ships in the harbor, and the British destroyers sank the *Wilhelm Heidkamp* (Commodore Bonte was among those killed) and the *Anton Schmitt*. They heavily damaged the *Diether von Roeder,* slightly damaged two other German destroyers, and sank six ore-laden cargo ships. The British destroyers also exchanged fire with German troops on shore before departing.

Wreckage from the naval battles that occurred off Narvik in Norway on April 10 and 13, 1940. The photo was taken following the German capture of Narvik on June 8, 1940. (Library of Congress)

As the British flotilla withdrew with only one ship slightly damaged, three German vessels emerged from an adjacent fjord and gave chase. Then, when it appeared that Hardy's force would successfully extract itself, two more German destroyers appeared from their anchorage farther down Ofotfjord and attacked on the flanks with guns and torpedoes. In the engagement that followed, the British destroyer *Hardy* was hit several times and beached, the *Hunter* was sunk, and the *Hotspur* was damaged but managed to escape.

The Germans then withdrew because of a shortage of fuel. On the way out of the Vestfjord to the sea, the *Havoc* and *Hostile* fired on the German ammunition ship *Rauenfels*, which exploded and sank. Warburton-Lee was

among the British dead in the battle; he was posthumously awarded the Victoria Cross.

British naval reinforcements, including the cruiser *Penelope*, now blockaded the fjord, and on April 11, the German destroyer *Erich Koellner* sustained additional damage when it ran afoul of uncharted rocks. The Royal Navy was determined to sink the remaining German destroyers at Narvik, and on April 13, the Admiralty dispatched Vice Admiral William J. Whitworth with the battleship *Warspite* and nine destroyers to the site. The battleship's reconnaissance Swordfish aircraft engaged and sank the German submarine *U-64* and warned of German destroyers lying in ambush positions in side fjords. A destroyer action then commenced outside Narvik Harbor in the early afternoon. Aircraft from the British carrier *Furious* tried to engage the German warships in advance of the *Warspite*'s arrival but were not successful, and two of them were lost.

In the ensuing fighting, the *Warspite*'s 15-inch guns proved especially effective against the German ships and shore installations. German submarines launched several torpedo attacks against the British battleship but were unsuccessful. With the German destroyers running low on ammunition, they retired up the Rombaks and Herjangs fjords, where they were pursued. In the engagement on April 13, the *Erich Koerllner* was sunk, followed by the *Hermann Künne, Diether von Roeder*, and *Erich Giese*. The remaining German destroyers were then scuttled.

The only German warships that survived in the area were four submarines and the tanker *Jan Wellem*. The British suffered serious damage to the destroyer *Eskimo*, which lost its bow but managed to stay afloat. Another British destroyer, the *Bedouin*, was slightly damaged. The Germans lost 316 men killed, the British lost 188, and the Norwegians lost 435 in both battles.

Although he had discretionary authority to do so, Whitworth declined to send his marines and sailors into action against the German soldiers ashore, but he recommended that a military force be dispatched forthwith to exploit the situation because the Germans had limited ammunition reserves and their motor transport had been captured at sea on April 11. No force was sent until May 28, however.

Combined with other losses sustained, the Germans paid a heavy price for their operations in Norway, especially in naval forces. Adolf Hitler considered the loss acceptable because taking Norway protected his northern

flank, secured continued access to vital Swedish iron ore, and provided bases for submarines and German surface raiders to operate in the north Atlantic.

Narvik, Operations in (April 24–June 7, 1940)

The British naval victories off the northern Norwegian post of Narvik on April 10 and 13, 1940, cleared the way for an Allied amphibious assault. Narvik itself was important as the only winter transshipment point for high-grade Swedish iron ore to Germany. In executing such an operation, there was marked disagreement between the Admiralty, which pushed for an immediate landing, and more cautious army leaders, who realized the difficulties of a campaign in the late Norwegian winter. This clash of opposites was reflected in the two men selected to lead the campaign—Major General Piers Mackesy and Admiral William H. Boyle, Lord Cork and Orrery. The two were never briefed together, their instructions were contradictory, and they did not meet for the first time until April 15.

On April 24 in a blinding snowstorm, the Royal Navy bombarded Narvik. Poor visibility prevented observers from determining if German resistance had been broken, and the operation was aborted after three hours. Although the Royal Navy continued to bombard Narvik regularly, Mackesy refused to conduct a direct assault. By May 10, the Allies had assembled 30,000 Norwegian, British, Polish, and French mountain troops and two battalions of the Foreign Legion. Opposing them was a ragtag German force of

paratroopers, Austrian mountain troops, and seamen from the 10 sunken German destroyers of the previous naval battles off the port—in all, some 4,000 men under the command of Lieutenant General Eduard Dietl. Reinforcements and supplies were already coming in by rail via Sweden, though, and soon German troops and aircraft would be available from the south.

Commander of the Franco-Polish expeditionary force to Norway General of Brigade Antoine Béthouart was experienced in leading troops in rough terrain. He opposed both Lord Cork's boldness and Mackesy's caution, preferring to work his way up the peninsula in stages until he reached Narvik. The assault began at Bjervik on the night of May 13. Darkness minimized Luftwaffe interference in operations while allowing the Allies to make use of naval gunfire support. The success of this first attack led the British to remove the timid Mackesy from his post the next day and replace him with Lieutenant General Claude Auchinleck, a move that improved inter-Allied relations. It did not alleviate other problems faced by the multinational force, however, including shortages of supplies, winter equipment, and interpreters. Nevertheless, the Allied forces gradually closed on Narvik from its western approaches.

The impending defeat of the Allies in France on May 25 prompted the British War Cabinet to order that Narvik be captured and then Norway be evacuated. When the order was relayed to Lord Cork, he was not authorized to notify either the Norwegians or the French of the decision. Lord Cork disobeyed and told Béthouart but not the Norwegians.

On the night of May 27–28, the Allies launched their final assault on Narvik. Heavy resistance by the Germans gained sufficient time for Luftwaffe bombers to attack the naval flotilla and drive it from Narvik, depriving the attackers of heavy artillery support. Fierce German counterattacks nearly drove the invasion force back into the sea, but support from British Hurricane fighters, coupled with desperate assaults by Norwegian troops and French Foreign Legion troops, turned the tide. By the evening of May 28, Norwegian units entered the town.

Evacuation of the Allied force began almost immediately afterward, on June 1. Again disobeying orders, Lord Cork prevailed on the British ambassador to inform the Norwegian government of the evacuation. On the evening of June 7, the last Allied units reboarded their transports for the

journey to Britain. Two days later, the Norwegian forces disbanded and an armistice went into effect.

The struggle for Narvik demonstrated conclusively the importance of air supremacy, which was held throughout by the Germans. The Allied defeat there dashed any Allied hopes of maintaining a foothold in Norway.

National War Labor Board, U.S.

U.S. government agency established by executive order on January 12, 1942, to arbitrate disputes between labor and management, thereby ensuring that wartime production was not hindered by strikes, walkouts, or worker slowdowns. Later, the National War Labor Board (NWLB) was also empowered to set and review wages for most workers earning less than $5,000 a year. During World War I, President Woodrow Wilson had established an organization by the same name, although its purview was limited to mediation efforts alone.

The genesis of the NWLB can be found in a conference that President Franklin D. Roosevelt convened at the White House only days after America’s entrance into the war in December 1941. Meeting with representatives of organized labor as well as industry leaders and government personnel, the Roosevelt administration exacted a pledge from labor not to strike or stage lockouts for the duration of the war. The conferees also agreed that any labor disputes would be settled peaceably and that the administration would create a war labor board as soon as possible.

After the creation of the NWLB on January 12, 1942, Roosevelt promptly assembled a 12-person tripartite board made up of 4 individuals representing labor, 4 from industry, and 4 “public” members who represented neither labor nor management. Many wartime boards were constructed this way in an effort to involve all sectors of American society in the war and mobilization efforts. The tripartite arrangement also helped to blunt criticism that one side or the other was exerting too much influence on the process. The NWLB operated out of offices in Washington, D.C.

On October 3, 1942, Congress called for a full and integrated economic stabilization program to control wages and prices, mandating that prices and wages be frozen at the level that existed on September 15, 1942. On October 3, Roosevelt greatly expanded the NWLB’s powers by giving it the authority to set wages and salaries for all workers making $5,000 per year or less. The Internal Revenue Service would be responsible for stabilizing wages and salaries over $5,000 per year. With the exception of railroad employees and agricultural workers, the NWLB administered wage policies for all other workers. The NWLB’s initial wage guideline followed the so-called Little Steel Formula, which mandated that wage increases could not exceed 15 percent of the cost-of-living index as of January 1, 1941. By June 1943, the NWLB was employing a more equitable “bracket” formula to determine wage adjustments, wherein each occupation or labor group within a region was assigned minimum and maximum wage rates.

These changes resulted in Herculean workloads for the NWLB, which was expanded to include 12 regional tripartite boards that were empowered to set wages for specific geographic regions. The Washington office remained chiefly as a policy-making center and a place of last resort for arbitrating management-labor disputes. The board also worked closely with other agencies, including the National Labor Relations Board, the Bureau of Statistics, the Office of Price Administration, the War Production Board, the Department of Labor, and numerous other agencies. This was to ensure that wage guidelines were in harmony with overall economic stabilization and contributed to efficient industrial production.

At its peak of operations, the NWLB had 2,631 full-time employees at the national and regional levels. By August 1945, it had arbitrated 17,807 disputes involving nearly 12.3 million workers. Applications for wage adjustments averaged about 2,700 per week, and by August 1945 the board

had reviewed some 415,000 wage-adjustment requests involving nearly 26.3 million workers. The NWLB contributed significantly to the war effort by preventing labor problems, keeping wages (and therefore inflation) in check, and ensuring that war industries had a readily available labor supply. The NWLB was disbanded in 1946.

Naval Armament

Naval guns are classified by width of bore, in inches, and by caliber (the length of the barrel expressed as diameter of the bore). Thus, the U.S. Navy 5-inch/38-caliber gun was 5 inches wide with a barrel length of 190 inches (5 times 38), or almost 16 feet. A gun's power and ability to penetrate armor are roughly proportional to its size.

Between the world wars, the Washington and London naval treaties defined warship types and sizes and influenced their design and armament. Most nations sought to build ships close to the limits of treaty-specified size and main armament: 16-inch guns for battleships, 8-inch guns for heavy cruisers, 6-inch guns for light cruisers, and 5-inch guns for destroyers. Although some ships straddled the treaty classifications (most notably Germany's Deutschland-class pocket battleships), most large warships fit within the treaty categories.

The German battleships *Scharnhorst* and *Gneisenau* and the pocket battleships of the Deutschland class mounted 280mm (101-inch) guns, because the terms of the Versailles Treaty that ended World War II restricted Germany to that size of capital ship armament. Otherwise, battleship main

armament ranged from 12-inch guns in older battleships to 16-inch guns in the newer U.S. battleships and Britain's *Nelson* and *Rodney* and to the 18.1-inch guns of Japan's superbattleships *Yamato* and *Musashi* (the only battleships that exceeded the 16-inch Washington Treaty limit). Most British battleships, the Italian Littorio class, and the German *Bismarck* and *Tirpitz* battleships carried 15-inch guns, although Britain's King George V–class ships mounted only 14-inch guns because the failed 1936 London Treaty would have limited navies to 14-inch guns. Many older Japanese and U.S. battleships also carried 14-inch guns.

The battleship guns of the 1930s and 1940s were much more powerful than older guns of equivalent size. The U.S. battleship *Iowa*'s 16-inch/50-caliber guns, for example, fired a much heavier shell with greater penetrating power 2,000 yards farther than the 16-inch/45 caliber guns of the nation's older battleships. With a few exceptions, the power of guns of similar age and size was roughly comparable across different navies. The 2,700-pound shells fired by the 16-inch guns on the U.S. Iowa-class battleships were particularly powerful, whereas the 3,200-pound shells fired by the *Yamato* and *Musashi*'s 18.1-inch guns were of mediocre quality, making the two guns roughly equal in striking power.

Mounted in double or triple turrets—or in a few cases (Britain's King George V class and France's Dunkerque and Richelieu classes) in quadruple turrets—and firing a variety of high-explosive and armor-piercing ammunition, these heavy guns gave World War II battleships considerable striking power. Even at 20,000 yards, 11-inch guns could penetrate 8 inches of armor, and 16-inch guns could penetrate a foot of armor at 30,000 yards.

The range of guns varied depending on their age, size, shell design, propellant charge, and elevation. In the 1930s, most navies enlarged the gun ports of their older battleships to allow higher gun elevations and thus longer ranges. Most battleships could fire at ranges greater than 30,000 yards and some beyond 40,000 yards, but combat usually occurred at shorter ranges, even after the introduction of effective fire-control radar. On May 24, 1941, the *Hood* and *Bismarck* opened fire at one another at 26,500 yards, and on October 25, 1944, in Surigao Strait during the Battle of Leyte Gulf, U.S. radar-equipped battleships opened fire on the Japanese at 22,800 yards.

The 6-inch and 8-inch guns common to cruisers fired shells that ranged in weight from 100 to 300 pounds. The older 6-inch guns had ranges between

15,000 and 20,000 yards, and the superior 8-inch weapons sometimes managed 30,000 yards. Although they were unable to penetrate the thick armor of battleships, these weapons could wreak considerable damage on exposed and unarmored systems, as was seen when the three British cruisers with 6-inch and 8-inch guns engaged the lightly armored German pocket battleship *Graf Spee* at the Battle of Río de la Plata on December 13, 1939, knocking out ammunition hoists, fire-control, and other critical systems; however, their shells bounced off the *Graf Spee*'s turrets and heavily armored areas. Similarly, off Guadalcanal on the night of November 14–15, 1942, a barrage of 8-inch Japanese shells failed to penetrate the thick armor of the U.S. battleship *South Dakota*, but they did considerable damage to its exposed areas. These weapons, however, proved to be more than sufficient to penetrate the thinner armor of cruisers and destroyers. Combined with torpedoes, they made cruiser and destroyer actions particularly deadly, as was demonstrated in the Battle of the Java Sea on February 17, 1942, and the Battle of Savo Island on August 8–9, 1942.

Battleships generally carried secondary batteries of 5-inch or 6-inch guns, and cruisers carried secondary batteries of 3-inch to 5-inch guns for use against smaller ships, particularly attacking torpedo craft. All warships also mounted antiaircraft guns, and navies added more and more of these to their ships during the course of the war. When it was completed in 1941, for example, the *Yamato* mounted only 24 25mm antiaircraft guns, but by 1945, it carried 150 25mm guns and many 13mm machine guns in addition to its 5-inch and 6-inch secondary batteries. Late in the war, U.S. battleships similarly mounted more than 125 antiaircraft guns in addition to their 5-inch secondary batteries.

Several navies developed dual-purpose guns that proved to be effective against both ships and airplanes. The U.S. Navy's 5-inch/38-caliber gun was the best of these and helped make U.S. warships the most effective antiaircraft platforms of the war. U.S. battleships carried 16 to 20 of these in dual mounts. They formed the primary armament of U.S. destroyers and antiaircraft cruisers and made up the secondary battery of most U.S. heavy and light cruisers. The 5-inch gun fired 25 rounds per minute, had a range of 18,200 yards and a ceiling of 37,200 feet, and, in some mountings, could fire straight up. It earned a particularly deadly reputation among Japanese aviators even before proximity-fuze ammunition entered service. Only the 5-

inch/.38-caliber gun fired proximity-fuzed ammunition, because the fuzes were too large for smaller antiaircraft shells. The U.S. Navy developed a replacement, the even more powerful radar-controlled 5-inch/54-caliber gun, in 1945, but it came too late to see service in the war.

The German dual-purpose 4.1-inch/.65-caliber gun was comparatively ineffective, and German capital ships deployed 5.9-inch antiship secondary batteries in addition to antiaircraft armament. These crowded the decks and sometimes interfered with one another. Italian and some Japanese battleships also deployed 5-inch or 6-inch antiship secondary batteries in addition to dual-purpose and antiaircraft guns. Britain developed several dual-purpose guns in the 4-inch and 5-inch range but never settled on a standard or manufactured them in sufficient numbers to equip all ships in the fleet. Only a few British destroyers carried dual-purpose guns. Japan developed a good 4.7-inch dual-purpose gun in the 1930s, but it lagged behind similar U.S. and British guns in performance by 1941. Many Japanese ships also lacked the high-angle mounts to maximize effectiveness against enemy aircraft.

The increasing dominance of aircraft soon made antiaircraft weapons the most important and most often used warship armament, particularly in the Pacific theater, where U.S. battleships became valued for the tremendous quantity of antiaircraft fire they could generate rather than the striking power of their 16-inch guns. Most warships carried specialized antiaircraft guns that ranged from 40mm and 20mm cannon to smaller machine guns such as the American .50-caliber.

The United States and Britain adopted the excellent Swiss Oerlikon 20mm and the Swedish Bofors 40mm, which replaced the U.S. Navy's 1.1-inch machine guns and steadily displaced the Royal Navy's 2-pounder pom-poms. The Bofors fired 120 rounds per minute, and the shorter-ranged Oerlikon fired almost 500 rounds per minute. The Oerlikon accounted for one-third of the U.S. Navy's antiaircraft kills, but it lacked the power of the Bofors to shatter kamikaze aircraft before they hit their targets.

The Italian Navy relied on reasonably effective 37mm and 20mm Breda antiaircraft guns. The German Navy developed 37mm and 20mm weapons of its own but began replacing them with superior Bofors guns late in the war. Japan adopted a 25mm Hotchkiss weapon as its primary antiaircraft gun. Plagued with problems, it attained only half the Oerlikon's rate of fire and lacked the Bofors' hitting power. Poor sights, particularly in its double and

triple mountings, made it difficult to track the high-speed aircraft introduced later in the war, and this partly accounts for the Japanese Navy's poor air defense record. In a further demonstration of the changing face of naval warfare, both the Japanese Navy and the Royal Navy experimented with antiaircraft shells for their battleship main armament but with only limited success.

Naval Gunfire, Shore Support

Gunfire from ships offshore was one of the great assets making possible Allied amphibious landings in both the European and Pacific theaters. The traditional adage "a ship's a fool to fight a fort" had seemed borne out at Gallipoli in World War I. During the interwar years, most navies therefore neglected support of joint operations. The U.S. Navy developed no bombardment ammunition for its battleships until 1940; the Japanese did not do so until 1942. Thus, the amphibious landings of World War II supported by effective naval gunfire present one of the great, if unexpected, success stories of 20th-century military operations.

During the North African Campaign in 1941 and 1942, the British found most useful two old monitors, the *Erebus* and the *Terror,* that had been originally built to support British troops in Belgium in World War I. With the Allies trying to regain a foothold on the continent in 1943, naval gunnery assets proved to be one of their trump cards. In the invasions of French North Africa, Sicily, Salerno, and finally Anzio, U.S. and British warships provided great assistance to Allied troops ashore.

Naval gunfire really came into its own on June 6, 1944, during the Normandy Invasion, Operation OVERLORD. Promises that heavy bombers would substitute for field artillery, unavailable until at least two days after the initial landings, proved hollow when most bombs fell behind the beaches. Fortunately, the Allies had mustered a strong bombardment force of 137 warships, including 7 battleships, 2 monitors, 23 cruisers, and 105 destroyers. At Omaha Beach, 9 U.S. and 3 British destroyers moved as close as 900 yards from shore to destroy German guns with counterbattery fire. U.S. lieutenant general Omar Bradley concluded that "The Navy saved our hides." He remarked on another occasion that "I would gladly have swapped a dozen B-17s for each 12-inch gun." At Normandy, Allied warships fired approximately 141,000 rounds of 4-inch and larger shells, a majority of which were controlled by aerial spotters.

In concluding that naval gunfire was approximately 10 times as accurate as bombing, the British also noted that casualties from friendly fire were rare. German field marshal Erwin Rommel reported to Adolf Hitler that Allied naval gunfire was so effective "that no operation of any kind by either infantry or tanks is possible in the area commanded by this rapid-fire artillery." Field Marshal Gerd von Rundstedt counted naval gunfire as one of the three principal factors in the German defeat at Normandy. Following the Saint-Lô breakout (July 11–19, 1944), British warships continued to assist Allied troops advancing along the coast into November 1944, with the veteran battleship *Warspite* shooting until its guns were worn out.

In the Pacific, naval gunfire support proved at least as important as in Europe. In their first test in this role, U.S. warships at Tarawa (November 20–24, 1943) destroyed nearly all the Japanese artillery positions and wire communications. Many enemy machine guns remained operational, however, and inflicted heavy casualties on the attacking marines. In consequence, naval gunfire preparation for the next landing, Kwajalein (January 19–February 6,

1944), was more extensive. The official report concluded that “The entire island looked as if it had been picked up to 20,000 ft., then dropped. All beach defenses were completely destroyed.”

The 6-inch guns of the U.S. light cruiser *Philadelphia* firing in support of the Allied landing in southern France, August 1944. (Corbis)

The Japanese increasingly sited their defenses specifically to avoid naval gunfire. At Iwo Jima (February 19–March 26, 1945), their deep tunnels enabled many soldiers to escape the extensive three-day bombardment, although the big naval guns, often firing at ranges of less than two miles, destroyed over 60 percent of the Japanese coastal artillery in the target area. The defending general, Kuribayashi Tadamichi, reported that “The firepower of the American warships and aircraft makes every landing possible.” In contesting the final Allied invasion of the war at Okinawa (March 1945), the Japanese command deliberately chose to burrow into the coral ridges in the southern portion of the island to escape the fury of naval gunfire. Still, U.S. warships fired in support of troops 23,210 battleship projectiles and 261,000 5-inch to 8-inch rounds.

During the war, the tonnage of ordnance laid down by Allied warships backing invasions totaled five or six times that delivered by aviation. The

Axis powers gave far less attention to naval gunfire support, although the Italians did build some coastal monitors. In the closing stages of the war, the Germans employed cruisers and the pocket battleship *Admiral Scheer* in support of retreating German units on the Courland coast.

Only once did Japanese battleships bombard Allied troops. On October 14, 1942, at Guadalcanal, the *Kongo* and *Haruna* fired nearly 900 14-inch projectiles, mostly at Henderson Field. Given the small size of the target area, this proved to be the most devastating bombardment fired against U.S. troops in any war.

Naval Strategy, Allied

The successful execution of Allied naval strategies, especially those of Great Britain and the United States, proved decisive in the Allied victory in World War II. In the case of Britain, the effective use of naval power made possible its national survival, while that of the United States was responsible for the defeat of Japan.

Upon the outbreak of war in September 1939, the naval forces of Britain and France found themselves arrayed against those of Germany. Britain, possessing the larger of the navies, was chiefly responsible for the formulation of naval strategy. The plan was roughly the same as that in World War I. First, the British instituted a blockade of Germany. British warships stopped and searched merchantmen steaming into the North Sea to deny contraband goods from being utilized by Germany. Although effective in World War I, this effort in World War II met with only limited success owing to a sweeping economic agreement between Germany and the Soviet Union. The German conquest of much of Western Europe in the spring of 1940 further undermined the blockade.

The second portion of British strategy also mirrored World War I, as the Royal Navy was responsible for keeping open the seaborne lines of communication upon which Britain relied for the vast majority of its raw materials and food as well as manufactured goods for both the military and civilian sectors. To this end, the British promptly instituted a convoy system for the transport of supplies. The British concentrated on the Atlantic, although resources were also stretched to guard the shipping lanes in the Indian Ocean and the Caribbean, while the French Navy protected Allied interests in the Mediterranean. Later, Canada and the United States assumed major responsibility for convoy protection on the Atlantic run.

The ability of the British to protect their interests and remain in the war was greatly hampered with the June 1940 defeat of France and the loss of the powerful French Navy. Although Britain was able to secure a part of the French fleet through Operation CATAPULT (July 1940) and also garnered 50 destroyers through the Destroyers-for-Bases Agreement with the then benevolently neutral United States, British forces were stretched thin, as they also had to dispute control of the Mediterranean owing to the June 1940 Italian entry into the war on the Axis side.

The U.S. practice, beginning in mid-1941, of employing U.S. naval forces to escort convoys from the U.S. East Coast to Iceland offset this problem somewhat, but the June 1941 German invasion of the Soviet Union compelled the British to divert naval forces to the protection of Arctic convoys bound to this new Allied power. As of June 1941, British naval strategy appeared ineffective given that shipping losses to German

submarines by that date amounted to 5.7 million tons, while British shipyards could only replace a small fraction of that.

The entry of the United States into the war as an Allied power following the December 7, 1941, attack by Japan on Pearl Harbor greatly improved Britain's strategic situation at sea, despite the fact that the Japanese Navy was able in short order to sweep the British from most of their possessions in Asia. Unlike the Axis powers, Britain and the United States closely coordinated their efforts at sea to great advantage. While the European theater was not the primary one for the U.S. Navy, it did share in the protection of Allied supply lines to Britain, and by early 1943 U.S. and Canadian naval forces had assumed responsibility for safeguarding convoys in the Western and Central Atlantic.

The United States also contributed warships to the Allied war effort in Europe, particularly for operations in the Mediterranean, and offset merchant losses through its massive shipbuilding capacity. By the late spring of 1943, Allied naval strategy was successful in that the Axis submarine menace was contained. Great Britain's survival ensured a staging point for amphibious operations versus Axis Europe that resulted in the landings in North Africa, Sicily, Italy, and France, with subsequent drives into Germany by Allied ground forces.

While Britain was almost exclusively involved with the European theater of operations at sea, the United States directed its naval efforts at Japan in the Far East. Upon the attack on Pearl Harbor, the United States and the Allies suffered a succession of defeats at the hands of the Japanese. By early 1942 Japan had invaded the Philippines, which ultimately fell in May 1942, and had conquered Malaya and taken the great British Pacific bastion of Singapore, while the ABDA Command—a collection of Australian, British, Dutch, and U.S. warships tasked with defending the Netherlands East Indies—had been destroyed, as the Japanese conducted operations to conquer that resource-rich area. Amid these events, in early 1942 U.S. and British leaders agreed that naval operations would be divided into strategic theaters. The United States would concentrate on the Pacific while Britain dealt with the Atlantic, the Mediterranean, the Middle East, and the Indian Ocean.

U.S. strategists held to a plan that called for recapturing lost U.S. possessions and conquering Japanese Pacific holdings as forward bases to conduct fleet operations for an eventual invasion of the Japanese home

islands. Command of the Pacific was divided into two theaters—the Southwest Pacific under General Douglas MacArthur and the North, Central, and South Pacific under Admiral Chester Nimitz. MacArthur desired an advance of army and ground-based forces from Australia through the Dutch East Indies toward the Philippines.

Nimitz, however, argued for the execution of Plan Orange, the naval strategy for the defeat of Japan formulated in the interwar years that called for U.S. naval forces to drive through the Central Pacific and seize Japanese island possessions through amphibious operations while at the same time engaging and defeating the Japanese Navy. The ultimate goal was to cut off the resource-poor Japanese home islands from supply and destroy Japan's war-making capacity through strategic bombing from the captured islands. Because sufficient resources were available, the U.S. Joint Chiefs of Staff endorsed both plans, although the bulk of naval assets were directed to Nimitz and his Pacific Fleet.

Pending the arrival of new naval construction to offset the Pearl Harbor losses, operations first centered on the use of submarines to attack Japanese shipping, a series of carrier raids, and arresting the expansion of the Japanese defensive ring. Although the submarine campaign got off to a slow start, due in large part to faulty U.S. torpedoes, in the spring of 1942, with the Battle of the Coral Sea (May 7–8) and the Battle of Midway (June 3–6), U.S. naval forces decisively halted the Japanese advance and destroyed much of Japanese naval aviation.

U.S. industrial might, meanwhile, ultimately produced the world's most powerful navy—larger than all other navies in the world combined. Japan proved unable to halt subsequent U.S. assaults in the South and Central Pacific during 1943–1944, when the Americans replaced island-hopping with leapfrogging, in which some Japanese strongpoints such as Rabaul and Truk were bypassed, cut off from resupply, and allowed to wither on the vine.

In July 1944, U.S. president Franklin Roosevelt met in Pearl Harbor with MacArthur and Nimitz to discuss strategy. MacArthur argued that the next U.S. move should be the liberation of the Philippines; Nimitz, supported by chief of naval operations Admiral Ernest J. King, wanted to bypass the Philippines and secure Formosa. With sufficient assets to accomplish both, Roosevelt agreed with MacArthur that the Philippines should be retaken. This

shifted Nimitz's operations farther north to Okinawa, which was to be the staging point for a projected eventual invasion of the Japanese home islands.

With the Japanese aware of U.S. plans to cut them off from the resources—especially oil—of the Netherlands East Indies, they gambled all in the war's largest naval battle, Leyte Gulf (October 23–26, 1944). It ended with the destruction of the Imperial Japanese Navy as an effective fleet fighting force.

These offensives, combined with the devastating toll exacted on Japanese merchant shipping by U.S. submarines, starved Japan of resources. The conquest of the Mariana Islands in the summer of 1944 provided B-29 bomber bases from which to strike the Japanese home islands in a highly effective strategic bombing campaign. The conquest of Iwo Jima on March 6, 1945, and Okinawa in April—the latter being supported by the British Pacific Fleet, making it the first large-scale Allied operation in the Pacific since the opening of the war—virtually accomplished the goals of Plan Orange and ensured Japanese defeat.

Sustained heavy bombing missions from the Marianas coupled with carrier operations against Japan and aerial mine laying and submarines destroyed Japan's industrial centers, much of its transportation system, and the majority of its shipping. An invasion of Japan, planned for the fall of 1945, proved unnecessary following the Japanese surrender after the atomic bombs dropped on Hiroshima (August 6) and Nagasaki (August 9). The fact that the formal Japanese surrender took place on the decks of the battleship *Missouri* was a strong indication of the success of U.S. naval strategy and its place in the defeat of Japan.

Naval Strategy, Axis

During World War II, Germany, Italy, and Japan pursued diverse naval strategies, usually without regard for those of their partners. The failure of the Axis powers, especially Japan, to win control of the seas had much to do with their defeat in the war.

Germany's naval strategy had been developed after Adolf Hitler's assumption of power in 1933. In 1935 Britain, much to the displeasure of France and in violation of the Treaty of Versailles, concluded a naval agreement with Germany that granted the latter the right to build up to 35 percent the size of the Royal Navy in surface ships and parity in submarines. Hitler had instructed his naval chief, Grand Admiral Erich Raeder, not to expect war before 1943, and so Raeder had been busy building a balanced fleet that was to include aircraft carriers and would be able to project German power overseas. Both Hitler and Raeder envisioned the day when Germany might challenge Britain and the United States for world naval mastery. The ambitious German Z Plan, spelled out in 1938, was to be completed by 1948.

When war came in September 1939, this construction program was, of course, far from complete, and Germany found itself with the wrong type of navy with which to carry out a war against commerce. Raeder intended to employ such ships as he had to attack British commerce, using strong surface units as commerce raiders, since the navy in 1939 had available only 57 submarines, and half of these were not suitable for blue water operations. A

good bit of the German Navy—especially its destroyers—was also consumed in the successful German invasion of Norway in April 1940. Unfortunately for the German effort at sea, the defeat of France that June did not bring major naval acquisitions, for the armistice agreement left the fleet disarmed but in French hands. Then, in Operation CATAPULT (July 1940), the British acquired or neutralized as many of the French ships as they could reach.

German naval strength, apart from submarines, continued to diminish, and the use of German capital ships as surface raiders largely ended with the May 1941 sinking of the battleship *Bismarck* and Hitler's increasing reluctance to risk further loss of his surface units. Ultimately, most of the capital ships either lost their guns or served as stationary gun platforms.

For the remainder of the war, German strategy centered almost exclusively on the use of U-boats as commerce raiders in the Battle of the Atlantic, seeking to cut the lifeline to Britain and force that nation from the war. Although the submarines inflicted great damage on Allied shipping—particularly that of Britain—the Allies contained that threat by May 1943 through the use of convoys, technological innovations, aircraft, and code breaking. By war's end, little remained of the German fleet due to losses at the hands of the Allies, although the German Navy was able to accomplish a great success in the evacuation of personnel from the Baltic states late in the war.

With France near defeat, Italy entered the war in June 1940. Throughout the interwar period, Italian naval construction was based on the assumption that it would be deployed against France in the Mediterranean. Italian dictator Benito Mussolini's concept of Italy as an aircraft carrier because of the relatively short distances in the Mediterranean meant that Italy did not commission such ships in the war. Italian naval strategy rested on the navy supporting operations in North Africa, disputing the Allies' use of the Mediterranean's central basin and blockading the Strait of Sicily so that Great Britain could not supply its Middle Eastern forces through the Mediterranean.

While the Italian Navy was on paper a substantial force and had some fine ships, it suffered heavily from technological deficiencies, such as the lack of radar and sonar at the opening of the war and poor coordination with land-based air assets. After the first year of war, fuel shortages severely limited operations. In naval engagements fought with the British, Italy suffered several major defeats and won few clear-cut victories, but the navy

did ensure that 86 percent of supplies and 92 percent of Italian and German troops it escorted to North Africa arrived safely. The navy also prevented Allied supply of the Middle East through the Mediterranean and maintained a blockade of Malta until November 1942.

Despite these successes, Italian naval operations were insufficient to bring victory. In 1943 Axis troops were cleared from North Africa, and Allied forces launched invasions of first Sicily and then Italy proper. In September 1943, Italy renounced its alliance with Germany, and most of the fleet went over to the Allies, although Germany acquired some ships and sank several others, including the new battleship *Roma*.

While the naval arm was important to both Germany and Italy in the war, it was essential to Japanese military strategy, for as an island nation, Japan required a powerful fleet to project its military power. By December 1941, the Japanese Navy possessed a number of modern ships (and soon the two largest battleships ever to go to sea), more aircraft carriers than any other power with pilots who had gained experience in the fighting in China, the superb Long Lance torpedo, and probably the best-trained ship crews of any navy in the world.

As in World War I, Japanese leaders saw the beginning of World War II as an opportunity to secure the natural resources that fate had denied their nation. But Japanese expansion in China and in French Indochina brought opposition from the United States in the form of economic sanctions, which were supported by both the British government and the Dutch government-in-exile. These economic sanctions—especially the cutoff of oil—threatened Japan's survival, and Tokyo decided on war rather than give up its hard-won China conquests and foothold in Indochina.

Japanese leaders realized that the far greater industrial capacity of the United States would make such a war difficult, so they opted for Combined Fleet commander Yamamoto Isoroku's plan of a preemptive strike on the U.S. Pacific Fleet, recently relocated to Pearl Harbor in the Hawaiian Islands. The Japanese goal here was to cripple the Pacific Fleet sufficiently to purchase time for the Japanese fleet and army to conquer the areas containing the needed natural resources (especially oil from the Netherlands East Indies) and then construct a defensive ring.

The Japanese envisioned the U.S. fleet being savaged by submarines and surface ships with the Long Lance torpedo as it attempted to fight its way

west across the Pacific and then fight a great battle or series of battles ending in Japanese victory. Japanese leaders believed that ultimately the United States would tire of the war and acknowledge Japanese hegemony in Asia.

This strategy proved unworkable, and the Pearl Harbor attack of December 7, 1941, was a major mistake in that it unified the U.S. public squarely behind the war effort as nothing else could have. As it turned out, the Japanese lacked the industrial strength to fortify the islands of their defensive perimeter to the point where they could be effectively defended.

While Japan enjoyed initial successes versus the U.S. Navy, especially in night actions, the industrial power of the United States vastly outstripped that of Japan. Although Japan had more carriers than any other nation (thanks to Yamamoto), much of its naval airpower was smashed in the Battle of Midway of June 3–6, 1942, and an inadequate pilot replacement program hindered the fleet air arm thereafter. The Japanese also had only a limited merchant marine capacity, especially in tankers, and they lacked convoy escort ships and had largely neglected antisubmarine warfare. They also trailed in the development of radar. In the end, Japanese will and training were overcome by improved U.S. training, technological advances such as the variable-time fuze (proximity fuze), superior aircraft, better-trained pilots, and sheer numbers. The ability of the U.S. Pacific Fleet to operate at great distance through the fleet train concept and the acquisition of Japanese-held islands brought the eventual isolation of the Japanese home islands and that nation's defeat.

Naval Strengths, Atlantic Theater (September 1, 1939)

At the outbreak of World War II, the British naval forces in Atlantic home waters stood at 7 battleships (the *Nelson, Rodney, Royal Oak, Royal Sovereign, Ramillies, Resolution,* and *Revenge*), 3 battle cruisers (the *Hood, Renown,* and *Repulse*), 3 aircraft carriers (the *Ark Royal, Courageous,* and *Hermes*), 18 cruisers, 35 destroyers, 7 fleet minesweepers, and 16 submarines. The British Mediterranean Fleet comprised 3 battleships, 1 aircraft carrier, 6 cruisers, and 44 destroyers. To bolster its forces in the Atlantic, especially in the escort of merchant shipping, the Royal Navy enjoyed the cooperation of the Royal Canadian Navy, which began the war with only 6 destroyers and 5 minesweepers but ended the conflict with more than 363 ships.

In 1939, the French Navy was the fourth largest and most modern in the world. France possessed 5 older battleships (the powerful new battleships *Jean Bart* and *Richelieu* were in the final stages of construction), 1 aircraft carrier, 2 modern battle cruisers (the *Strasbourg* and *Dunkerque*), 19 cruisers, 64 destroyers, and 77 submarines. In September 1939, much of this naval strength was deployed in the Mediterranean, the West Indies, and Indochina.

Poland had only a small navy in September 1939. It counted four destroyers, five submarines, one minelayer, and six modern minesweepers as well as several auxiliary and training ships.

Italy, neutral until 1940, had an impressive navy in September 1939 consisting of 4 reconstructed World War I–era battleships, 7 heavy cruisers,

12 light cruisers, 90 destroyers, and 97 submarines.

The Soviet Union, officially neutral until June 1941, had begun an ambitious naval construction program, but in September 1939 it operated 3 old battleships, 6 cruisers, 4 destroyer leaders, 30 destroyers, and 165 submarines.

The outbreak of war in September 1939 caught the German Navy in transition. Because Chancellor Adolf Hitler had said that war would not occur before 1943, German Navy commander Grand Admiral Erich Raeder had been building a balanced fleet to include aircraft carriers. In September 1939, the German Navy consisted of the battleships *Scharnhorst* and *Gneisenau* (the powerful battleships *Bismarck* and *Tirpitz* were under construction), 3 pocket battleships (the *Admiral Scheer, Admiral Graf Spee,* and the *Deutschland,* soon renamed *Lützow*), 1 heavy cruiser (the *Admiral Hipper*, with 4 additional heavy cruisers under construction), 6 light cruisers, 34 destroyers and torpedo boats, and 56 submarines.

In September 1939, the U.S. Navy may have been the world's most powerful. It maintained 15 battleships, 5 fleet carriers, 1 light carrier, 37 cruisers, 149 destroyers, and 71 submarines. Although officially neutral when the war in Europe began, the United States lent unofficial support to the Allies. The United States divided its ships between the Atlantic and the Pacific. In September 1939, U.S. forces in the Atlantic, commanded by Rear Admiral Alfred W. Johnson, consisted of 3 old battleships (the *New York, Arkansas,* and *Texas;* the battleship *Wyoming* was a training ship), the aircraft carrier *Ranger*, 8 cruisers, 43 destroyers, and 21 submarines. The United States had significant naval building programs under way centered on fast battleships and Essex-class aircraft carriers. In addition, Washington ordered 110 decommissioned World War I–vintage destroyers refurbished for service.

Naval Strengths, Pacific Theater (December 7, 1941)

On the eve of the Japanese attack on U.S. and British possessions in the Pacific on December 7–8, 1941, the Japanese Navy held a considerable advantage in terms of numbers of ships deployed by the United States and Great Britain in the Pacific. Possessing more aircraft carriers than any other power, and with the world's most experienced naval air arm as well as the excellent Long Lance torpedo, the superbly trained Imperial Japanese Navy was ready to run riot, at least in the short term.

In the Pacific and Indian Oceans in early December 1941, the Japanese counted 10 battleships (not including the *Yamato,* the largest battleship ever built, that entered service later that month), 11 aircraft carriers, 18 heavy cruisers, 23 light cruisers, 129 destroyers, and 67 submarines.

The Japanese ships were entirely in the Pacific, whereas the ships of the United States were split between the Atlantic and the Pacific, and Great Britain had most of its naval strength in the Atlantic and the Mediterranean; even Australian and New Zealand ships were serving abroad. The U.S. Navy possessed in its Pacific and Asiatic fleets a total of 9 battleships, 3 aircraft carriers, 13 heavy cruisers, 11 light cruisers, 80 destroyers, and 56 submarines.

British Empire forces, including Australian and New Zealand ships still in the Pacific, numbered 1 battleship and 1 battle cruiser, 1 heavy cruiser, 7 light cruisers, and 13 destroyers. The Netherlands Navy added 3 light cruisers, 7 destroyers, and 13 submarines. Thus, the total Allied force was inferior to that of Japan in numbers in everything except battleships (where they were equal) and submarines (69 to 67). Also, most Japanese ships were newer, faster, and more heavily armed than their Allied counterparts. These figures do not take into account training or command and language difficulties experienced by Allied forces.

The naval strengths listed above are, however, misleading in the sense that they also do not take into account ships under construction or the potential for new construction, a function of industrial capability. Here, as thoughtful Japanese strategists had known all along, Japan was no match for

the United States, and the longer the war endured, the more likely Japanese superiority would disappear. Those in Tokyo supporting war believed that a preemptive strike would sufficiently cripple U.S. naval strength, allowing Japan time to secure its resource base (the reason for the war) and build a defensive ring to blunt U.S. attacks and force Washington to recognize Japanese hegemony in the region. This appraisal could not have been more incorrect.

Naval Warfare

Naval operations conducted on a truly global basis were critical in the outcome of World War II. In September 1939, Allied naval superiority was even more marked than in World War I. Britain had one of the world's two largest navies (the other being the United States), and France had the world's fourth-largest fleet. Although challenged by German U-boats and later by Japanese surface warships, Allied strength at sea enabled them to tap the world's resources, transport men and supplies vast distances, and provide naval bombardment and logistics support to amphibious operations while largely denying these capabilities to the Axis powers. Both sides resorted to convoys as protection against surface raiders and submarines.

Naval technology at the beginning of World War II was little changed from World War I. Warships of the 1920s and 1930s were larger and faster than in World War I, and surface ships boasted improved gunnery control.

With the exception of radar, however, there had been few technological breakthroughs. The aircraft carrier, which had appeared at the end of World War I, although it was regarded as an important ship type, was not yet seen as the new capital ship.

In 1939, the world's admirals still gave the battleship primary place. The Japanese hoped to secure a decisive edge in the war at sea with the powerful Yamato-class battleships. Their doctrine called for a decisive contest at sea, and the Yamato-class seemed to promise that. Built in great secrecy and displacing nearly 73,000 tons fully loaded and armed with nine 18.1-inch guns, the *Yamato* and *Musashi* (two others were projected, one was finished as an aircraft carrier, and the fourth was never completed) were the largest battleships ever built. The United States built 10 modern battleships, more than all three Axis nations combined. The 4 U.S. Navy Iowa-class battleships, although they displaced only 57,500 tons fully loaded and were armed with nine 16-inch guns, were faster and not that much off the Yamato class in capability. The great battleship confrontation at sea during World War II at Jutland never occurred.

The primacy of the battleship changed with the Japanese attack on Pearl Harbor (December 7, 1941), especially when the Japanese sank the British battleship *Prince of Wales* and battle cruiser *Repulse* from the air off Malaya (December 10, 1941). Unlike the U.S. battleships at Pearl Harbor or the Italian battleships attacked by British aircraft in Taranto Harbor in November 1940, the two British capital ships were under way and firing antiaircraft weapons. From this point on, ships that ventured out without aircraft protection did so at their peril.

The once-mighty battleships never engaged one another in decisive fleet action (apart from the Battle of Surigao Strait during the October 23–26, 1944, Battle of Leyte Gulf), but the torpedoes fired from U.S. destroyers and torpedo boats probably inflicted the greatest damage. Battleships proved their usefulness in shore bombardment, as antiaircraft platforms (virtually all warships received increased numbers of antiaircraft guns), and as "armored oilers" to accompany the aircraft carriers, the new titans of the seas.

Britain's concern over operating its aircraft carriers in narrow seas such as the North Sea and the Mediterranean, which would subject them to attack from land-based aircraft, led to the introduction of an armored flight deck. The four-ship Illustrious class, which entered service in 1940 and 1941,

carried heavier antiaircraft protection, an armored flight deck, and an armored "box" protecting the aircraft hangar. These additions provided greater protection but also limited British carriers to fewer aircraft than their U.S. and Japanese counterparts.

British naval resources were stretched thin at the start of hostilities, and although duties and scope of operations roughly corresponded to those of World War I, ships were far fewer. Thus, instead of major surface actions, the majority of the fighting at sea in the European theater centered on the destruction and protection of seaborne trade, especially in the Atlantic Ocean, which was the critical area of operations. The Royal Navy's chief responsibility was to maintain Britain's seaborne lines of communication, on which the survival of the nation depended.

The Royal Navy transported the British Expeditionary Force (BEF) to France and then to Greece, and the BEF reinforced and supplied garrisons in North Africa, among other places. The Royal Navy also rendered invaluable service by extracting the BEF from France in 1940 and from Greece and Crete in 1941. Had the Royal Navy not been able to execute these operations, Britain could have been forced from the war.

Many of the French ships were modern, the result of a major building program undertaken in the years immediately before the war that had drained sizable resources from the army. French naval strategy at the beginning of the war centered on cooperation with the Royal Navy. The French North Atlantic Fleet had two principal missions: to work with the British in protecting merchant shipping and escorting convoys and to use its most powerful assets, built around the battle cruisers and organized in the *Force de Raid*, against German surface raiders.

For the German Navy, war came too early. When Adolf Hitler took power in 1933, the Kriegsmarine was basically a coastal defense force. Hitler wanted a powerful navy that might one day challenge Britain—or even Britain and the United States—for Atlantic mastery, but he assured German Navy chief Grand Admiral Erich Raeder that he had no intention of waging war with Britain. In November 1937, Hitler had stated that war would not occur before 1943 or 1945.

Raeder thus set out, in the Z Plan of January 1939, to construct a balanced fleet of battleships and battle cruisers, aircraft carriers, cruisers, destroyers, and a force of 249 submarines. He fixed 1948 as the date for its completion,

but Hitler gave him a deadline of six years (i.e., 1945). With a lead time on capital ship construction of as much as three or four years, the outbreak of the war thus caught the German Navy with the wrong mix of vessels. Germany's sole aircraft carrier, the *Graf Zeppelin*, was never completed. Italy, neutral until 1940, had an impressive medium-sized navy, but its operations, apart from submarines, were largely confined to the Mediterranean.

The Soviet Union projected by 1943 a powerful oceangoing fleet, but by the time of the German invasion in 1941, the largest surface additions were four Kirov-class cruisers. The Soviet naval minister in Moscow was subordinate to the army, and ships were under the control of front commanders; thus, the navy played little part in World War II.

When the war began, the overwhelming Allied naval superiority promptly drove German shipping into neutral or home ports. Except in the Baltic, the German flag disappeared from the seas. The British were content, however, to institute a naval blockade of Germany with the aim of denying Germany vital imports but also preventing sorties into the Atlantic of powerful German surface ships. Such a blockade, from 1914 to 1918, had been a key factor in the German defeat. The blockade of 1939 had little effect on Germany, however, given its economic arrangements with the Soviet Union and Italy. After Germany's victories of 1940 and 1941 in Denmark, Norway, the Low Countries, France, Yugoslavia, and Greece, moreover, Germany could tap the agricultural and industrial production of most of Europe.

Raeder pursued a commerce-raiding strategy, and he struck back with surface raiders, land-based aviation, mines, and, above all, submarines. His goal was to disrupt Britain's seaborne trade and starve Britain into submission. Germany had a submarine commander of genius in Karl Dönitz, who had assumed control of the U-boat program in 1935, but the paucity of U-boats made it impossible to wage any meaningful campaign against Allied shipping.

Dönitz believed that the only way Germany could pressure Britain was through interdicting its Atlantic shipping lanes, and he estimated that 90 submarines on station would ensure success. This meant that a force of some 300 submarines was required. At the start of hostilities, though, Dönitz had only 56 U-boats, of which 46 were ready for action; only 26 were suitable for Atlantic operations. Once the war began, Raeder suspended the Z Plan and

gave priority to submarine construction and a commerce-raiding strategy, but much valuable time had been lost.

The April 1940 Norwegian Campaign ended as a brilliant strategic success for Hitler, but it also ruined the German surface navy. The Kriegsmarine lost 3 cruisers and 10 destroyers, half the German total, as well as having several other ships damaged. On the plus side, the many Norwegian fjords provided additional bases for German surface raiders and submarines. The greatest gain for Germany in this regard came in the defeat of France in June 1940. The acquisition of the French Atlantic coastline immensely benefited the U-boat war in the Atlantic, and by early August 1940, German submarines were operating from Lorient on the Bay of Biscay. These bases provided easier access to the Atlantic shipping lanes, and the French repair facilities were superior to the overburdened shipyards in Germany, translating into more U-boats at sea.

After the defeat of France and the loss of its powerful navy, Britain found itself in desperate naval straits. A new naval threat now arose in the form of a belligerent Italy, opening the Mediterranean Sea as a major theater of war. The Italian fleet posed a severe strategic threat to the key British lines of communication through the Mediterranean. Italy had some excellent ships, and its navy, although far weaker in total strength than that of Britain, was concentrated, giving it what appeared to be local naval superiority. The Italian Navy, however, lacked radar until 1942, and it was deficient in night-fighting equipment, antiaircraft protection, and antisubmarine capabilities. The Italians also did not have a naval air arm, which Benito Mussolini and Italian admirals had opposed, claiming that Italy was itself an aircraft carrier. There was no doctrine, however, for employment of land-based aviation in concert with naval units.

Oil from the Persian Gulf and other resources vital to the British war effort passed through the Suez Canal into the Mediterranean, then through the Strait of Gibraltar into the Atlantic and to Britain. Without this route, British shipping would have to go all the way around the Horn of Africa.

In the struggle in the Mediterranean, Allied code breaking was vital. Intelligence from Ultra provided information to the British about the timing of Axis convoys. Malta also proved critical. The British were able to hold it and use it to harry Axis reinforcement and resupply of North Africa. By the end of 1942, British aircraft were sinking many of the Axis ships involved in

supplying Axis forces in the Mediterranean, with a profound impact on the North African campaign.

Meanwhile, a grim struggle was under way in the Atlantic. The campaign here was certainly one of the key contests of the entire war, for without victory in the Atlantic theater, Britain would have certainly been forced to sue for peace. On the outbreak of war, the Allies had promptly resorted to convoys. The convoy system was predicated on reducing the number of targets and on the assumption that the more targets there were, the more likely they were to be found. Large numbers of merchant ships would steam together, protected by escort vessels. The U-boats might still sink some vessels, but the percentage of losses would be significantly less. Further, the submarines themselves ran the risk of being sunk by the escorting destroyers and destroyer escorts.

It was 1941 before the U-boat building program really emerged. Dönitz asserted that he would have won the Battle of the Atlantic in 1941 or 1942 had he possessed the 300 U-boats he deemed necessary at the beginning of the war. It is probably a false claim, as a higher rate of sinking of merchantmen would only have forced the Allies to shift assets earlier, including shifting long-range aircraft to Coastal Command. Dönitz's submarines lacked effective radar until near the end of the war, and they struggled—at least in the first year—with defective torpedoes, the same problem that plagued the Americans at the beginning of their submarine campaign against Japan.

To compensate for Allied superiority, Dönitz developed new tactics for his submarines, the most important of which was the *Rudeltaktik* (pack tactics, which the Allies referred to as the "wolf pack"). Groups of 15 to 20 submarines would spread out along the Atlantic sea-lanes. Merchantmen traveling alone would be immediately attacked, but in the case of a convoy, the submarine would shadow it and radio for reinforcements. The closest U-boats would then converge for a night surface attack, which would maximize confusion for the defenders and minimize the possibility of submarine detection. The submarines would then submerge and reorganize for a second attack.

To enable his submarines to remain on station for longer periods, Dönitz sent out supply submarines. The Germans also had success in code breaking. The German Navy's B-Dienst intelligence service listened to Allied radio

traffic and broke the British convoy codes, enabling Dönitz to direct his boats to where enemy ships would be. The Germans also used aircraft, particularly the long-range Focke Wulf Fw-200, with great effectiveness against Allied convoys in the Eastern Atlantic when they came within range of German air bases.

British defenses of the vital Atlantic trade routes were strengthened in May 1941 when the U.S. Navy began escorting convoys between the United States and Iceland. Then in June 1941, Canada created the Canadian Escort Force for the same purpose. The Royal Canadian Navy grew dramatically in size during the conflict and played a key role in the Battle of the Atlantic.

By June 1941, however, the Germans had sunk some 5.7 million tons of Allied shipping. British shipyards were able to launch only 800,000 replacement tons. Large Italian submarines, several of them operating from Bordeaux, were also effective. The Germans virtually controlled the Atlantic for more than a year after America's entry into the war. By May 1943, half of the world's 5,600 merchant ships in 1939 had been lost. May was probably the month when the tide of battle turned and the Allies went on the offensive.

A combination of factors brought the Allies victory in the Battle of the Atlantic. The convoy system was important, but so too was technology, primarily 10cm radar sets that could be carried aloft in long-range aircraft, sonar, improved depth charges, rockets fired from aircraft, and forward-thrown antisubmarine "hedgehogs" or "mousetraps" (small depth charges known to the British as "squids"). The high-intensity Leigh light on aircraft illuminated the sea at night. Radio detection equipment was vital, and long-range aviation helped close the so-called Black Hole in the Middle Atlantic.

Intelligence also played a role, chiefly Ultra intercepts of U-boat communications that guided aircraft to the submarines. The creation of hunter-killer groups of escorts and escort carriers designed for 15 aircraft, each operating independently of the convoys, carried the war to the submarines. It is also true, however, that Allied and interservice cooperation was far too long in coming.

For the Allies, the Battle of the Atlantic was a close-run thing, and it claimed significant resources. German submarines sank 2,452 Allied and neutral ships, totaling 12.8 million gross register tons. During the war, the British merchant marine lost 40,248 men and the Royal Navy another 73,642. The Royal Air Force (RAF) Coastal Command sustained losses of 5,866 men

and 1,777 aircraft. The Royal Canadian Navy lost 1,965 men, and U.S. Navy losses in the battle were 2,443 men.

The Germans also paid a high price. During the war, Germany built 1,162 submarines. Of 830 operational U-boats, 784 were lost (696 destroyed by enemy action). Of 40,900 Germans who served in submarines, 25,870 perished and more than 5,000 were taken prisoner. U-boat crew fatalities were thus 63 percent, and the overall loss rate was 76 percent, the highest for any service in the war.

In the vast Pacific theater, sea power was the most important element. The fight here was largely a U.S. Navy enterprise, and it ended in perhaps the most comprehensive victory in naval history. In going to war with the United States, Japanese leaders completely miscalculated in several key areas. They assumed that the Imperial Japanese Navy (IJN) could cripple the U.S. Pacific Fleet, carry out a series of conquests to secure desired natural resources, and build a defensive ring that would hold the U.S. Navy at bay until America recognized the inevitability of a new Japanese empire.

Yet the final defeat of Japan was almost certain. The key to victory in the Pacific lay in numbers of ships and planes—and Japan, with a vastly inferior industrial base, was bound to lose that race to the United States. Beginning in 1943, significant numbers of the new Essex-class carriers and accompanying vessels reached the fleet.

Another important factor in the U.S. Navy victory over Japan was the concept of the fleet train, which enabled carrier task forces to operate for extended periods of time and at great distances from their bases. The fleet train was a vast enterprise that included supply ships, tankers, repair vessels, dry docks, and tenders for seaplanes, destroyers, and submarines. As a result, the U.S. Navy enjoyed unparalleled mobility; its strategic reach in the war was unmatched by any other navy. It was this capability that made possible the recapture of Pacific islands that had been taken by the Japanese, from which long-range land-based strategic bombers could attack the Japanese mainland. It also enabled the navy to establish large fleet anchorages in remote locations such as at Ulithi.

An essentially defensive policy forced the IJN to disperse its assets. Japan’s navy was never able to support individual isolated Japanese strongholds before the Americans overwhelmed them. Japan’s leaders also miscalculated their vulnerability in a war against merchant shipping.

U.S. and British warships ride at anchor in the harbor at Hvalfjörður, Iceland, May–June 1942. (Corbis)

Obsessed with carrying out fleet actions against the U.S. Navy, the IJN gave scant consideration to the protection of Japan's highly vulnerable merchant trade. Antisubmarine warfare was all but ignored. In December 1941 the IJN had but four purpose-built escort vessels, and it was not until the autumn of 1942 that any escorts were equipped with sonar. The United States also led Japan by a wide margin in antisubmarine technology.

Japan was highly dependent on imports and yet boasted only a marginal shipping capacity. Even with their early successes, the Japanese would not be able to capture, build, or salvage the necessary tonnage to replace even modest losses. As it turned out, U.S. submarines devastated the Japanese merchant marine. The United States outbuilt Japan in submarines by a ratio of 2:1. The U.S. Navy entered the war with 114 submarines; Japan had 64. During the war, the United States built another 206, and Japan only built 116. In the entire conflict, the United States lost 52 submarines, and Japan lost 128.

During the Pacific war, the U.S. Navy became the most successful practitioner of the *guerre de course* (war against commerce) in history. One could argue that the submarine was the most important factor in the Allied

victory in the Pacific. In effect, the United States succeeded where Germany failed in both world wars.

The United States built long-range submarines of 2,000 tons with 10 torpedo tubes each. Although the Japanese produced some fine boats and actually built the largest submarines of the war (3,500 tons and carrying three disassembled planes) with exceedingly long range (in 1942, Japanese submarines shelled the Pacific U.S. coast), their submarine strategy was flawed. They directed their submarines against U.S. warships. Although the Japanese enjoyed some success, operating against enemy warships took a high toll. Later, the Japanese used their large submarines chiefly to supply isolated garrisons such as Rabaul. The obvious target for their submarines was U.S. cargo vessels, but the Japanese never went after the long and vulnerable U.S. supply lines.

U.S. submarines, moreover, had a deep-dive capability. The standard diving depth for submarines was 300 feet, but U.S. boats could reach 400 feet without stressing the hull and could go deeper if necessary. This was one of the best-kept secrets of the war, and enemy depth charges usually exploded above them. But for the first two years of the war, U.S. submarines suffered because they carried inferior torpedoes. The magnetic pistol to explode the charge under the target ship often did not function correctly. The torpedoes also circled, and at least one U.S. submarine, the *Tang*, was sunk by one of its own “fish.” In late 1943, however, new contact pistols were installed, and by 1944 the navy had a new magnetic pistol.

From the beginning of the war against Japan, the United States waged unrestricted submarine warfare. In December 1941, Japan had 5.4 million tons of merchant shipping—only a marginal capacity. The Japanese constructed or acquired another 3.29 million tons during the war, but U.S. submarines sank 6.9 million tons of merchant ships (1,113 vessels). U.S. submarines also extacted a heavy toll of Japanese warships, sinking 201 totaling 577,000 tons. The Japanese were so short of aviation fuel by 1944 they could scarcely train pilots. In American submarine successes, code breaking (Magic) played a major role.

The June 3–6, 1942, Battle of Midway marked the turning point of the war in the Pacific, but the October 23–26, 1944, Battle of Leyte Gulf, the largest naval battle in history, finished off the Japanese fleet as an organized fighting force. Japanese courage and tenacity were overcome by American

determination and numbers. In February 1945, the five carrier task groups operating against the Japanese home islands included 119 warships, yet only 4 had been in service before December 7, 1941. By 1945, the U.S. Navy counted 23 battleships, 19 fleet carriers, 1 light carrier, 108 jeep carriers, 351 destroyers, and 255 submarines. The U.S. Navy was, in fact, larger than all the other navies of the world combined.

Nazi Racial Policies

National Socialist (Nazi) ideology advocated all-embracing "scientific" solutions of social problems to the extreme in that entire peoples were to be incorporated into a bureaucratic racial-biological design and all sources of nonconformity were to be eliminated. The Nazis took a hierarchy of races for granted. They divided mankind into "culture founders," "culture bearers," and "culture destroyers." The bearers of cultural development in the modern world were the "Aryans." The great counterpart to "the Aryan" was "the Jew." Jews were the *Todfeind,* the mortal enemy. The concept of "Aryan" remained vague, however, and Nazi ideology failed to establish a hierarchy of nations within the so-called Aryan race.

Overt racism was accompanied by a collectivist creed. Establishment of the National Socialist utopia of Volksgemeinschaft (ethnic or racial community) entailed a dual approach: its internal aim was to engineer a society fostering loyalty, obedience, and self-sacrifice. Its external goal was to segregate and eventually eradicate those who were not part of the Volksgemeinschaft: aliens, political opponents, the asocial, and the Jews.

In Adolf Hitler's mind, at least, the Jews were the archenemy of civilization and the source of all evil in the world. The image of Jews as the root of misfortune, manipulating events, was an ideological synthesis of various anxieties about civilization and self-contradictory racial notions focused on political targets. Unlike traditional anti-Semitism of a religious or nationalist cast, Nazi anti-Semitism was directed not against selected characteristics of people but against an abstract object. "The Jew" was an artificial racial construct.

The idea was essential to the National Socialist ideology, and after Hitler took power, he established through decrees the so-called Nuremberg Laws that denied Jews basic rights. In speeches Hitler warned that if the Jews dared touch off another world war, it would mean the destruction of the Jewish "race" in Europe. When the war came, though, it mattered not at all who started it. For the Nazis, the time had come for what their official memoranda termed "the final solution of the Jewish question." Following attempts to exclude the Jews from everyday life and drive them abroad, every Jew they could lay their hands upon would now be killed. The all-encompassing image of "the Jews" required an all-encompassing "final solution."

Throughout the lands they came to rule, but especially in the Slavic nations east of the Reich, the National Socialist New Order meant total

subjugation to the German *Herrenvolk* (master race). Administered by the Schutzstaffel (SS), the New Order imposed a reign of terror designed to grind down the non-Aryans and advance the racial frontier eastward. While Hitler never drew up a detailed plan for his 1,000-year Reich, his speeches and orders indicate the sort of empire he had in mind. The Nazi leadership had long coveted the eastern expanses and dreamed of securing them for its *Lebensraum* (living space). These lands and their Slavic populations, which Hitler termed *Untermenschen* (subhumans), were to be ruthlessly exploited for the benefit of the Reich.

After the conquest of Poland in 1939, Hitler began to execute his plans. In October 1939, he appointed SS chief Heinrich Himmler to take charge of establishing the New Order in Eastern Europe. Special SS and Gestapo (Geheime Staatspolizei, or secret state police) units were set up to supervise the operations: rounding up and deporting men and women for slave labor in Germany, eliminating Poland's ruling gentry and intelligentsia, and herding the Jews of Warsaw and other cities into walled ghettos. In the summer of 1941 following the German invasion of the Soviet Union, Himmler's deputy, Reinhard Heydrich, was instructed to draw up plans for the so-called Final Solution (Die Endlösung) of the Jewish problem. In the course of the next four years, some 6 million Jews were systematically slaughtered in the Nazi Holocaust.

Nazi-Soviet Non-Aggression Pact (August 23, 1939)

Pact that made possible the German invasion of Poland on September 1, 1939. In March 1939 Adolf Hitler violated the pledge he had made at the Munich Conference only six months before and absorbed the Czech areas of Czechoslovakia. The British government then extended a guarantee to defend Poland, Hitler's presumed next target, which already had a mutual defense pact with France.

On May 23 Hitler met with his leading generals and informed them of the inevitability of war. He told them that he intended to expand Germany's frontier eastward to secure living space and food supplies and planned to attack Poland at the first opportunity.

That same month Britain and France initiated negotiations with the Soviet Union for a mutual assistance pact that would protect Poland and the Baltic states, but in sharp contrast to the negotiations by the Western powers with Germany that had involved heads of government, Britain and France sent only low-level delegations, and they traveled to the Soviet Union by ship. Although negotiations continued until August, they failed to produce agreement. As a consequence of the 1920 Polish-Soviet War, Poland's eastern border extended eastward almost to Minsk, and the Soviets claimed that the French and British simply wanted them to bear the brunt of any German attack. Another major reason was the attitude of the Poles.

Poland, Latvia, Lithuania, and Estonia were all unwilling to allow Soviet armies within their borders, even to defend against German attack. Many in these countries feared the Russians more than the Germans, and Polish leaders also refused to believe that Hitler would risk war with Britain and France.

The Poles also had an exaggerated sense of their own military power. Their plan if war came was to invade Germany. In any case, the Anglo-French negotiators refused to sacrifice Poland and the Baltic states to Stalin the way they had handed Czechoslovakia to Hitler.

While Soviet dictator Joseph Stalin negotiated more or less openly with Britain and France, he also sought an understanding with Germany, covertly dispatching several personal emissaries to Berlin. Stalin's overriding consideration was the best interest of the Soviet Union. Upset with the Western capitulation at Munich, which he regarded as an effort by British and French leaders to divert Hitler eastward, on March 10, 1939, Stalin had announced that the Soviet Union did not intend to "pull anyone else's

chestnuts out of the fire." He thus signaled to Hitler his readiness to abandon collective security. Within a week Hitler had annexed Bohemia and Moravia, confident that the Soviet Union would not intervene. Another consideration for Stalin was that the Soviets faced the potential of war on two fronts, as armed clashes had resulted in heavy fighting between Japanese and Soviet troops in the poorly defined triborder area where Siberia, Manzhouguo (Manchukuo), and Korea came together.

On May 3, 1939, Stalin gave further encouragement to Hitler when he replaced Commissar for Foreign Affairs Maxim M. Litvinov with Vyacheslav Molotov. Litvinov was both a champion of collective security and a Jew. Hitler later said that Litvinov's dismissal made fully evident Stalin's desire to transform its relations with Germany. At the end of May the German Foreign Office informed its Moscow embassy that Berlin wanted to make "a certain degree of contact" with the Kremlin. This led to negotiations, culminating in Stalin's invitation to German foreign minister Joachim von Ribbentrop to come to Moscow.

Ribbentrop arrived in the Soviet capital on August 23 and concluded final negotiations with Stalin personally. The Soviet-Nazi agreement was signed that night. Its frontispiece was a 10-year nonaggression pact, but there were two secret protocols, which did not become generally known until Rudolf Hess revealed them during proceedings of the International Tribunal at Nuremberg. These secret arrangements, not publicly acknowledged by the Soviet Union until 1990, partitioned Eastern Europe between Germany and the Soviet Union. Any future territorial rearrangement of the area would involve a sharing of territory. The Soviet sphere included eastern Poland, the Romanian province of Bessarabia, Estonia, Latvia, and Finland. Lithuania would go to Germany. A month later, Hitler traded Lithuania to Stalin in exchange for further territorial concessions in Poland. In addition, a trade convention accompanying the pact provided that the Soviets would supply vast quantities of raw materials to Germany in exchange for military technology and finished goods. This economic arrangement was of immense assistance to Germany early in the war.

Stalin personally guaranteed Ribbentrop that the Soviet Union would not betray its partner, and he lived up to his word, for the Soviet Union gave Hitler no excuse to turn on it. Stalin miscalculated, however, when he

assumed that Hitler would face a protracted ground war in the west that would allow the Soviet Union time to rebuild its military.

The Non-Aggression Pact shocked the world community. Communism and Nazism, supposed to be ideological opposites on the worst possible terms, had come together. A generation more in tune with ideology than power politics was dumbfounded.

On August 22, Hitler summoned his generals and announced his intention to invade Poland. Neither Britain nor France, he said, had the leadership necessary for a life-and-death struggle. British and French armament did not as yet amount to much. Germany therefore had much to gain and little to lose, for the Western powers probably would not fight. In any case, Germany must accept the risks and act with reckless resolution.

The German invasion of Poland, set for August 26, actually occurred on September 1. The delay was brought about by Italy's last-minute decision to hedge its bets and remain neutral. So little did Italy count in the German plans that the invasion was put off only until September 1. On that day, following false charges that Polish forces had crossed onto German soil and killed German border guards—an illusion completed by the murder of concentration camp prisoners in Polish military uniforms—German forces invaded Poland, beginning World War II.

Neame, Sir Philip (1888–1978)

British Army lieutenant general. Born on December 12, 1888, at Faversham, England, Philip Neame was educated at the Royal Military Academy, Woolwich. Commissioned to the Royal Engineers in 1908, he served in France during World War I and won the Victoria Cross. In the 1924 Paris Olympic Games, Neame was a member of the British team that won the gold medal for shooting. After serving 12 years in India and Tibet, he was promoted to major general in 1937. He became commandant of Woolwich in 1938.

In 1939, Neame went to France as deputy chief of the General Staff in the British Expeditionary Force (BEF). Prior to the start of the fighting, he was appointed to command the 4th Indian Division in Egypt. In 1940 and 1941, Neame commanded British forces in Palestine and Transjordan. In February 1941, he was appointed to head the newly created Cyrenaica Command in Libya. In the previous months, British and Commonwealth forces under Major General Richard O'Connor had smashed the Italian army and advanced into Libya. However, O'Connor's advance was halted when British resources were diverted to Greece. With limited resources at his disposal, Neame was directed to remain on the defensive in Libya.

The British did not expect an Axis offensive for a considerable period, but German lieutenant general Erwin Rommel disrupted British plans by launching an offensive into Cyrenaica in March 1941. In quick order, Rommel defeated the weak British force and advanced toward Egypt. Theater commander General Archibald Wavell had little confidence in Neame and sent O'Connor forward to Neame's headquarters. O'Connor was not to relieve Neame but merely to be present to advise the battlefield commander. On April 7, 1941, Neame and O'Connor stumbled into a German patrol while traveling by car in the desert and were taken prisoner. They spent the next two years as prisoners of war in Italy. After the Italian armistice in 1943, Neame and O'Connor were released and escaped to the Allied lines.

After the war, Neame served as lieutenant governor of Guernsey (1945–1953). He retired from the army in 1947 and died in Kent on April 28, 1978.

Nearne, Eileen (1921–2010)

British secret agent. Born in London, England, into an Anglo-Spanish family on March 15, 1921, Eileen Nearne moved with her family to France when she was two. Growing up there, she was fluent in French. When the Germans invaded France in May 1940, Eileen and members of her family fled through Spain to England. She, her sister Jacqueline, and Francis, one of her two brothers, were all recruited by the British Special Operations Executive.

Following training, Eileen Nearne followed her sister in being inserted into France by a British Lysander aircraft along with another agent on March 2, 1944. Making her way to Paris by train with her radio transmitter in a suitcase, she worked from safe houses in Paris to transmit information back to London to organize British weapons drops to the French Resistance. She made 105 transmissions over a five-month span until July, when her transmissions were detected and she was arrested by the Gestapo. Sent to the Ravensbruck concentration camp near Berlin, she was beaten and tortured. Stripped naked, she was repeatedly submerged in freezing water until nearly drowned, but she refused to divulge any information and held to her cover story that she was simply a naive young woman hired by a local businessman to send coded messages she did not understand.

In April 1945, Nearne was transferred to Markleberg near Leipzig, where she worked on a road repair gang for 12 hours a day. While being transferred again, she managed to escape and hid in a church in Leipzig, Germany, until the city was liberated by the Americans, who then held her for a time as a suspected member of the Gestapo until London could verify her identity.

Returning to England, Nearne lived with her sister while suffering from psychological symptoms brought on by her wartime experiences. She never married and told few people of her wartime experiences, living alone after her sister died in 1982. Nearne died a recluse and in poverty in a flat in Torquay, England. Her body was discovered on September 2, 2010, and she was about to be buried in a pauper’s grave when her medals, including the

Croix de Guerre and Member of the Order of the British Empire, were found. It became front-page news in Britain, and a veterans' organization and anonymous donors paid for her funeral, which was attended by representatives of the British armed forces and the French consul general.

Nehring, Walther Kurt (1892–1983)

German Army general of panzer troops. Born on August 15, 1892, in Stretzin, West Prussia, Walther Kurt Nehring joined the 152nd Infantry Regiment at Marienburg as an officer candidate in 1911 and fought throughout World War I, winning the Iron Cross 2nd and 1st Class in 1915. Continuing in the postwar Reichswehr, Nehring was selected for General Staff training and was closely associated with Heinz Guderian in building the panzer forces.

On the outbreak of World War II, Nehring was a colonel and chief of staff of Guderian's XIX Panzer Corps. He served in that post during the German invasions of Poland in 1939 and France in 1940. Promoted to major general in August 1940, Nehring took command of the 18th Panzer Division and led it as part of Guderian's Second Panzer Group in the June 22, 1941, invasion of the Soviet Union (Operation BARBAROSSA), winning the Knight's Cross for action around Borisov in July 1941.

In late May 1942, Nehring was promoted to lieutenant general and given command of the German Afrika Korps. He promptly launched the envelopment attack on the Gazala Line (May 26–June 13) that destroyed British armor and captured Tobruk (June 20–21). Promoted to general of panzer troops on July 1, Nehring was chiefly responsible for the fighting

during the Battle of Alam Halfa (August 31–September 7, 1941), but he was seriously wounded in an air attack on August 31.

While Nehring was convalescing in Germany, the Allies launched their invasion of Northwest Africa, but commander in chief, south, Field Marshal Albert Kesselring ordered Nehring to Tunisia on November 16 to form available troops into XC Corps and establish a beachhead while reinforcements arrived from Sicily. Nehring quickly organized the defenses and defeated Allied troops at the critical Battle of Medjez-el-Bab. By the end of the month, he had launched a counteroffensive that recaptured Djedeida and halted the Allied "race for Tunis" from the west. Kesselring was impressed with Nehring's performance but disliked his outspoken pessimism concerning problems facing the German army in North Africa. Nehring was replaced in December 1942 by General Hans Jürgen von Arnim.

Still highly regarded as a panzer commander, Nehring returned to the Soviet Union on February 9, 1943, to command the XXIV Panzer Corps. He then held a sequence of senior commands—Fourth Panzer Army (June to August 1944), the XLVIII Panzer Corps (August 1944), and then the XXIV Panzer Corps again. He was awarded the Oak Leaves to the Knight's Cross of the Iron Cross in February 1944 and the Swords in January 1945 for defensive action in Poland. Group Nehring was driven back into Silesia, where Nehring took command of the First Panzer Army on March 20, 1945.

Nehring surrendered to U.S. forces on May 9. After a brief period as a prisoner of war, he spent his retirement quietly in Düsseldorf, where he died on April 20, 1983.

Nelson, Donald Marr (1888–1959)

Industry executive, mobilization official, and chairman of the War Production Board (WPB) from January 1942 until August 1944. Donald Marr Nelson was born on November 17, 1888, in Hannibal, Missouri. After graduating from the University of Missouri in 1911 with a degree in chemical engineering, he joined Sears Roebuck and Company as a chemist in 1912. Nelson worked his way steadily up the corporate hierarchy, in the meantime taking primary responsibility for purchasing and procuring over 135,000 different products sold through the Sears catalog and its retail outlets. In 1930, he became the company's vice president, and in 1939 he was named executive vice president and vice chairman of the company's executive committee. Nelson's vast experience as a purchasing agent, coupled with his extensive contacts with business and industrial executives, made him a natural choice for a high-level mobilization job as World War II began.

President Franklin D. Roosevelt tapped Nelson to head the Treasury Department's procurement division in May 1940. Nelson was tasked with procuring and selling raw materials to the Allies. In January 1941, with World War II already under way for nearly a year and a half, the Roosevelt administration created the Office of Production Management (OPM) in an attempt to centralize material procurement, and Nelson now became head of the OPM's priorities division. In July 1941, Nelson was named chief of the newly created Supply, Priorities, and Allocations Board. Nelson was stymied in his efforts to centralize priorities and allocation functions, however, and quit the board in frustration in the fall of 1941.

After the December 1941 attack on Pearl Harbor and American entry into the war, the Roosevelt administration created the WPB, which was given sweeping powers to regulate and prioritize all industrial production, procure and allocate strategic and scarce raw materials, control prices and wages, and supply the nation's armed forces with armaments and supplies of every type. Nelson was named chairman of the new agency in January 1942. He immediately set to work to centralize and streamline the mobilization process.

One of his most notable early decisions was to bring Ferdinand Eberstadt on board as vice chairman of the WPB and chairman of the Army-Navy Munitions Board in the autumn of 1942. With Nelson's encouragement, Eberstadt established the Controlled Materials Plan (CMP), which simultaneously prioritized the needs of military and civilian manufacturers so that the proper end items were produced at the right time and in the right quantity. The CMP proved to be highly effective and significantly enhanced wartime production.

Nelson soon found out, however, that military planners were all too eager to take control of the mobilization process themselves. He was engaged in near-constant turf wars that bred waste and duplication in the military procurement process. By early 1943, Nelson suspected that Eberstadt had become too cozy with the military. Military officials, meanwhile, complained that Nelson acted too slowly and was indecisive. Despite these problems, industrial output continued to increase, and Nelson remained with the WPB until August 1944, at which time he returned to his position with Sears. Julius S. Krug replaced Nelson as chairman.

In 1945, Nelson was named president of the Society of Independent Motion Picture Producers. His tenure there was a stormy one, abetted by personal problems including multiple high-profile divorces and poor health. In December 1947, Nelson tendered his resignation. He thereafter sat on numerous corporate boards. Nelson died on September 29, 1959, in Los Angeles.

Netherlands

Nation located in Western Europe that borders Germany to the east, Belgium to the southwest, and the North Sea to the west and north. In 1939, the Netherlands numbered about 9 million people. Although encompassing just 16,500 square miles, the Netherlands had important overseas possessions in the Netherlands West Indies and Netherlands East Indies. The overseas empire was rich in raw materials and provided rubber, coffee, tea, palm oil, metals, and many other products.

The Netherlands had not been at war with another state since 1815, and when World War II began, Queen Wilhelmina declared the nation's neutrality. Adolf Hitler sent the queen his personal assurances that he would respect Dutch neutrality. The Dutch government made no plans with other nations, not even with neutral Belgium, for a concerted defense. The Dutch strategy in case of war with Germany, known as Fortress Holland, called for blowing up bridges and dikes, but it failed to take into account the realities of modern warfare.

On paper, the Dutch Army appeared impressive. General Henri Gerard Winkelman commanded 400,000 men in eight divisions and four brigades plus several smaller units. The army was, however, poorly armed and trained. It had not a single tank and had only 26 armored cars and 656 obsolete artillery pieces. Its Military Aviation Division possessed only 175 aircraft, of which 132 were serviceable but only 72 were modern. The navy was modern but small. It consisted of 4 cruisers (another was almost complete), 8 destroyers, 16 minesweepers, 24 submarines, and several torpedo boats and auxiliary craft. Most of it, however, was in the Pacific to defend the Netherlands East Indies.

German paratroopers descending from Junkers Ju-72 transport aircraft over The Hague at the commencement of the German invasion of the Netherlands, May 10, 1940. (Ullstein Bild via Getty Images)

Beginning at 3:00 a.m. on May 10, 1940, German forces invaded the Netherlands in what Queen Wilhelmina characterized as a flagrant violation of international law. The Germans employed some 1,000 aircraft to attack Dutch airfields and military installations, and most Dutch aircraft were destroyed the first day. The Germans also used parachute and airborne forces effectively as well as their Eighteenth Army.

The Dutch put up stout resistance, especially along major rivers. Hitler ordered the capture of the Dutch royal family, but they escaped from The Hague to Britain aboard two British destroyers. With negotiations already in progress but as an inducement to bring about a speedy Dutch surrender so that their forces could be released for the fighting in France, on May 14 the Germans bombed Rotterdam, destroying much of the city center and causing considerable civilian casualties. Later that same day, Winkelman ordered Dutch forces to lay down their arms.

Also on May 14, Wilhelmina established a government-in-exile in London and announced in a radio broadcast to the Dutch people her determination to continue the fight. The government-in-exile secured most of the ships of the important Dutch merchant marine. Its 640 ships, not counting

200 smaller vessels, were of immense help to the Allies. The merchant marine played a key role in the Battle of the Atlantic. Ultimately, half of the ships were lost in the war, and some 3,000 Dutch seamen were killed. In early 1942, the Japanese occupied the Netherlands East Indies, leaving only Suriname in South America and such islands as Aruba, Bonaire, and Curaçao in the Netherlands West Indies under the free Dutch government.

The Nazis held the Dutch to be fellow Aryans, and Hitler intended to incorporate the Netherlands into a greater Germany. To win the support of the Dutch, Hitler ordered that German occupying forces be on their best behavior. He also released Dutch prisoners of war as a conciliatory gesture. At the same time, the Germans worked to tie the economy of the Netherlands to that of Germany.

On May 26, Hitler established a government in the Netherlands with Arthur Seyss-Inquart as Reichskommissar. Hitler deliberately ignored Dutchman Anton Mussert, head of the small National Socialist Movement (Dutch Nazi Party) in the Netherlands, although he did grant him the honorific title *de leider* (leader) of Holland. Seyss-Inquart had full administrative authority.

In October 1941, Seyss-Inquart abolished the Dutch parliament and instituted the German judicial system. Labor unions lost their autonomy, and remaining political parties (the communist and socialist parties had been immediately banned) were forced into one political entity, the National Unity Party, although it too was disbanded within a year. Censorship was complete; Germany maintained control over the mass media and issued fines for municipal authorities that violated German rules. Education was reorganized along German lines, with the promotion of Nazi racial theories and the rewriting of textbooks.

The British naval blockade during the war cut off traditional markets and access to the Dutch colonies overseas, factories had difficulty securing materials for production, and there was rampant inflation. Rationing was enforced, but food and consumer goods became scarce. The Germans sought to exploit the Netherlands economically, and this agriculturally rich country was forced to deliver most of its produce to Germany. The economic situation worsened after 1943, as the Germans expropriated whatever they deemed useful to their war effort, including personal property. As early as

1941, skilled Dutch workers were transported against their will to the Reich to work in German factories. This practice intensified as the war continued.

Jews were a special German target. Legislation deprived 140,000 Dutch Jews of participation in Dutch society and then of their livelihoods. By 1944, some 110,000 Dutch Jews had been removed from the Netherlands altogether and sent to concentration camps; only 5,000 returned after the war. The other 30,000 survived by going into hiding. Jewish losses in the Netherlands were the highest, in terms of percentage, in Western Europe.

Dutch resistance was negligible during the first two years of the German occupation and mostly passive. But Nazi methods were abhorrent to the Dutch, and by 1943 resistance became active. Resistance groups robbed banks, conducted sabotage, and even assassinated Germans. Not until September 1944, however, were the resistance groups unified.

Some Dutch collaborated with the Nazis, revealing the location of Jewish hiding places, for example. After the war, more than 100,000 people were arrested for collaboration, and approximately half of them were brought to trial.

On September 17, 1944, when the Allies initiated Operation MARKET-GARDEN to secure a crossing over the Rhine River at Arnhem, Pieter Sjoerds Gerbrandy, prime minister of the Dutch government-in-exile, called on Dutch railroad workers to strike, and they heeded the call. In response, Seyss-Inquart shut down shipments by rail and canal that were essential to feed much of the population. The winter of 1944–1945 is remembered as the Hunger Winter, and some 20,000 Dutch died of starvation. Misery was compounded by the intense cold. There was no access to coal, electricity, wood, or running water.

During the latter stages of the fighting, defensive flooding inundated large areas, with resultant damage from seawater. Many homes were also destroyed. Trade was at a standstill, and the economy was in a shambles. German occupation costs alone had robbed the economy of 8 billion guilders. The Netherlands was by far the worst affected by the war of any West European state.

After the war, the Dutch temporarily brought back the death penalty and executed the most blatant Nazi collaborators. Seyss-Inquart was tried at Nuremberg, found guilty, and executed. The war also caused the Netherlands to abandon its policy of neutrality in favor of a defensive pact with Belgium

and Luxembourg and later membership in the North Atlantic Treaty Organization.

Netherlands Campaign (May 10–15, 1940)

In May 1940, the Germans launched FALL GELB (CASE YELLOW), their campaign against France and the neutral Low Countries. In the case of the Netherlands, the country was overrun in five days and suffered heavy losses. The German strategy to invade Western Europe called for an attack through neutral Belgium and the Netherlands as well as across the Franco-German border farther south to enable the German forces to carry out a grand sweeping movement. Known as Operation SICHELSCHNITT (CUT OF THE SICKLE), it was in effect a reverse of the World War I Schlieffen Plan designed to trap advancing British and French forces in Belgium.

General Henry G. Winkelman's Netherlands army of 8 infantry divisions, plus 2 in reserve, faced Colonel General Fedor von Bock's Army Group B, consisting of General of Artillery Georg von Küchler's Eighteenth Army of 11 divisions (9 infantry and 1 each of cavalry and tanks) and Colonel General Walther von Reichenau's Sixth Army, with 17 infantry and 2 panzer divisions. The Dutch forces were basically militia with little training and no fighting experience. They had no tanks and hardly any antitank weapons.

Although some Dutch units fought well, the army as a whole broke down rather rapidly.

The attack against Fortress Holland, as the defensive strategy was known, began in the early hours of May 10, 1940. As in the previous month's offensive against Norway, an air assault spearheaded Germany's operation. Most of these air assaults were successful, as with 12 seaplanes landing at Rotterdam and the 120 troops on board securing three important bridges. This was at some cost to German air assets. On May 10 alone, the Luftwaffe lost some 170 aircraft and had about the same number damaged.

Most key defensive installations were in German hands by the middle of the first day, however. Of the crucial bridges over the Juliana Canal, the Germans captured all but one completely intact. Although by May 12 Allied bombers began to target key bridges in the Netherlands, most bridges had already been secured by the Germans, allowing their forces to advance rapidly.

On May 13, Lieutenant General Alfred Ritter von Hubicki's 9th Panzer Division managed to achieve a breakthrough toward the bridges at Moordijk, 15 miles south of Rotterdam, captured intact by German paratroopers at the start of the operations. Two of these structures were then the longest road and rail bridges in the world. This enabled the Germans to advance to Rotterdam and split the Netherlands in two. Counterattacks by the French Seventh Army failed to retake the bridges and establish contact with Dutch forces. The French then were forced to fall back toward Antwerp, making the Dutch position untenable.

German soldiers observe burning buildings as their forces attack Rotterdam during their May 1940 invasion of the Netherlands. (Hulton Archive/Getty Images)

Recognizing that further resistance would not reverse the situation, the Netherlands government considered capitulation. On May 13, Queen Wilhelmina, other members of the Dutch royal family, and the government fled to Britain, where a government-in-exile was quickly established.

The resistance of Netherlands forces had surprised the Germans, and they wanted to end the campaign quickly to enable forces there to be shifted to France. When on May 14 the Germans demanded the surrender of Rotterdam, the Dutch at first refused. In one of the most controversial decisions of the war, commander of the German Air Force Field Marshal Hermann Göring then decided to commit Junkers Ju-87 Stuka dive-bombers of Fliegerkorps IV against the city to hasten Dutch capitulation. Talks began at noon, but faulty communications meant that the air attack went forward, and the city center was virtually destroyed. On May 15, the Netherlands surrendered.

In the five-day campaign, the Netherlands had lost 2,890 dead and 6,900 wounded. There are no separate German casualty figures for the Netherlands fighting. The Netherlands remained under German occupation for the next four years.

Netherlands East Indies

At the beginning of World War II, the Netherlands East Indies (NEI, today the Republic of Indonesia) was a colony of the Netherlands. The world's largest archipelago, it is located in Southeast Asia straddling the equator and sitting astride major strategic shipping routes from the Pacific Ocean to the Indian Ocean. The NEI extends over a vast area some 2,275 miles wide by 1,135 miles long and comprises some 17,000 islands, 6,000 of which are inhabited. The largest of these islands are Java, Sumatra, Dutch Borneo, Dutch New Guinea, Celebes, western Timor, and the Moluccas. Their 1940 population was about 70 million people, of whom 1 million were Chinese; some 250,000 were of Dutch extraction. About 70 percent lived on Java. The islands had as many as 300 different ethnic groups speaking 365 languages.

The NEI was immensely rich in natural resources, including oil (more than 59 million barrels produced in 1940), tin, bauxite, and coal. It also produced rubber, copra, nickel, timber, quinine, and important foodstuffs such as rice, sugar, coffee, and tea. The NEI thus represented a major prize for Japan in World War II, especially as Japan had no oil of its own.

Dutch rule in the islands was paternalistic and exploitive; the Indonesians were treated as little more than children. Some 90 percent of the population was illiterate; only a minority attended school in 1940, and few jobs were available for educated Indonesians in a bureaucracy dominated by the Dutch. The authorities ruthlessly crushed any nationalist sentiment, and repressive measures in the 1930s created a wide psychological breach between rulers and ruled.

In May 1940, German forces quickly overran the Netherlands, although the Dutch royal family and some government officials escaped abroad and established a government-in-exile in London. The advisory Volksraad (People's Council) at Batavia, the NEI legislative body on Java, declared its loyalty to the London government but was soon virtually autonomous. It did

refuse Japanese trade demands and obeyed the decision by the Dutch government-in-exile in August 1941 to cut off the export of oil to Japan.

The Netherlands government-in-exile, acting in concert with the British and U.S. governments, declared war on Japan after Japan attacked the United States at Pearl Harbor (December 7, 1941). Japan desperately needed the resources of the NEI and sought to add the NEI to its Greater East Asia Co-Prosperity Sphere. Tokyo soon dispatched a large number of troops to secure the islands as soon as possible.

Beginning on December 20, 1941, units of Lieutenant General Imamura Hitoshi's Sixteenth Army landed on oil-rich Dutch Borneo as well as Celebes and the Moluccas. The poorly equipped Royal Netherlands East Indies Army resisted as best it could, supported by some British, Australian, and U.S. forces. With their few air assets soon destroyed, all the Allies could do was delay briefly the Japanese advance. The Japanese Navy crushed Allied naval forces in the Battle of the Java Sea (February 27, 1942), and on March 8 the Dutch surrendered on Java. Resistance continued in Dutch Borneo and Celebes until October 1942, and the Japanese never did conquer all the islands.

Following their victory, the Japanese sent the Indonesian soldiers home and arrested some 170,000 Europeans, including 93,000 Dutch soldiers. All were treated inhumanely on starvation diets, which caused the deaths of 40 percent of the adult males, 13 percent of the women, and 10 percent of the children. Under the Japanese administrative division of the NEI, Java and Madura came under the jurisdiction of the Sixteenth Army.

The Twenty-Fifth Army controlled strategically important Sumatra, while Celebes, the Moluccas, and Dutch New Guinea were under Japanese Navy administration. Japan's army and navy remained at odds, and there was no unified policy for the islands, which in any case differed sharply in size, population, and economy.

Many Indonesians initially welcomed the Japanese as liberators. Japanese rule was far more ruthless and exploitive than that of the Dutch, though. The Japanese took advantage of nationalist sentiment and worked with those leaders whose approach was to seek at least public accommodation with them.

An antitank gun crew of the Netherlands East Indies Army, December 9, 1941. (Bettmann/Corbis)

The systematic Japanese plunder of NEI resources began immediately after the invasion. Japan also mobilized as many as 2 million unskilled laborers. More than 270,000 of these were sent overseas, but only 50,000 to 70,000 of them returned.

Because of a shortage of labor and the arrest of Dutch administrators, production fell off sharply. By 1943, rubber production was at one-fifth and tea at one-third of pre-1941 levels. Rice output fell 25 percent. The occupation currency issued by the Japanese also rapidly declined in value. By 1945, it was only worth 2.5 percent of face value. Severe shortages and acute economic hardship resulted. The closing of the export market also hurt the economy. In any case, thanks to Allied submarines, shipment of NEI resources to the Japanese home islands, especially desperately needed oil, steadily declined during the course of the war.

Japanese authorities early on prohibited all political activities in the islands. They also banned use of Dutch and English and insisted on Japanese language instruction in the schools. Western symbols—statues, for example—were torn down, and streets were renamed. The Japanese ruthlessly crushed all dissent but worked with Indonesian nationalist leaders to help administer the islands under their “guidance.” Clearly, Japan’s leaders hoped to annex the islands outright. In January 1943, as a means of securing support for the Japanese war effort, Japanese prime minister Tōjō Hideki announced that Burma and the Philippines would be made independent within a year.

However, there was no such mention of independence for the NEI until September 7, 1944 (by Prime Minister Koiso Kuniaki), and then only at some unspecified future date.

As the tide of war sharply turned, the Japanese sought to mobilize Indonesians against the Dutch. This included heavy use of propaganda, military training for the young, and the creation of a 25,000-man auxiliary military force, the Heiho, which served with the Japanese, and another volunteer force, the 57,000-man Fatherland Defense Force (Pembela Tanah Air), as a guerrilla operation under Indonesian command.

Support among Indonesians for Japan ebbed as the economy declined and as the Japanese seized rice stocks and requisitioned labor. In some cases, the Japanese army also treated the population brutally. The occupation had the effect of crystallizing Indonesian opposition to foreign rule, and at the end of the war the nationalists moved into the vacuum. On August 17, 1945, at Jakarta, they proclaimed the archipelago independent of the Netherlands and then promulgated a new constitution. The Dutch government in the Netherlands initially refused to accept these actions. Not until 1949 did it bow to the inevitable and agree to an independent Republic of Indonesia.

Netherlands East Indies, Japanese Conquest of (1942)

The desire of Japanese leaders to secure the vast oil and mineral resources of the Netherlands East Indies (NEI) was one of the principal reasons they took their country to war against the United States. Conquest of the NEI presented difficulties, as its 17,000 islands extended over a vast area some 2,275 miles wide by 1,135 miles long.

The Japanese planned a three-pronged semisimultaneous strategy to secure the archipelago's resources as quickly as possible. In the east, their forces would move from forward bases in the southern Philippines on the islands of Ambon and Timor to sever communications and reinforcements from Australia. In the center, forces from the Philippines would push southward through Borneo and Celebes. In the west, Japan forces would move against Sumatra as soon as Singapore was conquered. Finally, when all initial objectives were secured, the three forces would combine for an assault on Java, the center of Allied naval operations in Southeast Asia and headquarters of the joint Allied military command, the ABDA (Australian-British-Dutch-American) Command.

Formed on January 15, 1942, the ABDA Command was charged with the defense of Malaya, Singapore, the Netherlands East Indies, and the northwestern coast of Australia. British general Sir Archibald Wavell commanded from Lembang, Java. He did what he could to rally his defenders, but Japanese resources were vastly superior. On December 20, units of Lieutenant General Imamura Hitoshi's Sixteenth Army, having departed from Mindanao in the Philippines, landed on Dutch Borneo, Celebes, and the Moluccas. On January 11, Japanese paratroops saw their first action in the war when about 500 were dropped and secured an airfield on Celebes. Supported by the 21st and 23rd Air Flotillas, the Japanese also captured oil fields in Dutch Borneo and airfields at Kendari in Celebes and Ambon in the Moluccas. On February 16, 460 Japanese paratroopers assisted other Sixteenth Army forces in taking the major oil refinery at Palembang in southern Sumatra.

Japanese paratroopers also took part in the February 19 invasion of East Timor. Australian reinforcements bound for Timor turned back after Japanese

bombers from Kendari began attacking the transports. On February 19 and 27, Japanese raids destroyed much of the defenders' land-based aircraft fleet.

On the seas, the Allies had some success on the night of January 23–24, when U.S. destroyers sank three Japanese transports off Balikpapan. Wavell hoped to concentrate his isolated assets, but protection of convoys took most of his surface ships, leaving only submarines and a handful of destroyers to defend the whole of the Indies.

For the defense of Java, the last of the Japanese objectives, the Allies had 12 Dutch and 2 Australian infantry battalions, a U.S. artillery regiment, a home guard of 40,000 inexperienced volunteers, and some 90 aircraft. Land commander Lieutenant General Hein ter Poorten placed his best troops at the extremities of the islands, where he expected the Japanese to come ashore. On February 25, however, the ABDA Command was dissolved, and the Dutch governor-general on Java assumed command of the remaining forces.

Having secured their other land objectives, the Japanese dispatched two invasion forces for Java under Vice Admiral Ibo Takahashi. On February 27, 1942, the Japanese won a naval victory over Allied warships in the Battle of the Java Sea. Then on March 1, the Japanese landed in several locations on Java, with the capital of Bandung as their ultimate objective. These assaults met only minimal resistance. The 48th Division reached the capital by March 7, and the 56th Regiment broke off to assault Tjilatjap, the chief port on the southern coast.

On March 8, General ter Poorten surrendered the 93,000 men of the Royal Netherlands East Indies Army. The Japanese also took as prisoners some 5,000 Australian, British, and U.S. military personnel. That same day, Japanese forces landed in northern Sumatra. By the end of the month, they had conquered all of Sumatra and begun an invasion of Dutch New Guinea. Resistance continued in Dutch Borneo and Celebes until October 1942 and on Timor until December 1942. Part of Dutch New Guinea continued under Dutch control, and the Japanese never did conquer all of the 1,300 islands constituting the NEI.

NEULAND, Operation (February 1942–September 1943)

German submarine campaign in the Caribbean. In the shadow of Operation PAUKENSCHLAG (DRUMBEAT, January 13–July 19, 1942) the German submarine offensive against the American East Coast, the German U-boat command conceived a second offensive against Allied shipping in American waters. This new operation was named NEULAND and was aimed at Allied oil and gasoline shipments in and from the Caribbean Sea. The destruction of large numbers of tankers had a serious impact on both the U.S. and British economies, because whereas the losses of dry-cargo tonnage were quickly replaced by new construction, tanker losses were not.

Operation NEULAND, as with DRUMBEAT, began against a poorly prepared enemy, even though Admiral Karl Dönitz had dispatched only five large Type IX U-boats to the Caribbean. On February 15, 1942, two U-boats entered the two most important oil ports of the Western Hemisphere, Saint Nicholas on Aruba and Willemstad on Curaçao, where they torpedoed several tankers and attempted to shell the refineries. Meanwhile, the other three U-boats created havoc along the crude oil routes from Lake Maracaibo (Venezuela) and in the anchorage of Trinidad, the main Allied base in the region.

Although the Caribbean had been formally integrated into the U.S. seaward defense organization in July 1941, the initial response to the German threat was completely uncoordinated and ineffective. Between February 1 and June 1, 1942, German and Italian submarines encountered only minimal resistance in the Caribbean and sank 52 tankers (out of a total of 114 Allied tankers sunk in that period). The results were devastating: oil imports to Great Britain, which had stood at 1.1 million tons in February 1942, dropped

to 623,000 in May. On May 2, the British government asked the U.S. government for a loan of 700,000 tons of tanker tonnage to avert fuel starvation of the British war effort. The United States complied by transferring a total of 854,000 tons to Great Britain and Canada. The measure incurred a temporary rationing of oil in the northeastern United States until sufficient tank car and pipeline capacity, a more efficient allocation of tanker tonnage, and, ultimately, new tanker construction alleviated the situation during the second half of 1942.

Neither did the introduction of convoys in the Caribbean bring instant relief. The largely American escort forces in the Caribbean were initially inadequately equipped and too inexperienced to take on the battle-hardened U-boat veterans.

Nevertheless, by September 1942, the convoy system had forced the U-boats to concentrate around Trinidad in search of prey. Since February, the antisubmarine forces had accounted for six U-boats and had damaged several more. For the Germans, however, this was still a favorable exchange rate, given the destruction of 187 Allied merchant ships in the Caribbean to that point.

Whereas the offensive against the U.S. East Coast fizzled out in August 1942, the offensive in the Caribbean continued in October when the boats of the first wave returned after the necessary rest and maintenance period. In spite of the stiffened resistance and ceaseless American air patrols, German U-boats sank another 160 Allied merchant ships in the Caribbean theater up to the end of the year. During the 319 days of the offensive, the U-boats had thus sunk a total of nearly 1.9 million tons of Allied shipping in the Caribbean, or 36 percent of all Allied merchant ship losses in 1942 worldwide.

The second part of the offensive came to a climactic end with the destruction of two tanker convoys: TM.1, bound from Trinidad to Gibraltar, and TB.1, bound from Trinidad to Bahia (Brazil). In a spectacular four-day action from January 8 to 12, 1943, five U-boats sank seven of TM.1’s nine tankers. The shadow of defeat that hung over the German U-boat campaign in early 1943, however, did not spare the Caribbean theater.

The reassignment of many boats to meet the Allied invasion fleet of North Africa (Operation TORCH, November 8, 1942) and the Allied air offensive in the Bay of Biscay, which forced many U-boats to abort their

missions, resulted in a lull in Caribbean activities. When the German U-boat command attempted to revive the Caribbean theater following the collapse of the main U-boat campaign in the North Atlantic in May 1943, the offensive ended in failure before it could begin in earnest. Of 44 U-boats assigned to the renewed operation, 7 were lost in the Caribbean, but even worse, 22 more —including 11 U-tankers and auxiliary U-tankers vital to the operation— were sunk during transit through the Bay of Biscay and across the Atlantic. The few fuel-starved U-boats that made it into the Caribbean were hastily recalled after the loss of the U-tankers, and from September 1943 onward U-boats ventured into Caribbean only occasionally to maintain a diversion of Allied antisubmarine assets.

Neurath, Konstantin Hermann Karl von (1873–1956)

German foreign minister. Born into a noble family in Klein Glattbach, Württemberg, on February 2, 1873, Konstantin von Neurath joined the German diplomatic service in 1901 and served in London from 1903 to 1908. During World War I, he served as a captain of grenadiers. Wounded, he was invalided to the diplomatic service and posted to Constantinople.

Neurath remained in the diplomatic service after the war and was ambassador to Denmark from 1919 to 1921, to Italy from 1922 to 1930, and to Great Britain from 1930 to 1932. In June 1932, Neurath became foreign minister. He joined the National Socialist Party in 1937. Adolf Hitler dismissed Neurath in February 1938 because of his opposition to the führer's aggressive foreign policies. Joachim von Ribbentrop succeeded him as foreign minister.

In March 1939, Neurath was appointed Reichsprotektor of Bohemia-Moravia, apparently to assure the Western powers of the benevolent nature of the German regime there. Neurath balked at instituting Nazi policies there, including rounding up the Jews, and he left Prague on extended leave in September 1941. Hitler did not officially accept Neurath's resignation until 1943.

Although he had contact with the German opposition to Hitler, Neurath opposed the plot to assassinate him. Neurath was tried at the International Tribunal at Nuremberg in November 1946 on four counts of war crimes, including planning wars of aggression and crimes against humanity. Convicted, he received a sentence of 15 years, regarded as a lenient punishment, because of his opposition to Nazi policies in Czechoslovakia. He was released from Spandau Prison, Berlin, on grounds of ill health (he had suffered a heart attack) in November 1954. Neurath died in Enzweihingen on August 15, 1956.

New Britain, Landings on (December 1943)

New Britain is an island in the northern Solomon Islands. Rabaul, the major Japanese air and naval base in the South Pacific, is located in East New Britain. New Britain is an island in the Bismarck Archipelago. In 1942 and 1943, the major Allied effort in the Pacific war was centered on Operation CARTWHEEL, which was designed to neutralize Rabaul. Operation CARTWHEEL began in August 1942 with an Allied landing at Guadalcanal in the southern Solomons.

During the next year, the Allies advanced up the Solomons and along the northern coast of New Guinea so that by the fall of 1943, they were approaching New Britain. At the same time, Allied air raids eliminated Rabaul as a significant threat to future operations. Even though there seemed no reason to capture Rabaul, General Douglas MacArthur, commander of the Southwest Pacific Area, intended to establish a presence on New Britain. An amphibious assault against the Japanese stronghold, which was defended by nearly 90,000 Japanese troops and naval personnel, was deemed too costly, but the western end of the island was defended by only 7,500 Japanese, who were cut off from reinforcements by a lack of roads and by rugged terrain and Allied air and naval superiority.

MacArthur planned a two-pronged attack. The 112th Cavalry Regiment would land at Arawe on the southwestern coast of New Britain to attract and pin down Japanese reserves, while the 1st Marine Division would land at Cape Gloucester on the northwestern coast, where the Japanese had two

airstrips. From these airstrips and a patrol-torpedo (PT) boat base at Arawe, MacArthur would complete the isolation of Rabaul.

The New Britain landings began on December 15, 1943, when the 112th Cavalry Regiment came ashore at Arawe and established a strong perimeter against little resistance. On December 26, two Japanese battalions launched a counterattack but were beaten back, and in mid-January 1944 the 112th Cavalry eliminated the last pockets of Japanese resistance.

The Cape Gloucester landing began on December 26. The marines easily overwhelmed local Japanese resistance, although Japanese bombers sank the destroyer USS *Brownson*. By December 30, the marines had captured Cape Gloucester; however, to secure the lodgment they had to expand their perimeter to two fortified hills on the western side of Borgen Bay. In fierce fighting made more difficult by swamps and heavy rains, they seized Hill 660 on January 14, 1944, ending any Japanese threat to Cape Gloucester.

New Britain now became a backwater as Allied forces moved west along the New Guinea coast. The Americans were content to protect their lodgments rather than mount an advance against Rabaul. But the Australian 5th Division, which replaced the Americans at the end of 1944, launched minor offensives against the Japanese that lasted until the end of the war. Total Allied casualties in the New Britain campaign were more than 2,000 killed or wounded. The Japanese lost more than 20,000 dead. In retrospect, given the air superiority the Allies had acquired over Rabaul by November 1943 and the seizure of the Huon Peninsula on New Guinea in early 1944, the New Britain landings were of little influence in the course of the war.

New Fourth Army Incident (January 4, 1941)

Also known as the Southern Anhui (Anhwei) Incident, this military clash between Guomindang (Kuomintang, Nationalist, GMD) and Chinese Communist Party (CCP) forces during the Second Sino-Japanese War (1937–1945) ended the anti-Japanese United Front established between the two

parties in 1937. The CCP New Fourth Army had enlarged its area of operations in the Changjiang (Yangtze) River delta area. GMD generals, who feared that the Communists would try to politicize the peasants as the Eighth Route Army had done in northern China, now sought to force the New Fourth Army and also part of the CCP Eighth Route Army, driven by the Japanese south of the Changjiang, back north of that river.

In response to pressure from the Nationalist generals, GMD officials issued a directive on December 9, 1940, demanding that the Communists withdraw their forces north of the Changjiang River by December 31, 1940. The Communists delayed executing this movement. Indeed, they attempted to win mass support to remain south of the river.

On January 4, 1941, seven Nationalist divisions surrounded and attacked the headquarters force of some 9,000 New Fourth Army troops near Maolin in Jiangsu (Kiangsu) Province. In the course of heavy fighting during January 7–13, 1941, Nationalist forces killed about 3,000 New Fourth Army troops and captured the remainder. Among the dead was New Fourth Army general Xiang Ying (Hsiang Ying). General Ye Ting (Yeh T'ing) was captured and imprisoned. On January 17, 1941, the GMD government of Jiang Jieshi (Chiang Kai-shek) dissolved the New Fourth Army and closed CCP military liaison offices in many GMD-held cities.

Although this incident dealt a serious blow to the Communist effort in central China, it was also an advantage to the revolutionary cause. First, Liu Shaoqi (Liu Shao-ch'i), a member of the CCP Central Committee, was appointed political commissar of a revitalized New Fourth Army, and he promptly created a "post-Incident" line that urged mobilization of the masses. Despite brutal Japanese pacification campaigns in the region between 1941 and 1945, the New Fourth Army survived into the postwar period when it profited from its long familiarity with the region.

Also, the New Fourth Army Incident provided the Communists with a powerful propaganda tool by which they could present themselves as martyred patriots. Mao Zedong (Mao Tse-tung) proclaimed that key elements in Chongqing (Chungking) wanted to substitute civil war for the war of resistance against Japan. No single event during the entire Sino-Japanese War did more to elicit sympathy for the CCP and establish its patriotic credentials both at home and abroad than the New Fourth Army Incident of January 1941.

New Georgia, Battle of (July–October 1943)

The New Georgias are an island group in the central Solomon Islands, which were occupied by Allied forces from the South Pacific Area Command in the summer of 1943. The Battle of New Georgia was part of Operation CARTWHEEL, the Allied campaign to neutralize the Japanese base at Rabaul on New Britain Island at the northern end of the Solomons. At the end of June 1943, Major General John Hester's New Georgia Occupation Force (NGOF), which included Hester's 43rd Infantry Division, landed on islands in the New Georgia group to capture the airfield at Munda Point on the northwest coast of the main island of New Georgia. Major General Sasaki Noboru commanded 10,500 Japanese troops located on the island group.

The main U.S. advance toward Munda, assigned to the 43rd Infantry Division, started on July 5 from Zanana Beach five miles east of the airfield. It immediately stalled in the face of fierce Japanese resistance, a shortage of supplies, poor leadership and inexperience, forbidding terrain, and jungle conditions. As the advance sputtered, the 37th Infantry Division and units from the 25th Infantry Division were committed, and Major General Oscar W. Griswold, commander of XIV Corps, replaced Hester as commander of the NGOF. Griswold later replaced Hester as commander of the 43rd Infantry Division with Major General John Hodge.

Meanwhile, the Allied landings sparked a series of naval battles off New Georgia. On the morning of July 6 in the Battle of Kula Gulf, a U.S. Navy task force intercepted a Japanese squadron bringing reinforcements and supplies to New Georgia Island. The Americans lost a light cruiser while

sinking two Japanese destroyers. On July 13, in the Battle of Kolambangara, U.S. and Japanese task forces again battled, and the Japanese lost a light cruiser and the Americans a destroyer. Then in the Battle of Vella Gulf on August 6–7, a U.S. Navy task force of six destroyers smashed a Japanese squadron of four destroyers transporting 900 men and supplies to New Georgia. The Americans sank three of the Japanese destroyers, resulting in the deaths of some 1,000 Japanese. Thereafter, the Japanese gave up any hope of expelling the Americans.

Griswold launched a major offensive against Munda on July 25 supported by massive air, artillery, and naval bombardment. Initially the Americans gained little ground, but after days of brutal close-in fighting, Griswold's men slowly pushed the outnumbered Japanese from their positions. On August 5 following Noboru's decision to pull back because of heavy casualties, the 43rd Infantry Division captured Munda Airfield. During the next weeks, despite an aggressive pursuit, most of the remaining Japanese defenders escaped to nearby islands. In September, the Americans seized Baanga, Arundel, and Vella Lavella Islands. In early October, the campaign came to an end when the Japanese evacuated 9,000 defenders of Kolambangara Island to Bougainville Island 100 miles to the north.

The New Georgia operation provided the Allies with several good airfields and brought them closer to Rabaul. U.S. losses were 1,094 dead and 3,873 wounded as well as several thousand casualties from disease and battle fatigue. Japanese losses are not known, although XIV Corps reported 2,483 Japanese dead exclusive of those on Vella Lavella.

New Guinea Campaign (March 8, 1942–September 13, 1945)

Important Pacific theater land campaign that became the focal point for Australia's military efforts. The northeastern corner of the island of New

Guinea and the whole of New Britain Island were granted to Australia as a League of Nations mandate after World War I. The southeastern corner of New Guinea contained the Australian colony of Papua.

On January 23, 1942, Japanese forces under Major General Horii Tomitaro invaded New Britain, capturing Rabaul from its Australian garrison, known as Lark Force. Moving into mainland New Guinea on March 8, Japanese forces then occupied Lae and Salamaua. The Australian defenders (code-named Kanga Force) retreated to the mountain town of Wau while the Japanese moved against the ports of Madang, Finschhafen, and Wewak. For the next 10 months, there was a stalemate as both sides poured resources into the Papuan Campaign.

When the Papuan Campaign ended on January 25, 1943, 1,000 Japanese survivors escaped into New Guinea. That month the Japanese dispatched to New Guinea Lieutenant General Adachi Hatazo's Eighteenth Army, including the 6th Air Division. The Japanese 41st Division deployed to Wewak, the 20th Division deployed to Madang, and part of the 51st Division went to Lae/Salamaua.

To oppose the Japanese, General Douglas MacArthur had at his disposal the U.S. 32nd and 41st Infantry Divisions, the Australian 6th and 7th Divisions, and a militia brigade. The 32nd Infantry Division was not immediately available as a consequence of battle losses, and two brigades of the Australian 7th Division were temporarily deployed to Ceylon (present-day Sri Lanka). The remaining brigade was sent to New Guinea to reinforce the militia brigade there. Australia was raising more militia, and its veteran 9th Division returned from Egypt in February. MacArthur also had the U.S. Fifth Fleet as well as the Royal Australian Air Force and the small U.S. Seventh Fleet comprising U.S., Australian, and Dutch warships.

To regain the initiative, Adachi ordered his 102nd Regiment to attack Wau on January 16. By January 28 the Japanese had driven Kanga Force to the edge of Wau Airfield, but the Australian 17th Brigade then flew in under Japanese fire to reinforce Wau. The fighting lasted until January 30, when the Japanese retreated to Salamaua. This defeat depleted the Japanese forces available to defend Lae/Sala-maua, and on February 28 the bulk of the Japanese 51st Division boarded eight merchantmen at Rabaul and, escorted by eight destroyers, sailed for Lae.

On March 1, Allied aircraft spotted this convoy in the Bismarck Sea.

MacArthur's air commander, Lieutenant General George Kenney, sent 181 aircraft against the Japanese. Employing skip-bombing techniques, during March 2–5 Kenney's aircraft sank all eight Japanese transports and four of the destroyers, resulting in the loss of some 3,700 men. Only 850 Japanese soldiers reached Lae. In retaliation, the Japanese attempted to destroy Allied airpower in Papua and Guadalcanal. Between April 11 and 14, Japanese aircraft struck Oro Bay, Milne Bay, and Port Moresby, sinking two Dutch merchantmen and destroying 45 Allied planes. But Japanese aircraft losses were higher.

Both sides now slowly built up their forces. The Japanese used barges and submarines to bring reinforcements to Lae and Salamaua. MacArthur flew troops into Wau. During April, the Australian 3rd Division assembled at Wau and began to push toward Salamaua. MacArthur needed a coastal base for his twin offensives against Lae and Salamaua, and in the Seventh Fleet's first amphibious operation, the U.S. MacKechnie Force (named for Colonel Archibald R. MacKechnie) seized Nassau Bay on June 29, 1943. The Americans then moved up the coast toward Salamaua, linking up with the Australians on July 21.

U.S. infantrymen advance past the wreckage of a Japanese plane near the Kamiri airstrip in New Guinea. The island of Noemfoor was taken within two days, and the Americans moved on to Saipan to achieve the same result. (Getty Images)

Distracted by this threat, the Japanese were surprised by a U.S. airborne drop on Nazab in the Markham Valley on September 1. Allied forces quickly constructed airfields to receive the 7th Division, which began an inland advance on Lae. The 9th Division then landed north of Lae on September 4. The encircled Japanese abandoned Salamaua on September 17 and then Lae the next day and retreated into the interior.

Pursued by the 7th Division, the Japanese conducted a fighting withdrawal through the rugged terrain of the Markham and Ramu Valleys. It took the Australians a month to overcome a key Japanese position at Sattelberg. To prevent the Japanese from reaching Finschhafen on the coast, the Australian 20th Brigade landed farther west at Scarlet Beach on September 22.

Now isolated, the defenders of Finschhafen joined the Japanese exodus inland on October 2. Adachi tried to retake Finschhafen by counterattacking Scarlett Beach on October 20, but his forces were defeated. MacArthur had found a winning strategy. He used the Australians to engage the Japanese while his American forces bypassed Japanese strongholds.

On December 23, 1943, U.S. marines invaded New Britain Island. The Allies then constructed air bases there, enabling them to neutralize Japanese aircraft from Rabaul. On January 2, 1944, the U.S. 126th Infantry Regiment invaded Saidor and began a coastal drive on Madang. Meanwhile, the Australians pursued the Japanese overland toward Bogadjim, where a supply road led to Madang. Japanese defenses that were centered around Shaggy Ridge were taken on January 23.

On February 29, 1944, U.S. forces invaded the Admiralty Islands north of New Guinea, severing the Japanese Eighteenth Army’s lifeline to Rabaul. Then on February 10, the Australians linked up with the Americans at Saidor. The Japanese high command reacted to this by withdrawing its defense line to Wewak, supported by a new base at Hollandia in Dutch New Guinea. The Japanese then sent their 6th Air Division from the Netherlands East Indies to defend these bases. Radio intercepts revealed these plans to MacArthur, who ordered an air offensive against Wewak and Hollandia. From March 30 to April 16, the Fifth Air Force obliterated the 6th Air Division, destroying 390 planes and killing 2,000 Japanese pilots and air personnel.

After the fall of Bogadjim on April 17, 1944, the road to Madang was open for the Allies. Adachi evacuated his Madang headquarters, intending to

fall back on Wewak and Hollandia. On April 24, the Australians entered Madang. Two days previously, U.S. forces had invaded Hollandia and Aitape. The Allied capture of Aitape 125 miles east of Hollandia blocked the escape of the Eighteenth Army. Now desperate, Adachi used his dwindling resources to transport three regiments to Aitape. Their unexpected attack on July 11 drove the U.S. 32nd Infantry Division to the Driniumor River. Fighting continued until August 25, when the Japanese retired to Wewak.

During October 1944, the Australians replaced the Americans at Aitape. MacArthur's return to the Philippines was to be an American operation, with the Australians assigned to containing the bypassed Japanese. But the Australian government wanted Wewak retaken. This pointless offensive had little air or naval support, because that had gone to the Philippines. On May 23, 1945, Wewak fell to the Australians, and Adachi withdrew into the Prince Alexander Range for a last stand. The remnants of the Eighteenth Army surrendered there on September 13, 1945.

New Zealand

An island nation located in the Southwestern Pacific, New Zealand consists of the two large North and South Islands and numerous smaller islands. New Zealand covers 103,483 square miles and is situated some 900 miles east of Australian across the Tasman Sea and some 600 miles south of New Caledonia. With a population of only 1.6 million people in 1939, New Zealand made a major effort in World War II; it suffered the highest proportion of soldiers killed of any Commonwealth participant, and its expenditure on the war as a percentage of gross national product equaled that of Britain.

New Zealand declared war on Germany shortly before midnight on September 3, 1939 (the same date as Great Britain). Two days later, Prime Minister Michael Joseph Savage affirmed his country's support for Britain: "Where she goes, we go; where she stands, we stand." The only real opposition to New Zealand's participation in the war came from the country's small Communist Party. Apart from mines laid off its ports by auxiliary cruisers, New Zealand never came under actual attack by Axis forces.

New Zealand immediately pledged to raise a division-strong expeditionary force to serve with Commonwealth forces, train pilots for the Royal Air Force (RAF), and expedite shipments of food—chiefly meat, butter, and cheese—to help feed Britain (before the war, 97 percent of New Zealand food exports went to the United Kingdom). Wellington (its capital) also released the New Zealand Division of the Royal Navy for service at the discretion of the British government and transferred other assets, including aircraft and personnel, to British command. Finally, the government initiated programs to enhance New Zealand's own military capabilities.

In June 1940, the government introduced conscription. Price and wage controls as well as rationing were all gradually implemented to secure adequate supplies of food for export to Britain and help feed U.S. troops in the Pacific and to protect the economy. In July 1940 the General Assembly formed a war cabinet, and in 1942 a national unity government came into being. Also, for the first time in its history, New Zealand established diplomatic missions with non-Commonwealth nations, including the United States.

During the war, some 306,000 men were called up for military service. In June 1942, New Zealand had 157,000 in its armed services, 50,000 of them serving overseas. This represented half the adult male population aged 18 to 45 and 30 percent of the adult male workforce. One effect of this mobilization was a dramatic increase of women in the workforce, including in war-related industries. Also, at its peak in 1942, some 75,000 women served in organizations under the Women's War Service Auxiliary. Efforts were also initiated to mobilize the Maori population of some 90,000 people, including the formation of a Maori Battalion organized along tribal lines.

In 1939, the Royal New Zealand Air Force (RNZAF) consisted of two bomber squadrons. During the war, the government maintained two reconnaissance squadrons in New Zealand and two in Fiji. New Zealand's main contribution early in the air war, however, was to train RAF aircrew. At the beginning of the war, more than 500 New Zealanders served in the RAF; at the end of the conflict there were more than 10,000, including those in seven New Zealand squadrons.

RNZAF servicemen were in Great Britain undergoing training when the war began. These crews and their planes fought with the RAF in the July 10–September 30, 1940, Battle of Britain, in which 129 RNZAF pilots died. RNZAF pilots also served on Malta and in Africa. By the end of the war, the RNZAF boasted 83 aces.

To protect against German raiders in the Pacific, the British turned over a variety of aircraft to New Zealand, including reconnaissance aircraft and bombers. Most of the planes were outdated, however, and the entry of Japan into the war necessitated the formation of New Zealand–based air squadrons. These fell under the operational command of the United States.

The RNZAF made a significant contribution to the air war in the Pacific; seven squadrons and a radar squadron supported the Guadalcanal Campaign (August 1942–February 1943), and five fought in the battles for the Eastern Solomon Islands. Some 45,000 served in the RNZAF during the war, one-third of them in the Pacific. By the end of the war, the RNZAF had grown from 766 personnel and 102 aircraft to 42,000 personnel with 1,336 aircraft. One-quarter of pilots aboard British carriers at the end of the war were from New Zealand. The RNZAF recruited women, and by August 1943 the Women's Auxiliary Air Force numbered 4,000 personnel.

In 1939, the New Zealand Division of the Royal Navy consisted of two

new light cruisers, the *Achilles* and *Leander;* a minesweeper trawler; and two British escort vessels. The *Achilles* participated in the December 13 Battle of the Río de la Plata against the German pocket battleship *Admiral Graf Spee*. Because the country's navy was initially part of the Royal Navy, some 7,000 New Zealanders who volunteered for service were assigned to British ships. Meanwhile, efforts were made to increase the nation's own naval resources. During the war, the navy added 2 corvettes, 16 minesweepers, 12 antisubmarine patrol boats, and more than 100 other craft. In October 1941, King George VI authorized the formal creation of the Royal New Zealand Navy (RNZN) with its own command structure, independent of the Royal Navy.

With a total population of less than 2 million, New Zealand was strained by wartime demands. Women worked on farms and in factories to ensure production of food and provide facilities for American soldiers stationed in the South Pacific. (Library of Congress)

RNZN forces concentrated on minesweeping and defensive mine-laying operations and provided convoy protection for merchant vessels in the Pacific. They also escorted troopships on their way to Europe and the Middle East and hunted German commerce raiders. When Japan entered the war, the RNZN vessels joined the British Far East Fleet, but after the sinking of the

Royal Navy battleship *Prince of Wales* and battle cruiser *Repulse*, the nation's naval assets in the Pacific were placed under the auspices of the U.S. forces until the return of the Royal Navy in 1944. Women also served in the RNZN; in 1944, there were 500 women in the New Zealand section of the Women's Royal Naval Service.

The initial New Zealand ground contribution came in the form of the Second New Zealand Expeditionary Force (2nd NZEF, so designated to distinguish it from the First Expeditionary Force of World War I). Major General Bernard Freyberg commanded the 2nd NZEF, whose members were commonly referred to as the "Kiwis." The New Zealand Division (designated the 2nd Division in June 1942) represented, in terms of percentage of population, the equivalent of 25 British divisions. In June 1940, the government began conscripting men, and over the next five years it called up 306,000 men. At the peak in September 1942, there were 157,000 New Zealanders in the armed services, of whom 50,000 were stationed overseas. This was an astonishing effort for such a small nation.

Troops from the New Zealand Division were sent to Egypt at the onset of the war and then fought in the Balkan Campaign in 1941. Following the evacuation of the British Expeditionary Force from Greece, Freyberg was appointed commander on Crete with two New Zealand brigades. There the Kiwis lost almost half their number as casualties or prisoners of war. In New Zealand, the May 1941 Battle for Crete was seen as a testament to the toughness of the Kiwi troops. New Zealand troops also served in North Africa in 1942 and in the 1943–1945 Italian Campaign.

After Japan entered the war, public sentiment demanded the return of troops to protect New Zealand from Japanese invasion. To forestall the recall of New Zealand forces from the Middle East, British prime minister Winston L. S. Churchill called on Washington to take up the slack, and the U.S. government agreed, as in the case of Australia, to reinforce New Zealand. The soldiers intermingled with the local population, and by the end of the war there had been some 1,400 marriages between U.S. servicemen and New Zealand women.

The New Zealand government attempted to raise another division of troops to fight in the Pacific, but after two years it found that it could neither spare the manpower, nor did it have the financial resources. Consequently, the division was disbanded. In 1944 the government released more than 9,000

men from this 3rd Division for civilian work, half of whom went into agriculture.

Kiwi forces fought in several battles in the Pacific. They also relieved American units for service elsewhere, including on Vella Lavella. Royal New Zealand Army (RNZA) units also provided a variety of combat support functions, including engineering and logistics for Allied forces in the Pacific. Women served in the RNZA as well. Formed in 1941, the Women's Army Auxiliary Corps had 4,600 members in July 1943.

In the war, New Zealand suffered 11,671 dead (6,839 in the army, 4,149 in the air force, 573 in the navy, and 110 in the merchant navy), 15,749 wounded, and 8,469 prisoners taken. This amounted to some 6.7 percent of the population.

Niemöller, Martin (1892–1984)

German clergyman and opponent of National Socialism. Born on January 14, 1892, in Lippstadt, Westphalia, Martin Niemöller joined the navy in 1910

and served with distinction as a U-boat captain during World War I. Following the war, Niemöller studied theology at the University of Münster and was ordained a Lutheran minister in 1924. In 1931, he accepted a pastoral post in Berlin-Dahlem.

Niemöller initially supported the National Socialists and voted for the party beginning in 1924. After Adolf Hitler came to power in January 1933, however, Niemöller became concerned about Nazi attempts to control the churches, and he opposed government interference in religious matters. He helped lead religious opposition to the regime and also helped to found the Pastors' Emergency League in September 1933 and the Confessional Church, formed in opposition to Nazi-imposed church organization, in May 1934.

Following a verbal confrontation with Hitler during a meeting in January 1934, Niemöller found himself targeted by the Nazi regime. Arrested in July 1937 by the Gestapo and tried on charges of "attacks against the state" and "abuse of the pulpit," he received a sentence of seven months, but the court considered it already served. Immediately afterward, the Gestapo again seized Niemöller and sent him to Sachsenhausen concentration camp as the führer's personal prisoner. In 1941, Niemöller was transferred to Dachau, where he remained for the rest of the war.

Surviving the concentration camps, Niemöller helped draft the "Stuttgart Confession of Guilt." This document stated that German Protestant churches had been morally responsible for failing to resist the Nazis. He also opposed German rearmament in the 1950s and became a peace activist. Niemöller died in Wiesbaden on March 6, 1984.

Nie Rongzhen (1899–1992)

Chinese Communist military general and later marshal of the People's Republic of China. Born in Jiangjin (Chiang-ching) in Sichuan (Szechwan), China, on December 29, 1899, Nie Rongzhen (Nieh Jung-chen) went to France in late 1919, where he joined the Paris branch of the Chinese Communist Party (CCP) in 1923. Returning to China in 1925, Nie, together with fellow CCP member Ye Ting (Yeh T'ing), joined the staff of the Huangpu (Whampoa) Military Academy as a political instructor and secretary-general of its Political Department. Nie left his post in early 1926 because its commander, Jiang Jieshi (Chiang Kai-shek), was suspicious of the CCP. Nie next worked in the CCP Guangdong (Kwantung) Regional Commission, representing the party to cooperate with the Guomindang (Kuomintang, Nationalist, GMD) to launch the Northern Expedition of 1926–1928.

After the GMD-CCP split in mid-1927, Nie cooperated with Ye, who was a regimental commander of the Nationalist forces, in staging two abortive uprisings at Nanchang in Jiangxi (Kiangsi) and at Guangzhou (Canton) in Guangdong, in August and December, respectively. At year's end, Nie fled abroad. He returned to Shanghai in 1930, organizing efforts to educate the masses about communism. In December 1931, Nie went to the central Soviet base at Ruijin (Juichin) in Jiangxi, where he helped organize the Red Army and the Long March of 1934–1935.

After the Second Sino-Japanese War began in July 1937, Nie became deputy commander and political commissar of Lin Biao's (Lin Piao) 115th Division of the Eighth Route Army, a product of the GMD-CCP united front, and he participated in the September Battle of Pingxing Pass (P'inghsingkuan) in Shanxi (Shansi). Nie was then sent to the Wutai (Wu'tai) mountain area to develop a guerrilla base behind Japanese lines.

Nie also cooperated with local leaders on the borders of Shanxi in Hebei (Hopeh) and Chaha'er (Chahar), a province comprising the northwestern part of today's Hebei and part of Inner Mongolia, in establishing a regional government in the summer of 1938. Through its participation in the August–December 1940 "Hundred Regiments" offensive and in anti-Japanese mopping-up operations since November 1940, the Shanxi-Chaha'er-Hebei border region helped restore Chinese administration to a considerable part of

northern China before the war's end. In August 1943, Nie returned to Yan'an, where he remained until the war's end.

After Japan surrendered, Nie moved into Inner Mongolia and Manchuria, reestablishing Chinese Communist power in northern China, which ensured the CCP's victory in the Chinese Civil War in 1949. In 1955, Nie was rewarded by being named among 10 marshals of the People's Liberation Army. Nie died in Beijing (Peking) on May 14, 1992.

Nimitz, Chester William (1885–1966)

U.S. Navy fleet admiral and commander of the Pacific Fleet. Born on February 24, 1885, in Fredericksburg, Texas, Chester William Nimitz graduated from the U.S. Naval Academy at Annapolis in 1905. He first served with the U.S. Asiatic Fleet. Promoted to lieutenant in 1910, he assumed command of the submarine *Skipjack* in 1912. He then studied diesel engine construction in Europe and supervised construction of the U.S. Navy's first diesel ship engine. On U.S. entry into World War I in April 1917, Lieutenant Commander Nimitz served as chief of staff to the commander of submarines in the Atlantic Fleet (1917–1919).

Following the war, Nimitz was appointed to the Navy Department staff in Washington, and in 1920 he transferred to Pearl Harbor to oversee construction of a new submarine base there. During the next 20 years, he served in a wide variety of submarine billets as well as in battleships and destroyers. Promoted to captain in 1927, he spent several tours in Washington and helped establish the first Naval Reserve Officer Training Corps programs

at U.S. universities. He was assistant chief of the Bureau of Navigation during 1935–1938 and was promoted to rear admiral in 1938.

Nimitz led a cruiser division and then a battleship division. When Japan attacked Pearl Harbor on December 7, 1941, he was serving as chief of the Bureau of Navigation. On December 31, 1941, on the recommendation of Secretary of the Navy Frank Knox, President Franklin D. Roosevelt secured the promotion of Nimitz to full admiral and appointed him commander of the U.S. Pacific Fleet, replacing Admiral Husband E. Kimmel at Pearl Harbor.

Although a single U.S. command in the Pacific would have been more satisfactory, General Douglas MacArthur would not agree to serve under a naval officer. As a result, two commands emerged. As commander in chief, Pacific Ocean Area, Nimitz directed all U.S. military forces in the Central Pacific and provided support to MacArthur and his forces in the Southwest Pacific.

Admiral Chester W. Nimitz commanded the U.S. Pacific Fleet and the Pacific Ocean Area during

World War II. (Naval Historical Society)

Although the Allies made the war against Japan secondary to their Europe First strategy, Nimitz did not delay his plans to halt Japanese expansion, retake territory lost to Japan, and bring the war to the Japanese homeland. Using information provided by U.S. code breakers about Japanese plans, Nimitz halted the Japanese invasion of Port Moresby in the Battle of the Coral Sea (May 7–8, 1942) and the Japanese effort to take Midway on June 3–6. The latter battle gave the United States the initiative.

Nimitz and MacArthur cooperated in a series of island-hopping campaigns that progressed closer and closer to the Japanese mainland. Nimitz's forces took the Gilbert Islands in November 1943, the Marshalls in February 1944, and the Marianas in August 1944. In October, he joined MacArthur's forces to retake the Philippines.

Nimitz's accomplishments were recognized in December 1944 by his promotion to the newly established five-star rank of fleet admiral. His forces were preparing to invade Japan when the Japanese surrendered. On September 2, Nimitz signed the formal Japanese surrender aboard the battleship *Missouri* in Tokyo Bay.

Nimitz returned to Washington in October and assumed the post of chief of naval operations. For the next two years, he supervised the postwar demobilization of men and ships and provided input into the development of nuclear-powered submarines. Nimitz retired in December 1947. In the following years, he briefly served as adviser to the secretary of the navy, and for two years (1948–1949) he was the United Nations commissioner for Kashmir. He also served for eight years as a regent of the University of California. Nimitz died on February 20, 1966, on Yerba Buena Island, California.

Nishimura Shoji (1889–1944)

Japanese Navy vice admiral. Born in Akita Prefecture on November 30, 1889, Nishimura Shoji graduated from the Japanese naval academy in 1911 and specialized in navigation. After graduation from the naval war college in 1918, Nishimura served as a navigation officer on destroyers and cruisers. Promoted to commander, he captained several destroyers during 1926–1929. He then commanded destroyer squadrons (1931–1936). Promoted to captain in 1934, Nishimura commanded the 10th Destroyer Division. From 1937 to 1940, he commanded first the cruiser *Kumano,* then the battleship *Haruna,* and then the 4th Torpedo Flotilla. Promoted to rear admiral in November 1940, he took command of the 4th Destroyer Squadron.

Nishimura's 4th Destroyer Squadron participated at the beginning of the Pacific war in amphibious operations in the northern Philippines and Balikpapan and Borneo in the Netherlands East Indies, and it fought in the Battle of the Java Sea (February 27, 1942). In June 1942, Nishimura assumed command of the 7th Cruiser Division and fought in the naval battles off Guadalcanal (August 1942–February 1943). In 1943, he was promoted to vice admiral and assigned command of the 2nd Battleship Squadron. He commanded C Force, Southern Force, in the SHŌ-1 plan, an attempt to reach the U.S. landing beaches in Leyte Gulf through Surigao Strait in the October 23–26, 1944, Battle of Leyte Gulf.

Nishimura's force was met in Surigao Strait by Rear Admiral Jesse B. Oldendorf's Task Group 77.2 of 6 old battleships, 4 heavy cruisers, 4 light cruisers, 28 destroyers, and 39 patrol-torpedo (PT) boats. Early in the morning of October 25, 1944, Nishimura's ships were first savaged by the U.S. PT boats and destroyers along the strait, with the U.S. battleships and cruisers athwart the end of the strait, in effect crossing the T of Nishimura's formation. In the ensuing battle, all of Nishimura's ships were sunk except

the destroyer *Shigure*. Oldendorf lost no ships, and only one destroyer was badly damaged when it was caught in the cross fire of Japanese and U.S. guns. Nushimura died during the battle.

Nishi Takeichi (1902–1945)

Japanese Army colonel. Born in Kagoshima on July 12, 1902, Nishi Takeichi graduated from both the Hiroshima Army Cadet School and the Japanese military academy. He was initially trained as a cavalry officer. A brilliant horseman, Lieutenant Nishi won an equestrian gold medal in the 1932 Olympic Games and became a national hero. He also took part in the 1936 Olympic Games in Berlin.

After working in teaching and administrative posts, Nishi was transferred to a mechanized unit. In the late 1930s and early 1940s the cavalry was gradually abolished, and various cavalry units were reorganized as mechanized scout units and attached to infantry divisions. As a part of this program, in 1942 Lieutenant Colonel Nishi assumed command of the 26th Division Scout Regiment. In 1943 he took charge of the 1st Division Scout Regiment, and in March 1944 he commanded the 26th Tank Regiment. In late 1944 Nishi and his tank regiment were sent to Iwo Jima, but half of his tanks and equipment were lost en route to U.S. submarine attack.

On Iwo Jima, Nishi came under the command of Lieutenant General Kuribayashi Tadamichi. Nishi dug in his 27 tanks and a small artillery unit. His unit fought tenaciously in the February 19–March 26, 1945, Battle of Iwo

Jima. Nishi died in the fighting on March 22 and was posthumously promoted to full colonel.

Noble, Sir Percy Lockhart Harnam (1880–1955)

British Royal Navy admiral. Born on January 16, 1880, into a military family stationed in India, Percy Noble entered the Royal Navy in 1894. Before and after World War I, the energetic and diplomatic Noble qualified as a signal specialist and served on a wide variety of destroyers and cruisers and on the royal yacht, often in staff positions.

Promoted to rear admiral in 1929 and to vice admiral in 1936, when he was also knighted, Noble became fourth sea lord in 1935 and commanded the China station from 1937 to 1940. Here he skillfully handled numerous Japanese threats against Hong Kong and Shanghai without provoking outright hostilities.

In February 1941, Noble became commander in chief, Western Approaches, based at Liverpool, with primary responsibility for interdicting U-boat attacks on British-bound convoys. Realizing that specialized antisubmarine training was the key to success, he instituted intensive programs and exercises to this end and also improved coordination within convoy escort groups, greatly enhancing the effectiveness of convoy protection. Noble frequently went to sea with ships under his command and flew with Coastal Command aircraft. His efforts laid the foundations for the eventual success of British antisubmarine efforts in the Atlantic.

In November 1942, Noble went to Washington as head of the British Admiralty delegation to the Combined Chiefs of Staff. His qualities of tact, firmness, and common sense all proved valuable in planning smoothly

coordinated joint naval operations. In 1943, Noble became first and principal naval aide-de-camp to King George VI. Noble retired in January 1945 and died in London on July 25, 1955.

Noguès, Charles Auguste Paul (1876–1971)

French Army general. Born in Monléon-Magnoac on August 13, 1876, Charles Auguste Paul Noguès graduated from the École Polytechnique in 1899 and was commissioned in the artillery. He served in Morocco and Tunisia before joining the staff of legendary colonial administrator General Louis Hubert Lyautey. During World War I, Noguès fought on the Western Front and rose to command his artillery regiment. After holding high staff positions in Paris, he returned to Morocco. In 1936, he became resident general and commander in chief of all Moroccan troops.

Appointed commander in chief, North African theater, in 1939, Noguès maintained order locally despite losing many of his forces to the Western Front. He initially urged the Vichy government to fight on in North Africa rather than sign an armistice with Germany, but he soon became less sanguine as to the practicability of such a course, whereupon he followed Vichy orders and arrested French officials who fled to his jurisdiction hoping to continue the fight against Germany.

Noguès reverted to his Moroccan position after the armistice, and in June 1941 he retired from the army, retaining only his civil position. Although anti-German, Noguès sought to observe the armistice terms, fearing any Allied liberation effort might provoke an uprising by the Moroccan people against French rule. In November 1942, General Antoine Béthouart informed

him that Allied forces would shortly land in Algiers and sought to win him over. Noguès ordered Béthouart's arrest, and only the timely arrival of the Allies saved him from execution. Noguès also ordered his forces to resist the Allies, which many did.

Following negotiations with Allied and Free French representatives, in December 1942 Admiral Jean Darlan took authority in Algiers, but later that month he was assassinated. Because the Allies initially needed his support, for several months Noguès retained his authority in Morocco and was also appointed deputy high commissioner for French North Africa. Predictably, Noguès was appalled when U.S. president Franklin D. Roosevelt promised Morocco independence. In June 1943 when Free French leader Charles de Gaulle bested General Henri Giraud in the internecine struggle for power in Algiers, Noguès lost his post and fled to Lisbon.

In November 1947, a French court sentenced Noguès in absentia to 20 years' hard labor, a sentence later confirmed but on his appearance in court immediately revoked in 1954, whereupon Noguès returned to Lisbon. He died in Paris on April 20, 1971.

Nomonhan Incident

See Khalkhin Gol, Battle of

Nomura Kichisaburō (1887–1964)

Japanese Navy admiral and diplomat. Born in Wakayama on December 10, 1887, Nomura Kichisaburō graduated from the Japanese naval academy in 1898 and fought in the 1904–1905 Russo-Japanese War. He taught at the Japanese naval academy in 1905. Nomura then studied in Australia from 1908 to 1910 and in Germany during 1910 and 1911. Appointed naval attaché to the United States in 1914, Nomura was promoted to captain in 1917.

Promoted to rear admiral in 1922, Nomura became vice chief of the Navy General Staff in 1926, when he was also promoted to vice admiral. In 1927 Nomura assumed command of the Third Fleet. On April 29, 1932, Nomura lost his right eye in an attack by Chinese aircraft on his ship off Shanghai. Promoted to admiral in 1933, Nomura retired from the navy in 1937.

In 1939, Nomura was appointed foreign minister in the cabinet of Prime Minister Abe Nobuyuki. In February 1940, he was appointed Japanese ambassador to the United States, in large part because he was acquainted with U.S. president Franklin D. Roosevelt. Nomura negotiated with U.S. secretary of state Cordell Hull and Roosevelt to ease tensions between the United States and Japan. In his negotiations with Hull, Nomura ran up against Foreign Minister Matsuoka Yosuke's belief that the Tripartite Pact with Germany and Italy would deter the United States from entering the war.

In July 1941, Prime Minister Konoe Fumimaro dismissed Matsuoka as foreign minister but too late for Nomura to improve the situation. In addition, Nomura was not informed in advance of his government's decision to attack Pearl Harbor on December 7, 1941.

During the Pacific war, Nomura was an adviser to the Privy Council, and after the Japanese surrender, he was elected a member of parliament. Nomura died in Tokyo on May 8, 1964.

Norden Bombsight

Primary U.S. bombsight for precision daylight bombing. It was developed by Dutch-born U.S. immigrant Carl Lukas Norden, who was initially employed by Sperry Gyroscope Company designing bombsight equipment for the U.S. Navy. Norden left Sperry in 1915 to establish his own business, and by 1931 he had developed a sight that was superior to that of Sperry. The navy was interested in the sight to enable it to carry out bombing of enemy ships from 20,000 feet. The navy then discovered that it was virtually impossible to hit maneuvering ships from high altitude, regardless of the bombing device, and decided to concentrate on dive-bombing. The U.S. Army Air Corps remained interested in high-altitude, level-flight precision bombing, though, and in 1935 it purchased the sight for that purpose.

In the years before World War II, Army Air Corps engineers improved the Mark XV bombsight and the Army Type C-1 autopilot. During "undisturbed" runs, where speed and altitude were maintained for 15–20 seconds, bombardiers using the Norden could place their bombs within 200 feet of the target from altitudes of 12,000 to 15,000 feet.

The Norden was essentially an analog computer that addressed the problem of accurately hitting a target from an aircraft at high altitude. The sight had to compensate for flight speed, wind direction, and height. This was accomplished through a collection of gyros, motors, mirrors, gears, and cams. At the heart of the Norden was an autopilot device that allowed the bombardier to control the plane and line up the crosshairs on the target.

Bombardiers claimed that the Norden enabled them to place a bomb in "a pickle barrel" from 20,000 feet. But the Norden was accurate only under ideal conditions and with a long, level run to the target. Under combat conditions of flak, fighters, and clouds, results were not so effective. Still, no other country possessed anything comparable to the Norden, and it became one of the most guarded pieces of equipment during the war. The sight was under cover while on the ground, and bombardiers were required to take an oath to destroy the sight if they were shot down.

More than 40,000 Norden sights were built in World War II. It continued to be the primary daytime sight for the U.S. Air Force in the Korean War.

Some were recalled for service by the U.S. Navy during 1967–1968 for the Vietnam War.

NORDWIND, Operation (December 31, 1944–January 25, 1945)

German code name for their 1944 New Year's Eve attack on Lieutenant General Alexander Patch's U.S. Seventh Army of the 6th Army Group. One hour before midnight on December 31, 1944, without artillery preparation, the German XIII SS Panzer Corps of Colonel General Johannes Blaskowitz's Army Group G, led by the 17th SS Panzergrenadier Division, struck Major General William F. Dean's U.S. 44th Infantry Division in the center of Major General Wade H. Haislip's U.S. XV Corps, between Sarreguemines and Rimling, and headed for the Rohrbach road junction, which had previously been contested.

South and southeast from Bitche, a much less powerful German thrust by the 256th and 361st Volksgrenadier Divisions made deeper gains because that area of the Low Vosges was only lightly held by a cavalry task force of Major General Edward H. Brooks's VI Corps. This task force was composed of the 117th Cavalry Reconnaissance Squadron, part of Combat Command R, 14th Armored Division; a tank destroyer company; and a chemical mortar company. By dawn on January 1, 1945, the U.S. task force was in a hasty retreat, the 117th having to extricate itself from virtual encirclement.

By January 4, the German XC Corps of the German First Army had punched a hole some six miles deep into the Seventh Army front, reaching to the town of Wingen on the Moder River. The two German corps hoped to

reach the Saverne Gap, severing the Seventh Army's line of communication on the Rhine and in the Lauterbourg salient. If they could accomplish this, they would also envelop Major General Withers A. Burgess's U.S. 100th Infantry Division.

On January 4, General of Division Jacques Philippe Leclerc's French 2nd Armored Division moved into position to support XV Corps. That day, the Germans employed captured U.S. M4 Sherman tanks against the French in an unsuccessful effort to take Gros-Rederching, which lay on the border between the 100th and 44th Divisions.

Supreme Allied commander General Dwight D. Eisenhower had believed that Patch's extended line was dangerous and had so informed Sixth Army Group commander Lieutenant General Jacob Devers. When the Germans attacked Patch, Eisenhower ordered Devers to pull VI Corps back and hold the forward areas with reconnaissance units. He believed that the German offensive in the area would slow down and that light troops might stop a German reoccupation of Alsace. But when Devers announced the withdrawal, which would expose Strasbourg to recapture, French head of state General Charles de Gaulle vowed to withdraw all French forces from his command. Faced with an immovable de Gaulle, Eisenhower relented.

The Germans forced both VI Corps and XV Corps back to positions on or near the Moder River. The two corps completed forming the new line on the night of January 20–21. The Germans launched a six-division drive on January 24, but it was blunted by the following day, and German forces began to withdraw soon afterward.

Normandy Invasion (D-Day, June 6, 1944) and Campaign

The cross-Channel invasion of France. U.S. officials, principally U.S. Army chief of staff General George C. Marshall, had long sought the earliest possible invasion of France as the way to win the war in the shortest possible time. They supported both GYMNAST, a British cross-Channel invasion contingency plan for late 1942, and ROUNDUP, a 48-division invasion of France projected to occur by April 1943. The failure of the Allied raid on Dieppe, France (Operation JUBILEE), on August 19, 1942, however, led the Americans to concede the British position that a cross-Channel invasion was many months, if not years, in the future. Prime Minister Winston L. S. Churchill and British planners meanwhile sought to interest the United States in a more opportunistic approach that would include operations in the Mediterranean theater, and the Americans reluctantly went along.

This led to Operation TORCH, the Allied invasion of North Africa (November 8, 1942), and to subsequent British and U.S. landings in Sicily and Italy. The United States insisted, however, that the 1943–1945 Italy Campaign would be a secondary effort. At the Tehran Conference in November 1943, Soviet leader Joseph Stalin had pressed President Franklin D. Roosevelt and Churchill for the cross-Channel invasion. Stalin agreed to mount a major offensive by the Soviets on the Eastern Front to coincide with the landing. He also pressed Roosevelt to name the commander of the invasion force, and shortly after the conference Roosevelt appointed General Dwight D. Eisenhower to the post of Supreme Commander, Allied Expeditionary Force.

Fortress Europe and its coasts of Holland, Belgium, and France bristled with all manner of German fortifications and booby traps. Organization Todt had begun erecting defenses there in mid-1942. Over the next two years, the

Germans used some 17.3 million cubic yards of concrete and 1.2 million tons of steel in thousands of fortifications. Field Marshal Erwin Rommel, who had command of Army Group B and the coastal defenses, disagreed with German field marshal Gerd von Rundstedt, commander in chief, west.

Rommel, well aware from the campaign in North Africa what complete Allied domination of the air would mean, believed that if it was to be stopped at all, the invasion had to be defeated on the beaches. Rommel told Adolf Hitler, “If we don’t manage to throw them back at once, the invasion will succeed in spite of the Atlantic Wall.”

Rundstedt and Hitler placed their hopes in a large mobile reserve that would defeat the Allied forces once they were ashore. Hitler seems to have welcomed the invasion as a chance to engage and destroy the British and U.S. forces. In Britain, the Allied armies could not be touched; in France, they could be destroyed. Hitler was convinced that the Allied effort would result in another Dieppe. “Let them come,” he said. “They will get the thrashing of their lives.”

Rommel did what he could, supervising the construction of elaborate defenses, the placement of half a million foreshore obstacles, and the laying of some 4 million mines. Rommel had at his disposal the Fifteenth Army in northern France and the Seventh Army in Normandy—a total of 25 static coastal divisions, 16 infantry and parachute divisions, 20 armored and mechanized divisions, and 7 reserve divisions. The Germans were weak in the air and on the water, however. The Third Air Fleet in France deployed only 329 aircraft on D-day, whereas German naval forces in the area consisted of 4 destroyers and 39 E-Boats. Germany also deployed several dozen U-boats, most from French ports, during the campaign.

Meanwhile, U.S. and British aircraft worked to soften the German defenses and isolate the beachheads. Between April 1 and June 5, 1944, Allied aircraft flew 200,000 sorties in support of the coming invasion and dropped 195,000 tons of bombs. The Allies lost 2,000 aircraft in the process, but by D-day they had largely isolated the landing areas and achieved virtually total air supremacy.

The Germans also greatly strengthened the English Channel port defenses, which Hitler ordered turned into fortresses. All of this was for naught, because as German minister of armaments Albert Speer noted, the Allies came over the beaches and “brought their own port with them.… Our

whole plan of defense had proved irrelevant." In one of the greatest military engineering achievements in history, thousands of men labored in Britain for months to build two large artificial harbors, known as Mulberries A and B. Plans called for these, after the initial Allied landings, to be hauled across the Channel from Britain and sunk in place. Their importance to the Allied cause may be seen in that by the end of October, 25 percent of stores, 20 percent of personnel, and 15 percent of vehicles had passed through Mulberry B.

The Allies worked out precise and elaborate plans for the mammoth cross-Channel invasion, code-named OVERLORD, to occur on the Cotentin Peninsula in Normandy. British admiral Bertram H. Ramsay had overall command of the naval operation, code-named NEPTUNE, and British general Bernard Montgomery exercised overall command of the land forces. The object of the operation was "to secure a lodgement on the continent, from which further offensive operations can be developed."

The landing would be preceded by a night drop of paratroops. General Marshall, an enthusiastic supporter of airborne forces, urged the use of five airborne divisions, but Eisenhower had his doubts, and as it transpired, only three were used: the British 6th and the U.S. 82nd and 101st. The lightly armed paratroopers, operating in conjunction with the French Resistance, had the vital task of securing the flanks of the lodgment and destroying key transportation choke points to prevent the Germans from reinforcing their beach defenses. The German 21st Panzer and 12th Schutzstaffel (SS) Panzer Divisions were stationed just outside Caen. If they were permitted to reach the beaches, they could strike the amphibious forces from the flank and roll them up.

The amphibious assault would occur early in the morning after the airborne assault with five infantry divisions wading ashore along the 50-mile stretch of coast, divided into five sectors. The designated beaches were, from west to east, the U.S. 4th Infantry Division (Utah), the U.S. 1st Infantry and 29th Infantry Divisions (Omaha), the British 50th Infantry Division (Gold), the Canadian 3rd Infantry Division (Juno), and the British 3rd Infantry Division (Sword). Operation OVERLORD proved to be a vast undertaking. The airborne forces alone would require 1,340 C-47 transports and 2,500 gliders. Ten thousand aircraft would secure the skies. Naval support for the invasion would come from 138 bombardment warships, 221 destroyers and other

convoy escorts, 287 minesweepers, 495 light craft, and 441 auxiliaries. In addition, there were 4,000 landing ships and other craft of various sizes.

Eisenhower faced a difficult decision, given terrible weather in the days preceding the planned landing. Informed by his chief meteorologist that a break in the weather might occur, Eisenhower decided to proceed. This decision worked to the Allies' advantage, for the Germans did not expect a landing in such poor weather. The French Resistance was informed by radio code, and the airborne forces took off.

The airborne operation involving 23,400 U.S. and British paratroops and glider troops occurred on schedule on the night of June 5–6, but thick cloud banks over Normandy caused pilots to veer off course to avoid midair collisions. German antiaircraft fire, jumpy flight crews, and Pathfinders that were immediately engaged in firefights on the ground and unable to set up

their beacons led to premature drops and to paratroopers being scattered all over the peninsula. Some were even dropped into the English Channel, where they were dragged down by their heavy equipment. Gliders crashed into obstacles, and they and the paratroopers came down in fields that had been deliberately flooded by the Germans as a defensive measure. Much equipment was thus lost. Nonetheless, the wide scattering of forces caused confusion among the defenders as to the precise Allied plans. Officers collected as many men as they could, and improvised units were soon moving on the objectives, most of which were secured.

Success was likely if the Allies could establish a bridgehead large enough to allow them to build up their strength and overcome the German defenders. Once they broke out, the Allies would have the whole of France for maneuver, because their armies were fully mechanized and the bulk of the defending German forces were not. The only possibility of German success was for the defenders to rapidly commit panzer reserves, but this step was fatally delayed by two factors.

The first was Allied naval gunfire support and air superiority of 30 to 1 over Normandy itself (there were large numbers of ground-support aircraft, especially the P-47 Thunderbolt and the P-51 Mustang). The second was Hitler's failure immediately to authorize commitment of the armored reserves. Hitler was convinced that the invasion at Normandy was merely a feint and that the main thrust would come in the Pas de Calais sector. Allied deception measures played a key role in deluding him.

The British double-cross system worked to perfection. Every German agent in Britain was either dead, jailed, or working for British intelligence. The British actually controlled the entire German spy network in the United Kingdom and used it to feed disinformation to the Germans. Operations FORTITUDE NORTH and FORTITUDE SOUTH also deceived Hitler. Operation FORTITUDE NORTH caused him to believe that the Allies intended to invade Norway from Scotland, leading him to maintain and even reinforce substantial German units there; FORTITUDE SOUTH led Hitler to believe that the main Allied effort in France would be a subsequent landing in the Pas de Calais area, the narrowest point of the English Channel, and that the lodgment in Normandy was only a feint.

To this end the Allies created the "First U.S. Army Group" under Lieutenant General George S. Patton, still without command following an

incident in which he had slapped soldiers suffering from combat fatigue in Sicily. The Germans expected that the aggressive Patton would command any Allied invasion of the continent. The First U.S. Army Group, an imaginary formation of 18 divisions and 4 corps headquarters, contributed nothing to OVERLORD but did confuse the Germans.

Not until late July did Hitler authorize the movement of the Fifteenth Panzer Army from the Pas de Calais to Normandy. In effect, the deception totally immobilized 19 German divisions east of the Seine. Although units of the Fifteenth Army were moved west to Normandy before that date, this was done piecemeal, and hence they were much easier for the Allies to defeat.

Meanwhile, the actual Normandy Invasion began. In the days before the invasion, some 2,700 vessels manned by 195,000 men were on the move. In Operation NEPTUNE, the naval part of the invasion, they transported 130,000 troops, 2,000 tanks, 12,000 other vehicles, and 10,000 tons of supplies. At about 5:30 a.m. on June 6, 1944, the bombardment ships opened up against the 50-mile invasion front, engaging the German shore batteries. The first U.S. assault troops landed 30 to 40 minutes later, and the British landing craft were ashore two hours later.

The landing was in jeopardy only on Omaha Beach, where, because of rough seas, only 5 of 32 amphibious duplex-drive tanks reached the shore. Support artillery was also lost when DUKW amphibious trucks were swamped by the waves. Some landing craft were hit and destroyed, and those troops of the 1st Infantry Division who gained the beach were soon pinned down by a withering German fire. U.S. First Army commander Lieutenant General Omar N. Bradley even considered withdrawal.

American soldiers going ashore from an LCI (Landing Ship Infantry) at Normandy, while under heavy German fire, during the D-Day invasion of June 6, 1944. (Universal History Archive/UIG via Getty Images)

At 9:50 a.m., the gunfire support ships opened up against the German shore batteries. Destroyers repeatedly risked running aground to provide close-in gunnery to assist the troops ashore; indeed, several destroyers actually scraped bottom. It was nearly noon before the German defenders began to give way. The 1st Infantry and 29th Divisions overcame German opposition with sheer determination reinforced by the knowledge that there was no place to retreat.

The landings on the other beaches were not as difficult. Overall, for the first day, the Allies sustained some 10,300 casualties—4,300 British and Canadian and 6,000 U.S. A recent study suggests that a night landing would have produced fewer casualties. The Allies had used night landings with great success in the Mediterranean, but Montgomery believed that overwhelming Allied air and naval power would make a daytime landing preferable. Still, the losses were comparatively light.

The Allies put ashore 75,215 British and Canadian troops and 57,500 U.S. forces on D-day and 1 million men within a month. Unfortunately for the Allies, during June 19–20 a Force 6–7 storm blew out of the northwest and severely damaged Mulberry A in the American sector. It also sank well

over 100 small craft and drove many more ashore, bringing to a halt the discharge of supplies. Vital ammunition stocks had to be flown in. Mulberry A was abandoned, but a strengthened Mulberry B provided supplies to both armies until the end of the war.

Eventually the United States committed 60 divisions to the battle for the continent. The British and Canadians never had more than 20, and as the disparity grew, so too did U.S. influence over military and political strategy. Churchill was understandably insistent that Montgomery exercise prudence and not sacrifice his men needlessly, which would reduce British influence.

U.S. infantrymen charge a German position during the Normandy campaign. The prone soldier in the foreground is preparing to fire a rifle grenade. (Getty Images)

The Allied ground offensive proceeded more slowly than expected. Hitler ordered his armies to fight for every inch of ground rather than withdraw along phase lines as his generals wanted. At first this delayed the Allied timetable; however, it also greatly accelerated the ultimate defeat and ensured that it would be costly. Complete Allied air superiority devastated the Germans by day and forced them to move largely at night. The French Resistance also played an important role, providing the invading Allied forces with intelligence information and impeding German resupply efforts through sabotage and the destruction of rolling stock and bridges.

The Normandy countryside proved to be ideal defensive terrain. Over the centuries, the dividing lines between individual fields had been allowed to

grow up into tangled hedgerows. This bocage resisted passage and slowed the Allied advance to a crawl. On June 17 and 18, the Germans blocked Montgomery's efforts to take the city of Caen. Major General J. Lawton Collins's U.S. VII Corps had more success on the Allied right, gradually pushing across the base of the Cotentin Peninsula. On June 18, it turned north to liberate the important port of Cherbourg, while the remainder of Bradley's army maintained an aggressive defense. Cherbourg fell on June 27, but its German defenders destroyed the harbor facilities, and it would take U.S. engineers under Major General Lucius Clay six weeks to get the harbor facilities back in operation.

Not until Operation COBRA on July 25–31 were the Allies able to break out. Bradley's U.S. First Army forced the German line west of Saint-Lô, and Collins's VII Corps made the main effort. All northern France was open for the highly mechanized Allied units to maneuver. On August 15, Allied forces also came ashore on the French Mediterranean coast in Operation DRAGOON. The German defenders were now in full retreat, but it remained to be seen if the Allies could maintain their fast-lengthening supply lines and end the war in the west before the Germans had a chance to recover.

Norstad, Lauris (1907–1988)

U.S. Army Air Forces general. Born on March 24, 1907, in Minneapolis, Minnesota, Lauris Norstad graduated from the U.S. Military Academy at West Point in 1930. Commissioned in the cavalry, he was soon assigned to the Army Air Corps. After a series of operational assignments in the Air Corps, he graduated from the Air Corps Tactical School in 1939 and was promoted to captain the next year. In November 1940, he was a staff officer under the deputy chief of staff for air. He was promoted to major in June 1941 and to lieutenant colonel in January 1942.

In February 1942, Norstad served as a member of commander of Army Air Forces Lieutenant General Henry Arnold's personal advisory council and conducted studies on strategic issues. He was promoted to colonel in July 1942 and became the assistant chief of staff for operations of the Twelfth Air Force. In this capacity, he traveled to London and helped plan the air component of the November 8, 1942, invasion of North Africa, Operation TORCH.

Norstad then assumed broader responsibility as assistant chief of staff for operations for Northwest African Air Forces. Promoted to brigadier general in March 1943, that December he became director of operations of the Mediterranean Allied Air Forces. He helped plan and direct the air operations during the invasions of Sicily and Italy and air support for the campaign in Italy, including the interdiction efforts of Operations STRANGLE and DIADEM.

In August 1944, Norstad returned to Washington with dual responsibilities as chief of staff of the Twentieth Air Force and deputy chief of the air staff. His staff responsibilities changed when he was made assistant chief of the air staff for plans in May 1945. The next month, he was promoted to major general. In his Twentieth Air Force role, Norstad was directly involved in planning the final bombing campaign against Japan, including the dropping of the atomic bombs.

After the war, Norstad served as the director of plans and operations of the War Department, and in 1947 he became the first vice chief of staff for operations of the new U.S. Air Force. In October 1950, General Norstad began a series of senior European assignments in the North Atlantic Treaty Organization. He initially served as commander of U.S. Air Forces in Europe (1950–1953) with combined responsibility as Commander, Allied Air Forces Central Europe. In July 1952, he was promoted to full general. He was then assigned as air deputy to the supreme Allied commander, Europe (1953–1956), and then to supreme Allied commander, Europe (and to commander in chief of the U.S. European Command when it was created). He served as supreme Allied commander, Europe, from November 1956 until he retired in January 1963. Norstad died in Tucson, Arizona, on September 12, 1988.

North Africa and the War

In 1939 all the countries of the Maghreb—the Mediterranean coastal region of North Africa stretching from the Atlantic shoreline of Morocco to Libya's

border with Egypt—were under administration by one or more of the European colonial powers of France, Spain, and Italy. This was a relatively recent development: although Spain had possessed tiny island enclaves along the Barbary coast since the late Reconquista period, the first serious encroachment did not begin until 1830, when the French began their conquest in Algeria.

Morocco and Libya had not been incorporated into the European orbit until the eve of World War I. Although the Maghreb had a long history of previous colonial suzerainty from Ottoman Turkey, the problems of administering such a vast and forbidding region—1.8 million square miles spread over 38 degrees of longitude—meant that Constantinople's hold had been traditionally weak, and the indigenous peoples were conscious of their autonomous heritage. World War II was to provoke an even greater desire among the inhabitants for national independence, establishing the conditions for the tumultuous decolonization saga of the 1950s.

Each North African state was organized under unique constitutional arrangements, and the states' wartime experiences were a product of peculiar local circumstances and events, but several general conditions applied to some degree throughout the whole of the Maghreb. Geographically, the region was composed of a fertile coastal strip running along the Mediterranean shoreline that contained most of the farms and larger settlements and a barren desert hinterland broken by the Atlas mountain chain. The population was predominantly Arabic and Berber, the Berbers tending to live in semiautonomous nomadic tribes away from the coast. About 10 to 15 percent of the inhabitants were colonists, a heterogeneous mixture of South European stock—Spanish, French, Italian, and Maltese. This elite community owned most of the best land, controlled the local political and legal administrations, and was vociferously opposed to any attempt by their metropolitan governments to make concessions to the local population.

Resistance to the imperial regime usually came in three forms, either singly or in combination. If the Europeans had maintained a traditional client ruler, that ruler might—however complacent his manner—become the focus of patriotic opposition. Religious revivalists and unconquered tribal chieftains sometimes provided a premodern call to arms. Most significantly of all, the small class of local European-educated residents that had been nurtured to

serve in each colony's petty bureaucracy became politicized during the 1920s and 1930s, spawning nationalist parties that demanded civic rights and representative assemblies. These parties were typically banned and their leaders incarcerated in periodic bouts of imperialist repression.

The outbreak of the European war did not immediately disturb the Maghreb. The territories of French Morocco, Algeria, and Tunisia sent regiments of indigenous and settler troops to man the Franco-German border, but their neighbors in Spanish Morocco and Italian Libya remained neutral. The swift French collapse following the German invasion of May 10, 1940, and Italy's entry into the war on June 10 transformed the situation. For the next two years, Libya was a fiercely contested battleground in the war between the British Western Desert forces and the Italians, later reinforced to spectacular effect by German general Erwin Rommel's Afrika Korps. The French North African colonies spurned General Charles de Gaulle's entreaties to continue the war against the Axis powers, and Vichy administrators remained loyal to the Henri Pétain government—a decision made all the easier by the Royal Navy's preemptive strike on units of the French fleet at Mers-el-Kébir in northwest Algeria on July 3, 1940.

On November 8, 1942, the combined Anglo-American forces of Operation TORCH landed on the Atlantic coast of Morocco, with subsidiary operations around Oran and Algiers. These met scattered and indifferent resistance, and after a few days the local Vichy authorities—who had already seen their home government overrun by the Germans as a retaliatory measure—capitulated to the Allies. The subsequent inheritance of French North Africa was a matter of intrigue, with claimants including the former Vichy commander in chief Admiral Jean Darlan (assassinated a month after the landings) and the feuding Free French commanders de Gaulle and General Henri Giraud.

Despite American opposition, de Gaulle proved more politically adept than his rivals, and it was ultimately the Gaullist-dominated Comité Français de la Libération Nationale (French Committee of National Liberation) that secured power. During this period, the Axis forces had been defeated in Egypt, and with Libya secured for the Allies, the final military encounter took place in Tunisia. In May 1943, the Germans and Italians were expelled from the African continent. France's triumphant reconquest of the Maghreb was at best a partial victory; however, its humiliation in 1940 had not gone

unnoticed by the indigenous population, and the heady Allied rhetoric of liberation was seized on by local nationalists who saw little victory in a mere transition between imperial occupiers.

Each of the North African colonies was affected differently by the war. Algeria was the keystone of French North Africa, and uniquely among the Maghreb territories, it was administered as a metropolitan department with a governor-general answering to the Ministry of the Interior in Paris. Its 6.6 million Arabs and 1 million European settlers (colons) lived mostly along the Mediterranean shore, with the massive Saharan hinterland given over to army patrols and scarcely governed Berber nomads. Moderate assimilationist reformers such as the Young Algerians had given way by the 1920s to more radical nationalist campaigners, such as Ahmed Messali Hadj, who were subsequently persecuted by the colon-led authorities.

An attempt by the Popular Front government in 1936 and 1937 to grant full French citizenship to certain Algerians without stripping them of their Islamic property and marriage rights—a traditional bar to naturalization—met with such tenacious resistance from the settlers that it was abandoned. After the armistice in 1940, the colons accepted the new Vichy regime with little outward dissent, the appointment of the highly esteemed General Maxime Weygand as the new delegate general for North Africa helping to smooth the transition. Their focus of attention remained the crushing of nationalist activism. In March 1941, Hadj's Parti du Peuple Algérien was broken up and its leaders sentenced to long prison terms.

Following the TORCH landings and Algeria's reversion to the Allied cause, there were new nationalist initiatives, predominant among them the "Manifesto of the Algerian People" presented to the authorities in February 1943 by its author, Ferhat Abbas (later first president of the Algerian Republic). French governor-general Marcel Peyrouton provisionally accepted Abbas's manifesto, which called for wholesale reforms of the colony's legal and political structure and the end to the hegemony of the colon elite, but as French sympathies proved ever more lukewarm, Abbas's lobbying group, Amis du Manifeste et de la Liberté (Friends of the Manifesto and Liberty), was suppressed on charges of sedition. The Free French government did make some effort to address the changing realities of imperial politics: in 1943, de Gaulle spoke of a new compact with the indigenous peoples as a reward for their loyalty during the war, and the following year the Brazzaville

Conference on colonial reconstruction expounded a new model of autonomous self-government, if not outright independence. But Algeria's wartime story ended disastrously on V-E day when a celebratory crowd in Sétif turned into a pronationalist demonstration and was fired on by troops; a cycle of reprisals and even greater counterreprisals ensued in which tens of thousands of people, mostly Algerians, were killed. This souring of the hopes for a postwar rapprochement prefigured the brutal civil war of a decade later.

Unlike its larger neighbor, Tunisia was a protectorate (established in 1881) with a ruling indigenous monarch, the bey of Tunis, who theoretically maintained absolute rule with only the "guidance" of the French resident general. Relations between the 200,000 settlers and 2.6 million indigenous people were somewhat less abrasive than in Algeria, but the colony had nonetheless gone through several political disturbances during the 1920s and 1930s. The most important nationalist force was the Destour (Constitution) Party, which lobbied without success for a greater Arab role in Tunisian affairs. In 1934, lawyer Habib Bourguiba created a radical breakaway party, the Neo-Destour; four years later, this splinter group was broken up in a repressive purge, and Bourguiba was transported to a French metropolitan prison.

Politics under the Vichy regime were complicated by the evident Italian desire to include Tunisia in its regional sphere of influence. In June 1942 a new bey, Sidi Mohammed el Moncef, took the throne; his obvious sympathy for the nationalists alienated the French authorities from him, but when Vichy fell in November 1942 he was feted by the Italians in the hope that they could win him over to their cause. Bourguiba and the other Neo-Destour leaders were also transferred to Italian custody as potential puppet rulers, but neither the monarch nor the attorney was persuaded by this line of reasoning. When Axis forces evacuated Tunisia in the spring of 1943, the bey was promptly deposed, and Bourguiba, who had returned to Tunis that March, fled into exile.

On the western edge of the Maghreb, Morocco was also under a protectorate established after the 1912 Agadir crisis by the Treaty of Fez. Nominally a united country under a single sultan, Morocco was in reality partitioned between French and Spanish zones, with the town of Tangier (the traditional diplomatic center) having international status. The French, who controlled 90 percent of the country, spent the interwar years developing the

cities of the Atlantic coastline, building a new administrative capital at Rabat, and expanding the port of Casablanca. By 1939, the population stood at 6.25 million, including about 190,000 European settlers. As with the other Maghreb colonies, Morocco had its persecuted nationalist parties such as the Comité d'Action Marocaine; there were also more traditional forms of interwar dissent, such as the so-called Rif Rebellion in 1926 and the Berber tribes' resistance to the "pacification" of the interior.

But it was Sultan Mohammed Ben Youssef who was at the heart of anti-French loyalties, especially after the Vichy takeover. He objected to the repeal of the 1872 Crémieux decree that had given North African Jews rights of citizenship and refused to accede to Resident General Auguste Noguès' demand that he retire from the capital after the TORCH landings. Youssef's greatest coup was his private meeting with U.S. president Franklin D. Roosevelt during the 1943 Casablanca Conference, in which the American leader expressed his sympathy for eventual Moroccan independence. The following year, the Independence Party formally petitioned the occupying Allied administration for the right to self-government. The French responded with some unconvincing accusations of collaboration between nationalists and the Axis forces, and in accompanying riots in Fes (Fez), several demonstrators were killed.

Libya, the second largest but most sparsely populated of the Maghreb states, was occupied by Italy in 1911 during its war with Ottoman Turkey. The coastal provinces of Tripolitania and Cyrenaica fell relatively quickly, but pacification of the Berber hinterland continued for the next two decades and was accelerated with great brutality in the 1930s by generals such as Rodolfo Graziani and Pietro Badoglio. By the outbreak of war, Italian settlers made up about 10 percent of Libya's 900,000 people. The country's poverty and scattered population centers precluded the development of a strong nationalist movement before 1939, but the unpopularity of the Italian regime was made evident by the enthusiasm with which Libyans greeted their British "conquerors" during the war. After Italy's final ejection from its North African territory, few traces of colonial culture survived long.

North Africa Campaign (1940–1943)

The campaign in North Africa was fought largely over control of the Suez Canal. Great Britain depended on the canal for access to Middle Eastern oil and raw materials from Asia. The canal and the Mediterranean also formed the primary lifeline to Britain's overseas dominions. The ground campaign in North Africa and the naval campaign for the Mediterranean were therefore two sides of the same strategic coin.

The fight to control North Africa began in October 1935 when Italy invaded Ethiopia (Abyssinia). Britain, meanwhile, stationed a significant military force in Egypt to protect the Suez Canal. Britain and France also agreed to divide the responsibility for maintaining naval control of the Mediterranean, with the main British base in Egypt at Alexandria.

Italy was the unknown variable in the Mediterranean strategic equation. A neutral Italy would mean that British access to the vital sea-lanes would remain reasonably secure. However, operating from its main base at Taranto in southern Italy and supported by Italian Air Force bases on Sicily and Sardinia, the seemingly powerful Italian Navy had the potential to close off the Mediterranean. When Germany invaded France in June 1940, Italian dictator Benito Mussolini could not resist the opportunity to grab his share of the spoils. On June 10, Italy declared war on Great Britain and France.

The British and Italian armies initially faced each other across the Libyan-Egyptian border in an area known as the Western Desert. Italian marshal Rodolfo Graziani had some 250,000 ground troops in Libya, and General Sir Archibald Wavell, British commander in chief of the Middle East, had only 100,000 soldiers to defend Egypt, Sudan, and Palestine. The British Army, however, was far better organized, trained, equipped, and led.

Graziani reluctantly moved into Egypt on September 13, 1940, halting at Sidi Barrani just short of the British main positions at Mersa Matrûh. The Battle of Britain (July 10–September 30, 1940) was then reaching its climax, and the beleaguered British were facing a possible German invasion. By October, however, the threat from Operation SEA LION had eased, and the British began to reinforce Wavell. Through December, 126,000 more Commonwealth troops arrived in Egypt from Britain, Australia, New Zealand, and India. On December 9, the Western Desert Force, commanded by Lieutenant General Sir Richard O'Connor, attacked at Sidi Barrani.

The British drove the Italian Tenth Army from Egypt and achieved a major victory on January 3, 1941, at Bardia, just inside Libya. Driving deeper into Cyrenaica (eastern Libya), the British captured the vital port of Tobruk on January 22. Continuing forward, O'Connor trapped the Italian Tenth Army at Beda Fomm on February 7, 1941. In just two months, two British divisions advanced 500 miles, destroyed 10 Italian divisions, and captured 130,000 prisoners. The British suffered only 555 dead and some 1,400 wounded.

Shortly after the British successes in North Africa, Prime Minister Winston L. S. Churchill decided on February 22 to send British troops to Greece. Most of those forces were withdrawn from Cyrenaica, leaving Wavell with only five brigades in Libya. But just a few weeks earlier, German leader Adolf Hitler had decided to reinforce the Italians in North Africa with German forces. On January 8, the Luftwaffe's Fliegerkorps X started operating from bases in Sicily against Allied shipping headed for Benghazi in Libya. The British forward units in Libya were forced to resupply through Tobruk, more than 450 miles away. Two German divisions and two additional Italian divisions were sent to Libya from Italy. On February 12, Lieutenant General Erwin Rommel took command of the German divisions. In short order, Rommel's force grew into the three-division-strong Deutsches Afrika Korps.

Rommel probed El Agheila on March 24, 1942, and continued driving rapidly to the east, despite Hitler's orders to maintain an overall defensive posture. The Germans surrounded Tobruk on April 10 but were unable to take the fortress by a coup de main. Rommel left a siege force of mostly Italian units and continued his drive toward the Egyptian border. But the Tobruk garrison held out for 240 days and tied down vital Axis manpower in Rommel's rear area. Rommel's main force, meanwhile, reached Sallum on the Egyptian border on April 14, and the Germans occupied the key terrain of the Halfaya Pass.

Churchill pushed for an immediate counteroffensive, but Wavell wanted to gain control of the Halfaya Pass first. On May 15, the British launched Operation BREVITY under the command of Brigadier William Gott. Rommel skillfully parried the thrust and then counterattacked. By May 27, the Germans recaptured the Halfaya Pass, but they then began to run out of supplies and had to halt. They dug in and reinforced their positions, using the 88mm antiaircraft guns in an antitank role. The British came to call the heavily fortified and fiercely defended pass "Hellfire Pass."

Churchill continued to pressure Wavell for action. Operation BATTLEAXE began on June 15, 1942, with a frontal attack through the Halfaya Pass toward Sallum. The German 88mm antiaircraft guns stopped the British armor, and the Germans then counterattacked. The British lost 91 tanks, and Operation BATTLEAXE was over by June 17. Churchill relieved Wavell four days later and replaced him the following month with General Sir Claude Auchinleck. General Sir Alan Cunningham (the brother of Admiral Andrew Cunningham) took command of the Western Desert Force, which had been redesignated the British Eighth Army.

Rommel's force in North Africa slipped to near last priority for logistical sustainment after Germany attacked the Soviet Union in June 1941. By November 1941, Rommel had 414 tanks, 320 aircraft, and nine divisions (three German), four of which were tied down in the siege of Tobruk. The British had some 700 tanks, 1,000 aircraft, and eight (larger) divisions. Operation CRUSADER opened on November 18 with the British XIII Corps advancing on the Halfaya Pass and XXX Corps attempting to sweep around Rommel's southern flank to reach Tobruk. Following a string of fierce tank battles on November 22 and 23, Rommel drove deep into the British rear with two panzer divisions and the Ariete Armored Division in an attempt to

relieve the Axis forces at Halfaya and simultaneously cut off the Eighth Army.

As British tank losses rose, Cunningham wanted to halt the operation. Auchinleck relieved Cunningham and replaced him with Major General Neil Ritchie. The British finally broke through to Tobruk on November 29.

Overwhelmed by attrition to his forces, Rommel began to withdraw on December 7. The Germans retreated back across Cyrenaica, reaching El Agheila on January 6, 1942. Operation CRUSADER was a victory for the British, but they were unable to exploit it because of a lack of reinforcements.

Rommel launched his second offensive on January 21, 1942. Within days he drove the British back almost 300 miles, halting on February 4 between Gazala and Bir Hacheim. Both sides then concentrated on building up their strength for the next four months. Rommel resumed operations on May 26 with Operation VENEZIA, his attack against the Gazala Line. Both forces were roughly equal in strength, but Ritchie's armored units were widely dispersed, whereas Rommel kept his concentrated. Rommel swept his armor around the Free French Brigade at Bir Hacheim on the southern end of the line and turned north, cutting across the Allied rear. A secondary attack in the north by Axis forces pinned down the Allied forces there.

By May 28, the Axis armored units behind the Allied lines were in trouble. Rommel had lost more than one-third of his tanks, and the rest were short of fuel and ammunition. On May 29, the Italian Trieste Division managed to clear a path through the center of the Gazala Line, and that opening became a lifeline to Rommel's panzers. On May 30, Rommel consolidated his remaining armor in a defensive position that came to be called "the Cauldron."

German field marshal Erwin Rommel talks to Afrika Korps troops in the Libyan coastal town of Tobruk during the fighting in North Africa. (Heinrich Hoffmann/Hulton Archive/Getty Images)

On June 5–6, 1942, Rommel successfully beat back Ritchie's series of piecemeal counterattacks against the Cauldron. On June 10–11, the Axis finally drove the Free French from Bir Hacheim, and on June 11, Rommel's panzers broke out of the Cauldron. The Eighth Army once more started falling back to the Egyptian border. On June 15, German tanks reached the coast, and Rommel shifted his attention to Tobruk, which fell on June 21. Along with the vital port, the Axis forces captured 2,000 tons of much-needed fuel and 2,000 wheeled vehicles.

The British fell back to Mersa Matrûh about 100 miles inside Egypt. Rommel, promoted to field marshal for his victory at Gazala, pursued. Auchinleck relieved Ritchie and personally assumed command of the Eighth Army. Rommel had only 60 operational tanks, but he still attacked at Mersa Matrûh on June 26 and routed four British divisions in three days of fighting. The British fell back again another 120 miles to the east to the vicinity of El Alamein, less than 100 miles from Alexandria.

Auchinleck was determined to hold near El Alamein. Although under constant pressure from Rommel's forces, Auchinleck improvised a fluid defensive line anchored on Ruweisat Ridge a few miles south of the El Alamein perimeter. Rommel attacked on July 1, intending to sweep around El Alamein, but Auchinleck skillfully battled Rommel to a standstill over the

course of three weeks of fighting. Auchinleck then launched a major counterattack on July 21–22 but made no progress. Exhausted, both sides paused to regroup.

Despite the fact the British had finally halted Rommel's advance, Churchill relieved Auchinleck in early August and replaced him with General Sir Harold Alexander as commander in chief of the Middle East. Sir William Gott was promoted to general and placed in command of the Eighth Army. On August 7 while flying to Cairo to take up his appointment, Gott was killed when a German fighter attacked his airplane. Churchill then selected Lieutenant General Bernard L. Montgomery to succeed Gott in command of the Eighth Army.

On August 31, 1942, Rommel launched what he believed would be the final attack to carry the Axis forces to the Nile. Montgomery, however, had made extensive preparations around El Alamein, based on a plan developed by Auchinleck. Montgomery also had the advantage of knowing Rommel's plan through Ultra intercepts. Rommel intended to sweep around to the south of Ruweisat Ridge and cut off El Alamein from the rear. However, the British had laid extensive minefields and heavily fortified Alam Halfa Ridge behind and southeast of El Alamein. Rommel's attack ran short of fuel and stalled by September 3. Montgomery counterattacked immediately but halted as soon as the Axis forces were pushed back to their starting positions. Taken together, the battles at Ruweisat Ridge and Alam Halfa marked the real operational turning point of the war in North Africa.

Montgomery used the time after Alam Halfa to carefully plan a set-piece counterattack from El Alamein. Rommel, meanwhile, returned to Germany on sick leave. When Montgomery finally launched the attack, the British had an overall force superiority ratio of three to one. Rommel immediately returned from Germany when the Battle of El Alamein started on October 23, 1942. The Allies tried for five days to break through the Axis positions and took 10,000 casualties in the process. On October 31, Montgomery renewed the attack with strong support from the Royal Air Force. Critically short of fuel and ammunition, Rommel was forced to disengage on November 3. The following day, the 1,400-mile Axis withdrawal to Tunisia began.

For the next three months, Montgomery followed rather than aggressively pursued Rommel and the Axis forces across the northern coast of Africa.

Rommel reached the Tunisian border at the end of January 1943. By the time he got there, however, another Allied force was waiting for him.

On November 8, 1942, four days after Rommel began his long withdrawal, the British and Americans initiated Operation TORCH, the invasion of Northwest Africa. U.S. lieutenant general Dwight D. Eisenhower had overall command. In a coordinated series of landings, the Western Task Force under Major General George S. Patton Jr. landed on the Atlantic coast near Casablanca, the Center Task Force under Major General Lloyd Fredendall landed just inside the Mediterranean around Oran, and the Eastern Task Force under Major General Charles Ryder landed near Algiers. Although all the landing sites were in Vichy French territory, the ultimate objectives of the operation were the Tunisian city of Tunis and the port and airfield complex at Bizerte.

The Germans reacted by sending troops from Sicily to Tunisia on November 9. From the moment the Allies landed, the campaign in Northwest Africa and the race for Tunis were a logistical battle. The side that could mass forces more quickly would win. For the Germans, control of the Tunis complex was critical to prevent Rommel from being trapped between Montgomery in the east and the newly formed British First Army in the west. On November 28 the Allies reached Tebourba, 20 miles from Tunis, but an Axis counterattack drove them back 20 miles in seven days. In January 1943, the winter rains and resulting mud brought mechanized operations to a halt in northern Tunisia. The Axis side had temporarily won the race.

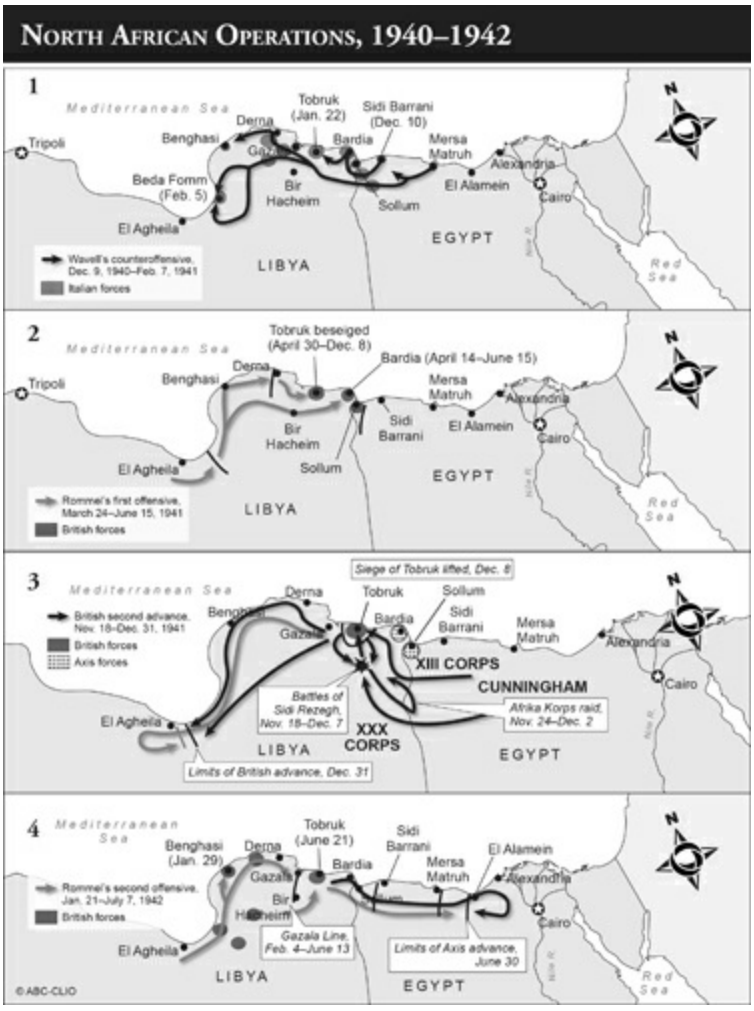
Waiting for better weather in the spring, the Allies continued to build up their forces. Lieutenant General Sir Kenneth Anderson's British First Army was organized into three corps—the British V Corps, the U.S. II Corps, and the French XIX Corps. The Axis forces in northern Tunisia now consisted of Colonel General Jürgen von Arnim's Fifth Panzer Army. Once Rommel's Panzerarmee Afrika crossed into southern Tunisia, it occupied positions in the old French fortifications of the Mareth Line. Rommel's 10 divisions were well below half strength, with a total of only 78,000 troops and 129 tanks.

Before he had to face Montgomery, rapidly closing from the rear, Rommel intended to eliminate the threat of the British First Army to his north. On February 14, the Germans launched the first leg of a two-pronged offensive, with Arnim's forces attacking through the Faid Pass for Sidi Bou Zid. The following day, Rommel in the south attacked toward Gafsa. The

bulk of Rommel's forces, however, remained along the Mareth Line. By February 18, the Kasserine Pass was in Axis hands, and the U.S. Army had suffered its first major defeat at the hands of the Germans. Rommel tried to advance north through the Kasserine Pass on February 19, but he did not get the support he expected from Arnim. Hampered by a divided German command structure and the rapidly massing Allied reinforcements, the attack stalled.

The Allies recaptured Kasserine Pass on February 25. Rommel returned to the Mareth Line and prepared to face Montgomery. When the Eighth Army reached Tunisia, the Allies reorganized their command structure along the lines agreed to at the Casablanca Conference. General Eisenhower became the supreme commander of all Allied forces in the Mediterranean west of Tripoli. Alexander became Eisenhower's deputy and simultaneously commander of the 18th Army Group, which controlled the First and Eighth Armies, and the now separate U.S. II Corps commanded by Patton. On February 24, the Axis powers also realigned their command structure, with Rommel becoming the commander of Armeegruppe Afrika, which included the Afrika Korps, Arnim's Fifth Panzer Army, and the Italian First Army under General Giovanni Messe. For the first time, the Axis powers had a unified command structure in Africa.

Montgomery's units crossed into Tunisia on February 4, reaching Medenine on February 16. Hoping to catch the British off balance, Rommel on March 6 attacked south from the Mareth Line. Warned by Ultra, Montgomery was ready.



Immediately following the failure of the Medenine attack, Rommel returned to Germany on sick leave. Arnim assumed overall Axis command, and Messe took command in south Tunisia. On March 20, Montgomery attempted a night penetration of the center of Mareth Line. That attack failed, and on March 23 he shifted the weight of his main attack around the southwestern flank of the line through the Matmata Hills. By March 26, the British broke through the Tebaga Gap, forcing the Italian First Army and the remainder of the Afrika Korps back to the north. Under continuous pressure from the Eighth Army on one side and the U.S. II Corps on the other, the Axis forces withdrew north to Enfidaville.

On April 7, 1943, the Allied First and Eighth Armies linked up, squeezing the Axis forces into a tight pocket. On the east coast, the Eighth Army took Gabès on April 6, Sfax on April 10, Sousse on April 12, and Enfidaville on April 21. In the north, the U.S. II Corps, now under Lieutenant General Omar

N. Bradley, took Mateur on May 3 and Bizerte on May 7. Montgomery's 7th Armoured Division also captured Tunis on May 7. The remaining Axis forces in Tunisia were caught in two pockets, one between Bizerte and Tunis and the other on isolated Cape Bon.

Arnim surrendered his forces on May 12, 1943, and Meese surrendered his on May 13. The Royal Navy, waiting in strength offshore, made sure that few Germans or Italians escaped to Sicily by sea. Axis losses in the Tunisian Campaign totaled 290,000 to 362,000, including 238,243 prisoners. The Axis powers also lost 250 tanks, 2,330 aircraft, and 232 vessels. British (including losses in the First Army from November 8, 1942), American, and Free French casualties totaled 76,020. For the entire North African Campaign, the British suffered 220,000 casualties. Total Axis losses came to 620,000, which included the loss of three field armies. The losses were large for what amounted to a secondary theater for both sides.

North Cape, Battle of (December 26, 1943)

Naval battle fought between British and German naval units on December 26, 1943, off Norway. In the autumn of 1943, the Western Allies agreed to send 40 merchant ships per month to the Soviet Union via the Arctic to Murmansk. The chief German reaction to this effort was expected to come from two German submarine flotillas in Norway, but German Navy commander Grand Admiral Karl Dönitz sought to employ German surface units as well.

Dönitz had planned to use the battleship *Tirpitz* for this purpose, but it had been damaged in a British midget submarine raid in September. Gaining permission from German chancellor Adolf Hitler also proved difficult, but Dönitz persevered, and in December 1943 he was ready. On December 19, he informed Hitler that the Germans would attack the next eastbound convoy. Ultra intercepts and increased German air, surface, and submarine activity provided advance warning to British Home Fleet commander Admiral Sir Bruce Fraser of the German plans.

On December 20, convoy JW 55B of 19 merchant ships sailed eastbound, and two days later the corresponding homebound convoy of 22 merchant ships departed Kola Inlet. Each convoy had a close escort of about a dozen

destroyers. Long-range protection of both convoys fell to Vice Admiral Robert Burnett with the cruisers *Norfolk*, *Belfast*, and *Sheffield*.

On December 22, Luftwaffe reconnaissance aircraft spotted the eastbound convoy JW 55B. The British deciphered this sighting report and orders for all U-boats in the area to close with the convoy. Fraser guessed that German surface units in Norway, led by the battleship *Scharnhorst*, would join the hunt, and he departed Iceland on December 23 with the battleship *Duke of York* (flagship), the light cruiser *Jamaica*, and four destroyers. Fraser's intention was to position his surface forces between the Germans and their base at Altenfjord.

On December 25 the homeward convoy had cleared the danger point, and four of its destroyers were therefore shifted over to the outward convoy. Meanwhile, Burnett's cruisers were closing from the southeast. As anticipated, German rear admiral Eric Bey led the *Scharnhorst* and five large fleet destroyers to sea on December 25 from Altenfjord. His orders were contradictory; he was to attack the convoy but not to engage heavy enemy units encountered. Early the next morning, the Admiralty signaled to Fraser that the *Scharnhorst* was most probably at sea.

Bey ordered his destroyers to fan out ahead and sweep for the British convoy. The conditions were appalling, marked by darkness and snow squalls. At 7:30 a.m. on December 26, Bey detached his destroyers to look for the convoy to the southwest. They must have come close but did not sight it, and in the process they lost touch with the *Scharnhorst*.

At 9:00 a.m., the *Belfast* secured a radar contact on what proved to be the *Scharnhorst* about 30 miles from the convoy. The range rapidly closed. At 9:24 a.m. the British cruisers fired star shells, and the *Scharnhorst* immediately turned away. The *Norfolk* hit with its second or third 8-inch salvo, which knocked out the battleship's FuMo27 radar. Bey replied with the ship's aft turret as he maneuvered to break off the action. The four British destroyers detached from the westbound convoy now reached Burnett. Rather than pursue the *Scharnhorst*—the traditional job for cruisers in a covering role—Burnett turned northwest to protect the convoy. He gave as his reasons poor visibility, the *Scharnhorst*'s superior speed in heavy seas, and his conviction that the Germans would renew the attack.

Bey did indeed return. Shortly after noon, the *Belfast* reported a radar contact. A second action ensued that involved all three British cruisers and

lasted about 20 minutes. Although the British claimed several hits, in fact the German ship went untouched, while it had inflicted heavy damage on the *Norfolk*. The four destroyers were unable to carry out a torpedo attack because they were on Burnett's port bow, and the *Scharnhorst* turned away in the opposite direction.

Bey now headed south. This time Burnett pursued, continuously supplying position, course, and speed information that allowed Fraser to intercept. Fraser's ships were closing from one side and Burnett's from the other. The *Duke of York* picked up the *Scharnhorst* on radar at 45,500 yards and locked in its gunnery radar at 25,800 yards. The *Duke of York* engaged when the range had dropped to 12,000 yards and hit the *Scharnhorst* with the first salvo; however, the *Scharnhorst* was a fast and well-armored ship, and Bey responded with a burst of speed. Returning fire, he tried to open the range. He was almost successful, but a British salvo disabled one of the *Scharnhorst*'s boiler rooms at a critical juncture, and Fraser's cruisers and destroyers fired from both flanks a total of 55 torpedoes, of which probably 11 hit.

The *Scharnhorst* went down at 7:45 p.m. The British ships searched for survivors, but only 36 members of the German battleship's 3,000-man crew were saved. The last capital ship duel in European waters had ended in a British victory.

Northeast Europe Theater

In August 1939, the Soviet Union and Germany concluded a nonaggression pact that allowed Adolf Hitler to begin his invasion of Poland without fear of Soviet intervention. In return, the Soviets acquired territory in the Baltic states and eastern Poland. With the defeat of France in June 1940, Soviet troops occupied the Baltic states of Lithuania, Latvia, and Estonia and then incorporated them into the Soviet Union.

World War II operations in Northeastern Europe can be divided into three stages: the Russo-Finnish War of 1939–1940, the German invasion and conquest of Denmark and Norway in the spring of 1940, and the struggle in the Baltics, Finland, and northwestern Russia between the Soviet Union on the one side and Finland and Germany on the other from June 1941 until the fall of 1944. Sweden remained officially neutral during the war.

Soviet leader Joseph Stalin initiated the Russo-Finnish War (also known as the Winter War) when Finnish leaders refused his demands for the Karelian Isthmus and bases. Although Stalin offered more territory than he demanded (albeit in the far north), the Finns believed that the Soviets were bluffing. On November 30, 1939, five Soviet armies crossed the border. The main attack came in the southeast from the Leningrad area in the direction of Finland's second-largest city, Viipuri (Vyborg).

The unprepared Soviet forces were soon halted by deep snow and dense woods but also by the fierce and stubborn Finnish resistance. A major share of blame for the failure of the Soviets to win the war quickly rested with Stalin, who had refused to take Finland seriously. Stalin personally intervened to reject the plan advanced by chief of staff Marshal Boris M. Shaposhnikov that entailed a careful buildup and employment of the best Soviet troops, even those from the Far East. Many of the Soviet units were poorly trained scratch formations. Worse, the Soviet troops were unprepared for winter fighting.

By January 1940, Soviet troops had moved deep into Finnish territory in the north. In the southwest, however, the Finns halted the main Soviet thrust at the so-called Mannerheim Line. After the Soviets regrouped and brought up reinforcements, it was only a matter of time before Finland was defeated.

At the beginning of February, the Red Army began another determined attack, managing to achieve a breakthrough after two weeks. Finland surrendered on March 12, 1940.

Under the peace terms, Finland was forced to surrender more territory than Stalin had originally demanded, including eastern Karelia and large areas in the northeast as well as a naval base at Petsamo. Although Finland lost 25,000 men killed and a comparable number wounded, the Soviets lost perhaps 250,000 killed and a comparable number wounded. One consequence of the war was that it convinced Hitler that his armed forces could defeat the Soviet Union easily.

Meanwhile, Hitler believed that the Allies intended to occupy Norway, and he was determined to beat them there. Securing Norway would guarantee the Germans access to vital Swedish iron ore, which in the winter came from the Norwegian port of Narvik. The many fjords along the Norwegian coast would also provide bases for German submarines and surface raiders into the north Atlantic, as well as airfields from which the Luftwaffe might attack Britain. Acquiring Denmark would mean additional foodstuffs, especially dairy products, for the Reich.

The German assault on Norway and Denmark began on April 9, 1940. With virtually no military means to defend itself, Denmark succumbed in less than a day. The occupation of Norway, spearheaded by air attacks, saw the first real employment of paratroopers near Oslo and the port city of Stavanger. At the same time, German amphibious landings took place at Narvik, Trondheim, Bergen, Kristiansand, and Oslo. Allied forces landed in Norway beginning on April 15. While British troops in the south had to be evacuated after two weeks, a combined Norwegian, British, French, and Polish force gained a foothold in the north, taking Narvik on May 28. The Germans sent reinforcements to the north to recapture it. This, combined with the German invasion of France, forced the Allied expeditionary force to withdraw on June 8. Norway capitulated two days later.

The Norwegian Campaign brought immense gains to Germany, but it also severely affected the German surface navy. Germany lost 3 cruisers and 10 destroyers, half of the navy total. Hitler had secured additional food production for the Reich and protection for his northern flank on the Baltic. Most important, the Kriegsmarine had locations for naval bases nearer to the Allied Atlantic convoy routes. From these bases, it would launch attacks into

the North Atlantic and later the Allied PQ Arctic convoys bound for the Soviet Union.

Both Norway and Denmark were under occupation until the German capitulation. The Germans established a puppet state in Norway headed by home-grown Nazi Vidkun Quisling, whose name became synonymous with "traitor." King Haakon VII escaped abroad on June 7, and after the Allies evacuated Narvik, he set up a government-in-exile in Britain. Most of the country's 4.7 million tons of merchant shipping now passed into Allied hands, an invaluable addition. In 1941, 40 percent of foreign tonnage destined for English seaports was Norwegian. By the end of the war, Hitler had some 400,000 men and major artillery assets in Norway, providing security and protecting it against invasion although it was a serious drain on stretched German resources.

Operation BARBAROSSA, the attack on Soviet Russia, began in the early hours of June 22, 1941. Army Group North's 4th Panzer Group and Sixteenth Army advanced through Lithuania, Latvia, and Estonia toward the Russian border. At the northern end of the line, German troops were aided by Finnish forces. Finland rejoined the war against the Soviet Union as a cobelligerent.

In the so-called Continuation War, 16 revamped Finnish divisions recaptured the territory lost earlier to the Soviet Union. The Finns refused, however, to shell Leningrad. In the winter of 1941, when Soviet lines were stretched to the breaking point, a determined Finnish assault would undoubtedly have given the Germans Leningrad, with uncertain consequences for the war in the east.

The Finns had originally planned to unite their troops with German Army Group North around Leningrad. On September 1, they reached the former Finnish-Soviet border. Mannerheim now essentially went over to defensive operations. Soviet resistance stiffened, and after capturing Petrozavodsk and Medweschjegorsk on the western and northern shore of Lake Onega, in December 1941 the Finns established defensive positions slightly inside Soviet territory.

To the south, German forces in Operation BARBAROSSA had come close enough to Leningrad by September 1 to start shelling the city. A week later, Leningrad had been cut off from the last land connection, and Hitler decided to starve the city into capitulation. Food supplies ran out after a month, and in November 11,000 people died. Even though the Soviets managed to supply the city via the frozen Lake Ladoga in winter, up to 20,000 people died each day of starvation, exhaustion, or disease.

Attempts to relieve Leningrad between August 19 and the end of September 1942 were defeated by the German Eighteenth Army. On January 11, 1943, the Soviets managed to establish a small corridor south of Lake Ladoga through which they could also deliver supplies. The siege ended in January 1944 after 900 days. Other than that, the northern sector of the Eastern Front saw only limited action between the fall of 1941 and January 1944.

Pressed by the Soviet Leningrad, Wolchow, and 2nd Baltic Fronts, German Army Group North then withdrew from the Leningrad area in January 1944 and fled toward the Baltic coast. By the end of April, the Soviets had recaptured most of their pre-June territory in the Baltics. As Army Group Center also had fallen back, Army Group North was now certain to be cut off. The 3rd Belorussian Front, the northern front of the Soviet drive on Army Group Center, took Vilnius on July 13.

In July and August 1944, the Red Army’s three Baltic fronts occupied the eastern parts of Latvia and Lithuania. German Army defensive positions fell

in succession. Tallinn (Reval) fell on September 22, and the Germans fled to the islands of Dagö and Ösel. The Red Army captured Riga on October 15. Already at the end of September, the whole of Army Group North was trapped in Courland, where it remained until the end of the war, although the German Navy carried out perhaps its most brilliant operation of the war, evacuating many troops and German civilians by sea.

By October 1944, Soviet forces had advanced into eastern Prussia, and fighting now took place inside Germany. After stopping at Memel, the 1st Baltic and the 2nd and 3rd Belorussian Fronts advanced on Königsberg (Kaliningrad) and the coast, trapping German troops and civilians against the Baltic Sea for the remainder of the war. Those who could not be evacuated surrendered on May 9, 1945, with the rest of the German Army.

In June 1944, the Soviet Karelian and Leningrad Fronts began an invasion of Finland on both flanks of the Ladoga Lake. West of the lake, they overwhelmed defenses at the Mannerheim Line. Vyborg was taken on July 20. To the north and east, even though they failed to achieve a breakthrough, the Soviets forced the Finns to retreat and took the Murmansk Railway. In northern Finland the Soviet Fourteenth Army threw back German forces at Liza, supported by a large amphibious landing near Petsamo.

In accordance with the September 19, 1944, armistice ending Finnish participation in the war, Finland had to help eject German forces from its soil, because Hitler refused to extract them. By the end of the month, the Germans had withdrawn completely into Norway. In late January 1945, the Soviets reached the coast west of Danzig and the mouth of the Vistula River. By the end of the month, the Soviets had passed Posen (Poznan). By early February, the Red Army had reached the Oder, within 40 miles of Berlin, surrounding large German troop concentrations at Posen and Breslau. Neither side gave quarter in the bitter fighting, and as they advanced, Soviet troops took their revenge on the Germans with as many as 3 million civilian casualties as well as looting and rapes.

Norway

Scandinavian nation encompassing 148,746 square miles. Norway, which had a 1939 population of 2.9 million, borders Sweden and Russia to the east, the Norwegian Sea to the west, and Finland and the Skagerrak Strait to the south. Norway also includes several Arctic islands. German leaders expected little or no resistance to their surprise assault on Norway in April 1940. Against great odds, Norwegian king Haakon VII rallied his government and his people against the German invaders.

During the campaign, until he was removed to Great Britain by sea on June 7, 1940, Haakon become known for his sangfroid, decisiveness, and dry wit. The exiled king was no stranger to London; as a prince, he had married the daughter of Edward VII. Haakon soon established an effective government-in-exile. Free Norwegian forces, organized within the framework of the British armed forces, fought with distinction on the Allied side, losing some 1,100 killed in the war.

In occupied Norway, German authorities attempted to impose Norwegian traitor Vidkun Quisling on the Norwegians. In 1931, Quisling had been minister of defense in an Agrarian Party government. He founded his own fascist party in 1933, but it garnered only 1.8 percent of the vote in the general elections of 1936. Nevertheless, Quisling attracted the support of Nazi ideologue Alfred Rosenberg, who arranged for Quisling to meet German dictator Adolf Hitler. German leaders, hoping for a bloodless occupation of Norway, saw in Quisling a promising means to that end. Following the invasion, however, Norwegians overwhelmingly rejected

Quisling. Although Quisling was styled minister-president, the Germans treated him with scorn. After the war, Quisling was tried as a traitor and shot.

Resistance to German occupation began immediately after formal hostilities ended on June 10, 1940. Chief justice of the Supreme Court Paal Berg was the principal organizer of the resistance movement. Armed resistance was embodied in the Militär Organisasjon, or Milorg, recognized in October 1941 by the Norwegian government-in-exile as the Home Forces. Early in 1943, the exceptionally able Jens Christian Hauge thoroughly reorganized and unified the Milorg. He also brought the civilian and armed resistance movements together.

Seeking to avoid reprisals against the small population, the resistance emphasized civil disobedience. When in 1942 Quisling attempted to make the schools a tool for Nazi indoctrination, the teachers refused to bow to his demands. They endured miserable conditions in concentration camps from May to the fall of 1942, when Quisling relented and allowed the schools to reopen and the teachers regained their freedom. Although the resistance stressed nonviolence, 1,357 Norwegians lost their lives.

Norway made an immense contribution to the Allied war effort with its merchant fleet. With 4.8 million tons of shipping, the Norwegian merchant marine was the world’s fourth largest and among the most modern. The Norwegians possessed almost as much oil tanker capacity as the larger British merchant fleet.

Norwegian ships became an essential element in the Atlantic convoys, which were so vital to survival and victory in the Mediterranean and European theaters. In 1941, 40 percent of foreign tonnage destined for English seaports was Norwegian. In the course of the war, 706 Norwegian merchant vessels, almost half of the total tonnage, were sunk. Of the 25,000 Norwegian seamen, some 4,000 died during the war.

A coastal oil facility goes up in flames from a British attack on German-occupied Vaagso Island off the Norwegian coast, December 27, 1941. (Hulton Archive/Getty Images)

Most military operations in Norway were executed within the framework of the British Special Operations Executive (SOE). In March and December 1941, commando and SOE raids were unleashed against fish oil factories in the Lofoten Islands that produced glycerin, which is used for explosives. German reprisals against civilians were savage, and Norwegians held the raids responsible for these. A Norwegian section was then established in the SOE. This group was entrusted with joint British-Norwegian planning of future operations in Norway.

A key objective proved to be the hydroelectric plant of Norsk Hydro, at Vemork in the mountains of Telemark, that the Germans were using to produce heavy water, in which hydrogen atoms were replaced by atoms of deuterium. The Germans planned to use heavy water as a moderating agent for a nuclear reactor. At great risk, Norwegian scientists and engineers conveyed the information necessary to attack the installation.

On the night of February 27–28, 1943, a Norwegian team ably led by Lieutenant Joachim Rønneberg clambered down a steep ravine, crossed the frozen Maan River, and entered the plant by way of a tunnel. The group destroyed containers of heavy water and machinery and then escaped unscathed. Working strenuously, the Germans restored heavy water

production by June. The Germans then planned to transfer the heavy water and production apparatus to Germany, but this shipment had to traverse Lake Tinnsjå. On February 20, 1944, Lieutenant Knut Haukelid and his team sank the ferry in deep water. Ultimately, German nuclear research failed for many reasons, but delays caused by Norwegian sabotage put nuclear weapons out of German reach.

Following the conquest of Norway, Hitler remained deeply concerned about an Allied invasion of north and central Norway. The large-scale raids on the Lofotens greatly reinforced Hitler's fears. Indeed, British prime minister Winston L. S. Churchill throughout 1942 urged an Allied seizure of north Norway, which the British chiefs of staff wisely blocked. However, as Operation JUPITER, the plan was used as a cover for the real Allied invasion of North Africa in 1942, which began on November 8. Playing to Hitler's fears, JUPITER as a deception measure was a brilliant success.

By 1943, the Germans had 12 infantry divisions stationed in Norway and 250 batteries of heavy guns deployed at key points along the coast. Germany's steel and arms industry did depend heavily on high-quality Swedish iron ore sent in the winter months by rail to the ice-free Norwegian port of Narvik and then by ship through coastal waters to German ports. To protect this vital traffic, the German Army felt compelled to screen the coast with troops and guns.

Until the end of the war, however, Hitler expected a major Allied invasion of Norway. Consequently, approximately 400,000 German troops, among the best soldiers in the German Army, were stationed in Norway at the end of the conflict. The Germans also deployed to Norway some 1,000 guns of 100mm or larger caliber. These were manned by 13 naval artillery battalions and 12 army coast artillery regiments. Thus, Norway diverted a significant German force from the decisive Russian and European theaters of the war.

Norway, Air Force

In 1940, the Norwegian military had on order 60 U.S. Curtiss Hawk 75A-6 and A-8 fighters, 36 Douglas 8A-5 attack aircraft, and 24 Northrop N-3PB torpedo seaplanes. Also on order were 20 twin-engine Italian Caproni light bombers and 12 twin-engine German Heinkel He-115 torpedo floatplanes. When it was invaded in April 1940, however, Norway had in service only 6 of the Heinkels and 4 of the Capronis. The Norwegians also had a collection of obsolete biplanes: Fokkers from 1935, MF.11 seaplanes from 1931, and 11 Gloster Gladiator fighters. Flying all these aircraft, Norwegian pilots fought gallantly but were overwhelmed by the Luftwaffe.

Following the German conquest of their country, Norwegian airmen in exile resumed combat, flying within the framework of the British Royal Air Force (RAF). New arrivals were trained at Island Airport near Toronto, Canada. In April 1941, the Norwegian Naval Air Service, based in Iceland, began operations as Squadron 330 of the RAF Coastal Command. Flying Northrop N-3PB single-engine seaplanes, the Norwegians flew convoy escort and antisubmarine patrols. In 1943, the squadron moved to the Shetland Islands and was equipped with long-range four-engine Short Sunderland flying boats.

A second naval squadron, Squadron 332, went into action in 1943. Based in Scotland, it flew Catalina flying boats and Beaufighter and Mosquito fighter-bombers. The Catalinas reconnoitered German shipping along the coast of Norway, which was then attacked by the Beaufighters and Mosquitoes.

In July 1941, Norwegian Army pilots formed RAF Squadron 331. Based in the Orkney and Shetland Islands, it flew Hurricane fighters in defense of

the major naval base at Scapa Flow. A second squadron, Squadron 332, was deployed in January 1942. That April, both units were equipped with Spitfire Vbs. Both formations were moved in May 1942 to North Weald air base outside London. Flying offensive operations across the English Channel, the Norwegians distinguished themselves in heavy fighting. Consequently, they were among the first to receive the formidable Spitfire IX in October 1942. In 1943, Squadron 331 ranked first and Squadron 332 third in German warplanes shot down by the RAF. The leading Norwegian ace—Svein Heglund—destroyed 17 enemy fighters. Fourteen other Norwegian pilots were also aces.

In November 1944, the army and naval air arms combined to form the Norwegian Air Force. By the end of the war, this Luftforsvaret numbered 2,600 men and 79 combat warplanes.

Norway, Army

The Norwegian Army of 1940 was an infantry force organized as a trained reserve within a framework of officer cadres. On mobilization, it fielded six divisions containing 16 infantry regiments, 4 artillery regiments, 3 mounted infantry regiments, and support units. Norwegian soldiers were armed with the 1894 model Krag-Jorgensen 6.5mm rifle and the Madsen light machine gun. Colt 7.92mm machine guns and 81mm mortars were in short supply. Artillery was of World War I vin tage: 228 77mm guns and 36 120mm howitzers. Possessing no antitank guns, the Norwegians had no effective defense against German light tanks.

Army supply depots were located in the major population centers along the coast. Unfortunately, the Germans seized many of these depots by

surprise when they invaded in April 1940. The swift German assault also disrupted Norwegian preparation for war, with the result that the army was only partly mobilized.

In these chaotic conditions and under unremitting German air attack, Norwegian Army commander General Otto Ruge waged a tenacious defensive campaign. Many Norwegian soldiers, cut off from their assigned units, joined any formation they could find. Their stubborn resistance enabled the royal family and the government to escape capture and sail to England, where a Norwegian government-in-exile was established. Abandoned by his British and French allies, Ruge surrendered his surviving forces on June 10, 1940.

Norwegians in exile mounted several commando operations against key objectives in Norway thereafter. However, most of these raids were undertaken within the framework of the British Special Operations Executive organization. Norwegian ground forces in exile were devoted to preparing a peaceful and stable liberation of the homeland. Based in Scotland, the Norwegian Brigade mustered 4,000 men organized in two infantry regiments and one artillery battalion. Under British command, the Norwegians were outfitted with English weapons and equipment.

Within Norway, resistance to German occupation began immediately. Demobilized veterans formed the Militär Organisasjon, or Milorg. Initially quite successful, Milorg was devastated by Gestapo infiltration of its ranks in 1942 and subsequent mass executions. An outstanding leader, Jens Christian Hauge, enabled Milorg to recover from this setback. Milorg grew from 20,000 men in 1941 to 40,000 by 1945. Between the fall of 1944 and the spring of 1945, Milorg trained and armed its formations in three secret mountain bases. During the war, many Norwegians fled across the border to neighboring Sweden, and beginning in 1943, Swedish authorities permitted the training of Norwegian “police” in special camps. By 1945, about 14,000 Norwegians had received military training in Sweden.

As the war drew to a close, German forces in Finland withdrew into northern Norway, leaving a charred wasteland down to Lyngen Fjord. Into this vacuum, 3,200 Norwegian troops were sent from Scotland and Sweden. When German forces in Norway capitulated on May 8, 1945, Milorg mobilized. On May 13, Crown Prince Olav, commander of all Norwegian

forces, returned to Oslo. On May 26, the rest of the Norwegian Brigade returned to Tromsö. Norway was liberated peacefully.

Norway, German Conquest of (1940)

In 1929, German admiral Wolfgang Wegener argued in *The Sea Strategy of the World War* that in the event of future conflict with Great Britain, Germany should seize Norway, the Shetland and Faroe Islands, and Iceland. Only in this way could the ships of the German Navy escape the confines of the North Sea and gain a dominant strategic position in the North Atlantic. These arguments deeply influenced the leadership of the German Navy; Grand Admiral Erich Raeder, chief of the German Navy, repeatedly pressed them on German chancellor Adolf Hitler.

At the outset of World War II, Hitler supported neutrality in Scandinavia as ensuring a continued flow of Swedish iron ore to Germany. The Swedish ores had an iron content of 60 percent, permitting great economies in the production of steel. Low in phosphorus, Swedish ore produced high quality steel. Between December and April when the Baltic was frozen, iron ore from Swedish mines was sent by rail to the ice-free Norwegian port of Narvik and then through neutral Norwegian coastal waters to German ports.

British first lord of the admiralty Winston L. S. Churchill was keenly aware of the importance of this ore traffic and determined to halt it. The British and French planned an expedition to aid the Finns when the Soviet Union attacked Finland in November 1939, but in reality this plan was a cover for the Allied seizure of Narvik and the ore fields in northern Sweden. The end of the war in Finland compelled the Allies to abandon this plan.

Churchill now sought to mine Norwegian waters, forcing German ore ships to sea, where they could be taken. This violation of Norwegian neutrality would undoubtedly provoke a German reaction, allowing the British to land troops in Norway.

Convinced that the Allies were planning a Norwegian intervention, Hitler began in February 1940 to prepare for Operation WESERÜBUNG (WESER EXERCISE, the Weser being a German river), the German occupation of Denmark and Norway. The invasion was scheduled for March 20, but ice in the Baltic delayed it until April 9. Meanwhile, the British began their mine-laying operation in Norwegian territorial waters early on April 8.

Nonetheless, the timing and magnitude of the German invasion caught Churchill and the British by surprise. For the assault on Norway, Hitler committed five infantry divisions, two regiments of mountain troops, and a battalion of 66 light tanks. Operation WESERÜBUNG would also see the first use of paratroops (three companies) in combat. To seize six Norwegian coastal cities, the German Navy transported 8,850 soldiers in 2 battleships, a pocket battleship, 2 heavy cruisers, 3 light cruisers, 14 destroyers, and smaller vessels. The remaining 54,500 troops would be sent in once these objectives were secure.

The Luftwaffe amassed more than 1,000 aircraft for the operation. Fast heavily armed twin-engine Me-110 fighters possessed the range required to operate in this theater. Flying from captured airfields, Stuka dive-bombers proved devastatingly accurate. The most daring feature of German air operations was the first large-scale use of transport aircraft to deploy troops, support units, and supplies into the attack. More than 500 took part.

Norwegian defenses were woefully deficient. Of 63 warships in the Norwegian Navy, only four small destroyers and a minelayer were modern. All but 10 of the 150 Norwegian warplanes were obsolete biplanes. The Norwegian Army lacked sufficient numbers of heavy machine guns and artillery, and it possessed no antitank guns. Much of the Norwegian population lived in coastal cities where mobilization centers and arsenals were located. Surprise German attacks captured much Norwegian equipment and disrupted Norwegian mobilization.

German preparations for the invasion were noted by British and Norwegian authorities. While the British misread both the timing and the scale of the German attack, Norwegian government attention was riveted on

the British violation of Norway's neutrality. Thus, the Norwegian parliament authorized mobilization of the navy and air services but only 7,000 soldiers.

Norwegian soldiers handing over rifles and other firearms to German soldiers following their country's surrender, May 2, 1940. (Getty Images)

The Germans secured most of their immediate objectives. German paratroopers seized Sola, the largest Norwegian air base, and by April 11, 200 German warplanes, especially Junkers Ju-87 Stuka dive-bombers, were flying from the airfield. The fortress of Oscarsborg commanded the water approach to Oslo. It mounted three 11-inch guns, installed in 1905, and a torpedo battery. Scorning the weaponry as antiquated, the Germans assumed that Oscarsborg was no longer manned. Firing at point-blank range and using torpedoes, the Norwegians sank the German heavy cruiser *Blücher* with heavy loss of life, and the German convoy it had been escorting was forced to withdraw. The Germans then took Oslo's Fornebu airport, and transport planes landed two battalions of troops who soon occupied the Norwegian capital. King Haakon VII and his family, the government, and the parliament had already departed.

The Royal Navy struck swiftly at the German ships. On April 10, British destroyers attacked German destroyers at Narvik. Backed by the old battleship *Warspite*, the British attacked again on April 13, sinking the last of the 10 German destroyers. British warships operating off the central Norwegian coast without fighter protection came under attack from

approximately 90 Luftwaffe bombers. The Royal Navy quickly decided not to risk major warships within range of German airpower.

German Army commander General Nikolaus von Falkenhorst organized his forces in highly mobile groups, effectively supported by light tanks, as ski troops from Bavaria and Austria repeatedly outflanked enemy defensive positions. Norwegian Army commander General Otto Ruge sought to delay the German advance until Allied forces could arrive. Norwegian troops, poorly trained and armed, were in disorder and came under heavy air attack. Ruge rallied his men, who fought tenaciously in the narrow mountain valleys of central Norway. Such delaying actions made Allied expeditions to Norway possible.

The Allies committed 12,500 soldiers to central Norway. By April 20, three battalions of British and three battalions of French mountain troops were at Namsos, 127 miles northeast of Trondheim, and two British battalions (later reinforced by three additional battalions) were at Åndalsnes, 100 miles southwest of the major Norwegian city and transport hub. In a pincer movement, the two forces were intended to recapture Trondheim.

Confusion in unit deployment led to chaos in logistical support in Britain. Allied troops arrived without necessary items, from ski bindings to artillery. The swift advance of the Germans forced the British at Åndalsnes to turn south and wage a series of defensive battles. Meanwhile, a Luftwaffe airlift reinforced the German Trondheim garrison, while Allied bases at Namsos and Åndalsnes were reduced to ashes by German bombing. Much to the disappointment of the Norwegians, the Allies abandoned central Norway by May 3.

German soldiers move heavy artillery forward during their April 1940 invasion of Norway. (Hulton-Deutsch Collection/Corbis)

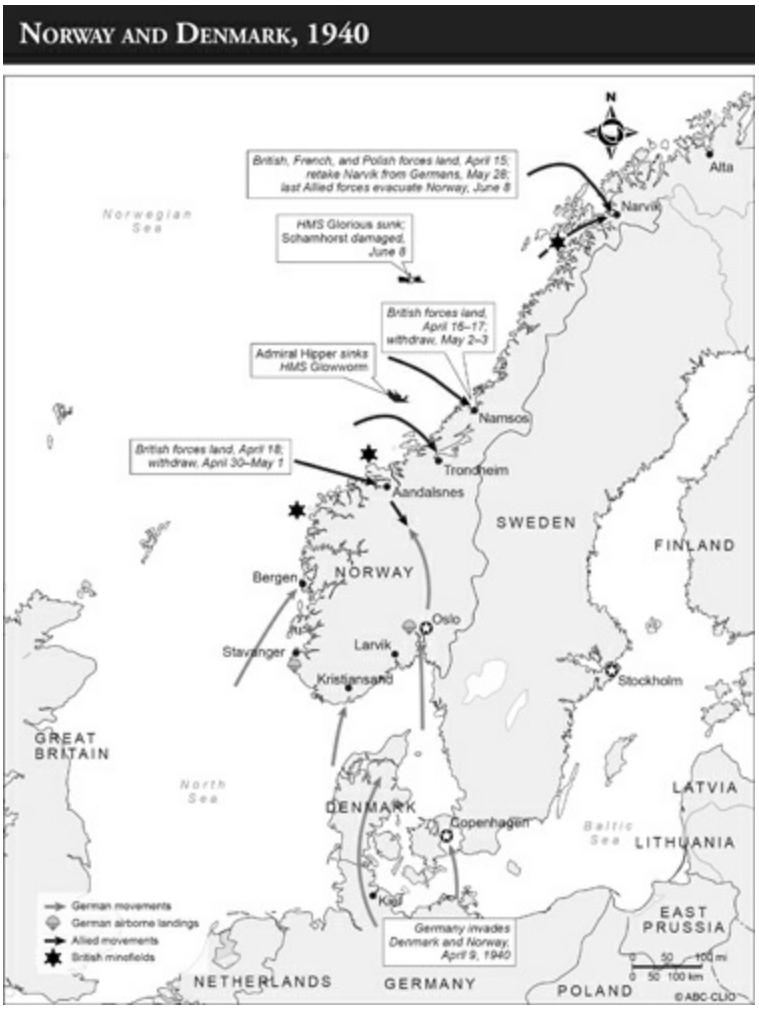
Isolated at Narvik, the three battalions of German mountain infantry were supplied by Ju-52 transports and seaplanes flying at maximum range. On April 15, a British Guards brigade that included Scottish, Irish, and Welsh battalions arrived at Harstad, 70 miles from Narvik. Three battalions of French mountain infantry arrived later. But conflicting orders and clashing command personalities handcuffed Allied operations in the north.

Beginning on May 10, the Germans launched a massive attack against France, the Netherlands, and Belgium. Compelled to consolidate their forces, the Allies decided to seize Narvik, destroy its ore-loading facilities, and then evacuate the royal family and government of Norway and Allied troops.

Disputes between the British Army and the Royal Navy were put aside, and a new army commander, Lieutenant General Claude Auchinleck, arrived on May 11. Reinforcements ably led by French general of brigade Antoine-Marie Béthouart included four battalions of Free Polish infantry and two battalions of the French Foreign Legion. Norwegian troops held the mountains ringing the town. Six hundred local Norwegians improved the air base at Bardufoss, and 14 Gladiator biplanes and 16 modern Hurricanes successfully covered the seizure of Narvik and the subsequent evacuation of Allied forces.

On May 28, French, British, Polish, and Norwegian troops ousted the Germans from Narvik and drove them to the Swedish border. The evacuation of 25,000 Allied soldiers then began and was completed by June 8. A British cruiser transported the Norwegian monarch and government to Britain. Ruge disbanded his forces, and hostilities ended in Norway on June 10.

In fighting on land, the Germans lost 3,692 men killed or missing, the Norwegians 1,335, and the French and Poles 530. The British lost 1,896 dead, missing, or severely wounded. The Luftwaffe lost 242 aircraft; the British 112. In fighting at sea, the British lost an aircraft carrier, 2 light cruisers, and 7 destroyers. The French and Poles each lost a destroyer. The Norwegian Campaign severely crippled the German surface navy; its losses included 1 heavy cruiser, 2 light cruisers, and 10 destroyers. It now had only 3 cruisers and 4 destroyers undamaged, although other damaged ships could be repaired.



After the Germans effected repairs at Narvik, the flow of Swedish iron ore resumed and continued without interruption to the end of the war. The strategic advantage of Norwegian bases came into play as the war unfolded. Based in Norwegian fjords, the battleship *Tirpitz* pinned down much of the battleship strength of the Royal Navy. Convoys to Russia were decimated by the Luftwaffe flying from northern Norway and by submarines. But Germany was never able to use Norway as a springboard to the Faroes, Shetlands, and Iceland. The British took the Faroes under their protection on April 12 and Iceland on May 10. The keys to the North Atlantic remained firmly in Allied hands.

An unforeseen result of the Norwegian fiasco was the resignation of British prime minister Neville Chamberlain on May 10 following the debacle in central Norway. Ironically, the architect of the disaster, Churchill, then became prime minister. His effective leadership would be amply demonstrated in the difficult summer and fall of 1940. Based in London, the indomitable King Haakon VII and his Free Norwegians continued the struggle to liberate their homeland.

See WESERÜBUNG, Operation

Norway, Navy

The Norwegian Navy of 1940 consisted largely of obsolete warships and fishery protection ships. Norway had not fought since the Napoleonic Wars, and in 1933 the defense budget was the smallest in recent history. It grew in the late 1930s as world tensions increased, but the naval construction program was modest and, in any case, undertaken too late.

In 1940, the Norwegian Navy consisted of two armored coast-defense ships, the *Eidsvold* and *Norge*, with main armaments of two 210mm (8.26-inch) guns, launched in 1900 and forming the Panserskips Divisjon (armored ship division). Two other older coastal defense ships lay disarmed at Horten, a naval base outside of Oslo. The Germans sunk the first two at Narvik in their invasion of Norway in April 1940. They captured the latter two and rearmed them as antiaircraft guard ships.

In terms of modern ships, Norway had a minelayer and 4 600-ton torpedo boats. Several destroyers and torpedo boats were under construction at the time of the German attack. The remainder of the fleet consisted of 4 destroyers and 11 torpedo boats, all built before 1920; 9 submarines; and miscellaneous warships, 1 of which dated from 1858.

Commander of the navy Rear Admiral Henry E. Diesen was viewed as a political admiral. The officer corps had been gutted in the early 1930s as a consequence of budgetary constraints, and a substantial element within it supported Vidkun Quisling's Norwegian Nazi Party. However, most officers rallied to king and country when Germany invaded.

The dramatic event for the Norwegian Navy in the war was the German invasion of Norway in April 1940. It was a surprise on two levels. It was a strategic surprise because Norwegian leaders were more concerned by an invasion or limited naval action by the Allies, primarily the powerful British Royal Navy, and did not foresee an attack from the smaller German Navy, which presumably would not have command of the seas. The Germans also achieved surprise at the operational level, although a steady stream of

warnings of German warships and troopships moving north arrived in the hours before the attack.

After two months of fighting, 13 warships of the Norwegian navy and about 500 officers and sailors reached British ports. Only 1 of these ships was modern. The remaining Norwegian naval vessels were either sunk or incorporated into the German Navy. The Norwegian Navy used its older warships for training and patrol and minesweeping operations, and the Norwegian government-in-exile added to these more than 50 whaling ships that had been operating in the polar regions when Norway had been invaded. These 300- to 500-ton ships saw British and Norwegian service as minesweepers and in clandestine operations. More than 200 of the latter operations occurred in Norwegian waters as part of the "Shetland Bus," the clandestine special operations link between Shetland, Scotland, and German-occupied Norway.

During the war, the Norwegian Navy secured under Lend-Lease 5 U.S. World War I–era destroyers and 7 British-built destroyers. It obtained an additional 3 submarines, 7 corvettes, 3 submarine chasers, 1 patrol craft, and 29 motor torpedo and motor launches that saw much action in the English Channel and in Norwegian coastal waters.

Norwegian Navy ships participated in the Battle of the Atlantic, helped protect the convoys to Murmansk, and took part in Operations TORCH (November 8, 1942) and the Normandy Invasion (June 6, 1944). Of major combatants, Norway lost in battle one submarine while attempting to land agents in Norway as well as two destroyers and three corvettes in the Atlantic. The Norwegian Navy also operated a modest naval air arm from Scotland for patrols in the Norwegian and North Seas.

Norway's greatest contribution at sea during the war was its merchant marine, the fourth largest in the world with more than 1,000 ships totaling more than 4.8 million tons. By 1945, Norway emerged with an effective and sizable navy ready to help lead the way into collective military action under the future banner of the North Atlantic Treaty Organization (NATO).

Novikov, Aleksandr Aleksandrovich (1900–1976)

Soviet Army chief marshal of aviation. Born in the village of Kryukovo, in Kostroma Province, on November 19, 1900, Aleksandr Novikov was called up for the Red Army in 1919, during the Russian Civil War (1918–1920). He joined the Communist Party in 1920 and took part in the bloody suppression of the Kronstadt Revolt in March 1921, where he was impressed with the role of aircraft in a ground-attack role.

In 1921, Novikov attended the field academy of the Red Army at Vystrel, and in 1927 he attended the Frunze Academy. In 1933, despite his defective eyesight, Novikov secured a transfer from the infantry to the air force and learned to fly. In 1935, he took command of the 42nd Light Bomber Squadron, and in March 1936 he won promotion to colonel.

Novikov managed to avoid the great purge of the military, although many of his colleagues were arrested and shot in 1937 and 1938. Novikov became chief of staff of the Karelian Front during the 1939–1940 First Finnish-Soviet War (Winter War). As a major general, he commanded aviation in the Leningrad Military District, which became the Northern Front after the June 22, 1941, German invasion of the Soviet Union.

Novikov became deputy commander of the Red Army Air Force in February 1942. Promoted to lieutenant general in April, he assumed command of the Red Army Air Force, a post he held until March 1946. In this position, Novikov was responsible for coordinating Soviet air assets in Stalingrad (August 23, 1942–February 2, 1943), Kursk (July 5–13, 1943), and during Operation BAGRATION (June 22–August 29, 1944). Promoted to colonel general in 1943, Novikov was the first Soviet marshal of aviation and one of only two officers to be made chief marshal of aviation during the war.

Following the defeat of Germany, Novikov directed air actions against the Japanese Guandong (Kwantung) Army in Manchuria.

Arrested in March 1946 in a purge of the military as Soviet dictator Joseph Stalin removed war heroes, Novikov was held under strict confinement from 1946 to 1953, but he was released in May 1953 following Stalin's death. Rehabilitated the next month, he held a succession of important posts, including commander of long-range aviation units and deputy chief of staff of the now-independent Soviet Air Force in 1954–1955. Novikov retired in 1956 because of ill health. He died in Moscow on February 3, 1976.

Nuclear Weapons

Weapons using energy released from the nuclei of atoms to generate destructive power. Nuclear energy is created when atoms are split (fission) or when atoms are combined (fusion). During the 1920s and 1930s, scientists suggested that the energy within atoms could be used to produce incredible power, including the potential to create weapons significantly more destructive than any in existence. Early in World War II, Germany, Japan, the Soviet Union, Great Britain, and the United States had research programs examining the potential of nuclear weapons.

Although the German nuclear program had significant potential because of a strong prewar scientific community, it failed to produce a weapon. Historians debate the reason for the German failure, citing a lack of resources and high-level support, basic technological and scientific errors or failures,

and possible intentional slowdowns by German scientists. The Japanese program, with some assistance from Germany, made limited progress in basic research but did not come close to producing a viable weapon.

Soviet nuclear research activities were disrupted by the German invasion in June 1941 and the occupation of the Soviet industrial heartland. The Soviet research effort was reborn in late 1942, motivated by appeals from Russian physicists and reports of nuclear advances in Germany, Britain, and the United States. The Soviet nuclear weapons project continued throughout the war and afterward. Assisted by information provided by an active espionage network in the United States and Great Britain and the contributions of captured German scientists, the Soviets exploded their first nuclear device on August 29, 1949.

Only the Americans, assisted by British, Canadian, and émigré scientists, were successful in developing an atomic bomb during the war. The perception of a significant German scientific capability, reinforced by intelligence reports of progress in nuclear matters, was a strong motivation for the British and American research efforts. In the United States, émigré scientists including Leo Szilard and Enrico Fermi were key participants in and advocates of nuclear research. In August 1939, Albert Einstein wrote a letter to President Franklin D. Roosevelt that drew attention to the potential of the concept and gained increased government support for the American scientific research effort.

The U.S. government accelerated its nuclear research activities in August 1942 by creating a highly secret top-priority program that was given the cover designation “Manhattan Engineer District,” normally shortened to “Manhattan Project.” Brigadier General (later lieutenant general) Leslie Groves, a U.S. Army engineer, directed the program. The central research facility was established at Los Alamos, New Mexico, with support provided by a nationwide network of facilities including university laboratories, industrial sites, and major new nuclear production sites at Hanford, Washington, and Oak Ridge, Tennessee. The Manhattan Project was a massive undertaking that involved solving the theoretical foundations for nuclear fission and fusion designs and then the practical engineering challenge of creating a functional, deliverable weapon.

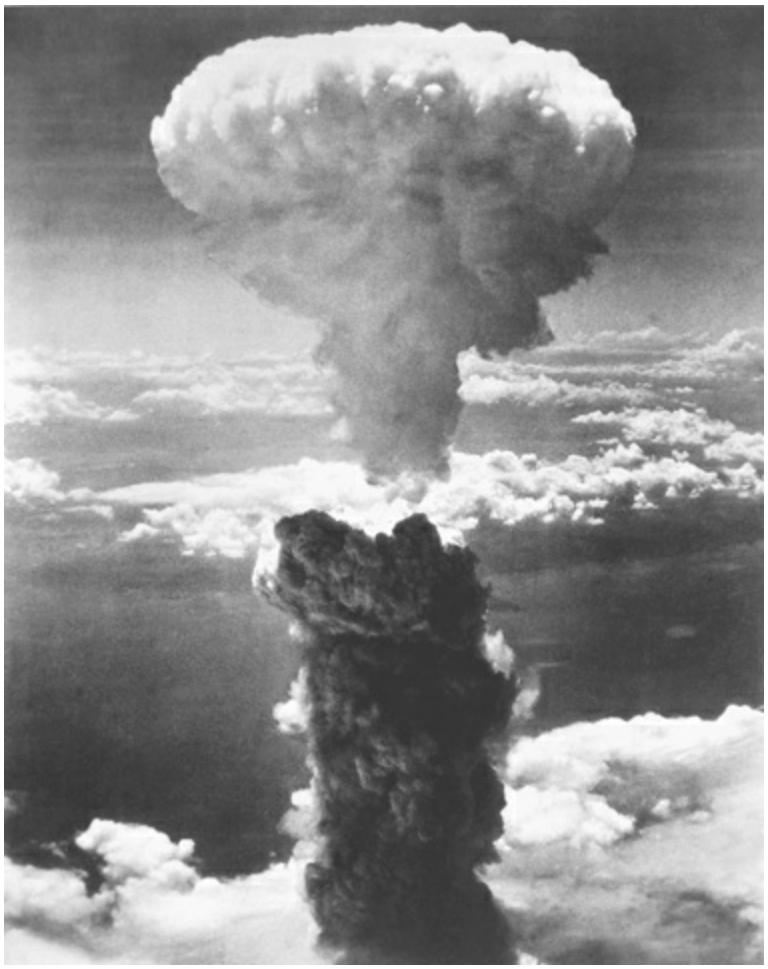
The Manhattan Project produced two successful atomic bomb designs. Both brought sufficient fissile material together quickly to create a

supercritical mass, which was triggered into a rapid fission chain reaction by an initiator that injected neutrons into the mass. The result was the explosive release of the binding nuclear energy. The simplest design used a gun assembly to fire one subcritical mass, termed a “bullet,” into a second subcritical mass, the target, to create a supercritical mass. The gun-assembly weapon used uranium-235 as fuel and was the design of the “Little Boy” bomb dropped on Hiroshima on August 6, 1945.

The second approach used an implosion technique and plutonium-239 as the fuel. The implosion design used shaped conventional high-explosive charges to compress a subcritical mass into a denser mass that became supercritical. The implosion design was used for the first atomic test explosion on July 16, 1945, when a device named “Gadget” was detonated at the Trinity site on the Alamogordo Bombing Range in New Mexico. The “Fat Man” bomb dropped on Nagasaki on August 9, 1945, was also an implosion design.

The two bomb designs included significant emphasis on safety. In addition to design safety and arming procedures, key parts of the bombs were not inserted until after the B-29s of the 509th Composite Group took off from their base on Tinian Island. This procedure was intended to prevent a full nuclear explosion if an accident occurred, although the “Little Boy” design still had significant inherent safety problems. Both bombs used radar altimeters for fuzing and had a barometric altimeter as a backup.

The effects of nuclear weapons are generally described in terms of a comparable amount of thousands of tons of conventional explosives, kilotons, of yield (usually TNT). The “Little Boy” bomb was estimated to have the explosive power of 15 kilotons, and the “Fat Man” bomb had 21 kilotons. This description does not fully describe the effects of these weapons, as in a normal bomb design approximately half of the yield was produced in blast energy, approximately one-third of the energy was thermal radiation, and the remainder was released in the form of radiation.



A dense column of smoke rises more than 60,000 feet into the air over the Japanese port of Nagasaki, the result of an atomic bomb. The second atomic weapon employed in warfare, it was dropped on that industrial center on August 9, 1945. (National Archives)

Although the atomic bombs developed by the Manhattan Project used nuclear fission, the fusion process had been considered in the theoretical discussions and was recognized as having even greater destructive potential. The fusion weapon design, often referred to as the “Super,” was not produced until after the war. Fusion weapons, known as thermonuclear weapons or hydrogen bombs, used a fission detonation to trigger the fusion reaction, which generated significantly higher destructive power.

The United States detonated the first fusion device, with a yield of 10 megatons (million tons), in October 1952 in a South Pacific test. The development and use of atomic bombs in World War II and the subsequent development of thermonuclear weapons had a significant effect on postwar

military forces and national security policies, especially in the form of deterrence doctrines that dominated the Cold War period.

Nuremberg Laws (1935)

Denaturalization laws passed in pre–World War II Germany designed to systematize discrimination against German Jews. The Nuremberg Laws on Citizenship and Race (Nuremberg Laws) were the most spectacular manifestation of Nazi-inspired anti-Semitism. From September to November 1935, German chancellor Adolf Hitler introduced the so-called Nuremberg Laws that defined citizenship and deprived noncitizens, including Jews, of rights. Special sessions of the Reichstag (parliament) were held at Nuremberg in 1935, at which legislation was passed that deprived Jews of citizenship and forbade intermarriage between Jews and non-Jewish Germans. This was the most prominent instance in modern times of the deliberate incorporation of prejudice and intolerance into the laws of a nation. Above all, the Nuremberg Laws officially attempted to define what being Jewish actually was.

The supplementary decrees specified the following:

> On the basis of Article 3 of the Reich Law of Citizenship of September 15, 1935, the following is hereby decreed:

ARTICLE 1 (1) Until further provision concerning citizenship papers, all subjects of German or kindred blood who possessed the right to vote in the *Reichstag* elections when the Law of Citizenship came into effect, shall, for the present, possess the rights of Reich citizens. The same shall be true of those upon whom the Reich Minister of the Interior, in conjunction with the deputy to the Führer, shall confer citizenship….

ARTICLE 2 (1) The provisions of Article 1 shall apply also to subjects who are of mixed Jewish blood.

(2) An individual of mixed Jewish blood is one who is descended from one or two grandparents who, racially, were full Jews, in so far that his is not a Jew.… Full-blooded Jewish grandparents are those who belonged to the Jewish religious community.

Jewish Germans were not permitted to employ non-Jewish maids under 45 years of age, were prevented from marrying non-Jews, and were excluded from citizenship, even if they had been born in Germany. They had to adopt Jewish first names, wear the yellow Star of David in public, and avoid public facilities where they might mix with gentiles. They could not teach, practice law or medicine, or perform/entertain in public. (Much of this had already been legalized in 1933–1934.)

The Nuremberg Laws set into motion a frightening series of measures that ultimately sought to destroy the Jews of Europe. After the racial laws came enforced concentration into ghettos or similar areas within cities. Finally came deportation to the concentration camps of eastern Germany or Poland, with death through overwork, starvation, or systematized extermination. The transition from deportation to mass murder did not occur until the invasion of the Soviet Union in June 1941.

Nuremberg Rallies

Massive national conventions held chiefly in Nuremberg and sponsored by the German Nazi Party between 1923 and 1938. The first such rally was actually held in January 1923 in Munich. In September 1923 another rally was held, this time in Nuremberg, which was selected because of its central location. By the late 1920s, all of the rallies were held in September, to coincide roughly with the autumnal equinox. The Nuremberg rallies were chiefly huge propaganda events that glorified the Nazi Party and its ideology. They grew in popularity and attendance each year, particularly after Adolf Hitler came to power in 1933.

Once Hitler had ensconced himself in the German psyche, the Nuremberg rallies were also used to augment his personality cult, portraying him as the selfless leader destined to be Germany's modern savior. Hitler routinely gave a major speech to the throngs at Nuremberg, where as many as 500,000 Germans gathered in an immense open-air arena. A number of Nazi propaganda films emerged from the Nuremberg rallies, the most notable being Leni Riefenstahl's *Triumph of the Will* (1934). Usually, each rally followed several weeks of preparatory festivities, including sporting events, air shows, and music festivals featuring German composers.

Each Nuremberg rally had a theme, and all were carefully choreographed to match or magnify Nazi ideologies and policies. Thus, the 1935 rally was titled "Rally of Freedom," symbolizing the reintroduction of compulsory military service, which was meant to portray German's freedom from the Treaty of Versailles. The next year's rally celebrated the remilitarization of the Rhineland, which returned "honor" to the German nation. The 1937 rally, celebrating German laborers, was spectacular for the 150 giant searchlights designed by Albert Speer that sent vertical shafts of light into the night, designed to look like a huge floating building. The military also had a major presence at the rallies, especially during the mid and late 1930s. Thousands of German soldiers passed in review, goose-stepping with their weapons.

The Nuremberg rallies also served as the national convention for the Hitler Youth, comprised of German girls and boys ages 10 to 18. Hitler and other top Nazi officials took a keen interest in cultivating German youths and inculcating in them Nazi values. Thus, the rallies provided thousands of youths the opportunity to see their führer in person and to listen to his speeches. The rallies not only proved to be a propaganda bonanza in Germany but were also meant to impress and perhaps intimidate other nations. Newsreels filmed at the rallies made their way into movie theaters throughout Europe, the Americas, and elsewhere. The Nuremberg rallies were profoundly dramatic and symbolic, featuring trumpet fanfares, military parades, Wagnerian music, and massive torchlight parades.

The 1938 "Rally of Greater Germany" was the last rally ever held. Although a rally was planned for September 1939, it was canceled because of the German invasion of Poland on September 1, which began World War II.

Nuremberg Trials

See International Military Tribunal, Nuremberg Trials

Nuri al-Said Pasha (1888–1958)

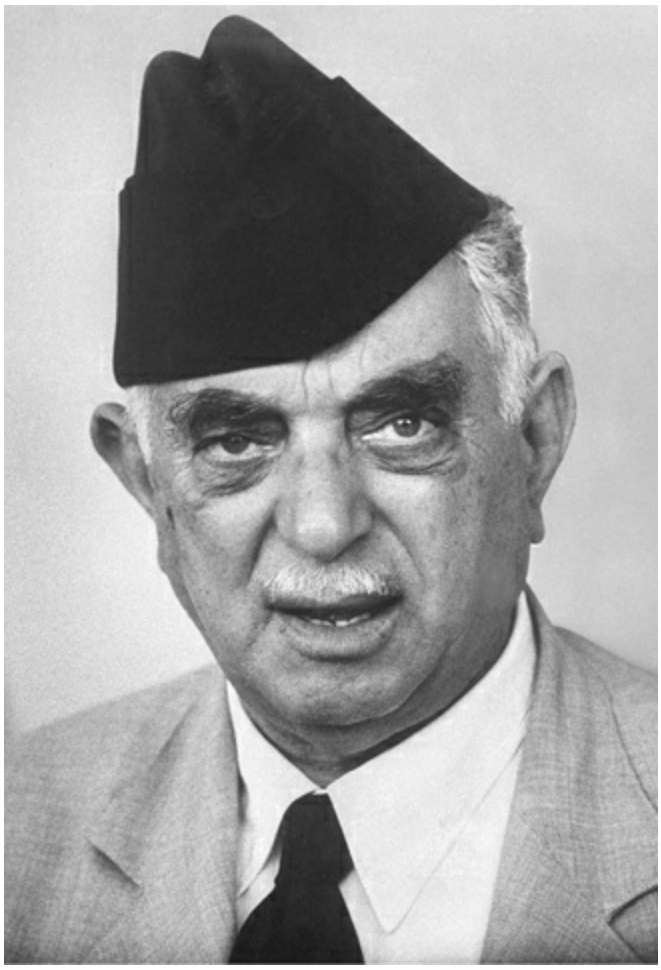
Iraqi political leader. Born in Kirkuk (Iraq) in 1888, Nuri al-Said (Nuri as-Said) Pasha received a military education. He graduated from a military academy in Istanbul in 1905 and the next year was commissioned an officer

in the Ottoman Army. He became active in politics and joined the Ahd Party in 1912.

During World War I, Nuri participated in military operations against the British but was captured. Nuri later distinguished himself in battle during the Arab revolt against Ottoman rule. After the revolt, he participated in the administration of a new Arab state with its capital in Damascus. He attended the Paris Peace Conference in 1919 and was appointed chief of staff of the Iraqi Army in 1920. In 1922, Nuri became director-general of the Iraqi police, serving under King Faisal. Nuri became prime minister in 1930.

While prime minister, on June 30, 1930, Nuri signed a treaty with the British that granted independence to Iraq. Prime minister on 14 different occasions, Nuri remained pro-British. When Faisal died in 1933, much of the Iraqi population, especially the young, disagreed with Nuri's views. Conflicts arose at the start of World War II when Nuri supported the British and declared war on Germany in 1940.

In April 1941, Rashid Ali Gailani staged a coup and forced Nuri and his supporters into exile. While Rashid was in power, he ignored Italy's declaration of war against Britain and permitted anti-British propaganda and activities. In May 1941, however, the British sent in military forces and crushed the Rashid Ali regime. Nuri then returned to Iraq and served as prime minister with British sponsorship from 1941 to 1944. Nuri maintained political dominance and sought to create a union of Arab states with British support.



Iraqi political leader Nuri al-Said, shown here in 1957. (Time Life Pictures/Getty Images)

Iraq became a charter member of the Arab League in 1945. At the end of World War II, however, there was strong nationalist feeling in Iraq and resentment toward the West, while Nuri favored continued ties with the Western powers. In February 1958, Nuri sponsored a union with Jordan. On July 14, 1958, Iraqi Army units overthrew the monarchy and executed King Faisal II and most of his family. Nuri al-Said was killed by a mob in Baghdad the next day.

O

Obata Hideyoshi (1890–1944)

Japanese Army general. Born in Osaka Prefecture on April 2, 1890, Obata Hideyoshi graduated from the Japanese Military Academy in 1911. A graduate of the Army War College in 1919, he also served as an instructor there. Obata was resident officer in Britain from 1923 to 1926, military attaché in India during 1927–1929, and on the staff of the War Ministry and the General Staff (1929–1930). Promoted to colonel in 1934, he was chief of the Operations Section of the General Staff in 1934 and 1935 and commanded the 14th Cavalry Regiment from 1935 to 1937. He became assistant director of the Akeno (Army) Air School in 1937 and then the director in 1938 as a major general. In 1940, he was promoted to lieutenant general and took command of the 5th Air Group.

At the beginning of the war, Obata's air group supported Japanese operations against the Philippines and Burma. As commander of the Third Air Army from 1943, Obata supported defensive operations in Burma. In February 1944, he became commander of the newly established Thirty-First Army, which was scattered over a vast area of the Northwest Pacific. Obata was at Palau on an inspection trip when U.S. forces attacked Saipan on June 15, 1944. He commanded his army from Guam, fighting directly against U.S. forces there from July. Obata was killed on Guam on August 11, 1944, and brevetted full general after his death.

O’Connor, Richard Nugent (1889–1981)

British Army general. Born in Srinagar, Kashmir, on August 21, 1889, Richard Nugent O’Connor was educated at the Royal Military College, Sandhurst, and commissioned in the Scottish Rifles in 1909. In World War I, he was posted to the 7th Division on the Western Front. In June 1917, O’Connor assumed command of a battalion as a temporary lieutenant colonel but reverted to captain at the end of the war. Postwar service included attendance and an instructor assignment at the Staff College, Camberley. In 1931, he was again promoted to lieutenant colonel and commanded the 1st Battalion of The Cameronians.

Promoted to brigadier, O’Connor then commanded the Peshawar Brigade on the northwest frontier in India in 1936. After two years there, he was promoted to major general and took command of the 7th Division in Palestine, which meant that he was also military governor of Jerusalem.

In June 1940, O’Connor moved his division to Egypt, and as a lieutenant general, he took command of the small Western Desert Force in Egypt. When Italian forces invaded in September, O’Connor skillfully led his vastly outnumbered troops in Operation COMPASS (December 7, 1940–February 7, 1941) to destroy an Italian army; capture prisoners, equipment, and supplies; and secure the port of Tobruk on January 21–22, 1941. In 10 weeks, at a cost of fewer than 2,000 casualties, his forces inflicted 12,000 killed or missing and took 138,000 prisoners, including 5 generals, as well as 400 tanks and 850 guns.

Following the arrival of the German Afrika Korps in North Africa in February 1941, Lieutenant General Erwin Rommel launched a counterattack in March that achieved success in large part because much of the Western Desert Force had been sent to fight in Greece. O’Connor was then commanding British troops in Egypt, and he was ordered to the front to serve

as adviser to his successor, Lieutenant General Philip Neame. O'Connor and Neame were captured by a German patrol on April 6. Held as prisoners of war in Italy for the next two and a half years, both men managed to escape in September 1943 and return to Britain.

O'Connor returned to duty in January 1944 and commanded VIII Corps beginning in June but was posted to India in November to head first the Eastern Command and then the Northwestern Command. He was promoted to full general in April 1945. He later served as adjutant general to the forces in 1946 and 1947. O'Connor retired in September 1947. He died in London on June 17, 1981.

O'Daniel, John Wilson (1894–1975)

U.S. Army lieutenant general. Born in Newark, Delaware, on February 15, 1894, John "Iron Mike" Wilson O'Daniel joined the Delaware National Guard while still a student at Delaware College. Mobilized with the guard in 1916, he served on the Mexican border. In 1917, he secured a commission in the regular army and fought in France during World War I. It was there that he received his nickname, the consequence of wounds received. O'Daniel served with the Civilian Conservation Corps from 1933 to 1938 and was then professor of military science at the Academy of Richmond County (1936–1938). He graduated from the Command and General Staff School in 1939 but had no General Staff service.

In World War II, O'Daniel became an expert on amphibious operations. Promoted to colonel, in July 1942 he commanded the American Invasion

Training School in Britain. In November 1942, he was promoted to brigadier general and commanded a 34th Infantry Division regimental combat team that landed at Algiers, Algeria, as part of Operation TORCH, on November 8. In December 1942, O'Daniel organized the Fifth Army Invasion Training Center to prepare for the invasion of Sicily. He accompanied Major General Lucian Truscott's 3rd Infantry Division to its beachhead in Sicily (July 9, 1943), and he managed the American VI Corps landing area at Salerno, Italy, on September 9.

Truscott made O'Daniel his assistant division commander later in the Italian Campaign (1943–1945). At Anzio (January 22–May 25, 1944), O'Daniel took command of the 3rd Infantry Division when Truscott assumed command of VI Corps. Truscott claimed that O'Daniel "had no equal" as an infantry division commander. O'Daniel was promoted to major general in May 1944.

Following the capture of Rome early in June 1944, the 3rd Infantry Division was one of three American divisions selected for the Seventh Army landings in southern France on August 15. From there, O'Daniel led his command into Bavaria. The 3rd Infantry Division ended the war near Berchtesgaden on May 7, 1945.

After the war, O'Daniel commanded the Infantry School (1945–1948), served as army attaché in Moscow (1948–1950), and commanded I Corps in Korea (1951–1952), where he was promoted to lieutenant general in 1951. He was next commander of the U.S. Army, Pacific. He also directed the U.S. Military Assistance and Advisory Group, Vietnam (1954–1955). O'Daniel retired in February 1956. He later founded the American Friends of Vietnam, a group that lobbied for support of the Republic of Vietnam government in South Vietnam. O'Daniel died in San Diego, California, on March 28, 1975.

Oesch, Karl Lennart (1892–1978)

Finnish Army general. Born on August 8, 1892, in Pyhäjärvi (then part of the Russian Empire), Karl Lennart Oesch served in the German Finnish Jäger Battalion from 1915 to 1918. In the Finnish War of Independence he commanded a battalion. From 1923 to 1926, Oesch studied at the French Ecole Militaire. From 1930 to 1940, he was chief of the Finnish General Staff and served under Marshal Carl Mannerheim during the 1939–1940 Russo-Finnish War.

In March 1940, Oesch assumed command of forces at the Gulf of Viipuri (Vyborg), known as the Coastal Group, from Major General Kurt Wallenius, whom Mannerheim relieved from command. In short order Oesch achieved spectacular gains, reorganizing the Coastal Group into an effective command. The Gulf of Viipuri was the scene of some of the most bitter fighting of the war, and Oesch managed to hold Viipuri itself until the end of the war.

Oesch's forces retook the remainder of the territory in 1941 during the Continuation War. Oesch was chief of staff of the army in 1944. That November, Oesch commanded both the III and IV Army Corps in the defense of the Karelian Isthmus. Despite a tenacious Finnish effort, vastly superior Russian forces overran Oesch's defenders, resulting in the loss of Viipuri. Oesch, however, was able to save his force from complete annihilation. Following the war, Soviet pressure resulted in Oesch being sentenced by a Finnish military court to 12 years' imprisonment at hard labor on a charge of mistreatment of Soviet prisoners. Oesch died on August 8, 1978.

Office of Price Administration, U.S.

U.S. government civilian agency charged with establishing price controls, controlling rents, and rationing scarce commodities. The Office of Price Administration (OPA) was formally created by executive order on August 28, 1941, and was headed by Leon Henderson; its predecessor agency was the Office of Price Administration and Civilian Supply. The OPA's first substantive action occurred on December 27, 1941, 20 days after the Japanese bombing of Pearl Harbor, when it mandated the rationing of rubber tires. The goals of the OPA were to control prices, thereby dampening inflation; to keep demand and supply in balance thereby mitigating shortages; to prevent excess profiteering; and to keep the American public tuned in and involved with the war effort.

On January 30, 1942, Congress passed the Emergency Price Control Act, which formally permitted the OPA to institute price controls on virtually all commodities and products with the exception of agricultural products, which were controlled by another government agency. The agency was also allowed to implement rent controls nationwide. The main pricing formula was set in May 1942 by the General Maximum Price Regulation, which set a ceiling on prices based on the level seen during March 1942. Producers and sellers wishing to exceed the price ceilings were obligated to apply for a price adjustment with the OPA; prices could not legally be raised beyond the ceiling price without official OPA authorization. Enforcement occurred mainly at the local and district levels, although serious violations made their way to the national level and were reviewed and pursued in Washington, D.C., where the OPA was headquartered.

To keep the OPA bureaucracy from becoming too large and to involve civilians in the economic stabilization process, the OPA decentralized its operations. It maintained eight regional offices, dozens of district offices, and dozens more at the local level. Thousands of civilian volunteers—many of

them women—helped establish prices and monitored enforcement. At the time, women were the main shoppers in a given household, especially for groceries, clothing, and other products that were particularly price-sensitive. The OPA also rationed commodities such as shoes, nylon, gasoline, fuel oils, coffee, and meats by issuing ration cards to each individual or household in the United States. The OPA also helped organize recycling drives for scarce commodities such as rubber and various metals.

In 1943, Prentiss Marsh Brown succeeded Henderson as the OPA's chief administrator; he was succeeded in turn by Chester Bliss Bowles, who headed the agency until it was organized out of existence in 1946. In October 1942, Congress created the Office of Economic Stabilization, which coordinated pricing policies with the OPA and wage policies with the National War Labor Board to ensure that all were working to prevent inflation and labor disputes.

Most Americans willingly complied with the OPA guidelines, and it did an adequate job of preventing runaway prices and profiteering. Between 1942 and 1945, aggregate retail prices rose by about 31 percent; this compared to a 62 percent increase during World War I, during which prices were not strictly controlled by the government. In 1943, the OPA reported some 280,000 violations; in 1944, 205,880 violations were reported. Most violations warranted only a warning letter; a small number required a fine. Only about 1.5 percent of all violations resulted in a jail sentence.

As early as August 16, 1945, the OPA had lifted the rationing of gasoline and oil as well as processed foods. De-control occurred at a rapid rate, and by year's end most controls had been lifted. In December 1946, most of the OPA's remaining functions were transferred to other agencies. It was liquidated entirely on May 29, 1947, by executive order.

Office of Strategic Services

The Office of Strategic Services (OSS) was a U.S. foreign intelligence agency and the forerunner of the Central Intelligence Agency. The OSS was established in June 1942 and disbanded on October 1, 1945. President Franklin D. Roosevelt established the OSS at the urging of Colonel William J. Donovan, a prominent lawyer and former U.S. assistant attorney general who had served in the army during World War I and then took an interest in intelligence matters.

At the beginning of World War II, Donovan, who had close connections with like-minded British intelligence operatives and with Roosevelt, persuaded the president that the United States needed a centralized, civilian-run intelligence agency that would report directly to the White House. In July 1941, before the United States entered the war, Roosevelt established for this purpose the Office of Coordinator of Information, headed by Donovan. A few months after the December 7, 1941, Japanese attack on Pearl Harbor, this agency became the OSS, which was to report directly to the newly created Joint Chiefs of Staff.

The OSS undertook a wide variety of activities during the war. In the United States, Donovan recruited academics for research and analysis functions. The OSS also mounted numerous covert activities in both the European and Pacific war theaters. It had particularly close links with British intelligence services, which Donovan regarded as providing a desirable model for a potential U.S. agency. OSS European operations were based in London and headed by Colonel David K. E. Bruce. OSS operatives infiltrated Axis-occupied territory, aiding resistance groups and providing the U.S. military with firsthand intelligence. In the Asian theater, OSS agents worked closely with nationalist forces in China and Indochina, and as the war drew to a close they reported favorably to Washington on both the Chinese Communist movement and its Vietnamese counterpart.

Despite its successes, the OSS attracted fierce criticism from the American military, particularly General Douglas MacArthur, commander of

U.S. forces in the Southwest Pacific; military intelligence operatives; and other rival intelligence agencies, such as the Federal Bureau of Investigation. Donovan's forthright style did little to allay such tensions. The OSS recruited its operatives disproportionately from the American social elite to which Donovan belonged, winning it the nickname "Oh So Social" and enabling detractors to denigrate its accomplishments.

In September 1945, President Harry S. Truman disbanded the OSS, ignoring Donovan's forceful pleas to establish a centralized U.S. intelligence agency. Within a few months, however, rising Cold War tensions led Truman to reverse this decision. The OSS was the de facto precursor of the Central Intelligence Agency (CIA), established by presidential executive order in 1946 and, more formally, by the National Security Act of 1947. Many CIA operatives, including several influential directors, began their intelligence careers as OSS agents.

PRISCILLA MARY ROBERTS

Built for the Office of Strategic Services (OSS), this tiny "M.B." camera—no larger than its namesake, a matchbox—could be easily hidden in a man's hand and used to take a picture under the cloak of such a simple gesture as lighting a cigarette or reading. Eastman Kodak designed and built 1,000 of these cameras for use by OSS agents and underground forces during the war. (Bettmann/Corbis)

Office of War Information, U.S.

U.S. government agency created by executive order on June 13, 1942, designed to control and disseminate information on the war effort at home and abroad. Although the Franklin D. Roosevelt administration eschewed using the term "propaganda" to describe the agency's functions, the Office of War Information (OWI) did indeed engage in propagandistic activities, particularly in Europe and Japan.

Unlike its World War I predecessor (the Committee on Public Information), the OWI was not empowered with any censorship powers. Elmer Davis, a news reporter for CBS radio, headed the new agency. His mandates were to coordinate the production and dissemination of war news and information, aid in the recruitment of civilian workers for defense work (mostly women), promote patriotism, discourage activities that might hinder the war effort, and create an overseas component that would engage in propaganda and disinformation campaigns aimed at the Axis powers.

The OWI used a variety of media to advance its agenda. These included numerous radio broadcasts and radio shows, posters, leaflets, brochures, films and newsreels created by the agency, and Hollywood films. The agency also employed more novel approaches to propaganda, including the issuance of matchbooks, pocket sewing kits, seed packets, and other similar items. Matchbooks had the "Four Freedoms" printed on the inside covers, seed packets carried an American flag and a prowar message, and special soap

packets were inscribed with the message “Wash off the Nazi Dirt.” In addition, a small army of OWI photographers recorded factory workers, shipyard workers, and many others to document and encourage American participation in the war.

The OWI staff, which included journalists, writers, and academics, worked closely with U.S. broadcasting companies as well as Hollywood movie producers. Indeed, the Bureau of Motion Pictures, which operated under the aegis of the OWI, worked cooperatively with Hollywood producers and directors, who were generally supportive of the effort. The OWI staff believed that film was perhaps the most effective way to reach and inform audiences about the war effort. By the end of 1943, all film companies except for Paramount had agreed to permit OWI personnel to review scripts before production on a film commenced.

Perhaps one of the OWI’s best-known domestic efforts came in the numerous wartime posters designed for domestic consumption. The most popular of these were ones aimed at American women, exhorting them to actively join the war effort by taking jobs previously held by men in the nation’s war factories. “Rosie the Riveter” became an instantly recognized symbol of the centrality of women in the war effort.

Abroad, the OWI’s activities were numerous and clearly propagandistic in nature. The agency formed the Voice of America in 1942 (it still exists today), which produced and broadcast radio shows heard by millions around the world. The Psychological Warfare Branch engaged in producing both print and radio messages designed to demoralize enemy civilian populations and soldiers alike. This was accomplished chiefly by way of foreign-language newspapers and leaflets, which were frequently dropped by airplane. Between 1942 and 1945, the OWI dropped some 180 million leaflets over Japan; some 98 million were dropped over Japan during May–August 1945 alone.

By 1943, however, the OWI became embroiled in partisan politics. Many in the agency’s senior staff were avid supporters of Roosevelt and his New Deal, so this bias tended to come out in radio broadcasts. This rankled congressional opponents of the OWI, especially Republicans, who claimed that the OWI was engaged in activities that extolled Democratic virtues while ignoring Republican values. The House of Representatives refused to fund the OWI for 1944; the Senate reinstated the funding but at a much-reduced

level. Thus, between 1944 and 1945, the agency curtailed much of its domestic operations, including the Motion Picture Bureau. In the last 18 months of the war, the OWI focused chiefly on foreign activities and propaganda abroad. The OWI was abolished by executive order on September 15, 1945.

Oikawa Koshiro (1883–1958)

Japanese Navy admiral and minister of the navy. Born in Morioka, Iwate Prefecture, on February 8, 1883, Oikawa Koshiro graduated from the Japanese Naval Academy in 1903 and became a torpedo specialist. He entered the Naval War College in 1913 as a lieutenant commander. During 1915–1922, he was aide-de-camp to Crown Prince Hirohito. Oikawa took command of the 5th Destroyer Squadron in 1922, and as a captain he commanded the cruiser *Kinu* followed by the cruiser *Tama*.

In 1924, Oikawa became the chief of the Operations Department of the Naval General Staff. After promotion to rear admiral in 1928, he was assigned to be chief of staff of the Kure Naval District. In 1932, he assumed command of the 1st Air Squadron.

Appointed superintendent of the Japanese Naval Academy in 1933, Oikawa assumed command of the Third Fleet in 1935. Continuing his rapid rise, he became director of the Air Command in 1936. Promoted to vice admiral in 1938, he assumed command of the China Fleet. On November 15, 1939, he was promoted to full admiral, and in 1940 he commanded the Yokosuka Naval District. On September 5, 1940, Oikawa was appointed minister of the navy.

As naval minister, Oikawa was involved in making two fateful decisions: the conclusion of the Tripartite Pact with Germany and Italy (September 27, 1940) and the declarations of war against the United States and the United Kingdom. Although many in the Imperial Japanese Navy, including commander of the Combined Fleet Admiral Yamamoto Isoroku, opposed the Tripartite Pact, Oikawa was pressured to approve it. He privately told Prime Minister Konoe Fumimaro that he lacked confidence in the navy's ability to fight the United States, but he later refused to speak as plainly to other cabinet members.

Oikawa left his post in October 1941, conceding to General Tōjō Hideki's rejection of his choice of Admiral Toyoda Soemu, a well-known opponent of army policies, to be his successor. Oikawa next became superintendent of the Naval War College and military adviser to the emperor. In November 1943, he headed the new Grand Escort Command Headquarters, composed of four escort carriers and a naval air group, to protect Japanese convoys from U.S. submarine attack. In August 1944, Oikawa resumed his position as chief of the Naval General Staff, although mounting Japanese defeats led to his withdrawal in April 1945 and his retirement on September 5, 1945. Oikawa died in Tokyo on May 9, 1958.

Okamura Yasuji (1884–1966)

Japanese Army general. Born in Tokyo on May 5, 1884, Okamura Yasuji graduated from the Japanese Military Academy in 1904 and the Army War College in 1913. He served on the army General Staff during 1914–1917,

1923–1925, and 1928. Promoted to major in 1919, he was resident officer in Europe during 1921–1922. Stationed in Shanghai during 1925–1927, he was promoted to colonel and commanded a regiment. As vice chief of staff of the Guandong (Kwantung) Army, Okamura helped plan the Japanese takeover of Manchuria in 1931–1932. Promoted to major general and appointed deputy commanding general of the Shanghai Expeditionary Army in February 1932, Okamura was sent to break the boycott of Japanese goods following the takeover of Manchuria.

Okamura was military attaché to the puppet Japanese state of Manzhouguo (Manchukuo) during 1933–1934. He was then chief of the Intelligence Division of the army General Staff during 1935–1936. Promoted to lieutenant general in 1936, he commanded the 2nd Division in Manchuria during 1936–1938. Okamura played an important role in the Sino-Japanese War (1937–1945) as commander of the Eleventh Army in China during 1938–1940. Well-informed regarding Chinese affairs, especially the Guomindang (GMD, Nationalist) government of Jiang Jieshi (Chiang Kai-shek), Okamura was reluctant to escalate the war. His forces fought the Chinese Communists who had launched their so-called Hundred Regiments Campaign against the Japanese in August 1940.

Promoted to full general in 1941, in July Okamura was appointed to command the North China Area Army. He carried out the Japanese Sankō Sakusen (Three Alls) policy of “Kill All, Burn All, Take All” designed to pacify northern China. Initiated in 1940 by Major General Tanaka Ryūkichi, Okamura intensified it in 1942, with the full support of Imperial General Headquarters and perhaps even Emperor Hirohito.

Northern China was divided into pacified, semipacified, and unpacified areas, and the program included burning villages, confiscating grain, and forcing the Chinese peasants to construct collective hamlets. It also included the construction of containment walls, moats, watchtowers, and roads. The program targeted for death “enemies pretending to be local people” and all males between ages 15 and 60 suspected of being “enemies.” Although no precise figures are available, it may have resulted in the death of some 1.7 million Chinese.

In 1944 Okamura became commander of the Japanese Expeditionary Army in China and launched Operation ICHI-GO, a major offensive in central and southeastern China from mid-April to December 1944. Employing

410,000 troops, the Japanese made major territorial gains and realized their goals of eliminating U.S. air bases in China for the strategic bombing of Japan and opening land communications from northern China to French Indochina. Okamura halted the advance because he feared that the Soviet Union would enter the war against Japan.

Although Okamura and his 1 million Japanese soldiers in China were never defeated by the Chinese, he surrendered unconditionally in Nanjing (Nanking) on September 9, 1945. After the war, Okamura was brought to trial by the Nationalist government of China. Okamura had developed close ties with members of the government, so it came as no surprise when he was found innocent. He then worked with the Nationalist government during 1946–1948. The Chinese Communists tried to capture him, but Okamura escaped to Japan. In February 1950 Okamura arranged to send his former staff officers, known as the Pai Tuan (White Company), to Taiwan to assist the Nationalist government there. Okamura died on September 2, 1966.

O’Kane, Richard Hetherington (1911–1994)

U.S. Navy rear admiral. Born in Dover, New Hampshire, on February 2, 1911, Richard Hetherington O’Kane graduated from the U.S. Naval Academy at Annapolis in 1934 and began a series of tours aboard cruisers and destroyers. He entered the submarine service in 1938. After duty aboard the mine-laying submarine *Argonaut,* O’Kane reported to the submarine

Wahoo in early 1942. When Lieutenant Commander Dudley W. Morton took command of the *Wahoo* after its second war patrol, O'Kane became its executive officer. Morton and O'Kane worked closely to develop more aggressive submarine tactics, which proved to be some of the most effective of the war. The *Wahoo* was soon the navy's most effective submarine, sinking 16 Japanese vessels totaling some 45,000 tons between May and July 1943.

In July 1943, O'Kane was ordered to fit out and take command of the new submarine *Tang*. He commanded the *Tang* throughout its career, implementing and improving the tactics that he and Morton had previously developed. On October 24, 1944, during its fifth war patrol in an attack on a Japanese convoy between Taiwan and the Philippines, one of the *Tang*'s Mark XVIII torpedoes malfunctioned, circled back, and sank the submarine. Only O'Kane and eight of his crew survived the sinking; they were picked up by Japanese ships. The *Tang* was credited with sinking 24 Japanese ships totaling 93,285 tons.

O'Kane spent the duration of the war in a Japanese prisoner-of-war camp. For the *Tang*'s final patrol, O'Kane was awarded the Medal of Honor. O'Kane remains the highest-scoring submarine commander in U.S. naval history.

O'Kane held various commands after the war. In 1949, he commanded Submarine Division 32. Promoted to captain in 1953, he attended the Naval War College and then commanded Submarine Division 7 at Pearl Harbor, followed by the Submarine School at New London and Submarine Squadron 7. O'Kane retired from active duty as a rear admiral in 1957. He died in Petaluma, California, on February 16, 1994.

Ōkawa Shūmei (1888–1957)

Japanese right-wing political leader. Born in Yamagata Prefecture on December 6, 1888, Ōkawa Shūmei graduated from Tokyo University in 1911. He resided in Tokyo and worked as a translator for the Japanese Imperial Army. Having studied Indian philosophy, Ōkawa became interested in India's independence movement and contacted Indian activists in Japan who opposed Western colonialism in Asia.

In 1918, Ōkawa joined the South Manchurian Railway Company. He then earned his doctorate at Tokyo University and taught the history of colonialism at Takushoku University, proposing that Japan liberate Asia from Western imperialism. Ōkawa founded nationalist organizations such as Yuzonsha that were designed to preserve traditional Japanese values and promote the renovation of Japan.

In the first half of the 1930s, Ōkawa established connections with like-minded military officers and became involved in plans for a coup d'état. In 1932, Ōkawa was arrested for his involvement in the May 15 Incident—the assassination of Prime Minister Inukai Tsuyoshi. Sentenced to five years in prison in October 1935, Ōkawa was released after serving less than two years.

Following his release, Ōkawa published numerous works on the history of Japan and on Western colonialism and expansionism in Asia. He advocated the necessity for Asian nations to cooperate and adopt common policies against the West. During World War II, Ōkawa argued for "Asia for the Asians" and called on all Asian peoples to join Japan in the "Great Asian War" against the Allied powers.

Following World War II, the Allied powers viewed Ōkawa's ideas as the foundation for Japan's Greater East Asia Co-Prosperity Sphere that had led to the Pacific war. He was arrested as a Class A war criminal but was declared unfit to stand trial by reason of insanity. Ōkawa recovered in two years and continued to publish and promote his ideology until his death in Tokyo on December 24, 1957.

Okinawa, Invasion of (March 16–June 21, 1945)

Last major battle of World War II in the Pacific and the largest and most complicated amphibious operation in the theater. Okinawa, the largest of the Ryukyu Islands and only 350 miles from the Japanese home island of Kyushu, had long been regarded as the last stepping-stone before a direct Allied attack on Japan. The island is 60 miles long and at most 18 miles wide. Japanese leaders considered the defense of Okinawa as their last chance to hold off an invasion of the homeland, and they were prepared for their forces to battle to the death. Allied strategists decided that a major amphibious operation, code-named ICEBERG, would be mounted to take the island to secure harbor and air-base facilities for the projected attack on the Japanese home islands. Taking the island would also sever Japanese communications with southern China.

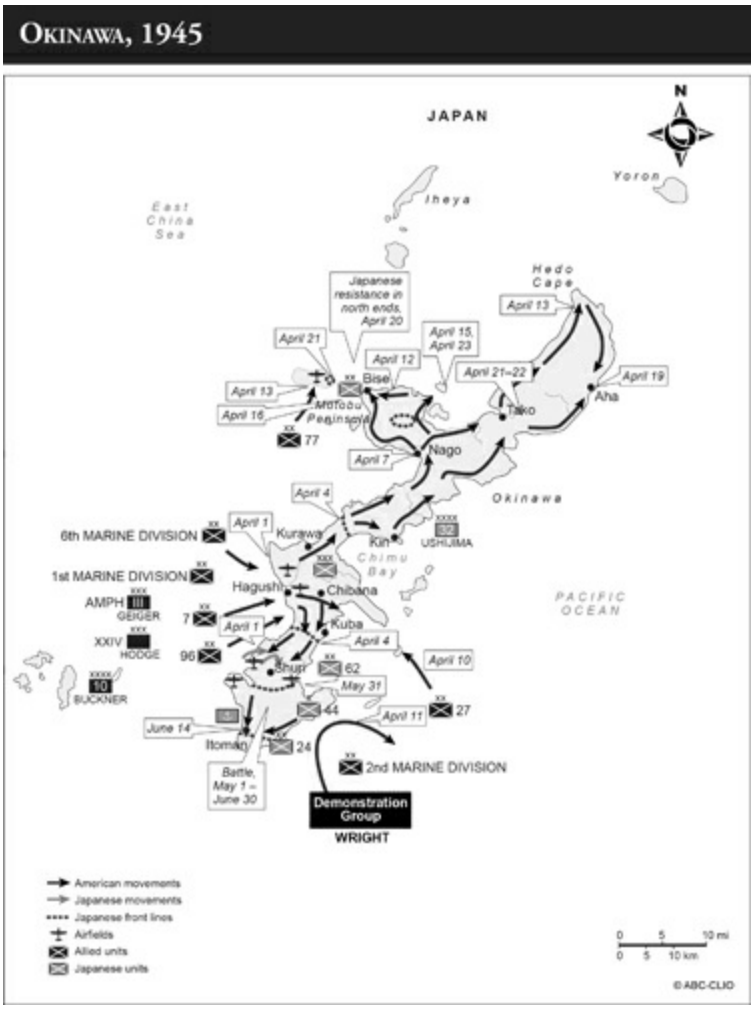
U.S. admiral Raymond Spruance, commander of the Fifth Fleet, was in overall command of the invasion operation. The covering force included 18 battleships and 40 carriers in Vice Admiral Marc A. Mitscher's Fast Carrier Force (TF-58) and the British component commanded by Vice Admiral Henry Bernard Rawlings (TF-57, 1 battleship and 4 carriers plus supporting ships, 22 in all). The transport force of Vice Admiral Richmond K. Turner's Joint Expeditionary Force, TF-51, comprised some 1,300 ships. Operation ICEBERG included the largest number of ships involved in a single operation during the entire Pacific war.

The land assault force consisted of U.S. Army lieutenant general Simon Bolivar Buckner's Tenth Army of some 180,000 men. The Tenth Army included Major General Roy S. Geiger's III Marine Amphibious Corps (1st, 2nd, and 6th Marine Divisions) and U.S. Army major general John R. Hodge's XXIV Army Corps (7th, 27th, 77th, and 96th Infantry Divisions).

The Japanese defenders were formed into the Thirty-Second Army (Ryukyu Islands). It comprised four divisions (9th, 24th, 62nd, and the 28th on Sakishima) plus additional units. Lieutenant General Ushijima Mitsuru commanded about 130,000 men, including the 20,000-man Okinawan Home Guard. The Japanese had constructed a formidable defensive system, particularly on the southern part of the island.

The invasion was originally scheduled for March 1, 1945, but delays in the Philippines Campaign and at Iwo Jima caused ICEBERG to be postponed for several weeks. The operation began with the occupation of the Kerama Islets, 15 miles west of Okinawa, on March 16, 1945. Five days later, a landing was made on Keise-Jima, from which point artillery fire could be brought to bear on Okinawa itself. Then, on April 1, Easter Sunday, the landing began with a feint toward the southeastern shore of the island. The real assault was made by 60,000 U.S. troops landing on the central stretch of Okinawa's west coast. They quickly seized two nearby airfields and advanced east to cut the island's narrow waist. The marines and army troops attained most of their initial objectives within four days.

Ushijima had concentrated the bulk of his defenders out of range of Allied naval guns off the beaches and behind the strong Shuri Line at the southern end of the island. There, the Japanese planned to inflict as much damage as possible on the invaders, supported by the last units of the Imperial Fleet and kamikaze raids. U.S. forces encountered the Shuri Line for the first time on April 4. They fought for eight days to take a ridge and flush the Japanese from numerous caves. Fighting was intense as the Japanese defended every inch of ground. The 1st Marine Division finally took Shuri Castle on May 29.



The Japanese then withdrew to the south to establish another defensive line at Yaeju Dake and Yuza Dake. Fierce fighting continued until most Japanese resistance had been eliminated by June 21. During the battle for Okinawa, both commanders died within five days of each other. Buckner died of shrapnel wounds inflicted by Japanese artillery at a forward observation post on June 18, and Ushijima committed suicide on June 23.

While the battle had raged ashore, fighting in the waters around the island was just as intense. Japanese kamikaze attacks reached their highest level of the war as the suicide pilots flung themselves against the Allied fleet. Several thousand pilots immolated themselves against U.S. and British ships, sinking 36 and damaging another 368.

The largest kamikaze was the giant battleship *Yamato*, dispatched to Okinawa with sufficient fuel for only a one-way trip. It was to inflict as much damage as possible before being destroyed. The Japanese hoped that the

Yamato might finish off the Allied fleet after the latter had been weakened by kamikaze attacks, then beach itself as a stationary battery. This mission came to naught on April 7 when the *Yamato* was attacked by U.S. carrier aircraft. Hit repeatedly by bombs and torpedoes, the vessel sank long before reaching the invasion site.

Okinawa was officially declared secure on July 2. Both sides had suffered horrendous casualties. The Japanese sustained 92,000–94,000 military dead. Okinawans especially suffered. Of the preinvasion population of 450,000, perhaps 94,000 died. On the U.S. side, the army lost 12,520 dead and reported 36,631 wounded. The marines suffered 2,938 dead and 13,708 wounded. The navy lost 4,907 men killed with another 4,874 wounded, primarily from kamikaze attacks. The navy was the only service in which the dead exceeded the wounded. This figure was greater than the navy's casualties in all U.S. wars to that date.

The Battle of Okinawa was the costliest battle of the Pacific war for the Americans. Nevertheless, it was used to support the case for bringing the war to an end by means other than the invasion of Japan itself and certainly influenced the decision by the United States to use atomic bombs against the mainland of Japan in August 1945.

Oktyabrsky, Filip Sergeyevich (1899–1969)

Soviet Navy admiral. Born in the village of Lukshino, now in Kaliningrad Oblast, on October 23, 1899, Filip Oktyabrsky entered the Red Navy in 1918 and joined the Communist Party in 1919. After routine assignments, he commanded the Amur Military Flotilla in February 1938 and then the Black Sea Fleet (March 1939–May 1943). He was promoted to rear admiral in June 1940 and to vice admiral in June 1941.

Oktyabrsky directed the land defense of Odessa from July to October 1941 and executed a masterly evacuation of Odessa on the night of October 15–16. From November 1941 to June 1942, he commanded the defense of Sevastopol against German attack, being evacuated on orders from Moscow at the last moment. Oktyabrsky again commanded the Amur Military Flotilla (June 1943–March 1944) and then commanded the Black Sea Fleet as a full admiral.

Continuing as commander of the Black Sea Fleet after the war, Oktyabrsky was also first deputy commander in chief of the navy until 1950. His criticism of naval policy led to his retirement that year, but he reemerged in 1957 to head the Black Sea Higher Naval School. In 1959, he joined the General Inspector's Group. Oktyabrsky died in Sevastopol on July 8, 1969.

Oldendorf, Jesse Bartlett (1887–1974)

U.S. Navy admiral. Born in Riverside, California, on February 16, 1887, Jesse Bartlett Oldendorf graduated from the U.S. Naval Academy at Annapolis in 1909 and was commissioned an ensign two years later. During World War I, Lieutenant Oldendorf served on North Atlantic convoy duty. He next served as engineering officer on a cruiser and aboard a former

German transport. A series of shore billets followed. From 1924 to 1927, Oldendorf commanded the destroyer *Decatur*. He then attended both the Army and Navy War Colleges (1928–1930). Following service on the battleship *New York*, Oldendorf served as an instructor at the U.S. Naval Academy (1932–1935) and was then executive officer of the battleship *West Virginia*. Promoted to captain in March 1938, Oldendorf took command of the heavy cruiser *Houston* the next year. In 1941, he was assigned to the staff of the Naval War College.

Promoted to rear admiral in January 1942, Oldendorf held a series of commands in the Aruba-Curacao and Trinidad sectors of the Caribbean and then commanded a task force in the Atlantic Fleet. In January 1944, he was transferred to the Pacific in command of Cruiser Division 4, which supported U.S. operations in the Marshall Islands against Truk, in the Mariana Islands, and at Peleliu (September 15–November 27, 1944). In October 1944, Oldendorf commanded the Seventh Fleet's Fire Support Force of six prewar battleships, four heavy cruisers, four light cruisers, and numerous destroyers and patrol-torpedo (PT) boats, all supporting the U.S. amphibious landing on Leyte Island in the Philippines.

On the night of October 24–25, 1944, Oldendorf positioned his forces in Surigao Strait between Leyte and Mindanao to meet Vice Admiral Nishimura Shoji's Japanese Southern Force, part of the SHŌ-1 plan to destroy U.S. forces off the landing site. In a classic crossing of the T, Oldendorf placed his battleships across the mouth of the strait to rain shells on Nishimura's ships, which were proceeding in single-file line. At the same time, his destroyers and PT boats lining the strait launched torpedoes from the flanks. Oldendorf's ships also engaged a trailing Japanese force, the Second Diversion Attack Force, which was commanded by Vice Admiral Shima Kiyohide. Oldendorf's ships scored one of the most complete U.S. naval victories of the war—sinking both Japanese battleships, damaging 3 of 4 cruisers, and sinking 3 of 10 destroyers without U.S. loss.

Promoted to vice admiral in December 1944, Oldendorf then commanded Battleship Squadron 1 and Battleship Division 4 in support of landings in the Lingayen Gulf, Luzon. After recovering from an injury, he headed Task Force 95 at Okinawa from June to November 1945.

In November 1945, Oldendorf took command of the 11th Naval District and San Diego Naval Base. He ended his career in command of the Western

Sea Frontier and the “mothball” (reserve) fleet at San Francisco (1947–1948). Oldendorf was promoted to admiral on his retirement from the navy in September 1948. He died in Portsmouth, Virginia, on April 27, 1974.

Ōnishi Takijirō (1891–1945)

Japanese Navy admiral. Born in Hyōgo Prefecture, Honshu Island, Japan, on June 2, 1891, Ōnishi Takijirō graduated from the Japanese Naval Academy in 1912. Promoted to ensign in 1913, he studied at the Gunnery School in 1914 and 1915, and was assigned to Yokosuka Naval Station from 1916 to 1918. One of the pioneers of the Japanese naval air arm, Ōnishi learned to fly in 1915. He served as Japanese naval attaché in Britain and traveled in Britain and France from 1918 to 1922 to study naval aviation.

In the mid-1920s, Ōnishi served as an instructor in the Kasumigaura Air Training Corps under Captain Yamamoto Isoroku. In the 1930s, Ōnishi served in various staff and line positions in naval aviation, including heading the Training Section of the Naval Aviation Department. Promoted to rear admiral in 1939, Ōnishi took command of the 2nd Combined Air Corps, which flew shore-based, long-range Mitsubishi G3M (“Nell” in the Allied code system) bombers. Based in Hankow, he commanded strategic bombing operations in the Sino-Japanese War. In early 1941, Ōnishi was appointed

chief of staff to Vice Admiral Tsukahara Nishizo, commander of the Eleventh Air Fleet, the first entirely shore-based air fleet of its kind.

In January 1941, commander of the Combined Fleet Admiral Yamamoto Isoroku ordered Ōnishi, then regarded as Japan's foremost expert on naval aviation, and Genda Minoru, commander of the naval air group at Yokosuka, to plan an attack by carrier-borne aircraft against the U.S. Pacific Fleet base at Pearl Harbor in the Hawaiian Islands. At the outbreak of the Pacific war, the Eleventh Air Fleet based in Taiwan made a decisive contribution to the Japanese military effort by destroying U.S. airpower in the Philippines.

Ōnishi then held important administrative posts, including chief of the Naval Aviation Department and deputy chief of the Aerial Weapons Department of the Ministry of Ammunition. In the latter capacity, he had the unenviable task of trying to reconcile navy-army demands for resources in aircraft production.

In October 1944, Ōnishi was appointed commander of the First Air Fleet in the Philippines. Facing a desperate situation, he adopted the tactic of suicide air attacks against U.S. warships. On his order, the first kamikaze operation was implemented. Thereafter, Ōnishi commanded kamikaze attacks from the Philippines and then from Taiwan until he was recalled to become vice chief of the Navy General Staff in May 1945.

At the end of the war, Ōnishi strongly opposed Japanese acceptance of the Potsdam Declaration. On learning of the surrender, he committed suicide in Tokyo on August 16, leaving behind a statement expressing deep gratitude to those who had sacrificed themselves in kamikaze missions.

Oppenheimer, Julius Robert (1904–1967)

U.S. scientist who helped develop the atomic bomb. Born in New York City on April 22, 1904, Robert Oppenheimer was gifted and precocious. Graduating summa cum laude in three years from Harvard University, he did his graduate work at the Cavendish Laboratory (University of Cambridge) and at Göttingen under Max Born. A brilliant dissertation on quantum theory confirmed a vocation and his status as a leading theoretical physicist. In 1929, he accepted joint appointments in physics at the University of California, Berkeley, and at Caltech.

Ambitious and possessing an incredibly quick and agile mind, Oppenheimer attracted a coterie of stellar students at Berkeley. A chain smoker with a penchant for martinis, he stood six feet and weighed just 125 pounds. Economic depression and the rise of fascism piqued his interest in the Communist Party, and he later married a former party member. Yet his left-leaning political stance failed to deter Brigadier General Leslie R. Groves from recruiting Oppenheimer to lead a centralized laboratory for the construction of atomic bombs. Groves recognized Oppenheimer's genius for science, his extensive connections and ability to recruit talent, and, most important, his improvisational and organizational skills and his determination to prove his patriotism. Overriding objections from army counterintelligence, Groves appointed Oppenheimer in October 1942.

Oppenheimer assembled his initial team of approximately 30 scientists at Los Alamos in April 1943. Because Oppenheimer encouraged a sense of community and open communication, the team overcame seemingly intractable difficulties to produce a working nuclear device in just more than two years. Despite intellectual assertiveness that bordered on arrogance, Oppenheimer proved to be the indispensable man of the Manhattan Project. His unqualified success earned him the Presidential Medal of Merit in 1946.

In 1947, Oppenheimer became director of the Institute for Advanced Study at Princeton and chairman of the General Advisory Committee of the Atomic Energy Commission. Initially entranced by the "technically sweet" challenge of building atomic bombs, he later remarked that, with Hiroshima, physicists "have known sin." His opposition to the hydrogen bomb within the

corrosive climate of McCarthyism in the early 1950s led to hearings in 1954 that stripped him of his security clearance. Rehabilitated by 1963, he received the Enrico Fermi Award. Oppenheimer died in Princeton, New Jersey, on February 18, 1967.

Oradour-sur-Glane Massacre (June 10, 1944)

German atrocity against French civilians. During World War II, German armed forces—both Wehrmacht and Waffen-Schutzstaffel (Waffen-SS)—committed an untold number of atrocities. Although the vast majority occurred in Eastern Europe and the Soviet Union, Western Europe saw several notorious German war crimes, including the massacre of innocent men, women, and children at Oradour-sur-Glane.

Located 15 miles northwest of Limoges in central France, the village of Oradour-sur-Glane, although it lay within the German zone of occupation from June 1940, managed to escape the horrors of World War II for the better part of four years. This all changed, however, on June 10, 1944, when Sturmbannführer Otto Dickmann and troops from the 1st Battalion, 4th SS Panzergrenadier Regiment, 2nd SS Panzer Division (Das Reich), entered the village, slaughtered its inhabitants, and looted and burned its houses and buildings.

Commanded by Brigadeführer Heinz Lammerding, Das Reich, one of the original Waffen-SS divisions, had been transferred from the Eastern Front to Montauban in southern France in early 1944. In the immediate aftermath of the Allied Normandy Invasion of June 6, Das Reich received orders to

redeploy to the Normandy front. As it made its way north, the division came under attack from French Resistance forces and engaged in several firefights. On June 9, the Resistance captured one of the division's officers, the popular Sturmbannführer Helmut Kämpfe. Possibly, the massacre at Oradour-sur-Glane was in reprisal for this act.

On entering the village, the troops of the 4th SS Panzergrenadier Regiment's 1st Battalion forced the startled residents to assemble in the central square. Separating the men from the women and children, the Germans herded the former into barns and the latter into the village church. They then burned both barns and church, tossing in grenades for good measure and gunning down those who tried to flee. After plundering and setting fire to other buildings, the 1st Battalion withdrew. A total of 642 victims, including 207 children, lay dead. Only 7 villagers managed to escape.

At war's end, French authorities decided to maintain Oradour-sur-Glane as it had been left by Das Reich, transforming the remnants of the village into a national monument. As for the perpetrators, 7 Germans and 14 Alsatians were tried by a French military court at Bordeaux in 1953. The court found 20 of the defendants guilty and sentenced 2 to death and 18 to imprisonment at hard labor for terms ranging from 5 to 20 years. Amnesties and pardons, however, led to all 20 being freed within 5 years.

Order 270

Issued by Soviet dictator Joseph Stalin on August 16, 1941, Order 270 classified as traitors all Soviet soldiers who were captured by the Germans

and held as prisoners of war. As further punishment, it also removed their families from ration lists. Many Red Army soldiers were captured through no fault of their own for lack of ammunition or because they had been surrounded, and leading figures such as General Georgii Zhukov pointed out the negative effect this would have on morale, but Stalin insisted on carrying it out.

Order 270 was first employed against Lieutenant General Andrei Ivanovich Eremenko, who retreated with his men east from the Bryansk front in late August 1941. This order was followed by Order 0064, which ordered execution for those "who did not do their duty," and Order 227, which insisted that the Red Army take "not one step further back."

Read to every Soviet soldier, because many were illiterate, these measures were bitterly resented by military commanders such as Zhukov, who not only realized the real situations in which Soviet soldiers had been forced to surrender but also believed that both Stalin and Foreign Minister Vyacheslav Molotov had themselves collaborated with the Germans in the August 23, 1939, Nazi-Soviet Non-Aggression Pact. Despite wide knowledge of these orders within the Soviet Union, the documents concerning them were not made public officially until Soviet leader Mikhail Gorbachev was in power, nearly 50 years after the war.

Organization Todt

Organization Todt (OT), named for German Minister of Arms and Munitions Fritz Todt, handled construction projects throughout territory occupied by the German Army during World War II. Formed in 1933 by Todt, then head of

technology and road construction, the OT was at first chiefly identified with construction of the great autobahn road system that was the pride of the Third Reich. In 1938, German leader Adolf Hitler assigned OT the task of quickly completing the West Wall (known to the Allies as the Siegfried Line), defenses in western Germany that were designed to hold back a French Army attack to allow Germany to concentrate its military resources in the east against Poland. Todt was an adroit manager, and in record time, some 500,000 workers constructed 5,000 concrete bunkers.

With the beginning of World War II, the OT provided the German Army with engineers and construction specialists involved in the building and repair of bridges, dams, airfields, and fortifications as well as factories. In March 1940, Todt became the Reich's minister of arms and munitions. The OT was the only organization in the Third Reich, apart from the Hitler Youth, that bore the name of a member of the governing elite.

Following the German invasion of the Balkans in the spring of 1941, the OT had charge of extracting minerals there and shipping them to the Reich. With the invasion of the Soviet Union, it took on the great responsibility of reconstructing and maintaining the Soviet transportation network. The OT also made use of vast numbers of conscript laborers throughout German-occupied Europe. In all, the OT mobilized some 1.4 million people, 80 percent of whom were non-Germans (many were prisoners of war).

The OT's most ambitious task was the construction of the Atlantic Wall, the German defenses against an invasion of France by the Western Allies; it ran from Norway to the Bay of Biscay. On this effort, the OT expended some 13.3 million tons of concrete and 1.2 million tons of steel in 3,000 fortifications. The ruins of many of these still may be seen today. The OT also built the submarine pens in France that proved so difficult for Allied aircraft to destroy.

Following Todt's death in an airplane crash on February 8, 1942, his assistant, Albert Speer, took over the organization, and under him, it reached its greatest extent. Increasingly, the OT was involved in cleaning up bomb damage from Allied air raids on Germany. In the autumn of 1944, the organization was renamed Front-OT, when it was armed and enlisted in the defense of German territory.

Ormoc Bay, Battle of (December 3, 1944)

U.S. Navy raid on a Japanese anchorage conducted to interdict the delivery of supplies during the Leyte campaign (October 20–December 24, 1944). The U.S. Navy failed to secure control over the eastern approaches to Leyte immediately after the landings there, and this allowed the Japanese to ferry in reinforcements and attempt to fight a decisive battle on the island. Only in late November did U.S. minesweepers clear the passage around Leyte to allow the surface strike groups to proceed east into the Camotes Sea to cut this Japanese traffic.

On the afternoon of December 2, air reconnaissance reported a Japanese convoy en route to Ormoc, the main port on eastern Leyte. Naval command dispatched the freshly arrived Destroyer Division 120, commanded by Commander John Zahm, with the new large Sumner-class destroyers *Allen M. Sumner, Cooper,* and *Moale* to intercept.

The Japanese force, consisting of the destroyer-transport *T9,* two landing ships, and the destroyer escorts *Take* and *Kuwa,* slipped into Ormoc Bay on December 2 and began off-loading late that evening. A few minutes before midnight, Division 120 arrived after an approach marked by Japanese air attacks. The U.S. ships were in line abreast to maximize their heavy forward armament and present a smaller target.

At 11:55 p.m. on December 2, the *Sumner* detected contacts 20,000 yards to the north, and at 12:05 a.m. on December 3, Zahm ordered his ships to engage. U.S. radar had picked up the *Take* and *Kuwa,* which were standing

out of the bay. The U.S. destroyers severely damaged the *Kuwa*. The Japanese replied, supplemented by the dozens of 25mm guns arming the landing ships, and this intense opposition disrupted the U.S. formation. The *Sumner* turned west at 12:08 a.m. to put some distance between itself and the enemy guns.

Meanwhile, the *Moale* swerved in front of the *Cooper* to avoid torpedoes, forcing the *Cooper* to hold fire. After the *Moale* moved on, the *Cooper* engaged the *Take*, but the Japanese ship already had fired torpedoes. At 12:13 a.m., a Long Lance torpedo hit the *Cooper* amidships, and the U.S. ship sank in just 30 seconds. At the same time the *Kuwa*, torn apart by U.S. gunfire, followed the *Cooper* to the bottom of the bay.

The two surviving U.S. destroyers withdrew, shooting as they fled and moderately damaging the *Take*. When he learned that the *Cooper* had sunk, Zahm judged a rescue attempt too risky, and the U.S. destroyers turned for home.

The *Sumner* had suffered minor damage from aerial attacks and one small-caliber shell. Three rounds lightly damaged the *Moale*. Many near misses peppered both ships with splinters. Three hours after the Americans departed, the Japanese convoy weighed anchor. The *Take* limped along on one engine, but the landing ships escaped major harm.

The *Cooper* was the last large U.S. warship sunk in a surface naval action. The destroyer was a new ship with an untested crew fighting in bright moonlight, factors contributing to its loss. The Americans fought another minor action in Ormoc Bay on December 12, and although General Douglas MacArthur declared Leyte secure on December 25, Japanese resistance continued until May 1945.

Ortona, Battle for (December 5–28, 1943)

In 1943, the town of Ortona was a community of some 10,000 people on Italy's Adriatic coast. Ortona also anchored the Adriatic end of the German Winter Line, and in December 1943 it became the center point of the plans of British Eighth Army commander General Bernard Law Montgomery. He sought to break through the German lines at Ortona, opening the road to Rome and securing for his forces an Adriatic port by which supplies could be more easily distributed to his troops without the necessity of having them trucked north from southern Italian ports already in Allied hands.

Montgomery assigned the task of securing Ortona to the Canadian 1st Infantry Division. From December 5 to 20, the Canadians attacked the entrenched German lines south of Ortona. In the course of this fighting, they forced the Germans to relieve and replace the manhandled 90th Panzergrenadier Division with the 1st Parachute Division. This latter unit held the town when the Canadians finally approached its outskirts after more than two weeks of heavy combat.

With a deep ravine to the west and the sea to the east, Ortona was little more than 500 yards in width. The Germans had blocked the narrow side roads with rubble, channeling all traffic along the road that entered the town from the south. The Germans entrenched in the rubble and in buildings with commanding views, and across from their strongpoints they destroyed the fronts of many houses along the road to create a free field of fire into their interiors. They also mined and booby-trapped the rubble and many of the buildings they did not occupy.

Beginning on December 20, elements of the Canadian 2nd Infantry Brigade moved into Ortona. During the following week, the Canadians fought a house-to-house battle to take the town. Constrained by the geography, they were only able to move along a two-battalion front, limiting their ability to bring their superior numbers to bear. Nonetheless, by December 27, the Canadians had taken most of the town, and German resistance collapsed when elements of the 1st Canadian Infantry Brigade managed to outflank the town's defenses and cut the coastal supply lines.

German losses were heavy; intercepted messages revealed that the battalions of the 1st Parachute Division had been reduced to company strength. The battle for Ortona also claimed nearly 5,000 Canadian casualties, and the battered 1st Division was in no condition to move past to attempt the Rome-Pescara highway. The Allies had taken an excellent Adriatic port, but the fighting had left the town in such ruins that they were unable to exploit the victory. The victory thus did little to support Montgomery's ambitions to take Rome, and before the battle had ended he was moved to another command in Britain. Perhaps the only real victory in the battle was for Canadian morale, as the Canadians came to regard Ortona as revenge for their defeat during the disastrous August 19, 1942, raid on Dieppe, France.

Ōshima Hiroshi (1886–1975)

Japanese soldier and diplomat. Born in Gifu Prefecture, Japan, on April 19, 1886, Ōshima Hiroshi came from a prominent family. Following graduation from the Military Academy in 1905, Ōshima rose steadily in rank. As a major in the early 1920s, he served as an attaché in the Japanese legations in Germany, Austria, and Hungary. He was singularly unimpressed by these war-torn European societies and particularly detested the struggling democratic Weimar Republic.

The 1930s provided unique opportunities for Ōshima. Not long after Adolf Hitler came to power in Germany, largely through the influence of militarists and pro-Axis elements in the Japanese government, Colonel Ōshima was appointed senior military attaché in the Imperial Japanese embassy in Berlin. Ōshima was at once comfortable and effective in his new post, and he wholeheartedly approved of the Nationalist Socialist movement. With the aid of political and military contacts in both Tokyo and Berlin, he soon gained direct access to the upper echelons of the government and met privately with Hitler for the first time in the autumn of 1935. Ōshima progressed from the rank of colonel and attaché in 1934 to lieutenant general and ambassador by 1938.

Japanese ambassador to Germany Ōshima Hiroshi presenting his diplomatic credentials to Adolf Hitler at the Berghof, February 27, 1941. (National Archives)

The rabidly anticommunist Ōshima worked hard to conclude the 1936 Anti-Comintern Pact, which would culminate in the Tripartite Pact of 1940. Hitler's rush to war in September 1939 triggered Ōshima's recall by the Tokyo government not long after the German invasion of Poland.

The Japanese government was impressed by German military successes during 1939–1940, and as a result, Ōshima was reappointed ambassador to Germany. He and Hitler widely agreed on political and military matters in their subsequent and numerous meetings, and Ōshima became something of a Hitler confidante.

By this time, however, the U.S. Army Signal Intelligence Service had solved the most sophisticated of Japanese diplomatic ciphers, known as Purple. The circle was complete: Hitler and his senior assistants confided their strategic intentions and military thinking to Ōshima, who reported to

Tokyo by the supposedly secret Japanese diplomatic cipher, but his more than 2,000 reports were quietly intercepted, deciphered, and translated by the Allies. U.S. Army chief of staff General George C. Marshall regarded Ōshima's reports as his main basis of information for unmasking Hitler's intentions in Europe.

Ōshima escaped from Berlin in April 1945, soon to surrender in the Alps to U.S. forces. In July, he was interned in the United States until Japan's surrender. Afterward, he was taken to Japan, where he was indicted and tried as a war criminal at the International Military Tribunal for the Far East. Found guilty on November 12, 1948, he was sentenced to life imprisonment. In December 1955, however, Ōshima was paroled from prison and then granted clemency in April 1958. He died in Chigasaki, Japan, on June 6, 1975, still unaware that his wartime correspondence was read in Washington and London.

Österman, Hugo Viktor (1892–1975)

Finnish Army general. Born on September 5, 1892, in Helsinki, Hugo Viktor Österman interrupted his studies at the University of Helsinki in 1915 to receive military training in Germany. He entered the Finnish army on its formation and, as a major in February 1918, began organizing its 5th Jaeger Battalion.

Österman commanded the Pori Regiment from 1919 to 1925, when he was reassigned to the 3rd Division. In January 1933, Major General Österman was appointed commander in chief of the Finnish armed forces, a

post he held until 1939. Österman was known as a tough, intelligent commander.

During the 1939–1940 First Finnish-Soviet War (Winter War), Lieutenant General Österman held the most important command, the Army of the Karelian Isthmus of six divisions. As such he was chief of staff to overall commander Marshal Carl G. Mannerheim. The two men disagreed over the placement of light Finnish forces in the buffer zone between the Mannerheim Line and the frontier. Mannerheim wanted to pin down at least one large Soviet formation in that area and then attack it, but Österman thought this was too ambitious, particularly with largely untried troops against Soviet tanks. He envisioned a strictly delaying action. Mannerheim thought that Österman had yielded territory too easily and blamed him for the collapse of Mannerheim's "forward zone" strategy.

Österman, who had been cautious in his handling of the early border battles, then strongly advocated an ambitious counterattack to destroy three Soviet divisions entrenched before Summa. He proposed this on December 11, but Mannerheim initially rejected it as premature. The counterattack began, too late, on December 23, and enjoyed only limited success, delaying the start of the Soviet Isthmus Offensive by barely a week.

Finnish troops brought the Soviet advance to a halt in February 1940, but Soviet forces eventually broke through. On February 19, 1940, Österman resigned his post, citing health reasons. He then served as inspector general of Finnish infantry. At the beginning of the 1941–1944 Finnish-Soviet War (Continuation War), he sought frontline service but without success.

In February 1944, Mannerheim dispatched Österman as his representative to German military headquarters. Österman returned from that post in July 1944 and served the remaining weeks of the war as inspector of infantry. He retired from the army in December 1945. Österman then worked for almost 15 years as managing director of Electrical and Power Plant Employees until 1960. He died on February 17, 1975.

Ōta Minoru (1891–1945)

Japanese Navy vice admiral. Born on April 7, 1891, in Chiba Prefecture, Honshu Island, Ōta Minoru graduated from the Japanese Naval Academy in 1913. He saw service in a cruiser and in battleships and was promoted to lieutenant in 1916. After a year's leave while he battled tuberculosis during 1917–1918, Ōta returned to active duty and completed courses in the Torpedo School and the Naval Artillery School. Following service on two battleships, he was an instructor at the Naval Engineering College.

An expert in amphibious operations, Ōta commanded a battalion of the Special Naval Landing Forces (SNLF), the equivalent of the U.S. Marine Corps, in the 1932 First Shanghai Incident. Ōta was promoted to commander in 1934. He commanded SNLF units until, in 1937, he assumed command of the oiler *Tsurumi*. He was promoted to captain the same year.

In 1938 Ōta was assigned to Kure Naval Station, Japan, as commander of the 6th SNLF. In 1941 he was assigned to command the SNLF in the China Area Fleet at Wuhan, China.

Ōta returned to Japan in 1942 and took command of the 2nd Combined Special Naval Landing Force that was assigned to capture Midway Island. After the Japanese lost the Battle of Midway (June 3–6, 1942), he was assigned command of the 14th Naval Base at Kavieng in Papua New Guinea as a rear admiral in 1943. In 1944 he returned to Japan as commander of the Coast Guard at Sasebo.

In January 1945, Ōta was assigned to Okinawa. During the Battle of Okinawa (March 16–June 21, 1945), he commanded all Japanese naval forces on the island. Ōta took charge of the defense of the Oroku Peninsula, but on June 6 the Japanese position was surrounded by U.S. marines. On June 12, Ōta sent a farewell telegram to the Navy Department in Tokyo in which he praised the valor of his men and especially that of the Okinawan people

and asked that because of its sacrifices, Okinawa be granted special consideration from the Japanese government in the future. He committed suicide on June 13, 1945. Ōta was posthumously promoted to vice admiral.

OVERLORD, Operation, Planning for

Operation OVERLORD, the invasion of Normandy, France, on June 6, 1944, was the Western Allies' greatest operation of World War II and the finest hour of Anglo-American cooperation. Only the United States and the British Empire could have successfully undertaken the largest and most dangerous amphibious assault in history. The operation was so complicated that U.S. Army chief of staff General George C. Marshall said that it almost defied description. The Allies assembled 2 million troops of numerous nationalities, nearly 5,000 ships, and 11,000 aircraft without the Germans knowing where or when the invasion would take place.

British prime minister Winston L. S. Churchill, already thinking offensively, established the Office of Combined Operations to plan raids on Nazi-occupied Europe. A cross-Channel invasion became likely after the December 1941–January 1942 Arcadia Conference in Washington, which reaffirmed British-U.S. determination to defeat Germany first. Marshall flew to Britain in April to propose an early opening of the second front (code-named SLEDGEHAMMER), and although he returned to Washington in the belief that an invasion of the continent would take place within a year, the British sent Vice Admiral Lord Louis Mountbatten, head of Combined Operations, to Washington in June to tell the Americans that a cross-Channel invasion

was not possible in 1942. This was confirmed in the disastrous Allied Dieppe Raid of August 19, 1942.

At the January 1943 Casablanca Conference, where U.S. president Franklin D. Roosevelt and Churchill agreed to exploit Allied success in North Africa, they also stipulated that preparations for a cross-Channel attack should continue. Shortly after Casablanca, General Frederick E. Morgan was appointed chief of staff to the supreme Allied commander (designated COSSAC), and a small Anglo-American planning group began work in Norfolk House, St. James's Square, London, on what would become the greatest military operation in history. Its objective was to mount an invasion with a target date of May 1, 1944, to secure a lodgment on the continent from which further offensive operations could be carried out.

By the end of July 1943, the Anglo-American COSSAC staff had produced a 113-page plan for OVERLORD. Limited by a lack of amphibious landing craft, the initial plan called for a three-division assault along a 30-mile front. After a weekend conference at Largs in Scotland, planners selected the Normandy coast as offering the best chance for success. An invasion there would be most likely to surprise the Germans, who would expect it to occur in the closed point to Britain, the Pas de Calais, and who concentrated their defenses on that stretch of the French coast. Normandy was within the maximum range of Allied air cover. The Allies hoped that it would result in early capture of the port of Cherbourg. The disastrous failure of the Dieppe Raid, in which the attacking Canadians suffered 60 percent casualties, appeared to rule out a direct attempt to seize a major port. The Allied answer was to build, tow across the Channel, and assemble their own artificial harbors, known as Mulberries.

COSSAC planners examined meticulously the requirements necessary for successful invasion. These included such variables as weather, tide and moon conditions, and sand on the landing-site beaches. All were designed to produce a solution to the ultimate question of where and how a cross-Channel invasion could be launched.

An essential part of planning for OVERLORD included an elaborate deception plan, the largest of the war by either side. Originally the brainchild of COSSAC staff, the operation, code-named FORTITUDE, involved a massive effort to deceive Germany about the date and place of the invasion. It saw the creation of a nonexistent U.S. army to mislead the Germans into believing

that the Normandy landings were merely a feint and that the main landing would be under the command of Lieutenant General George S. Patton in the Pas de Calais. The ruse reinforced the already existing German conviction that the main landing would indeed take place in that part of France closest to Britain. Another part of FORTITUDE was to draw off resources from France by convincing the Germans that the Allies also intended to invade Norway. Both aspects of FORTITUDE worked to perfection.

On December 6, 1943, Roosevelt named General Dwight D. Eisenhower as commander of Supreme Headquarters, Allied Expeditionary Force (SHAEF), which replaced COSSAC. Morgan continued on as deputy chief of staff, SHAEF. Both Eisenhower and British general Bernard L. Montgomery, who was designated ground forces commander for D-day, argued for a month's delay of the invasion until June in order to obtain another month's production of the critically important landing craft. Acquisition of these was necessary to increase from three to five the number of divisions in the initial assault. The delay would also allow increasing the number of airborne divisions to protect the flanks of the 50-mile beachhead from two to three.

The scale of preparations for OVERLORD was staggering. In the four months before D-day, plans poured forth from SHAEF and Allied armies. The U.S. First Army, in coordination with the Western Naval Task Force and the Ninth Tactical Air Force, planned the landings on Omaha and Utah Beaches. The British Second Army, in coordination with the Eastern Naval Task Force and the British Second Tactical Air Force, planned the landings on Sword, Juno, and Gold Beaches. The Ninth Air Force's plan for the invasion alone ran 847,500 words in 1,376 pages and weighed more than 10 pounds.

By June 1944, there were 1,536,965 U.S. troops in Britain. Stockpiles of equipment for the invasion came to 2.5 million tons and included everything from artillery and bulldozers to dental chairs and tanks. Wags remarked that only the barrage balloons overhead kept the British Isles from sinking under the weight of men and equipment. Administrators required each unit landing in France to carry a 30-day supply of blank forms and stationery. Approximately 7 million tons of oil were stored in the United Kingdom.

On the eve of D-day, 2,700 vessels (not counting the 1,897 smaller landing craft carried in the landing ships) were steaming toward Normandy. No fewer than 195,000 sailors manned the invasion fleet, carrying 130,000

troops, 12,000 vehicles, 2,000 tanks, and nearly 10,000 tons of stores. Overhead, thousands of Allied fighters provided a protective umbrella for the invasion force.

Fortunately, OVERLORD planners had the invasions of North Africa, Sicily, and Italy as well as amphibious operations in the Pacific as guides for their D-day planning. Allied planning for OVERLORD, based on honest debate, cooperation, and teamwork, laid the groundwork for the massive defeat of the German Army in the Battle of Normandy.

Ozawa Jisaburo (1886–1966)

Japanese Navy vice admiral. Born in Miyazaki Prefecture on October 2, 1886, Ozawa Jisaburo graduated from the Japanese Naval Academy in 1909. He served as a torpedo officer on several ships and as an instructor at the Torpedo School. He was assigned to destroyers from 1918 to 1921.

Promoted to lieutenant commander in 1921, Ozawa graduated from the Naval War College the same year. He commanded destroyers in 1924 and 1925 and then was assigned to the staff of the Grand Fleet as a specialist in torpedo tactics. Promoted to commander in 1926, he was an instructor at the

torpedo school and also traveled in Europe and the United States for nine months.

Promoted to captain in 1930, Ozawa commanded a destroyer division in 1930 and 1931 and next was an instructor of tactics at the Naval War College. In 1934 and 1935, he commanded first the cruiser *Maya* and then the battleship *Haruna*. He was promoted to rear admiral in 1936. In 1937 Ozawa was assigned as chief of staff of the Combined Fleet. He next commanded the 8th Cruiser Squadron and the 3rd Battleship Squadron, served as superintendent of the Torpedo School (1938), and commanded the 1st Fleet Air Group (1939).

Despite his lack of expertise in this area, Ozawa was a forceful advocate for naval aviation. Promoted to vice admiral in 1940, he was appointed superintendent of the Naval War College in September 1941. In 1941, he assumed command of the Southern Expeditionary Fleet. On the beginning of the Pacific war, from December 1941 to March 1942 his fleet supported the Japanese invasions of Malaya and the Netherlands East Indies. He also conducted a successful commerce raiding operation into the Indian Ocean during March and April 1942.

Japanese vice admiral Ozawa Jisaburo. (Naval Historical Center)

In November 1942 Ozawa took command of the Third Fleet, and in March 1944 he commanded the 1st Mobile Force (Carrier Force), which incorporated all remaining Japanese aircraft carriers. Ozawa suffered disastrous defeats in the June 19–21, 1944, Battle of the Philippine Sea (Operation A-GO) and in the October 23–26, 1944, Battle of Leyte Gulf (Operation SHŌ-1). In the latter, Ozawa's mission was to serve as bait, his carriers luring Admiral William F. Halsey's Third Fleet north to leave the U.S. landing site in Leyte Gulf undefended. In the battle, Ozawa's force suffered heavy losses, although with few aircraft this was certainly not his fault.

From November 1944, Ozawa was simultaneously vice chief of the Naval General Staff and president of the Naval Staff College. In May 1945 when Toyoda Soemu assumed the office of chief of staff of the navy, Ozawa became the last commander of the Combined Fleet. He is remembered in

Japanese naval history as a brave and capable commander and a leading exponent of naval aviation. Ozawa died in Tokyo on November 9, 1966.

P

Paget, Sir Bernard Charles Tolver (1887–1961)

British Army general. Born at Oxford on September 15, 1887, Bernard Charles Tolver Paget was educated at Shrewsbury and the Royal Military College, Sandhurst. He was commissioned in the Oxfordshire and Buckinghamshire Light Infantry in 1907. Paget served in France during World War I and was severely wounded in March 1918.

On his recovery, Paget held a series of instructional posts and staff positions. He assumed command of the Quetta Infantry Brigade in 1936. The next year, he was promoted to major general, and in 1938 he was posted back to England as commandant of the Staff College, Camberley. In the early stages of World War II, Paget commanded an infantry division in Britain.

In April 1940, Paget was ordered to central Norway and was given command of British forces opposing the German invasion there. On April 25, 1940, he arrived at Andalsnes, Norway, to assume command of his two-brigade formation. British forces in Norway were ill-equipped and severely outnumbered, and the Germans held air superiority. In these desperate circumstances, Paget was reduced to fighting a series of bitter rearguard actions until orders were issued to evacuate his force. The last contingent of Paget's command was evacuated from Norway on May 3, 1940. Despite the defeat in Norway, Paget's performance was praised in the House of Commons on May 8, 1940, by Winston L. S. Churchill. His short participation in the Norwegian Campaign was Paget's only battlefield command during the war.

In 1940, Paget served as chief of staff of the Home Forces, and the following year he became commander in chief of Southeastern Command. In late 1941, Paget succeeded General Sir Alan Brooke as commander in chief of Home Forces. Promoted to full general in 1943, he formed and commanded the 15-division 21st Army Group in mid-1943. He did much to train and prepare this formation for the June 6, 1944, Normandy Invasion but

turned over his command to General Sir Bernard Montgomery in December 1943.

In January 1944, Paget was appointed commander in chief of the Middle East Command. In 1946, he retired. Paget died in Hampshire on February 16, 1961.

Palatinate Campaign (March 1945)

Military engagement between the Western Allies and German forces west of the Rhine River. When German forces retreated from the West Wall (known to the Allies as the Siegfried Line) in February and March 1945, there were insufficient fortified positions between them and the Rhine. In spite of this fact, German oberbefehlshaber west (commander in chief, west) Field Marshal Albert Kesselring insisted on the principle of no retreat unless absolutely necessary. Thus, the Germans were driven back to the river by the advancing Allied armies at considerable cost to both the attacking and defending forces in terms of men and matériel.

In early March, Allied commanders carefully studied the area then known as the Palatinate (die Pfalz) as they consolidated their victories in the adjoining Rhineland and pummeled the West Wall in and around the Saarland. On March 17, supreme Allied commander General Dwight D.

Eisenhower decided to authorize Lieutenant General George S. Patton's U.S. Third Army to attack southeastward toward Kaiserslautern and the Rhine from the direction of Trier. Simultaneously, Lieutenant General Courtney Hodges's U.S. First Army, on Patton's left (northern) flank in the Rhineland, was spreading out from the initial bridgehead at Remagen.

Patton's line of advance was to go deep and cut across the axis of attack by Lieutenant General Alexander Patch's U.S. Seventh Army, which was on Patton's right and was still slugging its way through the West Wall but was headed northeastward, also toward Kaiserslautern. Patton was to cut off the Germans being driven backward by Patch before they could flee across the Rhine. The French First Army, under General Jean de Lattre de Tassigny, yet farther south, was on Patch's right flank and likewise was attacking northeastward toward Speyer and the Rhine from the Saar and Strasbourg regions.

From March 17 to 24, the Germans fought a desperate delaying action while the Western Allies marched inexorably onward. General of Infantry Herman Foertsch's German First Army, along with elements of General of Panzer Troops Erich Brandenburger's German Seventh Army, bore the brunt of the Allied two-pronged attack. The U.S. Army cut a swath of territory several miles wide across the northern half of the Palatinate and the southern Rhineland all the way to the Rhine. At the same time, the U.S. Seventh Army and the French First Army pushed through the West Wall and then chased the shattered defenders from their improvised fallback positions.

Allied forces crossing the Rhine River at Remagen, March 1945. (Corbis)

Amid these circumstances, large numbers of German soldiers discarded their uniforms and donned whatever civilian clothing they could find in an effort to escape. German officials directed the evacuation of the civilian population to the degree possible. Policemen and firemen disappeared too as did the civilian officials, and with their incriminating Nazi files.

German cities fell in rapid succession. Bad Kreuznach and Bingen capitulated on March 18. Worms fell into American hands on March 19, and the same fate befell Zweibrücken, Mainz, Idar-Oberstein, and Kaiserslautern on March 20.

As the situation unfolded, the only possible escape route for the Germans was through the heavily forested Haardt Mountains (Pfälzerwald) south of Kaiserslautern. That route had limited roads and trails, which soon were either blocked or covered by the pursuing American ground and air forces. Landau, Neustadt, Germersheim, and Dörrenbach surrendered on March 22. Bad Bergzabern surrendered on March 23; Speyer and Leimersheim did likewise on March 24.

Only mopping-up operations remained by March 25. Many German cities were badly damaged in the fighting. Bad Kreuznach, Kaiserslautern, and Ludwigshafen were more than 25 percent destroyed. Pirmasens and Worms lost at least 50 percent of their structures, and in Mainz and Zweibrücken more than 75 percent of the buildings were reduced to rubble.

The Palatinate Campaign saw elaborate, well-coordinated offensive maneuvers by the various U.S. ground and air forces and the French First Army. German forces, on the other hand, managed an improvised, stubborn delaying action until the very end in the face of overwhelming odds. Because military operations did not follow Germany's internal political boundaries, it is difficult to assign casualties on either side to specific geographic areas. In the combined Rhineland-Palatinate Campaign, however, there were 20,000 American and 60,000 German military dead or wounded. Additionally, the Americans took 250,000 German prisoners of war. By the end of March, the victorious combat forces were headed eastward at high speed, and U.S. Military Government detachments were left in charge throughout the Palatinate.

Palawan Massacre (December 14, 1944)

Japanese massacre of American prisoners on Palawan Island, located in the Sulu Sea, southwest of Luzon in the Philippine Islands. The 150 American prisoners of war there had been constructing an airfield for the Japanese. The

prisoners were subjected to brutal treatment by the men of the Japanese 131st Airfield Battalion, commanded by Captain Kojima Nagayoshi. In October 1944, American Consolidated B-24 Liberator bombers began to attack the airfield, and as American morale in the camp soared, Japanese treatment of the prisoners worsened. The Japanese did reluctantly allow the Americans to construct three log and earthen shelters to provide limited protection during the air attacks, however.

On December 14, 1944, with air-raid sirens sounding and in the mistaken belief that American forces were about to land on Palawan, the Japanese herded the prisoners into their shelters, then doused the shelters with gasoline and set them on fire. When the prisoners attempted to escape, they were machine-gunned, bayoneted, and clubbed to death. Some of the prisoners managed to kill several of the Japanese, however, and 30–40 of them, many badly burned, managed to reach the beach area, where they sought to hide among the rocks. The Japanese then ferreted them out and tortured and executed them that day and night. Of the 146 enlisted men and 4 officers held in the camp, only 11 survived the massacre, most of them by swimming across the bay where they found refuge with Filipino guerrillas and were eventually taken to Leyte. The Palawan Massacre sparked a series of subsequent raids in an effort to liberate other American prisoners of war held by the Japanese in the Philippines.

In August 1948, 16 Japanese were brought to trial in Yokohama, Japan, for the Palawan Massacre, although few of them were actually members of the garrison. In the end, 6 of the defendants were acquitted of war crimes charges. The other 10 were given sentences ranging from 2 years' imprisonment to death. The death sentence for Sergeant Deguchi Taichi, who was actually involved in the massacre, was commuted to confinement at hard labor for 30 years on July 19, 1950, by General Douglas MacArthur. On March 23, 1949, Ogawa Toru, a company commander in the 131st, was sentenced to 2 years' hard labor, reduced for time served. All those convicted were released by a general amnesty in 1958. In 1952, meanwhile, the remains of 123 of the Palawan victims were transferred to the Jefferson Barracks National Cemetery near St. Louis, Missouri.

Palembang, Battle of (February 14–16, 1942)

In February 1942, Palembang, the center of oil production on Sumatra in the Netherlands East Indies, was one of the main targets for the invading Japanese. By the beginning of February, Singapore had been effectively neutralized, allowing the Japanese to attack Sumatra from French Indochina.

One regiment plus a battalion involved in the capture of Hong Kong formed the core of the Japanese invasion force, which departed from Cam Ranh Bay in Indochina in two convoys on February 9 and 11. Light escorting forces were supplemented by a distant heavier task force under Vice Admiral Ozawa Jisaburo that included an aircraft carrier. During the voyage, the Japanese encountered a large number of British ships fleeing Singapore. One was the former Yangtze River steamer *Li Wo*. Although armed only with a 4-inch gun and two machine guns, the *Li Wo*’s scratch crew set one transport on fire and then rammed it.

Allied reconnaissance planes soon spotted the invasion convoys. Dutch rear admiral Karel Doorman, commander of the ABDA (Australian-British-Dutch-American) strike force, tried to intervene with his ships, but he was forced to return to Java with minor losses because he lacked air cover. By February 14, the invading Japanese force was proceeding up the Moesi River to Palembang.

The defenders on Sumatra included seven battalions of Dutch troops, but they had to cover an area larger than the Japanese home islands. Only 2,000 Dutch troops were positioned near Palembang. They were concentrated around the main targets, the Royal Dutch Shell refineries at Pladju and the main airfield at Pangkalanbenteng (known as P1), both near the city of Palembang itself. Although the refineries and oil storage tanks had been prepared for destruction, production continued up to the last minute.

On the morning of February 14, aircraft at P1 attacked the Japanese invasion convoys. As the aircraft returned home, they flew through formations of Japanese planes bound for the same destination. These included 34 Japanese Kawasaki Ki-56 ("Thalia" in the Allied code system) transport aircraft, which then dropped 270 paratroopers of Colonel Kume Seiichi's 2nd Parachute Regiment. They were accompanied by 18 Ki-21 ("Sally") bombers, which dropped antipersonnel bombs and equipment for the paratroopers. Japanese paratroopers, 180 of them, landed at P1. British planes trying to set down were taken under fire while the two sides also battled on the ground. Most of the British ground crew at P1 were unarmed and were sent to the backup airfield of P2 50 miles away. The remaining 90 Japanese paratroopers landed at the refineries, which they soon overran. The Japanese then disarmed the demolition charges. Although the Dutch were able to retake the refineries, they were not able to destroy them.

The Japanese were soon reinforced by another 60 paratroopers, who jumped onto P1 two hours after the original landing. Although armed only with light weapons, they managed to control the airfield through the remainder of the day and night. On the morning of February 15, the seaborne invasion force began coming ashore at Palembang, and another 100 paratroopers were also dropped.

Japanese sea and airborne forces linked up late on February 15. The Dutch ordered a retreat after setting the oil storage tanks on fire. The Japanese soon extinguished these fires and restarted the virtually undamaged refineries. By February 16 in only three days of fighting, the Japanese had secured one of their key war objectives.

Panama Canal

Major international shipping canal that links the Atlantic and Pacific Oceans and bisects the Panamanian isthmus in Central America. A major engineering feat, the Panama Canal was constructed by the United States between 1904 and 1913; it first was opened to commercial ship traffic in 1914. Approximately 41 miles in length, the Panama Canal utilizes an elaborate series of locks, channels, and man-made lakes. It takes about nine hours for a ship to traverse the entire canal.

The Panama Canal revolutionized shipping in the Western Hemisphere. Prior to its construction, a ship would have to cover some 14,000 miles, navigating around the entirety of the South American continent, to travel from New York to San Francisco. Once the canal was operational, the same journey entailed just 6,000 miles. Utilizing the canal, the U.S. Navy could move assets between the Atlantic and Pacific in a fraction of the time previously needed and at a much lower cost. The canal also ensured that the United States would be able to exert full control over the Caribbean Sea and the Gulf of Mexico.

During World War II, the canal proved invaluable in the U.S. prosecution of a two-theater war and facilitated the movement of millions of troops and millions of tons of matériel and cargo to the Pacific theater. Fully aware of its importance, the Japanese developed plans to attack the canal utilizing giant I-400–class *Sen-tokus* (special submarines) 400 feet in length and displacing 6,500 tons submerged. The subs were capable of each carrying three Aichi M6A1 Sieran floatplane torpedo bombers. The war ended before the Japanese could bring the plan to fruition, however.

Panay Incident (December 12, 1937)

The Japanese attack and sinking of the U.S. Navy gunboat *Panay* in China's Chang Jiang (Yangtze River). On December 11, 1937, because of the advance of Japanese troops, the United States evacuated its consulate personnel from Nanjing (Nanking) in the U.S. Navy river patrol craft *Panay* (PR-5), captained by Lieutenant Commander James Joseph Hughes. The *Panay,* a flat-bottomed river patrol vessel, was part of the U.S. Navy's Asiatic Fleet Chang Jiang patrol, charged with the protection of U.S. lives and property in China.

When the *Panay* set out, it had on board 5 officers, 54 seamen, 4 embassy personnel, and 11 civilians. The *Panay* was escorting three Standard Oil barges—the *Mei An*, *Mei Ping*, and *Mei Hsia*—up the Chang Jiang. Two British gunboats, the *Ladybird* and *Bee,* and other British craft joined the flotilla. As the ships proceeded upriver, Japanese artillery opened fire on them.

At 11:00 a.m. on December 12, the *Panay* and three barges anchored near Hoshien, upstream from Nanjing. Their crews hoisted U.S. flags on the ships and painted U.S. flags on the awnings and topsides. It was a clear, sunny day, and no guns on the *Panay* were manned or uncovered. At about 1:30 p.m., three Japanese Mitsubishi bombers flew over and dropped 18 bombs on the four vessels. One struck the forward section of the *Panay,* knocking down its foremast, disabling the forward 3-inch gun, and wrecking the pilothouse, radio room, sick bay, and fire room. The blast blew Commander Hughes across the pilothouse, breaking his thigh and incapacitating him. Executive officer Lieutenant Arthur F. "Tex" Anders was struck in the throat by a bomb fragment. Unable to speak, he nonetheless assumed command and issued orders by writing them on a bulkhead. Another officer was badly wounded, as were several crew members and two civilian passengers.

Immediately after the first Japanese strike, 12 additional Japanese aircraft arrived and dive-bombed the four ships, and nine other Japanese aircraft conducted repeated strafing runs for more than 20 minutes. The *Panay*'s crew

fought back with .30-caliber machine guns, four of which were mounted on each side of the vessel. The guns could fire horizontally and vertically but not straight forward or aft, the directions from which the Japanese strafing planes struck. By 2:04 p.m. the *Panay* was sinking, and Captain Hughes ordered the crew to abandon ship. The Japanese then strafed the ship's boats as they made their way to shore. In the attack, two of the three oil barges were also bombed and sunk.

Assisted by friendly Chinese, the survivors were taken aboard USS *Oahu,* HMS *Ladysmith* and HMS *Bee* two days later. In the attack, 43 sailors and 5 civilians were wounded. Two sailors and 1 civilian subsequently died of their wounds. Earlier in the day, a Japanese shore battery had fired on both the *Ladybird* and the *Bee,* and each sustained damage, but their commanders did not hesitate to go to the aid of the Americans.

Some of the U.S. Navy wounded sailors from the gunboat *Panay,* sunk by the Japanese on the Yangtze on December 12, 1937, being transported by litter through a Chinese village. (Hulton Archive/Getty Images)

The U.S. government formally protested the attack, leading Tokyo to issue a formal apology and to claim that the attack was accidental. U.S. radio intercepts revealed that the aircraft had attacked under orders and that it was not a mistake (information not revealed at the time for security reasons). Japan also agreed to pay reparations to the United States in the amount of

$2,214,007.36. Tokyo was no doubt surprised that Washington did not take an even tougher line, but as a result of the attack, U.S. public opinion became even more strongly pro-China and anti-Japan. The following month, U.S. president Franklin D. Roosevelt asked Congress to raise defense spending substantially, specifically requesting a 20 percent increase in the existing shipbuilding and replacement program.

Pantelleria, Allied Occupation of (June 11, 1943)

Allied operation, code-named CORKSCREW, to secure the small (8.5 by 5.5 miles) Italian island of Pantelleria situated in the Sicily Strait some 60 miles from Sicily and 70 miles from the North African coast. In 1943 the Western Allies considered the capture of Pantelleria vital to the success of Operation HUSKY, the planned invasion of Sicily (July 9–August 22). The island lay astride the main invasion route from North Africa to Sicily, but the real prize was a large airfield there, which the Allies wanted to use for fighters supporting the Sicily invasion. Otherwise, these aircraft would have to operate from bases in North Africa.

CORKSCREW commenced in mid-May. In one of the outstanding examples of overwhelming force during the war, the Northwest African Air Force dropped 6,400 tons of bombs on Pantelleria during 4,218 bomber and fighter-bomber sorties. Airpower advocates hoped to demonstrate that bombing alone could force an enemy surrender. The 12,000-man Brigata Mista Pantelleria on the island also was subjected to naval gunfire.

The Italian garrison on Pantelleria and nearby Lampedusa Island surrendered immediately on the landing of British troops on June 11. The British took 11,399 prisoners. The sole British casualty was a soldier bitten by a mule.

Papagos, Alexandros (1883–1955)

Greek Army field marshal and prime minister of Greece. Born on December 9, 1883, in Athens, Alexandros Papagos attended military academies in Athens and Brussels and was commissioned in the army in 1906. He fought in the 1912–1913 Balkan Wars and served in Anatolia in the 1919–1922 Greco-Turkish War, commanding first a battalion and then a regiment. Promoted to major general in 1927 and to lieutenant general in 1934, in 1935 Papagos became minister of war. The next year, he became army chief of staff under General Ioannis Metaxas when the latter seized power and became dictator.

Papagos took command of the Greek Army in September 1940 and prepared Greek forces for the anticipated Italian invasion of Greece, which began on October 28, 1940. Under his leadership, Greek forces halted the Italian invasion and then assumed the offensive. Papagos adroitly confined Greek military operations to the mountain areas, where the Italians could not exploit their technological advantage. Papagos's forces defeated the Italian Ninth Army and then invaded Italian-held Albania. He halted another Italian offensive in March 1941.

Following the German invasion of April 6, 1941, Greek forces fought bravely, but Papagos could not halt Field Marshal Wilhelm List's Twelfth

Army, even with British assistance. Taken prisoner, Papagos was sent to Germany and imprisoned at Dachau.

Papagos was released by U.S. troops in 1945 and returned to Greece. Recalled to active duty in 1947, he was promoted to full general and reappointed commander in chief of the army in January 1948. Papagos used American aid to defeat communist insurgents in the ensuing civil war. Hailed as the savior of democratic Greece, Papagos was promoted to field marshal in October 1949.

Papagos resigned his military posts in May 1951. He then formed the conservative Greek Rally Party, which he led to victory in the November 1952 elections. As prime minister, Papagos strengthened ties with the West, improved the Greek economy, and signed an alliance with Yugoslavia and Turkey in 1954. Papagos died in office in Athens on October 4, 1955.

Papen, Franz von (1879–1969)

German politician and chancellor during 1932. Born on October 29, 1879, in Werl, Westphalia, Franz von Papen joined the German Army and was a captain on the General Staff in 1913. He then served as the German military attaché in Mexico City and in Washington. He was expelled from the United States in 1916 for directing sabotage activities and returned to Germany. During the rest of World War I, he served on the Western Front, in Turkey, and in Palestine.

Papen left the army after the war and entered politics, becoming a leader of the ultraconservative wing of the Catholic Center Party. From 1921 to 1932, Papen was a member of the Prussian Landtag (state parliament). He

was opposed to political ties with the socialists and liberals and urged restoration of the monarchy. Nationalist politician General Kurt von Schleicher, who did not yet seek the chancellorship himself, saw in Papen a useful puppet. Schleicher used his influence with President Paul von Hindenburg to secure the appointment of Papen as chancellor on May 31, 1932.

Papen formed a cabinet of prominent aristocrats and right-wing nationalists. Believing that the National Socialists could be controlled and exploited, Papen secured an end to the ban on the Sturmabteilung (SA, storm troops), providing the Nazis with increased power. Although Papen toed the Nazi line in foreign policy pronouncements, Adolf Hitler had no intention of sharing power and rebuffed his overtures. In late June, Papen deposed the Social Democratic government of Prussia and assumed direct control of Prussia as federal commissioner.

New elections for the Reichstag (federal parliament) occurred in November 1932, and Papen remained chancellor only until the next month. In December, Schleicher and his allies forced Papen's resignation, Schleicher becoming chancellor himself. Papen then allied himself with Hitler and played a key role in bringing him to power. Papen helped to convince a reluctant Hindenburg to appoint Hitler as chancellor on January 30, 1933, with himself as vice chancellor, claiming that he could "control" the Nazi leader.

As vice chancellor, Papen intrigued for a return of the monarchy, something he called for publicly in a sensational speech at Marburg University on June 17, 1934. Saved from death in the June 30, 1934, Blood Purge ("Night of the Long Knives"), Papen managed to restore himself to Hitler's good graces and served as German ambassador to Austria from 1934, where he played a key role in the German takeover of that country (the Anschluss) in 1938. He was then German ambassador to Turkey.

After the war, Papen retired to Westphalia. Arrested by Allied authorities, he was tried by the International Military Tribunal at Nuremberg in 1946 but found not guilty. Rearrested and tried by a German denazification court, he was found guilty and sentenced to two years in prison, after which his property was returned to him. Papen died in Obersasbach, Baden Württemberg, on May 2, 1969.

Papuan Campaign (July 1942–January 1943)

Important Pacific theater land campaign and U.S. general Douglas MacArthur's first victory. Papua was Australian-controlled territory in the southeastern corner of the island of New Guinea. On March 8, 1942, the Japanese moved into New Guinea, occupying Lae and Salamaua. Engaged in their Philippines and Burma campaigns, the Japanese did not advance on Papua. Instead, they subjected its capital of Port Moresby to air attack. Having lost their 8th Division defending Singapore and the Netherlands East Indies, the Australians were greatly alarmed. While veteran Australian troops were fighting in Egypt, their homeland was being defended only by militia, obsolete planes, and a few ships.

On March 17, 1942, General MacArthur reached Australia from the Philippines. He found that he had insufficient forces to defend his new command and none to spare for the relief of the Philippines. MacArthur's appointment as Southwest Pacific Area commander reassured the Australian government that U.S. aid would be forthcoming.

Australia was also already withdrawing two divisions from the Middle East. The 6th Division arrived during March, and the 7th Division returned in April. On April 6, the U.S. 41st Infantry Division reached Australia, followed by the U.S. 32nd Infantry Division by May 14. The Royal Australian Air Force reequipped while the U.S. Fifth Air Force formed in Australia. The U.S. Navy could spare few ships for MacArthur, however.

To isolate Australia from further reinforcements, the Japanese Navy tried to seize Port Moresby. But during the May 4–8, 1942, Battle of the Coral Sea, the Japanese suffered their first major naval defeat. The loss of four of

their aircraft carriers in the next large naval engagement, the June 3–6 Battle of Midway, prevented the Japanese Navy from attacking Port Moresby again. Subsequently, the Japanese initiated plans for an overland strike against the port.

Anticipating this Japanese move, MacArthur sent U.S. engineers and Australian troops to Milne Bay to construct a strategic airfield on Papua's eastern tip. MacArthur also ordered two Australian militia battalions, code-named Maroubra Force, to Buna, a possible north coast landing site. Commanded by Colonel Bill Owen, the Maroubra Force began its march on July 7, 1942, along the narrow track called the Kokoda Trail across the formidable Owen Stanley Mountain Range separating Port Moresby from Buna.

The Maroubra Force was spread along the track when Colonel Yokoyama Yosuke's 2,000 Japanese troops of the 144th Regiment invaded Buna and Gona on July 21. Two days later, Yokoyama attacked Owen's vanguard at Awala. A Papuan battalion fled into the jungle, and B Company of the 39th Battalion retreated to Oivi. Encircled on July 27, the Australians withdrew through the jungle around Kokoda Airfield, regrouping at Deniki.

Between July 28 and August 10, the Australians fought desperately. Kokoda was retaken twice, but Owen was among those killed. The Japanese had superior numbers and drove the Australians back to Deniki. The Australians lost that place on August 14 and retreated to Isurava. On July 29, Allied aircraft damaged the Japanese transport *Ayatozan Maru,* but Major General Horii Tomitaro and 11,450 reinforcements reached Buna by August 21. American landings at Guadalcanal on August 7, however, increasingly diverted Japanese resources there.

Concerned by Japanese progress, MacArthur ordered the Australian 7th Division to Papua on August 3. Its 18th Brigade went to Milne Bay, and the 21st Brigade started up the Kokoda Track on August 18. As few transport planes were available, Papuan carriers delivered supplies.

On August 25, the Japanese invaded Milne Bay as a flanking move against Port Moresby. Allied aircraft sank some barges at Goodenough Island, stranding some Japanese. The main Japanese force landed at Ahioma, however; spearheaded by two tanks, it drove the Australian forward units back toward the vital airfield.

Japanese reinforcements arrived on August 29. On August 31, the

Australians defeated the Japanese attacks across the airfield. By September 7, the Japanese had evacuated 1,300 survivors. It was their first land defeat of the war.

At Isurava, the exhausted Australian 39th Infantry Battalion was joined on August 25 by the 21st Brigade's lead battalion. Fresh Japanese troops supported by artillery attacked the next day. For four days, a crucial battle raged. Outflanked and then pursued by the Japanese, the Australians destroyed Myola supply dump and prepared to defend Efogi. Delivering reinforcements to Gona on September 2, the Japanese attacked with 5,000 troops on September 8. The exhausted, hungry, and malarial Australians retreated to Ioribaiwa Ridge on September 11.

Belts of cartridges hang over branches in the New Guinea jungle as American soldiers carry ammunition cases to the front for operations against Japanese in the Buna area in 1942. (Hulton-Deutsch Collection/Corbis)

Reinforced by two battalions of the 25th Brigade, the Australians then counterattacked. Defeated, they withdrew to Imita, the last ridge before Port Moresby, on September 17. Horii's troops, suffering from disease and starvation, were preparing to attack Imita when, on September 25, the Japanese high command made Guadalcanal its priority and ordered Horii to

withdraw. Two days later, Australian patrols found Ioribaiwa abandoned. The Australians then began the pursuit.

Horii's fighting withdrawal held the Australians for a week at Eora. On November 2, Australian troops entered Kokoda. At Oivi on November 10, the Australians drove the Japanese from the track, and Horii drowned crossing the Kumusi River. Few of his soldiers reached Buna, which was garrisoned by Japanese marines and base troops.

In late September, MacArthur ordered Major General Edwin Harding's 32nd Infantry Division to Papua. MacArthur wanted his Americans to use the Kapa Kapa Trail to take Buna from the rear. From October 6 their vanguard Medendorp Force spent two harrowing weeks crossing the mountains. Luckily, airfield sites were discovered on the north coast that enabled an airlift in of the remaining Americans.

On November 17, the Japanese landed 1,000 reinforcements, who moved into the formidable Buna and Gona defenses. These comprised a system of concealed log bunkers with cleared fields of fire covered by artillery and machine guns. Commencing on November 19, Allied attacks on Buna and Gona stalled before these bunkers.

Dissatisfied, MacArthur ordered I Corps commander Lieutenant General Robert Eichelberger to assume personal command of the battle, telling him to "take Buna or die." Eichelberger relieved Harding as divisional commander and replaced him with the divisional artillery commander, Brigadier General Albert W. Waldron. Allied aircraft stopped four Japanese supply convoys reaching Buna, but 500 reinforcements landed on December 2 and another 800 arrived on December 14.

Disregarding the terrible conditions in Papua, MacArthur decided not to bypass the starving Japanese. A bloody battle of attrition followed. Artillery and aircraft could not neutralize the bunkers, so tanks were used instead. The Australians finally took Gona on December 9. The American Warren and Urbana Forces next invested Buna, which fell on January 2. Japanese resistance continued at Sanananda until January 18.

In the Papuan Campaign, the Australians lost 2,165 dead and 3,533 wounded, the Americans sustained 930 dead and 1,918 wounded, and the Japanese suffered some 12,000 dead and 2,000 wounded.

Parachute Infantry

Development of troop-carrying aircraft before and during the war allowed for the deployment of parachute infantry in cohesive units behind enemy lines to secure key objectives or to act in a reinforcing role. Noting that artillery observers had employed parachutes to escape from damaged balloons and then aircraft in World War I, American colonel Billy Mitchell envisaged parachuting infantry as an airborne assault force to break the stalemate of trench warfare. Mitchell suggested assigning the U.S. 1st Division in an air assault role to be carried to drop zones behind enemy lines by aircraft. Friendly aircraft would then provide subsequent air support. The war ended before such a plan could be tried.

The Soviet Union was the first to carry out extensive experiments with parachute troops. Beginning in 1922, Soviet troops were dropped successfully from aircraft. The Soviet Union made extensive progress by encouraging parachuting and gliding as national sports, and paratroopers captured a corps commander during a 1930 training exercise. By 1936, there were 115 parachute training schools in the Soviet Union at which civilians made 1.6 million jumps from towers and 30,000 jumps from aircraft. During a 1936 exercise, a group of 1,500 infantrymen parachuted onto an “enemy-held” airport, securing it before being reinforced by air-landed and then armored forces. Although foreign military observers were greatly impressed,

apathy on the part of Western governments precluded an equivalent effort in these states.

In 1927, Italy adopted the Salvator parachute. Unlike aircraft seat-mounted, ripcord-operated parachutes, it was carried on the individual's back and connected to the aircraft by a static line. Beginning in 1938, Italy trained two battalions in military parachuting. This force was expanded during the war and made several operational drops. The Italians adopted the German parachute as their standard because the Salvator caused too many injuries.

Germany was the first to use airborne troops effectively in battle. Through secret military agreements with the Soviets, German advisers attached to the Red Army took note of Red Army experiments, although the concept of parachute troops lagged until Adolf Hitler came to power. Large numbers of highly trained paratroops deploying rapidly behind enemy lines or smaller groups seizing key objectives proved ideal for the new practice of blitzkrieg.

Because Germany was surrounded by numerous linear defensive works, such as the Maginot Line, it encouraged the evolution of the concept of vertical envelopment. On January 29, 1936, some 600 German troops under Lieutenant Colonel Bruno Bräuer started parachute training at the Döberitz training area near Berlin. Political infighting dogged early training. The army wanted a battalion for rapid reinforcement, the air force desired troops for demolition tasks where air defense was too hazardous for bombers, and the Schutzstaffel (SS) sent a platoon to be trained without any specific rationale. Even the Nazi paramilitary force, the Sturmabteilung (SA), wanted two battalions: one parachute and one that would be air-landed.

On July 4, 1938, Colonel (soon major general) Kurt Student was ordered to fuse this disparate group into an airborne division by September 1. Student established the 7th Flieger Division of nine battalions: two parachute and seven air-landed. In all, there were 9,000 troops (minus aircrew). Despite having components stripped away that winter, by September 1939 Student rebuilt an airborne force of one parachute division (the Luftwaffe's 7th Flieger Division) and one air-landing division (the German Army's 22nd Infantry Division).

The effectiveness of this new form of waging war was demonstrated with the invasions of Norway and Denmark on April 9, 1940. Incredibly, four objectives in two separate countries were assigned to only the 1st Parachute

Battalion. Despite high winds, low clouds, and confusing orders, these paratroopers took Norway's Fornebu Airfield (Oslo) and Sola Airfield (Stavanger), Denmark's Aalborg Airfield, and the Vordingborg Bridge to Copenhagen. German airborne forces subsequently secured bridges and routes across the Netherlands and the Belgian frontier in May 1940 on the occasion of Germany's invasion of France and the Low Countries. Although the Scandinavian operations had alerted the West to German capabilities, innovative techniques carried the day. These included attacking Eben Emael fortress (May 10–11) utilizing glider troops and securing a Rotterdam bridge by landing at its abutments in seaplanes.

That winter, the airborne force expanded into the XI Flieger Corps, adding supporting elements such as signals, medical and supply battalions, an assault engineer regiment, and a squadron of reconnaissance aircraft. In April 1941, the paratroopers contributed to victory in Greece by blocking the British retreat across the Corinth Canal.

In late May 1941, German forces carried out an airborne invasion of Crete. It was a close-fought battle, and many of the air-landing troops were killed when their gliders broke up on the rocky objectives. Through Ultra intercepts, the Allied defenders were aware of the German landing sites and planned accordingly. Although British and Commonwealth troops were defeated and driven from Crete, the operation cost the paratroopers some 5,000 dead and 2,500 wounded from an attacking force of 22,000. Adolf Hitler then decided that the days of paratroopers were over, and the German units fought as elite infantry for the rest of the war.

Early discussions between the Japanese and the Germans ensured that Japan was also aware of the potential of airborne troops. Japanese parachute training extended over a six-month period and produced few graduates. With the arrival of German instructors, the courses were shortened to approximately eight weeks, with slight variations between the army and navy schools. By late 1941, 100 German instructors were guiding the instruction of more than 14,000 men in nine training centers.

The army's airborne forces were contained in the 5,575-member all-ranks Raiding Group, consisting of the Raiding Flying Brigade with directly assigned aircraft and the Raiding Brigade of two parachute battalions, support elements, and two never-manned glider battalions. Assigning the aircraft directly avoided the problems experienced by some other armies in which the

airborne forces were members of the army and the aircraft belonged to the air force. This Raiding Group spent most of the war on home islands reserve. A second smaller Raiding Brigade was established to provide troops for operations in China.

The Japanese Navy created two special naval landing forces, each with a strength of 844 officers and men. Early naval paratroop operations all met with success but at varying costs. The 1st Yokosuka Special Naval Landing Force secured the Menado Airfield on Celebes on January 11, 1942. The paratroopers were scattered, suffered losses, and required reinforcements. Fortunately for them, the Japanese enjoyed air superiority.

Three days later, however, because of the distance to the targeted oil fields at Palembang (Sumatra), there was inadequate air support, and the daytime preparatory bombing served merely to alert the defenders. With the Japanese approach route directly over several antiaircraft units, the drop was scattered. The oil fields were captured the next day with the aid of a reinforcing parachute drop, however.

The Japanese airborne assault on Timor on February 21, 1942, commenced with a feint assault by paratroops several miles from the actual objective's drop zones. With the Dutch defenders reacting to the deceptive attack, the main body of paratroops easily secured and held the Allied communications lines until follow-on amphibious forces overran the island. Although the Japanese did conduct several additional parachute operations during the war, these tended to be smaller-scale missions. The initiative passed to the Allied forces.

The Allied response to early parachute experiments was varied, although the underlying theme was usually neglect or hostility. The French, for example, began training airborne troops in 1937, but France's army was defeated before they could be used. On June 21, 1940, the British established the Central Landing School in Ringway to develop expertise in glider and parachute operations the day before Prime Minister Winston L. S. Churchill made his noteworthy call for the formation of a force of at least 5,000 parachute troops. Not until October 1941, however, was Major General Frederick Browning ordered to form the 1st Airborne Division; a second, the 6th Airborne Division, was authorized in April 1943.

A common problem for fledgling paratroopers was a lack of support in the form of aircraft and doctrine. British airborne forces, however, faced

special impediments, given the concentration of resources in home defense. At first, the British used obsolete bombers; the paratroopers jumped either from a platform where the tail turret was previously or through a hole cut in the aircraft's floor. The arrival of American Douglas C-47 Dakota aircraft by 1942 led to changes in many of the British techniques. By 1945 Britain fielded two airborne divisions, each consisting of two parachute brigades and an air-landing (glider) brigade.

As noted, the Soviet Union had been a leader in parachute operations, but during the war Soviet airborne forces usually dropped onto territory they already held or into partisan-prepared drop zones. Such missions stiffened partisan morale and reinforced ground troops already in location. This policy seems to have resulted from a disastrous three-brigade paratroop operation in June 1942 where the Germans destroyed the Soviet force.

The United States experimented with military parachuting on a small scale in the late 1920s, but the army largely ignored military parachuting until the German successes early in World War II. In August 1940 a test platoon of volunteers made a mass jump, and the next month the chief of infantry authorized the establishment of the 501st Parachute Infantry Battalion. U.S. Army chief of staff General George C. Marshall was profoundly impressed by the German success in Crete. Convinced that the concept of vertical envelopment was here to stay, he initiated plans to field substantial American airborne forces. With the subsequent expansion of airborne forces, the four American battalions established by February 1942 (the 501st, 502nd, 503rd, and 504th) each became parachute infantry regiments (PIRs) comprising three subordinate battalions.

The expansion also reinforced the requirement for higher command elements. The 82nd Infantry Division divided, becoming the 82nd Airborne Division and the 101st Airborne Division, each equipped with two parachute regiments and one glider regiment for a total of 13,000 personnel. Further expansion provided the 17th (December 1942) and 13th airborne Divisions (August 1943), both destined for the European theater, and the Pacific theater's 11th Airborne Division (February 1943). In all, between 1941 and 1945 American airborne forces increased from 600 to more than 65,000 men.

The 503rd PIR made the first U.S. combat jumps, into Algeria and Tunisia on November 8 and 15, 1942. Almost a year later on September 5, 1943, the 503rd PIR also conducted the first U.S. Pacific theater airborne

assault at Markham Valley, New Guinea. For this operation it was augmented by an Australian artillery unit, which underwent a one-jump parachute qualification mere days before the combat jump. The 503rd PIR also carried out an airborne drop on Corregidor Island in the Philippines on February 16. The 503rd PIR was atypical of U.S. parachute units in that it operated independently of a higher airborne formation, although the Panama-based 550th and 551st PIRs were initially independent before being absorbed into the 82nd Airborne Division. They saw action in Italy and southern France and during the Ardennes Offensive (December 16, 1944–January 25, 1945). On February 24, a parachute company from the 11th Airborne Division's 511th PIR jumped at Los Baños Prison in the Philippines in a coordinated operation to release 2,147 internees there.

As the war progressed, Allied airborne formations were committed in large-scale multinational operations. The June 6, 1944, Normandy Invasion, for example, used American, British, and Canadian paratroopers: the American 82nd and 101st Airborne Divisions and the British 6th Airborne Division. Operations in the Netherlands committed American, British, and Polish troops. The parachute operations supporting the Sicily invasion (July 9–August 22, 1943) had convinced the U.S. Army of the requirement for integral combat support, such as artillery and engineers. This necessitated larger gliders, because parachuting artillery and jeeps in adequate quantities was not feasible until after the war.

Haphazard parachute drops often marked operations. During the Sicily invasion, for example, the 505th PIR was scattered over 65 square miles. Many of the planes bearing the 504th PIR were shot down by mistake by U.S. Navy and ground troops, who believed that they were German aircraft. The Normandy drops 11 months later proved to be no better organized, but this worked in their favor. German efforts to reinforce the beaches were hampered because they could not determine the extent of the threat, as the paratroopers were so widely scattered, thus allowing the amphibious foothold.

The most memorable parachute campaign was Operation MARKET-GARDEN (September 17–26, 1944), the planned effort to sweep across the Netherlands, outflank the Siegfried Line, and secure a Rhine River crossing at Arnhem. The U.S. 101st and 82nd Airborne Divisions eventually secured bridges in the Eindhoven and Nijmegen areas, respectively, and the British 1st Airborne

Division and the Polish 1st Separate Parachute Brigade were virtually annihilated while attempting to seize the Arnhem Bridge. The plan was flawed from the start, given inadequate airlift, drop zones too distant from objectives, leadership's refusal to listen to intelligence reports about German strength, a narrow route susceptible to counterattacks, and inflexibility worsened by inefficient communications.

As part of their Rhine crossing operations, on March 24, 1945, the Western Allies mounted Operation VARSITY in the Wesel area east of the river. It involved 21,692 Allied paratroopers and glidermen of the British 6th Airborne and U.S. 17th Airborne Divisions of Major General Matthew B. Ridgway's XVIII Airborne Corps along with 614 jeeps, 286 artillery pieces and mortars, and hundreds of tons of supplies, ammunition, food, and fuel. A total of 1,696 transports and 1,348 gliders participated in the operations, and some 240 B-24 bombers were specially rigged to drop supplies and equipment. The airborne forces quickly secured most of their objectives, virtually wiping out the defending German 84th Division, with 3,500 Germans taken prisoner. Although VARSITY was a success, the airborne forces sustained higher casualties than did the Allied ground units in their Rhine crossings.

Paratroopers and gliders participating in Operation MARKET-GARDEN, a failed effort by the Western Allies to cross the Rhine at Arnhem and outflank the principal German defenses of the Siegfried Line. (Corbis)

Airborne forces played important roles in the war. Their success ensured that they would continue to be used by all the world's major militaries in the postwar period.

Parachutes

Means of delivering personnel safely from flying aircraft for the purpose of inserting individual agents surreptitiously behind enemy lines, landing large shock forces, or effecting the emergency evacuation of aircrew from damaged airplanes. Parachuting evolved slowly from Muslim cleric Armen Firman's recorded jump, using his billowing cloak (852 CE), and Leonardo da Vinci's sketches (ca. 1495) illustrating a parachute of taut cloth over a rigid pyramidal structure. Carnivals featured occasional "daredevil" balloon jumps dating from the 18th century.

U.S. Army captain Albert Berry is generally credited with the first descent from an aircraft, over Jefferson Barracks, St. Louis, on March 1, 1912, pulling his parachute from a container attached to the plane's landing skid. After numerous somersaults during parachute deployment, Berry declined to repeat the performance. Early parachutes were made of canvas and later of silk, but the conventional round solid configuration remained unchanged because of its reliability.

Military circular parachutes had a 28- to 35-foot canopy. It was soon discovered that providing an 18-inch hole in the canopy apex (top center) allowed air to escape, reducing oscillation and injury to the parachutist on landing. Usually, 28 suspension lines running down to four cotton web risers attached the canopy to the jumper's harness. The harness held the jumper in place during descent and carried the parachute pack tray. In many aircraft, the parachute was automatically opened as the jumper fell away by means of a 16-foot static line attached to the airplane. Parachutes and their harnesses commonly weighed between 35 and 50 pounds and would allow for a rate of descent of 22 to 25 feet per second for a jumper with 100 pounds of equipment. Allied forces carried a smaller reserve parachute on the front of their body.

During World War I, parachutes were used by artillery spotters to escape from damaged observation balloons, but they were considered impractical for airplanes. During World War II, parachutes were used to deliver supplies and special assault troops with their equipment. Parachutes were used frequently during the war for resupply of ground troops, and they were also used in deception operations. By 1945, parachutes had also saved approximately 34,000 Allied aircrew forced to abandon disabled aircraft.

Paris, Liberation of (August 19–26, 1944)

The Allied plan for the liberation of France called for the destruction of occupying German armed forces and rapid movement toward Germany to end the war in Europe as quickly as possible. The Allies planned to bypass the French capital of Paris on the assumption that once German forces had

been isolated there, they would soon surrender. Supreme Allied commander General Dwight D. Eisenhower issued orders to commander of French Forces of the Interior General Pierre Joseph Koenig that there be no uprising in the city with consequent diversion of Allied troops there, but political events dictated otherwise.

Beginning with a strike by French gendarmes (the civilian police) on August 15, 1944, two factions of the French Resistance movement vied for the credit of liberating the French capital. The well-organized and more numerous communist wing of the Resistance advocated a complete uprising in Paris, hoping that with popular credit for liberation of Paris they would have a significant advantage in taking power in France after the war. Gaullist Free French Resistance leaders in Paris were well aware of this plan, and although they feared destruction of the city by the Germans in any uprising, they grew increasingly concerned that an Allied failure to act would jeopardize future Gaullist control of the French government.

General of Infantry Dietrich von Choltitz had taken command of the greater Paris area on August 7, 1944. Choltitz had established his military credentials on the Eastern Front, especially in heavy fighting that led to the capture of Sevastopol in July 1942. He had a reputation of following orders to the letter, and these, delivered to him in a personal meeting with German leader Adolf Hitler, called for the destruction of Paris before allowing it to fall into Allied hands.

On August 19 when Allied forces were still more than 50 miles from the city to the north and south, Gaullist elements in Paris preempted their communist rivals by seizing the Paris prefecture of police. On learning this, the communist organization initiated a general uprising within the city. Choltitz immediately deployed infantry backed by tanks around the city, and the fighting spread. German tanks opened fire on the prefecture of police. The citizens of Paris were no longer intimidated by the Germans, however, and Resistance fighters fought the Germans with what weapons they possessed, mostly small arms and homemade gasoline bombs used against German vehicles. By August 23 more than 400 street barricades went up, and localized intense fighting occurred in many areas of the city.

Both Hitler and Eisenhower were soon aware of the fighting in the city. As the number of German casualties steadily mounted, Choltitz was faced with a dilemma. Plans were in place for the destruction of not only public

works and buildings but also monuments and museums in Paris. Swedish consul general in Paris Raoul Nordling pleaded with Choltitz to save the city and attempted on his own initiative to arrange a cease-fire. However, commander of communist forces Henri Tanguy (alias Colonel Rol) refused.

Crowds of French citizens line the Champs Élysées to view Allied tanks and half-tracks pass through the Arc de Triomphe on the liberation of Paris, August 25, 1944. (Library of Congress)

Choltitz had his orders; he also had serious doubts about Hitler's mental condition and did not wish to become notorious for all time as the destroyer of one of the world's most beautiful cities. Choltitz could not cede the city to the insurgent civilians without resistance, because his family members were in Germany; his not unreasonable fear of reprisals against them apparently had some bearing on his decisions. Choltitz, however, minimized the combat in various ways, especially by his decision to move the bulk of German combat forces outside the city and into formal tactical defensive positions oriented toward the approaching Allied armies in areas beyond the city limits. During the fighting, he also withheld the use of heavy artillery.

On August 21, Major General Philippe Leclerc, against Allied orders, turned his Free French 2nd Armored Division north toward Paris. Meanwhile, within the city, Resistance leaders met and decided to continue

fighting. Choltitz, now determined to spare the city, sent Nordling to the Allies to ask that they enter Paris. Choltitz pledged to hold off destroying the city until they arrived. Eisenhower then agreed that Leclerc's division should move into Paris. Choltitz rejected repeated orders from Berlin to begin the destruction of the French capital.

By August 23, fighting in parts of Paris was intense. That day, Nordling conferred with commander of U.S. 12th Army Group Lieutenant General Omar N. Bradley. Impressed by what Nordling told him, Bradley ordered the U.S. 4th Infantry Division to move into Paris before Choltitz could change his mind.

By early August 24, Leclerc's tanks had reached Rambouillet, 20 miles south of Paris. De Gaulle arrived at the Château of Rambouillet that same day. Fighting was now raging in virtually every section of the city. Late on August 24, Leclerc's tanks arrived in Paris. Part of his division moved through the Porte d'Orleans, and the rest entered by the Porte de Vanves. By 11:30 p.m., Leclerc's tanks were in front of the Hôtel de Ville (city hall) in the center of Paris, and the bells of Notre Dame pealed out the good news to the populace.

On August 25, French and U.S. forces eliminated pockets of German resistance, and at 3:00 p.m. Choltitz and his staff surrendered to French officers. Many of the German troops, unaware of the surrender, continued to fight. De Gaulle arrived in the city that evening, and the next day he and the Resistance moved on foot from the Arc de Triomphe to Notre Dame Cathedral for a celebratory mass. Although there was sniper fire, both events proceeded.

It is impossible to accurately assess casualties in the liberation of Paris. Although the cost in casualties to Allied forces was slight, the liberation of Paris and the need to feed the city were heavy loads on an already overburdened Allied supply system. But the cost of a destroyed Paris would have been far higher, and the liberation of the French capital was a great psychological boost to the Allies in their effort to defeat the Third Reich.

Paris Peace Treaties (February 10, 1947)

Following preliminary draft treaties prepared by the deputy foreign ministers of the major Allied powers, the Council of Foreign Ministers met in the Luxembourg Palace in Paris in two sessions of several weeks each from July to October 1946. There were sharp exchanges and disagreements among the former allies, but after further discussions in New York City in November 1946, the peace treaties were signed at the Quai d'Orsay in Paris on February 10, 1947. The main provisions of the five peace treaties with Italy, Finland, Hungary, Romania, and Bulgaria are as follows.

Italy

The most difficult of the territorial discussions centered on Italy. At the end of the war, Yugoslavia had attempted to secure land at the expense of Austria and Italy, and the conferees spent much time discussing the Italo-Yugoslav frontier. Ultimately, they adopted the compromise put forth by the French. The port city of Trieste, which was 80 percent Italian, became a Free Territory under the authority of the United Nations Security Council. Fiume (Rijeka), Istria (to include the Italian city and naval base at Pola), and most of the Julian March were awarded to Yugoslavia, as was Zadar, a partly Italian city in Dalmatia. Yugoslavia and Albania also secured from Italy some islands in the Adriatic. The status of Trieste was not finally resolved until

1954, when improved relations between the two states led to Italy receiving the city and Yugoslavia receiving the area around it.

France secured some strategic territory from Italy along their common frontier in the Tenda-Briga sector, and Greece obtained the Greek-inhabited Dodecanese Islands off southwestern Turkey, which the Italians had gained from Turkey after World War I. Italy did retain control of Tirol south of Brenner Pass, claimed by Austria. Ethiopia was recognized as independent, and Italy lost its overseas colonies of Libya, Eritrea, and Somaliland, which were now under British control. There was no immediate agreement on their disposition, with the conferees agreeing that should there be no resolution within one year, their fate would be decided by the United Nations. This is indeed what happened, with all three states moving toward independence. Italian reparations were set at $360 million, and the Italian Army was limited to 250,000 men.

Finland

Finland was reduced to its borders following the First Finnish-Soviet War of 1939–1940, thereby losing the Karelian Isthmus and Vyborg as well as land north and east of Lake Ladoga and some of Lapland. In addition, Finland was now forced to yield Petsamo, its only Arctic port. The Soviet Union also secured a lease on the Porkkala Peninsula on the Gulf of Finland near Helsinki as a naval base in exchange for the return of Hanko.

Hungary

Hungary was obliged to return to Romania that portion of Transylvania it had occupied. Hungary was again reduced to the post–World War I borders of the 1919 Treaty of Trianon, with the exception that it was also forced to yield a small amount of territory to Czechoslovakia at Bratislava. Czechoslovakia, in turn, had to relinquish to the Soviet Union a portion of sub-Carpathian Ruthenia, which now gave the Soviet Union a direct border with both Hungary and Czechoslovakia. Hungary’s reparations were set at $300 million.

Romania

Romania was obliged to recognize as final its 1940 loss of Bessarabia and northern Bukovina to the Soviet Union. Romania was also forced to cede the southern Dobruja to Bulgaria but regained the portion of Transylvania that Germany had forced it to cede to Hungary. Romania also had to pay reparations in the sum of $300 million.

Bulgaria

Bulgaria received the southern Dobruja, which Germany and Italy had insisted it give to Romania in 1940. Bulgaria was assessed $70 million in reparations.

All five states also agreed to restore the legal and property rights of the victorious powers, dissolve fascist organizations, and guarantee human rights and fundamental freedoms. All treaties except that with Finland contained provisions that the occupying Allied nations would withdraw their troops, although the Soviet Union retained the right to maintain forces in both Hungary and Romania to safeguard its lines of communication to Austria until it concluded a peace treaty with that nation in 1955.

Because of sharp disagreements between the Western Allied powers and the Soviet Union and the coming of the Cold War, no formal peace treaties were agreed to by the former Allies with either Germany or Japan. After the fall of the Berlin Wall in 1989, negotiations on a treaty to "end" the war began. The Treaty on the Final Settlement with Respect to Germany was signed in Moscow on September 12, 1990.

Park, Sir Keith Rodney (1892–1975)

Royal Air Force air chief marshal. Born at Thames near Auckland, New Zealand, on June 15, 1892, Keith Park joined the New Zealand artillery during World War I and earned a commission. Park transferred to the Royal Flying Corps in 1916 and, as a pilot, scored some 20 aerial victories by war's end. Remaining with the new Royal Air Force after the war, Park joined Fighter Command Headquarters in 1938 as senior air staff officer under Air Chief Marshal Hugh Dowding.

In April 1940, Dowding named Park commander of Number 11 Fighter Group, which defended London and southeast England. After providing vital fighter coverage for the May 26–June 4 Dunkerque evacuation, Number 11 Group faced the onslaught of the Luftwaffe during the Battle of Britain (July 10–September 30). Park clashed with his counterpart at Number 12 Fighter Group, Air Vice Marshal Trafford Leigh-Mallory, over fighter tactics. Park believed in radar early warning and single-squadron intercepts of the German bombers before they could reach their intended targets, whereas Leigh-Mallory favored the slower-reacting, multiple-squadron Big Wing tactics. When the Air Ministry backed Leigh-Mallory, Park was relieved in December 1940, after the Battle of Britain had essentially been won.

Following assignments with Training Command and in Egypt, Park was ordered to Malta in July 1942 to organize air defenses on that crucial island. Park used the same fighter tactics at Malta that he had used with Number 11 Fighter Group. His air defenses caused the Luftwaffe to expend precious resources needed in North Africa. Park also counterattacked, hitting German supply convoys as they left Italy and striking Axis positions throughout the theater.

In January 1944, Park became air officer commanding in the Middle East, and in February 1945 he transferred to the South-East Asia Command as head of all Allied air forces there. Park was promoted to air chief marshal in August 1945 and played a key role in the Allied reconquest of Burma (today Myanmar).

Over Park's objections, the Air Ministry retired him from active duty in 1946. Entering private business with Hawker Siddley Aircraft, Park returned home to his native New Zealand in 1948. He died in Auckland on February 6, 1975.

Parker, George Marshall, Jr. (1889–1968)

U.S. Army major general. Born on April 17, 1889, in Sac City, Iowa, George Marshall Parker Jr. graduated from the Shattock School in 1909 and was commissioned in 1910. During World War I, he trained troops in the United States and ended the war as a major. He was a graduate of the Command and General Staff School in 1923 and of the War College in 1925. Promoted to colonel in January 1939 and to brigadier general in April 1941, Parker was assigned to the Philippine Islands as commander of the post of Manila. He arrived on Luzon on May 8, 1941.

Parker began organizing and training his Filipino infantry corps with just five U.S. officers and two enlisted men, and his Filipino soldiers were newly drafted and unfamiliar with all things military. On November 5, 1941, Parker assumed command of the South Luzon Force of two divisions, about 25 percent of the Luzon strength of U.S. Philippines commander General Douglas MacArthur. Parker was responsible for the defense of Luzon south of Manila. MacArthur incorrectly estimated that he had sufficient strength to defeat a Japanese invasion on the beaches, and he had scrapped the original plan of a concentrated defense in the Bataan Peninsula in favor of a defense of the entire island.

After hostilities began, and aware that the Japanese would soon invade, on December 8 Parker deployed his men for beach defense. He was promoted to major general on December 18. Parker commanded the South Luzon Force

during the Japanese landing at Lamon Bay on December 24 and then delayed the Japanese advance as he withdrew his men through Manila to Bataan. Renamed the II Philippine Corps on January 7, 1942, Parker's 25,000-man force of four divisions and one regiment defended the right of the Bataan Line east of Major General Jonathan Wainwright's I Corps. Parker commanded at Layac, Abucay, and his half of the Orion-Bagac Line.

Parker was then in poor health, lacking the vigor needed to motivate soldiers in a desperate situation, and he was relatively timid and averse to risks in war. Considering the poor training of his men, lack of weapons and supplies, rampant sickness, and starvation rations, Parker could do little more than react to Japanese initiatives.

From April 3 to April 9, 1942, the Japanese effectively destroyed the weakened Bataan force. Parker ordered several counterattacks to restore the broken corps line, none of which succeeded. He then fought a delaying action toward the southern tip of the peninsula, employing his few available regulars. Parker surrendered II Corps as ordered on April 9.

The Japanese sent Parker by vehicle to a prisoner-of-war camp, and he thus missed the April 1942 Bataan Death March. Surviving nearly four years of Japanese prison camps, he was repatriated on August 18, 1945. Parker retired from the army in September 1946 and died in Portland, Oregon, on October 24, 1968.

Partisans/Guerrillas

Indigenous combatants operating in enemy-held territory and conducting military and paramilitary operations. During World War II, numerous Allied partisan or guerrilla units operated in Axis-controlled areas, carrying out intelligence-gathering, sabotage, pilot-rescue, and harassment operations. Partisans worked together in organized units.

Motivations for joining partisan movements varied widely. Many became members as an act of survival; others joined from ideological motivations or to protect their families. Some groups were made up of escaped prisoners of war and political prisoners. Regardless of the reason, partisans assumed an incredible burden as well as the risk of being shot out of hand if they were apprehended.

Early on, partisans spent much of their efforts merely establishing their organizations and working to sustain them by securing food, supplies, weapons, and ammunition. Late in 1942 as Axis battlefield fortunes turned, the partisans began conducting raids against railways and supply depots. Some even participated in assassinations of Axis officials.

Life for the partisans was difficult. For their own security, they tended to live in, and operate from, inhospitable terrain such as mountains, swamps, and deep forests. Partisans had to endure primitive living conditions, malnutrition, lack of medical assistance, and enemy patrols. They took inspiration from successful operations of this type in the past, such as the guerrillas in Spain who fought against the French Army during the Napoleonic Wars.

The British Special Operations Executive and the U.S. Office of Strategic Services (OSS) established contact with many partisan units, helping to coordinate their activities and to supply them with weapons and matériel. In return, the partisans provided intelligence, assisted Allied operatives and downed airmen, and conducted limited sabotage and assassination operations. In some cases, partisans found themselves pawns in the geopolitical contest by the various Allied powers during the war, as was the case in Yugoslavia and Greece.

Partisan units varied in strength and tactics from country to country. Space does not allow discussion of even a majority of such movements, but some of the most famous of partisans were the Polish Home Army, the French Maquis, the Greek ELAS (National People’s Liberation Army), the Yugoslavia Partisans, and fighters in the Soviet Union. Numerous other

partisan groups also operated in Europe and in the Pacific. As a rule, the more crucial the role that partisan groups played in liberating their country from occupation, the more likely they were to have a major part in establishing and running its postwar government.

Poland

Although Poland was defeated by Germany in September 1939, many Poles continued the fight. Resistance groups coalesced into the Polish Home Army, which sought to combat the occupation of the country by both German and Soviet troops. With nearly a fifth of the country in forests, the Poles had a natural base for unconventional warfare. The Polish Home Army did provide useful intelligence to the Western powers and, once the tide of war had turned, began to attack German supply trains and tie down German forces that might otherwise have been at the front.

Their most spectacular action by far, however, was the Warsaw Rising of August 1–October 2, 1944. When Soviet forces arrived at the city limits of the Polish capital, the Home Army came out in the open and battled the Germans for control. The Soviets refused for more than two months to move to assist the Poles. The Home Army fought on virtually alone until it was defeated. Warsaw was largely destroyed in the fighting. Some accurately viewed the Soviet refusal to act as a deliberate decision to effect the destruction of the natural Polish leadership and thus help ensure Soviet control of Poland in the postwar period.

France

Probably the best-known partisan efforts in the West were those in France, particularly the guerrilla units known as the Maquis. The French Resistance as a whole included everything from underground opposition newspapers to organized combat units; the Maquis carried out sabotage and harassment operations. Originally operating in southern France, the Maquis spread throughout the country. The Maquis provided immense assistance to the Western Allies in the June 6, 1944, Normandy Invasion when it conducted wide-scale sabotage operations against German lines of communication and

helped isolate the battlefield from German reinforcement. The Maquis also harassed small German units.

Yugoslavia

Following their conquest by the German Army, the Yugoslavs formed resistance movements. The two chief groups were bitter rivals: the Četniks (named after the Serbian guerrillas who had fought the Turks), who were loyal to the monarchy and were led by General Dragoljub “Draza” Mihailović, and the Partisan movement, led by veteran communist Josip Broz (Tito). These two organizations, often at odds with each other, fought the occupying Axis powers and the fascist Ustaše movement in Croatia.

Partisan activities here were among the most effective in Axis-occupied Europe and tied down a great many Axis troops, but they also exacted a high cost in the form of reprisals and casualties to the civilian population. During the course of the fighting, the British government, which was supplying aid to the Yugoslav Resistance, decided to back the Partisans exclusively because, unlike the Četniks, they did not hesitate to engage the Germans. At the end of the war, the Partisans were the dominant force in Yugoslavia and, in consequence, liberated much of the country themselves.

Yugoslav partisans, shown here in 1942. (Library of Congress)

Greece

In Greece, resistance to the Axis occupiers began almost immediately. The largest group was the leftist National Liberation Front (Ethniko Apeleftherotiko Metopo, EAM), with the Greek People's Liberation Army (Ellinikós Laïkós Apeleftherotikós Stratós, ELAM) as its military wing. It had poor relations with the more conservative National Republican Greek League (Ethnikos Dimokratikos Ellinikos Syndesmos, EDES), and the two groups fought each other during the winter of 1943–1944, although a truce was arranged in February 1944. When the Germans pulled out of Greece, the EAM held the vast majority of the country.

Italy

Following the September 8, 1943, armistice, Italian resistance began against the Germans and Benito Mussolini's subsequent Italian Social Republic (Repubblica Sociale Italiana, RSI) based in the northern part of the country. Early groups sprang up around former military units and were centered in the Alpine Valleys and the Piedmont. The partisan groups varied ideologically, but those in the cities tended to be largely socialist or communist. In turn, the RSI fielded groups to fight the partisans. Captain Junio Valerio Borghese headed an independent unit allied to the Germans. It numbered 10,000 men and fought against partisans in both Italy and the Yugoslav border area. The Italian Resistance claimed that in fighting from September 1943 to May 1945, it sustained 36,000 killed out of 250,000 participants. Some 10,000 civilians also died in reprisals.

Soviet Union

The rapid German advance through the Ukraine and White Russia led many Red Army stragglers and those opposed to the Nazis to find refuge in the forests. Only 11 days into the war, Soviet leader Joseph Stalin called for a partisan uprising to harass the Germans. Nazi occupation policies played a key role, driving many who had initially greeted the Germans as liberators over into the partisan camp.

Partisans operated extensively in the region of the Pripet Marshes south of Minsk. They formed around smaller cells known as Orgtroikas, consisting of officers and operatives from state, party, and Narodnyy Kommissariat Vnutrennikh Del (People's Commissariat for Internal Affairs, NKVD) sources. By the summer of 1943, about 17,000 partisans were conducting sabotage and harassment operations in the Pripet Marshes; at the time of Operation BAGRATION in 1944, these numbers reached 140,000 people. Despite the efforts of special German antipartisan units, Soviet partisans carried out some 40,000 railway demolitions alone, greatly aiding the Red Army offensive.

In the Ukraine, nationalist movements such as the Ukrainska Povstanska Armiya (Ukrainian Insurgent Army, UPA) formed, bent on driving out both the Germans and the Soviets. General Roman Shukhevich, leader of the UPA, controlled a wide swath of territory. Although conflicts between pro-Soviet partisans and nationalist partisans reduced the effectiveness of the movement, such activities forced the Germans to divert significant military resources to maintaining lines of communication. German general Heinz Guderian later wrote that this was one of the prime factors in the defeat of the German Army in the east.

Jews able to escape the German grasp also sought to organize. The Bielski Partisans were the most famous of the Jewish Resistance groups. The movement began as an act of simple self-preservation and the rescue of other Jews fleeing the Nazis, and eventually it grew to more than 1,000 people, including children and the elderly. Jewish partisans lived in constant danger because of rampant anti-Semitism among others apart from the Nazis.

The Germans did their best to crush the partisan movements. Their tactics included reprisals against villages aiding partisans and the taking and execution of hostages, often at the rate of 20 or more executed for every German killed. Regardless of the tactics used, and probably because of the Germans' ruthlessness, partisan numbers continued to grow.

In the Pacific, partisan movements were found in many locations, most notably in the Philippines. Following the Japanese victory at Corregidor in May 1942, some 260,000 Filipinos and Americans organized to oppose the Japanese occupiers. Most notable among these groups was the Hukbong Bayan Laban sa mga Hapon (The Nation's Army Against the Japanese), Hukbalahap or Huks for short. Communist Luis Taruc organized a Huk army

of 30,000 men that ultimately controlled much of Luzon. U.S. forces not captured by the Japanese attached themselves to Filipino partisan groups.

Groups in China, Southeast Asia, the Philippines, and some Pacific islands initiated intelligence-gathering and sabotage operations against the Japanese. One of the better known of the partisan groups was the Viet Minh, led by Vietnamese nationalist Ho Chi Minh. It helped rescue downed Allied pilots and conducted guerrilla operations against both the Japanese and the French.

PASTORIUS, Operation (June 1942)

Planned German sabotage operation against industrial targets in the United States. Shortly after midnight on June 13, 1942, the German submarine *U-202* put ashore on a beach near Amagansett, Long Island, New York, a team of four saboteurs headed by George Dasch. The submarine also landed a considerable quantity of explosives, primers, timing devices, and incendiaries to support an anticipated two years of operations against American defense-related economic targets.

The four men were wearing German uniforms so if captured on landing they would be treated as prisoners of war. After coming ashore, the men buried their equipment. They had not yet completely changed into civilian

clothes, however, when they were spotted by a coastguardsman. They attempted to bribe him, but he subsequently reported their presence to his superiors. By the time armed coastguardsmen had arrived on the scene, however, the would-be saboteurs had taken a tram into New York City.

On June 17 another German submarine, the *U-584*, landed a second group of saboteurs, headed by Edward J. Kerling, at Ponte Vedra Beach, near Jacksonville, Florida. They were undetected. The two groups had been provided a total of $175,000 in U.S. currency to finance their operations. Rear Admiral William Canaris, head of Abwehr, the German military intelligence service, named the sabotage mission for Francis D. Pastorius, leader of the first German settlement in America.

All eight of the would-be saboteurs had lived in the United States, and two were U.S. citizens. Targets for their operation included hydroelectric plants at Niagara Falls, New York; aluminum plants; locks on the Ohio River; key rail centers and bridges; and a cryolite plant in Philadelphia.

Two of the members of the New York group, U.S. citizen Ernst Burger and George J. Dasch, decided to defect, however. Dasch traveled to Washington, D.C., and there turned himself in to agents of the Federal Bureau of Investigation, who initially refused to believe him until he showed them a large amount of cash. By June 27, all eight saboteurs had been arrested without having accomplished a single act of destruction.

Tried before a military commission of seven officers, the saboteurs were all found guilty and sentenced to death. President Franklin Roosevelt commuted Dasch's sentence to 30 years and that of Burger to life in prison. The remaining six were executed on August 8, 1942, by means of an electric chair in the District of Columbia jail. In 1948 President Harry S. Truman granted clemency to Dasch and Burger on condition that they be deported to the American occupation zone of Germany.

PASTORIUS is the only known organized sabotage attempt against the United States by German authorities during the war.

Patch, Alexander McCarrell, Jr. (1889–1945)

U.S. Army general. Born at Fort Huachuca, Arizona, on November 23, 1889, Alexander Patch Jr. was the son of an army officer. Graduating from the U.S. Military Academy at West Point in 1913, Patch was commissioned in the infantry. He served in the Punitive Expedition into northern Mexico in 1916 and 1917 with the 18th Infantry Regiment and deployed with his unit to France during World War I. There he commanded a machine-gun battalion, then served as director of the Machine Gun School. He ended the war as a temporary lieutenant colonel.

Following occupation duty in Germany, Patch returned to the United States in 1919 and reverted to his permanent rank of captain. Patch graduated from the Command and General Staff College, Fort Leavenworth, Kansas, in 1925. He next served as an instructor at the Staunton (Virginia) Military Academy (1925–1928 and 1932–1936). Patch then commanded a battalion of the 12th Infantry Regiment at Fort Washington, Maryland, from 1928 to 1931. He graduated from the Army War College in 1932.

U.S. Army major general Alexander Patch, 1942. (Fox Photos/Hulton Archive/Getty Images)

Appointed to the Infantry Board at Fort Benning, Georgia, in 1936, Patch helped develop and test the three-regiment “triangular” division. Between March 1939 and August 1941, Patch held several assignments, including command of the 47th Infantry Regiment. He was promoted to colonel in August 1939. Promoted to temporary brigadier general in August 1941, Patch took command of the Infantry Replacement Training Center, Camp Croft, South Carolina.

In March 1942, Patch, promoted to major general, commanded Task Force 6814, which was sent to New Caledonia. The task force was soon organized into the Americal (American, New Caledonian) Division, and it relieved the marines on Guadalcanal in December 1942. From January to April 1943, Patch commanded XIV Corps, including troops on Guadalcanal and the neighboring islands.

Returning to the United States, Patch took command of IV Corps at Fort Lewis, Washington. In March 1944, he was sent to Sicily to command the Seventh Army as a lieutenant general. On August 15, 1944, the Seventh Army invaded southern France in Operation DRAGOON. Part of the 6th Army Group, the Seventh was the first army to cross the Rhine, fighting in the Colmar Pocket and meeting up with General Mark Clark's Fifth Army at the Brenner Pass on May 4, 1945.

In July 1945, Patch took command of the Fourth Army, Fort Sam Houston, Texas, and in October he headed a group assembled to make recommendations about the army's postwar organization and strength. Patch contracted pneumonia and died at Fort Sam Houston in San Antonio, Texas, on November 21, 1945. He was posthumously promoted to general in 1954. Patch Barracks, the headquarters of today's U.S. European Command in Stuttgart, Germany, is named in his honor.

Pathfinders

Specialized U.S. Army paratroopers who facilitated airborne operations. Developed in the European theater of operations during World War II, Pathfinders jumped ahead of the main assault and directed following planes to their specific drop zones. Their efforts increased accuracy of placement of airborne forces and hence the effectiveness of such operations.

The Allied invasion of Sicily (July 9–August 22, 1943) was the impetus for the establishment of Pathfinders. Following the widely scattered airborne drops there, commanders sought a way to organize and deliver airborne

troops more accurately. The job fell to Colonel Joel Crouch of the Army Air Forces and Captain John Norton of the 82nd Airborne Division. Based at Biscari Airfield in Sicily, these men developed Pathfinder tactics.

In the first drops in the invasion of Italy, Pathfinders used colored lights, smoke pots, and vision panels to designate drop zones. These teams also used radio communication and a simple radar homing system consisting of two components, "Eureka" and "Rebecca," to aid in aircraft navigation. Once a ground team was positioned, it set up radios and activated the radar transmitter, the Eureka set. The Rebecca receiving device in the planes homed in on the signal produced by the ground team and used it to pinpoint the location for the drop. Pathfinder units were composed of a large squad of 9–14 men for signaling with two Eureka sets and nine Halifane (illuminating) lights and a 5-man security team. Squad members were volunteers from airborne units such as the 82nd and 101st airborne divisions.

Pathfinders jumped in Operations OVERLORD (June 6, 1944) and MARKET-GARDEN (September 17–26, 1944), among others. After World War II, Pathfinder techniques continued to undergo refinement. Pathfinders today are also used to determine and mark helicopter landing zones for air assault operations.

The term "pathfinder" was also applied in strategic bombing. After the Luftwaffe employed a specially trained force to mark and illuminate targets during the Battle of Britain, the Royal Air Force formed a similar group for the strategic bombing of Germany. Special squadrons of highly trained crews flying Wellington and Stirling bombers (later mostly Mosquito bombers) flew in advance of the main bomber stream to mark targets for the less experienced bomber crews following them. Pathfinders also marked the route to the target, and a senior pathfinder known as the master bomber or master of ceremonies would fly above the target and provide advice to the main bomber force by radio.

Patrol-Torpedo Boats

Known popularly as PT boats, World War II–era patrol-torpedo boats were the American equivalent of German E boats and British motor torpedo boats. They were small, fast, wooden-hulled, shallow-draft vessels that depended on surprise, speed, and maneuverability and thus did their best work in coastal waters.

During World War I, the Italian Navy built some 299 torpedo-armed motorboats and employed many of them against the Austro-Hungarian Navy in the Adriatic. From 1916, the Royal Navy used coastal motor boats in home waters and in the raids against Ostend and Zeebrugge, Belgium, in April 1918. Although the United States did not use such craft in World War I, the Electric Boat Company's Elco Division in Bayonne, New Jersey, constructed several hundred such vessels for Britain and Italy and gained expertise in designing and manufacturing this type.

In the late 1930s, the U.S. Navy was pushed toward the development of gasoline-powered motor boats by President Franklin D. Roosevelt and Assistant Secretary of the Navy Charles Edison, both of whom were concerned about European interest in these craft. They secured a 1938 appropriation of $5 million for the construction of ships of fewer than 3,000 tons displacement. In June, the navy staged an American design competition, selecting seven winners for further testing, but Edison decided instead to put into limited production at Elco a 70-foot craft, with a crew of 10, from the British designer Hubert Scott-Paine. Elco's boat substituted Packard engines for those of Rolls-Royce.

By 1941, Elco had progressed to a 77-foot version that demonstrated an average speed of 27.5 knots in rough waters and mounted two 21-inch torpedo tubes and two 50-caliber machine guns in twin turrets. The boats also had the ability to lay smoke screens. Andrew Jackson Higgins, a Louisiana

shipbuilder, developed a similar 78-foot vessel. At 80 feet or less, the boats could be carried on long voyages by larger ships.

During World War II, the United States deployed in the Pacific 350 PT boats, mostly of the Elco and Higgins types, along with 42 in the Mediterranean and 33 in the English Channel. Together, they launched in combat a total of only 697 torpedoes, usually with minimal success. All too often, American torpedoes were defective, and firing them accurately from fast-moving vessels was problematic in any case. Nor were PT boats fortunate at antisubmarine warfare, being much too noisy to make effective use of sonar equipment.

The most memorable action in European waters by this type of craft came from the Germans when they sent their E boats in an attack on an American landing exercise (Exercise TIGER) at Slapton Sands, England, on April 18, 1944. The Germans sank two LSTs (landing ships, tank), damaged a third, and killed more than 700 Americans.

In the South and Southwest Pacific theaters, the most profitable service of American PT boats was in coastal work. Their speed made them difficult targets for shore batteries. With a 40mm gun and, perhaps, 4.5-inch barrage rockets or mortars replacing their torpedoes, they could attack Japanese landing barges (*daihatsus*), which, as the war progressed, were typically used to deliver reinforcements to forward positions. In one five-month period off New Guinea, PT boats claimed some 115 barges sunk with minimal losses of their own.

A U.S. Navy PT boat patrolling the waters along the coast of New Guinea in 1943. (National Archives)

Two PT boat events, because of the personalities involved, overshadowed all others in the war. The first, in the Philippines in the early weeks of the conflict, involved Motor Torpedo Boat Squadron 3 under Lieutenant John D. Bulkeley. He and his men displayed great gallantry in various actions but achieved limited success against Japanese invading forces. Then, in March 1942, theater commander General Douglas MacArthur, under orders to leave the Philippines for Australia, selected Bulkeley and his four available boats to convey his party of 22 persons—including his wife, young son, housekeeper, and key staff members—more than 500 miles from Corregidor Island in Manila Bay through the Japanese blockade southward to Mindanao, from where MacArthur could complete the trip by air. At great risk, the journey was completed between March 11 and 13. MacArthur could have traveled much more easily and safely in a submarine but seemed to have been unwilling to be confined beneath the waves at such close quarters. As it was, his escape from Corregidor—and the PT boats' role in it—proved to be the stuff of legend and were recounted in W. L. White's 1942 book *They Were Expendable* and John Ford's 1945 film of the same name.

The second incident involved a confused night action. In Blackett Strait off Kolombongara in the Solomon Islands on August 1, 1943, Lieutenant John F. Kennedy's *PT-109* was struck and sunk by the Japanese destroyer *Amagiri*. Kennedy and other survivors then swam to a nearby Japanese-held

island, from which they were rescued after several days. Although written up in the *New Yorker* magazine by John Hersey during the war, the incident became widely known only after Kennedy launched his successful run for the presidency in 1960. By 1963, Kennedy's experiences had inspired several books, the film *PT 109*, and (at least indirectly) the television comedy series "McHale's Navy."

Overall, the PT boat proved to be a serviceable but not decisive weapon. The successors of such craft were later employed in riverine operations during the Vietnam War.

Patterson, Robert Porter (1891–1952)

U.S. undersecretary of war. Born in Glen Falls, New York, on February 12, 1891, Robert Porter Patterson attended Union College in Schenectady, New York and Harvard Law School. He then practiced law. Military service in Mexico in 1916 and in France in 1918, where he earned the Distinguished Service Cross, interrupted his legal career. In 1930, Patterson became a judge of the U.S. District Court, Southern New York District.

In the summer of 1940, President Franklin D. Roosevelt appointed Patterson assistant secretary of war under Henry L. Stimson. Patterson's mandate was to facilitate industrial procurement, manpower, and training as the U.S. military, much neglected during the 1930s, readied itself for possible entry into World War II. Patterson worked indefatigably, showing a mastery

of logistics, and in December 1940 earned promotion to undersecretary. Throughout the conflict, he made winning the war as expeditiously as possible his overriding goal, demanding that American industrialists and workers alike devote all their energies to this end. Patterson made a particularly effective team with his Navy Department counterpart, Undersecretary James V. Forrestal. Both men thought it essential that the United States should remain militarily strong and well prepared after the war.

After the war, President Harry S. Truman appointed Patterson to replace Stimson. Patterson, convinced that the developing Cold War demanded substantial increases in American military commitments and budgets, strongly supported aid to Greece, Turkey, and other countries facing communist threats. He also forcefully advocated unification of the three armed services under a single secretary of defense, returning to private life when this was implemented in late 1947. Patterson died in a plane crash in Elizabeth, New Jersey, on January 22, 1952.

Pattle, Marmaduke Thomas St. John "Pat" (1914–1941)

Leading Royal Air Force flight lieutenant and fighter ace. Born in Butterworth, Cape Province, South Africa, on July 3, 1914, Marmaduke Thomas St. John Pattle entered the South African air force as a cadet. Disappointed that he was not accepted for aircrew training, in 1936 he joined the Royal Air Force, demonstrating excellent flying aptitude. Once trained, Pattle was assigned to Number 80 Squadron.

In 1938, Pattle's squadron, in which he had risen to flight commander, was posted to Egypt. Against numerically superior and more modern Italian aircraft, British squadrons Numbers 80 and 33, in which Pattle served temporarily in 1940, provided air cover to British forces. The squadrons inflicted disproportionately heavy losses on the Italians, many of them because of Pattle's personal kills. Shot down over the Libyan desert in August 1940, Pattle managed to make his way safely back to British lines.

In November 1940, Italy invaded Greece, and Number 80 Squadron, under Pattle's command, moved to support the Greek Army. His command received some new Hurricane fighters in February 1941, but from April, 200 British aircraft faced 1,200 German planes. On April 20, 1941, Pattle's 15 remaining Hurricanes faced more than 100 German aircraft bound for Athens. Pattle shot down at least 2 German planes but fell victim to a Messerschmitt Bf-110 and died when his Hurricane crashed in Eleusis Bay.

Pattle personally shot down between 34 and 41 planes in combat, on several occasions 3 in one day, winning the Distinguished Flying Cross and Bar.

Patton, George Smith, Jr. (1885–1945)

U.S. Army general. Born on November 11, 1885, in San Gabriel, California, George Patton Jr. attended the Virginia Military Institute for a year before graduating from the U.S. Military Academy at West Point in 1909. An accomplished horseman, he competed in the 1912 Stockholm Olympic Games. He participated in the 1916–1917 Punitive Expedition into Mexico.

On U.S. entry into World War I, Patton deployed to France as an aide to American Expeditionary Forces commander General John J. Pershing, but he

transferred to the Tank Corps and, as a temporary major, commanded the first U.S. Army tank school at Langres, France. Patton then commanded the 304th Tank Brigade as a temporary lieutenant colonel. Wounded in the Saint-Mihiel Offensive, he was promoted to temporary colonel and took part in the Meuse-Argonne Offensive.

After the war, Patton remained an ardent champion of tank warfare. He graduated from the Cavalry School in 1923, the Command and General Staff School in 1924, and the Army War College in 1932. Returning to armor, Patton was promoted to temporary brigadier general in October 1940 and to temporary major general in April 1941, when he took command of the newly formed 2nd Armored Division. Popularly known as "Old Blood and Guts" for his colorful speeches to inspire the men, Patton commanded I Corps and the Desert Training Center, where he prepared U.S. forces for the invasion of North Africa.

In November 1942, Patton commanded the Western Task Force in the landing at Casablanca, Morocco, part of Operation TORCH. Following the U.S. defeat in the Battle of the Kasserine Pass (February 14–22, 1943), in March he was promoted to lieutenant general and assumed command of II Corps. He quickly restored order and morale and took the offensive against the Axis forces.

In April, Patton assumed command of the Seventh Army for the invasion of Sicily in July 1943. He employed a series of costly flanking maneuvers along the northern coast of the island to reach Messina ahead of the British Eighth Army on the eastern side. Patton, however, ran afoul of the press and his superiors when he struck two soldiers who suffered from battle fatigue in August. Relieved of his command, he was then used as a Trojan horse to disguise the location of the attack of Operation OVERLORD, the cross-Channel invasion of France (June 6, 1944). The Germans assumed that Patton would command any such invasion, but he actually remained in Britain in command of the Third Army while appearing to be in command of the fictional 1st U.S. Army Group, a successful ruse to trick the Germans into believing that the invasion would occur in the Pas de Calais area.

General George S. Patton Jr. at his headquarters at the last press conference held by him for war correspondents on completion of the fighting in Europe in 1945. (Time Life Pictures/Mansell/The LIFE Picture Collection/Getty Images)

Following the Normandy Invasion, Patton was at last unleashed in August when his Third Army arrived in France and spearheaded a breakout at Saint-Lô (July 11–19) and campaigned brilliantly across northern France. Moving swiftly, his forces swung west to clear the Brittany Peninsula and then headed east, although he was frustrated by the failure of General Omar Bradley and supreme commander General Dwight D. Eisenhower to recognize the importance of sealing the Falaise-Argentan gap. Patton's forces crossed the Meuse River in late August to confront German defenses at Metz, where the Germans held the Americans until December. During the German Ardennes Offensive (Battle of the Bulge, December 16, 1944–January 25, 1945), Patton executed a brilliant repositioning movement and came to the relief of the hard-pressed American forces at Bastogne.

By the end of January, Patton began another offensive, piercing the Siegfried Line between Saarlautern (Saar Louis) and Saarbrücken. On March 22, the Third Army crossed the Rhine at Oppenheim. Patton continued his drive into Germany and eventually crossed into Czechoslovakia. By the end of the war, his men had covered more ground (600 miles) and liberated more territory (nearly 82,000 square miles) than any other Allied force.

Promoted to temporary general, Patton became military governor of Bavaria. He soon found himself again in trouble for remarks in which he criticized denazification and argued that the Soviet Union was the real enemy. Relieved of his post, he assumed command of the Fifteenth Army, a force that existed largely on paper. Patton suffered a broken neck in an automobile accident near Mannheim and died at Heidelberg on December 21, 1945.

PAUKENSCHLAG, Operation (January 13–July 19, 1942)

German U-boat offensive conducted off the East Coast of the United States, in the Caribbean, in the Gulf of Mexico, and off Brazil. Commander of German U-boats Vice Admiral Karl Dönitz welcomed the entry of the United States into the war in December 1941 as an opportunity to widen the U-boat

offensive in the Atlantic. In planning Operation PAUKENSCHLAG (DRUMBEAT), Dönitz intended to operate larger Type IX U-boats with greater range against the United States and into the Caribbean. He would employ shorter-range Type VII U-boats off Newfoundland and Nova Scotia, which were much closer to his U-boat bases.

Dönitz requested 12 Type IX boats from the Naval War Command for the operation but was informed on December 10 that he would have only 6. Although submarine construction had accelerated, there were still too few U-boats available. Bad weather in the Baltic had also disrupted U-boat training, and the Naval War Command insisted on maintaining a large number of U-boats in the Mediterranean to assist Axis operations in North Africa. In the end, Type IX vessel *U-128* was not ready at the start of the operation, so Dönitz had less than half the force he had requested.

Operation DRUMBEAT began with only five Type IX U-boats from the Gulf of Saint Lawrence to Cape Hatteras, North Carolina. Seven Type VII U-boats went to Newfoundland and Nova Scotia. All were in place by mid-January 1942, and DRUMBEAT never involved more than a dozen German submarines at any one time. To keep the Americans off balance, a month after DRUMBEAT was launched Dönitz switched its focus to the Caribbean, where several Italian submarines joined operations.

The first victim of DRUMBEAT, the British freighter *Cyclops,* fell victim to *U-123*, a Type IX boat, on January 12, 1942. Other sinkings quickly followed. The United States was totally unprepared for the U-boat attacks. Coastal cities were ablaze with lights at night, silhouetting the merchant ships plying the coast and making them easy targets. There were few escort vessels available, and merchant ships sailed independently in the hundreds because Chief of Naval Operations Ernest King refused to institute a convoy system, believing that an inadequately protected convoy system was worse than none. All of this meant that through April 1942, German submarines sank 216 vessels aggregating 1.2 million tons in the North Atlantic, the vast majority of these in waters for which the U.S. Navy was responsible.

This “American turkey shoot” for German submarines finally came to an end through a mandatory blackout of coastal U.S. cities, the instigation of convoys and antisubmarine training schools, the relocation of air assets to antisubmarine duties, and the addition of antisubmarine warships. Not only

did merchant shipping losses drop off, but increasing numbers of U-boats were sunk.

On July 19, 1942, Dönitz withdrew his last two U-boats from the East Coast of the United States, relocating his submarine assets back to the mid-Atlantic and signaling an end to the campaign. U.S. unpreparedness had a high price. Operation DRUMBEAT was arguably Germany's most successful submarine operation of the entire war, resulting in the sinking of some 3 million tons of shipping. Undoubtedly, Dönitz would have enjoyed even greater success had he been able to employ more U-boats at the beginning of the campaign.

Paul, Prince Regent of Yugoslavia (1893–1976)

Prince regent of Yugoslavia. Born on April 27, 1893, in Saint Petersburg, Russia, to Arsen Karadjordjević and Aurora Pavlovna Demidova, Paul was by nature withdrawn. He attended boarding school in Lausanne and was also educated by tutors in the royal palace in Belgrade and at Oxford. In 1923, he married Princess Olga of Greece.

On October 9, 1934, King Alexander of Yugoslavia was assassinated by Croatian terrorists. Alexander's son Peter was only a child, so as Peter's great-uncle, Paul became the principal regent. The problems then facing the country were virtually unsolvable. The deeply entrenched nationalist, political, and ethnic rivalries of Yugoslavia meant that it entered the war sharply divided.

Although Paul declared Yugoslavia neutral at the beginning of World War II, this did not spare the country from involvement in the conflict. Paul's anglophilia and over-whelmingly pro-Allied sentiment among the Serb population reinforced the belief that sooner or later Yugoslavia would enter the war on the Allied side. Adolf Hitler, mean-while, insisted that Yugoslavia declare for the Axis. Paul sought to delay that decision.

Finally, in early March, under a verbal onslaught from Hitler at Berchtesgaden, he concluded that not joining the Axis would bring about the end of his country. On March 25, 1941, Yugoslavian ministers traveled to Vienna to sign the Tripartite Pact. Anti-German Serbs, however, held Paul to be a traitor.

Anti-German demonstrations occurred in Serbia and Slovenia. Early on March 27, 1941, Yugoslavian senior army officers, who were Serbs, responded with a coup d'état, deposing Paul. The underage Peter was declared of age as King Peter II.

This infuriated Hitler, who took the coup as a personal insult. Beginning on April 6, 1941, German, Italian, Romanian, and Hungarian forces invaded Yugoslavia and occupied the country. Paul, who had been en route to Zagreb at the time of the coup, escaped to London. In 1943, he moved to South Africa. Paul's efforts to clear his name and reputation occupied much of his time until his death in Paris on September 14, 1976.

Paulus, Friedrich (1890–1957)

German Army field marshal. Born on September 23, 1890, in Breitenau, Friedrich Paulus joined the German Army in 1910 and was commissioned a second lieutenant the following year. He served on both fronts during World

War I. Paulus ended the war as a captain, winning the Iron Cross, First and Second Class. He continued in the Reichswehr after the war, was promoted to lieutenant colonel in 1934, and succeeded Colonel Heinz Guderian as chief of staff of Germany's mechanized forces in 1935. Contemporaries viewed Paulus as stiff, methodical, and occasionally indecisive.

Paulus was promoted to major general in 1939 and was appointed chief of staff of General Walther von Reichenau's Tenth Army. Paulus participated in the conquest of Poland and the 1940 offensive into Belgium and France. When the invasion of Britain, Operation SEA LION (SEELÖWE) was canceled, Paulus became deputy chief of staff for the Supreme Army Command and helped plan Operation BARBAROSSA, the June 22, 1941, invasion of the Soviet Union.

In January 1942 at Field Marshal Reichenau's request, Paulus was promoted to general of panzer troops and assigned command of the Sixth Army (formerly the Tenth Army), which was part of Army Group South. After an initial success at Dniepropetrovsk, he was forced to retreat to better defensive positions before counterattacking. The Sixth Army then advanced slowly on Stalingrad during the summer, reaching the Volga River north of Stalingrad on August 23, 1942. From August 23, a great battle raged over the city. Fighting was fierce, but Adolf Hitler ordered Paulus to take the city at any cost. In the end, the Sixth Army was trapped there.

Paulus has been much blamed for refusing to disobey Hitler and taking the decision on his own to withdraw before it was too late, but his and Hitler's greatest failure lay in not anticipating the Soviet encirclement, Operation URANUS, begun on November 19. Although relief efforts failed, Hitler refused Paulus permission to try to break out, ordering him instead to hold all ground taken. On January 24, 1943, Hitler denied Paulus's request for permission to surrender and promoted him to field marshal. Paulus surrendered nonetheless on January 31, claiming that he was "taken by surprise" but refusing his men the same option. Paulus was the first German field marshal to be captured in battle.

In the aftermath of the failed July 1944 bomb plot intended to kill Hitler, Paulus made anti-Nazi broadcasts for the Soviets. Hitler ordered Paulus's entire family jailed. Paulus appeared as a witness for the prosecution at the

Nuremberg Trials, but he remained in a Soviet prison until 1953. On his release, he became an inspector in the East German Volkspolizei in Dresden. He died in that city on February 1, 1957.

Pavelić, Ante (1889–1959)

Ruler of the puppet Croatian state (1941–1945). Born in Bradina, Bosnia-Herzegovina, on July 14, 1889, Ante Pavelić studied law at the University of Zagreb. Elected to the Yugoslav parliament in 1920, he represented the small nationalist party, the Croatian Party of the Right. Pavelić believed that violence and terrorism were legitimate means to achieve political ends. Following Yugoslav King Alexander's suspension of the constitution and a government crackdown on nationalist activities in 1929, Pavelić fled to Italy, where the following year he formed the Croatian Liberation Movement, known as the Ustaše.

With covert Italian support, Pavelić launched a terror campaign against the Yugoslavian state. In October 1934 Ustaše gunmen assassinated King Alexander and the French foreign minister at Marseille, for which a Yugoslav court sentenced Pavelić to death in absentia.

Upon the German invasion and defeat of Yugoslavia in April 1941, Pavelić and his supporters established the Independent State of Croatia with the backing of Italy, which in return annexed portions of the Dalmatian coast

and occupied the country. Following the Italian surrender in 1943, Pavelić's Ustaše regime transferred its allegiance to Germany and remained a German client until 1945.

Pavelić, who proclaimed himself *poglavnik* (leader), subjected Croatia to four years of terror. Bands of Ustaše militia roamed the countryside, expelling or executing hundreds of thousands of Serbs, Muslims, Jews, and other minorities in an attempt to create a purely Croatian state. Roman Catholic priests in the Ustaše forced the conversion of thousands of non-Catholics. Aping the Nazis, the Ustaše also established concentration camps in which tens of thousands of victims were exterminated. Ultimately, the lawlessness and violence of Pavelić's regime alienated it from the majority of Croatians and swelled the ranks of the Partisans. His rule even alienated the Nazis, who complained—ironically—that his measures hampered the war effort.

Pavelić escaped abroad to Argentina from Croatia in May 1945. He died in exile in Madrid, Spain, on December 28, 1959.

Pavlov, Dimitri Grigorevich (1897–1941)

Soviet Army general. Born in the village of Vonyukh, Kostroma region, on November 4, 1897, Dimitri Pavlov fought in World War I and was taken prisoner by the Germans. He joined the Red Army and the Bolshevik Party after the war. Commissioned in the cavalry, Pavlov graduated from the Frunze Military Academy in 1928 and from the Military-Technical Academy in 1931. He then commanded the 4th Mechanized Brigade.

Pavlov next headed the Armored Directorate in 1937 and was chief of the Soviet tank advisers sent to assist the Republican side in the Spanish Civil War (1936–1939). Pavlov erroneously concluded as a result of that experience that there was no future for large armor formations. Although this decision was shared, such thinking helped bring the disbandment of the Soviet mechanized corps and at least until Joseph Stalin's death, Pavlov was blamed for it. In 1939, Pavlov became head of the Armed Tank Directorate.

As a colonel general, Pavlov was appointed to the Main Military Council in July 1940. Promoted to general of the army in February 1941, he received command of the Western Front on June 6 just prior to the German invasion of June 22. Facing German Army Group Center, Pavlov positioned three of his armies well forward and only one in reserve.

A week after the German invasion of the Soviet Union and the collapse of his sector of the front, Pavlov and his chief of staff Major General Vladimir Efimovich Klimovskikh and several others were ordered to Moscow. Pavlov was made the scapegoat for Soviet military failures. Falsely accused of collaboration with the Germans, he was tried, convicted, and shot on July 22, 1941. Also executed were Klimovskikh, Fourth Army commander General Aleksandr Andreevich Korobkov, and several divisional commanders and commissars.

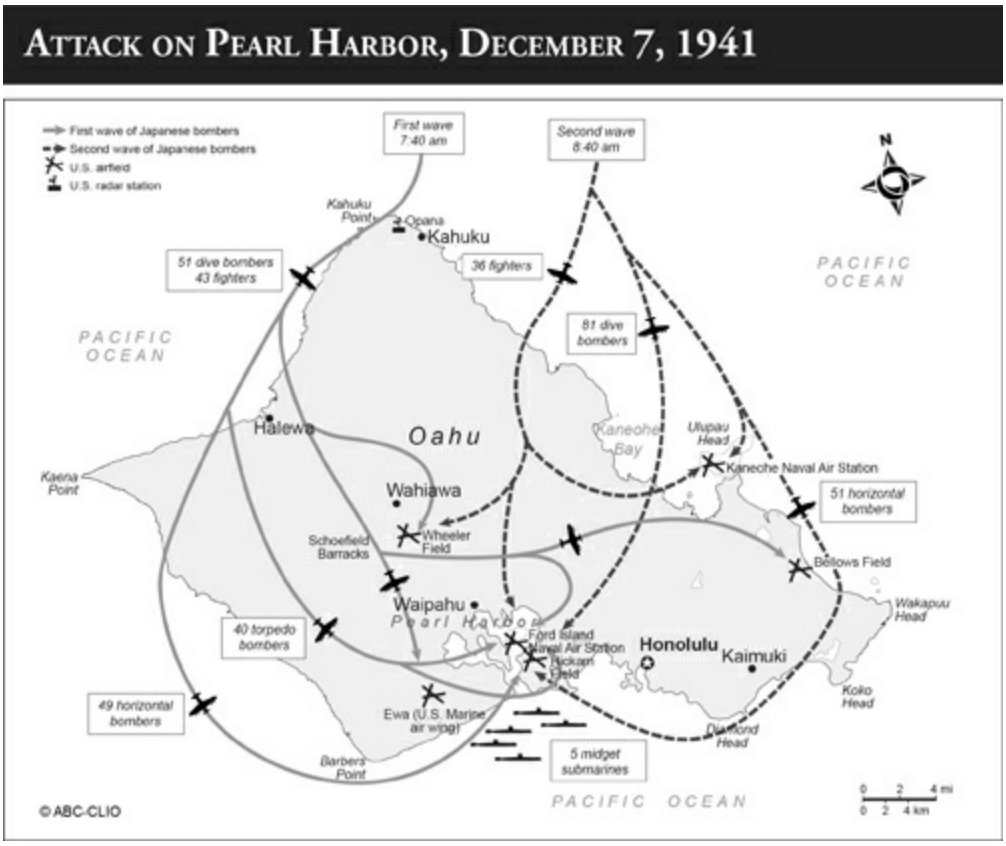
Pearl Harbor, Attack on (December 7, 1941)

Japanese military attack against the U.S. naval base at Pearl Harbor in the Hawaiian Islands, which prompted the United States to declare war against Japan. By early 1941, tensions between Japan and the United States had

reached the breaking point. Japan's 1937 invasion of China and its occupation of French Indochina in 1940–1941 had led U.S. president Franklin D. Roosevelt to embargo scrap metal and oil and to freeze Japanese assets in the United States. The Japanese particularly resented the embargo on oil, characterizing it as "an unfriendly act." Japan had no oil of its own and limited stockpiles. Without oil, the Japanese would have to withdraw from China.

An army-dominated government in Tokyo now sought to take advantage of British, French, and Dutch weakness in Asia to push its own plans to secure hegemony and resources. Japan was determined to seize this opportunity, even if that meant war with the United States. The United States misread Tokyo's resolve, believing it could force Japan to back down.

Both sides visualized the same scenario for war in the Pacific. The Japanese would seize U.S. and European possessions in the Far East, forcing the U.S. Navy to fight its way across the Pacific to relieve them. Somewhere in the Far East, a great naval battle would occur to decide Pacific hegemony. In March 1940, commander of the Japanese Combined Fleet Admiral Yamamoto Isoroku scrapped the original plan—which called for using submarines and cruisers and destroyers with the Long Lance torpedo and savaging the U.S. battle fleet as it worked its way west—in favor of a preemptive strike against the U.S. fleet, which Roosevelt had shifted from San Diego to Pearl Harbor on the island of Oahu. Yamamoto believed that such an attack, destroying the U.S. carriers and battleships, would buy time for Japan to build its defensive ring. Yamamoto also misread U.S. psychology when he believed that such an attack might demoralize the U.S. people and force Washington to negotiate a settlement that would give Japan hegemony in the Western Pacific.



With both sides edging toward war, U.S. Pacific Fleet commander Admiral Husband E. Kimmel and U.S. Army lieutenant general Walter C. Short made their dispositions for the defense of Oahu. Both men requested additional resources from Washington, but the United States was only then rearming, and little additional assistance was forthcoming.

The Japanese, meanwhile, trained extensively for the Pearl Harbor attack. They fitted their torpedoes with fins so they could be dropped from aircraft in the shallow water of Pearl Harbor, and they also planned to use large armor-piercing shells to be dropped as bombs from high-flying aircraft. No deck armor would be able to withstand them.

Following the expiration of a self-imposed deadline for securing an agreement with the United States, Tokyo ordered the attack to go forward. On November 16, 1941, Japanese submarines departed for Pearl Harbor, and 10 days later the First Air Fleet, commanded by Vice Admiral Nagumo Chūichi, sortied. This attack force was centered on six aircraft carriers: the *Akagi*, *Hiryū*, *Kaga*, *Shōkaku*, *Sōryū*, and *Zuikaku*. They carried 423 aircraft,

360 of which were to participate in the attack. Accompanying the carriers were two battleships, three cruisers, nine destroyers, and two tankers.

Surprise was essential if the attack was to be successful. The Japanese maintained radio silence, and Washington knew only that the fleet had sailed. A “war warning” had been issued to military commanders in the Pacific, but few U.S. leaders thought that the Japanese would dare attack Pearl Harbor. Nagumo planned to approach from the northwest, move in as close as possible before launching his aircraft, and then recover them farther out, forcing any U.S. air reaction force to fly two long legs. Nagumo ordered the planes to launch beginning at 6:00 a.m. at a point about 275 miles from Pearl Harbor.

Two events should have made a difference to the Americans but did not. Before the launch, U.S. picket ships off the harbor entrance detected one Japanese midget submarine. Then they sank another. There were five Japanese midget submarines in the operation. Carried to the area by mother submarines, they were to enter the harbor and then wait for the air attack. Probably only one succeeded.

Another warning was a radar report. At 7:00 a.m., a U.S. mobile radar station near Kahuku Point on the northern tip of Oahu detected the approach of a large number of aircraft about 130 miles out. However, personnel at the information center at Fort Shafter interpreted this as a flight of B-17s scheduled to arrive from California. The radar operator failed to report the key point that it was probably more than 50 aircraft; there were only 12 B-17s, which were in any case approaching from the east rather than the north.

At 7:50 a.m., the first wave of Japanese aircraft began attacking the ships at Pearl Harbor and air stations at Ewa, Ford Island, Hickam, Kaneohe, and Wheeler. Most U.S. planes were destroyed on the ground. They were easy targets because Short, to avoid sabotage by the many Japanese on the island, had ordered the planes bunched together and ammunition stored separately.

The Japanese achieved great success. In an attack of some 140 minutes, the Japanese sank four of the eight U.S. battleships in the Pacific and badly damaged the remainder. Seven smaller ships were also sunk, and four were badly damaged. A total of 188 U.S. aircraft were destroyed, and 63 were badly damaged. The attack also killed 2,280 people and wounded 1,109. The attack cost the Japanese only 29 aircraft and fewer than 100 aircrew dead.

The Japanese attack on Pearl Harbor, Hawaii, December 7, 1941. Prominent in this photograph are the battleships *West Virginia* and *Tennessee*. (Time Life Pictures/US Navy/The LIFE Picture Collection/Getty Images)

The chief drawbacks in the raid from the Japanese point of view were that the U.S. carriers were away from Pearl Harbor on maneuvers and were not attacked. The Japanese also failed to hit the oil tank storage areas, without which the fleet could not remain at Pearl. Nor had they targeted the dockyard repair facilities. Nagumo had won a smashing victory but was unwilling to risk his ships in further strikes. The task force recovered its aircraft and departed.

Yamamoto's preemptive strike was a brilliant tactical success. Japan could carry out its plans in the South Pacific without fear of significant U.S. naval intervention. However, the Pearl Harbor attack also solidly united U.S. opinion behind a war that ultimately led to Japan's defeat.

PEDESTAL, Operation (August 3–15, 1942)

The last contested British Royal Navy operation to resupply Malta. Maintaining the effectiveness of the island's aircraft and warship strike forces against the long and vulnerable Axis supply routes to North Africa was crucial, especially as the Allies prepared for a new offensive in the Western Desert and the invasion of Vichy French North Africa. In June 1942, an effort to supply Malta with large convoys from both the east and west had led to the eastern operation, code-named VIGOROUS, of 11 merchant ships being turned back, while 3 of 5 freighters and the tanker SS *Kentucky* were lost in Operation HARPOON, the western operation. Malta thus faced a growing shortage of supplies, particularly of fuel, and despite the risks of heavy losses among the merchant vessels and their escorting warships, the Allies decided to mount another convoy operation.

Axis control of the North African coast ruled out a westbound convoy. An eastbound convoy would be vulnerable to attack from Sardinian and Sicilian bases for some 400 miles, requiring moonless nights, fast merchantmen, and a heavy escort for passage. Numbering 14 ships, including the tanker *Ohio*, the convoy carried 85,000 tons of supplies and 12,000 tons of fuel. Close escort to Malta was provided by the Royal Navy in the form of Force X of 4 cruisers and 11 destroyers. Additional cover as far as the Skerki Channel would come from Force Z of 2 battleships, 3 carriers with 100 aircraft, 3 cruisers, and 13 destroyers. Two oilers and a tug, escorted by 4 corvettes, accompanied the armada. The carrier *Furious*, escorted by 8 destroyers, used this opportunity to fly off 40 Spitfires to reinforce Malta before returning to Gibraltar. Nine submarines were deployed to counter possible movements by Italian surface forces.

On August 10, 1942, Axis forces received confirmation that the convoy had passed through the Strait of Gibraltar. Twenty submarines (18 Italian and 2 German) were deployed to intercept, and the convoy was shadowed from the air. At 1:15 p.m. on August 11, the German submarine *U-73* torpedoed and sank the carrier *Eagle* and escaped. Two hours later, the first Axis air attack in the form of 36 German aircraft from Sardinia arrived. It inflicted no damage to the convoy at the cost of two of its planes shot down.

Major air attacks from Sardinia commenced the next morning. Between 9:00 a.m. and 4:30 p.m., 134 Italian and 77 German aircraft made three attacks in five waves, slightly damaging the carrier *Victorious* and slowing the merchantman *Decaulion,* forcing it to proceed independently. Axis forces lost 12 aircraft. At 6:35 p.m., 95 aircraft attacked the convoy in six waves. They made a glancing hit on the battleship *Nelson,* torpedoed the destroyer *Foresight,* and hit the carrier *Indomitable* with three bombs, putting the last two out of action.

Force Z turned back to Gibraltar at 6:55 p.m., 20 minutes earlier than planned, but its carrier losses reduced the convoy's air cover to six Beaufighters from Malta. At 7:30 p.m., as the convoy entered the Skerki Channel, Italian submarines struck. The submarine *Axum* hit the British cruisers *Cairo* and *Nigeria* and the tanker *Ohio* with one spread of four torpedoes. The *Ohio* continued, but the *Cairo* was scuttled, and the *Nigeria* turned back to Gibraltar. A cruiser and two destroyers were detached from Force Z as reinforcements, but before they arrived, a German night attack by 37 aircraft caused the loss of three freighters (including the *Decaulion*) and seriously damaged a fourth; the destroyer *Ashanti,* the new flagship after the crippling of the *Nigeria,* was also damaged. The *Kenya* was torpedoed by the submarine *Alagi* at 9:12 p.m. but could still steam at convoy speeds and so continued.

On August 13 shortly after midnight, 19 Italian and 4 German motor torpedo boats commenced a series of attacks. The Italian boats sank the cruiser *Manchester* and three transports while the Germans accounted for one transport. Another freighter was damaged.

By dawn, the convoy was scattered and reduced to 7 merchantmen (3 damaged) escorted by 2 cruisers and 16 destroyers. A planned interception by 6 Italian cruisers and 12 destroyers was called off by the naval command shortly before midnight, after 1 of the British cruisers sent back to reinforce

the escort by Admiral Syfret was misidentified as a battleship. On their way back to base, the submarine *Unbroken* torpedoed 2 cruisers off Cape Milazzo.

Air attacks from Sicily recommenced at 9:15 a.m., sinking two merchantmen and further damaging the *Ohio*. By 11:00 a.m., however, Spitfire fighter cover from Malta effectively prevented further successful attacks. Four merchantmen (one damaged) and the *Ohio,* barely afloat, entered Valetta's Grand Harbor, bringing 32,000 tons of supplies and 11,500 tons of fuel to the garrison, sufficient for two months of operations. Force X successfully returned to Gibraltar through the gauntlet of Axis air, submarine, and motor torpedo boat attacks, losing only the damaged *Foresight*.

Operation PEDESTAL was an Axis tactical victory. The British lost eight freighters, one carrier, two cruisers, and a destroyer. One carrier, a cruiser, and a destroyer also suffered heavy damage. The Italians lost two submarines, and two cruisers and two submarines were heavily damaged. Aircraft losses on all sides were modest, considering the numbers engaged. Even so, the British, despite heavy merchant ship losses, had achieved a strategic victory by successfully resupplying Malta, which had an immediate serious impact on the Axis supply lines to North Africa at a critical moment.

Peenemünde

Peninsula on the Baltic German coast that served as a German rocket manufacturing and test site during World War II. At Peenemünde, German

engineers designed and tested the V (for *Vergeltung*, or "vengeance") weapons with which Germany hoped to reverse the course of the war. In 1932, artillery captain Walter Dornberger established the Verein für Raumschiffahrt (VfR, Rocket Society) to build a military rocket. Soon Dornberger and VfR member Wernher von Braun gathered a group of some 80 engineers at Kummersdorf to construct rockets for artillery use. Braun also hoped to build both jet-propelled bombers and rocket fighters. Kummersdorf was not large enough for this work, so Peenemünde was selected. There in the summer of 1936, the German military developed a secret test site with restricted access. Dornberger, now a major general, headed the wartime program.

The V-1 flying bomb (known as the "buzz bomb" from its sound) was first test-fired at Peenemünde in December 1942. The second V weapon was initially designated the A-4. Renamed the V-2, it was a 12-ton, single-stage rocket fueled by alcohol and liquid oxygen. A true guided missile, it was the prototype of all such weapons to follow. Peenemünde engineers launched the first V-2 on October 3, 1942. Unlike the V-1 buzz bomb, which simply fell to earth when the engine cut off, the V-2 could be targeted accurately and directed against large cities, such as London. Adolf Hitler was determined that the V-1 and V-2 be used as terror weapons, especially following the destruction of German cities by Allied bombers.

Although reports reached Britain that Germany was developing secret weapons, Peenemünde was not specifically identified until members of the Polish underground provided specific confirmation. It was in 1943 that British prime minister Winston L. S. Churchill ordered that a heavy Bomber Command strike be mounted against Peenemünde. That raid occurred on August 17–18.

Peenemünde Raid (August 17–18, 1943)

Information about German operations to build the V-2, a single-stage rocket, at Peenemünde on the German Baltic coast first reached the British in November 1939. In 1943, further information came to light, and reconnaissance missions were flown that produced photographic evidence of a rocket on a trailer. The Allies decided that Peenemünde had to be destroyed, and the task was assigned to the Royal Air Force (RAF) Bomber Command. The raid was launched on the night of August 17–18, 1943, and occurred only a few hours after the U.S. Army Air Forces had begun raids against Regensburg and Schweinfurt. There was also a diversionary raid against Berlin.

The British hoped that the raid would delay German rocket research by many months. This would entail destroying the facility and killing as many people working there as possible, especially the scientists. Head of Bomber Command Air Chief Marshal Arthur Harris decided on a mix of precision and area bombing, and to achieve the maximum results he decided to employ the entire strength of Bomber Command. He would also use Pathfinder aircraft.

Peenemünde was 500 miles from the British bases, and the British would come under full German attack. The RAF strike on the night of August 17–18 used 596 bombers (324 Lancasters, 218 Halifaxes, and 54 Stirlings), of which 560 reached the target area. British losses were heavy, with 41 bombers shot down. The Germans lost 12 fighters.

The raid destroyed several facilities at Peenemünde and killed between 120 and 178 people working there, along with 600 inmates of a nearby forced-labor camp. Although it is impossible to judge this with any certainty, the raid probably retarded German V-2 production by up to six months. The first V-2s did not fall on London until September 8, 1944, three months after

the June 6 Allied invasion of Normandy. The raid is also notable as the first time the Germans used their Schrage Musik cannon, upward-firing 20mm guns that were mounted on Bf-110 aircraft and claimed six British bombers. Peenemünde would continue to take a heavy toll of Allied bombers for the remainder of the war.

The U.S. Army Air Forces also raided Peenemünde three times in 1944, causing the Germans to move much of their development work elsewhere. At the end of the war, the Americans secured most of the German rocket scientists as well as Peenemünde itself, from which they gathered V-2s and related equipment, filling 300 railroad cars before destroying the site. The personnel and material captured at Peenemünde became the foundation of the U.S. space program of the 1950s and 1960s.

Peiper, Joachim (1915–1976)

German Waffen-Schutzstaffel (Waffen-SS) Obersturmbannführer. Born in Berlin on January 30, 1915, Joachim Peiper came from a military family; he was well educated and fluent in both English and French. Peiper joined first the Hitler Youth, then the SS. Commissioned in the SS in 1936, he served on Heinrich Himmler's personal staff but sought a combat command. He was a company commander in the elite SS Liebestandarte Adolf Hitler (LAH) in the invasion of France and the Low Countries in May 1940 and led an abortive effort to seize bridges over the Meuse. He served in the LAH in the invasion of the Soviet Union beginning on June 22, 1941. There his unit was noted for its military efficiency and extreme brutality; it was involved in massacring the inhabitants of several villages. Transferred to Italy, in September 1943 Peiper's troops destroyed the town of Boves and murdered 45 of its inhabitants.

After the LAH transferred to France, Peiper studied techniques for night movements that were later used effectively in the Ardennes Offensive (Battle of the Bulge, December 16, 1944–January 25, 1945). In that offensive, SS-Obersturmbannführer Peiper headed Kampfgruppe (battle group) Peiper, which was the lead element for the 1st SS Panzer Division, itself the main effort for the entire Sixth Panzer Army. Peiper's mission was to race ahead of the main body of the division, bypass all determined resistance, and capture

the bridges across the Meuse River at the small Belgian village of Huy. This would allow following forces to cross this major water obstacle en route to their planned envelopment of Allied armies to the north.

Kampfgruppe Peiper never achieved its objective, being thwarted in Huy on December 20. After several determined efforts to break through failed, on December 23 Peiper and his 800 remaining men abandoned their equipment and retreated on foot under cover of darkness. Before then, Peiper's unit had already committed one of the most infamous massacres of the war, at Malmédy on December 17.

SS colonel Joachim Peiper, who led the German unit that killed 83 unarmed U.S. soldiers taken prisoner near Malmédy, Belgium, on December 17, 1944. (Corbis)

There Peiper's lead elements had overrun a U.S. unit, Battery B of the 285th Field Artillery Observation Battalion. The lead element (with Peiper present) rapidly disarmed the Americans and passed them along to following forces. The soldiers of these trailing units within Kampfgruppe Peiper herded the roughly 150 prisoners into a field and then opened fire on them with machine guns and small arms, killing 83 and wounding others.

For this atrocity, Peiper and 69 others were tried before a U.S. military court at Dachau in the spring of 1946. On July 16, 1946, the tribunal condemned Peiper and 43 others to death, although the sentences were subsequently reduced to life in prison. Peiper was released in December 1956. Since 1972 Peiper had been living in France in the small village of Traves. In late June 1976 his presence there was revealed in the communist

newspaper *L'Humanité*. On July 14, 1976, Peiper's house burned in mysterious circumstances, reputedly firebombed. Peiper's body was discovered in the remains with a bullet hole in its chest. The perpetrators were believed to have been either communists or former members of the French Resistance. Peiper had begun writing a book about Malmédy and its aftermath.

Peleliu Island, Battle of (September 15–November 27, 1944)

Pacific island battle, one of the bloodiest of the war. Peleliu had been taken by Japan from Germany during World War I. Located about 2,400 miles south of Tokyo and having a land area of only about 7 square miles, Peleliu Island was largely blanketed by a tropical forest. Before General Douglas MacArthur's forces could retake the Philippines, he would have to neutralize the Palau Islands, and Peleliu specifically, to protect his right flank. Admiral Chester Nimitz also believed that Peleliu was needed as a staging area for the invasion of Leyte. Securing the island would ensure domination of all the Palaus and neutralize Japanese submarine facilities.

Beginning on September 12, 1944, the U.S. Navy began a three-day naval and air bombardment. The naval fire-support group included 5 battleships, 5 heavy and 3 light cruisers, and 14 destroyers. Between 7 and 11 escort carriers provided combat air and antisubmarine patrol. The ground force went ashore beginning at 8:32 a.m. on September 15. It consisted of the 1st, 5th, and 7th Marine Regiments of Major General William H. Rupertus's 1st

Marine Division. The assault was made in amphibious tractors (amphtracs and landing vehicles, tracked [LVTs]) across 600–800 yards of coral reef on the southwest corner of the island. Rupertus predicted victory in 4 days.

Two U.S. marines, one cradling a 30-caliber machine gun in his lap, during a break in fighting on Peleliu Island, 1944. (National Archives)

Colonel Nakagawa Kunio, commanding some 5,000 Japanese troops, had adopted new tactics. The Japanese did not defend at the beaches, but inland they were well dug in to make the attackers pay the highest possible price. The Japanese only had 13–15 light tanks. On the first afternoon, these were destroyed when they tried to break through the attackers' line. The marines' objective on the first day was to secure the high ground, soon known as "Bloody Nose Ridge," but that effort was only partly successful. On September 16, the advance resumed. On September 17, led by 1st Marine Regiment commander Colonel Lewis B. "Chesty" Puller, the marines attacked the ridges and destroyed many Japanese strongpoints.

On September 22, the marines were reinforced by the U.S. Army 321st Regimental Combat Team of the U.S. Army's 81st Infantry Division, which was the floating reserve. The next day the Americans secured the airstrip, but the Japanese then retreated to prepared positions in caves on Umurbrogol Ridge. On September 26, the 5th Marines seized Radar Hill, the easternmost

and highest terrain on the island and site of a Japanese radar installation. By the end of September, the Japanese soldiers were compressed into a pocket only 90 yards long and 400 yards wide. In mid-October, the U.S. Army 81st Infantry Division replaced the marines on Peleliu, but the island was not declared secure until November 27, although some Japanese did not surrender until February 1945.

Even with total U.S. air and naval superiority, lavish naval gunfire and air support, and a ground manpower superiority of four to one, American forces paid a heavy price for the seizure of Peleliu. U.S. casualties totaled some 9,615, with 1,656 of them killed in action. Of 6,000 Japanese defenders, only 33 surrendered or were captured. The same Japanese tactics were replicated, more spectacularly, in their defense of Iwo Jima (February 19–March 26, 1945). The seizure of Peleliu, while costly, did neutralize some 25,000 Japanese troops on Babelthuap, the largest island of the Palaus.

Peng Dehuai (1898–1974)

Chinese Communist general. Born a peasant in Xiangtan (Hsinangt'an) in the southern province of Hunan on October 24, 1898, Peng Dehuai (P'eng Te-huai) enlisted in a warlord army in 1916. Military talent and an expanding social conscience inclined him first toward the Guomindang (Kuomintang, Nationalist, GMD) military, but ultimately he joined the Communist Party in 1928. Peng fought in early battles against GMD forces and survived the Long March (1934–1935).

In 1937, Peng was appointed second-in-command of the new Eighth Route Army, which although ostensibly under GMD control within the "United Front" was actually under Communist general Zhu De (Chu Teh). More conventional than Mao Zedong (Mao Tse-tung), Peng favored professional soldiers over guerrillas or commissars as well as larger, more aggressive assaults against the Japanese. Initially, he also favored more genuine cooperation with the GMD.

In August 1940, Zhu ordered Peng to attack the Japanese in Shanxi (Shansi) and Hebei (Juprh) Provinces southwest of Beijing (Peking). In the largest Chinese offensive of the war, Peng amassed some 104 regiments, comprising 200,000 regulars and 200,000 guerrillas, who successfully destroyed blockhouses and rail lines. In October, strong Japanese counterattacks drove Peng westward into the mountains. Although successful in its initial phase and in countering claims that Communists were avoiding the Japanese, this "100 Regiments Campaign" cost at least 22,000 Chinese lives, compared with about 5,000 Japanese killed.

In retaliation, the invaders accelerated their "burn all, kill all, destroy all" campaign in northern China, killing tens of thousands more Chinese. By late 1941, Peng had returned to Yan'an (Yenan), Shaanxi (Shensi) Province. He spent more time on political work than military campaigning for the rest of the war, gravitating more toward Mao's ideas on politics and war. Peng mounted no more offensives against the Japanese.

Peng led the Northwest Field Army during the subsequent civil war and led all Chinese forces in the 1950–1953 Korean War. Promoted to army marshal and minister of defense in 1955, he was purged in 1959 for criticizing Mao's Great Leap Forward program. During the Cultural Revolution, Peng was vilified, jailed, and tortured. He died in a military prison outside Beijing on November 29, 1974.

Penicillin

Antibiotic agent first discovered in 1928 by Alexander Fleming in London and made available for widespread use during World War II. Fleming discovered penicillin by happenstance as he was conducting research on staph infection, a potentially lethal malady spread by bacteria and that usually begins on the skin. Observing that a mold that had contaminated one of his cultures had caused the bacteria to stop growing, he transferred some of the mold to another culture, with the same result. The mold belongs to the genus *penicillium*, which prompted Fleming to name it penicillin.

Penicillin and its related products are effective mainly against gram-positive bacteria; the drug has shown to be largely ineffective for gram-negative bacteria. Since its discovery, many variations of penicillin have been produced, widening its appeal and therapeutic qualities. Penicillin also led researchers to develop other kinds of antibiotics, including those that effectively treat gram-negative bacteria.

By the late 1930s, research on penicillin at Oxford University proved that the mold was highly effective in treating a wide variety of bacterial infections in animals, principally mice. In the spring of 1941, the first trials on humans took place. Penicillin was administered to a number of patients who were desperately ill and in all likelihood would have died without the drug. The results were dramatic. At the same time, scientists and researchers in the United States were conducting their own research on penicillin, and with war looming, the U.S. government sped up patient trials on the drug. During 1942, 122 million units of penicillin were cultured and made available for clinical trials at the Mayo Clinic and at Yale University.

By the early spring of 1943, 200 patients in the United States had been given the drug, with results so impressive that U.S. surgeon general Thomas Parran Jr. ordered drug trials carried out at a military hospital. Soon, the drug was widely available in hospitals, including military hospitals in the United States and abroad.

While penicillin appeared to be a miracle drug, the manufacturing and administration of it were far from trouble-free. Early on, the mold had to be grown—or cultured—in a laboratory, a time-consuming and not at all efficient process. There were attempts during World War II to chemically synthesize the drug, but none proved successful. Another challenge the drug posed was that it was excreted in a patient's urine quickly, which necessitated frequent dosing. Up to 80 percent of penicillin is excreted from the body within three to four hours of administration. Because of this and the scarcity of penicillin at the time, the urine of patients on the drug was collected so the penicillin could be extracted and reused.

In time researchers overcame both problems, but only after many trials and much expense. By 1943, numerous manufacturing plants in the United States were churning out millions of doses of the drug; by war's end, 23 plants around the country were producing penicillin. Between 1943 and 1945, the U.S. military was consuming 85 percent of the nation's output of the antibiotic, which in 1943 alone accounted for 231 billion units.

Penicillin revolutionized medicine in the 1940s, particularly military medicine. Many soldiers stricken with communicable diseases or infections stemming from wounds or surgery who otherwise would have died were saved by penicillin. The incidence of death from disease and/or wounds during World War II was 0.6 per 1,000; during World War I, less than 30 years prior, the death rate for soldiers was 16.5 per 1,000. Only 4 percent of soldiers who were admitted to a hospital during World War II died; during World War I, the death rate for soldiers in hospitals was double that, at 8 percent.

Pentagon

U.S. military headquarters located just outside Washington, D.C., in Arlington, Virginia. Constructed between September 11, 1941, and January 15, 1943, at an approximate cost of $83 million, the massive five-sided office building consolidated the 17 separate buildings of the War Department under one roof.

The U.S. Army grew from a force of approximately 190,000 men in the fall of 1939 to more than 1.4 million by the summer of 1941. Responding to international crisis and the outbreak of war in Europe, the War Department was growing exponentially to keep up with increasing responsibilities, and there would be a critical need for more space for war planning if the United States did indeed enter the war.

Brigadier General Brehon Burke Somervell was chief of construction for the War Department in 1941. He proposed that a single building should house the entire War Department, uniting all the military decision makers under one roof. Somervell's personal determination, his access to President Franklin D. Roosevelt, and his highly competent engineers and architects, who developed the original Pentagon plans in one harried weekend, all contributed to the ultimate success of the project that some referred to as "Somervell's folly."

Aerial view of the Pentagon, headquarters of the U.S. Department of Defense in Arlington County, Virginia, 1944. (AFP/Getty Images)

When Somervell took his plan to Congress for the necessary appropriations, many objected to the estimated cost of $35 million. Others were opposed to locating the building outside of Washington, D.C., and some believed that the building would be useless once the current war crisis passed. Even Roosevelt thought that the Pentagon would only temporarily house the War Department and would later be used mainly as a storage facility. Some in Congress observed that construction of such a massive building would use too many scarce materials, especially steel.

Engineers replaced steel frames with reinforced concrete made from sand and gravel dredged from the bottom of the nearby Potomac River. They also saved steel by constructing ramps instead of elevators from level to level within the building.

Construction got off to a slow start but speeded up considerably after the December 7, 1941, Japanese attack on Pearl Harbor created a new urgency to occupy the building. Somervell brought in Colonel Leslie R. Groves, who would later head the Manhattan Project, to oversee construction. Two of the five building sections were completed by the following spring, and the first War Department employees, 300 Ordnance Department workers, moved into the first section at the end of April 1942.

In 1989, the Pentagon was placed on the National Register of Historic Places. Renovation and restoration, partly because of age and partly because of the terrorist attack of September 11, 2001, continues on the building, still a symbol of U.S. military power.

Percival, Arthur Ernest (1887–1966)

British Army lieutenant general. Born at Aspenden, Hertfordshire, on December 26, 1887, Arthur Ernest Percival was educated at Rugby School. He was in business in London during 1907–1914 and joined the British Army as a private at the beginning of World War I. Percival fought in France in 1915, was wounded in 1916, and won two Distinguished Service Orders and the French Croix de Guerre. He was also promoted to captain.

After the war, Percival served in north Russia and in Ireland (1920–1922). He attended the Staff College at Camberley and served in Nigeria. He also attended the Imperial Defence College course in 1935. Percival was promoted to lieutenant colonel in 1932 and to colonel in 1936. He then served in Malaya as a staff officer (1936–1938).

Percoval returned to Britain to take command of Aldershot in 1938 and 1939. Promoted to brigadier in 1939, Percival assumed command of the 43rd Division of the British Expeditionary Force in France. Following the Dunkerque (Dunkirk) evacuation (May 26–June 4, 1940), he commanded the 44th Division in Britain.

Largely because of his previous service there, Lieutenant General Percival took command of British forces in Malaya in July 1941. British defenses in the area depended on controlling the sea and air. His defenses

inadequate, Percival requested six additional divisions and extra air support. He received only two and a half poorly trained divisions and therefore did little to prepare for an invasion.

Japanese forces commanded by Lieutenant General Yamashita Tomoyuki invaded Malaya in early December 1941, and on January 27, 1942, Percival ordered a general withdrawal from the Malay Peninsula to Singapore Island. Percival rejected suggestions that the British construct defensive positions on the northern side of the island because he feared this would adversely affect the morale of his troops and civilians. The Japanese invaded Singapore proper in early February 1942 and drove back the unprepared British forces. British prime minister Winston L. S. Churchill demanded that Percival hold the island to the last, but the water supply was dangerously low and defenses inadequate.

Although British troops outnumbered the Japanese forces on February 15, 1942, Percival was bluffed into surrendering, in large part to spare civilian casualties. In Britain's most humiliating defeat of the war, 130,000 British, Australian, Indian, Malay, and local troops became prisoners of the Japanese.

Percival spent the next four years as a prisoner of war. On the defeat of Japan, he was released and witnessed the formal Japanese surrender on board the battleship *Missouri* on September 2, 1945. Percival retired from the army in 1946 and died in London on January 31, 1966, a broken man.

Pétain, Henri Philippe (1856–1951)

French Army general and chief of state of the Vichy government of France during the German occupation. Born on April 24, 1856, in Cauchey-à-la-Tour, Henri Philippe Pétain graduated from the French Military Academy of Saint-Cyr in 1878 and was commissioned in the army. He served as an officer in a line regiment and then on the staff at the École de la Guerre (War College). His career was less than distinguished, and Colonel Pétain was nearing retirement age at the beginning of World War I.

Vichy chief of state Henri Philippe Pétain. A World War I hero, he was convicted after World War II of collaboration with the Germans and sentenced to life in prison. (Library of Congress)

One of the few experts in the French Army in defensive warfare and the effectiveness of modern firepower, Pétain advanced quickly in rank. His leadership in the 1916 Battle of Verdun won him hero status in France and, in April 1916, command of Army Group Center. In May 1917, he replaced General Joseph Joffre as commander in chief of the French Army. Promoted

to marshal of France in 1918, Pétain remained in command of the army until his retirement in 1931. He served briefly as minister of war in 1934.

During 1939–1940, Pétain was French ambassador to Spain. In the desperate circumstances of the Battle for France (May 10–June 25, 1940), Pétain was recalled to serve as vice premier to Paul Reynaud to lend his personal credibility to the war effort. He ended up moving the government in another direction. Believing that the situation was hopeless, he took over as the last premier of the Third Republic, determined to end the fighting on the best terms possible.

On the conclusion of an armistice with the Germans, Pétain became chief of state of the unoccupied part of the country with its capital at Vichy. Pétain, who at first enjoyed virtually unanimous French support, established an authoritarian government that accepted the principle of collaboration with the Germans. In October 1940, Pétain met with Adolf Hitler at Montoire-sur-Loire. Pétain consistently made concessions to Germany, including limited cooperation with the Germans in the deportation of Jews and hunting down anti-Nazi operatives in unoccupied France.

Following the Allied invasion of North Africa in Operation TORCH (November 8, 1942), German forces occupied the remainder of France, and Pétain's government lost what little authority it had enjoyed. He continued to urge his countrymen to follow a neutral course, even insisting that they not aid the Allies following the Normandy Invasion on June 6, 1944.

Removed to Germany in August 1944, Pétain voluntarily returned to France in April 1945 to defend his policies. He claimed that he had been trying to dupe the Germans and buy time for France to recover. Put on trial for treason, Pétain was convicted in August and sentenced to death. Head of the Provisional Government General Charles de Gaulle commuted the sentence to life imprisonment because of Pétain's contributions in World War I and the fact that Vichy had at least kept alive some French independence. Pétain died a prisoner on the Isle d'Yeu on July 23, 1951. He was buried there, because the French government refused permission for his remains to be buried in mainland France. Various groups have endeavored to remove his remains for burial at Verdun.

Petlyakov, Vladimir Mikhailovich (1891–1942)

Soviet aircraft designer. Born at Sambek (now Novoshakhtinsk) near Taganrog on July 27, 1891, Vladimir Mikhailo-vich Petlyakov studied at Moscow Higher Technical School under Nikolai Zhukovsky, and while there he worked as a laboratory assistant at the Central Aerodynamics and Hydrodynamics Institute (CAHI), graduating in 1922.

After graduation, Petlyakov continued at CAHI as a structural designer. He became Andrei Nikolayevich Tupolev's deputy (and head of the heavy airplane brigade) in 1931. Petlyakov's first independent design was the ANT-42 of 1934. It eventually entered production as the Pe-8, the Soviet Union's sole long-range heavy bomber of World War II. This excellent aircraft carried five tons of bombs, but because the Soviet military leadership had little interest in strategic bombing, only 79 Pe-8s were produced. Petlyakov became chief of CAHI's experimental aircraft factory in July 1936 and its chief designer a year later. He was arrested on July 20, 1937, during Stalin's purges and sent to a *sharashka*—a Soviet labor camp used for secret research and development.

At the *sharashka,* Petlyakov set up Special Technical Department 100, where he designed the Vi-100, a sophisticated prototype high-altitude fighter and dive-bomber. Although it was successful, the air force decided that the MiG-3 could better meet the high-altitude requirement. On May 25, 1940, the air force gave Petlyakov's team until June 1 to design a conversion to a three-seat attack bomber. The mock-up PB-100 passed inspection on June 1, 1940, and the type was approved for production on June 23.

Petlyakov's success led to his release from prison in July 1940 and his installation as head of his own experimental design bureau, the Opytnoe

Konstructorskoe Byuro (OKB), in Moscow. The production PB-100 was redesignated the Pe-2 and became the Soviet Air Force's most successful standard tactical bomber of World War II. The two-engine Pe-2 was the counterpart to the German Ju-87 Stuka dive-bomber, U.S. A-20, and British Mosquito. With some 11,000 produced, the Pe-2 made up two-thirds of Soviet bomber production in World War II. The Pe-2 had a crew of three, was armed with five machine guns, and could carry 6,600 pounds of bombs. It was fast at a maximum speed of 360 mph, and even some fighters had problems keeping up with it.

Following the German invasion of the Soviet Union (June 22, 1941), the Petlyakov OKB was evacuated to Kazan in October 1941. Petlyakov was killed when the Pe-2 in which he was traveling from Kazan to Moscow caught fire and crashed on January 12, 1942.

Petrov, Ivan Yefimovich (1896–1958)

Soviet Army general. Born in the village of Trubchevsk, Bryansk region, on September 30, 1896, Ivan Yefimovich Petrov attended a theological seminary and was commissioned in the Russian Army from military school in 1917. He joined both the Red Army and the Bolshevik Party in 1918 and fought in the Russian Civil War as a platoon leader, rising to political commissar in a cavalry regiment. In the 1930s he commanded a cavalry regiment and a cavalry brigade, and he then headed the Tashkent Infantry College.

In March 1941 Petrov formed a mechanized corps in the Central Asian Military District, and in May he was promoted to major general. Following

the German invasion of the Soviet Union (June 22, 1941), Petrov served mainly in the Crimea and Caucasus regions. He first commanded the 2nd Cavalry Division before Odessa and then the Special Maritime Army in the Crimea from August to October 1941. Forced to withdraw to the Crimea, he commanded Sevastopol's land defenses, escaping at the end of June with other senior commanders just before Sevastopol fell to the Germans. In October, Petrov took command of the Forty-Fourth Army in the Crimea. Promoted to lieutenant general, he then served as chief of staff of the North Caucasus Front.

Promoted to colonel general in August 1943, Petrov led the Novorossiysk-Taman Offensive during September and October 1943 and was promoted to army general. Following command differences, he was demoted to colonel general and removed from his post in January 1944. That March, he took command of the Thirty-Third Army. He took command of the Fourth Ukrainian Front in August 1944, regaining the rank of army general.

Petrov led the Western Carpathian Offensive in January and February 1945, but he was removed following a failed offensive in March. At war's end, he was chief of staff of the 1st Ukrainian Front in the Berlin Offensive. Petrov was among the Soviet generals dispersed to distant posts after the war and headed the Tashkent Military District from July 1945 until 1952, when he retired. Petrov died in Moscow on April 7, 1958.

Philippines

The Philippine Islands are strategically located between Formosa (present-day Taiwan) and the Dutch East Indies. In 1941, the nearly 7,100 islands that

comprise the Philippines had a population of some 17 million people speaking some 13 different languages. There are also many religions, although Catholicism predominates. The islands cover almost 115,831 square miles and are divided into three main groups: Luzon in the north, the Visayas in the middle, and Mindanao in the south.

The United States had acquired the Philippine Islands as a consequence of the 1898 Spanish-American War. Prior to that they were a Spanish possession since the late 16th century. The United States decided to grant independence to the Philippines in 1946 after an interim period, and under the Tydings-McDuffie Independence Act of 1934 the government of the islands changed in 1935. In March 1935 President Franklin D. Roosevelt approved a new constitution for the islands, which the Filipinos accepted in May. In September, Manuel Quezon was elected president, and in November, when he was inaugurated, the Commonwealth of the Philippines was formally established. Quezon was reelected president in November 1941.

Quezon wished to strengthen the defenses of the Philippines against a possible attack by Japan. In 1935 he invited General Douglas MacArthur to the islands as his military adviser, and the following year Quezon appointed MacArthur field marshal of the Commonwealth forces.

Although U.S. war plans called for defense of the Philippines, the U.S. Congress had done little to provide funding. In 1941, the Philippine Army numbered only about 90,000 men. Four-fifths of them were Filipinos and the rest U.S. troops. The Philippine Navy consisted of two torpedo boats, and the air force had 40 aircraft. With war threatening, on July 26, 1941, President Franklin Roosevelt federalized the Philippine Army and integrated it into the new U.S. Army Forces in the Far East, commanded by MacArthur, recalled to U.S. service as a lieutenant general (promoted to general on December 20). The principal ground element of this force was Major General Jonathan Wainwright’s Philippine Division, consisting of 8,000 Philippine Scouts commanded by U.S. officers, a U.S. infantry regiment of 2,000 men, and an artillery regiment. In August 1941, MacArthur began to mobilize and train the Philippine Army’s reserve forces of 10 lightly armed infantry divisions.

The Japanese attacked the Philippine Islands, beginning with air raids on Clark and Iba Airfields, on December 8, 1941, one day after the attack on Pearl Harbor. Japanese forces then landed and drove on Manila, forcing MacArthur to withdraw onto the Bataan Peninsula. U.S. and Filipino forces

fought surprisingly well, however, and delayed the Japanese timetable. Cut off from the outside and starved of resources, even food, the Americans were forced to surrender on April 9, 1942. The fortified island of Corregidor fell on May 6. President Roosevelt had already ordered MacArthur to Australia. Meanwhile, President Quezon established a government-in-exile in Washington.

Japanese claims of Asian solidarity rang hollow given their practice of treating the Filipinos with contempt and brutality. The Japanese were surprised to discover that most Filipinos remained loyal to the United States. As early as 1943, Tokyo announced its plans to grant independence to the Philippines. Japanese leaders hoped that this would diminish anti-Japanese sentiment and allow some Japanese troops to be shifted elsewhere. But the

Japanese also insisted that any grant of independence be accompanied by a declaration of war by the Philippines against the United States. Under Japanese pressure, in September 1944 the puppet Philippine government headed by José Laurel, former minister of the interior, declared war on the United States.

As elsewhere, there were Filipino collaborationist elements, but resistance activities also occurred. Resistance on the big island of Luzon was led by the Filipinos, Americans, and Hukbalahap ("Huks," People's Anti-Japanese Army) guerrillas. Although the fighters did not seriously disrupt the Japanese occupation, they proved to be an irritant to the Japanese, provided intelligence information, and greatly assisted in the reconquest of the islands by U.S. troops.

Following U.S. landings in the Philippines in October 1944, the Philippine government was reestablished in the islands at Tacloban, Leyte, on October 23. U.S. forces then invaded Luzon, and following two weeks of heavy fighting that devastated the city, retook Manila in February. Laurel and some other collaborators fled to Japan, where they eventually surrendered to U.S. authorities. On July 5, 1945, MacArthur announced that the Philippines had been liberated. The Philippine Congress met on June 9 for the first time since 1941, and in September it ratified the United Nations Charter.

Following the liberation, MacArthur, much to the surprise of many, adopted a lenient attitude toward the collaborators and personally pardoned Manuel Roxas, a prominent collaborator who won election to the presidency in 1946.

Sporadic violence continued in the Philippines after the war, fed by serious economic problems and separatism. Some guerrilla warfare occurred, led by the Huks. Full independence came to the islands on schedule on July 4, 1946. The Philippines then concluded free trade agreements with the United States, secured significant funding for reconstruction, and granted long-term leases on military and naval bases to the United States.

Philippines, Japanese Conquest of (December 8, 1941–May 8, 1942)

At the beginning of the Pacific war, Japanese leaders sought to capture the Philippine Islands to control the islands' resources and to protect the Japanese supply route to the Netherlands East Indies (Indonesia). In early December 1941, U.S. forces in the Philippines numbered 19,116 U.S. regulars, the excellent 12,000-man Philippine Scouts, a 3,000-man Philippine Constabulary, and 107,000 poorly trained and poorly equipped recently drafted Philippine army troops.

Much of Admiral Thomas C. Hart's U.S. Asiatic Fleet, already weak, had been withdrawn from the Philippines. Only 4 destroyers, 28 submarines, small vessels, and some torpedo boats remained. U.S. air assets and air warning capability in the islands were woefully inadequate. The Far East Air Force in the islands numbered about 277 aircraft, about half of which were obsolete. There were 35 B-17s and more than 100 modern P-40 fighters. U.S. commander in the Philippines General Douglas MacArthur hoped to use his limited air and naval assets to savage any Japanese seaborne attack and was confident that he could defeat any actual landing force should the Japanese get ashore.

The original U.S. plan for the defense of the Philippines was based on the premise that troops there could hold out against the Japanese until the Pacific

Fleet could force its way across the ocean to their relief. U.S. ground troops were to withdraw into the Bataan Peninsula and the fortified island of Corregidor until the fleet could arrive. The plan called for prepositioned depots on the Bataan Peninsula and Corregidor sufficient for 43,000 men on Bataan and 7,000 on Corregidor for 180 days.

MacArthur, convinced that he could defeat any Japanese invasion, scrapped this plan in favor of a forward defense, but resources scattered in this effort were insufficient to defend the entire islands. Most significant was Washington's realization that no relief expedition could be sent out immediately after the start of hostilities. The result was a great deal of confusion.

When word was received in the Philippines of the Japanese attack on Pearl Harbor (December 7, 1941), MacArthur's air force commander, Major General Lewis H. Brereton, sought permission for a strike on Formosa. Brereton was refused permission to see MacArthur but received a message from MacArthur's chief of staff, Brigadier General Richard Sutherland, that he was to wait for an overt act by the Japanese. Brereton suggested that the Japanese attack on Pearl Harbor was such an act.

Although MacArthur eventually granted permission for a strike on Formosa, it came too late. At 12:30 p.m. on December 8, 1941, Japanese aircraft from Formosa struck the Clark and Iba airfields. Without an effective air warning system in the Philippines, many U.S. aircraft, including about half of the B-17s and a third of the fighters, were destroyed, most of them on the ground, at a cost of only 7 Japanese aircraft. Unlike the Japanese attack on Pearl Harbor, there never was an investigation into the attacks on the Clark and Iba airfields, despite a loss of life comparable to that at Pearl Harbor.

Tokyo assigned the task of conquering the Philippines to Lieutenant General Homma Masaharu's Fourteenth Army based on Formosa. Many of Homma's 43,100 men had fought in China, and Tokyo was optimistic that victory in the Philippines would be quick. The timetable for conquest of the islands was only 50 days. MacArthur's prewar goal, to be reached by April 1942, was 200,000 men under arms, but on December 15, 1941, he had only some 120,000 Philippine Army troops in all the Philippines and roughly 31,000 U.S. troops and Philippine Scouts. MacArthur had claimed that he could defend the entire Philippines against Japanese invasion. But most of the

regulars were kept back near Manila, with the result that likely landing sites along the extensive coastline were covered only by poorly trained Filipino troops. This meant that the Japanese would encounter little resistance in getting ashore.

On December 8, 1941, the first Japanese troops landed on Bataan Island. On December 10, Japanese forces invaded Aparri and Vigan on northern Luzon. Two days later, they came ashore at Legaspi in southern Luzon. The bulk of Homma's forces landed at Lingayen Gulf beginning on December 22. Homma commanded in the Philippines a force, at peak strength, of some 65,000 men.

With the Japanese troops ashore and moving on Manila, on December 23 MacArthur reverted to the original Bataan defense plan, without, however, adequate preparation for its implementation, especially in prepositioning supplies and food. MacArthur directed his North Luzon Force field commander, Major General Jonathan Wainwright, to stage a fighting withdrawal along five preplanned defensive lines into the Bataan Peninsula. On December 26, Manila was declared an open city. Japanese forces entered it on January 2, 1942.

MacArthur's troops executed an effective withdrawal and were established on the Bataan Peninsula by January 6. Japanese strength on Bataan was only about 30 percent of their own (some 23,200 Japanese to 80,000 defenders). The Bataan Peninsula is only about 20 by 25 miles in size. MacArthur was handicapped by having to feed more than 110,000 people there and on Corregidor, including civilians, rather than the 43,000 in the original plan. Supplies were entirely inadequate, with many dumps having been lost in the hasty withdrawal, so the defenders in the peninsula immediately went on half rations. Moreover, the peninsula was extremely malarial. By late March, barely a quarter of the defenders were able to fight.

Washington decided against attempting to relieve the position. Rather than yield a tremendous propaganda advantage to the Japanese with the capture of the U.S. commander in the Far East, on February 22 President Franklin D. Roosevelt ordered MacArthur to Australia. He departed Corregidor on March 11. Derisively referred to by many of the defenders as "Dugout Doug" for his failure to leave Malinta Tunnel on Corregidor (he visited Bataan but once), MacArthur later received the Medal of Honor. Wainwright assumed the Philippines command.

By early April, conditions in the Bataan Peninsula for the defenders were desperate, prompting the commander on Bataan, Major General Edward P. King, to surrender the Filipino and American forces there against direct orders from Wainwright. After a major Japanese offensive that shattered his army—and facing widespread starvation, disease, and no hope for victory—King surrendered his 70,000 men on April 9.

The Japanese forced the weakened survivors of Bataan to march 55 to 60 miles to prisoner-of-war camps. Most of the prisoners were sick and hungry, and there was little food. In fairness to the Japanese, they were unprepared for the large influx of prisoners, but it is also true that they behaved with a shocking disregard for the norms of warfare and even denied the prisoners water. Up to 650 Americans and 5,000–10,000 Filipinos died in the Bataan Death March to Camp O'Donnell. Another 1,600 American and 16,000 Filipino prisoners died in the camp in the first six to seven weeks of their imprisonment.

The fight then shifted to Corregidor, with its fewer than 15,000 defenders. Only two miles separate the island from the Bataan Peninsula, enabling the Japanese to bombard it with artillery and attack it from the air. On the night of May 5–6, the Japanese staged a successful amphibious assault accompanied by tanks. On May 6 Wainwright, his resources exhausted and with less than three days of water remaining, ordered all U.S. forces throughout the Philippines to surrender to avoid unnecessary casualties. Formal resistance ended on May 8.

Japanese troops celebrate the capture of Bataan in the Philippine Islands, 1942. (National Archives)

The Japanese conquest of the Philippines was a major blow to American morale and assisted the Japanese in their effort to dominate the Southwest Pacific and control that region's resources. What was remarkable about the Philippine Campaign was not its conclusion but rather the skill and determination of the defenders, who held out for six months. Homma was called back to Japan in disgrace.

Perhaps the greatest surprise was the loyalty of the Filipinos to the United States. The Japanese expected the Filipinos to rally to them, leaving the Americans to fight alone. But after its first hasty retreats, the poorly trained and inadequately equipped Philippine Army settled down and fought well. That army and the vast majority of the Filipino people remained loyal to the United States during the campaign and the long Japanese occupation that followed.

Philippines, U.S. Recapture of (October 20, 1944–August 15, 1945)

In July 1944, U.S. president Franklin D. Roosevelt met at Pearl Harbor with his two Pacific theater commanders, General Douglas MacArthur and Admiral Chester W. Nimitz. MacArthur insisted that the next U.S. move in the Pacific be the liberation of the Philippine Islands. The islands were, he argued, U.S. territory, and he had vowed that "I shall return." Nimitz, supported by chief of naval operations Admiral Ernest P. King, argued in favor of an assault farther north, on Formosa. The former made political sense, the latter military sense. Either move would, however, have the same advantage of cutting off the Japanese home islands from the oil of the Netherlands East Indies (Indonesia). Roosevelt decided to approve two operations: the first would be against the Philippines; it would shift the second—Nimitz's invasion—farther north, to Okinawa.

Recapture of the Philippines would provide vital strategic bases for further Allied operations against Japanese forces to the north. The plan, as approved, called for MacArthur's forces to attack Mindanao, and those under Nimitz would strike Yap. The two would then combine for an assault on

Leyte. MacArthur's forces would next invade the big Philippine island of Luzon, after which Nimitz's forces would move against Iwo Jima and Okinawa. Unfortunately, there was no unity of command for the U.S. invasion of Leyte.

Japanese commanders recognized the vital importance of the Philippines, and they were prepared to commit the bulk of their remaining naval assets to thwart a U.S. effort to recapture the islands. The U.S. invasion of Leyte in fact prompted the Battle of Leyte Gulf (October 23–26, 1944), the largest naval battle in history.

The landings on Leyte began on October 20; 132,000 men of Lieutenant General Walter Krueger's Sixth Army put ashore the first day. MacArthur landed with the third wave, accompanied by members of the Philippine government and press. Japanese general Yamashita Tomoyuki, the conqueror of Malaya, had overall command of the defenders. Although some 350,000 Japanese Army troops garrisoned the Philippine islands, only the 16th Division of 16,000 men was on Leyte. The invaders had an accurate picture of Japanese strength and dispositions, thanks to Filipino guerrillas. Filipino support was a morale booster for U.S. forces.

General Douglas MacArthur (center) wades ashore following the successful U.S. initial landing at Leyte in the Philippine Islands, October 20, 1944. (National Archives)

The Japanese did not fight for the beaches. They chose instead to contest the advance inland and away from naval gunfire. The U.S. drive was slowed by heavy rains, skillful Japanese delaying actions, and rugged terrain. Yamashita also reinforced Leyte with some 45,000 additional troops sent from Luzon and the Visayas. U.S. aircraft and ships gradually severed this supply line, and the U.S. 77th Infantry Division also went ashore on the west coast of Leyte. Organized Japanese resistance ended on December 25. The United States had suffered 15,584 casualties; Japan's losses were more than 70,000. There were no survivors from the Japanese 16th Division, which had conducted the infamous Bataan Death March. On December 15, the Americans seized the island of Mindoro in the northern Visayas, just south of Luzon, for use as an advance air base for the strike against Luzon.

Yamashita had 250,000 troops on Luzon, but an Allied deception caused him to withdraw most of them south toward Manila. Meanwhile, kamikaze pilots took a heavy toll on Rear Admiral Jesse B. Oldendorf's gunfire-support group in Lingayen Gulf, sinking an escort carrier and damaging a battleship, an escort carrier, one heavy and four light cruisers, and other vessels. Nonetheless, on January 9, 1945, Krueger landed 68,000 men of his Sixth Army almost unopposed at Lingayen Gulf in northern Luzon. Then when Yamashita had committed his forces to the northern threat, Lieutenant General Robert E. Eichelberger's Eighth Army landed in southern Luzon and struck north. Handicapped by shortages of equipment, transport, and air support, Yamashita organized his forces on Luzon into three main groups and settled in for a static defense.

Japanese rear admiral Iwabuchi Sanji received Yamashita's order too late to withdraw from Manila and ordered his 17,000-man Manila Naval Defense Force to hold the capital to the last. The Battle for Manila lasted from February 3 to March 3, 1945, and saw the destruction of much of the city as well as an estimated 100,000 civilian casualties. Afterward, the United States held Yamashita responsible for Japanese atrocities committed in Manila and executed him as a war criminal. At least 16,655 Japanese were killed in the battle. Most of Luzon was secured by July.

With no hope of victory or rescue, most Japanese stoically fought on. With his force down to 50,000 men, Yamashita surrendered on August 15. The U.S. campaign for the Philippines was skillfully fought with proportionally few U.S. casualties, an exception to the general rule in warfare that attackers generally suffer higher losses than defenders. The Battle for

Luzon cost Japan some 205,535 killed and 9,050 captured. U.S. losses were 8,310 killed and 29,560 wounded.

Meanwhile, from February to August, Eichelberger's Eighth Army liberated the Visayas and southern Philippine Islands. Simultaneously, Australian troops took the remaining Japanese strongholds on New Guinea and in the Bismarcks and the Solomon Islands.

Philippine Sea, Battle of the (June 19–21, 1944)

Battle between the Japanese Navy and the U.S. Navy in the largest aircraft carrier engagement in history. The Battle of the Philippine Sea virtually destroyed what remained of Japanese naval aviation capability. In June 1944, U.S. forces launched Operation FORAGER to capture the Mariana Islands for use as bases for Boeing B-29 strategic bombing raids on Japan. On June 15, U.S. marines invaded Saipan, northernmost of the principal Marianas. Admiral Raymond A. Spruance had overall command. His Fifth Fleet and its main strike force, Vice Admiral Marc A. Mitscher's Task Force 58, provided support and protection. Task Force 58's assets included 7 fleet carriers, 8 light carriers, 7 battleships, 8 heavy cruisers, 13 light cruisers, 69 destroyers, and 956 aircraft.

Also on June 15, the Japanese First Mobile Fleet under Vice Admiral Ozawa Jisaburo emerged from the Philippines through the San Bernardino Strait and headed northeast, a move intended to draw the U.S. fleet into a decisive battle that would reverse the course of the war in the Central Pacific. Assembled over the preceding month, Ozawa's force comprised 90 percent of Japan's surface naval strength and consisted of 5 fleet carriers, 4 light carriers, 5 battleships, 11 heavy cruisers, 2 light cruisers, 28 destroyers, and 473 aircraft. Ozawa believed that his inferior aircraft numbers would be offset by the greater range of his planes and by the presence of 90 to 100 land-based aircraft on the islands of Guam, Yap, and Rota, with which he planned to attack the U.S. carriers to initiate the battle. As Ozawa's carriers came into range, his planes would launch a second strike, refuel and rearm on the islands, and then attack the Americans a third time while returning to the Japanese fleet.

The U.S. submarine *Flying Fish* reported the Japanese sortie from the Philippines. Leaving his older battleships and several cruisers and destroyers to protect the Saipan beachhead, Spruance joined Mitscher's Task Force 58 on June 18 to search for Ozawa. Misled by the commander of the Japanese land planes and unaware that most of them had been destroyed by attacks from Mitscher's undamaged carriers, Ozawa launched four attack waves on the morning of June 19, only to lose 346 planes in what the victors called the "Great Marianas Turkey Shoot." That same day, the U.S. submarine *Albacore* sank the *Taiho,* Japan's newest and largest carrier and Ozawa's flagship. Another submarine, the *Cavalla*, sank the Japanese fleet carrier *Shokaku*.

Spruance still did not know Ozawa's precise location, and he rejected Mitscher's urging that he move offensively toward the west for fear that the Japanese might flank him and get between him and the Saipan landing sites. Aerial night searches were deemed impractical because aircrews were exhausted and the moon was new. Although Mitscher dispatched extensive search missions through the morning and early afternoon of June 20, not until 4:00 p.m. were Ozawa's ships finally sighted, at the extreme range of the U.S. aircraft.

A Japanese heavy cruiser under attack by U.S. Navy carrier-based aircraft during the Battle of the Philippine Sea (June 19–21, 1944). The Japanese ship was sunk. (Corbis)

Despite knowing that his planes would return to their carriers in darkness and that many of them would probably exhaust their fuel beforehand, Mitscher ordered a massive strike. It found Ozawa's ships shortly before dark and sank another fleet carrier, the *Hiyo,* and two oilers. It also severely damaged three other carriers, a battleship, a heavy cruiser, and a destroyer and eliminated all but 35 of the remaining Japanese aircraft.

The return flight of the U.S. aircraft became one of the most dramatic episodes of the Pacific war. Only 20 of the 216 aircraft sent out earlier had been lost in action, but 80 were lost in ditchings or crash landings. Ignoring the risk of Japanese submarines, Mitscher ordered his carriers to turn on all their lights to guide his fliers. Efficient search-and-rescue work recovered all but 49 airmen. Spruance pursued the retreating Japanese from midnight to the early evening of June 21, but he was slowed by his destroyers' need to conserve fuel, whereas Ozawa accelerated the withdrawal begun after his losses on June 19.

Although it effectively destroyed Japanese naval airpower, the Battle of the Philippine Sea quickly became controversial. Members of Mitscher's staff condemned Spruance for not steaming farther westward on the night of June 18–19 to give Mitscher a more favorable launch position. Mitscher, for his part, was criticized for not sending out night searches on June 19–20 that might have found Ozawa sooner and allowed the Americans more daylight for their air attack on the Japanese fleet, perhaps even creating conditions for a surface engagement. Such a scenario, however, might have resulted in much greater losses for the U.S. side with no more strategic benefits than were actually gained.

Phillips, Sir Thomas "Tom" Spencer Vaughan (1888–1941)

British Royal Navy admiral. Born on February 19, 1888, in Falmouth, England, Tom Spencer Vaughan Phillips became a naval cadet in 1903. He joined the navigation branch of the service and saw action during the 1915 Dardanelles Campaign, but he spent much of the rest of World War I in the Far East.

Phillips attended the Naval Staff College (1919–1920); served on the Permanent Advisory Commission for Naval, Military, and Air Questions of the League of Nations (1920–1922); and was promoted to captain in June

1927. He ended a three-year tour on the operational staff of the Royal Navy Mediterranean command in May 1928. Phillips was assistant director of plans at the Admiralty from 1930 to 1932, served with the East Indies Squadron from 1932 to 1935, and was director of plans at the Admiralty from 1935 to 1938. In April 1938, Phillips commanded the Home Fleet destroyer flotillas. He was promoted to rear admiral in January 1939 and served as deputy chief of the Naval Staff during 1939–1941.

First Sea Lord Sir Dudley Pound, chief of the naval staff, selected Phillips as deputy chief over several more senior officers. At first, Phillips had the confidence of Prime Minister Winston L. S. Churchill, who recommended him for the rank of acting vice admiral in February 1940. Rapport between the two men gradually eroded, and Phillips opposed Churchill's proposal in September 1940 for retaliatory bombings of German cities. He also opposed Churchill's decision in March 1941 to divert scarce forces from North Africa to bolster Greece. His personal contact with the prime minister practically ceased thereafter.

Phillips was appointed commander in chief of the Eastern Fleet in May 1941, but he retained his duties as vice chief of the naval staff until October, when he took up his new command with the acting rank of admiral. He sailed for the Far East on October 25 in the new battleship *Prince of Wales*, which was joined en route by the old battle cruiser *Repulse*. Phillips arrived in Singapore on December 2, only to face the Japanese attacks on Malaya on December 8. Intelligent, self-assured, and hardworking, Phillips also lacked combat experience and did not appreciate the need for air cover.

Phillips had a difficult choice. He could attempt to oppose the Japanese amphibious landings in Malaya, or he could remain in Singapore. Phillips gambled on the offensive, and his Force Z of the *Prince of Wales*, the *Repulse*, and four old destroyers sailed on December 8 with the hope that radio silence, bad weather, and the element of surprise might enable him to catch the Japanese transports. His plan had some merit, as the *Prince of Wales* was stronger than any Japanese ship. Phillips also knew that the Japanese had no aircraft carriers, and he observed that the Japanese were taking risks in pushing their troopships forward. An unknown factor remained the strength of Japanese land-based aircraft, their range from their recently captured airfields, and the availability of British air cover. On December 9, Phillips was advised that he would have no friendly air cover,

but he elected to press on. Phillips had great faith in the antiaircraft armament of the *Prince of Wales* and did not believe that land-based airpower could sink underway capital ships. No capital ship had yet been sunk at sea by aircraft.

Japanese reconnaissance aircraft discovered Force Z on December 9. Phillips finally opted to turn around, but his ships were attacked by a large formation of Japanese land-based naval aircraft on the morning of December 10. Within two hours, both capital ships were sunk in what was Britain's worst single naval defeat of the war. Phillips went down with his ship.

Photoreconnaissance

Photoreconnaissance refers to the use of cameras on aircraft to gather photographic information in support of planning and combat operations. It was an important source of intelligence for both sides in the war. Camera-carrying aircraft often provided commanders on the ground with a clear picture of enemy locations and strength. Photoreconnaissance also led to a simultaneous growth in deception operations to mislead intelligence collection by the opposing side.

Interest in aerial reconnaissance photography came with balloons, well before the first military aircraft. In 1911, the U.S. Army Signal Corps added aerial photography to the curriculum at its flight training school, and the Italians used aerial photography to assist their troops in Libya during the war with Turkey in 1911–1912. During World War I, two-man observation aircraft of all major warring powers produced aerial photography through handheld cameras. The low speed of such aircraft made them vulnerable to fighter aircraft, however. During the war, aerial photography developed significantly, and geographic survey work during the interwar years stimulated technological improvements in aerial cameras.

Photographic analysis was an important part of this process. It normally occurred at two levels—immediate exploitation at or near the airfield to identify information with time-sensitive value followed by in-depth study at a centralized facility serving the entire theater of operations. Centralized processing and analysis also allowed analysts to link the information from the photographs to information from other intelligence sources to create a more refined assessment.

In Britain, Royal Air Force (RAF) group captain Frederick William Winterbotham of MI-6 took a keen interest in photoreconnaissance. In September 1938, he approached Australian Sidney Cotton, who had developed a new type of film, and Cotton agreed to undertake high-altitude reconnaissance flights. Late that same year, the British initiated clandestine photoreconnaissance missions over Germany and over Italian territory in the Mediterranean. Cotton's missions acquired photographs of the area between Dusseldorf, Aachen, and Köln (Cologne) from an altitude of 32,000 feet. These flights confirmed the utility of aerial photography.

Pilots flying such missions, however, encountered high-altitude flying problems, and condensation trails gave away the presence of the aircraft. Such flights nonetheless provided the French with information about the Siegfried Line, which they had been trying to obtain since 1936. They also allowed Bomber Command to update its military and economic targeting files, and tactical units secured photographic images of bridges and road junctions along expected German invasion routes.

On the outbreak of war, aerial reconnaissance was transferred to the RAF. This entailed little change in personnel since, under now Wing Commander Cotton, most men were already RAF personnel. Cotton acquired two Spitfire

fighter aircraft and modified them by removing guns and radios and installing downward-facing stereoscopic cameras. The unit became the first of six strategic photoreconnaissance squadrons: four in Europe and two in Asia.

The United States readily adopted the British system. The U.S. Army Air Forces (USAAF) also moved from slower and older aircraft for short-range reconnaissance and modified bombers for long-range missions to the fast Lockheed P-38 Lightning and North American P-51 Mustang.

The United States made extensive use of photoreconnaissance in both the European and Pacific theaters. One of the most prominent examples of the value of photoreconnaissance to the Allies came in the hundreds of thousands of photographs of France produced in the course of 4,500 photoreconnaissance sorties flown in the weeks and months leading up to the June 6, 1944, Normandy Invasion.

Although the Soviet Union had stressed the value of photoreconnaissance to military operations, after 1941 the Red Air Force proved sadly deficient in this area. Its aircraft, such as the Polikarpov Po-2, usually proved too slow and vulnerable. Soviet photoreconnaissance did register improvements, albeit at a slow pace, during the course of the war.

The Germans also appreciated the value of photoreconnaissance to military operations, and the Luftwaffe began the war with several dedicated reconnaissance squadrons. The Luftwaffe employed the Henschel Hs-126 as well as the Dornier Do-17F and Junkers Ju-88D. The Luftwaffe also modified for reconnaissance purposes fighter aircraft such as the Messerschmitt Bf-109 and Focke-Wulf Fw-189 and Fw-190 but never did adopt the Allied practice of removing aircraft armament to improve speed and range. Intelligence gained by aerial photography was an important factor in the early German successes during and after Germany’s June 22, 1941, invasion of the Soviet Union. In Western Europe, at least, Allied air superiority by 1942 enabled the British and Americans to restrict significantly the effectiveness of German photoreconnaissance, although the Germans continued to operate reconnaissance aircraft effectively on the Eastern Front for the remainder of the war.

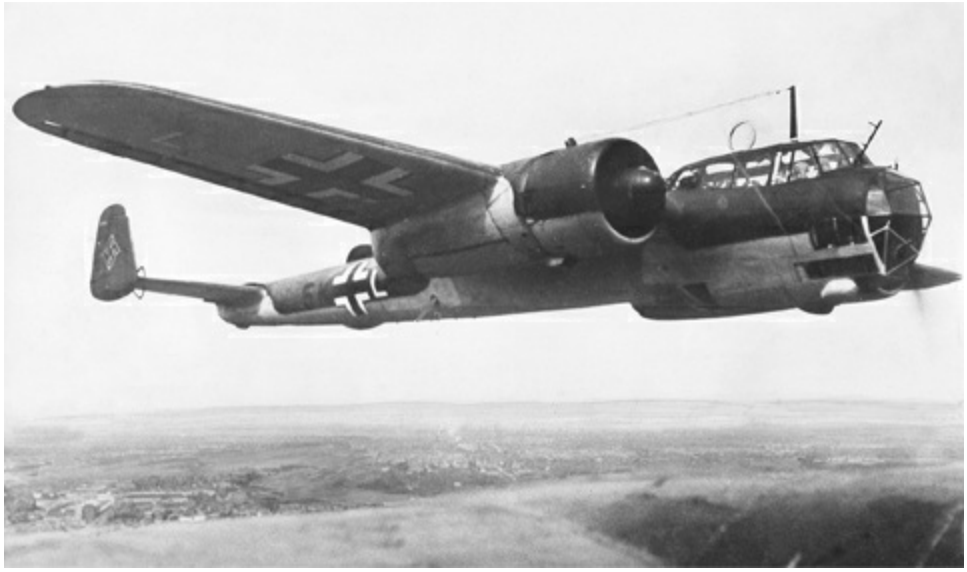

Photo reconnaissance was extremely important during the war. Shown here is a Luftwaffe Dornier Do-17 on a reconnaissance mission during the Battle for France in 1940. (Ullstein Bild via Getty Images)

Photoreconnaissance was immensely useful in mapping, mission planning, and briefing. It could also be used to benefit the side being observed. For example, the Allies instituted an elaborate two-part deception plan to support the Normandy Invasion. Operation FORTITUDE NORTH was to convince the Germans that the Allies intended to invade Norway from Scotland; FORTITUDE SOUTH led the Germans to believe that the Pas de Calais rather than Normandy was the Allied objective in France. The plan made use of dummy tanks, landing craft, and airfields. The Allies allowed some German reconnaissance aircraft to fly over these areas and photograph them. The deception was entirely successful.

Aerial reconnaissance proved of great importance in the Far East, where Japanese movements and intentions were difficult to discern because of the vast areas. Although much information was gleaned from signals intelligence or long-range surveillance flights such as by Catalina flying boats, photo flights were required for intelligence purposes. The USAAF modified B-24 and B-29 bomber aircraft to undertake long-range photoreconnaissance missions. Increased Allied successes and air superiority reduced the ability of the Japanese to counter photoreconnaissance flights, forcing the Japanese increasingly to adopt decoys similar to the Normandy deceptions, such as straw aircraft dummies, to lure Allied attacks.

Advances in technology, specifically the use of smaller, more sophisticated cameras in higher-performance aircraft, revolutionized photoreconnaissance. Optics allowed for information collection at the greater safety of higher altitude and speed than physical observation. Acquiring such imagery for subsequent detailed analysis became a critical intelligence function for the world's military establishments. The importance of photoreconnaissance is reflected in the development of specialized high-altitude aircraft especially for this purpose.

Pick, Lewis Andrew (1890–1956)

U.S. Army lieutenant general. Born in Brookneal, Virginia, on November 18, 1890, Lewis Andrew Pick graduated from the Virginia Polytechnic Institute in 1914 and served with the U.S. Army 23rd Engineers in France during World War I. Commissioned into the U.S. Corps of Engineers in 1917, Pick was stationed in the Philippines from 1921 through 1923, where he established a Filipino engineer regiment.

When Pick returned to the United States, he assisted with flood control work. From 1928 to 1932, he was on Reserve Officers' Training Corps duty at Texas A&M University. He graduated from the Command and General Staff School in 1934 and taught tactics there until 1938. In 1939, he graduated from the Army War College and was assigned to the Corps of

Engineers' Ohio River Division. In December 1941, Pick was promoted to temporary colonel. He became the Missouri River Division engineer in April 1942. Working with W. Glenn Sloan of the Bureau of Reclamation, Pick sought ways to prevent the Missouri River from overflowing its basin. The Pick-Sloan plan that incorporated several of his ideas for the Missouri River basin went into effect in 1944.

In October 1943 Pick was deployed to the China-Burma-India theater, where he replaced Brigadier Raymond A. Wheeler in directing engineers who were building the Ledo Road, which came to be known as "Pick's Pike." This crucial land supply route extended from northern India through Burma to China and tied in with the old Burma Road to supplement the Himalayan air routes. The difficult jungle terrain seemed almost impossible for road construction, but Pick persevered. Although he and the majority of his workers were sickened by malaria, Pick pushed the main road ahead while also providing for construction of side roads for combat troops to pursue the Japanese. It took slightly more than two years to complete the route.

Promoted to brigadier general in February 1944, Pick led the first convoy into Kunming on February 4, 1945. Pick's men also built an airfield for Merrill's Marauders during the Siege of Myitkyina (May–August 1944). Pick was promoted to major general in March 1945.

Following the war, Pick resumed his peacetime position as division engineer in Missouri until March 1949, when President Harry S. Truman named him chief of the Army Corps of Engineers. Promoted to lieutenant general in 1951, Pick headed the Corps of Engineers until his retirement in November 1952. Pick died in Washington, D.C., on December 2, 1956.

Pistols and Revolvers

Modern pistols are magazine-fed hand weapons that fire semiautomatically each time the trigger is pulled. Most pistols have a minimum capacity of at least eight rounds, although there are variations. A revolver has a rotating cylinder of chambers (normally six), which are each loaded with one cartridge. The action is fired by pulling on the trigger, which cocks the weapon and rotates the chamber to the next live round (double-action), or by cocking first and then firing (single-action).

The pistol, or revolver, is a single-handed weapon with a short barrel firing a low-energy cartridge. This means that it is largely inaccurate at ranges in excess of about 30 yards, and few soldiers can use it effectively except at the closest belt-buckle range. In the period prior to World War II, the pistol was the side arm of officers and cavalrymen and was regarded as a weapon of last resort.

Pistols have been used by soldiers since firearms were first invented, but the ineffectiveness of the weapon at any but the shortest range has always been its drawback. Long-barreled weapons of the 19th century suffered from loss of penetration power, as the cartridge was low-powered. Attempts have been made to increase accuracy by firing “super” or magnum cartridges, but the short barrel makes accuracy questionable.

In World War II, a development in firearms design reduced the importance of the pistol still further; this was the submachine gun, which fired the same cartridge as the pistol but from a heavier longer-barreled weapon, increasing rate of fire and effectiveness to about 100 yards. The Soviets adopted the submachine gun to good effect, arguing that a heavy weight of fire at short range was far more effective than single rifle shots at longer ranges.

A soldier holding a Colt .45 pistol, the standard sidearm for U.S. military personnel during World War II. (William Vandivert/The LIFE Picture Collection/Getty Images)

Nevertheless, the pistol was still issued. The U.S. Army employed the Colt M1911A1 .45-caliber pistol, which was carried by officers, noncommissioned officers, and air and tank crews. The pistol was intended to be an individual side arm that was easy to carry and use and was with the soldier at all times in a holster on his belt. The .45 ACP (Automatic Colt Pistol) cartridge had significant power, capable with one shot of disabling or killing the targeted individual. Lieutenant General George S. Patton's famed six-shooters were certainly never used in anger, but they perpetuated the American myth that the spirit of the frontier was alive and well and perhaps enshrined within the general himself. The Americans also used the Smith and Wesson M1917 revolver, derived from the British .38/200 revolver.

European forces primarily used the 9mm Parabellum cartridge, invented in Germany, that was fired by a variety of weapons, including the famous Luger Pistole '08 and the Walther P38. Most nations in Europe used this caliber and cartridge for the simple reason that it was effective and was a disabling cartridge, if not a true killer. The standard Italian-issue side arm was the well-made 9mm Beretta Model 1934 with seven rounds. The French used the old (1892) revolver, the so-called Lebel of 8mm, but in the 1930s they introduced two new 7.65mm pistols: the M1935A and M1935S each carried eight rounds. The British, idiosyncratic to the last, persisted in issuing

a rimmed .38-caliber cartridge-firing revolver to their officers and mechanized troops, although many were rearmed with the Sten (9mm) or the Thompson (.45-caliber) submachine gun.

On the Eastern Front, troops on both sides were armed with pistols as well as rifles or submachine guns, particularly when engaged in house-clearing or close-terrain operations because of the close-quarters element of such fighting. German medical troops (banned from carrying weapons by the Geneva Convention of 1929) carried pistols for close protection when it was found that Soviet troops did not always respect the Red Cross.

The principal Japanese side arm was the Taisho 04 (or 1915), known as the Nambu for its designer, Colonel Nambu Kirijo. An 8mm, it held eight rounds. The follow-on was the Taisho 14 (1925) Nambu. Nambus were never considered reliable firearms, especially those produced late in the war.

The reason for arming mechanized troops and officers with pistols was to ensure that they had some protection. This was despite the fact that officers had many other tasks to perform, among which fighting was less important; mechanized troops operated in confined spaces, into which a full-length rifle or even a submachine gun was difficult to fit. U.S. forces used the M1 carbine in preference to the pistol, but the weapon was not popular, as it lacked killing power.

Pistols were also carried by police units within armies as well as by secret police units and were issued to individuals in the secret services. Some of these latter were designed for concealment or to be one-shot weapons, for use only in emergency situations.

Pius XI, Pope (1857–1939)

Roman Catholic prelate and pope (1922–1939). Pope Pius XI was born Ambrogio Damiano Achille Ratti on May 31, 1857, in Desio, Italy, and ordained a priest in 1879. He thereafter earned three separate doctorates from the Gregorian University (Rome) and became a professor in a seminary. He began his career at the Vatican in 1911, when he became its vice prefect. In 1918, Ratti began his diplomatic career when he was posted to the newly independent Poland. There he helped establish a working relationship with the Polish government and also sought an accommodation with the Bolsheviks in Russia. In 1921, he became archbishop of Milan, one of the most important posts in the Catholic Church at the time. He was then elevated to the College of Cardinals. After Pope Benedict XV died, Ratti was elected to the papacy on the 14th ballot on February 6, 1922, and took the name Pius XI.

Scholarly and bookish by nature, Pius XI was an activist pope who in many ways embraced modernity and did not shy away from using new media such as the radio to broadcast the church's message and teachings to a wide audience. He also greatly accelerated evangelism by sponsoring more missionaries throughout the world and by ordaining more priests and other religious personnel.

It was in the diplomatic realm, however, that Pius's reign had the most far-reaching effect. Although he deeply distrusted Italian fascism and eyed Benito Mussolini warily, in 1929 he signed the Lateran Treaty with Mussolini's government, which was an understanding between the church and the state in which both parties pledged not to interfere in the affairs of the other; Mussolini also agreed to recognize Vatican City as a sovereign state within Italy, something that had not existed since before Italian unification.

Pius soon ran afoul of Mussolini's regime. By the early 1930s Pius had denounced fascist youth groups in both Italy and Germany. In 1931, he authored a papal letter in which he stated that one could not be a fascist and a Catholic at the same time. Not surprisingly, the Vatican's relations with the Mussolini regime went into a tailspin. This did not stop Pius from negotiating a concordat with Adolf Hitler's Nazi regime in Germany in 1933.

Pius was later criticized for this, but to his way of thinking, communism was a worse scourge than fascism. Thus, he sought to protect Catholics and Catholic clergy in Germany while hoping that Hitler would continue to be a bulwark against Soviet-exported communism. In any event, Hitler largely

ignored the concordat, and by the late 1930s Pius had begun to denounce Nazi ideology—especially its rabid anti-Semitism. He also lambasted Mussolini for copying the Nazis' anti-Semitism beginning in 1938.

Pius XI continued to be outspoken in his dislike of fascism, communism, and nationalism. He was also the first pope to address seriously the subject of Christian ecumenism (interfaith dialogue ultimately resulting in cooperation among denominations and faiths) and issued a stinging indictment of racism of all kinds, which was clearly aimed at Germany and the Soviet Union. Pius's health began to deteriorate rapidly in late 1938, and he died in the Vatican on February 10, 1939, only months before World War II began.

Pius XII, Pope (1876–1958)

Roman Catholic prelate and pope. Born in Rome on March 2, 1876, Eugenio Pacelli was ordained to the priesthood in 1899 and accepted appointment to the Secretariat of State for the Vatican in 1901. He served as papal nuncio to Germany from 1917 to 1929 and observed firsthand the early manifestations of Nazi ideology. He was probably the Vatican official most familiar with the goals of Nazi dictator Adolf Hitler. Pacelli was elevated to cardinal in 1929 and became secretary of state at the Vatican in 1930.

During Pacelli's tenure, the Vatican negotiated a concordat with Germany that formally separated religion and politics. Pacelli encouraged the German Catholic hierarchy and individual clerics to abide by the terms of the agreement and to seek accommodation with the National Socialist regime. In an effort to keep favorable diplomatic relations with the German government,

the Vatican never publicly challenged the ideology of the Nazi Party and punished clerics who spoke against some of the overtly racist policies that emerged in Germany during the 1930s.

On March 2, 1939, Eugenio Pacelli was elected pope, taking the name of Pius XII. He was soon confronted with the horrors of World War II, which began that September. Pius XII's challenges during the war included maintaining civil relations with extremist governments, responding to the pastoral needs of Catholic peoples facing the horrors of war, and managing a worldwide enterprise divided by civil loyalties. His skills as a lifelong diplomat and his understanding of the ideas of realpolitik characterized his papacy during the war.

Clearly, Pius XII preferred fascism and Nazism, which at least tolerated Christian churches, to godless communism. Pius attracted considerable criticism, both during and after the war, for his lack of response to the anti-Semitic policies of the Third Reich, especially the Holocaust. Although Pius XII made several oblique condemnations of deportations, racial laws, and the plight of Roman Jews, he never exposed Nazi policies or condemned them outright. Recent investigations reveal that he was aware of the extent of the Holocaust. Pius XII understood the dangers that condemnation of Nazi policies would bring, and although he apparently agonized long and hard over the matter, he came to the conclusion that strong condemnation would be counterproductive to the interests of the church.

Pius XII was also later criticized because the Vatican issued passports to many suspected war criminals, allowing them to secure safe haven in other parts of the world. Pope Pius XII died in Rome on October 9, 1958.

Placentia Bay Conference (August 9–12, 1941)

The first wartime meeting between British prime minister Winston L. S. Churchill and U.S. president Franklin D. Roosevelt. The meeting at Placentia Bay, sometimes called the Atlantic Conference, occurred off the coast of Argentia, Newfoundland, and evolved from the correspondence between the two leaders and a growing desire to meet face-to-face. The idea for a meeting was first raised in 1940, but it was delayed repeatedly by political and war events. Argentia was chosen as a rough midway point for the two leaders. A new U.S. base that could provide cover was located there, and the location was remote, ensuring secrecy.

Roosevelt left Washington on August 3, 1941, under the guise of a fishing trip, but instead he secretly boarded the heavy cruiser *Augusta* off Martha's Vineyard and steamed north. Likewise, Churchill had quietly crossed the North Atlantic in the new battleship *Prince of Wales*. Each leader traveled with a substantial entourage of military and political advisers.

On Saturday, August 9, both parties arrived, and Churchill boarded the *Augusta* for the first meeting of the two leaders, during which the respective staffs had the opportunity to get to know one another. On Sunday, August 10, a shared religious service was held on the quarterdeck of the *Prince of Wales,* where the attendees sang familiar hymns.

On August 11, the real work of the conference began with three parallel meetings: Churchill and Roosevelt, their diplomatic assistants, and the military chiefs of staff. As a result, the United States agreed to accelerate aid to both Britain and the Soviet Union and to increase naval patrols in the Atlantic. The two countries also agreed to a protective takeover of the Canary Islands (by Britain) and Azores (by the United States) if Germany invaded the Iberian Peninsula. But the Americans made it clear that they did not intend to intervene beyond these actions because of domestic isolationist political pressure and military unpreparedness. Among the controversies that arose, however, was one over the British plan to rely for victory on heavy bombing, whereas the Americans argued that an invasion by ground forces would be needed to overcome Germany.

August 12 was dominated by discussion of the forthcoming Anglo-American mission to Moscow and final amendments to the joint eight-point

statement of goals and aims, which became known shortly thereafter as the Atlantic Charter. Both leaders then departed Argentia.

Roosevelt and Churchill discussed the meeting and the Atlantic Charter with journalists in the days that followed. Disagreement resulted from the softening by Secretary of State Sumner Welles of a statement to which Churchill and Roosevelt had agreed concerning further Japanese intentions in the Pacific. Welles believed that American political opinion was not ready for too firm a stand against the Japanese, and Roosevelt agreed with the new version as opposed to the near ultimatum that had been penned in Argentia. Principles expressed in the Atlantic Charter lasted far longer.

Ploieşti, Raids on (August 1, 1943–August 18, 1944)

Major and costly U.S. air raids against the refineries of Ploieşti, Romania, known as Operation TIDAL WAVE. The refineries there supplied almost one-third of Germany's oil requirements. A land invasion of Romania to seize the Ploieşti refineries was impractical, so on August 1, 1943, the United States launched a yearlong air campaign to destroy them.

The first raid on Ploieşti was conducted on June 1, 1942, by 13 Consolidated B-24 Liberator bombers of Halverson Detachment, led by Colonel Harry A. "Hurry-Up" Halverson. The mission originated in Fayid, Egypt. Twelve planes reached the target and bombed it from high altitude,

escaping without loss. Damage to Ploieşti was negligible. Three times during that first week in June, the Soviet Air Force sent small numbers of bombers against Ploieşti. The last inflicted some damage but at the cost of several Soviet planes and airmen. This ended Soviet interest in the refineries.

At the Casablanca Conference in January 1943, President Franklin D. Roosevelt and Prime Minister Winston L. S. Churchill endorsed a plan to bomb Ploieşti from North Africa. Planners decided that a low-level attack would be safer and more productive than one from the traditional high level. Three U.S. B-24 bomb groups from England were added to the two in Brigadier General Uzal G. Ent's IX Bomber Command, which was already in North Africa.

After studying the plan (code-named TIDAL WAVE) with his commanders and staff, Ent wrote a note to his superior officer recommending against a low-level mission. He did not know that this had already been decided. Once informed, he began intensive training of the five groups.

On August 1, 1943, 178 B-24s departed for Ploieşti. Eleven bombers either aborted or were lost en route to the target. Unknown to the Allies at the time, the Germans detected and traced the air armada from takeoff all the way to the target. As a result, German air defense fighter squadrons and antiaircraft defenses were fully alerted, and the German fighters were particularly effective against the bombers during the return from the mission.

Because of a navigational error, the bomb runs could not all be made as planned. Nonetheless, substantial damage was inflicted on several refineries, although oil production was reduced only in the short term. The bombing results did prove that the low-level attack destroyed more of the target area than raids made from high altitudes. At this point in the war, however, the 2,700-mile round-trip raid by unescorted bombers was an epic. Losses, although heavy, were fewer than Ent had feared. American losses included 310 men killed and some 130 wounded (including those who crashed or landed in neutral territory). Eighty-eight aircraft returned to base, but only 33 were fit to fly, and Ent had just over half his original complement of airmen. For this raid, 5 men were awarded the Medal of Honor, 3 of them posthumously. Ent and several others were awarded the Distinguished Service Cross, America's second-highest award for heroism.

Ploieşti had an impressive and deadly array of antiaircraft guns and fighter planes to defend the area during the August 1, 1943, raid. Following

that, German lieutenant general Alfred Gerstenberg, who commanded Ploieşti's defenses, improved the defenses with additional guns and planes and, as a final touch, smoke pots. These pots were scattered throughout the refinery area and could be lit to cover the targets. He also installed an oil pipeline system, linking all the refineries, so that oil could be diverted from more damaged refineries to those less damaged or undamaged, maintaining optimal output.

Between April 5 and August 19, 1944, the U.S. Fifteenth Air Force made 5,479 high-level sorties in 19 raids against Ploieşti, with a loss of 223 aircraft. On June 10, 1944, 46 P-38 fighters made a low-level attack, and 24 were lost. Some 2,829 American airmen were lost (killed or captured) during the entire campaign. During the summer of 1944, Britain's Royal Air Force (RAF) flew 924 high-level sorties against Ploieşti, in which 38 planes were lost.

In the raids, the Fifteenth Air Force and the RAF destroyed nearly 1.2 million tons of Ploieşti oil production, amounting to 84 tons of oil lost for each ton of bombs dropped. When Soviet troops entered Ploieşti on August

30, 1944, they found five refineries producing just 20 percent of normal production.

PLUTO

PLUTO was the acronym/code word for "Pipe Line under the Ocean" or "Pipe Line Underwater Transport of Oil." It was designed to supply petroleum to France following the Normandy Invasion of June 6, 1944. A sustainable and considerable supply of petroleum was essential to maintain the highly mechanized and motorized Allied forces in their drive across France, and General Dwight D. Eisenhower identified PLUTO as second in importance only to the Mulberry artificial harbors for the success of the invasion and subsequent liberation of France.

A network of high-pressure pipelines, PLUTO carried vital petroleum products. The three-inch pipelines were of two types. The HAIS was of lead with an outer steel winding, and the HAMEL was of steel. Each mile of HAIS pipe incorporated 24 tons of lead, 7.5 tons of steel tape, and 15 tons of steel outer armor, in addition to other materials such as cotton tape and jute serving. In all, PLUTO incorporated nearly 800 miles of pipes, the vast majority of which came from British manufacturers. PLUTO pumping stations were carefully disguised as buildings and gravel pits; one was even disguised as an ice cream shop.

The pipe was laid from large floating steel bobbins known as "conundrums," for cone-ended drum. Each weighed 1,600 tons and carried 60 miles of pipeline. The first pipe-laying ship was the converted coastal

freighter HMS *Holdfast*. As it and the other three pipe-laying ships towed one of the five conundrums across the channel, the cable unrolled from its bobbin and sank to the seabed. In all, a total of 34 pipe-laying ships and 600 officers and men were involved in the operation.

The two principal pipelines were "Bambi," from the Isle of Wight to Cherbourg, and "Dumbo," from Dungeness in Kent to Boulogne. Bambi ultimately had 4 lines totaling 280 miles, while Dumbo numbered 17 lines totaling 500 miles of pipeline capable of pumping 1,350,000 gallons a day. Supplementing these were Tambola ship-to-shore pipelines.

Although Bambi and Dumbo were ready by D-day, the pipeline operation was delayed by the prolonged German defense of Cherbourg and mining of that port. In the meantime, oil went ashore to the Normandy beaches directly from tankers via minipipelines.

By September 18, when both pipelines were working, Allied forces had already retaken Paris and broken the German army in France. Bambi closed on October 4 (U.S. tankers were then directly delivering fuel to Cherbourg and Le Havre), and Dumbo then supplied all the cross–English Channel pumping.

PLUTO made it possible to dispense with a large number of tankers and remove them as possible targets. It also sharply reduced congestion at Mulberry B and the French ports once the latter were back in operation. By the end of the war in Europe, PLUTO had delivered 172 million gallons of petroleum to France.

The vast majority of the PLUTO pipelines were salvaged during 1946–1949. Some of the pipe missed by the salvage operation can be seen in the Isle of Wight Shipwreck Centre and Maritime Museum at Arreton.

Poland

Nation located in East-Central Europe with a 1939 population of 34.774 million. In 1939, Poland bordered Romania, Hungary, Bohemia, and Moravia to the south; Germany to the west and northwest; Lithuania and Latvia to the north; and the Soviet Union to the east. Poland's interwar land area covered approximately 150,000 square miles. The Second Polish Republic, which did not come into being until 1918, governed Poland as an independent state until September 1939, although the Polish government had become increasingly repressive and authoritarian in the years leading into World War II.

On September 1, 1939, 1.8 million German troops moved into Poland from three directions. The Germans had more than 2,600 tanks to only 180 for the Poles and more than 2,000 combat aircraft for only 420 Polish planes. Furthermore, the Polish armed forces were only about one-third mobilized by the time the attack came. Britain and France had pressured Poland not to mobilize earlier to avoid provoking Germany with "aggressive behavior."

Britain and France declared war on Germany on September 3. Under the security guarantees that had been given to Poland, that nation was supposed to fight a defensive campaign for only two weeks, at which time the Allies would counterattack from the west. That Allied offensive never occurred. By September 14, the Germans had surrounded Warsaw. Three days later, Soviet forces invaded Poland from the east. The last Polish forces surrendered on October 5.

There are many myths about Germany's so-called blitzkrieg campaign against Poland. The Polish Air Force was not destroyed on the ground on the first day of the war, and Polish horse cavalry units never mounted wave after wave of suicidal attacks against the German panzers. Nor was the campaign a walkover. The Poles held out for twice as long as they were expected to. In six weeks of fighting, the Germans suffered 50,000 casualties and lost 697 aircraft and 993 armored vehicles.

Under a secret clause of the German-Soviet Non-Aggression Pact of August 1939, Germany and the Soviet Union participated in a fourth modern partition of Poland. The Soviets absorbed the eastern part of the country, including the great cultural centers of Lvov (L'viv) and Wilno. In the Soviet zone, 1.5 million Poles were deported to labor camps in Siberia. In a deliberate effort to exterminate the Polish intelligentsia and leadership

classes, Soviet authorities transported thousands of captured Polish officers, including many reservists from universities and industry, to the Katyn Forest of eastern Poland and other locations, where they were executed and buried in anonymous mass graves.

Of the territory they occupied, the Germans annexed Pomerania, Poznan, and Silesia in the west. What was left became the General Government, under the harsh rule of Hans Frank. The Germans then began a campaign to liquidate the Jews of Poland and grind down the rest of the Poles. The Polish Jews were first herded into ghettos while the Germans built more than 2,000 concentration camps in Poland, including the industrial-scale death centers at Auschwitz, Birkenau, and Treblinka.

A number of Poles, including many in the armed forces, managed to escape from the country before the Germans and Soviets tightened their viselike grip on it. Those who escaped established a government-in-exile in London, with Władysław Raczkiewicz as president and General Władysław Sikorski as prime minister. In Poland, meanwhile, the Polish Resistance established the Armia Krajowa (Home Army, AK), which became the largest underground movement in Europe, with 400,000 fighters.

Outside of Poland, the Polish Army, the Polish Air Force, and the Polish Navy reorganized themselves in Britain and continued the war. The Britain-based Polish Army eventually fielded a corps in Western Europe. After Germany attacked the Soviet Union in June 1941, the Soviets released several thousand Polish prisoners of war to establish another corps under General Władysław Anders. The Polish II Corps was allowed to leave the Soviet Union by way of Persia and Egypt, and it eventually fought with distinction in North Africa and Italy.

Prior to the start of the war, Polish intelligence had managed to duplicate a German Enigma cipher machine. Copies were turned over to both the French and British in July 1939 and were the starting point of the Allies' spectacular success with radio-derived communications intelligence. Later in the war, the intelligence service of the AK recovered a German V-2 rocket that had crashed in the Bug River after a test flight and sent the key components to London.

In 1943, the Soviets formed their own division of Polish troops to fight on the Eastern Front. That unit would eventually grow to field-army strength. But when the Germans later that year discovered the bodies of the Polish

officers executed at the Katyn Forest and broadcast this news to the world, it opened a rift in Polish-Soviet relations that remained until the end of the Cold War.

As the Red Army slowly pushed the Germans from the Soviet Union back to the west, the Soviet Union's postwar intentions for Eastern Europe began to unfold. At the November–December 1943 Tehran Conference, British and U.S. leaders agreed to Soviet leader Joseph Stalin's demands that the Soviet Union be allowed to keep the Polish territory taken in September 1939—in effect, the old Curzon Line established by the Allied governments in the peace settlement following World War I. After the war, Poland was partially compensated for its territorial losses in the east with a strip of German land in the west to the line of the Oder and Neisse Rivers. In July 1944 after Lublin was liberated, the Soviets established their own Polish government, a direct rival to the one in London, which was now led by Stanisław Mikołajczyk.

By August 1, 1944, the Red Army reached the right bank of the Vistula River opposite Warsaw. Armia Krajowa units in the city rose up against the Germans, anticipating Soviet support against the common enemy. The Soviets did nothing. Not only did they not help the AK, but they also refused landing rights on Soviet-controlled airfields for any Allied aircraft that might attempt aerial supply missions. The Poles fought on alone, street by street and house by house, for 63 days, and in the end the Wehrmacht and the Waffen-Schutzstaffel (Waffen-SS) destroyed virtually the entire city. When the Germans finally withdrew from what was left of Warsaw, the Soviets moved across the river.

The destruction of Warsaw eliminated the remaining political and military institutions in Poland still loyal to the London government and paved the way for a complete Soviet takeover. The final blows to a free Poland were delivered by the victorious Allies at the 1945 Yalta Conference. World War II ended, but Poland remained under the Soviet yoke until the end of the Cold War more than 40 years later.

Poland suffered as heavily as any nation in the war, losing an estimated 38 percent of its national assets. The country lost 22 percent of its population —some 500,000 military personnel and 6 million civilians. Roughly half the Poles who died between 1939 and 1945 were Jews. Most of the approximately 5.4 million victims died in concentration camps and ghettos or

by starvation, epidemic, or other causes resulting from the brutal occupation. One million of the survivors were war orphans, and another half million were invalids.

Poland, Air Force

There were three separate incarnations of the Polish Air Force (PAF) in World War II: the force that fought the campaign in Poland in 1939, the reconstituted force that fought under Allied control in the west, and the Polish air units that fought under Soviet control on the Eastern Front. Nonetheless, the small PAF played a disproportionately significant role in World War II.

Poland produced some fine aircraft in the 1930s. The P7 parasol-winged fighter, which entered service in 1931, was built entirely of metal and covered with stressed skin. The follow-on version, P.11 Jedenastka (Eleventh), entered service in 1935. Ruggedly built, it was fast and maneuverable. As with many other countries, in the mid-1930s Poland shifted development priority to bombers. Poland had two primary bombers, the P.23 Karas single-engine light bomber and the P.37 twin-engine medium

bomber. The latter, which entered service in 1938, was a world-class aircraft, but Poland had only about 75 of them when the war began, and only half were fully equipped.

At the start of the war on September 1, 1939, the PAF contained a total of 397 combat aircraft, including 159 fighters, 154 bombers, and 84 reconnaissance craft. Prior to the German attack, almost all the operational aircraft were dispersed to outlying airfields in accordance with established plans. Despite the enduring but false myth of the PAF being destroyed on the ground on the first day of the war, most of the aircraft hit by the Luftwaffe were nonoperational aircraft used for spare parts. Even though the PAF was outnumbered more than four to one, it still inflicted surprisingly heavy losses on the Luftwaffe. During the monthlong campaign, the Germans lost 564 aircraft in Poland, at least 121 in air-to-air combat. The Poles lost almost all of their aircraft, 70 of them in aerial combat.

After the Soviets invaded Poland on September 17, the remainder of the PAF withdrew into Romania and Hungary. Many Polish pilots and ground crew made their way to France and reconstituted the PAF under the Polish government-in-exile. During the France Campaign (May 10–June 25, 1940), the PAF had almost 7,000 men, but they were equipped with only obsolete aircraft. Nonetheless, the PAF scored 56 aerial victories in May and June before withdrawing to Britain and reconstituting again.

Flying under the control of the Royal Air Force (RAF), the PAF finally came into its own, especially during the pivotal July 10–September 30, 1940, Battle of Britain. During the two and a half short months of history's first decisive air campaign, British airspace was stoutly defended by a razor-thin line of only 2,363 pilots—446 of whom were killed in action. Almost forgotten today is the fact that 487 of those pilots—some 21 percent of the total—were not British at all. They were a mixed assortment of volunteers from many nations, including contingents of various European air forces in exile. The 146 pilots of the PAF were by far the largest group of non-British pilots flying under RAF operational control. On September 11, 1940, one of the pivotal days of the battle, the Poles accounted for 18 percent of the Luftwaffe aircraft destroyed. On September 15, they accounted for 14 percent. On September 19, they shot down 25 percent, and on September 26, they shot down a staggering 48 percent.

The PAF's Number 303 "Kosciuszko" Squadron was the top-scoring

squadron in the entire Battle of Britain. The Number 303 Squadron downed three times the average RAF score while incurring only one-third the average casualties. The RAF as a whole lost 1 pilot for every 4.9 enemy kills. The Polish squadrons shot down 10.5 German aircraft for each of their pilots lost.

The PAF in Britain eventually numbered 20,000 airmen organized in 14 squadrons, including 3 bomber squadrons. By the end of the war, they had flown almost 90,000 combat sorties, had destroyed more than 500 Axis aircraft and some 200 V-1 flying bombs, and had flown 16,000 transport sorties.

The final Polish air element of the war fought on the Eastern Front. In the summer of 1943, the Soviets established Polish air units to support the Polish ground units then fighting under Soviet control. These began flying combat missions on April 23, 1944. By the end of the war, the Polish 1st Composite Air Division had flown almost 19,000 combat sorties, downing 20 German aircraft.

Poland, Army

Faced with growing German aggression in Eastern Europe, the Polish Army introduced a new mobilization plan on April 30, 1938. Plan W called for drafting 1.3 million new troops and raising a total of 39 infantry divisions, 9 reserve infantry divisions, 11 cavalry brigades, 2 armored brigades, and 3 separate tank battalions. In the event of a national emergency, the Poles

planned to mobilize 28 of the divisions, with the remaining 11 called up only after the declaration of a general mobilization.

By September 1939, the Polish Army had some 500,000 men, 41,000 machine guns, 3,500 antitank rifles, 1,200 mortars, 1,200 antitank guns, 462 antiaircraft guns, and 3,388 artillery pieces of various sizes. The Poles, however, were poorly motorized, having fewer than 6,000 motor vehicles. Traditionally considered among the best military horsemen in Europe, the Poles continued to rely heavily on horses for economic reasons more than anything else.

The Poles had 887 tanks, but 550 of these were small two-man TK and TKS tankettes, mounting little more than machine guns. The Poles had only 170 larger tanks mounting guns up to 47mm in size, and they also had 102 obsolete French tanks of World War I vintage. Although this force was less than one-third of the nearly 2,500 tanks the Germans could field, the Polish armored force was larger than that of the contemporary U.S. Army. The Poles, however, made the mistake of adopting the flawed British and French armored doctrine, which regarded tanks as infantry-support weapons.

Under French and British pressure, the Poles delayed declaring a general mobilization until August 30. The Germans attacked two days later, and many of the Polish units never had the chance to reach their authorized strength. According to British and French assurances, the Poles were only supposed to fight a delaying defense for two weeks, until their allies could attack Germany from the west. That never happened, and when the Soviet Union invaded Poland from the east on September 17, all hope of Polish survival disappeared. The last major Polish forces surrendered on October 5, 1939, having suffered 210,000 killed or wounded and 580,000 captured by the Germans and another 200,000 captured by the Soviets.

Some 100,000 Polish soldiers managed to evade capture and escaped through Romania, Hungary, and the Baltic states. Many eventually made their way to France and joined the Polish government-in-exile, which was headed by General Władysław Sikorski. Meanwhile, as early as May 1939, Polish and French officials had discussed the feasibility of forming military units manned by some of the half million Polish immigrants then living in France. By May 1940, the reconstituted Polish army in France had some 84,500 troops organized into two infantry divisions and a mechanized

brigade. In addition, the Podhale Rifle Brigade fought in Norway, and the independent Carpathian Rifle Brigade was formed in the Middle East.

During the May 10–June 25, 1940, France Campaign, the Polish 1st Grenadier Division was destroyed fighting in Lorraine. The 2nd Rifle Division escaped into Switzerland, and its soldiers were interned there for the remainder of the war. Only some 30 percent of the Polish army managed to escape to Britain, where it again reconstituted and formed the Polish I Corps. That unit eventually consisted of the 1st Armored Division, the 4th Infantry Division, and the 1st Independent Parachute Brigade. The parachute brigade's most celebrated battle was its doomed jump into Arnhem to support the British there in Operation MARKET-GARDEN (September 17–26, 1944).

Sikorski, meanwhile, had been negotiating with the Soviets to form another Polish unit from the prisoners of war (POWs) who had been imprisoned in the Siberian labor camps in late 1939. In August 1941, a Polish force of 96,000 men was formed under Soviet control to fight against the Germans on the Eastern Front. But there were conflicts and tensions between the Soviets and Poles from the start, and the British pressured Soviet leader Joseph Stalin to release the force to fight under their control in the Middle East.

A fanfare of trumpets salutes Polish army tanks as they move through the streets during a military parade in Warsaw, Poland, on May 11, 1939. (Bettmann/Corbis)

Therefore, in August 1942 General Władysław Anders led 74,000 Polish troops and many accompanying civilians from the Soviet Union through Iran to Palestine. After merging with the Carpathian Rifle Brigade already there,

the newly established Polish II Corps moved to Libya. By the end of 1943 the force moved to Italy, where it continued to fight under British control. II Corps eventually consisted of the 3rd Carpathian Rifle Division, the 5th Kresowa Infantry Division, the 2nd Armored Brigade, and an artillery group. II Corps suffered 17,000 casualties during the 1943–1945 Italian Campaign and distinguished itself during the fighting for Monte Cassino in 1944.

Thousands of Poles remained in Soviet captivity, however, even after Anders moved his corps to the Middle East. Soviet-Polish tensions reached a new high in May 1943 after the Germans discovered the mass graves of thousands of Polish POW officers murdered in the Katyn Forest in 1940. The Soviets used the rising tensions as a pretext to sever relations with the Polish government-in-exile in London and to establish their own government-in-exile composed of Polish communists. The Moscow-based Union of Polish Patriots raised the first units of what would become the Polish People's Forces (PPF), fighting under Soviet control.

The initial PPF unit, the 1st Infantry Division, was named after Polish national hero Tadeusz Kosciuszko, who ironically had led the Polish revolt against the Russians in the 1790s. The division first went into action at Lenino in October 1943. In 1944, the Polish force had grown to the size of a field army. Designated the First Polish People's Army, it was under the command of General Zygmunt Berling. It had some 107,000 troops and consisted of five infantry divisions, a tank brigade, and supporting artillery units.

After the Red Army entered Poland and began to push the Germans back to the west, the Soviets installed a communist provisional government at Lublin, the Polish Committee of National Liberation, also known as the "Lublin government" to distinguish it from the Polish government-in-exile in London, the "London government." That government expanded the PPF by adding another field army. By March 1945, the PPF numbered some 400,000 troops, which were under the command of Marshal Michal Rola-Zymierski. The order of battle included 14 infantry divisions, an armored corps, and 16 artillery brigades. The Second Polish People's Army took part in the capture of Dresden, and the First Polish People's Army participated in the March 31–May 2, 1945, Battle for Berlin. The Poles suffered 30,500 casualties in that fighting.

The Poles were the first to fight the Germans. They fought the Germans

the longest and fought them on every major front: Norway, North Africa, Italy, Western Europe, and Eastern Europe. At the end of World War II, more than 620,000 Poles were under arms in both the west and the east. The Polish armed forces in the west numbered close to 200,000 men, including 14,000 in the air force and 4,000 in the navy. Between 1940 and 1945, the exile force in the west sustained 43,500 casualties, including 7,600 dead. When the force in the west demobilized in 1946, only a small number returned to communist-dominated Poland.

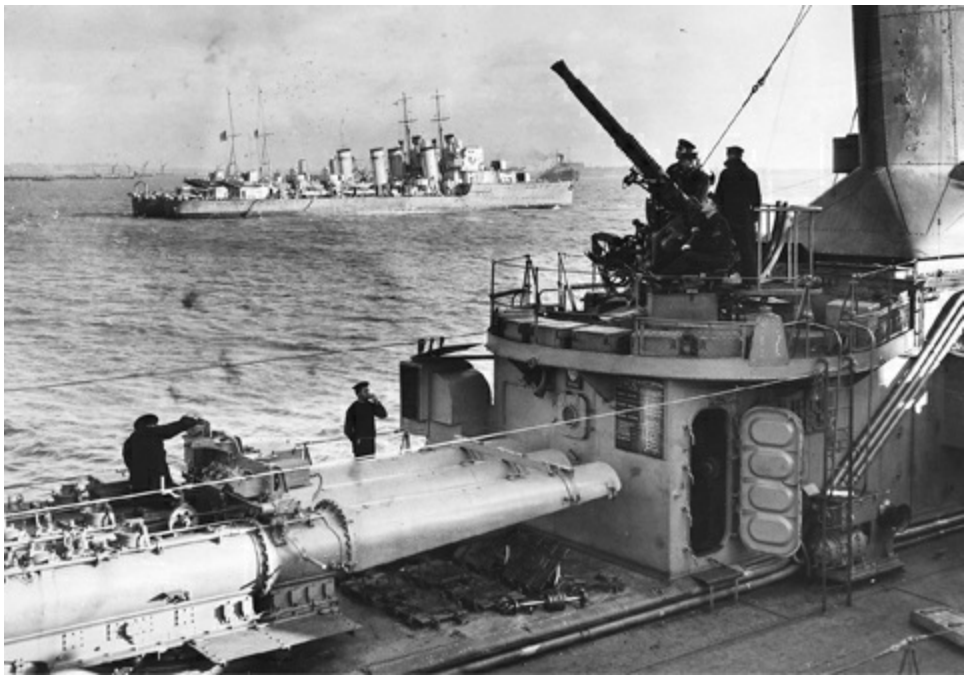
Poland, Navy

One of the smaller navies in Europe, the Polish Navy was the first Allied force to see combat in World War II. Navy commander Vice Admiral Jozef Unrug commanded 34 vessels, including 4 modern destroyers, a large minelayer, and 5 submarines.

The Polish Navy was unprepared for the scale of the German air and naval attacks launched on it beginning on September 1, 1939. Unrug, a former U-boat captain in the German Imperial Navy, foresaw the impending invasion and sent his three newest destroyers to Britain in late August. He knew that the lack of Polish antiaircraft defenses and the concentration of much more powerful German naval units in the southern Baltic made defeat inevitable.



Sailors manning an anti-aircraft gun on one of the two Polish destroyers operating with the British Navy, November 1939. (Fox Photos/Getty Images)

Those ships that remained behind at Gdynia and Gdansk endured two days of constant German air and naval attacks that damaged or sank all of them except the submarines *Orzel* and *Wilk,* which managed to escape. Unrug and his staff withdrew to the naval base on the Hel Peninsula after the invasion and were the last of the Polish military to surrender, on October 2, 1939. During the campaign, the Polish Navy lost 26 vessels. Personnel casualties amounted to 1,500–2,000 men killed and perhaps 3,500 wounded.

Some naval personnel escaped to Britain to serve with the remnants of their navy, reorganized under Royal Navy command. The Poles received two new destroyers from the British through the Anglo-Polish Naval Accord of November 18, 1939. The destroyer *Grom* and the submarine *Orzel* were sunk during the German invasion of Norway in 1940, and the destroyer *Burza* was heavily damaged during the Dunkerque (Dunkirk) evacuation (May 26–June 4, 1940).

The navy of the Polish government-in-exile remained active in the Allied war effort, thanks to a steady flow of recruits from Polish refugees in Britain and the addition of new British destroyers and gunboats. The Polish Navy participated in a wide range of actions, including the May 1941 sinking of the German battleship *Bismarck,* protection of transatlantic convoys, and the

amphibious assaults on Sicily (July 9–August 22, 1943) and Normandy (June 6, 1944).

The 4,000 Polish Navy officers and sailors operating in conjunction with the British manned 47 warships (including 2 cruisers, 10 destroyers, and 5 submarines). They sank 9 enemy warships and 39 transport vessels. The Polish Navy lost 3 destroyers and 2 submarines and suffered 404 dead and 191 wounded.

Poland Campaign (1939)

World War II began in Europe with the German invasion of Poland on September 1, 1939. The Poland Campaign, however, was soon overshadowed by the campaigns and battles that followed. It is best remembered today in mythsand legends, almost all of them untrue. Polish horse cavalry units never mounted suicidal charges against German panzers, the Polish Air Force was not destroyed on the ground on the first day of the war, and the Polish Army was far from a pushover for the German Army.

Under the command of Marshal Edward Rydz-Śmigły, the Polish Army in the summer of 1939 had roughly 500,000 men, organized into 30 regular and 9 reserve infantry divisions, 11 cavalry brigades, and 2 mechanized brigades. The Polish Army had 887 tanks, less than a third of the almost 2,500 tanks fielded by the Germans. When it became obvious they would be attacked by Germany, the Poles opted for a forward defense designed to withdraw slowly to the east to buy more time for mobilization.

Plan ZACHOD (WEST), issued on March 23, 1939, correctly assumed that the German main attack would come from Silesia in the direction of Warsaw, with supporting attacks from German Pomerania and East Prussia. The Poles therefore positioned four armies along Poland's western border. In north-central Poland, one army was positioned to defend Warsaw from a German thrust south from East Prussia. After the Germans moved into Slovakia, the Poles also established a weak army in the south to defend the passes through the Carpathian Mountains.

Plan ZACHOD was based on a fighting withdrawal, with armies Pomorze, Poznan, and Lodz all falling back to the west while pivoting on the strong Army Krakow, the southern anchor of the Polish line. Many military historians have been highly critical of the Polish plan, positing that Poland's armies were deployed too far forward and spread too thin. But the Polish Army by itself could have never beaten the Germans, regardless of its strategic plan. The Polish-German border was 1,250 miles long, and the German extension into Bohemia and Moravia and Slovakia added another 500 miles. Plan ZACHOD was based on the assumption of a strong attack by Britain and France against Germany in the west. Unfortunately for the Poles, that promised attack never came.

In August 1939, the Wehrmacht had 51 active divisions, 51 reserve divisions, and 1 active cavalry brigade. All the reserve divisions were infantry units, and the active force included 6 panzer and 4 motorized divisions. The average panzer division had 310 tanks, most of which were the lightly armed PzKpfw-I and PzKpfw-II models. The Germans had a total of about 500 of the heavier PzKpfw-III and PzKpfw-IV tanks. They also made use of PzKpfw 35(t) and PzKpfw 38(t) tanks, redesignated Czech machines acquired in the March 1939 takeover of Bohemia and Moravia.

The Wehrmacht's active strength was roughly 730,000 men, and its reserve strength was about 1.1 million men. On April 3, 1939, Adolf Hitler's headquarters responded to British prime minister Neville Chamberlain's declaration of support for Poland by issuing FALL WEISS (CASE WHITE), the plan for the invasion. The success of FALL WEISS hinged on a calculated political risk that made most of Hitler's generals nervous. The Germans had to secure a quick victory in Poland in order to shift their forces rapidly back to the west to fend off any attack from the French and British.

The Wehrmacht of 1939 was neither large enough nor strong enough to

mount simultaneously a massive attack in the east and a strong defense in the west. Thus, the attack in the east could only be strengthened at the risk of weakening the defense in the west. Hitler was willing to gamble that the French and British would not act in time to save Poland. FALL WEISS then called for Germany's border with France to be guarded by the relatively weak Army Group C, which consisted of 21 active and 14 reserve divisions.

A total of 52 divisions, including all of the panzer and motorized divisions, were allocated for the attack on Poland. They were organized into Army Group North and Army Group South under Colonel Generals Fedor von Bock and Gerd von Rundstedt, respectively. The original plan did not include military operations east of the Vistula, on the assumption that Soviet forces would move rapidly into that area. The campaign would end with the Tenth Army linking up with Army Group North at Warsaw and then sealing off the Polish units in western Poland and preventing them from escaping east to the Narew–Vistula–San River line.

Beginning in July, 386,000 army and 55,000 Luftwaffe reservists were called to active duty under the guise of training maneuvers. By the end of August, Army Group North had 630,000 men, and Army Group South had 886,000. Hitler initially set August 26 as Y-day, the start of the attack. But then Hitler blinked when Britain and France, on August 24, responded to the German-Soviet Non-Aggression Pact of the day before by giving Poland written guarantees of military support, and Benito Mussolini backed off, bringing Italy into the war on Germany's side. Late on August 25, Hitler canceled the attack orders, but several small German units still crossed the frontier and clashed with Polish border guards before they could be recalled.

After a few more days of diplomatic cat-and-mouse games, Hitler on August 31 signed "Führer Directive No. 1 for the Conduct of the War." On August 30, Rydz-Śmigły ordered a general mobilization. That brought an immediate and sharp reaction from Britain and France, who were afraid of provoking Germany and remembered only too well the spiral of mobilizations that triggered World War I. Within three hours, the French government had pressured Rydz-Śmigły into revoking the mobilization order.

With the German forces in position and ready to move, Hitler needed only a provocation to provide a fig leaf of respectability. Leaving nothing to chance, the German Sicherheitsdienst (SD), dressed in Polish uniforms, "raided" the German Silesian town of Gleiwitz on the night of August 31.

They seized the local radio station and played a pre-recorded anti-German message in Polish. After firing off a few rounds for effect, the SD unit withdrew, leaving behind several “Polish casualties” as evidence. The bodies were actually prisoners from the Sachsenhausen concentration camp dressed in Polish uniforms and murdered specially for Hitler’s little charade.

According to the FALL WEISS plans, the invasion was to commence at 4:45 a.m. on September 1. The first shots were fired 15 minutes early, however, when three dive-bombers of the 3/1st Stuka Geschwader (Squadron) hit a Poznan air base, which turned out to be deserted. The Luftwaffe immediately followed through with attacks on Polish airfields and rail centers. For the most part, the attacks on the Polish airfields were failures. Anticipating the strikes against the bases, the Polish Air Force on August 31 dispersed its frontline aircraft to secret secondary bases to avoid having them caught and destroyed on the ground.

Pabjanice, during the Polish Campaign of September 1939. (Library of Congress)

The Luftwaffe dwarfed the Polish Air Force, which had only 392 first-line combat aircraft. The Luftwaffe in March 1939 had 4,303 aircraft, including 1,180 bombers, 336 dive-bombers, and 1,179 fighters. In support of the German invasion, Army Group North was allocated Luftflotte 1 under General of Flyers Albert Kesselring; Army Group South was supported by General Alexander Löhr's Luftflotte 4. The combined force totaled 36 groups and included all of Germany's dive-bombers, 70 percent of its bombers, and 50 percent of its fighters.

Vastly outnumbered and technically outclassed, the Polish pilots put up a stiff resistance. The law of numbers, however, dictated that the Polish Air Force would play only a marginal role in the overall outcome of the campaign. By September 6, Polish fighter units were down to 50 percent of

their original strength. A few days later, the surviving fighters began withdrawing toward Romania with the rest of the Polish army.

In the end, the Poles lost almost 300 combat aircraft, and they evacuated 98 to Romania. But the Germans suffered heavy losses as well, with 285 aircraft destroyed and another 279 severely damaged. Despite the great technological disparity in aircraft, Polish fighter pilots scored at least 121 confirmed air-to-air kills for the campaign. German records indicate that the true number may have been closer to 160.

The Poles had no illusions about their strategic situation. On August 30, Vice Admiral Józef Unrug, commander of the Polish Navy, initiated Operation PEKING, ordering Poland's three modern destroyers to leave immediately for British ports. At 4:43 a.m. on September 1, the old German battleship *Schleswig-Holstein* opened fire on the Polish military supply base on Westerplatte Island in Danzig Harbor.

The ground war started within minutes of the *Schleswig-Holstein* opening fire. In the north, visibility was limited by heavy ground fog as Bock's units jumped off. The Third Army, under General of Artillery Georg von Küchler, attacked south toward Warsaw, and Lieutenant General Günther von Kluge's Fourth Army sliced into the Polish Corridor, which divided East Prussia from the rest of Germany. The Fourth Army's objective was to clear a path for the one panzer and two motorized divisions of General of Panzer Troops Heinz Guderian's XIX Corps to drive a pincer arm southwest toward Warsaw.

The weather in the south, meanwhile, was clear as Army Group South crossed into Poland. General of Infantry Johannes Blaskowitz's Eighth Army drove toward the Polish industrial city of Lodz. In Rundstedt's center, his Tenth Army, under General of Artillery Walther von Reichenau, struck from Opole toward Czestochowa, Piotrków, and Tomaszow to encircle Warsaw from the south. The Fourteenth Army, under Colonel General Wilhelm List, attacked from German Silesia and Slovakia to cut off Krakow. By September 4, the Germans had managed to drive a deep wedge between Army Lodz and Army Krakow.

On September 5, the first major clash between German and Polish tanks occurred at Piotrków. At the end of the day, the Germans penetrated Polish defenses and secured the key road links to Warsaw. The breakthrough at Piotrków marked the end of the first phase of the Poland Campaign.

By the evening of September 5, the Polish armies were retreating all

along the line. With his thin defensive shell cracked, no reserves to commit, and much of his army still mobilizing, Rydz-Śmigły believed that he had no alternative but to order a withdrawal to the line of the Vistula. Simultaneously, German field commanders such as Guderian sensed victory and pushed the German high command to authorize operations beyond the Vistula.

The Germans now directly threatened Warsaw. On September 7, Rydz-Śmigły compounded the Polish command-and-control problems by ordering the withdrawal of the high command eastward to Brześć (Brest). The Polish command-and-control infrastructure was primitive to begin with, but the move from Warsaw to Brześć virtually guaranteed that the Polish high command would no longer play any significant role in managing the campaign. In the north, meanwhile, the Fourth Army pushed Army Pomorze out of the Polish Corridor, bypassed Army Poznan, and was approaching Warsaw. On September 8, the 4th Panzer Division attempted to take the Polish capital by storm, but it was driven back and lost 60 armored vehicles after heavy street fighting.

In their rush to reach Warsaw, the Germans lost track of General Tadeusz Kutrzeba's bypassed Army Poznan. They assumed that it had been pushed back as well and was now incorporated into the Warsaw garrison. Kutrzeba's force, in fact, was entrenched behind a bend in the Bzura River about 30 miles west of Warsaw. Locally, Kutrzeba held a three-to-one superiority in infantry, and he decided to attack.

The ensuing Bzura River Offensive was the only major Polish counterattack of the campaign. On September 9, the Poles caught the German 24th and 30th Infantry Divisions by surprise, taking more than 1,500 prisoners from the 30th alone. But the Germans, with their far greater mobility and firepower, were able to shift other forces rapidly to contain this Polish offensive. Army Poznan finally surrendered on September 21, with the Germans capturing more than 100,000 Poles.

With the Bzura Offensive under control, the Germans turned their attention back to Warsaw to conduct a set-piece siege. On September 15, the German Third Army forced its way into Warsaw's Praga District, on the east side of the Vistula. By September 23, Warsaw's food and water were running out, and the city was completely ringed by 13 German divisions and more than 1,000 guns. On September 25, a day the Poles still call "Black Monday,"

Hitler personally ordered an armada of 420 German bombers to savage the capital with repeated sorties. Warsaw finally surrendered on September 27, after suffering some 2,000 military and 40,000 civilian dead.

It quickly became obvious to Rydz-Śmigły that his order to withdraw to the rivers had come too late. With their vastly superior mobility, the Germans were able to reach the river lines before the Poles could man them. Given approval by the high command, German field commanders now advanced their forces east of the Vistula. On September 9, the Fourth Army initiated a drive toward Brześć that was spearheaded by Guderian's XIX Corps. Two days later, Rydz-Śmigły ordered the surviving Polish units to withdraw toward the southeast, to the so-called Romanian bridgehead.

Plan ZACHOD had been based on holding until the French and British could attack Germany from the west. The Poles were promised that attack no later than September 16. It did not occur. On September 17, Soviet leader Joseph Stalin drove the final nail into the Polish coffin by invading Poland from the east. Hiding behind the excuse of occupying eastern Poland "to protect its fraternal Belorussian and Ukrainian populations," the Red Army marched in with two fronts (army groups). The Belorussian Front, under General Mikhail Prokofevich Kovalev, and the Ukrainian Front, under General Semen Timoshenko, had a combined strength of 24 infantry divisions, 15 cavalry divisions, and 2 tank corps.

The Soviet invasion caused immediate problems for the German field commanders, who already were operating well to the east of the demarcation line agreed to in the German-Soviet Non-Aggression Pact. On September 20, Hitler ordered a withdrawal to the designated line, with movement to start the next day. The Soviets reached the Bug River on September 23.

On the diplomatic level, meanwhile, the Soviet government initiated negotiations to shift the line to the east in exchange for Lithuania. The Germans agreed, and on October 1 the new demarcation line was established along the general line of the Bug River. The result was to extend the German zone to the east by as much as 100 miles in some places.

Poland suffered staggering losses in the campaign, amounting to 66,300 killed, 133,700 wounded, 587,000 taken prisoner by the Germans, and another 200,000 taken prisoner by the Soviets. Polish civilian deaths were close to 100,000. Virtually all of Poland's military hardware was destroyed or

captured, with the exception of the handful of obsolete fighters that escaped to Romania.

Despite the claims of German minister of propaganda Josef Goebbels, the Germans paid a high price for such a short campaign. The Wehrmacht suffered 16,000 dead and 32,000 wounded. It lost 217 tanks and had another 457 so heavily damaged that most never returned to service. Thus, the Germans lost one-quarter of the tanks as well as one-fifth of the combat aircraft they committed to the campaign. On top of that, they expended eight months' worth of fuel, ammunition, and repair parts in an operation that lasted little more than one month.

The performance of the Polish military can perhaps be put into proper perspective by comparing it with that of the Western Allies in the spring of 1940. Only partly mobilized, vastly outnumbered, with obsolete weapons, and attacked from all sides, the Poles held out for 36 days and inflicted heavy losses on the Germans. The British, French, Belgians, and Dutch had almost nine months to mobilize and prepare. When war did come in the west, the Allies had near parity in ground and air forces, actual superiority in tanks, and outright supremacy at sea. Yet in a 39-day campaign, they inflicted fewer losses on the Germans than had the Poles.

Poland–East Prussia Campaign (July 1944–April 1945)

Important Eastern Front campaign. On June 22, 1944, the third anniversary of the German invasion of the Soviet Union, the Red Army launched Operation BAGRATION, a massive offensive to drive German forces from western Belorussia. By mid-1944, the German Army was only a shell of what it had been in 1941, whereas the Soviets had superior numbers of artillery pieces, tanks, trucks, and aircraft as well as a four-to-one manpower advantage on the Eastern Front. The Soviets had also developed new tactical doctrines that took advantage of their improved mobility.

The great Soviet offensive involved 11 fronts (army groups) and stretched from the Baltic in the north to the Black Sea in the south. Within two months, the Red Army had liberated Belorussia and destroyed German Army Group Center, but even before the conclusion of BAGRATION, Soviet leader Joseph Stalin issued new orders through Stavka for the liberation of the Baltic states and Poland and a drive on Berlin. From north to south, this effort involved the 1st Baltic and 3rd, 2nd, and 1st Belorussian Fronts.

On July 20, 1944, units of the 1st Belorussian Front crossed the Bug River in three places and captured Lublin. There the Soviets established their own Polish government and army and declared open season on the London government's anticommunist Polish Home Army. On July 25, the Red Army reached the Vistula. The great city of Brest, encircled, fell on July 28 after a single day of fighting. Meanwhile, Lvov, the capital of Galicia, capitulated on July 27 as the other fronts, north and south, achieved their objectives against varying degrees of resistance. Some German Army units, cut off and isolated against the Baltic, did not surrender until the end of the war.

German colonel general Joseph Harpe, commander of Army Group A (the redesignated Army Group North), could do little more than delay the inevitable. Adolf Hitler's demand for "no retreat," when obeyed, resulted in the destruction of many German units in untenable positions, and static defense also brought the destruction of the few remaining German maneuver elements. Adding to Harpe's difficulties was Hitler's decision to withdraw units to prepare for the December 16, 1944–January 25, 1945, Ardennes Offensive (the Battle of the Bulge) in the west.

At the end of July, Stavka ordered the 1st and 2nd Belorussian Fronts to drive to the Narew River and Warsaw. The 2nd Belorussian Front was to advance to Ostróda and Łomża. The 1st Belorussian Front drove on the Warsaw suburb of Praga, along the way seizing crossing points over the Narew and Vistula Rivers. Although these objectives were secured, the Red Army offensive had lost momentum. In the drive, the Soviets destroyed 28 German divisions, inflicting 350,000 casualties, but logistical problems—the consequence of the rapid advance and two months of solid fighting—forced a pause.

On August 29, Stalin ordered all Red Army fronts to dig in generally along the line of the Vistula and Narew Rivers. Although the 1st and 2nd Belorussian Fronts continued limited attacks to strengthen their hold across the Narew, Soviet forces made no effort to cross the Vistula and move into Warsaw. This decision produced one of the most controversial episodes of the entire war, the Warsaw Rising of August 1–October 2, 1944.

With the rapid Soviet advance, Polish Home Army commander General Tadeusz Bór-Komorowski ordered a general uprising in Warsaw, which brought quick German Army reaction. The Soviets made only halfhearted efforts to assist the Home Army in the form of air-dropped supplies. Although it is true that the Red Army suffered from genuine logistical problems, it is also quite true that Stalin was delighted to see the Germans eliminate the anticommunist Home Army forces, whose existence he correctly believed would hinder his postwar control of Poland. The Soviets not only refused to help the Poles in any meaningful way but also obstructed efforts by the Western Allies to air-drop supplies to the Polish fighters. The fighting brought the destruction of 90 percent of the buildings of Warsaw but also claimed 10,000 German casualties—a tribute to the ferocity of the two-month-long Polish Home Army resistance.

Stavka, meanwhile, laid plans for the final control of Poland in an offensive that would carry from the Vistula to the Oder. The massive offensive involved Marshal Georgii Zhukov's 1st Belorussian Front, Marshal Konstantin Rokossovsky's 2nd Belorussian Front, General Ivan Chernyakovsky's 3rd Belorussian Front, and Marshal Ivan S. Konev's 1st Ukrainian Front, all of which were on the Narew-Vistula Line. General Ivan Petrov's 4th Ukrainian Front occupied positions along the San River line in southern Poland and Galicia.

Stalin's orders were to destroy Army Group A, with the secondary objective of drawing off German reserves in response to Western appeals during the German Ardennes Offensive. Under Stavka's plan, the 1st Belorussian Front was to take Poznan and destroy forces cut off in the Warsaw area. The 2nd Belorussian Front would assist in surrounding Warsaw and also take Marienburg. The 1st Ukrainian Front, with five combined-arms armies, two tank armies, and four tank/mechanized corps, would carry the brunt of the offensive, breaking out of the Sandomierz bridgehead and driving to Breslau. The 4th Ukrainian Front would drive on Kraków. The Soviet offensive was massive. The 1st Ukrainian and 1st Belorussian Fronts together contained 2.2 million ground troops (a six-to-one advantage over the defending Germans) in 163 divisions supported by more than 32,000 artillery pieces and almost 4,800 aircraft.

The second half of the offensive to clear Poland began on January 12, 1945. Radom fell on January 16. By January 17, Zhukov's 1st Belorussian Front and the Soviet-controlled Polish First Army had liberated Warsaw. Within the next week, the 1st Belorussian and 1st Ukrainian Fronts had punched a 310-mile hole in the German lines and driven 100 miles. There was little that Harpe and the German forces could do to arrest the Soviet advance. Kraków and Poznań were taken in late January, and on January 22 Konev's 1st Ukrainian Front bridged the Oder. Zhukov also reached the river and got his troops across, although it took three weeks to close the 70-mile gap separating these two Red Army fronts. On January 28, forces of the 1st Belorussian Front entered German Pomerania, where they were met by the hastily formed Army Group Vistula, commanded by head of the SS Heinrich Himmler. Königsberg was surrounded and taken on April 9. Meanwhile, the 1st Ukrainian Front eliminated pockets of German forces in southwestern Poland.

Soviet forces had once again outrun their logistical support and were forced to halt. Nevertheless, the Red Army was now poised to begin its final offensive: the drive on Berlin to end the war.

Popov, Markian Mikhailovich (1902–1969)

Soviet Army general. Born in the village of Ust-Medveditskaya, Volgograd Region, on November 15, 1902, Markian Mikhailovich Popov became an officer candidate in the Russian Army in 1916 and fought in World War I. He then joined both the Red Army and the Bolshevik Party. Chief of staff of a division during the Russian Civil War, Popov graduated from the Military Political Academy in 1931.

Popov was chief of staff of the First Special Red Banner Army in the Far East in 1938 and 1939. He assumed command of the Leningrad Military District in January 1941 and held a succession of commands there following the German invasion on June 22. Popov commanded the Sixty-First Army in the Bryansk Front from November to June 1942. Then, in succession, he commanded the Fortieth Army, the Fifth Strike Army, the Forty-Fifth Tank

Army, and the Reserve Front during 1942–1943. Promoted to colonel general, he directed the Bryansk Front from June 1943 until he was promoted to army general. He took command of the Baltic Front, which became the Second Baltic Front, in October 1943. He thus participated in the liberation of Leningrad, which was completed by January 27, 1944.

A cautious commander, Popov came under criticism for moving too slowly. When his forces failed to take Riga, he was removed from command, reduced in rank, and made chief of staff of the Leningrad Front and the Second Baltic Front during 1944–1945. After the war, Popov commanded various military districts. He was restored to the rank of army general in 1953 and was appointed to the military inspectorate in 1962. Popov died in an accident in Moscow on April 22, 1969.

Portal, Sir Charles Frederick Algernon (1893–1971)

Royal Air Force (RAF) marshal. Born on May 21, 1893, in Hungerford, England, Charles Frederick Algernon Portal joined the Royal Engineers during World War I. During World War I, in 1915 he was commissioned in the Royal Flying Corps, qualifying as an observer and then a pilot. He won the Distinguished Flying Cross for shooting down several German aircraft. Between the wars, his posts in the RAF included commander of British forces at Aden (1934–1935) and the Imperial Defence College (July 1937). Promoted to air vice marshal in July 1937, he became director of organization and was responsible for developing 30 new RAF bases around Britain.

Portal became chief of Bomber Command in April 1940, initiating the first RAF raids against Germany. He was knighted that July. On October 25, 1940, Portal was named chief of the air staff and air chief marshal (the highest RAF post). In addition to his Air Ministry duties directing the policy and operations of the RAF, Portal participated in all the summit conferences as a member of the Chiefs of Staff Committee. He supported Sir Arthur Harris's controversial stewardship of Bomber Command and the policy of area bombing (until it was halted by Prime Minister Winston L. S. Churchill in March 1945). A strong believer in airpower, Portal saw the role of the RAF and its U.S. Army Air Forces ally as destroying Germany's ability to resist invasion. Portal was made a baron (Lord Portal of Hungerford) in August and served as RAF chief until December 31, 1945.

From 1946 (when he was raised to viscount) to 1951, Lord Portal was responsible for administering the atomic research facilities at Harwell. He served as chairman of the British Aircraft Corporation from 1960 to 1968. Portal died on April 23, 1971, in Chichester, England.

Portugal

Portugal, located in the western Iberian Peninsula, borders the Atlantic Ocean to the west and south and Spain to the north and east. At the time of World War II, Portugal was dwarfed by its extensive overseas empire, which was chiefly in Africa. Portugal itself comprises only about 35,500 square miles and had a metropolitan population in 1939 of 7.7 million people.

A republic had been proclaimed in 1910, but the years that followed were turbulent; there were 40 cabinets in the first 14 years of the republic. Finally, in 1926 the military seized power and subsequently summoned a university economics professor, Antonio Salazar, as minister of finance to restore economic order. For the next 40 years, until 1968, Salazar completely dominated Portugal.

In 1932 Salazar became premier as head of an authoritarian government, and under a 1933 constitution, Portugal became a corporative republic. A national assembly elected by the heads of families served as the legislative body. A corporative chamber advised the assembly on social and economic matters; it represented syndicates of various corporations. The Catholic Church also maintained considerable influence. Salazar's National Union party was the political voice of the so-called *estado novo* (new state). This system came to be known as clerical fascism.

Salazar avoided Portuguese entanglement in the 1936–1939 Spanish Civil War, and on March 31, 1939, he and Spanish dictator Generalissimo Francisco Franco signed a friendship and nonaggression treaty, which pledged both countries to mutual aid if either was attacked. Portugal was a long-standing ally of Great Britain and had entered World War I in 1916 as a result of British ties, but when World War II began, Salazar proclaimed Portuguese neutrality. He was convinced that although the war would be long, the Allies would eventually win. During the conflict, Salazar's policy of collaborative neutrality helped keep German troops out of the Iberian Peninsula.

Several consequences flowed from Portugal's neutral stance. From the beginning of the war, refugees flooded in and were given sanctuary in Portugal or allowed to transit the country. The wealthy political opponents of the Nazis, English and American expatriates, the homeless and displaced, and desperate Jews all found in Lisbon a travel terminus to North Africa or the Americas. At the same time, Portuguese neutrality provided a transit point for goods bound for the Axis powers.

At first the Salazar government ignored the Jews, but it then issued an order (Circular 14) to forbid the issuance of visas. Aristides de Sousa Mendes, Portuguese consul general in Bordeaux, France, not only ignored this order, but over a six-month period in 1940, he issued more than 30,000 visas to Jews and others, allowing them to escape the Nazis. Mendes was

dismissed and disgraced and eventually died in poverty. Not until 1987 did the Portuguese government honor his deed.

To meet the refugee problem, various charities operated in Portugal. The Red Cross headquarters for relief operations, prisoner-of-war packages, and the like in Europe during the war was centered in Portugal. Others also came to neutral Portugal to operate. As the war continued, shortages developed, unemployment rose, and the government ruthlessly crushed all strikes.

Spies from both sides made Lisbon a hotbed of intrigue and espionage during the war. Businessmen from both sides in the war sought Portuguese goods. The Axis side wanted Portuguese tin, cork, wool, fish, and especially tungsten for use in hardening steel.

Portugal in fact supplied tungsten to both sides. When the Germans insisted on increased deliveries, Salazar resisted, and on October 12, 1941, 80 miles from Lisbon, the crew of the German submarine *U-83* searched and then sank the Portuguese merchant ship *Corte Real* on the grounds that it was carrying contraband. Many believed that this was intended to intimidate the Portuguese. Salazar nonetheless refused to change his policy of evenhanded neutrality. He attempted to regulate the sale of tungsten; however, the Germans increased their share by smuggling it from private mines. Finally, in June 1944, with the tide of war having turned, Salazar agreed to impose an embargo on the sale of tungsten to the Axis side.

The Portuguese Azores in the Atlantic were islands of great strategic importance and figured in German invasion plans for the Iberian Peninsula, which were never implemented. To prevent the Azores from falling into Axis hands, in June 1943 the British invoked the Anglo-Portuguese Alliance of 1373 and requested the use of bases on the Azores. Salazar, well aware of the change in Germany’s military fortunes, complied, and on October 8, 1943, Britain landed troops in the Azores to establish bases there.

Portugal retained its overseas colonies during the war, with the one exception of the island of Timor in the Indonesian archipelago. In late 1941, fearing a Japanese attack there, a combined Australian and Dutch force took control. In early 1942, the Japanese drove them from Timor.

Salazar’s policy of neutrality kept one of Europe’s poorer countries out of the conflict. Certainly Salazar emerged from the war in a much better position than Franco. Portugal was readily admitted to the United Nations and was later invited to join the North Atlantic Treaty Organization.

Potsdam Conference (July 17–August 2, 1945)

Final wartime conference involving the leaders of the major Allied powers. The conference was held in 1945 from July 17 to August 2 in the Cecilienhof Palace at Potsdam, near Berlin. Its code name, Terminal, signaled both the end of the war and the wartime alliance. U.S. president Franklin D. Roosevelt had died in April 1945; President Harry S. Truman represented the United States, assisted by Secretary of State James F. Byrnes and chairman of the Joint Chiefs of Staff Admiral William Leahy.

The results of British elections were announced in the midst of the conference, and in one of the most stunning upsets in British electoral history, the Conservatives were ousted. Prime Minister Winston L. S. Churchill resigned, replaced by leader of the British Labour Party Clement Attlee, with Foreign Secretary Ernest Bevin. No elections disturbed the Soviet delegation, headed by Joseph Stalin, assisted by Foreign Minister Vyacheslav Molotov. Despite French leader Charles de Gaulle's appeals to Washington, France was not represented at Potsdam. The day before the conference formally opened, Truman received word of the first successful explosion of an atomic bomb at Alamogordo, New Mexico.

Among issues discussed at the conference were the future of Germany and Eastern Europe and involving the Soviet Union in the war against Japan.

On July 26, U.S. and British leaders issued a surrender ultimatum to Japan. Designed to weaken Japanese resistance to surrender, the Potsdam Declaration held out some hope to the Japanese for the future. Although their country would be disarmed, occupied, and shorn of its conquests, Japan would be allowed access to raw materials after the war and would have the opportunity for democratic development. If, however, Japanese leaders refused to surrender, the nation would be destroyed. The Soviet Union, several weeks away from a declaration of war against Japan, was not a party to this proclamation.

Stalin demanded heavy reparations from Germany for the vast damage suffered by the Soviet Union in the war. He held out for a firm figure, whereas Truman would agree only to the Soviet Union receiving a set percentage of a whole to be determined on the German capacity to pay. The U.S. delegation also disagreed with the Soviets over their loose interpretation of "war booty"—goods that could be confiscated without reference to reparations. Agreement was reached at Potsdam, however, that the Russians would receive 25 percent of plants and industrial equipment removed from the western zones. In return, the Soviets were to repay 15 of the total 25 percent in food and raw materials from their zone. The Soviets also received permission to seize German assets in Bulgaria, Hungary, Finland, Romania, and their zone of Austria. No agreement on reparations was ever reached, but it is estimated that the Russians probably took about $20 billion (the total sum discussed at the Yalta Conference) from their zone of Germany alone.

The Allies also reached agreement on the "three Ds"—democratization, denazification, and demilitarization. German leaders were also to be punished as war criminals, and Germany's resources were to be used to repair the damages that had been inflicted in the war on its neighbors. German industrial production was set at a level no higher than the average for Europe as a whole.

British prime minister Winston Churchill, U.S. president Harry Truman, and Soviet premier Josef Stalin shake hands at the Potsdam Conference of July—August 1945, held to discuss postwar Germany and to plan the end of the war against Japan. (Harry S. Truman Library)

No peace treaty was signed between the Allies and Germany, so further "temporary" arrangements sanctioned by Potsdam became permanent. Following the war, East Prussia was divided according to agreements made at the Tehran Conference. Königsberg, Memel, and northern East Prussia were appropriated by the Soviet Union, and the remainder of East Prussia went to Poland. The conferees at Potsdam agreed on an "orderly and humane" transfer of the German population from this region. This did not occur. Perhaps 2 million Germans lost their lives in the forced reparations and exodus that followed.

Agreement was reached over the surrender of Japanese forces in Korea and Indochina. In the case of Korea, the Soviets were to be responsible for

their surrender north of the 38th parallel, and American forces were to be responsible south of that line. In Indochina, Chinese forces would take the Japanese surrender north of the 16th parallel, and British forces would take the surrender south of it. Never intended as political boundaries, these too became part of the Cold War.

The leaders at Potsdam also established a Council of Foreign Ministers to plan the preparation of peace treaties. Their discussions produced increasingly bitter exchanges that reflected the start of the Cold War.

Pound, Sir Alfred Dudley Pickman Rogers (1877–1943)

British admiral. Born on August 29, 1877, near Ventnor, Isle of Wight, Alfred Dudley Pickman Rogers Pound entered the Royal Navy in 1891 and was commissioned as a sublieutenant in 1896. He qualified as a torpedo specialist in 1901. Promoted to captain in 1914, he was second naval assistant to First Sea Lord Admiral John Fisher (December 1914–May 1915). During World War I Pound was flag captain of the battleship *Colossus* (1915–1917).

After the war, Pound served on the Admiralty Staff (1917–1919), was head of the Royal Navy Plans Division (1922), served as aide-de-camp to the

king (1925), and commanded the battle cruiser squadron (1929–1932). He was knighted in 1930 and served as second sea lord (1933–1935). Pound returned to sea and served as commander in chief of the Mediterranean Fleet (1936–1939), training its personnel for the impending war.

On the eve of war, Pound was promoted to admiral of the fleet; he was named first sea lord and chief of the naval staff in June 1939. Under him, the navy planned and saw through the initial stages of the successful war at sea, although not without setbacks. Pound blamed himself for the loss of the *Prince of Wales* and the *Repulse* to Japanese air attack on December 10, 1941. In July 1942, wanting to clear convoy escorts for expected German surface attack, Pound ordered the Russia-bound convoy (PQ-17) merchant ships to scatter, and 22 of 35 ships were subsequently lost to U-boat attack.

In an effort to lighten his load, Pound handed over chairmanship of the Chiefs of Staff Committee to General Alan Francis Brooke (Lord Alanbrooke) on March 9, 1942, and a deputy first sea lord was appointed to assist him two months later. Pound declined a peerage, but he was awarded the Order of Merit in 1943. Following the death of his wife in July 1943, his own health failed. Although the cause was not realized at the time, he was suffering from a brain tumor. Pound eventually suffered a stroke while accompanying Prime Minister Winston L. S. Churchill to the Quebec Conference and died on October 21, 1943, in London.

Prestwood, Viscount

See Attlee, Clement Richard

Prételat, André Gaston (1874–1969)

French Army general. Born at Wassy in Champagne on November 14, 1874, André Gaston Prételat joined the French Army and from 1910 to 1912 served as military attaché in Tangier, Morocco. During World War I, he rose to command the French 159th Regiment in 1917 and held a staff position with General Henri Gouraud's Fourth Army in 1918. In 1919, Prételat was chief of staff of the French Army of Alsace. He also served as chief of staff under Gouraud in the Levant from 1920 to 1922.

From 1930 to 1934, Prételat commanded France's 2nd Military Region. In 1934, he began five years as a member of France's Supreme War Council. As commander-designate of the French Second Army, in 1938 he conducted exercises paralleling the May 1940 German attack, which revealed that the Ardennes were then virtually indefensible. Following the Munich Conference, in December 1938 Prételat issued a report warning that defensive fortifications in the northeast were inadequate. Four months later, he was asked to draw up a plan to improve the fortifications, although when war began in September 1939, little had been done to implement this.

In early September 1939, Prételat was one of two outright opponents of war on the 19-man war council. To demonstrate French support for Poland, as commander of the French Second Army Group, on September 8 he launched a halfhearted offensive against the German Siegfried Line in the Saar region. Prételat believed that he possessed inadequate air support for such an undertaking, and with Poland collapsing, French chief of staff Maurice Gamelin ordered the offensive halted on September 12. When Poland capitulated, Prételat pulled his troops back behind the Maginot Line.

When German forces invaded on May 10, 1940, Prételat's 2nd Army Group forces played little part in the initial fighting, sheltering behind the Maginot Line. Historians later alleged that in comparison with French units facing the brunt of the German attack, Prételat's sector was grossly overmanned. During two weeks, however, he released 20 of his 30 divisions to reinforce units facing the German assault in the northwest. By May 26, Prételat, conscious that the 1st and 4th Army Groups to his west were flagging, feared that the Germans would turn his left flank and sought permission to abandon the Maginot Line and retreat, but this was refused. Only on June 12, as a military debacle approached, was he ordered to withdraw. Despite his continuing desperate resistance, within a week German forces encircled the battered remnants of the 2nd Army Group, and France accepted German armistice terms on June 22. An embittered Prételat took no further part in the war. He died in Paris on December 6, 1969.

Prien, Günther (1908–1941)

German naval corvette captain. Born on January 16, 1908, in Lübeck, Günther Prien joined the merchant marine at age 15 to help support his family. He impressed his superiors with his skill and graduated from captain's school in 1932. In 1933, he entered the German Navy. Commissioned an ensign, he volunteered for submarine school in 1935. During the 1936–1939 Spanish Civil War, he served in *U-26* off the coast of Spain.

In 1938, Prien was assigned command of *U-47*, one of Germany's new Type VIIB submarines. From the start of World War II, Prien's submarine patrolled the Atlantic shipping lanes. He logged his first kill, a merchantman, on September 5, 1939. The next month, commander of German submarines Admiral Karl Dönitz picked Prien for a daring mission to penetrate the principal anchorage of the British Home Fleet at Scapa Flow in the Orkney Islands. On October 13, Prien was able to pass *U-47* between sunken blockships in Kirk Sound and gain the harbor. At about 1:00 a.m. on October 14, Prien fired four torpedoes at the battleship *Royal Oak*, sinking it. The *U-47* managed to avoid detection in departing the harbor. This was a major propaganda coup for the German Navy, and German chancellor Adolf Hitler awarded Prien the Knights Cross of the Iron Cross. Prien was also promoted to captain-lieutenant.

Adolf Hitler, accompanied by Admiral Erich Raeder (left edge) and Captain Günther Prien, decorates Prien's U-boat crew after they sank the British battleship *Royal Oak* at Scapa Flow, with the loss of 833 British sailors, Berlin, 1939. (Corbis)

Prien went on to sink 31 Allied ships and assisted in sinking 4 others, for a total of 213,283 tons. On March 8, 1941, the British destroyers *Verity* and *Wolverine* surprised Prien's *U-47* and *U-99* on the surface. The *U-99* reported a nine-hour attack with more than 50 depth charges. It is possible that Prien's *U-47* succumbed to this assault, although another theory suggests that Prien counterattacked and his submarine was struck by one of his own circling torpedoes. In any case, all contact with *U-47* was lost.

Prince of Wales and *Repulse,* Sinking of (December 10, 1941)

Following World War I, British authorities decided to develop Singapore as the most important naval base in the Far East for British forces to protect the vast British imperial and commercial interests in the region. During the interwar period, a major base was created somewhat haphazardly, including land defenses and provisions for air support. Part of the plan involved deploying a large naval force to Singapore, a force as large as or larger than the Japanese battle fleet. The doctrine was called Main Fleet to Singapore.

By the late 1930s, however, naval commitments in home waters and in the Mediterranean Sea reflected increased threats from Germany and Italy so that at the beginning of World War II, the Royal Navy battle fleet was spread thinly. Finally, in October 1941Prime Minister Winston L. S. Churchill decided to deploy a squadron of capital ships to Singapore under new Eastern Fleet commander Admiral Sir Tom Phillips. Some viewed this as the Main Fleet to Singapore force designed to overawe the Japanese from the seemingly impregnable base at Singapore.

Phillips flew his flag in the *Prince of Wales,* a King George V–class battleship that was completed in March 1941. Britain's newest capital ship, it had fought the German battleship *Bismarck* and carried Churchill to meet with U.S. president Franklin D. Roosevelt at Placentia Bay, Newfoundland. The *Prince of Wales* mounted a main armament of 10 14-inch guns in two quadruple and one double turret, along with 16 5.25-inch quick-firing guns. It also was armed with 64 2-pounder pom-poms, 8 40mm Bofors, and 25 20mm Oerlikon antiaircraft guns.

The battle cruiser *Repulse,* completed in 1916 during World War I, accompanied the *Prince of Wales*. That ship mounted 6 15-inch and 15 4-inch guns plus 4 4-inch quick-firing antiaircraft guns. The aircraft carrier *Indomitable,* which was to have accompanied these two capital ships, ran aground off Jamaica and was undergoing repairs. The decision to send the two capital ships to the Far East without air cover was fateful, as it deprived the squadron of the means to defend against Japanese air attack. Land-based air forces at Singapore were also inadequate. Churchill and Phillips, however, both believed that capital ships could not be sunk by aircraft while the ships were under way and were defending themselves with antiaircraft guns.

The *Prince of Wales* and the *Repulse* arrived at Singapore on December 2. Following the Japanese attack on Pearl Harbor on December 7, the two were the only Allied capital ships on station between Hawaii and the Mediterranean. On December 8, the Japanese invaded Malaya, and Phillips immediately took his ships to sea to intercept a Japanese convoy off of the Kra Isthmus of Malaya. His Force Z consisted of the two capital ships and the destroyers *Vampire, Tenedos, Electra*, and *Express*.

With no British air cover available and all hope lost of surprising the Japanese naval units, Phillips ordered his ships to return to Singapore. At this point, he received a report of another Japanese landing at Kuantan, closer to his position. He headed there but maintained radio silence so as to not alert the Japanese. This prevented the dispatch of British land-based aviation, which Phillips assumed would be forthcoming.

The British ships had been sighted by a Japanese submarine, and on the morning of December 10, the Japanese launched massive air attacks against them. The Japanese force consisted of 86 twin-engine bombers, 18 high-level bombers, and 25 torpedo bombers of the First Air Fleet at land bases in Indochina. The attacks began at 11:15 a.m.; Force Z was then about 50 miles off the east coast of Malaya. The *Repulse* was sunk first, then the *Prince of Wales*. Both ships were victims of air-launched torpedoes. The *Repulse* went down with 327 of its crew of 960; the *Prince of Wales* was struck by one or two 1,100-pound bombs and as many as six torpedoes. Of its 1,612 crew members, the destroyers rescued 1,285. Neither Admiral Phillips nor Captain J. Leach, captain of the *Prince of Wales*, was among the survivors. The Japanese lost only three aircraft in the battle.

The destruction of Force Z came as a great shock to the Royal Navy and the British government and public. It has been characterized as a sign of the end of the battleship era. No longer could capital ships operate alone without air and subsurface protection. The associated surrender of Singapore to inferior numbers of Japanese forces in February 1942, the greatest defeat suffered by Britain in its modern history, was seen as the end of British, even Western, dominance in East Asia.

Prisoners of War

In 1929, the Geneva Convention Relative to the Treatment of Prisoners of War (POWs) replaced the Hague Convention of 1907 regarding protection of POWs. The Hague Convention had dealt primarily with the means of war (for example, it prohibited the use of exploding bullets), whereas the Geneva Convention dealt exclusively with the protection of victims of war. It held that POWs should be considered on a par with the detaining power's garrison troops as far as rations, living space, clothing, and access to medical care were concerned. It also addressed such issues as permissible work and punishment and access to letters and packages.

Allied soldiers stand guard over blindfolded German soldiers taken prisoner during the raid on Dieppe, France, on August 19, 1942. (Library of Congress)

Forty powers signed the Geneva Convention, but the Soviet Union did not, meaning that prisoners taken by its forces were not subject to Geneva Convention protection. Although the Japanese delegates at Geneva signed the POW convention, the Tokyo government never ratified it. Its military leaders assumed that no Japanese would be taken prisoner and that the convention would thus be applied unilaterally. Cultural attitudes also played an important role, and authorized punishments for POWs were much milder than those the Japanese meted out to their own soldiers. Although in 1942 the Japanese government pledged to live up to the spirit of the convention, its treatment of Allied POWs during the war clearly ran counter to its assurance.

Europe, Eastern Front

On September 1, 1939, German forces invaded Poland; two days later Britain and France declared war on Germany, igniting World War II. Two weeks later, Soviet forces invaded eastern Poland in accordance with the secret provisions of the August 1939 German-Soviet Non-Aggression Pact. Sometime in 1940, Soviet authorities executed perhaps 15,000 Polish officers

in the Katyn Forest of eastern Poland. Prisoners taken by the Germans were sent to slave-labor camps. The Poles thus did not benefit from the Geneva Convention.

On June 22, 1941, German forces invaded the Soviet Union. In response to inquiries by the U.S. government, Moscow had stated that the Soviet Union would observe the Hague Convention of 1907 regarding land warfare, the Geneva Protocol of 1925 regarding chemical and bacteriological warfare, and the Geneva Convention of 1929 regarding care for the wounded and sick of warring armies. However, the Soviets said that they would observe the agreements on POWs only as "they were observed by the Germans."

The German government was as obstinate on the issue as the Soviets, and the cost was ultimately very high for the POWs captured in the fighting. Both German and Soviet POWs suffered conditions that were approached only by treatment accorded prisoners of the Japanese. Of some 5.7 million Soviet soldiers taken prisoner by the Germans, at least 3.3 million died in captivity, a mortality rate of 57 percent. This compares with a mortality rate of only 3.5 to 5.1 percent for British and American POWs in German hands.

Many Soviet prisoners taken early in the fighting were simply starved to death. According to Adolf Hitler's notorious May 13, 1941, Commissar Order, political officers were to be shot on capture. Jewish soldiers taken prisoner were handed over to the Schutzstaffel (SS) to be executed.

Conditions were horrendous for the others. The Germans marched the prisoners for long distances to the rear. There was little food, and there was no prepared lodging or sanitary facilities when they reached the camp locations. As a result, POWs died by the hundreds of thousands. The leaders of the Reich regarded the prisoners as subhuman and treated them accordingly. Of 3.2 million Soviet soldiers taken prisoner by December 1941, 2 million were dead by February 1942.

As the German advance came to a halt and it became impossible to demobilize German soldiers, the Reich's leaders sought to make more effective use of the Soviet POWs by putting them to work under difficult conditions in road building, mining, and agriculture. Not until mid-1944, however, did food rations for Soviet POWs approach those of other Allied POWs in German captivity. So difficult was it for Soviet prisoners of war that at least a quarter million volunteered to serve as auxiliaries to the German Army, working as cooks, drivers, and the like, simply to stay alive.

Tens of thousands of others also agreed to serve in a German-sponsored Russian Liberation Army led by former Soviet lieutenant general Andrei A. Vlasov. Hitler, however, refused it any combat role, and it became simply a means to encourage desertions.

The plight of Soviet POWs in German hands did not end with the defeat of Germany. Soviet leader Joseph Stalin's infamous Order 270 of August 1941 had branded as traitors all Red Army personnel who allowed themselves to be taken prisoner, regardless of circumstances. It also ordered rations cut off to their families. Of some 1.8 million Soviet POWs repatriated at the end of the war, at least 150,000 were sentenced to long prison terms of forced labor for having "aided the enemy."

On the other side, about a third of the nearly 3 million German and Austrian soldiers taken by the Soviets in the war died in captivity. Of some 91,000 Germans taken prisoner in the August 23, 1942–February 3, 1943, Battle of Stalingrad, fewer than 5,000 survived Soviet captivity. Death rates were comparable for the 2 million Axis soldiers taken prisoner by the Soviets.

The only difference in German and Soviet treatment of POWs was that for the Germans, it was systematic government policy to work the prisoners to death, whereas POWs in Soviet hands fell victim to the general inefficiency and indifference of the Soviet POW camp administrative system, the Main Administration for Affairs of Prisoners of War and Internees; lack of resources in a country ravaged by war; and individual acts of reprisal. Rising numbers of German POWs after 1942 simply overwhelmed available Soviet means to care for them. The Soviets did not begin major repatriation of its POWs until 1947, and the last were not released until 1956.

Western Europe

During World War II in Western Europe and North Africa, the Axis powers captured some 3.5 to 4 million enemy soldiers. In turn, the Western Allies took some 5.25 million Axis soldiers captive, 3.4 million of whom surrendered with the end of hostilities on the Western Front.

Few problems were reported for POWs held by the Italian government. Experiences for POWs held by the Germans varied according to their citizenship. Treatment was decidedly better for West Europeans and North

Americans than for those from Eastern or Southern Europe. The Germans did not expend scarce resources on the prisoners, however. Thus, in consequence of the high number of parcels sent to Western Allied POWs, the German government decided to cut food rations to U.S. and British Commonwealth POWs by one-third, forcing these Allied governments to subsidize German Geneva Convention obligations. The Germans also employed many of their French and Belgian POWs in labor activities (such as the armaments industry) that directly benefited the German war effort.

The Germans organized their POW camps quite methodically. Internally, the camps were run by the prisoners. Generally there was a senior Allied officer or senior American officer, depending on the mix of prisoners. Officers were segregated from enlisted men. Stalags (Stammlager, main camp) were camps that held enlisted personnel as well as noncommissioned officers. Oflags (Offizierlager, officer's camp) were camps with only officers and some noncommissioned officers. In the Stalags, there was generally a "man of confidence" who was usually elected by his fellow POWs, although on occasion he was appointed by the Germans.

Camps usually contained more than one compound, and prisoners were segregated among the compounds by uniform, not by claimed citizenship. Hence, U.S. personnel who flew with the Royal Air Force (RAF) and were captured in RAF uniform were considered to be British and housed with British flyers. Compounds held French, Russians, British, Commonwealth, and various other nationalities. Some camps held only one nationality; some held many different nationalities.

There were also POW camps located in areas that held concentration camps. Auschwitz, which is known for being an extermination center, was actually a complex of camps comprising more than just the extermination center. French, Soviet, and other nationalities of POWs were held there. Two exceptions to the generally satisfactory German treatment of Western POWs came in Hitler's Commando Order of October 18, 1942, which allowed the killing out of hand of Allied commandos, and Berga, a Buchenwald sub-camp that held 352 U.S. "Jewish" POWs. Of that number, only 70 were actually Jewish, but the others were chosen by the Germans because they "appeared" Jewish. Prisoners were regularly beaten and starved, and several were murdered.

There have been unsubstantiated charges in recent years of British and

U.S. mistreatment of German POWs in the months immediately following the end of the war in Europe. There is, however, no proof of this or of any widespread mistreatment of Axis prisoners of war by British and U.S. authorities during the war itself.

Far East

Japanese cultural attitudes played an overwhelming role in Japanese treatment of POWs. The Japanese believed that soldiers should die in battle rather than surrender and that those who allowed themselves to be taken prisoner had dishonored themselves. Japanese treatment of POWs was atrocious. Prisoners were subject to torture, starvation, beatings, and denial of medical care. Most were required to perform slave labor, from building railroads to working in coal mines and factories, all of which were forbidden by the Geneva Convention. Mistreatment was rampant, as were disease and starvation, not only among military prisoners but also with civilian internees. Nor would the Japanese allow humanitarian aid to reach the prisoners.

The generally accepted figure for Allied POWs in Japanese hands is 320,000: 140,000 Europeans and North Americans and 180,000 Chinese, Filipino, Indian, and other Asian troops. Most of Japan's prisoners were taken during the successes of late 1941 and early 1942, especially in the Netherlands East Indies. Although the Japanese soon released many of the nonwhite prisoners, they held their white captives until the surrender in 1945.

The Japanese captured some 25,600 U.S. prisoners. Of these, 8,288 died, a rate of 35.6 percent. This was appreciably higher than the rate for all prisoners who died in Japanese hands: 37,800 or 26.9 percent. Part of this disparity was the result of the many American and Filipino POWs who died in the April 1942 Bataan Death March.

Prisoners of the Japanese received no medical care and little food, and they were seldom allowed to contact their families.

Many of the prisoners were transferred from the Philippines and other places to Japan or Manchuria to prison camps. Sent by ship, the prisoners were entombed belowdecks with little or no access to fresh air or water. Many hundreds of men died in these "Hell Ships," but the exact total is unknown. Several of the ships, unmarked by the Japanese as transporting POWs, were sunk by Allied planes or submarines. In addition, many POWs

who ended up in Manchuria were subjected to the horrors of biological warfare and vivisection experiments carried out by the infamous Japanese Unit 731.

Japanese military codes forbade surrender, and in consequence, the Western Allies took few Japanese prisoners. During the Battle of Iwo Jima (February 19–March 26, 1945), U.S. marines took fewer than 300 prisoners from the 21,000-man Japanese garrison, and only about 7,400 of nearly 115,000 Japanese soldiers during the Invasion of Okinawa (March–June 1945) surrendered. It is also true that once Allied soldiers learned of the barbaric treatment accorded by the Japanese to their prisoners, there was a tendency to decline to take prisoners, although this was never official policy.

Some 633,000 Japanese personnel were taken prisoner in Southeast Asia, and most of them surrendered to the British at the end of the war. Many of these were held well after the war and worked as laborers without pay. Only in October 1947 were Japanese released from Singapore. Some Japanese POWs were also rearmed and forced to serve with Dutch forces in the Netherlands East Indies in violation of international law, and nearly 1,000 died.

It is unclear how many Japanese were taken prisoner by the Soviet Union, which entered the war in the Pacific on August 9, 1945. The Soviets claimed to have captured 594,000 Japanese and claimed that upwards of 71,000 of these were immediately freed. Japanese scholars, however, insist that the number was much higher. Sent to Siberia, the Japanese worked there for several years before they were released. Because of the dishonor associated with being captured, few Japanese ex-POWs have left memoirs of their experiences. The record of Americans and Europeans held by the Japanese is, however, well documented.

North America

When the United States entered World War II, little thought had been given to the establishment of POW facilities. In March 1942, President Franklin D. Roosevelt authorized the evacuation of Japanese Americans from “military areas,” especially on the West Coast of the United States. Ultimately some 120,000 Japanese Americans were affected. Although they were not called prisoners of war, they were interned in camps in Wyoming, California,

Colorado, Arizona, Idaho, and Arkansas. Early in the war, Italian nationals (non-U.S. citizens) were also interned in temporary camps in the U.S. West, although the Roosevelt administration reversed that policy within a year.

Following the Axis defeat in North Africa, large numbers of German and Italian POWs were brought to camps in the United States. Ultimately, some 425,000 Axis prisoners of war were held in the United States. By the end of the war, the United States had established 141 permanent base camps and 319 branch camps, each holding an average of about 2,500 prisoners.

Given the labor shortage in the United States because of the demands of the war, many of the POWs went to work, but they were paid for their labor according to rank. Officers were not required to work, although several did accept supervisory positions. Contractors who hired the POWs paid the U.S. government some $22 million for their services so that the program was nearly self-sufficient. By the end of the war, of 370,000 POWs in the United States, nearly 200,000 were employed in nonmilitary jobs, most of them in agriculture. Conditions in the U.S. camps were generally excellent. The major problem came from die-hard Nazi fellow prisoners, who had to be segregated in special camps.

Following the war, several U.S.-held POWs were turned over to France and Britain to work in mines and help clear bombed roads and cities. Most of these POWs were repatriated to Germany in late 1947 and early 1948, embittered over their postwar treatment.

Propaganda

Organized and usually emotional government campaigns employing print, film, and especially radio designed to persuade audiences of nefarious enemy actions while supporting one's own war effort. Propaganda as a modern psychological weapon of war was first systematically applied by all major combatants in World War I. With more modern media available—and a far clearer ideological conflict between democracy and fascism—propaganda became much more pervasive in World War II. Some was aimed domestically to encourage support for the war; the best-known efforts were directed at opponents.

The Axis Powers: Germany, Italy, and Japan

Germany's highly effective propaganda efforts drew on Hitler's own experience of Allied propaganda during World War I. Recognizing the importance of a clear effort, Germany developed centralized control of all media from the beginning of the Nazi regime with the March 1933 creation of the Ministry of Public Enlightenment and Propaganda, headed by Dr. Joseph Goebbels. Initial efforts were largely domestic and soon included a steady beat of anti-Semitic and anticommunist content. Another theme was how World War I had been lost not on the battlefield but thanks to subversion and internal collapse. By the late 1930s, propaganda focused on how others

(such as Poland) had attacked Germany and on the “decadent” Slav people. There was also a steady building of the Hitler personality cult.

Two media were especially valuable to Goebbels—radio and dramatic films and newsreels. Epitomized by *The Triumph of the Will* (1935), Leni Riefenstahl’s heroic film portrayal of the Nazi Party’s 1934 Nuremberg Rally, sound, Wagnerian music, and dramatic photography combined to illustrate Germany’s growing might. Shortwave radio, including the use of turncoat broadcasters such as “Lord Haw Haw” and “Axis Sally,” was used in attempts to weaken enemy morale and soften up target countries before and during attacks. Film and radio helped promote the power of German arms on land, on the sea, and in the air, as did bright poster art and printed media.

Italian efforts were more for internal consumption and dated to the beginning of Benito Mussolini’s regime in 1922. Marshaling all media, the fascist movement was pictured as reviving the glorious days of Imperial Rome. Central to that message was (as in Germany) building a cult around the “maximum leader,” Mussolini.

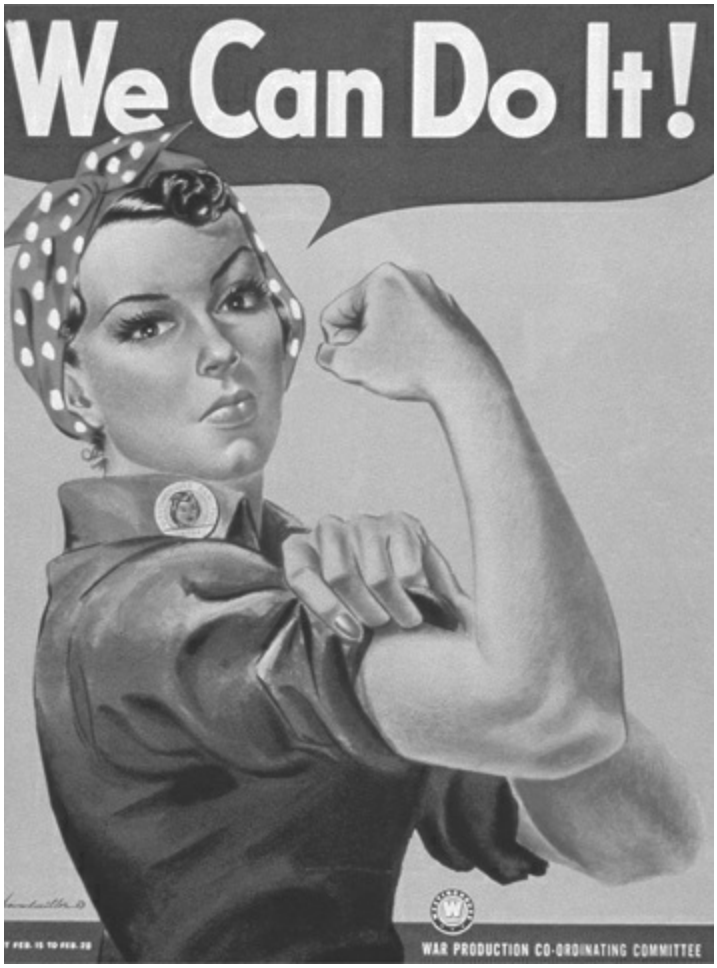
Japan’s approach to propaganda, or what its leadership termed “thought war,” centered on the conception of the Greater East Asia Co-Prosperity Sphere. This economic empire backed by Japanese arms was described as liberating Asia for Asians as old colonial powers (Britain, France, the Netherlands) were beaten back. The glory of empire was personified again, this time in the role of the virtually godlike emperor.

Given the distances covered by Japan’s conquests, at their height stretching from the borders of India to the Central Pacific, Japan relied on extensive use of shortwave radio, and “Tokyo Rose” and others broadcast directly to American troops. Internal propaganda emphasized Japanese victories and expansion even when that was no longer true. Japanese listeners were thus stunned when they first heard Emperor Hirohito call for an end to hostilities in August 1945, having had no idea of the true direction of the war for the previous two years.

The Allies: Britain, United States, and Soviet Union

Allied propaganda efforts began as a response to Axis messages. The British drew lessons from their World War I experience and again divided internal and external propaganda operations. The former involved considerable

reliance on media cooperation with authorities rather than on government orders. Prime Minister Neville Chamberlain's government established the Ministry of Information (January 1940) under former British Broadcasting Corporation (BBC) director-general Sir John Reith. Prime Minister Winston L. S. Churchill appointed Duff Cooper in May 1940 and then Brendan Bracken, a journalist and close political associate, in July 1941. Although there was some clumsy initial censorship, the ministry found its feet as the war took hold. Churchill also established the Political Warfare Executive (September 1941) to direct propaganda aimed at enemy countries. These efforts included massive leaflet drops from bombers and effective use of BBC news and other broadcasts.



This poster by J. Howard Miller is the quintessential image of the female defense worker during World War II. The image of the factory woman, depicted in many ways and popularized as "Rosie the Riveter," became a national symbol of American unity and patriotism. (National Archives)

Themes evident in print, film, and radio propaganda emphasized that all Britons were in the war together. “We” might be “standing alone,” but “London can take it.” These and similar themes helped to rally domestic support even during the Blitz (August 1940–May 1941). In its 4,000 theaters, Britain made excellent use of hundreds of motion pictures, including both features and short news items. Some were screened in the United States to encourage U.S. support of Britain’s fight. The BBC played a central role, including broadcasting Churchill’s persuasive and gripping speeches. Churchill and others made use of the “V for Victory” appeals from early 1941 to mid-1942 and succeeded in covering Europe with the painted sign or Morse code signal “…-.”

Through 1941, the United States remained isolationist and wary of foreign propaganda. After the December 7, 1941, Japanese attack on Pearl Harbor and several initial organizational attempts, President Franklin D. Roosevelt formed the Office of War Information (OWI) in June 1942 under respected radio news commentator Elmer Davis. The OWI established domestic and overseas sections, the latter eventually becoming the Voice of America.

American propaganda themes emphasized Roosevelt’s Four Freedoms (of speech and worship and from fear and want). Messages promoted military victories combined with some censorship. That the efforts of women were needed to back the fighting men was evident in posters featuring “Rosie the Riveter” and in Hollywood films that presented a positive view of the war. Frank Capra’s seven-film *Why We Fight* series comprised some of the best wartime documentaries made. Films by John Ford and John Huston, among others, and wartime application of famous cartoon characters and comic book heroes all contributed to the effort. Commercial radio broadcasts incorporated the war effort in nearly all drama, variety, and music programs.

Soviet domestic propaganda had been pervasive. After the German invasion on June 22, 1941, propaganda messages focused on the Russian “motherland” and traditional values, historical victories (as over Napoleon), and the once-vilified Russian Orthodox Church. All were combined in propaganda depicting Joseph Stalin as architect of victory in the “Great Patriotic War.” Soviet authorities made good use of documentary and news film in major cities but relied on posters in rural regions.

Proximity Fuze

An artillery fuze that uses radar to detonate the projectile at a preset distance from the target. Shells require fuzes to detonate them. Point-detonating fuzes detonate on contact; time fuzes can be set for airbursts. Until the middle of World War II, all time fuzes were mechanical. Time of flight and the altitude of the target in relation to the gun required precise calculation of the initial time setting, which then almost always had to be adjusted by a forward observer. This process, requiring anywhere from two to four adjustment rounds, sacrificed the element of surprise at the target.

The proximity fuze used a radar transmitter and receiver to detonate the projectile at the appropriate distance from an aerial target, or height of burst above a ground target (usually 65 feet above the target) on the first round. Proximity fuzes originally were developed for antiaircraft fire. During World

War II, British and American scientific research successfully combined to produce a new method of shell fuzing that enabled the shell to sense its target electronically and to explode when it was within lethal range.

The British began work on this in 1939, and by the summer of 1940 the United States was involved as well. The first work was carried out by the National Defense Research Committee (Section T). Other participants included the Department of Terrestrial Magnetism of the Carnegie Institute, the Sylvania Company, RCA, the University of Michigan, Johns Hopkins University, the National Carbon Company, Raytheon, and Eastman Kodak. At the end of the war, the Naval Ordnance Laboratory took over research and development, producing infrared proximity fuze systems.

Shells with proximity fuzes were in production by early 1942. The Americans knew it as the VT fuze, which stands for "variable time." The first successful action for the proximity fuze came in January 1943, when a 5-inch gun in the secondary battery of the U.S. cruiser *Helena* shot down an attacking Japanese bomber. Initially, use of the proximity fuze was limited for security reasons to overseas actions, and the fuzes were producing spectacular results by the time the Japanese mounted their kamikaze attacks. The fuze was also used for field artillery later in the war, and it was particularly effective against German troops in the Ardennes Offensive (Battle of the Bulge, December 16, 1944–January 25, 1945). It was also important in the gunnery battle against the German V-1 buzz bomb.

The proximity fuze was developed in total secrecy. It was perfected by the time it was issued, and it worked. Its successful and rapid development and procurement represent a rare accomplishment in the history of weapons development.

Psychological Warfare

Operations crafted to undermine an enemy force or to propagate a message to a civil population. The main objective of such activities is not necessarily to garner enemy defectors but to lower morale, military or civilian. World War II saw the most extensive use of psychological warfare (psywar) in history.

The Germans entered World War II with a reputation for propaganda success, orchestrated by Joseph Goebbels, the Third Reich's minister of propaganda. German propaganda was aided immeasurably by Germany's early military victories and throughout the war by technically excellent radio broadcasts and an impressive documentary film legacy going back to the 1920s. Of course, much German propaganda on the Eastern Front was quickly vitiated by the Germans' brutality toward their prisoners and the local populations.

Undoubtedly Germany's best psywar was to be found in its English-language radio broadcasts, the producers of which had the good sense to use up-to-date American and British popular music and to go lightly on the overt propaganda message. In the field, however, German psychological warfare leaflets tended toward "We Will Crush You" themes or heavy-handed humor with out-of-date English slang that never came off.

Soviet propaganda used such common themes as "Why Die in a Lost War?" and "Save Your Lives," but such leaflets were effectively countered by German propaganda that proclaimed, realistically enough, "Sieg oder Siberia" (Victory or Siberia). One useful Soviet tool for undermining German troop morale was simply broadcasting a metronome's ticking and the lugubrious occasional voice-over: "Every 10 seconds, a German soldier dies in Russia."

U.S. and British psywar was by far the most effective of World War II. Allied psywarriors eschewed political themes ("Hitler Is the Ruin of Germany!") and made impossible demands on their enemies ("Refuse to Fight in This Impossible War"). The best leaflets instructed German or Japanese soldiers how to get out alive from a bad situation. The most successful such leaflet, in this or any other previous war, was the well-known U.S. Army *Passierschein*, an effort that resembled an international treaty,

with a multilingual text and a display of the Allied flags. The leaflet was represented as an order to American soldiers to receive the bearer as an honorable prisoner of war; it concluded with the signature of General Dwight D. Eisenhower.

In the Pacific theater, American psywarriors learned the hard way that Japanese soldiers do not "surrender" but that a few (as well as many more who were likely to be Taiwanese or Korean) might be persuaded to "cease resistance" or "take the honorable path." The most successful U.S. propaganda of the Pacific war was directed toward the civilian population—the justly famous "city leaflets" listing the Japanese cities to be bombed and the dates of the bombings. The fact that U.S. Army Air Forces B-29 bombers duly appeared on the dates given and that the "ever-victorious" Japanese Air Force could do little to prevent these publicly scheduled mass incendiary raids had a devastating effect on Japanese morale, judging by postwar interrogations, whose subjects included Emperor Hirohito.

Japanese radio propagandists, like their German allies, did garner a wide Allied listenership simply by playing popular music. But Japanese leaflets were an art form in themselves. They featured hard-core pornography (much appreciated by Allied troops) or hilariously mangled English, and sometimes both.

By the close of World War II, British and U.S. military propagandists arrived at several battle-tested psywar truths: know your enemy or target audience, know their language and culture as much as possible, tell no lies, never denigrate or caricature the enemy, and steer clear of politics in favor of simple how-to-save-your-life suggestions. Germany, Japan, and the Soviet Union, more often than not, violated every one of these maxims.

Puller, Lewis Burwell (1898–1971)

U.S. Marine Corps officer. Born in West Point, Virginia, on June 26, 1898, Lewis Burwell "Chesty" Puller attended the Virginia Military Institute, but anxious to fight in World War I, he left in 1918 to enlist in the U.S. Marine Corps. Puller did not, however, see overseas duty in the war. He then attended Officers' Training School, and in 1919, he was commissioned a second lieutenant in the Marine Corps Reserve. No officer slots were available in the military demobilization after the war, and Puller enlisted in the marines as a corporal. He then served in Haiti as an officer in the Gendarmerie (1919–1924).

Returning to the United States, Puller was recommissioned a second lieutenant in March 1924. He was stationed at Quantico, Virginia (1924–1926); in Hawaii (1926–1928); and in Nicaragua (1928–1931). In Nicaragua, he earned the first of his five Navy Crosses. In 1931, he attended the Army Infantry School at Fort Benning, Georgia. Puller returned to Nicaragua in July 1932, where he received his second Navy Cross for his aggressive exploits in a patrol during which at least 30 rebels were killed. From 1936 to 1939, Puller was an instructor at the Marine Basic School in Philadelphia. He was promoted to major while serving from 1940 to 1941 with the 4th Marines in Shanghai, China, where he became a battalion commander. He then served with the 7th Marines at Camp Lejeune, North Carolina, where he helped pioneer jungle training.

Following U.S. entry into World War II, Puller landed with the 7th Marines on Guadalcanal in August 1942. In the defense of Henderson Field, his battalion held off repeated Japanese attacks. Puller's men killed more than

1,400 Japanese during October 24–25, 1942, 20 Japanese for every American lost. For these actions, Puller was awarded his third Navy Cross. In February 1944, Puller was promoted to lieutenant colonel. That same year he earned his fourth Navy Cross during heavy fighting at Cape Gloucester, New Britain Island. He returned to the United States for training duty at Camp Lejeune in November 1944 and was promoted to colonel shortly thereafter.

During the 1950–1953 Korean War, "Chesty" Puller commanded the 1st Marine Regiment in the Inchon Landing and the subsequent capture of Seoul in September 1950. For this leadership in the Changjin (Chosin) Reservoir withdrawal, he was awarded a fifth Navy Cross, the most in U.S. Marine Corps history. For an action one week prior to the Chosin battle, he also was awarded an Army Distinguished Service Cross, the same level of decoration as the Navy Cross. In January 1951, Puller was promoted to brigadier general. Promoted to major general in September 1953, he commanded the 2nd Marine Division at Camp Lejeune. Puller retired in November 1955 as a lieutenant general, the most decorated and certainly one of the best-known marines in the history of the corps. Puller died at Hampton, Virginia, on October 11, 1971.

Pyke, Geoffrey Nathaniel Joseph (1893–1948)

Eccentric British inventor. Born into a well-to-do family in London on November 9, 1893, Geoffrey Nathaniel Joseph Pyke studied at Pembroke College, Cambridge, but left school to pursue a career in journalism. As a Reuters correspondent in Denmark during the summer of 1914, Pyke reported on German military and naval movements until he was ejected from that country. He subsequently found work with the *Daily Chronicle* as a correspondent within Germany. Reaching Berlin in late September 1914, Pyke was soon jailed as a spy, but he escaped the following summer and returned to London. By the early 1920s, Pyke's passions turned to education, and he founded the Malting House School.

Pyke designed a modified Harley-Davidson motorcycle to help the Republican cause in the 1936–1939 Spanish Civil War. After he became a scientific adviser to Vice Admiral Lord Louis Mountbatten in British Combined Operations in March 1942, certain examples of Pyke's military-scientific ideas began to bear fruit, such as a prototype snowmobile known first as the "Plough" and then more commonly as the "Weasel." Pyke also proposed making ships of ice to serve as unsinkable aircraft carriers for antisubmarine warfare and amphibious operations support. Both Mountbatten and Prime Minister Winston L. S. Churchill supported the proposal and authorized development of the idea.

The project was code-named HABAKKUK. Pyke's group concluded that the ice ship would need to be half a mile long, with a hull 30 feet thick made of reinforced ice known as "Pykrete." This mixture of solidly frozen water and wood pulp was stronger and more stable than ice and less inclined to melt. Pipes circulating cold air would keep the hull permanently frozen.

A prototype 50-foot-long Pykrete ship was built at Patricia Lake in Alberta, Canada, in the spring of 1943 and proved successful. The British were enthusiastic and put forth plans to build a fleet of these vessels, but the price tag was a staggering $70 million. The British could not afford this, and the Americans thought the project impractical. None were built.

After the war, Pyke helped the fledgling National Health Service solve staffing problems. Pyke, who battled depression all his adult life, committed suicide on February 21, 1948.

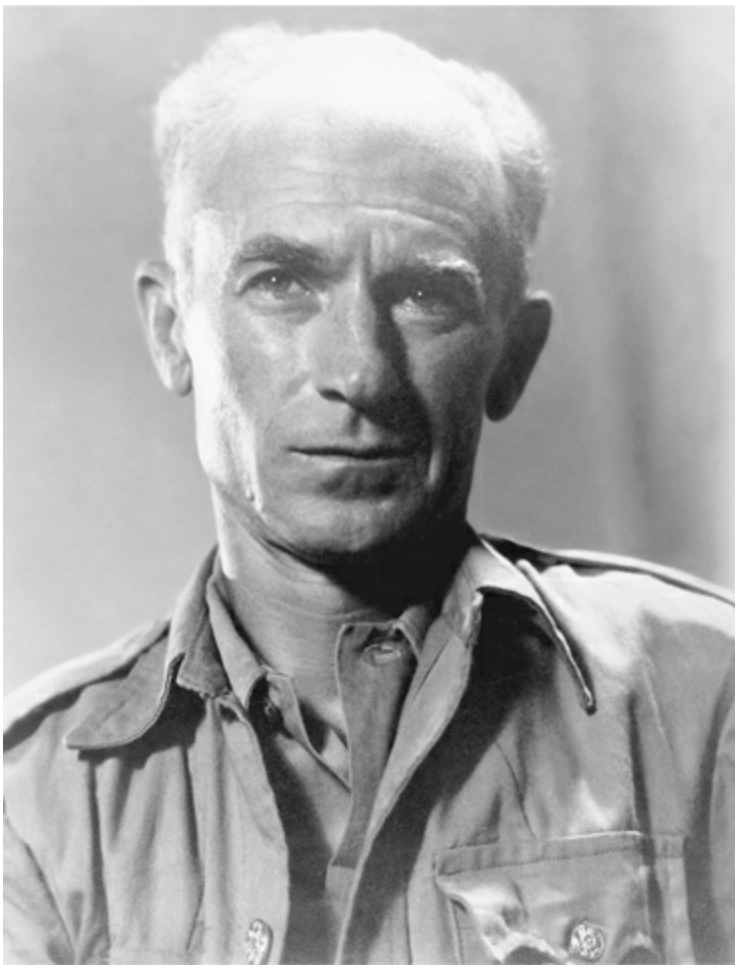
Pyle, Ernest “Ernie” Taylor (1900–1945)

Arguably the most beloved American journalist of World War II. Born on August 3, 1900, near Dana, Indiana, Ernest “Ernie” Taylor Pyle attended Indiana University (1919–1923), leaving just short of securing a degree in journalism to accept a job with a local newspaper. A few months later, he went to work for the *Washington Daily News*, a Scripps-Howard paper. During two stints with the paper, he wrote the first daily column about aviation news, and he later became managing editor.



Ernie Pyle, 1945. A journalist and correspondent, Pyle accompanied Allied troops in the field. His reporting focused on the grim realities facing individual soldiers. Probably the best-known American journalist of the war, Pyle was killed in the fighting for Okinawa in 1945. (Library of Congress)

Pyle found the lives of ordinary people fascinating. In 1935, he began a syndicated column for Scripps-Howard recounting his experiences as he drove across America. During the next four years, Pyle crossed the United States 35 times, chronicling the lives of everyday people doing sometimes extraordinary things.

In 1940, Pyle went to Britain to cover the Battle of Britain (July 10–September 30) for Scripps-Howard. Like radio commentator Edward R. Murrow, Pyle became the eyes and ears of America in London. His description of the hardships and courage of the average Briton tugged at the conscience of a nation not yet at war. When the United States did go to war, Pyle joined American troops as they landed in North Africa. Later he

followed them through Sicily, Italy, and even to Normandy on D-day (June 6, 1944).

Always near the front, Pyle gained a reputation for understanding the drudgery and fear that the average GI had to endure. He focused his stories and reports on combat infantrymen and soon became loved by the regular soldier and the public back home.

By 1944, Pyle's columns were carried by more than 400 daily and 300 weekly newspapers. That same year, he won the Pulitzer Prize for Journalism and was featured on the cover of *Time* magazine. Pyle's wartime books, compilations of his wartime experiences, became best sellers.

In early 1945, at the request of the U.S. Navy, Pyle deployed to the Pacific theater to cover navy and marine operations. He accompanied a marine rifle company. On April 18, 1945, during the March–June 1945 Okinawa Campaign, Pyle was preparing a story on the island of Ie Shima, not far from Okinawa, when he was killed by Japanese machine-gun fire. Later in 1945, famed director William Wellman released a film about Pyle titled *The Story of GI Joe* and starring Burgess Meredith as Ernie Pyle.

Quebec Conference, First (August 14–24, 1943)

Allied planning conference held in Quebec, Canada, from August 14 to 24, 1943. Code-named Quadrant, this meeting included U.S. president Franklin D. Roosevelt, British prime minister Winston L. S. Churchill, Canadian prime minister William Lyon Mackenzie King, and Chinese foreign minister Tse-ven Soong as well as their staffs and military advisers.

Regarding military strategy in Europe, Churchill continued to argue for concentration on the Balkans. The U.S. military chiefs were strongly opposed to this; they reminded their ally that the invasions of Sicily (July 9–August 22, 1943) and Italy (September 9) had been based on the premise that the next major objective would be the cross-Channel invasion of France. The conferees then approved tentative plans for the cross-Channel invasion, now code-named Operation OVERLORD, and fixed May 1, 1944, as the target date for its execution.

Churchill had argued that the commander of OVERLORD should be British, and he initially proposed General Sir Alan F. Brooke, chairman of the Imperial General Staff. By the time of the Quebec meeting, however, Churchill realized that the United States would have the preponderance of troops employed after the initial landing, and he had therefore concluded that the commander should be an American. At Quebec, he therefore proposed and it was agreed that an American general would command OVERLORD and a British general would have charge of the Mediterranean theater.

The Allies also agreed to accelerate the strategic bombing offensive against Germany from bases in the United Kingdom and Italy. The objectives of the bombing campaign would be to destroy German air combat strength; dislocate the German military, industrial, and economic systems; and prepare the way for a cross-Channel invasion. The United States agreed to a large-scale buildup of its forces in the United Kingdom prior to the invasion of France. The Allies also agreed to vigorously press the war in the Mediterranean. The objective here was to drive Italy from the war and secure air bases for operations against Germany in Italy and in Sardinia and Corsica. The Allies discussed a second landing in France, code-named Operation ANVIL, on the Mediterranean coast.

Allied operations in the Balkans would be limited to the supply of Balkan guerrillas by air and sea, minor commando raids, and strategic bombing. The Allies then agreed to intensify the war against German submarines and to make greater use of the Azores as an Allied naval and air base.

In the Pacific theater, the Allies decided to establish a separate South-East Asia Command, with Lord Louis Mountbatten as its commander. They also agreed to accelerate operations against Japan. The goals in the Pacific were to exhaust Japan’s air, naval, and shipping resources; cut its communications; and secure bases from which to conduct strategic bombing of the Japanese home islands.

Prime Minister Winston Churchill, President Franklin D. Roosevelt, and Prime Minister MacKenzie King at a press conference following the Quebec Conference of September 1944. (Corbis)

There was some disagreement on the last point about whether to set up air bases in China or on the Japanese barrier islands in the Central Pacific. This effort would be borne principally by expanding U.S. naval power, with large armies required only at the end to invade Japan. The British promised to participate fully in this effort once Germany was defeated. Finally, the United States, although it was opposed to formal recognition of General Charles de Gaulle's French Committee of National Liberation as the French government-in-exile, did issue a statement extending limited recognition to de Gaulle's government.

Quebec Conference, Second (September 12–16, 1944)

Allied summit held in Quebec, Canada. U.S. president Franklin D. Roosevelt and British prime minister Winston L. S. Churchill met in private conference and in plenary sessions with the Combined Chiefs of Staff to shape plans for the conclusion of the war in Europe, the defeat of Japan, and the governance of postwar Germany.

On September 12, the president met with his close friend, Secretary of the Treasury Henry Morgenthau Jr. A plan for the administration of postwar Germany drafted for Morgenthau by his assistant, Harry Dexter White, became a topic of discussion at the conference and a source of continuing study and controversy. The Morgenthau Plan suggested that Germany should be transposed into an agrarian economy following the war. All heavy industry would be stripped from the country.

Secretary of War Henry Stimson strongly opposed the approach, as did Secretary of State Cordell Hull. A memorandum from Stimson to Hull, which was passed on to the White House, argued strongly that the Morgenthau approach lacked economic sense and would invite political difficulties. The argument was also made that trying to keep the Germans limited to a "subsistence level" was unwise and wrong as well as impractical, because the reconstruction of Western Europe could not be realized without a robust German economy.

Roosevelt initially pretended that he knew nothing of the Morgenthau Plan; then he raised objections. On October 20, he sent a memorandum to Hull questioning the idea of "making detailed plans for a country we do not yet occupy," and after that he let the initiative wither. Churchill initially supported the Morgenthau approach. Speculation suggested that the British leader was mindful of the importance of American economic assistance after the war and wanted the support of the U.S. secretary of the treasury on the

matter. In any case, Churchill knew that the War Department in Washington would ultimately veto the plan. The Quebec Conference also revealed Roosevelt to be in failing health, which fueled speculation about his capacity to continue to lead the war effort.

Queen Elizabeth and *Valiant,* Sinking of (December 19, 1941)

The June 1940 German defeat of France and entry into the war of Italy as an Axis power were great blows to the British because they deprived them of the powerful French Navy, which had been charged with the defense of Allied Mediterranean interests. This duty now fell primarily to the British Mediterranean Fleet commanded by Admiral Andrew B. Cunningham and based at Alexandria, Egypt.

In late 1941, the Italians devised a night raid against the British Mediterranean Fleet involving the use of midget submarines, specifically human torpedoes. Italy had been in the forefront of the development of these during World War I. The craft for this operation was known as a Maiale (pig) because of its poor maneuvering ability. Electrically propelled, it had two crewmen in diving suits riding astride the torpedo who would steer it toward its target ship. The detachable warhead would then be employed as a limpet

mine, after which the crewmen would ride the torpedo away. The Maiale was 22 feet in length and 21 inches in diameter and had a 485 pound warhead.

The Italians launched their operation on the night of December 18, 1941, upon obtaining intelligence that the battleships *Queen Elizabeth* and *Valiant*, the two most powerful warships of Cunningham's force, were at Alexandria. The Italian submarine *Scire*, commanded by Lieutenant Commander Junio Valerio Borghese, surfaced about 1.3 miles off the entrance to Alexandria, then launched three Mailes. They were able to penetrate the harbor by following in the wake of three British destroyers. They subsequently sought out their targets in the early morning hours of December 19, as two attacked the battleships and the third concentrated on the Norwegian tanker *Sagona*, moored beside the *Queen Elizabeth.*

The Italians attacking the battleships made sure to place their explosive charges in areas of the hull that would produce the most damage. The British discovered the crew of the craft deployed against *Valiant,* captured them, and imprisoned them aboard the battleship for questioning. Their capture, however, did not enable the British to discover the placed charges, although one of the prisoners did warn the British about the possibility of an explosion.

The first charge to detonate was that attached to the *Sagona.* That blast, at 5:58 a.m., sank the tanker and damaged the bow of the nearby destroyer *Jervis.* The explosion of the next device, attached to the *Valiant,* occurred at 6:05 a.m., with all its men up from below and watertight doors closed. The blast flooded the battleship's forward magazine.

The last blast, at 6:16 a.m., opened to the sea the boiler rooms and engineering spaces of the *Queen Elizabeth*. Both battleships settled on the harbor bottom. Within 48 hours, the British had taken prisoner three of the men from the remaining two Italian teams, one having been killed. The *Scire* remained on station submerged for some 39 hours, then escaped.

The sinking of the *Valiant* and the *Queen Elizabeth* deprived the Royal Navy of its only battleships in the Mediterranean and shifted the balance of power in that theater. While both ships could be salvaged due to the shallow depth of the harbor, their temporary loss allowed the Italians to better supply their forces in North Africa in the opening months of 1942.

Quesada, Elwood Richard "Pete" (1904–1993)

U.S. Army Air Forces lieutenant general. Born in Washington, D.C., on April 13, 1904, Elwood Richard "Pete" Quesada attended the University of Maryland and Georgetown University. He enlisted in the U.S. Army Air Corps in September 1924 as a flying cadet and earned his wings and a commission in the Air Reserve in 1925. He briefly played professional baseball before going on active duty in September 1927. He flew as a crew member of the *Question Mark*, a modified Fokker C-2A trimotor monoplane that set a world record for airborne endurance in 1929. Quesada served in the 1930s as assistant military attaché to Cuba, personal pilot to the assistant secretary of war for air during an expedition to collect African wildlife, and technical adviser to the Argentine Air Force. Stints at the Air Corps Tactical School and the Army's Command and General Staff College led him to consider the problem of air-to-ground coordination.

After commanding the 33rd Pursuit Group at Mitchel Field, New York, in 1941, Quesada was promoted to brigadier general in December 1942 and deployed to North Africa. Taking command of the XII Fighter Command, he served as deputy commanding general of the Northwest African Coastal Air Force. Here he learned the tactical air doctrine developed by British air marshal Sir Arthur Coningham, which used air liaison officers (ALOs) to coordinate air-to-ground operations, colocated air and army command centers, and streamlined command-and-control procedures between ground units and supporting tactical air. Quesada adopted and improved upon all of these techniques in 1944.

Promoted to major general, Quesada commanded the IX Tactical Air Command in Europe for Operation OVERLORD (June 6, 1944). His support of Major General J. Lawton Collins's VII Corps demonstrated brilliant innovative tactics. Recognizing that close air support (CAS) was a key Allied force multiplier, Quesada installed VHF (very high frequency) air force radios in tanks to enable ALOs in armored assaults to talk directly to pilots overhead. Deviating from accepted doctrine that air units sacrificed effectiveness if distributed in "penny packets," he allocated fighter-bombers in four-ship formations to provide constant reconnaissance and CAS to Collins's armored columns. Quesada's tactics proved crucial to the success of COBRA (July 25–31), the Allied Normandy breakout in July.

Throughout 1944, Quesada continued to innovate. During the Ardennes Offensive (December 16, 1944–January 25, 1945), he used radar to provide CAS in poor weather. Using modified Norden bombsights combined with radar, he enhanced navigation and bombing accuracy.

During 1946–1947, Quesada commanded the Third Air Force, and in 1947–1948 he commanded the Tactical Air Command. However, Quesada was marginalized within the newly independent U.S. Air Force, which stressed strategic nuclear bombing. After commanding Joint Task Force Three at Eniwetok (1948–1951), Quesada retired as a lieutenant general. Entering private industry, he served as the first head of the Federal Aviation Agency during 1958–1961. Quesada died in Washington, D.C., on February 9, 1993.

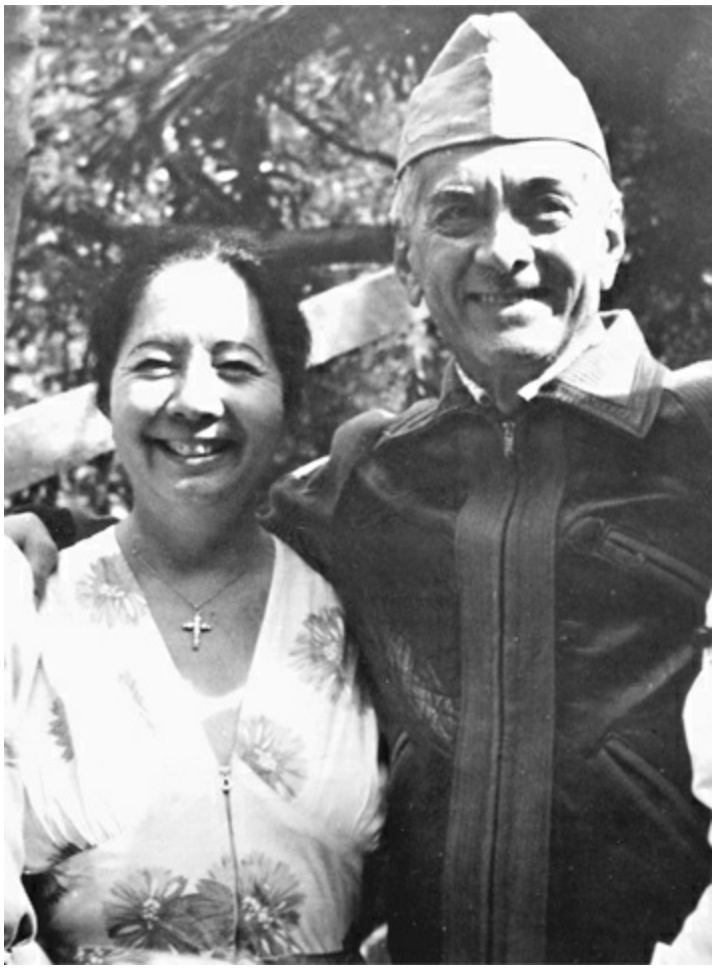
Quezon, Manuel Luis (1878–1944)

Filipino nationalist politician. Born at Baler in Tayabas (now Quezon) Province on August 19, 1878, Manuel Quezon studied law at the University of Santo Tomas in Manila. He interrupted his education in 1899 to join the forces of Emilio Aguinaldo fighting against U.S. rule in the Philippine-American War (1899–1902). After the U.S. victory, Quezon was briefly imprisoned. Upon his release, he resumed his legal studies and passed the bar in 1903.

Quezon began his political career in 1905 when he ran successfully for governor of Tayabas. In 1907, he was elected to the Philippine Assembly, where he became floor leader of the majority Nacionalista Party. In 1909, Quezon was appointed resident commissioner for the Philippines in the U.S. House of Representatives. During his years in Washington, he vigorously lobbied to secure passage of the Jones Act (1916), which pledged future independence of the Philippines. On this success, Quezon returned home a hero and became the first president of the new Philippine Senate.

In 1934, with Quezon's urging, the U.S. Congress passed the Tydings-McDuffie Act, which provided for independence 10 years after the adoption of a constitution and inauguration of a new government. On September 17, 1935, Quezon was elected president of the preindependence Philippine Commonwealth. Alarmed by the advance of Japan into Southeast Asia, in 1941 Quezon took several emergency steps that vested him with dictatorial powers. He was reelected president that November.

In December 1941, when Japanese forces invaded the Philippines and occupied Manila, Quezon accompanied U.S. commander General Douglas MacArthur to the fortified island of Corregidor in Manila Bay. He departed the islands by submarine on February 20, 1942, and formed a government-in-exile in Washington, D.C., in May. There he served as a member of the Pacific War Council and signed the United Nations Declaration. In November 1943, President Franklin D. Roosevelt signed into law a bill extending Quezon's term in office until the end of the Japanese occupation of the Philippines. Quezon died in Saranac Lake, New York, on August 1, 1944, only months before his country's liberation.



The first president of the Philippines, Manuel Quezon, with his wife, Dona, in 1942. (Hulton-Deutsch Collection/Corbis)

Quisling, Vidkun Abraham Lauritz Jonsson (1887–1945)

Norwegian collaborationist. Born in Fyresdal, Norway, on July 18, 1887, Vidkun Quisling entered the army in 1911. By 1918, he was Norwegian military attaché in Petrograd, Russia. After holding several other administrative posts, in 1931 Quisling became minister of defense.

Known as a capable army officer and government official, Quisling became controversial through his support of the German National Socialist (Nazi) Party. In 1933, he helped found a Norwegian counterpart, the Nasjonal Samling Party. In 1939, on the failure of this party, Quisling met German dictator Adolf Hitler and argued for a German occupation of Norway with the object of placing the Nasjonal Samling in power. During the German invasion of Norway in April 1940, Quisling formed a government in which he was minister-president.

Quisling's government lasted only one week. The Germans installed a new ruling body, with Josef Terboven as Reich commissioner. On February 1, 1942, Quisling managed to attain greater political power as Norway's minister-president in a Nasjonal Samling government and subsequently embarked on a program of Nazification. His policies met opposition from most of the Norwegian population.

Quisling's government was also responsible for transporting more than 1,000 Norwegian Jews to German concentration camps. Quisling's government, however, was impeded by both interference from Berlin and Norwegian partisan resistance.

Following the liberation of Norway in May 1945, Quisling was imprisoned to await trial for war crimes. During the subsequent court proceedings, he claimed that he had acted for the greater good of Norway. Nonetheless, he was found guilty of high treason and executed by firing squad at Akershus Castle in Oslo, Norway, on October 24, 1945. His name has become synonymous with the term "traitor."

R

Rabaul

Principal Japanese naval and air base in the Southeast Pacific during World War II. The port of Rabaul, with its superb natural harbor, was located at the eastern end of New Britain Island, one of the islands in the Bismarck Archipelago mandated to Australia as a consequence of World War I.

On January 24, 1942, the Japanese overwhelmed the Australian garrison of 1,500 men at Rabaul and soon began construction there of a large naval support facility protected by five airstrips and two air armies with more than 600 aircraft. Rabaul became the base of the Eighth Fleet, and from that port the Japanese could defend the approaches to New Guinea and the Solomon Islands and strengthen the southern flank of the region covered by their Central Pacific base at Truk in the Caroline Islands.

General Douglas MacArthur, Allied supreme commander in the Southwest Pacific Area, made reduction of Rabaul a major objective. However, the position's strength persuaded Allied leaders at the August 1943 Quadrant Conference in Quebec to cancel MacArthur's plans for a direct assault in favor of a strategy of circumvention. Island-hopping was replaced by leapfrogging.

On October 12, 1943, however, the U.S. Fifth Army Air Force operating from New Guinea launched massive air attacks on Rabaul, followed on November 5 by carrier raids mounted by the *Saratoga* and *Princeton*. These U.S. attacks forced the Japanese garrison into a network of tunnels and caves and effectively ended Rabaul's usefulness as a naval base. Operation CARTWHEEL saw continued Allied efforts to neutralize Rabaul from the air. Through the spring of 1944, 29,000 Allied sorties dropped more than 20,500 tons of bombs on the Japanese base. At the same time, the Allies seized positions to the southeast on the island of Bougainville, at Cape Gloucester on the western end of New Britain, and to the north in the Admiralty and Saint Matthias Islands.

By March 1944, the Japanese had withdrawn their major naval and air units, first to Truk and later to Palau, but 100,000 military and civilian personnel remained at Rabaul. Cut off from air or sea resupply, the Japanese garrison suffered increasing deprivation until its surrender in August 1945.

Radar

System used to detect the position, movement, and nature of distant objects. The term “radar” is an acronym that references the operating principles and function of this technology: radio detection and ranging. Radar systems transmit radio waves with the aid of a directional antenna, and they receive and process the radio emissions that reflect off distant objects. The range of target objects is determined by measuring the time it takes for the electromagnetic emission transmitted from the radar antenna to reach the object and return.

The theoretical foundation of radar was established through the work of 19th-century scientists James Clerk Maxwell and Heinrich Hertz. Maxwell developed equations governing the behavior of electromagnetic waves in 1864. Inherent in his equations are the laws of radio-wave reflection, which were demonstrated by Hertz between 1886 and 1888.

A number of early-20th-century scientists and engineers recognized the potential for radio-based detection systems. Radio direction-finding and distance-measuring experiments were conducted during World War I and in the 1920s. From these early efforts, several theoretical radar systems were proposed before World War II. Between 1934 and 1940, practical radar systems were developed independently in several countries as military instruments for detecting aircraft and ships. One of the first practical radar systems was devised in 1935 by Scottish physicist Sir Robert Watson-Watt. His success with this early system can be attributed to the fact that a number of critical technical components became available during the 1930s; it was Watson-Watt who integrated transmitters and receivers, modulators capable of generating microsecond pulses, and high-speed cathode-ray tubes to display search results. Much of this equipment was the by-product of civilian work on broadcast television.

By the late 1930s, laboratories in Britain, the United States, Germany, France, Italy, and the Soviet Union had all begun radar experiments on a modest scale. Japan did not take notice until 1941 but then hurried to catch up. Thus, all of the principal belligerents in World War II entered the conflict with some radar technology.

At the insistence of Air Vice Marshal Hugh Dowding, Great Britain adopted radar in the late 1930s to augment the defenses of the home islands.

Before the start of the war, Great Britain began construction of the Chain Home (CH) radar network, which was enhanced in 1939 with a number of Chain Home Low (CHL) stations, capable of detecting low-flying aircraft approaching the English coast. The CH and CHL stations were the first integrated radar defense system, staffed by crews who were trained to track incoming aircraft and relay tactical information to air defense control centers and air bases. The CH/CHL system played an important role during the Battle of Britain (July 10–September 30, 1940), giving British defenders valuable advance warning of the relentless attacks launched by the German Luftwaffe.

In September 1940, Britain provided the United States with examples of key radar components, including a magnetron, with the understanding that cooperation would lead to the further development of radar technology. The Americans moved quickly. The Radiation Laboratory was established in 1940 at the Massachusetts Institute of Technology under the leadership of Dr. Lee DuBridge. Other emergency radar research programs were created in 1940 and 1941, and the close cooperation of Bell Laboratories, the Army Signal Corps, and the Naval Research Laboratory led to substantial improvements in the accuracy and range of radar equipment. High-power microwave radar systems were among the important advances made by the United States.

Although Germany had the opportunity to exploit radar technology before World War II began, the indifference of the country's political leadership hindered the development of the technology. Before the war, Adolf Hitler and Hermann Göring, chief of the Luftwaffe, were reportedly suspicious of radar's utility and antagonistic to the idea of adopting the technology as a defensive weapon. Later, interservice rivalries within Germany slowed the development of radar even further as resources for research and development became scarce. Germany did finally put into operation the Kammhuber Line, an interlocking system of radar, aircraft, and ground controllers that ran from the North Sea to southern France and went into full operation in September 1942. It was similar to the CH system in scale and purpose, but the Allied use of long-range fighter escorts for bombers limited its value. Italy had a limited radar capability on land and at sea by the middle of 1942. It utilized its own equipment and that of Germany.

Radar played a key role in World War II, with the Western Allies making the most effective use of this new technology. A radar array is shown in operation in Italy in 1944. (Library of Congress)

The Japanese were late in developing and adopting radar technology, a fact that greatly advantaged the Allies in the Pacific theater fighting. However, although U.S. radar identified the Japanese aircraft approaching Pearl Harbor on December 7, 1941, the information was not utilized. Radar provided early warning of subsequent Japanese air strikes as well—for example, during the decisive Battle of Midway (June 3–6, 1942), where the Japanese lost four aircraft carriers. Throughout World War II, continuous improvements to radar technology increased the accuracy of the U.S. Navy's tracking and intercept capabilities.
